could take the results of your ad-hoc calculation at your lab bench or desk, and upload it to compatible software on the PC. that in turn could utilize local resources, or even the power of a computational grid, if necessary, to continue the work you started on the calc. It would work the other way too. Software on the PC could produce programs for the calc to allow it to participate, as appropriate, in a system design. Finally, you could do quite a bit of community grid stuff with these things. Yes, *do* imagine what a beowulf cluster of these would be like. 8)

Regards,  
Howard

*Message #14 Posted by [e.young](#) on 31 May 2007, 10:32 p.m.,  
in response to message #13 by Howard Owen*

Howard, you make good points, and I wouldn't be surprised if calculators evolved in a manner similar to what you describe. Star Trek predicted small portable storage media (floppies, etc) and communicators, so why not tricorders?

### **Re: Where is HP Going in the Calculator Marketplace? (e.young - it sounds like we do similar work)**

*Message #15 Posted by [ECL](#) on 31 May 2007, 12:02 p.m.,  
in response to message #12 by e.young*

e.young,

From your post, it sounds like you are a structural designer or analyst. Structures is my focus too. While I lean toward the analytical side (finite elements, boundary elements, etc.) I also make frequent use of CAD software including CATIA and Femap.

I do make use of my calculator on a daily basis, and am very enthusiastic about the new 35s. Particularly, I am hoping for multialpha labels, and matrix support. The keyboard is looking very promising. I do wonder, however, about the marketing...the bullet points on the PDF don't make much sense:

Quote:

\_\_\_\_\_

Get accurate results with edit, undo, delete capability

\_\_\_\_\_

I would have phrased that something like:

Gain more control over your operations with edit, undo, and delete capability

Well, I'm glad to hear of another structures person here!

ECL

**HP-34C**

Message #1 Posted by [Larry Fox](#) on 29 May 2007, 2:36 p.m.

I have seen an HP-34C that appears to produce the number 3.141492653 for pi rather than 3.141592654. Does anyone know if there is a known bug in some models of the HP-34C, or is this more likely to be a malfunction in this particular device? Thanks.

**Re: HP-34C**

Message #2 Posted by [Massimo A. Santin](#) on 29 May 2007, 5:51 p.m.,  
in response to message #1 by Larry Fox

On my (loved) HP-34C I obtain 3.141592654. It is a 1980 model (S/N begins with \*2045S... and I bought it in 1980).

Edited: 29 May 2007, 5:59 p.m.

**Re: HP-34C**

Message #3 Posted by [Mike T.](#) on 29 May 2007, 6:45 p.m.,  
in response to message #1 by Larry Fox

What does the self test return..?

(STO, ENTER)

Mike T.

**Re: HP-34C**

Message #4 Posted by [Larry Fox](#) on 30 May 2007, 7:49 p.m.,  
in response to message #3 by Mike T.

The self-test returned normal results, and as it turned out, the pi key also returned 3.141592654 according to the owner. Therefore, I have to agree with the respondents that suggested either hand key-in of the number or the results of a calculation. It was not seller's concern, but a prospective buyer's paranoia. Thank you, all!

**Re: HP-34C**

Message #5 Posted by [Don Shepherd](#) on 29 May 2007, 7:29 p.m.,  
in response to message #1 by Larry Fox

Larry, I noticed that readout in the EBay auction. I thought they just keyed the digits in that way, mistaking it for Pi. I don't think it is a failure (except in the seller's mind!).

**Re: HP-34C**

Message #6 Posted by [Gerson W. Barbosa](#) on 29 May 2007, 8:01 p.m.,  
in response to message #5 by Don Shepherd

It's also possible the seller has keyed this in:

```
[h] [pi] [f] [->H.MS] [g] [->H]
```

On my HP-34C this returns 3.141592653 :-)

Regards,

Gerson.

**Re: HP-34C**

Message #7 Posted by [Jimi](#) on 30 May 2007, 2:35 p.m.,  
in response to message #1 by Larry Fox

I would guess that the seller just keyed in 3.14159265358, rather than hit the PI key, and the calculator display stopped at the ...53. My 34 returns 54 as the last digits, I would be surprised if any of the 34s returned something other than this with the PI key.

**HP-42s Display repair?**

Message #1 Posted by [MikeG](#) on 29 May 2007, 2:35 p.m.

I recently picked this unit up on an impulse (ebay) thinking that I could clean up the display, but I should of checked here a little more carefully and paid more attention to the repair link stating the concerns in regards to opening these units.

Anyway, I'm wondering if all hope is lost or has anybody been successful in accessing the display on these units. From what I can make out is that the specks appear above the LCD, giving the impression that they can be removed.

Thanks

Message #2 Posted by [Nelson M. Sicuro \(Brazil\)](#) on 29 May 2007, 2:44 p.m.,  
in response to message #1 by [MikeG](#)

This black spots are impossible to remove, they are some type of leak or contamination inside the LCD's glass. The only source for that display is another HP-42S, a HP-17B or BII or 27S of the same year (same type of display bezel). I fixed mine with a 17B's, but the fix isn't trivial.

Good luck!

Nelson

### **Re: WHY THERE'S NO MENTION OF THE HP-35S ON THE HP SITE?**

Message #2 Posted by [Jim Creybohm](#) on 29 May 2007, 11:26 a.m.,  
in response to message #1 by Antonio Maschio (Italy)

Antonio, I found this one the HP site that Luis mentioned a couple of messages earlier.

<http://www.calculatrices-hp.com/35s.html>

If it looks like this, I will buy at least two. It almost looks to have the same kind of keys as the old 35.

\*feh\* I'll believe it when I see it.

### **Re: WHY THERE'S NO MENTION OF THE HP-35S ON THE HP SITE?**

Message #3 Posted by [Tim Wessman](#) on 29 May 2007, 11:40 a.m.,  
in response to message #1 by Antonio Maschio (Italy)

Same reason there was no mention of the 50G on hp's site until 3 months after people ALREADY had them. Distributors often leak info early, and often have the info up way before large companies due to size.

TW

### **Re: WHY THERE'S NO MENTION OF THE HP-35S ON THE HP SITE?**

Message #4 Posted by [Antonio Maschio \(Italy\)](#) on 29 May 2007, 11:55 a.m.,  
in response to message #3 by Tim Wessman

I hope so, and I also hope the site reported above is not fake. I'm afraid it's a \*BIG\* joke, because HP recently has showed a completely different feeling towards calculators (see Kynpo's models).

So today, while enthusiastic, I must hit the brakes and wonder if it's too early to enjoy such news. I don't want to regret later.

Anyway, thanks... and let's hope the news is right and that we'll have our models before Christmas....

-- Antonio

*Message #5 Posted by **Jim Creybohm** on 29 May 2007, 12:12 p.m.,  
in response to message #4 by Antonio Maschio (Italy)*

I am trying to convince myself that I am being unrealistically optimistic - building up to expectations that can't be met.

However after reading the website, and grokking the pictures as best I could, I do have only one complaint that has not yet been addressed by the other discussions; the decimal point looks very small, much like the 33's decimal point.

I wouldn't buy the 33 because of the enter key, the goofy keyboard, and the dinky decimal system which kind of capped off the lame factor for me. Hopefully, HP will graft the 9s display (or something similar) to the calc and give old eyes a break.

However, the chrome trim, (I am soooo 70's) the tall keys and the BIG ENTER KEY are all reasons enough for me to get antsy.

Please HP, I promise not to complain about the dinky decimal point too much.

**Re: WHY THERE'S NO MENTION OF THE HP-35S ON THE HP SITE?**

*Message #6 Posted by **Walter B** on 29 May 2007, 12:26 p.m.,  
in response to message #5 by Jim Creybohm*

Jim,

how about using a comma instead? Old Europe knows what old eyes need ;-) )

**Re: WHY THERE'S NO MENTION OF THE HP-35S ON THE HP SITE?**

*Message #7 Posted by **Jim Creybohm** on 29 May 2007, 4:32 p.m.,  
in response to message #6 by Walter B*

Of course Walter, I was being geocentric.

However, given the size of the comma in the 33, I am not sure that there is a lot of difference - maybe not enough for my eyes.

**Re: WHY THERE'S NO MENTION OF THE HP-35S ON THE HP SITE?**

*Message #8 Posted by **Walter B** on 29 May 2007, 5:45 p.m.,  
in response to message #7 by Jim Creybohm*

Hi, Jim,

don't get me wrong: you are just delivering more examples for US-centric views and language, pushing the rest of the world in the orbit d:-). End of kidding, back on earth: IIRC, "geocentric" means to put the whole (planet) earth in the center of the universe, which was the dominant ideology before Kepler (based on his observations) postulated the heliocentric picture, i.e. the planets revolving around the sun. IMHO, that's a totally different story than point and comma as decimal separators in separate parts of the world on earth. Hope I didn't confuse you d;-)

Back to calculators: commas on HP's calc LCDs are usually at least twice the size of points,

so this may support their visual detection in an aging society.

**Re: WHY THERE'S NO MENTION OF THE HP-35S ON THE HP SITE?**

*Message #9 Posted by [Jim Creybohm](#) on 29 May 2007, 11:31 p.m.,  
in response to message #8 by Walter B*

Darn, you're right. I should have said ethnocentric I guess. Seeing as I am in Canada, the US comparison is valid, but not technically correct.

You are right with the comma comment as well. I haven't actually seen the 9s or the 33 with the radix changed. I am still trying to adapt to the idea of grouping zeros without commas (or in the case you presented, decimals).

**It's Real, Antonio**

*Message #10 Posted by [Howard Owen](#) on 29 May 2007, 12:06 p.m.,  
in response to message #1 by Antonio Maschio (Italy)*

Message #13 in the [original HP-35s thread](#) contained [this deep link](#) into an HP site. The document is a regulatory filing for the 35s, confirming that a calculator by that name is about to be produced by HP.

Regards,  
Howard

**HP 29C**

Message #1 Posted by [Roberto \(Italy\)](#) on 29 May 2007, 9:31 a.m.

Hello. I have a two HP 29C,(Buy in Qatar 1978) one no working at all, one still working but I don't have a battery and charger 'cose is broken. can you help me to solve all this problems ? thanks for your attention. all the best.

Roberto

**Re: HP 29C**

Message #2 Posted by [Giancarlo \(Italy\)](#) on 29 May 2007, 9:43 a.m.,  
in response to message #1 by Roberto (Italy)

Ciao Roberto.

First of all, I strongly suggest to browse some of the very good stuff you can find on this very same site - for example:

<http://www.hpmuseum.org/collect.htm#batts>  
<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=267>  
<http://www.hpmuseum.org/batts/battery.htm>  
<http://www.hpmuseum.org/disasm.htm>

Then, if you're still in need of further info, I'd suggest to google with the following search string:

HP29C site:www.hpmuseum.org

It'll bring up lots of information, where you can hopefully find the most helpful and suitable for your needs.

Hope this helps.

Saluti.

Giancarlo

### HP10S: Is it new, too?

Message #1 Posted by [Vieira, L. C. \(Brazil\)](#) on 29 May 2007, 6:54 a.m.

HP10S; announced to arrive in June 2007. Have not heard of it. Is it new for you, too?

I feel as if I'm out for a while...

Cheers.

Luiz (Brazil)

Edited: 29 May 2007, 6:55 a.m.

### Re: HP10S: Is it new, too?

Message #2 Posted by [DaveJ](#) on 29 May 2007, 8:10 a.m.,  
in response to message #1 by [Vieira, L. C. \(Brazil\)](#)

Yes the 10S is new, we only heard about it at the same time as the 35S. It is being "announced" along with the 35S in the next few days.

Dave.

### Emulators for the new calcs?

Message #3 Posted by [Mike \(Stgt\)](#) on 29 May 2007, 9:22 a.m.,  
in response to message #2 by [DaveJ](#)

The HP-35S' CPU is a SPLB31A. Sounds like 12C-platinum or HP-17B2, IMHO. Any emulators around for it? For sure, but where?? TIA!

Ciao.....Mike

BTW: currently I play with ancient MacOS using [Mini vMac](#) - great fun 2 find 10 yrs old solutions of todays man-machine-interfaces 4 PCs. <G>

### Re: Emulators for the new calcs?

Message #4 Posted by [Eric Smith](#) on 29 May 2007, 5:48 p.m.,  
in response to message #3 by [Mike \(Stgt\)](#)

Same CPU as the 33s. The 35s is almost certainly an evolution of the 33s design. Fortunately, it is obvious that HP has been listening to what users have been asking for!

### Evolution of Design

Message #5 Posted by [Mike \(Stgt\)](#) on 30 May 2007, 5:04 a.m.,

*in response to message #4 by Eric Smith*

Hi Eric!

HP tries to make money with those calcs so they need to get back the reputation of "enduring quality" and "fits exactly your needs". The catch up by re-design (HP-50G et al) and now by \_retro-design\_. Let's see if the preamble about care for quality shows up again in the new manuals.

One more word about design: some years ago I assumed the future of pocket calculators will be in emulators (or simulations) running on a PDA. I was wrong. Users still like to have those High Price (=high value, highly specialized) devices as real hardware. What leads me to an other approach: one hardware (display, keys, ...) and task-specific software from the Internet or on a flash card from your dealer. Something like -- wasn't it yours?? -- the prototype of a 'most-classics-simulator' with keyboard overlays as Matthias showed me in Allschwil. Future will show what users buy.

Best regards, Mike

*Message #7 Posted by **Bruce Bergman** on 30 May 2007, 1:09 p.m.,  
in response to message #6 by Massimo A. Santin*

The new HP-10s is most likely a rebadged Casio. HP did this with the HP-8s (a very interesting looking device, for sure), so it's not like they're breaking new ground here. I suspect the HP-10s won't be available in the USA; just EMEA. It's been almost impossible to find an HP-8s in the USA, even on eBay.

It doesn't stir me like an RPN model, or especially the new HP-35s, but it still kinda neat looking. I'd rather use THAT than the HP-6s (the other solar-powered model) which -- while very thin and small -- kinda sucked. ;-)

thanks, bruce

### Scan / PDF / text file of HP41 application pac program listings?

Message #1 Posted by [Gene](#) on 28 May 2007, 9:11 p.m.

If this is on the Museum DVD, let me know and I'll dig mine out.

I'm looking for the program listings to the programs on the HP41 application ROMs. The manuals are available, but are the listings?

If I want the listing to the standard pac blackjack program, or any other program on a 41c rom from HP, are those listings available anywhere?

### Re: Scan / PDF / text file of HP41 application pac program listings?

Message #2 Posted by [Dave Hicks](#) on 28 May 2007, 10:04 p.m.,  
in response to message #1 by Gene

Some but not all of the modules have text files associated with them on the DVD.

After the next version of the DVD (actually 2 DVDs now) goes to the factory and after I start whittling down my in-box, I was planning to ask for scans of more software. I have a few dozen user's library programs here but hopefully we can find many more. Depending on whether it turns into dozens or thousands of scans, these could go on-line or on another DVD.

### Re: Scan / PDF / text file of HP41 application pac program listings?

Message #3 Posted by [Gene](#) on 28 May 2007, 10:17 p.m.,  
in response to message #2 by Dave Hicks

Ok, I'll check my copy of the DVD.

If the standard pac, math pac, and others aren't there, then I'll drop another note.

Thanks Dave...see you in San Diego in September?

### Re: Scan / PDF / text file of HP41 application pac program listings?

Message #4 Posted by [Dave Hicks](#) on 28 May 2007, 11:42 p.m.,  
in response to message #3 by Gene

Yes, I plan to be there. I haven't actually booked yet but it's on the TODO list.

### Nope - no 41c math pac program listing on DVD

Message #5 Posted by [Gene](#) on 29 May 2007, 9:55 a.m.,  
in response to message #4 by Dave Hicks

I found the text files containing program listings, but there wasn't one for the math pac. Does

anyone have this in electronic form so I don't have to recreate the wheel by finding my thinkjet printer and generating the listing?

I'm particularly looking for the listing to the MATRIX program.

Could it be generated by the emulator on a palm?

?

**Re: Nope - no 41c math pac program listing on DVD**

*Message #6 Posted by [Meindert Kuipers](#) on 29 May 2007, 4:11 p.m.,  
in response to message #5 by Gene*

In the software for the MLDL2000 is a ROM disassembler that also decompiles user code, it will work with the MATH ROM. Only disadvantage is that it will not yet decompile the XROM numbers to its function name. This software can be downloaded from [hp41.kuipers.to](http://hp41.kuipers.to)

Go to Tools -> ROM/SR Handler and Open the MATH ROM file (only .ROM format supported) in the ROM tab. Then press DisAsm ....

Copy and paste the resulting listing in whatever you like ....

I just tried it, "MATRIX" it is 603 lines, otherwise I would post it here (but maybe I would violate copyrights???)

Meindert

**Re: Nope - no 41c math pac program listing on DVD**

*Message #7 Posted by [Werner](#) on 30 May 2007, 3:25 a.m.,  
in response to message #6 by Meindert Kuipers*

? It's 566 lines, 983 bytes. MATH-1C version. I have a listing (painstakingly copied by hand..), but only of the MATRIX program. I can email it, if you want.

Cheers, Werner

**Re: Nope - no 41c math pac program listing on DVD**

*Message #8 Posted by [Meindert Kuipers](#) on 30 May 2007, 4:17 a.m.,  
in response to message #7 by Werner*

You're totally right. The disassembler counts the line numbers a bit different (this is a limitation in the decompiler). For numeric entries each digit is decompiled in a separate line, sorry for the confusion.

Meindert

**Re: Nope - no 41c math pac program listing on DVD**

*Message #9 Posted by [Les Wright](#) on 30 May 2007, 6:55 p.m.,  
in response to message #5 by Gene*

Gene, I think the best, albeit somewhat time-consuming, way to generate a listing is this:

1. Get the Math Pac MOD file from TOS--it comes with V41.
2. Convert the MOD file to ROM format using the modfile.exe utility, also from TOS.
3. Convert the ROM file to \*.raw format using the rom2raw utility from Thomas Okken's Free42 site.
4. Using a clean instance of Free42 (i.e. back up and move any existing state files, since the menu will fill up with labels and we don't want to get confused), import the resultant \*.raw file into Free42.
5. In Free42, PRP the "MATRIX" program from the menu, making sure that in Free42's preferences the "print to text file" or, on Palm, "print to Memo" options, whatever you desire, are selected.

Do all of this correctly, you get, voila, a text listing.

I already created the RAW file some time ago, so it took me just a moment to print and cut and paste the following for you. Please keep in mind that some of the commands are in their 42S versions (e.g. ISG ST X instead of ISG X and Rv instead of RDN), but this is easy enough to clean up if you ever want to. Also, since the program listing has just one END in it, I think that Leo Duran's hp41uc utility can be used to generate a text listing from the RAW listing in original HP41 format and nothing should be missed. I find that if a RAW file includes several routines with internal "END"s, the hp41uc decompiler will only convert up to the first END it hits. I also believe the issue occurs in the reverse situation of compiling a text to RAW file using hp41uc. Hence, I prefer to use PRP in Free42.

```
00 { 1032-Byte Prgm }

Les

P.S. If you have the "paid" version of P41CX, you can load the Math Pac ROM with the P41CXR utility, then go into P41CX, set the program pointer to MATRIX with GTO ALPHA MATRIX ALPHA, then print the program listing to the Memo application with XEQ PRP ALPHA ALPHA, just as you would on the real calculator with printer or IR module attached-- make sure that MAN is selected in the printer options menu. This will print out the 566 steps to two memos, which are easy enough to find on the Palm. Hotsync with your PC and you can cut and paste the listing right out of Palm Desktop.

## **Re: Nope - no 41c math pac program listing on DVD**

*Message #10 Posted by [Les Wright](#) on 30 May 2007, 7:26 p.m.,  
in response to message #9 by Les Wright*

Quote:

Please keep in mind that some of the commands are in their 42S versions (e.g. ISG ST X instead of ISG X and Rv instead of RDN), but this is easy enough to clean up if you ever want to. Also, since the program listing has just one END in it, I think that Leo Duran's hp41uc utility can be used to generate a text listing from the RAW listing in original HP41 format and nothing should be missed.

Using Export Program from the Free42 menu, I was able to export MATRIX and its subroutines, up to the END at step 566, to its own separate RAW file, which I call simply MATRIX.RAW. Then, with the command hp41uc /r=MATRIX /t /n, I get the following MATRIX.TXT:

```
01 LBL "MATRIX"  
02 2.01  
03 LBL 15  
04 CF IND X  
05 ISG X  
06 GTO 15  
07 SF 04  
08 SF 21  
09 CF 29  
10 "ORDER=? "  
11 PROMPT
```

<snip>

```
551 LBL 32  
552 SF 06  
553 XEQ 18  
554 STOP  
555 FC?C 22  
556 GTO 31  
557 STO IND Y  
558 GTO 32  
559 LBL 02  
560 FS?C 08  
561 SF 05  
562 GTO 19  
563 LBL 14  
564 1 E3  
565 /  
566 END
```

This time, the desire HP41 format of the commands is preserved.

Also, just for fun, I was able to generate barcode. But this is not efficient--the program takes up 148 registers. I think ideally the program should be run from the module so that as many registers as possible are available to store matrix elements.

Les

In respect to concerns about copyright I snipped the innards of my listings. The point was really not to provide a full listing--rather, to demonstrate that a text listing could be readily reproduced with freely available software and utilities--no painstaking hand transcription required!

### A MoHPC's 9114 Repair Manual?

Message #1 Posted by [PeterP](#) on 28 May 2007, 8:01 p.m.

Hi,

I (and my 9114) have tremendously benefited from the collective knowledge around the 9114 that can be found in the archives here as well as active contributors (in particular Tony Duell in my case). Given that the 9114 is a subject that appears a few times every year I thought of trying to create a document that combines at least a large set of the knowledge found here. It could provide a starting point for most questions with regards to the 9114. Please find a first rough draft of this document [at this link](#) . I have tried to cover the subjects which appear most often. For each tid-bit of collected information I have provided a foot-note with a link to the thread where the information was gleaned from. Naturally it has a section at the end giving credit to the people who provided those tid-bits (or truck-loads) of information over the years.

One question in particular to Tony Duell: I have a reference to your datafile article on how to clean the 9114. Yet as it is your article I was unsure if you would want it included in the document, so I have not included its contents as of now (and a link to it is AFAIK not available). It has been invaluable to my cleaning efforts yet if you prefer to not have it as part of a larger document, maybe the articles section of this site might be a very good place as well (that is how I have linked in the information from Steve's article into the document. Via a link to the article section here)

If the community thinks that this is a worth-while undertaking I would greatly appreciate some feedback and error detection on the document. After it went through a few iterations and the community thinks it is a useful document we could send it to David and suggest to add it to the article section.

Thoughts?

Cheers

Peter

Message #2 Posted by [Vieira, L. C. \(Brazil\)](#) on 28 May 2007, 9:22 p.m.,  
in response to message #1 by [PeterP](#)

Hi, Peter;

I opened the document and it looks perfectly fine, well organized and consistent. I just missed the links in some references, e.g., p.02 , item 'i', were one reads [this store](#). I could not find where it points to. Other references, with complete www address, work fine.

I opened the pdf with Acrobat Reader 7. Should I use another, upgraded version?

Congrats! I think that this sort of document, written by members, should become a common sense.

Best regards and thanks. (I was gifted a complete, perfect 9114B by one of our contributors about two years

ago, and it is working pretty fine, so far... cannot help expressing him my thankfulness every time I mention this fact).

Luiz (Brazil)

One question in particular to Tony Duell: I have a reference to your datafile article on how to clean the 9114. Yet as it is your article I was unsure if you would want it included in the document, so I have not included its contents as of now (and a link to it is AFAIK not available). It has been invaluable to my cleaning efforts yet if you prefer to not have it as part of a larger document, maybe the articles section of this site might be a very good place as well (that is how I have linked in the information from Steve's article into the document. Via a link to the article section here)

---

I have no objection to the article appearing in the document, provided I get credit for it. Perhaps as a separate section (appendix?) with 'Tony Duell's DataFile article' as a title.

How you get the article is another matter. I can easily provide you with the plain text version of the textual part (just e-mail me). But I don't have a fast net connection, so I can't do the photos. Perhaps Bruce Horrocks (HPCC editor) can provide you with the article.

I have now discovered there's a second version of the eject mechanism, which seems to have come in about the time of the FC16 PCB (old drives have an FC9 PCB). It doesn't come apart so completely, the linkages are rivetted to the chassis parts. So there's less to take off, but cleaning the old grease out is harder.

I have no idea if it ever turned up in the 9114A, though.

I did take one of these apart and photograph it, and was planning on writing a second article covering that. Unfortunately, due to, how shall I say, disagreements withing HPCC, I don't know if/when I'll bother to write it, or indeed if it will ever be published.

## **Re: A MoHPC's 9114 Repair Manual?**

*Message #4 Posted by **PeterP** on 30 May 2007, 12:59 a.m.,  
in response to message #3 by Tony Duell*

Hmm, yes I gathered from some in-between-the-lines reading some slight discontent, I'm very sorry.

I have included your article as an apendix, it is also mentioned in the opening paragraph

Quote:

---

The appendix contains the full document from Tony Duell with pictures on how to clean the 9114.

---

The watermark for a test-version is there only temporary, before sending it on its way I will have found a

way to remove it :-)

Luiz, thank you for your kind information with regards to the links, I believe I have fixed that. My appologies for this.

Please let me know what you think and if you believe it is a worth while submission to the article section.

Cheers

Peter PS: The link is still the same. [The MoHPC 9114 Repair Manual](#)

Don't you mean two? That's what I'm buying, and since hearing my fathers response this news he will be doing the same.

**Re: ENTER key is back and in the right place***Message #7 Posted by [Walter B](#) on 29 May 2007, 2:51 a.m.,  
in response to message #6 by [Hugh Evans](#)*

Hugh,

so far, I'm content with one sample of each scientific HP model. I don't see a need to change this policy, also since I hope for more models of similar kind and design. I've got some models aged >30, and they are still going strong :-)

And HP won't stop production of this new 35s after some months, I guess, based on all the resonance seen here.

BTW, this buying policy saves some money for other expenses, too...

## HP-35S and the significance of "E.M.E.A."

Message #8 Posted by [Karl Schneider](#) on 28 May 2007, 8:45 p.m.,  
in response to message #4 by marais

Quote:

Anybody know when this wonder will be available in Europe?

Perhaps sooner than in North America. After not finding anything about the HP-35s at HP's official website ([www.hp.com/calculators](http://www.hp.com/calculators)), I decided to browse the site originally provided (<http://www.calculators-hp.com>), and found the following:

---

*www.calculators-hp.com is the official hp partner site for EMEA.*

*In 2007, Solution Micro System (SMS) has become the official importer and distributor for hp calculators for **Europe, Middle East & Africa**. SMS is more seeking for resellers & partners in each available countries.*

*In 2006, SMS has become the official partner and importer for HP Calculators for EMEA\*. In 2007, SMS is setting up a complete network of exclusive distributor per country.*

*www.sms.fr*

*\* SMS has distribution for all Europe, Middle East Africa excluding Spain, Portugal, Germany, Austria and Italy.*

---

My nearest full-service retailer (in Wilsonville, Oregon) did not have any HP-35s in stock.

I would hope that the HP-35s is the replacement for the HP-33s.

I'm still wondering about a few things on the HP-35s, but the answers will have to wait until it's available. I, too, noticed the square brackets and the new "(j)". Yes, square brackets are how matrices are denoted on RPL-based models; "(i)" and "(j)" could serve as matrix indices. Matrices would also be the best use of "800+ independent storage registers". However, I'm just not seeing any commands that would provide matrix functionality. (Consider the HP-15C, with function keywords MATRIX, DIM, RESULT, and a number-coded set of useful functions.)

Remember also that the indirect pointer-containing register was denoted "i" on the HP-33S, and that "(i)" provided access to the pointed register. Lower case was used to prevent confusion with the lettered register "I". On the HP-35S, however, there is an "i" that enters the basis of imaginary-valued numbers. So, "(j)" could be used to provide access to the pointed register now specified in "(i)".

Just curious: Where are "IP" and "FP"? I also don't see polar<->rectangular conversions, which might now reside under "ARG".

UNDO is a good use of RPL functionality to exploit the 31 kB of memory. However, the HP-32/33 paradigm and apparent lack of I/O will still render all that RAM difficult to fully utilize.

As far as I can tell, the HP-35s is still not an HP-15C, but it's a vast improvement over the HP-33s.

## Re: HP-35S and the significance of "E.M.E.A."

Message #9 Posted by [Howard Owen](#) on 28 May 2007, 9:20 p.m.,  
in response to message #8 by Karl Schneider

I wonder if they will continue to be HP's EMEA partner after leaking this news. HP hates that sort of thing. Does the site have product in stock? I'm betting they don't. Outpost.com (owned by Fry's Electronics) is still selling the 33s as of this evening, so I think we are dealing with a prerelease announcement.

IP and FP do appear to be missing. These are very basic programming functions, so that leads me to wonder if there isn't more to this calculator than meets the eye. Perhaps there are functions only accessible through menus? (Or perhaps "XEQ" is more like it's namesake on the 41C/42S?) Good catch on UNDO, also.

Regards,  
Howard

in response to message #18 by Gerson W. Barbosa

Hi, Gerson --

After reviewing the French-language version website (with a little on-line translating), it seems to me that the HP-35S

and HP-10S will be *exhibited or introduced* at this "MEDPI" electronics fair in Monaco during 29 May - 1 June, but the models will not be available for retail until sometime in Summer. I don't know if US/Canada introduction will be concurrent with 'foreign' introduction.

Note that "ete" (e's are 'accented') means "summer", and "juillet" means "July".

I have heard from a local Australian dealer that the 35S has not even gone to mass production stage yet, so don't expect it anytime soon.

Dave.

### New HP-35S

Message #22 Posted by [Karl Schneider](#) on 28 May 2007, 6:12 p.m.,  
in response to message #3 by [Thibaut.be](#)

Hi, all --

Quote:

Seems they've been reading this forum...

Looking forward to seeing this calc.

Quote:

holy s\*\*t, they listened!

I'll say! Yes, I strongly suspect that HP has been reading this Forum, because it seems that practically every item that I and others have posted about -- and more -- has been addressed. For example:

- The yellow-and-blue colors on a dark background with rectangular beveled keys for a neat arrangement is immediately noticeable.
- The one-line complex-number display with "i" key and blue-shifted angle is present, and I hope it works as I've advocated.
- HYP is adjacent to the trigonometric keys.
- The logical grouping is much improved.
- The minimally-useful cube root and cube ( $x^3$ ) functions seem to be absent, despite what the ad copy says.

Yes, fundamentally it's a redesigned HP-33S, but the effort at first glance is very impressive.

I'll get one ASAP.

I'd like to use both the HP-50g and the HP-35s, but the lack of a keyboard standard might be a problem. I particularly appreciated the row above the ENTER key, as it almost matches the one on the HP-48G/GX keyboard. If only there were an HP-50g version with this key pattern...

**keyboard standards**

Message #26 Posted by **bill platt** on 3 June 2007, 12:06 p.m.,  
in response to message #25 by Gerson W. Barbosa

When I grew from being a mere HP user to being a collector, one of the 1st awakenings I went through was the keyboard variations. After 4 years of collecting, I can now quite good at going back and forth. It is rather similar to going from the workplace computer to the home computer--you just switch gears as it were.

I think a keyboard "standard" would be rather constricting to good design; on the other hand certain functions certainly do belong near each other.

One other anecdote:

I used an 11c for 13 years non-stop--and then had to replace it with the 32sii. I quickly adapted to that machine, appreciating its similarities with the 11c, along with the changes generally all for the better. Nevertheless when I finally bought an 11c again to begin my collection, I was amazed at how I was instantly back home. I found I even remembered the keycodes from programming it!

**Re: keyboard standards**

Message #27 Posted by **Gerson W. Barbosa** on 3 June 2007, 2:43 p.m.,  
in response to message #26 by bill platt

Of course the keyboard standard would apply only to a small subset of keys: [0]..[9], [ENTER],[/],[\*],[-],[+],[+/-],[EEX],[SIN],[COS],[TAN],[SQRT],[HYP],[y^x],[1/x], the shift keys, the shifted functions LN/e^x, LOG/10^x, x^2 and xSQRTy, for instance. This would make things easier for the user when switching from the graphic to the scientific calculator. Anyone who uses the HP-50g and the HP-33s on a regular basis knows what I mean :-)

*Message #31 Posted by [Howard Owen](#) on 28 May 2007, 5:43 p.m.,  
in response to message #30 by [Paul Dale](#)*

At a glance. the features do indeed look very similar to a 33s. I have hope for the programming model. The mention of "800+" registers means they've put some thought into how to use the ~32K of memory, much of which went to waste in the 33s. Perhaps you can have 800+ labels now, too.

It sounds like they listened carefully to the feedback they got at last year's HHC.

Regards,  
Howard

Not only a big ENTER key, but a slightly modernized "tall key" design. Excellent! Lets hope these are solid hinged keys, not the wobbly rubber keys. And RPN keystroke programming, not RPL. I'm in!

Based on the keyboard, the available functions seem very similar to those on the 33S, although cosmetically the 35S is much superior.

The question is whether or not the 35S has better programming capabilities than the 33S. The 33S, like its predecessors the 32S and 32SII, had very limited numbers of variables and labels, which hindered programming. Basically, the 33S is limited to single-letter, non-repeating variables and labels ("A", "X", "T", etc.).

The brochure indicates that the 35S has "800+ Memory Registers", so something must be different. No indication about the number of labels. There doesn't appear to be an alpha-lock key, which suggests that the 35S still may not support long variable names.

Apparently no I/O.

Any indication of a price anywhere?!

Has the same weight as my 33s (which is about half that of my 35), so construction is probably similar.

**Re: hp 35s arrived**

Message #39 Posted by **Howard Owen** on 28 May 2007, 5:55 p.m.,  
in response to message #38 by Dave Shaffer

I just got my first 35, and I was surprised by its weight. The keyboard looks so similar to later TI models, all of which were lightweights, that the heft was disconcerting. I weighed it just now on my questionably accurate postal scale, and came up with 8.5 Oz. However, taking out the battery dropped it down to 6.5 Oz. My 33s weighs in at 4.4 Oz, so that cuts the difference in half.

Regards,

Howard

Congrats to all of you patient HP RPN fellows!

Looks like a beautiful product worth to be added to my HP calculator line as well - although my daily work is focussed more on using the financial line of HPs calculators.

For us Europeans one questions comes up after reading through the announcement of SMS (claiming to be the new EMEA distributor) - will Moravia Consulting still honor their extended 3 years warranty for the HP49G+ ???

Best regards

Peter A. Gebhardt

And to think you guys tried to beat my enthusiasm into submission! :-P I will accept appologies ;-)

It's not up on the HP website yet. Doesn't look fake though, and it's past April fools, must be the real thing!

I wonder if in RPN mode you get both X and Y regs displayed on the two line display like the 42S? Presumably the firmware would come from the 33S?

I do hope it's got proper rubber feet on the bottom!

I'm surprised there is no special 35th anniversary marking on the case.

Things I like: - It's got the right "look" deserving of the 35s title. - Traditional key placement including the large ENTER key - Separate exponent, 1/x, and sqrt keys, the most used keys IMHO (they could have goofed this one) - The colour contrast on the keys looks good. - Appears to strike a good balance of features in order to keep it a basic scientific but make it marketable to the general public. - Raised edges to protect the keys.

(Selfish) Things I dislike: - The arrow keys. A basic scientific shouldn't need them. - It's too powerful for my needs, and the result is having shifted keys that I would have preferred to have as dedicated. - It's too big and thick, I would have preferred something a bit smaller -Battery life could be longer.

Of course the negatives are quite minor and personal, overall I think they have done a supurb job, my hat is off to the people at HP, it appears they really do care! I think they are on a winner.

Just hope the quality is there.

Dave.

I would have preferred traditional keys instead of the "cursor diamond", but please see that the up and down keys may be used to navigate menus and programs... something we used to do with SST and BST, which doesn't appear in the 35s. Left and right allow for editing, more convenient than just backspace... but, by the way, at its time we welcomed backspace as more convenient than just CLx...

If you say so, but it seems to me that's a matter of conditioning rather than an inherent resemblance. The cross layout is logically valid for moving a cursor on a screen intuitively in two dimensions.

Perhaps, but those keys have a different size, shape, color and layout than all the other keys, which I find visually distracting. I'd like them to be just like all the others in their section of the keyboard, such as on the HP48. In fact, I'd prefer that *all* the keys were exactly the same size, shape and color (except the [ENTER] key) and that they were laid out in even rows, with the same number of keys on each row and the [ENTER] key exactly twice the size of the others, so that the keys formed a perfect grid, and the only way to tell them apart would be by reading what's printed on them.

Well, ta di da.

How nice that you have appointed yourself king of all standards.

You want them all the same size except the ENTER key? How consistent of you.

Be consistent and have all of them the same size.

I bet HP is crying that you won't be buying one.

**Re: hp 35s arrived (cursor keys)**

Message #51 Posted by [Wayne Brown](#) on 29 May 2007, 4:33 p.m.,  
in response to message #50 by John

You might have noticed that I said I'd *prefer* they all be the same size. There are a lot of other things I'd prefer, too: Like perfectly straight sides, knife-sharp edges and corners (no curves or rounding of any surface) on the cases, etc. But no calculator -- even my all-time favorite, the HP-41 -- had those features. I'd like to have those things, but they aren't essentials. The only flaw that keeps me from wanting a 35s -- the only "deal-breaker" for me -- is the cursor-key issue.

Yes, I'm sure HP doesn't care whether I buy one or not. They probably don't even care about the tens of thousands of dollars my employer spent on Sun equipment after I recommended against HP-UX servers, but it made *me* feel better.

I know, I know, you would prefer to have blood gushing down your arm if you squeeze the calculator too tightly, and you'd want holes in your shirt pocket if you put the calculator in your pocket. Last time you said you wanted the knife-sharp edges I thought you were exaggerating, but now I'm not so sure. Somehow I don't think anyone else would be interested in something so impractical. I carry a knife on my keychain so I don't have to use my calculator to cut things.

Rounded edges make it much more comfortable to hold and prevent it from causing excess wear on its case (or anything else it touches -- I don't want my wood tabletop dented because I dropped the calculator a few inches onto it). Plus, sharp edges chip more easily, so rounding the edges makes the calculator itself more durable.

Something you need to realize is that *not all change is bad*. Sometimes changes, perhaps through improvements in manufacturing technology, make things more usable. For example, it makes sense to make all buttons the same size and color if you are trying to save money when manufacturing the product, but I want a premium calculator, and therefore I am willing to pay extra to have buttons of different sizes

and colors to improve usability.

Some of my slide rules have sharp edges and corners, but I've never cut myself on any of them, even the metal ones. In particular, my aluminum Pickett N600-ES has such sharp corners and edges on the slide that it probably could be used as a weapon. (I've always found it amusing that airport security lets me carry it on planes while forbidding less "dangerous" items.) The leather case protects both the rule itself and my pockets from damage.

My coffee table also has corners that would draw blood if I bumped a knee against it, but somehow I've survived it all these years.

But what I'd really like *is* a change. None of the HP calculators with which I'm familiar has all the buttons the same size and shape; the number buttons generally are larger than the others. And even the HP-41 has slightly curved sides; plus, it's thicker at one end than the other. What I *really* would like is a calculator that is a geometrically perfect rectangle, with uniform thickness and everything laid out to be perfectly symmetrical with nothing but arrow-straight lines meeting in perfect right angles. The more it resembled a precision-cut slab of polished black marble, in appearance, surface texture, and weight, the better I'd like it. I'd be willing to pay extra for *that*.

Yes, I know. I already said HP has never made a calculator with all the design features I'd like (and neither has anyone else, as far as I know). I don't expect anyone ever will, either. That's why I might be willing to settle for a 35s, *if* they would replace those cursor keys with the HP48 arrangement.

Cue recording of "Also Sprach Zarathustra".

And would the edges be in the ratio of 1:4:9?

How would you distinguish the keys and read the display, if the whole thing is featureless black?

Don't *ever* set foot inside the cockpit of a plane. All the controls are different colours and shapes, for perfectly valid usability reasons. You'd *hate* it.

Best,

--- Les

Too late. I've flown with a pilot friend in small planes on a number of occasions, and used those controls myself. (He handled the take-offs and landings, and let me fly between airports, "fly the pattern" and make the approaches.) I like aircraft gauges and controls (especially those

in large planes) for one reason: They look insanely complicated to the uninitiated. That's another thing I like in a calculator, too. I like any sort of equipment that looks cryptic and intimidating to those who haven't taken the time to master it; hence my extreme dislike of things like the 33s that try to look "cool" or "friendly" to non-technical people. Dark, somber colors, and a heavy, solid, industrial appearance that says, "Watch out, you need a great deal of expertise before you even *think* of trying to use me!" are what I prefer.

Are you thinking of that monolith in "2001", some 5 years before HP35A? Anyway, HP's key history (sic!) is a line of cost cutting: starting with 4 groups of individual keys in different colors on HP35A, running through all black individual keys on the Voyagers (but still colored prefixes), down to a grid of all black keys on the Pioneers and 48s. So, the line *was* running towards your target!

I can appreciate that, but for some reason I don't find it annoying. The fact that the cursor keys are unique in their function of navigation vs. command execution justifies their unique appearance. It's sort of like a keyboard and mouse combination on a pc. The cursor keys serve as a sort of mouse, so their inconsistent appearance is consistent with their purpose.

Message #66 Posted by **Walter B** on 28 May 2007, 6:30 p.m.,  
in response to message #65 by Howard Owen

My impression, too. Round brackets on top, square brackets in blue. If you do not allow implicit multiplication, then you need just one key for ALG-mode parentheses:

If pressed after an operation (+, -, \*, /, y^x), it will open a new parenthesis.

If pressed after a number, it will close a parenthesis.

Please also note the red print on the keys "0" and ".": there seem to be two index registers, i and j.

Gerson.

**Re: Check This Out**

Message #77 Posted by **Howard Owen** on 28 May 2007, 8:45 p.m.,  
in response to message #76 by Gerson W. Barbosa

There's a SOLVE key, which could have more capability than the solver on the 33S.

I don't know for a fact that matrices are implemented on the new machine. But taking the square brackets,

the two indirection operators and the 800 registers together, I'm guessing that some sort of matrix solution is in there. the evidence is a little thin, I'll admit.

The other unknown operator I notice is the ARG key. (It is definitely "ARG" and not "ALG".) Any guesses as to what that is?

Regards,  
Howard

It would certainly be nice if matrix functionality is included, but I'm skeptical since it is not mentioned in the datasheet -- and matrix functions would be more noteworthy than cube root! But, here's to hoping.

The measurements indicate that the 35s is about the same size as the 33S in length and width, albeit somewhat thicker. I would really like something thin like the 6s.

### **RPN By Default?**

*Message #83 Posted by [Howard Owen](#) on 28 May 2007, 7:11 p.m.,  
in response to message #1 by [ssf](#)*

I see evidence of this in that brochure. The headline is

Quote:

Get professional performance from the ultimate RPN scientific programmable calculator. Switch between RPN\* and algebraic entry-system logic at any time.

It's "The ultimate RPN scientific .." And you can "[s]witch between RPN and algebraic" as you like. Note the order. Finally, the picture has the RPN annunciator lit.

Regards,  
Howard

in response to message #1 by ssf

Anyone else notice that the Left and Right shift keys don't actually make sense, as the functions aren't listed Left/Right on the keys, but Up and Down?

Colour coding is consistent though.

And what's with the red "Ab/c" mark below the "." key, it sticks out like a dogs hind leg!

Dave.

---

Just as much sense as 'f' and 'g' (and sometimes 'h') meant!

Interesting that there are both ARG and LASTx (shifted) functions, as well as both INTEG and Integralsign.

Keep in mind that the actual released 33S had some different key placements than depicted in pre-release photos.

In addition to the apparently missing polar/rectangular conversions, I don't see how to change modes between RPN and algebraic -- perhaps buried in the FLAGS menu?

Since [if?] this is to be officially announced soon, then those who have been playing with it and bound by NDA will soon be able to answer our questions (and we know who you are!!).

in response to message #93 by DaveJ

Quote:

And what's with the red "Ab/c" mark below the "." key, it sticks out like a dogs hind leg!

That's the fraction entry function, same as on the 33s. It looked like it was pasted on as an afterthought on the 33s, too. Only with the 35s, the color contrast is better, so it's even more obvious. 8) The reason it's stuck on is that it is neither a main, left or right shifted key. Its fraction input function is enabled in context. So

1 . 2 . 3

is one and two thirds, the second period changing the meaning of the preceding and following digits.

**Last Year's NDA**

Message #113 Posted by **Howard Owen** on 28 May 2007, 11:51 p.m.,  
in response to message #1 by ssf

Since this has been publicly revealed, I'm free to state that we were shown a layout like this (keys only, no function labels) at last year's

HHC conference. They were very closed lipped on the details other than the fact that they were working on a machine, and that it was shaped like you see, with a big ENTER key. We saw a small amount of other stuff that *hasn't* been revealed, so I have to remain quiet about that.

In particular, we were not given any information with regard to the implementation of the calculator. But Richard and Wlodek presented papers regarding what needed fixing in the 33s, and what "nice to have" features they wanted. All of the attendees gave HP an earful on the same subjects as well. They seem to have listened to at least some of the advice they were offered then. To be fair, with a guy like Sam Kim guiding product generation, they may have come up with most of the ideas themselves. Without touching this calc, I can tell you I am 99% certain the build quality will be up to snuff in the eyes of this community, since Sam, an old time PPC member and "calculator geek" was involved. Kudos to him, and to everyone else at HP involved in bringing this machine to market.

There's just one problem I can see. My expectations of what you will produce next have been raised considerably. Of course, that's my problem, not yours. Way to go!

Regards  
Howard

### HP-35S: Last Year's NDA

Message #114 Posted by [Karl Schneider](#) on 29 May 2007, 1:31 a.m.,

Hi, Howard --

"...presented papers?" Heck, the following thread from August 2004 would have (and actually seems to have) covered most of it! Oh well, whatever it took...

- "Forgotten Fundamentals: the HP-33S" at <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62029#62029>

Now, if the complex-number functionality is implemented substantially as outlined in the September 2004 thread below, I'll demand consultant's fees and formal acknowledgement! (*Just kidding*).

- "User-friendly complex numbers" at <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=63415#63415>

### Re: HP-35S: Last Year's NDA

Message #115 Posted by [Howard Owen](#) on 29 May 2007, 1:59 a.m.,  
in response to message #114 by Karl Schneider

That is a pretty thorough analysis of what is wrong with the 33s, Karl. I don't know what processes Richard Nelson and Włodek Mier-Jędrzejowicz followed to arrive at the contents of their papers. They may well have read your post, or maybe not. The papers covered similar ground, of course, but with perhaps different emphases and styles. At any rate, the papers were indeed presented at the conference, and framed the discussion there regarding the 33s.

I'd be very interested to see you revisit your critique, comparing the new machine, once you get your hands on one.

Regards,  
Howard

### What else is in the pipeline then ?

Message #116 Posted by [Donald](#) on 29 May 2007, 3:56 p.m.,  
in response to message #113 by Howard Owen

Quote:

---

... at last year's HHC conference... We saw a small amount of other stuff that *hasn't* been revealed, so I have to remain quiet about that.

---

I think the HP 35s is a fantastic step forwards, for which HP must be congratulated - it will sell a whole lot better than anything they have had on the books lately.

However, I showed the datasheet to a work colleague who I know prefers RPN calcs. He was not that impressed, saying 'I like the small ones they used to make'  
- like this ? ( my HP15c ) 'yes'.

Given the very middle road status of the older HP33S, and considering there are 4 financial models: This model seems like a #3 in the line model. Can we expect an even more up market position #4 model before too long?

So, even though the dust hasn't settled on this one, any thoughts on the nature of, and which market segment the still to be 'revealed' items will fall ?

A premium professional, direct HP15C replacement, a la HP12C platinum.  
or for the student market: a color competitor to the TI-NSPIRE uber-PDA with keys.

Has the HP48S ... HP50G line reached the natural end of it's development ?

### **Re: What else is in the pipeline then ?**

*Message #117 Posted by [Howard Owen](#) on 29 May 2007, 5:54 p.m.,  
in response to message #116 by Donald*

Quote:

---

So, even though the dust hasn't settled on this one, any thoughts on the nature of, and which market segment the still to be 'revealed' items will fall ?

---

I feel free to speculate on this because we weren't given anything to chew on in that regard other than what I've already talked about.

My guess is they won't come out with a Voyager style machine. The reason is twofold. First in terms of features, the 35s seems to cover quite a bit more than the 15c in many respects. Where it is lacking in comparison with the 15c, it ought to be possible to make up for it with programming. (I.e., matrices, possibly.) That means there would be little to differentiate a Voyager form-factor calculator from the 35s. Of course, HP would be free to implement even more functions on such a machine, but that brings me to my second point. The 50G stands as a barrier to any midrange scientific in terms of adding features. If you enhance the midrange too much, it will start to cannibalize sales from the 50g. I think that's one reason you won't see USB or serial I/O on a midrange scientific. But oh, some removable flash would be nice! (BTW, I've noticed a fairly steep drop off in 48GX prices lately. I wonder if that's due to the 50g and its available enhancements?)

As far as the RPL models go, I think there's lots of room for improvement there. Memory prices continue to drop, and power efficiency per unit CPU cycle continue to rise, so hardware trade-off calculations will change over time. With 64 MB of RAM and a 1GHz processor, say, you could do quite a lot of interesting portable mathematics. (Mathematica/Maple/what have you in your palm?) At the interface of hardware and software, there's the whole issue of Saturn emulation. A native ARM implementation or a greatly enhanced emulation could lead to big performance gains. At the operating system level, there's the whole "port" architecture, which is a kludge to get around the limits of the Saturn address bus. Well, if you aren't emulating a Saturn, you can do away with that. SysRPL, like UserRPL is a magnificent language, fully general, and fun to use once you get over the steep learning curve. I'm sure that despite that, both dialects could be improved, and this offers another avenue for progress.

Regards,  
Howard

Or maybe like IJ on the HP-42S, for matrix indexing?

### Re: hp 35s arrived i j

Message #121 Posted by [Valentin Albillo](#) on 30 May 2007, 6:35 p.m.,  
in response to message #120 by Thomas Okken

Hi,

Self-quoting from [this message](#) I posted a few days ago:

*"[...]ARG" (yellow), and "Theta" (blue), over and on the "i" key are obviously the functional equivalents of the R-P/R rectangular/polar conversions, as they probably input/return/display the components of a complex number either in rectangular form or polar form. Also "i" itself must surely be the way to specify the imaginary part in rectangular form, so all three related functions are very ergonomically placed on the same key.*

*This being so, "(i)" and "(j)" must surely be used for indirect addressing, and they do correspond to 2 separate special registers which are both used to independently specify indirect addresses, Register (i) and Register (j).*

*This would be very convenient, as having more than one register for indirect addressing is pretty useful in matrix programming, say. That's why the HP-41C/42S would support any register from 00 to 99 (and more using synthetic means) to be used for indirect addressing, while regrettably the HP-15C was limited to just one, the "(i)" register."*

i.e., (i) and (j) I are just two special registers mainly used for indirect addressing, instead of just one. I don't think the HP35s has any built-in matrix functions or matrix-specific capabilities.

Best regards from V.

Yes, you're probably right. The 35s looks like it has at least *some* functions hidden in menus (the shifted functions on the cursor keys look like menus to me, and the flyer mentions menu and softkey functionality, too)... but there are no signs of any significant matrix support on that keyboard. *\*sigh\** It's too bad... Having two index registers is better than having just

one (implementing matrix code on the HP-67/97 and HP-19C/29C could be pretty painful because of this) but then again, having only 2 index registers is seriously lame compared to having 100 of them like on the HP-41 and 42S (never mind the TI-58/59 that started this trend!).

Awww, shucks.

Fantastic!!

I think HP is finally tapping into their heritage...part of which is the superior keyboard layout that Bill Hewlett and his original team put so much thought into. It's about time.

Now Mr. Hurd, take this concept across the board and make true HP's out of the entire model line.

Hal

**Re: hp 35s arrived**

*Message #127 Posted by [Les Wright](#) on 29 May 2007, 1:52 a.m.,  
in response to message #1 by ssf*

Wow!

This seems almost too good to be true.

It looks like it extends the number of registers beyond the 26 lettered ones on the 33S (plus the stats registers that can be indirectly addressed). Lets hope that the number of program labels is correspondingly increased, ideally by alphanumeric strings for globals and numbers for locals, as in the 41C and 42S.

If the picture is to be believed, we have single line complex numbers, like with the 42S. And the keyboard layout and colours are most attractive.

I wonder what the pricing will be? Probably a bit more than the 33S, but I would expect not much more.

Maybe this will be the thank you gift at HHC2007?

Les

Dearest HP33s calculator, (a bit of humor)

I've met something new. It's a little older, and refined...but goodness, it's sleek! I can't stop thinking about it... Unlike you, it's comfortable with who it is- No! You know exactly what I'm talking about! For the last two years I feel like I've been dating a cellphone or...gasp- a PDA! I don't like the looks I've been getting from people since we've been together.

Don't take this the wrong way...I need more than 30-some REGisters! I feel like you've been holding out on me, what with all that MEMory. I won't be teased any longer! There's really nothing to ARGue about.

Sure we had some good times...but I'm often confused when I look at your face. There's too much going on there...besides, that shade of green (turquoise?) is all wrong for you. Don't frown at me like that! You always were a bit edgy... To be honest, I knew from the moment we ENTERed into this that it wouldn't really LAST. We'll always have final exams! :)

I won't even mind if the packaging features a couple of engineering students huddling over a desk that has a superimposed image of a 35s on it, lol :)

Whoo-hoo! The return of HP Calculators is here!

Message #136 Posted by **Alex L** on 29 May 2007, 2:38 p.m.,  
in response to message #135 by Steve Borowsky

Quote:

What's a reasonable price?

I wish that question had an easy answer.

Consider the condition and whether you'll be including a manual or case. Look at recently ended auctions/sales for the same item. Consider how much you value knowing that by selling it here you will probably bring someone joy.

In the last month, I've seen them go for nearly \$200, I've seen them go for \$50.

Maybe wait until the price of the 35s is revealed, and sell it for that amount plus shipping & a small profit. If I were to find one today at a garage sale for a buck, that's probably what I'd do.

Best wishes,

Alex

Quote:

What's a reasonable price? I might be willing to part with one of my 32's because of the 35s.

I'd happily pay \$100.00. I'd swallow hard and pay up to \$300.00. I doubt they will go that high, considering the competitive landscape. (They are the underdog, needing to convince users of an entrenched competitor's product

to switch if they want to gain share.) The 33s lists for \$50.00, and the 50g for \$150.00. So \$100.00 list would split that difference down the middle.

Regards,  
Howard

Can't find it right now, sorry. It was simply a (private) case design study. I tried to keep it as simple as possible, retaining classic design elements only where they don't interfere function.

In the end, I've chosen to place the LCD in topmost position and to bevel the bottom edge, placing the HP logo there.

The actual 35s is way more related to the classics in terms of design. I like it :-).

in response to message #130 by [Antonio Maschio \(Italy\)](#)

Gee, they must've rehired the guy that designed the HP65/67 - lotsa design cues there.

My compliments, HP, for listening to folks here and bringing back Big Enter and losing the 'chevron' layout.

And at the very least we have a physical platform that can be changed.

We could put a 41/42S emulator inside - the actual key legends are not too crazy for this purpose, and a new, quality overlay for shifted function legends could readily be manufactured in small quantities.

Whee! It's a pretty good calc, and we have the mechanical handiwork done for us so all we need to do is new firmware if we want a certain style of calc.

BTW, the Sunplus SPLB31 is a flavor of a 65C02...

Please note standard overlays will hide the golden print only, leaving the blue visible. Using slightly more flexible material, however, simple overlays may be made also covering the slanted key fronts with something like a flap, one flap per key. Then, we are really free to change the shifted functions.

But let's get the original first at least once before changing it! I'm really looking forward to this model d:-)

Any information about prices yet?

Now - can anyone confirm whether there is any I/O capability?

Well, I'd say *confirmation* will have to wait until someone gets hardware in their hands, or HP puts up some additional information. So for now, you'll have to settle for *pure speculation*:

Evidence and/or factors suggesting it **will** have I/O:

- One giant drawback to the 33s is lack of I/O, and HP seems to have listened to most of the suggestions/demands for improvements to the 33s. So maybe HP might also provide I/O in the 35s.
- I/O functions could easily be included in a menu accessed by the MEM function (e.g., Archive and Restore commands)
- no mention of NCEES on the "Permitted for use on" line.
- Surveying is listed on the "Subject suitability" line. My understanding is that surveying is data intensive and there has historically been a vibrant industry in developing programs, both of which would certainly benefit from I/O.

Evidence and/or factors suggesting it **will not** have I/O:

- no mention of I/O on the spec sheet. I/O is a pretty major feature to leave off of the list.
- no mention of an I/O cable on the "What's in the box" line.
- I/O might be the feature that is the "line in the sand" between the scientific models and graphing models.

It does not say it has Flash ROM, and even if it did it would not surprise me if HP ordered a Mask ROM version. That means the code can't be changed. But it would still be possible to hack the machine with an equivalent flash ROM processor to run custom software for those who are that keen on changing things, if there is space inside that is. Should be enough room though, it's thick enough!

Dave.

in response to message #152 by DaveJ

Quote:

But it would still be possible to hack the machine with an equivalent flash ROM processor

Not easily. Assuming that it is constructed similarly to other recent HP calculators, the processor is mounted using Chip-on-Board (CoB) assembly, where the die is attached directly to the PCB, wire-bonded, and covered with a blob of epoxy. It's not possible to simply desolder the chip and solder in a replacement.

Once upon a time, I asked someone at HP about the possibility of buying an OEM version of the HP 49G with no HP logo and no key legends, and was told that it was probably possible even in relatively low volumes (e.g., quantity 1000). If someone is serious about selling a calculator with custom firmware, this might be worth pursuing for a newer model such as the 50g or 35s. For the 35s, though, such an OEM model would presumably be delivered with \*no\* processor, and the volume would probably have to be significantly higher.

**Re: hp 35s arrived - we can change it if we don't like it**

Message #154 Posted by [Hugh Evans](#) on 29 May 2007, 9:56 a.m.,  
in response to message #146 by Bill Wiese

Well, I'm planning to buy at least two of these anyways. But, I think we owe it to ourselves to make modification kits by replacing the PCB, popping in a more powerful CPU, emulating the 41c, adding USB support, and then dealing with key labels.

I strongly doubt HP will be molding the key legends, which leaves them open to stripping and silk screening. Judging by the thickness of the enclosure, it should be possible to fit in some much higher capacity batteries.

Or judging by how well they've done with this 35s, we could just ask HP if they're already planning something along these lines as well as a 15s. :-)

## HP35s: A few assorted observations

Message #156 Posted by [Valentin Albillo](#) on 29 May 2007, 5:26 a.m.,  
in response to message #1 by [ssf](#)

Hi all:

Very nice-looking machine, and what a surprise, I was also expecting some existing calc relabeled as "35th Anniversary" !

I'll certainly get a couple of them (or more if the price's right, to present them to selected people), if only for writing programs for it and articles about it. As it seems some of the nastiest software and hardware annoyances of the HP33S (which prevented me from buying it in the first place) have been corrected, this surely will be both interesting and enjoyable.

Some random thoughts, after inspecting the keyboard and brochure:

- The 800+ storage registers might be addressed like this:

```
Register 00 to Register 99 = 100 registers
Register A to Register Z = 26 registers
Register AA to Register ZZ = 676 registers
Register (i) and (j) = 2 registers
-----
                        804 registers
```

This would cater for 800+ registers, all of them *\*directly\** addressable (as well as indirectly, of course), and would provide compatibility both for classic calculator's programs (R00-R99) as well as HP33S' programs (RA-RZ).

If this addressing scheme is indeed used for direct storage register addressing, it seems to me quite possible that it's also used for label addressing, so it would support up to 802 labels, namely LBL 00 to LBL 99, LBL A to LBL Z, LBL AA to LBL ZZ. This would be more than enough for 32 Kb worth of program code.

- Even 800+ registers only take 6.5 Kb, at 8 bytes per register. As 32 Kb seem to be available, that would mean that most of it can only be used for program storage but not for data storage, unless the 800+ register count only refers to *\*directly addressable\** registers, as outlined above, but you can have nearly 4,000 of them *\*indirectly\** addressable and this is simply not mentioned in the add because 800+ is more than enough and mentioning indirect addressing would incur in too much specific technical details for such a simple brochure.
- "ARG" (yellow), and "Theta" (blue), over and on the "i" key are obviously the functional equivalents of the R-P/P-R rectangular/polar conversions, as they probably input/return/display the components of a complex number either in rectangular form or polar form. Also "i" itself must surely be the way to specify the imaginary part in rectangular form, so all three related functions are very ergonomically placed on the same key.
- This being so, "(i)" and "(j)" must surely be used for indirect addressing, and they do correspond to 2 separate special registers which are both used to independently specify indirect addresses, Register (i) and Register (j).

This would be very convenient, as having more than one register for indirect addressing is pretty useful in matrix programming, say. That's why the HP-41C/42S would support any register from 00 to 99 (and more using synthetic means) to be used for indirect addressing, while regrettably the HP-15C was limited to just one, the "(i)" register.

I don't think that "(i)" and "(j)" have anything to do with built-in matrix functionality, which I think is absent, but sure I would like to be proved wrong on this.

- INTG seems to me to be "Integer Part", as the INTEGRAL functionality seems to be the "integral" character over the EQN key. If that's so, it might be possible that the square-brackets symbol "[ ]" is actually the "Fractional Part" operation, though perhaps it might be used for additional purposes depending on the context or mode.
- LOGIC must surely be a menu, including such logical operators as AND, OR, XOR, NOT, etc., while BASE is obviously another menu including base-n operations/conversions.

Now, let's hope the physical quality is adequate, most specially the keyboard if nothing else, and we're all set up for an interesting ride again ! This is what the HP33S should have been !! :-)

Best regards from V.

\_\_\_\_\_

Valentin, I really hope your analysis is correct, but I must admit I am not going to rush out and buy one until I start seeing some reviews here in the months to come.

It would break my heart to have 31KB of memory and 800 storage registers yet still a measly 26 labels, as in the 33s. I really hope that the number of labels is generous, and, ideally labels can be reused in different programs, just as they can on the 41C and 42S.

I do like the look of it--its slight curves on the side are certainly reminiscent of Classics, Woodstocks, and the 41 series. If the unit is a bit thicker at the top vs. the bottom, I will enjoy that classic profile too.

**Re: HP35s: A few assorted observations**

Message #165 Posted by **Karl Schneider** on 31 May 2007, 3:05 a.m.,  
in response to message #156 by Valentin Albillo

Hi, Valentin --

You've posted some insightful thoughts. I'll elaborate a bit with some of my own considerations.

I've believed (and posted here) that the ideal mid-range (*i.e., less sophisticated than the HP-42S*) non-graphing scientific calculator would combine the best of the HP-32SII and the HP-15C. The HP-32SII paradigm provided a great starting point, but the immediate challenge is to incorporate the missing functionality that is present in the HP-15C: Matrix calculations, mathematically-complete and convenient complex-number functions, and INTEG-within-SOLVE and vice-versa.

I've thought about how all that would be done, and have failed to devise satisfactory resolutions that would provide consistent and intuitive usage. This is why I'm eager to see the finalized HP-35s.

Matrix functionality:

Quote:

*I don't think that "(i)" and "(j)" have anything to do with built-in matrix functionality, which I think is absent, but sure I would like to be proved wrong on this.*

The basic problem within the HP-32SII paradigm is the *identification* of matrices. Consider that the HP-15C offers only numbered registers for scalars, while matrices are identified with a single-letter A-E. Thus, there is no confusion between scalars and matrices. The HP-42S offers full alphanumeric naming capability, and a flexible stack with plenty of free RAM that accommodates different kinds of objects.

The HP-32SII/HP-33S, on the other hand, offer storage registers denoted by single letters without full alphanumerics or an ALPHA mode. Another dimension is the equation functionality that was lifted from the algebraic HP-22S.

- How would a scalar be distinguished from a matrix?
- Could matrices be utilized in equations?

These questions have ramifications about how functions work, consistency, and breadth of capability. For example, if a single-letter variable had been redimensioned as a matrix, programs and equations could fail to execute for unobvious reasons. Simple commutativity of multiplication would not hold, leading to possibly erroneous results. (Granted, the same kind of pitfalls could occur on an HP-42S, but that's more sophisticated, and equations would not be an issue.)

Expanded registers and labels:

Quote:

*(...Register 00 to Register 99 ... Register AA to Register ZZ... LBL 00 to LBL 99 ... LBL AA to LBL ZZ)*

Numbered registers and numeric labels, as well as two-letter labels, have been requested in the name of additional capability and fuller usage of RAM. In fact, why not, for example, A1 and T9 as registers and labels? The questions are:

- How to provide these without employing an ALPHA mode or requiring extra keystrokes for single-letter variables?
- If ALPHA mode must be provided, why impose a limit of two characters?
- How to utilize 0-9 when their keys are assigned to letters?

For example, how would a value be stored to, or recalled from, variable "TA" under the existing paradigm -- 'RCL T RCL A' couldn't be distinguished from 'RCL T' followed by 'RCL A' unless something else was done.

As for the last question, a trick from the HP-41 could be borrowed, with STO or RCL being followed by either shift key to access 0-9.

Complex numbers, angles and polar<->rectangular:

Quote:

*"ARG" (yellow), and "Theta" (blue), over and on the "i" key are obviously the functional equivalents of the R-P/P-R rectangular/polar conversions, as they probably input/return/display the components of a complex number either in rectangular form or polar form.*

You may be right, but the ARG function on RPL models is essentially an "ATAN2" function that provides only the angle of a complex number given in rectangular form. The magnitude is calculated separately using ABS (unless a switch to POLAR mode is made on HP-48 and above, in which case the entire stack of complex numbers is converted).

It would be a shame if the only way to perform a full conversion is to enter the number as complex-valued. This would be unintuitive to many users, and would represent a reduction of functionality from the HP-15C and HP-42S, for which P->R and R->P would work on two real-valued inputs or one complex-valued input. Oftentimes, the components must be separated or be calculated separately prior to "assembly", which brings me to the next point:

Will the RPL functions C->R and R->C be available on the HP-35s? The HP-15C offers R->C as "f I"; the HP-42S kludges the two functions together as the "COMPLEX" function printed on the faceplate. ("COMPLEX" on the HP-42S, incidentally, works quite differently from the way "COMPLEX" works on the HP-33S and predecessor HP-32S/SII -- a "Simon says" command prefix that I hope is gone for good on the HP-35s.)

#### Modification/extraction of floating-point numbers:

Quote:

*INTG seems to me to be "Integer Part", as the INTEGRAL functionality seems to be the "integral" character over the EQN key. If that's so, it might be possible that the square-brackets symbol "[ ]" is actually the "Fractional Part" operation, though perhaps it might be used for additional purposes depending on the context or mode.*

The INTG function on the HP-33S returns the *next lower* integer, as opposed to the *closest* one. It is separate from IP, INT/, and integration. It's possible that INTG (and maybe ARG ?) could represent menus. One detail from the HP-42S, HP-32S, and HP-32SII is that the faceplate legends denoting menus were highlighted by a darker background. This detail was lost on the HP-33S.

It's important to remember that the HP-35s illustration looks like a virtual image, not a photo of a physical calculator. There may be further changes before it is publicly available, and I'm very curious what the end result will be.

### **Re: HP35s: A few assorted observations**

Message #166 Posted by [Walter B](#) on 31 May 2007, 10:28 a.m.,  
in response to message #165 by Karl Schneider

Karl,

as usual, you posted quite some valuable input. Based on the questions you (and others in this thread) have raised, let me point out that there is a big amount of speculation and/or phantasy in whatever is written about those operations of the HP35s being not really evident. So far, nobody (except the guys of HP) *knows* all of the acronyms visible on the picture, or which one represents a menu or a single command, we can only *guess* extrapolating our knowledge of earlier models.

The only facts we know are those written in the ad sheet (showing some differences between the English and French version already). And we *think* we know many of the prints we see on the keys and plate of the new calc.

1. The probability is almost 100% that e.g. SIN will be the well known trigonometric function again. EQN, MODE, DISPLAY, FLAGS, MEM and CONST will probably be menus as well as LOGIC, BASE, L.R., SUMS,  $x^y$ ,  $x^?0$ , and the shifted operations of "+" and EQN. But, to start with something very basic, how are you going to select a menu item easily without menu keys (or some keys you can use instead like the top row on 42s and more Pioneers)? There are only 4 candidates for such a task in the top row of HP35s, and that's too less IMHO. I hope they do not follow the CASIO-approach to menus, but who knows? And how shall you exit a menu called erroneously without EXIT?
2. There are a number of commands we miss, like INT and FRAC, RECT and POLAR, or EXIT, as just mentioned. And the English text mentions explicitly a cube root I do not see anywhere on the picture.
3. And furthermore, there are a number of ambiguous items, at least for me, where I am not sure about their meaning and what they represent (menus or commands), like INTG, blue-shifted SIGMA+, gold-shifted "0", the brackets etc. Even "i" may be used for complex number input and indirect addressing, for example, plus who-knows-what.

One final example: I would guess HYP is a menu, because IMO it's painful to be forced to press "<- SIN "->" SIN (i.e. HYP ASIN) for ASINH, but that's only an educated guess.

Exactly that was the reason why - in an earlier post of this thread - I offered 95 points for the person discovering the owner's manual (and making it accessible online, of course :) Until then, I regard lengthy speculations about the functionality of this new

calc not being very effective.

Regards, Walter

Message #167 Posted by [Antonio Maschio \(Italy\)](#) on 31 May 2007, 11:39 a.m.,  
in response to message #166 by Walter B

Well, I remember the HP-33S, when it was shown the first time, had a different keyboard than the marketed model. I guess the same could be for the HP-35S. And so, some uneasy combination could be modified for the final assembly.

The model shown in the English pdf seems complete, but surely, as you observed, it could be bettered.

Message #168 Posted by [John](#) on 31 May 2007, 11:51 a.m.,  
in response to message #166 by Walter B

The 33s method for selecting menu items may be used. It did not use menu keys but numbered choices for items in a menu.

**Re: HP35s: A few assorted observations**

Message #169 Posted by [Howard Owen](#) on 31 May 2007, 11:51 a.m.,  
in response to message #166 by Walter B

Quote:

.. how are you going to select a menu item easily without menu keys ..

The 33s uses the stupid 4-way directional toggle at the top center. The 35s no doubt uses the arrow keys for this.

Quote:

And how shall you exit a menu called erroneously without EXIT?

The 33s uses the ON key (labeled "C") for this. I'm 95% sure the 35s will use the same key.

Quote:

Until then, I regard lengthy speculations about the functionality of this new calc not being very effective.

Ah, but that ignores the fact that for many of us, such speculation is *fun*. 8)

The Time Line is impressive but wrong on two counts :

- 1979 : the HP41 is not the first alphanumeric programmable calculator, the Sharp EL5100 predates it (at least), there were certainly others.
- 2007 : It is merely impossible that the HP10S be the first scientific calculator with both solar and battery power. Even the HP6S predates it, not to mention vintage Toshiba (and others).

Yes, shame about the cursor keys. They could have put in 4 regular looking keys with exactly the same functionality. Perhaps marketing stood firm on this one and the design engineers had to cave in on something to keep them happy?

Dave.

Overall, the 35s looks better than anything HP has made in at least 15 years. My only wish is that before production they will swap the positions of sqrt, y^x, 1/x, with RCL, ROLL, SWAP.

### Re: hp 35s arrived

Message #183 Posted by **Bill (Smithville, NJ)** on 29 May 2007, 11:09 a.m.,  
in response to message #182 by Hugh Evans

Hi Hugh,

Quote:

swap the positions of sqrt, y^x, 1/x, with RCL, ROLL, SWAP

When I took look at this, I noticed the STO is a shifted function - OUCH! And it's a Blue Shift, not a Yellow Shift as I would think it would be. For everyday calculations, I use the STO/RCL keys very heavily. Have the STO as a Shift would be a real pain.

I guess to make up all happy, what is really needed is a fully re-assignable keyboard. Then we could each configure it how we like. Of course, would need some way to re-label them.

Still, I'm looking forward to giving it a test drive.

Bill

in response to message #186 by Ron

On the size issue, it IS an anniversary model...but then again, we wouldn't cheer if it had a '70-era chip set either :)

On the SHIFTEd STO key, I use this frequently as well, but it doesn't compare to my dismay as I left my college bookstore and noticed the  $x^3$ , as well as the  $x^2$  not being a SHIFTEd root(x) key. That was painful!

This new machine looks beautiful, and brings back the clear color scheme and the large ENTER key. YES!

Another thing on the thickness:

I recall the older HPs had a slight tilt built in, so the user could clearly see/read it on the desk without having to hunch over the keyboard...could this be part of the reason for T=0.73"?

Also, this is just the thickest part. It doesn't necessarily mean that the whole machine is that thick, right?

Hoping for something awesome! Did anyone else notice the notes in the PDF: Something to the effect of "Be confident that every calculation is reliable...etc."

Sounding better by the minute!

I think you're probably right. It's probably shaped to recall the classic Woodstocks, without being identical to them. I note many of the design cues: the "bare metal" strips on the sides, the color scheme, the keys, etc. So, probably, the shape as well, if not the weight -- it only takes two lithium coin cells, like the 33S, so it will probably weigh approximately the same as a 33S. Ah well, we can open it and put some weight inside. ;)

I also note that it appears that the sides rise above the plane of the keypad, which is welcome; that will serve to partially protect the keys from accidental presses and wear.

I would. For an anniversary edition, I'd rather they made an exact replica of the original HP-35, with the limitations, bugs and all, so that the only way anyone could tell them apart would be by the serial numbers. But the 35s is a step in the right direction for what I'd like the *new* (non-anniversary-edition) HP calculators to be.

I know they wouldn't do that. That's why I dislike HP so much: They care more about making "business sense" and money than about upholding their own traditions. I don't expect anything better from most companies, but HP should be better than that. I expect more from them than from any other company on earth -- even though I know they're never going to live up to either my own expectations or their own past.

Dude,

I am afraid you are becoming nonsensical. Traditions? It is a business, and no business survives on traditions--all survive on profit. Traditions are utilized only when they foster profit.

Why on earth do you hold HP to this artificial unrealistic religious standard? Perhaps you forget that not all that long ago, both Hewlett and Packard were in the top 5 on the Forbes 400 list of the wealthiest Americans. Clearly they put profit right at the top of their thinking. You can't survive in any business if you put profit after tradition.

### Re: hp 35s arrived

Message #195 Posted by [Wayne Brown](#) on 31 May 2007, 10:17 a.m.,  
in response to message #194 by bill platt

Years ago (in the '70s and '80s) I used to see lots of articles in trade magazines criticizing HP's lack of "business sense." Business analysts complained about how HP put too much emphasis on engineering and not enough on sales and marketing. HP was depicted as being run by engineers who were in love with technology for its own sake and who cared more about impressing other engineers with "neat and cool" features than about profits. (One of these writers described someone taking an old car and turning it into a hot rod with all kinds of unnecessary "bells and whistles" that did nothing to make the car more practical for street use. He said, "That's an HP engineer's dream car.") Many of the HP people I came into contact with during that period (mostly HP support technicians for their minicomputer systems) fit into that image quite well. (One of them gave me the source code to a "practical joke" program to run on the system consoles. It masqueraded as the standard command interface and confused the heck out of our operators by giving all sorts of bizarre responses to ordinary commands. When they reported problems to me, I would hit a keystroke combination that disabled the program and say, "What's your problem? It works fine when I do it." Then I'd re-enable it and leave the room. I really had them going for awhile until one of them figured it out. :-)

Criticism of that sort helped cement my loyalty to HP. That cement was chipped away over the last decade or two by HP's "new" attitude.

Quote:

Traditions are utilized only when they foster profit.

If that's what you believe, then there's no point in us discussing this any further. For me, tradition outweighs nearly everything else in nearly every aspect of life.

Quote:

You can't survive in any business if you put profit after tradition.

I respect and admire stubborn determination to maintain one's principles and traditions at any cost, even at the cost of survival, far more than I value so-called "success." But then, I've always considered those who take valiant stands in lost causes, and those who "go down with the ship" rather than admit defeat, to be superior to the rest of us.

I wonder if they will release a limited "anniversary edition" with a special logo because I would hate to buy 2 hp-35s when they come out and 2 months later discover the release of an anniversary edition. Does anyone know anything about this ?

### Re: hp 35s arrived

Message #197 Posted by **Jeff O.** on 30 May 2007, 8:00 a.m.,  
in response to message #196 by Pascal

The accepted date of introduction for the HP-35 is February 1, 1972, although there seems to be some indication that some within HP think it was July 1, 1972. Either way, it is doubtful that the 35s will hit the streets before July 1, 2007, so the actual 35th anniversary date will have passed. It would not make sense to then introduce a 35th Anniversary Special Edition at a still later date. However, that does not mean that they won't do it. Maximizing potential sales would suggest that they do just that.

Message #198 Posted by **Kevin Kitts** on 30 May 2007, 11:40 a.m.,  
in response to message #197 by Jeff O.

Just curious. Is there any way to save programs entered into the HP-33s? Infra-red? Do you lose the programs when you change batteries? It has always bugged me that when I customize a program that it gets lost when changing batteries - I'd like to have a way to refer to work that I did earlier.

Will the HP-35s, since it seems to be somewhat derivative of the HP-33s, also likely have no way to save the programs one may write? Seems a shame not to be able to backup that 32K of memory. ;-)

### Re: hp 35s arrived

Message #204 Posted by [Frank Rottgardt](#) on 2 June 2007, 10:41 a.m.,  
in response to message #202 by [Tizedes Csaba \[Hungary\]](#)

Hi,

my first post here.

Certainly its not a hoax! Already in april when HP launched a customer video-contest in order to honour the HP-35 launch 35 years ago, there was a statements from a HP-spokesman that they will launch a new calculator.

<http://www.computerworld.com/blogs/node/5323>

At the same time the HP-33s becomes somewhat rare at certain US-discounters. Coincident ???

Also, as other forum members already mentioned, at the time when the new HP-35s data sheet has been displayed on the european distributors page, the HP-33s was taken away.

Since HPs strategy to design a simple programable scientific calculator (33s) specially for the US exams w/o any I/O proved to be successful, it is logical to come up with a successor dealing with all shortcomings the HP-33s has. I guess the critics from students about the limited number of registers must have been loud enough to be heard even by HP. And here the new model comes with 800+ registers. In my eyes this is by far the most important improvement over the HP-33s. Beside the more old-HP-like design and improved keyboard layout I cant see much better specs compared to the HP-33s. What I really can't understand is the fact that the HP-35s still seems to lack a build-in function to deal with matrices! Calculating with matrices has been one of the most frequent tasks when I was student (mechanical engineering) back in the the 90's. My faithful HP-28s saved me hours of manual work on paper when I had to solve huge equation-systems. I still have this HP-28s and will never ever give it away. He served me so well and earned his retirement (lying in the drawer with removed batteries).

Half a year ago when I decided to buy a new RPN-HP I thought I could get a kind of HP-42s for more daily number crunching without the need of graphics and a better scale factor. I really was surprised when I had to learn that there was only one calculator left in the HP-range which matched my specs: the HP-33s. I had not been following what happened to HP calculators since I bought my HP-28s back in 1991! But since RPN was a Must for me, the HP-33s was the only calculator left to buy. And I must confess it is not THAT bad. OK, HP is still far far away from its quality design it ones used to come up with. And I guess it never will get back there. The old design teams and with them the HP-spirit vanished for good. But lets give the new HP calcaultor division a fair chance to show what the can go for. The HP-35s is a step in the right direction. I will buy one!

Greetings, Frank

IMHO as long as he writes better English than you German, I propose to neglect some errors if they do not distort the meaning.

I couldn't have said it better! I am constantly amazed and impressed with the excellent writing skills of the people on this forum. Being well-aware of the diverse nationalities behind many of these posting, it is amazing (to me anyway) how crystal-clear the meaning and intent of the messages come through, especially from those friends here whose primary language isn't English. I'm not kidding, it makes me try harder to make sure my writing is understandable. My sincerest compliments to you.

I have some German colleagues that, when we need to troubleshoot different control systems or understand the interactions between automated equipment, will often refer to one machine as "him" or the other as "he". This really simplifies the understanding of the communication signals that are being exchanged between each other (as though they

were people having a conversation). I find it refreshing to discuss these technical details in such a "human-like" manner.

Take care, Matt

**Re: You Go Frank! You Go Walter! :-)**

Message #208 Posted by [Howard Owen](#) on 5 June 2007, 1:42 p.m.,  
in response to message #207 by Matt Kernal (US)

I also use "he" or "she" sometimes when referring to machines, and I'm a native English speaker.

Of course I'm also a technophilic weirdo who spends more time with computers than with people, but that's beside the point. 8)

I actually use personal pronouns occasionally when explaining technical issues in computer systems. Something like "I'm the mail server and you are the mail client. First you connect to my port 25, then .." is the pattern. (It's actually less suggestive than it sounds. 8)

I'm ignorant about German, but I know Romance languages have gender for nouns and adjectives. Thus it isn't surprising to me hear a French, Spanish or Portuguese native speaker use pronouns like "he" or "she" in English conversation when referring to objects other than human beings. Is German the same in that respect?

Regards,  
Howard

German features 50% extra: it has 3 genders for nouns like Latin or Greek. So there is male, female and neutral. It's pretty hard for foreigners to learn which noun carries which gender. E.g. locomotive is female, lake is male, and girl is neutral d:-)

English was that way once, like the other Germanic languages. For instance, *stan* (stone) was masculine, *sunne* (sun) was feminine, and *scip* (ship) was neuter. But we've lost most of that, except for personal pronouns like he, she, and it.

**Linguistic gender**

Message #211 Posted by [James M. Prange \(Michigan\)](#) on 6 June 2007, 1:52 a.m.,  
in response to message #209 by Walter B

English can be rather strange with regards to the "genders" too.

"Gender" in language, at least originally, referred to which "kind" a word was, not necessarily to which sexual characteristics were associated with it, which may perhaps explain some seeming oddities in linguistic genders.

But of course, which sexual characteristics (masculine or feminine) something seems to have, or the lack of sexual characteristics (neuter), seems a natural way of classifying into which "kind" it is too, and the modern usage of "gender" is usually understood to mean which "sex" something is.

English started out as a west Germanic dialect, so modern English does share a lot with modern German and the other modern "Germanic" languages, but English has been extensively modified (and, in some ways, simplified) by the use of Latin by the church and the learned, intermingling with the "Danes" (Vikings) and the Norman French, and many of its speakers being familiar with and rather freely borrowing from other languages. Remember that English was once a rather obscure language usually used only in a part of the island of Great Britain.

Of course, sometimes a language is modified just for the fun of it, or to identify the speakers with a particular group.

In modern English, for the personal pronouns and adjectives, only the third person singulars "he", "him", "his", "she", "her", "hers", "it", and "its" have any gender. Plural and first and second person pronouns and adjectives are "genderless".

For the most part, a "person" is either masculine or feminine, and a "non-person" is neuter.

The feminines are always used for a definitely female person, but the "masculines" are used both for a definitely male person and for a "person of unknown gender".

Some seem to find using the masculine for a person of unknown gender rather uncomfortable or downright objectionable, as if the "masculine" should be used only for a male, and not for either a male or a female, whichever the person happens to be.

Sometimes, to avoid using a masculine for a person of unknown gender, a plural is resorted to. For example, the plural "they" is sometimes used with the singular "everyone", and the plural "their" is sometimes used with the singular "anyone". This seems to be pretty much accepted English usage, but the disagreement in number rather jars on my ears.

Similarly, constructions such as "he or she" or even "he/she" are sometimes resorted to, but they seem clumsy and just don't "sound right" to me.

Those who object to English using the "masculine" for a person of unknown gender sometimes seem to make it a point to use the feminine for such cases, but that sounds very stilted and unnatural. "Making a point" about one of the oddities of standard English language rather distracts me from whatever other communication is being attempted.

A human is almost always treated as either masculine or feminine, but an infant is sometimes treated as neuter, as though not really a "person" yet.

Sometimes it's ambiguous which sex a person is, and in such cases, it's rather debatable which gender to use.

An animal may be treated as masculine or feminine (a "person"), even if it has been physiologically "neutered", but may be treated as neuter (a "non-person").

Inanimate nouns are usually neuter, but sometimes an inanimate noun is "personified", in which case it's treated as either masculine or feminine, depending on tradition or on which characteristics seem most important. For example, the sun is neuter, but the Sun is male; the earth is neuter, but of course Mother Earth is feminine. A ship is feminine (even if it has a "masculine" name) or occasionally neuter, and automobiles and other machines (things that males "fall in love with", I suppose) are often feminine. An oak may be treated as masculine due to its sturdiness (even though its acorns may seem a feminine characteristic), and a willow may be treated as feminine due to its suppleness.

I'm often impressed by how clearly those in this forum who (I guess) don't have English as their mother tongues communicate in English, sometimes better than those of us who (I guess) do have English as our native language. Maybe those who use English as a second language tend to be particularly careful in how they use it.

Regards,  
James

Quote:

(things that males "fall in love with", I suppose)

Don't you mean "things with which males fall in love"?

Ending a phrase with a preposition is so common place that it is not even considered bad English anymore--you see it here even in the esteemed Globe & Mail, the Toronto-based newspaper that is about the closest we get here in terms of erudition and prestige to the New York Times or Washington Post. But it still drives me bananas.

And also don't you mean "things with which men fall in love?" Male and female are, I thought, properly used as adjectives. Particularly fussy and inflexible grammarians of a former age may snarkily inquire "but what do you mean? a male sheep? a male cat? a male frog?"

This all said, I am reminded that present day linguists would remind us that language is organic and changes continually (notice I said continually and not continuously) and would advise that notions of "properness" and "correctness" are all relative to social and historical norms and expectations of the day and as such are scarcely absolute.

So, with apologies to GBS, there are some annoying things in spoken and written English today up with which I just have to put!

Les

*Message #214 Posted by **Howard Owen** on 7 June 2007, 5:54 a.m.,  
in response to message #213 by Les Wright*

Irregardless of our sensibilities, language won't stand still. The word I began that sentence with is a good example. It actually means "regardless," so the negating prefix "ir-" is nonsensical when combined with the negating suffix "-less." But I remember that the then President of the United States, a Nuclear Engineer by the name of Jimmy Carter, used the word in a televised press conference, which generated howls of outrage from my English professor father. The word now appears in most dictionaries of American English, although it's an even bet whether it will make it into the O.E.D. this century.

English is a particularly supple language. I think that is partly America's fault. We tend to be contemptuous, ignorant or at least unmindful of most traditions, linguistic or otherwise. But we Americans didn't originate the tendency to borrow from other languages. The Romans, Vikings and Norman French all brought distinct influences to bear on the then parochial English language. Another factor contributing to the current rate of change in English is its widespread use around the world. The British Empire spread English all over the globe in the 18th and 19th Centuries, and the American ascendancy in cultural, economic, military and political terms in the last half of the 20th Century greatly expanded on that base. The Internet, invented in the US, and mostly text based even today,

contains many English pages. (I don't know if Chinese has caught up yet. I read somewhere that it is predicted to do so.) All of these non-native English speakers contribute their idioms and vocabulary too.

So IMHO, I think y'all should jes' sit back and enjoy the diversity. It ain't a big deal if'n a body caint speak like a banker or a lawyer. LOL!

Does still the verb "to bobbit" exist, after some Lorena Bobbit did what she did long time ago?

An Italian tv news journal, then, affirmed how fast was English to create new words, but I wonder

- a) if they are widely accepted and
- b) if they last enough to be put into a dictionary.

*Message #217 Posted by [Vieira, L. C. \(Brazil\)](#) on 5 June 2007, 6:55 p.m.,  
in response to message #208 by Howard Owen*

Hi, Howard;

Quote:

Thus it isn't surprising to me hear a French, Spanish or Portuguese native speaker use pronouns like "he" or "she" in English conversation when referring to objects other than human beings.

There are neither neutral articles nor pronouns in Portuguese, we have 'ele' for 'he', 'ela' for 'she', and 'eles' or 'elas' for 'they'. Articles, by their own, are 'o' for 'male' objects and 'a' or 'female', both replacing 'the'. Like:

'o' livro (the book) or 'a' cadeira (the chair).

The problem is that there is no way to 'signify' an object as male or female, and in some cases, their gender 'shift' from one language to another. I know German has the three possibilities: an object may be neutral, female or male. AFAIK, english officially defines one female object: ship. They are all 'she'. Is that correct?

Also, there is no direct replacement for 'it', completely new for us, Portuguese speakers. If someone sees a dog and wants to ask if it belongs to someone, it would be:

'Ele é seu?' (Is HE yours?)

There is no portuguese word for 'it'. We have some instances that allow us to believe that we had the chance to have some neutral references, because in Portuguese we have 'esse', 'essa' and 'isso', being them the equivalent to 'this' as for male, female and neutral. (same for 'aquele', 'aquela' and 'aquilo', equivalent to 'that' the same way)

Again, this forum rules!

Cheers.

Luiz (Brazil)

'Tis true: a ship is feminine--is "she."

And yet, just to keep the consternation factor high, it is of course perfectly acceptable to name a ship after a man, E.G. the "Harvey Gamage."

### **Re: You Go Frank! You Go Walter! :-)**

*Message #219 Posted by [Howard Owen](#) on 5 June 2007, 9:24 p.m.,  
in response to message #217 by [Vieira, L. C. \(Brazil\)](#)*

Quote:

AFAIK, english officially defines one female object: ship. They are all 'she'. Is that correct?

That's just a matter of customary usage, not language structure. English lacks gender qualified articles, so "the ship" is the neutral translation of the gender qualified Spanish "el barco." Wikipedia's article on grammatical gender contains [a section on English](#). It points out that English retains a few gender qualified nouns. The suffix "-ess" is used for some nouns to indicate the "natural" gender of the object. So we have "actor" and "actress," for example. But the referenced article states that ".. these are insignificant features compared to a typical language with grammatical gender." Usage of the "-ess" ending is on the decline in American English, at least, primarily due to the influence of Feminism. (And, no doubt, to the well established trend in English to wring out redundancy in the language.)

Regarding the use of the gender qualified pronoun "she" used in speaking of a ship, the Wikipedia article says this: "The pronoun "she" is sometimes used to refer to countries, ships *or machines*, and in poetic personalizations, though this is considered a stylistically marked, optional figure of speech. This usage is furthermore in decline and advised against by most journalistic style guides such as the Chicago Manual of Style." (Emphasis added.) So the complaint about referring to a calculator as "he" has even less basis than I thought. 8)

in response to message #242 by Howard Owen*

Actually, the LCD is fine; it's not broken. What you're seeing in there is the reflection of the giraffe's foot. Orange leg, black hoof on a yellow background. I've seen that baby blanket print before. ;-)

thanks, bruce

**Re: hp 35s arrived**

*Message #244 Posted by **Howard Owen** on 2 June 2007, 1:36 a.m.,  
in response to message #243 by Bruce Bergman*

That's plausible.

So I think we should view this picture as part of a field stress test, which to judge by the subject's expression, seems to have gone very well! That old HP quality is back for sure!

### HP-9G programming bug

Message #1 Posted by [Xerxes](#) on 28 May 2007, 9:54 a.m.

I tried to program the N-Queens Problem on the HP-9G for benchmarking and get a "NEST Er" without a plausible reason. After investigating the problem, I have found the following:

```
N=3
S=0
Lb1 0:
S=S+N
IF(--N)THEN{GOTO 0}
PRINT S
```

This simple program for the sum of 1..n works only to N=3. The reason seems to be the jump out of the IF block more than 3 times.

Is it possible to avoid this problem?

### Re: HP-9G programming bug

Message #2 Posted by [Raymond Del Tondo](#) on 28 May 2007, 11:12 a.m.,  
in response to message #1 by [Xerxes](#)

Hi,

did you try other variable names?

Did you try with discrete operations,  
like N=N-1 instead of '--N' ?

What does the doc say about that 'GOTO 0' construct ?  
Or about the error message?

A nesting error indicates that either calling the  
subprogram would exceed the the allowed nesting depth,  
or maybe you forgot the correct return statement.

Raymond

### Re: HP-9G programming bug

Message #3 Posted by [Xerxes](#) on 28 May 2007, 11:43 a.m.,  
in response to message #2 by [Raymond Del Tondo](#)

I have tried N=N-1 or other variables too. The "NEST Er" is discribed in the manual for the GOSUB statement with a maximum of 3 nesting depth.

Another example:

```
N=0
Lb1 0:
```

```
IF(1) THEN { N=N+1 }  
GOTO 0
```

```
N=0  
Lb10:  
IF(1) THEN { N=N+1 ; GOTO 0 }
```

The first example works but the second gives a "NEST Er".

### Which mathematical functions live out in the suburbs?

Message #1 Posted by [Bob Wang](#) on 27 May 2007, 11:12 p.m.

Call me a masochist, but Ron's question about Lorentz transforms brought back fond memories of tackling DEQ, in the days before calculators ;-)

Also brought back memories of a BAD joke:

Which mathematical functions live out in the suburbs?

Why, commuting derivatives, of course.

### Re: Which mathematical functions live out in the suburbs?

Message #2 Posted by [Ron Allen](#) on 28 May 2007, 1:03 a.m.,  
in response to message #1 by Bob Wang

Sorry people, my use of DEQs has to be LIMITED since I am self-taught, (sort of a self-made masochist). Hey! That's not only cheating on yourself (kinky), but, it's unnecessarily redundant. I'll try this pun thing anyway.

Ron

### 71B/EMU71 + 9114B error

Message #1 Posted by [Egan Ford](#) on 27 May 2007, 8:41 p.m.

I am testing a 9114B post-repair and get the following error after a successful copy of a specific file (MATHROM.LEX):

```
HPIL ERR:Not LIF Format
```

Once I get this error I cannot read the disk again until I power cycle the drive or initialize the diskette.

I am using EMU71 with an HP-IL ISA adapter and a 9114B.

Session:

```
>INITIALIZE :HP9114B
>COPY MATHROM:HDRIVE2 TO :HP9114B (:HDRIVE2 = lexfl1.lif)
>COPY JPCLEX:HDRIVE2 TO :HP9114B (:HDRIVE2 = lexfl1.lif)
>COPY WB71:HDRIVE2 TO :HP9114B (:HDRIVE2 = lexfl1.lif)
>COPY NIBBLEX:HDRIVE2 TO :HP9114B (:HDRIVE2 = lexfl1.lif)
>COPY LEXOFF:HDRIVE2 TO :HP9114B (:HDRIVE2 = lexfl1.lif)
>CAT :HP9114B
```

| NAME    | S | TYPE | LEN   | DATE     | TIME  |
|---------|---|------|-------|----------|-------|
| MATHROM |   | LEX  | 32745 | 05/02/07 | 00:56 |
| JPCLEX  |   | LEX  | 11173 | 05/02/07 | 01:00 |
| WB71    |   | ROM  | 32768 | 05/02/07 | 01:04 |
| NIBBLEX |   | LEX  | 329   | 05/02/07 | 01:05 |
| LEXOFF  |   | LEX  | 152   | 05/02/07 | 01:05 |

```
>INITIALIZE :HDRIVE1
>COPY JPCLEX:HP9114B TO :HDRIVE1
>COPY WB71:HP9114B TO :HDRIVE1
>COPY NIBBLEX:HP9114B TO :HDRIVE1
>COPY LEXOFF:HP9114B TO :HDRIVE1
>COPY MATHROM:HP9114B TO :HDRIVE1
```

```
HPIL ERR:Not LIF Format (huh?)
```

```
>CAT :HDRIVE1 (file did get copied. I verified with lifget/md5sum, all bits are there)
```

| NAME    | S | TYPE | LEN   | DATE     | TIME  |
|---------|---|------|-------|----------|-------|
| JPCLEX  |   | LEX  | 11173 | 05/02/07 | 01:07 |
| WB71    |   | ROM  | 32768 | 05/02/07 | 01:08 |
| NIBBLEX |   | LEX  | 329   | 05/02/07 | 01:09 |
| LEXOFF  |   | LEX  | 152   | 05/02/07 | 01:09 |
| MATHROM |   | LEX  | 32745 | 05/02/07 | 01:09 |

```
>CAT :HP9114B (cannot read drive)
```

```
HPIL ERR:Not LIF Format
```

Power cycle or initialize and all is well again.

What is special about MATHROM.LEX?

Could this be isolated to EMU71?

Is there any other way to reset the 9114B remotely?

Thanks.

**Re: 71B/EMU71 + 9114B error**

*Message #2 Posted by **Howard Owen** on 28 May 2007, 3:26 a.m.,  
in response to message #1 by Egan Ford*

Quote:

Is there any other way to reset the 9114B remotely?

There are several things you can try. Here's what I can think of, in no particular order.

- If flag -21 is clear (the default) a real 71 attempts to power off all devices on the loop when it is powered off itself. I assume the equivalent operation would be to stop and restart EMU71.
- You could try RESTORE IO, which will readdress the loop, and reset talker/listener status for all devices.
- CLEAR :HP9114B might work. That is supposed to reset the internal state of the addressed device, without touching its interface, i.e. not doing anything RESTORE IO does.
- In case the problem is with EMU71's HPIL state, you can RESET HPIL/RESTORE IO. RESET HPIL does a cold boot and self test of the HP-IL interface. RESTORE IO will recall the PRINTER IS and DISPLAY IS devices, in addition to readdressing the loop. The readdressing will happen before the next I/O operation in any case.
- Finally, you might look up what the HP/IL message sequence is for power down, and send that to the drive. This might work better if you were programming this stuff, instead of sitting with EMU71 or a real 71 in front of you.

That is mighty weird about MATHROM.LEX. I assume you get that result no matter in what sequence you copy the files back from the 9114?

Regards,  
Howard

Order does not matter. Tried multiple disks as well.

**Re: 71B/EMU71 + 9114B error**

Message #4 Posted by **J-F Garnier** on 28 May 2007, 7:21 a.m.,  
in response to message #1 by Egan Ford

Hi Egan,

Strange. I tried the same procedure using Emu71 and the 2 internal drives, without errors.

It would be interesting to know if this behavior happens using a real HP-71B as controller, doing "CONTROL OFF" on Emu71 side.

I can't do it by myself, my HP9114 battery is out of order, and it's a HP9114A version with a probably older firmware version.

I'm not sure CLEAR :HP9114 can reset the fault condition. Maybe ejecting and inserting the floppy disc again can fix it, just it can't be done remotely...

J-F

Howard

**Re: 71B/EMU71 + 9114B error**

Message #8 Posted by **Egan Ford** on 28 May 2007, 2:32 p.m.,  
in response to message #1 by Egan Ford

Update. I swapped system boards. The problem follows the drive. I cleaned it and the problem went away. Well sort of...

I cannot reproduce the problem with a 71B, only with EMU71. EMU71 will read it once without error, the 2nd read of only MATHROM (no other file) yeilds a "New Medium" error after the copy. The copies are complete.

*Edited: 28 May 2007, 2:39 p.m.*

**Re: 71B/EMU71 + 9114B error**

*Message #9 Posted by **Howard Owen** on 28 May 2007, 3:04 p.m.,  
in response to message #8 by Egan Ford*

Huh.

Assuming there are no firmware bits outside the main board, then there must be a physical flaw/quirk that copying the MATHROM sets up. It's probably independent of head position, unless the file ends up in the same sectors each time. So it has to be in the electromagnetic state of the system. That seems bizarre, but I can't think of another angle. The particular bit patterns in the deadly file must set up magnetic flux that jiggers the read mechanism somehow.

Anyone have a less UFO-like explanation?

Regards,  
Howard

**HP 01 prototype? with pictures....**

Message #1 Posted by [geoff quickfall](#) on 27 May 2007, 7:28 p.m.

HP 01 prototype?

Posted by Geoff Quickfall on 27 May 2007, 7:24 p.m.

Looking for more info on the HP-01. I now have restored 3, two to NOS condition and one almost, see pictures.

GROUP:

[http://i45.photobucket.com/albums/f96/geoff\\_q/closegroup.jpg](http://i45.photobucket.com/albums/f96/geoff_q/closegroup.jpg)

GROUP WITH PAPERS:

[http://i45.photobucket.com/albums/f96/geoff\\_q/groupa-1.jpg](http://i45.photobucket.com/albums/f96/geoff_q/groupa-1.jpg)

BEFORE AND AFTER:

[http://i45.photobucket.com/albums/f96/geoff\\_q/beforeafterbrown.jpg](http://i45.photobucket.com/albums/f96/geoff_q/beforeafterbrown.jpg)

The one of interest is an HP-01 with US case and strap. The keyboard is a heavy rough bakelite type unlike the polished black and bronze keyboards the other Swiss cases have. The D, A, M, T keys are very low, i.e. don't project far above the keyboard as the Swiss case ones do.

Two more points, no name on the crystal, not even a trace and the condition of the crystal, scratched and chipped precludes a polishing to remove the name. The second odd point was the lack of a serial number (see picture).

The provenance of the watch is that it came from the son of an HP employee who worked in Corvallis on the watch team. The owner has passed on and the history other than what you have here is all I know.

In summary:

US made case and strap,  
no Hewlett Packard name on original crystal (not polished off),  
no serial number on case back,  
low projecting D, A, M, T keys, much lower than the Swiss,

Any thoughts or ideas. Also looking for a bracelet stylus if anyone will part with a spare!!!!

The watch pictured has a hand made crystal by me from an old derelict HP calculator that was cut, fitted and polished by hand:

BEZEL:

[http://i45.photobucket.com/albums/f96/geoff\\_q/hp01proto.jpg](http://i45.photobucket.com/albums/f96/geoff_q/hp01proto.jpg)

CASE BACK:

[http://i45.photobucket.com/albums/f96/geoff\\_q/caseback.jpg](http://i45.photobucket.com/albums/f96/geoff_q/caseback.jpg)

*Edited: 27 May 2007, 9:46 p.m.*

### **Re: anyone?**

*Message #3 Posted by [Frank Boehm](#) on 31 May 2007, 3:06 a.m.,  
in response to message #2 by geoff quickfall*

Well, you said it all, didn't you? No serial number means pre-production prototype (production prototypes usually have at least odd serial numbers). The non-standard keyboard hints towards being an early prototype as well.

### **Thanks**

*Message #4 Posted by [Geoff Quickfall](#) on 31 May 2007, 10:12 a.m.,  
in response to message #3 by Frank Boehm*

Thanks, Frank

I was looking for some type of confirmation. That's, what I thought, even the module keyboard has a different key pad contact spring system to the others.

I will replace the quartz crystal with one of a similar vibration and fabricate the ground battery clip to see if I can resurrect the original module.

Right now all it does is display a zero for 6 seconds then turnoff.

Cheers, Geoff

**Hp-67 Card reader**

Message #1 Posted by [Tim](#) on 27 May 2007, 6:06 p.m.

I have done a repair on the card reader. The calculator pulls the card through the calculator now. However it keep telling me error. Any suggestions?

**Re: Hp-67 Card reader**

Message #2 Posted by [Randy](#) on 27 May 2007, 6:45 p.m.,  
in response to message #1 by Tim

Reading or writing failures?

**Re: Hp-67 Card reader**

Message #3 Posted by [Dan W](#) on 27 May 2007, 10:45 p.m.,  
in response to message #1 by Tim

More or less what I do, in this order:

Make sure you have a known good card. Helps to have a working 67.

Double check all 5 of the wires from the r/w head. These can come loose easily and it's easy to miss.

Also check all the other wires attached to the PCB.

Be sure the PCB is correctly connected to the mainboard.

If that fails, open it up and check that all 4 tiny balls and the roller are in place, and also the two metal leaf springs are in place.

Try writing instead of reading to isolate the problem.

-- Dan

**Re: Hp-67 Card reader**

Message #4 Posted by [Tim](#) on 27 May 2007, 11:03 p.m.,  
in response to message #3 by Dan W

It fails on reading only.

**Re: Hp-67 Card reader**

Message #5 Posted by [David Smith](#) on 30 May 2007, 10:53 a.m.,  
in response to message #4 by Tim

A card reader that writes but does not read is almost always a bad tantalum filter capacitor (usually a small blue dipped tantalum) on the card read power line.

### **Re: Hp-67 Card reader**

*Message #6 Posted by **Tony Duell** on 29 May 2007, 4:30 a.m.,  
in response to message #3 by Dan W*

Do you have another 67, 97 or 41 (that is, something that can read a 67 card)? If so, try writing a card on the faulty machine and see if you can read it on the good one.

If you can't, check the head wiring, and check the head windings for continuity. There are 2 windings, IIRC, one has red and yellow wires, the other blue and orange wires (but I would have to check that in the schematics). If one winding is open, you can neither read nor write a card, and you're looking for a new head assembly (yes, I have had them fail).

The other thing to check are the decoupling capacitors on the various power lines. If one is defective, you get noise in the read amplifier from the motor. This will stop the machine from reading (although it will normally write OK).

### **Re: Hp-67 Card reader**

*Message #7 Posted by **Tim** on 30 May 2007, 8:18 p.m.,  
in response to message #6 by Tony Duell*

What is the value of the tantalum? Does anyone have the schematic?

### **Re: Hp-67 Card reader**

*Message #8 Posted by **Randy** on 30 May 2007, 8:55 p.m.,  
in response to message #7 by Tim*

It's the only 6.8uf on the reader board.

Schematics of the 67 and others are available from <http://www.hpcc.org/cdroms/> and are well worth the \$. Thank you Tony...

### HP OmniGo 100 Question

Message #1 Posted by [Maximilian Hohmann](#) on 27 May 2007, 6:41 a.m.

Hello!

Yesterday, I found an hp OmniGo 100 on the flea market. Not that I'm interested much in PDAs and suchlikes, but it is from hp and over 10 years old (and has an hp-12C emulator in its ROM!), and therefore I paid the 20 Euros for it, that the guy would accept as lowest bid.

I understand, that this thing can run DOS applications and also, that it accepts CF-cards through a PCMCIA-memorycard-adapter.

What I haven't found out yet, is how to get a DOS-prompt so that I can launch DOS-programs from the memorycard... Has anybody got an idea about that maybe?

Greetings, Max

*Edited: 27 May 2007, 6:41 a.m.*

The OmniGo 100 has limited DOS functionality, it is not a true DOS machine like the 200LX. See: <http://www.palmtoppaper.com/PTPHTML/24/pt24001e.htm> <http://www.daniel-hertrich.de/og100/>

Dave.

### Re: HP OmniGo 100 Question

Message #3 Posted by [Raymond Del Tondo](#) on 27 May 2007, 1:06 p.m.,  
in response to message #1 by Maximilian Hohmann

Hi,

the OG100 holds some questionable records.

It has the display with lowest possible contrast,  
the smallest display compared to the other LX based machines,  
and the shortest possible battery life.

Actually you can virtually watch the battery go flat.  
Of course the OG 100 was the first LX based device  
\*without\* an AC adapter option...

The GEOS and the switchable display are the most interesting things on the OG,  
other than that the OmniGo was designed to avoid success;-)

The OG 120 has some \*minor\* improvements over the OG 100,

such as a better battery life, and a so-called 'holographic' display.

Actually the display is much better readable than on the OG 100, but still way substandard, even at the time of introduction.

I paid more than 500 DM for my first OG 100 when it was new, and regretted it shortly after...

OMHO

Raymond

**OpenRPN**

Message #1 Posted by [DaveJ](#) on 26 May 2007, 11:14 p.m.

So what happened to the OpenRPN website (www.openrpn.org)?

Last update I can find in the web archives is Aug 28th, 2005.

I'm curious to see all the details people have been talking about but can't find anything.

Also, from what details of the proposed hardware I could find, it seems not that dissimilar to the 50G (e.g ARM processor, graphic screen (colour? - why??), AAA batteries etc) Has anyone given any thought to simply writing custom firmware for the 50G? (probably possible given that it has FLASH memory). Or does the 50G hardware suck so much that the point is for the project to be just as much a hardware project as a software project?

Dave.

Dave.

**Re: OpenRPN**

*Message #4 Posted by **Walter B** on 27 May 2007, 2:56 a.m.,  
in response to message #3 by DaveJ*

IIRC, Hugh Evans will reopen an OpenRPN site soon, i.e. within some weeks.

What I remember being published in the old site:

- Dimensional specs for housings, keys, LCDs including CAD drawings (or sketches, since no dimensions were given there)
- Electronic specs for LCDs, processors, I/O interfaces
- Keyboard layouts (some published also in this forum)
- Function sets
- Software specs and sets as Paul mentioned

plus a lot of discussions about these topics.

Being a project initiated in the USA, an elaborated vision and mission statement and more marketing stuff seemed to be inevitable, though not supporting the progress too much. IMHO, however, the specs were neither complete nor completely consistent at the time I last looked at them. Maintaining the project documentation was a topic with space for improvement, though not the only one. Nobody is perfect.

I've got some of the specs copied and all of the layouts, but Hugh is the project head, so your request should be addressed to his attention.

OpenRPN.org will be coming back online. I'm back in touch with my old cohort Chad regarding this.

In response to your question, I have considered porting \*fix to the 49G+/50g although I have determined that it is too much work and too far from our actual goals.

Ummm... Graphical FSTN reflective LCD, but not color. Just the best grayscale available.

The overall point is that people want something close a voyager or pioneer, they already have the 50g for graphing. As I said in an earlier post, people would like classic calculators with improved modern electronics.

Send me an email for any more discussion on this. The people around here have heard far too much of it already.

That's what I thought. It's just that I stumbled across an old post of yours that mentioned a colour graphics screen as being one of the goals. I believe you would be right to stick with the classic model. I believe many people would even be happy with a non-programmable model.

Dave.

Quote:

I believe many people would even be happy with a non-programmable model.

I'm leaning more to this view over time.

I've come to the conclusion that an RPL based device is overkill and probably unwarranted. RPN is good enough for most purposes even if it lacks the *elegance* of an RPL model. Internally, I've no objection to RPL/\*fix, that is a different matter entirely.

What is important is a rich enough function set (whatever that means) and numerical stability and accuracy (i.e. **all** functions accurate to at worst 1 ULP).

Message #8 Posted by **Bill Wiese** on 28 May 2007, 2:54 a.m.,  
in response to message #7 by Paul Dale

Another 48/49 clone with RPL and non-4-level stack will not be warmly received. At least going back and doing Woodstock or Pioneers will address a replacement market for the fervently loyal.

Why buy such a 48/49-like product when there's new & used ones available? Who (other than starving students) really uses a CAS system when they have PC software available? It's overkill.

This "project" has grown into creeping featurism - heavyduty ARM CPU, etc.

If someone gave me a 48/49 calc, I might use it for a wheel chock for my truck. I've given away two 48s - they're useless to me: too much in too small of a box.

Many others here probably feel the same - 48/49 is overkill, if we need that much functionality we

can go use Matlab, Maple, etc. on a PC.

A nicely-done 41CX/42S/15C (or some combination thereof) - with XYZT+L stack and a large Enter key - is the functionality that I think many or most here want. An alternate idea might be to support 71B BASIC programmability with a regular RPN calc 'front end' for direct-mode use.

In any case, it appears everyone is worried about which CPU or which LCD, etc. All these are relatively trivial decisions, and which are academically fun to make but which are kinda useless since any HP calc can be emulated on any reasonable 8-bit microcontroller these days.

Y'all are thinking like EEs, where all problems are electronic-related - which they often aren't. Packaging is key, and no one has addressed this for any manufacturability.

It will cost about the same to get a 40 key calc produced whether or not it has a fancy CPU.

The real issue in making this come to fruition is packaging and keytop issues. These require a chunk of money for NRE, and since no one rationally will drop \$50K min to get this started, choice of CPU is irrelevant as it's all an academic exercise.

*Message #9 Posted by [hugh steers](#) on 28 May 2007, 7:45 a.m.,  
in response to message #8 by Bill Wiese*

hi bill,

i agree with your points, probably all of them except that i have a slightly different take on the CPU. i have forgotten where my 48 is, but still use my 15c daily.

because CPUs are now cheap, makers think we want CAS, as you point out, this is mistaken because for anything even slightly complicated people will use their PC. i am typing this message on a PC only about twice the size of a 48 - but it can run a full up CAS and can display results in hires. this is not the realm for calculators.

my take on the CPU is that cheap performance should be deployed in other ways for pocket devices. this october, i plan to give a talk at the HPCC conference in london UK, on a new way to calculate. right now i have only some rough notes, but i do have some working software.

without giving too much away at this time, i want to show how you can go right back to basics with arithmetic itself and redo it another way. the result is a pocket calculator (im using the 50g platform as my example HW) that performs numerical calculation, not at all a CAS, without error. for example, punch in  $\sin(60!)$ , it displays, 0.949360891195. im also hoping to show how to perform numerical integration without error which would be interesting.

its what i think calculators shoule be like rather than simply piling on more and more features.

## Re: OpenRPN

*Message #11 Posted by [Gerry Schultz](#) on 28 May 2007, 2:48 p.m.,  
in response to message #9 by hugh steers*

I've been reading this thread about a better HP calculator and what pops in my head is how complex the RPL machines have become. I'm not a programmer but I can't get my head around all the things a 49g+ or a 50g can do.

If I were to design a calculator, I would want it to have different layers a functionality. The first layer would be a simple scientific calculator without programmability that would give a beginner easy access to just what he needs.

The second layer would have simple programming included so that when a user is ready, they can experiment with that. The final layer would contain the full functionality of the calculator for the user who is ready for that.

I know this sounds rather simplistic, but I think the first step in a new calculator is to make it very useful to a new owner right from the start. The steep learning curves of present calculators make it difficult for a beginner to find the calculator useful. It also doesn't help that HP's documentation is so poor.

----- for example, punch in sin(60!), it displays, 0.949360891195. -----  
-

Here's an example. I punched sin(60!) into my 49g+ (Revision #2.09) and got 0.342020143326. I don't have my 50g (also #2.09) with me to check but why the difference? I tried both in RPN and ALG and got the same answer.

I find that very frustrating.

Gerry

## Re: OpenRPN

*Message #12 Posted by [Howard Owen](#) on 28 May 2007, 3:30 p.m.,  
in response to message #11 by Gerry Schultz*

I made this suggestion to HP at the last HHCC conference. RPL is too complex for the average user, but it is darned nice for the calculator geek. So have an interface that "unfolds" in front of the user. The first layer is a basic scientific or financial, perhaps, with somewhat limited functionality. Unfold that, and you have keystroke programmability, ala the 42S, but updated. Next you have User RPL, or something like it. Each of these layers can interact with the one below it, or the one above if it is enabled. So, for example, the RPN programming can call the RPL if that is turned on.

But the points made by others in this thread are well taken. It's hard for me to see how to implement that without switching keyboards. The new TIs do that, so it isn't impossible. But it's very likely to add to the baseline cost. Since nobody can come up with the costs projected for simpler designs, it's doubtful this pipe dream would be feasible.

I'm fascinated by hugh steer's teaser, however. A reinvention of the calculator is more likely to come from that direction than from any hardware innovations.

Regards,  
Howard

### **sin (60!) [Updated with insight]**

*Message #13 Posted by **Karl Schneider** on 28 May 2007, 5:13 p.m.,  
in response to message #11 by Gerry Schultz*

Quote:

It also doesn't help that HP's documentation is so poor.

----- for example, punch in sin(60!), it displays,

Here's an example. I punched sin(60!) into my 49g+ (Revision #2.09) and got 0.342020143326. I don't have my 50g (also #2.09) with me to check but why the difference? I tried both in RPN and ALG and got the same answer.

I find that very frustrating.

I don't have an HP-49G+ or its documentation available, but that's a really bad example. First of all, the angular mode makes a difference in the result. Secondly, "60 factorial" has more than 12 digits that precede the string of 14 trailing zeroes. So, the correct result is theoretically achievable only in exact mode.

My HP-49G in exact mode will return 0.34202014333 as the sine of "60 FACT" degrees. However, so do all my Saturn-based 12-digit HP's lacking exact mode.

The HP-49G correctly returns 0 in exact mode for MOD(60!, 360), as  $60! = 60 \cdot 6 \cdot [\text{an integer product of the remaining terms}]$ . So, zero is the correct answer for sine, which is achievable if MOD were internally performed in degree mode using 360. Either the internal MOD or the SIN calculation does not utilize the full precision of exact-mode integers.

The HP-42S, lacking exact mode, returns 160 for MOD(60!, 360), which must be based upon the limit of precision available:

$(60! / 1E68) / 360$  yields a full 12-digit integer (231,138,530,909); MOD (60!, 360) yields a result of 160, which does not change as 60! is divided by powers of 10 that are lower than 68. The sine of 160 degrees is indeed 0.342020143326.

*Message #14 Posted by **GE** on 30 May 2007, 5:22 a.m.,*

*in response to message #13 by Karl Schneider*

This is very interesting. I wonder what mathematical trick you use to calculate  $\sin(60!)$  apart from having PI in ROM (or recalculating it) to lots of significant digits. I understand that if we can do  $\sin(N)$  with N a big integer the case of  $\sin(X)$  with X a big real number is simple. Thanks for sharing if possible.

**Re: sin (60!)**

*Message #15 Posted by **Thomas Okken** on 30 May 2007, 4:26 p.m.,  
in response to message #14 by GE*

My guess would be that, in exact mode, there are a few special-case checks for numbers like 60 degrees (mod 360); that check would have to be performed \*before\* converting the angle to radians.

Free42 performs such checks, but only for multiples of 90 degrees or 100 grads (SIN, COS, ->REC), and for multiples of 45 degrees or 50 grads (TAN).

However, note that getting cases like  $\sin(60!)$  right requires arbitrary-precision math.

- Thomas

**Re: sin (60!)**

*Message #16 Posted by **GE** on 1 June 2007, 3:32 a.m.,  
in response to message #15 by Thomas Okken*

60! is not 60 degrees or a multiple thereof, it is exactly  $(60! * 180 / \pi)$  degrees. The fractional part of this number is very hard to find with only 15-digits PI. The trick is was I was asking for.

**Re: sin (60!)**

*Message #17 Posted by **Paul Dale** on 30 May 2007, 4:51 p.m.,  
in response to message #13 by Karl Schneider*

I suspect Hugh was talking radians in his original message. Using wcalc, I get his answer in radians and 0 in degrees mode.

- Pauli

**Re: sin (60!)**

*Message #18 Posted by **hugh steers** on 31 May 2007, 5:45 a.m.,  
in response to message #17 by Paul Dale*

indeed!

my point is simply that there should be a handheld calculator for manual calculation that has no exact mode or non-exact mode, whatever, which is simple to use and doesn't have special modes that either gives the right answer or tells you it can't do it with no wrong answers.

i think that's a reasonable thing to ask.

**Re: sin (60!) [Updated with insight]**

Message #19 Posted by **Rodger Rosenbaum** on 31 May 2007, 3:18 p.m.,  
in response to message #13 by Karl Schneider

Quote:

My HP-49G in exact mode will return 0.34202014333 as the sine of "60 FACT" degrees. However, so do all my Saturn-based 12-digit HP's lacking exact mode.

The HP-49G correctly returns 0 in exact mode for MOD(60!, 360), as  $60! = 60 \cdot 6 \cdot [\text{an integer product of the remaining terms}]$ . So, zero is the correct answer for sine, which is achievable if MOD were internally performed in degree mode using 360. Either the internal MOD or the SIN calculation does not utilize the full precision of exact-mode integers.

My HP-49G has old firmware, version 1.05; I've never updated it.

When I calculate 60 FACT on it in exact and degrees mode, I get 8320987...00000; when I then press SIN, I get SIN(8320987...000000). I have to then do ->NUM to get it to return .342020143326. It's apparently converting the many digits of 60! to approximate mode before calculating SIN.

I get the same behavior in exact and radians mode. If I do 60 FACT SIN, I get SIN(8320987...000000). Doing ->NUM then returns 8.40001652835E-2.

On the other hand, on the HP49g+, in exact and degrees mode, if I do 60 FACT SIN, I get 0. The HP49g+ is apparently doing a 360 MOD in exact mode before passing the result to the SIN function.

If I do 60 FACT SIN in exact and radians mode, I get SIN(8320987...000000), the same as the HP49G.

If I switch to degrees mode with SIN(8320987...000000) still on the stack and do ->NUM, I get .342020143326. In this case, the 360 MOD isn't done in exact mode before executing the SIN function; apparently the SIN function's own internal, approximate mode 360 MOD is done.

Message #20 Posted by **Hugh Evans** on 28 May 2007, 2:29 p.m.,  
in response to message #8 by Bill Wiese

Amen. The electronics are the easy and cheap part to produce, since tooling costs, etc. don't exist. The bulk of the work I do on OpenRPN is finding and in some cases developing manufacturing processes to cut down on startup costs.

If we wanted to just get these things into production immediately, it would cost at least \$50k to get the ball rolling. My goal is to cut that number drastically, or produce a few prototypes and license it to a bigger company that thinks the product is worthwhile (this could be one of the smartest moves HP was made in decades).

-Hugh

**Re: OpenRPN**

*Message #21 Posted by **Bill Wiese** on 28 May 2007, 4:24 p.m.,  
in response to message #20 by Hugh Evans*

Frankly,

We should just talk to Kinpo and do a 'prototype' run for 'market investigation'.

Use an existing kinpo calc and we do our own firmware - just port over 41C emulator etc.

Frankly a nonprogrammable shirt-pocket sized TI25X with 4-level RPN, large enter key, hex/binary/dec conversion & logic functions and PV/FV/i/PMT/n functionality would be a very useful device.

Bill Wiese San Jose CA

**Re: OpenRPN**

*Message #22 Posted by **Hugh Evans** on 30 May 2007, 2:28 a.m.,  
in response to message #21 by Bill Wiese*

Actually, I may give that idea a shot. If they can produce machines using my designs and specifications that's all that matters.

**Hp-67**

Message #1 Posted by **TIM** on 26 May 2007, 10:43 p.m.

Does anyone know the order of the wires from the magnetic head to the circuit board? Does anyone have a picture?

**Re: Hp-67**

Message #2 Posted by **Randy** on 27 May 2007, 10:36 a.m.,  
in response to message #1 by TIM

There are two different board patterns, the early version where the wires where soldered in, the later version where they where in small sockets.

The soldered:

```
org
blk
yel
red blu
```

The socketed:

```
blu
  blk
yel
  red  org
```

Beware of older units with the wires exiting the head that are covered by a blob of RTV. Too much stress and or flexing and the wires can break off at the head.

### quick mini-challenge for 12c

Message #1 Posted by [Don Shepherd](#) on 26 May 2007, 5:37 p.m.

All right, write the shortest possible program for the 12c that does this: You input the sum of 2 numbers, the difference of the same 2 numbers, and the program calculates and displays the 2 numbers.

### Re: quick mini-challenge for 12c

Message #2 Posted by [Gerson W. Barbosa](#) on 26 May 2007, 8:54 p.m.,  
in response to message #1 by Don Shepherd

```
01- STO 0
02- +
03- 2
04- /
05- ENTER
06- ENTER
07- RCL 0
08- -
```

Too many steps?

### Re: quick mini-challenge for 12c

Message #3 Posted by [Don Shepherd](#) on 26 May 2007, 8:59 p.m.,  
in response to message #2 by Gerson W. Barbosa

Gerson, your program displays the smaller of the two numbers, but not the larger (if I entered it correctly).

### Re: quick mini-challenge for 12c

Message #4 Posted by [Gerson W. Barbosa](#) on 26 May 2007, 9:06 p.m.,  
in response to message #3 by Don Shepherd

Sorry, I forgot to mention the other number is in register Y.

### Re: quick mini-challenge for 12c

Message #5 Posted by [Don Shepherd](#) on 26 May 2007, 9:07 p.m.,  
in response to message #4 by Gerson W. Barbosa

Yes, I saw that after I replied. I've got a 7 line program that pauses after the first number then displays the second.

### Re: quick mini-challenge for 12c

Message #6 Posted by [Gerson W. Barbosa](#) on 26 May 2007, 9:23 p.m.,  
in response to message #5 by Don Shepherd

Something like this?

```
01 -  
02 LSTx  
03 x<>y  
04 2  
05 /  
06 PSE  
07 +
```

### **Re: quick mini-challenge for 12c**

*Message #7 Posted by [Don Shepherd](#) on 26 May 2007, 9:27 p.m.,  
in response to message #6 by Gerson W. Barbosa*

Actually, more like your first one, except a little different:

```
01 STO 1  
02 -  
03 2  
04 /  
05 PSE  
06 RCL 1  
07 +
```

But yours works too. It's always great to see another mind at work!

### OT: Forth on Sharp PC-1500 question

Message #1 Posted by [Klaus1500](#) on 26 May 2007, 2:57 p.m.

Hello, sorry if it's OT, but I don't know another place to ask. I recently got an device for testing data-transfer via radio for the Sharp pc-1500, and included is the PC-Forth from RVS. I also have a manual as pdf, but it's OCR'd, hence my problem: According to the manual:

Quote:

Due to technical reasons, PC-Forth always uses " instead of "

Apparently the OCR misinterpreted the String delimiter. I tried using the quotes, but

```
. "Test "
```

does not work, and on its keyboard, the PC-1500 does not have that many signs that look similar to the quotes.

So does anyone know how to use Strings in PC-Forth?

Have a nice weekend! Klaus

### Re: OT: Forth on Sharp PC-1500 question

Message #2 Posted by [Garth Wilson](#) on 26 May 2007, 5:27 p.m.,  
in response to message #1 by [Klaus1500](#)

I don't know what "RVS" or "OCR" stand for in your post, but to enter a quoted string literal in Forth, you need to put a space after the first quote mark. Otherwise it'll look for a word with a 7-character name called ".Test" and say it's not found. Remember there's no punctuation in Forth. Everything is a word, including "." (pronounced "dot-quote"). For the command-line interpreter to see it and know what to do with it, it has to have a space between it and your first string character T. ". " will look for the final quote mark as a delimiter.

Garth

E-mail: wilsonmineszdslextremezcom (replace the z's with @ and .)

### Re: OT: Forth on Sharp PC-1500 question

Message #3 Posted by [Klaus1500](#) on 27 May 2007, 11:56 a.m.,  
in response to message #2 by [Garth Wilson](#)

Hi Garth, thank you for your answer. I don't get that to work. Since the manual explicitly mentions that the quote-sign (") from fig-Forth is written as something else in PC-Forth, I think there must be another character starting a String. Would this character be mentioned in the vocabulary (listed with VLIST in PC-Forth)?

RVS = The company that ported Forth to the Sharp PC-1500 With OCR I mean converting the images

from the scanner to text

**Re: OT: Forth on Sharp PC-1500 question**

Message #7 Posted by [Klaus](#) on 29 May 2007, 2:35 a.m.,  
in response to message #6 by Antonio Maschio (Italy)

"Klaus1500" was my alias in my new webbrowser, because I didn't have the login information at hand...

Hi Antonio,

The Forth program is stored in the device I acquired. To run it, you have to type in a command, then it is copied to the CE-161 ram card. Please note that this version of Forth has some special commands to communicate with the device, apart from that, it seems to be the standard version 1.1 of PC-Forth from RVS. I did not find any information about it on the internet, but I have seen it appear once on TAS as a cassette version.

**Re: OT: Forth on Sharp PC-1500 question**

Message #8 Posted by [Bill \(Smithville, NJ\)](#) on 29 May 2007, 2:29 p.m.,  
in response to message #7 by Klaus

Hi Klaus,

Forth on the PC-1500 sounds pretty neat.

Quote:

\_\_\_\_\_

The Forth program is stored in the device I acquired

\_\_\_\_\_

By this do you mean it is stored in the PC-1500 memory? Or do you load it from a separate module?

If it's in the memory, it should be possible to save it to a cassette tape or as a sound file on the PC. If it can be saved, then I'd like a copy so I could play around with it.

I have several PC-1500A with the plotter. Great little computer.

Bill

### **Re: OT: Forth on Sharp PC-1500 question**

*Message #9 Posted by **Klaus** on 30 May 2007, 4:27 a.m.,  
in response to message #8 by Bill (Smithville, NJ)*

Yes, you can use the forth in your PC-1500A (provided you also have a CE-161 ram-card).

The device I acquired ( a BMC datalogger) has the forth built-in. To use it, you use a special command for the datalogger, then it is copied on you 16K ram card (CE-161). Now the forth can be used without the datalogger (it contains some commands to control the datalogger, but they won't bother you).

Currently I am building a RS-232 cable, so I might be able to copy an image to my PC.

If you can write a program that PEEKs all the memory of the CE-161, and saves it on a cassette tape, I could produce a cassette image (or a .wav file) now. (According to the manual, all information is stored on the CE-161 and not in the memory of the PC-1500).

### **Re: OT: Forth on Sharp PC-1500 question**

*Message #10 Posted by **Bill (Smithville, NJ)** on 30 May 2007, 8:14 p.m.,  
in response to message #9 by Klaus*

Hi Klaus,

If I understand you, the datalogger is a device that probably plugs into an expansion port and it has the Forth language in it. I'm wondering if it actually copies the entire Forth to the CE-161 or if it just sets up the data structure on the CE-161 and then makes calls to the rom of the datalogger.

One way to find out would be to initialize the forth from the datalogger, then remove the datalogger and see if the forth still works without the datalogger being attached.

From reading the CE-161 manual, it can be set up several diferent ways, depending upon the switch setting and some poke commands.

I'm not not sure if the module can be peeked by a basic program. I'll have to get my module out and play around with it this weekend.

Please do the test of removing the datalogger and seeing if the forth still works. If it doesn't then making a copy of the forth could be difficult.

If you want to take this off-line, you can reply through yo my hpmuseum e-mail link.

Thanks,

Bill

If I understand you, the datalogger is a device that probably plugs into an expansion port

\_\_\_\_\_

Yes, it plugs into the connector on the top of the CE-150 Plotter

Quote:

\_\_\_\_\_

One way to find out would be to initialize the forth from the datalogger, then remove the datalogger and see if the forth still works without the datalogger being attached.

\_\_\_\_\_

Yes, this was the first thing I did. It works without the device.

**Re: OT: Forth on Sharp PC-1500 question**

It works without the device.

\_\_\_\_\_

Fantastic!! Then it should be possible to dump it out of the CE-161. I'll try some playing around with the PC-1500 and CE-161 this weekend to see what it might take to dump the memory to tape.

I did get your e-mail message and will be taking this further off-line with you.

Bill

### Lorentz transformations

Message #1 Posted by **Ron Allen** on 26 May 2007, 4:19 a.m.

One of you mathematical specialists could help me probably. I have recently renewed my interest in theoretical physics. As a result, the Lorentz transformations worry me again.

Would you be willing to point me to some gentle reading on that history? For example, did they precede Einstein's search for solutions of relativity or devised to make the theory work? Not being a math or physics major in school, I had developed a certain suspicion about the need to explain why kinetic energy,  $E=Mc^2$  instead of the integration of momentum,  $1/2Mc^2$ . I can see how Lorentz makes the difference when the velocity of the relative frames is near the speed of light and that they would not change Newton's perspective at the speed of a horse race or a steam engine, even a shooting star.

I am not working on a challenge, certainly not a 100 years after the fact. Better reason - I'm not qualified. Probably my ignorance that allows me to question things like this anyway. Lots of things about math seem a little convenient to me anyway, like we do indeed "manage the errors" when doing numerical analysis, calculus for sure. What about regression, especially if we use it for cause and effect or extrapolated predictions (HP instructions and menus for regression even use keys for "Pred" which is an extrapolated projection of some curve, not telling what R is, or which is implied cause or effect.

We are sometimes too inventive about creating an explanation (hypothesis) for things we leave outside the box or sphere like dark matter. Ether served scientists of Einstein's time, even him. Why isn't the prevailing explanation for too much mass that we can't see the other side of galaxies, even our own? Didn't we find a bulge in the moon when we finally saw it?

I just want to understand Einstein a little better before this old frame passes on, hopefully with some recognition of the truth.

Ron

*Message #3 Posted by **Ron Allen** on 27 May 2007, 5:49 a.m.,  
 in response to message #2 by Giancarlo (Italy)*

THANKS TO ALL OF YOU WHO RESPONDED WITH SUCH SPLENDED ADVICE AND INVITATIONS TO DEBATE ANY ISSUES I MIGHT WISH TO ENGAGE.

The subject is fraught with traps, but it also loaded with serious thinkers with plenty of room for amateurs like me. I took a quick look at some of the references you shared and can see that they should measure up to the challenge while some might not pass the threshold for "gentle." I'm certain that you all are familiar with the fact that "amateur" means something like "lover of the activity, the game, the endeavor, " etc. An amateur in photography, for example, could very well perform much better than his professional neighbor measured for quality versus quantity.

Whoah, Sam, I didn't mean to step on a nerve. Maybe I should not have been too quick to draw a conclusion of my own by asserting that too many people have access to some pretty powerful stuff in these calculators. Correct me if I am wrong, but isn't a regression analysis a quick study of the existing relationship between or among pairs or groups of historical data, optimized by fitting them in a linear or quasi linear fashion to a group of curves from which to see the historical relationships and to suggest a lead with variable significance of the results. No doubt there are many examples of "winners" in regression curves that qualifies the method to be joined with other methods of reaching good leads into solid trouble-shooting type activities. As I understand it the residuals have meaning also, which is one of the reasons I believe that regression has its limited place. I am more inclined to push the idea that the dice have no memory, especially after hearing of so many stories from Las Vegas about sure fire betting schemes. I do believe that regression has its place but that statement was made to point out the fact that even a respected company like the one we buy from, makes the published error in a user document that implies a definite cause and effect relationship by labeling it "Pred." I think some trouble-shooters who trust their instincts can abandon an existing problem after losading their logical engine with data and then go into a rest mode like a cup of coffee and talking about football or some other distraction and suddenly experience brilliance when their subconscious returns the answer. That probably describes you in which you have included some regression statistics for final analysis. Foolish question - if predictive nature is prevalent in the model, why do they throw out the "outliers?"

Not sure I understand, "REPLACE THIS TEXT WITH YOUR LISTING," But I like the odds that it is a challenge for me to respond with a program to out-perform regression curves in a controlled environment.

Ron

Thanks again to all of you and your stimulus. I have Parkinsons and need all the stimulation I can get.  
 Keeps the fog at sea.

Message #5 Posted by [Sam](#) on 26 May 2007, 2:45 p.m.,  
in response to message #1 by Ron Allen

<What about regression, especially if we use it for cause and effect or extrapolated predictions (HP instructions and menus for regression even use keys for "Pred" which is an extrapolated projection of some curve, no telling what R is, or which is impied cause or effect.> There was a problem involving a gas law which has 2 companies stumped. I had a new calculator and entered the data into an exponential analysis. The correlation was 0.384 . I retried it with a power law regression and obtained a correlation of 0.996 . A gas leakage problem that was assumed exponential turned out to be an outgassing of adsorbed helium, I made a log-log plot of the data which fit correctly. There was a point almost off the graph from an unusual data point, but it fit the power law plot extended. With a programmable calculator I made fits to all sorts of difficult curves; thermistors and other electronic curves. It is an addiction of mine. I enjoy reducing intractable data to a formula. Sam

Message #6 Posted by [Thomas Okken](#) on 26 May 2007, 2:45 p.m.,  
in response to message #1 by Ron Allen

From what I remember from college, H. A. Lorentz derived his transform to account for the bizarre results of the [Michelson-Morley experiment](#) -- this was the famous experiment that led to the discovery of the invariability of the speed of light. What Michelson and Morley were trying to do is to measure the speed of the Aether (the hypothetical medium through which electromagnetic waves were then thought to travel). Lorentz' assumption was that Michelson's and Morley's negative results were caused by their apparatus being distorted by its own motion through the aether, in such a way as to cancel out the expected differences in the speed of light depending on the relative motion of the observed light source, and his transform described how spacetime would have to be altered for this to account for the observed results. His assumption turned out to be wrong, but he got the transform right, for the Special case of relativity anyway. And, perhaps most importantly, the Lorentz transform reconciled the inconsistencies between Newton's laws of motion and Maxwell's laws of electricity and magnetism.

I don't remember the title of my college textbook for this subject, which is probably just as well, because, while I did ace the test, I was just as confused at the end of the course as at the beginning.

However, for a gentle introduction on just about any subtopic of physics, for people who really want to know the nitty-gritty, you can't beat [The Feynman Lectures on Physics](#). What you're looking for is in Volume 1, Chapter 15, "The special theory of relativity", but I recommend getting the whole set. Great stuff.

- Thomas

Message #8 Posted by [Dave Shaffer](#) on 26 May 2007, 5:23 p.m.,  
in response to message #1 by Ron Allen

re: "Why isn't the prevailing explanation for too much mass that we can't see the other side of galaxies, even our own? Didn't we find a bulge in the moon when we finally saw it?"

We can, in fact, "see" the other side of the galaxies (and our own Galaxy, too). Infrared, X-rays, and radio waves all pass right through. We don't see anything out of the ordinary "on the other side." Plus, the real indicator that there really is "missing mass" (meaning mass we can't "see") is its gravitational effect, which is not affected by lack of transparency in any part of the electromagnetic spectrum.

There's no extra bulge on the other side of the Moon, either. The core of the Moon does seem to be somewhat offset, but that is completely explainable by tidal effects as the molten, newly-formed Moon cooled down under the influence of the Earth's gravity.

**Re: Lorentz transformations**

Message #9 Posted by [Ron Allen](#) on 28 May 2007, 4:45 a.m.,  
in response to message #8 by Dave Shaffer

Dave, thank you so much for responding to my ignorance about Dark Matter. Your straight forward, no nonsense explanation of my misinformation has already awakened me to more discipline in my efforts to understand. It has been a few years since I fell more naturally into the good lab habits. You've been a great help and I look forward to more exchanges.

Hopefully it won't be too long before I start making a contribution in the subject matter, maybe even approach parity, or close enough to carry my side of a decent argument. (If there is ever a "side" beyond a devil's advocate's position in a mock debate.) In the meantime I shall remain content to have people of your qualifications willing (hopefully) to critique my efforts.

Sincerely, Ron

**Re: Lorentz transformations**

Message #10 Posted by [Anthony L. Mach](#) on 27 May 2007, 4:05 a.m.,  
in response to message #1 by Ron Allen

Hi Ron,

You've picked an interesting topic, indeed!

If you are interested in how the transforms are derived, I can scan my derivation and send it to you. The Lorentz equations are surprisingly intuitive when you see them and you'll get a nice moment of clarity! There doesn't seem to be any easily understood algebraic derivations out there on the internet... Unfortunately, many of the science / math Wiki entries tend to confuse many folks that aren't already knee deep in it!

If you want to know where all that mass is, do a search for 3 degree cosmic background radiation.

A searchable online version of Einstein's Relativity can be found here: [Relativity](#)

If you want my opinion, go forth and read my so-called "holy trinity of space, matter, and time." This includes:

...Einstein's "Relativity" ...Martinus Veltman's "Facts and Mysteries in Elementary Particle Physics" ...Steven Weinberg's "The First Three Minutes"

in response to message #10 by Anthony L. Mach*

Hi, Plastics Guy - good of you to jump in with your advice. You sound very much like a professor or doctoral candidate at a really good institution with time to inspire thinking. I'm currently enjoying the non-technical biography, "Einstein." I have some time I can use to ask some reasonably pertinent questions that go to the central issues of Relativity, Quantum, String Theories, and other topics within the realm of "Theoretical Physics or possibly philosophy.

It would be ideal if there was a University close by with an honors class I could audit and participate or at least listen to arguments. I don't imagine anything of that nature will be forthcoming in my area soon. I may be relocating to the Huntsville vicinity by fall. There could be such an opportunity sponsored by N.A.S.A near there. Even if not, the chances of creating or joining an existing group or "club" for a subject like that would be the next best thing to having M.I.T. or Cal Tech in my back yard.

Thanks again for your encouragement and your references. I especially appreciate being set straight as to the current status of Dark Matter.

Ron.

in response to message #11 by Ron Allen*

Hi Ron,

Thanks for your comments, but I am neither/nor! Actually, I work full-time in a plastics recycling plant and have decided to go back to school to finish my degree and get a minor in physics along the way. My best wishes to you in your journey of knowledge. One can gain a great deal by checking out the modern physics classes at any local university. Of course, you'll find many reasons (excuses?) for using your trusty HP in class!

Have fun!

Tony

### **Re: Lorentz transformations**

*Message #13 Posted by [Ron Allen](#) on 28 May 2007, 7:03 p.m.,  
in response to message #12 by Anthony L. Mach*

Hi, Plastic Guy,

I catch the connection - recycle, guy (male persuasion) well-read in physics and astro physics self educated for the most part. You are the epitome of my definition of a student. That person who somehow realizes that a large part of their education is dependent on a qualified faculty with reasonable resources (library, visiting professors, an inspirational environment all focused on the

customers, the student base. Yet they are more dependent on themselves setting goals, finding ways to make every course interesting, participating in and out of the classroom, socializing with other individuals and groups, taking advantage of what resources they have and expanding resources by access through other means such as the internet. Sure, you'll have to take some structured courses for basic liberal education, but the real student taking the opportunity to become a better-educated individual will study some of Shakespeare's plays along with the English majors instead of survey courses mandated and designed to meet minimum degree requirements. I am a strong advocate for a minimum exposure to liberal arts and science degree at the BS or BA level with graduate study at the professional or specialty level.

A BS will get you a stacks pass at the library, a better chance to audit classes you want to sit for, a chance for graduate school and the opportunity to contribute to the alumni fund along with the chance to get in line for a pair of season tickets. Liberal arts will make you a better Supreme Court Justice, Holistic MD, Teacher, Writer or, as indicated, a well-educated person probably parking cars at your favorite Restaurant.

I have to tell you that like you, I went BACK to college and found it to be a real challenge because of time constraints, but I managed to squeak into first place by something like a hundredth of a point for graduation.

Best of luck, Prof.

Ron

## Re: Lorentz transformations

Message #14 Posted by **Ron Allen** on 28 May 2007, 5:50 a.m.,  
in response to message #10 by Anthony L. Mach

I would be a happy Dude indeed to see the scans of your derivations of the Lorentz transforms. (anything else you care to share). Are they derived through fairly simple 1st or 2nd order linear DEQs? I use Mathcad Release 13.1 which has a few options for DEQs with parameters, initial boundaries plus partials and systems. Several options are included for interpolation. Release 13 of Mathcad changed the solve block design to facilitate solutions with parameters, symbolic in some cases, numeric in every one I have solved. The other major improvement in the solve block design allows you to place a block inside a loop to assist in solving all DEQs.

In case you aren't familiar with the software, it is built around some Maple modules with CAS assistance. Some of the logic is illogical and it can be a hard one to program, but it can interface with scripted controls from C++ or AS An ADDIN WITH EXCEL. I am beginning to sound like a sales person for Mathsoft, not intended. Just wanted you to know that I'm not limited to that one relative weakness of the 50g vs laptop. I use the 50g for integration or differentiation any time I want to show steps. Needless to say, but I am very pleased with my 50g and Mathcad.

Ron

### 15C square root key loose - problem?

Message #1 Posted by [Mike Ingle](#) on 26 May 2007, 3:47 a.m.

I just got a HP15C off Craigslist. It is basically new, except the keys on the left top are looser than the rest. The square root key is most noticeable. It has a lot more movement than other keys before there is any resistance. Hold the calculator upside down and tap the square root key, and it will rattle. Is this keyboard faulty, with a broken heat stake or something? Do other 15Cs feel this way?

Mike

### Re: 15C square root key loose - problem?

Message #2 Posted by [Randy](#) on 27 May 2007, 10:54 a.m.,  
in response to message #1 by [Mike Ingle](#)

The heads (mushrooms) of the heat stakes have failed. If the unit is in great condition, the problem was a manufacturing issue and you're likely to find with just a light touch on the other mushroom heads that they'll just pop right off. I've seen units where every heat stake had failed except for the bottom. If the unit has been well used, the popped heads are due to stress failures.

The generally accepted repair method is to hold the board tightly in place and place a very small amount of super glue on the post. Follow that with drop or two of instant cure and move to the next post. You can also use rubberized super glues, they're flexible, black and work well in this application.

I cannot over emphasize the \*small amount\* disclaimer above. Too much and you'll glue the key hinge, seizing the key and turning your great find into a paperweight.

### Just a thought. Wanna share

Message #1 Posted by **Olivier TREGER** on 25 May 2007, 6:05 p.m.

Sorry to interrupt the flow of mathematical/technical exchanges on this forum.

I just wanted to share a thought: when cruising on <http://www.hpcalculators.net/HP-67/HP-67%20box1.JPG> , I noticed the quality of this HP67 GianMaria found (or maybe it's his own he kept in perfect shape) and especially the leatherette pouch.

It brings back memories of the time I had my very first HP21: I couldn't believe the quality of the pouch, although it came with a low-range calculator. Its softness, smell and much more.

Don't take me wrong: it ain't nothing physical in a politically incorrect way :-)

Just this feeling that you own something special, designed by special people, having the same expectations you have.

This I never forgot and it drove me to always get the top of the cream product if I can afford it. This way I'm sure people did care of me before I have to ask.

Sorry for this long thought but it brought me back in 1974 and I love that...

Good night (midnight over here)

in response to message #1 by Olivier TREGER

Hi;

cannot help adding a few lines here.

I was 13 YO in 1974, but I actually had the chance to see and operate an HP21 my older brother bought. That was the first calculator I saw, and I was killing my braincells in order to try to figure out how could it write numbers and compute them... I was not even aware of what [SIN], [STO] and other keys stood for, but the fact of being able to compute basic operations was... awesome!

In 1982 (I was 20, then) I could buy my first HP, an HP41C. Brand new! So, when I read

Quote:

\_\_\_\_\_

I'm sure people did care of me before I have to ask.

\_\_\_\_\_

I think I know what you mean, and I miss it, too.

Thanks!

Luiz (Brazil)

### **(OT) Craig engineering calc**

Message #1 Posted by [Ren](#) on 25 May 2007, 3:20 p.m.

Hello Fellow Forum Quorum!

This morning I bought a CRAIG 4512 Engineering Calculator at a garage sale. It has a horizontal format and a fluorescent type screen and leather case (sort of like slide rules came in). Anybody here collect Craig's? I'm willing to part with it. I haven't popped any batteries (4 AA's) into it yet, so I'm not sure if it works. It has been used, some of the finish is worn. No manual, but a hint plate on the back side.

I know there is a separate Classifieds forum but this isn't HP, so it doesn't go there, and it's not like I'm really selling it, more like offering it for cost and shipping (or trade?).

Sincerely (and apologetically) Ren

dona nobis pacem

### Mixing NiMH & NiCd

Message #1 Posted by [Geir Isene](#) on 25 May 2007, 3:46 a.m.

When rebuilding a woodstock battery pack, is it ok to use one NiMH and one NiCd battery?

### Re: Mixing NiMH & NiCd

Message #2 Posted by [Maximilian Hohmann](#) on 25 May 2007, 3:54 a.m.,  
in response to message #1 by [Geir Isene](#)

Hello!

No! They have different internal resistances and also different charging behaviours. This means, that the NiCd cell will always get discharged first and then polarity reversed while the NiMH cells continue to supply current, a process that kills the cell after very few cycles. You are supposed to not even mix different cells of the same kind if possible.

Greetings, Max

### Casio FX-7500g manual in English? :-)

Message #1 Posted by [gene](#) on 24 May 2007, 10:35 p.m.

Looking for an english manual for the Casio FX-7500g graphing calculator.

I tried here: <http://www.usersmanualguide.com/casio/calculators/fx-7500g>

but the link it gives is dead. Anyone have a link to the PDF or a copy of the PDF they could let me browse? :-)

### Re: Casio FX-7500g manual in English? :-)

Message #2 Posted by [Xerxes](#) on 25 May 2007, 3:05 a.m.,  
in response to message #1 by [gene](#)

Hi,

if you cannot find the manual, the FX-7000G is almost identical to the FX-7500G.

[FX-7000G manual](#)

### Re: Casio FX-7500g manual in English? :-)

Message #3 Posted by [Alex L](#) on 25 May 2007, 9:39 a.m.,  
in response to message #2 by [Xerxes](#)

I can confirm this - I have both the 7000 and 7500 manuals in front of me. Use the fx-7000g manual with confidence. The differences are minor and mostly related to the capacities of the machines, e.g. 7000: max 52 memories, 7500: max 526 memories.

Here is one added feature of the 7500g, transcribed from the manual. This appears at the end of section 3-2. (My 7000g doesn't have batteries in it at the moment; perhaps this exists as an easter egg in the earlier model?)

Quote:

\* Instant factor function

The instant factor function can be used to quickly magnify the size of a graph by  $2^n$  or reduce it by  $1/2^n$ . The change in size is centered at the pointer when it is displayed, and at the center of the graph when the pointer is not displayed.

- Operation

(Shift)( $\times$ ) ... 2X magnification in both  $x$  and  $y$  directions. Pressing (Shift)( $\times$ ) again magnifies by  $2^2$  or 4X, and a third press magnifies by  $2^3$  or 8X.

(Shift)(÷) ... 1/2 reduction in both x and y directions. Pressing (Shift)(÷) again reduces by 1/2 or 1/4, and a third press reduces by 1/2<sup>3</sup> or 1/8.

Since range contents are switched to their inverse proportions, the graphic display is cleared each time the instant factor function is executed.

...Examples...

The following input ranges (p201) are clarified in the 7500g manual:

```
log x, ln x: 10^-99 <= x < 10^100
x^y: When x<0, y=n, 1/2n + 1 (n is an integer)
      x=0 -> y>0
      When x>0, -10^100< y log x < 100
Pol(x,y): sqrt(x^2+y^2) < 10^100
```

With the exception of references to amounts of memory available or free in the text or on sample displays (422 bytes max on the 7000G, 4006 bytes max on the 7500G), some keycap graphics, and some of the physical specs in the back, I could detect no other differences.

Enjoy!

### Re: Casio FX-7500g manual in English? :-)

in response to message #3 by Alex L

I have tested the [Shift] [×] and [÷] on the FX-7000GA and it works like your discription.

### Re: Casio FX-7500g manual in English? :-)

Message #5 Posted by [Antonio Maschio \(Italy\)](#) on 25 May 2007, 4:50 a.m.,  
in response to message #1 by gene

I cannot confirm for the 7XXX series, but I got a fx-8000G and a fx-8500G that are \*totally\* equivalent, being the only difference the RAM memory available (around 1500 for the 8000, over 6000 for the 8500).

So I guess you can use safely the manual for the 7000 which is linked above.

Hi, Gene:

I think I got it some time ago from that same, now defunct link. Right now I'm far from home and can't check but tonight (i.e. within 8 hours from this post's timestamp) I'll do it.

If I do find it (which I think I should), it'll be a large PDF file. I'll upload it somewhere and tell you the download details.

Best regards from V.

**P.S.: Found it !** I'm uploading it right now, will send you a message through the MoHP forum soon.

### **97 card reader no write**

Message #1 Posted by [Hal Bitton](#) on 24 May 2007, 7:02 p.m.

Hi everyone...

I've just rebuilt the card reader on my 97, and it now reads cards beautifully. Upon attempting to write (programs or data), however, I get an error message after the card runs through. It's more than likely the write protect leaf switch, and that's what I will be checking first. Is there something else I should check while I'm in there?

Thanks and best regards, Hal

### **Re: 97 card reader no write**

Message #2 Posted by [Dan W](#) on 24 May 2007, 7:13 p.m.,  
in response to message #1 by Hal Bitton

Hi Hal,

Next thing I'd check is the bundle of 5 wires coming out of the read/write head. It is very easy for one of these to come loose when working on the card reader, and usually it's easy to miss since they are all bundled together.

Let us know what the problem was!

### **Reversed keys from factory?**

*Message #1 Posted by [Jimi](#) on 24 May 2007, 5:55 p.m.*

I saw an item (250119359325) on a popular auction site that will remain nameless, but I was not really sure what to make of the fact that the calculator has two keys reversed. It's indicated that it doesn't appear to have been opened, and from my personal experience with 41s, I can believe it. I mangled my original 41C getting it apart.

Has anyone seen a mistake like that before, or is it a sure sign it's been opened? Just curious.

### **Re: Reversed keys from factory?**

*Message #2 Posted by [Ron](#) on 24 May 2007, 7:55 p.m.,  
in response to message #1 by Jimi*

I believe it is possible to remove the feet, disassemble the halves, and reassemble, with no outward signs of having done so.

### **Re: Reversed keys from factory?**

*Message #3 Posted by [bill platt](#) on 24 May 2007, 10:05 p.m.,  
in response to message #1 by Jimi*

The fullnut is easy to take apart and put together. Even I did it successfully the first time. Search the archives (especially back in 2005 or before) and you'll find lots of great stuff written by Luiz, Randy, and a number of others on this topic.

### HP35 with "the Bug" and the CHS-EEX

Message #1 Posted by [Dan W](#) on 24 May 2007, 11:40 a.m.

Hi all,

I have one HP35 with "The Bug" and one without. The behavior of the CHS key with the EEX key is different with the buggy HP35 than the other. But I haven't found this difference written up anywhere.

On the buggy HP35, if I enter a number, then EEX, I do NOT see two digits off to the right until I type them in. On the non-buggy HP35 I see two zeros to the right as soon as I hit EEX.

On the buggy HP35 I must hit the CHS key immediately after the EEX key to get a negative exponent. When I do this I get -00 displayed, then I can punch in the actual exponent. But after that the CHS key does not do anything - I can't change the (-) to a (+).

On the non buggy, I can enter the EEX digits and hit CHS at will, reversing the EE sign each time.

Is this known behavior of some HP-35's or related to The Bug? Or is this a different problem?

Thx

-- Dan

### Re: HP35 with "the Bug" and the CHS-EEX

Message #2 Posted by [Eric Smith](#) on 24 May 2007, 10:04 p.m.,  
in response to message #1 by Dan W

I think that was a separate change, which occurred in a release before the famous bug fix. There were at least three public releases of the HP-35 firmware.

If you ever have occasion to open them, please note the part numbers on the ROMs (round metal cans, part number 1818-xxxx).

### Re: HP35 with "the Bug" and the CHS-EEX

Message #3 Posted by [Dan W](#) on 25 May 2007, 5:03 p.m.,  
in response to message #2 by Eric Smith

The ROMs for the one with the bugs are:

K7239FC 1818-0020 K7233GJ 1818-0017 K7231BF 1818-0006

The numbers are on the side, not the top.

Is there a document describing in detail the different ROMs sold and the bugs or errata in each set?

Thanks,

-- Dan

**Re: HP35 with "the Bug" and the CHS-EEX**

*Message #4 Posted by [Eric Smith](#) on 26 May 2007, 4:48 a.m.,  
in response to message #3 by Dan W*

There are at least three public releases, and possibly four. There were internal engineering releases, of which it is possible that some prototype units may exist.

Prototypes: combinations including 1818-0001 through 1818-0019

Earliest known release: 1818-0006, 1818-0017, 1818-0020

Intermediate: (unknown, possibly unreleased) combinations including 1818-0021 through 1818-0025

Bug fix: 1818-0024, 1818-0026, 1818-0027

Revision, purpose unknown: 1818-0024, 1818-0026, 1818-0028

Peter Monta has dumped the (6, 17,20) set, and a later release that is believed to be the (24, 26, 27) set, so these can be compared in simulation in Nonpareil. At some point it will be a good idea to dump the sets with 27 and 28 for verification.

**Re: HP35 with "the Bug" and the CHS-EEX**

*Message #5 Posted by [Dan W](#) on 26 May 2007, 10:43 a.m.,  
in response to message #4 by Eric Smith*

Thanks Eric.

This bug affecting the operation of CHS with EEX has much more user impact than the 2.03 ln e^x bug, but is less well known. Was it resolved quickly in an intermediate release before the more famous bug?

**9114 Controller Board Pic - 12v circuit?**

Message #1 Posted by **PeterP** on 24 May 2007, 3:01 a.m.

Tony (and anyone else who is still listening),

I have used the time away from home to mark a high-res picture of the controller board with the numbers for the individual parts. This might be of use to others as well, please feel free to download from [here](#)

Also, if possible I'd like to confirm that I have correctly identified the 12v PSU circuit with the 'monostable U106', 'MOSFET 105' and the related coils L101 and L102. For better identification I have circled them [here](#) for you. Maybe you can do a quick peek.

I was able to download a datasheet for the NE555N and will try to see if there are any oscillations on the Output pin. The result of which I will report. One thought I had that maybe the 100 Ohm resistor went, because we had so much amp flowing that the pico-fuse went. However via visual inspection the resistor looks fine. Anyway, I feel that over the last few days I have become a tiny bit better oriented on the PCB (yet it still looks like a miracle to me how you have been able to reconstruct the diagrams!)

Thanks a lot and - stay tuned!

Cheers

Peter I will be back home tomorrow night at which point I hope to be in possession of my scope already for an interesting weekend ahead!

**Re: 9114 Controller Board Pic - 12v circuit?**

Message #2 Posted by **Tony Duell** on 24 May 2007, 5:31 a.m.,  
in response to message #1 by PeterP

Yes, I think you've found the right components.

Don't rely on a visual inspection for that resistor. Check it (with an ohmmeter). It's best not to assume anything is OK...

**Re: 9114 Controller Board Pic - 12v circuit?**

Message #3 Posted by **Ronald P** on 24 May 2007, 5:19 p.m.,  
in response to message #1 by PeterP

Hi,

I have a 9114 circuit for spare parts lying somewhere in my "fix it all" box. If there is a special part you need, just say so. (only shipping costs).

Ronald

### **Re: 9114 Controller Board Pic - 12v circuit?**

*Message #4 Posted by **PeterP** on 24 May 2007, 10:42 p.m.,  
in response to message #3 by Ronald P*

Thanks, Ronald, that is super kind. I'll spend the weekend testing and let you know.

Greatly appreciate it!

Cheers

Peter

### **Re: 9114 Controller Board Pic - U106 measurements**

*Message #5 Posted by **PeterP** on 25 May 2007, 11:58 p.m.,  
in response to message #1 by PeterP*

Okay, I admitt of being slowly worn down by this board.

First, my scope did not come because it was sent to the wrong address or something. So it will come some time next week

Second, when I started the thing today, drive did not spin at all! Maybe something broke when I took it outside to take the digital pictures.

Okay, now here the measurement news:

1) As the drive did not spin at all, I re-did the selftest nr 1 and got the same (good) result that all internal chips like Ram, Rom, etc seem to be fine

2) On U106 I measured the following voltages: 1 - GRND - 0 2 - Trigger - 5.24 3 - Out - 2.42 (which is what you expected...) 4 - Reset - 5.90 5 - Ctrl Vol - 3.94 6 - Thresh - 1.30 7 - Discharge - 1.30 8 - Vcc - 6.11

There was no oscillation visible on my Ohmmeter, yet, as I mentioned, the scope was not here so no pic...

3) I measured also on Q105 and got 0 on ground and 6.11 on one side and 0.024(!) on the other

4) I measured the 100 Ohm resistor and it checks out.

5) I also check the amp again and now it draws much less, maybe 0.5 or so. Which I guess makes sense if the motor is not running at all...

Okay, I'm not sure what the next steps are, I'm a bit disenchanted that the drive now does not turn at all anymore...

Anyway, please let me know if all of this still points towards a broken Mosfet Q105 or any other ideas...

Your's faithfully

Peter

### **It is the darkest just before dawn & Tony, the Clairvoyant**

*Message #6 Posted by **PeterP** on 26 May 2007, 1:13 a.m.,  
in response to message #5 by PeterP*

Tony,

You will not believe it, yet the 9114a works again (at least outside of its encasing and with the direct power supply. But all in its own time!)

Having been slightly dinged by the previous tries, I had packed away all the parts. Only to unpack them some 10 minutes later with 'let's have another go at this!'

- 1) I tried to unsolder the existing Q105, which I failed to do due to lack of a) experience b) a proper soldering iron and c) a proper way to hold the PCB in place while I try to unsolder
- 3) So I first built a make-shift way to hold the pcb in place. Then I clipped the existing Q105 and then pushed the stumps through with the iron and a thin tip. (I picture a very painfully cringed face over in the UK right now...)
- 4) I put a new Q105 in place (side-remark: when I had ordered the picofuses I had overlooked the minimum order-size so they canceled my order. When I wanted to re-order you had already mentioned that you think the Q105 is broken so I added that to the pico-fuse order which got me over the minimum order size). It was such a hack-job that I myself felt badly about it. But in the end I had something that looked like connections on the new Q105
- 5) I turned things on now, only to be greeted with a fault light on and no turning of the motor whatsoever. However, I started with the measurements again and this time I did get the 12V where I expected it according to your diagrams. Hmm, something was clearly different (and better) than before. So why still no piep from the drive??
- 5) Then I realised that the HPIL cable and the disk-motor cable both have 4 pins and fit into each others male counterparts on the PCB. Turns out, I had the disk connected to the HPIL plug on the PCB... Dooh. No wonder it did not spin. So I fixed that and connected all to its proper place.
- 6) You can imagine my cry of joy when the drive went on, did it self-test and the fault light went out! Unbelievable!!! I did some more test, like formatting a disk, writing a file to it and reading it back, all successfully. Such simple joy!

Now, I know, I am not fully done yet, I still need to get the cover in place and there was some shorting or the like going on there beforehand. And I have to fix the battery-charging circuit and make it work with the battery. Yet I am quite a happy chap right now.

Let me be clear here, for all intense and purposes, Tony fixed that drive, not me! I merely was the across-the-atlantic-remote-controlled extended arm of yours. And without ever laying eyes on the board, not to speak of making a single measurement yourself, you nevertheless figured out which part was broken!

I learned a great deal about the 9114 and had a lot of fun and now even some good old fashioned satisfaction. Thank you very much indeed!

Now I will happily go to bed.

All the best

Cheers

Peter

**Re: It is the darkest just before dawn & Tony, the Clairvoyant**

Message #7 Posted by **Tony Duell** on 26 May 2007, 1:30 p.m.,  
in response to message #6 by PeterP

Quote:

Tony,

You will not believe it, yet the 9114a works again (at least outside of its encasing and with the direct power supply. But all in its own time!)

---

Excellent!

Quote:

---

Having been slightly dinged by the previous tries, I had packed away all the parts. Only to unpack them some 10 minutes later with 'let's have another go at this!'

---

Alas I know that feeling all too well. I leave a repair/design/whatever and go to bed, only to get up 10 minutes later, turn on the soldering iron again, and carry on well into the early morning....

Quote:

---

1) I tried to unsolder the existing Q105, which I failed to do due to lack of a) experience b) a proper soldering iron and c) a proper way to hold the PCB in place while I try to unsolder

---

What have you got against step 2 ;-)

Quote:

---

3) So I first built a make-shift way to hold the pcb in place. Then I clipped the existing Q105 and then pushed the stumps through with the iron and a thin tip. (I picture a very painfully cringed face over in the UK right now...)

---

No painful looks from me, I can assure you. You wanted to save the PCB, that's by far the most valuable part. I've known to clip the pins off a DIL IC and desolder them one at a time to protect the PCB (althought I must say I desolderd all 32 RAMs without clipping the pins when I upgraded the memory in my HP9816 recently...)

Quote:

---

4) I put a new Q105 in place (side-remark: when I had ordered the picofuses I had overlooked the minimum order-size so they canceled my order. When I wanted to re-order you had already mentioned that you think the Q105 is broken so I added that to the picofuse order which got me over the minimum order size). It was such a hack-job that I myself felt badly about it. But in the end I had something that looked like connections on the new Q105

5) I turned things on now, only to be greeted with a fault light on and no turning of the

motor whatsoever. However, I started with the measurements again and this time I did get the 12V where I expected it according to your diagrams. Hmm, something was clearly different (and better) than before. So why still no piep from the drive??

5) Then I realised that the HPIL cable and the disk-motor cable both have 4 pins and fit into each others male counterparts on the PCB. Turns out, I had the disk connected to the HPIL plug on the PCB... Dooh. No wonder it did not spin. So I fixed that and connected all to its proper place.

6) You can imagine my cry of joy when the drive went on, did it self-test and the fault light went out! Unbelievable!!! I did some more test, like formatting a disk, writing a file to it and reading it back, all successfully. Such simple joy!

---

Excellent!

Quote:

---

Now, I know, I am not fully done yet, I still need to get the cover in place and there was some shorting or the like going on there beforehand. And I have to fix the battery-charging circuit and make it work with the battery. Yet I am quite a happy chap right now.

---

I wonder if the short-through-the-cover or whatever is what blew the fuse in the battery pack. I don't think it would have damaged Q105, though. You want to look very carefully for trapped wires on the disk drive mechanism.

Quote:

---

Let me be clear here, for all intense and purposes, Tony fixed that drive, not me! I merely was the across-the-atlantic-remote-controlled extended arm of yours. And without ever laying eyes on the board, not to speak of making a single measurement yourself, you nevertheless figured out which part was broken!

---

To be fair, you made some measurements and reported the results. Without knowing it was certainly a problem in the 12V PSU circuit, I would not have homed in on Q105.

As to why I went for Q105, you can call it 'experience' (with SMPSUs, not the 9114 in particular) or 'good luck' :-).

Quote:

---

I learned a great deal about the 9114 and had a lot of fun and now even some good old fashioned satisfaction. Thank you very much indeed!

---

All I can say is that I am pleased another piece of fine HP calculator hardware is running again!

---

### **Battery Charger HP 82144A**

*Message #1 Posted by [Larry Fox](#) on 23 May 2007, 10:57 p.m.*

Does anyone know what device the HP 82144A Charger goes with? Unfortunately, I don't know what kind of plug is on the end.

### **Re: Battery Charger HP 82144A**

*Message #2 Posted by [Eric Smith](#) on 23 May 2007, 11:25 p.m.,  
in response to message #1 by [Larry Fox](#)*

I'm not certain, but it appears to be a DC-input (10-16V) charger for the Spice series (31E, 32E, 33E, 37E, 38E). Might or might not be OK with the continuous memory models (33C, 34C, 38C) as well.

### 50G or 48GII?

Message #1 Posted by **Bob** on 23 May 2007, 8:41 p.m.

Since I am in the market for a new calc, I was wondering if the 50G had it all over the 48GII? (in terms of quality, build, feel, bugs, etc)

I have glanced at the features and since both are much more powerful than what I need on a daily basis, I wondered if the 50G was worth the extra few bucks? I assume that both of them have the equation library and solver functions, particularly TVM, of the 48GX in them. (that may not be true of course, just my assumption)

Any and all opinions are welcome.

### Re: 50G or 48GII?

Message #2 Posted by **Vieira, L. C. (Brazil)** on 23 May 2007, 9:40 p.m.,  
in response to message #1 by Bob

Hi;

I have both (one of each) and in terms of 'worth it', I think the HP50G would be the choice because:

it accepts SD cards to increase memory capacity (my H50G has a 1GByte SD card...)  
upgradable operating system, meaning that bugs are ellectable to corrections.  
more lines in the LCD; somehow you can use it to show more data.  
more user RAM in the basic configuration; a bit more than 1MBytes (*377KB RAM and 780KB Flash ROM available to the user*, according to the HP50G datasheet).

About the HP48GII. It has almost all algebraic and math features available with the HP50G (CAS, equation Library, etc), but it has about 81KBytes RAM (*80.7KB available to the user*, according to the datasheet). If we consider that it has a lot of built-in resources, user RAM may not be an issue, I guess.

As a final consideration... I actually think that the HP50G has a better look, with black finishment. It is closer to previous, successful HP calculators, indeed.

Cheers.

Luiz (Brazil)

*Edited: 23 May 2007, 9:42 p.m.*

### Re: 50G or 48GII?

Message #3 Posted by **Bob** on 24 May 2007, 9:54 a.m.,  
in response to message #2 by Vieira, L. C. (Brazil)

Thanks, Luiz. I am leaning toward the 50G. I am hoping that the quality is also getting better as they build more HP models, but who knows? I also like the SD card capability and the black body color better. It just

seems "right".

### Re: 50G or 48GII?

Message #4 Posted by [Hal Bitton](#) on 24 May 2007, 6:50 p.m.,  
in response to message #1 by Bob

Hi Bob,

I've had my 50G since Christmas...the quality and feel are excellent, and as I've said before, the display is fantastic... With the "smaller" font selected, I have up to 7 stack levels on the display. What I really like, though, is that big equations will present on the stack in textbook format...just like in the equation writer (granted it's a minor issue, but I don't like having to decipher a one line representation of a big expression)  
Best regards, Hal

### Re: 50G or 48GII?

Message #5 Posted by [Ron Ross](#) on 24 May 2007, 8:41 p.m.,  
in response to message #1 by Bob

Hp48GII- NO EQ LIBRARY!!! (actually, I do believe someone got it to load but then had only a few K of RAM left!!)

### Oops! My bad... Sorry!

Message #6 Posted by [Vieira, L. C. \(Brazil\)](#) on 24 May 2007, 9:03 p.m.,  
in response to message #5 by Ron Ross

Hi, Ron;

I keyed EQNLIB in my HP49G+ and confused with the HP48GII.

Thanks...

Luiz (Brazil)

### Uh Oh

Message #7 Posted by [Bob](#) on 24 May 2007, 9:39 p.m.,  
in response to message #6 by Vieira, L. C. (Brazil)

Well, if there is no equation library in the 48GII and there is in the 50G, my decision is becoming much clearer.

### HP 12C in Technology Review

Message #1 Posted by [Larry Corrado](#) on 23 May 2007, 11:15 a.m.

Hello, All,

I just noticed that Technology Review magazine, published by MIT, has a full-page picture of the HP 12C in its May/June 2007 issue. The main topic of the the issue is well-designed technology, and the 12C is featured, along with about 10 other designs, in a photo essay.

It would be nice to have seen the 15C there, but in terms of number sold and market longevity, I guess the 12C wins. I imagine others would prefer to see the HP 41CX mentioned.

Larry

### Re: HP 12C in Technology Review

in response to message #1 by [Larry Corrado](#)

Do you have the link? Thanks.

### Re: HP 12C in Technology Review

Message #3 Posted by [Larry Corrado](#) on 23 May 2007, 2:18 p.m.,  
in response to message #2 by [Jeff](#)

Jeff:

Actually, I found the photo in the paper copy of the magazine in our university library. The link below takes you to the Technology Review log-on page, where you can register if you'd like, and then see the May issue, and presumably the photo. As a general rule, I myself don't register for things like this unless I have ongoing business with the site.

<http://www.technologyreview.com/Infotech/18630/>

Hope this helps.

Larry

in response to message #1 by Larry Corrado*

HI;

just to mention that the HP12C in the picture has

[3.14159265]

in the display. Intriguing... the only financial model in the Voyager series, and it shows PI in the LCD. OK, the number in the display may refer to anything BUT trigonometrics and it could be just a coincidence... d8^)

Cheers.

Luiz (Brazil)

### HP-70 INT key function

Message #1 Posted by [Dave Smith](#) on 23 May 2007, 5:35 a.m.

Could anyone please help me with the way in which the INT key is used on an HP-70. I have an HP-70 in perfect condition (as far as I know) that I plan to sell, but I don't know how to check fully the INT key function - all the others are OK.

On most (HP) calculators INT means INTEGER but on this one I guess it means INTEREST of some kind. I just don't know which combination of the n, i, PMT, PV & FV entries have to be entered to use this and what calculation is then performed. Most uses of this give me an flashing display illegal operation warning, but on the odd occasion I have got a result but can't remember how I got it!

Thanks for any help received.

### Re: HP-70 INT key function

Message #2 Posted by [Gene](#) on 23 May 2007, 7:31 a.m.,  
in response to message #1 by [Dave Smith](#)

Check the 12c manual, available online free, for it's INT function. Should help you here.

### Re: HP-70 INT key function

Message #3 Posted by [Eric Smith](#) on 23 May 2007, 4:12 p.m.,  
in response to message #2 by [Gene](#)

Note that the HP-80, HP-81, HP-70, HP-22, and HP-27 do not have the same five-variable TVM solver as later models. They only support certain combinations of four TVM variables, and do not use the sign convention for the direction of cash flow. Thus examples for the 12C won't work on the HP-70 without changes.

The HP-80 and HP-81 are even more primitive; they don't actually have registers to store the financial variables, but rather use the stack. If you try to calculate the values you're going to use, you may push some of your values off the four-level stack, and get the wrong answer from the TVM calculation.

### Re: HP-70 INT key function

Message #4 Posted by [Dave Smith](#) on 23 May 2007, 4:16 p.m.,  
in response to message #3 by [Eric Smith](#)

Thanks Eric, and to Gene, too, for his earlier reply. I checked out the 12c manual and realised the convention. The INT key works as it should do. I am most grateful for this prompt help.

### Short quadratic solver (HP-15C)

Message #1 Posted by **Gerson W. Barbosa** on 22 May 2007, 7:44 p.m.

Two and a half months ago Allen presented an RPL program and a quadratic formula quite suitable for short programs:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=109539#109539>

(scroll past the middle of the thread)

This is a 22-step program based on that formula. It was written then and no further attempt has been made to size-optimize it, so it's still possible someone come up with an even shorter program.

```
001- LBL E
002- ENTER
003- R^
004- /
005- LSTx
006- R^
007- x<>y
008- 2
009- *
010- /
011- CHS
012- ENTER
013- ENTER
014- x^2
015- R^
016- -
017- SQRT
018- +
019- x<>y
020- LSTx
021- -
022- RTN
```

Usage :

```
a ENTER b ENTER c GSB E => x1
                x<>y => x2
```

If flag 8 is set the program will also handle complex roots.

The record for the HP-41 appears to be a 16-step program available in the Software Library. What might be the record for the HP-15C?

Gerson.

P.S.: Of course, on the 33S I prefer to use Mr. Hanson's program available in the link. On my everyday 15C, however, every step counts...

### Re: Short quadratic solver (HP-15C)

Message #2 Posted by **Thomas Klemm** on 23 May 2007, 3:42 a.m.,  
in response to message #1 by Gerson W. Barbosa

Saved one step:

```
001- LBL E
002- ENTER
003- R^
004- /
005- R^
006- LSTx
007- /
008- 2
009- CHS
010- /
011- ENTER
012- ENTER
013- x^2
014- R^
015- -
016- SQRT
017- -
018- x<>y
019- LSTx
020- +
021- RTN
```

### Re: Short quadratic solver (HP-15C)

Message #3 Posted by **Gerson W. Barbosa** on 23 May 2007, 11:48 a.m.,  
in response to message #2 by Thomas Klemm

Quote:

\_\_\_\_\_  
Saved one step  
\_\_\_\_\_

Great job, Thomas!

And I have noticed now the greater root always shows up first, no matter the signs of the constants (on the previous program the lesser root appears first). That's what I would prefer on a two-line display calculator.

I would suggest the author of the shortest program submitted it to the Software Library (HP-15C). You're the winner so far! :-)

Best regards,

Gerson.

### Re: Short quadratic solver (HP-15C)

Message #4 Posted by **allen** on 24 May 2007, 8:46 p.m.,  
in response to message #1 by Gerson W. Barbosa

Beautiful program!!! I think it unfortunate with all of the Visual C++/Basic/... etc languages, the skill of writing efficient code is slowly becoming a niche market, rather than the mainstream. I'll try this out on my 15C once I get home!

### Re: Short quadratic solver (HP-15C)

Message #5 Posted by **Gerson W. Barbosa** on 24 May 2007, 11:23 p.m.,  
in response to message #4 by allen

Hello Allen,

Perhaps it's time to start using the registers. I haven't been able to get anything shorter than the 21 steps Thomas had already obtained, but I think someone can still save one step or two.

```

001- LBL E
002- ENTER
003- R^
004- x<>y
005- Rv
006- /
007- STO 0
008- x<>y
009- LSTx
010- /
011- 2
012- /
013- STO 1
014- x^2
015- RCL- 0
016- SQRT
017- RCL- 1
018- ENTER
019- 1/x
020- RCL* 0
021- RTN

```

Regards,

Gerson.

## Re: Short quadratic solver (HP-12C)

*Message #6 Posted by [Kalevipoeq](#) on 26 May 2007, 1:17 a.m.,  
in response to message #5 by Gerson W. Barbosa*

The quadratic solver on the HP-12C seems to be a real challenge : )

Case 1. Only 4-level stack is used

```

01  ENTER
02  RDN
03  RDN
04  X<>Y
05  ENTER
06  +
07  LST X
08  RDN
09  CHS
10  /
11  ENTER
12  *
13  LST X
14  X<>Y
15  RDN
16  RDN
17  X<>Y
18  /
19  -
20  SQRT
21  -
22  X<>Y
23  LST X
24  +

```

Case 2. Register R0 can be used

```

01  STO 0
02  RDN
03  X<>Y
04  STO/0

```

```

05  ENTER
06  +
07  CHS
08  /
09  ENTER
10  ENTER
11  ENTER
12  *
13  RCL 0
14  -
15  SQRT
16  -
17  X<>Y
18  LST x
19  +

```

Usage: a [ENTER] b [ENTER] c [R/S]

## Re: Short quadratic solver (HP-12C)

Message #7 Posted by [Gerson W. Barbosa](#) on 26 May 2007, 10:17 a.m.,  
in response to message #6 by [Kalevipoeg](#)

Congratulations!

Quote:

\_\_\_\_\_

The quadratic solver on the HP-12C seems to be a real challenge : )

\_\_\_\_\_

I do agree. The lack of  $R^{\wedge}$  is a problem for stack-based programs. Using only the stack allows for slightly faster programs, but this is not an issue in this case.

Your 19-step program (21 on the HP-15C) works also on the HP-33C and on the HP-15C (real and complex roots). In case you don't have a physical HP-15C, you can try a simulated one on [Nonpareil](#) if you wish.

Programs for the HP-12C and other RPN calculators are also welcome.

Regards,

Gerson.

## Re: Short quadratic solver (HP-15C)

Message #8 Posted by [Kalevipoeg](#) on 26 May 2007, 11:14 a.m.,  
in response to message #7 by [Gerson W. Barbosa](#)

This should work on the 11C, 15C, 34C etc. I tested with my 11C. Unfortunately there is no 15C in my collection...

```

001  LBL E
002  STO 0
003  RDN
004  X<>Y
005  STO/0
006  ENTER
007  +
008  CHS
009  /
010  ENTER
011  ENTER
012  x^2
013  RCL 0
014  -
015  SQRT

```

```
016 -  
017 X<>Y  
018 LST X  
019 +  
020 RTN
```

### Re: Short quadratic solver (HP-15C)

Message #9 Posted by [Gerson W. Barbosa](#) on 26 May 2007, 2:34 p.m.,  
in response to message #8 by Kalevipoeg

Quote:

\_\_\_\_\_

This should work on the 11C, 15C, 34C etc.

\_\_\_\_\_

Yes, your 20-step program does work on the HP-15C! Forgot to replace *ENTER* \* with  $x^2$ .  
Sorry!

Regards,

Gerson.

### Re: Short quadratic solver (HP-12C)

Message #10 Posted by [Kalevipoeg](#) on 26 May 2007, 3:25 p.m.,  
in response to message #9 by Gerson W. Barbosa

It's all right.

Back to the HP-12C programs.

Case 1. Only the stack is used (21 steps)

```
01  0  
02  +  
03  RDN  
04  X<>Y  
05  /  
06  2  
07  /  
08  CHS  
09  ENTER  
10  *  
11  LST X  
12  X<>Y  
13  RDN  
14  RDN  
15  /  
16  -  
17  SQRT  
18  -  
19  X<>Y  
20  LST X  
21  +
```

The HP-12C is getting close...

### Re: Short quadratic solver (HP-12C)

Message #11 Posted by [tony \(nz\)](#) on 26 May 2007, 4:07 p.m.,  
in response to message #10 by Kalevipoeg

Hello kalevipoeg! This [educalc post](#) shows we think alike, but don't let this stop

further improvement :-)

Cheers, Tony

### Re: Short quadratic solver (HP-12C)

Message #12 Posted by [Kalevipoe](#) on 27 May 2007, 1:34 a.m.,  
in response to message #11 by tony (nz)

Yes, it looks quite similar to mine. This was a nice "puzzle" anyway. Thanks to Gerson.

### Re: Short quadratic solver (HP-12C)

Message #13 Posted by [Kalevipoe](#) on 27 May 2007, 7:21 a.m.,  
in response to message #11 by tony (nz)

Some further thoughts.

We use RPN (REVERSE Polish Notation) and therefore we could input data in REVERSE order :-). In this case c, b, a.

We can just cut out the lines 01-04 from my first program listing and then we get 20 line program for the HP-12C.

