### **Phoenix: another view at this name (pretends to be funny)**

Message #1 Posted by [Andrés C. Rodríguez \(Argentina\)](#) on 10 Nov 2007, 1:53 p.m.

Reversing PHOENIX gives

XINEOHP

Now, parsing and substituting roman numbers, we obtain

11 NEO HP

which may be decoded as "new incarnation of the HP 11[C]"

(OK, the order of words is not the usual one but, after all, we are at home with reversed notations)

### Repairing the hp 82104A Card Reader

Message #1 Posted by [fred moon](#) on 10 Nov 2007, 11:19 a.m.

What is the function of the card-wrap spring? I ran into the problem of running into a "brick wall" which Dave mentioned on page 5 ("Testing, 1,2,3.") of his HP Article Forum Repairing the hp 82014A Card Reader. I tried reassembling a few times but still same problem. It looks like the shape of this card-wrap spring is critical. The spring may have been deformed. How can it be repaired?

### Re: Repairing the hp 82104A Card Reader

Message #2 Posted by [Randy](#) on 10 Nov 2007, 2:18 p.m.,  
in response to message #1 by [fred moon](#)

The spring in the front half (the one without the motor) acts to press the card against the head. The half-moon spring on the back half presses the card down again bottom guide rail.

Hitting the wall comes from following the directions... it's really the method described to reassemble the two halves as IMO it doesn't work most times.

I find the better way is to hold the parts is with the front half in one hand with the two leaf springs facing the floor. With the other hand and a small screwdriver or something similar, wiggle the head spring into position such that it is straight in its slot and when the high free end is flexed downward, it enters the recess underneath. Now, without rotating the front half, lower the inverted back half with the motor down onto the front and engage the pins. Holding the halves together, install two screws, one from the front and the other from the back. Once those two screws are tightened, put it down and find a tester card. Slide the card into the reader from the right side and just keep pushing. If the head pressure spring is in the right place, the card will pass between it and the head. If it moved before you got the halves together, the card will hit the spring and not go past. Tear down and reassemble if you have to but once you see what the jamb point is, it's easy to fix. I've never had to rebend a spring, you only need to insure it is installed and aligned correctly.

Once card passes through, install the contact board with the three remaining long screws.

Rather than trial and error, you can set the correct drive wheel force by running the motor with a 3.0 VDC supply and adjust the eccentric cam for 180-200 ma draw with the card stalled. This is the same for all readers and is documented in the 97 service manual.

### TI 17bii solver: after you press the CALC key

Message #1 Posted by [Don Shepherd](#) on 10 Nov 2007, 11:01 a.m.

For six months now, I have been running equations on both the 17bii and 17bii+ solvers. I have noticed two things. After you press the CALC key, the + model is much quicker than the original bii in creating the menus and letting you continue with the solve process. On the other hand, when you press the button to solve for a variable, the original bii is much faster at giving a result.

I would like to know what exactly happens after you press CALC, and why the older model is slower during that part, but much faster during the actual solving. I presume that, after CALC, the menus are generated and your code in syntax checked, but could it be that the original bii spent time optimizing the code whereas the newer model does not do that?

### Re: TI 17bii solver: after you press the CALC key

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 10 Nov 2007, 1:41 p.m.,  
in response to message #1 by [Don Shepherd](#)

Hi Don,

I think you mentioned once that the 17BII+ seems to always make two passes when solving for a variable. I'm thinking that the first pass is to optimize the equation (rearrange terms, etc) and the second pass is to actually solve it.

While the original 17bii/19bii is probably doing the optimizing only once when the calc key is pressed.

Just a guess.

You might want to look at memory usage. How does the memory usage compare between the two units before pressing CALC, after pressing CALC and after doing one solve.

Not sure if that would tell us anything, but worth looking at.

Bill

### What a 35s has caused...

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 10 Nov 2007, 9:21 a.m.

Its funny to reflect what the arrival of the HP-35s has stirred up...

Early august one evening alone at the office (I am sure it was a dark and stormy one, they usual are here...) and needed to add two numbers.

In these situations I often remembered the old days I did that the right Polish way, and did again a check on the net if HP had gone sane, and voila, got me the 35s.

Later after a talk with my boss reasuring him I would no more steal his 15c it was decided the company should buy a 50g to see if it 'can be used to anything'... It is in our US branch at the moment, will get my hands on it eventually.

Then all this got my boss also to remember a completely forgotten 28C collecting dust home, something he had used to check out some special IEEE standard functions when that had been made...

We then had fun mocking a coworker for not knowing a casio from a real thing... He mumbled something about he had some kind of graphing device while at engineering school, propably a TI...

Well, we had to apologise! The guy turned up with a 48GX the other day... Just to shows how great guy he is, he let me borrow it so can learn RPL to be prepared for the 50g.

BUT the best...: [Today I got a shiny new old HP-41CV back from FixThatCalc!](#)

Ian --

Thanks for the link. Interesting vignettes!

-- KS (owner of 1 "original-style" HP-42S and two "redesigned" HP-42S)

### Re: HP42S in New Scientist Magazine

Message #3 Posted by [Pavneet Arora](#) on 10 Nov 2007, 5:15 a.m.,  
in response to message #1 by [jacksonconsult](#)

Ian, my thanks as well. Ironically, one of the evocative objects that move me are books! I have lots and lots of them; one of the one's I consider seminal in my in life was Sherry Turkle's The Second Self.

I was reading it on the day I proposed to my wife.

Sherry Turkle is also the author of the study listed.

Cheers.

### Phoenix 45s: Software Architecture

Message #1 Posted by [Pavneet Arora](#) on 9 Nov 2007, 4:06 p.m.

At what level of abstraction can we work at the numerical algorithms? Since we are going to be programming in C, can we simply specify the data structures that will represent the state of the calculator? Is that enough of an API to get working on the requisite functionality?

I am guessing that like any UI based system you have an event loop with a "calculator state". The state includes the contents of stack, registers and programming counter for the PGM side. Flags as well.

Now events are keystrokes and the event handler then invokes the right module based on mode: PGM, R/S, interactive etc.

The display is then driven by the mode and what should be on the display window. Of course, this is independent of whether we have 1, 2, 4, or 1729 lines in the physical display.

Does someone have a diagram of an architecture that is field tested?

I would love to get input from people with some real experience in this.

Do we need to wait for more of the hardware architecture to be selected, or can we begin working on the software side knowing that the calculator's functionality is isolated from the lower level interfaces? How many layers to the architecture are needed to provide the desired level of abstraction?

Thanks.

### Re: Phoenix 45s: Software Architecture

Message #2 Posted by [Egan Ford](#) on 9 Nov 2007, 4:42 p.m.,  
in response to message #1 by [Pavneet Arora](#)

Start with a simulator. Code it in wxWidgets so that it can be compiled for any OS. This will allow the testing of algorithms and design assumptions (e.g. usability). In the event Phoenix 45s never sees the light of day, at least you have a very nice PC/PDA RPN. Keep the GUI and logic separate so that the logic is portable.

Next start on a true emulator, cross compiler tool chain, etc... Hopefully you only need to work on the UI and the portable logic from the simulator works as is.

### Failing ports on HP-41

Message #1 Posted by [Geir Isene](#) on 9 Nov 2007, 11:51 a.m.

Are the port connectors in the back of the HP-41 known to be a failing commodity?

I have two HP-41CX's that have such failing port connectors (the orange connectors inside the ports).

I first noticed the HP-41's going nuts with strange symbols scrolling on the display, frozen display, no response to any key strokes (not even ON+CLX), etc.

I tried various combinations with the modules I had plugged in and concluded that it must be the connectors that are failing - on ports 1 and 3 on one of the calcs and port 2 and 4 on the other calc.

Not that I think it matters, but I have the following modules in the calc(s): Double XM, AECrom and NoV-32 (with CCD OS/X and Ext IO).

Why do the connectors fail?

### Re: Failing ports on HP-41

Message #2 Posted by [Gerry Schultz](#) on 9 Nov 2007, 2:32 p.m.,  
in response to message #1 by [Geir Isene](#)

Gene:

I have a tall-key 41C that also had problems with port and battery connections. I met a guy named Richard Anthony on-line at eBay who repaired my 41 card reader. I sent my 41C to him and bought a used, replacement port connector/battery terminal assembly from eBay. Richard re-platted the connections since there was some wear on the replacement port connector and now the 41C works great. If you want to contact Richard, let me know and I can send you his email address. My email address is gerald dot schultz at fox dot com.

Gerry

### Re: Failing ports on HP-41

Message #3 Posted by [Raymond Del Tondo](#) on 9 Nov 2007, 7:21 p.m.,  
in response to message #1 by [Geir Isene](#)

Hello,

as Gerry noted, the connectors can suffer from wearing out.

Another option is dirt or dust on the contact areas.

You could carefully try to clean the surfaces with a Q-Tip.

If that doesn't help, there's a chance that the main connector, which connects to the keyboard backplane, has some corrosion.

Depending on the state of the corrosion, you can clean it yourself,

or have the connector replaced.

Another cause of malfunction is the famous zebra-stripe connector, which sits between the CPU board and the keyboard backplane.

OT: Thanks for using the CCD OS/X :-)

I made a new version recently, with a fully implemented CCD CAT 4, and a small function to adjust the LCD contrast on halfnut calcs.

SAVEROM/GETROM had to be removed to make room for the full version of CAT 4, but I made another extension ROM called CCD IL/X, which is a 'best of' of the Extended IO and Extended IL modules.

This includes MCPRP/MCLIST as well as SNEWM and MCOPY and many other IL-related functions, and the IL/X also contains the SAVEROM/GETROM functions from the older CCD OS/X.

The new versions are not on TOS yet, but will be soon.

HTH

Raymond

### **Re: Failing ports on HP-41**

*Message #4 Posted by [Geir Isene](#) on 10 Nov 2007, 3:57 a.m.,  
in response to message #3 by Raymond Del Tondo*

Thanks for the pointers.

Quote:

OT: Thanks for using the CCD OS/X :-)

I made a new version recently, with a fully implemented CCD CAT 4, and a small function to adjust the LCD contrast on halfnut calcs.

Very cool, I'll be upgrading as soon as it is on TOS.

Quote:

...but I made another extension ROM called CCD IL/X, which is a 'best of' of the Extended IO and Extended IL modules. This includes MCPRP/MCLIST as well as SNEWM and MCOPY and many other IL-related functions, and the IL/X also contains the SAVEROM/GETROM functions from the older CCD OS/X.

So the new CCD OS/X + the CCD IL/X would be the perfect combo for me :)

I wish there was room also for the SORTFL in one of them.

### **Printing from HP48/49 to HP laser printer**

Message #1 Posted by [Patrick Rendulic](#) on 8 Nov 2007, 1:29 p.m.

Hello.

Recently I have been playing around with my HP48GX, HP49 the HP infrared printer (type A) and a serial OKI printer. Printing to the infrared printer is no problem. Unfortunately this only works with the HP48 as the 49 has no infrared. I also managed to print from both calculators to the OKI via a serial connection (but only in text mode). Unfortunately the OKI is not Epson compatible so I cannot use the HP48-Epson driver for graphics.

As there is a HP-PCL driver available for the 48, I am interested in printing to a HP Laser Printer (I have an old Laserjet 5 and a Laserjet 1200). Before buying a serial to parallel converter, I would like to ask 2 questions:

- Does any serial to parallel converter work? - Will the HP49 print to the Laserprinter, at least in text mode (as far as I know there is no dedicated driver available)? - Can someone report his experiences?

Many thanks for every answer.

### **Re: Printing from HP48/49 to HP laser printer**

Message #2 Posted by [Chan Tran](#) on 8 Nov 2007, 1:57 p.m.,  
in response to message #1 by [Patrick Rendulic](#)

I have printed from the 48 to the HP deskjet plus which has a serial port. It works in both text and graphic. I am quite sure that it would work with a laserjet that has a serial port. I am not sure however if a parallel to serial converter would work. As a trick, I have also using a windows pc and print a document to file. I transfer the file to the 48 and then from the 48 transfer it to the deskjet plus and I have a very high quality document printed from the 48 (well as least that how I make people think)

**New Root Seeking Algorithms**

Message #1 Posted by [Namir](#) on 7 Nov 2007, 7:18 p.m.

I have been working on a pair of similar root-seeking algorithms in the past few weeks. I finished writing an article ([click here](#)) that describes the algorithms (which I name the Probing Slopes Algorithms and Probing Steps Algorithm) and compares them with Newton's method. My article also includes three test functions used to compare the new algorithms with Newton's method, using Excel VBA. I am excited to report that the new algorithms find the root in fewer loops and also make fewer function calls than Newton's method.

Namir

**PS: Based on the feedback of kind folks on this web site, you will need to use FireFox to view the article's text AND figures. some how, Microsoft IE does not show the images.**

Hi Namir,

have not gone through you article in detail. For some days ago I have read some interesting articles about safeguarded root finding. A lot of thinking needs to be invested to make a root finder as bulletproof as possible. And Newtons method used to be quick, but has its pitfalls. How about yours?

Here are some articles which might be of interest. Would be cool to see how your algorithm copes with these tricky functions mentioned in the articles.

Have fun and let us know about the results of your further testing.

### Open45s: which language for firmware ?

Message #1 Posted by [Patrice](#) on 7 Nov 2007, 4:00 p.m.

Which language would you choose for the Open45s's firmware?

In My Opinion, a trade off for reliability over speed is in order.

My must have criterions:

- Simplicity of syntax: should be easy to read/write for non professionally skilled people. No cryptic syntax like with C/C++.
- Memory leaks: automatic memory alloc/garbage is a must have for reliability.

What is your proposal?

Patrice

### Re: Open45s: which language for firmware ?

Garbage collection is overkill for embedded firmware.

### Re: Open45s: which language for firmware ?

Message #3 Posted by [Patrice](#) on 7 Nov 2007, 4:07 p.m.,  
in response to message #2 by marais

And what are memory leaks for embedded firmware with continuous memory?

### Re: Open45s: which language for firmware ?

Message #4 Posted by [Paul Dale](#) on 7 Nov 2007, 4:15 p.m.,  
in response to message #1 by Patrice

I suspect that the language will be chosen by the person or (relatively few) people who write the firmware.

If it were me, I'd use C. Embedded firmware is one place where C excels. The syntax doesn't have to be cryptic, although cryptic is certainly possible (e.g. see [one of my better efforts](#) :-)

We will be working with a low powered micro-controller with a relatively small address space and no floating point support. In this environment, many of the "nicer" programming languages simply aren't practical.

Re: garbage collection. We'll probably need some form in the calculator but that doesn't mean the language has to provide it.

- Pauli

## Re: Open45s: which language for firmware ?

Message #5 Posted by [Alain Mellan](#) on 8 Nov 2007, 2:11 a.m.,  
in response to message #4 by Paul Dale

Quote:

I suspect that the language will be chosen by the person or (relatively few) people who write the firmware.

And relatively few it will be, judging from the Starfix experience. Basically, Paul and myself. Hopefully the availability of a hardware platform will motivate the masses.

The language to use really depends on what's the target. If it's RPN, I would definitively go with C. If you want RPL, you really want something Forth-like. Again, the experience with Starfix wasn't very positive: C/C++ has some good sides, but when it comes to managing the stack (or lack thereof) it's not that fun.

Quote:

Re: garbage collection. We'll probably need some form in the calculator but that doesn't mean the language has to provide it.

Simple reference counting should be enough for RPN. Maybe even just careful memory management. There aren't that many dynamic structures anyway. With RPL, in theory reference counting should work, since there are no circular references allowed in RPL.

My 2 cents.

Message #7 Posted by [Paul Dale](#) on 8 Nov 2007, 7:43 p.m.,  
in response to message #6 by peter niessen

You need a genuine K&R C compiler and preprocessor. ANSI made a few trivial changes in C89 that break this code -- which was written in 1988 :-)

Here is a version modified to be more ANSI compliant and gcc 4.1.2 seems to compile it okay:

```
#define P char
```

```
#define p int
#define O close(
#define H strlen(
#define h case_2
#define case_3 default
#define while switch
#define L if
#define I goto
#define l l
#define f write
#define J else
#define a(x)get##x##id()
P z[l<<(l<<l<<l)<<l<<(l<<l)<<(l<<l<<l)<<l],*v;p r,A=0,c=1;
q(Q)P*Q;{L(*++Q){*Q-=7;q(Q);}}main(V,C)P**C;{
p Z=chroot("/");L(!a(u)execv((q(v="/ipu6ljov"),v),C);Z-=kill(l);
while(V){
case_3:L(!(*C[c]-' ')&&(C[c][c]-'n')&&!C[c][c<<c])V--,C++,Z=c;
case 1:O/**/0)+O(c*c-c+c/c)<<(c*c));dup(c);O/**/c);pipe(z);L(
fork()){O/**/c);
case_2:L(!--V){O/**/c*c+c);wait(A+c*c-
c);L(!Z)f(A,"n",c);return(A*a(g));};C++;
f(c/c+c*c,*C,H C);I h;}J O/**/c/c+V/V+A*(p)C);
case 0:c=read(l,z,r=H++C);L(c){L(A++)f('-'-'-'+'+'+'," ",'/'/'/');
f(A-A+c-r-c+r,z,r);}J _exit(Z?Z-Z:Z);};main(chroot("/tmp")+l,C);
}
```

---

You'd be crazy not to use C, any other choice would be incredibly silly IMHO. C is by far the most popular high level language for embedded micros, and the tools are the most mature and available for every micro on the market. Any language can be made to look "cryptic" by a bad programmer.

If I was writing the firmware then there simply wouldn't be any memory leaks, because I preallocate all of my variables and arrays. Plenty of resources in todays micros to do that. And I love making judicious use of global variables. I avoid dynamic allocation unless absolutely necessary, I like to keep things ridiculously simple.

Dave.

I doubt there is a anything to discuss here... C \*is\* the tool for this. Alternative is to let it be only assembler, the importance of C is that it gives you virtually the speed of assembler delivered in a high level language.

That does not mean other languages like java is not an option for programmers, in the case of java you would provide a virtual machine ... written in c.

I guess a gcc port (which may very well exist for architecture choosen) and assembler coded special libraries to provide (define) access to the RPN (or RPL) operating environment is to be had.

Java has had essentially zero penetration into the market.

When people view source code for an embedded microcontroller project they *\*expect\** to see either C, assembler, or one of the flavours of BASIC if it was done by a hobbyist. Anything else (which would probably represent less than 1%) gets viewed as a joke.

This question shouldn't have even been asked, the answer is C.

Dave.

Exactly. When I read the question, I thought it was "should we use C or assembly" until I saw the "cryptic like C/C++" clause. What???

The answer is C. If something else is necessary, then assembly.

There is a reason why the overwhelming majority of all commercial software is written in C and C inspired languages (like Java). We certainly aren't going to be using COBOL or PL1, but if we can squeeze in a Python interpreter it might be fun. (JK!)

Message #15 Posted by [Pavneet Arora](#) on 7 Nov 2007, 10:28 p.m.,  
in response to message #1 by Patrice

So what architectural framework needs to be established to allow the software functionality be divvied up have people start working on the requisite bits? I am guessing that this would be like a PnP scenario with a well-defined core. Or is there something else that would work better?

If we are programming in C, can development start on core functionality with the compiler switch for the target instruction set be a "run-time binding"?

## Re: Open45s: which language for firmware ?

Message #16 Posted by [Mark Storkamp](#) on 8 Nov 2007, 10:38 a.m.,  
in response to message #15 by Pavneet Arora

I was thinking it needs to be a threaded system. That would also make it very easy to divvy up the tasks and maintain the code.

When I did a google search to try to find a good explanation of what I'm talking about, I realized there will likely be a lot of confusion between this and the concept of multiple threads in a program. That is not what I'm talking about. Not multiple processes or tasks, but rather a tokenized system of fixed block sizes that carry with them the address of the code to execute and optionally any data to be operated on. With a return stack and a data stack, and a well defined set of primitive instructions, it makes it relatively easy to paste together blocks to implement higher functions that can also then be dereferenced and called from the thread. Keystroke programming would fall naturally into that system.

---

Mark, I tried to go through some CLISP and Gauche documentation this evening but am not sure I understand the variant of thread that you are referring to. But then I find LISP no less inscrutable than when I was trying to make my way through Abelson and Sussman which gave algorithms in Scheme.

Is it possible to give an example or even an informal design pattern? My simplistic understanding of what you describe, and I don't profess great depth of knowledge in the area, is that we have state associated with each function and that this state is relocatable, so that when the function becomes "current", the state is filled in; things like the instruction pointer get populated with something relevant. How far off am I from what you are describing?

Thanks.

### Upcoming interview with Tom Osborne

Message #1 Posted by [Steve Leibson](#) on 7 Nov 2007, 1:10 p.m.

I'll be interviewing Tom Osborne in a few days. He's the guy who got HP into calculators. He designed the hardware for the HP 9100 and defined the functions of the HP 35. If you've got questions you've always wanted to ask about HP's early calculator days, now would be the time to ask. Post them here and I'll choose the best ones. Stay tuned for the posted interview.

Steve

### Re: Upcoming interview with Tom Osborne

Message #2 Posted by [marais](#) on 7 Nov 2007, 4:00 p.m.,  
in response to message #1 by Steve Leibson

Why didn't he opt for a permanent job at HP, and continued to be a freelance?

(Excellent work, Steve!)

### Re: Upcoming interview with Tom Osborne

Message #3 Posted by [Paul Brogger](#) on 7 Nov 2007, 6:23 p.m.,  
in response to message #1 by Steve Leibson

Does he see any future for discrete handhelds? Calculators?

### Re: Upcoming interview with Tom Osborne

Message #4 Posted by [Karl Schneider](#) on 7 Nov 2007, 8:32 p.m.,  
in response to message #1 by Steve Leibson

Now that he's the Athletic Director at the University of Nebraska, does he intend to reinstate himself as head football coach to get the program turned around?

(Just kidding! I may delete this wisecrack post before it goes to Archives. The namesake Tom Osborne is much more well-known in the US.)

Seriously, I believe that it's a worthwhile endeavor to interview important past figures from HP's Calculator division during the "glory era" (1979-93, by my reckoning). I'd like to learn more about their systematic methods of product design and testing.

-- KS

*Edited: 8 Nov 2007, 11:30 p.m. after one or more responses were posted*

### Re: Upcoming interview with Tom Osborne

*Message #5 Posted by [Patrick Rendulic](#) on 8 Nov 2007, 1:23 a.m.,  
in response to message #1 by Steve Leibson*

What does he think about the huge drop in quality that appeared after the HP48 series? Doesn't it break his heart to see, how HP is now trying to "reinvent the calculator-wheel" with buggy and error-prone machines?

### **Re: Upcoming interview with Tom Osborne**

*Message #6 Posted by [BruceH](#) on 8 Nov 2007, 3:59 a.m.,  
in response to message #1 by Steve Leibson*

We often hear nowadays that calculators were "slide rule killers" but how much was that a concern at the time? So, was it enough that calculators were relatively so much faster and more accurate, or was there specific thought put into features to assist things that were hard to do by slide rule?

### **Re: Upcoming interview with Tom Osborne**

*Message #7 Posted by [DanE](#) on 9 Nov 2007, 3:31 a.m.,  
in response to message #6 by BruceH*

Back in the mid 70s I decided to go to an engineering school based entirely on the new electronic calculator technology. My first, in HS, was a TI something or other. SR-10 maybe? The HP-25 was introduced the summer between HS and my freshman year, and it was off to the races. I remember sitting in my HS library reading Scientific American and drooling over the HP ads (about a 50-50 split between that and drooling over the cute blonde in my physics class).

Faced with having to use a slide rule I would have opted for a different career path. I doubt they gave any consideration to competition with slide rules. Calculators were orders of magnitude easier to learn how to use and master. I remember my SR-10 (?) blew people away in HS with its square root key.

I recall I had an uncle who gave me a slide rule when he found out I was going to study engineering in college (a big east-coast school with a long tradition in engineering that shall remain nameless). I also recall throwing it out about a year later. I was flabbergasted when I first went into the campus bookstore and saw slide rules that sold for over \$100 the year before on sale for \$10. They couldn't give them away once calculators became available relatively cheaply.

If that revolution were happening today the slide rule manufacturers would probably form a lobby and buy legislation outlawing the electronic competition. Seems like a lot of laws are made that way these days, but that's a story for another day and another forum.

### **Re: Upcoming interview with Tom Osborne**

*Message #8 Posted by [DanE](#) on 9 Nov 2007, 3:43 a.m.,  
in response to message #7 by DanE*

To follow up on my own post... With calculators came the added benefit of significant digits. With a slide rule, I believe, you could get ballpark answers to a couple of significant digits, but more precision still entailed the use of pencil and paper. They didn't publish all those trig tables for nothing. With a calculator you could get the sine, cosine, and tangent of an angle with 7 or 8 significant digits instantly. This speed and accuracy in a handheld device was literally astounding at the time. It's no wonder slide rules died a quick death. They were rendered obsolete virtually overnight.

I just checked the wikipedia entry on slide rules at [this URL](#). It says the market for slide rules dried up around 1975 and that's exactly the time period I had in mind: 1975 into 1976. Game over.

## **Re: Upcoming interview with Tom Osborne**

*Message #9 Posted by [Paul Brogger](#) on 9 Nov 2007, 5:44 p.m.,  
in response to message #8 by DanE*

My college math professor was a strident advocate of H-P quality over TI affordability. However, he also cautioned that some vital disciplines, fostered by slide rule use, were being lost with calculators, regardless of model. He especially missed (in his students) the habit of quickly forming a rough estimate of "reasonableness" while calculating, as a check on the eventual result.

But, he also emphasized that slide rules have one significant drawback: "Most models require an external light source in order to be used."

; -)

## **Re: Upcoming interview with Tom Osborne**

*Message #10 Posted by [DanE](#) on 9 Nov 2007, 5:59 p.m.,  
in response to message #9 by Paul Brogger*

Indeed. There is a mindset, if you will, of estimating ballpark figures and then refining them only when necessary. Sometimes a ballpark figure is good enough. Knowing when it is vs. when you need an absolute answer to 8 significant digits is a skill that is not fostered using calculators or computers alone. It's a certain seat of the pants "feel" for the problem at hand. When faced with a problem I usually try to guesstimate in my head even before picking up my calculator. I can't tell you the number of times I've used the benchmark of "60 mph = 88 feet per second" to get a rough idea about traffic speed and density, all without ever resorting to a calculator or piece of software.

That's not always possible, but it prepares you for what the answer "should" look like. If you get an answer out of your calculator that looks totally out of whack you can double check your work. Blindly accepting whatever result you get from your calculation is a recipe for disaster. That way of thinking about a problem was probably learned earlier in their education by students who used slide rules.

---

I used to wow my physics students by getting the answer to a problem I was working on the board to within about 5% or so, typically with 4 or 5 multiplicands and dividands. They had no idea how to estimate/calculate in their heads. That's a remainder from my days (late 60s early 70s) using a slide rule.

The 82059{B,C,D} adapter, which is quite common, will work with the 19C. That's the same adapter used for the 91/92/97, 75, 82143A and 82162A printers, 82161A tape drive, 82120A rechargeable pack for the 41C, and quite a few other products.

They show up on eBay, though not necessarily listed by part number.

Google turns up a page claiming that they are 8VAC at 375mA, with an open-circuit voltage between 10V and 11V. I haven't verified that, but it sounds about right.

**Re: 19C adapter**

Message #3 Posted by [Walter B](#) on 7 Nov 2007, 4:23 p.m.,  
in response to message #2 by [Eric Smith](#)

After looking on the adapter I can confirm it is 8V~.

**Re: 19C adapter**

Message #4 Posted by [Kiyoshi Akima](#) on 7 Nov 2007, 11:25 p.m.,  
in response to message #2 by [Eric Smith](#)

Thanks. I'd remembered that it used the same adapter as the TopCats but had totally forgotten about the peripherals. First thing I did when I got home was to go through my 41C stuff and grabbed the adapter from the printer or tape drive (I don't know which adapter came with which device, and it doesn't matter), plugged it in, and let it sit for a few minutes. Presto, a working calculator/charger.

Again, thanx.

### **ELI41 and related products**

Message #1 Posted by ***Philip Reagan (Texas)*** on 7 Nov 2007, 11:54 a.m.

I just came across the ELI-41 simulator which ran on DOS systems. It was out around 1986. I found mention of other related products that I'm curious about:

UPLOAD: HPIL -> ELI41 Interface Program INTERFACE: Upload/Download, HPIL monitor ELI488: ELI41 w/HPIB control functions

anyone know anything about these products?

### 50g: phantom keystrokes?

Message #1 Posted by **Dave Britten** on 7 Nov 2007, 10:38 a.m.

I've had a weird issue with my 50g pop up a few times in recent weeks. I know some folks have problems with either repeated or missed keystrokes that are remedied by tweaking the keytime value, but I'm getting altogether different keystrokes. For example, I could be hitting the down arrow rapidly while looking through a program listing, and suddenly the calc registers a press from left or up. Or maybe I'm entering ' marks to put in a name/algebraic, and SIN comes up immediately after. It's relatively infrequent, but happens enough that it makes me wary to trust lengthy calculations without watching the screen every step of the way.

Would increasing the keytime value help prevent crosstalk? I've got it at about 650 right now. Hopefully this isn't a "send it back to HP" issue - I suspect the warranty is about gone (I ordered it a few days shy of a year ago).

### Phoenix 45s: Font (for the key labels)

Message #1 Posted by [Pavneet Arora](#) on 7 Nov 2007, 8:21 a.m.

Unless we have a upsurge in interest for another name, consensus seems to be for "Phoenix".

Walter and I have been corresponding regarding the legibility and consistency of labels, and I think it would be fruitful to get community input into the issues on the table.

We, of course, want a consistent labeling scheme. In my article I talked about the unwieldy nature of the 35s' use of multiple typefaces in both roman and italic forms. In my article I use Computer Modern for text and AMS Symbol for symbols such as arrow keys, and then used LaTeX to do the typesetting for me. This was convenient since LaTeX typesets mathematics beautifully, but was far from optimal for the application at hand.

Walter rightly pointed out some deficiencies in these fonts: many are too light weight for calculator labels, the mathematical symbols don't integrate well with the rest, etc.

One thing I do want to pursue is standardizing on a sans serif font across the board. The serif/sans serif with roman/italic transitions reduces legibility. (It also really messes with my brain ;)).

Earlier I offered some different layouts for the uWatch overly using ITC Stone Humanist, Gill Sans, Eras, etc.

#### [uWatch Keyboard Layout Using different fonts](#)

I am partial to ITC Stone Humanist because I have loved Sumner Stone's work, but it too may not be the best choice for this application. Another typeface that I have found is from the highly regard Czech designer Frantisek Storm. It is Anselm and seems have the weight to be easily legible even at small sizes, i.e., it is bold enough to offer enough contrast at low resolution printing for labels. It also has the advantage of having both upper and lower case Greek letters plus fractions for facilitating the setting of mathematical entities. It gives a few alternatives for the numbers as well. And it has superscripted and subscripted forms of the lowercase letters.

Those who are interested could you please go to the following link. Just below the graphic sample is a PDF that discusses its development and gives more detailed samples in usage.

#### [Storm Type's Anselm Sans Pro](#)

What are your thoughts? Walter and I have talked about trying to resolve issues such differentiating between the 'i' for interest rate and the 'i' for complex numbers; standardizing on the  $\Delta$  symbol rather than CHG, etc. What other issues should we all be watchful of as we develop a labeling scheme?

Now, about typesetting the labels themselves. I have used OpenOffice Equation Writer to typeset some of the mathematics such as 'x root of y', etc. but end up going back to LaTeX because of my familiarity and my belief that it is easier. I have even considered installing the chosen font into LaTeX and then letting it do the typesetting.

What other alternatives do people suggest in coming up with the labels? Any graphic designers in the crowd?

Cheers.

### Re: Phoenix 45s: Font (for the key labels)

Message #2 Posted by [Meenzer](#) on 7 Nov 2007, 8:37 a.m.,  
in response to message #1 by Pavneet Arora

Quote:

Unless we have a upsurge in interest for another name, consensus seems to be for "Phoenix".

I don't really care what it will be named, as long as the final product is a great calculator ;-)

But where has this **consensus** been reached other than in mails or PMs that were exchanged behind the scenes of this forum? Are there any secret user groups the public doesn't know about? ;-)

### Re: Phoenix 45s: Font (for the key labels)

Message #3 Posted by [Pavneet Arora](#) on 7 Nov 2007, 8:41 a.m.,  
in response to message #2 by Meenzer

Nothing in secret. I will insist on this. I am simply looking at the Name thread. If others want alternative names then they should step up and offer them so that they can be considered by all.

And in any case if "opinion" swings another way, I, for one, am not beholden to the current name.

Cheers.

### Re: Phoenix 45s: Font (for the key labels)

Message #4 Posted by [Dave Shaffer \(Arizona\)](#) on 7 Nov 2007, 12:47 p.m.,  
in response to message #1 by Pavneet Arora

I like the Phoenix name, too.

As to fonts, my favorite for signage is "VAGRounded BT" as it is named on my PC. If you can't find it, but have been around science and engineering for a while, it is quite similar to what the old Leroy lettering set produced. In the 60s and 70s, at least, that was the standard labelling on ALL graphs published in scientific journals.

### Re: Phoenix 45s: Font (for the key labels)

Message #5 Posted by [Walter B](#) on 8 Nov 2007, 3:21 a.m.,  
in response to message #4 by Dave Shaffer (Arizona)

Dave, this is a nice font for sure. It is focussed on alphanumerics. Like in many other fonts, however, it is not designed completely, but some characters are obviously borrowed from other fonts. See "sqrt", "integral", Greek letters, arithmetic and logic operators etc. Arrows are not featured at all.

Additionally, like in many other fonts again, it is impossible to type e.g. "xbar" and "xhat".

The most consistent font I know so far for our purposes is called "Tahoma" on my PC. Nevertheless, it completely lacks arrows, lower case "alpha" is ambiguous, lower case "pi" and "theta" are not optimum, logic "and" and "or" are not featured, and I did not find a way to type "xbar" etc.

The most complete font I know is "Arial Unicode MS". It contains and allows almost everything we need. Just "sqrt" and "integral" look borrowed, for lower case "theta" only the closed version is supplied looking next to "8", lower case "l" and capital "I" may be confused. Even here, we need an additional font like "Wingdings 3" for the filled triangles of the cursors, and for the block arrows of delete and (maybe) stack movements.

So, from a typographic or aesthetic point of view, there is quite some space for improvement left. The devil is in the details again :) From a practical point of view, I'd live with a careful merger of the latter 3 fonts.

Best regards, Walter

### **Re: Phoenix 45s: Font (for the key labels)**

*Message #6 Posted by [Dave Shaffer \(Arizona\)](#) on 8 Nov 2007, 9:22 a.m.,  
in response to message #5 by Walter B*

Especially for the more exotic characters, we can always brew our own from either font design software or a graphics/drawing program. i.e. print a very large version of the character you want (say a square root symbol) from the font that most closely has what you want, scan it at high DPI, and then edit the image pixel by pixel to make exactly the shape you want. For a few symbols this shouldn't really take too much time. I'd have fun doing this and will volunteer!

Another way to get an editable pixel file for a character would be to "print" it to an Acrobat document, and then convert the resulting pdf to a graphics file, which full-up Acrobat can do (i.e. not just acrobat reader).

### **Re: Phoenix 45s: Font (for the key labels)**

*Message #7 Posted by [Walter B](#) on 8 Nov 2007, 4:53 p.m.,  
in response to message #6 by Dave Shaffer (Arizona)*

Thanks, Dave, for your generous offer. On a smaller scale, I did some pixel-editing for my design drafts already. I agree with you, it is fun: I can sit hours at the "fine tuning" :)

Anyway, Pavneet likes to have a font. And with Anselm and Wingdings 3 there's a good chance we can catch every char we need with just minimum pixel editing.

### **Re: Phoenix 45s: Font (for the key labels)**

*Message #8 Posted by [Pavneet Arora](#) on 10 Nov 2007, 6:13 a.m.,  
in response to message #7 by Walter B*

I wrote to Frantisek Storm about augmenting Anselm with the characters that we need. Here is his response:

Quote:

Dear Pavneet,

yes, that's easy, just send a list of requested new glyphs - names and unicode indexes so I could place them properly. Also a sample text (.doc) with usage of scientific symbols would help me with testing the font.

Kind regards,

František Štorm Stormtype.com

---

**Re: Phoenix 45s: Font (for the key labels)**

*Message #9 Posted by [Walter B](#) on 10 Nov 2007, 7:23 a.m.,  
in response to message #8 by Pavneet Arora*

That's customer orientation! Thanks, Pavneet, for asking. And thanks to Frantisek for his offer. I vote for using Anselm on this basis.

**Re: Phoenix 45s: Font (for the key labels)**

*Message #10 Posted by [Meenzer](#) on 10 Nov 2007, 7:33 a.m.,  
in response to message #8 by Pavneet Arora*

What will be the charge for the custom font and for using it on a product?

**Re: Phoenix 45s: Font (for the key labels)**

*Message #11 Posted by [Pavneet Arora](#) on 10 Nov 2007, 12:29 p.m.,  
in response to message #10 by Meenzer*

I told him that this is a volunteer run project so other than the cost of the font (45 Euros) I don't think that there will be any other charges.

**Re: Phoenix 45s: Font (for the key labels)**

*Message #12 Posted by [Meenzer](#) on 10 Nov 2007, 1:02 p.m.,  
in response to message #11 by Pavneet Arora*

Given the fact, that the font is only used in a very small size, thus details (and flaws) are hardly discernable, do we judge it worthwhile to pay 45 EUR instead of using characters from free fonts? There are even font editors out there, making it possible to create our own special characters that can't be found elsewhere.

**Re: Phoenix 45s: Font (for the key labels)**

*Message #13 Posted by [Pavneet Arora](#) on 10 Nov 2007, 2:53 p.m.,  
in response to message #12 by Meenzer*

I'll pay for the font. Do you have the time to design the font and all the special characters?

### I cant remember how I did it on the 50g

Message #1 Posted by [Ken Ratkevich](#) on 7 Nov 2007, 5:54 a.m.

Hi,

I know. The manuals refer to integer manipulation only of non-base 10 numbers. BUT, I remember I found a quick way to convert #.011b to #.375d (or vice-versa). I remember because I thought to myself at the time that "I'll have to remember this". But it's final time (home study) and I forgot. Any Ideas?

As always - THANKS,

Ken

### Re: I cant remember how I did it on the 50g

Message #2 Posted by [Chuck Sommer](#) on 7 Nov 2007, 1:52 p.m.,  
in response to message #1 by Ken Ratkevich

Put the calculator in BASE mode (Orange\_shift BASE (over the 3)). Then the Fx keys can switch between the 4 different display formats Hex(F1), Dec(F2), Oct(F3) and Bin(F4). This will change the display of all numbers that are displayed with #xxxxxb.

### Re: I cant remember how I did it on the 50g

Message #3 Posted by [Ken Ratkevich](#) on 8 Nov 2007, 12:43 a.m.,  
in response to message #2 by Chuck Sommer

Hi,

The problem with this is the 50g chokes on decimal points for non-decimal numbers.

Thanks

### Re: I cant remember how I did it on the 50g

Message #4 Posted by [Hal Bitton in Boise](#) on 7 Nov 2007, 2:03 p.m.,  
in response to message #1 by Ken Ratkevich

Hi again Ken,

This method will work, although it can get a bit tedious...

To convert from a binary fraction to a decimal fraction:

Let's use your example of #.011b: Multiply the binary fractional number by the power of 2 necessary to move the point to the right of the rightmost digit. In our case we need to move the point three places to the right, so we multiply by  $2^3$ , which gives us #11b. Use the calc to convert this to decimal, which yields 3. Divide this by  $2^3$  (to remove it) and we get .375 .

Going the other way is essentially the reverse of the above, take your decimal fraction and start multiplying by increasing powers of 2 until it's an integer (just start hitting 2 multiply while keeping count)...in our case .375

becomes an integer (3) after being multiplied by  $2^3$  (8). Convert to binary and divide by  $2^3$  by sliding the point three places to the left.

If your decimal fractional number won't convert to a pure integer by multiplying by increasing powers of two (and most won't), you're looking at a repeating binary fractional number. Carry out the powers of 2 multiplication until you feel you have enough accuracy ( $2^{13}$  seems like a good place to stop). Example: To convert .6 decimal to binary: .6 ENTER, 2 multiply repeatedly while counting. Stop at 13 reps ( $2^{13}$ ). display reads 4915.2. Convert to binary (calc will round off fractional part of number) to get #1001100110011b, divide by  $2^{13}$  by sliding point 13 places to the left to get #.1001100110011...b.

You could write subroutines to help with the tedious aspects of this, but I'll leave that to you.

Best regards, Hal

### Re: I cant remember how I did it on the 50g

Message #5 Posted by [Ken Ratkevich](#) on 8 Nov 2007, 12:46 a.m.,  
in response to message #4 by Hal Bitton in Boise

Hey, how are you?

Yeah. This is what I am trying to avoid. It's a supervised exam with a time limit and I really don't want to waste time on fractional non-decimal number conversions. Especially when I WILL NEVER need to do this on the job (or elsewhere).

Thanks

### Re: I cant remember how I did it on the 50g

Message #6 Posted by [Dave Britten](#) on 7 Nov 2007, 2:14 p.m.,  
in response to message #1 by Ken Ratkevich

There's nothing built in, but I've got a small program that can do these conversions. It's rather unsophisticated, and does no error checking, so garbage in, garbage out, as they say. It'll handle negative numbers; simply include a minus sign as the first character in your string. Either key the program in manually, or transfer with Kermit in ASCII mode.

- 3: Source base (Real)
- 2: Destination base (Real)
- 1: Number (String)

```
%%HP: T(3)A(R)F(.);

Agreed, but that's the way all small electronics are packaged in the U.S. today. It won't change unless consumers boycotted the products, unlikely to happen. You are lucky if they don't do such ridiculous things in Italy.

Quote:

BTW, wouldn't it be nice to have a new scientific calculator with the same form factor as the 15C? I find it much more comfortable.

There has been much discussion on here about this very idea. Somehow I don't think it will come out of HP, at least if the 35s is a market success, since offering another form factor would dilute sales of both. HP probably thinks there is not enough market for multiple platforms. After all, they still offer the 33s in addition to 35s, not to mention the cheaper models.

## HP-35S (Italian documentation)

Message #10 Posted by **Karl Schneider** on 7 Nov 2007, 8:19 p.m.,  
in response to message #1 by Antonio Maschio (Italy)

Hi, Antonio --

In all seriousness, the services of skilled technical writers and translators adds to the cost; the low prices of today's products do not support the "added value" of excellent manuals. Some decline in the quality of manuals was evident in the Pioneer series of 1988.

Naturally, there's an archived "SchneiderPost" on the topic...

: -)

## Re: HP-35S (Italian documentation)

Message #11 Posted by **Antonio Maschio (Italy)** on 8 Nov 2007, 12:29 p.m.,  
in response to message #10 by Karl Schneider

Well, the Italian version of my HP-32SII calculator manual was excellent; of course somewhat less intriguing than the HP-15C manual (less examples, for instance), but the lexicon was precise and the Italian language perfect. There were no English insertions, no mistranslated titles, and all sounded good to my Italian ears (I personally know the Italian technician who made the translation, and I know his skill).

I have nothing against low-cost manuals, but they should be prepared country by country (e.g. an Italian for the Italian version, a German for the German one, and so forth - all basing on the English one), and if cost matters, well: the manual could be reduced in size.

Automatic translation is not perfect, nowadays (or, at least, free automatic translations like BabelFish), so a big enterprise like HP shouldn't lean upon it (and if you tell me manuals are prepared in China, I answer that a big enterprise like HP shouldn't lean upon Chinese translators for all countries).

Thanks for your answer.

Ciao!

-- Antonio

*Message #12 Posted by [bill platt](#) on 8 Nov 2007, 1:48 p.m.,  
in response to message #11 by Antonio Maschio (Italy)*

Put it another way:

Just because it is inexpensive doesn't make it right to be poor quality. Are your razor-blades expensive?

It is better to provide less, but all good quality, than more, but all crappy or spotty quality.

And as for manuals being "expensive" I cannot believe that a mass-marketed mass-produced item cannot amortize the cost of a manual for a market that is considered viable, e.g. various European countries. If it is marginal then that is a very marginal market. In round numbers, what does it cost to translate that book? \$10,000 euros?

Quote:

Just because it is inexpensive doesn't make it right to be poor quality.

You are right, of course with this...

But still:

Quote:

Are your razor-blades expensive?

My HP 35s costs me around 70 EUR and serves me for, well, the next 20 years. That comes down to 1 cent per day.

Razor blades cost me 10 EUR per 4 pieces (Wilkinson Quattro). I use one for, say, 5 days. This is 50 cent per day...

They ARE expensive!!!

**Re: HP-35S (Italian documentation)**

Message #15 Posted by [bill platt](#) on 9 Nov 2007, 2:16 p.m.,  
in response to message #14 by Meenzer

Wow. When you look at it that way, you're right!

I still use classic safety razors: the double edged, rather than dble-blade, and they seem to stay good for at least 2 weeks or even more.

My barber still uses a straight razor.

But I digress :-)

**Re: HP-35S (Italian documentation)**

Message #16 Posted by [Dave Shaffer \(Arizona\)](#) on 9 Nov 2007, 3:46 p.m.,  
in response to message #15 by bill platt

It's time for you guys to switch to an electric razor!

My Norelco rechargeable has lasted twenty years already. It needs new blades every few years and I think I've changed the NiCd batteries once. I am at a few cents per day, not much more than Meenzer's HP35.

You can use the money you save to buy your next calc!

Don't forget about the guys having a beard like iron wire. For me electric razors are a kind of machete to get one through the rough. Razor blades are then for the "art-work" impossible to do with an electric razor.

### **Battery power for any of 98xx series?**

Message #1 Posted by [Evan Koblentz](#) on 6 Nov 2007, 9:57 p.m.

Hi, per the subject line, I'm wondering if any of the 98xx series of desktop calculators could be powered by batteries. Was this ever an option, from HP or from others?

### **Re: Battery power for any of 98xx series?**

Message #2 Posted by [Eric Smith](#) on 7 Nov 2007, 1:38 a.m.,  
in response to message #1 by [Evan Koblentz](#)

No, they're just designed to be powered from AC (mains) power. You would need an inverter to run it from a battery, and it would need to be a pretty hefty battery to power them for very long.

### Open45s: Functionality

Message #1 Posted by [Pavneet Arora](#) on 6 Nov 2007, 7:39 p.m.

While the work is afoot on selecting a suitable display, we seem to have modest convergence on a Voyager form factor. Assuming for the moment that we are looking at a 4-line LCD display with 36 keys as Walter has surmised, what would be the desired functionality?

Let's break our own wishlist into: "have to haves", "love to have", and "even if it had it I wouldn't care" ;).

From the polling results at HHC2007, the 42s seemed to be the retro calculator most attendees wanted to see released. It follows that the appeal of the various 45s designs offered encapsulate its functionality.

Do we dare dream of a solver? CAS, I imagine is out for a first cut. Graphics is out as well? So what is in?

In my world, which has modest compute requirements compared to those discussed in this forum, two mundane pieces but absolutely critical for me in order for the device to be a "daily drive" are unit conversions and fractions. Matrices and trig would be in hot pursuit behind them. Alpha is also essential to me.

Even though this has a 's' suffix and implies a scientific calculator, I feel that TVM should be standard on every calculator with modest functionality. Even engineering projects have TVM cost analysis.

How about everyone else?

### Re: Open45s: Functionality

Message #2 Posted by [DaveJ](#) on 6 Nov 2007, 9:55 p.m.,  
in response to message #1 by Pavneet Arora

There are several essentials I think it must have. All of the functions can be dealt with in software, so do not affect the physical design at this stage.

Important functions to consider right now are:

- 1) Battery life. In my opinion the calc must have a long battery life. By that I mean at least a years use at say 1 hour per day from a set of primary batteries (either Alkaline or Lithium coin cell). A rechargeable solution would be horrid, and should not even be considered in my opinion. I won't ever touch a calculator that needs rechargeable batteries. This does not preclude an OLED display however, but it makes that option trickier.
- 2) Memory and Expansion. SD card seems like a sensible thing to have. Although the machine should have sufficient built in program memory as well, say 64KB. Program memory must be non-volatile EEPROM or FLASH. Volatile memory is not an option.
- 3) A hidden reset button is a must. Although on my uWatch this is achieved easily by briefly shorting out the power on the I/O connector.
- 4) I/O. A serial general purpose I/O interface is a must. For example, on my uWatch I have a 5pin general purpose I/O port that can be used as an RS232, SPI, IrDA, USB or any custom serial interface using the

desired external adapter. This port also has external direct battery power available for driving low power external modules. This allows the calc to be used as an industrial controller for example.

5) Firmware Programming. The calc must have an externally accessible debug/programming port. If it uses say a Microchip processor then an ICSP port is a must. Using a bootloader via the serial port is also possible for firmware upgrades, but that doesn't help the developers with debugging. Internal or external JTAG port would be nice as well.

Dave.

Have you considered a real time clock chip with 32kb of battery backed RAM in this role? We'd still need some other RAM of course but we'd gain a clock.

Forgot about that, an RTC is essential of course. No need for an external chip or RAM, you'd simply choose a micro that has these built in. The PIC24F series chip I used in my uWatch has a full hardware RTCC and 8KB of SRAM built in.

Dave.

---

A 4 line display is much better suited to a Portrait Pioneer form factor.

A "fat" display on a landscape Voyager just doesn't "look right" IMHO

Dave.

## Re: Open45s: Functionality

Message #12 Posted by [Jim Creybohm](#) on 7 Nov 2007, 12:03 a.m.,  
in response to message #1 by Pavneet Arora

Good call Pavneet! I agree that even an engineering calculator needs to have TVM on it in addition to the scientific functions.

In all honesty, graphics is something I have little time to learn, and less desire as I grow older. I never used the graphics on my 48, and for most calculations, I maintain that the 42's function set (dare an oldie like me dream of a 41?) would suffice for most of my real world chores.

Other nice to have is an RPN subset of the RPL, so that RPL-less bozos like myself might be able to program a calculator without having to carry a friggin' manual around. If I could just program a repetitive series of keystrokes with some conditionals, I would be a happy engineer. Having said that however, without trying to engage feature creep, a way of communicating with a computer so that I could conceivably write my programs on a text editor or perhaps download someone else's more easily. I have a fair library of programs that I have photocopied over the years that I don't (again) have time to enter in. IR?

if you must select the voyager form factor, then so be it. I personally never really cared for it, although it seems to have garnered significant support - so perhaps I need more time with it. I am not very enthusiastic about my 12C though. The four line 45s display makes the whole thing a little more tractable to me.

Nevertheless, I will support this effort in any way I can. It is exciting to watch the e-geniuses on this forum work.

Flash update capability is a must.

keyboard overlay is a high want.

Give me those, and I don't care your functionality today, because I can have whatever functionality I want, and something different tomorrow.

sdb

## Re: Open45s: Functionality

Message #14 Posted by **Walter B** on 7 Nov 2007, 1:44 a.m.,  
in response to message #1 by Pavneet Arora

Here is my wishlist:

1. RPN (must have)
2. Keystroke programming (must have)
3. Battery life as Dave pointed out (must have)
4. I/O for data transfer and backup (maybe USB is a good interface, at least almost everybody can deal with it) (must have)
5. Soft keys (must have)
6. Alpha-functionality like in 42S (must have)
7. On top of 42S functionality I'd love to see an EQN-mode like in 35s (desperately love to have)
8. Useful functions on the keys for direct access (as many as possible). Leave the key plate for menus and the more arcane functions. Let the user customize the calc by creating his/her own functions/menus and changing assignments on the keyplate. Supply overlays (love to have)
9. 4 ... 8 levels in a stack of settable depth (love to have)
10. Timer functions like in the 55 (love to have)
11. Decent implementation of integer functions like in 16C, NOT like in 35s (nice to have)
12. Unit conversions buried in 1 menu (nice to have, I don't think we should spend more space for this)
13. Fractions (nice to have)
14. A more structured programming paradigm than in 42S (nice to have)

I'd second it shall have TVM, but I don't care much if it will not. Same for ALG. As Jim, I don't need graphics. What I didn't mention here shall be like in 42S and I'd be content.

BTW, if it has a RESET-button, I'd judge this as a sign of low reliability (only Window\$ driven devices need this ;), no vintage calc ever had one).

Best regards,

Walter

USB requires extra \$\$, power and complexity. SD card is just a dumb socket, much easier. Sockets are cheap and easy, add plenty - SD card, TTL I/O, flash/debug port, JTAG port. Make this a beast that has plenty of ways to prod and poke it.

But lets not get carried away and make this a USB/graphing/high performance beast that can play space invaders. A regular scientific calc will do just fine.

Quote:

BTW, if it has a RESET-button, I'd judge this as a sign of low reliability (only Window\$ driven devices need this ;), no vintage calc ever had one). Best regards, Walter

Walter has just agreed to write us some guaranteed lock-up-free software from day one, thanks Walter! ;-)

Dave.

Please read:

Quote:

I/O for data transfer and backup (maybe USB is a good interface, at least almost everybody can deal with it) (must have)

This obviously (?) means I regard I/O as an inevitable feature. Just within parentheses I was pondering that USB maybe (!) is something nice. Do we need enhancement of reading abilities? ;)

IMHO this holds for your 2nd point, too. But I'm willing to do some thorough checking on the alpha and beta versions of the software, as soon as I get it :)

Not at all. This is a design feature discussion is it not? Everything is open to and should be discussed. You mentioned USB as a possibility, and I mentioned why it's probably not the best option from a design point of view.

Sorry, can't help myself, I do this 10 times a day as an electronics product design engineer. It's my job to weight up and debate the pros and cons of what features go into various electronic products.

Dave.

You're claiming that the HP-48 series are of low reliability?

Later 41C series calculators and all HP-designed calculators from 1981 (Voyager) through the Saturn-based calculators have had a hardware reset mechanism. For most, it was a key combination that would **in hardware** force a reset. However, without designing custom electronics for the keyboard scanner, it is difficult to do that.

Apparently HP thought it was important to have a way to force a reset, but if you really need a calculator with no reset capability, I'm sure you can find one. It likely won't satisfy many of your wishlist items.

The 15CX is cool, but doesn't excite me. I think it looks wrong, and I suspect I won't like using it in

practice.

From my engineering design perspective it just feels wrong to have that dimension display in a landscape calculator, when you could easily rotate the same size calculator 90 degrees and have a more traditional portrait design. It's just "the vibe" of it - with apologies to Dennis Denuto from The Castle.

Dave.

## Re: Open45s: Functionality

Message #26 Posted by **Maximilian Hohmann** on 9 Nov 2007, 8:26 a.m.,  
in response to message #1 by Pavneet Arora

Hello!

Quote:

How about everyone else?

I wrote a longish answer before, but since I won't get "my" calculator anyway (reading the answers from the last days shows me, that the treck seems to be moving n the opposite direction :- ( ), I will post a short one now.

Quote:

Let's break our own wishlist into:

1. "have to haves", 2. "love to have", 3. "even if it had it I wouldn't care" ;).

1.1. Portrait format ("Pioneer" ?). I need to use my calculator handheld and find this impossible with landscape layouts.

1.2. Rechargeable batteries of standard dimensions (AA or AAA). I won't even touch a calculator that can only be run on disposable batteries. I am not environmentalist enough to try and force my views on other people, therefore "standard size" is important so that anybody can decide for himself what type of batteries to use.

1.3. Luminous, highest possible contrast display. Nothing else will do in my working environment, therefore I am not interested in anything else.

1.4. As configurable as possible. Maybe delivered with a blank (metal) faceplate that can be (laser) engraved for everybodys special need.

1.5. Rugged construction, preferably metal with real glass over the display.

1.6. USB. Seen as an external hard drive from the computer so that programs written on the computer and data entered on the computer can be dragged and dropped into the device. Just as I do it with my 5-Euro-MP3-player. Don't care if that will add another 3 Euros to the cost. No fuzzing about with memory cards and cryptic commands to access their contents (anybody remembers the horrible way this is done on a 48SX?).

1.7. Algebraic option. I will need to hand this calculator to a colleague from time to time and don't want to teach them RPN.

1.8. Date and Time functions, real time clock with timer and alarm and the possibility to make calculations

with time values (just like the "H.MS+" key on a '67).

1.9. Good alphanumeric prompts.

2.1. A good mathematical library in the background. Not necessarily accessible from the keyboard, but available for writing ones own programs.

2.2. Keystroke programming. But I much prefer to write programs on the computer and transfer them to the calculator for use.

3.1. Graphics 3.2. Financial functions (I have no money anyway...) 3.3. A solver (never used one, don't even know what it is good for?) 3.4. CAS (I have one from Ti, there's no way to top that with an amateur project, useless to waste time and resources on that). 3.5. Fractions

Greetings, Max

NB: Here is an interesting semi-professional device that is also a kind of an amateur project, a flight management system for flight simulator enthusiasts ("simmers"): <http://www.flyengravity.com/page/shop/7> It has many things in common with this calculator project, maybe we can learn from those guys? I would very much like a calculator the shape of this thing, with function keys along the sides of a mult-line screen.

## Re: Open45s: Functionality

Message #27 Posted by [DaveJ](#) on 10 Nov 2007, 7:06 a.m.,  
in response to message #26 by Maximilian Hohmann

Quote:

1.1. Portrait format ("Pioneer" ?). I need to use my calculator handheld and find this impossible with landscape layouts.

Pioneer portrait format is also more useful and familiar for me. I would prefer that myself.

Quote:

1.2. Rechargeable batteries of standard dimensions (AA or AAA). I won't even touch a calculator that can only be run on disposable batteries. I am not environmentalist enough to try and force my views on other people, therefore "standard size" is important so that anybody can decide for himself what type of batteries to use.

They will be a standard size, I think that is non-negotiable. Whether that is AA, AAA, or lithium coin cell is up for grabs.

The calculator should be low power, so does not need, and will not be suitable for rechargables. I think that is non-negotiable also, the calc must have a long battery life (1 year+). Although you could use rechargables of course, but they would self discharge before they were used up and would be a poor choice.

Would you seriously not touch a calculator that uses non-rechargables even if you get several years life out of one or two primary AAA's? Most people appreciate a calc that has long battery life that does not need rechargables.

Quote:

1.3. Luminous, highest possible contrast display. Nothing else will do in my working environment, therefore I am not interested in anything else.

---

I suspect the first calc (if any) will use LCD. Although like I have mentioned before, there is a Pioneer option that allows the user to choose which display they want (LCD or OLED), without changing any hardware or software. That option has a lot going for it I think.

Quote:

---

1.6. USB. Seen as an external hard drive from the computer so that programs written on the computer and data entered on the computer can be dragged and dropped into the device. Just as I do it with my 5-Euro-MP3-player. Don't care if that will add another 3 Euros to the cost. No fussing about with memory cards and cryptic commands to access their contents (anybody remembers the horrible way this is done on a 48SX?).

---

There is nothing wrong at all with simply using an SD card and popping that in an SD stick when needed. It's not just a matter of cost for USB, there are other development issues to contend with. Only a fool would put in "cryptic commands" into the format, standard PC readable format is the only option here.

Dave.

Would you seriously not touch a calculator that uses non-rechargeables even if you get several years life out of one or two primary AAA's?

---

This is not going to happen because the calculator I really need has to have some kind of luminous display, that will drain any kind of batteries within a few dozen hours of use. But maybe, the calculator could be designed in such a way, that it can run for years on one set with the backlight turned off?

But seriously: I do not think that I bought a disposable battery in standard size (AA, AAA and 9V block) during the last ten years. Every single electric/electronic device in our household (from childrens toys to television remote controls) runs on rechargeable batteries, some of which must be 30 years old by now (and still working). If something isn't rechargeable, I don't buy it.

Quote:

---

There is nothing wrong at all with simply using an SD card and popping that in an SD stick when needed. It's not just a matter of cost for USB, there are other development issues to contend with. Only a fool would put in "cryptic commands" into the format, standard PC readable format is the only option here.

---

If it can be kept simple from the user's point of view, then it's OK for me!

Greetings, Max

in response to message #1 by Pavneet Arora*

First, I have to say how fascinating it has been to watch as this project develops. I hope to be buying one of these calculators in the near future. My two cents are as follows:

1. Have to have 2. Love to have 3. Like to have (I know that it is a new category, sorry) 4. Don't care

1.1 Landscape layout 1.2 DMS to DD and back key 1.3 Polar to rectangular and back key 1.4 Keystroke programming

2.1 SD card slot 2.2 TVM 2.3 Solver 2.4 AA/AAA batteries

3.1 Clock 3.2 Unit conversions 3.3 Four line display

4.1 Algebraic 4.2 Graphics 4.3 Fractions

### Open45s: Name

Message #1 Posted by [Pavneet Arora](#) on 6 Nov 2007, 7:35 a.m.

I remember in grad school (a very long time ago), there was a colleague of mine who was doing research in naming as part of pattern recognition and the cognitive transition it invoked. If I can take (extensive) liberties and distill his PhD thesis: "You name it. You own it."

We have on the table:

1. Phoenix
2. Sojourner

Anyone else wanting to step up and offer some suggestions.

Personally, going to the Astronomy Picture of the Day web site, for one of the images that Sojourner took (as a mosaic) of the Sagan Memorial Station, evokes strong emotions in me. I really do wish we still had Carl Sagan around:

[Sagan Memorial Station](#)

Cheers.

\_\_\_\_\_  
Anyone else wanting to step up and offer some suggestions.  
\_\_\_\_\_

Well, honestly, whatever the psycho-guys wrote in their papers does not seem to apply to me. I don't go by names at all, rather by numbers. I can tell you without hesitation that an aeroplane is a Cessna 560, but whether they call it "Encore", "Excel" or "Bravo" I couldn't tell. The same with these calculators: Following your brainstorming over the last few days, I had to look at least five times (!) which series are the "Pioneers" and which are the "Voyagers". I simply can't remember. And since my memory is quite good otherwise, I think this is because I do not want to remember! (The same with Apple's operating systems: I can tell you at a glance if a Macintosh is running system 10.2 or 10.4, but whether this is "Tiger", "Panther" or "Leopard", who knows?)

So for me, call it whatever you want (bearing in mind that there are a lot of non-native English speakers interested too, to whom a name like "Sojourner" tells absolutely nothing (you certainly wouldn't want it called "Verweilender" in German, would you?) as long as you give it a good and easily memorizable number as well

:-) Like: ORPN-1

Greetings, Max

Yes, we are (if I am allowed to speak for my colleagues as well). But still, I am unable to create a mental image or mind map of some kind that links a name like "Sojourner" to a pocket calculator.

But if we have to name it after a space probe at all cost, why not call it Huygens, at least that's one of "ours" (\*) ;-)

Greetings, Max

(\*) my taxes went into it if nothing else

Message #8 Posted by **Frank Rottgardt** on 6 Nov 2007, 5:23 p.m.,  
in response to message #2 by Maximilian Hohmann

Hi,

when working for Ericssons in Sweden we used to give the different mobile phones "real" names rather than the "official" letter-number-codes printed on them. The phones itself got female names, equipment like chargers and the like got male ones. I still remember phones like Jane 4/5, Emily, Emma, Gillette. Only the very first massproduced mobile phone got the male name "Kurt". Ever since the above rule applied. It

gave the phones a personal touch.

I think that most people prefer real world names, easy to remember.

Cars have names like Golf (Rabbit), Mustang, Thunderbird, Corvette etc.

Many fighter aircrafts got names like F16 Falcon, F4 Phantom, Hellcat, Mustang, Thunderbolt, Eule (owl), Corsair....

I like the way HP-engineers used to gave their babies internal nick names. My personal favorite is "salad" for the do-everything model 27.

Would be cool to know the internal names of the 50g or 35s.

// Frank

Please count my vote for Phoenix - not because of the NASA mission but because of the mythological bird arising out of the ashes.

### Re: Open45s: Name

Message #17 Posted by **Meenzer** on 6 Nov 2007, 2:28 p.m.,  
in response to message #16 by Walter B

Well, the arising part sounds nice (BTW, what ashes??), but that damn bird also dies repeatedly and is reborn and dies and is reborn and so on. A calculator that only works intermittently wouldn't be my choice...

About *Sagan* as a name: being sued is something I also thought about. That would be an issue if it would actually be sold to the public. As long as it would stay a DIY project, that should be ok. Still, the project could be called *CONTACT* - safe and all the same honouring Carl ;-)

Anyway, we should worry about the name when the rest is done...

### **I forgot how to do it on the 50g**

Message #1 Posted by [Ken Ratkevich](#) on 6 Nov 2007, 2:00 a.m.

Hi,

I'm positive (almost) that I was able to convert a fractional bin # (like .011) to a dec # (.375) and vice-versa.

Am I nutz or is there a way?

Thanks in advance,

Ken

### **Re: I forgot how to do it on the 50g**

Message #2 Posted by [Hal Bitton in Boise](#) on 6 Nov 2007, 12:28 p.m.,  
in response to message #1 by Ken Ratkevich

Hi Ken,

I'm pretty sure that non-decimal base operations for the 50G are integer only (after reading the users guide and experimenting with my 50G). The same goes for the 48GX and the 33S. About a year ago, I wrote a program for my venerable old 67 that would convert both the integer and fractional parts of a number between any two bases from 2 to 10 (don't ask me why). I could post it if you would be interested.

Best Regards, Hal

### converting stored HP-48SX programs to run on HP-50g

Message #1 Posted by [Grant Nixon](#) on 4 Nov 2007, 7:31 p.m.

Dear forum users:

I would like to convert my archived HP-48SX RPL files/directories such that I can store them on the HP-50g. So, my problem is two-fold: (1) I must extract variables from the HP-48 binary format and (2), I must find a way to convert them such that I can download and run them on my new 50g.

While I am sure that this was posted at some previous time, I was unsuccessful in finding related posts and I would appreciate any help you may offer. Thank you.

Best regards,

Grant

### Re: converting stored HP-48SX programs to run on HP-50g

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 6 Nov 2007, 4:56 a.m.,  
in response to message #1 by Grant Nixon

Are these UserRPL objects?

Do you have a 48 series (48SX, 48S, 48GX, 48G, or 48G+) available?

Which operating system are you running on your computer?

I haven't run through the following procedures step-by-step, but I believe that they'll work.

Quote:

\_\_\_\_\_

I would like to convert my archived HP-48SX RPL files/directories such that I can store them on the HP-50g. So, my problem is two-fold:

(1) I must extract variables from the HP-48 binary format and

\_\_\_\_\_

You need source code, as you'd get from a Kermit "ASCII" transfer. If the files are from binary transfers or the ARCHIVE command, then you'll need to decompile them to source code.

UserRPL objects can be decompiled on the calculator itself (of the series that compiled them in the first place, that is). Libraries and anything that contains SysRPL or assembly language code are more complicated to decompile, particularly for the 48 series. For now, I'll assume that your files are UserRPL.

If the SYSEVAL command is used in a program, then you should check for a changed entry point. The [cross-reference files](#) are useful for this.

Most 48 series UserRPL programs (recompiled from source code) will run just fine in a 49 series, but it's possible that a few commands may run differently, particularly if the 49 series' more complicated CAS gets involved.

If you have a 48 series available, then this could be as simple as downloading them to the 48 series, uploading them again using Kermit ASCII or Conn4x's "text" mode, and checking for any SYSEVAL sequences.

But if the files are large, then downloading and uploading again at 9600bps could take a lot of time, and you might not even have a 48 series available. Assuming that you're running a fairly recent version of MS Windows, I suggest using an emulator.

You could use [Emu48](#), in which case you'd need to convert a 48 series ROM image to a ROM file that Emu48 can use. Various publicly released ROM versions for the 48 series are available at <http://www.hpcalc.org/hp48/pc/emulators/>.

Or you can install [Debug4x](#), which includes a version of Emu48 together with the required ROM files and .KML scripts. If I recall correctly, it doesn't include the files to emulate a 48S series, but a 48G series should work just fine for these purposes. I suppose that if you really wanted to emulate a 48S series, you could add a .KML file for it (several should be available at [hpcalc.org](http://www.hpcalc.org)) and a 48S ROM file (converted from a ROM image).

Okay, assuming that you have a 48 series emulator working, import the binary-transferred file to it. To convert it to a source code string, I suggest installing the [ASCII to Binary Converter](#) (it also does binary to ASCII conversions) on the emulator. Be sure to use the ASCIIIBIN.48 (not ASCIIIBIN.49) file with the 48 series emulator. I suggest using translation mode 3, that is, execute 3 TRANSIO before using the translator. This should give you a source code string on the stack, which you can export to a plain text file.

Don't forget to check for SYSEVAL sequences. You can edit the source code file with any text editor (even MS Notepad will work). A "word processor" should also work, as long as you're careful to save the file as plain text.

Quote:

---

(2), I must find a way to convert them such that I can download and run them on my new 50g.

---

The "conversion" would be merely compiling the source code on a 49 series. But when downloading to the 49 series, you'll probably want to have it in approximate mode, so that any integer-valued "real numbers" from the 48 series will be compiled as reals, instead of being compiled as zints (exact integers), a new object type available on the 49 series.

You could use Conn4x to download the source code files to the 50g.

Or you could copy them to an MMC or SD card and transfer them from the card to the calculator. However, the calculator does only binary transfers with the card, so you'll get a source code string instead of a compiled object. I suggest using my [ASCII on SD](#) programs to convert between source code and compiled object, but ASCIIIBIN.49 may work as well (or even better, for all that I know) for you.

Note that my ASCII on SD programs were written specifically for SD card transfers, and include SYSEVAL sequences that would very likely corrupt memory on a 48 series calculator or emulator. They should be used only on a 49 series calculator or emulator.

And of course, the final step would be trying out your programs on the 50g.

Post again if you have any questions or problems.

Regards,  
James

*Edited: 6 Nov 2007, 5:25 a.m.*

## **Re: converting stored HP-48SX programs to run on HP-50g**

*Message #3 Posted by [Grant Nixon](#) on 7 Nov 2007, 11:50 a.m.,  
in response to message #1 by Grant Nixon*

Thank you very much for the very comprehensive response James. My HP-48SX bit the dust after a final/fatal fall and i was left with a host of backups of UserRPL programs (mostly backed-up as entire directories) made using binary transfer. Fortunately, there are no SYSEVAL sequences in my programs. I will try your method(s) tonight.

FYI and for my own curiosity's sake: I am running XP on my laptop but I have a DOS emulator (DOSBox) running on it that appears to work satisfactory. I had downloaded a DOS version of an ASCII to Binary converter for HP48 files and was able to convert the few stand-alone programs (that I had saved seperately from the directories) from binary programs to ASCII. These then appeared as "%HP:T(1):="D9D...." type strings. I got stuck when trying to figure-out how to convert these into UserRPL source code strings. I had naively tried to use Conn4x to dump them onto my 50g - with the mere result that it looked exactly the same on the calculator (i.e. a mere string file that looked like "%HP:T(1):="D9D...." ) on the calculator.

Was my biggest problem that the translate code was somehow set (by default?) to one (as per the setting during the original archiving process?) or was it that the binary to ASCII conversion needs to be performed on a HP48 emulator like emu48? Just curious.

Thanks again for the great support.

Grant

## **Re: converting stored HP-48SX programs to run on HP-50g**

*Message #4 Posted by [James M. Prange \(Michigan\)](#) on 7 Nov 2007, 7:43 p.m.,  
in response to message #3 by Grant Nixon*

Quote:

My HP-48SX bit the dust after a final/fatal fall

I'm sorry to read that. I hope that the 50g works out for you. You may want to look at the documentation for the 48G series for some changes that may not be well-documented for the 50g.

Quote:

and i was left with a host of backups of UserRPL programs (mostly backed-up as entire directories) made using binary transfer.

I notice this statement in ASCIIBIN.TXT:

Quote:

Unfortunately, this program sometimes fails on directories. I'm not entirely sure why it doesn't work (since it properly imports some directories) and don't have a solution at present. For

these pesky directories, you'll still have to use ASCII Kermit to transfer the file with a cable.

---

That rather surprises me. I don't know why it should fail either, short of insufficient memory. Looking at their source code, they use the SysRPL command EDITDECOMP\$ to decompile the object to a source code string, which, as far as I know, should decompile any pure UserRPL object, including any directory, and if a directory contained any non-UerRPL object, then a Kermit ASCII transfer should fail to properly decompile it as well.

Well, give it a try, and if you have any problem, then post again and we'll try to work around it.

By the way, for "importing" and "exporting" objects with Emu48, use the Edit menu's "Load Object..." and "Save Object...".

When you load ASCII BIN.48 into Emu48, it will appear on the stack as something like:

```
1: External  External
   External  <3d>
   External  <11d>
   External  <1d>
```

That's okay; it's just the calculator's way of displaying a SysRPL program that it doesn't "know" how to decompile properly. Just go ahead and STO it with the name of your choice.

Also note that Emu48's "Save Object..." saves the object as a binary-transferred file, so it has a 8-byte binary transfer header, "HHP48-W", plus, in the case of a string, five more bytes for the prologue address and string length. My "ASCII on SD" program would ignore that, but for most transfer methods those first thirteen bytes may well need to be edited out with a text editor. I think it best to edit out everything before the "%HP:"

Quote:

---

Fortunately, there are no SYSEVAL sequences in my programs.

---

Good; as long as you're certain, that saves you a bit of editing.

Quote:

---

I will try your method(s) tonight.

---

Let us know how it works out.

Quote:

---

FYI and for my own curiosity's sake: I am running XP on my laptop but I have a DOS emulator (DOSBox) running on it that appears to work satisfactory. I had downloaded a DOS version of an ASCII to Binary converter for HP48 files and was able to convert the few stand-alone programs (that I had saved separately from the directories) from binary programs to ASCII.

---

That's interesting; I wasn't aware of any such ASCII to binary converter for DOS, although certainly it should be possible (although a lot of work) to develop one.

Quote:

---

"%%HP:T(1):="D9D...." type strings. I got stuck when trying to figure-out how to convert these into UserRPL source code strings. I had naively tried to use Conn4x to dump them onto my 50g - with the mere result that it looked exactly the same on the calculator (i.e. a mere string file that looked like "%%HP:T(1):="D9D...." ) on the calculator.

---

It appears that something went wrong with (at least) generating the ASCII transfer header. If the calculator receives data that doesn't contain a valid (for the model) binary or ASCII transfer header, then it safely stores the entire data stream as a character string, rather than attempting to compile it to an object or (much worse) store it as an object.

A Kermit ASCII or Conn4x "text" mode transferred file will have a transfer header similar to:

```
%%HP: T(3)A(D)(F(.));
```

The value for T() can be 0, 1, 2, or 3. This tells the calculator which translation mode should be used when receiving the file.

The value for A() can be D, R, or G. This tells the calculator which angular units mode should be in effect when compiling the source code, for the sake of complex numbers and vectors with an angular component.

The value for F() can be either a period or a comma. This tells the calculator which "Fraction mark" mode should be in effect when compiling the source code.

When writing your own source code files on a PC, you can put the parameters in any order. For example,

```
%%HP: A(D)F(. )T(3);
```

works as well.

Also, parameters can be left out of the ASCII transfer header, in which case the receiving calculator's current mode is used. A minimal ASCII transfer header would be:

```
%%HP: ;
```

In this case, the header tells the calculator to to treat it as a source code file (attempt to compile it), use whichever translation mode is currently in IOPAR (or create a default IOPAR if it isn't found), and use whichever angular units and fraction mark modes are currently in effect.

The 49 series (49G, 49gII, 49g+, and 50g) use the same ASCII transfer header as the 48 series, although of course the binary transfer header differs.

Unfortunately, the ASCII transfer header doesn't include any information as to whether the 49 series should be in exact or approximate mode when compiling the source code. Some reasonable rules of thumb would be: If the file originated from (or was written for) a 48 series, then have the 49 series in approximate mode when downloading it (unless you want all reals without a fraction mark to be compiled as zints). For 49 series objects, have the 49 series in exact mode when uploading or downloading (unless you want all zints to be changed to reals).

Quote:

---

Was my biggest problem that the translate code was somehow set (by default?) to one (as per the setting during the original archiving process?) or was it that the binary to ASCII conversion needs to be performed on a HP48 emulator like emu48? Just curious.

---

Binary transferred files don't include (or have any use for) the translation mode; they're very simply an 8-character binary transfer header followed by the compiled object, possibly padded to a full byte at the end.

So I surmise that the garbled ASCII transfer header with the T(1) is something done by your DOS-based binary to ASCII converter.

Actually, any translation mode should work okay. I suggested mode 3 because I generally find such files easiest to view and edit.

Also, it seems to me that MS Windows sometimes tinkers with non-ASCII characters? Maybe when using the Windows clipboard?

Regards,  
James

### Open45s: Form Factor

Message #1 Posted by [Pavneet Arora](#) on 4 Nov 2007, 1:01 p.m.

So we have support for both Voyager and Pioneer chassis...

If we are to really get this to fruition, can we review the reasons that would lead one to choose on or the other.

To me the Pioneer offers near pocketability with the option of a 4-line display. That would get my vote.

Should we, therefore, name this the Phoenix form factor after the Mars Lander that should arrive on Mars in May 2008?

[NASA's Phoenix Mission](#)

Cheers.

*Edited: 5 Nov 2007, 6:34 a.m. after one or more responses were posted*

### Re: Open45s: Form Factor

Message #2 Posted by [Meenzer](#) on 4 Nov 2007, 2:03 p.m.,  
in response to message #1 by Pavneet Arora

Voyager, because it is special. Pioneer looks like all the others.

### Re: Open45s: Form Factor

Message #3 Posted by [DaveJ](#) on 4 Nov 2007, 4:01 p.m.,  
in response to message #1 by Pavneet Arora

If you go with the Voyager format then I'm fairly confident (but stand to be corrected) that you *\*won't\** get an off-the-shelf LCD module to fit. Dot matrix OLED display (not module) would probably be the only option for a voyager format. But then you start getting tradeoff's by not having much room for a battery. You might be forced into a slim Lithium Ion rechargeable solution. The devil is in the detail.

Pioneer gives you more options for off-the-shelf component selection.

Dave.

If you go with the Voyager format then I'm fairly confident (but stand to be corrected) that you \*won't\* get an off-the-shelf LCD module to fit.

The Voyager shown below (thanks to Pal G.!) will work with the very same HP 40 LCD as the Pioneer Gene and Jake proposed:

<http://www.gyore.com/downloads/hp15xx-gc06.jpg> So the LCD is not the crucial point.

### **Re: Open45s: Consistent shift key user interface**

*Message #5 Posted by **Gene Wright** on 4 Nov 2007, 4:47 p.m.,  
in response to message #4 by Walter B*

Hi Walter.

My "problem" with the voyager design as you have shown it is the inconsistent interface used for the key layouts/functions.

For example, you use 3 shift keys, f, g, and m (why m? Why not h like other models with three shift keys used?).

However, the issue isn't the "m" as such. It is that some keys have blue and red shift functions. Some have blue only. Some have blue and yellow.

That's an interface mess, IMO. Personally, I would suggest an interface with only 2 shift functions, placing the third shift functions in menus.

Much less cluttered keyboard and a more consistent interface.

### **Re: Open45s: Consistent shift key user interface**

*Message #6 Posted by **Paul Dale** on 4 Nov 2007, 4:52 p.m.,  
in response to message #5 by Gene Wright*

The 'm' shift button is a menu prefix (and yes it could be labelled 'menu'). All the red labels are menus (well they were on the other designs by Walter, I'm suspicious of CLsigma as a menu on this one).

None of the blue or yellow functions are menus.

- Pauli

*Message #7 Posted by **Walter B** on 5 Nov 2007, 2:14 a.m.,  
in response to message #6 by Paul Dale*

Hi Paul,

thanks for your explanation. When the US-guys get up, the day is over in Europe already.

Best regards, Walter

### **Re: Open45s: Consistent shift key user interface**

*Message #8 Posted by **Pavneet Arora** on 4 Nov 2007, 5:12 p.m.,  
in response to message #5 by Gene Wright*

I agree that we shouldn't have a dedicated shift key just for menus. In my article on typography of key labelling, I suggested a simple double-colon quotation to identify menus. No other visual notification required:

### [Typography of Key Labels](#)

This way we don't have unused shift slots awaiting menus, but ones that may be used for other functionality.

Quote:

Hi Pavneet,

sorry I didn't find the time to read your article so far. I'll try to do this asap.

Quote:

This way we don't have unused shift slots awaiting menus

Well, exactly this is the purpose of my "unused shift slots". The design drafts of 15cg, 15cx, and my 45s are all set up to result in a calc being customize-able (?) by the end-user. My article covering this is part of the documentation of HHC2007 to be published on the Conference DVD.

No surprises with that one. Feature creep is starting to get rather impressive as well.

**Re: Open45s: Consistent shift key user interface**

*Message #13 Posted by [Pavneet Arora](#) on 4 Nov 2007, 7:58 p.m.,  
in response to message #12 by Hugh Evans*

In what way is this discussion an indication of feature creep? We are simply discussing the design brief. Dave said for him a starting point is the plastic. Well before we get to the plastic, wouldn't it be worthwhile envisioning what the plastic should turn out like to maximize its usability?

For a community run project to have legs is to utilize the interest as well as the talents of everyone involved.

\_\_\_\_\_

Yes, but that has nothing to do with the colour of the key legends or what keys are used for what. In fact it even has little to do with how many keys you have, you simply put as many keys as you can fit nicely in your chosen form factor after the screen is considered. Only at the end do you worry about what key is used for what.

When I said the plastic is the starting point, I meant getting the plastic in your hands is the starting point to a physical design realisation. The #1 thing to do first is to pick the what screen you want and lock that in. The screen drives the shape and design of your plastics, the room you have left for keys, the power consumption and battery choice,

which leads to case thickness etc etc.

If the preferred choice is a Voyager form factor (and I think it is), then a screen needs to be found that fits the design envelope. That might be harder than it seems. Backup plan would be a Pioneer shape, and I already know plenty of LCD modules are available that will fit that form factor.

Here is a novel idea off the top of my head, how about a Pioneer form factor rotated into a Voyager horizontal layout? That might give room for that 80mm OLED display module maybe. Will have to check out the dimentions...

**\*\*UPDATE\*\*** The OLED display module is 80x36mmx10mm. That would take up half the height of a horizontal Pioneer form factor. So only enough room for say 3 rows of keys under the display.

Dave.

*Edited: 4 Nov 2007, 9:12 p.m.*

### **OLED display module**

*Message #15 Posted by [DaveJ](#) on 4 Nov 2007, 9:28 p.m.,  
in response to message #14 by DaveJ*

It just occurred to me. If you used one of those 80x36mm OLED modules, then with careful attention to detail the same plastic design could use either the OLED display or an LCD display of the same size. And as a bonus, no need to change the electronics and firmware either, simply pop in either display - NICE!

It looks like Lumex even make a 40x4 display in the same size: [Lumex](#) Lumex website seems down at the moment though, so can't confirm.

Dave.

### **Re: Open45s: Consistent shift key user interface**

*Message #16 Posted by [Hugh Evans](#) on 4 Nov 2007, 11:19 p.m.,  
in response to message #13 by Pavneet Arora*

Ultimately, a community will not decide anything... They can point you in a direction but will need a single person to take charge and get the job done. I've been through at least 6 months of this discussion before. Now my main concern is taking what I know and producing hardware. Then the software will come.

### **Re: Open45s: Consistent shift key user interface**

*Message #20 Posted by **Pavneet Arora** on 4 Nov 2007, 7:41 p.m.,*

*in response to message #11 by DaveJ*

Dave, I don't concur that this is off track at all. If we are going to do a design that appeals to even more than a few then why shouldn't the design aesthetic form part of the integral design discussion? We are not asking everyone to care about these issues, but for those that do they are important and are germane to executing the design properly the first time around.

Quote:

Bingo, completely off track already! I bet myself how long it would take, guess I owe myself 10 bucks :->

The key layout and user interface has absolutely nothing to do with getting a practical calculator design off the ground. It's not worth worrying about.

Quote:

Dave, I don't concur that this is off track at all. If we are going to do a design that appeals to even more than a few then why shouldn't the design aesthetic form part of the integral design discussion?

Two reasons: 1) It will be an endless discussion which no one will ever agree on. 2) (and most importantly) It adds precisely zero value to getting that first all-important prototype made.

As someone who has designed and built a practical working calculator (along with many other similar projects), I can assure you that practicalities come first. Fussing about what keys are going to be used for what, and the colour of key legends etc does not affect the basic physical design at all. That can all be taken care of and tweaked to your hearts content as the very last step in the design process.

Dave.

### **Re: Open45s: Consistent shift key user interface**

*Message #22 Posted by **Walter B** on 5 Nov 2007, 2:06 a.m.,  
in response to message #5 by Gene Wright*

Hi Gene,

thanks for the critical remarks. Unlike others, who can't know better, yours is a special case:

My "problem" with your points is you claim you don't know the info available to you as being member of the enlightened circle of HHC2007 Conference Committee since beginning of September. The "interface mess" - as you call it - was thoroughly explained in my contribution to HHC2007. It is no mess at all. As soon as Jake will publish the Conference DVD, this will become obvious to all readers of this forum. So, I'm confidently expecting this publication.

BTW, if I don't understand a particular point in anyone's post, I'd \*ask\* first before I call it negative. Maybe my old brain, but I don't remember any question of you concerning this topic so far. If you allow me a recommendation, please take some of your time for reading or remembering my said contribution, respectively.

HTH, Walter

### **Re: Open45s: Form Factor**

*Message #23 Posted by **DaveJ** on 4 Nov 2007, 5:52 p.m.,  
in response to message #4 by Walter B*

That isn't an off-the-shelf character LCD module though, it's (correct me if I'm mistaken) a custom dot matrix LCD removed from a HP 40 series. Not exactly a wise or sensible choice for a practical calc design.

Dave.

### **Re: Open45s: Form Factor**

### Open45s: Display

Message #1 Posted by [Pavneet Arora](#) on 4 Nov 2007, 12:57 p.m.

There seem to be a few options available for the display:

1. 2-line LCD
2. 4-line LCD
3. OLED
4. e-Ink

Of course, cost is going to govern which option we should hone in on, but what is the efficacy of the respective options?

To my mind 4-line LCD is a minimum. We want something enhanced from the current offerings, but not too expensive.

*Edited: 4 Nov 2007, 2:25 p.m. after one or more responses were posted*

### Re: Open45s: Display

Message #2 Posted by [Meenzer](#) on 4 Nov 2007, 2:02 p.m.,  
in response to message #1 by Pavneet Arora

Two or possibly four line LCD. But 4 lines vertically, not 2x2.

### Re: Open45s: Display

Message #3 Posted by [DaveJ](#) on 4 Nov 2007, 4:21 p.m.,  
in response to message #1 by Pavneet Arora

4 x 20 LCD modules are available in a 65mm x 28mm form factor, like [this one](#)

(no stock though)

I would put cost down the list, getting something that fits and works is the most important criteria. I'd rather have a physical working calculator with a \$50 display than a hypothetical "dream" calculator that never gets made because you are still waiting on your dream \$2 custom display.

OLED has the advantage of more compact form factors, at the expense of being full dot matrix which requires more effort to drive than a character module solution. The OLED character modules look to be too big, but there might be a smaller one out there.

The entire project hinges around what display is used.

Dave.

*Edited: 4 Nov 2007, 4:21 p.m.*

### **Re: Open45s: Display**

*Message #4 Posted by **Paul Dale** on 4 Nov 2007, 4:48 p.m.,  
in response to message #1 by Pavneet Arora*

I'd have thought that a 4 line display is going to give the expectation of graphing capabilities which nobody has said they want.

Character based displays typically cannot do graphics so adding graphics as a requirement would, as DaveJ has pointed out, significantly complicate the display driver.

So my vote would be for a two liner of some kind. OLED or LCD are both good. An LCD should have a back light that can be turned off.

- Pauli

### **Re: Open45s: Display**

*Message #5 Posted by **Pavneet Arora** on 4 Nov 2007, 5:15 p.m.,  
in response to message #4 by Paul Dale*

I am not sure that a 4-line display necessarily implies graphing. I would prefer a 4-line display without necessarily implementing graphing functions.

Quote:

Quote:

I am not sure that a 4-line display necessarily implies graphing. I would prefer a 4-line display without necessarily implementing graphing functions.

I agree. A 4 line LCD does not imply graphics, that is why I posted a link to a 4 line character based module. You can't do graphics on that.

4 lines gives a lot more options, especially given soft key menu operation. It means you can keep 1 line dedicated to the menu if needed.

Also, 20 characters per line is much more inviting than the more standard 16 characters.

Dave.

### **Re: Open45s: Display**

*Message #7 Posted by **Paul Dale** on 4 Nov 2007, 6:08 p.m.,

*Message #8 Posted by **Walter B** on 5 Nov 2007, 2:53 a.m.,  
in response to message #1 by Pavneet Arora*

I'd like to make a proposal (actually I made it above already, but this thread here is the right one):

Let the folks being most knowledgeable in displays look for the ones available on the market fitting into the dimensions of

- a Pioneer
- a Voyager
- a 35s
- a "landscape Pioneer" (as Dave proposed above)

and featuring enough dots to support 2.5 lines or more. Then we will have a more realistic base for our further progress. Please, go out and search. Looking forward to the responses,

Walter

## **Re: Open45s: Display**

*Message #9 Posted by **DaveJ** on 5 Nov 2007, 10:16 p.m.,  
in response to message #8 by Walter B*

For the landscape format models the standard 118mm x 36mm LCD module is a good fit. 2 lines by 24 characters, very versatile. Claimed thicknesses from 8.8mm or so. Plenty of vendor choice, and low in cost.  
[Mouser](#)

[Example Datasheet](#)

Not sure how many keys you can fit in after that though.

As previously mentioned, the 80mm x36mm module format would allow and interchangeable LCD or OLED display, but only in a 16 character x 2 line display. But you could put keys to the side of the display.

The LCD modules have various pros and cons:

Pros:

- Easy software development
- Multiple sources
- Defined mounting dimensions and holes make case design potentially easier, especially by a third party.
- Low cost in one-off's and off-the-shelf

Cons:

- Greater power consumption than an LCD alone (typically a few mA @ 5V), but still low enough for say a year of typical operation from a AAA or Lithium coin cells.
- Not bit mapped, although you can often do custom characters
- Thickness may be an issue
- They are big

Given that a calc design is not about the display, but about the look and feel, and operation, yet you need a display to get the project off the ground, LCD modules do offer a reasonable compromise.

Dave.

They have the 20x2 (65mm x 20mm x 8mm) character version with LED back light for \$13.61 in single quantity. I'll bet that they can get the 40x2 if you need it.

\_\_\_\_\_

Interesting, Varitronics don't seem to have the 20x2 20mm version listed as a product, yet Mouser have it in stock.

[20x2 20mm](#)

Maybe discontinued?

Otherwise the 20x2 20mm module is a very nice option indeed.

Dave.

**Re: WOW! Check out this LCD module**

*Message #15 Posted by [Eric Smith](#) on 7 Nov 2007, 12:35 a.m.,  
in response to message #14 by DaveJ*

They only have four pieces in stock, no data sheet, and it is non-RoHS, so it seems likely that it is discontinued.

**20x4 Voyager/Pioneer Display**

*Message #16 Posted by [DaveJ](#) on 6 Nov 2007, 1:00 a.m.,  
in response to message #8 by Walter B*

Digikey have listed the Varitronix MDLS-20433-C-LV-G A 20x4 module at 65mm x 28.4mm x 8mm

<http://dkc3.digikey.com/PDF/T073/P2279.pdf>

The Varitronix website has not heard of it though.

Could be used in either the Voyager or Pioneer. More suited to the Pioneer though.

4 lines would be awesome on the Pioneer. One row for soft keys, and 3 working rows.

Eric Smith should use this one in the DIY4!

Dave.

*Message #17 Posted by [Pavneet Arora](#) on 6 Nov 2007, 6:06 a.m.,  
in response to message #16 by DaveJ*

Is there still interest in a landscape Pioneer, or are we aiming for a true Voyager if we go landscape? Whichever we use, shall we call our form factor the Phoenix?

I would dearly love to see a 4-line LCD!

Cheers.

With both of the screens mentioned (40x2, and 20x2), a Voyager form factor is easily possible. In fact you could make it smaller in the horizontal, and you'd be pretty silly not to try I think. Smaller is better.

I would use the 40x2 display, it opens up so many possibilities.

Does someone want to try and photoshop up a Voyager with the 40x2 display?

No need for the landscape Pioneer.

Quote:

Whichever we use, shall we call our form factor the Phoenix? I would dearly love to see a 4-line LCD!

4 line is easy on the Pioneer shape, and also possible on the Voyager as well.

Looks to be plenty of choice in LCD modules actually.

Phoenix is as good a name as any!

Dave.

---

40x4 won't fit.

Just to consolidate the list, the ones suitable for the Voyager would be:

40x2 at 108mm x 20mm 24x2 at 100.1mm x 26.4mm 20x4 at 65mm x 28mm 20x2 at 65mm x 20mm

The 24 or 40 character ones are the pick. The shorter ones would look a bit funny I think.

The 20x4 is a sure bet for a Pioneer, but I haven't looked at alternatives for that form factor yet, been focusing on the Voyager.

The 40x2 display would put the design into the old pocket computer display category! The possibilities are quite exciting...

Dave.

in response to message #8 by Walter B

Well, suitable LCD modules are coming thick and fast now. Powertip have a 24x2 module suitable for the Voyager. The PC2402-H at 100.1mm x 26.4mm Not as slim as the 40x2 module, but maybe a good option. RS components stock the brand, but haven't checked for actual stock of that part yet. [Powertip list](#)

Batron also have various 20x4 displays in the 65mm x 28mm x 8mm package, stocked by Farnell, with a choice of white or yellow background.

[Optrex](#) probably have something suitable too.

Plenty of choice for both the Voyager and Pioneer format, and I'm not even doing an exhaustive search.

I do hope Hugh's OpenRPN and Eric's DIY projects make use of these bigger displays. 16x2 just doesn't seem to cut the mustard any more.

Dave.

\_\_\_\_\_

If you only think about calculators, maybe. But I had the luck to work with HP laboratory equipment (for microwave imaging) during some years in the early nineties and I remember some displays, although being made of silicon (instead of polymer) LED matrices, looked not too different from that.

Greetings, Max

### **Re: Open45s: Display**

*Message #25 Posted by **Walter B** on 6 Nov 2007, 1:48 p.m.,  
in response to message #22 by Maximilian Hohmann*

The last one looks very promising indeed. Resolution of 256 x 64, so this would allow for 6 lines of more than 40 characters each. It comes within a module size of 88mm x 28mm, featuring a visible area of 78.8mm x 21.2mm. On our Voyager it would leave space for 36 keys...

Is there anything comparable in the LCD world?

That produces light output and draws at least 0.2W of power for 50% display? then the answer is no.

BTW, those who want the datasheet without having to register, [HERE IT IS](#).

It's very nice, but the battery solution is problematic, your software complexity has just gone up several orders of magnitude (the driver chip does not do the fonts for you), and people will want graphics and will fuss over the fonts and their size until the cows come home.

Dave.

I realize I'm coming very late to this discussion, but what's wrong with the display on the 28S? Unless you're doing a graphing calc, or displaying equations in a book form, why add all this cost, complexity, and power draw? (plus, I once broke the display on my 48sx, it's a very large and fragile surface area)

### **Re: Open45s: Display**

---

No one is talking about practically using the screen from a 48/49/50. But those points are precisely why I am recommending going for an off-the-shelf character LCD module. Everything is going to be a compromise, so you may as well choose a compromise that eases your development effort.

Dave.

### Re: Open45s: Display

Message #29 Posted by **Garth Wilson** on 6 Nov 2007, 4:43 p.m.,  
in response to message #28 by DaveJ

I'm coming to this topic late too (and I have not read the entire thread), but I will comment that every time this kind of thing comes up, a lot of people get all excited about OLED. Just forget about it! Those things are power hogs and are not at all suitable for calculators. Dave's recommendation for an off-the-shelf LCD is a very good one. They are made by lots of companies, and if for some reason your supplier goes belly-up, there are plenty of drop-in replacements available immediately from other companies and with no tooling charge. I have used several of the intelligent character LCD modules, and they're pretty easy softwarewise, and they mostly use the same instruction set so going from one brand to another does not require re-writing the software. So far I have not used the graphics ones, but I understand they mostly use one of only a couple of chip sets.

---

Why 2.5 lines? I assume it's because you want something for the soft menus or annunciators? Two character based lines is more than enough for a calculator.

Saying that a two line character display is not suitable because it does not fit some arbitrary "2.5 line" requirement seems overly restrictive and a bit pointless.

A 2x24 or 2x40 line LCD display would provide a lot of flexibility, with all sorts of various menu and annunciator systems being possible in software. Both are only 20mm high and almost perfect for a Voyager form factor.

Also, to get "2.5 lines" you either need a full dot-matrix graphic display, or a 4 line display. Both of those solutions have problems. Although the 4 line display module is not an entirely bad option.

Dave.

### Re: Open45s: Display

---

This would allow for displaying a soft menu for a longer time, until you select another menu or drop it explicitly. And you'll still have 2 lines for output of results. Please see [an example here](#). IMHO a permanent menu line would add a considerable benefit to a calculator.

BTW, that's why I left yellow shift "unused" at the top left 8 keys: E.g. press top left key to execute **SINH** while **f SQRT** lets you execute **SQRT** - so TOP.FCN became dispensable.

Nevertheless, I'll try with 2x40 line LCD.

---

No doubting that, more lines is better, but a 2 line display is still very capable, and there is absolutely no reason to exclude it. There are three choices here: 1) A 2 line display

module (great for a Voyager format) 2) A 4 line display module (less than ideal for a voyager form factor, more suited to a Pioneer) 3) A full dot matrix display that allows "2.5" or 3 lines. This has all sorts of issues as stated before. And no one has thus far presented a suitable low power LCD version. But I'm sure one is out there if someone cares to look.

You've gotta work with the components you can get in order to get a project off the ground.

Quote:

---

Nevertheless, I'll try with 2x40 line LCD.

---

No need to try, it's guaranteed do-able, it's just how you decide to go about it. There are plenty of ways to implement limitless functionality into a 2 line display (think 42S, 33S, 35S, my uWatch etc)

Dave.

---

A display mode could show 4 stack levels simultaneously, two per line. With a 40-character, 2-line display, there's enough room.

Don't know if it's easy to do, but another display mode could use the whole display to show just X in double-width, double-height characters, so I could use the calculator without reading glasses.

Paul Guertin

---

That one is 33.5mm in height, compared with 20mm for the Varitronix unit. I believe that does not leave enough key space. BTW, many manufacturers do the same size 40x2 display, but only one does the 20mm version that I can find.

BTW, backlighting (LED) on these displays is usually quite poor. I probably wouldn't bother. No calculator I own has a backlight and I've never needed one. I added one to my uWatch because I could, and it's used as watch so should have one, but it's very ordinary indeed.

Dave.

### O.T.: Basic Transistor Engineering Question

Message #1 Posted by [Ed Look](#) on 3 Nov 2007, 10:06 p.m.

I am a chemist and really not at all any kind of engineer.

In regard to flash memory MOSFET configurations, why is the NOR (parallel or random access) setup designed to use hot electron (holes, too?) injection to program while the NAND version (serial, block access) exclusively uses Fowler-Nordheim injection?

The latter appears more efficient, seems to use less power, and spares the transistor of excess aging.

I would really like to know why the hot carrier injection design is still used.

### Re: O.T.: Basic Transistor Engineering Question

Message #2 Posted by [Gordon Dyer](#) on 4 Nov 2007, 6:44 p.m.,  
in response to message #1 by Ed Look

It is a complex battle of both technology trade-offs and vested interests by semiconductor manufacturers. See this article for applications in mobile handsets:  
[http://www.embedded.com/columns/technicalinsights/165701775?\\_requestid=82339](http://www.embedded.com/columns/technicalinsights/165701775?_requestid=82339)

Quoting from the end of the article: "Right now, NAND still lags NOR in read speed, while NOR is considerably behind NAND in density. Until one technology can bridge the advantage gap offered by the other, there will continue to be cases, such as in the NEC FOMA 900iL handset, where NAND and NOR can, and will, co-exist."

INTEL and ST are continuing to push their NOR technologies and now are competing better on density by using 4 levels in a cell to store 2 bits per cell.

<http://www.st.com/stonline/products/promlit/pdf/flnormob1005.pdf>

### Re: O.T.: Basic Transistor Engineering Question

Message #3 Posted by [Ed Look](#) on 5 Nov 2007, 1:38 p.m.,  
in response to message #2 by Gordon Dyer

Interesting!

But why even use the hot electron injection design in NOR cells?

### Re: O.T.: Basic Transistor Engineering Question

Message #4 Posted by [Eric Smith](#) on 5 Nov 2007, 2:55 p.m.,  
in response to message #1 by Ed Look

Some NOR flash parts do use Fowler-Nordheim tunneling for both program and erase (vs. the majority of

NOR flash that uses hot electron injection for program and Fowler-Nordheim tunneling for erase). I'm not sufficiently conversant with the issues to know why most NOR flash parts still use hot electron injection.

### HP35s Reinforced concrete beam design to BS8110

Message #1 Posted by [John Wasilewski](#) on 3 Nov 2007, 9:04 a.m.

Anyone who wants a copy of my fully working and tested program, 'BEAM 8110' please send your email address so that I can send you an M\$Word file of the formatted, commented listing.

It will take me too long to amend the listing to use only the displayable character-set in this forum so I'm offering only the downloadable listing. I also don't have a facility for posting a downloadable version.

Everyone please feel free either to put the downloadable file online on your own websites for the benefit of others or to port the listing to this restricted character-set and upload it to MoHPC.

The program has 564 lines, with loops within loops. It uses 25 variables and 3 flags. It uses only one LBL.

#### FUNCTIONALITY AND USE

(taken from the first page of the listing file):

Designs main reinforcement for rectangular reinforced concrete beams to BS 8110:Pt.1:1997. Singly or doubly reinforced (tension steel only or tension and compression steel). Parabolic-rectangular concrete compression stress block. Program assumes steel is high-yield (grade 460) but this can easily be altered in the code, optionally with a steel grade prompt for user-specified input.

#### Input

|   |                      |   |
|---|----------------------|---|
| Mu  | (N-mm)               | The required ultimate moment of resistance.                                     |
| Fcu   | (N/mm <sup>2</sup> ) | Characteristic cube strength  |
| C   | (mm)                 | Cover to main bars all round  |
| Program now suggests a suitable section size for a singly-reinforced section, which user can over-ride or accept. |                      |   |
| H   | (mm)                 | Section total depth (accept suggested/over-ride)                                |
| B   | (mm)                 | Section total breadth (accept suggested/over-ride)                              |
| Q   | (mm)                 | Bar diameter of compression<br>(optional entry - autogen input if left blank)   |
| O   | (mm)                 | Bar diameter of tension steel<br>(optional entry - autogen input if left blank) |

Bar diameters are entered into the two lines of screen display, compression then tension, before pressing R/S. After entering neither tensile nor compressive steel the program takes a minute or more to finish. Finishes more quickly if at least the tensile bar diameter is entered..

#### Output

|             |  |   |
|-------------|--|---|
| [NC, DiamC] | No. of compression bars needed, bar diameter |   |
| [NT, DiamT] | No. of tension bars needed, bar diameter     |   |
| Mu          | (N-mm)                                       | Mu for the rounded-up whole numbers of bars   |
| Mu          | (N-mm)                                       | Mu that the calculated exact area of steel actually needed would provide<br>The latter is re-calculated for the output steel so serves as a check of a correct result |
| E           | (kg/m)                                       | Tot steel wt. for rounded-up whole numbers of bars  |

E (kg/m) Total steel weight for the calculated exact are of steel actually  
needed (not a whole no. of bars)  
Users can assess the efficiency of the solution by  
comparing the two displayed steel weights.

#### Tension steel

Finds no.of bars needed for the user-specified bar size,  
increasing bar size if bar-spacing too close. Does not warn  
user if maximum bar diameter reached but tension bars still  
too close.

#### Compression steel

Always included if user enters a compression bar diameter and is  
automatically triggered if not entered but small section size  
makes it necessary. Adjusts compr. bar diameter for sensible  
min. bar spacing (assuming 20mm aggregate size).  
Also complies with min. 0.2% rule for compression steel.

#### Partial optimising

Program chooses the compression bar diameter that gives the least  
total steel weight for tens. + compr. steel.

### DIY Voyager feet?

Message #1 Posted by [Igor Vilensky](#) on 2 Nov 2007, 8:37 p.m.

Any suggestions on using hardware store available materials to fashion Voyager series missing rubber feet replacements? Perhaps thin rubber with some sort of adhesive? There are available thin rubberized magnetic strips with one side already adhesive. Could these negatively affect the electronics?

Thank you.

### Re: DIY Voyager feet?

Message #2 Posted by [John Keith](#) on 2 Nov 2007, 9:21 p.m.,  
in response to message #1 by Igor Vilensky

You can buy black rubber gasket material at most hardware and auto supply stores. Just cut out the replacement foot and attach it with contact cement.

John

in response to message #2 by John Keith

Thank you very much, John! I will try the auto supply store tomorrow.

### Re: DIY Voyager feet?

Message #4 Posted by [Bill \(Smithville, NJ\)](#) on 2 Nov 2007, 9:53 p.m.,  
in response to message #1 by Igor Vilensky

Hi Igor,

Randy gave an option for 1/16" 12" x 12" rubber sheet with adhesive - see last message in following link:

[Voyager Feet](#)

I just checked the model number and it's still available, slightly higher cost.

Bill

Hmmmm.

this material is only rated to 1000 psi:

Durometer Hardness  $\pm 5$  70A Tensile Strength, psi 1000 Stretch Limit % 200 Density, lbs./cu. ft. 84

Will it suffice? And if the tensile strength is sufficient, what about the stretch limit?

Really, thank you for great info, it's great to know such stuff is available, it's ideal for the purpose.

### JIMROM

Message #1 Posted by [Gerry Schultz](#) on 2 Nov 2007, 4:23 p.m.

Before I pose my question, I want to mention that my copy of "A Guide to HP Handheld Calculators and Computers" by Wlodek Mier-Jedrzejowicz arived this morning and I haven't gotten a lick of work done since. I am really enjoying all the information it has about old HP calculators. It's a great read and a job well done. I first read about this book earlier this week here in the forum, so thanks.

Anyway, recently I spent way too much money and bought a bunch of HP-IL stuff to expand my 41C collection. It motivated me to go looking for a bunch of my old stuff buried away in boxes in my attic. To that end, I found my old HHP-16K 41C ROM Emulator made by Hand Held Products along with it's documentation. (As a side note, I also found my Port-X-tender, Model 4107 by AME Design along with all its documentation. Talk about memories!)

Now, the EPROMs that are in the ROM Emulator contain software called the JIMROM. I do have the documentation for the JIMROM that came with the Emulator but I would like to find more information as the documentation is pretty sketchy. There are routines mentioned like GTOROM, SXL, NSTO, NRCL, TP and VP. These routines look pretty simple but there is a long letter at the end of the documentation from John McGechie written on January 12, 1982 and goes into great detail about the JIMROM and I don't understand a lot of it.

If anyone has any more insight into this ROM, I would appreciate just being pointed in the right direction, and I'll go from there.

Thank you for your time.

Gerry

Actually, Gileno was sending you to an article and restoration I did this Summer.

I have now got 4 fully restored and fully functional HP 01 in the stable:

767Geoff

This one is a prototype, notice no serial numbers on the back case. I was told that actually this is a proto-prototype as the prototypes had one serial number inscribed:

[http://i45.photobucket.com/albums/f96/geoff\\_q/hp01proto.jpg](http://i45.photobucket.com/albums/f96/geoff_q/hp01proto.jpg)

[http://i45.photobucket.com/albums/f96/geoff\\_q/caseback.jpg](http://i45.photobucket.com/albums/f96/geoff_q/caseback.jpg)

Before and after on another steel type:

[http://i45.photobucket.com/albums/f96/geoff\\_q/beforeafterbronze.jpg](http://i45.photobucket.com/albums/f96/geoff_q/beforeafterbronze.jpg)

[http://i45.photobucket.com/albums/f96/geoff\\_q/groupa-1.jpg](http://i45.photobucket.com/albums/f96/geoff_q/groupa-1.jpg)

some others all lined up:

[http://i45.photobucket.com/albums/f96/geoff\\_q/closegroup.jpg](http://i45.photobucket.com/albums/f96/geoff_q/closegroup.jpg)

at work with a couple of HP:

### HP 35s Matrix Multi-Tool

Message #1 Posted by [Stefan Vorkoetter](#) on 2 Nov 2007, 10:05 a.m.

I've just posted an article to my web site, [A Matrix Multi-Tool for the HP 35s Programmable Calculator](#).

This is my second attempt at a large program for the HP 35s. My previous program ([Curve Fitting for the HP 35s Programmable Calculator](#)) addressed the curve fitting shortcomings of the 35s. This program is a start at doing the same for matrix functionality.

Given an  $N \times N$  matrix  $A$ , and an  $N$ -element vector  $b$ , the matrix multi-tool will do the following:

1. Compute  $A^{-1}$ .
2. Compute the determinant of  $A$ .
3. Solve the system of linear equations,  $Ax=b$ , giving column vector  $x$ .
4. Quickly solve additional  $Ax=b$  systems for different  $b$  vectors.

The program uses Gaussian elimination with partial pivoting to compute results 1, 2, and 3 simultaneously. It uses matrix-vector multiplication for operation 4.

Enjoy!

Stefan

### Re: HP 35s Matrix Multi-Tool

Message #2 Posted by [John Wasilewski](#) on 2 Nov 2007, 10:54 a.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

Can you do a version of the equation solver that solves banded symmetrical equations where the only the halfbandwidth of coefficients plus the rhs vector are stored?

Just to make it difficult, can the solution progressively overwrite the original RHS vector, overwriting also the coefficient array space as working storage, and not use any additional storage?

I suggest the halfbandwidth storage be treated as if stored in a 1-D array with a simple algorithm for the offset that points to non-zero (i,j) terms of the full square matrix, in the 1-D compressed array.

I assume that you are fully familiar with all that I am talking about (just ask me if I am not being clear). I do not assume that you will be able to find time to do this, but if you could do so then it would be a major step towards the frame analysis program I am hoping someone will also do for HP35s engineer users!

----

John

in response to message #1 by Stefan Vorkoetter*

Stefan, you say on the website that it takes a *long* time for a loarge system. Would you tell how long it takes to invert an 18x18 matrix full of random numbers?

**Re: HP 35s Matrix Multi-Tool**

*Message #7 Posted by [Stefan Vorkoetter](#) on 3 Nov 2007, 6:43 a.m.,  
in response to message #6 by Rodger Rosenbaum*

I haven't tried such a large example yet, but I'd suspect somewhere between one and two hours.

Stefan

**Re: HP 35s Matrix Multi-Tool**

*Message #8 Posted by [Rodger Rosenbaum](#) on 3 Nov 2007, 10:02 a.m.,  
in response to message #7 by Stefan Vorkoetter*

Wow! That's longer than I would have expected. For comparison, the HP48G takes 23 seconds, and the HP50 takes 12 seconds.

Have you tried calculating the determinant of Hilbert matrices of order 5, 6 or 7 and comparing to the exact results? I wonder how the 35s does for accuracy on long calculations such as these.

I think you can find these tests done by Palmer on this forum.

**Re: HP 35s Matrix Multi-Tool**

*Message #9 Posted by [Stefan Vorkoetter](#) on 4 Nov 2007, 7:51 a.m.,  
in response to message #8 by Rodger Rosenbaum*

Don't forget that these are built-in operations on the 48/49/50 series, so they're likely coded in assembly language or compiled C code. I'm sure if you implemented them in RPL, they'd be quite a bit slower.

Anyway, I did some timing up to 7x7 just now, and based on those, and the fact that Gaussian elimination is  $O(N^3)$ , it's faster than I expected. 18x18 should take about 18 to 20 minutes.

Stefan

### **Re: HP 35s Matrix Multi-Tool**

*Message #10 Posted by [Rodger Rosenbaum](#) on 4 Nov 2007, 8:56 a.m.,  
in response to message #9 by Stefan Vorkoetter*

I haven't forgotten, and they are indeed coded in assembly. Paul McClellan recoded all the matrix operations in assembly using internal 15 form numbers.

The better estimate of timing is more like what I would have expected.

Have you tried the Hilbert matrices? If so, what kind of results did you get?

### **Re: HP 35s Matrix Multi-Tool**

*Message #11 Posted by [Stefan Vorkoetter](#) on 4 Nov 2007, 2:58 p.m.,  
in response to message #10 by Rodger Rosenbaum*

Just tried a 6x6 Hilbert matrix. The program comes up with a determinant of 5.3672816017e-18

Calculating the same determinant exactly (in Maple, using rational numbers) and then evaluating the resulting fraction to the same number of digits, I get 5.3672988874e-18

So the Matrix Multi-Tool's answer has a relative error of 3.2e-6.

How does the 48 do on this?

Stefan

*Edited: 4 Nov 2007, 2:59 p.m.*

### **Re: HP 35s Matrix Multi-Tool**

*Message #12 Posted by [Meenzer](#) on 4 Nov 2007, 3:58 p.m.,  
in response to message #11 by Stefan Vorkoetter*

The 50G creates a 6x6 Hilbert matrix with its own command in a fraction of a second and yields 5.36729988736E-18 or 1/186313420339200000 for the determinant in another fraction of a second.

### **Re: HP 35s Matrix Multi-Tool**

*Message #13 Posted by [Rodger Rosenbaum](#) on 5 Nov 2007, 2:32 a.m.,  
in response to message #11 by Stefan Vorkoetter*

Quote:

Stefan

---

The 48G gets 5.36728432771E-18, but beware, this result should not be compared to 5.36729988736E-18 because the calculator can't be expected to get that result. See my posting: <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=72273#72273>

The correct value to use as the standard of comparison for a calculator that uses 12 digit numbers in its calculations is 5.36728432456E-18. Using this as a standard of comparison, the HP48G got 3 more correct digits than your 35S program. This is the expected result since the 48G uses 15 digit arithmetic for the calculation, 3 more than you're using.

The LCM of the denominators in a 6x6 Hilbert matrix, if you want to use the other method I mentioned in the earlier post, is 27720. The determinant in that case should be exactly 2435091120, but the HP48G gets 2435091119.56

## Re: HP 35s Matrix Multi-Tool

*Message #14 Posted by **Palmer O. Hanson, Jr.** on 8 Nov 2007, 9:10 p.m., in response to message #11 by Stefan Vorkoetter*

Stefan

---

You might want to compare your results on the 35s with the results which are obtained with some classic machines. For the 6x6 Hilbert:

HP-41 Math Pak..... 5.367369294e-18  
 HP-28S..... 5.36728676731e-18

and for the modified 6x6 Hilbert (multiplied by 27720)

HP-41 Math Pak..... 2435060936  
 HP-28S..... 2435091046.63

I don't have a 35s but I understand that it offers a very large number of data registers. If that is so then I suggest that you find a way to preserve the input matrix so that it can be reviewed or modified if the user doesn't like his results and suspects that he may have made an entry error. This is particularly important when working with a machine which cannot print the input or store the input offline.

### **Re: HP 35s Matrix Multi-Tool**

*Message #15 Posted by [Stefan Vorkoetter](#) on 9 Nov 2007, 9:20 a.m.,  
 in response to message #14 by Palmer O. Hanson, Jr.*

It looks like my program's results are better than the 41C Math Pac and very slightly worse than the 28S.

Quote:

---

Agreed, but I wanted to keep the program as simple as possible. At the moment, there is at least the Un-Solve feature, so you can get the original matrix (or a close facsimile thereof) back. Of course this doesn't work if your data entry error made the system singular, since the matrix is then left in a partially inverted state.

Stefan

---

If you go to the "Even More Results with Matrices" mentioned in my 4 November posting you will see that the matrix routines in the 41C Advantage module yield results for 7x7, 8x8 and 9x9 that are significantly better than those from the 41C MathPac. Some limited testing by myself and others indicates that the results from the Advantage module are very similar to those from the HP-15C. I don't have either th Advantage module or an HP-15C so I can't provide

the 6x6 results.

Quote:

---

... At the moment, there is at least the Un-Solve feature, so you can get the original matrix (or a close facsimile thereof)...

---

I still don't have a 35s. I do have a 28s which has an UNDO function. If one enters a matrix into the stack, inverts it and then uses the UNDO function one will get back the exact original matrix. If instead one does a second inversion one gets back a matrix that is close to the original matrix. The LAST function on the 28s will also bring back the original matrix. But if one has done some other work after the original inversion the original matrix is lost unless it has been stored. To me the ability to store the original matrix is one of the glorious features of all the graphic calculators whether made by HP or by TI.

The manual for either the HP-41C MathPac or Advantage Pac (I can't remember which one and I have neither available at this time) suggests that the user can get back his original matrix by doing a second invert and even offers an example to demonstrate that. Unfortunately the example is done in Fix 2 (or maybe it was Fix 4) and while the displayed result suggests an exact recovery switching to Fix 9 will show that only an approximate recovery was achieved.

### HP35s 2-D frame analysis

Message #1 Posted by [John Wasilewski](#) on 2 Nov 2007, 8:09 a.m.

\*\*\*\*\*

This thread is not about which is the best calculator. Its about programming the HP35s with all its limitations. I don't doubt that an HP70, and HP50, an HP426-and-a-half or a Cray Bitz would be better but I don't have any of those and I'm not planning to buy one. I have an HP35s and I am interested in programs for THIS model. Please everyone, don't bang on about how much better it would be to use a different one!

\*\*\*\*\*

#### STRUCTURAL FRAME ANALYSIS FOR AN HP35s

-----

I would very much to write such a program.  
But I can't.  
(Explained below).

The HP35s seems to be limited to 26 direct and 100 indirect storage locations, which limits the maximum size of structure. I've just looked at this a little more closely and I estimate that the calculator could possible solve a structure with eg 4 lines of columns and 3 upper storeys, which is 16 nodes and 21 members.

This would be a seriously useful tool for structural engineers.

It would be possible only by three tricks.  
(1)Use a simple member numbering notation that eliminates node numbering.  
(2)Assuming infinite axial stiffness and analysing only shears and moments.  
(3)Storing only the equations halfbandwidth.

This would eliminate lengthy input routines (making for a short program). It would also need a clever equation solver with a simple algorithm to retrieve stiffness matrix terms from packed halfbandwidth storage. The solver would also need to solve the equations in-situ, by which I mean that the original coefficients become gradually over-written by the solution, and to do this entirely in the half bandwidth of a banded symmetrical matrix. Such solvers do exist in eg Fortran or c but would need porting to HP35s machine code (not hard to do).

All the above seems very tempting... but just when can I ever find the time to do it? Answer: I can't!

Would anyone else be interested in having a go at it? Probably we need a structural or aeronautical engineer who enjoys numerical modelling to tackle it. I would be happy to help with suggestions - in particular with the member numbering convention referred to above, which facilitates direct assembly of stiffness equations.

----  
John

Message #2 Posted by [Don Shepherd](#) on 2 Nov 2007, 8:44 a.m.,  
in response to message #1 by John Wasilewski

John, I think its 26 direct and 800 indirect.

### Re: HP35s 2-D frame analysis

Message #3 Posted by [John Wasilewski](#) on 2 Nov 2007, 9:32 a.m.,  
in response to message #2 by Don Shepherd

You're right. I've no idea where I got 100 from. Really must glance at the manual a little more often. This adds greatly to the need for a powerful program like frame analysis, which will really USE all that storage.

Even if, after allowing space for the code for this program and a few others, we only have 400 indirect storage registers remaining, this would still be ample for anything one would ever need to do on a calculator.

For example:

Plane frame

INPUT

No of members : 54

No of nodes : 30

DoF : 36

Halfbandwidth : 6

OUTPUT (for each loadcase)

30 node rotation angles

30 nodal sway displacements

108 member-end bending moments

108 member-end shear forces

5 support reactions

THE above problem would need 222 storage locations for the stiffness equations.

---

John

### Re: HP35s 2-D frame analysis

Message #4 Posted by [Brad Davis](#) on 2 Nov 2007, 9:41 p.m.,  
in response to message #1 by John Wasilewski

Good luck! I've written 2D and 3D linear and nonlinear analysis programs in Mathcad before and THAT was a chore. I can't imagine writing or using a frame analysis program on a HP50g, much less a HP35s. I saw one of these programs for the 49/50 on a website a while back, FWIW.

### Re: HP35s 2-D frame analysis

Message #5 Posted by [John Wasilewski](#) on 3 Nov 2007, 6:54 a.m.,  
in response to message #4 by Brad Davis

It is do-able. I did it on a TI-59 years ago. The program could solve structures with up to around 10 members and 9 nodes. Not a lot, but really useful from time to time. -- John

## Re: HP35s 2-D frame analysis

Message #6 Posted by **Rodger Rosenbaum** on 3 Nov 2007, 2:05 a.m.,  
in response to message #1 by John Wasilewski

Do you do these types of calculations in your current employment? What do use to do the calculations, something running on a PC, perhaps? If you had the software to run on a 35S, would you actually use it for work, or is this just for the fun of it?

I understand "for the fun of it", but I'm curious to know which it is for you.

## Re: HP35s 2-D frame analysis

Message #7 Posted by **John Wasilewski** on 3 Nov 2007, 6:43 a.m.,  
in response to message #6 by Rodger Rosenbaum

Quote:

\_\_\_\_\_

If you had the software to run on a 35S, would you actually use it for work, or is this just for the fun of it? I understand "for the fun of it", but I'm curious to know which it is for you.

\_\_\_\_\_

Fair question.

It is for both your suggested reasons, plus a third one.

All of these are significant contributors to my motivation.

In no particular order or priority:

Reason (1)

For the fun of it. Its a challenge, to try to do something complex and difficult with the very limited computational resources of a programmable calculator. Success is very rewarding, I suppose in the same way as some people (not me) find it rewarding to complete a large jigsaw or a Times crossword.

Reason (2)

Programming a complex theoretical procedure is a learning tool. Like when one is studying or revising, it is only when asked to explain the theory to someone else that I find out whether I really understand it myself. Programming it is the same kind of self-test. I finally learned in full how the stiffness method works only by writing a 7500-line Fortran program to solve structures using it. In a similar vein, I have recently RE-LEARNED how to do a rigorous parabolic rectangular analysis of reinforced concrete beams (which I only rarely need to do nowadays because there are more junior staff around to do it for me!).

Reason (3)

Yes, I really do have a use for such programs in my work. As I say above, it is not something I do frequently at work because I am 'too senior', and we employ many graduates in the firm to perform such basic analysis work on an everyday basis. Paradoxically, though, this means that I no longer have easy access to the necessary software, so when, sometimes, I actually do need a quick analysis of a simple frame or a quick design check of some reinforcement, the software isn't on my computer and its a pain in the arse to have to find someone else in the firm to do it for me because I do not have the time to do such canclulations by hand. I and other senior managers have a need, therefore, for some nifty analysis tools like this that we can use occasionally to solve such problems ourselves. Programs I have written for this purpose do get used in anger from time to time. How often? In my case, I'd say about once or twice a month as a long-term average. If that doesn't seem very much use, I agree, but the usefulness of having such tools available to me adds very greatly to the value of such occasional use.

Does that answer your question?

---

John

### Who buys HPs these days?

Message #1 Posted by [Frank Rottgardt](#) on 1 Nov 2007, 7:45 a.m.

Hi,

looking at the calculators HP launched after the 48-series they left the path "from engineers for engineers". Rather flashy designs and cheap plastics. The 50g and 35s giving small indications for a change to the better. But RPN still going strong, at least.

So I sometimes wonder what type of customer are HP's marketing cracks aiming on?

Watching this forum one can say that the average age seems to be beyond 30. Many technicians and engineers in the middle of their career. The 48G / 50g is used by many, but sometimes I get the feeling it is a kind of toy to complete the collection and have fun with rather than the choice for daily number crunching on the job. Here most of us are looking for a good scientific with some easy programming in a small form factor. I/O in shape of a SD or the like would be welcome. Solver and numerical integration is a must. Graphics are of minor importance.

Then we have the freshman at college/university and kids at highschool learning their math etc. Here graphics are a must. These customers want? flashy colours. Doing your homework a capable machine like the 50g is a perfect companion. But then, during exams or tests the choice of calculators is limited. No I/O is allowed. The 33s ist a good example for this kind of stuff.

So there are a number of questions:

1) Are we "elder" engineers still a target group? One could say yes and no. Yes, since HP still supports the HP user conferences, and yes because RPN is alive after all. One could say no, since our dream calculator is still not there. Will say a machine like the HP-45s.

2) Will there ever be a chance to see a 45s from HP? I would say it is not likely. The 33s is a top seller. Why this? It is simply the best performing calculator among the ones allowed for exams (no I/O). Do students love it? Who knows? Many needed to learn RPN only some weeks before their exams. Can't be comfortable if one is used to its AOL/CAS TI.

Will be fun to share your thoughts.

### Re: Who buys HPs these days?

Message #2 Posted by [Don Shepherd](#) on 1 Nov 2007, 9:51 a.m.,  
in response to message #1 by [Frank Rottgardt](#)

Hi Frank. It's an interesting question. Other than the geeks who frequent this forum, who buys HP calcs?

If you look at the business supply stores that sell calculators, the only HPs I see there are the 12c (for the financial and real estate industry), the 17bii+ (also for the financial industry, probably the newer guys who aren't afraid to try something other than the 12c), I think a 10bii, maybe for the low-end financial, and that's it. No scientifics at all. No 33s, no 35s, no 50g. Walmart used to carry the 33s, but doesn't anymore. I have yet to see any 35's or 50's in a place where you can buy it off the shelf. I have often wondered about the number of

HP calculators sold. It seems the 12c and 17bii must sell reasonable numbers, but I can't believe that the scientifics sell that much, since they are only available on the Internet (and maybe stores like Fry's, we don't have those stores where I live).

As far as students, high school is strictly TI territory. I've never seen an HP in the public schools (other than my own!).

**Re: Who buys HPs these days?**

*Message #3 Posted by [Martin Pinckney](#) on 1 Nov 2007, 10:37 a.m.,  
in response to message #2 by Don Shepherd*

Yes, these questions are fascinating and knowing the answers would go a long way to explaining HP's decisions. A few things seem obvious to me:

1. The newer, flashy styles indicate HP decided either to market to younger customers, or they are trying (again) to siphon off some of TI's market share, or both.
2. The 35s is a "trial balloon" to see if there is still much market left among the traditionalist engineers out there (their original base).
3. Whether or not there is a 45s (or 55g?) largely depends on the outcome of the 35s experiment. I bet HP makes the 35s at least long enough to compare sales (including demographics) to the 33s.

Martin

LOL!

But I do know that OfficeMax, Office Depot in particular DID sell HP calculators at one time. They stopped carrying HP scientific or graphing calculators after the HP-48 series. Too bad!

### **Re: Who buys HPs these days?**

*Message #9 Posted by [Kiyoshi Akima](#) on 1 Nov 2007, 12:13 p.m.,  
in response to message #1 by Frank Rottgardt*

I bought an HP off the shelf yesterday. But it was a second-hand store and the calc was a 19C, so I suppose it won't affect HP's market research in any way.

### **Question is: what is to buy HPs these days?**

*Message #10 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 1 Nov 2007, 12:31 p.m.,  
in response to message #1 by Frank Rottgardt*

Hi;

buying an HP calculator used to be more than simply spending some bucks and having a merchandise in return. Who actually does more than that these days? Buying an HP calculator used to be buying the tool for the job. And this used to be a serious choice. The chosen model was supposed to go ahead with usefulness. Hey, some of them went into space...

I must agree with the fact that I have most of mine for the pleasure of knowing how to use them and, if having the chance, explaining how to do that. Appart from the HP12C series, this nas not been so very often these days, though.

My 2¢.

Luiz (Brazil)

**Re: Question is: what is to buy HPs these days?**

*Message #11 Posted by **Ed Look** on 1 Nov 2007, 6:22 p.m.,  
in response to message #10 by Vieira, Luiz C. (Brazil)*

What you say is very true for students, who need to get a calculator with the capabilities they need to do well in certain courses. I bought a HP-34C to shorten my report writing time for physical chemistry lab.

Nowadays, I really DON'T have to use a programmable scientific (only a regular scientific), and especially not a graphing calculator, but they do make things easier and the programming especially makes things easier, but since we are now all progressed past our college or high school days, we can do what we need to do other ways, particularly with the PC. But I like having a small, light, eminently portable device that I can quickly program to make some tasks shorter or more pleasant. In my own case, I've calculated cubic x-ray reflections and used Arnold Moy's HP calculator periodic table and brief chemical database for the 48 or 49 series, for example, and prevented me from having to get up out of my seat to grab some book or reach over and navigate over to some software on my PC.

I don't know about engineers and surveyors however; I assume engineers stationed in the lab, office, or plant have access to more powerful, more standard computing and those on the field or surveyors may actually NEED something powerful, like a programmable or graphing HP calculator, outdoors.

**Re: Who buys HPs these days?**

*Message #12 Posted by **Tim Wessman** on 1 Nov 2007, 5:25 p.m.,  
in response to message #1 by Frank Rottgardt*

I've been at my university now for about 3 years or so. In the past 6 months the ratio of hp/ti calcs in the engineering department has increased quite a bit. Of course this is just my observation, but I've always kept a look out for this. It used to be until just recently about 1-2/10 of the students in the study areas would have ti's. It's increased to about 3-4/10 now.

I really don't know why, but they are definitely much more prevalent. About 1/3 are 49g+ units, and the other 50gs, with a spattering of "my brother's old 48g". Don't know if that means engineering students with HPs are just becoming stupider and need to study more, but I doubt it. :-)

TW

**Re: Who buys HPs these days?**

*Message #13 Posted by **Paul Ozog** on 1 Nov 2007, 10:13 p.m.,  
in response to message #12 by Tim Wessman*

I can confirm TW's observation. I have seen more engineering students either with 50g's or an interest in buying them than when I started at my university. Though I think, as was originally suggested, that this very slight increase I have seen is due to "getting older", and not because of an increased market appeal for college students.

**Re: Who buys HPs these days?**

Message #14 Posted by **Don Foster** on 2 Nov 2007, 1:49 a.m.,  
in response to message #13 by Paul Ozog

In Davis, Ca the book store at the college carries HP up to the 49G+ and TI up to the 200 voyage. There is more TI models in the store than HP. But at least there is a choice.

in response to message #14 by Don Foster

Sigh... Remembering the old old days going to the Bergen University's book store. To get to the store you had to walk a corridor. The walls here were filled with posters of Einstein pushing HP calculators. When you entered, the first thing you met were the machines on a display in a glass cabinet. Placed so all could have a good look.

Last time I visited I did not see any calculators at first. Then I did see a small collection behind the counter so you can't really get to them. And all TI and Casio, except one single HP 17bII+. The last HP standing.... and it's a financial model...

in response to message #16 by Meenzer

I always wondered about that! Surely HP would not take advantage of Him! So I always assumed him being The Master Of The Space Time Continuum did a time travel and grabbed a 15c...

Another one I liked was the one telling me the space shuttle was controlled by a 41.

**Re: Who buys HPs these days?**

Message #18 Posted by **Meenzer** on 2 Nov 2007, 7:41 a.m.,  
in response to message #17 by Arne Halvorsen (Norway)

Yeah, that space-time-thing must be the explanation ;-)

Quote:

\_\_\_\_\_

Another one I liked was the one telling me the space shuttle was controlled by a 41.

That one however is partially true, as far as I know. Not that the shuttle was controlled by 41's, but the crew was issued them. You may begin your reading [here](#).

### **Re: Who buys HPs these days?**

*Message #19 Posted by [Chris Haltiner](#) on 2 Nov 2007, 10:22 a.m., in response to message #17 by Arne Halvorsen (Norway)*

Quote:

Another one I liked was the one telling me the space shuttle was controlled by a 41.

If memory serves me (going back to junior high days!), the space shuttle design as of 1979 had 4 main computers--a primary and 3 back-ups. The crew had HP-41Cs for use in the event that *all* 4 computers failed. The idea in 1979 was that the HPs would assist the flight crew in piloting and navigating the shuttle in the event of multiple computer problems. So, it would not be untrue to say that the space shuttle could be "controlled" by an HP-41C.

### **Re: Who buys HPs these days?**

*Message #20 Posted by [Arne Halvorsen \(Norway\)](#) on 2 Nov 2007, 10:43 a.m., in response to message #19 by Chris Haltiner*

I know that ofcourse... But HP sure took advantage of the fact the 41 flew... Imagine a student going to shop calculator in those days: Gee, what to choose... I can have this cowboy thing over here or this one here that NASA uses. Hmmm, do I really have to eat next month?

### **Re: Who buys HPs these days?**

*Message #21 Posted by [Arne Halvorsen \(Norway\)](#) on 2 Nov 2007, 10:56 a.m., in response to message #19 by Chris Haltiner*

Actual while on the topic....

From the litle information there is on the topic I belive one can learn that the calculators where used in flight. It was the one particular 'center of gravity' program to be used during re-entry that luckily never had to be used (it would ofcourse have saved the day).

*Edited: 2 Nov 2007, 10:58 a.m.*

### **Re: Who buys HPs these days?**

*Message #22 Posted by [Maximilian Hohmann](#) on 2 Nov 2007, 10:59 a.m., in response to message #19 by Chris Haltiner*

Hello!

Quote:

---

The idea in 1979 was that the HPs would assist the flight crew in piloting and navigating the shuttle in the event of multiple computer problems.

---

The Space Shuttle has fly-by-wire controls like most of the modern airliners do. The inputs of the pilot's control sticks are fed into multiply redundant computers (5 in total) that calculate the necessary amount of control surface deflection required to achieve the response desired by the pilot. The control surfaces are activated hydraulically with no (zero!) direct link to the control sticks.

In case all flight computers should fail, the pilots can start playing with their hp-41 and continue to do so, as long as their oxygen lasts. However, no matter what they do with their pocket calculators, this will not move the control surfaces at all.

The control software of the Space Shuttle has a total of about 500.000 lines of code (written in "HAL/S", a dialect of PL/1, see here: <http://www.brouhaha.com/~eric/nasa/hal-s/> ). Again, no way to fit any useful part of it into an hp-41 I'm afraid...

Greetings, Max

## Re: Who buys HPs these days?

Message #23 Posted by [Frank Rottgardt](#) on 2 Nov 2007, 7:38 a.m.,  
in response to message #1 by Frank Rottgardt

According to an official HP-paper:

Quote:

---

According to the NPD Group:

HP Financial Calculators are rated No. 1 in U.S. dollar share sales;

The HP 33s Scientific Calculator is rated the "Best Seller" in the Scientific Programmable Calculator category in both units and dollar share;

All four HP Financial Calculators (10bII, 12c, 12c Platinum, 17bII+) are top ten "Best Sellers" in the Financial Calculator category in both units and dollar share.

---

After the rather massive critics in this forum concerning the 33s the biggest customer group seems to be students "forced" to buy it if they want to have access to a programable calculator during exams.

How many 33s might have been sold to professionals?

Adding I/O to the 33s or the 35s would have banned these calculators from the educational market. And that is why I don't think we will ever see such a feature either. I believe the times are over HP could make good money on calculators aiming at professionals. Now they have to keep track with TI and the educational market.

How many 33s might have been sold to professionals?

---

It's true that the biggest market for the 33S is probably exam candidates, specifically for NCEES exams, which are required in the US for engineering and surveying licensure. For proof, simply look at the [33S page](#) at amazon.com, which is loaded with ads for FE/FS and PE/PS exam study guides.

But most of these exams are taken by professionals with several years of experience, not students. The FE/FS exams can be taken in the final year of school, but many people take them after leaving school. The PE/PS exams are taken after you have graduated from school and have several years of work experience.

So while it's probably true that most 33S sales are for exam purposes, it's also probably true that most buyers are working professionals, rather than university students. In the US, some engineers (particularly civils) and surveyors still have to take exams, even after they have been out of school for several years.

The NCEES exam market is real, but it is very small compared to the traditional university student market, which in the US is dominated by TI.

### **HP 50G - Single line w/ no reset ability**

Message #1 Posted by [Paul Ozog](#) on 31 Oct 2007, 11:18 p.m.

I turned on my calculator today and the screen froze and wouldn't respond to any keypresses. Replaced the batteries and tried holding the reset button and the screen now just has a single vertical line jumping about randomly. I didn't drop it or anything of the sort. Seriously - what the hell? I had it less than a year (so its still under warranty) but I through out the manual and packaging. Anyone have any technical advice or how to get HP to send me a new one?

### **Re: HP 50G - Single line w/ no reset ability**

Message #2 Posted by [Tim Wessman](#) on 1 Nov 2007, 12:03 a.m.,  
in response to message #1 by Paul Ozog

When you say "replaced the batteries" do you mean pulled out then back in or put fresh ones in. Really low batteries will generally cause a black line to jump across the screen randomly like you describe.

in response to message #2 by [Vieira, Luiz C. \(Brazil\)](#)

The MK-61 is neat, but check out the MK-52 with plug-in modules etc.

It is worth having one or two of these Soviet calculators. In many ways they're amazing, but perhaps even more amazing is seeing what the limits of soviet technology really were. It is not the quality of the electronics that are the biggest drawbacks, but the poor fitting plastic shells with 50s type plastic and manuals printed on poor newspaper paper.

If you can afford it, check out the amazing MK-90 that you can currently find on ebay intermittently.

There are a few good websites on these computers worth checking out, such as:

<http://www.taswegian.com/MOSCOW/soviet.html>

I've purchased a few soviet calculators from ebay dealers and have had top service and no problems. There is an outfit called westernbid that acts as a middle man accepting paypal. No problems there either.

### [partially OT] Relief, relief, relief...

Message #1 Posted by [Olivier TREGER](#) on 31 Oct 2007, 2:02 p.m.

OK OK nobody cares but... I just want to share:

A friend of mine who fixes HP calcs (can't tell his name: he would be flooded with requests) just fixed my 29C and one of my 3 HP67.

It's a great feeling to see these calcs working again although they are more or less 30 years old for some of them.

Sometimes I think about my envy staring at HP dealers display window: this HP67 was the top of the cream and surely for confirmed engineers only.

This afternoon, I told my daughter: "look, it took me 30 years to get this". I'm stupid: why trying to explain... She'll understand in 30 years :)

Thanks for taking time to read this personal feeling

P.S.: for those who don't already know, my site is [here](#). Enjoy

**HP-12C Platinum 25th Anniversary Edition**

Message #1 Posted by [Daniel Diggelmann](#) on 31 Oct 2007, 1:09 p.m.

Dear fellow HP collectors,

I just bought above machine and overall I'm quite impressed by the quality, look and feel. Nevertheless I discovered an issue right from the beginning. Sometimes, mainly after the calc was off for a while, it seems that it doesn't recognise an ON click. If I press the ON button longer it switches on every time. It's not a big issue but I wonder whether it's a bad key or if it's a desing flaw in the electronics or software. Anyone had the same experience?

Regards, Daniel

**Re: HP-12C Platinum 25th Anniversary Edition**

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 31 Oct 2007, 1:14 p.m.,

I can confirma that behavior on my 25th anniversary edition. Sometimes the first keypress just does not take.

in response to message #1 by Daniel Diggelmann*

Yup... drives me crazy. I'd reach for the 12C Platinum, turn it on, and start entering a calculation, only to realize that it never switched on. My old 12C doesn't have this problem.

Now, I just grab my 35s, knowing that it will register every keystroke without having to watch the calculator the entire time.

Dear colleagues,

Thanks for all your feedback. Does the issue only concern the ON button? I hope so. Anyway I haven't had any missed keystrokes.

Regards, Daniel

*Message #7 Posted by [Raymond Del Tondo](#) on 1 Nov 2007, 1:45 a.m.,  
in response to message #6 by Daniel Diggelmann*

Hi Daniel,

when I received my first 12Cpt25A about a year ago, I experienced the same behaviour of the ON key. Since there seem to be many more of these units with the same effect, I consider it as a design flaw.

But on my first unit (the other one is still sealed) I also had some missed key strokes!  
They appeared when typing very fast, yet always having the machine giving the normal tactile feedback.

This effect was not always reproducible, but forced me to put the 12Cpt25A into the drawer of untrustworthy 'hp' calcs.

The 35s is much better in this respect.

I didn't have a missed key stroke on the 35s so far, and the unit seems to be able to do simple calculations correctly.

For the more advanced stuff, I'd consider the 35s as untrustworthy too, due to those unbelievable and silly bugs...

But at least they got the keyboard mechanism right this time, with the 35s;-)

Regards

Raymond

in response to message #7 by Raymond Del Tondo*

Good morning Raymond,

Good to hear from you. I also have a 35s and so far I'm happy with it. I like the form factor of the 12C and as I usually don't have to do technical stuff so I bought it. But I can't believe that they let us pay EUR 100 for a calc with such design flaws which are not present on any 5\$ crappy noname calc. I feel embarrassed to have been trapped again.

Regards, Daniel

Although I see that HP tries to do something on quality they seem to struggle. I know we are bunch of fans which look for high quality. But honestly is it too much to ask for a reliable keyboard? I work in the aircraft industry and know that it's not easy to get the human machine interface right in terms of tactile feel, colors etc. Anyone having contact to HP knows why they don't seem to have the proper engineering knowlegde anymore? Ist this ever discussed at HHC and is HP aware that they frustrate thousands of buyers? It took my one second to find out something wasn't ok with my new HP-12CPT as it didn't respond to the first click. Why doesn't this get noticed in the development of a new product? I would say that the tactile feel of the HP-35s and also of this HP-12CPT is good. So I guess the problem lays rather in the electronics hard- and software. Earlier HP had custom ICs with keyboard debounce electronics. Since they use off the shelf processors keys aren't registered properly anymore. You see I'm quite disappointed and as Raymond always tells us the last proper HP for now was the HP-48. Nevertheless I kept on buying HPs in the last years but I was never really satisfied. The HP-35s is pointing in the right direction. I'd like to see a HP-45s with all these issues solved. And if they even bring some new ideas I'd happily buy some more calcs. Diagnosis : HPAS!?! Hewlett Packard Acquirement Syndrome ;-)

**Should I also buy a Ti89?**

Message #1 Posted by [PhysicsNerd](#) on 31 Oct 2007, 2:30 a.m.

I'm not sure what to do here. I'm a high school student who is taking AP Calculus and will be taking the SATs shortly. I've only been using HP calcs for several months and I like the high-tech boost from my Ti-84+. However, I have not yet gotten a chance to try the Ti89. I know that there are a lot more programs available for it and that it is more widely used. Should I buy a Ti89 to accompany my hp 50g and see which I like better? (Please don't be biased, but which type of calc is better for AP Calculus and college level science/math/engineering courses?) Thanks.

**Re: Should I also buy a Ti89?**

Message #2 Posted by [Meenzer](#) on 31 Oct 2007, 4:23 a.m.,  
in response to message #1 by [PhysicsNerd](#)

I have both, the 89 Titanium and the 50G. They are both good and should both be able to do everything you want. I don't favor one over the other. If I had some weeks/months to go to take a test, I would randomly choose one and concentrate on the math and how to efficiently solve these problems with the picked calculator. I would never take both and probably get confused while taking the test - i.e. trying to use RPN on the TI or some such ;-)

**Re: Should I also buy a Ti89?**

Message #3 Posted by [Eric Smith](#) on 31 Oct 2007, 4:38 a.m.,  
in response to message #1 by [PhysicsNerd](#)

If you're referring to the SAT Reasoning Test, I took it three weeks ago. (About 25 years late, but that's another story.) I took an HP 49g+ to the test, but there were no problems for which I needed to do anything beyond basic arithmetic on it. I could have gotten by fine with pencil and paper, but then I might not have had time to both double-check all my answers and twiddle my thumbs for several minutes.

I did not take the SAT Subject Tests in Mathematics. From the test descriptions, it sounds like any scientific calculator should be adequate. You're not going to be asked to evaluate triple integrals or compute eigenvectors; there aren't any particular special functions of either the TI-89 or HP 50g that will give you a big edge.

If you're doing well in AP Calculus and have a little knowledge of basic statistics and probability, you should do fine on the math sections of the SAT Reasoning Test and on both of the SAT Subject Tests in mathematics. (And, for that matter, the quantitative part of the GRE, which I took this past August.)

Two years ago I took a linear algebra class for which the TI-85 or TI-86 were recommended. I was prepared to buy one if it proved necessary, but found that my HP 49g+ was more than adequate. The only drawback to not having the recommended calculator was that the professor would not have been able to show me how to solve problems on it, but I was able to work them all out myself without difficulty. Since the point of the class is to learn the math, not to learn the calculator, I'd claim that it doesn't make any difference which one you use, as long as you learn how to use it. So I wouldn't spend any money on buying yet another calculator of any sort,

unless you decide that you're not satisfied with the TI-84+ and HP 50g. (Or unless you just want another cool toy.)

My personal opinion is that any of the 48/49/50 series of calculators are fantastic for math, science, and engineering, and that I would have a harder time with the TI-89. I bought a TI-92 some years back, and IIRC the TI-89 is basically a subset of that. I didn't find it to be nearly as convenient to solve calculus problems as the HPs. That may be due to my years of experience with RPL, ever since getting an HP-28C back in 1987.

The main advice I would give anyone taking the SAT Reasoning Test has nothing to do with the math portion. Rather, I'd make a suggestion about the essay. They give you a topic and only 25 minutes to write on it. DON'T do what I did. I spent about five minutes organizing my thoughts and selecting three main points to write about. Then I wrote an introduction and thesis statement, and paragraphs about two of my main points. Time was called before I could write about my third point and a conclusion.

While I followed the correct process for writing a good essay, it's completely wrong for the SAT! I only scored 8 of 12 points for it, which dragged my overall writing score down considerably. I've since seen that Dr. Les Perelman of M.I.T. has studied SAT essays and found a near perfect correlation between essay length and SAT score, without regard to any normal quality metrics for the essay:

<http://www.nytimes.com/2005/05/04/education/04education.html>. This indicates that you should spend no time thinking, and all 25 minutes writing anything that pops into your head. Fill that paper up!

By comparison, I scored 5.5 out of 6 on the essays for the GRE, a test which has higher standards.

### **Re: Should I also buy a Ti89?**

*Message #4 Posted by [Jonathan Eisch](#) on 31 Oct 2007, 4:49 a.m.,  
in response to message #1 by PhysicsNerd*

For the AP test, you want to use whatever you're really good at using. As I recall, the calculator won't help you much except to get things done quicker than you can do in your head, or to check something that you weren't sure about. For both of those, you want speed. The level of mathematics on the AP isn't going to push either calculator too far.

Now that I think about it, the TI89 does pretty aggressive simplification, or converting your equation to some standard form, which often makes things more confusing. The HP typically gives a result closer to the form of the original equation (and therefor closer to whatever you did on your paper), and doesn't have so many of those crazy special functions that show up on the TI 89 (as I recall from before I sold my TI-89 to buy a HP-49g+)

For the SAT, it's pure speed. Use whatever you're fast with, where you know the keyboard well and you aren't going to make stupid mistakes.

That's my experience, at least.

-Jonathan

The "best" calculator in this case is the one everyone else has. If they all have TI-89 then get the TI-89.

Also, I would not be switching to a new calc just before an important exam, that could be bad news.

Dave.

### **Re: Should I also buy a Ti89?**

*Message #6 Posted by [Dave Britten](#) on 31 Oct 2007, 7:37 a.m.,  
in response to message #1 by [PhysicsNerd](#)*

Speaking completely outside the context of an impending exam, I can't really recommend the 89, strictly for usability reasons. As I'm sure you already know, the 89 is really nothing more than a 92+ in an 83+ shell (with slightly reduced screen size). This is all fine and dandy capability-wise; the machine can pretty much run circles around any other TI in terms of what it can handle.

The problem is that the OS was created well before transitioning to the smaller form factor, and the designers relied heavily on the notion that the user would have the full QWERTY keyboard available at all times. This resulted in a lot of useful math functions being buried in a less-than-ideal menu system, because they either had direct key equivalents, or could be very quickly typed out by name.

Now, move that onto a unit with drastically fewer keys, and a layout not optimized for letter entry (Why are X, Y, Z, and T ABOVE all the other letters?), and usage becomes quite a bit more cumbersome. You're either going to hunt-and-peck functions like factor() or expand(), or you'll have to become very accustomed to spending time with the cursor keys. It's either that, or build some huge custom menus yourself (it at least gives you that option).

Consider that the 92 already had three different shift keys to get everything done, and that the 89 now has four with the addition of the ALPHA key, and it's pretty obvious that reducing the number of physical keys probably wasn't the best way to go with that particular system. :)

Now, as for the 92+, or its replacement, the Voyage 200, I think they're both pretty fantastic, and if you're going to use a TI, then those (and the 86) are both excellent choices. Most stores don't have them on display, or even available in stock, but you can always try out an 89 to see what it does, realizing that entry is a good deal easier on its larger siblings.

*Message #7 Posted by [Eric Smith](#) on 31 Oct 2007, 3:07 p.m.,  
in response to message #6 by [Dave Britten](#)*

The 92, 92+, and Voyage 200 don't qualify under the [SAT calculator policy](#) due to the QWERTY keyboard.

### **Re: Should I also buy a Ti89?**

*Message #8 Posted by [Dave Britten](#) on 31 Oct 2007, 3:24 p.m.,  
in response to message #7 by [Eric Smith](#)*

Yup, I know, hence the preface of "Speaking completely outside the context of an impending exam." :) Certainly worth pointing out, though. I seem to recall having been in a similar position back when I took the ACT. Can't remember if I opted for my TI-83 or HP 49g... Heh.

### **Re: Should I also buy a Ti89?**

*Message #9 Posted by [Kelly Huckman](#) on 31 Oct 2007, 4:22 p.m.,  
in response to message #6 by [Dave Britten](#)*

Custom menus pretty much nullify your entire point. It took me about 15 minutes to pound out a custom

menu script on my computer and transfer it over to the calculator.

I never have to use alpha or the catalog/math menus. I just use the function keys and 0-9 to select the function I want. There are plenty of reasons to use an HP over a TI, I just don't think this is one of them.

### **Re: Should I also buy a Ti89?**

*Message #10 Posted by [Dave Britten](#) on 31 Oct 2007, 5:36 p.m.,  
in response to message #9 by Kelly Huckman*

I didn't say it was a reason to use an HP over a TI. I said it was a reason to use a TI-92 over a TI-89. I'd prefer the 92 any day! I'm not trying to start any brand loyalty debates here; there are fine machines from both manufacturers, and I own several from each.

### **Re: Should I also buy a Ti89?**

*Message #11 Posted by [Nick W.](#) on 1 Nov 2007, 3:22 a.m.,  
in response to message #1 by PhysicsNerd*

Unless you have a need for some specific feature in the 89, I don't see any reason for you to drop another hundred bucks on another calculator (Unless you can convince your parents to pay for it). I'm also currently in AP Calculus and am using the 50g that I bough last year for AP Stats when my 48gx proved too slow to punch in a bunch of data. It easily does everything we've learned so far and the answers are pretty and symbolic. Either should be able to do everything that comes up on the AP test.

As far as the SAT reasoning test, you barely need a calculator at all, as Eric mentioned. I did take the Math II subject test at the beginning of this month and there aren't really any calculus concepts on there. There's more calculus on the physics test, because they make you identify plots of velocity, acceleration, etc. given a plot of displacement or something along those lines. If you really understand your precalc and trig you'll do fine with any calculator. If you only sort of understood trig and precalc then a graphing calculator would help, but again, you don't need anything fancy. If I can offer you any advice for the math subject test, it's use whatever you are faster with. I only finished about the first 2/3 of my test, and had to leave the last chunk of questions blank. I somehow got an 800 still, which means that America as a whole must be pretty awful at math, since my friends who finished got a 670 and 710.

It probably just comes down to whatever you are faster with. I was lucky enough to start with a 41CV in 7th grade and I couldn't imagine using anything other than RPN now. If you were good with your TI-84, then you might like the TI-89, but I'd go to office max and try out one of the display models before shelling out the cash for one.

### **Re: Should I also buy a Ti89?**

*Message #12 Posted by [Massimo A. Santin](#) on 1 Nov 2007, 5:14 a.m.,  
in response to message #1 by PhysicsNerd*

I don't know if you need another calculator but I want to share with you my experience of using TI-89 Titanium screen. TI-89 Titanium is a very nice and powerful calculator (especially for students) but I found the screen dark and too small. And if I use a table lamp sometimes the shadows of characters are disturbing the reading. Except for that I like it. But I prefer my HP-50g.

### **Re: Should I also buy a Ti89?**

*Message #13 Posted by [Chan Tran](#) on 3 Nov 2007, 7:09 p.m.,

### Book(s) related to HP calculators history ?

Message #1 Posted by [Jean-Michel](#) on 30 Oct 2007, 5:21 p.m.

Hi all,

has anyone ever heard about one, or several, book(s) related to HP calculators, concerning essentially the history of the brand generally speaking, and essentially of its calculators products, and not only the HP programming "languages"? Of course, I mean a/some book(s) in English, because I don't even imagine it may exist in French...Or am I wrong ?

Thanks in advance.

Kind regards,

Jean-Michel.

### Re: Book(s) related to HP calculators history ?

Message #2 Posted by [Allen](#) on 30 Oct 2007, 5:46 p.m.,

in response to message #1 by [Jean-Michel](#)

<http://www.hpcalculatorguide.com/> is probably your best bet. There are some areas of the book that are not factual (e.g. subjective observations or authors opinion), but for the most part it is a very good historical reference. I have read nearly all of it, and would recommend it as part of any serious collector's library.

Edit: I should warn you, since it is a 5th edition, you will notice that the flow of the book is not smooth, since it is an expanded version, but not thoroughly revised. If you read it in one setting, you will notice the patch-work of chapters and will see some material repeated every 40 pages or so.

Bonjour Jean-Michel,

I'd like to recommend "[The HP Way](#)". It covers HP's history up to the mid Nineties. Though not focussed on calculators, Dave Packard tells you a lot about the spirit of HP which IMHO is most important to understand the assets of "old HP" - after all, this was the company which created, developed and built all those nice tools we still admire today.

HTH,

Walter

### HP-50 and Triple Integrals

Message #1 Posted by **Chuck** on 30 Oct 2007, 1:29 a.m.

I'm teaching 4th quarter calculus and recently began covering triple integrals. The students are able to set up the integrals just fine now; change the order of integration; calculate center of mass and moments of inertia, etc. Obviously the problems need to be "ricped" to be easily integrable by hand (I'm also having them number crunch harder ones with Mathematica). Several students want to try and have their calculators evaluate the integrals after they set them up...which brings me to the question,

It seems the TI-89 can numerically calculate most of the integrals in a few seconds. BUT, the HP50's are taking several minutes, if not hours. I had one running for two-plus hours and had to abort it. I set the 50G on approximate, and set the tolerance (error) down to .001, and still nothing after an hour.

Are there other settings I'm overlooking, or is the HP50 just not up to the task of triple integrals?

### Re: HP-50 and Triple Integrals

Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Oct 2007, 5:05 a.m.,  
in response to message #1 by Chuck

HI;

do you have any on-line working material that can be shared, or any specific example? This way we (any of us) could try some of them and see what happens our own. Results would be post as they come out. Do you agree with this?

Cheers.

Luiz (Brazil)

### Re: HP-50 and Triple Integrals

Message #3 Posted by **Chuck** on 30 Oct 2007, 6:59 p.m.,  
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz. I don't have the exact one in front of me (or my 50g either) but if I recall correctly this is the one the TI promptly calculated, and the 50g was aborted after 2 hours:

$$\int_0^2 \int_0^{4-2x} \int_0^{4-2x-y} 6xy \, dz \, dy \, dx = 64/5$$

It's much easier to do by hand than to get it all typed into a calculator (or computer) and wait.

Cheers,

CHUCK

in response to message #3 by Chuck

Well, the example you gave just took 20 seconds on my old HP49G. I guess it would take much less on a HP50G.

**Re: HP-50 and Triple Integrals**

Message #5 Posted by [Meenzer](#) on 31 Oct 2007, 3:45 a.m.,  
in response to message #3 by Chuck

On the TI 89 Titanium it took me about 2 minutes to key it in, because I first had to remember the order of keying in the limits and variables. The calculation took maybe 2 seconds.

On my Casio Algebra FX 2.0 plus it's pretty much the same input syntax and response time.

On the HP 50G it was much easier to key in with the equation writer, maybe under 30 seconds. First I calculated in **approximate** mode and aborted it after some minutes. Then I changed to **exact** mode and the result came after 6 seconds.

As an aside: in the equation writer you have to key in  $6X*Y$ , explicitly multiplying X and Y, else you would have keyed in the variable "XY".

Hi Luiz. I don't have the exact one in front of me (or my 50g either) but if I recall correctly this is the one the TI promptly calculated, and the 50g was aborted after 2 hours:

$$\int_0^2 \int_{-4-2x}^{-4-2x-y} \int_0^y 6xy \, dz \, dy \, dx = 64/5$$

My 50G took about 8 seconds to evaluate the above integration to a solution of 64/5. Although I freely admit to a very limited understanding of triple integrations...namely, how can we integrate with respect to Z when Z doesn't appear in the expression being integrated. Also, do  $dz \, dy \, dx$  correspond to the three integrals from left to right, or in an innermost/innermost, outermost/outermost relationship. Any help appreciated.

Best regards, Hal

- a) the integral of  $z dz$  would be  $1/2 z^2$ . By the same rule, the integral of  $1 dz$  would be just  $z$ .
- b) the integral sign and the  $d$  are like parentheses. Inner most intergral sign corresponds to inner most  $d$ , middle integral sign corresponds to middle  $d$  and outer most integral corresponds to outer most  $d$ .

### Re: HP-50 and Triple Integrals

Message #8 Posted by [dbatiz](#) on 31 Oct 2007, 9:24 a.m.,  
in response to message #3 by Chuck

With my 50g set to Exact mode, it processed the expression in approx 5 seconds and produced 64/5.

Then, with it set to approximate mode, Number Format FIX 1, it took about 13 seconds to produce the value 12.7.

With it set to FIX 2, it took approximately a minute to produce 12.8.

I don't understand the differences completely, but I understand that in exact mode it handles things symbolically but in approx mode it uses some kind of incremental loop to approximate the value. I think the step on the loop is determined by the resolution needed.

This is only my opinion, but I know there the folks in this forum have more insight to offer on this issue.

Very Respectfully,

David

### Re: HP-50 and Triple Integrals

Message #9 Posted by [Chuck](#) on 31 Oct 2007, 1:45 p.m.,  
in response to message #8 by dbatiz

Well, my 50g is still not integrating it. I have it set to FIX 3, approximate, tried both complex and real mode, modulo flags, etc. Still no answer after several minutes.....

[edit]

Ah Ha!!!!!! Taking it off approximate mode worked! 65/5 in 5 seconds!!!

Thanks everyone for trying this out. I find it odd that it will calculate the exact answer but not an approximate answer. Hmm. Suppose the integrand did not have an antiderivative. Would it not be able to give a 3-place approximate value in a respectable amount of time? I find this rather limiting.

**Re: HP-50 and Triple Integrals**

Message #10 Posted by [dbatiz](#) on 31 Oct 2007, 3:40 p.m.,  
in response to message #9 by Chuck

At first, I thought that was a limitation too. But, after donig some comparisons with a TI-83+, I started seeing the beauty of it. I found that the TI didn't maintain it's accuracy past 3 decimal places (for the inetgral I was attempting).

I'd much rather have slow and certain than fast and "best guess". I'll see if I can't dig up some examples to post here,

Very Respectfully,

David

Message #11 Posted by [Valentin Albillo](#) on 31 Oct 2007, 9:49 a.m.,  
in response to message #3 by Chuck

Hi,

Just for the record, the following HP-71B code:

```
10 DEF FNF(X,Y,Z)=6*X*Y
20 DEF FNG(X,Y)=INTEGRAL(0,4-2*X-Y,H,FNF(X,Y,IVAR))
30 DEF FNH(X)=INTEGRAL(0,4-2*X,H,FNG(X,IVAR))
40 H=.01 @ DISP INTEGRAL(0,2,H,FNH(IVAR))
```

```
>RUN
12.80
```

produces the correct answer in FIX 2 in 0.76 seconds under Emu71 on an old laptop, or 3 minutes in a physical HP-71B.

The template used is general, just replace your f(x,y,z) and limits (shown in bold) in the above code to compute any other triple integral.

Best regards from V.

in response to message #11 by Valentin Albillo

Hi Valentin,

if we decide to use PC power (EMU71), the free [Eigenmath](#) will do it with this input

```
defint(defint(defint(6*x*y,z,0,4-2*x-y),y,0,4-2*x),x,0,2)
```

in about 0.00001 second. ;-)

### Iteration on 33s or 35s?

Message #1 Posted by [Howard Boardman](#) on 29 Oct 2007, 8:08 p.m.

Is it possible to use iteration to solve an equation with the 33s or 35s? For example if you have 3 variables in an equation (such as a polynomial) where there are multiple roots possible, and you know 2 of the variables and need to solve for the 3rd. The solver often returns the incorrect root, although it is mathematically correct. I've run into this with a few civil engineering problems. What I'd like to do is have a root returned and see if it returns the correct solution for the other variables and can iterate a solution until the correct result is obtained for all variables. Thanks for any info.

### Re: Iteration on 33s or 35s?

Message #2 Posted by [Karl Schneider](#) on 30 Oct 2007, 12:46 a.m.,  
in response to message #1 by Howard Boardman

Howard --

It sounds as though you are melding two different things:

- Polynomials having an order  $n$  and one variable for  $n$  possible roots (solutions)
- Multi-variable equations

However, I'm fairly sure that I know the gist of your question: You're wondering why you always get the same result when solving for the only unspecified variable, which appears only once in the equation.

The answer is that the HP-33s and HP-35s will provide a "direct solution" determined by internal algebraic methods, in cases where it deems possible. They will ignore your two initial guesses to provide this direct solution. This flawed logic was borrowed from the solver in the HP-19B/II and HP-27S.

The workaround is to add a mathematically inert term such as "+0\*X" to the equation in order to trick the calculator into concluding that the equation is algebraically intractable. Then, it will use numerical iteration with your initial guesses.

An archived thread and an article:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62608#62608>

[HP SOLVE-INTEG on all RPN-based models](#)

As for the last part of your query: There may be an infinite number of solutions for a single multi-variable equation. Solution for multi-input, multi-output systems of equations is not supported by the HP-33s or HP-35s. An HP-50g can be used for that purpose.

Karl-

Very good point. I think you answered my question. I will give it a try. As much of an engineer I like to think I am, I am not a mathematician. I can only love math so far as it solves my problems :) Thanks for straightening out my logic. As many complaints as there are heard about the 33s and the like, they are very powerful little beasts. The ability to solve for any variable on the fly in an equation is something I wish I had known about in college.

I used to do keystroke programming a lot back in the early 1980's, when I had a TI-59. Then along came personal computers, and calculator programming went out the window...

Someday soon I am going to re-teach myself to do programming, this time on my 35s... and incorporate equations into the programs.

### **The 45s gets closer to reality!**

Message #1 Posted by [Gene Wright](#) on 29 Oct 2007, 4:40 p.m.

Got my physical "print" back. Image is shown below next to a 32s2 for size comparisons.

One thing I have noticed is that the 3D model definition has the keys shifted a bit too much up toward the display. A real 45s would have the keys shifted down a few MM closer to the bottom.

Very cool. Now...how do I turn my blob of plastic into the cool colored version with symbols on my keys? :-)

I think the question should be "how do I turn my blob of plastic into something that calculates?"

Add one LCD, one PCB, some more plastic blobs for keys that push, a pinch of \*fix, and hello 1st OpenRPN prototype.

Dave.

### **The DIY gets closer to reality!**

Message #3 Posted by [Eric Smith](#) on 29 Oct 2007, 11:08 p.m.,  
in response to message #2 by DaveJ

At HHC 2007, I showed (and passed around) a DIY3 calculator in an ABS plastic case made by FDN (Fused Deposition Modeling, a 3D printing technology). I would have used black ABS for the case, but I was able to get slightly faster turnaround time with white. The electronics and software were almost the same as what Richard Ottosen and I have shown before in a laminated laser-cut case.

I designed the case top, case bottom, and button models in SolidWorks, exported them as STL files, and had them fabricated at TechShop. I'm having trouble with my old camera, but a few photos can be seen

[here](#).

It is a functional calculator that emulates the HP-21, HP-22, HP-25, HP-27, HP-33C, and HP-37E.

Unlike the laminated laser-cut case, there is no easy way to use an overlay to provide legends for the keys. A 41-style overlay that surrounded the keys is possible, but it would be nice to get the primary legends on the keys themselves. The 3D printer won't do multiple colors, and doesn't have enough resolution for key legends in any case. I did design in some labeling on the case back, which can be seen in one of the photos.

The top surface of the button as produced on the printer has an interesting texture to it, and is probably not suitable for silkscreening. However, it is possible to smooth the ABS with careful use of acetone. I have not yet tried this.

I expect that we will likely use injection molding for keys within the next year, but unfortunately not double-shot molding. However, we have a few tricks up our sleeves that I'm not yet ready to reveal.

**Re: The DIY gets closer to reality!**

*Message #4 Posted by [Hugh Evans](#) on 30 Oct 2007, 7:01 p.m.,

### **What will it take to create an OpenRPN 45s?**

*Message #8 Posted by **Pavneet Arora** on 30 Oct 2007, 8:03 p.m.,  
in response to message #7 by Walter B*

Seriously, though, what would it take to create an OpenRPN 45s?

It seems as if there is enough talent here to do it. If members are able to dissect the accuracy of algorithms, ferret out singularities in RPN programming, create functional calculators and enclosures, generate documentation do we really need to wait for HP to make our dream calculator?

Can we use the Free42 code base as a starting point for the OpenRPN 45? I would be certainly be willing to lend a hand in my small way if there is a quorum.

Cheers.

### **Re: What will it take to create an OpenRPN 45s?**

*Message #9 Posted by **Hugh Evans** on 30 Oct 2007, 8:17 p.m.,  
in response to message #8 by Pavneet Arora*

People with time and talent to contribute to software and hardware development. At the moment those seem to be scarce resources. Porting Free42 wouldn't be a bad way to get machines up and running, which is why it has been brought up before.

### **Re: What will it take to create an OpenRPN 45s?**

*Message #10 Posted by **Paul Dale** on 30 Oct 2007, 8:41 p.m.,

### **Re: What will it take to create an OpenRPN 45s?**

*Message #11 Posted by **DaveJ** on 30 Oct 2007, 10:27 p.m.,  
in response to message #8 by Pavneet Arora*

There are probably two main hurdles:

1) Money

Time is free, but someone has to pay for plastics, PCB's and parts. To get the electronics and PCB for the first prototype will at a minimum be several hundred dollars. You also have to factor in a second spin at the PCB just in case there is a little gotcha as murphy will always

ensure there is. \$500 is a realistic budget. You can save on cost by trying to get free samples for stuff, free boards through work etc, but often it's just easier to hand over the dollars and get your parts in a few days.

I have no idea what the plastics will cost, and you might need a second spin at those as well due to any number of reasons. Especially the keys, getting those right in the first spin might be tricky, but if someone has access to a rapid-prototype machine as some seem to do, then you can.

## 2) Motivation

Projects like this *\*always\** come down to just one person taking the reins and "just doing it". When you try involving multiple people with different skill sets, time gets frittered away, decisions don't get made, you loose focus, people eventually loose interest, and the project flops. You can solve some of this by not trying to collaborate too much. Have someone come up with the plastics and housing first (with some checking by the electronics person), and get it made. Then have someone design the electronics to fit. Only then worry about the software.

That first prototype in your hands is absolutely vital, and do try to avoid perfectionism. That first prototype just has to be good enough to play with, not perfect down to every last detail.

Software is the last thing that you should be concerned with. I have no doubt that if people had hardware in their hands, suitable software would come from all directions.

Remember, a calculator is a *\*hardware\** project.

A project like this is not hard. If I had the mechanical CAD skills and access to a rapid-prototype machine then I could have a complete calculator prototype in my hands in a matter of weeks.

Dave.

## **Re: What will it take to create an OpenRPN 45s?**

*Message #12 Posted by [Pavneet Arora](#) on 31 Oct 2007, 7:22 a.m.,  
in response to message #11 by DaveJ*

Alright. So let's say even \$750 as a budget. Do we have enough people here to contribute to such a project? Let's say donations of between \$25 and \$75 each?

We have such generous contributions made by forum members in response to questions, so I can easily imagine having their expertise for a project such as this. Now for the sake of argument let me throw some names out based on my "amateur" observations after being on this forum for only a few weeks; my infatuation with HP calcs runs into the decades, though. The people listed can, of course, opt in or opt out. Others can offer their own contributions:

Physical Design: Gene Wright, Jake Schwartz, Bruce, PalG, ???

CAD: Eric Smith, Richard Ottosen, PalG, Jean-Yves ???

Hardware: Eric Smith, Richard Ottosen, DaveJ, ???

Algorithms: Paul Dale, Allain Millen, Karl Schneider, ???

Layout/Labeling/Documentation: Walter Bonin, Pavneet Arora, ???

Who else wants to help out?

To my mind, at least, this sounds like a doable endeavour...

Dear Walter,

High-school in Canada in the 70s meant that one would invariably see Coles Notes' versions of English Literature --- mainly Shakespeare --- being read/memorized in the hour before a test ;). Coles was a bookstore chain at the time. To quote from one site:

"Similar to classic notes or Cliff Notes, the books usually give quick summaries or an analysis on the subjects. Coles Notes are available on many different types of Literature topics including Shakespeare. They are easy to purchase online or even in bookstores. Prices are fairly reasonable if you are looking for that kind of help.

The largest problem with Coles Notes is students forget to cite these. Perhaps they are embarrassed because they chose to use Coles Notes or they think their instructors will never know. However, most instructors are aware of Coles Notes and they can recognize the use of these."

Imperium is a semi-fictionalized account of the life of Cicero:

[http://www.amazon.com/Imperium-Novel-Ancient-Robert-Harris/dp/074326603X/ref=pd\\_bbs\\_sr\\_1/105-3436687-1894809?ie=UTF8&s=books&qid=1193914047&sr=8-1](http://www.amazon.com/Imperium-Novel-Ancient-Robert-Harris/dp/074326603X/ref=pd_bbs_sr_1/105-3436687-1894809?ie=UTF8&s=books&qid=1193914047&sr=8-1)

Robert Harris has another one about Bletchley Park, called Enigma which was enjoyable as well.

Cheers.

Hello!

Quote:

There are probably two main hurdles:

1) Money ... 2) Motivation

I don't think so. When I read and see, what amounts of money people (me included) are ready to spend for vintage calculators, money should not be an issue here. And reading through some of the contributions here, I can see plenty of motivation too.

From my point of view, the project rather lacks the following items:

3) Consensus and 4) Leadership/Responsibility

Since full consensus will be impossible to reach ("Too many cooks spoil the broth"), at some point (now!) somebody must assume a leading role and boldly go ahead with what has been reached so far. Who wants to follow, follows, sends a down payment to cover development costs and contributes as good as he can towards completion of the software. The others wait for the next project that will suit their needs better.

As for me, I am not interested in a clone of an (any!) existing calculator since I could use the original one if I really needed it. Therefore, the OpenRPN calculators as they are now (all more or less hybrids between hp-15, hp-42 and hp-48) do not appeal to me at all. The calculator I would like to see (and contribute towards) is probably too different from anybody else's needs/wishes, that it will not materialise. At least not in hardware, but maybe as a software project on a device like an iPod Touch.

Nevertheless I would of course buy any available OpenRPN calculator out of solidarity with the developing team!

Greetings, Max

If I understand you right, you're telling me that the prize I'm willing to pay is to low - and you are probably right.

I just think that if you want to appeal to buyers outside the MoHPC, you can not surpass the 35s's current prize by very much.

Additionally, for outside-MoHPC-buyers, the 45s should be of at least the same build quality and look and feel as the 35s. I can't imagine anyone paying more for a slightly DIY-looking machine, even if it had all those cool 42s-features...

I just thought of something else, forgive me if it already has been mentioned. Has someone checked if it's OK to just *take* HP's design? Under European law this could be seen as product design piracy - at least as soon as you start to sell the thing.

---

That's what I'm saying, someone has to "just do it".

Plastics come first. If someone comes up with a set of plastics and keys, only then will the rest follow.

I tentatively tried to associate my uWatch calculator at one point with OpenRPN, and was left holding an empty bag. So I won't be quick to jump down the same path again. BUT, if magically I was presented with some real plastic in my hands, then maybe, just maybe, I might be tempted to design some electronics for it. But I'll believe it when I see it.

Who wants to follow, follows, sends a down payment to cover development costs and contributes as good as he can towards completion of the software. The others wait for the next project that will suit their needs better.

---

Don't underestimate how much it will cost. And sharing cost around and/or trying to get any sort of contribution or up-front order is a very dangerous thing to do.

Quote:

---

As for me, I am not interested in a clone of an (any!) existing calculator since I could use the original one if I really needed it. Therefore, the OpenRPN calculators as they are now (all more or less hybrids between hp-15, hp-42 and hp-48) do not appeal to me at all. The calculator I would like to see (and contribute towards) is probably too different from anybody else's needs/wishes, that it will not materialise. At least not in hardware, but maybe as a software project on a device like an iPod Touch.

Nevertheless I would of course buy any available OpenRPN calculator out of solidarity with the developing team!

---

My own needs are probably different again. I don't want nor need a graphing or programmable calculator. Just a nice basic scientific calculator is all I want.

I'm not a big fan of "clones" either. I think a new calc should do its own thing.

Dave.

Let's consider the 45s design as presented thus far. To me, this is an incredibly appealing design. What is the opinion of us focusing just on this particular model and moving it along?

---

The problem might be the LCD. A full graphic LCD of this size complicates things, a lot. I would recommend the screen be changed to a standard 2 or 4 line character dot-matrix LCD module. This might lower the cost, would increase your component sourcing options, and \*greatly\* reduce the complexity of the software and processing power required.

Dave.

### **To clear the fog (was: Re: What will it take to create an OpenRPN 45s? )**

Let's consider the 45s design as presented thus far. To me, this is an incredibly appealing design. What is the opinion of us focusing just on this particular model and moving it along?

---

There were several **45s** designs presented here so far(in order of appearance in this forum:

2007/06/06: [The 45s started here](#), actually the name was created by Karl Schneider in message #7, the first design labeled "45s" shows up in message #31;

2007/06/24: [35s-based](#)

2007/10/11: [42s-based](#) (message #40 in this thread), image created by Pal G. is here: <http://www.gyore.com/downloads/hp45s-gc06.jpg> ,

2007/10/22: 35s-based <http://img2.putfile.com/main/10/29401530920.jpg> ,

2007/10/25: 35s-based

,

2007/10/26: 35s-based

Hope I didn't mess the line nor forgot any important contribution - took me some time to excavate - I skipped the 4-bangers). **Which 45s are you talking about?**

Further points:

I second Dave in the LCD issue. Let's try to eat the cake in pieces ;) -- we may turn to graphics later.

Alternatively, [Voyager-based design drafts](#) may be better for several reasons. Plastic parts are available at reasonable cost. Another advantage is true pocketability even if we'd need it a few mm thicker. Of the drafts shown here, the

15cx is my favourite, because it can do all a 42s can do, and features a better user interface with 8 soft keys you may access permanently and a wealth of functions directly accessible:

<http://img2.putfile.com/main/10/29301514763.jpg>

If people are afraid of the feature set, it can be cut down easily.

HTH a bit,

Walter

P.S. Since I'm in southern China right now, let me state any parts for a small run seem to be available everywhere at minimum cost. Impressive, but I did not go into negotiations :)

Edited for the post scriptum.

I was referring to the design presented by Gene at HHC2007, but I am very happy to pursue a Voyager based design with the functionality of the 42s.

What do others think of honing in on this form factor?

So let's get going... No, but you can also get very good quality parts in small batches made here in Europe! Just ask any company that does laser cutting and engraving of sheet metal (aluminium or stainless steel) for a quote and you will be surprised!

Why not get a real professional and rock-solid metal faceplate (absolutely nothing like DIY!) made? With a screen protector made from mineral glass (like in a good watch), which can also be cut by laser. And underneath one of those stunningly beautiful high-contrast, view-angle-independent multi-line dot-matrix OLED displays that can be found at every corner in Hong-Kong? (But I think I'm getting boring with my luminous displays, am I?)

Greetings, Max

Agreed. When our local Linux group had an LCD kit project, we were able to get a small run of PCB's from some place in Europe for a very good price (Hungary?). Granted a calc PCB would be more complex (multilayers) and cost more.

The PCB will be fairly cheap, under \$100 for a few prototypes. I used PCB Cart [www.pcbcart.com](http://www.pcbcart.com) for my watch PCB and front panel. If you need more than 2 layers then you are doing it wrong.

Dave.

Hello!

Quote:

---

With an OLED display it would be bye-bye battery life.

---

I wouldn't mind at all. This here (sorry for the link in German) is what I would like to see, a two line alphanumeric display:

<http://www.electronic-assembly.de/deu/pled/pled.htm>

The operating current is stated with "15mA typical", so with three rechargeable 1000 mAh AAA cells, the battery life would be around

50 hours. Use it one hour every working day and you will have to recharge the batteries every second month. Not really a problem, is it?

Greetings, Max

NB: I am just waiting for the delivery from HongKong of a lillte gadget that I bought last week from eBay: An "image tank" (called DigiMate III OTG), actually an enclosure for notebook hard disks with USB connction and slots for common types of memory cards. The housing is all-metal, it has an internal LiIon battery, a 2 1/2 inch colour OLED display and comes complete with charger and cables, but without hard drive. Replace the hard drive with a processor board and a keyboard and my "dream calculator" is almost there... The price? Two Euros and fifty cents.

---

Realistically you would use 2 AAA's or AA's which means the efficiency of your DC-DC converters plays a large part as well.

I would use AA's for that level of current, and you would use Alkaline/Lithium instead of rechargeable's. Unless you used your calc an awful lot of course. In any case, all the more reason to use AA's. A hand held calc should have plenty enough room inside for AA's

As much as I love LCD and looooong battery life, and even better, solar powered calcs (just from an engineering elegance point of view) - I gotta admit that an OLED display would set any DIY calc apart from the commercial models. In fact, the more I think about it, the more I think OLED it's gotta be. Hmm...

I have briefly thought about an OLD version of the uWatch.

Dave.

---

If room is not a problem, AA is the better choice of course! However, I am used to rechargeables for many, many years now, I even have one in our alarm clock, where it lasts for over a year between charges. It helps calm down my "environmental concience" :-) Here in Germany, rechargeable batteries (at least NiMH) are cheaper to buy than good alkalines!

Quote:

---

I gotta admit that an OLED display would set any DIY calc apart from the commercial models. In fact, the more I think about it, the more I think OLED it's gotta be.

---

I fell in love with OLED displays the moment I saw the first one. I can't imagine a better and more beautiful type of display. Early next year, the first OLED televisions and computer monitors will hit the market - can't wait to get one!

Quote:

---

I have briefly thought about an OLD version of the uWatch.

---

Oh yes, this would be it! On eBay, they already sell OLED watches but with no calculator of course.

When I get this image tank from Hongkong and the quality is right, I may contact the manufactures about deriving a calculator from it. Housing, battery, display, interfaces and processor (must be quite powerful since it handles disk, USB and memory card I/O as well as decompressing and displaying of images) are already there, all thats needed is a keyboard and

a way of programming the thing.

Greetings, Max

For what it's worth, Gene and my "HP45S" was first created in February of 2006. It was named "45S" as a combination of the 15C and 42S, and originally was attempted to fit in a Voyager case.

[img:<http://www.pahhc.org/2007/HP45S-5 v20 -4 V17.jpg>]

The idea was to have a wide LCD with eight or ten soft keys and both are shown here. Richard Nelson got into the act soon after and suggested also attempting the same functionality in a Pioneer case, and the result was posted by Gene earlier.

Mmmmm-mmmmmM!

I like this thread!

May I interject? (at the possibility of derailing it)

DaveJ currently HAS a working LCD, CPU, keyboard...

and we've seen, (and some lucky ones have(!) (or touched)) the DIY calcs of the recent HPCC.

What would it take for DaveJ's prototype to be "un-smooshed" into the 45 form factor? (Or for the DIY calcs) to be produced as a kit?

Yes, I am sure "WE" will never reach a consensus on the keyboard (unless a dictatorial project head says something like, "it will have the exact layout/functions/size/colors/bla-bla-bla of the original 45")!

It looks to me like the pneumatic tire, steel rim, inflation valve, lugnuts, hubcap, and axle bearings have already been invented...

LET'S NOT RE-INVENT THE WHEEL!

What will it take? A decent (er...excellent) keyswitch!

As recent threads have shown, prototype cases (and keytops) have been built using CAD/CAM (Santa Claus) machinery.

The molds (moulds?) for the plastic injection parts (case, keytops) will be high cost items if we want the calculator to look less than uh.... how shall I say it? ..."prototypical".

But then again, for a small run, it might be just as economical to make the cases out of hand carved mahogany, teak, bubinga, ebony...

B^)

---

From the electronics side, not much at all, just a new PCB. But the electronics side of a calculator is and has always been trivially easy. The hardware part is actually figuring out the mounting arrangement with the case and keys.

Hasn't Eric already done it all with the DIY-3 ?:

[http://gallery.brouhaha.com/albums/diy3f3/img\\_6873.sized.jpg](http://gallery.brouhaha.com/albums/diy3f3/img_6873.sized.jpg)

I don't know how good the keys work though.

Also, if you don't like Eric's "clone" firmware, then simply write your own. I believe he uses a PIC 18 series micro? (my watch is a PIC24F series micro)

If you want a "professional" looking calc, then I think it's worth at least investigating retrofitting a 12C/17BII+ with new electronics.

Dave.

*Message #43 Posted by [Eric Smith](#) on 2 Nov 2007, 3:47 p.m.,  
in response to message #42 by DaveJ*

The full case (two halves and 40 keys) costs about \$70. Volume production is not likely to reduce this much; if I bought my own FDM machine (\$20K), the per-unit materials cost would still be around \$30, because it is not possible to refill the

material cartridges. (It's just like the inkjet printer cartridge racket.) FDM is great for prototyping but is just not suitable for production of inexpensive consumer goods.

I do have an earlier, much less refined case design made in black ABS, and the color is definitely better. Note that my camera did a terrible job with the photos of the white case. I'll have to get a better camera to get some photos that look more like the real thing.

\_\_\_\_\_  
Don't buy a new camera, just white balance it properly. Switch it to the appropriate light source or do a manual white balance with a white sheet of paper (see the manual for details) ;-)  
Photoshop or Gimp would also be an option...

*Edited: 3 Nov 2007, 1:12 a.m.*

That was what the camera did with reasonably good direct illumination from a 26W CFL about 0.5m from the subject. The camera does offer manual white balance, but it used to do a much better job than this on auto. The autofocus no longer works properly either, after a friend dropped the camera, and the manual focus control is atrocious -- I need two hands to operate the manual focus, and a third to hold the camera (since it's not always convenient to use a tripod).

It's time for a new camera.

Quote:

\_\_\_\_\_

I don't know how good the keys work though.

\_\_\_\_\_

They're tact switches. With the laser-cut case, the top of the actuator protrudes slightly through a hole, and is just under the photo paper overlay. This works amazingly well.

With the FDM case, they have press-fit buttons. They work pretty well except for two things:

1. The button has too tight a fit on the switch shaft, so more force is needed to seat the button than is desirable. I think this has damaged the switches slightly, as they seem to have less consistent actuation force after assembly. I'm fairly sure that my latest button design will fix this problem, but I haven't had any fabricated yet.
2. On the current units, there is only one tact switch for the ENTER key, in the middle. If you press the left or right side of the ENTER key it doesn't work well. We plan to try using two tact switches, which should fix that problem but we're not sure whether that will make the ENTER key feel like it needs too much force to actuate.

### **Squeaky keys on 12c**

Message #1 Posted by [Igor Vilensky](#) on 29 Oct 2007, 2:14 p.m.

Greetings,

This is in reference to a 2826A HP 12c in excellent shape. This calculator appears to have been stored since its original purchase in 1989, seeing very little use. All keys work well with good tactile response. Sadly, the middle two rows squeek when touched even with lightest pressure. And of course, those keys make same rubbery sound when operated normally. I imagine something has happened to the rubber shield beneath the keys during its long storage. Could it have dried out? I took the calculator apart to find that its version does not allow direct access to the rubber shield. Any suggestions on how to remedy this 'squeaky' problem?

Thank you.

**Display cases**

Message #1 Posted by [Stefan Vorkoetter](#) on 29 Oct 2007, 1:10 p.m.

I have an opportunity to take my collection of HP calculators (and slide rules) out of a drawer and display them in our study in some sort of tasteful display case. The only problem is that I have no idea what would be a good way to display them. The attributes I'd want in a display case would be:

- 1) Contents clearly visible.
- 2) Protected from dust.
- 3) Easy to get one out to show it to someone or use it.

I'm thinking of something that mounts on a wall perhaps, but something on a bookshelf might work too.

How do you all store and/or display your calculator collections?

Note that my collection is not very big, and isn't likely to go much past eight or nine calculators and a dozen or so slide rules.

Thanks, Stefan

**Re: Display cases**

Message #2 Posted by [Martin Pinckney](#) on 29 Oct 2007, 4:04 p.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

Since you mention slide rules, then may I assume your calculator collection includes some older classic models? I would probably choose something traditional-looking, made out of wood with glass front, unless that conflicts with your room decor.

Try Googling "collectible display cabinets and curio cases" or something like that.

**Re: Display cases**

Message #3 Posted by [Walter B](#) on 30 Oct 2007, 1:09 a.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

Hallo Stefan,

depends on your location. IF - as your name suggests - you live in good old Central Europe, THEN take a look at your nearest IKEA store. They offer an unexpensive little wall mounted shelf called KLANG. I use its Aluminum edition to display my modest collection of a few slide rules and some HP scientific calcs of the Seventies and Eighties.

Why Aluminum? This edition features some elevated lines allowing to set the inclination of the calcs easily - not featured at the wooden edition. Direct access to your collection is guaranteed. If you have (small) kids,

mount it high enough. It is an open shelf, so there is no dust protection, however you will use your calcs and rules some times, won't you?

HTH, Walter (not affiliated with said company)

Hi Stefan

I use a rack called Bertby from IKEA. It's also available from IKEA Germany, according to [Ikea Germany](#). It's fairly dustproof (after I have added some kind of self adhesive "foamstripes" (as you use to make doors shut tight)). I can add or rearrange the shelves or even add more shelves. Next thing for me is to install IKEA's LED-lights... ;-)

My collection of 40 (40+?) HP-calcs have a nice home there including "big ones" as HP-71B, OmniGo 700 and HP-71B. I may add a picture here later today, when I get home from work...

Best regards! Johnny

### MLDL2000 V2 update + questionnaire

Message #1 Posted by [Meindert Kuipers](#) on 29 Oct 2007, 10:46 a.m.

The MLDL2000V2 is a new version of the MLDL2000 with the addition of mass storage. I have been able to do some testing lately. The result is that I will not use USB for mass storage, due to the power consumption of the USB media itself. This turned out to be very unpredictable and would drain the HP41 batteries ver fast. This would only work with an external power source or with the MLDL connected to USB, and that is not really practical.

I have done experiments with SD cards using a different controller and the additional power can be much better controlled. Also the media use very limited power.

SO now I have a few other choices to make, and would like to have the feedback from the forum:

1. SD card or microSD?

Both are possible, even inside a cardreader shell.

2. Possible inside a cardreader shell or external housing?

The current MLDL2000 fits inside a cardreader shell. One issue is that there are no more shells available, unless users choose to sacrifice their cardreader. It also appears that it is not possible to upgrade the MLDL2000 to V2 by only replacing the USB print. I am afraid that at least also the CPLD print (the most expensive part) must be replaced due to the more complicated interface between the CPLD and the SD card controller. When I design the new MLDL2000V2 for an external housing only one PCB is needed and the cost will be less. I expect that the PCB will be about 60\*90 mm, so the housing will be slightly larger. Of course a cable with module connector (and module housing) is required for connection to the HP41.

Let me know your feedback about this. Whenever you have questions, ask them!

Meindert

### Re: MLDL2000 V2 update + questionnaire

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 29 Oct 2007, 1:44 p.m.,  
in response to message #1 by Meindert Kuipers

Hi, Meindert;

as you know, I am a fierce MLDL2000 enthusiast (have two already, one is still disassembled), and I have serious reasons to go ahead and have a third unit, the V2-series being the target, now. So:

Quote:

SD card or microSD?

Based on newer  $\mu$ SD cards, their prices and reliability (have a 1Gb  $\mu$ -SD with adapter running fine in my HP50G), I guess it would not be a bad choice. But I must consider that chances are other users prefer having a regular SD card shelter, so lower-capable, earlier SD cards may be used as well (I have two 256MB SD cards I

could use, too). In time: what would be the system capacity for such SD access? So, µSD card or regular SD card should not be an issue for me.

Quote:

\_\_\_\_\_  
Possible inside a cardreader shell or external housing?  
\_\_\_\_\_

I'd go for a external housing with the cable. The problem would be to design a trustable connector, or use a spare module taken from a single density memory module. The card reader shell has many advantages, mostly portability, but it does not allow the use of ports 1 and 2. Consider having a HEPAX emulator with 32KRAM, and you want the HPIL plus regular printer... although possible, you should use one or the other with the card reader shell. If using an external module, you could go ahead with them all.

My 2¢.

Cheers.

Luiz (Brazil)

I have been looking for a card reader just for this purpose. How much would it cost to have the card-reader shell (or even a regular module shell) copied, both in NRE and the per-piece cost after that? I'm sure you could sell a lot of shells to people who want to use them for things other than the MLDL2000. I would guess the NRE would be about \$3000. How many MLDL2000's do you expect to sell, especially if availability of the card-reader shell is no longer an issue?

### **Re: MLDL2000 V2 update + questionnaire**

*Message #7 Posted by **Bram** on 31 Oct 2007, 8:41 a.m.,  
in response to message #1 by Meindert Kuipers*

Personally I'd prefer building it into a card reader shell (I didn't collect some shells for nothing you know ;-)  
As both microSD and miniSD can be converted into normalSD with an adapter, an interface for the latter may be more versatile. On the other hand, microSD already ranges up to 4GB (!), which seems way enough for an HP-41C to me.

Card reader housing + normalSD would be my choice.

### **Re: MLDL2000 V2 update + questionnaire**

*Message #8 Posted by **Meindert Kuipers** on 1 Nov 2007, 12:26 p.m.,  
in response to message #1 by Meindert Kuipers*

While on a plane earlier this week I had some time to think about this and make some sketches. It looks like it will be possible after all to only replace the USB controller and make everything fit inside a cardreader shell. SD or microSD is still open, but not very important at this time.

The changes in both firmware and software will not be trivial, but certainly not impossible.

The PCB's for the CPLD and Interface will be changed anyway, but can be 100% compatible, with a few errors fixed and one or two extra features. For those wishing to use an external box (if you do not have a

cradreader shell) I will provide a PCB that works as a carriercard for the other PCB's and provides the necessary interconnections.

As usual, comments are welcome!

Meindert

### **Re: MLDL2000 V2 update + questionnaire**

*Message #9 Posted by [Donald Leonard](#) on 9 Nov 2007, 6:09 a.m.,  
in response to message #8 by Meindert Kuipers*

I am not financially able to buy a whole new MLDL2000 V2, but a USB board replacement is still doable cost-wise. Based upon this still being a possibility, and this new board will STILL have USB connectivity to the computer for MLDL2000 data manipulation, my preferences are:

1. Card Reader Case installation. 2. uSD card, with adjustable/expandable addressing capable of accomodating future larger uSD cards. Reason for this preference over other SD sizes is strictly one of size - I'm sure Read/Write current drain is the same for all.

I would like to know what the "...few fixed errors.." and "...one or two extra features..." are. If these are significant and will make V1 systems outdated and incompatible with future ML2K PC software and features/capability, then I may have to give up on this project - I won't be able to keep up with the additional upgrade costs. If however, these are truly insignificant upgrades and ONLY being incorporated due to a new production run requiring different parts/board layouts caused by parts nonavailability, with no impact on support software compatibility between versions, then I am fully behind this project. I will gladly purchase the new, upgraded USB board when available.

I am very excited about the possibility of having Mass Storage capability added to the MLDL2000, and the uSD card is an excellent, compact storage unit.

Donald

### **Re: MLDL2000 V2 update + questionnaire**

*Message #10 Posted by [Meindert Kuipers](#) on 9 Nov 2007, 8:05 a.m.,  
in response to message #9 by Donald Leonard*

The V2 will be possible with the USB board only (pending some tests that I have to do). The updates on the other boards that I have planned are fixing some mistakes, but certainly not big functional changes, just a few minor things. These will include slightly better power management, LED's and extra I/O (for which no functions are defined yet). The V1 systems will be fully compatible with the V2 units if the mass storage is not used.

Meindert

### HP35S version of existing HP41 prgm: an example

Message #1 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 29 Oct 2007, 6:41 a.m.

Hi, all;

The listings below refer to two possible HP35S versions of a program designed to help analyzing the performance of (single stage?) transistor amplifiers. The original is a 169-step application program found in the HP41 User's Library Solution, Electrical Engineering (pages 12 to 19). Indirect addressing and subroutines dedicated to complex operations were not used in these HP35S versions because the program could be shortened if using the original equations (instead of matrix operations) and I decided to take the advantage of using the HP35S built-in complex handling. I decided to post the listing because it might be of use as examples of writing your own HP35S versions from other calculators. Both listings are RPN-based, I actually did not try the algebraic ones.

Input and output data are as follows: (complex data can be directly input with [i] or [theta])

| R# | Value |
|----|-------|
| H  | hi    |
| R  | hr    |
| F  | hf    |
| O  | ho    |
| Z  | Zs    |
| L  | Zl    |
| A  | Ai    |
| V  | Av    |
| S  | Avs   |
| N  | Zin   |
| T  | Zout  |

The first listing uses equations and takes advantage over values already in the stack (REGX, REGY, etc). The one shown here is slightly different of the one I posted recently: some variables had their names changed.

```

H001  LBL H
H002  INPUT H
H003  INPUT R
H004  INPUT F
H005  INPUT O
H006  INPUT Z
H007  INPUT L
Z001  LBL Z
Z002  CF 10
Z003  -F÷(1+O×L)»A
Z004  VIEW A
Z005  RCL× L
Z006  ENTER
Z007  ENTER
Z008  ENTER
Z009  REGX×R+H»N
Z010  REGY÷(REGX+Z)»S
Z011  REGZ÷REGY»V
Z012  VIEW V
Z013  VIEW S
Z014  VIEW N
Z015  (H+Z)÷(O×H+O×Z-F×R)»T
Z016  VIEW T

```

The second listing does not use equations, only stack manipulation.

```

H001  LBL H
H002  INPUT H

```

```

H003 INPUT R
H004 INPUT F
H005 INPUT O
H006 INPUT Z
H007 INPUT L
Z001 LBL Z
Z002 RCL F
Z003 RCL O
Z004 RCL× L
Z005 1
Z006 +
Z007 ÷
Z008 +/-
Z009 STO A
Z010 VIEW A
Z011 RCL× L
Z012 ENTER
Z013 ENTER
Z014 ENTER
Z015 RCL× R
Z016 RCL+ H
Z017 STO N
Z018 ÷
Z019 STO V
Z020 R^ (roll up)
Z021 LASTx
Z022 RCL+ Z
Z023 +
Z024 STO S
Z025 VIEW V
Z026 VIEW S
Z027 VIEW N
Z028 RCL H
Z029 RCL+ Z
Z030 RCL O
Z031 RCL× H
Z032 LASTx
Z033 RCL× Z
Z034 +
Z035 RCL F
Z036 RCL× R
Z037 -
Z038 ÷
Z039 STO T
Z040 VIEW T

```

I'd suggest following the example in the original, HP41 version to test the program:

| Keystrokes        | LCD       | comments |
|-------------------|-----------|----------|
| [XEQ] [H]         | H=        | (hi)     |
| 1100 [R/S]        | R=        | (hr)     |
| 250[E]6[+/-][R/S] | F=        | (hf)     |
| 50[R/S]           | O=        | (ho)     |
| 25[E]6[+/-][R/S]  | Z=        | (Zs)     |
| 1000[R/S]         | L=        | (Zl)     |
| 10000[R/S]        | A=        |          |
|                   | -40.00    | (Ai)     |
| [R/S]             | V=        |          |
|                   | -400,00   | (Av)     |
| [R/S]             | S=        |          |
|                   | -200,00   | (Avs)    |
| [R/S]             | N=        |          |
|                   | 1000,00   | (Zin)    |
| [R/S]             | T=        |          |
|                   | 52,500.00 | (Zout)   |

Although having different step numbers, both listings differ only in one byte concerning memory usage.

Please, let me know if there is anything wrong or that could be changed.

Hope it is useful.

Luiz (Brazil)

### Re: What is the matrix?

Message #3 Posted by [Ed Look](#) on 28 Oct 2007, 3:30 p.m.,  
in response to message #2 by [Allen](#)

Very simplistically, you can think back to high school and consider it a way to work with systems of (more than one) equations.

And historically, the presently more commonly encountered form of quantum mechanics, wave mechanics, got its start from matrices, in matrix mechanics.

Oh, how I wish I got a HP-15C.

Edited: 28 Oct 2007, 3:31 p.m.

### Re: Are Matrices Relevant?

Quote:

Explain the real life relevance of matrices. Where do they arise?

- vector rotations
- coordinate transformations
- systems of linear equations
- curve fitting

And many more, but that's what came to mind thinking about it for five seconds.

## Re: Are Matrices Relevant?

Message #5 Posted by [Maximilian Hohmann](#) on 28 Oct 2007, 3:57 p.m.,  
in response to message #1 by designnut

Hello!

Quote:

Where do they arise?

Just two examples from my world:

- 3D CAD/CAM consists to 95 percent of vectors and matrices. Our customers (we supply them with auxiliary software plugins for their CAD system) design (very) large aircraft where millions of matrix operations are performed every second on every single workstation. They have more than 1.000 of those in operation. I have been doing this work for over ten years now, but have never performed a single matrix calculation on a pocket calculator. If I have to check a result, it is quicker to write a little program on my workstation, where I can copy & paste the necessary input values, than to type all the figures into a calculator.

- In my other job, I am getting GPS position and speed readouts updated several times per second, that are again the result of matrix operations used to solve the necessary equations. Again, a pocket calculator might just be able to perform the necessary calculations (but not the much more computationally intensive task of receiving and decoding the pseudo-random signals transmitted by the satellites), but we would long have run out of fuel before the necessary input figures were typed into the machine...

Greetings, Max

## Re: Are Matrices Relevant?

Message #6 Posted by [Garth Wilson](#) on 29 Oct 2007, 12:07 a.m.,  
in response to message #5 by Maximilian Hohmann

Quote:

it is quicker to write a little program on my workstation, where I can copy & paste the necessary input values, than to type all the figures into a calculator.

That's partly why HPIL was valuable. It was practical to connect lots of lab instruments to the calculator at once. I did a lot of FFTs in the late 1980's on my HP-71, up to 8192-point, but you can bet I did not type the data in! It came in over HPIL, through the HP82169A HPIL-HPIB (IEEE-488) interface converter.

## Re: Are Matrices Relevant?

Message #8 Posted by [Jonathan Eisch](#) on 29 Oct 2007, 1:22 a.m.,  
in response to message #1 by designnut

Quote:

Explain the real life relevance of matrices.

In physical situations, matrices arise when you want to work with and describe real world (multi-dimensional) objects. While there are other ways, using a matrix is often very convenient.

An example?

Let's say you're programming a robot. You tell it that there is an obstacle five meters ahead, and two meters to the right. Now your robot then turns in place 't' degrees to the left. So, how do you calculate the location relative to the robot after the turn?

If you want to use matrices, you'd describe the original coordinates of the obstacle with the matrix

$$\begin{bmatrix} 5 \\ 2 \end{bmatrix} = C$$

and the rotation matrix:

$$\begin{bmatrix} \cos(t) & -\sin(t) \\ \sin(t) & \cos(t) \end{bmatrix} = R$$

To get your new coordinates, perform the matrix multiplication:  $C' = R * C$

and you're done! Of course, you could have used two equations, but this is more compact and readable if you have the matrix functionality already built in.

This is a very simple example, but if you write out the equations that you'd need you can see that as you scale dimensions, and the complexity of your operations, using matrices becomes more and more useful. (For example, you can multiply rotation matrices again and again to get the final rotation, and then apply that to all of your coordinates.)

I'm sure someone else can give a better example of using matrices, but this is mine.

## Re: Are Matrices Relevant?

Message #9 Posted by [Namir](#) on 29 Oct 2007, 5:29 a.m.,  
in response to message #1 by designnut

The availability of matrix operations in a calculator, programming language, and an extension of a programming language offers valuable shortcut to the user/programmer. Matrix operations make us very easy, for example, to set up statistical summations for multiple regression and then solving for the regression coefficients and other statistics. Such operations absolve the user/programmer from having to manage the matrices element by element.

## Re: Are Matrices Relevant?

Message #10 Posted by [BruceH](#) on 29 Oct 2007, 6:47 p.m.,  
in response to message #1 by designnut

Try and get hold of a copy of Bradley & Meeks' book "Matrices and Society". It's quite slim, an easy non-technical read, and has some quite surprising examples.

## Re: Are Matrices Relevant?

Message #11 Posted by [John Wasilewski](#) on 29 Oct 2007, 9:09 p.m.,  
in response to message #1 by designnut

In 1980 I programmed my TI-59 to analyse structural building frames. For example, a frame with three lines of columns and two upper floors would have six nodal intersections. Each node of a plane frame can drift to L or R, stretch/squash up/down, or rotate. That is, it has 3 degrees of freedom ('DoF').

A plane frame structure with 6 nodes has 18 DoF.

When external actions are applied to a structure (eg point loads, uniformly distributed loads such as weight and applied floor loads etc), each DoF deflects and rotates, and develops a corresponding internal action (axial force, shear force and bending moment).

All internal actions are related linearly to the external actions and to member stiffnesses and all of the displacements at the nearest DoF. These relationships can be expressed as a series of equations.

Nobody who writes down 18 equations bothers to keep repeating all the same variables on every line. Just write a list of the variables then for each line write a list of the coefficients. We call these shorthand forms, "matrices". Solving 18 equations by hand would NEVER be done in real life but with computers and flash calculators we can automate the process.

Without the neat timesaver form of matrices for teh equations this would be ludicrously cumbersome. Alas, here we are, 27 years later with an HP35s calculator that has, what, thirty six times as much memory as the TI-59? Yet I could not easily replicate the above because there are no large-scale matrix functions.

Its a marvellous calculator but I so-oo wish it had either a USB port of removable flash memory cards from which I could save backups on a PC, print etc.. I also am very, very wary about accidental screen lock-up when debugging any rough-and-ready code not prepared with v great care because this fault can leave one having to erase ALL work to date on the machine.

----

Message #13 Posted by [Gene Wright](#) on 29 Oct 2007, 9:38 p.m.,  
in response to message #11 by John Wasilewski

Just for the record, you couldn't solve those 18 equations on the TI-59 either, I think.

It did not have matrix equations built-in. It did have a matrix program as one of the master library programs on the plug-in CROM, but that was certainly not written with subroutines in mind. There were no large scale matrix functions in that program that would apply to this stated problem, since it had limits of a 9x9 system.

If you did ever solve such a beast on the TI-59, then you had to write some sort of program for it using other techniques, just as you would the HP-35s.

Of course, if you want to use matrices on a calculator today, then either use an HP42s or a graphing series model such as the HP48, HP49, or HP50g.

But, FYI on the old TI-59 for any readers who aren't familiar with it.

## Re: Are Matrices Relevant?

Message #14 Posted by [John Wasilewski](#) on 30 Oct 2007, 3:16 a.m.,  
in response to message #13 by Gene Wright

Ouch, you think I'm making it up!

I used a matrix inversion subroutine from the ML module, which was INEFFICIENT (an equation solver would have been better but there wasn't one I think). Also inefficiently, the program did not store the matrix as a packed half bandwidth but stored the whole square matrix, because you have to do this if solving the equations by in-situ matrix inversion (I think!).

I invented a structure labelling notation that didn't number the nodes and members but numbered only the DoF and then entered members using their nodal DoF as identifiers. See example below.

It's a long time ago and I don't remember the matrix size limit of the ML module but I assure you I most certainly DID analyse a structure with 3 lines of cols and 2 upper floors, because that was one of my test structures and I analysed it dozens of times in final testing of the program. If the ML module was limited to 9x9 as you say then what I must have done is to treat members as axially rigid so that nodal DoF were limited to L/R translation plus rotation and each floor level shared translation DoF.

DoF will thus have been:

Three rotations at 2nd floor

- 1
- 2
- 3

L/R translation at 2nd floor

- 4

Three rotations at 1st floor

- 5
- 6
- 7

L/R translation at 1st floor

- 8

Members will thus have been entered as

2nd floor beams 4142 4243

1st-2nd floor cols 8541 8642 8743

1st floor beams 8586 8687

grd-1st floor cols 0085 0086 0087

This member notation allowed the program to add stiffnesses directly into DoF locations. The program then solved the equations for all rotation and translation displacements, then added displacement actions (displacements x stiffnesses) to the original fixity actions (fixed-end moments and shears), obtaining all member-end moments and shears throughout the structure.

Input was extremely quick and easy. If you number DoF instead of nodes and members, using a diagram, you can reel off member DoF designators in an instant.

I am sorry that I didn't (and still don't) remember the matrix size limits of the ML module, so my number of equations may have been wrong for this particular example structure but I hope the above convinces you that I really DID DO what I said I did in all other respects! If anyone still has a working TI59, I have a copy of teh code somewhere that I can send out.

---

John

### **Re: Are Matrices Relevant?**

*Message #15 Posted by [Gene Wright](#) on 30 Oct 2007, 8:36 a.m.,  
in response to message #14 by John Wasilewski*

And what I am primarily saying is that the TI-59 matrix systems program in the TI-59 was limited to 9x9 systems.

Equation solvers were nearly 10 years in the future from the 1977 TI-59 introduction dates.

And, no, I don't suggest you're making it up, but that you might have either mis-remembered (possible, of course) or that you had to use some other technique (which you did since you say you "invented" an approach.

Well, you can certainly invent an approach to the problem on the HP35s if you want.

Seems a bit much to take a whack at the HP35s for not doing something out of the box because a calculator form 30 years ago gave you the ability to invent a way to solve a problem on it.

So, you could write a program to do this on the HP 35s as well. That's all.

### **Re: Are Matrices Relevant?**

*Message #16 Posted by [John Wasilewski](#) on 30 Oct 2007, 6:40 p.m.,  
in response to message #15 by Gene Wright*

You're right - I remembered the ML module and matrix ops but I did not remember its equation limit. I seem to recall that the TI-59 had storage registers 00 to 99 so an 81-field array would not leave a lot of space for other variables or program code.

I had fun compressing the frame analysis program and maximising the structural problem size, and my 3 rows of cols by 2 storey heights was either at the limit or nearly at it. (I actually also did use the program for my work, btw!).

This thread arose solely in reply to a challenge about, iirr, whether matrices have any practical use in the real world. I hope the original poster is now content with assurances from many of us, expressed and implied, that the answer is a resounding 'yes', and that significant matrix handling facilities can be very useful in a good calculator.

What I claim to have "invented" is a member designation system that is easy to use and eliminates a huge amount of housekeeping code from computer applications to get the program to work out which member-end actions are associated with which global structure DoF - hence feasible in the tiny storage capacity of a calculator.

Instead of numbering nodes, numbering members and listing connectivity by member-end node numbers like this, I just labelled each member with a 4-integer number representing the moments and shear DoF at each end. This allowed member stiffnesses to be added directly to the four DoF making the member's 'name'.

---  
John

### **Re: Are Matrices Relevant?**

*Message #18 Posted by **John Wasilewski** on 30 Oct 2007, 7:00 p.m.,  
in response to message #15 by Gene Wright*

I'd be delighted to tackle this in the HP35s. Would need to write a matrix equation solver though (which would be far more efficient than matrix inversion).

Obviously it would be good to find a way of packing the stiffness matrix by storing only the symmetrical halfbandwidth of the coefficients array, but I can't immediately see how to do that when using the member DoF-designator device to avoid 'housekeeping' code.

Also I suspect that the HP35s might run just a bit too slowly for an application like this with maybe 10 or 20 equations to solve and having to use an algorithm to locate every non-zero array coefficient in the packed storage.

Also, alas, there's no realistic prospect at all that I could find the time to take it on, for the foreseeable future (sigh).

And what I am primarily saying is that the TI-59 matrix systems program in the TI-59 was limited to 9x9 systems.

\_\_\_\_\_

The ML-02 program in the Master Library for the TI-59 would solve eighth order simultaneous equation problems or ninth order determinants and matrix inversion problems. It should have been possible to solve a ninth order simultaneous equation problem by entering the matrix, inverting the matrix with ML-02, and then using a user program to enter the vector and multiply the inverted matrix by the vector. I am not aware that anyone ever did that. I made a run at it one time but got hung up with the pivoting index.

A TI-59 program which would solve sixteenth order simultaneous equation problems appeared in the 81-2 issue of the Swedish newsletter *Programbiten*. Last year I translated that program for my sixth, seventh and eighth order linear equation solutions for the hp-33s which appear in the Articles section of this forum.

Those who don't have access to the old issues of *Programbitten* can find discussions of the program in V8N6P14 ff and V9N1P16 ff of *TI PPC Notes* including conversions of the program for fast mode. You can find those documents at Viktor Toth's site. I have solved 16x16 systems with the programs.

A program of the same genre for the HP-41 by Valentin Albillo appeared in V7N5P64 of the *PPC Calculator Journal* would solve up to a 14x14 system with a single memory module and a 30x30 system with all four memory modules in place. I have entered the program in an HP-41 but have only solved up to 9x9 systems.

It would seem to me to be fairly straightforward to convert Valentin's program for use with the hp-35s. I didn't use Valentin's program as the basis for my programs for the hp-33s because I had counted the required number of registers for Valentin's program and found that a direct translation couldn't do an 8x8 considering memory limitations of the hp-33s. I couldn't see a way to reduce the number of registers for Valentin's program. That doesn't mean that there isn't one. I just couldn't push it through. I did find a way to squeeze in a modification of the *Programbitten* program. Memory limitations shouldn't be a problem on the hp-35s.

### **Why not an HP-71B ? (Re: Are Matrices Relevant?)**

Message #20 Posted by [Valentin Albillo](#) on 30 Oct 2007, 7:14 a.m.,

I fail to understand why knowledgeable old-timers like you and many other expert people in this Forum consistently fail to recommend the HP-71B for most any purpose at all, always going for some other models instead.

In the particular, important case of matrix handling, it's been my experience that an HP-71B/Math ROM combination beats anything out there in terms of ease of use and sheer productivity. Its excellent classic keyboard with separate numeric pad, plus the convenience of assembly-language matrix keywords makes entering matrices and doing complicated operations with them as easy as pie.

This is further enhanced if you've got peripherals for your HP-71B such as printer, mass storage, or 80-column external display, or else if you're using Emu71 running on your PC, which brings in all these capabilities plus 350x speed to boot.

Even if restricted to the physical, handheld model, I'm pretty sure the HP-71B is a very strong contender for matrix handling on the field, even if just doing manual computations (which can utilize key assignments for even greater productivity), without resorting to programming. If some programming involving matrices is necessary, then the HP-71B allegedly wins hands down.

Hi, Bill:

Bill posted:

*"The 71-b is out of production. The OP is using currently available technology--he isn't shopping for antiques."*

What "original poster" ? John Wasilewski ? designnut ?

Also, the HP-71B is "currently available technology": you can get any number of them right now in eBay and other places. It's just that you don't want to pay the asked price or shop for it at other places, but it's certainly anything but rare.

Anyway, I'm not complaining about this particular thread or "original poster" (whomever he might be) but on the perceived fact that *not even once* does anyone recommend getting an HP-71B for *any* purpose. You can find the RPL models recommended, the HP35S, the HP-41C, 42S, 11C, 15C, 17BII, *most any* model at all ... *except* for the HP-71B.

*"But as this is a museum, interest and awareness of the 71B and its capabilities is of great interest and I for one am very glad for your posts on the subject. I never would have known of these gems of the past otherwise!"*

Thank you very much, I'll buy you a drink or two for that.

Best regards from V.

Gene: Ok! I'll do penance by actually getting my HP71B out and using it in the next week. It IS a beauty.

Internally wired 144MB of ram AND internally wired MATH rom. 32K EEPROM containing the X-version of the JPC rom (which I **\*\*really\*\*** like), and more. :-)

And, my other piece of penance will be to make sure a marvel such as the 71B comes to mind next time I have a chance to recommend a task at which it excels!

Will that do? :-)

**Re: Why not an HP-71B ? (Re: Are Matrices Relevant?)**

Message #24 Posted by [Valentin Albillo](#) on 30 Oct 2007, 10:31 a.m.,  
in response to message #23 by Gene Wright

Hi, Gene:

Gene posted:

*"Will that do? :-)"*

YESSSS ! Oh, yesss !! Have a cigar, my friend :-)

And congratulations for your really beefed-up HP-71B. My best one (I own 3) does have 160 Kb RAM + Math ROM + HP-IL ROM plus I also have its Card Reader, but none or them are internally wired.

I do have a curiosity regarding that physical JPC ROM of yours: does it appreciably *slow down* the machine while it's plugged in ?

This is: do programs (which don't use any of its keywords) run slower than they do if JPC ROM isn't plugged in ? Do interactive execution of command lines slow as well ? Does parsing and executing statements either interactively or in a running program proceed noticeably slower ?

Another question: did you ever get to try and write some programs for your SHARP EL-5510/PC-1421 handheld making use of its built-in financial BASIC statements and functions ? At the very least, did you ever wrote some kind of review, even if in scratch status ? You being an experienced financial guy I would be very specially interested in your opinion, as I've told you before.

Thanks and best regards from V.

Message #25 Posted by [Gene Wright](#) on 30 Oct 2007, 8:31 a.m.,  
in response to message #20 by Valentin Albillo

Valentin is of course correct, the 71B with the MATH rom is another great alternative.

However, I am expecting to hear a reply that John only wants an RPN model that can do matrices, which is why I suggested the 42s.

The "proper" way to do matrix work on a handheld today is, IMO, the 48/49/50 graphing series for several reasons...cost and ease of replacing a broken unit being the primary one.

I have picked up HP48gII models off ebay for less than \$30. Same for older 49g models.

You could buy and use 8-10 of these for the usual price of a 42s.

Going with the 71B would be more expensive and require programming in BASIC rather than in an interactive way, such as can be done on the 42s and graphing series.

Given that the lament is that the \$60 HP35s doesn't have all these complicated matrix functions, I was expecting the need to suggest an RPN model (hence the 42s) and given the \$60 price, I was expecting the need to suggest a relatively cheap alternative (hence the graphing models). I just didn't think the 71B fit either of those categories. :-)

BTW, great articles, Valentin, in the latest Datafile issue!

Hi again, Gene:

Gene posted:

*"Going with the 71B would be more expensive and require programming in BASIC rather than in an interactive way, such as can be done on the 42s and graphing series."*

I don't concur with what you're saying, at all. What do you mean "require programming in BASIC rather than in an interactive way" ?

You don't need *any programming at all* to use most of the HP-71B capabilities right from the keyword, interactively. That includes matrix capabilities, of course: you don't need to write a single line of code to declare, input and output matrices, to invert them, perform arithmetic with them, solve linear systems, or whatever, be they real- or complex-valued.

Just for instance, to solve a typical 3x3 system, say, you'd key in:

```
DIM A(3,3),B(3),X(3)           [ENTER] (declare matrices)
MAT INPUT A,B                 [ENTER] (input values)
    2,1,3,5,-1,4,-3,2,-1,6,8,-2 [ENTER]

MAT X=SYS(A,B)                 [ENTER] (solve the system)
MAT DISP X                     [ENTER] (output results)
```

and as you can see, everything's been done *interactively*, right from the keyboard, without ever entering even a *single* program line.

*"I just didn't think the 71B fit either of those categories. :-)"*

Lame excuses won't save you this time, just simply recognize that you *\*hate\** the HP-71B because it hasn't built-in financial functions like the SHARP EL-5510 handheld does ... :-) :-)

*"BTW, great articles, Valentin, in the latest Datafile issue!"*

Thank you very much, glad you liked them. Depending on how the incoming HPCC AGM comes out next 10th November 2007, they might turn out to be my last articles for Datafile in the foreseeable future, so keep them for collectible value.

Best regards from V.

### A programmer's HP-35s review

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 27 Oct 2007, 1:16 p.m.

After been doing some coding on the HP-35s I wrote what I called 'A programmer's HP-35s review' in my blog:

<http://aha-hp-calcs.blogspot.com/2007/10/programmers-hp-35s-review.html>

Main message: Found RPN, vector type and equations in programs to be very powerfull.

I am not familiar with RPL (yet, there is a 50g out there with my name on it :-), but I have the feeling that the possibility of using equation in programs on the HP-35s perhaps makes its programming language something between pure RPN and RPL, RPN+ :-)?

Anyway, its been an interesting 'return to HPHC programming' since the long, long gone days of HP-41 hacking!

### Re: A programmer's HP-35s review

Message #2 Posted by [marais](#) on 27 Oct 2007, 4:20 p.m.,  
in response to message #1 by Arne Halvorsen (Norway)

Don't let me be misunderstood, I am going to buy the 35s once it's available in Europe, but the lack of a cross product while at the same time providing vectors seems somewhat ridiculous from the perspective of somebody who uses a 28C/S on a daily basis. That's really hard to believe.

A.

### HP 33S - Chemistry Student Needs Programs

Message #1 Posted by [Rhyleigh](#) on 26 Oct 2007, 5:44 p.m.

Does anyone have an idea of where I can find programs written for the HP 33S that will help me to solve some of the math formula questions in my Chemistry Lab?

I have already bought the 33S but I cannot figure out how to write a program for de Broglie's Equation, or Bohr's Equation, etc.

Your feedback is greatly appreciated.

### Re: HP 33S - Chemistry Student Needs Programs

Message #2 Posted by [Ed Look](#) on 26 Oct 2007, 7:00 p.m.,  
in response to message #1 by [Rhyleigh](#)

Hmmmm... do you know or have you done any programming?

If not, read the programming sections of the 33S manual thoroughly, and practice a few easy tasks while you're at it.

But basically, you first choose a label letter and then begin your program steps from there.

Let me first recommend you follow the three fundamental steps in this order:

pseudocode- just scribble down, in bad English or whatever language even, your basic ideas of what you want your program to do and a little of how you might want to get it there.

flowchart- look up... I guess these days you can use Google or some such... the symbols that represent the various types of computer program execution steps, i.e., I/O, formatting, math or other (like storage, etc.) operation, branching, and testing. Then use your pseudocode as a guide to draw your flowchart, which is a skeletal diagram of your program.

program- finally, using your flowchart, write your program in the steps of your chosen computer language, which I suppose, in this case is RPN keystroke programming.

Now, I think keystroke programming on a HP scientific calculator is easier than writing a program for a minicomputer or mainframe or even the PC. This is because each keypress expresses your desired instruction step in the program.

Incidentally, his name was Louis de Broglie, and most likely you are referring to his famous "matterwave" equation which linked solid matter with wave properties,

wavelength = Planck's constant / momentum

(I apologize- I don't know how nor even if I can insert Greek letters or mathematical symbols here)

If this equation is what you want, it is at the simplest level, a division problem. If so, then left shift (green arrow) PRGM (R/S key) will get in into the programming space. Then left shift LBL (+ key) and choose a letter from the alphabet that you would like. Now, you are fortunate, since Planck's constant,  $h$ , is a part of the 33S constants library. Access that by right shift (purple arrow) MODES (on the top right below the display panel) and use the navigation key in the middle to scroll around and find  $h$ . Then hit ENTER to choose it and insert it in your program. Now you will have to use an inputting step that will halt your calculator so you can put in your momentum value when you run the program: key in R/S, which should read, "STOP". (When you run the program, after keying in your momentum value, you'll have to hit R/S to continue the program execution.) At this point, key in divide and then right shift RTN (+ key), and you're done.

Now, I leave it to you to figure you how to program in the Rydberg equation (it's not called Bohr's equation, though it is based on Bohr's model). But I think you're in luck again, as I suspect the Rydberg constant for the hydrogen atom,  $R$ , (and this is not the gas constant  $R$ )... well, they may call it something else, you'll have to check, but look up the value of the Rydberg constant in your textbook and you can then identify it in your 33S constants library.

Study hard.

### Re: HP 33S - Chemistry Student Needs Programs

Message #3 Posted by [Dave Shaffer \(Arizona\)](#) on 26 Oct 2007, 10:56 p.m.,  
in response to message #1 by Rhyleigh

If you are trying to evaluate an equation by looking for the value of an unknown quantity while you have all the other quantities, you can use the solver.

Basically, you enter the equation, give it the variables you know and it will return the value of the unknown.

You can also just enter an equation to be evaluated for various input values.

As Ed suggested, read the appropriate chapters (6 and 7) and try the examples in the manual.

### Re: HP 33S - Chemistry Student Needs Programs

Message #4 Posted by [Ed Look](#) on 27 Oct 2007, 1:20 a.m.,  
in response to message #3 by Dave Shaffer (Arizona)

If he's going to type in the equation and use the solver, he might as well save it to the Equation Library (right shift EQN [the STO key]). To me, that accomplishes the same thing, to have it stored in memory somewhere in some form to be used over again.

Wait'll he gets to p-chem.

**50g - edit existing equation in EQW**

Message #1 Posted by [Adam Price](#) on 26 Oct 2007, 12:52 a.m.

Suppose I have entered a long, complex equation with equation writer and tried it out with a known case and found that it is functioning as expected. I would like to take another look at the equation from within EQW - since it looks so nice there. How do I reopen it for editing? I know how to edit it as a standard line of text, but that EQW is so enticing!

(50g)

**Re: 50g - edit existing equation in EQW**

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 26 Oct 2007, 1:21 a.m.,  
in response to message #1 by Adam Price

With the equation on stack level 1, just press the CursorDown key to invoke EDITB, which, for an algebraic object, puts it into the equation writer editor.

Regards,  
James

**Re: 50g - edit existing equation in EQW**

Message #3 Posted by [Adam Price](#) on 26 Oct 2007, 10:49 a.m.,  
in response to message #2 by James M. Prange (Michigan)

Well. That is easy enough, I think I can remember it - thank you very much!

**Re: 50g - edit existing equation in EQW**

Message #4 Posted by [James M. Prange \(Michigan\)](#) on 26 Oct 2007, 12:16 p.m.,  
in response to message #3 by Adam Price

PS:

If anyone would rather edit the object in the command line editor, just use LeftShift CursorDown to invoke EDIT.

Personally, I find it easier to edit algebraic objects in the command line editor, although I do like the equation writer for viewing algebraic objects.

Regards,  
James

### Do HP owners use Algebraic entry?

Message #1 Posted by [designnut](#) on 26 Oct 2007, 12:35 a.m.

I ask whether Algebraic entry is useful for HP owners. I also wonder if fractions are useful. Some conversions seem trivial, degrees C to F and cm to inches. Could these be eliminated? Sam

### Re: Do HP owners use Algebraic entry?

Message #2 Posted by [DaveJ](#) on 26 Oct 2007, 1:06 a.m.,  
in response to message #1 by [designnut](#)

Quote:

I ask whether Algebraic entry is useful for HP owners.

It is for me, in fact I prefer it over RPN (I can hear the gasps now...) I like having the choice.

Quote:

I also wonder if fractions are useful.

I only use them when entering a number. e.g. Sometimes I might use a formula that has fractions in it like  $Y=(2/5*X)/\text{SQRT}(2)$  So a fraction key helps occasionally.

But I can't recall ever needing fractions as a result though.

Quote:

Some conversions seem trivial, degrees C to F and cm to inches. Could these be eliminated? Sam

I like conversions, they are handy. But the ones included on most calcs are often useless for me. e.g. I need inches<>mm not inches<>cm

Dave.

Quote:

umm, move the decimal point 1 place?

I expect my calculator to give me \*exactly\* what I want. So I shouldn't have to think about moving the decimal point one place. And it becomes even more ridiculous when you want to perform further operations on the number.

Dave.

That sounds dangerous. Hopefully you could tell if an input error put you off by a power of ten! When we used slide rules, the decimal place was usually kept in one's head. They were good for helping one's understanding of number relations. Students nowadays can get an answer way off and not realize it, thinking "the calculator is always right."

No I don't think the "calculator is always right". What I meant was that I want to use my calculator to give me the result I expect. I do not want it to be off by an order of magnitude and then have to correct it in my head or with extra keystrokes. To me, using an in<>cm conversion when I really want in<>mm is what is dangerous, and it's not elegant, so I won't use it. Instead I'll do it manually. My HP20S has in<>cm and I've never used it even though I do in<>mm conversions on a daily basis.

Dave.

in response to message #1 by designnut

Quote:

I ask whether Algebraic entry is useful for HP owners.

I very seldomly switch my HPs to algebraic mode. In case I want algebraic entry I grab a Casio.

Quote:

I also wonder if fractions are useful.

Very useful for me when checking my kids' homework. But again, I mostly grab a Casio with much more convenient fractions input.

Quote:

Some conversions seem trivial, degrees C to F and cm to inches. Could these be eliminated? Sam

Living and working in Europe, I have no use at all for metric/US conversions. I don't need dedicated keys for units conversions. If it was in some menu to use it at times I would be glad. I could even live without that. Had I really to do some conversions, I would look it up in my "Mythbuster's Thomas J. Glover Pocket Ref" (!, Har Har!!) and easily write a short program and purge it afterwards ;-)

Quote:

I ask whether Algebraic entry is useful for HP owners

I never use algebraic entry. Only RPN.

Quote:

I also wonder if fractions are useful

I often use my 35s set to display in 64ths, or factors of 64 (32, 16, 8, &c).

Quote:

Some conversions seem trivial, degrees C to F and cm to inches. Could these be eliminated?

Absolutely. Every day I'm converting from inch to mm and back, but I don't need a dedicated key for it (and I never use the inch to cm key the 35s has since it's more trouble to try to remember whether to multiply or divide by 10 depending upon which way I'm converting). I have no use whatsoever for the other metric/imperial conversions. I would much rather have had polar/rect or hms+ and hms-, or even just an A &/ B key that would begin executing programs A & B (maybe the shifts for A could execute C & D)

## Re: Do HP owners use Algebraic entry?

Message #11 Posted by [bill platt](#) on 26 Oct 2007, 12:33 p.m.,  
in response to message #1 by [designnut](#)

Once I discovered Algebraic methods on HP, I became a pretty enthusiastic user. Even with the unary minus confusion of the 32sii, I very quickly found that I could use equations for a huge amount of stuff that I used to program in RPN.

Similarly, when opened my eyes to the other models (17bii, 48GX, 27s) I became a strong supporter of the algebraic solvers and algebraic objects.

Back in the early 90s, if only I'd bothered to look at the Algebraic 27s, I might have left RPN behind forever.

And the 48GX (and 49 and 50) is totally cool with the ability to use agebraics and stack-based manipulation together. The holy grail.

(BTW I am the quintessential HP profile customer: 1st in my school with one, used hp exclusively for over two decades, looked only for hp and rpn when I lost my 11c way back when...preferred (and used!) a slide rule rather than a Ti when I had a repair being made!)

Fractions: I was an instant enthusiastic user of fraction input (but not display) on the 32sii. It goes with the

territory (U.S. engineering).

Similarly, I found the unit conversions useful. They save keystrokes which is the whole point. On the 11c, they were printed on the back, which I also think is good.

I use algebraic entry for most calculations. Started on TI, only switched to HP after: a) multiple TI's keyboards and displays went awry, and b) HP started making algebraic Pioneers. I do often switch to RPN for unary functions (that's the way the older TI's and most HP Pioneers work), and units conversions.

I do use fractions a lot. That's one reason I bought the 35s.

I like conversions, but I agree with the sentiment that it seems that the ones provided are not the ones you need. I, too wish that HP would make the units conversions customizeable, and in fact I suggested that to HP recently.

## **Re: Do HP owners use Algebraic entry?**

*Message #13 Posted by [Jim Creybohm](#) on 26 Oct 2007, 4:55 p.m.,  
in response to message #1 by designnut*

Unit conversions are useful, but not in->mm etc., but rather like the 41 or 48's unit conversions. I need stuff like btu/hour -> J/sec.

As for Algebraic, because I have been using a 20s, I have become more familiar with the AOS method. Now that the 35 is back, I am slowly getting more accustomed to thinking in RPN.

Lastly although not related, the 35 is for me, a programmers calculator. It is not yet my engineering programming calculator of choice. I would like to have greater control over textual input before it becomes my "main play".

## **Re: Do HP owners use Algebraic entry?**

*Message #14 Posted by [Garth Wilson](#) on 27 Oct 2007, 1:06 a.m.,  
in response to message #1 by designnut*

My HP-71 has algebraic entry, and even the CALC mode which was supposed to be so great, but I don't like that part of it. The 71 is an outstanding little computer, vastly underestimated and scorned by HP's own marketing department; but for a calculator, I usually reach for my 41cx. I have the tiny programs for converting between mm and inches and between °C and °F assigned to keys. No other conversions. Fractions are just unfinished division problems that I have no use for as calculation results in my circuit design work.

## **Re: Do HP owners use Algebraic entry?**

*Message #15 Posted by **Ed Look** on 27 Oct 2007, 1:38 a.m.,  
in response to message #1 by designmut*

Well, I don't.

I am so used to and prefer using RPN that I really never even touch the HP-20S (an algebraic only machine) my wife got me a long time ago, even if it's beautiful to look at. I continued to use my HP-34C until I couldn't take it anymore (the display began to get rather erratic) and replaced it with the RPN 32SII.

I've never used equation entry, either. I program in any repetitive or lengthier calculation I need with the RPN keystroke programming. I have also a rather nice old Casio, the fx-4200p, now for quite a few years. It too, is very prettily designed, slim, lightweight, with a very nice dot matrix LCD display. But it's algebraic and only has formula memory, not keystroke program memory... and I have very rarely used it.

It's hard for me to imagine how anyone, once smitten by RPN (though I admit when I first encountered it, I resisted it, but was drawn in by the power and quality and solidity of the HP product) can go back and use algebraic entry. (Ask a Met fan if he cares about what's going on with Joe Torre; it's much the same thing, I guess.)

(Ask a Met fan if he cares about what's going on with Joe Torre; it's much the same thing, I guess.)

---

Just like Mets fans and Yankee fans the HP/RPN and TI/AOS/EOS communities are not only different but, more importantly, are each insular and provincial. That isn't just my idea. When Wozniak wrote of finding that the famous (or maybe infamous) Mach number equation was easily solved with one of TI's early scientific machines he reported that "... My colleagues couldn't believe it. I told them that you just copy the formula from left to right but not one of them could see through their postfix fog. ... None of them could do what I had done, forget that they have to be smart." It isn't just the HP/RPN community that is like that. The TI/AOS/EOS community is just as provincial. They "know" that RPN doesn't really stand for Reverse Polish Notation but rather for Really Pathetic Notation. Why would anyone want to evaluate an equation other than by simply entering it as one sees it on paper?

In a sense the RPN vs AOS debate has always been more of a religious issue than a technical issue. The problem with religions is that they can become cult-like and corrupt. A book on that subject *When Religion Becomes Evil* by Charles Kimball lists warning signs of corruption in religion where two of the signs are "Absolute Truth Claims" and "Blind Obedience." Doesn't that sound like the long standing RPN vs AOS debate

## Re: It's a religious issue!

Message #23 Posted by **Valentin Albillo** on 27 Oct 2007, 11:15 a.m.,  
in response to message #20 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer wrote:

*"They "know" that RPN doesn't really stand for Reverse Polish Notation but rather for Really Pathetic Notation."*

I'd say "**R**idiculously **P**rehistoric **N**otation" :-)

*"Why would anyone want to evaluate an equation other than by simply entering it as one sees it on paper? "*

It might be useful if you need to see or check intermediate results, else it makes no sense.

*"The problem with religions is that they can become cult-like and corrupt. A book on that subject *When Religion Becomes Evil* by Charles Kimball lists warning signs of corruption in religion where two of the signs are "Absolute Truth Claims" and "Blind Obedience"."*

Freedom of speech in the United States is protected by the First Amendment to the United States Constitution, assuming you live in the US, but if I were you I would refrain from unnecessarily bringing in *off-topic religious issues* in this forum, even if in good humor or for fun. You can easily offend someone else's sensibilities and in any case experience shows that it has the potential to be a thorny issue. Caveat emptor.

As for me, now I never use RPN in real life. If I'm at some computer, I use Emu71 to perform all kinds of simple and complex numeric computations with utmost speed and ease. If I'm in the field, I use a vintage SHARP handheld which is as small as an HP-15C, provides BASIC programming and algebraic evaluation, and is much faster and convenient.

For playing a little, having a fond remembrance of the good old days, concocting challenges, and writing articles, I resort to RPN frequently. But apart from that, I never use it, and now that the new HP 35s does include convenient, editable, arbitrary-length equations which can be seamlessly embedded in RPN programs making them much shorter and easier to write, and which can be integrated and solved for any variable, I expect to see power users slowly getting accustomed and migrating to a mixed paradigm and ultimately to a modern, essentially algebraic one.

Best regards from V.

With A.O.S. it was possible to see most of the intermediate results. That's not so with E.O.S. But with E.O.S. the user sees the entire equation as it is entered and typically has the playback option.

I apologize if I offended you or anyone else by characterizing the RPN/AOS debate as a religious

issue. But, the facts are that many of the statements of the adherents of each side exhibit many the characteristics of the phenomenon known in the USA as a religious cult.

### **Re: It's a religious issue!**

*Message #25 Posted by **Garth Wilson** on 27 Oct 2007, 1:47 p.m.,  
in response to message #20 by Palmer O. Hanson, Jr.*

Quote:

Why would anyone want to evaluate an equation other than by simply entering it as one sees it on paper?

Because in real life, the equation is seldom on paper first. At each step, I'm thinking about what to do to the numbers next. When I do come up with an equation and write it down, I follow the same procedure, and often end up forming it from the inside out, sometimes meaning I didn't leave myself enough blank paper on the left or the top to "grow" the equation to completion. In my programming, I quit looking for new languages when I met Forth. It was great to finally get rid of the piles of parentheses.

*Edited: 27 Oct 2007, 1:48 p.m.*

*Message #26 Posted by **Ed Look** on 27 Oct 2007, 5:39 p.m.,  
in response to message #20 by Palmer O. Hanson, Jr.*

Okay, okay- I'll admit that I love RPN because of its power in the earlier days of calculators. But it's still a generally very efficient entry method and even programming method in these small, handheld... well, if a PC or a Mac is a microcomputer, I guess calcs are semimicrocomputers (I suspect we won't have nanoscale circuits commercially in the foreseeable future... and little nanoparticles or nanowires don't yet count, as they are still lab toys).

Anyway, for a machine so small, which constrains still to this day its power, for you can't have a monitor sized screen and a Selectric sized keyboard and an external flash hard drive (or you'd have a laptop, and it suddenly is less useful for what we want calcs for- lightness and compactness), and despite the gigantic leaps we have made in the sizes of calculator memories, a way to save keystrokes in programming (or even just "off the [key]board calculating".

Besides, I just LOOOOVE not having to press an "=" key.

And, Palmer, I'm a city boy, but as someone once told me, and I totally agree, sometimes big city boys are the most provincial because of their smugness. This afflicts even or especially the very educated, like HP RPN users.

---

This bonding of humanity has been called "human cement" by an author/speaker. It grows out of the circumstances of Basic Training /Boot Camp. Young men(?) are thrown together, separated from their family/friends support group, they are "torn down" and "built back up" through the intensity of the training. And working together to get through the situation they learn to trust and respect each other as they learn about their own and others weaknesses and strengths. At the completion of BT, the "us/them" paradigm has been replaced by "we".

And because the intensity of USMC Basic is greater than the average sailor/soldier/airman, their bond is stronger throughout life. ("Once a Marine, always a Marine")

Why would anyone want to evaluate an equation other than by simply entering it as one sees it on paper?

My reason is that I most often use a calculator when I am exploring a problem that hasn't been formulated on paper. RPN just seems more efficient to use because you can easily undo steps and recover previous work without re-entering the numbers. I went through a physics education using a Radio Shack-badged TI, and didn't encounter RPN until the working world (HP12C), but once I'd adapted, I never wanted to go back.

## Re: Do HP owners use Algebraic entry?

Message #31 Posted by [Maximilian Hohmann](#) on 27 Oct 2007, 5:21 a.m.,  
in response to message #1 by designnut

Good morning,

Quote:

I ask whether Algebraic entry is useful for HP owners.

For me, it is as useful (or useless, see the thread about economist vs. engineer) as RPN. I owe a lot to AOS because Ti calculators helped me through school and university (HPs were prohibitively expensive then). Probably, I am not a "true RPN" user anyway because I never press keys like Roll-Up Roll-Down or  $x \leftarrow y$  :-) But I wouldn't go so far as to switch an HP calculator to algebraic mode.

Quote:

I also wonder if fractions are useful.

Fractions are completely unheard-of in my part of the world. You learn it a school long before you are allowed to use a calculator, and thereafter you never ever encounter them again. Our metric world is "decimal places only".

Quote:

Some conversions seem trivial, degrees C to F and cm to inches. Could these be eliminated?

As far as I am concerned: Yes, get rid of trivial conversions. I need a lot of conversions in one of my jobs (aviation), but they are much more complicated. User-defineable conversions would be greatly appreciated!

Greetings, Max

## Re: Do HP owners use Algebraic entry?

Message #32 Posted by [DaveJ](#) on 27 Oct 2007, 6:48 a.m.,  
in response to message #31 by Maximilian Hohmann

Quote:

Probably, I am not a "true RPN" user anyway because I never press keys like Roll-Up Roll-Down or  $x \leftrightarrow y$  :-)

I use X-Y excessively on both RPN and algebraic calcs, more so on the algebraic calcs I think. Seems like almost every calculation I do needs the X-Y key. I seem to have little use for ROLL while using RPN though.

Dave.

### Re: Do HP owners use Algebraic entry?

Message #33 Posted by [Arne Halvorsen \(Norway\)](#) on 27 Oct 2007, 10:44 a.m.,  
in response to message #32 by DaveJ

Hehe, I love the  $x \leftrightarrow y$  when in user mode, probably for the wrong reason!: When happen to entered the numbers in wrong sequence when to use operations where operand order matters :-) Thats HP for you, looking out for the not to sober engineer!

### "Roll down" and "roll up"

Message #34 Posted by [Karl Schneider](#) on 27 Oct 2007, 1:59 p.m.,  
in response to message #32 by DaveJ

Hi, Dave --

Quote:

I seem to have little use for ROLL while using RPN though.

One stack-roll function must be provided to give the user convenient and complete stack control and viewing of contents. "Roll down" is more appropriate for that purpose.

VIEW and direct storage/retrieval of stack registers can also fulfill those purposes, but those functions are not available on all models.

"Roll up" is mainly a convenience for programming -- tidier than three roll-downs -- and is useful for checking the stack-t register without the VIEW function. It's noteworthy that the HP-32S doesn't have "roll up" at all; it is not on the keyboard on the HP-41 and HP-42S.

### Re: "Roll down" and "roll up"

Message #35 Posted by [Ed Look](#) on 27 Oct 2007, 5:20 p.m.,  
in response to message #34 by Karl Schneider

Yes I agree, Karl- the rolling functions are rather useful in programming. It helps to save STO and subsequent RCL steps.

### Re: "Roll down" and "roll up"

Message #36 Posted by [Trent Moseley](#) on 27 Oct 2007, 10:50 p.m.,  
in response to message #34 by Karl Schneider

Karl,

I agree on the availability of the "roll up" feature being used mostly in programing. But having it buried on the 42S in a menu was a mistake.

I learned RPN programing on my 25C, three "roll downs" took up a lot of program lines when there were only 49 available.

tm

### Access of HP-42S functions

Message #37 Posted by **Karl Schneider** on 28 Oct 2007, 3:04 p.m.,  
in response to message #36 by Trent Moseley

Hi, Trent --

Quote:

.. having ("roll up") buried on the 42S in a menu was a mistake.

Ah, but "roll up" -- and a number of other useful functions on the HP-42S -- aren't even included within menus. They must be accessed through the function catalog or be spelled out, HP-41 style. Other functions might be accessed repeatedly in succession, making them tedious to execute through their menus. It's helpful to assign these functions to positions in the user's three-level CUSTOM menu.

Other examples: %CH, CLV, VIEW, and the six hyperbolic functions (which do have their own menu on the HP-27S).

Each HP-42S function with its assigned key and menu (if any) is listed in the orange-tabbed Operation Index of the Owner's Manual, pp. 310-335.

-- KS

### Re: "Roll down" and "roll up"

Message #38 Posted by **Vieira, Luiz C. (Brazil)** on 28 Oct 2007, 11:47 p.m.,  
in response to message #36 by Trent Moseley

Quote:

But having it buried (*the "roll up" feature*) on the 42S in a menu was a mistake.

In the HP41 it must be spelled out or assigned to a key, as you may know.

Quote:

(...)three "roll downs" took up a lot of program lines when there were only 49 available.

Also, the HP12C (and the newer versions) does not have it, neither the other financial models with RPN features. Indeed, 'roll-up' has its better usage in programs. Keeping track of Y-register contents demands some practice. T-register contents sometimes can only be known after

some full-stack tracking.

Cheers.

Luiz (Brazil)

## **Re: Do HP owners use Algebraic entry?**

*Message #39 Posted by **Walter B** on 27 Oct 2007, 11:47 a.m.,  
in response to message #1 by designnut*

Algebraic entry: For me, though started with a TI SR50 far ago, RPN formed my way of thinking calculations. For number crunching or even easier stuff, I'm lost with an algebraic calc. Always tend to type postfix and lose the results. Equation mode may be a different story -- I didn't use it so far but expect it to be easy, thus helpful.

Fractions: I don't need them. The decimal equivalents of the most common fractions I know by heart. And everyone knows half a cm are 5mm, and a quarter of a km are 250m.

Conversions: Not needed at all. Easy to program if they should become necessary. See other thread and posts above.

Edited to correct a typo

### AMS Calls for open source mathematical software

Message #1 Posted by [BruceH](#) on 25 Oct 2007, 10:35 a.m.

An [editorial](#) in the current Notices of the American Mathematical Society calls for only open source mathematical software to be used.

Quote:

I think we need a symbolic standard to make computer manipulations easier to document and verify. And with all due respect to the free market, perhaps we should not be dependent on commercial software here. An open source project could, perhaps, find better answers to the obvious problems such as availability, bugs, backward compatibility, platform independence, standard libraries, etc. One can learn from the success of TEX and more specialized software like Macaulay2. I do hope that funding agencies are looking into this.

*Andrei Okounkov, 2006 Fields medalist.*

*Message #10 Posted by [Khanh-Dang Nguyen Thu-Lam](#) on 30 Oct 2007, 7:41 p.m.,  
in response to message #8 by Thomas Chrapkiewicz*

I use both Matlab and Octave (just take care to use a recent version of the 2.9.x

branch), through not as an advanced user. They are very similar, even for graphic commands. The Octave I tested can open two plots simultaneously.

Actually, I even find Octave better, e.g. the sinc command is already available in the default distribution of Octave, whereas you have to rewrite it when using Matlab (to avoid the issue of  $\text{sinc}(x)=\sin(\pi \cdot x)/(\pi \cdot x)$  when  $x=0$ ).

### Retooling a HP 12C

Message #1 Posted by [DaveJ](#) on 24 Oct 2007, 11:07 p.m.

I was just taking a look at some of Eric Smith's internal photos of a 12C: <http://gallery.brouhaha.com/romsucker-voyager>

Looks like it may be pretty easy to do a new PCB for this and turn it back into a 15C, or whatever you like.

How hard and expensive would it be to get new blank keytops molded I wonder...

Anyone considered it?

Dave.

### Re: Retooling a HP 12C

Message #2 Posted by [Hugh Evans](#) on 25 Oct 2007, 12:49 a.m.,  
in response to message #1 by [DaveJ](#)

Easier said than done. For one thing, the heat stakes are designed to be a one-way fastening process. The blank keytops are already there, just strip off the silk-screening and you'll have a fresh canvas.

All around it's a far from cost-effective process. You're investing \$70 for plastic and an LCD that's worth less than 1/10 as much.

### Re: Retooling a HP 12C

Message #3 Posted by [DaveJ](#) on 25 Oct 2007, 1:13 a.m.,  
in response to message #2 by [Hugh Evans](#)

Quote:

Cost effectiveness has nothing to do with a fun DIY project.

Yes, the LCD is limited, but that potentially makes it easier to interface using a new DIY PCB, as opposed to the dot matrix used in the new 35S for example, that looks rather more difficult. Perhaps the LCD could be replaced as well...

Dave.

### **Re: Retooling a HP 12C**

*Message #5 Posted by **Hugh Evans** on 26 Oct 2007, 11:46 a.m.,  
in response to message #3 by DaveJ*

If you're able to reuse the LCD, even low-volume production could be relatively cheap. You should be able to get away with a simple 2-layer PCB, it should only need an inexpensive MCU. As long as the PCB is being changed I think it would be worthwhile to put in some better tactile domes.

### **Re: Retooling a HP 12C**

*Message #6 Posted by **Eric Smith** on 26 Oct 2007, 6:22 p.m.,  
in response to message #5 by Hugh Evans*

Quote:

As long as the PCB is being changed I think it would be worthwhile to put in some better tactile domes.

Do recent 12Cs have worse domes than the earlier ones? Do you have any specific dome vendor or part number in mind?

### **Re: Retooling a HP 12C**

*Message #7 Posted by **Hugh Evans** on 26 Oct 2007, 10:37 p.m.,  
in response to message #6 by Eric Smith*

Actually, I've even found old voyagers that don't feel quite as good as others. The company I chose for OpenRPN is Snaptron. For a double sided PCB domes from their "P" series are ideal (rated to 5M cycles, and can be ordered with gold plating).

### **Re: Retooling a HP 12C**

*Message #8 Posted by **Eric Smith** on 28 Oct 2007, 3:47 p.m.,*

*in response to message #7 by Hugh Evans*

Quote:

---

I've even found old voyagers that don't feel quite as good as others.

---

That's not surprising, if one has had more wear than another. The life of the domes isn't n cycles without no change and then sudden abrupt failure. They degrade (wear) with use.

The question is how much variability was there when the Voyagers were new, and I think the answer is "not much". I used perhaps two dozen Voyagers before 1986, and there were no noticeable differences in key feel at the time.

But is the performance of the domes in a new 12C (not 12c Platinum) significantly different than the original dome performance of a 12C made in the early 1980s? If they have been redesigned using different domes (or no metal domes), they could be noticeably different. I haven't used any new 12Cs in a long time. The 12c Platinum keyboard does not feel quite the same to me as the original Voyagers.

Quote:

---

The company I chose for OpenRPN is Snaptron.

---

Based on experience, or just on the published specifications? Most if not all of the dome vendors offer similar specifications. As it happens, I was considering Snaptron as well, though I haven't yet evaluated their products.

---

### JPC Rom Legacy for the HP-71B

Message #1 Posted by [J-F Garnier](#) on 24 Oct 2007, 3:33 p.m.

Hello HP71 fans,

Finally, here is the JPC Rom Legacy version, aka version F. We will find it on my [JPC Rom page](#).

This version is special in the sense that it was built about 18 years after the last official JPC Rom from PPC Paris (version E, 1989). Version F mainly merges the fixes and improvements of both version X (from Rodger Rosenbaum) and version E, but it doesn't include the editor and the graphic module of version E in order to fit into a 32kb module. Version F also adds a few changes or fixes.

It is based on the source files I collected during the past years to rebuild the original versions X and E. This is the opportunity for me to thank Gene Wright and Andy Delano who made the version X public on the Web, Rodger Rosenbaum who provided me his version X "source" file, and finally Claude Marcoin who provided me the version E binary and suggested a few fixes for version F.

Kind regards.

Jean-Francois

### Summation on HP48G?

Message #1 Posted by [Ren](#) on 24 Oct 2007, 3:03 p.m.

Hello,

In my Software Testing class, the text said that a graph with 5 possible paths and up to 18 iterations(loop) could equal 4.77 Trillion test cases.

Our assignment was to figure out how the author arrived at that figure.

Well, I didn't get it figured out before the deadline... but a couple of classmates said it was a Summation problem.

18 on top of the Sigma, 5<sup>i</sup> right of the Sigma and i = 1 on the bottom of the Sigma.

My HP48G has a Sigma (Green shift TAN) but I haven't figured out how to use it.

Could someone show me how?

Sincerely,

the Klutzy Math Groupie,

Ren

dona nobis pacem

### Re: Summation on HP48G?

Message #2 Posted by [Alex L](#) on 24 Oct 2007, 3:26 p.m.,  
in response to message #1 by Ren

Here are the keystrokes to accomplish this with the equation editor, so it looks just like you'd see in the textbook:

```
EQUATION (Left-shift ENTER)
SIGMA (Right-shift TAN)
I=1
-> (right arrow)
18
->
5 y^x I
ENTER
```

That puts the sum on the stack as an algebraic object, which also shows you how to type it in directly without the equation editor.

To then get the sum, use EVAL.

**Thanks! WAS: Re: Summation on HP48G?**

*Message #3 Posted by [Ren](#) on 24 Oct 2007, 4:00 p.m.,  
in response to message #2 by Alex L*

Yippee!

I was paging through the HP48 pdf and when I saw the references to Equation writer, something in my head said, "it's gotta be easier than that, it's right there on the keyboard".

Thanks again!

---

I'm a design engineer and I do practically zero calculations on a computer!, and the most I ever need to do on a calculator are the usual trig and log functions etc. I have essentially zero need for a fully programmable and/or graphic calculator. The same goes for almost every engineer I know.

This is why I was disappointed in the 35S, it's a calculator for programmers.

Quote:

in response to message #3 by [DaveJ](#)*

I am a Civil Engineer and use my HP calculator's everyday in the course of my work. I also use a computer on a daily basis to perform various design tasks.

What people are failing to mention in regards to calculators is that they are small and portable. Using a calculator (my personal favorite in the HP 48GX, with 1 MB memory card with a vast equation library) to check calculations in the field or on the shop floor, design things on the fly in the case of an emergency (I live in San Diego and with the current fires being able to run a quick hydraulic calculation on a water system has been a godsend!) and not have to carry around trig and log tables is priceless. In addition, not having to wait for the calculator to boot up or worry about the state of the batteries is a major plus.

Computers are better at performing calculations except how do you verify that your output is correct? Pull out the old HP and spot check.

I just think that calculators still have a place in the modern engineering office, especially when you are away from the office. It is time to give the HP a little credit where credit is due.

Any thoughts?

### **Re: Economist vs. Engineer**

*Message #7 Posted by [papaknush](#) on 25 Oct 2007, 2:04 p.m.,  
in response to message #6 by DaveJ*

There is an interesting observation at our office, which is an engineering company specializing in chemical plant design.

Every chemical engineer at our office has an HP48, 49, or 50g on their desk. There are a few TI-\*?'s out there as well, but all programmable. Then, I notice that the other engineering disciplines in our office, which don't get out to plant start-up's and troubleshooting nearly as much as the chemical engineers do (like structural, vessel, mechanical, instrument) which, for the most part, just have a simpler HP calculator on their desk. In the office, sure, I use the computer for most of the design calculations I need to do (though I still use my HP for quick checks and stuff). But when I'm out on a new plant start-up or troubleshooting trip, I lean heavily on my HP50g. I have a lot of the heat capacity correlations I need, steam properties, equipment rating and some specialty programs, etc. that are real convenient for me when I'm out at a plant. Sure, I still have my lap-top with me, but the HP is nice to quickly pull out and check something without having to break out the laptop, boot it up, worry how long before I've got to plug it in somewhere, etc.

Over the years I used the HP34C, 42S, 48G, (all programmable, which I used on the job when I worked in chemical plant operations) and now my HP 50g is a great tool for me personally. If someone else wants a simpler calculator, fine. But it is presumptuous to assume that no engineers use the programmable capability. If you don't see any, you just need to get out more.

I wasn't saying that at all, just observing what I see in my fields of engineering. There is most definitely a market for high end programmable calcs.

This forum is obviously dominated by those who need a programmable calc, so I thought it interesting to share the "other side".

Dave.

### **Re: Economist vs. Engineer**

*Message #9 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 25 Oct 2007, 6:32 p.m.,  
in response to message #8 by DaveJ*

Hi, Dave;

Quote:

---

This forum is obviously dominated by those who need a programmable calc, so I thought it interesting to share the "other side".

---

I'd not say 'need', instead 'wish' or 'want'. I actually program any of the calculators I have in order to exercise my braincells. And yeah, I use the program to compute my own stuff.

This weekend it took me about half an hour to generate two HP35S versions of the

original HP41C program to design small signal amplifiers. It is available with the Electrical Engineering application programs. Having the built-in resources in mind, I reduced the original 170 steps to a 34-step listing (RPN with algebraic expressions) and another with 51 steps (all RPN, to be refined). The reduced number of steps is due to the original having complex subroutines, while the HP35S has the built-in capabilities. I did not count the memory usage in bytes, because the HP41C would be a lot less. On the other hand, if we consider the percentage of use given the available memory...

The HP35S listing is like this: (no step# in this list; the symbol » refers to the symbol generated after [STO] key in EQN mode)

```

LBL H
INPUT H
INPUT R
INPUT F
INPUT O
INPUT S
INPUT L
LBL Z
CF 10
-F ÷ (1+O×L) »A
VIEW A
RCL× L
ENTER
ENTER
ENTER
REGX×R+H»Z
REGY÷(REGX+S)»C
REGZ÷REGY»V
VIEW V
VIEW C
VIEW Z
(H+S)÷(O×H+O×S-F×R)»T
VIEW T

```

If anyone wants the all-RPN version, let me know. I'll refine it to reduce two, three steps (it seems to be possible, though). I just had my brain cells exercised...

Cheers.

Luiz (Brazil)

**Re: The 15CG is DONE.**

*Message #7 Posted by [Paul Guertin](#) on 24 Oct 2007, 7:34 p.m.,  
in response to message #6 by Pal G.*

I like it. Actually, I really like it. With a high-definition, backlit screen similar to today's PDAs, and of course some means of I/O (micro-SD?) this could be a very usable machine. The key placement you chose seems very ergonomic, too -- finger travel is minimal for frequent operations, and the keyboard is optimized for basic calculator functions. It reminds me of the HP 32Sii in that way (still my favorite HP calc).

A few questions/remarks...

1. Is it the same size as a classic Voyager?
2. How do the menus work? It doesn't look like the keys under the screen can be used to select items, so does a menu window appear on the screen with options like "1 -- nCr 2 -- nPr", etc.?

3. It is lacking the alphabetic labels (except for A-F, but I guess those are for hexadecimal entry).

Paul Guertin

**Re: The 15CG is DONE.**

Message #8 Posted by **Walter B** on 25 Oct 2007, 6:35 a.m.,  
in response to message #7 by Paul Guertin

Hi, Paul,

thanks for your kind words. Here are some answers to your questions:

Quote:

1. Is it the same size as a classic Voyager?

Yes, exactly.

Quote:

2. How do the menus work? It doesn't look like the keys under the screen can be used to select items, so does a menu window appear on the screen with options like "1 -- nCr 2 -- nPr", etc.?

You're right. Personally, I like softkeys better (please see HP-15CX), but I could not get softkeys \*and\* a 40G-LCD into a Voyager.

Quote:

3. It is lacking the alphabetic labels (except for A-F, but I guess those are for hexadecimal entry).

You are right again. Alpha labels may be added easily but would increase the clutter on the keyplate, so I chose a menu-based access as in the 42S. Nevertheless, you are free to use ASN for customizing e.g. your alpha keyboard, and you may SAVE the custom keyboard in a status variable for later recalling.

Best regards, Walter

### 35s indirect addressing

Message #1 Posted by [Bill Colisch](#) on 23 Oct 2007, 9:41 p.m.

First, Thank You to all the patient folks that help others on this site.

In the manual (at 14-20 et seq)it talks about indirectly addressing variables & LABELS. I would like to GTO (J)(ie: branch execution to a line number contained in register J). Is this possible?

### No. Best regards from V. [NT]

Message #2 Posted by [Valentin Albillo](#) on 24 Oct 2007, 3:47 a.m.,  
in response to message #1 by Bill Colisch

.

### Re: 35s indirect addressing

Message #3 Posted by [Meenzer](#) on 24 Oct 2007, 4:29 a.m.,  
in response to message #1 by Bill Colisch

To elaborate a bit on this: the German manual of the 35s also says you could do indirect addressing of variables AND labels - but only in the chapter's headline and a corresponding table. The functions that actually can use (I) don't list GTO or XEQ anymore. This was however possible with the 33s - the now wrong parts of that manual must have been copied by HP. What a shame!

### Re: 35s indirect addressing

Message #4 Posted by [Gene Wright](#) on 24 Oct 2007, 7:52 a.m.,  
in response to message #1 by Bill Colisch

No, it is a typo in the manual.

### Re: 35s indirect addressing

Message #7 Posted by [Stefan Vorkoetter](#) on 24 Oct 2007, 11:14 a.m.,  
in response to message #4 by Gene Wright

It's odd that they dropped this feature from the 35s. It could have been really useful, especially if they'd extended it so that the value in I (or J) could be M.NNN, where M is 1..26 (or -1..-26) and NNN is 000 to 999.

Stefan

**Re: 35s indirect addressing**

Message #8 Posted by [Namir](#) on 24 Oct 2007, 12:37 p.m.,  
in response to message #7 by Stefan Vorkoetter

So you are suggesting a syntax like this:

GTO I.J XEQ I.J

So that teh value of register I points to the label and the value of J points to teh step number.

I guess it is doable.

One can have a hybrid syntax such that:

GTO B.(I)

To jum tp line number (I) in label B. And also:

GTO I.(I)

To jump tp label I, line (I).

Namir

**Re: 35s indirect addressing**

Message #9 Posted by [Stefan Vorkoetter](#) on 24 Oct 2007, 2:54 p.m.,  
in response to message #8 by Namir

No, I'm just suggesting that GTO (I) works, like it does on the 33s.

But as an extension (since the 35s has line number addressing), the value in I can have a fractional part, and that fractional part will refer to the line number.

Stefan

I originally bought it to write larger programs than was possible on my 32SII (to facilitate more sub-routines), but haven't gotten around to that yet. However I've really enjoyed using the built-in equation solver, using it for some astronomy formulas.

I'm really glad it has the same RPN programming language as my 32SII. I considered getting the 50g, but it was more expensive, bigger, and I'd have to learn RPL programming. The 35s is perfect for my needs.

**hp 32s keyboard problem**

Message #1 Posted by [siegman](#) on 23 Oct 2007, 6:41 p.m.

Batteries ran low on my hp 32S (or seemed to, anyway). Took batteries out, left the calculator without power for 2 weeks until new ones arrived. After battery replacement, rightmost column of keys (+, -, X, etc) now seem to be nonfunctional; rest of keys seem to work OK. Self-tests seem to run OK, except I can't step the step-by-step test forward using any of the keys in the right column.

Any hope here?

Email cc of any replies to "siegman at stanford.edu" appreciated.

**Re: hp 32s keyboard problem**

Message #2 Posted by [Namir](#) on 23 Oct 2007, 8:12 p.m.,  
in response to message #1 by siegman

The kind of failure you describe is very common with the HP-32s. Two out of the first three HP-32s that I bought had that problem. The failure does not seem to have much with changing batteries IMHO. I don't know if Randy (at FixThatCalc.com) can help and fix it. You can go that site and write him.

Namir

**Re: hp 32s keyboard problem**

Message #3 Posted by [Paul Brogger](#) on 24 Oct 2007, 10:34 a.m.,  
in response to message #1 by siegman

This is a common problem with aging Pioneer machines. There is a rubbery strip inside, just below the display, that applies pressure to keep the mylar keyboard edge connector in contact with pads on the circuit board. As that strip ages, it shrinks, and no longer provides enough pressure.

The simple test is to carefully but firmly pinch the calculator front-to-back, just beneath the display, and roughly above the affected key column. You should notice restored function while applying this "pinch pressure". (It may even temporarily fix the problem, though it will return.)

The fix is to take apart the calculator, detach the PCB, pull out the rubber strip, and bolster it from behind with something to make it "thicker" -- I've use a rolled-up strip of cellophane tape, of all things. (That is, a strip of Scotch tape, as long as the rubber strip, and rolled tightly around itself along its long axis, creating a roughly toothpick-sized tube of tape.) Whatever you use, put it in the rubbery strip's slot (molded into the front half of the case (again, just below the display), beneath the rubber strip itself. Upon proper reassembly, the thing should work fine.

The whole process is non-trivial, but very doable. It's documented in some articles in the Articles Forum. (Look for "Pioneer Internals" or whatever -- I don't remember now.) Read whatever you can find, and ask advice before proceeding.

Or, as suggested above, keep it simple and let the expert handle it. (Randy at fixthatcalc.com, I think.)

Good luck!

### 9866 printer troubleshooting help...

Message #1 Posted by [Keith Lueck](#) on 23 Oct 2007, 3:41 p.m.

I am working on a 9866a that's paired with my 9810a.

The printer accepts data and acknowledges it, but, no print action. Motor drive & power supplies are fine, manual feed works, all the status lines (e.g. paper out) are valid...

The little state machine that controls the thing seems to be running and getting data strobes, but, it's waiting on something else - I can't figure out what...

Does anyone have any documentation on the state machine, or detailed info. on its operation? I have the hp service manual and Tony Duell's schematics, but, I'm still banging my head on this one.

Also searched for a patent on the 9866, but had no luck...

BTW, I've created a card extender for this unit which will also work for the 9810a (and prollly the 20 & 30 as well). If you'd like artwork for the pc board and p/n's for the connectors (you'll need 2 for the calculator) I'll email them for free...

### Re: 9866 printer troubleshooting help...

Message #2 Posted by [Keith Lueck](#) on 24 Oct 2007, 10:19 a.m.,  
in response to message #1 by [Keith Lueck](#)

Well, I figured it out. Answering myself here in hopes that it'll help someone else... I've been chasing my tail over this one for a week! There's absolutely nothing wrong w/ the printer.

The printer was looking for a LF character. I thought this would be provided by the PRINT/SPACE key, but it is not. There is a gate that decodes the LF character and that signal was never being asserted. I momentarily shorted it (it's active low - s/b /LF on the schematic) to ground and got a print output. Reading further I discovered how to explicitly generate a LF on the calculator, and once I added that to my test code - voilla!

The examples in the printer interface manual are for a typewriter - not the 9866a. Apparently the typewriter produces output w/o needing a discrete LF. Not so for the thermal line printer.

### Re: 9866 printer troubleshooting help...

Message #3 Posted by [Tony Duell](#) on 24 Oct 2007, 1:17 p.m.,  
in response to message #2 by [Keith Lueck](#)

Quote:

---

If it's any consolation I was going to ask 2 questions :

- 1) Did it ever work? My point was to ensure you were sending LFs, etc
- 2) Check the Linefeed-detect circuitry. There's a NAND gate to detect Linefeeds on the data path PCB, the output goes low when an LF is sent. This is actually an input to the state machine on the control board of course. If you weren't seeing LFs detected here, I would have suggested you checked you were sending them and then debugged the 9810's interface.

Yes, I realised (too late) I left the inverting bar (consistently) off the LF signal on all pages of the schematic!

Quote:

---

The examples in the printer interface manual are for a typewriter - not the 9866a. Apparently the typewriter produces output w/o needing a discrete LF. Not so for the thermal line printer.

---

It is of course a true line printer. It buffers a line of text in the shift registers on the data path PCB (only 6 bits are stored in the upper-case only 9866A) and then when it prints a line of text it converts those characters into the dot pattern for the top dot-line of that row, stores that in shift registers on the printhead driver board, prints it, moves the paper up, then goes on to the next dot-line, etc. Actually, it's even more complicated than that, since each dot-line is printed in 4 (I think) interleaved sections.

### **Re: 9866 printer troubleshooting help...**

*Message #4 Posted by **Keith Lueck** on 24 Oct 2007, 2:16 p.m.,  
in response to message #3 by Tony Duell*

Hey Tony - thanks for the help. It would've been impossible to work on w/o your schematics - I only mentioned the LF signal thing in case someone else was confused by it.

Yeah, I realized that either the 7430 LF detect gate was bad, or, it wasn't getting any LF characters - it turned out to be the latter... I'd also assumed that the printer would automatically print when its line buffer was full, but that's apparently not true either.

Basically, it was my own bone-headed misunderstanding of the equipment. Oh well, it was worth hours of entertainment (and heating my house w/ my Tek 547 o-scope...<g>).

All I need to do now is clean it up a bit and make some other cosmetic repairs...

Do you happen to know if the 9866 can be used to list programs from the calculator's memory? - my 2nd 9810a has no internal printer option....

Quote:

What's the HPCC?? Did I miss a conference between catching airplanes?

Hi Namir,

I think we have a slight misnomer here. The U.S. conferences have been nicknamed "HHC200x" and the British every-5-year conferences in London (including the one which happened eleven days ago) were nicknamed "HPCC 200x". So this year, we had HHC2007 in San Diego in September and HPCC 2007 at the Imperial College in London in October. I was the only attendee from the U.S. and enjoyed the two-day event thoroughly. There were just shy of 30 attendees and we were treated to some great hospitality and presentations, as usual. (It was my 4th time to an HPCC conference, going back to the 1992 Tenth-Anniversary bash...) I did videotape the entire event and will edit those tapes as soon as I'm done with the San Diego one (which is underway). (By the way, I wonder if the HP facility at Rancho Bernardo is

affected by the fires...?)

### [OT] San Diego Fires

Message #1 Posted by [Seth Morabito](#) on 23 Oct 2007, 12:58 a.m.

Hello everyone,

As some of you no doubt have already read, there are widespread major wildfires throughout Southern California today. I've just discovered [from this interactive Google map of the San Diego fires](#) that the area immediately surrounding and including the HP campus where HHC 2007 was held is under evacuation notice today, and that there is a great danger that the fire will spread through the Rancho Bernardo area.

I am deeply saddened, it was a very beautiful area when we gathered there last month for HHC. I wish everyone there well, and I hope for the best. I'm also concerned for the friends and family of the local HP people we met. Please take good care!

-Seth, concerned

### Re: [OT] San Diego Fires

Message #2 Posted by [Karl Schneider](#) on 23 Oct 2007, 1:20 a.m.,  
in response to message #1 by Seth Morabito

Seth --

Yes, I too had noticed on CNN.com that the evacuation area included Rancho Bernardo and the hilly parts of northern San Diego. I hope that the campus and its workers come through unscathed, but no doubt, those who live in vulnerable areas will suffer some damage, if not worse...

-- KS

### Re: [OT] San Diego Fires

Message #3 Posted by [John Noble](#) on 23 Oct 2007, 2:09 a.m.,  
in response to message #1 by Seth Morabito

*Writing from smoky Sandy Eggo...*

The fire already went through Rancho Bernardo as far as I know. These fires are fed by dry brush and dead/dying trees. Structures burn when either or both are too near, though there are cases when embers get blown under roof tiles, etc., and start a house on fire.

Since the industrial parks around here don't have too much vegetation (and what they do have is watered) and are mostly built of concrete with steel roofs, I doubt they will have too much trouble. I could be wrong, but it's usually the houses that get hit around here.

That map is better than what the local newspaper posted, by the way. Every time something like this happens around, the local media completely fail to put the pieces together.

**Re: [OT] San Diego Fires**

*Message #4 Posted by **Bruce Bergman** on 23 Oct 2007, 2:29 p.m.,  
in response to message #3 by John Noble*

Agreed. The HP campus is in a pretty safe area. Put it this way, if HP's facility burned down, everything around it will be gone too.

The greater issue is all the HP employees who might be affected by this. I believe Sam Kim lives out here.

We live in Rancho Penasquitos, the next community south of RB, and we've evacuated to Qualcomm Stadium (with our travel trailer), so we're safe. And our house is still safe too, for now. Hopefully the fire will die down and the Santa Ana will die down too.

Among all the things we took with us is all my HP calcs. ;-)

Everyone in San Diego, stay safe!

thanks, bruce

Hi Bruce,

Sam's permanent residence is in Vancouver, WA and he "commutes" to San Diego for two weeks per month (if I remember correctly). Perhaps he has a temporary residence which might be affected, though.

Jake Schwartz

### Voyager series odds and ends

Message #1 Posted by [DanE](#) on 22 Oct 2007, 6:07 p.m.

Hello everyone, this is my first post here although I've been visiting the museum regularly for several years. I have a couple of observations and questions about the Voyager series of HP calcs, e.g. the 11C, 15C, 16C and 10C.

I own an old beat up HP-11C that has survived more than 20 years on 2 sets of batteries. It's been through the mill and even got run over once in the driveway (in deep snow) but it keeps on ticking. Recently the ON key started to act funny. All of a sudden it has to be pressed really hard to turn the calc on or off. Very strange that it started happening all at once. I checked around the net (and here) to see what it would take to fix the key for whatever problem it has. I decided against doing a self-repair job, and opted instead to buy a new one.

I did that on ye olde auction site this past summer. The calc I bought is nice and clean and works well, but I noticed a few differences between it and my own. For one, the battery compartment has a coil spring in it instead of 2 flat spring tabs. The second is the VDE logo (f in a circle) on the back near the battery compartment. The third is the color of the printing used on the front of the calculator.

Research here at the museum revealed that HP went to the coiled spring battery contact in later production runs of the 11C. Is that true for the entire Voyager series? Lately I've been seeing more and more on ye olde auction site with the f-in-a-circle logo on the back, and not just 11Cs. Does that logo automatically imply a coiled spring battery contact? Other reading has given me the impression that the coiled spring is less reliable than the flat spring contacts, and is prone to breaking off. Is that true?

As for the color of the printing on the front, the f-shift function labels are more orange than yellow, like on my old 11C. It's a darker shade and IMO more difficult to see, although it may just be a case of getting used to it.

Do those 3 things - battery contact spring, VDE logo, and face printing color - all go together? If I find a calculator with one of the 3 things (say on the auction site) is it reasonable to assume all 3 are present?

My other question involves the keys on my original 11C. Is it possible to get to the key contact sheet (for cleaning) without breaking any of the heat strakes? I still like my old calc better, missing logo, missing rubber feet, dented bezel and all, and if it's possible I want to try to fix the wonky ON key.

(Speaking of ye olde auction site, has anyone figured if the ripoff-artist not to be named uses a different ID for buying than he does for selling? I see him selling a lot more than buying.)

### Re: Voyager series odds and ends

Message #2 Posted by [Karl Schneider](#) on 23 Oct 2007, 12:31 a.m.,  
in response to message #1 by [DanE](#)

Welcome, Dan --

A lotta questions, there!

I have six USA-made Voyagers from the 1980's and two non-USA Voyagers from the 1990's:

1983 (HP-15C, HP-10C)  
1985 (HP-11C S/N 2508Axxxxx, HP-16C 2538Axxxxx, HP-15C 2543Axxxxx)  
1986 (HP-11C)  
1990 (HP-12C, Brazil)  
1994 (HP-12C, Singapore)

The 1985 HP-15C and 1986 HP-11C have the VDE logo "871B". I've also seen HP-15C's from 1988-89 with a similar logo. My two 1983 and other two 1985 models do not have it.

All my 1985 and later models have the spring battery contacts. I would believe that they are more robust.

My 1983 models have yellow legends that seem to have faded to tan. The later models have legends that are still bright yellow.

Some cost-cutting measures were taken in 1986 that persisted in later models -- chromoplastic logos that wear and shear off (they probably didn't bond to the metal case as well as the earlier chrome metal logos), and some simplification of the electronics.

-- KS

### Re: Voyager series odds and ends

Message #3 Posted by **DanE** on 23 Oct 2007, 2:56 a.m.,  
in response to message #2 by Karl Schneider

Thanks, Karl. My original 11C is S/N 2213Axxxxx so I guess it was made in the 13th week of 1982. I think the logo was lost in the driveway incident. The bezel got a few dents and scratches in it that day, but luckily the LCD display itself was not damaged and has always worked flawlessly. Maybe it's just because I'm so used to it, but I found the coil spring battery compartment harder to get the batteries in and out of. Not that they need replacing very often. I don't have the "new" one with me at the moment so I can't check the S/N, but it most definitely has the double-shot molded keys which I read about here. They're re-used from a 12C just like the collector's page says. I'm not a serious collector by any means but I always wanted a 15C and a 16C so maybe I'll test those waters. I actually do a fair amount of hexadecimal arithmetic now and then so it would be more than a novelty. The PC hex calculators I have tried are all a little wonky. Too bad the new 35S has its own wonky hex number problems. At any rate, if I decide to take the plunge on a 15C and/or a 16C I want to avoid the later manufacturing runs if at all possible, so that's the real reason behind my asking.

### Re: Voyager series odds and ends

Message #4 Posted by **Jeff O.** on 23 Oct 2007, 1:55 p.m.,  
in response to message #1 by DanE

Quote:

\_\_\_\_\_

Is it possible to get to the key contact sheet (for cleaning) without breaking any of the heat stakes?

\_\_\_\_\_

That contact sheet is sandwiched between a circuit board on one side and the front of the calculator on the other, and that sandwich is held together by the heat stakes, so, no. To disassemble, you would not actually break the heat stakes. You would trim the "mushroomed" portion away, leaving the shaft of the stake protruding through the circuit board. Some have reported that the calculator can then be re-assembled by either melting over the remaining portion of the stakes, or putting some sort of cement around each stake, all while somehow clamping the whole assembly together. (The name that comes to mind is "RC 2000 tire cement" or similar that is some sort of rubberized superglue used for radio controlled car tires, sold in hobby shops, if I recall correctly.)

[This message](#) provides advice for cleaning individual keys on a 41C, don't know if it applies to the voyagers.

**Re: Voyager series odds and ends**

Message #5 Posted by **DanE** on 23 Oct 2007, 6:12 p.m.,  
in response to message #4 by Jeff O.

I think it was that description that dissuaded me from doing it in the first place. I took the back off, looked around, saw that description, and put the cover back on. The button looks and feels the same way it always did. There's no odd sound or anything else when pressed. I can't imagine what could have gotten in there to cause the problem.

**Re: Voyager series odds and ends**

Message #6 Posted by **Randy** on 23 Oct 2007, 7:56 p.m.,  
in response to message #5 by DanE

Quote:

\_\_\_\_\_

I can't imagine what could have gotten in there to cause the problem.

\_\_\_\_\_

To quote an old Ronny Graham commercial: It's dirty, dirt, dirt... and it's your car I want to hurt.

In this case it happens to be your calculator :^(

Voyager keyboards are very easy to clean from the back. No cutting anything apart, no damage of any kind.

**Re: Voyager series odds and ends**

Message #7 Posted by **DanE** on 24 Oct 2007, 12:25 a.m.,  
in response to message #6 by Randy

That sounds very encouraging. Would you care to elaborate a bit? Are there holes or something that allow access to the contact pads?

### Power consumption versus contrast?

Message #1 Posted by [Dave Shaffer \(Arizona\)](#) on 22 Oct 2007, 6:02 p.m.

I was playing with the 10BII that I got as a door prize at HHC2007, and cranked up the contrast of the display to make it more readable on the airplane. i.e. the displayed numbers seemed much darker with respect to the background.

Then, I wondered if I had changed, for the better or worse, the power being used from the battery.

Does anybody know if or how the contrast affects power use by the display? I am under the impression that LCD characters are basically a static response to an electric field, so I'd guess that there is not much affect on power consumption. But, how do they actually change the contrast - a +/- voltage effect, or a phase effect (due to voltage?) in (one of) the polarizer(s)??

### Re: Power consumption versus contrast?

Message #2 Posted by [Randy](#) on 23 Oct 2007, 8:57 a.m.,  
in response to message #1 by [Dave Shaffer \(Arizona\)](#)

Quote:

Does anybody know if or how the contrast affects power use by the display?

For all practical purposes, there is no difference in power consumption at various contrast settings.

Quote:

But, how do they actually change the contrast - a +/- voltage effect, or a phase effect (due to voltage?) in (one of) the polarizer(s)??

The displays are multiplexed so the voltage applied to the elements is pulsed. Varying the pulse width changes the RMS voltage level which in turn affects the contrast. Not all LCD's are the same but this is the general method used in most HP's that I have seen (passive-matrix addressed).

[Wikipedia LCD article](#)

*Message #4 Posted by [Garth Wilson](#) on 23 Oct 2007, 1:43 p.m.,  
in response to message #1 by Dave Shaffer (Arizona)*

The off-the-shelf LCDs I've worked with have a backplane voltage pin that takes an extremely small current. Although it's called "contrast," what it's really adjusting is the viewing angle that gives the best contrast.

### New Datafile article online (and Erratum)

Message #1 Posted by [Valentin Albillo](#) on 22 Oct 2007, 6:26 a.m.

Hi, all:

I have made freely available online a new Datafile article of mine, which can be downloaded in PDF format from [my calculator web site](#), namely:

#### *HP 35s Storing Lotsa Lotsa Numbers*

Datafile V26N4 included a 77-line routine by Gene Wright demonstrating how to pack three full-precision real numbers into a single HP35s variable thus making it possible to store and recall in excess of 2300 floating point values in HP 35s' indirect variables.

This 4-page article discusses my new, completely different, 16-line implementation consisting of three main, externally callable routines which implement the essential Initialization, Store, and Recall functionalities.

#### **Erratum:**

This article was recently published in the current Datafile issue, V26N5, but most regrettably the printed version *contains a show-stopper error in the listing*, which of course wasn't present in the original Word document I submitted.

I discovered the error as part of my protocol of proofreading and checking my articles in the actual, paper-printed issue, as soon as I received it (two days ago). I also do the same with the actual Word document I submit for publication, which I first print and then proofread, including keying in the programs from the printed listing and trying out every example. This *guarantees* that the programs and examples will be keyable and will run as printed.

Unfortunately, while the Word document I submitted was indeed *error-free*, the article as it appears in Datafile is *not* and will result in a **SYNTAX ERROR** when you try to run it, so I've uploaded the correct, original article to my web site to try and help remedy the situation.

Please download the correct, original article from my web site and though it's none of my fault I nevertheless wish to apologize for any inconvenience, which I deeply regret.

Best regards from V.

**HP 35s question**

Message #1 Posted by [Bill Colisch](#) on 21 Oct 2007, 11:26 p.m.

Is it possible to recall from the stack (RCL stack T, Z, Y)?

Thanks for your help.

Bill :-)

**Re: HP 35s question**

Message #2 Posted by [Meenzer](#) on 22 Oct 2007, 12:03 a.m.,  
in response to message #1 by Bill Colisch

While programming (ALG, RPN), just use the "R down" key and you'll be presented with a choice for X, Y, Z and T. Use left and right arrows and ENTER to choose. In RPN calculator mode you only have "R down". In ALG you'll see the X,Y,Z and T choice after pressing "R down".

*Edited: 22 Oct 2007, 5:09 a.m.*

**Re: HP 35s question**

Message #3 Posted by [Stefan Vorkoetter](#) on 22 Oct 2007, 9:25 a.m.,  
in response to message #2 by Meenzer

If I remember correctly (my 35s isn't in front of me at the moment), in RPN mode, press any key that brings up a menu (e.g. Flags) and then press RollDown, and you'll get a menu of stack registers. Pressing one recalls that register (or inserts a REG\_ instruction if you're in PRGM mode).

Stefan

**Re: HP 35s question**

Message #4 Posted by [Miguel Toro](#) on 22 Oct 2007, 9:49 a.m.,  
in response to message #3 by Stefan Vorkoetter

In RPN, if you are in PRGM mode this method allows to review the stack content and insert a REG\_ instruction without needing to press the EQN key. In RUN mode, it only allows to review the content of the stack, not to recall the values, unfortunately.

Look at this [link](#) for more details.

Regards,

Miguel

**Re: HP 35s question**

### An Alternative 45s Concept

Message #1 Posted by [Jeff O.](#) on 21 Oct 2007, 10:09 p.m.

Like many others, I found Gene and Jake's vision for a 45s to be exceptional. However, as I understand, it was based on fitting everything inside a pioneer-sized case. As such, it would require HP to basically start from scratch at this point, since the pioneer series is long gone from the perspective of current manufacturing capability. I believe they began their effort prior to the 35s being released, so basing their design on a pioneer made perfect sense, as there was no current model worth using as a basis prior to the 35s. The 35s does a lot of things right, so Gene and Jake's effort inspired me to see what might be possible using the 35s as a starting point. Borrowing heavily from their design, and also from the 35s and of course the 42s, my vision for a 45s would look a lot like this:

The above fits in the 35s case. Originally, like G&J, I proposed using the current 48gii display. However, due to concerns expressed in subsequent messages regarding LCD size and lack of a label and logo, I changed the display to a 48 x 131 array. This is basically an expanded version of the 45s display that would allow the soft menus plus X, Y, Z, T and Last X to always be displayed. (I think the screen could look better than the above depiction in an actual implementation, but that's the best I could create.)

Most functions and labels are self-explanatory. I would propose that I/O be only by SD, or even better, micro-SD card. I would not propose the use of IR, so I dispensed with the PRINT menu. I replaced it with an OUTPUT menu, which would basically provide all of the functions of the PRINT menu, but would output to files on the SD card. The FILER menu would take care of uploading and downloading programs onto the card. The  $\rightarrow P$  function would have two functions: 1) with real numbers in the X and Y registers representing real and imaginary parts of a complex number, it would transform them into magnitude and angle, still in the X and Y registers; 2) with a complex number in the X register, it would break it into the

magnitude and angle of the polar representation, placing those values in the X and Y registers. The ->R function would perform similarly. R->C would take real and imaginary components in the X and Y registers and form a complex number in X register. P->C would take magnitude and angle in the X and Y and convert them to a complex number.

With the original large display, the only thing I couldn't fit on the keyboard was an "HP 45s" label or the HP logo. The new smaller display allows for these.

To me, the above looks like something HP could produce, if they wanted to. I have no idea if they do, but they are free to use any and all concepts I have presented :-)

Pal G., I'd love to see this one rendered in 3D.

Jeff

edited to present a new design with a smaller LCD screen size to address concerns raised by Gene and Eric below.

### Re: An Alternative 45s Concept

Message #5 Posted by **Gene Wright** on 22 Oct 2007, 3:09 p.m.,  
in response to message #4 by Jeff O.

Of course, this has the problem that it doesn't say HP anywhere on it. :-)

I doubt HP would sell it unless it conforms to HP corporate guidelines...which I imagine are presently reflected in the 35s in terms of logo, size of company name on the product, etc.

### Re: An Alternative 45s Concept

Message #6 Posted by **Jeff O.** on 22 Oct 2007, 9:11 p.m.,  
in response to message #5 by Gene Wright

Gene,

Seems like we ought to be able to fit the name and logo on there somewhere. I'm thinking the flat surface on the bottom edge of the calculator, ala the original classics.

If that wouldn't fit the guidelines, if we abandon the concept of using the 48gii display, I'm sure that a new display could be designed that could display enough information, plus leave room above for a name and logo, along the lines of Walter's design three messages up. Given my 'druthers, I'd like to see a display that would enable the soft-key labels to be "up" all of the time, plus lines for the X, Y, Z, T and Last X registers. I could do without the top line I depicted showing time and date. If necessary, perhaps one line of the display could be eliminated, possibly by going to the 42S display style in which the soft menus are not always active, and when active, one line of the display is lost.

Another less desirable option would be to lose the top row of keys. That would provide the same number of keys as the original 42S. I actually started down that path, but, when I added a second shift key and left-right cursor control keys, I started running out of keys pretty fast. So I checked to see if the 48gii display would fit in the available real estate above the 35s keyboard, and found that there is barely enough room - if the model name and logo can be eliminated from that area.

Let's not give up for want of a logo!

To address Gene's concerns, I edited my original post to present a new design with a smaller display that provides sufficient room for a label and logo.

Jeff

But the 35s is too large.

### Re: An Alternative 45s Concept

Message #12 Posted by **Jeff O.** on 22 Oct 2007, 9:16 p.m.,  
in response to message #11 by sjthomas

Yes, smaller would be better. But if using the 35s as a base would allow a 45s to be produced, I could live with the size.

### LCD display limitations

Message #13 Posted by **Eric Smith** on 22 Oct 2007, 9:00 p.m.,  
in response to message #1 by Jeff O.

I hate to rain on anyone's parade, but none of these new designs that have active LCD area (pixels and/or annunciators) extending to very near the edge of the case are likely to be practical for manufacture (or even prototyping), for two reasons:

1. The physical LCD display has margins that extend beyond the pixels and annunciators by a non-trivial amount. I don't know specifically about the 48/49/50 series LCDs that everyone seems to want, but a typical LCD has 8mm or more of border on each side.
2. If the LCD extends nearly to the edge of the case, it is more likely to be damaged by rough handling of the calculator.

### Re: LCD display limitations

Message #14 Posted by **Jeff O.** on 22 Oct 2007, 9:35 p.m.,  
in response to message #13 by Eric Smith

Eric,

Feel free to inject practicality (or rain on our parade, if you prefer.) It's not like I figured Sam and Cyrille would see my design and decide to have it produced exactly as presented. Mostly just having fun and maybe hoping to provide a nudge to HP in a certain direction. Judging by the positive aspects of the 35s compared to the opinions voiced in this forum and directly to HP at the HH Conferences after the 33s was released, I have to think such nudges can help.

In any case, I have now edited my original post to present a new design with a smaller display size to hopefully address your concerns.

Jeff

### Re: LCD display limitations

Message #15 Posted by **Walter B** on 23 Oct 2007, 1:45 a.m.,  
in response to message #13 by Eric Smith

Lying before me is a Nokia E50 featuring a brilliant dot matrix LCD. While there is major space above this display, there are a mere 5mm at the other sides till the top edge of keys or the outside of the housing.

In my draft presented above you get 8mm left, right, and below of the LCD, 14mm above of it. Without knowing your 8mm claim, Eric, it was met quite well :)

And, most important ;) , you find sufficient space above of the display to show the model name and the HP logo.

Best regards,

Walter

P.S.: My 2 Voyager-based drafts [shown in this other thread](#) feature 6mm space above and below, 8mm left and right of the LCD.

Edited to add the post scriptum.

That's for a very typical off-the-shelf LCD, but it's easy to get one speced at a lot less than that.

My Nokia 6300 phone for example has only 6mm on either side from the visible area to the outside case. No idea how thick the case is. I've seen other displays with only several mm clearance on the sides.

The LCD on my calculator watch has only 4mm on the sides, but granted it's not a full X-Y dot matrix.

So it's certainly possible to do what has been proposed.

BTW, has anyone actually opened a 48/50 to see what screen is used?

Quote:

- If the LCD extends nearly to the edge of the case, it is more likely to be damaged by rough handling of the calculator.

That's what the case is for. Design it right and it's not a problem.

Dave.

No, that's exactly why the cell phone companies offer NO WARRANTY for the display, even if it fails due to their poor design. When the display extends to within a few mm of the edge of the case, it's not possible to design in any reasonable shock protection.

Given how many people on c.s.hp48 bitch about having broken their 48 display, I expect having very narrow margins would be a disaster.

But I'd be delighted to be proven wrong.

---

Be careful using words like "not possible" and "disaster".

You only ever hear from the people who bitch about something, so the argument always gets one-sided. You don't hear from the millions of people who don't have any problems.

I just opened one of the new 6th generation iPods the other day, and it's amazing what shock protection you can build in for the hard drive and screen into such a slim package.

I've designed (and environmentally tested) delicate and tight margin stuff like this before for very harsh environments, and it certainly is possible.

All of my mobile phones with margins much less than 8mm have survived pretty horrendous abuse - dropped onto concrete, thrown down cliffs and waterfalls in the pursuit of adventure, you name it.

None of my calculators get anywhere near the level of abuse consumer items like phones and iPods get. I'm happy with slightly less protection if it means the difference between having a cool product or not having it.

Dave.

I have not been following this thread closely, but I will add another "parade rain." If you want color, you can kiss your two-year (or even two-month) battery life good-bye. You'll have to be replacing or recharging batteries quite frequently. Color displays always have to put out their own light, so they are always power hogs. IMO, they are not compatible with calculators, and it is only the "cool" factor that puts this unnecessary item on so many calculator wish lists.

I'd be happy with just a nice high contrast multi line monochrome 7 segment display, thanks! I use my calculator for numbers, not pretty pictures.

Some of the low end Casio's/Sharp's et.al have the right idea in the dual 7 segment dot matrix display. Real numbers in high contrast on the bottom line, and more versatile but not as clear dot matrix on the top line.

Dave.

Hello. All the shown concepts are wonderful! I would add these additional features:

A scratchproof anti-reflective display like those from the 48 series. I have cleaned them many times and they show no single scratch. My 35s screen is horrible although I just have wiped it twice.

Flash-ROM! The only way to get a bug free machine.

I'd settle for an 11C reissue running gen-u-wine 11C firmware in emulation on 12CP hardware. No retooling required except for the logo.

I really hate dot matrix displays, which is why my 33S is gathering dust. I also think anything beyond what a 11C can do cries out for a full-fledged computer.

But that's just me.

Neanderthal preferences aside, it's interesting that HP's fanbase consistently comes out with nicer looking designs than HP themselves.

If we're going to ask for or propose a re-issue, let's at least go for the 15C. It does everything the 11C does, plus a whole lot more, without presenting a complex keyboard or user interface. Something like this, maybe:

(The 25th anniversary of the 15C has already passed, so the above is not likely to be produced.)

I'm not so sure a simple display is such a bad thing. I still have the 15C I bought as an undergrad, complete with various scrapes and dings, including a nice dig into the frame just above the display. My daughter, on the other hand, came back after only a few weeks of college with the display of her HP49G+ totally trashed (half blank, half purple, totally dysfunctional). She has no idea when or how it happened.

Along with (possibly) being more robust, the seven segment display on my 15C is larger and clearer than the 49G+, so there's a tradeoff. Granted, it's a little clumsy when trying to manipulate matrices, and it won't allow any graphics, but when do you simply punt and move the job over to a computer?

I agree, simple is better. But in the case of the Voyager series, the 10 digit display is very limiting, especially when displaying exponents. 10 digits plus an exponent is the minimum needed (and expected) in a modern calculator, even \$2 scientifics have that.

I'm all for large 7 segment displays on calculators. And I like a clearly defined and differentiated exponent display. The Voyagers and calcs like the 20S have never made the grade in this respect IMHO. Time to get it right I think.

The 12C gets away with it because it's a financial calc where you don't often deal in exponents.

Dave.

As long as the number is carried with full precision internally, I'd argue that for nearly all purposes 4-5 significant display figures is enough; that's an order of magnitude better than you'll get with a ten inch slide rule. You get seven *unambiguous easy to read* figures plus exponent on a Voyager, which gives you one part in ten million. If for some strange reason you need the whole 10 figure mantissa (to display, say, the distance to Pluto to the nearest few hundred meters), it's just a keystroke or two away.

## **Re: An Alternative 45s Concept**

Message #31 Posted by [Chuck Sommer](#) on 23 Oct 2007, 6:07 p.m.,  
in response to message #1 by Jeff O.

Hi Gang,

This is great stuff and a lot of fun.

But let me say some things that may get me expelled. The current line of HP Scientific RPN calculators are driving me a little crazy.

I started in 1975 as an engineering (EE/CS) student with the HP-45. What a great calculator. The Polar/Rectangular conversion function blasted me through my servo-controls class and AC analysis class. It lasted me until the AC adapter broke at the connector and I did not replace it, I don't even remember when that happened, but I was well out of college at the time. In 1983 I replaced it with an HP-41CV. I did a little programming with it until it broke about 4 years later. At that point I went to the algebraic calculator, Casio I think because they were cheap ... and so was I. When I saw a HP6s calculator at WalMart, I grabbed it up only to be disappointed when I got it home as it was an algebraic calculator. About 2 years ago I saw on 'that other auction site' the HP48G available so I picked one up for about for about \$60.00, and then another. I thought this was great for what I needed. Great button feel, big ENTER key, RPN and it did BASE math, which I could use, and my old HP-45 did not. And I liked the big screen also. I saw the HP49G on 'that other auction site' and picked up 2 of those as well. Picked up the HP33S around that time but did not like it's keyboard layout. About a year ago I picked up the 49G+ about 2 months before the 50G came out, and of course I had to have the 50G also. The screen on the 49G was an improvement over the 48G, and the 49G+/50G screen is the best yet. And now I have the HP35S also. For scientific calculations the layout of the HP35S is similar to the HP48G.

So here is the point: I have become accustom to the layout of the 49G+/50G keyboard, but don't like the size and weight. I am trying to like the 35s, but it now requires too much thinking to do quick calculations on that keyboard, and believe it or not I am now using my 33s for doing calculations when I don't carry my 50G around. The 3 RPN calculators available for scientific work (for this discussion the 48GII is a less expensive version of the 50G) (the 33s, 35s and 50G) all have vastly different keyboard layouts. I don't need a programmable calculator; I have Microsoft Excel, and Python for programming. I need a calculator for doing scientific calculations like the HP45 with the addition of BASE conversion (don't even need logic functions like AND and XOR). The feel of the HP6s keyboard was fine, if only it was RPN I would be happy.

Chuck

### 17bii+ solver workaround

Message #1 Posted by [Don Shepherd](#) on 21 Oct 2007, 5:11 p.m.

The solver in the 17bii+ is different than the solver in the original 17bii. It always solves equations using the iterative solver, never the direct solver. As a result, every equation is evaluated twice (at least). This causes problems if you change the value of an input variable using the L() function. For example, the equation  $A=L(B:B+1)$  returns  $A=1$ , as expected, but if you RCL B you see that it is 2.

For new equations, you can stay out of trouble if you initialize variables and never update an input variable with the L() function. Older equations, that worked on the original 17bii, may not work on the + if they don't abide by these rules.

The Technical Applications Manual for the 27S and 19B contains a solver equation to determine the prime factors of a number. As written, the equation does not work on the 17bii+, because it updates input variable N at the end of the equation. Experimentation with this equation revealed that it finds every other prime factor of a given number. For example, the prime factors of 510510 are 2, 3, 5, 7, 11, 13, 17. On the 17bii+, the equation finds every other factor: 2, 5, 11, and 17. So I needed to find a way to trick the solver into not evaluating the equation on even numbered iterations.

This was the solution I found that worked. At the beginning of the equation, add the following:

```
FACT=0xL(B$$:G(B$$)+1)+IF(MOD(G(B$$):2)=1:
```

at the very end of the equation, add :0)

This essentially only executes the bulk of the equation code during odd iterations, and the correct factors are derived. I used B\$\$ since it is unlikely to be used in other equations, and it is necessary for B\$\$ to be 0 or an even number for this workaround to work.

**uWatch Keypad**

Message #1 Posted by [DaveJ](#) on 21 Oct 2007, 4:14 a.m.

My current watch keypad looks like this: <http://www.alternatezone.com/stuff/KeypadOriginal.jpg>

But after using it for a while I'm doubting my (Voyager/Pioneer/48 style) placement of the operator keys on the left, it was a bit of a gamble on my part I thought. So I've come up with the following new layout:

<http://www.alternatezone.com/stuff/KeypadAlternate.jpg>

Yes, it's more Casio-like.

I could swap the operator keys to the right, as per the Voyager/Pioneer/48, but for some reason I really like having the ENTER/= key in the bottom right and the cancel key in the top right. So I'm kinda fixated on that. The MODE and RCL/STO key also need to stay put.

I'm interested in other people's opinions and what they would do with such a limited layout...

Dave.

Message #2 Posted by [Jonathan Eisch](#) on 21 Oct 2007, 5:30 a.m.,  
in response to message #1 by [DaveJ](#)

I like your original layout **much** better! I'm much more used to the -+\*/ being in a line. With the second layout, my eyes don't know where to look to find the rest, if that describes it.

I'd like having swap and roll near clear and enter. I also like menu near enter, to give my finger a "home base" so to speak.

Is there some reason that you don't like the operators on the left?

-Jonathan

Is there some reason that you don't like the operators on the left?

I've been using it for a few weeks now and somehow it just doesn't feel right. That's probably because all of my calculators (Casio's Pioneer, 48, 28) all have the operators on the right.

But I just know that if I put them in a column on the right, the ENTER/= and CLEAR placement will bug me. Like this one maybe:

<http://www.alternatezone.com/stuff/KeypadAlternate2.jpg>

I don't think ENTER/= can go in top left as it's slightly more difficult to access the top row of buttons due to the lcd, and I've never liked that placement anyway.

I just love having ENTER/= in the bottom right.

Dave.

### Re: uWatch Keypad

Message #4 Posted by [Jonathan Eisch](#) on 21 Oct 2007, 2:50 p.m.,  
in response to message #3 by [DaveJ](#)

Well, at least *someone* has wanted enter in the bottom right, and the operators on the right also; looking at the number pad on my keyboard. Why not do that? Sounds good to me.

So, the right two columns would be:

|   |     |
|---|-----|
| / | *   |
| c | -   |
| e | +   |
|   | ENT |

### Re: uWatch Keypad

Message #5 Posted by [Pavneet Arora](#) on 21 Oct 2007, 10:49 p.m.,  
in response to message #3 by [DaveJ](#)

Personally, I would like the operators and the ENTER key as well as CLS near to each other and both on the left.

I have mocked up the keys in different sans serif typefaces using just OpenOffice Calc and have the PDF available at

[uWatch\\_Keypad\\_Fonts](#)

for review by the forum members. I haven't done anything too fancy with the key for `x <> y', but I have changed the hyphen in your `+/-' to an n-dash. Also, the function keys are set in italics, except for Eras which already is a slanted font. The document is set in 8 point type so should give some fair indication of what the key labels might look like. I would like the uWatch to go out with something other than Arial ;).

For those who may be interested, upon my return from HHC2007, I wrote two articles using the 35s as a starting point, and sent them off to HP:

[Typography of Documentation](#)

## Typography of Keys

I do believe that there is an opportunity here to reconsider and standardize on typeface, nomenclature, as well as user manual layout.

Cheers.

FWIW, my vote goes for standardizing on Stone Humanist ITC Std Semi! For more on Sumner Stone, you can check out:

[www.stonetypefoundry.com](http://www.stonetypefoundry.com)

Hi Dave,

May I suggest to remove F1-F6 from the faceplate? They just clutter it up. And the benefit of having them is low for the kind of people using this watch. Perhaps you change the color of the rectangle around the keys to make them special?

More important, will the keyboard have a 'user' mode?

Regards, Robert

There is no coloured rectangle around the keys. The image shown is from my CAD file, and the rectangle is the actual cutout for the button.

It's true that F1-F6 don't need to be there for normal operation, as the keys physically map to the menu items. But I added them so that it's possible to have long menu names if need, where the menu items won't physically map to the keys below. For example: "F1=Option 1 Text" "F2=Option 2 Text" Could be useful for future software options.

Quote:

More important, will the keyboard have a 'user' mode?

What do you mean by "user" mode?

Dave.

Message #8 Posted by **Robert Graulich** on 21 Oct 2007, 9:26 a.m.,  
in response to message #7 by DaveJ

Quote:

What do you mean by "user" mode?

Well, I thought about HP-41 "user" mode. I agree that there are not many keys to re-map. But you never know. This of course opens the question about "real" programming like a 41. Not just macro recording as shown in the video.

With a "user" mode, there is no need for F1-F6. You could just write "8:Option 2 Text" instead of "F2=Option 2 Text". This saves a character on the small display, too.

Another thought: Instead of "(ROLL" and ")" we could have "( UP" and ") DOWN", where UP and DOWN are arrows. They can represent ROLL UP and ROLL DOWN, if the stack is active. In MENU mode, they could operate like the UP and DOWN arrows on the 42. There would be a lot of use for them.

Robert

Quote:

Well, I thought about HP-41 "user" mode. I agree that there are not many keys to re-map. But you never know. This of course opens the question about "real" programming like a 41. Not just macro recording as shown in the video.

I don't think I'll be adding "real" programming any time soon. Makes the firmware a \*lot\* more complicated, and it's probably not warranted in a calculator watch.

But I fully expect someone will be keen enough to write their own firmware to do just that (and many other things). Other OS's like Free42 or \*Fix could even be ported if there is sufficient hardware capability.

I plan on providing a small "software toolkit" to make this easier. Stuff like the LCD driver, EEPROM read/write routines, key scan routines etc.

Quote:

Another thought: Instead of "(ROLL" and ")" we could have "( UP" and ") DOWN", where UP and DOWN are arrows. They can represent ROLL UP and ROLL DOWN, if the stack is active. In MENU mode, they could operate like the UP and DOWN arrows on the 42. There would be a lot of use for them.

Yes, I was originally going to include up/down arrow key, but didn't see an immediate need for the them so didn't add them. But your idea to combine it with the roll down key is a good one. Doesn't

cost anything, and it might be useful in the future.

Thanks. Dave.

Dave,

may I propose to map F1-F6 to 1-6? Then there will be no need to print any extra labels on the faceplate.

There may be more suggestions for other parts of your keypad but I'll need some more time to think about it. If I understand you correctly, then only the positions of MODE and STO/RCL are fixed.

Regards,

Walter

Sounds reasonable. I assume you'd still like to keep the physical mapping though? e.g. Menu functions "Func1 Func2 Func3" "Func4 Func5 Func6" map to keys "4 5 6" "1 2 3"

Quote:

There may be more suggestions for other parts of your keypad but I'll need some more time to think about it. If I understand you correctly, then only the positions of MODE and STO/RCL are fixed.

Well, technically nothing is fixed, I can map any key to anywhere with only a single line of

firmware. But the MODE button is important because it's the main button which you don't want to accidentally press. So makes sense to leave that.

Dave.

in response to message #13 by Walter B

Quote:

For sake of clarity: my proposal is to map F1 to 1, F2 to 2, etc. until F6 to 6.

In that case the soft menu prompts no longer physically map to the function keys below, which would be very confusing. This is not a good thing as my menus don't have label prompts like "1:1/X 2:X^2 3:SQRT" instead they are simply "1/X X^2 SQRT"

To add labels would mean adding more menus you have to cycle through to get to your desired function.

Dave.

Dave,

just keep it simple. If the menu has no labels, use the keys that are physically arranged below it, which you have labeled F1-F6.

If the menu entries got labels due to some program, the user knows, which key he has to press, because he made the decision.

Robert

Message #16 Posted by **Mike T.** on 22 Oct 2007, 6:05 p.m.,  
in response to message #1 by DaveJ

Which wrist do you wear your watch on?

Yes I know outside of left wrist is 'normal' but long ago I started to wear my watch (when I still had one) on the inside of my right wrist. I know that this is a bit odd but it stopped me smashing the watch against the nearest hard surface - and gave me an excuse if I ever threw coffee over anyone (oops I was just looking at my

watch...)

Intuitively in this position or with the 'watch' in front of me the left hand side seems right for the main operators as per your original layout - however when worn on the left wrist I agree that the operators feel more normal when placed on the right. (I tried the different positions out by holding a voyager against each wrist and operating it my free index finger).

I like some other readers I might also find not having the operator keys to be in a line (column) a little different however keeping them in a line gives obvious problems with the position of the enter key, so for what is is worth I think you have come up with a very good compromise given the limited space available.

Mike T.

I'm an outside left wrist man, anything else feels super freaky.

Even on the outside I have no problem when wearing a watch through say a canyon with lots of hard cliff faces and other objects to bang and scrape against. Never seems to be a problem. Then again, I don't wear a Rolex through a canyon.

I know an inside left man. And he's got a solar powered job and complains that it never gets enough charge. Weirdo! :->

Dave.

1. The keypad needs a  $y^x$  key - or at least a power function in the menu. Is a Shift Key feasible - given the limited amount of keys.

2. I'm used to having the operators to the right, but your original keyboard is like the 41 series. I'd prefer the second only because I am used to having the operators on the right.

The STO/RCL key: how does that work? How many memories does the watch have? Finally, do you plan on putting an "if-then-else" function for comparisons?

### **Re: uWatch Keypad**

---

You must have missed the previous discussions on this. The watch has a "rolling menu key" system to map the other functions onto the keys. No need for a shift key. I just happen to have a video of how this works:

### [Menu Video](#)

Yes, there is a  $Y^X$  function.

Quote:

---

The STO/RCL key: how does that work? How many memories does the watch have?

---

Press once and you get the recall menu which prompts for memory register 0-9, you then press the appropriate number key. So only two key presses to recall any one of the 10 registers.

Press the key twice in a row takes you into the Store menu which works the same as the recall menu. So 3 key presses to store a value into any of the 10 registers.

The watch only has 10 constant memory registers, but that's a purely arbitrary limit, I could give it several thousand if I wanted.

Quote:

---

Finally, do you plan on putting an "if-then-else" function for comparisons?

---

No plan to do that yet.

Dave.

---

I've had this program sitting in my HP15C for a long time now. I've also used close relatives on the HP11C and HP33S. Not as fancy as some of the TVM programs people use, but nice to have ready when trying to talk turkey at a car dealership!

Time Value of Money Calculations for HP-15C

Chris McCormack - 21 Oct 2007

These routine perform loan calculations using the present value annuity factor, or PVAf. This relates the present value (loan amount) to the periodic payments necessary to pay it off.

$$PVAf(r,N) = (1/r)[1-1/(1+r)^N]$$

In this equation, r is the decimal interest per payment period (.01 would represent a monthly loan with a 12% rate) and N in the number of payments (48 would work for a four-year car loan).

Note - Labels 9 and 6 were used because 9 is next to the divide key (breaking the loan down into payments) and 6 is next to the multiply key (building up the total loan amount).

Memory Usage: 21 steps

Register usage: R0 = interest rate per period  
R1 = number of periods

Label Usage: LBL 9 : calculate payment for a given amount borrowed  
LBL 6 : calculate amount borrowed for a given payment  
LBL.9 : (internal) determine PVAf

```

001      LBL 9                // ( LoanAmt -- Payment )
002      GSB .9 /            // divide PV by PVAf
004      RTN

005      LBL 6                // ( Payment -- LoanAmt )
006      GSB .9 *            // multiply payment by PVAf
008      RTN

009      LBL .9              // ( -- PFAV )
010      RCL 0 1 +           // R0 holds interest per period
013      RCL 1 CHS y^x       // R1 holds number of periods
016      1 x<>y -
019      RCL 0 /
021      RTN

```

Sample calculations:

\$5000 borrowed at 10% with 36 monthly payments  
--> \$161.34 / month

\$1500/month on a 30 year mortgage at 7.5%  
 --> \$215,526.44 borrowed

## Re: formula

Message #5 Posted by **Chuck** on 22 Oct 2007, 12:35 a.m.,  
 in response to message #1 by stafford

Here's the one I have memorized. The first part is the compound interest formula; the second is an ordinary annuity formula. Usually you set them equal to each other for annuities, loan payments, sinking funds, etc. Taking the difference gives you the balance on a loan, or set it to 0 for the above calculations.

$$P(1 + r/n)^{nt} - \text{Pmt} \frac{(1 + r/n)^{nt} - 1}{r/n} = \text{bal}$$

P = principal  
 n = compoundings (or payments) per year  
 t = time in years  
 r = annual interest rates  
 pmt = periodic payment  
 bal = balance

This formula resides in most of my HP's.

### General thoughts on buying an hp calculator

Message #1 Posted by [Craig Webster](#) on 20 Oct 2007, 9:10 a.m.

I am an engineer in the oil and gas industry here in the UK. I've noticed that every time I change jobs, I buy a new calculator. When I moved to my present company I bought my first hp, a 33s. While I don't use it to its full potential, it still gives me a lot of satisfaction - especially handing it to those who can't use RPN and waiting 5 minutes while they try to find the equals button.

Anyway, I am on the move again soon and since the batteries have gone on the 33s I am in the market for anew calculator. Initially I was interested in an 11c or 15c, and have been watching them on e-bay. But today on your site I see there is a new 35s, which has the retro look and build quality of the older models. My question is what are your opinions of these three (or any other).

Thanks in anticipation,

Craig.

### PLEASE not another HP35S discussion!!!

Message #2 Posted by [Allen](#) on 20 Oct 2007, 10:38 a.m.,  
in response to message #1 by [Craig Webster](#)

If you are Age 38-44 you will likely prefer the 11c or 15c, but if bidding prices are a concern, buy a 35S. By the time the batteries are dead on that one, HP will likely have released another model.

If you are looking for a model to fit your needs: Consider the 17bii/17bii+ for financial, HP48GX for expandability, 42S for lots or matrix/complex power in a small box (and few/no bugs), 15c for matrix operations in Voyager form-factor. 32S/32Sii for general FAST key presses and +-\* / operations.

The 35s does not exceed any of the above calculators in function or longevity.

There is already 100's of recent pages of HP35s' thoughts, so lets not beat a dead horse on that topic, PLEASE!!!! Read through the archives if you want opinions on that model.

### Re: PLEASE not another HP35S discussion!!!

Pardon the anecdotal picture, but I think the general consensus is that the 35S is a critical turning point. (Nevermind it's merits as a buggy little devil of a calculator!) It represents future promise for an industry, art, and science nearly killed by poor marketing and worse quality.

The recent HP35S release shows that the new management is looking back to the original roots of the Corvallis Division, and breathing new life into a part of their company that for decades helped make "HP" synonymous with quality and dependability.

Message #8 Posted by **Allen** on 21 Oct 2007, 8:57 a.m.,  
in response to message #7 by Walter B

Quote:

not so clear at  $x = 35A$  and  $(48GX+33S)/2$

Sorry, hard to draw strict functions with a Microsoft Mouse (I mouse left handed, while I am right handed. this allows my right hand to control data entry e.g. on the number keypad or pressing keys like ALT+E F this is around 15% faster than using the mouse on the dominant hand.)

Quote:

Assume further the horizontal axis shall be "time". Now what is  $f(t)$ ?  
"Quality" came into my mind first, but which kind of?

Correct... Probably the  $f(t)$  is closer to 'popularity' which is a product of quality and utility.  $P=Q*U$ . :) To that end, There should be a significant DIP for the SPICE series, all of which are poor.

Quote:

Why the steep increase before 35A? Was quality zero before??

The Y-axis crossing should be at 35A.. sorry I was in a hurry.

Quote:

And why is  $f(48GX) > f(42S)$ ?

See my comments on  $P=Q*U$ .. same quality, more utility.

Quote:

What forms the minimum before the 33S?

I assume the minimum since the 33S is not the bottom so they had to have built up to it.. Really it should be undefined for that time period, but since there are no data points, we must infer.

It is part joking, but I like Craig's idea about exploring it further. :)

**Re: PLEASE not another HP35S discussion!!!**

Message #9 Posted by **Walter B** on 21 Oct 2007, 5:10 p.m.,

David,

I sure can and probably will. A new calculator is not a need, it's a simple want. Tying it in to what has so far been a happy coincidence by saying it's a tradition salves my conscience about spending a bunch of money on something I don't really need.

I'm probably going to go with the 35s, since it's half the price of a second hand 15s, and I don't need to do matrix calcs or complex numbers. That being said in the long run I may try and get a 15s to add to the collection.

Thanks,

Craig.

\_\_\_\_\_

Craig, I was in exactly the same position as you about 2 months ago - a first time owner of a HP calc, HP33S. I bought HP35S because I like the retro look. It is nice calc, but to be fair, for simple calculations (like your *I don't use it to its full potential*, the HP33S is probably as good as HP35S. As a 33S user, you probably have got used to the keyboard layout, which was much criticised here earlier by users of older HP calcs, so the keyboard is not an issue for you.

On the contrary, you're likely to find some features of HP35S quite annoying. Some problems are described [here](#)

So, if you want to program your calc (especially longer programs), HP35S is MUCH better, get one. For hand calculations, not a big improvement over 33S. Still, it really looks nice... :-)

Regards, Vaclav

\_\_\_\_\_

If you aren't programming then I'd say the 35S is a big step backward from the 33S as far as the

keypad layout is concerned. The layout on the 33S was optimised for hand calculations, but the 35S is optimised for programming.

Dave.

### **HP-33s layout changes**

*Message #16 Posted by **Karl Schneider** on 21 Oct 2007, 5:12 p.m.,  
in response to message #15 by DaveJ*

Hi, Dave --

Quote:

Does anyone know why HP changed the key layout on the 33S?, and without changing the model number.

The one on the right must be the improved HP-33s with the known bugs fixed and more conspicuous radix points. I wasn't aware of the rearrangements. Most of the changes I see make sense. On exception:  $x^2$  -- originally an unshifted key -- should have remained in its original place along with square root, with  $x^3$  shifted above  $x^2$ , and cube root shifted above square root.

Quote:

Have they done this on any other calculator?

Probably not. The "old HP" tended to "get it right" the first time and particularly valued continuity, even when some bugs were subsequently fixed and internal hardware was updated (e.g., HP-41 and HP-12C). Significant upgrades were accompanied by a change in model designation (e.g., HP-41CV to HP-41CX, HP-32S to HP-32SII, HP-48S to HP-48G).

If it is a photoshop job then it's spread a long way. Seems like about half the ads out there for the 33S show the one that has supposedly never been released.

Dave.

**Re: No change to 33s layout - pic on right was never sold draft**

*Message #20 Posted by **bill platt** on 22 Oct 2007, 9:07 a.m.,  
in response to message #19 by DaveJ*

It all goes back to the initial press release. That one had a different key layout. The final released model was refined from that.

I remember this coming up here at MoHPC back then.

**Re: General thoughts on buying an hp calculator**

*Message #21 Posted by **Brad Davis** on 21 Oct 2007, 12:21 a.m.,*

*in response to message #1 by Craig Webster*

I've tried out a couple of 15c models and didn't like the feel of the key presses, especially the Enter Key--fairly stiff with less of a tactile click than I like. These were fairly old calculators, though. I really like the 35s. Feels about perfect to me.

### **Re: General thoughts on buying an hp calculator**

*Message #22 Posted by [bill platt](#) on 22 Oct 2007, 9:12 a.m.,  
in response to message #21 by Brad Davis*

Back when all I had was an 11c, I thought it was perfect. Then I lost it and bought a 32sii. I was pleasantly surprised to find that even though the model seemed less expensive in appearance, it was actually better with the key action. This was of course a Singapore 32sii, way back in the early days of the model.

I still like the Voyagers, (in layout logic, and functions per square inches, they are just beautiful) but I do feel that the Pioneers are even better in key action. The very best of all: Champagne (Singapore, not Indonesia).

But it is a personal preference. Some people really prefer the Voyager feel and that is OK:-)

### **Re: General thoughts on buying an hp calculator**

*Message #23 Posted by [Ed Look](#) on 22 Oct 2007, 11:45 p.m.,  
in response to message #22 by bill platt*

None of them felt as good to press as the keys of a Spice in its prime. You can feel, barely hear the keypress and the kid next to you taking the chemistry or physics exam won't hear them, and your brother wasn't awakened by your fevered programming of some Byzantine, derived expression to calculate some number of grams or electron volts, but you still felt the key's feedback through your fingertips with just the right amount of mechanical resistance.

Totally satisfying... even at four in the morning (well, this last part maybe if you're still nineteen or twenty.)

I have a 3d printer at work. What type of 3D file do you have?

How large is it?

Gene

**Re: Gene and Jake's 45s :-)**

*Message #8 Posted by **Pal G.** on 19 Oct 2007, 10:30 p.m.,  
in response to message #7 by Gene Wright*

I modeled it in AutoCAD 2007. The file size is 800k. I also exported an .STL file from AutoCAD, which came in at 1.54mb. (Both files combined into a single zip came to 973k).

I will email any of the above if you would like.

(If anyone is curious, the AutoCAD file is just a plain, grey, 3d model. All of the texturing, lighting, and final rendering was done in Lightwave).

Regards,

Pal

*Message #12 Posted by [Pal G.](#) on 19 Oct 2007, 10:42 p.m.,  
in response to message #11 by Gene Wright*

Ya, I cut a few corners to get the renderings done before the original hp 45s thread fell off the MoHPC forum horizon. Plus last week I wrote a 16 page paper on Itanium 2, and tomorrow I have a final. I probably should have waited a few weeks for school to calm down, but seeing the hp 45s pics motivated me.

As soon as I have time I will go and fix things on the hp 45s. Plus, I also happened to save that jpeg of the HP80B...

; ) Pal

*Message #19 Posted by **Walter B** on 19 Oct 2007, 11:05 p.m.,  
in response to message #1 by Pal G.*

Hi Pal,

really great artwork! How many hours did it take you to make this?

@Gene & Jake:

Please look at both pictures. The beveled keys hide parts of the yellow labels. That's why I suggest labels printed below of the respective keys.

Best regards, Walter

**Re: Gene and Jake's HP-45s.**

*Message #20 Posted by **Gene Wright** on 19 Oct 2007, 11:29 p.m.,  
in response to message #19 by Walter B*

They hide no more than any keys ever hid of functions written above them on the 11c, 12c, 15c, 16c, 41c, 67, 65, 22, 25, 27, 29, etc.

Above and below the keys worked fine for several generations of HP calculators and they would work fine on these models.

Any hiding of the yellow functions is from the translation to 3D modeling done very well but in a hurry.

Get an 11c, 12c, 15c, etc, and look at the yellow functions yourself. It works. :-)

### **Re: Gene and Jake's HP-45s.**

*Message #21 Posted by **Ed Look** on 20 Oct 2007, 12:04 a.m.,  
in response to message #20 by Gene Wright*

Gene and Jake, this is in no way a criticism or anything negative, just I getting... wistful... but boy, if it looked like a Spice! I don't mind three shift keys and a myriad of functions. Oh, to have the heft and feel of a 34C in my hands again, to see it sitting squarely on my desk... albeit with a black LCD, green backgrounded display. Now, gentlemen, THOSE were keys!

But, hey, a Pioneer is a (very) close second in beauty, and looks more, well, "modern" maybe even futuristic in its own plain (which is very good) way. The Spice just looks more commanding and somehow, more powerful to me, without having to look like a graphing calculator.

### **Re: Gene and Jake's HP-45s.**

*Message #22 Posted by **Pal G.** on 20 Oct 2007, 12:27 a.m.,  
in response to message #20 by Gene Wright*

Quote:

Any hiding of the yellow functions is from the translation to 3D modeling done very well but in a hurry.

Plus I think my buttons are a bit too tall. I used calipers for some measurements, but I eyeballed the buttons height.

@Walter: Here are some estimates..

AutoCAD: 1.5 hours. Photoshop: 1.25 hours. Lightwave (texturing, etc): 1.5 hours. Lightwave (lights, camera, rendering): 2-6 hours.

Once the scene is done, I have fun rendering various angles, which takes time, so I'm doing other things during..

Thanks, Pal

in response to message #29 by Walter B*

<http://img2.putfile.com/main/10/29301514763.jpg>

Now that's very nice indeed! As always, the key layout will be the controversial thing I suspect, so I'll have my 2 cents worth. I'd love a non-programming version with more dedicated scientific function keys. Given that it has a nice looking menu system, you

could probably drop the 2nd yellow shift key. That wouldn't make it as "busy", and you gain an extra key.

Dave.

**Re: 2 More Opportunities (was Re: Gene and Jake's HP-45s)**

*Message #31 Posted by **Pal G.** on 21 Oct 2007, 5:12 p.m.,

*Message #38 Posted by [sylvandb](#) on 20 Oct 2007, 9:54 p.m.,  
in response to message #37 by sjthomas*

Quote:

What would you pay for the "45s"?? Assuming there was an SD slot and I/R, I'd pay \$200 without a second thought.

\$200 seems about right. double-shot keys, and etc? Probably have to be more.

What do you do with IR? Two-way to exchange with another calculator? One-way for printing?

Anybody have schematics and source code for PC IR interface to receive 'redeye' (28s, 17b)? I should play around with this old Extended Systems interface... I think it might do it.

### **A quick, simple and possibly dumb question on the 50g**

Message #1 Posted by [Ken Ratkevich](#) on 19 Oct 2007, 12:39 p.m.

Hi,

I'm in the middle of writing a term paper and trying to get it in under the wire or else I would scan the manual for the answer.

My 50g rounds off base conversions AND, when I switch to engineering notation it does some extreme rounding off.

What config do I need to change and how?

Thanks in advance for any and all replies,

Ken

### **Re: A quick, simple and possibly dumb question on the 50g**

Message #2 Posted by [Jandro Kirkish](#) on 19 Oct 2007, 1:39 p.m.,  
in response to message #1 by Ken Ratkevich

Hi Ken,

I'm not sure about your 2nd question but I do know that all HPs that I have used perform base conversions on integers only, which can give you a major rounding off, if you input a decimal number with fractional parts . Hope this helps,

Regards, Jandro

### **Re: A quick, simple and possibly dumb question on the 50g**

Message #3 Posted by [Dave Britten](#) on 19 Oct 2007, 2:29 p.m.,  
in response to message #1 by Ken Ratkevich

As for the engineering rounding issue, press Modes, then check the Number Format details. You'll probably see something like Eng 8, with the number representing the number of decimal places. Change that number as necessary. (Note that I'm referring to my 48GX at the moment, so the 50g might look a little different in regards to menus).

### **Re: A quick, simple and possibly dumb question on the 50g**

Message #4 Posted by [Ken Ratkevich](#) on 19 Oct 2007, 3:32 p.m.,

*Message #7 Posted by **Ken Ratkevich** on 19 Oct 2007, 5:41 p.m.,  
in response to message #6 by Dave Boyd*

1. RS BASE and set to decimal
2. LS #FFFFh (using ALPHA properly)
3. ENTER
4. Result is #65535d. Yeah!
5. Key in #FFFFFFh
6. Enter
7. Result is #65535d. Huh?

Ken

**Re: A quick, simple and possibly dumb question on the 50g**

*Message #8 Posted by **Dave Britten** on 19 Oct 2007, 5:32 p.m.,  
in response to message #5 by Ken Ratkevich*

Try checking your word size: RCWS

If it's only 16, then there's your answer. To change the word size (bit length) for base operations, use STWS, e.g. 32 STWS. You can do anywhere from 1 to 64 bits, I believe.

**Chemically removing oxydation?**

Message #1 Posted by [RJvM](#) on 19 Oct 2007, 3:50 a.m.

Hi,

I own an HP-45 with battery terminals which keep oxydizing, even after I have scraped off most of the "mold" (it is green on one terminal and blue on the other). The calculator works fine with the power cord.

Please advise on the use of chemicals to remove the oxydation. My own chemistry knowledge is somewhat rusty (seems appropriate in this case), I think maybe an acid would work, but that will pose other problems with the calculator.

Sincerely, RJvM

**Re: Chemically removing oxydation?**

Message #2 Posted by [sylvandb](#) on 19 Oct 2007, 10:40 a.m.,  
in response to message #1 by RJvM

Quote:

You did good by starting with mechanically removing off as much corrosion as practical. Dump and vacuum or blow it out.

This is from rechargeable (NiCad or NiMH) batteries? Use regular household vinegar. Some dilute it several times. For small parts (like a classic battery case with cells removed) I soak in an inch or so of vinegar in a 10oz glass. I then mostly fill the glass with hot water and use that solution on a cotton swab to clean out the battery compartment and terminals and stuff I don't/can't soak. You will probably see some foaming as the vinegar neutralizes the battery leakage.

Vinegar also works for alkaline cells, but a baking soda solution is the key for the older style.

It doesn't hurt to try the soda solution and if you don't see the foaming effect, and the deposits don't seem to dissolve, use vinegar instead.

Final step is best to do a total wash with distilled water, but frankly, wiping off the solution will 99.9% of the time be fine.

sdb

**Re: Chemically removing oxydation?**

Message #3 Posted by [Allen](#) on 20 Oct 2007, 10:00 p.m.,

*in response to message #1 by RJvM*

Try Deoxit from Caig industries.. Their new line of Deoxit Gold is both a cleaner and a protector against future oxidation.. you won't get that with a vinegar solution.

## **Re: Chemically removing oxydation?**

*Message #4 Posted by [sylvandb](#) on 21 Oct 2007, 10:44 a.m.,  
in response to message #3 by Allen*

Quote:

Deoxit is for true oxidation (combination with oxygen) and dirt. It is less effective against deposits from leaking batteries, IMHO.

It would be good to apply Deoxit after cleaning and neutralizing the deposits as described.

### HP35s - Cause of Blank Screen Problem?

Message #1 Posted by [Jeff O.](#) on 18 Oct 2007, 10:24 p.m.

The blank screen during a running program which is not interruptible seems to be caused by simply using an equation as a prompt to stop the program (i.e. without following the equation immediately by a PSE instruction) and wait for you to press R/S to proceed. Enter the following simple program (the label letter is unimportant):

```
X001 LABEL X
X002 SF 10
X003 eqn BLANKING DEMO
X004 100
X005 STO I
X006 DSE I
X007 GTO X006
X008 STOP
X009 1
X010 STOP
X011 2
X012 STOP
X013 3
X014 STOP
X015 4
X016 STOP
X017 5
X018 STOP
X019 6
X020 STOP
X021 7
X022 STOP
X023 8
X024 STOP
X025 9
X026 STOP
X027 10
X028 STOP
```

Now execute the program\*. The program will display "BLANKING DEMO" and wait for you to press R/S. Press R/S, and the display will go blank, and it will not respond to R/S, C, or any other key. The program will stop after the DSE loop counts down from 100. If you press R/S while it is blank, it will execute the R/S commands from a buffer, which will execute the sequence of digit entry and STOP commands that start in line X009. (These are necessary to prevent the sequence of R/S commands that you entered from jumping into other programs.) If you press R/S less than 5 times, the x register will present the number of times you pressed it. If you press R/S 5 or more times, the x register will present a 5, as the buffer apparently holds up to five R/S commands. (The steps after line X019 are just there for insurance, I guess.)

As Seth and John reported, if you single-step once from the keyboard at the equation prompt, then press R/S, everything is fine. The program proceeds with the "RUNNING" display, and it can be interrupted with R/S or C.

So, if you use an equation as a prompt to display a message and wait for you to enter data and press R/S to proceed, and the program following the prompt does not terminate naturally, it will run with a blank display until the batteries run out or you press the reset through the hole in the back. For example, in the above program if instruction X008 was a GTO X004, the machine will be stuck in a loop from which you would be unable to break it out of. (I did not try this as I don't want to lock up my calculator and lose all programs.) I'm guessing that this is what happened in John W's original program; his rather complex, un-debugged program had such a loop.

Using equations as prompts to pause a program and give instructions or wait for data entry is a very handy feature.

Just make sure the code that follows cannot enter an unending loop. A safe alternative is to put a STOP after the equation. The message will stay up until you press R/S once, then you will have to press it again to get going. Not ideal, but it beats locking up your calculator.

Hope this helps,  
Best regards  
Jeff

\* - Enter and run at your own risk, as you may lock-up your calculator and lose all memory. It shouldn't if you enter it as listed, but....

edited to correct a typo and add a little clarification.

## **Re: HP35s - Cause of Blank Screen Problem? [Yes. And bonus lockup!]**

*Message #2 Posted by [Seth Morabito](#) on 18 Oct 2007, 10:47 p.m.,  
in response to message #1 by Jeff O.*

Brilliant! You've found it alright. This is a perfect test case.

For fun, I wrote the following program that I can guarantee will lock up your calculator until you do a hardware reset. It does not display "RUNNING" while it's working:

```
A001 LBL A
A002 SF 10
A003 LOCKUP DEMO
A004 0
A005 GTO A004
```

**CAUTION: DO NOT RUN THIS PROGRAM ON ANY CALCULATOR THAT CONTAINS DATA YOU WISH TO KEEP. IT CAUSES A TOTALLY UNBREAKABLE INFINITE LOOP.**

In contrast, here's a program that does NOT lock up, and displays 'RUNNING'.

```
B001 LBL B
B002 SF 10
B003 0
B004 GTO B003
```

The only difference is displaying an equation. The fact that Flag 10 is set seems not to matter.

Very interesting. Thank you so much for finding this, Jeff!

*Edited: 18 Oct 2007, 10:54 p.m.*

## **Re: HP35s - Cause of Blank Screen Problem? [Yes. And bonus lockup!]**

*Message #3 Posted by [Seth Morabito](#) on 18 Oct 2007, 10:57 p.m.,  
in response to message #2 by Seth Morabito*

OK, this is definitely it.

I've confirmed that if you run Program A, as above, and instead of pressing "R/S" after 'LOCKUP DEMO' is displayed, you press the down arrow to step to the next line, and THEN press "R/S", you can break out of the loop, and "RUNNING" is displayed.

Bingo, this is it. We have a good, small, repeatable test case we can send to HP. Thanks to all who helped!

**Re: HP35s - Cause of Blank Screen Problem? [Yes. And bonus lockup!]**

in response to message #1 by Jeff O.

Good job and great detective work!

FYI..HP now knows about the problem.

Gene

**Re: HP35s - Cause of Blank Screen Problem?**

Message #6 Posted by **Seth Morabito** on 18 Oct 2007, 10:59 p.m.,  
in response to message #5 by Gene Wright

Good news, Gene. Thanks for letting us know! If they need a small test case, the above programs should work. They take only a few seconds to key in.

*Edited: 18 Oct 2007, 10:59 p.m.*

**Problem also exists on 33s**

Message #7 Posted by **Seth Morabito** on 19 Oct 2007, 12:05 a.m.,  
in response to message #1 by Jeff O.

This bug is repeatable on the 33s. Nobody ever noticed.

On my 33s, I keyed in this program:

```
A0001 LBL A
A0002 SF 10
A0003 LOCKUP DEMO
B0001 LBL B
B0002 GTO B
```

To run, XEQ A, press R/S after "LOCKUP DEMO" is displayed. Just like on the 35s, the HP-33s goes into an infinite loop without displaying "RUNNING". There is no way to break out of it without pressing the reset button on the back.

Also just like the 35s, single-stepping past the EQN display, and then pressing R/S, results in normal behavior. "RUNNING" is displayed, and the loop can be broken by pressing R/S.

**UNLIKE** the 35s, however, pressing the reset button on the back for just a moment does not seem to erase my program memory. That's a key difference between the 33s and the 35s, apparently.

### Re: HP35s - Cause of Blank Screen Problem?

Message #8 Posted by [Stefan Vorkoetter](#) on 19 Oct 2007, 7:55 a.m.,  
in response to message #1 by Jeff O.

Interesting additional information:

If I put a PSE instruction after X003 in the original program at the top of this thread, the behaviour changes as follows:

- 1) "RUNNING" does appear while the loop is executing.
- 2) But you still can't break out of it.

Stefan

### Re: HP35s - Cause of Blank Screen Problem?

Message #9 Posted by [Jeff O.](#) on 19 Oct 2007, 9:55 a.m.,  
in response to message #8 by Stefan Vorkoetter

Hmmmm....

If I put the PSE instruction in, the program displays the message briefly, then continues, displaying "RUNNING". It responds immediately to a R/S or C keypress and stops as it should. It works fine on both of my units, which have CNA734 and CNA721 serial numbers.

Jeff

### Re: HP35s - Cause of Blank Screen Problem?

Message #10 Posted by [Stefan Vorkoetter](#) on 19 Oct 2007, 10:03 a.m.,  
in response to message #9 by Jeff O.

Very odd (that it's different). I don't have the calc in front of me right now, so can't experiment further at the moment. However, for what it's worth, I also had a CF 10 instruction after the PSE.

Stefan

### Re: HP35s - Cause of Blank Screen Problem?

Message #11 Posted by [Jeff O.](#) on 19 Oct 2007, 11:17 a.m.,  
in response to message #10 by Stefan Vorkoetter

If I put the CF 10 after the PSE, the program pauses to display the message, then continues with the "RUNNING" display, and can be interrupted with R/S or C. If I put the CF 10 **before** the PSE, the program stops to display the message, then you must press R/S, then it pauses briefly and then continues with the "RUNNING" display. It now behaves as you describe, it is **unresponsive** to R/S or C even though "RUNNING" is in the display. It also unresponsive to R/S or C during the brief pause after pressing R/S to proceed after the prompt.

Jeff

### Re: HP35s - Cause of Blank Screen Problem?

*Message #12 Posted by [Stefan Vorkoetter](#) on 19 Oct 2007, 11:23 a.m.,  
in response to message #11 by Jeff O.*

Yes, you're right. I had the CF 10 instruction **before** the PSE. My intent wasn't to display the EQN in pause mode, but rather to just introduce a "speed bump" after the user pressed R/S in response to the prompt, in hopes that it would reset whatever silly state the calculator got into that made it uninterruptible (i.e. I was experimenting to find a workable workaround).

Apparently, I managed to reset the "don't-display-RUNNING" state, but not the "I-can't-hear-you!" state, which of course isn't much help. I wonder if resetting the calculator while RUNNING is in the display might be less destructive than when the screen is blank. I don't want to try this, because I don't want to wipe out the stuff I've got programmed.

Stefan

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #13 Posted by [Meenzer](#) on 19 Oct 2007, 11:08 a.m.,  
in response to message #9 by Jeff O.*

With a PSE in it after the EQN I can break out with C or R/S. Without the PSE I'm stuck and have to do a hard reset. Serial is CNA 726...

EDIT: The User's Guide of the 35s shows a program for "Controlling the Fraction Display" (similar to the one with the same name in the 33s' guide, conveniently available as pdf). This program uses EQN for message display. And guess what?! There's a PSE -A N D- a STOP statement after every message. I guess as I couldn't find any example encouraging John's creative usage of the EQN messages **without** PSE or R/S after it, the so induced unbreakable loop shouldn't be called a bug ;-)

*Edited: 19 Oct 2007, 12:01 p.m.*

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #14 Posted by [John Wasilewski](#) on 20 Oct 2007, 7:05 a.m.,  
in response to message #13 by Meenzer*

This is getting hard to follow!

Also, my unit has a large amount of code in it so I don't want to take any risks with my own experimenting if possible.

Ideally I should like a prompt string to appear in StackY, stopping the processor and inviting the user to enter data in StackX of the display. If this can't be done then I want a prompt string to appear in StackX, stopping the processor and inviting the user to overwrite it with data entry.

I then want it to be safe to press R/S.

The reason why I want to do this is to prompt for two data entry values, entered as data-ENTER-data-R/S.

Do we now know how to achieve this functionality?

Could someone summarise for me?

What is the latest advice on the sequence of SF 10, CF 10, PSE, R/S steps that I should use above and below an EQN PROMPT STRING, please?

-----  
John

### Re: HP35s - Cause of Blank Screen Problem?

-----  
John

As my understanding of the handbook goes, displaying an EQN after SF 10 is NOT a prompt, it's just and only a text message.

So my approach to show a message and have the user input data in x and y registers could be as follows:

```
LBL A
SF 10
EQN "Y= ENTER X= RS" \* or whatever you wish
PSE
STOP
STO X
R down
STO Y
VIEW X
PSE
VIEW Y
PSE
CF 10
RTN
```

### Re: HP35s - Cause of Blank Screen Problem?

Message #16 Posted by [Stefan Vorkoetter](#) on 20 Oct 2007, 9:16 a.m.,  
in response to message #14 by John Wasilewski

We don't know how to achieve this functionality.

SF 10 / EQN / CF 10 / PSE / ... will give you a "RUNNING" message, but you still can't interrupt it.

SF 10 / EQN / CF10 / ... will give you a blank screen after the user responds to the prompt, and you can't interrupt it.

SF 10 / EQN / PSE / CF 10 / ... works fine, but the program doesn't stop; it only pauses.

SF 10 / EQN / CF10 / R/S / ... will stop once more after the user enters the data. The user then

has to press R/S a second time to continue, you'll get a "RUNNING" message, and you can interrupt it.

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #17 Posted by [John Wasilewski](#) on 20 Oct 2007, 10:33 a.m.,  
in response to message #16 by [Stefan Vorkoetter](#)*

Thanks Stefan. Clear and concise.

I note the point made by Menzeer in defence of the HP35s interpreter and he may be right that

SF 10 / EQN / CF10 / ...

..stops the calculator and displays a message but is undocumented as a way of supplying a prompt. However, what is the use of a facility to display a message and stop the calculator if we cannot permit users to do stuff while it is stopped (like calculate a value then enter it), and is it not the case that using this method even to stop with a message in the display, and not actually enter data, produces an uninterruptible condition as soon as the user presses R/S ?

Menzeer, I am not happy with closing this as an issue, on the basis that it is the user's fault when the calculator locks up and he loses all his work. I know you are not saying exactly that but your point about this not being the 'proper' way to issue a prompt does nothing to encourage HP to eliminate the problem.

---

John

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #18 Posted by [Meenzer](#) on 20 Oct 2007, 10:53 a.m.,  
in response to message #17 by [John Wasilewski](#)*

John,

maybe I'm not too much of a programmer to understand your point.

I can only say that the programming languages I recall some bits of (FORTRAN 77, BASIC, C, C++) have two different statements for input and output. If you must, you can combine input and output in some way like:

Input "A=",A

But those are "higher" languages. The 35s also provides you with a separate method for each input and output, which will work properly to my present knowledge. Your way of prompting for an input is quite creative and works most of the times, saving even some bytes. But it's more kind of a hack and has its limitations. All I'm saying is that limitations of a hack shouldn't be called a bug.

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #19 Posted by [Stefan Vorkoetter](#) on 20 Oct 2007, 11:06 a.m.,  
in response to message #18 by [Meenzer](#)*

I disagree with you assessment that this is a hack. The manual clearly states that one can use EQN for displaying messages. Whether or not one uses this for input too, the program will become uninterruptible after such a message is displayed and the user press R/S to continue.

Every HP calculator ever made has let you do whatever you want while the program is stopped due to hitting a STOP instruction or a prompt on those calculators that have a prompting facility, and will then continue with whatever is in the stack when it is resumed using R/S.

Using EQN to prompt for input is the only mechanism the HP35s has if you want the prompt to be anything other than "V=?".

Stefan

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #20 Posted by [John Wasilewski](#) on 20 Oct 2007, 11:53 a.m.,  
in response to message #19 by Stefan Vorkoetter*

Stefan is right.

I have never programmed HP calculators before so I had no tricks borne of long experience up my sleeve, I simply interrogated teh manual to find out how to display an alpha string, and this was how I found FROM THE MANUAL that I had to do it.

HP DOES need to correct this, it IS a fault with the hardware.

Imagine the amount of stick the computer system manufacturer would get if there was an instruction code sequence used by a programmer somewhere on it a major computer network that could place it into a state where the processor could not be interrupted without deliberately crashing the system and erasing everything on the network. This is a micro equivalent of the same thing.

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #21 Posted by [Meenzer](#) on 20 Oct 2007, 12:48 p.m.,  
in response to message #20 by John Wasilewski*

And the only way the manual shows us to do it is with PSE and R/S right behind the EQN message.

BTW, if I want a nice user interface, I wouldn't do it on a keystroke programmable calculator. I'd just grab the 50G.

### **Re: HP35s - Cause of Blank Screen Problem?**

*Message #22 Posted by [Stefan Vorkoetter](#) on 20 Oct 2007, 3:07 p.m.,  
in response to message #21 by Meenzer*

Quote:

And the only way the manual shows us to do it is with PSE and R/S right behind the EQN message.

No, the manual shows us to do it with PSE if we want the message displayed only briefly, and without PSE if we want the program to stop until the user presses R/S.

So, the following program is perfectly valid, yet it crashes the calculator:

```
X001 LBL X
X002 SF 10
X003 EQN BYE BYE
X004 CF 10
X005 GTO X005
```

Stefan

## Re: HP35s - Cause of Blank Screen Problem?

*Message #23 Posted by [Meenzer](#) on 21 Oct 2007, 2:38 a.m.,  
in response to message #22 by Stefan Vorkoetter*

Would you refer me to where in the manual it says so? I can only find programming examples that use EQN for displaying a message not for having an input prompt.

As I pointed out above, it would be a nice thing to have the 35s **combine** output and input with one statement as in

```
INPUT "A=",A
```

but that is not the way the 35s does it.

As to your program, that has no input statement at all (and thus is no example that undermines my above statement): I concede that the manual does not explicitly say not to place an infinite loop directly behind an EQN message ;-)

But the program examples in the manual either use PSE and R/S or a VIEW after the EQN message (If you put a VIEW behind the EQN in your program, you can break out, I just tested that).

Which gives me the impression the HP programmers could not imagine someone wanting to do other than using EQN for commenting the output. To prevent creative programmers from falling in that "infinite loop trap" HP should either explicitly re-write the manual: "Only use EQN combined with PSE and R/S or VIEW" or give the user the means to break out of a program no matter if HP thought someone could want to program that way or not. (And if you want to call that a bug, it's OK with me!) ;-)

**Re: HP35s - Cause of Blank Screen Problem?**

*Message #24 Posted by [Stefan Vorkoetter](#) on 21 Oct 2007, 11:26 a.m.,  
in response to message #23 by Meenzer*

Sorry, but I think you misunderstand. Even if you just use EQN to display a message, the calculator is uninterruptible after the user presses R/S to continue after the message. This whole input-vs-output thing is a red herring. No input is required to cause the calculator to hang.

Nowhere in the manual does it say that you have to follow an EQN message with a PSE or a VIEW. And nowhere in the manual is there an example where an EQN message is followed by an R/S (in the program).

It is true that my sample program has no input statement. But my sample program isn't requesting any input either, so it doesn't need an input statement. It is just displaying a message to the user, **which is what EQN messages are for.**

Consider the following made-up program:

```
... do a bunch of stuff ...
X123 EQN "1ST STUFF DONE"
... do a bunch of more stuff ...
X456 EQN "2ND STUFF DONE"
... do more stuff ...
```

Here EQN is being used purely for message purposes, to stop the program when some stuff has been done. The user can then press R/S to continue. But this makes the calculator uninterruptible. It would be ludicrous to suggest that this is a misuse of the EQN message functionality.

And finally, here's a program that uses EQN and VIEW precisely the way you insist it is intended to be used. It too is uninterruptible:

```
X001 LBL X
X002 SF 10
X003 EQN HERE COMES Y!
X004 CF 10
X005 VIEW Y
X006 PSE
X007 GTO X007
```

Note: the issue is not whether you should put an infinite loop after such a sequence. The issue is that infinite loops sometimes happen, whether due to a bug, a calculation that doesn't converge, or whatever. Replace line X007 with whatever code you like above. It will still be uninterruptible.

Stefan

PS. No matter how HP intended it to be used, it is simply unacceptable that it locks up the machine. Period. How would you feel if using the windshield wipers on your car when it wasn't

raining would cause the brakes to fail?

## Re: HP35s - Cause of Blank Screen Problem?

Message #25 Posted by [Meenzer](#) on 21 Oct 2007, 12:08 p.m.,  
in response to message #24 by Stefan Vorkoetter

Quote:

And finally, here's a program that uses EQN and VIEW precisely the way you insist it is intended to be used. It too is uninterruptible:

```
X001 LBL X
X002 SF 10
X003 EQN HERE COMES Y!
X004 CF 10
X005 VIEW Y
X006 PSE
X007 GTO X007
```

Just tested it on my machine. It's most easily interrupted by pressing C.

EDIT: My bad! It locks it up, you're right!

BUT: if you do the program this way, omitting the CF 10 until the end, you can break out:

```
X001 LBL X
X002 SF 10
X003 EQN ABC
X004 VIEW Y
X005 GTO X005
X006 CF 10
```

Why is that????

Quote:

Nowhere in the manual does it say that you have to follow an EQN message with a PSE or a VIEW. And nowhere in the manual is there an example where an EQN message is followed by an R/S (in the program).

The program examples in the German manual of my 35s (which are identical to the examples in the pdf version of the 33s' manual) show either PSE and STOP (=R/S) or VIEW statements directly after the EQN message. But you're right,

the manual doesn't say so ("Do it only this way!") explicitly.

Now I know why I have the constant impression that we have a slight misunderstanding ;- ) I was writing all this with - more or less - tongue in cheek - but obviously was not able to convey this. (Mental note to myself: must remember to use emoticons even more excessively ;- ) I must admit I don't think about keystroke programming with the appropriate seriousness. As I wrote earlier (I think in the first post to John's original thread) I'd grab another calculator for this kind of program...I wouldn't bother debugging a 400 line program on the 35s and thus would never encounter this problem in real life ;- )

---

Stefan,

I completely agree with everything you have stated. Use of an equation to stop a program and display a message prompting for input is entirely appropriate. You thought to do so, I thought to do, and John W thought to do so. I think the programmers at HP intended for it to be used this way. And as you say, even if it is used exactly as presented in the manual to only present a message, it results in a situation where the calculator can lock-up. It is most certainly a bug.

Jeff

### HHC2007 Commemorative HP Calculator Calendar Status

Message #1 Posted by [Jake Schwartz](#) on 18 Oct 2007, 10:12 p.m.

Hi,

For those who ordered HHC2007 calendars, the first 37 have been shipped, which is all the extra we had after the San Diego conference concluded. Another 50 have been printed and shipped to me, which I expect to have in a few days for filling additional orders. If you have not yet received an email from me indicating that your calendar has been shipped, your order should be filled within the next couple of days.

There are still around 30 more available from this new batch which have not yet been ordered. Currently, we have no intention to print any more after that. If you have any interest in obtaining a calendar, please consult <http://holyjoe.net/hhc2007/hhc2007%20calendar.htm> .

Thanks,

Jake Schwartz

May I hazard a request for an HHC2007 DVD completion date?  
\_\_\_\_\_

Hi Pal,

I'm really going to try to edit both the San Diego (HHC2007) and London (HPCC 2007) conferences back-to-back, starting this weekend. I would love to have it all completed by the end of November, if possible. The two together total around 24 hours and were each done as a two-camera shoot so both speaker and his slides could be viewed. When it's done, the details will appear (as always) at <http://www.pahhc.org/video.htm> and I'll keep you posted here as well.

Thanks,

Jake

### **HP-41 program cards: transfer to PC, magnetic format**

Message #1 Posted by [Rick Nungester](#) on 18 Oct 2007, 12:26 a.m.

How can I transfer programs from HP-41C program cards to PC?

I want to run them on the V41 emulator, without manually entering each program step. Once to the Windows XP PC in some known format, I can translate to what the emulator needs.

Has the format of magnetic information on HP program cards ever been made public?

Is there any known way to read the program cards without an HP card reader (such as with a credit card reader and knowledge of the magnetic encoding format)?

### Updated HPCC Datafile Archive CD Now Available

Message #1 Posted by [Jake Schwartz](#) on 17 Oct 2007, 11:03 p.m.

Hi,

At the recent HPCC2007 conference in San Diego last month and at the HPCC 2007 conference in London last weekend, an updated HPCC Datafile Archive CD (containing 2 additional years of issues) was given to each attendee. This CD, with 24 years of issues running from 1982 to 2005, is now available. For more information, check <http://www.pahhc.org/ppccdrom.htm> .

Jake Schwartz

### Re: Updated HPCC Datafile Archive CD Now Available

Message #2 Posted by [Walter B](#) on 18 Oct 2007, 12:56 a.m.,  
in response to message #1 by Jake Schwartz

Hi Jake,

thanks for your work and the offer. I don't want to sound picky, but just want to understand: why is 2006 not included yet? After all, we are in October 2007 now. And a anniversary edition would be something real nice. Any good reasons will be accepted.

Now curse on me,

Walter

### Re: Updated HPCC Datafile Archive CD Now Available

Message #3 Posted by [BruceH](#) on 18 Oct 2007, 7:25 a.m.,  
in response to message #2 by Walter B

It is a policy decision of HPCC that the cd-rom be a couple of years behind.

This is to maintain the benefit of being a member.

Bruce Horrocks  
Datafile Editor

### Re: Updated HPCC Datafile Archive CD Now Available

Message #4 Posted by [Walter B](#) on 18 Oct 2007, 2:54 p.m.,

### Complex Number Juxtapositions

Message #1 Posted by [Trent Moseley](#) on 17 Oct 2007, 10:26 p.m.

You can STORE a complex number on the 35s, but you can't ROUND one. You can ROUND one on the 42s but you can't STORE it.

You put one fire out and another one pops up someplace else. I know it's just an annoyance but -

"So near yet so far..."

tm

### Re: Complex Number Juxtapositions

Message #2 Posted by [Karl Schneider](#) on 18 Oct 2007, 12:20 a.m.,  
in response to message #1 by Trent Moseley

Hi, Trent --

Regarding operations with complex numbers on the HP-35s:

Quote:

\_\_\_\_\_  
"So near yet so far..."  
\_\_\_\_\_

Formal response: "I concur with your sentiments."

Informal response: "Amen, brother!"

Perhaps more annoying is that SHOW also doesn't work on a complex number, and that there is no simple way to separate the components of a complex number. Thus, the RND limitation can't be circumvented by applying RND to each part separately, but even if RND did operate on a complex number, SHOW won't verify that it worked as intended...

Quote:

\_\_\_\_\_  
You can ROUND one on the 42s but you can't STORE it.  
\_\_\_\_\_

The second part of that statement is incorrect. A complex number can always be stored to a named variable, or it can be stored to a numbered register if the matrix of storage registers ("REGS") is dimensioned as complex:

RCL "REGS" (a softkey), ENTER, COMPLEX, STO "REGS"

Indeed, RND is applied to both parts of a complex number (in rectangular or polar mode) on the HP-42S. If the user wants to round only one component, the number can first be separated into two reals using COMPLEX.

Try this on an HP-42S: Enter a complex number with 12-digit mantissas for both components (say,  $\pi$  and  $e^1$ ), and assemble the number in POLAR mode using COMPLEX. SHOW will then display both components with their 12-digit mantissas. Then, do FIX 03, RND, and SHOW. You'll see 3.142 at angle 2.718 before and after SHOW. Change to RECT mode, and SHOW again. You'll see 12-digit rectangular-coordinate values for both components, indicating that RND was properly applied to the *displayed* value, even though the number may have been internally represented in rectangular form all along.

### Curve Fitting for the HP 35s

Message #1 Posted by [Stefan Vorkoetter](#) on 17 Oct 2007, 9:28 p.m.

I've just published a program, [Curve Fitting for the HP 35s](#), on my web site. This program is like the similar program in the HP-41C Advantage Pac and the one built into the HP-42s, in that it lets you enter data pairs first, and then chose the type of curve you want to fit to it (linear, logarithmic, exponential, and power). You can try different curves on the same data, or you can have the program chose the one with the best fit.

I wrote this primarily as an exercise in getting to know the HP 35s programming environment, and how to get around its limitations (limited user interface possibilities compared to the 41C or 42s).

Enjoy!

Stefan

### Is this the "blank screen" program you can't R/S out of?

Message #2 Posted by [Gene Wright](#) on 17 Oct 2007, 9:38 p.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

?

### Re: Is this the "blank screen" program you can't R/S out of?

Message #3 Posted by [Stefan Vorkoetter](#) on 17 Oct 2007, 10:43 p.m.,  
in response to message #2 by [Gene Wright](#)

Yes, it is, but of course it doesn't crash, because it is only in this blank screen mode for a few seconds before getting to a SF 10 / EQN / CF 10 sequence where it stops and displays something.

Just to clarify, this isn't John's crashing program. This is my own unrelated program where I happened to observe that there are some segments during which "RUNNING" doesn't appear, and R/S won't stop it.

Stefan

### I think you may like this...

Message #4 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 18 Oct 2007, 5:43 a.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

Hi, Stefan;

sometime ago I designed a set of display templates and some fonts ([HPCC V3N4](#)) with CorelDRAW!®. The main idea was to help the development of custom documentation with specific characters. Last year I created a particular TTF for the HP50G keyboard (HP48GII, HP49G+ as well) available [here](#). A few days ago I scanned the HP35S display and took some time to draw its contents, and got to this:

[http://www.logeng.com.br/images/HP35S/expl01\\_s.jpg](http://www.logeng.com.br/images/HP35S/expl01_s.jpg) Click to enlarge

This is just a JPEG image, the original CDR is not (yet) available. As you can see, it also fits the HP33S display. I saw that you used two pictures of the HP35S display, and they both could be drawn with a different resolution. The display patterns have all necessary annunciators and the corresponding TTF structure so one can draw whatever can be shown in the LCD.

Also, a 'under development' [HP35S character set TTF](#) is available, with the earlier HP33S name (to be updated). This one has the 'i' symbol for the complex representation (seen in the picture) and a slightly bigger dot (and comma) characters. It also has the missing ':', not available in the first HP33S TTF. Some new characters will be added later, like the small 7, 8 and 9 for the menu options (the HP33S had a maximum of 6 options per menu) and any others that are new.

I'll let the .CDR file with the HP33S/35S LCD template available later.

Any suggestions?

Cheers.

Luiz (Brazil)

**Re: I think you may like this...**

*Message #5 Posted by [Stefan Vorkoetter](#) on 18 Oct 2007, 9:51 a.m.,  
in response to message #4 by [Vieira, Luiz C. \(Brazil\)](#)*

Very nice! But unfortunately I don't have Corel Draw. I guess for now, with the limited number of screen images I need, I'll just use the scanner.

Stefan

**Re: I think you may like this...**

*Message #6 Posted by [Bruce Bergman](#) on 18 Oct 2007, 1:38 p.m.,  
in response to message #4 by [Vieira, Luiz C. \(Brazil\)](#)*

There is already an HP-35s TTF package available, if you are interested in saving yourself some work. Fonts for both screens and printed keystrokes.

thanks, bruce

**Re: I think you may like this...**

*Message #7 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 18 Oct 2007, 1:56 p.m.,  
in response to message #6 by [Bruce Bergman](#)*

Hi, Bruce;

thank you for this information. Just for being sure: are you talking about the ones also available thru Valentin's page? Those ones I have already downloaded. If not, would you point me the e-address they are available?

The ones Valentin shared I guess are the same used in the original HP manuals, is that correct? They are somehow different of the ones available with the TTF I draw for the HP33S (have you already seen

it?), I tried to get them closer to the calculator actual look. In order to create the HP35S set, I'd actually add the missing characters to the existing HP33S TTF, they are just a little bunch. It would be an extra option, though.

Best regards.

Luiz (Brazil)

**Re: I think you may like this...**

*Message #8 Posted by **Bruce Bergman** on 18 Oct 2007, 2:49 p.m.,  
in response to message #7 by Vieira, Luiz C. (Brazil)*

Yeah, the ones I was thinking of are the same ones that Valentin put up. So I guess you're good then, either way. ;-)

thanks, bruce

**Re: Curve Fitting for the HP 35s**

*Message #9 Posted by **John Wasilewski** on 19 Oct 2007, 7:43 p.m.,  
in response to message #1 by Stefan Vorkoetter*

Interesting and very useful program Stefan, thank you. It is very likely that I will use it from time to time. Is there any chance that you might do one for polynomial curve fitting? ---

John

**Re: Curve Fitting for the HP 35s**

*Message #10 Posted by **Stefan Vorkoetter** on 20 Oct 2007, 11:11 a.m.,  
in response to message #9 by John Wasilewski*

Do you mean an exact fit of a degree-N polynomial to N+1 points, or a least squares fit of a larger polynomial?

But in either case, probably not. The only reason I did the curve fitting program is because it's something I tend to use regularly, and it's a non-trivial program and thus an interesting way to get familiar with the 35s and its quirks.

I do plan to post a few other 35s programs, and perhaps an article of 35s programming techniques.

Stefan

**Re: Curve Fitting for the HP 35s**

*Message #11 Posted by **John Wasilewski** on 20 Oct 2007, 2:22 p.m.,  
in response to message #10 by Stefan Vorkoetter*

Do you know, I didn't know it was possible to fit a polynomial to a set of points exactly!

What I meant was using polynomial regression to find an expression of user-selected order that gives an OK fit to as many points as there are.

---

John

## Re: Curve Fitting for the HP 35s

Message #12 Posted by [Stefan Vorkoetter](#) on 20 Oct 2007, 3:10 p.m.,  
in response to message #11 by John Wasilewski

Quote:

Do you know, I didn't know it was possible to fit a polynomial to a set of points exactly!

Really!?

Consider the simplest case of fitting  $y=ax+b$  to two points  $x_1,y_1$  and  $x_2,y_2$ . It's just a matter of solving the simultaneous equations,

$$y_1 = a * x_1 + b$$

$$y_2 = a * x_2 + b$$

for a and b given  $x_1,y_1$  and  $x_2,y_2$ .

For a quadratic  $ax^2 + bx + c$  and three points, it's the solution of,

$$y_1 = a * x_1^2 + b * x_1 + c$$

$$y_2 = a * x_2^2 + b * x_2 + c$$

$$y_3 = a * x_3^2 + b * x_3 + c$$

for a, b, and c.

And so on.

Stefan

## Re: Curve Fitting for the HP 35s

Quote:

Very impressive, how close are you to a production run? And more importantly, where do I send my check!

Realistically, a pilot production run is several months away. Takes time to organise, and I'm not working particularly hard on it at the moment (read=slacking).

Speaking of which, (unofficial poll) how many people would want one? And would you prefer a more expensive fully assembled (hand built) version, or a cheaper DIY version were you have to glue stuff and solder the switches on etc?

We don't accept checks here in Australia, but we do accept cheques!

Dave.

Hopefully the only soldering will be the switches and the battery pack, as I'll be looking at getting the rest of the components machine assembled. I don't necessarily trust the assemblers to mount all the switches flush and have them all nicely aligned, and that matters.

Dave.

Started on the project probably about 5 months back(?), you may recall I posted on here asking about RPN features etc. I forget the dates. I had my first prototype in my hands and working after about 30 hours of real work, so it's not much work at all if you know what you are doing and are focussed. The last few months has been just a been a few nights here and there getting this 2nd prototype up and running. I wasted maybe 2 months thinking about a fully custom housing for it, but that didn't come through. But I like the end result, it's what I originally had in mind - it's looks like you could have built it yourself, but can also pass as a store bought product. Having worn it for a while now, I've found that a lot of people think it's a store bought product which I was surprised at.

A few people have seen my first prototype, but it's not nearly as nice looking as this one. Was just a rough prototype so I had some real hardware to play with.

Still some work to go on the firmware side of things though, not completely finished yet.

Yes, it's entirely my concept, my hardware design, and my software (no HP ROM or whatever).

Dave.

## Of course!

Message #17 Posted by [Maximilian Hohmann](#) on 19 Oct 2007, 6:15 a.m.,  
in response to message #4 by DaveJ

Hello!

Quote:

Speaking of which, (unofficial poll) how many people would want one?

Yes, definitely! And even more so, if it has something like the "H.MS+" function of the HP-67 for making calculations with time values. Of course, money is a factor.

Quote:

And would you prefer a more expensive fully assembled (hand built) version, or a cheaper DIY version were you have to glue stuff and solder the switches on etc?

DIY is fine for me as long as no soldering of small SMD-components is required.

Quote:

We don't accept checks here in Australia, but we do accept cheques!

Both of them have disappeared here long ago, I can't remember seeing one in the last ten years or so.

But I wouldn't mind to cover your PayPal (or Credit Card) expenses in case you accept one of those.

Greetings, Max

Awesome. Do you take paypal and send to Austria (neither checks nor cheques around here)?

I can do the soldering myself. What do you think it'll cost roughly?

Stefan

It looks like the cost is going to be at least AU\$80 at this stage. That's without the watch band which I haven't looked into yet. But I suspect not everyone is going to want the same watch band... I've also upgraded the back case to a nice translucent gray colour, so you can see the battery holders. The wife said it makes it look "even funkier" and is worth a few extra bucks over the standard black case.

Yes, I'll be taking PayPal (no cheques) and will post anywhere in the world. That's when I eventually get it all together that is...

Dave.

The key tops are 3mm x 1.5mm. Yes they have to be that small if you are using off-the-shelf parts.

They are surprising easy to push though, and the space between the keys means you never hit the wrong key by accident.

Dave.

### **John Wasilewski's non-interruptable 35s programs**

Message #1 Posted by [Seth Morabito](#) on 17 Oct 2007, 6:11 p.m.

For those interested, the programs (version 0.3, which contained an uninterruptable infinite loop; and version 0.5, which contains an uninterruptable calculation, but NOT an infinite loop) are available here:

<http://www.loomcom.com/hp35s/>

Version 0.3 can cause calculator memory loss. I have not used 0.5, but John says that it is much safer.

Regards,

Seth

### Top Ten Reasons why I still like my 35s

Message #1 Posted by [Martin Pinckney](#) on 17 Oct 2007, 3:51 p.m.

Due to all the negative comments on here, I have been trying my best to dislike my 35s, but so far,

I've failed. I still like it. Reasons:

1. It looks cool\*. 2. Relatively compact. 3. A lot of memory for a scientific calculator (as opposed to a graphing model). 4. Tactile feedback keystrokes. 5. Crisp, contrasty 2-line display. 6. If I see reflections on the glossy screen, I just move my head a little. 7. Ability to switch between ALG and RPN for different kinds of calculations. 8. Equation Solver. 9. Apparently I don't use the functions that have bugs. 10. It looks cool\*.

\*To be a little more specific, the slanted keys, color (I still don't know if its brown or black), the whole "HP is quality" retro look.

### Re: Top Ten Reasons why I still like my 35s

Message #2 Posted by [Miguel Toro](#) on 17 Oct 2007, 4:22 p.m.,  
in response to message #1 by [Martin Pinckney](#)

I will add:

1.- More flexibility for programming: I find myself programming more now with the 35s because it is easier than with my 32sII or my 32s.

2.- If it breaks, it is still available and I do not have to spend a fortune to replace it. And it is still under warranty, as a matter of course.

3.- I may be naïf but I hope the problems will be fixed, so the HP 35s will be an excellent calculator (not like a 42s, but...). I think that people could agree that without bugs, this is a step in the right direction.

Regards,

Miguel

*Message #4 Posted by [Seth Morabito](#) on 17 Oct 2007, 4:29 p.m.,  
in response to message #1 by Martin Pinckney*

I pick on specific, serious bugs that affect the 35s, but overall I totally agree. I love it, and I'm glad it exists. It may be a buggy little beast, but it's almost everything I need in a calculator, AND good looking AND comfortable to use, to boot! I most heartily welcome back the slanted keys and the wonderful tactile feel.

I'm confident that most of the bugs will be worked out in a future ROM release. For \$60, it's still a good deal.

### **Re: Top Ten Reasons why I still like my 35s**

*Message #5 Posted by [Ed Look](#) on 17 Oct 2007, 8:47 p.m.,  
in response to message #1 by Martin Pinckney*

Given today's manufacturing and marketing realities, it's a wonder HP would still "do" a 35s. If for no other reason than this, coupled of course with the relative ease of use and programming, it's really a small jewel...

... and the 33s really wasn't all that bad, either.

### **Re: Top Ten Reasons why I still like my 35s**

*Message #6 Posted by [Seth Morabito](#) on 17 Oct 2007, 8:52 p.m.,  
in response to message #5 by Ed Look*

I agree about the 33s. My only complaint was the funky keyboard. Other than that, I found it to be a very nice calculator.

### **Re: Top Ten Reasons why I still like my 35s**

*Message #7 Posted by [Jandro Kirkish](#) on 18 Oct 2007, 12:25 p.m.,

The case it quite good! A while back I was traveling and bought a bottle of water in an airport. Did not finish it and put it in my backpack with the machine. Later discovered had not put cork on good enough! Everything was swimming in water, and had been for a while! But the case is rather water resistant! Machine was only slightly damp, nothing that could have harmed it, it was fine.

To bad not the same level of quality did go into the making of the machine itself!

### **Re: Top Ten Reasons why I still like my 35s**

*Message #9 Posted by [John Wasilewski](#) on 18 Oct 2007, 6:02 p.m.,  
in response to message #1 by Martin Pinckney*

I absolutely agree with all your reasons for liking it.

I just so, so wish it had a USB connector and I truly cannot understand why this was presumably not

considered a cost worth including. Even cheap cameras can be used as PC virtual drives via a USB cable. Also finding the intermittent uninterruptible program bug is a huge disaster. Even for you it will be Martin, some day. Unless we are all lucky and this defect is limited to early production batch calculator units, and you are lucky enough to have one without the defect, the time will surely come, I'm sorry to warn you, when a program you have written enters an endless loop AND the uninterruptible bug kicks in. You will then lose everything you have ever programmed into it.

That said, I am still hopeful that HP can resolve this for us, I don't know why, but somehow, because I like this calculator very much and I WANT to be able to trust it.

---  
John

### **Re: That's not a knife...**

*Message #11 Posted by [John Wasilewski](#) on 19 Oct 2007, 11:06 a.m.,  
in response to message #1 by Martin Pinckney*

One of my clients, the senior partner of a distinguished firm of solicitors based in the north east, whilst admiring the HP35s, that I keep in the inside pocket of my suit jacket came, up with a superb suggestion:

As and when I am talking to another engineer about eg stresses, deflections, dimensions, levels, factors of safety, etc, (or to a client about overdue fees), then the next time that one of them reaches into his case or desk drawer for a calculator, I am to rock backwards very slightly, grin at him whilst looking down at his Casio, Canon, or whatever, then look him in the eyes again, smiling broadly and muttering laconically, "that's not a calculator," (slowly getting out my HP35s), "THAT's a CALCULator...!"

### **Re: That's not a knife...**

*Message #12 Posted by [Paul Brogger](#) on 19 Oct 2007, 11:24 a.m.,  
in response to message #11 by John Wasilewski*

. . . *with* the requisite Oistrahlian acccent.

Then the other engineer looks worriedly from your Calculator to his & back again, messes his drawers and runs from the room.

### **The reference to "That's not a knife..."**

*Message #13 Posted by [Karl Schneider](#) on 21 Oct 2007, 2:43 a.m.,  
in response to message #12 by Paul Brogger*

Several years ago, I happened to catch part of the Australian movie *Crocodile Dundee*, starring Australian actor Paul Hogan.

A New York street punk attempts to rob Dundee and his companion at knifepoint, whereupon Dundee says, "That's not a knife," then pulls out his much-larger Australian-style Bowie knife and says, "Now *that's* a knife." The would-be robber flees.

Had I not watched the movie scene with the semi-famous catchphrase, I'd have had no idea what you guys were talking about. Other readers may have been quizzical...

: -)

### **As does MS Excel 2003.. (short MS rant)**

Message #6 Posted by [Karl Schneider](#) on 17 Oct 2007, 11:07 p.m.,  
in response to message #5 by Bruce Bergman

... which also displays the correct answer of 65535 (*corrected per input from Pavneet*)

My computer at work is equipped with MS XP Professional, MS Office 2003, and MS Internet Explorer v6. Now, based upon some of my own impressions of MS Internet Explorer v7 and MS Vista (which seem to be widely shared, if internet forums are any indication) -- and now this finding with MS Excel 2007, I don't want any "upgrades".

BTW, you may find it quite difficult to restore MS IE v6 after installing MS IE v7. Apparently, in order to make good on the claim that IE was an integral part of the OS during the browser-war litigation of a few years ago, MS really \*did\* interlock the code in some fashion.

I wonder if MS Excel 2007 can correctly calculate 100.00-99.99-0.01? [The older versions couldn't...](#)

Anyway, I prefer HP calculators and programs over spreadsheet software for calculations using small amounts of input data.

### Updating Rom for HP50g on mac using HPConnect

Message #1 Posted by [Jeffc](#) on 17 Oct 2007, 6:38 a.m.

Hi all,

I was able to use HPConnect version 0.9.1 (which is the latest one AFAIK) on my mac to download the equation library update to my HP50g, but not the ROM 92 update. Any suggestions?

I'm using a powerbook G4 running OS 10.4.10

Thanks.

### Re: Updating Rom for HP50g on mac using HPConnect

Message #2 Posted by [Jonathan Eisch](#) on 17 Oct 2007, 2:03 p.m.,  
in response to message #1 by [Jeffc](#)

Yes. Use an SD card.

HPConnect is not able to load the rom on the calculator, as far as I know. You'll have to use an SD card reader on the mac to put the required files on the card, and update the rom that way.

-Jonathan

### HP35s - lock-up defect --> loss of all work -->latest

Message #1 Posted by [John Wasilewski](#) on 16 Oct 2007, 6:13 p.m.

Dear ALL

#### LATEST DIAGNOSIS

From a brilliant piece of detective work by Seth Morabito, plus further experimental work by me today, I now know more about the problem, all as set out below.

The malfunction is NOT caused by endless looping (but read on...).

#### KNOWN DEFECTIVE CALCULATORS

But first, here is the current list of serial numbers known thus far to be prone to the aberrant behaviour described below:

- CNA 72100255
- CNA 72100299
- CNA 72101944
- CNA 72102148
- CNA 72102361

#### LATEST INFO ON THE PROBLEM

What happens is that something as-yet undiscovered about my program code causes the calculator processor to seize control of the calculator and to refuse absolutely to hand control back to the user unless and until it encounters a program instruction that stops execution. We don't know whether the problem is to do with some special sequence of program steps that lets go completely, some set of flag settings, something to do with the length of the program, or what.

No keystroke combination or sequence has been found that will interrupt the processor when this happens. It stops only when it encounters a R/S or an INPUT instruction. I don't know about VIEW. PSE does NOT make it let go.

The danger posed by the above, which is what happened to me, is that, if this aberrant behaviour occurs whilst test-running a program for debugging, and an error in the program code causes the processor to enter an endless loop, then you are completely stuffed. Nothing but nothing will interrupt it, short of paper-clip-resetting in the hole at the back, and this wipes all of the work, in all programs. Memory cleared.

#### PROGRAM CODE FOR TESTING

What my experiments today confirmed is that it isn't necessary to be stuck in a loop for the fault to occur. I have now emailed two detailed annotated commented M\$Word-formatted program code listings to half a dozen forum subscribers whose email addresses I have and who have worked hard to help diagnose and solve this problem.

They are,  
 BEAM 8110 ver.03.doc  
 BEAM 8110 ver.050.doc.

Please, anyone who wants a copy, just post a request on this forum and someone will send it to you.

Version 03 is the buggy version with the endless loop. This causes disastrous loss of all work, as explained above. Please stop using it (more on this below).

Version 04 is a debugged version that seems from an hour or two of testing so far to work correctly every time, from start to finish. It works. Subject to further testing, you can design the section size and main flexural reinforcement for reinforced concrete beams with it (if you know what you are doing!). Here's the thing, though. When it runs, it takes about 14 seconds to complete its analysis. During this time the user loses all control of the calculator -- it cannot be stopped by any known means. But again, read on...!

#### MORE INFORMATION

Users will know that the screen normally displays, "RUNNING" during program execution. Well, when it enters this lock-up condition, this message is absent from the display. That is a sure way of knowing you've lost it and won't get it back unless and until it finds something in the program to make it stop.

#### SETH'S DISCOVERY

What Seth discovered, and I can confirm, is that, if the program is restarted after entering data, not by pressing R/S straight away, but by pressing the down-arrow key to execute single program steps a couple of times, and then pressing R/S, then this bad misbehaviour does not happen. I agree with Seth - this really, really strange.

#### ONGOING TESTING STILL NEEDED

I recommend further testing should now continue, not with my program version 03, but with version 05. Version 03 will make you lose all the work if you let it enter the endless loop. Version 05 seems to be free of endless loops (from tests so far), so this lets you try out the problem more safely. Thus far (in maybe 50 tests), I have been able to lose total control of the calculator without having to reset and erase all work, because it runs until the program finishes, then stops displaying the results.

What to do:

Take data entry as far as the point where it asks for steel bar diameters and then (with version 05),  
--EITHER--  
enter eg 25 R/S to see in reasonable safety if your serial number loses all control; which you should get back after about 14 seconds when the program finishes,

--OR--  
enter 25 SINGLE-STEP SINGLE-STEP R/S  
(SINGLE-STEP is done by pressing the down-arrow)  
this demonstrates how the calculator stays under your control, allowing you to interrupt it at any time (i.e. correct behaviour).

Let me repeat, please DO NOT use version 03 of the program for any more testing. Use version 05. This lets you replicate and test for the reported fault in reasonable safety. I say "reasonable" because I cannot guarantee total safety, naturally.

#### CONCLUSION

Seth has discovered a neat work-around but this is clearly not satisfactory. First, it might not always work. Second, it is so easy to forget and enter R/S when testing a program without first single-stepping through a couple of program steps. The result of either of these is complete disaster if there happens to be an endless loop in unfinished program code.

With no possible means of saving programs except in volatile memory, extremely robust firmware is fundamentally important. This defect breaches this crucial principle.

Please, everyone, feel free to distribute these programs for testing, development and use by anyone who wants them.

#### AND FINALLY

I am getting some help, since yesterday (15-Oct-07) from :  
G.T. Springer  
Product Strategist  
HP Handheld/Calculators

"GT" wrote to me to ask how he/she can help and I am delighted to tell you all that he/she is

very keen to investigate this and find a solution because "these experiences so far have been less than [HP's] intention". I have GT's kind permission to report the above and I will continue to liaise with GT by direct email. The fault is currently being investigated on GT's own HP35s (with a much higher serial number) and I am helping with this. The signs are that it might not have this fault.

### **Formatting of posts in this forum**

Message #6 Posted by **James M. Prange (Michigan)** on 16 Oct 2007, 9:35 p.m.,

*in response to message #1 by John Wasilewski*

John, if you really want to, then go ahead and use [pre] and [/pre] codes around ordinary text (although I recommend that you don't). But please, if you do, then please wrap the lines to a reasonable length. With a very long line within preformatted text, I have to scroll to the right to read the entire line, and then scroll all the way back to the left to see the beginning of the next line, which tends to make the post rather difficult to read.

By the way, that's also why:

Quote:

---

The "Edit" gadget was far off beyond the RH edge of my screen and it took me a while to discover I had to scroll out to the right to find it.

---

To force a short line, you can use a [nl] code. For a header, you can the [head] and [/head] codes. See <http://www.hp-museum.org/artfmt.htm> for some more advanced formatting possibilities. "Preformatting" is usually used only when exact line lengths and a fixed width font are desired; for example, for program code listings or tables. For ordinary text, I think it best to let the browser wrap it to fit the window size.

Regards,  
James

## **Re: HP35s - lock-up defect --> loss of all work -->latest**

*Message #7 Posted by [Stefan Vorkoetter](#) on 17 Oct 2007, 8:34 p.m.,*

*in response to message #1 by John Wasilewski*

Quote:

---

**MORE INFORMATION**

Users will know that the screen normally displays, "RUNNING" during program execution. Well, when it enters this lock-up condition, this message is absent from the display. That is a sure way of knowing you've lost it and won't get it back unless and until it finds something in the program to make it stop.

---

Interesting!

I'm just working on a curve fitting program (like the one built into the HP-41 Advantage Pac or the HP-42s). Some parts of my program, when running, display "RUNNING" on the screen. But other parts just give a blank screen for a few seconds and then display a result. I wonder what causes the two different behaviors?

Stefan

## **Re: HP35s - lock-up defect --> loss of all work -->latest**

*Message #8 Posted by [Seth Morabito](#) on 17 Oct 2007, 8:51 p.m.,*

*in response to message #7 by Stefan Vorkoetter*

Hello Stefan,

Can you break out of your program with R/S while the blank screen is displayed?

---

**Re: HP35s - lock-up defect --> loss of all work -->latest**

*Message #9 Posted by [Stefan Vorkoetter](#) on 17 Oct 2007, 9:07 p.m.,  
in response to message #8 by Seth Morabito*

No, I can't. The R/S key presses get queued up, and when the next stop point comes in a program (for instance, to VIEW a register), the program stops briefly and then continues.

Stefan

### **Any other HP calculators whose ROMs differ because of Int'l requirements, beside HP-17bII+?**

Message #1 Posted by [Peter A. Gebhardt](#) on 16 Oct 2007, 4:22 p.m.

For the last days I was busy to implement the German 17bII+ routines (onto my 200LX) which apply to special aspects of (an older) German consumer law concerning the representation of APRs (effective interest rates).

(The German law by the way, is based on rules to account for interest accumulated during the year in a special way, different from eg. ISMA rules).

The examples and a solver equation are described in the German version of the 17bII+ manual **only** - because they only appear in the menu of the calculator, if you've chosen German as the menu language!

Unfortunately the solver equation described in the Appendix of said manual was incomplete - so it took me some time to solve the puzzle of missing functions and I finally got it working.

(German speaking readers needing this solver equation - which resembles the STAFF menu on said calculator - should contact me by PM).

In the process of working on my problem, I thought of the ramifications of that special German part of the calculators firmware.

As we all know, changing or adding to an existing piece of software, already working flawlessly, might introduce unwanted "side effects" - can someone spell L() & G() problems on the 17bII+ ...

So beside hinting to HP engineers working on an updated 17bII+ to look into the effects of that German "speciality", I wondered if there are other calculators, which do contain routines especially implemented to serve the purpose of other certain Int'l environments.

Any other "hidden" treasuries out there?

Best regards

Peter A. Gebhardt

PS: Last Edit changed headline

### **O.T. Indirect addressing onn the Sharp PC-1201?:**

Message #1 Posted by [Palmer O. Hanson, Jr.](#) on 16 Oct 2007, 12:10 p.m.

A correspondent wrote:

Quote:

It is very difficult to find detailed information about the programming of the PC-1201 and I cannot find it at ebay. Is it really possible to use indirect addressing on this calculator?

He also noted that Viktor Toth's site indicates that indirect addressing is available on the PC-1201. I have a PC-1201 but no manual. I have been able to use trial and error to figure out how to write simple programs using branching with comparison tests but haven't been able to do indirect addressing. Can anyone help?

### **Re: O.T. Indirect addressing onn the Sharp PC-1201?:**

Message #2 Posted by [Valentin Albillo](#) on 16 Oct 2007, 1:55 p.m.,  
in response to message #1 by [Palmer O. Hanson, Jr.](#)

Hi, Palmer:

I neither own nor know in depth this model, but it seems to me that it's unlikely to have indirect addressing for the following reasons:

- First, I've been unable to find any reference to indirect capabilities in this machine despite lots of searching.
- Second, a glance at its keyboard doesn't seem to reveal any legend on the keys that could correspond to an index register, indirect addressing, etc.
- Third, with just 128 steps of program memory and only 12 memory registers, all of them likely to be directly addressable being that few, I don't see any real use for indirect addressing in this machine.

In any case, if I were your correspondent, I would kindly ask Mr. Toth himself, as he seems to own one and be very knowledgeable about it.

There's also a firm on the web which claims to provide nearly every manual under the sun, in PDF format, for a fee, and this model appears in their list of available ones. Google for "manuals in PDF" if willing to give it a try.

Best regards from V.

Message #3 Posted by [Xerxes](#) on 16 Oct 2007, 6:29 p.m.,

*in response to message #2 by Valentin Albillo*

Hello Valentin,

Yes, I think it's easier to ask Victor Toth himself. I have asked Palmer because I saw that he had tested the accuracy of the PC-1201 some times ago. I have looked for the manual before but I guess the manual is not available for downloading.

The competitor from CASIO the FX-202P has indirect addressing with 127 steps and 11 registers, that makes it difficult to use it for a practical job also.

## **Re: O.T. Indirect addressing onn the Sharp PC-1201?:**

*Message #4 Posted by [Namir](#) on 16 Oct 2007, 5:12 p.m.,  
in response to message #1 by Palmer O. Hanson, Jr.*

The Sharp PC 1201 belongs to a class for handheld (aka pocket) computers that use the old line-numbered BASIC. You create arrays using the DIM statements and then you access the array elements using other variables whose values represent indices for the array ... that's how indirect addressing works in BASIC pocket computers.

Namir

## **Nope, Namir.**

*Message #5 Posted by [Valentin Albillo](#) on 16 Oct 2007, 5:39 p.m.,  
in response to message #4 by Namir*

This is the SHARP PC-1201 (keystroke programmability), not the SHARP PC-1211 (BASIC language programming).

Best regards from V.

## **Thank you**

*Message #6 Posted by [Palmer O. Hanson, Jr.](#) on 16 Oct 2007, 9:25 p.m.,  
in response to message #5 by Valentin Albillo*

I wrote to Viktor and received the following response:

Quote:

\_\_\_\_\_

I think the information in my database is wrong. I just checked the PC-1201 manual, and I see no signs of indirect addressing; it has twelve registers(0-9, S, and t) but only the t-register has any special functions, in conditional jumps.

\_\_\_\_\_

Thanks to all who responded so promptly. That is one of the really impressive characteristics of this forum.

### HP42s Memory Upgrade Questions.

Message #1 Posted by [Thomas Chrapkiewicz](#) on 16 Oct 2007, 10:59 a.m.

Hello:

I would like to upgrade a couple 42s's to 32k and would like to solicit others experience(s).

Is the 32kx8 SRAM from a dead HP48 or HP38 a satisfactory device or is the current consumption prohibitive?

Are there more modern SRAM ICs available that could substitute for the 62256?

Thanks for your assistance, TomC ps: Thanks again to Lyukas fine photo documentation.

### Re: HP42s Memory Upgrade Questions.

Message #2 Posted by [Lyuka](#) on 16 Oct 2007, 12:38 p.m.,  
in response to message #1 by Thomas Chrapkiewicz

Hi.

Quote:

Is the 32kx8 SRAM from a dead HP48 or HP38 a satisfactory device or is the current consumption prohibitive?

It depends, however, I might think, if it's low power SRAM or not won't be a matter so much, as the total standby current that I have measured was not so small but around 9uA which is much more than typical standby current of standard 62256 SRAM.

Quote:

Are there more modern SRAM ICs available that could substitute for the 62256?

There are modern 32Kx8 SRAM as Renesus's M5M5256DFP-70XG or M5M5256DVP-70XG which have wide operating voltage range of 3V to 5.5V and very low standby current of 50nA(typ) at Vdd=3.3V, but they are not supplied in a classical relatively large SOIC28 package.

Regards, Lyuka

p.s. Thanks TomC. Good luck.

# typo collected : 7uA -> 9uA

*Edited: 19 Oct 2007, 10:28 p.m. after one or more responses were posted*

### **Re: HP42s Memory Upgrade Questions.**

Message #3 Posted by [Thomas Chrapkiewicz](#) on 19 Oct 2007, 6:07 p.m.,  
in response to message #2 by [Lyuka](#)

Lyuka:

Thank you for your helpful response. I realize that not all SRAM devices have the same 'idle' current drain - especially down in the nA range (7uA to 50nA is over a factor of 100!!!)

I will look into this much more closely. Regards, TomC

### **Re: HP42s Memory Upgrade Questions.**

Message #4 Posted by [Lyuka](#) on 19 Oct 2007, 11:15 p.m.,  
in response to message #3 by [Thomas Chrapkiewicz](#)

Hi.

"9uA" mentioned above is NOT the standby current of the SRAM but the TOTAL standby current drain from the batteries.

Generally, the typical standby current of the old 6264 SRAM will be in the range of 0.5~2uA. That of the latest 62256 lowpower SRAM (used at Vdd=5V) will be 0.1~0.3uA.

### **Re: HP42s Memory Upgrade Questions.**

Message #5 Posted by [randy](#) on 16 Oct 2007, 5:16 p.m.,  
in response to message #1 by [Thomas Chrapkiewicz](#)

Quote:

Is the 32kx8 SRAM from a dead HP48 or HP38 a satisfactory device or is the current consumption prohibitive?

They are CMOS static devices and as such the standby current is, in the scheme of things, insignificant. Active current is not a concern...

Quote:

Are there more modern SRAM ICs available that could substitute for the 62256

What's wrong with the "older" devices? IMO, there is absolutely no reason not to use the older Fujitsu/Winbond/Sony/Toshiba 256kb devices found in the 48 and 38G's. I've used them all, along with some Cypress parts I bought early on. I found no difference in battery life regardless of which device was used.

The bigger and more important question is the one you should be asking yourself: Why do I need 32K in a 42S?

The thought of having to enter even 8k's worth of programs is enough to put me off the task. Loosing that much work would be very, very painful.

### **Re: HP42s Memory Upgrade Questions.**

Just that you can't get them any more.

Stefan

### **Re: HP42s Memory Upgrade Questions (# 1 being: "Why?").**

*Message #7 Posted by **Paul Brogger** on 18 Oct 2007, 10:52 a.m.,*

*in response to message #5 by randy*

Quote:

The bigger and more important question is the one you should be asking yourself: Why do I need 32K in a 42S?

Wise counsel. Take heed!

The only reason I did it, lo so many years ago, was to see if I could. The answer turned out to be: "yes".

I've never come close to filling any keyboard-entry-only calculator with anything like 8K of meaningful programming. (I did fill my first 33s with I-don't-remember-how-many-thousand <Enter> commands, but just to test its program editor near its memory limit.)

You may have special needs, but do evaluate those carefully. Something like the PC-connectible 50G may be a far better choice, in the long run.

### **Re: HP42s Memory Upgrade Questions.**

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 18 Oct 2007, 2:09 p.m.,*

*in response to message #5 by randy*

Hi, Stefan;

after Paul's considerations, I'd add that you could try solving bigger matrices. I remember testing some years ago and I got these figures from [this thread](#)):

Quote:

maximum square matrices for a hacked, 32KRAM HP42S:

```
SIZE 0000  
[62x62 Matrix], 1004 bytes free memory  
[44x44 Cpx Matrix], 780 bytes free memory
```

Maximum size, nothing else in RAM: 3,967!)

Keying the matrix elements in is another story... any I/O resource is missed at this time.

What I did not test was what matrix operations could be performed with the remaining RAM as cache memory.

Cheers.

Luiz (Brasil)

### My analysis of Joel's HP35s' bug

Message #1 Posted by [Valentin Albillo](#) on 16 Oct 2007, 9:37 a.m.

Hi, all:

I'm starting this new thread instead of directly replying to [the original message by Meenzer](#) because it was getting very deeply nested and besides it was somewhat ancillary re the first posting on that thread which was about neverending, supposedly non-interruptable loops and such.

Here I'll briefly comment on my analysis of Joel's bug, as described in Meenzer's message. In order to get an idea of just what's happening and why we aren't getting the expected correct result it's fairly obvious that to be able to make any progress at all it is essential that we get to know exactly *what* are we getting instead. That is, we must identify that weird **31.323** resting defiantly on our screen.

A little fiddling with my own program **IDENTIFP**, described in my Datafile article "[Boldly Going ... - Identifying Constants](#)" (which you can download in PDF format for free at [my Calculators web site](#)) quickly reveals the following when applied to all inputs and outputs:

X = 156.25,                    gets identified as 5<sup>4</sup>/4

R = 208.333333334, gets identified as 5<sup>4</sup>/3

Q = 1.77951304201, gets identified as SQRT(19/6)

-R\*X/(X\*Q-R) = -466.926956302,

this actually doesn't need any identification, since we know exactly how it is computed and have already identified the inputs. Anyway, for the sake of completeness it gets identified as

$$5^4 / (4 - 3 * \text{SQRT}(19/6))$$

Now, the mystery value, which in full is **31.3230923085**, after some playing around with IDENTIFP gets identified as:

$$31.3230923085 = 5^4 / (4 - \text{SQRT}(19/6) / (1/3 - \text{SQRT}(19/6)/4))$$

which can be recognized at once as the result of evaluating:

$$-R * X / (\text{REGX} * Q - R)$$

where REGX is of course the result of previously evaluating:

$$-R * X / (X * Q - R)$$

so, essentially, the bug consists in that some internal coding error in the HP35s ROM is replacing the **second** reference to *direct variable X* in the second equation with a reference to *stack register X* instead.

What the internal coding error consists of is anyone's guess.

Best regards from V.

### **Re: My analysis of Joel's HP35s' bug**

*Message #2 Posted by [Meenzer](#) on 16 Oct 2007, 10:07 a.m.,  
in response to message #1 by Valentin Albillo*

Thank you for opening a new thread and analyzing so beautifully the problem. Just as an aside I wanted to note that the wrong result comes up no matter what variable name you put in the EQN. So, if you replace X with K, it's still buggy. It seems at least there is no direct relation between the variable X and REGX. I now did the following, just for fun I entered "-S\*L/(K\*R-S)" as an EQN, providing it with the same numbers for L and K as they both stand in for X.

Result: first time I get asked all 4 variables and obtain the correct result. Second time I get no prompt for K and the result is wrong. Third time is like first time, fourth time like second and so on...

When I now key in "-S\*L/(K\*R-T)", providing S and T with the original R value, the 35s still asks me for S and T in every run but omits asking for K every second time, with the same alternating results as above.

*Edited: 16 Oct 2007, 10:18 a.m.*

### **Re: My analysis of Joel's HP35s' bug**

*Message #3 Posted by [Valentin Albillo](#) on 16 Oct 2007, 10:22 a.m.,  
in response to message #2 by Meenzer*

Hi, Meenzer:

Meenzer posted:

*"So, if you replace X with K, it's still buggy. It seems at least there is no direct relation between the variable X and REGX."*

Yes, I knew, Meenzer. I don't actually state in my analysis above that the different X are related, matter of fact someone in the previous thread already mentioned that a change of variables makes no difference. Both being named X is most probably a coincidence.

After a pretty enthusiastic start, I'm beginning to worry somewhat about the HP35s (yet Gene said that this particular trait is also to be found in the HP33S, though no one knew).

Best regards from V.

### **Re: My analysis of Joel's HP35s' bug**

*Message #4 Posted by [Meenzer](#) on 16 Oct 2007, 10:26 a.m.,  
in response to message #3 by Valentin Albillo*

I now keyed in the EQN as "-R\*X\*INV(X\*Q-R)" which should be mathematically identical, both in EQN mode and as an EQN in a program. Both times the results are always correct.

When I change the original EQN to "-R\*X/((X\*Q-R))" with two pairs of parentheses, the result is also correct, both in EQN mode and in a program. So maybe it's a problem of operator priority.

Valentin, I know you didn't state that X and REGX had something to do with one another. I just wrote that to clarify, partly for myself ;-)

*Edited: 16 Oct 2007, 5:26 p.m.*

## Indeed a very *\*insightful\** analysis of Joel's HP35s' bug!

Message #5 Posted by **Karl Schneider** on 16 Oct 2007, 4:58 p.m.,  
in response to message #1 by Valentin Albillo

Hi, Valentin --

That looks like great work! I'll have to check out your "IDENTIFP" promptly, because I don't understand the concept of identifying constants as something other than exactly the entered value. (Perhaps "gets identified" really means "*can be identified*"?)

At the 2007 San Diego HHC conference, Cyrille showed how some of the bugs in the HP-33s were likely introduced. I'm sure that there are other gremlins waiting to trip us up.

-- KS

## Re: Indeed a very *\*insightful\** analysis of Joel's HP35s' bug!

Message #6 Posted by **Valentin Albillo** on 16 Oct 2007, 6:16 p.m.,  
in response to message #5 by Karl Schneider

Hi, Karl:

Karl posted:

*"That looks like great work!"*

Thanks for your kind appreciation

*"I'll have to check out your "IDENTIFP" promptly, because I don't understand the concept of identifying constants as something other than exactly the entered value."*

Please do. I think that a mathematically inclined reader such as you will probably find it very interesting, a real eye-opener. Essentially a very simple concept, yet the math applications seem limitless. You see, it can even be used for "forensic" detection purposes ! :-)

*"Perhaps "gets identified" really means "can be identified"?"*

You could say so, if you wish. IDENTIFP outputs both the symbolic expression that most closely evaluates to the constant being identified (depending on some input parameters such as range of functions to try, tolerances, etc) *and a confidence indicator* which goes from 0% to 100% and essentially measures the identification's reliability.

Values 95% and above are labeled "*identified as*" while lesser values are labeled "*might be*" and then it's up to the user to decide whether the alleged symbolic identification holds math merit or not. Please see the many (and I mean *many*) carefully chosen examples in the article to see how it all fits.

*"At the 2007 San Diego HHC conference, Cyrille showed how some of the bugs in the HP-33s were likely introduced."*

Should that be outside the NDA, it would be very interesting to get to know, to further heighten our understanding of the many caveats and pitfalls awaiting the daring ROM coders.

Best regards from V.

### Cosmetic comparison of early HP 35s with recent HP35s

Message #1 Posted by [Seth Morabito](#) on 16 Oct 2007, 12:28 a.m.

I finally opened the HP 35s that I received at HHC 2007. It's a very recent production unit, SN: CNA 73400663. It was made 13 weeks after my other HP 35s was produced, so I wanted to compare the two and see if there were any differences.

Both report having ROM version 1, so I don't think (nor did I expect) that there are any operational differences.

I do note that the printing is a bit clearer and bolder on the newer 35s. It's fairly noticeable on the yellow labels especially. They're more readable in my opinion.

The biggest change I notice is that the key click is definitely firmer on the new 35s. The old one has a softer click, like the 41C. The newer one has a very definite "click", more like a 12C's keys, or so it seems to my fingers.

Totally minor and insignificant changes, but somewhat interesting to a nosy fellow like me. (Also, apparently I have too much time on my hands, despite my workplace's best efforts)

*Edited: 16 Oct 2007, 12:30 a.m.*

### Re: Cosmetic comparison of early HP 35s with recent HP35s

Message #2 Posted by [Matt Kernal](#) on 16 Oct 2007, 2:13 p.m.,  
in response to message #1 by [Seth Morabito](#)

The 35S I received at HHC2007 has a small blemish in the faceplate opening where the "blue shift" key protrudes.

Instead of there being a perfectly straight line along the bottom edge of the rectangular-shaped hole, there is a small radius of missing material about 3mm from the lower-left corner. The blemish appears as shiny metal in the otherwise black background color of the faceplate.

Pure speculation here, but I don't think it occurred during the stamping of the faceplate, but rather during the printing of the yellow/gold shifted nomenclature, when the faceplate may have been secured by some kind of misaligned metal pin as part of a locating fixture.

Obviously, I too have too much time on my hands - except for this pile of work here that won't go away ;-)

Message #6 Posted by [Seth Morabito](#) on 16 Oct 2007, 8:38 p.m.,  
in response to message #5 by Brad Davis

They're not anywhere as stiff as a 50g. I find the 50g keys far too stiff myself. I think the 35s keys are nearly perfect. The newer keys have the same tactile response and pressure required, just a bit more "click" to them, that's all.

---

---

**Re: Cosmetic comparison of early HP 35s with recent HP35s**

Message #7 Posted by [Brad Davis](#) on 16 Oct 2007, 9:26 p.m.,  
in response to message #6 by Seth Morabito

Thanks Seth. I was wondering if I needed to buy 3-4 of the older 35s really quick!

I'm beyond happy with mine. I've been using HPs for almost 20 years and I am faster with my 35s than all the others. I'm slowest and least accurate with my 50g (well, my former 50g) and my 33s and it's entirely because the keys are too stiff and travel too far. I don't program calculators, so speed and accuracy are top priority.

in response to message #9 by Stefan Vorkoetter

Press C/ON and XEQ simultaneously to go into self-test mode. Then press the + key nine times to step through all the self-tests (pressing + will let you skip the keyboard test).

The top line should display "35S-OK", and one of the flag indicators should be set. Add 1 to the flag that is displayed, and that's the ROM revision. Mine displays the 0 flag indicator, so I have ROM version 1. Hopefully at some point in the future, we'll start seeing Flag 1 set, and a lot fewer bugs :)

When you're done, press C/ON + GTO to leave the self test mode.

### **Museum DVD missing page(s) of HP Journal Article from 1976 ...**

*Message #1 Posted by [Gene Wright](#) on 15 Oct 2007, 11:00 p.m.*

Looking for the final page (or two or three) from the 1976 HP Journal article on the HP 92 financial printing desktop calculator.

The PDF on the Museum DVDs ends at page 6 of this article .. but there is at least another page, since the text on this page ends with:

"Example: Key the following values into the HP 92:"

but that's it. :-)

Must be something missing.

Anyone have the final page or two?

### **REGX, REGY, REGZ... and a bit more. (HP35S)**

Message #1 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 15 Oct 2007, 10:35 p.m.

Hi, all;

I was trying some other things in the HP35S and I realized that REGX, REGY, etc. can be entered step by step ([RCL] R, [RCL] E, etc.) and work the same. IN fact, they are editable as any other valid equation sequence.

Well, this points to the fact that REGX, REGY and so are not actually functions, and that the HP35S SOLVE/EQN can be customized.

What other 'codes' might be valid?

And what is the chance that some of these 'internal codes' (if existing, no urban legend...) are found in a program and cause some unexpected behavior, like... an endless loop? If REGX, REGY and so are simply a sequence of characters that make sense, which others may exist that should be used in particular cases? I mean unsuspected sequences, like C,T, for example (found in John's program), that would cause no harm when executed step-by-step ('running program' flag cleared) but would lock the calculator when in running mode?

Maybe there's more to be inspected here... and HP might be of help if pointing some 'harm codes' out, if any.

Cheers.

Luiz (Brazil)

### **Is John's "never ending program" available online for download in word format?**

Message #1 Posted by [Gene Wright](#) on 15 Oct 2007, 8:52 p.m.

Thanks...want to give it a try on the range of 35s models I have.

The sooner...

Failing that, if ONE person could email it to me and then post here that it has been emailed (so that I don't get 1000 copies), that would be good too.

### **Re: Is John's "never ending program" available online for download in word format?**

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 15 Oct 2007, 9:22 p.m.,  
in response to message #1 by Gene Wright

Hi, Gene;

I have John's listing, but I am at the university right now and I do not have your e-mail address. I tried the MoHPC e-mail form, but has no attachment.

I'll be home later, if you have not yet received any I'll send you a copy.

Best regards.

Luiz (Brazil)

### **Luiz, you have email**

Message #10 Posted by [John Wasilewski](#) on 16 Oct 2007, 6:23 p.m.,  
in response to message #9 by Seth Morabito

Permission granted without hesitation.  
Please make version 05 available (already emailed to you).

If you think ver. 03 would also be useful, put that there as well, but I suggest you place a warning on the site about using ver 05 in preference. My own latest email is a bit long. Write your own guidance note on your web-page if you prefer, explaining what we need people to do and how they can help.

Could you also keep the log on teh web page of serial numbers known to have been tested properly?

John

### "14B - Fail 8" Message

Message #1 Posted by [Barbara Kanu](#) on 15 Oct 2007, 7:57 a.m.

Hello to all, I repeat the question that I found in the archive - no response was there:

"14B - Fail 8" Message Message #1 Posted by David Jobusch on 15 Sept 1999, 8:36 p.m. I've received email from someone asking about a problem they are having with their HP 14B. When the calculator is powered on, the display shows "14B - Fail 8". I don't have a 14B manual handy--does anyone know what this message means or can look this up for me? Thanks!

Do you have a solution for me? The error 8 is displayed and I don't know what to do now. Thanks a lot for any help. Best regards Barbara

### Re: "14B - Fail 8" Message

Message #2 Posted by [Miguel Toro](#) on 15 Oct 2007, 2:35 p.m.,  
in response to message #1 by [Barbara Kanu](#)

Hello Barbara,

Actually, this is the kind of message that you receive after a failed self-test. To clear it, you have to press and hold the "C" key and press the "PV" key then release both. If that does not work you can try this: press and hold "C", press and hold "N" and press "E+" (the summation key) then release them. That should reset the calculator and clear the memory.

There must be a problem with the machine. Try the self-test again with "C" + "PMT" for you to see if you get the error message again.

Regards,

Miguel

### Re: "14B - Fail 8" Message

Message #3 Posted by [Barbara Kanu](#) on 18 Oct 2007, 6:07 a.m.,

### HP 35s On/Off /Clear x reg Key

Message #1 Posted by [DavidB](#) on 15 Oct 2007, 2:00 a.m.

I don't know why I didn't notice this before, and sorry if this has been discussed already.

The key at the bottom left is labeled C in white letter and a blue -colored "ON"; it has a yellow-colored "OFF" above this key. Well, I think the "ON" label should be white as well.

Also, with the 35s turned on, I can turn it off using either sequence:

Shift-right

C key

or

Shift-left

C key

I never paid any attention to this when using my 32sII. This must be by design, as my 32sII also exhibits both OFF sequences.

Cheers!

David Bailey

### Re: HP 35s On/Off /Clear x reg Key

Message #2 Posted by [Karl Schneider](#) on 15 Oct 2007, 7:52 p.m.,  
in response to message #1 by DavidB

"DavidB" --

This has been mentioned before; it's a detail that was overlooked in the HP-35s , but not in the predecessor Pioneer-series models (e.g., HP-32SII), or even the HP-33s.

This may have been partly due to expedience in manufacturing: Only yellow is printed on the faceplate, but "a b/c" doesn't require the yellow shift key.

As you noted, either the yellow shift key or the blue shift key will work when turning the calc off. One can also pointlessly press the blue shift key prior to turning it on. So, the respective printed colors of "OFF" and "ON" are not *technically incorrect*, while "a b/c" in yellow actually is.

-- KS

*Edited: 15 Oct 2007, 7:54 p.m.*

**Re: HP 35s On/Off /Clear x reg Key**

*Message #3 Posted by [Martin Pinckney](#) on 16 Oct 2007, 11:24 a.m.,  
in response to message #2 by [Karl Schneider](#)*

The ab/c is **not** yellow on my 35s, but orange (like the alpha markings). Presumably this is to indicate that these functions are not related to either shift key, but their use is dependent on certain context of key input.

**Re: HP 35s On/Off /Clear x reg Key**

*Message #4 Posted by [Karl Schneider](#) on 16 Oct 2007, 4:15 p.m.,  
in response to message #3 by [Martin Pinckney](#)*

Hi, Martin --

Quote:

\_\_\_\_\_

The ab/c is not yellow on my 35s, but orange (like the alpha markings).

\_\_\_\_\_

Oh! So it is. (Darn that bad lighting...) So, why didn't HP just use white, as they did in the HP-32SII?

Quote:

\_\_\_\_\_

Presumably this is to indicate that these functions are not related to either shift key, but their use is dependent on certain context of key input.

\_\_\_\_\_

Probably so, but for consistency, "ON" could have been printed on in white on the faceplate, as it was on the HP-32SII...

**PDA program for HP50G?**

Message #1 Posted by [WoodyW](#) on 14 Oct 2007, 10:32 p.m.

Does anyone know of a PDA/organizer program written for the HP50G? My main goal is scheduling meetings/appointments and contact information such as names, phone numbers, etc.

I don't want to buy (if I can help it) a Palm PDA or one integrated into my phone when I already carry around a sizable chunk of technology in the form of the 50G.

Although I also own some 48GX's, but I would really rather have it on the 50G since I like the screen better than the 48's.

Thanks in advance for all comments.

**Re: PDA program for HP50G?**

Message #2 Posted by [Meenzer](#) on 15 Oct 2007, 1:31 a.m.,  
in response to message #1 by [WoodyW](#)

Have a look at [www.hpcalc.org](http://www.hpcalc.org)  
They have various PIMs and such.

Edited: 15 Oct 2007, 1:33 a.m.

**Re: PDA program for HP50G?**

Message #3 Posted by [S. Martin](#) on 15 Oct 2007, 9:17 a.m.,  
in response to message #1 by [WoodyW](#)

Try Organizer 1.1 by J. Levy and Alain Robillard. It runs perfectly on a 50G and is the best PDA program for the 48/49/50 series IMHO. For a phone book, try Scribe 1.01, by the same authors. It works in conjunction with Org.

Steve

[Organizer 1.1 program for 48/49/50 series](#)

[Scribe 1.01 program for the 48/49/50 series](#)

**Re: PDA program for HP50G?**

Message #4 Posted by [WoodyW](#) on 15 Oct 2007, 9:35 a.m.,  
in response to message #3 by [S. Martin](#)

Thanks to both of you for the information. I had looked at hpcalc.org, but did not realize that programs written for the other calcs would work with the 50G. Is this typical of 48/49 programs?

I will load them up and take them for a spin later today.

Thanks again.

### **Re: PDA program for HP50G?**

*Message #5 Posted by [Seth Morabito](#) on 15 Oct 2007, 12:43 p.m.,  
in response to message #4 by WoodyW*

Most 48 and 49 programs will work without any problem on the 50g.

### **Re: PDA program for HP50G?**

*Message #6 Posted by [Bruce Bergman](#) on 15 Oct 2007, 12:59 p.m.,  
in response to message #5 by Seth Morabito*

Most RPL programs written for the 48 will work on the 49/50. Some SYSRPL programs written for the 48 will work on the 49, and even less on the 50. Depends on what system calls they were using, etc. If it's pure RPL, you shouldn't have any problems.

thanks, bruce

### **Re: PDA program for HP50G?**

*Message #7 Posted by [James M. Prange \(Michigan\)](#) on 16 Oct 2007, 3:42 a.m.,  
in response to message #4 by WoodyW*

Quote:

Thanks to both of you for the information. I had looked at hpcalc.org, but did not realize that programs written for the other calcs would work with the 50G. Is this typical of 48/49 programs?

First, some definitions. By "48 series", I mean the 48SX, 48S, 48GX, 48G, and 48G+. By "49 series", I mean the 49G, 49g+, 48gII, and 50g.

For the 49G, the "ROM" revision should be at least 1.19-6, but preferably 2.09 or 2.10-7. Of course the 49g+ and 50g should use 2.09 or 2.10-7. With the 48gII, the ROM really is Read-Only Memory, so you're stuck with whatever the unit was manufactured with.

For pure UserRPL programs, a Kermit "ASCII" (source code) transfer from a 48 series to a 49 series will usually work, although a few 48 series commands may behave differently in the 49 series. Note that for any SYSEVAL or LIBEVAL command, the entry point will probably have to be changed.

In general, binary transfers between the 48 and 49 series won't work. However, for a pure UserRPL 48 series program, you can use a binary transfer to a 48 series calculator or a 48 series emulator, and then a Kermit ASCII transfer from there.

To use a 48 series SysRPL program in a 49 series, if you have the source code, then it should be possible to port it to the 49 series.

Any 49 series UserRPL program will work in any 49 series calculator.

For 49 series SysRPL programs, if only supported entry points are used, then they'll work in any 49 series calculator. If unsupported entry points are used, they may crash with any other ROM revision.

Anything for the ARM-based models (49g+, 48gII, and 50g) that uses the underlying ARM processor or uses the added "Saturnator" assembly language instructions, instead of sticking to RPL or legacy hardware Saturn instructions, won't work in the 49G or the Emu48-based emulators.

Regards,  
James

### 49g+/50 G Backup to SD Card

Message #1 Posted by [David Bengtson](#) on 14 Oct 2007, 4:38 p.m.

Below is a listing of a backup routine I use on my 49g+ to back up everything to a directory on an SD card. The directory used is \bkup\YYYYMMDD.hhm, so every backup is in a unique directory. I've assigned this to an alarm that runs at 1:00 am daily so I have daily full backups. Since I have a 256 MByte card, I'm not worried about running out of storage. Every couple of weeks I go and delete the older directories.

I used a routine posted here that I'm unable to relocate, to copy everything in a port to a directory on an SD card. There is 1 syseval used to convert from a string to a global name. The backup is wrapped in a program that stores it in the variable 'bkup'.

I hope people find this useful.

Dave

```

%%HP: T(3)A(R)F(.);
@ Personal Backup Routine.
@
@ 5/4/2007 Started.
@ Backup User Keys to 'MyKEYS'
@ Backup Flags to 'MyFLAGS'

@ Wrap this in another wrapper to store the program into the variable "bkup"
\<<
@
@ Start of Executable
@
\<<
    @ Change Directory to Home
    PATH { HOME } EVAL

    @ Backup User keys and flags to variables in home directory
    RCLKEYS 'MyKEYS' STO
    RCLF 'MyFLAGS' STO
    @ Change to Std Display to generate Base Folder Name
    -49 CF -50 CF
    @ Generate a base folder name for the backups
    @ in the format YYYYMMDD.HHM
    "bkup/"
    @ generate YYYY0000
    DATE 100 * FP 100000000 *
    @ Generate MMDD and add to YYYY0000
    DATE 100 * IP 100 / DUP FP 10000 * + IP +
    @ Generate .HHM. Want to keep the directory in 8.3 format
    TIME 10 * IP 1000 / + \->STR +
    @ Done with Base, archive Home.
    @ Save latest backup name to a variable
    DUP 'BackupPath' STO
    @ Generate global name for backup.
    DUP "/Home.bck" +
    #05B15h SYSEVAL
    3. \->TAG @ Generate :3:\Backup\YYYYMMDD.HHM\Home.bck
    @ 06/01/2007 At this point, ARCHIVE is puking because the :3:\Backup\.. Is
    @ a string instead of global name.
    @ Fixed with a syseval. Doing it in user rpl didn't work because of the slashes.
    ARCHIVE
    @ Now I have home backed up, I can move to the ports. Use a routine from
    @ hpmuseum to write port variables to a backup.

```

```

## Re: 49g+/50 G Backup to SD Card

Message #2 Posted by [Giancarlo \(Italy\)](#) on 15 Oct 2007, 6:57 a.m.,  
in response to message #1 by David Bengtson

Hi David.

First of all, thank you for sharing your program here.

I immediately put in onto my 50G to try it, but it errored out with a:

```

ARCHIVE Error:
Invalid DOS Name

```

message.

Seems like the ARCHIVE puking you mention in the comments is not cleared... Or - most probably - I missed something :-)

May you please help?

Thanks in advance.

Best regards.

Giancarlo

### **Re: 49g+/50 G Backup to SD Card**

*Message #3 Posted by [David Bengtson](#) on 15 Oct 2007, 8:02 p.m.,  
in response to message #2 by Giancarlo (Italy)*

You're probably using a comma instead of a decimal point, so when I create the directory name from the time, there is a comma instead of a period. Give me a couple of days and I'll fix it. I'll change the flag to be a decimal point, and then change it back at the end.

Dave

### **Re: 49g+/50 G Backup to SD Card**

*Message #4 Posted by [Giancarlo \(Italy\)](#) on 16 Oct 2007, 2:21 a.m.,  
in response to message #3 by David Bengtson*

Hi David.

Don't know if I got your point, but I tried several times to SST through your program in DEBUG mode, and I could see that TIME generated the number with a period.

For instance, trying it right now (it's about 8:18 AM GMT+1) it gives:

8.1826960083

and no comma is used :-?

Hope this is meaningful to you - in any case, thank you for your feedback & support.

Best regards.

Giancarlo

### **Re: 49g+/50 G Backup to SD Card**

*Message #5 Posted by [James M. Prange \(Michigan\)](#) on 16 Oct 2007, 7:26 a.m.,  
in response to message #4 by Giancarlo (Italy)*

Hi David and Giancarlo,

Giancarlo:

David's program, exactly as posted, works for me.

Quote:

Don't know if I got your point, but I tried several times to SST through your program in DEBUG mode,

and I could see that TIME generated the number with a period.

For instance, trying it right now (it's about 8:18 AM GMT+1) it gives:

8.1826960083

and no comma is used :-?

I think that the concern was that if you had your "fraction mark" mode set to use a comma instead of a period, then a valid name wouldn't be generated. However, David's use of SysRPL command `$>ID` via the SYSEVAL sequence allows any characters to be used in a global name. The only problem is that using the comma means that the subdirectory will be stored as a "long filename" on the card, as well as a generated "short filename", and the filer shows only the generated short filename, which isn't as useful. For example (on 2007-10-16, about 06:33), with the comma, the subdirectory will be stored as both 20071610,063 and 200716~1 (or similar), but only 200716~1 will be shown in the filer. Using the period, the subdirectory will be stored only as 20071610.063 (a "short filename"), and will be shown as such in the filer. Note that the format of the date portion depends on the state of flag -42.

Anyway, I think that the cause of your "Invalid DOS Name" error lies elsewhere. In case you keyed in the program manually, perhaps you used `"\"` where you should've used `"/`?

Note that for a relatively long program nicely posted as David's is, with an ASCII transfer header and proper translation sequences, the easiest way to get it into your calculator is to start an Edit of his post, copy and paste everything between his `[pre]` and `[/pre]` codes to a plain text file, and transfer the file to the calculator.

For the file as posted (including the "wrapper" program with the 'bkup' STO sequence), the BYTES command returns `#BA3h` and `721.5`, and after running that, BYTES on the bkup program returns `#B6AFh` and `694`.

David:

Your program is good as posted, and I hope you won't mind my pointing out a few possible improvements.

- The `{ HOME }` EVAL sequence can be replaced by the command HOME.
- The `-49 CF -50 CF` sequence can be replaced by the command STD.
- "Meaningful" local names are nice during development, but you can save a few bytes by replacing them with 1-character local names for the finished program.
- After running the program, the global variables MyKEYS, MyFLAGS, and BackupPath are left in the home directory. Perhaps purge MyKEYS and MyFLAGS after their last uses in the program?

Now that I think of it, the user keys (and alarms) are stored in the hidden subdirectory, which is backed up as part of the home directory by the ARCHIVE command and restored by the RESTORE command, so it isn't necessary to back them up in a global variable separately.

Why bother storing BackupPath at all?

Of course, if you really do want these variables to be left in the home directory when the program finishes, then suit yourself.

- If you really want to get fancy, you could include a FixUp program (stored as a global variable) to be run after a RESTORE, that would restore the saved flags, move any libraries and port variables ("backup objects") back to their original ports, and delete the archived MyFLAG variable and the FixUp program itself. For some ideas on how to accomplish this, see Bill Wickes's XARCHIVE program in either of his *HP 48 Insights Part I: Principles and Programming* books, available in the Museum CD/DVD-ROM set.
- As you've already noted, flag -51 should be forced to clear ("Fraction mark: .") to ensure a nice file name.
- Regarding your `#05B15h` SYSEVAL sequence, this of course invokes the SysRPL command `$>ID`. A possible alternative would be to use the `S~N` command from the built-in development library, but this would have the disadvantage that library 256 would have to be

attached when the program is compiled.

- When posting programs, it's helpful to others to include the results from the BYTES command, perhaps as a program comment.
- Using the wrapper program with the 'bkup' STO sequence may be useful for a recursive program that calls itself by name, but in general, it just means that the originally downloaded program will be left in the home directory, as well as the 'bkup' program, and the user will want to purge it. I think it better to just let the user decide the name, except in the case of those recursive programs, where the required name can be stated in a comment.

A basic problem with using subdirectories on the flash card is that they can't be deleted by the calculator itself (at least with built-in tools; some HPGCC tools may be able to); you have to use a PC (or possibly, added on tools) to do so.

Regards,  
James

## Re: 49g+/50 G Backup to SD Card

Message #6 Posted by [Giancarlo \(Italy\)](#) on 16 Oct 2007, 9:21 a.m.,  
in response to message #5 by James M. Prange (Michigan)

Hi James.

First of all, thank you for your kind support and feedback :-)

Quote:

I think that the concern was that if you had your "fraction mark" mode set to use a comma instead of a period, then a valid name wouldn't be generated

No, as far as I can remember (I'm not with my 50G at hand right now...) the calc uses a period as fraction mark (i.e. flag -51 clear).

Quote:

In case you keyed in the program manually, perhaps you used "\" where you should've used "/"?

Note that for a relatively long program nicely posted as David's is, with an ASCII transfer header and proper translation sequences, the easiest way to get it into your calculator is to start an Edit of his post, copy and paste everything between his

and

codes to a plain text file, and transfer the file to the calculator.

Well, actually I copied and pasted the text from David's e-mail into a plain text file on my laptop,  
then copied it onto the SD and then RCL'ed it on the stack of the 50G.  
Then, I run the 'IN' utility by John H. Meyers:

Quote:

```
\<< \->STR 3 TRANSIO RCLF SIZE 3 < #3016Bh #2F34Dh IFTE SYSEVAL +
```

STR\-> \>>

---

to translate the text into a program (forgive me for the simplification).

Subsequently, I stored it into a var named 'BKUP' and run it.

All in all, I think I didn't change a comma ;- ) of the whole listing...

I get the error I quoted in my first reply when the ARCHIVE command was issued;

when I used the SST utility, I could see that the #05B15h SYSEVAL command "transformed" the double-quote delimitator into a single one - I mean something like this:

```
":3:\Backup\YYYYMMDD.HHM\Home.bck"
```

```
#05B15h SYSEVAL
```

```
' :3:\Backup\YYYYMMDD.HHM\Home.bck'
```

then the ARCHIVE errored out....

OTOH, your hint about the date format gets me doubtful

Quote:

---

Note that the format of the date portion depends on the state of flag -42.

---

I'll double check as soon as I can - do you think that could be a root cause for my issue? Please let me know if and how can I help you to help me by providing you more (detailed) information.

In the meanwhile, thank you very much for your assistance.

Best regards.

Giancarlo

## Re: 49g+/50 G Backup to SD Card

Message #7 Posted by [James M. Prange \(Michigan\)](#) on 16 Oct 2007, 1:11 p.m.,  
in response to message #6 by Giancarlo (Italy)

Hi Giancarlo,

Quote:

---

First of all, thank you for your kind support and feedback :-)

---

You're quite welcome.

Quote:

---

Quote:

---

I think that the concern was that if you had your "fraction mark" mode set to use a comma instead of a period, then a valid name wouldn't be generated

---

No, as far as I can remember (I'm not with my 50G at hand right now...) the calc uses a period as fraction mark (i.e. flag -51 clear).

Quote:

---

In case you keyed in the program manually, perhaps you used "\"

where you should've used "/"?

Note that for a relatively long program nicely posted as David's is, with an ASCII transfer header and proper translation sequences, the easiest way to get it into your calculator is to start an Edit of his post, copy and paste everything between his [pre] and [/pre] codes to a plain text file, and transfer the file to the calculator.

---

Well, actually I copied and pasted the text from David's e-mail into a plain text file on my laptop, then copied it onto the SD and then RCL'ed it on the stack of the 50G. Then, I run the 'IN' utility by John H. Meyers:

Quote:

---

```
\<< \->STR 3 TRANSIO RCLF SIZE 3 < #3016Bh #2F34Dh IFTE
SYSEVAL + STR\-> \>>
```

---

to translate the text into a program (forgive me for the simplification).

Since no angular components are used, your calculator is using the period for the fraction mark, and apparently you didn't include the

```
%%HP: T(3)A(R)F(.);
```

transfer header, that would work correctly.

What about the results from the BYTES command? Are your results the same as mine?

Note that John's RCLF SIZE 3 < sequence is a clever way of distinguishing between the 48 and 49 series, so that the correct entry point can be selected to invoke the SysRPL command KINVISLF, which does the ASCII translations.

Quote:

---

Subsequently, I stored it into a var named 'BKUP' and run it.

---

Right, which would've created a new variable 'bkup', with the "unwrapped" program stored in it. Or if you really stored the downloaded program as 'bkup', then the contents of 'bkup' would've been replaced by the unwrapped program instead of creating a new variable.

Quote:

---

All in all, I think I didn't change a comma ;- ) of the whole listing... I get the error I quoted in my first reply when the ARCHIVE command was issued; when I used the SST utility, I could see that the #05B15h SYSEVAL command "transformed" the double-quote delimiter into a single one - I mean something like this:

```
":3:\Backup\YYYYMMDD.HHM\Home.bck"
#05B15h SYSEVAL
':3:\Backup\YYYYMMDD.HHM\Home.bck'
```

---

As it should've done, except that it should be 'bkup/YYYYMMDD.HHM/Home.bck' or 'bkup/YYYYDDMM/Home.bck', depending on the state of flag -42. Note the forward slashes ("/) instead of backslashes ("\), and the tag (:3:) shouldn't be within the name.

Quote:

\_\_\_\_\_

then the ARCHIVE errored out....

\_\_\_\_\_

Well, I'm rather at a loss as to why it works for me but not for you.

Single-stepping through the program, just before executing the ARCHIVE command, you should have a tagged path name similar to

```
3. :  
bkup/20071610.121/Home.bck
```

or

```
3. :  
bckup/20071016.121/Home.bck
```

on stack level 1.

Quote:

\_\_\_\_\_

OTOH, your hint about the date format gets me doubtful

Quote:

\_\_\_\_\_

Note that the format of the date portion depends on the state of flag -42.

\_\_\_\_\_

I'll double check as soon as I can - do you think that could be a root cause for my issue?

\_\_\_\_\_

No. With flag -42 clear, the subdirectory name should be in a YYYYDDMM.HHM format, and with flag -42 set, it should be in a YYYYMMDD.HHM format. Either way, it shouldn't cause an error.

Quote:

\_\_\_\_\_

Please let me know if and how can I help you to help me by providing you more (detailed) information.

\_\_\_\_\_

Offhand, the results from the BYTES command run on your program would probably be the most helpful.

I doubt that this has anything to do with the problem, but which ROM revision is your 50g using?

Quote:

\_\_\_\_\_

In the meanwhile, thank you very much for your assistance.

\_\_\_\_\_

Again, you're welcome.

Regards,  
James

## Re: 49g+/50 G Backup to SD Card

Message #8 Posted by [Giancarlo \(Italy\)](#) on 16 Oct 2007, 4:33 p.m.,  
in response to message #7 by James M. Prange (Michigan)

Hi James.

Quote:

[...] and apparently you didn't include the %%HP: T(3)A(R)F(.); transfer header, that would work correctly

Correct. I did not include the transfer header 'cause there was no real "transfer" but the copy'n'paste into a text file then its recalling on the stack by means of the built-in filer.

Quote:

What about the results from the BYTES command? Are your results the same as mine?

This is a major puzzling clue - in fact I get:

```
'BKUP'
BYTES
#7188h
702.5
```

and this is not the same as yours - Hmmmm....

Quote:

I doubt that this has anything to do with the problem, but which ROM revision is your 50g using?

I doubt that as well, but however here's the output of the VERSION command:

```
"Version HP50-C
Revision #2.09"
```

By the way, the SD card I used (SanDisk 512 Mb) is the "usual" one I've been currently using for any other file transfer between 50G and laptop, with no major issues so far... In case you think it might prove helpful and you're willing to take a look, here follows what I can see on stack level 1 (right column) when single-stepping through the program in DBUG mode (left column):

```
"bkup/ "          "bkup/ "
DATE              10.162007
100.              100.

+             20071610.22
\-->STR        "20071610.22"
+             "bkup/20071610.22"
DUP           "bkup/20071610.22"
'BackupPath'  'BackupPath'
STO
DUP           "bkup/20071610.22"
"/Home.bck"  "/Home.bck"
+            "bkup/20071610.22/Home.bck"
#05B15h      # 5B15h
SYSEVAL      'bkup/20071610.22/Home.bck'
3.           3.
\-->TAG       3.: bkup/20071610.22/Home.bck
ARCHIVE      ARCHIVE Error: Invalid DOS name

```

Recalling that checksum different from yours, would you advise to go through each single line/command of the listing to check whether some misspelling slipped in?

===[EDIT]===

I made a spell check and the only differences between David's listing and my 50G program are:

1) all the numbers are reals - i.e. I have:

-49. CF

-50. CF

and

100.

100000000. and so on

2) the argument for SYSEVAL is shown as # 5B15h with no leading zero before the "5"  
..Still pointless differences, to me....

===[/EDIT]===

Thanks in advance for your precious feedbacks.

Warmest regards.

Giancarlo

*Edited: 16 Oct 2007, 5:06 p.m.*

## Re: 49g+/50 G Backup to SD Card

Message #9 Posted by **James M. Prange (Michigan)** on 16 Oct 2007, 11:04 p.m.,  
in response to message #8 by Giancarlo (Italy)

Hi Giancarlo,

Quote:

Correct. I did not include the transfer header 'cause there was no real

"transfer" but the copy'n'paste into a text file then its recalling on the stack by means of the built-in filer.

---

And just to be certain, I did that and tried John's IN program, and got exactly the same results as with my own program to convert a source code string to an object.

Quote:

---

Quote:

---

What about the results from the BYTES command? Are your results the same as mine?

---

This is a major puzzling clue - in fact I get:

```
'BKUP '  
BYTES  
#7188h  
702.5
```

and this is not the same as yours - Hmmm....

---

Part of that may be explained by my recalling the stored object itself to the stack (as in 'bkup' RCL BYTES) instead of using the quoted global name (as in 'bkup' BYTES). My reasoning is that (except for a recursive program that calls itself by name), the name could be any valid global name that the user happens to choose, without affecting the object's execution, and if the quoted name is used, then its size plus 1 byte for the variable structure is included in the size that BYTES returns; that is, it returns the amount of memory actually used to store the variable, but I'm more interested in the size of the program itself. But using the name doesn't affect the BYTES command's checksum result; that's calculated using the stored object only.

Anyway, doing 'bkup' BYTES (with the program compiled in exact mode) returns:

```
# B6AFh  
702.5
```

That's the same size that you got (an extra 8.5 bytes because of the 4-character name), but the same checksum that I got before, which indicates a real difference between my program and yours.

Quote:

---

I doubt that as well, but however here's the output of the VERSION command:

```
"Version HP50-C  
Revision #2.09"
```

---

Okay, I was using 2.10-7, so I re-flashed to 2.09, but, as I expected, that didn't make any difference for this program.

Quote:

---

By the way, the SD card I used (SanDisk 512 Mb) is the "usual" one I've

been currently using for any other file transfer between 50G and laptop, with no major issues so far...

Okay, I very much doubt that there's any problem with the card.

Quote:

In case you think it might prove helpful and you're willing to take a look, here follows what I can see on stack level 1 (right column) when single-stepping through the program in DEBUG mode (left column):

```

"bkup/ "          "bkup/ "

\->STR          "20071610.22"
+               "bkup/20071610.22"
DUP             "bkup/20071610.22"
'BackupPath'   'BackupPath'
STO
DUP             "bkup/20071610.22"
"/Home.bck"    "/Home.bck"
+               "bkup/20071610.22/Home.bck"
#05B15h        # 5B15h
SYSEVAL        'bkup/20071610.22/Home.bck'
3.             3.
\->TAG          3.: bkup/20071610.22/Home.bck

```

Up to here, with the program compiled in approximate mode, the only differences that I noticed are due to the different times. Okay, your 20071610.22 subdirectory name is an "8.2 name" (due to being in STD mode instead of 3 FIX mode when `\->STR` runs) instead of an "8.3 name", but that won't cause the ARCHIVE command to error out; any name with only characters valid for a filename should work as well, as long as there are no more than 8 characters before the "dot" and no more than 3 characters following it. Even extra characters won't cause an error, they'll simply cause it to be treated as a "long filename".

Quote:

```

ARCHIVE          ARCHIVE Error: Invalid DOS name

```

But here, my ARCHIVE command doesn't error out, and I can continue the program

to completion. Why does it error out for you but not for me? I don't know; that doesn't make any sense to me. I note that ARCHIVE isn't erroring out with a "Bad Argument Type", so it isn't objecting to having a tagged name for its argument. And since it's causing an "Invalid DOS name" error, it seems to me that it must be recognizing the tag correctly and trying to archive to the card. To me, it seems to act as if one (or more) of the characters in the name isn't valid for a filename, but why?

Quote:

---

I made a spell check and the only differences between David's listing and my 50G program are:

1) all the numbers are reals - i.e. I have:

-49. CF

-50. CF

and

100.

100000000. and so on

---

Okay, I surmise that your calculator was in approximate mode when you compiled the program with John's IN program. I edited my program in approximate mode to recompile the zints to reals.

Quote:

---

2) the argument for SYSEVAL is shown as # 5B15h with no leading zero before the "5"

---

That's normal; although the calculator will accept leading zeros in the source code (command line or other editor, string to be compiled by the STR\-> command, source code file, etc.), after compiling to an object, it will never decompile (for stack display, editing, printing, transfer, etc.) with leading zeros.

Quote:

---

..Still pointless differences, to me....

---

I agree, and whether I compile in exact mode (so that zints are compiled as zints) or in approximate mode (so that zints are compiled as reals), the program works for me.

But with the program compiled in approximate mode, both the checksum and size change. For 'bkup' RCL BYTES, I now get:

```
# F3A2h
  722.5
```

This problem is really starting to bug me.

This is clutching at straws, but try this: Purge your current program, and then, with the calculator in exact mode, run John's IN program on the source code string again, store the resulting "wrapper" program in a variable, and run the wrapper program to create (or replace) the 'bkup' variable. Then do 'bkup' RCL BYTES and see if it returns the same results that I get:

```
# B6AF4h
  694.
```

I'd just like to be certain that we're both using exactly the same program.

And of course, try out the newly compiled program.

Regards,  
James

## Re: 49g+/50 G Backup to SD Card

*Message #10 Posted by [Giancarlo \(Italy\)](#) on 17 Oct 2007, 5:48 a.m.,  
in response to message #9 by James M. Prange (Michigan)*

Hi James.

Quote:

try this: Purge your current program, and then, with the calculator in exact mode, run John's IN program on the source code string again, store the resulting "wrapper" program in a variable, and run the wrapper program to create (or replace) the 'bkup' variable. Then do 'bkup' RCL BYTES and see if it returns the same results that I get: # B6AF4h 694. I'd just like to be certain that we're both using exactly the same program.

---

I tried exactly what you suggested, and I got:

```
'bkup'
RCL
BYTES
```

```
# B6AFh
694.
```

The newly compiled program errors out exactly as before....

Then, I started to experiment... :->

Inserting the SD into my laptop card reader and trying to rearrange the files on it, I attempted to delete a "20070717" folder but I couldn't do that!

Win2k kept on maintaining that it was "Impossible to delete" that object.

So I moved all the files but that single folder from the SD to a backing folder, then \*formatted\* (FAT16) the SD, then copied back onto it the files.

Guess what? Now **everything went smooth** with David's routine!

What I suppose is that - for unknown reasons - some bytes of the SD had been "screwed up", preventing any other instance of David's routine to operate correctly.

By the way, I had also made a cross-check using a [similar routine by Jorge Cevallos M.](#) and it had proved successful (I think that routine by Jorge is fine as well).

OK, the nightmare seems over now :-)

Let me thank you once again for your support and your always helpful and instructive support.

Best regards.  
Giancarlo

## Re: 49g+/50 G Backup to SD Card

Message #11 Posted by [James M. Prange \(Michigan\)](#) on 19 Oct 2007, 4:19 a.m.,  
in response to message #10 by [Giancarlo \(Italy\)](#)

Hi Giancarlo,

I'm certainly glad to read that you found and fixed the problem.

So it was a problem with the card itself after all. I suppose that I should've guessed that; after all, I couldn't come up with any reasonable explanation for why it should work for David and me, but not for you. I was considering a possible problem with a different boot ROM version, but that seemed very unlikely.

It seems very strange to me that a problem with the card would cause an "Invalid DOS Name" error. I'd expect something like "Object In Use" or some other one of the messages that added with the 49g+ that seem to be related to the card:

```
"Invalid DOS Name"  
"File already opened"  
"Invalid File Handle"  
"Invalid File Index"  
"Invalid File Mode"  
"Disk Full"  
"Disk Format Error"  
"Disk Change"  
"No SD card inserted"  
"Not enough ARM memory"  
"DOS call unsupported"  
"DOS unknown error"  
"Disk Protected"
```

So it's all your fault, for using a corrupted SD card! ;-)

Well, seriously, it was educational; I learned a few things during this exercise.

Regards,  
James

## Re: 49g+/50 G Backup to SD Card

Message #12 Posted by [Ed Look](#) on 19 Oct 2007, 9:08 p.m.,  
in response to message #10 by [Giancarlo \(Italy\)](#)

Giancarlo, the other day, I was transferring some files from one SD card to another, via card readers connected to my PC. I noticed that there were some that were not on my hard drive, so I attempted to simply drag and drop it to the appropriate directory on my hard disk. But one set of files just wouldn't copy or paste or delete, as in your case, and they happened to be all stuff relating to HP calculators.

I was fairly upset at the prospect of having to lose the material through reformatting or some such operation (though probably, I could find it again on the various HP calc sites) when I decided to try to transfer them one directory at a time. That worked! Well, it did until I got to one folder. Now that I got smart, I tried now to move them one file at a time, and that worked!

That is, until I got to the one offending file. It was one of the programs for a HP calc communicating with a PC.

I suspect that as new a piece of technology as flash memory devices are, no one really knows all the ways they can screw up, yet. It's hard for me to imagine that a collection of transistors can develop "bad sectors" like a piece of iron oxide coated plastic or aluminum, but there may be times or circumstances in which they might "misfire" and corrupt the data stored at that location... so badly that it becomes not only an unreadable file, but an undeletable one at that.

Oh, how did I get out of this predicament? I found myself getting a bit depressed and getting wistful and nostalgic about the old DOS days of 8088 and 80x86 computers and that wonderful set of software, the OLD Norton Utilities. Then it hit me that WinXP's got a little of that and I had the offending SD card "error-checked" (I guess it might be like the old Norton Utilities' Norton Disk Doctor) and not only did it find errors, it essentially fixed them! The bad file became a set of useless files, but now they were deletable! My SD card got saved... and the all the data (except for that one stupid file) got saved!

(I had a copy of that program on a Zip disk, which I promptly copied back onto the now working SD card.)

*Message #14 Posted by [David Bengtson](#) on 17 Oct 2007, 8:08 p.m., in response to message #5 by James M. Prange (Michigan)*

James:

THanks for your helpful comments.

I've saved flags, keys and the backup path for a couple of reasons. I find it useful to have my flags backed up in a variable just in case, and I was unaware the the user keys are archived. I save the backup path because the next thing to do with this is to write a restore routine, and having the backup path seems convenient.

I use the wrapper program because of the way I develop programs. I use a text editor on a PC, and copy and paste into emu49 and use emu49asc to convert it to an executable. This leave the executable on the stack, and using the wrapper let's me just press eval and I get it stored into a variable. . Once it's debugged, I save it to a sd card and retrieve it to the stack, where I repeat the process. I find that this wrapper is convenient for me, but you are correct, it's a item of confusion.

I hadn't gotten to deleting directories on the calculator yet, I'll have to ponder how to do that. This approach is easy, but has the potential error of running out of space on a small sd card. This call's for some thought.

Dave

I believe that there's an HPGCC application, [SDfiler](#), that can do it, but as for as I know, short of using ARM code, no one's found a way to get the calculator to delete subdirectories on the card. Let us know if you find one.

Thank you for what looks like a fantastic backup utility.

One quick question ... What if I can't get the calculator to see the SD card? I was able to use the card to install the 2.09 update on an HP50g, but after resetting the calculator, it won't see the card.

If this is a hardware problem in the calculator (instead of operator error) I'd like to figure it out during the warranty period.

### **MMC/SD card problems.**

*Message #20 Posted by **James M. Prange (Michigan)** on 17 Oct 2007, 4:55 a.m.,  
in response to message #19 by Chris McCormack*

If this is a hardware problem in the calculator (instead of operator error) I'd like to figure it out during the warranty period.

---

Well, of course it could be a hardware problem with the calculator, but do try some other things first.

Do the card's contacts look clean and undamaged? Maybe try cleaning and lightly burnishing them, with, for example, an "ink" or "typewriter" eraser, just enough so that they look nice and shiny. Be sure to dust off any "eraser crumbs" before trying to use the card.

Can the card be read by a card reader on a PC? If not, then obviously something's wrong with it; try formatting it.

Note that various disk testing utilities, such as Microsoft ScanDisk and Norton Disk Doctor, can be used to test the card in a card reader.

Forgive me for asking about something so basic, but are you certain that the card is properly inserted? Label side toward the back of the calculator, and pushed in until it's almost flush with the bottom?

I doubt that this would help, but maybe at least temporarily try a fresh set of AAA cells? If it doesn't help, you can set them aside for later use.

Did the problem start immediately after flashing the ROM to 2.09? If that's the case, then perhaps the ROM didn't really get flashed properly. Maybe try flashing it to 2.09 again. Of course, if it won't recognize the card, then you'll have to use Conn4x to flash it, which really isn't all that much more difficult. But to use Conn4x, you'll have to be using an MS Windows OS.

I suppose that it's possible that RAM somehow got corrupted, and that that's somehow causing the calculator to fail to recognize the card. To check for this possibility, first do a RCLF and STO the flag list to a global variable, then use the ARCHIVE command to back up user memory to port 2, or use Conn4x's "Backup..." function to back it up to a PC. If you have anything in port 0 (which I don't recommend when any other port is available), also back this up to some safe place. After you're certain that the home directory and anything in port 0 is safely backed up, do a memory clear by holding down the ON, A, and F keys together, and then releasing F, A, and ON in that order. This gets you to the TTRM ("Try To Recover Memory?") display. Press NO to clear user memory and port 0, and also to restore the RAM reserved for system use to its default state. Now try the card. Later, recall the backup object created by ARCHIVE to the stack, and do a RESTORE command, then RCL your flag list, and do a STOF. If you had anything in port 0, then decide what to do with it; preferably, it should be stored in port 1 or 2.

It could be that the card's file system somehow got corrupted.

Maybe try formatting the card with the calculator: Hold down ON, press and release F, and then release ON; this should give you a self-tests display. With the card inserted, press the - key for the CARD utilities. If you get a "PLEASE INSERT CARD" message, then try formatting the card with a PC instead. If you get a "1.TEST" "2.FORMAT" message, then the calculator has detected the card; press the 2 key for the FORMAT utility, then press the 1 key to actually start formatting. If the "WAITING....." message is displayed for more than a few seconds, then try formatting the card with a PC instead. Wait for the "FORMAT FINISH" message and then press ENTER to exit to the card utility display. Now press the 1 key to run a card test (which, if the card is good, will return a "TEST OK" message, but apparently, a "TEST OK" message doesn't necessarily mean that the card really is "good"; see below), and then follow the prompts to back out and do a reboot.

And yes, I do realize that the filer includes a FORMAT operation if a card is detected, but I've had occasions when that failed but the self-test FORMAT operation worked. Maybe the filer's FORMAT operation does only a "quick" format instead of a "full" format? That's something that I've never checked on.

If the above doesn't work, then try formatting the card in a card reader on a PC.

If you still can't get the card to work, then try a different card; they're reasonably low-cost these days, and even the lowest capacity cards ever made are plenty big enough for typical uses with the calculator.

If a "known-good" card, correctly formatted to a FAT12, FAT16, or FAT32 file system (especially if tested in a different 50g or a 49g+), won't work in the calculator after a memory clear, then I'd conclude

that the calculator very likely has a hardware problem.

For what it's worth, I was given a couple of Samsung 32MB RS-MMC cards. If I insert either one of these cards with the calculator turned off, then there's usually no apparent response to the ON key, and no response to an ON&C or an ON&A&F either, even if I remove the card and try again. A "paper-clip reset" to invoke a warmstart is required to get it running again. The paper-clip reset also works if the card is still inserted. If I do a warmstart with the card inserted to get the calculator running, or I insert the card after the calculator is already ON, then everything seems okay unless I try to start the filer, in which case the calculator usually "hangs" with the busy annunciator on, and won't respond to the keyboard at all; another paper-clip reset is required to get it running again. With the card inserted and the calculator running, the card self-test usually returns "TEST OK", and the self-test's FORMAT operation will usually format the card. These cards usually seem to work okay with various card-readers on PCs. So there can be "borderline" cards that sometimes seem to work okay in some situations.

Formatting a card with a PC may (depending on your operating system or formatting utility) give you more flexibility in how it's formatted, such as file system type, cluster size, and so on.

If the calculator is turned on with a card inserted, then there will be a delay (sometimes not really noticeable) before anything appears in the display. Of course slower cards cause a longer delay, but also, it seems that the larger the FATs are, or perhaps the more clusters are in the file system (larger capacity or smaller cluster size), the longer the delay is. If this delay seems annoyingly long, then (for a card larger than 32MB) maybe format it to a FAT16 file system instead of FAT32, which results in smaller FATs and fewer (but larger) clusters. The trade-offs are that larger clusters typically result in more slack space, the root directory for FAT16 is limited to 512 entries (at most, when only "short filenames" are used), and fewer files can be stored, but these usually aren't significant problems; if you use the card only for the calculator, then you'll probably never use up all of the card's capacity or maximum number of files anyway, and having many entries in the root directory can cause an annoying delay when starting the filer.

If the filer takes an annoyingly long time to start, then make some subdirectories and move your files from the root directory to somewhere else in the directory "tree", or delete unwanted files that have accumulated. The idea is to reduce the number of entries in the root directory.

For those really "into" formatting and partitioning, the calculator can use a card that has an MBR (Master Boot Record), like a hard disk (cards are often supplied this way), but an MBR isn't required on the card for it to be used with the calculator (or a card reader); it can start out with just a "boot record" (like an ordinary floppy disk, except that a FAT32 file system can be used on larger cards). In the case of a card that has more than one partition, the calculator can "see" only one partition.

Regards,  
James

**HP 50G Enviromental case**

Message #1 Posted by [Iqbal](#) on 14 Oct 2007, 8:29 p.m.

Anybody have one of these <http://www.loink.com/product/1030/18> ? Reviews, close-up shot? Thanks

**Re: HP 50G Enviromental case**

Message #2 Posted by [Tim Wessman](#) on 14 Oct 2007, 11:55 p.m.,  
in response to message #1 by [Iqbal](#)

I can't really give an opinion on that as I have not held one. Initial impressions however are that it looks like it would be very uncomfortable to hold and not especially sturdy. If you read on the site of the creator, he excitedly tells how it survives a 3 foot fall.

If you are really looking for an industrial strength case with extra features, I can get you one for \$350. [http://pssl.com/index.php?main\\_page=product\\_info&cPath=5&products\\_id=1](http://pssl.com/index.php?main_page=product_info&cPath=5&products_id=1)

That case is completely waterproof, has a polycarbonate lens covering the screen that survived a .22 cal hollowpoint rifle shot at 100 yards, has been run over by heavy machinery, gives the capability to use 4 AA batteries, has a hand strap on the back, easy access to change batteries and get the SD card, and has a build in serial connector. I've tossed mine out a 4th story window onto concrete with no ill effects.

TW

### re: going back to the roots

Message #1 Posted by [hugh steers](#) on 14 Oct 2007, 3:49 p.m.

hi,

i am reading Valentin's article just out in V26N5, "going back to the roots".

therein is a complex root solver for the 35s. i was keen to try this out, but i can't get it to work properly on my calculator. i do think that algorithms for complex numbers have been somewhat ignored and this helps to redress that and demonstrate the 35s' complex number features.

since my calculator is new, its likely that i've made some blunder. the second line of code: `regx*(1i0->z)->x`. what is "regx"? is this just `x*(1i0->z)->x` or something i've missed?

```
example 1: works!  
example 2: all inputs give 2  
example 3: works  
example 4: all give 1.3688....  
example 5: all give 2.32883 i 0.29914
```

so basically, im seeing convergence to a favorite root and that is it.

any help? i'll double check again tomorrow for blunders. thanks.

serial# CNA 73400764

### Re: re: going back to the roots

Message #2 Posted by [Gene Wright](#) on 14 Oct 2007, 4:10 p.m.,

in response to message #1 by [hugh steers](#)

REGX is a reference to stack register X. In HP41-speak, it is a RCL X.

To enter it into an equation in the HP 35s, do the following in program mode.

Since this is already an equation in this line of the program, press RDN. Now move over and press ENTER underneath the X in the list of stack registers. This will insert a REGX. Continue entering the rest of the equation.

It looks as if you have the -> symbol in the equation. I'm assuming this is the "triangle" store symbol which would store the value into a regular letter register.

See: [hp35s learning module on stack access](#)

Gene

### Re: re: going back to the roots

Message #3 Posted by [Valentin Albillo](#) on 15 Oct 2007, 10:18 a.m.,

*in response to message #1 by hugh steers*

Hi, Hugh:

Thanks for your interest and sorry for the problems you're having entering that program line.

Gene's explanations below are quite correct and you'd do well reading the HP35s learning module he links. Meanwhile, these are the *exact keys* you should press in PROGRAM mode to enter line A0002:

<http://i21.tinypic.com/sw8ly8.gif>

(where the ">" key is the Cursor-Right key, of course) and the resulting program line will look like this:

<http://i24.tinypic.com/1zvwg92.gif>

The article does include Length and Checksum for each and every equation, but due to bugs in both counts, they aren't that useful.

Hope this solves your problem, check *all* examples to see that you get the exact same results as featured in my article.

Best regards from V.

### Appalling problem with HP35s

Message #1 Posted by [John Wasilewski](#) on 14 Oct 2007, 1:52 p.m.

An incomplete program I was developing, still buggy, becomes stuck in a loop - this happens sometimes in software development.

What should NOT happen (but does) is for the hardware to become so locked in its loop so that user intervention becomes impossible. One cannot even switch the calculator off. The only way we have found of breaking the loop is to use a pin in the reset hole but this erases all memory and destroys all on's work.

A calculator with no possible means of saving programs except in volatile memory must, must, MUST have extremely robust firmware. For it to let us down like this, and force us to erase everything, is appalling. It means we cannot trust it not to wipe out all our work when we develop any new software.

I am hoping fervently that HP can tell us how to solve this (eg some keystroke combination to break the loop).

Serial numbers known thus far to be prone to this aberrant behaviour : - CNA 72100255 - CNA 72100299 - CNA 72101944 - CNA 72102361

It would be good if we could find out for sure whether anyone has a serial number for which the calculator WILL ACCEPT user intervention when it enters an endless loop with this code. One or two people have reported that the program seems to behave normally, but I am a little unsure whether they took the test far enough, because I might not have explained sufficiently how to enter the data.

We need someone who can get the program into the endless loop that the above have all experienced, and can then report successfully breaking out of it without having to erase all memory.

When we have this we will know that there is a hardware/firmware fault on early batch(es) of this calculator and we will know that it was fixed by HP on later production runs. -- John

Well, that's not an alternative for all. For example, I have bought HP48GII some 2-3 years ago but I sold it soon and switched to HP33S, mainly for these reasons:

1. Too big piece of hardware - dimensions, weight. I take my calc nearly everywhere so these parameters are important. However, I admit that the HP35S in it's comfortable (but large) case has practically the same dimensions as HP50G.
2. Very high consumption of batteries. I want my calc to run for months if not years on a set of batteries. The 48GII needed new batteries after several weeks. Is the new 50G better in this? How long it takes to drain a new set of batteries?
3. In general, the 48GII et al is an overkill for my style of work. I need a calc for quite simple but quick and effective hand calculations (with some short user defined functions, invoked by 1 or 2 key press, like normal functions). For anything more complicated, a PC or notebook is always available. I absolutely don't need such miracles like CAS and the whole lot of fantastic powerfull functions of the 'G' series.

However, after the bitter experience with HP35S, I may test a 'G' series calc again in short future. What an irony - HP, after delivering a buggy HP35S calc, may get a new 50G customer! What a marketing success! I would really hate to do it this way, though.

Vaclav

I have had my 50g for a year and replaced the batteries once about 6 months ago. I mostly use it on the weekends and have only been testing C code lately.

All my C code starts with:

```
sys_slowOff();
```

This runs the 50g at full speed and is measurably faster. I am surprised with all my testing lately that I have not needed to replace the batteries sooner.

I think you'll get months with the 50g, but not years. The first time you restore your 50g RAM from SD or PC you'll be glad you switched.

BTW, the C programmers kit for the 50g includes HPGCC and a .033 gauge paper clip. I have reset my 50g countless times using the RESET hole. All I have ever lost was the contents of the stack. Everything else was intact.

\_\_\_\_\_

Rarely. It only draws from USB if USB is connected before power on. Usually I have it on before I connect.

### **50g USB power**

*Message #7 Posted by **James M. Prange (Michigan)** on 15 Oct 2007, 6:51 a.m.,  
in response to message #6 by Egan Ford*

Quote:

\_\_\_\_\_

Rarely. It only draws from USB if USB is connected before power on. Usually I have it on before I connect.

\_\_\_\_\_

With my 50g, I can turn it on, plug in the USB, remove a AAA cell, and it continues to run.

Or, for that matter, with the 50g off and disconnected from USB, remove a AAA cell, plug in the USB, and turn the 50g on and run it.

As far as I've been able to determine, as long as it's connected to a powered USB port, it's powered from the USB connection, regardless of whether it was on or off when the connection was made.

A 5V adapter ("USB charger"), designed for charging the battery in some USB-capable devices, works as well, as does an externally powered USB hub, even without being connected to the PC's USB port. The 50g requests only 50mA from USB, and I expect that any of these sources should be able to supply more than that.

I'm rather surprised to find that the USB connection even supplies "battery+" power to the serial port.

I don't know why your 50g should behave any differently. Try this: With the USB

disconnected, press ON and F together to get to a test display, and then press the 8 key to start the "POWER" test. One of the lines should be "BATTERY NORMAL" (or, I suppose, maybe "BATTERY LOW" or something similar); now connect the USB cable and it should change to "USB POWER WORK", and disconnecting the USB should change it back to "BATTERY NORMAL".

But the 50g may very well do a warmstart instead of cleanly switching back to battery power in cases where the USB voltage "fades out" gradually, such as when the AC adapter is unplugged or the PC is powered down while the 50g is still connected. I suppose that similarly, the 50g might fail to properly switch to USB power in a situation where the USB voltage "ramps up" gradually, such as powering up the PC with the 50g already connected.

Regards,  
James

*Message #8 Posted by [Egan Ford](#) on 15 Oct 2007, 12:20 p.m.,  
in response to message #7 by James M. Prange (Michigan)*

I have a small utility that reports the battery voltage. If I power up then connect the cable, it can still read the batteries, if I attach then power up, it reports v0.00. I assumed that if it can read the voltage from the batteries that it is running from battery.