```
01  ENTER
02  +
03  LST X
04  RDN
05  CHS
06  /
07  ENTER
08  *
09  LST X
10  X<>Y
11  RDN
12  RDN
13  X<>Y
14  /
15  -
16  SQRT
17  -
18  X<>Y
19  LST X
20  +
```

Example.  $f(x) = x^2 + 5x + 4$

```
4 [ENTER] 5 [ENTER] 1 [R/S]
running....-1.0000
[X<>Y].....-4.0000
```

What might be the record for the HP-15C by using reverse input?

### Re: Short quadratic solver (HP-12C)

Message #14 Posted by [Gerson W. Barbosa](#) on 27 May 2007, 10:37 a.m.,  
in response to message #13 by Kalevipoe

Quote:

What might be the record for the HP-15C by using reverse input?

At first glance, it appears the optimum input order would be  $b$ ,  $c$  and  $a$ . So, we should delete lines 002 through 005 in my second program and get this:

```
001- LBL E
002- /
003- STO 0
004- x<>y
005- LSTx
006- /
007- 2
008- /
009- STO 1
010- x^2
011- RCL- 0
012- SQRT
013- RCL- 1
014- ENTER
015- 1/x
016- RCL* 0
017- RTN
```

Using your example:

$$f(x) = x^2 + 5x + 4$$

```
5 [ENTER] 4 [ENTER] 1 [GSB] [E]
running.... -4.0000
[X<>Y]..... -1.0000
```

However, this is not the most natural way to enter the constants. Besides, this is not the record for this case, as you still could cut one step or two :-)

### hp 28s repair

Message #1 Posted by [Adrian](#) on 22 May 2007, 8:07 a.m.

My HP28s is dead. There are a few discrete components on the main board. A resistor marked 102K, is that a 100k resistor? Next to that a capacitor or resistor. It is 0 ohms. Next a glass circular component, possibly a diode. Then a three terminal device with two ports joined, probably a diode. A tantalum capacitor then a 1000uF electro.

Can someone verify these observations.

The case was easy to open and then repair if you have the right tools.

### Re: hp 28s repair

Message #2 Posted by [DaveJ](#) on 22 May 2007, 8:36 a.m.,  
in response to message #1 by [Adrian](#)

The case was easy to open and then repair if you have the right tools.

102K is 1Kohm, the "2" means "2 zero's". That zero ohm component is probably an inductor. If it does not look like the other resistor and it's not marked then it's more likely an inductor than a shorted capacitor. The three terminal device is most likely a diode. Glass circular components are almost always diodes.

I have never opened my 28S, so this is only an educated guess from an electronics designer.

Dave.

Really?! What tools? I've taken one apart, but how do you get it back together?

### Re: hp 28s repair

Message #4 Posted by **Randy** on 22 May 2007, 9:18 a.m.,  
in response to message #1 by Adrian

The 1000uf cap is the supply bypass/memory backup.

102k is a capacitor, the component next to it, an inductor. Those two form the clock tank circuit. The others are part of a voltage doubler for the LCD display driver.

The usual failure is not electrical but rather mechanical in nature - a loss in contact between the logic board and keyboard due to failed heat stakes around the keyboard connector area.

Quote:

\_\_\_\_\_

The case was easy to open and then repair if you have the right tools.

\_\_\_\_\_

What tools would those be?

### Re: hp 28s repair

Message #5 Posted by **Adrian** on 22 May 2007, 4:28 p.m.,  
in response to message #4 by Randy

Remove the decals, then using a drill bit slightly larger than the plastic pin diameter, drill the tops only of the plastic pins . I have a high speed drill press as used in drilling PCBs. I did not drill very deep just enough to weaken the plastic. The top simply pops off with most of the stakes remaining.

### Re: hp 28s repair

Message #6 Posted by **Adrian** on 22 May 2007, 5:18 p.m.,  
in response to message #4 by Randy

The 102K is 0.1 uF and the inductor ?????mH. Any suggestions as to its value.

Next step remove the 2 active components and test.

### Re: hp 28s repair

Message #7 Posted by **DaveJ** on 22 May 2007, 5:47 p.m.,  
in response to message #6 by Adrian

Quote:

\_\_\_\_\_

The 102K is 0.1 uF and the inductor ?????mH. Any suggestions as to its value.

\_\_\_\_\_

102K for a capacitor would make it 1nF (0.001uF). 0.1uF is 104. K means +/-10% tolerance

Dave.

### How to charge a 19C battery pack?

Message #1 Posted by [Walter B](#) on 21 May 2007, 3:06 p.m.

Recently I succeeded in getting such a NOS pack for my 19C. However, I doubt the cells in it are still "good enough" to allow me connecting my 19C to mains to charge them in the calc. On the other hand, I do not want to open the pack unnecessarily. And I lack any sophisticated electronic lab equipment. What do you recommend?

### Re: How to charge a 19C battery pack?

Message #2 Posted by [Vassilis Prevelakis](#) on 21 May 2007, 10:00 p.m.,  
in response to message #1 by [Walter B](#)

Open the pack, even if the cells are still OK, they will not last long, so you'll need to change them sooner or later.

Important advice: BEFORE YOU START! Take a bunch of pictures of the pack as it is with you digital camera, phone, whatever. make sure the pictures are clear (i.e. view them on your computer). Otherwise make a diagram of the orientation of the cells inside teh pack.

MARK the pack with signs showing the cell orientation to be sure you get it right in the future.

The pack is glued together, but you only need to use a shapr razor to split the glue at the seams, and the whole case will simply open.

The pack has four standard AA 1.2 NiCd cells, can't get anything more standard than that.

Take out the old cells and insert the replacements making sure the orientation is correct. The pack has springs on one side pushing the cells against contacts on the 19C mainboard, so you simply insert the cells against the springs and close the pack. No soldering or anything is needed.

Close the pack, using sticky tape to hold the two parts together. Do not glue the pack as you will need to open it again.

Insert the pack inside the 19C and run through the following checklist:

- 1) There is an indentation in the pack on the side of the contacts. If you do not see the indentation, you have inserted the pack upside down and you will not be able to close the cover.
- 2) The two middle tabs (contacts) have notes on them indicating the polarity of the battery next to them (there is even an arrow to tell you that the note applies to the battery on the side of the arrow). Anyway the batteries in the pack should match the polarity notes on the tabs. I.e. looking at the 19C batory compartment (the 19C is face down) with the contacts nearest to you, the polarity of the batteries should be (-), (+), (-), (+).

Close the cover, hope for the best and power on your 19C.

-----

Now to recharge the batteries, my advice is to simply take the batteries out of the pack and charge them on an external battery charger (i.e. never plug your 19C to the mains).

The advantage of this procedure is that you can now use NiMH cells that last much longer.

\*\*vp

## **Re: How to charge a 19C battery pack?**

*Message #3 Posted by **Walter B** on 22 May 2007, 2:14 a.m.,  
in response to message #2 by Vassilis Prevelakis*

Thanks a lot, Vassilis!

I will go out to buy cells today, and keep you informed about the results. Then I propose your advise shall be stored in a more permanent section of the museum, maybe in an article. Since I will take some pictures as you recommended, you may get them from me if you like.

Kalimera sou

## **19C resurrected!**

*Message #4 Posted by **Walter B** on 23 May 2007, 7:14 p.m.,  
in response to message #2 by Vassilis Prevelakis*

This is to let you know a 19C offered for parts some time ago turned out to be fully functional. It was risen from the death using a Swiss army knife, a razor, an old Sting battery pack bought separately, 4 new cells, a strip of household aluminum foil, some scotch tape, and a strip of a recent newspaper d:-)

So, how did I do this? I'll explain it commenting VP's instructions:

Quote:

Important advice: **BEFORE YOU START!** Take a bunch of pictures of the pack as it is ... **MARK** the pack with signs showing the cell orientation to be sure you get it right in the future.

The pictures really helped a lot, mostly by reassuring me I did it right. I skipped the marking. At the bottom line, most important is the orientation of the pack. And this is unambiguously determined by the PCB tabs extending into the compartment, and the indentation of the pack facing the cover of said compartment.

Quote:

The pack is glued together, but you only need to use a shapr razor to split the glue at the seams, and the whole case will simply open.

Well, this "simple" task took me quite some time and controlled brute force. The front and back sides of my pack measure 2.5mm each. Top and bottom halves feature some undercuts and were nicely glued together ... d:-/ and I wanted to use these plastic parts again!

Quote:

The pack has four standard AA 1.2 NiCd cells ... Take out the old cells and insert the replacements making sure the orientation is correct. The pack has springs on one side pushing the cells against contacts on the 19C mainboard, so you simply insert the cells against the springs and close the pack. No soldering or anything is needed.

---

True, almost. The original cells were spot-welded together like an "M". While the intercell contacts on the back side are perfectly established by the 2 springs found there, I needed to connect cell 2 to 3 at the front to reach 5V in total. This was where the aluminum foil came in. Took some fiddling but turned out to work fine.

Quote:

---

Close the pack, using sticky tape to hold the two parts together. Do not glue the pack as you will need to open it again.

Insert the pack inside the 19C and run through the following checklist:

1) There is an indentation in the pack on the side of the contacts. If you do not see the indentation, you have inserted the pack upside down and you will not be able to close the cover.

2) The two middle tabs ***indicate the polarity of the pack*** (there is even an arrow to tell you that the note applies to the battery on the side of the arrow). *I.e.* looking at the 19C battery compartment (the 19C is face down) with the contacts facing you, the polarity of the batteries should be (-), (+), (-), (+).

Close the cover, hope for the best and power on your 19C.

---

(The bold italic text indicates my modifications of VP's advice.) After all, the pressure did not suffice for a good contact in my 19C (though I cleaned the PCB tips). So I folded a paper strip several times and inserted it behind the pack.

Pictures of the different steps are available.

(Edited for better explanation)

in response to message #1 by Chuck*

I really like it, provided that it has a reasonable price and fits comfortably in my shirt pocket.

It seems to me that it would be easy enough to manufacture. After all, shouldn't it be simpler and cheaper to design and manufacture a calculator with an RPN user interface than with an algebraic user interface?

But it seems to me that a "35th Anniversary Edition" model ought to have at least the "scientific" capabilities of the HP-35, and be "shirt pocket-sized".

Regards,  
James

### **Re: Sneek Preview: Anniversary Edition**

*Message #7 Posted by **Antonio Maschio (Italy)** on 21 May 2007, 6:05 a.m.,  
in response to message #1 by Chuck*

Very very beautiful and tiny.

I'd add a big enter horizontal key (where now are the enter and + keys), shifting the four operations one row up, and using the three upper left keys for square root, percentage and reciprocal.

With these add-ons, this could be my most used calculator, since I find myself using these keys the 99% of the time (for trigonometry and exponentiation I could use another calculator, after all).

-- Antonio

P.S. could you update the picture as I suggested? Just for fun!

Edit: I did it for you.

Here's my result:

<http://it.geocities.com/tonibin/images/HP4f-v2.jpg>

... and of course, if a key could be destined to a shift function, a lot of alternate operations could be added! But let's keep it **\*\*very\*\*** simple...

Howard

**Re: Sneek Preview: Anniversary Edition**

*Message #11 Posted by **Antonio Maschio (Italy)** on 21 May 2007, 2:22 p.m.,  
in response to message #10 by Howard Owen*

Well, you're right.

What to say? If I have time, tomorrow, I'll fix this bug.

In any case, a four-op calculator in pure RPN mode, with a four-levels stack, with 10 or 12 digits (not more) and with that beautiful interface like the one suggested by Chuck, would probably cost around 15-20 dollars, and be the entry-level calculator with RPN input for thousands of algebraic users that cannot even conceive this usage (I'm not speaking of those who use algebraic calculators and know RPN and have chosen the former - I have already done such a mistake that arose a holy war some time ago).

For what about me, I'd buy 5, two for me and one for each member of my family. And maybe others for all my friends and parents for birthdays.

I like the idea.

Chuck, you made a start. Hopefully, HP will gather your suggestion. Who knows? Who cares?

-- Antonio

**Re: Sneek Preview: Anniversary Edition**

*Message #12 Posted by **James M. Prange (Michigan)** on 21 May 2007, 4:20 p.m.,  
in response to message #11 by Antonio Maschio (Italy)*

But for a very simple RPN non-programmable 4-banger calculator, wouldn't just 2 stack registers suffice? After all, each of the available operations always takes 2 arguments and returns 1 result.

Okay, even with just x and y registers,  $x \leftrightarrow y$  and CLx could be useful.

What I might add would be a "memory" register, with M+ and MR keys to use it, a +/- (CHS) key, and maybe a 1/x key, and even "dollar store" "4-bangers" usually seem to include a square root key.

I've never seen a percent key as being particularly useful on a calculator, but it seems that most seem to expect it.

How about an On/Off key to conserve battery power?

Yes, I really think that HP ought to market a low-cost entry-level RPN calculator to introduce algebraic users (and youngsters using a calculator for the first time) to the ease and simplicity of using RPN models.

Regards,  
James

### **Re: Sneek Preview: Anniversary Edition**

*Message #13 Posted by **Antonio Maschio (Italy)** on 22 May 2007, 2:54 a.m.,  
in response to message #12 by James M. Prange (Michigan)*

Here's an **\*\*ugly\*\*** attempt to figure out the calculator after your suggestions.

It's a collection of cut&copy, so the yellow of shifted functions is not the same, but just imagine it is.

What about it?

<http://it.geocities.com/tonibin/images/HP4f-v3.jpg>

Of course, in my mind:

The OFF should be automatic after 5 minutes, the ON happens when you hit any key; the RESET could be a back pencil hole (as in old SHARP calculators), or the batteries removal (there's little chance that this calculator hangs, anyway).

STO 0..9 are ten available memories

STO +/-/÷/x 0..9 work as accumulators (e.g. STO+6 add reg. X to memory 6)

f RCL 0..9 recall ten available memories

RCL +/-/÷/x 0..9 work as accumulators (e.g. RCL+6 add memory 6 to reg. X)

f 1..9 could set the FIX

f 0 could reset FIX

scientific format starts automatically when number doesn't fit the 10/12 digits (if you need to input 1E-25 probably you need a scientific calculator...)

the greek pi is a gift (one could calculate circle areas, right?)

well, that's all. Any need of a manual, for such a calculator?

-- Antonio

P.S. I invite you to find some substitutes for % and pi, since they are really the lesser useful keys of this proposal.

I also invite you to reconsider this: if the available memories were, say, 0..6, there would be three shifted function to add. What do you think could be added to enhance this calculator, without losing the point it must be a **\*\*simple\*\*** calculator?

Forget "f 1..9" being for FIX, the shift function on all those keys can be used for so many things, heck you could turn it into a very usable scientific. But if it had to stay "non-scientific" I'd add EXP, +ENG, -ENG, X^2, R->P, P->R, and simple base conversion. Would it be asking too much to get a Log key as well? Oh, and my favorite key that should be on every calc, a Parallel key. Only my Casio FX-61F has that.

Software and labels are cheap!

Dave.

### **Re: Sneek Preview: Anniversary Edition**

*Message #15 Posted by **GE** on 22 May 2007, 8:53 a.m.,

Yep, that's it. Incredibly handy for electronics guys like me. I only know one calculator that ever had it.

Dave.

### **Re: Sneek Preview: Anniversary Edition**

*Message #17 Posted by **Antonio Maschio (Italy)** on 22 May 2007, 10:15 a.m.,  
in response to message #16 by DaveJ*

I think you missed the point Chuck established. The calculator must be simple.

X^2 can be calculated by

```
<value>  
ENTER  
x
```

and the Parallel key is something too far for simple calculators. The same for LOG and +/- ENG. For those you need a scientific calculator.

for EXP: yes, it may be useful, but then something to manage the SCI format should be added. Since I said that scientific format should activate automatically,

well, I think it's enough.

for the CHS: some guy in an older message suggested its presence, and I agree. I find it useful, like the 1/x key and the fix format (since calculating money or centimeters decimals without having to round by mind is useful).

for time calculation: use decimal format (10:30 as 10.5 and so on)

The feeling of such a calculator should be: keep it simple. Chuck proposed an even simpler calculator, probably not that usable, and the effort of mine reached a (of course as a 'scherzo', if you know the musical notation strings) more usable an not that much complicated calculator.

I guess as HP should do.

-- Antonio

### **Re: Sneek Preview: Anniversary Edition**

*Message #18 Posted by [Maximilian Hohmann](#) on 22 May 2007, 10:33 a.m., in response to message #17 by Antonio Maschio (Italy)*

Hello!

Quote:

\_\_\_\_\_

for time calculation: use decimal format (10:30 as 10.5 and so on)

\_\_\_\_\_

If the world was so easy that there are only half hours, then we would need no calculator at all :-) HP itself has shown long ago that a time function can be very useful indeed: With the hp-01 watch that could perform such calculations...

Saluti, Max

BTW: This is my most useful little Casio time calculator (nearly as difficult to find than the hp-01!):

[http://www.bombie.de/tmp/casio\\_lc\\_403lu.jpg](http://www.bombie.de/tmp/casio_lc_403lu.jpg)

### **Re: Sneek Preview: Anniversary Edition**

*Message #19 Posted by [Antonio Maschio \(Italy\)](#) on 22 May 2007, 2:51 p.m., in response to message #18 by Maximilian Hohmann*

Ok, Max,

you won.

I thought over your proposal a lot, and probably the time function could be a very interesting add-on even for this tiny calculator.

So let's figure that HH.MMSS (or ->HMS à la HP) could be put in the

place of greek pi: after all, digiting 3.1415 is not that difficult, and if somebody doesn't know the pi value at the fourth decimal, probably he doesn't even need it.

Now, let's figure out the help page:

```
digit the hour in decimals (so for instance 10:25:56 becomes
10.2556) and hit f ->HMS
(the display shows the decimal version of the hour, that is
10,1520160000).
Digit another hour in the same way and then operate a + or a
minus....
```

and now? There would need another conversion key like ->HR on the result to restore the hour format. How does your Casio work? I don't see any other time key. We could think to use ->HR in place of the %. This could go.

What about it?

-- Antonio

### **Re: Sneek Preview: Anniversary Edition**

*Message #20 Posted by [Maximilian Hohmann](#) on 22 May 2007, 5:50 p.m.,  
in response to message #19 by Antonio Maschio (Italy)*

Hello!

Quote:

How does your Casio work? I don't see any other time key.

With the Casio, the "HMS"-key is really a mode-toggle: You start your time calculation by pressing "HMS" and from then on, it stays in time mode (until you press "AC") displaying a "-" sign as hour separator and " and ' to separate minutes and seconds (as in the picture above).

To enter values, you digit HHH (yes it can do up to 999 hours, other than some spreadsheets that wont go beyond 24 which is quite useless when you sum-up working hours!), then "HMS" then MM then "HMS" then SS. Of course, minutes and seconds are optional. And it is smart enough to know that when you dont press "HMS" first thing after "AC", you mean "%" instead :-)

Greetings, Max

### **Re: Sneek Preview: Anniversary Edition**

*Message #21 Posted by [Antonio Maschio \(Italy\)](#) on 23 May 2007, 2:09 a.m.,  
in response to message #20 by Maximilian Hohmann*

Aah! So it toggles its mode.

Well, I believe this is too much Casio-oriented. HP ->HR and ->HMS are more common on a (even hypothetical) HP calculator.

Don't you agree?

-- Antonio

## **Re: Sneek Preview: Anniversary Edition (FINAL RESULT)**

*Message #22 Posted by [Antonio Maschio \(Italy\)](#) on 23 May 2007, 9:02 a.m.,  
in response to message #21 by Antonio Maschio (Italy)*

Ok. This is my last effort.

I considered (hopefully) all the requests of this thread, some have been discarded and some kept (for what about the STO/RCL inversion, well, it can be done).

Here's my final result.

<http://it.geocities.com/tonibin/images/HP4f-v4.jpg>

It could a very handy calculator for any common calculation, even professional (if you know your formulae and don't need solving capabilities).

Apart from the display (LED or diods), I remark that if HP took this proposal into consideration (which is *\*always\** an idea of Chuck), the keys should be the ones of the old Voyager of Pioneer series, not the ugly keys of the current HP-9S/9G or HP-33S models. They shouldn't look too back in time: the keys of the HP-12C 25th anniversary I got are the best keys of all the voyager models I own.

Saluti.

-- Antonio

... and let another supercalculator be conceived at the 40th anniversary!

*Edited: 23 May 2007, 9:18 a.m.*

## **Re: Sneek Preview: Anniversary Edition**

*Message #23 Posted by [Maximilian Hohmann](#) on 22 May 2007, 9:28 a.m.,  
in response to message #13 by Antonio Maschio (Italy)*

Hello!

Quote:

What do you think could be added to enhance this calculator, without losing the

point it must be a **\*\*simple\*\*** calculator?

Before talking about adding something, I think there is one item that can easily be removed: The "CHS"-key (or better key label). This can be replaced by pressing the decimal point twice as on some old "Interton" calculators! (But I only found that out by reading the manual, so for a real "simple" calculator it might not be the right thing to do).

To add, I would consider some user-defineable constant-keys (say f-"C1", f-"C2" and f-"C3") that multiply the contents of the x-register with a constant without pressing any further key: Very useful for currency and units conversions!

Saluti, Max

And something else too: A ":" key that allows you to enter time values as hh:mm[:ss] for simple time calculations (working hours spent on a project, or flying time for the not-so-small (see below :-)) fraction of aviators amongst hp calculator enthusiasts). I have a little four-banger Casio calculator that can do exactly that and that probably is the calculator I need most often...

And to repeat myself I still think that a 35years anniversary hp calculator must have LEDs of some kind in its display. Be it a dot-matrix OLED display or a backlit (by red LEDs) inverse LCD.

*Edited: 22 May 2007, 9:36 a.m.*

### **Re: Sneek Preview: Anniversary Edition**

*Message #24 Posted by **GE** on 23 May 2007, 6:25 a.m.,  
in response to message #23 by Maximilian Hohmann*

You can remove the decimal point key as old Sinclair machines used to do. They only had an EE (enter exponent) key.

Also, there was one shift key only but pressing it twice would give a second shift state (IIRC).

But simplicity is probably better than saving one or two keys.

### **Re: Sneek Preview: Anniversary Edition**

*Message #25 Posted by **Paul Dale** on 22 May 2007, 5:02 p.m.,  
in response to message #13 by Antonio Maschio (Italy)*

If you introduce ATAN and SIN as replacements for % and PI you get functional trigonometric capabilities:

PI being  $4 \text{ ATAN}(1)$

COS(x) being  $\text{SIN}(\text{PI}/2 - x)$   
TAN(x) being  $\text{SIN}(x) / \text{COS}(x)$

ASIN(x) is  $\text{ATAN}(x/\text{SQRT}(1-x*x))$   
ACOS(x) is  $\text{PI}/2 - \text{ASIN}(x)$

Things have to be in radians so we can get PI back.

- Pauli

*Message #27 Posted by [bhtoeifr](#) on 24 May 2007, 8:25 a.m.,  
in response to message #12 by James M. Prange (Michigan)*

Half of the point of an RPN calc, though, in my opinion... is to have the multi-level stack, so you can queue up numbers.

Now, your "average" "4"-banger has the following functions:

Add/Subtract/Multiply/Divide

Memory (can be implemented the same way as the scientifics, with an S level)

Square Root

Percent

That's what I think an RPN "4"-banger should have, to be competitive. Now, of course, as has been pointed out... why not make it a modern day HP-35?

### **Re: Sneek Preview: Anniversary Edition**

Exactly. What's the point in making something so deliberately "simple" that's it almost no good for anything. The form factor is its draw card, why not add some real scientific functionality to it? Then it goes from being useful only for adding up your grocery bill, to something which could do 99% of everyday engineering and scientific tasks. All for the sake of adding a few labels to the keys and some extra lines of code.

Dave.

Quote:

\_\_\_\_\_

Now you are next to OpenRPN, aren't you? Or what shall be the difference? Waiting for enlightenment ...

\_\_\_\_\_

I don't know too much about OpenRPN, so correct me if I'm wrong, but I get the impression OpenRPN is a "do everything" project? All I want is \*small\* and \*basic\* scientific calculator. By small, I mean smaller than a Voyager.

The proposed "4 banger" seems a perfect size for me, but deliberately crippling it with only 4 functions seems incredibly silly, even as a "what if" argument. Buy hey, if everyone wants to play a theoretical "4 banger" game then by all means continue!

Perhaps it could have a swappable face plate and a switch on the back for "4 banger" or "Scientific"?

Dave.

No, "do everything" is for the big companies to play with. Everything from the 49g on has been grudgingly accepted at best by engineers and scientists at best. To satisfy virtually everyone in this community requires two basic forms of calculators: voyagers and pioneers. Generally speaking, people around here prefer one of the two layouts. Update the electronics to modern levels, keep the source code in the public domain, over-engineer everything, make outstanding documentation, and package the whole thing for \$100 or less.

This has been an exercise in minimalist design. I doubt anyone here expects something like this to actually be built. But it was interesting to start from something radically simple, and then add only those features people deemed essential in a basic "four-banger" calculator. I really would buy something like what we came up with - if only for the novelty. But that doesn't mean it would be a viable product.

Regards,  
Howard

Ok, if you want to talk minimalist design, then there are two keys too many, minimum. The STO and X-Y keys are redundant when you have a function key and all those normal keys. Put all the alternate functions as shift functions and you have saved those two keys.

Then again if you want to get radically minimalist, in theory you could do it all with just 2 keys total. Would suck to use, but that would be minimalist. In fact you could probably do it with just one key, but that would suck an order of magnitude more :->

A minimalist RPN calc would also only have a two level stack, not four IMHO. But of course 4 is much better, and would better deserve the "RPN" title.

Of course, a 4 function RPN calc would never sell in todays market, ever. But that exact same calc with scientific functions *\*would\** most likely sell.

I can design a real one in a few days, if someone can somehow make the buttons and housing!

Dave.

I have always thought if HP could make a basic RPN calc, with tactile keys, and

include the basic scientific functions of say, a \$9 TI-30, with a few TVM functions built-in, you would really have something. I would easily pay twice that for an HP with those features. :-)

I don't need hundreds of functions to make it a great daily user.

---

It is the glaringly obvious model missing from their line-up. They have cheap-n-cheerful algebraics for the school market, they have the 33S as a high end programmable, and the powerful graphic machines, but no normal RPN scientific.

Incidentally, when was their last basic scientific model produced?

Interestingly, in the real world of engineering the only calcs I ever see are basic scientifics, no engineer I know at any company I've ever worked for uses a graphic or other high end programmable on a daily basis. If they do have them I never see them on the desks.

Dave.

Dave,

I have had quite the opposite experience. Most nearly every engineer that has a calc on his desk at my work appears to have an HP graphing model. The 48g/x dominates with some 49g and also a gold 49g+ (must've been from the good batch). There's even (cringe) a few Ti-89s'.

Myself, I find myself using my 33s alot, since it is small and I carry it to the shop alot. But, I also keep the 48 on my desk (because I turn out needing it only when I leave it at home).

Interesting... What type of engineers are you talking about? I'm an electronics design engineer in Australia and have worked at primarily electronics (including defense) engineering companies with a large amount of mechanical, acoustics and software engineers. It's the same across all 4 disciplines.

I've heard a lot of guys talk about having owned a graphing calc when they were at Uni, but they don't use it any more as it's simply not needed for everyday calcs. Casio, Sharp and TI algebraics get about 90% of the desks, with the rest being oddball units like pocket computers, 4 bangers, or the occasional old HP.

I've had a similar experience while visiting parent companies in Singapore, UK, and Germany.

Age of the owner doesn't seem to be a major factor, although the old HP's and such are owned by the older crowd.

Dave.

Dave,

I'm an aerostructures guy, although we run the gamut here. There's mechanical designers, analysts, aerodynamicists, electrical too.

I did forget to mention that there's a daily use 15c here too.

The 48/49/50 series' pack a lot of capability, however I don't think that is to their discount. The problem as I see it is that they aren't as powerful as the PC. Memory, and speed included.

If you could carry your PC's functionality around in a 50g case, and USB it to a monitor when you get to your desk, would you turn it down? I just don't see much point to becoming a power user of the 50g, when I can't import/export files from my analysis package at work (and Excel, etc.)

I know this is a bit beyond the friendly chat we were having. Just some thoughts.

---

I believe that would be called a PDA?, and yes, I would turn it down as I don't need it. Frankly I have never really needed anything more than a basic non-programmable scientific calc for almost all of my work, and that's over 20 years in electronics design.

When I have had to do something a bit more complex, excel, Matlab, or other PC tools like a custom BASIC/C program get used as I find they are a much better interface.

The mechanical engineers seem to do everything on their cad packages, with FEA modelling and all that stuff.

Acoustics guys use Matlab all the time.

Production engineers use Excel.

But on the desks it's always the same when I look (and I do take note), I see almost nothing but non-programmable scientific calcs used by all these disciplines.

### **Re: Calcs used in the real world.**

*Message #40 Posted by **Donald** on 27 May 2007, 4:09 a.m.,*

*in response to message #39 by DaveJ*

Working for the instrument company formerly know as HP, it seems I have a three tier approach to calc use:

I primarily use a HP15C for:

Quick rule of thumb calculations - during initial design and discussions.

Simple arithmetic when creating new layout geometries.

Any from first principles paper work.

I still occasionally dig out my HP49 for:

Conversions : dBm <-> Vpp , RL<->VSWR, dB+ etc.

Pad design: T and PI pads, min-loss pads. T-couplers, Y-Delta etc.

Using legacy code I wrote on a HP48SX in the early '90s.

Anything that more involved, and it's the PC based design tools that get used:

ADS - for circuit and system simulation

Eagleware - for filters

MATLAB for DSP

Analogs PLL tool.

Lots of C++ for instrument control

R - Sweave - Latex for result plotting and reporting ( avoiding Excel and Word as much as possible, except when dealing with managers and production).

Lately, I've resurrected some 2-port network analysis code similar to LNAP on the HP41 and have a HP49 version and soon a HP15 version. This is to quickly see the response of LC filters I find in others schematics ( in less time than firing up ADS ).

I guess my ideal calculator for today's use would have a HP15 style complex stack and basic alpha features from the 41 ( bringing back the 41's extra segment LCD) . Adding basic text prompting and a XEQ key for alpha labeled functions - all in a small voyager styled case.

I should add there seems to be only a few engineers still using HP calculators. Of those who got a HP49 from a batch a few years ago, I can think of only one other who made the effort to program it

Those who did not use RPN HPs in the 80's/90's have never gotten into the habit at all, so tend to use basic TI calcs.

Currently, our IT procurement system does not even have a standard way to buy calculators.

---

I think you've hit the nail on the head there, most people just couldn't be bothered with programing a calculator, and it snow-balls from there: If you don't program it all the time then you forget how to do it and then it's just too much trouble. Next thing you know you have this wizz-bang calculator which is more optimised for programming and other complex graphics stuff than for the basic calcs you do 99% of

the time. Next thing you know you toss it in the draw and replace it with a \$20 non-programmable scientific for everyday use.

I suspect that's why I virtually never see programmable or graphics calcs on engineers desks, yet many will say they have owned one at one stage.

I find I do the same thing myself. I have a HP28S which I really like, but it's just useless for everyday use, so I've gone through several sets of batteries just having it sitting in the draw gathering dust.

Dave.

### **Re: Calcs used in the real world.**

*Message #42 Posted by [db \(martinez, ca.\)](#) on 27 May 2007, 12:13 p.m.,  
in response to message #41 by DaveJ*

OK.

The one major exception to your rule is field surveyors. We have always bought and used RPN (or RPL), and HP in particular. Something on the order of 99% of us have and use an hp programmable daily. The majority use canned programs and most of the rest, like me, just write additions to or throw out unused portions of commercially available packages. Still; the furthest you will usually see a surveyor go from the basic 41/42/48/49/50/32/33 is a 200lx or one of those TDS Rangers, and they both have an onboard RPN calculator too.

One thing we look for in a new calc is a logical progression of use and function, so we don't have to start learning from scratch - and just "toss it in the drawer and replace it with a \$20 non-programmable scientific for everyday use". About 20 years ago Ted Kerber gave my union's apprenticeship a bunch of his HP41 programs - when he was still selling them commercially. I've used his D'zign software on my 41, 42 & 48 and i see others using the software on the 33 & 49/50. The program runs similar enough across the different platforms so the old ones don't always end up "gathering dust" either. Well, not figuratively. In this work; everything gathers dust.

*in response to message #39 by DaveJ*

Hello!

Quote:

Amazing difference isn't it? Anyone else care to share their experiences?

I have been working as an engineer in Germany and Italy (for 3 years in the early 90ies) during the last 25-or-so years in the fields of satellite design, radar remote sensing, mobile network planning/wave propagation and CAD/CAM software development. My colleagues were either aerospace engineers like myself, mechanical engineers, electrical engineers, mathematicians, physicists, geographers or IT-people.

I have never ever seen anyone use a graphing calculator (actually, the only graphing calculators I ever saw are the ones in my collection). Not one. During the last 10 years, I have not seen anybody use a scientific calculator of any brand. Before that, they used mostly cheap Casio or Ti calculators that they had already used in school and university before. I probably have seen less than 5 hp RPN calculators being used at work!

Greetings, Max

*in response to message #43 by Maximilian Hohmann*

In my last office, with 17 engineers, we had quite a few HP:

Two used 48 series (one a 48s, the other a 48gx) three used 11c and 12c four used the 20s algebraic two used the HP41 one used the 17bii And then there was me: I used every HP!

In my current office, the chief engineer uses a 32sii, and one of the project managers (30 years old) uses a 48Gx and the top finance guy uses a 12c. There are about 10 engineers.

Speaking of Eric, cases and keys, I mentioned here sometime back that I thought an HP-97 shell, display and keys with new "guts" would be a killer hobbyist project. (I happen to have two spare 97s with hardware problems unrelated to the components in question.) Eric, you have your DIY calculator board. Have you given any thought to housing it inside classic HP calculator

shells like the 97? What challenges would you have to overcome to interface the keyboard and display?

Regards,  
Howard

From my understanding, the OpenRPN project really stalled over a lack of a hardware engineer to design the electronics. The software was/is coming along nicely (I did commit a fair chunk of source code so I am biased) and the physical design looked quite good. Some of the manufacturing issues had been investigated but I don't have any idea to what extent etc.

Several of the old 4 function RPNs [like this one](#) saved valuable key-al estate by using the + and - keys as positive and negative enter keys. They gained a change sign key in the process of loosing an enter key. This one could use the added two keys for a square root and what the hell, let's live dangerously, an ON key.

Y'know, if they put together a desktop model (something like the HP-97) with LEDs, they could sell that like one of those retro, "Sharper Image" products, and probably make a bundle. It wouldn't even need a printer or magnetic card I/O -- just a big, handsome LED display, with maybe clock & alarm functions to give it a reason to be ON all the time. It would probably be easier nowadays to accurately reproduce the HP-97's tactile feel (springy, adding-machine-like) than that of, say, the HP-15C.

But, of course, they're supposedly going to be celebrating the anniversary of their *pocket* scientific.

[edited in light of subsequent comment by DaveJ and my response to same]

If we're talking improved 4-bangers, how about this as an attempt. Think the bottom five rows of a spice model with a double width ENTER key on a row of slightly narrower keys.

My non-graphical layout is thus:

|       |     |       |     |
|-------|-----|-------|-----|
| ENTER | CHS | X<>Y  | CLx |
| 7     | 8   | 9     | -   |
| 4     | 5   | 6     | +   |
| 1     | 2   | 3     | *   |
| 0     | .   | shift | /   |

and the shifted functions to the same template:

|       |      |       |       |
|-------|------|-------|-------|
| LASTx | EEX  | Rv    | CLreg |
| 1/x   | sqrt | y^x   | HMS+  |
| %     | %chg | %T    | HMS-  |
| STO   | LN   | EXP   | ->HMS |
| RCL   | pi   | shift | ->H   |

Shift-2 and shift-3 aren't defined. Any good suggestions? Likewise, pi isn't a heap of use and could easily be

replaced by something else.

I'd assume that STO/RCL include arithmetic and that there are at least 10 registers: 0 .. 9 & maybe .0 .. .9, although the latter is overkill.

Thoughts anyone?

- Pauli

| *     | 1   | 2    | 3     |
| /     | 0   | .    | shift |

Thoughts anyone?

- Pauli

I'd have the ENTER key on the bottom right, and the +/-\*/ keys on the right column.

As a right hander it just feels more natural to me to bring my hand back right to perform the last key operation (+/-\*/). With the current arrangement I'd have to move my hand left to push the final button and then bring it all the way back to the naturally resting right side.

I go to the gym to do my lateral exercises, so have no need to perform extra here :->

Dave.

Message #65 Posted by **Paul Dale** on 25 May 2007, 3:03 a.m.,  
in response to message #64 by DaveJ

No objection to shifting the digits to the left and moving the arithmetic operators to the right side. I don't like the idea of moving the enter key to the bottom, looks ugly :-). Also makes the keyboard unlike anything I've ever seen...

For the two missing operations, LN and E^x seem fairly natural. We'd then probably want to ditch the R^ and replace it with EEX. The E^x and y^x we're going to want exponents.

- Pauli

**Re: Sneek Preview: Anniversary Edition**

Message #68 Posted by **Dave Shaffer** on 25 May 2007, 12:08 p.m.,  
in response to message #64 by DaveJ

I'm a right-hander, too, but I like the arithmetic keys on the left, along with ENTER. I like to look at the keyboard as I am punching away, and this arrangement lets me see what I am doing.

And, appropriately, since this is the "Anniversary Edition," it then also mimics the original '35 key layout!

**Re: Sneek Preview: Anniversary Edition**

Message #69 Posted by **Walter B** on 25 May 2007, 7:01 p.m.,  
in response to message #63 by Paul Dale

Paul,

Quote:

My non-graphical layout is thus:

|       |     |       |     |
|-------|-----|-------|-----|
| ENTER | CHS | X<>Y  | CLx |
| 7     | 8   | 9     | -   |
| 4     | 5   | 6     | +   |
| 1     | 2   | 3     | *   |
| 0     | .   | shift | /   |

and the shifted functions to the same template:

|       |      |       |       |
|-------|------|-------|-------|
| LASTx | EEX  | Rv    | CLreg |
| 1/x   | sqrt | y^x   | HMS+  |
| %     | %chg | %T    | HMS-  |
| STO   | LN   | EXP   | ->HMS |
| RCL   | pi   | shift | ->H   |

Some proposals:

1. Rearrange the arithmetic operations like in Pioneers (/ \* - + from top to bottom). Reason: more logical sequence.
2. Swap the  $x \leftrightarrow y$  and the CHS key. Reason: stack operations are next to each other.
3. Use +/- instead of CHS. Reason: better worldwide understanding.
4. Put HMS+ on + and HMS- on -. Reason: more logical.
5. Put  $y^x$  on \* and  $1/x$  on /. Reasons: more logical and  $1/x$  next to  $y^x$  for roots.
6. ...

Became more than I first thought. For sake of clarity, I propose to arrange the shifted functions like this:

| LASTx | Rv   | EEX   | CLreg |
|-------|------|-------|-------|
| %     | %chg | %T    | 1/x   |
| sqrt  | LN   | $e^x$ | $y^x$ |
| STO   | >HR  | >HMS  | HMS-  |
| RCL   | pi   | shift | HMS+  |

BTW, I do not see the need for %. IMHO, for scientific people, trig functions are far more useful than % (=E-2). So an alternative may look like this:

| LASTx | Rv   | EEX   | CLreg |
|-------|------|-------|-------|
| SIN   | COS  | TAN   | 1/x   |
| ARC   | LN   | $e^x$ | $y^x$ |
| STO   | >HR  | >HMS  | HMS-  |
| RCL   | sqrt | shift | HMS+  |

It will even revive the ARC operation as in HP35 d:-) Of course you will reach ARC SIN with 1 shift only: Shift 4 7

Best regards, Walter

(Edited for error correction and to add the unshifted pattern proposal for sake of completeness:

|       |                       |       |     |
|-------|-----------------------|-------|-----|
| ENTER | $X \leftrightarrow Y$ | +/-   | CLx |
| 7     | 8                     | 9     | /   |
| 4     | 5                     | 6     | *   |
| 1     | 2                     | 3     | -   |
| 0     | .                     | shift | +   |

)

## Re: Sneek Preview: Anniversary Edition

*Message #70 Posted by [Paul Dale](#) on 27 May 2007, 1:47 a.m.,  
in response to message #69 by Walter B*

As usual Walter is way ahead of me in keyboard layouts. I like all the changes.

I too had thought to drop the % functions. I thought of replacing them with  $\gamma/x!$ , permutations and combinations.

I did think about including the trigonometric functions but then it kind of escalated into wanting degrees and radians, conversions of same, PI etc :-)

So the modified shifted layout excluding trig functions and including the ones I mentioned above is:

| LASTx | Rv    | EEX   | CLreg |
|-------|-------|-------|-------|
| $x!$  | $Pxy$ | $Cxy$ | 1/x   |
| sqrt  | LN    | $e^x$ | $y^x$ |

STO >HR >HMS HMS-  
RCL PI shift HMS+

Message #74 Posted by **Paul Dale** on 27 May 2007, 6:05 p.m.,  
in response to message #72 by Thibaut.be

Come on why only five shift keys? That only elucidates 55 functions from the remaining eleven keys. The

"optimal" arrangement has eight shift keys producing 64 functions from the remaining 8 keys. For useability's sake, I'd consider six shift keys for 60 functions leaving the digits all unshifted.

: -)

### HP Classic - battery latches, anyone have broken?

Message #1 Posted by [Don Shaffer](#) on 20 May 2007, 12:20 p.m.

I am wondering if anyone would be interested in buying replacement battery door latches for the hP Classic (35, 45, 55, 65, 67) type calculators. I recently have purchased a used one and it had one door latch snapped off. I think I can make these. I was just wondering if there was anyone else who might be interested if I start fabricating these parts?

### Re: HP Classic - battery latches, anyone have broken?

Message #2 Posted by [Gerson W. Barbosa](#) on 20 May 2007, 1:49 p.m.,  
in response to message #1 by Don Shaffer

All latches are broken in both my HP-35 and HP-45. They stay in place though. Anyway, I'd be interested in four, depending on the price. The rubber feet should be reused.

I rebuilt the HP-35 battery pack:

[http://www.geocities.com/gwbarbosa/HP-35\\_back.JPG](http://www.geocities.com/gwbarbosa/HP-35_back.JPG)

I partially rebuilt the HP-45 battery pack (the case is missing). I wasn't able to find your your packs at eBay.

Now, I would be really happy if someone started fabricating replacement Voyager bezels. I have a very good HP-16C, except for the aluminum bezel...

Regards,

Gerson.

### Re: HP Classic - battery latches, anyone have broken?

Message #3 Posted by [Dan W](#) on 20 May 2007, 2:47 p.m.,  
in response to message #1 by Don Shaffer

I have a bunch of battery doors, with latches, but the retention part of the latches are missing so that they can fall out of the door when the door is not installed.

Not a big deal really but I would consider buying latches that will stay in place.

Couple of other things you could make now that you are a plastics man:

(1) Classic charger cord with plug.

(2) Clear plastic Classic housings - the back side, so the mainboard is visible.

Cheers,

-- Dan

**Re: HP Classic - battery latches, anyone have broken?**

Message #4 Posted by [Don Shaffer](#) on 20 May 2007, 3:55 p.m.,  
in response to message #3 by Dan W

I looked at the latches and they are pretty simple design. I think I could likely CNC mill these out of some type plastic rather than molding them. I will have to look to see what I can get in black. alternatively I could mill them from bronze, or aluminum.

I do not currently have capacity to press an entire back of a calculator. I will look into what I would need to do to make these however.

Also I have kits for a Classic battery repair. These include new pair of molded plastic covers with a set of new Nickel battery terminal straps that you would weld to the batteries. Contact me at [dsmail@earthlink.net](mailto:dsmail@earthlink.net) if interested as this is not in the classified ad section.

Message #6 Posted by [Thomas Okken](#) on 21 May 2007, 10:44 a.m.,  
in response to message #1 by Don Shaffer

I'd buy one. Also, to chime in with the suggestions made by some others for other useful parts: I'd also be very interested in something that lets me charge a Classic battery pack outside the calculator, without having to take the pack apart (I do that for charging the batteries for my HP-25, but that pack is a lot easier to take apart!).

- Thomas

**Re: HP Classic - battery latches, anyone have broken?**

Message #7 Posted by [Don Shaffer](#) on 21 May 2007, 9:11 p.m.,  
in response to message #6 by Thomas Okken

HP made such a product called the external charger. I was a small package just larger than the Classic battery pack and the normal 82002A charger plugged into a connector on the bottom just like the ones on the calculators. i've seen acouple recently on ebay for auction but I do not know the number of the item. The Museum likely has it on the collector listing of items. I think the last time I looked it said very hard to find, but I see them every once in a while on ebay as I said. Work nicely if you have two battery packs you can charge one and use the other in your calculator. I have one that I use all the time. The only strange thing about the external charge is that it does not have any HP part numbers on it. Only marking is the normal HP label on the front just like a calculator Logo plate. I think making the plugs for these chargers

would not be very difficult but the only thing is how to identify the pin sockets they used on the originals. So far I have not found the right size. anyone know what these were originally AMP's or another?

**Re: HP Classic - battery latches, anyone have broken?**

*Message #8 Posted by [Dan W](#) on 21 May 2007, 9:17 p.m.,  
in response to message #7 by Don Shaffer*

I've sold 2 of those on the unmentionable site. One was item 120119716243. They seem to be going for \$40-50 now. I think they're great accessories.

**Re: HP Classic - battery latches, anyone have broken?**

*Message #9 Posted by [GE](#) on 22 May 2007, 5:14 a.m.,  
in response to message #8 by Dan W*

You probably all have a spare machine into which you can charge battery packs. That machine doesn't have to be working. I have a dead HP21 which serves that purpose all right. And dead machines are going for less than \$40. Just a simple idea...

### **Our curator was not kidding!**

Message #1 Posted by [Namir](#) on 20 May 2007, 9:47 a.m.

A few weeks ago our web site curator, David Hicks, mentioned that he had a snag with a bank or something like that, because his name matched that of a terrorist. I almost fell off my chair when I read [this piece of news!!!](#). Our beloved David was not joking!!! There is a bad guy out there with the same name (and a similar general look to add insult to injury). Personally I will vouch for our David if he ever needs to be cleared of any mistaken identity.

Namir

### **Re: Our curator was not kidding!**

Message #2 Posted by [Gerson W. Barbosa](#) on 20 May 2007, 3:04 p.m.,  
in response to message #1 by Namir

Surely David was not kidding. Shortly before he mentioned here the problem he had at the airport I had seen a short notice on CNN about the other Hicks.

Having only two names, one of them not uncommon, as some of you appear to have, can easily lead to this kind of hassle. That's a trouble I will never have, as my middle name is very uncommon here. As if this was not enough it was misspelled at the notary's office (Washiski instead of Wasicki :-)

My wife, who had a problem of mistaken identity at the bank when she was single, readily appended my two family names to her own. Now her three middle names have to be abbreviated in order to fit in her papers. Nothing comparable to the names of those ladies and gentlemen though :-)

<http://www.archontology.org/nations/portugal/port009/>

Regards,

Gerson.

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 20 May 2007, 10:02 p.m.,  
in response to message #2 by Gerson W. Barbosa

Yes, the "Australian David Hicks" has occasionally been in the news for a few years now.

I think it rather ridiculous that "our Dave Hicks" had been on any kind of "watch list" while the other Dave Hicks was securely locked up at Guantanamo, but I could understand having that name "flagged" after the other Dave Hicks has been released. On the other hand, if a "bad guy" knows that law enforcement is watching for him, how likely is it that he'd be using his real name?

Yes, having a fairly common name could well lead to some unfortunate confusion. I know of at least one other person right here in Michigan who has an exact duplicate of my name, and I think a few others around the county, and I wouldn't have thought that my last name was all that common. Fortunately, it

doesn't seem that any of us has ever been in any really serious trouble with the law.

### 9114a open pics & strange error msg

Message #1 Posted by [PeterP](#) on 20 May 2007, 12:50 a.m.

Hi,

Following Tony's post, I have found a place to order some picofuses (and have compiled the available information on the forum with regards to those as well, which will go into my summary of this 'repairing the 9114' story)

In the meantime I have built a no-battery power source, using the information from some old posts about a suitable Radio-Shack charger. Carefully observing the polarity, I built a nice new plug directly into the 9114. And, it works!!! Sort of...

1) I do have a 9114b as well, which I had not opened and cleaned as the eject seemed to work just fine. Using this direct power-source I was able to initialize a disk (using brand new 2DD, not HD).

2) However, the 9114a, the one I started working on, is not quite working. Here is what happens: a) when started, it moves the head a bit and then the 'fault' light goes off. If a disk is inserted on power-on, it takes a tad longer, but eventually the 'fault' light goes off as well b) now I can talk from my 71b to the drive just fine. Things like assign, spoll, devaid, devaid\$, etc all work just fine. c) however, when I try to initialize a diskette, it starts spinning, I can see the head moving a couple of steps and then it stops with an error. Error Nr: 255026 Err MSG: Invalid Medium - Data Checksum Error detected. The suggested resolution is to Initialize the disk. Dooh! That's what I am trying to do...

So I have posted a few pictures of the open drive, with and without disk inserted in case I put the thing back together in the wrong way. Also I did some close-ups of the drive head. I can not compare it to the 9114b and I do not have another 9114a to check if my drive head is bent or somewhat out of shape. This would explain that I can talk to the drive as long as I do not want anything from the disk as the head can not read.

Please let me know of any ideas.

Until then

Your faithful student

Peter

### Re: 9114a open pics & strange error msg

Message #2 Posted by [Tony Duell](#) on 20 May 2007, 6:03 a.m.,  
in response to message #1 by [PeterP](#)

Do you still have problems if you have the metal screening cover on the drive (as you mentioned in the other post)? If so, we need to sort that out first.

Jamming the head movement shouldn't cause the thing to draw excessive current -- the head motor is (as

expected) a stepper motor that draws much the same current whether it's turning or not. Jamming the spindle motor would cause its current to go up, though.

Is it possible you've trapped a wire somewhere, maybe one of the ones going to the stepper motor or the head load solenoid? a short to earth there would cause excessive current.

The fact that the non-disk commands (DEVID\$, etc) work find suggests that most of the controller board is working properly. At least the HPIL interface, processor, ROM, RAM and so on.

I don't see anything wrong with the way the disk holder is assembled, or with the head. If the upper head was slightly out of position, you'd have problems reading disks written on other drives, but it should be able to format its own disks just fine. So I don't think that's the problem.

Another thing to try is to format a 'scratch disk' in the 9114B, write some files to it, and try CAT'ing it in the 9114A and reading the files back. If it fails, try the disk again in the 9114B (I want to see if it's corrupting disks, for example if the write current is always on).

After that, it's time to get into the more complicated stuff. Somewhere I have details of a cable to link the drive mechanism to a PC parallel port, and an MS-DOS program (turbo pascal IIRC) that lets you move the head around, check the track 0 sensor, etc. I used it to do a head alignment (along with a special CE disk) before I got a proper drive exerciser. I can see if I can find that. You'll need a 'scope or a logic probe to do much more on the drive, though.

### **Another thought.**

*Message #3 Posted by **Tony Duell** on 20 May 2007, 6:13 a.m.,  
in response to message #2 by Tony Duell*

If that unit is drawing excessive supply current for some reason, it might be loading your homebrew PSU too much, causing the voltage to drop (or it might be loading one of the internal regulators too much and cause its output to drop). That might cause all sorts of problems.

If you have an ammeter, connect it in series with the power supply (an easy way to do this is to connect it across the power switch on the back of the 9114, with the switch turned off. The circuit is then completed via the ammeter). A good drive will draw a little over 1A when running.

Also check the supply voltage testpoints I mentioned in the first thread when the unit is trying to initialise a disk. Maybe one is low for some reason.

### **Re: Another thought.**

*Message #4 Posted by **PeterP** on 20 May 2007, 11:49 p.m.,  
in response to message #3 by Tony Duell*

Tony,

Your patience is truly amazing and I can't tell you how much I appreciate it. I'm learning a ton here! Okay, I did all that you suggested, please find the results below, it seems we found something that is not as it should be :-)

1) I measured the current the unit is drawing on power-up and selftest and it is a bit less than 1A (BTW - this caused me to buy a better DMM. Fluke was a bit out of my range but I went for a Sperry DM-4400A and it immediately improved my handling of measurements and the like. And it has an amp-meter which my prior 5.95 USD pocket DMM did not have) So that is okay, if a bit low according to your expectations

2) I found a Service manual of the 9114a which has a few self-tests in there. I tried to set the jumpers correctly and execute the various self-tests (1-7). The first one, which tests the RAM, ROM, FDC and PIA, worked flawlessly. This confirms what you suspected already based on the good execution of the standard HP-IL commands

3) Then I also found the TP with the help of your schemata and the PCB (which is nicely labeled I must say). I can only try to imagine how much painstaking work it must have been to draw those schematics!

a) In the post which described the home-made PSU with a charger from Radio-Shack, it was mentioned to run the charger at 6.5V. I did the measurements below at both 6V setting and at 6.5V setting. The values in brackets relate to the test with the 6.5V setting.

a) I tested VC on TP8, which was at 4.97V (4.97V)

b) I tested +5V on TP 10 which was 5.02V (5.02V)

c) ! I tested 12V on TP9. And this one only showed 5.76V (6.22V) ! So there seems to be clearly something wrong here!

d) I also did the test you suggested with 1) writing something on the disk with the 9114, then 2) run a test, startup, initialize etc with the 9114a and 3) try to read the disk in the 9114B again. This test worked. cat :1 showed the very same files I had copied onto it.

So, it seems that something with the 12V circuit is broken. Is there any chance that we can figure out what without the scope/logic probe? It so happens that I was able to find a HP-IL 1631D Logic Analyzer and Digital Scope for rather cheap (I believe), yet i have not used a Scope in ages and never was very good at it at all. This was just the last standard HP-IL device I did not have yet and it was a good bargain.

Anyway, as always this late at night I leave my test-bed here with great excitement about the things I have learned and with great anticipation of the new wonders TD will (hopefully) send me next :-)

All the best

Cheers

Peter

Quote:

1) I measured the current the unit is drawing on power-up and selftest and it is a bit less than 1A (BTW - this caused me to buy

Well that's interesting. The picofuse in the HP battery is rated at 2A (early battery packs) and 5A (later ones). So something is causing this unit to draw too much supply current only under specific circumstances.

I assume you were measuring the current while the drive was spinning and/or the head moving during the self-test. That's when the unit draws the highest current

Quote:

---

a better DMM. Fluke was a bit out of my range but I went for a Sperry DM-4400A and it immediately improved my handling of measurements and the like. And it has an amp-meter which my prior 5.95 USD pocket DMM did not have) So that is okay, if a bit low according to your expectations

---

I must admit I tend to go totally OTT when it comes to tools and test gear.

Quote:

---

3) Then I also found the TP with the help of your schemata and the PCB (which is nicely labeled I must say). I can only try to imagine how much painstaking work it must have been to draw those schematics!

---

Actually, the 9114 schematics didn't take that long. The HP9100B was a lot worse. I'll explain. In the 9114, you have a number of 'large chips' that have well-defined functions. There's a 68x09 processor. It can only be used in one way. It needs a clock input, it needs reset, it has address, data, and control buses that go to the other chips on the board, and so on. The only 'inventive' part is the PSU. OK, there were a couple of little bits of logic to sort out, but most of it could realistically have only been wired one way, and was wired that way.

Now think of a board of simple logic chips -- say a board from a 9810. You come across a 7400. It's a quad 2 input NAND gate. Now those NAND gates could be used in many ways, they needn't all be used in the same part of the circuit. Maybe 2 are cross-coupled to make an SR flip-flop. Maybe one is cross-coupled with a NAND gate in another chip to make an SR flip-flop. Get the idea. A lot more to work out.

And now think of the 9100. No chips at all in the logic section. Just boards of transistors and a big board of mostly diodes. Now a transistor could be almost anything -- part of a flip-flop, part of a buffer circuit, even part of a power supply. You've got to do a lot of work to have some idea of the overall stuff on the board.

Quote:

---

a) In the post which described the home-made PSU with a charger from Radio-Shack, it was mentioned to run the charger at 6.5V. I did the measurements below at both 6V setting and at 6.5V setting. The values in brackets relate to the test with the 6.5V setting.

a) I tested VC on TP8, which was at 4.97V (4.97V)

b) I tested +5V on TP 10 which was 5.02V (5.02V)

c) ! I tested 12V on TP9. And this one only showed 5.76V (6.22V) ! So there seems to be clearly something wrong here!

---

The 12V supply is only turned on when needed -- that is when the disk drive is in operation (the 12V line is used for the motors). When it's turned off, TP9 will show the battery voltages less a little bit. Connect the meter to TP9 again and see if the voltage goes up to 12V when it's using the

disk (e.g. during the self test or a CAT operation).

Quote:

---

d) I also did the test you suggested with 1) writing something on the disk with the 9114, then 2) run a test, startup, initialize etc with the 9114a and 3) try to read the disk in the 9114B again. This test worked. cat :1 showed the very same files I had copied onto it.

So, it seems that something with the 12V circuit is broken. Is

---

Given that the thing can read a disk, I think not. The motors must be turning.

More likely it's a problem with the write circuit or the head selection circuit. This is on the PCB attached to the drive itself, and is mostly discrete SMD components. Actually, I've had a 9114A in for repair where a couple of those transistors had failed. I replaced them with pretty generic types and had no problems.

One thing that might not be obvious. On my schematics, a transistor with a circuit round it is just that -- a transistor. One with a square box round it is a 'digital transistor' -- it includes base resistors, etc.

Quote:

---

there any chance that we can figure out what without the scope/logic probe? It so happens that I was able to find a HP-IL

---

Maybe, but it's a lot easier with the test gear.

Quote:

---

1631D Logic Analyzer and Digital Scope for rather cheap (I believe), yet i have not used a Scope in ages and never was very good at it at all. This was just the last standard HP-IL device I did not have yet and it was a good bargain.

---

Oooh very nice. I hate to say this, but the way to get good at using test gear is to use it -- to practice. And this is a fairly good thing to practice on.

## 12v missing when spinning

*Message #6 Posted by [PeterP](#) on 21 May 2007, 2:50 p.m.,  
in response to message #5 by Tony Duell*

Tony,

Thanks for your kind reply. makes a lot of sense why the 9100B were so much worse. yet I am still very very impressed...

Quote:

---

The 12V supply is only turned on when needed -- that is when the disk drive is in operation (the 12V line is used for the motors). When it's turned off, TP9 will show

the battery voltages less a little bit. Connect the meter to TP9 again and see if the voltage goes up to 12V when it's using the disk (e.g. during the self test or a CAT operation).

---

As for the 12V - I did measure it while the drive was spinning (during the selftest on turn-on with a disk in there and during the tried Initialize) and it did not go to the 12V...

Quote:

---

Given that the thing can read a disk, I think not. The motors must be turning

---

Sorry, I was unclear. The thing CAN NOT read the disk! What I did was write to a disk in the 9114b, then try to run some tests on the 9114A and then put it back into the 9114B to see if the 9114B can still read it. Your idea here was that the 9114A has constant power to the head and this would have made the disk non-readable for the 9114B afterwards. Which, alas, is not the case.

Okay, so I will most definitely wait for the 'scope and then try to learn how to use it, maybe there will be some specific tasks related to fixing this 9114A you can think of.

In the meantime, is there anything with regards to the 12V circuit you can think of? As I mentioned, even when the drive is spinning and the head is moving during the self-test and the tried initialize, the voltage does not go to 12V...

Thanks a lot, I know already what I will be doing tonight :-)

Cheers

Peter

---

OK, you have a problem with the 12V step-up converter, this is essentially sheet 2 of the schematics on the Australian Site.

U108d and U107 form an oscillator. It can be controlled by U108c which compares divided-down version of the 12V line with the reference voltage. The oscillator also feeds a monostable U106 via U108b. The output of that drives the switching MOSFET Q105. The 12V supply really comes from the back EMF on L101 when Q105 turns off.

Now, since you have battery voltage at the 12V TP, L101 (switching coil), L102 (output filter coil) and CR103 are most likely fine.

I would start by looking at the output (pin 3) of U106. There should be oscillations here. If you can't use a 'scope, maybe connecting a meter here will show something around half the

battery voltage, but I'd prefer to check it was actually oscillating.

My guess, and it's only a guess, is that Q105 has failed. At least I've given it a standard type number

### **A few more measurements**

*Message #8 Posted by **PeterP** on 21 May 2007, 11:35 p.m.,  
in response to message #5 by Tony Duell*

Tony, made a few more measurements tonight, but nothing big to add to my other post ('12V missing')

- 1) when i do the Amp measurement, the drive does come up and does the self-test (and only draws about 0.75-0.85 amp), the battery led is blinking. I could not find what this means. Also, the fault light does NOT go off in this mode. Other than that, the drive does all the same things.
- 2) I double checked the 12v point and it does not go to 12V when the motor is running and the head is moving. As a matter of fact, it never goes to 12V or even close, no matter what command I send or what the drive does
- 3) I also measured the other TPs but only TP6 and TP7 had a fixed voltage (around 5v, just a tad below around 5.97 or so)

I tried to find the other components of the 12v circuit on the board but did not get very far... One thing that puzzles me - the spindle motor needs 12V (it is even marked on it) yet the 12V TP does not show 12v. How come the motor still spins?

Anyway, I'm awaiting further instructions if at all possible, yet I will be out until Friday next week when I can test them. In the meantime I was able to find the manual and even the service manual of the 1631D online - Agilent is amazingly well organized. I was able to download the manual and service manual for the 3468 A/B DMM as well!

Cheers

Peter

A blinking power LED means low battery voltage -- see the lower part of page 2 of the schematics. If the battery voltage is too low (detected by U104A), then Q104 turns on,

connecting C104 in parallel with C105. This slows down U102, so you can see the LED blink (actually, in a 9114A, the power LED is always blinking, it's just normally too fast to see).

Quote:

---

---

Well, it is getting some voltage -- about 6V from the battery. It'll probably run on that, albeit probably too slowly. But it's not suprising the whole thing doesn't work properly without the 12V supply.

### 35th Anniversary Calc

Message #1 Posted by [DaveJ](#) on 20 May 2007, 12:11 a.m.

Anyone want to hazard a guess as to what the HP 35th Anniversary calc will be and why (realistically speaking) ? Also, does anyone know what the likely release date is?

They way I see it, I think it's most probable it will be either a revamped 33s in a Pioneer casing or a new scientific in Voyager casing.

From a development point of view they probably would want to do as little as possible while leveraging current (or recent) housing and firmware technology. I suspect that would not rule out the Pioneer housing, and the voyager housing is still current of course.

I have read that HP may have lost old firmware like the 11C/15C, if so then a Voyager scientific may need fairly heavily modified firmware from another model?

Would an RPN 20S be out of the question?

Dave.

### Re: 35th Anniversary Calc

Message #2 Posted by [Donald](#) on 20 May 2007, 5:30 a.m.,  
in response to message #1 by [DaveJ](#)

I hope and pray for a revised HP15C.

Even though they have lost the code for the original HP15C, with today's excess computing power and memory, rewriting code in C would be an easy task.

As the hardware already exists for the HP12C, it should be a very low cost project for them to change the firmware, keycaps and overlays. Even a new processor and PCB is a low cost change.

Using my HP15 for some 2-port circuit analysis, has reminded me of the limitation of the first HP15C. So I hope they make handling complex matrices a bit easier, perhaps by allowing one step storage and recall of the complex stack pair. A lot more memory would also be easily achieved. Speeding it up would also be acceptable. Otherwise don't change a thing.

*Edited: 20 May 2007, 5:32 a.m.*

### Re: 35th Anniversary Calc

Message #3 Posted by [Thomas Radtke](#) on 20 May 2007, 7:47 a.m.,  
in response to message #1 by [DaveJ](#)

Probably a 30S with a "35th Anniversary" Sticker and an additional and very innovative blue faceplate.

### **Might be a rebadged 12c again**

*Message #4 Posted by **John** on 20 May 2007, 8:37 a.m.,  
in response to message #3 by Thomas Radtke*

Why not? They did it for the 12c anniversary.

Perhaps they will reintroduce the original 12c platinum and hope that everyone forgot it had been intro'd before?

### **Re: Might be a rebadged 12c again**

*Message #5 Posted by **DaveJ** on 20 May 2007, 5:18 p.m.,

They did it for the 12C anniversary because the 12C is a financial calculator. The 35 was a scientific calculator, so I would expect them to at least slap the anniversary badge on a scientific calculator. And given the 35 was famously RPN, I would also at least expect the badge to be on an RPN scientific calc.

That leaves the 33s or 48/50 series. If not, then they will have to come out with a new scientific RPN. Given that the 35 was also a pocket calculator, that seems to rule out the graphical 48/50. That leaves the 33s the most likely candidate in my book.

I don't think HP are silly enough to use a financial calc like the 12C, or anything other than an RPN scientific.

Dave.

### **Re: Might be a rebadged 12c again**

*Message #6 Posted by **John** on 20 May 2007, 5:24 p.m.,  
in response to message #5 by DaveJ*

You missed the sarcasm in the original comments. You're also assuming that the marketing droids at HP know the difference between a financial and scientific calculator. Be careful of assumptions, especially when they involve marketing droids who work for HP.

The 25th anniversary 12c wasn't much of an anniversary edition to begin with.

Why would you expect anything beyond a sticker on the box or an embossed 35th anniversary stamp next to the battery compartment?

People here get their hopes too high way too quickly. I would figure that would not continue to happen.

### **Re: Might be a rebadged 12c again**

*Message #7 Posted by **DaveJ** on 20 May 2007, 5:54 p.m.,*

*in response to message #6 by John*

Oops, sorry!

Quote:

You're also assuming that the marketing droids at HP know the difference between a financial and scientific calculator. Be careful of assumptions, especially when they involve marketing droids who work for HP.

Likewise you must also be careful assuming the product spec is being driven by marketing this time. The spec may just come from a technical level as someones pet project, who knows?

Quote:

The 25th anniversary 12c wasn't much of an anniversary edition to begin with.

Why do you say that? What's wrong with releasing the original product as-is with a nice badge? Why do there have to be any improvements or changes?

Quote:

Why would you expect anything beyond a sticker on the box or an embossed 35th anniversary stamp next to the battery compartment?

I don't, but I'd expect it to at least be on an RPN scientific calc, not a financial calc or an algebraic. That's where I'd put my money if I was a betting man. The only basic RPN scientific in HP's line-up is the 33S.

[/quote] People here get their hopes too high way too quickly. I would figure that would not continue to happen. [/quote]

Nothing wrong with hoping, and speculating can be fun!

Dave.

---

New here, aren't you? Hope springs eternal.

The rest of us are realists.

I do admit, it would be rather hilarious to have you show up, ask what should go into an RPN calculator just a couple of weeks ago, and then you manage to do what this openrpn project has been unable to do for years - create something real.

However, perhaps my own HP65 anniversary edition machines will be back from the fabricators in time to beat you all. Took me a while to decide whether to have 128 or 256MB of ram in them.

---

Well, I'll have something "real" in about a weeks time when I get my prototype PCB's back, then I'll be able to (hopefully) push buttons and watch an LCD instead of clicking the mouse button on my PC.

Firmware is already doing the basics on my processor simulator (but is far from finished), and I have some good reasons to have a working product to show within the next few months. There is a real deadline for this project.

Just hope it turns out as cool as I think it will be.

Dave.

in response to message #12 by John*

Yes, you are the folks that HP forced into buying a calculator you detested, right?

It's fine with me if you want to express disgust for chevron shaped keys, the lack of build quality, software bugs or what have you. Yes, it's a shame that those machines represented how far HP had fallen from its former heights, when calculators made up the bulk of their revenue. (I use past-tense because they have come back from that nadir to a small degree with the 50g.) But interpreting those shortcomings as personal affronts borders on the paranoid. These are inexpensive consumer products today, not the high end engineering tools of yesteryear. Get over it.

Regards,  
Howard

**Re: No, realists**

The fact that they switched from building high end engineering tools to churning out inexpensive consumer products is HP's biggest shortcoming. I certainly *do* see it as a personal affront, not just to customers but to all those who worked for HP during their glory years.

**Re: No, realists**

*Message #16 Posted by [James M. Prange \(Michigan\)](#) on 21 May 2007, 6:05 p.m.,  
in response to message #15 by Wayne Brown*

I agree that it's a real shame that HP stopped producing high-end engineering tools. Of course actually, the high-end engineering tools were split off into the new Agilent, with the "new HP" concentrating on the "consumer products". Too bad that the calculator division didn't go to Agilent, but I can see some logic in keeping it with the computer products, within HP.

To me, it would've made more sense to keep the HP name on the high-end products and split off the "commodity" products into a separate company.

The market for calculators as "consumer" and "educational" products is just too big to ignore; too bad that HP was so late trying to break into it.

I don't see any reason why HP couldn't have kept making a line of high-end engineering calculator models as well as ordinary consumer and educational models.

Inexpensive? Well, I can't think of any electronic device that isn't either much less expensive or else much more powerful than a few decades ago.

What I do object to is the "cheap" look and feel and low quality physical design and construction of the 49 series. That said, it does seem to me that HP has made some efforts to improve things lately. As for the design of the 33S, what were they thinking? It looks more like a child's hand-held video game than a calculator, and this is the model that I'd expect to have the most functional appearance.

I really don't think that HP intended to offend you or me or anyone else, it just made some (bad, in my opinion) business decisions.

Regards,  
James

### **Re: No, realists**

*Message #17 Posted by **Howard Owen** on 21 May 2007, 11:23 p.m., in response to message #16 by James M. Prange (Michigan)*

Quote:

As for the design of the 33S, what were they thinking?

The best guess I've heard is that they were trying to appeal to the educational market. But the other thing that is clear about the 33S is that it had minimal engineering input, just enough to slightly update the 32SII firmware, and a whole lot of marketing and design input. It seems obvious that the team that made the decision to go with the "chevron" design were completely isolated from any sense of the history of calculators at HP. Not that consumer electronics in general is known for respecting tradition. Combine that with the unfortunate production flaws, software bugs and the infamous tiny period and comma, and you have an RPN calculator people around here love to hate.

Myself, I can't quite hate a shipping \$50.00 programmable RPN calculator. I did wait until the fixes for the point and some of the software bugs were in before buying mine. And I also hope for better from HP someday.

Regards,  
Howard

To me, it would've made more sense to keep the HP name on the high-end products and split off the "commodity" products into a separate company.

---

Indeed. HP was known as an electronics test equipment company first and foremost, and that name change was hard on the industry. Most engineers I know still call Agilent gear HP. It would have been much easier to rename the computer and consumer part, as that is common in that industry and hardly anyone would have cared I suspect.

Quote:

---

The market for calculators as "consumer" and "educational" products is just too big to ignore; too bad that HP was so late trying to break into it.

I don't see any reason why HP couldn't have kept making a line of high-end engineering calculator models as well as ordinary consumer and educational models.

---

Simple - money, profit, margin, sales, "lean" processes, product range rationalising and all that other finance and management stuff. Managers love to can stuff that isn't the leading seller, gives them something to put on their monthly report. If sales drop xx% in the last year or two, out it goes, even if it still pulls in \$\$\$\$\$\$\$ per year.

Why did they keep the 12C and drop the scientific models? - you can bet your last dollar that it sold more, \*lots\* more than the scientific ones.

I suspect it would have required someone really high up with a love for the old models to keep them in production.

I suspect sales dropped off on the older models when the graphic units became all the rage. Sales never recovered and they got dropped from the line. That happens in almost every industry.

Quote:

---

Inexpensive? Well, I can't think of any electronic device that isn't either much less expensive or else much more powerful than a few decades ago. What I do object to is the "cheap" look and feel and low quality physical design and construction of the 49 series. That said, it does seem to me that HP has made some efforts to improve things lately. As for the design of the 33S, what were they thinking? It looks more like a child's hand-held video game than a calculator, and this is the model that I'd expect to have the most functional appearance.

I really don't think that HP intended to offend you or me or anyone else, it just made some (bad, in my opinion) business decisions.

---

I greatly doubt it was a \*bad\* business decision, just \*usual\* business for most big companies like that.

Dave.

---

That's the problem; no one should be *allowed* into a position "really high up" at HP without a love for the company's traditional product lines. I'm disgusted with HP not only for what they *do*, but even more for they *are* (or rather, for what they've become).

Here's the irony of the modern corporation: Motivated people often do what they do for the love of it. Corporations do what they do for money; specifically, for the shareholder's money. Corporations are made up of motivated people, so they often have to deal with love, but they count the results in money. People work for corporations, so they have to deal with the bottom line, but some count their results in how well things work, or how beneficially or beautifully and so forth. In other words, some people judge results by the love content. The irony is that these people tend to be the ones that can take a vision of quality and utility and make it real, if their love is aligned with the corporation's bottom line.

With me so far? OK, so the reality of corporations means that although neither love nor money is enough to get the job done, the ultimate arbiter of whether or not a corporation is successful is the P/L statement. If losses mount year upon

year, shareholders will fire managers, replace directors and officers, and generally make a nuisance of themselves. So love is trumped by money in the modern corporation. This means that "a love for the company's traditional product lines" is not a quality that will ensure continued employment "really high up" in any modern corporation. Taking an extreme example may make this more clear. In 1898, the (fictitious) American Buggy Whip Company was faced with an important personnel decision. They had to replace their VP of product development who had been hired away by Ford. The candidates were the current engineering chief, a 20 year veteran whose innovations in buggy whip design had led to ABW's dominance of the American buggy whip market, and a young whippersnapper (so to speak) fresh out of Harvard who advocated reinvention of the company as an automobile accessory concern.

Which choice would be more likely to lead to ABW's survival?

Regards,  
Howard

---

Totally agree with you Howard, so here's my ramble:

It reminds me of Asmiiov's psychohistory concept: the central premise of his foundation series: The path of developments over time are very predictable - groups will react in a uniform way allowing history to be mapped out. But over time, very very occasionally, a key player, a leader, a revolutionary, will arise and cause an unpredictable step change.

Bill and Dave were the revolutionaries with HP, at the right place and right time to set the ball rolling. The current management, are simply custodians, following the rules of the business game evolving in a predictable fashion. As such it's unlikely anything that sets the world on fire will emerge from within. Little sparks occasionally,

but no great fire.

Every so often, new entrepreneurs will decide to go it alone and driven by their convictions, seed new ideas, which will amble along, die or be swallowed. But eventually one will grow into something special ... then over time stagnate and decline.

Another name for those sorts of people are "visionaries." From the point of view of the love/money dichotomy, I think such people are those who both have the talent of seeing undiscovered or unexploited alignments between love and money, and who can compellingly communicate that to others.

I also don't think it's inevitable that companies that sink into complacency and stagnation will remain that way. Two examples from the 1990s are Lou Gerstner's turn around of IBM, and Steve Jobs returning to Apple. A more recent example may be Sun under Jonathan Schwartz, although the jury (in the form of financial results) is still out on that one. In each of those cases, the visionary took on the top job, and shook up and restructured a complacent organization that was heading toward financial disaster.

Good point, Howard.

The other thing that people sometimes don't think about is that with a corporation, it really IS the shareholders money. They (essentially) hire the company's officers to make more money for their investment.

If you loaned me money as an investment, you'd want a pretty substantial return, 10, 20, 30% or ?

Would you be happy if I used it to support my "Wacky Packages" hobby? I have made about 0.1% as the return on investment on that hobby over the years.

Or, would you prefer I use your money to make 20% ?

Gene

P.S. Again, great illustration Howard! See you at HHC2007!

I think we have to distinguish between the emotional component of celebrating the 35th anniversary of the HP-35 and the reality of **current** HP resources dedicated to calculators. Within these resources one can make a good guess that HP will celebrate the special occasion. Bringing old models back, like the 15C seems to me a no go. Putting a special label on a current calculator might be a more affordable way for HP to celebrate.

We can celebrate our memories and our dedication to outstanding machines like the 67, 41, 15, 11, and so on.

I am celebrating the 35th anniversary by **trying** to design an enhanced version of programmable RPN that can **compete** with RPL. I will implement this programmable enhanced RPN in either VB .Net or C#.

Namir

Ah.. so you have a vested interest in HP not producing something good :-). Anyway, I will hedge my bets and wish you success.

The 12C platinum data sheet says it has a 6502 based processor: Does anyone know if it's in-circuit programmable via JTAG or similar. Perhaps it's the basis for a re-write project - once the actual

processor and IO mapping is known.

Beyond lack in faith ( i.e. soul-less marketing: color schemes and a new badge), I think, that the biggest unknown surrounding the 'Anniversary Edition', is will HP start to look back to the original market it addressed with the HP35: engineering and science professionals rather than school students. If they do there might be some hope of something nice. I'm not sure how a DIY video competition fits in with this scenario though :-)

At the other end of the possibility spectrum: the phone has killed the gadget-PDA market ( except for GPS displays and MP4 players ), suggesting the anniversary enthused 'Innovation' is unlikely to be a feature packed and resurrected Expander with a color LCD aimed at students ( which they would not be able to use in exams anyway ).

The middle ground, I see is market convergence : A high end classic RPN model with all numeric features (i.e. no alpha or IrDa comms etc.) might best satisfy both the current professional and upper student (restricted exam) markets.

*in response to message #33 by Donald*

The 6502-compatible Sunplus microcontrollers used in several of the current HP calculators including the 12C Platinum and 33S use masked ROM. No possibility of end users changing the code in those; it probably costs HP \$50K in mask charges any time they want to change the code.

### **Re: 35th Anniversary Calc**

*Message #37 Posted by **Donald** on 21 May 2007, 5:05 p.m.,

Probably not significant to HP, but it is to some of us:

I was hopeful for a time that something like the above might possibly happen, based on the 12C Platinum 25th Anniversary model that HP produced last year. However that was before I realized that it is also the 35th anniversary of the HP-35, which has a better ring to it, and for which HP purportedly will be issuing some sort of commemorative model. Probably too much to expect a 35 and a 15C celebration.

I like it :-)

What's your intended use for the 'IO' function above the ON button ?

### **Re: 35th Anniversary Calc**

*Message #40 Posted by **Jeff O.** on 23 May 2007, 7:45 a.m.,  
in response to message #39 by Donald*

Input and output, of course!

I did not really fully conceive how it might be done. Maybe as simple as putting the calculator in "server" mode to communicate with a PC application that would let you see the contents of memory and drag and drop programs and data from and to the calculator. Or maybe a menu of functions similar to the MATRIX 0..9 and TEST 0..9 functions, where IO 0 might transfer all programs to a PC, IO 1 would transfer all storage registers, etc. The connection would be via the same USB to mini-USB (or whatever it is) cable used by the 50g. A utility program allowing 15c programs to be written and tested on the PC would also be handy.

### Re: 35th Anniversary Calc

Message #41 Posted by [Paul Dale](#) on 22 May 2007, 4:52 p.m.,  
in response to message #38 by Jeff O.

More likely:

- MATRIX will be replaced by RPN
- RESULT will be replaced by ALG
- SOLVE will be replaced by (
- Integrate will be replaced by (

Also the Re<>Im function will likely be omitted entirely.

Maybe I'm being a bit synical :-)

The 6502-like processor is a masked rom part. You can't reprogram it. With enough dedication and patience, you could probably scrape the processor "blob" off the board and re-use the rest of the hardware...

To be true to the 35th year concept (and this is really only speculation and wishful thinking), Hp could (and should) revamp/morph an Hp 33s into an Hp 35. Correct the silly layout and provide an old fashion large enter key back in the legacy location (and since you are returning the ENTER key, drop the algebraic option to save a key function, you will need to save another to substitute for a missing key the ENTER displaces).

Re-badge this package as an Hp35 Anniversary ed and I feel you would have a winner. Sadly, this is probably only wishful thinking.

Message #48 Posted by [James M. Prange \(Michigan\)](#) on 20 May 2007, 9:30 p.m.,  
in response to message #1 by DaveJ

I doubt that it will be marketed as an "Anniversary" model, but [CalcPro](#) has been listing a "48GS" together with the 48gII.

CalcPro doesn't say how they differ, and (as far as I know) HP hasn't announced it yet, but from a brief thread on [comp.sys.hp48](#), I gather that we can expect an improved keyboard, flashable "ROM", and a USB port in addition to the serial port (but still no SD card port).

In other words, the 48gs will bear a relationship to the 48gII similar to that of the 50g to the 49g+, a replacement model with some of the shortcomings fixed.

And the relationship of the 48gs will bear a relationship to the 50g similar to that of the 48gII to the 49g+, an

"economy model" for those unable or unwilling to buy the "premium" model.

As for what I'd like to see as a "35th Anniversary" edition, an RPN "scientific" model that fits comfortably in my shirt pocket would seem appropriate.

Regards,  
James

*Message #51 Posted by **Patrick R** on 21 May 2007, 2:24 a.m.,  
in response to message #1 by DaveJ*

In my view, a 35 year anniversary edition with any of the current production calculators would be a nice way to promote the huge backstep in product quality and feel. As long as HP doesn't manage to build a decent case around a calculator, including decent keys, I wouldn't even mind about releasing anniversary editions.

I want at least the quality of a 32sii or a 48G. Put the 50G in a 48G case, resolve the emulating issues and I will buy one.

Just recently a friend told me that he bought a 33S to replace his 15C. He was so disappointed by the quality of the 33S that it almost immediately went to the dustbin (I won't quote his insults towards the Chinese). Now it is rotting away in a drawer. He now considers buying a Casio.

So let's celebrate this anniversary.

away in a drawer. He now considers buying a Casio.

I have used the 33S for over a year now and I have to say that I have been pleasantly surprised by its performance. Is it perfect? No, but I also don't have to watch it like a hawk or worry about dropping it like I would my 41CV/42S/48GX models. The chevron pattern is more disturbing in pictures than in use. Besides, it is not bad for \$20 each. (I bought 4)

I certainly wouldn't trade a 33S for a comparable Casio, strictly based on my personal preferences. But, to each his own.

The 33s is *so freakin' beautiful* inside that it's *just* possible to get past its **outside**.

Even with its inherent limitations, that easiest-to-use 32s programming interface combined with essentially unlimited memory makes programming the 33s a sheer joy -- at least to this sub-RPL user.

In something like the old Pioneer or Voyager packaging, it would be fabulous. As it is, I still find it *very* usable.

(But, I repeat myself.)

Quote:

The 33s is *so freakin' beautiful* **inside** that it's *just* possible to get past its **outside**.

I also completely disagree. You shouldn't forget that the (almost) only interaction with the calculator goes via the keyboard (input) and the display (output). As a professional (I am a physics teacher), I use calculators on a daily basis (most of the time a 10 year old 32Sii) for numerical calculations (in exercises and problems, for correcting tests etc.). As I want to work fast, efficiently and flawlessly, I have to trust my hardware to 100%. This is not possible when using confusing keyboards or bad responding keyboards. The keyboard of the calculator simply is the "key" for accurate and fast calculations. The currently produced HP calculators simply don't respond to these (my, and hopefully other's) needs. New funtions, more memory, bigger screens etc., are useless if it is no longer possible to interact adequately with the calculator.

Sometimes HP is listening, so please, please, DO something!

**HP-67**

Message #1 Posted by [Tim](#) on 19 May 2007, 8:42 p.m.

Does anyone know where I can get a shell for the HP-67. Or a 67 that does not work?

**Re: HP-67**

Message #2 Posted by [Mad Dog ebaycalcnut](#) on 19 May 2007, 9:29 p.m.,  
in response to message #1 by Tim

The unmentionable auction website occasionally has some.

**Re: HP-67 (Where to get--working or not)**

in response to message #1 by Tim

The best source of no longer made HP calculators (both working and not working models) is International Calculator websites [www.internationalcalculator.com](http://www.internationalcalculator.com) or [www.intlcalc.com](http://www.intlcalc.com) I have made many purchases from and have good dealings with its owner/manager, Don O'Rourke.

**9114 - battery - take 2**

Message #1 Posted by [PeterP](#) on 18 May 2007, 11:32 p.m.

Hi,

Ok, so after some traveling I came back to work on my 9114 with all the tips I got. The new battery arrived and full hope I went into swapping the old battery out for the new.

And, as many here have said already, it really indeed was very simple.

Checking all contacts, I closed the battery up, plugged it into my 9114a, plugged in the power and turned the 9114 on.

Hurra!!! it worked, the two leds were on, we heard some moving off the head and after a few seconds the 'fault' LED went off. All seemed great.

However about a minute or so later, all lights went off. and no amount of trying from my side was able to make the 9114 turn on again.

So I opened up the battery and started checking some contacts. And somehow there was no current going to the plug into the 9114! I checked the battery - 6.5V, the current went to the PCB but did not come out the other end. I was stymed!

I though, okay, maybe the charger burned it - it had 12v coming out of it and maybe that was too much (though the label on the battery department said 20V max. the charger I used, by the way, was a standard HP charger, I believe 82059b)

As I have a second battery pack, I did the same thing again. Swap out the old battery. Check the contacts. Close the battery, plug it in, turn on the 9114. Hurra! both LED on, the 'fault' one went out after a few seconds. And a minute or so later, the thing turned off again. And when I again checked the output of the battery-pack, there was no current coming out of it!

I'm quite flabbergasted how turning on the 9114 could burn out some part of the PCB in the battery!

Anyway, are there any good ideas out there on what to try next? I will let the charger be plugged into the battery over night to see if that does anything (i do not know if the battery was full or not when I got it, however it continued to show a very steady 6.5V when tested directly. )

Thanks!

Peter

Message #2 Posted by [Tony Duell](#) on 19 May 2007, 4:06 a.m.,  
in response to message #1 by [PeterP](#)

There is a picofuse on the PCB (it looks like a resistor, you may have to trace the connections from the plug to find it). My guess is that you've blown that.

Of course it's easy to replace (DO NOT be tempted to short it out -- that battery can supply several hundred amps into a short circuit, and you don't want to fry tracks on the main PCB!), but the big question is 'Why did it blow'.

## **Re: 9114 - battery - take 2**

*Message #3 Posted by **PeterP** on 20 May 2007, 12:57 a.m.,  
in response to message #2 by Tony Duell*

Tony,

I did order the pico-fuse and also found some related info here in the archive following your pointer about the pico-fuse (will consolidate and add to the summary!) Will not short out, your warning is much appreciated.

In the meantime I have built a direct powersupply following some directions from you and others. This worked well on my 9114b, but I still have some problems with the 9114a (see my other post with pictures of the open 9114a).

As for why it shorted out, I have a suspicion: When I have the metal cover on the drive, the 'fault' light does not go out, yes it always goes out when the metal cover is off. This is how I was able to test all the HP-IL commands as posted. This makes me believe that maybe the metal-cover is too tight or I have put it on wrongly so that the head cannot move. If the head or some other part is trying to move yet is stuck, could that not cause the motor to suck too much current and burn the fuse?

Anyway, all in time, I'd say. I hope I am not testing your patience when I ask you to maybe take a look at the pictures to check if you see anything strange.

Thanks so much in advance!

Cheers

Peter

If the head or some other part is trying to move yet is stuck, could that not cause the motor to suck too much current and burn the fuse?

---

As the head motor is a stepper, it won't draw significantly more current when jammed than when moving. But if the heads can't move, the unit will not pass the self-test (the fault light will stay on) since the unit moves the head back and forth and checks that the track 0 signal does the right thing.

Of course that cover might be shorting something to ground.

### What is the next platform?

Message #1 Posted by [Jim Creybohm](#) on 18 May 2007, 6:44 p.m.

With the recent announcement of Dell's cessation of the Axim PDA series, I think a reasonable question is; what is the next platform for calculators and calculator simulators? Are we destined for example, to run Free42 on a cell phone for (insert favourite deity here) sake? Free42 on a blackberry?

I don't pack a laptop every day. The Dell Axim is like the 41. It is a venerable product, the standard if you will. Sony, Apple, Toshiba have all left the PDA market. These are large players who drop in and drop out of markets all the time. It is interesting, but not really surprising that they have dropped the PDA. Not so with Dell.

From a marketing perspective, I actually see the potential for growth in the calculator business. If the PDA does in fact, get phased out as a form factor with the rush to newer, cooler technologies.

Interested in others perspectives. HP-50 forever?

### Re: What is the next platform?

Message #2 Posted by [Gene](#) on 18 May 2007, 7:24 p.m.,  
in response to message #1 by [Jim Creybohm](#)

I still like the palm platform even though I had an Axim 50v for some time and the VGA resolution on that screen was amazing. I still prefer palm.

However, some sort of convergence is inevitable. People just won't carry a laptop, cell phone AND a PDA and an iPod.

Not going to happen.

Perhaps the iPhone will be a convergence product, particularly if Apple opens it up to third party applications.

Music, internet access, cell phone, lots of built-in apps, etc.

We'll see.

However, for dedicated number crunching, there is no way around the calculator. Who needs dedicated number crunching abilities? Certainly accountants and financial people who evaluate deals at a lunch table. :-)  
Students, certainly. Professional scientists, technicians? Harder to say. If there were a big market for calculators in these areas, they would have sold better.

Gene

in response to message #2 by [Gene](#)

Quote:

People just won't carry a laptop, cell phone AND a PDA and an iPod.

Actually, not only will they, they do!

Two trips back, I carried a cell phone in my left pocket, plane tickets in my left cargo pocket, wallet in my right pocket, A laptop over my shoulder, A 5 Mpx digital camera, and two calculators in my bag. This time I left the graphing calc behind.

I see guys with exactly the list you mentioned--routinely--in the airport, on the plane etc. A good number now have the PDA/cellphone merged and the calculator is gone, but the ipod and the laptop still travel. The ipod is tiny, and the laptop is huge. They are for such different purposes.

What is the last thing I bring, only if I really need it?

The laptop. I leave it home as often as possible.

### **Re: What is the next platform?**

*Message #4 Posted by [Hugh Evans](#) on 18 May 2007, 9:32 p.m.,  
in response to message #1 by Jim Creybohm*

I've been batting around this hypothetical in my mind for a while now, not that I'm necessarily interested in trying to produce one. I call it a PDX, essentially a PDA with extended capabilities and a keyboard that can either be folded or slid out. With the keyboard retracted it should be the same size as a modern PDA only thicker.

The big drawback will be power consumption, but anyone who has owned a PDA can tell you can popping it into a charging cradle is an easy habit to make. 1-2 weeks between charges should be achievable.

### **Re: What is the next platform?**

in response to message #5 by Eric Smith*

Not quite. I'd like to see a nice calculator keyboard slide out with full sized keys.

### **Re: What is the next platform?**

*Message #7 Posted by [DaveJ](#) on 19 May 2007, 3:36 a.m.,  
in response to message #1 by Jim Creybohm*

I hope the next platform is SMALL and dedicated. I don't need a scientific calculator in my phone, I don't need it in a PDA, I don't need it a notebook, I don't need it on my PC, I don't need it in \*insert new fangled tech item here\*

What I do need is a dedicated scientific calculator with no fancy stuff. One designed to do the job, and one that I can take with me. Something I can really slip in my shirt pocket, my back pocket, or on my wrist.

No I don't need a color screen, I don't need graphing, I don't need fancy programming.

And no, a Voyager is not small enough IMHO, so I hope the next platform is smaller again.

Dave.

### **Re: What is the next platform?**

*Message #8 Posted by [Hugh Evans](#) on 19 May 2007, 6:43 a.m.,  
in response to message #7 by DaveJ*

Understood. But the question here is hypothetical and dealing with advances beyond the same graphing machines that have been around for the past 15 years.

In terms of what most people around here would actually like to use... HP would do very well to make a 15c with a two-line display in a cast magnesium case slimmed down to 0.25" or so. Package it with a good manual, price it around \$75, sit back and watch engineers buy at least two each.

That's the reason I don't want to mess around too much with big graphing machines. I only ever use the things if I'm sitting down at a desk. My workhorse is the 11c I carry in my shirt pocket every day.

### **Re: What is the next platform?**

*Message #9 Posted by [Donald](#) on 20 May 2007, 5:50 a.m.,  
in response to message #8 by Hugh Evans*

Exactly my thoughts: the calculator is coming back into favour for small to moderately sized calculations. For anything more complex, MATLAB, ADS, Eagleware, R etc. is the best choice : so for professional use, the graphing calculator is a bulky irrelevance.

Experience has also shown us that PDA soft-calculators don't provide the user experience on a touch screen - and programming is not fun. Gadget wise most of now carry a iPod and a cell-phone even though the cell-phone has a MP3 player, but like the PDA calculator, it's not the same as a dedicated device. We are seeing just as much divergence through multiple smaller lower cost devices - as convergence with higher cost multi-use device.

If HP make what Hugh suggested, I would get one for home and one for work, as well as starting a deluge of orders for other engineers at work.

### **Re: What is the next platform?**

*Message #10 Posted by [Thor Lansen](#) on 20 May 2007, 11:22 p.m.,*

*in response to message #8 by Hugh Evans*

Or would they like even better, as I do, an "HP42SX", an HP42S with a bit more memory and a redesign infrared port that works not just as a printer port but as an interface to communicate with other devices such as a computer so as to download programs, etc. The HP42S already has a two-line display, is more powerful and user friendly (almost intuitive to use) than the HP15C, and as an added bonus is compatible with the best machine (not just a calculator) ever built, the HP41CX.

Regards, Thor

### checking homework technique

Message #1 Posted by [tropicflite](#) on 18 May 2007, 1:23 p.m.

My 12 year old son is learning algebra now, and while I'm a firm believer in the pencil and paper method for doing the homework, I also see this as a good opportunity for both of us to use our 33S to check the answers.

My question is, do you use your calculator's full capabilities to explicitly get an answer, or do you 'work with it' to try to simulate the pencil and paper method?

e.g. in multiplying rational numbers, we first multiply all the numbers and then count the number of negative signs to determine the sign of the product. So, (forgive the obviousness here) in:

$$-2 * 3 * -4$$

I teach him  $2 * 3$  is 6,  $* 4$  is 24, and since there's an even number of negative signs, the answer is positive.

Now, checking with the 33s, would you key

2 [+/-] ENTER 3 ENTER 4 [+/-] \* \*

or would you just key

2 ENTER 3 ENTER 4 \* \*

and then just count the signs?

In the thread about the percent key someone made the point that 'the mathematically-inclined user is expected to be able to mentally shift the decimal point two places to the right.' Does that reasoning apply here?

*Edited: 19 May 2007, 7:24 a.m. after one or more responses were posted*

### Re: checking homework technique

Message #2 Posted by [Dia C. Tran](#) on 18 May 2007, 3:44 p.m.,  
in response to message #1 by [tropicflite](#)

Personally I prefer to use the first method. Your example is very simple and thus most can do it even without the pencil and paper, but when you run into things that are more complicated, entering negative number as negative can prevent me from making mistakes. Anyway, I disagree that you're expected to shift the decimal point 2 places when using a calculator with the percent key.

### Re: checking homework technique

Message #3 Posted by [Hal Bitton](#) on 18 May 2007, 6:57 p.m.,  
in response to message #1 by [tropicflite](#)

My 11 year old son is in an accelerated math program...his teacher is really hitting the kids heavily with

manipulation of equations, various techniques for factoring polynomials, handling irrationals, radicals, etc. When we go over his homework, we work out the problems using the technique he was taught that day, but I usually check the solutions with my 50G (which of course does all the manipulation and simplification for you). He does use his 33S on rare occasions, but mostly wades through it with pencil and paper. When a calculator is called for in the classroom, the teacher passes out the classroom set of TI84's, but I understand that's seldom. I think when he starts doing trig, that will change.

Best regards, Hal

### **Need to fix HP 12c display**

*Message #1 Posted by [HP 12c Newbie](#) on 17 May 2007, 2:25 p.m.*

I have an old model of the HP 12-c (says "Made in Malaysia" in the back) and requires (3) 1.5 V batteries.

The bottom half of the numbers in the lcd screen are not displaying properly. They are faded.

I installed 3 new batteries, but this did not solve the problem.

Does anyone know how I can repair this calculator?

Thank you.

### **Re: Need to fix HP 12c display**

*Message #2 Posted by [db \(martinez, ca.\)](#) on 17 May 2007, 7:31 p.m.,  
in response to message #1 by [HP 12c Newbie](#)*

with luck you only have some tricky & tiny soldering ahead of you. or you can find one without a case or manual for a song on ebay. the shipping is likely to cost more than your replacement calculator.

since you're a financial person; then you can sell your old battery door for the same price. they are a precious commodity. net loss: 0

**Battery life**

Message #1 Posted by [PhysicsNerd](#) on 17 May 2007, 5:13 a.m.

What is the estimated battery life span of a Hp 50g assuming that you use the calculator for a couple hours everyday? I've had my calculator for no more than 2 months (I think) and the low battery sign has already appeared and thus I had to change the batteries. Is this normal?? It seems rather low because my Ti has a battery life of at least a few months or maybe even a year or so.

I'm glad that they went on before I took my test because I would have been in a hassle changing them during a test. Also, if you activate the key beeps from MODE do they drain your batteries a lot faster? I like these beeps as they inform me when I accidentally press down a button or something. Thanks.

*Edited: 17 May 2007, 5:14 a.m.*

**Re: Battery life**

Message #2 Posted by [Les Wright](#) on 17 May 2007, 10:53 p.m.,  
in response to message #1 by [PhysicsNerd](#)

Sounds normal to me. I have a 49G+ and was chagrined to find that a fresh set of alkalines drained down to the lowbat warning in a few weeks even if the calc just sat around. Indeed, the way the calc ate batteries inspired me to not even use it, since I cringed at the waste of plowing through disposable batteries.

I have mentioned already several times here that, to my great satisfaction, 1000mAh Duracell rechargeables give me very satisfactory service, especially when I combine them with a quick charger and regularly back up my memory to SD card. The 49G+ is well used now, and I like it so much I may actually invest in 50G eventually.

I understand that the battery consumption of the 50G is similar. I also understand that some users are very satisfied using NiMH rechargeables in the 50G. This could be the solution for your exam situations--a full charge certainly will give more than just a few hours of use, so if you go into a test with a freshly charged set in the calculator you should be fine. Edwin Cordoba's BatStatus application for 49G+ is very informative for me, but I am not sure it would display correct information in the 50G, which takes four cells vs. three.

I do believe the "beep on" setting would increase battery drain. I also believe that displaying the clock also increases battery drain.

I don't understand why it would be inconvenient to change batteries during a test. Are you not allowed to keep fresh batteries on hand? Does opening up the calculator during a test arouse the suspicion of the examiner? Also, do you use the calc with the beep setting on, and if so does this not disturb your colleagues?

Les

**Re: Battery life**

Message #3 Posted by [Tom \(UK\)](#) on 18 May 2007, 9:49 a.m.,  
in response to message #1 by [PhysicsNerd](#)

Sounds similar to when I was using my HP49G. It did get annoying to have to buy new batteries every few months - something I didn't need to do with previous HP calculators. I can't comment on TI calcs battery use.

Strange that displaying the clock takes much power, the timer will be running if it is displayed or not, the LCD display shouldn't take much power - so the circuit updating the screen must be drawing much more power than it really needs - perhaps the main processor is running (but idle) on a much higher clock than is necessary.

Message #4 Posted by [Jean-Michel](#) on 17 May 2007, 4:40 a.m.,  
in response to message #1 by [db \(martinez, ca.\)](#)

Hi all,

here is a question that I really wanted to ask for a long time, but without daring to do it. Another thing which is also interesting to know about all of us here, is : "What's your job ?". I know if may be kind of inquisitive, but no one is obliged to answer. In fact, more than the actual job, or the social level in society (correct ?), I think it would be interesting to know if someone is interested in calculators because he's a scientist, an engineer, or something like that, and then he uses one every day for his job, or if it's a hobby without any link

with his job. (I apologize for my poor english writing, it's awful !).

My answer to all of these questions and others asked before in the Forum : I'm french, I live in the woods in a small village (which isn't the center of anything, but a nice region), I'm 40, I own 4 HP's (33C, 41C, 28S and 48GX), that I use quite every day (not the 4 at the same time :-) !) in my job, as a technician in car industry. Hope it's interesting and will be followed.

Kind regards.

JML

in response to message #10 by MarkWayne*

What a rich tradition in math and theoretical physics, you and Jean Michel have there in France! And to be in education, standing "on the shoulders" of so many great men and women!

I am on Mobile Bay, Eastern Shore, about 88.5W, 30.5N; or 1.5 East of New Orleans, Katrina's eastern boudary - got the reference to Orleans, Jean-Michel. Schooled at Tulane and University of New Orleans. Would like to visit your part of France someday.already been to Paris a few times.

Would like to get a few threads on Relativity, Quantum, String, etc., plus other "Theoreticl" thoughts - would be kind of selfih of me since I would have little to contribute beyond some good questions. If "y'all" are interested maybe we could get some stimulating chatter in a new subject.

Regards,

Ron

Comodoro Rivadavia, República Argentina. Small city in the middle of the east coast of Patagonia Argentina. I can not explain why my fascination with calculators. I am Civil Engineer. I do not use them so much, because computers (desktop or laptops) are much more convenient if the calculation is beyond a couple of operations. I own hp calculators because I like to have fine tools to do my job. I am not comfortable working with cheap thinks. Of course, it is now, when I am a profesional (40 years). As a student, I used a cheap casio.

Trinidad, West Indies. 41CV,41CX,4-42S, a couple 48GXs,48G+,33S and of course HP50G. Land Surveyor and Lecturer at University of Trinidad and Tobago. I am 40 but I feel like I'm 20 :). I'm Addicted to HP calcs. and 80's music.

## Some other "border-straddling" towns

*Message #26 Posted by **Karl Schneider** on 26 May 2007, 3:56 p.m.,  
in response to message #24 by Richard Garner*

Hi, Richard --

Quote:

Twice as Nice, Twin City of Texarkana Arkansas/Texas. Known as the only city in the world where the dividing line between the 2 cities and 2 states is a City Street/Federal Highway, State Line Avenue. The Federal Courthouse/Post Office sits straddling the state line between the 2 states.

- Texarkana, [Texas](#) and [Arkansas](#)

Other examples of "border-straddling" twin cities:

- Kansas City ([Missouri](#) and [Kansas](#))

- Bristol ([Tennessee](#) and [Virginia](#))

But here's a more intriguing example:

- [Derby Line \(Vermont, USA\) and Stanstead \(Quebec, Canada\)](#), featuring the border-straddling (by design) [Haskell Free Library and Opera House](#)

which is one of many "border oddities" between Canada and the US' New England region, which includes towns and even houses bisected by the border, which were platted or built prior to accurate surveying.

---

Er, yes, HP calculator-related content:

Click on the link for the Library and Opera House, and notice that the co-ordinates for Derby Line, Vermont is slightly north of 45 degrees North. I'd always assumed that the international border there was exactly 45 degrees. However, the [Webster-Ashburton Treaty](#) established the location 3/4 of a mile north of the line, so that a pre-existing U.S. fort would be on U.S. soil.

Convert the 45 degrees, 0 minutes, 20.81 seconds latitude of Derby Line to decimal using " 45.002081 - >HR ". Multiply the fractional part by 60 nautical miles per degree of latitude. Then, multiply by 1.15077714646 to obtain 0.39913 US statute miles, placing the Library and Opera House less than a half-mile north of the Derby Line location (presumably City Hall).

The ideal tool for this calculation is the HP-28C/S, with its fine units library with definitions and conversions. (Unfortunately, units cannot be *attached* to numbers, as with the HP-48/49/50.)

Regarding calculations for surveying: If one does not wish to purchase specialized calculating software or tools, or the accessories for the HP-48/49/50 series, there are several less-expensive options:

- HP-71 5061-7238 Surveying ROM
- HP-41 Surveying Pac
- HP-65 Surveying Pac

Living in Flagstaff, Arizona (where it is fairly cool, unlike most people's perception of Arizona - we are at an elevation of 7000 feet!) My favorite place in the world, though, may be Green Bank, West Virginia - the original site of the National Radio Astronomy Observatory.

I'm a semi-retired Radio Astronomer.

In order of acquisition, I have HP35, 11C, 41CX, 38G (via eBay, I was faked out by the big "enter" key - thought it was RPN but it's algebraic!), 41C (via ebay), 32Sii, 42S, 48GX, and 33S (all acquired new except as noted). I used my Dad's 35 for 2 days straight to finish my thesis, then I had to get one of my own. I still use one of the 41's almost every day for both scientific and casual calculations.

Rats! While I was playing around with the Radio Shack EC-4004 (re-badged Casio fx-3600P) the **original** CR2025 cell finally went dead. I know for certain that I used it in 1988, and perhaps a few years before that, so that CR2025 lasted about 20 years. But I'll grant that it's seldom been turned on since I got my hands on the HP-28S.

Regards,  
James

*Message #33 Posted by **James M. Prange (Michigan)** on 21 May 2007, 6:55 p.m.,  
in response to message #31 by James M. Prange (Michigan)*

PS:

For work, normally a 48SX, but occasionally a 48GX.

For "real work" at home (when I just want to get some calculating done with no nonsense), either a 48SX or 48GX, whichever one is easiest to reach.

For just playing around with, most often the 50g now, but sometimes the 49g+ or 49G.

The Sharp is "interesting" and powerful, but I rather object to switching between "calculator" mode for ordinary interactive calculating and "basic" mode for writing and running programs, and of course, in calculator mode, it's an algebraic model.

The Radio Shack is interesting and powerful too, even though it's algebraic, and writing programs for it can be rather a challenge, but I'm often amazed at how much can be accomplished in just 38 program steps (but some things, such as storing a number into a constants register, count as only 1 program step, not 3 as might be expected).

The Lloyds is just a simple 8-digit 4-banger plus square root, %, +/-, and a memory register, but it's my oldest still-working calculator, and it still works with the original battery from about 1980.

I overlooked at least one, even though it's often in my shirt pocket, a Radio Shack EC-232. This is a thin solar-powered "credit card-sized" 4-banger with a membrane keypad. It's a pain in the neck to use, but the nice thing about it is that it fits in my shirt pocket so comfortably.

Regards,

James

**A couple suggestions**

Message #36 Posted by **Valentin Albillo** on 18 May 2007, 4:32 a.m.,  
in response to message #35 by Giancarlo (Italy)

Nice effort, Giancarlo !

Just a couple of well-spirited suggestions:

1. Sort the list, either by name or surname, I guess by name would be better
2. Include also age, job, and calcs, as many people gave those data and they're pretty interesting as well.

This could be the early stages of a proper 'Active Directory' of forum regulars :-)

Best regards from V.

in response to message #39 by Giancarlo (Italy)

Well, I'm 41 and I'm a civil engineer, with 75 calculators in the collection, and among these 17 HPs.

Just to update your table, Giancarlo!

-- Antonio

P.S. My father had your name.

in response to message #39 by [Giancarlo \(Italy\)](#)

Giancarlo,

This is GREAT! Thanks for all the work.

I second Valentin's suggestion that this somehow become a quick intro to the denizens of the forum.

Is there some way to make this updatable by each of us so you don't have to do all the work? (Probably not - somebody will trash it!) Actually, once the initial work is done, it might not be too much work to add new folks as they send you their details.

I would suggest instead of age (which changes!) that year of birth be used.

Maybe also a column for number/brands of calculators (like the recent round of such info) as well as a column for favorite(s).

PS for the current table, I'm 61.

---

**A minor correction ...**

Message #44 Posted by [Valentin Albillo](#) on 18 May 2007, 12:20 p.m.,  
in response to message #39 by [Giancarlo \(Italy\)](#)

Hi, Giancarlo:

Giancarlo posted (the underlining is mine):

*"A new update including some suggestions (still compiling tghe list for owned calcs :-)"*

I think that it should be calcs *actually used at work* rather than *owned* calcs. At least that is what was originally asked, and the first posters replied to that, myself included: obviously I do have 70 calcs, but the only one I *use at work* is Emu71.

This would be much more interesting and IMHO preferable to a long list of calculators in everyone's collection. As the jobs are being included too, it's far more relevant and interesting to know that an astronomer, say, still uses an HP-41CX for work, than to know that he owns precisely such, and such, and such, and ... vintage calcs.

Also, if at all possible, sort the list. It's very easy to do using a great variety of tools and applications, but all failing, issuing a simple SORT command in an MS-DOS box under Windows, like this:

```
SORT < inputlist.txt > sortedlist.txt
```

say (or a variant), will do the work.

Thanks a lot for your efforts and

Best regards from V.

Hello neighbours (Antonio, Giancarlo, Massimo) ...

I am still far enough (Zagreb, Croatia) from the Adriatic sea so I don't have to be affraid of global warming too much.

Age: 37

Job: Software Developer

Calculators used:

(3x) HP-48GX running HP-71X (with HP-IL emu), HP-42X, HP-41X (with HP-IL emu), HP-15X, HP-16E, HP-11E, HP-12E and TI-57E (in order of significance)

(1x) HP-48G expanded to 1280K running all above

(1x) HP-48G+ running HP-15E, HP-16E, HP-11E and TI-57E

(1x) HP-49G running HP-71X (with HP-IL emu)

Best regards.

Hrast

in response to message #50 by Vassilis Prevelakis

Living in **France**, 42 years young, in Finance but originally an engineer.

I own about 30 HP, most vintage LED and rarely (if ever) used, with exceptions like the HP41CV/CX (with an MLDL2000, thanks Meindert), HP71s and HP42Ss. No calculators are necessary at work, alas. I collect this because of an early fascination for math and technology, doing so for the last 15 years.

Calculators: 12 HP (21, 25, 41CV, 11C, 12C, 15C, 16C, 32S, 32Sii, 28S, 48GX, 71B) and a TI 92 Plus.

## Re: where are we? additions and corrections

Message #65 Posted by [Ron Allen](#) on 18 May 2007, 6:17 p.m.,  
in response to message #63 by Don Williams

Mobile Bay is in Alabama - I went to college in New Orleans.

Retired from the computer business: IBM, REI, ITEL. STARTED WITH THE TI 59, my first programmable about 1975. First programs for demonstrations in the field included financial and operations analysis deriving workload projections using learning curves and ques based on reliability statistics for various equipment installed. Other uses of the hp line included statistical analysis in market research (mostly before laptops with significant storage). Now using the hp50g in my retirement as a hobby: projecting value of timber harvests, photography in such things as depth of field calculations, etc. and current pet is catching up on readings in theoretical physics.

Cities lived in during working career: Birmingham, Al, Anniston, Al, Huntsville, Al, New Orleans, La, Dallas, Tx, Frankfurt, Germany, Chicago, Il, Washington, DC, Los Angeles, Ca, San Francisco Bay area, Ca, Pensacola, Fl, Tryon, N.C., Montgomery, Al, and finally in Fairhope, AL, a neat village on the eastern shore of Mobile Bay. Reminds me much of the village of Carmel, California and the string of villages between San Francisco and San Jose: Palo Alto, Mountain View, Saratoga, Los Gatos, to name only a few. As Director of Product Assurance, I enjoyed the opportunity to live in Cupertino just a few blocks from HP.

*in response to message #70 by Jim Creybohm*

Hi Jim;

Sounds like we have alot in common. I was raised around the oil patch on the gulf coast of Texas in the 40's and early 50's. Spent a little time in the late 60's and early 70's buying oil & gas leases in the Powder River basin.....didn't make any money. Am not a cat wrangler, but do have a 3 year old cocker spaniel who takes me for a long walk every day. And I have spent many days horseback in my younger years. Wanted to go to school at Colorado school of mines, but ended up at Denver University instead. Am not a golfer however.

best wishes

Don

I'm French, living in Encinitas, California, north of San Diego. Google eEarth says 33° 03' 42.38" N, 117° 15' 58.63" W altitude 51m

Age 44, designing software and hardware for a semi-conductor company. My first HP calculator was an HP43C, bought in 1981. I still own an HP15C from 1985, and in the past years acquired an HP41C and a 48G.

I'm also using Free42, x48 and Emu48 on various computers...

-- alain.

Age 29, living in Luxembourg, physics teacher.

I own "not too many" HP calculators. Several HP48GX's and HP49G's and some HP32sii's. I often play around with a HP42 and a HP97.

Hi all,

except if I made a mistake on a firstname (Marta ?), I didn't notice any woman in this long list...

"Où êtes-vous Mesdames ?" (Were are you, Madame ?)

On the contrary, lots of physicists...

Howerver that may be, all of this is sympathetic !

Regards,

JML

Name: Jeff Kearns

Born: 1965

Job: Engineering Manager and formerly a Marine Engineer

Location: Ottawa, Ontario, Canada

Calculators: HP 33E, 41C, 15C, 32sii, 33s, 49G+, Free42, and P41CX for Palm

Main Calculator: HP 41C with Advantage Pac, Machine Design, MATH/STAT and Quad Mem. I also use the others regularly.

My main uses are for Finance, Applied Statistics, Calculus.

Hello to all from NY ( NJ ) almost the center of the world, but ... just after Nantes :

Name : Antoine M. Couëtte

Age: 54

Job: Airline Pilot for a Cargo Company based in Milan Italy

Hobbies: Celestial Navigation, Navigation in general and maritime navigation in particular, Solar System Planetary Theories, HP41 Programming, " Baroque " Music ( i.e. European music between 1630 and 1760 ) , playing the organ or the piano, writing music, and of course ... long haul flying around the world

Loc: Nantes ( France ) @ N 47° 13' and W 001° 35'

Calculators : HP41X/Y/Z running on HP48GX and HP49G from HrastProgrammer, and Emu41 by Jean-François Garnier

Best Regards to everybody and in particular to Valentin since I " cut and pasted " the frame of your own answer.

Last Note : The simple fact that many of us - dwelling in quite different areas in the World - are ALL right in stating that they live in the center of the World is an extremely sound and strong proof that our Earth can be quite closely identified to a Sphere ...

**Best regards to you, too, Antoine ! [NT]**

Message #82 Posted by **Les Bell** on 20 May 2007, 1:10 a.m.,  
in response to message #1 by db (martinez, ca.)

Who: Les Bell

City: Sydney State: New South Wales Country: Australia

Age: 51

Job: Information security consultant, lecturer, author. Though I've taken a year away from most work to complete a Masters degree and (perhaps) start a PhD.

Calculators: Still have a 16C, 41CV, 41CX (with various peripherals & Pacs), plus a 48GX, all bought new. Over the years I've also had a 45, 65, 67 and 41C.

Hobbies: Flying, playing (well, trying to play) guitar.

Best,

--- Les

| 1         | TRINIDAD&TOBAGO |          |
| 1         | UNITED KINGDOM  |          |

Yes, it looks like a big, variegated family :-)

Best regards.

Giancarlo

**Re: where are we? The picture of the "big family" :-)**

*Message #84 Posted by **Thomas Okken** on 21 May 2007, 10:57 a.m.,  
in response to message #83 by Giancarlo (Italy)*

I hate to be the geek to point this out, but you can't reliably find a person's year of birth by subtracting their age from the current year! I'm 42 but I was born in 1964.

- Thomas

**Re: where are we? The picture of the "big family" :-)**

*Message #85 Posted by **Giancarlo (Italy)** on 21 May 2007, 11:07 a.m.,  
in response to message #84 by Thomas Okken*

Thomas,

I got the point, but I had to make some assumptions because I had "mixed" figures (some years of birth and some ages).

However you and any other please feel free to point out any amendment you'd like to see and I'll be glad to update the table accordingly :-)

Thank you and best regards.

Giancarlo

*Message #86 Posted by **Nelson M. Sicuro (Brazil)** on 21 May 2007, 11:23 a.m.,  
in response to message #83 by Giancarlo (Italy)*

Please add my data:

Name: Nelson M. Sicuro

City: Curitiba

State: Paraná

Country: Brazil

DOB: 1967

Job: Chief Software Developer at UFPR, electronics hobbyist

Calcs:

\*Several HPs, mostly used: 15C, 42S (with 32K+32K RAM!!), 32S

\*One HP-85A :D

\*One sharp PC-1260 (updated to 16KB RAM) that I love and carry everywhere :D

Best regards,

Nelson

Buon giorno Giancarlo,

please add 1954 as my DOB (though I gave you my age, but it was ambiguous).

Mille grazie!

in response to message #1 by db (martinez, ca.)

As Garrison Keillor once said; "ask a question, get an answer". In this instance; the answers were better than my question.

To Anntoine M. Cou ette: Ah, but Martinez *is* the center of the surface of the world. No place on earth is farther than 180 degrees around the spheroid from us. While this can be claimed by any other place, i thought of it first. "I leave the proof of this as an exercise for the reader".

To Giancarlo: You did a great job on that database. Next time one of life's riddles rears it's head; i'm calling *you*. The blank info for me is 1955, Surveyor & Licensed Engineering Contractor, 41cx.

-----

...but since the Earth is flattened at the poles, the North Pole has a better claim to be the center of the surface of the Earth. And if you limit your possible destinations to dry land, you'd probably have to pick a spot somewhere in the Middle East. (Update: [Egypt](#), actually.) (Another update: [Turkey](#), actually -- I should have read that web page more carefully the first time around!)

It's all moot, anyway. Everybody knows New York is the center of the universe. ;-)

Message #101 Posted by [Olivier TREGER](#) on 22 May 2007, 1:56 a.m.,  
in response to message #1 by db (martinez, ca.)

Hi,

Olivier, 46yr-old, used to be a salesman in computers (Tandy, DEC, NeXT, Compaq, HP,...)

I'm located in Levallois-Perret, close suburb of Paris (N-W).

Location: 48°54'2.40"N 2°17'9.95"E

Here's a view on my collection: <http://calc.treger.net> (around 50 calcs all together)

Enjoy

## Re: where are we? UPDATE

Message #102 Posted by [Giancarlo \(Italy\)](#) on 22 May 2007, 2:55 a.m.,  
in response to message #1 by db (martinez, ca.)

Hi all.

You can find the most updated version of the "database" here:

[Form Contributors Database](#)

I tried to consider all your suggestions and/or amendments.

If I didn't succeed, it's my fault, even though in good faith :-)) so please feel free to issue any RFA (Request for Amendment) and I'll tak care of it.

Thank you for contributing.

Best regards.

Giancarlo

## Re: where are we? UPDATE

*Message #103 Posted by **Thomas Radtke** on 22 May 2007, 9:25 a.m.,  
in response to message #102 by Giancarlo (Italy)*

To fill some gaps:

YOB: 1967

JOB: Physicist

Calcs used at work: Currently an OEM Sharp scientific (no one ever steals a calc like that) at workplace #1, 32SII, 48G and TI-66 at workplace #2 (my home)

Thomas

### **Re: where are we? UPDATE**

*Message #104 Posted by **Trent Moseley** on 22 May 2007, 3:40 p.m.,  
in response to message #102 by Giancarlo (Italy)*

Giancarlo,

Please update:

Year of birth: 1926

HP calcs owned: HP-25C, HP-31E, HP-67, HP-12C, HP-15C, HP-16C, HP-32Sii, HP-33S, and an HP-42S.

Thanks. I would of done this by e-mail but it's having problems right now.

tm

**Re: where are we?**

*Message #115 Posted by **Larry Corrado** on 27 May 2007, 7:14 a.m.,  
in response to message #1 by db (martinez, ca.)*

Good Morning!

Name: Larry Corrado

Location: Manitowoc, Wisconsin USA (on the western shore of Lake Michigan)

Age: 64

Number of HP's: 26

Other calculators: about 100 TIs, other electronics; Curta II (from my sports car rallying days), misc slide rules, abaci, Napier's bones, calculatoria

Occupation: retired professor: physics, computer science

My first HP was an HP-25 in 1977, which I used virtually daily until I retired in 2002. It was then that I found a dusty HP-22 in a secondhand store, cleaned it up, and began collecting calculators.

Best regards to all, Larry

**Re: where are we?**

*Message #116 Posted by [Thibaut.be](#) on 27 May 2007, 10:57 a.m.,  
in response to message #115 by Larry Corrado*

Hi,

I live here 50°45'5.54"N, 4° 7'33.93"E and am a Finance Director. I'm 39 years old. I use a 41CX on a daily basis for number crunching. I also use my brains for simple add/subtract numbers on the screen as it takes less time to calculate mentally than losing the line you were to type the numbers.

Cheers !

### Data transfer from 9895 8 inch floppy

Message #1 Posted by [Wilbert Wilson](#) on 16 May 2007, 7:33 p.m.

Hopefully someone can help me with this. I have several 8 inch floppy disk and would like to transfer the data and program files from the 8 inch media to a media able to be read by a PC. The HP9895A disk drive is connected to a HP9835A desktop computer.

Any help would be appreciated

Thanks

Wilbert Wilson email [Wilbert\\_Wilson@Teledyne.com](mailto:Wilbert_Wilson@Teledyne.com)

### Re: Data transfer from 9895 8 inch floppy

Message #2 Posted by [Vassilis Prevelakis](#) on 17 May 2007, 11:24 p.m.,  
in response to message #1 by [Wilbert Wilson](#)

Wilbert Wilson wrote:

```
> Hopefully someone can help me with this. I have several 8 inch floppy disk and would like to transfer the data and program files  
> from the 8 inch media to a media able to be read by a PC. The HP9895A disk drive is connected to a HP9835A desktop computer.
```

First WOW! I really would like to get my hands on such a machine.

Now a couple of assumptions I need to make:

1. The HP9895A and HP9835A are operational.
2. You want to transfer the programs and data so that you can port the applications to a new computer.
3. The HP9835A has a working HP-IB interface (it should be able to talk to the HP9895A).

-----

Given the above, you'd be better off sending everything as ASCII over HP-IB, rather than getting the stuff off the floppies. This is because you'd then have to decode the info inside the retrieved files. This would involve de-tokenizing the BASIC programs and reverse engineering the structure of the data files, so that you can extract the data.

One easy way to get your HP9835A to send the programs and data as ASCII is to set up an HP-IB "printer" and then use the combination of your HP9895A and HP9835A to "print" the programs and data to the HP-IB "printer". Since I have these equipment handy, I'd use the HP82164A HP-IL/RS-232 Interface connected to the serial port of my PC (running, say, kermit to pick up the data received over the serial link). Note that the HP82164A is an HP-IL device, so I'd use the HP82169A HP-IL/HP-IB Interface to link my HP-IB equipped computer to the HP82164A.

```
+-----+ +-----+ +-----+ +-----+
| HP9835A +-----+ HP82169A +-----+ HP82164A +-----+ PC |
+-----+ +-----+ +-----+ +-----+
          HP-IB          HP-IL          RS/232
```

-----  
Alternatively, if you happen to have an HP-IB ISA or PCI card for your PC, you may want to read the

"[3] Transferring Files Over HP-IB"

section of this article found at:

<http://www.series80.org/Articles/xfer-to-dos.txt>

**Testing UserRPL arguments for numerosity?**

Message #1 Posted by [Sleazey](#) on 16 May 2007, 5:58 p.m.

I am writing a package of routines to do both algebra and numeric calculations using the generalized hypergeometric function.

If all incoming parameters are numeric, or can be evaluated to numeric, then for some ranges of the parameters, I can return a numeric result.

However, if a parameter is a symbolic, and cannot be evaluated to a numeric result (like an undefined global name, etc.) then I can't return a numeric result, (but I may be able to return a simplified symbolic result).

Here comes the question: What's the best way to validate/evaluate/check/test incoming parameters for "numerosity"? That is, what's the best way to test a parameter to see if it can be resolved to a numeric value?

Is there any kind of built in UserRPL function (or even a SYSEVAL) that does this kind of thing?

Right now I have a long CASE statement that checks various TYPE values, and returns true/false. That works ok, but it's not very fast.

Complications come in because an algebraic expression may be evaluable down to a numeric result, and I would like to handle that case correctly too.

Global names may have a numeric value; need to handle that too. Perhaps a global name refers to another global name, that refers to another global name, that refers to a numeric or an evaluable algebraic; that should count as a numeric parameter too.

Would it be better just to attempt to do an EVAL and/or a ->NUM against a parameter (guarded with IFERR) and see if that results in a numeric? Would that be definitive?

Thanks for any suggestions!

**Re: Testing UserRPL arguments for numerosity?**

Message #2 Posted by [hugh steers](#) on 18 May 2007, 4:13 a.m.,  
in response to message #1 by [Sleazey](#)

what goes wrong if you just eval it? is it the error trapping?

**Re: Testing UserRPL arguments for numerosity?**

Message #3 Posted by [Sleazey](#) on 18 May 2007, 2:20 p.m.,  
in response to message #2 by [hugh steers](#)

Actually I have something that works for all the cases I have tried. It ended up being a very long IF test, with some recursive calls to itself.

I also use IFERR extensively to catch errors during EVAL & ->NUM; if an error occurs, I just return a false result (treat it as non-numeric).

So, I do have it working, but it's slow, looks a bit inelegant, and I worry about obscure or rare combinations that could slip through the cracks. I just keep using it in my code; that will be the only way to thoroughly test it.

I looked in the SysRPL manuals, but didn't see anything quickly that looked what I wanted.

### Determining significant length of the HP 33s

Message #1 Posted by [G. Cone](#) on 16 May 2007, 5:32 p.m.

When dealing with numerical programming, one often is confronted with a conditional statement that requires a decision to be made based upon the difference or ratio between two variables being reasonably close to zero. The question then arises: how close is *reasonably close*? At first impulse, one may simply choose to select a tiny arbitrary value, say  $10^{-6}$  or better yet  $10^{-20}$  based upon the user's desire for precision. While this may seem like an acceptable method, it ignores the realities of the floating point representation being used by the machine.

Floating point numbers are usually represented in binary as follows:

$$SE_1E_2\dots E_mT_1T_2\dots T_n$$

where 'S' is the sign bit, the 'E<sub>i</sub>' are the exponent bits, and the 'T<sub>j</sub>' are the significant bits (also known as the mantissa). This implies that there is a *maximum relative spacing* between any two numbers for a given floating point representation. Given a [common floating point representation](#) such as double precision IEEE found on standard personal computers, this maximum relative spacing is 2.22E-16, yielding 16 digits of precision. This value can be determined from the formula:

$$\text{maximum relative spacing (epsilon)} = 2^{1-n}$$

where 'n' is the number of bits in the significant (note that IEEE uses a "hidden bit method" so that while there are only 52 bits in a 64-bit number dedicated to the significant, the value of 'n' in that case is really 53).

So for programmable calculators like the HP 33s, knowing what *epsilon* is important. The manual states that typical calculations are accurate to 12 decimal digits. This would imply an *epsilon* value of around  $10^{-12}$  to  $10^{-13}$  or the number of significant bits being as low as 39 up to 41 bits. Mr. Hanson mentioned in his article about a ["Cadillac" quadratic solver for the HP 33s](#) that the "tricky properties" of the statistical operations allow precision up to 15 digits; more in line with the 52 to 53 bit significant used in the IEEE floats.

I attempted to ask HP directly about the number of bits used for the significant in the HP 33s for both sets of operations to no avail. I'm trying to come up with a nifty program to determine the appropriate value for 'n' for standard operations. If anyone comes up with something, please post it.

For the time being, the few programs I have written (Mr. Hanson's program translation being the exception) use:

$$\text{epsilon} = 2^{-39} = 1.819\text{E-}12$$

Stay tuned for some programs that I've successfully translated to the HP 33s!

### Re: Determining significant length of the HP 33s

in response to message #3 by John Limpert*

Thank you Mr. Limpert. That's a piece of information that I obviously was unaware of. I'll definitely check that website out!

### **Re: Determining significant length of the HP 33s**

*Message #5 Posted by [Les Wright](#) on 17 May 2007, 11:08 p.m.,  
in response to message #1 by G. Cone*

I must admit that in pretty all of my RPN program that require convergence to equality of some sort, whether it is to zero or to something else, I simply go until actual equality and don't use epsilon in the same way one does in C, Visual Basic, or Pascal code.

My understanding is that even though the RPN calculators I use carry internal guard digits, these extra digits are lost when a value is returned to the stack. Therefore, in virtually all cases where I need a desired value to stop changing in the 12 (or 10) displayed digits before exiting a loop, simply testing for non-equality is the way I do it. If "old" and "new" values of the desired parameter are not equal, I loop back to the beginning of the loop, otherwise I skip the GTO after the conditional test and carry on.

This almost always works in cases where I am computing a convergent series or continued fraction representation of a desired function. In root solving, though, there may be some "wobble" in the last digit which I can see if I display interim approximations. In those cases the loop ends when I do specify some desired epsilon, such as 1e-8.

Les

### **Re: Determining significant length of the HP 33s**

*Message #6 Posted by [hugh steers](#) on 18 May 2007, 4:51 a.m.,  
in response to message #5 by Les Wright*

hi guys,

there's an interesting method to calculate the net accuracy in bits and as decimal equivalent. its not rigorous, but helpful. i first saw this in Jean Meeus' book (the astronomer).

here's a lua version (easier to see what's going on):

```

function precision()
  x = 1
  j = 0
  while (1)
  do
    x = x*2
    if x + 1 == x then
      print(j, j*0.30103)
      return;
    end
    j = j + 1
  end
end
end

```

transcript (hplua hp50g):

```

hplua -i acc.lua
Lua 5.1.2 Copyright (C) 1994-2007 Lua.org, PUC-Rio
HPLua version 0.4
=precision()
> 83      24.98549

```

first number is bits, second is decimal equivalent. so i'm seeing a payload of nearly 25 decimals on my 50g with this.

running this on a PC (IEEE754 doubles) as:

```

#include <stdio.h>
void showPrecision()
{
  double x = 1;
  int j = 0;
  while (1)
  {
    x = x*2;
    if (x + 1.0 == x)
    {
      printf("%d %f\n", j, (double)j*0.30103);
      return;
    }
    j = j + 1;
  }
}
int main()
{
  showPrecision();
  return 0;
}

```

i get, 52 15.653560 which is 52 bits and 15.6 decimals. maybe someone would like to try this method in RPL (i don't RPL anymore).

## Re: Determining significant length of the HP 33s

Message #7 Posted by [G. Cone](#) on 22 May 2007, 10:00 a.m.,  
in response to message #1 by G. Cone

I believe this [link](#) answers my original question quite well.

Given the BCD operation of these calculators, the epsilon value is 5.00000000001E-12.  
Oddly enough, 5.0E-12(exact) when added to 1.0(exact) doesn't add up to 1.00000000001, go figure...

### percent of total in rpn mode

Message #1 Posted by [tropicflite](#) on 16 May 2007, 2:13 a.m.

I have a 33s, and I cannot figure out how to find a percent of a total in RPN mode by using the % key.

i.e., 30 is 'what percent' of 50.

The best I can come up with is

30 enter 50 / 100 x

in ALG I can do

30 / 50% enter

isn't there a way to use the % key in RPN mode?

TIA,

tropicflite

### Re: percent of total in rpn mode

Message #2 Posted by [Walter B](#) on 16 May 2007, 2:27 a.m.,  
in response to message #1 by tropicflite

AFAIK this key is for another purpose, e.g.

50 ENTER 30 %

will display 15 in x while the base (50) stays in y, as it is done in earlier models. Never heard of the way you look for in RPN so far, but that doesn't mean it doesn't exist...

BTW, if you remember "%" abbreviates "per 100" you can save 1 keystroke to solve your problem in RPN, using

30 ENTER 50 E +/- 2 /

exactly equivalent to the expression you used in ALG.

HTH

Walter

*Edited: 16 May 2007, 2:39 a.m.*

### Re: percent of total in rpn mode

*Message #3 Posted by [tropicflite](#) on 16 May 2007, 10:01 a.m.,  
in response to message #2 by Walter B*

Your key sequence

30 ENTER 50 E +/- 2 /

is indeed one keystroke shorter than my version

30 ENTER 50 / 100 x

though I'm not sure it's an improvement over the the ALG

30 / 50% ENTER

BTW, I also tried making the equation

A / B x 100

and doing

30 R/S 50 R/S

This works well if you have a lot of percentages to compute, but it involves first writing the equation and then finding it in the list.

On my one-dollar LeWORLD 4-banger from Walmart, I can do

30 / 50%

which shaves a keystroke off the 33S's ALG version, and other HP's, (namely the 12C Platinum) have a %T key which allows

50 ENTER 30 %T

which is equally good, (though, thinking about it, wouldn't that key be better labeled as %Y ? But I digress..)

In the end, I think this a rare case where the ALG version is better, at least on the 33s.

Regards,

tropicflite

### **1 buck LeWorld -- It's at LEAST a five-banger**

*Message #4 Posted by [Paul Brogger](#) on 16 May 2007, 12:30 p.m.,  
in response to message #3 by tropicflite*

"%" is a fifth bang. I'll bet it has a square root, too. (Another case of bang inflation.)

I wonder, are there any REAL four-bangers out there?

### **Re: 1 buck LeWorld -- It's at LEAST a five-banger**

*Message #5 Posted by [tropicflite](#) on 16 May 2007, 1:49 p.m.,*

*in response to message #4 by Paul Brogger*

You, sir, are absolutely correct. It has the standard four 'bangs', percent, square root, as well as MRC, M-, and M+. I happen to have the lovely green model.

[http://www.rskey.org/~mwsebastian/reviews/leworld\\_green.jpg](http://www.rskey.org/~mwsebastian/reviews/leworld_green.jpg)

Now *this* strictly meets the definition. Sadly, I don't have one.

<http://www.voidware.com/calcs/images/casiomini-1.jpg>

### **Re: 1 buck LeWorld -- It's at LEAST a five-banger**

*Message #6 Posted by **Paul Brogger** on 16 May 2007, 4:45 p.m.,  
in response to message #5 by tropicflite*

I believe Commodore had a couple of early, truly four-function models. (I believe I've got one buried in a box somewhere.)

I doubt there are any made these days.

The fact that yours is available for only one dollar (and the Scientific is like ~\$4, right?) is pretty amazing -- especially given the value of a dollar these days. Times *do* change!

*Edited: 16 May 2007, 4:48 p.m.*

### **Re: "True" four-banger -- There's one on my Nokia cell phone!**

*Message #7 Posted by **Paul Brogger** on 17 May 2007, 7:03 p.m.,  
in response to message #6 by Paul Brogger*

Couldn't be more basic -- but with an interesting interface to compensate for the fact that the four operations are not mapped to any of the keys.

You key in a number, scroll to the desired operation, key in another number, and press "EQUALS" (assigned to the menu selection key).

### **Re: percent of total in rpn mode**

*Message #8 Posted by **Vieira, L. C. (Brazil)** on 16 May 2007, 7:11 a.m.,  
in response to message #1 by tropicflite*

Hi;

the shortest expression for %T (percent of total) would be:

$$\%T(b, a) = 100 \times \frac{a}{b}$$

being b the total and a the part. If you want to use the percent key, you should see the expression for percent, that is::

$$\%(b, a) = \frac{a \times b}{100}$$

I cannot see an easy way to compute %T by using the % key, though.

Hope this clears the subject up... a bit.

Cheers.

Luiz (Brazil)

### Re: percent of total in rpn mode

Message #12 Posted by [ECL](#) on 16 May 2007, 3:11 p.m.,  
in response to message #1 by tropicflite

Here's the sequence, using only 4 keystrokes:

3 ENTER 5 /

First, do a mental  $30/50 = 3/5$  calc. Also, you don't really need to multiply by 100, if you acknowledge that you are seeing the percent in decimal form. :)

ECL

### Re: percent of total in rpn mode

Message #13 Posted by [Robert H](#) on 16 May 2007, 3:54 p.m.,  
in response to message #1 by tropicflite

50 ENTER 30 %CH

-40.00

therefor 30=60% of 50

### Re: percent of total in rpn mode

Message #14 Posted by [tropicflite](#) on 16 May 2007, 6:03 p.m.,  
in response to message #13 by Robert H

Quote:

50 ENTER 30 %CH

-40.00

therefor 30=60% of 50

This is a step in the right direction, but it still needs

100 +

to get to the correct answer.

So, 30 ENTER 50 %CH 100 +

gets us there, but not any more efficiently than

30 ENTER 50 / 100 x

### RPN, algebraic, and the % function

Message #15 Posted by [Norris](#) on 16 May 2007, 6:54 p.m.,  
in response to message #1 by tropicflite

On an RPN calculator, it's impossible to implement a single % function that duplicates the % key on an

algebraic calculator.

On an algebraic calculator, there are actually two different % functions, and the calculator chooses one or the other based on the preceding operation. For example, compare the following using an algebraic calculator, or on the 33S in ALG mode:

200 + 30%  
 200 - 30%  
 200 \* 30%  
 200 / 30%

In the first two cases, an algebraic calculator generates the number "60" when you press the % key. In the next two cases, an algebraic calculator generates the number "0.30" when you press the % key. So the % function is defined differently, depending on whether the preceding operation is addition/subtraction or multiplication/division.

On an RPN calculator, no such ambiguity is possible. The % function will be followed, not preceded, by addition/subtraction or multiplication/division. The RPN calculator, while powerful, is not psychic, and does not know what operation will come next. So the % function can only be defined in one way. The 33S in RPN mode assumes that you are doing addition/subtraction with %. If you want to do multiplication/division with %, then you are out of luck (or you simply program an alternative function).

Note that the ambiguous % function can also cause issues on algebraic calculators. For example, algebraics (including the 33S in ALG mode) typically return different answers for the following equations:

200 + 30% = 260  
 30% + 200 = 200.30

*Edited: 17 May 2007, 12:31 a.m. after one or more responses were posted*

### **Re: RPN, algebraic, and the % function**

*Message #16 Posted by [Norris](#) on 16 May 2007, 7:08 p.m.,  
 in response to message #15 by Norris*

If you want to add a % function for use with multiplication/division to the 33S, just program it in as follows:

```
[left-shift] PRGM
[left-shift] LBL I
100
/
[right-shift] RTN
[left-shift] PRGM
```

Now simply use XEQ %, instead of %, when you use % with multiplication and division operations. Example: 30 ENTER 50 XEQ % / yields 60. Continue to use the existing % function when you use % with addition and subtraction.

### **Re: RPN, algebraic, and the % function**

*Message #17 Posted by [tropicflite](#) on 16 May 2007, 10:35 p.m.,  
 in response to message #16 by Norris*

First, thanks for you efforts. Your program works a treat, and now lives in my 33S. That said, I was curious about the results of the 2 different % functions you mentioned, so I tried it on 3 different calculators, which yielded some interesting (and varying) results.

Calculator 1: LeWorld one-dollar six-banger

200 + 30 % --- returns 260

200 - 30 % --- returns 140

200 \* 30 % --- returns 60

200 / 30 % --- returns 666.66666

Calculator 2: TI-30X IIS (2-line ALG scientific calc)

200 + 30 % --- returns 200.3

200 - 30 % --- returns 199.7

200 \* 30 % --- returns 60

200 / 30 % --- returns 666.66666

Calculator 3: HP-33S (in ALG mode, results exactly as you stated)

200 + 30 % --- returns 60

200 - 30 % --- returns 60

200 \* 30 % --- returns .30

200 / 30 % --- returns .30

*Edited: 16 May 2007, 10:55 p.m.*

## **Re: RPN, algebraic, and the % function**

*Message #18 Posted by [John Smitherman](#) on 16 May 2007, 11:23 p.m.,  
in response to message #17 by tropicflite*

Quote:

Calculator 3: HP-33S (in ALG mode, results exactly as you stated)

200 + 30 % --- returns 60

200 - 30 % --- returns 60

200 \* 30 % --- returns .30

200 / 30 % --- returns .30

Hi tropicflite. I believe that you need to press Enter after pressing the % key in order to complete the operation.

Regards,

John

### **Re: RPN, algebraic, and the % function**

*Message #19 Posted by **Norris** on 17 May 2007, 12:02 a.m.,  
in response to message #18 by John Smitherman*

As stated above, if you add "ENTER" to the 33S operations, you will get the final results of the percentage calculations (which should be 260, 140, 60, 666.67). I omitted this step, because I wanted to emphasize the differences in the intermediate result obtained from the % function alone.

As you have probably figured out, for an equation like:

$X + Y\% =$   
then Y% is defined as  $XY/100$

but for an equation like:

$X / Y\% =$   
then Y% is defined as  $Y/100$  (which is different)

The algebraic calculator "knows" which Y% you want, because it "sees" the preceding operator (unless you feed it an equation without a preceding operator, like  $30\% + 200$ , in which case it may err). The RPN calculator doesn't "see" the preceding operator, and therefore can't make that determination.

### **Re: RPN, algebraic, and the % function**

*Message #20 Posted by **Norris** on 17 May 2007, 12:26 a.m.,  
in response to message #19 by Norris*

I have to say that I was surprised by the results that you got from the TI-30 IIS. The " $200 + 30\% = 200.30$ " is probably not the result that most people would expect. Like the 33S in RPN mode, the TI-30 IIS apparently uses only one of the two %-formulas (but the 33S/RPN uses the  $XY/100$ , while the TI-30 IIS apparently uses  $Y/100$  instead).

I found a TI-30 IIS here in the office and tried it, and got the same result that you did. My old TI-30X Solar, on the other hand, returns the expected result of 260 for this calculation.

### **Re: RPN, algebraic, and the % function**

*Message #21 Posted by **Bill Rice** on 17 May 2007, 8:22 a.m.,  
in response to message #20 by Norris*

Truly "unexpected" is the result on a Casio fx-115MS:  $200 + 30\% = 766.66667$

$30\% + 200 = 230$

This is why I've never trusted that key on anything but a 12c.

## RPN, algebraic, and the % function on TIs

Message #22 Posted by [Norris](#) on 17 May 2007, 11:45 a.m.,  
in response to message #20 by Norris

I would expect that the most common use of the % key is to calculate costs, given discounts or surcharges. For example, what is the total cost of a \$19.95 item if it is 25% off, and if there is 8% sales tax?

You can readily solve this problem with the % key on most cheapo algebraic calculators ( $19.95 - 25\% + 8\% = 16.16$ ). Or you could use an HP RPN calculator, because its % function is designed to work with addition and subtraction.

But you can't solve this problem with some high-end TI calculators, including the "top-of-the-line" TI-89. On the TI-89,  $19.95 - 25\% + 8\%$  ENTER yields 19.78. The % function is designed for use with multiplication/division, not addition/subtraction.

The "top-of-the-line" HPs, like the 48G series or 50G, have both the % and %T functions.

## The % function on Casios

Message #23 Posted by [Norris](#) on 17 May 2007, 1:39 p.m.,  
in response to message #20 by Norris

The % function on some Casios apparently can't be used with addition/subtraction either. On a Casio fx-260 Solar:

$200 + 30\%$  yields 766.66667 (as noted above for the Casio fx-115MS)  
 $200 - 30\%$  yields 566.66667

$19.95 - 25\% + 8\%$  yields -20.2 (after subtracting 25%) and then -152.5 (after adding 8%). I have no clue how it gets these results.

I looked in the Casio manual for this model. It only provides examples for using % with multiplication/division. There is no warning about using % with addition/subtraction.

*Edited: 17 May 2007, 1:46 p.m.*

## Re: The % function on Casios

Message #24 Posted by [Bill \(Smithville, NJ\)](#) on 17 May 2007, 2:31 p.m.,  
in response to message #23 by Norris

Hi Norris,

Check out the Casio FX-260 training guide (PDF):

[Training Guide](#)

It has the following example of how to add a percentage:

Quote:

\_\_\_\_\_

To add a percentage 15% to 1000 (or 1000 increased by 15%)

[1000] [x] [15] [SHIFT] [%] [+]

Result = 1150

---

There's some other Percentage operations included in the guide.

Bill

*Edited: 17 May 2007, 2:59 p.m.*

### **Re: The % function on Casios**

*Message #25 Posted by **Norris** on 17 May 2007, 3:00 p.m.,  
in response to message #24 by Bill (Smithville, NJ)*

OK, that procedure, while clumsy and unintuitive, does work on my fx-260, for both adding and subtracting percentages. For example:

[19.95] [x] [25] [%] [-] [x] [8] [%] [+] yields 16.16

But this procedure is not documented in the [User's Manual](#) that comes with the calculator. I don't think there was any "Training Guide" included.

Apparently the 260 only implements one form of the % function, designed for use with multiplication/division. So to add or subtract %, you have to append the addition or subtraction operator at the end of the equation, after you've calculated the percentage. It's almost like RPN ! (except, of course, for the preceding multiplication operations)

*Edited: 17 May 2007, 5:37 p.m. after one or more responses were posted*

### **Re: The % function on Casios**

*Message #26 Posted by **Bill (Smithville, NJ)** on 17 May 2007, 3:22 p.m.,  
in response to message #25 by Norris*

Hi Norris,

Quote:

---

But this procedure is not documented in the User's Manual that comes with the calculator.

---

Is the User's manual you posted a link to the same that came with the calculator? If so, then check Example 3, at bottom of page 10 and Example 4 at top of Page 11:

EXAMPLE 3: To add 15% onto 2500

[2500] [X] [15] [SHIFT] [%] [+] yields 2875

The Training Guide I found by doing Google Search. I don't have any Casio's, but the Casioeducation site looks interesting. But I think it may need a login to get to the training guide through the normal way on their web site.

Bill

Yup, you're right, I missed it.

**Re: RPN, algebraic, and the % function**

*Message #28 Posted by **Paul Brogger** on 17 May 2007, 4:19 p.m.,  
in response to message #17 by tropicflite*

All of the foregoing just underscores the point that the % "function" is a marketing gimmick, with varying implementations and interpretations.

In the interest of learning "real" math, far better to understand what "percent" means, and to become accustomed to (for example) multiply by 1.3 rather than "<n> + 30 %".

**Re: RPN, algebraic, and the % function**

*Message #29 Posted by **Norris** on 17 May 2007, 6:49 p.m.,  
in response to message #28 by Paul Brogger*

You're right. For example, I never really appreciated the variability in the % function before this tread started, because I never use this key myself.

**Re: Percent of total in RPN mode**

*Message #30 Posted by **Karl Schneider** on 17 May 2007, 12:35 a.m.,  
in response to message #1 by tropicflite*

Quote:

I have a 33s, and I cannot figure out how to find a percent of a total in RPN mode by using the % key.

i.e., 30 is 'what percent' of 50.

The best I can come up with is

30 enter 50 / 100 x

That indeed is the best way to perform the calculation. But really, the mathematically-inclined user is expected to be able to mentally shift the decimal point two places to the right. That's probably why no built-in function was provided on RPN *scientific* models.

However, the *financial* models (e.g., HP-12C, HP-10B, HP-14B, and HP-17B), whether RPN or algebraic, usually include a "%T" (percent of total) function. This function is implemented where possible in a menu, which makes RPN or algebraic mode irrelevant.

**50th Anniversary Display Issue**

Message #1 Posted by [Ron](#) on 15 May 2007, 9:45 a.m.

Over the years, I have come across only one each of the 14B and 32S 50th anniversary models. In both cases, the display is very dark and hard to read, and you can see some of the printing on the back of the LCD. I looked at the pictures here on the museum, and the display looks normal. Has anyone else here seen this? How common is this variant?

**Re: 50th Anniversary Display Issue**

Message #2 Posted by [jacksonconsult](#) on 15 May 2007, 12:49 p.m.,  
in response to message #1 by Ron

Hi Ron,

I have an HP-32S and HP-14B 50th Anniversary and use them regularly. The display is pretty clear, but of course you can adjust the contrast by holding down both the ON key and the + key (display gets darker) or the ON key and the - key (display gets lighter).

Ian J

**Re: 50th Anniversary Display Issue**

Message #3 Posted by [Ron](#) on 15 May 2007, 12:59 p.m.,  
in response to message #2 by jacksonconsult

Hi, Ian. Thanks for the note. I'm aware of the contrast adjustment. On these two units, you have to make it really dark just to differentiate the numbers from the background. The whole display is dark. I've seen lots of bleeding screens, and this doesn't appear to be from bleeding screen either. I would say I'm 99% sure it's a manufacturing or design irregularity... Or a regularity, if there are a lot like this.

**Re: 50th Anniversary Display Issue**

Message #4 Posted by [Walter B](#) on 15 May 2007, 4:25 p.m.,  
in response to message #3 by Ron

Ron, don't get me wrong, but did you check the batteries? It was my immediate idea when reading your post...

**Re: 50th Anniversary Display Issue**

Message #5 Posted by [Ron](#) on 16 May 2007, 9:16 a.m.,  
in response to message #4 by Walter B

Thank you for the suggestion, Walter. It's not a battery issue though. The LEDs are not dim. The whole display is dark, and somewhat transparent. If I ever get my lawn mower fixed, maybe I'll find time to post a picture. I'm really not looking for a fix though, as I'm sure it's a mfg/design

variant. I was just wondering how common it is. So far, it looks like I have the only two in existence. :^) Of course, this means I'll still have to find one of each in the more common configuration.

## **Re: 50th Anniversary Display Issue**

*Message #6 Posted by [Les Wright](#) on 16 May 2007, 5:49 p.m.,  
in response to message #1 by Ron*

The displays on my 50th anniversary 14B and a near-mint 32sii are just fine.

Indeed, the least satisfactory display I have seen on the Pioneers must belong to the nearly-canonized 42S. For this reason, virtually all of my 42S-type work is done under Free42.

"...wireless signals from pupils' handheld calculators to a personal-computer screen ... lets instructors correct and analyze errors in real time. The teacher can understand who's not getting it by assessing which functions students keyed into their calculators..."

This is over-reliance on technology. What's obviously needed, especially in the critical early years, is good old-fashioned 3R teaching. Seems like most of the teachers nowadays are just button-pushers teaching more button-pushing instead of real math skills.

If this is what's being currently taught, how the heck are we as a nation going to compete with India, China, and so on? I fear for the future...

### Off Topic - I fear for the future

Message #4 Posted by [Bill \(Smithville, NJ\)](#) on 15 May 2007, 10:46 a.m.,  
in response to message #3 by Happy HP User

"I fear for the future" has been around for many many years and cuts across all boundries. Just did a quick

search for the phase and came up with:

I fear for the future when it is placed in the hands of the children of today.  
I fear for the future of women in the new Iraq.  
I fear for the future of our country  
I fear for the future of my daughter in the present life  
I fear for the future if we were to withdraw  
I fear for the future of Israel  
I fear for the future of Apple  
I fear for the future of the United Kingdom  
I fear for the future if this is allowed to continue  
I fear for the future of my beloved ThinkPads  
I fear for the future of my company and the whole industry  
I fear for the future generations who are growing up  
I FEAR FOR THE FUTURE OF MY CHILDREN  
I fear for the future of content creators  
I fear for the future of the PC  
I fear for the future of my marriage  
I fear for the future of humanity  
I fear for the future of our kids and our schools  
I fear for the future of the horror genre  
I fear for the future of a watered down specialty  
I fear for the future of the human race  
I fear for the future of the next generation  
I fear for the future of my medical colleagues  
I fear for the future of the Middle East  
I fear for the future of our press corp  
I fear for the future of both our sport and our industry  
I fear for the future of music  
I fear for the future of the Western way of life  
I fear for the future of analysis  
I fear for the future of my sex life.  
I fear for the future of traveling  
I fear for the future of the world  
I fear for the future of old homes  
I fear for the future of academic dentistry  
I fear for the future of this vital tool  
I fear for the future of the Sportsman  
I fear for the future of employment in the city  
I fear for the future in ten or twenty years  
I FEAR FOR the future of environmental history  
I fear for the future of TV  
I fear for the future of books  
I fear for the future of the FOCUS line  
I fear for the future of the internet  
I fear for the future of community theatre  
I fear for the future of this plucky fish  
I fear for the future of the NHS  
I fear for the future of iriver  
I fear for the future well-being of Malaysia  
I fear for the future of our nation's highest court  
I fear for the future of the show I love  
I fear for the future of gaming  
I fear for the future of many of our football clubs  
I fear for the future of film-based photography  
I fear for the future of Irish song writing  
I fear for the future of Scottish winter climbing  
I fear for the future of my ability  
I fear for the future happiness of Grant and Hepburn  
I fear for the future of girls like this  
I fear for the future of a global disarmament agenda  
i fear for the future of boxing  
I fear for the future of the English language  
i fear for the future of MF digital  
I fear for the future of my four-year-old  
I fear for the future as a result  
I fear for the future of the archipelago's natural resources  
I fear for the future they will inherit  
I fear for the future of radio against the monster of television  
I fear for the future of our species  
I fear for the future of ColdFusion  
I fear for the future of naturism  
I fear for the future of the small-scale composting industry  
I fear for the future of the Army  
I fear for the future of science in schools  
I fear for the future of SUSE, and KDE  
I fear for the future of Pan Fish employees in Scotland  
I fear for the future until the next reboot  
I fear for the future of the all-too-easy-to-snap Arachnid legs  
I fear for the future of our health

I fear for the future of that poor debauched squishy cow  
I fear for the future of redheads  
I fear for the future of Banana  
I fear for the future of the band  
I fear for the future of C++  
I fear for the future if this is a sample  
I fear for the future of haiku  
I fear for the future of information exchange  
I fear for the future of personal freedom  
I fear for the future of "normal unhappiness"  
I fear for the future today  
I fear for the future of this opinion  
I fear for the future with the disastrous  
I fear for the future, I really do.

I fear for the future of my collection

Fearing for the future seems fairly common.

Bill

Calculators are not necessary to learning math, and aside from proficiency, have no place in the classroom until well into college. Only a handful of majors require studies beyond entry level calculus, and I know from experience that you don't need a calculator to make it through differential equations.

### eBay - For Sellers

Message #1 Posted by [Ron](#) on 14 May 2007, 7:55 a.m.

If you are an eBay seller, you may want to take note of this. I search daily for a certain calc. On Saturday I did the search, and at least two new auctions came up, but they weren't new. They were several days old. Point being, that the eBay search is missing some of the auctions. I had wondered at some of the low prices I had been seeing in the closed auctions lately, and this helps explain it.

I contacted eBay about the problem, expecting their usual "you don't know what you're doing type of canned answer," but actually got a real response. They said it is an intermittent problem that they are working on. So anyway, consider this if you're about to list something, or if you've recently received a very low final bid for your auctions. I don't know if there is any recourse for this, or not. Maybe you can refuse to make the sale, because of technical difficulties in the eBay system, or whatever. I guess you would have to discuss that with eBay and/or the high bidder.

### Re: eBay - For Sellers

Message #2 Posted by [Howard Owen](#) on 14 May 2007, 11:43 a.m.,  
in response to message #1 by Ron

When I sell, it's in very low volume. I always do a search to be sure I'm showing up. I imagine the first question eBay might ask if I attempted to wiggle out of a sale on the basis you mention would be "how do you know you couldn't be found?" And if the answer was "I tried it and it failed" the next question would be "why didn't you contact us then?"

Regards,  
Howard

### Re: eBay - For Sellers & Buyers

Message #3 Posted by [Dave Shaffer](#) on 14 May 2007, 12:55 p.m.,  
in response to message #1 by Ron

Have you noticed that for "high-value" items (I haven't figured out where that kicks in - seems to be >\$100 at least), eBay no longer gives the bidders ID, but rather just a bidder number (i.e. there will be Bidder #1, Bidder #2, etc.)? There is no way (that I've seen) to relate "Bidder #1" to a real individual (except to Bidder #1 him/herself as well as the seller).

I can understand eBay's logic about protecting bidders' identities to prevent spam and other nefarious happenings, but I think this takes away some of the logic & experience that one might use for bidding. If you know who you are bidding against, and have competed with him/her before (or just watched them in action - Cobubba!), your bidding strategy might well be different.

Seems to me that there could be a unique bidding-only ID for everybody (you could even chose your real ebay ID if you wanted to). That name would always show up when you bid, but would not have any way of being related to an actual person or e-mail address.

Has this affected or bothered anybody here?

### **Re: eBay - For Sellers & Buyers**

*Message #4 Posted by **Forrest Switzer** on 14 May 2007, 9:30 p.m.,  
in response to message #3 by Dave Shaffer*

Dave,

Yes, it bothers me, but I believe the seller may be able to see the bidders names. I cannot tell how they make the choice of when to give the bidders names and when to not give them.

I would like to see who I am bidding against and be able to see where they live, their feedback, etc. I know they give some of that information if you hover over a part of their bid information or if you click on the bidder number. Still I prefer the old way of just showing the bidders.

Also, I think the seller has the option to have a private bid anyway, so this appears to be an eBay attempt to protect bidders even if they did not request it.

Forrest

### **Re: eBay - For Sellers & Buyers**

*Message #5 Posted by **Ron Ross** on 14 May 2007, 11:22 p.m.,  
in response to message #4 by Forrest Switzer*

I also believe it is a sellers option to make the auction private. Shilling then becomes even harder to detect. However, it can still be good thing for the seller as it eliminates the friendship factor. There are certain names on ebay that I recognise and though I may want an item, simply refrain from bidding if I see a forum member or other associate bid.

This is my decision (and therefore shouldn't be construed as bid fixing) and in my little mind helps eliviate the price inflation of the calculator world just a wee bit.

### **Re: eBay - For Sellers & Buyers**

*Message #6 Posted by **Gerson W. Barbosa** on 20 May 2007, 5:49 p.m.,

Good point! At least once this happened to me. About two years ago, I was interested in an HP-35, but I refrained from bidding when I saw the higher bidder was one of the forum members. He eventually got it for a reasonable price, by what I can remember - it's one with back label in Spanish, if I am not wrong. Yet I was willing to pay at least 50% more.

By the way, I used to be gwbarbosa at eBay :-)

Regards,

Gerson.

Wow 2k+!

I'll see you in the CCA (calculator collectors anonymous) 12-step group I guess :) I'll be the person in the back of the room sheepishly admitting to having around 400 about 1/3 of which are HP's.

## Re: A new criterion: Purchased Brand New

Message #40 Posted by [Trent Moseley](#) on 15 May 2007, 10:38 p.m.,  
in response to message #1 by Geir Isene

All nine of my HP's that I own were purchased brand new. This does not include two (also brand-new) that I gave away to people in my family many years ago

Gifted an HP-11C to a dear friend who is now deceased, and an HP-48GX to a grand-nephew, ulterior motive there, I can't stand RPL.

What's left: HP-25C, HP-31E, HP-67, (the card reader works thanks to people in the Forum), HP-12C, (a newbie compared to the rest), HP-15C, HP-16C, HP-42S, HP-32II, and an HP-33s.

Message #42 Posted by [Palmer O. Hanson, Jr.](#) on 16 May 2007, 12:00 a.m.,  
in response to message #40 by Trent Moseley

Of my 35 HP's only three were purchased new -- an HP-11c and two hp33s's where the second hp33s was purchased at a clearance sale at Wal-Mart for twenty dollars.

I got my HP-28S at a garage sale from an owner who was totally disgusted when he lost all his files while fumbling with the battery compartment cover during battery replacement, and to quote his exact words "I just want to get the damn thing out of my sight". Actually, I kind of like the 28s but the battery compartment cover is a piece of garbage.

I got one of my four HP-41's for a dollar at a thrift store where it (and a TI-59 which I also got for a dollar) had been thrown in a bin with the used TV remotes and was being sold at the same price as the

remotes. That tells you just how cloistered we calculator nuts really are.

**Re: How many calculators do you have?**

Message #49 Posted by [Karl Schneider](#) on 23 May 2007, 2:41 a.m.,  
in response to message #1 by Geir Isene

My focus is what I consider the "golden era" of HP calculators -- mature and (mostly) well-engineered and -documented products introduced between 1979-1993. This era includes the the HP-41, the Spice, Voyager and Pioneer series, all Saturn-processor models, all original RPL-based models, and the Champion series.

I do also have a few HP models from outside that period, as well as a few non-HP's -- all but one of which are

"low-end":

Classic (1971-74): 35

Spice (1978-79): 34C (3)

Coconut (1979-83): 41C, 41CV, 41CX

Voyager (1981-82): 10C, 11C (2), 12C (2), 15C, 16C

BASIC computer: 71B (+ Math)

Pioneer (1988-91): 10B, 14B, 17B, 17BII, 20S (2), 21S, 22S, 27S, 32S, 32SII (2), 42S

RPL-based (1988-99): 28C (2), 48G, 49G

Other (ahem) "HP": 33S, 6S

Other makes:

Casio fx-3600P, fx-115MS

Texas Instruments TI-30 (LED), TI-36X, TI-82

Sharp EL-520R

Rockwell 18R

Le World scientific

GRAND TOTAL: 43

## Re: How many calculators do you have?

*Message #50 Posted by [Valentin Albillo](#) on 23 May 2007, 7:03 a.m.,  
in response to message #49 by Karl Schneider*

Hi, Karl:

Nice collection you have, but I've noticed some unexpectedly missing models, IMHO, namely:

HP: HP-25/25C, HP-67, HP-28S

The HP-67 I can understand, as it's a most difficult model to get, but HP-25 and HP-28S are both quite affordable, and both deserve to be collected, owned, used. If you haven't still read my "**Long Live the HP-25!**" on-line PDF article (freely available for download at [my calc web site](#)), please do, so that you can see for yourself why I'm being so enthusiastic about this particular model and why it is such a worthwhile, outstanding calc.

As for the HP-28S, I see you've got two 28C, so it might seem redundant to own one. However, the 28C was so incredibly limited by its ridiculous RAM (relatively much worse than an HP-41C with no RAM modules) that you really couldn't use its many revolutionary capabilities to the fullest, far from it, while you can with the 28S model and its 32 Kb RAM (vs about 1.5 Kb for the 28C).

As you know, I don't like RPL at all, but the 28S is the one and only RPL model in my collection because of its revolutionary nature and because it's obvious that a lot of thought and love were put into its design. But in order to fully realize its potential it absolutely needs RAM, which the 28C simply utterly lacks. Get a 28S, and enjoy dealing with large symbolic expressions, large complex-

valued matrices, and many-term Taylor series expansions, while learning or practicing RPL in a comfy environment to your heart's content, with no annoying "Low RAM!"-type messages constantly appearing and ruining your concentration and ultimately your enjoying this calc.

As for other makes, I'm really surprised that you don't have any BASIC-programmable SHARP handhelds at all, nor any of the really beautiful early alphanumeric fully-algebraic calculators, such as the EL-5100 or EL-5101. I would very heartily suggest that you try and get some of them, namely:

SHARP: PC-1211 (or 1212), PC-1262 (or 1261,1260),  
PC-1360 (or 1350), PC-1403H, PC-1475  
PC-E500S (or E500), PC-1421 (financial!)

Some of these are very easy and inexpensive to get (PC-1350/60, for instance), others are less so (PC-1421), but all of them are revolutionary in some aspect, in ways that HP models of the time weren't, while HPs had of course other high-points that some of these SHARP models lack.

All in all, both makes are highly complementary, and I guess that such a *connoisseur* as yourself would be very pleased to get to know and own some of these SHARPs, you'll probably be amazed at what you've been missing ! :-)

Best regards from V.

### "How many?" and the ones I don't have...

Message #51 Posted by [Karl Schneider](#) on 25 May 2007, 2:19 a.m.,  
in response to message #50 by [Valentin Albillo](#)

Hi, Valentin --

The "how many calculators do you have" thread has been introduced several times within the past four years. For everyone's reading enjoyment, here are several links:

[Dec 2003 \(Archive 14\):](#)

[Oct/Nov 2005 \(Archive 15\):](#)

Within the 2005 thread is a remarkably-similar exchange we had, concerning Sharp Pocket Computer models and the HP-28C/S:

[KS: "Re: HP Collection"](#)

[VA: "Re: HP Collection"](#)

[KS: "Sharp pocket computers \(and other topics\)"](#)

[VA: "Sharp pocket computers \(and other topics\)"](#)

as well as my comments on the HP-25 and HP-67, in response to the comment of another:

[KS: "Woodstocks \\*are\\* golden"](#)

My stance really hasn't changed. I probably ought to get one or two of the fine Sharp models from the 1980's for collection purposes, if not to undertake thorough exploration thereof.

I do also have some capable ROM's and accessories for the HP-41 and HP-71, which could certainly

keep me occupied with challenging projects if I chose to indulge the time. That's probably why I don't actively seek to pursue a "different direction" in hobbyism...

Best regards,

-- KS

Hi, Karl:

Karl posted:

*"The "how many calculators do you have" thread has been introduced several times within the past four years. For everyone's reading enjoyment, here are several links:"*

Thanks for the links. I don't usually store or keep track of past threads so I'm prone to repeat myself from time to time, not remembering that I've already discussed that particular topic with that particular person a number of years ago.

My bad no doubt, but I'm not for frantically searching the archives for each and every topic I want to post something about in order to avoid redundancies so I'll have to live with it.

As for you, next time you notice I'm repeating myself please simply ignore my posts.

Best regards from V.

### **Coburlin shocker!!!**

Message #1 Posted by [Mad Dog ebaycalcnut](#) on 12 May 2007, 2:28 p.m.

I cannot believe Coburlin is willing to pay well over \$100- for a 42s manual and a 48 case!! As best as I can tell, no actual calculator is included.

#### [HP-42S manual and 48 case](#)

While I am pointing out the ad, I have to say it is a little confusing when it says:

Quote:

Considered by many as the best calculator ever made by HP, this is the Classic 42S Engineering and Scientific calculator from Hewlett Packard.

And also calls the non-leatherette 48 case leatherette (and seems to hint that it is for the 42s at that!)

I wonder if Coburlin wins, will Coburlin actually pay that much for the lot?

*Edited: 12 May 2007, 2:30 p.m.*

Message #2 Posted by [Gene](#) on 12 May 2007, 2:34 p.m.,  
in response to message #1 by [Mad Dog ebaycalcnut](#)

My guess is that he will pay, get the case and manual, then go ape.

I'd also guess that what he did was to put in snipe bid thinking it was both calculators when he first saw the listing. Then he never went back to look at it again.

### **Re: Coburlin shocker!!!**

Message #3 Posted by [Mad Dog ebaycalcnut](#) on 12 May 2007, 2:38 p.m.,  
in response to message #2 by [Gene](#)

Geez, maybe someone should tell him with an "Ask Seller A Question" on one of his listings with less than 12 hours to go in the 42s manual auction (which happens to be when Coburlin cannot do a bid retraction!)

The thought of Coburlin going ape over the last 11 hours of an auction might be seen by some as amusing!

*Edited: 12 May 2007, 2:39 p.m.*

**Auction Vampire Spotted!!**

<http://retrocalculator.com/images/coburlinfaratu.jpg>  
**(And He's Not That Smart After All)**

San Jose CA, May 11, 2007: Something creepy is stalking eBay HP calculator enthusiasts. The enigmatic presence, known as "Coburlinfaratu," or just "Coburlin" for short, has never been caught in public. But his trail is littered with the corpses of his victims, many of whom don't know they are dead to this day! All that changed today when the reprehensible rounder with rodential dentition was spotted paying too much for a modicum of mathematical memorabilia, a cache of calculator curios, a tiny token of tasty technology. "What a doofball!" chortled leading eBay calculator financier Mad Dog ebaycalcnut. "He probably thought he was getting two real calculators. Instead, he bought a couple of manuals for \$100.00! Yippee!" "His reign of terror is close to an end," agreed Namir, another august TAS auctioneer. "He sank his fangs into something a little too firm for him to handle, that time. He may think twice before jumping on the next unsuspecting virgin eBay seller with more valuable old calculator stuff than sense!" In spite of suspicious sanguinity on the part of HP handheld helpmeets, it is this reporter's fear that we haven't seen the back of the crack calculator killer quite. Stay tuned to WWN in case the invisible vampire strikes again!

Apologies to everyone involved,  
Howard

So, who are the idiots?

Coburlin, whose automatic bidding software almost committed him to buy something that was, to be fair, listed in the wrong category (and, because of this, he probably could have gotten out of it with Ebay, had he won)...

or those who took joy in the anticipation of him having to pay big bucks for something that was to most people (but not all, obviously) overpriced?

I'm beginning to agree with Valentin. Why does anyone even care about this guy?

**Re: get a life**

*Message #14 Posted by **Namir** on 13 May 2007, 2:27 p.m.,

*Message #17 Posted by **Howard Owen** on 13 May 2007, 6:12 p.m.,  
in response to message #13 by Don Shepherd*

Take a close look at the article on the vampire of eBay. Vampires don't exist, do they? But people love to imagine they do.

Coburlin annoys me, but I don't imagine that he's truly a monster. He's just a small time retailer who has found a scheme (he would probably say "a business method") to make money off certain goods on eBay I doubt he cares very much about the articles themselves. (He does the same sort of thing with old Microsoft software and with HP PCs.) That us what annoys me, and outrages others around here. These "articles" are objects of veneration to many of us. This guy is treating them like crass material goods. Oh, wait, I guess that's right, in a sense. Well, he's certainly driving up the price on those crass material goods by picking up many of the remaining bargains on eBay before any of us.. wait.. that can't be it, can it? 8)

Regards,  
Howard

**Well, he won! Re: Coburlin shocker!!!**

### Hewlett Packard 46 Electronic Calculator-Price Question

Message #1 Posted by [Achilleas](#) on 12 May 2007, 6:21 a.m.

Hello to everyone,

My research institute is sorting out old equipment. They are throwing away a Hewlett Packard 46 Electronic Calculator complete with the suitcase, the calculator cover, the instructions manual and the electricity cable. The calculator works and prints fine.

Would it be possible to give me an idea if there would be people interested to purchase the particular calculator and what the price range might be? I found nothing on ebay. I would appreciate your help since I have hardly any idea on the subject. Thanks a lot for the help in advance,

Achilleas.

### Re: Hewlett Packard 46 Electronic Calculator-Price Question

Message #2 Posted by [Bruce Bergman](#) on 12 May 2007, 10:33 a.m.,  
in response to message #1 by [Achilleas](#)

There HAVE been some of these on eBay. Rare, but they are there. They don't go for much (under \$200, if I remember), but should at least be of interest to the calculator collectors here and there. I do track this particular model on eBay when it appears. If you're looking to get a mint for one, I don't think it will happen. If you want to get a few bucks AND not throw out a good calc, sell it. ;-)

thanks, bruce

### Re: Hewlett Packard 46 Electronic Calculator-Price Question

Message #3 Posted by [Giancarlo \(Italy\)](#) on 12 May 2007, 11:07 a.m.,  
in response to message #1 by [Achilleas](#)

Hi.

You may want to have a look at this:

<http://www.hpmuseum.org/collect.htm#diff>

Hope this helps.

Best regards.

Giancarlo

### Re: Hewlett Packard 46 Electronic Calculator-Price Question

Message #4 Posted by [Achilleas](#) on 12 May 2007, 12:06 p.m.,  
in response to message #1 by [Achilleas](#)

Thank you very much for your replies...

I will try to sell this calculator since on the "Collector's Corner" it says that its "Very Difficult" to get so some collectors might be interested.

Should I try ebay? Do you know any other more specialised markets?

Thank you very much for the help again..

it would have been a pity to throw this calculator in the garbage..

Achilleas.

### Will these batteries damage my HP 50g??

Message #1 Posted by [PhysicsNerd](#) on 11 May 2007, 7:54 p.m.

I want to switch my batteries in my 50g because I don't want them to run out on test day. It is okay if I make a switch like this right? Will my memory be erased?

The batteries that I'm planning on switching over to are different than the ones I have in my calc now. They are TITEN (no mercury added) Super Heavy Duty R03P/SUM-4/1.5V -0% mercury and cadmium batteries. These won't be bad or damage my calculator will it?

The reason I'm asking is that I saw a couple of posts about concerns about batteries. Thanks.

### Re: Will these batteries damage my HP 50g??

Message #2 Posted by [Tim Wessman](#) on 11 May 2007, 9:11 p.m.,  
in response to message #1 by [PhysicsNerd](#)

As long as your backup battery isn't dead (which it shouldn't be since your calc is new) you can replace the batteries with whatever you'd like.

I'd recommend just keeping the 4 batteries in your bag and replacing them during the test if you get a low battery warning. No need to do it sooner.

TW

### Re: Will these batteries damage my HP 50g??

Message #3 Posted by [Eric Smith](#) on 12 May 2007, 1:53 a.m.,  
in response to message #1 by [PhysicsNerd](#)

In devices like calculators, alkaline batteries will generally last longer than "super heavy duty" (zinc-carbon) batteries. But either should work fine.

Rechargeable NiCd or NiMH batteries should work well in the 50g also, however since it is designed for alkalines, you might not get as much low-battery warning.

### Re: Will these batteries damage my HP 50g??

Message #4 Posted by [DaveJ](#) on 12 May 2007, 2:47 a.m.,  
in response to message #1 by [PhysicsNerd](#)

Quote:

now. They are TITEN (no mercury added) Super Heavy Duty R03P/SUM-4/1.5V -0% mercury and cadmium batteries. These won't be bad or damage my calculator will it?

No they won't, they are completely compatible, but there is no reason to use them over better quality Alkalines. "Super heavy duty" batteries are lower capacity and won't last as long as Alkaline.

Dave.

*Message #5 Posted by [Les Wright](#) on 12 May 2007, 6:13 p.m.,  
in response to message #1 by [PhysicsNerd](#)*

This is yet another good juncture for me to sing the praises of rechargeables in HP49 series.

I invested in set of 1000 mAh NiMH Duracells and quick charger for my 49G+. I also routinely and quickly back up my home directory and flag settings to an older SD card--at 128MB too small to be useful in many other devices, but positively huge as far as the 49G+ is concerned.

My 49G+ sat mostly unused for almost a year since I disliked to expense and waste of it gobbling alkaline batteries--certainly unlike anything I had ever encountered with my 48G. But recently, the HP49G+ has got routine and extensive use--so much so that the infamous and unpopular gold paint job (which I actually find strangely appealing) is beginning to wear and pit around the edges of the keyboard. Indeed, in recent weeks it has become my favourite calculator and I am spending more time trying to master UserRPL instead of more familiar RPN keystroke programming.

The old wisdom was that rechargeables were unsuitable for these calculators for fear that they would conk out without adequate warning and you would lose memory. But NiMHs are actually pretty good these days. And, at least in my 49G+, the backup wafer cell seems just fine to preserve memory while the batteries are out the 10 minutes it takes to recharge them.

In an examination setting you may want to carry a backup set of batteries with you in any case, no matter what kind of cells you use.

As for preserving your memory, this is certainly one of the areas where the 49 series tower over their older predecessors. The smaller SD cards have become so inexpensive these days that I think that there is no good reason for any serious user of the 49G+ or 50G not to have one in the calculator at all times. It is so quick to and straightforward to back up the HOME directory and flag settings that I have a little program to do it that I run out of habit several times the calculator is on and almost always just before a finish a session with it. Backing up the calculator state of the HP41 requires a card reader, 11 magnetic cards, a few minutes, adequate batteries, and plenty of concentration lest the cards get mixed up. And you can't even back up the memory of the much-celebrated 15C and 42S.

Les

**HP41 - Guide and tools to develop a new ROM module**

Message #1 Posted by [Jose L. Nieto](#) on 11 May 2007, 9:22 a.m.

Hi,

I have rediscovered my old HP41 just a few weeks ago. It's great all the information available nowadays about this machine. But I'm a little confused ....

I need some information, to choose the best way in developing a new ROM module. I only have a HP41CV and a selfmade clonix module. (Thanks Diego for explanations).

The question is ..... Wich are the best todays tools to develop a ROM module, just using this hardware items and a PC??? I will try to include in the module some MCODE functions and some USER programs. So I guess the process is ... write MCode program, run it in emulator with breakpoints and step by step capabilities. Compile complet 4k ROM, test it in V41 emulator. Burn it in a Clonix module ....

I would like to ask people with more experience in HP41 programming that explains the procedures to follow and the suitable tools.

Another question .... Is there any software to convert ROM files into MOD files.?? (To load a ROM image created with SDK41 in V41 emulator.)

Best regards

**Converters**

Message #2 Posted by [Mike \(Stgt\)](#) on 11 May 2007, 10:21 a.m.,  
in response to message #1 by Jose L. Nieto

Yep, I do have [some converters](#), but only for those experts which still have access to a host running VM/CMS (the best OS I know). Only two of those routines may (and did) run on PCs.

Ciao.....Mike

in response to message #2 by Gene

Please, Gene, explain:

what does mean STO EEX? What function does it bring?

-- Antonio

### Re: HP 12C--- "c" on the bottom right hand side of the display screen

Message #4 Posted by [Gene](#) on 11 May 2007, 2:11 p.m.,

in response to message #3 by Antonio Maschio (Italy)

From page 64 of the HP12c platinum owners manual.

"At your option, the calculations of i, PV, PMT, and FV can be performed with either simple interest or compound interest accruing during the odd period. If the C status indicator in the display is not lit, simple interest is used. To specify compound interest, turn the C indicator on by pressing STO EEX. Pressing STO EEX again turns the C indicator off, and calculations will then be performed using simple interest for the odd period."

Full manual available as a PDF here:

[http://www.educalc.net/ftp/educalc/HP12C\\_OH.zip](http://www.educalc.net/ftp/educalc/HP12C_OH.zip)

Funny, but I can't find the link to the manual on the 25th anniversary 12c web page.

### [O.T.] Sharp Pc-1500

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 11 May 2007, 6:08 a.m.

Hi,

I recently bought a Sharp PC-1500, with an uninstalled 8 KB Ram module. I unscrewed the back cap where 4 AA batteries reside, but I don't know how to open the little cover of the RAM slot.

I dare not unscrew all the seven/eight screws on the back (since I suspect this is the only way), but if I receive some reassuring news, I'll do it (I want my PC to be enhanced, after all). The RAM slot cover has a little hole in which a hinge could go for pressure, but I was not able to open it, and it seems not separated from the rest.

What about it?

-- Antonio

### Re: [O.T.] Sharp Pc-1500

Message #2 Posted by [Klaus](#) on 11 May 2007, 6:57 a.m.,  
in response to message #1 by Antonio Maschio (Italy)

Just pull the lid of the module-slot!

Edit: I found it useful to unscrew and disassemble the unit. If you use rechargeables, you can adjust the contrast that way. And if the speed of the clock is wrong, you can clean and adjust it this way.

*Edited: 11 May 2007, 7:00 a.m.*

### Re: [O.T.] Sharp Pc-1500

Message #4 Posted by [Bill \(Smithville, NJ\)](#) on 12 May 2007, 10:33 p.m.,  
in response to message #3 by Antonio Maschio (Italy)

Hi Antonio,

The PC-1500 is a great computer. Did you also get the four pen color plotter/printer with it? The PC-1500 was my first pocket computer - I think I paid over \$700 for it with the printer/plotter. The hard

part is finding the pens - Last year I bought a set of color pens from a person in Italy on e-bay. They worked great.

Be sure to check out the following site:

[PC-1500](#)

There's a great emulator and also some utilities to convert cassette files to WAV, binary and text files.

Have fun with it.

Bill

HI;

the [v] (cursor-down), auto-edit feature, is context-sensitive, meaning it will activate the best suitable editor according to the object being edited: matrix writer, equation writer, command line... I do not remember if this is actually possible to change, meaning that if you have an algebraic in level one, [v] key will cause the equation writer to be activated.

Hope this answers your question.

Cheers.

Luiz (Brazil)

**Repair broken LCD in 71b**

Message #1 Posted by [PeterP](#) on 10 May 2007, 11:29 p.m.

Hi,

Lucky me was able to find a math-module that was offered together with a 71b. No problem I thought, I get the module and then either have a spare calc or can offer it to a better home.

Unlucky me however got the pain-cramps when the calc arrived. The seller had packed it very densely and tightly. Hence the LCD became part of the 'shock absorbing material' and promptly broke! It now sports a large Rorschach test blob in the middle (with broken glass lines) and a small blob on the left. (It is the LCD glass that is broken, not the cover glass on top...)

Now, here is my question to the wizards here - is there a way to replace the LCD in the 71b? I opened up the good thing (with my newly acquired Torx screwdriver!) but it seems the LCD is put directly in the PCB that also holds the keyboard. So the only thing that seems 'replaceable' is the full upper half of the 71b with keyboard and all.!? Is that correct?

If not, is there a description on how to replace the LCD (I have another 71b which has a fine LCD but otherwise looks like it has been used as a chewing toy for a medium sized dog...)? Or is there someone who can perform such a procedure? Or, last but not least, does someone have a superfluous 'upper halve' with good keyboard and LCD that they'd like to sell/trade?

Thanks so much in advance, in the meantime I'll try to recover from the sight of an otherwise AAA+ 71b with broken LCD...

Cheers

Peter

**Re: Repair broken LCD in 71b**

Message #2 Posted by [Tony Duell](#) on 11 May 2007, 1:36 p.m.,

Unfortunately that's what the official HP service manual for the HP71B says. Component level repair was performed on the lower (memory) PCB, but any fault on the top PCB meant a complete new top case.

In your case (!) I'd probably dismantle the machine with the broken display as carefully as I could -- cut away

the heat stakes removing at little plastic as possible. If you find you can get the PCB out, I'd then do the same to the machine with the mangled case and swap the innards over.

I believe the HP71B service manual is on the Australian Site, BTW

### More on testing calculators and computers

Message #1 Posted by [Palmer O. Hanson, Jr.](#) on 9 May 2007, 11:10 p.m.

In a recent thread Rodger Rosenbaum suggested:

Quote:

Try doing the sin cos tan atan acos asin test all on one command line with starting values of 6,7,8,10,11, and 12 degrees and see if the results are all as good as when starting with 9 degrees.

I responded with the results with my Durabrand 828. I have since completed tests over the same input value range with several other machines as shown in the following table:

| N     | N - f(N)  |           |           |           |           |         |
|-------|-----------|-----------|-----------|-----------|-----------|---------|
|       | Durabrand | TI-30     | HP-41/67  | TI-59     | HP-28     | TI-85   |
| 08 5  | +3.15E-09 | -1.67E-01 | +1.20E-04 | -3.60E-05 | +3.35E-06 | -7.27E- |
| 08 6  | +3.23E-09 | -1.69E-01 | -4.44E-04 | +4.32E-08 | +1.64E-06 | +3.36E- |
| 08 7  | +2.73E-09 | -1.07E-01 | +4.80E-04 | -6.55E-05 | -3.18E-06 | +6.49E- |
| 09 8  | +6.02E-10 | -1.68E-01 | -2.88E-04 | -1.60E-05 | +2.88E-06 | +9.61E- |
| 08 9  | +1.92E-09 | -1.77E-01 | -4.17E-04 | -4.66E-06 | +1.36E-06 | +3.04E- |
| 08 10 | +5.93E-10 | -1.53E-01 | +1.83E-04 | -5.28E-05 | +3.35E-06 | +2.99E- |
| 08 11 | +3.79E-10 | -4.49E-02 | -3.40E-04 | -5.21E-05 | +2.47E-06 | +2.20E- |
| 08 12 | +4.07E-10 | -8.59E-02 | -1.09E-04 | -2.91E-05 | +1.55E-06 | -3.62E- |
| 08 13 | +6.10E-10 | -1.05E-01 | -3.07E-05 | -4.12E-05 | +1.89E-07 | -1.67E- |
| 08 14 | +8.09E-09 | -9.36E-02 | -5.02E-05 | -3.12E-05 | -5.47E-07 | -1.81E- |
| 08 15 | +1.43E-09 | -6.49E-02 | -1.27E-04 | -3.12E-05 | -2.97E-07 | -1.15E- |
| 09 20 | +8.93E-10 | -5.29E-02 | -1.28E-04 | -7.38E-06 | -8.10E-07 | -9.06E- |
| 09 25 | +5.44E-10 | -2.20E-02 | +2.74E-05 | -9.42E-06 | -5.76E-07 | -6.33E- |
| 09 30 | +3.09E-10 | -4.53E-02 | +5.90E-05 | -1.78E-06 | -9.43E-07 | +3.78E- |

where getting the results in tabular form takes more time than getting them. As expected the machines which carried more digits yielded better results. I note that only the TI-59 showed one result (for 6) which was much better than the typical values.

In the same thread Rodger proposed some arithmetic tests of calculators and computers which do not use higher math functions:

Quote:

Here is a test that only checks the calculator's basic arithmetic accuracy. It is based on the observation that if you reciprocate certain integers twice, you don't get the original integer back, and indeed you shouldn't on a finite precision BCD machine.

For example, type  $6 \frac{1}{x} \frac{1}{x}$  and you should see 5.9999999... on any calculator that does rounded arithmetic properly. If you see exactly 6 then the calculator isn't displaying all the digits in the result, or it's a "pleaser", like the HP30 (you should get 6.00000...0002 if it truncates properly).

So, the idea is to program a loop, apply  $1/x$  twice for a range of integers, each time subtracting the result from the original integer that was reciprocated, and summing the absolute values of those small differences. This is another of my "what should we get" tests, because the result is determinate; there is a correct result, depending on how many digits are used, and the rounding mode.

Here's the program:

```
10 N=500 REM NUMBER OF ITERATIONS
20 S=0 REM INITIALIZE RUNNING SUM
30 FOR I = 1 TO N
40 S=S+ABS(I-1/(1/I))
50 NEXT I
60 PRINT S
```

---

Rodger gave a result for the HP-71 and suggested "I'm sure you'll want to try it on your own calculators." I started with my old Radio Shack Model 100 which carries thirteen or fourteen digits depending on whether the value to the left of the decimal point has an odd or even number of digits. The sum was 1.9564E-09 .

Rodger also suggested that

Quote:

---

The square root function is also specified by the IEEE, so line 40 in the program can be modified to:

```
40 S=S+ABS(I-SQRT(I)*SQRT(I))
```

and the program should give a specific result on a compliant machine.

---

I tried that on my Model 100. The sum was 7.9719E-09 . Then, I remembered that there are 22 perfect squares between 1 and 500 which should yield zeros for the value  $(I-SQRT(I)*SQRT(I))$  . I added a couple of lines to the program which would count the occurrences of zeroes. The program reported 84 zeroes instead of the expected 22. I returned line 40 to the original format which tests reciprocals and found that the program reported 300 zeroes.

I tried the reciprocal and square root tests on the HP-41, HP-33s, TI-59, TI-85 and Durabrand 828 with the following results:

|           | Reciprocal Test |        | Square root - square Test |        |
|-----------|-----------------|--------|---------------------------|--------|
|           | Sum             | Zeroes | Sum                       | Zeroes |
| Model 100 | 1.956E-09       | 300    | 7.972E-09                 | 84     |
| HP-41     | 6.134E-06       | 397    | 3.217E-05                 | 206    |
| HP-33s    | 6.803E-08       | 389    | 3.127E-07                 | 204    |

|       |           |     |           |     |
|-------|-----------|-----|-----------|-----|
| TI-59 | 6.894E-09 | 402 | 3.843E-07 | 22  |
| TI-85 | 7.353E-10 | 386 | 5.743E-09 | 142 |
| 828   | 0         | 500 | 0         | 500 |

I don't understand why the TI-59 only gets the expected 22 zeroes. I will try to look harder at how I am doing the Durabrand 828 tests. I remember that back when I was doing square root of two - squared tests on the Casio fx-7000G I had to be careful or adjacent square roots and squares would somehow just cancel each other out.

### Re: More on testing calculators and computers

Message #2 Posted by **DaveJ** on 9 May 2007, 11:31 p.m.,  
in response to message #1 by Palmer O. Hanson, Jr.

My HP 20S gives: 5.99999999999 for 6 7.00000000001 for 7 9.00000000001 for 9 etc

Dave.

### Re: More on testing calculators and computers

Message #3 Posted by **Rodger Rosenbaum** on 10 May 2007, 4:49 p.m.,  
in response to message #1 by Palmer O. Hanson, Jr.

You report in the text that the Model 100 got 7.9719E-09, but in the table you show 7.972E-09. It would be good to report all the digits you get in the test when you do the table.

The results you report for the 1/x test for the HP-41, HP-33S and TI-85 are exactly what should be gotten for 10, 12 and 14 digit BCD calculators.

The results for the SQRT test for 10, 12 and 14 digit machines should be 3.2127E-05, 3.1267E-07 and 3.0483E-09.

I wonder if the discrepancy for the HP-41 SQRT test is simply because you didn't report all the digits.

I have a TI-86, which I would expect to get the same result as a TI-85. I get the same result you do for the 1/x test, but for the SQRT test I get 3.0483E-09 which is the "what should you get" exact expected result. I was pleasantly surprised to find that the TI-86 did so well on this test and the 1/x test. Evidently TI has cleaned up their basic arithmetic.

Perhaps you could double check your result on the TI-85 SQRT test. Here are some of the results I get for different loop repetition counts.

| N   | Result   |
|-----|----------|
| 10  | 3E-13    |
| 20  | 3E-13    |
| 50  | 4.3E-12  |
| 100 | 2.83E-11 |

I don't have an HP-33S, but I ran the SQRT test on the HP-71, a 12 digit Saturn machine, and I got 3.1267E-07.

Here are some results from a 12 digit Saturn machine:

| N | Result |
|---|--------|
|---|--------|

|     |         |
|-----|---------|
| 10  | 7E-11   |
| 20  | 7E-11   |
| 50  | 4.7E-10 |
| 100 | 2.67E-9 |

Perhaps you could also double check your HP-33S results for the SQRT test.

The Model 100 you refer to is the old Radio Shack machine, isn't it? That machine is running Microsoft Basic isn't it? That would mean that it's doing binary arithmetic. I haven't worked out "what we should get" for binary machines, so I can't comment on your results for the 100. :-{

The result for the TI-59 isn't what should be expected for a 13 digit machine. A 13 digit BCD calculator should get 6.204E-07 for the 1/x test, and 3.1777E-08 for the SQRT test. I assume this discrepancy is because the TI-59 didn't do basic arithmetic as well as the later TI calculators.

When I get a bad result in one of these tests that involve a lot of iterations, such as the Savage benchmark with its 2500 iterations, I always wonder where the mistake was made. What I do is to change the number of iterations by half and compare the result with the "correct" result. If there's still an error, then cut the number of iterations in half again. If there's no error this time, then increase the number of iterations to a point halfway to where the last error was made, and so forth until you get to the particular calculation that made the error. This binary search technique is the fastest to zero in on where the error was made. When you get there, then you can examine the individual calculation that made the error in detail and find out what went wrong.

## More on the TI-85

Message #4 Posted by *Palmer O. Hanson, Jr.* on 12 May 2007, 11:44 p.m.,  
in response to message #3 by Rodger Rosenbaum

Rodger:

You wrote:

Quote:

I have a TI-86, which I would expect to get the same result as a TI-85. I get the same result you do for the 1/x test, but for the SQRT test I get 3.0483E-09 which is the "what should you get" exact expected result. I was pleasantly surprised to find that the TI-86 did so well on this test and the 1/x test. Evidently TI has cleaned up their basic arithmetic.

Perhaps you could double check your result on the TI-85 SQRT test. Here are some of the results I get for different loop repetition counts.

| N   | Result   |
|-----|----------|
| 10  | 3E-13    |
| 20  | 3E-13    |
| 50  | 4.3E-12  |
| 100 | 2.83E-11 |

I ran the square root - squared test problem from the keyboard of my TI-85 for integers 1 through 20 with the following results:

|   |        |    |        |
|---|--------|----|--------|
| 1 | 0      | 11 | 0      |
| 2 | 0      | 12 | 0      |
| 3 | -1E-13 | 13 | 0      |
| 4 | 0      | 14 | 0      |
| 5 | 0      | 15 | -1E-12 |
| 6 | -1E-13 | 16 | 0      |
| 7 | +5E-13 | 17 | 0      |
| 8 | +5E-13 | 18 | 0      |

|    |   |    |       |
|----|---|----|-------|
| 9  | 0 | 19 | 1E-12 |
| 10 | 0 | 20 | 0     |

I ran my program which sums absolute values from 1 to 10 and got a sum of 1.2E-12 with six zeroes, and from 1 to 20 and got a sum of 3.2E-12 with 14 zeroes. Those values agree with the data from the keyboard. I conclude that my program is OK and that the previously reported result of 5.7932E-09 for 1 through 500 is probably correct. Thus, the TI-85 does not do as well as the TI-86. This may be associated with the release of the TI-85 in about 1992 and the TI-86 in about 1997. There were ten releases of the ROM for the TI-85. The machine I am using has version 10.0 . .

### **Re: More on the TI-85**

*Message #5 Posted by **GE** on 14 May 2007, 4:19 a.m.,  
in response to message #4 by Palmer O. Hanson, Jr.*

Hello, I don't think the TI85 went through all versions 1.0 to 10.0, there were (I believe) only 2 or 3 versions sold to the public.

I just got a NOS TI86, do you know how to display the ROM version ?

I feel the TI86 is the equivalent of the HP42S for TI : the last wonderful example of engineer craftsmanship. Newer machines, however powerful, had less soul.

\_\_\_\_\_  
I found the information on the ROM versions of the TI-85 at [//www.ticalc.org/basics/calculators/ti-85.html](http://www.ticalc.org/basics/calculators/ti-85.html) where it says that to check the ROM version you press 2nd - MODE - ALPHA - S . I did that and got 10.0. The unit I am using is S/N 48005260. I have an earlier serial number unit in Florida. I will check its version next week.

To check on the ROM versions of the TI-86 go to <http://www.ticalc.org/basics/calculators/ti-86.html> . It shows that there were versions 1.2 through 1.6 . You can check your version with the same sequence as with the TI-85. Before you try this be sure to read the instructions about NOT pressing ENTER in that mode or you will clear memory.

Thank you, I have version 1.6. That machine was purchased new last week ! Serial number is 14226797 I-06981. The hard clear plastic package contained batteries valid until 2005...  
Sorry for off-topicness.

### **Re: More on the TI-85**

*Message #8 Posted by **Rodger Rosenbaum** on 15 May 2007, 11:59 p.m.,  
in response to message #4 by Palmer O. Hanson, Jr.*

Palmer,

I checked the case of  $n=8$  on the TI-86 (version 1.6) in more detail.

When I do  $\text{SQRT}(8)*\text{SQRT}(8)$ , I get 8.0000000000001. When I do  $\text{SQRT}(8)^2$ , I get exactly 8.

What do you get on your TI-85?

### **Re: More on testing calculators and computers**

in response to message #1 by Palmer O. Hanson, Jr.*

You can see what I was getting at when I asked you to do the sin cos tan atan acos asin test with several input arguments. Most of the calculators' results varied over an order of magnitude. So if you were comparing two calculators, one of them might, by accident, happen to give a especially good result, while the other might happen to give an especially bad result.

And, occasionally, as you found with the TI-59, you might get an *\*really\** good result.

These various tests that only use one value are not particularly good for comparing calculators for this reason.

### **Re: More on testing calculators and computers**

*Message #10 Posted by **Palmer O. Hanson, Jr.** on 10 May 2007, 9:36 p.m.,  
in response to message #9 by Rodger Rosenbaum*

Roger:

Thank you for your review of the data I presented.

The difference between the value in the text and in the table is simply due to the fact that I rounded all of the answers back to four significant digits in the table. I have the full values in my notes.

I did manage to do the two tests on a TI-55. The sum for the  $1/x$  test was 3.362E-07. The sum for the square root test was 3.494E-06. I was not able to find the number of zeroes because the TI-55 does not provide any comparison tests and I am just not up to checking the answers for the five hundred input values one by one.

I also did the two tests on my HP-12C and got exactly the same results as with the HP-41.

The only other machine that I have here in North Carolina is an HP28S. I just don't do very well programming in RPL.

I am not sure about the Model 100. My recollection is that I did the Paranoia test with it back in the eighties and it came up as base 10 with guard digits and rounding. My recollection is that the Radio Shack Color Computer was base 2. I will try to verify those recollections.

I agree with your comment about the questionable value of doing tests which use only one value.

Palmer

## What is unique about 39?

Message #11 Posted by **Palmer O. Hanson, Jr.** on 11 May 2007, 10:11 p.m.,  
in response to message #10 by Palmer O. Hanson, Jr.

Rodger:

You wrote:

Quote:

---

The results for the SQRT test for 10, 12 and 14 digit machines should be 3.2127E-05,  
3.1267E-07 and 3.0483E-09.

I wonder if the discrepancy for the HP-41 SQRT test is simply because you didn't report all  
the digits.

---

You are correct. My exact result for both the HP-41 and the HP-12C as 3.2127E-05. There were 206  
zeroes out of the 500 calculations.

When we were doing comparative tests on machines back in the 1980's it was said that some machines  
(I think it was the HP's, but I'm not sure, and the results which follow suggest that the supposition was  
incorrect) had "smarter"  $y^x$  algorithms in the sense that if the exponent was an integer, then the  
machine did repeated multiplications rather than, it was said, taking the logarithm of  $y$ , multiplying by  $x$   
and taking the antilog. The result quoted above was for a program with either the square root multiplied  
by itself or for the square root squared with the  $x^2$  function. When I did the problem with the square  
root raised to the second power using the  $y^x$  function the result was 3.2137E-05 with 205 zeroes. I  
didn't mistype. The thousandths digit is really a three.

I wrote a program which compared the results for each integer calculated using the two methods. When  
the integer was 39 the result with the  $x^2$  method was zero but was 1E-8 with the  $y^x$  method. The  
results were identical for the other 499 integer values. I extended the search for differences. The  
differences I found before I stopped were at 965, 2813, 1902, 3441 and 3446.

If the the HP41 and the HP-12C were using the "smarter"  $y^x$  algorithm then I would have thought that  
there would have been no differences. I haven't identified anything unusual about 39, 965, etc.

The results with the hp-33s were 3.1267E-07 with 204 zeroes for either method of calculating.

I found the reference to the use of the Paranoia program to find that the Model 100 used radix 10. It is  
too long to reproduce here. You can see it by going to Viktor Toth's site and looking at pages 6 and 17  
of TI PPC Notes.

I will look at my TI-85 results next. I will also try to get some TI-82 results but my machine has a  
balky ENTER switch. .

---

What is happening here is the same phenomenon that causes the HP-71 not to get the "expected" result in the Savage benchmark.

To take the case of 39. The  $Y^X$  function takes the natural log of  $Y$ , multiplies it by  $X$  and then takes the EXP of that result. This all takes place with 13 digit arithmetic on the HP41, HP15, etc.

Do this same calculation with exact arithmetic using a PC program like Derive, Maple, Mathematica, or such, so that you can be sure you're getting correct results. If you start with the 10 digit  $\text{SQRT}(39)$ , take the 13 digit LN, multiply by 2, take the 13 digit EXP you should get exactly 38.99999999502. Notice the last 3 digits. Those digits will be dropped when the result is rounded to 10 digits, but they determine which way the rounding will go. If we round 38.99999999502 to 10 digits we get 40.00000000. Why didn't the HP41 get 40.00000000? When the calculation was done exactly, the result was 38.99999999502, but the HP41 must have gotten a 13 digit internal result a little less than 38.99999999500, and therefore it didn't round the result up. If the HP41's internal result was in error by only -3 ULP's, that would account for the error. This is perfectly excusable. It's why the calculator uses 3 more digits internally than are returned to the user. This way the internal errors are thrown away. It's only when the exactly correct 13 digit value is right on the borderline where it will round up or down that this kind of error occurs.

I wrote a Mathematica program to search for all the values resulting from the  $n \text{SQRT } 2 y^x$  sequence where the last 3 digits of the exactly correct 13 digit value are 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, or 505, with  $n$  ranging from 1 to 100. The values are:

| $n$ | Last 3 of 13 digits |
|-----|---------------------|
| 39  | 502                 |
| 155 | 500                 |
| 240 | 502                 |
| 279 | 504                 |
| 394 | 496                 |
| 552 | 502                 |
| 705 | 502                 |
| 965 | 501                 |

Any of these *could* have exhibited the error, but the HP41 often gets it right. But if the error is going to happen, it will be one of these cases where the rounding boundary is very close.

I searched up to  $n=7000$  and found a bunch more possible candidates for the error. The only way to be sure is to test them all on the HP41 to see if the error occurs. The additional ones I found that

make the error are:

4655  
4659  
5414  
6221  
6528  
6982

And, note that the error the HP41 makes isn't always negative; it can be in either direction. For example, the exact 13 digit result for  $n=3446$  is 3446.000000497 so the HP41's internal result must have had the last 3 digits greater than 500, causing it to round up when it shouldn't have.

This can also happen on a Saturn machine, of course. It will happen when the internal 15 digit result has the last 3 digits very close to 500. I searched for these and got a list of candidates which I then tested on the HP50. The ones that made the error are:

415  
519  
946  
968  
979  
2715  
2718  
2730  
2772  
2798  
3151  
3447  
3475

The HP-33S should make the error with these values of  $n$ .

I can't observe what the HP41 is doing internally, but it's pretty easy to see what the internal long real results are on a Saturn machine. So, to show that my explanation is correct, here is what I found on an HP48G using Jim Donnelly's program to do 15 digit arithmetic. The exact result for  $n=415$  should be 415.000000001495, but the HP48G gets 415.000000001502, and in fact when you execute  $415 \text{ SQRT } 2 \text{ y}^x$  on the keyboard, you get 415.000000002 instead of 415.000000001. The HP48G got 502 for the last 3 digits of its internal result instead of the 495 it should have gotten, so it rounded up when it shouldn't have.

### Some hp33s Results

Message #13 Posted by *Palmer O. Hanson, Jr.* on 13 May 2007, 11:10 p.m.,  
in response to message #12 by Rodger Rosenbaum

Rodger:

You wrote about differences between the square root times the square root and the square root squared using the  $y^x$  function:

Quote:

. This can also happen on a Saturn machine, of course. It will happen when the internal 15 digit result has the last 3 digits very close to 500. I searched for these and got a list of candidates which I then tested on the HP50. The ones that made the error are:

415  
519  
946

968  
979  
2715  
2718  
2730  
2772  
2798  
3151  
3447  
3475

The HP-33S should make the error with these values of n.

---

I tested my HP-33s (CNA 53200443 in case that makes a difference) using the following program:

```
LBL R
1
STO B
LBL S
RCL B
SQRT
2
y^x
RCL B
SQRT
ENTER
x
Is x not equal to y?
STOP
1
STO+ B
GTO S
```

The program stopped at 2798 which is in your list above. It did not stop at any other integer in your list. It also stopped at 5670, 6536 and 6833. I continued to run until the test integer was over 100,000 and did not get any more stops.

Palmer

---

Did it stop at any value of n between 1 and 3500 other than at 2798?

I generated the list of possible candidate values up to 100000 and checked the last few. The HP50 failed on the 3rd from the end, namely 99590, and another picked at random from the list, 87778. I'm sure it will fail for a lot more from the list.

Somehow I was thinking the HP-33S was a Saturn based machine. Apparently not.

\_\_\_\_\_

Did it stop at any value of n between 1 and 3500 other than at 2798?

\_\_\_\_\_

It did not. Just to be sure that I didn't have some sort of curious programming error I checked all of the other numbers on your list between 1 and 3500 from the keyboard. They all yield identical results for the two methods.

I checked a few of the numbers on my second hp33s S/N 52402428 . The results were the same.

**Ideal RPN calculator features...**

Message #1 Posted by [DaveJ](#) on 9 May 2007, 8:53 p.m.

Hi

I'm in the process of designing a (non-programmable) RPN calculator, and I am after some opinions on what people would like to have in their "ideal" RPN calculator. My practical experience with RPN is fairly limited, so I don't know all the permutations of all the HP models and their pro's and con's etc so I'm trying to figure it all out and what seems good and what's not (in my opinion).

Right now I have a 4 level stack with T operating as a constant, STO, RCL, DROP, ROLL UP/DOWN, SWAP etc similar to what is described on the (very useful) RPN pages on the museum site.

But there are things like should I have  $X^Y$  or  $Y^X$ , how to implement base-N modes, is LAST X useful, that kind of stuff.

Would you prefer just one memory using STO/RCL, or multiple constant memories called something like M1, M2, M3?

Are memory operations like M+ and M- useful? and should it operate on STO/RCL register or be separate?

Would a deep stack be better than the basic 4 level type? if so how deep and why?

I will have a two line display, how do you think that display should best be utilised?

At the moment I have the Yreg on the upper line and Xreg on the lower. Should I waste display space showing "X:" and "Y:" at the front, or is that distracting and redundant?

Should the display simply "switch" to displaying Z: and T: or should it "slide" up and down?, or not have that feature at all?

BTW, I'm not looking at emulating any particular HP model, just simply make a good RPN calculator with as many useful features as possible that follows familiar and "accepted" practice.

Any input is appreciated.

Thanks Dave.

Just copy the features of an HP model you like. The HP engineering teams spent LOTS of time on this question for every model ever built. Why waste time doing work that has already been done to perfection?

Besides, trying to reach a consensus here on such a feature set is akin to herding cats :)

Yeah, but it's often fun to watch the cats get herded! ;-)

I guess my goal is to simply pick the best bits from various models, and that's really the sorts of suggestions I'm after. I don't really want nor expect a consensus, just some ideas so I can pick what I think are the best bits and what fits well with my design.

Thanks. Dave.

## Re: Ideal RPN calculator features...

Message #4 Posted by [Howard Owen](#) on 10 May 2007, 1:13 a.m.,  
in response to message #1 by DaveJ

You might get consensus on some things. For instance, I'll bet there's a broad consensus that  $Y^X$  is better than  $X^Y$ , if only for familiarity's sake. HP had the latter function on the first scientific hand-held calculator, the HP-35, but abandoned it in favor of the former in all subsequent calculators. The keystroke for  $2^5$  would be **5 ENTER 2 X<sup>Y</sup>** for the HP-35 way of doing things, and **2 ENTER 5 Y<sup>X</sup>** for the "normal" way. That way just seems more natural to me, with the digit order as keyed similar to the expression on paper.

People here will no doubt be delighted to share their opinions on this topic with you, but there's nothing like experience to help develop your own opinions about what the ideal RPN calculator should be. Most of the machines we discuss here are available in software for Windows and/or Linux, and most of those programs are free. There are also free and for fee RPN calculator programs for Palm and Windows PDAs. Many of them are simulations of HP calculators, but some are original creations, expressing the author's opinions of the ideal RPN machine. I have used NeoCal and MathUPro. I mention them because they both represent different takes on the RPN approach than what you might find on an HP machine. NeoCal is a non-programmable, but customizable software calculator that began life on the Palm. It's very nice looking and usable in my opinion. MathUPro represents an attempt to realize the ideal RPN programmable calculator. The author seems to be an HP fan, to judge from the feature set. He's implemented an unlimited stack, but allows you to put it into a 4 stack simulation mode. It's got very geeky programming feature set, with a unique programming mode that takes some getting used to, but fits the PDA form factor well. In short, it is much geekier and complicated than NeoCal, and represents a good counterpoint to the former's approach.

And don't neglect the RPL models. They represent HP's own answer to the question of what should come after RPN and keystroke programming. They are anathema to some RPN enthusiasts, but I think they are complicated and quirky in a very cool and interesting way. They are important to understand RPN in its full context in any case.

Best of luck with your project!

Regards,  
Howard

**Re: Ideal RPN calculator features...**

*Message #5 Posted by [DaveJ](#) on 10 May 2007, 7:06 a.m.,  
in response to message #4 by Howard Owen*

Thanks Howard. I've downloaded "Free42" by Thomas Okken which looks like a very nice 42S emulator. Anyone know if it's a 100% accurate emulator?, it certainly looks and sounds like it.

Actually, the more I play with it the more I am liking the 42S. It's got a two line display just like mine will have, I like how the complex mode works (don't know if mine will have complex mode though), and I like the numbered STO registers.

Anyone have any issues with the 42S?, the interface, things that could have been done better or more intuitively etc, or a feature other models have that this one lacks?

What are people's opinions on the "X:" and "Y:" register labels being constantly displayed? Are they perhaps a bit redundant for the more experience user?

Thanks Dave.

**Re: Ideal RPN calculator features...**

*Message #6 Posted by [Howard Owen](#) on 10 May 2007, 7:58 a.m.,  
in response to message #5 by DaveJ*

Free42 is a great program that justly deserves the praise showered on it by its users. It is a reimplementaion of the 42S, not a simulator. That is, it doesn't simulate the original hardware and use the original calculator ROMs unlike EMU42 or many of the other PC based calculator programs like Nonpareil, EMU48, V41, EMU41 or EMU71. that means Free42 can sometimes behave differently from the original machine, by design or otherwise. But Thomas Okken works assiduously to minimize those differences, and with the help of users on this forum and elsewhere, has achieved very close compatibility. The recent thread titled "HP42S Mini-Challenge: Optimizing !" will give you an idea of how close. This was a programming challenge by Valentin Albillo that involved the 42S. Participants used real calculators, EMU42, a ROM based simulator, and Free42 on PCs and Palm devices to respond to the challenge. Nowhere do you see issues related to compatibility of Free42 in that thread.

A lot of folks, myself included, think that in many ways the 42S represented the highest level the classic programmable RPN calculator ever reached. It has it's drawbacks, lack of I/O and expandability among them, but the user interface and feature set are very nifty. I also believe that the 42S shouldn't be the last word on the subject. That is, 20 years of Moore's Law and progress in Computer Science and user interface design could have produced interesting developments beyond what the 42S offered. The RPL models are what HP actually went to, but they represent a revolutionary break with keystroke programmable machines like the 42S. It's interesting to speculate what a more evolutionary approach might have produced.

Regarding the labeling of the stack registers, my opinion is that it depends on whether or not you change which registers are displayed. If it's always X and Y in the display, then there is no need to label them. But if you scroll the stack display, then you will have to use labels to avoid confusion.

Regards,  
Howard

*Message #7 Posted by [Jeff O.](#) on 10 May 2007, 1:27 p.m.,  
in response to message #6 by Howard Owen*

I had prepared a response off-line, and when I went to post found that Howard had posted a reply that was essentially identical to mine. (I'll spare Howard the insult of saying he and I must think alike.) The only things I might add would be my oft-repeated desire for a slightly enhanced way to enter, display, and manipulate complex numbers, and a five line display showing X, Y, Z, T and Last X. I also usually suggest a user settable variable stack height from say 3 to 10 levels. However, without programmability, a fixed four level stack is probably fine.

-----

That's what it aims to be. There are differences: the HP-42S uses a decimal representation with a 12-digit mantissa and an exponent range of -499..+499, while Free42 Binary uses IEEE-754 double precision binary floating point, and Free42 Decimal uses a base-10000 representation that is effectively equivalent to 25 digits with an exponent range of -10000..+9999.

Also, the SOLVE and INTEG commands use different algorithms than HP's implementations (HP's algorithms were never published; some technical highlights were explained in HP Journal at various times, but never the kind of detail that would allow one to replicate their algorithms fully).

Finally, the HP-42S has a few known bugs (there is a list in the top-level README file in the Free42 source package). These bugs were not replicated in Free42.

Apart from those differences, Free42 should be 100% compatible with the HP-42S -- if it's not, then that's a bug. :-)

HTH,

- Thomas

*Message #9 Posted by [db \(martinez, ca.\)](#) on 10 May 2007, 2:38 a.m.,  
in response to message #1 by DaveJ*

you can't go wrong by copying the function set of the 45-21-31, ie the 35 with polar/rectangular. a 4 level stack is more useful for what most people do; you can load it. memory is negotiable. if it's non-programmable but has a 4 level stack then one or two registers will be enough but if your chip allows 10.....

*Message #10 Posted by [Sam Levy](#) on 10 May 2007, 12:44 p.m.,  
in response to message #9 by db (martinez, ca.)*

I think it would be nice if the calculator understood that Alpha values with no separators meant multiplication, as  $2\pi FRC=1$  is understood mathematically as the product. I would double or triple the 26

letter memory storage by some added coding like A A, and A. could access added memory space. I suggest that statistical data could be stored in pairs BEFORE curve fitting analysis so that trials could made for the best fits. I would omit trivial conversions like cm-ins and f to C degrees. You might allow the user to store his most used constants with symbols instead of a rom. I would dispense with fractions.

Thanks for the reply!

As a fading Electronic Tech, have you decided on the architecture or keyboard? (You don't have to answer, as it might cause this thread to wildly spin-off). Good Luck!

\_\_\_\_\_

I have indeed decided on both of those things, but I'm keeping mum for the time being :-P All will be revealed in due course though.

Dave.

**Re: Ideal RPN calculator features...**

Message #16 Posted by **Katie Wasserman** on 10 May 2007, 1:22 p.m.,  
in response to message #1 by DaveJ

I agree that the HP engineers have done a great job at figuring out the ideal set of RPN functions to include in a calculator. But after using RPN since 1972 I find two functions missing on most of their older calculators: MOD and OVER. MOD is simply remainder as in: 7 ENTER 3 MOD --> 1 and OVER is the stack manipulation function that copies Y into X pushing the old value of Y into Z, and the old value of X into Y. For example: A ENTER B OVER --> A B A.

-Katie

---

**Re: Ideal RPN calculator features...**

Message #17 Posted by **Gene** on 10 May 2007, 3:22 p.m.,  
in response to message #16 by Katie Wasserman

Of course, OVER is simply a RCL Y on the HP41.

Doesn't help us on our 12c machines, though.

---

### Re: Ideal RPN calculator features...

Message #18 Posted by [Sam Levy](#) on 10 May 2007, 4:01 p.m.,  
in response to message #17 by Gene

A program I find useful is an x to t function, in RPN it is enter, enter, enter RTN. I use it to fill the stack with a constant or clear stack by first clearing X.

### Re: Ideal RPN calculator features...

Message #19 Posted by [Howard Owen](#) on 10 May 2007, 10:40 p.m.,  
in response to message #17 by Gene

Quote:

Of course, OVER is simply a RCL Y on the HP41.

Which also has a MOD function. Ditto for the 42S since it is 41C compatible.

You could argue that RCL Y is less ergonomic than an OVER key would be. It's really three keystrokes: **RCL . Y** (where the last key is the multiplication key on the 41, also labeled "Y", and a soft key on the 42.) But I think Katie must be referring to the majority of the rest of the RPN calculators that HP produced which lack those register ops.

Regards,  
Howard

### Re: Ideal RPN calculator features...

Message #20 Posted by [Allen](#) on 11 May 2007, 12:57 a.m.,  
in response to message #1 by DaveJ

Quote:

My practical experience with RPN is fairly limited.

This is a concern, but not a grave concern. If you are looking for something evolutionary, I would recommend buying a slide rule and learning how to use it. Then apply the lessons you learned to a new calculator design. The four-function calculator, which was meant to replace the old slip stick in many ways diverged from sound mathematical practice. For example, an entire generation now believes that 'math' involves blindly plugging numbers into a bit-box. Only a few disciplines still appreciate the idea of 'significant figures'. (Ask any college grad how many significant figures are in 0.03560.)

Before you get too far along your requirements verification 'V' please read Chapter 2.5 of John A. Ball's book on RPN algorithms- all of the permutations of 4-level stack operation that are available with +,-,CLX, X<>Y and ROLLUP/DOWN and ENTER. I know there are some improvements to be made, such as the OVER command in RPL. But I feel strongly that any stack operation that requires an operand input is an annoyance on a non-programmable calculator- especially one with only a 2 line display.

I am looking for a paper I saw a year or so ago on this forum relating to the problems of modern calculators, or the comparison with slide rules.. something of the sort. I printed it, read it, and put it somewhere for safekeeping. You know what that means: I can't find it now that I need it. Does anyone have the link to that paper? Append to that link the following two books for recommended reading:

1. *Algorithms for RPN calculators* John A. Ball All parts.. especially 2.5 and the monadic/dyadic/Bifid functors

discussion is central to your quest

2. *HP 48 insights* William C. Wickes Sec. 1.1 on the history of RPN and 3rd gen calculators like the 28/48 series. and Sec 2.0 RPN Principals

## Re: Ideal RPN calculator features...

Message #21 Posted by [Karl Schneider](#) on 11 May 2007, 2:36 a.m.,  
in response to message #1 by [DaveJ](#)

Quote:

I'm in the process of designing a (non-programmable) RPN calculator, and I am after some opinions on what people would like to have in their "ideal" RPN calculator.

Any input is appreciated.

Hello, Dave --

If input ye ask, input ye shall receive ...

Quote:

Right now I have a 4 level stack with T operating as a constant, STO, RCL, DROP, ROLL UP/DOWN, SWAP etc

DROP is stack operation for only RPL's (e.g., HP-48) dynamic-depth stacks. It is unneeded for RPN's fixed-depth stack. SWAP is the RPL term for  $x \leftrightarrow y$ .

Classic RPN gets by just fine with the elegant simplicity of " $x \leftrightarrow y$ " and "roll down". "Roll up" is a convenient nicety, useful mainly for programming. The HP-41/42S models add direct access to stack elements and a VIEW command.

Quote:

should I have  $X^Y$  or  $Y^X$ , how to implement base-N modes, is LAST X useful

$x^y$  was offered only on the HP-35, perhaps because it lacked a  $10^x$  function and common logarithms:

$x$  [ENTER] 10  $x^y$  =  $10^x$

$y^x$ , however, is more natural and consistent with subtraction and division.

Most scientific RPN and AOS models starting with the Pioneer series (in 1988) offered integer arithmetic in base-2, base-8, and base-16, while base-10 remained floating-point with conventional BCD math.

LASTx is very useful for error recovery and as a convenient "stack-extender." RPN models lack RPL's UNDO function.

Quote:

Would you prefer just one memory using STO/RCL, or multiple constant memories called something like M1, M2, M3? Are memory operations like M+ and M- useful? and should it operate on STO/RCL register or be separate?

---

If more than one memory is offered, M1, M2, M3 with M+ and M- will make for a busy keyboard. Most models have storage-register arithmetic functions, such as STO+3 and RCL/2, giving extended functionality without additional functions on the keyboard.

Quote:

---

Would a deep stack be better than the basic 4 level type? if so how deep and why?

---

A user-settable fixed stack up to 9 or 19 elements deep (e.g., [STKD] 9 or [STKD] .9), with default of 4, would be useful.

Quote:

---

I will have a two line display, how do you think that display should best be utilised?

At the moment I have the Yreg on the upper line and Xreg on the lower. Should I waste display space showing "X:" and "Y:" at the front, or is that distracting and redundant?

Should the display simply "switch" to displaying Z: and T: or should it "slide" up and down?, or not have that feature at all?

---

The "X:" and "Y:" indicators on the HP-42S were present because the temporary menu-line display in the bottom row necessitated the identification of what was displayed above. Space for the indicators was made available by its fine-grain LCD display.

Up/down scroll arrows would make possible viewing of the stack without modifying it, but is hardly needed with a short stack, roll down, and the VIEW command. The down scroll arrow, however, is used for single-step execution on the HP-32/42 models.

I generally prefer a larger, easier-to-read one-line display on non-graphing models, although the two-line display has some advantages.

## **Re: Ideal RPN calculator features...**

*Message #22 Posted by [Alex L](#) on 11 May 2007, 9:07 a.m.,  
in response to message #1 by [DaveJ](#)*

After seeing a [pair of threads](#) in these fora recently (and being sure there are numerous others), I think the single most important feature is a well-documented, strictly followed set of computation rules. We don't seem to mind odd results from odd calculations if they're expected based on the published specs.

Along with the above, I think high precision is a must. How many sig figs can you squeeze out of your hardware at reasonable speed? Perhaps a user-selectable single/double precision setting.

And it would be especially cool and interesting if along with a SHOW type of function to see all the precision available, the calculator could report the number of digits that should be accurate after a chain calculation. I know nothing about implementing this sort of thing, so I have no idea whether it would be practical.

---

## **Precision: Ideal RPN calculator features...**

Message #23 Posted by [Karl Schneider](#) on 11 May 2007, 11:39 p.m.,  
in response to message #22 by Alex L

Hi, Alex --

Quote:

---

Along with the above, I think high precision is a must. How many sig figs can you squeeze out of your hardware at reasonable speed? Perhaps a user-selectable single/double precision setting.

---

Double-precision calculations are generally not meaningful without double-precision variables. There are exceptions, of course -- namely, to reduce roundoff error in a calculation that is susceptible to it. However, the three "guard digits" of internal extended precision built into HP and other brands of calculators will generally suffice.

The IEEE has established formal definitions for 32-bit (single precision) and 64-bit (double-precision) floating-point binary representations. 80-bit extended-double-precision words are also commonly used with floating-point math in PC software (and exclusively in the HP-30S) to reduce roundoff errors. However, I believe that to add a double-precision type of variable to a handheld calculator would cause undesired complexity and reduced computational speed, both of which are issues of concern: Calculators use low-power and inexpensive microprocessors, usually performing BCD mathematics.

I rather like the approach taken for all HP's based on the Saturn microprocessor, which is to accept input of 12 significant digits, and then use algorithms designed to return answers correct to *all 12 significant digits*.

Earlier HP's, modern low-end calculators, and even some later high-end TI's don't perform to that standard. Calculators of the first two groups offer only 10 digits. In at least one respect, both the 10-digit models and the 12-digit TI-82 from 1993 (a "high-end" TI model) don't always fully utilize available significant digits for a result.

Try  $\sin(3.141592653 \text{ radians})$  or  $\sin(3.14159265358 \text{ radians})$ , as appropriate: You'll typically get an answer with only two significant digits:

5.9E-10 or 9.8E-12 respectively, which may very well be the three internal "guard digits", rounded. However, the string of leading zeroes and the lack of overlap between the input and output make a full-precision result possible. Saturn-based HP's (and their descendants) give 9.79323846264E-12.

Karl,

Thank you for helping me to clarify in my own mind what my true wish is.

I like the 50g's feature of 12-digit precision for decimals, but arbitrary precision for integers.

So that's my real "high-precision" wish - available high precision (say, 30 digits?) for integers.

-Alex

Message #28 Posted by [Gene](#) on 12 May 2007, 12:13 p.m.,  
in response to message #27 by [Hugh Evans](#)

While I would prefer to do neither inside or outside, I do wish to continue pointing out that the only proven thing OpenRPN has produced so far are CAD drawings (nice ones) and different forms of specs.

I believe OpenRPN is in the same position as JYA's abortive attempt to produce the Quonos. Too much capital required, etc, for it to become a reality.

Too many people are too quick to place their hopes into a basket that has no real bottom.

That said, it also reflects upon HP's failure to produce a good, quality, RPN calculator. I'm not stupid enough not to see why people want to believe in projects like OpenRPN.

At present, however, I believe they are like the true believers in UFOs, because the amount of evidence offered as proof is about the same.

Gene

P.S. I'll be glad to eat lots of crow when presented with a working, relatively inexpensive prototype. Really, I'll eat crow and offer public mea culpas. I'll prepare a picture of myself with a caption that says "I should have believed but I believe now". I just think the odds of that happening are so low

as to not worry about it.

### **Re: OpenRPN again?**

*Message #29 Posted by [Hugh Evans](#) on 12 May 2007, 10:09 p.m.,  
in response to message #28 by Gene*

QonoS had massive overhead costs, in large part due to some poor development choices (injection molded prototypes rather than rapid prototyping for example). OpenRPN requires startup costs measured in only tens of thousands of dollars rather than millions.

The big curse of open hardware development is that one has nothing to show for their efforts until a product reaches the marketplace. The most realistic outcome for OpenRPN is convincing a company to license production of an effectively ready-to-go product.

As far as eating crow is concerned, buying two OpenRPN end products will be thanks enough. ;-)

As always, I look forward to proving the naysayers wrong.

-Hugh

The big curse of open hardware development is that one has nothing to show for their efforts until a product reaches the marketplace

\_\_\_\_\_

How about...

- \* a project plan, with realistic and measurable goals?
- \* a website where evidence of progress is given, not just endless forum debates over the size and placement of the ENTER key? (I'm sure an up-to-date website would attract more interest in the project, and recruit more volunteers)
- \* a public source code repository, much like you have at the moment? It's easy to see if the code is being worked on or not.
- \* hardware block diagrams, and later on schematics as the hardware evolves?
- \* photographs of some prototypes? Not just CAD drawings, but something that has actually been built. Heck, a \$30 evaluation board with an LCD saying "hello world" is a step in the right direction.

Denial is more then a river in Egypt.

I couldn't agree more with your comments. The early days of OpenRPN were ill-founded, but gave me a chance to understand end-user expectations. At the moment I'm facing a restart of the project... I couldn't ask for a better opportunity to decentralize management, and if nothing else, design market-ready products with a few full prototypes that can be funded from pre-orders or better yet licensed to a capable company that will accept our specifications.

I don't give a damn about making a buck from OpenRPN. Engineers and other scientific professionals deserve capable, well-made calculators at a reasonable price that aren't 15-20 years old.

The members of this community are more than capable of accomplishing such a goal. Let's just step up and make it happen.

-Hugh

---

That last paragraph has made me curious. Nostalgia, emotions and other wish lists

aside, what is actually wrong with calculators of today? Are they not capable? Are they not well made? (or at least reasonably made?) Are they not affordable?

In what ways do you and the OpenRPN community think you can do better?

Please don't get me wrong, I'm not having a go at you or the OpenRPN community, in fact I think it's great idea, and I may even contribute something myself at some stage. But as an electronics product design engineer I am interested in knowing what the issues are.

Thanks. Dave.

### **Re: OpenRPN again?**

*Message #35 Posted by **Eric Smith** on 19 May 2007, 2:40 p.m.,  
in response to message #34 by DaveJ*

Quote:

Are they not well made?

In terms of physical construction, they are definitely not as well made as traditional HP calculators (though HP had their own screw-ups from time to time, such as the press-fit construction 30-series, and the use of the NiCd battery to limit the charger voltage).

Quote:

Are they not capable?

In terms of functionality, things are less clear. If what you want is a non-scientific traditional RPN calculator, the 12C or 12c Platinum will do. But if you want a traditional RPN scientific, the only one is the 33s, which is reasonably good other than the decimals in the display (still not great even after the improvement) and the wacky keyboard.

There's clearly room for improvement. Competition would help drive that, but the chance of any real competition in RPN calculators coming about seems negligible.

### **Re: OpenRPN again?**

*Message #36 Posted by **Ren** on 14 May 2007, 12:27 p.m.,

### HP 33E Battery Contact Polarity?

Message #1 Posted by [Danny Eskenazi](#) on 9 May 2007, 5:03 p.m.

Hi,

I have an HP 33E but the rechargeable battery pack is long gone. I've heard that one can use standard AA batteries if you wire them in series. Is that correct? If so, which battery contact is the positive contact? I don't want to plug the batteries in backwards and fry it!

Thanks,

-Danny Eskenazi

### Re: Spice Batteries -- Could Alkalines cause "2 Disease"?

Message #2 Posted by [Paul Brogger](#) on 9 May 2007, 5:17 p.m.,  
in response to message #1 by [Danny Eskenazi](#)

You may wish to think that one over.

My experience is admittedly VERY limited, but my HP-31E, in which I've used AA alkaline batteries, has developed the "2 Disease", while my HP-34E with a rebuilt Ni-Cd pack has not.

I've asked here once before whether the slightly higher voltage of the Alkaline batteries might account for the dreaded "2 Disease", but I don't know that anyone ever refuted that suspicion. (I certainly could be mistaken.)

Does anyone else have an opinion on this?

*Edited: 9 May 2007, 5:18 p.m.*

### Re: HP 33E Battery Contact Polarity?

Message #3 Posted by [Les Wright](#) on 9 May 2007, 9:37 p.m.,  
in response to message #1 by [Danny Eskenazi](#)

Looking at the bottom of the calculator with battery cover off and top end of the calc away from you, the bottom left contact is positive. The upper left contact is negative. I tape two NiMH cells together and use an aluminum foil jumper to complete the circuit on the right hand side.

I wouldn't bother with alkalines. The NiMH cells will take a charge within the calculator (takes a while, mind you), and last quite a long time when they are fully charged.

Be careful when inserting and removing such a makeshift pack. The fit is snugger since the positive pole buttons are not recessed and make the batteries a little longer. My 33C has the positive contact broken off, but enough of a stub remains to complete the connection fine. The 34C has contacts intact but I am careful.

Mixing up polarity won't fry the unit but in continuous memory models it will discharge the capacitors and

erase programs. I have done that a couple of times :)

Les

*Message #5 Posted by **Randy** on 9 May 2007, 11:06 p.m.,  
in response to message #4 by Trent Moseley*

Be aware that the 30 series units do not offer any internal reverse polarity protection. A shorted transistor or other damage in the power supply is possible.

**Re: HP 33E Battery Contact Polarity?**

*Message #6 Posted by **Trent Moseley** on 9 May 2007, 11:15 p.m.,  
in response to message #4 by Trent Moseley*

Les,

Another thought. Since the NiMH cells work so well with my 31E, do you think it's ok to use them in my 25C battery pack? I'm now using NiCads.

tm

**Re: HP 33E Battery Contact Polarity?**

*Message #7 Posted by **Randy** on 9 May 2007, 11:22 p.m.,  
in response to message #6 by Trent Moseley*

NiMh cells in Woodstocks is fine so long as you charge them externally in a proper NiMh charger. Very long run times per charge and no danger of frying your 25C are both very good reasons to do it.

I NEVER charge batteries in a good machine. It just isn't worth the risk.

**Re: HP 33E Battery Contact Polarity?**

*Message #8 Posted by **Trent Moseley** on 10 May 2007, 10:27 p.m.,

**9114A woes**

Message #1 Posted by **PeterP** on 9 May 2007, 1:31 a.m.

Hi,

Thanks to Tony's wonderful article (and lots of other goodies I found here in the archives) I mustered the courage to open up my 9114A drive to try to get it to work. I carefully disassembled the drive and cleaned all things out. Now when pressing the eject button an inserted disk comes out very easily (I actually was lucky as I did not have to disassemble everything, grease-lock was not that bad)

However the original problem persists:

When turned on (no disk) both of the LEDs turn on (the one marked power and the one marked fault) and stay on. The little LED underneath the disk flickers a little bit once in a while but no sustained light.

When turned on with disk inserted the behavior is exactly the same. I also hear no movement of the head or anything the like. Erie silence is all I get...

naturally I have the charger plugged in and while I understand that this might not be enough to use the drive (though the postings in the archive diverge on this point at times...) at least I would expect the fault light to go off...

I measured the power coming out of the charger and it is 8.8V (my voltmeter is not very accurate).

So with my limited latin at its wits end I turn faithfully to the group for advice on the next steps. I read posts about how to replace the battery pack yet at this point I'd like to avoid having to try this without knowing that this even has a chance of being the sole culprit. And somehow this does not seem to likely at this point.

Steve mentions in his article in the article section that there is a chance that the HP-IL interface in the drive is faulty/broken. How could this happen and how could I test that the HP-IL in the drive is fine? I do have Extended IO and the Devil for the HP 41 and Data Acq and Data com for the 71 (but I'm greener than spring grass behind my 71b ears!) in case that would help.

Thanks a lot for all you who have listened until here and even more to those who kindly are willing to offer some advice!

Cheers

Peter

**Re: 9114A woes**

Message #2 Posted by **Tony Duell** on 9 May 2007, 6:01 a.m.,  
in response to message #1 by PeterP

Firstly, the battery must be good for the 9114A to pass the self-test. During the self test, the unit spins the disk and moves the head about (which are the operations that take the most power from the battery, of course), so if the battery is bad, it'll not manage to do that. The charger will NOT be enough on its own.

You can get my schematics for the 9114A from the Australian site. I would start by looking at pages 1 and 2 of the controller PCB schematic, which are the PSU section. There are 3 power rails in a 9114A -- Vc, which is 5V all the time the unit is switched on (it powers the RAM chip, etc), +5V, which powers the rest of the logic and which is turned off when the unit goes into powersave mode, and +12V, which is only turned on to the drive power connector when the unit needs to operate the disk drive motors.

Check the output of the battery pack when the unit is turned on and performing the self-test. A convenient way to do this is to connect the -ve side of your meter to the drive chassis (this is connected to the unit's ground rail) and the +ve side to one of the wires on the back of the power switch. You should get 6V here, it should not drop during the test.

Then measure Vc on TP8. Then check 5V on TP10 (this should be present during the self-test). And finally check the +12V line on TP9 (TP11 is the common ground connection for the -ve side of your voltmeter).

If all that checks out, then I think you're going to have to get into the controller board logic circuitry. Do you have a logic probe, logic analyser or oscilloscope?

Message #3 Posted by **PeterP** on 9 May 2007, 11:46 a.m.,  
in response to message #2 by Tony Duell

Tony, Luiz,

Thanks so much. Again. :-)

So the first thing I did is to search for the right replacement battery in the archives. Many people seemed to have used the Powersonic PS-628 with great success. It still can be found [here](#) for 20 USD.

So my next step will be to replace the batter pack and try again. In the meantime I'd love to try study the suggestions from Tony, yet I do not know the Australian site? Can you point me in the right direction, please?

BTW - I was amazed at the level of detail and care in your article about the cleaning of the drive, quite exceptional! I almost failed before I even started due to those deeply recessed torx screws to open the drive, as I have no torx drivers. Turns out I had an exact fitting flat-head (?) screw-driver which worked as well. I read in a post that the 71b need a 6 and the drive is an 8, but there is also a thread which claims it is a 9. Would you happen to know the size Torx needed for the drive?

Thanks again, and I will most definitely keep you all in the know of how your student is doing.

Cheers

Peter

---

I have long been of the opinion that before you change any components -- yes, even batteries -- you should do tests to find out what is wrong. This may not be the way of the modern board-swappers, but all I can say is that my stuff keeps on working..

Before you spend \$20 on a new battery, I really would check the voltage. If you take the top cover off the drive, it's really easy to do. I'd do it without the charger connected, you're more likely to show up a dead battery that way. If the voltage is lower than 6V, or if it drops when the unit tries to do a self-test, then change the battery, sure.

Alas I don't know. My toolkit contains all sizes from TX3 (!) up to TX70. I know I had a tool that would fit it... Sometimes I forget that not everyone has literally hundreds, if not thousands, of tools...

It's the same size as the 2 screws on top of the battery pack. You could take that to a good tool shop and see if they can find the size that fits it.

*Message #5 Posted by **PeterP** on 9 May 2007, 1:55 p.m.,  
in response to message #4 by Tony Duell*

Tony,

Thanks for your fast response.

You are absolutely right. I forgot to mention this in my thread - I did test the output voltage of the battery. if unconnected to the charger it is just a couple of volts at best, it almost appears close to 0 (my voltmeter is not that good, and neither is the operator...). However, with the charger attached and the charger plugged in I get the full 8.8 Volt. So from that I inferred that the battery is dead. Please correct me where I did something wrong (other than not telling you about it, silly me...)

Will follow your advice on the Torx, especially as it needs the long shaft. You can buy a whole set for 10 USD over the internet, but they all have only 50mm shaft and then I'm not too sure about the quality...

last but not least, can you be so kind and point me to the Australian site so that I can get my hands on your schematics?

Thanks so much!!

Cheers

Peter

Please correct me where I did something wrong (other than not telling you about it, silly me...)

---

That pretty much shows your battery is dead. It's fairly easy to replace it, you remove the 2 screws on top of the back, free the cover from the little 'clips' round the edges, and the battery just lifts out. The wires go on with 'faston' spade terminals, as expected the red wire is +ve.

*Message #8 Posted by [PeterP](#) on 10 May 2007, 1:41 p.m.,  
in response to message #7 by Tony Duell*

Thank you Tony and Klaus. I added another link to my HP41 link selection, very nice and very much appreciated!

If and when the batteries arrive and I have made the replacement, I will most definitely report on the outcome.

One question - I have scoured the archive for articles on 9114 and it is true that especially the question about the batterie is coming up with high regularity. As for cleaning, there is Steve's article here.

Tony, I was wondering if it would make sense for me to put together a little primer on the various subjects that can be found in the archives and the answers from the experts (you, Steve, Garth, etc) and create a little 'Review of Questions about the 9114' article that can be added to the article section and you can point to it in the future for easy reference. I must have read at least 7 posts of you talking about the the difference between 9114a and 9114b, 300rpm PC and 600rpm 9114, etc :-). Also, I was wondering what your options are with regards to the article you submitted to Datafile - does that mean it now belongs to them and it can not be posted here? I think the pictures and detailed description make a very nice complement to Steve's article here.

Naturally, I would want to ask you and/or the forum to 'proof read' that summary article before suggesting it to Dave, but I thought it might be useful for others at least as a starting point. What do you think?

Cheers

Peter

---

Sounds like a good idea.

As regards the article in Datafile, I still own the copyright on that (although obviously I've given HPCC the right to reproduce it -- but not the exclusive rights).

Now, I don't have modern things like a graphical display on my PC, or a digital camera. Therefore, that article was submitted to HPCC in bits -- a CD-ROM of pictures produced by the minilab that processed and printed my film (some of those pictures had nothing to do with 9114s at all!), and a text file of captions and which photos to stick in. Bruce Horrocks (HPCC editor) put it all together for me.

I've suggested that he puts a copy on the web somewhere (I would certainly be happy with that), but AFAIK he's not had time to sort it out.

Having had so many problems with cheap DMMs and VOMs over the years, I now only use what are considered to be good quality brands, like AVO and Fluke. Yes, they're expensive, but they're worth it IMHO, if only in terms of the time saved by not having to worry if the readings are sane.

Quote:

---

I don't think Sears will sell you a new operator, though!

---

Alas that's a lot more important than the instrument. The best piece of test gear is a brain, as I've said many times...

**Re: 9114A woes**

*Message #13 Posted by [Dave Shaffer](#) on 11 May 2007, 10:47 p.m.,  
in response to message #12 by Tony Duell*

Tony,

When it counted (i.e. I was getting paid for the job!), I did use a Fluke (paid for by my company). But when I'm paying for it, I tend to go downscale a bit. So far, my Heathkit DVM, along with its Radio Shack and Sears companions have functioned way beyond what I might have expected. I don't use them very hard, but when I need them (perhaps once a week) they seem to perform more than adequately.

The requisite brain, to make sure it is all working OK at the expected levels is, indeed, an important part of the equation, though.

### hp 35 chrome trim question

Message #1 Posted by [db \(martinez, ca.\)](#) on 8 May 2007, 7:51 p.m.

someone wrote with a question about a 35 i am flogging on ebaby. he wanted to know if the chrome trim is worn off & missing or never was there at the top. i know there were different patterns but not what they were. is there someone lurking here i could send a photo to who would know?

### Re: hp 35 chrome trim question

Message #2 Posted by [Randy](#) on 8 May 2007, 7:55 p.m.,  
in response to message #1 by [db \(martinez, ca.\)](#)

I've never seen one without chrome, at least what was left of it...

### Re: hp 35 chrome trim question

Message #3 Posted by [Dan W](#) on 8 May 2007, 10:34 p.m.,  
in response to message #2 by [Randy](#)

All of the 35's should have two rows of chrome trim, one thicker than the other. This is a chrome finish over plastic and wears off especially around the on/off switch.

### Re: hp 35 chrome trim question

Message #4 Posted by [db \(martinez, ca.\)](#) on 9 May 2007, 12:42 a.m.,  
in response to message #3 by [Dan W](#)

Dave has a picture of one with only one row of chrome [here](#) comparing it to the others. I was wondering if there was a no-chrome-on-the-top-row version. Probably not. The previous owner may just have erased it off so it didn't look worn in one spot.

The one i'm offering has no chrome on either of the top rows. The topmost row is not even smooth under magnification like the chromed areas; it's mottled but not so much as the rest of the body.

Thanks for the input Randy and Dan. It's not really a big deal to me but as i said; somebody asked and i thought i'd find out. I told him to read this thread so he will know as much as i do. God help him if that's all he knows.

Besides; it's hard for me to see that area with all that glaring light from the red dot on the on switch blinding me.

just kidding.

*Edited: 9 May 2007, 12:46 a.m.*

### Re: hp 35 chrome trim question

*Message #5 Posted by [Jeff O.](#) on 9 May 2007, 7:42 a.m.,  
in response to message #4 by db (martinez, ca.)*

I presume we are talking about [this auction](#)? Certainly appears to be an HP35 version 4 with the one and only top chrome trim bar either completely worn off or intentionally removed. For more info, see item 4 [here](#), below the **HP-35 Versions and Bugs** heading.

**Re: hp 35 chrome trim question**

*Message #6 Posted by [Dan W](#) on 9 May 2007, 2:20 p.m.,

### Implicit multiplication

Message #1 Posted by [Sam Levy](#) on 8 May 2007, 10:16 a.m.

I wrote 2PiF and my calculator wouldn't work. I had wrongly assumed that would be understood as multiplication. This led me to ask: Why can't this be designed into the calculator? If one alphas has a power sign, it could be interpreted as applying to that term only. Does anyone know if that has been implemented? Sam

### Re: Implicit multiplication

Message #2 Posted by [Dia C. Tran](#) on 8 May 2007, 11:08 a.m.,  
in response to message #1 by Sam Levy

I am not sure of your expression either so I wouldn't expect a calculator can. I guess you meant  $2 * \text{Pi} * F$ ? It could be interpreted as  $2 * \text{Pi} F$  or  $2 * P * i * F$ .

### Re: Implicit multiplication

Message #3 Posted by [Ron Ross](#) on 8 May 2007, 12:33 p.m.,  
in response to message #1 by Sam Levy

Actually, the lower end modern (I could use more descriptive, yet probably vulgar derogatory terms) Hp's and other brands DO such implied multiplication. The higher Hp's look as such a combination as a total descriptive name of a variable (which is way more versatile and powerful, especially if you have a feeble memory as myself!).

The Hp33s and Hp39/40GS series would do as you wish, aside from Pi. That would be P\*I. You get the BAD with the good in your example.

### Re: Implicit multiplication

Message #4 Posted by [bill platt](#) on 8 May 2007, 8:30 p.m.,  
in response to message #3 by Ron Ross

The 33s doesn't do implicit multiplication, right?

I know that the 30s \*does\* do it, but that is hardly such a great advantage considering the other aspects it lacks.

Parsing the implicit multiplication certainly must be possible in the 48 series if you program a front end for such a purpose. For instance does Erable or ALG48 have that sort of feature?

### Re: Implicit multiplication

Message #5 Posted by [Hal Bitton](#) on 8 May 2007, 7:38 p.m.,  
in response to message #1 by Sam Levy

If you are using an RPL machine (48 series, 49 series, or 50g), build your equation directly on the stack using

RPN keystrokes like this: 2 Pi(using the pi key) 3 multiply multiply.  
Simple, clean, powerful, totally unambiguous...that's RPN!

PS...it works for big equations too.  
Best Regards, Hal

### Re: Implicit multiplication

Message #6 Posted by **Palmer O. Hanson, Jr.** on 8 May 2007, 10:45 p.m.,  
in response to message #5 by Hal Bitton

As others in this thread have indicated there can be problems with implicit multiplication if the user doesn't understand the rules; for example, if a machine allowed variable names consisting of more than one character and allowed implied multiplication then it would be hard-pressed to tell the difference between a single variable ABC and implied multiplication of three variables A, B, and C. Therefore, machines which allow ABC as the implied multiplication of A and B and C typically limit variable names to single letters. That does limit the number of available variables. Many of the machines which operate in some version of an Equation Operating System which includes the use of parentheses (Oh HORRORS!) allow implied multiplication as in  $(A + B)(C + D)$ . Some of those machines (the HP-33s is one of them) actually eliminate the multiplication as part of assembling the user input; that is, if the user enters  $(A + B) \times (...)$  the machine doesn't put the multiplication symbol in the display. It really isn't as hard as the typical RPN afficianado makes it out to be.

### Re: Implicit multiplication

Message #7 Posted by **Palmer O. Hanson, Jr.** on 9 May 2007, 8:58 p.m.,  
in response to message #6 by Palmer O. Hanson, Jr.

I wrote:

Actually, my description of the implied multiplication of the algebraic mode of the HP-33s was backwards. If the user keys in the following sequence

$(RCL A + RCL B) (RCL C - RCL D)$  where the sequence assumes there is implied multiplication then the display will actually show  $(A + B) \times (C - D)$  where the machine supplies the multiplication sign.

Mea culpa.

### Re: Implicit multiplication

Message #8 Posted by **Maximilian Hohmann** on 9 May 2007, 1:17 p.m.,  
in response to message #1 by Sam Levy

Hallo!

Quote:

Does anyone know if that has been implemented?

---

The Ti Voyage 200 (or Ti-89) does exactly what you ask here! But you have to enter Pi by using the appropriate key. If you enter 2pif it will interpret this as  $2 * \text{pif}$ , because variable names can have arbitrary length.

Greetings, Max

### [OT] Contacting me

Message #1 Posted by [Valentin Albillo](#) on 8 May 2007, 4:49 a.m.

Hi, all

I've recently noticed that many people that do try to send me a message, either via direct e-mail to my public address or via this MoHP forum message mechanism, frequently forget to include the text string "HP CALCS" in the subject line, as instructed in my web page.

Just in case you didn't know or simply forgot about it, that's the *\*only\** way that your message may have a chance to reach to me, because any message not including "HP CALCS" in the subject will automatically be redirected to the trash bin, sight unseen, without me even noticing that it ever arrived.

If you happened to send me some message and were appalled at my lack of response, rest assured that the only reason I did not reply was that your message didn't have the required "HP CALCS" subject line, as I always reply within a few days at most to any message sent to me (as long as it is an honest, polite request, of course).

Sorry for the off-topic, thanks and

Best regards from V.

### Re: [OT] Contacting Valentin

Message #2 Posted by [Paul Brogger](#) on 9 May 2007, 7:13 p.m.,  
in response to message #1 by Valentin Albillo

So, should I *rather* be appalled that you "blame it on the computer"?

;-)

Let's see if I have this right: You *\*know\** people are sending you messages but *\*you\** don't want to respond because they didn't go to your website to find the secret password?

Now that's appalling ;-)

Question: If I sent you a message via the MoHPC system, how would I know you have a website?

## **Re: [OT] Contacting Valentin**

Message #5 Posted by [Valentin Albillo](#) on 10 May 2007, 4:50 a.m.,  
in response to message #4 by Randy

Hi, Randy:

Randy posted:

*"Let's see if I have this right: You *\*know\** people are sending you messages but *\*you\** don't want to respond because they didn't go to your website to find the secret password?"*

First of all, thanks for your interest in my post. Now, I don't *"\*know\*"*, I just "noticed" by sheer accident.

Second, you've read far too many novels: I don't call it *"secret password"* but "spam filter". My public address is that, public, so it gets tons and tons of spam, about 1000 spam e-mails for each legitimate one or more, most of which are potentially harmful even to just open, if not downright disgusting.

Thus it's not that I *"don't want to respond because they didn't go to your website to find the secret password"*, but else that unless I filter out the spam there's no way I would ever be able to find the legitimate messages sent to me among that many garbage.

The "HP CALCS" subject does just that: any message not including it is considered spam and immediately deleted, any message including it does end up in the Inbox for me to eventually read it.

And, just in case you were thinking or implying that I want to force people to visit my website, nothing could be further from the truth: my website, in its actual status, is rather worthless to visit save for the occasional article which I make available online periodically, and which gets announced here when I upload it. I'm not interested in the least in the visitor's count or whether it's linked or not from other sites. Matter of fact, I think that there is no link to it in the appropriate Links section of this MoHP site, for instance, but whether that's the case or not, I doesn't trouble me in the least.

*"Now that's appalling ;-)"*

You're entitled to your opinion, of course, but I've found no better way to deal with the spam, and just by googling for the pretty obvious "albillo hp calcs" search string will immediately get you to my web page, where the "HP CALCS" subject line theme is explained at the very beginning.

Unfortunately, there's no provision in the MoHP forum posting system to include such a warning, and repeating it here periodically would be unpolite, incredibly narcissistic on my part, and quickly get on everyone's nerves: just imagine if many other people did the same, the forum would get crowded with "How to contact me!" instructions.

*"Question: If I sent you a message via the MoHPC system, how would I know you have a website? "*

If you're a regular, that should be known to you because I frequently include references to its existence when I put online some articles, etc. If you're a newbie, you must assume you don't know everything and a useful strategy is to google to see if that person has a website or a blog or does post in the news.

That failing, and in urgent cases, it's rather common to post a message such as "Mr. XX, I want to contact you!" or something like that, which normally gets read and answered immediately.

Also, please take into consideration that I don't get paid for answering unrequested e-mails and thus I am under no obligation whatsoever to reply to anyone or read each and every mail sent to me, let alone thread among thousands of spam just to find the few legitimate ones. I just do it out of politeness and as a contribution to the HP community, in case I can be of any help to someone or someone wants to discuss some HP- or math-related matter with me. This being the case, I establish the appropriate rules that suit me and that's it.

Anyway, if you can think of a better mechanism, short of posting a front-page add in each and every publication in the world, I'll certainly consider it and will thank you for it.

Best regards from V.

Forum email comment is displayed in the contact form if someone tries to email you and you have a Forum Email Address which isn't Private. It is usually used to tell a human how to fix an obscured email address. For example "Remove SPAM from the email address." Unless you use an obscured email address, you will usually leave this blank.

QUESTION TO DAVE HICKS - Could this be changed so that this Email Comment would appear for both Public AND private email?

Is there some downside to doing this that I'm missing?

Seems like that would solve your problem - at least for anyone using the museum e-mail system.

I'll also send Dave an e-mail direct asking if this could be changed in case he misses my question buried in this message.

Bill

Message #7 Posted by [Valentin Albillo](#) on 10 May 2007, 8:46 a.m.,  
in response to message #6 by Bill (Smithville, NJ)

Hi, Bill:

Thank you very much for taking the trouble, it certainly seems that if the proposal you make could be arranged, that would certainly solve the problem. Including a comment such as:

*"Please include HP CALCS in the subject line to avoid the automatic spam filtering"*

would be clear enough. I don't see a downside to this, really, but Mr. Hicks will surely know better.

And, by the way, I've checked how did I exactly set up this "spam filter", and the rules are slightly more relaxed, namely, as long as "HP CALCS" is included in the Subject and/or in the email's Body, it will reach me. So, for instance:

*Subject: HP CALCS*

or

*Subject: Re your Mean Matrices article (HP CALCS)*

or

*Subject: Re your Mean Matrices article*

*Body: [...] and best regards from Bill (HP CALCS) [...]*

would all pass muster and be delivered to the Inbox.

Thanks again and

Best regards from V.

Message #8 Posted by [GE](#) on 11 May 2007, 6:05 a.m.,

*in response to message #7 by Valentin Albillo*

My experience on a nice mailing list elsewhere is that any message sent to the list has its subject prepended with [XYZ] (XYZ different in real life, would be HPMUSEUM here I guess) before being forwarded to list members.

I can imagine a simple mechanism by which any email sent with the HPMuseum reply system would have this marker added. It would not go really in the way and anyone would have a chance to set a spam filter like yours.

Sold ?

**Re: Sold ! :- ) Perhaps Mr. Hicks would agree ...**

*Message #10 Posted by [Paul Brogger](#) on 10 May 2007, 12:57 p.m.,  
in response to message #3 by Valentin Albillo*

It's actually a snide comment, not in keeping with the generally positive tenor of this forum. I apologize for giving in to one of my base urges.

I would say (and this observation *also* comes from a software developer's standpoint) that you may be putting forth an unfortunately over-complex user interface. Expecting others to remember the particular details required for contact may put you further out of touch than intended.

**Re: [OT] Contacting Valentin**

*Message #11 Posted by [Valentin Albillo](#) on 10 May 2007, 1:54 p.m.,  
in response to message #10 by Paul Brogger*

Hi, Paul:

Paul posted:

*"I would say (and this observation also comes from a software developer's standpoint) that you may be putting forth an unfortunately over-complex user interface. Expecting others to remember the particular details required for contact may put you further out of touch than intended. "*

Thanks for your comment, the present one that is, as I still don't understand the previous "sarcastic" one, it was lost on me.

As for your statement *"Expecting others to remember the particular details required for contact may put you further out of touch than intended"*, I think this is putting the cart before the horse.

In other posts of mine in this very thread I've quite clearly explained the rationale for the required subject (or body, actually) string, which may be liked or not but certainly is in no way arbitrary or irrational, so I won't repeat myself here.

But about the reversed situation, I don't expect anyone to remember anything to contact with

me, nor do I have any special interest in being contacted at all, I'm fully busy right now as it is. The one and only reason I provide a public address is because of a willingness to help HP-calc fans like me if I can, and to provide a way, some way, for them to contact me if they need or want to. I'm under no obligation to do that, nor do I specially want to be 'contacted' because of scarce time, as I've said many times before.

Take for instance this forum. Mr. Hicks gently provides it for us, for free, and does his best to keep it running smoothly and even upgrading it at times. But he's not under any obligation whatsoever to answer us, to fulfill our requests, or even to run this site indefinitely. We are the ones obliged to him, not the other way. He sets the rules and we simply abide by them, and thankfully at that.

Same here. I intend to provide some way to contact me and do my best to reply each mail I get, but I have no obligation to do it. I set my rules (the infamous HP CALCS string) and people wishing a reply from me must abide by them if they want to succeed, and that's the way it is.

Also, I've noticed that despite my best efforts I do not seem to be making many friends here, because it seems funny to me that a well-meant attempt to explain why some emails might not be reaching me and provide some simple instructions to improve my accessibility gets in return a number of criticisms and "snide" comments from people who seem to consider including a simple text an unbearable and abusive requirement on my part, when lots of people in this forum post in a completely anonymous way and are impossible to contact, while on the other hand I'm willingly taking the trouble to read the unsolicited emails sent to me and trying to help if possible or at the very least reply to questions or comments. Funny indeed.

Best regards from V.

Message #12 Posted by [bill platt](#) on 10 May 2007, 7:33 a.m.,  
in response to message #1 by Valentin Albillo

Hi Valentin,

I don't understand what the problem is. Yes, spam is annoying, so create a \*new\* address and use it only for the HPforum registration. That way, when someone logs in and uses the HP forum email mechanism, you'll get a message in an uncorrupted account.

I have 4 email addresses, and I do not get much spam at all. I have had zero spam attributable to the HP forum. Furthermore my most used email address is readable to anyone who logs into google groups. So far, I have had no spam attributable to that either, and I've been on usenet for years.

Really, there are better ways to deal with spam than making this subject line filter. Just start fresh and keep it from going "public" (in other words, protected from crawlers and bots).

kindest regards from

Bill Platt

## Re: [OT] Contacting me

Message #13 Posted by [Valentin Albillo](#) on 10 May 2007, 8:34 a.m.,

Hi, Bill:

Bill posted:

*"Yes, spam is annoying, so create a \*new\* address and use it only for the HPforum registration. That way, when someone logs in and uses the HP forum email mechanism, you'll get a message in an uncorrupted account."*

This is a workable solution, indeed, but the problem with it is that it would be yet another e-mail address to manage. You mention you have 4, I must have on the order of 20+, if not more, each for their own particular use, because there's not only family, work, friends, etc., but apart from math and HP calcs I do have many other hobbies and occupations which made necessary such a measure in the past.

Also, for security reasons, it would have yet another different password to remember, and I would also have to remember checking it periodically, etc. I know that there are ways of managing the passwords and there are ways to forward e-mails from one account to another, etc., but setting it all amounts to further complications for me, and, essentially, having to invest time to set it all up and administer it, and time is the scarcest resource for me.

*"Really, there are better ways to deal with spam than making this subject line filter. Just start fresh and keep it from going "public" (in other words, protected from crawlers and bots)."*

I'm using an image instead of plain text for my public address as featured in my website, using an HP-41C font, so it should be safe from bots and such, but I guess that sooner or later someone uses your e-mail address as plain text in some email-chain, say, or some address lists of theirs, and presto, your address becomes fodder for spammers sooner or later. I'm glad that you've found no such problems but my mileage does vary: no matter what precautions I take, inevitably spam gets its way in and I have to eventually install some filtering mechanism.

Anyway, I'll consider your valuable suggestion and may test it for a while in another more controlled environment. If I find that it does work and I don't have to spend extra time managing it, I may implement that here as well. But for the moment, the "HP CALCS" subject will remain in effect.

Thanks for your interest and sound, well-meant advice and

Best regards from V.

Message #14 Posted by **PeterP** on 10 May 2007, 1:23 p.m.,  
in response to message #13 by Valentin Albillo

Valentin,

I believe that I am the culprit of this whole thread and I thoroughly apologize. I tried to send you an email and you were kind enough to spend the time to post to let me (and others) know how to best reach you.

Personally, I found that effort on your part very kind and your rule no trouble at all and very reasonable. I certainly can sympathize with large numbers of email-accounts and the difficulty in managing them.

Again, I thoroughly appologize for at least contributing substantially to the cause of this public discussion of your very private way of keeping your email-avalnche in check.

Cheers

Peter

**Re: [OT] Contacting me**

*Message #15 Posted by **Valentin Albillo** on 10 May 2007, 2:00 p.m.,  
in response to message #14 by PeterP*

Hi, PeterP

Thank you very much for your kind and supportive words but no need to apologize, believe me, it's not your fault at all.

I think I pretty much know the reasons behind it all, but this is not the place to comment on them.

As for your latest e-mail, it actually did reach me, and the only reason I haven't sent you a reply to your proposal yet is because I was first considering some requirements. Please check your e-mail within a few hours and you'll find my reply there.

Again, thank you very much for your support but much more importantly, for your unfailing enthusiasm.

Best regards from V.

**Re: [OT] Contacting me**

*Message #16 Posted by **Howard Owen** on 11 May 2007, 6:35 p.m.,  
in response to message #1 by Valentin Albillo*

I've kept a single non-work related email address - hbo AT egbok DOT com - since 1995. I find that it helps old friends and acquaintances get in touch with me. I currently pre-filter the mail to classify messages according to various mail lists. I then scan sender and subject for the non-list mail, throwing out the obvious SPAM. This is 95% of the remainder, about 600 messages a day. The list mail and the manually filtered mail is then pulled in to my home email system. There it is all run through SPAM Assassin and archived. This allows me to see most of the non-SPAM mail that is sent directly to me, and not to a list.

All that is a lot of work, of course. I choose to do the work because I don't want to knuckle under to the low-life miscreant SPAM mongering criminals that push their swill of fraud and virus laden mystery meat around the Internet. SPAM is a terrible scourge because it subverts the ideal of open information exchange the Internet was built upon. I want my email to be the broad-spectrum tool for communication it was intended to be. This is a personal choice I make.

But I support your approach to dealing with the SPAM scourge too, Valentin. I don't think my approach is better in an absolute sense, only better for me. You're eloquence in defense of your right to choose what communication you accept or reject is completely convincing.

Regards,  
Howard

## Re: [OT] Contacting me

Message #17 Posted by [Valentin Albillo](#) on 11 May 2007, 9:08 p.m.,  
in response to message #16 by Howard Owen

Hi, Howard:

*"[...] All that is a lot of work, of course."*

Yes, it is, which essentially means time, which in my case is particularly scarce (I'm writing this at 3:05 AM Spanish local time, after a very hard week) and which I'd rather use in replying to HP fans who send legitimate e-mails instead of dealing with spam.

*"SPAM is a terrible scourge because it subverts the ideal of open information exchange the Internet was built upon. "*

Absolutely right. It completely defeats the whole purpose of near real-time, easy, world-wide communications (remember "snail mail" regular letters or telegrams). It ruins a magnificent technological blessing and, IMHO, it should be considered a federal crime, and punished as such. Anyone remembers "[Spamford](#)" [Wallace's outrageous attitude](#) on the subject ? Whether you remember him or never heard of him, try the link and get surprised and astonished at what unbelievable depths that man was eager to go to forcibly get his garbage down everyone's throats. And his de-facto 'heirs' are certainly in the same league if not worse.

*"But I support your approach to dealing with the SPAM scourge too, Valentin. I don't think my approach is better in an absolute sense, only better for me. You're eloquence in defense of your right to choose what communication you accept or reject is completely convincing."*

Thank you very much, your kind support is really much appreciated, and really helps here ! :-)

Best regards from V.

**Graphing functions..**

Message #1 Posted by [PhysicsNerd](#) on 7 May 2007, 10:50 p.m.

Okay, I have a bunch of equation in my STORED Plot-function window Y1-Y11 but I only have 1 equation actually highlighted in present in the Plot-Function window itself. How come when I press draw it draws 3 of the functions, 1 of which is the one in my window and the others that are stored but not present in the window? What do I have to do to get my calc to graph 1 function only? Also, how do you delete the stored functions? Thanks

**Re: Graphing functions..**

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 8 May 2007, 1:45 a.m.,  
in response to message #1 by [PhysicsNerd](#)

I rather seldom use the graphing features of the RPL models, so I'm not, offhand, certain of correct answers to your questions. I suppose that I could do a bit of research and find out easily enough, but on the other hand, you could do that.

Have you tried reading the fine documentation?

Or maybe there's a "training module" about graphing?

Or you could try an advanced search of the comp.sys.hp48 usenet group from [http://groups.google.com/advanced\\_search?](http://groups.google.com/advanced_search?)

If you don't find an answer, then you could try posting a question to the newsgroup. In case you don't already use a newsreader, you should be able to access it from <http://groups.google.com/group/comp.sys.hp48/topics>.

Please be sure to include which model you're talking about with your question.

Regards,  
James

**Re: Graphing functions..**

Message #3 Posted by [Happy HP User](#) on 8 May 2007, 9:49 a.m.,  
in response to message #1 by [PhysicsNerd](#)

There are several ways to do this:

When in Plot - Function, (LeftShift hold F1), just ERASE the functions you don't want plotted. Or, when in Plot SetUp, (LeftShift hold F4), edit the EQ list. From either screen, clear the old plot and redraw with ERASE DRAW.

You can also call up the old HP48 commands. Type 81 MENU (with flag 117 set: -117 SF) and you get the complete HP48 plot menu.

## **Re: Graphing functions..**

*Message #4 Posted by [ECL](#) on 9 May 2007, 9:37 p.m.,  
in response to message #1 by [PhysicsNerd](#)*

I hesitate, at the risk of sounding superior (which I don't intend), to say this:

Spend some time reading whatever literature you have at hand, even consider downloading the manual (from HP's site). The RPL machines are not the most straightforward, yet once you become accustomed to the machinery it will express you forward.

I found that by resisting expressing frustration at every corner and instead just learning (accepting that I wasn't in command), I had a fairly easy time picking the system up.

Have fun:)

### For the best of you in geometry

Message #1 Posted by [Jean-Michel](#) on 7 May 2007, 4:11 p.m.

Hi,

just to see what the best of you can do with their powerful brain and HP's, let me submit to you this little problem. (I apologize first for my poor english writing.)

"A bricklayer is working a the tenth floor af a building, without any lift in order of working at the moment. He is in a corridor, from which he needs to know the with, but he has forgotten his measuring tape in his car, and is too lazy to go to take it by feet... Fortunately, he's noting that his 3 m long ladder and his 2 m long, placed "symetricaly" in the corridor (the bottom of one ladder at one side of the corridor, and the top of this ladder on the opposite wall, and the opposite for the other ladder), are crossing themselves at just 1 m of the floor (the length of his plumbline). He is thinking that it must be enough to calculate the withd of the corridor, but he finds the problem difficult..."

Could someone here help him to find the solution (not graphically, of course...)

(I'm sorry, but I didn't manage to enclose any picture.)

Hope this will entertain you !

Regards from J.-M.

### Re: For the best of you in geometry

Message #2 Posted by [Valentin Albillo](#) on 7 May 2007, 6:19 p.m.,  
in response to message #1 by Jean-Michel

Hi, Jean-Michel:

It's just a simple problem of dealing with similarity relationships among the several triangles that result from drawing it all. It readily leads to a 4th-degree polynomial equation in the general case, and this small HP-71B program I've just written for the occasion does it all in 3 lines: prompt for the necessary data, construct the equation, solve it, and output the labeled result:

```
10 DESTROY ALL @ INPUT "Ladder1,Ladder2,Height=";A,B,C
20 DEF FNE(K)=K^4-2*C*K^3+(A^2-B^2)*K^2-2*C*(A^2-B^2)*K+C^2*(A^2-B^2)
30 K=FNROOT(C,MAX(A,B),FNE(FVAR)) @ W=SQR(B^2-K^2) @ DISP "Width=";W
```

```
>RUN
```

```
Ladder1,Ladder2,Height=3,2,1 [ENTER]
```

```
Width= 1.23118572377
```

Best regards from V.

**Re: For the best of you in geometry**

Message #5 Posted by **Valentin Albillo** on 8 May 2007, 2:45 p.m.,  
in response to message #3 by Jean-Michel

Hi again, Jean-Michel:

It wasn't my intention to spoil your interesting challenge, matter of fact I thought you would receive a number of additional inputs such as, for example, detailing the triangle relationships necessary to form the quartic equation (which is what results after squaring some intermediate expressions to get rid of several square roots), perhaps additionally including graphics, etc. With a lot of visitors owning and being very fond of graphic RPL models, I was sure some screen dumps would appear in this thread.

An interesting extension of your challenge would be the following: notice that with the particular numbers you provide for the lengths of the ladders and the height of their crossing point, namely 3, 2, and 1, the resulting width comes out as an ungainly irrational number. So, it would be interesting to write a program to search for *integer lengths and heights* that do result in *integer widths* as well. Other interesting constraints come to mind but the one searching for all-integer inputs and outputs in the simplest to program and probably the most interesting too.

Perhaps you or other readers might give it a try :-)

Best regards from V.

### **Rebate hassle - HP should be embarrassed!**

Message #1 Posted by [Canucklehead](#) on 7 May 2007, 1:57 p.m.

I tried doing a forum search on this topic, so if I'm repeating something that's already been discussed, my apologies.

Last August, I purchased a 12C Platinum Anniversary edition at a University bookstore here in Toronto. There was a \$10 rebate offered through HP, so I mailed in my receipt with the applicable paperwork and diarized to follow up in 6-8 weeks to ensure the funds arrived.

8 weeks passed, so I signed on to rebatestatus.com. They had a record of my request, and the message says that they're processing it. I check back a week later, same response.

I also emailed rebatestatus.com however every response was a form letter.

This process of checking online and emailing goes on for months, until finally a couple of weeks ago, my request drops off their system (I guess I could have done more to try and reach an actual person, however it is only \$10...I'm not going to invest too much time into this!)

It has now been 9 months and I am still without my rebate. I've also lost any online record of my submission. I can only assume now that I won't be receiving my rebate.

While I'm not losing sleep over \$10, this whole experience has left a bad taste in my mouth. HP should show more concern over their reputation. They should hold any outsourced firm accountable; if they are not meeting the terms of an agreed-upon SLA, then find someone else who will.

I'm not sure whether this was just a Canadian offer or whether it was open to US residents as well. If it's the latter, then I imagine that others out there experienced this. Any ideas?

### **Re: Rebate hassle - HP should be embarrassed!**

Message #2 Posted by [Jeff](#) on 9 May 2007, 9:51 a.m.,  
in response to message #1 by [Canucklehead](#)

Actually, they are referred to as "rebait." It happens a lot. They bait you into buying with a fake rebate and hope that the buyer forgets. They usually do. They make extra sales without having to pay the rebates.

Send an online mail fraud complaint to the U.S. Postal Inspection Service. Also, file a consumer fraud complaint with the state that HP is located in - California.

### **Re: Rebate hassle - HP should be embarrassed!**

Message #3 Posted by [bill platt](#) on 10 May 2007, 10:55 a.m.,  
in response to message #1 by [Canucklehead](#)

I bought two 33s calcs with a rebate.

They paid the 1st one, but not the second even though it was a separate purchase in my wife's name.

### Resetting when changing batteries?

Message #1 Posted by [PhysicsNerd](#) on 6 May 2007, 11:15 p.m.

I've just changed the 4 AAA batteries and somehow everything (the text, everything in MODE) turned to default! How come it resets the memory like this? What do you need to do to avoid this defaulting when changing batteries?

### Re: Resetting when changing batteries?

Message #2 Posted by [Tim Wessman](#) on 7 May 2007, 12:50 a.m.,  
in response to message #1 by [PhysicsNerd](#)

Just so you know, this forum is mainly dedicated to older "collector" models. Sure, most people on here have some newer calcs, but the best place for 50G discussion is probably the newsgroup: comp.sys.hp48 (which can be conveniently accessed here - <http://groups.google.com/group/comp.sys.hp48/topics> ) You will generally receive many more answers there, and can conveniently search thousands of messages.

As to losing your settings, the only way that should happen if you changed the 4AA batts is if you don't have the backup memory battery (the "watch" battery) installed or if it were dead.

TW

### Re: Resetting when changing batteries?

Message #3 Posted by [Les Wright](#) on 8 May 2007, 7:23 p.m.,  
in response to message #1 by [PhysicsNerd](#)

This is no comfort after the fact, but I would suggest investing in a smaller size SD card (they are very cheap these days) and learning how to back up your home directory using ARCHIVE and how to store your flag settings to a variable that can also be backed up. That way, you can restore your lost settings if this happens again.

I have a 49G+ and refresh my NiMH AAAs with a rapid charger. I find that during the max 10 minutes this takes the calculator memory remains unmolested, so I guess my backup wafer battery is still fine. Sounds like yours is not, alas.

Les

Good catch. Obviously, I didn't take the time to finish the sequence :-)

Good thing my answer was of the non-committal type, with generous use of "escape" language, such as, "On first glance.." and "seems about right..".

Now I'm sounding like a politician :-)

Matt

### A simple math puzzle (SPOILER)

Message #7 Posted by **Gerson W. Barbosa** on 6 May 2007, 6:19 p.m.,  
in response to message #6 by Ken Ratkevich

Ken,

Perhaps Richard just didn't want to spoil the fun:

$$(9+9) + (7+2) = 27$$

$$(2+7) + (4+5) = 18$$

$$(1+8) + (3+9) = 21$$

and so on...

Regards,

Gerson.

Hi, Antonio:

Antonio posted:

"Please, explain..."

It's actually extremely simple: the first four forms are just the ASCII representation of the shape of the digits 1,2,3, and 4 with their mirror images prepended.

The next element thus is to be an ASCII representation of the shape of a 5, with its mirror image prepended.

Best regards from V.

Peter

**Re: [OT & NT] - To Valentin: You've got mail :-)**

*Message #16 Posted by [Valentin Albillo](#) on 7 May 2007, 7:14 p.m., in response to message #15 by PeterP*

Hi, PeterP:

Actually, I've got nothing (yet). I've checked the usual accounts but nothing there from you, unless you were telling me that a recently deceased relative has left me 6 million sterling pounds in his will and that I should send my bank account details for the transfer of the funds to be made. If that was the case, sorry but I decline the kind offer, I'm far too modest a person, as everyone

knows, and wouldn't know what to do with that much money, it would spoil my healthy habits for sure.

Now seriously, did you remember to include the string "HP CALCS" in the subject line, as instructed in my web page ? Else, \*anything\* sent to my usual account (via this MoHP form, for example) without including such a text string in the subject is automatically and invisibly redirected to the trash bin, sight unseen.

Thanks for whatever it was and

Best regards from V.

**Re: [OT & NT] - To Valentin: You've got mail :-)**

*Message #17 Posted by **PeterP** on 7 May 2007, 9:27 p.m.,  
in response to message #16 by Valentin Albillo*

my mistake, really sorry. Forgot about the subject line. Mistake corrected.  
Thanks for the reminder!

Cheers

Peter

**Re: A simple math puzzle (SPOILER)**

*Message #18 Posted by **Ken Ratkevich** on 7 May 2007, 4:08 a.m.,  
in response to message #7 by Gerson W. Barbosa*

Oh, I see now!

I got off on the wrong foot since  $99/72 = \text{remainder of } 27$  and  $54/27 = \text{remainder of } 18$ . I lost it after that.

At least the solution was a little bit tricky. I don't need to be that embarrassed.

Ken

**48GX feel vs 50G**

Message #1 Posted by [martin](#) on 6 May 2007, 9:10 a.m.

Hi

I have a 48GX for a couple of years now and want to switch to a 50G. I came accustomed to the quality "feel" (keystroke pressing) of the 48. How does the 50G key pressing feel vs the 48?

Regards

**Re: 48GX feel vs 50G**

Message #2 Posted by [Hal Bitton](#) on 6 May 2007, 10:38 a.m.,  
in response to message #1 by martin

The detents on the 50G aren't quite as firm as on the 48G, but they're not bad (I understand they are a great improvement over early 49 series keys). The thing you'll miss the most is the enter key too small and in the wrong place!! On the up side, the 50G has a fantastic display. It will display textbook format right on the stack, which all but renders the equation writer a moot point (why use the algebric equation writer when you can build an equation right on the stack using RPN keystrokes!).

My call...get a 50G, but keep your 48GX :)

Best regards, Hal

**Re: 48GX feel vs 50G**

Message #3 Posted by [Tim Wessman](#) on 6 May 2007, 10:51 a.m.,  
in response to message #1 by martin

The key travel length is about twice as long. This means it doesn't feel as sharp or defined. 50G is still great though.

TW

### Simple HP 50g questions

Message #1 Posted by [PhysicsNerd](#) on 5 May 2007, 9:57 p.m.

How do you convert decimals to fractions?

Is there anyway to reduce the autopower off time? It's too long.

How do you erase all of the data (all of the previous calculations and notebook stuff)?? I think it is slowing my calculator down.

Thanks!

### Re: Simple HP 50g questions

Message #2 Posted by [Happy HP User](#) on 5 May 2007, 10:08 p.m.,  
in response to message #1 by [PhysicsNerd](#)

>How do you convert decimals to fractions?

->Q or ->QPI

>Is there anyway to reduce the autopower off time? It's too long.

RightShift On turns the machine off.

>How do you erase all of the data (all of the previous calculations and notebook stuff)?? I think it is slowing my calculator down.

RightShift BackArrow to clear stack.

### Re: Simple HP 50g questions

Message #3 Posted by [Tim Wessman](#) on 5 May 2007, 11:36 p.m.,  
in response to message #2 by [Happy HP User](#)

If you'd like to change the auto time-off, store a hexadecimal number in a value named TOFF in your home directory.

#(sec\*8192)d is the number, so for 15 seconds, it would be #122880d (15\*8192). Default time is 5 minutes I think.

TW

### Re: Simple HP 50g questions

Message #4 Posted by [James M. Prange \(Michigan\)](#) on 5 May 2007, 11:37 p.m.,  
in response to message #1 by [PhysicsNerd](#)

First off, be sure to have the *HP 49g+ & 48gII\_Advanced User's Reference Manual*; it's available from [this HP page](#).

Also have a look at the [training modules](#).

Quote:

\_\_\_\_\_

How do you convert decimals to fractions?

\_\_\_\_\_

Of course, for an exact conversion, you could consider the "real" (decimal) number to be the numerator of a fraction with 1 as its denominator, and multiply both the numerator and denominator by whichever is the lowest power of 10 required to make the resulting numerator an integer.

Other than that, for approximate conversions, you could try the `\->Q`, `\->Q\pi`, or `XQ` commands.

Also try searches of <http://www.hpcalc.org/> and <http://groups.google.com/group/comp.sys.hp48/> for programs such as PDQ (or maybe PDQ1 or PDQ2) and DEC2FRAC.

Maybe read the training module entitled *Working with fractions*.

Quote:

\_\_\_\_\_

Is there anyway to reduce the autopower off time? It's too long.

\_\_\_\_\_

Yes. With any 49 series, store a binary integer up to `#FFFFFFFFh` (the largest 32-bit integer) in the reserved variable 'TOFF'. This represents the number of ticks (1 second = 8192 ticks) of inactivity before the calculator automatically turns off, with a minimum of 5 seconds as a "safety net". For example, storing `#5A000h` in TOFF results in a 45-second automatic timed OFF.

For a "never-off" mode, an alternative is to store a program that doesn't include the OFF command in the reserved variable 'STARTOFF', which will be run whenever the automatic timed OFF would occur, whether the default 5 minutes or as set by TOFF. But note that STARTOFF won't be invoked by RightShift OFF, which simply invokes the OFF command itself, unless you assign something else to that keystroke.

Quote:

\_\_\_\_\_

How do you erase all of the data (all of the previous calculations and notebook stuff)?? I think it is slowing my calculator down.

\_\_\_\_\_

?????

Do you mean how to clear the stack? RightShift CLEAR does that. Of course that simply invokes the CLEAR command. Generally, clear the stack either when you're sure that you're finished with a problem, or just before starting a new problem.

If you mean how to purge variables, you can use the PURGE (or for directories, PGDIR) command, or you can use the filer (LeftShift FILES) to purge variables. To purge all variables from the current directory, use the CLVAR command.

To clear memory entirely, press and hold [ON], [A], and [F] all at the same time, then release [F] first, followed by the other two keys, to get a TTRM (Try To Recover Memory?) screen.

Of course, all of this assumes that you have the 49 series in "RPN" mode, not "ALG" mode.

Last but not least, for RPL models, you'd probably do better searching the comp.sys.hp48 usenet group from [http://groups.google.com/advanced\\_search?](http://groups.google.com/advanced_search?), or if you can't find the answer, post your question to the newsgroup.

Regards  
James

**41CV auto off question**

Message #1 Posted by [scott parker](#) on 5 May 2007, 5:40 p.m.

My 41CV is now turning off automatically in 20 seconds since I installed new batteries. Can it be set back to the original 10 minute turn-off?

*Edited: 5 May 2007, 5:46 p.m.*

**Re: 41CV auto off question**

Message #2 Posted by [Diego Diaz](#) on 6 May 2007, 8:17 p.m.,  
in response to message #1 by [scott parker](#)

Hi Scott,

This has nothing to do with the new batteries set nor it's re-settable to the standard 10 min. timeout by any keystroke sequence.

I will assume yours is a Fullnut (square display corners). In these models time constant for Auto-off feature is determined by one mask programmable oscillator inside the display unit.

That oscillator (OC1) signal requires an external capacitor (C2) which is placed (also soldered) in the main board.

The path from the OC1 line in the display to C2 in the main board comes thru display pin-4 (soldered to the keyboard PCB) and then thru "zebra" strip into pin-1 of the main board.

Assuming solder joints are in good shape, and capacitor is not damaged (I see no reasons to suppose the contrary) chances are that your calc is suffering a weak screw-post or damaged post case.

More likely in the bottom left screw. To confirm the last, please check pressing firmly the keyboard frame on the "cross" of "x" "/" "1" & "0" keys as well as on "2" "3" "." "R/S" keys while calc is ON. If your calc doesn't turn OFF in 30 sec. The reason of the malfunction is the referred "weakness".

There are several ways to fix that problem, please see "Articles Forum" Article nr. 2 for details.

Hope this helps.

Diego Díaz.

### Installing 50G downloads - no kit.

Message #1 Posted by [Ron Allen](#) on 5 May 2007, 3:40 p.m.

I have downloaded lots of software, but never for a calculator. I have received a copy of the zip file to install 92, but haven't received a "connectivity kit."

Help on connectivity kit please! Is software part of the download? Does the "KIT" contain more than a USB cable or can I just stop by Staples or Radio Shack, pick up the correct small cable and run software already on the system or boot-strapped from the downloads?

Thanks for your help

Ron

### Re: Installing 50G downloads - no kit.

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 5 May 2007, 5:47 p.m.,  
in response to message #1 by Ron Allen

I take it that you mean "v.92", really revision 2.09 build 92?

Anyway, the "connectivity kit" software should've been included on the CD-ROM that came with the calculator, but there were some reports of problems with that one. Download the latest starting from [HP's site](#). Choose your operating system from that page, although I believe that the software is the same for all supported MS Windows systems. For that matter, it will also take you to the newest official 49g+/50g ROM release.

If you also want the periodic table library, then that, along with the equation library files, can be downloaded from <http://www.hydrinx.com/Download/Hp/4950Libraries/>.

A USB cable should've come with the calculator too. In case you don't have it, it's a standard male A to male 5-pin mini-B cable.

Note that you can update the ROM using an MMC or SD flash memory card instead, assuming that you have one and a reader to use it as a removable media mass storage drive with your PC. Personally, I find this easier than using the USB cable and Conn4x.

Regards,  
James

*Edited: 5 May 2007, 9:02 p.m.*

### Re: Installing 50G downloads - no kit.

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 5 May 2007, 9:14 p.m.,  
in response to message #2 by James M. Prange (Michigan)

PS:

The Xmodem server required for making full use of the Conn4x "connectivity kit" is built-in with all 49 series calculators.

The Conn4x package includes an Xmodem server library that can be installed on the 48G series to make full use of Conn4x.

The 48SX/X doesn't have Xmodem built-in, so I wouldn't expect the Xmodem server library to work with that.

Regards,  
James

### **Teflon or Urethane O-Rings for HP41 card Reader : Where can I find some?**

Message #1 Posted by [Antoine M. Couët](#) on 5 May 2007, 3:35 p.m.

Hello to all !

I need to replace the O-rings of my two HP41 card readers.

I am aware that this subject has been earlier adressed here.

Very recently Massimo Gnerucci from Milan Italy very kindly indicated to me the following links to cover this subject: [ebay HP41 Card Reader Repair Service](#) , [ebay HP41 Drive repair Service](#) , [ebay O-Rings sold by Mark Hoskins](#) , and [Card Reader Repair Short fix Approach by Mark Hoskins](#) .

Still, I think I also read somewhere else - but I am unable to recover this in the Archives here - that there also might exist some Teflon or Urethane O-rings.

Could anyone give me information about such ( possibly existing ) Teflon or Urethane O-rings : qualities ( namely efficiency and usable life ) and price compared to compared to conventional Rubber O-rings ?

Thank you very much in advance.

Antoine M. Couët

### **Re: Teflon or Urethane O-Rings for HP41 card Reader : Where can I find some?**

Message #2 Posted by [Randy](#) on 6 May 2007, 2:06 p.m.,  
in response to message #1 by Antoine M. Couët

Teflon would be the worst choice you could make... since it is friction you want, not slip. Urethane was the original drive surface but you'd be hard pressed to duplicate it and finding the right characteristics in an o-ring would be difficult at best.

IMO, silicone tubing works consistently better due to more surface area and will no doubt survive the test of time far better than o-rings. If it is cheap and easy you want, go with o-rings. If it is a reliable and long-lasting repair you want, take the time to source some 1/4 inch OD silicone tubing.

*Edited: 6 May 2007, 2:10 p.m.*

### **Re: Teflon or Urethane O-Rings for HP41 card Reader : Where can I find some?**

Message #3 Posted by [Antoine M. Couët](#) on 6 May 2007, 8:52 p.m.,  
in response to message #2 by Randy

Quote:

\_\_\_\_\_

If it is a reliable and long-lasting repair you want, take the time to source some 1/4 inch OD silicone tubing.

\_\_\_\_\_

Thank you very much Randy for your reply.

Any idea about where to source OD silicone tubing in the USA ? I quite often come to Chicago O'Hare, where I am currently standing ( I will take off to-nite but will fly back within 10 days ).

Best Regards

Antoine

**Re: Teflon or Urethane O-Rings for HP41 card Reader : Where can I find some?**

*Message #4 Posted by **Richard Ottosen** on 6 May 2007, 9:24 p.m.,  
in response to message #3 by Antoine M. Couëtte*

Antoine:

"OD" means outside diameter.

You can find silicon tubing at hobby shops. It is used as fuel line for model airplanes. I don't know for sure that 1/4 inch outside diameter is a size that is used for fuel line.

Silicon tubing is sometimes used for air supply lines in fish tanks. The tubing I found has a bluish tint. It has a more rubbery feeling than the clear tubing. Again, I don't know if it is going to be the size you need. The tubing I have is about 10% larger than 0.25 inches in diameter. Maybe Randy can tell us if that is close enough to work properly.

-- Richard

**Re: Teflon or Urethane O-Rings for HP41 card Reader : Where can I find some?**

*Message #5 Posted by **Randy** on 7 May 2007, 8:23 p.m.,

**HP25 Programming Failure**

Message #1 Posted by [MikeG](#) on 5 May 2007, 12:27 p.m.

Does anybody know the cause where by none of the functions/keys are stored via program. [n1]

Example in PRGM mode: (Program cleared first)

Key in G 2 (x^2) Display: 01 40

Key in G . (pi) Display: 01 40

Key in x Display: 01 40

All keys and functions work in run mode though.

Thanks

*Edited: 5 May 2007, 12:32 p.m.*

**Re: HP25 Programming Failure**

Message #2 Posted by [Randy](#) on 5 May 2007, 1:54 p.m.,  
in response to message #1 by [MikeG](#)

The problem is usually the result of a fried ram chip (1820-1564). The only source for a replacement is from another 20 series unit (27 excluded). The usual indication of the failure is 13 00 in all program registers that cannot be changed.

There are two other but less likely possibilities.

1) Corrosion on the circuit board, especially under the ram chip. Try standing the board in vinegar up to the battery contacts for an hour or so. Warming the vinegar first accelerates things. Then rinse the board very well and shake dry or blow dry with canned air. Let it dry well in a warm place overnight.

2) [Common Woodstock problems](#)

### Re: Simple HP49G+ question !

Message #3 Posted by [Vieira, L. C. \(Brazil\)](#) on 5 May 2007, 12:17 p.m.,  
in response to message #1 by Gary Fok

Hi;

One of the options is [this one](#), but you can also install the libraries that come with the new ROM update. From [hpcalc.org](#): \_\_\_\_\_

Flash update file to update the HP 49G+'s ROM to version C-2.00, build 50. This is the official 2.00 release. **Adds the equation library**, much better support for the full 80-line screen, support for FAT32-formatted SD cards, a completely rewritten keyboard handler to reduce the number of missed keystrokes, and many bugfixes. This is the official HP installer that only runs on 32-bit Windows.

\_\_\_\_\_

The flash ROM can be downloaded from [here](#).

Hope this helps.

Cheers.

Luzi (Brazil)

### Re: Simple HP49G+ question !

Message #4 Posted by [James M. Prange \(Michigan\)](#) on 5 May 2007, 5:57 p.m.,  
in response to message #3 by Vieira, L. C. (Brazil)

Revision 2.00 is a bit out of date. Please see [my post](#) responding to Ron's questions.

Regarding the libraries, if you use the USB connection to download them to the calculator, then I suggest that you use the filer to move them to port 2 (or port 1); don't leave the originals in the home directory. If you use a flash memory card instead, then you can either copy or move them from the card ("port 3") to another port; it won't hurt to leave the originals on the card.

Regards,  
James

**HP-41C and HP-41CX**

Message #1 Posted by [JeffD](#) on 4 May 2007, 7:30 p.m.

I have purchased and am in the assembly process of a MLDL2000, Thank you Meindert. I have noticed that with the HP-41CX Halfnut and Fullnut I get intermittent results when using the MLDL2000. Ususally the HP-41CX will, when a CAT 2 is done, drop into neverland when it gets to the M2K ROM and then the display goes blank for a while and then returns to finish the CAT 2.Usually the listing in the CAT 2 is gibberish when trying to display the M2K ROM. Now with the HP-41C Halfnut tall key version, everything runs awesome with the MLDL2000 connected. Run a CAT 2 and everything is good. Is there a difference with the way the CX versions connect with modules vs the C? I am confident this is not an MLDL2000 problem because it works on the 41C. Is the "zebra" connector slightly thinner or different from the CX? Is the case tighter on the C vs the CX? Has anyone had a similar problem before? Thanks, Jeff

**Re: HP-41C and HP-41CX**

Message #2 Posted by [Raymond Del Tondo](#) on 4 May 2007, 9:47 p.m.,  
in response to message #1 by [JeffD](#)

Hello,

there are various differences between the C and the CX.

The Catalog function of the CX has been slightly changed, so CAT 2 will display module headers only by default. This way the user can get an overview of the installed ROMs, and only view the details of the wanted ROM.

Please also check the CX manual about this feature.

I didn't check the M2K ROM in particular, but defective Catalog displays are usually an indicator of either a bad FAT, or a special character in a function name.

The M2K ROM intercepts key sequences at specific occasions, but Meindert should be able to tell you more about it;-)

About the zebra connectors:

There were different fashions of these connectors, I know of at least three completely different constructions.

The pink rubber type ones may cause problems over time because they will shrink, and the metall ring type connectors are sensible against corrosion.

Note that the CX halfnut doesn't have these connectors, since the hardware layout is completely different to the non-halfnut calcs.

HTH

Raymond

### HP 41 Printer Battery Pack 82033A replacement

Message #1 Posted by [Rolland Hamm](#) on 4 May 2007, 11:43 a.m.

Would like to know what rechargeable batteries are recommended to replace dead batteries in HP 82033A Rechargeable Battery Pack that is dead and no longer chargeable.

### Re: HP 41 Printer Battery Pack 82033A replacement

Message #2 Posted by [Les Wright](#) on 4 May 2007, 6:12 p.m.,  
in response to message #1 by Rolland Hamm

Ebay seller waterhosko makes his own and even though they aren't aesthetically perfect (he uses styrofoam "casing" to provide bulk and snug fit in place of the original plastic case) the price is good--\$27US plus a modest shipping charge.

Randy at FixThatCalc.com will refurbish your existing dead pack for \$33US, which includes return shipping within the US. You do have to factor in the cost of shipping the dead pack to him, but he does try to use the highest rated NiCads he can find so the extra cost vis-a-vis the waterhosko packs is probably well justified.

I have one of each which I use interchangeably in my HP97 and 82143 printer. Both really seem to work very well.

There are other alternatives out there. I believe some folks have fashioned their own packs with NiMH cells, and even though they take forever to charge within the printer or calculator they do have certain advantages over NiCads--longer life, less environmental nastiness.

Les

### **New TTF available**

Message #1 Posted by [Vieira, L. C. \(Brazil\)](#) on 3 May 2007, 8:50 a.m.

Hi, all;

I was in the need to prepare some material related to the new HP48GII/49G+/50G series and I found no suitable font for the keyboard. So I decided to go ahead and I created this one:

#### [HP50G Keyfont TTF](#)

This [PDF file](#) explains the keyboard mapping and some interesting 'features'... Some guys will like a particular feature, I guess.

I'd appreciate any feedback. I particularly found the characters smaller than I wish it should be, but it somehow helped me a lot when creating some presentations this weekend, as well as some document scratches.

Thank you for taking your time evaluating it. The TTF is free for use, and it is not yet finished.

Best regards.

Luiz (Brazil)

in response to message #1 by Vieira, L. C. (Brazil)*

Muito obrigado, Luiz,

especially for your fine work to do the tricky coloring of keys d:-)

As people say, appetite grows with eating, so may I ask you a question? Shoot me if it's impolite d;-) Is there a way to achieve similar results with your good old KeySet4 to have e.g. black keys with white print? No hurry, just want to know.

Cumprimentos, Walter

*Edited: 3 May 2007, 5:44 p.m.*

### **Re: Thanks a lot!**

*Message #5 Posted by **Vieira, L. C. (Brazil)** on 4 May 2007, 9:31 p.m.,  
in response to message #4 by Walter B*

Olá, Walter;

Não seja por isso. (common answer to 'Muito obrigado', something like 'Not for that')

Yeap, it can be done. But... it would need some different approach, because many characters found in KeySet4 have different sizes, so they'd need masks with different sizes as well.

In fact, I'm planning to rework KeySet4 (July vacances, maybe...). I noticed some glitches in some lower-case characters. Some of them have half-frames thinner than the ones in the whole set. You can see that they need leveling when using bigger characters.

Anyway, I plan to do a whole negative KeySet4, so you'll have all the existing keys with black/coloured backplane.

I'll let you all know.

Thanks again for your support, folks.

Cordialmente (Cordially)

Luiz (Brazil)

### **Re: Thanks a lot!**

*Message #6 Posted by **Walter B** on 5 May 2007, 9:23 a.m.,  
in response to message #5 by Vieira, L. C. (Brazil)*

Olha, Luiz,

estas sao novidades boas! Exciting announcements! So, IF you are going to rework, THEN please take into account the blue and gold print on dark back, too. /\* Comment for our younger members: These colors were/are common on the calcs we love so well. May even be these colors are supporting this love. So it would be nice to be able to reproduce the respective keys when writing some manuals for these instruments (or for similar new stuff perhaps). \*/ CONTINUE dreaming: the opportunity to choose any arbitrary combination of colors within KeySet4 would be great (e.g. black print on colored back, white print on dark back, colored print on dark back). EOD (= End Of Dream).

AFAI understand your new keyset, you can compose exactly such keys there already. Thinking about it, you will need less characters than before in KeySet4 when allowing free color combinations. So you (and we) get more for less. I think I can even convince a controller now ... d;-)

Com os melhores cumprimentos, Walter

*Edited: 5 May 2007, 9:26 a.m.*

**Fixing Classic LED segments?**

Message #1 Posted by [Dan W](#) on 2 May 2007, 9:11 p.m.

Hi all,

I have an HP-45 and a couple of the LEDs have some segments that don't light. What's the likely cause of this? Would I most likely need to replace the whole LED chip or could it be another part that is the problem?

TIA

-- Dan W.

**Re: Fixing Classic LED segments?**

Message #2 Posted by [Thomas Radtke](#) on 3 May 2007, 3:57 a.m.,  
in response to message #1 by Dan W

Fixing might just be a matter of cleaning contacts. Have you had a battery leakage?

**Re: Fixing Classic LED segments?**

Message #3 Posted by [Eric Smith](#) on 3 May 2007, 4:34 a.m.,  
in response to message #1 by Dan W

If a whole digit is out, or if the same segment is out on all digits, it could be a contact problem.

If there's a segment out, but it appears in other digits, and other segments appear in the same digit, that generally indicates that the segment has actually failed.

**Re: Fixing Classic LED segments?**

Message #4 Posted by [Dan W](#) on 3 May 2007, 10:16 a.m.,  
in response to message #3 by Eric Smith

Just a few segments on 2 digits. One 8 looks like a 9. The other has only two horizontal digits working. The 2 digits are on 2 chips, the left and center.

Also, the digit that looks like a 9 has 2 horizontal segments that are always faintly lit.

There's no leakage visible but I haven't opened it up yet. Could have had a cup of coffee spilled in it. ;) But I won't know until I open it.

Owner said it worked fine when put in storage 20 years ago, but I doubt this problem would develop over time when not used.

I'd like to be able to repair this type of problem, isolating it to the LED chips, driver chips, discrete component or some mechanical PCB trace or something.

-- Dan

### **Re: Fixing Classic LED segments?**

*Message #5 Posted by [Paul Brogger](#) on 3 May 2007, 11:36 a.m.,  
in response to message #4 by Dan W*

As alluded to in one of my MoHPC "HP Memories" entries ([#1](#)), I used to give dramatic demonstrations of my HP-21's durability by tossing it to the floor. Eventually, the display started acting up.

As told in the article, I took the calculator apart, and removed the clear plastic lens strip from the display board by melting the heat stakes. Under a dissecting microscope (binocular, ~20 power or so?) I could see that the inertia of repeated impacts had collapsed some of the little jumper wires that connect the chip pads to the PCB traces. With a sharpened and de-burred plastic soda straw, I was able to pick up each of the collapsed wires and fix the display.

I imagine that, if there was any moisture in the display, your connecting wires (or chips?) might have gotten corroded over time in storage. I don't know how you would solder anything so tiny, but there may be a way. Take a close look at the chip/PCB connections and you may find your cause.

[Edited: Oops! I assumed the 45 and 21 had similar displays. Sorry!]

*Edited: 3 May 2007, 5:42 p.m.*

### **Re: Fixing Classic LED segments?**

*Message #6 Posted by [David Smith](#) on 3 May 2007, 4:36 p.m.,  
in response to message #4 by Dan W*

The problem is a faulty LED module (DIP chip). There are three matched 5 character LED modules in a classic calculator. Only source is another machine. Modules were brightness matched at the factory and a letter code is stamped on the bottom of each one. The closer the letter code, the better the match. Also be aware that modules with gold and silver leads have slightly different digit heights. Before soldering down a replacement module, inspect its alignment with a magnifying glass, solder two opposite corner pins, and recheck the alignment.

### **Re: Fixing Classic LED segments?**

*Message #7 Posted by [Dan W](#) on 4 May 2007, 1:02 p.m.,  
in response to message #1 by Dan W*

Thanks guys. You've told me pretty much what I expected but didn't want to hear.

Let me ask the opposite question: I have occasionally seen LED segments that are faintly lit all the time, typically opposite vertical segments on one digit. This I'm guessing is not in the LED chip itself, but what would cause it?

### "Simple" Math Question (to keep Namir busy)

Message #1 Posted by **Chuck** on 2 May 2007, 8:48 p.m.

I know I've seen this discussed before, and could probably do a search to find the golden answer provided by the likes of Wikipedia) but that would take all the fun out of debate....

Let's assume there are 6 billion people alive today, and it's fairly safe to say that none were alive 100 years ago. But, in the last 100 years there has been many births and deaths of people not counted in the current 6 billion. Plus, many numerous other factors during the milleniums past have had drastic affects on population (what century saw the only MAJOR world population decline.)

So my question is...what is your best estimate of the total number of different people (homonids, bipedals, etc., your choice what to include) that have ever been born?

My knee-jerk response was triple, or about 18 billion, but I think that is woefully small. What's your best guess???

No fair looking up info on the Web.

### Re: "Simple" Math Question (to keep Namir busy)

Message #2 Posted by **allen** on 2 May 2007, 9:16 p.m.,  
in response to message #1 by Chuck

your answer is in first line of the preface to Aurthur C. Clarke's '2001: a space odyssey' which out of respect for the strictest copyright conventions, I shall not post in this forum. GRIN! just kidding!

Quote:

Behind every man now alive stand thirty ghosts, for that is the ratio by which the dead outnumber the living. - AC Clarke

### Re: "Simple" Math Question (to keep Namir busy)

Message #3 Posted by **Chuck** on 2 May 2007, 10:20 p.m.,  
in response to message #2 by allen

So if Arthur is "the man" then we're already down to "behind everyman stands 15 ghosts" (assuming 1960's population of about 3 billion). Pretty soon there will be only one additional ghost per person. Not a happy thought. 8(

### Riverworld saga answer

Message #4 Posted by **Gene** on 2 May 2007, 10:22 p.m.,  
in response to message #2 by allen

The Riverworld saga by Phillip Jose Farmer also speculates on this number...depends of course on the

starting date and definition of a human. :-)

It's quite an interesting series of books.

<http://www.amazon.com/Your-Scattered-Bodies-Riverworld-Saga/dp/0345419677>

"To Your Scattered Bodies Go is the Hugo Award-winning beginning to the story of Riverworld, Philip José Farmer's unequaled tale about life after death. When famous adventurer Sir Richard Francis Burton dies, the last thing he expects to do is awaken naked on a foreign planet along the shores of a seemingly endless river. But that's where Burton and billions of other humans (plus a few nonhumans) find themselves as the epic Riverworld saga begins. It seems that all of Earthly humanity has been resurrected on the planet, each with an indestructible container that provides three meals a day, cigarettes, alcoholic beverages, a lighter, and the odd tube of lipstick. But why? And by whom?"

### **Re: "Simple" Math Question (to keep Namir busy)**

*Message #5 Posted by **Peter A. Gebhardt** on 3 May 2007, 4:34 a.m.,  
in response to message #1 by Chuck*

Chuck,

you might search the internet for "Stochastic Present Value".

Think along the line of adding up a series of (say) yearly "reproduction amounts" like the PMT in TVM problems, BUT with stochastic varying PMTs AND stochastic varying (reproduction- aka interest) rates.

Usually solved by Monte-Carlo Simulation, you might also find some closed form solutions.

Best regards

*Edited: 3 May 2007, 5:31 a.m.*

### **Re: "Simple" Math Question (to keep Namir busy)**

*Message #6 Posted by **Namir** on 3 May 2007, 11:01 a.m.,  
in response to message #1 by Chuck*

Chuck,

Your assumptions are shaky. You should take into account the average lifespan of each generation (and not 100 years), which has increased especially recently. You should also take an average growth rate (which fluctuates according to the UN web site).

You can simplify things, but the result may not be relevant.

Peter's analysis is very insightful. You should follow his analysis.

Namir

### **Re: "Simple" Math Question (to keep Namir busy)**

*Message #7 Posted by **Barry Schwartz** on 3 May 2007, 1:16 p.m.,  
in response to message #1 by Chuck*

There is an article entitled "How Many People Have Ever Lived on Earth" by Carl Haub (available on-line). His analysis came to the conclusion (the article was written in 2002) that the number is 106 billion.

**Re: "Simple" Math Question (to keep Namir busy)**

Message #8 Posted by [Peter A. Gebhardt](#) on 3 May 2007, 6:43 p.m.,  
in response to message #7 by Barry Schwartz

Barry,

Thx. for pointing to this article - although (and because) I wasn't able to retrieve it online, I started googling for other sources (out of curiosity) and found this article which does offer a simple "macro-model" which (as claimed) possesses a very high accuracy to describe the population growth since 25.000 B.C.

### Re: HP82183A Extended I/O module

Message #5 Posted by [Garth Wilson](#) on 2 May 2007, 1:27 p.m.,  
in response to message #1 by [Gonzalo Fernandez](#)

The XIO module allows you to get closer control of the interface loop, which is especially useful if you use the HPIL-to-HPiB (IEEE-488) interface converter to control many pieces of lab equipment simultaneously. IEEE-488 opens the door to controlling thousands of different models of equipment on the market. HPIL is essentially a serial implementation of IEEE-488, and this becomes quite clear with the XIO module. With it, you can make your program find and identify the various pieces of equipment connected, configure them, respond to service requests from the instruments, read their status, get tight control of bytes transferred, have string functions and use ALPHA as an I/O buffer, etc.. I used it extensively in automated test set-ups in the mid-1980's, although I did not go to the extent of making one device talk directly to others and manually specifying low-level device-dependent talker and listener commands. Without this module I would not have been able to do what I got the 41cx for. I got my XIO module built into my HPIL module in order to save a port.

Even if all you were using it for were an 82161A tape drive, it still gives more capabilities. You can copy from one drive to many others simultaneously, or ask for example, "What's the name of the 11th file?"

**S/N 9999Axxxxx**

Message #1 Posted by [Steve S](#) on 2 May 2007, 12:58 a.m.

There's an HP-67 calculator that just appeared on eBay with a serial number of 9999Axxxxx. Can someone remind me of the significance of the leading 9's?

**Re: S/N 9999Axxxxx**

Message #2 Posted by [GE](#) on 2 May 2007, 11:43 a.m.,  
in response to message #1 by Steve S

This unit is a prototype.

I just happen to have had 9999A00180 in my very own hands 2 hours ago, it belongs to a friend, and is a clear case back HP67 in mint condition.

Lucky guy !

**Re: S/N 9999Axxxxx**

Message #3 Posted by [Matthias Wehrli](#) on 2 May 2007, 1:43 p.m.,  
in response to message #2 by GE

Maybe proto... indeed the clear cases are not prototypes. I have some of them, got some of them from a man that worked in a modeling firm from HP. These cases are more curiosities.

Matthias

**Re: S/N 9999Axxxxx**

Message #4 Posted by [GE](#) on 3 May 2007, 5:29 a.m.,  
in response to message #3 by Matthias Wehrli

That machine was BOTH clear case back AND a prototype. It has a "HP67 - IL2" sticker (looks original and official) in place of the usual "Hewlett Packard 67", and was sold by high-rank official at HP who retired recently.

Personally, I'd like to have one of these just out of scarcity.

### HP42S Mini-Challenge: Optimizing !

Message #1 Posted by [Valentin Albillo](#) on 1 May 2007, 10:57 p.m.

Hi all,

A new month's just begun and a little, HP42S-specific Mini-Challenge might prove an adequate welcome for it and a nice occasion to flex your HP42S programming muscles. So this is

### The Mini-Challenge

We say that a positive integer is *palindromic* if it reads the same forwards and backwards, such as 1771 or 32823. Some *integer squares* can also be palindromic, such as  $121 = 11^2$ .

There is *one and only one 12-digit palindromic square* and you must write an HP42S program to try and find it, your choice(s) among three possible flavours:

1. Optimized for *minimum size*, regardless of speed
2. Optimized *primarily for speed*, secondarily for size
3. Optimized for *maximum speed*

#### Some notes:

- The goal for (1) is to achieve the smallest possible program, even if it would take extremely long to find the unique answer.
- The goal for (2) is to find the answer as quick as possible but with some concern as to program size and reasonably "elegant" code.
- The goal for (3) is to find the answer as fast as possible, even at the expense of longer or not-so-elegant code.
- Both (2) and (3) must be able to find the solution in a *physical* HP42S in a few hours at most.

Your program must stop as soon as it finds the unique answer (no need to search for more) and the usual caveats apply, namely:

- Avoid *googling* for the answer, any moron can do that and it would be extremely *lame*. The idea is to work it out and show some *programming muscle* and good, worthwhile *ideas* which might be useful for other tasks. If you can't solve this on your own, you aren't worth your salt as an HP-calc programmer.

- Using reasonable, sound *heuristics* which can be rationalized in a few words is Ok and recommended, but avoid doing all the theoretical work yourself with paper and pen, then have the program simply print the answer after looking at a handful cases. The idea is for *the machine* to do the bulk of the work, not *you*.
- This mini-challenge is HP42S-specific in the sense that I'll post my original solutions which are HP42S RPN programs using some neat tricks that are indeed HP42S-specific. It would be nice if you would write HP42S programs too, you can always use some good emulator (Emu42 or Free42, for instance) if you don't have a physical HP42S.

That failing, you may nevertheless use any 12-digit HP calc model and see what you come up with.

---

I'll post my original solutions for the HP42S within a few days, as always, which, as a guide to measure your efforts, have the following characteristics:

1. Trivial but takes ages
2. 72 steps (157-byte), R00-R11 used, finds the unique solution in 2 h 42 min in a physical HP42S, 85 seconds in Emu42 @ 2.4 Ghz, 44 seconds in Free42 @ Palm Z100
3. 129 steps (239-byte), R00-R11 used, finds the unique solution in 1 h 48 min in a physical HP42S, 56 seconds in Emu42 @ 2.4 Ghz, 29 seconds in Free42 @ Palm Z100

Enjoy ! :-)

Best regards from V.

## Re: HP42S Mini-Challenge: Optimizing !

Message #2 Posted by **Egan Ford** on 2 May 2007, 12:31 p.m.,  
in response to message #1 by Valentin Albillo

Thanks for this challenge. My 42S has been collecting dust since I use my 15C, 71B, and 50G for challenges.

Here is my first min size entry. I didn't have a lot of time to work on it. I know there is room for improvement.

This is a brute force search starting at 999999 and working down. Once squared a decimal point is used to separate the 2 halves. The right half is flipped and subtracted from the left half. If the result = 0, then you have found it.

40 steps, 66 bytes. Free42 on my notebook breezed through this in about 40 seconds. ETA for physical 42S: 95-96 hours. I do not have any EMU42 timings. I am too lazy to dump my 42S ROM to my 48GX so that I can use EMU42. I hate to ask this, but can someone please email a ROM dump (I can provide proof that I own a 42S if necessary).

This does not use any unique feature of the 42S so it should be portable to other models (e.g. 15C, however you'll have to settle for a 9 digit palindromic square, there is no 10).

Message #3 Posted by [Paul Dale](#) on 2 May 2007, 5:44 p.m.,  
in response to message #1 by Valentin Albillo

[edit: added solution time]

Interesting challenge as usual.

I cannot think of a "clever/short" method to do the palindrome generation on a 42S, however I did some up with this fragment on the HP49g+:

```

->STR
DUP
SREV
==

```

You'll need to attach library 256 for the SREV to be resolved properly (i.e. 256 ATTACH before entering the above fragment. You'll also want everything to stay integer (i.e. not approximate mode).

A final program that performs the search:

```

<<
 6
ALOG          10^x
WHILE
  1.
REPEAT
  1
  -
  DUP
  SQ          x^2
  ->STR
  DUP
  SREV
  ==
  << HALT >>
  IFT

```

```
END  
>>
```

70.5 bytes, checksum #AF30h

Running time is a couple of minutes under an hour for an agumented version that inserted a TICKS before the HALT.

- Pauli

## Re: HP42S Mini-Challenge: Optimizing !

*Message #4 Posted by [hugh steers](#) on 2 May 2007, 6:17 p.m.,  
in response to message #1 by Valentin Albillo*

hi valentin,

i started wondering if the so-called "196" algorithm was a good way to search for palindromes of a given size.

196 algorithm: given a number, reverse its digits, add to original number. repeat process until palindromic (or give up after too big). i figure that since your number is unique, unless the 196 can't hit a 12 digit number, it will find it by chance fairly quickly.

sure enough i get it after putting in 899. so it took me 799 trials (started at 100). end of the output looks like this:

```
870 8836886388  
871 15851  
872 1661  
873 2772  
874 3883  
875 4994  
876 23232  
877 47674  
878 878  
879 0  
880 0  
881 233332  
882 1881  
883 2992  
884 7117  
885 9339  
886 1136311  
887 0  
888 888  
889 881188  
890 881188  
891 79497  
892 3113  
893 5335  
894 7557  
895 9779  
896 22022  
897 46464  
898 898  
899 133697796331  
woot!
```

not sure if this would make a good approach for a 42 program. probably not.

## Re: HP42S Mini-Challenge: Optimizing !

*Message #5 Posted by [Paul Dale](#) on 2 May 2007, 6:26 p.m.,  
in response to message #4 by hugh steers*

Quote:

899 133697796331

I'm not sure you're on the right track here. You've found a 12 digit palindrome but 133697796331 is not a square number.

Palindromes of this size are very easy to find, choose any six digit number not ending with a zero reverse the digits and prepend. Finding the unique one which is also a square is harder.

- Pauli

## Re: HP42S Mini-Challenge: Optimizing !

Message #6 Posted by [Egan Ford](#) on 2 May 2007, 10:46 p.m.,  
in response to message #1 by [Valentin Albillo](#)

My first attempt at fast. I have not tested on real 42S yet, but with Free42 it runs in about 10 sec.

This differs from my brute force attempt in a number of ways.

Instead of calculating squares with  $X^2$ , squares are calculated by subtracting odd numbers. (A perfect square  $N^2$  is = to the sum of the first  $N$  odds). By using the squares I can cut the numbers of searches by half because perfect squares cannot end in 8,7,3 or 2. I can also skip 0 since palindromic numbers do not start with 0. So I only check numbers starting with 9,6,5,4 and 1.

There is no need to check every square, only check the squares ending with the starting number. I can determine the next square with that matches the lead digit by multiplying the next square deference by 10 and subtracting 90. This has to be done twice because there are two patterns of matching digits spaced 10 squares apart. This reduces the number of searches by 4/5ths. (A simple mod 10 check may be faster).

Overall the total number of iterations required vs. brute force is 1/10.

To further increase performance the check for palindromic exits early if any number does not match (brute force checked all digits). Loop unrolling also helps. This part needs more help.

Like my earlier post this is not 42S specific.

I'll include my Perl prototype, it is easier to read.

## Re: HP42S Mini-Challenge: Optimizing ! (Doh! Bug!)

Message #7 Posted by [Egan Ford](#) on 4 May 2007, 12:55 a.m.,  
in response to message #6 by [Egan Ford](#)

Line 80 above:

```
80      *
```

Should be

```
80      x
```

txt2raw.pl will ignore the \*. The above takes 10 times longer than it should. Below is a fixed version with a few other cleanups. Still not 42S specific.

Run times:

```

Free42 @ 1.7 GHz Pentium M:    1 sec
Emu42  @ 1.7 GHz Pentium M:   60 sec
Free42 @ 471 MHz PXA255:      70 sec

```

I'll key this in my 42S and report the time this weekend.

Message #9 Posted by [Alex L](#) on 3 May 2007, 3:23 p.m.,  
in response to message #1 by [Valentin Albillo](#)

This is my first-ever submission to one of these challenges. I was aiming at part (1), but mostly just learning how to program my 42S.

41-byte, 25-step program, at the end displays both the base number in Y and the sought square in X. Uses only R01 and ALPHA. Fairly 42S-specific, I think, as it depends on the existence of a 12-digit integer representation to move into the ALPHA register with AIP.

I had started counting up from 316228, but then realized that I could save 3 bytes in step 01 by counting down from 1E6. Turns out to save execution time, too.

18s on Free42 @ 2.1GHz, and based on two partial runs, an estimated 11h25m on a physical 42S. Since I'm an HP calculator programming rookie, I'd guess someone on this forum can make this algorithm even shorter.

Message #10 Posted by [Karl Schneider](#) on 4 May 2007, 12:18 a.m.,  
in response to message #9 by Alex L

Hello, Alex --

Quote:

---

This is my first-ever submission to one of these challenges. I was aiming at part (1), but mostly just learning how to program my 42S.

---

Well, I'm very impressed with your elegant program. I believe that you've taken the approach that Valentin had in mind, and which I didn't quite see how to do, having not researched all available HP-42S string commands.

Quote:

---

Fairly 42S-specific, I think, as it depends on the existence of a 12-digit integer representation to move into the ALPHA register with AIP.

---

AIP (or J-F Garnier's "ARCL ST X") is indeed the key to making this approach work. If I were to tackle this problem with a C-language program, I would use "sprintf" or a non-standard library routine "itoa" to

convert an integer to a string, then compared pairs of digits, working from the outside inward. I thought that the HP-42S "ATOX" and "XTOA" would be analogous, but they weren't. However, ATOX *in conjunction with AIP* and AROT was just the ticket.

I've taken a similar approach, using numerical calculations instead of string operations to extract and remove the first and last digits of  $N^2$ . It's slower and more cumbersome.

Quote:

I'd guess someone on this forum can make this algorithm even shorter.

I don't see any particular way to make your algorithm much more concise, but the execution speed could be improved by using some basic heuristics that restrict, within appropriate ranges of N, which last-digit values of  $N^2$  to even check for.

Good job!

-- KS

Message #11 Posted by [Alex L](#) on 4 May 2007, 11:16 a.m.,  
in response to message #10 by Karl Schneider

Karl,

Quote:

Well, I'm very impressed with your elegant program. ... Good job!

Thank you! I'm especially happy with the generality of this algorithm. If you append 4 steps/6 bytes:

```
26 STOP
27 1
28 X!=Y?
29 GTO 01
```

then the program will display each palindromic square of 12 digits or fewer (36 in all, counting the trivially palindromic squares of 3, 2, and 1, only one other of which has an even number of digits). But it will take days on a physical 42S.

Quote:

the execution speed could be improved by using some basic heuristics that restrict, within appropriate ranges of N, which last-digit values of  $N^2$  to even check for

I'm enjoying studying the other submissions to this challenge to see slick ways to do exactly that.

-A

Karl, I am surprised that you made no comment RE the 32 byte solution or the X/11 heuristic I added below, the former being 25% smaller than the previous post. I really enjoy the 'write a small program' challenges. Also enjoy the heuristics you added. In both case 1 and 3 (but not Valentin's case #2-speed/size challenge) The creation of these algorithms is mathematical poetry! You and Alex are both great writers, among others here. Hats off to all.

### **Some comments: HP42S Mini-Challenge**

*Message #13 Posted by **Karl Schneider** on 10 May 2007, 12:58 a.m.,  
in response to message #12 by Allen*

Quote:

Karl, I am surprised that you made no comment RE the 32 byte solution or the X/11 heuristic I added below,...

Hi, Allen --

I did incorporate the X/11 heuristic into my own solution, which reduced the execution time by more than 60%. Paul Brogger had included it in his submission, prior to yours. I hadn't even known of the theorem until then.

Your 32-byte program seemed to have the same basis as Alex' program. His algorithm was already taut, but there's always a way to save a few bytes...

Quote:

I really enjoy the 'write a small program' challenges.

I don't, in particular. It seems to me that reduction of program size to its absolute minimum defeats the true purpose of a programmable calculator: To allow the user to quickly create functional programmed solutions to a problem without the need to remember syntactical rules, spellings, formalities, and compilation procedures.

"Paring down" of a program may have been necessary for implementing anything non-trivial on the earliest programmables, but not on a HP-42S with 7 kB of RAM.

### **Re: HP42S Mini-Challenge: Optimizing !**

*Message #14 Posted by **Werner** on 3 May 2007, 4:57 p.m.,  
in response to message #1 by Valentin Albillo*

I took the following approach: I generate the 12-digit palindromes, generating the first (and last) two digits separately making use of the knowledge that the number is a square (thus dividing the work by four, roughly),

and just blind force for the inner loop. It is not HP-42 specific.

timing: 1m13s @ 1.4Ghz size: 115 Bytes, regs R1-R5 used

## Re: HP42S Mini-Challenge: Optimizing !

Message #15 Posted by [Paul Brogger](#) on 3 May 2007, 7:24 p.m.,  
in response to message #1 by Valentin Albillo

I wrote mine originally on the HP-33s, then copied it to Free42 on Windows. As such, it doesn't make use of any particular HP-42s features, and so isn't optimized for that machine.

It uses two registers, R00 and R01.

```

00 { 66-Byte Prgm }
01>LBL 00
02 99999          Iterate through all 6-digit first-halves,
03 STO 00          starting at 100,000

04>LBL 01
05 1
06 STO+ 00        Increment high-order six-digit section
07 0
08 RCL 00          Put it in x
09 XEQ 02
10 XEQ 02          Reverse
11 XEQ 02
12 XEQ 02          that
13 XEQ 02
14 XEQ 02          in y
15 Rv
16 RCL 00          and
17 1E6            splice
18 *              them
19 +              together
20 STO 01          (save 12-digit value, in case I need it later)
21 SQRT
22 FP
23 X!=0?          Is it the square of some integer?
24 GTO 01          no -- try next 6-digit value
25 RCL 01          yes! -- stop with 12-digit palindromic square in x
26 STOP

27>LBL 02
28 10             Take low-order digit
29 ÷              in x,
30 FP
31 LASTX
32 IP
33 Rv
34 +              and append it
35 10             to y, shifting that left
36 *
37 R^
38 RTN

```

Pretty fast (~53 sec.) on Free42Decimal (on 2.8GHz Win2000) and very slow (still running) on HP-33s.

(To use only one register, don't save in R01, and replace line 25 with a LASTx, x^2.)

## Re: HP42S Mini-Challenge: Optimizing !

Message #16 Posted by [Paul Brogger](#) on 4 May 2007, 2:30 a.m.,  
in response to message #15 by Paul Brogger

This one takes about a third the time of my previous attempt. It has (if I do say so myself) a pretty slick test for palindromicity (?) in section labeled LBL 02.

```

00 { 58-Byte Prgm }
01>LBL 00
02 316227
03 STO 00

04>LBL 01          Increment integer
05 1
06 STO+ 00
07 RCL 00
08 X^2            and square it
09 1E6
10 <div>          prior to palindrome test.

```

```

11>LBL 02      Assumes decimal point in center of
12 X=0?       even-length palindromic sequence in x.
13 GTO 03     If zero, we've found our result.
14 10
15 <mult>      Shift one digit left
16 FP
17 LASTX
18 IP
19 100        Then two digits right
20 <div>
21 IP
22 LASTX
23 FP
24 0.11       Divide middle two digits by .11
25 <div>
26 FP
27 X!=0?
28 GTO 01     Don't match? Try square of next integer.
29 Rv
30 +          Concatenate remaining fragments
31 GTO 02     and test next middle two digits

32>LBL 03
33 RCL 00
34 X^2
35 RTN

```

It uses only register R00.

## Re: HP42S Mini-Challenge: Optimizing ! (final submission)

Message #18 Posted by [Egan Ford](#) on 5 May 2007, 1:41 p.m.,  
in response to message #1 by Valentin Albillo

Quote:

Enjoy ! :-)

I did. This is my final submission for part 3 (speed) of this mini challenge. One of my objectives from the start was to NOT be 42S specific (personal challenge). As for, "*Using reasonable, sound heuristics which can be rationalized in a few words is Ok*". I'll let you be the judge.

Answer:  $798,644 * 798,644 = 637,832,238,736$

Runtimes:

|                            |          |
|----------------------------|----------|
| Free42, 1.7 GHz Pentium M: | <1 sec   |
| Emu42, 1.7 GHz Pentium M:  | 23 sec   |
| Physical 42S:              | 1h, 2min |

Code suitable for import into Free42 or Emu42: <http://sense.net/~egan/pp9.txt.raw>.

I broke this problem down into two separate problems: iteration reduction and verification optimization.

Iteration reduction:

My initial brute force approach started at 999999 and counted down until a solution was found. I selected count down vs. count up because I was planning on using DSE (easier than ISE). This approach will make 201,355 attempts to find a solution. Heuristical methods will need to be used to reduce this.

Knowing that perfect squares must end in 0, 1, 4, 5, 6, or 9, I opted to count down from the largest 12 digit square ( $999999^2$ ) and ignore any that didn't start with 9, 6, 5, 4, or 1. This will cut the number of iterations roughly in half. 89,333 iterations to be exact. Since  $N*N =$  the sum of the first N odd numbers, counting down is easy. Just find the last odd:  $999999*2 - 999998*2$ . Then subtract 2 from the odd in a loop to get the difference to the next perfect square.

Of the perfect squares only a fraction will end in with a digit that matches the first. Is there a way to determine the next first/last matching digit perfect square? Yes, there is. Just sum 10 sequential odd numbers to get a result that ends in 0. Simply find the first perfect square with matching first/last digit by subtracting the odds,

then to get 10 odds down, take the next odd, multiply by 10, subtract 90. This approach does have one gotcha, there are 2 series of first/last matching squares, and both have to be searched, e.g.:

```

999999^2 = 999998000001 <= Start at top. End in 9? No, then subtract odd difference.
999998^2 = 999996000004 <= End in 9? No, then subtract odd difference.
999997^2 = 999994000009 <= End in 9? Yes, 10*odd diff - 90 -----
999996^2 = 999992000016
999995^2 = 999990000025
999994^2 = 999988000036
999993^2 = 999986000049 <= Opps, missed this one. 10 down-----
999992^2 = 999984000064
999991^2 = 999982000081
999990^2 = 999980000100
999989^2 = 999978000121
999988^2 = 999976000144
999987^2 = 999974000169 <-----
999986^2 = 999972000196
999985^2 = 999970000225
999984^2 = 999968000256
999983^2 = 999966000289 <-----
999982^2 = 999964000324
    
```

This happens because there is no guarantee that a downward count of the next odd will always end at 9. If ending at 7, 5, 3, or 1, then the next matching first/last digit will be less than 10 odds away.

```

(9 + 7 + 5 + 3 + 1 + 9 + 7 + 5 + 3 + 1) mod 10 = 0
(7 + 5 + 3 + 1 + 9 + 7 + 5 + 3) mod 10 = 0
(5 + 3 + 1 + 9 + 7 + 5) mod 10 = 0
(3 + 1 + 9 + 7) mod 10 = 0
(1 + 9) mod 10 = 0
    
```

To get around this problem without too much work I just did two passes. Pass 1 starts with the highest first/last matching square, pass 2 starts with the 2nd largest. Each pass jumps 10 squares at a time. This reduces the number of iterations by ~1/5. 20,271 iterations to be exact.

Lastly I started looking at the 2nd digits. Without much thought you can prove that the 2nd to last digit of all perfect squares is even, unless the last digit is 6.

E.g. take squares ending in 9. Only 3\*3 or 7\*7 end in 9, so...

|                |                     |
|----------------|---------------------|
| $x + 3$        | $x + 7$             |
| $x + 3$        | $x + 7$             |
|                |                     |
| $3x + 9$       | $(7x+4) + 9$        |
| $x^2 + 3x$     | $x^2 + (7x+0)$      |
|                |                     |
| $x^2 + 6x + 9$ | $x^2 + (14x+4) + 9$ |

2nd digit will be 6x, and even\*anything is even. This is true for 14x+4 as well (note the even carry digit). You can do the rest of this exercise in your head (i.e. avoid *doing all the theoretical work yourself with paper and pen*), just look at the carry digit, e.g. to end in 9 you must have 3\*3 or 7\*7, the carry digit is even (i.e. 0 or 4), to end in 6 you must have 4\*4 or 6\*6, the carry digit is 1 or 3 ending with a even + odd for the 2nd digit. IANS, implementing this will reduce the number of iterations by ~1/2. 8,889 iterations to be exact.

3rd digit? Too much brain power was needed, further optimization will need to be done in the verification.

Verification optimization:

The first check is the most important check. Taking a hint from Paul Brogger I cut out the center, divided by 11 and checked for FP = 0:

```

1E-5
x
IP
100
MOD
11
    
```

```

÷
FP
X!=0?

```

Other attempts that set up an efficient way to check the rest of the digits is a waste. The first digit check will happen at each iteration. The probability of a match is only 1:10 making the 2nd check take place ~1/10 of the iterations. Make the first check fast, make the rest source efficient.

More optimization can be done, but I made my ~1 hour time target.

Finally, I must state how awesome the 42S is. I did all my development using the VI editor and then using txt2raw.pl to convert to raw for import into Free42/Emu42. I was not looking forward to keying this into my 42S for a formal benchmark. After doing so, I must state that there is an attention to detail that I do not think I have seen with any other vertically oriented HP (48GX is close). The orientation of the menus and keys made for very accurate and quick work of entering this code. I applaud the 42S architects.

Source with comments:

```
00 { 279-Byte Prgm }
```

```
Main loop. DSE from 9 to 1. If 8,7,3,2 skip
since perfect squares only end in 9,6,5,4,1,0.
```

```
If '6' then note the 2nd digits will be odd (start with 9
count down by 2). Evens start with 8 and count down by 2.

**Re: HP42S Mini-Challenge: Optimizing !**

Message #19 Posted by **Karl Schneider** on 6 May 2007, 1:57 a.m.,  
in response to message #1 by Valentin Albillo

(NOTE: This post was edited to implement the heuristic regarding divisibility by 11, which was identified by others. Only two instructions in my program were changed, reducing execution time by more than 60%.)

To get a working and fast program for this challenge, I finally installed Thomas Okken's magnificent Free42 software that I had downloaded quite a while ago. It was quite easy to do; I ought to have done it a long time ago.

My intended approach was similar to the one elegantly implemented by "Adam L", which was to convert  $N^2$  to a string, then compare the outermost "digit-characters", working toward the middle from each end each time a match was found, and immediately jumping to the next  $N$  upon getting a mismatch. Not immediately seeing how to do that with HP-42S string functions, I implemented the same logic with mathematical calculations based on INT and MOD. This is slower and more cumbersome on a physical HP-42S, but it worked.

My "ideal" optimized program would incorporate heuristics 3 and 4 into Adam L's tidy code.

The heuristics:

1. It is faster and simpler to generate a square and iteratively check for its "palindromicity" than to generate palindromes and check for integer square roots. There are 900,000 possible 12-digit palindromes, which can also be cumbersome to generate.
2. The lowest integer  $N$  that produces a 12-digit square is 316,228; the largest is 999,999. The overall search should be restricted to this range of 683,772 possibilities.
3. A squared integer not divisible by 10 can end only with 1, 4, 5, 6, or 9. Since the last digit of  $N^2$  must match the first, there is no need to try values of  $N$  for which  $N^2$  is within the inclusive ranges {200,000 to 399,999} or {700,000 to 899,999}. Therefore,  $N = 447,214$  through 632,457 and  $N = 836,661$  through 948,683 can be bypassed *en masse*.
4. A palindrome having an even number of digits will be evenly divisible by 11. Therefore, all values of  $N$  that are *not* as such can be skipped over, eliminating 91% of all remaining possibilities.
5.  $N$  ending in 0 will yield an  $N^2$  ending in 00. If the first two digits were to match,  $N^2$  would be only a 10-digit number. Therefore, each  $N$  that is a multiple of 10 can be skipped over. In view of the preceding heuristic, however, this may not yield a significant reduction in processing time for the programming effort.
6. For a given value of the leading digit of  $N^2$ , only one or two ending digits of  $N$  will match it. However, checks for this heuristic are a bit cumbersome to implement, and may not save much execution time.

So, here's my program, which finds the unique solution *working upward from  $N = 316,228$* . It runs in only 1.8 seconds on Free42 Binary and 7.2 seconds on Free42 Decimal, on a PC with twin Pentium IV 3.0-GHz CPU's.

The program could be easily modified to search from  $N = 999,999$  downward. This would find the answer even faster, as it turns out.

Lines 52 and 53 (FIX 00 and RND) were necessary to eliminate floating-point arithmetic errors. Line 57 (ALL display format) is for debugging purposes.

*Edited: 13 May 2007, 4:20 p.m.***32 byte, (20 steps in 55 sec.) solution for free42 Mini-Challenge***Message #20 Posted by [allen](#) on 6 May 2007, 9:04 a.m.,  
in response to message #1 by Valentin Albillo*

This was also my first occasion to write a 42s program, though the title of the challenge could be best titled "free42 challenge" since the minimum size contest is likely not practical on a REAL 42S. Accordingly, like Karl, I had to dust off the free42 installation from last year and learn how to use it. What a GREAT program!!!

I propose a 32 byte solution using the STAT register as the counter. (mainly because the \sigma+ command automatically puts the increment result on the stack eliminating the need for a 1 STO+ XX RCL XX to bring the value back to the stack.) Runtime is <1min on free42.

```

00 { 32-Byte Prgm }
01 CL\Sigma          ' Clear stat register
02>LBL 00           ' Begin counting loop
03 \Sigma+          ' Increment STAT register
04 X^2
05 CLA              ' Clear Alpha register
06 AIP              ' Pull result to Alpha reg
07 6
08 STO 01           ' Store counter for length loop
09>LBL 02           ' Begin palindromic check / length loop
10 -1
11 AROT             ' Rotate last char to front of ALPHA reg
12 ATOX             ' Pull last character code to X
13 ATOX             ' Pull first character code to X
14 X!=Y?           ' Are the first and last characters equal?
15 GTO 00           ' if not save time by ending loop early and go to counterloop
16 DSE 01           ' if they are, decrement and check for length
17 GTO 02           ' if too short, go to the length loop
18 X=0?            ' otherwise was the last result from an empty ALPHA reg?
19 GTO 00           ' if yes, return to counter
20 RCL 16           ' otherwise SUCCESS!!! - recall the stat N value

```

*Edited: 6 May 2007, 6:33 p.m. after one or more responses were posted***Re: 41 byte, 7 second solution for free42 Mini-Challenge***Message #21 Posted by [allen](#) on 6 May 2007, 6:13 p.m.,  
in response to message #20 by allen*

Using the heuristic that palindromes are divisible by 11, one can add 4 steps to the program and finish 90% faster:

```

00 {41-Byte Prgm }
01 CL\Sigma          ' Clear stat register
02>LBL 00           ' Begin counting loop
03 \Sigma+          ' Increment STAT register
04 X^2
05 121              ' ADDED TO CHECK ONLY MULTIPLES OF 11
06 *
07 CLA              ' Clear Alpha register
08 AIP              ' Pull result to Alpha reg
09 6
10 STO 01           ' Store counter for length loop
11>LBL 02           ' Begin palindromic check / length loop
12 -1
13 AROT             ' Rotate last char to front of ALPHA reg
14 ATOX             ' Pull last character code to X
15 ATOX             ' Pull first character code to X
16 X!=Y?           ' Are the first and last characters equal?

```

```

17 GTO 00      ' if not save time by ending loop early and go to couterloop
18 DSE 01      ' if the are, decrement and check for length
19 GTO 02      ' if too short, go to the length loop
20 X=0?        ' otherwise was the last result from an empty ALPHA reg?
21 GTO 00      ' if yes, return to counter
22 RCL 16      ' otherwise SUCCESS!!! recall stat N value
23 11
24 *           ' ADDED TO CONVERT couter to X^2 format where X is couter*11

```

This differs slightly from my initial 44 byte program where I used an (ATOX POSA x=0?) loop similar to Alex's above (ATOX ATOX X=Y?). I was hoping to use the ATOX and POSA commands to create an AND gate so I would not have to process both the length loop and the empty ALPHA loop.

### Re: 41 byte, 7 second solution for free42 Mini-Challenge

Message #22 Posted by [Alex L](#) on 8 May 2007, 12:34 p.m.,

in response to message #21 by allen

Add me to the "why didn't I think of that" category with the 11 heuristic.

That can be incorporated into my submission at a cost of 4 bytes and 0 steps (plus manually checking 999999), by changing step 01 to 999999, and step 04 to 11. This finishes in under 2 sec on Free42, which leads me to believe it should be just over an hour on a physical 42S, which puts it into the range of respectability. Perhaps I'll check. :)

Of course it's no longer necessarily going to work for the general case.

### Re: 41 byte, 7 second solution for free42 Mini-Challenge

Message #23 Posted by [Gerson W. Barbosa](#) on 8 May 2007, 9:31 p.m.,

in response to message #22 by Alex L

Hello Alex,

Congratulations for your tiny versions. The MOD(11) heuristics others have found is a killer one indeed. I added it to the simple 71B program I had written yesterday (too lazy to write a 42S or 33S version; besides, just a variation of what has already been written).

I've just run your latest version on my HP-42S: 1 hour 3 minutes.

Here is the HP-71 program:

```
10 DESTROY ALL @ T=TIME
20 FOR N=999999 TO 316228 STEP -11
30 X$=STR$(N*N) @ I=0 @ S=0
40 I=I+1
50 IF X$[I,I]#X$[13-I,13-I] THEN 80
60 S=S+1 @ IF I<6 THEN 40
70 IF S=6 THEN DISP X$;TIME-T @ END
80 NEXT N
>run
637832238736 15.02
```

15 seconds @ 500 MHz, about 26 minutes on the real 71B. 144 bytes.

By the way, the latest version of J-F Garnier's Emu71 (2006) is a pleasure to use: copy and paste to and from the DOS window works nicely. I have to remember to upgrade to the registered version, even though I still don't have the serial interface :-)

Regards,

Gerson.

## Re: HP42S Mini-Challenge: Optimizing !

Message #24 Posted by [Werner](#) on 7 May 2007, 7:49 a.m.,  
in response to message #1 by [Valentin Albillo](#)

Second try..

heuristics:

- palindromes with an even nr of digits are divisible by 11, so x has to be divisible by 11 as well.
- if x ends with digit i, y starts/ends with digit  $i^2 \text{ MOD } 10$  and x is between  $\text{SQRT}(i*10^{11})$  and  $\text{SQRT}((i+1)*10^{11})$

We'll loop over the 'ending digits' and determine the range to check.  
Within that range, only multiples of 11 ending in the same digit have to be checked.

timing: Emu42 @ 3Ghz: 9s

It should be noted that since the result is obtained with ending digit 4, counting upwards would've been faster still.

## Re: HP42S Mini-Challenge: Optimizing !

Message #25 Posted by [Werner](#) on 7 May 2007, 3:36 p.m.,  
in response to message #24 by Werner

a few corrections: the intro should read:

- palindromes with an even nr of digits are divisible by 11, so x has to be divisible by 11 as well.

- if x ends with digit i, y starts/ends with digit  $j = i^2 \text{ MOD } 10$  and x is between  $\text{SQRT}(j*10^{11})$  and  $\text{SQRT}((j+1)*10^{11})$

Since x also has to be a multiple of 11, we have:

$$\text{SQRT}(j*10^{11}) < x < \text{SQRT}((j+1)*10^{11})$$

$$< 11*(10*z + i) <$$

We'll loop over the 'ending digits'  $i=9..1$  and determine the range to check.

Within that range, only multiples of 11 ending in the same digit have to be checked.

And the length of the program is 112 Bytes, not 115

## Re: HP42S Mini-Challenge: My Original Solution & Comments

Message #30 Posted by [Valentin Albillo](#) on 9 May 2007, 7:21 p.m.,  
in response to message #1 by Valentin Albillo

Hi all,

First of all, thank you very much for the overwhelming response to this 42S mini-challenge. Awesome solutions have been produced and though I should pretty much be used to it by now, I'm continually amazed at the ingenuity displayed by so many contributors, both frequent posters and newcomers alike. I'm sure we all have learned a lot from these excellent solutions and added a lot of fine techniques and brilliant ideas to our arsenal of programming knowledge, not only HP42S-related but general in nature.

For the record, I'll give and briefly discuss my original solutions. I initially wrote the (b) case solution, then suitably modified it to also cover cases (a) and (c).

My rationale was as follows: the task consisted of finding a 12-digit palindromic square as easily and fast as possible. Two approaches came to mind immediately:

- Generate all squares in the required range ( $316228^2$  to  $999999^2$ , in steps of 11 (because a palindromic even-digit number is necessarily a multiple of 11, thus its square root must be as well as 11 is a prime number), and test them for palindromicity. This amounted to some 62000 candidates, thus some 31000 on average.
- Generate all 12-digit palindromes from 100000000001 to 980000000089 subject to some simple heuristics, and test them for squaredness.

Both approaches seemed feasible but I decided that it would probably be a lot easier and faster to test for squaredness (which can be done in just 3 fast steps) than testing for palindromicity, which is more involved and slow, so the second option seemed easier as long as I could devise a fast, simple procedure for directly generating 12-digit palindromic numbers and further, to only generate those which had a chance of being perfect squares, thus reducing the number of candidates to a reasonable minimum.

This I could do, so I opted for the second approach. My program for the case (b) below directly generates 12-digit palindromes in a very fast way, using pre-stored constants which are quickly initialized once at the beginning of the program, and taking all loop invariants out of the innermost loops, so that redundant arithmetic operations are avoided.

The following extremely simple heuristics are used:

- We only need to loop from 100000 to 999999, the first six digits of the palindrome, as the remaining 6 are simply the mirror image of these, thus a maximum of some 900000 loops would be needed

Further, a perfect square can only end in the following digits:

01,04,09,16,21,24,25,29,36,41,44,49,56,61,64,69,76,81,84,89,96

the termination 00 being discarded as otherwise the palindromic number would begin by 00 and thus be just a 10-digit number. These ending sequences must of course also appear (reversed) at the beginning of any candidate, thus limiting the maximum number of cases to try to some 210000 in the worst case, an average of about only 105000 statistically probable. This is about 3 times as many candidates as the first option, but requiring a much simpler and faster test per candidate so it seemed plausible to go this way.

Assuming I could generate the palindromic candidates very fast subject to these constraints, and as the squaredness test was just 3 fast steps, I considered that 105,000 cases (average) to try was perfectly feasible even on a physical HP42S. This is the resulting 72-step (157-byte) program:

```

01 LBL "P"          19 x              37 LBL 02          55 GTO 04
02 (see *1)        20 LASTX           38 RCL 04          56 Rdown
03 (see *1)        21 RCLx 04        39 STO 02         57 RCL+ 08
04 1000000100     22 LASTX           40 RCL 10         58 DSE 02
05 STO 06          23 RCL/ 04        41 LBL 03         59 GTO 03
06 100001E3       24 IP              42 RCL 04         60 RCL 07
07 STO 07          25 RCLx 05        43 STO 03         61 STO+ 10
08 1001E4         26 -              44 Rdown          62 DSE 01
09 STO 08          27 +              45 ENTER          63 GTO 02
10 11E5           28 VIEW ST X      46 LBL 04         64 RCL 06
11 STO 09          29 STO 11          47 ENTER          65 STO+ 11
12 10              30 RCL 04          48 SQRT           66 DSE 00
13 STO 04          31 STO 00          49 FP             67 GTO 01
14 99             32 LBL 01          50 X=0?           68 GTO 00
15 STO 05          33 RCL 04          51 GTO 05         69 LBL 05
16 LBL 00          34 STO 01          52 Rdown          70 LASTX
17 1E10           35 RCL 11          53 RCL+ 09        71 X^2
18 ATOX           36 STO 10          54 DSE 03         72 END

```

\*1:

- line 2 is alpha text formed by the following ASCII characters:

10,40,90,61,12,42,52,92,63,14,44,94,65,16,46

- line 3 is appended alpha text formed by the following ASCII characters:

96,67,18,48,98,69

All of them are keyable from the ALPHA entry menus. This is an image of how they should look like as program lines:

<http://i10.tinypic.com/4uke69e.gif>

As you can see, an added *finesse* is to have all 21 possible beginning (i.e., reversed ending) sequences stored as ALPHA characters in the ALPHA register, from which they are easily taken out, one at a time, with a simple ATOX instruction. This is fast and saves many program steps/bytes and/or registers.

The resulting program find the only solution,

$$\underline{637,832,238,736} = 798,644^2$$

in just 2 h 42 min in a physical HP42S, 85 seconds in Emu42 @ 2.4 Ghz, and 44 seconds in Free42 @ a very modest Palm Z100.

Once I had this solution, I created the one for case (c) by simply unrolling the innermost loop, like this:

```

...
41 LBL 03
42 ENTER
43 ENTER          50 ENTER          113 Rdown      (line 56 of (b))
44 SQRT          51 SQRT          114 RCL+ 08    (line 57 of (b))
45 FP           52 FP           ...           (etc)
46 X=0?        53 X=0?        ...
47 GTO 05      54 GTO 05      ...
48 Rdown       55 Rdown
49 RCL+ 09     56 RCL+ 09

```

which produces a 129-step (239-byte) program which, as compensation for these extra steps, runs much faster, finding the solution in 1 h 48 min in a physical HP42S, 56 seconds in Emu42 @ 2.4 Ghz, and 29 seconds in Free42 @ Palm Z100. Thus it's quite clear that when speed does matter a lot, and in certain architectures, unrolling the innermost loop or loops actually pays handsomely.

As for the case (a) solution, it was just the one for case (b) with all the heuristics and finesses removed, which made it much shorter but unbearably slow. We've seen much better case (a) solutions posted here so it doesn't bear posting it.

By the way, I'm including here my case (a) solution for the HP-71B as a bonus, which is the following 2-line (58-byte) program (STD display mode is assumed):

```

1 FOR I=999999 TO 316228 STEP -11 @ S$=STR$(I*I) @ IF S$=REV$(S$) THEN DISP I,S$
@ END
2 NEXT I

```

It does find the unique solution in just 3 seconds under Emu71 @ 2.4 Ghz, about 12 min. in a physical HP-71B. Apart from reversing the loop, I don't think it can be made much simpler :-)

Again, thanks a lots for your valuable and superb inputs and get ready for the next one, it will be tougher and that's a promise.

Best regards from V.

Hi, Gerson:

Gerson posted:

*"I have printed out both the HP-71 and the Math Pac Owner's Manual. I should have printed out the one with REV\$ keyword :-)"*

Thanks for your kind words of appreciation and for your posted contributions to this mini-challenge.

I'm sure you are already aware but just in case, the REV\$ keyword is not available in a bare-bones HP-71B. It resides in a number of LEX (Language EXtension) files, such as STRUTIL, for instance, which can be copied to RAM or used from some ROM or EPROM. It's also simple enough that it can be very easily POKEd in as well with a fairly small program or even manually.

For people using Emu71, the basic freeware install does include the STRUTIL LEX file already resident at :PORT(5), as you can check by using CAT, so REV\$ is already immediately available.

As I use Emu71 to develop my programs and create my challenges, mini-challenges, and articles, I usually include in them the functionality afforded by Emu71 right from installation, which means:

- all Math ROM keywords (e.g.: MAT A=INV(B))
- all HP-IL keywords (e.g.: BIT, etc)
- all STRUTIL keywords (e.g.: REV\$, RPT\$, etc)

Also, the physical HP-71B is typically available with an HP-IL ROM already plugged in, though getting a physical Math ROM is certainly much more difficult, but its incredible usefulness more than justifies any effort to get one and, IMHO, you don't have a full HP-71B unless you have one plugged in.

Best regards from V.

## 71B...

Message #33 Posted by [Gene](#) on 10 May 2007, 3:20 p.m.,  
in response to message #32 by Valentin Albillo

I'm fortunate enough to have a physical 71B with the math rom and extra ram installed \*internally\*.

Leaves front ports open for the 41 translator, JPC X, etc. :-)

Hi Valentin,

Quote:

-----  
I'm sure you are already aware but just in case, the REV\$ keyword is not available in a bare-bones HP-71B.  
-----

Yes, I knew REV\$ was not a standard keyword when I noticed it wouldn't run on my physical HP-71B. I thought it was because mine is 1BBBB version, so your explanation has been much appreciated.

I was not lucky enough to have owned one when it was released. It was simply out of my reach! But I am lucky enough to have one now with the Math ROM as per your advice. I have also a card reader, though I believe an RS-232 interface would be more useful. I'm about to add a 32KB RAM module, which should be enough.

Since I am not familiar with the HP-71B yet, my programs tend to be longer than they ought to be. For instance, to get the following output formatted the way I wanted

```
R(4)    50° 07' 06" NW
```

I had to use almost two full lines:

```
280 M$=CHR$(48*(2-LEN(STR$(M))))&STR$(M) @ S$=CHR$(48*(2-LEN(STR$(S))))&STR$(S)
285 DISP "R(";STR$(I);")";TAB(T);D$;CHR$(167);" ";M$;"' ";S$;CHR$(34);" ";X$
```

Perhaps this could have been done with format strings, but I haven't figured a way to use them in this case. Reading the manuals might help :-)

Best regards,

Gerson.

## **Re: HP42S Mini-Challenge: My Original Solution & Comments**

*Message #36 Posted by [Valentin Albillo](#) on 11 May 2007, 7:27 a.m.,  
in response to message #35 by Gerson W. Barbosa*

Hi, Gerson:

Gerson posted:

"Perhaps this could have been done with format strings, but I haven't figured a way to use them in this case."

Try this:

```

1 I=4 @ M=7 @ S=6 @ T=10 @ X$="NW" @ D$="50"
2 !
280 M$=CHR$(48*(2-LEN(STR$(M))))&STR$(M) @ S$=CHR$(48*(2-
LEN(STR$(S))))&STR$(S)
285 DISP "R(";STR$(I);")";TAB(T);D$;CHR$(167);" ";M$;"' ";S$;CHR$(34);"
";X$
290 !
300 DISP USING
" 'R(' ,D, ' ) ' ,5X,2A,B,2(X,2Z,B),X,2A";I,D$,167,M,39,S,34,X$

>RUN

R(4)      50° 07' 06" NW

R(4)      50° 07' 06" NW

```

where lines 1 and 2 simply set up some variables to mimic the ones you're using in your code, lines 280 and 285 are your own posted coded, and line 300 is my suggested version, which seems to do what you want in a simpler way.

As you can see in the sample RUN, both your code and my line 300 code do produce exactly the same output for this particular example of yours. You may want to fine-tune it as you need to cover other more general cases in your program.

If the exact same format is to be used more than once at several different places, put it in their own IMAGE statement (say line 900 IMAGE ..., and then simply DISP USING 900; .... This will be simpler and more easy to maintain, as you would need to change just the image at line 900 to have the changes propagate to all DISP statements using it, instead of having to change them one by one, individually.

Best regards from V.

## Re: HP42S Mini-Challenge: My Original Solution & Comments

Message #37 Posted by [Gerson W. Barbosa](#) on 11 May 2007, 10:28 a.m.,  
in response to message #36 by Valentin Albillo

Hi Valentin,

Considering the HP-71B is relatively new to me, I was pleased with my HP-71B port of a CASIO PB-700 program I wrote years ago, except for those two lines. I will follow your suggestion in the definitive version.

The Owner's Manual doesn't cover formatting strings properly. A glance at the Reference Manual seemed more promising to me. I will print it out as well.

Thank you very much for the free lesson! :-)

Best regards,

Gerson.

I believe the Radio Shack TRS-80 PC-2 was an OEM version of the Sharp PC-1500 - and that they used the same BASIC. There's a nice resource page for the Pc-1500/PC-2 here, including a link to the PC-2 manual, which you probably already found: <http://www.pc1500.com/>

If the BASIC was indeed the same, then there isn't a built-in renumber command. My copy of the PC-1500 manual is at home -- I'll check tonight for you.

I loved my PC-2. I still think the tiny 4-pen printer/plotter was pretty darned cool. It's fun to dig it out and show it off every few years. Last time I had to build a new battery pack for the printer...

in response to message #1 by [Karl-Ludwig Butte](#)

Hi Karl,

As Dave has already pointed out, there's a great PC-1500 web page.

One way of doing it, would be to write it to the cassette port, save it as wave file on PC and then convert to text file where you could easily use a small program to renumber the source listing. You could also use the PC emulator to test the program out before reversing the Text to Wav and then using the cassette in to get it back

into the PC-1500.

A little klutzy, but do-able. I've used this method to dump a listing of a large program from a ROM cartridge to the PC and then print the listing for further study.

Good Luck,

Bill

*Message #4 Posted by [Peter Geiser](#) on 1 May 2007, 4:04 p.m.,  
in response to message #1 by Karl-Ludwig Butte*

Hi Karl

There is a RENUMBER in one of the Toolkits there were sold commercially.

It would be possible to write one in Basic, but you need to know how the line numbers are set up.

The number of a line is a 2-Byte binary number in memory, you need to PEEK it, change it, and POKE it back into the memory. A line of BASIC starts with the line number (2 Bytes), 1 Byte for the length of the line, then the BASIC-Tokens and commands, and finally as the end of the line the byte 0Dh (13 dec).

Depending on your RAM modules, the area for BASIC programs starts at 40C5, 38C5, 20C5 or 00C5 (all hex).

Best regards

Peter

### **Re: OT Renumber fpr Sharp PC-1500**

*Message #5 Posted by [Namir](#) on 1 May 2007, 4:54 p.m.,  
in response to message #4 by Peter Geiser*

Of course the renumbering task has to correctly renumber GOTO and GOSUB statements too. So the utility has to scan each line for the GOTO and GOSUB tokens and alter their parameters.

### **Re: OT Renumber fpr Sharp PC-1500**

*Message #6 Posted by [Peter Geiser](#) on 4 May 2007, 6:06 p.m.,  
in response to message #5 by Namir*

Namir

You know everything! I indeed forgot about that bit.

Btw., if the number in the GOTO, GOSUB or THEN (if followed by a line number) statement becomes longer, you will have to adjust the line length byte as well.

Thanks

Peter

### Ok, non-extended BASIC programs for matrix work - where?

Message #1 Posted by [Gene](#) on 30 Apr 2007, 9:27 p.m.

Suppose you have a BASIC capable machine without any real math extensions but that has numeric arrays.

I thought there would be somewhere on the web programs to do matrix determinant and inverses for arbitrary  $M \times M$  matrices, for example.

Can't find them.

Anyone have hints?

Won't do any good if it has specialized functions. Just basic arithmetic, loops, and matrices. :-)

### Re: Ok, non-extended BASIC programs for matrix work - where?

Message #2 Posted by [Namir](#) on 30 Apr 2007, 10:44 p.m.,  
in response to message #1 by Gene

Gene,

Numerical Recipes (Cambridge Press) the BASIC version is a very good book. I think the code for this book is in QuickBasic or QBasic, and is therefore a bit more structures.

McGraw Hill published in 1981 two volumes "Basic Scientific Subroutines" by Ruckdeschel. The code in this book is the old line-numbered BASIC. It should have subroutines for matrix manipulation.

If you can live with Visual Basic (version 3) code, then I wrote the book "Mathematical Algorithms in Visual Basic for Scientists & Engineers". Unfortunately you need VB 3 to read this companion disk!

I do have a VB Class (for Excel VBA and VB6) that does vector and matrix operations from scratch. The code is well commented and should be easy to follow.

Namir

### Re: Ok, non-extended BASIC programs for matrix work - where?

Message #3 Posted by [Valentin Albillo](#) on 30 Apr 2007, 10:49 p.m.,  
in response to message #1 by Gene

Hi, Gene:

Too late here (4:50 A.M) so I'm going to bed right now but you may want to have a look at these URLs

[Matrix inversion](#)

[Matrix determinant](#)

which I found instantly by googling searching for 'matrix inversion "next i" "next j"' and variants like that. You might try as well if the links I provided aren't what you need.

Hope it helps.

Best regards from V.

**Thanks, Valentin...that looks like what I want!**

*Message #4 Posted by **Gene** on 30 Apr 2007, 10:53 p.m.,  
in response to message #3 by Valentin Albillo*

I was doing searches on "Basic determinant -visual" etc stuff.

Plan to use these with the Sharp Wizard 8000S I now have with the BASIC card. I'm curious to see how accurate it will be with all the array elements in double precision.

**Re: Thanks, Valentin...that looks like what I want!**

*Message #5 Posted by **GE** on 2 May 2007, 11:40 a.m.,  
in response to message #4 by Gene*

Do you have the 32K or the 128K version of the Basic card ?  
I think the 8000 + 128K Basic card is the best Sharp computer ever.

**Re: Thanks, Valentin...that looks like what I want!**

*Message #6 Posted by **Gene** on 2 May 2007, 12:49 p.m.,  
in response to message #5 by GE*

I only have the 32K version...so far. :-)

I really like the double-precision mode when in Basic.

I did the usual 9 sin cos tan atan acos asin a minue ago and got 9.0000000000000000005 as the answer. NOT BAD.

I'm hoping to put in these BASIC matrix programs into it and run them in double precision mode to see how they do.

I'm hoping to use Valentin's "really mean" matrices he posted here and in Datafile to see how the determinant and inverse do.

That's why I'm hoping to find non-special function containing BASIC programs for matrix work to use on the 8000 model.

**Re: Thanks, Valentin...that looks like what I want!**

*Message #7 Posted by **Rodger Rosenbaum** on 2 May 2007, 3:07 p.m.,

\_\_\_\_\_

If the benchmark were carried with 23 digit arithmetic, and used round-to-even, the result *should* be 2499.9999999999999993.

Your actual result is very good, compared to what other calculators get on this benchmark.

Apparently, in a running program, intermediate results are kept to 23 digits, with the final result given to 20 digits. This is good, and not typical of other calculators, AFAIK.

However, on most calculators, when functions such as trig functions are calculated, the higher internal precision returns a result which is then rounded (or truncated) to the lesser displayed precision. Then the display precision value probably only has a few ULP's of error. The full internal precision function value, on the other hand, probably has hundreds of ULP's of error, and this may be visible in results from programs using those internal values. This doesn't seem to have happened here, and that makes me wonder if they might even use more than 23 internal digits sometimes.

**The Durabrand 828 calculates that way, sort of anyway**

Message #10 Posted by **Palmer O. Hanson, Jr.** on 3 May 2007, 9:21 p.m.,

This doesn't seem to have happened here, and that makes me wonder if they might even use more than 23 internal digits sometimes.

---

A currently available machine which performs in that manner (sort of, at least) is the Durabrand 828. It returns pi, square roots, trigonometric functions and calculated results to the display register which are typically correct to sixteen digits in the truncated sense. It displays results rounded to ten digits and stores results truncated to twelve digits in data registers. I tested the word length using a modification of the your test by calculating  $100000000/7 - 14285714$  and saw 0.28571428 in the display confirming that the word length is sixteen digits.

If you enter arcsin arccos arctan tan cos sin 9 and press EXE you get 8.999999998 in the display with 8.999999998078897 in the display register which is stored in a data register as 8.99999999807.

If you store each intermediate result, with a sequence such as sin 9 -> A EXE , cos A -> A EXE , etc., you effectively truncate each intermediate result from sixteen digits to twelve digits and get 9.000007164 in the display with 9.000007164103007 in the display register which is stored in a data register as 9.0000071641

### **Re: The Durabrand 828 calculates that way, sort of anyway**

*Message #11 Posted by **Rodger Rosenbaum** on 4 May 2007, 12:14 a.m.,  
in response to message #10 by Palmer O. Hanson, Jr.*

I've been thinking about calculator arithmetic tests that don't use the higher math functions, because those vary a lot among calculators, and the IEEE spec doesn't define their accuracy.

Here is a test that only checks the calculator's basic arithmetic accuracy. It is based on the observation that if you reciprocate certain integers twice, you don't get the original integer back, and indeed you shouldn't on a finite precision BCD machine.

For example, type  $6 \frac{1}{x} \frac{1}{x}$  and you should see 5.99999999... on any calculator that does rounded arithmetic properly. If you see exactly 6 then the calculator isn't displaying all the digits in the result, or it's a "pleaser", like the HP30 (you should get 6.00000...0002 if it truncates properly).

So, the idea is to program a loop, apply  $1/x$  twice for a range of integers, each time subtracting the result from the original integer that was reciprocated, and summing the absolute values of those small differences. This is another of my "what should we get" tests, because the result is determinate; there is a correct result, depending on how many digits are used, and the rounding mode.

Here's the program:

```
10 N=500 REM NUMBER OF ITERATIONS
20 S=0 REM INITIALIZE RUNNING SUM
30 FOR I = 1 TO N
```

```
40 S=S+ABS(I-1/(1/I))
50 NEXT I
60 PRINT S
```

The  $1/x$  function is required by the IEEE standard to give properly rounded results, so there should be one correct result from the program from any calculator that complies with the standard.

The square root function is also specified by the IEEE, so line 40 in the program can be modified to:

```
40 S=S+ABS(I-SQRT(I)*SQRT(I))
```

and the program should give a specific result on a compliant machine.

This can be done on a non-programmable machine, with a lot of button pushing, but it's more convenient on a programmable machine!

The HP-71 is a good machine to test this on, because it is known to have IEEE compliant basic arithmetic, and its rounding modes can be changed.

The result using  $1/x$  in line 40, with 500 iterations and OPTION ROUND NEAR set, is 6.803E-8.

With OPTION ROUND ZERO (truncating arithmetic), the result is 6.672E-8.

Both these results are exactly what they should be for a 12 digit machine.

I'm sure you'll want to try it on your own calculators.

A mini-challenge would be to verify the correct result for various numbers of digits used in the calculations, and with different rounding modes.

### More on testing arithmetic

*Message #12 Posted by [Palmer O. Hanson, Jr.](#) on 4 May 2007, 4:21 a.m., in response to message #11 by Rodger Rosenbaum*

Rodger:

You wrote:

Quote:

I've been thinking about calculator arithmetic tests that don't use the higher math functions, because those vary a lot among calculators, and the IEEE spec doesn't define their accuracy. ..."

It will take me a while to digest this. In the meantime I offer a response to a suggestion that you made later in this thread:

Quote:

Try doing the sin cos tan atan acos asin test all on one command line with starting values of 6,7,8,10,11, and 12 degrees and see if the results are all as good as when starting with 9 degrees.

I did those values and some more with my Durabrand 828 with the following results:

| N  | N - f(N)  |
|----|-----------|
| 5  | 3.153E-09 |
| 6  | 3.233E-09 |
| 7  | 2.730E-09 |
| 8  | 6.021E-10 |
| 9  | 1.921E-09 |
| 10 | 5.934E-10 |
| 11 | 3.791E-10 |
| 12 | 4.073E-10 |
| 13 | 6.103E-10 |
| 14 | 8.093E-10 |
| 15 | 1.433E-09 |
| 20 | 8.937E-10 |
| 25 | 5.447E-10 |
| 30 | 3.095E-10 |
| 60 | 6.158E-10 |

where all of the values in the second column are positive. I'll get some results for this test with some other machines before moving on to some of your proposed tests.

Question: Does anyone know how someone settled on 9 as the test integer to be used for this test?

Palmer

### **Re: More on testing arithmetic**

*Message #13 Posted by [Klaus](#) on 4 May 2007, 5:21 a.m.,  
in response to message #12 by Palmer O. Hanson, Jr.*

Yes, because the test number should be a bit away from 0 (as some algorithms have special cases for args near zero), and it should be a single keystroke to enter the number (possibly through the blister pack in stores).

### **Re: Thanks, Valentin...that looks like what I want!**

*Message #14 Posted by [Palmer O. Hanson, Jr.](#) on 4 May 2007, 10:05 p.m.,  
in response to message #7 by Rodger Rosenbaum*

Message No. 15 in the thread on the Savage benchmark as posted by Gerson Barbosa on 2 December 2006 quoted the Wlodek article as

Quote:

...on older HP calculators trig is accurate to almost 12 digits, but the policy of removing the last two digits, instead of leaving them hidden, can lead to less accuracy too. Newer HP calculators with a Saturn CPU work to 15 digits precision (and accuracy) internally, but round results to only 12 digits at the end of each calculation - the TI-74 works to 14 digits accuracy and precision, and leaves all 14 digits on the stack (with 4 hidden digits), so the final accuracy of the TI-74 result is 2500.0000291436.

I don't have all of my references here in North Carolina but my recollection is that the TI-74, and its predecessors the CC-40 and TI-99/4, operate with base 100. The result is that some calculations are done to 13 digits and some to 14. In this particular case when  $A < 10$  the value of A will have been stored to 13 digits not 14. I don't know what that means for the end result.

**Re: Thanks, Valentin...that looks like what I want!**

Message #15 Posted by **GE** on 7 May 2007, 3:59 a.m.,  
in response to message #14 by Palmer O. Hanson, Jr.

I think I recall that the TI74 and TI95 don't use CORDIC but polynomial approximations.

Quote:

I did the usual 9 sin cos tan atan acos asin a minue ago and got 9.0000000000000000005 as the answer. NOT BAD.

Gene, would you post all the intermediate results from this test?

**Re: Thanks, Valentin...that looks like what I want!**

Message #17 Posted by **Gene** on 2 May 2007, 4:19 p.m.,  
in response to message #16 by Rodger Rosenbaum

The D stands for double precision.

```
sin 9 = 1.5643446504023086901D-01
cos   = 9.9999627274288502412D-01
tan   = 1.7454999855488660791D-01
atan  = 9.9999627274288502409D-01
acos  = 1.5643446504023144653D-01
asin  = 9.00000000000000335019
```

Funny, but when it is typed in as one command line, I still get the 9.0000000000000000005 result.

Hmm...

**The table of the forensic results...**

Message #18 Posted by **Gene** on 2 May 2007, 4:22 p.m.,  
in response to message #17 by Gene

Contains an entry for the Sharp E-500 showing both results I have obtained - one in a single calculation, the other step by step.

*Message #19 Posted by **Rodger Rosenbaum** on 2 May 2007, 6:15 p.m.,  
in response to message #18 by Gene*

Note that footnote "m" on that site says of the two different values: "Unexplained different results from different contributors."

I guess we know the reason for the different results now!

### **Re: The table of the forensic results...**

*Message #20 Posted by **Gene** on 2 May 2007, 6:19 p.m.,  
in response to message #19 by Rodger Rosenbaum*

Yes, we do. Very odd. Wonder what it is doing in a chain calculation that is different from operating on a double-precision intermediate result?

Hmm..

### **Re: Thanks, Valentin...that looks like what I want!**

*Message #21 Posted by **Rodger Rosenbaum** on 2 May 2007, 6:21 p.m.,  
in response to message #17 by Gene*

What do you get if you type all on one command line:

```
1/7-.142857142857
```

### **Wizard 8000 results**

*Message #22 Posted by **Gene** on 2 May 2007, 10:14 p.m.,  
in response to message #21 by Rodger Rosenbaum*

0.0000000000001 in single precision mode and 1.4285714285D-13 in double precision mode.

### **Re: Wizard 8000 results**

*Message #23 Posted by **Rodger Rosenbaum** on 3 May 2007, 2:19 a.m.,  
in response to message #22 by Gene*

Quote:

```
0.0000000000001 in single precision mode and 1.4285714285D-13  
in double precision mode.
```

From this result we can see that the calc is using 23 digits internally in double precision mode, and displaying 20 digits.

But, it didn't round the result properly; it should have gotten 1.4285714286D-13, and the issue of "round-to-even" doesn't even arise. It just truncated the result.

Now about the forensic result:

```
sin 9 = 1.5643446504023086901D-01  
cos   = 9.9999627274288502412D-01  
tan   = 1.7454999855488660791D-01  
atan  = 9.9999627274288502409D-01
```

*there's a 1 ULP error here; the correct result of atan(1.7454999855488660791D-01) is 9.99996272742885024098463D-01, which should have rounded to 9.9999627274288502410D-01. The result is simply truncated.*

acos = 1.5643446504023144653D-01

*The correct result of acos(9.9999627274288502409D-01) is 1.5643446504023144644D-01, an error of 9 ULP's.*

asin = 9.00000000000000335019

This is really not too bad for trig functions for these arguments.

No doubt, when you evaluate this test all on one command line, the calculator is keeping intermediate results to 23 digits instead of just 20 digits as when you do it a step at a time, and so you get better accuracy.

If the test is carried out starting with 9 degrees, using 23 digit arithmetic with round-to-even, the result should be 8.999999999999999467, rather than the 9.000000000000000005 you actually got.

It's possible that the result starting from 9 degrees is especially good just by accident, due to compensating errors.

Carrying 24 digits, the result should be 9.000000000000000015.

Carrying 25 digits, the result should be 9.000000000000000001.

Try doing the sin cos tan atan acos asin test all on one command line with starting values of 6,7,8,10,11, and 12 degrees and see if the results are all as good as when starting with 9 degrees.

It appears that the calculator is truncating at least some of the time, when rounding would be better.

### **Result for the SHARP PC-1475**

*Message #24 Posted by [Valentin Albillo](#) on 3 May 2007, 3:25 p.m.,  
in response to message #6 by Gene*

Hi,

The result for the [SHARP PC-1475](#) model is (DEGrees mode):

```
>ASN ACS ATN TAN COS SIN 9#
```

```
9.00000000000000000005
```

Best regards from V.

*Edited: 3 May 2007, 3:26 p.m.*

Double precision is very nice. I'll try the simple inversion routine in double precision and post the results.

### **That over-rated trigonometric forensic!**

Message #26 Posted by [Karl Schneider](#) on 5 May 2007, 2:38 a.m.,  
in response to message #6 by Gene

Quote:

I did the usual

```
"9 sin cos tan atan acos asin"
```

a minute ago and got 9.000000000000000005 as the answer.

All --

I know that this topic has been discussed before, but I'm still chagrined that this "calculator forensic" procedure remains so commonly accepted as a *de facto* standard for ostensibly assessing the quality of a calculator's general accuracy.

The prescribed mathematical calculation is

```
asin(acos(atan(tan(cos(sin(9 deg))))))
```

in degrees mode, for which the exact answer is 9. Usually, the answer returned by handheld calculators is not 9, but very close to it -- within 0.0000151% (8.9999864267) for Saturn-based models, 0.00464% (9.000417403) for Spice/HP-41/Voyager models, and 0.0453% (9.004076901) for the venerable HP-35. The HP-30S returns the exact answer of 9 in this test, because it uses 80-bit floating-point math that provides about 24 internal digits, then rounds those results that are extremely close to integers, in order to help filter out the inexactitude of floating-point representation.

The computational sequence is mathematically "symmetrical", but not particularly useful in common practice. Why would one take the tangent of a sine of a cosine? If the units of 9 are degrees, what are the units of sine of 9 degrees for the cosine calculation? The angular unit is assumed to be degrees, but sine produces a plain ol' number without any units of measurement.

Much of the inaccuracy is introduced by roundoff error when results are internally multiplied by  $180/\pi$  ( $\approx 57.29578$ ) as the last step in the arc-functions to convert a radian-valued output to degrees. Smaller roundoff inaccuracies are also introduced during calculation of the trigonometric functions, in which each input is *divided* internally by  $180/\pi$ .

Obviously, the more *internal* digits a calculator has, the less susceptible it is to the unit-conversion errors. More *external* digits reduce roundoff errors in the final result of each calculation that is fed to the next one. The Saturn-based models have 12 external and 15 internal digits; the Spice/HP-41/Voyager models have 10 external and 13 internal. The HP-35 has 10 external and presumably fewer than 13 internal.

For comparison's sake, try the same computational sequence in radians mode, in order to eliminate the errors of converting between degrees and radians. The starting value will be  $9*(\pi/180)$  radians, which is mathematically identical, save for the small roundoff error of *that* computation.

Saturn-based models give 0.157079632681, for an error of about 1.273E-09%.

Spice/HP-41/Voyager models give 0.1570796319, for an error within 5.093E-07%.

Quite an improvement, I'd say -- four orders of magnitude smaller in each case. It is also noteworthy that the relative errors of the Saturn-based models and their immediate predecessors differ by roughly 2.5 orders of magnitude, in either degrees or radians mode. This is consistent with the two extra internal and external digits the Saturn-based models carry.

Radians mode is not available on the HP-35, but the HP-45 produces a result of 0.1570796336, for an error of 5.730E-07%. (A "thanks" to Gerson Barbosa)

Another difference of the HP-35 from the later models is that it does not seem to maintain ten *significant* digits to match its ten *displayed* digits. For example, the results of the three trigonometric functions are as follows:

| Model  | $\tan(\cos(\sin(9 \text{ deg})))$ |
|--------|-----------------------------------|
| HP-42S | 0.0174549998555                   |
| HP-11C | 0.01745499985                     |
| HP-35  | 0.0174549998                      |

The above is not intended to assert that the "forensic technique" has no value. The number of internal, external (displayable), and significant digits carried, as well as the algorithmic sophistication, will be reflected in the final result obtained. Still, it is instructive to know why a given result was obtained, and to use diagnostic/forensic calculations that are valid in real-world applications.

## Re: That over-rated trigonometric forensic!

Message #27 Posted by **Gerson W. Barbosa** on 5 May 2007, 9:50 a.m.,  
in response to message #26 by Karl Schneider

Hello Karl,

Quote:

Why would one take the tangent of a sine of a cosine? If the units of 9 are degrees, what are the units of sine(9 deg)?

You're right! The only real life example involving the computation of two chained trigonometric functions I can think of now is  $\cos(\text{atan}(Q/P))$ . I sometimes calculate power factors this way only as a convenience: 7 keystrokes versus 9 keystrokes on the HP-45, on which  $x^2$  is not a shifted function, when compared to the equivalent  $P/\sqrt{P^2 + Q^2}$ , for  $P=4$  and  $Q=3$ .

Quote:

No radians mode is available for the HP-35, but someone could try these with an HP-45.

0.1570796336 -> 5.730E-07%

Best regards,

Gerson.

### **Re: That over-rated trigonometric forensic!**

*Message #28 Posted by **Gerson W. Barbosa** on 5 May 2007, 11:16 a.m.,

Ok, on the HP-45 one could try also this 7-keystroke sequence:

```
3 ENTER 4 ->P 4 / 1/x
```

### **Trigonometrics for power factor**

*Message #29 Posted by **Karl Schneider** on 5 May 2007, 2:51 p.m.,  
in response to message #27 by Gerson W. Barbosa*

Hi, Gerson --

Quote:

The only real life example involving the computation of two chained trigonometric functions I can think of now is  $\cos(\text{atan}(Q/P))$ . I sometimes calculate power factors this way...

Being in the same line of work, I sometimes use the inverse calculation:  $Q/P = \tan(\cos^{-1}(\text{pf}))$ . For a power factor of 0.95, the magnitude of reactive power  $Q$  is about one-third that of the active power  $P$ .

However, these calculations are not the same as, for example, taking the cosine of a sine.  $Q/P$  is a dimensionless number;  $\text{atan}$  and  $\text{acos}$  produce an angle that has some unit of measure, which is the required input to  $\tan$  and  $\cos$ . Granted, the radian is *physically* dimensionless, but it is still a unit of measure.

An aside from a person who only ever uses trigonometry (these days) for weekend carpentry projects...

I'm not qualified to comment on the usefulness of the chain calculation as a determinant of calculator accuracy or applicability. However I thought its original usefulness was precisely because its "inaccuracy" provided something akin to a fingerprint of the underlying calculation engine. That fingerprint allowed a curious person to guess at the genealogy of a particular calculator. In this context it says more about the possible relationships between different calculators than it does about their suitability for a particular application.

## Try this simple inversion routine, Gene

Message #31 Posted by [Valentin Albillo](#) on 3 May 2007, 3:17 p.m.,  
in response to message #4 by Gene

Hi, Gene:

In addition to the code in the links I posted, try this extremely simple routine written and tested in plain vanilla BASIC:

```
>LIST

1000 REM dimension and read matrix from sample data
1010 RESTORE : READ N : DIM B(N,N)
1020 FOR I=1 TO N : FOR J=1 TO N : READ B(I,J) : NEXT J : NEXT I
1030 REM computing inverse
1040 FOR P=1 TO N : K=B(P,P)
1050 FOR I=1 TO N : FOR J=1 TO N : IF P<>J AND P<>I THEN B(I,J)=B(I,J)-
B(I,P)*B(P,J)/K
1060 NEXT J : NEXT I
1070 FOR I=1 TO N : B(I,P)=B(I,P)/K : B(P,I)=-B(P,I)/K : NEXT I :
B(P,P)=1/K : NEXT P
1080 REM output
1090 FOR I=1 TO N : FOR J=1 TO N : PRINT "B(";I;" ";J;" )=";B(I,J) : NEXT J
: NEXT I : END
1100 REM data for sample 4x4 matrix
1110 DATA 4
1120 DATA 6,-1,-3,1,-2,0,1,3,2,-1,0,1,-3,2,-1,0

>RUN

B( 1 , 1 )=-5
B( 1 , 2 )=-6
B( 1 , 3 )= 23
B( 1 , 4 )= 9
B( 2 , 1 )=-11
B( 2 , 2 )=-13
B( 2 , 3 )= 50
B( 2 , 4 )= 20
B( 3 , 1 )=-7
B( 3 , 2 )=-8
B( 3 , 3 )= 31
B( 3 , 4 )= 12
B( 4 , 1 )=-1
B( 4 , 2 )=-1
B( 4 , 3 )= 5
B( 4 , 4 )= 2

>
```

which will generically work for NxN matrices and you can easily customize for your particular input or output requirements.

Because of its extreme simplicity (the inversion code is just 4 lines) this routine won't work if there are any 0 elements in the main diagonal or if they do appear there while inverting, something which could be easily corrected with a few extra lines of code, but I don't think that's necessary for testing purposes: simply use it "as is" for examples where no 0's get in the way,

such as my [Mean Matrices \(tm\)](#), for example, or randomly generated matrices.

Should you absolutely need to run it with some sample matrix which has that problem, exchanging two rows or two columns usually solves the problem (unless the matrix is singular, of course) or you can try to add the necessary code to skip 0 pivots till the next iteration (just an extra line of code, really).

Best regards from V.

### **Great, that worked...now, about that AM#1 matrix...**

*Message #32 Posted by [Gene](#) on 3 May 2007, 4:48 p.m.,  
in response to message #31 by [Valentin Albillo](#)*

What I really want to do is test the Wizard 8000 w/the double precision BASIC card on those tough matrices you posted here and in Datafile V24N4P10.

This routine won't do that, of course, since those were 7x7.

And, alas, the BASIC on the card is not very enhanced. That's why I was looking for a vanilla BASIC determinant and inverse listing.

It really is a nice unit. Just want it to play with the big dogs!

### **Re: Great, that worked...now, about that AM#1 matrix...**

*Message #33 Posted by [Valentin Albillo](#) on 3 May 2007, 7:16 p.m.,

Hi, Gene:

Gene posted:

*"This routine won't do that, of course, since those were 7x7. And, alas, the BASIC on the card is not very enhanced. That's why I was looking for a vanilla BASIC determinant and inverse listing."*

I beg your pardon but I don't understand. The routine above is as generic as it can be, you just need to change the DATA statements to:

```
1110 DATA 7
1120 DATA ... the 49 elements of your 7x7 matrix
```

and there you are. As for vanilla BASIC, the above routine is absolutely plain vanilla, it uses nothing which isn't standard BASIC.

If that DIM B(N,N) troubles your BASIC, just remove line 1110 DATA 4 or DATA 7 or whatever and the corresponding READ N at line 1010 and simply directly specify DIM B(4,4) or DIM B(7,7) instead.

If this routine doesn't run in your particular card or machine, then I'm not sure it does actually support plain vanilla BASIC ... Good luck and

Best regards from V.

*Message #34 Posted by [Gene](#) on 3 May 2007, 8:05 p.m.,  
in response to message #33 by [Valentin Albillo](#)*

My fault. Sometimes English is tough for us Americans. I had mis-read your description of the code. I thought it would ONLY work for 4x4 matrices. Why? I'm stupid sometimes. :-)

It ran perfectly for the smaller data statements. I'll try AM#1 later and we'll see what it can do.

As Homer Simpson would say "Doh!"

*Message #38 Posted by [Rodger Rosenbaum](#) on 4 May 2007, 3:38 a.m.,  
in response to message #37 by [Gene](#)*

I'm surprised by your results. I would have expected better. You got 5 correct digits except for the 3rd item which has 4 (but almost 5) correct digits.

The condition number of the matrix is nearly  $10^{11}$ , which means that you should lose 11 digits in your results. If you do 20 digit arithmetic, you should have gotten about 9 correct digits.

The HP50 gets 4 correct digits. It uses 15 digit arithmetic internally, so  $15 - 11$  (the exponent of the condition number) is 4, the number of correct digits we should expect.

Perhaps this is because the routine you used doesn't do full pivoting.

Prof. Kahan's routine should do better.

### **Re: AM#1 row 7 inverse results...**

*Message #39 Posted by Gene on 4 May 2007, 4:17 p.m.,  
in response to message #38 by Rodger Rosenbaum*

Hi Rodger!

Are you sure about correct digits?

Valentin's article in Datafile says that the last row of the inverse should be:

Value 7,1: -96360787 compared to my computed -96360789.999, so I have 7 correct digits here.

Value 7,2: -320208 compared to -320207.999999, which is truly 5 digits, but oh so close to more.

Value 7,3: 537452 compared to computed 537451.999999, again, 5 correct but ...

Value 7,4: -2323663 compared to computed -2323662.99999, which is 6 digits, but...

Value 7,5: 11354927 compared to computed 11354926.9999, which is 7 digits.

Value 7,6: -30196488 compared to computed -30196487.9999, which is 7 digits.

Value 7,7: 96509954 compared to computed 96509953.999, which is 7 digits.

That's an average correct of 6.28 digits correct across the 7 elements, not counting the instances where it was off by 0.001 or less. :-)

The actual values only average 7.28 real digits across the 7 elements.

The HP71B in the datafile article using Valentin's Method 1 only got an average of 1.43 digits correct for the last row of the inverse, for the record.

Aren't there more correct digits from the Sharp 8000 than you indicated? :-)

### **Re: AM#1 row 7 inverse results...**

### **Modifications to Valentin's program...**

*Message #42 Posted by **Gene** on 4 May 2007, 8:21 a.m.,  
in response to message #41 by Gene*

I made the matrix B and the constant K both double precision. Everything else was single precision. I think those are the values that were used in the computations.

### **Re: Modifications to Valentin's program...**

*Message #43 Posted by **Rodger Rosenbaum** on 4 May 2007, 3:55 p.m.,  
in response to message #42 by Gene*

Quote:

I made the matrix B and the constant K both double precision. Everything else was single precision. I think those are the values that were used in the computations.

This is much better. The condition number of the matrix is about 3E12, so you should expect somewhat less than  $20 - 12 = 8$  correct digits. Your results have 7 and 8 digits correct. Very nice.

### HP-41CV won't power card reader?

Message #1 Posted by [Bob Cortopassi](#) on 30 Apr 2007, 7:02 p.m.

I have two 41CV's. One is a fullnut and the other a halfnut. The card reader works perfectly in the halfnut, but not the fullnut. In the fullnut, it never "engages" and grabs the card when inserted.

Other than the card reader problem, the fullnut works perfectly... I even tried inserting an Advantage ROM in the #4 slot where the card reader plugs in. The module is recognized and I can do a catalog 2 without error.

Any ideas??

Thanks, Bob

### Re: HP-41CV won't power card reader?

Message #2 Posted by [Les Wright](#) on 30 Apr 2007, 7:39 p.m.,  
in response to message #1 by [Bob Cortopassi](#)

It could be in the fullnut the batteries are potent enough to run the calculator but not enough to drive the motor in the card reader. I have a halfnut CX and fullnut CV and whenever I do any card reading (and especially writing) I make sure the stronger set of batteries I have is in the calculator. One of the two sets is just fine to do about anything I want EXCEPT drive the card reader.

Try swapping your battery sets between calculators first.

Does CAT 2 on the fullnut list the routines in the Card Reader when the reader is installed?

Les

### Re: HP-41CV won't power card reader?

Message #3 Posted by [Bob Cortopassi](#) on 30 Apr 2007, 8:02 p.m.,  
in response to message #2 by [Les Wright](#)

I should have mentioned that I did already try a battery swap. Your cat 2 suggestion was a good one, though. I did that, and the fullnut does indeed see the card reader functions when it's plugged in.

Thanks, Bob

### Re: HP-41CV won't power card reader?

Message #4 Posted by [Les Wright](#) on 30 Apr 2007, 9:03 p.m.,  
in response to message #3 by [Bob Cortopassi](#)

The only thing I can think off is that there is something fishy with Port 4 that renders it adequate to detect the Advantage and Card Reader ROMs but not enough to power the card reader.

I suspect there could be some wear or fraying of the plating on the contacts. I was having weird behaviour in with the card reader in my CV, and on taking the calc apart I noted there was some crimping of the contact along an edge of the male connector for Port 4. I gently flattened the crimping with a thumbnail, gave everything a good clean with 99% isopropanol, and all is fine since.

I don't know if this is your problem specifically, but it seems that the issue is in your fullnut calculator, not in the card reader.

Les

### **Re: HP-41CV won't power card reader?**

*Message #5 Posted by [Ron](#) on 1 May 2007, 9:28 a.m.,  
in response to message #3 by Bob Cortopassi*

Did you try BRAND NEW (shouting) batteries in the full nut? It sure sounds like a battery problem to me. As I remember it, this is how I discovered that my full nut took more juice than my half nut. The same used batts would run my reader in my half nut, but not in my full nut. New batts in my full nut did the trick.

### **Re: HP-41CV won't power card reader?**

*Message #6 Posted by [David Smith](#) on 1 May 2007, 12:50 p.m.,  
in response to message #1 by Bob Cortopassi*

The problem is most likely corrosion on the battery/port connector strip. Open up the machine and clean all the contacts with 91%+ isopropyl alcohol.

Could also be related to bad screw posts not keeping the circuits clamped together well, or wear on the port contacts.

**HP 29C 1-2-3 keys not working**

Message #1 Posted by [Olivier TREGER](#) on 30 Apr 2007, 11:55 a.m.

Hello,

I'm the happy owner of a nice-looking 29C that's unusable because "1","2" and "3" keys don't respond.

I've tried to open it but, of course, since the keyboard PCB is stuck to the face bezel, I can't even check the status of this row of keys.

Does anyone know how to dismount the KB PCB from the chassis?

Thanks for help, Olivier

**Re: HP 29C 1-2-3 keys not working**

Message #2 Posted by [Eric Smith](#) on 30 Apr 2007, 5:12 p.m.,  
in response to message #1 by Olivier TREGER

Does the multiply key work?

With three keys in a row not working (and most likely the fourth as well), the problem is more likely to be the contact between the keyboard PCB and the logic PCB. Check that the spring terminal isn't too compressed to make good contact.

**Re: HP 29C 1-2-3 keys not working**

Message #3 Posted by [Olivier TREGER](#) on 30 Apr 2007, 6:22 p.m.,  
in response to message #2 by Eric Smith

Eric,

You're right: the multiply key is out. What do you call the spring terminal?

**Re: HP 29C 1-2-3 keys not working**

Message #4 Posted by [Eric Smith](#) on 30 Apr 2007, 6:28 p.m.,  
in response to message #3 by Olivier TREGER

Those are the pins that are soldered to the logic board, and press into the plated-through holes in the keyboard PCB. The portion that fits into the hole is bifurcated and springy so that it makes electrical contact. It's also possible that some contaminant has gotten onto the contact or into the plated-through hole.

If it's not a problem with the contact pin, the next likely cause is ESD damage to the ACT (processor chip). But the mechanical contact is the more likely failure mechanism.

**Re: HP 29C 1-2-3 keys not working**

*Message #5 Posted by [Olivier TREGER](#) on 30 Apr 2007, 8:33 p.m.,  
in response to message #4 by Eric Smith*

How do you suggest that I access the area between keys and their PCB? I've noticed that they're kept together using melted plastic "sticks" (can't find the right term).

Is there a way to dismount that without making the calc unusable?

**Re: HP 29C 1-2-3 keys not working**

*Message #6 Posted by [Eric Smith](#) on 1 May 2007, 1:14 a.m.,  
in response to message #5 by Olivier TREGER*

You shouldn't need to take the keyboard apart. There is no common failure mode that would be on the top side of the PCB and would affect the entire row of keys.

**Re: HP 29C 1-2-3 keys not working**

*Message #7 Posted by [Olivier TREGER](#) on 1 May 2007, 12:11 p.m.,  
in response to message #6 by Eric Smith*

So... any diagnostic/advice?

**Re: HP 29C 1-2-3 keys not working**

*Message #8 Posted by [Ronald P](#) on 1 May 2007, 4:29 p.m.,  
in response to message #7 by Olivier TREGER*

Hi,

There are 2 possible solutions

If there is some dirt:

1) Use an ultrasonic cleaner, rinse afterwards with clean (distilled) water, blow t dry with compressed air then let it dry fully over 1 day.

If it is a corrode contact:

Use contact spray (I normally use Contact 900) press the buttons many times, let it soak, and press again the buttons a number of times, try to wriggle the keyboard a bit etc. Clean the keyboard again with the ultrasonic as described above.

Do NOT use the Ultrasonic to long or you will also remove the key text maybe.

Success

Ronald

**Re: HP 29C 1-2-3 keys not working**

*Message #9 Posted by [Eric Smith](#) on 2 May 2007, 5:02 p.m.,  
in response to message #7 by Olivier TREGER*

As I've said, there is almost zero chance that the problem is in the keyboard itself, if it

affects the entire row. It's highly likely (>90%) that it is the contacts **between** the keyboard and the logic board. One of the contacts is dirty or bent, or is not making contact with the plating of the hole it inserts into, or the hole is dirty.

You can test the keyboard with a multimeter, by probing the holes for the appropriate matrix position. The information needed is on the HPCC schematics CD. I don't have my copy handy. The general approach is to set the multimeter to ohms (resistance). With the key not pressed, the resistance should be near infinite. With it pressed, it should be near zero (under 10 ohms).

Measure the contact resistance of a working switch first to verify that your test setup is working. Then if you can measure the correct resistances for the non-working keys in both the open and closed positions, that will tell you that the keyboard itself is OK, and that there is no reason to disassemble it further.

If the multimeter shows the keyboard is OK, then you need to check the inter-board contacts carefully.

I wouldn't do any ultrasonic cleaning or washing until checking with the multimeter.

### **Re: HP 29C 1-2-3 keys not working**

*Message #10 Posted by **Olivier TREGER** on 3 May 2007, 2:10 p.m.,  
in response to message #9 by Eric Smith*

Eric,

Here is what I sent to Randy (FixThatCalc) to describe my problem:

Quote:

None of the holes shows any sign of corrosion. If you except some cosmetic details, the functional part of the calc itself seems perfect... except the row of keys.

Now, when I try the calc outside of its chassis, simply sliding the battery pack at the right place, I notice that depending on where I touch the back solderings (on the left part of the PCB, when I face the keyboard), "2" and "3" often work, "1" and "x" being harder to "wake up".

Looking at the soldered pins and the ICs gives no clue of where the failure may reside.

Does this ring a bell to you? Especially touching the soldered part of the pins on the PCB?

### **Re: HP 29C 1-2-3 keys not working**

*Message #11 Posted by **Eric Smith** on 3 May 2007, 3:37 p.m.,  
in response to message #10 by Olivier TREGER*

That makes it sound like the problem is the pin contacts, as I've been saying all along.

## **Re: HP 29C 1-2-3 keys not working**

*Message #12 Posted by **Randy** on 3 May 2007, 3:41 p.m.,  
in response to message #11 by Eric Smith*

Olivier, back in January, I sent you a photo so that we could identify which version of keyboard you had. I never heard back from you about this until a few days ago at which point I had forgotten about the earlier exchanges.

For the sake of those trying to help and to avoid duplication of effort, lets pick up that thread here publicly.

I've posted that photo originally sent below. I've added a small white circle and line pointing to the area that I think is the problem. I said I think it is the problem because I'm making an assumption about which version keyboard you have.

If memory serves me correctly, all 29C keyboards I've seen use snap domes formed on a plastic sheet, similar to the later 30 series keyboards. This is very different from the formed strips of the classic keyboards which were used on the early Woodstocks. The photo shows a 25 keyboard on the left with the flex strips, the keyboard on the right is a later model 29C keyboard with plastic domes. Notice that on the 25 keyboard you can see metal through the holes where the contacts are. There are no holes on the 29C keyboard due to the differences in construction.

The problem is most likely caused by a failure of the plastic heat stake(s) that hold the epoxy fiberglass part of the board against the flexing domed sheet. The heat stakes fail and the two halves loose connection(s). The area that I have circled is where the connection is made to the common of your keyboards problem row. The plate-thru hole connects to the tear-drop trace you can see through the board. The large circle is where the common of the plastic dome sheet connects to the circuit. It is only the pressure created by the surrounding heat stakes that hold them in contact. If the heat stakes fail, as is typical in that area since that is where most of the battery corrosion occurs, you're left with an intermittent keyboard.

Given the design of the molded part that has failed, there is little chance of a permanent repair. Any use of epoxies or the like will only result in frozen, non-moving keys. Small screws cannot be used as the surrounding plastic is only the diameter of the heat stake that has sheared off.

If that is indeed what has happened to your keyboard, I'm fresh out of ideas that would fix it.

[http://fixthatcalc.com/images/mohpc/woodstock\\_keyboards.jpg](http://fixthatcalc.com/images/mohpc/woodstock_keyboards.jpg)

*Message #13 Posted by **Eric Smith** on 3 May 2007, 5:05 p.m.,  
in response to message #12 by Randy*

You could verify Randy's hypotheis using the multimeter test approach I described earlier. That would tell you without a doubt whether the

problem is the keyboard itself, or the interconnect between the keyboard and logic board.

**Re: HP 29C 1-2-3 keys not working**

*Message #14 Posted by **Olivier TREGER** on 3 May 2007, 6:11 p.m.,

**HP34c decimal point/comma interchange for display**

Message #1 Posted by [Jason](#) on 30 Apr 2007, 12:58 a.m.

Hi

How do you change/alternate the comma/decimal point option on the display on HP34c - currently showing a comma as a decimal point between int/frac & a decimal point/dot as a 1000's separator on large integer display. I think it is a simple key stroke command sequence to interchange - anyone know what it is?

Thanks Jason

**Re: HP34c decimal point/comma interchange for display**

Message #2 Posted by [Valentin Albillo](#) on 30 Apr 2007, 2:20 a.m.,  
in response to message #1 by Jason

Hi,

No key sequence but an internal jumper. Have a look at:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=36588>

Best regards from V.

**Re: HP34c decimal point/comma interchange for display**

Message #3 Posted by [Mike T.](#) on 30 Apr 2007, 5:58 a.m.,  
in response to message #2 by Valentin Albillo

I've successfully done this on my own HP33C (which is similar).

However opening the case can be a bit nerve racking, as it can all go wrong if you are unlucky. If you haven't already seen it then I'd suggest you take a look at this guide to [spice repairs](#).

That jumper isn't hard to spot, particularly as the picture in the thread referenced above is so clear, but be warned that it is quite a bit smaller than it looks, so you will need a fine point on a your soldering iron..! (Not really a job for an amateur plumber like myself).

Mike T.

### 17bii+ ROM

Message #1 Posted by [Tim](#) on 29 Apr 2007, 11:40 a.m.

Hi -

I love my 17bii+, and would love to get an emulator for it. Seems that the hp42 emulator will work if I can get a ROM image for the 17bii (and having played around the the Free42 emulator, it's pretty sweet!).

Does anyone know if the newer 17bii+ version can do a ROM dump and/or if that + ROM will work with the emulator? All the documentation seems to just refer to the 17bii. Assuming it's workable I'm planning to beg borrow buy or steal a 48g so that I can get a ROM image for this. Would the newer 49g or 50 also work as a host?

Email me offline with any other suggestions on a solution: pierson\_2001 <at> yahoo <dot> com.

Thanks!

--Tim

### Re: 17bii+ ROM

Message #2 Posted by [Eric Smith](#) on 30 Apr 2007, 3:37 a.m.,  
in response to message #1 by Tim

There isn't any publicly available emulator for the 17bii+, and there isn't any known way to dump its ROM. Emulating a 17bii or 17B is the closest you're going to get.

### Re: 17bii+ ROM

Message #3 Posted by [Les Wright](#) on 30 Apr 2007, 9:58 a.m.,  
in response to message #1 by Tim

I can't help you with your request by I am delighted that someone other than me really likes the 17bii+ as well. Due to mistimed eBay bids I ended up with a second one, NIP, and the few offers I have received for it are a laughable fraction of what I paid for it. The Canadian reseller who sold me my 12cp and 49G+ last year tells me that now the 50G and 12c are his big movers, but he has a large inventory of the 17bii+ that no one seems to want. I had offered the 17bii+ to him in partial trade toward a 50G, whereupon he advised me he had more of the former than he knew what to do with.

Free42 is amazing but is technically a simulator, not an emulator, and I use it regularly, particularly on my old Sony Clie and newer Palm TX. Emu42 is the actual emulator, and I must admit I don't use it much. The internal 25-digit precision of Free42 is far too enticing for me. Moreover, even though Free42 is not entirely bug free, Thomas promptly responds to bug notifications and continually upgrades the software. It is important to note that Free42 implements features of the actual calculator in original code, which means it usually does not give identical results to Emu42 or the 42S. The built-in integrator is a case in point--on Free42 it is faster and will report back an estimated uncertainty in the result that is usually more refined than on the actual calculator. Being able to understand the source code a little helps me understand where these numbers come from, whereas the original calculator is more of a black box.

Keep on enjoying the 17bii+. Looks like the fan club is very small.

Les

### Re: 17bii+ ROM

Message #4 Posted by [Tim](#) on 30 Apr 2007, 12:24 p.m.,  
in response to message #3 by Les Wright

Bummer - I'm a huge fan of my 17bii+. Mainly need it for all the finance stuff, which is why the 42s is less useful. Most finance dorks prefer the 12c, but honestly I think the 17bii+ is much easier to use, and the solver is great too for all the other things I might want to throw in there.

If anyone can help out on the 17bii front for the emulator, it'd be greatly appreciated, since it looks like I'm SOL trying to dump my 17bii+ - I'd love to have it running in Windows or on my PDA...

Cheers,

--Tim

### Re: 17bii+ ROM

Message #5 Posted by [Ron Ross](#) on 30 Apr 2007, 12:42 p.m.,  
in response to message #4 by Tim

You can download an exe file for the Hp10Bii. It is a financial / business calculator w/o a solver. However it has the TVM solver and other financial functions that you may find acceptable. It is an algebraic model and this file is readily available to find via google (may even be on Hp's own site). You get no solver, but it is a decent low end financial calculator with moderate stats functions. (no RPN mode for this model though)

Hp also released the ROM of the 48 & 49G series graphics calculators. Both include built in finance applications and you can load up any other programs as if they were the real calculator onto your PC. This opens up a large realm of software that is available from hpcalc.org as well. These two also have a solver that is much better and more powerful than the solver included with the 17B series (and just a bit more complex).

One last option is to look for an Hp41c model emulator/simulator and then load a stat pack and Real estate module into it. This may be the hardest to readily acquire, but a persistent search on WWW should turn up something.

Your closest to use and approximation of the Hp17b series will be the Hp48G emulator, but may be a bit more complex to configure to what you want. The Hp10Bii is something you should look at. Granted it will have NO solver, be algebraic, but it will look like an Hp 17Bii with a similar keyboard layout.

### Differential Equations on the 49G+ and 50G

Message #1 Posted by [Les Wright](#) on 28 Apr 2007, 12:15 p.m.

That guru of programs for the the HP41, J-M Baillard, recently sent to me some routines to solve first and second-order ODEs by the Bullrisch -Stoer method, and I have some interest in adapting them for the 49G series, since, to be frank, I am really pretty underwhelmed with the built-in differential equation solver of my 48G and 49G+. Baillard's programs work really well on the 41-series and are lightning fast when I run them (no modification necessary) in Free42 both on PC and my Palm TX, so I am interested to see how the algorithm fares on the 49G+

I am finding that translating RPN to RPL is not for the faint of heart, and I am wondering if anyone out there knows if someone has already devised Bullrisch-Stoer ODE solvers for the 49G series. I don't mind a little challenge, but I don't want to completely reinvent the wheel.

Les

### Re: Differential Equations on the 49G+ and 50G

Message #3 Posted by [Les Wright](#) on 28 Apr 2007, 1:35 p.m.,  
in response to message #2 by John

Thank you! I have done a more specific search of hpcalc.org and haven't come up with anything that specifically refers to Bullrisch-Stoer. Perhaps some of the package you have have found implement it as an option, but in that case I expect the author(s) would have made specific mention in the description. Will take a look at some of the documentation of the routines and see what turns up.

Les

### Re: Differential Equations on the 49G+ and 50G

Message #4 Posted by [JM Baillard](#) on 30 Apr 2007, 4:48 p.m.,  
in response to message #3 by Les Wright

Hi everyone,

I have not ( yet? ) written a Bulirsch-Stoer program for the HP48  
( it's in the pipeline for the HP-41 to solve systems of ODEs )  
but I think that the built-in RKF is quite good.

In my RKF menu, there are

```
'X'   for the variable
'Y'   for the function(s)
'F'   for the routine that must calculate dy/dx
'tol' to specify the tolerance
'DIF' that contains the short program
```

```
<< { X Y F }  tol  ROT  RKF  DROP2  Y  >>
```

For example, to solve the system

```
dy/dx = -yzu      y(0)=1
dz/dx = x(y+z-u) z(0)=1
du/dx = xy-zu     u(0)=2
```

```
-Store 0 in 'X'
-Store the vector [ 1 1 2 ] in 'Y'
----- 10^(-11) in 'tol'
-and store the following subroutine in 'F'
```

```
<<  Y  OBJ->  DROP  ->  Y  Z  U
  <<  Y  Z  U  *  *  NEG
      Y  Z  +  U  -  X  *
      X  Y  *  Z  U  *  -  3  ->ARRY
  >>
>>
```

-Then to compute  $y(1)$   $z(1)$   $u(1)$  place 1 in the stack ( level 1 )  
and press the [DIF] key

-It gives in 77 seconds

```
y(1) = 0.258207906452
z(1) = 1.15762398074
u(1) = 0.842178311747
```

-It seems difficult to do faster in RPL  
-I've written an 'RK8' program for the HP-48  
that uses an 8th-order Runge-Kutta method  
and it yields almost the same results in 65s  
with stepsize = 0.1 but there is no error-estimate.

-Les, thank you for your appreciation  
but am I really a guru ? just an amateur.

Regards,  
JMB.

## Re: Differential Equations on the 49G+ and 50G

Message #5 Posted by [Les Wright](#) on 30 Apr 2007, 5:37 p.m.,  
in response to message #4 by JM Baillard

This is amazing! Quite ingenious.

The simple system given as an example on pages 19-5 and 19-6 of the HP48G User's Guide led me to believe that the calculator could handle vector-valued equations only when the arrays in question consisted of static numeric constants. Your example demonstrates that the built-in ODE integrator can indeed handle a broader range of problems provided that the equations are set up correctly and the derivative vector is computed "on the fly" as your procedure F does.

Thanks for sharing this with us. It helps me put more faith in the HP49+ Runge-Kutta ODE integrator, and I will experiment with it a bit more before embarking on the daunting task of Bulirsch-Stoer for the HP48/49. My RPL skills aren't nearly that good yet.

Les

Quote:

---

The simple system given as an example on pages 19-5 and 19-6 of the HP48G User's Guide

---

Just a little more info for those who may not know what I am talking about.

The Guide provides as an example the ODE  $y'' = .5y' + .5y + .5t + 1$  with initial condition  $y(0) = 0$  and  $y'(0) = 0$ . The example renders this equation as vector equation  $w' = fw*w + c*(.5t+1)$ , where  $w = [y \ y']$ ,  $fw = [[0 \ 1] \ [.5 \ .5]]$ , and  $c = [0 \ 1]$ .

JMB's approach to this problem would render the desired F subroutine as merely

```
<< Y OBJ-> DROP -> Y Z
  << Z
    X Y Z + + 2 / 1 +
    2 ARRAY->
  >>
>>
```

and store 0 in X and [0 0] in variable Y before executing the little routine DIF. This of course solves the system

$$\begin{aligned} dy/dx &= z & y(0) &= 0 \\ dz/dx &= (x + y + z)/2 + 1 & z(0) &= 0 \end{aligned}$$

which is equivalent to the original second order ODE.

I find JMB's approach much easier to follow.

Les

Just for the record, I should point out that the entry for RKF in the 49G+ AUR does NOT explicitly mention that the solution can be a vector. Nor does the lengthier description in the User's Guide on page 16-70 make this clear. One can infer it from the sample problem given on page 16-64 which uses a Solve dialog box rather than a command line solution. I

suspect there are a lot of functions in the 48 and 49 series calculators whose full power and scope are not fully and clearly disclosed. I never would have known how to use RKF in this way had JMB not pointed it out.

Les

### **Re: Differential Equations on the 49G+ and 50G**

*Message #8 Posted by [Les Wright](#) on 30 Apr 2007, 5:52 p.m.,

$y(1) = 0.258207906452$   $z(1) = 1.15762398074$   $u(1) = 0.842178311747$

My 49G+ returns the exact same result with your very same parameters in about 45 seconds. I would gather that the 50G is just as fast.

The solution appears much more quickly for less demanding tolerance levels--e.g., the default of .0001, or 1e-8.

Les

### **Re: Differential Equations on the 49G+ and 50G**

*Message #9 Posted by [Les Wright](#) on 30 Apr 2007, 7:34 p.m.,  
in response to message #4 by JM Baillard*

Quote:

-Les, thank you for your appreciation but am I really a guru ? just an amateur.

Actually, you under-value your prodigious contributions.

Your higher math programs in the HP41 software library on this site are remarkable for their sheer number and for the fact that they far surpass anything that has been widely available before, including routines in the original User's Library solution books. Your programs are more concise, quicker, and, from what I can tell, about as accurate as one can be on a 10 digit calculator that rounds results every time they are output to the stack.

Frankly, I haven't seen anything quite like this since the 1980s, when our very own Namir Shammass was probably the most prolific contributor of programs to HP41 User's Library catalogue.

Keep on churning out great programs, and hopefully some of the recent work you have shared with me directly will find its way to this site the next time Dave does an update.

Les

### **Re: Differential Equations on the 49G+ and 50G**

Message #10 Posted by **Les Wright** on 1 May 2007, 12:28 p.m.,

-and store the following subroutine in 'F'

```
<< Y OBJ-> DROP -> Y Z U
  << Y Z U * * NEG
      Y Z + U - X *
      X Y * Z U * - 3 ->ARRY
  >>
>>
```

I wonder if decomposing the input vector in one step with V-> and recomposing the the output in one step with ->V3 would speed things up a little?

I have to agree with you now that the built-in RKF function is quite good--provide that one is aware how to fully take advantage of it. I continue to be intrigued that the AUR entries for both the 49G+ and 48G are so limited. I guess that the authors assume that anyone wanting to use the ODE solver routines are knowledgeable enough about setting up their problems they would have figured it out eventually.

I would be really interested in seeing your RK8 routine as well.

Les

  PICK ->NUM 7 PICK * OVER -1.18686838868E-2 * OVER 9 / + 4
  PICK 2.00216599311E-3 * + 5 PICK 14 / + 6 PICK + 9 PICK
  ->NUM 8 PICK * OVER -.632546160696 * OVER .957605344019 *
  + 4 PICK .152777777778 * + 5 PICK 9.08696110082E-3 * - 6
  PICK 32 / + 7 PICK + 10 PICK ->NUM 9 PICK * OVER
  -1.81086308294 * OVER 1.06249844677 * + 4 PICK 2.03108313917
  * + 5 PICK .637931350185 * - 6 PICK 9 / + 7 PICK 14 / + 8
  PICK + 11 PICK ->NUM 10 PICK * OVER -2.22915821019 * OVER
  .940109451962 * + 4 PICK 7.55384044212 * + 5 ROLL
  7.16495155323 * - 5 ROLL 2.45138043242 * + 5 ROLL
  .551220563073 * - 6 PICK + 9 PICK ->NUM 8 PICK * 5 ROLL +
  9 * ROT 64 * + 3 ROLL + 49 * + 180 / +
  NEXT
>> ( #62676d , 1032 bytes )
```

32 bytes may be saved if you replace

10 by 1 ALOG , 49 by 7 SQ ... and so on ...

4 inputs are needed:

level 4: a program ( or its name ) that computes the derivative  
of the (n+1)-vector [ x y1 ... yn ]  
Since  $dx/dx = 1$  the first component is always 1  
level 3: the stepsize h  
level 2: the number of steps N  
level 1: the initial value [ x y1 ... yn ]

-For example, the system of 3 differential equations above  
with  $h = 0.1$  ,  $N = 10$ :

```
<< OBJ-> DROP -> X Y Z U
<< 1 Y Z U * * NEG
    Y Z + U - X *
    X Y * Z U * - 4 ->ARRY
>>
>> ENTER
0.1 ENTER
10 ENTER
[ 0 1 1 2 ] and press the [RK8] key
```

-It yields ( in 61 seconds ) in level 1

```
[ 1 0.258207906459 1.1576239808 0.842178311686 ]
```

-With  $h = 0.05$  and  $N = 20$  the result is:

```
[ 1 0.258207906457 1.1576239808 0.842178311706 ]
```

-It's probably faster with an HP-49G or 50G

Regards,  
JMB.

## Re: Differential Equations on the 49G+ and 50G

Message #12 Posted by [Les Wright](#) on 2 May 2007, 1:10 p.m.,  
in response to message #11 by JM Baillard

This is amazing! It will take a few minutes to move it over to my HP49G+ and edit all of the << and -> to their proper symbols, but I look forward to experimenting with it.

I anticipate that the routine will give excellent and quick results, especially if one is satisfied with at most 9 or so significant digits. Since the many rational coefficients that are required are rounded to twelve decimal digits, I anticipate that accumulated rounding error would readily supersede the  $O(h^9)$  global truncation error at some point. I have encountered the same sort of problem in porting Gauss-Legendre integration to the 49G+--the calculator is very good at computing weights and sample points, but the accumulated rounding errors tend to obscure the benefits of carrying out quadratures to a high degree.

I anticipate the actual formulae are much more complicated than the classical RK4 method or even the somewhat more complex RKF45 Runge-Kutta-Fehlberg method. What is your source? Abramowitz and Stegun doesn't go up that high!

Many thanks,

Les

\_\_\_\_\_

-It's probably faster with an HP-49G or 50G

\_\_\_\_\_

Actually it is a lot faster.

On my 49G+, the 10 step version of your example returns the exact same result as you get in 26 seconds. The 20 step version does likewise in--you guessed it--52 seconds.

Excellent bit of work. I am fascinated by RPL code that has such an obvious awareness of what is happening on the stack at all times. I am not so confident and use a lot of local variables instead, and I believe my programs are not as small or fast as they could be.

Please keep writing great stuff like this and sharing it. And this is a small nudge to Dave--a update of the software library is long overdue! ;) Yes, I know you have to squeeze it around 80 hours of week of scanning!

I found the HP41 routine and the reference--thank you.

I am happily corrected about the rounding errors. I find that integrating the IVP  $y' = y^2 + 1$ ,  $y(0) = 0$ , gives 11 correct digits with 12 steps, and the 12th digit is off by just 1 ULP. Increasing step number doesn't improve the situation. I think that's pretty impressive!

I wonder if there is any way of improving results with Richardson extrapolation? My preliminary impression is no--doing four steps, then eight steps, then extrapolating on the assumption that the procedure is of order 8 doesn't improve things much and doesn't give nearly as good results as just bashing ahead with 12 steps in the first place!

Les

## Re: Differential Equations on the 49G+ and 50G

Message #17 Posted by [Les Wright](#) on 3 May 2007, 9:25 p.m.,

Quote:

-It seems difficult to do faster in RPL  
-I've written an 'RK8' program for the HP-48  
that uses an 8th-order Runge-Kutta method  
and it yields almost the same results in 65s  
with stepsize = 0.1 but there is no error-estimate.

Actually, I have learned that if I can spare a couple of extra minutes on a problem your RK8 method applied twice can generate rough error estimates.

As an 8th order method, stepsize halving should (in theory) roughly improve the error by a factor of  $2^{-8} = 1/256$ . This means if I run the problem twice with stepsize  $2h$  and then stepsize  $h$ , the difference in results can give a rough measure of the estimated error for each run. I won't regurgitate the algebra, which is actually not too difficult, but it seems to me that the error of the  $2h$  run is of the order of  $256/255$  times this difference, and the error of the  $h$  run is roughly the difference divided by  $255$ .

I have experimented with this with some simple problems and find that the error estimates are actually pretty good, especially in those admittedly ideal situations where the analytical solution of the DE is nice and smooth and continuous with an infinity of well behaved higher derivatives that make the Taylor series upon which the error estimates are based a reasonable approximation of reality. The bottom line is that the difference between two runs can yield some meaningful information, and, if one is willing to take the time, one can get a sense of the result the solution is approaching.

I must confess that I do in some cases like routines such as this one where the number of iterations are set a priori by me, since I know it is going to end some time! Adaptive schemes that converge according to some desired tolerance may actually never converge, or take for ever. I would prefer to know as soon as possible whether a particular problem is stiff or just ill-posed.

I think your RK8 is in some ways a desirable alternative to the HP48/49 series built-in RKF45 adaptive solver. I am also impressed at how well it ports to these calculators, and how quickly I was able to get it onto my calculator via SD card. The HP41 version is excellent too, but is of course slower and really requires a card reader or extended memory so that one need only enter and store all of those constants once. I also think it would well on the HP42S--the constants can be stored and saved in a vector and swapped for the REGS variable as required. But I would have to hope like heck not to reset the memory at my next battery swap!

Les

Hi,

step doubling is always a good idea to provide an error-estimate.  
It can also be used to get a 9th-order method by the formula  
(  $256 y(h/2) - y(h)$  )/255 if it is applied at each step.

I've searched higher order formulas on the web,  
but they seem to be kept secret...  
or sold at a high price!

For practical use, I think that higher order routines are really more of a theoretical curiosity than anything.

I think your RK8 routine is about as complex as anyone using a handheld calculator could reasonably desire. Indeed, the 48/49 series implementation of RKF45 is also pretty powerful too. I really wish that the HP literature documented it better--I had to do a bit of outside reading to learn more about the algorithm and develop an appreciation about how clever it was. It really takes a lot of ingenuity to develop formulae that allow for both 4th and 5th order estimations while using the same set of computed coefficients.

Les

### More on the 49G+ and rechargeables

Message #1 Posted by [Les Wright](#) on 28 Apr 2007, 12:04 p.m.

I decided to splurge on a Duracell brand rapid charger, which, as advertised, will bring cells up to a full charge in a few minutes. It was not a cheap option--on sale I got mine for about USD52 + taxes, but this includes 4 AA 2400 mAh cells, for which I have other uses. But since I am concerned about the waste of disposables the higher frontend cost seems reasonable.

A full charge easily seems to give me quite a few days of very regular use. As someone in the earlier thread pointed out, voltage and capacity, as reported by Edwin Cordoba's BatStatus, drop fairly quickly to about 3.9V and 50% respectively, and seem to hover there for quite awhile. Indeed, I have yet to use the calculator until the low battery icon starts displaying--perhaps I should for the sake of the battery life. The cells take a few minutes to charge in the rapid charger, during which the backup cell seems to do a fine job preserving calculator memory. I have also gotten in the habit of regularly backing up main memory and flags to the SD card, and have a little program that automates the process.

In short, it looks like I can use NiMH cells with the 49G+ and run little risk of losing my work. It seems that rechargeable cells are actually a suitable alternative for the 49G+ and 50G after all, despite official recommendations to the contrary. NiMH seem to do the trick for me, and it looks like that there could be even better alternatives out there, like hybrid cells and rechargeable alkalines and the like.

Les

### Is fast charging OK??

Message #2 Posted by [Dave Shaffer](#) on 29 Apr 2007, 7:45 p.m.,  
in response to message #1 by Les Wright

Does anybody know if really rapid charging has any bad effects (i.e. shorter lifetime) on the NiMH cells? My charger for these things is quite leisurely (overnight, at least, for a full charge). After a couple of years of fairly light use, my AA batteries are still working well, although I have the feeling that I am beginning to see a shortening of how long they last per charge. They've been through fewer than 30 charge/discharge cycles.

### Re: Is fast charging OK??

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 29 Apr 2007, 10:57 p.m.,  
in response to message #2 by Dave Shaffer

I don't really know, but from what I've read, slow charging (as with a charger really designed for NiCd cells) is bad for NiMH cells. "Quick" charging (although I don't, offhand, know which rates) is supposed to be better for NiMH cells.

Also, if using a charger that charges 2 cells in series only, and 1 of the cells doesn't need as much charging as the other, then it will be over-charged, resulting in a shorter lifetime. Try to get a charger that charges each cell individually, especially when you're using an odd number of cells in a device, as in a 49g+. The best are supposed to be those that use a "negative Delta-V" method to determine when to switch to a trickle-charge mode or stop charging completely.

I really don't have that much experience with NiMH cells, but so far, the only problem that I've noticed (other than the self-discharge and relatively sharp drop at the end of the discharge curve) is that all of the NiMH AA and AAA cells that I have are slightly larger (longer, larger diameter, and corners not rounded as much) than is typical with ordinary alkaline cells, resulting in a tight fit in some devices.

I haven't tried the "hybrid" (NiMH + alkaline?) cells, but I've read that they're supposed to have a much slower self-discharge rate, but on the other hand, can be recharged maybe only half as many times as more conventional NiMH cells.

Regarding the rechargeable alkaline cells, specifically Rayovac Renewal cells, I was lucky with them (no damaged calculators), but note that they can't be successfully recharged all that many times, and worst of all, my experience was that after being recharged several times, they started leaking while in the charger. I decided not to use them any more.

Regards,  
James

### **Re: Is fast charging OK??**

*Message #4 Posted by [Les Wright](#) on 30 Apr 2007, 9:41 a.m.,  
in response to message #3 by James M. Prange (Michigan)*

My Duracell quick charger has dedicated "lanes", it seems--indeed, if one loads a fully charged cell into it along with a discharged cell, it will give an error condition (blinking LED) until the full cell is removed. So it seems smart that way.

If the quick charger is a little harder on on NiMH cells vs. a standard charger, so be it. I have no illusions about NiMH cells lasting forever either. But still, from a "green" perspective, I would rather go through a set of NiMH AAA cells in my 49G+ every couple of years than piles of alkalines, even if it really isn't that much cheaper in the long run. Indeed, my spouse and I have tried to make a commitment to using NiMH cells around the house wherever we can in things like electric toothbrushes, TV and VCR remote control units, battery operated clocks, my beard trimmer, the remote mouse on her computer, etc. About the only thing around here that doesn't use NiMH cells are the cordless phones, my older calculators, and the smoke alarms.

The one advantage to all this is that my previously neglected 49G+ is now getting regular use--I feel liberated in using the machine knowing that when the cells run low it is little time and hassle to rejuice the cells. I don't seem to have the keyboard problem on this unit (yet), so I want to give it a good workout and get to know the machine more before I go to the expense of the 50G.

Les

*Message #5 Posted by [Rich Messeder \(US\)](#) on 30 Apr 2007, 10:44 a.m.,  
in response to message #1 by Les Wright*

I had the same question myself, in a general sense. So I searched the web for "NiMH batteries" and got boatloads of hits. Very useful info, though I don't recall exactly which sites I browsed. I use NiMH for nearly everything. My understanding is that the newer batteries decline slower than the older batteries, due to changes in technology. I keep my recharged batteries in the fridge; they hold a charge much longer that way. I use the battery check feature in my 49 and 50 periodically to check the voltage levels so that I am not caught unaware

when the battery dies. I have a small plastic case in which I carry 4 cells (now) for the 50. It seems that charger technology is getting smarter and cheaper.

Rich

## rechargeables

*Message #6 Posted by [Sam Levy](#) on 30 Apr 2007, 2:26 p.m.,  
in response to message #5 by Rich Messeder (US)*

Thank you for your interest in Sanyo batteries.

Please do not store your batteries in your refrigerator. The difference in temperature in your home and the refrigerator is really not enough of a difference to make it worth storing them in the refrigerator. Due to safety reasons, we recommend that you do not store your NiMh cells in your refrigerator with your food items.

Please let us know if we may be of any further assistance.

Best regards,

SANYO Energy <http://www.sanyobatteries.com>

*Message #7 Posted by [Eric Smith](#) on 30 Apr 2007, 6:34 p.m.,  
in response to message #6 by Sam Levy*

For NiMH cells perhaps the refrigerator doesn't extend the life much, but it definitely does for alkalines.

The concern about contaminating food is exaggerated. Just keep the batteries in a sealed plastic container. It's not likely that they will leak, but if they do, the container will keep them from contaminating anything else.

Do not keep any normal consumer-grade batteries in a freezer. My mother tells me that when she worked in surgery, certain kinds of batteries were kept frozen. However, normal batteries are not designed for that, and freezing them may damage them and cause leakage.

**Precision Surveying Solutions L L C**

Message #1 Posted by [Forrest Switzer](#) on 28 Apr 2007, 1:38 a.m.

I just got my April issue of The American Surveyor magazine "A foot in the past... An eye to the future" and there is a great article in it about the DC50 along with some great pictures and pictures of the line of HP Calculators that were used in surveying leading up to the HP 50G. This can be found at [www.TheAmericanSurveyor.com](http://www.TheAmericanSurveyor.com) and under the "articles" link. Look near the bottom of the list in a Product Review by Al Pepling,LS.

Tim Wessman is named in the article. "...and the software benefitted tremendously from Tim's programming skill."

Way to go Tim. The article is good, the pictures are good and I'll bet the product is good.

I just wish I had received my magazine earlier in April.

I hope I did the link correctly. If not maybe Tim can fix it for me.

Forrest

Man, that guy is a real fan! What a wonderful writeup. Congratulations on a great product!

You can tell that the working surveyor who wrote the referenced article hated the 49G+ keyboard as much as the "purists" on this site, and welcomed the fixed 50G model too. I can't express how great it is to see that working code brought forward from the 41, and through the 48GX, finally landed on a 50G based product with the double threat of long experience and cutting edge tech. (Twin BT radios - cool!) Together they make what looks to be a huge winning combination. *That's* how the values I treasure in the old machines can make a difference in the present day - by embracing new technology, but retaining the timeless core of great engineering knowhow!

Regards,  
Howard

Message #3 Posted by [Tim Wessman](#) on 28 Apr 2007, 10:49 a.m.,  
in response to message #2 by Howard Owen

He is quite a fan. Al is doing another entire article dealing with nothing but field usage as well. There will also be an article about the company, how we were started, goals, etc. Naturally, it is quite exciting for us.

Professional Surveyor is working on a review, and POB asked one of our best customers (who has already written some userRPL progs because he likes it so much) to write one.

Sales are picking up as a result of weather and reviews. In the past 2 days, we sold about \$35k. If this keeps up, I'll be able to collect a paycheck soon! :-)

in response to message #3 by Tim Wessman*

Tim,

Wow, all three magazines!!! It will be interesting to see how the other two review. I assume you have an idea about their reviews, and they are positive. It is really great to see this considering how dominate TDS is. Watch out though, TDS or Carlson may make you an offer you can't refuse. Carlson sucked up Simplicity, but I kinda think Simplicity was hoping that would happen.

And, the pay check thing is important also.

By the way I am not worried about the quote or the above exclamation marks. I might as well say eBay and be tripple dammed.

Forrest

### **Re: Precision Surveying Solutions L L C**

*Message #5 Posted by **Howard Owen** on 28 Apr 2007, 7:03 p.m.,  
in response to message #3 by Tim Wessman*

To amplify a point I made above, It's likely this reviewer would not have been as enthusiastic about a 49G+ based product, even though I'm sure you guys would have made the best of the keyboard issues using software. The point for HP is this: to win a spot in the niche you used to dominate, you must pay attention to some of the things that were important to you back then. In particular, the build quality matters for professional equipment. It's clear that some folks at HP still hold up those values, just as it is clear that they have had to fight an uphill battle to see them expressed. Way to go, guys, and keep it up!

Regards  
Howard

### **HHC2007 in London, October 13-14, 2007**

Message #1 Posted by [Gene](#) on 26 Apr 2007, 10:26 p.m.

Some news from Wlodek:

13-14 Oct 2007, location is Imperial College, London again, Themes include HP-35 35th anniversary and other HP calc anniversaries, HPCC 25th anniversary, etc

### **Re: HHC2007 in London, October 13-14, 2007**

Message #2 Posted by [Tony Duell](#) on 27 Apr 2007, 2:15 p.m.,  
in response to message #1 by Gene

Very little has, AFAIK, been formalised yet, but I believe this will be a much less formal affair than the previous 2-day conferences.

The HPCC committee have decided that as the 1-day 'mini-conferences' were enjoyed by everyone who attended, then this event should be a 2-day 'midi conference', in much the same style. A handful of talks on HP calculators and related topics given by people who truly love the machines (and the aspect they're talking about). I believe it will be free for HPCC members, no idea what the policy is on non-members attending.

I think that members will have to organise their own food and accomodation, the club is not doing this.

I believe there will be no proceedings, rather summaries of the talks will be printed in Datafile (HPCC journal)

*Message #6 Posted by **Dan M (Vermont, USA)** on 27 Apr 2007, 9:38 p.m.,  
in response to message #3 by Howard Owen*

The last time I was at Imperial College :- ) I had a very pleasant and relatively inexpensive stay at the Baden-Powell House. This is a hostel -and more- run by the Scouts ("Boy Scouts") in London. It is adjacent to both Imperial College and the Subway stop from Heathrow. It helps, price-wise, if you are a "member of the Scouting family," but it is not necessary. The worst of it was I didn't have any extra time to hang out there. I instead lollygagged around with a bunch of calculator nerds, go figure.

The accommodations were clean, comfortable, friendly, well-priced, etc, etc. Very nice.

I don't know the details, but was clued in by somebody on the plane, to avoid the "Heathrow Express" if you arrive at Heathrow airport and are going to go near Imperial College. Yes, it is much more expensive and moves faster, but it drops you off at Paddington Station which is at least one train/subway transfer away from where you want to be. And, if it is morning rush hour when you get there, which it easily can be, and if you have one or more pieces of luggage with you, and if you are tired from being on an airplane all night, you are far better off taking the much cheaper and slower Subway from Heathrow directly to your destination. I have no idea about public transportation options at any of the other London airports. Heathrow has always worked well for me, or worked well enough, anyway.

Have a fun time this fall, I will miss both meetings, as far as I know.

I've seen none of you guys. I'll try my best to be there.

**Re: HHC2007 in London, October 13-14, 2007**

*Message #18 Posted by [Tony Duell](#) on 29 Apr 2007, 5:19 a.m.,  
in response to message #17 by Geir Isene*

I am planning on being there (I live in london) and may well bring along a few toys for you to look at (and look inside). There are a couple of things that would keep me away (ask me privately if you're curious), though.

If I attend I intend to give a talk, but on something other than the HP35. I'll leave that machine for the rest of you ;-)

As regards transport, nearer the time (because these things can change) I can give details of public transport to Imperial College. The best airport to fly into would be Heathrow, it has a Tube (London Underground railway) station with a direct train to South Kensington (nearest tube station to Imperial College).

I cannot offer help with accomodation, nor can I accomodate anyone. My spare bed is covered to a depth of about 3 feet in HP80-series machines, BBC micros, PC parts, etc. And to get to said bed you have to climb over a PERQ, a MINC, a MicroVAX and an HP9100B.

As I said, I assume non-members (of HPCC) can attend, but I don't know the details. What I do know is

that there will be no registration or payment on the day -- quite reasonable members of the HPCC committee would rather hear the talks than collect people's details.

## **Re: HHC2007 in London, October 13-14, 2007**

*Message #19 Posted by [Wlodek Mier-Jedrzejowicz](#) on 30 Apr 2007, 9:04 p.m.,  
in response to message #18 by Tony Duell*

### **Some information about the London meeting:**

As Tony Duell says, HPCC members would rather listen to talks and presentations about our favourite HP devices than spend time signing in pre-registered folks and registering others at the door.

In fact the organizers would rather not spend time organizing - but some organization will be needed! So we are aiming for a semi-formal meeting like our own mini-conferences, or the meetings Matthias Wehrli has arranged in Basel, rather than a formal conference. That should give people more freedom - for example to visit the Science Museum - 5 minutes' walk from the meeting place - and see their computing collection including the working Difference Engine.

Baden-Powell House is also 5 minutes from the meeting place and a good choice for affordable accommodation - if you can get it - fortunately there are more rooms free there and elsewhere in October than earlier in the year.

The underground (tube, metro, subway) stations nearest the College are South Kensington and Gloucester Road - check them out on the map at [www.tfl.gov.uk/assets/downloads/colourmap.pdf](http://www.tfl.gov.uk/assets/downloads/colourmap.pdf) - Heathrow Airport is at the lower left of this map and the blue line (Piccadilly Line) goes directly from there to Gloucester Road and South Kensington, approximately 14 stations down the line - the exact count depends on which terminal you come from at Heathrow and whether all the stations along the route are open.

Our present policy is not to charge a formal registration fee but to try to cover all expenses from HPCC funds - and just possibly from requests for donations - but these will certainly not be obligatory. Not printing proceedings will save a lot of expenses.

What would be very helpful would be to know roughly how many people plan to come, so we can book meeting rooms of an appropriate size. We shall be putting pages about the conference, including this request, on our web site [www.hpcc.org](http://www.hpcc.org) nearer the dates.

I hope to meet many of you there and am delighted to read on this thread that many friends have already decided to come - see you all!

Wlodek Mier-Jedrzejowicz

### HP 41 doesnt work

Message #1 Posted by [Juergen Richter](#) on 26 Apr 2007, 4:28 p.m.

I have a Problem with my 41 cv. I Changed the Batteries and a short time latter nothing goes. I took new batteries and nothing goes. Is there an special shortcut to reset the Computer.

Otherwise I need an diskription how i can open the calculator to search for malcontacts.

The Batteriecontacts are looking good.

Thanks for your help

Juergen

### Re: HP 41 doesnt work

Message #2 Posted by [Ron](#) on 26 Apr 2007, 5:02 p.m.,  
in response to message #1 by Juergen Richter

So far, every malfunctioning 41 I've seen has been either corroded contacts, or broken posts. Since your contacts are clean, I suspect it's a cracked/broken post. There is a screw under each foot, going into a post. If a post is cracked, there is poor contact between the electronics in the two halves of the calc. Depending upon how bad the posts are, they may be repairable. Check them out, and post your findings. I think many people here have experience repairing these.

### Re: HP 41 doesnt work

Message #3 Posted by [Juergen Richter](#) on 27 Apr 2007, 3:40 p.m.,  
in response to message #2 by Ron

Thanks to all that have answered.

Bevor opening the calculatot I tried the other tests.

Then i opend the calculator.

Indeed there was a little corrosin an the contacts between the both halves. when i desambled the calculator (The posts are fortunatly ok) i found it and removed it.

So again Thank you Jürgen

*Message #5 Posted by [Chiu Yiu Wai](#) on 27 Apr 2007, 11:48 a.m.,  
in response to message #1 by Juergen Richter*

On my experience,one situation also out of consideration,and it can make hp41 can not turn on,"the spring of battery holder", the "spring" was dead form "elastic deformation" it has not enough force to push up the battery to contact the battery terminal.Maybe you can try add some metal foil between spring and battery,may be solve your problem.

Wish it can help you.

**HP49+ - Backing Up Calculator State**
 Message #1 Posted by [Les Wright](#) on 25 Apr 2007, 4:04 p.m.

I am trying to create a "one touch" routine that will, as much as possible, back up the entire state of my calculator to the SD card.

The commands are simple enough to backup the home directory (ARCHIVE) and flag settings (RCLF then STO to a variable of form :3:FLAGS, for example).

However, I would like my little program to be as thorough as possible, and I was wondering if there is any easy way write the entire contents of IRAM, ERAM, and FLASH (ports 0, 1, 2) to backup objects on the SD card, as effortlessly as ARCHIVE does for the HOME directory.

At this point this is largely an academic point--I don't store program objects or variables in ports 0 thru 3, and since I install libraries from the SD card I have the originals to reinstall manually if I ever have to. But it is a curiosity and it would be neat to know if anyone else has ever considered it.

As for backing up user key assignments, I must admit this interests me not at all. The HP49+ keyboard is busy enough without me make a dogs breakfast of it with my own assignments, so I don't use them. But if these assignments can be recalled and saved to a backup object, like flags can, that would be good to know.

many thanks, Les

 in response to message #1 by Les Wright

Hi Les.

You may want to have a look at this post of John H. Meyers' on a looong thread on comp.sys.hp48:

[http://groups.google.com/group/comp.sys.hp48/tree/browse\\_frm/thread/b556b30be73ff9f942e5c13528971d4?num=21&q=backup+HOME+directory&\\_done=%2Fgroup%2Fcomp.sys.hp48%2Fbrowse\\_frm%2Fthread%2Fb556b30be73ff9f9%2F641d6fee23c0feb%3Flnk%3Dgst%26q%3Dbackup%2BHOME%2Bdirectory%26rnum%3D1%26#doc\\_641d6fee23c0feb](http://groups.google.com/group/comp.sys.hp48/tree/browse_frm/thread/b556b30be73ff9f942e5c13528971d4?num=21&q=backup+HOME+directory&_done=%2Fgroup%2Fcomp.sys.hp48%2Fbrowse_frm%2Fthread%2Fb556b30be73ff9f9%2F641d6fee23c0feb%3Flnk%3Dgst%26q%3Dbackup%2BHOME%2Bdirectory%26rnum%3D1%26#doc_641d6fee23c0feb)

There were some interesting tips, IIRC.

Hope this helps.

All the best.

Giancarlo

**Re: HP49+ - Backing Up Calculator State**
 Message #3 Posted by [Antonio Maschio \(Italy\)](#) on 26 Apr 2007, 6:26 a.m.,  
 in response to message #2 by Giancarlo (Italy)

Here's mine

```
<<
3: BACK49P PURGE 3: BACK49P ARCHIVE[ln]
3: KEYS49P PURGE RCLKEYS 3: KEYS49P STO 3:[ln]
FLAG49P PURGE RCLF 3: FLAG49P STO[ln]
>> ARCH STO
```

and another useful too:

```
<<
3: KEYS49P EVAL STOKEYS[ln]
3: FLAG49P EVAL STOF[ln]
3: BACK49P RESTORE[ln]
>> REST STO
```

Change 3: to 2: if you don't have an SD card. After RESToring, the calculator resets. This preserve settings and the rest.

 Message #4 Posted by [Les Wright](#) on 26 Apr 2007, 9:25 a.m.,  
 in response to message #3 by Antonio Maschio (Italy)

Thanks, Antonio, mine looks very similar, but my original question asked if one can go one step further--namely, backup port memory in backup objects on the SD card?

Let's say I have libraries installed in ports 1 and 2--is there a convenient, one step way to backup those ports the same way ARCHIVE backups the HOME directory to a single backup object? My combing over the AUR would suggest no. But I would like to try. It would be a shame to lose things from port memory and have to reinstall each library individually. But if that is the way it needs to be, so be it.

Les

Hi Les.

Quoting from:

[http://groups.google.com/group/comp.sys.hp48/tree/browse\\_frm/thread/b556b30be73ff9f942e5c13528971d4?num=21&q=backup+port+memory+in+backup+objects+on+the+SD+card&\\_done=%2Fgroup%2Fcomp.sys.hp48%2Ffrowse\\_frm%2Fthread%2Fb556b30be73ff9f9%2F641d6fee23c0feb%3Flnk%3Dgst%26q%3Dbackup%2Bport%2Bmemory%2Bin%2Bbackup%2Bobjects%2Bon%2Bthe%2BBD%2Bcard%26rnum%3D1%26#doc\\_641d6fee23c0feb](http://groups.google.com/group/comp.sys.hp48/tree/browse_frm/thread/b556b30be73ff9f942e5c13528971d4?num=21&q=backup+port+memory+in+backup+objects+on+the+SD+card&_done=%2Fgroup%2Fcomp.sys.hp48%2Ffrowse_frm%2Fthread%2Fb556b30be73ff9f9%2F641d6fee23c0feb%3Flnk%3Dgst%26q%3Dbackup%2Bport%2Bmemory%2Bin%2Bbackup%2Bobjects%2Bon%2Bthe%2BBD%2Bcard%26rnum%3D1%26#doc_641d6fee23c0feb)

"ALL objects (except libraries) that are stored into ports are also \*automatically\* enclosed within a Backup object, basically to provide a single consistent structure within the contiguous memory of a port, giving every stored object a length and a name"

so that a built-in capability seems not to be available.

But you can use specific piece of software, like this one:

<http://www.hpcalc.org/details.php?id=5955>

which is commented as follows:

"This 688-byte program allows you to backup all the data of your HP 49G+ into the SD card in just a few seconds. You can select to save Home and/or any port(s) in any path of port 3. Tested with ROM 1.23. By Jorge Cevallos M."

Hope this helps.

Best regards.

Giancarlo

 Message #6 Posted by [Les Wright](#) on 26 Apr 2007, 11:11 a.m.,  
 in response to message #5 by Giancarlo (Italy)

Perfect! Exactly what I was looking for.

Doesn't backup flags and user key assignments, but that is easy enough to incorporate into a custom routine which, among other tasks, calls the software.

Thanks for the tip!

Les

### Re: HP49+ - Backing Up Calculator State

Message #8 Posted by [James M. Prange \(Michigan\)](#) on 26 Apr 2007, 9:42 p.m.,  
in response to message #1 by Les Wright

Quote:

I am trying to create a "one touch" routine that will, as much as possible, back up the entire state of my calculator to the SD card.

I expect that it's possible.

Quote:

The commands are simple enough to backup the home directory (ARCHIVE) and flag settings (RCLF then STO to a variable of form :3:FLAGS, for example).

Or just store the list in a global variable, which will be included in the archive.

Quote:

However, I would like my little program to be as thorough as possible, and I was wondering if there is any easy way write the entire contents of IRAM, ERAM, and FLASH (ports 0, 1, 2) to backup objects on the SD card, as effortlessly as ARCHIVE does for the HOME directory.

Well, first off, on the 49 series (except perhaps the 48gII, which I'm not very familiar with), I'd recommend not using port 0 for anything, unless perhaps some library requires that it be in port 0. So why is it there? Well, because it is useful on the 48 series, because a port is required for using libraries, but not everyone owns an SRAM card for his 48SX or 48GX, and of course the other models can't use a card. You might think as port 0 as being somewhat like a RAM disk on a DOS system; if you don't have the hardware, then simulate it with software. A major disadvantage of using port 0 is that it shares the same pool of memory with "System RAM", so using it reduces the amount of free memory. Another disadvantage is that a memory clear clears port 0 as well. But with the 49 series, you have other ports built-in, so why use port 0?

Quote:

At this point this is largely an academic point--I don't store program objects or variables in ports 0 thru 3, and since I install libraries from the SD card I have the originals to reinstall manually if I ever have to. But it is a curiosity and it would be neat to know if anyone else has ever considered it.

Sure, Wolfgang's Filer6 program includes includes an ->SD-> card operation, capable of moving selected or all port objects to a flash card. See <http://page.mi.fu-berlin.de/raut/WR49/index.htm#General>. It also has other advantages; I prefer it to the built-in filer.

Quote:

As for backing up user key assignments, I must admit this interests me not at all. The HP49+ keyboard is busy enough without me make a dogs breakfast of it with my own assignments, so I don't use them. But if these assignments can be recalled and saved to a backup object, like flags can, that would be good to know.

That's not an issue anyway, because the user key assignments and alarm information are stored in the hidden subdirectory, and are included within an archive. Of course, when you RESTORE the archive, some of the alarms may be past due, so I suppose that it would be a good idea to check them.

But you wanted all objects in a port to be backed up to the card, not just the libraries. A very simple and easy (but not "one-touch") way is to tag all of them in the filer, and then use it to copy them to the card. But writing a UserRPL program to do it seems pretty straight-forward.

Traditionally, existing objects in ports can't be overwritten; if you want to replace one, you have to purge it first. This first program behaves like that; it errors out the first time that it can't store a file on the card.

```

%%HP: T(3)F(,);
@ For 49+ or 50g.
@ Program to copy all objects from port 0, 1, or 2 to a flash card.
@ Will error out ("Object In Use") if the file already exists in the directory
@ on the flash card.
@ There must be enough free system memory available to hold the largest object
@ in the port, plus a little more.
@ There must be enough available capacity on the memory card to hold all of
@ the objects from the port.
@ Arguments:
@ Level 2: Real or zint, port number to copy objects from.
@ Level 1: String, directory on the card to store the files in, in the form
@ "DIR1/DIR2/DIR3". Use just an empty string, "", to store them in
@ the root directory. To key in the / character, press ALPHA (if
@ needed), then press RightShift, and then press the divide key.
@ Results from the BYTES command:
@ Checksum: #784Eh
@ Size: 149.
<<<
/* + @ Begin program.
SWAP PVAR5 DROP @ Append to path.
1. @ List of port variable names.
OVER SIZE @ Loop index initial value.
FOR n @ Loop index final value.
DUP n GET @ Tagged port variable name.
DUP RCL @ Port variable object.
SWAP DTAG @ Untagged port variable name.
IF @
DUP TYPE 28. == @ Library number?
THEN @
"L" SWAP + @ Prepend "L".
ELSE @
\>STR @ Quoted name within string.
2. OVER SIZE 1. - SUB @ Remove "*" name delimiters.
END @
4. PICK SWAP + @ Prepend path string.
3. \>TAG @ Tag with port number for memory card.
STO @ Store object as file on memory card.
NEXT @ Discard path and list.
DROP2 @
>> @ End program.

```

But suppose that you want to store the files on the card, even if they already exist there? That's an easy modification. This next program will replace existing files **without warning**.

```

%%HP: T(3)F(,);
@ For 49+ or 50g.
@ Program to copy all objects from port 0, 1, or 2 to a flash card.
@ Will replace same-named files without warning.
@ There must be enough free system memory available to hold the largest object
@ in the port, plus a little more.
@ There must be enough available capacity on the flash card to hold all of the
@ objects from the port.
@ Arguments:
@ Level 2: Real or zint, port number to copy objects from.
@ Level 1: String, directory on the card to store the files in, in the form
@ "DIR1/DIR2/DIR3". Use just an empty string, "", to store them in
@ the root directory. To key in the / character, press ALPHA (if
@ needed), then press RightShift, and then press the divide key.
@ Results from the BYTES command:
@ Checksum: # C9E8h
@ Size: 154.
<<<
/* + @ Begin program.
SWAP PVAR5 DROP @ Append to path.
1. @ List of port variable names.
OVER SIZE @ Loop index initial value.
FOR n @ Loop index final value.
DUP n GET @ Tagged port variable name.
DUP RCL @ Port variable object.
SWAP DTAG @ Untagged port variable name.
IF @

```

```

DUP TYPE 28. == @ Library number?
THEN
  'L' SWAP + @ Prepend 'L'.
ELSE
  \->STR @ Quoted name within string.
  2. OVER SIZE 1. - SUB @ Remove "*" name delimiters.
END
4. PICK SWAP + @ Prepend path string.
3. \->TAG @ Tag with port number for memory card.
DUP PURGE @ Purge file if it exists.
STO @ Store object as file on memory card.
NEXT
DROP2 @ Discard path and list.
\>> @ End program.

```

How about one that asks what to do if the file already exists? That doesn't seem as if it ought to be too difficult, but I was surprised at how much time I spent chasing down typos, as well as some things that I meant to type in, but apparently didn't; maybe I needed a little food to power my brain? I really should remember to eat when I need to. Anyway, this one seems to work now.

```

$$$F: T(3)F(.);
@ For 49g+ or 50g.
@ Program to copy all objects from port 0, 1, or 2 to a memory card.
@ Will ask whether to replace a file.
@ There must be enough free system memory available to hold the largest object
@ in the port, plus a little more.
@ There must be enough available capacity on the memory card to hold all of
@ the objects from the port.
@ Arguments:
@ Level 2: Real or zint, port number to copy objects from.
@ Level 1: String, directory on the card to store the files in, in the form
@ "DIR1/DIR2/DIR3". Use just an empty string, "", to store them in
@ the root directory. To key in the / character, press ALPHA (if
@ needed), then press RightShift, and then press the divide key.
@ Results from the BYTES command:
@ Checksum: # D168h
@ Size: 493.5
\<< @ Begin program.
\< @ Beginning of recursive subprogram for file exists.
PICK3 @ Untagged port variable name string.
"\010already on card.\010Press R to replace.\010Press S to skip.\010Press Q to quit." @
+ @ Concatenate strings.
CLLCD @ Clear display.
3. DISP @ Prompt for keystroke.
0. WAIT @ Wait for keystroke.
CLLCD @ Clear display.
IF @ Ignore keyplane.
CASE
  DUP 52. == @ R pressed?
  THEN @
  DROP @ Discard key value.
  DUP PURGE @ Purge file from card.
  STO @ Store object as file on memory card.
END
  DUP 53. == @ S pressed?
  THEN @ Discard key value, name, and object.
  END @
  51. == @ Q pressed?
  THEN @
  5. DROPN @ Clean up stack.
  0. DOERR @ Error out.
  END @
  \<-s EVAL @ Recurse.
END
\>> @ End of subprogram for file exists.
\> \<-s @ Bind.
\<< @ Begin local defining procedure.
+ @ Append to path.
SWAP FVARS DROP @ List of port variable names.
1. @ Loop index initial value.
OVER SIZE @ Loop index final value.
FOR n @
  DUP n GET @ Tagged port variable name.
  DUP RCL @ Port variable object.

  2. OVER SIZE 1. - SUB @ Remove "*" name delimiters.
  END @
  DUP UNROT @ Copy to level 3.
  5. PICK SWAP + @ Prepend path string.
  3. \->TAG @ Tag with port number for memory card.
  DUP2 @ Copy for error condition.
  IFERR @ Trap error.
  STO @ Try storing object as file on memory card.
  THEN @
  IF @
  ERRN #9h == @ "Object in Use" error?
  THEN @
  IF @
  -55. FC? @ Last argument saved?
  THEN @
  DROP2 @ Discard extra object and name.
  END @
  \<-s EVAL @ Execute subprogram.
  ELSE @
  ERRN DOERR @ Execute any other error.
  END @
  ELSE @
  DROP2 @ Discard extra object and name.
  END @
  DROP @ Discard the string.
  NEXT @
  DROP2 @ Discard path and list.
\>> @ End local defining procedure.
\>> @ End program.

```

I really admire the input form in Jorge's BCKP21, but I'm too lazy to attempt that.

A bigger problem would be automatically restoring the files to a port, as there doesn't seem to be any built-in RPL (or assembly language) method of getting a list of the files on the card (or in one of it's directories). Using the filer is easy enough, but [SDFiler](#) may well include that capability (I haven't tried it yet).

Quote:

many thanks,

many welcomes, and,

Regards,

James

James,

hats off to your post!! (and I feel this is a very well-spent pair of exclamation marks :-)

An outstanding piece of information and education of User RPL programming at the same time.

I'm really delighted and I'm gonna bookmark and save it for any future reference.

Thank you & best regards.

Giancarlo

### Re: HP49+ - Backing Up Calculator State

Message #10 Posted by [Les Wright](#) on 27 Apr 2007, 4:18 a.m.,  
in response to message #8 by [James M. Prange \(Michigan\)](#)

Wow!

This wildly beyond anything I dreamed of when making my original query.

For whatever reason, I prefer to back up flags to a separate file on the SD card and restore them before restoring the rest of the archive, very much as in Antonio's little routine. My little routine is quite similar--indeed, the file names are actually the only thing that is really any different.

I agree with you that it is unwise to put anything in port 0 and I frankly never do.

This discussion has got me wondering how desperately important it is for me to back up ports 1 and 2 to the SD card, since automating the process is not as straightforward as backing up main memory, flags, and key assignments. The fact is, I only use ports 1 and 2 to store libraries, and in the unfortunate and unlikely event that these libraries get erased (ON-A-F and dead main batteries do not erase ports 1 and 2, and the backup button cell seems in good shape on my unit), it is a simple matter to copy the desired libraries back over from the SD card to the desired ports and reattach them via ON-C.

My interest in "total backup" is linked to my newfound preference for powering the unit with NiMH cells. One of the great advantages of the 49 series is SD storage capability. It is fast and robust, unlike the fussy and delicate magnetic cards of the 41 series and the at-times complicated serial port interface of the 48 series.

Indeed, I would make the admittedly bold statement that there is absolutely no excuse for the truly serious user of 49g+ or 50g not to have an SD card in the calculator for backup at all times. Granted, there was a time when such memory was not cheap--just four years ago I paid 130CAD (about 110USD) for a 128MB MemoryStick for my Sony Clie!--but nowadays the smaller size cards, which are more than adequate for use with the the relatively tiny files created by these calculators are so cheap it seems that some sellers can't even give the things away! Indeed, the 128MB card I use with my 49G+ was a throw-in accessory with a digital recorder I bought. It is woefully inadequate for serious sound recording and will only accomodate a few minutes of a 96kHz/24bit WAV file, so I wasted no time in getting 2GB card for that device. But the little card is positively huge as far as the 49G+ is concerned--I could back up my existing memory hundreds of times over and still have lots of space.

So my low-level solution right now is the little program similar to Antonio's, which I assign to a the global variable BKUP. I hit that key several times when using the calculator, always before turning it off after a session. And every so often I copy the contents of the SD card to a folder on my PC. Overkill?--perhaps. But it is just so quick and easy especially when I consider that using WALL to backup my 41CX takes 11 magnetic cards, a few minutes of time, fairly fresh batteries, and organization lest I mix up the cards! And I am ever mindful that the much celebrated 42S, 32SH, and 15C don't have any backup capacity at all.

As for backing up port memory, I can do that less frequently and by using either James's code or the very easy to use BCKP21.

Les

**HHC2007 HP Handheld Conf 9/29-30 in San Diego**

Message #1 Posted by [Jake Schwartz](#) on 25 Apr 2007, 4:02 p.m.

It's finally time to announce the HHC2007 U.S. HP Handhelds Conference, to be held in San Diego, California on September 29th and 30th. The event is scheduled to be held at the HP facility there, where the majority of the Calculator team is located. One of the themes of this year's affair is "The 35th Anniversary of the HP35" and we are asking those attendees who own HP35s to bring them along as a show of support for three and a half decades of Hewlett-Packard Calculator development.

For all the details on conference registration, recommended hotel location, speaker signups, etc. check out <http://holyjoe.net/hhc2007/> on the web. There will be updates posted on a regular basis, so check back at the website for attendee and speaker lists as they become available, as well as links to any HP Handheld-related news that is relevant. As all the other times, going back to the original PPC Conference at the HP Santa Clara office in 1979, it should be an interesting weekend.

Hoping to see you in San Diego in September,

Jake Schwartz

Jake,

Thank you for the information!!! I will be there. I have my airline ticket! I will have to leave Saturday night because my step-son is getting married on Sunday. However, I figured spending at least the most part of Saturday on this very special occasion, will be a minimum for me.

Namir

**Re: HHC2007 HP Handheld Conf 9/29-30 in San Diego**

*Message #9 Posted by [Rich Messeder \(US\)](#) on 29 Apr 2007, 8:07 a.m.,  
in response to message #1 by Jake Schwartz*

While I cannot attend due to prior commitments, I have a few items, (that I think are probably on the minds of others, as well). I used to be active in the PPC back in the 1980s, and have many fond memories of the club, its activities, and the Journal.

I am involved in University activities now, and wish that HP would return to the position that it had decades ago as preeminent in the HHC field. It is noteworthy to me that college texts refer to TI machines, and many professors don't even know how to use RPN machines. Yet, in the past year alone, my discussions of the benefits of RPN have led several Engineering and Physical Science students to borrow one of my calculators and eventually purchase their own. Two of them were outspoken critics of the idea that RPN could be worth considering in light of TI's dominance in the field of education and the fact that TI machines are used extensively in grades below college. One of their comments, prior to actually testing an RPN machine, was that RPN was too difficult for beginners to learn. My own experience contradicts this belief, and their opinion on the subject changed, too, once they had tried RPN.

I don't know where the future of HHCs is headed, but the need for them appears to be still strong. Education should be about providing our students with the most efficient tools and methods to acquire knowledge and to explore the scientific world. I think that HP HHCs have been the best tool for the job until the recent past. Though I still will not use anything but an HP, I opine that HP has lost the edge.

HP should give serious thought to making inroads in the lower educational circles, to getting their products showcased at universities and high schools, and to getting the benefits of RPN into texts.

WRT the latest offering at the high end, the HP 50g can benefit greatly from an upgraded display (more resolution), increased data entry history, and a host of other features that have been mentioned here. I hope that HP will have folks at the conference who will take the suggestions of attendees seriously.

I recall a number of years ago when I was working at a nuclear facility. I used an HP HHC extensively in my work, and was well-known at the site for my opinions about the benefits of RPN in general and HP's quality in particular.

On one occasion, I was working on reactivity calculations with another engineer who was critical of the "weird-ness" of RPN. The small group of engineers present suggested an impromptu face-off using the calculations at hand. The HP 15C was a clear winner, and, as a result, one of the Ph. D.s switched to HP within a few months (after asking me to demonstrate further capability that the 15C had that the current TI devices did not).

On another occasion, I had moved up to a new machine, and that new product had keyboard problems (sound familiar, HP 49 users?). I had been used to entering my data and being confident that the result would be correct. When I discovered that this was not the case, I called HP, //who assigned a field engineer to handle my problem// because they were concerned about their reputation in the nuclear field. I eventually wound up with a new device in the same series that did not have the problem (which I still have). Can you imagine this in today's HP climate?

I look forward to hearing about the conference and to seeing the direction that HP chooses for the future. We don't need a rah-rah nostalgic look at the past as much as we need dedication to quality and excellence in the future.

Rich

### **Correspondence between Sharp PC-XXXX and Sharp EL-YYYY models?**

Message #1 Posted by [gene](#) on 25 Apr 2007, 2:35 p.m.

Does anyone have a table (or can put one together) of model equivalence for Sharp handheld PCs?

For example, the Sharp PC-1421 and EL-5510 are the same model.

What other "equivalents" are out there?

### **Re: Correspondence between Sharp PC-XXXX and Sharp EL-YYYY models?**

**HP-71B, CMT-CR-128K memory module**

Message #1 Posted by [John Pierce](#) on 25 Apr 2007, 1:27 p.m.

Much to my surprise, I just read where the CMT 128K memory module for the HP-71B retains its memory when detached from the HP71B. I opened the memory module and found a very small (smaller than a dime) battery pack with no identifying marks. The voltage across the contacts was .883 volts. Can anyone help me identify this battery so I can get a new one. Thanks. John Pierce

**Re: HP-71B, CMT-CR-128K memory module**

Message #2 Posted by [Rodger Rosenbaum](#) on 25 Apr 2007, 3:04 p.m.,  
in response to message #1 by John Pierce

It's undoubtedly a 3 volt lithium cell. It should have a part no. on the cell, but if not, any lithium cell that fits will work. Check the Digikey catalog. Be sure to get a cell with tabs for easy soldering without damaging the cell. And watch the polarity!

### 50g/48GX vs. 71B matrix operations--getting slightly different results

Message #1 Posted by [Egan Ford](#) on 24 Apr 2007, 11:32 p.m.

The 50g, 48GX, and the 71B all have the same Saturn processor (50g emulated). All 3 have the same machine epsilon (the smallest  $n$  where  $n+1=1$ ,  $n>0$ ) and the same random number generator.

First generate a large (order 20+) random square matrix and vector with values ranging from  $-1/2$  to  $1/2$ .

Next solve for  $x$  ( $Ax=b$ ):

50g/48GX:

b A / (x on stack)

71B:

MAT x=SYS(A,b)

Compare  $x$  on both systems. They are exactly the same, as are  $A$  and  $b$  (assuming the random seeds are the same).

Next check the accuracy of the matrix operations ( $Ax-b$ ):

50g/48GX:

A x \* b - (Z on stack)

71B:

MAT Z=A\*X @ MAT Z=Z-B

Compare  $Z$  on both systems. Some of the values differ by 1 ULP. Why?

Output of my test:

| 50g/48GX        | 71B             |    |

Burned, came on EPROM.

### Re: 50g/48GX vs. 71B matrix operations--getting slightly different results

Message #5 Posted by [Rodger Rosenbaum](#) on 25 Apr 2007, 2:19 a.m.,

in response to message #1 by Egan Ford

You don't need to go to anywhere near that much trouble to see the differences.

Start with this matrix:

```
[[ 888445 887112 ]
 [ 887112 885781 ]]
```

Invert it.

On an HP71 or HP48S, you will get:

```
[[ 1279847.88527 -1281771.02151 ]
 [ -1281771.02151 1283697.0475 ]]
```

On an HP48G, HP49, HP49G+ or HP50G (in approximate mode), you will get:

```
[[ 885436.50322 -886766.985569 ]
 [ -886766.985569 888099.46714 ]]
```

The HP48G and its successors have matrix arithmetic that was reworked by Paul McClellan to use 15 digit arithmetic for internal operations, rounding to 12 digits only occurring after everything is done.

The HP71 and HP48S rounded internal operations to 12 digits at intermediate steps in the carrying out of matrix operations.

**Re: 50g/48GX vs. 71B matrix operations--getting slightly different results**

Message #6 Posted by **GE** on 25 Apr 2007, 6:49 a.m.,  
in response to message #5 by Rodger Rosenbaum

On the Casio 9860, you get for the inverse :

[ 888781 -887112]

[-887112 888445]

This answer seems to be exact. How do you explain this ???

**Re: 50g/48GX vs. 71B matrix operations--getting slightly different results**

This answer seems to be exact. How do you explain this ???

Did you make a typo when you copied the 1,1 element of the inverse?

I don't know anything about the Casio 9860, so I can only guess about why it gets the exact result. (The HP50 also gets the exact result when it's in exact mode.)

What does the 9860 get for the determinant of the original matrix?

What does it get for  $885781 * 888445 - 7.8696E11$  (do the calculation in one step if you can) ?

What does it get for  $1 / 7 - .142857$  ?

The HP48G, etc., usually uses the LU decomposition to determine the determinant of a matrix, but for a 2x2 matrix, it does it directly. Perhaps the 9860 treats a 2x2 matrix specially when inverting, and therefore gets an exact result.

**Re: 50g/48GX vs. 71B matrix operations--getting slightly different results**

Message #8 Posted by **GE** on 25 Apr 2007, 10:47 a.m.,  
in response to message #7 by Rodger Rosenbaum

Hi Rodger, this machine is the non-CAS current top of the line Casio. It is the fastest non-CAS machine ever. See Xerxes' speed tests in the Articles section.

Yes there was a typo, the [1,1] element is 885781.

It gets the determinant of the original matrix as exactly 1 (det M -1 gives Zero).

$885781 * 888445 - 7.8696E11$  returns 7700545.

$1/7 - .142857$  returns  $1.42857143e-07$ , and  $1/7 - .142857142857$  returns  $1.43e-13$ .

Casios are notorious for rounding  $N + \epsilon$  to  $N$  ( $N$  integer) when  $\epsilon$  is small, a bad

behavior.

You are probably right for the special case of dimension 2.

**Re: 50g/48GX vs. 71B matrix operations--getting slightly different results**

Casios are notorious for rounding  $N+\epsilon$  to  $N$  ( $N$  integer) when  $\epsilon$  is small, a bad behavior.  
You are probably right for the special case of dimension 2.

It looks like they're keeping 15 digits in displayed results, and therefore, using at least 15 digits for internal calculations.

Message #10 Posted by [Egan Ford](#) on 25 Apr 2007, 10:02 a.m.,  
in response to message #5 by Rodger Rosenbaum

Quote:

You don't need to go to anywhere near that much trouble to see the differences.

The 71B code was intended to act as a memory check. That is why it defaults to the largest  $N$  that will fit into memory. I wrote this to check some used RAM I purchased, but when the residuals didn't match EMU71 I got concerned. I used the 50G as a tie breaker, but as demonstrated above that didn't help either. As for the memory check, the residuals did match after I used matching Math ROMs in my 71B and EMU71.

Quote:

The HP71 and HP48S rounded internal operations to 12 digits at intermediate steps in the carrying out of matrix operations.

Thanks, that is helpful. I will use a 48SX for comparison. Now please tell me why there are two different Math ROMs for the 71B both with a version of 1A. Are there others?

Thanks again.

**Re: 50g/48GX vs. 71B matrix operations--getting slightly different results**

Message #11 Posted by [Rodger Rosenbaum](#) on 25 Apr 2007, 2:55 p.m.,  
in response to message #10 by Egan Ford

Would you try running the following little program with each of the MATHROM's you have, and posting the results?

```
10 OPTION BASE 1 @ DIM C(5) @ COMPLEX R(4)
20 READ C
30 MAT R=PROOT(C)
40 MAT DISP R;
```

100 DATA 1,4,6,4,1

You may have to type DELAY 9,0 before you run the program. Then you can press enter repeatedly to see each root.

edited for grammar :-(

*Edited: 25 Apr 2007, 8:57 p.m. after one or more responses were posted*

in response to message #11 by Rodger Rosenbaum*

Here are the results (Egan was so kind to send me a copy of "his" Math LEX that I named "math1x" for convenience):

```
>lex math1x off @ lex math1a on
>run
(-1,0)
(-.9999999501113,0)
(-1.00000024944,4.89897948557E-7)
(-1.00000024944,-4.89897948557E-7)
>
>lex math1a off @ lex math1x on
> run
(-1,0)
(-1,0)
(-1,0)
(-1,0)
```

Impressive!

Rodger, it seems you know very well this Math Lex version, can you tell us more?

J-F

I get the same results.

**Re: 50g/48GX vs. 71B matrix operations--getting slightly different results**

*Message #14 Posted by [Rodger Rosenbaum](#) on 25 Apr 2007, 8:54 p.m.,  
in response to message #12 by J-F Garnier*

That is a MATHROM that I modified about 20 years ago so that the internal 15-form arithmetic was properly rounded to even just like the 12-form arithmetic.

I was curious as to just how much improvement could be had by doing this, and the PROOT function shows the improvement. The 4th order polynomial with equal roots is solved exactly, but not the 5th and higher! The overall improvement is fairly small except for some special cases.

This LEX got out to the world by mistake! I didn't take care of the details of NAN's, INF's, etc., so this LEX shouldn't be relied on.

I didn't change the version to 1x because I didn't ever expect to release it. It would be good to make that change so that it isn't confused with the real thing.

### HP-41 in Space - Shuttle Training Manual

Message #1 Posted by [Bill \(Smithville, NJ\)](#) on 24 Apr 2007, 3:44 p.m.

Hello All,

I just received the Space Shuttle DVD from World Space Flight News. It has just about every type of shuttle manual including the:

Hewlett-Packard 41 Calculator/Shuttle Portable  
Onboard Computer Training Manual.

It's a 45 page manual dated November 1985. It covers both the HP-41 and the Grid Computer. A lot of it covers pretty basic HP-41 operating procedures.

But there are a few tidbits of interest:

1. HP-41C were used on the early flights. They were retired to be used as training units once the HP-41CV became available. What's interesting is that they did not use the HP-41CX, even though they were using the time module on some programs.
2. The 41C was outfitted with x-functions, two x-memory and the time module under normal use.
3. Programming is not covered.
4. All of the shuttle flight programs must be run in the User mode.
5. Programs are loaded from the digital cassette drive. Reading in the programs also reassigns the keys, initializes the variables and sets the flags.
6. A brief description is given for the six programs:
  - Center of Gravity
  - Orbit
  - Alarm/Hex
  - Landing
  - Proximity Operations
  - Tail
7. Now for the real teaser - They refer you to the "HP-41 Flight Procedures Handbook" for details on each program. That handbook is not on the DVD and, so far, I can find no other reference to it.
8. One very interesting plug in module is the "HP-41 Tone Amplifier". This would plug in place of one of the other modules and be used with the Alarm/Hex program.

That's about it. Sure wish I could find that HP-41  
Flight Procedures Handbook.

Bill

## **Re: HP-41 in Space - Shuttle Training Manual**

*Message #2 Posted by **Karl-Ludwig Butte** on 25 Apr 2007, 5:58 a.m.,  
in response to message #1 by Bill (Smithville, NJ)*

Hi Bill,

thanks a lot for sharing these infos. A Google-search with "HP-41 Flight Procedures Handbook" brought no hits but "Flight Procedures Handbook" produced a few at least. Alas, the links showed no trace of HP-41. It seems there were several Flight Procedures Handbooks with different content.

Kind regards

Karl

**HP-75CX**

Message #1 Posted by [Matthias Wehrli](#) on 24 Apr 2007, 2:09 p.m.

Got a HP-75CX from one of you, thanks. Can someone tell us more about this version? We all know the C and the D version. My 75CX shows Version aaaaaa and 14271 K memory (without a 8k expansion). The calculator is labeled 75CX, like the 75C and the 75D are...

Matthias

**Re: HP-75CX**

Message #2 Posted by [Eric Smith](#) on 25 Apr 2007, 7:28 p.m.,  
in response to message #1 by Matthias Wehrli

75CX was one of the pre-release designations.

At one point, the plan was to have 8K and 16K units, which would have been the 75C and 75D. I'm not sure whether the 75CX was before or after that. But the 8K unit was dropped, and the 16K was introduced as the 75C. By mistake, a photo showing a 75D was in the press kit.

The 75D designation was used later, but had nothing to do with the RAM size.

### HP 15C Simulator - Change Comma to Decimal Point

Message #1 Posted by [Paul](#) on 24 Apr 2007, 10:30 a.m.

I would like to know how to change the radix from a comma to a decimal point in Torsten Manzow's HP 15c simulator?

Does anyone have an email for him?

Paul

### Re: HP 15C Simulator - Change Comma to Decimal Point

Message #2 Posted by [Torsten](#) on 24 Apr 2007, 10:42 a.m.,  
in response to message #1 by Paul

There are several ways to change the settings:

- Press <Alt>-<.> or <Alt>-<,>
- Press <Alt>-<O> or right click the area around the display and choose "1.000,00 -> 1,000.00" from the pop-up menu.

The HP-15C simulator contact address can be found in the online help. Press <F1> on the simulator.

Torsten Manz

### HP50g DESOLVE Help

Message #1 Posted by [Chuck](#) on 24 Apr 2007, 10:05 a.m.

On page 14-3 of the 50G Users manual are some commands to use the DESOLVE. The second example is entering:

```
[ 'd1d1y(t)+5*y(t)=2*COS(t/2)' 'y(0)=6/5' 'd1y(0)=-1/2' ]
```

```
ENTER 'y(t)' ENTER DESOLVE
```

The solution "should" be in terms of sine and cosine, as is reported in the manual. Mine keeps the solution in terms of the complex expressions  $e^{(a+bi)}$ , etc. I can certainly do the rewriting myself, but what possible setting am I missing to have the calculator to convert to sines and cosines?

The modes I am using are: soft menus, RPN, RAD, Complex, 't' var, the usual... But I must be overlooking something.

Any suggestions?

Thanks, all.

### Re: HP50g DESOLVE Help

Message #2 Posted by [Happy HP User](#) on 24 Apr 2007, 9:53 p.m.,  
in response to message #1 by Chuck

Using ROM version 2.09:

1) the variable stored in 'VX' should be 't'

2) the machine should be in radians, real, exact mode: you should see RAD XYZ R = 't' at the screen top

With that done, on my 50g:

```
[ 'd1d1y(t)+5*y(t)=2*COS(t/2)' 'y(0)=6/5' 'd1y(0)=-1/2' ]
```

```
'y(t)'
```

DESOLVE returns, and after one minor simplification:

```
'COS(t*1/2)*8/19+COS(t*SQRT(5))*74/75-SQRT(5)/10*SIN(t*SQRT(5))'
```

Not bad for a handheld, Maple's closed form for this ODE is quite similar.

### Re: HP50g DESOLVE Help

Message #3 Posted by [John](#) on 24 Apr 2007, 10:02 p.m.,  
in response to message #2 by Happy HP User

Of course, flag settings are probably to blame.

One thing you could do is completely reset your 50g, or post your complete flag settings to let us see what flags are set.

### Re: HP50g DESOLVE Help

Message #4 Posted by **Chuck** on 24 Apr 2007, 11:49 p.m.,  
in response to message #2 by Happy HP User

Hmmm. No go. So here's a simpler one that I tried...

```
[ 'd1d1y(T)+y(T)=0' 'y(0)=2' 'd1y(0)=0' ]
'y(T)'
```

DESOLVE returns (after a simplification)

$$y(T) = \frac{(e^{iT})^2 + 1}{e^{iT}}$$

It would be nice if it just gave back  $2\cos(T)$ . :(

The obvious modes shown on the screen are: RAD XYZ BIN C='T'

In the CAS MODES I have Complex checked, and Simp Non-Rational checked.

The system flags that are checked are {27, 34, 40, 56, 57, 68, 76, 82, 90, 103, 117, 119}

My version number is #2.09

Any more clues????

Thanks.

*Edited: 24 Apr 2007, 11:52 p.m.*

### Re: HP50g DESOLVE Help

Message #5 Posted by **Happy HP User** on 25 Apr 2007, 10:12 a.m.,  
in response to message #4 by Chuck

Change COMPLEX to REAL mode. The shortcut key method is press and hold LEFT SHIFT, then press and release the TOOL key. This is a toggle between COMPLEX to/from REAL mode. You should see the 'C' change to an 'R' and vice versa when this key sequence is done.

At the top of the screen, you should see RAD XYZ DEC R='T'

Otherwise, solve your difeqs with Maple or Matlab...

### Re: HP50g DESOLVE Help

Message #6 Posted by **Chuck** on 25 Apr 2007, 12:27 p.m.,  
in response to message #5 by Happy HP User

Quote:

At the top of the screen, you should see RAD XYZ DEC R='T'

**Re: HP50g DESOLVE Help**

*Message #7 Posted by [Happy HP User](#) on 25 Apr 2007, 8:14 p.m.,  
in response to message #6 by Chuck*

Your're welcome! Oh, you're students are so lucky to be able to use such marvels as an HP50!

**Re: HP50g DESOLVE Help**

*Message #8 Posted by [Ron Allen](#) on 26 Apr 2007, 12:41 a.m.,  
in response to message #6 by Chuck*

I see you got this "Complex" problem around to a "Real" solution. My 50, even with ROM still degraded to 2.08, wants to use complex equivalents when the DE lends itself to complex solutions. (I carried a K & E "Deci-lon," scabbard and all, when I was a student [ University of New Orleans, 1967 and Tulane University.]

I agree with you that Chuck's students have a wonderful, portable solution to quicker understanding and modeling of engineering challenges.

Regards,

Ron

**HP 33S formula solver**

Message #1 Posted by [Sam Levy](#) on 23 Apr 2007, 1:34 p.m.

HP describes it as " Multiple-variable expression storage and evaluation". You may write an equation with multiple variables and SOLVE\_ for the one of your choice. Each variable is then shown from storage or you may insert a value and it proceeds to a solution. This is in addition to expressions you can integrate or programmed solutions. I had not seen this feature before.

**Re: HP 33S formula solver**

Message #2 Posted by [John](#) on 23 Apr 2007, 1:37 p.m.,  
in response to message #1 by Sam Levy

Yes, this has been around for years.

Welcome to the 21st century. Glad to have you here.

**Re: HP 33S formula solver**

Message #3 Posted by [Vieira, L. C. \(Brazil\)](#) on 23 Apr 2007, 2:45 p.m.,  
in response to message #1 by Sam Levy

Hi;

the first one having this feature as a 'built in' was the HP28C, IIRC. The HP41 and the HP15C (thanks to Karl) can be programmed to do so, but they lack a built-in resource for this case.

Others like the HP27S, the HP39G series, the whole HP4xG, the HP50G and some others also have it.

Cheers.

Luiz (Brazil)

**Re: HP 33S formula solver**

Message #4 Posted by [bill platt](#) on 23 Apr 2007, 4:21 p.m.,  
in response to message #3 by Vieira, L. C. (Brazil)

Didn't the 18c have this feature before the 28c?

**Re: HP 33S formula solver**

Message #5 Posted by [Ron Ross](#) on 23 Apr 2007, 4:28 p.m.,  
in response to message #4 by bill platt

Technically yes, but both were released so close to each other that Scientific, technical types often overlook the 18C.

**Re: HP 33S formula solver**

Message #6 Posted by [Vieira, L. C. \(Brazil\)](#) on 23 Apr 2007, 7:14 p.m.,  
in response to message #5 by Ron Ross

Oops! My bad...

Good to know, thank you both.

In fact, I have the original HP Journal issue with both HP18C and HP28C in the front cover. I actually missed that...

Cheers.

Luiz (Brazil)

**Re: HP 33S formula solver**

Message #7 Posted by [Mike \(Stgt\)](#) on 24 Apr 2007, 3:39 a.m.,  
in response to message #3 by Vieira, L. C. (Brazil)

IMHO the Solver was even ported to DOS -- on the HP200LX. You may even run it on Windows using the 200LX Connectivity Pack or emulators of the calculators you mentioned. <G>

Ciao.....Mike

**Re: HP 33S formula solver**

Message #8 Posted by [Norris](#) on 23 Apr 2007, 4:44 p.m.,  
in response to message #1 by Sam Levy

If you like the Solver on the 33S, you might also like the "Multiple Equation Solver" (MES), an even more powerful feature found on HP 48, 49, and 50 series calculators. The MES allows you to group several equations together, and will automatically switch between them as necessary to solve for a given variable.

Example: you enter and group three related equations for the properties of circles:

$$\begin{aligned} C &= \text{PI} * D \\ A &= \text{PI} * R^2 \\ D &= 2 * R \end{aligned}$$

where A = area, C = circumference, D = diameter, and R = radius.

Then you can enter a value for C, and then ask the MES to calculate the value of A. None of the equations above directly link C and A. But the MES will find A anyway: it will automatically use the first equation to calculate D, then the third equation to calculate R, then the second equation to calculate A.

The MES, unlike the 33S Solver, also recognizes units. For example, if C is entered as '6\_in', then the MES will calculate A as '2.8648\_in^2'

*Edited: 23 Apr 2007, 4:45 p.m.*

**Re: HP 33S formula solver**

Message #9 Posted by [Karl Schneider](#) on 24 Apr 2007, 12:15 a.m.,  
in response to message #1 by Sam Levy

Quote:

HP describes (*the HP 33S formula solver*) as "Multiple-variable expression storage and evaluation". You may write an equation with multiple variables and SOLVE\_ for the one of your choice. Each variable is then shown from storage or you may insert a value and it proceeds to a solution. This is in addition to expressions you can integrate or programmed solutions.

---

Hi, Sam --

I'm not sure if your post is a statement of personal revelation or an indirect request for more details, but I'll assume the latter...

The predecessor of the HP-33S -- namely, the HP-32SII -- to my knowledge is the only other model with all of the capabilities you mention, to include solving and integration of *both* equations *and* programmed functions.

RPL-based models allow solving and integration of algebraic expressions (and even multiple expressions in the case of the HP-48/49/50-series, as mentioned previously). Solving and integration of functions written as RPL programs cannot be done in a direct, straightforward manner, as far as I know.

Many models going back to the HP-34C in 1979 allowed solving and integration of single-input, single-output programmed functions. A few Pioneer-series algebraic models from the late 1980's allowed solution of multi-variable equations, but not integration.

Luiz (Hi!) stated in reply:

Quote:

---

... The HP41 and the HP15C (thanks to Karl) can be programmed (*for use with multiple-input functions*), but they lack a built-in resource for this case.

---

"thanks to Karl" might be just a tad generous, but I did present a technique for doing so in the following MoHPC article, which provides some detailed background about SOLVE and INTEG on the RPN-based models:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=556>

Happy reading!

Actually, short quotes such as this one are permitted without violating copyright. A link was also provided, so this would not be a problem.

You can quote a few sentences, but not pages worth of material and be ok.

### Re: Copyright VIOLATION!!!

Message #4 Posted by [Karl Schneider](#) on 22 Apr 2007, 3:03 p.m.,  
in response to message #2 by [Namir](#)

Most publications state a specific word-count limit for quotes or excerpts. I found no detailed guidelines at

the following sub-link:

<http://www.hemispheresmagazine.com/legal.html>

I seriously doubt that United Airlines would make an issue about something of this nature. It amounts to free advertising at no cost for the publisher, or any undeserved benefit to the quoter.

Howard,

I don't write for airlines. So it's not my stuff. But I have written many books and yes deem copying and pasting just like that, with no permission, to be wrong.

The links the other folks provided don't really represent references to US government websites on copyright laws. I take what Wikipedia says with a grain of salt!

Namir

### **Re: Copyright VIOLATION!!!**

*Message #10 Posted by **Egan Ford** on 23 Apr 2007, 12:18 p.m.,  
in response to message #9 by Namir*

This link may help everyone:

<http://www.copyright.gov/fls/fl102.html>

IOW, it is a grey area and in the context of this thread everyone may be right.

I'll risk the wrath of the Copyright office and provide a few quotes:

"...examples of activities that courts have regarded as fair use:...summary of an address or article, with brief quotations, in a news report..."

"The safest course is always to get permission from the copyright owner before using copyrighted material."

Interestingly, Google has no problem with leveraging fair use, type:

Hewlett-Packard 12c site:hemispheresmagazine.com from google.com, then click cashed.

Also interesting is the legal notice: <http://www.hemispheresmagazine.com/legal.html>

*Edited: 23 Apr 2007, 12:26 p.m.*

### **Re: Copyright VIOLATION!!!**

*Message #11 Posted by **bill platt** on 23 Apr 2007, 12:32 p.m.,  
in response to message #10 by Egan Ford*

Or, more to the point, the tests for infringement are as follows (this is excerpted from the link <http://www.copyright.gov/fls/fl102.html>):

1. the purpose and character of the use, including whether such use is of commercial nature or is for nonprofit educational purposes;
2. the nature of the copyrighted work;
3. amount and substantiality of the portion used in relation to the copyrighted work as a whole; and

4. the effect of the use upon the potential market for or value of the copyrighted work.

Now look at each test in the context of the disputed quotation.

1. Purpose and character: clearly not commercial.

2. Nature of work: a review in teh context of advertising

3. amount and substantiality: Well, it is the whole text of one subject of a multi-subject advertising review. So it is substantial, but again based on the other three tests, there is no harm.

4. Effect on value: clearly not negative. The quotation brings in more business than it destroys. In fact it destroys nothing.

**get real Namir :-)**

I think the link is more than enough to take anyone who is curious to read the original text. The copying was not necessary to inform us.

**Re: to Namir**

*Message #14 Posted by [Andrés C. Rodríguez](#) on 23 Apr 2007, 8:10 p.m.,  
in response to message #13 by Namir*

Links are not forever, and there is no warranty that the publisher will keep an inflight magazine issue online forever (it has bandwidth and storage costs to consider, among other things).

So perhaps, when in the future someone tries to take a look to HP12C advertisements (something many people here does, looking for 1970 ads), he/she will just find a broken link.

A quotation will be sort of a fossil, a small clue of how things were...

IMHO this case doesn't amount to a copyright violation.

Message #17 Posted by **Steve Borowsky** on 23 Apr 2007, 8:05 p.m.,  
in response to message #16 by Frank Boehm

To abandon reason on the alter of a pure idea is likely to be inherently destructive. We live in an age where intellectual property is reaching dangerous extremes. Chemical, agricultural, and medical corporations are seeking to copyright the very substances of life. If a patented seed by chance blows onto a farmer's land, germinates, and bears fruit, the farmer is then, according to current law, financially beholden to the corporation holding the patent, even though no action in violation of patent law was taken by him. Disney got it's start by introducing Mickey Mouse in a cartoon parodying a popular film of the day, in other words, via a derivative work. Today such actions are the subject of lawsuits, to the detriment of our cultural enrichment. Intellectual property deserves its due respect and protection under the law, but I can only hope that in the course of time our grasping, possessive, and greedy nature does not bankrupt our culture in the feverish pursuit of its autocratic ends.

**OK ... OK ... I overreacted!**

Here are some funny numerical questions, not the caliber of VA's stuff but you could try it :

1. What is the interval of definition of  $\log(\text{abs}(\text{tg}(355/(226+x))))$  ?
2. find the solutions of :  $0 = x^2/30 + 0.99*\sin(7*x)$
3. Calculate the first 100 terms of :  $U_0=1, U_1=1,$   
 $U_{n+2}=U_{n+1}-\text{Sqrt}(\text{abs}(6-U_n^2))/U_{n+1}$
4. Find the square triangle (english?) with integer sides, minimal perimeter, and maximal area, that area being less than 1000.

Questions like this show how graphical calculators allow us to "see" solutions manually.  
Enjoy.

OK, here is :

1. All reals apart from the interval ]1,9190491358E-05 to 1,9190491414E-05[ on my example of machine, depends on precision thereof (the better, the smaller).
  2. typing error, I must check.
  3. Graphs as a series of strange segments heavily depending on calculator precision
  4. sides are 23, 60 and 68
- Granted, not very exciting...

### Equation library on HP48GII

Message #1 Posted by [Mike Ingle](#) on 21 Apr 2007, 8:21 p.m.

The equation library on the HP50G is two libraries in port 2. I tried beaming these libraries from a Build 91 HP50G to a Build 39 HP48GII, and to my surprise, have a working equation library on the HP48GII. It also has 8KB free, so this is not terribly useful.

Send the libraries using RECN on the 48GII, since the GII has no port 2. Recall each library from the variable, purge the variable, then store it to port 0. If you do not purge the variable first, the larger library does not fit in memory. Turn the calculator off and on. You now have an equation library option in APPS.

### HP-65 Medical Pac 1 Manual?

Message #1 Posted by [Dan W.](#) on 21 Apr 2007, 4:47 p.m.

Hi all,

I recently bought the Museum documentation DVD and I must say it is well put together and exhaustive. Highly recommended!

However there is one manual I am looking for that is not on the disk. It is the manual for the HP-65 Medical Pac 1 Cardiopulmonary.

Anyone know where I could obtain one?

TIA

-- Dan

in response to message #1 by Richard Z.

Sounds like you are screwed. Tell you what. If you send me the calculator and a \$10- bill, I will happily dispose it for you.

**Re: HP 41 CV dead?**

Message #3 Posted by [Mike Ingle](#) on 21 Apr 2007, 7:48 p.m.,  
in response to message #1 by Richard Z.

I had one of those. Press the case down tightly while pressing the power switch. Works? If so, probably the plastic screw sockets are cracked and there is no pressure holding the circuit board in contact with the display. I used longer screws and some glue to hold it together and now have a working calculator. Clean the contacts while you are at it.

**Re: HP 41 CV dead?**

Message #4 Posted by [Les Wright](#) on 22 Apr 2007, 12:40 a.m.,  
in response to message #1 by Richard Z.

If you are not a DIY type, as I am not, a trip to FixThatCalc.com is money well spent. Randy will rebuild the cracked posts, clean the thing well, and send it back to you with fresh batteries.

**Re: HP 41 CV dead?**

Message #5 Posted by [Julio Ponce](#) on 4 May 2007, 2:37 p.m.,  
in response to message #4 by Les Wright

If you wish you can repair the cracked posts by your self, the repair consiste of a few drops of cyanocrylate glue, and a wrap of fine wire around the posts until the glue had thoroughly set. then close the calculator carefully.

**Re: HP 41 CV dead?**

*Message #6 Posted by [David Smith](#) on 5 May 2007, 11:41 p.m.,  
in response to message #5 by Julio Ponce*

CA glue is a VERY poor fix. It will almost certainly fail in short order. The only (fairly) reliable fix is to use a plastic welding solvent like methylene chloride (available in small bottles at most good hobby shops). It melts the plastic and allows it to be rejoined like a weld in metal.

**Re: HP 41 CV dead?**

*Message #7 Posted by [Ron](#) on 6 May 2007, 8:37 a.m.,

### Creating local variables in RPL

Message #1 Posted by [Les Wright](#) on 20 Apr 2007, 10:09 p.m.

I am wondering if there are any more elegant ways of creating local variables aside from using ->.

I am trying to port some short C programs to the HP48/49, and since I haven't yet gotten to the stage where I do everything on the stack with things like PICK, DUP, and ROT I find I use quite a few local variables to keep track of things. In my programs, I am finding I have programs within programs, since local variable declarations need to be set apart from the routine in which they are used by <<. If I have, say, 8 local variables to declare, I have a rather inelegant declaration looking like this: << 0 0 0 0 0 0 0 0 -> a b c d e f g h << prgm >> >>. This of course is nested in another pair of <<>> brackets since I need to take my input off the stack into yet other local variables, so my overall program form may look like this:

```
<< -> x y << 0 0 0 0 0 0 0 0 -> a b c d e f g h << prgm >> >> >>
```

This is my RPL analogy to a function in C of the form float func(x,y).

Of course, I know that the zeros can (and should where possible) be initialized with values based on the x and y input, or whatever other starting values the program uses. My point is that this seems to be a rather complicated way to do a very simple thing.

Am I over complicating this? I must admit I came up with this approach by trial and error--took me a few hours, for example, to figure out that a local variable declaration must be followed immediately by an opening <<.

Grateful for whatever wisdom you can offer.

Les

### Re: Creating local variables in RPL

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 20 Apr 2007, 11:06 p.m.,  
in response to message #1 by [Les Wright](#)

I assume that you mean in UserRPL, as using local variables in SysRPL is rather different; more flexible, but perhaps more complicated.

Try changing:

```
<< -> x y << 0 0 0 0 0 0 0 0 -> a b c d e f g h << prgm >> >> >>
```

to:

```
<< 0 0 0 0 0 0 0 0 -> x y a b c d e f g h << prgm >> >>
```

to create local variables x and y with two objects from the stack, and local variables a through h with initial values of 0, and then within << prgm >>, when the desired values become available, use 'a' STO, 'b' STO, etc. to replace the values of the existing local variables.

Current ROM revisions (starting with 1.19-4) for the 49 series also include the commands LOCAL for creating and initializing local variables from a list and UNBIND for deleting local variables, but I think that they're intended for ALG mode, and I don't know whether they can be used in RPN mode.

Regards,  
James

## Re: Creating local variables in RPL

Message #3 Posted by **Ron Allen** on 21 Apr 2007, 8:19 p.m.,  
in response to message #1 by Les Wright

I have had some similar problems with LOCALS. It seems that the syntax wants to follow the minimum control path here, but don't assume that I have it figured out yet.

Here's what I think I know about it.

First, the local variables want to serve only the current program and the one being called by the level defining such variables LOCAL. If you do use a compiler, you can be a little more flexible. Since you apparently use the documentation, I advise using the "Advanced User Reference Manual" AND THE USER MANUAL. They seem to combine at times to resolve some things.

There is a method with a compiler, at least by indirect reference which might help some in your quest. Rather than try to paraphrase the method, I'll just point you to the subject - COMPILED LOCAL VARIABLES. This method ostensibly will allow you to use locals in all the succeeding program levels called directly in sequence after the initiating definition. This means that any definition performed at level 3 treats the COMPILED LOCAL designation using special naming convention will be treated as LOCAL within the sequence. Better research it yourself.

Best of luck,

Ron

## Re: Creating local variables in RPL

Message #4 Posted by **James M. Prange (Michigan)** on 22 Apr 2007, 3:34 a.m.,  
in response to message #3 by Ron Allen

In UserRPL:

A procedure (program or algebraic object) can use any local variable already existing or defined for it, provided that a more recently created local variable with the same name doesn't exist.

In other words, an "inner" procedure can use a local variable defined for any "outer" procedure, but an outer procedure can't use any local variable defined only for its inner procedures.

A new, entirely separate, local variable can be defined with the same name as an already existing local variable. Only the most recently created (inner-most) existing local variable with a particular name is accessible.

Note that the index of FOR loop is actually a local variable, existing for as long as the loop is running, so suppose that I define a local variable n for a program, and then use n as a FOR loop index name; in that case, any use of n within the loop uses the loop index, not the local variable n previously defined for the program.

Also, local names can be the same as command names, library command names, or global names. So you could have a local variable named, for example, SIN, or i, or e, in which case only the local variable could be accessed, not the command with the same name.

If you use the HALT command, or various other commands that suspend program execution, any existing local variable is retained, and may be used while the "suspended environment" exists, as long as a newer local variable with the same name doesn't exist.

I'd forgotten about "compiled local variables". Starting with the 48G series, any name beginning with a <- character will be compiled as a local name, even if a local variable with that name doesn't currently exist and isn't being created. This simplifies using a local variable within a program (to be stored in a global variable) which will be called by name from within another program which defines that local variable. But note that compiling the name as local doesn't actually create a local variable; to use a local variable, it has to be currently defined.

If you try to evaluate a local name for which no local variable is currently defined, you get (what else?) an "Undefined Local Name" error.

Regards,  
James

### **Re: Creating local variables in RPL**

*Message #5 Posted by [Ron Allen](#) on 22 Apr 2007, 7:46 p.m.,  
in response to message #4 by James M. Prange (Michigan)*

Thanks, James, for the details on local variables! As usual you show considerable research into the subject.

I am sure you understand this structure as you do the rest of it. I am puzzled by the distinguishing characteristics between RPN and RPL PROGRAMMING. Is it somehow similar to BASIC in that it can be compiled by USERRPL or run under an Interpreter? There so many good things hinted at by the instructions, but they fail ME) to produce the end result I think I am reading into it.

I think I will try to organize this thought in another post more on point by tomorrow and generate a question then. Kind of confusing in this topic.

Ron

### **Re: Creating local variables in RPL**

*Message #6 Posted by [Les Wright](#) on 22 Apr 2007, 10:23 p.m.,  
in response to message #4 by James M. Prange (Michigan)*

Quote:

\_\_\_\_\_

In other words, an "inner" procedure can use a local variable defined for any "outer" procedure, but an outer procedure can't use any local variable defined only for its inner procedures.

\_\_\_\_\_

I have capitalized on this fact in a little routine I just wrote to compute the incomplete beta function by its continued fraction expansion. The local variables a, b, and x are used both in the outer procedure, and in the inner procedure that specifically computes the continued fraction. Indeed, whether or not  $x < (a+1)/(a+b+2)$  determines whether a, b and x are passed "straight" to the inner procedure or whether b, a, and 1-x are passed to a, b, and x in the inner procedure and the complementary function is

computed by a reflection formula.

Despite James' initial advice, I have found that breaking up my local variable definitions in a "nested" way makes my programs easier to read and makes it very clear (at least to me) which procedure a local variable is local to.

Les

### **Re: Creating local variables in RPL + RPL IN GENERAL**

*Message #7 Posted by **Ron Allen** on 23 Apr 2007, 11:48 p.m.,*

*in response to message #6 by Les Wright*

Really enjoy the knowledge that flows between you two. I wonder if you or some will take on some relatively simple subjects, simple to many on this forum - but sometimes confusing to me.

What is the essential difference between RPL and RPN? Is it like the difference in Excel between the live,interpreted language of RPN and the pre-programed structure of the same language, with some few exceptions, referred to as RPL? A language that can be programmed and compiled via C++ or other compilers into machine language for more rapid execution. Using the case of "COMPILED LOCAL" variables, is this a description of variables compiled by the machine language compiler or by the process that uses the interpreter level, RPL, being a structured object made up of RPN commands, etc.?

In my book this would be very similar to BASIC INTERPRETER and QBASIC or VBASIC. By the way, I am speaking of the 50. So, does the COMPILED LOCAL VARIABLE have the flexibility discussed when it operates fully compiled as machine language or "compiled" as RPL? Is there a third alternative?

One more question, please. Is my system up-to-date and ready to share with Excel and Word? I get "Version HP50-C Revision #2.08"

Thanks,

Ron

### **Re: Creating local variables in RPL + RPL IN GENERAL**

*Message #8 Posted by **Karl Schneider** on 24 Apr 2007, 12:52 a.m.,*

*in response to message #7 by Ron Allen*

Hi, Ron --

Quote:

What is the essential difference between RPL and RPN?

Flippant answer:

RPN is like a sharp, no-nonsense dress shirt and trousers, but **RPL is like a leisure suit.**

Serious answer:

RPN is a means of calculation by postfix operation, in which operands are maintained in a stack, and operators are not stored, but are executed immediately upon request.

RPL is an adaptation of RPN to an object-oriented LISP-like structure, in which all forms of data -- simple forms such as actual numbers or display-setting values, or compound forms such as entire programs, entire matrices, or algebraic expressions -- are represented as "object types" that are carried in a dynamic-depth stack. Operations invariably "consume" their inputs, so that compound inputs are not preserved for subsequent use or re-trial unless previously saved to a named variable.

-- KS

**Re: Creating local variables in RPL + RPL IN GENERAL**  
*Message #9 Posted by **Ron Allen** on 24 Apr 2007, 2:44 a.m.,

- 20) How can I intimate this to my most intimate friend?

Let's face it - English is a crazy language. There is no egg in eggplant, nor ham in hamburger; neither apple nor pine in pineapple. English muffins weren't invented in England or French fries in France. Sweetmeats are candies while sweetbreads, which aren't sweet, are meat. We take English for granted. But if we explore its paradoxes, we find that quicksand can work slowly, boxing rings are square and a guinea pig is neither from Guinea nor is it a pig.

And why is it that writers write but fingers don't fing, grocers don't groce and hammers don't ham? If the plural of tooth is teeth, why isn't the plural of booth, beeth? One goose, 2 geese. So one moose, 2 meese? One index, 2 indices? Doesn't it seem crazy that you can make amends but not one amend? If you have a bunch of odds and ends and get rid of all but one of them, what do you call it?

If teachers taught, why didn't preachers praught? If a vegetarian eats vegetables, what does a humanitarian eat? Sometimes I think all the English speakers should be committed to an asylum for the verbally insane. In what language do people recite at a play and play at a recital? Ship by truck and send cargo by ship? Have noses that run and feet that smell?

How can a slim chance and a fat chance be the same, while a wise man and a wise guy are opposites? You have to marvel at the unique lunacy of a language in which your house can burn up as it burns down, in which you fill in a form by filling it out and in which, an alarm goes off by going on.

English was invented by people, not computers, and it reflects the creativity of the human race, which, of course, is not a race at all. That is why, when the stars are out, they are visible, but when the lights are out, they are invisible.

PS. - Why doesn't "Buick" rhyme with "quick"

You lovers of the English language might enjoy this .

There is a two-letter word that perhaps Has more meanings than any other two-letter word, and that is "UP."

It's easy to understand UP , meaning toward the sky or at the top of the list, but when we awaken in the morning, why do we wake UP? At a meeting, why does a topic come UP? Why do we speak UP and why are the officers UP for election and why is it UP to the secretary to write UP a report?

We call UP our friends. And we use it to brighten UP a room, polish UP the silver, we warm UP the leftovers and clean UP the kitchen. We lock UP the house and some guys fix UP the old car . At other times the little word has a real special meaning. People stir UP trouble, line UP for tickets, work UP an appetite, and think UP excuses. To be dressed is one thing but to be dressed UP is special.

And this UP is confusing: A drain must be opened UP because it is stopped UP. We open UP a store in the morning but we close it UP at night.

We seem to be pretty mixed UP about UP! To be knowledgeable about the proper uses of UP, look the word UP in the dictionary. In a desk-sized dictionary, it takes UP almost 1/4th of the page and can add UP to about thirty definitions. If you are UP to it, you might try building UP a list of the many ways UP is used. It will take UP a lot of your time, but if you don't give UP , you may wind UP with a hundred or more. When it threatens to rain, we say it is clouding UP. When the sun comes out we say it is clearing UP .

When it rains, it wets the earth and often messes things UP.

When it doesn't rain for awhile, things dry UP.

One could go on and on, but I'll wrap it UP, for now my time is UP , so..... Time to shut UP.....!

Oh...one more thing:

What is the first thing you do in the morning & the last thing you do at night? U P

These are great. They remind me that French (and all languages) are full of idiomatic expressions that get "outsiders" into humorous situations!

This also reminds me that once upon a time I saw a very clever short that was composed entirely of the spelling anomalies--it was virtually unreadable! What I mean is things like starting a word with the "f" sound but spelled GH as in "enough" viz "fathom" would be spelled GHETHIM or something, "telephone" would be TELAGHOAN etc. (You might have noticed that I was stretching the unstressed vowels pretty far there--in other words a tremendous number of words have the same phoneme in the unstressed vowel position--yet they can be spelled with virtually any vowel. This is at the root of a number of common mis-spellings.)

### AME Port Extender

Message #1 Posted by [MikeG](#) on 20 Apr 2007, 12:10 a.m.

I have recently acquired one AME port extender for the HP41 unfortunately with no documentation, and that's what I'm inquiring about. Does anyone have any information on this item.

Thanks in advance

### Re: AME Port Extender

Message #2 Posted by [Tony Duell](#) on 20 Apr 2007, 4:40 a.m.,  
in response to message #1 by [MikeG](#)

What do you need to know? I have one of these units, no manual, but I traced out the schematic and it's really simple.

A few things to get you started :

It plugs into any port on any HP41. It ignores the select lines on the port.

There are DIP switches at the front to enable/disable slots 1-6 and switches on the side to select which port slots 5 and 6 act like.

The 4 slots labelled 1 2 3 and 4 act like the corresponding ports on the HP41. So you can't have a ROM module in Port 1 of the HP41 and Port 1 of the extender (well, not unless one takes the high half of the page, the other the low half). You could have, say, an HPIL module in port 1 of the HP41 and a ROM module in port 1 of the extender without problems

The 2 slots labelled 5 and 6 can be set using 2 DIP switches each to act like any of the 4 ports on the HP41. Since you can use the front switches to enable/disable a particular slot, you could put a ROM module in slot 1, and in slot 5 (set to slot 1) provided only one is enabled at a time.

I forget what slot 7 is. I think it's another Port 4 by default, but you can add a couple of wires inside the extender to make it controllable by the last 2 (normally unused) DIP switches.

You can put a PX28 battery inside the extender to maintain the contents of RAM (HP41C memory modules, extended memory modules) when you unplug the extender from the HP41. There's a toggle switch that turns on an LED when pushed one way if that battery is good. Pushed the other way it checks the HP41's batteries.

Let me know what else you need to know

### Re: AME Port Extender

Message #3 Posted by [MikeG](#) on 20 Apr 2007, 10:21 a.m.,  
in response to message #2 by [Tony Duell](#)

Thanks for the info. I tried out the unit by plugging it into port 4, the other three ports were taken up by the

following: Quad memory, X functions, Math1.

When I plugged the unit in and turning the calculator on the display was corrupted so I immediately turned it off and unplugged the extender. Turning the calculator back on resulted in "Memory Lost" displayed where by hitting R/S would bring me into PRGM mode, in the end I had to disconnect the batteries to restore the 41.

The extender's configuration is as follows:

A. I replaced the A544 battery and performed the battery test = OK B. The DIP switches on the bottom of the unit were configured with 6 = on, 5 = on, 4-1 off C. The DIP switches on the side of the unit were configured with 1-4 = on, 5-6 = off (ON = number depressed..right) This corresponds to what I ascertained from the description on the case as the proper configuration to enable ports 5 and 6 while having the unit plugged into port 4 of the HP41.

The result after the extender was plugged in and a Circuits I module plugged into port 5 was that the 41 wouldn't turn on, removing the extender resulted in having to go through the restore method described above.

Looking back on your response, I'm beginning to think that you cannot have any modules plugged into the 41 since the extender ignores the port lines as you indicated, is this true?

Either I must be seriously doing something wrong (most likely) or the extender is malfunctioning (not much there). Again I appreciate any advice.

Thanks

*Message #4 Posted by **Richard Garner** on 20 Apr 2007, 11:06 a.m.,  
in response to message #3 by MikeG*

I had a Port-X-Tender years ago. It sounds like you have a port sharing problem. Remove the Math Module and try it again. If it works without the Math Module in, then plug the Math Module into one of the X-Tender ports and run a catalog 2 to see if the module shows up for use. I remember I ran into a port sharing problem and had to block that port on the X-Tender from being shared with the dip switches.

---

No. What that has done is make ports 5 and 6 both act like (IIRC) port 4. There is no reason why you have to have those 2 slots set to port 4 if you plug it into port 4.

Quote:

---

The result after the extender was plugged in and a Circuits I module plugged into port 5 was that the 41 wouldn't turn on, removing the extender resulted in having to go through the restore method described above.

---

No. The RAM modules (normal and extended), HPIL module, printer, timer module all have their own spaces in the memory map and will never conflict with ROM modules. So unless your maths and circuits modules ended up in the same port, you shouldn't have any problems at all.

Quote:

---

Either I must be seriously doing something wrong (most likely) or the extender is malfunctioning (not much there). Again I appreciate any advice.

Thanks

---

It's always possible there's a broken wire in the cable, or dirty contacts somewhere...

## **Re: AME Port Extender**

*Message #6 Posted by **Eric Smith** on 20 Apr 2007, 4:53 p.m.,  
in response to message #5 by Tony Duell*

Quote:

---

The RAM modules (normal and extended), HPIL module, printer, timer module all have their own spaces in the memory map and will never conflict with ROM modules.

---

In more detail:

The 82106A memory modules and 82170A quad memory module must not be used on a 41CV or 41CX, which already contain the full complement of normal memory. Only one 82170A may be used on the 41C, and may not be combined with any 82106A modules.

The 82180A extended function/memory module and 82182A time module must not be used on a

41CX, which already incorporates their functionality.

No more than two 82181A extended memory modules may be used, and if one is plugged into an even port, the other must be plugged into an odd port. On a 41C or 41CV, the 82181A is generally only useful if you also install an 82180A.

Only one printer may be used. The 82143A printer and 82442A IR printer module cannot be used together. If either is used with an HP-IL module, the switch on the HP-IL module must be set to disable the HP-IL printer functions.

The service ROM will not work with an HP-IL module with printer functions disabled, because disabling the printer functions moves them to page 4, which is where the service module is addressed.

Mike

### **Re: AME Port Extender**

*Message #9 Posted by [Juan J](#) on 20 Apr 2007, 10:12 p.m.,  
in response to message #8 by MikeG*

Hello Mike,

I have one of these. Presently I do not have the manual at hand (I am at work, away from home)but do remember a couple things.

It is supposed to connect in Port 3. You can activate ports 1 through 4 of the Port Extender using the DIP switches, which gives you access to multiple modules through Port 3. Ports 5 and 6 can behave like the 41's Ports 1 through 4 by toggling the DIP switches on the right side of the extender. Care must be taken with this; otherwise the 41 will crash.

A typical configuration can be two Extended Memory modules in Ports 1 and 2, an Application Pac (for instance, the Advantage Pac) on Port 3. CAT 2 will report the Pac and you will have 600 Extended

Memory registers. I use an HP-41C with a Quad Memory Module on Port 1, Extended Memory/Functions Module on Port 2, the Port Extender with the above mentioned modules on it, and a Card Reader.

Port 7 is used to plug in the 82143A printer, the 82153A Wand or the HP-IL Module. I do not remember how to enable it but it has to do with the front DIP switches.

Hope this helps.

### Two new Datafile articles online (PDF format)

Message #1 Posted by [Valentin Albillo](#) on 19 Apr 2007, 8:39 p.m.

Hi, all

I've just updated [my HP calc web site](#) to include two additional Datafile articles written by me, freely downloadable in PDF format, namely:

- **"HP-71B Sudoku Generator & Coach"**

This completes my *Sudoku Trilogy* with a 14-page article featuring a Sudoku Generator & Coach which can generate an essentially infinite number of puzzles per the user's specifications, including number of empty places, symmetries and, optionally, guaranteed uniqueness and solvability without guessing ever being necessary, in a fully ergonomic, printable format. The coach part can give appropriate hints of various types, one by one, guaranteed to be deductible by the user in the given order, either fully completing the puzzle or stopping midway, both for the self-generated puzzles and externally provided ones.

- **"Long Live the HP-25 !"**

7-page article to commemorate the HP-25, my first HP calculator ever and one of the most memorable classics ever made. The article includes some fond personal remembrances of those golden times, as well as a thorough explanation of why the HP-25 made such an impact back then, all of it conveniently laced with two awesome programs written in the 70's by two enthusiastic youths, namely my friend Fernando del Rey and myself. Single-stepping through the code is a revealing experience, where you can see what can be done in less than 40 steps and how everything fits together and works as if by magic.

and last but not least ...

- **"Boldly Going - Identifying Constants"**

This is my latest published Datafile article, which isn't available online but featured in the current Datafile issue, V26N2 pp24-37. It's a 14-page article which includes a truly awesome (if simple) program which allows *ye goode olde* HP-71B to perform some rather impressive 'symbolic' feats. The program does *not* require any additional ROMs or files, just a bare bones HP-71B, and can be converted to any other suitably fast HP model or emulator with minimum effort.

Have a look at the very first page of the article which tells it all (the full 14-page article boasts more than 40 worked out examples, including the five shown in this first page, as well as three detailed *extensions*, the last being an 'exercise' for the reader, solution included ! :-)

<http://i14.tinypic.com/4ibordg.gif>

That's all. Hope you enjoy the two new uploaded articles and

Best regards from V.

*Edited: 20 Apr 2007, 7:33 a.m.*

**Re: Two new Datafile articles online (PDF format)**

*Message #2 Posted by **Valentin Albillo** on 22 Apr 2007, 1:32 p.m.,  
in response to message #1 by Valentin Albillo*

Hi all,

My HP calc web site has had over 400 hits in the last two days, which is many times the usual rate, so thanks a lot for your interest in my articles.

And of course, any and all comments are most welcome.

Best regards from V.

**Re: Two new Datafile articles online (PDF format)**

*Message #3 Posted by **Gerson W. Barbosa** on 22 Apr 2007, 2:14 p.m.,  
in response to message #2 by Valentin Albillo*

Hello Valentin,

I am particularly fond of the "Long Live the HP-XX !" series articles. I am glad you keep on producing them. Thanks a lot!

Gerson.

**Re: Long Live ! Series**

*Message #4 Posted by **Valentin Albillo** on 22 Apr 2007, 2:59 p.m.,  
in response to message #3 by Gerson W. Barbosa*

Hi, Gerson:

Thank you very much for your unfailing interest in my humble productions, really much appreciated.

As for the "Long Live Series", the following articles have already appeared published in Datafile, though still not available as online PDF downloads:

- Long Live the HP-34C !
- Long Live the HP-71B !
- Long Live the HP-35 !

and another one is already written but not yet sent for publication, namely "**Long Live the HP-67 !**".

Unlike Wlodek, I do not intend to cover every HP calculator under the sun nor limit myself exclusively to HP calculators. I may, for instance, write "Long Live" articles about some outstanding ROM or peripheral, as well as some nice HP microcomputers, such as the HP-85.

But all in all, it won't be a very long series, just the models I know best and like the most.

Best regards from V.

Message #5 Posted by **GE** on 24 Apr 2007, 4:07 a.m.,  
in response to message #2 by Valentin Albillo

Thank you for those articles. And I am still wondering why I'm not a Datafile subscriber yet...

**Re: Two new Datafile articles online (PDF format)**

Message #6 Posted by **Valentin Albillo** on 24 Apr 2007, 7:36 a.m.,  
in response to message #5 by GE

Hi, GE:

GE wrote:

*"Thank you for those articles. And I am still wondering why I'm not a Datafile subscriber yet... "*

Thanks to you for your kind words, GE, much appreciated.

Actually, encouraging words like that do wonders to provide the necessary motivation to try and write new articles. Otherwise, imagine how one would feel if, after spending most of the scarce free time available in a whole month to develop and write down a full 14-page article (program included), one would then get no feedback whatsoever, be it positive or negative. It would leave quite an 'empty' feeling and a strong urge to allocate time to more rewarding endeavours ... :-)

As for not being a Datafile subscriber yet, unless you've tried to and there were some problems while processing your subscription, I would encourage you to become one: the cost is truly minimal, you'll be supporting the last great HP fan magazine out there, and the very best part is you'll find yourself eagerly awaiting for your issue every other month, reliving that wonderful feeling we had back in our youth, in the golden PPC days.

Which is more, you could even consider submitting your own articles and comments, the more the merrier. Meanwhile, my very next "Boldly Going" series article is really going to both break new grounds and prove immensely valuable in actual use, I'm really proud of it. Stay tuned !

Best regards from V.

### OT- Binary Watch

Message #1 Posted by [Mike H](#) on 19 Apr 2007, 5:04 p.m.

I didn't know if I should laugh or get out my credit card...

Recent Skymall ad...

BINARY CODE WATCH Hard-core techies love this watch. So do design devotees. Red lights on the green circuit-board face represent powers of two: 2, 4, 8, 16, 32. A series of electrical impulses turns them on (1) or off (0), displaying the time in binary code. If you know the code, you can tell the time, amazing those around you who don't have a clue. Water-resistant to 100 ft., watch has a stainless-steel case and soft leather band. Face is 1 5/8" across.

It is to ease the transition from the one type to the other 9, or the nine to the one (whichever you prefer)

### Re: OT- Binary Watch

Message #5 Posted by [Ren](#) on 20 Apr 2007, 10:49 a.m.,  
in response to message #1 by Mike H

I've seen that ad a number of times and the one thing I don't "get".

The "hour" display is 4 LED's, the hour shown in the picture is "13" (8+4+1). Yet, 4 LED's can only display

up to "15" hours...

So.... If the watch can't display 24 hours (that would require 5 "hour" LED's), why is it displaying "13"?

After that I haven't even bothered to decipher the minutes.

Ren

dona nobis pacem

### marketing strikes again

Message #6 Posted by [Don Shepherd](#) on 20 Apr 2007, 11:28 a.m.,  
in response to message #5 by Ren

Good point. I'll bet the picture wasn't from a production watch, but was created by the marketing guys who obviously goofed it. I bet the watch really only displays hours 0-12.

### Re: marketing strikes again

Message #7 Posted by [Geir Isene](#) on 20 Apr 2007, 4:48 p.m.,  
in response to message #6 by Don Shepherd

Yes, it only goes to 12 :)

Apparently, you're a card-carrying member of the target demographic. (They might do well to *aim* a little better . . . )

### Re: OT- Binary Watch

Message #9 Posted by [Philip Reagan](#) on 20 Apr 2007, 5:10 p.m.,  
in response to message #1 by Mike H

Yes, I have one too. Friends call it my geek watch. I generally wear it on important days such as Sunday at Church. I get a lot of questions and interest and they want to know how to tell what time it is. Unfortunately, it only takes about 10-15 seconds before they say, "never mind" and loose interest in how to tell the time.

FYI, there is no provision to tell AM or PM unfortunately nor is their a calender. It is a fun watch however.

### Re: OT- Binary Watch

I never had the need for a watch to tell me night from day.

## Re: OT- Binary Watch

Message #11 Posted by [Matt Kernal \(US\)](#) on 21 Apr 2007, 3:04 p.m.,  
in response to message #1 by Mike H

At last September's HHC2006, folks were asking to see Eric Smith's watch - which IIRC, was this [Nixie Tube](#) model (don't miss the Quicktime movie :-). The first HP-01 watch I had ever seen (in person), was also worn by Eric - at the HHC1998 (or 99?) in Vancouver, WA.

People often ask "What is that?" when they point at the [BCD Clock](#) in my office. I can rattle off the time instantly (because they don't notice the regular clock-radio sitting behind the BCD clock ;-).

Matt

## Re: OT- Binary Watch

Message #12 Posted by [Wayne Brown](#) on 27 Apr 2007, 1:51 p.m.,  
in response to message #11 by Matt Kernal (US)

My office clock has the hours marked in multiples of pi radians:  $\pi/6$  for one o'clock, followed by  $\pi/3$ ,  $\pi/2$ ,  $2\pi/3$ ,  $5\pi/6$ , etc. It's fun to watch people staring at it and trying to figure out how to read it. Eventually, most of them realize they can just ignore the numbers, since the hour marks are in the same places as on a regular clock. :-)

### Polar Coordinates

Message #1 Posted by [Sara](#) on 19 Apr 2007, 10:28 a.m.

I don't know how to convert from regular to polar coordinates (&back) on my HP 50g. Any ideas? Thanks

### Re: Polar Coordinates

Message #2 Posted by [Vieira, L. C. \(Brazil\)](#) on 19 Apr 2007, 11:40 a.m.,  
in response to message #1 by Sara

Hi;

the HP50G deals with number representation for both polar and rectangular coordinates in a way you can show each representation without actually converting the numbers themselves. Anyway, in the MODES menu you can choose either rectangular or polar representation. The calculator will not actually convert the number, just show it in the selected mode. Given a complex number in any format in the display, the HP50G has the following functions:

ARG - returns the angle of the polar representation  
 ABS - returns the absolute value of the polar representation  
 RE - 'extracts' the real part of the number  
 IM - 'extracts' the complex part

You can download [this training module](#) and [this other one](#) for further information.

Luiz (Brazil)

### Re: Polar Coordinates

Message #3 Posted by [Hal Bitton](#) on 19 Apr 2007, 12:12 p.m.,  
in response to message #1 by Sara

Hi Sara,

Go to the MTH menu (left shifted SYMB key), and the VECTR sub menu (far left), and press NXT. You will see RECT (rectangular) and CYLIN (polar) soft key labels on the far left. Enter your coordinates in a suitable format (x,y) for rectangular, or (magnitude,<angle) for polar (note that the less than symbol really represents the angle symbol, which is accessed by ALPHA right shift 6 on the calculator. Once you get the coordinates on level 1 of the stack, simply select rectangular or cylindrical (using the F1 and F2 soft keys) to convert. If you key in coordinates in one system (say rectangular), and the the other system is selected (in this case CYLIN), the conversion will take place as soon as you hit the enter key, and vise-versa.

This is rather keystroke intensive compared to the old machines (where you just threw two numbers onto the stack and hit the P<R key), but bear in mind that with the 50G, you don't have to convert to do vector arithmetic. (I.E. you can add two sets of polar coordinates without having to convert them to rectangular and back again...the calculator will do that for you).

Best regards, Hal

**Re: Casio FC-1000 manual? Anyone?**

*Message #6 Posted by [Valentin Albillo](#) on 19 Apr 2007, 7:22 p.m.,  
in response to message #1 by Gene*

Hi, Gene:

I've downloaded and looked at the manual and it seems a pretty interesting machine.

Matter of fact, it can be considered like the Financial version of my Casio fx-7500g, which seems to be identical to yours, only Scientific instead of business (and with nearly 2x the memory), as if they were the 'equivalents' of the HP-12C and HP-11C, respectively.

My scientific fx-7500g is an awesome machine, unbelievably small, capable, and fast, much faster than most HP models, and with a very nice graphic and alpha screen. I'd love to see some of your comments, tests, and even reviews when you get to know your business model and write some programs for it. I'm even considering writing some review and programs for my scientific model in comparison with equivalent HP ones. Your review and mine would make a fine couple of paired articles :-)

Best regards from V.

in response to message #1 by Roland Storz

Namir, Klaus, thanks to both of you, I did cross-check the museum, you can find anythink you can imagine, however I couldn't find the manual for this specific math/stat module, did I miss something? Regards, Roland

**Re: HP 5061-7287 MATH STAT PAC MODULE**

Message #5 Posted by [Monte Dalrymple](#) on 19 Apr 2007, 1:29 p.m.,  
in response to message #4 by Roland Storz

The Math/Stat module didn't come with its own manual. Included with the module was a copy of the manual for the Math Pac and a copy of the manual for the Stat Pac. The Math/Stat Pac effectively just combined those two modules into one housing.

Monte

**Re: HP 5061-7287 MATH STAT PAC MODULE**

Message #6 Posted by [Dan M \(Vermont, USA\)](#) on 19 Apr 2007, 1:27 p.m.,  
in response to message #1 by Roland Storz

I believe that this particular PAC was a repackaging of the "Math Pac" and the "Stat Pac" into one module. As such, it shipped with 2 manuals, one for "Stat Pac" and another for "Math Pac" and didn't have one manual all to itself.

Plugging in this one (combined) module acts the same as plugging in one "Math Pac" module and one "Stat Pac" module, except it only takes up one Port.

Hope this helps,

Dan M.

### **solving inequalities with my 50G**

Message #1 Posted by [Hal Bitton](#) on 18 Apr 2007, 9:11 p.m.

OK, I must be going crazy...the other night (with my 50g) I was merrily solving inequalities for a variable (checking my son's homework;)using the far right soft key labeled "solve" in the s.solve menu. (As a very simplistic example, for the inequality  $X < 3Y$  in level 1 of the stack, I would key Y into the command line and press the solve soft key...the result could be  $Y > X/3$ ).

Just now, I'm trying to do the same thing again and I get a window that says "Solve Error: Parameters not allowed". So now I'm thinking maybe I wasn't using the solve soft key the other night...or maybe a flag or setting is not configured properly...or maybe I'm just losing my marbles 8/ ---->ooooo  
Anyway, any help on this would be greatly appreciated. Thanks, and best regards, Hal

### **Re: solving inequalities with my 50G**

Message #2 Posted by [Ron Allen](#) on 27 Apr 2007, 1:24 p.m.,  
in response to message #1 by Hal Bitton

Hal, did you get answered?

I don't recall ever getting solutions for inequalities as a part of CAS or anywhere within the solvers. That doesn't mean it isn't designed to or specified to. A solve error, "parameters not allowed" would be the message expected, at least to me. I can generate that response every time on my 50.

Regards,

Ron

### **"Orange" and "white" shift keys.**

Message #1 Posted by [Bob Blaylock](#) on 18 Apr 2007, 5:31 p.m.

I have found several instances in which instructions on how to do a particular thing on an HP48 calculator make reference to "orange" and "white" shift keys.

I haven't had any trouble figuring out that where I see these, the intent is to refer to the two up-and-to-one-side keys between the ON key and the alpha key. But on my HP48G, the up-right key is green, and the up-left key is lavender.

Apparently, HP hasn't been consistent in its use of color for these keys on different variants of the HP48.

So, I have a question and a comment.

First, the comment: When specifying instructions for doing something on an HP48, please be aware that not all HP48s use the same colors as yours in the same way, so referring to these keys by color isn't helpful to someone who has a calculator that uses different colors.

Second, on those HP48 calculators that do use orange and white, which is which?

### **Re: "Orange" and "white" shift keys.**

Message #2 Posted by [allen](#) on 18 Apr 2007, 5:52 p.m.,  
in response to message #1 by Bob Blaylock

the 50g has orange and white not the 48 series. ( orange and blue or teal and lavender. Cheers -al

Message #3 Posted by [John](#) on 18 Apr 2007, 6:00 p.m.,  
in response to message #2 by allen

There have been no 48SX, 48S, 48GX, or 48G calculators that used Orange and White shift keys.

The color scheme is the same for ALL the 48SX and 48S models that HP sold.

The color scheme is the same for ALL 48GX and 48G models that HP sold.

Without a link to the specific statement to which you are referring, we can't help you more than this.

### **OT: About the photo on the 50G packaging :-)**

**Re: "Orange" and "white" shift keys.**

*Message #10 Posted by **James M. Prange (Michigan)** on 18 Apr 2007, 6:49 p.m.,  
in response to message #2 by allen*

And on the 49g+, the LeftShift is green and the RightShift red.

From HP's site, it looks as if the 48gII's LeftShift is sort of dark blue, and it's RightShift is red.

I agree that identifying a shift key by colour is poor communication. Even though I have all of the RPL models except the 48gII, I wouldn't know which shift key is a particular colour on any given model without actually taking a look at the calculator.

Regards,  
James

**Re: "Orange" and "white" shift keys.**

*Message #11 Posted by **Howard Owen** on 18 Apr 2007, 9:17 p.m.,  
in response to message #10 by James M. Prange (Michigan)*

I agree. "Left Shift" and "Right Shift" is the way to go in describing these keys.

The color wouldn't be a bad means of communicating the difference if it weren't for the color scheme changes over the years. At least the current scheme is high-contrast.

Regard,  
Howard.

P.S.

I once knew a Bob Blaylock in my Apple ][ days.

[ [Return to Index](#) | [Top of Index](#) ]**Substitute variables on a array of equations...***Message #1 Posted by [regisxp](#) on 18 Apr 2007, 2:29 p.m.*

Hi all!

I have a function that returns me a array with two equations... Something like this:

 $[x^2+y \quad X^2-2y]$ 

Is there any way that i can use to substitute X and Y by real numbers, like; x=2 and y=1

And get an array with the responses: [5 2]

Thanks a lot!!!

**Re: Substitute variables on a array of equations...***Message #2 Posted by [Vieira, L. C. \(Brazil\)](#) on 18 Apr 2007, 8:06 p.m.,  
in response to message #1 by [regisxp](#)*

Hi;

one of the simplest way would be creating the variables 'x' and 'y' then attributing them the values you want to. Consider this:

```
[x^2+y x^2-2y] [ENTER]
2 'x' [STO]
1 'y' [STO]
[->NUM]
```

Alternatively you can store the initial expression in a separate variable, say 'EQ1', with the following sequence:

```
[x^2+y x^2-2y] 'EQ1' [STO]
2 'x' [STO]
1 'y' [STO]
'EQ1' [->NUM]
```

This way, you could attribute x and y other values, say 3 and 4, like this:

```
3 'x' [STO]
4 'y' [STO]
'EQ1' [->NUM]
```

There are other ways, for sure. This is one of them, though.

Cheers.

Luiz (Brazil)

*(PS: there may be errors, I have no calculator at hands, now...)*

### Repair of keyboard HP 55

Message #1 Posted by [Kees van der Sanden](#) on 18 Apr 2007, 1:57 p.m.

I own a HP 55 calculator. This calculator works fine except for three keys, marked ., 1 and 2. These keys are functional but missing the click feeling. Can this be repaired easily and do I need spare parts?

### Re: Repair of keyboard HP 55

Message #2 Posted by [Gerson W. Barbosa](#) on 18 Apr 2007, 5:59 p.m.,  
in response to message #1 by [Kees van der Sanden](#)

\_\_\_\_\_

One EE trainee who worked with us had an HP-49G+ on which these same keys were broken (he'd put pieces of papers around the key slots to hold them in place). [Benford's law](#) as observed in calculators? This was first noticed in logarithmic tables (first pages, the ones with numbers beginning with 1 and 2, were much more worn and smudged than later pages).

No keys in my HP-45 have lost that click feeling yet :-). However, on occasions keys '2' and '3' bounce if I don't press them firmly.

\_\_\_\_\_

I think <http://www.fixthatcalc.com> can fix it for you, in case you're loath to open it yourself and try to discover what is wrong. Once I was able to fix a similar problem in an HP-15C, but that was a spare unit and I wouldn't mind if anything went wrong.

Regards,

Gerson.

### Re: Repair of keyboard HP 55

Message #3 Posted by [Randy](#) on 18 Apr 2007, 8:01 p.m.,  
in response to message #1 by [Kees van der Sanden](#)

The loss of tactile feedback in LED classic machines is due to a failure of the key strip. In the photo below, the keyboard assembly is on the left, you can see the small projections where each key is. The flexing strips develop stress fractures at the base of each hinge point, when they fail, they work electrically but you lose the mechanical feedback.

The only source for a replacement strip is from another HP classic machine but it is not an easy task to remove and graft a replacement on to the original as they are spot welded in place. They can be soldered but the results are not always 100%, the best solution is to replace the entire assembly. Unfortunately, the keyboard of the 55 is unique due to the timer/pgm/run switch.

in response to message #1 by Kees van der Sanden

Hi;

My HP55 has the same problem with the [1] key. I noticed that there is a small crack at the side of the flex strip, and I hope it does not break definitely. I use the calculator only when I want to check some particular operation or to test programs, procedures, specifically for it.

Hope you succeed.

Cheers.

Luiz (Brazil)

in response to message #4 by Vieira, L. C. (Brazil)

Hello,

I have reasonable good experiences with rewelding the strip: Loosen the strip and soldering it back to the welding points. The trick is in soldering the strip back with the right curvature. If done well, it will be as new, if not....

If the strip is broken however, you will have to salvage one from a other keyboard.

If you need more help, I am located in the Netherlands around Utrecht so we could call if needed.

Ronald.

### NiMH batteries in the HP48 and 49 series

Message #1 Posted by [Les Wright](#) on 18 Apr 2007, 1:19 a.m.

As I get exasperated with how my 49G+ gobbles batteries, and I fret about the the cost and the waste, I am contemplating investing in a few of the highest rated AAA NiMH batteries I can find and seeing how I make out. I understand that the main beef with rechargeables and the 48 and 49 series is that they can conk out without adequate "low bat" warning and you lose the memory of the calculator. As the life of newer rechargeables increases, I am wondering if anyone has had better luck with the NiMH solution as opposed to plowing thru piles of alkalines. I find that just sitting around doing nothing is enough for my 49G+ to kill a set of batteries in a few short weeks. The 48G is much kinder to batteries, but still once under regular use it gobbles the alkalines too.

Les

### Re: NiMH batteries in the HP48 and 49 series

Message #2 Posted by [Rodger Rosenbaum](#) on 18 Apr 2007, 3:52 a.m.,  
in response to message #1 by Les Wright

I posted some info about this on comp.sys.hp48 last year:

Quote:

I used a variable bench power supply to run 3 calculators, and reduced the voltage until the low battery indicator came on in the display. These are the results.

| Calculator | Total voltage when<br>low batt came on | Per cell voltage when<br>low batt came on |
|------------|--|---|
| HP-48G     | 3.20 volts                             | 1.067 volts                               |
| HP-49G+    | 3.45 volts                             | 1.15 volts                                |
| HP-50G     | 4.85 volts                             | 1.2125 volts                              |

If you replace your (alkaline) batteries when the low battery indicator first comes on, the HP-50G will have significantly shorter run time.

See the discharge characteristic at: <http://data.energizer.com/PDFs/E92.pdf> and you will see that if you only discharge to 1.2125 volts per cell, you will have used less than half the energy in the cell. Also, note that the HP-48G in allowing the cell voltage to drop to 1.067 volts has used about 85% of the energy in the cell. (These are eyeball estimates)

The high turn-on voltage for the low battery indicator on the HP50 may be a good thing when using NiMH or NiCAD batteries.

If the low battery indicator turned on at slightly more than 1 volt per cell (which is good when using alkalines), the NiMH cells would be on a very steep part of the discharge curve, only minutes away from exhaustion.

But the HP50's low battery indicator comes on at 1.2125 volts per cell (my HP50 does so; I don't

know about any others). Eyeballing the NiMH discharge curve, this looks to me like the cells would be about 70% discharged, so there is ample time to change them.

The slightly lower per cell voltage when the low battery indicator comes on will mean that NiMH cells will be more discharged in an HP49G+ than in an HP50, but I think you will still have a bit of time before they completely die.

Note that the HP49G+ has a lithium memory backup battery, so that even if the main batteries die, you won't lose your memory contents, although some of the settings may be lost if you leave the main batteries out for a long time.

I've been using NiMH's in my HP50 with great success for about 9 months now.

### **Re: NiMH batteries in the HP48 and 49 series**

*Message #3 Posted by [Vieira, L. C. \(Brazil\)](#) on 18 Apr 2007, 9:20 a.m.,  
in response to message #2 by Rodger Rosenbaum*

Hi;

I've been using 750mAh to 1100mAh NiMH cells in about all of my 48/49/50 series. Only my HP48SX, the oldest of them, is still powered by regular alkalines.

I cannot complain. Although the NiMH cells need constant recharging, about one time a month if I use the calculator in a daily basis, I can tell I have not been buying batteries for some time. As a consequence, no disposal chemicals...

My 2¢.

Luiz (Brazil)

### **Re: NiMH batteries in the HP48 and 49 series**

*Message #4 Posted by [James M. Prange \(Michigan\)](#) on 18 Apr 2007, 3:29 p.m.,  
in response to message #2 by Rodger Rosenbaum*

Interesting; the other measurements that would be useful would be the current draw under various conditions.

Although the calculators still run after the low battery indicator comes on, if I recall correctly, they'll refuse to do any external I/O.

Unfortunately, my first impression is that my 50g is as much of a battery hog as my 49g+.

I seem to have good luck using NiMH cells in the 49g+ and 50g, but still use alkaline cells in the 48 series and 49G, which aren't so hard on batteries. But if you're going to be doing a lot of external I/O, particularly via IR, it may be better to use NiMH cells in the 48 series as well.

Of course, if you use rechargeable cells, you should have a spare set easily available.

My general impression is that the power requirements (from highest to lowest) are something like this: writing to flash, via IR I/O, via wire I/O (except via USB with the 50g), running a program, on (idle), off, and for the 48 series, coma mode.

Of course the 50g can be powered externally via the USB port, in which case the battery isn't even

required.

Regards,  
James

## Re: NiMH batteries in the HP48 and 49 series

*Message #5 Posted by **Rodger Rosenbaum** on 20 Apr 2007, 1:52 a.m.,  
in response to message #4 by James M. Prange (Michigan)*

Also from the newsgroup:

Here's what I posted back on March 24, 2006:

" I made some measurements of the current consumption of the HP49G+ with standard alkalines installed:

| Condition of measurement   | Current drain |
|----------------------------|---------------|
| Calc on, doing nothing     | 18 mA         |
| Calc on, holding ON down   | 75 mA         |
| Calc running a program     | 65 mA         |
| Calc on, pressing RED key  | 30 mA         |
| Calc on, pressing BLUE key | 30 mA"        |

and:

" I have two HP49G+'s. The older one draws 29 uA when off and the newer draws 14 uA when off."

and finally:

" Here are the measurements from my new HP50:

| Condition of measurement     | Current drain |
|------------------------------|---------------|
| Calc off                     | 28.4 uA       |
| Calc on, doing nothing       | 14.6 mA       |
| Calc on, holding ON down     | 82.5 mA       |
| Calc running a program       | 73.1 mA       |
| Calc on, pressing ORANGE key | 25.8 mA       |
| Calc on, pressing WHITE key  | 25.8 mA       |

So, you can expect about the same battery life with the HP50 as with the HP49G+, although the HP50 will wear out 4 rather than 3."

*Message #7 Posted by [Tim Wessman](#) on 18 Apr 2007, 10:05 a.m.,  
in response to message #1 by Les Wright*

In powering our data collection system ([www.pssllc.com](http://www.pssllc.com)) we've learned lots about batteries.

Most interesting is that certain units respond differently to the same sets of batteries. Some calculators appear to respond with a low voltage message much earlier than others.

One in particular, will give 8 full hours of use after the first low voltage warning. That is powering two long range (up to 1700' working range!) Bluetooth adapters and an external communication circuit board. The same set of batteries, charged in the same manner, will only last 3 hours past the warning on other units.

Some units will run for 3 days consistently moving in and out of the "low voltage" warning level, and then moving above the threshold.

In short, I've learned never to replace the batteries until the calculator refuses to turn on. I often get several more days out of my rechargeables on my "non" data collector units.

TW

I am thinking of getting the 50G and I don't know how much of a power hog it is. With my 48SX and 48GX the alkalines last a long time so I don't think it's good idea to use NiMH with them as the NiMH has short shelf life.

### **NiMH batteries**

*Message #9 Posted by [Sam Levy](#) on 18 Apr 2007, 11:16 a.m.,  
in response to message #8 by Dia C. Tran*

NiMH cells do self discharge faster than alkaline cells. I think you could do an exchange on a regular basis so you are always on full. I have 2 smart chargers from La Crosse US or foreign voltage through Thomas distributing. I use them in toothbrushes, flashlights, TV remotes, RF headphones, pocket rasios, CD players and even to run a self opening trashbasket!

**Re: NiMH batteries**

*Message #10 Posted by [Dave Shaffer](#) on 18 Apr 2007, 2:22 p.m.,  
in response to message #9 by Sam Levy*

"even to run a self opening trashbasket!"

Wow - does it open as you (or what it senses to be trash) approach, or does it open periodically and demand to be fed?!?!

PS don't let your calculators get too close!

**Re: NiMH batteries**

*Message #11 Posted by [Sam Levy](#) on 18 Apr 2007, 4:59 p.m.,  
in response to message #10 by Dave Shaffer*

My niece who cares for me said she wanted a trashbasket with a lid, and found a battery operated one. It has an optical proximity sensor and is supposed to run from 4 D cells. The charger kits I bought for AA and AAA had bodies that used AA to substitute for C or D cells and that runs it..for a long time. we had it near the fridge but it kept opening, so it is nearer the wall. Priced at 100 she bought it at a discount warehouse for 50. Nice seal too. Sorry Dave,

*Message #12 Posted by [Patrick R](#) on 19 Apr 2007, 2:46 a.m.,  
in response to message #8 by Dia C. Tran*

Panasonic has a new series of NiMHs, the Infinium series (AA and AAA sizes are available). They claim that after one year of storage, this new battery still has 80% of its initially stored capacity. So this could be a good alternative to alkalines and standard NiMHs. I use them in my digital SLR.

Nevertheless I continue using alkalines in my HP48 and HP49.

**Re: NiMH batteries in the HP48 and 49 series**

*Message #13 Posted by [Les Wright](#) on 19 Apr 2007, 9:06 p.m.,  
in response to message #1 by Les Wright*

I have bought a set of 1000mAh NiMH Duracells, about which I am optimistic given the great experience I have with 2650 mAh AA Duracells in my 82240 printer.

After a full charge, Edwin Cordoba's BatStatus reports the cells as having 85% capacity, which makes sense to me since I believe NiMHs have slightly lower voltage than alkalines.

It will be interesting to see how much use I get out of this single charge.

Les

### **Re: NiMH batteries in the HP48 and 49 series**

*Message #14 Posted by [Les Wright](#) on 22 Apr 2007, 10:34 p.m.,  
in response to message #13 by Les Wright*

I am finding that with pretty regular use a full charge gives me a few days of use at least. BatStatus seems to suggest that the battery drains quickly to about 50% capacity, and after that the drain seems to slow.

Thanks to the backup battery, I don't worry about memory loss. Even if I didn't have the backup cell, I regularly back up my HOME directory to SD card using ARCHIVE and my flags to a list variable using RCLF. That way, if the calculator resets or loses memory, I can recover most if not all of its last saved state.

Les

### **Re: NiMH batteries in the HP48 and 49 series**

*Message #15 Posted by [David Smith](#) on 24 Apr 2007, 8:19 a.m.,  
in response to message #14 by Les Wright*

NiCad cells peak at about 1.4V and NiMH about 1.33 V after charging. This voltage rapidly drops to a fairly steady 1.2V for about 90% of the charge remaining. It then falls very rapidly. Consider it fully discharged at 1V. The 1.2V plateau is probably where your calc says 50% remaining... I suspect it will stay around 50% for quite a long time. Also the battery will self discharge at about 1% a day.

### **Re: NiMH batteries in the HP48 and 49 series**

*Message #16 Posted by [Les Wright](#) on 25 Apr 2007, 4:26 p.m.,  
in response to message #15 by David Smith*

This is proving to be my experience exactly.

I recently went out of town on a business trip and since I couldn't take my entire collection I chose one toy and made it the 49G+, which has seen more use in the past two weeks than in the last year. With quite a bit of use this week BatStatus reports a capacity of about 50% and it has hovered around there for a couple of days.

With the decent quality of the NiMH batteries, the backup wafer cell, the availability of pretty rapid chargers (my Sony camera charger will give the cells a full charge in a couple of hours, albeit only two at a time), and the ability to back up regularly and quickly to an SD card (and keep in mind that the smaller capacity cards which are more than adequate for calculator use are now dirt cheap), I can think of no good reason at all to go back to using alkalines, unless I am in a real pinch.

This was a really good discovery to make. Until now, I used the 49G+ only lightly, since the high battery drain seemed so wasteful. Now, I don't worry about this. Of course, now that the calculator is seeing more use, it may be a matter of time before the infamous keypad failure sets in. I have put off getting a 50G--frankly, it seems to me that it is basically the same calculator, albeit with an improved keyboard and some extra goodies and USB power if desired and a broader repertoire of interface options.

Les

### **Re: Exclamation Points are Good!**

*Message #6 Posted by [Earl Kubaskie](#) on 20 Apr 2007, 12:11 a.m.,  
in response to message #5 by Walter B*

I wonder where the anti-CAPS thing started. Early on, we didn't have 'puters that DID lower case. Some of us were proud to have a teletype terminal hooked up printing via baudot codes, and lc just wasn't there!

Meanwhile, here I am today in the CAD world. Lower case is so rare in engineering drawings that we spend half our life with caps-lock on. Then some wannabe dictator flames us for posting in caps. The term "Get a life" comes to mind.

### **Re: Exclamation Points are Good!**

*Message #7 Posted by [Palmer O. Hanson, Jr.](#) on 20 Apr 2007, 9:49 p.m.,  
in response to message #6 by Earl Kubaskie*

The article that I quoted on the subject of exclamation points began with the following paragraph:

"E-mail isn't the most self-conscious medium; haste and volume encourage many correspondents to forget themselves. Still, everyone settles on a style. The lower-case non-punctuators, the serial capitalizers, the rhetorical questioners, the subpoena-anticipators, the posterity watchers: **they all have** their reasons, and **their conceits.**"

The emphasis is mine.

All this talk about capitals and lower case reminds me of Archie and Mehitabel in the poetry of Don Marquis. Does anyone else remember "CAPITALS AT LAST!!!!!"

**CQ, CQ, CQ -- Calculator Fans**

Message #1 Posted by [Katie Wasserman](#) on 17 Apr 2007, 5:04 p.m.

I recently got my HF ham radio license and was wondering if there are any hams here that might be interested in forming a net (informal group) to talk about calculators (HP calculators mostly one would presume) on a regular basis.

I suspect that the intersection of: calculator fans, ham radio operators, people that like nets and that live within say a 1500 miles of me is quite small. So I'm not expecting a big response, it's just a thought.

73,

Katie (W2LP)

in response to message #2 by Dave Johnson

Quote:

\_\_\_\_\_

Yeah, just order a replacement from Educalc

\_\_\_\_\_

If that were the case, you could just send it to HP to have it repaired... but that ended in 1995 or so.

Sherman, set the wayback machine...

## Re: HP41cv sticky keys

Message #4 Posted by [Randy](#) on 17 Apr 2007, 7:52 p.m.,  
in response to message #1 by Michael Sayers

Dirt is the usual offender. The common repair method from the archives (Courtesy of David Smith):

\*\*\*\*\*

Each switch dome has a small hole under it that you can clean the switch through. You need to make a tiny wire brush out of three wire brush bristles twisted together in a pin vise, trimmed even. Place a drop of 90%+ isopropyl alcohol on the offending switch hole, dip the brush in more alcohol, and gently "scritch" around in the hole.

Keep the alcohol off the display window. It leaves a white stain.

\*\*\*\*\*

I can add to that by saying do not over do things and break a bristle off inside the switch dome.

\*\*\*\*\*

The next logical question:

HP41 Disassembly from the "repairs" section:

Remove the battery pack. There are four screws underneath the feet that are held on with adhesive. Peel up the feet and remove the screws. The back will come away easily. This calculator will not work properly if the case halves are not held securely together. Over-tightening the screws can strip the threads and lead to a malfunction.

### HP-71B Math ROM IDS !?

Message #1 Posted by [Valentin Albillo](#) on 16 Apr 2007, 10:27 a.m.

Hi, all:

Does anyone have (or can tell me where to find) the commented assembly language listings for the source code of the HP-71B Math ROM ?

I'm not sure if there is some official HP documentation for it (the equivalent of the System ROMs IDS volumes), or else if some knowledgeable individuals took on the hard work of disassembling the ROM and create some documented listings of it.

This failing, any listings or documentation about its internal routines, data structures, entry points, etc. would be most welcome. Thanks in advance and

Best regards from V.

### Re: HP-71B Math ROM IDS !?

Message #2 Posted by [Eric Smith](#) on 16 Apr 2007, 1:01 p.m.,  
in response to message #1 by Valentin Albillo

HP didn't publish any documentation on the internals of the Math ROM. I've heard of one person disassembling it.

### Re: HP-71B Math ROM IDS !?

Message #3 Posted by [Mike \(Stgt\)](#) on 17 Apr 2007, 3:48 a.m.,  
in response to message #1 by Valentin Albillo

That would be a nice to have. But even in the VASM listings of the HP-41 (NoMaS) all programers comments are discarded in the math routines. If you look just for "Math on Machines" or such kind of stuff see at [Numerical Recipes](#).

Ciao.....Mike

### Re: HP-71B Math ROM IDS !?

Message #4 Posted by [Eric Smith](#) on 17 Apr 2007, 3:55 a.m.,  
in response to message #3 by Mike (Stgt)

Quote:

even in the VASM listings of the HP-41 (NoMaS) all programers comments are discarded in the math routines.

It is my understanding that the core math routines were never commented. The documentation consisted of

detailed annotated flow charts, which were maintained separately from the source code.

The mainframe VASM listings were not sanitized in any way before PPC published them.

## Re: HP-71B Math ROM IDS !?

*Message #5 Posted by **Valentin Albillo** on 17 Apr 2007, 5:58 a.m.,  
in response to message #3 by Mike (Stgt)*

Hi, Mike & Eric:

Thanks for your help. I'm not looking for general math routines or such but for specific Math ROM internal details.

I'm just finishing a program for the HP-71B, to be featured in a future article in Datafile belonging to my new "Boldly Going" series which, although already offering impressive performance, it would nevertheless benefit enormously in terms of speed and accuracy if only I could implement a couple of LEX keywords which would have to perform some pretty intricate numeric array processing and arithmetic.

Being able to have a look at Math ROM assembly language listings would provide the necessary examples on how to parse and decompile MAT keywords, how to efficiently access array elements, and how to use internal Math ROM routines to do most of the grudgery, such as converting values back and forth between their usual 12-digit representation and the internal 15-digit form with extended exponents.

Having that kind of 'sample code' to have a look at, I would be able to concentrate in the specific math in my routine and so would be able to complete it with 1% the effort and time than if I have to try and concoct parsing, etc, starting from scratch. Due to my ever increasing lack of enough free time for these endeavours, this would surely mean the difference between being able to do it or not doing it at all.

If any of you can supply such details, either taken from existing Math ROM listings or from other sources (perhaps LEX files implementing some MAT-style keywords and such), I would be very obliged indeed. Specifically I would need to have a look at sample code to:

- Parse and decompile a MAT-style keyword (e.g.: MAT R=GINIT(N), MAT A=EVAL(A,X) )
- Efficiently access elements in a numeric array, both recall and storage
- Convert elements taken from the array in 12-digit form to 15-digit for processing, then back to 12-form for storage in the result array.
- Details (entry point, parameters, conditions on entry & exit, etc) of useful routines in the Math ROM to help with basic matrix operations such as arithmetic, scaling, zeroing, etc.

Thanks in advance if you can help with some of this, and

Best regards from V.

## Re: HP-71B Math ROM IDS !?

*Message #6 Posted by **J-F Garnier** on 17 Apr 2007, 7:00 a.m.,  
in response to message #5 by Valentin Albillo*

Hi Valentin,

I don't know many LEX that implemented MAT-style keywords. I remember one LEX from PPC-Paris, but I'm not sure it was fully fool-proof, I will look if I can recover it.

If you want examples of Math processing, the HP71 IDS is of course a valuable source, but also the [JPC Rom](#) source files (that I'm proud to have rebuilt last year :- ) e.g. the div.a or combarr.a modules. Most comments are in French...

J-F

**Thanks a lot, J-F. [NT]**

### 49g+/50g v.92 ROM Upgrade

Message #1 Posted by [John Kono](#) on 16 Apr 2007, 2:55 a.m.

I happened to notice that HP is offering this "ROM" update and I was wondering if anybody has updated a 49g+. If so, I've got a couple of questions...

- 1) Having looked through the zip file and the HP site, I can't seem to find any information on what issues this update actually addresses. Does anyone have a list of bug fixes included or something?
- 2) What version of the firmware (i.e. version as reported by the VERSION command) does this upgrade include?

Thanks!

### Re: 49g+/50g v.92 ROM Upgrade

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 17 Apr 2007, 8:38 p.m.,  
in response to message #1 by John Kono

Quote:

I happened to notice that HP is offering this "ROM" update and I was wondering if anybody has updated a 49g+.

Yes, both the 49g+ and 50g. The 48gII emulator included with Debug4x also uses this update, although I don't know whether it's yet used for the (non-flash) ROM in the newest 48gII units.

Rather interestingly, with a slight modification to a .KML file, this update can also be downloaded from the emulated 49G to a real 49G as well.

Quote:

If so, I've got a couple of questions...

Quote:

1) Having looked through the zip file and the HP site, I can't seem to find any information on what issues this update actually addresses. Does anyone have a list of bug fixes included or something?

Apparently, HP's current policy is to not list which issues have been addressed by an update. However, the readme.txt file included with Bernard Parisse's latest ROM does list changes since 2.01; see <http://www-fourier.ujf-grenoble.fr/~parisse/english.html>. For some known issues, also see <http://bugs.hpcalc.org/>, and for other hints, try a search of the comp.sys.hp48 usenet group archive; see [http://groups.google.com/advanced\\_search?](http://groups.google.com/advanced_search?)

Quote:

2) What version of the firmware (i.e. version as reported by the VERSION command) does this upgrade include?

Well, on a 50G, it will report "Version HP50-C", on a 49g+, "Version HP49-C, and anything else (48gII or 49G) "Version HP48-C", in any case, followed by "Revision #2.09".

In any case, updating either the 49g+ or 50g is very easy, and I advise using this update, unless you care to update to Bernard's "Version HPxx-G Revision #2.10-7".

By the way, the "v.92" designation no doubt comes from this ROM being build 92.

Regards  
James

### Re: 49g+/50g v.92 ROM Upgrade

Message #3 Posted by [John Kono](#) on 20 Apr 2007, 1:49 a.m.,  
in response to message #2 by James M. Prange (Michigan)

Quote:

Nifty! I may have to try that at some point. Thanks for the tip!

Quote:

Well, on a 50G, it will report "Version HP50-C", on a 49g+, "Version HP49-C, and anything else (48gII or 49G) "Version HP48-C", in any case, followed by "Revision #2.09".

That's what I was looking for. Thanks!

Quote:

By the way, the "v.92" designation no doubt comes from this ROM being build 92.

That's pretty much what I figured. The most annoying thing about the update package is that it doesn't indicate anywhere what firmware versions it applies to, or how to check whether or not it's already been applied. Frustrating.

Interestingly enough, I just got a recently manufactured 50g (CNA710xxxxx) and it still has the rev 2.08 image. I guess the update hasn't made it to manufacturing yet.

Thanks for the info, and I'll be looking into Bernard Parisse's release. It looks like it has some interesting enhancements.

John

## Re: 49g+/50g v.92 ROM Upgrade

Message #4 Posted by [Mike \(Stgt\)](#) on 20 Apr 2007, 4:20 a.m.,  
in response to message #2 by James M. Prange (Michigan)

Well, ah, probably I get the answer RMF, anyway: I tried Bernard's Version on Emu48 and get "HP48-G Revision #2.10-7" displayed. An elder ROM from Bernard correctly displayed "HP49-...". In the KML I define Model X in both cases. TIA 4 all hints.

Ciao.....Mike

## Re: 49g+/50g v.92 ROM Upgrade

Message #5 Posted by [James M. Prange \(Michigan\)](#) on 20 Apr 2007, 6:49 p.m.,  
in response to message #4 by Mike (Stgt)

The revisions 2.08, 2.09, and 2.10-7 ROMs were apparently intended for only the ARM-based models (48gII, 49g+, and 50g), and never check for the possibility that they're actually running on a 49G. The VERSION command (which can be decompiled with Nosy) first checks whether it's a "Big Apple" (49g+ or 50g), and if so, whether it's a 50g. If it's a Big Apple but not a 50g, then it must be a 49g+. If it's not a Big Apple, then it must be a 48gII, right?

But it appears that the ROM code is actually developed using a 49G, or perhaps more likely, an emulated 49G. The PC based emulator doesn't emulate the ARM processor or ARM-emulated "Saturn+" (AKA "Saturnator") processor with its additional opcodes as used in the ARM based models, but only the "hardware Saturn" with its legacy opcodes as used in the 49G. So at that point in development, it can run just fine on a 49G, although it does misidentify which model it's running on. As a final step, some legacy code is replaced with faster Saturn+ routines.

Bernard's revision 2.10-7 is also available as a .flash file for the 49G.

For information on installing 2.08 or 2.09 on a 49G, see this [comp.sys.hp48 thread](#).

Regards,  
James

*Edited: 20 Apr 2007, 6:54 p.m.*

## Re: 49g+/50g v.92 ROM Upgrade//200LX

Message #6 Posted by [Mike \(Stgt\)](#) on 23 Apr 2007, 6:16 a.m.,  
in response to message #5 by James M. Prange (Michigan)

Thank you very much for your long explanation. And tnx a lot 4 the link to the comp.sys.hp48 thread where I found mentioned VM/CMS -- my favourite OS.

With your help I now understand Bernard Parisse's statement some time ago, when he offered "the last CAS for the HP49G". Formerly I understood it as announcement to stop any further work on it. The other way round: Bernard will focus on the ARM-based machines (well, that's in conflict with the 2.10-7 .flash he offers for the 49G). Anyway, the ROMs he offers run fine in Emu48 versions with a revision code that ends with a "+". I found one on [Bernard's site](#) and one is bundled with [Bill's Debug4x](#) (quite new, last compile 4/17/2007).

In this context I remember Christoph Gießelink's statement at the last Allschwil meeting: he has nothing to do with those "+"-Versions of Emu48, the developement is just based on the Emu48-freeware (GNU General Public License), but that's all. He is a purist and his emulators are as close

as possible to the real HW. To emulate the ARM-based machines in a similar manner would be quite some work.

Now a little subject drift: how difficult would it be to do an emulator of similar quality as Emu48/Emu42 etc. for the HP200LX? Yes, I know, it sounds dull to emulate a DOS-machine on a PC. But i) the Connectivity Pack does not the "virtual multitasking" of the 200LX, ii) there are replacements for several applications running on Windows with some restrictions, and iii) we have "Felix" (alas not the latest revision) but not all DLLs to run the code compiled for the target HW. So where are the experts which may point to the right direction or say "stop, almost impossible"?

Ciao.....Mike

BTW, Christoph! I hope to find some time that we may meet between the Allschwil events. M.

### **New version of MLDL2000 Software posted**

Message #1 Posted by [Meindert Kuipers](#) on 15 Apr 2007, 2:41 p.m.

Hello all,

I have been working on the M2kM software this weekend, and released a new version. This can be downloaded from [hp41.kuipers.to](http://hp41.kuipers.to). Apart from fixing one or two minor issues, the big changes are:

- The HP41 Disassembler is now integrated in M2kM ROM/SR Handler. Note that this only works with a ROM loaded in the ROM tab. The disassembler will work on complete ROMs with a FAT, and will also decode User Code. It is not complete yet, but will work most of the time. The listing is shown in a separate window, where code can be copied form and pasted in a text editor for saving.
- The contents listing of the MLDL2000 can be downloaded in the Settings Register tab of the ROM/SR Handler by using the "List MLDL" button. In combination with the view of the HP41 Pages, it is now much easier to manage the Settings Registers. Double clicking a ROM will now automatically add it to the selected Page/Bank, and when downloading a set of SR's from the MLDL2000, the ROM names are now automatically shown.

The disassembler can also be used without having an MLDL2000, but make certain that none of the functions are used that communicate with the unit. In the next version I will improve the error handling for this.

Have fun!

Meindert

### **The New version of MLDL2000 Software ROCKS!**

Message #2 Posted by [Vieira, L. C. \(Brazil\)](#) on 16 Apr 2007, 4:22 p.m.,  
in response to message #1 by Meindert Kuipers

Hi Meindert, all;

I tried (for good!) the new MLDL2K.EXE and found it amazing! The previous 1.01 beta version was actually a necessary improvement, because it allowed FLAHS SR contents to be updated without disturbing all FLASH memory contents in the botton-boot type memory. Now, with the new version, I can see where are the ROM images I stored in the MLDL2000 memory prior to set the SR contents. And while I'm setting the SR, I can see each ROM header... Wow! That's GOOOD! I had to keep a record of all ROM images prior to handle them. Now I can do this on line!

And it has a disassembler... <8^))))

Three things I noticed:

1 - I tried to run the two new versions in a computer wihtout the borlndmm.dll file and in both versions it was required; they both ran OK after copying borlndmm.dll in the windows/system directory. Both versions ran OK in the computer I had the original MLDL2K.EXE version 1.00, and in this case, borlndmm.dll was already installed.

2 - I missed the ROM/SR handler window size control in the new 1.10 version; it only accepts either regular

(default), minimized or full-screen options. I could not stretch it vertically as I used to do in order to see previous windows. Not a problem, though, just a comment.

3 - While reading MLDL2000 contents, an 'integer error' is generated, but the memory seems to be read O.K.

Meindert, thanks again. The new version is a 'must have', nothing else to add.

Best regards.

Luiz (Brazil)

*Edited: 16 Apr 2007, 4:32 p.m.*

## **Re: The New version of MLDL2000 Software ROCKS!**

*Message #3 Posted by **Meindert Kuipers** on 17 Apr 2007, 3:11 a.m.,  
in response to message #2 by Vieira, L. C. (Brazil)*

Luiz, all,

Thanks for your feedback. I already have a long list of improvements for the disassembler and will work on that when I have MLDL2000V2 finished. The disassembler is something that I have created many years ago and I thought it would be useful. I have already prepared it to be a multi-pass disassembler, so it would show local labels. Of course there should be labels for the system calls.

1 - M2kM should run without the borlndmm.dll file, but maybe I did leave some reference in it. This DLL was required when calling external DLL's (in this case the DLL for the USB interface), but with the new Turbo Delphi I thought it was not needed anymore. I will check this again.

2 - I deliberately removed the size control. With two list-views in the SR tab, resizing is really weird, unless I add an extra panel and a divider. I am not a GUI specialist, and this stuff is really complicated for me, but I will look into this.

3 - I have not seen the 'integer error'. Can you give me some more information about this?

I have also seen that when loading the SR's from a file the TreeView looks a bit strange, this is a separate piece of code that I have not changed yet ...

Please let me know if there are any other issues that you want to improve,

Meindert

## **two pass disassemblers; math routines**

*Message #4 Posted by **Eric Smith** on 17 Apr 2007, 4:07 a.m.,  
in response to message #3 by Meindert Kuipers*

The disassembler in Nonpareil, udis, is also a two-pass disassembler, but it only disassembles microcode (for Classic, Woodstock, and Nut architectures), and doesn't handle 41C module FATs. The version in the "current" (now very old) release of Nonpareil isn't very good; the one in the Subversion repository is much better. I'm still struggling to finish some big changes so I can release a new version.

udis generates labels based on the address and whether the address is ever called as a subroutine (prefix "S"), or only by jumps (prefix "L"). I've considered adding an additional class of local labels for addresses that are only the target of a small number of nearby branches.

I've found this to be very useful in tracing the evolution of the math routines in the various series and models. For instance, the 19C, 27, 29C, 67, and 97 all use basically the same math routines, which are

different than those of the earlier Woodstock models (21/22/25). These are the changes described in the HP Journal sidebar "The New Accuracy". I expect that the same routines are used in the 91, 92, and 95C, but have not yet got ROM dumps of those models.

There were a few more changes made in the Spice series, but the math routines then remained almost unchanged through the 41C and Voyager series. In the 41C VASM listings, there are a few comments where peephole optimizations could be made to use new instructions of the Nut CPU; those changes were actually made in the Voyager series.

### **Re: two pass disassemblers; math routines**

*Message #5 Posted by [Meindert Kuipers](#) on 17 Apr 2007, 4:29 a.m.,  
in response to message #4 by Eric Smith*

Eric,

Some good ideas that I will use, especially the prefixes for Local labels and Subroutines. The most difficult thing is to handle code that is actually data. Do you actually analyze code to check if it is ever called at all? The HP41 FAT structure makes disassembly a bit easier. My current disassembler already does a first (half) pass to identify FAT elements, function names and user code, so this does not get disassembled by accident.

Let me know if you want to have a look at my code so you could use portions. It will work with HP41 User code, this might be useful for you. My code is written in Delphi and limited in such a way that it really only works with HP41 ROMs with a FAT structure. And of course there is a lot of room for further improvements and bug fixing ....

Meindert

### **Re: two pass disassemblers; math routines**

*Message #6 Posted by [Eric Smith](#) on 17 Apr 2007, 2:02 p.m.,  
in response to message #5 by Meindert Kuipers*

Most disassemblers I have written maintain a "trace queue" for static analysis of code flow, and treat any locations that can't be reached by the static analysis as data. This won't find code that is only reached by computed or indirect branches (e.g., table lookup).

The HP Classic and Woodstock architectures did not have any way to access instruction memory as data (no CXISA instruction), so udis does not bother with code flow analysis. For the Voyager ROMs, there are relatively few data areas which are small, but there is a lot of code that is only reached by indirect jumps, so it still treats everything as code.

I've considered adding a feature to use a user-supplied input file to specify entry points, data areas, and labels.

Thanks for the offer to use your disassembler code. At the moment I don't have time, but I may want to look into that later. If it's of any use to you, you're welcome to use the udis code from Nonpareil (or any of the Nonpareil code) under the terms of the GPL. If you need it for non-GPL use, let me know.

### **Message is "Integer Overflow"**

*Message #7 Posted by [Vieira, L. C. \(Brazil\)](#) on 17 Apr 2007, 7:48 p.m.,  
in response to message #3 by Meindert Kuipers*

Hi, Meindert;

The correct message is 'Integer Overflow', and it appears everytime I download the MLDL contents. I captured the image with the message, and I'll post it later, O.K.? Anyway, I think that the download procedure resumed fine, I can see all ROM headers in the ROM/SR window.

More later...

Luiz (Brazil)

*Edited: 17 Apr 2007, 8:50 p.m.*

### **Re: Message is "Integer Overflow"**

*Message #8 Posted by [Meindert Kuipers](#) on 18 Apr 2007, 4:59 a.m.,  
in response to message #7 by Vieira, L. C. (Brazil)*

Luiz,

Can you also send me the list of ROM images you have? I cannot imagine that just reading the MLDL contents gives this error, however the contents themselves are also used (to read the ROM name), and if there is an address pointing the wrong direction an error could occur.

Also a check is done if there is something resembling a ROM image, but especially in SRAM this could possibly go wrong when the contents are random and there is not too much error checking in the routines. If the download stops on a certain ROM, let me know, I would like to have the ROM contents to try it out myself.

It may be better to send this by email instead of posting it here ...

Meindert

### HP 48GX and 48SX and 48G and 48S and 48G+

Message #1 Posted by [Mad Dog ebaycalnut](#) on 15 Apr 2007, 2:01 p.m.

If I buy a 48GX with an earlier rom than R, will the difference ever ever ever likely enter into my daily life? Same question for earlier 48SX rom than later.

I am not an entomologist or physicist.

I am just wondering if anyone here ever had a screwed up calculation that they actually needed for school or work because of a rom issue on the GX or SX. Not some calculation designed just to push the calculator capability for kicks.

*Edited: 15 Apr 2007, 2:04 p.m.*

### Re: HP 48GX and 48SX and 48G and 48S and 48G+

Message #2 Posted by [Han](#) on 15 Apr 2007, 4:45 p.m.,  
in response to message #1 by [Mad Dog ebaycalnut](#)

I think all the ROM differences can be found in the HP48 FAQ (I don't know if it's still being maintained since the HP48 series is no longer in production). At any rate, there are a few ROM bugs that may affect calculations and/or cause memory crashes. However, I vaguely remember them being fairly obscure, except for the bug with respect to fast fourier transforms. The rest have to do with expansion ports.

### Re: HP 48GX and 48SX and 48G and 48S and 48G+

I don't think that it's maintained any more, but it can be found from <http://www.hp48.org/search.php?query=FAQ>.

Also, some issues discovered with the 49 series may go back to the 48 series; see <http://bugs.hp48.org/>.

Of course, for any information about RPL models, the comp.sys.hp48 newsgroup may be the better place to search. In case you're not using a newsreader, see <http://groups.google.com/group/comp.sys.hp48/>, or for an advanced search of the newsgroup archive, all the way back to 1991, start at [http://groups.google.com/advanced\\_search?](http://groups.google.com/advanced_search?).

Regards,  
James

### A modest arithmetical challenge

Message #1 Posted by [Karl Schneider](#) on 14 Apr 2007, 8:58 p.m.

Hi, all --

Here is an interesting arithmetical problem that appeared in a student-engineer magazine in 1993 or 1994:

Assume that each integer from 1 through 9 is used *exactly once* to form three quotients of single-digit integer numerators and two-digit integer denominators. How many ways could the digits be arranged such that the sum of these three terms equaled unity?

Example:

$$\frac{7}{12} + \frac{8}{36} + \frac{9}{45} = \frac{181}{180} \approx 1.005$$

is almost a solution.

I obtained the above result by trial-and-error, but was unable to analytically deduce the correct answer. In 1995, I wrote a recursive C-language program that found the solution by "brute force", evaluating all  $9! = 362,880$  possible combinations of digits. Of course, there are six ways to arrange the three terms, so there are "only" 60,480 *unique* combinations.

Several years ago, I showed this problem to a colleague who offered the following:

"There is a subset that populates a more general relationship,

$$\frac{A}{B} + \frac{C}{D} + \frac{E}{F} = 1$$

where A is odd and  $2 \cdot D = F$ .

Example:  $1/2 + 1/3 + 1/6 = 1$ ."

He obtained the correct solution by trial and error within this subset of combinations. I can't offer a proof that the stated equation is generally true, or why it may have been a necessary (not merely sufficient) condition for the solution.

So, the challenge: Can anyone provide a direct analytical solution to this problem? If not, would anyone dare to attempt to write an efficient HP calculator program to solve the problem?

I believe that the HP-15C offers sufficient programming features to tackle the problem using the brute-force method:

- Enough storage registers to maintain nine separate digits and to store solutions
- Nine usable flags (flags 0-9 excluding flag 8) to track whether a digit is "in use"

- Subroutines, conditional tests, and plenty of labels
- A versatile indirect register

So, a workable HP-15C program could be written. However, I also believe that such a program might take literally weeks to run to completion on an actual HP-15C! Recursion and integer arithmetic could not be employed, as my C program does.

The HP-71B would be more suitable, with 12 times the speed, BASIC language, and recursion.

Of course, with computing speed being an important issue, a PC-based simulator would be a better choice than an actual calculator.

I doubt that there is any trivially-simple derivation of the solution; I also believe that an efficient program would require time and effort. Still, the mathematical knowledge and programming skills offered in response to Valentin's challenges never ceases to impress me. I'll post my C-language program shortly, as a guide for those who might find it useful.

Best regards,

-- KS

in response to message #1 by Karl Schneider

Hi, Karl:

Nice arithmetic challenge. Regrettably, I don't have the time to produce an efficient and elegant solution which only tests unique permutations of the 9 digits and uses integer arithmetic and recursion as your C program does, nor can I indulge in trying bitmasks and boolean operations to discard impossible combinations if using another approach not requiring the recursive generation of permutations, but this extremely quick-and-dirty, 14-line brute-force HP-71B program which took me only about 10 minutes to write, enter, and run, actually does the job:

```

1 DESTROY ALL @ FOR A=1 TO 9 @ FOR D=A+1 TO 9 @ FOR G=D+1 TO 9
2 FOR E=1 TO 9 @ IF E=A OR E=D OR E=G THEN 13
3 FOR F=1 TO 9 @ IF F=A OR F=D OR F=G OR F=E THEN 12 ELSE N=10*E+F
4 FOR B=1 TO 9 @ IF B=A OR B=D OR B=G OR B=E OR B=F THEN 11
5 FOR C=1 TO 9 @ IF C=A OR C=D OR C=G OR C=E OR C=F OR C=B THEN 10
6 M=10*B+C @ R=M*N @ S=A*N+D*M
7 FOR H=1 TO 9 @ IF H=A OR H=D OR H=G OR H=E OR H=F OR H=B OR H=C THEN 9
8 P=9*H+45-A-B-C-D-E-F-G @ IF R*(P-G)=P*S THEN DISP
A;"/";M;"+";D;"/";N;"+";G;"/";P;"= 1"
9 NEXT H
10 NEXT C
11 NEXT B
12 NEXT F
13 NEXT E
14 NEXT G @ NEXT D @ NEXT A @ DISP "OK"

```

>RUN

5/34 + 7/68 + 9/12 = 1

OK

and it finds the unique solution (and the fact that there are no others) in about one minute under Emu71, which translates to about 4 hours in a physical HP-71B. Improvements like the ones mentioned above would easily diminish these times enormously, but it would take me more than 10 minutes in all to

concoct. :-)

Thanks for your interesting and entertaining challenge and

Best regards from V.

### **Re: A modest arithmetical challenge**

*Message #3 Posted by [Karl Schneider](#) on 15 Apr 2007, 3:54 p.m.,  
in response to message #2 by Valentin Albillo*

Hi, Valentin --

Well, I can't verify your astounding claim of only 10 minutes for analysis, development and entry of code, and testing. Still, I'm quite impressed by your analytical and programming skills. Your program did indeed produce the only correct result.

A solution based on Fortran 77 (which does not support dynamic memory allocation for recursion), would likely utilize eight or nine nested loops, as you did using BASIC. I developed my C program for learning experience after my collegiate course in C showed that recursion was supported. Recursion can make the code more compact and flexible, but likely slows the execution due to O/S overhead for assignment and release of RAM.

I will likely post my C program on Monday evening (Tuesday morning for those of you in Europe), because an electronic copy of the source code is not readily available at home.

Your BASIC program as it is structured -- which is not difficult to interpret -- may not port readily to a "clean" RPN-keystroke program absent excessive conditional tests and GTO's. However, despite your description of it as "quick-and-dirty", I see clear evidence of logical structure and thought. Furthermore, it already performs the optimization not to execute redundant permutations of digits by setting in line 1 the condition  $A < D < G$  (which are the three numerators). Your program also wisely calculates the common-denominator products instead of the three quotients. I had done the same in my C program both to eliminate the possibility of roundoff errors and to exploit the much-faster integer arithmetic.

A program that I would write for an HP-15C/32S/32SII/33S/41\*/42S would probably emulate the approach I used for my C program, which uses a variable in the fashion of a Fortran LOGICAL variable to identify which digits were already "in use". Flags would fill that role on an HP calculator. Use of an indirect register would reduce redundant code considerably.

Thanks again for your informative contribution,

-- KS

### **Re: A modest arithmetical challenge**

*Message #4 Posted by [Valentin Albillo](#) on 15 Apr 2007, 7:09 p.m.,  
in response to message #3 by Karl Schneider*

Hi again, Karl:

Karl posted:

*"Well, I can't verify your astounding claim of only 10 minutes for analysis, development and entry of code, and testing. Still, I'm quite impressed by your analytical and programming skills.*

*Your program did indeed produce the only correct result."*

Thanks a lot for your appreciation but neither my 10-min claim is astounding nor does this "klutzy" piece of code demonstrate much about my "skills". :-)

The 10-min claim is easily justified by simply looking at my program: it is nothing but a series of brute-force loops, with the only proviso being the storage of invariant intermediate values out of the loops which doesn't affect their value, the final digit being directly computed as 45 less the sum of the others (as all 9 digits add up to 45), and clumsily testing each digit against the previous ones to make sure no digits are repeated.

This straightforward logic can be keyed in very quickly, as the HP-71B lets you enter a variant of a program line by simply editing its line number, kind of a copy-paste operation. You just enter first the most complicated FOR ... IF ... line, then edit its variable and line number (deleting the final test) to enter the next simplest one, which is then edited likewise to produce the next one, etc. (BTW, anyone who's got Emu71 can enter this code by simply doing a real copy-paste of the code from the posted message to Emu71, no need to actually key anything in).

As for testing time it's actually zero because, matter of fact, everything is so simple that no debugging was needed, it produced the correct solution on its 'maiden' run.

*"I will likely post my C program on Monday evening (Tuesday morning for those of you in Europe)"*

It will be interesting to have a look at it. A recursive solution for the HP-71B can be concocted in much fewer lines than my posted iterative one, so your C code must also be extremely compact.

*"However, despite your description of it as "quick-and-dirty", I see clear evidence of logical structure and thought."*

It was all trivial, Karl, it's only that I didn't have the time to have a go at an elegant, efficient solution as you originally asked for, but not wanting to let your challenge unanswered on my part, I did what I could in 10 min. If you check the timestamp of my posted solution, you'll see that I saw it and wrote a quick'n'dirty solution for it by 10:49 P.M. MoHP Forum's Official Time, which translates as 4:49 A.M. Spanish Time, i.e., 4:49 in the midst of the night, after a very hard daytime with some certification training, with a mild headache and practically asleep.

If I get the time, I'll try to post a decent solution but I doubt I will be able to do that before you (or someone else) post your own. In the meantime, some trivial modifications to my posted program produce these interesting additional results:

```
Largest sum      : 7/46 + 8/25 + 9/13 = 1.16448160535      (17409/14950)
Smallest sum     : 1/74 + 2/85 + 3/96 = 0.0682929252782  (6873/100640)
Closest sum >1  : 4/76 + 8/23 + 9/15 = 1.00045766590      (2186/2185)
Closest sum <1  : 5/87 + 6/24 + 9/13 = 0.999778956676     (4523/4524)
```

On the analytic front, it's easy to prove that in order for the three fractions to be able to add up to 1 or greater, the digit 1 must forcibly be the first digit of a denominator, and the corresponding numerator must then be > 5. Making use of this shortcut will help save lots

of running time.

Thanks for your delightful arithmetic challenge, seconds please ! :-)

Best regards from V.

### **Discussion ("A modest arithmetical challenge")**

*Message #5 Posted by **Karl Schneider** on 19 Apr 2007, 12:42 a.m.,  
in response to message #4 by Valentin Albillo*

Hi, Valentin --

Quote:

Thanks a lot for your appreciation but neither my 10-min claim is astounding nor does this "klutzy" piece of code demonstrate much about my "skills". :-)

Oh, I wouldn't denigrate your own work, even if it doesn't represent your finest efforts. Hardly anyone -- including myself -- could have immediately written a working program to solve the problem without a fair amount of forethought.

Quote:

It was all trivial, Karl, it's only that I didn't have the time to have a go at an elegant, efficient solution as you originally asked for, but not wanting to let your challenge unanswered on my part, I did what I could in 10 min.

As far as I'm concerned, your effort surpassed the specification. I never stated "elegant", and "efficient" implied only that it would run in a reasonable amount of time without exhausting multiple sets of batteries. The techniques of computational reduction and the "special sums" you offered were an added bonus.

Quote:

Thanks for your delightful arithmetic challenge, seconds please ! :-)

Sorry, but I don't have any others in store at the moment. I suspect, though, that any I had would cause me "Mom's lament": An hour to prepare, and ten minutes to demolish... :-)

Best regards,

-- KS

*Edited: 19 Apr 2007, 12:44 a.m.*

### **Re: Discussion ("A modest arithmetical challenge")**

*Message #6 Posted by **Gerson W. Barbosa** on 19 Apr 2007, 8:25 p.m.,  
in response to message #5 by Karl Schneider*

Quote:

I suspect, though, that any I had would cause me "Mom's lament": An hour to prepare, and ten minutes to demolish... :-)

---

Karl,

Don't worry about it being solved that soon. Ten minutes really appears to be the standard time to write a program to solve your challenge:

Quoted from <http://users.skynet.be/worldofnumbers/ninedig3.htm>:

Quote:

---

The solution is very easy to search for, Preon tells. It is

$$(9/12) + (7/68) + (5/34) = 1$$

*"The solution is unique as my program revealed, took maybe 10 minutes to write the code and 1 minute to run and display the only answer."*

---

Having it take me at least 100 minutes to write that ugly piece of Turbo Pascal code only shows I was right not having tried to pursue a career in computer programming :-)

Best regards,

Gerson.

*Edited: 19 Apr 2007, 8:37 p.m.*

## Re: A modest arithmetical challenge

Message #7 Posted by **Gerson W. Barbosa** on 14 Apr 2007, 11:30 p.m.,  
in response to message #1 by Karl Schneider

Hello Karl,

Quote:

---

"There is a subset that populates a more general relationship,

$$\frac{A}{B} + \frac{C}{D} + \frac{E}{F} = 1$$

where A is odd and  $2 * D = F$ .

Example:  $1/2 + 1/3 + 1/6 = 1$ ."

---

The relationships below might also be useful to reduce the use of brute force:

$$\frac{A}{B} + \frac{C}{D} = 1 - \frac{E}{F}$$

$$\frac{A * D + B * C}{B * D} = \frac{F - E}{F} \quad \Rightarrow \quad \begin{aligned} E &= F - A * D - B * C \\ F &= B * D \end{aligned}$$

Regards,

Gerson.

## Re: A modest arithmetical challenge

Message #8 Posted by [Gerson W. Barbosa](#) on 15 Apr 2007, 7:10 p.m.,  
in response to message #7 by Gerson W. Barbosa

Not an elegant and concise solution as Valentin's, but this Turbo Pascal 3 program does find the solution:

```
-----
Program KarlsProblem;
var a, b, c, d, e, f: integer;
    x: real;
    t: boolean;

begin
  ClrScr;
  a:=-1;
  repeat
    a:=a+2;
    for b:=12 to 49 do
      for c:=1 to 9 do
        for d:=12 to 98 do
          begin
            t:= (a <> b div 10) and (a <> b mod 10) and (a<>c) and (a <> d div 10) and
(a <> d mod 10);
            t:= t and ((b div 10)<>(b mod 10)) and ((b div 10)<>c) and ((b div 10)<>(d
div 10)) and ((b div 10)<>(d mod 10));
            t:= t and ((b mod 10)<>c) and ((b mod 10)<>(d div 10)) and ((b mod 10)<>(d
mod 10));
            t:= t and (c<>(d div 10)) and (c<>(d mod 10));
            t:= t and ((b mod 10)*(d mod 10)<>0);
            if t and (d=2*b) then
              begin
                for e:=1 to 9 do
                  for f:=12 to 98 do
                    begin
                      t:= (a + c + e + (b div 10) + (b mod 10) + (d div 10) + (d mod
10) + (f div 10) + (f mod 10))=45;
                      t:= t and (e<>a) and (e<>c);
                      t:= t and (e<>(b div 10)) and (e<>(b mod 10)) and (e<>(d div 10))
and (e<>(d mod 10));
                      if t and (e<>(f div 10)) and (e<>(f mod 10)) and ((f div 10)<>(f
mod 10)) then
                        begin
                          x:=(a/b+c/d+e/f);
                          if (x<1.0000001) and (x>0.9999999) then
                            WriteLn(a:2,'/',b:2,'+',c:2,'/',d:2,'+',e:2,'/',f:2,' =
',x:1:0)
                        end
                    end
                  end
                end
              end
            end
          end
        end
      end
    end
  until a=9
end.
-----
```

The output is:

$$5/34 + 7/68 + 9/12 = 1$$

The tests in the outer loop filter 232 candidates. Additional tests are performed in the innermost loop in order to obtain the final solution. This runs instantaneously on my slow computer but I guess it would take too much time on the HP-71B, even longer on the HP-33S in case it could be ported to it. This is still brute force; I cannot think of a way to speed it up.

Karl's problem is a *pandigital* one, that is, a problem whose solution involves the use of nine or ten unrepeatd digits. There seems to be variations: some allow the use of decimal point, square root symbol,

factorial and other functions whilst some allow only integers numbers and the arithmetic operators.

Incidentally, I was playing with these when Karl posted his interesting problem:

```
'71/(2*9+4.60)-8^(-sqrt(53))' (to be evaluated on a ten-digit calculator)
```

or

```
'710/CEIL(sqrt(26^4/9))-8^(-sqrt(53))'
```

This looks like cheating, but it's hard to get 226 out of the digits 2, 4, 6 and 9 :-)

Gerson.

*Edited: 16 Apr 2007, 6:43 p.m.*

## Another approach

*Message #9 Posted by **Gerson W. Barbosa** on 16 Apr 2007, 10:11 p.m.,  
in response to message #8 by Gerson W. Barbosa*

Let's give luck a chance:

```
-----
10 DEFINT J-N
12 DEFSNG X
15 CLS
17 RANDOMIZE (7)
20 FOR K = 0 TO 8
30   N(K) = K + 1: M(K) = 0
40 NEXT K
34 J = 0
50 K = (RND * 8)
60 IF N(K) <> 0 THEN M(J) = N(K): N(K) = 0: J = J + 1
70 IF J < 9 THEN 50
80 X = M(0) / (10 * M(1) + M(2)) + M(3) / (10 * M(4) + M(5)) + M(6) / (10 * M(7) +
M(8))
90 IF (X < .99999) OR (X > 1.00001) THEN 20
100 PRINT M(0); "/" ; 10 * M(1) + M(2); "+" ; M(3); "/" ; 10 * M(4) + M(5); "+" ; M(6);
"/" ; 10 * M(7) + M(8); "=" ; X
-----
```

Output:

```
5 / 34 + 7 / 68 + 9 / 12 = 1
```

This QBASIC program finds the solution in about 15 seconds (Pentium III @ 500 MHz). The random generator seed in line 17 was chosen arbitrarily.

-----

P.S.: Only 14 lines as I've just noticed, but this took at least 20 minutes between the first idea and the printing of the answer :-)

-----

These two lines should be replaced in the QBASIC program above:

```
30   N(K) = K + 1
```

```
45 J = 0
```

By the way, it's easy to port the program to the HP-71B:

```

10 DESTROY ALL @ OPTION BASE 0 @ DIM N(8),M(8) @ RANDOMIZE 8
20 FOR K=0 TO 8 @ N(K)=K+1 @ NEXT K @ J=0
30 K=INT(RND*9) @ IF N(K)#0 THEN M(J)=N(K) @ N(K)=0 @ J=J+1
40 IF J<9 THEN 30
50 X=M(0)/(10*M(1)+M(2))+M(3)/(10*M(4)+M(5))+M(6)/(10*M(7)+M(8)) @ IF X#1 THEN 20
60 DISP
M(0);"/";10*M(1)+M(2);"+";M(3);"/";10*M(4)+M(5);"+";M(6);"/";10*M(7)+M(8);"=";X

>RUN
5 / 34 + 7 / 68 + 9 / 12 = 1

```

The result was found in 57.75 seconds (Emu71 @500MHz), 1 h 40 min 53 sec on the real HP-71B, according to the built-in timer. Previously I had run the program on the emulator once with the original seed but I quit after one hour with no result. This was the second seed I tried.

-----

Some interesting seeds:

```

10 DESTROY ALL @ OPTION BASE 0 @ DIM N(8),M(8) @ RANDOMIZE 2.9

10 DESTROY ALL @ OPTION BASE 0 @ DIM N(8),M(8) @ RANDOMIZE 10.99

10 DESTROY ALL @ OPTION BASE 0 @ DIM N(8),M(8) @ RANDOMIZE 82.622

10 DESTROY ALL @ OPTION BASE 0 @ DIM N(8),M(8) @ RANDOMIZE 82.583

```

Respectively 71.9, 51.8, 12.56 and 1.43 seconds on the **real** HP-71B. This is plain cheating though :-)

-----

The equivalent Turbo Pascal program finds the result in 3 minutes and 20 seconds on the HP-200LX, the first time it is run:

```

Program Karls_Problem;
var a, b: array[1..9] of byte;
    i, j: byte;
    r: real;
begin
  ClrScr;
  repeat
    for i:=1 to 9 do
      a[i]:=i;
      i:=1;
      repeat
        j:=Random(9)+1;
        if a[j] <> 0 then
          begin
            b[i]:=a[j]; a[j]:=0;
            i:=i+1
          end
      until i=10;
      r:=b[1]/(10*b[2]+b[3])+b[4]/(10*b[5]+b[6])+b[7]/(10*b[8]+b[9])
  until (r>0.99999) and (r<1.00001);
  for i:=0 to 2 do
    Write(b[3*i+1]:1,'/',b[3*i+2]:0,b[3*i+3],'+');
  WriteLn(#8,'=',r:1:0)
end.

```

**9/12+7/68+5/34=1**

Karl,

Quote:

\_\_\_\_\_

Can anyone provide a direct analytical solution to this problem?

\_\_\_\_\_

interesting challenge!! I am looking into this approach. So far I have the following:

The initial problem:  $X+Y+Z=1$  is analogous to the sum of the interior angles of a triangle (normalized to  $\pi$ ). Since A-A-A is not enough to specify a triangle, I declare the triangle to be of unit volume and then solve for the sides using the law of sines, law of cosines, and the volume eqn's of a triangle. (the answers  $A/DE + B/FG+C/HK$  are then in radians  $\rightarrow$  FDISP to get the fractions on my 32sii. More later if time allows.

Regards, al

All --

Thanks to all who have read or taken interest in "A modest arithmetical challenge", and especially to Valentin and Gerson for developing solutions in computer language.

As promised, I'm posting my recursive C-language solution from 12 years ago. I wrote it more as a training exercise than as a fully-optimized product. It performs much redundant processing by generating *every possible* permutation of digits (9! in all) instead of restricting the selections to those that are feasible and mathematically-unique.

The source code would be more compact if it weren't for the comments and two subroutine definitions with required function prototypes and variable declarations. The code is ANSI-standard C (1989), so if you have a C compiler, the copied and pasted code should work just fine.

-- KS

---

```

/*****

```

```

This program solves the equation

```

$$\frac{d1}{d2d3} + \frac{d4}{d5d6} + \frac{d7}{d8d9} = 1$$

where each dn is a UNIQUE digit from 1 to 9.

e.g.,  $7/12 + 8/36 + 9/45 = 1.005$  (181/180)  
is ALMOST a solution.

This problem appeared in an issue of IEEE Potentials in early 1994, I believe.

The answer, which you can obtain by compiling and running this program, is

$$5/34 + 7/68 + 9/12 = 1.00000$$

## A physical HP-15C solution in 48 minutes

Message #13 Posted by [Valentin Albillo](#) on 22 Apr 2007, 2:39 a.m.,  
in response to message #12 by Karl Schneider

Hi, Karl:

I don't want to let people think that the HP-15C isn't powerful enough to solve your puzzle unless it runs some program for several months or weeks, so I took a little time from sleep to post the following admittedly unelegant code which does the proper thing.

The following HP-15C program will find the solution in a deterministic way (i.e., not depending on random factors) and using nothing but several simple heuristics *in a mere 48 minutes*, when running on a *physical* HP-15C:

```

01 LBL A      27 LBL 3      RCL+ 5      RCL- 7      RCL 5      RCL 1      RCLx 0
   10      RCL 3      /      STO 8      STO I      STO I      RCL+ 5
   STO 0      STO I      STO 9      RCL RAN#      CF I      CF I      R/S
   9      F? I      9      RCL+ 9      106 LBL 5      131 LBL 1      RCL 6
   STO 1      GTO 3      STO 6      RCL 6      DSE 5      DSE 1      R/S
   GSB C      SF I      57 LBL 6      RCL 7      GTO 5      GTO 1      RCL 7
08 LBL 1      9      RCL 6      RCLx 0      RCL 4      RTN      RCLx 0
   RCL 1      STO 4      STO I      RCL+ 8      STO I      135 LBL C      160 RCL+ 8
   STO I      35 LBL 4      F? I      /      CF I      STO I
   SF I      RCL 4      GTO 6      +      112 LBL 4      137 LBL 0
   2      STO I      SF I      1      DSE 4      CF I
   STO 2      F? I      9      TEST 5      GTO 4      DSE I
14 LBL 2      GTO 4      STO 7      GTO B      RCL 3      GTO 0
   RCL 2      SF I      65 LBL 7      RCL 7      STO I      RTN
   STO I      9      RCL 7      STO I      CF I      142 LBL B
   F? I      STO 5      STO I      CF I      118 LBL 3      9
   GTO 2      43 LBL 5      F? I      94 LBL 7      DSE 3      GSB C
   SF I      RCL 5      GTO 7      DSE 7      GTO 3      RCL 1
   RCL 1      STO I      44      GTO 7      RCL 2      R/S
   RCL 2      F? I      RCL- 1      RCL 6      STO I      RCL 2
   RCL+ 0      GTO 5      RCL- 2      STO I      CF I      RCL+ 0
   /      SF I      RCL- 3      CF I      124 LBL 2      R/S
   STO RAN#      RCL 3      RCL- 4      100 LBL 6      ISG 2      RCL 3
   9      RCL 4      RCL- 5      DSE 6      126 LBL 2      R/S
   STO 3      RCLx 0      RCL- 6      GTO 6      GTO 2      RCL 4

```

To find the puzzle's solution:

```

FIX 0, GSB A -> 9, R/S -> 12,
          R/S -> 7, R/S -> 68,
          R/S -> 5, R/S -> 34

```

i.e.:  $9/12 + 7/68 + 5/34 = 1$ , which is the one and only solution, found in *just 48 minutes* on my physical, normal speed HP-15C. A 750x emulator would run this program in *less than 4 seconds*.

Some worthwhile programming techniques used:

- Flags are used to keep track of which digits are already in use to avoid repeating them. Notice that when flag 8 gets set, the HP-15C *automatically enters complex mode*, but *this doesn't bother the program in the least* nor does it affect the computations. Matter of fact complex

mode is being entered and exited any number of times without the execution being affected. Likewise, when flag 9 is set, the HP-15C enters "blink mode", which is transparent to the user and the program. *All flags are cleared* as soon as the solution is found, so restoring the HP-15C to normal operation upon program's termination.

- In order to find a solution as fast as possible, running speed has been optimized at the expense of code length, so no subroutines are called within the inner loops even if it means duplicating code, and no tricks are played with indirect addressing even if it means replicating whole sections. This gives the fastest possible code.
- Intermediate invariant results are calculated as soon as the variables involved are known and kept in auxiliary registers to avoid recomputing their value in the inner loops. Also, the frequently used value 10 is kept in an auxiliary register, saving program steps and improving execution speed.
- The following simple heuristics are used, as already discussed by myself in a previous post:
  - It's quite easy to prove that in order for the three fractions to add up to 1 or more, it's mandatory that one of the denominators begins by the digit 1 (i.e.: 12, 13, ..., 19). The program makes use of this and, as the order doesn't matter, the first digit of the first denominator is assumed to be 1 without loss of generality.
  - The fact that the corresponding numerator must be 6,7,8, or 9, isn't made use of, but as the first fraction must be large enough for the sum to reach 1, all digits in all fractions are tried in reverse order, from 9 down to 1, except for the first denominator's second digit, which are tried in lowest to highest order. This ensures that the first fraction is as big as possible as early as possible (i.e.: 9/12, 9/13, ..., 9/18, 8/12, 8/13, ..., 8/19, etc).
- Once a solution has been found, the program clears all the flags, outputs the solution, and duly ends.

These same techniques can be applied to create an HP-71B version, which would find the solution in a mere 2 minutes in a physical HP-71B or a few seconds under Emu71. I have absolutely no more time available so that's left as an exercise for the reader. :-)

Best regards from V.

Message #14 Posted by **Gerson W. Barbosa** on 22 Apr 2007, 12:44 p.m.,  
in response to message #13 by Valentin Albillo

Hi Valentin,

That's the HP-15C solution Karl and all of us here were waiting for. That's what we would expect from you, no less!

Quote:

\_\_\_\_\_

I don't want to let people think that the HP-15C isn't powerful enough to solve your puzzle unless it runs some program for several months or weeks,

\_\_\_\_\_

I don't think anyone might have been led to believe this just because of my program. As I said earlier in this thread, a plain brute force program would be able to find the solution within hours, not weeks. I also said I thought I was unable to write one due to its intrinsic complexities. On the other hand, my

solution based on random numbers was quite easy to implement, so easy even I was able to do it. My approach would apply only to today's blazingly fast computers though, which can find the solution in less than one second. A quite good compromise between developing and running times, in my opinion.

Best regards,

Gerson.

### **Re: A physical HP-15C solution in 48 minutes**

*Message #15 Posted by **Valentin Albillo** on 22 Apr 2007, 6:59 p.m.,  
in response to message #14 by Gerson W. Barbosa*

Hi, Gerson:

Of course, of course, I wasn't trying to belittle your highly imaginative non-deterministic solution, far from it.

Many times Monte Carlo-like methods provide very reasonable solutions for highly intractable problems, or even the only way to solve them, as is the case for multidimensional integration of high dimensionality ("the curse of dimension").

It's only that I got the impression that some people reading this thread could be led to the wrong conclusion that it would take excessively long for an HP-15C to try and solve this puzzle, and I won't suffer such a humiliating situation for my beloved HP-15C if I can do something about it, which I can.

So, a couple of hours later I had written and run the posted program which, indeed, does find the solution in a pretty decent time. A first version using subroutines was very much shorter and elegant, but it took more than twice the time, at some 2 hours. Removing subroutines and unrolling some loops resulted in the 160-step, 48-min program posted, which can be further optimized but to no real purpose. As a 'concept proof' of the HP-15C capabilities, it's already more than adequate.

Thanks for your comments and

Best regards from V.

### **Re: A physical HP-15C solution in 48 minutes**

*Message #16 Posted by **Karl Schneider** on 22 Apr 2007, 3:34 p.m.,  
in response to message #13 by Valentin Albillo*

Hi, Valentin --

Well, sir, that's quite impressive. I'll definitely run your program on my HP-15C, and perhaps install the emulator program to give it a try there. After I accelerate an HP-15C, I'll quite likely re-visit the program to measure the benefit.

The intelligent heuristics you applied are absolutely necessary to make the program acceptably efficient. My "days/weeks" estimate was admittedly worst-case, as it included exhaustive trial of all possible combinations (or at least,  $1/6\text{-th} * 9! = 60,480$  combinations excluding mathematically-equivalent combinations), assuming no knowledge that only one solution existed, and not simply terminating upon finding one.

An estimated five seconds per trial times 60,480 trials would still make 84 hours, which is unacceptable. Fixing one digit reduces the number of total trials to an eighth thereof, and counting digits downward from nine so that larger numerators are tried first is certainly a more intelligent way to find the answer quickly.

Thank you much for your enlightening solution to an HP-15C challenge that has stumped me for years!

Best regards,

-- KS

## **Re: A physical HP-15C solution in 48 minutes**

Message #17 Posted by [Valentin Albillo](#) on 22 Apr 2007, 7:27 p.m.,  
in response to message #16 by Karl Schneider

Hi, Karl:

I'm quite glad you like it. It's actually been a very interesting challenge, and I only regret that I really couldn't afford the dedicated time it deserved, which is easily seen in the non-elegant, non-optimal solutions I could accomplish, sorry :-)

By the way, quoting some of your comments in your original post, here is how they apply to my posted solution:

*"I believe that the HP-15C offers sufficient programming features to tackle the problem using the brute-force method:*

1. *Enough storage registers to maintain nine separate digits and to store solutions"*

Yes, except that there's no need to store solutions in this case, as there is but one which can simply be output right away.

2. *Nine usable flags (flags 0-9 excluding flag 8) to track whether a digit is "in use"*

He, he, there's no need either to "exclude" flag 8 as in this case entering and exiting complex mode is transparent to the program's computations. At some times it is actually doing complex-number arithmetic, but the results are of course the same.

That's one of the most beautiful advanced characteristics of the HP-15C, the natural, almost transparent way in which it handles complex-number calculations, which very frequently require *the very same keystrokes/program-steps* as their real-valued counterparts.

3. *Subroutines, conditional tests, and plenty of labels*

No subroutines are called within the main loops, for speed, and nearly all numeric labels are reused *two times* (except LBL 2, which appears *three times*, one of them as a mere placeholder for the ISG instruction). This extremely convenient reutilization of labels would be *impossible* in an HP33S, say.

4. *A versatile indirect register*

Yes, but having the equivalent of SF IND X, CF IND X, FS? IND X, as in the HP-41C, would have resulted in a much shorter, clearer, and faster program. Alas, flag indirection can only be done via the I register in the HP-15C, not the X register.

*So, a workable HP-15C program could be written. However, I also believe that such a program might take literally weeks to run to completion on an actual HP-15C!"*

In the end, with a few sensible (and easy-to-justify) heuristics here and there, it actually could be done in less than an hour. I expect this will increase even further your already high appreciation of this most awesome model.

Best regards from V.

## A physical HP-71B solution under 20 minutes

Message #18 Posted by **Gerson W. Barbosa** on 24 Apr 2007, 12:28 a.m.,  
in response to message #13 by Valentin Albillo

Hello again Valentin,

Quote:

These same techniques can be applied to create an HP-71B version, which would find the solution in a mere 2 minutes in a physical HP-71B or a few seconds under Emu71. I have absolutely no more time available so that's left as an exercise for the reader. :-)

I didn't try your technique but I did try another solution on the HP-71B.

Accepting, without proving, the relationship provided by Karl, that is,

$$D=2*B$$

it's easy to obtain

$$F = - \frac{D * E}{2 * (A - B) + C}$$

The program also assumes A is even, as Karl has suggested.

The program runs in about 11 second on Emu71 (@500MHz), however the unique answer is shown after 6 seconds. On the real HP-71B the total running time was exactly 19 minutes and 58 seconds (Well, that's under 20 minutes :-) As always, my best solutions are 10 to 20 times slower than yours, but I am glad I was able to come up with something that would not take days or weeks on the real calculator :-)

Best regards,

Gerson.

5 / 34 + 7 / 68 + 9 / 12 = 1

```

Here is the equivalent Turbo Pascal program, for clarity:

```

-----
Program Karl_Problem;
var a, b, c, d, e, f, i, j: byte;
    x, r, s: real;
    ok: boolean;
    m, n: array [1..9] of byte;
begin
  ClrScr;
  for i:=1 to 9 do
    m[i]:=i;
  a:=-1;
  repeat
    a:=a+2;
    for c:=1 to 9 do
      if c>a then
        for e:=1 to 9 do
          if (e<>c) and (e<>a) then
            for b:=12 to 49 do
              if ((b mod 5)<>0) and (b<>(a+c/2)) then
                begin
                  d:=2*b;
                  x:=-d*e/(2*(a-b)+c);
                  if (Abs(Frac(x))<0.000001) and (x<99) and (x>11) and (x<>b) then
                    begin
                      f:=Trunc(x);
                      if f mod 10 <> 0 then
                        begin
                          n[1]:=a; n[2]:=b div 10; n[3]:=b mod 10;
                          n[4]:=c; n[5]:=d div 10; n[6]:=d mod 10;
                          n[7]:=e; n[8]:=f div 10; n[9]:=f mod 10
                        end;
                      ok:=true; i:=0;
                      repeat
                        s:=0; i:=i+1;
                        for j:=1 to 9 do
                          if m[i]=n[j] then
                            s:=s+1;
                        if s<>1 then
                          ok:=false
                      until (i=9) or (not ok);
                      if ok then
                        WriteLn(a:1,'/',b:2,'+',c:1,'/',d:2,'+',e:1,'/',f:2,'=1')
                      end
                    end
                until a=9
              end.

```

## HP-15C program

Message #19 Posted by [Gerson W. Barbosa](#) on 17 Apr 2007, 8:45 p.m.,  
in response to message #1 by Karl Schneider

Quote:

I believe that the HP-15C offers sufficient programming features to tackle the problem using the brute-force method:

Enough storage registers to maintain nine separate digits and to store solutions Nine usable flags

(flags 0-9 excluding flag 8) to track whether a digit is "in use" Subroutines, conditional tests, and plenty of labels A versatile indirect register So, a workable HP-15C program could be written. However, I also believe that such a program might take literally weeks to run to completion on an actual HP-15C! Recursion and integer arithmetic could not be employed, as my C program does.

The HP-15C program below might find the solution, given enough time (five days? one week? one fortnight?). Of course, this depends also on the quality of the random number generator.

As a test, the line 57 could be replaced with .25 and the line 58 with g TEST 8. If the program has been keyed in correctly, the answer will be 439,265,871.0, that is,  $4/39 + 2/65 + 8/71$ . This is equal to 0.2460093897, the first sum less than 1/4 found by the program. This takes less than 60 seconds on my 2.2x 15C.

Line numbers followed by a lower case "u" have to be keyed in USER mode.

This has been written just an exercise to remember the use of matrices on the HP-15C. It is far from optimized. Improvement suggestions are welcome. Besides pure brute force, the program relies on luck, which is not good, unless, of course, we are lucky enough :-)

The program is just a translation of the previous QBASIC program to RPN. The second matrix is not initialized to zero because this is not necessary.

Regards,

Gerson.

019-   1                038-   g TEST 9        057-   1
-----

```

Estimated runtime:

$((9! * 40s * 1.5)/86400s)/2 = 126 \text{ days! (or up to 252 days)}$

(Assuming each combination takes 40 seconds to process, and there are 50% of repeated combinations).

I would recommend a voltage adapter since the batteries would last only 60 hours, according to the manual :-)

Message #20 Posted by **Karl Schneider** on 19 Apr 2007, 12:20 a.m.,  
in response to message #19 by Gerson W. Barbosa

Hi, Gerson --

Thank you for the imaginative HP-15C solution. I'll have to give it a try on an accelerated calculator or emulator.

I have to admit that an approach utilizing random numbers never would have occurred to me...

Best regards,

-- KS

---

**Re: HP-15C program**

Message #21 Posted by **Gerson W. Barbosa** on 19 Apr 2007, 12:43 p.m.,  
in response to message #20 by Karl Schneider

Hello Karl,

Quote:

-----  
I'll have to give it a try on an accelerated calculator or emulator.  
-----

I fear this might not be a good idea. The average number of tries before the solution was found was 91,985.8 in 50 runs of a modified QBASIC program. In the first run the solution was found after 166,192 tries while in the second run the answer appeared after only 3,394 tries (this was the least number of tries; the maximum number of tries was 256,069, in the 23rd run). Assuming my sped-up 15C takes 20 seconds to process each try, this would take from 19 hours to 60 days to run (from 42 hours to 131 days on a normal 15C!).

I wish there were a fast running mode in Nonpareil :-)

Regards,

Gerson.

-----  
P.S.: This modification saves one step and might cause the solution to be found weeks earlier or later :-)  
)

```
001-   f LBL B
002-   1
003-   STO RAN #
004-   9
005-   f DIM A
      .
      .
      .
```

-----  
The estimated runtime I provided earlier was wrong. The correct average runtime should be:

$(9!/3!)*40s/86400 = 28 \text{ days}$

(Assuming it takes 40 seconds in average to generate each set of 9 different digits, which I haven't checked yet).

A feasible way of solving the problem on the HP-15C would be running the program simultaneously on, say, 15 calculators (or Nonpareil instances), each beginning with a different seed. It is probable at least one of them would complete the task in less than 30 hours...

A program using plain brute force would be longer, I guess, and would take about the same time to reach the solution. However, I think I wouldn't be able to write one...

Anyway, considering an HP-15C was recently given the task to compute pi using a Monte Carlo method, the idea of using random numbers to find those three fractions don't look so absurd :-)

## Re: HP-15C program

Message #22 Posted by [David Jedelsky](#) on 20 Apr 2007, 6:15 a.m.,  
in response to message #19 by Gerson W. Barbosa

Hi, it really works. I tried it in my testing simulator of 15c and got answer in about 68min of cpu time. If my estimate is correct it roughly corresponds to 850hours on real calculator. Here is the result:

```

|   |   |   |   |   |   |   |   |

## Re: HP-15C program

Message #23 Posted by [Gerson W. Barbosa](#) on 20 Apr 2007, 12:34 p.m.,  
in response to message #22 by David Jedelsky

Hi David,

Thanks for taking the time to test the program on your simulator. I have an instance of Nonpareil running since yestarday (seed=1); my sped-up 15C (2.2x) ran for at least 52 hours before the batteries went down (not fresh alkaline batteries). By the way, is your simulator freely available? Does it run under DOS or Linux? Is it based on Eric Smith's Nonpareil? 750x is quite good :-)

The modification below, beginning from line 40 would save about two hours in a month, on a real HP-15C. Optimizing the first part of the program would give a better result though.

```
039-   GTO 7           058-u   RCL B
040-   f MATRIX 1     059-u   RCL B
041-u   RCL B         060-    1
042-u   RCL B         061-    0
043-    1             062-    *
044-    0             063-   RCL B
045-    *             064-   f MATRIX 1
046-u   RCL B         065-    +
```

```
047-   +           066-   /
048-   /           067-   +
049u  RCL B       068-   1
050u  RCL B       069-   g TEST 6
051-   1          070-   GTO 2
052-   0          071-   0
053-   *          072-   STO 2
054u  RCL B       071-   f LBL 9
055-   +           .
056-   /           .
057-   +           .
```

One could use the simulator to try different seeds (twenty of them would suffice) until the solution was found under 20 hours on the real calculator. Of course, this would be cheating :-)

Best regards,

Gerson.

### Re: HP-15C program

Message #24 Posted by [David Jedelsky](#) on 20 Apr 2007, 5:33 p.m.,  
in response to message #23 by Gerson W. Barbosa

Hi Gerson,

I appreciate your interest in my simulator, but I'm afraid it is not much of general usability. I created it just as a reference platform for the testing of my PIC simulator core. It runs under linux and I even used one source file (digit\_ops.c) from Nonpareil (thank you Eric), because the implementation of arithmetic operations was clear and it saved me some time. It is pure console application, as you can also see from the printed result in my previous post. Moreover, it accepts keys just by internal calculator codes. So, it is not mentioned as simulator for the general calculator use. It is just testing tool. Anyway, if anybody want to use it or take a look at it I'm prepared to publish it.

Regarding the speed. I don't think 750x is really good, but definitely enough :). If I include optimization options to gcc and place my cpu at regular speed 2.2GHz it runs even somewhere around 1000x. But the code is far from optimal. I think it is possible to reach several times better speeds with optimizations.

I didn't try your modification so far. But at least tried seed bases from 0.00 to 0.99 ;). The winner is 0.12 (12 STO RAN#). My estimation for your 2.2x calculator is around two hours to get the result (but maybe I'm wrong).

Well, you are right, it is kind of cheating, but who don't want to see real result after all this effort :-).

Best Regards,

David

### Re: HP-15C program

Message #25 Posted by [Gerson W. Barbosa](#) on 21 Apr 2007, 12:21 a.m.,  
in response to message #24 by David Jedelsky

Hi David,

Thanks again for testing.

Quote:

---

My estimation for your 2.2x calculator is around two hours to get the result (but maybe I'm wrong).

---

You are right! I forgot to check the chronometer: last time I had checked about 1 hour and 50 minutes had elapsed. When I remembered to check it again 15 minutes later the calculator was still on and displaying 912.768.534,0. So, we can conclude it will take about about 4 hours and 30 minutes on a normal 15C if the following modification is made in the original program:

```
001-   f LBL B
002-   1
003-   2
004-   STO RAN #
005-   g LOG
006-   9
007-   f DIM A
      ...
```

This 75-step program may not be fastest one to solve Karl's problem on the 15C, even considering the cheating, but surely is one of the shortest ;-)

Just a curiosity, from 1000 runs of the equivalent Turbo Pascal program:

```
...
7 6 8 9 1 2 5 3 4 993 112691
9 1 2 7 6 8 5 3 4 994 30159
9 1 2 5 3 4 7 6 8 995 5370
9 1 2 5 3 4 7 6 8 996 175788
5 3 4 9 1 2 7 6 8 997 6076
9 1 2 7 6 8 5 3 4 998 1388
7 6 8 9 1 2 5 3 4 999 59464
9 1 2 7 6 8 5 3 4 1000 7443
```

```
mean: 61158.5180 min: 8 max: 422667
```

It is possible there is a magic seed that allows the solution to be found in only eight tries on the 15C as well, that is, in about five minutes! On the other hand, 422667 tries would require at least 6 months...

Best regards,

Gerson.

-----

P. S.:

This run is even more amazing:

```
...
9 1 2 7 6 8 5 3 4 998 88848
9 1 2 7 6 8 5 3 4 999 3748
5 3 4 7 6 8 9 1 2 1000 40377
```

```
mean: 61250.5890 min: 1 max: 593567
```

At least once the solution was found in the first try...

**power notation**

Message #1 Posted by [Dan Ripley](#) on 14 Apr 2007, 9:41 a.m.

realise everyone is probably over these questions but ive got no where else to try, just wondering how to work with power notation, for example numbers like  $4^5 \times 6^4$ , any ideas how to output answers like these?? thanks again Dan

**Re: power notation**

Message #2 Posted by [Rich Messeder \(US\)](#) on 14 Apr 2007, 11:01 a.m.,  
in response to message #1 by Dan Ripley

Hi Dan, Assuming that you are using an RPN calculator or you wouldn't be here... $4^5 \times 6^4$ ...looks like this

```
4
Enter
5
y^x key
6
Enter
4
y^x key
x
```

Rich

### working with fractions

Message #1 Posted by [Dan Ripley](#) on 14 Apr 2007, 7:12 a.m.

Hello, just wondering if there was an way to simplfy fractions, for example  $34/21$  or  $8/2$ , and ideas?? I always thought calculators were meant to make things easier??

### Re: working with fractions

Message #2 Posted by [Dan Ripley](#) on 14 Apr 2007, 7:18 a.m.,  
in response to message #1 by Dan Ripley

Also is there a way of entering fractions along the lines of  $3\frac{4}{8}$  (three and four eighths) or  $-5\frac{9}{10}$  ( negative 5 and nine tenths)

### Re: working with fractions

Message #3 Posted by [Sam Levy](#) on 14 Apr 2007, 10:30 a.m.,  
in response to message #2 by Dan Ripley

On the HP33S the decimal point serves to delineate the whole number and fractions on entry. See the lessons below. <http://h20331.www2.hp.com/hpsub/cache/301034-0-0-225-121.html>

### Re: working with fractions

Both the HP-32SII and HP-33S are the only (RPN-based, at least) HP models that have this capability. It's actually quite good, in that the closest fractional approximation (having a denominator no greater than 4096) to a floating-point value can be produced.

sorry I forgot to mention im using the HP 50g, thanks for the reply though

**Re: working with fractions**

*Message #7 Posted by [Christoph Widmer](#) on 15 Apr 2007, 4:05 a.m.,  
in response to message #6 by Dan Ripley*

Hi Dan, the HP 50g can indeed do fractions. Do do what I presume you want to do, first set the calculator to symbolic mode (Press the "MODE" key, select "CAS", and have both "Numeric" and "Approx" unchecked). A simple example (in RPN, but works analogously in algebraic): 10 ENTER 6 Divide --> '5/3'. 7 ENTER 12 Divide --> '7/12', then Add --> '5/3 + 7/12'. Press EVAL yields '9/4'. For further information see also the User's Guide, pages 5-23 ff.

I hope this helps. Good luck and best regards.

**Re: working with fractions**

*Message #8 Posted by [Christoph Widmer](#) on 15 Apr 2007, 4:14 a.m.,  
in response to message #7 by Christoph Widmer*

Dan, I just remembered that HP has a training module on fractions for the HP 50g, here it is: [http://h20331.www2.hp.com/Hpsub/downloads/50gWorking\\_with\\_fractions.pdf](http://h20331.www2.hp.com/Hpsub/downloads/50gWorking_with_fractions.pdf)

I think this explains things well. There is quite a number of other training modules as well, I found them very helpful.

Best regards again. Chris.

**HP-41C "Standard Module"**

Message #1 Posted by [EJ](#) on 13 Apr 2007, 8:38 p.m.

Hello All HP-41C Experts !