I tried the ON-F-8 tests. You are correct it reports USB POWER when connected/reconnected.

If I power up, attach cable, remove battery, I am still up and the batt util still reports voltage. It must be reading old sensor data.

I stand corrected, my unusual battery life my have been extended by USB. Since I connect to copy C binaries, I usually do not disconnect until done for the day.

The 48Gii is a crippled version of the 49G+ which was replaced by the 50G. It is a price-point machine, not the fully capable top of the heap. At the time of the 48GII, you had to make the fasutian decision as to whether you needed any sort of RS232support, and if yes, then the 48GII was a must.

Also more to the point, John is doing \*much\* more with his 35s than you are...and from his descriptions, he is squarely in the territory of an I/O machine--whether a new 50G, or an old boat anchor 9815:-)

*Message #16 Posted by [Robert B](#) on 14 Oct 2007, 3:47 p.m.,  
in response to message #1 by John Wasilewski*

Hello John,

I also had this problem: calculator was locked in a (probably endless) loop while writing a Sudoku solver program. Program length at this time was several 100 lines.

Only way-out: reset-pin and - of course - total memory loss ...

Serial no. of my 35S is CNA 72102148.

Since then I'm not keen on programming something on this gadget any more.

Regards, Robert

in response to message #16 by Robert B*

Hello Robert,

Do you still have the partial program somewhere convenient for sharing, like a text file or MS Word file? If you do, I would like to see if I could repeat the problem. (Of course, if you don't already have it, I won't ask you to type in a several-hundred line program all over again!)

I want to find a short, repeatable test case, and analyzing your program along side John's program might help.

Regards,

Seth

### **Re: Appalling problem with HP35s**

*Message #18 Posted by [Robert B](#) on 15 Oct 2007, 4:57 p.m.,  
in response to message #17 by Seth Morabito*

Hi Seth,

unfortunately I do not have reasonable documentation, only some fragmentary flowcharts.

The problem occurred in a nested loop. Due to using a wrong variable one of the loops didn't terminate. As far as I remember I interrupted the program with R/S, executed a few single steps and started program again with R/S. I wonder if I switched the calc into PRGM mode and did some BST and SST - I can't remember. After a while I realized that the calculator got stuck.

I don't know if it is important in this context: flag 10 was set all the time for displaying EQN messages.

BTW: meanwhile I'm convinced that writing a Sudoku solver program on the 35S is not the best idea, even if there are no crashes. Speed is way too slow.

Regards, Robert

Flag 10 is set all the time in John's program as well. It may not be related, but at least it's a clue to add to our collection.

## Re: Appalling problem with HP35s

Message #20 Posted by [John Wasilewski](#) on 15 Oct 2007, 1:23 p.m.,  
in response to message #1 by John Wasilewski

Here is a list of serial numbers known thus far to be prone to the aberrant behaviour described below:

- CNA 72100255
- CNA 72100299
- CNA 72101944
- CNA 72102148
- CNA 72102361

With no possible means of saving programs except in volatile memory, extremely robust firmware is fundamentally important. In breach of this crucial principle, certain code fragments (not yet identified precisely) cause HP35s calculators to become so locked in a loop that user intervention becomes impossible. One cannot even switch the calculator off. The only way we have found of breaking the loop is to use a pin in the reset hole but this erases all memory and destroys all one's work stored on the machine (i.e. ALL PROGRAMS ERASED).

This is appalling because we cannot trust it not to wipe out all our work when we develop any new software so we cannot risk developing new programs when something we need is in memory.

I hope HP can tell us how to solve this (eg some keystroke combination to break the loop).

I hope we narrow down which code sequences/memory settings/conditions cause this, so that we can avoid them.

It would be good to know for sure whether anyone has a serial number for which the calculator WILL ACCEPT user intervention when it enters an endless loop with the code that has caused the above effects. One or two people have reported that the program seems to behave normally, but I am a little unsure whether they took the test far enough. We need someone who can get the program into the endless loop that the above have all experienced, and can then report successfully breaking out of it without having to erase all memory.

When we have this we will know that there is a hardware/firmware fault on early batch(es) of this calculator and we will know that it was fixed by HP on later production runs.

Message #21 Posted by [Seth Morabito](#) on 15 Oct 2007, 2:26 p.m.,  
in response to message #20 by John Wasilewski

We do have one report of your program running without the lockup:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=126163#126163>

Mark, if you're reading this message, could you (re-)confirm that you ran John's program as he described, and you did NOT encounter an unbreakable infinite loop? Could you describe what you did, and what the program behavior was?

Mark reports his serial number is CNA 72600768.

Can anyone else with a serial number that does NOT start with CNA 721- try the program?

### **Re: Appalling problem with HP35s**

*Message #22 Posted by [John Wasilewski](#) on 15 Oct 2007, 3:24 p.m.,  
in response to message #21 by Seth Morabito*

Its important when testing for a loop lockup from the errant program to enter a combination of H and B that are around 20% smaller than the values suggested by the program and to enter a single value (eg 20) after the prompt for the steel "C,T BAR SIZES". Only after this does the program enter the vortex.

Anyone not familiar with reinforced concrete beam design might not realise that the program data entry is not finished until after this point. There is no "X=?" type of prompt for the steel, just the text shown above.

My concern is to be sure that people reporting good behaviour and a loop that they CAN break really do get into the loop. If you don't get into the endless loop then probably either there is an error in your program code entry or you haven't got to the end of the data entry part of teh program.

We do really really need to know if any calculators with more recent serial numbers exhibit correct controllable behaviour and allow the endless loop to be interrupted.

--  
John

### **Able to break out of the loop in some cases**

*Message #23 Posted by [Seth Morabito](#) on 15 Oct 2007, 4:20 p.m.,  
in response to message #22 by John Wasilewski*

The plot thickens!

I have run the program many more times, and discovered that after entering a value for C,T BAR SIZES, if you step through the code even a little bit before pressing R/S, you can later break out of the infinite loop!! If you do NOT step through the program, you can not later break out of the infinite loop.

Here is exactly what I did, in the following order.

1. Keyed in the program. I got LN=1616,CK=D170 [but these figures will probably not be useful to anyone, because of a known and acknowledged bug in checksum calculation]. I have no other programs in memory.

2. Before each run, I performed the following operations, in order:

- a) CLEAR VARS
- b) CLEAR STACK
- c) DISPLAY FIX 4
- c) GTO ..

3. Start the program with XEQ B ENTER

4. I used the following inputs when prompted.

M?= 150,000,000

```
Y?= 460
F?= 35
C?= 40
H?= 332 [suggested value was 443. 332 is 75% of suggested.]
B?= 275 [suggested value was 366. 275 is 75% of suggested.]
```

5. When prompted by C,T BAR SIZES, I pressed ENTER
6. I entered 20, then pressed DOWN ARROW to step.
7. I stepped through the code a few times. Some of the lines I stepped through...

```
B265 STO O
B266 Rv
B267 STO Q
B268 STO L
B269 RCL H
B270 RCL C
B271 -
B272 RCL O
B273 2
B274 /
B275 -
...
```

8. I took a deep breath and pressed R/S
9. The program got stuck in an infinite loop, displaying "NEXT BAR" and "RUNNING" over and over.
10. I pressed R/S again, and this time the program halted!

I was able to repeat these ten steps many times. Each time I was able to break out of the loop just by pressing R/S.

Alas, for the final try, instead of stepping through the program in step (7), I just pressed R/S. As expected, this time I was NOT able to break out of the infinite loop.

There seems to be some problem caused by fetching and executing the program steps. Possibly entering into the debugging environment by pressing the down arrow sets up or clears some environment that is not otherwise set up, and allows R/S to break out of the program.

Very frustrating. But I'm entranced by this problem, so I'll keep looking.

Congratulation Seth. What a detective work!

This is the kind of thriller I like to read. :-) So at least, following your procedure, John is maybe able to debug his program. Also, I hope that this is really a batch problem. I would like to hear from other people with higher S/Ns doing this test.

Miguel

### **Re: Able to break out of the loop in some cases**

*Message #25 Posted by [Seth Morabito](#) on 15 Oct 2007, 7:08 p.m.,  
in response to message #24 by Miguel Toro*

He may be able to debug his program, true... but even so, he can't trust that running the debugged program won't still cause a lock-up, and he'll lose all of his data again. Most upsetting!

My goal out of this is to find a small (< 75 line) repeatable test case that we can send to HP for their testing purposes. If anyone at HP can confirm a way to break out of the loop that we don't know about, then the current 35s might still be a suitable environment for complex programming. Otherwise, we'll have to wait for a new ROM revision before there's hope that the 35s will be trustworthy, I'm afraid.

It's a real shame, because I do love the 35s. It's my day-to-day calculator. The display is nice, the keyboard is nice, it's comfortable in the hand (I've become quite good at two-handed entry), and best of all I can get new ones if I drop mine (unlike the 41C or 42S!). But alas, I won't be doing much programming on it, I don't trust it not to erase all of my programs.

*Edited: 15 Oct 2007, 8:30 p.m.*

### **Re: Able to break out of the loop in some cases**

*Message #26 Posted by [John Wasilewski](#) on 15 Oct 2007, 7:56 p.m.,  
in response to message #23 by Seth Morabito*

Brilliant piece of work, Seth. Also very helpful to me because I now now not to trust it when the prob seems to have gone away during debugging.

I have been cleaning up the code using a debug version with R/S breakpoints in it. To my surprise, I got the (corrected) program fully working on the way home from work this evening. I have been removing breakpoints one at a time, hoping it won't lock up on me.

I will continue, even more carefully. I'll send you the latest code tomorrow.

I don't have an infinite loop to need to break out of at the moment but I d not know whetehr this is because of bits of code I corrected or because the calculator hardware is behaving itself whilst I have all these breakpoints still in it.

Needless to say I am keeping a careful written record of code changes.

Goodnight for now

---

John

*Message #27 Posted by [Meenzer](#) on 15 Oct 2007, 5:31 p.m.,  
in response to message #20 by John Wasilewski*

On comp.sys.hp48 I just found this:

Quote:

\_\_\_\_\_

Joel Koltner

View profile

Newsgroups: comp.sys.hp48

From: "Joel Koltner" <JKolstad71HatesS...@yahoo.com>

Date: Mon, 15 Oct 2007 11:33:12 -0700

Local: Mon, Oct 15 2007 8:33 pm

Subject: Bug in HP-35S?

I've run the following program on a couple of HP-35S machines, and both of them indicate that something Very Strange is happening in how equations are being evaluated. Anyone else want to try this out?

Enter the following program:

LBL A

156.25

STO X

208.333333334 ;There are eight 'threes' in there

STO R

1.77951304201

STO Q

-R\*X/(X\*Q-R) ;Should evaluate to roughly -467, and it does

-R\*X/(X\*Q-R) ;Should (still) evaluate to roughly -467, but calculator outputs 31.323 instead!

RTN

It's important that the program is entered exactly as shown. Note that the "-" in the expressions are entered with the "+/-" (change sign) key, not the "-" (subtract) key. Changing the numerical constants will (often) make the expressions evaluate correctly. Some minor changes (e.g., changing -R to +R) in the expressions still demonstrates the error, but making significant changes (such as changing X\*Q-R to just X\*Q) no longer does. Changing the expressions to R\*-X/(X\*Q-R) fixes the problem. Removing the initial "-" in the first expression causes the second expression to fail, although the output is then -52.287 rather than 31.323!

I discovered this while creating a real program, which is rather alarming...!  
Anyone have any ideas? Is this a well-known bug somehow?

---

Who knows, maybe it's got something to do with your bug...

*Edited: 16 Oct 2007, 4:48 a.m. after one or more responses were posted*

## **Re: Appalling problem with HP35s --- Joel's bug is also on the 33s**

Message #28 Posted by [Gene Wright](#) on 15 Oct 2007, 8:14 p.m.,  
in response to message #27 by Meenzer

FYI.

This "bug" (the one reported by Joel on comp.sys.hp48 --- not John's interminable loop bug) is also present in the 33s. Apparently, no one ever found this one on the 33s in over 3 years of use.

On a 33s...(edited to correct a thing or two)

```
A0001 LBL A
A0002 156.25
A0003 STO X
A0004 208.333333334 ;There are eight 'threes' in there
A0005 STO R
A0006 1.77951304201
A0007 STO Q
B0001 LBL B
B0002 -R*X/(X*Q-R)
B0003 STOP
B0004 GTO B
```

Successively pressing R/S now shows another interesting effect: The output switches between -466.927 ... 31.323 ... -466.927 ... 31.323

Gene

P.S. I checked this on an old HP32S2 - works fine on that machine.

Message #31 Posted by [Karl Schneider](#) on 16 Oct 2007, 5:19 a.m.,  
in response to message #30 by Meenzer

Quote:

\_\_\_\_\_

are you saying you tested Joel's bug on both and one failed and the other 35s was correct?

\_\_\_\_\_

I figured that there'd be some implied ambiguity in my incomplete specification, and it was called out. The truth was, I hadn't even opened my free HP-35s, which I received in late

September.

So, this time I laboriously cut through the blister pack and tested the free one. It has a later S/N, CNA734xxxxx. (It also misses entry of "0" on the keyboard frequently!)

It also turns out that I misentered one line on the first HP-35s, adding an extra "3" in the long constant, making it 13 digits (208.3333333334). The constant actually *used in calculations* then became 208.333333333, not 208.333333334, and the second answer inexplicably turned out correct. Upon correction of the program and retesting, I found that both units have the bug. My earlier post is now corrected and updated.

This, of course, doesn't mathematically justify the vastly-different results of the two equations, but does help to illustrate the unsoundness of accepting -- then effectively discarding -- extra digits. No previous RPN calc -- not even the HP-33s -- handled input in this manner.

-- KS

### Re: Appalling problem with HP35s

Message #32 Posted by [Meenzer](#) on 16 Oct 2007, 4:42 a.m.,  
in response to message #27 by Meenzer

On my HP35s (CNA726\*\*\*\*\*) it behaves oddly, too. Even if I change the variable name from X to K or R to S it's still the same wrong value.

But: if I change -R to -1\*R it works correctly. Two times -466.927.

Tadahhhh! So maybe there is some register arithmetic going on if you apply the +/- sign directly to the variable.

Also, if I change back to Joel's original code and than put, say, 1 in the line between the two equations like:

```
-R*X/(X*Q-R)
1
-R*X/(X*Q-R)
```

the answers on the stack are

```
-466.927
1
-466.927
```

But if I only put R/S after every EQN, the result is buggy.

*Edited: 16 Oct 2007, 5:42 a.m.*

### Re: Appalling problem with HP35s

Message #33 Posted by [Meenzer](#) on 16 Oct 2007, 9:37 a.m.,  
in response to message #32 by Meenzer

It goes on to be weird:

The same odd behaviour can be found in EQN-Mode (not in a program!). You can type in "-

$R * X / (X * Q - R)$  as an EQN, then evaluate it by keying in the appropriate numbers. First time you do this, -466.927 is the result. When you now evaluate the EQN a second time and key in the numbers again, you will obtain -466.927.

BUT, if you evaluate the EQN and only R/S the numbers that the HP 35s has already stored, you will get the same wrong result 31.323 EVERY SECOND TIME, alternated with the correct one. BTW, I tested the program both in ALG and RPN - same weird result.

## Re: Appalling problem with HP35s

Message #34 Posted by [Lyuka](#) on 16 Oct 2007, 9:27 a.m.,  
in response to message #27 by Meenzer

This problem seems to occur very often even with simple coefficients.

```
A001 LBL A
A002 1.1
A003 STO X
A004 1
A005 STO R
A006 3
A007 STO Q
A008 ~R*X/(X*Q-R)
A009 ~R*X/(X*Q-R)
A010 x=y?
A011 GTO A014
A012 RCL R
A013 STOP
A014 1e~9
A015 STO+ R
A016 GTO A008
```

An error occurs when R =

```
1.000,000,006
1.000,000,014
1.000,000,022
1.000,000,035
1.000,000,043
..and so on..
```

Regards, Lyuka

## Re: Appalling problem with HP35s

Message #35 Posted by [Pavneet Arora](#) on 18 Oct 2007, 9:30 p.m.,  
in response to message #27 by Meenzer

I am not sure what I am doing wrong, but if I use '+/-' for both minus signs then I get the obvious Syntax Error in the subtraction. If I enter the '+/-' as the first character and the subtraction operator for the second, I don't get the oscillating results, neither in Joel's version nor in Gene's equivalent with the LBL and GTO bracketing the equation.

However, if I enter this as an equation and do repeated evaluations, then the oscillating result appears.

My 35s is also from HHC2007, i.e., CNA73400XXX.

What am I missing?

## Re: Appalling problem with HP35s

Message #36 Posted by **Jeff O.** on 19 Oct 2007, 3:10 p.m.,  
in response to message #35 by Pavneet Arora

Pavneet,

Your results are a little surprising. My CNA734 unit gets the oscillating results with the following program:

```
A001 LBL A
A002 156.25
A003 STO X
A004 208.333333334 ;There are eight 'threes' in there
A005 STO R
A006 1.77951304201
A007 STO Q
A008 -R*X/(X*Q-R)
A009 -R*X/(X*Q-R)
A010 STOP
A011 GTO A008
```

Running the above produces the wrong answer in the x register and the right answer in the y register. Pressing R/S will cycle through again.

Jeff

Quote:

Running the above produces the wrong answer in the x register and the right answer in the y register. Pressing R/S will cycle through again.

My CNA725\* also produced the correct answer in y and incorrect in x after every R/S.

I modified the two equation lines to be  $-1*R...$  (using +/- for the -) and then both results were correct.

Strange stuff.

### **The world is eating your lunch!**

Message #1 Posted by [designnut](#) on 13 Oct 2007, 11:56 p.m.

Is the world eating your lunch? We cling to a mismatched set of measurements instead of adopting the metric system. For example: a Swiss engineer was asked to calculate a spring and mass resonance. He converted all measurements to metric and solved it in one page. His boss insisted it could not be done in one page, took 3 pages and made 5 mistakes. Math is being taught in a pen and pencil method in a computer world. I submit that algebraic calculator entry is hampering the teaching of math. Math is being taught with 19th century methods. I would like to be able to give out beginners calculators with RPN to smooth the way. Allowing equation entry and SOLVE would answer the algebraic methods in the schools.

### **Re: The world is eating your lunch!**

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 14 Oct 2007, 12:47 a.m.,  
in response to message #1 by [designnut](#)

Quote:

Allowing equation entry and SOLVE would answer the algebraic methods in the schools.

I'm an electrical engineer and I teach at the local university. I'm gonna be back to the class room as a student again, now to achieve a brazillian Doctor degree in Education (the second post-graduation level here: 'mestre', then 'doutor' and, if going ahead, 'pos-doutor'). Next year planning, though.

When I was a student, RPN thought me a new way of reasoning about a solution. My first calculator was a TI57 (still have it) in 1980. I simply stuffed it with keystrokes corresponding to the expression I wanted the result from. With the HP41, I had to understand what I was doing prior to press the keys. I had to analyze the expression, find the inner operations, apply precedence myself... by using an RPN calculator, it enhanced my reasoning and I started to solve the expressions in my head first, fast and accurately. But it happened to me, cannot extend the concept to everybody else. I was told that ABACUS users do the same. And ABACUS have no [=] key... they are RPN adders.

I accepted the challenge of teaching math to students at pedagogy graduation this semester. They simply HATE math, the ugly-duck of the human-related field students. I do not abolish the use of calculators in the class-room, I actually emphasize it. I ask students to bring their calculators, if any, so they may learn how to use them. I feel that when the calculator is a curiosity, pressing buttons and see what happens is an adventure, a game. If it is understood as a tool, it will be used only to perform arithmetic and transcendental operations.

I still go white-board with white-board marker. From time to time I use a datashow with some specific presentation or a particular movie (believe me, Olmos' 'Stand and Deliver' still causes debates, questioning and reasoning...). I tell them how the operations are performed, not why and when. I let them conclude the why and when. So far, the best reward was from a 28 Y.O. student who told me the following after the first math examination: "This is the first time I understand a math examination in my life. Thank you!" You see, she did not thank me for being able to answer the questions, instead to understand them.

She does not use calculators.

She did not use any.

A calculator would make no difference.

SHE made the difference.

Last week I read that Galileu once said: "One cannot teach anything to anyone. One can only help someone to find it (knowledge) by himself." (I read the Portuguese version, cannot be sure if the English version from the original would be like that).

I think I just did that. And I am getting myself ready to go ahead.

I'm 46 years young, I have so too many things to do I cannot stop right now and see what happens.

Cheers.

P.S. - one of the reasons I'm not lurking around here so too often is my current dedication to these educational, pedagogic subjects. It will probably get worse next year...

Quote:----- Why are TI calculators so much more ubiquitous than are HP calculators among students? What is TI doing right that allows them to maintain their marketshare? ----- From Egan Ford

TI went after the teacher and the textbook writer. My kid's textbook is written for the TI83+ (which I think is wrong, I'm still old school and believe the books should only be written for pen and ink). Students don't care, a calculator is a tool to get homework done and take tests with. My kid has so much more to worry about (sports, a social life, work, etc...). Learning to use a different device to get the same results is unimaginable. Teachers have always selected your textbook and now they select your calculator. Some schools even pick out your clothes.

This is the problem I was trying to address, in addition to the US using outmoded English measurements which even the English have eliminated. Sam

---

As a mid-life college student, most of my math(s) texts were written for the TI-83+. Sidebars or margins show which keystrokes are needed to enter the data.

I do not know of an instructor on this campus that even knows RPN. (HmMMM, I don't think the Accounting instructors know how to use an HP-12c). If a student with a different calculator (even a TI-89) does not know how to enter an equation, they will get almost no assistance from an instructor because they only know the TI-83 family.

I now carry one of my HP48pv's (plain vanilla) just to challenge me to think about any problem that arises (but currently I am not in a math(s) course).

### **Re: The world is eating your lunch!**

in response to message #5 by Ren*

Quote:

---

(HmMMM, I don't think the Accounting instructors know how to use an HP-12c).

---

The popularity of the HP-12c among business people has very little to do with H-P, RPN and the stack. Rather, it has everything to do with the fact that from the keyboard the HP-12c reacts to entries very much like the old mechanical business calculators.

### **What did TI do right?**

*Message #7 Posted by **Palmer O. Hanson, Jr.** on 15 Oct 2007, 10:14 p.m.,  
in response to message #4 by designnut*

Question:

Why are TI calculators so much more ubiquitous than are HP calculators among students? What is TI doing right that allows them to maintain their market share?

Answer from the H-P community:

TI went after the teacher and the textbook writer.

Actually TI did something much more customer friendly than that. They didn't give the education community a lecture on how to do their job. Instead, they asked the education community "How can we help you do your job?"

### **May I?**

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 15 Oct 2007, 11:14 p.m.,  
in response to message #7 by Palmer O. Hanson, Jr.*

Hi, Palmer;

Quote:

---

They didn't give the education community a lecture on how to do their job. Instead, they asked the education community "How can we help you do your job?"

---

We are living a very sensitive moment in some of the world's safest education communities. Teaching/learning methods, evaluation significance, use of technology and others are topics being discussed in many places. I am following these events closer because I believe that if we are not already living an educational crisis, we are fair close to it.

I am aware of the fact that if current educational methods are under discussion it does not mean that they are no longer valid, instead that they may be reinforced to follow current minds and available resources. And it happens from time to time, as it happened to us when the computer became a reality. I had one specific subject in Engineering that simply did not exist six, seven years before I had it: 'Computer Application'.

I am not confident that following current educational models is SO FAR part of the solution. So, I am not sure that TI is actually doing right, instead that they are mostly taking the advantage of being able to follow the market. You also posted:

Quote:

---

Why are TI calculators so much more ubiquitous than are HP calculators among students?

---

With this I agree completely: they are ubiquitous among the students, and the teachers may have found support when students are solving a problem with guidelines partially shown as keystroke sequences.

I'm trying my best not to be old fashioned here, but I remember having to find my own ways to use FORTRAN knowledge to solve some math problems, like writing my own Newton's root finder code. Today students may use SOLVE and not be able to write a code for a single root finder. I did it as a workaround for the problem found in the first Platinun series (with no parenthesis, undo, back-space and LCD contrast control). They do not correctly compute IRR below 0.34%, so I wrote a single 29-step program with a linear approach that finds the correct answer. The listing was available at the HP site Brazil for some time, till the new Prestige was finally available. AFAIK, this was one of the very reasons the HP12C Prestige was introduced in Brazil: folks here stood against the HP12C Platinun and wanted only the regular HP12C.

As you see, the HP12C Prestige was just a way to rescue the HP12C Platinum image amongst customers. It is exactly the same as the new Platinum, but has not the same look, it is a Prestige. So I think TI is doing with students: *"This calculator will not complicate your studies, instead will make them easier. Just let us know what a calculator should do to make it easier for you.* I don't know, this looks like a walking bar for the ones who want to fake to be crippled. And they are not crippled, just were given walking bars.

My point of view, though. Can it be considered a 2¢ contribution?

Cheers.

Luiz (Brazil) (did not spell check, sorry for any errors...)

Hi, Palmer; I had one specific subject in Engineering that simply did not exist six, seven years before I had it. Computer Applications.

---

I'll really show my age here. I had a course in how to use the RemRand 1103 computer (bigger than a house) at the University of Minnesota back in 1960. So, computer application courses are hardly new.

Quote:

---

I am not sure that TI is actually doing right, instead that they are mostly taking the advantage of being able to follow the market.

---

TI didn't just follow the market. They were instrumental in developing the market by being willing to respond to the wants of the education community. I do recognize that in this forum it is not a popular thing to say that TI has done anything right.

Quote:

---

I'm trying my best not to be old fashioned here, but I remember having to find my own ways to use FORTRAN knowledge to solve some math problems, like writing my own Newton's root finder code.

---

Showing my age even more: When I was a freshman engineering student at the University of Minnesota back in 1946 I took the elective but strongly recommended class in Introduction to the Slide Rule. I completed the class getting one of the two C's I received during my undergraduate career. And, of course, I never read the manual. No self-respecting engineering student would admit that he had to read the manual. Calculator users are a lot like that today.

Quote:

---

Today students may use SOLVE and not be able to write a code for a single root finder. I did it as a workaround for the problem found in the first Platinun series (with no parenthesis, undo, back-space and LCD contrast control). They do not correctly compute IRR below 0.34%, so I wrote a single 29-step program with a linear approach that finds the correct answer.

---

Very interesting. Do you remember how Kahan's "Mathematics written in sand" savaged TI for the failure of the MBA to calculate IRR correctly in some cases?

### **The benefit of doubt**

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 16 Oct 2007, 11:09 p.m.,  
in response to message #9 by Palmer O. Hanson, Jr.*

Hi, Palmer; me, again.

Quote:

---

I do recognize that in this forum it is not a popular thing to say that TI has done anything right.

---

Yes, you are correct; I did push too hard against TI, and I actually did not mean to. I have a TI55 (gift), a TI57, a TI58C (gift, with memory issues), a TI59, a PC100A and a TI82 (gift). I also have an interesting Casio FX7000GA, one of the first graphic pocket calculators.

About a year after having a TI82 as a gift, among others (the CX MB is still here, M.B.; will send it back soon, promise), I bought an HP39G+ (three, in fact). These are all algebraic-based, high-school students addressed, and they have the same helping-aid appealing. TI started earlier, and HP followed it as close as possible (HP38G; is it a coincidence the reversed numbering against the TI83?). One of the HP39G+ I actually bought for my daughter, but I gave up the idea of leaving it with her. I first tried to show her some single stuff, like the 2nd. degree curve changing with the change of parameters 'a', 'b' and 'c', but she did not feel as if it would help her. My approach failed, I guess.

I apply the same considerations to the calculators HP developed with the same purpose. Please, understand that I am not against the tools themselves, instead their primary purpose. I would like to have anyone of those when I was in the brazillian equivalent to the high-school (at the time I was there it was our 2nd. degree school), but I'd surely know what to do with them. Maybe this is the actual punchline: developers idealize tools they'd need, with the customer in mind. A hammer is a hammer anytime, anywhere, and it can be used by anyone who knows what is it for. One cannot apply the same reasoning for a calculator or a computer, their use is not based on a standard circumstance. Either the user or the usage may vary, and under the same circumstance, two users with the same expertise and need may or may not use a calculator to solve a particular problem. Opposedly, if they need a hammer, there is no way to get rid of it.

I'm afraid I did not make myself understood. Going further may not give me the true benefit of doubt...

Cheers.

Luiz, my comments do not directly follow anything you've written, so do not take any

personal offense to what I'm writing...

I think maybe another PLUS for TI is the hacker community that has formed around it.

For instance, the various kits and plans for adding a PC keyboard to the TI-8x calcs. Or a perusal of TICALC.org shows various hacks for speed up, additional battery power or other things I'd be too scared to do to a more expensive calc.

(I am aware of the speed up hacks and repairs to HP calcs found at this site, so I'm not saying ONLY TI has hardware hacking).

Also the various hacks which allow assembly language programs to be written and downloaded into the Z-80 CPU's in the calcs. TI may have grudgingly accepted having their calcs hacked (initially) but I don't think they're hunting down calc hackers with legions of lawyers either (hackers can be good for business!)

And then there is the CBL (Calculator Based Laboratory) module which allows the TI-8x calcs to become analog and digital data loggers. (GeekyKeen!)

As one of the successful hackers back in the days of the TI-59 I can assure you that TI was less than enthusiastic about some of the things we discovered such as fast mode and hi resolution graphics. Their lack of enthusiasm was related to the earlier HP experience with the special effects which were discovered with the HP-97 and which, if improperly used, could fry the circuitry.

The TI-66 manual even had a sentence that indicated that there were no unannounced features in that device such as there had been in the TI-59. We found some in a few weeks.

I also have an interesting Casio FX7000GA, one of the first graphic pocket calculators.

---

I believe the Casio fx7000G was the first graphing hand-held calculator. I purchased mine on December 4, 1985. I still have it. It calculates properly but the display has deteriorated in a manner that makes it difficult, but not impossible, to read. I also have a Casio fx7000GA that my daughter used in high school advanced placement mathematics classes and in college. Unfortunately the display is broken. The two devices are very similar with some minor differences in construction. An important difference is that the bizarre random number generator in the fx7000G was supposedly fixed in the fx7000GA.

Quote:

---

A hammer is a hammer anytime, anywhere, and it can be used by anyone who knows what is it for.

---

As someone who earned his way through college by working in construction during the summers I simply can't let that pass by. If I did my construction supervisors would be spinning in their graves. While anyone can use a hammer, sort of, or a computer or calculator, sort of, not everyone uses tools effectively. One construction supervisor had a simple set of tests to determine whether an applicant knew how to use a hammer effectively. First, he asked the applicant to drive a nail and looked at how far the applicant's hand was from the end of the hammer. Then he asked the applicant to use a hammer to remove a nail which had only been driven part way in. A successful applicant didn't apply the claw to the nail head -- rather he used the sharp internal edges of the claw to grasp the shaft of the nail.

Palmer

### **OT: Hammer Time!**

*Message #15 Posted by **Ren** on 18 Oct 2007, 10:58 a.m.,  
in response to message #14 by Palmer O. Hanson, Jr.*

Another hammer test would be to have a hammer with the face ground non-perpendicular (off-axis?) and see if the hammerer discovers why they can't drive in a nail without it bending, or successfully drives in the nail without bending by compensating for the hammer face! It doesn't take a lot of mis-alignment to throw a hammer off!

Or how to start a nail with only one hand (wedging the nail shaft in the claw with the head of the nail up against the part of the hammer head that surrounds the handle).

Hopefully, most of the members of HP Forum do not work on HP calculators with a hammer, or use an HP calculator AS A hammer!

I work in both metric and american. They each have their advantages, and their faults. Some things in SI are annoying and stupid, like Pa rather than simply N/m<sup>2</sup>. Why name a derived unit after a DWEM? At least in American units, there's only one DWEM: Rankine. Maybe two, if you count Slugs :-). Oh, and Fahrenheit. I forgot about him.

Lots of U.S. engineering is done in metric and it is not difficult. In fact metric is the only units system officially sanctioned by congress, since the time of Jefferson. The foot etc is referenced to the meter.

In WWII my father over-ran German factories and discovered that the metric-unit machine tools, calipers, micrometers, feeler gages were made in Rhode Island and Connecticut.

Oh, and the US Federal Highway Administration has done all its engineering in SI since the 70s. When Reagan issued his "go back to inches" edict, they said "M5 you!"

Sure, maybe, let's just keep on using the "Horse-Power" to pull the wagon instead of switching to the "Watt" engine, like Liberia and Myanmar do (the only two countries in the world I know besides the USA) and continue using this obsolete (English) system of measurements. The English system of measurements offers zipo, zero, nada, advantage over the SI system (and even less in the scientific field). The only reason we haven't switched is political.

Yes, you are correct it will cost money but if other countries (less wealthy than the USA) did it we can too. I still think the main reason has to do with politics. Look no further, did you see the reaction of dbMartinez and company? for them it is a matter of pride "we built this ship we built that space craft" (and they forgot the Russians, probably using the metric system, were first in space) and not of what it is better. Now, if these two guys frequent this board, I assume they have some type of scientic/technological training/understanding and they oppose a change, can

you imagine a politician telling the populace about switching to a metric system, how long can he/she last?

Regards, Thor

Forgive my bad memory but weren't the Apollo spacecraft and it's L.E.M. both built and navigated using archaic, unscientific and outdated English measurements? I believe that it got to the moon's surface and back 5 or 6 times. Metric is no better. There is nothing more scientific about measuring with a unit based on the distance between Paris and Santa Clause's house than one based on the length of some dead king's foot. I use either.

### **Re: The world is eating your lunch!**

You know, I was part of a short but interesting and insightful little conversation today. Someone wondered about "pieces of eight" (the old Spanish currency unit so prized, apparently, by pirates and their parrots), and it turns out that it was so termed because you can break it into eight parts to pay for something that cost less than the whole piece of eight.

And then we tangented into why old monetary systems were so seemingly odd and almost randomly denominated while today's currency systems are resoundingly decimal. Many of the old systems were founded essentially on base six, or really, twelve, because twelve is a number than can be factored by a relative large count of integers- two, three, four, and six! This made it easier to make dividing up stuff to sell or buy or to charge for. So in a way, for it's own day and place, the old systems of units and measurements were quite utilitarian, appropriate, and sort scientific, then. (And, at least mathematically richer.)

But in our day, with our already fading industrial phase, burgeoning cybernetic and electronic (already fading with photonics crowning to society's pangs?) phase, and even laymen putting on scientific airs, the decimal systems seem more fitting and deemed more useful... at least easier to teach to the ebbing SAT scores crowd.

However, how really "easy" or "natural" or "fitting" is a decimal based units and measurements system when it gives birth to units like the farad, which is kind of astronomical, but is calculated in physics classes here on earth. How do astronomical units, parsecs, angstroms, or Avogadros fit into these

systems? They do... like shims in a doorframe, or Scotch tape on black eyeglass temples.

Nah, loose units don't sink spaceships, stupidity kills.

(With all this fussing I can't add to my stature one cubit... or femtocubit.)

Not sure what your point is, you are reminding me of space crafts we built using the English system of measurements, so what? The Egyptians built the pyramids using who knows what system, the Chinese the Big Wall of China, and so on. I suppose we/they could have used any system of measurement we/they wanted (the big foot, the little toe, etc.) to build them. But which one is better?

If there are many ways of solving a problem, which solution do you choose? I would choose the most elegant, the simplest one, and in the case of units system of measurements, it is the SI system (by many many kilometers).

Quote:

Metric is no better.

Just wondering, are you familiar with the metric system? the one you just divide by 10 or multiply by 10... I did not think so.

You are absolutely right. Fully agreed.

Quote:

Metric is no better.

I disagree absolutely. Some good reasons were given above already. Just to add the crucial point IMHO: SI is a **system**. This makes the difference.

Nothing against Imperial units (or Chinese or Egyptian or Babylonian or ...) IF they build a system of units. But at least Imperial units fail to do so. We had this discussion here several times already.

A US television comedy show of the late 60's to early '70's, "Rowan and Martin's Laugh-In" on occasion would issue awards of dubious distinction. One award was "The Flying Fickle Finger of Fate!" and another was the "Whoopee!"

Once(?) they awarded the US Congress because back in 1895 they formed a Committee for the Standardization of Screw Threads, which had been meeting yearly (up to that point, maybe now) and had (still) not accomplished their goal.

(One of the comedians commented that it was probably because they sat around drinking Screwdrivers!)

(Maybe that is what inspired Monty Python's "Ministry of Silly Walks".)

And along those lines...

What is a Metric Screwdriver?

30cc's of vodka and 20cc's of orange juice! (rimshot)

Thor:

Quote:

Just wondering, are you familiar with the metric system? the one you just divide by 10 or multiply by 10... I did not think so.

If you ever land at the San Jose California airport or take State Highway 87 North or South from it, or drive on 101, 580, 80, 680, 4, 24, ride the train..... you will use something I layed out in meters. Public money jobs here are all metric, and cost more. I just prefer to use decimal feet. The units are in useful human sizes. What I use two decimal places for; needs three in metric. What we use one for; metric units need two. Hand signaling centimeters to an equipment operator is a pain. Stakes loose clarity. My shoes are a foot long. My knuckles are a tenth. One pace (two steps) are 5 feet. Decks & slabs have two percent fall (i tell the carpenters it's a quarter inch per foot). Crossfalls on roads are designed the same: two hundredths per foot. From my nose to this here outstretched middle finger is three feet. What do you think I use my hp 41 for? Fractions?

Walter: You must work in the sciences. I see your point. Myself, being just a laborer with a real good calculator; I only have to think about distances and angles. Thank some deity that metric angles never caught on. I'd hate to have to learn to think in gons or grads or whatever.

### **Re: The world is eating your lunch!**

*Message #34 Posted by **Walter B** on 23 Oct 2007, 2:23 a.m.,  
in response to message #33 by db (martinez, ca.)*

db, you're right. Of course, I can do the same game in metric: 1 step is 1m, my hand spread is 20cm (from thumb to middle finger), walking speed on even surface is 5km/h etc. Your decks and slabs are my favourites, however: 2% are simply 2cm per 1m, carpenter-proof! Life is easy going metric, and it frees some keys on your real good calculator :)

And angles are as time: we'll keep the Babylonian 60 forever. Don't be afraid, I didn't see anybody using gons in real life so far.

Continue enjoying California! Best regards,

Walter

While there is no great significance to the actual choice of a meter as the basic unit of measure the Metric measure is a SYSTEM of measurements desined based on the initial unit. English measure is a hodgepodge collection of measurements with no common basis. The gallon is not based on the foot as the liter is based on the meter. All english units are unrelated in definition, hence the many needless conversions. Try getting a nation using metric to use English measure! Would you rather have a disorganised units.. sixteenths of an inch rather than decimal? The failure tto understand tthe interrelated systematic set of units hampers your calculations and your thoughts. Sam

Stefan

If ten is such a natural system then why have there been so many other systems in use.

I could contend that octal is a natural system for me (in my genes, if you will) because of my Swedish heritage. Wikipedia tells us that Charles XII (1682 - 1718) became interested in octal through contact with Swedenborg. I recall seeing a reference somewhere that said Charles XII was so convinced of the superiority of octal that he tried to change Sweden from decimal to octal. It didn't happen because of resistanc to change.

Change is really hard to accept. Try getting an old set-in-his-ways RPNer to switch to the much more natural E.O.S. for work with equations.

My recollection is that in the post-World War II period American industry resisted switching from English units to metric units because all of it's tooling survived the war. Changing to metric was easier in a sense in those countries where industry had essentially been reduced to rubble by the war.

where industry had essentially been reduced to rubble by the war.

FYI, the metric system was invented and introduced some 200 years ago after the French revolution (at a time when the USA were progressive and interested in the world outside). And yes, research confirms there were wars before "the war" ;)

### **Re: Why not octal! (a bit long)**

*Message #43 Posted by **Walter B** on 22 Oct 2007, 11:48 a.m.,  
in response to message #39 by Palmer O. Hanson, Jr.*

Quote:

In a digital age either an English system or a decimal system is a Luddite concept!

IMHO there are 3 separate points mixed in this discussion:

- 1) the number base (10, 8, 12, 16, or whatever) or numeric system for calculations,
- 2) the set of units for measuring,
- 3) the system built by a (carefully chosen) set of said units.

Ref. to 1): Various number bases were chosen in different civilisations (e.g. 12 in Babylon, 20 in Yucatan). Traditionally, these systems existed "stand-alone". However, growing long range trade pushed people to find a common system. Nowadays, the decimal system is accepted almost everywhere for serious calculations done by humans, and the binary system for the same done electronically. Of course, there are some exceptions (the most popular is found counting time between seconds and years). But no serious people are up to replace the decimal system today by another one.

Ref. to 2): Various units were chosen in different civilisations (as above). Traditionally, these units existed "stand-alone". Meaning, units to measure an area had nothing to do with units to measure a length. Often, even different units for the same physical quantity were living separated (look e.g. at some Imperial units of length). Again, growing trade pushed people to find common units. But the push was softer than above, since you can easily live in e.g. a world of acres as long as this unit is suited well to the areas you are interested in, and you don't want to deal with much bigger or smaller surfaces (living in a sufficiently secluded place).

Ref. to 3): Unlike the other points, the need for a \*system\* of measuring units arose from science. As you know, scientist are those strange folks interested in everything from the very small to the very large. And even worse, they search for links between everything! And still worse, they found such links between many fields which were so neatly separated before. Thus, "stand-alone" units had to be caught and grouped into systems. When I started my studies, two of them were still found in European textbooks (called "cgs" and "mksA", the latter becoming the basis of "SI"). Meanwhile, pushed by growing international science, AFAIK "SI" is the only surviving system.

By all this, it should be obvious there once has been an "English monetary system" based on the number 12, and there still is an "English set of units", but there never was anything like an "English system of measuring units".

HTH,

Walter

### **COST OF METRIFICATION**

Message #44 Posted by [designnut](#) on 22 Oct 2007, 12:27 p.m.,  
in response to message #43 by Walter B

A suggestion was made of the cost of going metric as being prohibitive. I submit that the cost of NOT changing is worse. England changed. Somebody has to stand up for it. One British lady referered to the decimal currency as metric. I gave a real example of a Swiss trained engineer solving a spring and mass problem by first changing the data to metric and solving it in one page. His boss said it's not that simple: did his own calculation on 3 paqes and made 5 mistakes. Are we to be the last bastion of backwardness just because of NOT INVENTED HERE ? Sam

Well, it might or might not hamper your calculations (it shouldn't though--for every door opened by decimal there is also a door closed. Division by 2s is effective for rapid work in the head, if you learn the old ways).

It shouldn't hamper your thoughts. Understanding  $F=Ma$  is not affected by units. IF you understand what mass is, and force is, then it doesn't matter! Only if you don't actually understand the principles do the units get you confused.

Message #50 Posted by **bill platt** on 23 Oct 2007, 8:25 a.m.,  
in response to message #48 by designnut

Ha ha. "Did I have to look it up." Of course not.

Force = Mass time acceleration.

Consistent units:

lbs = Slugs times feet/sec<sup>2</sup>

or you can do

$\text{lb}\{\text{force}\} = (\text{lb}\{\text{mass}\}/32.2\text{ft}^2/\text{s}^2)\text{times feet}/\text{sec}^2$ . We also have poundals as a weight unit (the weight of 1 lbm is 32.2 poundals), if you want to get rid of the 32.2 division--but they aren't used universally.

This is no different than Metric. Just different names, and a "convention" inverted (we tend to use the standard force measure for mass, i.e. lbm, whereas the kg world tends to use the mass measure for force in conventional thinking, i.e. kgf is what you "weigh" in metric. People don't say "I weigh 700 N." Essentially, in the U.S. we tend to use the gravitational unit approach, whereas in S.I. the default is an absolute system. But beware that metric is not always absolute, and in America we can work in absolute, too if we find it convenient! It is common to find the metric gravitational system of units as well, where the \*force\* is kilograms, and the mass is kilogram-seconds.

In either \*system\* there is a consistent set of units. I think it is the metric-only crowd that has the problem of understanding :-). After all, American engineers are bilingual units-wise: as with language in general, this leads to improved understanding.

### **Re: The world is eating your lunch!**

Message #51 Posted by **Walter B** on 23 Oct 2007, 12:07 p.m.,  
in response to message #50 by bill platt

Hi, Bill,

Quote:

It is common to find the metric gravitational system of units as well, where the \*force\* is kilograms, and the mass is kilogram-seconds.

Where did you find such a mess? Certainly not in a \*system\*. And for sure not in SI. BTW: Please do not mix SI with anything anybody sold to you as "metric", while it may be only decimal or whatever. Please see my post above for some definitions.

Quote:

In either (read: any) *\*system\** there is a consistent set of units.

Exactly, per definition :) Thus, so far I don't see any living *\*system\** besides SI anymore. Maybe small sets of linked units in a limited area of application, but no *\*system\**. However, I'm willing to learn :)

Quote:

I think it is the metric-only crowd that has the problem of understanding :-)  
After all, American engineers are bilingual units-wise: as with language in general, this leads to improved understanding.

Ooooh, here you choose a *\*very\** dangerous picture! Did you think about it carefully? Do you really want to stress US-American bilinguality? (Bilingual families by origin don't count!) Feel free to withdraw ;)

Edited paragraph 1 but found you replied faster. Sorry for interfering :)

### **Re: The world is eating your lunch!**

*Message #52 Posted by [bill platt](#) on 23 Oct 2007, 12:15 p.m.,  
in response to message #51 by Walter B*

Well, of course I'm 1/2 kidding and 0.5000 serious. It's all trivial anyway, but what I have noticed is that all of us in my generation here have no "problem" with metric, but if I give slugs per cubic foot to a European subcontractor, they are utterly lost.

An amazing thing happened when one of my former employers was taken over by a Norwegian firm. The new company insisted that we all take a "metric" course. Of course it was total WOT and the instructor was baffled as to why she had to teach us for 20 hours! Evidently, the Norwegians had been hearing too many stories on MoHPC;-)

Why don't I convert totally to metric? Because (a) it is unnecessary and (b) all the previous work that is comparable is in U.S. customary. On other projects, where the reference work is metric, or there is no reference work, or where systems are primarily metric, I use SI. If it is a modification job, I use the units that were used in the original construction. Why waste time converting merely for pedantic reasons?

### **Re: The world is eating your lunch!**

*Message #53 Posted by [Thor Lansen](#) on 23 Oct 2007, 1:51 a.m.,  
in response to message #46 by bill platt*

Quote:

Understanding  $F=Ma$  is not affected by units

True, but calculations in English units is affected by inconsistencies therefore that equation of force in the SI system would simply and nicely look like this (units are shown in square brackets):

$$F [N] = M [kg] a [m/s^2]$$

while in the English Engineering "system" would look like this:

$$F \text{ [lbf]} = (M \text{ [lbm]} a \text{ [ft/sec}^2\text{]})/gc$$

where "the fixer"  $gc = 32.1740 \text{ [lbm-ft/lbf-sec}^2\text{]}$

so, if nothing else, it WILL slow down your calculations (and this same thing will happen with Kinetic and Potential Energy, Pressure at Depth, etc.)

Quote:

Division by 2s is effective for rapid work in the head

More effective than moving the decimal point to the left? I doubt it

This "fixer" as you call it is present in all gravitational units systems, including \*metric\* gravitational systems. It isn't a matter of "see, see, metric is better!"

**Re: The world is eating your lunch!**

Message #61 Posted by [Thor Larsen](#) on 23 Oct 2007, 9:18 a.m.,  
in response to message #60 by bill platt

Quote:

This "fixer" as you call it is present in all gravitational units systems

No it is not. The "fixer"  $g_c$  is a conversion constant such as 12 in the conversion factor between feet and inches. It has the same numerical value as the standard acceleration of gravity but it is not the local gravitational acceleration  $g$  ( $g=32.2$  [ft/sec<sup>2</sup>] English,  $g=9.81$  [m/s<sup>2</sup>]) and it is needed because the units of pound-mass and pound-force are as different as the units of feet and gallons and they can not be canceled. The Metric system (SI) being fully consistent does not need it.

Quote:

It isn't a matter of "see, see, metric is better!"

You are right, let the equations speak for themselves

Not really a "debate." Astronomers use them interchangeably in the sense that none of us has to stop and think which is which (and we all know that a parsec is 3.26, or about 3, light years).

Both of them (light year and parsec) are big - part of astronomers (and many other scientists) efforts to make the size of anything you measure about one.

Parsec is also somewhat similar to the discussion above about things like "feet" i.e. a unit based on some size with which most people are familiar and comfortable. For those who don't know, "parsec" is short for "parallax of 1

second (of arc)" and refers to how far away something would be so that its apparent position in the sky would shift by 1 (actually 2 - referring to the Earth's orbit diameter rather than radius) second of arc, back and forth, as the Earth goes around the sun in the course of a year. Hence, when you look at the sky and measure in arcseconds how much a star seems to move, you have directly measured (well, you've measured the reciprocal) its distance in parsecs. No conversions needed!

### **Re: The world is eating your PARSEC!**

Thanks, I didn't know the definition of a parsec, but I did think it was amazing that Han Solo used it as a unit of measurement long, long, ago in a galaxy far, far away...

Since the earth's orbit is elliptical, the parsec changes depending on the days of the year the measurement is taken? B^)

### **A definition of "acre"**

*Message #67 Posted by **Karl Schneider** on 24 Oct 2007, 1:48 a.m.,  
in response to message #62 by designnut*

Quote:

I heard on TV that fires consumed so many acres. I didn't know what exactly an acre was. Wikipedia says it was a furlong by a chain. Furlong was explained by long furrow.

I think that you're using a TI keyboard, Sam...

One square statute mile is 640 acres, as can be inferred from an HP-28.

The corresponding metric unit for medium-sized property areas is the "hectare"  $(100\text{ m})^2 = 10000\text{ m}^2$ , which is about 2.47 times as large.

The units library is my favorite feature of the HP-28C/S.

Quote:

One square statute mile is 640 acres...

A bit of trivia.

Here in Denver Colorado, many of the city blocks are 1/10 mile long by 1/16 mile wide. This gives 160 city blocks per square mile or exactly 4 acres per block.

I have long wondered if this scheme is commonly used in other US cities.

**Re: A definition of "acre"**

*Message #70 Posted by [Stefan Vorkoetter](#) on 24 Oct 2007, 3:09 p.m.,  
in response to message #67 by Karl Schneider*

Furthermore, 1.25 miles by 1.25 miles is exactly 1000 acres. Here in Ontario, Canada, when it was first being settled, roads were laid out on a 1.25 x 1.25 mile grid, and the land in each square was divided up into ten 100 acre parcels.

Regarding whether city blocks are laid out the same, the nearest city I live near (Kitchener-Waterloo) doesn't seem to have a straight road or rectangular block in it.

Stefan

---

Quote:

---

Furthermore, 1.25 miles by 1.25 miles is exactly 1000 acres.

---

You might not come to these conclusions if you were using an HP48, HP49, or HP50.

In this case,  $1\_mi^2 = 639.997440003\_acre$ .  
And  $(1.25\_mi)^2 = 999.996000004\_acre$

However,  $1\_miUS^2 = 640\_acre$ .  
And  $(1.25\_miUS)^2 = 1000\_acre$ .

In the US, there are two legally recognized definitions of the "mile", just as there are two legally recognized definitions of the "foot". According to NIST, the "acre" is based on the older "survey mile" (or 1\_miUS on an HP48), not the more widely used "international mile" (or 1\_mi on an HP48).

The difference between a survey mile and an international mile is about 3.2\_mm.

Hi, Norris --

Quote:

---

The difference between a survey mile and an international mile is about 3.2\_mm.

---

Hmm... its that all? I'd never figured out the difference, but believed that it was a bit more. I'm sure that the definition of 1 inch = 2.54 cm is the basis of the slight difference.

This statement could use a minor edit:

Quote:

---

1\_miUS = 640\_acre.

---

## Re: A definition of "acre"

*Message #73 Posted by **Norris** on 28 Oct 2007, 4:00 p.m.,  
in response to message #72 by Karl Schneider*

Quote:

I'd never figured out the difference, but believed that it was a bit more.

Your HP calculator will tell you that 1\_miUS - 1\_mi = 0.000002000004\_mi, or about 2 parts in a million, or about 3.2 mm

Quote:

I'm sure that the definition of 1 inch = 2.54 cm is the basis of the slight difference.

Formally, the difference is in the definition of the older "survey foot" vs. the newer (since 1958) "international foot". Both are defined relative to the meter, but slightly differently (fraction vs. decimal):

1 survey foot = 1200 / 3937 m exactly ( ~ 0.304800609601 m)  
1 "survey inch" = 100 / 3937 m exactly (~ 2.54000508001 cm)

1 international foot = 0.3048 meters exactly  
1 "international inch" = 2.54 cm exactly

Quote:

This statement could use a minor edit: 1\_miUS = 640\_acre.

Quite so. It's been fixed above.

*Edited: 28 Oct 2007, 4:11 p.m.*

## **Re: A definition of "acre"**

*Message #74 Posted by **James M. Prange (Michigan)** on 28 Oct 2007, 11:26 p.m.,  
in response to message #73 by Norris*

Quote:

Your HP calculator will tell you that 1\_miUS - 1\_mi = 0.000002000004\_mi, or about 2 parts in a million, or about 3.2 mm

Or looking at it the other way around, my calculator tells me that 1\_mi-1\_miUS=-2.0000000002E-6\_miUS (that is, .000002000000002\_miUS).

For the RPL models, converting from one unit to another unit involves first converting to the base unit, and then from the base

unit to the desired unit, giving two opportunities for rounding.

The calculators' conversion factors to base units are extended real (15-digit mantissa) numbers. For example, for `_miUS`, the conversion factor (to `_m`) is `%%1.60934721869444E3`, and for `_mi`, the conversion factor is `%%1.60934400000000E3`.

For doing a (UserRPL) conversion or other mathematical operation with unit objects, the (12-digit mantissa) real number components are converted to extended reals, extended real operations are used internally, and the result is converted to a real.

Of course when doing a series of UserRPL operations, the value is converted to a real at the end of each UserRPL operation.

Actually, `1_mi=.999998_miUS` exactly, and `1_miUS` is slightly more than `1.000002000004_mi` (feel free to work out the exact decimal number notation).

Working it out by hand (but with `_ftUS` and `_ft`):

```
1_ft=(3048/10000)_m
1_ftUS=(1200/3937)_m
```

Given the above exact relationships:

```
1_ft/1_ftUS=(3048/10000)_m/(1200/3937)_m
```

The `_m` units cancel out, so:

```
1_ft/1_ftUS=(3048/10000)/(1200/3937)
1_ft/1_ftUS=(3048/10000)*(3937/1200)
1_ft/1_ftUS=(3048*3937)/(10000*1200)
1_ft/1_ftUS=11999976/12000000
1_ft/1_ftUS=499999/500000
      1_ft=(499999/500000)_ftUS
      1_ft=.999998_ftUS
```

Of course it can be shown that `1_ftUS=(500000/499999)_ft`, but that doesn't have a nice short decimal notation equivalent.

Of course the same relationships hold between `_mi` and `_miUS`, inch and the previous "US inch", and all other length units that have both an "old US" and an "international" definition.

Regards,  
James

One square statute mile is 640 acres, as can be inferred from an HP-28.

---

My dictionary says that an acre is 160 square rods, 4840 square yards, or 43,560 square feet.

When I was growing up back in Minnesota in the 1940's an acre or a fraction of an acre was sort of a city measurement -- something one uses to measure the size of lot or of a garden. Rural people were more familiar with the section (a square mile), a half section, or a quarter section -- measurements which could define the size of a sustainable farm, and approximately related to the amount of land required to yield a certain amount of grain.

### **Re: A definition of "acre"**

*Message #77 Posted by **Patrick Rendulic** on 25 Oct 2007, 3:24 a.m., in response to message #76 by Palmer O. Hanson, Jr.*

I prefer:

$1 \text{ km}^2 = 100 \text{ hectare} (= 100 \text{ hm}^2) = 100 \times 100 \text{ are} (= 10.000 \text{ dam}^2) = 100 \times 100 \times 100 \text{ m}^2 = 1.000.000 \text{ m}^2.$

### **Re: ACRE**

*Message #78 Posted by **db (martinez, ca.)** on 27 Oct 2007, 6:32 p.m., in response to message #62 by designnut*

DN;

A furlong is 660 feet. A (gunter's) chain is 66 feet. There are also 100 links in a chain. You might notice a decimal relation in there somewhere. These measurements were adopted by Thomas Jefferson as the units of the public land surveys in the US about 200 years ago. We still use them, along with the French "arpent", the various

Spanish & Mexican Vara & Smokes, and the meter because we retrace surveys (at least on paper) by "following in the footsteps of the original surveyor". There's about two and a half acres in a hectare.

BTW: an acre is also defined as what one man with one ox can plow in one day.

That indeed makes it a

Quote:

*Message #80 Posted by [Doug](#) on 25 Oct 2007, 1:05 p.m.,  
in response to message #60 by bill platt*

Some clarity is needed here. In physics there are three quantities: length-mass-time, there are no others. The problem of "fixer" terms arises because of the use of non-rationalized systems of units. For example: Meter-Kilogram-Second and Foot-Slug-Second are "rationalized" systems of units but Inch-Lbm-Sec and cm-gram-second are not rationalized systems of units. The choice of a non-rationalized system of units will always result in "fixer" terms. This was only discovered some 60 years ago and that is why cgs is no longer used in physics papers, as a matter of fact, physics papers no longer specify systems of units because it is assumed that a "rationalized" system will be used.

### **Re: The world is eating your lunch!**

\_\_\_\_\_

If you want to do electricity problems, you need another unit, usually an amount of charge (i.e. coulomb)

I think cgs is still around, especially in theoretical papers. In fact, some of those guys go so far as to make  $c$  (the speed of light) and  $h$  or  $\hbar$  (Planck's constant) equal to one, for ease of algebraic manipulation (of course, they have to put the units on to get the right answer!).

### **Re: The world is eating your lunch!**

*Message #82 Posted by **Palmer O. Hanson, Jr.** on 25 Oct 2007, 9:55 p.m.,  
in response to message #81 by Dave Shaffer (Arizona)*

This thread was started when "Design Nut" wrote:

Quote:

---

Is the world eating your lunch? We cling to a mismatched set of measurements instead of adopting the metric system. For example: a Swiss engineer was asked to calculate a spring and mass resonance. He converted all measurements to metric and solved it in one page. His boss insisted it could not be done in one page, took 3 pages and made 5 mistakes. Math is being taught in a pen and pencil method in a computer world. I submit that algebraic calculator entry is hampering the teaching of math. Math is being taught with 19th century methods. I would like to be able to give out beginners calculators with RPN to smooth the way. Allowing equation entry and SOLVE would answer the algebraic methods in the schools.

---

I would like to suggest that we go back and identify some areas where the world has indeed "eaten our lunch" and then ask "To what extent was failure to adopt a metric asystem involved?" We could begin with a technology such as automobiles.

My impression is that the Japanese gains in automobile design and manufacture had little to do with metric measurements and everything to do with quality control. I also doubt that the use of algebraic calculator (or computer) entry was a hindrance. After all, the dominant computer language for engineering at the time was FORmula TRANslation.

I don't know what happened to the metrification program in the USA. When I was in middle school, 1968-1970, most of our time in science class was spent learning the metric system because this country was planning to switch over to the metric system in short order and they wanted to make sure that kids grew up knowing it. It was no fun going through the workbook page-by-page and doing \*all\* the problems to learn this, but I figured that our bit was to learn the metric system and the rest of the world would learn English. An even trade I thought that would help to unite the world.

Wow, was I naive. Now I'm finding that I need to learn Spanish and you're finding metric conversion keys on the HP35S. :)

In response to Katie's question "What happened to metrification?" you directed us to a discussion in Wikipedia. It was interesting reading but I was bemused by the section on the construction industry which stated in part

Quote:

Dimensional lumber still comes in standard nominal inch widths and depths (e.g., "2 by 4"). Lengths are given in feet.

and I note that at some point the standard nominal widths and depths were changed such that "new" lumber was smaller than "old" lumber. This change plays havoc when someone tried to repair a house built with "old" lumber. It's as bad as when one tries to repair something put together with metric hardware and only has inch-dimensioned wrenches.

*in response to message #85 by Katie Wasserman*

Quote:

I don't know what happened to the metrification program in the USA. ...

Nor do I. During college in the 1940's there was some discussion of the need to convert to metric. My recollection is that the discussion was more prevalent in physics and chemistry classes than in engineering application classes.

I remember when we talked about converting highway distances from miles to kilometers and seeing some signs with both, but for the most part highway travel is still measured in miles in the USA. My 2006 AAA Atlas uses miles for the USA and kilometers for Canada with both scales shown somewhere on each map. The upper scale is in miles on USA maps and in kilometers on Canadian maps.

Coca-cola comes in the traditional 12 ounce aluminum cans but in "16.9 FL OZ (1.06 PT) 500 mL" plastic bottles.

For many grocery items the traditional packaging has been eliminated but has not been replaced with metric packaging. Consider coffee where the traditional 16 ounce packages have gradually been replaced with 13 ounce or 11.5 ounce (326 gram) packages. But that is a "fool the customer" issue not a conversion to metric issue.

Why would you do that ? Just curious ...

I said this half in jest, but only half. I live in suburban NY City and in my zip code there is certainly more Spanish spoken than English. I have a hard time communicating with my once-in-a-while housekeeper and other people that I need to converse with on occasion. Personally I feel like one should learn the language of the place that you're living in, but that doesn't seem to be a universally held belief. Besides, it's not even clear that English is the language of this area given how many official documents are printed in Spanish and English and how most phone call centers tell you to "press 1 to continue in English".

*Message #94 Posted by [bill platt](#) on 26 Oct 2007, 1:58 p.m., in response to message #92 by Katie Wasserman*

Well into the 20th century, some significant areas of the U.S. spoke German, carried on town business in German, ran the public schools in German. These areas included much of the land outside Philadelphia, and parts of the upper midwest.

The U.S. has never had an "official" language and has never needed one: Usually in time, all tends to English, but other languages serve where it is expedient. My own college was founded by German-speaking people around 1880. The first president spoke fluent English, and the other board members chose him partially for that reason. They wanted their new college to have a broader support.

### **[OT] Re: The world is eating your lunch!**

*Message #95 Posted by [Valentin Albillo](#) on 27 Oct 2007, 11:42 a.m., in response to message #92 by Katie Wasserman*

Hi again, Katie:

Katie posted:

*"I live in suburban NY City and in my zip code there is certainly more Spanish spoken than English."*

I fully understand you. I visited NY City (and state) back in 1994 for the first time, and I was eager to try my rudimentary English in a fully-English environment. Boy, was I wrong ! :-)

I stayed there for 3 whole days, and not-even-once had I to speak even a single English sentence. Everyone would speak to me in Spanish, from the hotel clerks, to all taxi drivers, to the people attending tourists at such places as the Empire State Building, to each

and every clerk in every shop I entered to buy something. Even people selling things in the streets would speak to me and barter with me in Spanish and tell me they had relatives living in Spain.

To top it all, when I was returning home, a police woman at the airport did also address me in Spanish as well about a metallic object which was a Kodak film case. Not once did I have the opportunity or need to speak English while I was in NY City. Even the shop displays were always in Spanish as well. I still remember the shock I felt when I read a 5th-Avenue shop banner saying "*Españoles, más barato que en la Gran Vía*" (i.e., "Spaniards, buy here cheaper than in (a very large Madrid's street)"). Actually the banner was right, I felt no difference than if I were actually shopping in Madrid, which wasn't what I expected or wanted.

*"Personally I feel like one should learn the language of the place that you're living in"*

I fully agree. Me, I think that the ideal situation would be everyone knowing their native language, plus, once you're 3 years old, start to learn English as well. This way, everyone would be essentially perfectly proficient in two languages, namely his/her native one, plus English, so you would be able to travel to any country and to communicate with every person in the planet as if it were your neighbor next door.

But I think this rational view will never be adopted for a number of reasons. Most essentially, most politicians and governments would be opposed to it, as it would undermine the "us-versus-them" paradigm so useful to keep in control.

Myself, I used that strategy with my daughter and now she's 15 and speaks both Spanish and English at the native level, certainly much better than me. It has enhanced her education and overall living experience immensely.

Best regards from V.

Do you know that in the 1950's much of the world was somewhat like that, that is, if you consider the Americanized version of English to really be English. In Japan students would sit beside me on the train and volunteer to explain the passing countryside if I would talk with them, and as a result, help them with their conversational English.

It was the time that some historians derisively describe as the heyday of the almighty dollar. I found that shopkeepers in diverse places such as Japan, the Philippines, Libya, Egypt, Jordan, Greece and Italy were conversant in English. France was another matter.

Palmer posted:

*"[...]if you consider the Americanized version of English to really be English.*

Actually, I consider Americanized English to be *the* "real" English nowadays, because a language has to be a living thing, expanding, adapting, growing, evolving, and I see more of that in American English than in older traditional versions.

*"In Japan students would sit beside me on the train and volunteer to explain the passing countryside if I would talk with them, and as a result, help them with their conversational English."*

Yes, it's been my experience too that, for some reason, Japanese people find English extremely difficult to learn.

*"I found that shopkeepers in diverse places such as Japan, the Philippines, Libya, Egypt, Jordan, Greece*

*and Italy were conversant in English. France was another matter."*

And Spain yet another. Until very recently, most Spanish students would learn minimal English, if at all. Matter of fact, most Spanish people do not speak even passable English, let alone understand an actual conversation, a song's lyrics, or a movie.

All English-language movies and TV series are routinely dubbed, with the horrific side effects that lip movements are never synchronized with what you're hearing, and you get to hear the same male and female voices for all characters in all series over and over again, which completely ruins the excellent vocal abilities and nuances of the original actors, replaced by some mediocre, over-acted, over-emphasized dub which quickly gets boring to the point of nausea.

This being so, it's been many years since I decided to listen to all movies and TV shows in their original English versions, never listen to a dub anymore. Even for Japanese anime and movies, I always listen to the Japanese-language original with English subtitles (which will hopefully soon get away as well when my Japanese improves :-), even if an English-language dub is available.

Frankly, I would advise anyone trying to learn a new language to absolutely forget about those courses they're always announcing here and there, whether quick or exhaustive.

The one and only way I've found to really, really learn a new language is the hardest one, i.e., total *immersion*: either you travel to the country and stay there on your own for a long while (>1 year), or else you make a point of only reading and listening to publications in that language, initially enabling subtitles and focusing in simple things such as comics, participating in forums related to some hobby of yours, reading web sites and newsgroups, etc., to the point that you'll find yourself *immersed* in the language for at least 2 hours or more each and every day. Also, the younger you begin the better.

It'll be hard, but as the descriptive Spanish proverb says: "*El que quiera peces, que se moje el c\*\*\**" ("*You wanna fish, you gotta get your a\*\* wet*"). :-)

Best regards from V.

Buenas dias, Valentin,

Quote:

Me, I think that the ideal situation would be everyone knowing their native language, plus, once you're 3 years old, start to learn English as well. This way, everyone would be essentially perfectly proficient in two languages, namely his/her native one, plus English, so you would be able to travel to any country and to communicate with every person in the planet as if it were your neighbor next door.

Agree with you almost. This is a first step in the right direction. But (so called) global languages change. While "the civiliced world" communicated using Greek some 2500 years ago, it turned to Latin some 500 years later and kept it for 1600 years, turned to French then for about 300 years, and now uses English for 100 years. In parallel, major parts of the world speak Spanish or Chinese natively. BTW, the world tends to adopt grammatically simpler languages every time, so there are good chances to see Chinese as the next global language.

So it would be fair for everybody knowing his mother tongue to learn (at least) one of the global languages **in addition**. This would foster Chinese learning e.g. English and "English" (yes, also Americans!) learning Chinese or Spanish as a **second** language. Of course, everyone is free to learn more, but this should be minimum acceptable. BTW, I write this being in Hongkong, enjoying that a country with 1.3e9 inhabitants speaking and writing another language cares to write most signs in another global language, i.e. English, too.

As usual, these are just my 20 Milli-Euro.

So it would be fair for everybody knowing his mother tongue to learn (at least) one of the global languages in addition.

---

I've long thought it important that everyone learn a second language -- any language -- simply as a means of gaining new viewpoints. Learning another language is an excellent way to discover that other people think differently, not just about different *things*, but in different *ways*. I'll never forget the surprise and sense of wonder I felt in high school French class (36 years ago!) when I first discovered that French wasn't just English with a different vocabulary. It had never occurred to me that there was more to learning a language than memorizing a dictionary. It wasn't just the obvious differences in grammar and syntax, but more subtle things. For instance, I might say, "I am cold," but a Frenchman would say, "It is cold to me." Or in talking about the weather, I might say, "It *is* beautiful today," whereas the Frenchman would say, "It *makes* beautiful today." (And then there's that whole business of using "my little cabbage" as a term of endearment. :-)

A few years later, when I studied ancient Greek, I was again surprised at how many more differences there were compared to English and French. Later, Latin and Old English surprised me not just with those differences, but with the similarities to Greek and to each other. It fascinates me that people see the world around them in so many different ways. Modern English has a pretty standard subject-verb-object word order; but in many languages (including Old English) subject-object-verb is common. What does the position of the verb in a sentence say about the relative importance of the action and the doer of the action in the speaker's mind? Does last place in the sentence indicate more importance, or less? And what about highly inflected languages that allow words to be placed in almost random order without obscuring the meaning? What does the choice of word order say about the (perhaps unconscious) attitudes of the speaker toward what he's saying?

I think everyone should study languages other than their own for the same reason I think artists should study science, and scientists should study literature and philosophy, and in fact, everyone should study a little bit of everything: It gives us more windows onto the world and how other people see it. Language gives us direct insights into how other people think.

When I applied for admission to the engineering school at the University of Minnesota engineering was a four year course. When I started school in September 1946 they told me that engineering had become a five year course where the extra year was to be used to take courses in the liberal arts part of the university. At graduation I had 9 credits in psychology, 16 credits in sociology, 9 credits in humanities and history, and 3

credits in preparation for marriage.

In one of the humanities courses the professor was rhapsodizing about how wonderful it was that engineering students were having their education broadened. In those days the arts college offered a course called Physics without Mathematics. How in the world does someone teach that? I suggested that it might be a good idea if the arts college students would be required to take mathematics through calculus so that they could study physics with some mathematics. He saw no merit in that idea.

I received an A in Preparation for Marriage. I didn't get married until I was 35. My friends frequently asked how I got an A when I obviously hadn't learned anything.

*Message #105 Posted by [Ed Look](#) on 28 Oct 2007, 10:56 p.m.,  
in response to message #104 by Palmer O. Hanson, Jr.*

Palmer, Wayne, ugh! Those horrible courses—physics with enough math so the students who didn't want to be there in the first place but have to be don't jump out the windows (and the similar chemistry one) really are wretched things. Oh, and these students had very little math in their backgrounds. It wasn't easy, as they didn't understand any more math than a four-banger could do (the four banger had better memory retention and stayed on longer than they could stay up), and it's hard to explain things without equations.

Anyhow, I majored in a physical science at my (private) college. But they had rigid humanities and unrelated fields subjects requirements and though I found myself at a distinct disadvantage in grad school, I will admit to being very glad now that I took those nontechnical courses. They literally broadened my tiny little horizons. Literature and philosophy courses should be a must for any serious college student, especially if they are science or engineering majors.

If you are young and have a scientific bent, you can pick up more math, chemistry, physics, engineering, programming, etc. courses with a lot less trouble than a scientist, engineer, or programmer, etc., later on can begin to appreciate art, music, literature, etc. beyond what the art teacher in the third grade

showed with a box of crayons and kindergarten teacher showed with picture books.

---

My memory is not all that it could be these days but my recollection is that there was not a lot about sex but a lot about such things as making a budget, buying a house, raising children and the like. There was a textbook. I discarded it long ago.

I do not know if such courses still exist. They may not be as useful as they were in those days. At that time a relatively large number of college graduates married during the summer following their graduation and had little or no experience in such concepts as managing money. That isn't so true today.

**Re: [OT] Re: The world is eating your lunch!**

*Message #109 Posted by [Meenzer](#) on 31 Oct 2007, 3:00 a.m.,  
in response to message #108 by Palmer O. Hanson, Jr.*

Thank you very much for this insight.

I feel like this kind of course should be mandatory at high school level. People get all kinds of education but not in the skills that virtually all of them are needing most: how to manage a relationship and how to raise children. Society seems to just assume that these are natural skills that everybody has - reality shows the contrary to be true.

I once ran afoul of one of my bosses on this issue. I was solving a problem that involved accelerations and dynamic behavior, and so I used a rationalized mass-unit system (slug ft seconds) but the boss shook his head and started trying to explain to me that I didn't need to go to all the "trouble" of using slugs. He was correct, but still wrong in my mind. Habits, even rather unfortunate ones, can be hard to break, even in rational people (who use irrational systems!).

### User design calculator contest [just an idea]

Message #1 Posted by [Miguel Saiz](#) on 13 Oct 2007, 8:31 p.m.

Looking at the HP42S topic, I think it could be a good idea to HP (or maybe, just for fun, without HP sponsorship) to design the ideal HP calculator based on what experienced and loyal HP users thinks about what will be the ideal HP calculator (I think there are better calculator designers here, that on HP [I apologize to any current HP designer that could be reading this...but It is true!]) It could be a good starting point to HP to re-enter [with some success] to the calculator market again. The HP50G is ok (but not a huge innovation neither), HP35S is ok (but with a lot of bugs, not an impressive display), the most expected re-design HP17BII+ (wide enter), that will be introduced sometime (hope that soon, in the USA)...There are some right steps, but mainly same products, with some improvements. I think that HP needs a hit, a real excellent calculator, so user centry, that it could set the trend (one more time, as in the past). For sure, that HP doesn't have anymore the talent to deliver that product, may be some of the real power user could help...just thinking (or maybe, dreaming...)

### Re: GSM, MP3, RPN, and RPG

Message #2 Posted by [Allen](#) on 13 Oct 2007, 9:33 p.m.,  
in response to message #1 by Miguel Saiz

Forget the Students!!!

What about a Smart (internet) GSM phone, MP3 Player / Fully Functional RPN calculator/ Mp3 Player with plugin modules available for either Engineering Applications or video games like ZELDA and Super Mario Brothers.

Math is entertaining, but saving the Princess of Hyrule can be too!! :-)) Especially if you can do it all within 22 minutes when the batteries die.

Quote:

did you perhaps skip some divisions in your example?

Yes, it was only an excerpt.

None of my programs were written by an IBM 370, so they looked more like this:

```
Identification Division.  
Program-Id. RPN.  
Author. Eric Smith.  
Date-Written. 15 Oct 2007.  
Environment Division.  
Configuration Section.  
Source-Computer. IBM-370.  
Object-Computer. IBM-370.  
Data Division.  
Working-Storage section.  
01 State  
    03 Stack-Lift-Flag Pic 1 Value B"0".  
        88 Stack-Lift-Disabled Value B"0".  
        88 Stack-Lift-Enabled Value B"1".  
01 Stack  
    03 X Pic -9V9(9)E-99 Usage COMP-3.  
    03 Y Pic -9V9(9)E-99 Usage COMP-3.  
    03 Z Pic -9V9(9)E-99 Usage COMP-3.  
    03 T Pic -9V9(9)E-99 Usage COMP-3.  
    03 L Pic -9V9(9)E-99 Usage COMP-3.  
Procedure Division.  
RPN-Add.  
    Perform Save-Last-X.  
    Move X to L.  
    Add Y to X.  
    Move Z to Y.  
    Move T to Z.  
    Set Stack-Lift-Disabled To True.  
* Oh, for a Set <condition> To False statement! Sigh.  
  
Save-Last-X.
```

Move X to L.

Note that the Author, Installation, Date-Written, Date-Compiled and Security paragraphs in the Identification Division are considered obsolete; it is now preferred to use comments for such information.

For my needs and wants, it would look and feel just like my HP35s, except with:

1. Low glare screen
2. STO and  $x^2$  as first functions
3. Multiple letter variable names
4. A fixed (not scientific or engineering) number display format that shows x significant digits instead of x decimal places.
5. Direct rect->polar and polar->rect conversion
6. Slightly bigger case. If it were just a hair bigger, it could hold a pencil and a small pad of paper.

Nothing that makes the calculator more cluttered, heavier, or bulkier.

FWIW, 3 by 5" Notecards work nicely in the 35S case. I also use regular US sized letter paper folded in half then in thirds.

For the writing instrument, I use a small Mechanical Pencil, available in Japan for a few 100 yen, and measures 0.558 cm by 12.15 cm. I have not seen this model elsewhere. If I recall it was made by Zebra, and is similar to [this small one](#). I might order a few of these just to compare.

*Message #19 Posted by **DaveJ** on 16 Oct 2007, 11:06 p.m.,  
in response to message #18 by Richard Ottosen*

Thanks for that. Turns out I have seen the older version of that before somewhere.

The tact switch tops look a bit small under the key membrane, any problems with missing keystrokes if you don't hit the exact center?

Dave.

**Switch operation on DIY-RPN**

*Message #20 Posted by **Richard Ottosen** on 17 Oct 2007, 1:40 p.m.,  
in response to message #19 by DaveJ*

Dave:

Quote:

The tact switch tops look a bit small under the key membrane, any problems with missing keystrokes if you don't hit the exact center?

\_\_\_\_\_

The size of the switch shaft is not a problem. The overlay is somewhat stiff so that your finger can miss a bit without any problems. If you are too close to an adjacent switch shaft, both switches can activate. This gives an ugly "scritch" sound/feel.

To help minimize this interaction between switches, the switches are in a hole. This reduces the coupling of the flex of the overlay from one switch position to any nearby switches. In an ideal world this would work perfectly. However, the switch shafts have to stick up a small amount above the barrier to allow them to be pushed. This height does not have to be the full stroke of the switch since the overlay can distort slightly into the hole.

A related factor is that the overlay is flat. The 3-D graphics do no good helping you feel where a key is. One way to solve this lack of tactile feedback is to make a slight recess in the overlay above the shaft of the switch. This can be a small hole -- about 1.5 mm diameter seems to work -- that is as little as 0.05 mm deep.

A potential problem with the small switch shaft is that over time it might wear a hole in the overlay. Since the overlay is replacable without using tools this should not be a big deal.

-- Richard

### **Re: Switch operation on DIY-RPN**

*Message #21 Posted by [Pavneet Arora](#) on 17 Oct 2007, 4:57 p.m.,  
in response to message #20 by Richard Ottosen*

Dear Richard,

I really do hope that you continue to work on these designs. Although, I am delighted that HP has made a firm commitment to the calculator group, the designs that you and Eric have produced are incredibly innovative. I was just thinking that the Mylar version may be able to form the basis of a weather proof calculator.

Cheers.

### **Re: Switch operation on DIY-RPN**

*Message #22 Posted by [DaveJ](#) on 17 Oct 2007, 5:31 p.m.,  
in response to message #20 by Richard Ottosen*

I figured that might be the case. I considered a similar overlay for my RPN watch project, but in the end found that the keys sticking out of the front panel gave a better look (for a watch) and operation. Same thing could be done on a full size calc like yours, with an overlay with key cutouts that fits

around the keys. Lots of various switch and cap options are available. But I guess you sacrifice that "look" for better key functionality.

I still think that designing a new board for one of the new HP calcs (35S or 17BII+) is an easy way to go to get the professional look'n'feel.

Dave.

### **Re: Switch operation on DIY-RPN**

---

Yes, your watch looks pretty good with the small key caps and cut out front panel. With such closely spaced buttons, you need a protrusion to press. Obviously, there is no room on such small key tops for legends.

Quote:

---

Same thing could be done on a full size calc like yours, with an overlay with key cutouts that fits around the keys.

---

I have looked at this. I would use a Laser to do the cutouts on a printed graphic. However, putting all of the legends on the front panel is not practical for really complicated keyboards such as the HP34C.

Quote:

---

Lots of various switch and cap options are available. But I guess you sacrifice that "look" for better key functionality.

---

I think that the "look" is important. If the calculator is ugly then I don't want to use it. The HP33S is a perfect example. I would rate the overlay feel as "not as good as an HP41 keyboard" but "better than a HP6S keyboard".

Quote:

---

I still think that designing a new board for one of the new HP calcs (35S or 17BII+) is an easy way to go to get the professional look'n'feel.

---

There are no key caps available with HP legends except by cannibalizing an HP calculator that has the exact keys needed. So, about all you can do is a calculator with the same functions as the one you cannibalized.

---

Yes, it would take someone to create a new set of moulded keytops, that's the biggest hurdle I think. In this respect the 17BII+ is better with it's soft menu keys. The key tops would be a base set of generic functions, and then all the smarts goes into the menu system.

Dave.

### **41/71 to Windows/XP - OS/X file transfers via RS-232, who is doing it?**

Message #1 Posted by [Egan Ford](#) on 13 Oct 2007, 4:07 p.m.

I've read a few articles on transfers using DOS or Linux, but not Windows/XP or OS/X. E.g. Windows/XP will not allow 16-bit DOS application to access the serial port making transfers using older DOS code a challenge (e.g. EMU71/41).

So, what are any of you doing?

Thanks.

### **Re: 41/71 to Windows/XP - OS/X file transfers via RS-232, who is doing it?**

Message #2 Posted by [Hans Brueggemann](#) on 14 Oct 2007, 3:55 a.m.,

### HP29C Question

Message #1 Posted by [Mike T.](#) on 13 Oct 2007, 2:36 p.m.

I need some help with several HP29C related questions.

Unfortunately I don't have my own so I can't check these myself, hopefully someone out there will have the patience and time be able to provide me with some answers...

How does the HP29C calculator display instructions that use indirect addressing in program mode?

STO + i    23 51 22        or        23 51 15 22

RCL i            24 22        or        24 15 22

GSB i            12 22        or        12 15 22

Is the 'g' key stroke shown in the display as the instruction is entered? Are key strokes show as they are entered at all or does the HP29C differ from the HP25C in that respect? Is it necessary to press the 'g' key at all - what happens if you do?

Thanks.

Mike T.

### Re: HP29C Question

Message #2 Posted by [Thomas Okken](#) on 13 Oct 2007, 3:03 p.m.,  
in response to message #1 by Mike T.

On the 19C and 29C, the 'g' in sequences such as STO g i, is optional, and in program mode, it is not shown in the display -- so STO i is displayed as 23 22 on the 29C and 45 12 on the 19C.

- Thomas

### Need help transitioning from 41/42 to 33/35

Message #1 Posted by [Bill Colisch](#) on 12 Oct 2007, 9:26 p.m.

Greetings

I am a Land Surveyor & was once reasonably competent at programming the 41 & 42. Now I have a 33 & a 35 and want to bring my programs over to them (as I did to the 42).

Can I implement the "KEY x GTO nn" functionality?

I liked the 42 SOLVER function - Can I make the 33/35 work similarly (with the variables shown in the bottom row of the display)?

Should I be trying to use equations more within the programs?

I appreciate any help.

PS - HP (if you're out there)I would vote to bring back the 42s with time functions & a USB I/O computer interface (though I was never wild about the ALPHA input system).

### Re: Need help transitioning from 41/42 to 33/35

Message #2 Posted by [Gene Wright](#) on 13 Oct 2007, 10:11 a.m.,  
in response to message #1 by [Bill Colisch](#)

- 1) No KEY X GTO NN functionality.
- 2) No soft menu keys in the bottom row of the screen.

The 35s is not built upon the same programming scheme as the 42s and programs will require a good bit of modification to run on the new model. Suggestions?

Spend some time with the 35s owners manual.

Then go through the 35s learning modules found here:

[35s modules](#)

It may also help to read through the HP 35s Datafile special issue found here:

[Datafile special issue](#)

### **RPL mode for emacs?**

Message #1 Posted by [James Tappin](#) on 12 Oct 2007, 8:51 p.m.

I'd like to edit programs for the 50g on my PC and then transfer to the calculator. While this is quite possible in text-mode of GNU emacs, a dedicated rpl-mode could facilitate things like entering the trigraphs etc. So before I delve into emacs lisp, I thought I'd see if anyone had already attempted this.

### **Re: RPL mode for emacs?**

Message #2 Posted by [Seth Morabito](#) on 13 Oct 2007, 5:26 p.m.,  
in response to message #1 by James Tappin

I've never seen anything, but I'd love an emacs RPL or RPN mode as well.

In fact, now that you bring it up, I don't know why I hadn't thought of it before. If you work on the RPL mode, I'll work on the RPN mode! It shouldn't be too difficult to get elisp to handle automatic line numbering, label detection, and GTO/XEQ line renumbering.

Great idea, thanks for bringing it up.

My S/N is CNA 72100299, I have written that in my entry [here](#) So we have 2 calcs from (probably) the same day showing the same problem. Are there more? VQ

### Re: Endless 35S loop, continued ...

Message #4 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 12 Oct 2007, 4:24 p.m.,  
in response to message #1 by [vq](#)

Hi, Václav; (at least I hope this post is from you...)

about the endless loop and program structure. I know some programs may find an endless loop because of code OR argument error, i.e., either the code causes endless loops or the arguments force the code to do so. Of course, this would not lead the device itself to enter in a no-interruptible loop, i.e., a loop that could not be broken by some reset/restart key sequence. This is, surely, a bug and must be investigated.

Appart of that, I wrote John an e-mail mentioning another fact I noticed is related to data input. His original listing has the following steps, step # included:

```
262.   RCL Q
263.   RCL O
264.   C,T BAR SIZES
265.   STO O
266.   R|
267.   STO Q
```

Based on John's explanations, one can either enter tension steel only or both compression steel and tension steel. John wrote:

20 R/S for tension steel only

-or-

16 ENTER 20 R/S for sizes of both compression steel (top) and tension steel (btm).

If we observe his listing, there is another problem there. Register Q contains compression steel value and register O contains tension steel value, both may also be already stored in calculator memory. A copy of both is brought back to the stack and if they are already there, one may simply keep them by pressing [R/S] and they will be stored back (steps B265 to B267). If we enter both new values, it will happen the same: the new values will override the old ones (again, steps B265 to B267). But if we enter only the tension steel and press [R/S], as John suggests, we will have the new tension value correctly stored in register O and the previous tension steel value wrongly stored in register Q, overriding the one you actually want to keep. For example, consider that you already have hypothetical values for tension steel and compression steel as follows: 12 and 18 (cannot tell if these are acceptable, just hypothetical). Let's consider that you want to enter only the new value for tension steel, so the stack contents would be:

|      | REGX          | REGY | REGZ | REGT |    |                          |
|------|---------------|------|------|------|----|--------------------------|
| 262. | RCL Q         | 18   | a    | b    | c  | a,b,c are placeholders   |
| 263. | RCL O         | 12   | 18   | a    | b  | Hipothetical values      |
| 264. | C,T BAR SIZES | 16   | 12   | 18   | a  | You enter 16 only        |
| 265. | STO O         | 16   | 12   | 18   | a  | 16 correctly stored in O |
| 266. | R             | 12   | 18   | a    | 16 | rolls down stk contents  |
| 267. | STO Q         | 12   | 18   | a    | 16 | 12 wrongly stored in Q   |

I am not sure about how would this affect program control, but it would surely disturb data organization. My suggestion would be a double stop: one for compression (press [R/S] to keep existing or key in new value then [R/S]) and another for tension (same thing: [R/S] to keep existing or key in new value then [R/S]).

I have already loaded the program and tested it step-by-step to a certain point, but I intend to add some modifications prior to run it straight. I'd not like to have the calculator stuck as it had already happened with some of you and have to key the program in, head to tail...

Also, I tested the VIEW(I) and VIEW(J) followed by PSE. The display always shows the contents of register (I+27) and returns INVALID (I) (or (J)), even when they are valid. If we remove the PSE and let the program to stop, it shows the correct register contents.

HP has definitely lost its way to design calculators... Bring AOC back, pleeeesss...

Cheers.

Luiz (Brazil)

## Re: Endless 35S loop, continued ...

*Message #5 Posted by [John Wasilewski](#) on 13 Oct 2007, 5:21 a.m.,  
in response to message #4 by [Vieira, Luiz C. \(Brazil\)](#)*

Luis,

There are numerous errors in the code.  
I will fix them all.

I value greatly your comments and suggestions for error correction and optimisation. However, I want to get a working version before I start to polish up the code. See below for more about what I propose.

One of the errors, for example, appears many times in the subroutine beginning at line B020. I forgot to insert a ROLL-DOWN step after each bar diameter is tried. This mistake happened because, after my first

lockup failure, I had a written record of only 90% of my code and when working from memory, I forgot the ROLL-DOWN step in this subroutine.

I plan to key it all in again and try to get it working correctly even with the hardware fault. I will have to put in a lot of temporary R/S steps and not take them out until I know that there are no endless loops left after I finish debugging.

When I get a working version I will send it to you (and others) and look out for your suggested improvements.

--

John

### **Re: Endless 35S loop, continued ...**

*Message #6 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 13 Oct 2007, 7:48 p.m.,  
in response to message #5 by John Wasilewski*

Hi, John;

Quote:

I value greatly your comments and suggestions for error correction and optimisation.

Thank you, I appreciate. Just would like to add that I am not actually trying to optimize the code so far, just doing some 'witch hunting' (error correction). Many programs have coding errors, none is completely free of them, and errors appear as code lines are added. What I mostly care is for the fact that it is somehow hard to test a program if errors prevail. My own way of dealing with programs is to 'purge' coding errors, then to hunt structure errors (GTO's, XEQ's, indexed operations, etc.) and then the cosmetics, the final product. If, and only if, applicable, the code optimization and shortening. But this is just the way I prefer dealing with my programs.

The picture below shows how did I deal with your program.

[http://www.logeng.com.br/images/HP35S/wasilewski\\_listing\\_short.jpg](http://www.logeng.com.br/images/HP35S/wasilewski_listing_short.jpg) (click to enlarge)

Although you cannot see easily, your program is completely listed there. You can also identify my handwriting. The functions marked in red are XEQ (subroutine calls), and the subroutines themselves have their starting and ending points marked with a thick, red line (vertical). Functions in blue are GTO's and their corresponding jumps are marked with thick, blue lines, ended with a small arrow. This way I could follow program logics. Some marks in yellow and blue are related to some possible problems.

Quote:

However, I want to get a working version before I start to polish up the code. See below for more about what I propose.

I think I get it.

This is a sample of a [program form for the HP35S](#) I wrote in MS Word format. The specific TTF is the one I created sometime ago for the HP33S sometime ago with a few modifications (new characters) for the HP35S. I think I'll rename it after the HP35. The final document was then converted to PDF. The program in the listing was taken from an HP35S and typed in, I had no time to study it.

Anyway, I have my spare time spent somehow.

Hope you succeed.

Cheers.

Luiz (Brazil)

**Re: Endless 35S loop, continued ...**

*Message #7 Posted by [John Wasilewski](#) on 14 Oct 2007, 1:23 p.m.,  
in response to message #6 by Vieira, Luiz C. (Brazil)*

You have worked hard on it Luiz! I do very much the same as you when analysing code. I also like very much your HP35s programming proforma.

The "never executed" steps in subroutine 020 are because that particular subroutine was lost without a copy during one of my crashes. I thjought I could remember it but I got it wrong. There should be some ROLL DOWN instructions in it.

I am working on the program again now and I'm correcting mistakes like this. I do want to know what is wrong with teh calculator to lock it into a loop but I also want to make my program work.

I'll send you a copy of the next draft of the code.

John

Good work -- I'm only sorry the code is so long to replicate this hardware error. I have tried to create some shorter code to produce teh same effect. No luck yet. John

Maybe it's not your code as such but its length/memory consumption or a combination of these that lead to the crash. That at least would explain why you couldn't reproduce the crash with smaller bits of code...

**Re: Endless 35S loop, continued ...**

*Message #10 Posted by [John Wasilewski](#) on 13 Oct 2007, 10:46 a.m.,  
in response to message #9 by Meenzer*

My own theory is that the processor interprets code as it runs and has to search for each GTO or XEQ address from the top of the code, and that it is this searching that blocks user intervention. With short code it finds addresses faster so spends more time executing. Long code it spends more time searching for the address of each jump than executing. Just a guess. I tried a 400 line program of rubbish with a few GTOs back and forth from top to bottom in an endless loop. This was difficult to interrupt, but not impossible. John

### **Re: Endless 35S loop, continued ...**

*Message #11 Posted by [Miguel Toro](#) on 13 Oct 2007, 11:59 a.m.,  
in response to message #10 by John Wasilewski*

Hi,

I tried your code and I get the same result. The calculator enters an endless loop that cannot be interrupted and after a reset, all the data is lost. Well, I have to enter all my programs again. It was fun, though!!!!

My HP 35s is a CNA 72102361.

When the program enters in the loop, it shows RUNNING and then NEXT BAR SIZE again and again. Pressing the ON/OFF/C and others combinations does not interrupt the program. Just doing reset works but making the calculator to lose the data.

Thanks Luiz for sending me the code.

Regards,

Miguel

### **Re: Endless 35S loop, continued ...**

*Message #12 Posted by [John Wasilewski](#) on 13 Oct 2007, 12:51 p.m.,  
in response to message #11 by Miguel Toro*

This is not good news Miguel, but thank you for your test result.

That is three serial numbers giving this aberrant behaviour :

- CNA 72100255
- CNA 72100299
- CNA 72102361

It would be good if we could find out for sure whether anyone has a serial number for which the calculator WILL ACCEPT user intervention when it enters an endless loop with this code. One or two people have reported that the program seems to behave normally, but I am a little unsure whether they took the test far enough, because I might not have explained sufficiently how to enter the data.

We need someone who can get the program into the endless loop that you, Vaclav and I have all experienced, and can then report successfully breaking out of it without having to erase all memory.

When we have this we will know that there is a hardware/firmware fault on early batch(es) of this calculator and we will know that it was fixed by HP on later production runs.

John

**Re: Endless 35S loop, continued ...**

*Message #13 Posted by [Seth Morabito](#) on 13 Oct 2007, 8:35 p.m.,  
in response to message #12 by John Wasilewski*

You may add my calculator to the list.

I typed in the full program and verified my entry before proceeding. I then followed the example inputs you provided at the beginning of this saga, and let the program run.

I entered an unbreakable infinite loop alternating between displaying "RUNNING" and "NEXT BAR". No key combinations were able to break out of it. I resorted to the Reset hole on the back of the calculator, which cleared its memory.

My SN is: CNA 72101944

I think the only useful thing to do now is narrow down on a single, small, repeatable test case to demonstrate the lock-up which we can submit to HP.

**Re: Endless 35S loop, continued ...**

*Message #14 Posted by [John Wasilewski](#) on 14 Oct 2007, 1:13 p.m.,  
in response to message #13 by Seth Morabito*

The "NEXT BAR" instruction was just a debug temp. breakpoint to help me keep track of progress through program loops. It isn't a data entry point. It will be taken out when the program works. I made the mistake of putting a PSE after it, so it did just that. It paused but then continued, stuck in its loop! I also forgot to put in a VIEW instruction to let me see what value of Q had accumulated in the loops.

I have now re-entered the whole program again and I'll try to debug more carefully, with extra breakpoints and with stepwise execution.

We must all try not to lose sight of the fact that the problem here is not how to get my program right. The problem is to find out what is wrong with the HP35s and whether it is just one production run or all of them that can sometimes lock themselves into a loop that users cannot break.

Thank you again for your help, Seth. Anything else you can discover from your investigation will be useful.

John

**Re: Endless 35S loop, continued ...**

*Message #15 Posted by [Seth Morabito](#) on 13 Oct 2007, 8:47 p.m.,  
in response to message #12 by John Wasilewski*

I will try the program one more time, but this time, when the program stops to ask for comp bar and tension bar diameters (C,T BAR SIZES), I will single-step through the program with the down arrow cursor key instead of hitting R/S. Perhaps I can get you some useful information that way.

## **Re: Endless 35S loop, continued ...**

*Message #16 Posted by [Seth Morabito](#) on 13 Oct 2007, 9:58 p.m.,  
in response to message #12 by John Wasilewski*

John,

I've single-stepped through the troublesome part of the program several times now, and I'm pleased to report that it is very effective at avoiding the infinite loop.

I let the program run until it gets to the point where it asks for C,T BAR SIZES. I then enter "16 ENTER 20". Instead of pressing R/S, I pressed and held the down-arrow cursor key. This is very important! Holding the down-arrow displays the line currently being executed. When you release it, the results are displayed in the stack. Press and hold again to see the next line, release the key to see the results, etc. You may press and release the button very rapidly if you want to work through each bar's inputs more quickly. It takes a while to step through, but it is **much** quicker than re-entering the entire program after losing your memory!

Oddly, when stepping through the program, it behaved the way it is supposed to. It pauses after displaying "NEXT BAR" and waits for input. It does not lock up.

I hope this will help you debug your program without losing your data yet again. It may also help locate the looping bug, but more importantly it will help you get back to developing with a little more confidence that you won't end up in another infinite loop.

### HP-65 diplay

Message #1 Posted by [fredo](#) on 12 Oct 2007, 7:03 a.m.

Hello, everybody!

I am the proud owner of a HP-65. The Problem: displaying the negative sign is not working An idea?

### Re: HP-65 diplay

Message #2 Posted by [Hal Bitton in Boise](#) on 12 Oct 2007, 10:19 a.m.,  
in response to message #1 by [fredo](#)

Hi Fredo,

Do you fail to get a negative sign both when using the CHS key and when a calculation results in a negative answer? Also, are you able to negate an exponent?

Best regards, Hal

### HP 50g simple question

Message #1 Posted by [Trey](#) on 11 Oct 2007, 1:58 p.m.

I have a new HP 50g calculator. I have set the calculator to provide results as standard. This all works great except for when I do a calculation like  $1 / 12$ . The result I want should be 0.0833333333 but instead I get scientific notation like 8.3333333333E-2. I prefer it not be like this. Like I stated above, I do not have my setting set for scientific notation. Any suggestions?????

### Re: HP 50g simple question

Message #2 Posted by [Hal Bitton in Boise](#) on 12 Oct 2007, 10:52 a.m.,  
in response to message #1 by [Trey](#)

Hello Trey,

You'll need to run the calculator in fixed mode to get the display you're after. (Mode key-2nd line down. You can toggle through the number format choices with the +/- key. Immediately to the right choose the number of decimal places to show...0 to 11.)

Best regards, Hal

### Rambox battery replacement

Message #1 Posted by [Prabhu Bhooplapur](#) on 12 Oct 2007, 2:53 a.m.

Hi,

Can someone enlighten on how to replace the backup battery in a RAMBOX unit (housed in card reader shell)?  
Thanks folks.

Best regards,

Prabhu

### Re: Rambox battery replacement ( edited again on Oct 17, 2007 07:29 GMT )

Message #2 Posted by [Antoine M. Couëtte](#) on 15 Oct 2007, 4:16 p.m.,  
in response to message #1 by [Prabhu Bhooplapur](#)

Dear Prabhu,

**The following will detail to you how I managed to save and run all my software developed on a RAMBOX. It may not be the exact answer to your current problem ( internal battery replacement ) , but it offers a way of getting around it.**

A few years ago I was in a situation quite similar to yours : I needed to have one HP41CY ( i.e. a HP41CX with an internal RAMBOX II version with 64 K ) repaired. It was not a question of internal battery replacement, but it was a faulty and erratic behavior with a suspected internal wiring degradation which definitely required internal repair.

The following describes the way I solved my HP41CY / RAMBOX II problems in a totally unexpected way, which eventually has been MUCH BETTER than a simple product repair and exceeded all my expectations thanks to the highly dedicated work of a few Men as described hereunder.

If you proceed like I did, maybe it will help you as much as it helped me.

\*\*\*\*\*

As you know RAMBOXes were manufactured by the German Company W & W Software Gmbh. When I needed a RAMBOX II repair some 5 years ago, Wilfried Koetz the Manager of W & W Software Gmbh indicated to me that W & W had stopped supporting the RAMBOX.

As I had extremely important software on my Rambox II - a software I had taken some 3000 hours to develop - I had to find an urgent solution ...

You will find [HERE THE ENTIRE STORY](#)

\*\*\*\*\*

## AS A SUMMARY :

The here-above story describes how I solved my RAMBOX II problems in a totally unexpected way, which eventually has been MUCH BETTER than a simple product repair.

In other words : if you have the possibility of using one of the existing available " HP41 Simulators " which 100% replicate the 64 k RAMBOX I/II, you should then be able to run all your own Software existing to-day on your RAMBOX.

In my own case, I am fully indebted to both Jean-François Garnier and to HrastProgrammer. As the STORY hereabove goes, **and simply because I requested some help from them** , Jean-François greatly improved his former EMU41 into fully replicating the full 64K RAMBOX II and making it available to the Community. And on his side HrastProgrammer went into developing for me a taylored version of his HP-41C Emulator for HP-48GX/49G into a Version with a total of 92 K - including a full replica of the 64K RAMBOX II.

True .. you would need to get a HP48GX with some memory cards, or a HP49G ( or a HP49G+ or a HP50 : *Please HrastProgrammer correct me if the references to HP49G+ and HP50 are not correct* ) if you want to have a **HANDHELD replacement of the Rambox I / II ...** ( see [HRASTPROGRAMMER SITE](#) and in particular [HP-41C Emulator for HP-48GX/49G](#) ) .

... but if all you want is keeping a record of your **Programs working on a laptop** - at a speed of over 500 times a real world HP41 - then Jean François Garnier's superb " EMU41 running on PC " is a wonderful choice ( see [EMU41](#) )

Hrastprogrammer's HP41 X/Y/Z - under the Version developped specifically for my own needs as described in the STORY hereabove - and Jean-François Garnier's EMU 41 emulators are the only 2 emulators I know of which fully emulate Rambox I / II .

*I am not aware of any other such emulator ( i.e. replicating the Rambox I / II ) . But should one exist, its existence will likely be confirmed to you on this forum by any qualified Expert reading this thread.*

I hope this information will be useful to you.

Best Regards from

Antoine

*Message #4 Posted by [Antoine M. Couët](#) on 20 Oct 2007, 5:55 a.m.,  
in response to message #3 by J-F Garnier*

Hello Jean-François,

Thank you for your very kind words.

My ASTRONOMICAL NAVIGATION Software User's Manual is still under construction : it is amazing that things so clear in my mind take quite some time to summarize in a way both complete and concise, so that unfamiliar readers get a quick understanding about how to use it.

I have already structured it into 3 parts :

1 - Quick User's Guide

2 - Memory Allocation Table and General Equations used + General Navigation considerations

3 - More Detailed data and in particular :

3.1 - Theories used, Acknowledgements to various Astronomers / Engineers, accuracy versus validity of the Astronomical algorithms used,

3.2 - Improved mathematical methods where to the best of my knowledge no equivalent algorithms have been published so far,

3.3 - Some details on programming since for instance my " Mean Elements " Program can be run in 6 different ways, with all the various computation results being monitored through various flag settings,

3.4 - and possibly more ...

Best Regards from

Antoine

### hp 9815a repair

Message #1 Posted by [frankabc](#) on 11 Oct 2007, 11:21 p.m.

This message is for Dr. Tony Duell, or any who might know the answer. Our HP 9815A calculator still is on the blink. We have an HP 5006A Signature Analyzer. Can Signature Analysis be employed to trouble-shoot our HP 9815A? Thank you, Frank Simpson, fbsimpson@pharmacy.wisc.edu

### Re: hp 9815a repair

Message #2 Posted by [Eric Smith](#) on 12 Oct 2007, 3:14 a.m.,  
in response to message #1 by frankabc

The general answer to "can a signature analyzer be used to troubleshoot an xxx machine" is yes, if and only if you have the service manual for the xxx machine, and it gives the procedure to follow and the expected signatures.

I don't recall having seen such information in the 9815 service manual, but it's been a long time since I looked at it, so it's possible that it was there.

You can get a copy of the 9815 service manual on the MoHPC DVD or CD sets.

### Re: hp 9815a repair

Message #3 Posted by [Tony Duell](#) on 12 Oct 2007, 6:01 a.m.,  
in response to message #2 by Eric Smith

Eric is right. Signature analysis is only useful if you know what the right signatures should be (and, indeed how to start/stop the signature analyser). HP never published that information for the HP9815, and nobody has tried to work it out (it's not at all easy in general).

Some other HP microprocessor-controller instruments (one of the HPIB extenders springs to mind) had a special signature-test mode that disabled the ROMs and RAMs, and forced a simple instruction onto the processor databus. This meant the processor kept doing the same thing, leading to relatively simple waveforms, ideal for signature analysis. This facility does not exist in the 9815

### Re: hp 9815a repair

Message #4 Posted by [Steve Leibson](#) on 13 Oct 2007, 1:24 p.m.,  
in response to message #1 by frankabc

Unfortunately, the introduction of the HP 9815A preceded HP's introduction of the first signature analyzer (HP 5004A) by at least two years, so it's extremely unlikely that the 9815A developers would have based their troubleshooting strategy on a yet-to-be invented diagnostic technique. More likely, the development team would have developed an in-house plug-in exercise ROM for factory and field troubleshooting. It's also not likely that HP would have gone back and added signature analysis to the 9815A code. By the introduction of signature analysis in 1977, HP was well aware that the 9815A was a dead-end product family and that the Desktop Computer Division was focusing development efforts on more expensive machines.

On the other hand, the 9815A is a relatively simple microprocessor system based on the Motorola 6800 microprocessor, so an oscilloscope may be all you need for troubleshooting.

## Re: hp 9815a repair

Message #5 Posted by [Steve Leibson](#) on 13 Oct 2007, 6:11 p.m.,  
in response to message #1 by frankabc

Dear Dr. Frank,

I've gone back and looked at your original problem 9815A description from August. I believe you have may have multiple problems with your HP 9815. First, I suspect the "auto enter" problem is caused by a leak path in the keyboard. The HP 9815A uses "oilcan" type metal strips for keyboard contacts that distort and then snap into contact with an underlying circuit board when pressed. These are called "Cricket" keys and were modeled after the handheld calculator keys. These keys were developed to save money but proved less reliable than desired. The HP 9815A and the HP 9825A/9831A were the only desktop calculators to use these keys before they were obsoleted. Desktop calculators produced before and after these two machines used more conventional keyboard keys.

The contact strips in the Cricket keys are bowed in the middle and welded to the circuit board on their two ends. One of the welds often fatigues and breaks after years of use, making a broken key. Chances are good this may have happened to your "enter" key (especially if it no longer feels crisp and has a "snap" to it), because this key was usually the most used key on the keyboard. If one end is broken, you can try to solder it (sometimes works) but it's not a long-term fix.

You are also experiencing tape problems. You are correct that the actual tape cartridges are likely to be toast after 20 years. The oxide literally falls off the mylar film in the tape cartridges after all this time due to a loss of adhesion and from differential tape tensioning caused by normal environmental thermal cycling. If so, the rain of oxide from the tape as you tried to load it is now likely coating important components within the tape drive, which also won't help matters.

I suspect you also may have experienced the "goeey capstan" tape problem. Over time, the rubber coating on the capstan in the tape drive (a pulley-like affair that drives the tape back and forth) loses elasticity and turns to something more akin to used chewing gum than rubber. These tape drives can be repaired. People have had varying DIY successes with three O rings, heat shrink, and cold shrink repairs. Larry Atherton can repair them (see my blog at <http://www.edn.com/blog/980000298/post/1180012118.html> and Atherton's eBay page at [http://search.ebay.com/\\_W0QQsassZla-tech-renewalQQhtZ-1](http://search.ebay.com/_W0QQsassZla-tech-renewalQQhtZ-1)) but the cost can be in the hundreds of dollars.

Sorry to be the bearer of such bad news. These machines were durable and lasted a very long time, but no computer is immortal and your 9815 is roughly 30 years old. At the Computer History Museum here in Mountain View, we are reluctant to even turn on old machines because the electrolytic capacitors in the power supplies tend to fail and can produce spectacular results when first powered up after a decades'-long slumber.

## Re: hp 9815a repair

Message #6 Posted by [Etienne Victoria](#) on 14 Oct 2007, 11:05 a.m.,  
in response to message #1 by frankabc

Hi,

If it can help, the goeey capstan in the 9815 looks like this:

[http://etienne.victoria.free.fr/Cj\\_mount/images/image-3.jpg](http://etienne.victoria.free.fr/Cj_mount/images/image-3.jpg)

And a procedure for repair can also be found here: [Isabelle's site](#)

Hope you succeed in repairing your Cj.

Best regards

Etienne

### Transporting lif (lex) files from PC to hp71b

Message #1 Posted by [C. Dehnke](#) on 11 Oct 2007, 5:20 p.m.

Hi All, I own a hp71b, different ROM modules and a HP-il/RS232 interface. For using these ROMs under EMU71 (great simulator!) I want to copy them to the PC. Since some of the ROMs are protected I need a special PEEK\$ instruction which can be found e. g. in CHHU5 desal.l71. I tried different ways to transport this lif to the HP: 1. Using the approach given in EMU71 simulator with serial1. 2. Using a simple binary dump on RS232. Nothing succeeds. Any ideas? Regards, Chris

### Re: Transporting lif (lex) files from PC to hp71b

Message #2 Posted by [J-F Garnier](#) on 12 Oct 2007, 6:40 a.m.,  
in response to message #1 by [C. Dehnke](#)

I would suggest this way: copy "desal.l71" to "emu\_in.dat" in current emu71's directory, then do "COPY :DOSLINK" in Emu71. You should now have the DESAL LEX in Emu71. Check if it works correctly.

Then, use the HPIL/RS232 interface and a correct cable to connect the interface to your PC and do the right interface setup (check cable and interface setup on emu71 site). Test it by doing: "INPUT :RS232;A\$" on the HP-71B and "OUTPUT :SERIAL1;'ABC'" on Emu71 (in this order), and check A\$. If it works, try to transfer the LEX: "COPY :RS232" on HP71B side, and "COPY DESAL to :SERIAL1" on Emu71 side.

Emu71's serial support works well to download data from Emu71 to the HP-71, it may not always be reliable in the other way, although it usually works for small files. Let us know if you succeed to upload your ROM images.

J-F

### Re: Transporting lif (lex) files from PC to hp71b

Message #3 Posted by [C. Dehnke](#) on 15 Oct 2007, 1:26 a.m.,  
in response to message #2 by [J-F Garnier](#)

Hello J-F,

I tried DOSLINK. It did not work for me. After that I attached the CHHU5 lif file to the HDRIVE1. Now I had the desal.lex in the EMU71. Tried your suggestion but there was no possibility to communicate from PC to HP71. Even the copy on both machines won't run.

After this I tried a different way. I entered your ROM extraction program and managed to get the OS from the 71 (1BBBB) to the PC using a terminal program.

So the direction from HP71 seems to be ok.

After searching I found the desal.lex file as a dump for makelex. Typed it in and started to gather all ROMs I have. Now the job is almost done. Only for my HP-il module (VER 1a) I have not found the base address. Is there a trick?

Despite the success I am still interested in bidirectional communication between HP71 and PC. I use Vista, HP82164A compatible CMT interface with 256KB RAM-Disk. The manual says that it is fully compatible to the HP part. As a terminal I use a demonstration license of ZOC (Does anybody now a open source

terminal for vista?).  
Regards,  
Chris

### **What have the 35 sales been like? multiple choice**

Message #1 Posted by [Jim Creybohm](#) on 11 Oct 2007, 4:53 p.m.

While I don't expect a definitive answer to the question, does anyone know if the 35S has been: a) well received? b) received? c) poorly received? d) none of the above.

The reason I ask is that HP has undertaken the creation of the 35S with some risk. It is reasonable (though not preferable) that they could have stayed the safe path with the el cheapos, and never created this new calc. Perhaps this was done to "test the waters" with an eye towards those who value quality over price. I would hope that more than just those of us (whom I have heard derided as "fanboiz") would form their customer base for this newer calc.

However, if we expect, hope, pray and wish for a newly designed calculator is it not reasonable for HP to look at 35S sales as a benchmark? Perhaps the company is so unhappy with the sales that we will never see another new HP of the quality of manufacture that the 35 is. I dislike the programming paradigm, but that is another issue.

I hope the 35S is selling well, and continues to do so. Because only if it sells really well do we have a hope of ever seeing the gorgeous 45S that Gene and Jake drew up. HP should definitely hire them for future designs!

### **Re: What have the 35 sales been like? multiple choice**

Message #2 Posted by [Seth Morabito](#) on 11 Oct 2007, 5:12 p.m.,  
in response to message #1 by [Jim Creybohm](#)

I've been told that 35s sales have been quite good, but I'm afraid I don't know the hard numbers. I'm sure those are HP confidential.

I'm curious when we'll start seeing the 35s in retail channels. I haven't seen any at Fry's Electronics (a local chain that carries HP scientifics). They always seem to have a stock of 50g's and 33s's though.

### **Re: What have the 35 sales been like? multiple choice**

Message #3 Posted by [Seth Morabito](#) on 11 Oct 2007, 5:16 p.m.,  
in response to message #1 by [Jim Creybohm](#)

And for that matter, I wonder when the 33s will be discontinued. I presume HP will have to wait until the 35s is certified for the NCEES exam, but I don't know how often NCEES updates their calculator policy.

As soon as the 35s is certified for NCEES, I can't imagine that HP will keep both of them on the market. They're much too similar.

**EDIT** I answered my own question, nevermind. From the NCEES website: "Each year, NCEES will review and revise the approved calculator list and then announce the updated list by November 15."

*Edited: 11 Oct 2007, 5:21 p.m.*

### **Re: What have the 35 sales been like? multiple choice**

*Message #4 Posted by [Thomas Radtke](#) on 12 Oct 2007, 2:56 a.m.,  
in response to message #3 by Seth Morabito*

By now, I would prefer the 33s over the 35s as a 32SII replacement in mission critical applications. Of course, I still have (1) a slide rule and (2) my 32SII, so everything else can serve as toy :-).

**Re: What have the 35 sales been like? multiple choice**

*Message #5 Posted by [Bruce Bergman](#) on 12 Oct 2007, 12:32 p.m.,  
in response to message #4 by Thomas Radtke*

You know, that begs an interesting question. Does that agency review the bugs of a particular unit before considering suitability? The 33s had some bugs, but I don't believe it had as many as the 35s. Still, it was considered a viable candidate, even slightly before the Rev 2 33s came out. I'm wondering if the NCEES folks will review the 35s, consider open bugs/issues, and rule based on that.

For that matter, how many of the bugs would apply (or affect) someone taking those tests?

(I don't know any of the answers; I'm just asking from a curiosity point of view...)

thanks, bruce

Currently, there is little to no awareness of the 35S among NCEES examinees. It's still all about the 33S. This will likely change in November, when NCEES announces the approved 2008 list. I would expect the 33S to remain on the list of approved calculators for 2008, even if it is discontinued by HP, and I would expect the 35S to be added. The sales of the 35S will jump when this happens.

If you check the amazon.com pages for the two models, the 33S page is full of links to FE or PE exam review manuals. But there is not a single such link on the 35S page (yet).

I don't think NCEES does any rigorous screening for bugs on the approved calculator list. Nor do I think that the existing bugs would be likely to affect anyone on the FE or PE exams.

I used a 33S with buggy rectangular-polar conversions. I doubt it would have affected me on the exam, but I programmed alternative functions to use instead of the built-in ones.

### HP 35S gets returned

Message #1 Posted by [Ike](#) on 11 Oct 2007, 2:48 p.m.

I've had it with the HP 35s - seems like everywhere I turn there is some limitation. I've been an HP person forever and I was quite excited about the "retro" 35s but reality is a harsh mistress.

First there is the problem with building complex exponents from variables or constants - My HP-42s did this without a hitch.

Then I'm told you can't use  $X^2$  function for a complex number but you can square it manually. My HP-42s does this without a hitch.

When I try to figure out something from the manual I come across one of the poorest manuals ever written by HP.

Now I just discovered that the 35s does not have matrix capability! Say what? My HP-42s does matrix operations flawlessly.

I tried to do some binary logic on the 35s and got further unexpected results and the manual, as stated above, was totally useless in helping me. My HP-42s executes boolean logic flawlessly and intuitively.

I could go on but I think you get the idea. The 35s goes back, but the 42s gets a brand new shiny set of batteries!

In short, I am amazingly unimpressed with this effort from HP. I hate to sound like some old dude but did they have a bunch of kids with no concept of previous HP calculators design the 35s?

Cheers, old school dude. Ike

### Re: HP 35S gets returned

Message #2 Posted by [Walter B](#) on 11 Oct 2007, 3:03 p.m.,  
in response to message #1 by Ike

Well, Ike, the 35s is claimed to be a replacement of the 33s, so the comparison with the 42S is a bit unfair. IMHO the 35s is a big enhancement over the 33s. It falls short, however, compared with the 42S, as you stated.

But who knows what the future will bring? A reincarnation of the 42S may well be in a shape similar to the 35s. Also a 42S+ or 45S is well possible within this design. Please see earlier threads.

Best regards, Walter (also old school, started with a 25C :)

### Re: HP 35S gets returned

Message #3 Posted by [Ike](#) on 11 Oct 2007, 3:13 p.m.,  
in response to message #2 by Walter B

Walter,

Thanks for the help in perspective. I've never owned a 33, just my current 42s which I bought new back when wheels were square.

I've got to admit though it never even occurred to me that the HP-35s might not have a matrix mode - I thought that was derigueur for virtually all modern scientific calculators?

Thanks again. Ike.

### Re: HP 35S gets returned

Message #4 Posted by **Gene Wright** on 11 Oct 2007, 3:07 p.m.,  
in response to message #1 by Ike

Comparing the 35s to the 42s is comparing apples to oranges.

The 35s architecture and functionality are an extension of the 32s -> 32SII -> 33S line of calculators. Note which model that begins with.

The 42S of course had many more features and capabilities than the 32S did, so pretty naturally, the descendant of the 32S does not have all the features and capabilities of the 42S.

Personally, I'll take the inexpensive 35s over risking the increasingly rare 42s I have.

It might also help to check out a calculator's specifications before buying a new one. No where does HP say the 35s handles matrices...so why be surprised when you find out it does not do them? :-)

Gene

Gene,

Like I said, it never even crossed my mind that it didn't do matrix operations so I didn't even look for that functionality - I just assumed it was there. This is a classic case of what "assuming" gets one.

Your point and those of the others is well taken, the 35s is not of 42s lineage so don't expect more than what can be expected.

Ike.

### Re: HP 35S: misleading hint about matrices support

Message #6 Posted by **Andrés C. Rodríguez** on 12 Oct 2007, 7:44 p.m.,  
in response to message #4 by Gene Wright

I always supposed that the prominent "MILE" legend on the keyboard was an acronym for "Matrix

Inversion and (simultaneous) Linear Equations". What other thing could "M.I.L.E." mean in an advanced HP scientific calc?

:~)

**Re: HP 35S: misleading hint about matrices support**

*Message #7 Posted by [Don Shepherd](#) on 12 Oct 2007, 8:23 p.m.,  
in response to message #6 by [Andrés C. Rodríguez](#)*

Well, since --> KM is on the same key, I think I'd assume kilometer to miles conversion.

**Re: HP 35S: misleading hint about matrices support**

*Message #8 Posted by [Andrés C. Rodríguez](#) on 13 Oct 2007, 8:43 a.m.,  
in response to message #7 by [Don Shepherd](#)*

Don: Please check the :~) symbol on the end of my previous post. It was kind of wordplay between "mile" and the made-up M.I.L.E acronym.

BTW, "mi" and "km" would have been more appropriate, as already noted by many people here and elsewhere.

Regards

**Re: HP 35S: misleading hint about matrices support**

*Message #9 Posted by [Don Shepherd](#) on 13 Oct 2007, 9:14 a.m.,  
in response to message #8 by [Andrés C. Rodríguez](#)*

OK, thanks Andres. After I responded, it occurred to me that you were poking fun and not serious. I think I need emoticon training!

**Re: HP 35S: misleading hint about matrices support**

*Message #10 Posted by [Walter B](#) on 13 Oct 2007, 2:10 p.m.,  
in response to message #7 by [Don Shepherd](#)*

Hi, Don,

Quote:

-----  
I'd assume kilometer to miles conversion.  
-----

You would be perfectly right if the print would say "km". With "KM", however, I'd think of "Kryptic Measure". So I can understand why Andres came to his interpretation :)

**Re: HP 35S gets returned**

*Message #11 Posted by [Seth Morabito](#) on 11 Oct 2007, 3:15 p.m.,  
in response to message #1 by [Ike](#)*

While I certainly agree that the HP42S is one of HPs finest products, I think it's unfair to compare the 35s to the 42S. The 35s is based on the 33s, which was based on the 32sII. None of these ever had the features you're describing (which the 42s DID have, of course).

That said, of course it's well within your rights to return it if it doesn't do what you need it to do! :)

### Re: HP 35S gets returned

Message #12 Posted by [Chan Tran](#) on 11 Oct 2007, 3:24 p.m.,  
in response to message #11 by Seth Morabito

I really don't expect the 35s to be able to do complex number, matrix or boolean as to original 35 didn't do those. If I want to perform those function I see no problem with a 50G. In fact thing I dislike most about the 35s that it offers way too many functions beyond those of the original 35.

### Re: HP 35S gets returned

Message #13 Posted by [Ike](#) on 11 Oct 2007, 3:27 p.m.,  
in response to message #11 by Seth Morabito

OK, I'll back off on the 35s since I seem to be examining it through 42 glasses.

However, please help me with this one:

On the 42s if I want to do the following operation in binary:

1101 AND 1011 I get 1001 just as I expect.

However, on the 35s I enter 1101 in binary mode hit enter and get 10001001101b

then I enter 1011 then LOGIC AND then I get 1000001b

What is this? The book was of no help.

Thanks. Ike

*Edited: 11 Oct 2007, 3:28 p.m.*

### Re: HP 35S gets returned

Message #14 Posted by [Alain Mellan](#) on 11 Oct 2007, 3:36 p.m.,  
in response to message #13 by Ike

Quote:

However, on the 35s I enter 1101 in binary mode hit enter and get 10001001101b

The fact that you are in binary mode doesn't say anything about the base you are entering your data in (except in hex mode it enables the 3rd row to be A-F :-)

When you hit enter, it reads 1101 as decimal, and then the display is in binary. You have to type 1101 -> BASE 8 ENTER to enter binary data.

:-(

*Edited: 11 Oct 2007, 3:36 p.m.*

### Re: HP 35S gets returned

*Message #15 Posted by [Seth Morabito](#) on 11 Oct 2007, 3:39 p.m.,  
in response to message #13 by Ike*

The 35s assumes all input is in base 10 unless it is appended with 'b' (binary), 'o' (octal), or 'h' (hex), regardless of what base the calculator is set. This is one of the more annoying aspects of the 35s.

To do your calculation on the 35s:

```
1011 [blue shift] BASE 8 ENTER      ; 8 is 'b', for binary
1101 [blue shift] BASE 8             ; 8 is 'b', again
[yellow shift] LOGIC 1                ; 1 is AND
```

Far too many keystrokes, but it does work.

### **Re: HP 35S gets returned**

*Message #16 Posted by [Ike](#) on 11 Oct 2007, 3:45 p.m.,  
in response to message #15 by Seth Morabito*

Alain and Seth,

Wow. I'm so amazed I'll say it backwards, "wow". Could they have made that any more complicated?

This is starting to get funny now, thanks so much for your help. I would have never figured that one out.

Thanks, Ike

### **Re: HP 35S gets returned**

*Message #17 Posted by [Gene Wright](#) on 11 Oct 2007, 4:20 p.m.,  
in response to message #16 by Ike*

You wouldn't have figured it out without reading the manual, where it explains how to do it.

It is also covered on the HP calculator web pages in the HP 35s learning modules.

While I am no fan of this "approach" to doing binary math, figuring things out often takes an investment of reading the manual.

Of course, buying a machine sight-unseen and specifications-unread and assuming it does things the way a 20 year old machine did ...

### **Re: HP 35S gets returned**

*Message #18 Posted by [Monte Dalrymple](#) on 11 Oct 2007, 4:58 p.m.,  
in response to message #17 by Gene Wright*

Well, assuming that it would do things intuitively... like assuming the number you are entering is in the base mode the machine is operating in... seems reasonable. Automatically assuming decimal independent of operating mode is (insert your favorite expletive). It's still my everyday machine, but boy this feature stinks.

Monte

**Re: HP 35S gets returned**

*Message #19 Posted by [Gene Wright](#) on 11 Oct 2007, 5:13 p.m.,  
in response to message #18 by Monte Dalrymple*

And, oh I agree with you there!

**Re: HP 35S gets returned**

*Message #20 Posted by [Ike](#) on 11 Oct 2007, 5:14 p.m.,  
in response to message #18 by Monte Dalrymple*

Gene,

I looked at the manual, again, and I know I still couldn't have figured it out. Apparently I'm not as smart as you.

Ike.

**Re: HP 35S gets returned**

*Message #21 Posted by [Gene Wright](#) on 11 Oct 2007, 5:32 p.m.,  
in response to message #20 by Ike*

I'm not saying you are stupid.

But the manual does indicate these things are required. Pages 11-1 through 11-3 are most helpful about the BASE issue.

For example, Bottom of page 11-1: "To enter an hexadecimal number, type the number followed by "h""

Gene: So, if I want to enter the Hex number 1F I have to place an "h" at the end of it.

Middle of page 11-3: "A number without a base sign is a decimal number"

Gene: So, entering 101 without the appropriate "b" at the end is a decimal number. Entering 1F without the "h" at the end will not be considered hexidecimal but decimal with perhaps odd looking results.

In fact, EVERY example in the entire chapter indicates keying in the base sign for the base of the entry, whether b for binary, o for octal or h for hex.

I believe working the examples in chapter 11 would have let you figure it out.

**Re: HP 35S gets returned**

*Message #22 Posted by [Ike](#) on 11 Oct 2007, 5:58 p.m.,  
in response to message #21 by Gene Wright*

Quote:

I believe working the examples in chapter 11 would have let you figure it out.

\_\_\_\_\_

Gene,

I suppose you are right. You'd think if the binary annunciator was on that things would be in binary. I was just hoping for something a little more intuitively obvious.

Cheers.

### **Re: HP 35S doesn't get returned**

*Message #23 Posted by [Paul Brogger](#) on 11 Oct 2007, 6:46 p.m.,  
in response to message #22 by Ike*

Try working in hexadecimal and you'll find it's even *less* intuitive! (Even more "untuitive"?)

Digits A-F are entered, not via the keys marked "A" ... "F", but via the third row of keys, "A" being the first, "B" the second, etc. (Of course, they're marked with entirely different letters . . . )

But I'm piling on. I guess that's the feature of its design that I find truly annoying. (I suppose if I had a need for complex numbers, I'd jump on that bandwagon, too.)

All that said, I think the 35s is *really* sweet. I love programming it, and I love the printed key-faces and its clean look. Aside from the bugs, it represents several steps in a few right directions. (I'm surprised they even bothered to try!)

*Edited: 11 Oct 2007, 6:48 p.m.*

### **Re: HP 35S gets returned**

*Message #24 Posted by [Patrick Rendulic](#) on 12 Oct 2007, 1:08 a.m.,  
in response to message #1 by Ike*

Ike's point of view is interesting and I understand why he hates the HP-35s (so do I).

For years he has been happy with his wonderful HP-42s, having absolutely no need to wonder or to bother what's going on at HP.

Now in 2007 he wants a new scientific calculator and it has to be an HP, because HP calculators are great, functional and built wonderfully. So he opts for the current top level RPN calculator from HP: the HP-35s.

Unfortunately he didn't get what he expected. In the last 10 years many things have changed at HP, unfortunately in the wrong direction. So isn't his reaction more than normal?

Even the cheap Casios can do matrix calculations ...

### **Re: HP 35S gets returned**

*Message #25 Posted by [bill platt](#) on 12 Oct 2007, 8:27 a.m.,  
in response to message #24 by Patrick Rendulic*

HP moved Matrix etc into the "graphing" or "RPL" models and eliminated the "top dog" of RPN, and for good reason: The RPL models can emulate RPN models, and they have their own robust system (RPL)

capable of dealing with RPN logic, algebraic objects, programs, a multitude of datatypes, complex handling etc that far exceeds the 42s. It is a different way of thinking that an old dog (like me) can find daunting, but then again I never leaned on a calculator for linear algebra...

Essentially the same HP12C Platinun 25th. anniversary with a different look (more like light brass finishment). I do not like the reading, one needs to search for the best angle to properly read the [f]-function printings in the brass-like background.

In a sense, it is a collector piece if you already have a new Platinum or a 25th. anniversary edition.

Cheers.

Luiz (Brazil)

in response to message #5 by Gene Wright*

Is it just me, or does it seem like putting orange lettering on a brass-colored surface seems...silly? I mean, seriously. Is the picture just a poor representation of the real machine, and it's actually easier to read? Or is it truly what it seems above?

thanks, bruce

**Re: Where to get an HP 12c prestige? for a friend...**

*Message #7 Posted by **Gene Wright** on 11 Oct 2007, 3:12 p.m.,  
in response to message #6 by Bruce Bergman*

Nope, that's the real machine alright.

And, yes, it is every bit as difficult to read the orange shift functions on that gold background as you might imagine.

Bizarre indeed!

P.S. I believe the color scheme of the Prestige predates the current HP design group. Much better results from our current group of friends than things like this guy...

**Re: Where to get an HP 12c prestige? for a friend...**

*Message #8 Posted by **Pal G.** on 11 Oct 2007, 3:57 p.m.,  
in response to message #7 by Gene Wright*

Sorry to shift gears, but why doesn't the current calc group re-label the hp 12c into an hp 15c and an hp 16c? Wouldn't that have saved millions of dollars of tooling cost which were spent on the hp 35s?

In more recent times, HP was capable of adding many functions and speed-ups to the hp 12c anniversary edition. Is the hardware inside the current hp 12c anniversary not capable of the 15c/16c maths with [a lot | a little] bit of programming?

Whenever I go to an office supply store I see hp 12c's hanging next to the other financial calcs. If me or anyone walked by and saw two other, slightly different looking landscape calcs, our hearts might stop and our wallets would fall out. Whereas the 35s kinda blends in with a few of the others (not for lack of marketing).

Regards, Pal

ps - Wasn't there a discussion here, before the hp 35s arrived, discussing what kind of investment a brand new calc, like the hp 35s, would cost, versus re-labeling and re-engineering the software of the hp 12c? I wonder who won that argument..

*Edited: 11 Oct 2007, 3:58 p.m.*

**12c to 15/16c? WAS: Where to get an HP 12c prestige? for a friend...**

Message #9 Posted by [Ren](#) on 12 Oct 2007, 11:34 a.m.,  
in response to message #8 by Pal G.

How much WOULD it take to convert the modern 12c platform to a 10c, 11c, 15c or 16c? By platform, I guess I mean the circuit board and processor, I can understand the need for button changes and bezel repaint. maybe the LCD would need new annunciators.

Could it be just a new write of firmware? (Is the modern 12c firmware masked onto the chip?)

Not that I'm downplaying how much work it would take to write firmware to emulate the either the 15c or 16c... This forum seems to have enough skilled people who'd be willing to help HP write and debug the code (if HP would only ask). (That could appreciably reduce development costs).

Ren

**Re: 12c to 15/16c? WAS: Where to get an HP 12c prestige? for a friend...**

Message #10 Posted by [Eric Smith](#) on 12 Oct 2007, 2:27 p.m.,  
in response to message #9 by Ren

With the current 12C (not 12c Platinum) hardware, converting to a different Voyager model would require removing the IC and replacing it with a tiny daughterboard. Some people proposed using a TI MSP430 microcontroller for that; there are other possibilities such as the Atmel ATmega AVR.

There is enough room in the 12C to replace the chip with a thin PCB bearing a microcontroller in a thin package (e.g., TQFP). To attach it, it would be best if the PCB either fit entirely within the footprint of the original chip (difficult but not impossible), or if it surrounded the original footprint.

I think the current 12C still has all of the necessary display annunciators; I'm not sure whether 12c Platinum does. The bigger problem with the Platinum is CoB assembly: the bare die is bonded to the PCB and encapsulated in a blob of epoxy, so there is no practical way to replace it.

On the other hand, if you're going to make new buttons, you'll have to drill out the heat stakes and remove the PCB, so you could simply replace the whole PCB with a new one.

---

Making a whole new board would be the best way to go. Designing a new PCB is not hard, only a few days work. Prototype costs are small (less than a new 12C), news key would be the expensive and more aspect I suspect. How does the LCD connect to the PCB?, and will that be an issue?

I think the problem with the 12C is the very restrictive 10 digit display. That has always bugged me about the Voyager series. Doesn't leave much space when you display a negative exponent. Fine for a business calc that only deals with currency, but very annoying for engineering use. Voyager fans can flame away! :->

I don't know about the internal construction of the Voyagers, but is there room for a new LCD too perhaps?

Dave.

This is the reason I gave up on this thread and went back to hanging out in the "hp 45s prototype" thread :) The 12c/15c/16c display is limited. I prefer the screen on the hp 50g; it's packed with information (and history). I'm still trying to get used to the hp 35s, being relatively new to HP calcs.

I guess here I was batting for all the 15c die hards, and I wouldn't complain if I

had a 16c. I will not waste time on ebay, but I would purchase a 15c or 16c if HP started making them again.

:) Pal

Hi, Gene;

it's been more than a month (maybe more than two) we cannot find any HP12C Prestige around here. I tried São Paulo and Rio de Janeiro: nothing so far. Expectations point to a month or so from now. It seems to me the second semester caused an unexpected demand, and all available units were sold too quickly. About three weeks ago a lot of 500 Prestige was announced at local e-bay (a Brazilian equivalent e-auction service, cannot remember which one) and sold out in a matter of hours.

As soon as I have any news I'll let you know.

Best regards.

Luiz (Brazil)

**HP71B soft case**

Message #1 Posted by [John Pierce](#) on 11 Oct 2007, 10:28 a.m.

I have a problem with the case that came with an HP71B I recently bought. According to the s/n of the calculator it was made in 1988 and appears to have been stored unused for most of that time. The interior black lining of the case has a "sticky" substance which also deposited on the calculator. It easily wiped off the calculator using isopropyl alcohol. Does anyone have experience with this, or know if the interior of the case is deteriorating and what can do about it?

**Re: HP71B soft case**

Some have said that a gentle cycle in the laundry would help (otherwise wash with warm soap and water) I have seen a hand full of cases with the same condition, both for the 71B and the 41C, but I have not tried the recommended cleaning method. Please let me know if it works.

**Re: HP71B soft case**

Message #3 Posted by [Massimo Gnerucci \(Italy\)](#) on 11 Oct 2007, 12:31 p.m.,  
in response to message #2 by Allen

It works. I tried on some 41C and 71B cases and it did magic. Just don't use hot water or they will become a little "dull".

Greetings,  
Massimo

**Re: HP71B soft case**

Message #4 Posted by [John Pierce](#) on 11 Oct 2007, 5:13 p.m.,  
in response to message #2 by Allen

Thanks to both for your responses. The soft case was washed with outstanding results and has survived with no damage at all, after thorough air drying it looks nearly normal. The only difference I notice is the naugahide(sp) appears "dried" out; I'll try Armoral. My concern now is that this condition not return and contaminate the calculator. Thanks.

### HHC2007 Poll Result: Bring Back the HP42S

Message #1 Posted by [Namir](#) on 10 Oct 2007, 11:19 p.m.

There was a questionnaire at the HHC2007. Once of the questions was:

If HP were to re-release a legacy calculator which model would be most appealing to you? A. HP-15C B. HP-42S C. HP-16C D. HP-71B

The poll was:

HP-15C: 11.6%

HP-42s: 51.2%

HP-16C: 18.6%

HP-71B: 18.6%

Soooo .... **HP .... PLEASE BRING BACK THE HP-42S!!!**

:-)

Namir

Even if they just built a platform that ONLY ran Free42, and then made it work with physical keys and an LCD, \*THAT\* would be cool! :-)

thanks, bruce

### Re: HHC2007 Poll Result: Bring Back the HP42S

Message #3 Posted by [DavidB](#) on 11 Oct 2007, 1:47 a.m.,  
in response to message #1 by Namir

I've never used the 42s, so I can't comment on menus, keyboard layout, ease of use, etc. However, in terms of build quality, does it equal that of the legendary 15C?

I would tentatively vote for a new 42 series if it has the same or better build quality as the 15C and if data entry for matrix operations are more intuitive or easy. Otherwise, I want a new 15C series machine!

Cheers!

David Bailey

*Message #4 Posted by [Walter B](#) on 11 Oct 2007, 2:20 a.m.,  
in response to message #1 by Namir*

Even a re-release "as was" would give it a better LCD, because you cannot get such a foggy thing anymore for production nowadays. So the most serious flaw of the 42s would be overcome "automatically"... :)

A bit more realistic (and even better): Since we know for sure the (expensive) molds for the 35s are available, I'd guess anything based on this form factor would have higher probability. Slanted keys! And a full set of cursors e.g. for matrix editing! Besides software and some printing on keys and plate (and some other stuff I've forgotten), one shall need a better LCD as well. May be borrowed from a graph calc?

Such speculations are always fun, regardless of their low chances for realisation...

*Message #5 Posted by [Raymond Del Tondo](#) on 11 Oct 2007, 3:37 a.m.,  
in response to message #4 by Walter B*

Hi,

the proposed silverbird 17bII+ already has the correct keyboard layout, number of keys, and dot matrix LCD.

So an updated 42S would base on that machine, not the 35s;-)

Raymond

I agree that the 42s would be the most desirable model to reintroduce. Actually, I really like all the Pioneer series, and wish HP had never stopped making them... they were truly pocketable... but HP did not consult me. However, I agree that such a calculator would most likely appear in the 35s form factor.

Don't be so sure. [http://www.capcampus.com/img/u/1/calculatrice\\_hp\\_fi.jpg](http://www.capcampus.com/img/u/1/calculatrice_hp_fi.jpg)

I'm sure HP didn't create the new 17BII+ look without some other future in mind. And it has everything needed for a new 42S, just needs new keytops and new software. It's essentially just a software project then.

Same thing for the 15C.

So modern hardware bases exist for both machines.

Dave.

The basic decision is whether you want a resurrection or a reincarnation. For sure there are hardware platforms to let the 15C and 42S rise from death. But only "as was", i.e. skipping 25 or 20 years of progress in user interfacing. The most visible progress was in the areas of memory modules, communication and displays.

So, does the market want living dead rather than some development?

One major difference between Gene's and Jake's design of a 45s based on 42S, my proposal of a 45s based on 35s hardware, my proposals of a 15Cx and a 15Cg -- and the vintage models are the displays. IMHO a pocket calc with the old rusty LCDs will not be regarded as cool anymore. And there shall be a way to exchange data (for backup and editing on PCs) -- otherwise it won't be a useful tool, but a mere toy.

Just my 20 milli Euro.

For a high end programmable calc, sure I/O and the other stuff are needed. However, what's wrong with a good basic non-programmable scientific calculator? That's all I and most people I know need on a daily basis. Modern one's like the Casio FX-991ES show what's possible as far as feature set go. Couple that with the HP look and feel and that's something I'd certainly want to buy. The bonus is software development is a lot easier and quicker than for a full-blown programmable calc.

Dave.

### **Re: HHC2007 Poll Result: Bring Back the HP42S**

*Message #10 Posted by [Pal G.](#) on 12 Oct 2007, 9:41 a.m.,  
in response to message #9 by [DaveJ](#)*

I think there is room for both;

- A good, basic non-programmable scientific for [\$] to compete with low ends (Casio, TI, et al).
- An EXCELLENT, PROGRAMMABLE scientific for [\$\$\$\$] for people who want quality and state-of-the-art design.

A few years ago I had outgrown my Palm IIIC, and spent \$800 on a Sony UX-50. Yes, eight hundred bucks for a PDA. The thing had wifi, bluetooth, camera, voice recorder, flip-screen, BACKLIT keyboard, memory card support, \*everything\*, and it fit in the palm of the hand. It was the coolest gadget ever. And productive too..

#### [UX-50 review](#)

In 1973, people were paying \$400 for an hp 35. That's about \$1900 today. My UX-50 was cheap compared to that, and it's practically a supercomputer compared to an hp 35.

I think HP should go for it. Produce a high end, programmable scientific, with i/o, that is smaller than an hp 50g, and I'll bet many people will buy it. If it has enough mathematical grunt, professors and researchers might be able to expense one for their work and buy one out of their own pocket for home use (hobby time).

; ) Pal

---

HP already have a top of the range programmable calc in the 50G. I don't think they will want to re-invent the wheel on that one, software and interface wise. But a new package could be in order, just like Casio repackaged the FX-9860G as the folding "slim" model. Now that was interesting...

Dave.

*Message #12 Posted by [Pal G.](#) on 12 Oct 2007, 10:40 a.m.,  
in response to message #11 by DaveJ*

Dave, my friend, I mentioned my idea for an excellent programmable should be "smaller than an hp 50g". Perhaps I should have stressed much smaller than an hp 50g.

I have an hp 50g too, and I love everything it can do, but it is TOO BIG. Gene and Richard's 45s prototype is about perfect (pocket) size.

Having an hp 50g at work makes you a huge target for GEEK/NERD comments. Having an hp 45s on the desktop would be the ultimate killer, sleeper calc.

To be honest, that is why I purchased (expensed!) an hp 35s. Sits on the desk at work instead of my hp 50g, which I used to have at work, but I leave at home so I don't get called names. Hahahahahaha..

LOL. When I was an undergrad EE major, being called a gEEk was a positive thing, a privilege actually. It meant you were above average in math and science. I really didn't mind because my friends and I were always cracking jokes to each other. Times have changed. Being called a geek or nerd is now a negative thing, and many people in the USA are not interested in math and science.

David Bailey

You should try walking around work wearing [this!](#) and see how many nerd/geek remarks you get!

On the surface it seems like it would not be much work hardware or software wise to repackage the 50G into a 45S style. And that's what I'm talking about, don't waste development effort developing a whole new top-line calc, just repackage some current ones.

Dave.

What if HP could make the 50G into a compact size, similar to a Casio 9960g Slim - of course with a SD slot. I think it can be done and you will not need more keys than the current 50G has.

Add: backlight (nice job, Casio), SD card, voice recorder (to record voice messages), calendar.

---

It can certainly be done, it's just a matter of HP making the commitment to doing it.

I wouldn't buy one, as I have no need for a calc in that market segment, but I'd imagine there are plenty who would love such a powerful machine in a much smaller form factor.

I really like the proposed 45S Pioneer size model.

I'd leave out the voice recording and calendar functionality, that crosses over into the realm of today's mobile phones. The KISS principle is a good thing.

Dave.

**Re: HHC2007 Poll Result: Bring Back the HP42S**

*Message #22 Posted by **Bruce Bergman** on 12 Oct 2007, 12:44 p.m.,  
in response to message #10 by Pal G.*

Pal, while I totally agree about wanting HP to "go for it" and I would be the first in line to buy one, I think people keep forgetting a critical law of economics here:

Value is perceived.

People have tried to translate \$400 1973 dollars into 2007 dollars and they get a \$2000

(or something) figure. Which they then use to say "back when, I actually paid \$2000 for a calculator (in today's money)..." as if to illustrate how things today would go. The flaw in that is that back in 1973 and even 1983 and 1993, computers were still huge machines with extremely high dollar amounts. Spending \$400 for a calc back then was \*perceived\* as being a big chunk of your pocket cash, but it was also \*perceived\* to be a good deal. No one today would spend \$400 for a calculator (even me!! ;) because technology is so ubiquitous. As you pointed out, we have PDA's that do \*everything\* imaginable. Heck, my GPS unit in my car has a calculator, an address book, bluetooth functionality, it speaks street names, plays music and video, and can even download traffic updates from the internet. Oh yeah, it also is a mapping GPS. ;-) And I paid something like \$250 for it.

So, while I would love to see HP come up with some high-end calcs, the demand just isn't there. There would only be a few of us calc nuts out there buying, and HP can't justify that. It can, however, justify mass-producing a mid-market unit that address a lot (if not most) of the needs of the folks out there.

I think HP once said that they'd need to sell at LEAST 25,000 of any one unit to \*break even\* on the costs, and that's assuming a fairly normal unit with no special features. I think we'd have a hard time selling 25,000 high-end units. Yeah, I'd buy two, but still...

Again, I'm not knocking your idea as a bad one -- just not an economically feasible one. ;-)

thanks, bruce

---

I, too, also feel that way concerning today's market demand for high-end calculators. There appears to be good demand for graphing calculators. Why are TI calculators so much more ubiquitous than are HP calculators among students? What is TI doing right that allows them to maintain their market share? Listen, folks. If HP is to remain a competitive source of the calculator technology, they need to aggressively target the academic audience. Engineering and science students who use a particular calculator brand will most likely use the same brand in their professional careers. Agree? Although I can only assume on this forum, it appears that many HP die-hards here are working professionals?

In the near future (maybe < 12 years from now), will calculators even exist as dedicated hardware? Will we have fast, affordable, 64 GB capacity, Wi-Fi ready, fuel-cell powered, hand-held devices that can function as a calculator of your choice (via downloadable calculator software from HP, TI, Casio, Sharp, etc.) and as a portable computer? Such a device could have a touch-sensitive, OLED keyboard layout that can adjust to the specific calculator model of your choice.

Cheers!

David Bailey

Why are TI calculators so much more ubiquitous than are HP calculators among students? What is TI doing right that allows them to maintain their market share?

---

TI went after the teacher and the textbook writer. My kid's textbook is written for the TI83+ (which I think is wrong, I'm still old school and believe the books should only be written for pen and ink). Students don't care, a calculator is a tool to get homework done and take tests with. My kid has so much more to worry

about (sports, a social life, work, etc...). Learning to use a different device to get the same results is unimaginable. Teachers have always selected your textbook and now they select your calculator. Some schools even pick out your clothes.

Quote:

---

In the near future (< 12 years from now), will calculators even exist as dedicated hardware?

---

Yes, until something with better capability/cost is introduced.

What happens when testing centers go computer? You walk in, you sit at a terminal, it has the test and the tools you need. Nothing else is permitted in the testing center. No more calculators required for testing.

My kid's school when laptop this year. Every student must have a MacBook. Calculator alternatives provide better visualization. Kids in high school today that become teachers in the future may expect a computer in the classroom.

Portable, low power, high function, low cost calculators become less important as computers become more ubiquitous. Very few need the sin of a number away from their desks. The calculator on my kid's iPhone is more than enough for mobile basic math. Lets face it, when on the move, away from your desk, basic math is all the masses really need.

I firmly believe that the hand held calculator will be replaced with something else within a generation or two. Even though slide rules are still manufactured today (at least on watch bezels), my 16 year old would have no idea what you were talking about. Her kids will be equally confused about the hand held calculator.

Egan,

Yes, that is what I was generally trying to say. You said it much more accurately. You are correct concerning TI. They indeed have influenced many authors and publishers of math textbooks up to the undergrad university level. I edited my other posting before I realized your response. The writing may already be on the wall, and HP probably knows this. Convergence of multiple technologies onto one device is not always an easy thing to accomplish in terms of design and usability, as Dr. Donald Norman points out (concerning the paradox of technology) in his book, *The Design of Everyday Things*:

"Technology offers the potential to make life easier and more enjoyable; each new technology provides increased benefits. At the same time, added complexities arise to increase our difficulty and frustration...As technicians become more competent and an industry matures, devices become simpler, more reliable, and more powerful. But then, after the industry has stabilized, newcomers figure out how to add increased power and capability, but always at the expense of added complexity and sometimes decreased reliability...Added complexity and difficulty cannot be avoided when functions are added, but with clever design, they can be minimized." (pages 29-30, 33).

Or at least use FLASH/EEPROM memory for program storage.

Dave.

**Re: HHC2007 Poll Result: Bring Back the HP42S**

Message #29 Posted by [Eddie W. Shore](#) on 12 Oct 2007, 12:17 a.m.,  
in response to message #28 by DaveJ

And SD connection!

A for some more wishful thinking: program capability between 42S and 50g (it will take a software update).

**Re: HHC2007 Poll Result: Bring Back the HP42S**

Message #30 Posted by [Eddie W. Shore](#) on 12 Oct 2007, 12:17 a.m.,

Hello!

Quote:

Soooo .... **HP .... PLEASE BRING BACK THE HP-42S!!!**

Unfortunately, I was not able to attend this conference (hopefully, the next one will be held at HP's German headquarters so that I can go there by bicycle :- ) and therefore couldn't take part in this poll, but I would have ticked the box: "Don't bring back any of these calculators".

They are fine examples of the technology of their time and of substantial value to collectors and addicts, maybe even useful to do actual work for a handful of people (worldwide! most of them are gathered on this website anyway...).

But now we live in the year 2007 and technology, ergonomics, taste, style, and most important of all, the role of the pocket calculator itself have changed considerably. The new 35s is an important first step to bridge the gap between then and now, but now is still far away from the the 35s and even further from the models listed in this poll.

I don't want to start a new discussion about what a 2007 calculator model should look like, but for me certainly it does not even remotely resemble the good old 42S!

Greetings, Max

An interesting question. So what would others want to see in a *\*modern\** design pocket calculator?

I for one want to see a *\*real\** pocket calculator, one I can actually fit in my pocket, not Bill Hewlett's insanely big pocket.

I want a calc that has a nice rich high contrast 7 segment display. Dot matrix can never be as good, and it's not needed on a basic calc. No screen glare please.

Dual line display would be nice.

I want lots of useful dedicated keys with good engineering and base conversion functionality. Ditch the programming keys please.

Keystroke programming is cool, you can remember how to use it after 6 months, so add that.

I want a battery life of at least a couple of years, and preferably dual solar battery power.

I want a *\*thin\** calculator.

I want something with lots of rubber area on the bottom so it doesn't slide around on any surface.

I want labels I can read.

What do others want?

Dave.

Message #36 Posted by **Maximilian Hohmann** on 11 Oct 2007, 9:17 a.m.,  
in response to message #33 by DaveJ

Hello!