I recently began collecting the HP-41CX & its peripherals, and have many of the 41C plug-in modules with original manuals. However, I recently acquired a "Standard" module with no documents and I would like to know what is in it. "CAT 2" doesn't really help. I have the "Standard Applications" booklet, but it is just several useful programs in listed form; nothing to do with the little module with the word "Standard" printed on it. Any help would be appreciated in this.

EJ

**Re: HP-41C "Standard Module"**

Message #2 Posted by [Andrés C. Rodríguez](#) on 13 Apr 2007, 9:08 p.m.,  
in response to message #1 by EJ

If I recall correctly, the Standard module was just the module version of the Standard Apps Manual software. It sold for just U\$S 30, while other modules like Math 1, Stat 1, Circuit Analysis, carried a U\$S 45 price tag.

**9114A drive malfunctions shortly after receipt**

Message #1 Posted by [Les Wright](#) on 13 Apr 2007, 12:18 p.m.

I just acquired, for a price that was not cheap, a 9114A drive with refurbished SLA battery pack, and a custom alternative power input 6VDC positive tip connector installed by the previous owner. The disk mechanism has been dismantled cleaned and lubricated by someone who knows what he is doing. When I got the drive yesterday it worked beautifully and I was having a great time for several hours.

I woke up this AM and the drive wouldn't power up. I had left it plugged in on trickle charge overnight and I figured I had left the drive on inadvertently--I have read somewhere these SLA cells do actually discharge faster than they charge so I figured the battery was dead and would come alive soon charged for a bit outside of the drive.

About four hours later this is not the case. Still dead. I went to The Source (which took over Radio Shack in Canada) and bought a universal DC adapter that has the polarity switching tips like one the seller suggested. The only tip that fits is not the snuggest, but it does convey power. However, the behaviour has been strange. At first, the 6 volt setting left the fault light on and set the power light to flashing, but the self test did not proceed. But now, the power light comes on and nothing happens. No fault light, no whirring of a motor, nuthin'

In my quest to find an alternate adapter around here I could use with the custom connector I found that my Targus universal laptop AC adapter has a tip that fit well. The drive has, at least till this AM, powered up well on this and the self test would conclude, but I cannot access the disk--get TRANSMIT ERR. This makes sense--the Targus adapter has a higher voltage and probably has the wrong current and polarity. But this morning, even the trusty Targus only makes the power light go on--nothing else happens.

Does anyone have any insight? It was working beautifully last night, and I know it provided the previous owner with trouble free operation. I am wondering if my quest for an alternate power source has confused the unit? Even still, this doesn't explain why I can't power up from the SLA pack, even with the 82059 adapter plugged in. There is absolutely no response at all--not even a flicker.

My new universal adapter is rated up to 300 mA and 12 volts. I have tried all of the voltages between 6 and 12 and this seems to not help. Targus adapter does not give a current rating, but its voltages are somewhat higher--15-24, I think.

Maybe I need to let the drive sit and make sure the battery pack has an overnight charge. But this is weird. Right now, there aren't even any whirring motor sounds coming from the drive, neither with the new universal DC adapter or the Targus adapter. And the battery source + 82059B adapter still seems dead.

hope someone can help! Someone here must know this drive, and electronics, intimately, so maybe can tell me where I have gone astray. Thjs is an absolutely amazing machine to have and I want to get it to work again!

Many thanks in advance,

Les

p.s. I have peaked inside and the drive heads seem unbroken. I have not had any disk stick. I have given the unit the gentlest shake and nothing seems rattling inside. There have been no thunder storms or power surges here that I know of. I am, frankly, utterly perplexed.

---

**Re: 9114A drive malfunctions shortly after receipt**

*Message #2 Posted by [John Pierce](#) on 13 Apr 2007, 12:32 p.m.,  
in response to message #1 by Les Wright*

Hi Les, The battery pack for the 9114 disc drive has a "built in" battery charger. The output of the HP82059D AC adapter is approximately 12 VAC which is applied to the charging circuit. It appears to me that the "custom alternative power supply" is for use directly to the DC terminals of the disc drive. Try using an HP-82059D (or whatever) plugged into the battery properly installed in the drive and I believe all will work.

---

**Re: 9114A drive malfunctions shortly after receipt**

*Message #3 Posted by [Les Wright](#) on 13 Apr 2007, 12:48 p.m.,  
in response to message #2 by John Pierce*

The seller just called me and we suspect the problem is more sinister.

It seems that in experimenting with alternative power sources I may have cooked something by using too much voltage. The seller suspects that the apparently dead battery means the fuse in it is blown.

I am going to send the stuff back to him to see if he can fix or salvage it.

Eager for other more hopeful ideas!!!!

Les

### Difference between 19Bii and 19B

Message #1 Posted by [Namir](#) on 13 Apr 2007, 12:13 p.m.

Is support for RPN the only difference between the HP-19BII and the HP-19B?

Namir

*Message #11 Posted by **Bruce H** on 17 Apr 2007, 6:08 a.m.,  
in response to message #10 by Namir*

Hi Namir,

I thought that there were three models: 19B, 19BII and 19BII Business Consultant II.

I don't have access to mine at the moment to check the differences but I think RPN only appeared in the latter. The middle one has additional math functions (trig I think - but my memory is hazy here.)

All three were made with the side battery door design but with varying quality of keypress feel!

**Re: Difference between 19Bii and 19B**

*Message #12 Posted by **Eric Smith** on 17 Apr 2007, 2:04 p.m.,  
in response to message #11 by Bruce H*

Quote:

three models: 19B, 19BII and 19BII Business Consultant II

There might have been labeling variants, but I think that's only two models, with and without the "II".

**Re: Difference between 19Bii and 19B**

*Message #13 Posted by **Namir** on 18 Apr 2007, 2:10 a.m.,  
in response to message #12 by Eric Smith*

Eric,

Both models include "Consultant II" in their title. This has confused quite a few eBay sellers who sell an HP19B using HP19BII in their description, thinking that they can shift the "II" in "Consultant II" to the calculator number. Its' REALLY HP's FAULT FOR USING A POOR TITLE. Yes I am shouting so HP can hear me.

Namir

**Re: Difference between 19Bii and 19B**

*Message #14 Posted by **Eric Smith** on 19 Apr 2007, 3:55 p.m.,  
in response to message #13 by Namir*

Yes, the naming was astoundingly stupid.

The clamshell financials were:

- HP-18C Business Consultant
- HP 19B Business Consultant II
- HP 19BII Business Consultant II

The first part (HP-18C, HP 19B, or HP 19BII) is the actual model number. The rest is a marketing title. There may have been labelling variations regarding the title.

Whether the marketing title does or does not include "II" has nothing to do with whether it is a 19B or a 19BII. It either has the II **immediately** after the 19B, or not.

If someone offers a "Business Consultant II" for sale, that's not enough information to determine which model it is.

**LIFUTIL**

Message #1 Posted by [Ben](#) on 12 Apr 2007, 4:40 p.m.

I am in the process of converting a whole mess of files from LIF to DOS. I am having trouble using the LIF UTIL on any newer system. The older systems I have at my disposal are dedicated systems used for specific purposes. Is there a way to use a LIFUTIL to convert the LIF files to DOS on an XP?

**Re: LIFUTIL**

Message #2 Posted by [J-F Garnier](#) on 13 Apr 2007, 12:49 p.m.,  
in response to message #1 by Ben

AFAIK, LIFUTIL or similar tools that access LIF discs (including my own Emu41/71) don't work on modern OS such as Win2000/ME/XP, etc. They usually work well on Win98. I'm keeping a Win98 machine for this purpose.

J-F

**Re: LIFUTIL**

Message #3 Posted by [Raymond Del Tondo](#) on 13 Apr 2007, 1:19 p.m.,  
in response to message #2 by J-F Garnier

Hi,

the OS is not the main problem.

It's the diskette controller in modern PCs,  
which isn't adjustable for the weird track/sector combination of LIF disks.

Regards

Raymond

**Re: LIFUTIL**

Message #4 Posted by [Ben](#) on 13 Apr 2007, 3:48 p.m.,  
in response to message #3 by Raymond Del Tondo

I'm using the dedicated 95 system presently to do the data conversion.

So it's the version of FAT on the 3 1/2in floppy that is not compatible?

**Re: LIFUTIL**

Message #5 Posted by [Raymond Del Tondo](#) on 13 Apr 2007, 6:41 p.m.,  
in response to message #4 by Ben

It's not only the FAT format, but the different physical/magnetic formatting of LIF disks.

Check this: [Tony Duell's article about LIF format](#)

HTH

## Re: LIFUTIL

Message #6 Posted by [J-F Garnier](#) on 14 Apr 2007, 5:04 a.m.,  
in response to message #3 by Raymond Del Tondo

Hi Raymond,

That's not correct, the hardware is still able to read 256-bytes/sector LIF discs. The problem is that DOS programs like LIFUTIL rely on the BIOS to change the disc driver parameters from 512 to 256 bytes/sector. True "DOS Command Box" like in Win95/98 fully supports BIOS calls, but no more the "Command Line Boxes" in Win2000/etc that don't use the 16-bit ROM BIOS routines but just emulate a subset for DOS program execution.

I checked it by building a Win98 boot disc, with it I access to LIF discs without problem on my 1-year-old PC. But it is not very convenient because Win98 can't access my NTFS hard disc, and I have to transfer through floppy.

What is missing is a LIF driver for WinXP/etc, and a native 32-bit LIFUTIL-like utility. Any volunteer?

J-F

## Re: LIFUTIL

Message #7 Posted by [Chris Roccati](#) on 14 Apr 2007, 5:50 a.m.,  
in response to message #6 by J-F Garnier

Quote:

That's not correct, the hardware is still able to read 256-bytes/sector LIF discs.

The hardware is not actually REQUIRED to be able to read 256 bytes/sectors: the standard floppy device driver under window nt/2000/xp does not even acknowledge the existence of a 256 bytes/block format...

An interesting experiment would be to try calling the DeviceIoControl IOCTL\_DISK\_GET\_DRIVE\_GEOMETRY with a known good LIF disk to see what windows puts in .MediaType and .BytesPerSector, but it's quite likely it won't work at all.

The other choice would be to write a custom floppy driver which directly accesses the hardware, but it's not an easy route.

Using this [thing](#) would probably work too...

If you're **REALLY** hardcore, you could hack any SMSC based USB floppy, to use an external flash with a custom firmware...

**Re: LIFUTIL**

*Message #8 Posted by [Doug W.](#) on 14 Apr 2007, 3:33 p.m.,  
in response to message #6 by J-F Garnier*

Neat trick with the 98 boot floppy J.F!

Another method would be a "Dual Boot" system. Or use disk manager to create a FAT16 partition, then the 98 boot floppy would have some storage area.

in response to message #1 by JEANETTE

most people would look at the unmentionable auction website for a few weeks to get a price.

### Re: The unmentionable auction website.

Message #3 Posted by [Thor Lansen](#) on 11 Apr 2007, 10:46 p.m.,  
in response to message #2 by Mad Dog ebaycalcnut

or if you are registered with **ebay**, do an advanced search selecting "complete listings" and you get an idea of the sale prices in the last, I believe, 1 month or so.

Good luck, Thor

### Re: The unmentionable auction website.

Message #4 Posted by [Maddogebaycalcnut](#) on 12 Apr 2007, 11:27 a.m.,  
in response to message #3 by Thor Lansen

I think the completed only goes back a couple of weeks. I just did a completed on TI-83 calculators as there are millions of those on ebay. The oldest one I could find had a Start Date of March 18 and an end date of March 28. I don't know how ebay chooses exactly if it is based on start or on end; I think end date.

### Re: HP PRINTER 82143A

Message #5 Posted by [Les Wright](#) on 11 Apr 2007, 9:43 p.m.,  
in response to message #1 by JEANETTE

My goodness you don't need to shout!

I have an 82143A printer with box, power pack, and manual. It conked out on me after a few months and my tinkering made it worse so I got it serviced. I paid \$50US for the printer and \$30US to have it serviced. This doesn't count the shipping back and forth. So I am into this printer for \$80US plus shipping costs. But it works

beautifully now and I am delighted with it. That said, the more bargain savvy around here will probably suggest I have spent too much. I am not very good at DIY stuff, so I need to pay a bit more for stuff that is fully functional, and when I mess it up and I have to pay to have it fixed.

On eBay an 82143A in a box and accessories should go for \$50-60US tops, and if you want to sell it in our classifieds you may need to go \$10-20 less than that. If it is in good shape and works that helps. If the battery still holds a charge that is sweet indeed, since replacement packs go from \$27 from waterhosko to \$36 at FixThatCalc.com (I have one of each). Can't use this thing without a working battery pack, even off of AC.

The HP41 QRG may be worth a few bucks to a true collector, but a perfectly good facsimile of the card can be had for free at The Other Site. I would have to know more about the program cards and holder before hazarding a guess as to potential value.

HTH. And please disengage the caps lock!!!!

Les

**OT: cap's lock**

### Questions on printing, printing and printing.

Message #1 Posted by [Massimo Santin](#) on 11 Apr 2007, 4:00 p.m.

Hi everybody.

A friend of mine give me two HP calculators he dont'use anymore: an HP-28S and an HP-17BII. Including my HP-49G+, now I have 3 HP calculators that are able to print (on a "grand total" of 6 HP calculators). I would like to print something but I don't want to spend too much (my wife can't understand).

Now the questions:

1. Are some printers out there compatible with the 3 calcs?
2. Do you know if is there a IR printer server that can be connected to an external printer (USB, parallel, RS232, etc.).
3. Do know if is possibile to use a PC as a printer gateway for the 3 calculators?

Do you have some suggestions?

Massimo Santin

### Re: Questions on printing, printing and printing.

Message #2 Posted by [Les Wright](#) on 11 Apr 2007, 9:26 p.m.,  
in response to message #1 by Massimo Santin

The 82240A or 82240B printers are compatible with the three calcs you have, though keep in mind the IR range of the 49G+ is annoyingly short.

I have an 82240B printer and I love it. It came with the original box and works great. Including shipping I paid about \$75US, and if you are patient you can get one for a lot less.

I am sorry I don't have an answer for either of your other questions. I suspect the answer is no to both questions 2 and 3--I think the IR technology in HP calcs and in PCs are totally different. That said, I think someone was able to get a 50G to communicate wirelessly with a PC, so I could be corrected.

Les

### Re: Questions on printing, printing and printing.

Message #3 Posted by [Massimo A. Santin](#) on 12 Apr 2007, 12:56 a.m.,  
in response to message #2 by Les Wright

HP-49g+ (and 50g) uses IrDA, 28 and 17BII no. Is HP-49g+ compatible with 82240A or 82240B (that are not IrDA)? I know that these two printers are termal printers and aren't in production any more. My concern is about thermal paper. Are you able to find it to use with your 82240B?

Best regards.

MS

**Re: Questions on printing, printing and printing.**

*Message #4 Posted by [Les Wright](#) on 12 Apr 2007, 1:28 p.m.,  
in response to message #3 by Massimo A. Santin*

I like NCR brand black thermal paper. I get a three-pack of the big rolls and split them up into six smaller rolls. Costs about eight bucks a box.

Purists argue that thicker older genuine HP paper, blue or black, is the only safe stuff to use in the HP97, 82143A, and 82162A (this is all debatable and seems to be a matter of personal preference), but I believe that the newer 82240 printers have a mechanism that is considerably less fussy and more forgiving (it is a newer machine) and it doesn't seem to slip or misfeed at all with standard thermal paper. Indeed, my 82240 printer is the only printer I have that has given me trouble free operation since I got it. Heck, I charged the NiMH cells in it in January, and the printer still goes strong from that same charge. The NiCad packs in the older printers need a lot more TLC.

Les

**Re: Questions on printing, printing and printing.**

*Message #5 Posted by [James M. Prange \(Michigan\)](#) on 12 Apr 2007, 8:05 p.m.,  
in response to message #3 by Massimo A. Santin*

Either the 82240A or 82240B is good for the 28 series. The 82240A works with the 48 and 49 series (except the 49G, which doesn't have any IR), but some non-ASCII characters will have to be remapped (where possible) from the modified ECMA 94 character set to the Roman 8 character set. I've never used a 17BII. I think that the better match is the 82240B, which has additional advantages besides having both character sets. I guess that, with patience, you can probably get an 82240B on eBay for US\$50 or less.

For much more information on these printers, try a Google search of MoHPC like [this one](#).

By the way, [Martel Instruments](#) sells some printers which should work for anything that the HP 82240B works for. I don't know the prices of the Martel models though.

Quote:

HP-49g+ (and 50g) uses IrDA, 28 and 17BII no. Is HP-49g+ compatible with 82240A or 82240B (that are not IrDA)?

Yes. The IR encoding used for printing to the 82240A/B is different from the IR encoding used for I/O. For the encoding used for these printers, see the [HP 82240B Infrared Printer Technical Interfacing Guide](#). For the "Serial IR" used by the 48 series for I/O, see the [HP48 I/O Technical Interfacing Guide](#) or the [HP48 I/O Technical Interfacing Guide PDF](#). And of course, for information on IrDA start at <http://irda.org/>.

As Les noted, the IR range from the 49 series is much lower.

Quote:

I know that these two printers are terminal printers and aren't in production any more. My concern is about thermal paper. Are you able to find it to use with your 82240B?

No problem; although these printers are out of production, many "point-of-sale" printers use compatible thermal paper. Look for thermal paper with a width of 2 1/4 inch (57mm or 58mm), and a roll O.D. of a bit less than 2 inches. As Les noted, it's easy enough to rewind part of a larger roll onto an empty core. I've used the brands "Perfect Print", "NCR", and "IBM" with no problems. I did have a minor problem with some other brand (sorry, I don't recall the name) which printed a light purple.

For part numbers of the HP paper (and other accessories or parts) for these printers, see the [HP Part Surfer](#). You may be able to find some "genuine HP" paper, but, depending on the storage conditions, it may have deteriorated to the point that it's discoloured or otherwise doesn't print well.

Les mentioned a difference in thickness from the old HP paper to the other papers, but both my HP 82175A and NCR brand paper seem to be about .0025" thick, as best I can measure it with a micrometer. Perhaps some of the older HP thermal papers were different?

For the 48 and 49 series, you can set system flag -34 to "Print via wire". When printing "via wire", the translation mode used for ASCII transfers is respected for all characters except "LineFeed" (ASCII control code 10 decimal). A "LineFeed" character is translated to whatever character string is the 4th element in the list stored as the reserved variable PRTPAR, by default a CarriageReturn LineFeed pair.

For the 48 series, if flag -33 is clear (Transfer via wire), the "via wire" printing is from the RS-232 compatible port, or if flag -33 is set (Transfer via IR), the "via wire" printing uses "Serial IR".

For the 49G, printing is only "via wire" (flag -34 set) and only from the RS-232 compatible port (flag -33 clear).

For the 48gII, if flag -33 is clear (Transfer via wire), the "via wire" printing is from the wire serial port, or if flag -33 is set (Transfer via IR), the "via wire" printing uses IrDA.

For the 49g+, if flag -33 is clear (Transfer via wire), the "via wire" printing is from the USB port, or if flag -33 is set (Transfer via IR), the "via wire" printing uses IrDA.

For the 50g, if flag -33 is clear (Transfer via wire), the "via wire" printing is from either the USB port (flag -78 clear) or from the serial port (flag -78 set), or if flag -33 is set (Transfer via IR), the "via wire" printing uses IrDA.

So, depending on the model, the 48 and 49 series can print to a serial or an IrDA printer, or for that matter, you can "print" to a terminal emulator such as HyperTerminal. In most cases, you'd probably want to use translation mode 3, but if your printer allows a "downloadable font", you could install a user-defined font to match the calculator's character set. Come to think of it, you can even "print via wire" from one calculator to another.

Note that for the "screen capture" functions of the "connectivity kits" to work, printing has to be "via wire" and using the same I/O port.

Certainly it should be possible to design hardware to receive the IR meant for the printers and convert it to, say, an RS-232 compatible signal, but I don't think that anything like that is commercially available.

Designing hardware to convert the 48 series "Serial IR" to an RS-232 compatible signal should be much easier, and it might even be commercially available.

Of course RS-232/IrDA converters are commercially available. For MS Windows 2000/XP/Vista, you'd probably have to also install the [IrCOMM2k Virtual Infrared COM Port driver](#).

Regards,  
James

*Message #8 Posted by [Mike Ingle](#) on 12 Apr 2007, 5:18 a.m.,  
in response to message #1 by Massimo Santin*

The 28S, 17BII, 50G, 48GII, and 48GX will all print to an 82240A or 82240B. I have one of each and they all work. With careful alignment you can even get both printers going from one calculator.

Normal thermal roll paper works fine in these printers.

The 49 series (48GII, 49G+, 50G) can beam to a PC if you use the IRCOMM driver on the PC. The infrared is physically compatible but you have to install a driver.

The 49 series cannot beam to a 48G, G+, or GX. The 48GX series cannot beam to a PC. The only way to get data from a 48GX to a 50G is via a PC. Even using a null-modem cable between the serial cables (48GII to 48GX) does not work because neither device powers the port.

### J. Donnelly's book - a \*real treasure\* ?

Message #1 Posted by [Giancarlo \(Italy\)](#) on 11 Apr 2007, 11:55 a.m.

Hi Forum. I just made a search on Amazon.com for the book by James Donnelly: "An Introduction to HP48 System RPL and Assembly Language Programming" and it came up with 1 used and rated as much as 377.24 USD + 3.49 USD for shipping...!!! Yikes! I knew it could be a "good" reading, but did not expect it to be such a "precious" one :/ What are your thoughts about that? Would it be worth to get it anyway or is it definitely over-estimated ? And why should it be so highly-priced? Thanks in advance for any feedback. Best regards. Giancarlo

### Re: J. Donnelly's book - a \*real treasure\* ?

Message #2 Posted by [Valentin Albillo](#) on 11 Apr 2007, 12:04 p.m.,  
in response to message #1 by Giancarlo (Italy)

Hi, Giancarlo:

I can't comment on this particular book's contents, but as far as its price goes, it is vaaaaastly overpriced.

This is not uncommon with books sold in Amazon by third parties, at all. I've recently found several old books I was interested in, and they had outrageous prices just because they were the only one being sold, not because they were particularly good or special.

Seems to me a kind of TAS-syndrome or so, where the seller realizes he's the only one offering that particular book and fixes a ridiculously high price just in case some sucker takes the bait.

Best regards from V.

### Re: J. Donnelly's book - a \*real treasure\* ?

Message #3 Posted by [Giancarlo \(Italy\)](#) on 11 Apr 2007, 12:24 p.m.,  
in response to message #2 by Valentin Albillo

Hi Valentin.

Quote:

Seems to me a kind of TAS-syndrome or so, where the seller realizes he's the only one offering that particular book and fixes a ridiculously high price just in case some sucker takes the bait

Frankly speaking, it was my very same impression - right a TAS-style approach. That's why, in my deep ignorance, I asked myself - and some more knowledgeable people - if there was something I was sensationally missing or it was "the same old story" :-)  
Your feedback shed a sharp light - as usually :-)  
Just to fullfil the subject: in your opinion is there any alternative

to a contemptous refuse of the "blackmail"? :-|  
Think I know the answer...  
Thank you for your feedback.  
Warmest regards.  
Giancarlo

*Message #5 Posted by [Dave Hicks](#) on 11 Apr 2007, 12:18 p.m.,  
in response to message #1 by Giancarlo (Italy)*

A while ago I was looking for a book on investing and personal finance. It had gone out of print but had a good reputation. It was available Used on Amazon for prices ranging from \$300 to \$9400. A few weeks later another seller got a bunch of new/remaindered copies and priced them at \$6. I decided to go for \$6 instead of \$9400. ;-)

It was a fairly good book. It was compact, concise and a "quick read" for its field. It was definitely worth \$6 and it was probably worth its original \$19.95. The guy selling at \$6 had an impact on the market: now you can buy it new for \$18.21 or used for \$264.94, but no one is asking \$9400.

The Auction Site, a.k.a. eBay. Why they don't simply call it by its real name I don't know!

- Thomas

### Re: TAS?

Message #9 Posted by **Valentin Albillo** on 11 Apr 2007, 2:19 p.m.,  
in response to message #8 by Thomas Okken

Hi, Thomas:

Thomas posted:

*"Why they don't simply call it by its real name I don't know!"*

I think some people call it TAS just in case Mr. Hicks eventually decides to filter posts having the term "eBay" on them, in which case, referring to the site as TAS would help to avoid the forceful removal to another section or whatever.

In my case, it's just that I'm a life-long trekkie, and in that evil world the term "TOS" is an endearing acronym which automatically gets read as "The Original Series", and "TAS" simply reminds me of "TOS". :-)

Best regards from V.

### Re: TAS?

Message #10 Posted by **Walter B** on 11 Apr 2007, 2:56 p.m.,  
in response to message #9 by Valentin Albillo

Hi, Valentin, Thomas, Don,

IIRC TAS was invented here for pure fun shortly because of the long written history of TOS in this forum. TOS stands for "that other site" whose name must not be mentioned here for reasons buried in the past. TOS covers HP XLI (hope you can decode that).

Best regards, Walter

**Re: J. Donnelly's book - a \*real treasure\* ?**

*Message #19 Posted by **James M. Prange (Michigan)** on 12 Apr 2007, 8:54 p.m.,  
in response to message #1 by Giancarlo (Italy)*

Well, it is a very good book, but note that it's an "Introduction". Also, it's written for the 48 series, so it doesn't include the new capabilities and changed entry points for the 49 series.

Note that there's quite a bit of information on these topics available at <http://www.hpcalc.org/>.

As for that price, well, maybe someone will be able and willing to pay it, but I see that it's listed for US\$29.95 at <http://www.calcpro.com/>.

In case the book doesn't include the floppy disk that's supposed to come with it, the example programs are available at <http://holyjoe.net/hp/HP48.htm>.

As far as I know, Dave doesn't have permission to include James Donnelly's books on the MoHPC CD-ROM set / DVD-ROM. If he ever gets permission, I'd be happy to scan this and a few others.

Regards,  
James

### **a/b != a\*(1/b) on HP41CV, 33C, 15C, 67....**

Message #1 Posted by [Les Wright](#) on 11 Apr 2007, 7:42 a.m.

I am sure this is in the area of Numeric Programming Skills 101, but I thought I would share an observation.

I am working on an HP41 program that, among other things, computes the upper-tail probability of the Student t distribution given degrees of freedom and t statistic value. (The t distribution is a specific case of the incomplete beta function, and the program has code to compute that. I like J-M Baillard's programs in the Software Library, but I thought I would write my own routine using the Modified Lentz procedure in Numerical Recipes that didn't have dependency on other routines save a reliable way to compute the Gamma function.) In certain cases, such as when degrees of freedom are relatively large and the other argument is very small, I may need to compute a quotient that turns out to be pretty close to unity. For such arguments I was getting more digit loss in the final result than I expected, and found that the situation improved greatly when I computed such quotients as divisions a/b rather than multiplications (1/b)\*a. I thought the calculator would treat these situations as identical, but I was wrong.

For example, on all of my 10-digit HPs I get the following:

47 ENTER 47.0001 / 10 \* gives 9.999978723

BUT

47.0001 1/x 47 \* 10 \* gives 9.999978726

In Mathematica, the quotient to 20 digits is 9.9999787234495245755, so the straight division is the "more correct" result here.

It turns out that this difference of 3 ULP was having a profound effect on later computations such that 2 or even three digits were lost. When I programmed the division as, well, a division, the results were much better.

I am sure this has been discussed before, but I share it in case it has not come up in a while. It is a common step saving device in RPN programs to compute quotients as (1/b)\*a to avoid excessive stack lift and register swapping. I have used it a lot myself. But I will be more careful now, especially when I am interested in preserving as much digit accuracy as possible.

Les

P.S. The analogous discrepancy on my 12 digit calcs is similar but not as extreme--9.99997872345 with normal division, 9.99997872344 with the reciprocal and multiply technique. Normal division is again the correct approximation to the actual result.

### **Re: a/b != a\*(1/b) on HP41CV, 33C, 15C, 67....**

Message #2 Posted by [Les Wright](#) on 11 Apr 2007, 8:03 a.m.,  
in response to message #1 by Les Wright

Before someone points out the "why" I think I have an idea what is going on.

The "reciprocal then multiply" approach is a two step process. The intermediate step of taking the reciprocal of 47.0001 basically rounds that result to 2.127655048e-2, since every time a result is placed on the the stack the three internal guard digits are lost. Multiply that by 470, round to 10 digits, place on stack--voila! Inherited rounding error. 9.999978726 is not the properly rounded 10 digit result of 470/47.0001, but it is the properly round result of  $470 * 2.127655048e-2$ .

The division is a single step with all of the intermediate computations carried on internally to 13 digits before the final 10 digit rounded returned to the stack. So it gets the result right.

The lesson seems to be that if maximum possible accuracy is desired in division, I should just do a division, since adding extra steps just eliminates guard digits that could prove very important in certain situations.

Les

### ROM Based Procedural Language (RPL)??

Message #1 Posted by [Howard Owen](#) on 11 Apr 2007, 3:53 a.m.

I was reading through [HP's 35 year anniversary page](#) when I noticed this description of the HP-28C, near the bottom:

1987 HP-28C: First full RPL calculator  
 In the late 1980s, HP developed a new programming language for its new series of extremely powerful calculators. By combing (sic) elements of RPN, Lisp and Forth, HP came up with a language called RPL (or ROM-based Procedural Language).

Is this just a marketing goof or is their precedent for this expansion of "RPL?"

Regards,  
Howard

### Re: ROM Based Procedural Language (RPL)??

Message #2 Posted by [Giancarlo \(Italy\)](#) on 11 Apr 2007, 7:00 a.m.,  
 in response to message #1 by Howard Owen

Hi Howard.

Even though I already heard about that weird definition (see for example:

[http://en.wikipedia.org/wiki/RPL\\_%28programming\\_language%29](http://en.wikipedia.org/wiki/RPL_%28programming_language%29))

I'd rather stick to what William C. Wickes (the RPL "founding father" :) says in his book "RPL: A Mathematical Control Language":

Quote:

Several existing operating systems and languages were considered, but none could meet all of the design objectives. A new system was therefore developed, which merges the threaded interpretation of Forth with the functional approach of Lisp. The resulting operating system, known unofficially as RPL (for Reverse-Polish Lisp), made its first public appearance in June of 1986 in the HP-18C Business Consultant calculator

I took the quote from RPLman, as, alas, I don't have a copy of Bill Wickes' book :(

Hope this helps.

Best regards.

Giancarlo

### Re: ROM Based Procedural Language (RPL)??

Message #3 Posted by [Jeff O.](#) on 11 Apr 2007, 7:40 a.m.,

*in response to message #1 by Howard Owen*

From "A Guide to HP Handheld Calculators and Computers" by W. A. C. Mier-Jedrzejowicz:

Quote:

RPL stands for Reverse Polish Lisp - it combined the RPN calculator language of earlier models with features of the Lisp and Forth programming languages. For a time HP explained the letters RPL as an acronym for "ROM-based Procedural Language."

So there is precedent for this within HP. Perhaps "Lisp" and "Forth" were (and maybe still are) subject to copyright or trademark restrictions, so the "official" line had to be that RPL stood for something else.

### **Re: ROM Based Procedural Language (RPL)??**

*Message #4 Posted by [John Keith](#) on 11 Apr 2007, 10:25 p.m.,  
in response to message #3 by Jeff O.*

I have never heard of copyright restrictions on the names of programming languages before, so I don't think that's the reason. I think it is merely that HP thought (probably rightly) that the phrase "Reverse Polish Lisp" would strike fear and terror into the hearts of almost anyone! (Members of this forum excluded, of course ;-)

John

### **Makeup trick??**

Message #6 Posted by [John](#) on 10 Apr 2007, 4:41 p.m.,  
in response to message #3 by Tim Wessman

So HP is the mysterious force who has been buying up all the HP35 calculators on ebay.

Perhaps they are buying all of them up to polish them and clean them so they can sell them on the HP website!

**Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #7 Posted by [Dia C. Tran](#) on 11 Apr 2007, 2:51 p.m.,  
in response to message #6 by John*

for much less money than the went on ebay???

**Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #8 Posted by [Walter B](#) on 10 Apr 2007, 4:52 p.m.,  
in response to message #1 by Egan Ford*

Quote:

HP, in the next few months, will also debut a new calculator related to this anniversary, the spokeswoman said.

Can't imagine, but I'm willing to hope. However, it must be something revolutionary (like the HP35 was at its time), because the original function set you get for less than 10\$ everywhere meanwhile.

**Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #9 Posted by [Ren](#) on 12 Apr 2007, 12:07 p.m.,  
in response to message #8 by Walter B*

I wouldn't be surprised (if a 35th Anniversary calc is released), that HP might just rebadge a 50 and call it the Anniversary Edition.

HP could justify such an action by saying something like...

"The HP-35 was the best calculator of its time, and now the HP50G is the best calculator of our time, so it is only 'appropriate' to have the HP50G represent its fore-runner."

Okay, so I'm a pessimist! But an Anniversary Edition would sell like hotcakes...

Ren

**Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #10 Posted by [Howard Owen](#) on 12 Apr 2007, 2:35 p.m.,  
in response to message #9 by Ren*

Add a SysRPL HP-35 emulator and the cheap "special" would be complete.

I suspect that someone at HP (Sam?) might see how cheesy that would be.

I know it has been stated at least twice in this thread, but it bears repeating. There is no indication from HP that they will be releasing an HP-35 anniversary edition calculator of any description. No new

calculator is still the most likely outcome in my opinion, but it's fun to speculate on what such a machine might look like.

Regards,  
Howard

### **If True, As Close To "Bring Back The 15c" That's Been Wished For**

*Message #11 Posted by **Happy HP User** on 10 Apr 2007, 6:34 p.m.,  
in response to message #1 by Egan Ford*

And they'll probably sell quite a few. I'll buy at least two.

### **C'mon be real folks**

*Message #12 Posted by **John** on 10 Apr 2007, 6:55 p.m.,  
in response to message #11 by Happy HP User*

You have the offhand words of a spokeswoman, aka marketing droid, and you guys are going off the deep end with them.

I think TWs comments are wishful thinking or pulling our legs.

I'll eat my HP35 if HP comes out with any sort of new LED model.

### **I also note**

*Message #13 Posted by **John** on 10 Apr 2007, 7:01 p.m.,  
in response to message #12 by John*

that is was the blogger who suggested the parallel to the 12c anniversary.

Read the link carefully and you won't find that stated by the spokeswoman.

### **Re: I also note**

*Message #14 Posted by **Walter B** on 11 Apr 2007, 2:02 a.m.,  
in response to message #13 by John*

John,

This was noted already above. For sake of clarity, once again, the only real (though only quoted) statement we have is:

Quote:

\_\_\_\_\_  
HP, in the next few months, will also debut a new calculator related to this anniversary,  
the spokeswoman said.  
\_\_\_\_\_

I think this is exciting enough. Speculation is what "a new calculator related to this anniversary" will mean. I agree it won't be LED.

### **Re: I also note**

*Message #15 Posted by **Howard Owen** on 11 Apr 2007, 3:20 a.m.,*

*in response to message #14 by Walter B*

That prospect *is* exciting.

If true, I sort of feel like HP will be in a no-win position with respect to this community's reaction. I've heard two mutually contradictory expectations from folks. To a degree, I hold both positions myself. This leaves me only a little "twitchy" due to the cognitive dissonance. (The rest of my madness is due to other factors. 8)

First, to be equal to the memory of the HP-35, a new calculator would have to be as revolutionary as the 35 was in its day. I'm not sure it's easy for those of us that didn't live through the transition to grasp just how impossible this expectation is. Jumping from the slide rule, with its long history stretching back to "Napier's Bones," its built in accuracy compromises and its slow operation, to an electronic calculator complete with most functions considered standard on a basic scientific/engineering machine today must have seemed like a very sudden leap into the future. There were no direct precedents for this product. There had been pocket calculators before, and desktop scientific calculators, but never a pocket sized scientific calculator.

Second, to satisfy me, and perhaps others in this community, a new machine honoring the HP-35 would have to bring back some of the features I hold dear in the old RPN models. The large ENTER key is an obvious one, but also the RPN logic system and excellent build quality. This expectation doesn't seem like much of a stretch compared to the first one. But how the heck do you satisfy both? Do I really want the machine to be both revolutionary and traditional? (\*twitch\*)

In order to resolve the dissonance, I think I'll let go of all expectations regarding this vaporous anniversary model 35. If HP does something to remember its former glory in the history of scientific and engineering practice, I'll be happy. If they honor the things that made the old machines so wonderful, I'll be delighted. If they transcend the handheld calculator with a device I can't even imagine, I will soar into the clouds with joy and wonder.

If they do all of the above, I'll go back to being "twitchy." 8)

Regards,  
Howard

in response to message #15 by Howard Owen*

I doubt that they would do it. I think it would be nice to make the 35 again with some what smaller form factor and with LCD display. It should have the highest contrast LCD and very high quality of construction and keyboard. It should be even tougher and have better ergonomic than the original 35. The keyboard should have the exact same 35 keys layout and with a sliding power switch and same color scheme. It would provide also exactly the same function as the original 35. Selling price for \$150 and I would get one.

Me too. But that would be a machine purely for the enthusiast. An engineer or student in need of a basic scientific pocket calculator would look at that price and laugh.

The 12C Anniversary Edition was just a nicer looking model of a still successful business calculator. People in business schools and in the workplace obviously still buy those in large numbers, without regard to the historic value.

I see only two possibilities for a viable 35th anniversary HP-35. Either a low cost scientific model with styling and functions reminiscent of the original, or an entirely new calculator, perhaps called an HP-35, that does the washing and walks the dog, all with reference to the original, but not limited to the original's features. I'd prefer the latter, probably.

There I go being optimistic again. It's good for my nerves.

Regards,  
Howard

HP calculators / RPN, An Introduction to Reverse Polish Notation 2007-03-23

"If you're a frequent calculator user, you owe it to yourself to investigate the advantages of RPN. RPN stands for Reverse Polish Notation. Reverse Polish Notation was developed in 1920 by Jan Lukasiewicz as a way to write a mathematical expression without using parentheses and brackets. Hewlett-Packard Co., realizing that Lukasiewicz's method was superior to standard algebraic(1) expressions when using calculators and computers, adapted RPN for its first hand-held scientific calculator, the HP35, in 1972."

How did you find that article? It was interesting, but I took a step back in the web address to see when it was published, and didn't see the article listed. So I took two steps back, chose US, and went forward to [this page](#), which then has a link to the 35 anniversary article. But I still couldn't find the article you linked to.

Do you know when it was published?

**Online RPN (was HP-35 / 35th Anniversary )**

The calc was more RPL like than RPN. I didn't check it out carefully yet but it has the entry line and the top level stack doesn't duplicate.

\_\_\_\_\_

Such things as replicating the top stack register downward may well be considered an essential part of the "Classic RPN" system used on some HP calculators, but aren't essential to RPN as a mathematical notation.

To me, if the basic rules of operation are first input the arguments, and then perform an operation on them, then the system is some variety of RPN.

Message #28 Posted by [James M. Prange \(Michigan\)](#) on 13 Apr 2007, 7:12 p.m.,  
in response to message #24 by Mike H

I think that HP's article is inaccurate. My understanding is that Jan Lukasiewicz developed "Polish notation", that is, instead of using a mixture of prefix, infix, and postfix notation, with rules of precedence for determining in which order the operations are intended to be performed, uniformly using prefix notation. In Polish notation, the sequence would always be first the operator, and then the argument(s); for example, to add 1 and 2 in Polish notation, the sequence would be + 1 2.

Reverse Polish notation (RPN) of course reverses the position of the operator and arguments, making it postfix notation, that is, first the argument(s) and then the operator; for example, to add 1 and 2 in reverse Polish notation, the sequence is 1 2 +.

Regards,

James

## **Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #29 Posted by [Palmer O. Hanson, Jr.](#) on 13 Apr 2007, 6:08 p.m.,  
in response to message #22 by [Mike H](#)*

You quoted the article as saying

Quote:

---

"If you're a frequent calculator user, you owe it to yourself to investigate the advantages of RPN. RPN stands for Reverse Polish Notation. Reverse Polish Notation was developed in 1920 by Jan Lukasiewicz as a way to write a mathematical expression without using parentheses and brackets. Hewlett-Packard Co., realizing that Lukasiewicz's method was superior to standard algebraic(1) expressions when using calculators and computers, adapted RPN for its first hand-held scientific calculator, the HP35, in 1972."

---

But, if you go to [www.woz.org/letters/general/57.html](http://www.woz.org/letters/general/57.html) and read to the end you will find the following discussion by Wozniak, the co-inventor of the Apple computer and a former employee at HP:

"... At Hewlett Packard we were so proud that our calculators, the first scientific ones ever, were years ahead of competition. They used postfix partly because the least logic or ROM chips were quite expensive back then. It would have taken extra keys and an infix to postfix translator to use infix. Also, a larger and more expensive desktop HP machine from the division in Colorado Springs used postfix, for the same reasons. The HP-35 was an attempt to miniaturize this machine. ... "

That's the wonderful thing about history. It seldom tells us what really happened. More often it tells us what the historian would like us to believe. H-P, which doggedly continues to make RPN machines, even when machines with EOS (equation operating systems as on TI and Casio machines) or RPL (as on H-P machines) are clearly better when algebraic expressions are involved, can be expected to emphasize the claimed benefits of RPN to a user. Wozniak, who left H-P to develop the Apple product line which used a higher order language which is far more similar to AOS, EOS and RPL, can be expected to dismiss RPN as a language consistent with the memory limitations of the early 1970's.

The article's example calculation in algebraic mode emphasizes a need to remember an intermediate result. That is, of course, correct for the early machines which mimicked the operation of adding machines. It is not correct for any of the later algebraic machines which implement hierarchy. That's an attempt at salesmanship, I suppose. It will fall flat with any potential user who is familiar with the algebraic machines with hierarchy..

The article also offers an checkbook balancing exercise as a demonstration of the superiority of RPN. With RPN or with an adding machine one enters the last balance, enters a value and presses plus or minus depending on whether the value was a debit or a credit, and sees the result. With algebraic one enters the last balance, looks ahead to see whether the next entry is a debit or credit and enters a plus or minus depending on whether the next entry is a debit or credit, One then enters the value, looks ahead again to select a plus or minus, and when the plus or minus is entered sees the result of the previous transaction. This means that at the end of the balancing exercise the RPN user will have used exactly one less keystroke. Of course, the "looking ahead" which the AOS user finds natural and appropriate in this case is similar in a sense to the "looking ahead to find a starting point" which the RPN user find natural and appropriate when solving complex algebraic expressions such as the famous Mach Number equation.

**Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #30 Posted by **James M. Prange (Michigan)** on 13 Apr 2007, 8:03 p.m.,  
in response to message #29 by Palmer O. Hanson, Jr.*

True, different versions of history are often available, depending on who's writing it and what they want the readers to believe at the time.

I expect that the real reason for using RPN in early models was at least as much to simplify and minimize the hardware requirements as for any virtues of RPN as a mathematical notation. RPN is great for "number-crunching", but to me, it would seem difficult to use for algebraic manipulations.

Yes, the advantage of saving keystrokes is often overstated.

For me, the advantage of RPN is mostly that it seems more intuitive to me and is much more consistent; first the argument(s), and then the operator.

A basic feature of RPN is that the result of any operation is left on the stack, available as an argument to a subsequent operation (assuming that it isn't "pushed out" of a "top register"). To me, this seems to make it ideal for "working through" a real-world problem where the data is available and one has to decide what to do with it, although a bit of a pain when one has an algebraic formula and the data to "plug in" to it.

Regards,  
James

You wrote:

[quote] RPN is great for "number-crunching", but to me, it would seem difficult to use for algebraic manipulations. [/quote]

You may be correct on the "number crunching" idea, particularly if one does it step by step without the help of a program. The requirement for that sort of number-crunching was an inherent part of aerodynamics in the late 1940's when I was an undergraduate in aeronautical engineering, and was a part of my decision to do other kinds of engineering. By the time I encountered a need to do a lot of number crunching in the 1960's I had easy access to a computer network with an extended BASIC capability. I soon learned to reduce the number crunching to a program which made it palatable.

You were, of course, correct in Message #28 with your comment on the discussion of the origins of RPN.

In summary, I suggest that the H-P of the olden days wouldn't have let an article like that get into print. But, the emulator is kind of clever. The four line display speaks to one area of RPN that always has given me trouble, namely, how to keep track of what is in the stack without writing it down or doing endless roll-up's.

Palmer

*Message #32 Posted by **Bernie** on 15 Apr 2007, 1:54 p.m.,  
in response to message #31 by Palmer O. Hanson, Jr..*

RPN in HP style really shines if keystroke errors are to be corrected. Combined with LAST X most of all possible errors can be quickly and efficiently undone. A great feature not found in AOL or similar systems. And, RPN forces people to think. Use of a HP calc by kids certainly does not spoil their understanding that multiply / divide goes before add / subtract. Unfortunately, the TI-30 dominated schools all around the globe and maybe all those kids now are dumber if they had had a HP instead.

**Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #33 Posted by **John Smitherman** on 15 Apr 2007, 11:19 p.m.,  
in response to message #32 by Bernie*

My guess is that if HP does anything at all to celebrate it will update the 33s with a few software corrections and give it a facelift changing the key shape and layout, label colors and body color. Will they rename it? Maybe they will call it the 35s. This is similar to how they reimaged the 49G+ into the 50G.

Regards,

John

**Re: HP-35 / 35th Anniversary Edition expected soon**

*Message #34 Posted by **Steve Borowsky** on 16 Apr 2007, 4:58 a.m.,  
in response to message #33 by John Smitherman*

Well, if they make the 33S look like a 35 it would be a huge improvement. I don't think they're smart enough to do that though. The 33S was they're best shot at a decent, simple RPN calc and they ruined it with that sick perverted design. I can't even look at it let alone buy it.

**Colors for an HP-35 / 35th Anniversary Edition**

*Message #35 Posted by **Palmer O. Hanson, Jr.** on 16 Apr 2007, 10:52 p.m.,  
in response to message #34 by Steve Borowsky*

Will H-P will do something which picks up on the 35th anniversary of the introduction of the HP-35? Of course they will! From a marketing perspective it is just too good an opportunity After all, with an HP-35 designation and a 35th anniversary logo somewhere on the body HP-RPN afficianados will buy at least one whether or not they like how the machine looks and operates.

What key colors will be used? The original HP-35 used blue keys. Machines such as the HP-67 and the Voyagers used yellow and blue keys. However, the 35th anniversary gift is defined as coral for traditioinal practice and jade (i.e., green) for contemporary practice. The HP-33s already has a green key for selecting green options and a red key for selecting red options. Water down the red a little and you approach coral, and there you are.

... Unfortunately, the TI-30 dominated schools all around the globe and maybe all those kids now are dumber if they had had a HP instead.

---

The advocates of algebraic have always held that is the essence of dumb and dumber to insist on using a LOL (Lower Order Language) machine to evaluate equations if a HOL (Higher Order Language) machine is available. But, there have always been strong differences of opinion about the relative merits of RPN and Algebraic. In the olden days the HP/RPN community wrote about the TI/AOS community as being "the dark side". The TI/AOS community noted that the acronym RPN actually stood for **Really Pathetic Notation**. When I shared that with Richard Nelson last summer when we were discussing the differences between machines and users he responded that the correct definition was **Really Powerful Notation**. We agreed to disagree.

I suggest that the HP/RPN and TI/AOS communities are not only different but, more importantly, are each insular and provincial in their own ways. That isn't just my idea. When Wozniak wrote of finding that the famous (or maybe infamous) Mach number equation was easily solved with one of TI's early scientific machines he reported that "... My colleagues couldn't believe it. I told them that you just copy the formula from left to right but not one of them could see through their postfix fog. ... None of them could do what I had done, forget that they have to be smart." It isn't just the HP/RPN community. The TI/AOS community is just as provincial with [see my comment above] the emphasis on why would anyone want to evaluate an equation other than by simply entering it as one sees it on paper if only one could.

Message #37 Posted by **Katie Wasserman** on 17 Apr 2007, 12:03 a.m.,  
in response to message #36 by Palmer O. Hanson, Jr.

Five grueling years of graduate school in computer science taught me just one thing: "pick the language to most easily solve the problem in". The RPN vs AOS choice is just a special case of this edict.

### Repeating t register usage

Message #1 Posted by [Sam Levy](#) on 10 Apr 2007, 9:00 a.m.

HEWLETT PACKARD CALCULATIONS I used HP RPN pocket calculators for electronic solutions, and I wanted to find a fast way to solve common problems using as few keystrokes as possible, and getting maximum information during the process. This method uses the repeating t register. Formulas now in use were derived for pen and pencil mathematics, totally outmoded by the calculator. This is the keystroke procedure for quick solutions. With programmable calculators I added a small program to enter 3 times to fill the stack or clear it using zero entry. Resistive Dividers; when calculating from known resistors, enter the lower resistor repeatedly. Key in the top resistor, and add, the result is the total resistance, then divide, the result is the fractional output voltage of the divider. Then multiply and subtract to see the output resistance from the divider tap.

To design such a network, key in the output resistance desired, and enter repeatedly. Key in the division fraction, and divide to see the upper resistance. Divide again to restore the fraction, key 1, subtract, change sign, divide, and see the lower resistor. The relation between the upper resistor and the output resistance is the fraction of the divider. 1 minus the fraction is the relation between the output resistance and the lower resistance. Given the fraction and either resistor, the other value may be found.

I have used this method to find the added end resistors for setting particular potentiometer control ranges. The difference between the two potentiometer fractions desired at the potentiometer ends, relates the potentiometer resistance to the total resistance. Thus a particular value of potentiometer may be used to obtain the desired range of fractions. EXAMPLE: It was desired to use a 1K potentiometer to adjust a power supply to vary between 24 and 16 volts. The IC regulated at 4.75 volts from the potentiometer. It is desired to calculate the end resistors needed to set the correct range.  $4.75/24 = 0.2$  store 1.  $4.75/16 = 0.3$  store 2. Recall 1, subtract, see 0.1, key 1000 swap X&Y, divide, see 10105, the total resistance. Enter several times. Recall 1, multiply, see 2000, the resistance when the pot is at the lower extreme, add 2000 ohms to the lower end of the pot. Cl X, recall 2, multiply, see 3000, this is the sum of the pot resistance and the pot lower end resistor. The upper end resistor must be 10205 minus 3000 = 7105. Some compromise values may be used.

Transistor bias; I was solving for a transistor bias divider, and wondered how to account for the base current drop in the divider. I thought to divide the divider output resistance by Beta and add it to the actual emitter resistor. To do this procedure, solve the bias divider resistors, storing the divider fraction. With R0 in the register key Beta, divide, and see the emitter resistor equivalent to be added. Key the actual emitter resistor and add, see the total emitter resistor, accounting for the bias source drop. Key the source voltage; recall the fraction, multiply and see the divider voltage. Key 0.7, subtract, see the emitter voltage. Interchange X&Y and divide, to see the emitter current: check by multiplying by the collector resistor, to see the collector resistor drop.

Summing network; The resistive divider can be extended to a more general case. I needed to design a telemetry output that combined several signals, to a common output, having a 10 K output resistance. The signal of interest was a +/- 12 volt VCO control voltage. The telemetry output was to be 0-5 volts, using the range 0.5 to 4.5 volts normally. The centering voltage was 2.5 volts from a regulated 12 volts supply. A third resistor to ground gave the desired output resistance. I found a general solution. Each resistor is determined by the fraction of its input voltage contributed to the output sum, thus the telemetry signal was to output 1/6th of its signal. The resistor was then 10K times 6 or 60K. The centering voltage was 2.5 volts derived from +12, a ratio of 4.8 times, 48K. The third resistor was found by subtracting the other two fractions from 1:  $1 - 1/6 - 1/4.8$ , a fraction of 0.625 and dividing the output resistance to get a resistance of 16K. Some compromise values were used, which proved satisfactory.

RC frequency corners; the process may be simplified as  $2\pi fRC=1$ . The known values are multiplied, and the product inverted to give the missing element. For constant frequency solutions enter  $2\pi f$  repeatedly.

Tuned circuits; here intermediate results in the solution give other useful information. Key in L, then C, and store C in a register, divide and take the square root; this is the impedance of the resonant elements. Recall the capacitance value and multiply, then multiply by  $2\pi$  and invert to see the frequency in Hertz. This is the frequency corner formula using R0 as the R value. Q if known may be used to compute the resonant impedance, or the Q may be found by dividing the parallel circuit damping resistance by the impedance, or the impedance by the series circuit resistance. The square root of L/C is also the output resistance of a simple LC filter, such as a power supply, and can be used to estimate transient voltages from current changes.

Resonant values; When using a constant frequency, resonant values may be calculated quickly. Key in  $2\pi f$  and enter it repeatedly. Then key in either L or C, multiply twice, and invert to see the other resonant circuit element. When  $2\pi fL$  is shown, it is the reactance of the circuit values. This procedure gives quick trials of various circuit values, give impedance values for filter and by-pass elements, and value choices for a given Q.

Ohms law; this may seem simple, but can be used as a rapid verification of dissipation and the voltage and current relation. Remember the little circles of voltage E divided by the IR product. Key in the voltage repeatedly, and divide by either I or R to see the other value, as in  $E=IR$ . The power in a resistor can be found by keying in the resistor and dividing to get I, then multiplying to get EI. It can be used to solve  $W=EI$ , by keying in power repeatedly, and dividing to get either E or I. These methods allow such rapid solutions; they will increase your ability to investigate possibilities in your designs. Practice will allow fast and sure answers to a wide range of problems. Familiarity will allow you to extend these methods to your particular problems. I trained one tech to calculate time payments faster than they could be found in a book. E. Samuel Levy, 754 Temple St. San Diego 92106, 619-223-6292 designnut@cox.net

### Sam, what's this about?

*Message #2 Posted by [Dave Hicks](#) on 10 Apr 2007, 12:23 p.m.,  
in response to message #1 by Sam Levy*

I've received complaints about this post, and about the identical post that you made a few weeks ago, and the same post was made a couple of months ago, and I now that I've looked, I can see the same post made as far back as 2002.

If you're looking for a response, I think you need to be more direct. I can't figure out what you want from these posts.

### Re: Sam, what's this about?

*Message #3 Posted by [Sam Levy](#) on 10 Apr 2007, 2:51 p.m.,  
in response to message #2 by Dave Hicks*

Dave, I didn't know how to use the preformatted control and it all ran together. There is one unusual solution for the resistive divider output impedance that is unknown. I do solicit comments, like everybody knows that. I have seen people program these simple solutions that nat be made directly. When you have an HP-35 you need to use everything.

### I found these useful... (was: Sam, what's this about?)

*Message #4 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 11 Apr 2007, 9:03 a.m.,  
in response to message #2 by Dave Hicks*

Hi, Dave, guys;

I was affraid people would complaint about Sam's post, mostly because no one answered it. I have original Sam's 2002 post saved and printed. I followed his examples and saw that they use few keystrokes to solve problems related to electricity and electronics.

Matter of fact, they relate to specific subject and may not be of interest of the whole community. Also, the keystroke sequences should be followed by stack diagrams so we can 'see' what's happening (I did so...). I myself liked reading and testing them, but this is mainly because I am an electrical engineer, and had already performed much of Sam's suggested calculations.

I decided to write after reading what you wrote, Dave, because I could not figure out the reason for complaints, sorry to say. Sometimes we see posts with no specific subject that have a lot of followups, others generate kinda dog fights, and some people complaint about them, too. In Sam's case, I saw contribution. If we can go any further, Sam's post could be reworked to generate a good article, perhaps.

Just my view.

Luiz (Brazil)

When I read these sentences, I started wondering if Sam was advertising his services - especially since he gave his address and phone number. Up till then, I read his message as presenting some methods he'd found to do some Electrical calculations.

By the way, Sam, you probably do not want to ever include your address or phone number in a public forum. The WEB crawlers have a field day harvesting that information. In fact, most of us never put our e-mail address in the forum either. Dave has created a nice way of hiding the e-mail address from public view, but still allowing us to still e-mail one another without actual knowing the other's e-mail address.

Bill

**HP-65 in Space**

Message #1 Posted by [Karl-Ludwig Butte](#) on 10 Apr 2007, 4:24 a.m.

Hi all,

as is commonly known, NASA used the HP-65 during its Apollo space missions(see here at the museum for reference <http://www.hpmuseum.org/hp65.htm>. I wonder if the HP-65 programs were ever published and commented. Does anyone have some information or Internet links ? Thank you very much in advance.

Kind regards

Karl

**Re: HP-65 in Space**

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 10 Apr 2007, 10:08 a.m.,  
in response to message #1 by [Karl-Ludwig Butte](#)

Hi Karl,

Quote:

\_\_\_\_\_

I wonder if the HP-65 programs were ever published and commented.

\_\_\_\_\_

I had also wondered about this. A few years ago, I contacted several people connected with the current space program, plus a friend of mine that works on the Satelites Programs who then contacted several friends of his in Houston.

No one could find any record of the original HP-67 Cards or the program listings.

I had also tried to find references to the HP-41 that had been used on early Shuttle flights. No such luck. There is a HP-41 on display at the Air & Space Museum. Assumming it is one of the actual units used and it has the module still in it, then someone with contacts there might be able to see if a copy of the code could be made for historical purposes..

The following is a link to my earlier messages on the HP-41 in space:

[HP-41 in Space](#)

Did anyone ever try purchasing the HP-41 SPOC Manual from WSN? The WEB site is way out of date - last update 1998. So not sure if WSN is even still around.

NASA is supposed to have an Archive/Library somewhere - not sure if in Houston or elsewhere. That might be a good place to start.

Bill

## **Re: HP-65 in Space**

*Message #3 Posted by [John Limpert](#) on 10 Apr 2007, 3:10 p.m.,  
in response to message #2 by Bill (Smithville, NJ)*

I wouldn't be too hopeful about finding those programs. JSC had major problems finding the "old" software needed to support the reactivation and final days of Skylab. My experience is that most stuff ends up in a dumpster when a program is terminated. Nobody is willing to spend the money to archive old software and documentation. Your best bet may be some retired programmer's garage.

*Message #5 Posted by [John Limpert](#) on 11 Apr 2007, 3:26 a.m.,  
in response to message #4 by Karl-Ludwig Butte*

Sorry. JSC is the Johnson Space Center in Houston, Texas. The lead center for manned space flight at NASA.

## **Re: HP-65 in Space**

*Message #6 Posted by [Bill \(Smithville, NJ\)](#) on 11 Apr 2007, 7:59 a.m.,  
in response to message #4 by Karl-Ludwig Butte*

Hi Karl,

Quote:

\_\_\_\_\_

What is a SPOC-Manual, WSN

\_\_\_\_\_

SPOC stands for "SHUTTLE PORTABLE ONBOARD COMPUTER ".

And WSN stands for "World Spaceflight News".

More info at the link I posted to the earlier message thread:

[HP-41 In Space](#)

According to WSN, there was an actual 44 Page Manual describing the HP-41 SPOC. Title of manual is

"HP-41 / SHUTTLE PORTABLE ONBOARD COMPUTER (SPOC) Setup of hardware and operation; software descriptions; troubleshooting. 44 pgs. \$18.00"

That would be a very interesting manual to read.

Unfortunately, the WSN WEB site offering this for purchase, is way out of date. So I'm not sure if they are still in business or not. I do remember someone telling me that he had seen them offering CDROM's of groups of mnauals, at a fairly high price. Not sure if these are still available either. I tried e-mailing WSN some time ago and didn't get any response back.

But if they had a HP-41 SPOC manual, then maybe the NASA archives would also have a copy.

Bill

## Re: HP-65 in Space

Message #7 Posted by **Bill (Smithville, NJ)** on 12 Apr 2007, 10:27 a.m.,  
in response to message #1 by Karl-Ludwig Butte

Followup on World Spaceflight News.

I sent them an e-mail again enquiring about the SPOC HP-41 manuals. No response back as of yet.

On Amazon, WSN is listed as the publisher of many CDROM's and DVD's of related NASA, Shuttle, and other spaceflights.

I've just ordered the following DVD:

Quote:

\_\_\_\_\_  
America's Space Shuttle: Complete Set of NASA Astronaut Training Manuals and Major NASA STS Documents (DVD-ROM) (DVD-ROM) by World Spaceflight News (Author)  
\_\_\_\_\_

They state they had 4 in stock, so I should be receiving it in a couple of weeks. (Took the free shipping option to save a few dollars).

I'm hoping that out of the 50,000 pages on the DVD will be the 44 pages for the HP-41 manual.

I'll let you know what I find out.

Bill

## Re: HP-65 in Space

Message #8 Posted by **Daniel W.** on 12 Apr 2007, 11:24 a.m.,  
in response to message #7 by Bill (Smithville, NJ)

I spent 11 years at the Johnson Space Center - I'm an ex-rocket scientist. I can tell you that NASA doesn't throw anything away. The SPOC documents are somewhere, probably on microfiche in the main Library.

So if anyone reading this works at JSC, go have a look in the library and let us know what you find.

Back in '93 I was asked to develop a lunar landing guidance algorithm for an unmanned vehicle called Artemis. I discovered that there was no one at NASA who knew how to do this. Everyone who had worked on Apollo had long since retired. NASA had lost the expertise that made them great. But there was the

library and I was able to reverse engineer the original work and improve upon it. For a while I was probably the only person at NASA who knew how to do it.

Real engineer work !! Congratulations

**Re: HP-65 in Space**

*Message #10 Posted by **John Limpert** on 12 Apr 2007, 1:01 p.m.,  
in response to message #8 by Daniel W.*

I've seen lots of stuff get thrown away. I guess it depends on where you worked.

Many years ago, I was interested in looking at some of the ground systems software used to support Apollo. It was all gone. After ASTP, someone had decided that it was obsolete and threw all of it away.

**Re: HP-65 in Space**

*Message #11 Posted by **Karl-Ludwig Butte** on 13 Apr 2007, 4:17 a.m.,  
in response to message #7 by Bill (Smithville, NJ)*

Thanks a lot to all of you who have responded and helped me understanding new unknown abbreviations. Thanks especially to your offer, Bill, to keep me informed about the DVD-Set you ordered - I appreciate that very much.

**Re: HP-65 in Space (Apollo)**

*Message #12 Posted by **Andrés C. Rodríguez** on 13 Apr 2007, 9:04 p.m.,  
in response to message #1 by Karl-Ludwig Butte*

The last Apollo mission to the Moon was Apollo 17. It was launched in December 1972, just a few months after the HP35 introduction, and almost a year before the HP45 was announced. So it is safe to assume no HP calculator (and certainly no HP65) flew in the Moon missions. That leaves us with the Skylab missions as a possibility, but, at least from the materials I once read, the first HP calculator in space was an HP65 in the Apollo-Soyuz mission.

Take into account that NASA certification process takes many tests (and time) before declaring an article "spaceworthy". While the HP41C certainly flew in the Space Shuttles, it was mentioned at the time that NASA mandated some changes in parts of it (may be plastics and batteries, not sure about these) before allowing the HP41C to liftoff in the Shuttles...

**Re: HP-65 in Space (Apollo)**

*Message #13 Posted by **Bill (Smithville, NJ)** on 13 Apr 2007, 10:10 p.m.,  
in response to message #12 by Andrés C. Rodríguez*

Hi Andrés,

The following link from the Smithsonian gives some detail on the HP-41C's that flew on the shuttles.

[HP-41c on Shuttle](#)

Quote from article:

Quote:

Only minor modifications were made: adding Velcro strips to the case, and removing a few parts that might "outgas," or give off gases that might contaminate the cabin's air.

From the article, NASA used custom modules for the programs and also had an early pre-release time module.

Does anyone know if the HP-41C at the Air & Space museum still has the modules installed? If so, I wonder if Dave Hicks contacted the Museum, if they would work with him to document the programs - a Rom dump would be great so that we could play with it on the emulators.

Does anyone on the list have contacts at the Air and Space Museum??

Hopefully, that DVD I ordered will have the manual for it and we can finally get some answers.

Bill

*Edited: 13 Apr 2007, 10:16 p.m.*

### **Re: HP-65 in Space (Apollo)**

*Message #14 Posted by [Dave Shaffer](#) on 14 Apr 2007, 11:24 a.m.,  
in response to message #13 by Bill (Smithville, NJ)*

On the Air and Space museum website, there is an option to ask about archive material. Maybe a query there would be useful.

On the other hand,

"Does anyone on the list have contacts at the Air and Space Museum??"

I suspect I am only one person away from somebody who knows the boss (I'm trying to find out who it is, I might even know him/her).

### **Re: HP-65 in Space (Apollo)**

*Message #15 Posted by [S. Martin](#) on 16 Apr 2007, 10:30 a.m.,  
in response to message #13 by Bill (Smithville, NJ)*

Hi Bill,

I have visited the Air and Space Museum on several occasions (I live in the DC area). I have taken pictures of the 41CV they have on display, see the pictures in this thread:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv010.cgi?read=26263>

The 41CV on display definitely DOES NOT have any modules installed, that was the first thing I

looked for when seeing the display.

Steve

### **Beaming Windows XP <-> 50G works**

Message #1 Posted by [Mike Ingle](#) on 10 Apr 2007, 4:21 a.m.

How to use IR between a Windows XP machine and a 49/50 series machine:

Download the stable version of this driver: <http://www.ircomm2k.de/English/index.html>

The driver creates a virtual COM port attached to the IR port on your PC. Start hyperterminal and choose the virtual COM port, 115200, 8, N, 1, hardware flow control. Set the calculator to IRDA, Kermit.

With this setup I had no problem beaming to and from a 50G and a 48GII using a Dell D600. Worked on the first try.

Mike

**hp 33c don't turn off**

Message #1 Posted by [bernd scheurer](#) on 9 Apr 2007, 7:22 p.m.

hi, i got a hp-33c in a very good condition (looks like new) via ebay. only one of the screw threads (in the battery compartment) was broken. so i fixed this little problem with glue. now i can use both screws. but since this, the 33c don't turn off. the on/off-button has no function. as soon as the battrypack is inside the 33c, the calculator is on. for turning off, i have to remove the batterypack. selftest is positive an all parts (incl. on/off-slider und contacts) are in the right place! does someone know this problem?

thanks for help or tipps. kind regards bernd scheurer

*Edited: 9 Apr 2007, 7:25 p.m.*

**Re: hp 33c don't turn off**

Message #2 Posted by [Christoph Widmer](#) on 10 Apr 2007, 3:57 a.m.,  
in response to message #1 by [bernd scheurer](#)

Hi Bernd, I had once the same problem on a HP 97. There the issue was that, with long time use, the slider had scraped some metal off the contacts of the printed circuit and deposited in the gap between the contacts for the slider - effectively making contact all the time. I had to open the calculator and remove the metal deposit between the contacts. Of course, I cannot be completely sure your calculator has the same problem, but this is my best guess. If you attempt a repair, first consult the detailed descriptions on this website for taking apart the calculator and then don't forget to put back some appropriate grease on the switch contacts, otherwise your PCB-contacts will be scraped off rather quickly.

Good luck and best regards.

**Re: hp 33c don't turn off**

Message #3 Posted by [bernd scheurer](#) on 13 Apr 2007, 6:26 a.m.,  
in response to message #2 by [Christoph Widmer](#)

hi christoph, thanks for your feedback and your ideas. i opened the 33c and found absolut clean contacts. after rebulid, the calculator doesnt work again. i think, it takes a lot more of time to fix this bug. thanks und best regards bernd

### 50G vs 49G+?

Message #1 Posted by [Dia C. Tran](#) on 9 Apr 2007, 3:24 p.m.

I am thinking of getting a 50G and I am wondering if in any aspect the 49G+ could be better than the 50G? Also where is the best place to get a 50G?

### Re: 50G vs 49G+?

Message #2 Posted by [John](#) on 9 Apr 2007, 3:43 p.m.,  
in response to message #1 by [Dia C. Tran](#)

The keyboard of the 50g is much better than the early / mid 49g+ machines.

The color scheme is much better.

Otherwise, it is a 49g+.

### Re: 50G vs 49G+?

Message #3 Posted by [Ron Ross](#) on 9 Apr 2007, 3:58 p.m.,  
in response to message #1 by [Dia C. Tran](#)

To add a couple of other comments:

The 50G also has an RS233 compatible serial port (well to most, not so fussy RS232 devices). No cable is readily available though.

You use 4 batteries vs 3 for the older Hp 49G+. This should result in longer life between battery changes.

Keyboard is significantly better than all but the latest last year production of Hp49G+s.

USB is now powered from PC which can theoretically extend battery life. However, the typical user doesn't keep his Hp tethered to a PC.

### Re: 50G vs 49G+?

Message #4 Posted by [James M. Prange \(Michigan\)](#) on 9 Apr 2007, 5:10 p.m.,  
in response to message #3 by [Ron Ross](#)

Quote:

Keyboard is significantly better than all but the latest last year production of Hp49G+s.

Indeed, I rather suspect that the main reason for the model change was to distinguish the newer units from the 49g+, which has a very bad reputation for keyboard problems.

Quote:

---

The 50G also has an RS233 compatible serial port (well to most, not so fussy RS232 devices). No cable is readily available though.

---

No, the serial port of a 50g is **not** RS-232 compatible. To use it with an RS-232 device, you'd need at least a level-shifter, and possibly an inverter. The signal at the port is about 0V and +3.3V, but I don't know whether +3.3V represents a logical 1 or a logical 0.

So far as the cable goes, the serial port uses a non-standard ("captive") "4-pin USB mini-B" connection. No doubt one could build his own level-shifter. [Samson Cables](#) is supposed to be planning to market a suitable cable/adaptor real soon now.

The serial port also provides a connection to the battery terminals. This is supposedly for an option to provide power to whatever the user chooses to connect to the port, but, with a non-rechargeable battery disconnected, could be used to power the 50g, or with a rechargeable battery installed, could be used to recharge the battery as well.

Quote:

---

You use 4 batteries vs 3 for the older Hp 49G+. This should result in longer life between battery changes.

---

Well, it will extend the battery life if the 50g draws less current from the battery, but I don't know whether anyone has actually measured this.

Quote:

---

USB is now powered from PC which can theoretically extend battery life. However, the typical user doesn't keep his Hp tethered to a PC.

---

Perhaps more important is that via USB transfers and flash ROM upgrades won't be aborted due to a low battery condition.

The 50g can also be powered through the USB port with a 5V adapter, such as the ones available for various music/video players. The 50g requests 50mA from the USB, so any adapter that can supply at least 50mA at 5V should be okay. I don't know how much current the 50g actually draws; I expect somewhat less. I expect that the highest current requirement would be when writing to flash memory.

Note that the 49g+ and 50g seem to work well with NiMH cells, except that you won't have as much time between a low battery warning and the battery going too low to work at all. I suggest keeping a spare set of AAA cells easily available if you use rechargeable cells, but using them should save on battery costs.

For that matter, the 48 series and the 49G also seem to work okay with NiMH cells, but the battery life is usually much longer with those models, so I think that alkaline cells are usually more appropriate for them.

The 50g uses the same (flash memory) "ROM" as the 49g+, so except for using system flag -78 to select whether the "via wire" I/O uses USB or the serial port, programming should be the same.

Regards,  
James

Message #5 Posted by [Les Wright](#) on 11 Apr 2007, 9:56 p.m.,

*in response to message #3 by Ron Ross*

Gosh, I hope the battery life of the 50G is better!

I put a fresh set in my 49G+ just a couple of months ago. Being more at home in old-style RPN, I use the calc very infrequently. I use a "BAT" app to track battery life. Last I remember, I had 80% of battery life left. Now a few short weeks later, I am getting a lowbat warning. And this is just from mostly sitting around, turned off.

Sheesh! Can't imagine how many batteries I would eat if I used it as my main calc....

Les

### HP-15C Documentation Project.

Message #1 Posted by [Chris W](#) on 9 Apr 2007, 1:24 a.m.

HP-15C Documentation Project.

I have finally got the motivation to start a project I have been wanting to do for a while. I want to create a better electronic copy of the manual for the HP-15C, and the advanced functions hand book (I don't have a hard copy of the advanced functions hand book though).

My first thought was to do it in some publishing software, and provide a much better pdf file than the scanned version that is out there now. Since I will need lots of help with this I thought it was better to use html and css to make it easier for more people to help. If you would like to help please email me directly. You don't need to be familiar with css but you should know html reasonably well and then can just follow the methods I have already started. You can see what I have done so far on the hp15c.org site. . . [HP-15C Manual](#). There are 21 pages there right now. Six of them are contents pages with nothing in them, and page 14 and 15 both need tweaking. I would love to get input on the ways to improve the css that I am using. I plan to get a high quality scan of anything in the manual that I can not reproduce with html and css. I have a spiral bound version of the manual in good condition, I should be able to get quality scans of the graphics from it.

If you want to help don't start till you talk to me and get more details. I am using php to automate things like the navigation links at the bottom and the page headers. You will need a copy of the php files I have before you start. However, you don't need to know php at all just leave the php parts at the top and bottom alone and just edit the html in the middle.

I look forward to your input.

Chris W

### Re: HP-15C Documentation Project.

Message #2 Posted by [hugh steers](#) on 9 Apr 2007, 7:54 a.m.,  
in response to message #1 by [Chris W](#)

hi chris,

are you sure you won't run into copyright problems if you are, essentially, reproducing the existing manuals? i don't want to sound negative, because i very much like your idea. however, if hp decide to re-release the 15c, your project could be redundant. as a big 15c fan i always wanted more than what was in even the advanced function handbook. so a supplementary documentation project might be an interesting idea. there's a lot of 15c stuff discovered and written since the original manuals that would make great reading if it were all brought together.

?

### And, do you have permission to distribute the 15c manual on 15c.org?

Message #3 Posted by [john](#) on 9 Apr 2007, 8:00 a.m.,

*in response to message #2 by hugh steers*

HP gave the museum permission to distribute the old manuals in PDF format.

Did you receive such permission? Karl wondered below if you bought a museum DVD and put the manual online from it.

So, this new project might not be legit either. Unless you have HP's permission, of course.

### **Re: HP-15C Documentation Project.**

*Message #4 Posted by [Namir](#) on 9 Apr 2007, 9:57 a.m.,  
in response to message #1 by Chris W*

Chris,

I concur with the other messages about possible copyright violation. You can avoid the entire issue by simply writing a new manual in your very own words and using your own examples and graphics. You and only you will be the copyright holder of your own manual. No one will bother you then. If you are a true HP-15C admirer, then writing a new manual should be a true labor of love and a wonderful project to execute.

Namir

### Adding a crystal to my HP-45

Message #1 Posted by [Dan W.](#) on 7 Apr 2007, 12:52 p.m.

I might be some years behind the times, and the last on the planet to perform this mod, but I'd like to add a crystal to my HP-45. Anyone know where I can find a 784 kHz crystal?

Thanks, -- Dan

### Re: Adding a crystal to my HP-45

Message #2 Posted by [Gerson W. Barbosa](#) on 7 Apr 2007, 1:25 p.m.,  
in response to message #1 by Dan W.

Quote:

I might be some years behind the times, and the last on the planet to perform this mod,

You can bet you are not the last one! I have a good-looking HP-45. I like neither the initial FIX 2 display mode nor the automatic changing to SCI mode but I like the timer feature and might try the mod myself. I hope the crystal can be found in any electronic warehouse. Crystals can be found in cheap digital clocks or clock-calculators made in China (I don't know what their typical frequencies are). I was not intending to open mine, but since one of the decimal points don't light up I might check it out.

Regards,

Gerson.

### Re: Adding a crystal to my HP-45

Message #3 Posted by [Dan W.](#) on 8 Apr 2007, 11:52 a.m.,  
in response to message #2 by Gerson W. Barbosa

I've checked the usual sources: Digikey, Mouser, Jameco, All Electronics, but no luck. You might be on to something - taking apart some cheap device - but what else might use this frequency?

### Re: Adding a crystal to my HP-45

Message #4 Posted by [Richard Ottosen](#) on 8 Apr 2007, 12:26 p.m.,  
in response to message #3 by Dan W.

I also looked in Digi-Key and Mouser. The closest I came was some ceramic resonators at 800 KHz. These would most likely run the calculator correctly, however, this frequency is not accurate enough for time keeping.

None of the programmable crystal oscillators I looked at were specified for less than 1 MHz.

Another possibility is to run a crystal at an overtone. I saw some 153 KHz crystals. If you ran one of

these at the 5th (4th?) overtone then you would get 765 KHz. Again, the calculator would work but not for time keeping.

*Message #6 Posted by [John Limpert](#) on 8 Apr 2007, 4:13 p.m.,  
in response to message #1 by Dan W.*

I would go to a vendor like International Crystal Manufacturing Company (<http://www.icmfg.com>). I've used them when I needed crystals for amateur radio equipment. The problem is providing all of the specifications needed for them to make your crystal. Besides frequency, they need to know the cut, package, fundamental or overtone, accuracy, and probably other things that I don't remember.

**Re: Adding a crystal to my HP-45**

### HP 32E & 37E

Message #1 Posted by [Peter K Mueller](#) on 6 Apr 2007, 5:55 p.m.

I need help to replace the batteries or do something given I still have the chargers for each. Apparently it's not simple to do, so I would appreciate information on contacts who could do it for me.

### Re: HP 32E & 37E

Message #2 Posted by [Les Wright](#) on 6 Apr 2007, 9:23 p.m.,  
in response to message #1 by [Peter K Mueller](#)

Purists caution against it, but in both of my Spices I use AA NiMH batteries held together with a little tape and an aluminum foil jumper completing the circuit on the right side (when you look at the bottom of the calc, top end up, cover off). The nipples on the ends add length vs. the original NiCads so that the fit is snug. If you can find AA NiMHs with a recessed tip they may be a better choice, but frankly I could never really be bothered. In my 33C the lower contact was broken off but enough of a stub remains to contact the battery end.

The original Spice battery pack is basically a metal sheath tha exposes the ends on the left and completes the circuit on the right. It has the polarity marked on it. The calc itself does not, so when inserting my self made pac I have to remember "negative upper left", lest reverse polarity will clear the memory.

NiMH's take a goodly time to charge with the Spice adapter, but they last forever--I had my 34C run an endless loop program at FIX 9 for well over 30 hours before it died using 2000 mAH cells.

### Program Loss in HP-33S

Message #1 Posted by [Ed Look](#) on 6 Apr 2007, 4:47 p.m.

I went to use a program in my 33S just about a hour ago and I found all my stored programs gone!

I am quite certain I did not erase them and I cannot imagine any accidental keypresses that would do that.

Has anyone had this happen? (Does anyone have an explanation??)

### Re: Program Loss in HP-33S

Message #2 Posted by [John](#) on 6 Apr 2007, 4:53 p.m.,  
in response to message #1 by Ed Look

Electronic devices can have many things happen to them.

A stray gamma ray might hit the one bit of memory it uses as a cold start constant.

The battery power may have been interrupted unbeknownst to you and cleared ram.

If you have two 33S calculators, you may have picked up the clear one. (Being hopeful here).

But really, anything that relies upon battery power always runs the risk of memory clear. That's why offline storage or flash memory is so important.

### Re: Program Loss in HP-33S

Message #3 Posted by [Palmer O. Hanson, Jr.](#) on 6 Apr 2007, 10:09 p.m.,  
in response to message #1 by Ed Look

I lost memory in the first of my 33s machines by failing to see the battery annunciator which is easy to overlook because it is small and tucked up in the upper right corner of the display. I also failed to recognize that when the battery power is very low I would find that the machine may shut itself off but I could immediately start it back up and run for a short period of time. I think that this is a manifestation of the old characteristic where a battery recovers somewhat when it is off.

I also failed to see the annunciator when the battery power was low with my second machine. Fortunately, I also saw the self shut-off feature and remembered that it was time to replace the batteries.

Page A-2 of the manual states "... if the battery annunciator is on, and the display dims, you may lose data. ..." It may be that what I saw as a self shutoff was only a dimming of the display. but I returned the machines to operating condition for a short time by pressing ON.

### Re: Program Loss in HP-33S

Message #4 Posted by [Ed Look](#) on 9 Apr 2007, 10:21 p.m.,  
in response to message #3 by Palmer O. Hanson, Jr.

Thanks for your replies, John and Palmer.

I suppose the RAM clear must have happened when I was not looking. I have this habit of leaving the calculator on to turn itself off after I am through with it for a while... to save the keyboard from "undue" wear and tear.

Perhaps it may be better just to switch it off as soon as I am done with it, to reduce chances of something bad happening because it is still powered on.

Oh, and the batteries, I believe, are still good.

**82240 Printer Specs**

Message #1 Posted by [Joe Avins](#) on 6 Apr 2007, 12:46 p.m.

I'm interested in programming my PDA to print to an 82240 printer that I still have (even though the 42S I bought it for is long gone, the victim of a stolen brief case.) So, obviously, I need to know it's language, i.e. the message format for the IR transmissions to it.

If anybody has this data, or knows where to get it, please email me.

Thanks for your help.

### HP Classic Battery - Pac parts

Message #1 Posted by [Don Shaffer](#) on 5 Apr 2007, 1:11 p.m.

I finally have produced new battery pack covers for the type 82001 classic battery. Anyone interested in these should contact me at my email for added info. I will be offering covers for \$7.50 a set plus \$0.50 S&H and Ohio sales tax. Complete battery's should soon also be ready. I expect to have both a NiCd 1000 mAH and NiMH 1300 mAH version. Also covers available in standard black, red, green, blue, brown colors.

### **Re: Normally I'd agree, but...**

*Message #7 Posted by [Don Shaffer](#) on 6 Apr 2007, 10:51 a.m.,  
in response to message #6 by Dave Hicks*

Actually I got this crazy idea to try to make the Classic batterys back in 2004. It has been an interesting trip to get to today. I had to learn many new skills and purchase/build machinery. I can post some photos once I figure out how to download them. I'll need to get Dave to give me some help. I had been interested in the HP calculators since they first came out. My first machine was one of the hP-65's. One of my old friends Dean Lampman was one of the first persons outside of HP to actually see the HP-65 before it was released. He worked on making the first user pacs for machine design, and math and others. I can write up the story on how I got to make the covers, I guess to add to the museum.

### **Re: Normally I'd agree, but...**

*Message #8 Posted by [Dave Hicks](#) on 6 Apr 2007, 2:33 p.m.,  
in response to message #7 by Don Shaffer*

You can email the pictures and I can place them on-line, or you can create a forum account (click on "Login / Accounts" at the top right of the forum index) and email me that you've done that. Then I can set your account to allow picture uploads.

Either way, once they have been uploaded, you can then write up the article and click on the Image button or just refer to them like this:

For example, typing:

would produce:

Raymond

### Re: Article that finds inspiration in the PPC ROM

Message #3 Posted by [Jake Schwartz](#) on 5 Apr 2007, 12:09 p.m.,  
in response to message #1 by Frank Wales

It's interesting that the author chose to single out Bill Wickes, apparently due to his forward in the PPC ROM manual, and not Richard Nelson without whom the whole project wouldn't have even been conceived.

Jake Schwartz (PPC Member #1820 / PPC ROM Peripheral-Routines Coordinator)

### Re: Article that finds inspiration in the PPC ROM

Message #4 Posted by [Namir](#) on 5 Apr 2007, 9:28 p.m.,  
in response to message #3 by Jake Schwartz

Jake,

I agree. Richard played an important role. Many folks, like yourself, made valuable contributions. It was definitely a community effort.

The PPC-ROM came to be in a time where we had no email, no web pages to post material on, and so on.

If we ask HP to bring any machine back into production, it should be the HP41C. HP should include new modules, like one that is an SD card reader!!!

Namir

“.....“PPC ROM”that plugs into an HP personal computer that is now 25 years obsolete called an HP-41.”  
more like 40 years ahead of it’s time.

**Re: i beg to differ**

*Message #6 Posted by [Garth Wilson](#) on 5 Apr 2007, 4:06 p.m.,  
in response to message #5 by db*

In all the modules they mentioned, they did not include the HPIL or EXT I/O, which were my reasons for getting a 41. Previously I had a programmable calculator; but it couldn't control any of the lab instrumentation on the workbench. Their narrow consumer view of hand-held devices is what makes them fail to recognize the value of the 41. I'm glad they're drawing attention to community development however.

### HP 15C problem

Message #1 Posted by [Tom Handy](#) on 4 Apr 2007, 4:43 p.m.

Help! My calculator will only give answers to trig problems in radians. No matter what the mode is. Also, there is a small "C" in the lower right quadrant. ~?

Thanx, I hope.

Tom

### Re: HP 15C problem

Message #2 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 4 Apr 2007, 4:56 p.m.,  
in response to message #1 by Tom Handy

Hi;

your HP15C is set to work with complex numbers ( $x+iy$ ), and in this mode it 'understands' angles in radians, only.

Please, locate the [CF] inscription in blue, in the slanted face of the [5] key. Now press:

[g] [CF] 8

This should bring your HP15C to real-mode operation.

Cheers.

Luiz (Brazil)

*Edited: 9 Apr 2007, 3:22 p.m.*

Quote:

\_\_\_\_\_  
Also, there is a small "C" in the lower right quadrant.  
\_\_\_\_\_

The calculator is in complex mode. Press [g] [CF] [8] to leave this mode, in case you haven't done this yet.

Gerson.

### Re: HP 15C problem

Message #4 Posted by **bill platt** on 4 Apr 2007, 6:06 p.m.,  
in response to message #3 by Gerson W. Barbosa

two simultaneous answers---and both from Brasil no less!

### Re: HP 15C problem (trigs in "C" mode)

Message #5 Posted by **Karl Schneider** on 5 Apr 2007, 12:02 a.m.,  
in response to message #1 by Tom Handy

Tom --

Gerson and Luiz have already answered the question, and provided the remedy. I don't know if you have a manual, but a PDF scan can be purchased on a CD or DVD for a nominal price from this website. A print copy on eBay will cost US\$25-35.

Flag 8 set puts the calculator in "Complex mode", in which the input arguments and output results are complex-valued where applicable. It's one of the few things that are not very intuitive on the HP-15C. Flag 8 is testable, allowing user programs to account for results in real and complex mode. Other mode settings -- such as angular measure (DEG/RAD/GRD) or display (FIX/SCI/ENG) -- are not testable on the HP-15C.

So, why is radians mode enforced when Complex mode is set?

Answer: Trigonometric functions are mathematically defined for complex-valued arguments. Their formulae that involve hyperbolic functions, whose arguments must be dimensionless and unscaled (as radians are). For example:

$$\begin{aligned}\sin(a + ib) &= (\sin a)(\cos ib) + (\cos a)(\sin ib) \\ &= (\sin a)(\cosh b) + i(\cos a)(\sinh b)\end{aligned}$$

$$\begin{aligned}\cos(a + ib) &= (\cos a)(\cos ib) - (\sin a)(\sin ib) \\ &= (\cos a)(\cosh b) - i(\sin a)(\sinh b)\end{aligned}$$

Obviously, with  $b = 0$ , sine or cosine in complex mode (or these expressions) will produce results identical to sine or cosine in real mode with input in radians, but will take longer to execute.

### Re: HP 15C problem (trigs in "C" mode)

Message #6 Posted by **David Jedelsky** on 8 Apr 2007, 3:24 p.m.,  
in response to message #5 by Karl Schneider

Hi, I spotted scanned pdf manuals for 15c on <http://hp15c.org/about.php>

The 'Owner's Handbook' is hidden under button before 'Documentation' line and the 'Advanced Functions Handbook' under dot at the end of this line.

### Re: HP 15C problem (trigs in "C" mode)

Message #7 Posted by **Karl Schneider** on 8 Apr 2007, 10:22 p.m.,  
in response to message #6 by David Jedelsky

Hello,

Quote:

Hi, I spotted scanned pdf manuals for 15c on ...

Yes, I was aware of the availability of the manuals at that site. I didn't want to advertise it. That site host probably bought one copy of CD #1 from MoHPC, then made the manuals freely available to the world without permission to redistribute. There is certainly a reasons that the links are so (*ahem*) "subtle". It probably steals sales of MoHPC CD's and DVD's.

The issue was discussed a few months ago:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=102707#102707>

-- KS

### Re: HP 15C problem (trigs in "C" mode)

Message #8 Posted by [David Jedelsky](#) on 9 Apr 2007, 3:08 p.m.,  
in response to message #7 by Karl Schneider

Hi, I didn't know about that discussion and I found the page and pdf files accidentally when I was looking for other stuff. When I found that, I didn't notice any signs inside those files that it could belong to MoHPC CD's and DVD's. When you look inside those files you can hardly expect that it is based on work that somebody want to protect (even if such information was removed from the original files). Moreover, Tom apparently owns the calculator, therefore I didn't expect any reason why he shouldn't download those files. So, you can expect that somebody time to time will post this link with the best intention to help also in the future. Just because there is no way how to spot it could be problematic. If somebody takes it as problem he definitely should solve it with the owner of the site and not with anybody else.

Best Regards,

David

### Re: HP 15C problem (trigs in "C" mode)

Message #9 Posted by [Dave Hicks](#) on 9 Apr 2007, 3:30 p.m.,  
in response to message #8 by David Jedelsky

I've tried to avoid the issue because I thought Chris' heart was in the right place with wanting to bring back the HP-15C and all, but it is growing into an issue. It also appears to be becoming an issue at the HP level. The current calculator team recently asked me to show them the permission I received from an earlier team. When I was at HP recently, someone told me that they would like to clean up a lot of infringement on the net but they don't want to take down a lot of "good" sites with the "bad" sites.

For future reference, for the last 30 years or so, it hasn't been necessary to mark anything as copyrighted. This is the default. Instead you should look for a statement of the work being in the public domain etc. (This isn't meant to imply that you did something bad - just an FYI.)

*Edited: 9 Apr 2007, 3:59 p.m.*

### manuals

Message #10 Posted by [bill platt](#) on 10 Apr 2007, 12:12 p.m.,

*in response to message #9 by Dave Hicks*

When I bought a used 15c some years ago, it came with a CD with the whole manual scanned. Each page was a separate PDF file with rather low resolution and the pages were often skewed. I put part of it together and when I lent my 15c to Ben, I sent a copy of that manual along. I don't think it was the same scan as MoHPC. So perhaps there are a number of scans out there?

**Re: manuals**

*Message #11 Posted by [Dave Hicks](#) on 10 Apr 2007, 12:29 p.m.,*

*in response to message #10 by bill platt*

Yeah I bought some software from a major company on ebay recently and it came on a CD-R with an ink-jet printed label. Even after I questioned that, the seller claimed it was a legit "Corporate Disk". The software maker said it wasn't. The seller was happy to let me return it, so I did and it bounced back because his street address didn't exist. That account was closed down but I'll bet he has another one by now.

There's lots of stuff going on.

### Printing, Docs, HP 50G

Message #1 Posted by [Kevin Doyle](#) on 4 Apr 2007, 12:03 a.m.

Hi all,

Back into the HP calculator world after many years away, 3 kids in math courses and I want to get them to enjoy HP calcs like I did. Owned the 25C, 67/97, and the 41 system, tape drive, printer, wand reader, etc. Loved them, loved RPN, and always enjoyed working through that great HP colloquial documentation in those great, spiral bound books.

Bought a 50G about a week ago, and it is impressive. Gotta say I do miss the old beveled keys, but there is so much capability...unfortunately, not a useful manual however. The little book, and the pdf, are like reading stereo instructions, and bear no resemblance to the inspirational docs of my youth. Maybe those talented writers are still out there. Any suggestions on some cool 3rd party books?

I also picked up a 82240B printer to have mobile hardcopy output at school. Only problem is the calc does not seem to have the old trace modes to send work to the printer automatically as you work through the calculation, like the 97 or the 41C. Is this something you have to program...or am I just missing some simple flag to set in this mountain of functions? Any help would be appreciated...I am really feeling like a newbie here.

Thanks in advance...

### Re: Printing, Docs, HP 50G

in response to message #1 by Kevin Doyle

Hi Kevin.

Talking about docs, I think that as far as RPL programming is concerned you can certainly use either the \*good old\* 48 Series documentation or the HP49G Advanced User Reference Guide, that is available (of course :-)) at [hpcalc.org](http://hpcalc.org):

<http://www.hpcalc.org/hp49/docs/misc/hp49gpaur.zip>

If you're specifically looking for third-party books, then

I'd suggest Thomas Barber's recent book "The Definitive User's Guide to the HP48g/49g/50g Calculators", available at

<http://www.samsoncables.com/>

Last but not least, please get back to my quoting of [hpcal.org](http://hpcal.org) - it is \*the\* ultimate source for tutorials and programs for the 48/49/50 series.

Hope this helps.

Best regards.

Giancarlo

## Re: Printing, Docs, HP 50G

Message #3 Posted by [Jeff Kearns](#) on 5 Apr 2007, 2:27 p.m.,  
in response to message #2 by Giancarlo (Italy)

Hi Kevin,

You may also wish to visit the following link for some great resources for the 50G:

[http://www.engineering.usu.edu/cee/faculty/gurro/Software\\_Calculators/HP48\\_49G\\_Docs/HP50G+.html](http://www.engineering.usu.edu/cee/faculty/gurro/Software_Calculators/HP48_49G_Docs/HP50G+.html)

This site is maintained by Gilberto E. Urroz, Ph.D., P.E., an Associate Professor at Utah State University. The site has a wealth of info and additional links. He also published a two volume set entitled: "Science and Engineering Mathematics with the hp 49 g". A worthwhile purchase.

The HP website also has tutorials on many of the features of the 50G.

<http://h20331.www2.hp.com/Hpsub/cache/383692-0-0-225-121.html>

Enjoy,

Jeff

Message #4 Posted by [James M. Prange \(Michigan\)](#) on 5 Apr 2007, 5:48 p.m.,  
in response to message #1 by Kevin Doyle

The "print trace" modes aren't built-in on the 48 and 49 series, but you can accomplish much the same using vectored ENTER to customize the calculators. See [this thread](#) for much more information on the printers and vectored ENTER.

Regards,  
James

### **Programming of CMT EPROMS for 71b**

*Message #1 Posted by [PeterP](#) on 3 Apr 2007, 10:22 p.m.*

Hi, as I miraculously (?spelling) acquired recently a few CMT EMPROMS with some content I could not care less about, I was wondering if there is anyone in our community who has the ability tp program those EPROMS with more useful roms (MATH, JPC, FINANCE, CURVE FIT etc).

If so, I'd be super happy to hear from them to arrange for some kind of deal of interest to them.

Thanks so much in advance!

Peter (PS you can reach me at ppl4worl AT yahoo DOT com)

### **Re: Programming of CMT EPROMS for 71b**

*Message #2 Posted by [Raymond Del Tondo](#) on 4 Apr 2007, 12:31 a.m.,

### hp50g programs

Message #1 Posted by [Daniel Ripley](#) on 3 Apr 2007, 8:13 p.m.

hello, just purchased a hp50g and im having a lil difficulty getting used to it, just wondering firstly if 49 series programs are compatible with the 50 g, Ive tried to download a couple progams and couldnt get them to work, also is there an easier way to convert decimals to minutes and seconds without typing in "->hms\_" thanks

### Re: hp50g programs

Message #2 Posted by [Gene](#) on 3 Apr 2007, 9:07 p.m.,  
in response to message #1 by Daniel Ripley

Yes, many/most HP49g+ programs work just fine on the 50g.

You can assign the HMS functions to keys in USER mode and access them fairly quickly.

The HP50g webpage found at HP's site [www.hp.com/calculators](http://www.hp.com/calculators) has over 50 learning modules that show how to use your new 50g. One of these covers customization including the USER keyboard and CUSTOM menu.

More software can be found at [www.hpcalc.org](http://www.hpcalc.org)

You can also get lots of HP50g specific answers on the usenet newsgroup [comp.sys.hp48](mailto:comp.sys.hp48) which you can access through [groups.google.com](http://groups.google.com) or some other usenet portal.

### Re: hp50g programs

Message #3 Posted by [dbatiz](#) on 3 Apr 2007, 9:28 p.m.,  
in response to message #1 by Daniel Ripley

Converting in and out of HMS can be found in the TIME then TOOLS menu. I recommend having Soft MENU checked (flag 117). That way, once you activate the TIME (Right Shift then 9) then TOOLS menu, your softkeys will make HMS calculations a snap.

Good luck,

Very Respectfully,

David

Message #4 Posted by [daniel ripley](#) on 5 Apr 2007, 6:52 p.m.,  
in response to message #3 by dbatiz

thanks heaps guys, much appreciated, ahh just quickly is there any program that anyone can recommend for solving of triangles?

### Re: hp50g programs

Message #5 Posted by [Daniel Ripley](#) on 5 Apr 2007, 8:07 p.m.,  
in response to message #4 by daniel ripley

ok this is probably another annoying question but i just dont know how to get programs running on my calc, was this hard for anyone else the first time?? ive tried to install these two progs [TrigLib.zip](#)

and

[Triangle Sides](#) any help perhaps a kinda step by step thing would be appreciated, im trying to use to hp50g, thanks again

### Re: hp50g programs

Message #6 Posted by [dbatiz](#) on 6 Apr 2007, 7:29 a.m.,  
in response to message #5 by Daniel Ripley

I'm still learning how to make things happen in the 50g myself, but I hope this helps. Any comments from more seasoned people are definately welcome.

There is a difference between a "Program" and a "Library". One of the apps you are trying to install is a library. I got the following instructions from the Stat49 Pro package available from HPCalc.org:

Quote:

To install the library to port 0: (a similar procedure applies for port 1 or 2)

- a) Remove possible older version with :0:1043 PURGE
- b) Download the library to your HP49
- c) Recall the library to the stack and purge the variable created by the download procedure.
- d) Type 0 STO
- e) Press ON-C

In step a) above to remove the library once it's not longer needed. The library number will be different :0:XXXX.

I hope this helps get the trig library up and running. The other program, I'm not sure.

Good Luck,

Very respectfully,

David

**Re: hp50g programs**

Message #7 Posted by **Dan Ripley** on 14 Apr 2007, 7:09 a.m.,  
in response to message #6 by dbatiz

this calculator will be the death of me, now ive no idea which programs i should have on there and which programs or libraries i can or should take off, i still can get these libraries to work and now most importantly i think ive deleted the factory equation library,

**Re: hp50g programs**

Message #8 Posted by **Christoph Widmer** on 15 Apr 2007, 12:01 p.m.,  
in response to message #7 by Dan Ripley

Dan, if you have deleted the equation libraries, you can get them from HP from the ROM Upgrade page :  
<http://h20000.www2.hp.com/bizsupport/TechSupport/SoftwareIndex.jsp?lang=en&cc=us&prodNameId=3235174&prodTypeId=215348&prodSeriesId=3235173&swLang=8&taskId=135&swEnvOID=228>

and follow the instructions in the readme enclosed in the zip-file.

Sorry to hear the 50g is giving you difficulties. It is a complex piece of equipment but can really do unbelievably many things. My best advice is to take your time to work through the user's guide and do work through the HP tutorials here:  
<http://h20331.www2.hp.com/Hpsub/cache/383680-0-0-225-121.html>

Good luck and kind regards. Chris.

Will we ever see that again? If true, I'll buy two.

### **Ergonomic button shapes and arrangements**

*Message #7 Posted by **Karl Schneider** on 4 Apr 2007, 11:33 p.m.,  
in response to message #5 by Hal Bitton*

Hi, Hal --

Quote:

And while we're at it, lets dispense with the silly little round buttons on the 50G. You could put 6 proper keys into the space occupied by those 4 buttons...

Ah, like "cursor arrows" on PC keyboards and the original HP-48S/G series are. The probable reason for arranging these four keys in a "baseball diamond" square is improved correspondence between location and direction.

Now, as for round buttons:

Has everyone noticed how the "virtual buttons" on web-browser software -- particularly MS Internet Explorer (IE) -- keep getting goofier with every version? The ideal shape for virtual buttons is the square, because that shape makes it easiest to "land" the mouse pointer within it. The original Netscape (and Mosaic?) browsers displayed big square virtual buttons with clear borders in a row.

Then, MS used rectangular buttons just to be different, and perhaps to flatten toolbars. Netscape followed suit.

With IE v7.0, it's just bizarre: Two round buttons for forward and backward, and tiny square buttons for other functions scattered all over the place. I'm sure that it can be configured, but I haven't made the effort yet.

How about *physical* buttons? The ideal was probably the solidly-built, conventional American "Bell System" telephones: Square shape for conspicuity and neatness, with curved indentations to fit the fingertip, and only one direction of motion. Perfect function with a clean form.

Today, the free market provides cheaply-made telephones with buttons of all manner of weird shapes and sizes. Yet again, marketing trumps engineering.

Yet again, marketing trumps engineering.

Well maybe there is a light glowing at the end of the tunnel where engineering, marketing and ergonomic design finally meet:

The "Optimus keyboard" of Art Lebedev: <http://www.artlebedev.com/everything/optimus-concept/>

Just imagine a pocket calculator with a 5 by 6 (or 7 or 8 or whatever) rectangular arrangement of lcd-capped, large, square keys that can be labelled just as every user likes them best!

Greetings, Max

**Re: Ergonomic button shapes and arrangements**

Message #10 Posted by [Walter B](#) on 5 Apr 2007, 5:07 p.m.,  
in response to message #9 by Maximilian Hohmann

Very nice idea! Let's hope it will become reality. Personally, I see its application in custom keyboards for appliances with mains connector, not in battery powered small devices (so far). It may even overload (well, what's the opposite? Overdrain??) a notebook. But every progress in this matter is most welcome!

**Re: Ergonomic button shapes and arrangements**

Message #11 Posted by [Eric Smith](#) on 6 Apr 2007, 2:51 a.m.,  
in response to message #9 by Maximilian Hohmann

Quote:

---

Just imagine a pocket calculator with a 5 by 6 (or 7 or 8 or whatever) rectangular arrangement of lcd-capped, large, square keys that can be labelled just as every user likes them best!

---

Just imagine a \$1500 (MSRP) calculator with terrible battery life.

Maybe someday technological advances will reduce the cost enough to make it practical, but it's not likely to happen within the next 10-15 years. Those buttons are very expensive to make, and there's no obvious way to bring that cost down by more than a factor of two or thereabouts.

### Another MLDL2000 Update

Message #1 Posted by [Meindert Kuipers](#) on 3 Apr 2007, 3:12 p.m.

The following message was sent out today via email to my current mailing list of MLDL2000 users and those who have expressed their interest in obtaining one. If you did not receive this message and still want to be (or if you think you should be) on the waiting list, please contact me by email. Please note that being on the waiting list is NOT a commitment to buy one.

Best regards, Meindert

As you may have read in the MoHPC forum, a new version is being developed, and all 3 PCB's are undergoing revision to fix some design errors and add new features. For current users it is important to understand that their MLDL2000 has these issues already fixed with wires and other workarounds, and that all new features (with one exception) are also still possible without additional purchases.

The biggest change in the MLDL2000V2 will be the USB interface. This will have an additional USB host port that can be used for connecting a USB Mass Storage Medium (like a USB Stick). This should enable the use of the USB stick to store programs and files. With another user I am currently investigating the possibility to create a special ROM image to support this. The new USB interface could be used to replace the old one if you want this additional feature.

For new users the MLDL2000V2 will consist of 3 PCB's that will fit in a cardreader shell. Since I do not have any more of these left, you may have to sacrifice your own cardreader, or get an old one at eBay. As an alternative, I will make an extra PCB that will carry the 3 main PCB's for ease of interconnecting. This will make it very easy to put the MLDL2000V2 in an external box approximately the size of the HP41.

I do not know the exact pricing yet, and I suspect that the MLDL2000V2 will be a bit more expensive. As soon as I have more details I will let you know of course.

There is no time schedule. Right now I am finishing a critical piece of software for the M2kM software on the PC that turned out to be more complicated than I expected, and I cannot spend all my spare time on this. This software will allow upgrading the MLDL2000 firmware, which is required for any of the new functionalities to be programmed in the field by the user. The next step will be to verify in a hardware breadboard, firmware and software the functionality of the new USB Host interface and the other modifications before finalizing the new PCB's. At that point I will ask you to commit (or not) to purchase your MLDL2000V2 or upgrade. Based on the final quantity I can then give you the final price and production will start. The PCB design is done in draft already, I just need to verify if I have done it right this time.

**48GX button is stuck**

Message #1 Posted by [Natan Samuels](#) on 3 Apr 2007, 12:37 p.m.

My professor and I were crunching some numbers, he hit the "+" key, and it got stuck in the down position. Does anyone know how to remedy this situation?

**Re: 48GX button is stuck**

Message #2 Posted by [Dave Boyd](#) on 3 Apr 2007, 2:13 p.m.,  
in response to message #1 by [Natan Samuels](#)

Quote:

My professor and I were crunching some numbers, he hit the "+" key, and it got stuck in the down position. Does anyone know how to remedy this situation?

Since I lack anything useful to say, I'll just note, in passing, that this is why it's better to "massage" the numbers than to "crunch" them.

Ask any statistician.

**Re: 48GX button is stuck**

Message #3 Posted by [Natan Samuels](#) on 3 Apr 2007, 11:12 p.m.,

Yeah, that was a pretty useless comment, Dave.

**Re: 48GX button is stuck**

Message #4 Posted by [Jeff O.](#) on 4 Apr 2007, 8:02 a.m.,  
in response to message #1 by [Natan Samuels](#)

Not sure if this will be much more useful than Dave's comment, but, since none of the experts have chimed in, I'll tell you what I know.

The hp48 keyboard is formed as bunch of domes in a plastic sheet. When you press a key, the dome below it collapses and a conductive coating on the bottom of the dome makes contact with a circuit below. It sounds like you have a permanently collapsed dome, which is most likely not repairable. If you want to try, a detailed

description of how to open the 48 can be found by clicking on [this link](#). For repair tips and a description of keyboard construction, click [here](#).

Or maybe the key is just stuck down with some gunk, in which case rinsing and/or ultrasonic cleaning with distilled water has been discussed here a few times in the past, search the archives.

### **Re: 48GX button is stuck**

*Message #5 Posted by [Massimo Gnerucci \(Italy\)](#) on 4 Apr 2007, 1:49 p.m.,  
in response to message #1 by Natan Samuels*

A couple of months back I got a 48GX which had an **ON** key stuck down and I was not able to move it whatsoever.

Later I noticed that the metal bezel around this key was a little loose and bent up so I managed to push it down while playing with the key and then it was finally free.

The glue under the lower left corner of the bezel was probably gone... Since the + key is in the lower right corner you could check for a similar problem.

Just my 2¢

Greetings,  
Massimo

in response to message #5 by Massimo Gnerucci (Italy)*

Thanks so much, Jeff, Massimo, and Ron. You gave a lot of great tips and I'll probably try out some of the less-complicated ones this weekend. Hopefully, just the metal is off-center!

Natan

### **Re: 48GX button is stuck**

*Message #8 Posted by [Natan Samuels](#) on 6 Apr 2007, 3:57 p.m.,  
in response to message #1 by Natan Samuels*

The problem was indeed the metal bezel holding down the bottom of the "+" button. I'm trying to think exactly how that could have happened. Maybe the calc got shifted around in a funny way in my bookbag (even though I always keeping it in the case - with the quick guide inside facing the keys for extra protection). Here's what's bothering me: I lifted up the lower right corner of the bezel to unstick the key - which worked. However, replacing the bezel sticks the key again. Must I therefore always leave the corner sticking up? Mind you, it sticks up enough only to be level with the plastic shell, but that condition seems like it might lend itself to some other problem down the road. Nonetheless, I'm happy to have my calc working again without spending any money, and a very small amount of time!

By the way: This is a minute point, but my calc is a 48SX, not a GX.

## **Re: 48GX button is stuck**

*Message #9 Posted by [Randy](#) on 6 Apr 2007, 4:23 p.m.,  
in response to message #8 by Natan Samuels*

Trying to pull the metal back down generally ends in disaster. I've found you can carefully shave the metal away at the bottom to enlarge the opening. A new #11 X-Acto blade works well but you must do this with the plate lifted away from the calculator and be *\*very\** careful not to allow the blade to go past the metal and hit the key. If you hit the key hinge at the bottom (which is obscured by the plate), the + key will become loose and eventually you'll end up with a dead, non-repairable calculator. You also need to keep the shavings out of the keyboard. It takes a steady hand.

The usual cause for the damage is from the calculator having been dropped on the corner. SX's and GX's are for almost all purposes, identical, at least mechanically.

### 12c serial number oddity?

Message #1 Posted by [Morgan](#) on 2 Apr 2007, 2:33 p.m.

I've read the explanation of the serial numbers for both the "old" style formatting and the newer formatting. I looked on the back of my 12c (purchased approx. 18 months ago) and found the serial number: CNC51207503. I know the CN refers to china, the 05 to 2005...etc. What does the second "C" refer to? I haven't been able to figure this out. All the other examples I've seen only have two letters.

### Re: 12c serial number oddity?

Message #2 Posted by [Gene](#) on 2 Apr 2007, 2:41 p.m.,  
in response to message #1 by Morgan

Most I have start with CNA...

The CN is China, while I believe the 3rd letter is a plant location or some such.

I have not seen a China unit made in the last 3 years or so without a third letter.

Gene

in response to message #1 by Gene

I think I can say I've been filmed. I signed an NDA but didn't get a copy, so I'm assuming I can say that much.

However, after getting up at 2 AM and being filmed at 11AM and not getting any food in between, I have no idea if they got any sentences out of me that made any sense. I was going to eat at the airport but then the flight reservation got lost and there were complications because I'm on the No Fly list and am not allowed to make reservations right before flight... Oh boy. It's all a blur.

It was fun though!

"because I'm on the No Fly list"

You've got the same name as the Australian guy they held in Gitmo for four years and just convicted of something for which he got a several month sentence - to be served in Australia, I think.

Maybe when he goes home, you'll be cleared (let's hope so).

In the meantime, you could try some of us as character witnesses, but that would probably get you into MORE trouble!!

Well, I've been on the list for the last 5 years, while he was locked up in what is probably the most secure prison in the world, so I'm not holding my breath that sending him home is going to get "me" off the list ;-)

Not a chance. They put captured and dead suspects on the list. But it is well documented that many suspects that are at large are not put on the list in order to avoid tipping them off. In other words, the no-fly list is completely bloody useless BY DESIGN. It wastes our money and harasses the innocent, while doing not a damn thing to actually capture terrorists or prevent them from attacking.

You think that's useless... I had a package shipped to me overnight from England via DHL (avoid these scum like the plague). They called (yes indeed, it was actually DHL) a week later and said that if I wanted the package they needed a copy of my social security card and last years income tax forms! Why, Homeland Insecurity required it. Yeah, right. I told them to go suck eggs and ship the item back to England. My friend then popped it into Royal Mail and two days later it was sitting on my doorstep with nary a signature.

Any bad guy would have just photoshopped a SS card and used Turbo Tax to crank out a tax form. All this BS from DHL/Homeland Insecurity just opens honest people up to massive identity theft.

A few years ago I was told that my HP Museum bank account was no longer "Patriot Act Compatible" and that I needed to open a new one. That took 13 months. Why? Because part of the new "Patriot Act Compatible" bank account is answering questions such as: Where do you ship products? My answer was "everywhere". No, they needed a specific list. This was done in the bank and I'm supposed to list countries I've shipped to from memory. I barely pay attention to where I ship! Someone puts it on the order form and the Postal System takes care of the rest!

That wasn't good enough so the bank guy reads me a list and asks me to say yes or no to each. He reads: Afghanistan. Me: "yes". Him: "Really???" Me: "Yes. During the invasion I received several orders from the military and military contractors. That should be a good thing - right?" Um... Nope.... The "Patriot Act Compatible" interview process only accepts a list of countries. No reasons are provided...

There's an Australian kid named David Hicks who was captured during the initial invasion of Afghanistan and put in Guantanamo Bay. They put him on the list just in case he escaped from Guantanamo Bay, stole back his passport. (which I'm sure is kept no where near him.) made his way to the US and then booked a flight under his own name. All before anyone noticed that he was missing from an army prison camp. That never seemed like a very likely scenario to me.

All I know about the other David Hicks is from an Australian movie: "The President vs. David Hicks". From the movie, he appeared to be a mixed up kid that was searching for some cause to define himself. He tried to join the Australian army but was turned down. He went to Japan. Then he heard about people being oppressed in Bosnia so he went there and joined the US-supported Kosovo Liberation Army. Then, apparently he tried to become a Christian scholar and when that didn't work out, he tried Islam. Then he went to Pakistan to study Islam, and somehow ended up in Afghanistan. I'm sure terrorist groups would have loved to have a mixed up blond white kid on their side, but I don't know if he would have really been useful to them. He seems pretty flighty.

### [OT] C Programming and the 68HC11

Message #1 Posted by [Ken Ratkevich](#) on 2 Apr 2007, 7:29 a.m.

Greetings,

I know this is totally OT and I will delete it promptly if deemed innapropriate. However, I also know there are many code gurus and smart fellows that frequent this forum and that this is THE place to get a definitive answer.

I am currently involved in a home study course for my A.A.S degree in electronics. I am just finishing a module on the 68HC11 microcontroller. All programming up to this point has been assembly and machine code. But, at the very end, they stuck in a VERY brief intro to C programming and added a few questions in the exam concerning C programs for the 68HC11. I am having a problem with one very simple question. The question reads:

"Write a small program that will multiply the character variables X and Y if Y>X; otherwise it will perform an integer divide, X/Y."

My concern is that if I declare X and Y as "char" data types, the compiler will only RMB 1 for each. In this case, I think the IDIV instruction wont work properly because it fetches a 16 bit dividend and divisor. In either case I think I should declare Z (product or quotient) as "int" data type because bothe the MUL and IDIV instructions produce a 16 bit result. I am not sure how to handle this. Any help would be appreciated.

This is not cheating since this exam is open book and I am allowed to use "any resource" available.

Ken

Who cares? It's the compilers problem, not yours. If it can't use one instruction it will generate others that will give the correct result.

The whole point of using compilers and writing in C is so you don't have to worry about issues like these.

This function will work on any C compiler on any chip:

```
int doCalculation (char X, char Y){
if (Y>X) return X*Y; return X/Y;
```

```
}
```

### Re: [OT] C Programming and the 68HC11

Message #3 Posted by [Cameron Paine](#) on 2 Apr 2007, 9:16 a.m.,  
in response to message #2 by the person formerly known as dot

An observation, nothing more. The return value of your function will be widened to int. Depending on input values, this may result in an unintended side-effect. Perhaps this is one of those instances that aren't simply the compiler's problem.

Cameron

### Re: [OT] C Programming and the 68HC11

Message #4 Posted by [the person formerly known as dot](#) on 2 Apr 2007, 5:55 p.m.,  
in response to message #3 by Cameron Paine

That was intentional... which was why I made the function return int. The question didn't specify anything about the return value type.

### Re: [OT] C Programming and the 68HC11

Message #5 Posted by [Cameron Paine](#) on 2 Apr 2007, 9:07 a.m.,  
in response to message #1 by Ken Ratkevich

I'd take the former dot's response a little further: think of C as the target architecture that you're writing for. Knowledge of the actual platform is a distraction that should be ignored unless the problem you're trying to solve refuses to let it be. The question you ask is not such a problem; ejecting a char-sized object through an I/O port might be one that is.

An alternative solution:

```
return Y > X ? X * Y : X / Y;
```

Cameron

### Re: [OT] C Programming and the 68HC11

Message #6 Posted by [Ken Ratkevich](#) on 2 Apr 2007, 9:58 a.m.,  
in response to message #1 by Ken Ratkevich

Thanks to all for your input. You've both confirmed my assumption that it is the job of the compiler to generate the appropriate code for the target platform. I think I will like C (C++, C#) when I get to them in a more detailed lesson.

Ken

Message #7 Posted by [Alan Firth](#) on 2 Apr 2007, 1:15 p.m.,  
in response to message #6 by Ken Ratkevich

It may be a moot point to you, but if you get hooked by the microcontroller bug, check the Microchip website. They have a very good \*free\* development environment, and a 60-day evaluation of their C

compiler (the 'student version') for the '18' series chips. (The evaluation doesn't expire - it has slightly reduced functionality after 60 days)

Programmers are available from Microchip, as well as several other sources.

(I'm a 'Microchip jingoist')... not connected with them in any way.

*Message #8 Posted by [the person formerly known as dot](#) on 3 Apr 2007, 4:08 a.m.,  
in response to message #7 by Alan Firth*

PICs are OK, but I'd strongly recommend the Atmel AVR series. I think they're better than PICs in many ways (32 registers vs a single 'W' register, faster, very cheap Dragon debugger) but the best thing is the free GCC port. Combined with AVR studio, you get a C IDE + simulator for free.

### AC adapters

Message #1 Posted by [Keith Beyer](#) on 1 Apr 2007, 9:09 p.m.

Is there a source that lists which HP AC adapters works with which HP calculators? I know individual adapters work with multiple calculators, but I'm clueless which is which.

Thanks!

### Re: AC adapters

Message #2 Posted by [Karl Schneider](#) on 2 Apr 2007, 12:27 a.m.,  
in response to message #1 by Keith Beyer

Quote:

Is there a source that lists which HP AC adapters works with which HP calculators? I know individual adapters work with multiple calculators, but I'm clueless which is which.

Sure, there's a source -- *this very website*, of which the Forum is only one part. Load the home page and do an automated search on "chargers". You just might find something...

Now, a word of caution: What was produced are generally AC-powered chargers for rechargeable batteries, not AC "adapters". As a general rule, a functional battery pack must be installed in the calculator for the charger to be used without damaging the calculator.

An exception is the HP-71B AC adapter, which does not attempt to recharge installed batteries, since it uses disposable cells.

-- KS

### Re: AC adapters

Message #3 Posted by [Keith Beyer](#) on 2 Apr 2007, 9:29 a.m.,  
in response to message #2 by Karl Schneider

Maybe I should be more specific. Does the AC adapter that works on an HP 97 work on an HP 71B? I know there is a list on the Museum website of batteries/chargers and which calculators they work with, but will none of these work with the 71B?

Thanks!

### Removing Permanent Marker from HP 48SX

Message #1 Posted by [Clive](#) on 1 Apr 2007, 5:20 p.m.

Is it possible to remove what looks like a black spot from a permanent marker from the keyboard area of an HP 48SX? If so, how? Any suggestions for cleaning methods to try, that will not damage or leave any marks on the keyboard area? The mark is just a spot, and is above the top row of keys.

Thanks

### Re: Removing Permanent Marker from HP 48SX

Message #2 Posted by [Mike Sebastian](#) on 1 Apr 2007, 7:58 p.m.,  
in response to message #1 by Clive

Try using a dry-erase marker. The solvents in dry-erase markers dissolve the ink of most permanent markers. After the dry-erase "ink" dries, just erase it. I haven't tried this on a calculator, but it works very well with removing permanent marker ink from white boards.

### Re: Removing Permanent Marker from HP 48SX

Message #3 Posted by [Steven Burrows](#) on 2 Apr 2007, 4:46 p.m.,  
in response to message #1 by Clive

If this is a permanent marker like a Sharpie, you might try some rubbing alcohol (isopropyl) on a cotton swab. We use Sharpies to mark glassware and other things in labs, and alcohol always takes the marks off. Acetone also works, but this would almost certainly damage the plastic.

### Dice rolling Solver for HP 19BII - Please Help

Message #1 Posted by [Hans van der Drift](#) on 1 Apr 2007, 7:03 a.m.

Hi,

I have a Car racing board game that requires a lot of dice rolling (too much) I do not have the knowledge on how to write a formula for this but I hope I some one here could help (i am sure it is quite simple)I have a HP 19bII

So the input is "Gear" the output is "Spaces".

You get 6 dice, six of which represent gears on your car: d4 rolls 1 or 2 (first gear) d6 rolls 2-4 (second gear) d8 rolls 4-8 (third gear) d12 rolls 7-12 (fourth gear) d20 rolls 11-20 (fifth gear) d30 rolls 21-30 (sixth gear)

I will list out all 6 dice (or gears) and describe how many sides they have plus the results and chances.

**Dice/Gear 1** Sides = d4 Range = 1 - 2 Possibility: All 1 in 2

**Dice/Gear 2** Sides = d6 Range: 2 - 4 Possibility: 2: 1 in 6--- 3: 2 in 6--- 4: 3 in 6---

**Dice/Gear 3** Sides = d8 Range: 4 - 8 Possibility: 4: 1 in 8--- 5: 1 in 8--- 6,7,8: 2 in 8---

**Dice/Gear 4** Sides = d12 Range: 7 - 12 Possibility: All - 1 in 6

**Dice/Gear 5** Sides = d20 Range: 11 - 20 Possibility: All: 1 in 10

**Dice/Gear 6** Sides = d30 Range: 21 - 30 Possibility: All: 1 in 10

### Short & Sweet Math Challenge #18: April 1st, 2007 Spring Special

Message #1 Posted by [Valentin Albillo](#) on 1 Apr 2007, 12:01 a.m.

Hi all,

After nearly half a year has elapsed since my latest S&SMC, here's a new one for you to try and conquer, namely my brand-new **S&SMC#18: April 1st, 2007 Spring's Special**, similar in spirit to the one I posted in 2006 but this time for April 1st, 2007, i.e.: **4.012007** in plain numeric "date format".

To allow for variety, this S&SMC is further subdivided into 8 *sub-challenges*, all of them very short and sweet, and each one being assigned 10 points so that if you manage to solve them all, you'll get *a perfect 100% score of 80 points*. Some of them are intended for specific models, others are general in nature so any HP calc model can be used in principle to solve them though one or two might require suitably advanced models due to RAM requirements if nothing else.

You're expected to get your favourite HP calc, your programming ingenuity, experience and wits, and put everything to the task of solving them.

#### Notes:

- The model-specific questions apply only to that model in particular. They would probably be meaningless for any other models.
- If you use an HP-41C, you can also use any of these: Math ROM, Advantage ROM, Card Reader ROM, Printer ROM. No other ROMs or extra routines allowed.
- If you use an HP-71B, you can also use any of these: Math ROM, HP-IL ROM, STRNGLEX. No other ROMs or LEX files allowed.

## The Challenge:

1) (*HP-71B specific*) Find a root  $x$  of:

$$\text{Abs}(\text{Ln}(x*x) - \text{Ln}(x^2)) > 4.012007$$

where, of course, **Abs** is the "Absolute Value" function and **Ln** is the "Natural Logarithm" function.

Score:    Finding one root:    8 points  
           Finding additional roots: 2 points:

2) (*Any model*): Write a program that takes as input three positive integers A, B, M (A, B not being exact powers of 10), and outputs the difference between the probabilities P(A, M) and P(B, M) that two random powers of A and B (say  $A^i$  and  $B^j$  for some random positive integers  $i, j$ ) begin with M.

For instance, if  $A=265$ ,  $B=1387$ ,  $M=123456 \rightarrow \text{RUN} \rightarrow P(A,M) - P(B,M)$

where  $P(A,M)$  = probability that a random power of 265 begins with 123456  
 $P(B,M)$  = probability that a random power of 1387 begins with 123456

Use your program to compute this difference for the case:  $A=314159$ ,  $B=271828$ ,  $M=4012007$

Score: Writing a working program: 5 points:  
 Getting the correct answer for the specific case: 5 points

3) (Any model): Let  $F(X)$  be a function defined thus for real positive  $X$ :

$$\begin{aligned} F(1) &= 1 \\ F(X) &= F(X-1) + 1/X \end{aligned}$$

for instance:  $F(2) = F(1) + 1/2 = 1 + 1/2$   
 $F(3) = F(2) + 1/3 = 1 + 1/2 + 1/3$   
 $F(4) = F(3) + 1/4 = 1 + 1/2 + 1/3 + 1/4$   
 $F(\overset{\cdot\cdot\cdot}{100}) = 1 + 1/2 + 1/3 + 1/4 + 1/5 + \dots + 1/98 + 1/99 + 1/100$   
 ... etc ...

- Write a program that, given any real value  $N > 1$  and  $N < 200$  (for 10-digit models) or  $N < 1000$  (for 12-digit models), it will find the value of  $X$  (with full 10-12 digit accuracy) such that  $F(X) = N$ .
- Use your program to find  $X$  such that  $F(X) = 4.012007$

Score: Writing a working program: 5 points  
 Getting the correct answer for the specific case: 5 points

4) (Any model): Write a program, command line, or key sequence to compute the *exact symbolic value* of (in radians mode):

$$I1 = \int_0^{\text{Inf}} \frac{1}{(1+x^2) \cdot (1+x^{4.012007})} dx$$

$$I2 = \int_0^{\text{Pi}/2} \frac{1}{(1+\text{Tan}(x)^{4.012007})} dx$$

Score: 5 points for each correct symbolic value.

5) (Any 12-digit model): Given the succession defined thus:

$$X_0 = 0$$

$$X_N = \text{FractionalPart} \left( 2^4 \cdot X_{N-1} + \frac{30 \cdot M^2 - 89 \cdot M + 2^6}{2^3 \cdot M^4 - 2^6 \cdot M^3 + 178 \cdot M^2 - 206 \cdot M + 84} \right)$$

where  $M = 2^{2 \cdot N}$

write a program to compute the first 9 terms ( $X_1, X_2, \dots, X_9$ ) and print not each term  $X_k$  but  $\text{IntegerPart}(2^{4*X_k})$ . Once this is correctly done, you must answer these questions about the integer values thus obtained:

1. Give a description *as accurate and short as possible* of the printed values in this succession, i.e., what are they ?
2. Compute and output the next 9 additional (integer) values and state whether you deem them correct or not.
3. State whether you think the description you gave in (1) applies to your newly computed extra terms, and to the theoretically exact infinite sequence.

Score: Writing a working program: 4 points  
 Correct answer to (1): 4 points  
 Correct answer to (2): 1 point  
 Correct answer to (3): 1 point

6) (*HP-15C specific*): Assuming A and B are both  $N \times N$  matrices, their elements being integer values less than 5,000,000,000, write a program that will exchange their contents, for  $N \times N$  up to and including  $5 \times 5$ .

The program must take no input but assume both matrices already exist. None of the 21 conditional instructions available in the HP-15C are allowed.

Score: Writing a working program: 10 points

7) (*Any model*): Calculus tells us that the first derivative of a function such as  $x^3$  is  $D(x^3) = 3*x^2$  and its second derivative is  $D_2(x^3) = D(D(x^3)) = D(3*x^2) = 6*x$ , its third derivative would be 6, and finally its fourth derivative would be the first derivative of 6, but the first, second, etc, derivatives of 6, being a constant, are zero.

Let's consider the "Derivative" operator,  $D_n(f(x))$ , such that, for instance:

$$\begin{aligned} D_1(x^3) &= 3*x^2 & \rightarrow & \text{ at } x_0 = 2, D_1(x^3) = 3*2^2 = 12 \\ D_2(x^3) &= 6*x & \rightarrow & \text{ at } x_0 = 5, D_2(x^3) = 6*5 = 30 \\ D_3(x^3) &= 6 & \rightarrow & \text{ at } x_0 = \text{Pi}, D_3(x^3) = 6 \\ D_4(x^3) &= 0 & \rightarrow & \text{ at } x_0 = -4, D_4(x^3) = 0 \end{aligned}$$

1. Write a program that, given  $m$ ,  $n$ , and  $x_0$ , it computes and outputs the value of  $D_m(x^n)$  at  $x_0$ . In particular, use your program to compute the value of

$$D_{4.012007}(x^{\text{Pi}}) \text{ at } x_0 = e$$

2. Write another program that, given  $m$ , a constant  $c$ , and  $x_0$ , it computes and outputs the value of  $D_m(c)$  at  $x_0$ . In particular, use your program to compute the value of

$$D_e(4.012007) \text{ at } x_0 = \text{Pi}$$

(Strictly speaking, there are some combinations of  $m$ ,  $n$ , and  $x_0$  than aren't allowed because they would result in out of range values or division by zero, but your program needs not address them for this sub-challenge)

Score: For writing working programs: 3 points each  
For giving the correct answers to the specific cases: 2 points each

---

8) (*Any model*): Write a program to find, compute, and print all square factorials  $N!$  from  $N=1$  to  $N=512$ .

Score: For writing a working program: 6 points  
For correctly printing all results: 4 points

---

That's all. As usual, I'll post my solutions and comments within a week or so. This is the time to test what you're made of as far as HP-calcs programming goes, so go ahead full steam, do your best, engage, and may the force be with you.

Best regards from V.

## Re: Incredible!

Message #2 Posted by **J-F Garnier** on 1 Apr 2007, 11:08 a.m.,  
in response to message #1 by Valentin Albillo

Hi Valentin,

I was sure that your April 1st edition of your S&SMC was a joke, and I read it for the fun. Your first challenge just looked crazy:

$$\text{Abs}(\text{Ln}(x*x) - \text{Ln}(x^2)) > 4.012007$$

As  $x^2$  IS  $x*x$  by definition, it seems that there can be no solution. But I know you, Valentin, and you would not post nonsense. So I thought that some special cases could give different results for  $x*x$  and  $x^2$  due to floating point rounding effects. I quickly thought that only complex numbers could give such large differences.

After investigating a bit, what was my surprise to find THIS:

```
X=(1E-11,1-1E11)
X*X --> (-9.9999999998E21,-1.99999999998)
X^2 --> (-9.9999999998E21,-1.74532925.196)
```

We can call it a bug of the HP-71B Math ROM, no?

I never heard of that. Incredible!

J-F

## Re: Incredible! (S&SMC #18, item #1)

Message #3 Posted by **Karl Schneider** on 1 Apr 2007, 1:36 p.m.,  
in response to message #2 by J-F Garnier

Hi, J-F --

Quote:

---

```
X=(1E-11,1-1E11)
X*X --> (-9.9999999998E21,-1.99999999998)
X^2 --> (-9.9999999998E21,-1.74532925.196)
```

We can call it a bug of the HP-71B Math ROM, no?

---

Probably so. The HP-71B Math ROM was, I suspect, HP's first effort at handheld complex-number functionality for 12-digit arguments.

The successor HP-42S and HP-28C with their 12-digit arguments and built-in complex-number support give matching correct answers.

The successor HP-32S does not offer "COMPLX<sup>2</sup>", so no comparison is possible.

The predecessor HP-15C with its **10**-digit arguments and complex-number support give matching correct answers for 1E-09 and 1-1E09.

Message #4 Posted by [Valentin Albillo](#) on 2 Apr 2007, 5:42 a.m.,  
in response to message #2 by J-F Garnier

Hi, Jean-François:

Thanks for your interest and kind comments, and yes, your intuition was correct and as sharp as ever: complex numbers provide a correct solution for this subchallenge.

The key idea behind your solution is given in the May 1983 issue of the HP Journal, more specifically in the article "Scientific Pocket Calculator Extends Range of Built-In Functions" which in particular discusses the complex algorithms implemented for the HP-15C (pp 28-31). The concepts and compromises discussed there also apply somewhat to the HP-71B implementation and probably to other HP calcs as well.

Now that you've found a correct solution, let's give you a new goal perfectly suited to your worthiness:

Your solution is indeed correct but on aesthetic grounds one could say your X is somewhat *ungainly*, what with its absolute value being *very large* (about 1E11), and its real and imaginary parts being *22 orders of magnitude apart*. With so extreme a value, one would expect odd behaviour when using it in computations: it might exceed some limits here and there or incur in significant-digit-cancellation problems.

That being so, see if you can find a solution *which doesn't exceed 1 in absolute value* and where such digit-cancellations simply can't happen. If you succeed, that will tell you even more about the HP-71B's complex number implementation. :-)

Best regards from V.

### Re: Item#1, solution

Message #5 Posted by [J-F Garnier](#) on 2 Apr 2007, 7:21 a.m.,  
in response to message #2 by J-F Garnier

Hello all,

I'm sorry, but there is no bug in the Math ROM, the behaviour I reported yesterday (on April 1st :-)) is only

due to inherent limited accuracy of floating point calculations (and is not HP-71B specific) that I tried to mask using a number chosen on purpose to show apparently very different results for  $x*x$  and  $x^2$  (there are very close, actually). And this number even doesn't satisfy Valentin's first problem (I didn't claim it does...):

```
X=(1e-11,1-1e11)
ABS(LN(X*X)-LN(X^2)) = 0 !
```

Sorry again...

A "solution" of the first problem is much simpler (and is specific to the HP-71B):

```
X=-(0,1)
ABS(LN(X*X)-LN(X^2)) = 6.28 (about)
```

## Re: S&SMC #18: item #6

Message #6 Posted by [Karl Schneider](#) on 1 Apr 2007, 1:14 p.m.,  
in response to message #1 by Valentin Albillo

Hi, Valentin --

Quite an ambitious effort! I remember one like number 6, so it wasn't too difficult to develop a solution:

Quote:

6) (HP-15C specific): Assuming A and B are both NxN matrices, their elements being integer values less than 5,000,000,000, write a program that will exchange their contents, for NxN up to and including 5x5.

The program must take no input but assume both matrices already exist. None of the 21 conditional instructions available in the HP-15C are allowed.

Assume that the two matrices are identified as A and B. The user is responsible for ensuring compatibility of dimensions, which need not be square.

```
LBL A
MATRIX 1
LBL 0
RCL A
x<> B
STO A (user mode)
GTO 0
RTN
```

The matrix indices are automatically incremented after a STO or RCL instruction when "USER" mode is set, but otherwise are not. This program takes advantage of a thoughtful feature of the HP-15C: Within a program, if a matrix index is incremented past the last element back to (1, 1), the next instruction is skipped. This allows escape from a loop without a conditional test.

The feature is documented on pages 176-177 in the HP-15C Owner's Handbook.

This program also uses the versatile open-ended "x<>" function, which can be used with any numbered memory register, with the I register, with (i) for indirection, and with A-E for matrix elements. It was a significant improvement over the HP-11C's "x<>I" and "x<>(i)" functions, and also made a needed keyboard position available as well. ("x<>" was also unavailable on the HP-32S, but restored for the HP-32SII.)

BTW, How do you figure "21 conditional instructions"? There are 12 instructions that compare stack x with zero or stack y, plus 10 flag tests, plus DSE and ISG. That's 24 operations having a "do if true" rule, although "F? 8" should be avoided as a general-purpose instruction.

-- KS

### Sorry but no cigar ! :-)

Message #7 Posted by [Valentin Albillo](#) on 2 Apr 2007, 6:03 a.m.,  
in response to message #6 by Karl Schneider

Hi, Karl:

Karl posted:

***"Quite an ambitious effort! I remember one like number 6, so it wasn't too difficult to develop a solution:"***

Thanks for your interest and words of appreciation, but sorry, your alleged solution *isn't*, read below why.

The requirements for this subchallenge specifically state that *"None of the 21 conditional instructions available in the HP-15C are allowed."* What's a "conditional instruction" ? I thought it was pretty obvious but perhaps it wasn't, so I'll make it clear here:

*"A conditional instruction is any HP-15C's programmable instruction that can perform a conditional jump over the next step depending on some condition checked by the instruction as part of its execution. Examples of such instructions are the **TEST** instructions, **F?**, etc."*

Now, your alleged solution does include an **STO A** instruction *in user mode*. That's a conditional instruction as per the definition above, as it can skip the next step depending on some condition that it checks as part of its execution. So your alleged solution, most regrettably, *isn't*.

***"BTW, How do you figure "21 conditional instructions"?"***

As per the definition above. Also, you shouldn't count "10 flag tests" as *ten* different conditional instructions but merely *one*, **F?**.

Thanks again for your very didactic comments and worthy techniques, which certainly add value to the forum's community even if they didn't result in a valid solution in this case, and I hope you'll keep on contributing to this current S&SMC.

Best regards from V.

Quote:

Karl posted:

**"BTW, How do you figure "21 conditional instructions"?"**

As per the definition above. Also, you shouldn't count "10 flag tests" as *ten* different conditional instructions but merely *one*, **F**?

Lets see:

```
x <= y?
x = 0 ?
TEST
F?
DSE
ISG
SOLVE
Integrate
matrix STO in USER mode
matrix RCL in USER mode
```

Even counting the TEST as the full 10, I'm two short.

**Re: Sorry but no cigar ! :-)**

Message #9 Posted by [Karl Schneider](#) on 3 Apr 2007, 12:07 a.m.,  
in response to message #7 by Valentin Albillo

Hi, Valentin --

Ah, *there's* the rub! I had several nagging doubts: Why you would essentially repeat an earlier challenge, and why integer elements of less than half the exactly-displayable range were specified. I'd say that Paul Dale identified the reason, and that his approach is on track.

Of course, if a user wanted some HP-15C program code to perform a matrix swap, why else would one use slow (and sometimes space-costly) matrix arithmetic instead of "surgical element-wise replacement"?

To illustrate, here's an example from linear algebra. Suppose that a user were to calculate eigenvalues for small matrices on an HP-15C (not that I'd advise it, due to computational slowness).

Using "r" to denote a right eigenvalue of a square matrix A with a corresponding right eigenvector **x**, we have the following familiar derivation:

$$A\mathbf{x} = r\mathbf{x}$$

$$A\mathbf{x} - r\mathbf{x} = \mathbf{0}$$

$$(A - rI)\mathbf{x} = \mathbf{0}$$

Since the only eigenvector for a nonsingular  $(A - rI)$  would be the trivial solution  $\mathbf{x} = \mathbf{0}$ ,  $(A - rI)$  must be singular. Thus,

$$\det (A - rI) = 0.$$

Calculation of  $(A - rI)$  from a known or assumed value of r could be performed by creating an identity matrix, multiplying it by r, then subtracting from A. Or, a simple loop program could subtract r from each value on the main diagonal of A. Which is more efficient in terms of computing speed and space

requirements, both of which are rather limited on the HP-15C?

I suspect that these are the reasons why no utility for generating identity matrices was provided on the HP-15C. (Not to belabor the point, but the comparison of methods in your challenge offered a *segue*.)

Quote:

... Also, you shouldn't count "10 flag tests" as ten different conditional instructions but merely one, F?.

Point taken about *conditional* instructions, but I generally define instructions based on op-codes: If it has a unique code, it's a complete instruction. The basic command is a function. There are 700 programmable instructions on an HP-15C, but far fewer functions.

-- KS

### Re: S&SMC #18: item #6

Message #10 Posted by [Paul Dale](#) on 2 Apr 2007, 7:27 p.m.,  
in response to message #6 by Karl Schneider

I'm pretty busy at the moment so won't be able to do much on this set of problems, However, how about something along these lines for the sixth:

```
RCL MATRIX A
RCL MATRIX B
RESULT B
+           // B = A+B
RCL MATRIX B
RCL MATRIX A
RESULT A
-           // A = (A+B) - A = B
RCL MATRIX B
RCL MATRIX A
RESULT B
-           // B = (A+B) - B = A
```

I'm relying on the assumption that the matrix contents are integers and that a sum of two such won't overflow a register or lose any precision. This is justified given the problem statement.

- Pauli

### first thoughts on #3

Message #11 Posted by [hugh steers](#) on 1 Apr 2007, 6:03 p.m.,  
in response to message #1 by Valentin Albillo

using hplua on the 50g (counts as any calculator right?) im thinking of using the digamma function instead of loop and also to get the real-valued harmonic function.

start with definitions: harmonic(x) = sum(1,x,1/x), euler = euler's constant, digamma(x) = gamma'(x)/gamma(x) [prime = derivative] and harmonic(x) = euler + digamma(x+1)

since the digamma doesnt exist native, i try with a hacky numerical derivative like this,

```
function digamma(x)
  local dx = 1e-6
  return (math.fact(x-1+dx) - math.fact(x-1-dx))/2/dx/math.fact(x-1)
end
```

which is probably not terribly accurate but could be improved. then i get an answer for #3 using some functional programming and solve like this:

```
euler = 0.5772156649015328606
function harmonic(x)
  return euler + digamma(x+1)
end
function inversefn(f, eps)
  return function(x)
    local ff = function(y) return f(y) - x end
    return solve(ff, 1, 100, eps) end
end
```

transcript,

```
>hplua -i solve.lua
Lua 5.1.1 Copyright (C) 1994-2006 Lua.org, PUC-Rio
HPLua version 0.2
```

```
dofile("valentin3.lua")
invdi = inversefn(harmonic, 1e-10)
=invdi(4.012007)
> 30.523595225432980746
>
```

anywhere close?

### Re: first thoughts on #3

Message #12 Posted by [Valentin Albillo](#) on 2 Apr 2007, 6:50 a.m.,  
in response to message #11 by hugh steers

Hi, Hugh:

Hugh posted:

*"using hplua on the 50g (counts as any calculator right?)"*

Certainly, it does. The 50g is an HP calc model and anything that runs on it is valid and legal for this S&SMC. Matter of fact, it's most welcome, as it provides diversity and further shows the forum's community which tools are available and what can be done with them in a practical, not contrived situation.

*"> 30.523595225432980746 anywhere close?"*

Indeed. Your result agrees with my original one-line solution for the HP-71B to 12 significant digits save for a few ulps.

Thanks for your interest, congratulations for your correct and truly novel solution and I hope you'll consider trying your hand at some other subchallenges as well (or all!) :-)

Best regards from V.

### Re: first thoughts on #3

Message #13 Posted by [Rodger Rosenbaum](#) on 3 Apr 2007, 4:55 a.m.,  
in response to message #12 by Valentin Albillo

Quote:

\_\_\_\_\_

"> 30.523595225432980746 anywhere close?"

Indeed. Your result agrees with my original one-line solution for the HP-71B to 12 significant digits save for a few ulps.

The function to be used for this challenge was defined like this:

Quote:

Let  $F(X)$  be a function defined thus for real positive  $X$ :

$$\begin{aligned} F(1) &= 1 \\ F(X) &= F(X-1) + 1/X \end{aligned}$$

$$\begin{aligned} \text{for instance: } F(2) &= F(1) + 1/2 = 1 + 1/2 \\ F(3) &= F(2) + 1/3 = 1 + 1/2 + 1/3 \\ F(4) &= F(3) + 1/4 = 1 + 1/2 + 1/3 + 1/4 \\ &\vdots \\ F(\overset{\cdot\cdot\cdot}{100}) &= 1 + 1/2 + 1/3 + 1/4 + 1/5 + \dots + 1/98 + 1/99 + 1/100 \\ &\dots \text{ etc } \dots \end{aligned}$$

The description "real positive  $X$ " includes non-integers, although when I first looked at the definition, I couldn't see just how the recursion would terminate if  $X$  wasn't an integer. I suppose the process could be terminated just before the next term of the sequence becomes negative, but as I mention below, that stopping criterion doesn't always give a good result.

At any rate, if the value 30.523595225432980746 is substituted for  $X$  and the summation carried out, after adding 30 terms the sum is about 3.37647; after 31 terms, the sum is about 5.28634. With 32 terms, the sum begins to decrease, and its value is about 3.18724.

Using the function definition given in the original statement of the challenge, for  $X = 30.523595225432980746$ , the function is never equal to 4.012007 for any number of terms in the sum, so that for this part of the challenge:

Quote:

2. Use your program to find  $X$  such that  $F(X) = 4.012007$

30.523595225432980746 is not a solution (if we stick to the given definition of the function).

However, if we let  $X = 29.98952530377276865$  and add up 30 terms according to the given definition of the function, we will get a result very close to 4.012007. And, in fact, there are 30 values of  $X$  which will give 4.012007 with 30 terms added up. The values of  $X$  go something like this:

29.98952530377276865  
28.425274519995517519  
:  
:  
5.165990779772168  
:  
:  
0.12209269005912

If we choose to add up 29 terms, there are 29 starting values of  $X$  that give 4.012007. If we choose to add up 28 terms, there are 28 values of  $X$ , etc.

Notice that for the small starting values of X and with 30 terms, there are quite a few terms in the sum that go negative.

## #8 is a fool

Message #14 Posted by [hugh steers](#) on 1 Apr 2007, 7:27 p.m.,  
in response to message #1 by Valentin Albillo

here's my program:

1  
R/S

for there are no square factorials except 1.

proof: Suppose  $n!$  is a perfect square,  $n \neq 1$ . let  $p$  be the largest prime dividing  $n!$ , then we must have  $p^2 \mid n!$  and  $n! \geq p^2 > 2p$  when  $p > 2$ . But, there exist a prime  $q$ ,  $2p > q > p$  (bertran) But,  $q \mid n!$  so  $p$  was not the largest prime. contradiction.

!

## A suggestion (Re: #8 is a fool)

Message #15 Posted by [Valentin Albillo](#) on 4 Apr 2007, 4:34 a.m.,  
in response to message #14 by hugh steers

Hi, Hugh !

I do appreciate your mathematically orthodox reasoning but taking into account the particular nature of these "Spring Specials" I suggest some [lateral thinking](#) would be in order to deal with #8.

Best regards from V.

## Re: A suggestion (Re: #8 is a fool)

Message #16 Posted by [Bram](#) on 4 Apr 2007, 6:07 a.m.,  
in response to message #15 by Valentin Albillo

Perhaps I'm thinking too lateral now, but your suggestion convinces me that there are exactly 512 square factorials that would do for an answer, each being the square of its square root. You aren't asking for integers, so .....

It kind of depends on the definition of "square", doesn't it?

## Re: A suggestion (Re: #8 is a fool)

Message #17 Posted by [Valentin Albillo](#) on 4 Apr 2007, 6:23 a.m.,  
in response to message #16 by Bram

Hi, Bram:

"It kind of depends on the definition of "square", doesn't it? "

Yes, it does, and I'd further suggest that you go to the simplest definition (actually more like a mental image) you can think of for "square", actually what a young child would do; think of "Sesame Street"'s character Grover trying to explain the concept to a

toddler audience :-)

BTW, I've been missing your contributions, you frequently posted very interesting solutions and ideas in past S&SMC's.

Best regards from V.

**Re: A suggestion (Re: #8 is a fool)**

*Message #18 Posted by [hugh steers](#) on 4 Apr 2007, 8:24 a.m.,  
in response to message #17 by Valentin Albillo*

unless you mean all factorials of squares by the phrase "square factorials".

and indeed it does depend what you mean by a "square". i think it's up to the problem poster to define the problem properly if this is the case.

so there's bram's suggestion that square can apply to reals. in which case it might as well apply to rationals, complex and so on.

a square could also refer to being a quadratic residue. so  $n!$  is a square if there's an  $a$ , with  $a^2 = n! \pmod{m}$ . for some  $m$ ?

who knows?

**Re: A suggestion (Re: #8 is a fool)**

*Message #19 Posted by [Bram](#) on 5 Apr 2007, 4:02 a.m.,  
in response to message #17 by Valentin Albillo*

Hi Valentin,

you remarked:

*"BTW, I've been missing your contributions, you frequently posted very interesting solutions and ideas in past S&SMC's",*

which is very kind to say. Be assured that I do read your S&SMC's and I do think about them, but all too often a properly worked out answer would require the time I must spend on other things. Yet I'm sure that some contributions will emerge in the future. For now I seem to kind of have unlearnt the ability to think easily, so it's difficult to get these things square ;-)  
(I keep thinking about it, though)

**Last hint for #8**

*Message #20 Posted by [Valentin Albillo](#) on 6 Apr 2007, 9:31 p.m.,  
in response to message #14 by hugh steers*

Hi all,

It would be a real pity to left #8 "unattended" just because of some misunderstanding about the meaning of "square factorials".

I've given some advices and subtle hints about the proper meaning but either they weren't understood as well or simply there's no interest in #8.

Assuming the former, I'll give one last hint before I post my original solutions within 48 hours from now: "square" doesn't necessarily have to apply to the factorial's *value*. It may also apply to some other physical attribute, such as its *shape* when output.

Have you never heard of "triangular numbers", 'pentagonal numbers', 'polygonal numbers' in general ? Why do you think that square numbers were called precisely 'squares' back in ancient times ? Just try to dispose 16 marbles in your table to form some most regular pattern and you'll clearly see why ancient mathematicians would say that 16 is a square number ! Same for these factorials I'm asking for.

'Nuff said. Thanks for your interest and

Best regards from V.

I kind of figured that would be the case after the sesame street reference. Like the others I was confused about the term "square factorial". My first assumption matched Hugh's original solution. After that was shot down I turned to <http://www.research.att.com/~njas/sequences/A100777> (Square-factorial numbers). And wrote the following Perl prototype:

```
#!/usr/bin/perl
use Math::BigInt;
my $a = Math::BigInt->new("1");
foreach(1..512) {
    print $_;
    print "\t";
    $a = $a * l($_);
    print $a;
    print "\n";
}
sub l
{
    my $n=shift;
    for(my $i=int(sqrt($n));$i>0;$i--) {
        my $s=$i**2;
        if($n % $s == 0) {
            return($s);
        }
    }
}
```

However, I never got around to coding it in my 50G.

Your last two statements made me think about the shape as if each digit was a standalone unit (e.g. marbles).

The following 15C program computes the number of digits for N! for the range 1 to 512 then checks to see if the number of digits is a perfect square, if so print N.S, where N is 1 to 512 and S is the number of digits.

Output:

1.1  
2.1  
3.1  
7.4  
12.9  
18.16  
32.36  
59.81  
81.121  
105.169  
132.225  
228.441  
265.529  
284.576  
304.625  
367.784  
389.841  
435.961  
483.1089  
508.1156

Code:

```

**Re: Last hint for #8**

Message #22 Posted by [Valentin Albillo](#) on 7 Apr 2007, 12:59 p.m.,  
in response to message #21 by Egan Ford

Hi, Egan:

Congratulations, your interpretation and solution are both fully correct, there are 20 "square factorials" in the 1-512 range. Two comments:

- It would be extra-nice if you would also print the full "square factorials" in a square arrangement to further make the point and for visual impact. My original solution for the HP-71B, which is quite short, actually does it.
- Your HP-15C program admits a number of easy improvements. Just for instance, in the very first steps you set a constant for the counter, 1.51201. The final "01" is not necessary at all, if absent the "01" increment is assumed *by default*, saving 2 steps. Also, it would be better to use a *decrementing* counter, going from 512 down to 1 so the constant would be simply 512, additionally saving two extra steps.

Thanks for your contribution and

Best regards from V.

I figured as much. I'll post a 50G solution (no point in two 71B solutions) once I figure out how to display small fonts. The output will look like this (sans the extra space I added so that it looked more square here):

```

1
2
6
5 0
4 0

4 7 9
0 0 1
6 0 0

6 4 0 2
3 7 3 7
0 5 7 2
8 0 0 0

2 6 3 1 3 0

```

8 3 6 9 3 3  
 6 9 3 5 3 0  
 1 6 7 2 1 8  
 0 1 2 1 6 0

```

Quote:

Your HP-15C program admits a number of easy improvements. Just for instance, in the very first steps you set a constant for the counter, 1.51201. The final "01" is not necessary at all, if absent the "01" increment is assumed *by default*, saving 2 steps. Also, it would be better to use a *decrementing* counter, going from 512 down to 1 so the constant would be simply 512, additionally saving two extra steps.

Yeah, I know, but I wanted to count up.

## #8 solved

Message #24 Posted by [Bram](#) on 7 Apr 2007, 4:02 p.m.,  
in response to message #23 by Egan Ford

Ah! Right. So that's what is meant with square numbers. I was not even near this solution. It does make some sense, I must say.

And immediately a new question arises. The 20 answers can be connected to these numbers:

1 1 1 2 3 4 6 9 11 13 15 21 23 24 25 28 29 31 33 34

Quite irregular. Are there any known properties and behaviour of this series?

## only 20 squares?

Message #25 Posted by [hugh steers](#) on 7 Apr 2007, 9:44 p.m.,  
in response to message #24 by Bram

ha! well done Egan.

but valentin, you lateral dudes are so base 10, why stop there? a quick hack gives me,

```
function lngamma(z)
```

```

    return (z-.5)*math.ln(z)-z+math.ln(math.pi*2)/2+1/12/z
end

function isSquare(x)
    r = math.floor(math.sqrt(x))
    return (r*r == x)
end

function findSquares(b, list)
    c = 0
    s = math.ln(b)
    for i = 1, 512 do
        y = math.ceil(lngamma(i+1)/s)
        if (isSquare(y)) then
            print(i, y)
            list[i]=true
            c = c + 1
        end
    end
    print("total", c, "squares base", b)
end

function findAllSquares()
    list = {}
    for i = 2,10 do
        findSquares(i, list)
    end

    c = 0
    for k in pairs(list) do
        io.write(k, ",")
        c = c + 1
    end
    print("\ntotal squares in any base", c)
end

```

with transcript,

```
hplua -i valentin8.lua
```

```

Hi, Hugh!

Hugh posted:

*"[...] but valentin, you lateral dudes are so base 10, why stop there?"*

Yes, why ? :-)

Thanks for your interesting extension to bases other than 10, Hugh, it's nice to see people getting so involved with a challenge that they'll want to try and explore new possibilities beyond the original goals, as you've just superbly done. Way to go !

Thanks again and

Best regards from V.

## Re: #8 solved

Message #27 Posted by *Gerson W. Barbosa* on 8 Apr 2007, 5:35 p.m.,

Quote:

1 1 1 2 3 4 6 9 11 13 15 21 23 24 25 28 29 31 33 34

Quite irregular. Are there any known properties and behaviour of this series?

I'd say this sequence is just what it is: the sequence of the side lengths of *square factorials*. Anyway, if this can be of help, more terms can be obtained with the following HP-50G program:

```
%%HP: T(3)A(R)F(.);
\<< 1 \-> m n
\<< { } { }
DO 'FLOOR(LOG(2*\pi*n)/2+n*LOG(n/e)+LOG(1+1/(12*n)+1/(288*n^2)-
139/(51840*
n^3)-571/(2488320*n^4)+163879/(209018880*n^5)))' \->NUM 1 + DUP \v/
FP 0 ==
IF
THEN \v/ + SWAP n + SWAP
ELSE DROP
END 1 'n' STO+ DUP SIZE
UNTIL m ==
END
\>>
\>>
```

Output for m=50:

```
{ 1 2 3 7 12 18 32 59 81 105 132 228 265 284 304 367 389 435 483 508 697
726 944 1011 1045 1080 1115 1187 1454 1494 1617
1659 1788 1921 2012 2105 2200 2248 2395 2445 2861 2915 3192 3480 3539
3902 3964 4476 4542 4675 }
```

```
{ 1. 1. 1. 2. 3. 4. 6. 9. 11. 13. 15. 21. 23. 24. 25. 28. 29. 31. 33.
34. 41. 42. 49. 51. 52. 53. 54. 56. 63. 64. 67. 68.
71. 74. 76. 78. 80. 81. 84. 85. 93. 94. 99. 104. 105. 111. 112. 120.
121. 123. }
```

That's the same formula used in this OEIS sequence:

<http://www.research.att.com/~njas/sequences/A006488>

The formula needn't be that accurate for this application.

'FLOOR(LOG(2\*\pi\*n)/2+n\*LOG(n/e)+LOG(1+1/(12\*n)))' would be accurate enough and faster, except the first number in the second sequence would be 0 instead of 1, unless properly handled. Actually, nothing new here, this appears to be equivalent to Egan Ford's HP-15C program.

Regards,

Gerson.

**Re: Last hint for #8**

I'll post a 50G solution (no point in two 71B solutions) once I figure out how to display small fonts.

Ok, here it is:

```

%%HP: T(3)A(R)F(.);
\<< 1 \-> N
  \<< " " 1 512
    FOR I I N * 'N' STO N \->STR DUP SIZE \v/ DUP FP
      IF 0 >
        THEN DROP DROP
        ELSE \-> S M
          \<< 0 M 1 -
            FOR J S J M * 1 + J 1 + M * SUB 10 CHR + +
              NEXT
            \>> 10 CHR +
          END
        NEXT
      \>> 1 \->GROB
    \>>

```

#3 50G program:

```
<< 1 + Psi 1 Psi - ->NUM >>
```

Enter

```
Psi(X+1)-Psi(1)=4.012007
```

in NUM.SLV and press 'SOLVE' to get X=30.5235952258

#3 15C program:

```
1 LBL A
```

```
2 STO 0
3 0
4 ENTER
5 1
6 INTEGRAL 0
7 RTN
8 LBL 0
9 RCL 0
10 Y^X
11 CHS
12 1
13 +
14 X<>Y
15 CHS
16 1
17 +
18 /
19 RTN
```

Put 30.52359523 on stack, run A, and get: 4.012007.

Hi, Egan:

Egan posted:

*"Put 30.52359523 on stack, run A, and get: 4.012007."*

Yes, very nice and short solution, congratulations ! It agrees with mine to 12 digits save a few ulps, and your HP-15C program does indeed return 4.012007 in FIX 6, taking not too long.

By the way, you can easily make your 19-step HP-15C program a full *five steps shorter* (and slightly faster as well) by taking advantage of the HP-15C's extensive instruction set, as follows:

```
01 LBL A
02 MATRIX 1
03 X<> 0
04 0
05 INTEGRAL 0
06 RTN
07 LBL 0
08 RCL 0
09 Y^X
10 RCL- 1
11 1
12 Roll Up
13 -
14 /
```

In your original program, even the use of register 0 can be avoided altogether if needed, so using no numbered registers at all.

Congratulations again and I look forward to further contributions from you.

Best regards from V.

not sure how to get an exact symbolic value. i could "compute"  $\pi/4$  in symbolic mode, but i don't think that counts as evaluating the integral (although the problem doesn't say it requires the integrals to be evaluated).

progress made:

- $I_1 == I_2$ , since in  $I_1$ , let  $\tan y = x$  to get  $I_2$  in  $y$ .
- replacing 4.012007 with  $k$ , and considering  $I$  as  $I(k)$ , i can show  $I(2n)$  are all  $\pi/4$ ,  $n \geq 1$ . also  $I(2) == I(1)$ .
- $I(k)$  appears to be a constant  $k \geq 1$ . haven't proved this. not even sure it's true. maybe  $k$  has to be rational?

idea: prove  $I(4.012007) == I(1)$  or  $I(2)$  and find some dandy way to sym integrate the latter to  $\pi/4$ .

anybody?

50g:

$I_1$ :

Put on the stack:

```
4: 0
3: Inf
2: 1/((1+X^2)*(1+X^4.012007))
1: X
```

Press Integral (Right Shift TAN), then press EVAL, results:

.785398163394

To get symbolic press:

CONVERT (Left Shift 6), F4 (REWRITE), NXT, F6 (->QPI), results:

$(1/4)*\pi$

$I_2$ :

Put on the stack:

```
4: 0
3: PI/2
2: 1/(1+Tan(x)^4.012007)
1: X
```

Press Integral (Right Shift TAN), then press EVAL, results:

.785398163394

To get symbolic press:

CONVERT (Left Shift 6), F4 (REWRITE), NXT, F6 (->QPI), results:

$(1/4)*\pi$

### Re: stuck on #4

Message #35 Posted by [Egan Ford](#) on 3 Apr 2007, 8:33 p.m.,  
in response to message #34 by Egan Ford

I forgot to add a program for I1:

```
%%HP: T(3)A(R)F(.);
\<< 0. \oo 1. X 2. ^ + 1. X 4.012007 ^ + * INV X \.S EVAL \->Q\pi
\>>
```

I2 is equally as trival:

```
%%HP: T(3)A(R)F(.);
\<< 0. \pi 2. / X TAN 4.012007 ^ 1. + INV X \.S EVAL \->Q\pi
\>>
```

Edited: 3 Apr 2007, 8:39 p.m.

### Re: stuck on #4

Message #36 Posted by [hugh steers](#) on 4 Apr 2007, 4:26 a.m.,  
in response to message #34 by Egan Ford

hi egan,

that's what i did first, but i wouldn't call that a sure answer because you have no proof that your answer is exactly  $\pi/4$ . my interpretation of symbolic in this context is one in which approximations have not been used.

for example, maybe the answer is  $22/83 + 11/34 + 37/188$  which if you calculate on the 50g and press ->QPI you also get  $\pi/4$ .

my motivation for doubt is that if you replace 4.012007 with 4, straightforward integration is possible to give  $\pi/4$  and how can you prove the perturbation of .012007 does not, in fact, change the answer very very slightly away from  $\pi/4$ .

what i've been trying to do is show replacing 4.012007 with 4 (or something else) does not alter the result and then go with that. performing ->QPI on the simplified integrand is then more credible.

any ideas?

### Re: stuck on #4

Message #37 Posted by [Egan Ford](#) on 4 Apr 2007, 10:49 a.m.,  
in response to message #36 by hugh steers

You are probably right ->Qpi should not be used. I also noticed that if I change 4.012007 to 4 or 9 for that matter that I still get  $4/\pi$  (in approx mode).

**Re: stuck on #4**

Message #38 Posted by *[hugh steers](#)* on 8 Apr 2007, 10:43 a.m.,  
in response to message #37 by Egan Ford

i have a symbolic solution for #4.

because the calculator can't solve the problem itself symbolically, my approach is to prove the problem is equivalent one that the calculator \*can\* solve symbolically. consider the following lemma,

<http://www.voidware.com/tmp/lem1.jpg>

now, by putting  $\lambda = 4.012007$ , the lemma tells us we only have to calculate the definite integral of  $1/(1+x^2)$  between 0 and 1

so now the calculator part (using the 50g):

enter the integral (rpn mode):

ALPHA X 2 ^ 1 + 1/x

integrate symbolically,

CALC INTVX

substitute the limits and simplify,

0 1 CALC PREVAL

leaves the symbolic answer  $\pi/4$  on the screen.

for the second part of problem #4, the substitution  $\tan y = x$  transforms the integral into the first problem. therefore the answer is the same again.

IANS, Benford's law. Simply put, for natural (random) events the probability for any starting  $n$  is  $\log((n+1)/n)$ .

Seeing is believing. I generated as many  $2^x$  and  $3^x$  numbers as I could in a reasonable amount of time. (I used Perl, but with any 12 digit model you should be able to generate 1023  $2^x$  numbers and 646  $3^x$  numbers). After generating the 2 tables of numbers I computed the ratio of starting 1s, 2s, 3s, etc... within each set. Incredibly it matched  $\log((n+1)/n)$ , i.e. the number of 1s/1023 (for the  $2^x$  case) and the number of 1s/646 (for the  $3^x$  case) equaled  $\log((1+1/1))$ . The same was true for the 2s, 3s, etc... Benford's law is not limited to only the starting digit, but any sequence of starting digits. After removing the decimals from my tables (the larger numbers were formatted n.nnn...ennn) I checked various random starting numbers, such as 12, 123, 55, etc... All ratios in both tables matched  $\log((n+1)/n)$ , i.e.,  $\log(13/12)$ ,  $\log(124/123)$ ,  $\log(56/55)$ ...

I concluded that if  $A \leftrightarrow B$  and  $i \leftrightarrow j$ , then  $P(A,M) = P(B,M)$ , and therefore  $P(A,M) - P(B,M) = 0$  for any  $M$ .

Message #42 Posted by [GE](#) on 5 Apr 2007, 4:27 a.m.,  
in response to message #41 by Egan Ford

Hello, just to see if I understand your point.

First bizarre thing :

Any number starts with either 1, 2, 3, 4, 5, 6, 7, 8 or 9.

So since the probability of all these cases must be 1 (one), I get with that Benford's law :

$1 = \log(2)/1 + \log(3)/2 + \log(4)/3 + \log(5)/4 + \log(6)/5 + \log(7)/6 + \log(8)/7 + \log(9)/8 + \log(10)/9$   
That equality is very surprising.

Second bizarre thing :

- Is  $P(1,1) = 1$  ?

- Is  $P(A,M) = P(B,M)$  for any  $A, B$  and  $M$  (true of course if  $A=B$ ) ?

- If both are true, does it mean that for any  $B$  :  $P(B,1) = 1$  ?

That last theorem is very powerful and contradicts badly my guts feelings.

As Valentin can testify, I can make mistakes...

Please put my mind at rest !

### Re: Short & Sweet Math Challenge #18: April 1st, 2007 Spring Special

Message #43 Posted by [Valentin Albillo](#) on 5 Apr 2007, 9:59 p.m.,  
in response to message #42 by GE

Hi, GE:

GE posted:

*"As Valentin can testify, I can make mistakes..."*

Yes, I testify. Here you are, a few more. Let's see:

*"I get with that Benford's law :  $1 = \log(2)/1 + \log(3)/2 + \log(4)/3 + \log(5)/4 + \log(6)/5 + \log(7)/6 + \log(8)/7 + \log(9)/8 + \log(10)/9$  That equality is very surprising."*

First mistake: it is not:

$$1 = \log(2)/1 + \log(3)/2 + \log(4)/3 + [\dots] + \log(10)/9$$

but:

$$1 = \log(2/1) + \log(3/2) + \log(4/3) + [\dots] + \log(10/9)$$

which taking into account that, informally speaking,  $\log(a)+\log(b)$  equals  $\log(a*b)$ , then the expression is equivalent to:

$$1 = \log\left(\frac{2}{1} \frac{3}{2} \frac{4}{3} \frac{5}{4} \frac{6}{5} \frac{7}{6} \frac{8}{7} \frac{9}{8} \frac{10}{9}\right) = \log(10)$$

which is hardly surprising because your "log" should be *base-10 logarithms*, i.e. "lgt" in HP-71B BASIC. "Log", unqualified, is normally understood to be natural logarithms, also notated as "ln".

*"Second bizarre thing : - Is  $P(1,1) = 1$  ? - Is  $P(A,M) = P(B,M)$  for any  $A, B$  and  $M$  (true of course if  $A=B$ ) ? - If both are true, does it mean that for any  $B : P(B,1) = 1$  ? That last theorem is very powerful and contradicts badly my guts feelings."*

The problem's description specifies that neither A nor B can be a power of 10, and as it happens, 1 is a power of 10, namely  $10^0$ , so Benford's law does not apply in that case. Any non-negative integer power of 10 (1 included) begins exclusively by 1, 10, 100, ..., obviously.

I hope your mind is at rest now. Thanks for your interest and

Best regards from V.

## **Re: Short & Sweet Math Challenge #18: April 1st, 2007 Spring Special**

Message #44 Posted by **GE** on 6 Apr 2007, 3:57 a.m.,

in response to message #43 by Valentin Albillo

Thanks !

It was not obvious from E.Ford's message that he was using base 10 logarithms. I hope he did.

Also, it is quite strange to take into account 1 as a leading number both in its "1" form and "10" form. This accounts for my misunderstanding.

Last, it was not stated that Benford's law doesn't apply for powers of the base.

Again, let me say that your challenges are a real pleasure to bang one's head at, and this one is *\*\*especially\*\** mind-boggling. I can't even say which one is the most novel, intriguing piece of math (well #1 is a bit too machine-specific to my taste...).

Best regards

Message #45 Posted by [Valentin Albillo](#) on 6 Apr 2007, 11:22 a.m.,  
in response to message #44 by GE

Hi, GE:

Thank you very much for your continued appreciation of my humble work.

Despite the long 6-month pause since my latest S&SMC#17, this "Spring Special" (aka "April's Fool") S&SMC#18 hasn't been as successful as I hoped it would be.

Perhaps people are too tired of these mostly mathematical ramblings or maybe people are out enjoying the Easter holidays or whatever, but there's been less inputs than, in my humble opinion, these subchallenges deserved.

In particular, *subchallenge #5 is a real marvel*, both from the mathematical and the strictly computational points of view, with its amazing result and the hard fact that our calculators may 'deceive' us without we being even aware. It's also very important from a theoretical point of view, and if some facts about it could be proved, it would make worldwide headlines in the mathematical research world.

Yet, despite the additional fact that it's very easy to program, noone seems interested in it and it has received exactly zero inputs. A real pity. :-(

Enough 'rants' :-) Thanks and

Best regards from V.

Hello Valentin,

Quote:

Yet, despite the additional fact that it's very easy to program, noone seems interested in it and it has received exactly zero inputs. A real pity. :-(

I was tired and sleepy this afternoon, but since you have called our attention I gave it a try. No in-depth analysis, just a quick program and the outputs but at least a start. I am looking forward to more solutions and, of course, to your final comments and solutions.

Best regards,

Gerson.

## #5

Message #47 Posted by **Gerson W. Barbosa** on 6 Apr 2007, 3:00 p.m.,  
in response to message #1 by Valentin Albillo

Hello Valentin,

Here is an attempt to number 5:

A simple 32SII program:

```

LBL A          *
0             84
STO i         +
STO X        RCL M
LBL B          x^2
1             30
STO+ i       *
4             89
RCL* i       RCL* M
STO M        -
ENTER        64
ENTER        +
ENTER        x<>y
8            /
*            16
64          RCL* X
-            +
*            FP
178         STO X
+           LASTx
*           IP
206         R/S
-           GTO B

```

```

A: CK=57E9  006.0
B: CK=E781  063.0

```

```

XEQ A -> 3
R/S -> 2
R/S -> 4
R/S -> 3
R/S -> 15
R/S -> 6
R/S -> 10
R/S -> 8
R/S -> 8

```

1. These are the first hexadecimal digits of pi:

3.243F6A88

2. The next 9 digits given by the program are:

8, 2, 3, 9, 6, 15, 5, 7 and 11

Only the first digit in this sequence is correct, due to rounding errors.

3. This would require further analysis. All I can say, the formulas gives at least 15 correct digits on sixteen-digit machines.

Best regards,

Gerson.

Hi, Gerson:

Your solution is correct, congratulations ! :-)

I'll post my original solutions and comments within 48 hours, so you've got plenty of time to add whatever you'd like to.

By the way, I've noticed that you last edited your post *exactly at 3:14 p.m.* I assume this was fully intentional, right ? ;-)

Thanks for your continued interest and kind appreciation and

Best regards from V.

**Re: #5**

*Message #49 Posted by [Gerson W. Barbosa](#) on 7 Apr 2007, 8:10 a.m.,  
in response to message #48 by Valentin Albillo*

Hi, Valentin!

Quote:

By the way, I've noticed that you last edited your post *exactly at 3:14 p.m.* I assume this was fully intentional, right ? ;-)

You're right! After I posted I noticed I had skipped one line in the 32SII program listing. When I finish to edit my posting I saw it was 3:11 p.m. so I decided to wait three more minutes before saving the edited post :-)

Best regards,

Gerson.

P.S.: I should have used the extra three minutes to correct "the formula<sub>s</sub> gives" to "the formula gives" :-)

*Edited: 7 Apr 2007, 11:45 a.m.*

**S&SMC#18: My Original Solutions & Comments [LONG]**

*Message #50 Posted by [Valentin Albillo](#) on 9 Apr 2007, 7:07 a.m.,  
in response to message #1 by Valentin Albillo*

Hi all,

Thanks to all lurkers and posters alike for your interest in this S&SMC#18, there's been a healthy

number of keen solutions and interesting comments to some of the most difficult subchallenges and I'll now give my original solutions plus assorted relevant comments:

## My Original Solutions:

### 1) (HP-71B specific) Find a root X of:

$$\text{Abs}(\text{Ln}(x*x) - \text{Ln}(x^2)) > 4.012007$$

As Jean-François Garnier early pointed out, this subchallenge seems at first sight to have no solution at all, since you seem to be subtracting two mathematically equivalent quantities and requesting that the difference is to be a relatively large value which can't possibly be brought about by minor rounding errors.

The solution, which is HP-71B specific, lies in the fact that the developing team for the internal ROMs and the Math ROM didn't have the necessary allowances for ROM space and time to be able to fully implement the Math IEEE proposals to consistently handle *signed zero*, most specially when dealing with complex numbers and branch cuts. So there are times when +0 and -0 aren't treated equivalently in a number of complex-valued functions where they should be. This "x\*x vs x^2" affair is but one such case.

Jean-François gave the simplest possible example for the case x\*x versus x^2, where an explicit zero component of a complex value had its sign explicitly changed. This can be further masked out of user's sight by using instead some function or operation that returns a -0 result from some nonzero argument, such as, in degrees, Cos(270).

So, a complex number such as  $X = \text{COS}(270) + i$  will be a particular solution for this challenge, and, in general:

$$\begin{aligned} X &= \text{COS}(270+360*k) + m*i, \\ X &= \text{COS}(-270-360*k) + m*i, \end{aligned}$$

with k integer  $\geq 0$  and  $m \neq 0$  in both cases, will be a solution too. The following short program demonstrates this by evaluating the expression  $\text{LN}(X*X) - \text{LN}(X^2)$  for complex arguments formed using all integer values of the angle between 0 and 360 degrees:

```
10 DEF FNF(X)=LN(X*X)-LN(X^2)
20 OPTION ANGLE DEGREES @ STD @ COMPLEX X @ REAL Y,I
30 FOR I=0 TO 360 @ X=(COS(I),1) @ Y=ABS(FNF(X))>1
40 IF Y THEN DISP "A solution is: x = (COS(";STR$(I);" deg),1)"
50 NEXT I
```

>RUN

```
A solution is: x = (COS(270 deg),1)
```

and, as you can see, only COS(270) results in a difference greater than 1 (or than 4.012007 for that matter, namely  $2*\text{Pi}$ ). So it's not just a question of starting with a *weird* initial value, -0, and not-so-unexpectedly getting *weird* results, the problem is that you can start with such a *nice* integer value as 270 and, totally unaware of this pitfall, get *weird*, outrageously out-of-range results where all other integer (or even real) values in 0-360 would give you no unexpected complications at all.

Even the neighboring values 269.999999999 and 270.000000001 will return the expected results,

but there's a huge, abnormal discontinuity exactly at 270 degrees in this case.

---

**2) (any model) Write a program that takes as input three positive integers  $A, B, M$  ( $A, B$  not being exact powers of 10), and outputs the difference between the probabilities  $P(A, M)$  and  $P(B, M)$  that two random powers of  $A$  and  $B$  (say  $A^i$  and  $B^j$  for some random positive integers  $i, j$ ) begin with  $M$ .**

---

This subchallenge was also cleverly solved by Egan Ford, and indeed the solution is a program which simply outputs 0, regardless of the inputs.

This is based on the proven fact that the probability that a power of any positive integer  $A$ , whose logarithm to the base 10 is *irrational* (i.e.: any positive integer other than a power of 10), begins with the digits that represent the number  $M$  (in decimal notation) is

$$P(A, M) = \text{LGT}(1 + 1/M)$$

i.e.: *independent of  $A$* . This is actually quite easy to prove, both formally and informally, and due to its independence of  $A$ , *the difference of both probabilities is always 0*, regardless of the values of  $A$  and  $B$  within the original constraints.

---

**3) (any model) Let  $F(X)$  be a function defined thus for positive  $X$ :**

$$\begin{aligned} F(1) &= 1 \\ F(X) &= F(X-1) + 1/X \end{aligned}$$

**Write a program that, given any value  $N > 1$  and  $N < 200$  (for 10-digit models) or  $N < 1000$  (for 12-digit models), will find with the maximum possible accuracy a value  $X$  such that  $F(X) = N$ . Use your program to find  $X$  such that  $F(X) = 4.012007$**

---

This definition is one of the many that can be formulated for the Harmonic Number function,

$$H(N) = 1 + 1/2 + 1/3 + \dots + 1/N$$

The challenge resides in how to *extend* the function's domain to *arbitrary real values*, as the given definition is only useful for discrete positive integer values, which is perfectly Ok as a theoretical definition is not necessarily an effective computation scheme.

This is quite similar to the well-known factorial function,  $N!$ , usually defined as

$$\begin{aligned} F(0) &= 1 \\ F(X) &= F(X-1) * X \end{aligned}$$

which can only be used to compute the function for discrete positive integer values, and its extension to arbitrary real (and even complex) values  $X$ , usually known as Gamma function, requires a new definition which totally agrees with the discrete case and further meets a number of continuity requirements, etc.

In our case,  $H(N)$ , a simple but appropriate extension would be this:

$$H(N) = \int_0^1 \frac{1 - (1-x)^N}{x} \cdot dx$$

which coincides with the original definition for all positive integer values of  $N$ , plus it also works

for suitable positive real arguments.

An HP-71B program to find N for a given value of F(N) would then simply be:

```
10 DESTROY X,N @ INPUT "F(N)=" ;N @ X=FNROOT(1,100,LN(FVAR)+.577-N)
20 DISP FNROOT(X-1,X+1,INTEGRAL(0,1,1E-12,(1-(1-IVAR)^FVAR)/IVAR)-N)
```

```
>RUN
  F(N)=4.012007 [ENTER]
```

```
30.523595225 (25.37 sec. in Emu71)
```

which can be shortened to a single line, or directly evaluated from the command line with no program necessary, but as written we first compute a suitable first approximation by using a well-known asymptotic approach to H(N) (which involves the EulerGamma constant 0.577...), and this initial approximation is then used to bracket the two initial guesses for the FNROOT (Solve) built-in function when applied to the integral extension in order to appreciably reduce computation time. The single-line version works the same, but takes longer unless you supply good initial guesses.

**4) (any model) Write a program, command line or key sequence to compute the exact symbolic value of (in radians mode):**

$$I_1 = \int_0^{\infty} \frac{1}{(1+x^2)(1+x^{4.012007})} dx$$

$$I_2 = \int_0^{\pi/2} \frac{1}{(1+\tan(x)^{4.012007})} dx$$

As some of you quickly found out, both integrals are one and the same upon a simple change of variables. Furthermore, the value of

$$I = \int_0^{\pi/2} \frac{1}{(1+\tan(x)^S)} dx$$

is independent of the particular value of S, i.e. it is the same whether S = 4.012007 or S = 2007, or S = 0 for that matter, so we can take S = 0 and then the integral's value always will be:

$$I_2 = \int_0^{\pi/2} \frac{1}{(1+\tan(x)^0)} dx$$

$$= \int_0^{\pi/2} \frac{1}{2} dx = \pi/4.$$

As for a program to compute this, it suffices to supply the integrand 1/2 to any integration

program or built-in functionality, and either recognize the computed value by comparing it with submultiples of Pi or else call QPI or any other such program to do the recognizing, that is, assuming your HP model doesn't feature some CAS because if it does, any CAS can symbolically evaluate the definite integral of  $1/2$  and return  $\text{Pi}/4$  at once. The details are absolutely trivial.

The fact that the original general integral is independent of the value of S is but a particular case of a much more general, extremely powerful, multiparameter *master formula* whose value also happens to be independent of one of its parameters. For instance, a particularized case for three specific values of its parameters would get us this unusual exact symbolic computation:

$$I = \int_0^{\text{Inf}} \frac{dx}{(x^4 + (1+2*\text{Sqr}(2))*x^2 + 1)*(x^{100} - x^{98} + \dots + 1)} = \text{Pi}/(2*(1+\text{Sqr}(2)))$$

5) (any 12-digit model) Given the succession defined thus:

$$X_0 = 0$$

$$X_N = \text{FractionalPart}\left( 2^4 * X_{N-1} + \frac{30 * M^2 - 89 * M + 2^6}{2^3 * M^4 - 2^6 * M^3 + 178 * M^2 - 206 * M + 84} \right)$$

$$\text{where } M = 2^{2*N}$$

write a program to compute the first 9 terms ( $X_1, X_2, \dots$ , etc.)

The following routine for the HP-71B implements the above recurrence:

```
10 X=0 @ Z=0 @ FOR N=1 TO 9 @ M=2^2*N
20 X=FP(2^4*X+(30*M^2-89*M+2^6)/(2^3*M^4-2^6*M^3+178*M^2-206*M+84))
30 DISP INT(2^4*X); @ NEXT N @ DISP
```

>RUN

2 4 3 15 6 10 8 8 8

which happen to be *the first 9 hexadecimal digits of the fractional part of Pi*. This HP-71B program, which of course uses 12-digit arithmetic, can't do better and the very next terms are all wrong, starting with the 10<sup>th</sup> which comes out as 2 instead of the correct 5. This is a problem of insufficient computational precision, not of the formula itself. So the correct answer to the first question is:

"The N<sup>th</sup> term is the N<sup>th</sup> hexadecimal digit of the fractional part of Pi"

Surprisingly, it is not known if this is true for the *whole* infinite sequence, but it's been proved that there can only exist a finite number of exceptions, and the formula has been numerically checked correct for the first 1,000,000 terms.

The theoretical importance of this sequence lies in the following fact: if it could be proved that the generated terms are *uniformly distributed* in the range 0-16, then Pi would be proved *normal* to base 16 (and also to base 2).

Currently, Pi hasn't been proved to be normal to *any* base, despite the fact that more than  $10^{12}$

digits of Pi have been computed and they pass all statistical tests for normality to all bases, and despite the proven fact that *almost all* real numbers are normal to *all* bases.

---

**6) (HP-15C specific) Assuming A and B are both NxN matrices and that their elements are integer numbers less than 5,000,000,000, write a program that will exchange their contents, for NxN up to and including 5x5.**

---

The problem here is that, not being able to use any conditional instruction, it's quite impossible to exchange the elements using a loop, and further there's not enough RAM to define an auxiliary 5x5 matrix to help make the exchange. The correct solution is thus the following 11-step program for the HP-15C:

```

LBL A
RCL MATRIX A
RCL MATRIX B
RESULT A
+
RCL MATRIX A
LAST X
RESULT B
-
RESULT A
+

```

which succeeds in exchanging the contents of A and B by arithmetic means, without loss of precision because due to the original constraints on the elements, no intermediate result ever exceeds the allowed range for exact integers. Paul Dale correctly saw the right arithmetic approach, with his quickly concocted 13-step solution.

---

**7) A very interesting and commonsense-defying subchallenge which no one took (perhaps Calculus-themed challenges aren't that popular here), thus best left for a future Datafile article.**

---

**8) (any model) Write a program to find, compute, and print all square factorials  $N!$  from  $N=1$  to  $N=512$ .**

---

Despite this being an "April's Fool" subchallenge, which frequently need some lateral thinking nevertheless, and despite my hints suggesting the need to think plainly about what a "square" is (the kind of way Sesame Street's Grover would explain the concept to toddlers, which probably wouldn't grasp irrationals, complex arguments, modular residues, and existence proofs), noone stumbled upon the correct interpretation initially.

The alleged "squareness" of the sought-for factorials made actually no reference to their *\*value\** but to their *\*shape\** when printed. For instance,  $12!$  can be printed thus:

```

4 7 9
0 0 1
6 0 0

```

which, sure enough, it's pretty square on paper or screen. This is possible because  $12! = 479001600$  is a 9-digit integer, and thus, having a *square* number of digits, it can be printed as a square array of digits, which is all perfect and good and quite pleasant from an aesthetic point of view.

The concept itself is hardly new and I saw it for the first time several decades ago in one of Martin

Gardner's extremely popular Scientific American columns, where he discussed not only "square" factorials, but "polygonal" factorials in general, including a very nice-looking, pretty-printed "octogonal" factorial !

All we need then is some program which can detect which factorials from 1! to 512! do have an square number of digits, compute them to full precision, and print them as an square array of digits.

This short program (465 bytes) is my complete solution for the HP-71B, which includes a *multiprecision factorial-computing subprogram*, **BIGFACT** (which accepts two parameters, one by value which is the integer argument, the other by reference, which is a string variable where the resulting multiprecision factorial representation will be returned), and a simple "driver" program, **SQRFACT**, which finds out which factorials do have an square number of digits by using a simple Stirling approximation, then calls **BIGFACT** to fully compute the ones found in order to subsequently print them (20 in all):

```

100 DESTROY ALL @ FOR N=1 TO 512
110 D=MAX(SQR(INT(N*LGT(N/EXP(1))+LGT(2*PI*N)/2+LGT(1+1/12/N))+1),1)
120 IF FP(D) THEN 140 ELSE DIM S$[D*D] @ CALL BIGFACT(N,S$) @ DISP N;LEN(S$)
130 FOR I=1 TO D @ DISP S$[1+(I-1)*D,D+(I-1)*D] @ NEXT I
140 NEXT N
150 !
160 SUB BIGFACT(N,S$) @ OPTION BASE 0 @ K=9 @ L=10^K @ STD
170 M=INT((N*LGT(N/EXP(1))+LGT(2*PI*N)/2)/K)+1 @ DIM F(M)
180 MAT F=ZER @ F(0)=1 @ FOR I=2 TO N @ MAT F=(I)*F @ FOR J=0 TO M-1
190 T=F(J) @ IF T>=L THEN F(J+1)=F(J+1)+T DIV L @ F(J)=MOD(T,L)
200 NEXT J @ NEXT I @ P=1 @ S$="" @ B$="" @ FOR I=M TO 0 STEP -1
210 IF F(I) AND P THEN P=0 ELSE IF P THEN 230 ELSE B$="0"
220 A$=STR$(F(I)) @ S$=S$&RPT$(B$,K-LEN(A$))&A$
230 NEXT I

Hi, Hugh:

Hugh posted:

**"Can you reveal the "master" formula ?"**

Certainly, here you are (9-page, 124 Kb PDF document):

["An Integral With Three Parameters" \(by George Boros & Victor H. Moll\)"](#)

The particular definite integrals I used in my subchallenge can be found at **Example 3.6** in page 4 of the above excellent PDF document, where you'll also find an incredible wealth of awesome symbolic evaluations.

Thanks for your interest and

Best regards from V.

Message #53 Posted by [hugh steers](#) on 10 Apr 2007, 2:19 p.m.,  
in response to message #52 by Valentin Albillo

hi valentin,

thanks for posting the pdf paper with the master formula, it is interesting. i am hoping you (or someone) can help me understand something about lemma 2.1. which says, if  $f(1/x) = x^2 \cdot f(x)$  then integral  $f(x)/(1+x^b)$  from 0 to infinity is independent of b. a detailed proof is not given only the phrase; the proof follows easily from differentiation wrt b and put  $x \rightarrow 1/x$ .

This is what i originally tried with your problem #4. the the end i managed to prove it another way because i got stuck with trying to show  $dI/db = 0$  which is what i presume is done in the paper.

from lemma 2.1, if i try the "follows easily" bit, i get this:

<http://www.voidware.com/tmp/lem21.jpg>

but how is this necessarily zero, or have i made a mistake?

any help?

### **Re: S&SMC#18: A nicer demonstration**

Message #54 Posted by [Valentin Albillo](#) on 10 Apr 2007, 8:49 p.m.,

Hi, Hugh:

Hugh posted:

*"i am hoping you (or someone) can help me understand something about lemma 2.1 [...] a detailed proof is not given only the phrase; the proof follows easily from differentiation wrt b and put  $x \rightarrow 1/x$ ."*

Well, I assume you're experienced enough in all things mathematical to know that

*"... the proof follows easily ..."*

actually means

"... only to PhD's who specialize in that field, or to instructors who have taught the course 100 times ..."

i.e. the resulting integral after differentiation under the integral sign indeed is identically zero, but the above actual meaning fully applies.

Fortunately with a little ingenuity and experience in formal manipulation of mathematical entities it's perfectly possible to get away with the awkward differentiation process and concoct instead a much nicer demonstration of your Lemma 2.1, in the sense that all steps are *crystal-clear* and I'll get you *directly* to a this-time-fully-obvious result. Bear with me:

1. Assuming that  $f(x)$  is a function that satisfies the functional equation  $f(1/x) = x^2 \cdot f(x)$ , I'll try and demonstrate that the value of the definite integral:

$$\int_0^{\infty} \frac{f(x)}{1+x^b} \cdot dx$$

does **not** depend on  $b$ .

2. To that effect, I first split the integral into two parts:

$$\int_0^{\infty} \frac{f(x)}{1+x^b} \cdot dx = \int_0^1 \frac{f(x)}{1+x^b} \cdot dx + \int_1^{\infty} \frac{f(x)}{1+x^b} \cdot dx$$

3. Now I left the first part alone and perform the change of variable:

$$x = 1/t \quad (\text{so } dx = -1/t^2)$$

on the second part, so that (after cosmetically replacing on the fly the dummy variable  $t$  for  $x$  again in order to keep the same variable in both parts) the sum now becomes:

$$\int_0^{\infty} \frac{f(x)}{1+x^b} \cdot dx = \int_0^1 \frac{f(x)}{1+x^b} \cdot dx + \int_1^{\infty} \frac{f(1/x)}{1+(1/x)^b} \cdot \frac{1}{x^2} \cdot dx$$

4. Now, still focusing our attention on the second part, I'll multiply both numerator and denominator by  $x^b$  so that I'll have:

$$\int_1^{\infty} \frac{f(1/x)}{1+(1/x)^b} \cdot \frac{1}{x^2} \cdot dx = \int_1^{\infty} \frac{x^b \cdot f(1/x)}{x^b + 1} \cdot \frac{1}{x^2} \cdot dx$$

5. Now it's time to make use of the initial assumption, namely that  $f(1/x) = f(x) \cdot x^2$ . Substituting this equivalence in the second part and arranging its denominator in the proper order, I finally get:

$$\int_1^{\infty} \frac{x^b \cdot f(1/x)}{x^b + 1} \cdot \frac{1}{x^2} \cdot dx = \int_1^{\infty} \frac{f(x)}{1+x^b} \cdot dx$$

$$\begin{aligned}
 \int_0^1 \frac{1+x^b}{1+x^b} dx &= \int_0^1 \frac{f(x)}{1+x^b} dx + \int_0^1 \frac{x^b \cdot f(x)}{1+x^b} dx \\
 &= \int_0^1 \frac{f(x) + x^b \cdot f(x)}{1+x^b} dx = \int_0^1 f(x) \cdot \frac{1+x^b}{1+x^b} dx \\
 &= \int_0^1 f(x) dx
 \end{aligned}$$

which does *not* depend on  $b$ , **Q.E.D.**

Nice, uh ? :-)

Thanks for your interest in these mathematical ramblings o'mine and

Best regards from V.

Message #55 Posted by [hugh steers](#) on 11 Apr 2007, 4:12 a.m.,  
in response to message #54 by Valentin Albillo

hi valentin,

thanks very much for your detailed explanation. breaking up the integral is exactly what i did in my original post for the solution to #4, but i didn't have the general  $f(x)$  bit, only your original integrand. differentiating did not lead me anywhere helpful.

the paper, then, is a bit misleading because, the claimed, differentiation does not lead to a simple answer. i wondered if the authors knew of some "standard" result that allowed the differentiated version to be dismissed as zero quickly.

thanks again and thanks for your interesting challenges.

### Re: A few more comments on item#1

Message #56 Posted by [J-F Garnier](#) on 9 Apr 2007, 9:23 a.m.,  
in response to message #50 by Valentin Albillo

I think the unexpected result for  $\text{LN}(X*X) - \text{LN}(X^2)$  is not directly linked to the signed 0 implemented in the HP-71B. It is perfectly consistent that:

$$\begin{aligned}
 \text{LN}((-1, 0)) &= (-1, \text{PI}) \\
 \text{and} \\
 \text{LN}((-1, -0)) &= (1, -\text{PI})
 \end{aligned}$$

even if the two numbers  $(-1,0)$  and  $(-1,-0)$  are considered as equal:

$((-1,0)=(-1,-0))$  is 1 (i.e. true)

BTW, this is an example of a violation of the rule that states that if  $X=Y$  then  $f(X)=f(Y)$ . Another obvious violation is that  $1/0$  is different from  $1/(-0)$ . Maybe this is why HP abandoned the signed 0 in the next Saturn-based machines.

We could argue that the branch cut for LN complex function should turn  $-PI$  into  $+PI$ . But the HP-71B numeric constant  $PI$  is an approximation and the cut is not exactly  $PI$ .

The root cause is, in my opinion, that

$(-0,1)*(-0,1)=(-1,-0)$

but

$(-0,1)^2 = (-1,0)$

instead of  $(-1,-0)$  due to rounding effects. If it was  $(-1,-0)$ , no abnormal result would occur.

As a final point, this problem was specific to the HP-71B in the handheld calculator domain, but if we include classic desktop HP calculators, we can find other examples, that have nothing to do with the signed 0:

For example, the 9816/26, and other HP9000 serie 200/300 calculators using the HP Basic (I used version 6.2 running on a Viper PC card):

```
10 COMPLEX X
20 X=-CMPLX(0,1)
30 DISP X*X,X^2,LOG(X*X),LOG(X^2)
40 END
results are:
-1 0      -1 -1.22E-16      0 3.141592653589      0 -3.141592653589
```

Anyway, congrat to Valentin for proposing this interesting and unexpected challenge!

J-F

*Edited: 9 Apr 2007, 9:34 a.m.*

### **It's not due to rounding, J-F.**

*Message #57 Posted by [Valentin Albillo](#) on 10 Apr 2007, 6:54 a.m.,  
in response to message #56 by J-F Garnier*

Hi, Jean-François:

Jean-François posted:

*"The root cause is, in my opinion, that  $(-0,1)*(-0,1)=(-1,-0)$  but  $(-0,1)^2 = (-1,0)$  instead of  $(-1,-0)$  due to rounding effects."*

It has nothing to do with rounding, J-F. Your statement seems to imply that multiplication of such small constants has no rounding errors whatsoever, while raising a complex number to the 2<sup>nd</sup> power does entail some complicated operations which are prone to suffer from some rounding errors, however small, and this is what causes the incorrectly signed zero.

If that's what you mean, while plausible, let me assure you that this is not so, rounding has nothing to do with the differently signed zero, the same problem of incorrectly signed zeros does appear in operations not involving raising a complex number to a power but just a simple multiplication of small constants, say, where no rounding errors are possible.

*"Anyway, congrat to Valentin for proposing this interesting and unexpected challenge!"*

Thank you very much, I always appreciate your excellent inputs to my challenges and mini-challenges and always will be indebted to you for [Emu71](#), which is a most awesome HP-71B emulator without which most of my articles and challenges would have never seen the light.

Best regards from V.

### **Re: S&SMC#18: Problem #7**

*Message #58 Posted by [Eamonn](#) on 9 Apr 2007, 2:10 p.m.,  
in response to message #50 by Valentin Albillo*

Hi Valentin,

Thanks again for the entertaining challenge. I read through your solution and you point out that no one attempted #7. I searched online to see how non-integer derivatives are defined and found an explanation at the Mathworld site that led to the following two solutions that I hope are not too late for submission

For the first part of the challenge, here is a program that runs on the HP-32S/32S-II/33S:

```
LBL A
INPUT X
INPUT M
INPUT N
X!
RCL N
RCL -M
X!
/
RCL X
RCL N
RCL -M
Y^X
*
RTN
```

For  $M=4.012007$ ,  $N=\pi$  and  $X=e$ , this returns the value 0.414943481568.

For the second part of the challenge, I believe that the following program should suffice:

```
LBL B
INPUT C
INPUT M
INPUT X
RCL M
+/-
Y^X
RCL C
*
RCL M
+/-
X!
/
RTN
```

With  $M=e$ ,  $C=4.012007$  and  $X=\pi$ , this program returns the result 0.068980430225.

Best Regards,

Eamonn.

**Re: Problem #7 (Non-integer order derivatives)**

Message #59 Posted by **Valentin Albillo** on 10 Apr 2007, 5:08 a.m.,  
in response to message #58 by Eamonn

Hi, Eamonn:

Eamonn posted:

*"Thanks again for the entertaining challenge. I read through your solution and you point out that no one attempted #7. I searched online to see how non-integer derivatives are defined and found an explanation at the Mathworld site that led to the following two solutions that I hope are not too late for submission"*

Thanks a lot for your interest and kind words and no, it's *never too late* for submissions, the more (and for the most models) the better, we all can always learn something new or find some worthwhile routine, technique, or idea.

As for your programs and results, they're indeed fully correct and perfectly agree with my own original solutions and numeric values to full 12-digit precision, congratulations.

Just for the record, this is my original solution for the HP-71B, a pair of user-defined functions, callable from either programs or directly from the keyboard alone or as part of other expressions:

```
10 DEF FND(M,N,X)=GAMMA(N+1)/GAMMA(N-M+1)*X^(N-M)
20 DEF FND2(M,C,X)=C*X^(-M)/GAMMA(1-M)
```

The results for part 1, part 2, respectively:

```
>FND(4.012007,PI,EXP(1))
```

.414943481568

```
>FND2(EXP(1),4.012007,PI)
```

.068980430225

which fully agree with yours. The thrill of this particular subchallenge was two-fold:

- On the one hand, the weird, unexpected concept of *non-integer order derivatives*, where most people, even the ones who feel comfortable with Calculus, have never seen nor heard about anything other than integer-order ones: first derivative, second derivative, ...