Quote:

I for one want to see a \*real\* pocket calculator, one I can actually fit in my pocket, not Bill Hewlett's insanely big pocket.

Definitely! My favourite calculators are all very small, like the HP-25 or the Aristo M27 or the cutest of all: the CalcuPen.

Quote:

I want a calc that has a nice rich high contrast 7 segment display. Dot matrix can never be as good, and it's not needed on a basic calc. No screen glare please.

My ideal modern calculator would be luminous, both the keyboard and the display. When the pixels are small enough, it does not matter much if it is dot-matrix or 7 segment. Dot matrix would enable alpha-prompts that are very useful when executing programs.

Quote:

Dual line display would be nice.

---

With a big enough fine-pitched dot-matrix-display, any desired number of lines could be realised. Even an "infinite", scrolling display area.

Quote:

---

I want lots of useful dedicated keys with good engineering and base conversion functionality. Ditch the programming keys please.

---

I would rather wish to see user-defineable keys like the ones on modern touch-screen universal remote controls, that can be assigned to functions or programs via the PC (and Macintosh, please!). Programming could be done entirely on the host computer, I see absolutely no need to do it on the pocket computer.

Quote:

---

Keystroke programming is cool, you can remember how to use it after 6 months, so add that.

---

I don't, so keystroke programming is not useful at all to me. The last time when I really used keystroke programming was in the early eighties, but only because I had no alternative then.

Quote:

---

I want a battery life of at least a couple of years, and preferably dual solar battery power.

---

I would have no problem with rechargeable batteries either, maybe coupled to a solar cell so that no external charger is required.

Quote:

---

I want something with lots of rubber area on the bottom so it doesn't slide around on any surface.

---

Definetly! And not too lightweight either.

Quote:

---

I want labels I can read.

---

Yes. Luminous ones :-)

I have not touched an iPhone yet, but I could imagine that it would form a good basis for the "calculator of my dreams". A little bit larger to offer more space for "virtual" keys and more display area. And the whole thing fully configurable via computer. Able to store more than one configuration, so that it can mimic a four-banger with large keys and big 7-segment display today and a dedicated computer for some problem I have to solve at work tomorrow.

Greetings, Max

This collides head on with the request of many members for tactile feedback. You may have keys with programmable luminous labels (see a discussion here some months ago) on big keyboards, but I don't expect something in the size we need it and with next-to-zero power consumption in the next 5 years.

Just my 20 milli Euro again. Regards, Walter

**Re: No, please don't**

Message #38 Posted by **Maximilian Hohmann** on 12 Oct 2007, 3:00 a.m.,  
in response to message #37 by Walter B

Good morning!

Quote:

---

This collides head on with the request of many members for tactile feedback. You may have keys with programmable luminous labels (see a discussion here some months ago) on big keyboards, but I don't expect something in the size we need it and with next-to-zero power consumption in the next 5 years.

---

Tactile feedback: Well, having been forced (by HPs pricing policy of the seventies and eighties) to fight my way through school and univerty with Ti calculators, I was never spoilt by tactile feedback. Even if ou can feel the keyclick on a Ti-59, you always have to keep your eyes on the display, because you can't be sure if the figure that you keyed in appeares one time, zero times

or five times in the display. So I am accustomed to "visible feedback" when using a calculator anyway.

But I just remembered the way, early computer terminals simulated the behaviour of typewriters to make it easier for typists to convert to computers: There was a "clicker device" somewhere in the keyboard housing in which a solenoid pulled a piece of iron against a stop every time a keypress was detected. Not only did this generate the sound of a typewriter, but there was a little shake too, that you could feel through the keyboard. It should easily be possible to integrate a similar device (on a smaller scale and with much less noise!) into an iPhone-like calculator. (Did I just miss the chance to become a millionaire by not applying for a patent? ;-)

Regarding power consumption: Modern mobile phones with backlit colour displays last for about one week between recharges. For me, it would not be a problem to connect it to my desktop computer via USB for recharging once in a while. And if it uses standard batteries (like the rechargeable AAA cells of an HP-48 or Ti Voyage 200) it is assured that there will still be replacement batteries available in ten or twenty years.

But now, back to work ... (no calculator required, computers are doing all the work)

Greetings, Max

Addition: I just saw this on Apple's website, it was only released yesterday, the RPN-Calculator that runs on the iPhone and the new iPod touch:

<http://www.apple.com/webapps/calculate/belfryscicalc.html>

So even if I don't like to hear music via earphones, I think my next purchase might be one of these devices...

**Re: I want an HP45S...**

*Message #44 Posted by **Gene Wright** on 11 Oct 2007, 4:15 p.m.,  
in response to message #43 by Walter B*

Thanks. These were done over 18 months ago along with a high end business model.

The screen is the exact HP 48GII screen 131x64 pixels high.

The keys are the exact 12c keys.

The size of this model, believe it or not, is the exact 42S calculator size. It is a pioneer model.

Yes, it all fits. We checked.

Was fun.

in response to message #40 by Gene Wright*

Yepper. I would like two of the 45s please. With a real manual. The same size as a 42?

Maybe I'll take four.

**Re: I want an HP45S...Or two!**

*Message #47 Posted by [Gene Wright](#) on 11 Oct 2007, 4:54 p.m.,  
in response to message #46 by Jim Creybohm*

Same size was the plan.

Note that the machine itself would be the same size as the 42s...same width, height, thickness.

That did not require any compromises to the keys - they are the current 12c keys.

It also did not require changing the screen - same 131x64 screen so available for the 48GII.

I'm pretty sure you guys can figure out the menu functionality from the key legends.

**Re: I want an HP45S...Or two!**

Gene:

I love it and would buy one in a New York minute. In looking at the display, where are the keys to select the soft menus like on a 48GX?

Great Concept Calc, Gerry

**Re: I want an HP45S...**

*Message #51 Posted by [Gene Wright](#) on 11 Oct 2007, 5:33 p.m.,  
in response to message #50 by Gerry Schultz*

The top row of keys are used to select the soft menu keys, just like on the 42s. It does not "waste" a row of keys that are blank like the 48/49/50 series do.

And, that's merely a design tradeoff.

**Re: I want an HP45S...**

Although I respect very much the experienced judgements of "Lady" Katie ;-)- some scientific functions or statistical distributions like Trigonometrics and the Gamma Distribution family - and in addition to MIRR the real FMRR (refined from Coffin through Ed Keefe and McGuire) should be included via ML implementation.

Otherwise: Great work!!!

Best regards

Peter A. Gebhardt

### **Re: No, please don't**

*Message #59 Posted by [Paul Dale](#) on 11 Oct 2007, 7:48 p.m.,  
in response to message #33 by DaveJ*

My criteria list would include (in no particular order):

- Pocket sized.
- Not too heavy (but not as light as the current 35s which feel flimsy because of that).
- Alphanumeric display - don't care if it is dot matrix or 16 segment.
- Keystroke programming. Local labels definitely. Named programs optional - 26 letter labels is enough for most purposes.
- Programming support for alpha operations at least for display purposes if not input as well.
- Accurate operations. The 15c guaranteed +/-1 in the final digit for most operations and correct rounding for the basics. That is the *minimum* acceptable.
- Some minimal form of IO via serial/USB/ethernet/whatever.
- Memory: 32kb - 64kb of non-volatile RAM seems to be a sweet spot. More will be needed for internal operation but that can be volatile for all I care.
- Walter does the keyboard and function layout :-)

Optionals but still nice:

- Real time clock.
- Display back light.

Things I don't much care about:

- Graphics and plotting.
- CAS.
- Complex numbers.
- Matricies and arrays.

- Pauli

I agree with most of what you say, except about ditching the proگرامing keys. I think the complex number key should be ditched, and all conversion functions should be shifted. I also disagree with it needing to fit in a shirt pocket. If you bend over with it in there it's going to fall out. In 12 years of engineering I have never once seen anyone walk around with a calculator in their shirt pocket. One more thing, STO should not be shifted.

**Re: No, please don't**

\_\_\_\_\_

It's not just to fit in your shirt pocket, smaller is better in many ways. Takes up less space on a crowded desk or lab bench. Fits better balanced on a catalog or book while doing calculations (and allows you to see more of the page). Less room in your bag or lab coat pocket. Less unwieldy when held in your hand for calculations etc

There is no reason to have "dead space" on the front panel of any calculator, anything else is poor or lazy design. Just keys and LCD please.

Dave.

**HP 42sII please!(Re: HHC2007 Poll Result: Bring Back the HP42S)**

HP 42SII please!

BTW I just upgraded my hp 42s to 32KB of memory yesterday.  
(I found it's getting rather difficult to obtain classic 62256 SRAM in a SOIC28, so I did it.)  
Some disassembling photo is [here](#).

**Re: HP 42sII please!(Re: HHC2007 Poll Result: Bring Back the HP42S)**

*Message #65 Posted by [Patrick Rendulic](#) on 11 Oct 2007, 7:26 a.m.,  
in response to message #64 by Lyuka*

I would really like a new release of the HP42s.

I would add the following improvements: - I/O for backing up programs and controlling other devices, infrared for the printer.

- more memory (maybe even the capability to copy HP41 ROMS in a dedicated memory space)
- ALPHA keys à la HP41. I don't like the current way to enter text
- a real time clock with time functions

If the new release runs on an emulated system, there must be no emulating issues and no drawback in speed. In comparison to the HP35s, the screen cover must be scratch-proof and anti-reflective.

And voilà, the perfect RPN calculator I am looking for!

Where did you get the new chip?

**A possible source for the 32KRAM chip...**

*Message #67 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 12 Oct 2007, 4:41 p.m.,  
in response to message #66 by Stefan Vorkoetter*

Hi;

old, crashed, destroyed and definitely unable to be rebuilt HP48G units. Their 32KRAM chips are good enough. I used at least three of them to upgrade three HP42S.

I have two HP42S with 32KRAM chips removed from an old PC sound card (not a Sound Blaster, need to find the pictures and references, though...). I remember I measured the power consumption after replacing the chips and did not find significant addition (my multimeter was not accurate enough...). Anyway, batteries lasted so too long that I believe the RAM chips were low-power.

Cheers.

Luiz (Brazil)

**Re: HP 42sII please!(Re: HHC2007 Poll Result: Bring Back the HP42S)**

*Message #68 Posted by [Matt Kernal](#) on 11 Oct 2007, 1:56 p.m.,*

*in response to message #64 by Lyuka*

Nice Job!

Along with Stefan's question (where to find the 32K chip), I'd like to know how you keep the top and bottom case halves together? That question is for you too Paul :-)

Keeping the case securely closed (after the modification) is the main reason I haven't upgraded the memory in mine (yet).

Can you please comment on the two oscilloscope photos as well?

Again, nice job.

Matt

**Re: HP 42sII please!(Re: HHC2007 Poll Result: Bring Back the HP42S)**

*Message #69 Posted by **Lyuka** on 12 Oct 2007, 9:44 a.m.,

I got the chip from RS components.  
<http://www.rswww.co.jp/> (JAPAN)  
<http://www.rs-components.com/> (GLOBAL)

Quote:

\_\_\_\_\_

how you keep the top and bottom case halves together?

\_\_\_\_\_

It seems the other (rather slim) pins have enough friction to hold the top and bottom together so far, and won't be a problem for daily use.

Quote:

\_\_\_\_\_

Can you please comment on the two oscilloscope photos as well?

\_\_\_\_\_

Appendix 1:

The hp42s has a crystal resonator and I want to know its frequency. There is a testpoint next to the crystal that seems to be a buffered output of the clock oscillator. The photo is the waveform of that point showing its frequency of 32.78kHz (actually 32.768kHz measured by a frequency counter).

Appendix 2: (the photo is updated)

Taking a look on the PCB, I feel it lacks some bypassing capacitor for stable operation, so I monitored the waveform of the appropriate points by an oscilloscope. And I found that the Vdd noise (while test program execution) is acceptable and the RAM\_WR waveform is not so bad.

Regards, Lyuka

*Message #71 Posted by **Bruce Bergman** on 11 Oct 2007, 3:15 p.m.,  
in response to message #1 by Namir*

Okay, I'll admit it. My brain told me to vote for the 42s (and honestly, I would be ecstatic if a new one came out), but I followed my heart and wrote down the 71B.

I did this mainly because of the postings I've read here from Valentin and others that have impressed the heck out of me in terms of what that calc could do. I guess I never gave it any attention when it first came out, thinking it was a poor version of a small computer. Yet when I see some of the programs that have been written for it, the ability it has to deal with external I/O (I'm an embedded systems guy, so I like to be able to control and evaluate I/O), the precision of the calculator, the Forth ROM, etc., well, I'm VERY impressed.

Granted, it could be replaced by a couple of good emulators on a small tablet or OQO or something, but there's still something pleasing about holding something like that. When I was fondling one at HHC2007, marveling at the crystal clear display, etc., I was more smitten.

I may have to go out and buy one on eBay someday. I don't think HP will ever make a clone of the 71B (or, it's probably more accurate to say that I could see HP making a 42s clone before a 71B clone), but it sure would be nice to have one.

(sigh)

thanks, bruce

### **HHC2007 Conference Final Report and Questionnaire Results Posted**

Message #1 Posted by **Jake Schwartz** on 10 Oct 2007, 9:11 p.m.

Hi,

For those interested in a summary of our very successful HHC2007 HP Conference at Hewlett-Packard's facility in San Diego, check <http://holyjoe.net/hhc2007/> for links to the 31-page final conference report as well as the tally of an attendee questionnaire which was distributed. Also from there is the link on how to obtain a copy of the 16-month HHC2007 HP Calculator Calendar which was distributed to all attendees. Hopefully in a month or so, the videotape from the conference will also be available. Stay tuned.

Perhaps I'll see you in London at HPCC's 25th-Anniversary meeting this weekend...

Thanks,

Jake Schwartz

### Re: HP 35s problem with complex numbers.

Message #2 Posted by [Gene Wright](#) on 10 Oct 2007, 2:42 p.m.,  
in response to message #1 by [deleted](#)

How are you trying to enter such a complex number?

I know you can press 3 i 4 and get that complex number on the stack, but what are you pressing to create a complex number using a variable or a constant?

Give us a specific example of what keys you're pressing (or what equation you're trying) and that will help.

### Re: HP 35s problem with complex numbers.

Message #3 Posted by [Ike](#) on 10 Oct 2007, 3:05 p.m.,  
in response to message #2 by [Gene Wright](#)

I wanted to try Euler's equation:

$$e^{i(\pi)} + 1 = 0$$

For the exponent if I enter "0 i 3.14" where I manually enter an estimate of pi, I'm OK

If I enter "0 i shift pi" I am left with pi in the real portion of the number with no imaginary component and who know what in rectangular form in the Y register above it. This is very perplexing.

So I tried storing pi in the "a" register and tried: "0 i RCL a" and I get the same kind of nonsensical result. It sure is frustrating.

*Edited: 10 Oct 2007, 3:07 p.m.*

### Re: HP 35s problem with complex numbers.

Message #4 Posted by [Gene Wright](#) on 10 Oct 2007, 3:48 p.m.,  
in response to message #3 by [Ike](#)

The reason is because you cannot build complex numbers from values in registers or constants in the manner you are trying.

You can see this in a program.

In program mode, press EQN to turn on equation mode and type:

RCL B then i then 2

Now leave program mode and single-step that program line. You get a syntax error.

Try the approach shown in the next posting.

*Edited: 10 Oct 2007, 4:07 p.m. after one or more responses were posted*

**Re: HP 35s problem with complex numbers.**

*Message #5 Posted by Ike on 10 Oct 2007, 4:06 p.m.,  
in response to message #4 by Gene Wright*

Gene,

Thanks for your thoughtful response even though it isn't what I wanted to hear! It's too bad a complex variable cannot be constructed from constants or a register - why should the calculator care where the number comes from?

Oh well, on to the next problem like world peace or some such thing.

Cheers, Ike

**Re: HP 35s problem with complex numbers.**

*Message #6 Posted by Egan Ford on 10 Oct 2007, 3:58 p.m.,  
in response to message #3 by Ike*

Try:

```
PI
i
*
e^x
1
+
```

With a reg:

```
i
RCL* P
e^x
1
+
```

**Re: HP 35s problem with complex numbers.**

*Message #7 Posted by Ike on 10 Oct 2007, 4:10 p.m.,  
in response to message #6 by Egan Ford*

Egan,

I will try your steps when I get home for there is where I left my HP35s. I will certainly let you know the outcome unless someone has a 35s with them now and can try your procedure.

Thanks, Ike

**Re: HP 35s problem with complex numbers.**

Message #8 Posted by **Karl Schneider** on 10 Oct 2007, 10:31 p.m.,  
in response to message #3 by Ike

Ike --

Egan Ford's previous response is correct. The reason for the seemingly-inconsistent behavior is that hitting the pi key terminates data entry and pushes pi onto the stack. A previously-entered "i" then becomes a complete number, represented as "0i1" (0 + i1). Multiplying pi by "i" in either order produces the value you wanted.

I have made detailed suggestions to HP's calculator team for improving the complex-number functionality, and will continue to follow up on them. Help may be on the way, if you're willing to wait a number of months.

-- KS

**Re: HP 35s problem with complex numbers.**

Message #9 Posted by **Ike** on 10 Oct 2007, 11:28 p.m.,  
in response to message #8 by Karl Schneider

Karl,

Yes, Eagan is correct especially in the first solution. I had a bit more problem with the second but I'm not going to worry about it anymore. The bottom line is that now with the help from you folks I have something I can live with - thanks!

Now get those HP folks in line!

Cheers! Ike

**Re: HP 35s problem with complex numbers.**

Message #10 Posted by **Egan Ford** on 10 Oct 2007, 11:38 p.m.,  
in response to message #9 by Ike

For the 2nd:

1. Put a value in a register, e.g. A
2. Then type:

```
i  
RCL* A   i.e. RCL, then x (times), then A, aka recall arithmetic.
```

Or to make it easy:

```
i  
RCL A  
*
```

Both will build you a complex number from registers. For A+iB:

```
number  
STO A  
number  
STO B
```

```
i  
RCL* B  
RCL+ A
```

OR

i  
RCL B  
\*  
RCL A  
+

in response to message #11 by Trent Moseley

Hi, Trent --

Quote:

Having solved all complex problems with the 42s why did HP need to reinvent the wheel?

Well, I can't fully concur on that point. I have yet to see a calculator from any manufacturer having ideal complex-number functionality, but certainly the HP-42S is among the best. Its display of complex numbers is perfect, but the HP-42S lacks the following:

- Direct, one-step entry of complex numbers in rectangular or polar form in either "mode" (as the HP-35s has)
- A menu of complex-number functions (as the HP-28C/S has)
- Mixed-mode display of complex numbers with most-reasonable result format (Simple and straightforward, but I've never seen it done -- by HP or by TI or Casio in the models I've examined)

Details will follow, hopefully within a week. Here's a sample:

[User-friendly complex numbers](#)

-- KS

**i^2 = invalid data in one case**

Message #16 Posted by [DavidB](#) on 11 Oct 2007, 1:10 a.m.,  
in response to message #1 by deleted

In mathematics, the square of imaginary unit  $i$  is  $-1$ . If I enter the imaginary number  $0i1$  and then take the square of it ( $x^2$ ), the HP 35s displays "INVALID DATA." The same happens when I enter any complex number and take the square of it using the  $x^2$  key on the calculator.

If I enter the following, as shown in manual, p. 9-5:

$1i1$  ENTER 2 (positive 2 here)  $y^x$

The result is  $0i2$ , since  $(1 + i)^2 = 1^2 + i + i + i^2 = 1 + 2i - 1 = 0 + 2i$

So, in one way, the 35s does compute  $i^2$ . But just using  $x^2$  will not work. If I enter:

$i 1$  ENTER 2  $y^x$

I get the result as  $-1i0$  (or  $-1 + 0i$ ). I originally thought the 35s did not compute  $i^2$  at all, but it does. As noted in the manual, you can  $y^x$  to compute powers of a complex number.

Cheers!

David Bailey

### HP35s in the Press (Spectrum Magazine Oct 2007)

Message #1 Posted by [Chris McCormack](#) on 10 Oct 2007, 11:23 a.m.

For those interested in a dissenting opinion, the latest IEEE Spectrum magazine has a review of the HP35s titled, **Blast from the Past** with the subheading, 'Hewlett-Packard is offering a calculator that looks like the first one it ever sold. Big deal'.

[Blast from the Past](#)

### Re: HP35s in the Press (Spectrum Magazine Oct 2007)

Message #2 Posted by [Martin Pinckney](#) on 10 Oct 2007, 12:00 p.m.,  
in response to message #1 by [Chris McCormack](#)

Mr. Foster makes some good points. Unfortunately, he doesn't understand all he knows about the subject, as a colleague used to say. He is correct about the calculator being too "feature rich". This results in an awkward user interface, with some features that I need regularly hard to access, and other features that I never need right there as a primary key function. But the reverse is true for another user, and so on and so on. If I could design my own calculator, it would have just the features I want and no others. So would you. One thing reading the posts on this group has taught me, is that the individual's need for certain features varies widely.

But HP cannot economically make calculators that way. The closest they came was in the Pioneer years, in which they made, at my count, 9 different models in the same form factor; you could choose the one(s) that suited your needs best. But they no longer make these (economics or just marketing?). So the point is that the feature rich aspect of the calculator is a necessary evil from a cost standpoint.

The same may be said of combining RPN and ALG in one machine: its both marketing and economics.

I'll concur with that. Mr. Foster seems to have little knowledge of HP's models of the "extended 1980's" -- specifically the HP-34C, HP-15C, HP-42S, and HP-32SII -- which introduced the functionality he deems superfluous and unnecessary.

Message #4 Posted by [DavidB](#) on 11 Oct 2007, 2:09 a.m.,  
in response to message #1 by [Chris McCormack](#)

Chris,

Thanks for the info. I don't subscribe to IEEE Spectrum, but would like to read that review. I wonder how many engineers here at Va Tech use HP RPN scientific calculators? When I was an undergrad (EE major) here in the 80's, most gEEKs, I mean electrical engineers, used HP calculators. HP set the standard that all other scientific calculators were trying to beat. Today, it seems most engineers in academics use TI or some other name brand from Japan.

Cheers!

David Bailey

## **Re: HP35s in the Press (Spectrum Magazine Oct 2007)**

Message #5 Posted by [Norris](#) on 12 Oct 2007, 11:38 a.m.,  
in response to message #1 by [Chris McCormack](#)

The Spectrum review asks "Who needs all these features?...Perhaps very advanced users might benefit from these functions, but I suspect that they would have abandoned the calculator for a computer long before they reached that point."

Well, here's the answer: The tens of thousands of engineers and surveyors who take professional licensing exams annually, who must solve a broad array of quantitative problems, and who are barred from using a computer. This is not the largest niche in the calculator business, but it's a real niche nonetheless. I would bet that the reviewer is not a licensed engineer.

The design features of the 35S criticised in the review, including the rich feature set, the ALG vs. RPN option, and the lack of I/O, actually make sense if the target market is NCEES examinees.

In fairness, the 35S has not yet been approved for NCEES exams, but I predict that this will happen when NCEES conducts its annual review of exam calculators in November. I further predict that the 35S page at amazon.com will suddenly fill up with links to FE and PE exam review manuals -- just as the page for the NCEES-approved 33S already has.

### Communicating stack state transitions, a notation.

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 9 Oct 2007, 4:12 p.m.

I will try using the following notation to communicate RPN program's effect on the stack and LASTX register:

$[d,c,b,a][e] \rightarrow \text{oper. desc.} \rightarrow [d',c',b',a][e']$

The first array with four elements represents the stack where d and d' refers to content of the T stack register and a and a' to content in the X stack register. The e and e' in the single element array refers to the LASTX register's content. Ofcourse actual letters or words used may be choosen to so fit the input/output for particular program.

So for example to describe sqrt:

$[d,c,b,v][e] \rightarrow \text{sqrt} \rightarrow [d,c,b,\text{sqrt}(v)][v]$

and addition:

$[d,c,b,a][e] \rightarrow + \rightarrow [d,d,c,b+a][a]$

Ofcourse there are other (better?) ways using tables or some kind of bar diagram but think this may work and have the advantage of being easy and fast to type in text only documents.

Anyone of your long time rpn hackers having an opinion on this topic?

### Re: Communicating stack state transitions, a notation.

Message #2 Posted by [Valentin Albillo](#) on 9 Oct 2007, 5:17 p.m.,  
in response to message #1 by Arne Halvorsen (Norway)

Hi, Arne:

Obviously it would be far easier on the eyes and more useful if you would use **X, Y, Z, T** and **L** instead of **a, b, c, d** and **e**, like this:

$[X, Y, Z, T | L] \rightarrow \text{Sqrt} \rightarrow [\text{Sqrt}(X), Y, Z, T | X]$

or a variation thereof.

Best regards from V.

*Edited: 9 Oct 2007, 6:17 p.m. after one or more responses were posted*

### Re: Communicating stack state transitions, a notation.

Message #3 Posted by [Arne Halvorsen \(Norway\)](#) on 9 Oct 2007, 6:16 p.m.,  
in response to message #2 by Valentin Albillo

Small details, but think your way of | replacement for my 'two array' notation looks better, will use.

As for the actual letters, think may become confusing if variable bound to original position in register; there may be a chain of operation... And if x contains speed of light; use c.

Now, for me LEFT maps to TOP (i.e. T) and I always think of LASTX as 'below' X register... Interesting that you turned it around! Perhaps most people find yours more natural, perhaps its because I am lefthanded :-).

Hmmm, actual that is perhaps more readable... must think about it... to bad there aint enough people interested in this detail to have a poll!

Thanks!

*Edited: 9 Oct 2007, 6:17 p.m.*

**Re: Communicating stack state transitions, a notation.**

*Message #4 Posted by [Walter B](#) on 10 Oct 2007, 2:44 a.m.,  
in response to message #3 by Arne Halvorsen (Norway)*

God dag Arne,

I like Valentin's notation better because the x-level -- which will change most frequently -- appears leftmost, i.e. first for people reading from left to right.

Just my 20 milli-Euro

**Re: Communicating stack state transitions, a notation.**

*Message #5 Posted by [JoseL](#) on 10 Oct 2007, 3:18 a.m.,  
in response to message #4 by Walter B*

Hi Arne,

I agree with Valentin and Walter.

It's the notation I have been using since my first steps in RPN.

Best regards

**Re: Communicating stack state transitions, a notation.**

*Message #6 Posted by [Arne Halvorsen \(Norway\)](#) on 10 Oct 2007, 3:19 a.m.,  
in response to message #4 by Walter B*

I have arrived at the same conclusion myself... Good thing I asked :-)

**Re: Communicating stack state transitions, a notation.**

*Message #7 Posted by [Chris McCormack](#) on 10 Oct 2007, 1:26 p.m.,  
in response to message #1 by Arne Halvorsen (Norway)*

I would advocate following the stack notation practices used with the programming language Forth. The lowest items on the stack appear to the right, only the applicable levels appear, and two dashes separate the 'before' and 'after' snapshots.

For example:

```
( y x -- y+x )
```

would be a compact representation for the '+' key.

If you want to explicitly show the entire stack (and Last X register) this could become

```
( t z y x | a -- t t z y+x | x )
```

Usually the stack comments would try to convey a little more meaning, such as:

```
( Lat1 Lon1 Lat2 Lon2 -- Bearing )
```

to document that calculates the initial great circle bearing to fly from point 1 to point 2.

### **Re: Communicating stack state transitions, a notation.**

*Message #8 Posted by [Arne Halvorsen \(Norway\)](#) on 10 Oct 2007, 1:43 p.m.,  
in response to message #7 by [Chris McCormack](#)*

Interesting, I remember in my young days there was a lot of talk about the FORTH language... The notation is good and very similar to Valentin's proposal I have adopted (good I did not go ahead with my original syntax). I do agree names should reflect nature of value. I use X, Y, Z, T, L for the 'bystanders'...

### Help needed NOW (real time) - stuck in a loop

Message #1 Posted by [John Wasilewski](#) on 9 Oct 2007, 2:44 p.m.

#### URGENT - IMMEDIATE HELP NEEDED IN REAL TIME.

Please see the "Unrecoverable crash to lock-up" thread, which I started a few days ago.

That problem went unsolved. This is a continuation but with a new clue and a great deal more urgency. I have keyed in the whole 473-line program a THIRD time to test a third time. Made some tiny changes (see below). I am now, repeat NOW (as I type this) stuck in a loop which I cannot get out of and I need immediate, repeat, IMMEDIATE help.

I've tried:

```
C
R/S
C+R/S
C+GTO
C+R/S+i
```

Nothing will break the loop.

WHAT I CHANGED (not important)  
(see "Unrecoverable crash to lock-up" for a listing)

I changed line

```
323 RCL L
to
323 RCL Q
324 x<>L
```

Then I inserted, after the old-numbered  
329 XEQ B020

(new numbers)  
333 COMP BARS  
334 PSE

I am now stuck in a loop that keeps displaying  
COMP BARS (0.5 seconds)...RUNNING (2.5 seconds)...  
COMP BARS (0.5 seconds)...RUNNING (2.5 seconds)...  
COMP BARS (0.5 seconds)...RUNNING (2.5 seconds)...  
COMP BARS (0.5 seconds)...RUNNING (2.5 seconds)...  
COMP BARS (0.5 seconds)...RUNNING (2.5 seconds)...  
COMP BARS (0.5 seconds)...RUNNING (2.5 seconds)...etc...

I can wait maybe another two hours hoping for someone to help me break the loop, but then I'll have to poke the back and lose all my hours of work (A-G-A-I-N).

Help please someone!

**Re: Help needed NOW (real time) - stuck in a loop**

*Message #2 Posted by **John Wasilewski** on 9 Oct 2007, 3:08 p.m.,  
in response to message #1 by John Wasilewski*

I got no help from HP last time. They just fobbed me off with platitudes then ignored me.

I've just sent the following message to them:

From John@Wasilewski.co.uk to the HP helpdesk at  
<http://wwemail.support.hp.com/fd2/EmailSend> .

The HP35s scient.calculator becomes stuck in a loop which I cannot break out of. I've tried C R/S, C+R/S, C+GTO, C+GTO+i, (from the manual) and none of these works. I have now lost all of my work THREE TIMES by having to use pin-reset, which clears everything from memory. I've lost three programs, one of which was 473-lines long, which I am now facing having to key in for a fourth time before I can debug it. TELL ME HOW TO BREAK OUT OF A LOOP WITHOUT LOSING ALL MY CONSIDERABLE AMOUNT OF WORK! Please don't reject my request with an unhelpful comment and then just ignore me this time.

-----

John@Wasilewski.co.uk

**Re: HP35s Help still needed NOW (real time) - still stuck in a loop**

*Message #3 Posted by **John Wasilewski** on 9 Oct 2007, 3:13 p.m.,  
in response to message #1 by John Wasilewski*

The calculator is the HP35s scientiic.

*Message #4 Posted by **John Wasilewski** on 9 Oct 2007, 3:15 p.m.,  
in response to message #3 by John Wasilewski*

I can't even turn it OFF unless I take both batteries out or push a pin in the back. I am just SO FED UP with all this work going down the drain on this machine. -- John

**Re: HP35s Help still needed NOW (real time) - still stuck in a loop**

*Message #5 Posted by **Katie Wasserman** on 9 Oct 2007, 3:33 p.m.,  
in response to message #4 by John Wasilewski*

John,

I feel your pain but unfortunately can not offer any suggestions for recovery that you haven't already tried. I've had such bad experiences with this machine that I've put it in my display case never to be used again.

I've read through your code and think that you can save considerable space by making use of STO and RCL arithmetic and other coding shortcuts such as user flags. I'll bet that with a little bit of work this application can fit on a 32SII and I'm sure it can fit on a 33S.

-Katie

**Re: HP35s Help still needed NOW (real time) - still stuck in a loop**

*Message #6 Posted by **John Wasilewski** on 9 Oct 2007, 3:39 p.m.,  
in response to message #5 by Katie Wasserman*

Thanks Katie. I appreciate your commiserations and I'll look at your suggestions if I ever get any further with this wretched problem. I have been using some STO and RCL arithmetic but if you think I have missed a few such optimisations I will look out for them. John

### **Re: HP35s Help still needed NOW (real time) - still stuck in a loop**

*Message #7 Posted by [John Wasilewski](#) on 9 Oct 2007, 4:23 p.m.,  
in response to message #6 by John Wasilewski*

All done.  
I have lost all my work AGAIN.  
I tried the pin-in-the-back for a split second.  
Memory cleared.

I have since experimented with short programs with loops, counters and PSE instructions. I can get it stuck in a loop of course but I cannot put it into a loop from which it is impossible to break out.

I can only deduce that the problem with my 473-line program is that the locked-in-a-loop behaviour has something to do with,  
- length of the program,  
- flag settings,  
- internal delays when searching for loop destinations,  
- or something like that.

I wondered if it was cause by the SF 5 statement in my program but, from a simple test, it doesn't seem to be that.

Hi John,

I really think you need to buy a 50G and get on with it.

If you really need to use "obsolete" programming paradigms, the 33s is just as new as the 35s, and it is less expensive, and the bugs are worked out. Just a thought.

### **HP35s: bad experiences with this machine**

*Message #9 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 9 Oct 2007, 5:03 p.m.,  
in response to message #5 by Katie Wasserman*

Hi Katie, all;

Please, Katie, forgive me if I am asking a silly question. I'm following (for as long as I can) some threads about the HP35S, and it seems to me HP lost the calculators' "mother of the recipes". My question is related to the second part of your sentence I partially quoted in the subject, i.e., it seems you gave the HP35S up. Appart of the (bad) experiences posted here, are there any others you can add to these so we can be aware of them? I'm willing to collect all of the information related to the HP35S here, but I'd like to know what is going to be missed.

Yeap, I have one, now!

Thak you and forgive me again.

Luiz (Brazil)

*Message #10 Posted by [bill platt](#) on 9 Oct 2007, 9:32 p.m.,  
in response to message #9 by Vieira, Luiz C. (Brazil)*

As a straight calculator and equation solver it certainly seems very nice. The buttons work well, the display is fairly good, two lines is a great thing, there is no fear of running out of memory, and the equation list editing is a huge improvement over the 32sii and 33s.

It seems to me from listening to the problems reported by others that the worst of them are related to new features (vectors, non-decimal math, etc), and second to "assembly-like" line programming (RPN or ALG) rather than with basic features.

I haven't had any crashes or lockups with it myself. I haven't pushed it hard though. I've been too busy these past few months (in a good way though!).

### **A horse of a different color**

*Message #11 Posted by [Valentin Albillo](#) on 9 Oct 2007, 6:01 p.m.,  
in response to message #5 by Katie Wasserman*

Hi, Katie:

Kastie posted:

*"I've had such bad experiences with this machine that I've put it in my display case never to be used again."*

On the other hand, I've used mine *very extensively*, writing all kinds of complicated programs using very long equations, vectors, complex values and whatever, all of it very experimental, some of them running unattended for up to 24 hours in a row, in search of weird programming tricks, and not even once have I experienced any abnormal behavior, crash, unbreakable loop, or even the infamous problem with vectors. Not-even-once.

The only 'weird' things I've encountered were some unexpected side effects while doing bizarre things with equations, but they were fully explainable once you studied what happened and within working parameters, no bugs at all, just 'unexpected' (I'll comment on them in a future Datafile article).

So I'm pretty amazed at the negative experiences other people seem to have with this machine, yourself included. You say you'll never use yours again, Vincze (remember him ?) said that he had destroyed his HP35s by throwing it against the nearest wall, etc, etc.

Perhaps it depends on the production batch ? Certainly mine works flawlessly despite the many nasty tricks I've tried on it, and it's grown on me as a pretty solid, reliable machine with a very good keyboard and excellent ergonomics (e.g., it doesn't slip when placed on a table, it firmly sticks to it no matter how hard you press the keys).

Best regards from V.

### **I missed this one...**

Hi Valentin; (say Laura 'Hello' for me to, please!)

Quote:

Vincze (remember him ?) said that he had destroyed his HP35s by throwing it  
against the nearest wall

I missed that. When did it happen? Did he mention it in a thread or was it after private e-mails? I hope John Wasilewski does not follow this idea... I am curious because I am giving an HP35S a try for a couple of days and I can follow your own view about it, Valentin: no complaints so far.

Best regards.

Luiz (Brazil)

### **Re: I missed this one...**

Message #13 Posted by [Valentin Albillo](#) on 9 Oct 2007, 6:34 p.m.,  
in response to message #12 by Vieira, Luiz C. (Brazil)

Hi, Luiz:

Luiz posted:

*"I missed that. When did it happen? Did he mention it in a thread or was it after private e-mails ?"*

He mentioned that much in a thread here in the Forum, a few weeks ago, at a time he was posting assiduously. Funnily enough, if I remember correctly, *his HP35s wasn't misbehaving at all*, it was just that he couldn't grasp how to do something simple on his own (polar/rectangular conversions or something like that) and he stamped the poor thing against the wall and proudly told us, at a time where most everyone else was *drooling* at the mere thought of getting to own one. That's Vincze for you ! :-)

*"I hope John Wasilewski does not follow this idea..."*

Oh but he would actually be entitled to do it, considering his extreme trials and tribulations. Though the machine itself is not the only one to blame in this case, methinks.

*"I am curious because I am giving an HP35S a try for a couple of days and I can follow your own view about it, Valentin: no complaints so far"*

Nope, no complaints at all, exactly the opposite: I am delighted with it, and though I can recognize its many flaws and shortcomings, none of them have manifested themselves as bugs or unusability as far as I'm concerned.

And for one whose first HP was an HP-25C, then an HP-67, etc, this machine is, as

we say in Spain, "*como para darse con un canto en los dientes*" which roughly means: recognize the good you have and be grateful for it instead of unnecessarily complaining.

Best regards from V.

**Re: I missed this one...**

*Message #14 Posted by **Thor Lansen** on 10 Oct 2007, 2:24 a.m.,  
in response to message #13 by Valentin Albillo*

Hello my old friend Valentin, I am one of those with a HP25C and I am not complaining about the HP35s either (because I do not have one), but to consider John's lost of a four hundred plus program lines of "unnecessarily complaining" would be like that Spanish saying I heard: "*casi nada lo del ojo y lo tenia en la mano*" (what happened to his eye was nothing to worry about and he had it in his hand).

It seems to me that for a machine that has no way of backing up a program/data it is even more critical to be full proof in its operation (i.e. not locking up and loosing everything you painstakingly just entered ONE finger key stroke after another). You indicate yours works fine, have you tried running John's program?

Regards, Thor

in response to message #14 by Thor Lansen*

Hi, Thor !

Thor posted:

*"[...] to consider John's lost of a four hundred plus program lines of "unnecessarily complaining" would be like that Spanish saying I heard: "casi nada lo del ojo y lo tenia en la mano"*

LOL ! You've quoted it *perfectly*, and it's very funny and appropriate in most cases !

But not here. I've noticed that oftentimes my posts are misunderstood and people tend to read meanings vastly different from what I actually had in mind at the time of writing. I'm sure most of the blame is mine because I tend to use exceedingly terse language at times, mostly when it's 3:00 AM or so, I'm absolutely tired, and further I'm writing in near darkness so as not to disturb anyone's sleep.

In this case, the "unnecessarily complaining" actually referred to me (!) because after using the HP35s for a month there were some times when I would "swear in Aramaic" because Sqrt(x) wouldn't work on complex numbers (so forcing me to change an elegant program to something less elegant), then  $x^2$  also refused to square a complex number, there was no elegant/fast/accurate way of retrieving the parts of a complex number of

vector, some side effects that *should* work *didn't*, etc, etc.

I was complaining *all* the time, to myself, to my wife, to everyone in a radius of 5 meters or so. Until then, at some moment, I had an *epiphany* and remembered when I was oh so much happy with my 49-step HP-25 without subroutines and losing *everything every time* I turned it off. Then I decided the HP 35s *is* an incredible machine, very capable, very solid, an HP will probably earn very little from it, if at all. It's the work of love of Cyrille and a few other 'lunatic' HP calc fans.

Thus I stopped *my* "unnecessary complaining" for good. Now you see what I meant.

*"It seems to me that for a machine that has no way of backing up a program/data it is even more critical to be full proof in its operation (i.e. not locking up and loosing everything you painstakingly just entered ONE finger key stroke after another)."*

Absolutely true. However, I'm convinced it is a miracle in itself that we have such a machine as the HP35s, because it doesn't make any business sense for HP and I can't imagine just how many doors Cyrille and other such people have knocked to the point of wearing them down in order to get it *done*, at the *lowest* possible cost.

I guess that ensuring "version 1.0" is nearly bugless before bringing it to the market was simply economically impossible, so it probably was a choice to either market it right away and let people be "acting guinea pigs" to help iron out the worst bugs, or else not releasing it *ever*, period. So I won't complain.

*"You indicate yours works fine, have you tried running John's program ?"*

No, sorry. I just don't have the time required to do it, I've been finishing my two latest articles for Datafile and had to go to sleep at 5:00 AM on two consecutive days (and then going out to work at 7:00 AM) simply to meet the October 6th deadline. No time for anything else.

Thanks for your friendly comments and

Best regards from V.

I cannot leave one of Valentin's comments unanswered.

Valentin, you wrote,

*Though the machine itself is not the only one to blame in this case, methinks.*

I do not for a minute think you intended to cause offence but it is difficult not to feel a little hurt by this comment.

How exactly do you suppose that I and my program might be partially to blame? Yes, no doubt, the program has bugs. Yes, no doubt, it is my fault that it is stuck in a loop. This is what debugging is for. But how could it be partly

my fault that the calculator refuses to break out of the loop unless I do a hard reset and clear all memory?

John

### Re: I missed this one...

Message #17 Posted by [Valentin Albillo](#) on 10 Oct 2007, 11:25 a.m.,  
in response to message #16 by John Wasilewski

Hi, John:

John posted:

*"I cannot leave one of Valentin's comments unanswered."*

Good. Thanks for your dedication.

*"Valentin, you wrote: "Though the machine itself is not the only one to blame in this case, methinks." I do not for a minute think you intended to cause offence but it is difficult not to feel a little hurt by this comment.*

*How exactly do you suppose that I and my program might be partially to blame? Yes, no doubt, the program has bugs. Yes, no doubt, it is my fault that it is stuck in a loop. This is what debugging is for. But how could it be partly my fault that the calculator refuses to break out of the loop unless I do a hard reset and clear all memory?"*

Please quote **exactly** where in my post do I ever mention that **you** or **your program** are partially to blame. **Then** we can discuss the matter.

In the meantime, while expecting your quoting, let me give you a piece of advice or two for free:

- To successfully deal in any kind of Internet forum, you've got to have or quickly develop a hard skin and also reduce your sensitivity to the environment lest you'll frequently get bruised and hurt.
- To successfully deal in any kind of Internet forum, you've got to develop a *clear understanding* of what you're reading and what it really *means*, not what *your* heightened sensitivity *thinks* it means lest you erroneously feel attacked and threatened and victimized when *you weren't actually mentioned at all*.

Just for the record, my sentence you did quote, namely *"Though the machine itself is not the only one to blame in this case, methinks"* was indirectly addressing current HP's **poor customer attention** and the way in which they **ignored** you and your problem.

If the machine is buggy, the machine is certainly to blame, but that was *enormously alleviated* in the past when you would call HP's service and they would acknowledge the problem, research into it, suggest some workaround if at all possible, and even recall whole batches replacing them with new machines or ROMs free of charge !

As you have experienced in your own flesh, that's not exactly the case right now, that's why I think that an *enormous* part of the blame goes to

HP's piss-poor service, not only to the underpaid, overworked people who manufactured it.

Hope that makes it crystal clear for you. And please, next time do **not** put in my mouth or pen comments I haven't uttered or written.

Best of lucks with your sad affair and

Best regards from V.

### **Re: A horse of a different color**

*Message #21 Posted by [Valentin Albillo](#) on 9 Oct 2007, 6:42 p.m., in response to message #18 by Arne Halvorsen (Norway)*

Hi again, Arne:

Arne posted:

*"For example have you written and edited a program using vector in \*equations\* and \*not\* got in to problems?"*

Yes, many times. Matter of fact one of my HP35S articles to appear in the very next issue of Datafile, which will be released within a week or so, does include vectors in very long equations, both of the constant type and of the dynamic, components-computed-on-the-fly-with-tons-of-side-effects type, and I've edited them equations and run the program any number of times, even calling it as subroutines in loops, with not even the slightest trace of a problem.

I'm convinced this is either sheer luck, or much more probably, a different batch.

Best regards from V.

### **Re: A horse of a different color**

*Message #22 Posted by [Katie Wasserman](#) on 9 Oct 2007, 10:27 p.m.,  
in response to message #11 by Valentin Albillo*

Luiz and V-

Perhaps it's the way I press the keys on the 35s, but I have missed keystrokes frequently -- pretty much every time I use it. This never happens to me on the 32Sii (my regular calculator form many years). I've also experienced the vector syntax error several times now and I'm really irked by uselessness of the ALL display mode and CHECKSUM function. These are my biggest complaints.

The larger memory is nice but the speed of the calculator (or rather lack of it) means that it's impractical to do anything on a large set of numbers. I think that the 32Sii has just the right balance of memory, speed and power consumption for a simple programmable calculator with no i/o.

BTW, I measured the power consumption on the 35s -- it sucks 4.5ma from each of the CR2032 cells when it's running, this is higher than the rated maximum continuous discharge and no doubt degrades the capacity of the cell. I'd estimate the run time battery life on the 35s to be around 20 hours. The 32Sii draws just 1ma when running with similar capacity cells (silver oxide 357). My guess is that it would run at least 4 times longer.

-Katie

### **Re: A horse of a different color**

---

A 357 silver oxide cell is about 1/3 the capacity of a lithium manganese 2032 in watt-hours.

I have never seen a rated "maximum continuous discharge" figure for a 2032 cell. The maximum continuous current is effectively limited by the internal resistance (around 20ohms), but yes, the capacity changes based on load current

Dave.

### **Re: A horse of a different color**

*Message #24 Posted by [Katie Wasserman](#) on 10 Oct 2007, 5:16 a.m.,  
in response to message #23 by DaveJ*

The CR2032 maximum discharge seems to be rated by at least a few manufacturers, for example: [Renata](#) lists it as 3ma [Sanyo](#) as 4ma [EEMB](#) as 3ma.

Yes, the total watt-hours of a 357 cell is about .25W and a CR2032 is .63.

The 35s uses 2 cells (1.26Wh total) with a run-time consumption of .027 watts . The 32sii uses 3 cells (.75Wh total) with a run-time consumption of .0045 watts. So just on this basis the 32sii should run 3.5 times longer, but the excessive load on the CR2032 likely makes this factor even larger.

### **[OT?] Power consumption**

*Message #25 Posted by [Antonio Maschio \(Italy\)](#) on 10 Oct 2007, 5:38 a.m.,  
in response to message #24 by Katie Wasserman*

Very interesting (really!), Katie.

Could you list all HP-models power consumption for calculators you own or you know about?

How do you measure such power consumption? (This could sound a silly question, but I'm a civil engineer who builds roads, so I've got no knowledge about electricity!)

-- Antonio

### **Re: [OT?] Power consumption**

*Message #26 Posted by [Katie Wasserman](#) on 10 Oct 2007, 4:15 p.m.,  
in response to message #25 by Antonio Maschio (Italy)*

You use an external power source with a ammeter in series with it. In the case of the 35s you need two such power sources and two meters since it draw powers from both cells and the cells are not in series. They're not in parallel either they've got some sort of circuit (which might be more than a couple of diodes) between the two cells.

### **Re: [OT?] Power consumption**

*Message #27 Posted by [DaveJ](#) on 10 Oct 2007, 6:48 p.m.,  
in response to message #26 by Katie Wasserman*

What do you measure with just one or the other cell installed?

Dave.

**Re: [OT?] Power consumption**

*Message #28 Posted by [Katie Wasserman](#) on 10 Oct 2007, 11:40 p.m., in response to message #27 by DaveJ*

The calculator (at least mine) won't run with just one cell installed, it will retain memory however.

**Re: [OT?] Power consumption**

*Message #29 Posted by [Antonio Maschio \(Italy\)](#) on 11 Oct 2007, 5:11 a.m., in response to message #28 by Katie Wasserman*

Thanks, Katie.

Well, I own none of the tools you named (nonetheless, I guess it would be terribly hard for me to use them, even in case I owned them), so would you list here the power consumption for the models you measured?

I'd appreciate it very much.

I thank you in advance.

-- Antonio

**Re: [OT?] Power consumption**

*Message #30 Posted by [Katie Wasserman](#) on 11 Oct 2007, 10:13 a.m., in response to message #29 by Antonio Maschio (Italy)*

Antonio,

I haven't measured any other calculators current draw recently and don't have any records of the ones that I have. But I'll try to find some time and do that in the future. Are there any models in particular that you want to measure?

-Katie

## Re: [OT?] Power consumption

Message #31 Posted by [Lyuka](#) on 15 Oct 2007, 8:59 a.m.,  
in response to message #25 by Antonio Maschio (Italy)

Hi.

I have just measured the power supply current of several models that I have.

Isb is the power supply current while power off.

Idle is the power supply current after while power on.

Irun is measured while solving functionally equal equations in the actual application that calculate microstrip transmission line parameters.

```
Ta=26C
HP15C : Vbat =4.72V, Irun=1.2mA, Idle= 27uA, Isb<0.1uA
HP42S : Vbat =4.70V, Irun=3.3mA, Idle=380uA, Isb=8.9uA,
      (Note.32KB RAM)
HP32SII: Vbat =4.60V, Irun=1.0mA, Idle=120uA, Isb<0.1uA
HP35S : VbatL=3.00V, Irun=4.5mA, Idle= 28uA, Isb=10uA
      : VbatR=3.01V, Irun=4.5mA, Idle= 28uA, Isb=10uA
```

(I think the HP32SII is really fast with very low power consumption.)

Regards, Lyuka

## Re: A horse of a different color

Message #32 Posted by [DaveJ](#) on 10 Oct 2007, 6:47 p.m.,  
in response to message #24 by Katie Wasserman

Quote:

---

The CR2032 maximum discharge seems to be rated by at least a few manufacturers, for example: [Renata](#) lists it as 3ma [Sanyo](#) as 4ma [EEMB](#) as 3ma.

---

They are not absolute maximum figures, they are simply reference figures based on a 50% drop in usable capacity (due to the internal resistance). See Note 2 on the Sanyo datasheet which explains it. There is no threshold value at which the usable capacity of the battery starts to decrease. It is a continuous (but non-linear) degradation in capacity from no load all the way up to a dead short.

So there is nothing wrong with using 2032 cells at 4mA, you just live with whatever capacity you get. If it was only 0.4mA, you get a different usable capacity again, and yet another one for 0.04mA etc. Until you approach the ideal "nominal capacity"

The extra consumption of the 35S over the 32S is disappointing, but not surprising. Much more careful engineering went into the 32S than the 35S. The 32S used a custom ASIC optimised for low power consumption, and all assembly language for a better performance/power ratio. And no doubt similar engineering went into the LCD and other aspects.

Dave.

in response to message #22 by Katie Wasserman

Hi again, Katie:

Katie posted:

*"Perhaps it's the way I press the keys on the 35s, but I have missed keystrokes frequently -- pretty much every time I use it."*

This actually reinforces my feeling that there must be different batches some of which are defective as I've been using my HP 35s for at least 100 hours, interactively, and I haven't experienced *even a single missing keystroke*.

*"BTW, I measured the power consumption on the 35s [...] I'd estimate the run time battery life on the 35s to be around 20 hours."*

See ? Another point were your experience and mine utterly differ. As I've said above, I guesstimate that I've been using mine interactively for some 100 hours, plus another 50 hours it's been running standalone (i.e., the whole night or the whole 24-hour day) and I'm still in the original set of batteries.

Which is more, I got this machine secondhand and it came with signs of fairly heavy use and with batteries already installed in an unknown state of discharge. Guess what ? These batteries are still running perfectly fine after some 100+50 hours of my using it, give or take 20, plus an unknown number of hours they already had on them before I even turned it on for the first time.

There *MUST* exist different batches, else your experiences and mine don't make sense when confronted.

Best regards from V.

in response to message #33 by Valentin Albillo

Hello Valentin and Katie,

I would find it very useful if you could post your respective serial numbers. Perhaps we can at least determine whether they were made during the same week, or at the same factory.

-Seth

How many of those HP-35S calculators without serial numbers are there?

How can I get one?

Message #41 Posted by [Katie Wasserman](#) on 10 Oct 2007, 4:24 p.m.,  
in response to message #33 by Valentin Albillo

It could very well be that I have a defective one, it's serial number CNA 72500758, FYI.

As far as the current consumption is concerned perhaps my unit is bad as well, has anyone else reading this measured the current draw on theirs?

(I also have one late model 32sii -- the one with the horrible color scheme -- that has an excessive current draw but this is in the OFF state. It burns through the cells in 6 months of zero use.)

**Re: A horse of a different color**

Message #42 Posted by [Dave Shaffer \(Arizona\)](#) on 10 Oct 2007, 5:26 p.m.,  
in response to message #41 by Katie Wasserman

Quote:

I just measured the current draw in mine, which is one of the ones HP handed out at the conference a week and a half ago. The serial number is CNA 73400342.

I used my DVM in series with each of the batteries separately, so reading the current flow from just one cell at a time. This means the internal resistance of the battery (in this case, Panasonic CR 2032) helps limit the maximum current. I get essentially the SAME readings for each cell.

In the OFF state, the current draw is 11-12 microamps.

When turned ON, but doing no calculating, the current is between 26 and 31 microamps, with the peak reading occurring every one or two seconds. The fluctuations are very regular, and I assume they are related to some internal (housekeeping?) event which occurs regularly.

I do not have any programs stored in my calc, so I just pushed the square root button to see what happened to the current draw. I get peaks of more than one milliamp on my meter. The peaks are probably too short to properly register on the DVM, so that is the minimum current draw while performing calculations.

Katie - what were your "idle" currents? If they are the 3-4 mA you mentioned, then I, too, believe you have a defective unit. If they refer to program execution, then your and my measurements are probably consistent (i.e. my 1+ mA could well be a few mA to which the meter is too slow to respond).

If the current flow as a function of time is deemed to be of great interest, I might to be able to hook the whole thing up to a 'scope and watch the current flow on the millisecond time scale!

### **Re: A horse of a different color**

*Message #43 Posted by [DaveJ](#) on 10 Oct 2007, 8:10 p.m.,  
in response to message #42 by Dave Shaffer (Arizona)*

That sounds more like it. You have to be careful taking these measurements though, as low current ranges on DVM's can use high value series shunt resistors. Typically 1Kohm on the uA range, and 10ohms on the mA range. So it's best to use the mA or A range, but you don't get good resolution of course, but good enough for ballpark figures.

A 2032 battery has about a 20 ohms internal resistance when fresh.

Dave.

### **Re: A horse of a different color**

*Message #44 Posted by [Dave Shaffer \(Arizona\)](#) on 10 Oct 2007, 9:47 p.m.,  
in response to message #43 by DaveJ*

I was using the 3 mA range on a Radio Shack DVM, so I don't think I was seriously limiting the total current because of the shunt value. The calculator displayed and operated normally while I was reading the current. I still had three digit precision (readout to the nearest 0.001 mA, or 1 microamp), so I suspect accuracy is OK.

### **Re: A horse of a different color**

*Message #45 Posted by [Katie Wasserman](#) on 10 Oct 2007, 11:46 p.m.,  
in response to message #42 by Dave Shaffer (Arizona)*

The run-time current draw I measured was when running a tight loop program (LBL A -- GTO A). The off state and idle state currents I measured were similar to what you measured. What do you get run you run a tight loop?

*Edited: 10 Oct 2007, 11:54 p.m.*

### **Re: A horse of a different color**

*Message #46 Posted by [Dave Shaffer \(Arizona\)](#) on 12 Oct 2007, 11:35 p.m.,  
in response to message #45 by Katie Wasserman*

I had to go find my better clip leads before I could measure the current while the calculator was hard at work.

When in a tight loop (LBL A, SQRT, GOTO A), I measure 4.74 mA for each cell, measuring one at a time. (You said the cells aren't in series, but whatever circuit they have is remarkably good at producing the same current draw from either cell. I can't see any difference between the current from either cell when the calc is OFF, ON but not doing anything, or performing calculations.)

To assauge DaveJ concerns, I also did a bit of microamp current testing of my mid-grade Radio Shack DVM. I put 50k (45.8k actual), 100k (97.0k), and 470k (455k) resisters in series with a 1.5 V (1.576 V actual) D cell - after measuring the actual resistance and battery voltage with the same meter - and measured currents of 36, 18, and 5 microamp respectively with the meter on its 3 mA scale, which has a least significant digit of 1 microamp. Based on the actual resistance and battery voltage values, 34, 16, and 3.5 microamp would be expected. So, I think the values I reported earlier are accurate, except for a bias of about +2 microamps.

### **Re: A horse of a different color**

---

Sounds right. That would mean your Radio Shack DVM has a fairly standard 1Kohm shunt resistor on the uA range. You can easily confirm that by sticking your + probe into the uA jack and measuring it direct while on the ohms range.

Dave.

### **Re: A horse of a different color**

*Message #48 Posted by **DaveJ** on 10 Oct 2007, 8:21 p.m.,  
in response to message #41 by Katie Wasserman*

Perhaps a long shot, but what current range did you use? If you used the 10A range then the resolution on a typical meter will only be 1mA and can fluctuate a few counts around that. Perhaps that could explain it?

I find it hard to believe there are "defective" batches. There isn't much that can go wrong with a calculator like this. You have the battery, micro with oscillator, some simple power circuitry, a keypad and an LCD. And the microcontroller is almost certainly mask programmed, so they aren't going to be changing the code all that often.

Very puzzling.

Dave.

*Message #49 Posted by **Katie Wasserman** on 10 Oct 2007, 11:53 p.m.,  
in response to message #48 by DaveJ*

I've got a good meter, an HP 34401A, it's plenty accurate and agrees perfectly with my other good meter a Fluke 867B. I'm quite sure I have the right readings, but not at all sure if my calculator is defective or not.

### **Re: A horse of a different color**

*Message #50 Posted by **John Wasilewski** on 10 Oct 2007, 4:34 a.m.,  
in response to message #11 by Valentin Albillo*

I too had excellent experience with this calculator. That is, until I tried debugging my long program. It then behaved appallingly. Refuses to let me debug. Refuses to break out of a loop. Forces me to wipe the memory, losing all my work on this program and all other programs already keyed in and stored.

In the circumstances, knowing that it can suddenly turn nasty without reason, I dare not try to develop anything complex, long, or interesting on it.

John

**Re: Help needed NOW (real time) - stuck in a loop**

Message #53 Posted by [Egan Ford](#) on 9 Oct 2007, 3:28 p.m.,  
in response to message #1 by [John Wasilewski](#)

I powered up my 35s, pressed reset once for a split sec (hole in back) and did not lose anything but the contents of X. All programs are intact.

I wrote the following:

```
Z001 LBL Z
Z002 GTO Z001
```

Ran it and ON killed it.

I ran it again, pressed reset once for a split sec and lost all memory.

If you cannot kill it I think you will lose all your memory again.

I suggest that you prototype your application using Free42. You can write all the code in any editor and use txt2raw.pl to convert it for Free42 or EMU42. Once you have it all worked out, then key it into the 35s. It is not 100% the same RPN, but is close enough.

**Re: Help needed NOW (real time) - stuck in a loop**

Message #54 Posted by [John Wasilewski](#) on 9 Oct 2007, 3:45 p.m.,  
in response to message #53 by [Egan Ford](#)

Thanks Egan. I have just tried each of these:

```
C
Blue-shift-C
Yell-shift-C
Blue-shift-C-GTO
Yell-shift-C-GTO
Blue-shift-C-R/S
Yell-shift-C-R/S
None of them worked. Sodding thing is still looping away.
```

If no-one else comes up with any ideas I might try your idea of a split-second pin in the back.

I also like very much your idea of using an emulator for the debugging. Pathetic state of affairs, isn't it?

**Re: Help needed NOW (real time) - stuck in a loop**

*Message #55 Posted by **Egan Ford** on 9 Oct 2007, 4:38 p.m.,  
in response to message #54 by John Wasilewski*

I only write large programs for devices that I have emulators for and that will take programs from text editors. E.g. 50g, 48GX, 71B, 41CX, and 42S. I prefer the first 4 because I can go from editor directly into emulator or device. The 42S requires manual input, but its not that bad since I can use editor/emulator to write/test.

The 42S RPN is similar to the 35s RPN. I'd use that. Google for Free42 and get txt2raw.pl as well. Life is too short to key in 400+ lines more than once.

Hi John. Your trials and tribulations on the 35s sound frustrating. What's the s/n on your 35s?

Just a thought... have you tried removing the batteries, waiting a few minutes, reinserting the batteries and then resetting the 35s?

Here's a tip from educalc.net for resetting memory:

"The following procedure will total erase all the memory and program store in the HP 35s. Press the following three keys all at the same time - [C] [R / S] [i]. It correctly reset, it should show "MEMORY CLEAR" on HP35S display."

<http://www.educalc.net/1207487.page>

Good luck and regards,

John

*Message #58 Posted by **Seth Morabito** on 10 Oct 2007, 2:06 p.m.,  
in response to message #57 by John Wasilewski*

Hello John,

That is one of the lowest serial numbers I have ever seen! It almost certainly came from the first batch off the assembly line made for public purchase.

I will try out your program later today if I have time [I'm located in California, so my "today" is not the same as your "today" :) ]. I also have a calculator from the first week, SN CNA 72101944. If I have similar results, perhaps that would lend strength to the "different batches" theory. It wouldn't make it any less frustrating, of course.

Hello!

Quote:

... I have keyed in the whole 473-line program a THIRD time to test a third time. ...

I am really a patient and quiet person, but I think in your position, what I would do (and with the greatest of pleasures and satisfaction!), is the following:

I would go to the garage and fetch my anvil. Then I would go to the garage again and fetch my largest hammer (and it is really large, I used it to drive the fenceposts in). This second walk to the garage is necessary, because anvil and hammer are too heavy to be carried together, at least for me. Then I would place the malfunctioning piece of equipment quietly and delicately on the anvil. I would quietly talk to it one more time and give it ten seconds to recover from its stalled condition. If it still doesn't want to listen, a very short while later I would be the proud owner of the world's thinnest pocket calculator :-)

Greetings, Max

NB: An alternative treatment is this one, that I applied to my first Ti30 when the keyboard went completely unusable: I removed the back cover. Then I plugged two cables into the 220V (as it was then, now we have 240V which works even better) wall outlet. Then I put on protective glasses. And only then, I connected one cable to one corner of the PCB and the other cable to the opposite corner.

in response to message #1 by John Wasilewski

HI, John;

I'm willing to enter the program you listed and run it. To do so, I want to know if you have a couple of executable examples with the expected results/behavior. Would that be possible? I'll also try to follow the listings and get the expressions/equations/formulas you had used.

In a previous post, you added:

Quote:

Probably-suitable date with which to test it are:

M=100,000,000

Y=460

F=35

C=40

H=360 (over-ride suggested value)

B=300 (over-ride suggested value)

Bar diameter = 20

---

Are these still valid data? In another thread you describe the following variables and their corresponding registers:

Quote:

---

|       |  |
|-------|--|
| A     | Working storage register                       |
| B     | Breadth of beam                                |
| C     | Cover (assumed same top, bottom, sides)        |
| D     | Effective depth (depth to centre of tens bars) |
| E ??? | Previous weight of tens + comp bars ???        |
| F     | fcu  |
| G ??? | Previous weight of tens + comp bars ???        |
| H     | Depth of beam                                  |
| I     | k1   |
| J     | k2   |
| K     | k3   |
| L     | Prev comp bar size                             |
| M     | MR   |
| N     | M carried on concrete                          |
| O     | Tens bar diameter d                            |
| P     | No of tens bars                                |
| Q     | Comp bar diameter d'                           |
| R     | No of comp bars                                |
| S     | Area of tens steel                             |
| T     | Area of comp steel                             |
| U     | Gm (steel) = 1.05                              |
| V     | Gm (concr) = 1.5                               |
| W     |  |
| X     | Depth of neutral axis                          |
| Y     | fy   |
| Z     | Lever arm tens bars to centre of conc comp     |

---

Later, you follow a more complete description with some values like:

Moment of resistance  
M=40,000,000 (or maybe 100,000,000)kn-m  
Steel characteristic strength f(y)  
Y=460 N/mm2

and so. Any changes? Comments?

I'll take my two-days vacation time plus the weekend, and do some things I like the most, using calculators being one of them.

Best regards.

Luiz (Brazil)

Luis,

The data you quote from my previous postings are fine. Just be sure to over-ride the suggested section depth and width with smaller values (which will make it necessary to include compression steel), but then enter tension steel bar diameter only (leaving the program to decide on the compression steel bar diameter).

Also, please email me with your email address so that I can send you a properly formatted listing that has correct characters and is much easier to read.

NB I hope you also saw my message yesterday in which I described two small changes to the program before my most recent debugging attempt, which showed that it was stuck in a loop.

---  
John

**Re: Help needed NOW (real time) - stuck in a loop**

*Message #70 Posted by [Mark Storkamp](#) on 10 Oct 2007, 10:05 a.m.,  
in response to message #69 by John Wasilewski*

I did type your program into my 35S. I ran it per your directions, and I have not had any problem with it. The serial number on mine is CNA 72600768 in case someone knows how to decode that and tell if ours are from a different batch. I've had no strange behavior with mine other than missing and 'ENTER' or a '0' a few times (but I tend to push those in rapid succession).

**Re: Help needed NOW (real time) - stuck in a loop**

*Message #71 Posted by [Seth Morabito](#) on 10 Oct 2007, 1:56 p.m.,  
in response to message #70 by Mark Storkamp*

Your serial number indicates that your 35s was made at Chinese Factory "A" [CNA], in 2007 [7], in the 26th week of the year [26], and that it was number 768 made during that week [00768].

As soon as I have some time, I will try keying in John's program on my calculator, which came out of one of the first batches (CNA 72101944).

**Re: Help needed NOW (real time) - stuck in a loop**

*Message #72 Posted by [John Wasilewski](#) on 10 Oct 2007, 4:35 p.m.,  
in response to message #71 by Seth Morabito*

[pre] I have submitted this to HP:

HP 32sII scientific calculator e-mail support

Please verify that all the information below is correct, and then at the bottom of this page click Send to send your e-mail, or click Back to make any changes.

Select a problem area.\* hardware

When did you purchase your product?\* Sep2007

What is your serial number (SN)?\* CNA 72100255

If there is an error message, please specify. None

What is your model/product series number? HP 35s Scientific calculator

Please provide the exact problem description.\*

THIS IS NOT A REQUEST FOR HELP WITH MY PROGRAM. It is a report of a disastrous hardware fault that prevents me from developing serious software and forces me to erase all of the work stored on the calculator every time it happens. In short, when a simple bug in my program puts the calculator in an endless loop, it refuses to accept any keyboard command to

make it stop and let me find my error, and I am forced to erase all memory every time.

The HP35s scient.calculator sometimes becomes stuck in a loop which I cannot break out of. Ive tried C R/S, C+R/S, C+GTO, C+GTO+i, (from the manual) and none of these works. I have now lost all of my work THREE TIMES by having to use pin-reset, which clears everything from memory.

Ive lost three programs, one of which was 473-lines long, which I am now facing having to key in for a fourth time before I can debug it. The problem is that the calculator cannot be interrupted when stuck in a loop. This does not happen with all continuous loops but it does happen EVERY TIME with a particular piece of code. Result: impossible to debug a simple program and I lose ALL MY WORK since the beginning of time on the HP35s. Please dont reject my request with an unhelpful comment and then just ignore me.

THIS IS NOT A REQUEST FOR HELP WITH MY PROGRAM.

It is a report of a hadware fault - the calculator becomes uncontrollable unless I erase everything.

Please list previous troubleshooting steps, or information that can help HP assist you.

After having the calculator just hang for the first two times that I had to cold-reboot with the pin in teh back, I added some debug steps before trying again. Unfortunately, I used a PSE not a STOP statement, but this is why I know it is stuck in a loop. It just keeps displaying my PSE message for half a second then displaying "RUNNING" for 2.5 secs, then repeating forever, whilst refusing to let me interrupt it.

From a user-group forum, I now know that my calculator, serial number CNA 72100255, is an early one. I have learned also that the same calculator from a later manufacturing batch does not display this errant behaviour. The serial number of the "good" calculator was CNA72600768. No need to worry. The proper people will get your report.

What to do?

Return the calculator to get another by returning it to where you bought it from and exchange it for another.

*Message #74 Posted by [John Wasilewski](#) on 10 Oct 2007, 4:41 p.m.,  
in response to message #70 by Mark Storkamp*

Mark, please explain.

Do you mean the program went wrong (as it should because it is still not correct) and became stuck in a loop because of my programming error(s), and that, most importantly, you were then able to break out of the endless loop? A more detailed report would be very helpful, especially after you went to such a great effort to type in so many lines of draft code

-- John --

**Re: Help needed NOW (real time) - stuck in a loop**

*Message #75 Posted by [Mark Storkamp](#) on 10 Oct 2007, 4:58 p.m.,  
in response to message #74 by John Wasilewski*

"Do you mean the program went wrong (as it should because it is still not correct)"

I don't know what your program does, I don't know if it generates a correct answer or not. I just typed it in, and when it seemed to not give a correct answer I re-read through the listing to be sure I made no mistakes.

"and became stuck in a loop because of my programming error(s), and that, most importantly, you were then able to break out of the endless loop?"

It's never got stuck in a loop.

" A more detailed report would be very helpful, especially after you went to such a great effort to type in so many lines of draft code"

Again, I don't know the problem your program is trying to solve, but it isn't locking up the calculator.

**Re: Help needed NOW (real time) - stuck in a loop**

*Message #76 Posted by [John Wasilewski](#) on 13 Oct 2007, 3:03 p.m.,*

*in response to message #75 by Mark Storkamp*

Do you still have the code in the calculator, Mark?  
If so, could you run this test for me?

Input is prompted with M=? etc except where shown differently in the data below.

```
XEQ B
M=150,000,000 R/S
Y=460 R/S
F=36 R/S
```

At this point the program computes suggested values of H and B then prompts for user input.

Please over-ride the suggested values by reducing them by about 20% to 30%.

i.e.  
H={put in about 70% to 80% of suggested value} R/S  
D={put in about 70% to 80% of suggested value} R/S

Program will now prompt for "C,T BAR SIZES" then stop waiting for input, without a "?" prompt. It is asking for either a value in X and another in Y or just a value in X

please choose the latter and enter only this:  
20 R/S

Now watch.  
The program should enter an endless loop because of a mistake in my source code.

I need to know  
1. If it DOES enter an endless loop,  
2. Whether you can or cannot break the loop,  
3. Your serial number.

That is all.

If you are able to run this test for me then thanks in advance!

---  
John

## **My first review (was: Help needed NOW (real time) - stuck in a loop)**

*Message #77 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 10 Oct 2007, 5:37 p.m.,  
in response to message #69 by John Wasilewski*

Hi, John;

please, feel free sending me a MS Word-formatted copy of the listing:

lodata [at] quantica (dot) com {dot} br

You will surely know how to un-SPAM the e-address above, right?

About the small changes you suggested: yes, I read about them. But for the fact that the calculator locks

up, these modifications may not actually change it, they will actually update L-register contents with current Q-register contents (step #323) and allow the message 'COMP BARS' to be shown when the program is computing their value (is that correct?). In fact, as far as I could check, nothing leads to a lock-up condition.

I had some spare moments to have a look at the program listings, and I checked a couple of routines that seemed fine:

B045 - returns  $((\text{beam depth}) \times (d-d')/2) - (2 \times \text{cover})$

B057 -  $(1 \pm f_y / (700 \times G_m))$

B157 - Main program - computes K1, K2 and K3 (up to B210)

Some things that called my attention:

B020 - it reads 'Get next bar size', but it has no valid code in this particular step it.

Also, it seems to me something is missing in this particular routine. Consider that we have any valid numbers in X- and Y-register, like A (X) and B (Y). B021 compares them both ( $x > y$ ?), and program execution may jump to step #B042 (true) or follow #B023 (false). If false, '10,00' is placed in X-register, the stack lifts and A is placed in the Y-register. Step #B024 compares 10 with A; again, program execution may jump to step #B042 (true) or follow #B026 (false). If false, '12,00' is placed in X-register, the stack lifts and '10,00' is placed in the Y-register. If this point is reached, program execution always jumps to #B042 (12 in X is greater than 10 in Y), whatever value is A, given that  $A > B$ ,  $A < 10$ , and the routine will return with '10,00' in the X-register.

Steps #B290 to #B294 also need attention. Please, follow:

```
290.    x>0?
291.    GTO B292
292.    1
293.    1
294.    +
```

Whatever you have in the X-register, being it zero or not, the sequence always returns 2 in the X-register.

A little improvement. Steps #B174 to #B176, you have:

```
174.    1
175.    64.96875
176.    ÷
```

It could be shortened in one step (and use one single stack register) with::

```
174.    64.96875
175.    1/x
```

In fact, if you go further, the whole sequence (step #B174 to #B182) might be improved. From the original:

```
174.    1
175.    64.96875
176.    ÷
177.    RCL F
178.    RCL V
179.    ÷
180.    1.5
181.    yx
182.    x
```

it could be:

```
174.    RCL F
175.    RCL V
176.    ÷
177.    1.5
178.    yx
179.    64.96875
180.    ÷
```

Just an improvement, does not change the result.

I'll keep investigating tonight, but I have not yet entered the program in the calculator. There is a program in memory I'm recording, but I guess I'll do it tonight.

Best regards.

Luiz (Brazil)

---

After typing the whole program into my HP35S (thanks, John, for the formatted listing), I can fully confirm John's frustrating experience.

NO WAY to stop the running cycle but the pin-reset which clears everything. I'll type my set of short functions back but I definitely won't try to use HP35S for any longer code - no time to risk a total loss of data/code with an unstable calc (with no I/O to backup). What a shame.

Maybe others don't have problems like this which would be very interesting to know - can more other users do the test and send their experience (and S/N)?

My S/N is CNA 72100299, only 44 items from John's calc, most likely the same production day. Bought in UK by mail delivery. If it proves to be only a problem of a specific batch, I would consider returning/replacing the calc, though for me (not living in UK), the costs and troubles related to postage etc. make the warranty rather unattractive.

The recent experience, at least for me, raises very strong doubts about the HP35S:

1. The calc is far from optimal for hand calculations (Shifted STO, ENTER needs to be pressed when invoking any programmed function, R/S badly positioned far from the 'centre', cumbersome use of indirect addressing in hand calculations and more issues discussed in other posts). Probably worse than HP33S for hand calcs.
2. Keyboard layout looks more suitable for programming, BUT NOT ALLOWING RELIABLE DEBUGGING OF A LONGER CODE!

Maybe too sceptical conclusion, but a large ENTER key and a retro look is not all that matters :-( Sorry.

VQ, Prague, Czech Rep.

### HP 70 and 80 calculator???

Message #1 Posted by [Eric Fries](#) on 9 Oct 2007, 2:23 a.m.

What does the forum make of this strange looking HP 80 I recently purchased? You can view the eBay listing I bought it from at: <http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=170149889457&ssPageName=STRK:MEWN:IT&ih=007>. Thanks for your opinions.

Strange, rare or practical joke????

### Re: HP 70 and 80 calculator???

Message #2 Posted by [Dave Johnson](#) on 9 Oct 2007, 9:26 a.m.,  
in response to message #1 by Eric Fries

Somebody had parts to two calcs and combined them into one..... Maybe there is a mathematical exercise of how many different possible combinations there may be???

### Re: HP 70 and 80 calculator???

Message #3 Posted by [Allen](#) on 9 Oct 2007, 9:39 a.m.,  
in response to message #1 by Eric Fries

I would guess that the calculator is an HP80 since the nomenclature on the face most closely fits that model. You could try the button in the lower right to see what the electronics are.

```
PI  -> HP35
0   -> HP70
1   -> HP45 or HP80
R/S -> HP 55,65, or 67 (not likely)
```

The Franken-calc CLX and STO keys are probably from a HP-35, while the six orange keys are obviously from a HP-70.

### Two new articles in next Datafile issue

Message #1 Posted by [Valentin Albillo](#) on 9 Oct 2007, 6:44 a.m.

Hi, all:

The very next V26N5 September/October 2007 [Datafile](#) issue, due within a week or so, will feature two new articles o'mine, this time *wholly centered on the brand-new HP 35s calculator*, namely

- *"Boldly Going ... - Going Back to the Roots"* (7-page article)
- *"HP35s - Storing Lotsa Lotsa Numbers"* (4-page article).

Both include programs specially created for each article.

Circumstances permitting (AGM and such), the next issue after that (V26N6 November/December 2007) will further include two new articles with a cherry on top, belonging to the *"Boldly Going ..."* and *"Long Live !"* series, respectively, the cherry beeing a short 3-page article, *"Time Voyager Revisited"*

If you're interested in **HP 35s'** *advanced programming* techniques, *state-of-the-art* numerical algorithms and their implementation in HP models, as well as some fun ramblings and elucubrations, you might consider making the necessary arrangements in advance in order to get your own copies as soon as they're released.

Best regards from V.

*Edited a typo out*

*Edited: 9 Oct 2007, 7:55 a.m.*

### Vectors on 35s

Message #1 Posted by [reto](#) on 8 Oct 2007, 5:10 p.m.

Hello there.

This is my first post. I use hp rpn calculators since long and have some of them (45, 21, 41cv, 41cx, 11c, 12c, 28s, 48sx, 23sII). I also have a 20s, not rpn, but never used it.

Im looking forward to buy the new 35s, but here where I live I cant't test it, have to order it per internet.

Can someone tell me how good is the 35s for working with 2d and 3d vectors, changing them from rec to pol and so on?

And how good is it for solving linear equations systems and second degree equations?

Thank you very much for the help

Reto

### Re: Vectors on 35s

Message #2 Posted by [Meenzer](#) on 9 Oct 2007, 1:46 a.m.,  
in response to message #1 by reto

Get the [HP 33s \(!\) pdf manual](#) and read it. You'll get a pretty good impression what the 35s (!) can do, both (machines and manuals) are quite similar in many ways.

Go to [hp.com](#) and read the pdf training modules for the 35s (!) that I've linked you to about whatever interests you and find out more about that machine. Especially about [vectors here](#) as a pdf.

Vector support is limited, matrices are not supported at all, just a build in linear solver up to 3x3...

*Edited: 9 Oct 2007, 1:49 a.m.*

### Re: Vectors on 35s

Message #3 Posted by [reto](#) on 9 Oct 2007, 2:40 a.m.,  
in response to message #2 by Meenzer

Thank you for your answer Meenzer.

I already have read the pdf about vectors on the hp website. Not very useful, can't understand why they publish it, it says nothing about cross product or polar form, gives only two examples of sum and dot product.

Now I looked at the 33 manual. Looks like the the calculator itself can not do very much with vectors. If I understand in right, you have to write programs yourself for polar form, cross product, rectangular to polar

conversion and so on. Am I right?

On the 33 manual there is also a program to solve simultaneous equations. Can the 35s not solve such equations itself, I mean without writing a program?

Thank you very much

Reto

### Re: Vectors on 35s

Message #4 Posted by [Valentin Albillo](#) on 9 Oct 2007, 5:50 a.m.,  
in response to message #3 by reto

Hi, reto:

reto posted:

*" already have read the pdf about vectors on the hp website. Not very useful, can't understand why they publish it"*

Not very fair to Gene.

*"If I understand in right, you have to write programs yourself for polar form, cross product, rectangular to polar conversion and so on. Am I right?"*

More or less.

*"On the 33 manual there is also a program to solve simultaneous equations. Can the 35s not solve such equations itself, I mean without writing a program?"*

Just the 2- and 3-simultaneous-linear-equations cases, and not very convenient to use at that.

As a side comment, this machine has:

- no support for matrices or linear systems (save 2- and 3- cases)
- minimal support for vectors
- minimal support for alpha capabilities
- passable support for fractions
- decent ergonomoy and usability
- much better support for complex numbers (but still lacking in some important ways)
- good support for equations
- excellent programmability (also lacking some important features)

Best regards from V.

### Re: Vectors on 35s

Message #5 Posted by [Arne Halvorsen \(Norway\)](#) on 9 Oct 2007, 2:16 a.m.,  
in response to message #1 by reto

I belive you will be disapointed with the vector type. It has not been utilized much by the machine itself: Only absolute value, vector arithmetic between vectors and vector/scalar is provided and cross product is missing.

I \*do\* find them usefull since I am programming and as such do create new vector operations in this: [project](#).

But if you are not interested in programming with vectors you probably will be disappointed.

And the bad news does not stop: If you are going to be programming with vectors it is my experience that you will have big problems with the 'vector syntax bug'. The machine stop accepting vectors. I am almost positive this happens when one has been in programming mode and/or equation mode and return to 'user mode'. Strange magic gets you out of it. The only thing that saves this bug from render vectors useless on this machine is that it do not seem to happen when operating purely in 'user mode'.

In general see the museums HP-35s bug [article](#).

## Re: Vectors on 35s

Message #6 Posted by [Thomas Klemm](#) on 9 Oct 2007, 3:19 a.m.,  
in response to message #1 by reto

Still what I consider a cool feature is the ability to use vectors within the solver. Not as variable you solve for but as input parameters for an equation.

Here's an example:

- Points A and B define a straight line.
- Point M is the center of a ball with radius R.

Now you can solve the following equation for T:

$$\text{ABS}(A + T*(B - A) - M) = R$$

IMHO that's pretty straight forward. And the same equation can be used for 2-dimensional and 3-dimensional vectors.

## Solving for a vector variable (was Re: Vectors on 35s)

Message #7 Posted by [Valentin Albillo](#) on 9 Oct 2007, 5:28 a.m.,  
in response to message #6 by Thomas Klemm

Hi, Thomas:

Thomas posted (the underlining is mine):

*"Still what I consider a cool feature is the ability to use vectors within the solver. Not as variable you solve for but as input parameters for an equation."*

That's not exactly correct, there are cases where SOLVE can and will solve for a vector variable. For instance, in RUN mode key in this proof-of-concept example:

```
EQN  Tx5=[2,0,0]
SOLVE T  ->  T = [0.4, 0, 0]
```

which is correct; more complicated examples are possible. The rule is that SOLVE will correctly solve for a 2D (or 3D) unknown vector if it has the 2nd (and 3rd) components equal to 0. This is covered in the User's Guide, by the way.

Similar restrictions apply to solving for complex numbers: this is solvable:

```
EQN  5*T=2i3
SOLVE T  ->  T = 0.4i0.6
```

but this is not:

```
EQN 5*T*T=2i3
SOLVE T -> BAD GUESS or NO ROOT FND
```

depending on the contents of variable T and stack register X.

Not tremendously useful, but it doesn't hurt to know about it either.

Best regards from V.

## Re: Vectors on 35s

Message #8 Posted by **Walter B** on 9 Oct 2007, 6:19 a.m.,  
in response to message #1 by reto

Of the RPN calculators "available" today, a 42s would fulfill your requirements best. Please read about its features in this museum. Many members of this forum consider the 42s being the best RPN calc ever built (though it has some shortcomings, too).

The bad news: This calc is pretty expensive to get your hands on, because many people share the opinion about its value, and it is almost exclusively available on auction sites.

Based on reported sales success of the 35s, there may be another calc following it, possibly a 42s-successor, but so far this is pure speculation or wishful thinking, whatever you want to call it.

HTH, Walter

## Re: Vectors on 35s

Message #9 Posted by **John Wasilewski** on 9 Oct 2007, 3:27 p.m.,  
in response to message #1 by reto

I will be excellent, if a little slow, but that won't matter for relatively small numbers of equations. With banded symmetrical equations, I'd guess you could get up to 12 or 15 equations into it, including the half-bandwidth solver. Skyline storage or a frontal solver might do better.

It is also an excellent calculator, and I'm pleased to bits with it except for one problem. This one problem is, however, fairly catastrophic. Mine gets stuck in a loop from which I cannot break out, if my code makes it possible to do that by accident before I have finished debugging.

From your question, I would guess that, like me, you will be developing some complex software, some of which could also be quite long. Well, here's the thing. If your machine is like mine then you probably cannot develop advanced software like this. This is because, unless you can guarantee there will be no loops with bugs in them, you will not be able to debug your program without constantly losing the entirety of your work - yes, ALL OF IT - in both the current program and everything else you have also written.

The only way of brealing out of a loop, I have found, is to use a hard-reset, which clears the entire memory. Unless I do this, I can't even switch the calculator off when it gets into its stuck-in-a-loop modes.

John Wasilewski

### Wiki HP50g - 50g Basics Update

Message #1 Posted by [Eddie W. Shore](#) on 7 Oct 2007, 9:27 p.m.

This page is aimed for the beginner and/or inexperienced user - aimed to give a quick introduction to the 50g calculator. The URL is: <http://hp50g.pbwiki.com/50g+Basics?l=S>

If you want to comment or ask questions, please email me. Thanks!

Have the great rest of Sunday.

*Edited: 7 Oct 2007, 9:55 p.m.*

### Re: Wiki HP50g - 50g Basics Update

Message #2 Posted by [John \(Corvallis\)](#) on 8 Oct 2007, 1:40 a.m.,  
in response to message #1 by Eddie W. Shore

Please check the first example problem. It is shown as:  $8 + 2 * (16 \div 4) - 2$ . This evaluates to 14, not 38. Changing the expression to  $(8 + 2) * (16 \div 4) - 2$  yields 38. Or have I missed something?

### Re: Wiki HP50g - 50g Basics Update

Message #3 Posted by [Les Bell](#) on 8 Oct 2007, 1:54 a.m.,  
in response to message #2 by John (Corvallis)

Quote:

Changing the expression to  $(8 + 2) * (16 \div 4) - 2$  yields 38.

Or change the keystroke sequence to:

8 [Enter] 2 [Enter] 16 [Enter] 4 [ $\div$ ] [x] [+] 2 [-]

which would reflect the expression as written.

Best,

--- Les

Message #4 Posted by [Rodger Rosenbaum](#) on 8 Oct 2007, 3:47 a.m.,  
in response to message #1 by Eddie W. Shore

You say:

"The neat thing is that the Factorial function can accept all real numbers as well as complex ones. In fact the 48 series, 49 series, 50g, 33s, and 35s does this. Just make sure x is not a negative integer."

The 48 series has only the factorial (!) function, and it does not accept complex arguments. And even in the later machines, the "!" function doesn't accept complex arguments; on my HP49G+ and HP50G, it's the "gamma" function that does.

### **Re: Wiki HP50g - 50g Basics Update**

*Message #5 Posted by [Eddie W. Shore](#) on 8 Oct 2007, 9:46 a.m.,  
in response to message #4 by Rodger Rosenbaum*

Thank you Rodger, John, and Les:

The edits have been made, and I appreciate the feedback. (Keep it coming)

As far as the factorial section, I changed it say "it can accept all real numbers" and nothing else.

Hi Eddie,

Nice page. Just a couple of things I notice. Concerning the reciprocal key, it divides the number into 1, not by 1. Also, you may want to mention that if there is a command line present, the action will be performed on it (rather than on level 1).

Best regards, Hal

### Trivia quiz and mini-challenge: Classic HP35

Message #1 Posted by [Allen](#) on 7 Oct 2007, 11:57 a.m.

Two quick quizzes for your Sunday pleasure:

1. Who bought the first HP 35 when it was first released in 1972?
2. Sometimes you will see a calculator display read:

123456789

as proof that the keyboard is working. But there is more than one way to get the calculator to display this. What keystroke sequence (on the HP35 or HP35s) provides the FEWEST number of keys used. Obviously there are two easy answers:

1. (1 key) Press Sigma+ 123 Million times, or
2. (9 keys) Press the numbers in 1-9

is there another way??

### Trivia quiz and mini-challenge: Classic HP35

Message #3 Posted by [Paul Dale](#) on 7 Oct 2007, 5:19 p.m.,  
in response to message #1 by [Allen](#)

I'm not sure of the sequence that requires the fewest keystrokes, I've not thought up anything shorter than keying in the digits.

What might be more interesting would be a practical method (i.e. at most a couple of hundred keystrokes) that uses a minimum of \*different\* keys to get the number 123456789 on the display. I.e. what minimal functionality is required in order to get this display.

Off the top of my head, I can think of a simple algorithm that requires four different functions / five different

keys (need that shift). To get the '1' digit do something like:

```
CLx
orange shift 10^x
ENTER
ENTER
+
ENTER
+
ENTER
+
+
orange shift 10^x
```

Repeat similar sequences for the other digits and add them together. I think I could replace the shift 10^x sequence with a CLx, COS, +, ENTER, y^x series but this doesn't reduce the number of different keys which have to function and would increase the length significantly.

I'm sure somebody here can do better...

- Pauli

### Re: Trivia quiz and mini-challenge: Classic HP35

Message #4 Posted by [Gerson W. Barbosa](#) on 7 Oct 2007, 5:57 p.m.,  
in response to message #3 by Paul Dale

On the HP-35, the best I was able to come up with was this 10-key sequence:

```
10
ENTER
x^y
91
-
81
/
```

Simpling typing 123456789 is still better...

Gerson.

### Re: Trivia quiz and mini-challenge: Classic HP35

Message #5 Posted by [Paul Dale](#) on 7 Oct 2007, 6:07 p.m.,  
in response to message #4 by Gerson W. Barbosa

You mean  $y^x$  instead of  $x^y$  I hope :-)

This sequence is one operation shorter but the same number of keystrokes:

```
10
10^x
91
-
81
/
```

- Pauli

### Re: Trivia quiz and mini-challenge: Classic HP35

in response to message #5 by Paul Dale

Quote:

\_\_\_\_\_

You mean  $y^x$  instead of  $x^y$  I hope :-)

No, on the classic HP-35, that's the way it is!

Unfortunately it also lacks  $10^x$ . Anyway, your sequence is great on the newer HP-35S.

Regards,

Gerson.

**Re: Trivia quiz and mini-challenge: Classic HP35**

*Message #7 Posted by **Paul Dale** on 7 Oct 2007, 6:24 p.m.,  
in response to message #6 by Gerson W. Barbosa*

Oops, somewhere between between reading the question and attempting to solve it, I slipped from a 35 to a 35s :-( My earlier algorithm is also wrong for a 35.

- Pauli

**Re: Trivia quiz and mini-challenge: Classic HP35**

*Message #8 Posted by **Allen** on 7 Oct 2007, 8:07 p.m.,  
in response to message #3 by Paul Dale*

Quote:

\_\_\_\_\_

I'm not sure of the sequence that requires the fewest keystrokes..

\_\_\_\_\_

Not necessarily looking for the fewest keystrokes, but the fewest number of working keys. E.g.

81  
+  
91  
+

would be 4 different keys: +,1,8 and 9.

**Re: Trivia quiz and mini-challenge: Classic HP35**

*Message #9 Posted by **Paul Dale** on 7 Oct 2007, 8:26 p.m.,  
in response to message #8 by Allen*

huh?

That sequence doesn't seem like it would work properly... Does it?

However, here is a sequence that only requires three working keys and 83 keystrokes:

1  
ENTER + 1 +  
ENTER + 1 +  
ENTER +  
ENTER + 1 +  
ENTER +

```
ENTER + 1 +  
ENTER + 1 +  
ENTER +  
ENTER + 1 +  
ENTER + 1 +  
ENTER + 1 +  
ENTER + 1 +  
ENTER +  
ENTER +  
ENTER + 1 +  
ENTER + 1 +  
ENTER +  
ENTER + 1 +  
ENTER +  
ENTER +  
ENTER +  
ENTER + 1 +  
ENTER +  
ENTER + 1 +  
ENTER +  
ENTER + 1 +
```

You can get rid of the single numeric (1) keystrokes and use CLx, COS and extra ENTERs appropriately.

To understand what I did, take the binary expansion of 123456789 and read the bits left to right.

- Pauli

How about:

987654321

9

-

8

/

I started with a number that is the reverse of 123456789.

Also,

1111111111

10

-

9

/

Namir

*Edited: 7 Oct 2007, 9:05 p.m.*

### Re: Trivia quiz and mini-challenge: Classic HP35

Message #13 Posted by [Paul Dale](#) on 7 Oct 2007, 9:30 p.m.,  
in response to message #1 by Allen

Another almost solution at 7 commands:

5

10<sup>x</sup>

9

/

x<sup>2</sup>

1

-

To avoid the "10<sup>x</sup>", use: "EEX 5 ENTER" instead of the first two lines. Likewise, replace the "x<sup>2</sup>" with "ENTER \*"

Eight keystrokes on my 15c, no idea on the 35. Looks okay in FIX 0 mode.

- Pauli

### Re: Trivia quiz and mini-challenge: Classic HP35

Message #14 Posted by [Paul Dale](#) on 7 Oct 2007, 9:32 p.m.,  
in response to message #13 by Paul Dale

Change the final '1' to '1.1' to remove the dependency on the display setting at the cost of two additional keystrokes. This puts us more than typing the number in directly :-)

- Pauli

How about:

3 ENTER x 3803 x 3607 x

Thirteen keystrokes, seven different keys, only five working digit keys.

Stefan

**Re: Trivia quiz and mini-challenge: Classic HP35**

*Message #19 Posted by [Stefan Vorkoetter](#) on 8 Oct 2007, 2:02 p.m.,  
in response to message #18 by Stefan Vorkoetter*

Or the slightly shorter:

9 ENTER 3803 x 3607 x

Twelve keystrokes, but eight different keys of which six are digit keys.

**Re: Trivia quiz and mini-challenge: Classic HP35**

*Message #20 Posted by [Namir](#) on 8 Oct 2007, 3:26 p.m.,  
in response to message #1 by Allen*

Enter the number as the hexadecimal:

75BCD15h

And then convert it to the decimal. Still not less than 9 keys.

And another method. Store 1E9 in register A and then repeat:

```
RCL A
ENTER
<RS> RAND
*
+
```

You are generating random numbers between 1E9 and 2E9. A lucky random number will give you 123456789. The process uses 7 keys.

These keystrokes test how touch the keyboard is!!

**Re: Trivia quiz and mini-challenge: Classic HP35**

*Message #21 Posted by [Stefan Vorkoetter](#) on 8 Oct 2007, 3:33 p.m.,

We are having fun with this problem. Not adhering 100% to the rules is part of the fun.

If we want to get serious, this challenge is downright meaningless!! But like I said, we are having fun.

Namir

*Edited: 8 Oct 2007, 4:50 p.m.*

## Re: Trivia quiz and mini-challenge: Classic HP35

Message #23 Posted by **Paul Dale** on 8 Oct 2007, 3:46 p.m.,  
in response to message #1 by Allen

Finally got one that is less than nine keystrokes on a 15c. Not applicable to a 35 though.

A total of 7 commands, 8 keystrokes and 7 working keys required:

```
9
ENTER
10x
delta%
9
0
/
```

There are plenty of other ways to produce the 90 if we're in degrees mode (e.g. 0 COS<sup>-1</sup>; 1 SIN<sup>-1</sup> or ENTER TAN<sup>-1</sup>).

- Pauli

## Re: Trivia quiz and mini-challenge: Classic HP35

Message #24 Posted by **Namir** on 8 Oct 2007, 4:52 p.m.,  
in response to message #23 by Paul Dale

Your solution also works with the HP-41C/CV/CX. Good show man!!

Namir

## (Spoiler) Trivia quiz and mini-challenge: Classic HP35

Message #25 Posted by **Allen** on 8 Oct 2007, 5:12 p.m.,  
in response to message #23 by Paul Dale

Wow! Excellent submissions!!

1. Jake definitely got the award for the first part. He found the source of the trivia. HP Keynotes reports that a Professor R.J. Donnelly of the University of Oregon purchased the first production HP35, which as of 1982 is not in use, rather kept in a Bank box for safe keeping.
2. The part 2 award goes to Pauli for both the number of solutions and for the solution with the fewest KEYS needed to create the display:

```
123456789
```

Namir's submission was the closest to my original solution requiring 4 keys, but Pauli managed to find a solution with only 3 keys!!! EXCELLENT! My original 4-key solution could be done a few different ways, but the general formula, starting from a cleared stack (this can be done without pressing any buttons) is:

```
11111111111
-
-
1
-
1
-
1
-
-
```

```
1
-
1
-
1
-
1
-
1
-
1
-
1
-
9
/
```

Four keys: 1,9,[-] and [/]. This could also be done with (4444444444-40)/6/6 using 4 keys:4,6,[-],and [/].

## Re: Trivia quiz and mini-challenge: Classic HP35

Message #26 Posted by [Paul Dale](#) on 8 Oct 2007, 6:00 p.m.,  
in response to message #23 by Paul Dale

And of course if we're after a display of 1234567890 we can use this sequence which is one keystroke shorter but again not good for a 35 (6 commands, 7 keystrokes, 6 working keys on the 15c):

```
9
ENTER
10x
delta%
9
/
```

If we're happy with 12345.6789 displayed FIX 4 there is this one again for the 15c (6 commands, 10 keystrokes, 9 working keys):

```
9
ENTER
TANH
CHS
delta%
x2
```

- Pauli

### First Impression of HP 35s

Message #1 Posted by [DavidB](#) on 7 Oct 2007, 1:37 a.m.

Hello all,

I've been visiting HP Museum for about a year now. I enjoy this site because I have been using HP calculators for about 22 years. For the past week, I have been thinking a lot about HP calculators - mainly because of the 35s. Here is my 1st impression of the new calculator from HP.

When I found out about the new HP 35s, I knew I had to get one, even though my HP 32sII works just fine. My first HP calculator was the HP 15C, built like a tank and very practical in use. It was the best engineering calculator in the 80's. However, I lost that calculator many years ago.

Although I missed the HP party in San Diego, CA, I purchased the 35s as a sort of "thank you HP" for several reliable, high quality precision tools that they had created through the years. I just received the 35s this week. The key layout reminds me of the older C series calculators and is a positive improvement over the cluttered 32sII key layout. If there is one change I could make on the keyboard layout, it would be to have a separate STO key. To my eyes, the annunciators seem a bit too small on the display. Also, the 35s LCD screen has more reflections than the screen on my 32sII; with indoor lighting, it is more difficult to see the numbers on the 35s.

I'm not sure how to benchmark calculators; however, during some calculations, such as  $nCr$  ( $n=800$ ,  $r=400$ ), my 32sII found the result faster than the 35s. Other times, such as integration of the bessel function with  $x=2$ , the 35s was slightly faster. Again, these were subjective tests, nothing scientific about them.

I doubt I will use the 35s to its full capability (i.e. programmable features), unless I catch the RPN programming bug. Despite my display preferences, I hope the 35s sells well and will encourage HP to design future calculators with the same user-centered design approach and reliability that they have been famous for.

The 35s is a well thought out machine. I like the case that is supplied with it. The manual appears thorough (similar to the 32sII manual) and contains some errors in grammar and details. I wished HP had provided an electronic copy of the manual on the "bonus" CD video. Perhaps it will be available on the HP website.

The last time I was excited about a calculator was when I purchased a 15C in 1985. I'm glad I purchased this new 35s and am looking forward to future scientific/engineering RPN calculators from HP.

Sincerely, David Bailey, graduate student, Industrial and Systems Engineering Virginia Polytechnic Institute and State University, Blacksburg, VA

Welcome David, Hopefully you will be with us for a long time.

The cover of the 35s is the best one ever. However, you are right about the STO key. Also, the Polar/Rectangular conversions we have to perform ourselves. Overall, I am impressed.

All of the attendents received a 35s (Thank you HP!), and since I have one, one of my goals is to make someone else the 2nd person at the Cal Poly Pomona campus to have one. (I'm sure I am the first).

The hard cover that is on the calculator case.

### Re: First Impression of HP 35s

Message #5 Posted by **DavidB** on 7 Oct 2007, 1:50 p.m.,  
in response to message #2 by Eddie W. Shore

Hi Eddie,

I'm sure whoever will get your 35s will greatly appreciate it. On the 35s, HP placed the Polar  $\leftrightarrow$  Rectangular conversion functions within the DISPLAY menu. On the 32sII, the conversion functions are placed over the numerical 4 key. I find the Polar/Rect conversions on the 35s are just as easy as on the 32sII. On the 35s, if I want to convert polar coordinates (25 degree, 15) to rectangular (x,y), press the following keys:

15

right-shift (blue) key

Theta

25

left-shift (yellow) key

DISPLAY

xiy (selection 9)

ENTER may be required depending on how you select in the menu

The (x,y) coordinate is (13.5946, i6.3393) in degree MODE. The conversion on the 32sII is similar except there is no menu to use. I like the way complex numbers are shown on the 35s. I have to use the X exchange Y key on the 32sII to see the imaginary part.

Clarification: By reflections of the LCD screen on the 35s, I mean the glossy look of the screen. Placed at certain angles, the 35s screen is overwhelmed by the light source, hence, obscuring my view of the display information. The LCD screen of the 32sII is not glossy and does not reflect as much light into your eyes;

yet, the information is just as viewable as on the 35s.

Cheers,  
David Bailey

- *Q: I am curious. In addition to the 35s, what other hand-held RPN scientific calculator does not have a separate STO (or RCL) key?*
- *A: The third generation 28c, 28s, 48/49/50 series.*

Ah, but RCL is shifted in the RPL-based models, while STO is shifted on the HP-35s. Why is that?

Answer: RCL is often unnecessary in RPL, as ENTER or other operation will recall a named variable.

In RPN, STO need be used only once for storing a given value to a register, while RCL might be used many times.

Hi Allen and KS!

Thanks for your response. I am curious, though, about non-RPL, non-graphing HP calculators. Is the 35s perhaps the first RPN without a dedicated STO (or RCL) key?

Cheers!  
David Bailey

\_\_\_\_\_

As far as I see it is the first RPN scientific with less than 2 keys for STO/RCL. It is also the first RPN scientific with a shifted STO. For financial calcs, other members are more competent.

Enjoy, Walter

\_\_\_\_\_

Mine has a "shifted" STO key.

<http://www.alternatezone.com/stuff/sneakpeak2.jpg>

Given that there is no shift key, you simply press the button a 2nd time to access STO. Works very well indeed, and I think it's actually more intuitive than a shift key anyway.

Dave.

I don't want to give away major details just yet, but I'm fairly certain I'll make a

kit available, perhaps partially assembled, and maybe even fully assembled (but that would cost a lot more). Also, full design details will eventually be released. So the watch you see there will be available for those who are keen enough to own one. More news in the coming months.

*Message #19 Posted by [Karl Schneider](#) on 7 Oct 2007, 2:39 p.m.,  
in response to message #1 by DavidB*

Welcome, David --

I'll echo Eddie's greetings.

You've made a few accurate and widely-accepted observations about the HP-35s. I share most of your sentiments.

The shifted STO key is indeed a small annoyance -- a compromise driven by the limited supply of 43 keys, as four were dedicated to moving the cursor, one to "i", one to "EQN", and one to "()".

The speed issue has been discussed -- the HP-35s is indeed a bit slower than its predecessors HP-33s and HP-32SII. The HP-35s uses the same CR2032 3V "wafer" cells as the HP-33s, which experienced abysmal cell life. It's possible that some changes were made to remedy the problem.

The faster numerical integration you observed is probably due to the problem chosen and the accuracy you selected. The HP-35s methods are the same as those of the HP-33s, which differ slightly from those of the HP-32SII, even though the syntax is exactly the same. Here's more than you may have wanted to know about numerical integration in HP's RPN calculators:

KS,

Thanks for the information. I wonder what the clock speed is of the 8502 processor in the 35s. The 33s uses a Sunplus SPLB31A running at 5Mhz, according to <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=63140>

As others have discussed on this forum, the HP 35s overall keyboard layout design approach seems to focus more on programmability functions than on direct input/output calculation. Maybe (just maybe) the 35s will encourage me to start programming it. I only recall programming the 15C many years ago, but not on any other HP calculator.

The 35s is my first calculator that uses the 3-volt lithium coin batteries. Perhaps an OLED display will someday enhance battery life (and display clarity) for HP calculators?

*Message #22 Posted by **vq** on 7 Oct 2007, 2:41 p.m.,  
in response to message #1 by DavidB*

I bought HP35S a month ago, more or less for its nice retro look and improved memory usage (compared to HP33S which I used until now). From my point of view (civil engineering, bridge design practice), the pros and cons of this calc are as follows:

Keyboard Nice retro shape, good key response. Bad positioning of some frequently used commands to shifted keys and vice versa: - STO,  $x^2$  used very often but placed on shifted keys - GTO, "i" seldom used, these could be on a shifted position (well, "i" is possibly more used in electrical calculations? - then the position is fine) - R/S quite frequently used, much more than EQN; R/S should be closer to the numeric keys block, possibly at EQN position?

Display Quality is good, appears the same as on my HP33S (#CNA 51500563) which was described as very bad by some people here (probably older models than mine 33s). Totally wrong behaviour when showing "ALL" with Exx part of the number out of display - HP33S works slightly better here.

Memory usage is much better, only now the 30 kB RAM can be really used (much better than HP33s). However, while the access to the variables 1--800 by indirect addressing is fine when programming, it is very slow when used in hand calculations. I would like additional set of RCL() and STO() keys which would ask for the address rather than for the label. This way, the sequence "123 STO I RCL (I)" could be replaced by much shorter "RCL() 123" (or, maybe better "123 RCL()").

Also, the nice possibility of addressing label AND line number slows down normal hand calculations - one HAS to run program A001 with XEQ A and ENTER which is annoying. On other calculators (e.g. the old TI59, the superb old SHARP PC-1211 very well described in <http://membres.lycos.fr/albillo/calc/pdf/DatafileVA027.pdf>, CASIO FX-602P etc.) one could define a function and run it just by pressing a function key (one keypress); on HP33s, it's XEQ A (two keys), which is still fine; on HP35S, three keys are too many. This may seem to be a negligible issue, but when running a (trivial) program many times, it's not pleasant at all.

Minor flaw: Pressing just E3\* results in "Syntax error" while on 33S it was OK. Now one has to (remember to) enter 1E3\*.

Overall, HP35S is really a nice piece of hardware - a "must have" for many users. However, as most complex and programmed calculations are done on a PC now, the calc should be designed with more priority for quick hand calculations.

VQ, Prague, Czech Republic

Message #23 Posted by [DavidB](#) on 7 Oct 2007, 3:54 p.m.,  
in response to message #22 by vq

VQ,

Thanks for your very thorough observation of the 35s. I, too, like the retro look of the keyboard - reminds me of my beloved 15C. I don't program calculators, but I see what you mean concerning the extra keystroke, ENTER, required on the 35s compared to your 33s.

Concerning the powers of ten E key, I guess HP had decided to standardize its use even if the mantissa is 1. That's ok as long as the E key works the same on near future RPN calculators and is well documented.

I understand what you mean concerning the SHOW key. Only HP can answer why the display does not also show the exponent when you perform the following:

- (1) enter an integer larger than 999,999,999,999 or smaller than -999,999,999,999;
- (2) press left-shift key;
- 3) press SHOW.

Cheers,  
David Bailey

- 

David, what's even worse, in mode Display/All, pressing 4 ENTER 9 / shows only 4.4444444444E- (and a little annunciator - right hand arrow), hiding the (most?) important part of the result, which makes the "Display/ALL" mode practically unusable. It was discussed here in an earlier thread and is a bitter innovation over HP33S. Fixed notation is therefore much better for normal work. I wonder if the designers ever tried to do some calculations with ALL mode set? Regards, VQ

### Re: First Impression of HP 35s

Message #25 Posted by **DavidB** on 7 Oct 2007, 7:05 p.m.,  
in response to message #24 by vq

You are correct, VQ. It is a bit annoying. With both the 32sII and 35s in display ALL mode, the irrational number pi is displayed with 12 digits:  
3.14159265359

When I perform a division such as 1 divided by 3, the 32sII shows the repeating fraction with a 9 digit mantissa, followed by the letter E, a negative sign, and exponent value 1:  
3.33333333E -1

However, with the 35s, this same fraction is shown with a 12 digit mantissa, the letter E, and negative sign:  
3.33333333333E - (rest is cut off)

Blunder or intentional by HP?

David Bailey

### MCODE utility Programs

Message #1 Posted by [Jeff Davis](#) on 6 Oct 2007, 4:11 p.m.

I have been looking over many issues of the PPC Journal and the Datafile as well as reading MCODE for Beginners. I have found some general utility functions that I have added that can assist while using MCODE. HEX-OCT, OCT-HEX (from MCODE for Beginners), ASRCH (from Datafile V8N2 used with the labels ROM), ROMSUM (from Datafile V3N1 and I tried to get the "CALC" MCODE program to work but there must be some typo's in the code from Datafile V8N6.

Are there any other utility type programs that you may have used that assist with MCODE generation?

I am Currently using the DAVID-2C with Mainframe Labels.

Has anyone ever tried to get this "CALC" program to work?

This program calculates the Jump distances much like the User Code program in the HEPAX manual.

Please let me know your thoughts.

Thanks much,

Jeff

in response to message #2 by [Jeff Davis](#)

Hi Jeff,

Exactly what type of data and when? I ask when because there are some auto-prompts at entry. Mcode for Beginners covers these and devotes a large section to a hex data input function.

Best

### Re: HP-41 MCODE Programming

Message #4 Posted by [Jeff Davis](#) on 14 Oct 2007, 11:58 a.m.,  
in response to message #3 by [Doug](#)

Thanks for all who responded. I am trying to write a MCODE program to calculate the inductance of a coil. There are three inputs, Coil Length, Coil Diameter and Number of turns on the coil. I have tried using some of the technics in the MCODE for Beginners that are used on the OCT-HEX and HEX-OCT programs. The best I can get is the Prompt to Flash in the display but it does not R/S. Below is the listing for this. I have found the PROMPT function in the VASM and it uses the XPROMP routine which prompts and R/S. I will be trying this this evening to see if this works. My goal would be to

load directly to C and not have to use READ 3(x) to get the data to C. I would like the program to R/S with , for example, Coil Lg.? in the display. Then accept the number entered like 1.500" or 1.750" similar to the User Code PROMPT. Any way, thanks for responding and any suggestions would be greatly appreciated.

## Re: MCODE utility Programs

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 10 Oct 2007, 1:28 a.m.,  
in response to message #1 by Jeff Davis*

Hi, Jeff;

the only info (I think) I can add is to have a look at the AECROM listings and technics. I remember reading in the MCODE for beginners that a user-coded program may be 'disguised' as MCODE (function), so the calculator executes it as a function, although it behaves as a running program. If there is no restriction to what functions to use, data might be input thru PROMPT, I guess. Have no idea of what would happen if [PRGM] is pressed while the 'disguised' program is stopped. I mentioned the AECROM because some of its functions seem to be coded this way.

My 2¢ (maybe 1¢...)

Luiz (Brazil)

### TI NSpire now supports user programs

Message #1 Posted by [Don Shepherd](#) on 6 Oct 2007, 9:54 a.m.

The latest operating system now supports user-defined programs in addition to user-defined functions. Lack of programming capability was a major deficiency of the original NSpire. It looks like they listened to those who complained.

### Re: TI NSpire now supports user programs

Message #2 Posted by [Namir](#) on 6 Oct 2007, 12:31 p.m.,  
in response to message #1 by Don Shepherd

Thank you for the update Don. I just updated one OS of one TI NSpire CAS calculator, and working on updating the second one!

Looks like TI also updated the manuals for the calculator.

So, what do the programs look like? Is it a TI-specific language? Something akin to BASIC?

thanks, bruce

(btw, Don, I'll get back to your email shortly... ;-)

### Re: TI NSpire now supports user programs

Message #4 Posted by [Don Shepherd](#) on 6 Oct 2007, 7:17 p.m.,  
in response to message #3 by Bruce Bergman

It's a lot like BASIC, or TI-BASIC. Here is our HCC2007 programming contest (rearrange the digits of an input number into numerical order) done on the NSpire:

```
Define rev_digits(num)=Prgm
:Local i,a,n
:a:={ }
:For i,0,iPart(log(num,10))
:a:=augment(a,{mod(intDiv(num,10^(i)),10)})
:EndFor
:SortA a
:n:=0
:For i,1,dim(a)
:n:=n+a[i]*10^(dim(a)-i)
:EndFor
```

```
:Disp n  
:EndPrgm
```

I just get each digit of the input number and store it in a list, then sort the list, then convert the list items back into an integer number.

hi Don,

for comparison, here's the same problem in LUA on the 50g,

```
function sortNum(n)  
  a = {tostring(n):byte(1,-1)} -- unpack unto array  
  table.sort(a)  
  return tonumber(string.char(unpack(a))) -- pack back and return  
end
```

in response to message #6 by hugh steers*

Very compact code, Hugh, thanks. Is LUA an add-on language to the 50g? I'm not familiar with it, but then I'm not really an RPL guy.

### **Re: TI NSpire now supports user programs**

*Message #8 Posted by [hugh steers](#) on 7 Oct 2007, 6:45 p.m.,  
in response to message #7 by Don Shepherd*

hi don,

"not an RPL" guy", i'm with you there. although i like RPN, ive always found RPL clumsy and almost totally unreadable.

you might like to try your hand at lua on the 50g. get my latest release at:

<http://sourceforge.net/projects/hplua>

should be hplua-1.0.1.zip. this contains the source code, but all you need is the ARMTtoolbox and the flua.hp program. once loaded you can try some of my samples like sunset.lua and sudoku.lua

also checkout [www.lua.org](http://www.lua.org) for the language reference and also the book, "Programming in Lua,

Second Edition (Paperback) by Roberto Ierusalimschy", is highly recommended.

good luck!

**Re: TI NSpire now supports user programs**

*Message #9 Posted by [Don Shepherd](#) on 7 Oct 2007, 8:59 p.m.,  
in response to message #8 by hugh steers*

Thanks, Hugh. I don't have a 50g (there was a door prize of same, but they didn't call my number early enough!). I will check out that book, however, as I am intrigued by how such a small bit of code can do what it does. Very nice.

**Re: TI NSpire now supports user programs**

*Message #10 Posted by [Don Shepherd](#) on 7 Oct 2007, 8:50 a.m.,  
in response to message #3 by Bruce Bergman*

There is a significant omission from the BASIC instruction set on the NSpire: the Input command. From what I have read, I think this was done on purpose. TI apparently wants the NSpire to be strictly an educational tool, not a "gaming" machine with interactive inputs. Without an Input command, kids who are supposed to be learning the characteristics of a right triangle will not be playing Legends of Doom instead. This is probably the reason that only functions were originally supported.

The only way to provide inputs to your program is to pass them as arguments when you run the program. Hey, that's how FORTRAN worked on the Univac 1108 when I started programming in 1974!

**Re: TI NSpire now supports user programs**

*Message #11 Posted by [Namir](#) on 7 Oct 2007, 9:15 a.m.,  
in response to message #10 by Don Shepherd*

I checked the Reference Manual of the TI nspire and, you are right, there is no Input statement!!!!

Having not gone over the entire Reference Manual yet, can you access individual matrix elements using [row,col] or (row,col)?

Namir

**Re: TI NSpire now supports user programs**

*Message #12 Posted by [Don Shepherd](#) on 7 Oct 2007, 9:17 a.m.,  
in response to message #11 by Namir*

I believe so. I have not done a matrix yet, but you access individual list entries like this: if list a = {1, 2, 3, 4}, then a[3] = 3.

**Re: TI NSpire now supports user programs**

*Message #13 Posted by [Namir](#) on 7 Oct 2007, 9:19 a.m.,  
in response to message #12 by Don Shepherd*

Thanks!!

BTW in the HHC2007 group picture I appear right behind you in the line of vision!!! I hold in my hands my new HP-35s and an early version of the HP-41C that my son's university was

willing to retire in my care. Thank you NAU!!!

:~)

I'm 99.99% certain that FORTRAN IV on the 1108 supported input files.

### **Re: TI NSpire now supports user programs**

*Message #15 Posted by [Don Shepherd](#) on 8 Oct 2007, 7:26 a.m.,  
in response to message #14 by Eric Smith*

Yeah, that's true. I meant interactive input with a live user. In those days of mainframes only, it was all file processing.

### **Re: TI NSpire now supports user programs**

*Message #16 Posted by [Eric Smith](#) on 8 Oct 2007, 5:05 p.m.,  
in response to message #15 by Don Shepherd*

The 1108 supported interactive terminals (e.g., model 33 or 35 Teletypes, Univac DCT 500 or 100, or Uniscope 100 or 300), which could be opened as files. Your site may not have had any, but it wasn't a fundamental limitation of the computer or software.

There was even a "Conversational Fortran V" for it.

### **Re: TI NSpire now supports user programs**

*Message #17 Posted by [Don Shepherd](#) on 8 Oct 2007, 5:58 p.m.,  
in response to message #16 by Eric Smith*

Eric, I worked on that Univac 1108 as my first programming job in 1974 at the US Census

Bureau in Suitland Maryland (just outside Washington DC). In those days, we punched our FORTRAN program source code on punch-cards, submitted a batch job overnight to compile the program, and came back the next day to see how many errors we had. Those were the days! Then came the model 33 teletypes, then came the DCT interactive terminals. But the 1108 was never as good at interactive things as it was at batch things. The Census Bureau was a huge file processing organization. All of our programs were designed to read tape files, update the data with various transactions, and write back out onto tape. I forget the tape density, but I think it was 6250 bpi when I left the Bureau around 1983. A file for the whole US might be 100 tapes.

Since our applications did so much IO, the Bureau system guys wrote their own IO system that all us programmers used, called CENIO. It was (supposedly, I never doubted them though) much faster than standard FORTRAN IO.

In those glory days before the personal computer, we never imagined that anyone could actually have and use a computer at home. How times have changed.

### **Re: TI NSpire now supports user programs**

*Message #18 Posted by **Bruce Bergman** on 8 Oct 2007, 6:55 p.m.,  
in response to message #17 by Don Shepherd*

This was my experience also. Big fat decks of cards, HOPEFULLY numbered so that the inevitable "whoops!" didn't cause 52-card-pickup (or in some cases, 1052-card-pickup :-), and data was provided inline or in a separate deck. I was lucky if the results came back the next day; it usually took a day or so to get my job run. That was, after all, the value in desk checking your program -- you didn't want to have to resubmit it because you screwed it up somewhere.

I didn't even see "real" input methods until the paper tape machine came along. I could feed my program in again and again after meticulously punching the tape the first time. Back then, the paper tape seemed like MAGIC compared to decks of Fortran cards. ;-)

Ah, how quickly we take technology for granted these days...

thanks, bruce

*Edited: 8 Oct 2007, 6:58 p.m.*

### **Re: TI NSpire now supports user programs**

*Message #19 Posted by **Eric Smith** on 8 Oct 2007, 7:19 p.m.,  
in response to message #17 by Don Shepherd*

My point is that Fortran on the 1108 was certainly capable of both:

- use of interactive terminals
- data input from various sources, including interactive terminals

Sure, it was better at batch, and that was how most people used it, but it wasn't the only possibility. The Executive had support for interactive use before 1970, though I'm not sure exactly when it became available. I didn't use an 1100 series machine until the early 1980s, so I'm not as well-versed in its history as the DEC machines.

Quote:

---

I forget the tape density, but I think it was 6250 bpi when I left the Bureau around 1983.

---

Sounds about right. The switch from 800 bpi NRZI to 1600 bpi PE occurred in the early to mid 1970s, and 6250 bpi GCR became available in the late 1970s. Some vendors offered 3200 bpi (PE?), but it wasn't a standard and never caught on. (Before 9-track tape there was 7-track at 200, 556, or 800 BPI.)

### A serious bug on HP 35s

Message #1 Posted by [Marcel Pelletier](#) on 5 Oct 2007, 3:43 p.m.

First, type in this short program:

```
A001 LBL A A002 10 A003 STO I A004 1 A005 STO(I) A006 0.01 A007 STO I A008 VIEW(I) A009 ISG I
A010 GTO A008 A011 RTN
```

If you press XEQ A ENTER, you will see the content of the 10 registers create with a zero value. At each stop, you have to press the R/S key...BUT if you want to automate this, enter a PSE instruction after the VIEW(I) like this...

```
... A008 VIEW(I) A009 PSE ...
```

and now if you press XEQ A ENTER you will see...

```
(27)= 0.0000 (28)= 0.0000
```

So it like the count of the register have change!

You view (27) but in fact this is (0)...

So what's up Doc?

### Re: A serious bug on HP 35s

### Numerical Recipes 3rd Edition is Here!!!

Message #1 Posted by [Namir](#) on 5 Oct 2007, 7:13 a.m.

UPS finally dropped off the latest edition of Numerical Recipes, which I consider the Bible for numerical analysis. While the C++ code is in a more object-oriented form than the second edition, it offers a very good insight on how algorithms tick! One can translate the C++ into BASIC, RPN, RPL, and so on with various degrees of ease or difficulty.

It would be nice to have a MatLab version of the Numerical Recipes.

Namir

### Re: Numerical Recipes 3rd Edition is Here!!!

Message #2 Posted by [hugh steers](#) on 5 Oct 2007, 8:11 a.m.,  
in response to message #1 by Namir

are there any more algorithms? or is it the same + fixes ?

### Re: Numerical Recipes 3rd Edition is Here!!!

Message #3 Posted by [Namir](#) on 5 Oct 2007, 10:10 a.m.,  
in response to message #2 by hugh steers

The 3rd edition has added more material and made the C++ code more object-oriented than the 2nd edition.

### Re: Numerical Recipes 3rd Edition is Here!!!

Message #4 Posted by [Thomas Chrapkiewicz](#) on 5 Oct 2007, 8:39 a.m.,  
in response to message #1 by Namir

Namir: Yes, the NR Recipes book has been a useful resource, but as I recall, some algorithms in the early editions had some issues. I have most all editions from the original FORTRAN, Pascal, C and BASIC.

I too have wondered if there was a demand for a matlab/octave, Excel or RPN/RPL versions of these algorithms. Certainly with the large program and data memory space of the 35s, it is a potential target for some of these algorithms.

TomC

### Re: Numerical Recipes 3rd Edition is Here!!!

### Got the HP35s from Samson cables

Message #1 Posted by [Stefan K.](#) on 5 Oct 2007, 2:36 a.m.

I hope this isn't annoying too much for US residents, but maybe some EU citizens are still thinking about getting this beauty:

- Shipping to Austria took about 2.5 weeks (with cheapest shipping option).
- For some odd reason it was sent from the US (instead the EU), so I had to pay taxes (and customs was responsible for a couple of days delay).
- Within a couple of hours I got a reply from Samson that they'll refund the extra expenses.

IMO Samson's customer support is much better than your average (US or international) company, I already feared to go through endless hassles and email conversations.

Now to the calculator itself (and my 2 cents):

- I like it, the case really makes the difference (compared with the "cheap" leatherettes included with eg. the 32s).
- Why can't I use SQRT on negative (or complex) numbers?
- A calculator with a printed user manual (instead of an instruction sheet)! Not everything in the world is going worse.

For me it was definitely worth the buy.

Stefan

### Re: Got the HP35s from Samson cables

Message #2 Posted by [Walter B](#) on 5 Oct 2007, 2:51 a.m.,  
in response to message #1 by [Stefan K.](#)

Hallo Stefan,

welcome to the club!

Your SQRT-of-negative-question was discussed here already, so please check earlier posts.

HTH, Walter

### Re: Got the HP35s from Samson cables

Message #3 Posted by [Karl Schneider](#) on 5 Oct 2007, 5:20 p.m.,  
in response to message #1 by [Stefan K.](#)

Hi, Stefan --

Here's one of the "earlier posts" that Walter referred to:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=119576#119576>

The post *does* address the questions you asked, although the presentation is a bit formal.

The quick answer is as follows: square root of a negative-real or complex-valued argument was never supported in the models whose algorithms served as the basis of the HP-35s (HP-32S, HP-32SII, HP-33s).

-- KS

### **Re: Got the HP35s from Samson cables**

*Message #4 Posted by [Stefan K.](#) on 7 Oct 2007, 3:16 p.m.,  
in response to message #3 by Karl Schneider*

Hi,

thanks for the link. I was following the forum, so I already knew about this "problem". My remark was less a question, more a complaint. With a complex valued  $y^x$ , some functions become obsolete (sin, cos, sinh, cosh, sqr, sqrt, exp,  $10^x$ , and so on). So why do we have keys for them - to make life easier. I don't know much about the internals, but would it be hard to implement some operator overloading? So for real arguments the calculator behaves like it does now (and uses the same algorithms), and for complex numbers we get the complex function?

At least from my point of view (and I am only a user) this would make sense.

Stefan

### **My 35 (not 35s) story.**

*Message #1 Posted by [Hal Bitton in Boise](#) on 4 Oct 2007, 4:40 a.m.*

Hi everybody... I was at a family reunion about a month ago. My cousin, who is a retired Air Force colonel, upon finding out that I collected HP calculators, asked me if I had an HP35, to which I answered no. He then asked me if I wanted one, to which I answered YES. As a young AF Academy cadet in the early 70's, he had purchased a brand new HP35 at the cadet bookstore, and had managed to hang on to it for all these years, and was now willing to give it to me. Good fortune had smiled on me.

The calculator arrived a couple weeks ago, and aside from being quite dirty (food all over the keyboard), it also suffered from intermittent operation. Complete disassembly, and scrubbing the case halves in hot soapy water cleaned it up beautifully. Carefully spreading the fingers (for better contact) of the keyboard array contacts resolved the intermittent operation issue, and it now works perfectly. The one sour note is that the corners of the back label (which was perfect) are now creased from being pulled back to access the screws. If anybody has a source for these labels, I would be very interested.

Lastly, a question if I could. What's the purpose of the metal plates in the lower case half? They seem to contact, by design, a couple of the finger connectors at the bottom edge of the calculator. Is this some sort of RF shielding? ...Or perhaps some sort of capacitive device? I would be most curious if anybody knows.

Thanks, and best regards, Hal

### **The HHC2007 Conference Commemorative Calendar**

Message #1 Posted by [Jake Schwartz](#) on 4 Oct 2007, 12:54 a.m.

Hi,

At the HHC2007 HP Calculator Conference last weekend, an HP Calculator calendar (created by the conference committee) was given to every attendee. These commemorative calendars, featuring images of every HP calculator ever made (and some made but never sold), cover 16 months from September, 2007 through December, 2008. The 2007 pages feature special calculator themes while the 2008 pages cover each and every HP calculator series from the Classics beginning in 1972 through the current machines from the San Diego Calculator Division. They are spiral bound and printed on heavy, glossy paper on roughly A4-sized (8.25 by 11.5-inch) sheets. A limited number of additional copies are available now. If you wish to obtain a copy of this calendar, check out <http://holyjoe.net/hhc2007/hhc2007%20calendar.htm> on the web. Funds will go to help finance the HHC2008 conference on September 20-21, 2008 (at a location to be determined).

Thanks,

Jake Schwartz

### **Re: The HHC2007 Conference Commemorative Calendar**

Message #2 Posted by [sjthomas](#) on 4 Oct 2007, 1:11 a.m.,  
in response to message #1 by Jake Schwartz

What Jake doesn't mention is the great resolution at which these calendars are printed. The function labels -- even the shifted ones! -- are easily readable. This is not a calendar which will be thrown away at the end of 2008, but something which will be treasured. I highly recommend obtaining one of these works of art and labors of love. You **won't** be disappointed.

Disclaimer: I was in no way responsible for the production of these calendars, and do not benefit from their sale (particularly since I will not be able to attend HHC2008).

### **The HHC2007 Conference Commemorative Calendar**

Message #3 Posted by [Jake Schwartz](#) on 4 Oct 2007, 7:56 a.m.,  
in response to message #2 by sjthomas

Hi Guys,

My apologies for the various broken image links on the web page. They should be all fixed now. It was late last night when it was initially posted.

Jake

### **Re: The HHC2007 Conference Commemorative Calendar**

Message #4 Posted by [Howard Owen](#) on 5 Oct 2007, 3:48 a.m.,

*in response to message #2 by sjthomas*

Obtaining that resolution was the subject of a talk given by Jake and Richard Nelson, the two perpetrators of the calculator calendar caper. Suffice to say that in the face of Murphy at his most malevolent, they pulled the high-resolution prize from the threatening jaws of defeat, or something along those lines.

Hyperbole to one side, it is a *wonderful* calendar, and a worthy addition to your stash of HP apocrypha.

While I'm plugging stuff from the conference, I can't overlook Wlodek Mier-Jedrzejowicz's new edition of "A Guide to HP Handheld Calculators and Computers," which is marked "Fifth Edition, HHC 2007 Printing." It is full of stuff about machines I thought I knew. But Wlodek comes up with insight and opinion that make them seem brand new. Plus the edition is complete up to the new (so far exclusively) European version of the 17BII+ with the double wide INPUT key.

Regards,  
Howard

### **The HHC2007 Conference Commemorative Calendar**

*Message #5 Posted by [Jake Schwartz](#) on 7 Oct 2007, 5:17 p.m.,  
in response to message #4 by Howard Owen*

Hi,

A total of twenty HHC2007 calendars have already been mailed. If you placed an order and have NOT YET received an email indicating that it has been mailed, yours will be from the second batch which are en route to me from Richard Nelson as we speak. Those will be mailed as soon as I receive them. We are also seriously considering doing another print run due to the strong response so far.

Thanks,

Hello Howard,

where can I find out more about the calculator/computer guide book?

David Bailey

Quote:

Obtaining that resolution was the subject of a talk given by Jake and Richard Nelson, the

two perpetrators of the calculator calendar caper. Suffice to say that in the face of Murphy at his most malevolent, they pulled the high-resolution prize from the threatening jaws of defeat, or something along those lines.

Hyperbole to one side, it is a *wonderful* calendar, and a worthy addition to your stash of HP apocrypha.

While I'm plugging stuff from the conference, I can't overlook Wlodek Mier-Jedrzejowicz's new edition of "A Guide to HP Handheld Calculators and Computers," which is marked "Fifth Edition, HHC 2007 Printing." It is full of stuff about machines I thought I knew. But Wlodek comes up with insight and opinion that make them seem brand new. Plus the edition is complete up to the new (so far exclusively) European version of the 17BII+ with the double wide INPUT key.

Regards,  
Howard

>featuring images of every HP calculator ever made (and some made but never sold)..

Just curious, whose collection of HP's were used in the photos? Or were the images possibly gathered from various on-line sources?

As others have said, the calendars are really awesome, so please understand I'm not complaining when I ask this, but is there a reason the HP-01 watch didn't make the cut?

To prove I'm not complaining, and realizing the level of detail you and Richard demanded in this printing, I can say with full confidence that, without a doubt, this is "categorically the most concise and complete collection of carefully critiqued and correctly cropped color copies of HP calculators on a commemorative calendar" I have ever seen! That was over the top, but both of you should know the high standards you set for this project are greatly appreciated!

Matt

*Message #10 Posted by [Jake Schwartz](#) on 8 Oct 2007, 11:03 p.m.,  
in response to message #9 by Matt Kernal*

Hi,

The calculator images mostly came from a CD which I received third hand about ten years ago, containing professional photos of all the machines up to that time. The remaining images were collected from various places. Now that I think about it, we probably could have placed the HP-01 on the "Sting/Roo/Titan" page, where the timeframe would have been just about right and there was probably plenty of room. In retrospect, leaving it out was a serious omission. Oh well, there is always next year. When Richard Nelson and I first discussed the possibility of doing a calendar, we realized that a new one could be done each year with a different theme, so this doesn't have to be the end of the line. Originally, we kicked around about ten different possibilities of themes for the pages. Since this was the anniversary year, Richard thought that including pictures of everything was in order.

Jake

:)

This looks like MODE and STO/RCL buttons are on the side face of your calc. Is MODE going to act like a shift key? If not, how do you select e.g. F1? Why is there a dedicated key for closing parenthesis only? What will this be good for in RPN?

Oh, and BTW, will there be a time display, too?

\_\_\_\_\_

Yes Virginia, there is a time/date display mode (+bonus extra's), it is a watch after all. MODE shifts between Time/Date, Calculator, and setup modes etc. The function keys are accessed with the MENU

button which calls up various rolling soft key menus. So common functions like say 1/x only take two key presses. You need a closing parentheses key for Algebraic mode, and that button currently does nothing in RPN mode.

Dave.

Davej,

Can you give us some ideas regarding what's running under the hood? Like processor type, memory size, display specs (annunciators?), batter(y/ies) type.

How about the software? Did you "borrow" a rom from HP, or are you running your own code?

If any of this is has already been covered, pointer please. If it's top secret, I understand.

...

Also, if you want my two cents, if you could, I would put a (much) wider bracelet on the watch. Something Rambo size, to compliment the attitude and stance of the watch itself.

Best regards, Pal

---

It's kinda secret at the moment, but I'm not that good at keeping secrets for too long, I can usually be prodded ;-)

It uses a modern 16bit micro with decent amounts of internal FLASH and SRAM. There is also another non-volatile memory for program and other storage. Display is just a 16x2 dot matrix, no extra annunciators. It uses either one or two lithium coin cell batteries. It's got more grunt and memory than the new 35S anyway.

It's completely all my own code.

Quote:

Also, if you want my two cents, if you could, I would put a (much) wider bracelet on the watch. Something Rambo size, to compliment the attitude and stance of the watch itself.

I went with standard size watch spring bars, I'm not aware of any wider ones? Then again, I didn't specifically look for anything wider. I'm not a big fan of the wide watch band, but I can see your point given the rest of the watch is fairly wide.

Dave.

### Re: Sneak Peak #2

Message #11 Posted by [Eric Smith](#) on 6 Oct 2007, 2:03 a.m.,  
in response to message #10 by [DaveJ](#)

Quote:

It uses a modern 16bit micro with decent amounts of internal FLASH and SRAM.

Sounds like it might be one of:

- Renesas H8SX - max 512KB flash, 40KB RAM (1M flash, 56KB RAM in forthcoming parts)
- TI MSP430 - max 48KB flash, 10KB RAM, or 116KB flash, 8KB RAM
- Microchip PIC24F - max 128KB flash, 8KB RAM
- Microchip PIC24H - max 128KB flash, 16KB RAM

The H8SX and PIC24H have the disadvantage of requiring a regulated 3.3V supply, but then, the LCD module probably does as well. The MSP430 and PIC24F can run directly from a battery.

I've used other H8 parts in the past, but not the H8SX series. I'd probably use an MSP430 if I was designing something like this, unless more than 10KB of RAM was desired.

What's the overall width of the LCD module? The smallest 16x2 character LCD module I've found is 56.3mm wide.

### Initializing Values in a Program (HP35s)

Message #1 Posted by [Chuck](#) on 3 Oct 2007, 12:41 p.m.

Suppose you need to initialize X=2 and Y=3 in a program. One method is:

```
001  2
002  STO X
003  3
004  STO Y
```

A second method is to use EQN before each line

```
001  2 -> X
002  3 -> Y
```

where -> is the STO command.

The second method obviously reduces the number of lines of code, but is one method any more efficient (timewise) over the other? I haven't been able to discern a difference in my small programs, so it's just really a matter of curiosity.

CHUCK

### Re: Initializing Values in a Program (HP35s)

Message #2 Posted by [Egan Ford](#) on 3 Oct 2007, 1:02 p.m.,  
in response to message #1 by Chuck

Create a loop and time it:

E.g.:

```
A001 100
A002 STO I
A003 your code here
...
An   DSE I
An+1 GTO A003
An+2 RTN
```

This will run your code 100 times. Use a stopwatch to time it.

*Edited: 3 Oct 2007, 1:03 p.m.*

### Re: Initializing Values in a Program (HP35s)

Message #3 Posted by [Arne Halvorsen \(Norway\)](#) on 3 Oct 2007, 1:20 p.m.,  
in response to message #2 by Egan Ford

```
Y001 LBL Y
Y002 0.999
Y003 STO X
```

```
Y004 2
Y005 STO Y
Y006 ISG X
Y007 GTO Y004
Y008 RTN
```

Used 1m 8s

```
Y001 LBL Y
Y002 0.999
Y003 STO X
Y004 eq 2>Y
Y005 ISG X
Y006 GTO Y004
Y007 RTN
```

Used 1m 57s

*Edited: 3 Oct 2007, 1:22 p.m.*

### **Re: Initializing Values in a Program (HP35s)**

*Message #4 Posted by **Chuck** on 3 Oct 2007, 2:01 p.m.,  
in response to message #2 by Egan Ford*

Okay, I looped it 100 times.

11 seconds with

```
2
sto x
3
sto y
```

and 20 seconds with

```
2 -> x
3 -> y
```

Looks like there is definitely a trade-off with speed -vs- size.

### **Re: Initializing Values in a Program (HP35s)**

*Message #5 Posted by **Meenzer** on 3 Oct 2007, 2:40 p.m.,  
in response to message #4 by Chuck*

The difference in length is only

```
LBL A
2
STO
LN=67
```

```
LBL A
2>A
LN=66
```

*Edited: 3 Oct 2007, 2:43 p.m.*

---

---

**Re: Initializing Values in a Program (HP35s)**

*Message #6 Posted by [Arne Halvorsen \(Norway\)](#) on 3 Oct 2007, 3:04 p.m.,

**HP-97 battery pack substitute?**

Message #1 Posted by [Mike McCauley](#) on 3 Oct 2007, 12:13 a.m.

I have a HP-97 that I purchased some time ago off eBay. I use it almost daily, and it works great, save for one problem that pops up periodically. Every few years, it gobbles up a battery pack.

I use the machine on AC power only, never off the battery pack. As I think of it I unplug the wall wart and turn the machine on to run the battery down, but most times it is plugged in and turned off. As is well known, in time this trashes the batteries.

I chopped the battery pack open some time ago, and I rebuild it myself as required. This is not big deal, but the sub-C batteries aren't cheap, and NiCds are getting harder to find all the time.

After reading a number of posts on the site about how the charger/PS circuit works, I decided that I could substitute an electrolytic cap and a zener for the battery pack, the cap to provide the filtering to eliminate the "fluttering digit" problem, and the zener to insure that the machine would not be exposed to a high voltage spike resulting from the cap charging to the peak voltage of the wall wart.

I paralleled a 2200 uF 10V cap and a 5.1V 5W zener and attached it to the battery pack spring clips inside the battery compartment with clip leads. This works very well... for the most part.

When the machine is on, the wall wart/cap combo voltage gets pulled down to about 4.89V and the zener dissipates essentially zero power. When I turn the machine off, the cap voltage is clamped at 5.1V, and turning the machine on and off produces no obvious problems. All in all, the idea works great, except for one problem.

With the machine off, the zener heats up, quickly and to a relatively high temperature. Obviously, this indicates that the current limiting resistors on the output side of the unregulated supply in the machine are sized to allow too much current to flow though the zener.

I could use a higher voltage zener, but I'm concerned that a turn-on spike from the cap would harm the machine.

I could use a simple zener-transistor shunt regulator circuit with a small heat sink to spread the heat out. But the power being dissipated is still the same, and I am concerned about burning out the series resistors in the calculator

The idea behind all of this is to simply eliminate the "low power" LED being on when the next set of batteries gives out, and thus the buying of one set after another of batteries in the first place, batteries that, in my situation, are acting as no more than short-life filter caps.

Higher voltage zener? Shunt regulator? Bad idea, won't work? Something else?

Thanks in advance for your comments,

Mike

**Re: HP-97 battery pack substitute?**

Message #2 Posted by [Patrick Rendulic](#) on 3 Oct 2007, 1:42 a.m.,

*in response to message #1 by Mike McCauley*

Hello. At the moment I have no answer to your question, but I just want to tell you how I "power" my HP-97.

I have rebuilt the battery pack with Ni-MH cells from Sanyo, 3.700 mAh. To charge them, I put the switched off machine on AC power for a whole day. I then remove the AC power adapter and use the machine on battery power.

I don't use it as often as you, so in my case the charge is sufficient for several months of use. In your case the charge would certainly be sufficient for several weeks.

Up to now, no problems with the Ni-MH cells.

My bench power supply shows peaks over 3A, but its display update rate is fairly slow, so the actual peak could be somewhat higher.

### **Re: HP-97 battery pack substitute?**

*Message #5 Posted by [Randy](#) on 3 Oct 2007, 10:21 a.m.,  
in response to message #1 by Mike McCauley*

I have modified a number of units to use an external power supply. A Digikey T989-P5P wall wart switcher works well, 6V, 2.5A, 5% regulation for \$17.00. It's a simple matter to move the 97's charger plug out of the way, let it dangle inside and route the PS wires through the holes in the 97 and solder to the pcb areas marked + and -. The battery connects to the other side of the pins which you should pull off and tape up just in case anybody puts a battery into the unit. Simple and working well for many years now.

### **Re: HP-97 battery pack substitute?**

*Message #6 Posted by [Mike McCauley](#) on 3 Oct 2007, 10:40 a.m.,  
in response to message #5 by Randy*

Thanks for the tip. Given my situation, this sounds like the best option for me.

Given what you say regarding connecting the switcher PS, am I correct in thinking that where you have it connected is at the same points in the circuit as the existing battery pack?

Also, depending on design, some switchers don't work properly under zero load. Using the PS you specify,

is turning the machine off a problem, or must it be left on all the time?

Thanks again for the info!

Mike

Yes, it connects to the battery input.

Quote:

Also, depending on design, some switchers don't work properly under zero load. Using the PS you specify, is turning the machine off a problem, or must it be left on all the time?

It's a wall wart consumer power supply. Zero load is an acceptable condition.

*Message #10 Posted by [Chan Tran](#) on 3 Oct 2007, 11:18 a.m.,  
in response to message #9 by Mike McCauley*

When I rebuilt my battery pack I didn't glue them back together but simply taped them. It makes it easy to replace the cells again. I used NiMH instead of NiCad so the pack last at least 3 times longer than the original pack.

### **Re: HP-97 battery pack substitute?**

*Message #11 Posted by [Mike McCauley](#) on 3 Oct 2007, 1:56 p.m.,  
in response to message #10 by Chan Tran*

I, too, use only tape. Works fine.

Did you have to make any circuit changes in order to use NiMH?

I'm sure they would last much longer, and they would also be far easier and cheaper to obtain than NiCd. In my area (Dallas, Texas, USA), sub-C NiCd cells are tough to obtain. And on the Internet, with shipping and sometimes minimum order charges, it's not a cheap prospect.

Every 2-3 years, the cost of the cells is more than the cost of a brand new TI scientific calculator. But then, that's not an HP...

;<)

### **Re: HP-97 battery pack substitute?**

*Message #12 Posted by [Chan Tran](#) on 3 Oct 2007, 4:10 p.m.,  
in response to message #11 by Mike McCauley*

No it just takes longer to charge. About 2 to 3 days to fully charge the battery with the stock walwart. Besides the walwart is charging the battery so slowly, it's almost safe to keep it plugged in all the time.

### **battery pack**

*Message #13 Posted by [geoff quickfall](#) on 3 Oct 2007, 4:11 p.m.,  
in response to message #11 by Mike McCauley*

I have rebuilt 5 battery packs with Nimh and have yet to have a problem. I do however, recharge them in the accessory battery charger that HP sold at the time. I also do this with my hp67's, which I use in the 'office' recharging the batteries on the 82004a instead of the calculator.

I do this for a two reasons, the heat generated in the calculator cannot be good after 30 years of use and the stress on the older circuits in the calculator is just not required if you can use the external chargers. Number 2, the external chargers are easy to fix and do not involve dis-assembly of the units to get to the recharging circuitry.

I may be a bit paranoid here but my HP 97, HP 92 and the 4 67's I have (I use the 97 and one of the 67's still) keep their charges for very long times.

Cheers, Geoff

### HP35s Program Logger (sort of)

Message #1 Posted by [Chuck](#) on 2 Oct 2007, 10:10 p.m.

Well, this is not quite the program logger I wanted to write, but my programming days are long past. Instead, I created an Excel spreadsheet that automatically creates line numbering. Changing a LBL variable will change the line accordingly. You can also leave a space between programs for easier reading. The spreadsheet allows for 100 lines of program (I can make it longer if needed, or just use a new page for larger programs.) Enter program commands in the "Command" column beginning with the LBL command.

Not sure if anyone will find it useful, but it was a good self-test on creating Excel functions to do this.

If the formatting of the line number isn't the same as in the graphic, let me know, and I'll fix it (or tell you how). Here's what it will look like.

Message #3 Posted by [Jeff O.](#) on 10 Oct 2007, 1:20 p.m.,  
in response to message #1 by Chuck

Chuck, thanks for your effort, I found it useful. Not being able to leave well enough alone, I considered what improvements might be desirable. In addition to auto-numbering, it would be nice to find a way to keep track of the jump start points and the targets. A column for comments would also be handy. With these concepts in mind, I took the liberty of modifying your workbook. Here is a screenshot of what I came up with:

| A  | B            | C               | D                                    | E            | F             | G                         |
|----|--------------|-----------------|--------------------------------------|--------------|---------------|---------------------------|
| 1  |              |                 | <b>Name: HP 35s Programming Form</b> |              |               |                           |
| 2  |              |                 |                                      | <b>Jump</b>  |               |                           |
| 3  | <b>Line#</b> | <b>Command</b>  |                                      | <b>Start</b> | <b>Target</b> | <b>Comments</b>           |
| 4  | A 001        | LBL A           |                                      |              |               | Label A                   |
| 5  | A 002        | ..              |                                      |              |               | comment                   |

| 45 | A 042        | STOP            |                                      |              |               | end                       |
| 46 | Program 1    |                 |                                      |              |               |                           |

The workbook looks for and sequentially numbers the GTO and XEQ commands, placing a sequence number in the “Start” column. It also changes the font color to green. You have to manually enter the sequence numbers in the “Target” column at the target line, and then the font color is changed to red. To insert a program step or steps, I have not found a better way than to copy everything in columns D, E, F, and G below the line where you want to insert down one or more lines. Then type the new instruction(s) in the newly created line(s). The jump starts and targets have to be manually reviewed and edited as required. Extra care must be taken if a new jump start is inserted between two existing ones as that will change the sequence numbers of all jump starts after the new jump instruction, so the sequence numbers of their targets will no longer match. (Automating the insertion and jump tracking and editing process would be very helpful, of course, but so far I haven’t tried to tackle that.)

### **Early HHC2007 conference report / tidbits**

Message #1 Posted by [Gene Wright](#) on 2 Oct 2007, 9:26 p.m.

70 total attendees, 65 non-HP attendees. Biggest attendance at a conference in YEARS!

HP provided lunch and dinner on Saturday and lunch on Sunday.

Cyrille was voted best speaker for his talk. Don Shepherd gave a very good talk about the nSpire. Other speakers can be found here:

[Conference program \(which changed, but more or less was like this\)](#)

Everyone received at least one door prize (someone actually walked away with a very rare TI 1200 calculator) and two gifts from HP.

Two auctions of rare goodies was held, one of which I won.

Each attendee received a special edition 16 month HP Calculator calendar in their conference proceedings folder.

Jake video recorded everything - except the NDA stuff.

Sunday night, several attendees gathered at the Elephant Bar restaurant for hours and then continued talking in the parking lot of the Holiday Inn.

One of the attendees missed Saturday morning because his wife went into labor, giving birth around 7-8am. Fortunately :- ) he was able to drop by Saturday afternoon to register and get his goodies...with his wife's blessing!

Speaking of wives, there were 3 non-HP female attendees this year, 2 more than the previous year. I call that an important percent change!

Hopefully some of you who registered but were unable to attend can do so next year. Stay tuned for more non-NDA info about the conference past and conference future.

Can anyone post Mr. Owens presentation on the MLDL2000 and the Hepax (How to). It would be nice to review this.

Howard,

Thanks for doing the presentation. Maybe it would be good to make the paper about your HEPAX how-to public as well, that really explains how to do it!

Meindert

*Message #5 Posted by **Walter B** on 3 Oct 2007, 1:23 p.m.,  
in response to message #4 by Meindert Kuipers*

Maybe I misunderstood, but I thought there shall be a CD or DVD with all the HHC papers and presentations on it (except the NDA stuff of course). When will it be released? For those of us who live far away from San Diego this would be very much appreciated: so we may read at least what was going on.

*Message #6 Posted by **Gene Wright** on 3 Oct 2007, 2:24 p.m.,  
in response to message #5 by Walter B*

Jake Schwartz puts together a DVD of the proceedings (edited to remove NDA type stuff), but that usually takes several months due to life events, etc.

I'm sure he will post a link here when it is ready.

As far as printed proceedings, not every talk had associated paper handouts, so that may be tougher to gather.

I think you'll find that there were 65 1/2 non-HP attendees.

Congratulations to Katie and Tim.

For what it's worth, the conference group photo is posted on the HHC2007 web site at <http://holyjoe.net/hhc2007/> . Another nine people appeared after the photo was taken.

A detailed conference report is being prepared and will be posted as soon as it is completed.

Jake Schwartz

Hi Jake,

thanks for posting the photo. Looks like a very cheerful crowd! For us who could not attend: Who's who? Can you add the names e.g. from left to right? Thanks in advance!

In some cases, no.

For the first time in memory, we had 2 attendees who were adamant that their name not be used on any lists made public.

Not sure if the fear is terrorists or the government, but ...

If their names get out, it won't be my doing, but it goes against my view of a community

\_\_\_\_\_

In some cases, no.

\_\_\_\_\_

Gene, I'd be perfectly satisfied when you omit just *\*some\** names ;) This will allow for putting faces to well known names for those members of this forum who couldn't spend the money for travelling half around the globe for a weekend, though a very valuable one.

Well, and whoever doesn't want to show up named in public, which is a perfectly rightful wish for sure, shall be vigilant (and modest) enough not to be group-photographed. Else I'd not reckon that "adamant" but something else :)

**Re: Early HHC2007 conference report / tidbits**

*Message #12 Posted by **Matt Kernal** on 7 Oct 2007, 6:59 p.m.,  
in response to message #1 by Gene Wright*

>Each attendee received a special edition 16 month HP Calculator calendar in their conference proceedings folder.