The mere fact that a non-integer order derivative can be defined, how to go about computing it, how to physically interpret it (if at all) and what its real-life uses might be (if any) are mind-boggling questions to most mathematically-aware people.

- On the other hand, the paradoxical concept that a *constant* function (which always has zero derivative for all positive integer orders), can have non-zero, non-linear derivatives for positive non-integer orders, as can be seen in Part 2 of this subchallenge, where a non-integer derivative of the constant 4.012007 is evaluated for a given X value. This also seems to defy common mathematical sense, not only on computational grounds but on the very meaning of it all.

As you can see, this is a very deep subject that can't be easily dealt with here, so I'll leave

it for a future Datafile article, most likely.

For now, it might be comforting to know that non-integer order derivatives can indeed be soundly defined, they can be efficiently computed, they do have physical interpretation, and most definitely, they do have important real-life applications. The topic is not new (actually it's as old as Calculus itself), but it is now, with the advent of computers, when it finally gets to be studied and applied in full.

Thanks for your excellent solutions and

Best regards from V.

Thanks to all (and Valentin in the first place), this challenge was very hard (and thus very interesting), IMHO this explains the lower than usual number of replies, not at all any lack of interest.

I know I have been reading this forum morning and evening for news on the SSMC. Very much enjoyed !

There are still lots of thing not fully explained...

### **Re: Problem #7 (Non-integer order derivatives)**

*Message #61 Posted by **Eamonn** on 11 Apr 2007, 12:41 p.m.,  
in response to message #59 by Valentin Albillo*

Quote:

The thrill of this particular subchallenge was two-fold:

\* On the one hand, the weird, unexpected concept of non-integer order derivatives, where most people, even the ones who feel comfortable with Calculus, have never seen nor heard about anything other than integer-order ones: first derivative, second derivative, ...

The mere fact that a non-integer order derivative can be defined, how to go about computing it, how to physically interpret it (if at all) and what its real-life uses might be (if any) are mind-boggling questions to most mathematically-aware people.

\* On the other hand, the paradoxical concept that a constant function (which always has zero derivative for all positive integer orders), can have non-zero, non-linear derivatives for positive non-integer orders, as can be seen in Part 2 of this subchallenge, where a non-integer derivative of the constant 4.012007 is evaluated for a given X value. This also seems to defy common mathematical sense, not only on computational grounds but on the very meaning of it all.

I completely agree. I had not come across such definitions before, so it was a very interesting to see that it is possible to define non-integer order derivatives. And the fact that the non-integer order derivative of a constant is not necessarily zero was also counter-intuitive, but it does follow from

the definition of the non-integer order derivatives.

Thanks again Valentin.

Eamonn.

### Help Page - FAQ?

Message #1 Posted by [Eddie Shore](#) on 31 Mar 2007, 10:02 p.m.

Did we ever talk about putting a FAQ up for HP calculators?

### Re: Help Page - FAQ?

Message #2 Posted by [Raymond Del Tondo](#) on 31 Mar 2007, 11:06 p.m.,  
in response to message #1 by Eddie Shore

There's a [MoHPC FAQ](#) already, covering some of the most frequently asked questions, which are usually of the type RTFM, like the famous 'my HP-xx has decimal points and commas switched'.

And there are several FAQ pages related to HP-48 type calcs on [hpcalc.org](http://hpcalc.org) .

The problem is that noone seems to look at the FAQ pages;-)

HTH

Raymond

### Re: Help Page - FAQ?

Message #3 Posted by [Ron](#) on 1 Apr 2007, 3:37 a.m.,  
in response to message #2 by Raymond Del Tondo

No one looks at FAQ pages, because at most sites, they're not really FAQs. Instead they're QWWTABTNEAs (questions we want to answer, but that nobody ever asks). Also known as QWEOAs (questions with extremely obvious answers), or QWSCAs (questions with self contained answers). Such questions on the MoHPC would be similar to:

1. What model number is my HP 11C?
2. What does MoHPC (Museum of HP Calculators) stand for?
3. Are there very many calculators in the world?
4. Etc...

*Edited: 1 Apr 2007, 3:38 a.m.*

### Re: Help Page - FAQ?

Message #4 Posted by [Thomas Radtke](#) on 1 Apr 2007, 5:25 a.m.,  
in response to message #1 by Eddie Shore

How about turning that FAQ into a sticky thread in this forum?

## **Re: Help Page - FAQ?**

*Message #5 Posted by **Raymond Del Tondo** on 2 Apr 2007, 2:21 p.m.,  
in response to message #4 by Thomas Radtke*

That could be an idea.

However, one could argue that it's already 'sticky'  
on the main page [www.hpmuseum.org](http://www.hpmuseum.org) , near the middle of the page ;-)

### HP-41 digital cassette drive - how to test?

Message #1 Posted by [NRB](#) on 31 Mar 2007, 3:22 a.m.

I have a digital cassette drive and HPIL module, and would like to test the read/write using an HP41CX. Can anyone tell me how to do this? Thanks. - Robert

### Re: HP-41 digital cassette drive - how to test?

Message #2 Posted by [Raymond Del Tondo](#) on 1 Apr 2007, 7:40 a.m.,  
in response to message #1 by [NRB](#)

Hi,

if you have a suitable digital cassette you could insert the cassette into the drive, then perform DIR on the HP-41. The HP-41 should display a directory listing of the tape.

For more detail on using WRTP and READP I'd suggest to take a look into the manual or at least the QRG for the HP 82160A HP-IL module;-)

### Can HP48 transfer via IR to HP50?

Message #1 Posted by [Kevin](#) on 30 Mar 2007, 11:27 p.m.

Sorry to ask such a remedial question. I just got a HP50 to replace my aging HP 48GX (can I just say the new keyboard layout stinks?) and I've got a TON of stuff that I've written over the years that I want to transfer. I can't use my computer since HP seems to not know about Mac... Am I doing something really dumb or do these two machines not transfer via IR? Thanks for help anyone offers. - Kevin

### Re: Can HP48 transfer via IR to HP50?

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 31 Mar 2007, 9:13 p.m.,  
in response to message #1 by Kevin

No. The 48 series "serial IR" is not compatible with the 49 series IrDA.

If you build (or buy) an adapter for the 50g's serial port to make it RS-232 compatible, you should be able to make a "via wire" connection to the 48 series.

Other than that, you'll have to use something else as a "go-between" for the 48 series and the 49g+/50g.

Regards,  
James

*Edited: 31 Mar 2007, 9:28 p.m.*

### Re: Can HP48 transfer via IR to HP50?

Message #3 Posted by [bill platt](#) on 31 Mar 2007, 9:48 p.m.,  
in response to message #2 by James M. Prange (Michigan)

"use something else as a 'go-between'"

...as in download as text file to PC and do a fresh upload to the 50G?

### Re: Can HP48 transfer via IR to HP50?

Message #4 Posted by [James M. Prange \(Michigan\)](#) on 31 Mar 2007, 10:28 p.m.,  
in response to message #3 by bill platt

Quite so.

You bring up a good point; in general, compiled objects are not compatible between the 48 and 49 series, so an "ASCII" or "Text" transfer should be used.

Regards,  
James

## **Re: Can HP48 transfer via IR to HP50?**

*Message #5 Posted by [James M. Prange \(Michigan\)](#) on 31 Mar 2007, 10:52 p.m.,  
in response to message #1 by Kevin*

What are you having problems connecting to a Mac, the 48GX, the 50g, or both?

What ports are available on your Mac? RS-232? IrDA? USB?

Are Kermit-based or Xmodem-based applications available on your Mac? If so, then which ports can they be used with?

Any Kermit-based application should be able to work with all 48 and 49 series. I don't know much about Xmodem (maybe there's more than one "flavour" available?), but the 48G series and newer have it built-in.

But the 49g+ and 50g lack an RS-232 compatible port, which I believe Kermit and Xmodem applications generally expect to use.

That said, I have an RS-232/IrDA adapter which, with the included software, shows up on my PC as a "virtual COM port", which allows me to use at least HyperTerminal to connect with the 49g+ and 50g.

You might be able to use [HPConnect](#) between the 49g+/50g and your Mac for a USB connection.

Good luck.

Regards,  
James

**HP-6S Recovering from a crash**

Message #1 Posted by [Thomas Cox](#) on 30 Mar 2007, 7:03 p.m.

I have used a HP-6S for several years as my "shirt pocket" calculator. Long enough to have replaced the original battery with no problem. But today, it froze in the Radians mode with only partial segments showing and no keystrokes would change the frozen condition. Unit would sometimes show multiple decimal points.

Since there is no keystroke method to do a reset, and no reset switch, I removed the battery and shorted the battery terminals for about 30 seconds. When I removed the short, all possible display segments and indicators were on. Pressing Clear then restored normal operation with only the Solar power.

I reinstalled the battery and everything now seems fine.

As a cheap hand held, the HP-6s is superb. Not very good on a desktop as it will "walk" all over the desktop as keys are pressed.

**Re: HP-6S Recovering from a crash**

Message #2 Posted by [Namir](#) on 30 Mar 2007, 7:45 p.m.,  
in response to message #1 by [Thomas Cox](#)

I like the solar version. I have three 6-s solar units. Any complex calculations I want to do I use Excel, Matlab, and so on.

Namir

### What will replace the 25th anniversary HP 12cp?

Message #1 Posted by [mk](#) on 30 Mar 2007, 12:06 p.m.

When all the 25th anniversary editions of the HP 12 cp are gone, any idea of what will replace it? Will it simply be a duplicate without the 25th anniversary markings or will it be something else?

### Re: What will replace the 25th anniversary HP 12cp?

Message #2 Posted by [Gene](#) on 30 Mar 2007, 12:18 p.m.,  
in response to message #1 by [mk](#)

I hope so (but have no insider knowledge). The color scheme of the 12cp25AE is much better than the original 12cp, IMO.

Maybe they could just change it to the "26th anniversary edition"? :-)

### Re: What will replace the 25th anniversary HP 12cp?

Message #3 Posted by [Jonathan Eisch](#) on 30 Mar 2007, 8:54 p.m.,  
in response to message #2 by [Gene](#)

at this point in the game, why not make a 1x model? One that can be an 11, 12, 15 or 16, just by swapping the keytops? Or build it in to the rom, and let someone do the swap by cracking it open. I really can't imagine it would be "that" difficult.

-Jonathan

### Re: What will replace the 25th anniversary HP 12cp?

Message #4 Posted by [Gene](#) on 30 Mar 2007, 8:57 p.m.,  
in response to message #3 by [Jonathan Eisch](#)

Search the archives and you'll find explanations about why that would in fact be difficult.

Gene

### Re: What will replace the 25th anniversary HP 12cp?

Message #5 Posted by [Raymond Del Tondo](#) on 31 Mar 2007, 9:08 a.m.,  
in response to message #1 by [mk](#)

According to an article in the HPCC Datafile, hp had planned to replace the normal 12cp production with the 12cp25AE for about six months, after which they would switch back production to the 'normal' 12cp. This way nearly everyone should be able to get one of the Anniversary units.

Since the announced time period is over, the normal 12cp should be in production again.

IMHO the 12cp25AE looks \*much\* better than the normal 12cp, only the 'Special Anniversary Leather Case' is a waste of money.

Raymond

**Re: What will replace the 25th anniversary HP 12cp?**

*Message #6 Posted by [Namir](#) on 31 Mar 2007, 5:23 p.m.,  
in response to message #5 by Raymond Del Tondo*

I agree. The leather case looks like it belongs to a Nikon Coolpix digital camera!!!

### **48GX just beeps...**

Message #1 Posted by **Ron** on 30 Mar 2007, 10:31 a.m.

I powered up a 48GX I've had for several years (sitting on a shelf unpowered), and all it does is beep. Powers on okay, but each key causes a beep, and nothing more. If I press the ON key along with some other key, it's a continuous, "beep-beep-beep-beep..." I've tried master clear, the reset hole, and shorting the battery contacts. Any other ideas? Thanks, in advance.

### Just for some Minor Amusement

Message #1 Posted by **Chuck** on 30 Mar 2007, 12:19 a.m.

Teased a few colleagues today with a goofy little math problem...

Which is bigger (i.e., magnitude),  $i^{\pi}$  or  $\pi^i$  ?

One is quite obvious using DeMoivre's formulas. The other takes a little bit of paper and pencil (or you can wimp out and first try it on a calculator ;) Also, can you geometrically explain  $\pi^i$ ? Hmmmmm.

Have fun.

*Edited: 30 Mar 2007, 12:20 a.m.*

### Re: Just for some Minor Amusement (i and pi)

Message #2 Posted by **Karl Schneider** on 30 Mar 2007, 2:29 a.m.,  
in response to message #1 by Chuck

Hello, Chuck --

I've never seen that particular problem, but have worked similar ones.

$$\begin{aligned} \pi^i &= \cos(\ln(\pi)) + i\sin(\ln(\pi)) \\ &= 0.41329 + i*0.91060 \end{aligned}$$

$$\begin{aligned} i^{\pi} &= \cos(0.5*\pi^2) + i\sin(0.5*\pi^2) \\ &= 0.22058 - i*0.97537 \end{aligned}$$

The magnitude is unity in each case because  $\cos^2 x + \sin^2 x = 1$

The HP-15C handles these calculations with aplomb, if not blazing speed:

```

pi^i:      i^pi:

g pi      1
1         Re<->Im
Re<->Im   g pi
y^x       y^x
g ABS     g ABS

```

Here's an archived post of mine that some may find helpful:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=66246#66246>

Message #3 Posted by [Namir](#) on 30 Mar 2007, 6:49 a.m.,  
in response to message #2 by Karl Schneider

Looking at your  $\ln(\pi)$  term made me curious at it's numerical value. With a few calculator keystrokes, I discovered that:

$$\ln(\pi) = \pi - 2 \text{ (with a 0.1 \% error)}$$

and

$$e^{\pi} = 20 + \pi \text{ (with a -0.03 \% error)}$$

Pi continues to be spookie!!!

Namir

**Re: Just for some Minor Amusement (i and pi)**

Message #4 Posted by [Valentin Albillo](#) on 30 Mar 2007, 7:04 a.m.,  
in response to message #3 by Namir

Hi, Namir:

Just for the record, the numbers that *exactly* comply with your two simultaneous conditions are:

$$3.15098043851 \quad \text{and} \quad 2.71057757158$$

to 12 decimal places. Rounding to a mere two places, they would be 3.15 and 2.71, agreeing with **Pi** and **e** to a single ulp.

Best regards from V.

### Looking for HP97 printer gear

Message #1 Posted by [Doug Braun](#) on 28 Mar 2007, 11:40 p.m.

Hello,

I managed to successfully do the O-ring repair on my HP97's card reader, but two days later that plastic gear in the printer started falling apart.

Is that replacement gear still available from pic-design.com? Is that still the best way to repair it, or is there some other source?

Thanks,

Doug

### Re: Looking for HP97 printer gear

Message #2 Posted by [Etienne Victoria](#) on 29 Mar 2007, 2:12 a.m.,  
in response to message #1 by Doug Braun

Hello Doug,

I use one from GHW that I drill to adjust the center hole (see below).

Left: Broken gear, Middle: GHW gear, Right: drilled gear.

[http://etienne.victoria.free.fr/Topcat\\_gear/images/image-2.jpg](http://etienne.victoria.free.fr/Topcat_gear/images/image-2.jpg)

This works fine in my Hp-92 (daily use) and Hp-97.

More details on the procedure on [Isabelle's site](#)

Cheers

Etienne

in response to message #4 by Dia C. Tran

Hello, send me your address to ignaziocaraNOSPAM@tiscali.it, after removing NOSPAM, obviously. I will send you a predrilled gear for free. Regards.

Edited: 29 Mar 2007, 3:52 p.m.

**Re: Looking for HP97 printer gear**

Message #6 Posted by [Etienne Victoria](#) on 30 Mar 2007, 2:29 a.m.,  
in response to message #3 by marais

Hi Andreas,

I put the gear on a Dremel 212 drilling table and use the ref. 628-1,6mm drill at 15000 rpm.

Then, to secure the gear on the printer, I put a rivet cap on the axis instead of the low quality breakable original Hp locking part.

I forgot to put a picture of the tool and rivet on Isabelle's site.

Kind regards from France.

Etienne

But, I thought it has to be drilled to 1,92mm?

The gear must be drilled at 2,35-2,40 mm, IMO.

Ignazio

**Re: Looking for HP97 printer gear, Ignazio is right!**

*Message #9 Posted by **Etienne Victoria** on 31 Mar 2007, 4:05 a.m.,  
in response to message #7 by Steve Borowsky*

Hi all,

Ignazio is right!

I refer to the GHW 753030 gear which is the one I've pictured. The inner diameter is already 2,00mm.

I have remeasured the original Hp gear from my 92 & 97s and it is indeed around 2,30.

All my apologies for posting an incorrect dimension. Isabelle's site has been corrected accordingly.

Thank you Ignazio.

Etienne

I just received the gear from Ignazio and my calc now works beautifully. Thank you Ignazio, didn't know that you had to send it all the way from Italy.

**Re: Looking for HP97 printer gear**

*Message #11 Posted by **Doug Braun** on 6 Apr 2007, 9:30 p.m.,  
in response to message #2 by Etienne Victoria*

Thanks to everybody for all the advice. Before I saw your reply, I ordered a couple of gears from SDP:

<http://www.sdp-si.com/D790/PDF/D790C01036.pdf>

They arrived in only a couple of days, and my printer is already fixed! Their gear is probably identical to the one that PIC-Design sells. I had to trim one end, and use a 3/32"-to-1/8" sleeve. For the sleeve, I used a bit of brass tubing that I got at a hobby store. It was 3/32" ID and 1/8" OD, and it fit perfectly.

I also rebuilt my battery pack with the assembled cells from Digi-Key.

Thanks again to hpmuseum.org and this forum for all the help!

Doug

### What's the best way to do this ?

Message #1 Posted by [Charles](#) on 28 Mar 2007, 5:15 p.m.

I have an Excel spreadsheet with about 170 references to HP calculator programmes (41/25/67/97 etc.) in scientific journals. I'm happy to post it here but I'm not sure of the best way to put it on the site. I've asked Dave and he has suggested putting it on as text. I'm not sure how to do this and keep the format. I also have them available as tif files. Does anyone have any suggestions ?

Thanks Charles

### Re: What's the best way to do this ?

Message #2 Posted by [Giancarlo \(Italy\)](#) on 28 Mar 2007, 5:47 p.m.,  
in response to message #1 by Charles

Hi Charles.

How about pointing all of us to a link to your website (if any) where we could download the file from?

Best regards.

Giancarlo

### I second Giancarlo's suggestion... could it be done?d8^ (N.T.)

### Re: What's the best way to do this ?

Message #4 Posted by [Thomas Okken](#) on 28 Mar 2007, 5:57 p.m.,  
in response to message #1 by Charles

Using OpenOffice, you can open the spreadsheet in Calc, then copy the cells, and then use the Paste Special command in Writer to paste the data as HTML. Finally, save the Writer document as HTML, and you'll have your table data in an HTML table -- nicely formatted, and suitable for putting up on a web site.

The same trick can be used in Microsoft Excel and Word, too, but I don't remember the exact commands to do this. (I have used MS Office to do exactly this kind of thing quite a while back, but I switched to OpenOffice since then.)

- Thomas

### Re: What's the best way to do this ?

Message #5 Posted by [Andrés C. Rodríguez](#) on 28 Mar 2007, 9:09 p.m.,  
in response to message #1 by Charles

Please put your material on the Articles forum, and not here in the general forum, where it will become

covered with daily, less permanent material.

**Re: What's the best way to do this ?**

*Message #6 Posted by [Charles](#) on 31 Mar 2007, 4:43 p.m.,  
in response to message #5 by [Andrés C. Rodríguez](#)*

Thanks for your help. I've spent hours trying various forms of cutting and pasting but can't get it as a table. I've posted on the articles forum and it isn't great looking but at least it is there. I suppose that anyone can download it to a format they would like.

### About Palmer's "Cadillac" Quadratic Solver

Message #1 Posted by [Rodger Rosenbaum](#) on 28 Mar 2007, 3:11 a.m.

Palmer,

I was just reading your Article 593, and working the examples for the 8 cases.

I noticed that case 7 and 8 in this article are the same as the two additional cases in your Article 396, but that the result for R2 in the first additional case in Article 396 doesn't match the result for case 7 in Article 593.

Also, the result for the imaginary part of the roots of the second additional case in Article 396 doesn't match the result for case 8 in Article 593.

The error seems to be in the Article 396 results, and in fact, the R2 result for the first additional case in Article 396 seems to be the square root of the correct result.

### Re: About Palmer's "Cadillac" Quadratic Solver

Message #2 Posted by [Palmer O.Hanson, Jr.](#) on 29 Mar 2007, 10:31 p.m.,  
in response to message #1 by [Rodger Rosenbaum](#)

Rodger:

You are correct that I have published different results for the same problems. The situation is even worse than you describe as it also goes back to the documentation of the extended quadratic for the HP-41 which was where I started playing around with the funny properties. At the moment I don't know why I did that but I have started digging through my notes. I should be able to sort it out by the weekend.

Once again, all I can offer is a mea culpa.

### Re: About Palmer's "Cadillac" Quadratic Solver

Message #3 Posted by [Palmer O. Hanson, Jr.](#) on 30 Mar 2007, 10:41 a.m.,  
in response to message #2 by [Palmer O.Hanson, Jr.](#)

I agree that the errors are in the Article 396 results.

Looking at the first additional case in Article 396:

If  $a = 11,111,119$  ;  $b = 11,111,111$  ;  $c = 11,111,103$

Then  $d = 123,456,78,654,321 - 123,456,786,257 = 64$

Since  $d > 0$

$R1 = (b + \sqrt{d})/a = (11,111,111 + 8)/11,111,119 = 1$

$$R2 = (b - \sqrt{d})/a = (11,111,111 - 9)/11,111,119 = 0.999998560001$$

The value  $0.999999280001 = b/a = 11,111,111/11,111,119$

which is the value for both R1 and R2 if the word length of the machine in use is such that d is calculated as zero.

The correct value of R2 from Article 593 is close to, but not equal to, the square of the incorrect value of R2 in Article 396 where the difference is  $d/a^2$

Of course, that doesn't explain how I managed to publish the incorrect value for R2 in Article 396.

I have yet to figure out where the incorrect value for the imaginary part of the second additional problem came from.

### **Re: About Palmer's "Cadillac" Quadratic Solver**

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 30 Mar 2007, 10:52 p.m.,  
in response to message #3 by Palmer O. Hanson, Jr.*

Quote:

\_\_\_\_\_

I have yet to figure out where the incorrect value for the imaginary part of the second additional problem came from.

\_\_\_\_\_

Now I have:

If you divide 8 by 11,111,119 you will get the value shown in Article 396 for the imaginary part of the answer for the second additional test case. Unfortunately, those are the values for the square root of d and a from the first additional test case!

As a registered Republican I feel comfortable in saying that I can't recall how I did that.

### HP-25 / HP 41C

Message #1 Posted by [marsh](#) on 27 Mar 2007, 1:21 p.m.

hello,

today i found two old HP calculators from my father. i wonder if they still have some value.

HP-25 serial: 1605S32286 equipment: original HP leather case, ac adapter, user guide (german)

HP41C serial: 2041A01654 equipment: only the leathercase and 2 memoryunits

condition: both are used(of course) and a bit dirty, but they still work.

### Re: HP-25 / HP 41C

Message #2 Posted by [Hal Bitton](#) on 27 Mar 2007, 1:52 p.m.,  
in response to message #1 by marsh

Hello Marsh,

Both of those machines are desirable by collectors of vintage HP calculators. If they work and clean up well, I would say each of them would easily bring \$200 (US dollars) or more. Some of the software modules for the HP 41C bring a handsome price when sold separately...what modules do you have? Beware though...if you start working with them, you won't want to part with them :)

Best regards, Hal

### Re: HP-25 / HP 41C

Message #3 Posted by [marsh](#) on 27 Mar 2007, 2:14 p.m.,  
in response to message #2 by Hal Bitton

thanks for the information

i have no idea what software modules that could be. i don't even know how to find out if the memory modules contain anything. these are only the standard memory moudles that were shipped with the hp 41c (i guess)

and i have to update the condition of the HP-25. the battery cover broke on first touch (had a weak point i guess) and after running for 5 minutes on the ac adapter the display is only flashing now.

### Re: HP-25 / HP 41C

Message #4 Posted by [marsh](#) on 27 Mar 2007, 2:22 p.m.,  
in response to message #3 by marsh

uhh looks like the HP-25 had a special battery unit (wich is missing) and the battery cover i broke was from a completly different machine

**Re: HP-25 / HP 41C**

*Message #5 Posted by [Ron Ross](#) on 27 Mar 2007, 2:40 p.m.,  
in response to message #4 by marsh*

You may want to look further down on the threads about plugging in the Hp25 w/o a battery pack. It is very likely you may now have a paper weight instead of a collectable calculator (I hope not, but you will need to get a battery pack to confirm).

**Re: HP-25 / HP 41C**

*Message #6 Posted by [Dia C. Tran](#) on 27 Mar 2007, 1:53 p.m.,  
in response to message #1 by marsh*

They certainly have values. Check the "Prices and Rarity" section on this website as well as check completed ebay listing. If the calculators are in very good condition then they are worth about the prices when they were new. Of course sometimes they go on ebay for higher prices but sometimes you can get them for almost nothing at a garage or estate sale.

**HP 42S switches off immediately**

Message #1 Posted by [bafana](#) on 27 Mar 2007, 9:01 a.m.

Hi I inherited a 42S and it switches off immediately after switching on. In some cases the display will flash for a split second, in other cases it doesn't show anything. If I press the ON key fast enough I can keep the display on until I release the key.

The self test (ON-LOG) works just fine, and passes OK. But at the end it just switches off. ON-ROOT (the reset function?) works and very briefly display "Machine Reset"

I can even adjust the contrast, and even get it to do calculations if I press a key fast enough at power on, but it switches back off again as before.

Anyone know what is wrong? Is there any higher level reset function I can try?

The batteries are brand new and tested.

**Re: HP 42S switches off immediately**

Message #2 Posted by [Ron](#) on 27 Mar 2007, 9:44 a.m.,  
in response to message #1 by [bafana](#)

I saw one a lot like that on eBay recently. You might do a search, and contact the buyer, as he may have a solution.

**Re: HP 42S switches off immediately**

Message #3 Posted by [Thomas Radtke](#) on 27 Mar 2007, 11:02 a.m.,  
in response to message #1 by [bafana](#)

Looks like a very impatient auto power off functionality. A dead capacitor maybe?

**Have you tried... (was: HP 42S switches off immediately)**

Message #4 Posted by [Vieira, L. C. \(Brazil\)](#) on 27 Mar 2007, 1:37 p.m.,  
in response to message #1 by [bafana](#)

... the master clear procedure? Maybe it helps. Consider that everything stored in user memory is going to be lost, though.

Simply press and release three keys at the same time: [ON], [Sigma+] and [XEQ]. After releasing them, one message telling that all memory was cleared must be shown. If the calculator again flashes a message and turns itself off, then it may have other problems. I once found an HP41 with a bad capacitor showing this kind of behavior, but it has another design.

Hope you succeed.

Luiz (Brazil)

---

Hey, that was my calculator on eBay, and your post is an identical one(cut'n'paste) to MY post on here a while back! :-P

If you are the guy that bought it from me then best of luck getting it fixed, all of the suggestions on this group and other groups did not fix the problem.

No it's not the capacitor(s), or other passive parts, it's not the batteries, and all the power-on reset and battery shorting tricks etc do not work.

If you do find a solution I'd be interested to know what it was.

Dave.

### UserRPL Programming problem

Message #1 Posted by [Franco](#) on 26 Mar 2007, 3:47 p.m.

Hi all, I'm trying to resolve a problem with my 50g: I have three variables "y", "m" and "d" that contain respectively year, month and day of a certain date. I want to do some action only if that date is after a given date (for example, August 14, 1996). The quickest mode that I've found is to divide month and day respectively by 100 and 10000, sum these numbers and make the test. Example: `y m 100 / + d 10000 / + -> test IF test 1996.0814 > THEN...`

It works, but I'm not satisfied. It's inelegant. There is a more elegant way to do this task with my 50g?

Greetings,

Franco

### Re: UserRPL Programming problem

Message #2 Posted by [GT Springer](#) on 26 Mar 2007, 7:06 p.m.,  
in response to message #1 by Franco

There is a DDDAYS (Delta Days) command that will tell you indirectly if one day is before or after another. Dates in the 50g are of the form mm.ddyyyy or dd.mmyyyy (depending on flag -42 setting). For two such dates in levels 1 and 2 of the stack, DDDAYS returns the number of days between them. The number of days is positive if the level 1 data is later than the level 2 and negative if earlier. I do not know whether or not this gives you a more elegant solution - if y, d, and m are useful variables for you elsewhere, it may not be worth the conversions. I hope this was helpful to you.

### EMU71 and TCP/IP

Message #1 Posted by [Egan Ford](#) on 26 Mar 2007, 2:07 p.m.

While getting DOSBox setup on my Linux machines so that I could run EMU71 I noticed that DOSBox supports serial port virtualization using TCP/IP. (DOSBox is an x86/DOS emulator, a bit like Bochs, but DOS emulation is part of it and it is much easier to use. It runs on top of Linux, OS/X, Windows, and many other platforms.)

The setup is pretty straightforward (I tested this with DOSBox on Windows/XP).

Put the following in your configuration file.

```
[serial]
serial1=nullmodem server usedtr port:5000
serial2=dummy
serial3=disabled
serial4=disabled
```

DOSBox uses your existing filesystem--no need to create an image. Create a dosbox directory with EMU71 (<http://membres.lycos.fr/jeffcalc/emu71.html>) and BNU (<http://www.pcmicro.com/bnu/>) installed, then mount as drive C, e.g. my dosbox directory on Linux is /home/egan/dosbox, for Windows/XP c:\home\egan\dosbox. The command for any OS to mount within dosbox is:

```
mount c /home/egan/dosbox
```

First run bnu.com. BNU provides INT 14 needed by EMU71 serial port emulation.

```
c:
cd bnu
bnu.com
```

Next make sure you have SERIAL1 in your EMU71.INI file. I have mine as my 6th HPIL device.

That's it.

To test it I created a small reverse echo service using Perl. It will run on any computer with Perl. I tested it with Windows/XP.

```
#!/usr/bin/perl

use strict;
use IO::Socket;
use IO::File;

my $host = shift;
my $port = shift;

my $sock = IO::Socket::INET->new(
    PeerAddr => $host,
    PeerPort => $port,
);

if(!defined($sock)) {
    die "could not open socket";
}
```

```

}

while(<$sock>) {
    chomp();
    my $line = $_;
    $line =~ s/^[[:print:]]//g;
    my $revline = reverse($line);
    print "recv: $line\n";
    print "send: $revline\n";
    print $sock "$revline\n";
}

exit(0);

```

All this service does is connect to the host and port passed on the command line and waits for a message and then returns the reverse string of the message.

To test start up the service:

```
echorev.pl localhost 5000
```

From EMU71 type:

```

10 DIMA$[64] @ DIMB$[64]
20 INPUT "STRING: ";A$
30 OUTPUT :6 ;A$
40 ENTER :6 ;B$
50 DISP "GNIRTS: ";B$
60 GOTO 20

```

RUN

Example session:

Windows/XP + Cygwin/X (for Perl):

```

$ ./echorev.pl localhost 5000
recv: FOO BLAH BLEH BAR
send: RAB HELB HALB OOF
recv: aaaabbbbCCCCdddEEEE
send: EEEEdddCCCbbbbaaaa

```

Windows/XP + Dosbox + EMU71:

<http://sense.net/~egan/dosbox71.jpg>

I am sure that there are other serial port virtualization solutions that may run natively on Windows so that EMU71 would not need to run in DOSBox.

## Re: EMU71 and TCP/IP

Message #2 Posted by [Howard Owen](#) on 28 Mar 2007, 8:53 p.m.,  
in response to message #1 by Egan Ford

Oh, man!

What a neat shortcut to the 71B enthusiast's dream: an HP-IL<->TCP/IP gateway!

OK, so this won't let us work on HP-IL/IP, which is what I'd really like to do. But it's very, very cool nonetheless.

You've got mail. 8)

Regards,  
Howard

**Re: EMU71 and TCP/IP**

*Message #3 Posted by [GE](#) on 29 Mar 2007, 6:40 a.m.,  
in response to message #2 by Howard Owen*

This deserves an entry in the Articles Section.

in response to message #6 by Ed Look*

Just like our cell phone or PDA.

**Re: HP calculator**

*Message #8 Posted by [Christoph Widmer](#) on 26 Mar 2007, 10:59 a.m.,  
in response to message #7 by Gary Fok*

Battery life is a real issue. I have, for example, a really fine Dell Axim X51v PDA with a brilliant screen, but it does not run for more than three hours on a Li-polymer battery charge. For a calculator this would be really inconvenient, it would not even take you through an exam or an entire working day.

**Re: HP calculator**

*Message #9 Posted by [hugh steers](#) on 26 Mar 2007, 11:10 a.m.,

\_\_\_\_\_

If calculators are supposed to be small then why isn't there a really SMALL scientific calculator on the market? I don't even consider the 15C et.al small, I've been looking for something smaller for a long time.

Bring back the Casio CFX-400 scientific calculator watch I say, that's SMALL.

Yes, there are plenty of small lithium button cell batteries available, the 16xx and 20xx series et.al being the most popular.

Dave.

*Message #11 Posted by [Ed Look](#) on 29 Mar 2007, 9:42 p.m.,  
in response to message #10 by Dave J*

Really? What were the dimensions of the Casio CFX-400?

I have a Casio fx-4200p and I'll admit it's about a 3/8" shorter than a HP-32SII and roughly averages about three quarters as thin...

... but it has a significantly smaller screen area, which is not a step in the right direction. I do like the fx-4200p's size though, even if I'd prefer if it'd get a little longer and slightly thicker to accomodate a more comfortably viewable screen.

The CFX-400 is a watch, it fits on your wrist, with full scientific functions including base conversion.

Dave.

*Message #14 Posted by **Egan Ford** on 26 Mar 2007, 12:46 p.m.,  
in response to message #1 by Gary Fok*

Quote:

I don't understand why HP calculator do not have color screen ? Any help?

Cost. The mass market for calculators is the mid to low end--students with limited budgets, standardized exams, home/office use.

Power. TFT backlit screens use more power. Higher resolution screens also use more power. I have to charge my notebook, PDA, and phone frequently.

There are a number of new high resolution, color, low power display technologies under development. Eventually newer technologies will replace B/W low res LCD.

If you want a color, high function, high resolution calculator consider getting a PDA and using native and emulator applications.

E.g. I have a Zaurus c860. It has a QWERTY keyboard and a VGA color screen and runs Linux.

[http://sense.net/zc/x48/ryosc/IMG\\_3976.JPG](http://sense.net/zc/x48/ryosc/IMG_3976.JPG)

And, it is the same size as the 15C.

[http://sense.net/zc/x48/ryosc/IMG\\_3980.JPG](http://sense.net/zc/x48/ryosc/IMG_3980.JPG)

You can find more screen shots here:

<http://sense.net/zc/nonpareil/>  
<http://sense.net/zc/free42/>  
<http://sense.net/zc/x48/>

The above provides most of the classic calcs (15C, 41CX, 34C, etc...), 42S, and 48GX. I recently started using EMU71 under Dosbox on the Zaurus as well.

This site has a good collection of open source scientific/math apps for the Zaurus (e.g. Scilab, Octave, R, and more):

<http://yonggun.googlepages.com/scientificpdaxrom>

The Zaurus cSeries is EOL. The price varied for new units somewhere around \$400-\$600.

### **Re: HP calculator**

*Message #15 Posted by [Ed Look](#) on 26 Mar 2007, 3:46 p.m.,  
 in response to message #14 by Egan Ford*

You know, I have the 48G, 48G+, 49G+, 34C, 32SII, 20S, and 33S...

... and I prefer to reach for the 34C (until it got old and dotty; otherwise my favorite), 32SII (still; 20S is algebraic, so I use if only as last resort), and 33S (increasingly so) rather than the 48 or 49 models because of their small(er) form factor... rather, OPTIMAL form factor. I go for the 48G or G+ or 49G+ only if I need their power or more capacious programmability.

The less bells and whistles the better if just to keep it small enough to hold in my hand and see and use most easily. So, color or higher resolution screens, speakers, microphones, and the attendant bigger batteries I wouldn't want to see in a practical day to day (or so) use calculator.

### **Re: HP calculator**

*Message #16 Posted by [Les Wright](#) on 26 Mar 2007, 5:07 p.m.,  
 in response to message #14 by Egan Ford*

Wow!

I should look into getting a Zaurus. My Palm XT is getting some screen failure after a spill, and it looks

like there are so many different emulators that can run on the Zaurus. Indeed, the excellent Nonpareil does not yet have a PalmOS version, yet it has had a Zaurus version for awhile.

I really love Free42 on the Palm but I really wish I had other emulators in my handheld beside it, Power48, and P41CX that is sorely in need of an upgrade. Looks like there is more stuff available for the Zaurus.

Les

Quote:

I should look into getting a Zaurus.

I was a Palm user for a long time (almost from the beginning), but when my 2nd Vx was starting to fail (battery) I decided to try something new. I opted for the Zaurus 5500 and then later the c860. The Zaurus gave me increased levels of flexibility. I could do anything, BUT, get to meetings on time, take notes, look up contacts, or get it to sync properly and reliability with my notebook. The Zaurus is a crappy PDA. The Zaurus is more of a hobby and if you try to use it as a PDA (IMHO) you will lose productivity. (I feel the same about trying to use the 48GX as a PDA too).

I use my Windows Smartphone for my PDA and my Zaurus for advanced functions (emulators, movies, firefox, perl programming, ssh, other Linux only apps, etc...). It's more like a mini notebook that I can slip in my pocket when dragging my ThinkPad around would be inconvenient.

Message #18 Posted by [Garth Wilson](#) on 26 Mar 2007, 2:52 p.m.,  
in response to message #1 by Gary Fok

I have never wanted color on my HPs, and the extra power would definitely keep me from buying one with color. If you're marketing to technical professionals, you don't need it. If you're marketing to a bunch of giggling junior-high cheerleaders at the counter at WalMart, then go for it.

So far, numbers are B/W, aren't they?

**Re: HP calculator**

Message #22 Posted by **Ed Look** on 27 Mar 2007, 12:45 a.m.,  
in response to message #21 by Walter B

There is a, what, condition? ability? gift?... that some people have which allows them to make unusual associations mentally, like the "color" of a number, or the smell of a sound, or some such ordinarily unthought of connections... synesthesia, I believe it's called?

I guess there may be a small market for practical calcs with color screens... ;)

**Re: HP calculator**

Message #23 Posted by **Garth Wilson** on 27 Mar 2007, 1:19 a.m.,  
in response to message #22 by Ed Look

There was a young man with that ability on "60 Minutes" recently. He didn't need a calculator. I wonder if a running program in his incredible mind looked something like a fractals screensaver.

**Re: HP calculator (plus attempt at a transition)**

Message #24 Posted by **ECL** on 27 Mar 2007, 9:35 p.m.,  
in response to message #23 by Garth Wilson

All the genuine replies here are great, in that they are informative. However, I agree that Fok is playing the "why...why...why" game. For example:

Quote:

\_\_\_\_\_

Can they go li-poly?

\_\_\_\_\_

(or lithium, I forget)...

What could an intelligent person possibly hope to gain from asking such a question? Perhaps Fok would also like to know about the feasibility of a Cam-Calc. Could they go 5 Mega-pixel?? The answer to all such questions is Yes. "They" can do what ever "they" want! Oh..I could rant at length on this, but instead I'll comment positively on the 6x6 matrix solver (got it here....was is Palmer?) that I just finished punching in on my 33s: Cool! I launched an engineering program that I have on my laptop which, at one point, inverts a 6x6 matrix to determine stress and moment resultants on laminated structural plates. I was very happy to find that it gave very very similar results. The 33s program doesn't utilize pivoting, so I found that it is necessary to pre-condition the system before entering it (row-swapping, column swapping to create a diagonally-dominant system).

There. So...can they go 10x10 on that matrix solver? :) (joke)

ECL

ECL

No joke -- if you look at Article 678 you will see that I was able to go to 8x8 with some changes to the solver.

**Re: HP calculator**

Message #26 Posted by **Ben Salinas** on 27 Mar 2007, 11:48 p.m.,  
in response to message #1 by Gary Fok

From the standpoint of design, perhaps the question should be, "If there was no difference in battery life or readability of the screen, would you use a color display"

This would help us see what a color display could offer to a calculator user. Perhaps instead of a decimal point, you could configured your integer parts to be red and your decimal parts to be blue. Perhaps negative numbers would turn up as a different color. Perhaps, instead of having a small ^ in the top of the screen, an approximated number would be a different color, or a gradient of two colors.

Perhaps, on graphs, multiple functions could be indicated by different colors. Maybe, instead of differentiating between vectors and numbers in a program, one could differentiate by color. It might add some interesting components to the programming interface as well.

So all of these are just random ideas about what color might bring to a calculator. None of them should be treated as actual suggestions. I'm actually just quite curious as to what people would use color for. There is a Casio graphing calculator with color, but I don't think they used it to its full potential.

**Re: HP calculator**

Message #27 Posted by **Bill (Smithville, NJ)** on 28 Mar 2007, 4:49 a.m.,  
in response to message #26 by Ben Salinas

Hi Ben,

Quote:

From the standpoint of design, perhaps the question should be, "If there was no difference in battery life or readability of the screen, would you use a color display"

Exactly my thoughts when I read the first post.

Color must add some information to the display - otherwise it's just window dressing (or marketing hype). What kind of information would it add? You've mentioned a few and I'm sure we could come up with many more.

One main problem with color screens is that many are just plain unreadable in very bright lighting -

especially outdoors.

If there was a color calculator, I'd want to be able to change the colors so they would have special meaning for my application. I'd hate to be stuck with the color scheme that most marketers (or graphic design people) think look really "cool".

The one thing that would worry me the most is - if the manufacturer has a fixed design budget, then any effort devoted to putting color in will come at the expense of the Mathematical design of the calculator. Over the years, I have seen too many computer programs (and the calculator is just a form of a computer program) add really "neat" color graphical features to their programs while at the same time leaving in calculation errors in their programs.

About 15 years ago, I wrote an engineering program developer and informed him of a major calculation error in the program. He confirmed that the error did exist and would be fixed in the next release. Several months later, the next release arrived. It had added beautiful charts and graphs - but the error was still there. The charts and graphs did a great job of displaying the erroneous results in full color. When I called him, all he could discuss was about all the color output that had been added. Having correct results didn't seem to be of very high importance since color sells.

I have had the same experience on other programs.

Conclusion - give me a great monochrome calculator that does its job correctly. Then and only then, give me color.

Bill

### Infrared enabled calcs to iMac Intel ?

Message #1 Posted by [Olivier TREGER](#) on 25 Mar 2007, 12:21 p.m.

Hi there,

As stated in the title, I'd like to use the infrared capability of my iMac Intel slate-shaped computer to communicate.

Is there a way to do that?

Thanks

### Re: Infrared enabled calcs to iMac Intel ?

Message #2 Posted by [Guest](#) on 25 Mar 2007, 2:07 p.m.,  
in response to message #1 by [Olivier TREGER](#)

Probably not. The iMacs only have IR receivers for the remote. If they had transmitters, you might be able to do something useful. As it stands, the best you could hope to accomplish would be to print to the iMac.

### Re: Infrared enabled calcs to iMac Intel ?

Message #3 Posted by [Olivier TREGER](#) on 25 Mar 2007, 4:34 p.m.,  
in response to message #2 by [Guest](#)

By the way, I didn't intend to send anything from the Mac but rather TO the Mac.

Any idea?

### Re: Infrared enabled calcs to iMac Intel ?

Message #4 Posted by [Jonathan Eisch](#) on 25 Mar 2007, 7:53 p.m.,  
in response to message #3 by [Olivier TREGER](#)

The IR receiver is seen to the OS as a HID class device, that is, not IrDA or similar. So, you'll have to teach your HP to talk the apple remote language. I doubt the receiver hardware is capable of doing IrDA even with the right drivers. If you're using a 49g+/50g, we know the range of the IR is only a couple inches, so what's the point?

-Jonathan

*Edited: 26 Mar 2007, 1:36 a.m. after one or more responses were posted*

### Re: Infrared enabled calcs to iMac Intel ?

### MLDL2000 plans and new version

Message #1 Posted by [Meindert Kuipers](#) on 25 Mar 2007, 11:33 a.m.

After a long period of relative silence I am finally ready to start working on the MLDL2000 again, so I am now giving a short overview of the status and plans.

The current MLDL2000 design is ore or less stable, and no parts are available anymore. My first priority is to implement some features in the software, the most important being the option to upgrade the firmware. This will fix a few minor issues and will allow me to work on a number of additional features that can be easily implemented by the user.

Based on the current waiting list I have decided to do some more production. After the very good meeting and dicsussions we had in Allschwil last year I started thinking and came to the conclusion that it would be possible to add (at least) one great feature. This would require a hardware change however. Therefore I will do a redesign of the MLDL2000, that will be called MLDL2000V2. If there are better suggestions for a name let me know.

The MLDL2000V2 will have the following additional features:

- Redesign of all 3 PCB's to fix a number of design issues
- USB Interface will be fully redesigned and will have an extra USB Host controller that will allow the user to add a USB Mass Storage Medium (like a USB stick) that can be accessable from the HP41
- The new USB interface can be used in an existing MLDL2000, replacing the original USB interface
- Since there are no more empty card reader shell available an extra PCB will be designed as a carrier to the other PCBs. This will allow users to have the MLDL2000V2 in an external box

All the designs as mentioned above are in draft and need to be completed. More specifically I need to do some testing to verify if this is all really possible. At the same time I need to have an idea of how much interest there is, so please contact me if you want to be added to the waiting list. Please be aware that it wil take some time before MLDL2000V2 will be in production.

Most important is that I will need some support from the user community to create an HP41 ROM that will support the mass storage on USB, so any volunteers should step forward an contact me.

Please keep watching [my website](#) for further news.

Meindert

### Re: MLDL2000 plans and new version

Message #2 Posted by [Matt Kernal \(US\)](#) on 25 Mar 2007, 1:04 p.m.,  
in response to message #1 by Meindert Kuipers

Hi Meindert,

The "V2" plans sound great!!

Quote:

\_\_\_\_\_

I need to have an idea of how much interest there is, so please contact me if you want to be added to the waiting list.

\_\_\_\_\_

If I remember correctly (IIRC)..., in Nov'06, you asked if there was enough interest for a second production run of MLDL2000's. I jumped at the opportunity to be added to that list. With these new features, I again want to make sure I'm on the list (whether you're updating the "old" list, or creating a "new" list :-)

Thanks again for your efforts Meindert!

Matt

### **Re: MLDL2000 plans and new version**

*Message #3 Posted by [Matthias Wehrli](#) on 25 Mar 2007, 1:39 p.m.,  
in response to message #1 by Meindert Kuipers*

Great plans, Meindert

I have some other ideas for the future of the MLDL2000V2.. maybe one is worth thinking about it....

- HP-IR support: Maybe it is possible to add a HP-IR interface, so that the expensive but usefull module HP 82242A is no longer needed.

- power supply for the HP-41: On my MLDL you added a 6V plug in for a common power supply. Maybe this could be a addition. If not, maybe there is a possibility in your MLDL to add 4-AA cells to avoid the internal Lady-cells. The HP-41 could be driver cheaper with the AA-cells that do not leak that fast. Also the rechageable AA-cells hold longer than rechargeable Lady-cells.

- integration of the HP-IL module: Maybe there is a possibility to add a fourth PCB with the HP-IL module. The MLDL2000V2 would have a HP-IL plug in

- on april 1st I would add a internal radio module, that can be driven and programmed by the HP-41 ;)

Matthias (who is very occupied with his marriage on friday)

*Message #5 Posted by [Meindert Kuipers](#) on 26 Mar 2007, 7:05 a.m.,  
in response to message #3 by Matthias Wehrli*

Now for some serious stuff:

- I wanted to keep the April 1 update as a surprise, but with the new USB interface I could actually very easily make an MP3 player from your HP41 by adding just one extra IC ... and this is no joke!
- IR driver would be relatively easy, but I do not have the means to test it or to create the software with it, so this is a nogo as far as I am concerned
- External power is really tricky and can be unreliable, it would also make the box much bigger, but I will look into this a bit more
- Adding IL would be pretty complicated, I suggest you stick with an original IL module

Meindert

Hello Meinderts,

Please count me in for one of your updated MLDL2000.

Thanks in advance.

**MLDL2000V2: my name in the list, please...**

*Message #7 Posted by **Vieira, L. C. (Brazil)** on 26 Mar 2007, 7:08 a.m.,  
in response to message #1 by Meindert Kuipers*

Hi Meindert, guys;

I must confess I'm running out of available time this year. Because of some extra activities at the university I'm teaching, I'm using almost all of my spare time to rest a little bit. I do not even have my computer accessing the www at the weekends, I only read my e-mails at the University. Also, the last time I recall using any of my own HP calculator was in December 2006. I do not use the HP41 with the MLDL since October...

But I still want to be part of the MLDL2000 User's Club, and I actually want a new unit plus one spare new USB host controller.

About the mass storage on USB: what is the main idea?

Best regards.

Luiz (Brazil)

**Re: MLDL2000V2: my name in the list, please...**

*Message #8 Posted by **Raymond Del Tondo** on 26 Mar 2007, 7:24 a.m.,  
in response to message #7 by Vieira, L. C. (Brazil)*

Quote:

\_\_\_\_\_

About the mass storage on USB: what is the main idea?

\_\_\_\_\_

I don't know if I understood the question completely, but as far as I know one of the initial ideas behind this was to supplement or replace the older HP-IL mass storage devices;-)

Raymond

**Re: MLDL2000V2: my name in the list, please...**

*Message #9 Posted by **Meindert Kuipers** on 26 Mar 2007, 9:13 a.m.,  
in response to message #8 by Raymond Del Tondo*

Raymond was one of the initiators of the idea of having some mass storage available, and indeed it is

my intention to offer USB media as a means to replace card reader and IL storage with virtually unlimited capacity, and at the same time use the media for exchanging information with the PC world.

Meindert

**Re: MLDL2000V2: my name in the list, please...**

*Message #11 Posted by **Meindert Kuipers** on 26 Mar 2007, 10:55 a.m.,  
in response to message #10 by Geir Isene*

This will take a few months to sort out and finalize the design, so please be patient ...

**Re: MLDL2000V2: my name in the list, please...**

*Message #12 Posted by **Les Wright** on 26 Mar 2007, 6:19 p.m.,  
in response to message #11 by Meindert Kuipers*

I am interested too, and very patient, though I would have to hire out to someone I trust like Randy to do the final assembly work. I am hopeless with a soldering iron.

A USB interface with mass storage capability would be something else, though, particularly if the file formats were transportable from HP41 to PC. It would be something to be able to write text code, compile it to RAW with something like hp41uc, move the RAW to a flash drive, and move the program to the calculator with simply plugging the USB flash drive into the MLDL2000. And back again if one likes. Anything to keep one from having to rely on ancient computers and DOS....

Les

**Re: MLDL2000V2: my name in the list, please...**

*Message #13 Posted by **Meindert Kuipers** on 27 Mar 2007, 4:02 a.m.,  
in response to message #12 by Les Wright*

Those who have asked me to be on the list for an MLDL2000 in the past can trust that they still are. I will send out a message to all contacts that I have as a confirmation. If you do not get this confirmation from me within a week, please let me know. If you have only indicated your interest in this Forum, please send me an email, I really need your contact details.

Thanks,

Meindert

### Wired Magazine Rates Graphing Calculators

Message #1 Posted by [Tony](#) on 24 Mar 2007, 5:23 p.m.

The April 2007 Wired Magazine rates graphing calculators:

TI-89 Titanium - 8 of 10

HP 50g - 7 of 10

Casio ClassPad 300Plus - 7 of 10

Sharp EL-9900C - 5 of 10

Interesting note on the HP, "steepest learning curve of the lot".

### Re: Wired Magazine Rates Graphing Calculators

Message #2 Posted by [Eric Smith](#) on 24 Mar 2007, 8:06 p.m.,  
in response to message #1 by Tony

A steep learning curve is *good*. If the learning curve were shallow, it would take you a very long time to learn how to use it.

### Re: Wired Magazine Rates Graphing Calculators

Message #3 Posted by [Palmer O. Hanson, Jr.](#) on 24 Mar 2007, 10:35 p.m.,  
in response to message #2 by Eric Smith

Quote:

A steep learning curve is *good*. If the learning curve were shallow, it would take you a very long time to learn how to use it.

From my *Webster's New World Dictionary*:

"SYN. --**steep** suggests such sharpness of rise or slope as to make ascent or descent very difficult (a *steep* hill);"

But, of course, you already knew that.

### Re: Wired Magazine Rates Graphing Calculators

Message #4 Posted by [Les Bell](#) on 24 Mar 2007, 11:18 p.m.,  
in response to message #3 by Palmer O. Hanson, Jr.

Quote:

"SYN. --**steep** suggests such sharpness of rise or slope as to make ascent or descent very difficult (a *steep* hill);"

---

Sure, but the work done in raising a mass through a height vertically is the same, whether you do it quickly or slowly (of course, you already knew that!).

Me, I'd rather get it over and done with and reap the benefits ASAP. Steep learning curve for me, every time!

Best,

--- Les

---

Aha! But Les, as you most certainly know, the *POWER* requirement varies with velocity, lol! So we could say that you'd want a quick processor (brain) to tackle steep learning curves w/o devoting great amounts of time. :)

When you provoke engineers...lol ;)

### **Re: Wired Magazine Rates Graphing Calculators**

*Message #6 Posted by **Les Wright** on 24 Mar 2007, 11:45 p.m.,  
in response to message #2 by Eric Smith*

Thanks for pointing that out Eric.

"Steep learning curve" is one of those chalk-on-a-blackboard irritating cliches. Usually, overuse of cliches renders them meaningless. In this case, the cliché has taken on a meaning precisely the opposite to its original use, which I believe is the rather narrow field of experimental psychology--rats in mazes, that sort of thing.

In that case, if time is on the x axis and some measure of learning is on the y axis, smart rats will learn more in less time, and the slope of the resulting graph--the primordial learning curve--will be steeper.

I like to use the phrase "shallow learning curve" in casual conversation to really confuse folks easily baffled when the discussion moves into the Cartesian plane.

The smart rat gets the most pellets most quickly. I'd rather be the smart rat.

Les

*Edited: 24 Mar 2007, 11:47 p.m.*

**rats**

*Message #7 Posted by [Don Shepherd](#) on 25 Mar 2007, 9:30 a.m.,

*Message #9 Posted by [Bruce Bergman](#) on 24 Mar 2007, 8:58 p.m.,  
in response to message #1 by Tony*

I am quite certain the "steepest learning curve" is due to the mediocre documentation that comes with it. If it had a book as solid as the 40gs or the TI-89, it would be easier.

Go HP! :-)

### The Last of the HP-15Cs ?

Message #1 Posted by [Gerson W. Barbosa](#) on 24 Mar 2007, 4:15 p.m.

Today I received this HP-15C:

[http://www.geocities.com/gwbarbosa/HP-15C\\_b.JPG](http://www.geocities.com/gwbarbosa/HP-15C_b.JPG)

Actually, I had to walk ten miles for it. The post office I have a P. O. Box in is about three miles north from home. I decided to go on foot. When I got there I was told the package I was waiting for had gone to another post office, two miles farther north, because today's Saturday...

The seller, from São Paulo, told me he'd never used the calculator, as he bought it eighteen years ago for collecting purpose only. It really looks like it despite the absence of the original box. The picture I took just doesn't do it justice. It seems my quest for a pristine HP-15C is over... I just hope the equivalent to 225 dollars it cost me has not been too expensive :-)

But what has called my attention is the high serial number: 2905B29505. One of the last ever made?

There's only one thing I don't like: under daylight, viewing from certain angles, it is possible to notice **PMT** is hiding under the white  $y^x$  lettering. A more careful observation reveals **i**, **PV** and **FV** in the nearby keys... HP, why have you done this?

*Edited: 24 Mar 2007, 4:22 p.m.*

This would mean that those keys were not double shot moulded (at least not with the scientific symbols). Could this be true? I just scrutinized my 15C under sunlight and didn't see any sub markings. Mine is an older serial# (2443A06749 USA). I would be interested to find out about this.

Best regards, Hal

---

I sincerely hope it is not. I have an older 15C (2740B30986). Until now, I hadn't noticed this unit had also some reused 12C keys. It doesn't look like a simple repainting though. The keys look perfect after all these years, no signs of wear. I don't know what process they used but I think they knew what they were doing.

Quote:

This is from Mier-Jedrzejowiz's *A Guide to HP Handheld Calculators and Computers*:

"...Some later batches of the HP-15C were made using HP-12C keyboards, with HP-15C key functions painted over some of the HP-12C key functions. This is most obvious on the key labeled  $y^x$  which shows the legend PMT below it. Some collectors find this amusing and **are willing to pay extra** for such units."

The emphasis is mine.

### Re: The Last of the HP-15Cs ?

Message #7 Posted by [Gerson W. Barbosa](#) on 24 Mar 2007, 11:02 p.m.,  
in response to message #6 by Palmer O. Hanson, Jr.

Thanks for this quoting from Mier-Jedrzejowiz's *A Guide to HP Handheld Calculators and Computers*. One of these days Antonio Maschio asked how this feature would increase the value of his HP-11C as a collecting piece. This might properly answer his question in case no one did.

But there's still another thing I dislike: the contrast of the display is not so good as in my other Voyagers. Instead of the usual vivid black color the digits have kind of a grayish hue. But I think I can live with that.

Regards,

Gerson.

in response to message #1 by Gerson W. Barbosa

My 11c also shows the shadows of a 12c.

However I am not convinced that this means they are "painted." It could be that they used 12c keys as plugs for new molds and didn't completely remove the hints of the old during the buffing process?

Has anyone actually confirmed, through destructive analysis, that these sorts of ghosts-of-12c keys are painted rather than double-shot?

## **Re: The Last of the HP-15Cs ?**

---

I've just made a diagonal cut in the backspace key of a dead 11C (2632B03287). I can see it is double-shot indeed. I had noticed a very faint "C" on the left side of that key. There is also light evidence of PMT on the surface of the y<sup>x</sup> but I can't find more double-personality keys on this keyboard.

Gerson.

### **Turbo switch on 48GX**

Message #1 Posted by [Chris Cotter](#) on 24 Mar 2007, 3:07 p.m.

How do I permantly switch the HP48GX to Turbo?

CC

### **Re: Turbo switch on 48GX**

Message #2 Posted by [egorka](#) on 24 Mar 2007, 6:27 p.m.,  
in response to message #1 by [Chris Cotter](#)

There is no 'turbo' mode on a standard HP48GX as far as I am aware.

There is a modification that Cynox used to do to raise the clock frequency of the HP 48GX. I have one of these models. To activate it you need to hold the ON button in to turn it on- instead of just hitting it once. This puts the GX into TURBO mode.

Unfortunately, the clock also goes at double speed- so your time/date will not be accurate.

There are some tools- such as Metakernel- that speed up some of the functions of the HP48GX for a 'standard' HP 48GX.

I hope this helps. Eric

### **Try SpeedUI, the software turbo [was: Re: Turbo switch on 48GX]**

Message #3 Posted by [Raymond Del Tondo](#) on 25 Mar 2007, 5:52 p.m.,  
in response to message #1 by [Chris Cotter](#)

There exists a software turbo for the HP-48G+ and GX,  
the SpeedUI 7.03 Extreme Edition.

SpeedUI accelerates nearly every part of the user interface,  
including CHOOSE boxes, input forms, the MatrixWriter,  
and of course the stack and the cmdline/fullscreen editor.

I uploaded the current version (7.03) to [www.hpcalc.org](http://www.hpcalc.org) ,  
but it can take a few days until the site will be updated.  
So if you're interested, you could get SpeedUI from me directly.

### Varieties of magnetic cards

Message #1 Posted by [Les Wright](#) on 24 Mar 2007, 2:29 p.m.

So far in my collecting I have come across three types of blank magnetic cards.

The first is mostly white with a thin black border and the key labels demarcated by little hash marks.

The second is like the first except two of the corners are notched to guide where to make the write-protect clip-off.

The third type is my particular favourite aesthetically. These ones shipped in the HP65 Standard Pac. They were meant to be recorded on one side only, have the guide notches on one corner only, and there is more black, with the key labels demarcated by little windows rather than just little marks.

Does any one have any more knowledge about the history of HP magnetic cards? Also, does anyone know how to get the third type? I really like them but only have 19. I have piles of type number 1, and a couple dozen of type 2.

Les

in response to message #1 by Les Wright

Hi Les,

Am I correct in my assumption that cards for the 65 and 67 are not interchangeable due to different formatting?  
Thanks and best regards, Hal

### Re: Varieties of magnetic cards

Message #3 Posted by [Etienne Victoria](#) on 24 Mar 2007, 9:28 p.m.,  
in response to message #2 by Hal Bitton

Hi,

Cards for the Hp-65, 67 & 41 are physically the same and can be used in all calculators.

However, once recorded:

- Hp-65 cards can only be read by Hp-65s.
- Hp-67 written cards can be read & executed by either Hp-67 or Hp-41. The latter has a set of Hp-67 compatible instructions built into the card reader's ROM.
- Hp-41 written cards can only be read by Hp-41s.

Etienne

## Re: Varieties of magnetic cards

Message #4 Posted by [Thomas Chrapkiewicz](#) on 25 Mar 2007, 11:44 a.m.,  
in response to message #1 by Les Wright

Les/et al:

The HP65 was my second HP calculator which I had purchased back in 1974.

The third type of card you mentioned is the original card that came with the HP65. If I recall correctly, a while after the 65 was available (yet before the 67 came to be), it was discovered by the user community that the cards could be used 'double sided'. You may find references to this in the old 'HP65 User Group' (later the 'PPC') publications. This method was not ever accepted/recommended by HP at the time. [If my memory is still working, I was member 852 if the HP65 group.]

I believe the first type you mentioned - the mostly white but not double sided was released before the 67. I'm not 100% sure on this - again studying the old HP65 Users Club publications would lend some insight here. I have not dug them up to study this myself.

The second type you mentioned was after the 67 release and HP had acknowledged (and used) double sided writing on the cards. The HP67 also allowed writing data to the cards which the HP65 did not.

I believe the HP Journal articles on the HP65 show roughly where the data track was written on the card. The 67 wrote the track in the same location - although a bit denser to hold the 224 steps as opposed to the 100 of the HP65.

I do recall someone making 'homebrew' cards which were usually quite poorly painted - usually different colors. We would use dry transfer lettering both on these and the 'official' HP cards to arrive at a quite aesthetically pleasing card.

Keep in mind that the cards are 'formatted' as they are written - there is no hard track put on them until the data itself is written. I would often bulk erase (with an audio tape bulk eraser) the 65 cards before writing.

Perhaps I need to dredge up my archives and do some scans/pics if many out there are interested. Maybe there are other 'more mature' users out there that have some memories/recollections of these details to share!

Regards, Thomas Chrapkiewicz

### How to get HP 48G to talk to MacOS X?

Message #1 Posted by [Bob Blaylock](#) on 24 Mar 2007, 8:09 a.m.

I recently acquired an HP48G calculator, and my current obsession is to get it to communicate with my beige Power Macintosh G3, which is running MacOS X 10.2.8.

To this end, I have built a cable.

I've connected this calculator to my wife's Windows 2000 system using the cable that I have built, and installed [this software](#) on my wife's computer, and verified that this works.

I've then connected the calculator to my Macintosh, to which I have downloaded and installed [this software, which only works under MacOS 9 or lower](#), and verified that this works. So my cable is good, and my whole hardware setup is good.

So, what do I need to do to communicate with this calculator from MacOS X? I understand that this calculator wants to use the Kermit protocol, or alternatively, XMODEM. I'm an old fossil back from the days before mere mortals had access to the Internet, when geeks like myself communicated and exchanged software via standalone BBSes which we would dial directly into with our modems; so I have some basic familiarity with using a terminal program, and with protocols like Xmodem and Kermit.

I tried using [ZTerm](#) to talk to my HP48G, to no avail. It seemed obvious enough how to configure the HP48G and to configure ZTerm so that they should each be trying to speak the same protocols at the same speeds and everything, but try as I might, I could not get either ZTerm or the calculator to respond to anything done at the other.

Thinking there may be some problem inherent in ZTerm, I downloaded, compiled, and installed [C-Kermit](#) and tried using it. I got the same results as with ZTerm, which is to say, no results at all. (BTW, the answer to the trouble that the guy at the end of [this thread](#) had getting it to work seems to be that for whatever reason, C-Kermit needs to have root access in order to talk to the serial port. Don't ask me why. If I run it directly, it doesn't have permission to talk to /dev/cu.printer but it seems to work that far if I run it via sudo.)

So, I seem to have the hardware connection straight, and I've got two different pieces of software that should be able to speak Kermit. What am I missing? What do I need to do on each side of the connection to get the two sides to talk to each other?

*Edited: 24 Mar 2007, 8:45 a.m. after one or more responses were posted*

### Re: How to get HP 48G to talk to MacOS X?

Message #2 Posted by [Bob Blaylock](#) on 24 Mar 2007, 8:34 a.m.,  
in response to message #1 by [Bob Blaylock](#)

Quote:

...but try as I might, I could not get either ZTerm or the calculator to respond to anything done at the other.

Actually, this isn't completely true. If I type rapidly into ZTerm, I can see a little arrow-shaped icon flickering near the upper right corner on the calculator's display.

Also, if I run the serial loopback test on the calculator (On-D then PRG), ZTerm receives the following string: "AAAAAU\_LB 20000" (The "U\_LB 20000" also being displayed on the calculator, a code indicating the test failed (which is to be expected because there isn't a loopback connection)).

*Edited: 24 Mar 2007, 10:58 a.m.*

## Re: How to get HP 48G to talk to MacOS X?

Message #3 Posted by [Thomas Okken](#) on 24 Mar 2007, 11:20 a.m.,  
in response to message #1 by [Bob Blaylock](#)

To get Kermit to work between my PC and my HP-48G under Linux, I downloaded and compiled C-Kermit, and I use the following settings in my .kermrc file:

```
set modem type none
set line /dev/ttyUSB0
set carrier-watch off
set speed 9600
set parity none
set flow xon/xoff
set block-check 3
set transfer mode manual
set file type binary
set control prefix all
```

I expect you'll need something different for the "set line" command (don't be confused by the ttyUSB0 in my .kermrc: it looks that way because I'm using a USB-to-serial adapter). Most of the other settings are fairly obvious, except the "set control prefix all", which I finally found out about thanks to some helpful people on this forum.

BTW, you shouldn't have to be root to run Kermit; you can also just change the permissions on the serial port to allow read and write access for everyone: `chmod 666 /dev/cu.printer --` or, make the kermit executable `setuid root` (not recommended).

When it comes to using Xmodem, you need to install an Xmodem server on the 48G; in my case, I use the misleadingly-named [HP48GII and HP49G+ PC Connectivity Kit](#) (which supports the 48G just fine); it includes a nice Windows-based Explorer-like GUI for browsing files and directories on the calculator, and it includes the Xmodem server, which it will even install for you (it walks you through the commands you have to execute on the calculator for the upload -- very painless). The GUI won't do you any good on the Mac, but you may need the Xmodem server in case your Mac-based connectivity package doesn't already include one.

- Thomas

## Re: How to get HP 48G to talk to MacOS X?

Message #4 Posted by [Bob Blaylock](#) on 24 Mar 2007, 5:10 p.m.,  
in response to message #3 by [Thomas Okken](#)

Quote:

set block-check 3
set transfer mode manual
set file type binary
set control prefix all
```

I expect you'll need something different for the "set line" command...

---

On my system, the two serial ports (mine was the very last desktop Macintosh model to have built-in serial ports) are /dev/cu.modem and /dev/cu.printer. As I have an actual modem connected to cu.modem, I'm using cu.printer for my HP48G.

OK, now I seem to be getting somewhere. With these settings, I can now send files to the HP48G. I can also do a directory, that shows what the HP48G has at its root directory. I can't seem to CD on the HP48G, nor can I receive files, or do anything else, though.

And with similar settings, I can now also get ZTerm to send files to the HP48G as well; but I can't seem to interact with it in any other way.

All this is with the HP48G set to be in server mode.

On further experimentation, I see that if I type "connect" into kermit, and then go to the TRANSFER menu on the HP48G, I can send files from the HP48G to my Macintosh. But If I try to transfer "Remote Files from PC", I get error messages on both sides. I guess each side agrees on how to send a file from whatever side is being manually operated, but not on how to tell the side that is acting as a server what files to send.

Quote:

---

BTW, you shouldn't have to be root to run Kermit; you can also just change the permissions on the serial port to allow read and write access for everyone: `chmod 666 /dev/cu.printer --` or, make the kermit executable setuid root (not recommended).

---

No, I shouldn't. Other programs don't have this problem, but for some reason, kermit does.

I see now that it's complaining about not having permission to write to /var/spool/lock. Setting permissions on that directory to allow writing to it seems to solve that problem.

Quote:

---

When it comes to using Xmodem, you need to install an Xmodem server on the 48G; in my case, I use the misleadingly-named [HP48GII](#) and [HP49G+ PC Connectivity Kit](#) (which supports the 48G just fine)

---

It's not evident that that will help me.

Anyway, I seem to be making progress. There's still obviously quite a bit that I don't yet quite get. Any additional guidance would be appreciated.

Perhaps not, but installing the Xmodem server on the calculator means that you'll be able to do server-mode Xmodem transfers, which is presumably a bit less error-prone than manual transfers. I can't give advice on Xmodem beyond this, since I use Conn4x on the Windows side, meaning I never issue any Xmodem commands at all, it's all automated by this nice GUI.

As far as your Kermit problems are concerned, you may find this page -- straight from the horse's mouth -- helpful: <http://www.columbia.edu/kermit/hp48.html>.

Best of luck,

- Thomas

**New Casio's fx-9860G Slim**

Message #1 Posted by [Namir](#) on 24 Mar 2007, 8:07 a.m.

Casio has announced the Casio FX-9860G Slim. This is basically the FX-9860G calculator with a [new design](#). The model will be available in June for \$99 retail price. I think that may be the new trend in graphing calculator. I hope HP is watching!!!

Namir

PS: [Click here to see the picture of the calculator](#)

in response to message #1 by Namir

Very very very nice.

It reminds me of my first heavily used calculator, HP28S. I've always loved the HP28S clamshell design, so I'm naturally attracted to this casio calculator.

Today I'm back in school again, and am using the HP49g+, which I love, but I sure miss the clamshell.

When I get into the "real world" again, I can see myself grabbing this casio calculator for easy portability and quick calculations. I will definitely be buying one.

in response to message #1 by Namir

Nice compact item. However, the basic design of such calcs is known for decades (see e.g. the 95LX and more of its time). Based on my own experience with a f991ES having similar features, I rate Casio's user interface as rather confusing and inconsistent. A real mess to work with. No wonder, it is not RPN ;)

So, if we hope HP is watching, I'd prefer they do it a little bit more like [this](#).

**Re: New Casio's fx-9860G Slim**

Message #5 Posted by **Raymond Del Tondo** on 25 Mar 2007, 6:13 p.m.,  
in response to message #3 by Walter B

Now that's a thing I'd buy immediately!

I particularly like the key order of the numerical square block,  
with

7 8 9 /  
4 5 6 \*  
1 2 3 -  
0 . S +

That's how it should always be IMHO,  
and has been from the Pioneer series  
up to (and including) the HP-48 ,  
and also the Voyager series, of course.

Later 'hp' calcs (you know, the funny looking ones)  
shifted the arithmetic key column up one row,  
which I find very annoying.

Raymond

**RPN Alternative (was: Re: New Casio's fx-9860G Slim)**

Message #6 Posted by **Walter B** on 26 Mar 2007, 5:00 p.m.,  
in response to message #5 by Raymond Del Tondo

Hi Namir, Raymond,

thanks for your very friendly comments!

The draft you see contains the complete function sets of 42S, 16C, 21S, 32SII plus a bit more - e.g. RPN and ALG - just to demonstrate it can be brought onto one not too messy keyboard. It allows to reach each and every function with a maximum of 4 simple keystrokes (incl. all the items in the menus). Many functions are displayed immediately - in a structured way - to make them as easily accessible as possible without "drowning the eye".

Maybe somebody is watching...

Best regards, Walter

P.S.: I should mention I started these drafts for OpenRPN. But that project seems to have passed away in the meantime. No signs of life anymore for over 3 months :( Perhaps I should put it all into an article before it's lost.

Me too! I have also been wishing for something like a cross between an HP28 and HP95. The HP50g, nice as it is, is quite bulky, especially when in it's carrying case.

As to the Casio itself, there are some things I like (overall layout, backlit display) and some I don't (display too small, too few keys, several bad keyboard choices- SQRT a shifted key but LOG an unshifted key?). Here's hoping that HP will learn from Casio's mistakes;-)

John

in response to message #1 by Namir

Most interesting! This is a neat looking machine with a professional look. You are quite correct, HP's designers could do well to emulate this style.

Casios are fine calculators. The problem is while they have many features, they lack a units menu, which I use extensively. One of their models other than the Classpad, I can't recall which at the moment, had a CAS, which had me close to buying it. Not having the units menu stopped me, though.

Very nice. Casio is an innovator, has always been (the ClassPad is the most innovative CAS machine available nowadays).

This reminds me of the fx7500G, a very nice horizontally folding graphical scientific of the 7000G breed. It had a tactile keyboard, and mine works flawlessly.

Casio could lead if they listened a bit their customers (see CP300+'s most horrible sins).

This is a great design, too bad it's a Casio. I'd love to see an HP like that. The fx7500G was one of the coolest early graphing calculators. GE, I think the type of keyboard on the 7500 is actually nontactile. Mine also works flawlessly after all these years.

Sure there are 7 mechanical keys under the display, but the others are tactile (from memory). Just look at this nice page on V.Toth's site : <http://www.rskey.org/detail.asp?manufacturer=Casio&model=fx-7500G> I'll check. Just a minor detail anyway.

### **Re: Casio's fx-9860G Slim - Neat Looking Machine!**

*Message #16 Posted by [Steve Borowsky](#) on 28 Mar 2007, 6:14 p.m.,  
in response to message #15 by GE*

No, here's what I mean: I don't consider touch sensitive keys to be tactile. I know 'tactile' translates directly to mean 'by touch', but in the case of keys, since all keys are operated by touch, I consider the designation tactile to refer to the act of providing tactile feedback, responding to the users touch in such a way that the user receives tactile feedback that the key was pressed, which in the case of touch sensitive keys is absent, and in the case of mechanical keys is present, therefore, mechanical keys are tactile.

### **Re: Casio's fx-9860G Slim - Neat Looking Machine!**

*Message #17 Posted by [GE](#) on 29 Mar 2007, 6:49 a.m.,  
in response to message #16 by Steve Borowsky*

All right, I get it now. English not natively spoken here...

Now other horizontal folding designs were : Sharp PC-1280, Casio fx790 and fx795 (those are not really nice), Casio PB1000 (no TI, HP did it 'only' on organizers).

On vertical folding there were some like the Sharp EL-9000 (AER, not Basic) (TI did some non-programmable scientific calculators).

The good point with folding designs is that you don't need a case, and it tends to be more portable.

However, I'll not buy this "new" Casio because it is always the same old function set each and every 'generation' they put out.

Haha, exactly! That's what's so crazy about Casio; they made the worlds first graphing calculator (fx-7000G. 1985), but then almost every single graphing calculator they've made since then has been almost the s-a-a-a-a-ame (with a few exceptions), but same limitations etc etc. Crazy!!! BTW, the fx7000G was in production for 10 years, an incredibly long time!

*Message #24 Posted by [Eddie Shore](#) on 30 Mar 2007, 1:50 a.m.,  
in response to message #23 by Eric Smith*

I am curious to what the 9860G Slim will have as far as features. Will it be close to the basic models (like 7400G) or closer to the Classpad or the Algebra-2 Plus?

Has anyone tried to program a Casio calculator? I found it confusing.

My favorite Casios are the basic scientific calculators, because Casio manages to pack the most features into the basic calculators. Solar powered with integration, derivative, and normal distribution.

**Bringing an HP-42S Back to Life**

Message #1 Posted by [Juan J](#) on 23 Mar 2007, 11:52 p.m.

Hello,

A couple weeks ago I found an HP-42S on that auction site, described as “non functional, for parts or repair.” The description went on, detailing scratches and blemishes, but ended stating that the calculator passed the self-test. This little detail was intriguing to me. So I decided to bid and ended up winning the auction, at roughly less than half the price of a fully functional 42S.

The day seller shipped the 42S I received a message: “I hope you enjoy tearing the calculator apart.” No problem, I wrote back. The 42 eventually came home and stayed untouched, as I was away. But I came back home and decided to get to work on it. A sick puppy, I thought.

This was a battered puppy, S/N 3046SXXXXX with initials engraved on the front plate, next to “42S,” and a few scuffs. I turned it on. It was functional and passed the self-test, as the description said. However, the keys of the rightmost column were dead: [XEQ], [TAN], [<-], [/], [x], [-] and [+]. Strangely, they felt fine and the tactile feedback was the same as the rest of the keyboard.

At first I thought it was a dirt problem and tried contact cleaner, applied through the slits between the front plate and the keys, to no avail. The puppy needed surgery.

I got Paul Brogger’s article on how to disassemble a Pioneer and followed the instructions. The disassembly was just as Paul describes it, and I pulled out the back case half, then the PCB. The keyboard assembly was just as the article described, complicated to tear apart. Since the keys were working, I thought it might be a faulty contact problem, and examined first the PCB and then the contact ribbon that links the keyboard to the PCB.

There are 15 contacts between the keyboard and the PCB, seven to the left and eight to the right. The last contact to the right had what looked like dirt over it. I carefully scraped it with a precision knife, put the calculator back together and turned it on. Nothing. So I took it apart again and this time checked the keyboard contacts ribbon.

Interestingly, the last contact, which went into the PCB contact I had scraped clean was worn out and there was little conductor material left on the plastic. Quite possibly this damaged contact was the cause behind the dead keys. Lacking a conductive marker, I cut a small (3/8 in. x 1/32 in.) copper strip from a piece of foil I had at hand and folded it in half, so that half of it would replace the missing conductor and make contact, and the other half would fit behind the plastic ribbon to hold the strip in place. Just to check this setup, I put the 42S together, installed the batteries and turned it on. It worked. It was time to check the keys.

All the keys worked perfectly, main and shifted functions. The strip was working. I disassembled the 42S, secured the strip in place with a little bit of glue carefully applied with a brush and put it together again.

The sick puppy is cured and now works like a charm. Although the front plate still needs some work, namely removing the engraved initials and the scuffs, now I have a fully functional 42S. It feels so good to bring back to life one of these little machines! It might seem a contraption, but this keyboard fix may be applicable to Pioneers with the same problem. On the other hand, would this contacts wear be something to consider about long-term use (and abuse) of a Pioneer? Has anyone had this problem before?

The next step is removing the engraved initials. I am thinking about sanding them off and repainting the area, either by hand or using an airbrush. But this would need peeling the front plate from the calculator. Is it possible to do it without destroying it?

I have already thanked the seller. Now I want to thank Paul for his article, of which I keep a copy for future reference, and Dave, for this wonderful site.

The HP-35 page states: "it was built tough, and built to be repaired." The same could be said about almost all the subsequent models; the Pioneers are a little harder to repair but it is possible. They may not be as tough as the original 35, but they do endure punishment. Which makes me wonder if we are not only into collecting and repairing, but also into restoration and adoration with our little machines.

### **Re: Bringing an HP-42S Back to Life**

*Message #2 Posted by [Bruce Bergman](#) on 24 Mar 2007, 12:15 a.m.,  
in response to message #1 by Juan J*

Interesting!

I have a 32sii which has almost the exact same behavior. Keyboard fine except the rightmost column. I posted something on here a couple weeks about it but absolutely zero response on what the problem might be, so I assumed it was either a) beyond the skills of the folks on the board, or b) nobody else had this problem.

Now I found your message, which gives me hope. :-) I'll take another read and perhaps see if I can fix mine. THANK YOU for posting!

thanks, bruce

### **Re: Bringing an HP-42S Back to Life**

in response to message #2 by Bruce Bergman*

Hello Bruce,

I had not had this problem until now...

I am glad that my experience may help you. Good luck with your repair.

### **Re: Bringing an HP-42S Back to Life**

*Message #4 Posted by [Thomas Radtke](#) on 24 Mar 2007, 4:12 a.m.,  
in response to message #1 by Juan J*

Thanks for your article!

Would you think that conductive glue could have solved that problem more easily? This would have been my approach on Pioneer contact problems.

Quote:

\_\_\_\_\_

The HP-35 page states: "it was built tough, and built to be repaired." The same could be said about almost all the subsequent models; the Pioneers are a little harder to repair but it is possible.

\_\_\_\_\_

The classics are great in nearly any respect. Later models (all?) offered severe problems in repairing them,

mostly due to these plastic rivets (even Woodstock keyboard assemblies have lots of them). Some (Clamshell, Pioneer) can't even be taken apart without drilling here and there.

H-P's are great as long as they are intact. Excellent software, perfect feeling in touch and use. When they are dead, one wishes they were build like a TI or Casio ;-).

### **Re: Bringing an HP-42S Back to Life**

*Message #5 Posted by **Juan J** on 24 Mar 2007, 3:00 p.m.,  
in response to message #4 by Thomas Radtke*

Hello Thomas,

You are right. Conductive glue would do the trick. Alas, I had not any at hand. Hence the little copper strip. Not very elegant but functional.

Quote:

H-P's are great as long as they are intact. Excellent software, perfect feeling in touch and use.  
When they are dead, one wishes they were build like a TI or Casio ;-).

Again, you are right.

### 9s

Message #1 Posted by [Tadeyev](#) on 23 Mar 2007, 1:46 p.m.

Just for fun I bought a 9s to play around with. I must say, for the price, it really is lees bad than I expected. The keys work well and seems to have the fuctions one needs for basic stuff, although the layout is illogical and irritating...

The ENTER key is a real joke though, since it seems to function as no more than an '=' on a regular calculator. (And I thought they were giving youmg kids the RPN bug- no way!)

You can fix the length behind the decimal just like other HP's with FIX but what I can't figure out or find anywhere however is a comma separator for thousands...So big numbers not in engineering notation are just unreadable: 1,231,455,689.00 is just 1231455689.00 which I find impossible. Anyone know if this buggy has a comma somewhere? Thanks, Tadeyev

### Re: 9s

Message #2 Posted by [tadeyev](#) on 23 Mar 2007, 5:02 p.m.,  
in response to message #1 by Tadeyev

Well, I have foundd out that there is no comma available as thouands separator.. So, this 9s is bascially as good as a \$2.00 calculator in real use. It belongs in the list below this thread ;-)

**Worst (hp) calculator ever?**

Message #1 Posted by [Maximilian Hohmann](#) on 23 Mar 2007, 10:35 a.m.

Hello!

With all the "best calculator ever" threads abunding, I thought it was time for the contrary (didn't find any such thread through the search function).

Why this question? Because yesterday, I received an HP-10BII. Not that I care much about financial calculators or calculators with LCDs, but like everybody else here, I still dream my dream of one day owning a specimen of each hp calculator model. Yes, I know, there is nothing more dis-illusioning than a dream come true, but one keeps trying anyway :-)

So here it is, the worst, by far! calculator I have ever come across: The HP-10BII. Never have I seen such a cheap, flimsy piece of equipment, such a large step back from its predecessor (HP-10B, a solid and well made calculator). Everything about it looks cheap (even the "metal", or wahatever it is, trim around the display and the two top rows of keys), sounds cheap, feels cheap. Several segments of the display are not working anymore (the reason why I got it for one Euro - and this still is one Euro too much) and according to the previous owner he has used it only two ore three times before the display failed, out of warranty of course.

I have also some of the other Chinese made hp calculators (6S, 9S, 9G, 30S, 33S) and they all are about worth what you have to pay for them - but the 10BII is in a class of its own. If I was an hp official, I would try to buy them all back from the market, bulldoze them into pieces and use the plastic to make 12Cs out of it.

Sorry, I had to say this and now I feel better :-))

(And a lot more better, because this morning I got an Elektronika MK61 (Soviet RPN programmable) that looks and feels a litte cheap too and has a little display problem as well, but it is nearly 20 years old and very special in many ways.)

Greetings, Max

Message #2 Posted by [Ron Ross](#) on 23 Mar 2007, 10:59 a.m.,  
in response to message #1 by Maximilian Hohmann

I second your vote for the Hp10Bii!

From my experience with the Hp10Bii which is exactly the same as yours except THAT I did buy mine brand new. The keyboard was CRAP right out of the plastic anti-theft blister pack case (Only the dumbest thief would steal this \$hi7!). The top row right keys had no tactle feedback (mushy) right out of box.

However it sat in my collection for about a year, when I pulled it out to play with (I do that occasionally even with the financials). And guess what, the display had failed, just sitting in my collection. The warrenty had

expired and Hp was unsympathetic about replacement. I have not bought another Hp financial since (nor do I feel bad for not doing so, as I don't feel the need to collect financials).

I will have to agree that the 10Bii is without a doubt the worst piece of junk in the entire solar system. I was so glad when mine died a mysterious death. What were they thinking (drinking?)?

Don

### **Re: Worst (hp) calculator ever?**

Message #5 Posted by **Ron** on 23 Mar 2007, 11:35 a.m.,  
in response to message #1 by Maximilian Hohmann

I'm not actually answering the question posed, but thought this would be a good thread to mention the dumbest ideas I've seen in HP calcs. Top two are:

1. 6S solar, with battery backup, and no OFF key! This is such a bad design, it's funny. Any time it's dark, the battery is running down. At night, the battery keeps the calc on. Put it in the case, the battery keeps the calc on. This calc must have been designed by the Energizer Bunny. 2. Clamshell side battery doors. If it's not broken, it will be soon! It reminds me of the saying that "armadillos are born by the road, dead."

### **Re: Worst (hp) calculator ever?**

Message #6 Posted by **Katie Wasserman** on 23 Mar 2007, 11:53 a.m.,  
in response to message #5 by Ron

I vote for the 6S non-solar. It does have an 'off' key but the color scheme makes the functions almost unreadable.

I sort of like the 6s solar, it's cheap (\$2 each in the large quantity I bought for geocaching prizes) and although the battery does drain in low-light conditions it lasts for years.

### **Re: Worst (hp) calculator ever?**

Message #7 Posted by **Massimo Gnerucci (Italy)** on 23 Mar 2007, 12:54 p.m.,  
in response to message #6 by Katie Wasserman

I completely agree with Katie for the very same reasons.

I pulled off the batteries from the 6Sss (how many "s"!) I own and (very rarely) use them as pure solar calcs.

### **Re: Worst (hp) calculator ever?**

*Message #8 Posted by [Dave Shaffer](#) on 23 Mar 2007, 11:40 a.m.,  
in response to message #1 by Maximilian Hohmann*

Since you put (hp), I think one is allowed to comment about other calcs, too.

My vote goes for the 99 cent store special! There was thread here a few years ago which pointed out its existence. Since at that point I was accumulating cheap calculators (\$5-10 Casios, Canons, and TIs) which I could lend out in physics and astronomy labs (with little fear of loss if they disappeared), I figured I should get one of the 99¢ specials.

It was there in the store, alright. By the time I got it home, though, one of the screws holding the case together had fallen out, and the keyboard was truly crap. It did seem to perform its functions correctly, however.

It gets my vote for worst calculator.

### **Re: Worst (hp) calculator ever?**

*Message #9 Posted by [Paul Brogger](#) on 23 Mar 2007, 11:58 a.m.,  
in response to message #1 by Maximilian Hohmann*

For me, the 6s -- easily the worst H-P I've ever touched. (The 10Bii is a close second, though.)

Its AMAZING capacity for key bounce was instantaneously exasperating, and ultimately fatal (to the calculator).

I've said before, one of my most satisfying H-P moments was frisbee-ing that 6s into the dumpster, and not even bothering to confirm its hoped-for destruction.

*Message #12 Posted by [GE](#) on 23 Mar 2007, 5:42 p.m.,  
in response to message #11 by Dia C. Tran*

The HP10A is one of the rarest and most sought after models. I wish you the luck to get one some day. Probably few cash registers cost more (second hand).

My vote for the worst HP goes to the HP38G, the less usable graphical calculator I own. The programming, general behavior, and function set are exactly fine tuned to induce nervous breakdown. As for the 6S, yes it looks bad but it packs lots of function, and mine has not failed - yet. So it was less of a bad surprise.

## **I hate my 15C!!!!**

*Message #13 Posted by [Les Wright](#) on 24 Mar 2007, 9:39 a.m.,  
in response to message #1 by Maximilian Hohmann*

With apologies to Catherine Deneuve in that old commercial, I hate it because it is so beautiful.

It was an early acquisition for me and I paid premium price for it. The owner said it was like new and was right, a fact that became evident only when I got my well worn 11C and had a mode of comparison.

I am afraid to look at it funny. It stays in the case and every few weeks I take it out to admire it, then put it back quickly lest I scratch it.

I feel it is going to waste! I am wondering if I should trade with someone who has a less-than-perfect one that I won't fear using.

On the other hand, my 42S, which cost me even more and is well worn, gets used all the time, and occasionally I have to rescue it from under the belly of one of the fatter cats that live on my desk.

Damned perfect 15C. It many never get to truly know you....

Les

*Message #14 Posted by [Namir](#) on 24 Mar 2007, 10:36 a.m.,  
in response to message #13 by Les Wright*

Les,

Maybe an HP-15C emulator from [RLM Tools](#) can help solve your problem. You can use the emulator without worrying and wear and tear. It lives on your PC and if you have a laptop, it can go with you!!! The emulator can save your programs to the PC and load them later--big convenience. In addition, you can easily view memory registers, programs steps, and so on, in pop-up windows. If you get a master membership (one time fee) you get all of the emulators. There is an HP41 emulator in the works. I am not affiliated with that site. I am just a happy customer

Namir

## **Perfect HP-15C -- to use, or not to use?**

*Message #15 Posted by [Karl Schneider](#) on 24 Mar 2007, 3:01 p.m.,

I'd use it anyway, with clean hands, and always putting it back into a drawer inside its slipcover or case

when finished. There's no point in not using it; sometime many years down the road, it'll quit working.

Then there's Valentin's approach, using it only through a clear protective cover or glove.

Hi, Karl, Les:

Karl posted:

*"I'd use it anyway, with clean hands, and always putting it back into a drawer inside its slipcover or case when finished. [...] Then there's Valentin's approach, using it only through a clear protective cover or glove."*

Yes, that's true. I would advise against using such a perfect instance of an HP-15C with bare hands, because no matter how clean they are, they will nonetheless leave traces of greasy residues that in time will alter the touched surface. Also, unavoidable dust, particles, ambient humidity will also deposit slowly but surely over an unprotected surface.

What I do with my HP-15Cs, even the not-so-mint one, and with all my calculators getting use for that matter (several HP and two SHARP) is to have them hermetically thermo-sealed inside a suitably tight-fitting clear teflon cover, which doesn't affect their usability or visibility in the least, but effectively reduces to nil any effects from fingers, dust, humidity, or whatever. Nothing can enter the sealed protection and I can take the calculator and do whatever calculations with it, almost no matter where, and it remains as mint as it was. Even the occasional water spill (or even sugared coffee!!) means *\*nothing\** because it doesn't penetrate the teflon cover. They could stand open rain wholly unaffected, if necessary (which never is).

I would suggest doing something similar and that failing, at least *\*do\** *\*not\** put the HP-15C in its original slip cover, because this is going to mar the finish and eventually the logo itself. Place it everywhere but its tight-fitting, slip cover. The teflon protection is fine enough but else there are much better covers for it available in the usual places, made of cow-hide and with extremely soft, non-dusting interiors.

Best regards from V.

How about changing batteries ? (not a problem for the 15C, actually !)

I rather use kitchen plastic film, is not durable but does the job and can be replaced easily.

**Re: Perfect HP-15C -- to use, or not to use?**

*Message #18 Posted by [Valentin Albillo](#) on 24 Mar 2007, 7:22 p.m.,  
in response to message #17 by GE*

Hi, GE:

GE posted:

*"How about changing batteries ? (not a problem for the 15C, actually !)"*

Exactly. Not a problem at all, because batteries last some 10 years or more, while the teflon covering only last 3 years or so, depending on use and abuse, before needing to be replaced.

*"I rather use kitchen plastic film, is not durable but does the job and can be replaced easily."*

Several problems with kitchen plastic film:

- Not tough or resistant at all, gets easily teared or punctured, will deform very quickly with use. Thus, doesn't really protect the calculator as it should, at all.
- Can't be thermo-sealed, so there's no way to hermetically seal it so that moisture and external agents aren't able to penetrate.
- Ugly looking, and would stick to the calculator's surfaces, with unknown effects. Teflon is one of the very best antiadherent plastics, virtually no friction, and tolerates burning temperatures without damage. That's why it's heavily used in frying pans and kitchen appliances everywhere.

Best regards from V.

Also, unavoidable dust, particles, ambient humidity will also deposit slowly but surely over an unprotected surface.

---

Why not put it in a sealed container and just look at it ever now and then? I really cannot imagine not being able to actually touch the keys and I don't mean through a plastic bag. I guess the difference is - do we collect them as a museum piece or as a fun piece of history to play with. If it's a museum piece, then frame it and hang it on the wall to look at and appreciate for it's beauty.

Me, I want to pick it up, touch it, use it, play with it, enjoy it, calculate with it, and generally have fun with it.

Bill

## Re: Perfect HP-15C -- to use, or not to use?

Message #20 Posted by [Valentin Albillo](#) on 24 Mar 2007, 9:42 p.m.,  
in response to message #19 by Bill (Smithville, NJ)

Hi, Bill:

Bill posted:

*"Me, I want to pick it up, touch it, use it, play with it, enjoy it, calculate with it, and generally have fun with it."*

Correct, I want the same. It's only that different people do have different concepts of "having fun with". I simply wouldn't have fun at all if I touched the keys with my bare fingers or anyone else's, I would be upset to the max about it and would later have to give it a thorough and careful cleaning to remove any fingerprints and their unavoidable oily effects. That would take time, be no fun, and ultimately the frequent cleaning would have an undesirable effect on the surfaces.

That would be no fun either, thus the teflon protection, which is as good as it gets and keeps me using (and enjoying and having fun with) my calculators as frequently as possible.

Thanks for your heartfelt comment and

Best regards from V.

## What I wish the 15c had...

Message #21 Posted by [Gene](#) on 25 Mar 2007, 1:18 p.m.,  
in response to message #20 by Valentin Albillo

Rather than trying to add the kitchen sink / everything to the 15c, here are two or three things I really wish were different on the 15c that would make me use mine more. :-)

- 1) More RAM available for programs and/or data.
- 2) Kill the keycodes and use alpha for the function display. Something like the HP41 or TI66 even would be wonderful. I really hate that the 12c / 12cp still use keycodes!
- 3) Perhaps...Perhaps...a few more labels added somehow.

That's all I would do to an otherwise nearly perfect machine.

## Re: What I wish the 15c had...

Message #22 Posted by [Karl Schneider](#) on 25 Mar 2007, 6:30 p.m.,

Hi, Gene --

Quote:

... here are two or three things I really wish were different on the 15c that would make me use mine more.

- 1) More RAM available for programs and/or data.

---

RAM was costly in the early 1980's. If another R2D2 chip could have been squeezed onto the circuit board, the extra 32 registers or so would have been very welcome, and would likely not have had any significant "side effects". Please see this thread, which also addresses the speed issue:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=94725#94725>

Quote:

---

2) Kill the keycodes and use alpha for the function display. Something like the HP41 or TI66 even would be wonderful. I really hate that the 12c / 12cp still use keycodes!

---

Obviously, to make full alphanumeric possible would require a different display unit -- the HP-41 14-segment LCD or, better yet, dot-matrix. ALPHA support would also require a much bigger ROM.

Regarding keycodes, one feature I would have liked is for "A" through "E" to be displayed where appropriate (i.e., for labels and matrix identifiers) instead of a two-digit keycode. For example, "GTO A" would be displayed as "22 A" instead of "22 11". However,  $x^2$  would still be displayed as "43 11", because that function has nothing to do with "A". This enhancement was, in fact, incorporated into the HP-20S, which had a much more capable processor and presumably more space available for ROM.

For what it is, the HP-15C is just about perfect. To add new significant capabilities would have certainly have required more-expensive new or additional hardware. After doing that, it just wouldn't be a Voyager-series model anymore.

I must admit there is another reason.

All of the stuff everyone loves about the 15C--matrices, complex numbers, keystroke programming, built-in integrator and solver--I just find a lot easier to use on the 42S, even though the latter is admittedly a lot less attractive to look at. The diarrheal brown and orange lettering on the Pioneers is just not nearly as aesthetically gratifying as the colour scheme of the Voyageurs. And there is of course that annoying faint display on the 42S. The crisp and flawless display on my 15C is impeccable.

Les

You may have seen my recent post noting that I put "Roll up" in the first level of a custom menu on the HP-42S

The "Roll up" function, truth be told, is most useful for programming. The HP-41 also doesn't have it on the keyboard; the HP-10C and HP-32S (to name several) don't have the function at all.

### **Re: "Roll up" function**

*Message #31 Posted by [Trent Moseley](#) on 26 Mar 2007, 9:12 p.m.,  
in response to message #30 by Karl Schneider*

Karl,

I agree with you completely when one is programing. However when I'm just banging around doing some calcs no way am I going to use a menu to get a roll-up, so ala HP-25C it's three roll-downs. The 42 in my opinion should have used two shift keys and relied a little less on menus.

tm

### **Re: "Roll up" function**

*Message #32 Posted by [Ron Ross](#) on 26 Mar 2007, 10:15 p.m.,  
in response to message #31 by Trent Moseley*

Has everyone forgotten about the custom Menu in the 42s? You can customize upto 18 functions onto the soft menu and just leave them there for your convience if you need a certain set of functions on a repetative basis.

Merely assign the Rollup function to the key above ie rplace the SQRT and Voila! you now have the roll up key w/o second function, if that pleases you.

I love my Hp15c, but for me the Hp42s replaced it. I do like the form factor and admittedly complex numbers are integrated well, but the programming and customability of the 42s make it my calculator of choice (YES, IT IS 1 cm to DAMN TALL!).

## HP-41/42 "View" vs. "Roll up" function

Message #34 Posted by [Karl Schneider](#) on 27 Mar 2007, 12:44 a.m.,  
in response to message #31 by Trent Moseley

Hi, Trent --

Quote:

However when I'm just banging around doing some calcs no way am I going to use a menu to get a roll-up, so ala HP-25C it's three roll-downs.

There is also the "VIEW" command on the HP-41 and HP-42S, which can display a stack register without disturbing the stack and without requiring the user to think about and count "Roll downs". Unfortunately, it's not on the HP-42S keyboard, so the CUSTOM menu is good to utilize.

Quote:

The 42 in my opinion should have used two shift keys and relied a little less on menus.

Ah, but that would effectively renounce the "tidy face" design principle with no shifted function on the unbeveled key, developed for the Pioneer series. The 2nd shifted function would be printed adjacent to the first shifted function -- just like the menuless HP-20S and HP-21S, the subsequent HP-32SII, and the ancestor HP-34C.

### **Re: An HP calculator that "missed the mark"**

Message #38 Posted by **Valentin Albillo** on 27 Mar 2007, 6:33 a.m.,  
in response to message #37 by Karl Schneider

Hi, Karl:

Karl posted:

*"[...] but I'd say that it "missed the mark", and thus lasted less than three years on the market."*

Actually, it lasted less than *\*two\** years, more like 1.5 years to be exact:

Introduction Date: 1982-09-02  
Discontinuation Date: 1984-03-01

(Source: google for "Finseth, HP-10C" or have a look at Wlodek's Guide")

Nice machine, though. I like it very much on aesthetic grounds, having all the good physical points of the Voyager series, plus utmost simplicity with that uncluttered keyboard and that single yellow shift key. I think it would have made an excellent "Four-Function ++" calculator for anyone, me included, if it had been much less expensive. If it were commercially available right now, with the exact same quality as before but for, say, \$50, I would certainly buy several, both as gifts and to have one available at all places.

The sad truth is, it's outrageously difficult to find, though I managed to get a mint one a few years ago for just \$200, which is one of the high-points in my little collection, along with the SHARP EL-5101, PC-1421, and PC-1425.

Best regards from V.

\_\_\_\_\_

I agree that the HP-10C was still a good, quality-built basic scientific calculator. To me, however, excellence would have required the presence of backspace, %CH, hyperbolics, and (perhaps) roll\_up. All of these could have been provided with room to spare if its crude programming had been omitted.

I also bought mine several years ago, for \$225 -- a near-mint specimen whose owner stated having used it for his job helping to design a major new airport in the US. It's the most I've paid for any single calc (excluding accessories).

in response to message #38 by [Valentin Albillo](#)

Valentin,

You mentioned several Sharp calcs in your previous message. I know nothing about those models but I have a Sharp PC-1500A and a Radio Shack TRS-80 (made by Sharp) whose programs can interface with each other. Are they comparable to yours?

tm

## Re: Sharp Calculators

Message #41 Posted by [Valentin Albillo](#) on 30 Mar 2007, 5:58 a.m.,  
in response to message #40 by [Trent Moseley](#)

Hi, Trent:

Trent posted:

*"[...] I have a Sharp PC-1500A and a Radio Shack TRS-80 (made by Sharp) whose programs can interface with each other. Are they comparable to yours?"*

I also own a SHARP PC-1500A and two TRS-80 Pocket Computer units which, as you say, are exact clones of the pioneer SHARP PC-1211 save for minor cosmetic changes.

These are very worthy machines and they're certainly comparable to the models I discussed in my post in terms of physical quality, ruggedness and reliability, mines do work absolutely great and look new after some 20-25 years.

However, in terms of programming power, being the very first, pioneering models introduced into the market, they were later succeeded by more advanced models, with enhanced BASIC language, more RAM, larger displays, faster CPUs, etc. This doesn't demean them at all, they were the first ones and is only natural that improved versions would hit the market next.

It would be akin to compare an HP-65 to an HP-41C, say. It's not that the HP-41C is "better", it's simply that it wouldn't be a fair comparison to begin with. But in terms of actual capabilities, regardless of their time frames, yes, the HP-41C is more capable than the HP-65 and the SHARPs I mentioned in my post are more capable than the ones you have.

I would suggest two things, if you're still interested in SHARP machines and would like to get to know them better:

- Get some of these models (in order of easy availability thus low price): PC-1350 or PC-1360, PC-1262, [PC-1475](#), PC-E500S, PC-1421 (Financial).

- Get a copy of my article "*Know Thy Foe - A New Contender*", a 12-page article published in the 2006 May/June issue of [Datafile](#) (V25N3P21-32) which features a very thorough comparison between the HP-41C and the SHARP PC-1211 (i.e. your TRS-80 PC-1), including several pictures, many code snippets, 2 complete programs for the HP-41C and 6 complete programs for the SHARP including:
  1. Towers of Hanoi Puzzle (8 lines)
  2. Hyperbolic Functions (6 lines)
  3. Computing  $e$  (2.71828...) to 575 decimal digits (6 lines)
  4. Solving the general "N-Queens in an NxN chessboard" Puzzle (9 lines)

I think you'll enjoy both the article and the featured programs a lot and will learn new facts and techniques from them.

Thanks for your interest and

Best regards from V.

### **Re: Sharp Calculators**

*Message #42 Posted by [Gene](#) on 30 Mar 2007, 7:59 a.m.,  
in response to message #41 by Valentin Albillo*

The 1403 is similar to the 1475, except that the matrix functions are calculator mode only, is that correct? Would make them much less useful, IMO.

The EL-5510 aka 1421 (that I picked up recently) is quite nice. Keeping my eyes open for some of the others.

### **Re: Sharp Calculators: PC-1421 in particular**

*Message #43 Posted by [Valentin Albillo](#) on 30 Mar 2007, 9:13 a.m.,  
in response to message #42 by Gene*

Hi, Gene:

Gene posted:

*"The 1403 is similar to the 1475, except that the matrix functions are calculator mode only, is that correct? Would make them much less useful, IMO."*

The matrix functions in the SHARP PC-1475 are also "calculator mode only" if by that you mean that they can't be included in BASIC programs, unlike the financial functions of the SHARP PC-1421 which indeed can.

This does detract from their usefulness but the matrices used in calc mode (matrix mode more like) are shared with BASIC variable space, so you can have a BASIC program do something with a matrix (perhaps initialize it with computed entries dependent on previous user inputs, say), momentarily pause for the user to do something more using the fast built-in matrix functions, then CONTinue with your BASIC program which can then take those matrices and further process them or print them to a printer or to some mass storage device. Certainly not as convenient as having the capability to insert them into your own programs, but not absolutely impossible to pre-process and post-process

the matricial data and results either.

The real difference between the 1403 and the 1475 are:

- The LCD display: 1 line (1403) versus 2 lines (1475).
- The SHARP PC-1475 has double-precision variables and calculations, up to 20 significant digits. This is actually a very important feature for many (if not all) applications, I've always wondered why there are so few advanced models implementing this feature, even if as an option.

*"The EL-5510 aka 1421 (that I picked up recently) is quite nice. Keeping my eyes open for some of the others."*

By the way, Gene, being the knowledgeable financial expert that you are, I would be *\*extremely\** interested in reading your review of this PC-1421 as compared with the HP-12C, namely:

- What do you think of it now that you know it well ? How does it compare with the HP-12C not 'on paper' but in the real world, in actual financial use ? Pros ? Cons ? Would you be caught dead using a 1421 in public, in a financial meeting, say ?
- Have you written any programs for it, mostly those which would exploit its much larger RAM (4 Kb), faster CPU, printing capabilities, and advanced BASIC programming language features such as arrays, merging programs and data from tape, etc ? Would you care to publish some or let us know you impressions on its programming features ? Could we have a look at some actual BASIC code for this machine ?

I own one myself, but I'm no financial expert whatsoever so I am not really entitled to do a full review of its financial aspects, this would be an ideal task for mega-experts like Tony Hutchins and yourself.

I wonder what both of you would do when programming this 1421 model, when taking into account the absolute wonders you've provided us with while constricted by the HP-12C's tremendous programming limitations.

Thanks in advance for any inputs and/or comments on this and

Best regards from V.

*Message #44 Posted by **Gene** on 30 Mar 2007, 9:56 a.m.,  
in response to message #43 by Valentin Albillo*

Thanks for the clarifications about the 1475 vs. 1403. I did not know that. I had assumed the 1475 matrix functions were BASIC programmable.

I've had the EL-5510 for only a little over a week and have only played with it a bit. I'll write up my impressions after I use it for something "real".

I've also got a Sharp Wizard OZ-8200 coming. 64K of ram along with the double

precision math/BASIC card should make it interesting to use.

Just dipping my toe into the sharp world so far.

Gene

P.S. Tony is the expert around here, not me. My only strength seems to be a reasonable ability to explain things to others once I understand them. If I could make a living at it (the kind of living I want, that is), I'd have continued teaching. Alas.

*Message #45 Posted by [HrastProgrammer](#) on 31 Mar 2007, 5:23 a.m.,  
in response to message #43 by Valentin Albillo*

Hi Valentin and Gene,

Sharp threads are always interesting to me because I was involved into Sharps very much, long time ago ...

It is true that matrix operations are not accessible from BASIC using BASIC commands and functions but this doesn't mean that they aren't accessible at all :-)

I remember hacking PC-1403 some 20 years ago. I disassembled and analyzed large portions of its ROM (PC-1403 has 8K of ROM built-into CPU and 64K of bank-switched ROM in 4x16K banks). Between many other things, I found all matrix operations addresses in ROM. Fortunately, they are all located in ROM4 which is active by default when executing CALL so calling them from BASIC was possible without any trouble.

For example, suppose that you want to solve the following system of linear equations from the PC-1403 users manual (page 77):

$$\begin{aligned} 2x + 5y - z &= -1 \\ x - y + 4z &= 12 \\ 3x + 2y + z &= 9 \end{aligned}$$

The following program can do this without even blinking:

```
5 "A": CLEAR: RESTORE 20
10 DIM X(2,2): FOR I=0 TO 2: FOR J=0 TO 2: READ X(I,J): NEXT J: NEXT I
20 DATA 2,5,-1,1,-1,4,3,2,1
30 DIM Y(2,0): FOR I=0 TO 2: READ Y(I,0): NEXT I
40 DATA -1,12,9
50 CALL 26132: REM invX->X
60 CALL 26119: REM X*Y->X
70 FOR I=0 TO 2: PRINT X(I,0): NEXT I
```

Type DEF A and after less than 2 seconds this program will start printing the results: 3, -1 and 2 ... The results are saved into X because PC-1403 used regular X, Y and M variables to work with matrices.

Best regards.  
HrastProgrammer

The master!

Do you have the list handy of all the matrix functions addresses? You've provided two...what others do you have? :-)

Gene

**Re: Sharp Calculators: PC-1403 in particular**

*Message #50 Posted by [HrastProgrammer](#) on 31 Mar 2007, 10:24 a.m.,  
in response to message #49 by Gene*

Yes, I have addresses of all of them on paper because this was my main "storage medium" at that time when all of my "armament" consisted only of Texas Instruments TI-57, Sharp PC-1251 and Sharp PC-1403. The only "mass storage" device I had was a simple cassette recorder. BTW, PC-1403 was my main calculating machine until I bought HP-48GX.

I will retype and post them during the weekend ...

**Re: Sharp Calculators: PC-1403 in particular**

*Message #51 Posted by [HrastProgrammer](#) on 1 Apr 2007, 1:40 a.m.,  
in response to message #49 by Gene*

Here is the list of PC-1403 ROM matrix subroutines I found:

```
26109 X+Y->X
26114 X-Y->X
26119 X*Y->X
26124 X*invY->X
26132 invX->X
26140 (x)+X->X
26148 (x)-X->X
26153 (x)*X->X
26158 (x)*invX->X
26163 X<>Y
26171 trnX->X
26176 detX->(x)
26181 -X->X
26186 squX->X
26191 X->M
26199 M->X
26204 X+M->X
```

X, Y and M are matrices (DIMENSIONED 2-dimensional BASIC arrays) while (x) is the simple BASIC variable X. For example, X=10: CALL 26153 will multiply matrix X with a scalar value 10 and CALL 26176: PRINT X will print the determinant of matrix X. Using the above subroutines I was able to squeeze really big programs dealing with matrices into the limited PC-1403 memory (some 6878 bytes after reset).

But, please, don't take for granted that these addresses will work in all PC-1403s because of various ROM revisions or because I maybe retyped some of them incorrectly ...

Message #53 Posted by [Valentin Albillo](#) on 2 Apr 2007, 7:30 a.m.,  
in response to message #45 by HrastProgrammer

Hi, Hrast:

Thank you very much for your *most worthwhile* contribution to this thread.

I was aware of the fact that the matrix routines could perhaps be called from BASIC either directly by a CALL statement as you did, or else indirectly by using PEEK and POKE to enter some custom machine-language routine which would previously set up whatever was necessary to access them, then a CALL to this initializing routine.

Mentioning this earlier in this thread was probably getting off-topic too much, as it likely would result in more questions which I didn't have the time to answer, so I'm very glad that you already had solved this matter in the far past and had a list of relevant addresses at hand, and the knowledge that they could be called directly, no initialization needed.

Come to think of it, I'm sure I have the full ROM listing of this machine

available in some of the books I own dealing with SHARP PCs machine-language programming. I did also buy a PC-1403 from a very nice German seller which accompanied it with a whole big-sized folder full of his notes, machine-language routines, tentative ROM disassemblies, hardware notes, relevant clips cut from magazines, the works. I've never had the time to closely have a look at it, but the info isn't lost, and could be useful for future threads like this one, again if not too off-topic.

Thanks again, I'll try your entry points in my PC-1403 to see if they work in its ROM revision, and

Best regards from V.

### **Re: Sharp Calculators: PC-1403 in particular**

*Message #54 Posted by [HrastProgrammer](#) on 2 Apr 2007, 8:10 a.m.,  
in response to message #53 by Valentin Albillo*

Thanks Valentin, Bill, Gene, Namir, Max, ...

I hope some of you will find these addresses useful ...

I remember being very surprised by the simplicity of their usage. There was no initialization needed and you could use them almost as simple as using the regular BASIC instructions. I am wondering why Sharp didn't provide at least one BASIC matrix instruction (for example, MATRIX n where n=1..17). They certainly had some unused BASIC tokens at their disposal and all this won't require a lot of ROM.

*I'm sure I have the full ROM listing of this machine available...*

I disassembled the whole 24K PC-1251 ROM manually and started to disassemble PC-1403 ROM but then it was time to go to the army so only the most important addresses were disassembled and explored. Later I moved to other things and this job was never finished :-)

Best regards.  
Hrast

*Message #60 Posted by **GE** on 11 Apr 2007, 6:41 a.m.,  
in response to message #59 by GE*

Without an on-calc assembler (not possible in that small RAM IMHO), you'd be better use a cross-assembler. Ideally it would spit out a BASIC program made of POKE or DATA (+loop) statements capable of putting the target program in RAM.

No knowledge if that sort of beast exists.

I don't think you can directly import machine code from the serial interface.

Another way is to write the machine code on tape, as there is a statement to load ML from tape, but that would be more complex than the BASIC loader method.

Good luck.

Quote:

Antonio, are you looking for something special or just for general reference?

Well, just to be able to program in machine language on my beloved Sharp PC-1401; of course this means:

- knowing the mnemonics codes
- knowing the calling addresses of library routines (I/O, calculation, math function, and so on).
- knowing about the processor.

It's not a real need, of course. No hurry. Only a curiosity if someone, somewhere, has retrieved such information and published a pdf (or some sort of) book about it.

Thanks everyone for helping.

### HP-49g+ "Insufficient memory" message

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 23 Mar 2007, 5:04 a.m.

Hi,

I happened to load HP-Lua into my calculator, copying the HP-lua file into Port 0, which had 224 KB free. When I tried to move the HP-Lua file from port 0 to port 2, I probably messed up things, since the calculator refused to do it, and after ON+F3 I found

- port 0 void,
- port 2 with no such HP-Lua file
- and (worse) port 0 reporting 102 KB free.

I know I should defrag port 0 to recover lost chunks, but how can I do it?

Thanks in advance.

-- Antonio

### Classic Series Power Supply Schematic?

Message #1 Posted by [Daniel Weed](#) on 22 Mar 2007, 5:36 p.m.

Hi all,

Anyone have a schematic for the power supply of the classic series (HP-35, 45, 55)?

Not the power brick, but the internal supply which converts V<sub>bsw</sub> to V<sub>cc</sub> (+8.2V), V<sub>ss</sub>(+6V) and V<sub>gg</sub> (-12V).

I am wanting to repair an HP-45 and after metering the internal voltages at the testpoints, it looks like that's where the problem is.

Thanks,

-- Dan

### Re: Classic Series Power Supply Schematic?

Message #2 Posted by [Tony Duell](#) on 23 Mar 2007, 6:10 a.m.,  
in response to message #1 by [Daniel Weed](#)

I've traced out full schematics of just about all the old HP handhelds. They're available on the HPCC schematics CD-ROM (see the obvious web site for details).

This CD-ROM is produced by Dave Colver, the HPCC secretary. If you ask him nicely (I believe contact details are on the same site), he might e-mail you just the schematic for your machine.

My experience suggests that the 35 PSU schematic is somewhat different to the later ones (the later ones have a zener diode in the regulator circuit, the 35 one that I've seen simply sets V<sub>ss</sub> to be a certain multiple of the battery voltage).

Incidentally, if you're getting no outputs at all, most of the time it's the oscillator transistor that's failed. A 2N3904 is a suitable replacement. If you're getting excessive ripple on one of the outputs, or if the V<sub>gg</sub> line is crazy, I'd suspect the electrolytic capacitors.

### Re: Classic Series Power Supply Schematic?

Message #3 Posted by [Dan](#) on 23 Mar 2007, 12:03 p.m.,  
in response to message #2 by [Tony Duell](#)

Thanks. I sent a note to Dave.

Looks like this is a flyback converter with the oscillator circuit to the left, 3 windings on the transformer, and 2.2 uF capacitor/diode circuits to the right providing the voltages.

On the oscillator circuit there appear to be two transistors, both Motorola, labeled 4-094 and 4-550 (NPN and PNP?). I tried looking up these part numbers but didn't find anything. It also has a 60uF cap.

Usually the least reliable components would be the capacitors. But I would agree if the oscillator is dead the transistors may be the problem.

So far I've only hooked it up to a multimeter. This weekend I'll scope it to see what I find.

Also I took the board and scanned both sides on a flatbed scanner at a ridiculously high DPI in case I decide to try to reverse engineer this thing myself.

With all of the gold plating and the gold/ceramic Mostek chips, this board is a real work of art. I'm half tempted to frame the picture.

Any other thoughts or related experiences are welcome.

### **67 card reader problem - help!**

Message #1 Posted by [Dave Bowman](#) on 22 Mar 2007, 3:14 p.m.

I buy HP-67/97 calculators on eBay, fix them and sell them under username davehal2001. I have successfully repaired numerous card readers without any serious problems - until now. Mark Hoskins (waterhosko on eBay) recommends I bring this problem here, indicating there is nothing you folks cannot solve.

So here goes:I have a problem with a 67 card reader and I cannot solve this problem myself. This card reader has the gummy wheel repair complete. The clutch works as is, so it has NOT been repaired; the reader pulls the cards through VERY well. The problem is, when I run a card through, I get an error message almost every time, mostly when I try to read cards. About half the time I write cards it works. The other odd thing is it seems the motor "runs on" for a fraction of a second after the card is finished going through. I have checked the finger contacts and they seem to be connecting properly. Any ideas?

Thanks,

Dave

### **Re: 67 card reader problem - help!**

Message #2 Posted by [Klaus](#) on 23 Mar 2007, 2:27 a.m.,  
in response to message #1 by [Dave Bowman](#)

Did you change the capacitors? I solved problems like this by changing the capacitors on the card reader PCB and some on the Logic PCB. I have a low-resolution photo where I have marked the position, polarity and value of the capacitors. I can email it to you.

Dave

### **Re: 67 card reader problem - help!**

Message #4 Posted by [Les Wright](#) on 23 Mar 2007, 5:42 p.m.,  
in response to message #1 by [Dave Bowman](#)

Dave, I don't have an answer for you. I hope you find one.

The sickening "run on" noise is one I am well familiar with. It is a generic symptom of a failed card reading.

In my experience, it accompanies almost all HP67 card reading failures. I don't know what it means for sure. I do know that when it doesn't happen and the card still fails to read, that means usually corrupt card--the card passed normally but the calculator seemed to find no data at all.

I recently received an expertly restored HP67 and I must admit that coping with the sensitivities and idiosyncrasies of the card reader is enough to drive me nuts. I have learned a few things:

1. I try to do card reading and certainly writing with the thing plugged into AC. When the battery begins to flag even slightly, the motor gets sluggish, cards pass too slowly and sometimes get stuck, read failures occur and, most importantly, write failures occur even though the calculator gives no indication that this has happened. Indeed, I have been running my HP67 lately on AC trickle charge most of the time. Yes, scandalous I know!
2. I wash my hands before handling cards. Seriously! I had pizza for dinner one night this week, and evidently my fingers were more oily than I thought, since cards would not feed normally, would get stuck even with a full charge and AC power. Alcohol cleaning of the cards, a thorough handwashing, and a single pass of the evil red card was required to keep the oily residue from propagating further.
3. Inserting the card requires gentleness and good timing. Push it slightly too quickly, it will pass a little too quickly and misread. Hold onto it just a little too long when the motor engages, and that messes things up too. Getting the "touch" has taken me lots of practice.
4. When writing cards of something important I make multiple backups. As I get more comfortable I probably won't be so obsessive about this.

I recently acquired a plasmoid refurbished HP41 card reader and have found it much more forgiving, provided that the calculator is working properly and the batteries are good. Indeed, plasmoid is quite clear that read/write errors should be an uncommon occurrence in a working card reader. However, I do know that my errors on the HP67 are getting fewer with experience and practice. I am glad I have the HP41 card reader, though--since it can read and translate HP67 cards, and is more robust in general, if I get repeat errors on a card passing it through the HP41 reader is diagnostically useful since error messages are more specific. For example, CARD ERR almost certainly means bad card, whereas MALFUNCTION or no error at all means the card probably needs good cleaning before the fussier 67 will accept it, or there is something localizable to the HP67 (usually flagging power, or olive oil on the pinch rollers!!!!).

I really hope you solve your problem. A working card reader on these old calcs is a joy, and I really appreciate why our forebears in the 70s were so amazed by the 65 and 67. But a goofy card reader is sort of frustrating and sad, since you just can't tap into the mystery and power of these old machines if you can't save your programs.

Good luck, and keep us posted--

Les

### Try spit!

*Message #5 Posted by **Palmer O. Hanson, Jr.** on 23 Mar 2007, 8:18 p.m.,  
in response to message #4 by Les Wright*

I am not kidding. Back in the days that I was working regularly with TI-59's there were a number of recognized remedies for card reader problems such as running with the charger connected, installing a new battery pack, rounding the corners of the magnetic cards, and cleaning the card with alcohol or distilled water. I was having difficulty reading a card with a known good card reader and didn't have alcohol or distilled water readily available so I put a little spit on a handkerchief and wiped the card. Voila! It read like a charm. After finding that the method worked better than alcohol or water with other problem

magnetic cards I told others about it. They were always skeptical, but when they tried it they were often successful.

The spit technique did help with one difficult to read HP-67 card. I don't claim to understand why this works. Perhaps spit is just a superior solvent for oily residue.

### **Re: Try spit!**

*Message #6 Posted by **Les Wright** on 24 Mar 2007, 9:00 a.m.,  
in response to message #5 by Palmer O. Hanson, Jr.*

Quote:

Perhaps spit is just a superior solvent for oily residue.

I think it may be a matter of displacement, as saliva is mostly water, hydrophilic vs. hydrophobic, that sort of thing.

Saliva contains some lipase, the enzyme that lops the fatty acids off of their glycerol backbone in biological fats and oils, but doesn't kick in until the low pH in the stomach.

But spit is filled with stuff that makes it viscous and sticky--mucopolysaccharides and glycoproteins, for example. A light film of this on the card may be enough to assist the card reader to grab and pull a rogue card rendered slippery by a grease spot.

Seems plausible?

Les

in response to message #4 by Les Wright*

Quote:

I recently acquired a plasmoid refurbished HP41 card reader and have found it much more forgiving, provided that the calculator is working properly and the batteries are good. Indeed, plasmoid is quite clear that read/write errors should be an uncommon occurrence in a working card reader.

I second that. I used to own an HP-41C (later replaced by a CX) with card reader. I used the card reader pretty heavily for several years, writing programs that spanned half a dozen cards or more, using data cards etc. -- and in all that card reader usage, I never had a single read or write error.

I would expect a properly restored card reader to be very reliable as well, provided the electronics are OK - - others have mentioned the need for a stable power supply (problems with electrolytic capacitors going bad etc.). If you're not doing so already, you could also try running the calculator off NiMH batteries instead of NiCd.

Good luck!

- Thomas

### **Re: 67 card reader problem - help!**

*Message #8 Posted by [Les Wright](#) on 24 Mar 2007, 9:09 a.m.,  
in response to message #7 by Thomas Okken*

Quote:

\_\_\_\_\_

I never had a single read or write error.

\_\_\_\_\_

I don't have quite so perfect a record, but when I do have misreads on the HP41 there is a good reason - crud on the card, sluggish batteries, inept insertion.

Quote:

\_\_\_\_\_

If you're not doing so already, you could also try running the calculator off NiMH batteries instead of NiCd.

\_\_\_\_\_

There has been some talk around here recently about building custom NiMH pacs for the Classics, but the sense I got was that the calculator's charging system couldn't do them justice. So I have a waterhosko NiCad pac, and am getting Randy to build me another one with the high quality cells he uses. The waterhosko pac is better than an older pac I have, and I think Randy's pac are better than waterhosko's (though corresponding more expensive).

But I like to use NiMH when I can. The self-fashioned pacs in my Spice calculators run forever, and the 2650mAh NiMH Duracells in my 82240B printer have been charged fully only once and are still powering the printer with a battery rating of 3 almost three months later.

Les

### **Re: 67 card reader problem - help!**

*Message #9 Posted by [Les Wright](#) on 24 Mar 2007, 2:33 p.m.,  
in response to message #8 by Les Wright*

Of the 41 program and data cards in the Standard Pac and Surveying Pac, I have culled 8 that I know for sure do not work and need to be rerecorded.

As for the remaining 33 (65 sides of programs and data), I am happy to report that after charging the HP67 fully with the waterhosko battery pack I have been able to pass these 65 sides thru the card reader with battery power alone two times around so far without generating a single error.

So there is a learning process here.

Les

### **Re: 67 card reader problem - help!**

*Message #10 Posted by [plasmoid](#) on 28 Mar 2007, 10:06 a.m.,  
in response to message #4 by Les Wright*

Quote:

\_\_\_\_\_

I recently received an expertly restored HP67 and I must admit that coping with the sensitivities and idiosyncrasies of the card reader is enough to drive me nuts.

---

I would just like to point out that properly rebuilt HP67/65/97/82104A card readers are all extremely reliable. They should work reliably right up to the point of low battery indication. Read/write errors should be very uncommon. It sounds like your HP67 has some issues which need to be resolved.

That having been said, everything Les says about keeping your cards clean is excellent advice -- even a nearly microscopic bump of "crud" on a card can lift it out of contact with the head and cause a read/write error.

---

### Something's moving?

Message #1 Posted by [Giancarlo \(Italy\)](#) on 22 Mar 2007, 2:05 p.m.

Hi.

Have you seen this:

[http://groups.google.com/group/comp.sys.hp48/browse\\_frm/thread/f05377ce9432cb7f/#](http://groups.google.com/group/comp.sys.hp48/browse_frm/thread/f05377ce9432cb7f/#)

Seems like something's really moving up there...

Best regards.

Giancarlo

### Re: Something's moving?

Message #2 Posted by [Namir](#) on 22 Mar 2007, 3:43 p.m.,

in response to message #1 by Giancarlo (Italy)

Anyone knows the position of Sam Kim in HP's calculator division????? He attended and talked to us at the HHC2006 in San Jose. Sam used to be a member of the PPC!!! It was nice to see a fellow PPC member at the helm of HP's calculators.

Namir

### Re: Something's moving?

Message #3 Posted by [Bruce H](#) on 22 Mar 2007, 6:55 p.m.,

in response to message #2 by Namir

The job being advertised is Fred Valdez's by the look of it. Perhaps Sam will go for it?

### Re: Something's moving?

Message #4 Posted by [Bruce Bergman](#) on 22 Mar 2007, 9:15 p.m.,

in response to message #3 by Bruce H

If he does, then I plan on applying for Sam's position. That would be awesome, working back in the world of HP calculators...

thanks, bruce

### Re: Something's moving?

Message #5 Posted by [Namir](#) on 22 Mar 2007, 10:58 p.m.,

in response to message #4 by Bruce Bergman

Bruce,

Sounds like we share the same dream!!! Something tells me that we are BY FAR not the only ones sharing the same dream!! I'd looooooove to work for HP calculator division.

Namir

Hi, Don --

Quote:

John Backus, retired IBM employee who invented FORTRAN, died this past Saturday. FORTRAN was the first language I used on the job (US Census Bureau, 1974). Here's to the memory of another pioneer.

My first computer language, as well -- learned in college and used on the job in the 1980's. It's probably still the best-suited and straightforward number-crunching language available, with built-in complex-number support and minimal formalities.

In fact, I have likened aspects of RPN keystroke programming to Fortran:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62844#62844>

-- KS

**Re: FORTRAN inventor dies**

Message #9 Posted by [Palmer O. Hanson, Jr.](#) on 22 Mar 2007, 9:02 p.m.,  
in response to message #8 by [Karl Schneider](#)

You wrote:

quote]

In fact, I have likened aspects of RPN keystroke programming to Fortran:

-- KS [/quote]

I didn't understand. So I read your reference and I still don't understand.

Suppose that you had been asked to program the Mach Number equation in your Fortran class and you had done it by working from the inside out like you must in RPN, in line after line of boring and difficult to read code. What sort of grade would you have received. In my Fortran class back in 1968 something like that wouldn't have got me an F -- it would have got me a zero!

One of the aids we used in learning to use Fortran was the *Fortran Autotester* by Smith and Johnson (John Wiley & Sons, 1962). Near the end the following advice is given:

If anything can go wrong with a program -- it will.

Do not believe in miracles -- rely on them.

Smile -- tomorrow will be worse.

In those days I was known for Hanson's Law of Computer Programming. "There is always one more error. They just get more difficult to find."

I was another of those engineers who learned Fortran while using a mainframe with access with punched cards-- in my case, a Sigma 5. One of things that was good about the punched cards was the punched card boxes which made excellent storage containers. The only other use I found was while teaching Sunday school. We were learning about Joshua. I picked up a couple hundred of the punched card boxes -- they were everywhere in those days. The class built an impressive wall of Jericho. Some one got to play "The Lord" and make the walls come tumbling down. We had to do it as many times as there were students in the class.

**RPN programming features vs. Fortran**

Message #10 Posted by [Karl Schneider](#) on 22 Mar 2007, 11:53 p.m.,  
in response to message #9 by [Palmer O. Hanson, Jr.](#)

Hi, Palmer --

I stated, "*In fact, I have likened aspects of RPN keystroke programming to Fortran:*"

You stated, "I didn't understand. So I read your reference and I still don't understand."

The reference, of course, is my post of several years ago:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62844#62844>

Here's a lightly-edited and slightly-enhanced excerpt:

I would liken keystroke programming more to the assembly-language paradigm rather than to high-level compiled language -- each line contains one operation/instruction, rather than a complete statement.

However, I also believe that Fortran '66 and '77 may have served as an inspiration for the high-end programmable calculators of the mid-70's. I have noticed a number of parallels:

1. "GTO" and "GSB" are like "GO TO" and "CALL"
2. "ISG" and "DSE" provide the "DO" looping functions
3. Flags are like LOGICAL variables
4. HP-41C external labels ("LBL {alphanumeric}") are like entry points
5. HP-41C local labels ("LBL nn or a-e") are like statement labels
6. "END" defines a complete program, like Fortran "END"
7. Conditional tests emulate simple "IF" statements

Maybe a better word is "features", not "aspects" -- as in those programming features that have been provided in HP's upscale RPN calc's since the mid-1970's, providing structure and flexibility.

Keystroke programing -- RPN or any other variety -- is more like assembly language (rather than a high-level language), as I had stated.

-- KS

Good morning!

Sad to hear that another pioneer of our trade has passed away.

I think I personally owe John Backus a lot, because not only was Fortran the first programming language that I was taught, but it has helped me in earning my living for the last 20 years and still does now - and hopefully it will also tomorrow.

From the point of view of the computer scientist this may not be the greatest of all computer languages, but for me as an engineer it certainly is: Clear, simple and yet fast and powerful when it comes to high precision number crunching. No wonder that many "cfd" and "cad" and "ct" and "sar" and "fem" and countless other processing cores are still written in Fortran today.

Greetings, Max

**Re: FORTRAN inventor dies**

Message #13 Posted by [Antonio Maschio \(Italy\)](#) on 22 Mar 2007, 4:26 a.m.,  
in response to message #1 by Don Shepherd

Well, I'm so sad to hear this...

FORTRAN was the first language I studied at the University, since then (mid 1980s) C++ wasn't at the top yet, as it's now. FORTRAN and Pascal, of course, but FORTRAN looked (and looks) to me more... professional. Maybe it's because later I became an engineer.

Recently I came across some documents about Fortran history, and boys! if it's intriguing! Backus was a great genius of the XX Century.

Yes, I know, this is an HP calculators Forum, but J. Backus deserves a word.

in response to message #14 by Maximilian Hohmann

Hello Max,

Although my preferred programming language is [GW-BASIC](#) (just kidding :-), I am glad FORTRAN is still alive. It was the second programming language I was taught (Nevada FORTRAN, 1986). Because it took me quite a long time to graduate, as I moved from a course to another, various generations of computers, computer-languages, HP-calculators ...and even professors passed me by :-)

Cheers,

GWBarbosa

**Re: FORTRAN inventor dies**

Message #16 Posted by [Maximilian Hohmann](#) on 22 Mar 2007, 11:18 a.m.,  
in response to message #15 by [Gerson W. Barbosa](#)

Hello Gerson,

Quote:

- 
1. Although my preferred programming language is GW-BASIC
  2. I am glad FORTRAN is still alive.
  3. It was the second programming language I was taught (Nevada FORTRAN, 1986). Because it took me quite a long time to graduate, as I moved from a course to another, various generations of computers, computer-languages, HP-calculators ...and even professors passed me by :- )
- 

1. Oh yes, GW-Basic... somewhere in my garage I still have an hp-Version of GW-Basic (with floppy disk and manual - must be as precious now as a good hp-42 from the same vintage :- ) ) for my hp-150, that is also somewhere in my garage.

2. As long as CATIA (V4) is in widespread use as a CAD system, FORTRAN will live! Unfortunately, at least from the point of view of a FORTRAN purist, they chose C/C++ for the successor Catia V5. But then, I can easily program in C as if it was Fortran, much to the disgust of my goto-hating computer-scientist-colleagues ;-)

3. For me, it was actually the first language that I was properly taught (I had taught myself to program my dad's hp-67, my own Ti-59 and the PET 2001 that they bought at school during my last year). At the computer science department of our university (Stuttgart, Germany) we dumb aerospace engineers were not allowed to touch any of the few proper terminals, but had to use keypunches to feed our example programs into the Control Data CDC 6600 mainframe (that had been the fastest computer on German soil not long before 1982 when I took the programming course).

Greetings, Max

Message #17 Posted by [Ed Look](#) on 22 Mar 2007, 11:58 a.m.,  
in response to message #14 by [Maximilian Hohmann](#)

Not even a year ago, I had taught the basics of FORTRAN to students as part of a chemistry course.

Of course, the ONE student who had some programming experience complained, oh, so much about how primitive and uneconomical and silly FORTRAN seemed to him...

... but what other language with such power can you teach the rudiments of, to those who never even thought about programming, and in just a few weeks?

I still admire the language... and yes, the man who came up with it.

## Re: FORTRAN inventor dies

Message #18 Posted by [Giancarlo \(Italy\)](#) on 22 Mar 2007, 1:11 p.m.,  
in response to message #17 by [Ed Look](#)

FORTRAN was the very first programming language they taught me when at the college - back in the end of the 80's...  
There were still punched card (!!!) going around in the "computer room" full of VAX workstations - how many hours spent in front of those green pixels with a FORTRAN listing on the screen and a paper listing on the desk to take notes...  
Hats off to Backus.  
Best regards.  
Giancarlo

**Re: FORTRAN inventor dies**

*Message #19 Posted by [Walter B](#) on 22 Mar 2007, 5:31 p.m.,  
in response to message #18 by Giancarlo (Italy)*

Me too. Also learned FORTRAN IV as first programming language, also punching - even earned some money for doing it for others in university. Heavy card punchers in a small windowless room. Big stacks of cards for just a simple matrix inversion or some Monte Carlo calculation. Green and amber screens. Mag tapes. And lots of line printer paper!

Way back ...

Thanks to Backus for starting it all!

### HP32sii, espresso, and cats--close call!

Message #1 Posted by [Les Wright](#) on 21 Mar 2007, 11:50 a.m.

My newly acquired and very pristine 32sii just missed getting baptised with a couple of ounces of espresso, tipped over by one of our many kittens. I like my coffee sweet, so this could've been a gooey disaster.

My Palm TX took the hit, though. I frantically subjected it to an isopropanol bath, and in a few hours it powered up fine and all functions seem intact. The display is a bit dark and uneven, though, and I expect that it will take a while for the alcohol that got in between the layers to dry out. But the touch screen feature is fine.

Close call. Kids, don't try this at home.

Les

Message #2 Posted by [Maximilian Hohmann](#) on 21 Mar 2007, 12:57 p.m.,  
in response to message #1 by Les Wright

Hello!

Quote:

Close call...

Lucky you! I did a similar thing to my trustworthy Apple Titanium PowerBook a few weeks ago, without the aid of any animal and with pure mineral water!, but I was less fortunate: Although I unplugged the charger immediately, removed the battery, unscrewed the bottom cover and let it dry in the sun for a few days, it wouldn't power up again :-)

Now I sent it to a guy who promises to repair it with refurbished parts for a fixed sum of 250 Euros - but I will only believe this when I get it back - Apple charges 900 Euros for the replacement of the main board alone...

And the HP-71 that was on my desk next to the PowerBook didn't receive a single drop of the spilled water - I still don't know if I would have preferred to drown this calculator instead of the Apple...

Greetings, Max

Other Sharp models which are often overlooked are any IQ7xxx, IQ8xxx or IQ9xxx organizer with the additional Basic card.

IMHO the best Sharp pocket computer (apart from I/O) is the IQ8400 with the IQ871 card. With this combination you get :

- 128K Ram (not expandable, but sufficient !)
- a large 8x40 graphical screen, you can switch to 4x30 for old eyes
- Sharp's latest version of Basic with files and 20 digit precision, compatible with the PCE-500
- very fast hardware
- connection to a PC is possible
- a full friendly organizer comes with it, free !
- full keyboard with extended character set

And the full RAM can be swapped with another card and is battery backed.

The IQ871 is compatible with IQ7xxx and IQ9xxxx models, but on these the screen is limited to 8x20, a painful limitation.

### HP67 Cards--got 'em, need 'em?

Message #1 Posted by [Les Wright](#) on 21 Mar 2007, 5:56 a.m.

Thanks to the miracles of FixThatCalc.com, I am the proud owner of a fully functional HP67, sooned to be joined by an HP97.

I have full card sets for the Surveying Pac and Standard Pac. Several of the cards in the former are toast even after a good cleaning. I attribute read errors to the cards since the HP67 is fully charged and my HP41CV batteries are fresh and I get reading errors consistently in both calculators, and expect the same behaviour in the 97 when it gets here.

I am not surprised by this--I think the Surveying Pac cards were actually used, which means they could have started getting some microscopic damage if they passed thru a drive in days of yore as it was moving toward gummy failure.

I mention this since I would like a full working set of the cards and would like to know if anyone with intact sets can help me out of duplicates of my dead cards? I will in time make an inventory of what I need and post here. If you can help me out I with this I will see what sort of favour in kind I can offer you.

Many thanks!

Les

### Re: HP67 Cards--got 'em, need 'em?

Message #2 Posted by [Les Wright](#) on 21 Mar 2007, 11:55 a.m.,  
in response to message #1 by Les Wright

While I am at it, I should ask if there is any way to restore cards that generate more than their share of errors. Any tips, tricks of the trade, etc? I am guessing that in the old days really prudent HP65 and 67 users made at least one back up copy. A bit of misplaced dust or grit in the card reader could possibly score a card and render it useless. I am also wondering if one of my bum cards was inadvertently erased, though how you do that with protected cards on the 67 is beyond me.

Any insight is always appreciated.

Les

in response to message #2 by Les Wright

It is also possible for cards to lose their information without actually being damaged. You could try keying in the programs from the manuals and then re-recording them; there is some advice on how to trick the card reader into writing to write-protected cards [in this article](#).

\_\_\_\_\_

Thomas, I am really quite lazy and the listings in the HP67 books is quite tiny, being a shrunken facsimile of HP97 printer output. So I was hoping some of our friends could help be bypass the tedium. ;)

Also some of the bum cards are data cards for the surveying programs, and I think the manual includes only program listings but not data. I will have to recheck tonight.

### HP-IL Cables, where to get, how to make?

Message #1 Posted by [Egan Ford](#) on 21 Mar 2007, 12:18 a.m.

Google has yield few results.

Thanks.

### Re: HP-IL Cables, where to get, how to make?

Message #2 Posted by [Eric Smith](#) on 21 Mar 2007, 3:13 a.m.,  
in response to message #1 by Egan Ford

I'm not aware of any "reliable" source for HP-IL cables.

Making your own is somewhat impractical, as the connectors were custom-made, and are not any more readily available than complete cables. If you had a bad cable, you could cut out a section and splice replacement cable into it. The cable HP used was more flexible than most cables that one might find for replacement.

For a while there was a glut of NOS 82160A HP-IL modules in the used market, and it appeared that someone was cutting the captive cables from them and selling them separately.

The last time I purchased any HP-IL cables, a local electronics surplus store had a bin of them marked "fan cables". I happened onto them because I was actually looking for fan cables.

If you're sufficiently desperate, HP equipment resellers probably have some, but the pricing might make you ill.

Slightly related to your question, I have successfully hacked a 50 foot bidirectional HP-IL cable out of cat5 and four connectors cut from two short HP-IL cables. The HP-IL spec calls for twisted pair over a certain distance, and the impedance values match as well.

Regards,  
Howard

**Classic RPN**

Message #1 Posted by [John Limpert](#) on 20 Mar 2007, 11:46 p.m.

Was the HP-15C the last scientific calculator to support classic RPN? My definition of classic RPN is the programming model used in calculators like the HP-25C and HP-34C. Simple keystroke programming without things like formula entry and named variables.

**Re: Classic RPN**

---

Well, I'd question that definition, because those features are *supplements and enhancements* to RPN, not *modifications* of it.

However, if those features are grounds for disqualification, several other models released in 1982 or later lacked them:

- 1982: HP-10C (basic scientific)
- 1982: HP-16C (for computer science)
- 1983: HP-41CX (HP-41C/CV were released in 1979/1980)
- 1988: HP-32S ("lettered" storage registers, but not alphanumeric variables or equations)

### Cash for your trash?

Message #1 Posted by [Palmer O. Hanson, Jr.](#) on 20 Mar 2007, 9:52 p.m.

The article "Cash for Your Trash" on page 19 of the March/April 2007 issue of *AARP - The Magazine* states in part "... There's nostalgia value in early high-tech artifacts. 'We're progressing so rapidly that things from the '80s and '90s are becoming collectibles' ... .. An Apple IIe computer, that '80's pacesetter, recently fetched \$6,100. A 1982 HP programmable scientific calculator went for \$425."

I presume that the calculator was an H-15c.

I hate to see this sort of thing published. When an article which declared that slide rules were collectible was published in the *New York Times* back in the 1990's there was an immediate jump in prices at antique stores and an immediate shortage of slide rules in thrift stores. Of course, I admit that the value of my existing collection jumped as well.

And, yes, I am more than old enough to belong to AARP.

Of course, I admit that the value of my existing collection jumped as well.

That works both ways, too. HP-16C's and HP-IL's used to be somewhat rare on eBay; the high prices brought them out of the woodwork.

## Re: Cash for your trash?

Message #3 Posted by **Eric Smith** on 21 Mar 2007, 3:07 a.m.,  
in response to message #2 by Karl Schneider

I'm not sure I understand this statement:

Quote:

But the difference is that the HP still serves its intended purpose quite well, while the Apple IIe is an obsolete relic that takes up considerable space by comparison.

My HP-41C still works just as well as it did in 1981. It still works fine for simple manual calculations as well as running more elaborate programs such as sidereal time conversion.

My Apple IIe still works just as well as it did in 1984. It still works fine for word processing, spreadsheets, games, and other uses.

Both are obsolete from the point of view of the technology with which they are built, but both work just as well today as they did when originally introduced. I don't see that it makes any sense to say that one is an obsolete relic and the other is not.

From a functional perspective, I think you could find plenty of people who would claim that programmable calculators are obsolete. I don't happen to be one of them.

## "Obsolescence" of old HP calcs vs. old PC's

Message #4 Posted by **Karl Schneider** on 22 Mar 2007, 1:47 a.m.,  
in response to message #3 by Eric Smith

Hi, Eric --

"Obsolete relic" is indeed a bit harsh of a term for something (Apple IIe "non-IBM personal computer") that still performs certain practical tasks as well as it can. However, the bar for "PC" performance has been raised considerably since the 1980's, such that no one wanting to use a PC for modern capabilities (e.g., web access) and applications would use any product from that era.

One could certainly argue that the HP-41 is somewhat obsolete, because the tasks it is equipped to perform can be accomplished more efficiently with modern compact devices that run far faster. I use unaccelerated HP-41's with an application program and Navigation Pac to calculate the position of celestial objects for navigation, and must wait several minutes for a result.

Now, the HP-15C: I see nothing obsolete about it. The applications for which it is best suited have not changed a bit since the 1980's. Newer models such as the HP-32S/32SII/33S/42S do certain things better (e.g., alphanumeric display and 12 times the speed), but can't match the HP-15C's combination of easy accessibility with excellent functional integration. The user interface and functional integration of modern "swiss army knife" low-end calculators, such as the Casio fx-115MS, can't compare to that of any of the HP's mentioned.

\_\_\_\_\_

But then, celestial navigation by itself has become obsolete long ago. And for us aviators not only obsolete, but even impossible because the last aeroplane with a little roof window for a star sextant was the Boeing 707. Which reminds me that the ephemeris of my Tamaya NC77 calculator will definitely expire in June :- ( Another device that will become obsolete very soon.

Greetings, Max

Not so fast on the navigation thing . . .

As was briefly mentioned in the news recently, a few more pieces of orbiting space junk out there, and the treasured convenience and accuracy of GPS might become a wistful memory.

(How do I invest in sextant futures?)

---

I think you better invest your money in vintage calculators than in sextants (or maybe vintage sextants) ;-)

The danger to satellites from debris is mainly present in low earth orbit (up to 500 km above the earth surface), whereas the navigation satellites are positioned in a medium orbit at about 20,000 km distance.

Next, the American GPS system ist "backed up", so to say, by the very similar Russian Glonass, there are now even combination receivers available that can get their position information from any of the two systems. And in the near (or not so near, according to recent press releases) future, the european "Galileo" system will provide a third independent source for satellite navigation.

Anyway, (civilian) aviation does not yet depend on GPS in any way: Long and medium range navigation is based on inertial navigation systems, all solid state now with laser gyroscopes and silicon based accelerometers, which brings the price down to reasonable levels, and short range and terminal navigation is done by means of ground based radio navigation aids. Practical satellite navigation is still not part of the training syllabus for pilots!

Greetings, Max

### **Re: "Obsolescence" of old HP calcs vs. old PC's**

*Message #10 Posted by **Valentin Albillo** on 22 Mar 2007, 8:40 a.m.,  
in response to message #4 by Karl Schneider*

Hi, Karl:

I mostly agree with your post ("Mostly Harmless" ... :-)) but I want to comment a little:

Karl posted:

*"One could certainly argue that the HP-41 is somewhat obsolete, because the tasks it is equipped to perform can be accomplished more efficiently with modern compact devices that run far faster."*

Run time isn't everything. There are other timings involved in actually performing some computation in a given device, and it might perfectly be the

case that the time it takes to get the 41C, turn it on, and make the calculations is far below what it takes to do the same with some other, more modern, more complex devices, which might well imply longer delays for turning them on, supplying some password, navigate to some menu, launch some calc emulation or application, etc. When you 'nitpickingly' contabilize each and every delay and timing involved, it might well be the case that running time is one of the smallest factors of the whole process.

Also, the 41C had a tremendous Fun Factor For Fans (FFFF :-), which simply hasn't dissapeared, far from it, and will continue to exist indefinitely. Doing things with synthetics, M-code, or even plain old RPN and the versatility of stack and register addressing was extremely fun and challenging, and I know I was much more enthralled and had a much better time of creating an Othello program, say, for the 41C than I would ever had from doing the same for a more powerful or capable device. The very limitations of the 41C was what made it fun in the first place, and having an all-powerful, all-capable modern device available for this particular task would simply spoil the fun big time.

The same applies, of course, to other HP models, the HP-71B and the HP-15C being my favorite right now for this kind of fun programming. Wait till you see my very next Datafile article (to be published in April), you'll be amazed at what exciting, seemeingly ultra-complicated symbolic feats you can do with an HP-71B and 25+ lines of code ! This is both potentially useful and fun !

*"Now, the HP-15C: I see nothing obsolete about it."*

I fully agree. It would be great if it were revamped with some modern niceties in a transparent manner while maintaining its physical qualities, but it works perfectly as is.

Which is more, at times it seems even *\*more\** advanced than most modern devices. Each time most anyone sees my HP-15C, they are awed by its looks, its 'solidity' so to say, and it goes without saying, its functionality. They initially think it's just a cute but quality scientific calculator, and most of them being technical people, are amazed no end when they get to know it does matrices, complex arithmetic and special functions, hyperbolics, statistics, gamma, programming, the works. "Obsolete" is definitely *\*not\** the word for it, really.

Ah, and the keyboard never fails to elicit appreciative comments and envious looks. Those were the days ! ...

Best regards from V.

Well, if they need an excuse, the 15C was introduced on July 1, 1982. Everybody close their eyes, click their heels together and repeat after me...."HP15C 25th Anniversary Edition....HP15C 25th Anniversary Edition....HP15C 25th Anniversary Edition...."

Careful observers may note that my creation is a 15C *Platinum* 25th Anniversary Edition. This is because I would propose a couple of enhancements to the original. The 15C was of course a wonderful machine, but if given the opportunity to make changes I'm sure there would be no shortage of very worthy improvements. However, to make it as easy as possible for hp to bring it back, only a couple of very basic improvements are requested:

1. Additional memory - Nothing excessive, maybe just a total of 1 or 2 kbytes for programs, with up to 101 storage registers (0 to 99 plus I. This should be an easy change according to [this](#) thread).
2. Input/Output - maybe something as simple as a full download or upload of the calculator's memory to a PC, via a USB to mini-USB cable. Perhaps this would be too much to ask, but it sure would be nice! (IO has been added as a shifted-ON key function in my depiction.)

## **Re: "Obsolescence" of old HP calcs vs. old PC's**

*Message #14 Posted by **Mike Morrow** on 22 Mar 2007, 7:02 p.m.,  
in response to message #4 by Karl Schneider*

I have owned many HP calculators since I bought my first in 1976(HP-67, to be followed by 12C, 15C, 17BII, 21, 25, 28C, 28S, 32SII, 35, 38, 41C, 41CX, 42S, 48SX, 48GX, 49g+, and several others). My 1986 HP-15C immediately became my favorite. I used it daily for 11 years.

I was at last able to find a HP42S. It blows the HP-15C away in every detail except appearance. The HP42S is far far easier to use than the HP-15C. Its functions are much more naturally accessible and integrated, especially when dealing with complex numbers. It has much more memory, and far better program editing capabilities. Computation is much faster at much greater precision. It has a two-line LCD. It can send output via IR to a printer. It even has an (unadvertised) simple debugger that can be accessed to examine internal ROM/RAM or alter (temporarily) operating system RAM, in order to do such things as double the speed of operation. With all this, the HP42S is still essentially the same size and weight of the HP-15C. IMHO, this 20-year-old design is easily the best RPN calculator of all time.

The only things for which I would fault the HP42S are:

(1) That terribly ugly, low contrast, fecal brown and orange color scheme. Some gang of new-age left-coast artsy nitwits at HP really messed up \*all\* HP calculator color schemes after the mid-1980s (but that really started with that unappealing HP-41C in 1979). The classic sharp HP black case, gold and blue shift keys, and blue/black HP logo are far more attractive and easier on the eyes. The HP-15C was the last of that kind.

(2) I like the "landscape" key arrangement of the HP-15C better.

(3) No real-time clock/calendar, even though the hardware has a quartz clock. (The HP-15C didn't have one either.)

(4) No simple time-value-of-money functions. (Neither does the HP-15C.)

With respect to mechanical properties, the HP-15C is very prone to losing its rubber feet, the small battery door, and/or the model/logo square insert on the front. The aluminum around the LCD is easily scratched. The chrome paint on the logo insert quickly wears off. But despite daily use, my HP42S still has perfect feet and looks as good overall as the day I took it out of the box in 1997.

When I read comments that elevate the HP-15C over the HP42S, I have to wonder if those making

such comments ever actually \*extensively\* used \*both\* calculators over a long period of time. I have eleven years with the HP-15C, followed by ten years with the HP42S. I still have both, but only the HP42S (and my hp49g+) get any use today.

If the HP42S could be re-issued in HP-15C dress, that to me would be ideal.

Mike

### **Re: "Obsolescence" of old HP calcs vs. old PC's**

Message #15 Posted by [Valentin Albillo](#) on 22 Mar 2007, 7:58 p.m.,  
in response to message #14 by Mike Morrow

Hi, Mike Morrow:

A few comments to your post:

Mike Morrow posted:

*"I was at last able to find a HP42S. It blows the HP-15C away in every detail except appearance."*

Nope. The matrix and complex number paradigm are much better implemented in the HP-15C (matrix descriptors and parallel complex stack), among many other advantages.

*"The HP42S is far far easier to use than the HP-15C."*

In your dreams.

*"Its functions are much more naturally accessible and integrated, especially when dealing with complex numbers."*

This must be a joke, right ?

*"It has much more memory, and far better program editing capabilities."*

Agreed. But let it be at just "better" instead of "far better".

*"Computation is much faster at much greater precision."*

Agreement on the speed, but "much greater precision" is just the difference between 10-digit (13-digit internally) and 12-digit (15-digit internally). That's "greater" but not "much greater". If you want to know what "much greater" precision really means, have a look at the 20-digit SHARP PC-1475/E500S.

*"[...] (but that really started with that unappealing HP-41C in 1979)"*

Another joke, no doubt.

*"With respect to mechanical properties, the HP-15C is very prone to losing its rubber feet, the small battery door, and/or the model/logo square insert on the front."*

Agreed on the logo, nope on the other two, most specially the battery door, which I see no way it can get lost taking into account that you only take it out every 10 years or so to change batteries. By the way, I've noticed that you forget to compare

HP-15C's battery life vs HP42S's, why would that be ?

*"When I read comments that elevate the HP-15C over the HP42S, I have to wonder if those making such comments ever actually \*extensively\* used \*both\* calculators over a long period of time [...] I still have both, but only the HP42S (and my hp49g+) get any use today."*

Good for you. I actually find the HP-15C much easier to use than the HP42S, mostly because a set of menus will never beat having each and every function (700+) directly accessible on the keyboard. Free42 running on a palm makes it a little faster but still ...

*"If the HP42S could be re-issued in HP-15C dress, that to me would be ideal."*

Don't hold your breath. Seems the latest people at HP on charge of this just hit the road.

Best regards from V.

### **Here we go again ... :-)**

Message #17 Posted by **Valentin Albillo** on 23 Mar 2007, 9:49 a.m.,  
in response to message #16 by Thomas Okken

Hi, Thomas:

Here we go again ... :-)

The bad thing with posting anything in the web is that body language is totally absent, so there's no way to effectively convey the attitude, humor, etc, and general good mood that would be obvious if the exchange were verbal.

I've said time and again that I'm pretty jovial in my attitude towards life and there's no intention whatsoever to belittle anyone, I assume most of us are pretty much adults, with technical or financial careers, etc., so there's little point in trying to outsmart anyone when it's much easier that oneself is the one to be easily outsmarted.

There's also the language barrier. I guess you were alarmed by the "In your dreams" statement, perhaps. The equivalent Spanish idiom, which is "Ni soñando!" or "Ni en sueños!" is absolutely colloquial and devoid of any offensive nature, but probably the

English version tends to be considered rude, judging by your attitude.

In short, this is tiring. I mean no offence to anyone, I'm not the guardian of anything but my house and family, and I'm becoming tired myself of always getting misinterpreted. I'm really tempted to consider the possibility of posting under some other pen name, so that my messages aren't judged because they were uttered by "Valentin Albillo, the High-And-Mighty Guardian of Truth" but just on their face value and contents, and leave my real name just for issuing Challenges and Mini-Challenges or help others by answering to non-controversial technical questions.

Anyway, thanks for your comments and best regards from V.

in response to message #17 by Valentin Albillo*

Hi!

I have followed this discussion with mild disbelief...

Quote:

---

... I assume most of us are pretty much adults, with technical or financial careers, etc. ...

---

And therefore I am even more puzzled why we can get in such heated discussions about whether a HP-42 is better and faster at doing complex-valued matrix calculations than a HP-15. No "adult with a technical or financial career" has had to do such a calculation on a pocket calculator during the last 20 years or so, at least not during working hours. If he did so, it was because he considers this as part of his hobby!

It is a bit like getting in a fight whether a 1920ies BSA racing motorcycle outperforms a NSU bike of similar vintage - a purely academic question, nothing more, and something to be discussed over a pint or two of english beer :-)

Greetings, Max

**HP-42S vs. HP-15C attributes?**

*Message #19 Posted by **Karl Schneider** on 23 Mar 2007, 1:29 a.m.,  
in response to message #14 by Mike Morrow*

Hi, Mike --

I've seen Valentin's reply, but I've also got my own take on some of the statements...

Quote:

---

The HP42S is far far easier to use than the HP-15C. Its functions are much more naturally accessible and integrated, especially when dealing with complex numbers.

---

I just can't agree with that. Are functions under menus (or sometimes just the catalog) preferable

to functions that are visible and directly-accessible? I'd say not. I put several common, useful functions in the first level of the CUSTOM menu of my HP-42S, because they're not even available on the keyboard or any standard menu otherwise: "%CH", "Roll up", along with several others.

Defining a simple function for numerical integration or rootfinding is a minor hassle on the HP-42S, with its requirement for external-label programs, named variables defined using "MVAR", etc.

As for complex scalars, the main advantage of the HP-42S is the ability to see a complete complex-valued number (or two) in the display, and to directly enter, calculate, and display complex numbers in polar form. Other than that, the capabilities are quite similar.

Quote:

---

With respect to mechanical properties, the HP-15C is very prone to losing its rubber feet, the small battery door, and/or the model/logo square insert on the front. The aluminum around the LCD is easily scratched. The chrome paint on the logo insert quickly wears off.

---

The poorly-adhering logos with non-durable paint were the plastic ones that debuted as part of cost-cutting measures in 1986 -- when yours was likely made. The metal chromed logos of 1981-85 "held up and held on" much better.

Quote:

---

That terribly ugly, low contrast, ... brown and orange color scheme (*of the HP-42S*). Some gang of ... nitwits at HP really messed up *\*all\** HP calculator color schemes after the mid-1980s (but that really started with that unappealing HP-41C in 1979). The classic sharp HP black case, gold and blue shift keys, and blue/black HP logo are far more attractive and easier on the eyes. The HP-15C was the last of that kind.

---

I've commented on color schemes before. The sole shift color of the HP-42S is yellow, not orange. It followed the pattern of yellow, blue, black for shift keys, established with the Spice and HP-41 lines in 1978-79, as far as I know. The HP-41CX and HP-71B of 1983, as well as most Pioneer-series models in 1988, continued that pattern. Different shift colors were used on some models in the mid-1980's (e.g., HP-28C/S, HP-22S, HP-27S) before "designer" colors were introduced in 1993 with the HP-48G line.

Dark brown was used as a face color on the HP-12C and the HP-41CV (1986 model).

Quote:

---

When I read comments that elevate the HP-15C over the HP42S, I have to wonder if those making such comments ever actually *\*extensively\** used *\*both\** calculators over a long period of time.

---

I bought my HP-15C new in late 1983, and used it almost exclusively until 2002, when I got into collecting. I've had my own HP-42S since that year and have written a detailed (but unpublished) program for it. That's long enough to get a fair assessment.

-- KS

**Re: HP-42S vs. HP-15C attributes (origin of classical colors)**

*Message #20 Posted by **Walter B** on 24 Mar 2007, 1:58 p.m.,  
in response to message #19 by Karl Schneider*

Agree with almost everything you wrote, Karl. Just one point to correct: IMO the "classical" HP color scheme started with the HP65 (blue/gold) and reached full size with the HP67 (blue/gold/black), so a bit earlier than the Spices. You may even rate the HP55 as first HP with those 3 key colors.

Best regards, Walter

Hello Karl,

Quote:

Are functions under menus (or sometimes just the catalog) preferable to functions that are visible and directly-accessible? I'd say not.

Totally agree! When I upgraded to the HP-28S, then the most advanced scientific calculator, I loved it but I soon started missing my faithful HP-15C. Although I liked the softmenu keys, I didn't like the trigonometric functions being accessible through them.

Despite the existence of a menu system, the oftenly used functions should always be available right from the keyboard.

As an illustration, what calculator would you use to quickly evaluate this simple expression, the HP-42S or the HP-15C?

$$1 - \tanh(\ln 1.57) - 0.57/(9!)$$

(This is just an approximation, but it is correct to 10 digits! Found when playing with the HP-15C during 10 or 15 minutes)

Regards,

Gerson.

Boa noite Walter,

Quote:

my HP-11C returns 0.577 - so, what's the finding??

The full 10-digit answer is 0.5772156649. Thanks to Valentin, you should know the meaning of it by now, in case you had forgotten. I hadn't heard of the constant until last month, by what I can remember.

I hope the approximation makes it easier to remember.

More information here:

Shame on me! Well, maybe not too much, because I did not use this gamma for 30 years at least. And I'm not sure I used (or had to use) it earlier. The examples in the link look like perfect playground for pure mathematicans. Anyway,

obrigado, Walter

### An application...

Message #26 Posted by **Gerson W. Barbosa** on 27 Mar 2007, 7:16 p.m.,  
in response to message #25 by Walter B

I used it for the first time about one month ago, to solve a somewhat complicated integral. No achievement though, as I already new the answer. All I did was finding a way to reproduce a known result. In case your interested, here's the link:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=109056>

Some revision is still required, but this gives an idea of its application in solving some kind of integrals.

Message #27 Posted by **Paul Dale** on 26 Mar 2007, 8:21 p.m.,  
in response to message #21 by Gerson W. Barbosa

Interesting.

A few keystrokes less albiet slightly less accurate:

4 x! ASINH FRAC x^2 x^2

If you are in degrees mode, you can get a little more accurate with:

3 ACOSH 2 0 \* SIN

If you are in radians mode this is shorter but slightly less accurate:

6 TAN TAN COS COS

And if you use gradians, this is the same length but more accurate:

PI ->H.MS ->DEG FRAC SIN ->DEG

Does anybody run in gradians mode?

- Pauli

### Re: HP-42S vs. HP-15C attributes?

Message #28 Posted by **Gerson W. Barbosa** on 26 Mar 2007, 8:50 p.m.,  
in response to message #27 by Paul Dale

All your approximations give seven correct digits, which is nice. Rather than the number of steps, I was interested in an easy-to-remember approximation, something

like

1 ENTER . 4 TAN -

in radians mode. Six steps and only 4 correct digits. Yours are hard to beat!

Regards,

Gerson.

### Re: HP-42S vs. HP-15C attributes?

1 ENTER . 4 TAN -

in radians mode. Six steps and only 4 correct digits. Yours are hard to beat!

---

Try my:

6 TAN TAN COS COS

Also in radians mode, five keystrokes, more accurate and arguably easier to remember.

- Pauli

### EulerGamma approximation (Was: Re: HP-42S vs. HP-15C attributes?)

Message #30 Posted by [Gerson W. Barbosa](#) on 26 Mar 2007, 10:04 p.m.,  
in response to message #29 by Paul Dale

Quote:

---

Try my:

6 TAN TAN COS COS

---

Seen that!

Interestingly, only the eighth significant digit is wrong:

0.5772156349. A short twelve-digit approximation would be interesting for 12-digit calculators (except, of course, the HP-49G/50G which don't need it).

Regards,

Gerson.

## Pandigital approximation

Message #31 Posted by [Gerson W. Barbosa](#) on 1 Apr 2007, 10:23 p.m.,  
in response to message #27 by Paul Dale

Quote:

Interesting.

$1 - \tanh(\ln 1.57) - 0.57/(9!)$  is just a rational approximation in disguise, as you may have noticed.

Just for fun, I have rewritten it as the difference of two pandigital terms:

[http://www.geocities.com/gwbarbosa/E-G\\_Approx.gif](http://www.geocities.com/gwbarbosa/E-G_Approx.gif)

' $2*(3^{0+9})^4/(8! - 5671) - (48+9)/\sqrt{(2*\sqrt{(3*\sqrt{(5*\sqrt{(70))})})^16}$ '

Gerson.

-----

Another one:

' $(9-8)/\sqrt{\text{SINH}(1637/(2*450))}$ '

This is good to only 8 digits though (0.57721566).

### Applications: HP-15C vs. HP-41

Message #35 Posted by [Karl Schneider](#) on 24 Mar 2007, 7:01 p.m.,  
in response to message #34 by Thor Lansen

Hi, Thor --

Quote:

... could you please tell me what are the applications you are referring to that the HP15C is better suited for than the HP41CX?

I think that you may have misunderstood my intended meaning, which was that the HP-41's best-suited applications could be done better by more modern equipment, while the HP-15C's own *simpler* best-suited applications could not be done better by a more-modern device. I was not comparing the HP-15C directly to the HP-41.

But, since you asked: I had, in fact, three years ago compared the HP-15C to the HP-41 in detail for basic mathematical functionality and comparative ease of use thereof. The HP-15C is much more straightforward for applications that are not programmed by the user, but it cannot support peripherals or expansion hardware. The strengths of the HP-41 are its expandability and

advanced programmability. Here's the archived post:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61367#61367>

The HP-15C's built-in complex-number capability and matrix operations are much easier to use than those of the Advantage Pac (AP), although the AP's matrix operations are more advanced.

The HP-15C's arithmetic keys are on the correct side of the keyboard for right-handers and more-logically arranged, too.

SOLVE and INTEG from the AP are essentially the same as those in the HP-15C, but are a bit easier to use on the HP-15C without the alphanumeric hassle. More about SOLVE and INTEG:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=556>

Quote:

---

For example, I used my college HP41CX with an Advantage Module (the exam had economic analysis) for the Electrical Engineering PE Exam back in 2001 (and I passed) and I probably would use it again today.

---

Actually, you *couldn't* :-)

Four years ago, the NCEES banned the HP-41 and other highly-capable calculators from the EIT/FE and PE exams that the organization administers, based upon more-restrictive standards that were adopted. Subsequently, the NCEES banned all calculators other than those from a short "approved" list that were available on retail shelves. This, of course, excluded the HP-15C, even though it met the standards.

Quote:

---

Would you use an HP15C for the exam or is this one of the things (in my opinion critical for an Engineer's career) not very well suited for?

---

I passed the EIT/FE in 1994 on the first try using an HP-15C. If I had my free choice of compliant calculators to use on the PE, I would use the HP-15C again as my primary calculator.

-- KS

### **Re: Applications: HP-15C vs. HP-41**

Message #36 Posted by **Thor Lansen** on 24 Mar 2007, 10:52 p.m.,  
in response to message #35 by Karl Schneider

Karl, thanks for the response (or maybe not) you remind me I am getting old. I did not know they had banned all those vintage calcs. In my opinion, for the PE, you should be able to use whatever calculator you like (as it used to be) and open book (as it used to be, have they changed that also?). You indicated that if you could you would use your HP15C as your "primary" calculator. So, would you need a secondary? which one and why?

Assuming the HP15C has more straightforward applications, one must ask: is this a great advantage over the HP41CX? The fact that you can not add modules means you are stuck with what you have (well, maybe you can write a program or two but better do it in advance of the exam). I had the HP41CX, Advantage Module, and the card reader (that I did not

have to use) and I left the wand at home (I did not want to show off) and that was it, it had everything I needed it.

Not sure what your basis are to indicate that: "the arithmetic keys are more-logically arranged" but, in my opinion, for field work the HP15C (and alike) do not have the best ergonomics. I find it very uncomfortable to hold in one hand for a long period of time. Work gave us an HP11C for field work and I used it very little for that reason. I used my HP41CX instead. The HP41CX feels nice in my hand, not as nice as my first HP calculator, the HP 25C, but nice (well, no other calc feels like her, I still have it but I had to retire long time ago, maybe I should do the same).

Regards, Thor

*Edited: 24 Mar 2007, 10:58 p.m.*

### **Re: Applications: HP-15C vs. HP-41**

*Message #37 Posted by **Karl Schneider** on 25 Mar 2007, 2:22 a.m.,  
in response to message #36 by Thor Larsen*

Hi again, Thor --

Quote:

You indicated that if you could you would use your HP15C as your "primary" calculator. So, would you need a secondary? which one and why?

Obviously, a calculator with (complete?) built-in financial functions would be helpful. A compact model, such as an HP-27S, HP-17BII, or HP-12C would serve that purpose. (Unfortunately, none of these are on the "approved" list, and the first two have alphanumerics, which would render them "noncompliant".)

Quote:

Assuming the HP15C has more straightforward applications, one must ask: is this a great advantage over the HP41CX?

In a word, quickness -- being able to find and access functions quickly with a minimum of thought and formal protocol. That's important on an exam. If special programs are needed, the special calculator can be used.

Note also that the HP-41 does not have built-in hyperbolic functions, which might very well be required on a PE exam. The Math Pac provides them, but not for complex-valued arguments. The Advantage Pac doesn't provide hyperbolics as named functions. For more about that, see this archived post:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=48157#48157>

My emphasis was on "compliant" models, which the HP-41 and HP-48 series are not. I'm assuming that the exam would not put at a comparative disadvantage any testee who lacked a calculator with plug-in modules/cards or downloaded programs.

Quote:

Not sure what your basis are to indicate that: "the arithmetic keys are more-  
logically arranged" but, in my opinion, for field work the HP15C (and alike)  
do not have the best ergonomics.

Work gave us an HP11C for field work and I used it very little for that  
reason.

---

I agree that the landscape-layout calc's are best-suited for desktop work, preferably with  
no extended computer-keyboard tray -- the way most engineers worked before 1990, or  
students in class still do today. The HP-11C might not be the best choice for field work,  
if elaborate custom programs and data exchange are needed.

The columns of arithmetic keys of pre-Voyager and Voyager HP's are arranged as  
shown:

| pre-Voyager | Voyager     |
|-------------|-------------|
| (leftmost)  | (rightmost) |
| -           | /           |
| +           | *           |
| *           | -           |
| /           | +           |

What's wrong with the pre-Voyager arrangement?

1. The fingers of the user's right hand conceal the number keys when an arithmetic  
key is pressed. (90% of people are right-handed, and would use that hand to press  
keys.)
2. The corresponding members of the functional pairs (-, +) and (\*, /) are oriented  
inconsistently (i.e., - above +, but \* above /)

Starting with the Voyager series, HP "wised up" and arranged their arithmetic keys the  
way TI had done it since the 1970's.

### **karl's HP41 comparison...**

*Message #38 Posted by **Gene** on 25 Mar 2007, 8:30 a.m.,  
in response to message #37 by Karl Schneider*

Hi Karl.

One thing missing from your comparison is that the HP41 had the USER keyboard.  
Each function you label as "alpha" could in fact be assigned to any key you wanted  
and accessed with one or two keystrokes. . . about the same as a shifted function on  
the 15c. You could even use the overlay that had the built-in functions listed on it  
and add your add'l functions where you wanted.

Personally, the PPC ROM did a great number of things you have listed and once  
plugged in, I considered it just part of the machine. That adds root finders,  
integration, etc.

I do agree about the 15c's much better handling of things like complex hyperbolics, etc. There are some things where there just was no comparison.

However, to me, the immense storage capacity, alpha keycodes, alpha messages/prompts, and BEEP made all the difference.

So, two sides to most every story? :-)

### **Re: Karl's HP41 comparison...**

*Message #39 Posted by **Karl Schneider** on 25 Mar 2007, 5:38 p.m.,  
in response to message #38 by Gene*

Hi, Bill --

Quote:

---

One thing missing from your comparison is that the HP41 had the USER keyboard. Each function you label as "alpha" could in fact be assigned to any key you wanted and accessed with one or two keystrokes. . . about the same as a shifted function on the 15c. You could even use the overlay that had the built-in functions listed on it and add your add'l functions where you wanted.

---

True -- in fact, that's just what ASN ("assign") is for, and why ASN was on the keyboard. I, personally, don't think that the overlays look very good, and only one can be used at a time. (Most Pac's had their own overlays, too.)

Only the HP-41CX provided a listing of key assignments ("CATALOG 6"), and the assignments get wiped out by a master clear.

Quote:

---

Personally, the PPC ROM did a great number of things you have listed and once plugged in, I considered it just part of the machine. That adds root finders, integration, etc.

---

Like the Advantage Pac, this added functionality was available only at extra cost to a base price that was already considerably higher than that of the HP-15C. (I do acknowledge that there once may have been an HP-sponsored promotion that provided an Advantage Pac with purchase of an HP-41CX.)

Quote:

---

However, to me, the immense storage capacity, alpha keycodes, alpha messages/prompts, and BEEP made all the difference.

---

The storage capacity of the base HP-41C was surprisingly a bit smaller than that of the HP-15C (64 registers versus the HP-15C's 67 registers). Memory beyond, say, 128 registers as well as X-Memory were most useful for programming, as were the alpha keycodes, alpha messages/prompts, and the BEEP function. (I also acknowledge that the Advantage Pac's matrix functions could store matrices

directly to X-Memory.) Of course, it is understood that HP-41 programming capabilities are far superior to those of the HP-15C.

[ [Return to Index](#) | [Top of Index](#) ]**Multiple equation solver for the HP-28C (program)**Message #1 Posted by [Mike Ingle](#) on 20 Mar 2007, 3:24 p.m.

RPL calculators never had a simultaneous equation solver until the MSLV function on the 49 series. Recently I got an HP-28C and decided to write one small enough to run on it. I wrote the code on the 48GX and then keyed it in on the HP-28C. The 28C has some annoying limitations like no storage arithmetic or GET/PUT on local variables.

I changed to using stack storage rather than local variables. Surprisingly, all those ROLL and PICK operations use less memory than local variables even though the text is longer. The program after some optimization is 346 bytes on my 48GX. On the HP-28C I had 1274 bytes free after entering it. The 28C can solve useful systems of nonlinear equations.

The program is also useful on a 48G series machine or a 28S, and is small and simple to use. It runs quite a bit faster on the 48GX than on the 48GII, although the 48GII has a much faster editor.

To enter the program on a 28C, bring up the STACK menu first, because most of the keywords you will need are there. Make sure you enter it correctly. You probably will not be able to edit it. You may want to put a CLMF at the end so the display goes back to normal. On a 48 this is not required.

To use the solver:

Enter your expressions and save them in variables. They should be expressions for which the calculator will find a zero. If you start out with equations, put parens around both sides and change the = to a - sign.

Enter initial guesses and save them in the appropriate variables. All the variables must exist, so the expressions will eval to numbers.

Enter four lines on the stack:  
 List of expressions to solve.  
 List of variables to solve for.  
 Acceptable error, indicating when to stop.  
 Delta (small number which is added to obtain slopes.)

Run the solver. If you saved it as MSLV, enter MSLV CLMF

Example:

```
'2*X^3+Y+7*Z-96' 'E1' STO
'3*X+6*Y^3-2*Z-65' 'E2' STO
'-6*X+4*Y+2*Z^3-42' 'E3' STO
1 'X' STO
2 'Y' STO
3 'Z' STO
{ 'E1' 'E2' 'E3' }

```

```
MSLV CLMF
```

```
In 4 FIX:
X=3.3161
Y=2.1666
Z=2.9857
```

After the first iteration, you will see two lines. The first shows the iteration count starting at 1. The second shows the worst residual. The first line will count up and the second will hopefully move toward zero.

If the equations are ill-behaved the program may generate an error. Try a different set of initial guesses.

The program evals each expression at the current guess and at guess + delta for each variable. It fills out a matrix of the slopes and a vector of the values, uses the built-in linear algebra to solve the linear system, subtracts the result from the guesses, and repeats until the worst residual is less than the acceptable error.

## Re: Multiple equation solver for the HP-28C (program)

Message #2 Posted by [Egan Ford](#) on 20 Mar 2007, 4:49 p.m.,  
in response to message #1 by [Mike Ingle](#)

Quote:

---

RPL calculators never had a simultaneous equation solver until the MSLV function on the 49 series. Recently I got an HP-28C and decided to write one small enough to run on it. I wrote the code on the 48GX and then keyed it in on the HP-28C. The 28C has some annoying limitations like no storage arithmetic or GET/PUT on local

variables.

---

OT, is there any MES or SES for the 42S?

*Edited: 20 Mar 2007, 4:52 p.m.*

## Re: Multiple equation solver for the HP-28C (program)

OT, is there any MES or SES for the 42S?

---

Here's a quick-and-dirty port of Mike's program to the HP-42S. It could use some work to give it a nice user interface -- entering the vectors with the function and parameter names is pretty awkward right now. See the TEST program for how to initialize the parameters etc.; it's basically identical to Mike's RPL program.

In case you want to run it on an emulator, save yourself the trouble of typing and load [mes.raw](#) instead; it contains all the five programs listed below.

in response to message #3 by Thomas Okken*

Thomas, this is great!

You know, I am embarrassed to say that prior to this I didn't know that alphanumerics could be stored in matrices and vectors on the 42S. I thought you had real matrices and complex matrices, and that was it.

Les

*Message #6 Posted by [Les Wright](#) on 24 Mar 2007, 5:01 p.m.,  
in response to message #3 by Thomas Okken*

Thomas, for my own purposes I added SF 21 and VIEW "X", etc., to the test routine so I could either see or print the solution rather than search it out in my variable directory.

Les

**Re: Multiple equation solver for the HP-28C (program)**

*Message #7 Posted by [Thomas Okken](#) on 24 Mar 2007, 9:01 p.m.,  
in response to message #6 by Les Wright*

Printing the solution is a nice improvement, and there are a few others that come to mind: an easier way to enter the list of functions and parameters, and using a VARMENU to let the user set initial values...

I'll try to find some time to spiff up the MES program a little bit next week.

- Thomas

**Re: Multiple equation solver for the HP-28C (program)**

*Message #8 Posted by [Gerson W. Barbosa](#) on 20 Mar 2007, 5:34 p.m.,  
in response to message #1 by Mike Ingle*

This is worth going to the [Software Library](#). So far there's only one 28C/S program there. You might also consider submitting it to [hpcalc.org](http://hpcalc.org).

Quote:

---

I changed to using stack storage rather than local variables. Surprisingly, all those ROLL and PICK operations use less memory than local variables even though the text is longer.

---

This technique also makes for faster programs, as you may have noticed. I used it on this [simple prime-factorizer](#) for the HP-28C/S, which lacks it. I initially used global variables, then local variables and finally the stack only. The program is not fast because of the simple algorithm I used, but it would have been even slower otherwise.

Since we're talking about equation solver, I'd like to present a linear equations system solver for the HP-28S. It was written by one of my classmates back in 1987 and it was very useful in Circuit Analysis classes:

```
%%HP: T(3)A(D)F(.);
DIR
  \183\<-
  \<< VARS 1 OVER
  '\183\<-' POS 1 - SUB
PURGE
  \>>
  SYS
  \<< DUP SIZE \-> 1
n
  \<< n \->LIST
'EQS' STO 0 n
  FOR i 1 n
    FOR j i j
== 1 0 IFTE 1 j GET
STO
      NEXT 1 n
    FOR j '
EQS(j)' \->NUM
      NEXT n
  \->ARRY i
    IF NOT
    THEN NEG
  'VET' STO
    ELSE VET
  + ARRY\-> DROP
    END
    NEXT { n n
} \->ARRY 1 PURGE TRN
CONJ 'MAT' STO VET
MAT / n 1
  FOR i DUP i
GET 1 i GET STO -1
  STEP VET
  ARRY\-> DROP { n 1 }
  \->ARRY 'VET' STO
  DROP
  \>>
\>>
END
```

Usage and examples in this old thread:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=82010>

Unfortunately it doesn't work on the HP-49/50G. One possible reason is TRN (transpose) behaves differently on the 28/48 and on the 49/50 calculators. Could anyone please point out other reasons?

Regards,

Gerson.

**HP-75C Battery Question**

Message #1 Posted by [Maximilian Hohmann](#) on 20 Mar 2007, 7:14 a.m.

Hello!

This morning I got my first Christmas present for this year, when the postman delivered a box containing an HP-75C :-)

From the auction description I knew already that it has no battery (but is complete otherwise with charger, manuals, magnetic cards, video interface and cables - and working of course). It looks as if a classic series battery pack (3 AA cells) could fit inside, but the contacts are definitely different, as there are three of them instead of two... Unfortunately, the dead battery pack was not included, so I have no starting point for making a replacement

And so my question is: What are the specifications of the HP-75C battery pack? And is there maybe a source for refurbished batteries anywhere (I had no luck with google and ebay searches so far)?

Greetings, Max

**Re: HP-75C Battery Question**

Message #2 Posted by [Tony Duell](#) on 20 Mar 2007, 7:20 a.m.,  
in response to message #1 by Maximilian Hohmann

The original battery is the same as the one used in classic calculators -- 3 AA NiCds in series. It makes contact to 2 of the spring terminals only.

I forget what the third contact is for (and the service manual is not very clear on this).

**Re: HP-75C Battery Question**

Message #3 Posted by [Maximilian Hohmann](#) on 20 Mar 2007, 8:27 a.m.,  
in response to message #2 by Tony Duell

Hello!

**OT sticky plastic**

Message #1 Posted by [Charlie O.](#) on 19 Mar 2007, 1:32 p.m.

I have a Sharp OZ-6500 that has been inside a plastic grocery bag with a half dozen TI's. It is now very sticky except for the hinge. Does anyone know a cure? I've tried plain water and then liquid hand soap to no avail. Private email is ok if you consider this inappropriate.

Thanks, ceo

**Re: OT sticky plastic**

Message #2 Posted by [Egan Ford](#) on 19 Mar 2007, 3:13 p.m.,  
in response to message #1 by [Charlie O.](#)

Some wax-based hair removal kits have a thin cylindrical vial of blue liquid--ask your wife for some. If you take a Q-tip with some of that liquid (I think it's a light oil) and gently rub away at the sticky goo followed by water on the other end of the Q-tip followed by a dry cloth you should be gooless.

My wife also suggests trying candle wax remover or medical bandage goo remover wipes. I have tried the medical bandage goo remover wipes and the blue liquid on gooey plastic with success.

**Re: OT sticky plastic**

Message #3 Posted by [Paul Brogger](#) on 19 Mar 2007, 5:43 p.m.,  
in response to message #1 by [Charlie O.](#)

I've used a product called "Goo Gone" on lots of sticky stuff, like tape residue, etc. It seems pretty gentle, but if you try it, you'll want to test it somehow. (I don't know that I've yet used it on a calculator.)

Good luck!

**Re: OT sticky plastic**

Message #4 Posted by [Alan Firth](#) on 19 Mar 2007, 9:20 p.m.,  
in response to message #3 by [Paul Brogger](#)

Anyone tried using such a product to lift the back labels on 65's and 67's?

**Re: OT sticky plastic - not residue**

Message #5 Posted by [Charlie O.](#) on 19 Mar 2007, 9:47 p.m.,  
in response to message #3 by [Paul Brogger](#)

I find lighter fluid to work very well on sticker/tape residue but this is a case of the plastic turning sticky. It seems like the textured plastic case has had a reaction but the slick portions like the hinge, catch and working faces are fine. When I returned to my work area I layed the Sharp on a paper towel and later it stuck to the towel. The plastic has just softened, it seems. I had the bag in a laptop case behind the seat of

my truck while at work but it hasn't even been hot till the past week.

**Re: OT sticky plastic - not residue**

*Message #6 Posted by [Paul Brogger](#) on 20 Mar 2007, 10:37 a.m.,  
in response to message #5 by Charlie O.*

One of the plastics experts should chime in here.

I wonder whether you might harden it again by gently warming it in a well-ventilated space. If some volatile compound is at work, you might be able to "boil it off". (But I'm *way* out of my element, so do look for more informed advice!)

Sounds yucky -- good luck!

**Re: OT sticky plastic**

*Message #7 Posted by [Frank Boehm](#) on 20 Mar 2007, 11:03 a.m.,  
in response to message #1 by Charlie O.*

This is flexibilizer, used in a lot of plastic products (like plastic bags or plastic cases). I don't think there is a method to get rid of it again without damaging the plastics.

**Re: 82153A Wand**

Message #3 Posted by [Bill Smith](#) on 19 Mar 2007, 9:21 p.m.,  
in response to message #1 by [Chiu Yiu Wai](#)

I've found that my wand doesn't scan well when the calculator batteries are low, but not low enough to trigger the warning. Perhaps a charge-up or fresh batteries will do the trick.

**Re: 82153A Wand**

Message #4 Posted by [Thor Lansen](#) on 19 Mar 2007, 9:54 p.m.,  
in response to message #1 by [Chiu Yiu Wai](#)

Hello: I had trouble with mine getting it to work when I first got it. Nothing wrong with the wand, it was me, make sure you:

1) hold the wand angled between 10 and 20 deg 2) press wand switch and start to scan about 1 cm from first bar in the row 3) use a quick uniform speed, and 4) keep the wand in contact with the paper

Try it several times until it works.

Note: make sure the bar images you are trying to read are well defined and have sharp contrast with the paper.

Good luck, Thor

**Re: 82153A Wand**

*Message #5 Posted by [Chiu Yiu Wai](#) on 20 Mar 2007, 1:41 p.m.,  
in response to message #4 by Thor Lansen*

Thank you everybody give me respond and good suggestion , as Thor Lansen mention,the problem is me , not the wand, other item 1) ,I did not do anything suitable for wand operation.

*Edited: 23 Mar 2007, 10:52 a.m. after one or more responses were posted*

**Re: 82153A Wand**

*Message #6 Posted by [Les Wright](#) on 21 Mar 2007, 11:43 a.m.,  
in response to message #5 by Chiu Yiu Wai*

I am so relieved your wand works.

For me, the wand is proving the most reliable way to get programs into the calculator, and I have devoted some time to producing my own barcode using Leo Duran's hp41uc utility.

I am finding that magnetic cards are more fragile than I first thought, and the HP41 card reader works best only with the freshest batteries--I have been getting a lot more reading errors lately on cards that were recorded just a few weeks ago. But barcode is easily generated and printed and the wand seems more forgiving when the batteries start to weaken. If the paper printout becomes marked or stained, it is easy enough to print out a clean duplicate.

I love my wand. If there were an easy way to get edited programs out of my calculator on to my PC to produce revised barcode for archival purposes, that would be really cool!

Have fun with the wand.

Les

**Re: 82153A Wand**

*Message #7 Posted by [Dia C. Tran](#) on 21 Mar 2007, 4:35 p.m.,  
in response to message #6 by Les Wright*

Leo Duran's utilities has the ability to convert program in text form to raw then to barcode. I can print program from a 41 via the IR printer module to an HP48 capture with the inprt utility running on the 48. The text can be transfer to the PC. But I need to write a routine to fix the text file as it not quite the same as Leo's util expects.

**Re: 82153A Wand**

*Message #8 Posted by [Les Wright](#) on 21 Mar 2007, 5:07 p.m.,  
in response to message #7 by Dia C. Tran*

Wow!

I have an IR module. I have an HP48G (not GX). I have a 48G serial cable and a serial port on my computer.

I am dying to know more about how to do this! Can you tell me more about the inprt utility? Is it intrinsic to the 48G or is it something I need to get from hpcalc.org? Is it complicated to use? Is it possible to "print" programs from the 42S to the 48G in this way? Is there a comparable utility for the 49G+ or 50G, which have admittedly much weaker IR capabilities?

This sounds so cool and I would love to learn more.

Les

**Re: 82153A Wand**

*Message #9 Posted by [Chan Tran](#) on 21 Mar 2007, 7:35 p.m.,  
in response to message #8 by Les Wright*

You will need to down load the inprt program from some where. HPcalc.org is a good place. There are 2 version I think, one for the SX and one for the GX. It's a program written by HP.

**Re: 82153A Wand**

*Message #10 Posted by [Chan Tran](#) on 21 Mar 2007, 7:40 p.m.,  
in response to message #9 by Chan Tran*

And yes it will capture printout from the 42S as well as the 28C and S.

**Re: 82153A Wand**

*Message #11 Posted by [Vieira, L. C. \(Brazil\)](#) on 22 Mar 2007, 8:24 a.m.,  
in response to message #8 by Les Wright*

Hi, Les;

This is somehow easy to achieve, once you are able to transfer files from your HP48G to your computer. I've been doing this for such a long time, in order to store my original HP41/HP42/HP28 listings, that I thought everyone else knew the 'how-to'.

As explained, you'll need the specific HP48G [inprt](#) file to capture the IR originated listings and, if you are dealing with HP41 programs, you'll also need Leo Duran's lifutil (I still use the original DOS version...) to convert the captured listings to printable barcode. I must confess I have not been doing this for some time, but I remember reading about a Windows® version of Duran's lifutil. I also remember that I could generate HPGL coded barcodes that printed perfectly fine in my HP1100 laser printer, but I was never able to add the barcodes to, say, a Word®-based document. I once found an HPGL converter that returned convenient graphics from the HPGL file with the barcode data that could be inserted in a Word®-based document, but the line numbers that follow each row of the barcode were converted to a series of dots, though. No numbering...

I think better results may be achieved with newer converters and newer Word® versions, but I did not test any.

Sorry not being of further help.

Best regards.

Luiz (Brazil)

**HP9800 Emulator update release 0.30**

Message #1 Posted by [Achim \(Germany\)](#) on 18 Mar 2007, 1:06 p.m.

Dear friends and collectors of old computers, a new release of HP9800E is available from

<http://sourceforge.net/projects/hp9800e>

This release 0.30 contains new major functions, a completely new user manual, and some minor bug fixes. Please read the changes\_0.30.txt.

Have fun.

**Re: HP9800 Emulator update release 0.30**

Message #2 Posted by [J-F Garnier](#) on 28 Mar 2007, 7:13 a.m.,  
in response to message #1 by [Achim \(Germany\)](#)

I spent some time with the 9830 emulation during the last days. It is the most interesting machine for me, because it's the first HP Basic implementation on a desktop calculator.

A lot of documentation for the 9830 and ROM is available on The Australian Site, but I didn't find anything on the Infotek Fast Basic. Do these ROMs speed-up the Basic language, as their names imply? Any information will be appreciated.

I really liked the documentation, and the possibility to configure the optional ROMs. Great work, Achim!

J-F

(Still hoping to see a 9825/9835/9845 version some day...)

### Distance between geographic points

Message #1 Posted by [Sam Levy](#) on 18 Mar 2007, 11:53 a.m.

Around the HP-65 HP-67 era my boss had me calculate distances for his glider club. It was in the calculator book I was using, I shortened the program and made it automatic for crossing the equator. I have the manuals on CD and I request help finding that worked solution. If you could help me find the book and page please. Sam

### Re: Distance between geographic points

Message #2 Posted by [Thomas Okken](#) on 18 Mar 2007, 3:12 p.m.,  
in response to message #1 by Sam Levy

I have an HP-42S program that computes Great Circle Distance [here](#). Should be easy to adapt to the HP-65 or HP-67 or any other RPN scientific.

It takes coordinates in decimal degrees, so you may want to add ->HMS commands at a few places; it calculates the distance in kilometers, but that is easy enough to change to nautical miles by changing the final multiplication to 21600.

The formula used is

$$\text{dist} = \text{acos}(\cos(\text{lat1}) * \cos(\text{lat2}) * \cos(\text{lon1} - \text{lon2}) + \sin(\text{lat1}) * \sin(\text{lat2}))$$

Where dist is an angle on the Great Circle passing through the two points. Assuming the calculator is in DEG mode, multiply by 60 to get nautical miles, etc. This formula works for any pair of coordinates -- no issues with crossing the equator or passing over the poles or anything like that.

UPDATE: There is more information, and more accurate formulae, [here](#).

*Message #5 Posted by [Sam Levy](#) on 18 Mar 2007, 10:13 p.m.,  
in response to message #4 by Jean-Marc*

Thanks to all. I had hoped to find the example I used before but I will be more adventurous and try one of the complex solutions. Sam

**Re: Distance between geographic points**

*Message #6 Posted by [Les Wright](#) on 18 Mar 2007, 11:27 p.m.,  
in response to message #5 by Sam Levy*

Are you referring to the programs in the Navigation Pacs for HP65 or HP67? Both of those manuals are on the DVD under the "Calculator Software Manuals" subheading.

Les

**Re: Distance between geographic points**

*Message #7 Posted by [Les Wright](#) on 19 Mar 2007, 6:56 a.m.,  
in response to message #6 by Les Wright*

Actually, there is a simpler routine called Great Circle Navigation in the manual for the HP65 Standard Pac. That is on the DVD too. Maybe that is the one you are remembering? It just fits into the HP65's 100 steps.

Les

## Re: Distance between geographic points

Message #8 Posted by [Les Wright](#) on 19 Mar 2007, 7:01 a.m.,  
in response to message #4 by Jean-Marc

I would recommend this highly.

Jean-Marc doesn't post nearly frequently enough on the Forum for my liking. I have become a huge fan of his work--indeed, most of my more recent programming efforts in special functions for the HP33S and 32sii are basically shameless plagiarisations of his stuff. His contributions are prolific and are almost always huge improvements over what has previously been available in the HP41 users' library solution books.

Can you let us know if you ever locate the old program you were thinking of?

Les

## Re: Distance between geographic points

Message #9 Posted by [Sam Levy](#) on 19 Mar 2007, 9:04 a.m.,  
in response to message #8 by Les Wright

First my surprise at finding my own entry in this forum on Google search for Kinpo. Second the equation I used must have been in a calculator manual as I did not buy any other texts or programs. It specifically had a correction for crossing the equator when a certain term was evaluated. I found that term in the equation and during the solution added a test and a flag to make the correction automatic. It must have been for the HP-65 as it fit in the program space with few steps left. Sam Thanks all.

## Re: Distance between geographic points

Message #10 Posted by [Jean-Marc](#) on 20 Mar 2007, 5:46 p.m.,  
in response to message #8 by Les Wright

Hi Les, Thank you for praising my programs. The angular distance  $d$  between  $(L,b)$  and  $(L',b')$  on a sphere may also be obtained by

$$(\sin(d/2))^2 = (\sin(b-b')/2)^2 (\cos(L-L')/2)^2 + (\cos(b-b')/2)^2 (\sin(L-L')/2)^2$$

where  $L, L'$  = longitudes and  $b, b'$  = latitudes

These formulas are less accurate than Andoyer's formulas, except perhaps for nearly antipodal points.

Actually,  $d/2$  is in X-register at line 30 of the "TGD" program listed in "Terrestrial Geodesic Distance for the HP-41. ( delete lines 27 and 23 which are unuseful here ) and simply multiply by the Earth diameter to get the distance.

Regards, JMB.

### 42s Screen problem

Message #1 Posted by [Alan](#) on 18 Mar 2007, 1:31 a.m.

<http://img179.imageshack.us/img179/6963/untitledus8.jpg>

As you can see, a black patch has form on the screen. Is there any way to DIY fix it? Or is this the end of this 42s?

### Re: 42s Screen problem

Message #2 Posted by [Walter B](#) on 18 Mar 2007, 1:14 p.m.,  
in response to message #1 by Alan

Seems this is the end of this LCD :(

If you have another Pioneer to sacrifice, there may be a way out. IIRC, there were earlier threads about exchanging LCDs in this forum. May be worthwhile to search the archives. Good luck!

### Re: 42s Screen problem

Message #3 Posted by [Les Wright](#) on 18 Mar 2007, 3:19 p.m.,  
in response to message #2 by Walter B

Quote:

\_\_\_\_\_

If you have another Pioneer to sacrifice

\_\_\_\_\_

I don't think it can be just any Pioneer, alas. My 14B and 32Sii seem to have a very different pixel size and density from the 42S. Can't speak for the 17B or 17BII.

However, the screen on my much maligned 17Bii+ seems very 42S-like. Is it remotely feasible, I wonder, to fetch a 17Bii+ cheaply and cannabalize its LCD, or is the similarity merely superficial?

Randy of FixThatCalc.com has a masterful awareness of display issues, so you could try writing him. I find he is very generous with his advice.

Les

### Re: 42s Screen problem

Message #4 Posted by [Randy](#) on 18 Mar 2007, 4:04 p.m.,  
in response to message #3 by Les Wright

Quote:

\_\_\_\_\_

I wonder, to fetch a 17Bii+ cheaply and cannabalize its LCD, or is the similarity merely superficial?

\_\_\_\_\_

Yes, it's merely superficial. While it appears the same from the outside, it will not work in the 42S.  
Been there, done that.

The LCD's in the 17B, 17Bii and 27S are the only compatible displays.

### Clearing memory [HP41C]

Message #1 Posted by [eev](#) on 18 Mar 2007, 8:56 a.m.

Is there a way to clear al memmory's of the Hp 41C?

eev

### Re: Clearing memory [HP41C]

Message #2 Posted by [Randy](#) on 18 Mar 2007, 9:42 a.m.,  
in response to message #1 by [eev](#)

1. Turn unit off
2. Press and hold down the backspace key (cl x)
3. Press and release the ON key
4. Release the backspace key

You should see the message MEMORY LOST and the 41 is now reset to all factory defaults with memory cleared.

### There was a 12C copy made in China

Message #4 Posted by [CME750](#) on 18 Mar 2007, 3:09 p.m.,  
in response to message #3 by moise dan

A few years ago, a Taiwanese company began selling a 12C clone, marketed as the Aurora FN-1000. You could get it for \$25 from Fry's. More info here:

<http://www.finseth.com/hpdata/craig-aurora.html>

There was speculation that if the 12C could be cloned, then the 15C might be next. But the FN-1000 experiment was apparently unsuccessful. As far as I know, it was discontinued, and no further clones have appeared.

**HP 17bii+ solver problem, another solution**

Message #1 Posted by [Don Shepherd](#) on 17 Mar 2007, 8:52 p.m.

A few weeks ago I posted this solver equation that would not work on the 17bii+ (although it apparently worked on the older 17bii):

$$\text{sumofdigits}=\text{sigma}(i:0:\log(n):1:\text{mod}(n:10)+0xL(n:\text{ip}(n/10)))$$

A fellow forum member (as well as an HP rep) offered a solution that worked, but it involved defining and using another variable and using it in place of n. Today I determined that the offending part of the original equation was the  $\text{ip}(n/10)$ , and I found that the following solution also works (and does not require a second variable):

$$\text{sumofdigits}=\text{sigma}(i:0:\log(n):1:\text{mod}(\text{ip}(n):10)+0xL(n:n/10))$$

Interesting.

### 71B Math ROM, is there an alternative?

Message #1 Posted by [Egan Ford](#) on 17 Mar 2007, 1:54 p.m.

Math ROMs are scarce, is there an alternative?

Thanks.

### Re: 71B Math ROM, is there an alternative?

Message #2 Posted by [Eric Smith](#) on 17 Mar 2007, 2:19 p.m.,  
in response to message #1 by Egan Ford

An HP 50G? :-)

### Re: 71B Math ROM, is there an alternative?

Message #3 Posted by [JeffD](#) on 17 Mar 2007, 2:30 p.m.,  
in response to message #1 by Egan Ford

If you can find a 32K Ram Module then you could find the Math Rom on the internet and load this onto your HP-71B using the 9114 disc drive. The Ram modules might be easier to find???

### Re: 71B Math ROM, is there an alternative?

Message #4 Posted by [Namir](#) on 17 Mar 2007, 3:37 p.m.,  
in response to message #1 by Egan Ford

The HP-71B emulator by J-F Garnier has the MATH ROM included in the software.

Namir

### Re: 71B Math ROM, is there an alternative?

Message #5 Posted by [Howard Owen](#) on 18 Mar 2007, 3:20 a.m.,  
in response to message #1 by Egan Ford

I obtained a 64K CMT EEPROM with a 71 I bought off eBay. I also had a 32K EEPROM I had acquired earlier. I cut a deal with Mike (his username on this board is "Mike") to program the 64K chip in exchange for the 32K chip. I chose the math ROM and the JPCROM, plus a few other miscellaneous LEX files. Mike sells 64K and 32K EEPROMs on eBay along with the service of burning whatever software you supply him with onto the parts before he ships them to you. It's generally a lot cheaper than trying to outbid other collectors for the rare add-ons like the math ROM.

You can also just copy MATHROM.LEX (available on the swap disks) into RAM if you have enough. It works fine that way.

Regards,

Howard

## Re: 71B Math ROM, is there an alternative?

Message #6 Posted by [Valentin Albillo](#) on 19 Mar 2007, 8:17 a.m.,  
in response to message #1 by Egan Ford

Hi, Egan:

Egan posted:

*"Math ROMs are scarce, is there an alternative?"*

They're scarce indeed if offered individually, but much less when bundled with the HP-71B itself.

A couple of years ago I found someone offering several HP-71B for auction. The add only mentioned that they were clean, working, and included an HP-IL module and a 4 Kb RAM module, all ports, etc. I got three of them for just \$150 in all.

Once they arrived, I was astonished when I saw that not only were the machines virtually mint (with just a small case of battery corrosion which simply required a minor clean job of the battery contacts with a cloth) and working perfectly, but each and everyone of them did also include a mint, working Math ROM plugged in, which wasn't even mentioned in the add.

I guess these machines were part of a larger lot belonging to some company which decided to get rid of them all, including backup, never used models which had been in store for a long time (thus the minor corrosion in one of them and their pristine status). Their business obviously did require HP-IL and Math ROM functionality (matrices or complex arithmetic, most likely), plus 4 Kb extra RAM, so all their calcs did include all three modules. The seller was obviously unaware of such finesses and was merely getting rid of the lot for what he/she considered a fair amount for such obsolete, weird handhelds (\$50-\$70).

Perhaps you could also have a look at HP-71Bs offered to see if they might perchance include a Math ROM, which seems much more likely than finding the individual ROM, most specially if the seller isn't very knowledgeable about what he/she's selling.

Best regards from V.

## Re: 71B Math ROM, is there an alternative?

Message #7 Posted by [Egan Ford](#) on 19 Mar 2007, 7:55 p.m.,  
in response to message #1 by Egan Ford

Thanks for all the responses.

Eric, I have a 50G, but desire a more complete 71B. I am a fan of the Voyagers (best calculators--ever), the 71B is like an expandable 11C, but I need the ROM to make it more 15C-like (best Voyager--ever).

JeffD, I think getting the 9114 may be harder and I do not have the RAM (yet). If a fellow 71Ber and I both had HP-IL could it be transferred that way? I hope my batteries never die.

Namir, got it and use it. Very nice. The simulated 80 column display is also nice. [rumor]I look forward to the upcoming GUI based on emu48[/rumor].

Howard, great idea. "Mike", if you are listening, message me when you have EEPROMs in stock.

Valentin, with buyers asking more questions and sellers posting the answers the odds are low for such a pleasant surprise. But I will try.

Thanks.

### Help!! programming hp 48G

Message #1 Posted by [Marco](#) on 17 Mar 2007, 9:16 a.m.

hey! I hope someone could help me!

I have a set of equations that I would like to solve with a program:

$$A = bd - zd^2 \quad P = b + 2d \sqrt{1 + z^2} \quad R = A/P \quad V = 1/n * R^{(2/3)} * (1/2) \quad Q = A * V$$

I have already done it with the Multiple Equation Solver, but I'd like to know if there's another way of doing it. This is what I did:

```
<< {'A = bd - zd^2' 'P = b + 2d v(1 + z^2)' 'R = A/P' 'V = 1/n * R^(2/3) *(1/2)' 'Q = A * V'} 'EQ' STO MINIT
MSOLVR >>
```

And then I created another program to erase the variables that it stored:

```
<< {A b d z P R V n S EQ Mpar Q} PURGE >>
```

Please help me, I think this is not the best way to do it!

### Re: Help!! programming hp 48G

Message #2 Posted by [Benny](#) on 17 Mar 2007, 2:55 p.m.,  
in response to message #1 by Marco

Hi Marco,

This is what I do: I put each formulae in a variable F1, F2, F3, F4. Then I add a description in the variable TITLE and next I complete the sequence of the params in a list and store it in LVARI. Be shure the list is complete. The main program then looks clearly structured: << F1 F2 F3 F4 4 \-> LIST STEQ TITLE LVARI MINIT MITM MSOLVR>>

Using STEQ shortens the program.

Hope this helps.

Kind regards,

Benny Vanruten

### Re: Help!! programming hp 48G

Message #3 Posted by [Marco](#) on 17 Mar 2007, 5:20 p.m.,  
in response to message #2 by Benny

Hey Benny thanks for your answer!

I have some doubts in what you told me: how can I add a title in the global variable?, and what does LVARI do? thanks for your answer!, but I have another doubt, When I don't give a lot of values it tells me that it has TOO MANY UNKNOWNS, but with the same values that I give it I can solve the problem manually but it takes some time, I don't know if I can apply in the program an iteration method or something, what would you suggest me?

Thanks!,

Marco

### **Re: Help!! programming hp 48G**

*Message #4 Posted by **Benny** on 18 Mar 2007, 6:43 p.m.,  
in response to message #3 by Marco*

Hi Marco,

In the variable LVARI you put ALL your parameters in the sequence you like them to appear on the display above the F-keys: e.g. { A b d z P R V ... } In TITLE you put the title you want to appear on top of the display e.g. "MY EQUATIONS" TOO MANY UNKNOWNS: that is normally what you get when you did not define enough variables. Perhaps the program needs startvalues. You can find more in the hp50G users guide on pages 7-10 ... 7-21 (hp50gug.pdf) which you can download from [www.hp41c.org](http://www.hp41c.org) (november 24 2006). If you like to Purge you can call LVARI and issue PURGE. That saves time. The best way is to run the program in a separate directory.

KR

Benny Vanruten

### **Re: Help!! programming hp 48G**

### a 32sii equation bug?

Message #1 Posted by [Les Wright](#) on 17 Mar 2007, 8:23 a.m.

A recent thread dealt with integrating the bell curve integrand,  $\exp(-x^2)$ , on the HP48G, and I have been playing with the problem on my recently acquired 32sii.

When trying to integrate this expression as an equation, the calculator does not seem to like  $\exp(-x^2)$  in that very form and never seems to converge. But it seems to like  $\exp(-(x^2))$ ,  $1/\exp(x^2)$ , and  $\exp(-\text{sq}(x))$  just fine. It also works adequately when the function is provided as an RPN program (RCL X,  $x^2$ , +/-,  $e^x$ ).

The 33S handles  $\exp(-x^2)$  just fine in that form, without any need for extra parentheses or alternate representations of the quantity to be antilogged.

Weird....

Les

### Re: a 32sii equation bug?

Message #2 Posted by [Thomas Radtke](#) on 17 Mar 2007, 8:52 a.m.,  
in response to message #1 by Les Wright

In this case, the 32sii can't tell minus from a signed number, which has a higher operator precedence as the exponentiation. So, +/- seems to be the same token as '-' in the equation editor.

If you write explicitly  $\exp(0-x^2)$  instead, everything works fine.

Edit: And congrats to the 32sii! :-)

Edited: 17 Mar 2007, 8:54 a.m.

### Re: a 32sii equation bug?

Message #3 Posted by [Les Wright](#) on 18 Mar 2007, 3:32 p.m.,  
in response to message #2 by Thomas Radtke

Quote:

And congrats to the 32sii! :-)

I am particularly proud of this acquisition. It is in impeccable shape, and I got it for \$130 from a fellow Canadian, so no customs and shipping was inexpensive and quick. I didn't think this was such a big deal, but then I learned that some folks pay twice that for this item. As a lover of the 33S, I am right at home with it, though the tiny memory size takes some adjustment.

It came with a nice case too--the thicker lined stitched leatherette one, not the thin molded vinyl one.

Les

### Re: a 32sii equation bug?

Message #4 Posted by [bill platt](#) on 17 Mar 2007, 6:54 p.m.,  
in response to message #1 by Les Wright

It isn't a bug as much as a poorly implemented system for "unary minus" that is at the root of the problem. There is a "bug" aspect to the unary minus with the 32sii but that is not really the point.

If you read the manual for the 32sii, and then read the 33s manual, you will see that in fact the "unary minus" function was changed and improved (simplified) in the 33s. The 32sii has a bad behavior with it in equations and reading the manual, you can see that it might be trouble.

I think Jordi Hidalgo's DATAFILE article on the 33s has some discussion of this, too.

As Thomas points out, just use the parenthesis whenever you have leading minuses, and it makes life easier in the 32sii.

### Re: a 32sii equation bug?

Message #5 Posted by [Les Wright](#) on 18 Mar 2007, 3:26 p.m.,  
in response to message #4 by bill platt

Quote:

\_\_\_\_\_

If you read the manual for the 32sii, and then read the 33s manual, you will see that in fact the "unary minus" function was changed and improved (simplified) in the 33s. The 32sii has a bad behavior with it in equations and reading the manual, you can see that it might be trouble.

\_\_\_\_\_

So the much-denigrated 33S actually IMPROVED on something in a pre-Kinpo calculator? And a Pioneer at that?

Egad, the scandal!

Les

### Re: a 32sii equation bug?

Message #6 Posted by [Rav](#) on 19 Mar 2007, 12:51 p.m.,  
in response to message #5 by Les Wright

Actually I think that the 33s improved on the equation solver too. It seems that the 33sii is an iterative solver and so can fall over.

The people who kindly responded to this question,

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=85299>

explain it much more eloquently.

Rav

### what's the beef with the 17bii+?

Message #1 Posted by [Les Wright](#) on 17 Mar 2007, 8:16 a.m.

Due to goofy timing on eBay I ended up with two of these, and I can't seem to even give the extra one away.

I have been playing with it and even though I know it pales in comparison to its beloved Pioneer predecessor I really like it. It is so much easier to use than the 12C for financial and two variable statistical work, it has IR printer capability, the the display is an example of the crispness and good contrast that the 42S should have.

I know the Kinpos are generally disdained around here (even though the 50G may be winning some loyalty), but is the thing really that horrible? I have had no bites on my classified, and the reseller in my area who moves new Kinpo/HP stuff tells me he can't seem to sell these things, though the 50G and kinpo 12C and CP move like crazy.

Any ideas? I am mystified....

Les

### Re: what's the beef with the 17bii+?

Message #2 Posted by [Don Shepherd](#) on 17 Mar 2007, 9:11 a.m.,  
in response to message #1 by Les Wright

Hi Les.

I think the answer is easy. The business and financial people are hooked on the 12c, that's their gold standard and, as a group, they are reluctant to change.

The hobbyists (like us) don't want to put up with the 17ii+'s funky solver. Back when I taught programming, I said that any programming language needs to support 3 structures: sequence, decision, and iteration. The solver supports the first 2, but it only supports loops that have a specific beginning and ending limit; that is, it does not support do...while. I think that is true even in the original 17bii. As such, it is not a strong programming platform.

So where is the market?

### Re: what's the beef with the 17bii+?

Message #3 Posted by [buygm](#) on 17 Mar 2007, 12:00 p.m.,  
in response to message #2 by Don Shepherd

It could be the 12C preference!

But that said... I'm sort of in the same boat. I have a 17bii+ posting that expires today with no bites. Not even any watchers. They were pretty popular a short time ago, so I'm hoping that it maybe just that many folks are busy with the kids on spring break????

Anyway... I agree with you that the 17bii+ is very nice.

### **Re: what's the beef with the 17bii+?**

*Message #4 Posted by [Les Wright](#) on 17 Mar 2007, 12:09 p.m.,  
in response to message #3 by buygm*

That is discouraging!

I just had someone email a totally absurd lowball offer, so I am going to pull the ad, and give the thing to my partner to try to expose it to a more general eBay audience. Failing that, I will hang on to it. Heck, I am not that desperate to get rid of the thing.

Someone emailed me to suggest that the equation solver can call fewer functions than the original 17bii. I am a bit perplexed--I just looked at the table in question in the 17bii manual, and it doesn't look much different from the 17bii+ version. I really wonder if the strengths and limitations of the calculator are not properly understood.

Compared to the 12C, I just prefer everything about this thing--the alpha prompting, the menus, the cash flow lists that can be named meaningfully, the two variable statistics and regression stuff that is fairly intuitive. The IR printing is a bonus too.

Les

### **Re: what's the beef with the 17bii+?**

*Message #5 Posted by [Don Shepherd](#) on 17 Mar 2007, 12:25 p.m.,  
in response to message #4 by Les Wright*

Les, I think the fewer functions \*might\* be the financial functions. I think I read that the original 17bii could use all of the financial functions in solver equations, but the + cannot. Since I am not interested in financial functions, I have not tried them on the +.

*Message #8 Posted by **Bruce Bergman** on 18 Mar 2007, 4:38 p.m.,  
in response to message #1 by Les Wright*

Hi Les --

To be honest, I think it lacks a following, simply because people don't know much about it. I've been collecting my favorite HP calcs since 1977 and really never thought twice about it until recently when I needed a good, solid financial calc. I wanted something new (I've got a ton of old calcs) and I liked the form factor better than that of the 12c, of which I have two. I decided to just "go for it" and see what I thought.

I really like the feel and style of this calculator. Much more than I expected. And I had almost given the solver the thumbs up until Don Shepard and I started some offline conversations about what it could do, and then I found it was VERY capable. Yeah, it's got some differences from the solvers in the 17b and the 19b, but it still surpassed what I thought it could do. I really feel bad because I had severely underestimated this calc.

It is now, believe or not, one of my favorite calculators. I don't think it will ever be my MOST favorite, or have the power and flexibility of the 42s or 50g, but it is definitely in my pocket and used almost daily. That's quite a statement for a calculator that I thought wasn't worth the time of day.

I think if people gave it more of a chance, they'd be pleasantly surprised.

thanks, bruce

**aged 50g**

Message #1 Posted by [joan](#). on 16 Mar 2007, 2:23 p.m.

hi all,

Finally the hinges of my 49g+ went all silly and Hp gave a new 50g as a replacement, previous 150 € and only six more month of warranty. Maybe is because I'm not used to it but I like the look of the 50g. Don't get me wrong I'm proud owner of nearly all LCD RPN Hp's but they're safer at home. So my question is, has somebody been using the 50 intensively enough to tell how it ages?

Thanks

**Re: aged 50g**

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 16 Mar 2007, 4:15 p.m.,  
in response to message #1 by joan.

Better than early units of the 49g+.

Message #3 Posted by [Buy A BackUp Unit](#) on 16 Mar 2007, 11:06 p.m.,  
in response to message #1 by joan.

The new HP50 is outsourced stuff made by Kinpo. I love my HP50, but have bought a backup in case the original unit quits.

**Re: aged 50g**

Message #4 Posted by [Tadeyev](#) on 17 Mar 2007, 7:52 a.m.,  
in response to message #3 by Buy A BackUp Unit

So you mean to say that all those excellent Singaporean and Brazilian made Voyagers and Pioneers were made by special, purpose built HP factories :-)? I doubt it.

Don't get me wrong; almost all my old HP's are the USA made ones...because I hate the kind of economic globalization that causes industry to leak away to low cost labor markets.

But the fact is that Kinpo can make every level of quality their major customers dictate. And the demands HP makes on them qua design and quality is different from Citizen or Casio's. For me, an HP by Kinpo is still an HP.

The best Chinese factories are slowly taking over the lead(or they already have!) over Japan. We have to see how the newly announced TI series will be; but I think when you look at the marketplace the Kinpo/HP

products will still be the best around (since HP got back on track with calculators with the revised 33s and 50 anyway...) Just my 2 cents.. Tadeyev

### Re: aged 50g

Message #5 Posted by [Not Until The Process Is Improved](#) on 17 Mar 2007, 10:50 a.m.,  
in response to message #4 by Tadeyev

Until management institutes true quality control, unfortunately the best predictor of future performance is past performance. The atrocious key problems of the HP49+, paint flaking off after just a few months use, made them junk. One HP50 unit I have still misses some keypresses, despite all the ballyhoo that problem has been fixed.

Unless and until KinHPo improves their process, establishes a good track record, they are not like HPs of old to me, they're just outsourced Chinese junk. Whether you get quality or not is currently a statistical fluke. The Chinese could do well by studying how Deming revitalized Japanese manufacturing, and put his methods to work.

You are correct in that the only thing for users to do is to complain loudly, insist that KinHPo produce units that work to customers satisfaction. And I have done so.

Message #7 Posted by [the person formerly known as dot](#) on 17 Mar 2007, 6:08 p.m.,  
in response to message #5 by Not Until The Process Is Improved

>You are correct in that the only thing for users to do is to complain loudly, insist that KinHPo produce units that work to customers satisfaction. And I have done so.

Why would HP do so? As a company, they care about money - and by producing lower quality units, they make more sales. If the HP49g+ was well built, who would have bought a HP50g (assuming they already owned a 49g+)?

Personally however I think the HP50g is fairly decent. But when people buy multiple calculators as 'spares' because of concerns over quality, it just rewards HP for doing a less than perfect job.

### Re: aged 50g

Message #8 Posted by [John McCormick](#) on 18 Mar 2007, 2:08 a.m.,  
in response to message #1 by joan.

I got mine in August and use it heavily in school (7 sets of batteries before I finally went lithium). I'm not sure the button issues are completely fixed. My negation button is just mush and the tactile feedback on 0 no longer guarantees the appearance of a 0. I never had a 49g+, but I have a 48GX, so I know what "good" feels like. All in all though, I still love it.

### HP48 integration error?

Message #1 Posted by [k](#) on 15 Mar 2007, 10:53 p.m.

When I evaluate the integral of  $\exp(-x^2)$  from 0 to 1000 [by using the equation writer, then pressing "Evaluate"], the HP48 gives an answer of zero. Anyone know why this happens? When I evaluate the integral from 0 to 100, the HP48 gives an answer of 0.8862, which is the right answer.

### Re: HP48 integration error?

Message #2 Posted by [Karl Schneider](#) on 16 Mar 2007, 12:17 a.m.,  
in response to message #1 by [k](#)

Quote:

The exact answer is  $0.5 * \sqrt{\pi}$ . The reason for the erroneous answer of zero for a large upper limit of integration is sparse sampling. Too many values of the integrand are extremely small when the samples are stretched out to  $x = 1000$ , such that the calculated integral doesn't change very much when additional widely-spaced samples are taken. There's absolutely no point in setting the upper limit greater than 34, because the value of the integrand is less than  $1E-499$  from  $x = 33.89675$  onward. In fact  $x = 6$  would suffice as an upper limit.

This issue might not be covered in the HP-48 manuals, but a very similar problem is covered in the HP-15C Advanced Functions Handbook.

-- KS

### Re: HP48 integration error?

Message #3 Posted by [Les Wright](#) on 16 Mar 2007, 3:53 a.m.,  
in response to message #1 by [k](#)

I echo Karl's answer.

There is a lot of talk in the 15C manuals about how the algorithm samples the "interesting" part of the curve, and if there is lots of uninteresting tail stuff, these samples predominate.  $\exp(-x^2)$  goes to zero for big  $x$ , so lots of zeros get the weight.

Improper integrals are often handled best by a transformation of variables. In the case of the bell curve, integrating  $0.5/\sqrt{-\log[t]}$  from 0 to 1 is equivalent to integrating your problem from zero to infinity--still

an improper integral with poles at each end, but a finite interval, which is nicer. I leave it to you to determine the variable transform that leads from one to the other, because I am a lazy devil and it is late.

HTH,

Les

### **Re: HP48 integration error?**

*Message #4 Posted by [Les Wright](#) on 16 Mar 2007, 4:10 a.m.,  
in response to message #3 by Les Wright*

Actually, I think in this case cutting off the tail as Karl suggested is faster and easier.

Where the transform could be useful is if you want to find the area of the tail itself, from  $x$  to infinity, as in the computation of the complementary error function. But if you want  $\text{erfc}(x)$ , `SQ 2 * 1 SWAP UTPC` after putting your  $x$  on the stack is a lot faster. As a matter of fact, the following little code snippet of mine handles all real arguments:

```
<< DUP SQ 2 * 1 SWAP UTPC IF SWAP 0 < THEN 2 - NEG END >>
```

HTH,

Les

### **Re: HP48 integration error?**

*Message #5 Posted by [k](#) on 17 Mar 2007, 2:53 a.m.,  
in response to message #3 by Les Wright*

Les, Karl,

Thank you for your response, and your suggestions on evaluating the integral appropriately.

Still, what seems strange is that when evaluating the integral from 0 to 35, it takes about 5 seconds for the HP48G to yield the (correct, to specified decimal places) answer.

However, when evaluating the integral from 0 to 1000, the HP48 in a split second returns a zero answer. I would think it would take longer to evaluate the integral from 0 to 1000, compared to the time it took to evaluate the integral from 0 to 35, which is not the case.

Any thoughts on this?

In any case, when using the HP integrate function, it is clear the user must make sure the answers make sense.

This issue on evaluating integrals is not discussed in the HP48G Users Manual. Is there anyway you can copy the relevant excerpts from the HP15C manual into a response to this message?

Any help you could provide would be appreciated.

Thanks - kelly

**Re: HP48 integration error?**

Message #6 Posted by [Les Wright](#) on 17 Mar 2007, 6:31 a.m.,  
in response to message #5 by k

Yup, I have an idea.

The integration algorithm makes an estimation at a few points, then doubles the number of points and makes another estimation, refines this by something called Richardson extrapolation, etc., and continues until two or three subsequent estimations are equal to each according to the tolerance implied by the setting for FIX, SCI, or ENG.

When estimating this integral, the value of the integrand is  $< 1e-499$  for the huge majority of the range 0 to 1000. Basically, this is zero as far as the calculator is concerned. The value of integrand only becomes nonzero, as far as the calculator is concerned, somewhere between  $x = 33$  and  $x = 34$ . That part of the range of integration is stuck way on the left end, and it is unlikely that in a few sequential estimates the algorithm even samples much from that end. This means that you are going to get two or three consecutive estimates that are effectively zero, since the integral estimates are basically weighted averages of the integrand at the sample points. The weighted average of a bunch of zeros is always zero. This happens a a few times in a row (I think at least three) and tells the calculator convergence has been reached. That happens really quickly, right at the beginning, so false convergence is reached quickly.

The stuff in the 15C manuals is not conveniently copied in this forum, as there is pages of stuff. But, in a general sense, if you want to basic idea of what the 48G does in integration, google Romberg Method or Romberg algorithm. The math is not very hard, even though the notation can be confusing--subscripts to keep track of and that sort of thing. If you can appreciate graphically this sampling issue, you may grasp why the HP48G goes to 0 when you set up the integral with the 0-1000 limits.

Les

*Edited: 17 Mar 2007, 8:32 a.m.*

**Re: HP48 integration error?**

Message #7 Posted by [Les Wright](#) on 17 Mar 2007, 8:44 a.m.,  
in response to message #6 by Les Wright

Actually, trying plotting  $\exp(-x^2)$  directly on the calculator. Set the vertical range to  $-.1..1$  and the horizontal to  $0..1000$ .

When you execute DRAW you won't see much--mostly blank plot with maybe some extra pixels up against the y-axis. Even with the range set to  $0..35$  the visible part of the curve is scrunched up to the left, but the integrator will still sample some points over there. If you play around with the upper limit and replot, you will see why one can chop off the tail and still get a good estimate of the integral--there is just not much area under that tail once you get past  $x = 4$ , even. Choosing  $x = 35$  as an upper limit is sort of overkill.

Plotting a function before trying to integrate it always makes sense. And do try to learn about the Romberg method. I am of the school that no one who uses numerical integration should treat them just as black box routines.

Les

*Edited: 17 Mar 2007, 8:44 a.m.*

**Re: HP48 integration error?**

Message #8 Posted by [Les Wright](#) on 17 Mar 2007, 11:54 a.m.,  
in response to message #7 by Les Wright

Quote:

And do try to learn about the Romberg method

Just a warning--most theoretical discussions of the Romberg method seem to talk about it as extrapolating the trapezoid rule. In HP calculators since the 34C, the Romberg integrator actually use the midpoint rule (after certain transformations of variable), so that the endpoints of the interval of integration are never directly sampled.

For example, if integrating on the interval -1..1, the first iteration will sample at 0, the next at +1/2 and -1/2, the next at +1/4, +3/4 and the negative of these, the next at +1/8, +3/8, +5/8, +7/8 and the negative of these, etc.

On the other hand, the trapezoid rule would sample the endpoints 1 and -1 first, then the 0 between them, then the series of points given above, BUT the estimate integral would be trapezoid estimates based on the integrand values at the end of each subinterval, not midpoint estimates based on the middle point of each subinterval.

It really is a lot easier to look at pictures or draw this stuff out.

Les

**The Silver Line**

Message #1 Posted by [Ron](#) on 15 Mar 2007, 5:01 p.m.

I know there has been lots of discussion in the past (though not recently) concerning refurbishment of the silver lines on the 35, 45, etc... To the best of my knowledge, no one has yet come up with a suitable method for restoring the lines.

I thought I had a winner, but it didn't work out. I used the adhesive and silver leaf kits found a craft stores, as the representative example shown on the packaging looks close to the lines. But, alas, the real thing wasn't smooth and shiny. In fact, it looked a lot like the silver paint pens I've seen used before. Plus, the silver leaf is not durable at all. The one advantage leaf has over the paint pen, is that the leaf stays where you put it. With the pen, it's hard to keep the paint confined to the high places.

Does anyone else have a good solution for restoring the silver lines?

**Re: The Silver Line**

Message #2 Posted by [Trent Moseley](#) on 16 Mar 2007, 12:16 a.m.,  
in response to message #1 by Ron

My HP-67 is 27 years old and the "silver line" doesn't have a blemish anyplace. Could it be an aluminum strip?

tm

**Re: The Silver Line**

Message #3 Posted by [Walter B](#) on 16 Mar 2007, 3:10 a.m.,  
in response to message #2 by Trent Moseley

Trent,

on my 67 and 65, the lines look like silver print on top of plastic definitively, like the side lines on 35 and 45. AFAIK the only metal parts used in this context were the protruding lines next to the power switch on some models of 35 and 45. These are exposed to extra wear, as many of us know, while the others may survive decades almost unblemished, because they stand back a bit.

Best regards, Walter

**Re: The Silver Line**

Message #4 Posted by [Les Wright](#) on 16 Mar 2007, 3:39 a.m.,  
in response to message #1 by Ron

I don't have a good permanent solution. I use a metallic silver Sharpie on my 45. It is an okay colour match, not perfect, is harmless to the plastic (I think), the tapered tip allows accurate application with a steady hand,

and it can be restored when it wears off.

I think purists would recommend good quality silver paint of the kind scale model hobbyists use. I remember Testor's brand as a kid but I think there is better stuff.

HTH

Les

\_\_\_\_\_

This is exactly the "silver paint" you can purchase. (Though I have seen Inox steel based silver paint as well - looks much nicer, but is very expensive). The silver paint looks semi-good but is for display usage only. Touching the (dry) paint will rub it off and it gets dull. You will have black/silver fingers though :) It might work to cover the silver paint with clear varnish (it did not work out for me, though).

### **220V to 110V voltage converter for U.S. charger : that works !**

Message #1 Posted by [Jean-Michel](#) on 15 Mar 2007, 2:51 p.m.

Hi everybody,

I recently posted a thread when I was looking for a solution to use the charger designed for U.S. voltage of a HP-33C I received a few weeks ago, as I live in France where the voltage supply is 220V, instead of 110V in the U.S.

First of all, I would thank here all the persons who answered my question and helped me.

I finally found, and bought (12,50 Euro shipping included), a 45W 220V-240V AC to 100V-120V AC Plug-In Voltage Converter, and tested it last days : that works fine !

Probably most of the readers will know this solution, but maybe it may help someone who's got the same "problem" one of this days, who knows ?

This will be my modest contribution to this forum...

Regards.

### **Voltage converters vs. transformers**

Message #2 Posted by [Andrés C. Rodríguez](#) on 17 Mar 2007, 10:32 a.m.,  
in response to message #1 by [Jean-Michel](#)

They are not the same.

A transformer has an iron core (you can tell by its weight), and will deliver a sinusoidal voltage output. In your example, you will get a 110 V sinusoidal output from a 220 V sinusoidal input.

So the output will be similar enough to the USA 110 V mains, and your HP charger (which, incidentally, contains a transformer itself) will not "be aware of any difference" (see note below).

On the other hand, there are devices called "voltage converters", which are suited for irons, hairdryers, mixers, and other appliances. They work by altering the waveform, their output is no longer sinusoidal, but its power is equivalent (root mean square) to the 110 V mains. It is up to the receiving device to cope with the waveform issue. A heating element, a lamp, or a motor will almost always work with such converters; but electronic devices or transformers may suffer because their input will not be similar enough to the 110 V sinusoidal mains.

These voltage converters are electronic circuits, and are much lighter than transformers. Sometimes they are advertised as "travel" or "foreign" power converters.

I would strongly advise against using voltage converters to feed HP calculator AC adapters. They may just work (by luck, or for a while), but they may cause harm, even not instantaneously.

Transformers are on the safe side.

Note: Actually, 220 V mains have a 50 Hz frequency almost everywhere; 110 V USA mains are 60 Hz based. Using the HP USA AC adapter with the 110 V 50 Hz output of a 220 to 110 transformer will make it work a little warmer because of the different frequency and it's influence on the core magnetic behaviour. But this difference will not cause any harm.

Message #3 Posted by **James M. Prange (Michigan)** on 17 Mar 2007, 9:24 p.m.,  
in response to message #2 by **Andrés C. Rodríguez**

Perhaps a minor point, but the single-phase (normal residential or office) voltage here is supposed to be 120V +/-5%, or 114V-126V. The previous requirement was 120V +5% -10%, or 108V-126V, or taking the average of the highest and lowest, 117V, which no doubt explains why that's a fairly common nominal voltage for appliances. That's at the service entrance with no load; the voltage at an outlet on a loaded circuit will be lower, depending on the wiring resistance and load. Often an appliance will have a nominal voltage of 115V or 110V, and many will work okay as low as 100V. Of course for heavier duty appliances that use both "hot" wires, double the voltages.

Regarding the frequency, it's not just the U.S., but all of North and Central America, and quite a bit of South America, that uses 60Hz for most electrical power.

Regards,  
James

### **OT: Voltage converters vs. transformers**

Message #4 Posted by **Karl Schneider** on 19 Mar 2007, 1:58 a.m.,  
in response to message #3 by **James M. Prange (Michigan)**

Hi, James --

Quote:

Of course for heavier duty appliances that use both "hot" wires, double the voltages.

For international readers, this is typical of 120-volt household AC systems, in which two circuits and a neutral are provided. With the neutral tapped to the center of the 120-V transformer secondary, the two circuits are effectively 180 degrees apart, like a see-saw. Single-phase 240 V for heavy loads -- such as ranges, dryers, and fixed heaters -- is achieved by using both circuits instead of just one circuit and the neutral.

I believe that three-phase 220-V AC is common in Europe, at least in urban areas.

Quote:

Regarding the frequency, it's not just the U.S., but all of North and Central America, and quite a bit of South America, that uses 60Hz for most electrical power.

Surprisingly enough, part of Japan is also developed for 60 Hz, while other parts utilize 50 Hz. The infrastructure built after World War II by American companies, such as General Electric and/or Westinghouse, is 60 Hz. The infrastructure built by European companies (I assume Siemens) is 50 Hz. Energy can be exchanged between the systems using a set of "back-to-back" AC-DC-AC converters.

I believe that three-phase 220-V AC is common in Europe, at least in urban areas.

\_\_\_\_\_

Today, it is three phase 230 VAC. Reason was the unification of former 240 VAC (used in Britain) and 220 VAC (used elsewhere). IIRC this was done some 15 years ago.

Best regards, Walter

Message #6 Posted by **Maximilian Hohmann** on 19 Mar 2007, 7:57 a.m.,  
in response to message #5 by Walter B

Hello!

Quote:

\_\_\_\_\_

IIRC this was done some 15 years ago.

\_\_\_\_\_

Add 10 years to that ... some things really take awfully long to accomplish! The common 230 volts were agreed upon through IEC standard 60038 in 1983 already.

Greetings, Max

BTW: As others have already said, the small differences in voltage usually create no problems. But the difference in frequency can cause problems, especially with video signals and electric motors (like in cooling fans and synchronous drives like those of telescope mounts).

in response to message #4 by Karl Schneider

Look here for more than you ever wanted to know about power line voltages, frequencies and types of electrical plugs:

<http://www.calinst.com/literature.asp>

Click on "World Power Guide".

You have to register to do this download but it is well worth it if you want to know about the many variations. Be warned that this is a PDF of over 30 pages.

Scanning the Guide, I found that Johannesburg, South Africa is listed as having both 50 HZ a.c. power as well as d.c. power. My copy of the guide is several years old so I don't know if this is still true.

-- Richard.

### **Re: OT: Voltage converters vs. transformers**

*Message #8 Posted by **Gerson W. Barbosa** on 19 Mar 2007, 10:26 p.m.,  
in response to message #4 by Karl Schneider*

Hello Karl,

With the neutral tapped to the center of the 120-V transformer secondary, the two circuits are effectively 180 degrees apart, like a see-saw. Single-phase 240 V for heavy loads -- such as ranges, dryers, and fixed heaters -- is achieved by using both circuits instead of just one circuit and the neutral.

In Brazil this system is used only in central São Paulo city, except that the voltages are 110 and 220 V. Everywhere else three-phase wye systems are used (mostly 220/127 V; 380/220 V in some states). Frequency is 60 Hz, as already mentioned by Luiz. Because of São Paulo influence it's not uncommon to hear low-skilled electricians saying 110 V instead of 127 V. Until recently, incandescent light bulbs labeled 110 V (and actually designed for that voltage) were sold all over the country. Of course, they didn't last long under 127 V.

Regards,

Gerson.

### **Re: OT: Voltage converters vs. transformers**

*Message #9 Posted by **John** on 22 Mar 2007, 4:40 p.m.,  
in response to message #4 by Karl Schneider*

Quote:

I believe that three-phase 220-V AC is common in Europe, at least in urban areas.

In the UK (and I assume the rest of Europe) a 3-phase supply is available anywhere at a price. Such supplies are typically used for large motors, or for computer centres. The 'low voltage' 3-phase supply has three wires (red, yellow, blue) at 120 degrees out of phase with one another. The voltage between one phase and earth is 240V, the voltage between two phases is 415V.

I see from Wikipedia the colours are going to be 'harmonised': [http://en.wikipedia.org/wiki/Three-phase\\_electric\\_power](http://en.wikipedia.org/wiki/Three-phase_electric_power) to brown/black/grey.

I don't have any 'big iron' but I understand some hobbyists have a 3-phase supply to their home!  
Regards, John

*Message #10 Posted by **Vieira, L. C. (Brazil)** on 19 Mar 2007, 4:23 p.m.,  
in response to message #2 by Andrés C. Rodríguez*

Hi Andrés, guys;

In Brazil we have the 'conventional' three-phase 220VAC, 60Hz. Reasons apart, I have no informations about where are 60Hz or 50Hz used. I do not remember having access to such information. Anybody?

About video signals and electrical motor speed: current all-analog TV sets (either generation or receivers) are somehow rare, most of the new stuff (if not all) being digital when generating control signals are the issue. TV receivers mainly use switching power supplies, thus converting the AC supply into DC and using high-frequency PWM to control conversion (some thousands of hertz). So the 60Hz reference is internally generated, instead of using the AC mains reference.

Electrical motors designed to operate with 60Hz actually may need extra fanning when connected to 50Hz to keep lower temperature because, in most cases, their fan is built in their own axle and the air flow will be reduced in about 17% in this case.

Cheers.

Luiz (Brazil)

Olá Luiz,

Quote:

Reasons apart, I have no informations about where are 60Hz or 50Hz used. I do not remember having access to such information.

Paraguay uses 50 Hz. Half the turbines in Itaipu are designed for 50 Hz. That's why a 600 kV DC transmission is used when Paraguay sells its surplus energy to Brazil. If I am not wrong, the power of the voltage converters in both ends are 5000 or 6000 MW. That's what I call a voltage converter! :-)

Cheers,

Gerson.

Even here in the US, where there is no need to change from 50 to 60 Hz, some transmission lines are also run in DC at similar voltage levels, so they get the big voltage converters, too. Benefit: no radiation loss from the line.

## **Re: Voltage converters vs. transformers**

*Message #14 Posted by [Andrés C. Rodríguez](#) on 24 Mar 2007, 8:52 a.m.,  
in response to message #10 by Vieira, L. C. (Brazil)*

Hi Luiz, everybody!!

First of all, I apologize if my posting was not as complete or correct as it could have been. My main concern was to alert for possible damage to some of our beloved calculators because of the not-always-known difference between "electronic power converters" and "transformers". I felt time was running out, and something has to be posted in the shortest possible time.

I learned about this difference in a hard way some 30 years ago. I was connecting a (then) rare telephone answering machine (110 V based) in my "soon-to-be parents-in-law" home (220 V, as AC comes here). The salesperson included a power adaptor with the answering machine, but (oh!) it was not heavy at all!... Well, the machine worked for some ten minutes... but then we all heard a loud noise, and the smell of a burned electrolytic capacitor showed that something had went wrong.

I then realized a triac circuit was doing a not good enough "voltage conversion"...

End of story: Fortunately, I was able to put a new electrolytic in, fix the thing, connect a classical transformer, and the whole incident was over; as witnessed by the fact that we are about to celebrate our 24th wedding anniversary this year :-)

Regarding power systems, in Argentina we are supposed to have 220 V 50 Hz, and triphase systems are 380 V. Of course, these are rms, not peak values.

Our government here is trying to "manage" a large increment in the electric power demand, caused by a combined effect of politically-fixed prices, increased economic activity, and little long-term infrastructure planning (you may perceive my disagreement here). So it is very possible that, at this very same moment, we have something like 199.95 V and 48.7 Hz... You know, it is within the 10% range and the populace will not notice it. And the engineers out there have little influence for the upcoming elections. Sad.

One of these days they may decide to "manage" gravity...

## **50 hz**

*Message #15 Posted by [bill platt](#) on 24 Mar 2007, 9:53 a.m.,  
in response to message #14 by Andrés C. Rodríguez*

I didn't know that Argentina was on the euro-electric standard (220, 50 Hz) rather than the U.S. 60 Hz system. Are your neighbors (other than Paraguay) also 50 Hz?

(O.T. I have a beautiful stringed instrument I had custom-made in Buenos Aires. The 1st try got lost in the mail, but the luthier had insured it and so he simply made another one and sent it along a few weeks later. Apparently valuable things have a habit of getting "lost" in correo argentino. Perhaps there is some "management" of the post as well as electricity and gravity).

### HP-33S

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 15 Mar 2007, 10:50 a.m.

Does anyone know if the HP-33S has been updated in ROM?

Many bugs have been discussed here (let apart its shape and beauty), and probably these rumors have reached HP. So I suspect (or I hope?) an improvement/restyling is on the way.

What do you think about it? Have you heard news?

I own such model (CNA5150).

-- Antonio

### Re: HP-33S

Message #2 Posted by [Dave](#) on 15 Mar 2007, 12:56 p.m.,  
in response to message #1 by Antonio Maschio (Italy)

I certainly vote for a restyling. In addition to a traditional button layout, I'd also like to see a slimmer, more pocketable unit. Functionally, 15C style complex number and matrix capabilities would also be a plus (I'm not holding my breath for that one). Unable to tolerate the current styling, I promptly sold the 33s I bought when it first came out. I've been relying on a cheap casio as my pocket calc ever since, patiently waiting for HP to realize their mistake and produce something that fits in my pocket and doesn't make me cross-eyed.

### Re: HP-33S

Message #3 Posted by [Les Wright](#) on 15 Mar 2007, 1:37 p.m.,  
in response to message #2 by Dave

I am a fan of the 33S, warts and all, but having recently acquired a 32sii for a nice price I am perplexed why HP just didn't stick with a good thing and keep the Pioneer styling. A 33S with the 42S two-line display (only a little crisper) and somewhat more memory than the tiny 384 bytes of the 32sii would be darn near perfect for that class of calculator. Indeed, my only complaint about my 32sii is the limited memory--get a couple of good size programs in there, assign a few variables, do some statistical sums, and it goes pretty quickly. The 33S has gobs of memory but you are likely to use up all of the labels before you make much of a dent in it. Some middle ground would be nice indeed.

As for a day-to-day in-your-pocket calc, might a suggest splurging on a working grade 11C?

Les

### Re: HP-32S, 32SII & 33S

Message #4 Posted by [Paul Brogger](#) on 15 Mar 2007, 2:31 p.m.,  
in response to message #3 by Les Wright

The TWO improvements I've suggested for the 32SII: use a **32S** instead, and add memory to *that*.

The whole line has *such* a cool, easy-to-use (and easy-to-remember!) programming model -- *that's* what salvages the 33S, in my opinion.

A 33S with a clean 32S-ish layout (even at the cost of extensive menu access to tertiary functions) would be GREAT, even without more labels & data memory. (But those wouldn't hurt.)

### Re: HP-32S, 32SII & 33S

in response to message #4 by Paul Brogger

Paul wrote: "A 33S with a clean 32S-ish layout (even at the cost of extensive menu access to tertiary functions) would be GREAT..."

Gene: I seem to recall that the HP32s was updated to the HP32SII because, in large part, the clean look of the HP32s made prospective buyers think the calculator could not DO MUCH.

A clean look translated into "simple, not very powerful" for the 32s calculator.

That's one reason why the functions were put all over the place with the 32SII version.

Go figure. I'd prefer menus myself, but who am I?

I'd always assumed it was to reduce keystrokes for the Math Olympics (or whatever) competitors.

**Re: HP-32S, 32SII & 33S**

Message #7 Posted by [Eduardo](#) on 17 Mar 2007, 12:34 p.m.,  
in response to message #6 by Paul Brogger

\*Not\* for the Math Olympiads! As a former IMO (International Mathematics Olympiad) contestant and an active mathematician, I take exception to the comment. \*The\* mathematics olympiad is a contest based on theoretical knowledge in which calculators are not only banned, but also totally useless.

There \*are\* competitions that test (almost exclusively) calculation speed. The most famous is probably [Calculator Applications](#). I happen to know a high-school teacher who trains his students for this contest. Looking at the 80 problems (30 minutes to solve'em all!) I'd think it'd take a couple of hours to solve them with a calculator if you are pretty good and fast, \*if only\* contestants really had to \*think\* during test-taking. However, the contest is rather close to "standardized" in that many of the problems are taken from training booklets and based on, or copied from, problems from previous years. Sadly, what I discovered is that students who do well have to drill a lot on repetitive tasks; they like to use RPN calculators (32SII is the most popular) and, as far as I know, it's entirely possible that they have formulas pre-programmed on their device to speed things up considerably (there are always many problems on uniform and uniformly accelerated motion, ratios and proportions, solving triangles, and even a problem or two that need the use of a numerical solver.

Basically, students who do well do not necessarily understand the underlying mathematical concepts; the teacher trains them in previous years' problems (plus a public "study list" of problems for a given year) and gives them the keystrokes and/or programs to solve the "difficult" problems. Overall, as much as I love calculators and scientific computing, I think these contests are very much a step in the wrong direction---as a mathematician I strive for understanding and know that real challenges take time (by contrast, International Math Olympiad problems are 3 per 4:30 hour-long session---they require you to THINK!!! And of course research problems can take months or years to solve---if at all!)

Eduardo

Message #8 Posted by [Egan Ford](#) on 15 Mar 2007, 6:06 p.m.,  
in response to message #5 by Gene

I actually prefer the overloaded keys of the 32Sii, 48GX, 50G, 34C, and the 15C. I like the reduction in keystrokes and having more functions in plain sight. Not that I am opposed to menus, I like them too for what cannot be displayed in plain sight.

Clearly the 34C and 15C illustrate how to best overload the keyboard. Just look at them, clean and crisp:

<http://www.hpuseum.org/3qs/34c3q.jpg>  
<http://www.hpuseum.org/15.jpg>

IMHO, the 33S with its malformed keyboard and poor color selection is an exercise in what not to do.

Hallo!

Quote:

And don't forget the HP-67, like the 34C it had three shift keys. I love my 42S but with the one shift key and all those menus I have some problems, particularly when one is programming.

The same with me! I never had the slightest problem adapting to shift-keys. The last time I really worked with (and programmed) an hp-67 must be 20 years ago and still I remember that it is "f"-LBL, "g"-x^2, "h"-RTN and so on. You work with it for a few hours and the shift-prefixes automatically become part of the command in your mind.

On the other hand, I last played with an hp-48 a few days ago and I wouldn't be able - even if threatened with torture! - to say which menu and sub-menu leads to an inverse sin (it is the blue "g" shift key on the hp-67 :-)) ...

And more awful still are the alpha-functions of the hp-41: "Alpha" - letter letter letter letter letter "Alpha", what a nightmarish way to work with any device!

So from my point of view, and with my way of memorising things, the two function keys of the 33S are quite OK, the only bad thing about them is the weakish green and magenta colouring of the key labels. Make them yellow and blue like the "f" and "g" keys of a 67 and everything is OK for me!

Greetings, Max

NB: And as for the bugs with certain functions, I couldn't care less. I stopped doing the kind of calculations where these bugs matter on pocket calculators 20 years ago - we live in the age of the Gigaflop-Personal computer now :-))

Me too. When I bought an HP calculator as a university student in the early 1990s, I chose the 32Sii over the 42S and the 28S in part because the functions I'd use most often were in plain sight and accessible with one or two keystrokes. I never regretted my choice, and now that I'm a math teacher, I'm still using the very same calculator every day at work.

That's one reason why the functions were put all over the place with the 32SII version.

Go figure. I'd prefer menus myself, but who am I?

Hmm, the HP-32S and HP-42S are difficult to distinguish at first glance. Perhaps the "clean look" was not the best for the flagship RPN model?

I suspect that the real objections were hidden and missing functions. I would prefer that functions be visible and easily accessible with as few keystrokes as practicable. For example, a few menus (e.g., "LOOP", "P<->RECT", "H<->HMS", "D<->RAD") offered only two functions, making the user think where they would be found, and requiring extra keystrokes.

The HP-32SII offered quite a few more functions, too:

### Re: HP-33S

Message #13 Posted by [Ed Look](#) on 15 Mar 2007, 7:45 p.m.,  
in response to message #3 by Les Wright

It had been discussed in this forum some time ago: it is not feasible to manufacture a product exactly like a Pioneer... or a Spice... or a Classic, etc. Manufacturing paradigms change. Chip fabs age and the equipment used in them update and the product, if not by intention then by forced (economic) necessity changes. In fact, I think even the old solid-feeling heavier plastic cases, double shot molded keys, etc., can no longer be made with any of the current manufacturing methods (and no one's going to spend money to go back and open a plant like in the old days). I doubt if any chip fab will go back and "scale up" (batch manufacture is more like it) to make 8088s just to satisfy a few graying old fashioned DOS based video game junkies. I doubt if any shipyard is going to gear up to stamp out new battleships (even if the ship design was updated and technologically

superior) ; the technology is essentially lost, even if many still remember how it's done. (In the same way I doubt if we could duplicate the Gemini or Apollo spacecraft.)

It doesn't bode well for my dream of going to Macy's or someplace like that and pick up an affordable and spanking new HP-34C.

This and its actual good performance is why I have more than come to terms with the 33C; I actually like it quite a bit... more than bigger, badder models, as the 33C's form factor and weight in proportion to its power is quite good.

### Re: HP-33S

Message #14 Posted by **Dave** on 15 Mar 2007, 7:55 p.m.,  
in response to message #13 by Ed Look

Don't mean to go off on a "bring back the 15C" tangent here, but given that the 12C has been updated to modern hardware and manufacturing processes, why would it be such a leap to make something like a 15C, or even a 33s with mostly 12C hardware? Just make the buttons rectangular and readable. Is that too much to ask of modern technology?

As for the having to re-engineer the existing ROM, I assume somebody (Kinpo or HP) had to rewrite the 32s ROM for the 33s hardware. Many have written excellent simulators of the 42s and 15C for many platforms, including ARM, if that's the processor of choice. So that shouldn't be a huge hurdle either. It's already mostly done. And with many willing to pay up to \$300 for the old form factor and functionality, why wouldn't it be profitable?

As for adding too much functionality for the PE exam, that's a valid argument. Leave the function set alone if you have to. Please just fix the wacky keys and I'll buy at least two tomorrow, as will many others, I'm sure.

### Re: HP-33S

Message #15 Posted by **Jeff O.** on 16 Mar 2007, 8:10 a.m.,  
in response to message #14 by Dave

The only functionality that the PS/PE/EIT (NCEES) examiners worry about is input/output with text capability. Make it as powerful as you want. Of course there is the issue of the NCEES not wanting to have a long list of approved calculators to worry about. So if HP created a new 15C, they would have to take it to the NCEES and ask them to put it on the approved calculator list. Retaining NCEES compliance and approval might best be done by revamping the 33s, say into a 33sii:

<http://people.freenet.de/thradtke/33sii.jpg>

As far as the ease with which a new 15C could be created based on the fact that the 12C is still in production, the 12CP was created, etc., I once [though as you do](#), but wiser voices convinced me otherwise.

### Re: HP-33S

Message #19 Posted by [Norris](#) on 15 Mar 2007, 2:30 p.m.,  
in response to message #1 by Antonio Maschio (Italy)

The oldest 33S units (like mine) have significant bugs with the HMS, polar conversion, and combinations functions. HP actually issued a "User's Manual Update" to describe these problems and to provide workarounds. I understand that these problems were subsequently corrected in ROM. You can still see a copy of the "Update" at:

<http://homepage.mac.com/nwjh/HP-33S/c00251639.pdf>

The oldest 33S units also had a very hard-to-see decimal point. Again, I understand this problem was subsequently corrected.

I doubt that HP is planning any further changes, because it wouldn't make sense from a marketing standpoint.

It's probable that the biggest single market for the 33S is among people taking NCEES engineering and surveying licensing exams in the US. The 33S is the only RPN or programmable calculator that is legal on such exams. But since the 33S has no competition in these respects, there is no incentive for HP to improve it. Anyone who wants an RPN or programmable calc for NCEES exams already buys the 33S in its current form.

Furthermore, NCEES may change the rules again next year, and limit all examinees to just one acceptable model. If this does happen, and if NCEES doesn't choose the 33S, then sales of the 33S will collapse, regardless of any redesign. And if NCEES does choose the 33S, then sales will jump, regardless of any redesign. So again, there is no incentive for HP to invest in 33S improvements.

*in response to message #20 by Ron Ross*

The rocket ship styling wastes keyboard space. I think the yellow and blue prefix keys and text were good, all black is a loss. I gave a 11\$ Casio to a student and read that it has linear,log, power, exponential,inverse and quadratic curve fitting capability. With the large memory possible now I should like to input the data pairs and then try various matches afterward. With the wide use of GPS I should like to see calculations for distance and direction between coordinates built in. The Casio has a slide on front cover that stows in the back. The 33S case is bulky and clunky.

### Need battery cover for HP-16c

Message #1 Posted by [James Biddlecombe](#) on 15 Mar 2007, 7:05 a.m.

I recently acquired an HP-16c from ebay which came without a battery cover (which I knew about). Does anyone know of a source where I can buy one? - maybe someone breaking a voyager for spares? If so, feel free to email me at jamesb300 at hotmail dot com.

If not, I'll put an add in the classified section on this website, and failing that I'll try and source the cheapest 12c I can.

Can anyone confirm if the Voyager battery covers have changed over the years or would any vintage fit a 16c?

Cheers, James.

### Re: Need battery cover for HP-16c

in response to message #4 by Vieira, L. C. (Brazil)*

I have that situation too, but should be glad for it---work is a good thing.

### **Re: Need battery cover for HP-16c**

*Message #6 Posted by [James Biddlecombe](#) on 20 Mar 2007, 11:44 a.m.,  
in response to message #4 by Vieira, L. C. (Brazil)*

Further to my last note I have since noticed that there is some corrosion on the battery contacts as well as the contacts being a bit bent out of shape. The calculator itself is the older style with the sprung contacts at each end as opposed to the later models with the fixed contact and one end and the large spring at the other end. If I was to get an old 12c for parts, can anyone confirm what serial number range I should be looking for, in order to get a model with the earlier style sprung contacts.

Thanks, James.

### Pi day - Calculate Pi on your 15C

Message #1 Posted by [Egan Ford](#) on 13 Mar 2007, 9:51 p.m.

What's Pi day with out a Pi computation?

Yes, there have been a few short and fast solutions posted in this forum to compute Pi, but what about something painfully slow?

I submit for your consideration:

```

1      LBL A
2      0
3      STO 0
4      STO 1
5      LBL 0
6      RAN#
7      RAN#
8      ->P      # P is for Pythagoras
9      1
10     TEST 9 # x>=y
11     STO+ 1
12     0
13     1
14     STO+ 0
15     RCL 1
16     RCL/ 0
17     4
18     *
19     PSE
20     GTO 0

```

IANS, 2 random numbers are generated. The numbers represent the x and y coordinates of a point. If the distance to the point from the origin is  $\leq 1$ , then it lies within the unit circle and a counter is incremented.

The ratio of the area of the unit circle to the unit square is  $\pi/4$ . To calculate simply divide the number of hits by the total number of attempts and multiple by 4.

The real question is how many Pi days will pass before the 15C gets all 10 digits?

Screenshot (last 10 minutes of activity):

Dynamic update of my run, refresh often.

Message #2 Posted by [Les Wright](#) on 13 Mar 2007, 10:14 p.m.,  
in response to message #1 by Egan Ford

Pi meets Monte Carlo!

Neat!

I should set this up on Free42, which is very fast, and see how long it takes....

Les

**Re: Pi day - Calculate Pi on your 15C**

*Message #3 Posted by **Egan Ford** on 13 Mar 2007, 10:35 p.m.,  
in response to message #2 by Les Wright*

If you want speed consider a DSE loop within the main loop. Allow 1000s of iterations before displaying results.

**Re: Pi day - Calculate Pi on your 15C**

*Message #4 Posted by **Les Wright** on 14 Mar 2007, 5:10 a.m.,  
in response to message #3 by Egan Ford*

Actually, I just change the PSE to VIEW ST X and can watch the approximations race crazily past like in some sort of wild pi stopwatch!!!

I think you can do likewise on the real Free42 and watch the approximations click by a lot more quickly than if you pause the thing at each iteration--it is much faster, but obviously not nearly as fast as Free42 on handheld or PC.

Les

in response to message #6 by Kiyoshi Akima*

Great stuff! Thanks.

### Re: Pi day - Calculate Pi on your 15C

Message #8 Posted by [Les Wright](#) on 14 Mar 2007, 7:26 a.m.,  
in response to message #4 by Les Wright

I have run the original version of Egan's code (with the change of PSE to VIEW ST X) on Free42 on a Palm TX for a little over 2 hours.

The approximant to Pi is 3.14319940195 after 222,054 iterations.

I will run the PC version next. A lot faster I am sure.

Les

### Re: Pi day - Calculate Pi on your 15C

Message #9 Posted by [Egan Ford](#) on 13 Mar 2007, 10:55 p.m.,  
in response to message #1 by Egan Ford

Faster version (30 vs 18 iterations/minute):

```

1      LBL A
2      0
3      STO 0
4      STO 1
5      LBL 0
6      1
7      10^x
8      STO I
9      LBL 1
10     RAN#
11     RAN#
12     ->P
13     1
14     TEST 9 x >= y
15     STO+ 1
16     0
17     1
18     STO+ 0
19     DSE I
20     GTO 1
21     RCL 1
22     RCL/ 0
23     4
24     *
25     PSE
26     GTO 0

```

### Re: Pi day - Calculate Pi on your 15C

Message #10 Posted by [Paul Dale](#) on 13 Mar 2007, 11:30 p.m.,  
in response to message #1 by Egan Ford

How about this attempt:

```

001  LBL A
002  CLEAR REG
003  RAD
004  LBL 0
005  1
006  STO+I
007  RCL I
008  STO RAN#
009  RCL RAN#
010  1

```

```
011 0
012 *
013 COS
014 1
015 +
016 TEST 0      x<>0?
017 GTO 0
```

It is probably way faster to converge that the dart board approach.

- Pauli

## Re: Pi day - Calculate Pi on your 15C

Message #11 Posted by [Valentin Albillo](#) on 14 Mar 2007, 8:09 a.m.,  
in response to message #1 by Egan Ford

Hi, Egan:

Egan posted:

*"The real question is how many Pi days will pass before the 15C gets all 10 digits?"*

Assuming each "try" takes 2 seconds to complete, it will take on the order of  $2.31 \times 10^{15}$  days to get 10 correct digits. That's  $6.34 \times 10^{12}$  years, give or take a few thousand millennia, which is the asked number of 'Pi days' if there's one 'Pi day' a year.

Though HP-15C's battery life verges on the incredible, I guess the batteries would be utterly flat by then. The HP-15C would be flat. Heck, even the Earth would be flat by then !

More seriously, the HP-15C's random number generator has a much shorter period than necessary for so long a computation, so tries would start to badly repeat and some bias would be introduced which could affect results making it ultimately impossible even in theory to get 10 correct digits, no matter how long it would take.

Best regards from V.

*Edited: 14 Mar 2007, 8:12 a.m.*

I was concerned about this as well. I should have stated hypothetical. Does any have a paper or URL to how the 15C generates random numbers?

### **Re: Pi day - Calculate Pi on your 15C**

*Message #14 Posted by [Dave Shaffer](#) on 14 Mar 2007, 3:58 p.m.,  
in response to message #13 by Egan Ford*

At the risk of making your program even slower, it seems to me that you could randomize which random number(s) you are using to pick X and Y in order to reduce the effects of the finite length of the random number generator.

Easy way: after some number of loops (ideally, probably the length of the random number generator), insert an extra random call (or two or three or ...) between the one used to get X and then to get Y.

More work: generate a random number, pick a particular digit thereof (say, the fourth), generate that many random numbers before generating the one you will use. Do for both X and Y.

Without thinking too hard about it, this ought to greatly "lengthen" the generating sequence you are using.

in response to message #1 by Egan Ford*

I have updated my initial screenshot to update dynamically. This will remain in effect until I kill it.

### **Re: Pi day - Calculate Pi on your 15C**

*Message #16 Posted by [Palmer O. Hanson, Jr.](#) on 14 Mar 2007, 9:49 p.m.,  
in response to message #1 by Egan Ford*

I don't know how old the method which compares the number of "hits" within the circle to the total number of "shots" really is. It was discussed in A. K. Dewdney's column "Computer Recreations" in the April 1985 issue of *Scientific American*. Dewdney asked readers to send the results of 1000 "shots" to him.

The method appeared again in Michael Ecker's column "Easy Pieces" in the January 1991 issue of *Algorithm*. At that time graphing calculators had become available so the "shots" could be displayed on the screen as they occurred. If the random number algorithm of a given machine yields uniformly distributed numbers then one would expect the screen should approach being completely filled as the number of "shots" is increased. That was true with my Radio Shack Model 100 and my TI-81 but not at all true with my Casio fx-7000G which had a random number generator problem. The random number generator problem was fixed in the fx-7000GA.

All of this reminds me of John Von Neumann's admonition that "Anyone who considers mathematical methods of producing random numbers is, of course, in a state of sin."

### **Re: Pi day - Calculate Pi on your 15C**

*Message #17 Posted by **Egan Ford** on 15 Mar 2007, 5:11 p.m.,  
in response to message #16 by Palmer O. Hanson, Jr.*

I first encountered this method in *Using MPI*. MPI is the standard for parallel programming distributed memory supercomputers (a.k.a superclusters). As you can imagine 100s, 1000s, or 10s of 1000s of high-speed processors generating random numbers in parallel will crank out Pi to 10 digits much faster. Not surprisingly it still can take a relatively long time (a proper deterministic algorithm on a 15C will still best it). If you're ever interested in exploring the other side of the scientific computing spectrum, pick up this book, a cheap switch, a few cheap PCs, and Linux.

The Linux random number generator utilizes entropy to increase its randomness. Entropy sources include keyboard and mouse usage, disk I/O, and system interrupts. I have never tested how random this is, but it should be easy to test by simply generating a series of random bits and then trying to compress it.

Entropy should be possible on some calculators. The 50G should be able to create an entropy pool over time based on keystrokes, battery voltage, I/O, etc... Perhaps the 50G does this today. Probably not, it is unimportant for a handheld calculator to have a robust random number generator. Random numbers in Linux are critical for security. If I want to secure my 50G I'll just lock it in my office or car.

Back to the 15C. Instead of using random numbers we can assume that we have a random number generator with a perfect uniform distribution and at the same time we will assume that all numbers are generated at least once first before reoccurring similar to shuffling a deck of cards.

The smallest fraction that will generate Pi/4 is:

```
1570796327
-----
2000000000
```

If we generate  $2e9$  points with an even distribution from 0,0 to 1,1 then we should get Pi faster by simulating the uniform distribution of the inevitable if we had a true random distribution. Points for x and y will range from 0 to 1 step  $1/\sqrt{2e9}$ .

At 2 sec/iteration generating the 10 digits of Pi will only take ~ 126.75 years.

\_\_\_\_\_

That got me thinking about the random number generator on the fx-7000G. It turned out that the mean value and distribution of 1000 random numbers from a program on that machine would vary when the execution time between subsequent calls of the random number generator was changed. I didn't think of it at the time, but could it have been that Casio was trying to enhance the randomness?

### **Re: Pi day - Calculate Pi on your 15C**

*Message #19 Posted by **Egan Ford** on 17 Mar 2007, 2:31 a.m.,*

*in response to message #18 by Palmer O. Hanson, Jr..*

I know nothing about the fx-7000G. Does it have a clock or way to specify a delay?

It does not have a clock. I mechanized the delays by loops in the program. Since this is off-topic I suggest that if you want to pursue it further that you go to Viktor Toth's site at [www.rskey.org/](http://www.rskey.org/), go to the Library, go to Texas Instruments, go to TI PPC Notes and then look at page 13 of V10N4 and pages 8 and 9 of V11N1 to see all that I know about it.

### HP48-SX MES

Message #1 Posted by [J. Veazey](#) on 13 Mar 2007, 8:34 p.m.

(The 48 is my office machine; I have an HP-50g at home for serious play).

I've got an application that seems to be tailor made for the Multi-Equation solver, yet MES consistently tells me I have too many unknowns.

This is a vector triangle problem, having to do with the placement of sonobuoys in front of an advancing convoy by an ASW helicopter, and the flight time and course of the helo.

Here are my 3 equations:

$$Ca = Sr + Vc * Slt + Vc * t$$

$$R = \text{SQRT}(Ca^2 + D^2 - 2 * Ca * D * \cos(\alpha))$$

$$t = R / Vh$$

My 3 unknowns are:

Ca - convoy advance

R - flight distance of helo to sonobuoy location

t - flight time of helo to sonobuoy location

All the rest of the variables above are known constants:

Sr - sonobuoy detection range

Vc - convoy speed

Slt - sonobuoy lifetime

D - Distance from convoy to helo at start

Vh - helo speed

alpha - Angle on the bow from the convoy to the helo

This system can be solved iteratively by just cycling thru the 3 equations to generate updated values of the unknowns. It usually takes about 7 or 8 iterations to converge to full displayed accuracy (which is way overkill).

I have set it all up in its own directory. I have done an MINIT, and an MITM just fine. When I punch MSOLV softkey, all the softkey labels act like they should, displaying all my variable names on white softkeys. I initialize the constants and those soft keys turn dark to show they are not variables.

When I try to solve via LS-ALL, I get the message "Too Many Unknowns". Trying to solve for a single variable also fails with the same message.

I have tried reordering the equations. No joy. I even added the other 2 angles in this vector triangle as unknowns, and more triangle relations (3 law of sines equations) and the equation  $Pi = \text{sum}(\text{the angles in the triangle})$ . I hoped this would help since I added just 2 more variables, and 4 equations. But, attempting to solver still gets the "Too Many Unknowns".

Am I doing something wrong, or is this system simply something that the MES can't handle? It seems too simple for that to be the problem, but ....

**Re: HP48-SX MES**

Message #2 Posted by [Han](#) on 13 Mar 2007, 9:33 p.m.,  
in response to message #1 by J. Veazey

Have you tried giving each of the unknowns an initial value (to be used as guesses)?

**Re: HP48-SX MES**

Message #3 Posted by [J. Veazey](#) on 14 Mar 2007, 2:38 a.m.,  
in response to message #2 by Han

I forgot to mention that step.

I initialized the unknowns with values I knew were very close to the answers; I also tried 0's, and other "reasonable" values.

I still got the "Too Many Unknowns" message when attempting to solve.

**Re: HP48-SX MES**

Message #4 Posted by [Jean-Michel](#) on 14 Mar 2007, 10:29 a.m.,  
in response to message #1 by J. Veazey

Hi,

probably isn't what follows the answer you're waiting from, but why don't you put the algebraic value of Ca and t into the equation of R ? That would lead you to a simple second degree equation like :

$$K1.R^2 + K2.R + K3 = 0$$

where K1, K2 and K3 are constants which comes from the 3 equations you gave.

Regards.

**Re: HP48-SX MES**

Message #5 Posted by [Mike Ingle](#) on 20 Mar 2007, 3:27 p.m.,  
in response to message #1 by J. Veazey

I just posed a multiple-equation solver program that works on the 28 and 48. It might solve these equations.

### HP 50g - Loading Programs, Symbolic Calculus

Message #1 Posted by [DieCommie](#) on 13 Mar 2007, 4:10 p.m.

Hello, I have purchased the HP50g and am liking it so far. However, I find the manual and online references lacking in particular areas. For example...

1) How do I load a program into the calculator and then access it? I am able to use Conn4x and connect to my calculator. But then all I get is a list of files and a folder of more files.

The particular program I want to load is a periodic table. I dont know where to put the file, nor do I know how to access it once in the calculator. The readme for the program says this

#### 2.1 Installing

----- a) send either chemlb27.lib(full) or chemlt27.lib(light) to the HP48

b) put a copy of the library on the stack

c) enter the port number to store the library (0-33 GX, 0-2 SX)

d) here is an example of the stack setup so far:

-----

4:

3:

2: Library 1014: CHE...

1: 0

|||||||

e) at this point, press [STO]

f) perform a warmstart with [ON][C] or turn on and off the HP48

g) erase the variable containing the library. eg. 'CHEMLB27.LIB' PURGE

h) read the next section for the Universal Font Library (UFL) requirements

For part a, I dont know where exactly I need to send it. Part b, what does that mean, 'put a library in the stack'? I am pretty much lost after that...

2)Any tips on how to do symbolic integration? The integral button seems to only do definite integrals. I am having a feeling that this calculator is not good at doing symbolic calculus....

3) Finally if you have any tips/tricks or useful programs for the calculator please share! I want to learn how to use this thing real well over spring break.

## Re: HP 50g - Loading Programs, Symbolic Calculus

Message #2 Posted by **James M. Prange (Michigan)** on 13 Mar 2007, 10:34 p.m.,  
in response to message #1 by DieCommie

First off, if you use a "binary" transfer, then the compiled object has to be compatible with the 49 series. In general, compiled 48 series commands, and compiled 48 series programs, lists, and libraries that contain UserRPL or SysRPL commands, lack binary compatibility with the 49 series, because the entry points for many commands have changed. If it shows up on the 50g as a character string starting with "HHP48-x" (where "x" is a ROM version letter), then you used a binary transfer of a 48 series object and the 49 series safely stores it within a character string instead of as a compiled object. It's sometimes possible to fool the calculator into treating the object as compatible, but that may very well result in a TTRM (Try To Recover memory?) and clearing user memory.

In most cases, 48 series UserRPL objects can be transferred to the 49 series and will work, but you have to use an "ASCII" or "Text" transfer so that the calculator will compile the source code. At worst, with this type of transfer, you may get an "Invalid Syntax" error.

From your post, it appears that you're trying to install a library designed for the 48 series, which you shouldn't even try to install in a 49 series. Look in <http://www.hpcalc.org/> for libraries specifically designed for the 49 series.

For a port of the 48SX's *HP Solve Equation Library Library Application Card* (HP 82211B), except for the Tetris game, that works with the 49 series, see <http://www.hydrinx.com/Download/Hp/4950Libraries/> or <http://www-fourier.ujf-grenoble.fr/~parisse/english.html>. For the Equation Library, install libraries 226 and 227, or for the Periodic Table, install library 229. The Owner's Manuals for this card are available on the MoHPC CD-ROM set / DVD-ROM; see <http://www.hpmuseum.org/cd/cddesc.htm>, or some documentation for it is available in the 48G series and 49 series documents.

For a "program", just leave it in home or whichever sub-directory you transferred it to, or copy or move it to any sub-directory or any of ports 1, 2, or 3, and execute it from there.

For a "library", if you used a "via wire" or "via IR" transfer, then move it to any of ports 0, 1, or 2 (but not 3). Don't leave a copy of the library in the home directory (or any sub-directory) because its presence in "user memory" will interfere with the memory recovery routine in case you respond YES to a TTRM. If you used an MMC or SD card to transfer the library to the 50g, then it's okay to just transfer it to port 0, 1, or 2, leaving a copy of the file on the card (port 3). With the 49 series, it may be easiest to use the "filer" (press LeftShift FILES, over the G key) to move or copy the variable or file. Invoke a warmstart by holding down the ON key, pressing and releasing the C key, and releasing the ON key. Most libraries have a configuration routine that auto-attaches them to the home directory, and it will be invoked by the warmstart. If a library isn't auto-attaching, then get in whichever directory you want it to be attached to, put the library number on the stack and execute the ATTACH command. You can also use the DETACH command to (what else?) detach a library.

In a few cases (such as the Equation Libraries and Periodic Table library) the library will be attached even without doing a warmstart or an explicit ATTACH command.

In some cases, once attached, the library will be available by pressing the APPS key on the 49 series, otherwise press RightShift LIB (over the 2 key) to see the library names in the menu, and press the library's menu key to see its user commands.

In the event of a buggy library (or reserved variable STARTUP) "hanging" the 49 series, hold down the backspace key while doing a warmstart. This prevents the library configurations routines and STARTUP from

running, giving you an opportunity to purge the buggy library or edit or purge STARTUP.

By the way, in most cases, for RPL models, you'll have better luck with the comp.sys.hp48 usenet group. A searchable archive (going back all the way to 1991) is available at <http://groups.google.com/group/comp.sys.hp48>. If you can't find an answer to your question, then ask on the newsgroup.

Regards  
James

*Message #3 Posted by **Bruce Bergman** on 14 Mar 2007, 12:07 a.m.,  
in response to message #2 by James M. Prange (Michigan)*

I swear I'm going to start calling you the "50g Guru", James. :-) You always have the most thorough answers on any 50g topic I've ever seen in this forum. Great job!

I just wanted to add my \$0.02 about 48 libraries. I found some stats software I wanted to use on the 50g and decided to take a chance that it might work. Not only did it fail to work, but it also locked up my calculator so badly that I thought I had trashed it. I eventually got it back (again, thanks to your help James), but that taught me a lesson that I hope never to repeat.

My \$0.02 anyhow.

thanks, bruce

### **Re: HP 50g - Loading Programs, Symbolic Calculus**

*Message #4 Posted by **DieCommie** on 14 Mar 2007, 12:27 a.m.,  
in response to message #2 by James M. Prange (Michigan)*

Thank you very much for your thorough answer. Unfortunately much of it seems lost on me... I have no experience with programming. I dont know what is meant by UserRPL, SysRPL, binary transfer, libraries, strings etc. But I do want to learn!

First off I think my program is for HP 50G (or 49). I got it from <http://www.hp48.org/>. It is under chemistry, ChemLab 2.7. Is this a library or a program? What is the difference between a library and a program?

You say for a program I can leave it any directory. But what do you mean "or any of ports 1, 2, or 3, and execute it from there."? What are these ports and how could I execute it from them?

----Lookin in calculator---- Ok, I just looked in my calculator using Conn4x. I have ChemLab under the home directory and it appears to be a library. So I hit the LIB key and get the choices of 0 , 1 and 2. I am guessing these are ports? Under 0 and 1 there is no choice. But under 2 there are two choices, 226 and 227. I dont think either of these are my ChemLab. Regardless, I try to use one by clicking on it but all it does is put it in the stack.

??

*Message #5 Posted by **Clear, Simple, How To Do It** on 14 Mar 2007, 5:02 a.m.,  
in response to message #4 by DieCommie*

Chemlab 2.7 is a library. You've managed to download it to your calculator. Good, here's how to install and use it:

- 1) After downloading, you'll see the variable "Chem..." or "L1014" in the list of variables. In RPN mode, press the small button under that variable. You'll now see on stack level 1: "Library 1014: ChemLab 2.7..."
- 2) Now type :2: 1014 STO - this stores the library in the flash memory of port 2.
- 3) Now type :2: 1014 ATTACH - this attaches the library so you can actually use it.
- 4) To access/use the library, do RIGHT SHIFT, LIB and you'll see ChemL. Press that button, then the button under CHEM, and you get the periodic table you're after. Storing and using other libraries uses the same process, only the library numbers are different.
- 5) Now that the library is actually stored, you don't need the original stored variable anymore. Press the key under the variable. Again you'll see on stack level 1: "Library 1014, Chemlab..." Type PURGE, and it's gone, you're done.

For symbolic integration:

- 1) To get it right the first time, use the equation writer, RIGHT SHIFT, EQW to write your function, as a simple example, 'x^2-1'. You can use other variables if you wish, such as y or t.
- 2) ENTER the function onto the stack level 1. Then ENTER the variable of integration, which here is the variable of the function, x. You'll now see the function on stack level 2, the variable on stack level 1.
- 3) Simply type the RISCH command (which can be assigned to KEYS, another topic), which integrates to a specified variable. You will now see '1/3\*x^3-x' The constant of integration is omitted.

Enjoy your HP50!

Message #7 Posted by **James M. Prange (Michigan)** on 16 Mar 2007, 4:03 p.m.,  
in response to message #4 by DieCommie

Quote:

---

Thank you very much for your thorough answer. Unfortunately much of it seems lost on me... I have no experience with programming. I don't know what is meant by UserRPL, SysRPL, binary transfer, libraries, strings etc. But I do want to learn!

---

Then it seems to me that you have a bit of catching up to do. Do learn to do at least some UserRPL programming for your 50g; it makes using the calculator a lot faster and easier, at least for repeating a task frequently or repeating a lengthy or "complicated" task even once.

Of course see the printed "User's manual" that came with your 50g, but I expect that the "user's guide" that's on the accompanying CD-ROM will be more helpful. Also be sure to download and use the [hp 49g+/ hp 48gII graphing calculator advanced user's reference manual](#). The differences from the 49g+ to the 50g is that the 50g has a higher battery voltage (4 AAA cells instead of 3) and that the 50g adds a "serial" (but not RS-232 compatible) external I/O port; for transfers or printing "via wire", system flag -78 is clear for the USB port or set for the serial port.

Also see the "training modules" available at [HP's site](#). Besides this link, [hpcalc.org](#), and the [comp.sys.hp48](#) newsgroup, other helpful links include [The HP Knowledge Base](#), [Wolfgang's site](#), [Carsten's HP page](#), and <http://m.webring.com/hub?ring=hp48>.

For a deeper understanding of RPL, see Bill Wickes's *Insights* books, or if you're already familiar with "Classic RPN", then first see his *HP 48/HP 41 Transitions* book, all available on the MoHPC CD-ROM set / DVD-ROM.

In general, each new version of RPL, from the 28S through the 49 series, is a superset of the previous RPL language. The older documentation, particularly for the 28 series and 48SX/S, is often better written than the documentation for the newer models. Don't ignore information just because it's written for an older model; it often applies to a newer model too.

Quote:

---

First off I think my program is for HP 50G (or 49). I got it from <http://www.hpcalc.org/>. It is under chemistry, ChemLab 2.7.

---

Sorry, from your original post, you seemed to have instructions for installing it on a 48 series, so I assumed that you were trying to install a library intended for them. It seems that the developer ported his 48 series library to work on the 49 series, but didn't bother to update its documentation. I see that

hpcalc.org has two separate entries for ChemLab 2.7; if you haven't succeeded in installing this yet, be sure that the downloaded file is named chemlb27\_49.zip, not chemlb27.zip.

The library does seem to work in the 49g+ and 50g, but apparently was developed for the 49G, so only 64 (instead of 80) pixel rows are used for the graphical display.

In case you still haven't gotten it working, here's a method of installing it on the 49 series:

- Unzip the downloaded chemlb27\_49.zip file.
- Use Conn4x to download the file ChemLab.HP to the calculator's home directory, where it will be stored as a global variable named ChemLab (the menu label will show just ChemL).
- Press LeftShift FILES (over the G key).
- With Home highlighted, press CursorRight.
- With ChemLab highlighted, press the menu key for MOVE (the C key).
- Press the CursorUp key once or twice to highlight 2:Flash (or 1:ERAM or 0:IRAM).
- Press the menu key for OK (the F key), or press the ENTER key.
- Press CANCEL (the ON key) to exit the filer.
- Hold down the ON key, press and release the C key, and release the ON key to invoke a warmstart, which configures and attaches this library.

To use this library, press RightShift LIB (over the 2 key), press the menu key under the label ChemL (press the NXT key if it's not on the first menu page), then press the menu key for whichever command you want to use.

I do realize that I'm leaving many of your questions unanswered, but I expect that, with a little research, you'll easily find at least most of the answers yourself.

Regards,  
James

*Message #8 Posted by [DieCommie](#) on 17 Mar 2007, 1:59 a.m.,  
in response to message #7 by James M. Prange (Michigan)*

Thank you all. I did get the program installed, its good. I have also visited many of the links and done some cool stuff.

I have learned about RISCH and INTVX as promoted by the posts above. I am wondering what the difference is between them. I know INTVX automatically assumes a variable of X, but is that the only difference? Do they use different algorithms? Are there certain functions that are better integrated by the one or the other?

Anyway, thx again. I learned alot over spring break about this calc, but alas the break ends and I go back to classes. I will however likely be back come summer, see you all then.

### **Re: HP 50g - Loading Programs, Symbolic Calculus**

*Message #9 Posted by [Answer And More Links](#) on 17 Mar 2007, 11:06 a.m.,  
in response to message #8 by DieCommie*

The advantage of using the RISCH command over INTVX is RISCH integrates with respect to any variable, INTVX just to the variable in VX. Supposedly RISCH uses a partial implementation of the Risch integration algorithm used, but there doesn't seem to be any difference in answers returned by the two commands.

A nice explanation of the HP49 (which are the same on the 50) CAS commands was done by Prof. Renee deGraeve. The top of the page is in French, but the document is in English:

[http://72.14.203.104/search?q=cache:\\_N18IQonm2IJ:www-fourier.ujf-grenoble.fr/~parisse/degraeve/cas49\\_1.pdf+Renee+deGraeve&hl=en&ct=clnk&cd=1&gl=us](http://72.14.203.104/search?q=cache:_N18IQonm2IJ:www-fourier.ujf-grenoble.fr/~parisse/degraeve/cas49_1.pdf+Renee+deGraeve&hl=en&ct=clnk&cd=1&gl=us)

A two-volume book series on using the HP49 was written by Prof. Gilberto Urroz. Here is the link for volume two, scroll to the bottom of the page to buy both together, recommended:

[http://www.amazon.com/Science-Engineering-Mathematics-differential-statistics/dp/1588980448/ref=sr\\_1\\_6/002-3476684-9613639?ie=UTF8&s=books&qid=1174143817&sr=1-6](http://www.amazon.com/Science-Engineering-Mathematics-differential-statistics/dp/1588980448/ref=sr_1_6/002-3476684-9613639?ie=UTF8&s=books&qid=1174143817&sr=1-6)

### **An eBay story with a happy ending**

Message #1 Posted by [Les Wright](#) on 13 Mar 2007, 3:12 a.m.

A few months ago I paid a pretty generous sum for an HP65 with case, plastic case, adapter, dead battery, manual, QRG, and almost complete card sets for the Standard Pac and Surveying Pac (just one blank card was missing). But the manuals for the latter were missing and I didn't think anything of it, knowing I had our great DVD.

A few weeks later the seller contacted me to advise me he had located the manuals and he sent them along. So now I have a complete set, and since it was all recently lovingly refurbished by our friends at FixThatCalc.com, it is fully functional.

Just thought I would share this warm fuzzy to remind us that not all eBay calculator transactions are fraught with dishonesty and misinformation.

Les

### **Re: An eBay story with a happy ending**

in response to message #1 by Les Wright

Hi Les,

A great reminder to us all that most people are honest and try to do the right thing.

I have a similar story - only not with ebay but with the HPMuseum Classifieds. I worked out a deal to trade a HP-45 for a HP-25. I sent off the HP-45 and he mailed the HP-25 to me. But he also emailed me to say that he had accidently damaged the HP-25 when he was cleaning it before shipping and that if I wasn't happy with it, he'd gladly undo the deal. A day later he e-mailed that he was shipping a second HP-25 to me and that I could compare the two and keep which ever one I wanted and send the other back or we could undo the deal.

The two units arrived and I selected the one I wanted and sent the other back with a nice thank you. It was very trusting of him - I could have easily just kept both units.

Bill

in response to message #1 by Les Wright

Hi

I wish I could tell you a similar story but I can not:

10 month ago I won several auction for EPROMS from shturman76 (Emmanuel Compes). My paypal history shows, that I paid for the EPROMs on 2/5/06. Since then I'm waiting for the EPROMs (Emmanuel sent them,

but they were returned to him as they were sent to Italy instead of Switzerland). On 22/11.06 I got the manuals of these EPROMs from Emmanuel, but for the EPROMs itself I'm still waiting.

In January I won again an auction from Emmanuel. As I still did not get the EPROMs (I was waiting for them since 7 month) I decided not to pay for the newest auction unless I get the EPROMs first.

Since then I try to contact Emmanuel about 1-2 times a month but he does no longer reply on my mails. Finally we both gave us a negative feedback in ebay.

As I'm a honest buyer I still want to fix this deal and get my stuff I paid for. Emmanuel itself will also get some money from me for the last auction item. So it should also be an interest for him to fix this. But unfortunatelly he does no longer reply on my mails (I do not know why). So, what we need is maybe an adjustor, a mediator who can bring us together again. Maybe it's best if it's a person Emmanuel an I know. Is there someone out here who would try to help me (and Emmanuel) to get a conclusion again? Please let me know.

Yours, Matthias Wehrli

### **Re: An eBay story with a happy ending**

*Message #4 Posted by **Pascal** on 14 Mar 2007, 2:06 a.m.,  
in response to message #3 by Matthias Wehrli*

Hello Matthias,

I recently had a problem with an IBM PC 110 that was advertised as working but needing a new OS. The problem was more serious than that and it seemed that the graphic card was damaged. The seller refused to admit that it was DOA and said it was my fault if I was not able to install a new OS.

In order to solve this situation, I used squaretrade dispute resolution service as a mediator, as the seller advertised himself as squaretrade "compliant". After a few weeks of message exchange through squaretrade, he accepted that I return the computer and got a refund.

You can use squaretrade as a free service and you just exchange messages like in a message board (that's what I did) or you can at any time ask for a mediator to come in and help solve the problem. In this case the fee is \$30.

I've had several problems recently, with people never answering their emails. I've learned that the best way to solve an issue is always to call them directly by phone (you can request a seller's address and phone number through ebay). To illustrate this I recently bought an HP-110 and I paid but the item was never sent. After 2 months and at least 5 emails, I still got no answers. I called the guy and I was told by the father that his son has got into his mother's ebay account and made the sale without his mother's approval. His mother never checks her email account linked to ebay as she does not use ebay anymore and voilà ... the explanation of the unanswered emails.

I hope it helps.

Pascal.

*Message #5 Posted by **Matthias Wehrli** on 14 Mar 2007, 4:59 p.m.,  
in response to message #3 by Matthias Wehrli*

Interesting... within 24h I got three mails from frequent forum users that told me, they have / had problems

with Emmanuel too.

Here is my summary:

- All of us four had to wait long times for replies on our mails:

*It seems, that Emmanuel does have a problem answering mails continuously, either he has not the possibility to or he does not want to...*

- All of us four had to wait a extremely long periode of time until the paid item arrived:

*It seems, that the postal office in Evreux has internal problems as many parcels Emmanuel sends out were sent to wrong contries and then returned or the parcels were rubbed by thieves (3 years ago Emmanuel could prove this, and I trust him for this) or they were sent by Emmanuel several month after the payment without explanations.*

I was also told Emmanuel had another ebay account (XEQ41) he closed about two years ago, maybe because of negative feedbacks.

I'm very frustrated about his methods as I know him since a HP Meeting here in my apartment about 4 years ago. I had a good relationship to him and wonder what I did wrong that made him changing his mind.. :( I do not think, I'm a unethical ebayer.

Matthias

### **Pb with Emmanuel Compes**

*Message #6 Posted by **Jean-Michel** on 15 Mar 2007, 11:07 a.m.,*

*in response to message #5 by Matthias Wehrli*

Hi,

I also had some problems with Emmanuel COMPES (eBay "XEQ41", mail "shtruman76") when I bought him a HP-41C on eBay. I payed immediatly, but received the calculator only 2 weeks later, with quite no answer to my several mails. He said to me that the post service returned the parcel to him twice, and finally he sent it when I said to him that I had told Paypal about this problem. Finally, he called me by phone and seemed to be a very nice person ! He said that, due to his job, he hadn't time enough to read his mail and answer it. (?) He also never put any feedback for me on eBay..., even I asked him several times. (It was important for me because it was my first purchase on eBay, and then I would need a feedback for my future purchases)

Hope it helps...

Regards.

*Message #7 Posted by **Matthias Wehrli** on 21 Mar 2007, 1:54 a.m.,*

*in response to message #5 by Matthias Wehrli*

Still bad news for me and all winners of auctions from Emmanuel Compes...

Still no parcel from Emmanuel with my items won on 5/2/2006. But this is not the thing that makes me angry, but it's that Emmanuel does still not reply on any mails or on this forum topic. It shows me that he has become a rude seller with no respect.

**Emmanuel, you can be shure: As soon as I get my parcel I will tell the forum you sent it to me and that you became a trustfull seller again. It's up to you to blame yourself or not!**

Matthias

## **Re: An eBay story with a happy ending**

*Message #8 Posted by [Matt Kernal \(US\)](#) on 13 Mar 2007, 6:04 p.m.,  
in response to message #1 by Les Wright*

I have a very happy ending to an Ebay auction that I lost..

About eight years ago, I was wanting an HP 42S and was keeping my eyes open to different Ebay auctions for any good deals. One auction was offering a New-In-Box (NIB) 42S, but the description was written in an obscure manner, so unfortunately for the seller, the calculator wasn't getting a lot of bids. So I placed a bid of \$45, and was the high bidder.

The auction was going end the next morning at 6:30 am. But wouldn't you know it, my home PC decided to have a problem the night before, which meant I wouldn't be able increase my bid (if needed).

So the next morning I went to work early, to watch the auction and make sure I continued to be the high bidder. With five minutes left, someone out bid me, so I intended to increase my bid. But at that very minute, our IT department started some network backup/maintenance process, which decreased network performance to the point that it was useless. So I lost the auction, and the 42S went to the other bidder for \$50.

Five minutes after the end of the auction, the network was back up to full speed. I was SO frustrated!! I don't know why I did this, but I decided to write the seller just to say I would've bid so much more if my home PC and work PC hadn't of "locked" me out of the auction. Again, I don't know why I sent the message, because I knew it was pointless - the auction was over.

Within five minutes of sending the message, I received a phone call from the seller. He was calling to say he could tell how bad I wanted to win the auction, and if I really wanted a 42S, that he had bought a SECOND NIB calculator on clearance, at the same time as the first one (the one he just auctioned). He even said I could have it for the price I had bid - \$45! He wanted to know my address because he was going to the post office and wanted to drop it in the mail! I said I needed to pay him first, and he said we could take care of that later.

Needless to say, I was SO elated! I couldn't believe what had just happened! I sent him the money and added some more money too. I still can't believe that Texan man's unselfishness.

Matt

### Intermittent IR printing problem from HP 50g

Message #1 Posted by [Steve Pence](#) on 12 Mar 2007, 9:15 p.m.

I am using an HP 50g to print to an old 82240B that has seen a lot of use. I still prints fine, but there seems to be some intermittent communication issue. It will print a line or 2 (sometime quite a few lines) then the calculator will issue a very faint but audible beep, display an hour glass for a second or two, and all printing stops. Eventually, and I can't tell you when or why - seems random, printing starts again. When it dies, I just do "something else" for while, e.g. continue coding and testing non-print functionality. And mysteriously, the printing always, eventually, starts working again. When it prints, the print quality, fidelity, speed, etc. are excellent. I've changed the batteries and checked flag 34 at least 34 times. I've tried warm re-starting the calculator, which doesn't help. I can't do a pinter self test because the paper advance key (the one on the right) has died. (Too much sawdust. The setup is used by my Amish brother in law to print cut lists in his cabinet shop. His church prohibits PCs, but calculators aren't covered by the rules. :) ) Perhaps someone knows how to send the printer a soft command to run the self test. Other suggestions? Thanks, Steve Pence Chennai, India

### Re: Intermittent IR printing problem from HP 50g

Message #2 Posted by [Les Wright](#) on 12 Mar 2007, 10:52 p.m.,  
in response to message #1 by Steve Pence

I don't know if this will help you or if it answers your question, but my understanding is that the 82240 series printers are generally fussy with the 49 series calculators, and the calc has to be nestled pretty closely to the IR receiver for consistent printing--and then it can still act up.

Does the printer respond more consistently when you use an AC adapter?

If there is a way to "soft test" your printer from the calculator, someone around here will know.

Interesting that Amish are permitted calculators and not PCs!

Les

### Re: Intermittent IR printing problem from HP 50g

Message #3 Posted by [Les Wright](#) on 13 Mar 2007, 5:18 a.m.,  
in response to message #1 by Steve Pence

You know, it occurred to me that if you gave a specific example of the sort of print jobs you are doing when this occurs then there is the best possible chance that someone here (like the awesomely knowledgeable James Prange, for example) can help you.

I have no idea why things are occurring as they are, but to my unsophisticated way of understanding it seems like your work is loafing about in the print buffer until something happens to cue the printer to continue doing its thing. Do you keep the calc in close proximity to the printer during these frustrating wait times? It seems the calculator is usable during the wait times, which tells me that the information has been sent and the delay

in printing is likely on the printer side of things while it decides when it is good and ready to empty its buffer and carry on.

I also wonder if it is feasible to open the printer up, gently blow out some of that dust, and restore the function of the paper advance switch to you can do a proper test.

FWIW, I love my 82240B printer. I run it on a set of 2650 mAh NiMH Duracells that were fully charged once a couple of months ago and still report BAT: 3 when I run a self-test. I use it mostly my 42S, 17bii+, and HP41CV or CX with IR module. I know it works with my 28S, 48G, and 49G+, but I don't use those calculators as much. The good news is that these printers are not prohibitively expensive should you, heaven forbid, need to replace it. But I do hope you manage to troubleshoot this one first.

Hope this little bit of non-help is at the very least encouraging :)

Les

### **Re: Intermittent IR printing problem from HP 50g**

*Message #4 Posted by [Bruce H](#) on 13 Mar 2007, 2:30 p.m.,  
in response to message #1 by Steve Pence*

Printing to an 82240B is an entirely one-way affair - the printer does not send anything back. So the beep and intermittent/irregular printing is something on the 50g and nothing to do with the printer.

I'll try with my 50g/printer combination but won't be able to do so until the weekend.

### **Re: Intermittent IR printing problem from HP 50g**

*Message #5 Posted by [James M. Prange \(Michigan\)](#) on 13 Mar 2007, 8:31 p.m.,  
in response to message #1 by Steve Pence*

Hi Steve,

As Bruce noted, communication with the 82240A/B printers is entirely one-way; the printer is unable to tell the calculator anything about its status, which leads me to expect that the problem is with the calculator, not the printer.

Which ROM revision are you using in your 50g (execute the VERSION command to find out)? I'm not aware of any bugs that should affect printing, but in general, if you haven't already done so, then I recommend upgrading the 49G, 49g+, and 50g to either the official [2.09 revision](#) or to [Bernard Parisse's 2.10-7 revision](#).

Which printing commands are you using, and are you printing text, column graphics escape sequences, or grobs (graphic objects, which the calculator encodes as column graphics for printing)? How long are your print jobs?

As Les noted, the range for IR printing is drastically reduced with the 49g+ and 50g (and, I expect, the 48gII as well). This has to do with an intentional reduction of both the IR transmit power and IR receive sensitivity to result in a non-compliant IrDA range of only about 100mm (4 inches), to assure the educational community that it won't be used for surreptitious communications. In the 48 series, only the IR receive sensitivity is intentionally reduced for this purpose. Experimentally, the 49g+ and 50g IR printing range seems to be only about 2 1/2 inches (maybe 60-65mm), but this may well depend on the condition of the batteries in both the calculator and printer. Be sure to align the little triangle at the top of the calculator's display cover with the printer's IR receive window.

Does the printer occasionally print what looks like a solid block character? That would (except for character

158 in the ECMA 94 set or character 252 in the Roman 8 set) indicate that the printer received a byte with an uncorrectable error, usually due to a weak or briefly interrupted IR signal, but possibly due to interference from some other IR signal (such as from an IrDA transmitter), or conceivably from a problem with the calculator's encoding or the printer's decoding of the byte (including its error correction code bits).

The calculator can (after sending up to the first 200 bytes) insert a delay between sending lines to give the printer time to free up some room in its 200-byte input buffer before sending more bytes. With the 48 series, the default delay (in seconds) is 1.8, but with the 49 series (49G, 49g+, 48gII, and 50g) the default delay seems to be 0 (usually appropriate for printing "via wire"). Try changing the delay to 1.8 seconds by executing 1.8 DELAY (or by editing the first element of the list stored as the reserved variable PRTPAR, or by editing the delay in an input form), or if you're using an external power supply for the printer, a delay of about 1.1 should be okay.

With a fresh battery in the printer, you can get away with a delay of less than 1.8, but of course when using the battery only (no external power supply) the print speed goes down as the battery is used up, so the delay would need to be increased. Basically, with a long print job, near the end of the printing, you want a slight delay between the lines of printing.

If you use the printer only for printing grobs or character strings of column graphics escape sequences, a delay of 0 should be okay because a full line of column graphics (170 bytes total) prints in about the same time as a line of text, and the IR print transmitting speed is only about 78 bytes per second.

Of course, if you send 200 bytes or less in each print job and let the printer finish before sending anything else to it, then the delay doesn't matter.

Does the calculator sometimes print a character that looks like a block with a white slash through it? That would indicate that it experienced an input buffer overflow, usually caused by having the delay set too low, but conceivably from missing a "linefeed character" (control code <10> or <4>) that would tell the printer to print out whatever's in its buffer.

Yes, there is an escape sequence to tell the printer to start a repeating self-test (unlike the self-test by holding down the paper advance button when turning the printer on, this self-test repeats until the printer is turned off or the battery goes dead, whichever comes first). Where <n> represents a character with the decimal value n, the sequence is <27><254>. A program to send this to the calculator would be:

```
%%HP: T(3);
\<<
 27 CHR
 254 CHR
+
PR1
DROP
\>>
```

But note that although this built-in self-test checks such things as the print mechanism, at least some of the built-in font, the power supply, and that it correctly received those two bytes, I doubt that it thoroughly exercises the receiving circuits and input buffer.

For more information about the printers, see the *HP 82240B Infrared Printer Technical Interfacing Guide*, and, of course, the Owner's Manual, available on the current MoHPC CD-ROM set / DVD-ROM; see <http://www.hp-museum.org/cd/cddesc.htm>. There's also some interesting background information and diagrams in the October, 1987 HP Journal, also available on the CD-ROM set / DVD-ROM.

Regarding the problem with the paper advance button, as Les noted, it might be possible to fix that, although it's been a long time since I've taken one of these printers apart and don't recall how accessible the switch is, or what kind of switch it is. I'm pretty sure that the screws are hidden under the little rubber "feet" on the back of the case, and it seemed to me pretty easy to take it apart and put it back together without any damage, except possibly in getting the rubber feet to stick again.

Please let us know about any success or failure you have in solving the problem.

Regards,  
James

*On my list of things to do is to port emu48, free42, or nonpareil to my phone. I have the SDK, but I have had no time.*

How are smartphones different from Pocket PCs? Is it just the smaller screen size, or are there major APIs missing?

(I guess I shouldn't be asking these questions; I have eVC++ which includes the smartphone SDK, but still, I don't want to catch malaria exploring Terra Incognita if someone else already has.)

Quote:

On my list of things to do is to port emu48, free42, or nonpareil to my phone. I have the SDK, but I have had no time.

The first two work fine on my XV6700 with Windows Mobile 5. What's the issue with the Blackjack? There's also ev41 if you want a capable 41CX emulator.

emu48 for Pocket PC is annoyingly spread out in chunks across several downloads from hpcalc.org. What worked for me was to install [this one](#) for emu48.exe, mkshared.exe, the icon and program directory, then [this one](#) for beep.4[89], keyboard.kmi and some kml scripts. Then I dropped the 48g and 49g roms into \Program Files\emu48 and it all worked. I still don't have a nice vertical KML, but I'm sure they exist somewhere on hpcalc.org.

Regards,  
Howard

**33s repeated operations**

Message #1 Posted by [Sam Levy](#) on 12 Mar 2007, 1:52 p.m.

I am used to the RPN stack and often use the repeating t register to stream down a constant. For example the multiplication of a series by 2. I found in the algebraic mode if I keyed 2 X 2 enter, it of coursr gave 4. I entered again, it put the X number in Y and gave me the answer 8. It can be repeated.

**Re: 33s repeated operations**

Message #2 Posted by [Thomas Radtke](#) on 12 Mar 2007, 2:11 p.m.,

### hp50g surveying solutions

Message #1 Posted by [tom grimes](#) on 12 Mar 2007, 1:34 p.m.

Looking for hp50g land survey solutions, or instructions, comparable in simplicity to hp48 with cogo card. Curves, grades, triangles etc...

### Re: hp50g surveying solutions

Message #2 Posted by [ssf](#) on 12 Mar 2007, 6:37 p.m.,  
in response to message #1 by tom grimes

see precision DC50 at psslc com

### Re: hp50g surveying solutions

Message #3 Posted by [buygm](#) on 12 Mar 2007, 11:13 p.m.,  
in response to message #2 by ssf

I saw this on Ebay! Item no. 150101027312. It's a COGO software and instructional download for \$28.

But I don't have it myself... And I don't know much about it... But am curious. If you do get this (or something like it) please let us know what you think!

### Re: hp50g surveying solutions

Message #4 Posted by [Tim Wessman](#) on 13 Mar 2007, 2:46 a.m.,  
in response to message #2 by ssf

Well if you are going to link. . . [www.pssllc.com](http://www.pssllc.com)

Anyway, our software is set up for data collection. We've had one person from TDS cogo cards buy and dislike the interface. The majority however, have been very pleased. If you want something changed/added, we always take feedback.

We also offer a 30 day money-back policy. We have full page ads in POB, American and Professional Surveyor. Check one of those out if you have one. The DC50 assistant (calc+software+free upgrades) runs at 495\$. In the future you can upgrade to the full DC should you like. Also, on our page you can download the manual to see capabilities.

Another option is here: [www.softwarebydzign.com](http://www.softwarebydzign.com)

Ted's is good for desktop calcs. He does a few calculations we don't (mainly older layout type calcs) and uses a completely menu driven interface. We use a custom overlay, and mix direct keypresses, menus and graphics. Things we do that he lacks: GPS calcs, SPCs, real time plotting, autolinerwork, instrument communication, etc. (higher level stuff)

In other words, we are competing against TDS, Carlson, Topcon etc. . . not just providing something that

took 2 days to make. Many of the "COGO" packages you'll find, with the exception of Ted's are quite worthless.

Now I'll stop since I feel like I'm advertising. . .don't want to advertise. Sorry if this has bothered anyone.

Yes, Max!

That' s it! I never own one of these but I think it put me on the tracks of the mysterious and fascinating assembly language programming I started to study at computer school two years after..

For a calculator collector, that one is a "pièce de choix"...

Hello!

Quote:

For a calculator collector, that one is a "pièce de choix"...

Yes, definitely! I still keep some old electronics magazines from the late 70ies and early 80ies (like "Electronics Today International" and "Elektor/Elektuur") that have full-page advertisements for this assembly language trainer. For me, it was too expensive then (and still is, at over 200 Euros at eBay) but if I ever find one for an affordable price, I will certainly add it to my collection!

Greetings, Max

**Pi day**

Message #1 Posted by [Don Shepherd](#) on 11 Mar 2007, 1:10 p.m.

OK, Pi day is next Wednesday. Before my students ask me the obvious question, what is my answer?

The question is: Mr. Shepherd, you said that Pi is the ratio of the circumference of a circle to its diameter, but you also said Pi is an irrational number, which means it cannot be expressed as a ratio of one number to another. What gives?

**Re: Pi day**

Message #2 Posted by [Gerson W. Barbosa](#) on 11 Mar 2007, 1:34 p.m.,  
in response to message #1 by Don Shepherd

Quote:

\_\_\_\_\_

Pi is an irrational number, which means it cannot be expressed as a ratio of one number to another.

\_\_\_\_\_

Perhaps rephrasing this as "...a ratio between two integer numbers" would be better. A textbook might give a more rigorous definition for rational and irrational numbers.

Regards,

Gerson.

P.S.:

By the way, in this part of the world, Pi day falls on my birthday, 22/07 (Jul 22) :-)

The question is: Mr. Shepherd, you said that Pi is the ratio of the circumference of a circle to its diameter, but you also said Pi is an irrational number, which means it cannot be expressed as a ratio of one number to another. What gives?

---

It's straightforward: An irrational number cannot be expressed as a ratio of two *integers*.

Even a ratio of two floating-point values, each having a finite number of decimal digits, can be expressed as a ratio of integers, one of which may have trailing zeroes.

-- KS

## Re: Pi day

Message #4 Posted by [Dave Shaffer](#) on 11 Mar 2007, 4:05 p.m.,  
in response to message #1 by Don Shepherd

Of course, the "ratio of integers" is a good response, but I think you could also add that the radius and diameter are not "numbers" (let alone integers) but concepts.

While we humans insist on trying to give a value to everything, and one can measure the value of the diameter and radius, the values, at least in this case, are not exact, but only the best approximation that can be made with the measuring equipment at hand. (This is perhaps a good time to introduce the concept of significant figures and measurement/experimental errors. Even after a semester of beating on them, my physics students often screwed up their answers with regard to "sig. fig." (the notation from my red pen). Since our favorite calculators give results with 10 or 12 digits, they find it hard not to write them all down!)

## Re: Pi day

Message #5 Posted by [Valentin Albillo](#) on 11 Mar 2007, 8:06 p.m.,  
in response to message #1 by Don Shepherd

Hi, Don:

You might consider offering the following very easy Pi-related teaser to your students:

"Without using a calculator or actually computing the values, can you say which is greater,  $e^{\pi}$  or  $\pi^e$ ?"

A very simple argument, which involves only trivial arithmetic with integers and a little geometrical visualization, is sufficient to decide the question. They might enjoy the reasoning and also get the idea that calculators aren't everything there is and some logical thinking can get you very far.

Best regards from V.

## Re: Pi day

Message #6 Posted by [Don Shepherd](#) on 11 Mar 2007, 8:43 p.m.,  
in response to message #5 by Valentin Albillo

Hello Valentin!

Gosh, as much as I would like to use " $\pi^e$ " on Wednesday, my sixth-graders won't know what  $e$  is. In fact, they may not learn that until high school (9th grade here). Most of them have heard of  $\pi$ , and many will know that it is (approximately) 3.14, but I know that few of them know its relationship to a circle's diameter and circumference. So I'm going to bring in a bunch of round objects and let them measure diameter and circumference and see how close they get to 3.14.

My goal is for them to learn that diameter and circumference are related, no matter how big the circle, and that relationship is pi.

Interestingly, some web sites (www.brainpop.com in particular) claim that  $22/7$  is not a valid approximation for pi (presumably because, being irrational, pi cannot be expressed as the ratio of two integers), but 3.14 is. If a sixth-grader can come to understand that pi relates circumference to diameter, I don't think it is important whether he/she uses  $22/7$  or 3.14 or 3.14159.

Thanks V.

### Re: Pi day

Message #7 Posted by [htom](#) on 12 Mar 2007, 4:43 p.m.,  
in response to message #6 by Don Shepherd

You could try Count Buffon's Method, too. That's the one where you drop toothpicks (or pennies or ...) onto spaced lines and count intersections.

<http://www.worsleyschool.net/science/files/buffon/buffon.html>

### Re: Pi day

Message #8 Posted by [Crawl](#) on 15 Mar 2007, 3:59 a.m.,  
in response to message #7 by htom

No, pennies wouldn't work. The reason pi comes up in that calculation is because the possibility of having an angle with the toothpick. But a penny is round, and its angle of orientation has no effect on whether it'd hit a line. It's pretty obvious that if the line spacing was  $L$ , and the penny's diameter was  $D$ , then the probability of hitting a line would be  $D/L$ . No pi term.

### Re: Pi day

Message #9 Posted by [htom](#) on 15 Mar 2007, 12:10 p.m.,  
in response to message #8 by Crawl

Huh. Right. Why did I think that pennies would work?

If you drop pennies on a regular square grid with the square sides being diameters ( $d$ ) of the penny? Imagine circles centered at the intersections of the grid; the center of the penny falls either inside a quarter circle covering a part of the square or towards the center of the square, between the four circular arcs. If we take the unit to be the radius  $r$  rather than the diameter, the area of the square is  $4r^2$ , the circle is  $\pi r^2$ , the excluded area is  $4r^2 - \pi r^2$ .

There has to be a way to recover pi from that, but I'm stuck. Seventh grade was a long time ago.

--- later ---

If you randomly drop 400 coins, 314 of them should cover an intersection point, 85 should not, and the other should cover sometimes.

in response to message #1 by Don Shepherd*

Well, for tomorrow:

3.14 PI day à la US way

the PI Fraction Day is

22.7 (22/7) (or July 22) à la EU way.

**Re: Pi day**

Message #16 Posted by **Eduardo** on 13 Mar 2007, 3:21 p.m.,  
in response to message #15 by Antonio Maschio (Italy)

Elaborating on the 22/7 approximation to Pi. This is the partial fraction

$$[3;7] = 3 + 1/7$$

Anybody here know anyone born 16 July '03? (Either 1903 or 2003)

$$\pi = [3;7,16,\dots]$$

The next term in the fraction expansion of pi is 16, giving  $\pi = 3 + 1/(7 + 1/(16 + \dots))$ . Truncating, one gets the fraction 355/113, which is within  $3 \times 10^{-7}$  of the correct value.

Eduardo

### **program stored on cassett disk**

Message #1 Posted by [sevennt2020](#) on 10 Mar 2007, 3:30 p.m.

I have a computer program written in BASIC language in the 70's on a cassett tape. Are there computers available today that can read the tape for me?

### **Re: program stored on cassett disk**

Message #2 Posted by [Eric Smith](#) on 10 Mar 2007, 4:52 p.m.,  
in response to message #1 by sevennt2020

What kind of computer? For the most part, each kind of computer had its own tape format. Even when two used the same tape interface (e.g., Kansas City Standard), there were still incompatibilities in how BASIC programs were stored.

As long as the computer you used wasn't too obscure, it's likely that a suitable computer can be found. If the tape is in good condition (not sticky, and not too much printthrough), it can probably still be read.

### 12C - sell or collect

Message #1 Posted by [Patrick R](#) on 10 Mar 2007, 1:28 p.m.

Hello!

I've had the luck to buy 7 new 12C calculators (new in the box) at a very attractive price (at a discount of 84 %). The serial numbers are CN11xxxxxx, the calculators use 3 button cells.

What do you think would be better: selling them and making some profit or waiting 10 or 20 years before selling?

### Re: 12C - sell or collect

Message #2 Posted by [Raymond Del Tondo](#) on 10 Mar 2007, 1:57 p.m.,  
in response to message #1 by Patrick R

Hello,

the 12C is \*very\* common, and the Chinese and Indonesian models are not really comparable to the U.S. made or even the Malaysian or Brazilian units IMHO.

As you have the 3-cell version, it's the older design, so that could push up the value slightly somehow.

But I wouldn't wait years before selling the units, as I don't think the price will rise into the region of the HP-42S, HP-32SII, or HP-15C ;-)

<OT> I have to admit that the '12c Platinum Anniversary Edition' (of which I have two) is very nice.

The plastic of the shift keys looks a bit cheap, and the 'orange' shifted key legends are not the optimal color choice IMHO.

Not surprising, because nearly all newer 'hp' calcs from about 1999 on seem to have been designed by color-blind people...

</OT>

Raymond

### Re: 12C - sell or collect

Message #3 Posted by [Gene](#) on 10 Mar 2007, 2:15 p.m.,  
in response to message #2 by Raymond Del Tondo

I would agree about the color choices, in general.

However, I do think the contrast of the 50g color choices is very nice.

Worst? Probably the initial 39g+ with its dark blue, dark green shift functions, and black letters.

Amazingly bad.

### Pioneer Puzzle: a different kind of challenge

Message #1 Posted by [allen](#) on 9 Mar 2007, 11:44 p.m.

The Pioneer series was undoubtedly the most diverse series HP ever made..  
So, my fellow HP fans, here is a challenge for you:

1. Identify each Pioneer model by only the top row of keys. (picture below)
2. Let S be the Sum of the product of row number and model number for each calculator.  
For 17bii and 32sii use  $17^2$  and  $32^2$ .  
Voyager Example:

<http://www.enterhp.com/images/VoyagerPuzzle.jpg>

3.  $\text{SQRT}(S)+1$  is the year my first (and favorite) HP calculators were made.
4. What are my favorite calculators?

<http://www.enterhp.com/images/PioneerPuzzle2.jpg>

Hi, allen --

I suppose that you also own the complete Pioneer series.

Unless I made a mistake,

```
27S
21S
22S
14B
32SII
17B
32S
17BII
42S
10B
20S
```

```
sum = 8647
sqrt(8647) + 1 = 93.98925
```

Your favorites: HP-48G series

-- KS

I just pulled out the whole set of Pioneers. A few of the photos I could recognize without checking, but others were tricky.

That's really the main thing missing from the MoHPC -- a section dedicated to the Pioneer series. I've contributed some material, but it will be quite an undertaking to develop.

I am particularly impressed that the model in the introductory video is a teenage girl.

I am surrounded by women my age who not only think my calculator fetish is a bit weird but who clearly were educated in the days when math and science education was very much a boys' club. That said, I just read in the paper here that one of the highest performing schools here on standardized tests in math is a Catholic girls' school.

I really do hope that things are changing for the better. Disparities in numeracy based on gender are nothing to be proud of.

Les

### **girls and math**

*Message #5 Posted by **Don Shepherd** on 11 Mar 2007, 8:52 a.m.,  
in response to message #4 by Les Wright*

It is changing, Les, and that is good. I teach middle school (ages 11 to 13) math. In my classes, I have observed that most of the mathematically brighter students are girls. And they are not afraid to demonstrate their knowledge, which is different from past generations. I think more teachers today, than in the past, recognize that ability in math is not a gender thing. Even when I was programming for a living, I saw that there were as many good female programmers as male, although their total number was fewer.

### **Re: girls and math**

*Message #6 Posted by **Dia C. Tran** on 20 Mar 2007, 8:19 a.m.,  
in response to message #5 by Don Shepherd*

The Mac changed the way people use computers from computing to something else (desktop publishing etc..) although the computers still have to do serious computing inside. May be the Nspire does the same thing that people will rarely use the calculator for calculating but for something else.

### HP 50G PC Connection Problems...Old Fool Needs Help...!!

Message #1 Posted by [Alan Taylor](#) on 9 Mar 2007, 11:16 a.m.

Well I'm back in the HP fold. I have just purchased the HP 50G, my previous HP's were "the electronic slide rule" circa 1972. This unit replaced my trusty Decilon 10 inch and 5 inch slide rules (which I still have!!), then in the late 1980's I had a HP41..

First impressions.....well after all the technical inovations etc..the documentation for the HP50G is magnificently inadequate, to be more direct....it really \*\*cks!! My goodness, I remember when it was possible to settle down with a HP calculator and the superb manual(s)for a good evening read, and when finished to put everything back into the hard plastic carry case...those were the days...sigh.....)

Well here I am prostrating myself on this forum....stumped by my inability to connect my 50G to my PC. Any help would be much appreciated... God!! I feel such a fool!!!!!!

Really, I would not mind paying the few extra bucks for some good old fashioned HP manuals of yester-year style.... :(

Alan

### Re: HP 50G PC Connection Problems...Old Fool Needs Help...!!

Message #2 Posted by [Giancarlo \(Italy\)](#) on 9 Mar 2007, 12:13 p.m.,  
in response to message #1 by Alan Taylor

Hi Alan,  
welcome back to the group :)

I resonate with you about the quality of the last HP manuals....  
You might find some consolation by downloading and reading the good ol' 48G series manual  
(as far as programming RPL programming is concerned):

<http://www.hpcalc.org/hp48/docs/misc/hp48gaur.zip>

or the 49G user guide as far as getting to know how the 50G can be (almost fully) exploited:

<http://www.hpcalc.org/hp49/docs/misc/hp49gpugb.zip>

Please consider that 99% of what you can learn about the 49G+ hold trus for the 50G as well -  
and the manual is better....

Turning to your specific issue, you might find helpful to read this (long) thread on  
[comp.sys.hp48](http://comp.sys.hp48)  
(which is, by the way and IMHO, a better place to find help about the 50G than HP Museum  
forum):

[http://groups.google.com/group/comp.sys.hp48/browse\\_frm/thread/fea856d8f18cab28/5325118f3c1de62b?  
lnk=gst&q=50g+CONNECTION+TO+PC&num=9#5325118f3c1de62b](http://groups.google.com/group/comp.sys.hp48/browse_frm/thread/fea856d8f18cab28/5325118f3c1de62b?lnk=gst&q=50g+CONNECTION+TO+PC&num=9#5325118f3c1de62b)

Last but not least, as far as transferring files between a PC and a 50G is concerned,  
I'd strongly advise to use a SD card instead of the ConnKit (which I myself struggled a bit to  
get to work).

Hope this helps.  
Best regards.  
Giancarlo

### **Re: HP 50G PC Connection Problems...Old Fool Needs Help..!!**

*Message #3 Posted by [Dave](#) on 9 Mar 2007, 2:35 p.m.,  
in response to message #2 by Giancarlo (Italy)*

There's a fantastic manual for the 49/50g, even more comprehensive than the old 48 AUR. This post from James Prange has all you need.

Quote:

Regarding the manuals, get the [hp 49g+/ hp 48gII graphing calculator advanced user's reference manual](#) instead of (or in addition to) the 49G manual.

If your 50g comes with ROM revision 2.08 (check this with the VERSION command), upgrade it to [2.09](#) or Bernard Parisse's [2.10-7](#). Optionally, install libraries 226 and 227 for the equation library and 229 for the periodic table. Use the libraries that come with 2.10-7, also available at [Hydrix](#).

This forum is good, but for RPL models, you'd probably be better off with the usenet group comp.sys.hp48. In case you don't already use a newsreader, you can also access it (including the archive) through <http://groups.google.com/group/comp.sys.hp48>.

Regards,  
James

### **Re: HP 50G PC Connection Problems...Old Fool Needs Help..!!**

*Message #4 Posted by [Alan Taylor](#) on 12 Mar 2007, 10:44 a.m.,  
in response to message #2 by Giancarlo (Italy)*

Hi Giancarlo,

Thanks for this. I eventually managed to get the 50G to talk to my PC.

One of the issues was the activation of the XMODEM server. I eventually managed to start the server via the CAT dropdown.

Thanks for all the help from the guys.

The next issue is the 50G screen capture. The manual refers to the "up arrow"?? Just what is this??

Or is there a simpler command format...

Very Best Regards Alan Taylor

### **Re: HP 50G PC Connection Problems...Old Fool Needs Help..!!**

*Message #5 Posted by [Giancarlo \(Italy\)](#) on 12 Mar 2007, 11:45 a.m.,  
in response to message #4 by Alan Taylor*

Hi Alan.

Don't know if I understand correctly, but you can use the "File" menu in the ConnKit program - it provides a "Capture Calculator Screen..." option that according to the on-line help, allows to:

Quote:

---

#### Capture Calculator Screen

The screen image of the calculator can be captured into a graphic window. This window can then be copied to the Windows clipboard ready to be used in a graphics application.

The calculator provides this feature through its printing capability. It thinks that the HP 48, 49 Calculator Connectivity Kit is an HP graphics printer.

To use Screen Capture:

Disconnect any XModem connection with the calculator by selecting disconnect from the File menu. On the calculator, make sure flag -33 is clear and flag -34 is set. Get the screen that you want to show on the calculator Select Screen Capture from the file menu Follow the prompts to start the screen print on the calculator The captured screen should then appear Once the calculator screen has been captured, you may customize its appearance with the Screen Capture View Menu

---

Hope this helps.  
Best regards.  
Giancarlo

### **Re: HP 50G PC Connection Problems...Old Fool Needs Help...!!**

*Message #6 Posted by [dbatiz](#) on 9 Mar 2007, 1:18 p.m.,  
in response to message #1 by Alan Taylor*

Sir,

First make sure flag 33 is set to Transfer Via Wire.

Install the connectivity kit and calculator driver on your PC.

Connect the calculator to the PC with the USB cable.

Press (AND RELEASE) the right shift, then the right arrow. The display should say "Xmodem Server Waiting for command."

Start your Calculator Connectivity Kit. Set Connect Using to AUTO. Then press the quick connect button (it's right beside the button that looks like a camera).

Your directory tree should appear on the screen.

Good luck!

Very Respectfully,

David

### **Re: HP 50G PC Connection Problems...Old Fool Needs Help...!!**

*Message #7 Posted by [cfh](#) on 9 Mar 2007, 6:08 p.m.,  
in response to message #1 by Alan Taylor*

- 1) Make sure you have the latest connx4.
- 2) press and release shift right arrow (as pointed out here)
- 3) if no connection, turn on and off the 50, plug and unplug it again, sooner or later the PC will "find it". I have had similar problems - it seems a little stochastic at times finding the calculator for the connX4 program (while ALWAYS finding the calc as a RAM-card...)

If anyone else has ha perfectly clear answer to this I'd be glad to read it.

cheer

Carl

*Message #8 Posted by [Les Wright](#) on 13 Mar 2007, 5:26 a.m.,  
in response to message #1 by Alan Taylor*

I am so baffled by the USB interface with my 49G+ I don't even bother with it, and transfer files with an SD card. Fortunately, this is very straight forward for me since I have a cardreader on my PC--put the SD card in the slot, drop files into the folder, put card in calculator, navigate to the SD card with FILES, recall desired object to stack, store it accordingly as program, variable, or library on the calc.

The smaller SD cards, which are more than adequate for storing relatively tiny calculator programs and libraries, are really cheap these days, as are card readers that plug into a USB port. It means shelling out a little more money, but maybe this is a more sensible and intuitive file transfer solution? Were it not for my little SD card and card reader, I would be pretty befuddled when i comes to ROM updates and other file transfer tasks.

Les

in response to message #11 by Gerson W. Barbosa*

Quote:

That's one of the four round-shaped silver keys, the one just below the F5/E key.

Yes. Personally, I prefer to call it the "CursorUp key", largely because character 144 really does look like an arrow pointing up, and there are also characters that look like arrows pointing down, left, and right.

Anyway, to invoke the PRLCD command (used for Conn4x's "screen capture"), press and hold the ON key, press and release the CursorUp key, and release the ON key.

Regards,  
James

**Re: HP 50G PC Connection Problems...Old Fool Needs Help..!!**

*Message #13 Posted by **Alan Taylor** on 19 Mar 2007, 3:52 a.m.,

\_\_\_\_\_

Heck, I am fine with an old 128mb card, which does double duty in my Palm TX and the HP49G+. This is plenty to store all of my little files for the HP49G+ and Free42.

I do have a 2gig card but it is better used in a digital stereo recorder I have--the highest quality wave files are very big and 2gig handles about an hour of recording, I think.

Les

**HP 28c**

Message #1 Posted by [Tadeyev](#) on 8 Mar 2007, 1:54 p.m.

Hello all, I recall hearing something a while back about the hinged portion on these models, connecting both halves, being finicky or giving out in older models after long use. Can anyone enlighten me about that? Also: any impressions about use, quality? Thanks, Tadeyev

**Re: HP 28c**

Message #2 Posted by [John Limpert](#) on 8 Mar 2007, 3:10 p.m.,  
in response to message #1 by Tadeyev

I haven't seen any problems with the hinges on the calculators in my collection. The main problem is the battery door, which is easy to damage when changing the batteries. I've seen a few calculators with flakey displays. The keyboards seem to be pretty durable.

**Re: HP 28c**

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 8 Mar 2007, 3:40 p.m.,  
in response to message #2 by John Limpert

Agreed; the hinge seems as if it ought to be a likely failure with the clamshells, but I don't recall ever reading of it actually failing.

The battery cover is indeed difficult to to insert, particularly when in a rush to get it in place before memory is lost. Damage to the cover or the case in that area seems to be a common problem.

Regards,  
James

**Re: HP 28c**

Message #4 Posted by [Paul Marin](#) on 8 Mar 2007, 9:23 p.m.,  
in response to message #1 by Tadeyev

The only thing that I've known about that was bad about these units was that when I bought my first units in the late 80's, it kept losing memory if it was shaken a little, say when in a brief case. It was a few months old at the time and after getting frustrated I took it to a HP retailer who, after checking the serial number, replaced it with a new model. He told methat a bad batch were made with faulty battery contacts. Apart from that, the unitis in pristine condition and I have no trouble with either battery cover or hinge. Nice unit. Won't part with this one foe anything

Paul

**Re: HP 28c**

Message #5 Posted by [Juan J](#) on 8 Mar 2007, 10:56 p.m.,

*in response to message #1 by Tadeyev*

Hello,

Other than the battery door, there are no major problems with the 28C/28S. One of my 28S accidentally hit the ground a couple times but nothing happened.

I had to put my 28Ss under storage for three years, with batteries. All of them had the clock program; when I took them out from storage it was still running and kept time more accurately than a wrist watch.

My two cents.

### **Re: HP 28c**

*Message #6 Posted by [martin](#) on 18 Mar 2007, 2:57 a.m.,  
in response to message #5 by Juan J*

hello Juan J, my son throw away the batteries in my HP28S,thankfull if you can help me what type of battery I need to replace the batteries..Thank you in advance..do have a nice day!!

### **Re: HP 28c**

*Message #7 Posted by [Juan J](#) on 18 Mar 2007, 9:02 a.m.,  
in response to message #6 by martin*

Hello Martin,

The 28 uses three size N batteries. These are 1.5 Volts each. If I remember correctly, they are available from Eveready as model E90 and from Kodak as model KN. I prefer the latter, because it lasts longer and does not leak.

Be careful, as there are a few models with the same size (for garage door remote controls and similar devices) that are 3 Volts and even 6 Volts each. Check the voltage.

Hope this helps.

### **Re: HP 28c**

*Message #8 Posted by [Thomas Radtke](#) on 9 Mar 2007, 1:53 a.m.,  
in response to message #1 by Tadeyev*

Randy reported broken plastic rivets to cause keyboard failures, not the hinge IIRC. Aside from this potential problem and the battery door, the clamshell models seem to be quite reliable. I have and enjoy an 18C since years and lately got a 19B.

### **Re: HP 28c**

**I-Hp?**

Message #1 Posted by [dbatiz](#) on 8 Mar 2007, 8:42 a.m.

Form,

Has anybody tried powering thier HP50g using an Apple power block (or one of the many aftermarket products) intended for an I-Pod? They way these calculators kill betteries, it would be great to be able to use the power block as a power supply.

From my limited understanding of these devices, they only provide the operating voltage of a USB connection without any of the data lines being connected.

I'm suffering a little bit of chicken-ites. After reading about the damage caused by HP chargers being used without the re-chargable batteries installed I'm hesitant to just try it.

Very Respectfully,

David

**Re: I-Hp?**

Message #2 Posted by [Les Wright](#) on 8 Mar 2007, 9:12 a.m.,  
in response to message #1 by [dbatiz](#)

how would this work?

I never had the impression the 49G+ or 50G drew power thru the USB connection.

Les

**Re: I-Hp?**

Message #3 Posted by [Giancarlo \(Italy\)](#) on 8 Mar 2007, 9:45 a.m.,  
in response to message #2 by [Les Wright](#)

Hi Les.

The 49G+ was not capable of being powered through the USB, but the 50G is.

You can see it by yourself: press [ON]-[F] then [8] to enter the battery environment and you'll see it switching between "battery" and "USB" if you plug out or in a USB powered cord to the 50G.

Hope this helps.

Best regards.

Giancarlo

**Re: I-Hp?**

Message #4 Posted by [Les Wright](#) on 8 Mar 2007, 10:27 a.m.,

*in response to message #3 by Giancarlo (Italy)*

I have a 49G+, not a 50G.

If that is the case, then I think the iPod power block should work and be safe for the calculator. If the current carried through a USB connection doesn't fry the iPod, and if the Griffin powerblock is intended to replicate that delicate power source, it shouldn't cook the calculator either.

Les

**Re: I-Hp?**

*Message #5 Posted by [Gene](#) on 8 Mar 2007, 11:42 a.m.,  
in response to message #4 by Les Wright*

I'll test the Griffin Powerblock when I can.

**Re: I-Hp?**

*Message #6 Posted by [Bill \(Smithville, NJ\)](#) on 9 Mar 2007, 7:21 a.m.,  
in response to message #4 by Les Wright*

Hi Les,

Quote:

\_\_\_\_\_

If the the current carried through a USB connection doesn't fry the iPod

\_\_\_\_\_

Having too much "Current" can never fry anything. Too much voltage can. The Current rating on a power supply is the maximum amount of current that the power supply can provide at a certain voltage. The device using the power supply determines how much current will be attempted to be drawn from the power supply. If the device tries to draw more current than the power supply can provide, then, depending upon the regulation ability of the supply, the voltage will drop and the supply can overheat or malfunction.

As long as the power supply is rated at the corrent voltage and has, as a minimum, the required current rating, then the power supply can be used. Of course, polarity is very important. Make sure you don't get it reversed.

The nice thing about devices being powered through the USB connector, is that there is no way to get the polarity wrong. And any of the USB power devices can be used. I use the Griffen power cube with the USB cable to power my Ipod, Dell Axim, and a MIO GPS unit. I also have a Belkin USB lighter plug adapter that lets every thing be used in the car.

Bill

**Re: I-Hp?**

*Message #7 Posted by [Les Wright](#) on 9 Mar 2007, 7:32 a.m.,  
in response to message #6 by Bill (Smithville, NJ)*

Yet another reason why I should get a 50g, which regrettably is not cheap in Canada.

I would have multiple uses too for a Griffin powerblock (iPod, Palm, etc.)

**External power for 50g**

Message #8 Posted by [James M. Prange \(Michigan\)](#) on 8 Mar 2007, 3:31 p.m.,  
in response to message #1 by dbatiz

I haven't tried other power supplies with the 50g, but note that the 50g requests 50mA from the USB port. I expect that any source that can supply at least 50mA at 5V should work for powering it from the USB port.

Another possibility is that two of the pins of the "4-pin USB" port used for the serial connection are supposed to connect directly to the battery, so it should be possible to power it through that port too, as long as at least one AAA cell is removed. If rechargeable cells are used, it should be possible to connect an appropriate charger / battery eliminator through the serial port.

Of course the nominal purpose of the battery connection at the serial port is to optionally provide power to anything the user cares to connect to the serial port. I don't know whether power is available from the serial port while the calculator is being powered from only the USB port; but I rather doubt it.

Regards,  
James

**Re: External power for 50g**

Message #9 Posted by [James M. Prange \(Michigan\)](#) on 8 Mar 2007, 3:47 p.m.,  
in response to message #8 by James M. Prange (Michigan)

PS:

On second thought, although the 50g requests 50mA from the USB port, I don't know how much it actually draws; I expect somewhat less. But I guess that supplies intended for music players are probably rated to supply at least that much.

Regards,  
James

**HP50g External Power**

Message #10 Posted by [dbatiz](#) on 9 Mar 2007, 7:05 p.m.,  
in response to message #1 by dbatiz

I contacted Griffin and here is thier response:

Quote:

\_\_\_\_\_  
Hello,

We have not tested it with that unit, so we cannot guarantee that it will work, but it outputs the standard 5volts required for USB operation. So it should work.

Thanks,

JR

Griffin Technology Tech Support  
\_\_\_\_\_

I'm still waiting for a response from HP. I think it should work, but since I'm not a gambler man, I'm not willing to bet my HP on it. I'll wait for HP's answer first,

Very Respectfully,

Dave

## **HP50g External Power**

*Message #11 Posted by [dbatiz](#) on 16 Mar 2007, 7:26 a.m.,  
in response to message #1 by dbatiz*

I finally got an answer from HP: They were unable to test the 50g with an Apple Powerblock because they couldn't figure out how to connect it. I've not seen the Apple Powerblock, but they said its connector is not standard USB.

I tested my 50g using a Griffin model 17B061001 AC power supply. It has a standard USB output, 5.0V 500mA. Using the ON+F6, then option 8, I was able to verify it would switch to USB power using the Griffin PS.

I also took the AAA batteries out, and connected to the Griffin, the 50g worked.

After my test, I verified the operation of the USB connection, it suffered no apparent damage.

I think we have a winner!

Very Respectfully,

David

### What's the beef with the 14B?

Message #1 Posted by [Les Wright](#) on 8 Mar 2007, 7:42 a.m.

I acquired an Anniversary edition 14B mostly for its collector appeal. It did not come as a bargain and I figured recently to make the purchase worthwhile I should spend a little time with it. I must admit that even though the obligatory algebraic entry can be a bit annoying at times, I really do like it, particularly the great big 32S like display. All of the TVM and cashflow routines are aided by prompts and easy to use and seem very fast.

There is has been a lot of recent talk of financials here, such as the 17bii and 17bii+, but I never hear a peep about the 14B. Any idea why?

Les

### Re: What's the beef with the 14B?

Message #2 Posted by [Spacedog](#) on 8 Mar 2007, 9:50 a.m.,  
in response to message #1 by Les Wright

I don't have anything against the HP 14B, but then I don't really know anything about it either. The HP 17BII, however, feels like an old friend. This is because I used to use an HP 27S for years, which IMHO believe to be the most user-friendly scientific calculator ever made. And, viola, a lot of the 17BII works the same way as with the 27S (very user-friendly and with RPN to boot!, though sans firmware trig transcendentals).

An "HP 27SII" would have been great (Paul Ceruzzi thought the 4 register "stack" could so easily have been used for RPN right from the beginning (who gave me my 27S in the first place)), but alas I don't think it will ever happen.

Ian, thank you for your encouraging comments, which I got to see before the post was deleted. I really like the 14B, and it looks like I got a good deal on it, as I paid far less then you did (no box though).

I am also becoming a big fan of the 17bii+. I have little use now for my 12cp, with its sticky keys and TVM and cashflow capabilities that are a little less intuitive to use for me. I do get a kick out the old HP80 though, even though its TVM and cashflow features are even more peculiar to figure out!

Les

Maybe concern about spambots? Perhaps the cheeky reference to his child and nuclear science caused some offense? I have had a little correspondence with him since about the 14B and he didn't mention it one way or the other, so I am guessing that he has his own very good reasons that are idiosyncratic to him even if they seem obscure to us.

### Need crash course in HP41 HP-IL stuff

Message #1 Posted by [Les Wright](#) on 8 Mar 2007, 6:25 a.m.

I am awaiting delivery on an HP-IL module and HP-IL thermal printer from one of our members. This is an admittedly rather expensive alternative to a straight replacement of the 82143 printer I recently murdered, so I am obviously interested in exploring other peripherals to make the HP-IL module acquisition, which cost quite a bit more than the printer, truly worthwhile.

What should I be trying to acquire? Keep in mind I am not a sophisticate when it comes to these things. In the most basic sense, I guess you could say I am interested in mass storage, like the cassette drive, and in particular means to get HP41 programs to and from a modern day Windows XP PC--i.e. I don't want to have to deal with an old computer running DOS just to manipulate and transfer HP programs. This does not strike me as something for the faint of heart--I looked at the RS232 interface manual on our DVD and was utterly perplexed. I also surmised that the serial connector in question is not the same as that on my 48G serial cable or the old serial mouse I know longer use. One of our members has suggested to me the CMT 512K RAM Box with built in RS232 interface, which sounds positively fascinating but I would like to know more about what it could do for me before I break the piggy bank yet again.

Thanks for your wisdom.

Les

### Re: Need crash course in HP41 HP-IL stuff

Message #2 Posted by [Tony Duell](#) on 8 Mar 2007, 1:18 p.m.,  
in response to message #1 by [Les Wright](#)

I still do quite a bit with HPIL on the HP41 and HP71, but my PC runs (an ancient version of) linux, so some of what I say will not be directly applicable to you.

The first essential is the extended I/O module for the HP41. Without it, you can't do most useful things to HPIL devices. If you only have the 82162 printer and 82161 tape drive, I guess you'll be OK without the extended I/O module, but for any other devices (like the RS232 interface) it's a must!

The HPIL Development ROM (DevIL module) is useful, but suprisingly I use it less than the Extended I/O ROM

Forget the 82161 cassette drive unless you want to read old tapes. It's not really a practical solution for mass storage now, the tapes are hard to find (they're not standard audio tapes, not even mini or micro cassettes), and they tend to be unreliable.

If you can find one, get a 9114 disk drive (IMHO it doesn't matter whether it's a -A or -B, and I do have both). It uses DD floppy disks (aka '720K disks') which are not that hard to find. And you can read them on a PC -- there is software for MS-DOS and linux to do this.

The 82164 RS232 interface is 'interesting' (in the sense of 'may you live in interesting times' :-)). I have got it to talk to my linux PC, but I did have to wire up a special cable (I can give you details of the connections), and sorting it out involved a few long nights with a breakout box and the 82164 user and service manuals. I see no reason why it can't talk to a Windows machine, or to a modern machine via a USB-RS232 interface, but, not having any such hardware I can't talk you through it.

Those are, IMHO the essentials (disk drive and RS232). Other 'fun' devices include the 2225B (Thinkjet printer), 7470 Opt 003 (pen plotter), 82165/82166 (parallel interface modules, I use them a lot to link to homebrew projects), 82169 (HPIB interface).

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #3 Posted by [Les Wright](#) on 8 Mar 2007, 6:17 p.m.,  
in response to message #2 by Tony Duell*

This is very informative.

I think right now the most useful addition I can think of is the diskette drive. I do have a floppy drive on my PC and tons of 3.5" floppies that are easily formatted as single density.

Does the PC based software for reading these disks work in DOS box under Windows XP, or do I need a proper pre-Windows 95 DOS machine? Is the disk format out of the 9114 drive readable under DOS and Windows XP, or would my computer simply regard such 3.5" single density floppies as unformatted disks?

The member who has been writing to me about the CMT RAM box/RS232 interface mentioned both the Extended I/O Module and the Extended IL modules, like they were different things, but I must admit I have never heard of the latter and can't find a manual for it on the DVD. Can someone enlighten me?

I do have a small size serial port on my computer so I expect that if I got any RS232 interface I would need a 25-to-9 pin adapter to connect. Is it any more complicated than that? I did get a USB-to-serial adapter cheap once to try to connect the 48G to USB, but it doesn't work. I do know that an expensive Dynex adapter works with the 48G cable and an old serial mouse, but I took it back after I put the cheap one on order. False economy! I guess I could splurge the 50 bucks again and get another if I ever replace the computer for one without a serial port.

I have looked into Clonix and MLDL but there seems to be a bit of a hi-tech DIY requirement here. I just made a mess of my 82143 printer with a soldering iron, so I shouldn't be trying to build delicate electronics.

Also, let's say I just got the disk drive and couldn't find the Extended I/O Module. Would I be able to do basic read/write operations to the disk without it? Does that basic functionality exist in an IL with only the disk and the HP-IL module?

Many thanks for guiding me.

Les

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #4 Posted by [Les Wright](#) on 9 Mar 2007, 1:19 a.m.,  
in response to message #3 by Les Wright*

I guess I should ask the most basic question of all:

What is a fair price for these things? I must confess I have positively no clue. One of our members

mentioned to me an Extended I/O module and 9114 drive, and I threw out a very tentative first offer based on my experience regarding other tough to find HP41 modules and peripherals, but I fear I may have egregiously insulted him! Also, one of our members recent put a 512K CMT RAM drive up for auction, and the starting bid is much higher than I possibly could've guessed. Suffice to say I am really in the dark when it comes to pricing this stuff, so I am grateful for guidance. I want to pay a fair value to those who wish to sell me their stuff, but I don't want to get soaked either.

Many thanks,

Les

*Edited: 9 Mar 2007, 6:11 a.m. after one or more responses were posted*

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #5 Posted by [Les Wright](#) on 9 Mar 2007, 2:05 a.m.,  
in response to message #4 by Les Wright*

And another question:

If all I am really interested in with the 9114 is basic reading and writing to the disk, could I survive with just the HP-IL modules READP and WRTP functions? Could I get away without the Extended IO module if I don't plan on anything more fancy than this?

It is appearing to me that the Extended IO module could be more expensive than the disk drive itself, and if I don't really need it for basic storage and retrieval operations I would be happy to give it a pass.

Les

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #6 Posted by [Tony Duell](#) on 9 Mar 2007, 5:35 a.m.,  
in response to message #3 by Les Wright*

Quote:

\_\_\_\_\_

This is very informative.

I think right now the most useful addition I can think of is the diskette drive. I do have a floppy drive on my PC and tons of 3.5" floppies that are easily formatted as single density.

\_\_\_\_\_

Actually, it's double density. The 1.44M disks are 'high density'.

However, there are 2 problems with using 1.44M disks (PC 'HD' disks) in the 9114. The first is that the coercivity of the media is different. The 2 values are close, but not the same. This may not be reliable.

The second is that the 'HD detect hole' -- the extra hole that tells the PC that it's an HD disk -- lines up with the disk-inserted sensor in the 9114's drive and the latter will not recognise it has a disk inserted. A bit of tape over the hole will fix that.

But personally I'd look for some real DD disks.

Quote:

Does the PC based software for reading these disks work in DOS box under Windows XP, or do I need a proper pre-Windows 95 DOS machine? Is the disk format out of the 9114 drive readable under DOS and Windows XP, or would my computer simply regard such 3.5" single density floppies as unformatted disks?

---

A PC will not recognise the disks. The low-level format is totally different (the HP disk is 77 cylinders, 2 heads, 16 sectors/track, 256 bytes/sector, the PC (720K) format is 80 cylinders, 2 heads, 9 sectors/track, 512 bytes/sector).

Quote:

---

The member who has been writing to me about the CMT RAM box/RS232 interface mentioned both the Extended I/O Module and the Extended IL modules, like they were different things, but I must admit I have never heard of the latter and can't find a manual for it on the DVD. Can someone enlighten me?

---

The Extended IL module (XIL) was a third-party ROM that allowed the HP41 to easily use the entire capacity of the floppy disk, to print listings efficiently on an 80 column printer, and so on.

I don't use it. If I need a program listing on 'wide' paper, I transfer the HP41 program to the PC, and run it through a couple of programs there that firstly produce a listing and then reformat it as I want.

Quote:

---

I do have a small size serial port on my computer so I expect that if I got any RS232 interface I would need a 25-to-9 pin adapter to connect. Is it any more complicated than that? I guess I could splurge the 50 bucks again and get another if I ever replace the computer for one without a serial port.

---

The 82164 RS232 interface has a male DB25 plug on it. An internal jumper block lets you configure it either as DTE (terminal) or DCE (modem). You will therefore need the right adapters to link it to your PC DE9 connector

Personally I find the only sane way to use the 82164 is to leave that jumper block in the 'DTE' position and wire up the appropriate cables to get the signals where I want them for the other device. But then I think nothing about taking a soldering iron to a bit of hardware.

The reason it was more complicated for me is that I wanted to be able to transfer HP71 binary files. This meant I couldn't use XON/XOFF handshaking, I had to use hardware handshaking (some form of handshaking/flow control is essential or you will lose characters). And the 82164 uses the handshake lines in a somewhat odd way.

Quote:

---

Also, let's say I just got the disk drive and couldn't find the Extended I/O Module. Would I be able to do basic read/write operations to the disk without it? Does that basic functionality exist in an IL with only the disk and the HP-IL module?

---

Yes. You can use the disk drive with the normal commands for the cassette drive (they're in the ROM in the 82160 HPIL module, you don't need any other modules), but you can only use the first 128K of each disk. That's actually quite a lot of storage for an HP41, so you may be satisfied with that.

---

**Re: Need crash course in HP41 HP-IL stuff**

Message #7 Posted by [Tony Duell](#) on 9 Mar 2007, 5:37 a.m.,  
in response to message #6 by Tony Duell

One thing I forgot to mention is that the Extended I/O (or HPIL Development) ROM is pretty much essential to use the RS232 interface. You can't change any of the communication parameters (baud rate, handshake, etc) without it.

---

---

Actually I would be ecstatic with that.

128K holds the equivalent of about 570 magnetic cards, if I have my math correct. That is pretty impressive. If I could get a 9114 just to make back-ups of my mag cards, of which I have at most a few dozen, I would be positively tickled.

And I believe I have some real DD disks around here someplace. Not many, but I don't need many.

BTW, if a PC can't read a 9114 formatted floppy, how does LIFUTL work?

Thanks for the excellent information.

Les

---

**Re: Need crash course in HP41 HP-IL stuff**

Message #10 Posted by [Les Wright](#) on 9 Mar 2007, 4:49 p.m.,  
in response to message #8 by Les Wright

Quote:

BTW, if a PC can't read a 9114 formatted floppy, how does LIFUTL work?

I have found a couple of DD disks around here that format fine as FAT but when I try to initialize them to the appropriate format using LIFUTL I get an "error at track 0" message.

So I am starting to get the point.

I will try to keep an eye peeled for an old x86 machine. If it has DOS and LIFUTL, I am off to the races, since I really only need it to get programs on to the diskettes. I can do all of the editing and compiling to LIF or RAW format on my newer machine, where hp41uc works beautifully.

For this purpose, will any x86 series machine do, or does it have to be a really slow one, like a 286? If a 386, 486, or early Pentium machine will work, that would be great--indeed, I have an old Pentium 120 laptop, about 11 years old. Dead screen but the video output works fine. Needs DOS though, and I think my old MSDOS 6.22 disks have been toasted.... Any thoughts? I could try to turn the old laptop into a Linux box, but frankly that is a little complex for my blood. I am sure MSDOS can be found cheaply or for free.

One of our fellow contributors has offered me a 9114 for a superb price, so I look forward to experimenting with that. If I can use my old laptop as a transfer medium, then this would keep me happy, though I know I will want the convenience of the RS232 interface eventually....

Eager for more opinions,

Les

Message #11 Posted by [Howard Owen](#) on 9 Mar 2007, 7:12 p.m.,  
in response to message #10 by Les Wright

I had mixed luck with Linux on a Compaq Pentium/70 system. It worked better under DOS, which I had set up dual boot with Linux.

I got my DOS 6.22 from eBay. There's also [FreeDOS](#)

Shoehorning a modern Linux distro onto an old PC isn't easy. I ended up going with Slackware, as it was the only one whose installer would run in 32MB of RAM.

Don't forget those ISA slots if you get an old DOS PC. Cristoph's card or the HP 82973A ISA card it clones work really well with JF's EMU41 and EMU71.

Regards,  
Howard

I have used a 9114 (either version, A or B) with an HP41 with the 82160 HPIL module and no other ROMs.

The normal PC hardware can be programmed to read (and write) a LIF formatted disk, but standard PC software doesn't do it. That's why you need the LIFUTILS package or equivalent.

**Re: Need crash course in HP41 HP-IL stuff**

I have communicated with my prospective seller, and even though he has an Extended IO module, it is more expensive than the drive itself and I have decided if I can live without it he should hang on to it for now. Frankly, looking at the HP-IL manual, it seems I am interested really in only four mass storage commands--NEWM, to format the floppies, WRTP to write programs to the floppies, READP to recall them to the calculator, and DIR to see what's on the disk. If I get into the RS232 interface, I will need the extended functions IO, but right now since I am just interested in basic reading and writing to disk I will spare myself the extravagance of the expensive module but consider myself lucky to find a 9114 drive from a considerate collector at a good price.

Les

What kind of problems did you have? I used my 82161A drive a lot in the 1980's and never had any problem of any kind with it or the tapes. It proved to be 100% reliable. The cost per kilobyte was sure high though! OTOH, a kilobyte went a long way on a 41.

I haven't used the tape drive in years though, even though I use my 41 every day, because the 41cx has enough memory to simultaneously hold all the programs I need and it never loses memory. (One program I often use has been in the 41's memory continuously for almost 20 years.) I don't have the card reader. What I've been doing in recent years is to write programs in a text editor on the PC so I can put more than one instruction on a line and add lots of comments, and when I'm happy with it, key it into the 41, where it stays until I'm done with it. With the 71 nearby and the other computers around however, my HP-41

programs these days are seldom even 100 steps; and in the unlikely event that I accidentally delete one before I'm done, the small amount of time it would take to key it back in would be trivial compared to the time and money and uncertainty involved in buying a tape drive on eBay if I didn't already have one.

It was probably fine when the tapes were new...

The problems I have had (and in fact I wrote an article in Datafile (HPCC journal) several years ago about this) include :

The pressure pad in the cassette decaying and no longer holding the tape against the read/write head

The tape coming detached from the leader

The tape shedding oxide.

Even NOS tapes can suffer from the above, and the tapes haven't been made for years AFAIK.

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #16 Posted by **Howard Owen** on 8 Mar 2007, 1:53 p.m.,  
in response to message #1 by Les Wright*

I second much of what Tony said. I can confirm that the RS232 interface works with Linux (and Windows XP) and a USB to serial adapter. I was able to make the connection without extensive cable hacking, other than a 25 to 9 pin adapter and a 9 pin gender bender.

The simplest solution for getting software *from* your 41 *to* your PC is the 9114 floppy, as Tony points out. I've had less luck going the other way with just the floppy drive. What I use for that is an old PC (Pentium II/400, 256 MB of RAM) that has a single ISA slot. In that I place one of Cristoph Klug's HP-IL ISA cards. I drive it from Debian Linux directly, or via DOSEMU/FreeDOS, which are a Free Software 286 emulator and DOS 6.22 work alike respectively. In this environment I run various tools, but especially JF Garnier's 41 and 71 emulators. These give me complete flexibility in moving bits around between the 20th and 21st centuries.

I also agree that the extended I/O ROM makes the 41 a lot more capable with HP-IL. Unless you are motivated to collect old ROMs, I would suggest you look into acquiring a NovRAM32 or MLDL2000 rather than the ext-io ROM itself. These can be loaded with a variety of old ROMs from images available on the Internet. They are no doubt much cheaper than any classic MLDL you might find on eBay or elsewhere, and they each come with software to talk to a modern Windows PC. In fact, beating around the bush a little, you could configure either device to emulate a HEPAX with some RAM pages, and fill the latter (using the hex/binary representation) with all the user code you could stuff into them. That would solve the bidirectional file transfer issue in a very cool but geeky way. 8)

Good luck!  
Howard

For HP41 & HP-IL I recommend :

IL-Module + Clonix or NoVRAM with ROM image of the EXT-I/O Module

EMU41 fom Jean-Francois Garnier in combination with the HP-IL/PC Interface Card (needs ISA slot) or alternatively the RS232 gateway

Best wishes - Christoph Klug

\_\_\_\_\_

Is it really that complex? I did just download LIFUTL and it runs nicely on my PC, and appears to read the floppy drive fine. I am also very adept with Leo Duran's utility, and have no trouble creating raw files and barcode, so creating LIF files and moving them onto a disk can't be too terribly difficult.

I guess I will just have to acquire a 9114 drive and experiment. To start, I would be happy just to have the mass storage capability of the floppies, even if I can never use them as a transfer medium with the PC.

Les

Message #19 Posted by [Howard Owen](#) on 9 Mar 2007, 6:41 p.m.,  
in response to message #18 by Les Wright

I've had trouble writing files with LIFUTIL. I don't recall at the moment what exactly the issue was. I didn't try awfully hard because I went ahead with the ISA card solution, which I would have pursued anyway for the sheer geekly joy of it. 8) But that means I may have given up on LIFUTIL prematurely.

The 9114 is a very nice add on. It's the fastest and most convenient mass storage you can get for the 41C/71B/75C/Portable, in addition to being at least half of a file transfer solution.

I have hit the motherlode and a fellow contributor to our community is willing to pass on a 9114 drive for what I consider a very excellent price.

But it needs an adapter and I want to make sure I have the right ones.

I have two 82059B adapters for use with my HP97, dead 82143 printer, and HP-IL thermal printer when I get it. I know this adapter is compatible with the 9114B, but is it usable with other versions of the 9114 in the event that the drive I am getting is not the 9114B? In other words, did all versions of the 9114 drive have the same AC jack and thus took the same adapter?

Many thanks,

Les

*Message #23 Posted by [Howard Owen](#) on 9 Mar 2007, 6:58 p.m.,  
in response to message #22 by Les Wright*

The power adapters went through many revisions, but all the ones I've tried (I have about a dozen) are interchangeable. HP used that for many, many computers and peripherals. Here are the ones I know about:

- HP-97 (91, 92, 95C and 97S?)
- 41C rechargeable battery pack
- HP 82143A HP-41C Printer
- HP 82161A Cassette Drive
- HP 82162A Printer.
- HP 82163 HP-IL Video interface
- HP 82164A HP-IL/RS232-C Interface
- HP 82169A HP-IL/HP-IB Interface
- HP 9114/9114B Disc Drive
- HP 75C/D
- HP 71B
- HP 110 Portable and Portable Plus
- HP 2225B Thinkjet Printer

Those are the ones that I know first-hand use the 82059[ABCD] power supply (or their equivalents for the rest of the world.) I'm sure I'm missing several others.

Regards,  
Howard

> But it needs an adapter and I want to make sure I have the right ones.

a) this discussion applies to both 9114A and 9114B. The two models have a lot of differences but they take the same battery packs, floppies etc.

b) The 9114 does not connect directly to the HP82059B adapter. The 82059 connects to the battery pack which in turn slots inside the 9114 battery bay.

As such, an unmodified 9114 without a battery pack is dead in the water. Having said that, I recall seeing (I think on eBay) pictures of an 9114 with an external (home made) power supply which bypassed the battery entirely.

BTW the 82059 cannot, on its own, provide enough power to operate the 9114, it needs a working battery inside the battery pack.

9114 battery packs contain a lead-acid battery which is difficult to replace, but I recall an another thread (couple of years ago) in this forum discussing 9114 batteries.

a) this discussion applies to both 9114A and 9114B. The two models have a lot of differences but they take the same battery packs, floppies etc.

I thought the -A battery pack should only be used in the 9114A, but the -B pack could be used in either. Why I don't know, the difference is in the charger circuit (inside the battery pack).

Incidentally, the battery packs for the 9114 are probably dead by now and will need rebuilding. It's a 6V lead-acid battery, the pack originally contained a 'block battery', but 3 2.5Ah Cyclon cells fit perfectly into the housing and seem to be easier to obtain.

Quote:

b) The 9114 does not connect directly to the HP82059B adapter. The 82059 connects to the battery pack which in turn slots inside the 9114 battery bay.

As such, an unmodified 9114 without a battery pack is dead in the water. Having said that, I recall seeing (I think on eBay) pictures of an 9114 with an external (home made) power supply which bypassed the battery entirely.

The battery pack connects to the rest of the 9114 via a 2-pin 'mini Jones' connector inside the cavity that the pack fits into. Electrically the socket on the battery pack is connected to the terminals of the lead-acid battery (with a fuse in series, actually).

If you feed 6V DC with the correct polarity to the plug in the drive, the unit will work. That 6V can come from a specially-designed mains power supply. I made up a cable to link the 9114 to my workbench adjustable PSU, works fine.

Quote:

BTW the 82059 cannot, on its own, provide enough power to operate the 9114, it needs a working battery inside the battery pack.

Correct

Quote:

9114 battery packs contain a lead-acid battery which is difficult to replace, but I recall an another thread (couple of years ago) in this forum discussing 9114 batteries.

Difficult to replace or difficult to obtain? Actually fitting the replacement battery is not hard, getting the original type, I believe, is.

*Message #30 Posted by **Les Wright** on 11 Mar 2007, 9:37 p.m.,  
in response to message #29 by Howard Owen*

Thanks for all of the information.

I have written my prospective seller and advised him that I know nothing of the electrical or electronic nuances of these things and to clarify what, if anything, I need in order to use the drive. My understanding is that I would need my own 82059B power source since he didn't have a spare one. I also was of the impression that said power source was mandatory to power this thing since, to quote him directly, "their accus are all dead, so you need to use a power cable". I have no idea what an "accu" or "accus" is--I assumed he was referring to the lead acid battery cells. I assumed by power cable he meant the standard HP82059B adapter and nothing more fancy. If he uses a customized arrangement to power his 9114 drives that bypasses the need for working batteries, I need to know what it is to see if I can replicate it.

I have written the gent and have been candid with him as to my perplexity. From him, I seem to be hearing "batteries are dead but everything works fine on AC" yet in this thread I am hearing "drive won't work with dead batteries even with AC plugged in". And you all seem very credible to me! The good news is that if all this thing needs is a replacement SLA cell to drop inside the existing battery pack, these things seem readily available.

Money has not yet changed hands and I am confident all questions will get settled before it does.

Thanks for all of your time on this.

Les

**Re: Need crash course in HP41 HP-IL stuff**

*Message #31 Posted by [Howard Owen](#) on 11 Mar 2007, 10:02 p.m.,  
in response to message #30 by Les Wright*

I have run a 9114 on a dead cell - or at any rate, a cell that wouldn't power the device on its own - with an attached 82059 transformer. I'm guessing that there are degrees of "dead." That would allow for what Vassilis said being true at the same time as your seller's statement, even though they seem to contradict each other.

Bottom line, if your seller says it works, then he's representing that it will work for you. If this is a fellow collector, then odds are he will make things right one way or the other.

Regards,  
Howard

*Message #32 Posted by [Garth Wilson](#) on 12 Mar 2007, 1:24 a.m.,  
in response to message #30 by Les Wright*

I've never had a 9114, but I suspect it uses the same NiCd battery pack the Thinkjet used. When mine died, I wasn't about to pay what they were asking for a new one (something like \$37), and until I made myself a power supply for it, I actually ran it off a 9V alkaline battery a little bit. Then I built the power supply for fifty cents. I had everything I needed except one diode, and the diode was \$.50.

The one thing I didn't like about the tape drive was that it was not made to use standard alkaline batteries. Left to log data in a remote location unattended, a full charge was only good for 4 hours, whereas alkalines would have allowed it to go a whole work day.

Alas not. The Thinkjet takes a 7.2V NiCd pack (6 off sub-C cells in series, with a fuse and a little charger circuit in the case), the 9114 takes a 6V lead acid battery.

They're physically different too, of course -- the Thinkjet has a couple of metal contacts on the pack and spring terminals in the printer, the 9114 has that 2-pin Jones plug I mentioned.

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #34 Posted by [Meindert Kuipers](#) on 12 Mar 2007, 2:26 p.m.,  
in response to message #30 by Les Wright*

Seems like your seller is European. The term 'accu' is typically used for a rechargeable battery, probably NiCad. Same for the power cable, I think it is the adapter.

Meindert

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #35 Posted by [Les Wright](#) on 12 Mar 2007, 5:46 p.m.,  
in response to message #30 by Les Wright*

I have gotten some clarification from the seller, and it appears that the unit at least powers up on AC power, so maybe the batteries are not completely flat just yet. However, the seller uses other mass storage media for daily work so the 9114 has not had recent routine use. I was of the impression that this was an active-service unit that is functioning fully off of AC power despite dead or near dead batteries. This little bit of wishful thinking stems entirely from my misinterpretation of the information provided-- the seller made no such representation. So you can see now the source of my perplexity-- it comes entirely from my misapprehension of the information provided. The seller never made any such claims, and the confusion that ensued is due entirely to me.

If the seller hasn't become totally exasperated with me by this point, I hope to take the unit on an as-is basis, since it really is a very very good deal in any case. The best case scenario I envision is that all it really needs is new SLA cells, which seem to be readily and inexpensively available. As for testing the read/write capacity of the unit, this will be sort of jumping off a cliff at first. I have been advised that in some of these old units the drive heads can stick to the surface of the floppy and there is a risk of damaging the heads if one removes a disk too vigorously or quickly. I have had the exact experience in the floppy drive of an old Hitachi laptop, and I am not keen to repeat it!

Thank you so much for all of the information and clarification. I will let everyone know how it all works out.

Les

### **Re: Need crash course in HP41 HP-IL stuff**

*Message #36 Posted by [Vassilis Prevelakis](#) on 13 Mar 2007, 1:43 a.m.,  
in response to message #35 by Les Wright*

If you are going to mess with the battery pack, please remember:

- 1) There are two Torx screws on the top cover (on either side of the latch -- picture 1)

2) Assuming the two screws are on the side away from you, the other three sides of the cover have small protrusions that help secure it to the base. Be sure not to break any of them.

Apart from these warnings (and the Torx screwdriver) changing the battery inside the pack is trivial (its not even soldered).

Also, Tony Duell wrote:

```
> Difficult to replace or difficult to obtain?  
> Actually fitting the replacement battery is not hard,  
> getting the original type, I believe, is.
```

Yes.

\*\*vp

-----

Sorry for the horrible quality of the pictures, I used my idiotic phone.

Picture 1: Shows the battery pack connected to the external charger. Note the two Torx screws on the top cover, on either side of the latch.

<http://www.series80.org/Misc/9114-bat-3.jpg>

Picture 2: You can see the PowerSonic lead-acid battery pack with the charger circuit next to it. The two leads are connected to the battery via spade connectors so no soldering.

This is very helpful, thank you!

This is a repair that I could probably manage, given the correct tool and the correct replacement cell.

Since the mystery of the battery (actually, mysterious only to me) has been settled, I wonder if there is any wisdom out there regarding the care of the disk mechanism and drive heads themselves. I have been chagrined to learn that the 9114 (more so than the 9114B) is vulnerable to drive heads sticking to disk media and getting torn out with ejection of the disk. Is this a preventable problem? Is there anyway to diagnose an incipient problem before it occurs? I have asked the prospective seller to inspect this if he can, since I would be deeply mortified to separate this beloved unit from a collection only to irreversibly destroy it the first time I insert a disk! The seller has prudently reminded me that sometimes great care and patience is required to coax these old machines back to full function, and I really don't want to go blundering into that disk drive like a bull in china shop. So if you have any other wisdom or

experience to share, I would be grateful. For example, is it possible to clean the drive mechanism and/or prepare the floppies so as to minimize the risk of permanent damage to the heads?

Grateful as always for your patience and kind advice.

Les

> problem?

I bought 3 9114 units about 5 years ago (two 9114B and one 9114A) and they all had bad packs and stuck loading mechanisms.

I know nothing about the 9114 then, but I was lucky and the drives were OK. I had to take apart the drives to lubricate the loading mechanisms and also replace the lead-acid cells on their packs.

The 9114 box also uses Torx screws and since the screws are deeply recessed unless you have a long Torx screwdriver you will have a lot of trouble removing them.

Once the box is open you will see the motherboard on one side and the floppy drive mechanism. Although it looks like a PC floppy mechanism, it is not! So be careful not to damage it.

Tony has posted a detailed explanation on how to take the drive apart to lubricate the parts, but I can't find it now (it could have been about the floppy drive for the Integral PC which uses the same device as the 9114B).

BTW please do not use WD40 on the drive though!

*Message #39 Posted by **Dan M (Vermont, USA)** on 13 Mar 2007, 2:12 p.m., in response to message #38 by Vassilis Prevelakis*

As far as I know, the Torx screws in 9114 drives and battery packs are size T9. So make a note of that before you go to the tool shop. For some reason I have sizes T8, T9, and T10 near my HP stuff. T6 is/was useful for taking apart (and reassembling!) cell phones.

Have fun,

Dan M.

*Message #40 Posted by [Tony Duell](#) on 14 Mar 2007, 5:57 a.m.,  
in response to message #39 by Dan M (Vermont, USA)*

TX6 is also the size you need to take a HP71B apart.

**Re: Need crash course in HP41 HP-IL stuff**

*Message #41 Posted by [Tony Duell](#) on 14 Mar 2007, 5:56 a.m.,  
in response to message #38 by Vassilis Prevelakis*

The 9114A is prone to having dried-up grease on the loading mechanism, and if it's not caught in time, the top head will catch in the disk shutter when you eject the disk and will be ruined.

I'd always dismantle an 'unknown' 9114A (or any other machine that uses a similar drive) and clean off the grease. I wrote an article on how to do this (step-by-step with pictures) in the V26 N1 issue of Datafile (HPPC journal). If you ask the editor nicely, he might send you a copy of said article, I certainly have no objections to it being more widely distributed.

I can talk you through taking the casing, etc, apart if you have problems doing that.

**Re: Need crash course in HP41 HP-IL stuff**

*Message #42 Posted by [Eric Smith](#) on 14 Mar 2007, 1:51 p.m.,  
in response to message #41 by Tony Duell*

Does the 9114B require any similar precautions?

**Re: Need crash course in HP41 HP-IL stuff**

*Message #43 Posted by [Tony Duell](#) on 15 Mar 2007, 2:20 p.m.,  
in response to message #42 by Eric Smith*

I don't think the 9114B's drive suffers in the same way. It's a totally different design to the full-height drive used in the 9114A, in fact it's mechanically similar to an Apple Mac 800K drive. Even some of the electronic parts are the same.

I've never had any problems with the eject mechanism of the 9114B sticking, but if anyone's seriously interested, I can take my 9114B apart sometime and do a photoshoot and thus write an article. But I doubt very much if it will appear in Datafile.

**Re: Need crash course in HP41 HP-IL stuff**

*Message #44 Posted by [Eric Smith](#) on 15 Mar 2007, 6:43 p.m.,  
in response to message #43 by Tony Duell*

That would be interesting. I enjoyed your article in Datafile on the 9114A drive. I have not yet decided whether I dare try maintaining my 9114A drives myself, as I am not very mechanically inclined, but without your article I would not even have considered it.

Same charger, same battery pack. Be sure to have a working battery in the 97, otherwise it will behave strangely--even on AC, the 97 needs a working battery back installed to properly complete the circuit and work correctly.

Les

From Woodstock to Spice they went from the best industrial design they'd ever done to the

worst, presumably all in the interest of cost reduction. The press-fit construction cost them so much for warranty repairs that they redesigned it to be soldered.

They apparently really learned from that, as the industrial designs of the 41C and original Voyager series are very good and that of the slightly later Voyagers (single PCB) is excellent.

Unfortunately things started going downhill again in the 1990s, as HP moved away from double-shot injection molded key legends and metal snap discs.

Since almost no one will spend more than \$100 now for a calculator, and \$100 now is the equivalent of only about \$40 in early 1980s dollars, it's a reasonably safe bet that no calculators with industrial design approaching those of the Woodstock, 41C, or early-mid 1980s Voyagers will ever be mass-marketed again.

### **RE: Good books on MICROPROCESSORS and Integrated Circuits?**

Message #1 Posted by [Frank E. Travis](#) on 7 Mar 2007, 3:16 p.m.

I have a Bachelor of Science degree in Math/Computer Science from 1982 and 3 years of Computer Information Sciences (CIS) classes from a community college in the 1990s. My understanding is mainly software, although I have *Repairing & Upgrading Your PC*, as well as *Building the Perfect PC* (2nd ed.), both by O'Reilly publishing. I want to gain a greater understanding of how microprocessors work (but not too technical) and how integrated circuits work in today's computers and electronic devices. I purchased several Schaum's outline (and other related types of books), but these focus on the mathematics involved in finding the unknown resistance, inductance, etc. My main source of book reviews is [www.amazon.com](http://www.amazon.com) and [www.bn.com](http://www.bn.com). Any feedback in this matter is greatly appreciated.

A good book on general electronics (not specifically microprocessors, although they are covered) is

The Art of Electronics

by Horowitz and Hill

There's a companion book of experiments ('The student manual for the Art of Electronics' or some similar title) which is good too, but as it was written for a university course, it assumes you have access to reasonable test gear. But IMHO worth reading even if you can't do the experiments.

Be warned that neither book is cheap, but I find them to be clearly written, 'practical', and thus easy to follow.

**Re: RE: Good books on MICROPROCESSORS and Integrated Circuits?**

*Message #7 Posted by **Ren** on 13 Mar 2007, 4:35 p.m.,  
in response to message #1 by Frank E. Travis*

Going beyond "a book", I recommended a microprocessor trainer.

I think you should consider one (or more!) to gain "hands-on" experience with microprocessors. Unlike a PC, you will be entering assembly language and actually wiring up input/output ports.

A couple of decades ago u-processor trainers were all the rage, mainly because they were 8-bit so they were simple enough to understand. Personally I have Intel SDK's (System Development Kit) for the 8080, 8085, and 8086 UPC's. I also have a couple for the Motorola 6805 family. One in particular is the Lab-Volt System 348 which appears on eBay periodically. More recently, development kits for PIC's and Atmel processors are available.

Let me know if this is what you had in mind.

Sincerely,

Ren

dona nobis pacem

*Message #8 Posted by **Frank E. Travis** on 14 Mar 2007, 11:14 a.m.,  
in response to message #7 by Ren*

Thanks for your input. It appears as if The Art of Electronics (2nd ed.) ISBN # 0521370957 that was mentioned earlier is what I am looking for. A local branch of the Detroit, MI Public Library is trying to inter-loan it for me (for a \$3 fee) from one of the University Libraries in the state of Michigan that has it.

This book gets rave reviews on both [www.bn.com](http://www.bn.com) and [www.amazon.com](http://www.amazon.com). One of the librarians who is working on trying to inter-loan this book said that her husband (who designs electronic circuitry) borrows a copy of it from a friend of his every now and then. This book retails for about \$95. If it was more reasonably priced I probably would have bought it. I remember working with Microprocessor boards in college in 1981 and 1982 (LEDs and Assembly language programming). I have not really used Assembly language programming since the 1980s. Does any new type of training device exist which covers more modern microprocessors and integrated circuits (such as Intel Pentium 4, Core Duo, and well as AMD Athlon)?

### **KEY command with 50g and 39g**

Message #1 Posted by [Eddie Shore](#) on 7 Mar 2007, 10:01 a.m.

Say if I want the calculator to display random numbers to no end until the user presses a key.

If I create a game where the user "stops" the calculator to win (cyber)bucks.

The amounts for example would be "\$500", "\$1,000", "\$2,500", "\$5,000", "\$0} to be displayed randomly for a second. When the user presses any key, the "wheel" is stopped and you get a message "You win \$x!".

Any help is much appreciated, Eddie

[ [Return to Index](#) | [Top of Index](#) ]**HP-15C Mini-Challenge: Bits o'Pi**Message #1 Posted by [Valentin Albillo](#) on 7 Mar 2007, 9:12 a.m.

Hi, all:

A new month's just begun, the Spring is nearing, and before posting my traditional "*S&SMC 2007 Spring's Special*" next April, 1st, I'll submit for your consideration this petite & nifty

**HP-15C Mini-Challenge: Bits o' Pi**

(Well, not actually of Pi proper but it's *reciprocal*,  $1/\text{Pi} = .31830988618379\dots$ )

You're asked to write a program for the **HP-15C**, which must be *as short as possible*, take no input, and upon running *it must produce in order the bits of 1/Pi*, i.e.: the binary digits of 1/Pi when expressed in base 2.

**Notes:**

- As  $1/\text{Pi} = .31830988618379\dots = .010100010\dots$  in base 2, your program should work like this:
 

```
GSB A -> 0 -> 1 -> 0 -> 1 -> 0 -> 0 -> 0 -> 1 -> 0 -> ...
```
- The HP-15C being a 10-decimal digit calculator, your program is expected to produce *at least the first 30 correct bits of 1/Pi* (but the more the merrier of course, subject to minimum program size).
- Your program can assume any necessary display or angular modes are in effect (such as FIX 0 or radians mode, etc.) if required, no need to set them up in code. It must not assume any other requirements at all, such as specific registers' or stack's contents.

**Extra-Goals !**

As Bill has quickly succeeded in achieving the original goal with his 11-step, 31-bit solution (see his post below; congratulations, Bill !), I've added the three following additional goals, namely:

▪ **Goal 2:**

To improve upon Bill's solution to get *more than 31 bits* in 11-steps or less.

▪ **Goal 3:**

To get a solution in 11 steps or less and which can produce at least 30 correct bits, *without using the [Pi] function*.

▪ **Goal 4:**

To get a solution in 11 steps or less and which can produce at least 30 correct bits, *using neither the [Pi] function nor the [1/x] function*.

Well, give it a try. It may seem simple, even trivial, but let me assure you that there's more than meets the eye, and you'll be hard pressed to come up with the *shortest* possible HP-15C program to deliver what's asked.

If you don't have a physical HP-15C at hand, you can download Nonpareil for free, which provides a perfect HP-15 virtual replica, and you're of course welcome to use any other HP (or SHARP, say) model although in such case the shortest code will certainly vary a lot.

As always, within a few days I'll post my original solution (plus comments) which is an *11-step HP-15C-specific program* (including LBL A at the beginning but no RTN instruction at the end, as always) which meets the above requirements and correctly produces *the first 34 bits of 1/Pi*

**Note:**

For the sake of it, I'll also post a 27-character command-line expression for the HP-71B (i.e., slightly over 1/4th of a full-length line) which outputs even more correct bits; no ROMs required, just a bare-bones HP-71B. See if you can duplicate that as well ! :-).

Best regards from V.

in response to message #1 by Valentin Albillo

Hi Valentin,

Since I used the snow today as an excuse to skip work, I get a chance to try one of your wonderful HP-15C mini-challenges.

The following is an 11 line program for the HP-15C which is good to 31 digits.

```
LBL A
PI
1/X
LBL B
2
*
ENTER
INT
R/S
-
GTO B
```

Thanks again for an enjoyable challenge.

Bill

in response to message #3 by Valentin Albillo

Nice one Bill!

i like bill's answer. in fact, if he's allowed to also assume FIX 0. can't his solution be presented in 10 steps as,

```
LBL A
2
PI
/
LBL B
R/S
FRAC
2
*
GOTO B
```

furthermore, by taking the  $2/\pi$  out, this form should be more accurate than his original (don't have my 15 here to test unfortunately). ??

### Re: HP-15C Mini-Challenge: Bits o'Pi

Message #5 Posted by **Bill (Smithville, NJ)** on 8 Mar 2007, 7:26 a.m.,  
in response to message #4 by hugh steers

Hi Hugh,

Quote:

\_\_\_\_\_  
Nice one Bill!

Thanks. I normally don't have the time to do Valentin's challenges justice.

Quote:

\_\_\_\_\_  
in fact, if he's allowed to also assume FIX 0

Unfortunately, the display is rounded up, so 1.55 displays as 2 and not binary digit 1. Likewise, 0.55 would display as 1 instead of 0.

Bill

### Re: HP-15C Mini-Challenge: Bits o'Pi

Message #6 Posted by **Bill (Smithville, NJ)** on 8 Mar 2007, 10:47 a.m.,  
in response to message #1 by Valentin Albillo

I've tried a couple of PC programs to calculate the binary sequence for  $1/\pi$  and have come up with the following for the first 50 bits:

```
Bits 1-10      0101000101
Bits 11-20     1111001100
Bits 21 - 30   0001101101
Bits 31 - 40   1100100111
Bits 41 - 50   0010001000
```

Could someone please verify that I have it correct?

Thanks,

Bill

### Re: HP-15C Mini-Challenge: Bits o'Pi

Message #7 Posted by **GE** on 8 Mar 2007, 12:23 p.m.,  
in response to message #6 by Bill (Smithville, NJ)

I see an interesting formula on <http://mathworld.wolfram.com/PiFormulas.html> :

$$1/\pi = \sum_{n=0,+\infty} \text{Comb}(2n,n)^3 \cdot (42n+5) / 2^{12n+4}$$

The point is that the denominator is a power of 2, thus a simple shift.

No idea on how to apply it on the 15C, however, as the conversion of the numerator  $[\text{Comb}(2n,n)^3 \cdot (42n+5)]$  into binary would be quite a feat IMHO.

### Re: HP-15C Mini-Challenge: Bits o'Pi

Message #8 Posted by **GE** on 20 Mar 2007, 5:14 a.m.,  
in response to message #7 by GE

No takers ? I typed that formula and it doesn't work well.

Actually the term in that sum actually diverges !!

Thinking that this is "An infinite sum due to Ramanujan" (formula number 74), I wonder if Ramanujan was wrong, which is possible, or if Wolfram typed it wrong.

An uneasy feeling in any case, first time I find an error on the Mathematica Web site.

**Re: HP-15C Mini-Challenge: Bits o'Pi**

Message #9 Posted by [Rodger Rosenbaum](#) on 20 Mar 2007, 6:07 a.m.,  
in response to message #8 by GE

I don't get the result that you do.

I find that the first 7 terms give 12 accurate digits of 1/PI.

They are: {.3125,.0057373,.000071615,9.5315E-7,1.31759E-8,1.86518E-10,2.6833E-12}

**Re: HP-15C Mini-Challenge: Bits o'Pi**

Message #10 Posted by [Valentin Albillo](#) on 20 Mar 2007, 7:15 a.m.,  
in response to message #8 by GE

Hi, GE:

GE posted:

*"I typed that formula and it doesn't work well."*

You don't work well ! :- ) Try this straightforward HP-71B implementation:

```
10 DEF FNC(M,N)=FACT(M)/FACT(N)/FACT(M-N)

20 DESTROY ALL @ S=0 @ FOR N=0 TO 10 @ S=S+FNC(2*N,N)^3*(42*N+5)/2^(12*N+4)
30 NEXT N @ DISP S,1/S

>RUN

.318309886185      3.14159265358
```

You should really double-check your work before publicly labeling other people's as wrong :-)

Best regards from V.

**Re: HP-15C Mini-Challenge: Bits o'Pi**

Message #11 Posted by [GE](#) on 21 Mar 2007, 9:27 a.m.,  
in response to message #10 by Valentin Albillo

Sorry for some unwarranted criticism, I looked again at the convergence of terms and searched for the limit of the term for  $n \rightarrow \infty$ . After more research I found it to be equivalent to  $2^{(-6n)}$  which DOESN'T diverge...

So you're right this series has a limit.

I'll try to program this in BASIC.

**Re: HP-15C Mini-Challenge: Bits o'Pi**

Message #12 Posted by [Valentin Albillo](#) on 8 Mar 2007, 8:37 p.m.,  
in response to message #6 by Bill (Smithville, NJ)

Hi, Bill:

Your 50 bits are correct and there you are, 50 more:

```
1-10   0101000101
11-20  1111001100
21-30  0001101101
31-40  1100100111
41-50  0010001000

51-60  0010101001
61-70  0100111111
71-80  1000010011
81-90  1010101111
91-100 1010001111
```

These were produced by my program running in a multiprecision environment. The 11-step HP-15C version can produce the first 34 bits (*in bold face above*) correctly.

Best regards from V.

Message #13 Posted by **Karl Schneider** on 9 Mar 2007, 12:30 a.m.,  
in response to message #12 by Valentin Albillo

One way to get the 11th and 12th significant digits of pi from an HP-15C (or HP-41, HP-10C, HP-11C, or Spice-series scientific) is to take the sine of pi radians. The second digit is rounded to 9.

Now, how to incorporate that without adding steps is not clear to me, so there might be another way.

### Re: HP-15C Mini-Challenge: Bits o'Pi

Message #14 Posted by **Bill (Smithville, NJ)** on 8 Mar 2007, 11:45 a.m.,  
in response to message #1 by Valentin Albillo

Hi Valentin,

For Goal 2 & 3, I have a 12 step solution that gives 33 bits without use of PI.

RAD MODE

```
LBL A
1
ASIN
1/X
LBL B
ENTER
INT
R/S
-
2
*
GTO B
```

Now how do I get rid of that 12th step :)

And how do I do it without 1/X.

Something to mull over during lunch hour.

Bill

### Re: HP-15C Mini-Challenge: Bits o'Pi

in response to message #14 by Bill (Smithville, NJ)

Hi Bill,

Congratulations for you nice routines!

Quote:

Now how do I get rid of that 12th step :)

I wish I knew! Anyway, another 12-step solution, in case it might be helpful:

RAD MODE

```
LBL A
CLEAR SIGMA
ACOS
1/x
LBL 0
STO+ 2
RCL 2
INT
R/S
STO- 2
```

RCL 2  
GTO 0

Regards,

Gerson.

### Re: HP-15C Mini-Challenge: Bits o'Pi

Message #18 Posted by [Karl Schneider](#) on 10 Mar 2007, 7:31 p.m.,  
in response to message #1 by Valentin Albillo

There are quite a number of ways to calculate pi or its inverse without using the "pi" or "1/x" functions. Some of these can even utilize the complex-number mode, such as

```
(flag 8 clear)
```

```
2
ENTER
Re<->Im
COS-1
CF 8
*
```

gives pi in any angular mode.

Since not to use those functions would add steps, obtaining solutions to the additional goals would lengthen the programs. If there is a super-simple way to calculate the specific digits of a number, I don't know what it is.

Instead, I will utilize some of the HP-15C's built-in programming that can minimize the total amount of code for three of the objectives. The driver program in each is less than 11 steps, not counting the modified "Bill" program that is run as a subroutine labeled in his honor as "B". :-)

```
(in radians mode)
```

```
LBL B
2
*
ENTER
INT
R/S
-
x=0?
RTN
GTO B
```

| Goal 1                             | Goal 2               | Goal 3  | Goal 4  |
|------------------------------------|----------------------|---|---|
| LBL A<br>PI<br>1/x<br>GSB B<br>RTN | LBL C<br>????<br>RTN | LBL D<br>1<br>CHS<br>COS <sup>-1</sup><br>1/x<br>GSB B<br>RTN | LBL E<br>1<br>CHS<br>ENTER<br>COS <sup>-1</sup><br>x<>y<br>y <sup>x</sup><br>GSB B<br>RTN |

Granted, these may not be admissible solutions, but do show some thought...

*Edited: 10 Mar 2007, 7:55 p.m.*

## Re: HP-15C Mini-Challenge: Bits o'Pi

Message #19 Posted by [Gerson W. Barbosa](#) on 10 Mar 2007, 8:49 p.m.,  
in response to message #18 by Karl Schneider

Hello, Karl!

Quote:

There are quite a number of ways to calculate pi or its inverse without using the "pi" or "1/x" functions.

```

.          .          1
5          5          8
x!        CHS        0
x^2       x!        ->RAD
4
*         x^2

```

Also give pi, regardless of the angular mode and flag settings. With so many extra steps, none of these is likely to be part of Valentin's solution though.

Best regards,

Gerson.

## Re: HP-15C Mini-Challenge: Bits o'Pi

Message #20 Posted by [Bill \(Smithville, NJ\)](#) on 10 Mar 2007, 11:28 p.m.,  
in response to message #18 by Karl Schneider

Hi Karl,

Quote:

not counting the modified "Bill" program that is run as a subroutine labeled in his honor as "B". :-)

Thank you. I am honored :)

I've come up with a 13 step program that meets Goal 4 and is good to 33 bits:

```

RAD MODE

LBL A
CLEAR SIGMA
ACOS
SIGMA+
RCL / 3
LBL B
ENTER
INT
R/S
-
2
*
GTO B

```

Still too many steps. I just can't see how to reduce them.

Bill

*in response to message #1 by Valentin Albillo*

Hello Valentin,

Quote:

I'll also post a *27-character command-line expression* for the HP-71B

This is not so short as yours, but works:

```
X=1/PI@KEY"A", 'X=2*X@DISPMOD(IP(X),2)':
```

After pressing ENDLINE each successive press of the "A" key on the user keyboard (f USER), will display the following correct bits, one at a time:

```
0101000101111110011000001101101110010011
```

39 bits, the same length of the command-line expression! Wouldn't it be better just hard-coding the bit string? :-)

Best regards,

Gerson.

Hi, Gerson:

Gerson posted:

*"39 bits, the same length of the command-line expression! Wouldn't it be better just hard-coding the bit string? :-)"*

Possibly, but the 27-character solution is shorter than the equivalent string formed by the concatenation of the "0"s and "1"s it outputs.

BTW, the 27-char HP-71B version, being just my HP-15C's 11-step RPN program translated to HP-71B's BASIC native language, it also lacks both division ("1/X") and PI. It includes a conditional, though :-)

Thanks for your interesting idea, see if the above gives you any usable hints and

Best regards from V.

### Re: HP-15C Mini-Challenge: Bits o'Pi

Message #27 Posted by [Gerson W. Barbosa](#) on 11 Mar 2007, 8:43 p.m.,  
in response to message #26 by Valentin Albillo

Hello again Valentin,

Quote:

the 27-character solution is shorter than the equivalent string formed by the concatenation of the "0"s and "1"s it outputs.

When I talked about hard-coding the binary string I was referring to my *lengthy* solution.

Quote:

Thanks for your interesting idea

Actually, rather than an idea that was the result of an experimentation. I took 1/pi and observed what happened to the integer part each time it was doubled. It was easy to notice that when the integer part was odd then the corresponding binary digit was

"1"; when it was even the binary digit was "0":

```
0.318309886 * 2 -> 0.636619772 -> 0
                -> 1.273239544 -> 1
                -> 2.546479088 -> 0
                -> 5.092958176 -> 1
                -> 10.18591635 -> 0
                -> 20.37183270 -> 0
                -> 40.74366540 -> 0
                -> 81.48733080 -> 1
```

and so on...

Hence,

0.318309886 (base 10) = 0.01010001 (base 2).

So, the first  $m$  binary digits of a fractional base 10 number  $n$  can be obtained with this simple algorithm:

```
k := 0;
repeat
  k := k + 1;
  n := n * 2;
  dk := mod(int(n),2)
until k = m
```

Unfortunately, it may not be so efficient on the HP-15C, due to the lack of MOD function. I don't think an 11-step solution is possible even on the HP-33S, which has the RMDR function. Anyway, it appears to be simpler than other algorithms. Of course, this has yet to be proven, but I'll leave that as an exercise for the interested reader :-)

Best regards,

Gerson.

P.S.:

I've just tested the algorithm on Turbo Pascal 3 (does anyone still remember it? :-)

Here is the result:

```
program dec2bin;
var k,m: integer;
    n: real;
begin
  k:=0;
  m:=16;
  n:=0.3183098861;
  ClrScr;
  WriteLn(n:11:10);
  WriteLn;
  repeat
    k:=k+1;
    n:=n*2;
    Write(trunc(n) mod 2:1)
  until k=m
end.
```

-----  
0.3183098861

0101000101111100

## Re: HP-15C Mini-Challenge: Bits o'Pi

Message #28 Posted by **Bill (Smithville, NJ)** on 12 Mar 2007, 7:14 a.m.,  
in response to message #27 by Gerson W. Barbosa

Hi Gerson,

Quote:

\_\_\_\_\_

I've just tested the algorithm on Turbo Pascal 3 (does anyone still remember it? :-)

Sure do - I still use it on a regular basis and is one of the programs I keep on a USB flash drive along with several other useful utilities. I used Turbo Pascal 6 with Extended Real to calculate the first 50 bits of this challenge.

But Turbo Pascal 3 is my favorite for developing quick and dirty one-off type programs. Also use it a lot to create quick data filtering programs. Glad to see someone else still uses it.

Bill

Message #29 Posted by [Valentin Albillo](#) on 12 Mar 2007, 8:27 a.m.,  
in response to message #28 by Bill (Smithville, NJ)

Hi, Bill & Gerson:

I also do, and exactly for the very same reasons: it's about the smallest, simplest way of quickly developing and running a "console" executable anywhere, with no installation and minimum size, in any Windows system. It's ideal for small utilities to do the kind of tasks you would do with awk in Unix systems, for instance.

The one and only problem is it doesn't deal with long filenames, which is kind of a nuisance. But apart from that, it's really useful, capable and fast.

I usually begin all such created routines by first checking paramcount and, if no parameters are supplied, I immediately print its description and the correct syntax to call the routine. I also allow for input and output piping to enhance the usefulness if the routine is to be used more than once, thus allowing the routine to work like a filter. For instance:

```
C:>trimfile

          SYNTAX: trimfile <ascii file to trim> <# of columns>

C:\trimfile somedata.log 40 > trimdata.log

          Ok, done.
```

Best regards from V.

Quote:

Glad to see someone else still uses it.

Pascal was practically the first programming language I was introduced to in 1984, in the DEC-10 environment. Unfortunately, I don't use it so often as I should (I had to check the MOD syntax in the book). Unlike many here, my job is not related to information technology. But it's nice remembering things and learning from you and many other people here.

Best regards,

Gerson.

Hi Gerson,

Quote:

7718.07734 (\*)

(\*) You won't have trouble decyphering this one too :-)

Took me a second or two and then it hit me :)

Also broght back a lot of memories. Years ago, several of my co-workers and I wasted a whole afternoon. Someone had brought in a small book - may have been called "Fun with your Calculator" or "Calculator Fun" - something like that. It had a whole bunch of joke type problems where you'd do the calculations in the joke and then turn the calculator over to read the punch line in the display.

Great fun.

Bill

Message #32 Posted by **Egan Ford** on 12 Mar 2007, 10:05 p.m.,  
in response to message #1 by Valentin Albillo

Here is my 12 step solution for all goals:

```

1 LSTx
2 FRAC
3 ENTER
4 +
5 INT
6 RTN
7 LBL A
8 1
9 ENTER
10 ASIN
11 /
12 INT

```

Just need to lose a step.

**Re: HP-15C Mini-Challenge: Bits o'Pi**

Message #33 Posted by **Valentin Albillo** on 13 Mar 2007, 8:02 a.m.,  
in response to message #32 by Egan Ford

Hi, Egan:

Congratulations for your extremely ingenious near-solution ! The idea of placing the entry point (LBL A) mid-program is really neat, and works perfectly, up to 33 correct bits, while meeting all four goals save for the fact that it's 12 steps long, not 11 as requested.

That's where the real challenge is, of course ! :-) Some comments, which might perhaps give some usable hints (or not):

- *None* of the solutions or near-solutions already posted have stumbled upon my original challenge-solving algorithm.
- Your solution in particular isn't HP-15C-specific (it could perfectly run on other models), while the challenge-solving solution actually *is*. That's no fault of your solution, I just want to point out the fact that making use of HP-15C-specific functionalities might help decrease the number of steps.
- It may come as a surprise but not only does my challenge-solving solution make no use of either [Pi] or [1/X] instructions, as stated in goals 3 and 4, but also uses none of the *ersatz* methods to get Pi already posted, such as ASIN, GAMMA, or even DEG-RAD conversions ! Come to that, no division instructions of any kind are present at all either.

Thanks again for your excellent idea and

Best regards from V.

### Ersatz pi? [HP-15C Mini-Challenge: Bits o'Pi]

Message #34 Posted by [Karl Schneider](#) on 14 Mar 2007, 1:24 a.m.,  
in response to message #33 by [Valentin Albillo](#)

Quote:

...but also uses none of the *ersatz* methods to get Pi already posted, such as ASIN, GAMMA, or even DEG-RAD conversions...

"Ersatz"? Hey, what about ACOS? :-)

They all give answers identical to that of the pi function, although the tenth decimal digit is incorrect in all cases. Of course, it's 1/pi that matters.

Here's one that requires only the input value 1/2 and the square root function:

$$1/\pi = 0.5 * \text{sqrt}(0.5) * \text{sqrt}(0.5 + 0.5*\text{sqrt}(0.5)) * \text{sqrt}[0.5 + 0.5*\text{sqrt}(0.5 + 0.5*\text{sqrt}(0.5))] * \dots$$

But, I doubt that this is on the right track...

### The last hint (was Re: Ersatz pi? [...])

Message #35 Posted by [Valentin Albillo](#) on 14 Mar 2007, 10:34 a.m.,  
in response to message #34 by [Karl Schneider](#)

Hi, Karl:

Karl posted:

"Ersatz"? Hey, what about ACOS? :-)"

ASIN, ACOS, ATAN, ..., none of them is relevant in this case.

The heart of the matter is (and this is the last 'hint' I'll give before finally posting my original solution), that most people trying this mini-challenge out *automatically assume* that they must *first* generate the decimal value of 1/Pi in order to *then, and only then*, proceed to convert it to its binary form and output its bits, and of course, in the case of Goals 3 and 4, they do their best to try and generate 1/Pi using as few steps as possible and do likewise with the conversion loop, only to discover that they can't lower the step count to the 11-step requisite.

The key is: *there's no need to generate a decimal version of 1/Pi first*, a way must be sought to actually generate its binary form *directly*, without ever having a decimal Pi or 1/Pi to work with in the first place.

Once you realize this you discover you can save all steps to get Pi or 1/Pi and this is what ultimately allows you to achieve the 11-step goals, with the nice side effect of getting 34 correct bits in the bargain.

*Here's one that requires only the input value 1/2 and the square root function: [...] But, I doubt that this is on the right track..."*

Pretty, indeed; it's the well-known, old Vieta formula. And if "*on the right track*" means re this mini-challenge, certainly it's got nothing to do whatsoever. :-)

I hope the above 'last hint' sheds some really new light on the subject, and I'll await a couple of days to see if interested people like yourself take it for good and produce the ultimate solution. :-)

Thanks a lot for your comments and always interesting postings in each and every thread you post in.

Best regards from V.

It will be interesting and perhaps someone can improve upon it after being aware of your basic idea. That's synergy !

Best regards from V.

**Re: Post it, nevertheless ...**

Message #38 Posted by **Egan Ford** on 14 Mar 2007, 1:19 p.m.,  
in response to message #37 by Valentin Albillo

IANS convert this number:

3984801418

to base 2 starting with least significant. The challenge is getting 3984801418. That number alone is 10 steps.

I dumped the code shortly after writing it.

**Re: HP-15C MC Bits o'Pi - My Original Solution & Comments**

Message #39 Posted by **Valentin Albillo** on 16 Mar 2007, 7:15 a.m.,  
in response to message #1 by Valentin Albillo

Hi, all

Thanks for your interest in this HP-15C Mini-Challenge to both posters & lurkers, we've seen a very good early solution to the initial goal by **Bill (Smithville, NJ)** and some truly ingenious attempts to try and achieve the remaining three goals, which came pretty close to solve them all but for a single step, as well as worthy food-for-thought comments by **Gerson** and **Karl**.

As I told in a number of 'hints', the key lies in *avoiding* the seemingly obvious strategy of first computing the *decimal* value of **1/Pi** in order to then convert it to binary. This leads to very good solutions but not in 11 steps, there's simply not margin enough for that.

What must be done then is to use some algorithm that can compute the binary bits of *1/Pi directly*, without ever needing its decimal form in the first place. Such a convenient algorithm does exist and, most awesomely, Pi never explicitly appears at any stage but, implicitly, at the final output.

My original 11-step solution for all 4 goals is thus the following HP-15C-specific routine:

```
01  LBL A
02  MATRIX 1
03  LBL 0
04  RCL 0
05  STO+ 0
06  TAN
07  0
08  TEST 7 (X>Y?)
09  1
10  PSE (or R/S)
11  GTO 0
```

which, upon running, produces the *first 34 correct bits* of 1/Pi:

```
RAD, FIX 0 { set radians and FIX 0 display mode }
```

```

GSB A -> 0 1 0 1 0 0 0 1 0 1
         1 1 1 1 0 0 1 1 0 0
         0 0 0 1 1 0 1 1 0 1
         1 1 0 0

```

Notice that it doesn't explicitly use Pi and inverse trigonometric functions are also notably absent. The maximum precision obtainable depends on both the HP-15C being a 10-decimal digit calculator (13-digit internally) and the maximum accuracy of the TAN function for large arguments, but it suffices to correctly compute up to 34 base-2 digits which is roughly equivalent to 10 base-10 digits, as expected. Also, the only thing that makes it HP-15C-specific is the **MATRIX 1** instruction, so by replacing it by **1, STO 0** you'll have a 12-step solution for many RPN models.

This RPN routine can be trivially converted to a 27-character command line for the HP-71B, namely (in RADIANS and STD modes):

```
FORI=0TO40@TAN(2^I)<0@NEXTI
```

which upon running produces the first 41 correct bits of 1/Pi.

Can the RPN routine be improved further ? Yes ! By using the *mid-program entry point* technique posted by **Egan Ford** with my algorithm, *two additional steps can be saved* while keeping the algorithm and maximum achievable number of correct bits intact, thus resulting in an ultimate *9-step, 34-correct-bit RPN solution* for the HP-15C (10-step for many other RPN models) ! How's that for maximum results with a minimum of steps ? :-)

```

01 RCL 0
02 ST0+ 0
03 TAN
04 0
05 TEST 7
06 1
07 RTN
08 LBL A
09 MATRIX 1

```

The output sequence is now (after RAD, FIX 0, as always):

```

GSB A, R/S -> 0
        R/S -> 1
        R/S -> 0
        . . .

```

the only difference being the additional R/S necessary after GSB A to output the first bit.

Next April, 1st I'll post my **S&SMC Spring 2007 Special**, I hope to 'see' you there (if you think this Mini-Challenge is pretty unusual math, wait till you see the S&SMC ! :-) ).

Thanks for your continued interest and

Best regards from V.

## Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #40 Posted by **Gerson W. Barbosa** on 16 Mar 2007, 3:33 p.m.,  
in response to message #39 by Valentin Albillo

Hi Valentin,

Very nice original solution, as always. Thanks for taking the time to think of interesting problems and presenting them here. It's nice to see what team work, or synergy, can do: the resulting 9-step program is just amazing!

Now, a small variation in your challenge: imagine someone has asked for a binary expansion of, say, **Plouffe's b-constant**, and it has to be achieved in only 9 steps on an HP-15C. Impossible? Not at all! Just replace TAN with COS in Albillo-Ford's wonderful routine. At least the first 36 bits appears to be correct!

Now, what is **Plouffe's b-constant** anyway? I don't know, but thanks to your original solution, I can compute it on the HP-71B :-)

```

10 S=0
20 FOR I = 0 TO 40
30 IF COS(2^I)<0 THEN S=S+1/2^(I+1)
40 NEXT I
50 DISP S

```

This gives

.475626076737

The first 11 decimal digits are correct. Of course, there's a slight chance this is just a coincidence... Could someone compute 50 or more bits? On QBASIC I can compute only 32 bits (a little more on the HP-71B) :

```
'Binary expansion of Plouffe's b-constant
CLS
DEFDBL A-Z
S = 0
FOR I = 0 TO 31
  PRINT ABS((COS(2 ^ I)) < 0);
  IF COS(2 ^ I) < 0 THEN S = S + 1 / 2 ^ (I + 1)
NEXT I
PRINT
PRINT S
```

0 1 1 1 1 0 0 1 1 1 0 0 0 0 1 0 1 0 1 0 0 0 0 1 0 1 1 0 1 1 0 0

Best regards,

Gerson.

P. S.: Replacing TAN with SIN gives  $1/(2 * \pi)$ , also interesting.

### Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #41 Posted by [Valentin Albillo](#) on 16 Mar 2007, 6:48 p.m.,  
in response to message #40 by Gerson W. Barbosa

Hi, Gerson:

Thanks for your interest & kind comments, much appreciated.

Gerson posted:

*"Now, what is Plouffe's b-constant anyway? I don't know"*

Well, it is the XOR (Exclusive-OR) of the binary expansions of  $1/\pi$  and  $1/(2*\pi)$ , i.e:

$$\text{Plouffe's b-constant} = .475626\dots = 1/\pi (+) 1/(2*\pi)$$

where the (+) denotes a XOR operation applied to their binary expansions. As you correctly pointed out, it can be computed with the 11- or 9-step solutions by merely changing the TAN to COS.

By the way, these direct binary expansions aren't uncommon, every function which satisfies some addition formula has an inverse amenable to this treatment.

Best regards from V.

Message #42 Posted by [Rodger Rosenbaum](#) on 17 Mar 2007, 1:21 a.m.,  
in response to message #40 by Gerson W. Barbosa

Quote:

P. S.: Replacing TAN with SIN gives  $1/(2 * \pi)$ , also interesting.

Notice that the algorithm extracts the period of the function used (its reciprocal, actually).

A short program to do this on the HP50 is shown below. I have created a list of powers of 2 and saved it in a variable so I can play around from the keyboard. Create it like this:

2 {0, 1, 2, 3, ..., 37, 38} ^ 'pow2' sto

To carry out the algorithm, I then created the following little program:

```
{ 1, 2, 4, 8, ... , 274877906944 } TAN 0 <
```

or,

```
pow2 TAN 0 <
```

This will return a list of the binary digits of  $1/\pi$

If you set the calculator to degrees mode and run the program again, you will get the binary digits of  $1/180$ .

Now, show how to use this technique to compute the base 3 representation of  $1/\pi$ .

On the HP50 I get 26 accurate trits.

For a hint, notice that this program:

```
{ 1, 2, 4, 8, ... , 274877906944 } TAN ATAN 0 <
```

gives the same result as:

```
{ 1, 2, 4, 8, ... , 274877906944 } TAN 0 <
```

*Edited: 17 Mar 2007, 4:28 a.m.*

### Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #43 Posted by [Gerson W. Barbosa](#) on 17 Mar 2007, 12:24 p.m.,  
in response to message #42 by Rodger Rosenbaum

Quote:

Now, show how to use this technique to compute the base 3 representation of  $1/\pi$ .

Assuming 26 is on the stack, the following returns

```
{ 0. 2. 2. 1. 2. 1. 0. 0. 1. 0. 2. 1. 2. 2. 0. 2. 2. 1. 2. 0. 2. 1. 1. 1. 0. 1. }
```

```
< -> n
  < 3. 1. n
    FOR n n 1. -
      NEXT n ->LIST ^
TAN ATAN DUP ABS 1. >
SWAP DUP 0. < SWAP
-1. > AND 2. * 2.
  < +
  > DOLIST
>
```

Is there an easier way I missed?

Thanks for the interesting post.

Regards,

Gerson.

### Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #44 Posted by [Rodger Rosenbaum](#) on 17 Mar 2007, 6:46 p.m.,  
in response to message #43 by Gerson W. Barbosa

Your program does indeed return the correct ternary representation of  $1/\pi$ , but I think it may be because of fortuitous circumstances.

The program I gave for finding the binary result:

```
{ 1, 2, 4, 8, ... , 274877906944 } TAN 0 <
```

also gives the correct result if the calculator is in degrees mode (1/180), or grads mode (1/200).

Do you know why your program doesn't give the correct result for the other two modes?

Can you modify it so it works properly for all modes?

**Re: HP-15C MC Bits o'Pi - My Original Solution & Comments**

Message #45 Posted by **Gerson W. Barbosa** on 17 Mar 2007, 10:33 p.m.,  
in response to message #44 by Rodger Rosenbaum

Quote:

Can you modify it so it works properly for all modes?

Certainly, but don't expect for an elegant solution:

```
< 100. SIN ASIN 100.
+ DUP 100. <
< DUP
> pi IFTE / -> n k      ; pi = 3.14159...
< 3. 1. n
  FOR n n 1. -
  NEXT n ->LIST ^
TAN ATAN k / DUP ABS
1. > SWAP DUP 0. <
SWAP -1. > AND 2. *
2.
  < +
  > DOLIST
>
```

Using pi explicitly in the fourth line spoils a bit the fun though.

Very *fortuitously* the program computes correctly the first 32 digits of 1/180 when in degrees mode:-)

{ 0. 0. 0. 0. 1. 1. 0. 0. 1. 1. 0. 0. 1. 1. 0. 0. 1. 1. 0. 0. 1. 1. 0. 0. 1. 1. 0. 0. 1. 1. 0. 0. 1. 1. 0. 1. 1. 0. 1. }

And the first 28 digits of 1/200 when in grads mode:

{ 0. 0. 0. 0. 1. 0. 1. 2. 2. 1. 0. 2. 0. 1. 2. 1. 1. 2. 1. 1. 0. 0. 0. 0. 1. 0. 1. 2. }

And, of course, the first 26 digits of 1/pi when in radians mode:

{ 0. 2. 2. 1. 2. 1. 0. 0. 1. 0. 2. 1. 2. 2. 0. 2. 2. 1. 2. 0. 2. 1. 1. 1. 0. 1. }

The program will give always the base-three digits of 1/π, regardless of the angle mode, if the eighth line is replaced with this one:

```
k * TAN ATAN k / DUP ABS
```

Regards,

Gerson.

P.S.: cygwin and bc have been very useful when checking the results. Thanks again, Egan! :-)

**Re: HP-15C MC Bits o'Pi - My Original Solution & Comments**

Message #46 Posted by **Gerson W. Barbosa** on 19 Mar 2007, 1:32 p.m.,  
in response to message #45 by Gerson W. Barbosa

Quote:

the program computes correctly the first 32 digits of 1/180 when in degrees mode

Actually, the first 31 digits.

Fixed version:

```
%HP: T(3)A(D)F(.);
```

```
\<< 100 SIN ASIN 100 + DUP 100 <
\<< DUP
\>> \pi IFTE / \pi 3 / \-> n k k1
\<< 3 1 n
FOR n n 1 -
NEXT n \->LIST ^ TAN ATAN k / DUP ABS k1 > SWAP DUP 0 < SWAP k1 NEG > AND 2 * 2
\<< +
\>> DOLIST
\>>
\>>
```

This fixed version shouldn't fail for n=115, 138, etc. as pointed by Rodger Rosenbaum.

**Re: HP-15C MC Bits o'Pi - My Original Solution & Comments**

Message #47 Posted by [Gerson W. Barbosa](#) on 18 Mar 2007, 8:53 a.m.,

in response to message #44 by Rodger Rosenbaum

Quote:

Do you know why your program doesn't give the correct result for the other two modes?

No, I don't. Actually, I don't know why the program works in radians mode either... :-)

It took me about twenty minutes to come up with the first version of the program. I just computed atan(tan(x)) in radians mode for the first seven integer powers of three, as you had suggested. My first criterion was placing the results in three regions, according to the table below, which gave four correct digits. By dividing the table into six regions instead of three I obtained six correct digits (the sixth digit was wrong). This would lead to nowhere though. Then, a closer look to the numbers revealed a working criterion. I expanded the table to ten digits. Since the additional digits met the new criterion, I assumed the sixteen remaining possible correct digits on the HP-50G would meet the criterion as well.

When I lack the math background to solve an unusual problem, I try some unorthodox methods. Sometimes they work, but most of times they don't... By the way, I had tried sin(x) and cos(x) for x=1, 2, 4... on Valentin's original problem. I didn't try tan(x) because of the large results I would get. Anyway, I wouldn't think of the MATRIX 1 trick, even though it shows on the back of the calculator :-)

```

x: 1 3 9 27 81 243 729
pi/2 0 | * | | | | | | * | |
pi/6 2 | | | * | * | | | | * | |
-pi/6 1 | | | | | * | * | | | |
-pi/2 -+-----+-----+-----+-----+-----+-----+-----+
base-3 digits: 0 2 2 1 *1 *0 *2 (*) wrong digits

y=atan(tan(x)): 1 -0 -0 -1 -0 1 0
                . . . . .
                0 1 4 2 6 1 1
                0 4 2 7 8 0 5

abs(y) > 1 => 1 1
-1 < y < 0 => 2 2
0 > y =< 1 => 0 0
-----
base-3 digits: 0 2 2 1 2 1 0 all of them correct!
```

I'm looking forward to your orthodox solution.

Best regards,

Gerson

P. S.: Here is the second version of the program, in a more usable form:

```
%HP: T(3)A(D)F(.);
\<< 100 SIN ASIN 100 + DUP 100 <
\<< DUP
\>> \pi IFTE / \-> n k
\<< 3 1 n
```

```

FOR n n 1 -
NEXT n \->LIST ^ TAN ATAN k / DUP ABS 1 > SWAP DUP 0 < SWAP -1 > AND 2 * 2
\<< +
\>> DOLIST
\>>
\>>

```

Edited: 18 Mar 2007, 4:52 p.m.

## What about base 4?

Message #48 Posted by [Gerson W. Barbosa](#) on 18 Mar 2007, 8:51 p.m.,  
in response to message #44 by [Rodger Rosenbaum](#)

The program below returns the digits of 1/pi, 1/180 and 1/200 in base 4, depending on the angle mode (20, 22 and 21 correct digits, respectively):

```

%%HP: T(3)A(G)F(.);
\<< 100 SIN ASIN 100 + DUP 100 <
\<< DUP
\>> \pi IFTE / \pi 4 / \-> n k k1
\<< 4 1 n
FOR n n 1 -
NEXT n \->LIST ^ TAN ATAN k / DUP k1 > SWAP DUP 0 < SWAP k1 NEG < SWAP OVER XOR 3 * SWAP 2
* 3
\<< + +
\>> DOLIST

Message #49 Posted by [Rodger Rosenbaum](#) on 19 Mar 2007, 6:44 a.m.,  
in response to message #43 by [Gerson W. Barbosa](#)

Quote:

Assuming 26 is on the stack, the following returns

{ 0. 2. 2. 1. 2. 1. 0. 0. 1. 0. 2. 1. 2. 2. 0. 2. 2. 1. 2. 0. 2. 1. 1. 1. 0. 1. }

```

« -> n
  « 3. 1. n
    FOR n n 1. -
      NEXT n ->LIST ^
TAN ATAN DUP ABS 1. >
SWAP DUP 0. < SWAP
-1. > AND 2. * 2.
  « +
  » DOLIST
»
»

```

Is there an easier way I missed?

Thanks for the interesting post.

Regards,

I am sorry I cannot take a closer look to this interesting matter now. Among other things, I have to finish studying a thick Portuguese grammar for an examination due next April 1st (still deciding whether I will attend it or not). Did you know verb *ser* (to be) appears in at least 53 forms (if I haven't miscounted them), some completely different from each other? And that's the easy part, as I don't have problem with verbs (Portuguese verbs, I mean). :-)

Regards,

Gerson.

-----

Update:

This appears to work, although I don't know why:

```
%HP: T(3)A(D)F(.);
\<< 100 SIN ASIN 100 + DUP 100 <
  \<< DUP
  \>> \pi IFTE / \-> n k
  \<< 3 1 n
    FOR n n 1 -
      NEXT n \->LIST ^ TAN ATAN k / FLOOR 3 MOD
  \>>
\>>
```

Forget about this one. It's essentially the same. Looks like I've found it. Take a look at the next reply.

## Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #51 Posted by [Gerson W. Barbosa](#) on 19 Mar 2007, 7:07 p.m.,  
in response to message #49 by Rodger Rosenbaum

Quote:

Can you figure out why?

I think I can. The correct limits should be  $\pi/3$  and  $-\pi/3$  instead of  $1$  and  $-1$ . The odds of computing wrong digits because of this mistake are even greater than what you have observed. Perhaps your sample is not large enough.

Quote:

This shows how simply using numerical results can lead one astray. Just because a formula gives the correct result for the first  $n$  digits doesn't mean that it's correct for all  $n$ .

You're right! An example is this "algorithm" for finding the square root of four-digit numbers:

Separate the number into two halves and add them together. Let's try it with three random examples, say, 2025, 3025 and 9801:

```
sqrt(2025) = 20 + 25 = 45;   45 * 45 = 2025  ok!
sqrt(3025) = 30 + 25 = 55;   55 * 55 = 3025  ok!
sqrt(9801) = 98 + 01 = 99;   99 * 99 = 9801  ok!
```

The program below may pass your quality-control test, although I think you have a better algorithm:

```
%HP: T(3)A(D)F(.);
\<< 100 SIN ASIN 100 + DUP 100 <
  \<< DUP
  \>> \pi IFTE / \pi 3 / \-> n k k1
  \<< 3 1 n
    FOR n n 1 -
      NEXT n \->LIST ^ TAN ATAN k / DUP ABS k1 > SWAP DUP 0 < SWAP k1 NEG > AND 2 * 2
  \<< +
  \>> DOLIST
  \>>
\>>
```

Regards,

Gerson.

-----  
P.S.:

From Cygwin & bc:

scale=70

a(s(3^114)/c(3^114))  
1.03068168

a(s(3^137)/c(3^137))  
1.01053215

I should have examined the remaining five errors, but I think these are enough. Thanks for the lists!

## Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #52 Posted by [Rodger Rosenbaum](#) on 20 Mar 2007, 1:50 a.m.,  
in response to message #51 by Gerson W. Barbosa

Quote:

I think I can. The correct limits should be  $\pi/3$  and  $-\pi/3$  instead of 1 and -1.

This is exactly the correct reason. The TAN ATAN sequence is in effect the same as a PI MOD sequence applied to the input argument, the only difference being that the ATAN may return a negative result. In that case, adding PI will give the same result as PI MOD.

In the HP50, the range reduction process uses a PI of effectively 31 decimal digits. Try 1E20 PI MOD and compare to the correct result obtained from an arbitrary precision math package. The HP50 gets a wrong result. But now try 1E20 TAN ATAN PI + (in radians mode) and you will see the correct result (+- possibly a couple of LSD for some input arguments).

This might lead one to think that you could get  $31 * \text{LN}(10)/\text{LN}(2) = 102.979$ , or about 102 correct binary digits for  $1/\text{PI}$  with the algorithm we've been using. Unfortunately, the highest power of 2 that can be accurately represented with 12 decimal digits is 39, and that limits us to 39 correct binary bits.

Thus, it doesn't gain us anything on the HP50 to use the trig functions.

Quote:

The odds of computing wrong digits because of this mistake are even greater than what you have observed. Perhaps your sample is not large enough.

How do you know what the odds of computing wrong digits are?

I looked at a sample of 5000 digits, and there were 142 digit errors in that sample. In looking at the difference list, I didn't see any appreciable increase in the density of errors toward the end of the list, but of course I would have to look all the way to infinity to make a definitive statement about the density of errors.

Edited addition: Further edited to correct typo:

Your original program makes an error when the arctangent of the tangent of some power of 3 lies between 1 and  $1.047+ (\text{PI}/3)$ , and between  $-1.047+$  and -1. These two tiny zones are  $.047+$  wide. So out of a total range of PI, if the arctangent of the tangent falls in one of these two zones, an error will occur. The ratio of these zones to the total range is  $(2*(\text{PI}/3-1))/\text{PI} = .03004689+$ , so in my sample of 5000 digits, I would expect to find  $.03 * 5000 = 150$  errors. I actually found 142. This supports the notion that approximately 3% of the digits will be in error.

Using the trig functions on the HP50 can't get us any more significant digits because of the limitation I mentioned above in representing powers of 2 (or 3, or 4, etc.), so we might as well use the MOD function directly. Here is a little program to do the job. Just put the number whose reciprocal is to be converted to another base, the the number of digits desired, and the base, on the stack and execute. It doesn't test for errors, and, of course, if you ask it to give you too many digits, it will return garbage after a certain number of correct digits.

Also, it can't output alphabetic characters to represent digits in bases greater than 10.

The idea is to apply NUM MOD to the list of powers of BASE, and then realize that the result is a list of numbers, each of which can range from 0 to NUM. We need to transform them so that they range from 0 to BASE. We do this by dividing the list by NUM and then multiplying by BASE. Then a simple IP will give us the digits we want.

```

< -> NUM DIGITS BASE
< BASE 0 DIGITS 1 -
  FOR i i
  NEXT
  DIGITS ->LIST ^ NUM MOD
  NUM / BASE * IP
  »
»

```

The program only gives the digits of the fractional part of the reciprocal of the input number, so putting 1/PI on the stack and executing it only gives the fractional part of PI in the other BASE.

If you want to see the digits of PI (or some number whose reciprocal is less than 1) in another BASE, shift PI right by dividing by the BASE enough times so that the reciprocal of that number is greater than 1.

For example, to see the digits of PI in base 9, do this: PI 9 / 1/x 12 9 then execute the program. You will see: {3,1,2,4,1,8,8,1,2,4,0,7}

To see the digits of PI in base 2, do this: PI 2 / 2 / 1/x 39 2 then execute the program.

The last two digits are in error, in this case.

## Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #53 Posted by [Gerson W. Barbosa](#) on 20 Mar 2007, 10:48 a.m.,  
in response to message #52 by Rodger Rosenbaum

Quote:

The ratio of these zones to the total range is  $(2*(PI/3-1)/PI = .003004689+$ , so in my sample of 5000 digits, I would expect to find  $.003 * 5000 = 150$  errors. I actually found 142.

Your calculation is right, despite the typo (.003 instead of .03). I went wrong by a factor of 2.75: I did  $(PI/3-1)/(PI/2-1) = 0.0826872$ . That's the ratio between the sum of the "0" and "2" digits wrongly converted to "1" and the total of "1" digits in the first list. This would have made me expect 10 wrong "1" digits out of the total 122 "1" digits ( $0.0827 * 122 = 10$ ), which compared to the actual seven errors wouldn't have called my attention as my wrong assumption did ( $0.0827 * 301 = 25$ ).

Quote:

```

< -> NUM DIGITS BASE
< BASE 0 DIGITS 1 -
  FOR i i
  NEXT
  DIGITS ->LIST ^ NUM MOD
  NUM / BASE * IP
  »
»

```

This is a very nice tiny program! I will keep it.

Just out of curiosity, how far can you go beyond the 5000 digits you have already gone? I remember Carl Sagan in *Contact*, about computing *pi* to zillions of places: "*they don't do it because they need to, but because they like to*". I am not sure this is his exact phrase, as my book is a translation and I cannot find it to check this.

Best regards,

Gerson.

**Re: HP-15C MC Bits o'Pi - My Original Solution & Comments**

Message #54 Posted by [Rodger Rosenbaum](#) on 20 Mar 2007, 1:28 p.m.,  
in response to message #53 by Gerson W. Barbosa

Quote:

Your calculation is right, despite the typo (.003 instead of .03).

I was doing the calculations on the HP50. The ratio was in scientific format on the HP50 (3.00468943012E-2). I made the typo when I first typed it in my message, and propagated it subsequently. But, I did the multiplication by 5000 on the HP50 with the correct 3.00468943012E-2 and got the correct 150 in fixed format, which I then copied to the message.

I've noticed that on this forum, dealing with a lot of numbers, it's easy to make typos. I always proofread a couple of times, but they slip by anyway. I was up too late! Mea culpa.

Quote:

Just out of curiosity, how far can you go beyond the 5000 digits you have already gone?

I only let it go to 5000 which took a couple of minutes. If I remember correctly, it takes about 2400 decimal digits to represent  $3^{5000}$ , so I used 3000 digits in all the calculations, which leads to slowness. I suppose I could let it run all night!

**Re: HP-15C MC Bits o'Pi - My Original Solution & Comments**

Message #55 Posted by [Rodger Rosenbaum](#) on 20 Mar 2007, 6:06 p.m.,

In the HP50, the range reduction process uses a PI of effectively 31 decimal digits. Try 1E20 PI MOD and compare to the correct result obtained from an arbitrary precision math package. The HP50 gets a wrong result. But now try 1E20 TAN ATAN PI + (in radians mode) and you will see the correct result (+- possibly a couple of LSD for some input arguments).

This might lead one to think that you could get  $31 * \text{LN}(10)/\text{LN}(2) = 102.979$ , or about 102 correct binary digits for  $1/\text{PI}$  with the algorithm we've been using. Unfortunately, the highest power of 2 that can be accurately represented with 12 decimal digits is 39, and that limits us to 39 correct binary bits.

Thus, it doesn't gain us anything on the HP50 to use the trig functions.

It occurred to me that this isn't strictly true. In the one case where the BASE we want for our output is 10, the list of powers of the BASE can contain numbers that \*exactly\* represent those powers, because the mantissa parts of powers of 10 only contain the single digit 1. Thus, the HP50 can exactly represent powers of 10 up to the exponent limit of 499.

So, change the little program like this to do the TAN ATAN sequence, and then add PI to each element of the list to compensate for the fact that ATAN sometimes returns a negative result:

```
« -> NUM DIGITS BASE
  « BASE 0 DIGITS 1 -
    FOR i i
      NEXT
    DIGITS ->LIST ^ TAN ATAN
    NUM ADD NUM MOD
    NUM / BASE * IP
  »
»
```

We are now effectively doing a MOD with a 31 digit PI.

Now type PI 31 10 and execute the program.

See 31 correct decimal digits of  $1/\text{PI}$ .

**Re: HP-15C MC Bits o'Pi - My Original Solution & Comments**

Message #56 Posted by [Gerson W. Barbosa](#) on 21 Mar 2007, 8:50 a.m.,  
in response to message #55 by Rodger Rosenbaum

Quote:

Thus, the HP50 can exactly represent powers of 10 up to the exponent limit of 499.

Keen observation! And producing the first 31 decimals of  $1/\pi$  on the HP-50G without explicitly using it is really nice! By what I remember, it's possible to display  $\pi$  to 24 places on the HP-50G this way:

RAD mode

```
< pi 1E-11 - DUP SIN>
```

A made a plot, not on the computer but by hand, of  $\arctan(\tan(x))$ . I turned the saw-tooth graph into a straight line ( $y=x$ ) by adding successive multiples of  $\pi$  to each discontinuous section. This way, it was easy to see why the algorithm I presented on March 11th works (<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=110018#110018>). The algorithm can be generalized to any base, as we can see in the following 91-byte program:

```
< -> n d b
< " " 1 d
  FOR i b i ^ n * IP b MOD ->STR HEAD +
  NEXT
>
>
```

It returns the first  $d$  digits in base  $b$  of the fractional part of  $n$ . For instance, running the program after entering  $\pi 1/x 17 3$  produces a string with the first 17 ternary digits of  $1/\pi$ :

```
"02212100102122022"
```

If I had thought a bit rather than "blindly going where no one had gone before" I would have saved some time - and I might be now at page 500 of my Grammar book instead of page 300 :-)

Anyway, learning something from the mistakes is not bad. I have learned that analyzing a graph rather than a few numbers produces a better result. (Not to mention *ADD* is better than  $2 \llcorner + \gg$  *DOLIST* :-)

Thanks!

Gerson.

P.S.: Although I said the algorithm is valid to any base, the program will handle bases up to 10, unless some changes are made to allow it to work for greater bases up to the limitations of the calculator.

Edited: 21 Mar 2007, 9:12 a.m.

P.S.: Although I said the algorithm is valid to any base, the program will handle bases up to 10, unless some changes are made to allow it to work for greater bases up to the limitations of the calculator.

That last characteristic is why my program created a list rather than a string. Even though the alphabetic characters aren't created for hexadecimal based output, for instance, you can still see the digits with value over 9 in the list.

e.g., modifying your program like this will do it:

```
« -> n d b
« {} 1 d
  FOR i b i ^ n * IP b MOD +
  NEXT
»
»
```

Quote:

If I had thought a bit rather than "blindly going where no one had gone before" I would have saved some time - and I might be now at page 500 of my Grammar book instead of page 300 :-)

To be at page 500 of a grammar book! Is that not a fate worse than death? Or, almost worse, anyway!

What better way to take a break from the tedium of a grammar book, than to play with your calculator?

## Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #58 Posted by [Egan Ford](#) on 17 Mar 2007, 2:24 a.m.,

Could someone compute 50 or more bits?

```
0111100111
0000101010
0001011011
0010110100
1011001100
```

```
0011111101
1110100000
0100011010
0111111000
0111001000
```

If you have a Linux box or Cygwin on Windows run `bc -l` then enter this to generate the above bits.

```
scale=30
for(i=0;i<100;i++) {
  if(c(2^i) < 0) print 1 else print 0;
  scale=0
  if((i+1) % 10 == 0) print "\n";
  if((i+1) % 50 == 0) print "\n";
  scale=30
}
```

### Re: HP-15C MC Bits o'Pi - My Original Solution & Comments

Message #60 Posted by [Egan Ford](#) on 17 Mar 2007, 1:28 p.m.,  
in response to message #59 by Gerson W. Barbosa

bc is an arbitrary precision calculator language, no need to learn C/C++, just type "man bc". Cygwin is a free Linux environment for Windows, just install that and you will have a nice tool set--the bash shell, bc, perl, vi editor, etc...

Cygwin includes all the nice Perl math packages too, e.g. Math::Complex, Math::BigFloat, etc...

Perl is interpreted and very portable and easier to learn than C/C++. I only use C if I need speed. I try to approach any problem with "try smarter" instead of "try harder", and Perl always does the job.

If you want an easy way to get the LN(2) bits you are looking for just run bc -l and type:

```
ibase=10
obase=2
scale=30
l(2)
```

Output:

```
.101100010111001000010111111011111010001110011110111100110101011110010011110001110110011100110000000
```

Message #61 Posted by [Gerson W. Barbosa](#) on 17 Mar 2007, 4:12 p.m.,  
in response to message #60 by Egan Ford

Thanks for the explanation. I've just used bc to check the digits of  $1/\pi$  in base 3:

```
ibase=10
obase=3
scale=30
1/(4*a(1))
```

Output:

```
.022121001021220221202111012121112102011101212112211011211221010
```

Great tool!

Gerson.

### Re: HP-15C MC Bits o'Pi (proof of theorem?)

Message #63 Posted by [Karl Schneider](#) on 18 Mar 2007, 2:50 p.m.,  
in response to message #39 by [Valentin Albillo](#)

Hi, Valentin --

Well, I "never woulda think it" in a thousand years -- "tangent of  $2^{k-1}$  radians gives the k-th binary digit of  $1/\pi$ " as follows:

$\tan(2^{k-1}) > 0 \Rightarrow$  digit is 0

$\tan(2^{k-1}) < 0 \Rightarrow$  digit is 1

$\tan(2^{k-1}) = 0 \Rightarrow$  (can't happen)"

This just can't be a coincidence -- it must be a theorem. However, my cursory Google search yielded nothing about this. Could you point to a proof?

This exqmples ties in with a recent archived thread, "[Trigonometrics for really big input](#)". The calculations in your example are possible because the trig functions can be calculated accurately for inputs up to the limit of 10 or 12 significant digits. These, in turn, are possible because internal extended precision permits accurate calculation of, e.g.,  $\text{MOD}(8589934592, 2*\pi)$  for reduction of the input argument.

P.S.: Now, aren't you glad that "MATRIX 1" sets R0 and R1 instead of creating an identity matrix? (*Just kidding!*)

Hi, Karl:

Karl posted:

*"Well, I "never woulda think it" in a thousand years -- "tangent of  $2k-1$  radians gives the k-th decimal digit of  $1/\pi$ "*

*That's because, actually, it's unthinkable indeed: the Tan algorithm merely gives binary digits, not decimal ... ;-)*

*"This just can't be a coincidence -- it must be a theorem. However, my cursory Google search yielded nothing about this. Could you point to a proof?"*

Yes. I don't know about Google, I actually took the idea from my extensive math-related printed materials, in this case an article which can be located using this reference:

"Addition Theorems and Binary Expansions"  
Canadian Journal of Mathematics, 47:262-273, 1995.

*"P.S.: Now, aren't you glad that "MATRIX 1" sets R0 and R1 instead of creating an identity matrix? (Just kidding!)"*

*Touché, \*very\* good memory ! :-) :-) However, I rest my case and still wish that MATRIX 1 were an identity matrix creation statement instead of merely setting R0 and R1 to 1.*

Thanks for your interest and

Best regards from V.

**HP-19C charger...**

Message #1 Posted by [Geir Isene](#) on 7 Mar 2007, 7:07 a.m.

... I could use the same as... which charger?

**Re: HP-19C charger...**

Message #2 Posted by [Ignazio Cara \(Italy\)](#) on 7 Mar 2007, 11:30 a.m.,  
in response to message #1 by Geir Isene

Hello Geir Isene,

you can use the HP-97 charger like HP 82066A, without any kinds of problem.

Regards from Italy

Ignazio

*Edited: 7 Mar 2007, 11:34 a.m.*

**Re: HP-19C charger...**

Message #3 Posted by [Eric Smith](#) on 7 Mar 2007, 6:37 p.m.,  
in response to message #1 by Geir Isene

For standard US power receptacles (90-120V, NEMA 5-15R), you would want an 82059 (any suffix A through D). These are very common, as the B suffix and later used with the HP-91/92/97/97S, 41C with 82120A rechargeable pack, 82143A and 82162A printers, 82161A tape drive, HP-71B, HP-75C/D, etc.

Note that the 82059A is not suitable for some of the newer devices; I think that is due to a change to the shape of the plug; the newer devices require a full slot in the plug.

For 90-120V Europe (where?) the charger is the 82069B.

For 210-250V, the choices are 82066A/B/D (Europe), 82067B (United Kingdom), 82067B Option 001 (South Africa), and 82068B (Australia).

Although none of these chargers are universal voltage, you should be able to use any charger that is suitable for your local voltage with a plug adapter. If you need to use a 90-120V adapter on 210-250V power, or vice versa, you can do that with a voltage converter.

**Re: HP-19C charger...**

Message #4 Posted by [Tony Duell](#) on 8 Mar 2007, 1:22 p.m.,  
in response to message #3 by Eric Smith

Some of these chargers have a pair of inverse-series zener diodes inside the connector moulding, I think

they're rated at 27V each. This is mentioned-in-passing in the PortablePlus Technical Reference Manual, and I actually did electrical tests on a spare cable to confirm this.

I don't know if all 'Topcat series' chargers have these zeners, I suspect they may have been fitted to the new type of plug only.

FWIW, the difference between the -A and -B Woodstock and Spice chargers (you're supposed to only use -B versions on machines with continuous memory) is a similar pair of zeners. Personally, therefore, I'd only charge a 19C, a 95C, or any other machine with continuous memory from a charger fitted with the zeners.

**Re: HP-19C charger...**

*Message #5 Posted by [Eric Smith](#) on 8 Mar 2007, 8:19 p.m.,  
in response to message #4 by Tony Duell*

Thanks, I always wondered what the difference between the -A and -B chargers for the Woodstock and Spice series.

Why would they mold the zener diodes into the connector, rather than putting them in the transformer housing? And I wonder why they didn't use even lower voltage zeners, since 27V is well above the level likely to cause damage.

It still seems unconscionable that the calculators themselves don't have sufficient overvoltage protection to survive the expected input voltage peaks with no battery present. They saved at most around \$0.25 per calculator, on models with retail prices of \$120 and up. It's hard to believe that anyone involved really believed this was a good idea.

**Re: HP-19C charger...**

*Message #6 Posted by [Walter B](#) on 7 Mar 2007, 6:59 p.m.,  
in response to message #1 by Geir Isene*

Remember to have good rechargeable batteries installed before plugging in the specified charger. Otherwise you may roast your 19C, and you will want to avoid this, won't you?

**my hp 48 runs slow**

Message #1 Posted by [david](#) on 7 Mar 2007, 4:23 a.m.

my hp 48 runs slow when using tds survey card when i enter numbers on the keys, i get a delay of 3 or 4 seconds before the nos appear on the screen. also when i hit enter to go to the next line, it will delay a few seconds also. it functions ok and calcs ok, any clues . is it the tds card getting old or the hp 48.what powers the tds card, if i pull the tds card out and put it in another 48 i own , will i lose all my job info. the co ords are stored on the 48 memory right? the tds card is read only, is that right, in 10 years of ownership i never cared or needed to figure it out. can i take the cogo card out and start another job in the newer 48. can i infa red between the one with all the survey points to load them nto the other 48. will one receive via infa red, can that be so easy cheers david

**Re: my hp 48 runs slow**

Message #2 Posted by [Raymond Del Tondo](#) on 7 Mar 2007, 5:51 a.m.,  
in response to message #1 by david

Hi,

your calc may be low on memory,  
or the data stack may have many objects.  
Type MEM to check if you have at least 2K bytes free.

In the latter case (many stack obs) you could  
press the DEL key to clear the stack.

Another option is to initiate a warm start,  
which also clears the stack.

Deactivating USER mode will speed up key response, too.

HTH

Raymond

### Utah teapot rotating on the hp50g

Message #1 Posted by [hugh steers](#) on 6 Mar 2007, 6:29 p.m.

ok, try this guys, get <http://www.voidware.com/tmp/v3.zip>

and unzip it. inside there are files. V3, teapot, torus and dumbell.

put all these on your SD card and navigate to the SD card and Eval the V3 program. it should run standalone without the ArmToolbox.

you should be presented with a menu. make your choice and off you go. you might like to fiddle with the contrast too.

Warning: if you don't have enough free memory, it will crash the calculator (badly!). try torus first it's a lot smaller.

### Re: Utah teapot rotating on the hp50g

Message #2 Posted by [Marcus von Cube, Germany](#) on 12 Mar 2007, 1:28 p.m.,  
in response to message #1 by [hugh steers](#)

Torus works fine on mine but teapot crashes my calc. Do you know the memory requirements? How much memory needs to be free in IRAM?

Marcus

### Re: Utah teapot rotating on the hp50g

Message #3 Posted by [hugh steers](#) on 12 Mar 2007, 4:34 p.m.,  
in response to message #2 by [Marcus von Cube, Germany](#)

when i go into Files/SD it reports 236476. then it's ok.

i have found the amount of free memory varies wildly depending on what's just been happening. i think it could be undo info.

i know teapot is close, but i don't know how close. i shall have to improve the memory handling. the teapot is 3783 polygons!

good luck!

**Using Solver on The PC**

Message #1 Posted by **Bill (Smithville, NJ)** on 6 Mar 2007, 10:15 a.m.

There's seems to be a lot of interest in the Solver on the HP-17BII, 19BII and 17Bii+. Gerson has created some great Trig routines and there's been some other solver equations by various other members.

Even though I've been wanting to play around with some of these equations, especially the Trig ones, I'm just a little bit too lazy to type them into my 17BII or 19BII. So I've been looking for an easy way.

I first tried the HPCALC.EXE program that came with the old HP Omnibook computers. While it runs in Windows and does have a Solver Application, it's not a complete implemetation of the caculator solver. It doesn't seem to have L(), G() or SIGMA functions, and it has a lot of quirks on how it handles a lot of the solver functions.

Then I remembered the HP-200LX. It has a great calculator in it which also has a solver. Better yet, it does implement L(), G() and SIGMA.

The HP-200LX makes a great development platform for developing solver equations - the memo pad can be used to edit the equations - and results can be fully tested and debugged on the HP-200LX.

It's also very easy to copy equations, such as Gerson's TRIG ones, and then paste them into the SOLVER.EQN file on the PC, copy the file to a PCCard and insert into the HP-200LX for running.

The 200LX solver is 100% compatible with the 17BII solver with two exceptions:

You need to place a left Brace and Right Brace around the equation, and all Colons must be changed into Commas. Other than that, the equations work as-is with no modification.

**EDITED - As Gerson points out next message, there is no need to change the Colons into Commas. Just copy and paste into the SOLVE.EQN file. (Bill)**

Now for the really good part - You can emulate the HP-200LX (or 100LX) on the PC using CPACK100 or CPACK200. Doing this allows for using the Windows Notepad (or other editor) to edit the Equations, then run and debug on the emulator. Once the equation is perfect, you can print it out and enter it into the calculator.

For a test, I scanned the TRIANGLE equation pages from the Technical Applications Book, OCR'ed it, converted the Colons to Commas, and then copied it to the SOLVE.EQN file. Just had to correct a few mistakes due to the OCR, but the result worked great. A lot easier than typing it directly in.

The CPACK100 can be downloaded from:

[CPACK100](#)

Put all the files in a directly called CPACK100 and run the APP100.BAT file.

You now have a great development platform to let your Solver imagination run wild.

Bill

## **Re: Using Solver on The PC**

*Message #2 Posted by [Gerson W. Barbosa](#) on 6 Mar 2007, 11:54 a.m.,  
in response to message #1 by Bill (Smithville, NJ)*

Hello Bill,

Thanks for the link. CPAK200 would be great, but CPAK100 works.

Quote:

\_\_\_\_\_  
You need to place a left Brace and Right Brace around the equation, and all Colons must be changed into Commas. Other than that, the equations work as-is with no modification.  
\_\_\_\_\_

I had to enter a simple equation into the solver, so the file Solve.eqn was created. Once the file exists, it's just a matter of copying and pasting. There was no need to change colons into commas, though. Have you tried it?

This is a better development tool than the HP-200LX and a CF card I used when working on the equations. Thanks again!

Best regards,

Gerson.

## **Re: Using Solver on The PC**

*Message #3 Posted by [Bill \(Smithville, NJ\)](#) on 6 Mar 2007, 12:09 p.m.,  
in response to message #2 by Gerson W. Barbosa*

Hi Gerson,

Quote:

\_\_\_\_\_  
There was no need to change colons into commas, though. Have you tried it?  
\_\_\_\_\_

You're right - colons work fine. I was going by the list of functions which show commas in lieu of colons, so thought they had to be commas. I'll correct my original post. Thanks.

Sure is a lot easier to edit equations on the PC than in the calculator. I've used both CPACK100 and CPACK200. Both work fine.

Bill

### HP-65 Display Glare Shield?

Message #1 Posted by [John Garza](#) on 5 Mar 2007, 7:36 p.m.

I recently bought a used HP-65 Survey Pac that included a little plastic clip-on glare shield for the HP-65's display. It's relatively sturdy and looks to be made out of the same stuff as the 65's case. I guess it's useful if you're a surveyor out in the bright sunlight all day. I don't know surveying, but I've been around HP's for a few years and have never come across one before. I thought the only accessories for the 65 were the battery holder/charger, the hard field case, and the security cradle. Does anyone know anything about it, or if other unusual accessories were made?

-John

### Re: HP-65 Display Glare Shield?

Message #2 Posted by [Spacedog](#) on 5 Mar 2007, 9:37 p.m.,  
in response to message #1 by John Garza

If it is the same product that I used with my HP 67, then it is third-party. Mine was flat black and looked like the thing Mr. Spock looked into at his science station. It worked, too - as a glare shield, mean. :-)

Perhaps, this is the reason the Woodstocks' LED's were tunnelled in there pretty deep.

### Re: HP-65 Display Glare Shield?

Message #3 Posted by [John Garza](#) on 5 Mar 2007, 10:14 p.m.,  
in response to message #2 by Spacedog

Yep, that's it. It's exactly like a Spock sensor viewer. (For the TREK illiterate out there, think of the conical rubber hoods over old radar crt displays.) It just clips around the edge of the case. I figured it was 3rd party as I couldn't find an HP emblem on it. I honestly didn't think there were any 3rd party HP calc accessories until the 41C arrived on the scene - other than maybe a fancy stand or case.

-J

**Re: HP-65 Display Glare Shield?**

*Message #6 Posted by [Spacedog](#) on 7 Mar 2007, 9:51 a.m.,  
in response to message #5 by Paul*

Hi,

I am sorry to say that I no longer have my HP 67, nor any of the paraphernalia that I had for it. Perhaps, John G. would be kind enough to post a photograph of his HP 65/67 glare shield? Thank you. :-)

Actually, my main work calculator is now an HP 17BII. I also use powerOne Finance (HP-12C, 17BII, 19BII, TI-BAII+) and Thomas Okken's Free42 on my Fossil and Abacus Palm OS watches (I have both).

I still replace the battery in my HP 48GX RAM card annually and really like my HP 33S. Also, I must say, not having any of my HP 67, 41CV or 48SX stuff anymore, that I really appreciate this museum's DVD's, both from a practical standpoint and nostalgically!

### Irrational HP 50g Lust

Message #1 Posted by [Don](#) on 5 Mar 2007, 2:08 p.m.

I flunked out of physics/math in college, not from lack of interest but, rather, discipline. Now I'm a happy attorney who still remembers the good old days of programming on a TI-59. I do my taxes on an HP 15c (greatest calculator ever) and keep an HP 10B on my desk at work. I want to buy an HP 10BII but have even less justification than for getting a 50G

My question: I want to get a 50G, only about \$123 from a certain retailer named after a rain forest/large women, is it sacrilege to get such an incredible tool to essentially just play and explore with?

For the same price I could get MapleSoft or something else that makes more sense a thousand different way, but I have this insatiable lust for the 50G...the uber-calculator. As I was growing up in the 70s and 80s, every year or two, a more amazing calculator would come out and it was so exciting. I think I want to re-live some of the wonder of my youth playing around with a 50G.

Am I crazy?

### Re: Irrational HP 50g Lust

Message #2 Posted by [Ron Ross](#) on 5 Mar 2007, 2:41 p.m.,  
in response to message #1 by Don

"For the same price I could get MapleSoft or something else that makes more sense a thousand different way, but I have this insatiable lust for the 50G...the uber-calculator"

Does it make more sense to have MapleSoft? I just so happen to purchase an older copy and you know what? I don't (willingly) carry a laptop or pc around. But I often travel with an Hp to hack away at simple math problems. And what better tool than an Uber-Calculator for such recreation!

I will admit, if I am writing a report or something formal, the calculator is not the best tool for finishing the job, but it is a great starting tool to flesh out the math.

Do you do formal reports that require advance MapleSoft software? If so, then yes, Maple is your better buy. But if you are a recreational user (like I am 90% of the time), the Hp calculator is far more useful (as I have both, but I admit, I need a math package for reports, and I could make a laptop work, but a PC ISN'T a real substitute for a calculator for me anyway).

### Re: Irrational HP 50g Lust

Message #3 Posted by [Don](#) on 5 Mar 2007, 3:58 p.m.,  
in response to message #2 by Ron Ross

Quote:

Do you do formal reports that require advance MapleSoft software?

I have absolutely no need or use for MapleSoft or an HP 50G. However, I very much WANT and HP 50G. Usually, I can rationalize some need or use for stuff I buy...not so for the 50G. Only that I'll enjoy fiddling around with it.

I should be working right now, but I'm surfing calculator porn (pictures of calculators), reading user manuals and trying out emulators to get my fix.

Oh, how I used to look forward to the Service Merchandise catalog and spend hours pouring over it.

I remember when I saw my first LCD calculator thinking how flat and unreliable the display looked, like the wrong number could just flicker up at anytime.

## Re: Irrational HP 50g Lust

Message #9 Posted by [Dave Hayden](#) on 5 Mar 2007, 3:13 p.m.,  
in response to message #1 by Don

Go for it! That's what I did.

I was in high school from 77-81, right when programmable calculators became accessible. When I started high school, text books had tables in the back for  $\sin(x)$ ,  $\tan(x)$ ,  $\ln(x)$  and you had to learn on a slide rule. Then the TI-30 came out. It cost about \$30 as I recall and it did scientific calculations with great speed and accuracy.

Anyway, I got hooked on programming with an HP 29C. Graduated to a 41C when it came out, and got a 41CV in 1981 in college. I've used it steadily ever since.

Fast forward 26 years and my daughter needed a good calculator for math. I got her a TI 84+ (they recommended the TI83, which is compatible). "Hmm. I wonder what HP has done with calculators over the past 26 years?"

Within 3 weeks I bought an HP50g and I've been playing with it ever since. It's quite a fun machine!

A couple words of warning though:

1. When you aren't editing a value, the right arrow key executes  $x \leftrightarrow y$  (which is now called SWAP). This highly useful fact is buried deep DEEP in the documentation.
2. Don't even bother opening the "user's manual" that comes with the calculator. Download the "Users Guide" from the website. It's an expanded version of the manual. The manual will be good as a "quick reference guide" after you learn the thing.
3. Even the User's Guide is pretty awful. Just stick with it. You'll probably find yourself reading and re-reading the first 3 chapters before you can figure the thing out. Some of the big changes are: - the stack size is limited only by memory - it does symbolic math - the programming language is completely different
4. When you get to the chapter on programming, put down the User's Guide and download the HP 49 Advanced User's Manual (AUM) instead. This describes programming the calculator in far more detail, which is to say that it's more-or-less adequate.

The bottom line is that calculators have made gigantic advances since you and I used them heavily. I've been playing with mine almost every evening for a couple of weeks. Great entertainment (okay, I've a serious nerd). The downside is that the documentation is truly atrocious.

---

Be warned: I did exactly that, printing them double-sided in booklet-style, so they'd be hand-book sized. They each ended up requiring a two-inch comb, the User's Guide barely fitting that. These manuals are very thick especially in relation to the information density.

I suppose I won't be scaring an attorney by talking about thick books, though.

Are you looking for permission? I, a fellow human being, who does not especially need any of his many, many calculators in the practice of his chosen profession, hereby grant it.

Visualize this: you are holding a slim black object in your hand, and it is displaying a custom menu of your own making, containing a few collected functions. On the display is a beautiful equation -- say,  $e^{\pi^i} - 1 = 0$ . You manipulate it using a few keystrokes, rearranging the terms. You press a newly assigned key and the equation library pops up, ready for you to explore. Another few keystrokes, and you derive the required payment for a new car given the rate advertised in the newspaper. You enter and multiply two matrices. You murmur to yourself, "I am holding the most advanced, most powerful handheld calculator in the world."

Now ask yourself: are you happy in this visualization?

Either way, your course is clear. It's OK to be happy.

I am...

Can you? I just checked current pricing on Maple, Mathematica, and MatLab at their respective websites. The standard retail cost for each is in the \$1,800 to \$1,900 range. You can't get such software for a price comparable to the ~ \$125 cost of an HP-50G, unless you can qualify for an academic discount.

If you want to play around and explore mathematics and programming, clearly the 50G is a much better deal than the software.

Get both the software and the 50G. You can afford them.

### **Re: Irrational HP 50g Lust**

*Message #18 Posted by [Don](#) on 5 Mar 2007, 5:13 p.m.,  
in response to message #16 by Norris*

You are correct, I was counting on a student version. At those prices, it would be cheaper to enroll somewhere and get the student discount.

So is there a general consumer, approximately \$100, semi-ultimate math program for PCs?

### **Re: Irrational HP 50g Lust**

*Message #19 Posted by [Jonathan Eisch](#) on 5 Mar 2007, 11:21 p.m.,  
in response to message #18 by Don*

You could go through the trouble to enroll in a class, etc. but whatever software you'd buy will still depend on the operating system and computer you load it on. With Mathematica, if you upgrade your computer or operating system, you'll have to call them up to get a new pass (and they'll want your latest transcripts or schedule to confirm that you're still a student)....

On the other hand, whatever you learn about the HP-50g will be valid and useful as long as you have it.

-Jonathan

*Message #20 Posted by [Eduardo](#) on 7 Mar 2007, 9:27 p.m.,  
in response to message #18 by Don*

Don,

If you enjoy "playing" with high-powered PC software for scientific computing there are a more than a few programs available. Many are even 100% free.

Numerical linear algebra: Matlab, and its free clones octave, scilab, and Rlab.

Statistics: Stata, S, and its free variant R.

Symbolic math: Mathematica, Maple, the less well known semi-commercial MuPad, plus the free Axiom and Maxima.

The newest "Kid on the Block" of rather powerful free software for math applications is SAGE (Software for Algebra and Geometry Exploration) which is a meta-program that serves as interface to many free and commercial libraries. It caters to serious mathematicians working in number theory, algebra and algebraic geometry.

If you want to play but only have access to a Windows computer, I recommend that you burn a Quantian DVD. It contains quite a few scientific applications and will probably keep you busy (playing) for a while. Or you can download SAGE for Windows.

Eduardo

Don't forget one of the most powerful programming environments, that most people don't know they own--MS Excel. With VBA and solver, plus the analysis toolpack, it does it all except some plots and symbolic math. With precision every bit as good as most applications (except for esoteric issues that are more suitable for Matlab or Mathematica. Mathcad is no more accurate I've found for most functions.)

The symbolic capability on the 50g is quite nice. I purchased one on a whim after spending oodles on a palm device with lots of calculators. I like pushing buttons more than using the pens, although there are some very cool applications like Powergraph and PDACalc (which is like Matlab.) Problem with PDAs is battery power.

Cheers,

LouP

Quote:

Am I crazy?

Funny you should ask.

I am a psychiatrist who has taken time away from full-time practice to study music. HP calculators could not be more useless in my day-to-day professional and academic life.

But I own twenty of them, 18 of those acquired over the last year, as well as various peripherals and modules for the HP41. I have spent piles of money and lots of time. I also play around with Maple, Mathematica, and Matlab. This monkeying around, with no practical, professional, or academic motivation at all, consumes several hours of my life on most days.

The funny thing about math is that folks often feel very strange about enjoying it for its own sake--it has to be so practical and utilitarian lest you risk being accused of hopeless nerdiness. No one ever seems to struggle like this over enjoying art, music, or literature. This is a shame. I think there was a time in recent history when being well-read, artistically adept, and numerate were all seen as part and parcel of the well-educated package.

If you are crazy for wanting to splurge a hundred bucks on a 50G just to have some fun, then I am so far gone that it is unlikely I will ever be shocked back into coherence :)

Buy the 50G, and a nice financial too while you are at it. Have fun. You have my personal and professional

blessing.

Just for some absurdity, let's ride the metaphor train for just a moment...

You walk into a bar, ask all the people having/enjoying a drink (some of whom are alcoholics) if you should have a drink? What do you think the response would be?

It comes off snarky, but it is not meant to be. You absolutely should purchase one of these little gems. Why?

Because you are utilizing an intellectual pursuit as a hobby. Many people indulge in gratuitous, or destructive hobbies. 123 dollars is a small entry fee for a tool that can do so much.

Suffering from calculator lust is not a serious disease. If this is your 300th calculator, and you steal them out of Walmarts just to possess them, then I would say you have a problem. Unlike Les, IANAP. I don't know you, but from your post I would say that you are most likely a responsible adult with a reasonable degree of humanity and do not have the dreaded "Narcissitic Personality Syndrome" which affects more and more people each year. (If your post said "I deserve it", that would be different).

Don't analyze it. Do it.

Get the 50g! It would be far less expensive than trying to get a mint 41CX, 15C, or other immensely popular HP scientific from 20+ years ago. But beware, once I got bitten by the bug, about \$4k just jumped out of my pocket over a short period of time due to lust. I've since sold off 2/3 of my collection to another collector (but retain some favorites) to recoup of my losses, only to spend it on table tennis gear. So if you have an obsessive personality like the rest of us, try to set some limits early on so you don't go overboard. What's going to happen is that you start craving the build quality of the older calcs, then you want one, or two, then three and four, and so on. So enjoy that 50g, but try to stick to your predetermined limits.

in response to message #1 by Don*

Go for it and enjoy!

Even if you get bored with it after a couple of weeks, wasting \$123 is nothing compared to buying the wrong car, booking the wrong vacation, moving to the wrong neighborhood, etc...

The HP RPL calculators are a lot of fun to explore and play with, even if you don't actually need them. I don't have a 50g myself, but if you enjoy yours as much as I enjoy my 48G, then trust me, it'll be money well spent. (And I don't **need** my 48G either! I'm a computer programmer and I never take a calculator to work, unless you count my HP-42S simulator...)

### **Re: Irrational HP 50g Lust**

*Message #33 Posted by **Ron** on 5 Mar 2007, 10:18 p.m.,  
in response to message #1 by Don*

Don, buy yourself the 50g and look into Mathcad version 13 or 14 for around \$300 for your desktop or laptop. Mathcad is built on the engine for Maple which is in the \$1700 range. I can speak personally for release 13 which was a serious improvement over release 11. Forget 12.

The 50g is an amazing piece of equipment. You are correct in thinking to create copies of the user guide and advanced reference manuals for the 50g. Use Adobe reader to get your copies at Staples or office depot. My bound manuals cost about \$30 each. By the way, the advanced user manual is still called the 49, but about 99% useful for the 50. I am retired from corporate employment, where I reached the level of Director of Product Assurance for a competitor of IBM. I spent my early years at IBM in general systems involving main frames and peripherals (as opposed to special purpose computers for satellites, for example.) I hope you aren't crazy because that would make me raving. I can lose a half day or more if I take my 50g to the breakfast table. I just enjoy the old challenges with the ability to solve some differential equations or integrals and show me the methods used if I want. One can choose between algebraic or RPN, symbolic and numerical, etc.

I am programming the 50g to solve a cash manager's approach to Internal Rate of Return removing the fallacy of traditional methods. You might be interested in the simplicity of the solution to allow irregular periods if you do this kind of investment modeling. I turned 76 last week, so I might be a little slow finishing the project, but I have to say that my "irrational" relationship with this device gives me a great sense of achievement, which I need in the after life.

One of the subjects you should master early on is the difference between local and global variables. Locals get an additional dimension over RPN use when compiled. Worth a couple of hours study to avoid confusion, especially when programming interactively.

*Message #35 Posted by **James M. Prange (Michigan)** on 6 Mar 2007, 2:55 a.m.,  
in response to message #34 by Don*

Regarding the manuals, get the *hp 49g+/ hp 48gII graphing calculator advanced user's reference manual* instead of (or in addition to) the 49G manual.

If your 50g comes with ROM revision 2.08 (check this with the VERSION command), upgrade it to **2.09** or Bernard Parisse's **2.10-7**. Optionally, install libraries 226 and 227 for the equation library and 229 for the periodic table. Use the libraries that come with 2.10-7, also available at **Hydrix**.

This forum is good, but for RPL models, you'd probably be better off with the usenet group comp.sys.hp48. In case you don't already use a newsreader, you can also access it (including the archive) through <http://groups.google.com/group/comp.sys.hp48>.

Regards,  
James

### MAJOR RESULT DISCREPANCY; 50g vs. 41CX

Message #1 Posted by [Edward J Pec](#) on 5 Mar 2007, 1:27 p.m.

I recently found this site and there is a result discrepancy between the HP-41CX (I own 2 of them; same thing for both) and the new HP-50g, namely, the numerical result for the following (done in full floating point, maximum decimals in all attempted evaluations):

{ [3 x (5-(1/9))] / 23 ^3 } + e ^2.5 then sq. root of result

In the 50g, using RPN, the result is 3.49.... In the 41CX, the result is 3.83...

Independent evaluations indicate 3.49... is correct... as in the 50g User Guide, so what's going on ??

This can not be a rounding error, and the answer can not be a matter of calculator opinion, so please help my insomnia and tell me what's going on !

Edward (anyone with some info on this can also email me at: [epec@nj.rr.com](mailto:epec@nj.rr.com))

### Re: MAJOR RESULT DISCREPANCY; 50g vs. 41CX

Message #2 Posted by [Dave Hicks](#) on 5 Mar 2007, 1:48 p.m.,  
in response to message #1 by Edward J Pec

On the 41Cs and 41CXs that I happen to have handy, I'm getting 3.49.

I noticed that if I take just the first bit  $3x(5-(1/9))$  and take the sq root of that - then I get 3.83. Coincidence?

Edited: 5 Mar 2007, 1:51 p.m.

in response to message #1 by Edward J Pec

My 41CV gives 3.490515637 as result, same as my 32S (3.49051563628), TI-52 (3.490515636), Sharp PC1260 (3.4905156362).

Best regards,

Nelson Sicuro

**Re: MAJOR RESULT DISCREPANCY; 50g vs. 41CX**

Message #5 Posted by [Hal Bitton](#) on 5 Mar 2007, 6:40 p.m.,  
in response to message #1 by Edward J Pec

Hi Edward,

You may want to check your keystrokes on your 41CX('s)...I own 2 of them as well, and both of mine give me 3.490515637. This result is also achieved using my 29C, 34C, 67, 97 and 15C as well, so I think there is no question that it's the correct result. Bear in mind that the stack logic on your 50G (in RPN mode) is a little different than that of a vintage 4 level machine...I know some functions won't work on a 50G unless you bump the command line into level 1 of the stack (by pressing the enter key), where as there is no need to enter on an a pure RPN/four stack level machine. One such function that comes to mind is  $X \leftrightarrow Y$ . I was unable to duplicate your 3.83 result even by purposely miss-keying the equation (in several different ways), so if you wanted to post the exact keystroke sequence you are using (on your 41CX), we could take a look at that. Best regards, Hal

**Getting Edward's result**

Message #6 Posted by [Palmer O. Hanson, Jr.](#) on 6 Mar 2007, 10:09 a.m.,  
in response to message #5 by Hal Bitton

We begin by finding that the square of Edward's HP-41 result is 14.6689... which is very close to the result obtained from the  $[3 \times (5 - (1/9))]$  part of the proposed problem which is 14.6666... . Then we note that square of 3.49051... is 12.183699... which is close but not quite equal to  $e^{2.5}$  which equals 12.182439... Then we evaluate the  $\{ [3 \times (5 - (1/9))] / 23^3 \}$  part of the problem and find that it is equal to 0.0012054.... If we add that value to  $e^{2.5}$  and take the square root we get the correct answer. If we add that value to 14.66666...and take the square root we get 3.8298..., which is the incorrect answer.

Thinking about those results a little will reveal that somehow Edward's RPN sequence doesn't use the  $e^{2.5}$  value of 12.182439... but instead uses the value of 14.66666... . By working from the back of the problem to the front and inside out and adding a couple of unfortunate ENTER's the following RPN sequence will get the incorrect answer:

```
2.5
e^x
9
1/x
CHS
5
+
3
x
ENTER
ENTER
23
ENTER
3
y^x
/
+
SQRT
```

where the two ENTER's before the entry of 23, which aren't needed, push the  $e^{2.5}$  value out of the stack and leave a  $[3 \times (5 - (1/9))]$  value where it should have been.

I don't say this is necessarily the way Edward did it. I only say it is one way he could have done it. The RPN language can yield some strange results if one isn't careful about pushing values up and out of the stack. When an RPN solution goes bad it is reminiscent of the book I used to read to my children -- "Inside, Outside, Upside Down"

### Looking for RPN similar to 42s

Message #1 Posted by [Scott](#) on 5 Mar 2007, 12:56 p.m.

Hi. I have an HP 42s which sits in a drawer and is used about four times a year. I recently discovered that the calculator is somewhat collectable. I am contemplating putting it on eBay and let the collectors have it. My only hesitation is that I do really like the build of the calculator (quality, form factor, tactile feel of the buttons). I don't have any sentimental attachment, not do I use any of the advanced features. I would like suggesting inexpensive RPN replacement HP calculator. Either new or used is fine.

Thanks.

Scott

### Re: Looking for RPN similar to 42s

Message #2 Posted by [Norris](#) on 5 Mar 2007, 1:49 p.m.,  
in response to message #1 by Scott

The reason that old RPN calculators like the 42S are collectible is precisely because current RPN calculators are considered inferior in terms of quality and form factor.

You could sell your 42S for a few hundred dollars, and replace it with a brand new HP-33S -- the least expensive current RPN model -- for about \$50. But one glance at the 33S should help you to understand why the 42S is now highly collectible.

*Edited: 5 Mar 2007, 2:02 p.m.*

Message #4 Posted by [Ron Ross](#) on 5 Mar 2007, 2:02 p.m.,  
in response to message #1 by Scott

You could buy a new old stock Hp17Bii for a bit less than \$100. It is the EXACT same hardware and is also

RPN. It is not a scientific, but has a better stats package, timer and an extremely easy to use solver for input custom equations. And put \$100-200 in your pocket.

If you don't use the 42s all that often and not for trig, the Hp17Bii may even be more useful to you.

## Re: Looking for RPN similar to 42s

## Re: Looking for RPN similar to 42s

Message #6 Posted by [Raymond Del Tondo](#) on 5 Mar 2007, 6:41 p.m.,  
in response to message #1 by Scott

Hi,

as Ron wrote, a 17BII (NOT 17bII+) could be an adequate RPN machine for daily use. But I'd also suggest to take a look at the 32S or 32SII, whereas the latter (32SII) could be a bit high-priced, for similar reasons as those for the 42S prices;-)

The 32S (w/o the II) should be somewhat cheaper, somewhere between \$50 and \$100.

The 12C, although very common, is a completely different thing. It has a landscape layout, and the classic 12C doesn't have a backspace key, only a CLx key. Aside from that, the 12C is a very nice machine.

Raymond

## Re: Looking for RPN similar to 42s

Message #7 Posted by [Scott](#) on 6 Mar 2007, 12:54 a.m.,  
in response to message #1 by Scott

As it happens, I do have a 48gx as well as the 42s. I tend to use the 48gx instead of the 42s due to the larger visible stack size. Reading the above thread on "50g love" got me to wondering: how does the 50g compare with the 48gx?

## Re: Looking for RPN similar to 42s

Message #8 Posted by [Norris](#) on 6 Mar 2007, 11:44 a.m.,  
in response to message #7 by Scott

The HP49 and 50 series are successors to the HP48 series (as the model numbers might suggest).

The 50G is based on the 48G-series, but has an improved operating system, a larger display, is much faster, has far more memory, and has far better symbolic math capabilities ("computer algebra system"). The "build" of the 50G (e.g. appearance, form factor, durability) is generally considered acceptable, but not quite up to the standards of historical HP calculators like the 48GX.

The operating system and computer algebra system of the 50G are based on software that was originally developed for the 48G (e.g. MetaKernel, Erable, Alg48). If you get a pair of HP-48GX memory cards, then in theory you can upgrade your 48GX, add this software, and gain many of the capabilities of the 50G. This is not necessarily a great idea in practice, however, because a pair of 48GX memory cards may cost as much as a whole 50G. Furthermore, an upgraded 48GX is still much slower and clumsier to use than a 50G.

\_\_\_\_\_

Furthermore, an upgraded 48GX is still much slower and clumsier to use than a 50G.

\_\_\_\_\_

Not necessarily.

I recently made a new version of my user interface replacement libraries, the new version is a major improvement over the older versions, and is called 'SpeedUI 7.03 Extreme Edition'.

It accelerates the complete user interface of an HP-48G/G+/GX, including \*all\* input forms and choose boxes.

Furthermore, the new 6-level stack display is \*much\* faster than before, and the command line and full screen editing facility is the fastest one I ever saw on an HP-48.

It includes a real COPY/PASTE feature with a multiple object clipboard, as well as an interactive online command catalog with fast search capability and parameter help.

For example, loading the complete 'TEACH' subdirectory

from the stack into the editor takes only 2 (two) seconds,  
and scrolling down in the editor now really makes fun.

And my MatrixWriter replacement with switchable fonts  
is the fastest one available for the HP-48.

The new SpeedUI 7.03 EE isn't on hpcalc.org yet,  
but if anyone interested, I could send the archive as email.

(The SpeedUI version on hpcalc.org is outdated, and should not be used anymore)

Unlike 'MetaKernel', the SpeedUI components can be stored in any port,  
although port 0 or 1 are recommended for speed.  
Installation and deinstallation works as with any other libraries.

SpeedUI was made for users, not for hackers;-)

Raymond

### **Re: Looking for RPN similar to 42s**

*Message #10 Posted by [Les Wright](#) on 7 Mar 2007, 1:48 a.m.,  
in response to message #9 by Raymond Del Tondo*

I am interested, but have just a humble 48G, which frankly I never use because it seems so slow.

Is the new version of SpeedUI usable on the 48G?

Les

### **Re: Looking for RPN similar to 42s**

*Message #11 Posted by [Raymond Del Tondo](#) on 7 Mar 2007, 4:00 a.m.,  
in response to message #10 by Les Wright*

Hi Les,

unfortunately the new version doesn't fit into an 48G with 32K RAM,  
since the base library alone is about 15K,  
and the optional UI library (which makes the new & fast stack and editor),  
is about 20.5K , totalling to about 35K .  
So a G+ or GX, or an expanded G will be needed.

The older (now obsolete) version of SpeedUI,  
which is available on [www.hpcalc.org](http://www.hpcalc.org) ,  
has a very small footprint compared to the new version,  
so it will be usable in a normal 48G.  
The old version is nice, too,  
but lacks many features, like the fast editor.

However the system integration and stability  
of the new version is much better...

Nonetheless I could send you the new version,

so you could try it on Emu48.

Just drop me a mail to:

M a g i c 4 8 g e s [at] g m x [dot] d e

(Remove the obvious spaces and placeholders;-)

Raymond

*in response to message #11 by Raymond Del Tondo*

Quote:

Furthermore, an upgraded 48GX is still much slower and clumsier to use than a 50G.

I was thinking primarily in terms of the computer algebra system, rather than the user interface. For example, the best way to differentiate expressions on a 48GX is with the Erable library, but the best way to simplify expressions is often with the Alg48 library. And both Erable and Alg48 work slowly, as does graphing.

You can add CAS capabilities, or alternative graphing software, to the 48GX, but you wind up with a slow and clumsy "patchwork" system, whereas the CAS of the 50G is fast and streamlined.

I haven't tried SpeedUI, but I can believe that it might improve the user interface of the 48GX (the MetaKernel, which I previously suggested, also does this). But if you have to buy 48GX memory cards first, the cost savings over a 50G may not be great.

**HP-19BII Repair anyone ??**

Message #1 Posted by [Camabron](#) on 5 Mar 2007, 11:56 a.m.

Hi all.. does anyone know of a shop that repairs HP-19BII calculators anywhere ?? Thanks in advance.

**Re: HP-19BII Repair anyone ??**

Message #2 Posted by [Ron](#) on 5 Mar 2007, 12:48 p.m.,  
in response to message #1 by [Camabron](#)

What's wrong with it? Battery door, case coming apart, etc? They're pretty much made to throw away, as the internal posts/rivets often break off where they can't really be repaired. My experience anyway.

**Re: HP-19BII Repair anyone ??**

Message #3 Posted by [Camabron](#) on 5 Mar 2007, 1:13 p.m.,  
in response to message #2 by [Ron](#)

Water damage... I placed it near a container with tea inside and it spilled and got the calculator wet. Actually it does perform calculations, just that the first two menu lines buttons don't respond and neither does the first line of the text input on the left panel side.

**Re: HP-19BII Repair anyone ??**

Message #4 Posted by [Ron](#) on 5 Mar 2007, 2:45 p.m.,  
in response to message #3 by [Camabron](#)

Wait for someone else here to give further advice, but I would say a dunk or two in distilled water could do it some good. On advice I received here, I finally got up the courage to dunk my 32SII, and it did the trick on sticky buttons. Your mileage may vary, and you are responsible for any damage to your calculator.

Remove batteries. Place the whole calculator in a glass pan of DISTILLED (not purified, drinking, tap, or other) water. Calculator should be open. While under water, press each button, swish it around some, and do it some more. Take the calc out of the water, and shake the water out of the calc, then repeat the process with fresh distilled water. Then, let the calc dry for a couple of days in warm air - Over a heater vent worked well for me. Reinstall batteries, and give it a try.

Gudn luckn!

### I'm new

Message #1 Posted by [Gilles Collas](#) on 5 Mar 2007, 10:12 a.m.

Hi I' m gilles from france, I' m now 42 and an old HP calculator fan... I remember I've been put on the tracks of my job and career by the use of programmable calculator TI57 & 58 I discovered at high school ... with other crazy guys like me ! Once in the ending 70's, I've been writing a letter to HP France telling them I was not rich and starting studies that would need a performing calculator that my parents could not afford to pay for... Weeks later, the postman delivered a pack containing a brand new HP31E, with all relevant stuff, charger & docs !! For free, thanks to the holy person in HP that read my letter ... After using the calculator for a few days, I noticed that it has no serial number, neither the manufacturing location printed on the back, and it was some how bugged ! Memories contents swapping or vanishing .. hum.. strange. I decided to use it only for direct calculations not memory capacities as they were unreliable. It's thirty and more years old now and the HP31E is still on my side, but no longer alive ... I would like to make it run again and I was wondering if anyone yould help me in this ... Thanks

gilles

### 48GX Repair - Won't Beep

Message #1 Posted by [Ron](#) on 5 Mar 2007, 8:39 a.m.

I recently did a repair to a 48GX by shoring up the rubber pad which supports the contact strip connecting the keyboard to the PCB. The calc now passes the keyboard test and the self test. However, it now will not beep during testing. The spring is firmly soldered in place, and makes contact with the disc. Any ideas what else it could be? Thanks.

*Edited: 5 Mar 2007, 8:41 a.m.*

### Re: 48GX Repair - Won't Beep

Message #2 Posted by [Han](#) on 5 Mar 2007, 9:31 p.m.,  
in response to message #1 by Ron

There's improper grounding. Behind the battery holding area (upperhalf of the case) is a piece of metal that has a tab slightly bent away from the rest of the case. This metal tab needs to touch the metal from the lower half. At the moment, you're not getting the proper grounding. Either the lower section of the calculator near the 1, 2, and 3 keys is not properly closed (i.e. the four rivets there have not been reset) or the tab needs to be slightly bent (i.e. it was accidentally flattened out).

*Edited: 5 Mar 2007, 9:34 p.m.*

### Re: 48GX Repair - Won't Beep

Message #3 Posted by [Ron](#) on 6 Mar 2007, 12:58 a.m.,  
in response to message #2 by Han

Rebent the tab, and that did the trick. Thanks, Han!

### HP-41 CY Turbo: Ebay offer in German language

Message #1 Posted by [Richard Wilbourne](#) on 5 Mar 2007, 6:37 a.m.

Hi folks,

the HP-41 CY Turbo at Ebay: Can anyone tell me the differences between HP 41 CY and HP41 CX ? (the Ebay text is in German language). I know that it is a great machine and also extremely rare.

Item number: 180092629766

[http://cgi.ebay.com/HP-41-CY-Turbo-von-W-W\\_W0QQitemZ180092629766QQihZ008QQcategoryZ104502QQssPageNameZWVWQQrdZ1QQcmdZViewItem](http://cgi.ebay.com/HP-41-CY-Turbo-von-W-W_W0QQitemZ180092629766QQihZ008QQcategoryZ104502QQssPageNameZWVWQQrdZ1QQcmdZViewItem)

Best, Rich

*Edited: 5 Mar 2007, 6:57 a.m.*

### Re: HP-41 CY Turbo: Ebay offer in German language

Message #2 Posted by [Raymond Del Tondo](#) on 5 Mar 2007, 7:18 a.m.,  
in response to message #1 by [Richard Wilbourne](#)

Hi,

the CY has a 64K RAM box built-in, and also a 'turbo' switch, which will increase the CPU speed.

The RAM box is organized as two 32K pages, which can be switched by software, even under program control.

However, since the seller writes that the unit requires more than one press on the ON key to turn on, I assume that the backup battery on the machine up for auction is low, and so the RAMBox OS has vanished.

A new backup and my CY-INIT module would presumably restore the unit to full functionality;-)

HTH

Raymond

### Re: HP-41 CY Turbo: Ebay offer in German language

Message #3 Posted by [Rich](#) on 5 Mar 2007, 7:44 a.m.,  
in response to message #2 by [Raymond Del Tondo](#)

Hi Raymond, thanks a lot for your detailed clarification!

64K RAM is absolutely breathtaking!! It is like four DOUBLE HEPAX modules. Is the CY rambox organized like HEPAX RAM, i.e. with machine coding capability ?

Good to know that you have an INIT module available for recovering! Cheers,Rich

*Edited: 5 Mar 2007, 7:45 a.m.*

## **Re: HP-41 CY Turbo: Ebay offer in German language**

*Message #4 Posted by **Raymond Del Tondo** on 5 Mar 2007, 11:29 a.m.,  
in response to message #3 by Rich*

Hi Rich,

the principal structure of each RAM block is similar in all ROM-simulating devices, so the individual pages can be used for own ML programs, of course.

There are some differences between the HEPAX \*ROM\* and the W&W RAMBox OS regarding the bank switching schema. The HEPAX ROM uses all four banks of a single page, using the HP standard bank switching opcodes, whereas the W&W OS uses a variation (other combination) of opcodes to switch between (CY RAM) banks 1 and 2.

However the HEPAX RAM isn't bank switched.

You could use a HEPAX ROM, either a real one, or one on a Clonix, in combination with the CY, being able to use one of the two RAM banks of the CY, but you can't load the HEPAX ROM code into a CY, as the RAM banks of a CY are switched in a different way, and there are 'only' two banks, not four as the HEPAX ROM expects.

The above is an (incomplete) overview of some things to notice about HEPAX and W&W CY, but it should give you an idea;-)

About the CY INIT module:

Yes, this was a hard piece of work, I made it from scratch.

It's fully menu-driven, and safely restores a CY RAMBox with weird contents to a clean and working state, including loading RAMBox OS A and B, and optionally OS/X.

There are various articles about RAM boxes and the CY in the hpmuseum forum and articles archive.

Regards

Raymond

## **Re: HP-41 CY Turbo: Ebay offer in German language**

*Message #5 Posted by **Rich** on 6 Mar 2007, 8:50 a.m.,  
in response to message #4 by Raymond Del Tondo*

Thank you, Raymond! Very interesting issue! What is the \$price for a CY-INIT module (on Zeprom or where)? Or did you upload the code to the database of "the other hp41.-rg fan site" for loading into clonix or hepax ? Regards, Rich

**matrices on the HP 50G**

Message #1 Posted by [Amnon](#) on 4 Mar 2007, 3:27 a.m.

Hi

How can I incorporate matrix functions in equations? Essentially, I want to define something like

$$F(x) = c - 2 \cdot x' \cdot h + x' \cdot R \cdot x$$

where  $x$  is the input,  $x'$  is the transpose of  $x$ , and  $c$ ,  $h$  and  $R$  are constants, vectors and matrices as appropriate, already set up.

I can do this manually, but I'd like to speed things up by just sending  $x$  to  $F(x)$ , and getting an answer in one step. Using other matrix functions (other than transpose), such as the determinant would be useful.

Thanks

Amnon

**Trigonometrics on the 17bii+**

Message #1 Posted by [Les Wright](#) on 4 Mar 2007, 12:37 a.m.

Could someone point me to the recent, but obviously now archived, thread regarding this?

I believe there was a lot of discussion, initiated by Gerson, about applying his 12C trigonometry work to the 17bii+ equation solver, but I am darned if I can find it now....

Les

Edited: 4 Mar 2007, 12:37 a.m.

**Re: Trigonometrics on the 17bii+**

Message #2 Posted by [Bruce Bergman](#) on 4 Mar 2007, 2:04 a.m.,  
in response to message #1 by Les Wright

Hi Les --

I believe it was either in "archv014" or "archv016". Take a look in each, and search for 17bii+. I was just reading them the other day, but unfortunately don't have the link with me.

thanks, bruce

**Re: Trigonometrics on the 17bii+**

Message #3 Posted by [Bill \(Smithville, NJ\)](#) on 4 Mar 2007, 5:07 a.m.,  
in response to message #1 by Les Wright

Hi Les,

There's the Article by Bruce Maquire:

[Improved TRIG. and INVERSE TRIG. functions for the HP-17BII](#)

and the Message Thread started by Gerson Barbosa:

[HP-17BII - trig equations suggestions](#)

There may be others, but I think these are the main ones.

Bill

**Re: Trigonometrics on the 17bii+**

Message #4 Posted by [Gerson W. Barbosa](#) on 4 Mar 2007, 6:41 a.m.,  
in response to message #1 by Les Wright

Hello Les,

There are five sets of equations you can use here:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=695>

I would suggest the first set, as it faster and easier to enter. This still can be improved by someone who knows the HP-17BII/II+ solver better, like placing SIN, COS and TAN into a single menu group. They have been tested on the HP-17BII. I am curious if they work on the HP-17BII+.

Best regards,

Gerson.

**Re: Trigonometrics on the 17bii+**

*Message #5 Posted by **Bill (Smithville, NJ)** on 4 Mar 2007, 7:19 a.m.,  
in response to message #4 by Gerson W. Barbosa*

Hi Gerson,

How did I pick up on your message threads but totally miss your article? :) Sorry for missing it in my previous post.

Bill

**Re: Trigonometrics on the 17bii+**

*Message #6 Posted by **Gerson W. Barbosa** on 4 Mar 2007, 7:35 a.m.,  
in response to message #5 by Bill (Smithville, NJ)*

Hi Bill,

I think it's my fault. In the last message in the thread Bill Platt suggested it went into the Articles. I should have provided a link to the article (or to the draft-article, as there is still room for improvement) while the thread was still active. Thanks for remembering it.

Regards,

Gerson.

*Edited: 4 Mar 2007, 7:37 a.m.*

**Re: Trigonometrics on the 17bii+**

*Message #7 Posted by **John Smitherman** on 4 Mar 2007, 10:40 a.m.,  
in response to message #6 by Gerson W. Barbosa*

Hi Gerson. I entered the method 1 equations into a 17bii+ and all equations verify and solve within 2 seconds. I've tried a few values for x: 0, 15, 30, 45, 60, 75, and 90 and all seem to solve correctly. I'll do some more testing and will give you feedback.

Thanks for making this available to us.

Regards,

John

**Re: Trigonometrics on the 17bii+**

Message #8 Posted by **Gerson W. Barbosa** on 4 Mar 2007, 11:54 a.m.,  
in response to message #7 by John Smitherman

Hello John,

If they verify and solve in less than two seconds, this means the 17BII+ is significantly faster than the 17BII, which is great! I was intending to group all six functions in a single menu but I quit because the verification time would be too slow.

I wasn't interested in giving a complete trigonometric solution on the HP-17BII when I suggested two simple polynomial equations for sine and arctangent functions. So it was really great when Charles presented basically the same equations I used in set one and showed that the inverse functions could be obtained iteratively, as you can see in the link provided by Bill. It was a good start.

Other values you can check:

$$\begin{aligned}\sin(18) &= (\sqrt{5} - 1)/4 \\ \cos(22.5) &= (\sqrt{2 + \sqrt{2}})/2 \\ \tan(72) &= \sqrt{5 + 2 * \sqrt{5}}\end{aligned}$$

Regards,

Gerson.

*Edited: 4 Mar 2007, 12:03 p.m.*

**Re: Trigonometrics on the 17bii+**

Message #9 Posted by **Les Wright** on 4 Mar 2007, 9:44 p.m.,  
in response to message #4 by Gerson W. Barbosa

Quote:

\_\_\_\_\_

This still can be improved by someone who knows the HP-17BII/II+ solver better, like placing SIN, COS and TAN into a single menu group

\_\_\_\_\_

I think this can be done, but it looks like it can get complicated when the equations themselves are "busy". Probably need to work it out on paper first, then enter it in.

Quote:

\_\_\_\_\_

I am curious if they work on the HP-17BII+.

\_\_\_\_\_

I have entered only the SIN equation from set 1, and it works beautifully. Very fast. Solving for arcsine iteratively takes a couple of seconds and requires an intelligent initial guess lest one get a result outside of the -90 to +90 degree range that may not be trustworthy. Of note, naively solving for arcsin(1) from initial guesses of 85 degrees converges not to 90 degrees but rather 89.9998857789, which is expected since the sine of the latter is very close indeed to 1--0.999999999998 on my HP49G+.

This is a lot of typing and I am very interested in learning more about the Solver and combining these into

one omnibus equation that reuses the repeated polynomial material with the L() and G() commands. It would be nice to have all of this stuff in one solver menu, but this means it all needs to be in one huge equation with conditionals built in. Complicated!

Les

### Which quadratic solution should we use?

Message #1 Posted by [Palmer O. Hanson, Jr.](#) on 3 Mar 2007, 11:07 p.m.

A "more efficient and accurate" method for the solution of quadratic equations appeared in the *HP-67 Standard Pac*. A similar method which "avoids destructive cancellation" appeared in the *HP-15C Advanced Functions Handbook*. Those "better" methods have not been consistently used in later H-P applications.

Is there a reason for not using the "more efficient and accurate" methods?

Is there an earlier reference on the "more efficient and accurate" methods than that in the *HP-67 Standard Pac*?

Avoiding Destructive Cancellation in the Solution of a Quadratic Equation

Page 31 of Maurice D. Weir's *Calculus by Calculator* (Prentice-Hall, 1982) gives the typical algebra textbook solution for a quadratic equation but then states:

"... The program QUADS calculates the real roots (if they exist) for any specified quadratic equation. The formula used is a modification of Equation 1.11 [the textbook form] to reduce roundoff error."

Analysis of the QUADS program reveals that the solution sequence is:

1. Calculate the determinant  $D = B^2 - 4AC$
2. Calculate the value  $E = (\text{sqr}(D) + \text{abs}(B))/2A$
3. Change the sign of E if  $B < 0$
4. Calculate the real roots as  $C/AE$  and E.

A more thorough treatment of the subject with a similar solution method appears in the appendix "Accuracy of Numerical Calculations" to the *HP-15C Advanced Functions Handbook* also published in 1982. The discussion on page 191 presents the textbook formula and an algebraically equivalent calculation sequence which avoids "destructive cancellation". (Readers of that reference should note that for some reason the authors chose to define the quadratic as  $c - 2bz + az^2$ . The more common definition is used here.) The discussion states

"... Such a program will be listed later (page 205) and must be used in those instances, common in engineering, when the smaller root  $y$  is needed accurately despite the fact that the quadratic's other unwanted root is relatively large."

A demonstration problem is provided. For a quadratic equation of the form  $ax^2 + bx + c$  and  $a = 1E-13$ ,  $b = -2$  and  $c = 1$  the exact solution is  $r1 = 2E13$  and  $r2 = 0.5$ . Implementation of the textbook formula on most HP and TI machines will yield  $r1 = 2E13$  and  $r2 = 0$ .

The rest of this submission presents all the gory details which led up to this submission.

Some H-P History on a Better Quadratic Solution Method

This history is limited to the hardware and documentation available from my own collection.

The method was not included in the quadratic solution in the *HP-65 Standard Pac* printed in 1974 or in the quadratic solution in the *HP-27 Owner's Handbook* printed in 1976.

Pages 198 through 203 of the *HP-67 Owner's Handbook and Programming Guide* (Revision C 12/76) presented a quadratic solver program which used the textbook formula. The end of the discussion includes the following statement "For a more efficient and accurate method of finding the roots of a quadratic equation, see the Polynomial Evaluation program in your *HP-67 Standard Pac*."

The Polynomial Evaluation program on pages 9-01 through 9-04 of the *HP-67 Standard Pac* (1976) uses a routine which addresses destructive cancellation. It solves the test case successfully.

Pages 61 through 65 of the *HP-33E/33C Owner's Handbook and Programming Guide* (April 1979) presents a quadratic solver program which uses the textbook formula. It can not be expected to and does not solve the test case successfully.

Pages 179 through 183 of my copy of the *HP-41C Owner's Handbook and Programming Guide* (Revision B 8/79) present a quadratic solver program which uses the textbook formula. The program cannot solve the test case satisfactorily. A note at the bottom of page 179 does offer the following caution "Some values of a, b, and c may result in misleading answers because their solutions require greater than twelve digits of accuracy."

The "Polynomial Solutions/Evaluation" program of the *HP-41 Math Pac* (11/79) includes a quadratic solver which uses the textbook formula. It cannot solve the test case satisfactorily.

Pages 206 through 210 of the *HP-11C Owner's Handbook and Problem Solving Guide* (Revision B 9/81) describes how to develop a quadratic solver using the textbook formula.

A thorough discussion of the method for avoiding destructive cancellation appears on pages 191 and 205-211 of the *HP-15C Advanced Functions Handbook* which was published in 1982. A program for the HP-15C is included which will solve the test case satisfactorily.

The QUAD option of the SOLVE menu of the HP-28S (1988) does not solve the test problem correctly.

Pages 172 through 174 of my copy of the *HP-42S RPN Scientific Calculator Owner's Manual* (10/88) present a demonstration of the conversion of a quadratic solver program from the *HP-41CV Owner's Manual* for use on the HP-42S. The solution uses the textbook formula and will not solve the test case satisfactorily..

Some TI History on A Better Quadratic Solution Method

The "Solution of Quadratic Equation" in the *SR-56 Application Library* (1976) and page IV-82 of *Personal Programming* (the Owner's Manual for the TI-58/59, 1977) only present quadratic solver programs using the textbook formula which will not solve the test case satisfactorily..

A program for the TI-59 by Bill Skillman which uses a method which will solve the test case satisfactorily was published in late 1978 in V3N12P2 of *52 Notes*.

My article "Improved Solution for the Quadratic" on pages 8-12 of *TI PPC Notes* (1991) provides a solution for the TI-59 which uses the technique in *Calculus by Calculator*. It will yield the correct answer to the test case.

The POLY routine in the TI-68 (1989), the QAD routine of the TI-95 (1986) and the POLY routines in the TI-85 and TI-86 all yield the correct answer to the test case but there is no discussion of the use of an improved method in the manuals. The TI-89 yields inconsistent results. The Polynomial Root Finder of the Apps Desktop returns roots of 2.E13 and 0.51. However, if the test case is entered through the home screen as either a "factor" problem or as a "solve" problem a correct answer will be returned.

## hp-33s Results

The following table presents results obtained with two different solution methods on the hp-33s. The Textbook solution is from the Polynomial Root Finder program on pages 15-20 through 15-32 of the *hp-33s User's Guide*. The Revised solution is an implementation of the technique for avoidance of destructive cancellation defined in the *HP-15C Advanced Functions Handbook*. A listing appears at the end of this submission. The coefficients are from test cases 3 through 6 on page 207 of the *HP-15C Advanced Functions Handbook* but with the first degree coefficient multiplied by minus two to change the definition of a quadratic from  $ax^2 - 2bx + c$  to  $ax^2 + bx + c$ .

| Coefficients |          | Correct        | Textbook       | Revised        |
|--------------|----------|----------------|----------------|----------------|
| a            | 1E-13    | 2E13           | 2E13           | 2E13           |
| b            | -2       | 0.5            | 0              | 0.5            |
| c            | 1        |                |                |                |
| a            | 654323   | 1              | 1.000000921    | 1.000000000    |
| b            | -1308644 | 0.9999969434   | 0.999996022    | 0.999996943    |
| c            | 654321   |                |                |                |
| a            | 11713    | 62.77179203    | 62.771792026   | 62.771792026   |
| b            | -1470492 | 8.5375E-05 i   | 62.771792026   | 8.5375E-05 i   |
| c            | 46152709 |                |                |                |
| a            | 80841    | 12.2171175     | 12.217117552   | 12.217117552   |
| b            | -1975288 | 1.374514E-03 i | 1.374045E-03 i | 1.374514E-03 i |
| c            | 12066163 |                |                |                |

## HP-41 Results

The following table presents results obtained with three different solution methods on the HP-41. The Math-Pac solution uses a version of the textbook formula but with the coefficient of the second degree term set to one. The Textbook solution uses the HP-41 program from pages 172 through 174 of the *HP-42S RPN Scientific Calculator Owner's Manual* modified to complete the solution for complex roots. The Revised solution uses a program translated from the Revised hp-33s solution in this submission.

| Correct                      | Math-Pac                      | Textbook                      | Revised                        |
|------------------------------|-------------------------------|-------------------------------|--------------------------------|
| 2E13<br>0.5                  | 2E13<br>0                     | 2E13<br>0                     | 2E13<br>0.5                    |
| 1<br>0.9999969434            | 1.000000<br>2.0000E-05 i      | 0.999998472<br>0.999998472    | 0.999998472<br>0.999998472     |
| 62.77179203<br>8.5375E-05 i  | 62.77352410<br>62.77006000    | 62.77179203<br>62.77179203    | 62.77179203<br>62.77179203     |
| 12.2171175<br>1.374514E-03 i | 12.21711755<br>1.414214E-03 i | 12.21711755<br>1.369104E-03 i | 12.21711755<br>1.377460537E-03 |

The curious result from the Math-Pac for the second problem results from the definition of the coefficient of the second degree term as unity. That means that the coefficient of the first degree term is entered as 654321/654323 and the constant term as -1308644/654323. I obtain a similar curious result if I enter those coefficients in either the textbook solution or in the revised solution.

## Re: Which quadratic solution should we use?

Message #2 Posted by [allen](#) on 4 Mar 2007, 1:24 a.m.,  
in response to message #1 by Palmer O. Hanson, Jr.

I have been reading through Wickes's book "HP 48 insights" that another forum member sent. It is truly beautiful to see in practice what Karl mentioned a few days ago:

Quote:

---

...use equation-based programming when the formula is simple and straightforward, and use keystroke programming when the formula or calculation is lengthy...

---

Is not the quadratic equation a worthy example? I did not appreciate the simplicity of the equation until I saw it in this form:

[http://www.enterhp.com/images/quadratic\\_eq-512.jpg](http://www.enterhp.com/images/quadratic_eq-512.jpg)

There are really only two terms here:  $c/a$  and  $b/2a$ , the second of which comes up twice! So, a very straightforward RPN-equation would be a two-fold process:

`[a b c] -> [c/a b/2a] -> [root1 root2]`

I can't find my original program from 1993, so here is a rough hack for one at 52.5 bytes. I know someone can get one below 50 bytes.

```
<<
  SWAP -2 / ->V2 SWAP / V->      'sets up [c/a,-b/2a] using vector
  DUP SQ ROT - (SQRROOT)         'finds SQRROOT(b^2/4a^2 -c/a)
  DUP2 + 3 ROLL -                'gets both Y+X and Y-X on the stack.
>>
```

Then again you could just type in:

```
[pre]
<<
->V3 PROOT
>>
```

But I think that would defeat the purpose....

in response to message #2 by allen

This is very elegant but it still has destructive cancellation and gives wrong answers for all of the tough examples Palmer gives.

Message #4 Posted by [Karl Schneider](#) on 4 Mar 2007, 4:01 a.m.,  
in response to message #1 by Palmer O. Hanson, Jr.

Hi, Palmer --

Quote:

\_\_\_\_\_

A more thorough treatment of the subject with a similar solution method appears in the appendix "Accuracy of Numerical Calculations" to the HP-15C Advanced Functions Handbook also published in 1982. The discussion on page 191 presents the textbook formula and an algebraically equivalent calculation sequence which avoids "destructive cancellation". (Readers of that reference should note that *for some reason the authors chose to define the quadratic as  $c - 2bz + az^2$* . The more common definition is used here.) The discussion states

"... Such a program will be listed later (page 205) and must be used in those instances, common in engineering, when the smaller root y is needed accurately despite the fact that the quadratic's other unwanted root is relatively large."

\_\_\_\_\_

One advantage of defining the quadratic that way is that the determinant becomes  $b^2 - ac$  instead of  $b^2 - 4ac$ , and the magnitude of those terms is reduced by a factor of 4.

I haven't fully examined the program to determine exactly how it works. Both the  $b^2$  and  $a*c$  terms overflow a 10-digit register in cases 4, 5, and 6. " $b^2 - ac$ " nonetheless is calculated and tested against zero in several ways.

-- KS

Quote:

A demonstration problem is provided. For a quadratic equation of the form  $ax^2 + bx + c$  and  $a = 1E-13$ ,  $b = -2$  and  $c = 1$  the exact solution is  $r1 = 2E13$  and  $r2 = 0.5$ . Implementation of the textbook formula on most HP and TI machines will yield  $r1 = 2E13$  and  $r2 = 0$ .

I get

```
r1 = 1999999999999.499999999999875      = 2E13 - 0.5 - 1.25E-14
r2 = 0.50000000000001249999999996826535  ~=          0.5 + 1.25E-14
```

on Windows XP Calculator, with its 80-bit extended double-precision variables. These results are quite close to exact, with about  $1E-25$  calculation roundoff error when re-inserted into the original equation.

$x = 0.5$  would be the only (and exact) solution if "a" were zero.

$x = 2E13$  yields  $ax^2 + bx = \text{zero exactly}$ , so  $ax^2 + bx + c = 1$ .

In the original problem, calculating the square root of the determinant " $b^2 - 4ac$ " as

```
sqrt(abs(b + 2*sqrt(a)*sqrt(c)) * sqrt(abs(b - 2*sqrt(a)*sqrt(c)))
```

roundoff error was reduced, but 12 significant digits isn't enough without using special methods.

## Re: Which quadratic solution should we use?

Message #5 Posted by **Palmer O. Hanson, Jr.** on 4 Mar 2007, 9:22 p.m.,  
in response to message #4 by Karl Schneider

Quote:

I get

```
r1 = 1999999999999.499999999999875      = 2E13 - 0.5 - 1.25E-14
r2 = 0.50000000000001249999999996826535  ~=          0.5 + 1.25E-14
```

on Windows XP Calculator, with its 80-bit extended double-precision variables. These results are quite close to exact, with about  $1E-25$  calculation roundoff error when re-inserted into the original equation.

You can, of course, simply do the arithmetic with pencil and paper and find that  $r1$  will be a little less than

2E13 and r2 will be a little more than 0.5. Furthermore, for  $a = 1E-nn$ ,  $b = -2$  and  $c = 1$  the pencil and paper answers will be r1 a little less than 2Enn and r2 a little more than 0.5. Some tests with a number of machines show that if nn is less than the number of digits carried by the machine (but in some cases only if nn is two less than the number of digits carried by the machine) then the machine will get the 0.5 answer using the textbook solution. This means that getting the 0.5 answer for r2 from unknown routines on fifteen digit machines like the TI graphic calculators, for example, does not mean that the unknown routines use the more accurate formulation. I have tested the routines in the TI-85, TI-86 and TI-89 to verify that they will get the 0.5 answer when nn is greater than 15.

### Re: Which quadratic solution should we use?

Message #6 Posted by **John Keith** on 4 Mar 2007, 1:42 p.m.,  
in response to message #1 by Palmer O. Hanson, Jr.

Thank you, Palmer, for this thorough and enlightening post. To answer your original question, I am guessing HP's logic goes something like this:

Professional engineers etc. who are paying big \$\$ for the higher-end calcs and reading the advanced-function manuals are likely to run into unusual problems for which they need accurate solutions. Purchasers of simpler, less expensive machines are likely to be students for whom learning to use and program the calculator to solve textbook problems is more useful. HP may have thought that the more accurate but less obvious program would confuse and intimidate beginners and students but be worth the consideration (and extra keystrokes) of more advanced users

John

(Post edited for additional note)

Though it may be defeating some purposes, the PROOT function on the 50g returns the correct result for all 4 of Allen's examples, and does so in less than half a second. Presumably it uses the better algorithms that Palmer describes.

You may be correct. I find it interesting that H-P chose to give the more accurate formulation for the HP-67 and the HP-15C, albeit not in the baseline documentation but in extended documentation. This may be consistent with the opinion expressed with some frequency in this forum that H-P isn't providing documentation as carefully as they used to.

One concern about the "more accurate" method arises from my background in aerospace and weapons systems where we always worried a little (maybe a lot) when we changed software to fix one problem for fear that we may have inadvertently caused another problem.

### HP-200LX died sudenly

Message #1 Posted by [jbssm](#) on 3 Mar 2007, 6:16 p.m.

Hi all,

well, I know the 200LX is not really a calculator, but I wonder if someone can be of some help.

I stored my 200LX for about 2 months (without batteries), now it simply doesn't turn on, does anybody have some procedure I can try?

Thanks in advance.

### Re: HP-200LX died sudenly

in response to message #1 by [jbssm](#)

Take a look here

<http://www.hplx.net/faq.power.html>

Hope this helps.

Peter A. Gebhardt

### Re: HP-200LX died sudenly

Message #3 Posted by [jbssm](#) on 3 Mar 2007, 7:19 p.m.,  
in response to message #2 by [Peter A. Gebhardt](#)

Thank you Peter,

I've read trough the page, but it actually doesn't say how to solve the situation.

In section 2.2, it should tell how to exit backup mode ... but it actually doesn't.

I've tried new batteries and plugging the unit to current with my AC power adapter ... but to no luck :(

### Re: HP-200LX died sudenly

Message #4 Posted by [Bill \(Smithville, NJ\)](#) on 3 Mar 2007, 8:31 p.m.,  
in response to message #1 by [jbssm](#)

You could try the following:

1. Remove the backup coin size battery and leave it out.
2. Make sure that there are no cards in the card slot.
3. Buy a new set of AA batteries. Check their voltage to make sure they are above 1.5V.

4. Insert the new AA batteries only. Leave backup battery out.
5. Unit should come on at battery insertion.
6. Wait 8-10 seconds. You should hear a beep indicating that you have low backup battery.
7. Press ESC, then ON Key, then on key again. Unit should beep again indicating low backup battery.
8. Of course, you should be seeing something on the screen.
9. If screen remains blank, BUT you do hear the beeps, then unit is operating but something is wrong with the screen.

You could try ON with PLUS or MINUS key to see if contrast of screen is set too low or high. I once had a HP-200LX that was very temperature sensitive and I always had to play with the Contrast each time I turned it on and as I used it.

10. If you don't hear any beeps, then it's more than just the screen or contrast.

Good Luck,

Bill

### RPN vs ALGEBRA programming

Message #1 Posted by [E Samuel Levy](#) on 3 Mar 2007, 10:12 a.m.

I can see RPN when you have constraints of program size and processor speed. When given a formula you don't understand and none of the constraints apply I can see it is simply easier to slavishly insert it as written.

### Re: RPN vs ALGEBRA programming

Message #2 Posted by [Eddie Shore](#) on 3 Mar 2007, 10:35 a.m.,  
in response to message #1 by E Samuel Levy

For the 48/49/50 series, I tend to do simple tasks in RPN, but if I have a really complicated formula, I will use the ' delimiters.

### Re: RPN vs ALGEBRA programming

Message #3 Posted by [bill platt](#) on 3 Mar 2007, 10:51 a.m.,  
in response to message #1 by E Samuel Levy

"When given a formula you don't understand "

This is a problem regardless of the input-action logic paradigm.

\_\_\_\_\_  
Couldn't agree more d:-)  
\_\_\_\_\_

I wouldn't say that. I don't understand Maxwell's equations or Hilbert transforms (or even Einsteins  $e=mc^2$  as simple as it may look), but I could easily program them on any computer...

Greetings, Max

**Re: RPN vs ALGEBRA programming**

Message #6 Posted by [Karl Schneider](#) on 3 Mar 2007, 1:57 p.m.,  
in response to message #1 by E Samuel Levy

Hi, "Sam" --

Quote:

---

I can see RPN when you have constraints of program size and processor speed. When given a formula you don't understand and none of the constraints apply I can see it is simply easier to slavishly insert it as written.

---

I'm not quite sure what your "thesis statement" is, but my take on the matter is to use equation-based programming when the formula is simple and straightforward, and use keystroke programming when the formula or calculation is lengthy, intricate, or more difficult to implement.

Keystroke programming allows conditional tests, flags, branching, and debugging by single-step execution. Keystroke programs also run faster than equations.

The calculator models in which the user has a choice between equation-based and keystroke-entry programs are the HP-32SII, HP-33S, and the RPL-based HP-28/48/49/50. RPL programs, however, are completely different in form and lack single-step execution.

Now, about RPN versus AOS keystroke programs: The AOS program may not show each and every intermediate result, and is generally not different in sequence of entry from the algebraic expression. As a program, wouldn't a user rather see

$$X * ( Y + ( Z / T ) ) - W$$

instead of the following?

```
RCL X
*
(
RCL Y
+
(
RCL Z
/
RCL T
)
)
-
RCL W
=
```

The keystrokes are almost identical, but the only advantage of the keystroke program is the availability of intermediate results by single-step execution.

**cardboard foldup HP-45**

Message #1 Posted by [E Samuel Levy](#) on 2 Mar 2007, 8:55 p.m.

The first ad for the HP 35 was a page that made into a mock HP35. I spent 2 days trying keystrokes on the mockup before I decided to but it. One of the peddlars had one, and he said get your own, so I did. My boss borrowed it for a negotiating session with a customer who started throwing numbers at him, he threw them right back and won the day. One fellow bought one for show and walked around with it on his belt. He came to me in tears, his battery would only last 5 minutes. I referred him to the manual. My battery lasted longer and longer as it was really used.

**Re: cardboard foldup HP-45**

Message #2 Posted by [Bruce Bergman](#) on 2 Mar 2007, 8:57 p.m.,  
in response to message #1 by [E Samuel Levy](#)

Goodness. I don't quite know what to say about this.

**Re: cardboard foldup HP-45**

Message #3 Posted by [Steve Borowsky](#) on 6 Mar 2007, 9:35 p.m.,  
in response to message #1 by [E Samuel Levy](#)

I guess that's one advantage of the cardboard model: very good on batteries!

### hp17bii+ formula problem, HP response

Message #1 Posted by [Don Shepherd](#) on 2 Mar 2007, 6:53 p.m.

I recently bought a 17bii+ and had problems entering a formula that the solver would accept. I wrote HP, and this is their reply. I'm not sure I understand exactly what they are saying, but they seem to reflect the discussion on this forum recently about this problem. Their recommended solution DOES work, but I heard it first from Bruce, another member of this forum.

Their reply:

Hello Mr. Shepherd

Thank you for your support of HP Calculators.

My name is Rainer Boelzle and I am the HP Calculator WW TCE & Support Manager. Thank you for your letter dated 2/24/2007. I forwarded your email to our technical expert and he provided the following feedback:

-----  
The user is entering the following formula:

```
0*L(A: LOG(N)+1)+
sigma(I :1:A:1:
  MOD(N:10)+
  0*L(N:IP(N/10)))
```

Which is semantically correct, but meaningless.

The reason for this is that: The variable A is a 'place holder', not a real variable as it's value is changed all the time (by the L(A: LOG(N)+1). The variable N, the input is also changed all the time by the L(N:IP(N/10))

The solver will try to make the whole equation equal to 0, ie: Sum, LOG(N)+1 times of ( N mod 10, with a division of N by 10 each time). Ie, this equation calculates the sum of the digits in the integer part of N.

However, as the solver is iterative (ie it will execute the equation multiple times), after the first calculation, N will be equal to 0 and the solver will stop with whatever value in A and 0 in N...

If the user really wants to calculate the sum of the digits of a number he should do like this:

```
DIGITS=0*L(M:N)+sigma(I:1:LOG(N)+1:1:MOD(G(M):10)+0*L(M:IP(G(M)/10)))
```

And he will be able to enter a number in N and solve for digits and get the sum of the digits of the number.

Note that he will not be able to do the reverse, ie: enter a value for digits and find a number as this is not a continuous function and the solver can not solve for that...

-----  
I hope this helps. Please let me know if I can be of any further assistance.

Thank you.

Rainer

### Re: hp17bii+ formula problem, HP response

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 2 Mar 2007, 8:16 p.m.,  
in response to message #1 by Don Shepherd

Hi Don,

Very interesting. I just entered

$$S = 0 * L(A: LOG(N)+1) +$$
$$\text{sigma}(I : 1:A:1:$$
$$\text{MOD}(N:10)+$$
$$0 * L(N:IP(N/10)))$$

into my HP-19BII and it works great. I'm not sure I understand why the variable A would be changed since the SIMGA is the only area that should be calculated multiple times. It would appear that the re-arranging of the equation is done differently between the 19BII and the 17BII+.

I've just started playing around with the solver on the 19BII, so I may not really know what I'm talking about :)

Bill

### Re: hp17bii+ formula problem, HP response

Message #3 Posted by [Gene](#) on 2 Mar 2007, 10:18 p.m.,  
in response to message #2 by Bill (Smithville, NJ)

Yes, the solver doesn't work the same on the 17b2+ as it did on the 19bII (and original 17bII). That's the reason some things have to be done differently.

I AM glad their solution worked.

The 19BII solver also had the ability to use the financial functions INSIDE the solver. VERY nice. Unfortunately, they aren't in the 17b2+. Rats!

### Re: hp17bii+ formula problem, HP response

*Message #4 Posted by **Peter A. Gebhardt** on 3 Mar 2007, 6:37 a.m.,  
in response to message #1 by Don Shepherd*

Besides the known differences of the HP17bii solver -

Isn't it good news, that HP apparently is having at least one person able & willing to support questions in a NON "marketing way" like : "It is not mentioned in the manual - so why do you dumb a\*\* user use it?"

I welcome Rainer Boelzle and others from HP coming back to the community in a highly appreciated, supportive way!

Thanks a lot HP Calculator Division.

Best regards

Peter A. Gebhardt

### Misleading ebay auction using HP Museum photos

Message #1 Posted by [Mike](#) on 2 Mar 2007, 5:03 p.m.

Two problems with the auction. He describes it as **near perfect like new** and shows such a 71B. But the 71B is an HP Museum photo, with card reader.

No card reader is included AND the actual 71B is dented and scratched. **Be careful!**

[Not Near Perfect 71B](#)

### Re: Misleading ebay auction using HP Museum photos

Message #3 Posted by [Mike](#) on 2 Mar 2007, 10:55 p.m.,  
in response to message #2 by opotente

Misleading auctions are hard to report. EBay likely wouldn't even understand. However, using someone else's photos is a violation and easy to prove.

However, again, he has fixed the auction and stated there is no card reader and included a note about the dent. But some will still miss these points, I suspect.

### Interesting Response from seller

Message #4 Posted by [allen](#) on 4 Mar 2007, 12:02 a.m.,  
in response to message #3 by Mike

FWIW. I wrote him about the copyrighted pictures he lifted from Dave's website and recommended that he relist the item with the same price he had, but with the newly added (actual) pictures and description, and without the "borrowed" MoHP picture.

After a discussion where he accused me of jealousy, fear, etc.. he insisted that I was the one who posted the original link for this thread, and proceeded to ammend his NEW listing with the following accusatory note (mistaking me for mike):

Quote:

\_\_\_\_\_

This item was up for auction earlier but due to another Ebay member who has the same calculator for sale and complained (probably Feared mine selling and his would not) about

**HP-11C blinking asterisk**

Message #1 Posted by [Al Guim](#) on 2 Mar 2007, 12:03 p.m.

Hi there, my 11C is working normally, but lately an asterisk blinks constantly in the lower left corner of the display. No other ill effects that I can see; still calculates as expected. Should I be concerned?? Any way to disable it? Thanks!!

**Re: HP-11C blinking asterisk**

Message #2 Posted by [Chris Roccati](#) on 2 Mar 2007, 12:06 p.m.,  
in response to message #1 by [Al Guim](#)

The blinking asterisk is the low battery indicator. Sooner or later you'll have to replace the batteries. After that you won't have to bother with the asterisk for atleast ten years.

(My 11C worked with its original batteries for 18 years, now I am waiting to see how long the new ones will fare)

### **dv6258SE base hot when using**

Message #1 Posted by [Scooby Doo](#) on 1 Mar 2007, 7:46 p.m.

I need some help =- has anyone else had problems with the dv6258se notebook getting extremely hot on the base ( ram and hard drive areas ) when using on a lap pad or board on lap??

### **Re: dv6258SE base hot when using**

Message #2 Posted by [Eric Smith](#) on 1 Mar 2007, 8:01 p.m.,  
in response to message #1 by Scooby Doo

This isn't really the right forum, and I don't have that model (I've got a dv5210us), but basically all laptops/notebooks do that. A laptop typically uses 30-40W, and converts more than 95% of it to heat. By comparison, a heating pad uses about 8W and reaches 170-180 degrees Farenheit. So naturally the laptop will get very hot, and won't be too comfortable on one's lap.

If the laptop has a fan, make sure the vents are not obstructed, as the forced air cooling will exhaust some of that heat into the room rather than your lap.

### **Kahan's Integral for Laptops**

Message #3 Posted by [allen](#) on 1 Mar 2007, 10:45 p.m.,  
in response to message #1 by Scooby Doo

The probability that a laptop will get hot if insulated while running can be expressed as the integral:

$$P = \int_{x=0}^{x=1} \sqrt{1^{(s!!!)}} dx$$

Where s= the Processor speed in hertz. (undefined at s=0)

Richard P. Feynman spoke about this very issue in one of his later books. In brief, entropy is the way of the future.

Only now I have figured out what Gileno meant by that:

**Point not ! = Period [is] not exclamation mark**

(I used to be smarter :-)

That's because in Portuguese "period" is called "ponto". That's one of the many *false friends* we have to beware of. Yet another example:

*Idioma inglês* = English language, not "English idiom".

Gerson.

**Re: "Point not"? How about this one...**

Message #9 Posted by **Paul Brogger** on 2 Mar 2007, 3:32 p.m.,  
in response to message #8 by Gerson W. Barbosa

In 1984 I'd been away for a month in South Africa on business, and in anticipation of my return, I contracted to have a bouquet of flowers delivered to my wife. She'd been taking care of our "tribe" all alone, and was anxious for my arrival. So, on the little message card, I quoted a CSN&Y song, with,

And you know, the darkest hour . . .

thinking she'd mentally complete the sentiment with " ... is always just before the dawn".

After handing the note card to the clerk, he called the tele-florist company to convey that message to someone at a computer terminal somewhere, so it could be transmitted quickly to the local florist in Washington state who would actually create the bouquet. I clearly remember him carefully reading the message: "He wants it to say, 'And you know the darkest hour', followed by point, point, point."

As in, decimal points, right? (Those quaint other-worlders and their curious names for things!)

Well, what she got was

And you know the darkest hour!!!

Not exactly a momentous mis-communication, but neither did it *quite* convey the sentiment intended.

*Edited: 2 Mar 2007, 4:14 p.m.*

**Re: "Point not"? How about this one...**

Message #10 Posted by **Gerson W. Barbosa** on 2 Mar 2007, 8:44 p.m.,  
in response to message #9 by Paul Brogger

Fortunately the consequence in this case was just a small perplexity when the card was read, but some linguistic misunderstandings are said to have started wars. I don't know any true example, though.

Gerson.

P.S.: The florist company was not run by Mr. Flores, was it? Probably not, that other song is even older :-)

---

Hello Karl,

Yes, I know this part of John F. Kennedy's famous speech since I was 15. In the first page of an English book we had at home there was a picture of JFK and the phrase, accompanied by a Portuguese translation. This unusual negative imperative form sounds really very emphatic. It was quite a good surprise when my first multimedia encyclopedia (The New Grolier Multimedia Encyclopedia Release 6 - 1993) presented, under *Sounds/Famous Speeches/Kennedy, John F. (First Inaugural)*, this part of the speech in Kennedy's voice:

*"...and so my fellow Americans, ask not what your country can do for you — ask what you can do for your country. My fellow citizens of the world, ask not what America will do for you, but what together we can do for the freedom of man!"*

It would be amazing if there was a recording of Cicero's famous speech, in his own voice:

*"Quo usque tandem, Catilina, abutere patientia nostra?"*. The recording in this link is not bad, but has a bit of American accent :-)

<http://www.rhapsodes.fl.vt.edu/cicero.htm>

Regards,

Gerson.

Ciao, Massimo!

Quote:

I still remember what reaction this very quote (albeit a little paraphrased (sp?) ) had when I used it a couple of years back...

I wish you a better luck! ;)

I was thinking of providing a translation, but I couldn't think of anything close to the original. Anyway, the link shows the whole text and an English translation.

Best regards,

Gerson.

P.S.:

It seems I made a mistake when quoting from memory. That's the correct phrase, as quoted by you on 25 Oct 2005:

*"Quo usque tandem abutere, Catilina, patientia nostra?"*

Perhaps because the usual Portuguese translation is

*"Até quando, Catilina, abusarás de nossa paciência?"*

*Edited: 3 Mar 2007, 12:00 p.m.*

**Re: "Point not"? Aha! Thanks for the hint!**

*Message #15 Posted by **Walter B** on 3 Mar 2007, 3:13 a.m.,

Quote:

Only now I have figured out what Gileno meant by that:

Point not ! = Period [is] not exclamation mark

Muito obrigado, Gerson! Thanks a lot - I was guessing, but couldn't find a clue. So what Gileno wanted to express was IMO:

**Thank you. Period (not exclamation mark).**

... showing he has learned exclamation marks are not welcome here. Well, special characters seem to be used differently in different languages. Their meaning may even vary in the same. For me, it's always fun to see e.g. baker's ads reading

**"Frische" Brezeln**

(literally translated: "fresh" bretzels). Because, to me, the quotation (sic!) marks indicate a doubt, meaning the bretzels are \*called\* freshly baken, but may \*be not\*. The baker used the marks for emphasizing instead (incorrectly, but widespread, saving the ink for underlining d;-)

Lots of traps even without crossing a language barrier!

Solo debe saver que ha pensato il scrittore (hope that's halfway correct).

\_\_\_\_\_

Hello, Walter!

The first half of your phrase is Spanish, the second part is Italian. There is a light mistake in each half:

The correct Spanish word is saber, though it sounds approximately, but not exactly, "saver", in European Spanish. And the article before "scrittore" should be "lo", for euphony reasons.

But I have understood what you meant: only the one who writes can understand what he's written. I don't know if I have made myself clear, but I can understand everything I've just written :-)

By the way, Gileno, a nice guy, is from Brazil, where Portuguese is spoken (Spanish can be understood, though).

Best regards,

Gerson.

Thank you both for your comments. You are right, I got it mixed up. Its a nice feature of Roman languages you can understand a large fraction of them if you know one (or at least some Latin), but making it difficult not to run into a mess as I obviously did. Desculpe por favor. Obrigado. Ponto.

Hello Walter,

That's perfect Portuguese, although there is no need to apologize. About Romance languages, the ones that are most mutually understandable are Portuguese and Spanish. As of Latin, even Italian has become distant from it. It is helpful though. Too bad they don't teach it here anymore at public schools.

I appreciate your knowledge of these languages, considering your native language is German, it appears. To someone willing to learn a Latin language I would advise studying Spanish first, as there are only five vowels. In Portuguese there are 17 vowels, some of them nasal vowels. Once Spanish is mastered Portuguese will be a bonus :-)

Best regards,

Gerson.

### MultiFactorial using 19BII Solver

Message #1 Posted by [Bill \(Smithville, NJ\)](#) on 1 Mar 2007, 3:23 p.m.

Yesterday, Egan posted how to calculate multiFactorials, which I had never even heard of before his post. See following link

[MF Link](#)

Egan had posted a HP-15C program that would calculate it.

I've been playing around with the solver on the HP-19BII and thought I'd give a try at translating his 15C program to a solver equation.

I came up with the following:

```
MF = SIGMA(K:1:
      IF(X=N OR N=1:1:(X/N)+1):1:
      IF(K=1:0*L(M:X):0*L(X:X-N)+0*L(M:G(M)*X)))
  + IF(N=1:FACT(X):G(M))
```

Just enter X and N and press MF to solve.

I'm still trying to learn how to use the solver, and this is my first try with the SIGMA function. So would appreciate any suggestions, comments, etc on how to do it better.

Thanks,

Bill

*Edited: 2 Mar 2007, 8:40 a.m.*

### Re: MultiFactorial using 19BII Solver

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 2 Mar 2007, 8:48 a.m.,  
in response to message #1 by [Bill \(Smithville, NJ\)](#)

After a little more thinking and reading, I have come up with the following solver equation:

```
MF = IF (N=1:FACT(X):
      IF (X<=N:X:
          SIGMA(K:1:(X/N)+1):1:
              IF(K=1:0*L(M:X):0*L(X:X-N)+0*L(M:G(M)*X)))
          + G(M)))
```

It now checks for the simple cases of N=1 or where X <= N outside the SIGMA function.

Is there anyway to get rid of the Temporary Variable M?

Thanks,

Bill

*Edited: 2 Mar 2007, 1:50 p.m. after one or more responses were posted*

### **Re: MultiFactorial using 19BII Solver**

*Message #3 Posted by **Bill (Smithville, NJ)** on 2 Mar 2007, 10:22 a.m.,  
in response to message #2 by Bill (Smithville, NJ)*

Ooops...

Just noticed that if N is a multiple of X, then the solver always returns zero for MF, since the the final pass through the SIGMA loop would have  $X=0$ .

I could change the final index from  $(X/N)+1$  to  $(X/N)+0.99$  which would be correct for most cases, but would still fail under certain conditions. If the 19BII had the MOD fuction, then I could do

IF (MOD(X/N)=0:X/N:(X/N)+1

which would then add one more pass ONLY if N wasn't a multiple of X.

I could also add an IF statement to check for when  $X=0$  inside the SIGMA function and ignore multiplication. Not very elegant.

Anybody have any other suggestions?

Thanks,

Bill

### **Re: MultiFactorial using 19BII Solver**

*Message #4 Posted by **Bob Wang** on 2 Mar 2007, 12:14 p.m.,  
in response to message #3 by Bill (Smithville, NJ)*

Bill:

The 19BII does have a modulo function, MOD(X:Y)

Bob

### **Re: MultiFactorial using 19BII Solver**

*Message #5 Posted by **Bill (Smithville, NJ)** on 2 Mar 2007, 12:32 p.m.,  
in response to message #4 by Bob Wang*

Hi Bob,

Quote:

\_\_\_\_\_

The 19BII does have a modulo function, MOD(X:Y)

\_\_\_\_\_

Boy do I feel stupid - that's what I get for not checking the manual first. Thanks.

I just made the correction and it now works great. Corrected version follows:

MF = IF (N=1:FACT(X):

```
IF (X<=N:X:  
  SIGMA(K:1:IF (MOD(X:N):X/N:(X/N)+1):1:  
    IF(K=1:0*L(M:X):0*L(X:X-N)+0*L(M:G(M)*X))  
    + G(M))
```

Thanks,

Bill

**HP-65 Leather Case Tab**

Message #1 Posted by [John Garza](#) on 1 Mar 2007, 1:17 a.m.

Everyone may already know this - but I've never actually seen it in print anywhere. For the first few days of owning my HP-65, I wondered what that funny little tab was at the bottom of the case. First I thought it was a pencil holder. A Pentel mechanical pencil fits quite nicely. I remembered how I always had to "dig" the HP-65 out of it's case when I needed to use it. Then the LED went off over my head. Now when I want to remove the calculator, I open the velcro flap, lay the case down on it's back, pinch the little tab between my forefinger and thumb, then push the calculator up and out of the case with my middle finger. I thought "that's typical HP". A simple solution to a tricky problem.

**Re: HP-65 Leather Case Tab**

Message #2 Posted by [Palmer O. Hanson, Jr.](#) on 1 Mar 2007, 8:49 p.m.,  
in response to message #1 by John Garza

Quote:

\_\_\_\_\_

But, then they designed the battery compartment cover for the HP-28 and managed to accomplish a tricky solution to a simple problem.

**Re: HP-65 Leather Case Tab**

Message #3 Posted by [John Garza](#) on 2 Mar 2007, 1:47 p.m.,  
in response to message #2 by Palmer O. Hanson, Jr.

Yep, mine's broken too.

There is definitely a drop in quality between the LED machines and the LCDs. Some may say they're more rugged, but that's only because they're lighter. I wouldn't pay more than \$100 for ANY HP LCD machine. On the other hand, I'd pay \$1000+ for a state of the art machine that's built like a 67. But then, most people wouldn't, so that's why they don't exist. Most of the ones out there I classify as "kids toys" - and that includes the ones used for college & professional exams - kids need portable power to throw in a backpack & take to class. In the real world, it's all too easy to use a laptop, or if you want that handheld feel, run MathuPro on your cellphone. Let's face it - the only major market left for calculators IS "kids toys"!

**New Addiction**

Message #1 Posted by [dbatiz](#) on 28 Feb 2007, 5:11 p.m.

Sirs,

Has the forum ever considered a page for younger users? I envision a FAQ section with examples that would supplement the information in the manuals. And maybe a collection of programming challenges targeted at grade specific skills.

I've introduced two 8th graders to HP calcs (11c and 50g) and they both have sworn off algebraic devices for ever. A forum for middle school and high school students with tips, tricks and techniques may help firm up the next generation of HP users.

I say this is a new addiction because acquiring my 11c is nowhere as satisfying as seeing it used for homework. Same for my 50g, having mine is OK, but putting a one into a young persons hands as simply awesome! Even my wife supports this addiction...

Any thoughts?

Very Respectfully,

David

**Re: New Addiction**

Message #2 Posted by [Reuben](#) on 28 Feb 2007, 10:32 p.m.,  
in response to message #1 by [dbatiz](#)

I think this is a great idea! I started using my 28s that my brother found, and gave me, in 7th grade. I had no manual, and nobody to help me with it. Needless to say, I didn't get very far until I bought the manuals 2 years later.

And getting the youngsters hooked on HP RPN calcs will help ensure that they (the calcs) have a rich future!

--Reuben

**Re: New Addiction**

Message #3 Posted by [John Garza](#) on 1 Mar 2007, 1:04 a.m.,  
in response to message #1 by [dbatiz](#)

Excellent idea. Most new information is for the college student, PE exam taker, etc. There is definitely a gap.

In addition to traditional programming assignments, I think it would be a good idea to give small groups of students larger tasks, even at an early age. That way they can divide up the work, and integrate it into a cohesive whole. This gives them a taste of project management and working with others - something that is done in the real world but frequently omitted from academic assignments. Of course, this is done with some

prior instruction in solving problems with groups of people. And those skills are more valuable than learning programming.

I've found that once a young person sees what they can accomplish as a group - even if they are only moderately successful - it's very hard to douse the flame that follows.

## **Re: New Addiction**

*Message #4 Posted by [Bruce Bergman](#) on 3 Mar 2007, 1:10 a.m.,  
in response to message #1 by dbatiz*

David, I love the idea!

I have been trying to wage my own personal fight against the TI calcs with my nieces and nephews, but I figured the battle was solely mine. It appears I'm not alone. My family knows of my love of HP calcs, and I have offered to buy HP calcs for any of my nieces and nephews if they wanted to experience "the other side" of things. So far a couple of them have taken me up on it, which I am very happy about.

However, I had not thought there were many other youngsters into HP calcs, and I love your idea. In fact, I love it so much that I'd be willing to put up a complementary site for the purpose of giving kids a place to talk about their calcs, share tips, etc -- all the things you've mentioned. I'd be willing to get the domain name, host it and handle the administrative side of everything, but I would seriously need to rely on other experts from here or other places to contribute content. If there are others interested in helping, I think we can really get something going.

BTW, I don't envision this as a competitor at all to the awesome resource we have here, but rather a sister site -- something for the kids to use and which could leverage resources, including this one.

So, I've thrown down the gauntlet. :- ) I'll set it all up and get it going if there are folks willing to contribute. Anyone?

thanks, bruce

## **Re: New Addiction**

*Message #5 Posted by [Eddie Shore](#) on 3 Mar 2007, 10:39 a.m.,  
in response to message #4 by Bruce Bergman*

The two big calculators to target are the 50g and the 12c (for business).

I am willing to contribute tricks and programs.

## **Re: New Addiction (i.e., starting a site for kids)**

*Message #6 Posted by [Bruce Bergman](#) on 6 Mar 2007, 10:41 a.m.,  
in response to message #4 by Bruce Bergman*

Well, the response was...underwhelming. I guess we're not yet at the point where folks are ready to contribute their knowledge of HP and RPN to the younger generation. At least not outside the confines of this hallowed hall.

My offer will remain open indefinitely: if I can get a small cadre of dedicated helpers, I'll take it from there.

thanks, bruce

in response to message #2 by Egan Ford

I didn't mention it, but what i described before is what happens when i press the top of the key.

**Re: 11C enter-key question**

Message #4 Posted by [Raymond Del Tondo](#) on 28 Feb 2007, 4:56 p.m.,  
in response to message #3 by Lalo

This is normal on many Voyager series machines,  
and IMHO the only annoyance on the Voyager series.  
Most of my Voyager units require the ENTER key to be pressed  
with more force than the other keys.  
Also the key feedback (click) is different.

However on some of my units the ENTER key works as expected,  
with nearly the same feedback as the other keys.  
You can imagine that those are my favourite units;-)

Raymond

### **A funny thing happened to my 29C...**

Message #1 Posted by [John Garza](#) on 28 Feb 2007, 3:38 a.m.

I have an HP-29C that has been in storage for a few years. It seems to have absorbed some of the "black" from the inside of it's case into the tan/yellow outer shell. Warm water, kitchen cleaner, and a toothbrush didn't budge it. Looks like it's stained for good. It's faint, but bothersome as this was my mint-in-the-box 29C. The inside of the case was padded black fabric, whereas most of my other woodstocks have a tan fur lining. So, if you have a woodstock with a case with a black interior - beware.

### **Re: A funny thing happened to my 29C...**

Message #2 Posted by [David Smith](#) on 28 Feb 2007, 10:47 a.m.,  
in response to message #1 by John Garza

Try white gas (Coleman camping fuel). Removes most sticky stuff. Will not affect plastic cases. Also, toss that zip case into the washig machine. Your shedding goo problems will go down the drain,

### **Re: A funny thing happened to my 29C...**

Message #3 Posted by [Ron](#) on 28 Feb 2007, 12:00 p.m.,  
in response to message #2 by David Smith

I know I have read somewhere, that the white gas will surface damage the plastic. However, I assume you have used it with good results.

### **Re: A funny thing happened to my 29C...**

Message #4 Posted by [Ron](#) on 1 Mar 2007, 12:58 p.m.,  
in response to message #3 by Ron

I was mistaken. I had read on a Curta site not to use the Coleman fuel on the outside of a Curta.

### **Re: A funny thing happened to my 29C...**

Message #5 Posted by [John Garza](#) on 28 Feb 2007, 8:20 p.m.,  
in response to message #2 by David Smith

Well, it's not really gooey, and the case isn't shedding. I used to test E series cases by tapping the unzipped case over a sheet of white paper. Almost all would leave a black dust residue. I'm not getting that from this case. Maybe it's just getting ready to go. It has been stored in a low pressure environment for the past few years - perhaps there was some outgassing. Maybe I'll switch to dry nitrogen... Dammed oxygen. Can't live with it, can't live without it.

### **Re: A funny thing happened to my 29C...**

Message #6 Posted by [David Smith](#) on 1 Mar 2007, 10:44 a.m.,  
in response to message #5 by John Garza

Actually the residue is gooey and the case is shedding... it's a dry goo. You just can't feel it. I have seen the problem numerous times.

Coleman fuel does not affect most plastics. It is the best thing for removing sticker residue, etc. Also works fairly well for markers and ink. Keep it off the keyboard. My standard way of fixing badly scratched display windows is red jewelers rouge dampened with Coleman fuel. As with all commercial products, Coleman may get a wild hair up their alien probe hole and change their formula without notice. Test in an inconspicuous place if you are worried.

**Re: A funny thing happened to my 29C...**

*Message #7 Posted by [John Garza](#) on 1 Mar 2007, 10:58 a.m.,  
in response to message #6 by David Smith*

Ahhh... interesting. I suppose very tiny particles of goo would behave differently than a larger blob of goo. Like the way a very fine powder behaves as a liquid - a lot depends on the particle size. I'll try the Coleman fuel. I also noticed the rough texture of the case is much more evident than a typical woodstock - presumably from close to zero handling since manufacture. I have a 25C that's almost slick compared to it. I suppose that rough surface would provide better nooks and crannies for the goo particles to take up residence and avoid being washed away without using a solvent (like Coleman fuel) to actually dissolve them.

thanks,

-John

### HP 33S interactive site

Message #1 Posted by [E Samuel Levy](#) on 28 Feb 2007, 1:08 a.m.

Look at this site under product tour, it takes you through each button function. Good graphics.  
<http://h20331.www2.hp.com/hpsub/cache/301034-0-0-225-121.html>

### Re: HP 33S interactive site

Message #2 Posted by [Les Wright](#) on 1 Mar 2007, 12:46 a.m.,  
 in response to message #1 by [E Samuel Levy](#)

I think all of the present HP calcs have similar sites. Very helpful indeed!

I like the wide collection of pdf downloads available, even if some of them do duplicate what is already in the manual.

FWIW, I actually have a 33S routine for the normal and inverse normal distribution that is faster and more accurate since it works with the upper tail and doesn't depend on having to do an integration. I can share the listing if anyone wishes.

I have also just acquired a 17bii+, and I must confess I rather like it, though I have yet to bash heads with any of its bugs. The solver, cashflow, and TVM applications are very neat to use.

Les

Message #3 Posted by [Bruce Bergman](#) on 1 Mar 2007, 1:45 a.m.,  
 in response to message #2 by [Les Wright](#)

Hi Les --

Would *\*definitely\** be interested in your routines for the 33s. It's a great calc. Glad you're liking the 17bii+ -- Don and I have been having a blast with it -- admittedly sometimes frustrating -- and learning its nuances.

thanks! bruce

### Re: HP 33S interactive site

Message #4 Posted by [Les Wright](#) on 1 Mar 2007, 8:08 p.m.,  
 in response to message #3 by [Bruce Bergman](#)

Sure--basically, I have ported Baillard's HP41 routine for the error function, and added on another routine to compute the upper-tail normal distribution using it via the formula  $Q(x) = 0.5 \operatorname{erfc}(x/\sqrt{2})$ . Given this, you can set up a routine for the solver that finds  $x$  for a given upper-tail probability.

Let me work out some of the inefficiencies and get the code to you in the next few days. I have made a preliminary submission to Dave but have asked him not to post it until I revise it. In the 33S memory saving isn't as important as efficient use of labels, and I am trying to find ways of reducing label usage even if it means repeating similar steps at various points in the program.

Les

## Normal Distribution Stuff for 33S (LONG)

Message #5 Posted by [Les Wright](#) on 2 Mar 2007, 2:31 a.m.,  
in response to message #4 by Les Wright

Here are those listings.

Please note that the original routines for the HP41 are due to J-M Baillard and come from [here](#), though I have necessarily had to retool things to work with the limitations of the 33S.

Routine E computes erf and erfc for any real input using the alternating series expansion (<http://mathworld.wolfram.com/Erf.html> equation (6)) for  $x < 1.8$  and the continued fraction expansion (a version of equation (33) on the same page, computed out to 35 terms) for larger values.

Routine Q computes the upper tail and cumulative normal distribution using routine E and the relationship  $1 - P(z) = Q(z) = 0.5 \operatorname{erfc}(z/\sqrt{2})$ , where  $Q(z)$  is the upper tail and  $P(z)$  is the cumulative probability associated with  $z$  from a standard normal distribution (mean 0, variance 1).

Routine I is basically a programmed equation to compute the inverse distribution using Solve.

Thanks to the speed of the 33S, E and Q are surprisingly fast, returning a result in no more than a couple of seconds or so.

Computing the inverse probabilities takes longer since it uses the solver and requires repeat evaluations of Q, but with decent initial guesses will return a result in under a minute, I find. Note in routine I I take the difference of logarithms. This is especially helpful when the probabilities get really tiny and it helps the Solver avoid converging prematurely since the difference between two tinies is a tiny and may signal convergence before it is desired. Taking logarithms lets the solver work with numbers of more normal magnitude.

I0007 RCL Q
I0008 LOG
I0009 -
I0010 RTN

```

Given any real  $x$  for input, XEQ E will return  $\text{erf}(x)$  in the X register and  $\text{erfc}(x)$  in the Y register.

Given any real  $z$  for input, XEQ Q will return the upper tail normal probability associated with  $z$  in register X, and the complement lower tail cumulative probability in Y.

For example 2 XEQ E returns  $\text{erf}(2) = 9.99532223502e-1$  in register X and  $\text{erfc}(2) = 4.677734981e-3$  in register Y.

Similarly 2 XEQ Q returns  $Q(2) = 2.2750131948e-2$  in register X (the upper tail probability associated with  $z = 2$ ), and  $P(2) = 1 - Q(2) = 9.7724986805e-1$  in register Y.

To compute the inverse normal distribution, use the routine I with the Solver.

For example, to compute the  $z$  associated with an upper tail probability of 0.0001: 1. Set FN = I. 2. Place guesses for Z on the stack--I just use 3 ENTER 3 here. 3. Execute SOLVE Z. 4 At the prompt Q?, enter  $1e-4$  R/S. This takes a few seconds but will return  $Z = 3.71901648545$ . Checking it with XEQ Q returns 0.0001 in register X, 0.9999 in register Y.

Hope you get some use out of this.

Les

### Re: Normal Distribution Stuff for 33S (LONG)

Message #6 Posted by [Bruce Bergman](#) on 3 Mar 2007, 1:13 p.m.,  
in response to message #5 by Les Wright

Hi Les --

Looks great! Thank you. I'm out of town at the moment and didn't bring my 33s with me, but I'll take a gander at this next week. I appreciate the work.

thanks! bruce

### Re: Normal Distribution Stuff for 33S (LONG)

Message #7 Posted by [Les Wright](#) on 3 Mar 2007, 7:05 p.m.,  
in response to message #6 by Bruce Bergman

I have also produced a routine for the 42S that computes the cumulative normal and upper tail probabilities directly using formula 26.2.11 and 26.2.14 in Abramowitz and Stegun. I have discovered that with the 33S code above the scaling of the input by  $1/\sqrt{2}$  introduces rounding error that gets propagated throughout the calculations and leads to digit loss, so

usually you can trust at most 10 digits and occasionally 11. Computing the cumulative normal distribution directly by its own series and continued fraction expansions tends to produce better results than routing the computation through erf and erfc. Of course, in Free42 with its 25 digits of precision, all of this is moot since there are so many guard digits internally that the 12 digits that get displayed, and then some (usually up to 20 or 21) are usually right.

Of course, if you are interested in doing a lot better than, say, the SigmaNORMD routine in the HP41 Stat Pac, which uses an antiquated rational approximation that is prone to subtraction digit loss in the upper tail, then this routine will give great results as it is.

I haven't ported the "normal distribution directly" routine to the 33S yet. It shouldn't be too hard, since there is nothing I did in the 42S routine that doesn't have a direct equivalent on the 33S. If you have any interest in this I will get to it when I can. The problem is I am running out of labels in my 33S!

Looking at the relevant formulae in Abramowitz and Stegun, which can be found free online, is very informative. I think my point in all this is that I think it is more sensible and quicker to compute these things directly than by the numerical integration scheme in the 33S manual that takes at least a few seconds each time to give modest accuracy. Thanks to JM Baillard, I have also learned that it is feasible to write simple code that computes continued fractions from right to left that is fairly quick, and it takes just a little experimenting to discern how many iterations you should take for maximum accuracy.

Les

### Wisdom of the old ages and new ages

Message #1 Posted by [Namir](#) on 28 Feb 2007, 1:00 a.m.

"eBay snipers are like thieves in the night!" -- Confucius

"I know for a fact that HP will soon reintroduce the HP-15C any day now" -- Plato

"Your eBay bid is like a contract" -- Attila the Hun

"Don't bid unless you are serious" -- Dr Jekyll

"RPN will never die. It's here to stay!" -- Elvis

"eBay is another sad illusion" -- the Buddha

"The TI-59 suffers from dual personality ... split between true algebraic and RPN mode of operations" -- letter of Sigmund Freud to Carl Jung

"I am aware that some of you have joined our Russian campaign mainly to lute Russian RPN calculators!" -- Napoleon in a speech to the invading troops

"Cobubba! I am your father!!!" -- Ali Babba (of the Ali Babba and the forty thieves fame)

"I feel like cheating ... jumping in the future and grabbing one of them HP calculators with the SOLVE feature" -- personal note of Sir Isaac Newton right before he announced his root solving algorithm

And now for wisdom of the current age!!!

#### HP Collector's Twelve Steps

=====

1. We admitted we were powerless over collecting calculators that our lives had become unmanageable.
2. Came to believe that an RPL algorithm greater than ourselves could restore our code to sanity.
3. Made a decision to turn our will and our lives over to the care of HP as we understood HP.
4. Made a Google searching and fearless moral inventory of pi-calculating algorithms.
5. Admitted to HP, to ourselves, and to another collector the exact nature of our excessive spending.
6. Were entirely ready to have HP remove all these algebraic defects of our code.

7. Humbly asked HP to remove all of our EVAL statements and replace them with pure RPL code.
8. Made a list of all programs we had harmed, and became willing to make rewrites to them all.
9. Made direct edits to such code wherever possible, except when to do so would crash the system.
10. Continued to take personal inventory of algorithms and when we found the code was buggy, to promptly admitted it.
11. Sought through collection sales on eBay and reading through HP Museum threads to improve our conscious contact with HP as we understood HP,
12. Having had a mathematical awakening as the result of these steps, we tried to carry these algorithms to others, and to practice these principles of RPL in all our coding.

**82143 adventures**

Message #1 Posted by [Les Wright](#) on 27 Feb 2007, 8:11 p.m.

The printer head was sticking in its transit so I decided to open it up for a cleaning.

This simple little task took me nearly 8 hours. I got very good at soldering since I must have broken 25 year old connections inside on several occasions as I manipulated the innards to get at things.

Plus, I had no clue how to properly reassemble it so the printer head could move freely. So it came apart a few more times. And there was more soldering as I broke off more wires. Etc.

But I got to clean what shouldn't be greasy are regrease what should be. And I did sort out how to tuck things out of the way so the print head slides swiftly back and for.

At the end of the day, it works better than before.

But I won't be doing that again soon, sheesh.

Good thing I am not a surgeon....

Les

Message #3 Posted by [Les Wright](#) on 27 Feb 2007, 11:51 p.m.,  
in response to message #1 by Les Wright

Cancel my enthusiasm.

The thing is basically good for parts now.

I think my repeated resoldering of the yellow wires onto the printer mechanism (there is a pair coming off the mainboard) has done some damage by virtue of the heat. Now the motor simply spins briefly when I power up,

twists the rubber drive ring around its cam (if it doesn't get thrown off altogether) and the thing doesn't advance, the printer head doesn't move, and it just makes a whining sound. Does this when the yellow wires aren't connected either, so I surmise that when the yellow wires are connected they are not directing the behaviour of the print mechanism in any way.

I think I have damaged the printer mechanism proper and that can't be repaired.

I have done a real number on this thing....

Les

*Edited: 27 Feb 2007, 11:52 p.m.*

### **Re: 82143 adventures**

*Message #4 Posted by **Tony Duell** on 28 Feb 2007, 6:27 a.m.,  
in response to message #3 by Les Wright*

Don't give up so easily...

You can download 'my' schematic for the 82143 from The Australian Site. That'll give you a start, I hope.

The 2 yellow wires go to a switch contact in the mechanism that detects when the printhead is in the 'home' (right hand?) position. IIRC, part of the power-on initialisation is to run the printhead to the home position, detected by that switch. So if there's a problem with it, the motor will run the printhead into the side of the printer.

Take the printer mechanism out and connect an ohmmeter to the 2 yellow wires (unplugged from the logic PCB). See if the switch opens and closes when you turn the leadscrew by hand to move the head back and forth. I think the switch is closed at the home position, but I can't be sure.

Alas if that all seems OK, then the most likely problem is the microcontroller, which is custom-programmed for the 82143. But most 82143s seem to die from printhead problems, so finding a parts unit with a good microcontroller might not be too hard.

### **Re: 82143 adventures**

*Message #5 Posted by **Les Wright** on 28 Feb 2007, 2:44 p.m.,  
in response to message #4 by Tony Duell*

Frankly, Tony, I have learned I have no facility with microelectronics repair and really should've left well enough alone.

I have sunk many frustrated hours into this mess and I do not have the engineer's tenacity when it comes to fixing things.

I did pay just \$50 for the printer (plus shipping which in retrospect was a bit excessive), and did get a few months pleasure out of it, so I would like to chalk this up to a learning experience and pass it on to someone who can get some good out of it. I have already had inquiries from folks who will take it for parts. Frankly, I just want to get rid of it and if I need to print something I always have the 82240 which works beautifully (I also have the IR module for the 41C). Looking at it as a testimony to my ineptitude is a little painful.

many thanks,

Les

**Re: 82143 adventures**

*Message #6 Posted by [Les Wright](#) on 28 Feb 2007, 9:44 p.m.,  
in response to message #5 by Les Wright*

Actually, I can really get to like the IR printer.

It is a bit slower, but I like the font a lot better.

It also works with 6 of my calculators (41CV, 41CX, 42S, 48G, 49G+, 17bii+).

Maybe one day I will replace the murdered 82143. But I need time. Sort of like that feeling one has after a beloved pet has died.

If I don't firm up any arrangements for this thing for parts in the next couple of days I will place an ad in our Classifieds.

Les

**Re: 82143 adventures**

*Message #7 Posted by [David Smith](#) on 1 Mar 2007, 10:47 a.m.,  
in response to message #3 by Les Wright*

Try turning the drive wheel by hand. If the head is moving freely your problem is just an old drive band. Projector Recorder Belt Company model SCX2.4 (or is it 2.3?) works well. It is a square profile belt, but works fine. Standard .062" round o-rings are too fat.

**Re: 82143 adventures**

*Message #8 Posted by [Les Wright](#) on 13 Mar 2007, 12:36 a.m.,  
in response to message #1 by Les Wright*

Just wanted to report that our inimitable friend Randy was able to repair my mess very quickly and inexpensively.

Looks like previous repair attempts had led to a wrong size o-ring replacement, among other things. I would've spent eternity trying to reverse the problems with the tools and parts I had on hand.

Three cheers for the near-saintly FixThatCalc.com!!!

### Newbie Stack/Memory Management (33s)

Message #1 Posted by [Adam Price](#) on 27 Feb 2007, 6:24 p.m.

I posted last week about the sample vector operations that come in the 33s manual. It turned out my trouble wasnot being in ALG mode. I didn't like the idea of switching modes every time I wanted to do vector products, so I am rewriting in RPN. This also gives me the opportunity to restructure to match my workflow a little closer. I am beginning to get a handle on how the programming language works, and I would appreciate some feedback on two methods for performing a simple task in one of my subroutines.

TASK: Display or Input U,V,W coordinates. (May be called independently or from another routine) Calculate and display magnitude of vector.

#### METHOD A:

```
INPUT U
X^2
INPUT V
X^2
+
INPUT W
X^2
+
SQRT
STO M
VIEW M
```

#### METHOD B

```
INPUT U
INPUT V
--> THETA, r
INPUT W
--> THETA, r
STO M
VIEW M
```

Advantages I see: B: Shorter code. Easier to retype (slightly less resource usage, though both are tiny) A: Only uses two lines of stack (I think) vs. 3 for B

I used **STO M / VIEW M** because I wanted to not have the time restriction of PSE. Is there a better way? I doubt I will ever need the variable to actually be stored.

Is there anything else that folks would think about when forming a little snippet like this? One wants to begin a new language with good habits.

Thanks

Adam

### Keystroke recording on 50G (quite long...)

Message #1 Posted by [Giancarlo \(Italy\)](#) on 27 Feb 2007, 9:53 a.m.

Hi all.

As often happens to me, reading one of the most recent Forum post (guess which one...) reminded me to share a little experience of mine with you.

Even if this Forum is devoted mainly to vintage HP calc, my story is about the 50G - sorry :) Frankly speaking, it has already been posted on comp.sys.hp48, but I hoped it might be interesting here as well....

#### FOREWORD

As a contributor to the HP calculators forum

(<http://forums1.itrc.hp.com/service/forums/bizsupport/categoryhome.do?categoryId=408>), I thought it would be fine to get ("automatically" and straight away from the emulator) the list of keystrokes on the 50G when trying to reproduce an issue or suggesting a solution...

So, I needed a keystroke recording program for the 50G and found this one on [hpcalc.org](http://hpcalc.org):

<http://www.hpcalc.org/hp49/utils/misc/krec11.zip>

The program, unfortunately, does not "run in the background" (as macro recording on Excel does...) - I mean: it records the keystrokes but in the meanwhile does not let the calc do what the keystrokes are intended to.

Ideally, I liked to:

1. start the keylogging program - running in background
2. do whatever I like on the calc
3. stop the keylogging program
4. get a log file with the keystrokes

Then, on comp.sys.hp48, John Gustaf Stebbins pointed me to his own program on [hpcalc.org](http://hpcalc.org):

<http://www.hpcalc.org/details.php?id=6493>

but, in the meanwhile, as I had not been able to retrieve Stebbins' software by myself, I had gone the "dumb" way, by doing the following:

>>> on the 50G emulator bundled into Debug4x package (by William G. Graves - [www.debug4x.com](http://www.debug4x.com)), I used the

```
Tools---->Macro----> Record
```

feature;

>>> this left me with a .MAC file, which I was able to convert to plain text by using the Mac2txt.exe utility which comes with the above emulator;

>>> afterwards, on Christoph Giesselink's homepage, I downloaded the latest version of KML (Keyboard Mapping Language) documentation:

<http://privat.swol.de/ChristophGiesselink/Emu48/kml20r13.zip>

where I could find the "OutIn codes" for the HP49G keyboard.  
They were helpful to understand how to translate entries on the text files like

```
"P 3 1"
```

into

```
"press [0]"
```

```
>>> I arranged an Excel file with one column filled by all the OutIn codes, and aside each  
single substitution to be made, written in a "comprehensible and descriptive" language  
(like the "press [0]" above);  
>>> I got a shareware (RQ Search and Replace v. 1.72-2 by Andrew Shelkovenko) to  
make multiple search-and-replace operations on a file (I couldn't imagine it was so difficult  
to find a suitable one - or I was not so smart in the quest :/ ) - I needed one that could  
"learn" the search-and-replace pairs from a file (the .xls file I had already set up)  
>>> eventually, the steps I could perform were:
```

1. record a macro on the 50G emulator
2. convert the .mac file to a .txt file
3. feed the RQ Search and Replace program with the .txt file
4. get a file with all the keypresses translated into "descriptive" language.

I just liked to share this with the Forum - maybe some of you were not too bored by my story :-)  
And maybe somebody could point me to a "friendlier" program to perform multiple search-and-replace, or to a brand new and more efficient method to achieve my goal...

Any feedback will be appreciated.  
Best regards.  
Giancarlo

---

Gene posted:

*"Are you going to post any and every ebay deal you think is good here? "*

I fully concur with Gene, and I'll further add the following:

Are you, Gileno, going to post *anything* other than your continual exclamation-mark-ridden one-liner pleads for help about most anything under the HP-calc sun, or other than each and every eBay link that takes your fancy ?

Judging from your help pleas, you're up into a lot of topics such as LEX files for the HP-75C, MLDLs for the 41C, etc., etc., etc.

Are you ever going to *share* something valuable with the MoHP Forum community ? Seems to me that as you seem to only eat, swallow, and breathe all things HP-calc related, it should be actually the case that something of that could hold some interest to the community, right ?

Why don't you start to *give* a little, instead of *continually* and *desperately* asking for *help* (or even for *gifts* !), or *spamming* us with each and every eBay link you happen to find ?

Do you think we're so *dumb* that we can't find them ourselves, if interested ? Are you going to eventually *give* something worthwhile to the community ? It's all very well for continually *asking* but what about giving *something, sometimes*, in return ?

All of the above, respectfully of course, but somewhat *bored* of your attitude. You don't seem to *grow* or *learn*, you're like a spoiled brat, always asking for this and that, always striving to get the attention of everyone around. You're not the age for that.

It saddens me to say this, but if your attitude continues like that, your posts will only be fit for the trash bin.

Best regards from V.

### **Re: This attitude of yours**

Message #5 Posted by **Ren Tescher** on 27 Feb 2007, 12:01 p.m.,  
in response to message #4 by Valentin Albillo

Valentin, I've read and posted to MoHPC for years. But other than lame attempts at humor or a few gloats, I haven't contributed much either, I'm lousy at Math(s) so I'm awed by the expertise of the contributors of this forum and hope by "hanging around" some of the wisdom will "rub off on me". Do you want me to go away too?

Ren

dona nobis pacem

### **Re: This attitude of yours**

Thanks, Ron. Duly corrected above.

Best regards from V.

### **Re: This attitude of yours**

*Message #9 Posted by **Thor Lansen** on 27 Feb 2007, 2:16 p.m.,  
in response to message #4 by Valentin Albillo*

Whose attitude are you talking about, yours and Gene? The forum says: "This forum is for discussion of HP calculators including usage, repairs, sources of replacement parts, general information etc. furthermore there is a section for "Collectors" and how to collect. Like it or not eBay is the main source for vintage HP calculators and therefore Gileno's eBay postings are relevant and he has the same right as you and the rest of those that feel intellectually superiors and want to ban all eBay topics. I for one care less about your "challenges" and I see them as a worthless use of bandwidth, should I ask the moderator to ban them? no, I just do not read them. If you or those who feel eBay topics are not relevant then do not read them and stop whinnying about it.

Thor

Oh, yes, to the questions you sure have in mind: who is this guy, a troll? has he contributed to the forum? does he have the right to post here? to answer them, nope I am not a troll, as a matter of fact I am an Engineer (you can figure out my age, my favorite calculator is the HP 25C) and I can't stand those that feel they have the right to ban everything they do not like or like to put down others so they can show their

superiority, nope, I have not contributed (or very little) and yes I have the same privilege to post as you and Gileno and anybody else has.

**Re: This attitude of yours**

Message #10 Posted by **Valentin Albillo** on 27 Feb 2007, 3:16 p.m.,  
in response to message #9 by Thor Larsen

Hi, Thor:

Thanks for your comments. In no part of my post does it say that I intend or would like to ban anyone, less of all Gileno, nor do I feel superior to anyone or say so.

What you may interpret while reading my post is up to you but please don't put in my mouth/pen words that I haven't said/written.

And *nobody* has the *right* to post here, not Gileno, not you, not me, but only Mr. Hicks.

Best regards from V., a 48-year old fellow engineer. :-)

**Re: This attitude of yours**

Message #11 Posted by **Thor Larsen** on 27 Feb 2007, 5:11 p.m.,  
in response to message #10 by Valentin Albillo

Quote:

\_\_\_\_\_

And nobody has the right to post here ....

\_\_\_\_\_

Well, who is putting words on others mouth, I wrote "privilege" and not "right".

Thor

**Re: This attitude of yours**

Message #12 Posted by **Valentin Albillo** on 27 Feb 2007, 5:47 p.m.,  
in response to message #11 by Thor Larsen

Hi again, Thor:

Thor just posted:

*"Well, who is putting words on others mouth, I wrote "privilege" and not "right".["*

*Well, in your first reply you literally wrote:*

*"[...] contributed to the forum? **does he have the right to post here ? [...]"***

Best regards from V.

**Re: This attitude of yours**

Message #13 Posted by **Thor Larsen** on 28 Feb 2007, 4:45 p.m.,  
in response to message #12 by Valentin Albillo

Well Valentin since you insist I will elaborate: true, you did not say directly you wanted to ban Gileno but lets rewind a few months when you and others wanted to ban eBay postings. There was a vote and your side lost. No, that was not good enough for you. I remember you made a convoluted and nonsense argument about symmetry and blah blah blah and smoking mirrors (well, only tobacco smoking) and why your losing side still should win. So, yes you do want to ban eBay topics, Gileno's postings are 99.99% eBay stuff that he finds so, in essence, you want him out.

I do not know if you feel superior or not, but your posting came out that way.

Finally, if you look at the end of my first posting, I said: "I have not contributed (or very little) and yes I have the same *privilege* to post as you and Gileno and anybody else has." So, there it is.

Regards, Thor

PS: What I said about your "challenges" was to make a point and not true, I hope you continue posting them.

### **Re: This attitude of yours**

Message #14 Posted by [Valentin Albillo](#) on 28 Feb 2007, 6:58 p.m.,  
in response to message #13 by Thor Larsen

Hi again, Thor:

Thor posted:

*"There was a vote and your side lost. No, that was not good enough for you. I remember you made a convoluted and nonsense argument about symmetry and blah blah blah"*

I honestly don't actually think that it is a problem of "sides" and of winning or losing. I saw it more as a politeness thing, were we are all together in this forum politely sharing a hobby and something is done by some people that upsets others. It is thus not a problem of number, because in a polite environment if an 80% majority, say, are doing something that annoys a 20% minority, if there's something that can reasonably be done to avoid this it should be attempted, out of politeness if nothing else. In many countries there are laws to protect minorities, else they would always be subject to majorities no matter how just their claims could be.

In this case of eBay postings, the problem was an excessive amount at the time, mostly of very temporary things or centered in very specific sellers that, as Karl Schneider has said in a number of occasions, are not of lasting value whatsoever, because of their intrinsic in-built obsolescence, yet they were cluttering the forum to the point where it was actually difficult to find other threads thinly interspersed inbetween, and worse, these obsolete and/or inconsequential eBay threads do actually end up in the Archives, from whence they get eventually burned in the DVDs which Mr. Hicks kindly provides, and then it is simply a tremendous waste of space and potential.

If some solution could be found to avoid annoying the minority while preventing these threads to clutter the forum and end in the DVDs, it seemed reasonable to attempt to find it and see if it worked. That's my point

of view, and I stand by it, even if it is never actually realized. I don't think it is a nonsensical point of view, it makes perfect sense to me from a polite and practical stand.

*"So, yes you do want to ban eBay topics, Gileno's postings are 99.99% eBay stuff that he finds so, in essence, you want him out."*

That doesn't follow, and I want noone out because, just to begin with, I'm not the one to decide who stays and who goes, that's Mr. Hicks prerogative. I certainly found somewhat tiring Gileno's continual one-line desperate requests for help, without ever even introducing himself or his problem, or telling whether he had made any attempts at finding the information by himself, etc, just the one-line, exclamation-ridden plea.

Can you actually imagine that you attend some HP-fan meeting (like the HPCC ones, for instance), and there's some fellow there which continually gets to you (and everyone else for that matter) yelling "HELP, PLEASE!!!", right out, without saying much more, then the next time he yells again at you "I NEED THIS MANUAL!!!", etc. etc ? I hope you get the point. How long do you think you would stand this situation without asking him to behave in a more polite manner, to address you properly, and to explain a little more about his problem and his attempts ? Either that, or else you'd rather avoid him.

Same here. The mere fact that this is a written medium doesn't mean we should disregard all social politeness, rather we can and do engage in polite conversation, like you and me right now. If someone is desperately (so it seems) asking for help, the very least you would expect is for him to do so politely, not having him pester everyone continuously with his unpolite help requests.

I think that if someone doesn't behave, it's actually proper to let him know, respectfully, that he should change his attitude and warn him of the consequences if he doesn't. If said person is mature enough, he will think about it and might eventually take the hint. Or else, he can go wild, enter childish mode, make a pitiable ruckus, feel deeply offended, and leave. I think this isn't what you would expect of an articulate, mature person.

*"I do not know if you feel superior or not, but your posting came out that way."*

I'm sorry if it seemed that way, but let me assure you that this is not the case. I do have a strong attitude towards life and must confess that I don't suffer fools gladly, but I've always been the kind of person who loves giving and sharing whatever I feel seems worthy of it and which can be useful to others. Else, do you think I would spend so much time doing challenges, articles, posts, when I'm busy 24 hours around the clock and have wife and daughter to educate ? But I am as I am, some people do like me, some people do hate me, but that's everyone's experience in this world.

*"Finally, if you look at the end of my first posting, I said: "I have not contributed (or very little) and yes I have the same privilege to post as you and Gileno and anybody else has." So, there it is."*

Yes, I noticed. My sentence was addressed to your other rhetorical question, the one with the "right" in it.

*"PS: What I said about your "challenges" was to make a point and not true, I hope you continue posting them."*

Thank you very much. I'll do my best to try and keep them interesting and as little obnoxious as possible for those people that don't appreciate them. I sincerely do try to make them didactic in nature, and the many solutions for a great variety of HP models provided by forum contributors might actually be useful for other people trying to learn and understand programming techniques. A good, working example is usually much more useful and enlightening than several dense pages in a Reference Manual.

Thanks again for your comments and

Best regards from V.

Message #19 Posted by [Karl Schneider](#) on 28 Feb 2007, 12:10 a.m.,  
in response to message #4 by Valentin Albillo

I generally concur with Valentin's sentiments. Subject lines that include multiple exclamation points (and even more added out of spite) are something I find particularly annoying. Exclamation points are absolutely unnecessary unless immediate attention by the reader is critical. Requests for assistance should also be stated specifically and politely, and then only after the requestor has made good-faith efforts to research.

Regarding posts that provide links to routine eBay auctions without making any specific point: One must remember that the links have only fleeting value. When the post and all the ensuing discussion goes to the MoHPC Forum Archives that are included in the CD/DVD sets, those threads are essentially useless.

In fact, the particular linked auction has already closed, and this entire thread now has no value other than "entertainment".

Let's try to keep the Forum a forum, not a bulletin board or "chat room".

Message #21 Posted by [Egan Ford](#) on 28 Feb 2007, 1:30 p.m.,  
in response to message #20 by Tony Duell

Quote:

Unless we're discussing the factorial function :-)

(Yes, I know it's taken out of context, but I couldn't resist)

Excellent. I knew someone would find some math in this thread.

$n!$ ,  $n!!$ ,  $n!!!$ , etc... is legit. But what  $n!!$ ,  $n!!!$  is exactly, is not obvious. When I first encountered  $n!!$  years ago I incorrectly assumed  $(n!)!$  -- a very large number. But it is the opposite that is true.

For integers:

$$\begin{aligned} n! &= n(n-1)(n-2)\dots \\ n!! &= n(n-2)(n-4)\dots \\ n!!! &= n(n-3)(n-6)\dots \end{aligned}$$

Below is a plot that illustrate that the more ! you have the smaller your result is:

<http://sense.net/~egan/mf.jpg>

IOW, when it comes to !, less is more. You can draw your own parallels to ! abuse outside of mathematics.

Below is a Q&D 15C program for multifactorials. Put n, then the number of ! on the stack.

```

1 LBL A
2 1
3 -
4 TEST 1 x>0
5 GTO 0
6 X<>Y
7 x!
8 RTN
9 LBL 0
10 1
11 +
12 STO I
13 X<>Y
14 STO 0
15 1
16 STO 1
17 LBL 1
18 RCL 0
19 TEST 4 x<=0
20 GTO 2
21 STO* 1
22 RCL I
23 STO- 0
24 GTO 1
25 LBL 2
26 RCL 1
27 RTN

```

As I read the first post in this thread  $n!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!$  is the proposed problem.

Using the above on my 15C for various values I get:

```

mf(10,30) = 10
mf(20,30) = 20
mf(30,30) = 30
mf(40,30) = 400
mf(50,30) = 1000
mf(55,30) = 1375
mf(77,30) = 61523

```

I've long wished for a Google function that would post an exclamation point quotient (EPQ -- ratio of the number of exclamation points on the page divided by the total characters on the page) for each web site in the results list. The same would be nice in an email package.

Generally speaking, the value of any page (or email) is inversely related to (and bound by) its EPQ.

Gileno, I must confess that I usually just bypass your eBay link posts. The one reason is personal--I am trying to cut back on my eBay addiction so I don't want to give in to the temptation....

But the second reason is that, frankly, you usually don't provide any information as to why the link should be of interest. Something like "boy! an HP97 for four bucks and only 10 minutes in the auction! Too bad I already have three NIB...." gives us a sense of specific interest of the sale instead of leaping exclamation points.

You have been asked to share out of your wide range of expertise and interest. I do so and a lot of the time no one seems to care or I simply regurgitate a long-settled question. But I feel like I am contributing something to the dialogue.

Les

One reason I rarely post into this forum. I did post a technical help previously but its discouraging finding so much swill with the good stuff.

I hoped that the Ebay drivel be moved into a sub-forum but I understand a vote was taken and most are happy with keeping the Ebay posts in the main forum.

But then I guess its in the eye of the beholder. Some I'm sure are most fascinated with the lastest Ebay machinations and sales.

If I may say a few words.It seems to me that what we're dealing with here is primarily a language barrier. We all communicate here in English (for the most part), but for some English is not the primary language, and the degree of mastery varies greatly. In addition, the forum fills different roles for different individuals; the degree of emotional investment in the forum varies.

I think the root cause of Gileno's abbreviated posts is his inability to express his full emotions via the English language. Instead of eloquent prose, we get exclamation points! But we should never take language at its face value. Language exists only to express what's behind it. If we would attempt to perceive that directly, we could bypass much of the limitations of language, and realize that as beings in this world we have far, far, far, more in common with each other than we have differences.

It's never the words that really matter, it's what's behind them. Yet, in argument after argument, it's always the words that are picked apart and analyzed, in attempts to use them as weapons against their author, when if the energy were used to try to understand what's behind the symbols, even the simplest ones, misunderstandings would evaporate.

### **Re: This looks like a classified post to me**

Message #36 Posted by [Valentin Albillo](#) on 1 Mar 2007, 5:25 a.m.,

Hi, Steve:

Steve posted:

*"It seems to me that what we're dealing with here is primarily a language barrier [...] I think the root cause of Gileno's abbreviated posts is his inability to express his full emotions via the English language. Instead of eloquent prose, we get exclamation points"*

While I fully agree with you in general, this person's case is not only a language barrier problem. Within his language limitations, he can be pretty 'eloquent' (or at least he tries) when he feels like it, for example in his reply to my post, where he uses no less than 11 lines of 'eloquent' prose to try and retaliate against me, which are more or less equivalent to 10 of his usual postings.

This pretty much shows that, when he feels like it, he can write a lot more to try and make himself more or less understood. But he only does so in spite, when motivated. For his usual pleas for help and such, he apparently doesn't feel any need to state his problem in a polite way, or try and explain the steps he took before asking for help, or try to establish some kind of nice approach.

He just utters his request, in capital letters (akin to shouting), and duly laced with exclamation marks to try and give an urgency to his plea, as if it should be considered the most urgent matter in the forum, for all to see and take immediate notice and quickly do something about it. Yet, no 11 lines of 'eloquent' text to be seen there, to at least attempt to justify this implied urgency or make a convincing case of why one should be specially interested in it. He's been doing this for many months now, never evolving to more socially acceptable standards and better netiquette conformity, and I felt it was about time someone would give him some advice on this, even for his own good. But you can see above how he took the advice.

Thus, language is not the only problem here. It's attitude. I merely pointed that out to him, and instead of considering the matter and ponder the merit in my advice, he entered spoiled-brat mode, edited his original message to include 200+ exclamation marks in an extremely childish attempt to annoy me, did the same in other posts (which the moderator duly edited to sane lengths), took the trouble to write an 11-line retaliatory message to let me know that he didn't care at all for my advice, did include assorted would-be near-insults or despective statements, then got a reply by Mr. Hicks expressing an opinion on his original message, so he went into deeply-offended mode and announced his intention to not write anything else here, with a sad goodbye to top

it all. To just return a post or so later.

This is all *so childish, so blatantly childish and immature behavior* that I would never expect such from a supposedly grown-up, adult person, least of all an HP calc fan. It absolutely beats me how a normal, adult person (not a retarded or a moron) can behave like that when dealing with another adult person. Go figure.

As far as I'm concerned, this issue is over for me. This person has been duly included in my filtering script and he can do or act as brilliantly or childish as he cares from now on, I won't see it.

Thanks for your comments and

Best regards from V.

### Your favorite calculator?

Message #1 Posted by [Ruben](#) on 26 Feb 2007, 11:17 p.m.

Just curious what everyone's favorite HP is. Or if their favorite is even an HP (say it isn't so....). Lots of reasons to pick different models. Rarity, your first, just technically neat, the prize of your collection (if you have one). Could be tough.

I think my favorite is the HP-16C. It doesn't have the visual appeal of the HP-67 (or 34C, which IMHO may be the most attractive ever), but it's been a workhorse for many, many years. Amazingly, I think I'm on the second or third set of batteries since new. Small enough to always have around, and I never worry about it not working.

I'm actually a bit surprised that I decided on this one as my favorite, only because I consider the classics to be the ultimate representatives. I guess the functionality edges some others out.

### Re: Your favorite calculator?

Message #2 Posted by [Bruce Bergman](#) on 26 Feb 2007, 11:42 p.m.,  
in response to message #1 by Ruben

My favorite is, and I think always will be, the 19c. Love that calc, with its printer and coolness factor. Followed second probably by the 25c, which was my first HP.

### a new spin on an OLD question

Message #3 Posted by [allen](#) on 27 Feb 2007, 12:30 a.m.,  
in response to message #1 by Ruben

For just about any age group, you can guess their age or college graduation year based on their favorite calculator. For example here is a real conversation I had with a man I met last month:

"HP calculators are great!! I have both a HP 48S and a 28S at home!"

"I'll bet you graduated college in 1993."

"How did you know!!?"

If he had graduated 3 years earlier or later, he likely would have said "41cx" or "48gx" respectively. Was that a fluke? No, Both the 41cx and the 48gx are better calculators than the 48s in every way. He liked that because that is what he was exposed to when he 'converted'. The same holds true for many of us.

So really I think the "what is your favorite calculator?" question is just a disguised way of the AGE check they used to do in chat rooms and forums.

Try this: Take 2007 minus 1942 minus the date code from the favorite calculator and you can get an approximate age of the person. (+/- 2 years)

e.g. "I looooooove the Hp-34C!! (1981)  
2007-1942-21=44

Therefore I guess the person to be 42 to 46 years old.

e.e.g. Many of the low-level managers at large companies are carrying around 11c's or 15c's so 2007-1942-25= age 38 to 42

This will hold true until the 48gx owners retire. All of the models after that will be dead within a few years of purchase because of the tragedy that befell the RPN calculator industry with the millennial HP CEO, the merger with COMPAQ, spinoff of Agilent... etc.

Hi, Allen --

Quote:

---

Try this: Take 2007 minus 1942 minus the date code from the favorite calculator and you can get an approximate age of the person. (+/- 2 years)

---

Hmm, within a span of four years (1979-83), I became infatuated by the new HP-41C, several years later saw a more-attainable HP-34C, subsequently set out to buy one, but bought an HP-15C instead. All of these have the same date-code format. That makes me how old? :-)

Okay, I'm in my forties, like many of us here.

*Message #5 Posted by [Ruben](#) on 27 Feb 2007, 2:13 a.m.,  
in response to message #3 by allen*

Funny! Yeah, I guess that makes sense. I'm definitely on the outside of that curve though. 2007-1942-27 = 38. I recently turned 44.

My first was a 41C though, back in junior high it was. Mowed a LOT of lawns and washed a LOT of cars for it. It's not easy being the UberGeek in school. I went to college late though, at 26, and not long afterwards, I was tempted by the new and sexy 48SX because I used to be a gadget nut. It got me through my civil engineering degree though, and I still have it. I guess in reality, I owe a lot to that calculator.

I put myself through college though, as a code jockey in a research lab, hence the love of the 16C. Stuck with the software after school, and still use it, but not daily like I used to.... meetings... grumble...

Hmmm... That would make me 43. But actually, I'm 52 (as of today, in fact). I guess that's a pretty good birthday present; you've just made me 9 years younger. Thanks! :-)

It's hard to pick a favorite. I use my 48GX every day, for lots of things; but in some ways I like my 41CX better. However, if I could keep only one, it would be my 16C. That was my first HP, and it has such elegant and unique features that I'd be hard-pressed to give it up. So that's the one whose date code I used for the age calculation.

Message #9 Posted by **Dave Shaffer** on 28 Feb 2007, 4:22 p.m.,  
in response to message #3 by allen

Your formula shaves a decade or two off my age:

First HP - a '35, suggests I'm 52.

Favorite HP - a '41CX, suggests I'm about 41.

Actual age: 61 (as of less than two weeks ago) I guess more recent geeks get their hands on their first/favorite HP in their teens.

The 41C was my first, and still rates as my number one pick. It stays forever young with new hardware and software from a dedicated cadre of fanatics around the world. It just *feels* right in my hand, and I could program it in my sleep.

The 71B is a close second. Its expandability is similar to the 41's, and it has lots of cool toys you can plug in to it. It is also as open a system, with the commented internal source code available for inspection.

Third for me comes the 97. That is *such* a nice form factor. The large red LEDs are a knockout, too.

Fourth are the RPL machines. RPL has grown on me as a language. I now get a perverse (reverse?) pleasure out of expressing myself in cryptic stack imperatives, with nary an alphanumeric symbol in sight.

Regards,  
Howard

in response to message #1 by Ruben

My first experience with HP calculators goes back to when I was about 10 years old. My sister was about to go off to college and her then boyfriend, now husband bought her an HP-35 to use in math and science classes. I was not to see another HP until my junior year in high school where an exchange student from Sweden had an HP-41CV. About 4 years after that I was able to scrape up enough to get my own 41CX. Now over the years I have had several different HP's 41CX, 42S, 48SX/GX, 28S, 15C, 20S and a 33S. The one I always seem to grab the most when I want to do something fast is the 42S. The 41CX being my first actual purchase is a very very close 2nd, but the 42S is small, easy to program, has a great keyboard and display. I consider the 41CX the best calculator HP ever designed, but the 42S has almost everything I want in the perfect size.

### **Re: Your favorite calculator?**

Message #14 Posted by [Alan Firth](#) on 27 Feb 2007, 1:07 a.m.,  
in response to message #1 by Ruben

My favourite is the 25, because it was my first. ( $2007 - 1942 - 15 = 65 - 15 = 50$ ; actually I just turned 48 Not bad.)

Call the 25 the cusp of a normal curve - I've been collecting models from the 35 up to the 41. (So, a 35 would interest a 52 year old, and a 41, a 45 year old... The median, 48.5, is pretty close to my age)

Not coincidentally, the 41C was my second and last HP (bought new, that is)

So I'm saying that a collector's interest tends to vary around the midpoint defined by their two favorites... maybe. Any takers?

My favorite is the HP-15C. Yes, I know, it's not graphic. Yes, I know, it's got few memory for programming OR for registers. Yes, I know, it's not that fast.

But I like it much more than every other calculator in sight. Probably many models (even not HP) may be more useful than the HP-15C nowadays for several jobs, but when I use my HP-15C I feel fine.

-- Antonio

NOTE: This feeling is subject to change. I am not always the same man year after year ;-)

My favorite is the HP-67, HP-19C, HP-01, HP-34C, HP-41CX, HP-15C, HP-16C, HP-71B, HP-28S, and HP-48SX.

What, you thought I'd be able to choose just one?

If I really had to pick just one that I was actually going to use, I suppose it would have to be the 48SX, because it does everything the others do, except fit on my wrist or have a built-in printer.

Other than that, I actually use the 16C and 28S more than the others. The 16C is most convenient for simple tasks when I'm programming. The 28S is better for more sophisticated tasks. Although the 28S is not as powerful as the 48SX, I prefer the clamshell design. Though unfortunately it appears that the MTTF of the 28S is lower than that of the 48SX due to the flex circuit through the hinge. It's a very clever design but not as robust.

*Message #17 Posted by [Tony Duell](#) on 27 Feb 2007, 5:10 a.m.,  
in response to message #1 by Ruben*

You mean I have to pick \_one\_???

OK, it has to be the HP9830. A totally amazing machine for the time (it has a good claim to being the first personal computer), very well made, repairable, expandable. As an electronics person I like CPUs made from lots of small chips (as this is), and it's one of the few bit-serial processors made from SSI and MSI chips you're likely to find.

But I really don't want to pick just one machine...

The 9100 is probably the most elegant piece of electronics it's ever been my pleasure to work on. There must

be way under 1000 transistors in there. Really simple...

If I have to pick a handheld, then it's the HP41CX (as a hacker's toy), but the HP48SX as a calculator. The former because of the I/O and expandability, the latter because unlike many people here I do like the arbitrarily-large stack. The 48 wins over the 28 because of the serial port, I don't like programmable calculators that I can't back up.

For a pocket computer (i.e. something programmable other than in a keystroke language), I like the HP71B. The BASIC on that is very complete, and there's the Forth/Assembler ROM. But for hardware hacking the Sharp (!) PC1500 has a much simpler expansion bus.

Of course on my electronics workbench I have a 16C (what else ;-))

You know it'd be quicker to list the machines I don't like....

Hello!

Today, my favorite calculator is the hp-71B, because I happen to have taken it with me. Tomorrow, it might as well be the hp-19 or hp-25 (which probably is my real favorite...).

In the days when I really needed a calculator, I couldn't afford HPs and had to stick with a Ti-59, which therefore will always remain my own personal number one. Forever :-)

Anyway, I get more and more pleasure from other non-hp calculators lately, like from the Sinclair Scientific that I got last week (for a ridiculous price compared to what such a rare calculator from hp would have cost me): A very cleverly made, minimalistic RPN scientific thingy that takes half a minute to compute trigonometric functions - you really get a feeling what "calculating" once meant even for a machine.

Greetings, Max

Quote:

There is a Vulcan proverb. "Wanting is better than having. It is illogical, but often true."

I'm not a *Star Trek* enthusiast, but I just happened to catch most of one of the original 1960's episodes on TV several nights ago, in which Spock repeated this statement. It was the one in which Spock is somewhat compelled to duel to the death against Captain Kirk to "win" his pre-arranged Vulcan bride. Although quite winsome, the young lady is rather conniving, and Spock declines his prize even after he has "killed" Kirk. Spock offers the proverb to the bride's true suitor as words of wisdom.

I also noticed for the first time the communication devices that resembled today's slim flip-open cell phones. Remarkable prescience!

In total, I've probably seen no more than ten *Star Trek* episodes in all three(?) incarnations of the series, and have never seen a *Star Trek* movie. So, these comments might be "old hat" to some.

It's funny what you can notice. I watched an episode recently where Kirk & Spock walked into a crew recreation room on the ship. In addition to the cool 3D chess sets, I noticed something in the background. It was a large black tv/monitor stuck up on a wall. Looked just like my Sony!

### **Re: Vulcan proverb from Star Trek**

*Message #29 Posted by **Howard Owen** on 3 Mar 2007, 1:08 p.m.,  
in response to message #27 by Karl Schneider*

The original flip phone (or at least, the first one I ever saw,) was the Motorola "StarTac." I think that it wasn't prescience on the part of the *Star Trek* prop designers so much as excellent design that was then copied by the cell phone makers.

The other prominent design for communications gear I can recall in popular culture is the "two way wrist radio" and later "two way wrist TV" from the American comic strip "Dick Tracy." That idea went exactly nowhere. That's partly because power requirements dictate a larger form factor than the imagined wrist phones had. But even if the electronics and power supply were small enough to fit on your wrist, I suspect you would still prefer a headset to holding your wrist up to your mouth.

Another staple of 1960's Science Fiction, two way video telephony, went a little farther, renamed as "video conferencing." But is nowhere near as ubiquitous as the prognosticators expected. In this case I think there are several factors that bar wider adoption, at least in the US. First, the bandwidth for video is expensive to provide, and is still under 50% coverage in the US. Second, letting your callers see you isn't always what you want. If video phones were the rule, denying someone video access could imply things you might not intend. Finally, the voice network is "good enough" for many communications needs. Internet video conferencing is widely available, but so is Internet telephony. The latter is a viable base for several businesses, as POTS (Plain Ol' Telephone Service) still is. The availability of video phones hasn't killed off voice communications.

What's this got to do with calculators? Well, many of us bemoan the fact that the excellent design and construction of the old HP models is nowhere to be found in the modern world. TI calculators are "good enough" to meet the demand. As long as quality and utility meet a minimum standard, people will consistently pick the product that is lower in price, even if the quality is less. The Wal Mart phenomenon proves this.

Now, if only the physics were there to let some of the other design elements from Star Trek come true. I'd love to commute by transporter. Weekly jet setting is tiring.

Regards,  
Howard (from DFW)

I have two reactions to this. First, no doubt the transdimensional transport carriers will claim it's a lot safer than driving. Second, as long as I'm spinning a fantasy I reserve the right to spin it my way. In my version, a trip in the transporter is always safe, and always sets your biological age one day closer to 24, assuming you are older than that. And yes, you get to keep your experience and judgment so you don't act like a complete idiot when you *do* get behind the wheel of a car. 8)

in response to message #35 by Vassilis Prevelakis*

Dr McCoy on the original series had the same phobia.

Is it a physician thing?

In my fantasy, the transporter is implemented by transmitting quantum states of fundamental particles, within uncertainty, from here to there. And a hitherto unknown principle, sort of like a super Pauli exclusion principle, results in the spontaneous dissolution of the "from" particle at the instant the "to" particle is imprinted with the remote states. This would get around the messy need to destroy the from particles, and the philosophical problems of creating duplicates. Due to uncertainty, the worst side effect of "beaming" around might be some nausea and disorientation as your atoms snapped back into place from the random but small relative positional dispersion the beaming created. A balance between knowledge of complementary quantum states would have to be achieved. In my fantasy, this is possible.

The reversion one day closer to 24 for each beaming can't be mocked up in pseudo physics. So I'll just attribute that feature to ancient tribal magic instead. 8)

Regards,  
Howard

*Message #37 Posted by [db](#) on 7 Mar 2007, 1:51 a.m.,  
in response to message #36 by Howard Owen*

Howard:

Supposedly; transporters have "Heisenberg Compensators" which allow "quantum resolution" of objects.

They put the right *spin* on things ;-)

And the writers are not *uncertain* ;-)

Any race that can toss around matter like they do in those transporters can probably pop in and out of regular old spacetime when and where they want to just like in Star Trek too. None are on my Christmas card list though.

What do you want to bet *they'd* use RPN.

So, these comments might be "old hat" to some.

Probably showing my age, and a bit about my personality, but I did not even have to check any references to know that quote came from the episode titled "Amok Time". As far as the prescience of the show goes, the argument has been made that impressionable future scientists and engineers that grew up watching the shows are now making the technology come true.

I agree with the other posters about travel by transporter, it would take a lot of convincing for me to travel that way. I really don't like the method I have heard proposed where instead of actually transporting you from one place to another, you are scanned and an exact copy is made at the remote site from local matter - then the "original" is destroyed!

**Re: Vulcan proverb from Star Trek (further off topic)**

Message #41 Posted by **Walter B** on 4 Mar 2007, 6:28 p.m.,

Don't worry. Scanning some E27 atoms you consist of plus their states of excitation necessary to "cut and paste" you at another place will take enough time. So the original will be destroyed by mother nature well before the end of scan. Sorry ;-)

A year or so ago The History Channel (a cable television channel in the US) aired the two hour Mockumentary "How William Shatner changed the world". It was hosted by none other than William Shatner.

I don't think I watched the entire program, but I think it was a "response" to a college course titled "How Star Trek changed the World" Both the program and the course pointed to the similarities between today's and Star Trek's technologies as well as the social implications.

Personally, I think the cell phone is great, but I see another convergence occuring between the beds in "Sick Bay" and enhanced patient monitoring and diagnostics (MRI, CAT, PET scans)

The tricorder would be awfully handy as a portable diagnostic tool also.

The technology of Star Trek was elaborate and well thought out. That feature more than any other distinguished the series from any TV project that had gone before. Real hardcore Science Fiction fans, who had been starved for good stuff since Twilight Zone had left the air, seized on Star Trek as a genuine Science Fiction series. It wasn't really "hard" Science Fiction, since the transporter and warp drive had dubious scientific underpinnings. But compared to "Lost in Space," "My Favorite Martian" and "Time Tunnel" it was the real thing.

Regards,  
Howard

*Message #46 Posted by [Ed Look](#) on 27 Feb 2007, 1:19 p.m.,  
in response to message #1 by Ruben*

Mine is the 34C... and not for its visual design either, though I agree it is very attractive. In the many years it did work, I loved how it worked.

I loved its capabilities and power; I loved how the keys felt; I loved the red glowing display (playing Moon Lander in bed was a gas) ; I loved its programmability and related, it's continuous memory; I loved how solidly it felt in my hands; of course, I absolutely loved the RPN entry.

I even loved the depth of its manual! It had nice illustrations. A non-math major could learn some math and stat just from learning to use the calculator!

(I didn't like how fast the Ni-Cd batteries discharged however.)

The HP-34C; a great calculator.

Hi.

My favourite one is the 42S: so "harmless" in its appearance (might even seem a four-banger :), so powerful in its internals |-).

Best regards.

Giancarlo

### **Re: Your favorite calculator?**

*Message #48 Posted by [Ed Look](#) on 27 Feb 2007, 5:50 p.m.,  
in response to message #47 by Giancarlo (Italy)*

I have never had the pleasure of even touching a 42S, but I have seen pictures.

And from what I see, you may be very right! It IS inoffensive looking, rather pleasing, I'd say, with an unassuming form factor... well, really its flatness... and a soft(er) brown instead of the hardness of black.

Very nice looking machine. I hope someday to get one, just to play with it if not really do work on it.

### **Re: Your favorite calculator?**

*Message #49 Posted by [Gerson W. Barbosa](#) on 27 Feb 2007, 8:26 p.m.,  
in response to message #47 by Giancarlo (Italy)*

Ciao Giancarlo,

I would add the HP-42S has the most computing power per cubic inch among all HP RPN calculators. If it

only had a two-way interface for storing and loading programs... Well, this has been resolved with Thomas Okken's Free42, to whom I am grateful forever :-)

On my side, my favorite calculator has always been HP's latest top of the line calculator, starting with the HP-28S, then the HP-48G, then the HP-48GX, then the HP-50G! I skipped the 49G and the HP-49G+, because of the keyboard issue - I eventually got a 49G as a test before buying a 49G+. It turns out it was not a bad calculator as I had been led to believe.

But the elegance and comprehensiveness of the HP-15C, my first HP calculator (2343B) is unmatched. That's the only one that goes to work with me everyday, together with the Free42/Power48(HP-49G) combination on my PalmTX. So, I'd say my next favorite calculator is being designed (I hope), but the HP-15C and the HP-42S will always have a place in my heart.

Regards,

Gerson.

P.S.: Allen's clever formula works nicely in my case, if I add a three-year interruption between my last high-school year and my first college year:

$$2007 - 1942 - 23 + 3 = 45$$

### **Re: Your favorite calculator?**

*Message #50 Posted by [Patrick R](#) on 27 Feb 2007, 2:35 p.m.,  
in response to message #1 by Ruben*

Here is my favourite list:

1. HP48GX with Meta Kernel and 1Mb card. The "I can do it all calculator".
2. HP32sii (my first college calculator, the 48 was the 2nd), the number cruncher used almost daily while teaching.
3. HP97, I got it from a very good friend in exchange of a 32sii. Students say that I am crazy when I use it at the blackboard (but I calculate faster than they do). And best of all, it's older than I am!

So how old am I?

### **Re: Your favorite calculator?**

*Message #51 Posted by [JimC](#) on 27 Feb 2007, 6:22 p.m.,  
in response to message #1 by Ruben*

Good question! One which is guaranteed to draw a response from every HP nut. My favourites: the 21 (I first went to college using the 21), the 41 (I bought this after a rich summer job) and the 42 - because it is powerful, and it is 41 compatible.

I also like the 67, because it brings back the glory days of the space race, but it tends to chew batteries a little more than I would like.

FWIW, I graduated in engineering in 85.

*Message #52 Posted by [Les Bell](#) on 27 Feb 2007, 7:41 p.m.,*

*in response to message #1 by Ruben*

It's important to love all your children equally. ;)

My favourite calculator isn't my first, which was a 45, although I confess a certain sentimentality about it. Nor is it the 65 and 67 which followed it. They're all long gone, incidentally.

No, it's the 41. I've owned several over the years, but still use my original 41CX on an almost daily basis. But hang on - I carry a 16C around with me, and I *do* like the Voyager form factor.

And I'm sure that, one day, I will learn to love the 48GX which is resting in my desk drawer.

They're all good.

Best,

--- Les

My first, and happily recently refurbished, HP41CV, plus all manner of fun peripheral goodies. I actually prefer it over my 41CX--that wimpy halfnut display just leaves me a little cold.

The 42S with 82240 printer is a close second. If there were some way to quickly get programs into it, like with the 41 series, it would be my first.

Les

*Message #57 Posted by [John Keith](#) on 27 Feb 2007, 11:23 p.m.,  
in response to message #1 by Ruben*

I have to agree with Gerson, my favorite is my (less than 2 week old) 50g. According to Allen's formula, that makes me 19 years old, though my driver's license says I'm 48;-)  
My second favorite has to be the 11C, the perfect blend of size and features.  
Others I have: 49g+ (crummy keyboard); 16C (geekiest); 71B (Sherman tank).  
Used to have: 28S, 48SX, 48GX (all broken displays/keyboards, so much for the "good old days"); 15C (lost).  
No LED-era classics, too young/poor when they were out, too outraged by Flea-bay prices now!

Regards,

John

*Message #63 Posted by [Antoine M. Couët](#) on 28 Feb 2007, 10:49 a.m.,  
in response to message #1 by Ruben*

From Osaka Kansai, Japan, or from anywhere ... actually

My favorite is a mix of both "HP41" and "HP48GX" .

I mean the wonderful HP41X/Y/Z Software HrastProgrammer developed on HP48GX which fully emulates HP41CY on a HP48GX, and does much more, all of this at 3 times the speed of a conventional HP41 ! ( may I for one quite deserved exclamation mark ? ) I find this combination a winning one for most of my applications which absolutely require handheld format.

And - slightly off topic since it is not a "calculator" per se - for time consuming calculations and when handheld is not required, I also use Jean-François Garnier's HP41CY " Emu41 " Emulator. My applications run about 600 times faster on my laptop than on a standard HP41.

Again thank you to all of you, extremely talented and quite unique people, including but not limited to HrastProgrammer and Jean-François, who have made HP41 and Other Calculators ( HP71, HP48 and more ) Emulators available under various forms/supports to the Users Community.

*Message #65 Posted by [Thomas Okken](#) on 28 Feb 2007, 4:13 p.m.,  
in response to message #1 by Ruben*

In terms of usefulness, the HP-42S.

In terms of power and the WOW factor, the entire RPL series (I have a 48G which I like a lot).

In terms of misty-eyed nostalgia, the HP-67. Extremely well made, a true killer calc in its day and still very capable even now, and one of the best-looking ever.

- Thomas

Message #68 Posted by [Raymond Del Tondo](#) on 3 Mar 2007, 12:54 a.m.,  
in response to message #1 by Ruben

My favourites are easily counted: HP-48GX, HP-41, HP-42S, HP-11C, HP-33E;-)

I'm still developing for the HP-48 (SpeedUI,..)  
and HP-41 (INIT module for CY, CCD OS/X, other specialized ROM modules)

The HP that convinced me to enter the 'RPN side of life' was the 33E of a friend,  
which he gave me for a few days, and of which I worked through the whole manual.  
After that, I was kinda hypnotized by the RPN entry principle!

The HP-41C and the HP-11C were my first two real calcs, the 11C being small,  
robust and relatively modern compared to the LED calcs like the 30 or 60 series,  
but too limited regarding programming features.

So the 41 was my favourite for many years.

There also was a great user community for the HP-41,  
partly organized in clubs like the CCD and PPC.

I was introduced to Saturn assembly with the HP-71B and the Forth/Assembler ROM.  
Very powerful machine, but IMHO not very practicable due to the one-line display.

And then the HP-48 came out:-)

Still my favourite programming platform, and the last \*real\* HP Corvallis RPN/RPL calculator,  
with an ENTER bar where it belongs, and rock-solid hardware and OS software.

---

I think user-friendliness is in the eye of the beholder, like most things. Both the 12c (and its successors) and the 17bii+ are designed for the business guy, not the scientists and HP fanatics like us. It's difficult for me to put on the hat of a "businessman," but if I did, I would imagine that the 17bii+ would be more appealing, especially since I will never program the thing anyhow. Both fit in my pocket easily (without the case), and both can easily do the standard TVM stuff.

Since HP is still selling 'em, both must have enough appeal to make it worth marketing them.

### **HP-12C vs. HP-17BII "friendliness"**

Message #72 Posted by [Karl Schneider](#) on 3 Mar 2007, 2:46 p.m.,  
in response to message #69 by Eddie Shore

Hi, Eddie --

Quote:

My favorite financial calculator, surprisingly, is the 12c. The 12c is more user friendly than the 17bII

Much of the enduring popularity of the venerable HP-12C is due to its classy, unobtrusive look. You do have a good point about user-friendliness, however.

HP's apparent design objective with the HP-32S and HP-17B/BII was a "tidy" face with functions accessed through menus. The face of the HP-17B/BII was particularly sparse. One might wonder, "Where is everything?"

This approach wasn't entirely popular with users, and I share those sentiments. To find a function, one first has to think what the name of its parent menu is, then enter it using extra keystrokes. On the HP-12C, "what you see is what you get" -- *directly*.

One egregious example of this "over-compartmentalization" is DSE and ISG on the HP-32S. On the predecessor HP-15C and HP-11C (to name several) DSE and ISG are printed on the keyboard face. On the HP-32S, one must access these through the "LOOP" menu.

Thus, the HP-32SII was created, making more functions visible and directly accessible via a second shift key. New and previously-missing functionality was added, too. The HP-32SII looks a bit cluttered because it represented a design that "evolved" from a different concept, but it's a much better product, IMO.

-- KS

*Message #76 Posted by [Ed Look](#) on 5 Mar 2007, 11:27 a.m.,  
in response to message #75 by Tizedes Csaba [Hungary]*

Your first HP calc was the 32SII?

What an excellent starting point! I bought one after owning and using the 34C for many years, until it started to show signs of wearing out.

I posted earlier in this thread that the 34C is my absolute favorite one; the 32SII made me feel very good using it as it seemed to be so much like the 34C... and yet seemed also to be an improvement in things like

memory capacity and a few other things.

I'll confess that the 34C keeps it place in my heart because i) it was my first one; ii) it has that wonderful crisp-feeling set of keys iii) I love the way ALL Spice series calcs look; and iv) the look of red LEDs. What can I say?

### **Re: Your favorite calculator?**

*Message #77 Posted by [buygm](#) on 9 Mar 2007, 8:57 p.m.,

### AC Transformer for HP-33C

Message #1 Posted by [Jean-Michel](#) on 26 Feb 2007, 4:28 p.m.

Hi,

I received recently one HP-33C with it's battery charger ( :- ) , but for 90-120V AC input. I live in France where the voltage is 220-240V AC, and the plugs different from the ones on the original charger. As anyone here solved this problem ? Is it possible to adapt another european charger with 10V AC output ? If so, which kind of charger ? I'm not expert in this and don't want to burn my "new" old HP !

Thanks in advance.

Regards.

### Re: AC Transformer for HP-33C

Message #2 Posted by [Gerson W. Barbosa](#) on 26 Feb 2007, 5:51 p.m.,  
in response to message #1 by [Jean-Michel](#)

Hello Jean-Michel,

I guess you have an HP-82087B adapter, input 90-120 V AC, output 10V AC, 1.8 VA (this is the output power in VA). You'll need a 220 to 110 V AC transformer. This 50VA transformer below is a bit exaggerated and rather expensive. Perhaps you'll find a cheaper one (3 to 5 VA is all the power you will need).

[http://www.solded.com/boutique/product\\_info.php?products\\_id=499&language=fr](http://www.solded.com/boutique/product_info.php?products_id=499&language=fr)

Specifications from the linked site:

-----  
Entrée: 220-230v 50 Hz équipée d'un cordon secteur avec une fiche Européenne 2 pôles + Terre.  
Sortie :110-120-130 V 50 Hz équipée d'une prise femelle Type US 2 pôles + Terre

Autotransfo. U.S 220/110 50-60 Hz 50W  
Puissance en VA ou W :50 VA  
Longueur (mm) :76 mm  
Largeur (mm) : 90 mm  
Hauteur (mm) : 57 mm  
Poids en Kg : 0.73 Kg

-----  
Regards,

Gerson.

## **Re: AC Transformer for HP-33C**

*Message #3 Posted by **Walter B** on 26 Feb 2007, 6:17 p.m.,  
in response to message #1 by Jean-Michel*

Bonjour Jean-Michel,

you can split the problem in 2 parts: get a small 230V/110V transformer and look for a simple travel adaptor to let you connect your US charger with this transformer. I bought my transformer on eBay some years ago for a very reasonable price (postage was far more expensive, because this model is oversized by far), so this may be an alternative source for you, too. As Gerson mentioned, some 5VA will be sufficient. More power means more iron and will only increase the weight.

Regards, Walter

## **Re: AC Transformer for HP-33C**

*Message #4 Posted by **DBAX** on 26 Feb 2007, 6:23 p.m.,  
in response to message #1 by Jean-Michel*

Well, I wish you had one of the Classic hp calculators, then we could just trade. I just bought a European AC Transformer for my hp 45 and I'm in the U.S. Here's what I've found: There are "step-up/step-down" transformers that will take care of the voltage change needed. Many (most) of these are designed to work in both directions, i.e., convert from 110VAC to 220VAC and also convert from 220VAC to 110VAC. For small wattage devices they are fairly cheap. See for example the VT 100 model at <http://www.voltage-converter-transformers.com/step-up-transformer.html> for US\$17. Most of these have a switch that determines whether you are "stepping up" the voltage or "stepping down" as in your case. Your AC Adapter should plug right into the 110VAC side of this device.

## **Re: AC