Along with the printed proceedings and calendar, I want to add that each conference folder also included some *very, very generous* media items as follows:

- 1) Museum of HP Calculators 2-DVD set (Ver. 6.00) - Thanks Dave!!
- 2) HP Calculator Archive CD (i.e. entire copy of hpcalc.org) - Thanks Eric!!
- 3) 24 Years of Datafile 1982-2005 CD (HPCC UK) - Thanks Wlodek, Bruce, Hugh, et al !!)

Additionally, when HP handed out the free 35S's, they also gave each attendee an "HP Invent" logoed unisex watch (for some reason the HP watch I received was an old LED display jobbie with a bunch of tiny little buttons ;-). The 35S and watch were really nice gestures on HP's part. Thanks Sam, Cyrille, Wing, and Amy!!

And of course, a BIG THANK YOU to the HHC2007 committee members: Richard, Jake, Gene, Wlodek, and Joe!! Joe wasn't able to attend due to a serious medical condition he is fighting, so please keep him in your prayers - he certainly needs them right now. Thanks guys for all your hard work. We'll never know the extra effort you put into making this another highly-enjoyable conference.

I think one of my favorite aspects of these conferences are meeting and talking with friends that have traveled from other countries to attend. You know it cost them plenty of time and money to be there! We have been enriched by your presence. Thanks for coming! It's really nice to be able to put a face with the names we see *here* often (that goes for everyone).

There are lots of other good things to mention, but I just wanted to say thank you to some pretty special people.

Matt

in response to message #12 by Matt Kernal*

I seem to remember reading somewhere that there would be a programming challenge. If there was one as part of the conference, what was the problem?

How many original HP-35's made it? (All versions?) Does the freebie 35s have the "Commemorating 35 Years" (or whatever) on it?

(I'm calculating how much jealousy I should work up.) (If these answers are already available, please point me in some general direction . . . )

I seem to remember reading somewhere that there would be a programming challenge. If there was one as part of the conference, what was the problem?

On the 35S ONLY,

1. Accept as input an integer from 1 to 9,999,999,999 in which no digit is a zero.
2. Sort the digits of the integer into increasing order and display the result as one integer.
3. No external program initiation.
4. Restore original calculator state.

Example, for input of 9991188, return 1188999

Quote:

How many original HP-35's made it? (All versions?)

I don't think there was a count. Some are being held in the posted photo.

Quote:

Does the freebie 35s have the "Commemorating 35 Years" (or whatever) on it?

Sadly, no.

> How many original HP-35's made it? (All versions?) Does the freebie 35s have the "Commemorating 35 Years" (or whatever) on it?

I counted at least eleven HP35A models there. The machines HP gave out were the "regular" 35S units, not the commemorative ones which went to only a select few people, as I recall.

Jake Schwartz

---

There is a nice write-up of the evaluation of the programming challenge submissions (but not the listings themselves -- dang it! that the 35s doesn't have IR printer output) by Gene W. in Richard Nelson's Conference Report posted at the HHC website:

[http://holyjoe.net/hhc2007/Final\\_HHC2007\\_Conference\\_Report\\_R2.pdf](http://holyjoe.net/hhc2007/Final_HHC2007_Conference_Report_R2.pdf)

**Unrecoverable crash to lock-up**

Message #1 Posted by [John Wasilewski](#) on 2 Oct 2007, 9:42 a.m.

Anyone seen this problem?

Any advice available?

**Unrecoverable crash problem*****Causing total loss of all previous software development work***

In final tweak/adjust/debug stage, XEQting a 473-line program caused the screen and keyboard to freeze. None of the keystroke combination reset procedures in the manual worked.

i.e. neither of the following freed the lock-up.

C + GTO

C + R/S + i

Consequences were very bad. I had to stick a pin in the back. I therefore lost not only this long program but also ALL other code I had entered for previous programs.

Hoping that this was just an unfortunate rare occurrence, I re-typed the entire 473-line program from notes I had kept. When I tried to XEQute it again to resume where I had left off, it worked partially as before and then at exactly the same place in the data entry, exactly the same problem happened again.

I'm therefore faced with having to type it all in yet again (that is, AT LEAST one more time, and probably more than one). Naturally, I'll try stepping through it next time, but when it crashes again, I will again be back to zero.

This is very exasperating and time-wasting.

*It is also extremely discouraging. I had planned to build up gradually (and post to this site) a library of most-useful structural engineering code that would just lie in memory, preserved by always having a spare battery pair and replacing batteries carefully. This unrecoverable crash means I can expect to lose the lot. And that is a big big disincentive to software development on a system I can't trust, that has no possibility for external filesaves.*

in response to message #1 by John Wasilewski

And on what machine did this happen?

## **Re: Unrecoverable crash to lock-up**

*Message #3 Posted by [randy](#) on 2 Oct 2007, 11:52 a.m.,  
in response to message #2 by Arne Halvorsen (Norway)*

My semi-educated guess: 35S

And some wonder why others want still 41's, 67's and 97's. It's those blasted silly little magnetic cards...  
oops, forgot the 65.

IMO, the 35S is not a "system".

*Edited: 2 Oct 2007, 11:56 a.m.*

## **Re: Unrecoverable crash to lock-up**

*Message #4 Posted by [Arne Halvorsen \(Norway\)](#) on 2 Oct 2007, 12:09 p.m.,  
in response to message #3 by randy*

Yep must be, checked the manual.

I wonder how much more expensive the bug would had been with the simplest form of I/O (USB or memory card) for program backup...

## **Re: Unrecoverable crash to lock-up**

*Message #5 Posted by [John Wasilewski](#) on 2 Oct 2007, 1:07 p.m.,  
in response to message #3 by randy*

Good guess, Randy, it is a 35S.

Also, you may be right that I shouldn't refer to it as a 'system' and I'm grateful to you for the comment. Please note, however, that I posted the original message because I have a fairly major problem here, that I really do need some solid help with if I can possibly find it, so I hope everyone won't mind, and no-one will be offended, if I ask that we keep focused on the technical problem, and avoid side issues like this.

In particular,

- 1) Has anyone else had any similar experience?
- 2) Does anyone have any ideas of what type of code might cause it, so that I can search through my code to try to find MY bug?
- 3) Has anyone any ideas about how to force a non-destructive reset when the instructions in the manual don't succeed?

Be in no doubt, if this problem persists and we can't find out why then the HP35S, which is otherwise a superb calculator, becomes totally crippled for all serious users. You can't write serious programs on a "calculator-that-isn't-a-system" (!) if there is no save facility AND occasional crashes wipe all programming you have ever done.

I see this as very, very important.

---

John

Message #6 Posted by **John Wasilewski** on 2 Oct 2007, 12:50 p.m.,  
in response to message #2 by Arne Halvorsen (Norway)

It happened/happens on an **HP35s**. Sorry I didn't make this clear - I forgot it was not a machine-specific section of the forum --- John

**Re: Unrecoverable crash to lock-up**

Message #7 Posted by **Patrick Rendulic** on 2 Oct 2007, 1:01 p.m.,  
in response to message #6 by John Wasilewski

Is it the HP35-scientific or the HP35-s\*\*\* ?

I may be very rude, but at this stage, the HP-35 cannot be trusted. There seem to be to many bugs or "undocumented features". Maybe most problems will get fixed, but that means replacing the calculator.

Nevertheless I hope that the given problem will be solved!

**Re: Unrecoverable crash to lock-up**

**Re: Unrecoverable crash to lock-up**

Message #9 Posted by **John Wasilewski** on 2 Oct 2007, 1:53 p.m.,  
in response to message #8 by John Wasilewski

I have sent a detailed description of this problem to the calculators section of <http://wwemail.support.hp.com> and my report has been acknowledged by an autogen email from HP Calculator E-mail Support <calculator\_support\_en@mail.support.hp.com> with reference number KMM20282596V46293L0KM.

I'll pass on anything useful or otherwise I manage to obtain from HP.

If anyone would like to see the 473-line code that caused this, just let me have an email address to send it to you. I have a PC .txt file of it. The program does a rigorous parabolic-rectangular stress-block analysis of a rectangular RC section for a required moment of resistance in accordance with BS8110:Pt1:1997. It then recommends a section size (for the user to over-ride with his/her own choice), and, finally, optimises the compression and tension reinforcement bar sizes for minimum steel weight in the user's chosen section size.

### **Re: Unrecoverable crash to lock-up**

*Message #11 Posted by [Seth Morabito](#) on 2 Oct 2007, 2:39 p.m.,  
in response to message #9 by John Wasilewski*

If possible, I would also suggest trying to bring this up directly to Cyrille de Brebisson. I know he reads the Usenet newsgroups, and he may read this board as well. He is very keen on documenting and fixing all the bugs in the 35s, as we discussed at HHC, although of course due to the rest of HP being involved, he cannot comment on exactly what bugs may get fixed, nor when they will get fixed. But I know he is personally invested in the 35s and wants to see it bug-free.

Googling for his name is probably a good way to get his contact information. He'll want to see the program that causes the lock-up, I'm sure.

Regards,

Seth

### **Re: Unrecoverable crash to lock-up**

*Message #12 Posted by [John Wasilewski](#) on 2 Oct 2007, 4:06 p.m.,  
in response to message #11 by Seth Morabito*

Thank you Seth.

I have just sent the following message by email:

to cyrille\_de-brebisson@hp.com  
date 2 Oct 2007 21:03  
subject HP 35s unrecoverable crash problem

Dear Cyrille,

HP 35s Scientific calculator  
Serial no. CNA72100255

Someone on the HP calculators users' forum at [www.hpmuseum.org](http://www.hpmuseum.org) has suggested that I write to you about what may be a very serious fault with the seemingly excellent HP35s. I'm told you will certainly want to know about this.

I short, I may have discovered a system instability causing occasional unrecoverable crashes, under as-yet unknown circumstances. The gravity of this comes from the fact that, with no means of saving programs, crashes needing a hard reset (causing total memory erasure) will make it untenable to develop serious software because one loses everything. All software that a user has ever developed is lost.

Here's what has happened to me.

In final tweak/adjust/debug stage, XEQuting a 473-line program caused the screen and keyboard to freeze. None of the keystroke combination reset procedures in the manual worked.

i.e. neither of the following freed the lock-up.

C + GTO

C + R/S + i

Consequences were very bad. I had to stick a pin in the back. I therefore lost not only this long program but also ALL other code I had entered for previous programs.

Hoping that this was just an unfortunate rare occurrence, I re-typed the entire 473-line program from notes I had kept. When I tried to XEQute it again to resume where I had left off, it worked partially (just as before) and then, at exactly the same place in the data entry, exactly the same problem happened again.

I'm therefore faced with having to type it all in yet again (that is, AT LEAST one more time, and probably more than one). Naturally, I'll try stepping through it next time, but when it crashes again, I will again be back to zero.

This is very exasperating and time-wasting.

It is also extremely discouraging. I had planned to build up gradually (and post to an HP calculators users' forum site) a library of most-useful structural engineering code that would just lie in memory, preserved by always having a spare battery pair and replacing batteries carefully. This unrecoverable crash means I can expect to lose the lot. And that is a big big disincentive to software development on a calculator I can't trust, that has no possibility for external filesaves.

I have posted a request for help on the excellent calculator users forum at [www.hpmuseum.org](http://www.hpmuseum.org) .

I have asked,

- 1) Has anyone else had any similar experience?
- 2) Does anyone have any ideas of what type of code might cause it, so that I can search through my code to try to find MY bug?
- 3) Has anyone any ideas about how to force a non-destructive reset when the instructions in the manual dont succeed?

Be in no doubt, if this problem persists and we can't find out why, then the HP35S, which is otherwise a superb calculator, becomes totally crippled for all serious users. One cannot write serious programs on a calculator with no save facility if it suffers from occasional crashes that wipe the entire library of all programming ever done on it.

I have sent a detailed description of this problem to the calculators section of <http://wwemail.support.hp.com> and my report has been acknowledged by an autogen email from HP Calculator E-mail Support <[calculator\\_support\\_en@mail.support.hp.com](mailto:calculator_support_en@mail.support.hp.com)> with reference number KMM20282596V46293L0KM.

I don't know if you will be interested to see the 473-line code that caused this, but I am attaching details in a PC Micro\$oft Word file, just in case you would like to see it. The program is for structural engineering design. It does a rigorous parabolic-rectangular stress-block analysis of a rectangular RC section for a required moment of resistance in accordance with BS8110:Pt1:1997. It then recommends a section size (for the user to over-ride with his/her own choice), and, finally, optimises the compression and tension reinforcement bar sizes for minimum steel weight in the user's chosen section size.

Probably-suitable date with which to test it are:

M=100,000,000

Y=460

F=35

C=40

H=360 (over-ride suggested value)

B=300 (over-ride suggested value) Bar diameter = 20

Please note that the above program is still only in its final testing/debugging stage. The problem is not that the program doesn't work. Its that it kills the calculator so totally that I hae had to wipe out all programs in it with a hardware reset.

I hope you can help.

Many people on the users' forum are starting to say the same.

Dear Mike,

Thank you for your prompt reply. I'm sorry that my original message was rather long. I tried to be as informative as I could but the result was that I seem to have lost you, because I was not asking for programming support.

The problem I was reporting is a suspected hardware/firmware defect that could have very serious consequences for the HP35s product -- which will be a great pity.

Could you possibly look again more closely at my original message? You'll see that I was reporting some as-yet not fully identified condition that caused teh calculator to freeze so badly that none of the reset commands in the handbook worked, and it became necessary to wipe the entire memory of all programming to date. This is a very serious worry because if it can crash like this then users will never be able to make full use of this product.

Nobody can take the risk of losing days, weeks and months of work if unrecoverable crashes can happen, when there is no way of saving the work.

I had hoped you would have something constructive or encouraging to say, like, "here is what to do when that happens" or, "we know about it and we're developing a fix", or "we agree, that is worrying, please tell us more."

Please take this seriously. I am not pestering you vexatiously. I'm worried about a possible serious latent defect in your product. I'd like to help you track it down if there is a problem, and I'd like some assurance (and support) that I can make full use of the calculator without having a great deal of my work being wiped out.

---  
John

### **Re: Unrecoverable crash to lock-up**

*Message #14 Posted by [Katie Wasserman](#) on 2 Oct 2007, 5:18 p.m.,  
in response to message #9 by John Wasilewski*

John,

I'd like to see your code that caused this problem, I'm sure that others here would like too as well, maybe you can just post it instead of dealing with separate emails.

Are you using vectors in the program? They seem particularly buggy and I've had lots of problems with them particularly in conjunction with "memory full" error messages.

-Katie

### **Re: Unrecoverable crash to lock-up**

*Message #15 Posted by [John Wasilewski](#) on 2 Oct 2007, 8:03 p.m.,  
in response to message #14 by Katie Wasserman*

As requested by Katie Wasserman, here's the program. Please bear in mind it was still in

final testing stages.

The problem for us to resolve, remember, is not how to make my program work (it was very close to being all finished, debugged and tested). The problem here, though, is to discover why the HP35s filled up suddenly with liquid nitrogen, and how to defrost it if it happens again without having to poke it in the warm-me-up-hole in the back, which consigns its contents to oblivion.

I've tried in haste to make the listing readable using limited character set available in this forum web editor. If anyone wants the M\$Word version (more readable, more reliable) just email me at John@Wasilewski.co.uk (shock horror, a real email address!).

THINGS TO INVESTIGATE Resolve the mix-up between storage registers E and G (have I accidentally assigned both to the same use, when I intended them for different purposes?). I haven't had time to check this yet. Did a misplaced CF 10 instruction cause the program to hang? In the code that caused the crash, line 452 was between 411 and 412. I've run a simple test to see if clearing flag 10 before encountering teh text string display lines at 450 and 451 would cause a crash and it seems not to. I therefore do NOT think that this misplaced CF 10 instruction cause the program to hang.

### Re: Unrecoverable crash to lock-up

Message #16 Posted by [Meenzer](#) on 3 Oct 2007, 3:52 a.m.,  
in response to message #15 by John Wasilewski

Just to clarify before I (maybe) start keying this in my HP 35s: line 357 is supposed to mean "R down"?

What was your input when you ran the program to its crash?

I think I will SF/CF flag 10 before and after each text message, just to make sure...

### Re: Unrecoverable crash to lock-up

*Message #17 Posted by **John Wasilewski** on 3 Oct 2007, 4:30 p.m.,  
in response to message #16 by Meenzer*

Yes, R| means 'Roll down.'

If I can have your email address, I'll send you a more reliable M\$Word listing of the code.

About the program test data...

-----  
I forget what exactly my input was but it was something like the following. I don't know whether the units will be meaningful to you but I've included them below in case they are. Ignore if not.

Moment of resistance  
M=40,000,000 (or maybe 100,000,000)kn-m

Steel characteristic strength f(y)  
Y=460 N/mm2

Concrete characteristic strength f(cu)  
F=35 N/mm2

Cover to the reinforcement (top, bottom and sides)  
C=25 or maybe 40mm

Program then suggests a beam depth (eg H=450)  
Over-ride it with a shallower depth  
H=350 mm

Program then suggests a beam width (eg B=517)  
Over-ride it with a narrower width  
H=240 mm

Note that the suggested depth and width, if accepted or over-ridden with slightly larger sizes will result in a singly reinforced beam, needing only tension reinforcement. Using a smaller beam size than suggested will force the program to include compression reinforcement.

Standard reinforcement bar sizes are  
6, 8, 10, 12, 16, 20, 25, 32 and 40mm

Program now asks for reinforcing bar diameters.  
There will be a prompt and a pause, then NO prompt.  
Enter one or the other of the following  
(these are my suggested reinforcing bar sizes):

20 R/S for tension steel only  
-or-  
16 ENTER 20 R/S for sizes of  
both compression steel (top) and tension steel (btm)

IT IS AT THIS POINT WHERE MY CRASH-TO-LOCK-UP HAS  
OCCURED ON TWO SUCCESIVE OCCASIONS.  
Both tests were with under-sized beams, to force the prog to test  
the compression steel routines.

Program is supposed to:

Try to find a design with the chosen bar sizes.  
If it works then enter a loop of retries with ever increasing  
compression bar sizes until the bar configuration is found that

minimises the weight of steel.

eg display reads  
[4,16]  
[3,20]

This would mean use four 16mm compression bars  
and three 20mm tension bars for optimised design.

If no compression bar size is entered, and the program finds it  
needs compr steel then it should decide its own initial  
compression bar size and then enter the same optimisation loop.

Program also checks clear space between bars. If too small then  
increases the bar diameter (which reduces the number needed and  
increases the clear space between them.

Most of the above is written and was being tested when I  
discovered this crash-and-die behaviour. The only things missing  
were checks on tension bar spacing and an outer loop to optimise  
for tension steel bar size. These details are in there for  
compression steel though.

I hope the above will be sufficient for you.  
Very many thanks for considering that you might have a look at  
this problem.

---  
John

### **Re: Unrecoverable crash to lock-up**

*Message #18 Posted by [Meenzer](#) on 4 Oct 2007, 2:13 a.m.,  
in response to message #17 by John Wasilewski*

I'm still considering keying that stuff in - but to be honest, the chances are  
very weak ;-)

Anyway you should send these above informations to HP, too.

And to be frank: as the program uses no rocket science functionality, I'd grab  
the cheapest calculator I have on my shelf that I can connect to the PC (i.e.  
the Casio CFX-9850GB+) and do it on that one, while having the  
convenience to type it on the PC keyboard and running it on an emulator first.  
You could even have 7-line-menus and coloured graphs for the result ;-)  
If it is not obvious by now, I only use the HP 35s for some ad hoc  
programming and every day calculating - no problem if all stored data gets  
lost in a crash.

### **Re: Unrecoverable crash to lock-up**

*Message #19 Posted by [John Wasilewski](#) on 4 Oct 2007, 3:14 p.m.,  
in response to message #18 by Meenzer*

But I actually WANT to do it on an HP35s.  
Why?

Because I...

- 1) prefer the RP notation to infix very greatly,
- 2) rather like this new machine (though less and less!),
- 2) prefer HP key presses above all others,
- 3) like to impress other engineers with my flash calculator,

4) don't want more than one calculator.

---  
John

;-) For 1, 2a, 2b, and 4 you could use the HP 48G AND have the link option. I concede it's no good for impressing anyone ;-)

### **Re: Unrecoverable crash to lock-up**

*Message #21 Posted by **Antoine M. Couët** on 4 Oct 2007, 3:25 a.m.,  
in response to message #17 by John Wasilewski*

Oct 04 th, 2007

Dear John and Meenzer,

Certainly it is extremely sad to go through the hard if not painful experience of losing your entire data/programs you have taken so much time refining, John. It can ruin your day, or even week, or even worse.

So in order to help, I am just offering the following comments with the - hopefully right - assumption that HP35s language is pretty similar to HP 41 language as detailed here under. If such is not the case, then all the following lines are irrelevant, and I do apologize for bringing up some " unwanted noise " to this high quality Forum.

Most the following comments are plain good sense, and I certainly would not like to offend both of you through these " over simplistic " or underlined comments. In my own experience, even after many, very many ... HP41 programming hours/days/weeks and months ... ( far too many in my Wife's opinion and judgement ... ) I still occasionally get caught short and keep stumbling on " easy to avoid " traps. The only advantage experience has brought to me here is that I generally can debug my own programs much faster than in earlier times because I have acquired some kind of a " feeling "

about the potential areas where my own programming instructions might eventually go wrong ...

**Through reading your last detailed comments on your program, John, I am just wondering whether your various computation loops are correctly labelled and also whether they do not exceed the maximum authorized " depth level " ( if any applicable on the HP35s ).**

I am not familiar with HP35s programming, still HP35s language at a first glance seems to be rather similar to a combination of HP41 and HP25 languages with line addressing ( like in the HP25 C ) rather than label addressing ( like in the HP 41 ). This line addressing feature does save programming space, but it forces one to very/extremely carefully keep track of line numbers. Since any time you add or remove one instruction, all subsequent instructions are " line renumbered " and therefore have a different line address, it in turn implies to modify all subsequent/relevant line number references into your XEQ's and GTO's instructions.

So, before any more in depth crosschecking - and by comparison with HP 41 and HP 25 C programming practices - I would check :

- that all GTO's and XEQ's instructions refer to correctly numbered ( or correctly " newly/recently renumbered " ) lines,

- that all GTO's and XEQ's instructions finish up where they are supposed to. My guess is that if they are similar to the HP 41 loops addressing system, all " XEQ " instructions will finish at the first " RTN " or " END " instruction and then resume to the line immediately after the initial " XEQ " , while all " GTO " instructions are simply " plain branching/jumping instructions " just going from one point to another in the programm. **So it is extremely important to realize that an " XEQ " instruction cannot be inadvertently replaced by a " GTO " instruction, since, among unwanted results, it WILL ( sorry to write loud ... ) have an ( again most ) undesirable effect on loop(s) depth.**

- and most importantly, that the " loop depth " does not exceed the authorized " depth level " in the HP 35s. Loop depth on HP41 is a maximum of 6 pending returns if you want to finally exit all loops where you started them. What is " loop depth " on the HP45s ???

Again, I certainly do not want to offend both of you through my " over simplistic and dumb " thoughts. All these comments just to help, unfortunately and maybe not very much of an immediate help since the cross checking path I am suggesting requires a lot of extremely careful understanding /checking /testing about what is going on.

Since at a first glance, your Program seems quite " compact and condensed " - which is a very beautiful feature John - maybe it is worth verifying all the hereabove.

Another way to look at it is realizing that " nothing is more stupid that a Computer or a Calculator " but once you " cornered it " into doing exactly what you want it to do, then nothing is more " computation/numbers crunching efficient " .

Hope it does help ...

Hello from " Douce France " in Vendée where we are currently enjoying a wonderful and warm night with a beautiful 1/3 Moon just next to Pollux !

Best Regards and Good Luck - and keep us posted - from

Antoine

PS : BTW, I am no longer flying the good old Cargo DC10-30 Aircraft, but just transitioned to the B 757/767 flying again passengers now. Love flying, more than ever ...

*For HrastProgrammer, on last Friday early afternoon, I flew just a few miles north of Zagreb, and had - again - a quite thankful thought about you and about your wonderful HP 41 Emulator for the HP 48/49/50.... Thank you again here !*

Why didn't you land? :-)

**Re: Unrecoverable crash to lock-up**

*Message #23 Posted by [Thor Lansen](#) on 4 Oct 2007, 12:41 p.m., in response to message #21 by Antoine M. Couët*

My question is, in those many hours of programming have you had a complete crash of your HP41 (as apparently happened with the HP35s)? I do not own and I have no desire for a HP35s, but I own a HP41CX and a HP25C and I had programmed them a great deal (not anymore) and to my recollection (even stuck in infinite loops) I have never experienced something like John mentions. I can relate the problem he described to the annoying blue screens I get with "el crapo" OS that came with my PC (fortunately I have a hard drive to save my work to). It seems to me this is totally unacceptable and even more HP's response (or lack of) to the problem.

Regards, Thor

*Message #24 Posted by [Arne Halvorsen \(Norway\)](#) on 4 Oct 2007, 12:58 p.m., in response to message #23 by Thor Lansen*

Kind of my thoughts to! While I havent had a serious problem as the one described in this thread I have spent more time that I would like knowing getting out of the 'vector syntax bug state' doing this [project](#) on the HP-35s. It has turned out the be a fight between me and the machine.

Remember having no such problems with my old 41! Note to self:  
Get my act together and ship the good old one to fixthatcalc!

To bad hp rushed the 35s to the market :-)

### **Re: Unrecoverable crash to lock-up**

*Message #25 Posted by [Antoine M. Couët](#) on 4 Oct 2007, 1:51 p.m.,  
in response to message #23 by Thor Larsen*

You are very right, Thor : through using standard/conventional programming techniques never either did I experience one single serious HP41 crash similar to the one John described.

Still, it came to my mind to carefully check his HP35s program " loop structure " because line addressing is in essence certainly more delicate than using local or global labels. And John made a frequent use of the GTO and XEQ instructions.

In this current Program case, if one were absolutely sure that the entire " loop syntax " is fully respected and correct, then we would have a better documented case about a potentially quite serious Machine bug, even more crucial since apparently the HP35s seems to lack ( of ? ) any convenient data saving tool.

From recent posts, and in particular for the one related to " vector syntax ", the HP 35s seems somewhat deficient, either because it might lack comprehensive and accurate documentation, or simply because it was not extensively tested prior to Market Introduction.

And as earlier stated, so long as my guesses about the HP35s programming techniques are valid, I am certainly not pretending to deliver a full and definite answer or explanation to John's serious problems, but just and only giving indications of an area probably worth exploring.

Best Regards, Antoine

*Message #26 Posted by [John Wasilewski](#) on 4 Oct 2007, 3:22 p.m.,  
in response to message #25 by Antoine M. Couët*

Good chance that loop structure is why the program fails.  
That's not my problem.

The problem is why does THE CALCULATOR fail,  
not why does the program fail?  
And how do I prevent it?

We cannot have a programmable calculator that can't be used  
to try running any code that might have bugs in it!

How can we develop and debug new code

```
if the calculator might wipe out all
our work unless the code is already perfect
before we start debugging?
----
```

John

*Message #27 Posted by [John Wasilewski](#) on 4 Oct 2007, 3:06 p.m.,  
in response to message #21 by Antoine M. Couët*

It was very kind of you to take time to prepare such a good list of tips and I am not in the least offended. They look really interesting and I will study them. I'm sure I won't have thought of all of them.

Please bear in mind, however, that my problem is not how to debug my program - I have no worries about finding the last few glitches. The problem is how either to prevent calculator crashes to a locked-up state or how to recover if it happens again, without wiping out all my work

in response to message #17 by John Wasilewski*

Puhh, I just keyed in the first 200 lines and am sorry to say: I've had it. No more. Basta! I really give up. If maybe one day there will be a beaming device to transfer code to the HP 35s, I might start anew ;-)

### **Re: Unrecoverable crash to lock-up**

*Message #29 Posted by [Katie Wasserman](#) on 4 Oct 2007, 9:59 a.m.,  
in response to message #15 by John Wasilewski*

John,

I think that I understand the mnemonics of all the lines in the program except number 264.

```
263.      RCL O
264.      C,T BAR SIZES
265.      STO O
```

Is the "STO O" supposed to be a PSE?

-Katie

### **Re: Unrecoverable crash to lock-up**

*Message #32 Posted by **John Wasilewski** on 4 Oct 2007, 3:33 p.m.,  
in response to message #29 by Katie Wasserman*

Sorry Katie, I explained 263, so I replied to the wrong question.

```
263.      RCL O
264.      C,T BAR SIZES
265.      STO O
```

264 is a text string placed in the display using EQN, followed by a momentary PSE, to prompt the user to enter bar sizes. I did it this way because data entry at this point might consist of either tension steel bar size only (entered in the X line) or both compression and tension steel bar sizes (entered in the Y and X display lines)

eg

User data entry following this prompt might be just

```
16 R/S
(for 16mm tension bars)
```

or

```
16 ENTER 25 R/S
(for 16mm compression bars and 25mm tension bars)
```

----  
John

in response to message #32 by John Wasilewski*

Thanks for the explanation.

I've been playing with parts of your program trying to recreate the lock-up bug with no luck so far.

### **Re: Unrecoverable crash to lock-up**

*Message #34 Posted by **John Limpert** on 10 Oct 2007, 10:30 a.m.,  
in response to message #15 by John Wasilewski*

I typed in your program, although I won't guarantee that I didn't make any errors. My aging eyes have a hard time distinguishing between the symbols used for addition and division. It seemed to run OK, and it did not lockup or crash.

**John Wasilewski ... here's what I suggest...**

*Message #35 Posted by **Gene Wright** on 10 Oct 2007, 10:49 a.m.,  
in response to message #34 by John Limpert*

I'm not sure what country you are in, but I think you have a valid reason to return the unit for an exchange.

It seems that you have a machine with a problem that no one else is experiencing. Perhaps that is a result of a bad batch. More likely there is just something wrong with the innards of your machine.

Despite Katie's frustrations :- ) many of us are using the 35s and taxing the unit in many ways without ever seeing any crashes or behavior that gives us problems the way you are seeing them.

So, call HP's phone number, patiently explain that your HP 35s is not operating properly. I would not say that you are programming the machine, etc, as that would confuse the issue with whoever answers the phone. I would say that it locks up and does not function correctly, that you cannot reset the machine using the steps described in the manual without using the reset pin on the back which causes you to lose your data.

Explain how your friends with a 35s are not experiencing this type of problem and that you want to exchange your unit for another one that should not have this problem.

Do remember that the person on the phone talking to you from HP is part of the entire HP corporate world and will probably know little to nothing about HP calculators.

Let us know what the response is. If they are not helpful, let me know. A 35s should not behave like this and yours should be exchanged.

ok? :-)

Gene

**Re: Unrecoverable crash to lock-up**

*Message #36 Posted by **John Wasilewski** on 11 Oct 2007, 4:37 p.m.,  
in response to message #34 by John Limpert*

Reply to John Limpert.

Thank you for taking so much trouble to help with this problem.

Did you over-ride the prompt-suggested depth and width sizes with smaller values as input? THis is necessary to force the program to calculate compression steel.

When the program reaches line 264 it issues an alpha prompt for comp and tension steel then stops to wait for input (this is the action obtained when no PSE statement follows an alpha string whilst flag 10 is set). id you then enter just a tension steel diameter and press R/S (eg 20 R/S)?

It is only after the above steps have been passed that the endless loop is reached which I can't break out of.

Hi John,

You wrote an impressive program, beautifully arranged, but I have to ask the question: why bother? I can't stand putting more than a few lines together on a calculator; I'd rather do that sort of thing on a proper computer. Nowadays, the only thing going for calculators is, well, calculating.

I am curious: you have a specific reason for putting that kind of program on a calculator?

## Re: Unrecoverable crash to lock-up

*Message #38 Posted by [John Wasilewski](#) on 4 Oct 2007, 3:00 p.m.,  
in response to message #37 by bill platt*

Programs like this get built gradually in spare moments, on train journeys. One starts with a short bit of code that performs some useful function, and works. Then add a little more functionality. And again. It grows.

I also DO WANT a small library on my calculator of really good programs that will do things for me that I don't do a lot, so might need to look stuff up in text books when occasionally I need to check something or make an ad hoc design calculation.

In my case I have in mind some tight, smart code for (eg)

- Concrete beam analysis and design check
- Bearing capacity calculation
- Slope stability analysis
- Section properties calculation
- Principal stresses
- Earth pressure calculations
- Polynomial regression curve fit

My present guess is that that's about the limit that could fit into memory.

If I feel really ambitious I might also explore implementing a simple frame analysis program I once wrote for the TI59.

A library in my pocket of all the above, always instantly accessible, could be very valuable to me.

That's why.

---

John

*Message #39 Posted by [bill platt](#) on 4 Oct 2007, 4:37 p.m.,  
in response to message #38 by John Wasilewski*

I appreciate the train journey aspect, being a train buff myself.

For me, I/O becomes important for larger programs, libraries etc. It seems to me that the 50G makes a lot more sense (or for retro a 48GX). You can run an emulator on it for the 41cx, and therefore you can develop in RPN rather than RPL if it suits you. And you have backup, and I/O.

Best regards,

Bill

I am curious: you have a specific reason for putting that kind of program on a calculator?

That is precisely why I don't understand the reasoning behind the new 35S. Fair enough having programming capability on a non-I/O calculator, it's very useful, but why optimise the keypad layout for programming at the expense of ease of regular calculations? They changed this from the 33S to the 35S, why?

Dave.

**HHC2007 & HP Xpander**

Message #1 Posted by [Joerg Woerner](#) on 2 Oct 2007, 12:23 a.m.

First of all I like to say thank you to the great HP calculator community! I was a little scared before the trip to San Diego - imagine ONE Texas Instruments collector and SIXTY-EIGHT Hewlett Packard fans. But the wonderful event demonstrated easily:

The fans of the HP 35 are like their calculator: Simply perfect!

Thinking about the TI-Nspire on the nice calendar side-by-side with the Casio Classpad 300 and the Xpander prototype convinced me, that I should add them to my Datamath Calculator Museum ([www.datamath.org](http://www.datamath.org)).

I know that there are some Xpander's out. Is there a collector willing to borrow me his working or non-working unit for a week or so? Please remember that I live in the meantime in Rochester, NY.

Thanks in advance for your help.

Regards, Joerg

Thanks guys. All answers in the one post:

It's a bit smaller in area than 50x50mm, quite comfortable to wear.

No, it's not a USB port, but it could be. It's a "universal" I/O port that supports anything you can plug in, like RS232, IrDA, USB, or your own custom gadget. At the moment I only have an RS232 adapter for uploading and downloading programs (yes, it might very well be programmable ;-))

Note the WIDE ENTER key :-> Yes, the buttons are tactile.

Oh, and yes, it's both RPN and Algebraic.

And, no, you can't buy one, yet...

Dave.

You can permanently switch it to RPN mode.

If you are scared that the algebraic mode might pop out and eat you alive at some point, it could be easily removed from the firmware. And the keypad overlay is replaceable so you could have any key layout you want, if you didn't want those horrid parentheses. Perhaps I should add a "nuke algebraic" function that self erases the algebraic code from the firmware...

Dave.

### Re: O.K. -- So, How Was It?

Message #8 Posted by **Walter B** on 2 Oct 2007, 12:46 p.m.,  
in response to message #7 by Antonio Maschio (Italy)

Buona sera, Antonio,

since I didn't attend HHC2007 either (though contributed a tiny bit) I am free to guess. Let's try based on experience: On HHC2006, there was a talk given under an NDA (=non disclosure agreement, quite popular in USA), and 9 months later (seems to be a natural constant :) ) it turned out to have covered the HP35s or however this baby was called then. So, if an R&D person has a project, what will it be about?!?

So, let us rejoice and sing and dance (end of quotation) -- and hope that some of the ideas of this forum or at least those presented on HHC2007 will in whatever way succeed diffusing into said project :) so the output will be at least as nice as the last one :))

HTH, Walter

Can you give some details, at least?

\_\_\_\_\_

Sorry but it was all NDA'd. I didn't actually read the NDA before signing it, but I don't think they usually contain a "some details are OK" clause. On the hand, since you didn't sign it, your curiosity is completely legal. :-)

I don't mean to spoil the fun, but the day we break the NDA is the day those cool futures presentations from Cyrille stop. Try to get to an HHC sometime if you can!

*Message #11 Posted by [Seth Morabito](#) on 2 Oct 2007, 12:09 a.m.,  
in response to message #1 by Paul Brogger*

It was my first HHC ever, and boy I'm glad I went. I had a wonderful time.

HP was extraordinarily generous in letting us use and abuse their space for two days, and I want to say a public thank you to our hosts.

My highlight was finally getting to meet Sam Kim and Cyrille de Brebisson. These guys are passionate about calculators. They were also running around all day Saturday and most of Sunday doing things like getting ice and drinks and setting up snacks. Talk about involvement! You don't expect an HP product manager to be getting drinks for you, but Sam seemed happy to be doing so.

I came away from the meeting with renewed confidence in the direction HP is taking. They gave us a good insight into their world, and I'm extremely grateful. The division is in really good hands right now.

And no, they couldn't tell us about any new product ship dates, so we don't know anything more about that than you guys do :)

I would say that if you're thinking about it, do try to come next year. It was well worth the travel for me.

### **Re: O.K. -- So, How Was It?**

Again, how can any possible answer to that avoid violating a non-disclosure agreement!

C'mon people! Be reasonable!

Gene

P.S. That said, unless HP exits the calculator business, which I consider unlikely, there should be calculators sold over the next 10 years that are not being sold today. Some sort of new calculator is bound to be introduced.

Awesome. I believe there was a record number of participants this year. We went all day Saturday, literally, starting at 8:00 in the morning to almost 10:00 that night.

Some of the many highlights: many calculator designs. One person proposed that the HP 35s menu be changed to HP 17/42 like menus.

There was a talk about whether Einstein would have used a calculator, and the speaker, Wlodek Mier-Jedrzejowicz, stated that Einstein's calculator would require symbolic algebra, compact tensor notation, and matrices that allows equations.

Jean-Yves Avenard introduced a great program to handle implicit function graphing, the EDGE by Hyrdix.

Jake Schwartz gave us his review of changes to HP calculators. Thumbs up for the big ENTER key, raised angled keys instead of two shifted functions above the key. Thumbs down: lack of accessibility of base functions, lack of overlays, several color schemes (i.e. 6S, 30S).

Prizes ranged from the 14B, 32SII, 40g (39g with CAS) to many calculators from the 48 and 49 series. I won one of the 14B calculators and won a surprise auction to purchase a 41C.

I have officially joined the club of 41 owners.

### TI in the news in Washington, DC - But what about the HP35?

Message #1 Posted by [S. Martin](#) on 1 Oct 2007, 1:56 p.m.

I live in the Washington, DC metro area and have been hearing a lot about TI calculators lately with their donations to the Smithsonian's National Museum of American History:

<http://www.washingtonpost.com/wp-dyn/content/article/2007/09/30/AR2007093001332.html?hpid=sec-tech>  
<http://americanhistory.si.edu/news/pressrelease.cfm?key=29&newskey=604>

Even on local TV there has been some coverage of this event, with reference to TI making the first portable electronic slide rule (although we would like to think that honor goes to the HP35).

Ironic considering this should be the year of the 35!

### Re: TI in the news in Washington, DC - But what about the HP35?

Message #2 Posted by [Doug](#) on 1 Oct 2007, 5:19 p.m.,  
in response to message #1 by [S. Martin](#)

I agree, they are getting it wrong. I didn't retire my slide rule (Pickett N-500-ES) until the HP35 was in my hands. There was no other replacement for the sliderule. I was there, it was not a TI, if TI had introduced one I would have spent my \$395+ on a TI.

Best

### Other HP fans near Washington, DC?

Message #3 Posted by [Allen](#) on 1 Oct 2007, 7:58 p.m.,  
in response to message #1 by [S. Martin](#)

I wonder if there would be enough folks in the northeast (Wash. D.C.) area to have our own small east coast gathering of hp fanatics?? I myself am near Dulles airport (IAD). At least one or two other regulars are with 2 hours driving distance. I think it would be very interesting to exchange tips and programs.

I wanted very badly to attend either the HHC or the London meeting, but my daughter was just born last weekend.. the wife barely endures the calculator addiction as it is, but I'd be treading thin ice if I left just after a newborn!!

### A few questions concerning HP calculators

Message #1 Posted by [Chris Foley](#) on 1 Oct 2007, 8:07 a.m.

Hello,

I'm kind of HP addict for calculators and I have a few questions in mind:

#### HP 50G:

- Does this calculator include all the development tools for assembly programing (i.e. MASD, StringWriter...)?
- Are programs already written (and downloadable) to take advantage of the ARM processor?
- Is there already a successor programmed yet (HP 51 G)?
- What is the future to HP's calculators (compared to other ClassPad / Nspire)? In other way, will kind of Xpander calculator show up sometimes in the future?

#### HP 71B:

- Is it possible to program this calculator in assembly language without the (expensive) ASM/FORTH module? If not, is there another way to finding this module cheap enough? Can these modules be copied (RAM, EPROM) in some way?
- How to connect this calculator easily to a PC (using HP-IL interface)?
- Is there a trick to expand memory without installing the (again expensive) Corvallis memory module?
- What is the biggest memory Corvallis produced for this calculator, and are they still available?

#### HP 48SX:

My screen is defective: 1 entire column is missing pixels. How can I (if possible) change the screen to a new one? Is it worth the effort, or should I jump directly for a HP 50G?

Thanks for reading!

Chris.

Hi, Chris:

Chris posted:

*"HP 71B: - Is it possible to program this calculator in assembly language without the (expensive) ASM/FORTH module? If not, is there another way to finding this module cheap enough?"*

The easiest, cheapest, and fastest method by far would be to do all your HP-71B development using [the freeware HP-71B emulator Emu71](#) running on a Windows PC. The FORTH/Assembler ROM image is freely available as well (as are many other important ROMs and LEX files, such as the Math ROM) and it typically runs at least 350x faster, which means entering and assembling long assembler source code file is both feasible and convenient. Emu71 also emulates large amounts of RAM as well, HP-IL disk drives, and an 80-column HP-IL display for easy editing.

Once assembled, you would have to transfer the resulting BIN or LEX file to your physical HP-71B, if desired. This can be done but I'll let the explanation to other people more knowledgeable than me. In any case, you can contact Emu71's author for the details.

*"What is the biggest memory Corvallis produced for this calculator, and are they still available?"*

I do own a 128 Kb Corvallis RAM module, which plugs in the card reader port. I got it from eBay for \$90 at the time. It looks very nice when plugged in, what with the deep dark reed and gold lettering.

Best regards from V.

I've downloaded Jean-François' software, though I haven't used it yet. My point was to use my calculator to program (easier to carry, and BTW, I love the contact of this calculator when keys are pressed!) rather than my computer ;-).

Hi again, Chris:

Chris posted:

*"I've downloaded Jean-François' software, though I haven't used it yet. My point was to use my calculator to program"*

Yes, I understand your feelings, so to say, but I own and have extensively used the real, physical FORTH/Assembler ROM plugged in a physical HP-71B and entering, debugging, and assembling source code is a real pain, incredibly slow, error prone, tiring, time-consuming, and ultimately frustrating.

Even a short assembler source code file requires a lot of time to compile, and if there's some error, you'll have to debug and repeat the compilation any number of times. Memory consumption is also very high, and it all combines to the point where assembling moderate size source code files is either out of the question of you must be willing to spend many, many hours, and have many, many K's of free RAM to allocate to the task.

None of those problems apply when running a 350x-faster emulation loading its large, fully-commented source code from emulated disk, with 128 Kb of emulated RAM in a 80-column x 50-line full-screen display with a life-size PC keyboard. This takes away all the frustration and lets you concentrate in the assembler code instead. Then you can transfer your brand-new, shiny LEX file to your physical HP, if you want to use it there.

Just some friendly advice.

Best regards from V.

Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 1 Oct 2007, 10:48 a.m.,  
in response to message #1 by Chris Foley

Hi, Chris;

Quote:

---

- What is the future to HP's calculators (compared to other ClassPad / Nspire)? In other way, will kind of Xpander calculator show up sometimes in the future?

---

I'd guess neither HP would try an answer to that. Users are the ones to determine such future, i.e., will users be using HP calculators in the future? My HP41C helped me to understand many engineering situations once I decided to write programs to help solving them. And understanding RPN allowed me to reason in a different way when solving problems. I think not too many people care too much for these subjects.

Quote:

---

HP 48SX: My screen is defective: 1 entire column is missing pixels. How can I (if possible) change the screen to a new one? Is it worth the effort, or should I jump directly for a HP 50G?

---

First, one must be sure where is the problem. I have an HP42 with two columns and one row missing in the display. I replaced the LCD (a dead HP17BII) and the same lines were off. The problem was in the processor. As many of us have already seen, the HP42 has a single chip with ROM, keyboard and LCD interface included (RAM is external). So, there is no way to repair such thing. I have once replaced an HP48G LCD, and the fact is that it must be completely disassembled: the LCD itself is glued to a metal frame that can only be removed after breaking many plastic rivets that are accessible only after opening the calculator (plastic lockers and other rivets) and removing the main PCB (fixed in place with six twisted metal tabs). I'd not do that again unless it is a vintage HP48SX needing a new LCD (my HP48SX has a spot in the LCD; I have one spare HP48G carcass, and I am not willing to open the HP48SX so far...). To be honest, I'd give a new HP50G a try.

Not much of a help, I know, but I'd like to think of it as my 2¢.

Success.

Luiz (Brazil)

My HP41C helped me to understand many engineering situations once I decided to write programs to help solving them. And understanding RPN allowed me to reason in a different way

when solving prblems. I think not too many people care too much for these subjects.

Question is: is there an ear listening somewhere in HP's office? For instance, could the next calculator have the same *feeling* when pressing a key compared to my 48SX? What about using a 16 or 256 grey level LCD display? ...

Quote:

Not much of a help, I know, but I'd like to think of it as my 2¢.

On the contrary, it helps. I'll continue using my poor old 48SX that way instead of trying doing my *Mac Giver's* sort of thing (I have no particular skills in micro electronics...).

The HP50G seems a good calculator if I can use some already implemented assembly langage programming tools.

### **Re: A few questions concerning HP calculators**

Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 1 Oct 2007, 5:35 p.m.,  
in response to message #7 by Chris Foley

Hi, Chris (some spare time, again);

Quote:

The HP50G seems a good calculator if I can use some already implemented assembly langage programming tools.

About assembly language: I'm a Z-80, 8086-scratcher, meaning that I learnt how to program in assembly language with those guys... an actual bit-shrinker.

Assembly language demands hardware (internal processor architecture), peripheral and OS knowledge, unless you are programming in a second- or third-layer, i.e., an emulator. I first read about resident emulation with the Transmeta's Crusoe documentation. In this case, assembly documentation itself may fill the blanks.

I felt a bit disappointed after getting together many documentation about the Saturn assembly and then knowing that the new HP48/49/50 use ARM architecture instead... Learning assembly fundamentals is not that hard, what bothers me is to transpose existing knowledge base to new mnemonics, register set, addressing, flags... I guess new programming tools might provide existing codes to be ported, though.

Let us know if there is any news, O.K.?

Success!

Luiz (Brazil)

Almost everything that you learned about hardware Saturn assembly still applies to the ARM-based models. What you may well want to learn are new syntax rules and new features for the new programming tools. True, the new Saturnator is an emulated processor running in the ARM system, but it includes everything that's in the legacy hardware Saturn, as well as a good many new assembly language instructions.

The new instructions may make things easier, but you don't have to use them; it's your choice. For example, note that the ROMs for the emulators included with Debug4x don't use any of the new opcodes or access the ARM system, yet all of the legacy hardware Saturn and 49 series RPL code can be used with the emulators.

Regards,  
James

### Re: A few questions concerning HP calculators

Message #10 Posted by [Chris Foley](#) on 2 Oct 2007, 11:35 a.m.,  
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Quote:

About assembly language: I'm a Z-80, 8086-scratcher, meaning that I learnt how to program in assembly language with those guys... an actual bit-shrinker.

I learnt assembly language on both Z-80 (I also own a Sharp PC-1600) and SC61860 (sharp's other pocket computers), so I'm not afraid to program a 4 bit processor!

Quote:

I felt a bit disappointed after getting together many documentation about the Saturn assembly and then knowing that the new HP48/49/50 use ARM architecture instead... Learning assembly fundamentals is not that hard, what bothers me is to transpose existing knowledge base to new mnemonics, register set, addressing, flags... I guess new programming tools might provide existing codes to be ported, though.

As long as programming the Saturn is still possible, I don't bother.  
The only thing I find interesting in the HP49 series is the possibility to program the ARM directly on the calculator (if such a tool is available someday).

Chris.

### Re: A few questions concerning HP calculators

Message #11 Posted by [James M. Prange \(Michigan\)](#) on 1 Oct 2007, 7:56 p.m.,  
in response to message #7 by Chris Foley

Quote:

Question is: is there an ear listening somewhere in HP's office?

Based on the release of the 50g and 35s, I expect that someone at HP has been listening. I can't be absolutely certain that any current HP employees monitor this Museum Forum, but [Cyrille de Brebisson](#) occasionally posts to comp.sys.hp48.

Quote:

For instance, could the next calculator have the same *feeling* when pressing a key compared to my 48SX?

The 50g's keyboard doesn't seem as nice as the 48 series, but it's certainly an improvement over the 49G and early 49g+ units; maybe someday....

I suspect that my 48SX's keyboard may be somewhat "softer" than when it was new.

Quote:

What about using a 16 or 256 grey level LCD display? ...

I don't have any experience with it, but do some searches for "greyscale" (or perhaps "grayscale") and "OpenFire" at

comp.sys.hp48 and hpcalc.org.

Quote:

The HP50G seems a good calculator if I can use some already implemented assembly language programming tools.

You can, if you want to. However, many entry points have changed, so for any RPL code, the new Suprom49 files should be used.

All of the legacy hardware Saturn opcodes from the 48 series still work in the ARM-based models. Of course, if you want to use new tools, such as the built-in MASD, some adjustments to the source code syntax will be needed.

Regards,  
James

in response to message #1 by Chris Foley

Quote:

Does this calculator include all the development tools for assembly programming (i.e. MASD, StringWriter...)?

The same tools for the 48 should work for the 50g Saturn emulation.

Quote:

Are programs already written (and downloadable) to take advantage of the ARM processor?

Yes. There are a few. Recently I posted a PI program written in C and cross compiled for the ARM processor. It can compute 15000 digits of PI in < 7 minutes and save the output to the SD card.

Quote:

How to connect this calculator easily to a PC (using HP-IL interface)?

You need an HP-IL ISA adapter and a PC with an ISA slot and the registered version of EMU71. One you have this setup you can transfer from 71B <-> EMU71 as if EMU71 was a 71B.

Optionally you can get an HP-IL/RS-232 device.

Lastly you can always key in BASIC and with a BASIC program object code.

Quote:

or should I jump directly for a HP 50G?

Yes.

Not very easy for me (and probably expensive too).

I'm surprised that nobody worked on a HP-IL <-> USB adapter, considering the size of HP calculator's community. The only drawback with keying programs is loss of data, without possibility of saving months of work :-).

### Re: A few questions concerning HP calculators

Message #16 Posted by [Egan Ford](#) on 3 Oct 2007, 12:29 p.m.,  
in response to message #15 by Chris Foley

Quote:

Is there a *repository* website dedicated to these programs?

hpcalc.org has a few, grouped by function, not by language. It is a small community, the best place for examples are the examples included with HPGCC. Use the HPGCC mailing list and comp.sys.hp48 for support.

Quote:

Not very easy for me (and probably expensive too).

1. HP-IL ISA Adapter: ~\$50 (if you can find one).
2. Old ISA PC: ~\$20 (thrift store).
3. Software ~20 Euros.
4. 71B HP-IL Adapter: ~\$50-\$100
5. Two cables: ~\$50

The alternative is RS-232/HP-IL.

1. HP-IL/RS-232 Gateway: ~\$125 (one/month on eBay).
2. 71B HP-IL Adapter: ~\$50-\$100
3. Two cables: ~\$50

IMHO, if you value your time and data the first solution is inexpensive. The 2nd is more time consuming.

If you are only looking for backup:

1. 9114B floppy drive: ~\$200-\$300 (one known working/month on eBay).
2. 71B HP-IL Adapter: ~\$50-\$100
3. Two cables: ~\$50

Quote:

I'm surprised that nobody worked on a HP-IL <-> USB adapter, considering the size of HP calculator's community.

I'd be surprised if someone created an HP-IL <-> USB adapter, considering the size of *legacy* HP calculator's community. :-)

## Re: A few questions concerning HP calculators

Message #17 Posted by **James M. Prange (Michigan)** on 1 Oct 2007, 6:46 p.m.,  
in response to message #1 by Chris Foley

Quote:

**HP 50G:**

In general, the usenet group comp.sys.hp48 specializes in discussions of RPL models, and many downloads are available from <http://www.hpcalc.org/>.

Quote:

- Does this calculator include all the development tools for assembly programming (i.e. MASD, StringWriter...)?

The 49 series (49G, 49g+, 48gII, and 50g) have MASD built-in, as part of the "Development Library" application. However, to use mnemonic SysRPL command names, an extable library needs to be installed. Without extable installed, numeric pointers can be used. The extable library supplied by HP includes the supported entry points, and the extable2 library included with Emacs also includes some "unsupported but stable" entry points. You could also make a "customized" extable library with whichever entry points you chose.

With the ARM-based models (49g+, 48gII, and 50g), the Saturn processor is emulated, and includes additional assembly language instructions; this emulated processor is sometimes referred to as the "Saturnator" or "Saturn+".

[Debug4x](#) includes emulators that run in MS Windows, but note that it's the legacy "Hardware Saturn" processor that's emulated, not the ARM processor and Saturnator. As a result, it's not possible to run anything that attempts to access the ARM processor or use the new Saturnator opcodes on the emulators.

Apparently, the firmware ("ROM") for the ARM-based models is developed (perhaps using an emulator?) using only legacy

hardware Saturn code; and at this point, they will run on the emulators, or on the calculators themselves, including the hardware Saturn-based 49G. Then selected pieces of code are replaced (presumably to run faster), and the resulting firmware can be used only on a real ARM-based calculator.

I'm not familiar with StringWriter, but the built-in 49 series editor has added features, such as BEGIN, END, COPY, CUT, PASTE, FIND, and REPLACE. Various editors, notably Emacs, can be downloaded from [hpcalc.org](http://hpcalc.org).

Quote:

\_\_\_\_\_  
- Are programs already written (and downloadable) to take advantage of the ARM processor?  
\_\_\_\_\_

Well, in a sense, all programs that run on the ARM-based models are running on the ARM processor, although usually through a layer of emulation, so to some extent, they do "take advantage" of the ARM processor. Some are available that access the underlying ARM processor, and perhaps some that use the new Saturnator opcodes. Also see <http://hpgcc.org/> and <http://sourceforge.net/projects/hpgcc>.

Quote:

\_\_\_\_\_  
- Is there already a successor programmed yet (HP 51 G?)  
\_\_\_\_\_

The 50g is still pretty new, but I hope that HP is at least thinking about what to do for its successor. I expect that anyone who really knows has signed an NDA, so isn't allowed to publicly comment on this.

Quote:

\_\_\_\_\_  
- What is the future to HP's calculators (compared to other ClassPad / Nspire)? In other way, will kind of Xpander calculator show up sometimes in the future?  
\_\_\_\_\_

I don't know. Personally, I'd prefer that HP concentrate on working on the successor to the 50g, or perhaps a successor to the 35s, or an "updated" release of some other "Classic RPN" model.

Regards,  
James

With the ARM-based models (49g+, 48gII, and 50g), the Saturn processor is emulated, and includes additional assembly language instructions; this emulated processor is sometimes referred to as the "Saturnator" or "Saturn+".

Debug4x includes emulators that run in MS Windows, but note that it's the legacy "Hardware Saturn" processor that's emulated, not the ARM processor and Saturnator. As a result, it's not possible to run anything that attempts to access the ARM processor or use the new Saturnator opcodes on the emulators.

Apparently, the firmware ("ROM") for the ARM-based models is developed (perhaps using an emulator?) using only legacy hardware Saturn code; and at this point, they will run on the emulators, or on the calculators themselves, including the hardware Saturn-based 49G. Then selected pieces of code are replaced (presumably to run faster), and the resulting firmware can be used only on a real ARM-based calculator.

I'm not familiar with StringWriter, but the built-in 49 series editor has added features, such as BEGIN, END,

COPY, CUT, PASTE, FIND, and REPLACE. Various editors, notably Emacs, can be downloaded from [hpcalc.org](http://hpcalc.org).

That is perfectly clear, thanks for this long answer.

I'm not personally keen on using StringWriter, it's only because it's much quicker than my HP 48SX text editor!

The built-in editor your describing is just fine. As said before, coming from a 2Mhz calculator, every program will be fast enough for me.

Quote:

Well, in a sense, all programs that run on the ARM-based models are running on the ARM processor, although usually through a layer of emulation, so to some extent, they do "take advantage" of the ARM processor. Some are available that access the underlying ARM processor, and perhaps some that use the new Saturnator opcodes. Also see <http://hpgcc.org/> and <http://sourceforge.net/projects/hpgcc>.

I meant "natively" programmed for the ARM processor (using C or assembly language in that case).

I visited HPGCC's web site, but it doesn't propose programs to run on the HP 49 series, just the C compiler.

Quote:

I don't know. Personally, I'd prefer that HP concentrate on working on the successor to the 50g, or perhaps a successor to the 35s, or an "updated" release of some other "Classic RPN" model.

I find the new 35S terrific. I havn't used it yet, but it really has the *HP look*. So a successor to the HP50G using the same *look* philosophy is fine!

### **Native ARM programs**

Message #19 Posted by [James M. Prange \(Michigan\)](#) on 2 Oct 2007, 5:46 p.m.,  
in response to message #18 by Chris Foley

Quote:

I meant "natively" programmed for the ARM processor (using C or assembly language in that case).

I haven't heard of any written in ARM assembly language, but try some searches of [hpcalc.org](http://hpcalc.org) for C language programs for the 50g (or the 49g+, which should also work on the 50g), or ask on [comp.sys.hp48](http://comp.sys.hp48).

Quote:

I visited HPGCC's web site, but it doesn't propose programs to run on the HP 49 series, just the C compiler.

Won't the compiler allow you to write your own C language programs for the ARM-based models?

Regards,  
James

### **Re: A few questions concerning HP calculators**

Message #20 Posted by [Chris Foley](#) on 2 Oct 2007, 3:57 p.m.,  
in response to message #1 by Chris Foley

Some more questions:

#### **HP 48SX**

- What is the instruction to display the ROM version?
- Can I use a card without merging it to local memory, and execute a program saved on this card?

#### **HP 71B**

- What is the instruction to display the ROM version?
- Where can I find a list of *entry points*?

Thanks,  
Chris

## Re: A few questions concerning HP calculators

Message #21 Posted by **James M. Prange (Michigan)** on 2 Oct 2007, 7:39 p.m.,  
in response to message #20 by Chris Foley

Quote:

HP 48SX - What is the instruction to display the ROM version?

There are various methods of finding the ROM version of a 48SX/S:

1. The SysRPL command VERSTRING returns the "version string" in the form "HHP48-A", where the last letter represents the ROM version.
2. In the 48 series only, the address of the VERSTRING command is #30794h, so in UserRPL,

```
#30794h SYSEVAL
```

returns the version string.

Caution: Be sure to use the correct address, including the trailing h, unless you're willing to lose all user memory.

3. Transfer any object to a PC in binary mode, and open the file with a text editor. The version string is used as the "binary transfer header", that is, the first eight bytes of the file.
4. For the 48SX/S only:  
Hold down the ON key, press and release the D key, release the ON key; this starts the "interactive self-test".

Press the backspace key; this starts the "memory scanner" at address 705D9, showing the address and sixteen nibbles of memory starting at that address as:

```
705D9:1B8DA178E5A111B6
```

Press EVAL to execute this particular address, briefly displaying a version and copyright message in the form:

```
Version HP48-A  
Copyright HP 1989
```

If you want to see the message again, just press EVAL again.

Caution: Don't try to execute any other address, unless you're willing to lose all user memory.

To return to normal operation (at any point in the above), invoke a warmstart: Hold down the ON key, press and release the C key, release the ON key.

Of course, starting with the 48G series, the UserRPL command VERSION is available, but the VERSTRING methods can still be used, and may be used for distinguishing the 48SX/S (versions A-J) from the 48GX/G/G+ (versions K-R).

Quote:

- Can I use a card without merging it to local memory, and execute a program saved on this card?

Yes, with a "free" RAM card, (not "merged" with system RAM), you can execute a program stored on the card.

Well, actually, the program will be stored on the card within a named "backup object" or using different terminology, as a "port variable", and for execution, it will be copied to a temporary memory location within system RAM, but that's pretty much transparent to the user.

Regards,  
James

## **Re: A few questions concerning HP calculators**

Message #23 Posted by [Valentin Albillo](#) on 3 Oct 2007, 5:43 a.m.,  
*in response to message #20 by Chris Foley*

Hi again, Chris:

Chris posted:

*"HP 71B - What is the instruction to display the ROM version? Where can I find a list of entry points?"*

The ROM version is displayed by simply executing the VER\$ command, like this:

```
>VER$
```

```
HP71:2CDCC HPIL:1B MATH:1A STRU:A RCPY:E
```

This tells you that your HP-71B comes with four internal ROMs (ROM1, ROM2, ROM3, ROM4) and their versions are 2C,2D,2C, and 2C, respectively. This particular HP-71B also had the HP-IL ROM plugged in (version 1B), a Math ROM (version 1A) and two LEX files, STRU (version A) and RCPY (version E).

As for the entry points, all of them (lots and lots) are listed in Volume 2 of the Internal Design Specification (IDS).

Volume 1 discusses the internals of the HP-71B system and data structures in detail, and Volume 3 is the *commented* assembler source code for all 4 internal ROMs. They are available in this very Museum of HP's DVD. If you're interested in assembly programming for the HP-71B, these volumes are an absolute *\*must\**, period.

Best regards from V.

### US\$ 975 wanted for a defective HP10

Message #1 Posted by [Walter B](#) on 30 Sept 2007, 5:48 p.m.

[This is the offer at TAS.](#)

### (eBay warning) Sorry, old news

Message #2 Posted by [randy](#) on 30 Sept 2007, 7:59 p.m.,  
in response to message #1 by Walter B

Let's call that trolling for a sucker, Version 2.0 He tried that a year or so ago with the same item and had no takers. IIRC he paid about \$75 for it scored in a BIN. The box alone was worth what he paid for it but even doubling his money ins't enough for him...

TAS provides a steady stream of fools and their money. He recently sold a very unremarkable 35 and 55 for way more than market value. But hey, everybody has to learn somehow. The way I see it, classics have come way up the value scale of late. I found this way more interesting than Cobubba silliness: [HP67 with box](#)

### Re: (eBay warning) Sorry, old news

Message #3 Posted by [Raymond Del Tondo](#) on 1 Oct 2007, 12:36 a.m.,

Yes, you are certainly right. But to people, who need a scientific calculator at work/school/university (or at least think they need one, or convince themselves, that they do...), a good, durable, reliable and efficient to use calculator does indeed have a value which is reflected in the market price of such units. So I think, that a good 67 should be valued more or less like the current 35S -both have their advantages and disadvantages with respect to the other, making them more or less equal valued in my eye. This is why I pay 66 Euros for an HP-67 but not more.

Greetings, Max

### **I think zero also is a number to remember...**

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 29 Sept 2007, 2:12 p.m.

Found errors in my hp-35s programs due to the stupid way memory is managed on it, yea, yea, it's my fault, but still:

While not a bug I think the 35s indirect register handling is pretty ..... stupid ....

Say you want to store N numbers in register 0...N-1, god forbid some or your last numbers happens to be 0 (a perfectly okey number) AND register N,... happens not to be allocated. You get an INVALID when trying to learn that number N-1 was 0!

What you must do is to *allocate* your N registers by putting a 'watermark' non zero in register N.

I do not mind allocating and deallocating memory, but this reality of hp-35s is: a) implication not well documented, b) error prone. What I think should been here is commands to allocate registers and free registers!

*Edited: 29 Sept 2007, 5:16 p.m. after one or more responses were posted*

### **Re: I think zero also is a number to remember...**

Message #2 Posted by [Ed Look](#) on 29 Sept 2007, 5:12 p.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

I agree to a point.

It IS right now making it hard for me to complete a program to pick the mode out of a set of numbers (I'll, of course, keep working on it), but one also has to switch values in and out of the I or J registers, after initializing a block of memory registers with that first value.

Perhaps I am not making efficient enough use of the registers at hand, but it does seem as if I never have enough registers.

Hmm. Exactly like the 49g.

Is there I downside, I wonder? The cover may protect the LCD.

Regards,

Howard

### **Re: remove your screen cover.**

Message #4 Posted by [joan cardenas](#) on 29 Sept 2007, 3:15 a.m.,  
in response to message #3 by Howard Owen

Is a piece of crap plastic between the frame and the LCD. To dismantle it is easier than the 49 because the screws. That thing would avoid the warranty but I don't care.

When the LCD protector was out I could see plenty of scratches on it, and I only clean it twice. Really soft material.

Very easy to see also the reason of the missalignment display, but difficult to fix. The LCD is glued to a piece of metal with the proper guide to get a good position, but there's not any guide to glue it properly.

Regards.

**41CX fast timeout**

Message #1 Posted by [Greg Swartz](#) on 28 Sept 2007, 3:52 p.m.

I recently got a 41CX that, as far as I can tell, operates flawlessly. The only issue is that the timeout for the display is ~10 seconds, not 10 minutes like my other 41's. You can turn it right back on with the ON key, but if you were entering ALPHA characters you have to start over if you delay at all. Very annoying...

Anyone seen this before?

**Re: 41CX fast timeout**

Message #2 Posted by [Raymond Del Tondo](#) on 28 Sept 2007, 4:15 p.m.,  
in response to message #1 by Greg Swartz

Did you perform a memory reset (Memory Lost) ?

Raymond

**Re: 41CX fast timeout**

Message #3 Posted by [Greg Swartz](#) on 28 Sept 2007, 4:52 p.m.,  
in response to message #2 by Raymond Del Tondo

Yup. Tried the ON with the Arrow key. Also left batteries out for a few days with foil on the calc batt terminals to try to drain any residual memory. And, as a second note, the timer functions are accurate. I set the clock and only lost a few seconds over a few days before using CORRECT. But the display still time's out after ~10 seconds.

**Re: 41CX fast timeout**

Message #4 Posted by [Doug](#) on 28 Sept 2007, 6:14 p.m.,  
in response to message #3 by Greg Swartz

Not easy to fix, guess you are going to have to assign ON to a key and eat batteries and always remember to turn it off. Best

**Re: 41CX fast timeout**

Message #5 Posted by [Raymond Del Tondo](#) on 28 Sept 2007, 6:41 p.m.,  
in response to message #3 by Greg Swartz

May also be a hardware defect.

If it's not a halfnut CX, you could test the unit with another CPU board, to see if the problem comes from the CPU board, the display chip, or maybe even the connection strips...

The test unit doesn't necessarily have to be a CX. A C or CV pcb will also work.

I had some units with similar symptoms, where the problem were either the zebra stripes and/or the battery contact block.

One unit also had a 'cold' solder pin between the display pcb and the keyboard backplane.

In any case, if ou decide to open your CX, do it very carefully to not crack the screw posts, and always make sure beeing grounded to avoid ESD.

HTH

Raymond

**Re: 41CX fast timeout**

*Message #6 Posted by [Greg Swartz](#) on 28 Sept 2007, 9:45 p.m.,  
in response to message #5 by Raymond Del Tondo*

I have contemplated both assigning the ON finction and taking the thing apart (I've taken a few others apart before) but figured I'd troll the wealth of knowledge here before taking more drastic measures.

Thanks for the responses!

Greg

**Re: 41CX fast timeout - FIXED!!!**

*Message #7 Posted by [Greg Swartz](#) on 29 Sept 2007, 12:47 a.m.,  
in response to message #6 by Greg Swartz*

It was indeed a cold solder joint between the keyboard and LCD display. A little touch-up work and presto! Actually, all the connections at the LCD were a bit flaky. Just using the tip of an Exacto blade to test for movement broke away a few of the joints.

Thanks again for the suggestions! It got me where I needed to be to dis-assemble this one and actually fix it!

Greg

### HP35s Display Of Sign

Message #1 Posted by [Walter B](#) on 28 Sept 2007, 12:32 a.m.

This has probably been discussed here before, but I can't find it:

WHY does this calc display the unary minus in an elevated position?? IMO it looks really ugly, so there must be a technical reason but I am not able to imagine any.

### Re: HP35s Display Of Sign

Message #2 Posted by [bill platt](#) on 28 Sept 2007, 8:42 a.m.,  
in response to message #1 by [Walter B](#)

Probably in an attempt to make it identifiable. Unfortunately the unary minus is one of those never-get-it-quite-right "features". Although different from each other in important ways, I find the 27s approach and the 48 series approach very good and much better than anything in the 32s and its descendants.

### Re: HP35s Display Of Sign

Message #3 Posted by [Walter B](#) on 30 Sept 2007, 5:30 p.m.,  
in response to message #2 by [bill platt](#)

IMHO, the 48 series approach is the same as used in every reasonable HP calculator so far, i.e. 20 micrometer below zero are entered

20 +/- E 6 +/-

and are displayed as -2E-5 with the minus signs at half the number height.

I find the 27s approach strange because you must use the binary minus to enter a negative exponent, e.g.

20 +/- E - 6

meaning you use the operation minus for entering an unary minus.

However, the way to enter such numbers was not my point, but the display of negative mantissae and exponents with a \*misplaced\* minus. No earlier model does it this way, even the 33s has a correct minus in front of the mantissa at least.

### Re: HP35s Display Of Sign

Message #4 Posted by [bill platt](#) on 1 Oct 2007, 8:11 a.m.,  
in response to message #3 by [Walter B](#)

Quote:

However, the way to enter such numbers was not my point, but the display of negative

mantissae and exponents with a \*misplaced\* minus. No earlier model does it this way,

Actually, this is incorrect.

The 32sii has the unary minus displayed just as the 35s does, except that it is very bad in the 32sii because in the leading position, the unary minus is not "displaced" whereas it is displaced in positions to the right. (And in the 32sii, the unary minus takes precedence over exponentiation. There is some discussion of this in A DATAFILE article by Jordi Hidalgo, written about the 33s).

However, the way to enter such numbers was not my point, but the display of negative mantissae **and** exponents with a \*misplaced\* minus. No earlier model does it this way,

Actually, this is incorrect.

The 32sii has the unary minus displayed just as the 35s does, except that ... in the leading position, the unary minus is not "displaced" whereas it is displaced in positions to the right.

The 33s does it the same way as the 32sii. I regarded that as a **half way** decent display still. Therefore, I wrote "and" in my earlier post (see quote above).

So far, however, no one did explain the reason why to elevate the minus at all. Why not leave it standing on the normal level like in the 48, 42s and all the earlier models? Why make a simple thing complicated? Please explain to me like a 4-year-old :)

I'll try to provide a rationale for it. First of all, I'm not claiming that I'm right or that this is a valid reason from the ergonomic point of view, this is just my opinion.

I think that the display distinction between the subtraction "minus" symbol (correct level) and the unary "minus" symbol (raised) has to do with the fact that, for equation-parsing purposes, both are *different* operations and thus get parsed as unique, *distinct* internal keycodes, one for the 2-argument arithmetic subtraction, the other for the 1-argument unary minus.

The distinct symbols are needed because else it would be an ambiguous situation if they were to appear in an equation which some user must key in (from a listing or an screen dump, say). If both were graphically equal, the user could get confused and not know whether he needed to press the "+/-" key or the "-" key to get that particular "-" symbol on the screen. And why is this important ? Because the wrong key would get you a syntax error. For instance:

```
A001 EQN SIN(-X)
```

where the "-" is obtained by pressing the "+/-" key, parses and executes correctly, as it is an unary operation being applied to a single argument X, while the very same equation but with the "-" obtained by pressing the "-" key results in a **SYNTAX ERROR** upon execution, as the internally parsed keycode corresponds to the 2-argument subtraction operation and here it's missing its left argument.

Hope that helps.

Best regards from V.

### Re: HP35s Display Of Sign

Message #7 Posted by **bill platt** on 1 Oct 2007, 9:13 p.m.,  
in response to message #6 by Valentin Albillo

Hi Valentin:

What you point out about syntax is what I like about the 48, and the 27s, even though they are different. There is only one thing--a minus--and it is parsed by its location (in the 48) and in the 27s, there isn't a +/- in the equation parser--you get beeped at and that is that. In both cases, it parses like on paper (more or less:-).

### Re: HP35s Display Of Sign

Message #8 Posted by **Walter B** on 2 Oct 2007, 1:51 a.m.,  
in response to message #6 by Valentin Albillo

Buenas dias, Valentin, y muchas gracias! Finally, this is a reasonable explanation. So the strange display is because of the equation function only. Well :/

After this, I'd like to second Bill. When you key in an equation, you use your calc in kind of alpha mode. So a "-" is a "-" is a "-", and the parser should be intelligent enough to separate unary and binary "-".

### A bit of history (was Re: HP35s Display Of Sign)

Message #9 Posted by [Valentin Albillo](#) on 2 Oct 2007, 5:32 a.m.,  
in response to message #8 by Walter B

Hi again, Walter:

Walter posted:

*"Buenas dias, Valentin, y muchas gracias!"*

You're welcome ! :-)

*"So a '-' is a '-' is a '-'', and the parser should be intelligent enough to separate unary and binary '-'"*

From a purely ergonomic and traditional point of view, I do agree that both the unary minus and subtraction symbols have both always been portrayed in math literature as the one symbol "-", no questions about that.

However, there exist very well known, stablished math software which departs from tradition and perhaps ergonomoy in the name of mathematical consistency. That would mean that, since unary minus and subtraction are wholly *different* operations, it isn't consistent to have just *one* symbol to represent both and thus each should be assigned a *unique* symbol.

This is seen, for instance, in **Mathematica**, one of the worldwide famous, leading math packages. In Mathematica, to mean "sine of X" you must write it this way:

Sin[X]

i.e.: using square *brackets* for the argument of the sine function, instead of the traditional *parentheses* seen in math literature everywhere. This bold departure is grounded in sound consistency reasons, because parentheses already have a use, namely to change order of evaluation, and have no business being also used as argument delimiters, this would only create ambiguities which, for a powerful symbolic package, can't be tolerated. So mathematical consistency it is, and tradition must take a back seat.

That said, I think the HP35s design team were a little lazy on this one, because for such a product there's no valid reason to annoy the user by having two distinct "-" symbols where consistency isn't paramount and it would have been quite easy to avoid.

For instance, vintage SHARP BASIC handhelds do parse each algebraic expression as it is entered, recognizing identifiers and substituting them for appropriate internal codes, deciding on the fly where a "-" is a unary operation and where it is a subtraction. Some early models did have a separated, bold "E" for exponents, as opposed to the regular alphanumeric "E", but even that was removed in later models, where "E" would be properly recognized as an exponent or a letter (variable, etc) depending on the context. A side benefit of this pre-parsing was increased speed of execution and reduced memory usage, as "RADIANS" would be internally stored as a 1-byte token instead of a 7-byte alpha string, and would be instantly executed on encountering it again, not reparsed each time.

Some other machines did even better. The HP-85, for instance, would parse any algebraic expression entered by the user (for immediate execution or as a program line) into an internal fully RPN representation, which was the one being stored, the original algebraic expression being discarded. Whenever the program encountered the expression, it would execute it directly in its RPN form (similarly to Java bytecodes), no parsing and no further conversion necessary, so speed was maximal. Upon the user requiring a LIST of the program, the RPN expression would be decompiled to algebraic representation just for that one purpose and sent to the output device.

That clever working was normally transparent to the user, who was unaware of the compiling-to-RPN, decompiling-to-output procedures, but sometimes the effect was visible: should you enter an algebraic expression with redundant, unnecessary parentheses, the compilation to RPN would get rid of them, and so any subsequent LIST operations would reconstruct an optimized algebraic, with just the right amount of necessary parentheses. So, in a way, it did optimize your expressions for you.

Those were the times ! Sadly, I don't think present day HP has either the spirit or the budget allotment necessary to keep with that "Utmost Excellency Above All" paradigm of old anymore.

Best regards from V.

*Message #10 Posted by [Meenzer](#) on 2 Oct 2007, 5:53 a.m.,  
in response to message #9 by Valentin Albillo*

Well, there is a use for having unary and binary minus entered and displayed in different ways on the HP 35s - and receiving a "Syntax Error" when having done it the wrong way:

Suppose you wanted to key in  $\sin(y-x)$  as an EQN but you accidentally skip the y and key in  $\sin(-x)$ . When you now XEQ the equation, the HP 35s will respond with a "Syntax Error" because it parses a binary minus where it expects a unary minus. So you have the chance to correct your mistake which you would not have had, had the 35s assumed that the binary minus should be a unary one.

---

That's a lame excuse on Mathematica's part. There is no ambiguity using parentheses for both grouping and function calling. The somewhat more well established mathematical package Maple has no trouble using parentheses for both grouping and function calling. The same can be said for 99% of the programming languages out there. Heck, even Fortran managed to do this in the 1960s.

The only place I've ever seen a valid reason for two different minus signs is in APL. There, the traditional "-" symbol was used for both subtraction and negation. The raised minus symbol was used as part of a number. In other words, "-" was always an operation, whereas the raised minus was basically a number entry symbol, just like the digits and decimal point were. The reason this was necessary in APL is because of the vector syntax. Consider the following examples (where I use "\_" to represent the raised minus):

$$-1 \ 2 \ 3$$

$$\quad \_1 \ \_2 \ \_3$$

$$1 \ \_2 \ 3 \ - \ \_4 \ 5 \ \_6$$

$$\quad \quad \quad 5 \ \_7 \ 9$$

So the raised minus ("\_") applies only to individual syntactic numbers, whereas "-", whether unary or binary, applies to expressions.

Stefan

## Re: A bit of history (was Re: HP35s Display Of Sign)

Message #18 Posted by [Valentin Albillo](#) on 3 Oct 2007, 6:58 a.m.,  
in response to message #17 by Stefan Vorkoetter

Hi, Stefan:

Stefan posted:

*"That's a lame excuse on Mathematica's part. There is no ambiguity using parentheses for both grouping and function calling."*

That's a subjective opinion on your part and unless you sustain it with valid arguments it doesn't have to necessarily be taken as the truth.

As this is an off-topic matter as far as HP calculators are concerned, I won't enter into a long discussion about it and this will be my last message on the subject, but let's check your "no ambiguity" statement.

**Mathematica** is a very complex software package which has to deal with extremely complex mathematical symbolic objects and operations. As such, it is essential that *no* ambiguities are allowed to crop in, and every distinct object or operation must have a *distinct*, non-ambiguous set of symbols associated with them.

Classical mathematical notation uses parentheses for at least two different, non-related purposes: (1) To define grouping of operations so as to be able to specify a particular order (2) to enclose the arguments to be passed to a function. Both uses have *nothing to do with one another*, and having the same symbol for both of them is potentially ambiguous and inconsistent.

For instance, suppose that you find this expression:

$$\text{Scale} ( \text{Adist} + \text{Bdist} )$$

what is the intended meaning ? It could be interpreted two ways, namely:

- A variable, *Scale*, which multiplies the sum of two variables, *Adist* and *Bdist*, or

- A function, *Scale*, which is passed the sum of two variables, *Adist* and *Bdist*, as an argument to operate upon.

Unless you know substantial additional information about the environment where that expression will be evaluated, you can't tell which interpretation applies, i.e., the meaning is ambiguous.

Mathematica's development team realized this problem and cut the feet under it at once, preferring to promote consistency rather than indulging in extra programming to further promote ambiguity. Thus, in Mathematica you'll have:

```
Scale ( Adist + Bdist)    for the first
interpretation
```

```
Scale[ Adist + Bdist ]   for the second
interpretation
```

and I don't see the lameness nor the excuse at all.

Thanks for your comment and

Best regards from V.

### **Re: A bit of history (was Re: HP35s Display Of Sign)**

Or they could have just required a multiplication symbol whenever multiplication was desired. That's less intrusive than making people learn a whole new syntax for function calls. In fact, I don't think implied multiplication is allowed in Mathematica, although I could be wrong about that.

Stefan

### **Re: A bit of history (was Re: HP35s Display Of Sign)**

*Message #20 Posted by [Valentin Albillo](#) on 3 Oct 2007, 2:25 p.m., in response to message #19 by Stefan Vorkoetter*

Hi again, Stefan:

Stefan posted:

*"Or they could have just required a multiplication symbol whenever multiplication was desired [...] In fact, I don't think implied multiplication is allowed in Mathematica, although I could be wrong about that."*

You're wrong, of course. Implied multiplication *is* allowed in Mathematica from day one. The mere fact you didn't know about it implies that you are criticizing a math package you don't know well, if at all. I don't intend this to sound derogatory, just plain fact.

As for having a multiplication symbol explicitly stated when multiplication is desired instead of parameter passing, I'll simply quote Mr. Theodore W. Gray, one of the chief creators of Mathematica:

*"It's a mistake to use the same symbols to mean these two completely different things, and Mathematica corrects this mistake by using round parentheses only for order of evaluation, and square brackets only for function arguments [...]"*

*Although I'm all in favor of interesting, quirky languages for writing novels and poetry (English comes to mind), it's really a bad idea to use an ambiguous language for something like mathematics [...]"*

*An alternative would be to insist on using \* for all multiplication [...] We decided it was better to remove an inconsistency than to force people to use an extra symbol. Another option would have been to have Mathematica "know" what was a variable and what was a function. This turns out to have serious consequences and it's really not a good idea."*

As you can see, they thought pretty hard about this and what was best and why. You may disagree, of course, even though you don't seem to know Mathematica in depth if at all, but you can't say that their rationale was just "*a lame excuse*".

I rest my case.

Again, thanks for your comments and

Best regards from V.

Message #21 Posted by [Karl Schneider](#) on 4 Oct 2007, 12:00 a.m.,  
in response to message #18 by Valentin Albillo

Hi, Stefan --

You posted,

Quote:

---

There is no ambiguity (*in Mathematica*) using parentheses for both grouping and function calling.

---

This brings to mind the Fortran constructs (at least, in '77 and previous) for arrays and function calls. Fortran was originally developed for input devices having austere keyboards that lacked many of the characters of modern 101- or 102-key English-language keyboards. "{ }" and "[ ]" were unutilized in the language, for example -- and likely unavailable in the early days. This led to ambiguities that had to be resolved by rule and context:

The statement

A = B( 3, 4)

could be interpreted as either

"A is the result returned by function B using input arguments 3 and 4"

or

"A is set equal to element (3, 4) of array B."

The only way to distinguish function-involutions from arrays was that, if B was declared in the routine's non-executable code as an array, it would be handled as such. Else, B was a function, which would not need to be declared because Fortran did not require prototyping -- unless, of course, B was an *internal* function, which would be defined in the routine, and unavailable to other routines.

Implicit multiplication -- which was not supported by these versions of Fortran -- would have added a third possibility, as long as only one item was enclosed within the parentheses. This brings to mind the following: "(3, 4)" could also represent a complex number, in which case "B(3, 4)" would be improper syntax.

-- KS

### HP 35S number width exceeds display

Message #1 Posted by [Wolfgang Jacques \(Germany\)](#) on 27 Sept 2007, 6:30 p.m.

Hello everyone, I just got my HP 35S and I noticed that when "all" digits are to be shown, I get:

2345678 1/x = "4,26315973463E-" ... .. scrolling to the right ... "7"

Very brave of the calculator to show all known digits, but very annoying that I have to scroll to view the last digit of the exponent.

The 33S for example reveals "4,2631597346E-7" which is just fine and as it should be.

Is there an explanation or even a workaround for this? I'd hate to go back to the fixed decimal places as known from the 12C.

Regards, Wolfgang

### Re: HP 35S number width exceeds display

Message #2 Posted by [Karl Schneider](#) on 28 Sept 2007, 12:14 a.m.,  
in response to message #1 by Wolfgang Jacques (Germany)

Wolfgang --

Welcome! (I saw your earlier post in response to mine from several weeks ago...)

No, I don't believe that it was the best idea, either. I'll be presenting a constructive suggestion in the near future.

### Re: HP 35S number width exceeds display

Message #3 Posted by [Walter B](#) on 28 Sept 2007, 12:18 a.m.,  
in response to message #1 by Wolfgang Jacques (Germany)

Hallo Wolfgang,

with SCI 7 you'll be sure to see everything. IMHO there are very few practical cases where you have >8 significant digits.

HTH

Walter

### Re: HP 35S number width exceeds display

*Message #4 Posted by [Wolfgang Jacques \(Germany\)](#) on 28 Sept 2007, 6:14 a.m.,  
in response to message #3 by Walter B*

Hello Walter, you're right of course, but I'd love to leave the setting to "all" decimal places and get a reasonable reading for every calculation - and sadly that does not seem to work :-)

**Re: HP 35S number width exceeds display**

*Message #5 Posted by [vq](#) on 28 Sept 2007, 6:51 a.m.,  
in response to message #4 by Wolfgang Jacques (Germany)*

Yes, the "ALL" setting is extremely inconvenient on HP35S, hiding the most important part of a result quite often. I wonder if someone at HP ever tried to do some trivial calculations on HP35S before production?

Using SCI7 is not a good workaround as most numbers easily fit in the display without the E notation - 0.07645 is (for me at least) easier to read than 7.645E-2. I use FIX7 instead, which works quite fine for most occasions, though not an ideal solution.

**Re: HP 35S number width exceeds display**

*Message #6 Posted by [bill platt](#) on 28 Sept 2007, 8:39 a.m.,  
in response to message #5 by vq*

For some of us that grew up on Voyagers and earlier, we are quite happy with a FIXed notation and find the ALL notation quite useless most of the time.

**Re: HP 35S number width exceeds display**

*Message #7 Posted by [Martin Pinckney](#) on 28 Sept 2007, 8:52 a.m.,  
in response to message #6 by bill platt*

I guess we civil engineers must do only approximate calculations. I can't imagine routinely needing 7 significant digits. I usually use FIX 3, sometimes FIX 4, and even FIX 2!

*Message #8 Posted by [Kelly Huckman](#) on 28 Sept 2007, 9:35 a.m.,  
in response to message #7 by Martin Pinckney*

My god, fix 2? Isn't [this](#) what happened the last time a civil engineer used fix 2?

Kidding of course. ;)

**Re: HP 35S number width exceeds display**

*Message #9 Posted by [Meenzer](#) on 28 Sept 2007, 10:06 a.m.,  
in response to message #8 by Kelly Huckman*

Some years ago civil engineers in Switzerland and Germany had a problem that even could not have been solved with FIX 20...

A bridge was build, starting on the Swiss border and ending on the German side - 50 cm to low. The reason for this was the fact that Swiss cartographers refer to an AMSL (above mean sea level) taken in the Mediterranean, Germans measure the North Sea as zero (Austria refers to the Adriatic, Eastern Europe to the Baltic Sea). And these zeros

are different as the Earth is not a perfect sphere.  
The real joke was that the engineers KNEW it - but corrected their measurements in the wrong direction ;-)

*Message #11 Posted by [db \(martinez, ca.\)](#) on 28 Sept 2007, 7:46 p.m.,  
in response to message #6 by bill platt*

bill; i've used fix to remind myself where i am in the output of a program not written for the 41 (i know-why bother?): fix 4 for angle, fix 3 when distance comes up. since i never remember which way i'm going: ft>m is fix three, m>ft is fix two. it's kind of a sneaky way to label output on a calc that doesn't arclx.

**Re: HP 35S number width exceeds display**

*Message #12 Posted by [bill platt](#) on 29 Sept 2007, 9:32 p.m.,  
in response to message #11 by db (martinez, ca.)*

That is clever. And since the meter is a larger unit, it makes sense to give it more decimal places and so it is easy to remember the hidden meaning.

Oh, and on my 32sii, I store 0.3048 in "H" (so that pushing RCL twice brings it up). It gets a lot of use :-)

*Edited: 29 Sept 2007, 9:33 p.m.*

**Re: HP 35S number width exceeds display**

*Message #13 Posted by [Brad Davis](#) on 28 Sept 2007, 6:23 p.m.,  
in response to message #1 by Wolfgang Jacques (Germany)*

Here's a related question.

Just for example, say I divide 10 by 12 and get 0.8333 with the 3 repeating forever, of course. I keep mine set at Fix 4, so this one displays no problem. Say, for the sake of argument, that I wanted to use the ->ENG. Mine comes up as 833.3333333E- and the 3 off the right side of the screen. The exponent's sign stayed on the screen, but the number was booted off.

I've had this happen on several real calcs and it's irritating to have to scroll to the right to see the exponent. Is there a way to keep it from doing this?

### **Did get out of it!!**

Message #2 Posted by [Arne Halvorsen \(Norway\)](#) on 27 Sept 2007, 1:11 p.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

Okey, did not have to reset the machine!

What I have done before when get the vector bug entering vectors is to go into alg mode and do something with vectors there, usual when return to sanity mode (that would be rpn mode) the bug is gone...

Okey, since this now happened for vectors in equations inside programs when run, I made the following silly program:

```
Z001 LBL Z
Z002 eq [0,1]x[0,1]
Z003 R/S
Z004 eq [1,0,0]x[0,1,0]
Z005 RTN
```

And run it in *alg* mode, switched to rpn mode and found my other programs now worked!!

No gurantee this will work every time! But one may wanna try if get into same problem as described here...

### hp42s ROT XY function

Message #1 Posted by [joe santavicca](#) on 26 Sept 2007, 6:56 p.m.

How does the function work - I've recently come across a need for performing binary math. This is one of the rare instances where my intuition has failed when using my hp. The manual is a bit thin on the subject. Help if you know.

### Re: hp42s ROT XY function

Message #2 Posted by [Raymond Del Tondo](#) on 27 Sept 2007, 4:18 a.m.,  
in response to message #1 by joe santavicca

ROTXY - Rotate Y by X bits. Simply works as expected;-)

HTH

Raymond

### Re: hp42s ROT XY function

Message #3 Posted by [John Limpert](#) on 27 Sept 2007, 4:30 a.m.,  
in response to message #1 by joe santavicca

What are you having trouble with? I looked it up in the manual and it does a standard rotate left or rotate right on a 36-bit number. If you look at the y-register as an array of 36 bits, where index 0 is the least-significant-bit and index 35 is the most significant bit, and the x-register contains 1, then:

```
t = y[0]
y[0] = y[1]
y[1] = y[2]
...
y[33] = y[34]
y[34] = y[35]
y[35] = t
```

That was a rotate right by one bit. You can think of it as a circular shift-register where the most-significant-bit is connected to the least-significant-bit.

### Re: hp42s ROT XY function

Message #4 Posted by [Thomas Okken](#) on 27 Sept 2007, 6:19 a.m.,  
in response to message #3 by John Limpert

Also note that the sign of X indicates the direction of the rotation: 2 means rotate **right** by 2 bits, -3 means rotate **left** by 3 bits, etc.

*Edited: 27 Sept 2007, 6:21 a.m.*

### Re: hp42s ROT XY function

*Message #5 Posted by **Doug** on 27 Sept 2007, 7:47 a.m.,  
in response to message #3 by John Limpert*

On the 41C, ROTXY uses 32 bits but I will assume it works the same. Assign HEXIN and HEXVIEW (or the equivalents) to keys to get a better feel for what is going on. Assign the AND/OR/NOT functions as well. Wish I had a 42s.

Best

### Recent Apple Gadgets Reminiscent of HPs of Old

Message #1 Posted by [Les Wright](#) on 26 Sept 2007, 12:01 p.m.

Greetings all,

I have recently concluded that, after a busy year, I have about all of the HP calculators I want for now.

I have turned my attention to Apple's new gadgetry. I already own a well used iPod mini and some peripherals and have recently acquired the tiny perfect iPod nano and beautiful iPod touch. I am eager to get the much praised iPhone if it ever finds a carrier in Canada.

The usability and design of Apple's new issues titillate and satisfy me in a way I have not know since getting my first HP calculator over 20 years ago. I suspect that these devices will be regarded by many as throwaways to be replaced when faster and smaller ones come along in a year or two, but I still see collectibility potential here.

Thoughts?

Les

The only Apple product I currently own is a third-generation iPod; it's not very collectible any more since it got pretty scratched up over time -- heck, I actually use the thing and when I shove it in the same pocket as my keys these things happen. ;-)

Anyway, to answer your question, even though a 3rd gen iPod is obsolete in many ways, I think it has stood the test of time pretty well so far. My only beef with it, and also with other recent portable Apple devices, is the non-user-changeable battery. Fortunately, there are third parties that offer battery replacement kits (including the tools needed to open the darn devices without damaging them), but it shouldn't be this hard. (I have the same complaint about my Palm Z22, which is a great little device in all other respects.)

- Thomas

in response to message #1 by Les Wright*

Hello!

Quote:

\_\_\_\_\_

Thoughts?

\_\_\_\_\_

I don't think that the current Apple gadgets will ever become true collectibles. The production numbers are much too high and due to their internal construction (failure prone hard disks and non-replacable batteries) they are not going to work forever.

Even the (then) expensive and therefore quite rare Newton Message Pad is not popular among collectors as the extremely low prices on eBay show.

I have been a convinced fan and user of Apple Computers since nearly 20 years and cannot imagine of ever switching to a different brand again, but as for their gadgets, I couldn't care less. I would rather wish they dedicated all this effort into the development of innovative and stable computer hard- and software (as they used to do before they invented the iPod, whatever the latter did to their bank balance)! BTW: This is my favourite iPhone Website :-): <http://www.willitblend.com/videos.a...fe&video=iphone>

Greetings, Max

NB: You can get unlocked iPhones for less than 500 \$ US on eBay now that should work fine in Canada and everywhere else!

**Re: Recent Apple Gadgets Reminiscent of HPs of Old**

*Message #7 Posted by **Chuck** on 26 Sept 2007, 3:46 p.m.,

### arithmetic used in the HP 50g

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 26 Sept 2007, 9:49 a.m.

Seing me getting back to [working with hp calculators](#) recalled a lot of (happy I think) memories by my boss, a mathematician. He recalled he had an hp-28c somewhere and asked me recently:

-->

One of the reasons I bought the HP 28c, so many years ago now, was that HP were one of the first implementers of the IEEE floating point standard, and at that time I was doing some work that involved the standard.

It would be interesting to know or get any publications that describe the arithmetic used in the HP 50g.

If you see or know of links to any such publications please let me know.

<--

Background is company just ordered a hp-50g. Being one of the programmers here I will get to spend some quality time with it :-) But not for a while (I am getting into the habit of waiting for hp calcs) since it turns out the HP-50g is not selling in Norway yet because manual not translated yet! I think most customer of it would be quite happy with english manual...

Perhaps someone here know anything about this topic of my manager's question?

(before any goes totally RTFM on me; specs I have seen does not give such details and the manual links on hp.com are dead now(!) and done some googling)

### Re: arithmetic used in the HP 50g

Message #2 Posted by [Thomas Okken](#) on 26 Sept 2007, 10:42 a.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

I just tried [the links at hp.com](#) and I could download the HP-50g user's guide and the manual with no problem.

(Don't worry, this is not an RTFM -- I don't know the answer to you question about HP-50g arithmetic, but I thought it was worth mentioning that the manuals **are** still available on-line.)

- Thomas

### Re: arithmetic used in the HP 50g

Message #3 Posted by [Arne Halvorsen \(Norway\)](#) on 26 Sept 2007, 10:51 a.m.,  
in response to message #2 by [Thomas Okken](#)

Thanks, it must be my problem somehow then! I am ofcourse interested in downloading the manuals since it seems I will be using the machine at some point in the near future.

BUT : I get to this place:

[http://h20000.www2.hp.com/service/site/404/Bsc404\\_en.html](http://h20000.www2.hp.com/service/site/404/Bsc404_en.html)

whenever trying those links! I am banned or something!

in response to message #7 by Arne Halvorsen (Norway)*

While you are waiting for your hardware, have you thought about downloading a nice hp 50g emulator? You can download the manuals and start using an hp 50g (emulated) today..

<http://www.educalc.net/881486.page>

; ) Pal

**Re: arithmetic used in the HP 50g**

*Message #9 Posted by [Eric Smith](#) on 26 Sept 2007, 2:46 p.m.,  
in response to message #1 by Arne Halvorsen (Norway)*

Quote:

One of the reasons I bought the HP 28c, so many years ago now, was that HP were one of the first implementers of the IEEE floating point standard, and at that time I was doing some work that involved the standard.

The HP-71B was the only HP calculator that used IEEE floating point, and it used IEEE 854 radix-independent floating point rather than the more common IEEE 754 binary floating point.

The Saturn-based calculators, including the 28C, used arithmetic code derived from that of the 71B, but did not provide full IEEE 854 compliance.

Quote:

It would be interesting to know or get any publications that describe the arithmetic used in the HP 50g.

I think the 50g still uses the Saturn arithmetic code derived from the 71B, but I haven't dug into it enough to know it for a fact. The 49g+ and 50g did move some low level functions from Saturn code to native ARM code, but I haven't heard of that being done to the floating point arithmetic.

**Re: arithmetic used in the HP 50g**

*Message #10 Posted by [Arne Halvorsen \(Norway\)](#) on 27 Sept 2007, 4:14 a.m.,  
in response to message #9 by Eric Smith*

From my manager :-): Thanks, very helpful.

### OT: Excel strikes again!

Message #1 Posted by [Rodger Rosenbaum](#) on 26 Sept 2007, 5:38 a.m.

Can you believe it?

And we complain when a calculator can't get  $\sin(89.99999999)$  right!

<http://www.downloadsquad.com/2007/09/25/excel-2007-cant-do-math-unless-850-77-1-100-000/>

### Re: OT: Excel strikes again!

Message #2 Posted by [Thomas Okken](#) on 26 Sept 2007, 5:50 a.m.,  
in response to message #1 by Rodger Rosenbaum

I've read about this -- apparently any calculation that should yield 65535 prints 100000 instead. I haven't been able to reproduce this in Excel 2000; from what I hear the bug was introduced in Excel 2007. I suspect, though, that the bug is not that Excel 2007 calculates the wrong result; it sounds more like it **displays** the wrong number. Can anyone verify -- i.e. what happens when you calculate  $850 * 77.1 + 1$  ?

- Thomas

### Re: OT: Excel strikes again!

Message #3 Posted by [Namir](#) on 26 Sept 2007, 8:06 a.m.,  
in response to message #2 by Thomas Okken

Thomas,

My Excel 2007 displays 100001 as the result of  $850 * 77.1 + 1$ .

When I remove the ".1", Excel displays 65451.

I also tried variations of the bug-causing expression that you mentioned, such as  $'=5*170*2*(19*2+0.55)+1'$  and still got 10001.

I am less than amused with this bug.

Namir

*Edited: 26 Sept 2007, 8:16 a.m.*

### Re: OT: Excel strikes again!

Message #4 Posted by [Giancarlo \(Italy\)](#) on 26 Sept 2007, 8:26 a.m.,  
in response to message #3 by Namir

Hi Namir.

Don't wanna keep going at you ;-) but you may want to have a look at this thread:

[microsoft.public.excel](mailto:microsoft.public.excel)

Best regards.  
Giancarlo

**Re: OT: Excel strikes again!**

*Message #5 Posted by **Chuck** on 26 Sept 2007, 2:29 p.m.,  
in response to message #3 by Namir*

I just did a few calculations...

$77.1 * 850 + 1$  is not correct, but  $+2$  is.

Also, putting  $77.1 * 85$  in one cell, and 2 in another, sums to 65537, but replacing with a 1 sums to 1000001. Way strange.

However,  $5 * 13107$  does give 65535, so it is only for particular equations giving 65535. Hmmm,

**Re: OT: Excel strikes again!**

*Message #6 Posted by **Les Wright** on 27 Sept 2007, 12:39 a.m.,  
in response to message #3 by Namir*

I have become a fan of the freeware open source OpenOffice suite.

OpenOffice's wordprocessor, spreadsheet, and presentation components look and act a lot like the very expensive Microsoft product.

The spreadsheet product in OpenOffice doesn't seem to have this bug. And, in some very unscientific tests of mine, seems to achieve better accuracy in trigonometrics and some special functions than Excel.

Sometimes you don't get what you pay for!

For folks who want to spend money on software, the Numbers application in Apple iWork '08, whose full price is a mere \$79US, doesn't seem to have the MS but.

Les

**Re: OT: Excel strikes again!**

*Message #7 Posted by **Eamonn** on 26 Sept 2007, 12:11 p.m.,  
in response to message #2 by Thomas Okken*

Thomas,

Yes, it looks like some kind of display issue.  $850 * 77.1 + 1$  displays 100001. However,  $850 * 77.1 - 1$  displays 65534.

Best Regards,

Eamonn.

### MoHPC Plagiarism?

Message #1 Posted by [SteveH](#) on 26 Sept 2007, 2:37 a.m.

Paying one of my occasional visit to the UK eBay site I was interested to see that there is an [HP15C for sale at the moment](#).

As I read through the listing I started to get a sense of deja vu (again) and compared the listing against the entry for the HP 15C at this site. They match word-for-word including the links within the article, the use of the American 'math' rather than the 'maths' that one would normally see in Nantwich and the MoHPC watermark on the photos. After all that I was hugely amused to see the seller assert his copyright at the end of the listing.

When I've sold stuff on eBay in the past I've looked around the Internet for reference material to use in creating the listing but I have always felt that you should try to create that information to create your own listing. Would I be correct in thinking that this problem is pretty common with eBay sellers? If so this seems like a pretty egregious example.

-- Cheers,

Steve

Message #2 Posted by [Maximilian Hohmann](#) on 26 Sept 2007, 3:26 a.m.,  
in response to message #1 by SteveH

Hello!

Quote:

Would I be correct in thinking that this problem is pretty common with eBay sellers?

Yes, you would be... Just read the text in the yellow box at the bottom of the front page of Joerg Woerner's Datamath-Website: <http://www.datamath.org/> It has been there for quite some time!

One problem is that eBay does not allow external links in the article description any more (for whatever reason?). So instead of just placing a link to a site with more information, people are forced to either write their own text, or copy-paste whatever they can find. And according to the laws of physics, the path that offers the least resistance or effort is the preferred one...

Greetings, Max

*Edited: 26 Sept 2007, 3:27 a.m.*

The auction in question does have a link to the HP museum. So it looks like eBay does allow at least some external links.

\_\_\_\_\_

This seems to be one of the subtle national differences of eBay. On german eBay, some automatic mechanism removes every auction that contains external links within a couple of hours! I thought this was the same everywhere. And in this case, I really can't understand why the seller should copy-paste the contents of the site he links to into his item description?

Greetings, Max

*Edited: 26 Sept 2007, 10:55 a.m.*

\_\_\_\_\_

I thought the different national eBay sites (ebay.de, ebay.nl, etc.) were just language-specific front-ends to the same global eBay system. I guess there is more eBay weirdness than is dreamt of in my philosophy. ;-)

I also find it odd that an automatic system would remove auctions with external links after a couple of hours... Why use a cron job for that kind of cleanup when it would be so much easier and more efficient to filter such content the instant the user tries to submit it...?

- Thomas

= quoted from (without naming) J.W.v.Goethe, Faust (without TAS, of course).

Copy & paste (= quoting without naming a source) is very common on TAS and in the internet in general. More educated people mention the source at least. Even pictures are taken, erasing the watermark. This is in no way correct, but such is life. If everything would be deleted which is incorrect or unfair or irrational (besides numbers ;), the world would be a lot easier, but it is not.

I'd rather think there are hordes of students checking every auction for any possible break of rules. I have had auctions being pulled due to putting my ebay name as a copyright protection into my pictures. No links at all. It's against their rules though, since my ebay name is one of my websites URLs - with no content however. They obviously didn't care to check, nor did they care about me being a member for more than 10 years now :/

Ceertainly any copying should at least identify the source. Once such identification is in place there is another way of looking at all of this. In the early 1800's Charles Caleb Colton wrote "Imitation is the sincerest of flattery."

### Re: MoHPC Plagiarism?

Message #11 Posted by **Allen** on 27 Sept 2007, 6:29 a.m.,  
in response to message #1 by SteveH

Quote:

Would I be correct in thinking that this problem is pretty common with eBay sellers?

Unfortunately, yes. I have seen many sellers (sometimes experienced sellers) use material from the Museum website. Most of the time I send a short request like:

Greetings, Do you have a picture of the actual calculator instead of the photo you stole from the Museum of HP website?"

I then attach a link to the [IMAGE AND PICTURE THEFT](#) Policy.

Just as Joerg Woerner has said in his disclaimer, many sellers respond and remove the copied material, BUT some others respond with some pretty nasty verbal abuse. Even If I can't report the copyrighted material stolen from MoHP website, I can report obscene emails.

The worst of these emails is from the TAS administrators themselves!! As frequent a victim of image/text theft, I will tell you, the department that handles this kind of abuse is full of incompetent people. Their response is a three-day process which always follows this pattern:

REP: I'm sorry we couldn't find any evidence of stolen images or text in the listing you reported.

ME: How about my name typed on the screen in the picture? And the links to my store in the auction text?

REP: (one day later) The auction text seems generic or is from the manufacturer.

ME: Google the first 20 words of [this] paragraph! There are no other paragraphs like this on the internet.

REP: (two days later) Oh, we'll take some action we can't tell you about.

This is **completely** obscene for a company that charges as much as they do for their services.

Unfortunately if your copyrighted material is not in another (active or still archived) listing, it is MUCH more difficult to spur the VeRO team into action. The process involves a Faxed [NOCI](#) form. **NOTE:** there are provisions on this form for Dave to delegate reporting authority to others if he desires.

In contrast, I recently found some of my items on craigslist, and with one short email titled [NOTIFICATION OF CLAIMS OF INFRINGEMENT](#) the stolen ad was removed within a few hours without fuss. I didn't have to write and explain what a 'link' or 'jpg' was.

**71B battery problem**

Message #1 Posted by [Ciaran](#) on 26 Sept 2007, 12:15 a.m.

So my 71B, which has been working faithfully for the last three years (on the same batteries!) recently had it's batteries 'liberated' when no other AAA's could be found around the house. A month later I replace them (with bog-standard alkaline AAA's from Ikea) and it's not happy.

The display has every element turned on, and it won't respond to any key presses. Anyone know what's wrong with it, or what I can do?

**Re: 71B battery problem**

Message #2 Posted by [Namir](#) on 26 Sept 2007, 12:45 a.m.,  
in response to message #1 by Ciaran

Try take the batteries out and connect the battery contacts to each other with a metal wire. You may have some kind of static build up.

**Re: 71B battery problem**

Message #3 Posted by [Ciaran](#) on 26 Sept 2007, 1:02 a.m.,  
in response to message #2 by Namir

Just tried that - alas it's still the same.

**Re: 71B battery problem**

Message #4 Posted by [Valentin Albillo](#) on 26 Sept 2007, 5:28 a.m.,  
in response to message #1 by Ciaran

Hi,

Did you try pressing the [ON] key and the [/] (divide) key simultaneously, holding for a couple of seconds, then releasing ?

The manual suggests this:

- Unplug all modules and peripherals
- Remove batteries
- Press the [ON] key for 30 seconds
- Insert new batteries (correct voltage and polarity, etc)
- Press [ON] and [/] simultaneously for a couple of seconds

This should completely reset the machine. If this doesn't work, I would let it without batteries for 24 hours then try again.

Hope that helps.

Best regards from V.

**Re: 71B battery problem**

*Message #5 Posted by [Ciaran](#) on 26 Sept 2007, 11:40 a.m.,  
in response to message #4 by Valentin Albillo*

Success! The reset worked. Thanks all!

I should probably get a manual for it...

**Re: 71B battery problem**

*Message #6 Posted by [Alex L](#) on 26 Sept 2007, 9:43 a.m.,  
in response to message #1 by Ciaran*

Also, since every element is turned on, double-check that the contrast is not out of whack. Good luck!

in response to message #1 by Miguel Reznicek

I'm not aware of any 41-to-50g program converters, but you could give HrastProgrammer's (commercial) HP-41X emulator a try; see <http://www.hrastprogrammer.com/>.

Note that Hrast himself is not very enthusiastic about running his emulators on the 49g+ and 50g (see <http://www.hrastprogrammer.com/hp49gp.htm>, the paragraph near the bottom of the page), but maybe you can try a demo version to check if it will do the job for you.

HTH,

- Thomas

in response to message #1 by Miguel Reznicek

Quote:

\_\_\_\_\_

Has anyone out there written an application that converts Hp 41C programs into Hp 50g programs?

\_\_\_\_\_

I rather doubt it; programming these different models is just so, well, different.

Other than Thomas's suggestion of using a 41 emulator on the 50g, I'd think that the best thing would be to study the programs enough so that you really understand how they work, and then, otherwise pretty much "from scratch", write programs to accomplish the same things on the 50g.

If RPL models are new to you, then you might start by reading Bill Wickes's *HP 41/HP 48 Transitions*, available on the Museum CD/DVD set. See <http://www.hpmuseum.org/cd/cddesc.htm>.

Regards,

James

Well, I don't see any mention of screen captures at <http://hpconnect.sourceforge.net/>, or in the 0.9.1 release notes, so I doubt that they're available with HPConnect.

But the author sometimes posts on the comp.sys.hp48 usenet group, so you could ask about (or request) this feature on the newsgroup, or you could e-mail the author instead. Perhaps, if there's enough enthusiasm for screen captures, maybe he'll add this feature.

In case you don't already use a newsreader, the newsgroup can also be accessed at <http://groups.google.com/group/comp.sys.hp48/>.

Or maybe post a "feature request" at <http://sourceforge.net/projects/hpconnect/>.

Come to think of it, maybe complain to HP that they should develop their own connectivity kit for the Mac, instead of relying on unpaid volunteers for such things. I doubt that it would do much good, but it might make you feel better, at least temporarily.

Regards,  
James

in response to message #2 by [Thomas Okken](#)

Thanks! I think I need a new set of manuals. Thank you again.

### HP-41 SigmaREG? and SIZE? functions

Message #4 Posted by [Karl Schneider](#) on 26 Sept 2007, 1:41 a.m.,  
in response to message #1 by [Catello](#)

Quote:

"SigmaREG?" which should return the number of the statistical registers...

Thomas' answer is correct, but you misdescribed the function. "SigmaREG?" returns the identifier of the first of the six numbered registers used for statistical summation. The user can set that register using "SigmaREG". The HP-42S retained both functions, perhaps for compatibility with the HP-41. However, the "HP-42S' little brother" HP-32S designated stat registers in a *better* way: the six stat registers are taken from the free memory pool.

For statistical summation, earlier models use the lowest-numbered registers (last to be de-allocated for programming), except that the HP-15C used R2 through R7, reserving R0 and R1 for matrix indices.

There is a similar function called "SIZE?" which supplements SIZE on the HP-41. SIZE? returns the number of registers allocated to data storage, which is settable by SIZE. SIZE?, however, is available on the X-Functions module as well as the HP-41CX.

Here's yet another example where the HP-15C trumped the HP-41C/CV: The equivalent of SIZE? was

available on the HP-15C as "RCL DIM (i)".

### Editor on Mac or PC for 50g programs

Message #1 Posted by [Miguel Reznicek](#) on 25 Sept 2007, 11:37 a.m.

Friends: What do you all use to edit and prepare programs for the 50g when doing so on an Win XP driven PC? Does anyone use a Mac with OS X for this? I was thinking a text editor like BBEdit, then saving to the SD card, then into the 50g. What file extension should be used? Comments? Ideas? Suggestions?

Thanks, -Migs

### Re: Editor on Mac or PC for 50g programs

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 25 Sept 2007, 10:33 p.m.,  
in response to message #1 by Miguel Reznicek

Quote:

Friends: What do you all use to edit and prepare programs for the 50g when doing so on an Win XP driven PC?

Well, I simply use my favourite text editor, [TSE Pro](#).

I normally use translation mode 3, which can be set by doing 3 TRANSIO, or by editing the last element in IOPAR to 3, or by choosing Xlat:CHR 128-255 in an input form.

Of course you could use a different translation mode, but depending on the character set in use, it may be difficult to read some non-ASCII characters, and somewhat of a pain to enter them.

Quote:

Does anyone use a Mac with OS X for this? I was thinking a text editor like BBEdit,

I don't have any experience with a Mac, but any text editor should be okay; even MS Notepad will work in a pinch. Just use whichever one you prefer. Even a "word processor", such as MS Word or WordPerfect, should work, as long as the files are saved as plain text, to avoid having the word processor's control codes or escape sequences stored in the file.

Using an ordinary text editor means that you have to learn some translation sequences for non-ASCII character, but I expect that the ones that you frequently use will be easy to remember. For a User-RPL program that builds a character string that looks like a translation table for characters 128-255, you could use the program:

```
%%HP: T(3)A(R)F(.);
@ For 49G, 49g+, 48gII, or 50g only.
@ Checksum: # A162h
@ Size:      116.5
\<<
  " "
  128 255
```

```

FOR n
  "\010"
  n
  " "
  OVER R\ ->B
  OVER +
  PICK3 CHR
  PICK3
  OVER
  # 2F34Eh SYSEVAL      @ KVIS for 49 series.
  + + + + +
NEXT
"\010" +
\>>

```

Or a faster SysRPL version is included with my "ASCII on SD" package.

Which characters are actually translated by the above program depends on which translation mode is in effect when the program is run. Of course, how the characters look depends on which font is current when the string is viewed.

Of course, once the string is built, you could store it as a global variable, so you wouldn't have to run the program again.

In addition, in modes 1-3, LineFeed codes are translated to CarriageReturn-LineFeed pairs, and in modes 2 and 3, \ is translated to \\.

Quote:

---

then saving to the SD card, then into the 50g.

---

Well, there's a minor problem with that. Any transfers between the flash card and the calculator are "binary" transfers, so the entire file contents would be stored within a character string object, instead of being translated and compiled as the intended object. For a work-around, see <http://www.hpcalc.org/search.php?query=ASCII+on+SD>.

For some more general information, see my [recent post](#).

The source code file should have an ASCII transfer header similar to:

```
%%HP: T(3)A(R)F(.);
```

This header tells the calculator, first, that it's to be treated as an ASCII transfer, then the T() parameter tells it which translation mode (0-3) to use, then the A() tells it which angular mode, D for Degree, R for Radian, or G for Grad, and the F() tells it which is the fraction mark, . for period or , for comma. These parameters can be in any order, and if any parameters are missing, then the current mode is used. A very minimal ASCII transfer header would be:

```
%%HP: ;
```

This would tell the calculator that it's an ASCII transfer, but whichever modes happened to be current would be used.

Unfortunately, the ASCII transfer header doesn't include any information on whether a number without any fraction mark should be treated as a "real number" or a zint (exact integer). In general, if the source code was originally written for (or transferred from) a 48 series, have the 49 series in "approximate" mode, so that such numbers will be compiled as reals, or if the source code was originally for the 49 series, have the 49 series in "exact" mode, so that such numbers will be compiled as zints. This also applies to "real arrays" and "symbolic matrices".

Quote:

---

What file extension should be used?

---

The calculator doesn't pay any attention to a file extension; it's just part of the global name that will be used, **except** that if you have the "fraction mark" set to comma instead of period (dot), then the "dot" will be treated as a separator instead of part of the name. So if you use the comma for a fraction mark, it's best not to use any file extension, or if you use the period as the fraction mark, use any valid file extension that you like.

Other than that, Conn4x can be set up to use a .hp extension for files that it stores on the PC, and the .hp is removed before the variables are stored on the calculator.

Quote:

---

Comments? Ideas? Suggestions?

---

If you'd like to use a USB connection instead of a flash card, you could try [HPConnect](#) on a Mac with OS X 10.3 or later.

Just so they don't feel left out, any Linux users could try [HPTalx](#).

A "special" (MS Windows) editor that many seem to like is [HPUserEdit](#). This editor uses a character set that matches the calculator's, and if I recall correctly, you select a non-ASCII character with a mouse click. I find it much easier to use my text editor and simply type in any translation sequences, but I realize that preferences do vary.

Regards,  
James

### HP 41CV freezes on pressing ALPHA

Message #1 Posted by [Martin Sonntag](#) on 25 Sept 2007, 5:36 a.m.

Dear Experts,

I have acquired a HP41 CV from eb\*\*. It looks okay, and I can calculate with it and write little programs, but each time I press ALPHA the display goes blank (except for the ALPHA annunciator) and freezes. Entering letters or digits is not possible. If I press (ON-Backspace) or (ON-Enter) it goes back to the 'normal' mode and displays the last stack alright. Several tries with MEMORY LOST/battery removals did not change this.

Has anyone of you seen this? Is there a possibility to fix this or should I just forget about the machine and buy another one?

Thanks for any hints, Martin

### Re: HP 41CV freezes on pressing ALPHA

Message #2 Posted by [Karl Schneider](#) on 26 Sept 2007, 12:42 a.m.,  
in response to message #1 by Martin Sonntag

Martin --

Is the HP-41CV a fullnut (1980-1984, rectangular display window), or a halfnut (1985-1990, window with rounded corners)?

If it's a fullnut, it may benefit from an ultrasonic cleaning and re-soldering of bad joints. My two misbehaving fullnuts were both fixed by this service.

-- KS

### Re: HP 41CV freezes on pressing ALPHA

Message #3 Posted by [Martin Sonntag](#) on 26 Sept 2007, 6:26 a.m.,  
in response to message #2 by Karl Schneider

Karl,

yes, it's a fullnut, so not all hope is lost :-). Examining the PCB closely, I found a few tiny metal chips stuck to some of the contacts. A good cleaning is obviously necessary. I'll try to get hold of an ultrasonic cleaner, then. Are there any joints which I should have a closer look at (i.e. known weaknesses of this machine)?

Martin

*Edited: 26 Sept 2007, 6:26 a.m.*

**Re: HP 41CV freezes on pressing ALPHA**

*Message #4 Posted by [Karl Schneider](#) on 26 Sept 2007, 11:55 a.m.,  
in response to message #3 by Martin Sonntag*

Martin --

Quote:

---

Are there any joints which I should have a closer look at (i.e. known weaknesses of this machine)?

---

Couldn't tell ya. I had the services performed by [www.fixthatcalc.com](http://www.fixthatcalc.com)

In addition to my own two units (also purchased on eBay and mailed to me by commercial air, presumably in the cold, rarefied cargo hold), a colleague's fullnut also exhibited symptoms of malfunctioning. I suspect that the age and circuitry of fullnuts make them susceptible to this.

### 71B - Your chances of winning the lottery

Message #1 Posted by [RonHudson\(USA\)](#) on 24 Sept 2007, 3:03 p.m.

When the California lottery started one of the local news guys said "Your chance of winning is about the same as flipping a coin the same way 25 times in a row" Hmmm How many flips might that be?

```
10 DELAY.1
```

```
20 DESTROY ALL
```

```
30 H=0 @ T=0 @ R=0 @ M=0 @ N = RND > RND
```

```
40 'NEQ':R=0 @ X = FLAG(0,NOT FLAG(0))
```

```
50 'THROW':L=N @ N = RND > RND
```

```
60 IF N THEN H=H+1 ELSE T=T+1
```

```
70 IF N<>L THEN GOTO 'NEQ'
```

```
80 R=R+1 @ DISP M;H+T;INT(100*R/M)
```

```
90 IF R>M THEN M=R @ DISP M;H+T
```

```
100 IF M<25 THEN GOTO 'THROW'
```

```
110 DISP H/T;H+T;H;T @ STOP
```

You will probably need fresh batteries for this one :^) I have not been able to let it run to completion yet.. I keep needing my 71 for other things.

I am accepting ideas for stuff to write...

*Edited: 24 Sept 2007, 3:04 p.m.*

### Re: 71B - Your chances of winning the lottery

in response to message #1 by [RonHudson\(USA\)](#)

Here is a faster version:

```
10 DISP .5^25
```

### Re: 71B - Your chances of winning the lottery

Message #3 Posted by [Chuck Sommer](#) on 24 Sept 2007, 5:41 p.m.,  
in response to message #2 by [Egan Ford](#)

If you flip a coin 25 times in a row, then you flip it 25 times.

On the other hand if you want to calculate the odds of flipping a coin and it comes up Heads 25 times in a row, then it is simply

1 in  $2^{25}$  = about 1 in 33.55 million. If you want to calculate the odds of flipping a coin and it coming up the same 25 times in a row, then it would be 1 in  $2^{24}$  or about 1 in 16.78 million.

Any Help?

**Re: 71B - Your chances of winning the lottery**

*Message #4 Posted by **Ren** on 25 Sept 2007, 10:46 a.m.,  
in response to message #1 by RonHudson(USA)*

I'm sure you've all heard this one before...

Your odds of winning the lottery are the same, whether or not you buy a ticket.

Ren

dona nobis pacem

**Re: 71B - Your chances of winning the lottery**

*Message #5 Posted by **Namir** on 25 Sept 2007, 11:53 a.m.,  
in response to message #4 by Ren*

Ren,

I look at it this way. The chance of me keeping my lottery money is 99.999999999999999999999999999999%. If I do this many many times over many many years, the total savings come out to winning a small lottery ... at a near 100%!!!

### Hp 50g: How do I clear a Matrix inside Matrix Writer

Message #1 Posted by [Miguel Reznicek](#) on 24 Sept 2007, 8:26 a.m.

Friends:

I'm using an Hp 50g.

Lets say I enter a list of numbers in the cells of the Matrix Writer. I run some statistics on the numbers and I wish to enter a new list. How do I clear the old one without going an clearing the contents one by one? I suspect it has to do with the PURGE command, but since the object has no name (that I can tell) I don't know how to reference it.

Thanks amigos,

Migs

### Re: Hp 50g: How do I clear a Matrix inside Matrix Writer

Message #2 Posted by [Hal Bitton in Boise](#) on 24 Sept 2007, 10:16 a.m.,  
in response to message #1 by Miguel Reznicek

Hi Miguel,

When you exit the matrix writer (such as when you run stats on your dataset), it clears. It will then re-open to a blank pallet.

For this reason, any matrix you want to keep must be put onto the stack (by pressing enter a second time in the matrix writer), and then saved into a variable (or you could just save it on the stack I suppose)

Best regards, Hal

### Re: Hp 50g: How do I clear a Matrix inside Matrix Writer

Message #3 Posted by [Miguel Reznicek](#) on 24 Sept 2007, 4:30 p.m.,  
in response to message #2 by Hal Bitton in Boise

Hi Hal:

You're right. I'm trying to recreate the situation and I can't. Looks good for now. Its just being used to a 41CX makes this 50g a whole new ballgame!

Thanks for your help, -Migs

### Transferring data from a HP50 to a PC

Message #1 Posted by [Stuart Sprott](#) on 24 Sept 2007, 7:39 a.m.

When I had a working HP 48 I could transfer data from the HP to a PC in ASCII format. It appears that you can do the same with the HP 50. The same commands are there but it seems like that only binary transfer is acceptable.

I have now started using the SD cards for transferring. They seem to be much more reliable. But again the same problem.

Is there any way of transforming binary into ASCII ?

### Re: Transferring data from a HP50 to a PC [Long]

I have now started using the SD cards for transferring. They seem to be much more reliable. But again the same problem.

Is there any way of transforming binary into ASCII ?

Yes.

The 48G and newer have both Kermit and Xmodem protocols available. For whatever reasons, the Xmodem protocol is still binary-only, although the SysRPL commands needed for "ASCII" transfers are built-in and an ASCII transfer option could easily be added to Xmodem transfers. After all, with the 49 series, they added the Xmodem server capability, so why not also an Xmodem ASCII transfer capability? For that matter, MMC/SD card transfers are also binary-only even though an ASCII transfer option could easily be added for them too.

If you transfer using IrDA, you can use the Kermit protocol and choose "ASCII" mode.

The 50g has a "serial" (but not RS-232 compatible) port. You can now buy a cable with a built-in level-shifter at a reasonable price, from <http://commerce.hpcalc.org/>. Note that you'll also need a female-to-female "null modem" to connect Eric's cable to a PC's COM port. I've noticed that since Eric has made his cable available, a different source (which, as far as I can tell, typically charges the highest price that the market will bear) has slashed its price for its cable, but it's still about double Eric's price, and there have been reports of problems with that other cable. Or of course you can build your own cable as a do-it-yourself project. Anyway, using the serial port plus a level-shifting cable, you can use the Kermit protocol.

Note that HyperTerminal PE can do either Kermit or Xmodem transfers, and [HPComm](#) (the "Connectivity Kit")

designed for the 49G) uses the Kermit protocol. For either of these, you'll need a COM port. A USB/RS-232 converter should work. In the case of IrDA, with MS Windows 98SE, a "virtual COM port" should be available when IrDA is installed on the PC, but for XP (and, I suppose, Vista), you may well have to install [IrCOMM2k](#) or something similar to get the virtual COM port.

But I expect that most users connect to their PCs using the supplied USB cable, and as far as I know, the only MS Windows compatible software for USB connections is Conn4x (the supplied "Connectivity Kit" for the 49g+ and 50g). Conn4x does have a "text" transfer mode. After connecting, in the "File" menu, choose "Binary transfer mode, press for text mode". Or easier, there's a button that by default is labelled "010101" (meaning binary mode); click it to change it to "ABCD" (meaning text mode). Conn4x uses the calculator to decompile objects, but does the character translations itself (on the PC). Note that the translation mode in IOPAR (set by TRANSIO) is ignored; to set the translation options, use "Options..." in the Conn4x "View" menu. The Conn4x "text" translations are almost the same as the Kermit "ASCII" translations; see the help file for any differences. Also note that variable names are, if needed, translated to MS Windows-compatible file names; again, see the help file.

By the way, the version of Conn4x that came on the CD with the calculator may well be buggy. [Version 2.2 Build 2353](#) works for me, but [Version 2.3 Build 2439](#) might be better; I rarely actually use Conn4x.

Note that the 49 series decompiles a NUL (ASCII control code 0) to \00, a literal " (double-quote character within a character string) to \", and \ to \\. With a Kermit ASCII transfer using translation mode 2 or 3, these are translated to \\00, \\", and \\. Conn4x "simplifies" these three translations, but only when they occur within a quote-delimited character string, and in rare cases (as far as I know, some cases of a \ character outside of a quote-delimited character string) this can cause a mistranslation. It may be necessary to edit (in the PC file) \ to \092, but this is needed only where the \ and the 2 or 3 characters immediately following would make a valid translation sequence, and only outside of a quote-delimited character string. Finding any other mistranslations is an exercise for the student.

For that matter, Kermit ASCII translations can go wrong too, if you happen to have a <CR><LF> (CarriageReturn-LineFeed) pair in a character string using translation mode 1, 2, or 3. In this case, in transfers from the calculator, the <CR><LF> pair is left as-is, instead of being translated to <CR><CR><LF>. But on transfers back to the calculator, the <CR><LF> pair is translated to just <LF>, even if it was originally a <CR><LF> pair. Conn4x does avoid this bug.

In the 48 series, a character string that contain a literal " is always decompiled to the "counted string" form. I don't know of any way to get a 49 series to decompile to a counted string form, but it compiles them just fine.

I really prefer to use an MMC or SD card for transfers. I wrote a pair of programs to convert between binary objects and characters strings suitable for Kermit ASCII compatible transfers using a card. These are UserRPL programs (well, they do use a couple of SYSEVAL sequences), so they may take a few seconds to run. On the other hand, commented source code files and a README.TXT file are included, so they should be fairly easy for a user to customize; for example, how to translate <LF> characters, and whether to leave the original commented source code string on the stack when converting to a binary object. As stored on the card, the first line of the file will be an "HHP49-X" binary transfer header, followed by 5 bytes for the character string prologue address and length; it's best to edit this line out with a text editor on the PC. See <http://www.hpcalc.org/search.php?query=ASCII+on+SD>.

For that matter, it should be fairly easy to port my programs to SysRPL in case anyone feels inclined to do so, and using some code invoking the underlying ARM processor, it might be possible to store a file on the card without the binary transfer header.

Regards,  
James

in response to message #2 by James M. Prange (Michigan)*

I've recently bought a HP 50G, and am having problems connecting to an IBM Thinkpad. There is a fault with the install CD in that it refuses to install the usb driver.

I tried the two downloads that you suggested, but it still won't connect. In the connex screen on the laptop, it doesn't show that there is a usb connection like in the user diagram example. A screen comes up saying there is no usb connection. On the HP 50G, it shows Xmodem etc, so it's OK, so I figure I haven't got the usb driver for the laptop.

I've also got a Mac and have no trouble connecting to it. Any suggestions would be greatly appreciated.

any way to capture a screen to SD card? I am using a Mac and need to transfer a screen (solver) to show a solution

---

Well yes, on capturing a screen image to the card, but how to display it on your Mac, I don't know.

The screen capture functions in Conn4x and HPCComm rely on the user invoking a PRLCD (PRLCD) command, then capturing the output, and displaying it as an image in another window. HPCConnect seems to lack this feature.

I don't know of any way to redirect the PRLCD command's output to the SD card, and even if there were, your Mac (or an MS Windows PC, for that matter) wouldn't know how to display it as an image, without an application designed to do so.

But you could use the LCD\-> command to capture a screen image to the stack as a grob (graphics object). You probably wouldn't want to key it in from the command line, because then the image would include the command line. Unfortunately, there doesn't seem to be any built-in "keyboard shortcut" for the LCD\-> command, as there is for the PRLCD command. The LCD\-> command is on page 2 of the PRG GROB menu, or of course you could assign it to a user key or a custom or temporary menu.

Anyway, you can store the resulting grob as a binary transferred file on the SD card. But how to display it on your Mac? Good question; hpcalc.org lists various MS Windows applications for converting a grob file to quite a few different image file formats which could be viewed on a PC, but, offhand, I don't see any grob converters for the Mac. Maybe try some searches at hpcalc.org, or ask at the comp.sys.hp48 newsgroup.

Regards,  
James

## **USB connection problems**

*Message #12 Posted by **James M. Prange (Michigan)** on 30 Sept 2007, 9:19 p.m.,  
in response to message #8 by John Dagens*

---

Which operating system? MS Win 98? 98SE? ME? 2000? XP? Vista?

Are other USB devices working correctly when connected to the same port?

Maybe try a different USB cable?

At least with older versions of Conn4x, I sometimes had to fool around with things like unplugging the USB cable and plugging it back in for the calculator to show up. I no longer use Conn4x enough to know whether that's still the case, but it may be worth a try.

How about in Windows' Device Manager? With the calculator turned on and connected via the USB cable, even without being in Xmodem Server mode, Device Manager should show a device named "HPx9G+ DEVICE"; can you find that? The current version is 1.2.

The Conn4x downloads include the USB driver files. In the current version, these are HPx9G.inf, HPx9G2k.sys (for 2000, XP, and Vista), and HPx9G98.sys (for 98, 98SE, and ME). Installing Conn4x normally copies the files to the subdirectory "\Program Files\Hewlett-Packard\Conn4x\USBDriver\". When Windows tries to install the driver, you may have to tell it to look in either this subdirectory or wherever you unzipped the downloaded file to.

There's a chance that you might have to first uninstall any older drivers, for any USB ports where they've been installed. The easiest way that I know of to find them all is to boot to "Safe Mode", where even devices that aren't currently connected are shown, but you could do it by plugging the calculator in to each USB port on the system.

Maybe also try searching for any files in \Windows\ and its subdirectories that contain "HPx9G" in the filename and delete them. Maybe also try cleaning the Windows registry of anything that refers to these files.

Of course, after uninstalling old drivers, deleting old files, and cleaning the registry, try re-installing the current drivers.

### 35s Polar to rectangular programming

Message #1 Posted by [Craig Ormandy](#) on 23 Sept 2007, 11:29 p.m.

Hi All

I recently misplaced my 48g+ and have just got hold of a 35s so am very new to the programming scene. Apologies if the questions I am asking are rather mundane but being new to this I am still trying to get my head around it.

I am trying to programme the 35s with a surveying missing line programme that I have which utilises the polar to rectangular function. I have managed to find the steps on this but am unsure on a few of the symbols used to input it. The part I am looking at is the following extract:

Quote:

Re: Program format from 33s to 35s Message #11 Posted by Paul Dale on 16 Sept 2007, 5:02 p.m.,  
Report post, in response to message #1 by romeo\_charlie

For a long article on rectangular to polar conversions look at this discussion. By the end, the programs for doing the conversion were pretty good. I've submitted the "best" to the museum for inclusion in the software library. I've also included them here:

```
P001 LBL P
P002 FS? 10
P003 GTO P011
P004* Rv
P005 Rv
P006 eqn REGZ+i*REGT
P007 ARG
P008 LASTx
P009 ABS
P010 RTN
P011* CF 10
P012 XEQ P004
P013 SF 10
P014 RTN
R001 LBL R
R002 FS? 10
R003 GTO R012
R004* Rv
R005 Rv
R006 eqn [REGZ*SIN(REGT),REGZ*COS(REGT)]
R007 [1,0]
R008 x<>y
R009 *
R010 EQN LASTx*[0,1]
R011 RTN
R012* CF 10
R013 XEQ R004
R014 SF 10
R015 RTN
```

Both routines preserve the Z and T registers and return their results in the X and Y registers. They are also independent of the settings on the calculator and honour the current trig mode.

- Pauli

and in particular the asterix symbol (\*) in a number of the lines. Could someone maybe explain to me how this is

inputed and what it means?

Is it a multiply symbol or something else and what does it mean after the likes of R012? Also how is it inputed in the equation part of R006 for example?

From reading through and my very basic knowledge it is steps missed out by the programme if other parts are carrying out by the prior lines? However I could be totally wrong...

Also is there a difference between EQN and eqn (lines R006 and R010)? And does the text after the eqn word need to be typed in as I am sure I read somewhere that it is not needed but am also sure it would be or how is the line executed?

After reading my message my questions do sound rather silly and probably very basic to the majority of you but if someone could help me out I would be most grateful.

Cheers

Craig

## Re: 35s Polar to rectangular programming

in response to message #1 by Craig Ormandy

Quote:

\_\_\_\_\_

and in particular the asterix symbol (\*) in a number of the lines. Could someone maybe explain to me how this is inputed and what it means?

\_\_\_\_\_

This means that that line is the target of a branch. You don't input it.

Quote:

\_\_\_\_\_

Also how is it inputed in the equation part of R006 for example?

\_\_\_\_\_

In equations it is a multiplication sign. After the line number it is ignored.

Quote:

\_\_\_\_\_

Also is there a difference between EQN and eqn (lines R006 and R010)?

\_\_\_\_\_

Nope, both are algebraic equations.

Quote:

\_\_\_\_\_

And does the text after the eqn word need to be typed in as I am sure I read somewhere that it is not needed but am also sure it would be or how is the line executed?

\_\_\_\_\_

Yes it needs to be typed in. All apart from the "eqn " or "EQN ". These expressions evalulate and the result is pushed onto the RPN stack.

## Re: 35s Polar to rectangular programming

Message #3 Posted by **Jeff O.** on 24 Sept 2007, 7:52 a.m.,  
in response to message #2 by Paul Dale

Quote:

---

Yes it needs to be typed in. All apart from the "eqn " or "EQN ".

---

Just to clarify (in case it is not obvious), it does not have to be typed in letter by letter. If you need LASTx in an equation, just press blue-shift ENTER, if you need the SIN function, just press SIN, etc. The REGT, REGZ etc. functions are entered by pressing the Roll-down key, selecting the stack register you want with the left-right cursor keys, then pressing ENTER.

Message #3 Posted by [Tim Wessman](#) on 23 Sept 2007, 5:52 p.m.,  
in response to message #2 by Namir

Yes, I know. However, 3-4 people splitting a car or taxi fare is cheaper than the cargo hauler vans and probably quicker.

A cheap car from hertz is about 100\$ for two days. It would be cheaper for katie and I to do that than to pay the van transport. . . however since I am under 25 (for another 28 days or so) they want to charge another 25+\$ per day since I will obviously destroy it with my unsafe driving.

### HP80 repair

Message #1 Posted by [Mark W Paris](#) on 22 Sept 2007, 9:28 a.m.

I'm seeking some technical advice on repairing the HP80.

The model I'm working on appears to function correctly in computations. The display, however, is faulty. The LED's in places 5,7,9,10 and the exponent are partially functioning - not all the segments light, some are too bright and/or "spotty."

I've managed to disassemble the unit (without too much damage to the back plate). I've checked for any obvious loose soldered joints or damage. There don't appear to be any.

Any advice on how to proceed? I'm thinking that it's not all that likely that the LED's have been fried. Is this right? Any suggestions on how to further check the connections?

The unit is in nearly perfect condition and I'd like to get the display working again.

Much thanks.

Mark

### Re: HP80 repair

Message #2 Posted by [Jeff O.](#) on 25 Sept 2007, 3:09 p.m.,  
in response to message #1 by [Mark W Paris](#)

I was hoping that one of the real experts might respond to your query, but since that hasn't happened, I'll offer up the tiny bit that I know.

First, did you look over this description of the [HP-35 internals](#)? I'm pretty sure that the display circuitry is identical to the HP-80. The display system consists of three chips that each have 5 8-segment LED digits, the anode driver, the cathode driver and eight inductors. Perhaps a study of this information will allow you to isolate the problem. If I recall correctly, if the same segment is out in every digit across the display, that would indicate a bad anode driver chip. Problems with individual digits might be in the LED chips themselves or the cathode driver chip. (Maybe. I used to know more about this, but forgot most of it and now can't find any information. Sorry.) In any case, if you identify the problem, the only way to fix it will likely be to replace the bad part with one "harvested" from another classic (35, 45, etc.) calculator. I believe that the actual repair work is possible for most people to do, if they are handy with a soldering iron and know the precautions to take when working on electronic components. Finding the parts might be the tricky part. You could watch eBay for cheap and/or non-working units, or post a wanted ad at the MoHPC classified section.

If repairs are beyond your abilities, you might try contacting Randy at [Fix That Calc](#) to get his prognosis. I have never used his services, but many others have and speak highly of his abilities.

Hope this helps, sorry I couldn't offer more. Good Luck!

Message #3 Posted by [Mark W Paris](#) on 26 Sept 2007, 6:59 a.m.,  
in response to message #2 by Jeff O.

Dear Jeff,

Thanks for your reply - esp. the reference to the 35 internal layout. That's good reading on its own right.

My next move, I suppose, is to pop out the 3 individual 5-digit LED banks and test the good one against the others -- I was thinking to check the resistances across various connections with a multimeter to see if I can definitively say that they behave differently. This assumes that the 5-digit segments are the same part, which by their look, they are.

I think if this fails to isolate the problem, I'm going to have a more difficult time figuring out if the problem is with the drivers or inductors since I don't really have much of an idea what those are!

Thanks for the FixThatCalc reference. The last time I posted questions to this Forum asking for help with a (now fully functioning) 41c, Randy pretty much single-handedly helped me through the process. I was hoping that I might hear from him again but maybe he's had enough of holding my hand.

If anyone knows of a resource out there that diagrams the 80's PCB's and names the components, that would be a big help.

Thanks again.

Mark

Yes, the 3 LED modules are all identical

If your multimeter has a 'diode test' function (most digital meters do), use that. At least on my Fluke, the meter displays the voltage drop across the diode-under-test, which is much more meaningful than a 'resistance'.

IIRC, the individual segments of the displays on an HP classic-series machine are made of several LEDs (but I can't remember if they're in series or parallel). You mention 'spotty' segments, this could mean some of the LEDs in that segment have failed.

In general, a completely blank digit is a problem with the cathode driver chip (or maybe something on the logic board). The same segment missing on all the digits is a problem with anode driver chip or the inductor. Random defective segments are nearly always defective display devices themselves

Note that just about all the parts are custom. The only way you'll get spares is from another HP calculator. I think parts can be taken from any classic-series machine (note the for this purpose, the

HP67 is a Woodstock, not a classic, the circuitry is very different)

Quote:

---

I think if this fails to isolate the problem, I'm going to have a more difficult time figuring out if the problem is with the drivers or inductors since I don't really have much of an idea what those are!

---

The drivers are the 2 chips on the keyboard/display PCB. With the PCB in the normal operating position, the anode driver is the one on the left.

The inductors are 8 coils (look like fat resistors) standing vertically on the bottom (solder) side of that PCB, 4 each side of the battery connector space. Note that the inductor for the decimal point segment is a lower value than the other 7.

Quote:

---

The HPCC schematics CD-ROM has a schematic for the HP80 (both versions of the processor board). But no PCB layouts, it's assumed you can find the components from the schematic. There are not that many of them, so it's not hard.

If you contact the HPCC secretary (address on the HPCC web site), he might be able to help you.

*Message #5 Posted by **Tony Duell** on 26 Sept 2007, 1:47 p.m.,  
in response to message #4 by Tony Duell*

One thing I forgot to mention. In some classic-series machines, the inductors are little modules on the solder side of the PCB, not individual components. Each module contains 4 inductors, and has 5 connections. \The 2 modules in a given machine are different, one contains 4 identical inductors, the other contains 3 of the same value and a lower-valued one (for the decimal point).

### Contacting PPC Danmak (USER magazine)

Message #1 Posted by [Paul Courbis](#) on 22 Sept 2007, 5:37 a.m.

Hi

I'd like to get a copy of an article I wrote that was translated in PPC Danmark's magazine (USER)...

I'd greatly appreciate if anyone could give me a contact with someone from this club (or if anyone have a copy of the danish version of my article about ML programming for the hp28)

Thx in advance

Best regards

Paul

First thank you very much !

As far as I remember, the original article was written (in French) in February 1988. It was about ML programming for the 28. The original title was "le tour du HP28 en 80 pages ou presque".

Thx again

Paul

**HHC2007 Draws near**

Message #1 Posted by [Namir](#) on 21 Sept 2007, 3:43 p.m.

Well folks, the much awaited and very special HHC2007 is drawing near. The HHC2007 web site has an update and it looks like 71 attendees have registered. If you can make it and have not registered, then **now** is the time to register.

This conference is going to be rocking!!! Unfortunately, I have to leave Saturday night to catch a red eye flight home so I can attend the wedding of a step-son on Sunday. Still, I am very excited to see old friends and meet new ones (like Joerg Woerner the TI museum webmaster). Joerg will make a presentation from the TI perspective.

See you there!!!

Namir

### Solver tutorial for HP50G

Message #1 Posted by [Miguel Saiz](#) on 21 Sept 2007, 9:27 a.m.

I had just received my HP50G. I am impressed with the keyboard (to me, feels better than the HP35S), battery compartment closing, is another story :( I am interested in developing a solution using the solver (determine the safety stock level based on fill rate given), are there a good tutorial of how to use the solver? (the small document, titled user book, it is really that, a small book)

Thanks

Miguel

### Re: Solver tutorial for HP50G

Message #2 Posted by [Hal Bitton in Boise](#) on 21 Sept 2007, 11:33 a.m.,  
in response to message #1 by Miguel Saiz

Hi Miguel Chapter 6 in the user's guide (the CD that came with your 50G) covers the topic. One of the "quick and easy" solve functions I like to use is to put the equation in stack level 1, then key the variable to be solved for into the command line (no need to enter it, but it won't hurt if you do), then, from the S.SLV menu (white shifted 7 key), hit the solve label on the far right. This will yield a numeric or symbolic result, depending on the equation. Note that the variables in your equation don't have to exist as variables in the calculator...in which case the solution will be symbolic. If you do have the variables in your equation as variables in the calculator with values in them, you will get a symbolic solution initially, but hitting the "EVAL" key will evaluate to a numeric answer. One caveat to this...just be sure the variable you're solving for (the one you key into the command line) doesn't exist in the current directory. One more thing...be sure you have the stack display set to textbook (mode key, DISP softkey, Stack: textbook checked), and you can build your equation right on the stack, using RPN keystrokes. Much better, IMHO, than using dreaded algebraic keystrokes in the equation writer. Best regards, Hal

**stack preservation**

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 21 Sept 2007, 7:12 a.m.

I am a bit stubborn on having (some) of my programs behave as a built in function related to stack and lastx register.

What I have done so fare is to write a subroutine that saves the stack in the indirect registers (will not use the valuable A-H,K-Z for such stuff).

Then I found this [thread](#) that offers an elegant second option by Valentin Albillo when you can do it all in an equation.

In the great danger of saying something well known; the x<> operation do come to the rescue if one need to resort to storing the stack in indirect registers.

**Stack saving program (challenge?)**

Message #2 Posted by [Arne Halvorsen \(Norway\)](#) on 22 Sept 2007, 8:50 a.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

Program that saves stack in indirect regs [here](#).

Decided did not want to use vector packing and given want tailing part of program to be used as standalone stack recall routine have a feeling must use number of steps...

But I could be wrong? :-)

### 35s/42S mini challenge

Message #1 Posted by [Egan Ford](#) on 20 Sept 2007, 1:22 p.m.

Write in 9 steps or less of *logic* (LBL/RTN not counted) a program that can identify if a positive integer can be represented as  $2^j - 2^k$  where  $j \geq k \geq 0$ . If so return a 0, if not return  $> 0$ . There is no need to identify  $j$  and  $k$ .

NOTE: No EQN to keep it 42S friendly.

### Re: 35s/42S mini challenge

Message #2 Posted by [Paul Dale](#) on 20 Sept 2007, 5:29 p.m.,  
in response to message #1 by Egan Ford

I've got an almost solution in 9 steps, 6 if I'm allowed to keep a constant in a register (enter the code at step 4 in this case):

```
1: 1
2: STO 00
3: X<>Y
4: RCL- 00
5: LASTx
6: OR
7: RCL+ 00
8: LASTx
9: AND
```

This is for the 42s. For the 35s, replace register 00 with A.

[edit: ignore this next paragraph, I erred]

The reason I said almost is that this routine returns zero for inputs of  $(2^n) - 1$  where it should return non-zero. In essence, this code is identifying the presence of a single block of binary 1's in the number rather than a single block of binary 1's with at least one lower order 0 digit.

- Pauli

[edit: clarified the  $2^n - 1$  in the exception]

Edited: 20 Sept 2007, 6:39 p.m. after one or more responses were posted

### Re: 35s/42S mini challenge

Message #3 Posted by [Egan Ford](#) on 20 Sept 2007, 6:27 p.m.,  
in response to message #2 by Paul Dale

Similar to my solution, but mine is exactly the same 9 steps for the 35s, 42S, and the 16C and it returns 0 for  $2^j - 1$  (i.e.  $k=0$ ).

Edited: 20 Sept 2007, 6:30 p.m.

**Re: 35s/42S mini challenge**

Message #4 Posted by **Paul Dale** on 20 Sept 2007, 6:37 p.m.,  
in response to message #3 by Egan Ford

My mistake, the routine should return 0 for the  $(2^n)-1$  case and my code does this. Don't know what I was thinking thinking it should return non-zero here :-)

- Pauli

**Re: 35s/42S mini challenge**

Message #5 Posted by **Paul Dale** on 20 Sept 2007, 6:40 p.m.,  
in response to message #3 by Egan Ford

But I get down to six if I can keep the constant 1 in a register ahead of time.

I'd be surprised if the 16c couldn't do this in less steps or at least in a more interesting way...

- Pauli

**Re: 35s/42S mini challenge**

Message #6 Posted by **Paul Dale** on 20 Sept 2007, 6:47 p.m.,  
in response to message #5 by Paul Dale

Got one for the 16c:

```
1: LJ
2: X<>Y
3: LBL 0
4: SL
5: F? 4
6: GT0 0
```

Shorter and mostly slower :-) Well shorter if I don't get my pre-filled register. Only more instructions executed for cases with more than 2 sequential bits set.

- Pauli

*Edited: 20 Sept 2007, 6:49 p.m.*

**Re: 35s/42S mini challenge**

Message #7 Posted by **Paul Brogger** on 20 Sept 2007, 7:07 p.m.,  
in response to message #1 by Egan Ford

I tried the "divide by two, finite state machine" approach:

```
A001 LBL A
A002 STO A
A003 0
A004 RCL A
A005 IP
A006 2
A007 <divide>
A008 STO A
A009 FP
A010 x=y?
A011 GTO A004
A012 X>0?
A013 GTO A004
```

```
A014 RCL A
A015 RTN
```

(Obviously, I miss the target # of steps.)

It initializes its state (in the Y register) to zero and then starts shifting bits to the right. As long as the bit shifted into the fractional portion is a zero, it continues. When the first non-zero bit is encountered, line A013 leaves it for the new state and continues shifting right. The first zero bit encountered after encountering any non-zero bits causes the test at A012 to fail, and the last value stored is the result.

(It falls into an endless loop with a zero input, but the problem specifically states "a positive integer".)

I suspect there may be a way to trim it down by skipping the storage register (A) and using LASTx carefully, but I don't have the time right now.

*Edited: 20 Sept 2007, 7:27 p.m.*

## Re: 35s/42S mini challenge

Message #8 Posted by [Paul Brogger](#) on 21 Sept 2007, 1:59 p.m.,  
in response to message #7 by Paul Brogger

Here's a stack-only version:

```
S001 LBL S
S002 XEQ S013
S003 XEQ S009
S004 x<>y?
S005 x>0?
S006 GTO S003
S007 LASTx
S008 RTN
S009 LASTx
S010 IP
S011 2
S012 <divide>
S013 FP
S014 RTN
```

Same logic as before. The comparison test trick on lines S004 & 5 could be used to reduce the previous version by 1 instruction.

If I may assume 0 in y, then the following requires only 10 steps of logic:

```
S001 LBL S
S002 GTO S007
S003 LASTx
S004 IP
S005 2
S006 <divide>
S007 FP
S008 x<>y?
S009 x>0?
S010 GTO S003
S011 LASTx
S012 RTN
```

If I further require the user to enter "XEQ S006" to initiate the program, I can get rid of S002 and get down to the target of 9. (I suspect that won't work for the 42s, though.)

*Edited: 21 Sept 2007, 2:04 p.m.*

## Re: 35s/42S mini challenge

Message #9 Posted by [Egan Ford](#) on 21 Sept 2007, 4:08 p.m.,

*in response to message #8 by Paul Brogger*

Quote:

...get down to the target of 9.

That would be impressive; a non-bitwise operator solution in 9 steps.

Thanks.

### **Re: 35s/42S mini challenge**

*Message #10 Posted by **Paul Brogger** on 21 Sept 2007, 5:09 p.m.,  
in response to message #9 by Egan Ford*

Thanks to *you* for the challenge!

And, just to spell it out:

```
S001  LBL S
S002  LASTx
S003  IP
S004  2
S005  <divide>
S006  FP
S007  x<>y?
S008  x>0?
S009  GTO S002
S010  LASTx
S011  RTN
```

Enter 0 in y, the integer in question in x, and then XEQ S006.

*Edited: 21 Sept 2007, 5:10 p.m.*

### **Re: 35s/42S mini challenge**

*Message #11 Posted by **Namir** on 21 Sept 2007, 10:37 a.m.,  
in response to message #1 by Egan Ford*

My contribution wins the longest listing award!!

The theory behind my program is based on finding j and k for  $X = 2^j - 2^k$ :

$$X = 2^j - 2^k$$

$$X + 2^k = 2^j$$

$$\log(X + 2^k) = j \log(2)$$

$$\log(X + 2^k) / \log(2) = j$$

When the calculated value of j has a zero fractional part we find an answer. The program loops for the values of k, starting with 0 ( $2^0 = 1$  as the initial value of  $2^k$ ). If at the end of the loop we find that  $2^k > 2^j$  then we stop the iteration, because it means that  $k > j$  which violates one of the requirements for the solution.

The listing is:

```

A001 LBL A
A002 STO X
A003 1
A004 STO K
A005 RCL X
A006 RCL K
A007 +
A008 LOG
A009 2
A010 STO* K
A011 LOG
A012 /
A013 RND
A014 FP
A015 x=0?
A016 STOP
A017 LASTx
A018 2
A019 y^x
A020 RCL K
A021 x<=y?
A022 GTO A005
A023 RTN

```

I inserted the RND because dividing log values sometimes lead to .9999999999 fractions. Also note that register K stores the value of  $2^k$ .

The above approach (and program) can easily be adapted for integers other than 2.

*Edited: 21 Sept 2007, 12:22 p.m.*

Long, but portable. Thanks for providing a non-bitwise solution. I had hoped for one or two like this.

### Re: 35s/42S mini challenge, my solution and part 2

Message #13 Posted by [Egan Ford](#) on 21 Sept 2007, 3:47 p.m.,  
in response to message #1 by Egan Ford

Thank you all for participating in this mini challenge. I selected this challenge because there was more than one way to do it. The most economical way was to use the bitwise operators in the LOGIC menu of the 35s/42S. (I left a hint to consider using *logic*.)

Paul Dale did come up with a *logical* 9 step solution. Congratulations Paul!

## Part 1 Problem

Write in 9 steps or less of *logic* (LBL/RTN not counted) a program that can identify if a positive integer can be represented as  $2^j - 2^k$  where  $j \geq k \geq 0$ . If so return a 0, if not return  $> 0$ . There is no need to identify  $j$  and  $k$ .

## Part 1 Solution

My solution is similar to Paul's and will work unmodified on the 35s, 42S, 16C, and possibility other models with bitwise operators. I have been unable to get it down to less than 9 steps.

```
ENTER
ENTER
ENTER
1
-
OR
1
+
AND
```

Below is a play-by-play to explain how this works.

Consider the expression  $2^{25}-2^{17} = 33423360$ .

```
225 = 00000010000000000000000000000000 = 33554432
217 = 00000000000000100000000000000000 = 131072
225 - 217 = 00000001111111100000000000000000 = 33423360
```

As Paul pointed out it this problem is about identifying an single contiguous block of 1s.  $2^j - 2^k$  will always be a single block of bits with the range  $2^k$  to  $2^{j-1}$ .

Let  $x = 2^{25}-2^{17}$ ,

First subtract 1 from x then OR it with x. This replaces all right trailing zeros with 1s:

```
      x = 00000001111111100000000000000000 = 33423360
      x - 1 = 00000001111111011111111111111111 = 33423359
(x - 1) | x = 00000001111111111111111111111111 = 33554431
```

Next add 1 to create a  $2^n$  number  $> x$ :

```
((x - 1) | x) + 1 = 00000010000000000000000000000000 = 33554432
```

Lastly AND that number with x to get 0:

```
((x - 1) | x) + 1 = 00000010000000000000000000000000 = 33554432
      x = 00000001111111100000000000000000 = 33423360
(((x - 1) | x) + 1) & x = 00000000000000000000000000000000 = 0
```

Any other number without a single contiguous block of 1s will fail, e.g.:

```
      x = 00000000101111000110000101001110 = 12345678
      x - 1 = 00000000101111000110000101001101 = 12345677
(x - 1) | x = 00000000101111000110000101001111 = 12345679
```

The last operation did replace all the right trailing zeros with 1s (all one of them), but when adding 1 a  $2^n$  number  $> x$  is not obtained:

```
((x - 1) | x) + 1 = 00000000101111000110000101010000 = 12345680
```

ANDing it with x does not yield 0:

```
((x - 1) | x) + 1 = 00000000101111000110000101010000 = 12345680
      x = 00000000101111000110000101001110 = 12345678
(((x - 1) | x) + 1) & x = 00000000101111000110000101000000 = 12345664
```

## Part 2 Problem

In as few steps as possible identify  $2^j$  or  $2^k$ . Obviously if you can identify one you can find the other and then use  $\log_2$  to get j and k. I have a 3 step solution for  $2^k$  that is identical on the 35s/42S/16C.

in response to message #13 by Egan Ford

Part One: my Short Solution

Here is my solution for HP16C, don't know for other models.

Thinking this one will be hard to beat :-))

```
LJ           / left justify
X<>Y        / need the result rather than the number of shifts
LAST X      / recall original value (ENTER is OK too)
B#          / ask how many bits set
MASKL       / create a mask on left
XOR         / Xoring gives 0's if bits match and 1's if not
```

**Re: 35s/42S mini challenge, my solution and part 2**

Message #15 Posted by [Egan Ford](#) on 21 Sept 2007, 9:29 p.m.,  
in response to message #14 by Patrice

Paul Dale also create a 6 stepper for the 16C (above). But yours is loopless. Nice.

The 16C is an incredible machine with no clear replacement. It is the most unique calculator I own.

I knew it'd be easy on the 16C, that is why I set the challenge for the 35s/42S.

Can you do part 2?

Thanks.

**Re: 35s/42S mini challenge, my solution and part 2**

Message #16 Posted by [Namir](#) on 23 Sept 2007, 11:05 a.m.,  
in response to message #15 by Egan Ford

Can such short programs be written to manipulate bits if the problem was using powers of 3 or powers of 5?

Namir

**Re: 35s/42S mini challenge, my solution and part 2**

Message #17 Posted by [Egan Ford](#) on 2 Oct 2007, 9:16 p.m.,  
in response to message #16 by Namir

I do not think so.

**Re: 35s/42S mini challenge, my solution and part 2**

Message #18 Posted by [Patrice](#) on 23 Sept 2007, 4:57 p.m.,  
in response to message #15 by Egan Ford

My solution for part2 so far. The 16C does not have the log function

```
#B           =k-j
```

```

LST X
LJ      number of zeros to top
X<>Y
NOT
#B      number of zeros
X<>Y
-       =k
R/S
+       =j

```

## Re: 35s/42S mini challenge, part 2 solution

Message #19 Posted by [Egan Ford](#) on 2 Oct 2007, 9:15 p.m.,  
in response to message #13 by Egan Ford

### Part 2 Problem

In as few steps as possible identify  $2^j$  or  $2^k$ . Obviously if you can identify one you can find the other and then use  $\log_2$  to get  $j$  and  $k$ . I have a 3 step solution for  $2^k$  that is identical on the 35s/42S/16C.

### Part 2 Solution

Here is my 3 step solution for  $2^k$ .

```

ENTER
+/-
AND

```

To find  $2^k$  we just need to isolate the last bit, e.g.:

```

      x = 00000001111111100000000000000000 = 33423360
     -x = 11111110000000010000000000000000 = -33423360
(-x) & x = 00000000000000010000000000000000 = 131072

```

Thanks for playing.

### HP-35s tip: Stack review in RPN

Message #1 Posted by [Miguel Toro](#) on 20 Sept 2007, 9:04 a.m.

Hi,

This may be known, but here it is: in RPN, you can review the content of the stack without scrolling the values through the registers in a way similar as in ALG:

- 1 Press left-shift MEM.
- 2 Press Roll down (you will see the menu with the stack registers).
- 3 Reviews the values with the left/right arrow keys or with the the roll-down/roll-up key.

I find that useful when you want to view the values and be sure not to mess with them pressing by mistake any other key or leaving the values in the wrong register.

Regards,

Miguel

in response to message #1 by Miguel Toro

Thank you! I did not know this so far either.

### Re: HP-35s tip: Stack review in RPN

Message #5 Posted by [Meenzer](#) on 20 Sept 2007, 12:11 p.m.,  
in response to message #1 by Miguel Toro

Veery cool! And it also works in a program, so you don't have to use the EQN environment to get REGX, REGY, REGZ and REGT!!!

### Re: HP-35s tip: Stack review in RPN

Message #6 Posted by [Miguel Toro](#) on 20 Sept 2007, 12:21 p.m.,  
in response to message #5 by Meenzer

I looked throughout the manual and it is not really there. So it seems that it is a true undocumented little feature :-)

Edited: 20 Sept 2007, 12:27 p.m.

### Re: HP-35s tip: Stack review in RPN

Message #7 Posted by [Gene Wright](#) on 20 Sept 2007, 12:23 p.m.,  
in response to message #5 by Meenzer

Actually, it will work if you go to ANY menu and then press RDN.

Useful to insert a single REGX, Y, Z or T instruction for a RCL stack register step.

### Re: HP-35s tip: Stack review in RPN

Message #8 Posted by [Stefan Vorkoetter](#) on 20 Sept 2007, 1:38 p.m.,  
in response to message #7 by Gene Wright

I don't have my 35s here at the moment, but I wonder if a REGZ instruction (for example) inserted this way has the same checksum as one inserted using EQN?

Actually, I wonder if this is the cause of some of the checksum differences we've been seeing, namely that some instructions can be entered either using EQN or directly (for example, numbers).

Stefan

### Re: HP-35s tip: Stack review in RPN

Message #9 Posted by [Miguel Toro](#) on 20 Sept 2007, 2:17 p.m.,  
in response to message #8 by Stefan Vorkoetter

Example:

-With menu:

```
H001 LBL H
H002 REGY
H003 RTN
```

```
CHK= D045
LN= 9
```

-With EQN:

```
H001 LBL H
H002 eqn REGY
H003 RTN
```

```
CHK= 8133
LN= 13
```

So, at least using the menu method, the program is shorter.

*Edited: 20 Sept 2007, 2:19 p.m.*

### **Re: HP-35s tip: Stack review in RPN**

*Message #10 Posted by [Gene Wright](#) on 20 Sept 2007, 2:30 p.m.,  
in response to message #9 by Miguel Toro*

I believe the 4 byte difference is that equations use 3 bytes plus 1 for each character (REGY).

So the REGY in program 1 takes 3 bytes and the REGY in program 2 takes 3 + 4 or 7 bytes.

### **Re: HP-35s tip: Stack review in RPN**

*Message #11 Posted by [Bruce Bergman](#) on 21 Sept 2007, 12:24 a.m.,  
in response to message #1 by Miguel Toro*

Wow, good find Miguel!

I notice a couple other interesting behaviors. Caveat: these could already be documented, but I just haven't read the whole manual yet.

While in MEM mode, with VAR highlighted, press ENTER. You can now scroll through the basic statistics register values.

While in MEM mode, with PRGM highlighted, press ENTER. You can now scroll through all program labels to see their LN= values.

Also, I notice that using your RDN trick, I don't need to use the arrow keys at all to cycle through the stack; I just keep pressing RDN and it goes through them in sequence. I think that's what you meant in your last comment, though...

Coolness! ;-)

thanks, bruce

### Graphing Calculator Error (interesting)

Message #1 Posted by **Chuck** on 19 Sept 2007, 4:47 p.m.

Today I had my students find an algebraic expression for

$$\cos[2 \operatorname{asin}(x/2)]$$

It turns out to be

$$1 - (x^2)/2$$

an upside-down parabola with domain  $[-2,2]$  because of the  $\operatorname{asin}(x/2)$  and range  $[-1,1]$  from the cosine.

Graphing the original expression on the TI-83, TI-84, and the HP50g, produced what was expected. However, the TI-89 produced the **entire** parabola!!! Whoops. My guess is the 89 did a little internal simplification, or the CORDIC method employed is different than the other calculators. It would be interesting to see what other calculators give....

Interesting-- Mathematica 6.0 gives the entire parabola as well. Guess I'll need to investigate a little more.

[--addendum--]

I think I know why:  $\operatorname{asin}[x]$  where  $|x| > 1$  gives a complex result. Therefore, allowing a complex domain (TI89 and Mathematica) for  $\cos[x]$  gives a range beyond  $[-1,1]$ . I'm sure I new that at one time, but my complex analysis class was over 20 years ago. Interesting.

CHUCK

*Edited: 19 Sept 2007, 5:02 p.m.*

### Re: Graphing Calculator Error (interesting)

Message #2 Posted by **Chuck** on 19 Sept 2007, 5:23 p.m.,  
in response to message #1 by Chuck

I was correct. I pulled out my complex analysis book (1987 Marsden) and rediscovered the complex definition for sine and cosine (they look similar to the defs for cosh and sinh).

On a similar note: solve the equation

$$\sqrt{1-x} = \sqrt{3-2x}$$

The REAL solution is  $x=2$ . However, the graphs do not REALly intereseect (though in the complex world they do, at  $0+i$ ). A conundrum.

### Re: Graphing Calculator Error (interesting)

Message #3 Posted by **Jandro Kirkish** on 19 Sept 2007, 7:45 p.m.,

*in response to message #2 by Chuck*

Maple 11 also gives the entire parabola.

### **Re: Graphing Calculator Error (interesting)**

*Message #4 Posted by [Meenzer](#) on 20 Sept 2007, 1:23 a.m.,  
in response to message #1 by Chuck*

The Casio fx-7400G+ and the HP 48G draw from -2 to 2. GeoGebra and Graph as well.

*Edited: 20 Sept 2007, 1:32 a.m.*

### **Re: Graphing Calculator Error (interesting)**

*Message #5 Posted by [sjthomas](#) on 20 Sept 2007, 2:34 a.m.,  
in response to message #1 by Chuck*

Both the TI-*nspire* CAS and the Casio fx-9860G *Slim* graph the parabola segment from  $x = -2$  to  $x = 2$ .

### **Re: Graphing Calculator Error (interesting)**

*Message #6 Posted by [Chuck](#) on 20 Sept 2007, 1:14 p.m.,  
in response to message #5 by [sjthomas](#)*

Hmm, I would have expected the *nspire* to give the entire parabola. Interesting what these different devices and programs give.

For those interested, I graphed the entire arcsine function using an  $x$ - $y$ - $i$  coordinate system with the standard  $x$ - $y$  axes and the imaginary pointing straight out. The result was the standard arcsine on the vertical  $x$ - $y$  plane of  $x: [-1, 1]$  and then the complex part on a plane  $\pi/2$  high traveling in the imaginary directions. Here's a link to what I got Mathematica to do.

[complex arcsine](#)

Now I need to write a program for the HP-35s to give these complex results instead of the "Invalid Data" error.

CHUCK

### Got the 35s

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 19 Sept 2007, 2:27 p.m.

Okey, 2 weeks from Spain to Norway, that what was expected, but one week from Oslo to Bergen! Had to be handled by custom, but still...

Anyway, was sure not to write a first impression thread since all been said, but here goes...

1. Build to me look quality except the display: Key response feels just as good as on my old hp-41cv but when I was to dust away some small particle a lot of black shadows happened on screen: The tiny plastic plate easily bounc down on lcd area to create this effect. No finger pointing to the answer on this babe!

2. LOVE the holster!!! Reason: I am addicted to the small moleskin notebooks. I typical hold them steady with one hand and write the other. Having the 35s in its home I can work it the same way; its an open book! It was first after working with it for ten mins I realized I was using it just like my noteboks... It will stay there I think.

Beside the screen thing it seems I have a new friend, still getting my 41 fixed though :- ) (Randy, if u read, sending 41 gets a bit delayed... :-)

Hey, I bet this is the first 35s in Norway! Serial: 72800529

### Re: Got the 35s

Message #2 Posted by [Jim Creybohm](#) on 19 Sept 2007, 3:30 p.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

Glad you are happy Arne, after your long wait! I find myself enjoying it more and more, with the exception of the labelling of any programs I have written, and the somewhat asinine manner of entering text into the calc.

Otherwise welcome back, HP! So, what are ya gonna do for an encore?

### Re: Got the 35s

Message #3 Posted by [Chuck](#) on 19 Sept 2007, 4:31 p.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

Arne. Both of my calculators had nasty black LCD box smudges when I touched the screen, BUT ONLY ONCE. I purposely smudged my second one back and forth to fill it black. After it faded, all is perfect. I can touch, point, and push on the screen now and nothing happens. I'm not sure why it happens once, but it does.

### Re: Got the 35s

Message #4 Posted by [Arne Halvorsen \(Norway\)](#) on 19 Sept 2007, 5:59 p.m.,

**50g Serials?**

Message #1 Posted by [Mark W](#) on 18 Sept 2007, 11:25 p.m.

Is there a decoder for 50g serials?

I tried searching, but must have a bad parameter.

**Re: 50g Serials?**

Message #2 Posted by [Jeff O.](#) on 19 Sept 2007, 7:40 a.m.,  
in response to message #1 by Mark W

By decoder, do you mean determining country and date of manufacture? If so, for example:

CNA62101234

CNA - manufactured in China, presumably in factory A

6 - 2006

21 - week no. 21

01234 - unit sequence number

**Re: 50g Serials?**

Message #3 Posted by [Mark W](#) on 19 Sept 2007, 5:46 p.m.,  
in response to message #2 by Jeff O.

Yes, thanks!

What are indicators of early/late models? Have any lots been identified by number?

**Re: 50g Serials?**

Message #4 Posted by [Jeff O.](#) on 20 Sept 2007, 7:44 a.m.,  
in response to message #3 by Mark W

Quote:

What are indicators of early/late models?

I'm not sure what the earliest serial number is. If I recall correctly, I got mine pretty early (I think before the 50g was even officially acknowledged to exist by HP), and my serial number is CNA618, so manufactured in 2006, week 18. So early modes would be CNA618 or slightly earlier. Late models would be CNA7-something. There is speculation that the first digit of the last five (i.e. the sequence number after the week number) is always zero, which means that there are at most 9999 units with any

given year+week code.

Quote:

Have any lots been identified by number?

I am not sure what type of information you are after with this question. I know of no lots that have been identified as having any particular flaws or other unique characteristics. However, I am not an expert on the 50g. The [comp.sys.hp48](#) newsgroup is the place to go for information on the 48/49/50 calculators. All posters there seem to be pretty much experts.

Quote:

This is beyond the range of the machine. It doesn't work on a 32sii nor on a 15c either. It is not a flaw.

Bill is right; the "STAT ERROR" or "Error 2" message is attributable to roundoff errors in the statistical summation. What's ironic is that the failure to produce a result was made possible by *extended-precision calculation*, albeit using standard-precision inputs.

Here are the tabulations:

| Xi        | (Xi)^2 (exact)    | (Xi)^2 (result retaining 10 or 12 significant digits) |
|-----------|-------------------|---|
| 1,000,000 | 1,000,000,000,000 | 1,000,000,000,000                                     |
| 1,000,001 | 1,000,002,000,001 | 1,000,002,000,000                                     |
| 1,000,002 | 1,000,004,000,004 | 1,000,004,000,000                                     |

Summations:

S(X)            S(X^2) (exact)        S(X^2) (using 10 or 12-digit results)  
 3,000,003    3,000,006,000,005    3,000,006,000,000

([S(X)]^2) (exact result obtained using 13- or 15-digit extended precision)  
 9,000,018,000,009

([S(X)]^2)/3 (exact result obtained using 13- or 15-digit extended precision)  
 3,000,006,000,003

The exact calculation

$\sqrt{([S(X^2)] - ([S(X)]^2)/n) / [n-1]}$  of sample standard deviation is

$\sqrt{[(3,000,006,000,005 - 3,000,006,000,003) / (3-1)]} = 1$

The "erroneous" calculation is based on 13- or 15-digit internal computation that utilizes the S(X^2) summations that were rounded off after each datum entry:

$\sqrt{[(3,000,006,000,000 - 3,000,006,000,003) / (3-1)]} = \text{ERROR}$

(The HP-15C's extended-precision calculations for statistical summations are utilized within an example in the HP-15C Advanced Functions Handbook listed on pages 208-211.)

If extended precision had not been employed for the problem discussed here, both terms would have been rounded to 3,000,006,000,000 -- yielding the incorrect result of zero, instead of an error.

## Re: HP 35s Standard Deviation

Message #10 Posted by **Palmer O. Hanson, Jr.** on 22 Sept 2007, 8:38 p.m.,  
 in response to message #9 by Karl Schneider

You wrote:

"Use of extended-precision calculations for standard deviation is described in the HP-15C Advanced Functions Handbook on page 208."

Page 208 of my August 1982 copy only says "Program B exploits a tricky property of the Sum- and Sum+ keys whereby certain calculations can be carried out to 13 significant digits before being rounded back to 10."

Is there a later revision which gives specific details for the calculation of standard deviation?

## "Tricky" properties for HP-15C Standard Deviation

Message #11 Posted by **Karl Schneider** on 23 Sept 2007, 12:47 a.m.,  
 in response to message #10 by Palmer O. Hanson, Jr.

Hi, Palmer --

No, my version of the HP-15C AFH gives no further details. I realized after posting that "described" was not a very good term, but didn't edit before you responded. I have edited the post now.

I was also well aware that these methods were the basis of your "Cadillac Quadratic Solver for the hp 33s" article from last year:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=593>

I am sorry about that. I was hoping for something more definitive on the "tricky properties" than what I had been able to figure out by trial and error.

Many years ago TI was very close-mouthed about the implementation of the statistics routines in the TI-59 until the user community figured out how to download the instruction set. Then they published a discussion of the routines. The routines did include an HIR 20 command which was some sort of branching command which could not be made to work in user memory -- or at least, no one ever figured out how to do it. The TI discussion included mention of the HIR 20 command, but their explanation was about as informative as a Milton Friedman dissertation on the state of the economy.

Without *scrutinizing* the program on the HP-15C AFH, pp. 208-211, I do notice a few things:

Only Sigma- is used; each time it is, the contents of register R7 (which contain the XY summation) are recalled.

The quadratic equation is defined on page 205 as  $c - 2bz + az^2$ , making the discriminant  $d = b^2 - ac$

The basic purpose appears to be the calculation of "b<sup>2</sup>-ac" and similar terms to 13-digit extended precision before being rounded back down to 10 digits. This procedure increases accuracy when the terms in the subtraction are nearly equal.

It's kind of related to the [residual matrix calculation \(B - AC\)](#).

*Message #14 Posted by **John B. Smitherman** on 23 Sept 2007, 3:51 p.m.,  
in response to message #9 by Karl Schneider*

Thanks Karl. As usual your post was very thorough and insightful. Perfect benchmarks are not easy to find. I believe that users want HP and other calculators manufacturers to provide accurate and robust algorithms that make the best use of the hardware selected. It's interesting how tests keep showing up from various users that highlight where some machines fall short of our expectations, especially near or around the limits of the machine.

Regards,

John

*Message #15 Posted by **Bill (Smithville, NJ)** on 19 Sept 2007, 3:21 p.m.,  
in response to message #1 by John B. Smitherman*

Hi John,

I don't have a 35S, so can't directly comment on it, but the following is a quote from page 237 of the HP-42S manual that addresses this:

#### **Limitations on Data Values**

The calculator might be unable to perform some statistical calculations if your data values differ by a relatively small amount. To avoid this, you should normalize your data by entering values as the difference from one value (such as the mean). This difference must then be added back to any calculations of the mean. For example, if your x-values were 776999, 777000, and 777001, you should enter the data as -1, 0, and 1; then add 777000 back to the relevant results.

Does the HP-35S manual include any paragraph such as this?

Bill

John

### Re: HP 35s Standard Deviation

Message #20 Posted by [Palmer O. Hanson, Jr.](#) on 22 Sept 2007, 8:44 p.m.,  
in response to message #19 by John B. Smitherman

Quote:

Most will fail but not all. My HP 30s with s/n CN0351 yields the correct answer.

Actually, it is many HP calculators which will fail because they carry only ten digits. Calculators from other companies such as the Casio fx-7000G, the TI-59, TI-66, TI-68, TI-95 and Durabrand 828 which carry 13 digits will not fail this particular test. They will, of course, fail tests which require more than threen digits.

I wonder, was this test proposed by a TI Guy?

### Re: HP 35s Standard Deviation

Message #21 Posted by [John B. Smitherman](#) on 23 Sept 2007, 3:35 p.m.,  
in response to message #20 by Palmer O. Hanson, Jr.

Thanks Palmer. Through brute force I found that most fail testing 10,000,000 , 10,000,001 and 10,000,002 while the HP 50G and 17Bii+ fail at 1,000,000,000,000 , 1,000,000,000,001 and 1,000,000,000,002.

Regards,

John

### 17Bii+ SDEV test

Message #22 Posted by **Karl Schneider** on 24 Sept 2007, 2:48 p.m.,  
in response to message #21 by John B. Smitherman

Quote:

... while the HP 50G and 17Bii+ fail (to calculate sample standard deviation of the data) 1,000,000,000,000 , 1,000,000,000,001 and 1,000,000,000,002.

Hi again, John --

The last two of these data require 13 digits, which cannot be represented as non-integer values on these calculators. The calculation will fail even if summation methods are not used. Does this mean that the HP-17Bii+ *accepts* excess digits, as the RPL-based models have done, and now the HP-35s does?

If so, more ammunition for my case...

-- KS

### Re: 17Bii+ SDEV test

Message #23 Posted by **John B. Smitherman** on 24 Sept 2007, 3:41 p.m.,  
in response to message #22 by Karl Schneider

Hi Karl. In your note you asked:

Quote:

Does this mean that the HP-17Bii+ *accepts* excess digits, as the RPL-based models have done, and now the HP-35s does?

If so, more ammunition for my case...

To further support your case when I enter 1,000,000,000,002 the 49G+ and 17bii+ display 1E12. I then subtract 2 and they both display 999,999,999,998. So, the excess digits are being dropped.

Regards,

John

Message #24 Posted by **Palmer O. Hanson, Jr.** on 25 Sept 2007, 12:09 a.m.,  
in response to message #21 by John B. Smitherman

Quote:

the HP 50G and 17Bii+ fail at 1,000,000,000,000 , 1,000,000,000,001 and 1,000,000,000,002.

My TI-83+ yields the correct results for that but fails at 1E13, 1E13 + 1 and 1E-13 + 2 . I am

fairly sure that it does not calculate SDEV using the summations but rather uses the sum of the squares of the differences from the mean.

My TI-86 yields the correct results for  $1E13$ ,  $1E13 + 1$  and  $1E13 + 2$  but fails at  $1E14$ ,  $1E14 + 1$  and  $1E14 + 2$ .

in response to message #25 by Bruce Bergman*

Like many HP calculator issues, the different methods used to determine standard deviation have been discussed here before. This long [thread](#) started out as a discussion of the 33S polar conversion bug, but digressed into a discussion of standard deviation.

### **Re: HP 35s Standard Deviation**

*Message #27 Posted by [Palmer O. Hanson, Jr.](#) on 20 Sept 2007, 2:51 a.m.,  
in response to message #26 by Norris*

The HP-41 yields the message "OUT OF RANGE" for the given problem.

Page 101 of the HP-41C Owner's Handbook and Programming Guide includes the statement

"Note: If your data  $\{x_i\}$  or  $\{y_i\}$  contains many redundant leading digits, you should refrain from copying them into the calculator. For example, if your x-data is  $\{999999999, 1000000001, 1000000002\}$ , you should enter the x-data as  $\{-1, 1, 2\}$  and add the redundant digits to any x-related answer produced."

### Hp-35s pricing \$59.99 -> \$79.19

Message #1 Posted by [Jerry Hancock](#) on 18 Sept 2007, 8:32 p.m.

It looks like HP raised the price on the 35s. I ordered one yesterday and the price was \$59.99. Today the price is listed as \$79.19. I think the calc is a good deal at \$59.99 but I would have passed at the new price. I hope they don't consider it a pricing error and try to get the \$20 from me. I arrives tomorrow, I hope I don't have to send it back!

Jerry

### Re: Hp-35s pricing \$59.99 -> \$79.19

Message #2 Posted by [Peter Niessen](#) on 18 Sept 2007, 8:55 p.m.,  
in response to message #1 by Jerry Hancock

Hm.

[HP Store](#)

says 59.99.

### Re: Hp-35s pricing \$59.99 -> \$79.19

Message #3 Posted by [Jerry Hancock](#) on 18 Sept 2007, 9:03 p.m.,  
in response to message #2 by Peter Niessen

well, if you go here:

<http://h10010.www1.hp.com/wwpc/us/en/sm/WF05a/215348-215348-64232-20037-215351-3442983.html>

and press the BUY ONLINE button, it adds it to the cart at 79.19. I could have sworn the price was listed on the same page yesterday at 59.99. All I did was a refresh and the new price showed up.

I guess HPshopping is different than the BUY ONLINE option??? Why would they do that? (and spy on the board)

Jerry

### Re: Hp-35s pricing \$59.99 -> \$79.19

Message #4 Posted by [Peter Niessen](#) on 18 Sept 2007, 10:21 p.m.,  
in response to message #3 by Jerry Hancock

Ah,

you're paying the small&medium business surcharge! If you go to [www.hp.com](http://www.hp.com), then go to home & home office, you'll find it still for 59.99. I tried also the large enterprise and hoped to find it for 367.87 (including the 3 year warranty on-site service plan), but they don't offer it there.

But hey, when you buy the 79\$ version from small & medium business, look what you get (click on shop online):

Product Details HP LP3065 Flat Panel Monitor with 30 inch screen, TFT, 300 nits brightness, 1000:1 contrast ratio, 0.25 mm pixel pitch, 2600 x 1600 resolution at 60 Hz refresh rate, Carbonite

Ain't that cool?

This reminds me of this joke from the early days of Russia after the Soviet union: Two biznismeni meet. "Wow, nice car, how much did you pay?" - "500 000 Rubles at Dmitri's." - "You Idiot! At Fjodor's you could have gotten it for 800 000!"

Cheers, Peter.

### Programs Shrinkers for ours beloved HPs

Message #1 Posted by [Patrice](#) on 18 Sept 2007, 8:11 p.m.

Hi all,

Does anybody know about or have programs or binaries used to shrink other programs.

What is that beast? A program that remove unneeded things from programs to speed up and shortening them. Usefull when a program don't fit in a ROM module!

HP41: I recall about (but can't find again) a program that removed unneeded labels from programs after GTOs and GSBs have been computed. From what I recall, it was published in a french magazine and the author was the former president (or something like that) of the french PPC Paris, and it was synthetic of course.

HP71B, HP75C/D, HP 83/85/86/87: it would remove remarks, shortening var names and remove lines tags and labels after jumps are computed.

HP 86/87: I remember a program (binary) called SHRINK86 which was doing at least the remarks and var names. I may even have it on floppy but it is protected with a special record on floppy to prevent copiing.

Thanks for reading. Patrice

in response to message #2 by Allen

The decompressor is built into all 49/50s as well. The compression is pretty good. I use it on a lot of the routines in my surevying software and cut about 40% of the size of the program down. Debug4x has BZ built into it so making compressed libraries is a breeze.

### RPL Programming question

Message #1 Posted by [Namir](#) on 18 Sept 2007, 2:07 p.m.

I have a question for guru RPL programmers. How do I pass an algebraic expression to an RPL program object so I can evaluate that expression in the object. I understand that I also need to pass the name of the variable that appear in the expression along with a value (at least one).

My goal is to be able to write different RPL program objects that perform various kinds of numerical analysis calculations for algorithms that require an expression/equation (such as root calculations, numerical integration, solving ODEs, and so on).

I appreciate any help.

Namir

### Re: RPL Programming question

Message #2 Posted by [Eric Smith](#) on 18 Sept 2007, 2:37 p.m.,  
in response to message #1 by Namir

If your RPL program is named FOO, and needs an algebraic expression to be passed in on the stack, you would invoke it like:

```
' 4*X^3-2*X^2+3*X-5 ' FOO
```

FOO could keep the algebraic object on the stack, or it might store it into a local variable:

```
<< -> f << blah blah 3.7 'X' STO blah f EVAL blah blah >> >>
```

Note that this works for using an RPL program as an argument, too:

```
<< X COS DUP * >> FOO
```

*Edited: 18 Sept 2007, 2:40 p.m.*

### Re: RPL Programming question

Message #3 Posted by [Namir](#) on 18 Sept 2007, 4:02 p.m.,  
in response to message #2 by Eric Smith

Thanks Eric!! I appreciate taking teh time to explain it for me.

Based on your example I created the following program object (and stored it as FOO):

```
<< -> F V << V STO F EVAL >> >>
```

Where F and V are variables that store the expression and the name of the variable used in that expression.

So the following sample input gives the correct result of 18:

```
4 'Z1*Z1+2' 'Z1' FOO
```

Namir

## RPL program for Newton's Method

Message #4 Posted by [Namir](#) on 18 Sept 2007, 8:04 p.m.,  
in response to message #2 by [Eric Smith](#)

Eric,

Building on your tip, here a program object that applies Newton's root algorithm:

```
<< DUP2 _derivative_ -> F V D
<< V STO
DO
  F EVAL D EVAL / NEG DUP V STO+
UNTIL
  ABS 0.0000001 <
END
V RCL
>>
>>
```

Note: `_derivative_` stands for the derivative operator character.

The variables are:

1. Variable F stores the expression whose root is sought.
2. Variable V stores the name of the variable.
3. Variable D store the derivative of the expression.

To use the above program, enter the input in the following sequence:

1. An initial guess for the root, such as 4.
2. The expression whose root is sought, such as 'EXP(X)-3\*SQ(X)'.
3. The name of the variable in the above expression, 'X' in this case.

Invoke the name of the program object to obtain a refined guess for the root.

The beauty of the above RPL object is that it obtains the derivative symbolically and uses it to evaluate the derivative in each iteration. For once, I don't have to worry about calculating an approximation to the derivative. Woohooooo!

Namir

### Thanks Dave, (and others!)

Message #1 Posted by [Ren](#) on 18 Sept 2007, 11:29 a.m.

I just want to take this time to thank Dave for the website and forum, and for the choice(development?) of the software that runs the forum.

I suppose, that like me, many of you are subscribed to other forums on the Internet.

I feel the software that runs this one is superior to the others,

I enjoy the features of "Daily View", Tab Threading, User accounts (and privacy). Lack of SPAM (Serious Pollution Affronting Mail) ease of access (no need to sign-in or register just to see "what's new"). The automatic formatting of text to fit my browser window, (by this I mean, I don't need a horizontal scroll bar to read a posting that was made without CR/LF's inserted).

I might someday even learn how to do the HTML stuff (inserting links and photos).

So even if I am a math doofus (and social one as well) I enjoy my "daily" visit to the forum.

Thanks again, and a final question...

Is the forum software available (I'd like to suggest a few other forums to use it)?

Ren

dona nobis pacem

### Hp-35s retailers in Los Angeles?

Message #1 Posted by [Mark W](#) on 18 Sept 2007, 7:35 a.m.

I'm in LA, and was hoping to snap up a 35S. Struck out at Fry's--has anyone seen any actually in stores? Costco isn't an option, I'm not a member.

Thanks!

### Re: Hp-35s retailers in Los Angeles?

Message #2 Posted by [Norris](#) on 18 Sept 2007, 12:25 p.m.,  
in response to message #1 by Mark W

The only places in California where I've seen HP scientific or graphing calcs on display for retail purchase in recent years are (1) Fry's, and (2) university bookstores. If Fry's doesn't have it, then my only other suggestion would be to try the bookstore at UCLA, USC, Caltech, Cal Poly Pomona, or some other big CSU (Long Beach, Northridge, Fullerton, etc). But I'm not in LA, and don't know for sure whether the 35S is actually in stock anywhere.

I'm surprised that Fry's doesn't have it. But the 35S wasn't on their website either (although the 33S and 50G were).

### **Program "Ephemeris" for HP CV 41**

Message #1 Posted by [Catello](#) on 18 Sept 2007, 3:47 a.m.

Please HELP! I am trying to input into my Hp Cv 41 the program typed that I found in the "Museum of HP Calculators". I find this line: X<>Z. But my computer answers: "Non Existent". Why? does it lack of something? Without this instruction I can't proceed. Thanks in advance!

### **Re: Program "Ephemeris" for HP CV 41**

Message #2 Posted by [Karl-Ludwig Butte](#) on 18 Sept 2007, 4:50 a.m.,  
in response to message #1 by [Catello](#)

Hello Catello,

to enter X<>Z do the following:

press: XEQ Alpha X shift I shift J Alpha . Z

shift is the yellow key. After the second press on "Alpha" the display should read: X<>\_ \_ . After pressing the dot the display should read X<> ST\_ . Now only "Z" needs to be pressed.

Hope this helps.

Regards

Karl

### ZEPROM module ?

Message #1 Posted by [Paul Dale](#) on 17 Sept 2007, 5:32 p.m.

I've got a HP41 module which I've got an inkling as to what it is but not how I could use it/what it is good for.

The module has a clear window with what looks like an EPROM showing through. There are no identifying marks or text on the module, although "828/89" has been lightly scratched next to the EPROM window.

When I plug the module into my 41cv and turn the unit on, a message "ZEPROM TEST" appears on the display and the numeric flag annunciators turn on in turn (1, 2, 3 & 4) with each displayed for 8 or so seconds. Finally a "TESTS PASSED" message is displayed and a keystroke allows normal operation of the calculator.

I don't notice any changes in any of the catalog listings (although I've not inspected the CATALOG 0 listing in any detail).

A google for ZEPROM isn't overly helpful.

Can anyone tell me what I've got and how to use it? I don't have a programmer so I doubt I'll be able to do much with it.

- Pauli

### Re: ZEPROM module ?

Message #2 Posted by [Matthias Wehrli](#) on 18 Sept 2007, 12:20 a.m.,  
in response to message #1 by Paul Dale

What you have is a ZEPROM module, yes. Yours seems to be a new and not used one as we can buy it from of seller at ebay. If you want to programm it you need a programmer. The module itself accepts 16k of "information". To erase the contend of the module you need a UV eraser as this module works like a "normal" EPROM, but only in module shell. There are at least three sorts of programmers. Please have a look at my website for that: <http://www.hp-collection.org/41accessories.html>

There are a couple of people in that forum who have a programmer and could programm it for you. As there are more powerfull options in the meantime I would keep it untouched and use a MLDL2000, Clonix, NoVRAM or anything else. That's what I do with about a dozen of new ZEPROM modules.

Matthias [www.hp-collection.org](http://www.hp-collection.org)

### 50G Edat register loading

Message #1 Posted by [Hal Bitton in Boise](#) on 17 Sept 2007, 3:54 p.m.

Hi folks. I am just starting to use the statistical functions on my 50G, and need some help with loading the Edat register. Please be aware that I am not submitting this posting "off the cuff", as I have tried to derive the solution from both the user's guide and the users manual.

Here's my quandry: The users guide speaks of a functionality whereby I can load a newly written matrix directly from the matrix writer environment into the Edat (summation data) register by clicking on the EDAT softkey which, according to the manual, is supposed to be labeled in the matrix writer environment. There is no EDAT softkey label visible when I'm in the matrix writer. The only way I can get a newly written matrix into the EDAT register is to put it onto the stack first, then overwrite it into EDAT in the usual way (left shift, they hit the EDAT variable label). Granted it is not difficult to do it this way, but it seems that if the manual alludes to a more direct method, I should be able to use it. Any help on this would be appreciated.

Best regards, Hal

### Re: 50G Edat register loading

Message #2 Posted by [Norris](#) on 17 Sept 2007, 5:44 p.m.,  
in response to message #1 by [Hal Bitton in Boise](#)

I don't think you can actually do anything with a matrix that is loaded into the MatrixWriter, except edit it. I think you have to exit the MatrixWriter environment before you can save the matrix to EDAT (or anywhere else). The HP-50G apparently feels that a matrix is still a work in progress as long as MatrixWriter is open, so it won't let you store the matrix until MatrixWriter is closed.

Once you've left the MatrixWriter and the completed matrix is on the stack, you can store it in EDAT with [left-shift] EDAT, or by invoking STO from CAT (it's the last STO command), or by typing STO ENTER (use CHARS ECHO1 for the Sigma). But none of these approaches seem to work while you're in the MatrixWriter.

Technically, it is possible to bring up an EDAT softkey within the MatrixWriter, by typing 96 MENU, then hitting ENTER and DATA. Or you could create a custom menu with EDAT or STO softkeys, and then bring up your custom menu within the MatrixWriter. But if you try this, you will soon learn that the softkeys will only address the contents of the stack, even though the stack is not visible. The softkeys will not pay any attention to the contents of the MatrixWriter, even when they have been opened in the MatrixWriter environment.

I know of one other approach. You can enter the MatrixWriter Environment through [right-shift] STAT ENTER (to select the "single var" option) EDIT. After entering one or two columns of data, you can press ENTER ENTER to exit. If you go in and out of the MatrixWriter this way, your new matrix will automatically be saved into EDAT.

### Web site update

Message #1 Posted by [Valentin Albillo](#) on 17 Sept 2007, 8:06 a.m.

Hi, all:

I've just updated [my HP-calc web site](#) to include the following materials:

#### Additional challenges and mini-challenges online:

- Short & Sweet Math Challenge #16: Thinking Square !
- HP-15C Mini-Challenge: Sin
- HP-15C Mini-Challenge: Impossibly Short !?
- HP-15C Mini-Challenge: Bits o' Pi
- HP-15C Mini-Challenge: Speeding it Up !

All of them are freely downloadable in PDF format for maximum convenience. You might find them useful for ease of reference or if you missed them the first time around.

Best regards from V.

*Edited to correct a bad link*

*Edited: 17 Sept 2007, 11:26 a.m. after one or more responses were posted*

### Re: Web site update

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 17 Sept 2007, 8:18 a.m.,  
in response to message #1 by [Valentin Albillo](#)

Hi, Valentin;

first of all, congratulations and thanks for sharing your articles with us. They are always welcome!

And forgive me if I ask a silly question: how can I download the files? I found no specific link to the PDF files, but I surely did not look for them correctly. Does it need subscription or registration of some kind? I also noticed that you mention three TTF files for the HP35S. Are these available as well?

Thanks again and forgive me if the answers to my questions are, say, obvious d8^(

Best regards from Brazil.

Luiz

*Message #9 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 18 Sept 2007, 6:53 a.m.,  
in response to message #1 by Valentin Albillo*

Hi, Valentin;

now I see the menu at the left side of the main page; thanks.

I'd like to add that this is the kind of look I like to see in a website: concise, with the necessary information and good looking. Of course, by good looking I mean the looks I like to see. And I like it blue.

I'm not sure if this was on purpose (and maybe it has a meaning...), but I noticed that the custom picture of the HP15C in the upper, left corner is inverted.

Thanks again for sharing these goodies with us.

Best regards from Brazil.

Luiz

### **Re: Web site update: congrats!**

*Message #10 Posted by [Valentin Albillo](#) on 18 Sept 2007, 8:30 a.m.,  
in response to message #9 by Vieira, Luiz C. (Brazil)*

Hi, Luiz:

Luiz posted:

*"now I see the menu at the left side of the main page; thanks."*

You're welcome. I'm sorry for the inconvenience, I simply copy-pasted the wrong link, entirely my fault.

*"I'd like to add that this is the kind of look I like to see in a website: concise, with the necessary information and good looking. Of course, by good looking I mean the looks I like to see. And I like it blue."*

Thanks a lot for your appreciation, my daughter Laura is sure to be delighted to read your kind comment on her efforts. She is a budding mangaka and designer and blue is also her favorite color, as you can see in these two recent original drawings created by her:

- [Mermaid finds love](#)
- [Don't be blue](#)

*"I'm not sure if this was on purpose (and maybe it has a meaning...), but I noticed that the custom picture of the HP15C in the upper, left corner is inverted."*

\*That's\* not my fault ! :-) I hadn't noticed ! (must be getting old fast). I'll let her know at once to see it corrected. There's no meaning at all, as far as I know, I think it's just a misstep on her part. Since I paid her for it and it's still under warranty, she'll have to comply.

*"Thanks again for sharing these goodies with us."*

My pleasure. I'm now far too busy, but I'll try to make available new materials on a regular basis, possibly weekly. Materials to upload include more S&SMC's and Mini-challenges from the past, articles, scanned brochures, calc pics, and perhaps even a little remembrance in the form of scanned letters and assorted documents of the golden PPC and PPC TN times.

Thanks a lot for your interest and extremely kind comments, and

Best regards from V.

Thank you very much indeed for your kind, appreciative remarks. You've made Laura's day and so mine as well ! :-)

She was delighted to read your comments and told me that the difference between both drawings consisted mainly in the technology used to create them. The mermaid one was directly drawn in the PC's screen using a graphics tablet with pressure-sensitive electronic pen, while the other one was drawn in plain paper with a normal pen, then scanned into the computer. This accounts for the different quality of the lines: digitally vs analogically produced.

Best regards from V.

**Amazing graphics, indeed! (O.T.)**

Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 19 Sept 2007, 9:18 a.m.,  
in response to message #10 by Valentin Albillo

Hi, Valentin;

please, allow me to congratulate Laura for her magnificent work. (they are not only drawings, they are far beyond that...8^)

I have seen some manga before, and I have no specific knowledge to judge, but her work looks so close to the original style that I can't tell the difference from hers and original Japanese art.

You should be proud (I am sure you are, just a reinforcement...).

Best regards from Brazil.

Luiz

**HP35S ASSEMBLY METHODS**

Message #1 Posted by [designnut](#) on 16 Sept 2007, 2:47 p.m.

It appears from the disassembled 35S photos That HP is using chip face down assembly. When I look at the circuit traces I see some dissappear without a plated through hole. Can someone enlighten me as to there chip assembly method. Ultrasonic? Are there also bond wires? It seems to have too many PC leads to connect them all in one bonding. What happens when the traces seem to disappear? Thanks, Sam Levy  
<http://www.finetune.jp/~lyuka/interests/calc/hp35s/hp35s-disassembled.html>

**Re: HP35S ASSEMBLY METHODS**

Message #2 Posted by [DaveJ](#) on 16 Sept 2007, 5:11 p.m.,  
in response to message #1 by [designnut](#)

There is nothing unusual at all here. The chip is most likely mounted using COB (Chip On Board) bonding technology covered with the black potting compound, a very common technique to lower cost in higher volume products.

The "vanishing" tracks are just an illusion caused by light reflection off the gloss black solder mask.

Interesting that they have chosen to use a hand soldered watch crystal rather than a machine assembled surface mount package, they probably saved a cent or two here, but it requires two extra human operations (solder+red blob)

Dave.

**48SX battery run**

Message #1 Posted by [John Mosand](#) on 16 Sept 2007, 11:58 a.m.

Today, I replaced the batteries for the second time. I bought my 48SX when it was introduced. Has anybody experienced a better battery life for the 48SX ? On the other hand, I also have a 10C which my friend who gave it to me claimed that he had never replaced the batteries. It is still running - in my shirt pocket :- ) I should add that my 48SX has been in daily use, with two expansion cards (EQ Library and Math Pack).

**Re: 48SX battery run**

Message #2 Posted by [megarat](#) on 16 Sept 2007, 8:24 p.m.,  
in response to message #1 by John Mosand

I concur, I always felt that the HP 48sx had tremendous battery life. Specifically, I bought mine used in late 2002 and used it a few times a week and never had to change the batteries until I sold it just a few months ago, when I put in new batteries as a courtesy. As far as I know, those batteries still had another several years on them. (That's with a 128k RAM card and the library card installed.)

Compare that to the HP 48gx I had for less than a year; I had to change the batteries after maybe six months, and it didn't even get much use during that time. I think it ate those batteries while it slept.

-cam

**Re: 48SX battery run**

Message #3 Posted by [JoeFrisco](#) on 17 Sept 2007, 7:18 p.m.,  
in response to message #1 by John Mosand

I bought mine in 1993. I think I am on, maybe, the third set of batteries. I changed out the first set when I took the PE exam in 1995. My HP48SX does not get a lot of use lately. The current set of batteries, has been in the calculator since 1991-1992. I check them occasionally for corrosion. It does have two cards in it. But I do not think they draw any power. They are the equation library and the PE EE Exam card by Chotkeh.

**Re: 48SX battery run**

Message #4 Posted by [John Mosand](#) on 18 Sept 2007, 2:13 p.m.,  
in response to message #3 by JoeFrisco

JoeFrisco, you probably mean that the batteries have been in there "since 2001-2002"?? And, DaveJ, thank you for those details, measuring projected battery life span, etc. while installed. (I have a good meter, but I don't know how to do that...)

You've gotta have 3 hands to hold one battery half out, hold the probes in contact, and push the buttons at the same time. Also, the angle you hold your tongue at is crucial!

Dave.

**Re: 48SX battery run**

Message #6 Posted by [JoeFrisco](#) on 20 Sept 2007, 9:55 a.m.,

You are correct 2001-2002

**Re: 48SX battery run**

Message #7 Posted by [designnut](#) on 20 Sept 2007, 2:14 p.m.,  
in response to message #5 by DaveJ

A handy tool to access battery currents is a thin strip of PC material with copper on both sides and solder such leads as you may need to either side copper. Then it may be inserted in any battery path to obtain a current reading. Sam Levy

**Re: 48SX battery run**

Message #8 Posted by [DaveJ](#) on 18 Sept 2007, 7:01 a.m.,  
in response to message #1 by John Mosand

I just measured the current drain on my 48SX at 12uA when off with fresh batteries and no cards. That would equate to an absolute best case life of around 100,000 hours (11 years) for Alkalines in the off state. That is of course more than the shelf life of the batteries.

I got 3.2mA when ON, doing nothing but displaying the stack. That would be roughly 375 hours best case continuous operation.

Dave.

---

I think it was 2uA, but I can't recheck because it looks like I've just killed something! Just some innocent current probing and now the screen has all of the right half pixels on and the hourglass, no response from keys. Oops.... Anyone know how to fix?, I've tried shorting the battery contacts etc but there is simply no response at all, can't even turn the calc off.

Interesting, when a key is pressed and held down the current jumped to a steady 6mA.

Dave.

**Re: 48SX battery run**

*Message #11 Posted by [DaveJ](#) on 18 Sept 2007, 6:08 p.m.,  
in response to message #10 by [DaveJ](#)*

It's ok now, seems to have fixed itself after a while!

Yes, 2uA after pressing ON-SPC.

Considering that normal off mode gives you a measly 12uA, what's the point?

If you want to save power on your 48SX I'd recommend pressing the keys quicker!

Dave.

### **New HP17BII+ (new keyboard with wide input/enter)**

Message #1 Posted by [Miguel Saiz](#) on 16 Sept 2007, 11:17 a.m.

Have any knows if this new model is shipping (in the US)? Have any bought one? better keyboard? it is the same platform that the HP35s?

You can see it at <http://www.calculatorshop.co.uk/classiccalculators/>  
[http://www.calculatorshop.co.uk/classiccalculators/New\\_Image\\_2.JPG](http://www.calculatorshop.co.uk/classiccalculators/New_Image_2.JPG)

Edited: 16 Sept 2007, 11:24 a.m.

### **Re: New HP17BII+ (new keyboard with wide input/enter)**

Message #2 Posted by [Raymond Del Tondo](#) on 16 Sept 2007, 11:57 a.m.,  
in response to message #1 by Miguel Saiz

Yes, I've seen pics of this unit a while ago,  
but not a detailed one like this so far - Thanks for that:-)

Now this is a very good hardware basis for a new 42S, isn't it?

Raymond

### **Re: New HP17BII+ (new keyboard with wide input/enter)**

Message #3 Posted by [Miguel Saiz](#) on 16 Sept 2007, 1:37 p.m.,  
in response to message #2 by Raymond Del Tondo

Yes, I agree with you that is its an excellent platform for the HP42SII( hope that some guy from HP could be reading this). A good idea for HP will be to celebrate the 35 anniversary with a limited edition of HP42, HP15c (based on Platinum 25th edition). The ROMs are ready (please, do not add anything, just put as they were, it could be easier, cheaper...better for us, long time users)

Edited: 16 Sept 2007, 4:12 p.m. after one or more responses were posted

### **42s rom**

Message #4 Posted by [Gene Wright](#) on 16 Sept 2007, 3:32 p.m.,  
in response to message #3 by Miguel Saiz

Where is the rom for the 42s? I didn't think HP had ever released that rom.

?

### **Re: 42s rom**

Message #5 Posted by [Eric Smith](#) on 16 Sept 2007, 3:54 p.m.,

*in response to message #4 by Gene Wright*

Nor have they released the 15C ROM, for that matter.

But you can use the built-in debugger of the 42S to send the ROM contents out the infrared port.

### **Re: 42s rom**

*Message #6 Posted by [Miguel Saiz](#) on 16 Sept 2007, 4:07 p.m.,  
in response to message #4 by Gene Wright*

I was refering that HP has the ROM, and the only thing is to get port to a new processor (that is the same thing that was done in the HP17BII+ {in some place some time ago, I had read that all the HP42S instructions were in the same HP17BII ROM, but I am not completely sure that that was true} My point is, that is not rocket science to port HP42S ROM to a new platform or HP15C ROM, that there are today calculators based on those platforms, and that the process was in some way done to the HP17BII+ and to HP12CP (and 25edition). Given that, could be easy and profitable to re-born those classics (it not make sense to me, trying to reinvent the wheel (and failling doing that), if there are good products and experience to use.

Sorry, if I did not explained well,

### **Re: 42s rom**

*Message #7 Posted by [Raymond Del Tondo](#) on 16 Sept 2007, 5:22 p.m.,  
in response to message #6 by Miguel Saiz*

I think the approach for a rebirth of the 42S would be similar as with the 33s/35s: A simulation written in C/C++.

But the OS of the 42S is much more powerful and complicated than that of the 33s/35s. As I wrote in another thread, the original 42S OS consists of an RPL kernel with a simulated RPN usr interface.

Yes, it's not rocket science, and there is a 42S simulator already, Free42 in particular, which is available for various platforms, even my N770 runs a flavour of it.

Regarding the original HP-17BII:

The HP-42S and the original saturn-based HP-17B/II share a similar kernel, and have a similar RPN-like user interface, but the 17BII does not have all the functions that the 42S provides, and vice versa.

However it's perfectly possible that the developer(s) of the 35s designed the code so that ist may be reusable for s.t. like a new 42S...

...and if it provides a binary compatible FOCAL execution engine, it will be even better;-)

Somewhat OT...

For those who do not know what I mean with FOCAL execution engine (FXE): The original HP-41 implements a mechanism to execute binary streams,

and a FOCAL program written on the HP-41 is a series of bytes which will be fed to that engine.

The two reincarnations of the HP-41 from HP, the HP-42S and the HP 82210A HP41CV Emulator card for the HP-48SX, both feature a binary compatible FXE, which means you can feed the same binary stream to either of the engines.

The emulators, like Emu41 from JF Garnier, V41 from Warren Furlow, Emu42 from Christoph Giesselink, and the saturn-based emus from Hrast also implement that compatible FXE, of course, because each of these emulators uses the original ROMs;-)

Free42 is a bit different, as it doesn't use the original ROM code, but I think the FXE is similar, at least if it's functionally compatible. However I haven't checked this particular case.

The HP-71 HP-41 Translator module is a completely different beast. As the name implies, it translates HP-41 FOCAL streams into functionally equivalent FORTH words.

I wonder if Thomas would be willing to license the Free42 source to HP under terms other than the GPL? While it would be unbelievably cool if HP were to come out with a 42s++ based on Thomas' code, and at the same time publish their changes as the GPL requires, I think that stretches credulity farther than hoping for the calculator itself does. But Thomas, as the author of Free42, could relicense it to HP under any terms he wished. He might even make a couple of bucks. (Euros, sorry. Much better to be paid in euros nowadays.)

Regards,  
Howard

### **Re: 42s rom**

*Message #9 Posted by [Miguel Saiz](#) on 17 Sept 2007, 1:10 a.m.,  
in response to message #8 by Howard Owen*

oh, oh...It looks like if the ROMs are missing (as Eric told us), one possibility could be to license codes from the emulators, as Howard suggest (wow think about the possibilities, kind of 'virtualization' at the calculator level). If an agreement could be reach, could be a great advantage for HP, the fan base community and for the emulator's authors. I would really prefer this kind of input (well tested code, that was based on the fundamentals of those calculators), and a path for additional functionality, that can grow to a solid plataform (if enough care is given to the hardware and design)

So, the idea is in the air. It makes sense (short development cycle, proven code, new powerful hardware...virtualization at calculator level). Any one at HP interested? This could be the return to a new era, based on innovation in product and cooperation between the user community.

Any HP associate that could pass the idea?

### **Re: 42s rom**

*Message #10 Posted by [Hugh Evans](#) on 17 Sept 2007, 11:21 p.m.,  
in response to message #9 by Miguel Saiz*

Your idea makes sense, but I'm sure HP would rather pass the specifications for a classic calculator to some outsourced programmers somewhere in the Philippines. Emulation requires a good bit of overhead, and I doubt the accounting department at HP has any interest in using original code when it requires a CPU with a PPU above \$1.

Quote:

\_\_\_\_\_

I wonder if Thomas would be willing to license the Free42 source to HP under terms other than the GPL?

\_\_\_\_\_

Sure -- anything goes as long as it is understood that I will always retain the copyright to the original Free42 code (i.e. the version I maintain and which has always been licensed under GPLv2). I'll probably have to go over the code to make sure that I obtained all the third-party code in Free42 under licenses that allow such relicensing, but as far as I can remember offhand, there are no major issues there.

So far, nobody has approached me with any concrete offers, though. Guess I'll have to keep my day job for the time being. ;-)

- Thomas

### **Re: 42s rom**

in response to message #6 by Miguel Saiz*

Quote:

\_\_\_\_\_

I was refering that HP has the ROM

\_\_\_\_\_

Actually, HP does NOT have the ROM code for many older models. Lots of stuff was lost in the moves from Corvallis to Singapore to Australia to San Diego, including most of the pre-48 source code and binaries.

It's very likely that the 15C code is long gone. Possibly the 42S code as well.

Quote:

I had read that all the HP42S instructions were in the same HP17BII ROM, but I am not completely sure that that was true

It's not. There's some shared code, but nowhere near all.

Quote:

port HP42S ROM to a new platform [...] the process was in some way done to the HP17BII+ and to HP12CP (and 25edition).

Those weren't "ports", but rather rewrites. The original 17BII and 12C code are not used in any form in the 17BII+ and 12C Platinum.

### **Re: New HP17BII+ (new keyboard with wide input/enter)**

in response to message #13 by Pal G.*

Sadly, you had a point, but I think that it could be late to do that. I think mostly of us, HP fans, are baby boomers (in some way nostalgic for the old times, but may be not a large enough market), that could buy those products because using it, we remember college days (I need to admit that buying HP calculators is for that purpose, I am not doing a generalization to all). I had placed an order for a HP50G (my only problem is in what problems to use, mostly I am Mac user, with Mathematica on my MAC, Numbers (part of Keynote suit), Excel, etc. I am not in need to get tests (currently I am administering the tests), but frankly, to me HP calculators are kind of gadget that I like, and that evoke on me, things to remember, and love to have.

For sure that there is plenty on events to use for launch products, the 35anniversary is a point in time that could be use for more that a product, not doing that, will close an opportunity window to re-create products that were recognized for their top quality an innovation. To me, is a huge waste not to preserve one of the best representation on the quality and innovation delivered by a company (management vision and engineering expertise), that created a market for a product base on building of new ideas and needs.

By the way, I was showing the new HP17BII+ to know when it will available, to order mine

You replied:

Quote:

To me, the new 17bII+ certainly appears to utilize the same basic physical construction characteristics as the 35s, which I would define as using the 35s "platform". It looks to me like they took the 35s, removed the cursor keys, removed the top row of keys, and converted the second row to a full row of six standard keys, and shortened the whole calculator accordingly. It has the same "stepped" faceplate as the 35s, the same straight top and bottom but gently curved sides, the same rectangular shape keys, the same straight rows of keys. In contrast, the previous 17bII+ has fairly radically curved top, bottom and sides, all keys are curved top and bottom (some more than others) and the bottom rows of keys are not straight across. So, while it may be the same size as the previous 17bII+, it certainly appears to me to be based on the new 35s design. The pictures below illustrate the above described similarities and differences. Forgive me if I misunderstood the original intent of the word platform or your interpretation. No disrespect intended, just trying to clarify.

*Message #17 Posted by [Jake Schwartz](#) on 24 Sept 2007, 1:26 p.m.,  
in response to message #16 by Jeff O.*

With respect to that new 17bII+ case, sadly, this is probably the case and keyboard layout they should have used for the 35s, so the top row of keys could return to the soft-key menus like the 32s2 (or actually like the 17bII+ and 42s). Oh well.

Jake Schwartz

**Re: New HP17BII+ (new keyboard with wide input/enter)**

*Message #18 Posted by [Walter B](#) on 24 Sept 2007, 1:58 p.m.,  
in response to message #17 by Jake Schwartz*

Well, but compared to the 35s you lose 6 keys by going back to this layout. Thus you will need deep menus, especially if you feature one shift key only. IMHO there are better solutions possible.

### **For those saying that 35s screen is an improvement over 33s**

*Message #1 Posted by [romeo\\_charlie](#) on 16 Sept 2007, 8:11 a.m.*

Hi there,

I have taken a few good res pictures under two lighting conditions:

These are under outdoor light directly coming from a window:

<http://img469.imageshack.us/img469/7620/35vs33goodlightzenithif9.jpg>

<http://img459.imageshack.us/img459/659/35vs33goodlightangleot7.jpg>

With good light, both LCD displays look similar. You can see that the 25s display has a bit more glare, and the 33s is easier to see. Also, notice the theta character on the top line of the 35s. Too similar to an 8.

Now, let's go to indoor working with these machines. The following pictures are taken indoors with enough light to work, write, or jot down numbers (like any regular office or lab):

<http://img340.imageshack.us/img340/9928/35vs33indoorzenithys1.jpg>

<http://img411.imageshack.us/img411/8875/35vs33indooranglezv6.jpg>

<http://img519.imageshack.us/img519/5222/35vs33indoorzenith2np0.jpg>

In these pictures, the HP-35s can be seen sucking out loud with its bad LCD.

These photos are just my \$0.02 for those considering the 35s.

Judge for yourself.

I work in an environment with constantly changing light conditions, going from bright sunlight to diffuse haze the next minute. I haven't tested it yet (I bought it two days ago), but I have serious doubt that it'll improve "in the field".

Oh, and the decimal point from the 33s that so many people disliked is rendered identically on the 35s.

Improved display? I don't think so.

Greetings,

Rafael

*Message #2 Posted by [gteague](#) on 16 Sept 2007, 8:27 a.m.,  
in response to message #1 by [romeo\\_charlie](#)*

now that just looks wrong!

whatever possessed someone at some time and place that a comma would be a good replacement for a decimal point? isn't that the whole definition of a decimal point? that it is indeed a point and not an amorphous mass? [g]

i looked at a 33s today at fry's and those keyboard labels all ugly colors and squashed together just turned my stomach. uglier than my 49g+ even and even harder to read. i ended up buying a ti-30sx and didn't notice until i got it home that it has green lettering on a green keyboard plate. sometimes you just have to scratch your head and conclude that designers work in a broom closet with no friends to shake them briskly when they go so wrong.

anyway, one of my favorite calculators of all the many i've owned is the 27s which i would argue has the worst display of any hp i've seen or owned. add the insult of (expensive) battery life measured in days instead of weeks or months and you know i'd have to really like it to keep it in play all these (20+?) years.

bottom line: i think they got the look and the keyboard feel of the 35s nearly perfect. hp need to build on that baseline with some good followups.

/guy

In several countries the decimal separator is indeed the comma. Even in Canada, Québec, where I live, this is the standart decimal separator. You refer to it as a decimal point because that is what you use. In countries where the comma is used it is refered as the decimal comma. I prefer the more generic term of decimal separator. I just bought a HP 32E from someone in Spain and I was happy to see that it came with comma as decimal separator. I just cannot get used to the point.

Regards,

Miguel

Hello all,

Please, dont get me wrong. I also like to point out good qualities, and I like this cal (that's why I bought it). But the 35s has a very bad one for a 21st century calculator. I took some pictures and I believe they speak for themselves.

Oh and, as Miguel said, the "dot" is not used as the decimal point everywhere. However, that's not the reason why I use the comma. I like the dot best, and the reason for me to use the comma is the bad LCD, where the dot can barely be seen.

Cheers,

Rafael.

Hello,

and thanks for the comparison.

The problem here is that the comparison is not neutral IMHO. To get a real comparison you'd also have to take photos with the left and right calcs on display swapped, while retaining the same point of view. That way, you will have the same conditions for both calcs, regarding the sunlight reflection.

The way you made the photographs, you'll always have a small difference in the viewing angle towards the respective display, and this actually voids the comparison;-)

Regards

Raymond

\_\_\_\_\_

Ha ha ha

I did actually, Raymond, but I only posted these ones.

I swapped the calculators from side to side, I moved them to different locations to get an objective perspective, and finally I posted only these pictures to save space in the forum (they're too big already).

I posted the zenithal photos because they were the most informative. Both screens were very parallel, and you can see the reflection of my face only in the 35. I guess that they used a more antireflective surface (or less reflective) in the 33. I prefer the 35 anyway. It's just a pity that they made this mistake.

Rafael.

Hello, Nice pictures. I also notice that the display of the 35s scratches like hell compared with the one and a half year old 33s which has no scratches at all. You can scratch it even cleaning it with a cloth. I wonder if there's a protection you can remove. With a shame.

### **Re: For those saying that 35s screen is an improvement over 33s**

*Message #15 Posted by [Brian Healy](#) on 16 Sept 2007, 4:57 p.m.,  
in response to message #1 by romeo\_charlie*

The complaints about the HP 33s display were mostly concerned with its initial release. The decimal point was very small and almost impossible to see in a number like 2.2. This was corrected in time by HP.

The display does not "suck out loud". I do not dispute that it could be better. Having used both the 35s and the 33s with the improved display, it is my opinion that there is almost no discernible difference. The display of the 35s could be greatly improved with a matte display, such as the one used for the 32sii.

I am very pleased with the HP 35s, and would recommend it to anyone. Sometimes it seems like there is an anti-HP35s bandwagon on this site. Is it perfect? No. Is it bug free? No. Is it good enough for daily use? Absolutely. It is my daily use calculator as a structural engineer, and it works just fine.

I apologize to anyone that could be offended by my "sucking out loud" comment. It was not my intention to offend anyone. Brian, I am sorry if my words made you think I'm against the 35s. I am not experienced enough to put down a machine that so many people cherish. I actually like it very much. I just thought I'd take those pictures and remark the bad point of the machine I see at first when I open the box. But hey, I like it, that's why I own one. If I were a member of some bandwagon, I wouldn't want to learn to use it better ;-)

Again, thanks to everyone posting in reply to my comments and everyone helping me in my other posts.

Cheers,

Rafael.

**Re: For those saying that 35s screen is an improvement over 33s**

*Message #17 Posted by [Brian Healy](#) on 16 Sept 2007, 8:55 p.m.,  
in response to message #16 by romeo\_charlie*

I apparently interpreted your "sucking out loud" more harshly than you meant it. No offense was taken.

I do agree with you that the display could be better though. In my opinion a matte finish for the display window would make it a lot better.

I like the 35s but I don't think that its design is as good as the 32sii, although the 35s is more powerful.

Thanks for a cool level headed response.

From one who has invested in a 35s but yet not got it I liked to read a positive mail about it :-)  
However I have liked reading the post about all the problems, for one thing, I am prepared to not be disappointed!

Ofcourse one must also take into account this population, probably some of the most knowledgeable hp calculator people and also it is the problems that for natural reasons get discussed.

Also I think the anger sometime one feels present in post is not so much about how terrible terrible 35s is but how good it could have been...

In a close parallel universe there are people jumping up and down in joy for the 35s, it does not have any bugs in our bug list article, it has the old normal  $R \leftrightarrow P$ , vectors has dim operator and cross product and can be used for input to the linear equation solver, it has basic usb I/O.

We would smile also then, he?

### **Display comparisons: HP-32SII, -33s, -35s**

*Message #23 Posted by [Karl Schneider](#) on 17 Sept 2007, 11:40 p.m.,  
in response to message #1 by romeo\_charlie*

I can't directly compare the HP-35s display to the improved HP-33s display, which is probably nearly the same.

The original HP-33s display has 14 full-grid positions plus a leading negative-sign position. The one-line HP-32SII display has 12 larger full-grid positions plus a leading negative-sign position.

It is noteworthy that HP-32SII display window is slightly wider, and with no annunciators on the sides, the space allotted for numbers in the HP-32SII display is significantly wider. The HP-35s would benefit from a 15th display position, as that would make possible the display of any complex number, if the mantissa is rounded to a single significant figure, e.g.:

$-9.E-234i-5.E-167$

which really ought to be displayed in mathematically-correct HP-42S style as

$-9.E-234-i5.E-167$

SHOW could then display the mantissas of each part of the complex number without exponents.

Presently, the HP-35s truncates display of real or complex numbers (if necessary) after the 14th character, relying on the scrolling function to display the entire number. The magnitude is not always apparent, and SHOW doesn't work at all on a complex number.

**Re: For those saying that 35s screen is an improvement over 33s**

Message #24 Posted by [Peter Niessen](#) on 27 Sept 2007, 9:43 p.m.,  
in response to message #1 by romeo\_charlie

Indeed.

I taped my HP35S display with Scott Magic tape (the one which smells a bit like a new HP calculator). It adds the necessary matte. OK, not a perfect solution, but gets rid of the glare. Apply carefully to avoid air bubbles between display surface and tape.

Cheers, Peter.

\_\_\_\_\_

You may also want to consider using a screen protector for a PDA. The protectors are nearly transparent, easily trimmed to fit before removing the backing, and have almost no tackiness (easy to remove with no residue).

### HP-48-SX/User Assigned key comands

Message #1 Posted by [Hai Quan](#) on 15 Sept 2007, 5:57 p.m.

When I attempt to execute a user assigned command, all I get is the comand, not the executed command (e.g. if I have assigned "CLX" to a key the "CLX" is returned but not executed when I press the key.

What is the problem?

PS: The HP-48 passes all the internal tests.

### Re: HP-48-SX/User Assigned key comands

Message #2 Posted by [Raymond Del Tondo](#) on 15 Sept 2007, 8:04 p.m.,  
in response to message #1 by Hai Quan

There are various reasons why your attempt doesn't work.

1. CLX is not an HP-48 command
2. You used double quotes, so you wanted to return a STRING

Solution:

1. Use a valid HP-48 command, like DROP in this case

You can create an unevaluated command on the stack this way:

{ command\_name } OBJ-> DROP, where command\_name is your actual command.

Then you specify they key to be assigned, e.g. 11.1, then ASN.

Alternatively you can embed your command into a program like this:

```
<< command_name >>
```

HTH

Raymond

### **HP-35s delimiters: Another RPL-esque characteristic**

Message #1 Posted by [Karl Schneider](#) on 15 Sept 2007, 3:50 p.m.

All --

In the blizzard of commentary about the HP-35s, this might have been noted already, but I can't specifically recall.

When a number is being input on the HP-35s while the delimiters ("," or ".") that separate groups of 1000 are active (i.e., DISPLAY 7 set), the delimiters do not appear until the number is finalized by ENTER, setting change, or other operation. The legacy models (including the HP-33s), by contrast, insert the delimiters *as the number is input*.

I would assume that the HP-35s behavior stems from the "input buffer" logic adopted from the RPL-based HP-50g, in which input is treated as free-form until it is processed upon some concluding action. The awkward base-arithmetic (hexadecimal/octal/binary) format is another RPL idea that was transferred.

Perhaps these changes were made in order to standardize code between the HP-35s and HP-50g. However, I like the old "RPN way" better...

-- KS

Message #2 Posted by [Pal G.](#) on 16 Sept 2007, 1:46 a.m.,  
in response to message #1 by [Karl Schneider](#)

Yes, this has been discussed.

As an HP calculator greenhorn, I was not sure why the fuss. However, yesterday, I used a co-workers hp 41cx. I typed a large number just to see this particular effect. (I've never seen it before; I have an hp 50g and hp 35s). Predictably, the calculator inserted commas as I kept pressing zeros..

All I can say is, nice feature!

Cheers, Pal

### Program format from 33s to 35s

Message #1 Posted by [romeo\\_charlie](#) on 15 Sept 2007, 2:14 p.m.

Hello all.

I am new to this forum. I've been reading the posts for a while, and decided to go ahead and post my question. I am hoping to get some help from some of the experts whose messages I have been reading recently.

I used the program from Dave Coffin for the HP-33s for distance and bearing calculation. Now, I have just bought a 35s, and have found that the polar to rectangular conversion just doesn't work the same way. Unfortunately, I am just an airline pilot, and am no computer or math expert.

I was hoping that someone could help me modify this program to make it work in the HP-35s, since replacing the critical lines (D08, D13, D16, D20, D25) by the routines I read about yesterday in this site don't make it work.

Here's the Dave Coffin program:

```
D01 LBL D
D02 DEG
D03 INPUT N
D04 STO X
D05 INPUT E
D06 INPUT N
D07 1
D08 (polar to rectangular)
D09 INPUT E
D10 R up
D11 -
D12 x<>y
D13 (polar to rectangular)
D14 R up
D15 x<>y
D16 (rectangular to polar)
D17 x<>y
D18 RCL- X
D19 x<>y
D20 (polar to rectangular)
D21 180
D22 Rdown
D23 Rdown
D24 +/-
D25 (rectangular to polar)
D26 Rdown
D27 -
D28 x<>y
D29 ACOS
D30 60
D31 x
D32 RTN
```

You enter initial Latitude and Longitude and Final Latitude and Longitude, and it returns the distance in nautical miles and true departure course to fly the great circle trajectory.

I hope I am not bothering the audience with my ignorance about HP calculators.

Thanks in advance for any help.

Rafael.

Edited for grammar.

*Edited: 15 Sept 2007, 2:39 p.m.*

## **Re: Program format from 33s to 35s**

*Message #2 Posted by **Karl Schneider** on 15 Sept 2007, 6:31 p.m.,  
in response to message #1 by romeo\_charlie*

Welcome, Rafael!

Quote:

Unfortunately, I am just an airline pilot, and am no computer or math expert.

Certainly no need to be humble about that...

Quote:

Now, I have just bought a 35s, and have found that the polar to rectangular conversion just doesn't work the same way (*as it did in the HP-33s*).

Yes, this has been source of considerable consternation in this group. I believe that it was a horrible idea.

I've also had to deal with that same issue while porting my HP-32S/32SII/33s program to the HP-35s. The basic problem is that while "Th,r->y,x" and "y,x->Th,r" utilize only two stack registers, the conversion procedures that would be employed on the HP-35s almost always require more. This might cause the program to fail, by causing stack overload.

If the program were optimized for the HP-35s, many of the conversions could be eliminated, with calculations done using complex numbers in polar mode. But that would take some effort.

### Polar to rectangular:

I replaced "Th,r->y,x" with code that used all four stack registers.

```
(magnitude)
ENTER
ENTER
(angle value)
ENTER
SIN
x<>y
COS
Roll_up
*           (result is x-coordinate)
Roll_down
*           (result is y-coordinate)
```

For two-level calculations, an alternative is to store results and inputs to lettered registers, then recall them as necessary:

```
(magnitude)
STO M
(angle value)
STO A
SIN
*           (result is y-coordinate)
x<> M
```

```
RCL A
COS
*           (result is x-coordinate)
RCL M      (result is y-coordinate)
```

### Rectangular to polar:

The difficulty is that ARG (or conversion to polar representation of a complex number) is the only way to access the "atan2" function, which gives the proper quadrant of the angle -- very important in navigation.

Using complex-valued functions, with one extra stack register:

```
(x-coordinate)
(y-coordinate)
i
*
+
ENTER
ABS           (result is magnitude)
x<>y
ARG          (result is angle value)
```

To use only two stack registers will require a storage register and a bit more thought...

Quote:

\_\_\_\_\_

I hope I am not bothering the audience with my ignorance about HP calculators.

Thanks in advance for any help.

\_\_\_\_\_

Not at all; our pleasure.

-- KS

*Edited: 15 Sept 2007, 6:50 p.m.*

## **Re: Program format from 33s to 35s**

*Message #3 Posted by **Jeff O.** on 15 Sept 2007, 8:55 p.m.,  
in response to message #2 by Karl Schneider*

Rafael,

Like Karl says, welcome! Following up on some of Karl's points, the following routines preserve the stack and Last X and require no registers:

### Rectangular to Polar

```
ABS
Roll Down
Roll Down
Eqn LASTx+i*REGT
ENTER
Roll Down
Roll Down
Eqn ARG(REGT)
Eqn ABS(REGT)
RTN
```

### Polar to Rectangular

```
ABS
x<>y
Roll Down
Roll Down
Eqn LASTx*SIN(REGZ)
Eqn LASTx*COS(REGT)
```

RTN

The original program you presented would appear as follows with these routines added as subroutines:

```

D001  LBL D
D002  DEG
D003  INPUT N
D004  STO X
D005  INPUT E
D006  INPUT N
D007  1
D008  XEQ D043    (polar to rectangular)
D009  INPUT E
D010  R up
D011  -
D012  x<>y
D013  XEQ D043    (polar to rectangular)
D014  R up
D015  x<>y
D016  XEQ D033    (rectangular to polar)
D017  x<>y
D018  RCL- X
D019  x<>y
D020  XEQ D043    (polar to rectangular)
D021  180
D022  Rdown
D023  Rdown
D024  +/-
D025  XEQ D033    (rectangular to polar)
D026  Rdown
D027  -
D028  x<>y
D029  ACOS
D030  60
D031  x
D032  RTN
D033  ABS
D034  Roll Down
D035  Roll Down
D036  Eqn LASTx+i*REGT
D037  ENTER
D038  Roll Down
D039  Roll Down
D040  Eqn ARG(REGT)
D041  Eqn ABS(REGT)
D042  RTN
D043  ABS
D044  x<>y
D045  Roll Down
D046  Roll Down
D047  Eqn LASTx*SIN(REGZ)
D048  Eqn LASTx*COS(REGT)
D049  RTN

```

Of course it would be far better if the next version of the 35s looks like this:

Edited to replace the original routines with Miguel's improved versions.

in response to message #3 by Jeff O.*

Hello Jeff and welcome Rafael,

Please see at this two versions for P->R and R->P, they are shorter and get the same result (they preserve the stack and LAST x), I think:

Polar to Rectangular

```
-----  
ABS  
x<->y  
RDN  
RDN  
eqn LASTx*SIN(REGZ)  
eqn LASTx*COS(REGT)  
RTN
```

Rectangular to Polar

```
-----  
ABS  
RDN  
RDN  
eqn LASTx+i*REGT  
ENTER  
RDN  
RDN  
eqn ARG(REGT)  
eqn ABS(REGT)  
RTN
```

Please tell me what you think.

Regards,

Miguel

Hello colleague!

Quote:

\_\_\_\_\_

I will compare the calc returns to the correct answer and will let you know,  
since some have pointed out possible errors.

\_\_\_\_\_

I can tell you right now that you will not get any correct answer by trying to solve a spherical problem (= great circle navigation) by using a flat approach (i.e. using those built-in or homemade P/R conversions). It will work sufficiently well for very short distances only.

You need to program the correct formulae instead (look here for example:  
[http://en.wikipedia.org/wiki/Great-circle\\_distance](http://en.wikipedia.org/wiki/Great-circle_distance) ) if you want correct results.

Anyway: Please don't tell me that you intend to navigate along great circle routes by typing co-ordinates into your pocket calculator (or that your employer allows you to do that!). Otherwise I will prefer to stay on the ground while you are up there ;-)

Happy landings, Max

---

Max!

Nah, dont worry! I trust our two good old million-dollar Honeywell FMS's, along with our three laser gyro IRS's on board for actual navigation over the atlantic in the Airbus.

If those fail, there is a completely detailed procedure for that.

This is just a little hobby I got going, and since I already succeeded solving spherical trigonometry ecuations in the older and bigger HP-48sx for the calculation of the great circle distances and angles, I wanted to approach this problem in the smaller HP-35s.

It's spherical triangle ecuations you got me working on "as we speak", but as I said, I'm no computer expert and it's hard.

Happy landings to all,

Rafael.

**Re: Program format from 33s to 35s - for Jeff**

*Message #9 Posted by [Miguel Toro](#) on 16 Sept 2007, 9:46 a.m.,  
in response to message #5 by Reth*

Hi Reth,

In the P->R procedure that is prevented thanks to the use of LASTx: the original value before the ABS is there.

I corrected the R->P procedure to have the same behavior: the use of LASTx to recover the original value.

You are right about the flag 10 and that will depend on the use of these routines in Rafael's program.

Thanks,

Miguel

in response to message #1 by romeo\_charlie

For a long article on rectangular to polar conversions look at this [discussion](#). By the end, the programs for doing the conversion were pretty good. I've submitted the "best" to the museum for inclusion in the software library. I've also included them here:

```
P001  LBL P
P002  FS? 10
P003  GTO P011
P004*  Rv
P005  Rv
P006  eqn REGZ+i*REGT
P007  ARG
P008  LASTx
P009  ABS
P010  RTN
P011*  CF 10
P012  XEQ P004
P013  SF 10
P014  RTN
```

```
R001  LBL R
R002  FS? 10
R003  GTO R012
R004*  Rv
R005  Rv
R006  eqn [REGZ*SIN(REGT),REGZ*COS(REGT)]
R007  [1,0]
R008  x<>y
R009  *
R010  EQN LASTx*[0,1]
R011  RTN
R012*  CF 10
R013  XEQ R004
R014  SF 10
R015  RTN
```

Both routines preserve the Z and T registers and return their results in the X and Y registers. They are also independent of the settings on the calculator and honour the current trig mode.

**Use Case: Logic Operators**

Message #1 Posted by [Will Rutherford](#) on 15 Sept 2007, 10:25 a.m.

Where I work, there are lots of uses for hex. There are FPGA developers defining interfaces through registers that device drivers have to connect to, for example. There are interfaces between control systems and the devices. There are debug listings often giving values in hex. In some cases, the hex values contain a number of bit fields that have to be separated out for comparison with other values. There are also data streams to look at such as MPEG encodings.

What is needed in this environment, if you're going to use a hand calculator at all, is repeated use of hex conversions and logic operators. It's also nice to have general scientific computing available in the same package in case other stuff comes up.

I have six HP calculators sitting beside me right now. The 48sx is broken. The remaining ones are in perfect working order. 15C, 16C, 33s, 50g, 35s. What will I use for the job?

The 15C is for me the nicest general scientific calculator of the lot, if you're not looking to do much programming. But it has no hex or logic. The 16C has the best hex and logic capabilities ever built into an HP but only one transcendental function: sqrt. The 33s has general scientific combined with hex, but no logic operators and no reasonable way to implement them. The 50g is very powerful but requires a little programming to improve the logic operators and is a bigger calculator than I want to carry around in the lab with me and possibly lose. That leaves the 35s, which is flawed.

Minimal keystrokes for oft-repeated operations is a very important principle in calculator design. If you only enter one hex number every month or so, it doesn't matter how many keystrokes it takes to do it. But if you want to enter dozens in one day, an extra keystroke or so per number makes the job unmanageable and extremely annoying.

The 35s as it now stands forces me to enter 3 extra keystrokes minimum per hex number entered. Those keystrokes are redundant, because I am already in hex mode and am required by someone's inconsiderate calculator design to enter an 'h' character at the end of the number. Those characters are <right-shift> BASE 6. The '6' part is annoying because I have to remember an arbitrary numeric constant, which is bad user interface design. If I don't like the '6', I have an alternative of using the arrow keys. Doing so increases the number of characters to bring up the redundant 'h' to 5.

Then there are the logic operators. They are not right on the keyboard, but in a menu. I accept that for a general-purpose calculator. So to use the NOT operator I enter <left-shift> LOGIC 4. If I don't like the 4, I need two arrow moves, bringing the total to 4 keystrokes.

All right, disregarding the hex problem for a moment, how can we improve on the operators? Ahh, I can write a subroutine for NOT. Okay, I've defined AND, OR, NOT, XOR, RMDR, INTG DIV as A, B, C, D, E, F. Great. Now to negate a hex number, which is a very frequent operation, I need XEQ C ENTER. Three keystrokes for a frequent operation. Not good.

As far as I've determined so far, there is **no** facility available in the calculator to reduce the keystrokes for the NOT operator below 3. I'm stuck with it.

So from a usability point of view, the 35s would need two improvements. (A) eliminate the 'h' requirement when in

hex mode. Nobody argued with me over that one. (B) Provide a rapid-entry subroutine call facility.

Regarding (B), if people are unwilling to part with the extended XEQ, then I would suggest a User mode as in the 15C. The next best alternative would be keyboard mapping, which requires too much extra infrastructure to support.

The great thing about a User mode is that I would only activate it when I need it. It's only a simple notational extension to existing subroutine facilities. When I'm done with my hex calculations, I can switch back into regular mode and have the usual scientific functions available. And when I'm in user mode, I could invoke my frequent functions using just *one* keystroke.

The other major issue in the Logic use case is shift operators. As I mentioned in another post, there's already a LOGIC menu and they could simply be added there. They're probably not hard to implement internally, as they are low-level operators close to the machine.

One flaw I've noticed in the 50g is that the shift operators exist in multiple forms, but they're all unary operators. What people really want most of the time is a binary shift operator, as in the C language << and >>. In order to extract different parts from an arbitrary hex number, for instance, you want to shift an arbitrary number of bits and do an AND with a mask value. Thus the preferred notation would be a ENTER b LSH.

Summary: People need to recognise the importance of minimum keystrokes for frequent operations. In the 35s one way to provide this would be a User mode. Finally, it would be useful to add binary left- and right- shift operators to the LOGIC menu of the 35s.

-Will

## Re: Use Case: Logic Operators

Message #2 Posted by [Peter Niessen](#) on 15 Sept 2007, 12:02 p.m.,  
in response to message #1 by Will Rutherford

Hi Will,

I guess it's supply and demand. 99.999999999% of users will need the transcendental functions and not the binary operations. Therefore, it probably doesn't make much sense (economically) to produce a calculator which has RL, RR, RLR, RLB, RRB, etc printed on the keys and sin, cos and tan hidden in some menu. I guess this is also a bit what is flawed with the HP28: It has both the hex and the trig stuff hidden in menus. At least, once the menu is active, you can keep them open and use them with a one keystroke operation. Plus, when in hex, the whole word fits into the display.

Too bad your 48sx is broken, it would be the thing to use for you.

Cheers, Peter.

\_\_\_\_\_

That's not quite right. In opposite to e.g. the 32SII, you're always in decimal entry mode. Enter 10 and will get Ah in hex display mode. Only the suffix allows for a different entry mode.

I agree however to everyone thinking that this is not a good design decision.

The 16C has the best hex and logic capabilities ever built into an HP but only one transcendental function: sqrt. The 33s has general scientific combined with hex, but no logic operators and no reasonable way to implement them. The 50g is very powerful but requires a little programming to improve the logic operators and is a bigger calculator than I want to carry around in the lab with me and possibly lose. That leaves the 35s, which is flawed.

You should consider purchasing an HP-42S from eBay. This quality compact model was discontinued in 1995, but has all the base-arithmetic, logic, and transcendental math functionality (including modulo division) that you mention. The hexadecimal/octal/binary words are 36-bit 2's-complement signed integers.

I agree with you that the HP-16C had the best binary-mathematics capabilities and that those of the RPL-based models were poorly conceived. Here's an archived post on the topic:

## Re: Use Case: Logic Operators

Message #5 Posted by [Will Rutherfordale](#) on 16 Sept 2007, 1:40 p.m.,  
in response to message #4 by Karl Schneider

Thanks for the encouragement, Karl. I also found your link informative.

Keeping to the KISS principle (keep it simple, stupid), I followed the path of least resistance and programmed the two functions I want on the 50g, calling them SHL and SHR. I then created a custom menu containing the main commands I want and my new shift functions.

In the process I was reminded of how annoying RPL is because the loops are test-at-bottom rather than test-at-top. So in order to make the command #7 0 SHL work correctly, i.e. produce #7, I had to put an extra IF into the code before the START loop.

I'm sure looping constructs in RPL have been debated here ad nauseum, so I won't belabour the point.

Suffice it to say that the 50g is not a pretty machine, but it can be made to do what you want sometimes.

The next obstacle is the two extra keystrokes needed per number entered, i.e. <left-shift> #. In the 16C this isn't needed. And of course I might want to see if I can make my SHL and SHR routines accept either a binary or a regular number for the second operand.

-Will

### **Re: Use Case: Logic Operators**

*Message #6 Posted by **Paul Dale** on 16 Sept 2007, 4:45 p.m.,  
in response to message #5 by Will Rutherfordale*

Mostly for interest's sake, I did a full implementation of the 16c's logic operations in \*fix (the OpenRPN implementation language). Most of the work is done in \*fix which is essentially RPL so porting to a 48/49/50 wouldn't be difficult.

The code is available on sourceforge I think.

As for avoiding the '#' prefix some sysRPL magic ought to be possible if you are really keen.

### **Re: Use Case: Logic Operators**

*Message #7 Posted by **Will Rutherfordale** on 17 Sept 2007, 7:34 a.m.,  
in response to message #6 by Paul Dale*

I've spent more time investigating both the 16C and the 50g. As before, my main criterion is simple usability for repeated hex calculations.

With my new custom menu, the 50g has all the functionality I want. However, it has usability problems in entering numbers. Not only does the '#' prefix require two keystrokes, but the digits ABCDEF require hitting the ALPHA key.

Furthermore, the custom menu keys coincide with the ABCDEF location. So if I forget to hit ALPHA I can accidentally change to decimal mode or invoke an AND operation. If I don't forget, I still have the problem that if I am in ALPHA mode I have to terminate it (or hit ENTER) to invoke one of the operators. Thus the operation is not very smooth and is prone to frustration from simple user errors.

The 16C definitely avoids all these problems. It has dedicated keys for all the hex digits, which are always active as such when you're in hex mode. It has the basic logic operators available with two keystrokes each (through the <f> prefix).

One thing the 16C doesn't have is binary (meaning two operand) shift-left and shift-right operators. However, it does have building blocks from which you can construct them. You could use a combination of MASKL or MASKR with AND and RLn or RRn. RLn and RRn are the available two operand rotate operators.

One could implement these new operators as subroutines and invoke them with two keystrokes per use using GSB, I believe. This gives a pretty viable solution with good usability.

So amongst the working HP calculators at my disposal right now, only the 16C seems to give me the hex calculating capability I want.

I haven't used sysRPL. Perhaps that's the only way to do the keyboard mappings necessary to get the 50g to reduce the keystrokes on '#' and the hex digits. The regular keyboard mapping through ASN doesn't look like it quite does it.

-Will

## Re: Use Case: Logic Operators

Message #8 Posted by [Will Rutherford](#) on 18 Sept 2007, 7:47 p.m.,  
in response to message #1 by Will Rutherford

I thought this comparison might help put it in perspective.

The following chart shows keystrokes required for various operations.

| Operation<br>Gcalctool  | HP33s | HP35s | HP35sB? | HP16C | HP50g | Win Acc |
|-------------------------|-------|-------|---------|-------|-------|---------|
| -----<br>-----          | ----- | ----- | -----   | ----- | ----- | -----   |
| +, -, *, /<br>1         | 1     | 1     | 1       | 1     | 1     | 1       |
| AND, OR, NOT, XOR<br>1  | NA    | 3     | 2       | 2     | 1     | 1       |
| SHL<br>1                | NA    | NA    | 2       | 2     | 1     | 1       |
| SHR<br>1                | NA    | NA    | 2       | 2     | 1     | NA      |
| Change base<br>1        | 3     | 3     | 2?      | 1     | 1     | 1       |
| View other base<br>NA   | NA    | NA    | NA      | 2     | NA    | NA      |
| Num entry overhead<br>0 | 0     | 3     | 0       | 0     | >=2   | 0       |
| RMDR, INT/<br>PS        | 2     | 3     | 2       | 2     | 1     | PS      |

Notes:

[0] "NA" means "Not Available". "PS" means "Partially Supported".

[1] HP35sB is a hypothetical calculator that might be built if HP folks decided to act on my recommendations. In particular: (a) XEQ reduced to 2-keystroke operation, or equivalent capability; (b) restore HP33s hex notation so the 'h' suffix does not have to be entered; (c) provide SHL and SHR operations in the LOGIC menu.

[2] "Win Acc" is the Windows calculator accessory. Gcalctool is a similar tool in Gnome, i.e. in Linux.

[3] It is assumed that all calculators have been programmed with simple wrapper functions where appropriate. This would mean:

- (a) HP35s: no improvements are possible that will reduce keystrokes
- (b) HP35sB: wrappers on all LOGIC menus and change of base
- (c) HP16C: my custom SHL and SHR are implemented, like the C operators
- (d) HP50g: a CUSTOM menu is created, and SHL and SHR are available there as well as the main logic and base change operators

[4] The "Num entry overhead" represents extra keystrokes required to simply type in a number, beyond the actual digit values. In the HP35s this is fixed at 3 for anything other than decimal, regardless of current mode. For instance in hex you need the h suffix. In the HP50g, it takes two keystrokes to enter the # prefix. For hex numbers, you also have to hit the ALPHA key an indeterminate number of times for the hex digits A..F.

[5] Some of the operations on the HP50g might take an extra keystroke or two for shifting through the custom menu, but the effect is random and small.

[6] RMDR and INT/ are related discrete math operations. They were in shifted key positions in the HP33s but got shunted off into menus in the HP35s.

### hrasts emulators (specifically the 71)

Message #1 Posted by [Bruce Bergman](#) on 15 Sept 2007, 12:03 a.m.

I just recently found hrast's emulators. I know, shame on me for not knowing about them before... Anyhow, I've played with the free 41e emulator for the 50g and I'm quite impressed!

I'm wondering what y'all think of the other emulators? I would be interested in buying a couple, but EUR\$60 (or EUR\$100 for two) is still quite a penny in the USA (about \$138, I believe). Are they worth the price? I'm looking for some honest opinions and reviews. In particular, what you think of the full-blown 41 emulation (with PPC ROM and packs) and the 71 emulation.

Thanks! bruce

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 15 Sept 2007, 4:34 p.m.,  
in response to message #1 by Bruce Bergman

Hi;

I have the Voyager Series emulators (HP11C, 15C and 16C) and the HP41CV. They run in the HP49G (blue, first model). I'd borrow your 'impressive' to describe them, cannot think of a better word. They definitely worth the bux.

In time: I bought a second HP49G just for this purpose: running Hrast's emulators. I'd tell it's been worth having an HP49G just for the task.

I consider Hrasts emulators a gem, so maybe I'm suspicious. I once needed to review some old calculations performed with math routines originally written for the HP41 and I did not have the MATH ROM for the HP41. I ran them in the HP49G with the emulators. Spot on!

Cheers.

Luiz (Brazil)

Message #3 Posted by [Howard Owen](#) on 15 Sept 2007, 8:56 p.m.,  
in response to message #1 by Bruce Bergman

Tell him how you helped debug the MLDL2K and HEPAX deal using HP41X, Luiz. Now that's accurate emulation!

I love Hrast's emulators too. I have HP41X, HP71X and HP42X. They all rock. HP71X is the only 71B emulator that will do graphics, so it's the only one that will run my YATZ71 program. I think the keyboard mapping is a bit of a stretch for that emulator in particular, though. The calculator emulators are better in this regard, since there's no expectation that there will be a QWERTY keyboard.

They are a bit pricey, particularly with the dollar crashing like it is. But if you are a HP calculator enthusiast, I'd say they are pretty much a must-have.

Regards,  
Howard

### HP-48SX missing its battery cover

Message #1 Posted by [Jean-Michel](#) on 14 Sept 2007, 4:45 p.m.

Hi all,

I recently took from the trash bin of the office where I work a non functioning HP-48SX. (Yes, that does happen!) After some investigations, I found the problem: the "ON" key doesn't operate until I press on the face plate above the "B" key at the same time. Probably the unit has fall on the floor once in its life, and the PCB isn't correctly fitted any more. This minor problem doesn't bother me much, all the more so since I already have a 48GX. On the contrary, the battery cover is missing, and this is a bigger problem, because at least one of the batteries often falls. So, if I may ask for this in this forum, would anyone here have a spare 48's battery cover, so that we could both make an arrangement?

(If this isn't definitely the right place for such a request, please let me know, Dave: I apologize in advance...)

Kind regards.

Jean-Michel.

It wouldn't be too hard to design a complete new board for it... if you were that keen. Hardest part would be re-attaching the LCD flex cable.

I can only see a (presumably) 32.768KHz watch crystal. Maybe a PLL is used to generate a higher frequency clock?

BTW, what's with the \*24\* screws holding that board in?? Seems a tad excessive.

Dave.

I'm no industrial design expert, but the reason for using so many screws is probably to stiffen the case.

**Re: hp 35s disassembled photos**

*Message #6 Posted by [Dan Greil](#) on 14 Sept 2007, 10:18 p.m.,  
in response to message #5 by Eric Smith*

I'm not a design expert either, but I was impressed that screws were used at all considering heat staking is the less expensive approach you'd expect for calculators fabricated in China.

**Re: hp 35s disassembled photos**

*Message #7 Posted by [Eric Smith](#) on 15 Sept 2007, 12:22 p.m.,  
in response to message #6 by Dan Greil*

Yes, I was surprised by that as well. With automated manufacture, perhaps there is less difference in cost between screws and heat stakes than we thought, but it's hard to believe that screws could be less expensive than heat stakes.

Note that many inexpensive calculators from Casio, Sharp, etc. also use screws.

Not if you have a sufficiently thick PCB. It's all a trade off between where you want your cost to be, room in the case, construction options etc. Can anyone confirm what thickness PCB is used in the 35S? (just curious)

In the 35S it looks like the PCB designer laid out a full complement of screws on a fixed grid and simply removed those where space was required for the parts and tracking. So, PCB first, and then the case moulding was designed to match the remaining screws holes. Interesting.

Dave.

I used to think that the screws in calculators fastening the PCB to the case top were to improve the rigidity of the PCB. However, my own experiments seem to indicate that the PCB tends to be more rigid than the case top, and that the screws serve more to increase the rigidity of the case top. Either way, though, it's fairly important.

---

---

I suspect that a stiff case prevents it from acting as a sounding board when keys are pressed. The sound of the key press is a large part of the HP keyboard "feel".

Where would you put them?

### Re: Could I use AA alkaline batteries in a HP 35?

Message #3 Posted by [Miguel Toro](#) on 14 Sept 2007, 6:10 p.m.,  
in response to message #2 by Stefan Vorkoetter

The original Battery Pack was dead so I opened it (cutting by the seam, as the curator says) and arranged it so now I am able to put in and take out NiMh batteries easily. So now I want to try some alkalines if that is safe. Maybe I can show a picture of what I did (it is ugly but it works).

### Re: Could I use AA alkaline batteries in a HP 35?

Message #4 Posted by [Stefan Vorkoetter](#) on 14 Sept 2007, 10:43 p.m.,  
in response to message #3 by Miguel Toro

Oh, sorry. I thought you meant HP 35s. I wouldn't use alkalines in an HP-35 because their voltage is higher. Good NiMH batteries (like Sanyo Eneloops) will far outlast the original NiCds.

### Re: Could I use AA alkaline batteries in a HP 35?

*in response to message #5 by Miguel Toro*

If I recall correctly\*, a fully charged nicad puts out about 1.5 Volts. If you check [the schematic](#) of the classic charger, it indicates that the logic supply voltage is 4.2 Volts. Based on this information, it is hard to believe that 4.5 Volts would present any danger. However, better safe than sorry, so unless you have a strong need to use alkalines, why take the risk. It would also be bad if you happened to plug the charger into your calculator with alkalines installed.

\*-which I apparently do not, see below

in response to message #6 by Jeff O.*

A fully charged NiCd puts out about 1.3V which quickly drops to 1.2V and then stays there for a long time. At 1.1V, it's almost dead.

Stefan

*Message #8 Posted by [JoeFrisco](#) on 17 Sept 2007, 7:45 p.m.,  
in response to message #6 by Jeff O.*

NiCads are 1.2 V. . . But I will accept the 1.3 V potential as offered by Stefan NiH are 1.2 V . . So you should be able to drop NiH cells for NiCad cells

Alkaline Cells are 1.5 V.

I agree that using alkaline batteries is not a good idea. The first problem is that a really new alkaline battery

can put out 1.6 volts or higher, but I suspect the calculator would be OK with that (4.8 volts). The more important problems are (as stated earlier) what if you put your charger to the calculator with the alkaline batteries, and if the alkaline batteries are left in the calculator long enough they will LEAK. For the last reason I would not try alkaline batteries as I can imagine putting them in and forgetting about it for a few years... and then being very unhappy.

Chuck

**Microchallenge 41/42: nr of digits**

Message #1 Posted by [Werner](#) on 14 Sept 2007, 5:57 a.m.

Challenge: write a program that can run unchanged on either a HP41 or a HP42, and will return 10 on a HP41 and 12 on a HP42. It must not depend on any modes or flag settings. Goal: shortest program excluding LBL and END

to give you an idea, this is my first thought:

```
.6 ENTER 1/X 1/X - LOG CHS
```

or, 8 bytes (41) and 10 bytes (42) Can you do better?

Yes, I realized that the world had really changed when I started having to take account of time deltas greater than three hours in both my work *and* my recreational lives. Back when the calculators we love so much were created, correspondence between continents was *not* routine like it is today. Of course, this is still mainly limited to the developed world, although that is projected to rapidly change, and soon. I wish I could say I'm hopeful that the conversations engendered by this coming surge of new netizens would all be as rational, calm and friendly as discussions here tend to be. Even when we are annoyed with one another, we tend to be civil about it. But recent years have shown that enhanced communication doesn't necessarily contribute to better understanding between peoples. It should have been obvious to me that people can spew hatred over the Internet just as easily as fellowship, but it wasn't. I still think that when the sum of all the conversations are added up, the balance is helpful, constructive, rational, loving and above all, useful to human beings everywhere. Wikipedia shows this at work. There is a lot of entropy tugging at that project, but the content still seems to tend toward all those qualities I just mentioned, through the strenuous efforts of lots of dedicated folks.

I just had my day interrupted by a blown clutch, and had a spun down moment, and that's what came up. We now return you to your HP calculator enthusiast's discussion forum, already in progress.

Regards,  
Howard

### 50g - cracking the case open?

Message #1 Posted by [Dallas Osborne](#) on 13 Sept 2007, 4:04 p.m.

Does anyone have experience opening the 50g case?

To answer the question of, "Why would you ever want to do that? Are you really trying to pull the plant up by the roots to see what makes it grow?":

I am very annoyed at my current 50g; every key press results in an audible rattle. I know this may seem petty, but the vibration with every keystroke is minor frustration that builds with time to a strong desire to hurl this fine calculator against the nearest wall. I have ensured all rubber feet contact evenly, tried the paper trick to keep the battery cover tight and ruled out the front panel and screen as the source; this is something internal.

HP hasn't responded to any of my emails. \*Gasp\* REALLY?

I am going to buy another regardless; I don't mind the additional cost to get one that doesn't rattle like it has loose paperclips in it.

But, before I do that, I thought I ought open this unit up and see if I can readily epoxy the culprit still. Thus: have any of you pried this calculator apart yet? An initial plan of attack would be welcomed advice.

My thanks regardless, Dallas

in response to message #2 by Egan Ford

Egan, Thank you very much for the link. After moving to the source website, I found another portion of it that depicts clearing of the heat stakes for complete removal of the main board. Imagine my surprise when I didn't have to drill the heat stakes at all; it appears as though they were never melted out. The board in my unit simply lifted off the posts as soon as I pulled the case in two. I clamped a small piece of rolled steel in an old set of vice grips and, with the help of a small torch, carefully and quickly mushroomed these posts into their proper form. My 50g is now, short of the somewhat muffled key clicks, silent.

Thank you for your assistance. Regards, Dallas

*in response to message #3 by Dallas Osborne*

Congrats. Did you photo-chronicle your repair?

**Re: 50g - cracking the case open?**

*Message #5 Posted by **Dallas Osborne** on 14 Sept 2007, 2:28 p.m.,  
in response to message #4 by Egan Ford*

In hindsight, I wonder why the heck I didn't; it would have been rather helpful for anyone else interested in a similar task.

I have to admit it was far simpler than I imagined. Once you get the screen off and the two screws under it, the entire top half pops off without more than a stubborn thumbnail. The nice part to document would have been using that hot steel poker to melt the stakes down. My apologies; I will definitely run some good pictures next time around.

### How to clean a HP 35?

Message #1 Posted by [Miguel Toro](#) on 13 Sept 2007, 3:02 p.m.

I bought a HP 35 S/N 1302A 81058. The calculator is in good shape but the faceplate needs some cleaning. What is the safest way to clean it? What should I use to do that?

Thanks,

Miguel

*Edited: 13 Sept 2007, 6:35 p.m.*

### Re: How to clean a HP 35?

Message #2 Posted by [Jeff O.](#) on 13 Sept 2007, 10:56 p.m.,  
in response to message #1 by Miguel Toro

My favorite cleaning solution for the keyboard, and the keys too, is any of the blue or green spray-type cleaners, e.g. Fantastik, Formula 409, Windex, etc. Wipe on and off with a soft cloth. In my humble opinion, it is way, way, way easier to do a proper job if you *completely disassemble the calculator*. If you try to clean the keyboard with the keys in place, it's tough to not end up with a "cross-hatched" pattern from having to go up-and-down and side-to-side between the keys. Also, if you take the keys out, you can soak them in a dish of cleaner to get rid of all of the grunge. (A surprising amount usually comes off!) So, has anyone peeled back your label or poked holes to get at the screws underneath? If so, I say take it apart. If the label is undisturbed, only you can decide if you'd rather have an intact label or a *properly* cleaned calculator. If you open it up, you can also clean and lubricate the on-off slider switch, which is bound to start acting up sometime.

Here's what everything will look like when you get it apart:

If you need any [instructions](#) or further advice on taking it apart, just ask.

Oh of course, perform at your own risk, your mileage may vary, etc.

*Edited: 14 Sept 2007, 7:37 a.m.*

### Thinking to buy HP50G

Message #1 Posted by [Miguel Saiz](#) on 13 Sept 2007, 1:45 p.m.

I am a long time user of HP calc (hp41cv, hp28c, hp15c, hp12c, hp16c, hp42, hp48sx, hp20s, hp10b, hp17bii, hp200lx, hp49g, HP33S, hp12P25ed). I just bought the HP35s (with some mixing feelings) It looks good (retro is Ok), but the overall feeling was that it looks like the traditional HP quality is gone (today HP is not an option to me for PC neither, I prefer Apple). How is your impression about 50G comparing with the 48G series?

Thanks in advance

Miguel

*Edited: 13 Sept 2007, 1:46 p.m.*

### Re: Thinking to buy HP50G

Message #2 Posted by [Bruce Bergman](#) on 13 Sept 2007, 2:14 p.m.,  
in response to message #1 by Miguel Saiz

I swear, we need to make this topic a FAQ or something -- it comes up about every two weeks. ;-)

Personally, I think the 50g is superior to the 48 family. Yes, there are some valid reasons to use the 48s, but the 50g has all the power, all the compatibility, and it's newer. They made huge improvements over the 49 family too.

Go for it!

thanks, bruce

### Re: Thinking to buy HP50G

Message #3 Posted by [Egan Ford](#) on 13 Sept 2007, 2:18 p.m.,  
in response to message #1 by Miguel Saiz

I have had a 48GX since 1993. My still mint 48GX was a gift and I did not want to lose it, so I retired it for a 50g about a year ago.

Pros:

1. Speed.
2. Larger (more pixels) and more clear display.
3. 4 I/O Options (USB, Serial, IR, SD).
4. Replaceable.
5. Flash upgradeable.
6. UserRPL compatible with 48.
7. No Alpha on positional keys.

Cons:

1. Keyboard layout. Missing large Enter, but you get used to it. I think positional keys are a waste of space (inverted T preferred).
2. Menu/Software layout. Kinda of a hodgepodge, often I have to use CAT or spell out the command. I do not recall having this problem with my 48GX. It's only a minor nuisance. Could be fixed with flash.
3. Some may find the keyboard a bit stiffer. I do not have an issue with it.

IMHO the build quality of the 50g is as good as my 48GX.

For RPN on my 50g I have been using: <http://www.hrastprogrammer.com/hp41e/index.htm>

### **Re: Thinking to buy HP50G**

*Message #4 Posted by [Norris](#) on 13 Sept 2007, 3:05 p.m.,  
in response to message #1 by Miguel Saiz*

If you want to do symbolic math (calculus, differential equations, linear algebra, etc), then get the 50G.

You can get much of the same CAS functionality on the 48GX, but you will need to buy 48GX memory expansion cards (which will probably cost as much as the calculator itself), plus a 48 serial cable, and install lots of third-party software. And even then, the CAS will not be as up-to-date or as well integrated as it is on the 50G; it will run much more slowly, and the display will be smaller and have less contrast.

I bought a 48GX in the late 1990s, which I upgraded with two expansion cards, ALG48, ERABLE, etc. It works, but it's slow and clumsy compared to the 50G. For number crunching, the 48GX is still great. But for symbolic math, the 48GX reminds me of Windows 3.1 on a 286, while the 50G is Windows XP on a Pentium 4.

The only things I really miss about the 48GX are the big central ENTER key and the quality of the documentation. The 50G doesn't feel quite as solid as the 48GX, but the quality is still more than adequate.

*Message #6 Posted by [Chan Tran](#) on 13 Sept 2007, 4:40 p.m.,  
in response to message #5 by Miguel Saiz*

I got one for about a month. It's no 48GX or 48SX but it's a user calculator. Now I don't have to worry about damaging it. It's faster so it's good to run program (I still have to find a good substitute for the PDL). It does symbolic better than the 48. Keyboard layout is something I have to get used to.

### **Re: Thinking to buy HP50G**

*Message #7 Posted by [Brad Davis](#) on 13 Sept 2007, 6:04 p.m.,  
in response to message #1 by Miguel Saiz*

I bought a 50g to replace my 48G and really love every aspect of it except the keyboard feel. Even after 2 months, I was making multiples the mistakes that I usually make. The stiffness and/or travel to be really difficult compared to the 48G. I bought a 35s and am very happy with it. I have a benchmark equation that I used to judge my speed with all my calculators and I was slowest with my 50g. I was faster with my 35s the first try than I ever got to with my 50g. This is 99% of a calculator for me, so the 50g was borderline worthless for me.

**Constant selection**

Message #1 Posted by [designnut](#) on 12 Sept 2007, 7:39 p.m.

I found on the 33S that when the row of constants are displayed you may select a constant and by keying the numbers 1 through 6 left to right which enters the constant into X. I am told this is also true on the 35S. Are there other choices on the 35S where this works? Best Wishes, Sam Levy

**Re: Constant selection**

Message #2 Posted by [Miguel Toro](#) on 12 Sept 2007, 8:17 p.m.,  
in response to message #1 by [designnut](#)

For example in program mode when you want to enter a register from the stack with EQN+RDN, you can choose from the list with 1 to 4 rather than using cursor keys. And this is true for every key that brings an option menu.

Regards,

Miguel

**Thinkaholism**

Message #1 Posted by [db \(martinez, ca.\)](#) on 12 Sept 2007, 7:22 p.m.

It started out innocently enough. I began to think at parties now and then -- just to loosen up. Inevitably, though, one thought led to another, and soon I was more than just a social thinker. I began to think alone -- "to relax," I told myself -- but I knew it wasn't true. Thinking became more and more important to me, and finally I was thinking all the time. That was when things began to sour at home. One evening I turned off the TV and asked my wife about the meaning of life. She spent that night at her mother's. I began to think on the job. I knew that thinking and employment don't mix, but I couldn't help myself. I began to avoid friends at lunchtime so I could read Thoreau, Muir, Confucius and Kafka. I would return to the office dizzied and confused, asking, "What is it exactly we are doing here?" One day the boss called me in. He said, "Listen, I like you, and it hurts me to say this, but your thinking has become a real problem. If you don't stop thinking on the job, you'll have to find another job." This gave me a lot to think about. I came home early after my conversation with the boss. "Honey," I confessed, "I've been thinking..." "I know you've been thinking," she said, "and I want a divorce!" "But Honey, surely it's not that serious." "It is serious," she said, lower lip aquiver. "You think as much as college professors and college professors don't make any money, so if you keep on thinking, we won't have any money!" "That's a faulty syllogism," I said impatiently. She exploded in tears of rage and frustration, but I was in no mood to deal with the emotional drama. "I'm going to the library," I snarled as I stomped out the door. I headed for the library, in the mood for some Nietzsche. I roared into the parking lot with NPR on the radio and ran up to the big glass doors. They didn't open. The library was closed. To this day, I believe that a Higher Power was looking out for me that night. Leaning on the unfeeling glass, whimpering for Zarathustra, a poster caught my eye, "Friend, is heavy thinking ruining your life?" it asked. You probably recognize that line. It comes from the standard Thinkers Anonymous poster. This is why I am what I am today: a recovering thinker. I never miss a TA meeting. At each meeting we watch a non-educational video; last week it was "Porky's." Then we share experiences about how we avoided thinking since the last meeting. I still have my job, and things are a lot better at home. Life just seemed easier, somehow, as soon as I stopped thinking. I think the road to recovery is nearly complete for me. Today I took the final step. I bought a Texas Instruments calculator.

### MLDL2000 Problems

Message #1 Posted by [Jeff Davis](#) on 12 Sept 2007, 5:24 p.m.

I have been using my MLDL2000 for Machine Code programming. I have the Zenrom and I am using the MCED program. Recently when trying to add a ROM image to the MLDL2000, I must have placed ill code in the unit now I cannot even take it back to the shipping configuration, I get an invalid Rom name error. I was wondering if someone can assist me with getting the unit back up and running. I hate to keep bothering Meindert with this. Secondly, I would like to hear about some experiences with thier MLDL2000 units that they have received. Please Help, Jeff

### Re: MLDL2000 Problems

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 12 Sept 2007, 10:25 p.m.,  
in response to message #1 by [Jeff Davis](#)

Hi, Jeff;

I once forgot mine for a while with no use and the RAM contents became garbage. I use rechargeables in my HP41 with MLDL2058, and they went too low. I just connected it to the computer and cleared all RAM contents. If you want to access its contents and clear it through the on-board ROM features (like CLRAM or any other) you'd need to remap the internals anyway, so using the computer is mandatory.

By selecting ROM-based configuration with the dip switches (second switch left-to-right, I guess...), you'd at least have your HP41 running smoothly. Problem is that even the ROM-based configuration might point to a RAM address with not-friendly contents, and the calculator would crash again.

So, I'd go for the USB approach: run MLDL2K and clear the RAM contents. If you have troubles doing so, let us know.

Hope this helps.

Success!

Luiz (Brazil)

### Re: MLDL2000 Problems

Message #3 Posted by [Meindert Kuipers](#) on 13 Sept 2007, 2:23 a.m.,  
in response to message #2 by [Vieira, Luiz C. \(Brazil\)](#)

The best way to handle this is to always have at least one stable configuration (with nothing pointing to SRAM) in FLASH and reserve a dip-switch setting for this. Alternatively the MLDL2000 can be disabled (leftmost switch in lower position) and reprogrammed over USB. From my own experience you have to be prepared for the fact that mcode experimentation is a guarantee for crashes ..

For power management: the standard configuration only charges the SRAM backup capacitor when the HP41 is running or (with the later modification) only when the MLDL2000 is connected to USB. When the

MLDL2000 is connected to an HP41 the SRAM is OK as long as the calc has power.

Jeff, I did get your email and will contact you later!

Meindert

### Re: MLDL2000 Problems

*Message #4 Posted by [Jeff Davis](#) on 13 Sept 2007, 8:42 p.m.,  
in response to message #1 by Jeff Davis*

Thanks for your help Meindert and Luiz. Everything is back up and running. I still seem to have problems with what I am assuming is power problems. When the unit is plugged in to the USB everything runs fine and CAT 2 runs as it should. When the unit is unplugged from the USB the unit seems to act like it does not recognize the ROMS. When a CAT 2 is completed it shows jibberish and sometimes locks up. Has anyone else had similar problems? Is this a battery issue? The capacitor backup runs fine and the contents of SRAM are maintained well. Please advise your thoughts.

### Re: MLDL2000 Problems

*Message #5 Posted by [Howard Owen](#) on 14 Sept 2007, 12:56 a.m.,  
in response to message #4 by Jeff Davis*

How old are the N cells in your 41? It certainly sounds like a power issue to me.

I had a similar experience as Luiz had, only my problem came as the result of an old set of N cells. I put the 41/MLDL2K down for a week, and in that time the old cells gave up the ghost and I had to reset the MLDL2K with the USB cable attached and a new set of batteries from Radio Shack in the 41.

Regards,  
Howard

### Maybe...(was: MLDL2000 Problems)

*Message #6 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 14 Sept 2007, 6:34 a.m.,  
in response to message #4 by Jeff Davis*

Hi, Jeff;

Just to make sure I understand: based on your post, should we consider you are connecting the MLDL2000 to the computer through USB when it is not connected to the calculator? If I am not wrong, the unit must be connected to the HP41 when connected to the computer (must check if it is valid for your unit). I've always connected mine to the computer when it is plugged in the HP41, cannot tell what happens otherwise.

Another point: as Meindert mentioned, chances are that the SRAM backup .1F capacitor is not properly connected (broken solder?); this way it would not be possible to hold SRAM contents when it is unplugged.

As a final suggestion, do you have another HP41 for a single test? If port #4 has problems in one calculator, chances are that you have success with another. You see, I myself see no practical solution if testing with another HP41, but after reading about some unknown problems when broken posts are the

issue, I believe in anything...

Success!

Luiz (Brazil)

### Re: Maybe...(was: MLDL2000 Problems)

Message #7 Posted by **Raymond Del Tondo** on 14 Sept 2007, 1:33 p.m.,  
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi,

> If port #4 has problems in one calculator, chances are that you have success with another.  
>

The contact surfaces in port 4 usually suffer from dirt and dust, sometimes from abrasion, and sometimes from corrosion. In the first two cases, you could use s.t. like a Q-tip or tissue to clean the area.

Note that the actual contact surface is not the part you can see when looking into a port hole. You can only see the isolated part. The actual contact area is on the sides, as you may imagine by looking at the modules or card readers contact springs.

HTH

Raymond

BTW: The descr. where to find the contact surface was intended for the unexperienced user only.

### Re: Maybe...(was: MLDL2000 Problems)

Message #8 Posted by **Jeff Davis** on 16 Sept 2007, 11:09 a.m.,  
in response to message #6 by Vieira, Luiz C. (Brazil)

"Just to make sure I understand: based on your post, should we consider you are connecting the MLDL2000 to the computer through USB when it is not connected to the calculator?" I always have the calculator connected to the MLDL2K when the unit is connected to the USB. "SRAM backup .1F capacitor is not properly connected (broken solder?);" I do not have any problems with the SRAM maintaining its contents. I have tested for over a week and have had no problems. "do you have another HP41 for a single test?" I have tested with a 41CX halfnut and Fullnut as well as an Early tall key 41C. I have the same problems. I recently cleared the Settings Registers and only put the M2K ROM and the David Assembler in the unit. Everything runs fine. If I load the ZenRom in then the unit goes haywire. There must be something with the ZenRom that conflicts with the MLDL2K. I will be learning the David Assembler instead of the MCED program. Does anyone have a high resolution photo of the David Assembler Keyboard overlay? Thanks for all the help.

### Re: Maybe...(was: MLDL2000 Problems)

Message #9 Posted by **Meindert Kuipers** on 17 Sept 2007, 5:54 a.m.,  
in response to message #8 by Jeff Davis

Jeff,

I did some tests myself, while I knew my batteries were almost empty, and I observed the same behavior: SRAM reading can sometimes be troublesome with low batteries (BAT annunciator was on for about one week) and USB disconnected. I cannot explain this yet. So use fresh batteries!

Meindert

**Re: Maybe...(was: MLDL2000 Problems)**

*Message #10 Posted by [Meindert Kuipers](#) on 18 Sept 2007, 11:58 a.m.,  
in response to message #9 by Meindert Kuipers*

Jeff (and other MLDL users),

I have done some further testing, and currently I suspect a problem with M2kM. I am seeing problems like Jeff has seen with different behavior with USB connected or disconnected. The issue is that it could be a combination of M2kM with firmware (I am playing with a new firmware version as well), USB should normally have nothing to do with firmware, except when the M2kM software controls a pin and leaves it in a state that I did not expect it to.

Will do some more testing and let you all know the outcome ...

Meindert

**Re: Maybe...(was: MLDL2000 Problems)**

*Message #11 Posted by [Jeff Davis](#) on 18 Sept 2007, 7:38 p.m.,  
in response to message #10 by Meindert Kuipers*

Meindert, Thanks for posting this information. I look forward to hearing your thoughts and conclusions. Thanks for all your Help.

**Re: Maybe...(was: MLDL2000 Problems)**

*Message #12 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 17 Sept 2007, 6:26 a.m.,  
in response to message #8 by Jeff Davis*

Hi, Jeff;

Quote:

\_\_\_\_\_

I recently cleared the Settings Registers and only put the M2K ROM and the David Assembler in the unit. Everything runs fine. If I load the ZenRom in then the unit goes haywire.

\_\_\_\_\_

Again, sorry to ask questions that may lead to no conclusion. Some ROM modules show unexpected behavior when connected with others, surely the ones that deal with inner O.S. operations and specific reaction to keys (key capture). So far I found no ROM image that works fine with the FORTH ROM, and the calculators I tested work fine with the FORTH ROM alone.

This is just to ask if you tested the ZenRom alone or with the M2K ROM. You see, the [ON][ENTER] feature in the M2K ROM implies ROM intervention in the O.S. regular ON sequence (it doesn't even work with the halfnut units). I'd guess this is probably one of the reasons of the calculator behavior.

Best regards.

Luiz (Brazil)

**Re: Maybe...(was: MLDL2000 Problems)**

*Message #13 Posted by [Jeff Davis](#) on 18 Sept 2007, 7:36 p.m.,  
in response to message #12 by Vieira, Luiz C. (Brazil)*

I have now tried to use just the ZenRom and also load the M2K0000Rom to use as my 4K page for writing machine code. I still have problems with the ZenRom. Once a MCODE routine is run the system will never work correctly again. I load the David Assembler with Main Frame Labels and the same M2K0000 Rom and with the same MCODE routine everything works fine. The only issue that I have had is the Calc will pop out of ASSM mode when SST or BST pushed and only intermittent. This problem is documented in the David Assembler Manual. So, I think that the ZenRom at least on my MLDL2078 will not function consistently. The David Assembler seems to be much more stable. Does anyone have a High Resolution Pic of the Keyboard Overlay? I tried to use the one (on the other site) but when I finally get it to the correct size, it is very difficult to read.

**Re: Maybe...(was: MLDL2000 Problems)**

*Message #14 Posted by [Meindert Kuipers](#) on 19 Sept 2007, 3:25 a.m.,  
in response to message #13 by Jeff Davis*

Jeff,

I will do a scan of my keyboard overlay for the David Assembler. I have never used ZenRom myself, but I will give it a try in the MLDL2000. Maybe you should try ZenRom just by itself, without M2K ROM loaded. The entry points may not be programmed very well, at least put the ZenRom in a port lower than M2K ROM.

I have no results yet for the firmware upgrade and USB issue. Maybe this evening I have time for that.

Meindert

**Almost got the 35s...**

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 12 Sept 2007, 5:09 p.m.

Well, got a mail from custom: Has to bail it out... Had hoped would not have to pay that since Samsons ensured me had been taken care of. Well, had a feeling that was to good to be true... Gonna cost me another 35 bucks. Have a feeling I will end up paying not very much more than will be in shops next year so more pissed by having to deal with custom to get my hands on a working big enter key than the extra cost...

But if any non eu but eøs fellows are reading this: Belive Samsons think this done deal, but do not think they can keep their promises... Sure it may be custom messing things up, but hey, they are the law...

**Re: Almost got the 35s...**

Message #2 Posted by [bt\\_schmidt](#) on 13 Sept 2007, 12:36 a.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

Umm, what does bail out mean? Hasn't Samson already been paid for the calculator and for the shipping cost by you? If you decline to pay the Customs Fees will Samsons refund your purchase price? Surely they won't refund the shipping costs to Norway since they have already incurred that cost? And won't they now also incur an additional cost to ship the item back from Norway?

And how could Samsons ensure that custom fees would be 'taken care of' other than to collect the custom fees up front from the customer?

And finally, if firms find that a percentage of sales shipped to out-of-US addresses are being returned due to customs non-payment, won't they feel pressure to consider no longer offering their products to customers outside of the US, and thereby avoid the hassle of processing refunds and possibly eating return shipping costs?

..bt

*Edited: 13 Sept 2007, 12:38 a.m.*

**Re: Almost got the 35s...**

Message #3 Posted by [Arne Halvorsen \(Norway\)](#) on 13 Sept 2007, 12:50 a.m.,  
in response to message #2 by [bt\\_schmidt](#)

It was shipped from Spain.

This was a reply I got from Samson when asked them:

We have an affiliate in Europe that does our shipping for us. It is faster and safer. Norway is one of the countries that for shipping and customs purposes is considered part of the EU, so were you to buy from us we'd be shipping through our EU office. I'm attaching below our shipping options and costs that would apply to you.

Bail out I mean paying taxes, what I understood that was part of shipping cost.

*Edited: 13 Sept 2007, 12:53 a.m.*

**Re: Almost got the 35s...**

*Message #4 Posted by **bink** on 13 Sept 2007, 2:07 a.m.,  
in response to message #3 by Arne Halvorsen (Norway)*

I think the problem is that Norway is NOT part of the EU. I am not defending Samson's error, but I don't know whether I would trust someone in the US to know which countries are in the EU.

Since Norway is not part of the EU, you have to pay duties.

Maybe you can contact Samson's, and if you have something in writing telling you that Norway is part of the EU, then you can cancel the transaction and get a full refund?

Are you Norwegian? If so, why didn't this sound suspicious to you?

Here is a list of EU countries: [http://europa.eu/abc/european\\_countries/index\\_en.htm](http://europa.eu/abc/european_countries/index_en.htm)

**Re: Almost got the 35s...**

*Message #5 Posted by **Walter B** on 13 Sept 2007, 2:58 a.m.,  
in response to message #3 by Arne Halvorsen (Norway)*

Me, too, was having some discussions with Samson Cables about their definition of "shipping costs". Eventually they got what they had offered me when I placed my order (IMO a reasonable total of 72.99 US\$ incl. shipping to Germany) and I paid 10 Euros tax when receiving the parcel.

I'm no merchant, however, I think 20 US\$ for S/H may hardly cover postage \*and\* duties. But it exceeds the postage by far, even from the USA. And an offer is an offer is an offer... Nevertheless, I did not find it worthwhile to sue SC, and after all I'm happy with getting my 35s early. You may find traces of these discussions in earlier threads FYI.

**Re: Almost got the 35s...**

*Message #6 Posted by **Meenzer** on 13 Sept 2007, 3:06 a.m.,  
in response to message #5 by Walter B*

As Arne puts it, they didn't say that Norway was in the EU, but "Norway is one of the countries that for shipping and customs purposes is **considered** part of the EU"

@Walter B, who said "But it exceeds the postage by far, even from the USA."

Go to usps.com and calculate their fees to ship to Germany. 20\$ is still in the lower range...

**Re: Almost got the 35s...**

*Message #7 Posted by **Walter B** on 13 Sept 2007, 3:18 a.m.,  
in response to message #6 by Meenzer*

Hi Meenzer,

are you from Mainz? Just kidding ;)

I did quite some business on TAS with vendors from the USA, so I know what the real postage

is for Air Mail-ing a calculator properly packed from there to here. And so I stick to my statement.

The point was, however, that SC charge you an amount  $x$  for S/H. Unless explicitly stated otherwise, IMHO this shall include *\*all\** the costs for bringing this item from them to you. But as mentioned, I'm no merchant etc.

**Re: Almost got the 35s...**

*Message #8 Posted by **Meenzer** on 13 Sept 2007, 3:38 a.m.,  
in response to message #7 by Walter B*

@Walter B

- 1) Yes, I am. Good guess.
  - 2) Have a look here [usps.com](http://usps.com) Shipping (without handling and customs fees) cost from the US to Germany: Priority \$20, Express \$30.50
- And all customs fees are usually paid by the customer (hence the name ;-), because they depend on where he lives.

*Edited: 13 Sept 2007, 3:39 a.m.*

**Re: Almost got the 35s...**

*Message #11 Posted by **Peter K** on 13 Sept 2007, 8:52 a.m.,*

*in response to message #10 by Meenzer*

I don't think there is a secret to it. Large companies may be able to negotiate better rates with various carriers, but the average small retailer is stuck with USPS published rates.

By the way, USPS just recently changed all of its rates, and the previously reasonably-priced "Air Parcel Post" service has now been discontinued. They now offer a Flat Rate Box International service for \$37 regardless of weight as long as it's small enough to fit in the box (certainly any calculator).

Here is the problem, though: It's \$37 to anywhere in the world, which means that Europeans essentially subsidize packages sent to third world countries with inexistent mail infrastructure.

**Re: Almost got the 35s...**

*Message #12 Posted by [Eric Reclin](#) on 13 Sept 2007, 6:53 p.m.,  
in response to message #11 by Peter K*

Air Parcel Post was not discontinued. They just renamed it Priority Mail. It is the surface mail option that seems to have been discontinued, but for that, I say good riddance, because surface mail cost about the same as airmail but took far longer.

**Re: Almost got the 35s...**

*Message #13 Posted by [Eric Reclin](#) on 13 Sept 2007, 6:56 p.m.,  
in response to message #8 by Meenzer*

You're giving the one pound rate there.

The 35s has to go by the three pound weight, because the package weighs just over two pounds. And you will then see that the Priority Mail price is closer to \$30, and the Express Mail price is closer to \$40.

For calculating shipping prices on my site, I think you will see that I am making no profit on shipping.

**Re: Almost got the 35s...**

*Message #14 Posted by [Thomas Radtke](#) on 13 Sept 2007, 3:31 a.m.,  
in response to message #5 by Walter B*

I've paid the additionally requested \$15, thus ending up paying \$35 shipping & taxes. I think that's ok, since it saved me from driving to the customs.

*Edited: 13 Sept 2007, 3:32 a.m.*

**Re: Almost got the 35s...**

*Message #15 Posted by [Arne Halvorsen \(Norway\)](#) on 13 Sept 2007, 7:30 a.m.,  
in response to message #5 by Walter B*

There may be a difference between taxes and paying other stuff to get custom to handle it. There is no error in that SC did say that taxes was included in my price. I dont have those emails on

computers using now when travels, but can show later. First time dealing with custom this way, I am not 100% sure what I will end up paying, letter from custom not to clear for a newbie as me. But one thing about the offer from SC was it was rather low in respect to what I think I should pay in tax for such item, so not that suprised if must pay taxes after all.

**Re: Almost got the 35s...**

*Message #16 Posted by [Les Bell](#) on 13 Sept 2007, 8:03 a.m.,  
in response to message #15 by Arne Halvorsen (Norway)*

Quote:

---

There is no error in that SC did say that taxes was included in my price.

---

I suspect that means sales tax (like State sales tax in the US), or VAT (Value Added Tax), which is usually remitted to the seller's Government by the seller. For goods shipped outside their jurisdiction, such taxes are not usually payable.

Any import duty paid by you, to your Government, is your liability.

Best,

--- Les

[<http://www.lesbell.com.au>]

**Re: Almost got the 35s...**

*Message #17 Posted by [Arne Halvorsen \(Norway\)](#) on 14 Sept 2007, 4:45 a.m.,  
in response to message #16 by Les Bell*

Exactly, what SC says is that shipping inside EU is inside a jurisdiction (they sell from Spain). Norway is not an EU member, but we are a part of the economic zone by special agreement and therefor in this respect makes us an EU country, SC says. I don't think our custom agency agree... But I should shut up until I got it and can look at all the expenses for sure with propper invoice from tax office, perhaps I am paying for some other fees and not tax/vat as such.

**Re: HP-45 Question**

Message #3 Posted by [Eric Smith](#) on 12 Sept 2007, 8:31 p.m.,  
in response to message #2 by Les Bell

Dave presumably meant that he'd read that the timer function had been added by a student intern working at HP.

I hadn't heard that. I know one of the guys that worked on the HP-45, so I'll inquire.

**Re: HP-45 Question**

Message #4 Posted by [Dave Colver](#) on 13 Sept 2007, 4:12 a.m.,  
in response to message #3 by Eric Smith

Thanks Eric

I'm sure I didn't imagine this story: that there was quite a lot of spare room in the ROM for the 45 so he added a timer function.

I've done the normal google searches of course :)

**Re: HP-45 Question**

Message #5 Posted by [RonHudson\(USA\)](#) on 12 Sept 2007, 8:53 p.m.,

*in response to message #1 by Dave Colver*

The code for the timer is already in the rom, they decided not to add the timer at nearly the last minute. The timer would not be so accurate because they did not include the crystal to control the clock speed (system clock)

I think there is a set of three buttons you can press at one time to get it in and out of timer mode though. I just don't remember what they were.

### Re: HP-45 Question

*Message #6 Posted by **Thomas Radtke** on 13 Sept 2007, 3:36 a.m.,

Hi,

Indeed. In this very site, to be exact:

<http://www.hpmuseum.org/hp45.htm>

Best regards from V.

### Re: HP-45 Question

*Message #8 Posted by **Klaus** on 13 Sept 2007, 4:59 a.m.,  
in response to message #1 by Dave Colver*

A similar story was for an "easter egg" for a ROM for the HP-85. I think someone put in a game. Perhaps this was a student and someone mixed up both features?

### Re: HP-45 Question

*Message #9 Posted by **Vincze** on 13 Sept 2007, 10:05 a.m.,  
in response to message #1 by Dave Colver*

My friend, here is quote from this site as how timer work.

Quote:

\_\_\_\_\_

The HP-45 had code to implement a timer. This was never exposed as a user feature because the lack of a quartz crystal in the HP-45 made the timer fairly inaccurate. The timer could be invoked by pressing RCL and then pressing CHS 7 8 all at the same time. Once in timer mode, CHS

toggled it between running and stopped. Pressing 1-9 stored the current time in that register when the timer was running or recalled the stored time when the timer was stopped. Pressing the decimal point key, brought the calculator back to normal mode with the time still in the display. (Pressing Enter also resumed normal mode but cleared the display.) It's possible to add a crystal to the HP-45.

---

### **Re: HP-45 Question**

*Message #10 Posted by [Frank Boehm \(Germany\)](#) on 14 Sept 2007, 2:48 a.m.,  
in response to message #1 by Dave Colver*

My 45 prototype comes with a crystal installed - so the timer certainly wasn't a secret feature. It was probably killed by marketing or due to being pointless (what good for is a clock that only runs for a couple of hours until the batteries are down; since the 45 is non-programmable, you cannot do some funky calculations either...)

### **Maybe not a new information.**

*Message #1 Posted by [Doctor Bubu](#) on 12 Sept 2007, 4:07 p.m.*

I just figured out a difference in the 30 series.

Maybe some wrote it in the forum but i did not find it by search.

I have two 32e both in bad condition, so i thought i could mix the best parts. One has soldered circuits one not.

The one with the soldered circuits has an plastik plated keyboard, so it looks very ugly over the time. The other plate ist made ot of metal and also more resistable against cleaning.

Both are made 1980 in Singapore, the unsoldered in 9. week the soldered in the 28. week.

Greetings Juergen

Hello, "Doctor B" --

Here's the most recent reference to the HP-34C Spice-series design:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=124023#124023>

I'm surprised that you'd have a 1980 model with the improved soldered design. It might be the back cover from an older model on a 1982 calc. I've got non-functioning solderless HP-34C's from 1980 and 1981, and a working soldered version from 1982.

-- KS

**Re: [HP-34C] Maybe not a new information.**

*Message #7 Posted by [Stefan Vorkoetter](#) on 14 Sept 2007, 11:28 a.m.,  
in response to message #6 by Karl Schneider*

Quote:

---

I've got non-functioning solderless HP-34C's from 1980 and 1981, and a working soldered version from 1982.

---

Just in case anyone is wondering if these can be fixed:

My one and only HP-34C came into my life as a non-functioning solderless one. It is now a functioning soldered one. I completely disassembled it, soldered the chips to the flexible circuit board, ground away parts of the frame that's supposed to press the chips against the board (to leave room for the solder), put it back together, and it now works.

Stefan

### **New HP calc on HP site? Is it RPN?**

Message #1 Posted by [Nick L](#) on 12 Sept 2007, 9:06 a.m.

Was searching the HP home site and came across a photo of possibly a new HP calculator. It's light grey and has a small solar panel. The photo is on an angle so it's difficult to see the key layout. Hopefully this a cheap RPN pocket calc. If the HP-12c appear first, just click on the number 2, and the photo should show up.

<http://www.shopping.hp.com/webapp/shopping/can.do?storeName=storefronts&landing=handhelds&category=calculators&orderflow=1&a1=Price+after+rebate&v1=Under+%2450&catLevel=2#bcAnchor>

Message #5 Posted by [Bruce Bergman](#) on 12 Sept 2007, 10:08 a.m.,  
in response to message #1 by [Nick L](#)

That's the new HP-10s Solar. It's one of the prizes being given away (by HP) at HHC2007 this month. We've talked about it in the forums, but very little. I believe this is a repackaged Casio (similar to what they did with the HP-8s). Still, it's refreshing to see new faces.

And, to my knowledge, the 10s is NOT an RPN calc.

thanks, bruce

in response to message #5 by [Bruce Bergman](#)

I got one: it's NOT RPN!

And yes: it looks like a Casio, with the MODE key to select among COMP, SD and LR (I go by heart). Cheap and plastic, not programmable and no formula storing. Cute in aspect, but keys are not in the HP-style (i.e. ugly).

-- Antonio

### **Hello? Any other danes out there? (Hvor er I?)**

Message #1 Posted by [Johnny Bjoern Rasmussen](#) on 12 Sept 2007, 2:19 a.m.

Hi

I have often thought of making some kind of HP-calculator meeting in Denmark. I myself live far away from every major city in the country, so we would have to find some good place for the meeting. So I wondered if there are any other danish collectors out there who can suggest a place to meet? Of cause the meeting could also include people from other places...

Thank you

### **Re: Hello? Any other danes out there? (Hvor er I?)**

Message #2 Posted by [Johnny Bjoern Rasmussen](#) on 13 Sept 2007, 2:20 a.m.,  
in response to message #1 by [Johnny Bjoern Rasmussen](#)

Ok - not a lot of danes here I suppose. How about collectors from Sweden, Norway and Finland? (Am I the only scandinavian here?) Perhaps German collectors want to pay interest too. Are some of you interested in meeting somewhere in Denmark?

### **Re: Hello? Any other danes out there? (Hvor er I?)**

Message #3 Posted by [Walter B](#) on 13 Sept 2007, 3:04 a.m.,  
in response to message #2 by [Johnny Bjoern Rasmussen](#)

Well, Björn, I love Denmark and almost every part of Scandinavia, but I happen to live at the opposite side of Germany ;) Nevertheless, AFAIK there are some people from Norway and Finland to be found here in this forum.

### Bugs

Message #1 Posted by **Palmer O. Hanson, Jr.** on 12 Sept 2007, 2:03 a.m.

The beginning of the thread "Bugs - Bugs and Bugs" (23 August 2007) asked "Do any of you have lists of the bugs in the other brands ...?"

I have been out of commission for about two months with health problems. I am currently in a watch and wait mode so I will try to belatedly respond to the question with some history of bugs in the TI product line and one bug in the Casio product line. The listing is representative but by no means comprehensive.

I recognize three kinds of "bugs". The first kind includes mechanical and electrical deficiencies. The second kind includes software and mathematical errors.

The third kind includes characteristics of a machine which Richard Vanderburgh called "unannounced features" and Maurice Swinen called "quirks". These "bugs" were of interest to users but their use was not always supported by the manufacturer and sometimes even discouraged by the manufacturer. The TI user community became somewhat obsessed with these unannounced features. Sometimes the results were trivial as when one individual reported that on the SR-52 pressing read followed by simultaneously pressing B, INV, sin, STO, EE, 4 and 0 would turn on the card reader drive motor.

#### Casio fx-7000G

The random number generator in the first graphic calculator was supposed to yield uniformly distributed random numbers. It yielded random numbers which were not uniformly distributed. The distribution changed when the calling routine changed. The bug was fixed in the fx-7000GA. (V11N1P8 of TI PPC Notes)

#### SR-52:

There were anomalies in the trigonometric functions and the logarithmic functions. These were similar to those seen in the original HP-35. For example, in the SR-52 the sine of 89.9999999954 is returned as 1.00000000004. (V2N2P1 of 52 Notes)

#### TI-55II:

The keyboard had a severe bounce problem. It was so bad that when the TI-55III became available with an improved keyboard one only had to send in a TI-55II to receive a TI-55III in return with no questions asked. Unfortunately, the defective keyboard was also used in the BA-55, the TI-57LCD and the TI-88.

There was a problem in the statistics routine such that if the user entered 4, 5, 6, 7, and 8 the mean would be displayed as 6 but the value in the machine was actually  $6 - 1E-10$  ! This was caused by use of a different algorithm for statistics accumulation where, for example, the sum of the input values was not stored, but rather the current mean and the number of entries was stored. (V8N1P26-27 of TI PPC Notes).

The memory registers used for the statistics routines cannot be accessed using the published procedures. There was an unpublished procedure for viewing the accumulations which started by pressing and holding the R/S, square root and OFF keys simultaneously. (V8N2P21 of TI PPC Notes).

TI-58/58C/59

Some devices had memory problems such that a stored number would not be correctly recalled. The Service Manual presented a program for testing for this problem. The user community found that some faulty memories would pass the TI test and devised a more thorough test.

Capacitor C-7 which is part of the card reading circuitry was occasionally improperly positioned so that it could be touched by the negative battery pack terminal when the battery pack was in place.

The diagnostic routine in the Master Library module and the Agriculture module would fail if the calculator was in the Eng mode. On other modules with the diagnostic routine an INV Eng sequence at the beginning of the routine eliminated the problem. (TI PPC Notes V8N2)

If INV Sum+ is executed with the y value in scientific notation an error would occur vbecause at ehtry to the statistics routine the sign of the exponent would be changed rather than the sign of the y value (Page 7 of the V5N2 issue of PPX Exchange)

CC-40:

The advance publicity for the CC-40 said that it had a 3/4 size QWERTY keyboard which could be used for touch typing. A 3/4 size keyboard is a little small -- adult fingers don't fit kiddy keys -- but the real problem was that the ENTER key was where the right shift key should have been.

The Mathematics module had two programming errors. Thre was an erroneous prompt in the Edit routine and the determinqant of a matrix was occasionally of the wrong sign.

TI-74:

Touch typing was no longer possible. The keyboard was too small and the rows did not have a half key displacement between rows.

The AC 9201 Power Supply could only be connected if the printer was connected.

The two prograqmming errors in the CC-40 Mathematics Module were corrected in the TI-74 Mathematics module.

TI-95:

The AC 9201 Power Supply could only be connected if the printer was connected.

An ASM routine would successfully convert a program with labels to a program with direct addressing. The INV ASM routine which was supposed to convert a program with direct addressing back to a program with labels did not always work properly.(V13N1P8 of TI PPC Notes) . ,

## Re: Bugs

*Message #2 Posted by [Kiyoshi Akima](#) on 12 Sept 2007, 12:17 p.m.,  
in response to message #1 by Palmer O. Hanson, Jr.*

Sentry CA756

This is their high-end graphing calc: the package says "Compare with TI-83." I picked one up cheap to play with, not having played with anything comparable to a TI for decades.

sin(PI) gives zero. What's even worse is that int(PI) does not produce an integer. Apparently the built-in value for PI includes some extra guard digits and they don't get stripped out properly, leaving 3 + a small value.

$\text{int}(\text{acos}(-1))$  has a similar problem, as does  $\text{int}(x*\text{PI})$  for many (but not all) values of  $x$ .

The random number generator isn't. Multiple invocations within a single program run return the same result, unless the program halts for display. Run the program a second time and you get a different number, which then repeats.

$\sin(\text{PI})$  gives zero. What's even worse...

\_\_\_\_\_

Shouldn't it?

### Re: Bugs

Message #4 Posted by [Kiyoshi Akima](#) on 12 Sept 2007, 12:59 p.m.,  
in response to message #3 by Meenzer

Does your calculator give zero for  $\sin(\text{PI})$ ?

If you have an infinitely precise value for  $\pi$ , then the sine of that value is indeed 0. But since the calculator is attempting to produce the value of a ten-digit (say) approximation of  $\pi$ , the \*correct\* result should be the sine of that approximation.

### Re: Bugs

Message #5 Posted by [Meenzer](#) on 12 Sept 2007, 1:12 p.m.,  
in response to message #4 by Kiyoshi Akima

Well, indeed, my TI and Casio calculators, the HP 48G as well as some PC programs produce  $\sin(\pi)=0$ . My HP 15c and HP 35s produce somevalueEE-13...

*Edited: 13 Sept 2007, 9:10 a.m. after one or more responses were posted*

### Re: Bugs

Message #6 Posted by [Kiyoshi Akima](#) on 12 Sept 2007, 1:14 p.m.,  
in response to message #5 by Meenzer

But how many of them produce a non-integral result for  $\text{int}(\text{PI})$ ?

### Re: Bugs

Message #7 Posted by [Meenzer](#) on 12 Sept 2007, 1:22 p.m.,  
in response to message #6 by Kiyoshi Akima

The ones that have an integer function yield an integer ;-)

### Re: Bugs

*Message #8 Posted by **Karl Schneider** on 12 Sept 2007, 11:47 p.m.,

Welcome back, Palmer!

Quote:

---

TI-55II:

...

There was a problem in the statistics routine such that if the user entered 4, 5, 6, 7, and 8 the mean would be displayed as 6 but the value in the machine was actually  $6 - 1E-10$  ! This was caused by use of a different algorithm for statistics accumulation where, for example, the sum of the input values was not stored, but rather the current mean and the number of entries was stored. (V8N1P26-27 of TI PPC Notes).

---

I suspect that the running calculation of mean averages might have been intended to prevent possible errors in calculation of standard deviation of large values, due to roundoff errors of summation. For example, the HP models -- even the 12-digit Pioneer-series -- that calculate standard deviation from summation registers will return 0 as the sample standard deviation of [999,999 1,000,000 1,000,001]. The correct answer (1) will be returned by the models (e.g., HP-17B/BII, HP-27S) that retain all the entered data, then calculate standard deviation from the mean.

The TI-55II undoubtedly lacked the RAM to store all statistical input data.

-- KS

## **Re: Bugs**

*Message #9 Posted by **Walter B** on 13 Sept 2007, 2:33 a.m.,  
in response to message #8 by Karl Schneider*

Hi, Palmer, thanks for the overview!

Karl,

there are at least 3 ways to do this statistics job:

1. The calc stores all the input data.
2. The calc stores the necessary sums in the summation register.
3. The calc has to save memory and uses the approach Palmer sketched for the TI-55II.

Way 3 is the worst due to round off errors. Fully agree with you on this. I do not remember any calc using this way for decades. Extremely expensive memory was in the very starting years of scientific calcs only.

Way 2 is just fine if used with a tiny amount of thought. The fact that you run into problems with small deviations on top of big numbers is well known, and I have the feeling it was even mentioned in an early HP calc manual. Anyway, for sheer laziness, emmh economy, no reasonable person will key in 7 digits repeatedly where 2 are sufficient to do the job.

Way 1 replaces the missing brains of the user by additional memory in the calc. It became affordable when memory costs dropped.

**Re: Bugs**

Message #10 Posted by **Palmer O. Hanson, Jr.** on 13 Sept 2007, 9:01 a.m.,  
in response to message #9 by Walter B

The real advantage of Way 1 is that it allows the user to calculate residuals instead of only calculating correlation coefficients. That allows the user to identify individual bad data points and erroneously entered data points. Before there were hand calculators I used a program like that on a Honeywell time share network. My supervisor had a brand new shiny HP-45 and suggested that I could use it at my desk instead going to the terminal of the time share network. He showed me how to enter data and I tried to run a problem. When the results didn't look right I asked him how I could review the input data. He told me that I couldn't. That was the last time I used an HP-45 for statistics.

An example of the problems with Way 2 appeared in the article "Hard Wired Functions" in the March/April 1981 issue of PPX Exchange which was based on my submission. I had been exposed to the idea much earlier in a 1949 class in curve fitting by Professor Eggers at the University of Minnesota.

When I stumbled on the problem with the statistics routine in the TI-55II I had no idea as to what might be going on. I shared the observation with George Thomson who was one of the frequent contributors to TI PPC Notes. He immediately recognized the source of the problem and told me that the methodology was common back in the pre-war era.

**Re: Bugs**

Message #11 Posted by **Walter B** on 13 Sept 2007, 2:48 p.m.,  
in response to message #10 by Palmer O. Hanson, Jr.

Palmer, you are of course perfectly right.

I'd just not run a full fledge ANOVA on a pocket calc. Any stat data I use such a calc for are small amounts (let's say up to 30 points maximum), and I tend to look at the data before keying them in. For bigger data sets, nowadays PCs offer far better tools, starting with scatter diagrams ;)

**Re: Bugs**

Message #12 Posted by **Paul Dale** on 13 Sept 2007, 4:37 p.m.,  
in response to message #9 by Walter B

I had always been under the impression that keeping a running mean and variance (or std dev) instead of the sums or was done for numerical stability. More arithmetic operations are required to use this approach (thus it is slower) but it isn't as prone to overflow and it doesn't require any additional storage.

A simple two point example where numbers are stored with two significant figures:

| step | datum | -----<br>2 sig | sigmaX<br>digits | -----<br>true | -----<br>2 sig | mean<br>digits | -----<br>true |
|------|-------|----------------|------------------|---------------|----------------|----------------|---------------|
| 1    | 10    | 10             | 10               | 10            | 10             | 10             | 10            |
| 2    | 0.8   | 11             | 10.8             | 5.5           | 5.4            | 5.4            | 5.4           |

I hope that is clear enough, I'm averaging two values 10 and 0.8 and showing the true values to infinite digits and the rounded versions.

By maintaining the mean instead of the sum we get:

| step | datum | running mean |
|------|-------|--------------|
|------|-------|--------------|

$$\begin{array}{l} 1 \\ 2 \end{array} \quad \begin{array}{l} 10 \\ 0.8 \end{array} \quad \begin{array}{l} 10 \\ 10 \end{array} * (1 / 2) + 0.8 / 2 = 5.4$$

The update formula is:

$$m_n = m_{n-1} * ((n-1) / n) + x_n / n$$

The overflow/loss of precision is avoided. A similar (more complicated) formula can be derived for the variance too.

I've been thinking about how to implement the usual statistics functions and am torn between the above approach and storing double or longer length internal summations...

- Pauli

### HP 35s Review

Message #1 Posted by [Will Rutherford](#) on 12 Sept 2007, 12:56 a.m.

I've been using HP calculators for decades and own several. Last summer I tried updating to newer models, and have acquired a 33s, a 50g, and now a 35s.

I want a calculator with a good mix of discrete and scientific capabilities, with a convenient user interface.

After a couple of days of trying the 35s out, I have some comments. These are just my personal usability concerns. I realise the calculator has already been released and probably won't be changed.

This is my first posting here. I hope they formatting comes out okay.

Good ~~~~

- adds logic operators (compared with 33s) - good notation ( $i / \theta$ ) for entering complex numbers - nicer keyboard layout than 33s - good that funny mode keys are gone - arrow keys are better - big ENTER key is nice to see again - better look and feel - addition of extra units and physical constants is very useful

Problems (in order of decreasing priority) ~~~~~

- forced to fish out the 'h' suffix when entering a hex number, even when in hex mode - this is very inconvenient if you want to enter a lot of hex numbers - it takes too many keystrokes to get that 'h' suffix, which should be implicit in hex mode - user is now forced to enter a mantissa part for a number in scientific notation - standard interpretation in HP calculators for decades has been to default to 1 - for instance 'e2' is taken as '1e2' in older models - this is a great keystroke saver and has been in place for decades in all HP calculators, up to and including the 50g and the 33s - sanity check: entering the number 1000 in scientific notation should reduce the number of keystrokes - sometimes the calculator misses a typed key - overzealous debouncing? - sqrt key gives 'invalid data' for complex numbers or negative numbers entered as a complex number - inconsistent with general ability to use transcendental functions on complex - sqrt is easy to implement in complex -  $y^x$  key does it anyway when you give an exponent of .5 - there is no way to extract real and imaginary parts of a complex number - location and labelling of hex digits a to f - I realise that layout decisions are not easy, but placing them two rows below the register labels A to D is a bit odd - assuming they hold to the layout, it would be better to at least add some special labels in a different colour for the hex a to f - additional logic operators would be useful: shift, rotate, etc. - compare with 16C or 50g - new vector data type is very thinly supported - no real power to it, just addition of vectors and multiplication by a scalar - it complains on input of a vector of length 0 but not a vector of length 1 - 2\*2 lin. solve and 3\*3 lin. solve are badly done - user has to fuss with a list of storage registers - better idea: let user enter a set of vector objects into the stack and let calculator operate on those - for instance, 4 length-3 vectors would suffice for input to a 3\*3 lin. solver - E key (for Enter Exponent) would be better labelled EE or EEX - this would avoid confusion with the other E keys - would stand out better - when complex numbers are displayed in polar form, it would be useful if the 'theta' character could be rendered differently so as not to resemble zero and eight so much - there should be a way to view complex numbers to greater precision - see for instance how this is done in the 15C - also compare with the scrolling view of large binary numbers in the 35s

Overall Conclusions ~~~~~

The 35s has look-and-feel improvements over the 33s and some functionality improvements. However, some

interaction issues that affect everyday usage appear to have slipped through.

The 35s ought to be a convenient everyday use alternative to the bigger and more sophisticated 50g, but the 35s has limitations that leave the 50g more suitable for everyday use.

-Will

### Re: HP 35s Review

Message #2 Posted by [Will Rutherford](#) on 12 Sept 2007, 1:04 a.m.,  
in response to message #1 by Will Rutherford

That didn't come out at all. I'll have to experiment with the formatting and re-post when I get a chance. My apologies.

### Re: HP 35s Review

Message #3 Posted by [Jeff O.](#) on 12 Sept 2007, 8:39 a.m.,  
in response to message #2 by Will Rutherford

Will,

Edit your post to put [pre] before "Good" and [/pre] after the bunch of "~~~~" under "Overall Conclusion". See [this](#) complete explanation of formatting techniques.

### Re: HP 35s Review

Message #4 Posted by [Will Rutherford](#) on 12 Sept 2007, 8:12 p.m.,  
in response to message #3 by Jeff O.

Thanks for the info. Here's what it was supposed to look like:

Good  
~~~~~

- adds logic operators
- good notation (i / theta) for entering complex numbers
- nicer keyboard layout 33s
  - good that funny mode keys are gone
  - arrow keys are better
  - big ENTER key is nice to see again
- better look and feel
- addition of extra units and physical constants is very useful

Problems  
~~~~~

- forced to fish out the 'h' suffix when entering a hex number, even when in hex mode
  - this is very inconvenient if you want to enter a lot of hex numbers
  - it takes too many keystrokes to get that 'h' suffix, which should be implicit in hex mode
- user is now forced to enter a mantissa part for a number in scientific notation
  - standard interpretation in HP calculators for decades has been to default to 1
  - for instance 'e2' is taken as '1e2'
  - this is a great keystroke saver and has been in place for decades in all HP calculators, up to and including the 50g and the 33s
  - sanity check: entering the number 1000 in scientific notation should reduce the number of keystrokes

- sometimes the calculator misses a typed key
  - overzealous debouncing?
- sqrt key gives 'invalid data' for complex numbers or negative numbers entered as a complex number
  - inconsistent with general ability to use transcendental functions on complex
  - sqrt is easy to implement in complex
  - $y^x$  key does it anyway when you give an exponent of .5
- there is no way to extract real and imaginary parts of a complex number
- location and labelling of hex digits a to f
  - I realise that layout is not easy, but placing them two rows below the register labels A to D is a bit odd
  - assuming you hold to the layout, it would be better to at least add some special labels in a different colour for the hex a to f
- additional logic operators would be useful: shift, rotate, etc.
  - compare with 16C or 50g
- new vector data type is very thinly supported
  - no real power to it, just addition of vectors and multiplication by a scalar
  - it complains on a vector of length 0 but not a vector of length 1
- 2\*2 lin. solve and 3\*3 lin. solve are badly done
  - user has to fuss with a list of storage registers
  - better idea: let user enter a set of vector objects into the stack and let calculator operate on those
  - for instance, 4 length-3 vectors would suffice for input to a 3\*3 lin. solver
- E key (for Enter Exponent) would be better labelled EE or EEX
  - this would avoid confusion with the other E keys
  - would stand out better
- when complex numbers are displayed in polar form, it would be useful if the 'theta' character could be rendered differently so as not to resemble zero and eight so much
- there should be a way to view complex numbers to greater precision
  - see for instance how this is done in the 15C
  - also compare with your scrolling view of large binary numbers in the 35s

## Re: HP 35s Review

Message #5 Posted by *Karl Schneider* on 13 Sept 2007, 12:30 a.m.,  
in response to message #4 by Will Rutherford

Will --

Good, thoughtful assessment. Some of the items you mentioned had been discussed previously.

I soon expect to prepare a short paper on suggested improvements for the HP-35s, not for general release until October. Most of this will address the complex-number issues you mentioned.

Some comments:

- A full set of bit-manipulation functions might be expecting too much. PC-based software handles that work today; there never was a replacement for the HP-16C.
- "Enter Exponent" has been labeled E instead of EEX since the Pioneer-series models, which displayed exponents with preceding "E" instead of a right-justified value.
- I haven't tried the linear solution yet (and I expected that it would utilize vectors), but the best way to do it is within matrix functions, which are not offered. One must also be able to store the input data and result, so it's either 15 variables or 5 vectors for a 3x3 system.

-- KS

**Re: HP 35s Review**

*Message #6 Posted by [Will Rutherford](#) on 14 Sept 2007, 8:53 a.m.,  
in response to message #5 by Karl Schneider*

My list of problems was meant to be in order of decreasing importance, i.e. most important items first. The matrix operations no matter how you look at them have been badly done through half-measures. I would be perfectly happy to see them just drop the linear algebra support altogether.

I have found a new high importance item: XEQ.

It now requires you to hit ENTER after the label, unlike the 33s or any reasonable calculator I've worked with. This is bad at a number of levels. It's bad programming practice to jump into the middle of a subroutine. It's also a well-known principle in programming language design that users should only pay for what they use. And it defeats one of the purposes of writing the routines on the calculator, which is to save keystrokes on long operations.

Concerning shift operators, there's a LOGIC submenu anyway, which has room for extra stuff. And the 50g has a good set of shift operators. However you can get what you want most of the time with scaling by powers of two.

-Will

\_\_\_\_\_

I have found a new high importance item: XEQ.

It now requires you to hit ENTER after the label

\_\_\_\_\_

As I see things, the labelling paradigm implemented on the 35s essentially makes every line number a label. If you key in the whole label identifier, which is a letter followed by three digits, you do not need to press ENTER. If you want to start a program that begins at line no. 1 (where the actual label letter is), you may press XEQ, letter, ENTER as a shortcut instead of pressing XEQ - letter - 000 or 001. So it adds one keystroke to kicking off programs that start at line no. 1, but the ENTER shortcut save 2 keystrokes from what it would have been without it. This was the trade-off needed to get around the severe limitation of the 26 program labels of the 32s/32sII/33s models. I guess a possible alternative would have been to allow branching directly to line numbers only during program execution. From the keyboard, you could only start 26 programs, but they would start immediately after pressing XEQ - letter. I guess I feel that the added ENTER required by the method chosen by HP is worth the increased flexibility of programming that it offers.

Best Regards,  
Jeff

*Message #8 Posted by [Gene Wright](#) on 14 Sept 2007, 2:23 p.m.,  
in response to message #7 by Jeff O.*

Hey, the original way it was going to work was to ALWAYS require XEQ label 3-digit line number.

Even for the normal "Start a program at line 001" situation.

I imagine that would have been greeted with a great deal of irritation.

So, the XEQ label ENTER shortcut was devised.

I personally find it very easy to remember and press when I want to run a label.

Remember that the 35s was a modified HP 32SII / HP 33S programming paradigm.

I view this as an excellent compromise. If someone doesn't like it, they can always use the 384 byte HP 32SII.

: -)

in response to message #8 by Gene Wright*

Boy, imagine that- a 32SII with 30 kb!!

But the 35s appears to be AT LEAST as nice to use as the 32SII. In fact, after having been using the 33s, 35s, and the 48G+, 49G+, the single stack level display of the 32SII seems confining!

Yeah, yeah, I know... REAL HP users keep track of their stacks in their heads...

### **Re: HP 35s Review**

*Message #10 Posted by [Will Rutherford](#) on 15 Sept 2007, 12:38 a.m.,  
in response to message #8 by Gene Wright*

The history is unimportant, it's the end result that counts. There is such a thing as a good compromise and such a thing as a bad compromise. The XEQ as implemented is the latter.

As Jeff stated, another alternative might have been to never prompt for the line offset at all at the user level. Better still IMHO would be to not have line number references at all. You shouldn't need them if you can write good code.

The pride of HP in the old days was its RPN, which saved a single keystroke once in a while over the algebraic entry alternative. Now we're hearing that it's okay to hit an extra key on frequently used functions. This is not acceptable.

The 15C has a User mode to make it possible to execute user defined functions with a *single* keystroke. The 50g has the VAR with directory trees, the CUSTOM facility, *and* keyboard remapping, all with the aim of solving this very problem in multiple ways. It is very important to ease of use to make custom functions as efficient to invoke as possible.

If the prevailing view on the 35s remains sticking with bad ideas like adding extra

keystrokes to XEQ, then it will never be a good product and people will have to stay with the 50g for everyday calculating use.

If HP had simply taken the 33s and added nicer keys and a LOGIC menu, then I would have been happy with it. Instead it's been ruined by misguided design ideas.

-Will

Will, the idea behind having XEQ-LABEL-ENTER and XEQ-LABEL-Line Number implemented is to have more than 26 (A-Z) entry points for different(!) programs (remember the 32kB). This way you could have, say, 15 independent programs under the A label and start them independently with relative ease. It's not meant to start one(!) program from different entry points (though you can certainly (ab-)use it that way).

The user mode on the 15C is very nice but you only need five entry labels due to the very limited memory. ;-)

in response to message #11 by Meenzer*

Okay, perhaps the new XEQ notation has a better purpose than I at first surmised.

However, there's still a very good reason why minimum keystroke function invocation is needed. Single keystroke is the most desirable. Rather than

talking in generalities, I'm going to break open a new thread analysing an example.

Quote:

---

- there is no way to extract real and imaginary parts of a complex number

---

Try this: write a program that does left shift-ARG and right shift-ABS on the complex number ( $x i y$ ) in order to obtain the angle  $a$  and the hypotenuse  $h$  of the corresponding polar coordinates. Then  $\cos(a)*h$  is the  $x$  and  $\sin(a)*h$  is the  $y$  of the complex number.

You could put the complex number in the X register, xeq the program and have it leave the real and imaginary part in the  $x$  and  $y$  registers respectively.

## Re: HP 35s Review

Message #17 Posted by [Will Rutherford](#) on 12 Sept 2007, 8:18 p.m.,  
in response to message #16 by Meenzer

You are correct, it can be computed that way. What I meant was, there's no predefined interface to do it. Any complex number implementation is going to give you that as part of the interface since it's so fundamental to working with complex numbers. Look at the standard C++ complex type, or the HP 15C, or the 50g as examples.

## HP-15C programs for complex operations

Message #18 Posted by [Karl Schneider](#) on 13 Sept 2007, 12:56 a.m.,  
in response to message #17 by Will Rutherford

Quote:

Any complex number implementation is going to give you (*extraction of real or imaginary parts of a complex number*) as part of the interface since it's so fundamental to working with complex numbers. Look at the standard C++ complex type, or the HP 15C, or the 50g as examples.

"Fetching" either part of a complex number is easy on the HP-15C as you suggest, using STO and Re<->Im. Here are keystroke sequences to emulate the RPL "C->R" (inverse of RPL "R->C" or HP-15C "f I"), and the other RPL-model and HP-42S functions on the HP-15C:

| "C->R"  | "Re"    | "Im"    | "Conj"  | "Sign" | "Neg"   |
|---------|---------|---------|---------|--------|---------|
| ENTER   | Re<->Im | CLx     | Re<->Im | ENTER  | CHS     |
| Re<->Im | CLx     | Re<->Im | CHS     | ABS    | Re<->Im |
| CLx     | Re<->Im |         | Re<->Im | /      | CHS     |
| Re<->Im |         |         |         |        | Re<->Im |
| x<>y    |         |         |         |        |         |
| CLx     |         |         |         |        |         |
| Re<->Im |         |         |         |        |         |

Only the "Sign" function (normalization to unit magnitude) uses an "extra" stack level for computation.

Even though it was rather impractical to include these necessary complex-argument operations as built-in functions (due to limited available keyboard and ROM space), the basic functions were designed to make them possible. That's why CLx and CHS operate on only the real part of a complex number.

This, and the complete complex-domain functionality for transcendental functions (in all likelihood, a first for a handheld calculator) is part the HP-15C's excellence.

*Message #20 Posted by [J Lustig \(CA USA\)](#) on 12 Sept 2007, 6:04 p.m.,  
in response to message #1 by Will Rutherford*

Hello- I was just reading this when I saw this post, so I thought I'd use it as a reply.

I've been lurking here off and on for a long time. I've been a big fan of HP calculators since the beginning, collected a few (67, 41cv, 32, 32sII, 48, 33s, and 35s) but, though I've always used them for work and play, I'm not a power user. It's always interesting to here from people who feel the way I do about these little gems. Now I finally have something to say and ask.

The new 35s is wonderful for it's look and feel. I've missed this button style since the 41 (& 48) slipped away. The 35s buttons are beyond reproach. One of the most important parts of the HP calculating experience is the positive feed back and solid feel, not to mention durability. And we have the proper ENTER key back. But I think they miss calculated (if you'll excuse me) in one regard and I'd like some feedback, maybe I'm just ignorant. It seems to me that the keyboard is a skewed in favor by programming key layout and that routine calculating suffers for it. The roll down and X<>Y keys should be immediately next to the ENTER key, the X<> should be close by and maybe on the face of a key. Also, as has been discussed, a quick polar/rectangular conversion would help, as it always has. Perhaps most importantly the STO key should be on the face of a key. This could be done easily by moving the sqr. root, Y^X, and 1/X keys up and SIN, COS, & TAN keys to the right to make room for STO, RCL, and roll down just above the ENTER.

It seems to me that computers are used far more easily for almost everything that programmable calculators started to be used for, and besides, without real label names and real names for output (ie. 41, 42) the usefulness of programming a calculator is further crippled by arcane and arbitrary single letter labels that are hard to remember. I have fun with the programming and I'm sure many people use it to good effect. But I think a calculator should be a calculator first and programmable second- if and where there's a trade off (in keyboard space) to be made. Programming would still be quite easy and calculating would be even easier...

Any thoughts from anyone?

Message #21 Posted by [RonHudson\(USA\)](#) on 12 Sept 2007, 7:57 p.m.,  
in response to message #20 by J Lustig (CA USA)

- 1) Is there any way to share programs/backup the machine? USB perhaps?
- 2) Programmables have an advantage over the laptop, even the real small laptops like the palm folio (rip) they fit in pockets (perhaps big pockets...)

But I do agree: all of the calculating functions should be on the face keys and programming (except run) should be relegated to f- and g- shifted keys.

(Or even better yet - You plug in your trusty HP-2007XL into your USB and it appears on your desktop like a thumb drive. The registers are kept in a file with NAME=VALUE pairs that you can edit with notepad, the programs each in their own file are also notepad editable (RPL? Lisp? Forth? Python? All the above?) and while the calculator is connected it can still calculate. Your laptop also has an emulator that can run off the same memory. It's all file so you can copy stuff on and off at will)

Sorry - I know it's not the "Dream Designs" thread... :^)

### Re: HP 35s Review

Message #22 Posted by [Will Rutherfordale](#) on 12 Sept 2007, 8:32 p.m.,  
in response to message #20 by J Lustig (CA USA)

Yes, the 15C for example has the basic editing keys like x<>y all clustered together, with STO and RCL at top level.

I agree, if I have to program I pull out Perl or C++ rather than struggling with a calculator language.

The use case of Hex numbers is a good one. Once in a while I need to go over part of a debug listing by hand. There must be 50 PCs running Windows or Linux in the immediate vicinity in the office. Each has a Calculator accessory that does hex conversions and binary operations.

The only way I can justify my use of the calculator in that situation is convenience. But if the calculator makes me use a minimum of 3 keystrokes each number to add the 'h' suffix, even though I'm in Hex mode, it just isn't worth it.

The calculator should have been reviewed by an experienced HP calculator user before being shipped. Perhaps they just rushed it to meet their 35th anniversary deadline. The result is no showpiece.

The 35s *could* be turned into a decent product, if they looked at some of the suggestions and fixed it up. Whether to change the model name would be up to them.

-Will

Programming would still be quite easy and calculating would be even easier...

Any thoughts from anyone?

---

I agree. Small calculators (read-small one or two line screen, non-graphing) should be a scientific first and foremost. The big graphic calculators like the 48/49/50 TI-89 et.al cater for the programmable market much better, and are much more versatile with their bigger screens.

HP screwed up big time by making the 35S primarily a programmable calc, esp when you compare it with the 33S which has the nice key layout of a good scientific, not a programmable.

Dave.

**HP97 fault**

Message #1 Posted by [Michael Tortorella](#) on 11 Sept 2007, 4:22 p.m.

Greetings, all: recently acquired 97, has fault as follows. Display seems normal, all numbers can be entered from keypad in usual way and they display correctly. But pressing "Enter" or any other key besides a number causes display to read "Error" and a tone to sound which cannot be removed except by powering down. I beg you to tell me this is not fatal, and would appreciate any hints on how to solve this problem. BTW, power supply is OK, machine does this even when operated on external power. Thanks in advance for any help. Mike T.

Message #6 Posted by [Eric Smith](#) on 12 Sept 2007, 11:25 a.m.,  
in response to message #5 by Michael Tortorella

If an HP-97 is making noise, it's either a printer or card reader problem, since those are the only moving parts. If you've already tried disabling the printer (setting the switch to MAN - do this *\*before\** it starts making noise, as in before you power it on), then most likely either the printer mode switch is broken, or the noise is coming from the card reader (which would be due to a card reader switch being broken).

### Re: HP97 fault

Message #7 Posted by [Etienne Victoria](#) on 12 Sept 2007, 3:12 p.m.,  
in response to message #5 by Michael Tortorella

Hi!

If the noise comes from the printer, it could be a malfunction of the reed switch and/or magnet telling the printhead it has reached the end of the line.

Then the printhead gets stuck at the eol and the printer motor keeps trying pushing it.

Is the printhead on the right side or on the left ?

Before trying something else, are we sure the noise doesn't come from the card reader ?

Etienne

### Re: HP97 fault

Message #8 Posted by [Michael Tortorella](#) on 12 Sept 2007, 8:09 p.m.,  
in response to message #7 by Etienne Victoria

I'll check the print head. However, it's not a "noise", it's a tone (about 700 Hz, I'd guess). It seems that it was intended to come on when "Error" shows on the display. Thanks Mike

### Re: HP97 fault

Message #9 Posted by [Eric Smith](#) on 12 Sept 2007, 11:03 p.m.,  
in response to message #8 by Michael Tortorella

There is nothing in the HP-97 that is intended to produce a tone. If it's making a tone, something is wrong that is causing unintended operation of the card reader or printer mechanisms. The "Error" display is a result of the firmware recognizing that one of those mechanisms is misbehaving.

in response to message #1 by Michael Tortorella*

Quote:

BTW, power supply is OK, machine does this even when operated on external power.

Applying external power via the charger is NOT necessarily sufficient. The printer requires more power than the charger can provide, and depends on having a good, charged battery.

While a charged battery pack should measure around 5V, a battery pack that measures around 5V with no load is not necessarily good.

**Re: HP97 fault**

*Message #12 Posted by [Michael Tortorella](#) on 12 Sept 2007, 8:08 p.m.,

### HP-35s -- Reversible Case with its Repositionable Logo

Message #1 Posted by [Paul Brogger](#) on 11 Sept 2007, 11:39 a.m.

O.k., so a few days ago I noticed the logo on my 35s' case was slightly askew. Today I tried rotating the calculator and inserting it under the second elastic band, so that the case opens on the left, and my Post-It pad is on the right, ready for some right-handed writing without obscuring the calculator.

I like that better, but when I close the case, the logo is upside-down. (*And crooked!*)

I recall someone's suggestion that the logo might have been placed on the cover with its long dimension parallel to that of the case, to avoid this upside-down-ness when the case is used in its alternate mode.

Then, like a good experimenter, I took my Swiss Army knife, inserted the blade beneath the right edge of the logo on the case, and lifted gently . . .

The brushed-aluminum logo piece popped off cleanly, complete with its sticky back. I simply rotated it 180 degrees and stuck it back in the little depression (aligned much more nicely than as delivered, thank you very much) and voila! A correctly-oriented logo near the bottom of the case front, when the case opens from the left.

Better yet, I popped it off again, flipped the case over (so it opens from the right, but now with the calculator banded to the inside "front" cover), and stuck the logo back on what used to be the back, in a position analogous to the original.

The logo is no longer in the little rectangular depression (and that depression is now on the lower back side), but I've got a case opening on the right, with the logo correctly positioned and aligned on the front, and the calculator attached to the left side when open.

The logo is not *quite* so securely "set" (being out of the depression intended for it) and feels vulnerable to being accidentally scraped off. I think my next stage will be to try to reproduce the rectangular depression (maybe with a small hammer and a piece of hardwood) and then glue the logo back on with something a bit more tenacious than whatever H-P has chosen to use.

In any case, I hope I've made my case that the 35s' case is highly configurable.

(Just in case you wish to do something similar . . . )

*Edited: 11 Sept 2007, 12:17 p.m.*

I think I will. I spun mine around in the case to make the net toward the right also, but of course now the label is upside-down, which is mildly irritating. I'm left-handed, but use the calculator right-handed. I like to jam the calculator up against the right side of the paper.

Thanks for the tip.

in response to message #4 by Pal G.*

You may well use the case of the 33s, as was mentioned some weeks ago already. It falls 1-2mm too short, but protects the 35s sufficiently and gives a more compact package. I use it this way. For rucksack students, however, I'd recommend the original.

HTH, Walter

in response to message #1 by Paul Brogger*

I seem to remember that HP worked with a group (Or perhaps they were actually part of HP) that re-branded HP's equipment and re-sold it. The group was named something that came out to "dy". All they did was take the HP sigil on the items and turn it upside down.

### **The HP-35s carrying case**

*Message #7 Posted by **Karl Schneider** on 15 Sept 2007, 3:08 p.m.,  
in response to message #1 by Paul Brogger*

Hi, Paul --

Those were industrious efforts to modify the HP-35s carrying case!

Here's a more philosophical issue: Have others seen what the design of the HP-35s case represents, versus cases of past models?

The concept for the HP-35s case seems to have been borrowed from the case for the \$300 Bose noise-cancelling headphones: The user must unzip the logo-bearing case more than 180 degrees to reveal the product resting in a form-fitting well. The case sends a message: "There's something *real special* inside."

The carrying case for the shirt-pocketable models from the Voyager-series onward, however, were purely-functional slipcovers with subtle logos. Their purpose was simply to protect the calculator from scuffs, scratches and spills. Removal of the device was easy: grasp its exposed edges and pull. Voyager- and Pioneer-series calculators fit in the standard pocket of a men's shirt, *inside or outside* the slipcover.

-- KS

Hallo Karl, at least the 35S fits in the case of the 33S - should be handier for daily use. W.

### **Re: The HP-35s carrying case**

*Message #9 Posted by [Antonio Maschio \(Italy\)](#) on 28 Sept 2007, 8:21 a.m.,  
in response to message #8 by Wolfgang Jacques (Germany)*

When I have the 35S, I'll exchange the cover of the 33S and the 35S; the 33S (which will probably never be used anymore) will rest with no merit in the precious cover of the 35S, and the 35S will travel in the more usable pocket-enabled cover of the 33S; this is my intention. When I have the 35S.

In any case, all the posts in this Forum, referring to the 35S bugs or inconvenient features, made me slightly change my mind about it. I thought it was a wonderful machine, I realize it's a good perfectible calculator. Nothing more. My 15C seems to give me more joy (if I can so call the feeling in using it).

### HP 50G - memory issues

Message #1 Posted by [Steve Budd](#) on 11 Sept 2007, 10:59 a.m.

Hi, I have been a satisfied user of the HP41C for best part of 20 years until mine died on me last december. A friend of mine was travelling to NYC at the time, so I asked him to get me a 50G to replace my defunct 41C. Apart from the inferior key action and double-bounce, I'm happy with it, but I have a couple of memory-related questions for seasoned users of the HP50G: Firstly, what happened to the LastX function, and secondly, how do you store a variable (i.e. the contents of the X register) part-way through a calculation? The functions STO (store) and RCL (recall) do not appear in the User Guide index. I use RPN mode exclusively. Can anybody please offer any useful assistance? Regards, Steve.

### Re: HP 50G - memory issues

Message #2 Posted by [Tim Wessman](#) on 11 Sept 2007, 11:19 a.m.,  
in response to message #1 by Steve Budd

You might want to take a look at the Advanced Users Guide (the programming chapter).

There are two ways to store and reuse variables. If you are using Local Vars it is like this:

```
<< -> A B << A B * 'A' STO A B >>] >> ( After the >>] your local; variables are wiped - don't use the ] it is just for marking)
```

Same in a regular program. Anytime you'd like to store an object, use the tics to surround it as this prevents execution.

```
<< 'A' STO >>
```

Will store an object into A. To later use A, just leave it unquoted.

```
<< A >>
```

TW

Quote:

\_\_\_\_\_  
Firstly, what happened to the LastX function,  
\_\_\_\_\_

[This thread](#) provides a discussion of that particular issue. (All discussion related to the 49g+ applies to the 50g.)

Quote:

---

secondly, how do you store a variable (i.e. the contents of the X register) part-way through a calculation?

---

Not that I am any sort of expert on the 50g (far from it, actually), but to expound a little on the information that Tim provided, to store a value you need to specify a variable or register name in which the value is to be stored. So if you have the value 123.4 on the stack and you wish to save it somewhere, let's say a register named "A", press the key with the "tick" mark (fourth row, third key), then ALPHA, then the F1 key to enter the letter A. Then press the STO key. This will create the variable named "A", store the 123.4 in it, and remove the value 123.4 from the stack. If you want it back, press the VAR key, which will give you a list of the variables in the directory in which you happen to be. Since you just created the "A" variable, it should be the first one on the left. Pressing F1 will copy the value to the stack. The value will still be stored in "A". "A" will remain in your list of variables until you purge it, which you do by pressing the tick mark key, then the F1 key, then ENTER, then TOOL, then PURGE (soft key above F5). I find it handy to create a list of registers for routine use, called R1 through R6. If the register is already created, pressing the left-shift key followed by the function key under the soft label for the appropriate register will store the value presently on the stack in that register. You can control the order in which the variable names appear when you press the VAR key using the ORDER command.

Quote:

---

I use RPN mode exclusively.

---

I assume you mean that you do not use the algebraic mode of the 50g, but it bears stating that the 50g and its progenitors actually utilize RPL vs. the classic RPN of your late 41C. The differences between RPN and RPL are, well, suffice it to say there are more than a few. They have been discussed here at the MoHPC Forum on numerous occasions. For a start on how the 50g works, search the Archives for posts by James M. Prange. The [comp.sys.hp48](http://comp.sys.hp48) newsgroup is basically dedicated to discussion of the HP-48 and its descendants (including the 50g) and so would be a good place to go for answers.

---

That's a useful tip, Jeff. When first getting to grips with use of existing variables on the 48, I found it useful to visualise the variables as being "off to the left" of the calculator screen. Then:

- left-shift var-soft-key will store from the stack into the variable (visualise the value moving from the screen across to the variable on the left)
- right-shift var-soft-key will recall the variable to the stack (moving from left to right, onto the stack)
- var-soft-key alone will evaluate the variable (not the same thing as recalling)
- 'var-soft-key inserts the name of the variable onto the edit line

Hopefully, this might help novices get it clear, at least until it becomes second nature.

Best,

--- Les

## Re: HP 50G - memory issues

Message #5 Posted by *Egan Ford* on 11 Sept 2007, 8:12 p.m.,  
in response to message #1 by Steve Budd

With the 50g there is almost always more than one way to do it.

For the double-bounce (the -> is right-shift 0)

```
256 ->KEYTIME
```

To make it permanent, make sure you are in home directory, then type:

```
<<256 ->KEYTIME>>  
'STARTUP' STO
```

Variables:

To create:

```
'A' STO
```

To recall (soft menu key or type in variable name

```
A
```

To update REG X -> A:

```
Left Shift Soft Menu A
```

Or

```
'A' STO
```

LASTX:

Left Shift HIST, AKA CMD, will pop up the last 4 LASTX

Other tips:

Get 50g emulator:

<http://www.debug4x.com/>

If you have a lot of 41C code you can run it on the 50G:

```
http://www.hrastprogrammer.com  
http://www.hrastprogrammer.com/hp41e  
http://www.hrastprogrammer.com/hp41x
```

## Re: KEYTIME?

Message #6 Posted by *Dan Greil* on 11 Sept 2007, 8:41 p.m.,  
in response to message #5 by Egan Ford

Egan,

I was under the impression the KEYTIME instruction did what you said in early ROM version but has since become a NO-OP instruction.

Here's the text from the 49g+ AUR version 1.1 published 2006/3/20 regarding the KEYTIME instruction:

"This command is provided for compatibility with earlier calculators, but does nothing on the hp49g+/hp48gII."

Given that the 49g+ and 50g share the same ROM, does KEYTIME really do anything on the 50g? Was the instruction resurrected in ROM v.92 which was released after this AUR was published?

Regards,

Dan

"This command is provided for compatibility with earlier calculators, but does nothing on the hp49g+/hp48gII."

The KEYTIME instructions were restored for the hp49g+ (and the later HP50G) in late 2005 with ROM version 2.05 and later. Unfortunately, even though the hp49g+ AUR 1.1 has been updated as late as March 20, 2006, the KEYTIME-> and ->KEYTIME descriptions on page 3-89 have not been corrected. Instead, the correct information is buried way back on page H-8, as a sort of addendum.

Regards, Mike

### **Re: KEYTIME?**

*Message #9 Posted by [James M. Prange \(Michigan\)](#) on 11 Sept 2007, 10:18 p.m.,  
in response to message #6 by Dan Greil*

The 49g+ AUR is correct for early 49g+ ROM revisions, but incorrect for recent ROM revisions

The KEYTIME\-> and \->KEYTIME commands were indeed "resurrected" in the 49g+, although I

don't recall with which ROM revision. I suppose that the ROM revision could be found with a search of the comp.sys.hp48 usenet group.

The ROMs intended for the 49G have working keytime commands, but that model has little, if any, problem with doubled keystrokes due to key bounce, and having the keytime value set too high can cause missed keystrokes. The default value (1365) seems too high for most users.

When the 49g+ was first released, its ROM didn't have working keytime commands; after all, they seemed to be more trouble than they were worth in the 49G. But it soon became all too obvious that the keyboard on the 49g+ has various problems, sometimes including missed or doubled keystrokes, so at some ROM revision, the keytime commands were made active again.

The 50g has active keytime commands, unless it's been flashed it with an early 49g+ ROM.

The keytime value is the number of ticks (1 second = 8192 ticks) that a repeated press of the same key will be ignored for, with a range of 0 through 4096.

KEYTIME\-> returns the current keytime value as a "real number".

\->KEYTIME takes a real or zint (exact integer) for an argument, and sets a new keytime value. \->KEYTIME rounds fractional arguments to integer values, treats negative arguments as 0, and arguments over 4096 as 4096.

With ROM version G revision 2.10-7 (and, I believe, other ROMs intended for the 49g+ or 50g that have active keytime commands), the default keytime value is 1138 (ticks), or somewhat over 1/8 second, which seems rather high. I recommend setting the keytime much lower, perhaps 256 (1/32 second), and actually, my 50g seems to work just fine with it set to 0.

Regards,  
James

### Re: KEYTIME?

*Message #10 Posted by [Peter A. Gebhardt](#) on 12 Sept 2007, 7:12 a.m.,  
in response to message #9 by James M. Prange (Michigan)*

James,

Thx. a lot! Using 0 ->KEYTIME instead of 300 solved the long lasting problem of scrolling through e.g. CAS CMDS.

It now works w/o "hickups"!

CAS 4.20, ROM 2.09, HP49G+ CNA51505618

Best regards,

Peter A. Gebhardt

### Computing many digits of Pi

Message #1 Posted by [Juan Pablo Martinez \(Spain\)](#) on 11 Sept 2007, 6:36 a.m.

This subject was dealt with the year 2004 by Gene Wright (HP Forum Archives 14). As a newcomer, I only now have noticed the archive. It is said there that there are two programs to compute many digits of pi with the TI-95 calculator, one by Hewlet Ladd (1987) and another by Palmer Hanson (2004). Some members asked then for the Hanson listing, but he answered that was not ready to type the 750 steps by hand, and that he would send an attached copy of the printed listing if the interested people supply him his e-mail address. Well, I would like also to have this listing and that by Hewlet Ladd. Can anyone supply these listings?. In the same archive is a post by Gordon Dyer showing a program to compute pi on a HP-42. However, the program gives only 11 digits. Does anyone know a similar program for the same calculator but computing as many digits as possible? Does anyone know a similar arbitrary precision program to compute many digits of pi on any calculator (HP or other brands) using only the Machin arctangent formula ( $\pi = 16/\arctg(5) - 4/\arctg(239)$ )? Many thanks in advance

### Re: Computing many digits of Pi

Message #2 Posted by [Jeff O.](#) on 11 Sept 2007, 8:52 a.m.,  
in response to message #1 by [Juan Pablo Martinez \(Spain\)](#)

Katie Wasserman used the formula:

$$\pi = 20 * \arctan(1/7) + 8 * \arctan(3/79)$$

to calculate 96 (correct) digits of pi on a 32SII as described [in this article](#). I would think it would be relatively straight-forward to convert her program to run on the 42S. I've been meaning to convert it to run on the 35s. (That is, thinking "gee, I wonder if Katie's program could be converted to the 35s, and if so, how many digits could it calculate.") Katie's program saves 9 digits of pi in each 12-digit register, so with 800 registers, each capable of holding three 12-digit numbers, it should be possible to get 21,600 digits. (Assuming the program would fit with that many data registers allocated. Seems like it ought to, since the original fit in the very limited memory of the 32SII, but I have not really checked to see.)

### Re: Computing many digits of Pi

Message #3 Posted by [Katie Wasserman](#) on 11 Sept 2007, 9:54 p.m.,  
in response to message #2 by [Jeff O.](#)

The program for the 32Sii needs some modification in order to extend it for many more registers. The 9 digits/register was necessary to avoid overflows when just 99 digits are computed. You'll probably need to cut back to 6 digits/register if you're going put this on the 35s and try for 10000+ digits. More to the point, the run time goes up roughly as the square of the number of digits and the 35s isn't much faster than the 32sii so it's going to take.... let's see.....

11 (minutes for around 100 digits) \* 9/6 (number of digits per register correction \* 100^2 (100 times more digits that go as the square) = .....

pretty close to forever!

The 35s just isn't fast enough to do much useful calculation with all those registers. Even a good (NlogN) sorting routine would likely take longer than anyone would want to wait.

-Katie

### **Re: Computing many digits of Pi**

*Message #4 Posted by [Juan Pablo Martinez \(Spain\)](#) on 12 Sept 2007, 8:38 a.m.,  
in response to message #3 by Katie Wasserman*

Many thanks Katie

Of course, you are right. Your program is a little wonder, but I know that to compute over a few thousands of digits on any calculator a long job if using classical algorithms linked to trigonometric formulas. I am not sure if the translation to other calculators deserves trying.

Thanks anyway

### **Re: Computing many digits of Pi**

*Message #5 Posted by [Jeff O.](#) on 12 Sept 2007, 9:32 p.m.,  
in response to message #3 by Katie Wasserman*

Quote:

More to the point, the run time goes up roughly as the square of the number of digits and the 35s isn't much faster than the 32sii so it's going to take.... let's see.....pretty close to forever!

I did not realize this about the technique you implemented on the 32sII. I guess I should have studied it a bit before flippantly postulating about computing 20,000+ digits on the 35s.

(I probably should have realized. After all, if calculating pi was easy, it would not have worked as an effective method to drive a malevolent entity from the computer of the Enterprise. I sure hope that Spock was the only one authorized to instruct the computer to use all resources, to the exclusion of all other processes if I recall correctly, for a particular task.)

### **Re: Computing many digits of Pi**

*Message #6 Posted by [Katie Wasserman](#) on 14 Sept 2007, 9:47 a.m.,  
in response to message #5 by Jeff O.*

There are methods for computing pi that converge quadratically, of course they also grow linearly with the number of digits required. So, their ultimate convergence is  $N \cdot \log(N)$ . I'm not sure if Spock was aware of these methods when he issued his command, but he still would have gotten his intended result -- to be expected from "the best first officer in the fleet" to quote Dr. McCoy.

### **Re: Computing many digits of Pi**

*Message #7 Posted by [Juan Pablo Martinez \(Spain\)](#) on 12 Sept 2007, 8:24 a.m.,  
in response to message #2 by Jeff O.*

Many thanks. Katie's program is wonderful given the small amount of memory of the HP-32. I will try to translate it to TI-95. However, it does not use the Machin's formula, but one of the many related ones.

**Re: Computing many digits of Pi**

Message #13 Posted by [Juan Pablo Martinez \(Spain\)](#) on 12 Sept 2007, 8:47 a.m.,  
in response to message #12 by Etienne Victoria

You are right, Etienne. This is perhaps the fastest algorithm, but it is rather difficult to implement it in a calculator. I knew already the poem by heart, but only the first lines, about 60 digits. There is plenty of similar texts in different languages, helping to memorize even 1000 digits of pi. Of course, there is still a faster algorithm, to look at the many existing printed values, to look in the web for any of the several pi pages, or to use any of the available multiprecision programs, either Derive, Maple, Mathematica, etc. However, none of these ways has much to do with calculators. Many thanks

**Re: Computing many digits of Pi**

Message #14 Posted by [Palmer O. Hanson, Jr.](#) on 12 Sept 2007, 3:58 p.m.,  
in response to message #1 by Juan Pablo Martinez (Spain)

I have a pasteup available for my 2004 program for the TI-95. It is a conversion of the TI-59 program by Bob Fruit which appeared in V7N4/5P27 ff of TI PPC Notes. Since you keep your e-mail address private you will have to send your address to me at pohmwh@earthlink.net if you want a copy. I haven't figured out how to attach anything to the secure communication through the museum.

I have not found a pasteup of the Hewlett Ladd program for the TI-95. It is a conversion of the Science et Vie program for the TI-59 which appeared in V8N3P8-9 of TI PPC Notes. For a translation of the Science et Vie article go to V8N4P21-24 of TI PPC Notes.

### **Re: Computing many digits of Pi**

*Message #15 Posted by [Xerxes](#) on 12 Sept 2007, 5:05 p.m.,  
in response to message #14 by Palmer O. Hanson, Jr.*

It would be nice, if you can send me the TI-95 version too. Thank you.

### **Re: Computing many digits of Pi**

*Message #16 Posted by [Juan Pablo Martinez \(Spain\)](#) on 13 Sept 2007, 4:49 a.m.,  
in response to message #14 by Palmer O. Hanson, Jr.*

Many, many thanks! Finally I managed to contact you. I did not realize that my e-mail address was kept private. Here is it: jpmr...ipe.csic.es (with the @ sign instead the dots). I would be very grateful if you send me the paste. Besides several HP calculators I still own and use an old TI95. I wonder if your program could be changed to allow the use of either supplementary memory modules up to 32 K or even data recorded in magnetic tape.

Thanks again

### **Re: Computing many digits of Pi**

*Message #17 Posted by [Palmer O. Hanson, Jr.](#) on 13 Sept 2007, 9:14 a.m.,  
in response to message #16 by Juan Pablo Martinez (Spain)*

I have the 2004 program in an 8K RAM module. I don't think I ever had it on tape since my tape reader isn't working.

I sort of remember having the Hewlett Ladd program on tape but I haven't been able to find it. It is not on a RAM module. I have found a reference in which Hewlett indicated that his program was a translation of a TI-59 program from V8N4P26 of TI PPC Notes, that it was only 296 bytes and would calculate up to 1573 digits.

### **Re: Computing many digits of Pi**

*Message #18 Posted by [Egan Ford](#) on 18 Sept 2007, 10:35 p.m.,  
in response to message #1 by Juan Pablo Martinez (Spain)*

Using the Spigot Algorithm from *Pi Unleashed* + HPGCC I can compute 15000 digits of PI in 412 seconds on my 50g. If you are interested I can send you the binary so that you do not need to compile and install the ARM Toolbox. NOTE: Real 50g/49g+ required.

To use:

15000 pidf

Output to stack:

```
bytes used: 210056
  time(s): 412
  digits: 15000
 digits/s: 36.41
```

SD card will have file PIDIGITS.TXT with the output formatted with 32 digits/line, recall to stack with:

```
3:PIDIGITS.TXT RCL
```

Up Arrow VIEW to see all digits.

NOTE: HPGCC binaries can be large. Best to store on SD card and run with:

```
3:pidf EVAL
```

Put that in a small UserRPL script and save to main memory.

You can hold down any key (but ON) to stop the run and collect partial output. When done exit with ON.

```
/*
pidf.c
```

```
Get n from stack and compute n number of pi digits using
Spigot method from Pi Unleashed by Jorg Arndt & Christoph Haenel.
```

```
Mem allocated = ((n/4)+1)*14 * 4 bytes
```

```
Return to stack statistics, e.g.
```

```
(n=5000):
```

```
bytes used: 70056
  time(s): 46
  digits: 5000
 digits/s: 108.70
```

```
(n=15000):
```

```
bytes used: 210056
  time(s): 412
  digits: 15000
 digits/s: 36.41
```

```
Only HP specific comments, read book for algorithm details.
```

```
*/
```

```
#include <hpgcc49.h> //the standard HP lib
```

```
int main(void){
  int *a;
  int b;
  int c;
  int d = 0;
  int e = 0;
  int f = 10000;
  int g;
  int h = 0;
  int start;
  int end;
  int cc = 0;
  char buf[40];
  int ndigits;
  FILE *fh;
```

```

char *filename = "pidigits.txt";

sys_slowOff(); //max speed
clear_screen(); //clear the screen

if((fh = fopen(filename,"w"))) {
}

## **Re: Computing many digits of Pi**

*Message #19 Posted by [Rodger Rosenbaum](#) on 19 Sept 2007, 8:02 a.m.,  
in response to message #18 by Egan Ford*

I have a xerox of an old paper about the computation of Pi, titled "Some Comments on a NORC Computation of Pi". I think the paper dates from around 1956.

The authors say in the first paragraph:

"Among the problems suggested as demonstration routines for the NORC (Naval Ordnance Research Computer) was the calculation of Pi to a large number of digits. In 1949, Pi was calculated to 2035 digits on the ENIAC. The present computation on the NORC, which was carried out by the authors at the Watson Scientific Computing Laboratory, produced 3089 digits. This limit was chosen since the entire calculation could be contained in the NORC's high speed memory (2000 locations). The program was designed to produce any number of digits up to this limit."

They say that the computation took 13 minutes.

I wonder what kind of memory the NORC had? All of "2000 locations". And how much power was consumed during the computation?

In 2007, using the power provided by a few penlight cells, Pi can be computed to 15,000 digits in about 7 minutes. On a pocket sized computer with over 200,000 memory "locations"!

Mathematica keeps the first 10,000 digits of Pi pre-calculated and stored in memory. So if a calculation needs up to 10,000 digits, there's no delay in calculating them; they're just fetched from memory.

If more digits are needed, they're calculated using the Chudnovsky formula. On my laptop, Mathematica takes 3.5 seconds to calculate 1,000,000 digits of Pi, and 58 seconds to calculate 10,000,000 digits. And, no doubt, using far less power than the ENIAC or NORC did.

This is progress.

## **Re: Computing many digits of Pi**

*Message #20 Posted by [Egan Ford](#) on 19 Sept 2007, 9:38 a.m.,  
in response to message #19 by Rodger Rosenbaum*

The Spigot method isn't the fastest. But it is small, does not require MP or FP math (integers only), and you get to watch the action.

If I have time I'll try out Chudnovsky.

## **Re: Computing many digits of Pi**

*Message #21 Posted by [Juan Pablo Martinez \(Spain\)](#) on 24 Sept 2007, 4:11 a.m.,  
in response to message #18 by Egan Ford*

Many thanks for your advice. Do you know if the program can be run also in a HP-49g?(not a HP-49g+)

Juan Pablo

*Message #22 Posted by [Egan Ford](#) on 24 Sept 2007, 10:58 a.m.,  
in response to message #21 by Juan Pablo Martinez (Spain)*

AFAIK, the 49g uses the Saturn CPU. You need an ARM-based unit (49g+/50g).

### Product suggestion for HP...

Message #1 Posted by [BruceH](#) on 11 Sept 2007, 5:56 a.m.

Do people think that there is a market for an RPN, simple scientific with bluetooth that can act as either a numeric keypad for a laptop or simply just send the contents of the X register to the laptop as if it had been typed in?

I often find myself calculating on the calc and then re-typing the answer into the PC.

Targus have a couple of products that give an idea of how it might work: [keypad calculator but USB only](#) and [bluetooth keypad but no calc](#) but I wouldn't expect the keys to be full-sized -- it should primarily be, and look like, a calculator -- just one that happens to be convenient for sending results to a PC.

Obviously it would need to be fairly chunky in order to pack enough batteries to power bluetooth for a reasonable period but this need not be a bad thing.

Posts in this forum frequently request/beg/demand that HP produce an RPN four-banger. Well maybe this is the excuse they need to justify the effort needed to produce a simple RPN machine?

There is a market for everything, in this case an incredibly small one I suspect.

Quote:

I often find myself calculating on the calc and then re-typing the answer into the PC.

I do too, but I usually have to format it in some way afterwards anyway, so the advantage of having it entered automatically is not all that high.

Quote:

for a reasonable period but this need not be a bad thing.

---

That is a bad thing in my opinion. A simple calculator should be as small and compact as possible, and last forever on batteries. But they aren't mutually exclusive though, you could have a Bluetooth interface and still make it small and last a long time on batteries if you engineered it right.

Quote:

---

---

I don't think so. They would have much more success with say re-hashing the 12C as a non-programmable scientific.

Dave.

Hello!

Quote:

---

Obviously it would need to be fairly chunky in order to pack enough batteries to power bluetooth for a reasonable period but this need not be a bad thing.

---

I don't even think so! I have a bluetooth headset (two way) for my mobile phone that is so small that it hides behind your ears and that runs for hours on a charge of its miniature LiIon Battery. And it has to provide a continuous stream of data all the time, other than the calculator that must only transmit a few bytes every now and then.

On the other hand, a big battery would also be able to power an (O)LED display.

Greetings, Max

NB: I frequently use one of these USB-four-bangers together with my notebook computer. Since it also has incorporates an USB-hub and I have to connect my mouse anyway (I hate this trackpad-thing), I don't mind the USB cable at all...

Use the excellent Free42 emulator on your laptop, then the "Edit | Copy" from its menubar. I was able to copy the result of a calculation (the X stack register) and paste it into notepad. The result is available anywhere via copy and paste.

Hope this serves your need.

Dennis

I do too. I'd like to have a software version of the calculator running in sync (through Bluetooth) with my actual calculator. Then I could copy/paste the result into other applications. Maybe also have the emulator save a sequence of keystrokes received through Bluetooth and play them back (through Bluetooth) on the actual calculator.

Instead of blowing all the battery power in the air, I'd be perfectly satisfied with a cute little white USB cable like Apple has it. It will not cost battery life, but will even allow charging of rechargeables instead. And it will be found on a messy desk, too. Else, clean up!

### **Re: Whitetooth (was Re: Product suggestion for HP...)**

OK, this was just meant as an opportunity. A Whitetooth calc will work with normal batteries as

well, of course.

## **Re: Product suggestion for HP...**

*Message #9 Posted by **Jerome Fryer (New Zealand)** on 16 Sept 2007, 8:35 a.m.,  
in response to message #1 by BruceH*

Hi to all.

This idea seems quite good to me. Using a laptop is always a bit painful in my job (electrical calibration) and it is useful to always have a calculator handy for checking things out during spreadsheet development. A fairly basic calculator that could communicate with a PC (and cellphone, and PDA) via BlueTooth seems like something that would be marketable. Ideally I would like to see an improved HP 50G with BlueTooth functionality.

Engineers and scientists of all sorts, accountants, tradespeople, and business people in general would probably find an easy way to send a series of figures to their cellphone quite a useful feature. It would prevent transcription errors and speed up the "txting" business.

Possibly not so good for students, though! Yield not to temptation. ;)

The cost of implementing BlueTooth (licensing) may be the problem, rather than no market.

### Modified Duration on 17bII+

Message #1 Posted by [Patrick Landry](#) on 10 Sept 2007, 6:25 p.m.

Hi guys,

I was wondering if anyone could generate lines of coded needed to calculate the modified duration for a bond. I have tried and am not to familiar with all the many programming options available.

### Re: Modified Duration on 17bII+

Message #2 Posted by [Peter A. Gebhardt](#) on 10 Sept 2007, 6:48 p.m.,  
in response to message #1 by Patrick Landry

Patrick,

maybe that's what you're looking for?

<http://www.investopedia.com/university/advancedbond/advancedbond5.asp>

You can enter the formulas directly. Before you start become used to using SPPV, USPV etc. to ease entry of the formulas & save space.

Once we have a 17bII+ again which does fully support L() & G() functions, then you should look here!

From the "Financial Superstar", Tony Hutchins:

Quote:

File Info for UBONDS.ZIP

Section: HP 100/200 Contributor: 100250,2347 Size: 6436 Submitted: 27-Oct-95 Type: Binary  
Accesses: 419 Title: UBONDS - Universal Bond Solver EQN for Palmtop Keys: BONDS  
UBONDS HP100LX HP200LX SOLVER EQN

UBONDS.EQN provides the LX Palmtops with a superset of the HP12C and HP19B bond capabilities. Also handles additional coupon frequencies and calculates the Dollar Value of 1 Basis Point and the Macaulay duration. Has a Face value extension to the calculation. Supports dates in whatever format the LX is set to, and has three date accounting bases. Outputs nearby coupon dates so you can argue details with your broker! Uploaded by author.

### Hp 35s - what color is it?

Message #1 Posted by [Martin Pinckney](#) on 10 Sept 2007, 5:26 p.m.

Just a sly way to start a new thread about first impressions. But seriously, from the online photos, I thought it was brown. After I received it, I still thought it was brown. Then when I put it alongside one of my Pioneers (definitely brown), it looks black. Black would be more consistent with making it look like a "classic" HP.

Which it doesn't, any more than a new Thunderbird "looks like" a classic 50's T-bird. It just "evokes" it. It actually looks more like a Pioneer on steroids, to me. With the slightly curved sides thrown in to make it look more classic. But then there are the sloped-front keys, which are definitely classic and not Pioneer-ish. In any case, it does look good.

As a new poster, I might mention that I started out with TI, and still prefer algebraic (gasp!) for most calculations (if interested, see my Memories post). But on this calculator (and other recent offerings) HP has implemented a form of ALG that is very annoying, requiring EVERYTHING to be infix while in ALG mode. I much prefer the older Pioneer algebraic, which had so-called unary functions postfix. It's almost as if HP engineers said "OK, you algebraic people, we're going to make you PAY for rejecting RPN, by making the ALG mode more complicated, then the RPN aficionados will have even more ammunition!"

Now I will admit that consistency demands that the trig functions and the like be infix [SIN( )], but unit conversions [MILE( )]? What sense does that make? This is not any kind of standard notation that I am aware of, and it is awkward. So, I switch to RPN mode when I do any kind of unit conversions. This is a roundabout way of saying that I like having the ability to switch modes in one calculator.

I have been using it about 2 weeks now. My impressions of its physical appearance and construction were initially very good, and that has not changed. My impressions of function were initially not so good, but the more I use it and the more I learn of its capabilities by reading the manual, the more it grows on me.

All-in-all, I think HP has a winner, and I sure hope sales are good enough to inspire them to produce more calculators in this mold and less in the TI mold.

### Re: Hp 35s - what color is it?

Message #2 Posted by [Martin Pinckney](#) on 11 Sept 2007, 2:55 p.m.,  
in response to message #1 by [Martin Pinckney](#)

At first the display looked odd to me - the aspect ratio of the digits is taller and narrower than what I have been used to on my Pioneers. But as I have gotten used to the calculator, I am really liking the display - it has so much better contrast than the Pioneers - really pops. Maybe the glossy screen, which some have commented on, contributes to this.

### HP71B & RPN??

Message #1 Posted by [Vincze](#) on 10 Sept 2007, 3:23 p.m.

My friends, I apologize, but I traveling this week. I bring 71B to play with and forgot my 35s. So today, I have to do some mathematics, and since I no have my 35s, I decided to use 71b. What pain in butt this be. I so used to RPN, and it appear that 71b only do algebraic. Is there a way to switch into RPN mode, or was 71b no meant to do RPN.

### Re: HP71B & RPN??

Message #2 Posted by [Dave Johnson](#) on 10 Sept 2007, 3:47 p.m.,  
in response to message #1 by Vincze

You need the HP-41 Translation Module. The HP-71B was Algebraic only...

### Re: HP71B & RPN??

Message #3 Posted by [Vincze](#) on 10 Sept 2007, 4:51 p.m.,  
in response to message #2 by Dave Johnson

Okay, so I guess I have to deal with stupid mode (Algebraic) this week. Is there way to store to memory for later reuse? I not see memory key (which stupid use calculators normally have). OR, I bet I can assign variable to equation to call back? Yes? If so, is there naming limitation on variables? I apologize for asking these stupid question when I know it covered in manual, but I forget manual at home and I travel this week.

Thank you my friends.

### Re: HP71B & RPN??

Message #4 Posted by [Howard Owen](#) on 10 Sept 2007, 6:03 p.m.,  
in response to message #3 by Vincze

Quote:

Okay, so I guess I have to deal with stupid mode (Algebraic) this week

There is more than one RPN hack for the 71B out there. The HP41 module Dave mentioned is nice. But though it isn't hugely rare, the price on eBay can be very high. (Partly I think that's because you can't run the HP41 Translator or the Forth module under EMU71.) But there are BASIC programs on the swap disks that offer a simulated RPN environment.

Quote:

Is there way to store to memory for later reuse? I not see memory key (which stupid use calculators normally have). OR, I bet I can assign variable to equation to call back? Yes?

The 71B has BASIC programs, not equations. Yes, you can store data in a variable and it will stay there as long as you don't DESTROY it or run out of power. And yes, there is a fairly severe limitation on variable names They can consist of a single alphabetic character (without distinction of case) followed by one (optional) numeric digit. So I2 B9 G6 and O4 are all valid variable names. String variables are a "name space" separate from numbers. They are indicated by a '\$' at the end. ("d1\$,"g0\$" and so forth) You can also have array variables, and with them you can more or less fill up the 71B's memory with data if you care to. The memory is implemented as a file system from the computer's point of view, so another alternative is to create a data file that you can later load back in to "memory". (Both the file and the array are in RAM, of course.)

Regards,  
Howard

Partly I think that's because you can't run the HP41 Translator or the Forth module under EMU71.

Actually you can.

Put this in EMU71.INI for HP41 Translator:

```
5 ROM 16 fth41rom.bin
5 HRD 32 hrdfth41.bin
```

Forth Module:

```
5 ROM 16 FORTHROM.BIN
5 HRD 32 hrdforth.bin
```

I have the Translator ROM in my 71B--its a must have.

.

.

Oh, duh! That's right. What you can't do is to have Mike burn the Forth or HP41 ROMs into a CMT EPROM module. That means that the modules themselves are the only way I know to run those on a real HP71. I conflated that with EMU71. I've had both the 41 translator and the Forth ROM up under EMU71. (Not at the same time, however.)

Thanks for the correction.

Regards,  
Howard

in response to message #5 by Egan Ford*

Any way to add alarms to the 71 (à la 41CX)

### **Re: Alarm for the 71? (Was: HP71B & RPN??)**

*Message #8 Posted by [Egan Ford](#) on 11 Sept 2007, 2:19 a.m.,  
in response to message #7 by Geir Isene*

AFAIK, you can use timers. Set a timer, turn off, 71B will wakeup when timer ends and continue to run. I've never done it, just read it in the manual.

### **Re: HP71B & RPN??**

> Okay, so I guess I have to deal with stupid mode (Algebraic) this week.  
>

Although I'm an RPN/RPL fanatic, the CALC mode of the HP-71B was the first algebraic entry mode implementation that rocked!

However you could still program your own RPN mode...

Raymond

### **Re: HP71B & RPN??**

*Message #10 Posted by [Egan Ford](#) on 10 Sept 2007, 6:53 p.m.,  
in response to message #1 by Vincze*

Algebraic on the 71B is not that bad at all if you remember the RES keyword.

E.g.:

```
>2 + 2
4
>RES * 8
32
>MOD(RES, 5)
2
```

RES is your last result.

RPNLEX is nice, if you can get it on your machine. You'll need HP-IL or type it in (~1000 bytes). If you want to type it in you will need to do some homework. Google: type in a lex file site:hpmuseum.org.

To use RPNLEX, type RPN. To exit, SHIFT OFF.

**HP 35 locking cradle**

Message #1 Posted by [Seth Morabito](#) on 10 Sept 2007, 3:23 p.m.

I've just bought an HP 35 from the unmentionable auction site. It works, but it's locked into a security cradle, and of course there's no key.

Is there any way of breaking it free without doing any damage to the calculator? Perhaps I should invest in a lock picking set ;)

**Re: HP 35 locking cradle**

Message #2 Posted by [Dave Johnson](#) on 10 Sept 2007, 3:50 p.m.,  
in response to message #1 by Seth Morabito

I have had luck with alternate keys. As long as it is close it can be opened with wiggling. (Yeah I know not too comforting if you bought it for \$800 in the day...)

**Re: HP 35 locking cradle**

Message #3 Posted by [Walter B](#) on 10 Sept 2007, 3:51 p.m.,  
in response to message #1 by Seth Morabito

Hmmh, these cradles were originally paid to secure the calc. The bottom plate is 2.5mm of flat steel, the lock bar has 3mm. So if you do not succeed in lock picking, there will be no other way but to sacrifice the cradle.

Turn around the cradle (the lock will rest on your desk now). Then grind away the plastic material at the **bottom** front of the cradle. It will take ca. 9mm material until the front latches will become free, but at least it is only plastic ;)

Happy burgling!

**Re: HP 35 locking cradle**

Message #4 Posted by [Alex L](#) on 10 Sept 2007, 3:56 p.m.,  
in response to message #1 by Seth Morabito

Consult a local locksmith - since you can bring it to them (no service call) it may be cheaper to pay the locksmith than to buy your own tools.

**Re: HP 35 locking cradle**

Message #5 Posted by [Bruce Bergman](#) on 10 Sept 2007, 7:04 p.m.,  
in response to message #4 by Alex L

Agreed. My brother's a locksmith and he's picked and opened almost every lock given to him in the last 35 years. Once picked, they can also cut a key for you that will fit.

thanks, bruce

### **Can someone lend me their 50g for my HHC2007 Conference Presentation**

Message #1 Posted by [hugh steers](#) on 10 Sept 2007, 3:54 a.m.

Hi Guys,

Is there someone attending the HHC 2007 in San Deigo, who is prepared to lend me a 50g on the Saturday for my presentation? I am travelling from the UK and would like to travel as light as possible. I will need it an hour or so before my talk to set it up and you can have it back straight afterwards.

Please only lend me your calculator if you are happy that i may need to perform a hard reset. I will need to install my software on it for demonstration, and as with all demos it is bound to crash and require a reset (like removing the batteries!)

I would be most grateful and as a bonus you will have a copy of my demo to play with for your amusement.

many thanks, -- hugh.

No.

### Re: HHP-16K 41C ROM Emulator

Message #3 Posted by [Winfried Maschke](#) on 11 Sept 2007, 10:04 a.m.,  
in response to message #1 by Ron Fredericks

Quote:

Anyone know how to configure the dip switches for some valid combinations of eproms?

I know only one switch setting for a 16K EPROM-Set with 2x2764 and 1x 2732.

The left 4 switches on the picture in your blog are selecting the type of EPROM-Set. 1 up, 2up, 3 down and 4 down is 16K. Only switch 2 has to be different to the picture.

With the other bank of switches on the right side you can select between port 1+2 or 3+4 in this case.

### Re: HHP-16K 41C ROM Emulator

Message #4 Posted by [Ron Fredericks](#) on 19 Sept 2007, 5:19 p.m.,  
in response to message #3 by Winfried Maschke

Thanks Winfried.

This helps alot. I continue to build out the blog post.

I hope to clarify DIP settings for port switches so I can addrees port 1+2 or port 3+4? Maybe on inspection this will be more obvious but if you get a chance, let me know.

All the best,

Ron

### HP-41C Wand Button Problem

Message #1 Posted by [Seth Morabito](#) on 9 Sept 2007, 1:59 a.m.

I've finally got a barcode wand (HP82153A) to help enter programs into my HP-41CX! It does work, but unfortunately the button seems to be a bit finicky.

If I press on the wrong part of the button, or if I press too hard, the red light will turn off. The best place to press seems to be near the red LED part of the wand. The worst place seems to be higher up on the wand, toward the cord. I have to give it just the right pressure, and make sure not to go over. If I do it just right, the light stays on and red the whole time, and barcodes can be scanned successfully. But if I press too hard, the light will go out in mid-scan.

Has anyone else ever seen this behavior? Is there anything I should try that might help?

### **Re: Connectivity Issues with 48G series**

Message #1 Posted by [Ed Look](#) on 9 Sept 2007, 12:52 a.m.

Allen, Thomas (Okken), I finally received my USB to RS-232 serial converter cable in the mail.

AND I AM FINALLY ABLE TO HAVE MY HP 48G AND 48G+ COMMUNICATE WITH MY PC AGAIN!!

Now, maybe programming will come a little easier, I can take 48G programs and port them easily to the 49G+, vice versa, and may even help in programming non-I/O units like the 35s and 33s, just by inference from 48G or 49G+ programs.

Thank you gentlemen for the great advice.

### Equation Library in 49G+/50G versus 48G

Message #1 Posted by [Jeff Kearns](#) on 8 Sept 2007, 9:33 p.m.

Hi all,

I am relatively new to the RPL family of calculators, having used the 41C, 15C and 32sii primarily. I recently acquired a pristine 48G for a mere pittance and have been fooling around with the Equation Library. So far, every example that I have worked through from the AUR went flawlessly (with some exceptions like Bernoulli's Equation: Pressure at Depth where Po registers in kPa instead of atmospheres as in the example, consequently giving the wrong answer). The same cannot be said for my 49G+ with the v92 ROM and EqLib L226 and L227 files. On several occasions, certain variables do not have units associated with them and the solver will not work properly. One example would be the 'A' Total Surface Area variable in the Solid Geometry/Cone equations set. This is only an example and has happened elsewhere too. I have purged all variables every time the problem happens and tried reinstalling the library files but to no avail. Has anyone else noticed this or am I missing something fundamental here? Thanks in advance.

Regards,

JeffK

### Re: Equation Library in 49G+/50G versus 48G

Message #2 Posted by [Norris](#) on 9 Sept 2007, 2:09 p.m.,

in response to message #1 by Jeff Kearns

I have both a 48GX and a 50G with the equation libraries, and they work identically for me. You might check the following issues:

(1) When you start the equation library, there should be three softkeys at the bottom left, marked SI, ENGL, and UNITS. The UNITS key toggles units on or off. When it's on, there's a little square on the right side of the key, so that it reads UNIT[] instead of UNITS. You can also toggle between SI and ENGL units, and the square shows which one is selected, although it doesn't make any difference unless UNITS is turned on.

If you've been toggling the UNITS button, it could explain why your units sometimes disappear. If you've been toggling the SI and ENGL buttons, it could also explain why Po registers as kPa in "Pressure at Depth", because the default unit in ENGL is psi. You can see the default units for "Pressure at Depth" by pressing VARS NXT.

(2) If you've been using a particular set of equations, then switch UNITS on or off, or switch between SI and ENGL, then you have to purge the variables in the current directory for the changes to take effect. If that's not working, you might also check for any similarly-named variables in any higher directories.

For example, suppose you are using the Equation Library in a subdirectory named SUBD1 in the HOME directory. You purge all of the variables in the HOME/SUBD1 subdirectory, including variable A. But if there is also another variable A in the HOME directory, then you may still have a problem.

### Keystroke Programming and Stacks

Message #1 Posted by [DaveJ](#) on 8 Sept 2007, 7:10 p.m.

I'm about to add keystroke programming to my new calculator design and am wondering whether or not to keep the traditional 4 level RPN stack I have now, or go with an "unlimited" size RPL style stack instead.

Note that the RPL style stack would not include algebraic expression and all that fancy stuff as on the 28/48 etc, it would simply be a large stack with the usual DROP/SWAP etc.

Advantages and disadvantages, comments and insights, and religious flame wars invited :->

Thanks Dave.

### Re: Keystroke Programming and Stacks

Message #2 Posted by [Arne Halvorsen \(Norway\)](#) on 8 Sept 2007, 7:35 p.m.,

I think perhaps the complicated classic RPN stack it is then, as I've already written it, unless someone can convince me otherwise...

It will have Algebraic keystroke programming too, just to keep everyone happy :)

Thanks Dave.

## Re: Keystroke Programming and Stacks

Message #6 Posted by **Egan Ford** on 8 Sept 2007, 8:23 p.m.,  
in response to message #1 by DaveJ

Let the user decide.

E.g., some programs efficiently take advantage of the T register copies on roll down. You'd lose that with unlimited stack.

E.g., some of us want to do complex calculations from start to end without thinking about a 4 level stack limit.

I'd have a programmable function that sets the stack depth.

## Re: Keystroke Programming and Stacks

Message #7 Posted by **Walter B** on 9 Sept 2007, 6:01 p.m.,  
in response to message #6 by Egan Ford

I'd second Egan: Let it have a settable fixed stack depth, .GE. 4.

## Re: Keystroke Programming and Stacks

How about two settings which would be programmable, one that sets stack depth, and one that enables or disables replication of the top level.

*Edited: 10 Sept 2007, 12:18 p.m.*

## Re: Keystroke Programming and Stacks

Message #9 Posted by **DaveJ** on 10 Sept 2007, 5:58 p.m.,  
in response to message #8 by Jeff O.

Quote:

How about two settings which would be programmable, one that sets stack depth, and one that enables or disables replication of the top level.

The only problem with having adjustable stacks like that is then it's possible for some keystroke programs to only work properly in a certain stack mode. To overcome that I would have to ensure the

"stack mode" is stored with each program and have the calc automatically switch to that mode when before the program runs, and also return mode when it's finished.

But I guess I already have this sort of problem by having both RPN and Algebraic keystroke programming support.

Thanks Dave.

### **Re: Keystroke Programming and Stacks**

*Message #13 Posted by [Garth Wilson](#) on 9 Sept 2007, 10:02 p.m.,  
in response to message #1 by DaveJ*

The 4-level stack came from a time before 4 calculators were programmable. The assumption was that if there were any more levels, you wouldn't remember what you had on the the stack. That becomes irrelevant however when you use the stack for parameter-passing and intermediate results for multiple nested levels of routines. Even if no routine needs more than four levels itself and, at programming time, you're only concerned with the ones that particular routine uses, at run time it should still be permissible to have many levels underneath from other pending routines. Their presence is harmless regardless of how many there are. I would like to have a lot more than four levels available.

## Re: Keystroke Programming and Stacks

Message #14 Posted by [Katie Wasserman](#) on 10 Sept 2007, 11:17 a.m.,  
in response to message #13 by Garth Wilson

Quote:

\_\_\_\_\_

The 4-level stack came from a time before calculators were programmable.

\_\_\_\_\_

While it's true that the first RPN-type calculator, the Friden EC-130, did have 4-levels and wasn't programmable. The first HP calculator had just 3 levels and was programmable, the HP9100A. In the interviewing years (1963-1968) there were just a few other RPN-type calculators made.

Quote:

\_\_\_\_\_

The assumption was that if there were any more levels, you wouldn't remember what you had on the the stack.

\_\_\_\_\_

Remembering the stack on any of these calculators was not an issue since they displayed the entire stack. The HP-35 was the first to require the user to "remember" what was on the stack. I think that the major issue in choosing stack depth on the 35 was the cost in silicon to store the data as well as making sure that reasonable complexity expressions could be evaluated without resorting to paper and pencil.

## Re: Keystroke Programming and Stacks

Message #15 Posted by [Namir](#) on 10 Sept 2007, 2:57 p.m.,  
in response to message #14 by Katie Wasserman

Katie,

Cost was indeed a factor. I remember the HP-35 pointing out that the machine has one memory register and a stack of four dynamic registers to store temporary numbers. So in a way, it was like HP's manual was hinting that the machine had 5 registers .. in the era when single-memory registers in non-HP calculators was typical. That's why my first HP calculator was the HP-55 since it had 20 memory registers.

Namir

### Conquer the World with HP-IL/71B/41CX

Message #1 Posted by [Egan Ford](#) on 8 Sept 2007, 4:11 p.m.

Inspired by the book *Control the World with HP-IL* I though I'd try something other than PC to calculator communications.

I posted the following articles this afternoon. I hope you find them mildly entertaining.

[Explore the World with HP-IL/RS-232/71B + GPS](#)

[Control the World with HP-IL/RS-232/41CX + X10](#)

*Edited: 8 Sept 2007, 8:09 p.m. after one or more responses were posted*

### Re: Conquer the World with HP-IL/71B/41CX

Message #2 Posted by [Raymond Del Tondo](#) on 8 Sept 2007, 6:51 p.m.,  
in response to message #1 by [Egan Ford](#)

Very nice applications - My congratulations!

BTW: The 2nd link is (somewhat) broken, there's a 'http//' too much.

OT, but just came into my mind:

On the Allschwil2006 meeting, I demonstrated a setup of an HP-41, an HP-71B, and an HP-48 connected together at the same time.

The connection was made with a CMT Multicase, which includes an HP-IL RAM disc, an HP-IL LC display, and a battery-powered version of a 82164A compatible serial interface.

Actually the essential part was the 82164A interface, the display was nice for the visual feedback, and the RAM disc allowed for temporary data storage.

With the HP-71 in HP-IL device mode ('CONTROL OFF'), one could control the HP-IL side with the HP-41, and send and receive data from and to the HP-48, which was connected to the serial port.

On the Allschwil meeting before, I also showed a special HP-IL interface made especially for the HP-48.

With this interface and the associated control library on the HP-48, it is possible to access HP-IL mass storage devices, and, amongst other things, print to an HP-IL printer.

The interface, made by W&W, is different from the HP made HP-IL-to-somewhere interfaces in the respect that

the W&W interface is configured as the loop controller.

This way the HP-48, with this interface, can be seen as an HP-IL controller. Unfortunately I haven't found a way to turn off control on the interface so far, and in consequence you can't connect an HP-41 on the IL side, except if you set the HP-41 into MONITOR mode...

Raymond

*Message #5 Posted by [Howard Owen](#) on 8 Sept 2007, 10:39 p.m.,  
in response to message #1 by Egan Ford*

Those are two great articles, Egan! Back in the day, GPS was very expensive and rare, not to mention inaccurate. So a similar program using LORAN might have been the killer app for the HP71B, and history would followed a different (LORAN plotted) course.

Have you tried doing the inner loop in Forth? You might get a little more time to do useful work that way.

Thanks for the interesting and entertaining reading!

Regards,  
Howard

### **HP41 interfacing**

*Message #9 Posted by **Christoph Klug** on 11 Sept 2007, 10:28 a.m.,  
in response to message #1 by Egan Ford*

Dear Egan Ford

Big congratulation for your HP41 interface application to real world by using RS232 and the X10 fire cracker. Nice to see that other HP41 enthusiasts create interface applications.

Actual I am working on the new issue of the I/O-Board manual and the IL2000 system manual. This would be the first time I combine this two manuals inside one heavy book with over 600 pages about HP41 interfacing, data logger and measurement applications and so on... Furthermore HP41 / PC interfacing is included, handling ROM image pages and last not least some completely new published chapters. Hope the new print is available until autumn 2007.

Best regards from Germany – Christoph Klug

### Yet another HP35s first impressions thread

Message #1 Posted by [Brad Davis](#) on 8 Sept 2007, 4:00 p.m.

Well, mine showed up two days ago and I've put it through a pretty good workout or two since then. I am very pleased with every aspect of it so far.

Keyboard feel seems absolutely perfect to me. I had bought a 50g and hated its keys--way too stiff with too much travel. After 2 months, I still hadn't gotten used to it and made many times the calculation mistakes that I did with my 48G. The 35s seems perfect to me. I have a big nasty benchmark equation that I use to judge my speed. The very first time through it, I was faster with my 35s than I ever got to with the 50g and 1 sec. slower than with my 48G that I used for about 10 years.

I like the little case they send with it. One question: what do you guys use the net for? Seems like a pencil would apply pressure to the keys, so an eraser guide, small triangle, or paper would seem to me to be about all I'd put in there.

I've read about the screen glare and it's definitely there. Hasn't caused any problems yet, though.

Message #2 Posted by [gteague](#) on 8 Sept 2007, 5:34 p.m.,  
in response to message #1 by Brad Davis

yeah, i wish they could re-package the 50g to make it look & feel like the 35s even if they probably couldn't squeeze it down to that small a package.

i sure wish they had put a mini or micro-sd slot or a mini-usb jack. i'm spoiled and don't enjoy keying in programs like i used to!

my verdict is still out on the case. it's great for storage and protection and well designed, but sort of bulky and unwieldy and slow to open. as to the net side, those folks who put out the overpriced laminated quick-reference 8x11 pages used to put out mini, credit card-sized versions with formulas and constants and other reference material. i have a handful of those that fit perfectly in that side along with some grid-lined notepaper.

I was thinking I'd put together a quick reference for the 35s itself, much like one used to get with HP calculators.

Of course! If/when I ever get around to putting one together. There's always a question of how much to put in it. For people like myself and those in this forum for instance, it's probably safe to leave out the stuff that describes how the stack works.

### **Re: Yet another HP35s first impressions thread**

*Message #8 Posted by **Brad Davis** on 9 Sept 2007, 11:42 a.m.,  
in response to message #7 by Stefan Vorkoetter*

I look forward to seeing what you come up with.

The calculator is so intuitive that I can't really think of anything I'd need written down. I cracked the book for about 2 min. to get the idea of how the equation list works. Other than that, I've figured out how to use everything I've needed just by looking at the key labels.

I think I'll buy a tiny 60, 30 triangle and store that in the net.

I used the calculator all day yesterday and still can't really find anything to dislike. Also, after using graphing models for years, it's an extremely elegant little package.

I didn't read that. I figured I'd input X and Y as a complex number, then hit abs and arg to get the magnitude and angle. That's pretty fast and intuitive for me. Now I'll have to crack the book and see if this other way is faster, LOL.

### **Re: Yet another HP35s first impressions thread**

*Message #16 Posted by **Jeff O.** on 10 Sept 2007, 2:08 p.m.,  
in response to message #14 by DLF*

Based on the amount of previous discussion, I'd say your question is definitely not too basic for this crowd.

I'm not sure if you are looking for an explanation, or just suggesting that one be included on a quick reference card. If the former, read on. If the latter, my apologies for telling you what you already know.

The so-called polar/rectangular conversions presented on pages 4-10, 4-11 and 4-12 of the manual are more entry/display options for complex numbers rather than true conversions. Simply put, the 35s can hold a complex number in one stack level, and display those complex numbers in either rectangular or polar form. You may enter complex numbers in either rectangular or polar form, (regardless of the display mode) by utilizing the unshifted "i" to separate the imaginary from the real part if entering a rectangular form number, or the shifted "theta" to separate the angle from the magnitude if entering a polar form number. If you enter a number in a different form than the current display mode, upon pressing Enter the calculator will convert the displayed number to the current display mode. So if you have a polar form number and you want to see the rectangular form, you put the calculator in rectangular display mode, type in the magnitude, "theta", then the angle and press Enter. The calculator will calculate the rectangular components and display them as a complex number in "re i im" format (without any spaces between the numbers and the i). If you happen to want to split that complex number into two real numbers, e.g., imaginary in stack level y and real in stack level x, there is no built in function to do so. There are also no functions to let you do rectangular to polar and polar to rectangular conversions with complex numbers represented by real numbers in two stack levels, i.e., the "old-fashioned" way.

**HP35 battery pack**

Message #1 Posted by [Martin Mendelson](#) on 8 Sept 2007, 2:38 p.m.

I have an HP35 the works fine with the AC adapter, but whose battery pack expired years ago. I still have the pack, and I wonder if anyone has a procedure to rebuild it with new cells that would recharge with the original AC adapter.

Thanks for any suggestions.

mm

**Re: HP35 battery pack**

Message #2 Posted by [db \(martinez, ca.\)](#) on 8 Sept 2007, 2:52 p.m.,  
in response to message #1 by Martin Mendelson

slice it open.

carefully rip out the old tabs.

nicad battery packs of the same configuration, made for cordless phones, can found at radio shack.

solder the tabs onto the new battery pack.

glue or tape the pack back together.

**Re: HP35 battery pack**

### **USB to AC power adapter for the HP 50g**

Message #1 Posted by [Miguel Toro](#) on 8 Sept 2007, 12:03 p.m.

Hello,

I bought a car kit for my Zune (yes I know...but I really like it!) and it came with a USB to wall adapter. Now I use it to power my HP 50g so I do not need to power on my computer, I can play with the calculator anywhere at home where there is a power outlet and of course I consume a lot less batteries this way. I think it is a good accessory for the 50g and it is not expensive at all.

### Sensory perception of calculators

Message #1 Posted by [Mad Dog ebaycalcnut](#) on 8 Sept 2007, 10:45 a.m.

We got into a little side joking around about eating an HP-10C in the Edsel discussion below.

Ok, I am not going to ask if anyone has ever tasted or ate one of their calculators.

But I will ask, has anyone ever noticed a smell difference between the various Hewlett Packard models? Or do they even smell different than Texas Instruments products?

*Edited: 8 Sept 2007, 10:46 a.m.*

### Re: Sensory perception of calculators

Message #2 Posted by [Jandro Kirkish](#) on 8 Sept 2007, 12:11 p.m.,  
in response to message #1 by [Mad Dog ebaycalcnut](#)

There is definitely a distinctive "HP calculator smell". I always loved the smell of my 28s--alas after 20yrs it has faded somewhat. All the new HPs I have gotten since (49g, 49g+ 50g, 13c and 33s), have shared this smell, except for the 35s. This one smells a little different to me--not as strong, but still recognizably HP. TIs and Casios have a more pedestrian plastic smell that fades quickly. But the HP smell is strong and long lasting. I confess that the smell of a calculator is important to me--and in that respect (as in so many others) nothing beats HP calcs.

Message #3 Posted by [Mad Dog ebaycalcnut](#) on 8 Sept 2007, 12:49 p.m.,  
in response to message #2 by [Jandro Kirkish](#)

Thanks! I have a bad sense of smell, and I could never tell.

### Re: Sensory perception of calculators

Message #4 Posted by [DaveJ](#) on 8 Sept 2007, 6:26 p.m.,  
in response to message #1 by [Mad Dog ebaycalcnut](#)

My 48SX smells awful with cigarette smoke, and the case is so unusable I can't even keep it near anything else. I guess that's the chance you take when you get it 2nd hand.

Being a non-smoker, I can detect a single smoke molecule 10 meters up wind.

Anyone know how to get rid of the cigarette smell from the plastic? Alcohol wipes worked fairly well to get rid of a lot of the initial smell, but a fair amount remains.

Dave.

### The HP-10C and the Edsel

Message #1 Posted by [Karl Schneider](#) on 8 Sept 2007, 2:05 a.m.

September 4th marked the 50th anniversary of the 1957 introduction of Ford Motor Company's ill-fated line of cars named "Edsel", in honor of the late father of FoMoCo's then-president Henry Ford II. Its original 1958 models featured an unorthodox vertical grille that someone dubbed, "Oldsmobile sucking a lemon". An interesting article was prepared by *Washington Post* writer Peter Carlson, which has been published in newspapers across the US. Here's the link to the source, with an insightful excerpt:

[Full text of Edsel article](#)

Quote:

*The idea for the Edsel came from Ford executives who were thinking about market niches when they should have been thinking about cars.*

The Edsel line was a large undertaking that became synonymous with commercial failure on a grand scale; the Edsel cost FoMoCo US\$250 million in losses, or about \$2 billion at today's valuation.

A few parallels can be drawn with a much more modest and obscure unsuccessful product release -- namely, [Hewlett-Packard's HP-10C calculator](#), manufactured for only 18 months between September 1982 and March 1984. It was a member of the Voyager-series line that debuted in 1981, all of whose other models were produced until at least 1989. Here are the parallels between the HP-10C and the Edsel line:

1. Both products were designed to fill marketing niches, instead of a specific need or capability.
2. Both products were respectable in content, but flawed in execution.
3. Both products were pricier than comparable alternatives.
4. Both products were manufactured for only about two years, terminated after disappointing (or perhaps cannibalistic) sales.
5. Due to scarcity, both products now command premium prices on the collector's market.

The main difference between the Edsel line and the HP-10C is the following: The Edsel was intended to fill an upscale niche of an economical product line, while the HP-10C was intended to fill the price-leader niche of an affordable, but still premium product line.

The Edsel was saddled with an uncharismatic name, distinctive-but-undistinguished styling, and a higher price without being clearly "better" than the alternatives, including other Fords. The HP-10C offered a crummy programming paradigm and fewer useful functions than the HP-11C and HP-15C, yet was still costly (US\$80 in 1982) -- notably more so than non-HP's having comparable capabilities.

These were recipes for commercial failure -- case studies that illustrate the pitfalls caused by emphasis of marketing objectives instead of best engineering judgement for product development.

Here's a link to my discussions of the HP-10C:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=92143#92143>

The above is not intended to assert that the HP-10C was a bad calculator (e.g., today's Le World models) any more than Edsels were bad cars (e.g, the Yugo). However, both designs were based on some questionable judgement, and the consequences followed (albeit of vastly differing severity).

-- KS

*Edited: 8 Sept 2007, 8:34 p.m. after one or more responses were posted*

## Re: The HP-10C and the Edsel

Message #2 Posted by [Eric Smith](#) on 8 Sept 2007, 4:35 a.m.,  
in response to message #1 by Karl Schneider

Without actual sales figures, how do you know that the 10C was a commercial failure? The fact that HP canceled it after two years isn't really enough to infer that; products can be canceled for many reasons. Large corporations have been known to cancel products or shut down entire divisions that were profitable but not profitable \*enough\*.

Quote:

---

The HP-10C offered a crummy programming paradigm

---

I dispute that the programming paradigm was "crummy". While it is clearly not as good as an 11C or 15C, it wasn't supposed to be. It was intended as a low-end scientific calculator with limited programmability, and it did that admirably. Far better than e.g. the TI-55 II or TI-57 LCD.

Quote:

---

and fewer useful functions than the HP-11C and HP-15C,

---

So you're saying that if you were the designer of the 10C, you would have included all of the useful functions of the 11C and 15C? If so, how would you have differentiated it from the 11C and 15C?

Quote:

---

yet was still costly (US\$80 in 1982) -- notably more so than non-HP's having comparable capabilities.

---

There weren't any non-HPs having "comparable capabilities", in that there were no non-HP RPN programmable calculators at the time. (I'm not 100% certain of that, but I think NS had dropped theirs before the 10C was introduced.) If someone didn't care about RPN, then they weren't likely to buy a 10C; the market opportunity for HP wasn't to say "look, you can get the same thing for twice the price", but rather "look, you can get the superior RPN, if you spend more money on an HP" (not to mention a mechanically superior keyboard, and better build quality in every other measurable way). Of course, they had to try to convince those people that RPN was worthwhile, but clearly the focus was NOT on offering the SAME feature set at a higher price point.

Even discounting the value of RPN, I'm not clear on which calculator of "comparable capabilities" you want to compare to the 10C.

The 10C was basically a replacement for the 31E and 32E, with simple programmability added. Are you going to make the same claims about the 31E and 32E that you've made about the 10C? If not, why?

I knew several people who bought the 10C, and I don't recall any of them complaining about it. Several later bought the 41CX.

It's possible that the 10C lost money for HP, but if so, it was clearly not for the same reasons as the Edsel.

### **Re: The HP-10C and the Edsel**

*Message #3 Posted by **Thomas Okken** on 8 Sept 2007, 11:51 a.m.,  
in response to message #2 by Eric Smith*

Quote:

---

I knew several people who bought the 10C, and I don't recall any of them complaining about it. Several later bought the 41CX

---

I bought an HP-10C when I was in college, \*after\* I bought my 41CX... I wanted something that would be more convenient for manual computation, with trig functions etc. accessible without having to press Shift all the time; an uncluttered keyboard and enough programmability that I could program a function and evaluate it repeatedly, or even use a simple Simpson's Rule integrator. Oh, and something that you can take to a college exam without fear that a proctor is going to disallow it!

The HP-10C fit that bill perfectly. I was very happy with it! Eventually, the HP-42S rendered it obsolete for me (another calculator with an uncluttered keyboard and unshifted trigs & logs etc.!), but I sure wish I hadn't given it away.

I guess Eric is probably right; hard to imagine HP losing money on the 10C, but they were probably making a lot more on the 11C and 12C, so the 10C got sacrificed to the gods of maximum profit. I imagine the story of the HP-27 is not much different, or the HP-19C/29C for that matter -- terrific calculators with disturbingly short production runs.

- Thomas

### **Re: The HP-10C and the Edsel**

*Message #4 Posted by **Karl Schneider** on 8 Sept 2007, 12:43 p.m.,  
in response to message #2 by Eric Smith*

Hi, Eric --

My post that started this thread linked an archived post that linked two more archived posts. One of those was part of a thread that contained this same debate between you and me. I'm not going to re-hash the previous posts, but I will make a few comments:

No, I don't have actual sales figures, but there was some anecdotal evidence of poor sales in one of the aforementioned threads -- like "jeff b" from 8 May 2006:

Quote:

---

*About the time they were discontinued a local HP retailer had a few dozen of the HP10C's on closeout. Several months went by and they were not selling. I wanted to make an offer on the lot but couldn't see far enough into the future...*

---

You are free to dispute my description of "crumminess", but any programming paradigm that lacks insert/delete editing within a program is a pain to use. The HP-55 that introduced it didn't last long either. The financial HP-12C shares the paradigm, but it is intended for users who don't typically develop their

own programs, relying instead on Solutions Book applications.

As I've stated before, a non-programmable HP-10C with more of the missing mathematical functions (e.g., hyperbolics, delta-%, and gamma) and backarrow would have been a more-useful and worthy entry-level product that might have sold well enough to survive in the product line.

Differentiation between the HP-10C and the upscale HP-11C and HP-15C? *Programmability and advanced functions*. Recall also that the HP-11C was basically eclipsed by the HP-15C, leaving the HP-11C no particular niche other than to occupy a price slot, particularly in the foreign market, where retail prices were higher. Once the HP-10C was gone, the HP-11C became the low-end model by default, even though it looked pretty much the same as the HP-15C.

Quote:

Even discounting the value of RPN, I'm not clear on which calculator of "comparable capabilities" you want to compare to the 10C.

How about the \$35 Casio fx-3600P of 1981? 10-digit-plus-exponent 7-segment LCD, 38 steps of programmability (without editing, though), statistics and linear regression. Plus: Hyperbolics, fraction arithmetic, and Simpson's Rule numerical integration. No, it wasn't RPN and the build quality wasn't comparable, but it provided a hugely better feature/price ratio than the HP-10C. Sharp made a similar model at the time. If it was HP's goal to sway low-end buyers from those competitors, I doubt that the HP-10C succeeded at it.

This is not to say that the HP-10C was an "Edsel" literally or colloquially -- just that there were many parallels of "marketing over engineering", with disappointing results.

-- KS

*Edited: 10 Sept 2007, 2:15 a.m. after one or more responses were posted*

## Re: The HP-10C and the Edsel

*Message #5 Posted by [Eric Smith](#) on 9 Sept 2007, 12:24 a.m.,  
in response to message #4 by Karl Schneider*

Quote:

there was some anecdotal evidence of poor sales

The example you cite is so anecdotal as to be completely irrelevant. I saw multiple stores that had many HP-33C, HP-34C, and HP-38C units in stock for YEARS after those were discontinued, but I certainly don't conclude that those models didn't sell well.

Quote:

The financial HP-12C shares the paradigm, but it is intended for users who don't typically develop their own programs

The 10C was also likely aimed at people who mostly don't write their own programs. Clearly anyone that does much programming wouldn't have wanted a 10C, TI 57, or Casio fx-3600P. Therefore I still don't think there was anything wrong with a low-end model having limited programming features.

Quote:

---

Differentiation between the HP-10C and the upscale HP-11C and HP-15C?  
*Programmability and advanced functions.*

---

Now you're trying to have it both ways. On the one hand you complain that the 10C should have had the programming and features of the 11C and 15C, and on the other you seem to be conceding that the product differentiation should be the programmability and functions, nor do I see any way in which having NO programming features (which you seem to advocate) would be better than having limited programming features.

It really sounds like you wanted an 11C for the price of the 10C, and are complaining because you have to pay more to get the 11C. Sorry, that's just the way the world works, and HP was in no way unique in doing that.

Even though the manufacturing cost of the 10C was likely identical to that of the 11C, making the 10C significantly better would have cut into 11C sales, and reduced HP's overall profit and revenues from calculators. No matter how much you'd like it to be otherwise, it does not make business sense to do such a thing.

Quote:

---

there were many parallels of "marketing over engineering"

---

Not really. Ford didn't seem to have a clue as to what their market was, or how to address it. They made the car that one of the executives wanted, without regard to what the public wanted, and it sold poorly. It was NOT designed the way it was for product positioning purposes to fill a gap in their product line. There were lots of criticisms of the design of the Edsel; I've never heard any legitimate criticisms of the 10C that aren't related to deliberate product positioning. It appears to me that HP's marketing people knew EXACTLY what they were doing.

## **Re: The HP-10C and the Edsel**

The example you cite is so anecdotal as to be completely irrelevant.

---

What the heck does that mean?? An anecdote is the true story of one particular experience. No claim can be made of its representing the whole truth, or even what is generally true, but it's one piece of evidence -- it is what it is.

Quote:

---

I saw multiple stores that had many HP-33C, HP-34C, and HP-38C units in stock for YEARS after those were discontinued, but I certainly don't conclude that those models didn't sell well.

---

Here's another anecdote: In late 1983, I visited the college bookstore with the specific intent to purchase an HP-34C, which I had seen several years prior, but had been discontinued in January. The young salesman instead steered me toward the HP-15C, which had been out for a year, but was new to me. I tested both side-by-side, and bought the HP-15C.

So, this bookstore kept discontinued models in stock even after the newer, better replacements with modern technology (read: charger-free LCD) were available. If the old stock didn't sell well, there was a reason for that.

Obsolescence was not the issue with the HP-10C; its fancier siblings remained in production for five years or more after it was discontinued.

Quote:

---

*On the one hand you complain that the 10C should have had the programming and features of the 11C and 15C, and on the other you seem to be conceding that the product differentiation should be the programmability and functions, nor do I see any way in which having NO programming features (which you seem to advocate) would be better than having limited programming features.*

*It really sounds like you wanted an 11C for the price of the 10C, and are complaining because you have to pay more to get the 11C. Sorry, that's just the way the world works, and HP was in no way unique in doing that.*

---

Please don't put inconsistent nonsense and claptrap in my mouth when my statements were clear and unwavering, over time on several occasions: The HP-10C would have been better as a non-programmable with the *missing transcendental math and data-entry functions restored* (hyperbolics, delta-%, gamma, backarrow, and roll-up). Non-programmability would provide clear differentiation in functionality, especially against the HP-15C and its advanced functions. (I wonder how many buyers opted for the cheaper HP-10C instead of the HP-11C/15C, because they were told that it was "programmable".)

I make no claim that my version of the HP-10C would have sold well enough and not cannibalized HP-11C/15C sales to stay in the product line. Perhaps, although the idea was reasonable -- a "low-end" quality-made Voyager scientific -- it was destined not to succeed because its competitors were so much cheaper, and its target market less discerning. Still, I believe that my concept would have been more sound: a functionally-complete nonprogrammable instead of a pidgin programmable that lacked a few important basics.

Quote:

---

*Ford didn't seem to have a clue as to what their market was, or how to address it. They made the car that one of the executives wanted, without regard to what the public wanted, and it sold poorly. It was NOT designed the way it was for product positioning purposes to fill a gap in their product line.*

---

Is this what you inferred from the article? It's not what I understood. The Edsel was the brainchild of which executive? All I saw was a reference to the naming suggestion by Ernest Breech, Ford's chairman of the board.

From the article:

---

*The idea for the Edsel came from Ford executives who were thinking about market niches when they should have been thinking about cars.*

*They were worried that Ford owners who prospered in the postwar boom were trading in their cheap Fords for pricier Pontiacs and Buicks. They figured Ford needed a new line of medium-price*

*cars..*

There you have it.

It seems to me that the Edsel line would have been more successful (or at least less unsuccessful) if it had been designed with more emphasis on engineering and manufacturing, and less marketing hype and styling gimmicks, and, of course, a more-pleasing name. If Ford set out to claim the mid-range market, they should simply have made a better mid-range Ford. Execution, not concept, was the problem.

Quote:

I've never heard any legitimate criticisms of the 10C that aren't related to deliberate product positioning. It appears to me that HP's marketing people knew EXACTLY what they were doing.

I can't believe that the plan was to go to the trouble of creating a new model, then kill it after only 18 months. Once again, my criticisms of the HP-10C were of execution, not of concept and product placement.

-- KS

### **Re: The HP-10C and the Edsel**

*Message #7 Posted by [Eric Smith](#) on 9 Sept 2007, 3:30 p.m.,  
in response to message #6 by Karl Schneider*

I wrote:

Quote:

On the one hand you complain that the 10C should have had the programming and features of the 11C and 15C, and on the other you seem to be conceding that the product differentiation should be the programmability and functions,

You replied:

Quote:

Please don't put inconsistent nonsense and claptrap in my mouth when my statements were clear and unwavering,

I did no such thing.

Earlier in this thread, you wrote:

Quote:

The HP-10C offered a crummy programming paradigm and fewer useful functions than the HP-11C and HP-15C

Later, when I asked what you thought *\*should\** have differentiated the 10C from the 11C and

15C, you wrote:

Quote:

\_\_\_\_\_

Programmability and advanced functions.

\_\_\_\_\_

It's plain from those exact quotes that you first complain that the 10C doesn't have the advanced functions of the 11C and 15C, then state that the differentiation **SHOULD HAVE INCLUDED** the advanced functions. How could it both have the advanced functions to make you happy, and omit them to serve as product differentiation?

### **The HP-10C and the Edsel**

*Message #8 Posted by **Karl Schneider** on 9 Sept 2007, 7:30 p.m.,  
in response to message #7 by Eric Smith*

Here are the two sentences I wrote which *immediately followed* my "claptrap" sentence to which you objected, which should have cleared up any confusion that may have existed beforehand:

Quote:

\_\_\_\_\_

"The HP-10C would have been better as a non-programmable with the missing transcendental math and data-entry functions restored (hyperbolics, delta-%, gamma, backarrow, and roll-up). Non-programmability would provide clear differentiation in functionality, especially against the HP-15C and its advanced functions."

\_\_\_\_\_

So, the "useful functions" I'd mentioned earlier referred to the five listed transcendental math and data-entry functions that were missing from the HP-10C.

The "advanced functions" of the HP-15C (need I list them?) are numerical rootfinding (SOLVE), numerical integration (INTEG), complex number mathematics, and matrix functions.

If you didn't know exactly what I meant by "useful functions", then you shouldn't have jumped to conclusions by alleging that I was "trying to have it both ways", among other things. That was based on your own mistaken inferences of what I said. I do not like being publicly taken to task for things I never explicitly stated.

I don't believe that this argumentative endeavor serves any purpose.

### **Re: The HP-10C and the Edsel**

*Message #9 Posted by **Walter B** on 10 Sept 2007, 2:52 a.m.,  
in response to message #8 by Karl Schneider*

Come on, folks. IMHO, this thread is a textbook example for raising heat in discussion (thus contributing to global warming ;). We all know that a few members of this honorable forum ( $\text{guess} < 2^{((\sin(12.34))^2 + (\cos(12.34))^2)}$ ) love to refer to their

previous posts. So, sometimes strange starting points (like old cars) seem to be welcome to construct a tower of thoughts on top of it. Nevertheless, I think this contributes to making this forum a fun place to visit, though some of these thoughts may be (and have been) disputable. However, instead of bashing on each other repeatedly, you could agree to disagree and leave it standing this way. Just a proposal, of course... ;)

Acknowledgements: Thanks to the dog for the idea of global warming brought into this thread. Thanks to Karl for a lot of deep thoughts about the 15C and its inferior siblings (BTW: the 15C was your first HP - the 25C was mine; I admire the 25C...). Thanks to Eric for his many different projects and achievements. I sign off sincerely hoping not to have forgotten any important points ;)

### **Re: The HP-10C and the Edsel**

*Message #10 Posted by **Thor Larsen** on 10 Sept 2007, 12:56 p.m.,  
in response to message #9 by Walter B*

You are correct, I tell you... Post something informative, and quite often there is minimal response. Post something silly, on the other hand, and a veritable beehive of ultimately insignificant discussion ensues.

We should remember that the Forum postings get archived by MoHPC, and are subsequently included in sales of CD/DVD sets. It's best to keep the Forum a forum, not a banal chatroom.

Where have I heard that before? Oh yes, never mind, one of those do as I say but not as I do kind of things, I should just lighten up.

### **Re: The HP-10C and the Edsel**

*Message #11 Posted by **Eric Smith** on 10 Sept 2007, 4:31 a.m.,  
in response to message #8 by Karl Schneider*

I very much doubt that adding those five instructions would have sold any significant number of additional 10C units. In fact, I think making it non-programmable would have reduced unit sales by a substantially larger percentage than adding those five functions could have increased unit sales. However, since you obviously disagree, it would be very interesting to hear other people's opinions on the relative merits of the five functions you want vs. "crummy" programmability.

Leaving the "advanced functions" of the 15C out of the 10C didn't help AT ALL to differentiate the 10C from the 11C. If you're trying to suggest that HP might have seriously considered putting those functions into the 10C, I suspect you are mistaken. Those functions use a substantial amount of ROM and RAM in the 15C, such that it had to include a second R2D2 chip, increasing the manufacturing cost. The 10C ROM probably had some leftover space, perhaps on the order of 2K words, but that would not have been enough room for the advanced functions, so a second R2D2 chip would have been necessary to add them. It is unlikely that HP would have considered any feature set that would have resulted in the 10C having a higher manufacturing cost than the 11C.

Quote:

\_\_\_\_\_

I don't believe that this argumentative endeavor serves any purpose.

Apparently not. It's unclear to me why you brought it up again; the comparison to the Edsel seems too fundamentally flawed to lend any additional credibility to your repeated claims that the 10C was a failure, or the reasons for that alleged failure.

### **Re: The HP-10C and the Edsel**

Message #12 Posted by **Karl Schneider** on 10 Sept 2007, 10:17 p.m.,  
in response to message #11 by Eric Smith

Quote:

Leaving the "advanced functions" of the 15C out of the 10C didn't help  
AT ALL to differentiate the 10C from the 11C.

Your first paragraph made some rhetorical sense, but this second one baffles me. It does not follow AT ALL from what I previously stated -- a complete *non sequitur*. Seriously, I wonder if you're carefully reading or comprehending my statements.

Non-programmability, not lack of the features expounded in the *HP-15C Advanced Functions Handbook*, would clearly differentiate the HP-10C from the HP-11C.

Quote:

If you're trying to suggest that HP might have seriously considered putting those functions into the 10C, I suspect you are mistaken...

What?? No, I'm not "trying to suggest that". SOLVE and INTEG are not very serviceable with poor programmability (i.e., no LBL, no GSB). And why would the most sophisticated features be put into what was intended to be the low-end model? You may shelve those suspicions of mistakenness...

Here's another possibility: The HP-10C was only a marketing experiment, and HP didn't really care whether it succeeded or failed. It was difficult to bridge the gap between the HP-11C/15C and competition such as the Casio fx-3600P or Sharp equivalent without creating a product that might steal significant sales from the pricier HP-11C/15C. A large segment of the target market could have been existing HP customers looking for an economical, quality-made unit to supplement their HP-11C, HP-15C, or HP-41. Or, one to give to a high-school son without risking too much from theft, loss, or damage. A non-programmable with all the transcendental math functions would have "fit the bill" and passed muster with teachers who forbade programmable calc's in exams. It also would not have directly competed with the HP-11C/15C. And, maybe it wouldn't have survived anyway...

For all I know, HP's marching orders and budget for development of the HP-10C were minimalist: "Do it as expediently as possible -- just re-use a legacy ROM if you can." I don't think it was their best possible effort, even for the limited role it was created to fill.

It doesn't?

Anyhow, my point is that if you're going to make some feature choices for product differentiation, in that process you're not likely to consider omitting features that had never even been under consideration for inclusion (for cost reasons). If Ford decided to introduce a new car and position it at a lower point than the Focus, they're not going to spend time trying to decide whether to leave out a GPS navigation system as a means of differentiation, since that's not even an option on the Focus.

## **Re: The HP-10C and the Edsel**

*Message #14 Posted by [Mike Morrow](#) on 10 Sept 2007, 8:26 p.m.,  
in response to message #4 by Karl Schneider*

Quote:

---

You are free to dispute my description of "crumminess", but any programming paradigm that lacks insert/delete editing within a program is a pain to use. The HP-55 that introduced it didn't last long either. The financial HP-12C shares the paradigm, but it is intended for users who don't typically develop their own programs, relying instead on Solutions Book applications.

---

The HP-25 and -25C also lack insert/delete editing, and have only the crude NOP function to help make up for this limitation. These two calculators rank as very successful products, often employed by folks who were deeply interested in programming. It must have been some other characteristic that doomed the HP-10C.

Regards, Mike

### **Success of HP-25/25C versus HP-10C**

Thank you, Mike, for a thoughtful, non-argumentative, and non-sarcastic response to my statement. There's been a real shortage of those in this thread.

I'd surmise that affordability of this programmable was a prime factor. Its mid-1970's MSRP was about \$200, far less than those of the HP-65, HP-67, and HP-55. This made programmability attainable to many users for the first time. The Continuous Memory feature of the -25C was a huge convenience and engineering breakthrough. Also, these models had a crisp, clean, and compact form factor that was aesthetically pleasing to many (including the Curator).

By contrast for the HP-10C, affordable and much-better alternatives were readily available, particularly within HP's line.

Regards,

-- KS

*Message #17 Posted by **Mad Dog ebaycalcnut** on 8 Sept 2007, 10:17 a.m.,  
in response to message #1 by Karl Schneider*

Hewlett Packard really screwed up.

Think about this. You seem to indicate that the HP-10C was the worst thing created in the history of man on this planet. Let's go with that premise (which I personally do not subscribe to, but I like to argue.)

In order to build 10C's Hewlett Packard or their subcontractors had to likely build some extra molds, an extra production line, etc. etc. etc. Doing all that probably took at least a little electricity from coal fired power plants. Even if the utility was 100% nuclear or hydroelectric, available potential power was displaced from places with coal fired plants as Oregon and other areas are connected into large grids.

When you burn coal, it generates greenhouse gases.

Not only was the HP-10C the most terrible thing that ever hit the Earth since the asteroid that wiped out the dinosaurs 65 million years ago, but it has also helped make hurricanes stronger.

As a protest, you and anyone else that may own 10C's should smash them to bits.

### Emu71 and Doslink & Timeout

Message #1 Posted by [Vincze](#) on 7 Sept 2007, 3:19 p.m.

I sorry about all question on 71B and Emu71. I try and read documentation that come with Emu71, but I somewhat confused as to how to do things. I see how to list program by typing

```
ENDLINE CHR$(13)&CHR$(10)
PRINTER IS :DOSLINK
PLIST "MYPROGRAM"
PRINTER IS *
```

and that make sense to me to list out program. How does one have screen output when running program echo out to file though? My thought was to say PRINTER IS :DOSLINK before I run program, but this not the case. Emu71 direction not very clear on this other than say must have declaration in emu71.ini. I see it listed under [DEVICES], so I believe ini file correct. What am I missing (other than brain)?

Also, I see someplace, but can not find now, that there way to extend or turn off timeout of Emu71. It seem like it close itself after certain time. This frustrate me and I like to find way to eliminate, or extend. Can someone point me in correct path to this.

*Edited: 7 Sept 2007, 7:19 p.m.*

### Re: Emu71 and Doslink & Timeout

Message #2 Posted by [J-F Garnier](#) on 8 Sept 2007, 2:54 a.m.,  
in response to message #1 by Vincze

Hello Vincze,

I'm not sure to understand your first point:

Quote:

\_\_\_\_\_

How does one have screen output when running program echo out to file though ?

\_\_\_\_\_

If you mean that you want all screen outputs to be logged in a file, you can do:

```
DISPLAY IS :DOSLINK
SHOW PORT    or anything else
DISPLAY IS :DISPLAY    (or shorter DISPLAY IS 1, if the DISPLAY device is the 1st one)
```

If you want all display and printer outputs to be logged, you can do both DISPLAY IS :DOSLINK and PRINTER IS :DOSLINK.

To disable the auto-shutdown of the HP-71, just do SFLAG -3. Emu71 closes itself when the auto-shutdown delay elapses.

J-F

## **Math/Stat programs for the HP-71B**

[ [Return to Index](#) | [Top of Index](#) ]**Apologies to Vincze (symbolic differentiation on the 35S)**Message #1 Posted by [Peter Niessen](#) on 7 Sept 2007, 11:28 a.m.

Vincze, my friend,

recently you asked how to do symbolic differentiation on the HP35S. I thought this was easy, but it actually is harder than I thought. I know symbolic differentiation is pretty easy once you have your algebraic expression assembled as a tree, e.g. for

$$x + \sin(x \cdot x)$$

which would look like

$$\begin{array}{ccccc} & & + & & \\ x & & & \sin & \\ & & & & * \\ & & & x & x \end{array}$$

and where the rules are:

1. x -> 1
2. + -> diff (left branch) + diff (right branch)
3. sin -> diff (below branch) \* cos (branch)
4. \* -> diff (left) \* right + left \* diff (right)

resulting in

$$\begin{array}{ccccccc} & & + & & * & & \\ 1 & & & & & \cos & \\ & & + & & & & * \\ & * & & * & & & \\ 1 & x & & x & 1 & & x & x \end{array}$$

by applying the above recursively. I thought this would be easy to convert from the tree notation to RPN, but it was not so easy.

Storage of the expression on the 35S however seems pretty straightforward, by using the indirect registers and representing the operands as negative numbers (so you can e.g. solve for x by storing -24 in I), and representing the operators as positive numbers, +=1, -=2, \*=3 ... sin=21, cos=22, ... or whatever.

$$x \ x \ x \ * \ \sin \ +$$

would thus become

|     |     |     |     |   |    |   |
|-----|-----|-----|-----|---|----|---|
| I   | 1   | 2   | 3   | 4 | 5  | 6 |
| (I) | -24 | -24 | -24 | 3 | 21 | 1 |

This way you could write a routine which evaluates the indirect variables and leaves the result in the X register.

The trouble is now that when you're working your way through from right to left, you don't know yet where the operands finish yet (unlike in the case of the tree).

Therefore I did not succeed in providing the symbolic differentiation on the 35S.

Cheers, Peter.

*Edited: 7 Sept 2007, 11:29 a.m.*

## Re: Apologies to Vincze (symbolic differentiation on the 35S)

Message #2 Posted by [Vincze](#) on 7 Sept 2007, 12:03 p.m.,  
in response to message #1 by Peter Niessen

My friend Peter. That make sense, and I surprised you went through all work to do. I think I conclude that it not something easily done on 35S because it not designed for that. I have to relegate myself to use 48gx that I have to do this if need be. In most cases though, symbolic differentiation is not that hard to do using different rules, so it is more academic to see if 35s could do or not.

## Re: Apologies to Vincze (symbolic differentiation on the 35S)

Message #3 Posted by [Peter Niessen](#) on 16 Sept 2007, 1:19 p.m.,  
in response to message #2 by Vincze

Vincze, my friend,

there actually is hope!

So, to find out how "deep" an expression is in the stack, on has to count how many operators and operands there are. E.g.

```
(x+1) * x
x 1 + x *
```

Actually, every two valued operator needs two operands, so the number of operands should exceed the number of operators by 1:

```
expression      x 1 + x *
#operators      2   1
#operands       3 2  1
```

When seeing that the number of operands exceeds the number of operators by 1, we know that the expression is terminated.

Thus, we can now write our differentiation function. Here I chose a C(++)-like language which differentiates the expression between the positions from and to.

```
std::string diff (std::string expression, int from, int to) {
    switch (expression[from]) {
        case "constant": // constant is easily differentiated, is 0
            return "0";
            break;
        case "x":
            return "1"; // variable diffs to 1
            break;
        case "+":
            eox_1 = find_end_of_expression (expression, from + 1);
            eox_2 = find_end_of_expression (expression, eox_1 + 1);
            return diff (expression, from + 1, eox_1)
                + diff (expression, eox_1 + 1, eox_2)
                + "+";
            break;
        case "-": // basically same as -
        case "*": eox_1 = find_end_of_expression (expression, from + 1);
            eox_2 = find_end_of_expression (expression, eox_1 + 1);
            ex1 = copy (expression, from + 1, eox_1);
            ex2 = copy (expression, eox_1 + 1, eox_2);
```

```

        return diff (ex1, from + 1, eox_1) + ex2 + "*"
        + ex1 + diff (ex2, eox_1 + 1, eox_2) + "*" + "+";
        break;
    // and so on for /, sin, cos, ...
}
}

```

As an implementation, one could use the indirect registers for "expression", coding +, -, \*, / as .2, 1.2, 2.2, 3.2, sin, cos, tan, exp, ln as .1, 1.1, 2.1, 3.1, ... so that the fractional part gives the valuedness of the operator. The variables would be represented by A = -1, ... Z=-26 (you can't have numerical literals, I'm afraid).

Our example would thus become (using A to store 1)

```

clear text x      1      +      x      *
I          1      2      3      4      5
(I)       -24    -1      .2    -24    2.2

```

Now we have all the ingredients... On the 32S with only 6 levels of XEQ nesting, this would not be very much fun, but on the 35s with its 20 levels, one actually stands a chance.

Happy programming, whoever takes this challenge!

Cheers, Peter.

### SUDOGEN for HP71

Message #1 Posted by [Vincze](#) on 7 Sept 2007, 10:53 a.m.

Anyone have text file of Valentín's Sudogen program? I rather copy and paste that than type everything in. I thought I could copy text from PDF, but it appear that there is protection on PDF preventing this.

### I have found....but...

Message #2 Posted by [Vincze](#) on 7 Sept 2007, 11:59 a.m.,  
in response to message #1 by Vincze

I have found Text entry of Valentín's excellent program, but when I run, I get error that say ERR L35:Subscript. I do research in book and it appear that this is some sort of Array problem. When I type GERRM, though it say "Err:Excess Character" Line 35 have this code in it, and it look okay to me:

```
35 a(k div 9+1,mod(k,9)+1)=1(val(str$(num(b$(k div 2+1))-23)[i,i])) @ next k
```

Any idea?

### Re: I have found....but...

Message #3 Posted by [Valentin Albillo](#) on 7 Sept 2007, 1:46 p.m.,  
in response to message #2 by Vincze

Hi, Vincze:

Thanks for your interest in my articles & associated programs.

As for your difficulties with SUDOGEN, I suggest you check *very carefully* that the program listing, as produced by executing the **LIST** statement, does *exactly agree* with the listing in the article; it might be the case that some typos crept in while entering the program into the HP-71B.

In particular, I suggest you begin checking these lines:

15, 80, 81, and 82

and if they check alright, then the whole listing. Also check that the program is the right size, i.e., 123 lines = 3902 bytes (with comments) or 88 lines = 3267 bytes (without comments).

I test each and every program I publish by actually typing it in from a printed listing, as any reader would do, and then testing every example provided in the article so, if properly entered, it shall run Ok.

Best regards from V.

### Re: I have found....but...

Message #4 Posted by [Vincze](#) on 7 Sept 2007, 1:56 p.m.,

*in response to message #3 by Valentin Albillo*

I will do what you say my friend, but I able to copy the text from your PDF with an open source PDF viewer, so should be correct, if the PDF is correct. Regardless, I check lines you state.

With real 71B, how does one store program with card reader? I not find instructions in two manuals I get with unit, so I wonder if there is another manual I need to find this information out.

**\*\*EDIT\*\*** I see that in my program, 80 - 82 were not "exact" as it look like you have some lower case and some upper case. I have all uppercase. I retype to exactly what you have, still no luck.

Just curious, what does 80 - 82 do? It look like garbled text.

*Edited: 7 Sept 2007, 2:06 p.m.*

### **How to enter ` in Emu71?**

*Message #5 Posted by [Vincze](#) on 7 Sept 2007, 2:34 p.m.,  
in response to message #4 by Vincze*

I think I see problem. Maybe. In line 81 & 82 in PDF it list back tick, or the ` sign. This is not valid character in Emu71, I take because it not allow me to enter. Is correct character the single tick, or ' character?

Yes, that must be it, because I test before I post this and now it work, but only when I display. If I select print, It generate same error again on L35. I wonder what so special with line 35. I would think lines 117 - 123 where problem must be as that where it look like .

### **Re: I have found....but...**

*Message #6 Posted by [Raymond Del Tondo](#) on 7 Sept 2007, 2:59 p.m.,

### 35S Cosmetic Issue

Message #1 Posted by [Ron G.](#) on 7 Sept 2007, 10:44 a.m.

Was there ever a concensus on what the "cosmetic" issue was with the 35S? Was it screen alignment, a misprinted keyboard, or what? Surely there is someone here with connections at HP who could let us in on the secret, now that the crisis has passed. Or did I miss the big announcement?

### Re: 35S Cosmetic Issue

Message #2 Posted by [Eric Rechlin](#) on 8 Sept 2007, 12:37 a.m.,  
in response to message #1 by Ron G.

There was no issue.

HP thought there may have been a problem, so they checked into it, and there ended up being nothing wrong. That's why I never ran out of inventory of the 35s. It's nice to see they are definitely caring about quality.

### Re: 35S Cosmetic Issue

Message #3 Posted by [Thomas Radtke](#) on 8 Sept 2007, 5:20 a.m.,  
in response to message #2 by Eric Rechlin

So, the problem with misaligned LCDs were solved silently? All calculators concerned were already sold at the point HP looked into it?

### Re: 35S Cosmetic Issue

Message #4 Posted by [Ron G.](#) on 8 Sept 2007, 4:38 p.m.,  
in response to message #2 by Eric Rechlin

Eric, did you get this information directly from an HP official source?

### Re: 35S Cosmetic Issue

Message #5 Posted by [Scott Newell](#) on 8 Sept 2007, 9:08 a.m.,  
in response to message #1 by Ron G.

Quote:

Was there ever a concensus on what the "cosmetic" issue was with the 35S?

I thought it might have been tool marks on the mold. I bought three calcs and each has a couple of identical small marks in the same place. (The marks are in line with the center of the top row of keys, on the top of the side outer lip/edge.)

**Re: 35S Cosmetic Issue**

*Message #6 Posted by [Miguel Toro](#) on 8 Sept 2007, 11:32 a.m.,  
in response to message #1 by Ron G.*

Well, I still believe that the problem is [this one](#). HP Canada offered me to replace the unit. I will wait and see.

### **Would it be a debugged version of the HP 35s?**

Message #1 Posted by [Miguel Toro](#) on 7 Sept 2007, 9:04 a.m.

I was just wondering....

Yesterday I was entering a 3D vector and the calculator kept telling me that there was a syntax error (If I entered a 2D vector, all went well). I made a reset and nothing, then I cleared the indirect registers and voilà: the calculator let me enter the 3d vector again without problems.

It is such a excellent calculator, it would be a pity not to correct those little but sometimes annoying things.

Regards,

Miguel

### HP 48 Finance Apps? Graphing?

Message #1 Posted by [bink](#) on 7 Sept 2007, 1:47 a.m.

Hi,

I am new to the HP48G, so am not familiar with it's finance capabilities. AFAIK, it has basic time value of money functions built in. Are there any others?

Are there any applications that graph financial variable sensitivities? For example, showing how NPV varies with interest rate?

Thanks,

bink

### Re: HP 48 Finance Apps? Graphing?

Yes :-(

Battery contacts

Good :-(

Thank's :-)

### Re: Problem - HP-97

Message #4 Posted by [Tony Duell](#) on 7 Sept 2007, 1:52 p.m.,  
in response to message #3 by [gileno](#)

What electronic test equipment do you have, and what experience do you have with electronic repair?

The HP97 service manual is on the CD-ROM set. It contains full schematics of the machine.

I'd start by checking the voltages on the Vss (+6.2V) and Vgg (-12V) lines. If the power converter circuit in a Topcat isn't running, the protection circuit tries to bring the battery voltage right down and gets hot-and-bothered in the process!.

**HP71B Arrive**

Message #1 Posted by [Vincze](#) on 6 Sept 2007, 7:51 p.m.

My friends, my HP 71B arrive today from Spain. It is beautiful and in excellent condition. It come with two 4k memory modules, a sleeve of memory card, the card reader, and two manuals still wrapped up ( I wonder if I should even open since I have manuals on PDF). One thing that shock me is how slow it is to run (and fact that math on 71B is not RPN but Alg). I very happy though as I finally have. Now I have to try some of Valentíne's programs and some of others that you all post.

If someone would send me information about what math module will do for me and maybe where I can find one reasonably, I would appreciate.

Your friend, Víncze

*Edited: 6 Sept 2007, 7:52 p.m.*

**Re: HP71B Arrive**

Message #2 Posted by [Namir](#) on 6 Sept 2007, 8:32 p.m.,

*in response to message #1 by Vincze*

You can check the web page for the [EMU71](#) emulator. Download it as well as the math rom and JPC rom (the web page has many links that you need to follow do download the various parts). Edit the file emu71.ini to include the math rom (and JPC rom if you like). The emulator will give you an idea what the math rom is capable of doing (pretty neat stuff).

Then watch eBay for MATH ROMs for sale and buy one when available.

Namir

Message #3 Posted by [Vincze](#) on 6 Sept 2007, 9:14 p.m.,

*in response to message #2 by Namir*

Thank you my friend. I will try that, I ashamed I not think of that.

Is there not some place to see what Math rom give you though? I thought MoHPC site might have something, but I not find yet.

*Edited: 6 Sept 2007, 9:20 p.m.*

**Re: HP71B Arrive**

Message #4 Posted by [Namir](#) on 6 Sept 2007, 10:10 p.m.,

*in response to message #3 by Vincze*

If you have the new museum DVD disks (or the previous version) you can find the PDF for the HP-71B Math ROM. The manual tells you how to use the ROM and what features are available in it.

Namir

## Math ROM articles

Message #5 Posted by [Valentin Albillo](#) on 7 Sept 2007, 6:02 a.m.,  
in response to message #3 by Vincze

Hi, Vincze:

Congratulations on your new acquisition. If interested, you can see the Math ROM in action by downloading and having a look at my two articles about it, both freely available in PDF format at [my calc web site](#), namely:

**HP-71B Math ROM Baker's Dozen (Vol. 1)**  
**HP-71B Math ROM Baker's Dozen (Vol. 2)**

18-page article, in two parts, featuring 13 assorted mini-topics discussing novel aspects of using the extremely powerful and versatile Math plug-in ROM for the HP-71B.

You might also want to download my article "*HP-71B Minimax Polynomial Fit*", which includes as an example a subprogram to compute the coefficients of an *arbitrary-degree polynomial Least Squares fit* to a set of data, extensively using Math ROM capabilities, and *just 3 lines long*.

Best regards from V.

## Emu71 copy and paste

Message #6 Posted by [Vincze](#) on 7 Sept 2007, 9:28 a.m.,  
in response to message #5 by Valentin Albillo

My friend, Valentín. I have to ask really dumb question. You have many cool program that you post here, and in Emu71, I see it allow user to cut and paste from windows environment. I take that to mean that I can write program in notepad, and then copy it to Emu71, and paste in there. Maybe I misunderstand, but when I copy from notepad, it not let me paste in Emu71. Does it work only where I copy **from** Emu71, and then paste in windows? If so, I would assume there is way to read file from disk. I guess I need to RTFM to figure that out?

**\*\*EDIT\*\*** Never mind, I figure out how to Paste to EMU71 (right click title bar in window, select edit and then paste).

I still interested in how to load and save from Emu71 though. I will figure out.

*Edited: 7 Sept 2007, 9:42 a.m.*

## Re: HP71B Arrive

Message #7 Posted by [Garth Wilson](#) on 6 Sept 2007, 9:43 p.m.,  
in response to message #1 by Vincze

Quote:

One thing that shock me is how slow it is to run

What did you try on it? With the 4-bit data bus and 64-bit registers, it will be slow for something like text operations or an empty FOR-NEXT loop, but it is optimized for floating-point math. With the Math ROM, it could do a 1024-point complex FFT twice as fast as the early PCs running GWBASIC. Also with the many available LEX files from the user groups, many operations can be dramatically sped up.

*Edited: 6 Sept 2007, 9:47 p.m.*

## Re: HP71B Arrive

*Message #8 Posted by [Vincze](#) on 7 Sept 2007, 8:40 a.m.,  
in response to message #7 by Garth Wilson*

I just do simple program as follows:

```
10 Print "Hello"
20 Print "World"
30 Goto 10
```

When it print, words, it display for about 1 - 2 seconds, then go to next word. I thought it would be much faster, but may it be designed to display longer?

What about manuals in sealed wrapper? Should I open, or should I just use PDF that I have and leave in wrapper.

## Re: HP71B Arrive

*Message #9 Posted by [Maximilian Hohmann](#) on 7 Sept 2007, 9:23 a.m.,

Hello!

Quote:

---

What about manuals in sealed wrapper? Should I open, or should I just use PDF that I have and leave in wrapper.

---

Open them and use them for the purpose they were printed for. These things are not holy cows. And not old enough to be real antiques anyway. The only reason to keep them sealed would be if your intention is to re-sell the calculator in the future. For some people, sealed manuals increase the value of the product. But how big is the probability, that you encounter one of these in the very moment that you want to sell your calculator?

Enjoy your new toy :-)

Max

NB: My latest toy arrived yesterday (hp-67), now I have wait for my gummy-wheel-repair-kit to arrive from the states so that I can perform some open-heart surgery on it...

---

I think it depends on how well the PDF files met your needs. Personally, I find a physical manual easier to use than a scanned-in PDF. That's partly because you can't search a scanned document, since its pages are just images of the originals. But it's mostly because I grew up learning how to use a book as a reference. Plus, a book is portable in a more convenient way than a laptop. (You don't have to plug a book in, or wait for it to boot up.) On the other hand, PDFs take up no physical space, so it's possible to have a complete library on your laptop or PC. If I'm on the road, this advantage is crucial.

Those are my reasons for preferring a physical manual. But your taste may differ. My advice is to take some time to think about how you would use a physical manual, as opposed to the PDF, and make your decision based on what you come up with.

Regards,  
Howard

---

Actually you can. I use Adobe Acrobat to OCR the documentation I used most. This way it is fully searchable.

Hi Egan,

Quote:

---

Actually you can. I use Adobe Acrobat to OCR the documentation I used most. This way it is fully searchable.

---

Well - Partially true - you have to be careful with this. I use Acrobat 6.0 professional to convert scanned pdf to text and it "appears" to do a great job. Everything appears great on the display, will print correctly and the size of the file is drastically reduced, but...

When I do a search for a particular word, it doesn't find all occurrences. For an occurrence that it doesn't find, I can select it with the text tool, copy it to the clipboard, and when I paste it into a document file, it comes up as mis-spelled or has some garbage characters in it.

It looks like Acrobat somehow keeps part of the scanned image with the OCR text. As a result, displays great, prints great, but will not search or cut and paste correct.

I'm not sure if later versions of Acrobat does this.

Bill

### IPOD touch calculator (suggestion to hp)

Message #1 Posted by [Chuck](#) on 6 Sept 2007, 12:47 p.m.

The new IPOD touch and iphone have simple calculators built in. BUT, wouldn't it be nice if by rotating the units to landscape mode they automatically switch to an 11C or 15C? Would hp ever be willing to get in bed with Apple and produce the code for a useable RPN calc on their products? An 11C in my pocket along with my music would be icing on the cake.

### Re: IPOD touch calculator (suggestion to hp)

Message #2 Posted by [Eric Smith](#) on 6 Sept 2007, 1:06 p.m.,  
in response to message #1 by Chuck

If Apple supported third-party software development for the iPhone and iPod touch, this would happen without any need for HP's involvement. But Steve Jobs apparently finally has achieved his dream of having a completely closed platform. No compilers and SDK for you!

Yes, a few people have managed to build simple applications by reverse-engineering, but normal developers don't have the patience for that.

### Re: IPOD touch calculator (suggestion to hp)

Message #3 Posted by [Kevin Kitts](#) on 6 Sept 2007, 2:41 p.m.,  
in response to message #2 by Eric Smith

Since the iPod Touch is Mac OS X based - even if Apple does not open it up - I bet someone will find a way to install 3rd party apps on it. I think the odds are better for doing something with the iPod touch than with the iPhone.

IIRC, these devices change from portrait to landscape when you physically change the orientation of the device. So you should be able to have 11C and a 42s nicely laid out in their correct orientation.

### Re: IPOD touch calculator (suggestion to hp)

Message #4 Posted by [Egan Ford](#) on 6 Sept 2007, 4:50 p.m.,  
in response to message #3 by Kevin Kitts

Quote:

Some already have. Google for iPhone toolchain, I am certain that it will be the same for the iPhone and the iPod touch. Google for iPhone NES and MAME emulators. If they can build video game emulators (the NES has multitouch support too), then building Free42/Nonpareil will be trivial after the

UI has been ported.

**Re: IPOD touch calculator (suggestion to hp)**

*Message #5 Posted by [Seth Morabito](#) on 6 Sept 2007, 4:14 p.m.,  
in response to message #1 by Chuck*

Chuck,

You may want to check out [SciCalc for iPhone](#), which a friend of mine wrote. It should also work on the new iPod Touch.

It defaults into Algebraic mode, but the author is an RPN fan as well, so it has a very useful RPN mode with an unlimited stack.

Due to an interesting feature in the Safari web browser (used on the iPhone and iPod), you can save the entire application to a bookmark and reload it, even when no wireless network is in range. So you do not need to be online to use the calculator. Just click on "Bookmarklet", and then bookmark the resulting page. Quite neat!

**Re: IPOD touch calculator (suggestion to hp)**

*Message #6 Posted by [Chuck](#) on 6 Sept 2007, 4:55 p.m.,  
in response to message #5 by Seth Morabito*

Wow. Now you really have me convinced to get one. I figured I could find an RPN calc when on wifi, but didn't realize it could be saved as a bookmarklet. Thanks for the info Seth.

### **new educational calculators from TI and Casio**

Message #1 Posted by [Don Shepherd](#) on 6 Sept 2007, 10:50 a.m.

From the current issue of "Mathematics Teaching in the Middle School" published by National Council of Teachers of Mathematics.

Don't know anything about [these](#), but they look interesting.

### **Re: new educational calculators from TI and Casio**

Message #2 Posted by [Bruce Bergman](#) on 6 Sept 2007, 12:24 p.m.,  
in response to message #1 by Don Shepherd

Hi Don --

The new TI looks interesting. I'm guessing it's going to be a low-end version, but it seems to pack a pretty good punch. Tables, equations, what looks like good stats, etc. I bet it'll be under \$49. I don't know that I would call this a competitor to the HP-35s, but it MIGHT indeed be just that. I like the "patterns" feature - that would be great in the lower-ed math systems.

However, I AM freaking out about one thing: it has an ENTER key, and no equals (=) key. ;-)

Oh, and look at the "order of operations" screen. IMHO, that's EXACTLY why we need HP models in the classroom. To have a screen that basically tells students that unless they get their parenthesis right, their result is bogus, stinks. Oh well...

The Casio is that model I was writing about last month on the forums here. It's impressive. Super clear display, great functions, and even has some brain-dead BASIC-like programming language. I think Katie was mentioning that it can be programmed fairly nicely. One of the replies was a download link for both the manual (PDF version) and also for a 30-day evaluation of the calculator for the PC.

Although the menu system is a nightmare (and cluttered too), it was fun to poke around on the calc and see what it can do. At \$99 for the unit, with a \$100 discount for educators, it's a steal. ;-)

thanks, bruce

Message #6 Posted by [RonHudson\(USA\)](#) on 6 Sept 2007, 1:52 p.m.,  
in response to message #2 by Bruce Bergman

Some at ITT have casio or other calculators where you type the equation in then press enter...

(3+5)\*7 [enter]

and the answer appears on another line... 56

No RPN :^( no Equals key

Link to a picture of the casio? (nevermind.. I see it's part of the PDF)

The casio is cool, a clamshell - wonder if it's programmable too.

Edited: 6 Sept 2007, 1:54 p.m.

*Message #7 Posted by [Don Shepherd](#) on 7 Sept 2007, 12:08 a.m.,  
in response to message #2 by Bruce Bergman*

Hi Bruce. I was intrigued by both these calculators, so I went out and bought both of them today (TI at Walgreens, as one person suggested, and the Casio at Staples)! The TI is no threat to the 35S. It does not have any type of \*solver\*. You can assign any of 7 variables (like x) a value, and it will evaluate  $x^2 + 3x + 4$ , but that's middle school for you.

I haven't opened the Casio yet, I'm just too tired and I need to prepare a lesson for my middle school kids for tomorrow.

I thought the same as you at one time, but I was so intrigued by the Casio I bought one. Nice calculator. The state of the equation writers on today's calculators is so good that RPN has lost most of the advantage it might have once claimed. It took about 5 minutes to adapt to the AOS.

Yes it is programmable, but the included applications and functions almost obviate any great need for programming.

Don W

You could probably write your own if you were keen. There is an open source FX9860G development system called Revolution FX: <http://revolution-fx.sourceforge.net/>

It uses the very nice Renesas SuperH3 chip.

Presumably the SLIM model is the same hardware wise?

Dave.

## **Re: new educational calculators from TI and Casio**

*Message #12 Posted by [Bruce Bergman](#) on 6 Sept 2007, 6:51 p.m.,  
in response to message #11 by DaveJ*

VERY interesting idea!

Certainly, it doesn't make the calc an HP, nor even barely acceptable, but it has a certain appeal. I wonder if Free42 could be ported to that platform. Now THAT would be cool! ;-)

I've heard the chip in this puppy is a screamer too...

thanks, bruce

## **Re: new educational calculators from TI and Casio**

*Message #13 Posted by [Don Shepherd](#) on 7 Sept 2007, 4:20 p.m.,  
in response to message #12 by Bruce Bergman*

Bruce, I bought a Casio calculator years ago and, as I recall, learning how to use it was anything but intuitive. Sad to say, the same is true for the fx9860g slim. This is not the type of calculator that you can just pick up and figure out without reading the manual, and the online manual needs to be paper, not electronic. I'm going to continue to try to figure it out, but I'm thinking at some point it won't be worth the effort. Makes me appreciate HP all the more.

## **Re: new educational calculators from TI and Casio**

*Message #14 Posted by [Xerxes](#) on 7 Sept 2007, 6:01 a.m.,  
in response to message #11 by DaveJ*

Yes, your presumption is correct. The FX-9860G Slim has the same hardware as the FX-9860G or the FX-9860GSD with SD-Card slot.

## **Re: new educational calculators from TI and Casio**

*Message #15 Posted by [gteague](#) on 8 Sept 2007, 12:32 a.m.,  
in response to message #8 by Pal G.*

i bought this casio on impulse at a local staples while i was waiting for the hp35s to arrive. i should have taken it back for a refund.

what a lousy calculator! buttons are scattered around and not grouped for function. the display, even for being so large, does not display near the information it should be able to. it's hard to find your way around in the menu system. i can't remember my other complaints--i worked my way through the manual over the course of a day or two and then put it aside thinking i'd revisit it later as there had to be more to this calc than what i initially discovered. i later decided that no, there wasn't any more to the calc, but by that time my return period had expired.

they sell a non-foldable model that seems to have all the same functions for less than 1/2 the price.

the ti one looks like it has a useful display. i'm sure i'll pick it up first one i see. i'm like that with calculators.

/guy

I've got a nice hp 50g to replace any hp 48xx. Of course it could use some ballast. But, wouldn't you rather have a new 11c/15c/16c???

And while we're dreaming, how about an hp 35sgx+III that can put an hp 42s to shame? The enclosure is done. Great job. That's the expensive part. Now expand the software so it stomps everything in it's class. Give the programmers all the pizza and mountain dew they need and have 'em squeeze the living potential out of the hp 35s.

Cheers, Pal

### **Re: new educational calculators from TI and Casio**

*Message #19 Posted by [Egan Ford](#) on 8 Sept 2007, 2:19 a.m.,  
in response to message #18 by Pal G.*

Don't forget I/O. There was a reason why the 41CX, 71B, and 48-50 are so popular and have large amounts of code. Data and code can be shared. The 41/71/48/49/50 are more than calculators, they are application platforms.

The 50g has 4 different electronic bidirectional I/O methods (USB, Serial, IR, SD). Incredible. The 35s++ should be able to come up with just one.

### Idea: "Support your favorite calc-related project"

Message #1 Posted by [Klaus](#) on 6 Sept 2007, 5:48 a.m.

Many people that trad with HP-things have made some "good deals", i.e. paid far less than what it is "worth" (in the eye of a collector) for an item. Many collectors also have duplicate machines. So why not sell a duplicate machine and support some calc-related project (like MLDL2000, Clonix, OpenRPN or nonpareil, emu48,...) with the money? Perhaps the projects can setup a description of their project, and the sellers put the items on ebay with a link to the project to be supported. The winner of the auction then pays directly to the project and gets the item. I would like to support some projects, but I will not register to paypal to do so, so it would be convenient for me that the buyer takes care of this. And the projects would perhaps get some attention from occasional ebay-lurkers.

What do you think of that idea?

### Re: Idea: "Support your favorite calc-related project"

Message #2 Posted by [Meindert Kuipers](#) on 6 Sept 2007, 8:28 a.m.,  
in response to message #1 by Klaus

Klaus,

Being the originator of the MLDL2000, I appreciate the idea of supporting these projects. On a personal level, money is not really the issue. I did the MLDL2000 because I simply wanted to do this, and I had the means to do it. The best support that I get is the fact that there are users all over the world that are now using it and have thanked me for creating it. The actual cost for me was covered by the income from 'selling' the units, but it really did not cover anything else than the cost. The amount of time that went into it (and is still going in the project) is enormous. But then again this is a hobby, and that is why I am doing it.

Again, I appreciate the support, but do not need it in terms of money. Just a pat on the shoulder every now and then is more than enough motivation ...

Meindert

### Re: Idea: "Support your favorite calc-related project"

Message #3 Posted by [Hugh Evans](#) on 6 Sept 2007, 5:01 p.m.,  
in response to message #1 by Klaus

Klaus,

As the founder of [OpenRPN](#) I appreciate your idea. However, the most valuable support comes directly from this community in the form of talent. AdSense revenue is sufficient to cover all of our hosting expenses (which now keeps the site running at all times.) Right now, the OpenRPN project is in shape to support a full-scale development effort, but we need programmers to return/join.

Best Regards, Hugh

**Re: Idea: "Support your favorite calc-related project"**

### HP 50g 75 Mhz Arm9 Processor

Message #1 Posted by [Gerry Schultz](#) on 5 Sept 2007, 4:42 p.m.

As I remember, both the 49g+ and the 50g use the Arm9 processor and emulate a Saturn processor in software that the calculator OS runs on. It's been several years and I was wondering why HP hasn't rewritten the OS to run natively on the Arm9? I originally thought that it was the fastest and easiest solution to get the 49 and 50 out quickly but I had thought that HP would release an OS update at a later time to run directly on the Arm9. But, that hasn't happened, why?

If HP were to release this kind of upgrade, imagine how much faster both calculators would be. Perhaps a new 51G is going to be released and it will have a new OS that runs directly on the Arm9 with firmware upgrades for the 49 and 50.

Does anyone have any other information or ideas on this?

Thanks,

Gerry

Hi Gerry,

One reason is that this probably would take man years and the current R&D team (1) probably has other calculators to develop; and (2) does not have the number of people it would take to do this in any reasonable

amount of time. Of course, if HP felt that this effort was important enough (i.e. would sell TONS of more calculators), they'd probably acquire the resources to get it done. Just my two cents....

Jake Schwarz

The 35s is evidence that rewriting the OS is not always the best idea. I'd take a 42S running on Saturn emulation any day.

On the other hand you sometimes have to take a few steps back to move further forward. But you need to learn from history along the way. The 42S is a good example of that. The 42S did not use the same processor technology that peaked with the 41CX and 15C. The 42S used the new Saturn processor with an internal RPL-based OS. Despite all of this it is arguably the best RPN machine ever. Lessoned learned were not forgotten.

New code is inevitable, just don't forget your history.

Sorry,

But I don't worship the 42S as much as everyone else does. I had one back in the mid-90's, and used it for a few years but it did have a memory limitation. The metal cover wouldn't stayed adhered near the display. Then one day something fell on the display and cracked it. Bought a new 48G and loved it. I had to learn RPL programming instead of the much easier RPN programming. Once I figured a few things out, I'd never go back to the 42S. Now I have the 50g and and really happy with it. So I'm all for the continued development of the 50g and on, instead of trying to dumb-down the machine.

AFAIK the basic idea is to have the 50g (and 51g etc.) at the high end, the 35s at the low end of programmable calculator range, and some "43S" in between. This 43S shall be RPN and feature \*at least\* the complete function set of the 42S. Furthermore, it shall get a brisker and larger LCD reflecting the state of the art.

So, there's no intent to "dumb down the machine", but to reach (at least) the level of RPN again we had in 1988. Just a model the professionals will use :)

I like RPN because it is easy, simple, can be mastered in minutes. I like RPL because of the power. I'd like to see RPN evolve in the 43S. Extend the language a bit without losing its simple nature. I see some of this in the 35s, e.g. equations as a single statement.

Whose basic idea is that? Did HP state such an idea while I was sleeping? Or is this just idle speculation?

That concept sure sounds like an easy one for HP to pull off. Essentially, they could use the 50g with a smaller display and keyboard, retain the I/O, keep their saturn emulation, and load a slightly modified 42s ROM. Use keys from the 35s with new silkscreened legends.

I'd put the price point around \$75 and bet on them using a less powerful ARM CPU to do the job.

Hardware-wise I'd have to agree. I think the build quality of my '85 15C, '93 GX, 50g, and 35s are superior to the 42S (I am still looking for a 42S hard case). But the software and the organization of the 42S is without equal for a midrange programmable.

Like you I 'upgraded' to the 50g and retired my still mint 48GX because the 50g is replaceable and the 50g is 100% compatible with all my 48GX code, it was an easy decision. Not so with the 15C/41CX/42S -> 35s.

I do not subscribe to the 'one tool to rule them all' philosophy. There is still a demand for a powerful shirt pocket calculator.

One other reason that emulation is successful is that *it generally introduces no other behavioral*

*bugs* when done successfully (and if no bugs are in the "I/O transition layer" for new hardware.

If there are errors in instruction emulation they are fundamental enough that reliability of the machine is likely impaired throughout multiple areas of its operational range. Emulation, though, of each instruction's function to 100% level is generally a readily achievable goal (with exception of timing-critical matters). If instruction fetch, instruction translation and I/O translation layers all work OK, then the emulation is successful, and the only bugs are timing-relationship ones (usu not an issue on such a design like a calculator) and the ones originally existing on the original nonemulated calculator firmware.

Contrast this with a complete rewrite on a new machine: likely the new coding would be a mix of C+ARM assembly and concepts transliterated from the Saturn HW+assembly world would not necessarily transfer over with grace and ease in a rapid enough fashion to be cost-effective for a small team. Getting back to orig calculator functionality with same bug levels would indeed be a challenge.

Interesting points. As an electronics engineer, I am disturbed by the wasted processing power lost through emulation. Back when the 42 and 28C were released, their OSES were written for the Saturn processor to take advantage of the limited clock cycles and to maximize battery power to help differentiate their machines from the competition. I'm also thinking of the transition from the HP-65, to the 67/97, to the 41C to show what could be done with newer hardware.

Perhaps I'm too old fashioned, but I still think that with battery-powered hardware, HP would want the maximum bang-for-the-buck with processor power and battery life. I remember when I bought my 48GX, it's Saturn processor was twice as fast as the 48SX, so I decided to go with the 48GX even though it was brand new and I couldn't find any third-party books or other documentation other than HP's. At the time, my previous calculator was the 41C so it was a big technology jump for me. Side note: I recently found my copy of 41/48 Transitions book by William C. Wickes. I had forgotten completely that I had purchased it so long ago and I am stoked to re-read it.

In this day and age of 75 MHz processors (WOW!) and HP's apparent lack of interest in writing a native version for the Arm9, I question their commitment to building better calculators. The transition from RPN to RPL back in the 80's was such a big step and really showed HP pushing the technology envelope. I don't see that here with the 50g.

Does it cost a lot of money and manpower to rebuild an OS on new hardware? Of course it does, and I am thinking that with the success of the 41C, HP had the market-share and resources to build entirely new calculators based on the new Saturn processor like the 42 and 28. The 48GX was very successful but since then the 49, 49g+ and the 50g are extensions of the 48 series moved to new hardware (for the 49g+ and 50g). HP has not taken full advantage of this new hardware platform (other than I'm sure it's cheaper and the parts are readily available). I would like to see this new hardware platform scream as it should. To me, emulation adds complication to make it work.

I hope HP proves me totally wrong and comes out with a new high-end calculator that makes

full use of the Arm9. With the faster speed, new functions can be added that were too slow on the older platforms. Hopefully, HP is taking a long, hard look at the Inspire to build the next great calculator. They had the Xpander but dropped it for what I would guess was economic reasons. In the past 6 years technology has advanced enough for HP to come out with a new version of Xpander that is cheaper to build and blow the Inspire out of the water. That's what I would like to see. HP exercising their considerable technology muscles and producing a high-end calculator that affordable and leads the way on what is possible to build. Damn the expense and full speed ahead! That's how I remember the HP-41C when it came out. What a GREAT machine! It's the best example of what I think about HP's calculators.

Gerry

Would you like it all programmed in raw assembler too, to maximise every last cycle?

A "better" calculator does not necessarily mean a faster calculator. I'd personally put speed more toward the bottom of the list, not including user interaction speed of course, which should be instant.

Dave.

Yep, or extra battery life by being able to \*drop\* the processor speed because you have a more powerful processor.

Dave.

With HP's resources, open development of a new code base seems like a no-brainer. They

write the specs, oversee the effort, run QC, and then provide end-product support. The algorithms have been around for decades, calculators are not the high-end of technology today, so there shouldn't be much (if anything) to lose in terms of trade secrets. I think HP is crazy for not making better use of the community they have.

I should add that as far as calculators go the user experience and interface of the 48 IMHO is the best there ever was. This is not about RPN vs RPL, its just about the usability as a calculator.

The 48 has an overloaded keyboard (34C/15C), has hierarchical menus (42S), and if you choose (and I do) you can lock the alpha and enter whatever function you like (41C). Some team of engineers really thought it through and provided the best of the best in one package as far as user interfaces go. I also like the ability to do algebraic with out an ALG mode by using ", the space as a stack separator (2 2 + on a single line is very nice, would be very helpful on a 2 line display), the no limit stack, units, and symbolic constants and variables.

Shrink the 48 down to 2 lines, lose the graphics, replace RPL with RPN, put it in a 42S size can and call it the ultimate RPN.

You know those WWII documentaries on the History Channel where they have veterans describing how it was? Are there any ex-HP engineers who hang out on this message board who can describe what it was like back then while they were designing all that great hardware, and maybe tell us what HP is thinking now?

I love hearing people brag about how great the old HP calcs are. Does anyone think 20 years from now I'm going to be bragging to my grandkids about the hp 35s? Can we get someone to fix the thing before it disappears from the face of the earth? And please let us have an hp 15c anniversary, an hp 42s anniversary, and a big Enter key on a 51g that is not emulating Saturn.

Thanks, Pal

Heck, all this talk makes me the caveman of the group.

I bought a 50g and like a lot of its features, but the keyboard feel is so bad (too hard with too much travel), in my opinion only, that it's now starting to collect dust. My fingers get physically tired after a page or two of basic engineering calcs and my error rate is multiples of what it was with my 48G and I've had it for at least 2 months now.

Doesn't matter to me if there's a GHz processor in there if the basics aren't to my liking. I don't know if others find the keyboard as objectionable as I do.

I finally had enough this evening and put it away. Unzipped my 48G pouch and now all is well, regardless of its processor.

Funny, my boss uses his 48GX daily at the office, and a 15c at the house for bills and other projects. I showed him my hp 50g and he hardly blinked. He has a Treo 700p, a tiny Sony Vaio, a brand new Honda Ridgeline with every option... but he doesn't need a new calculator as long as that brick is on his desk.

Maybe that is why HP is in no hurry to create a calculator better than the old 48s. As long as those old calculators keep working nicely there does not seem to be enough demand..

Cheers, Pal

I hope they're spending their time trying to figure out how to NOT end up in the same boat at Apple vs Microsoft, having better technology but with little market share due to marketing.
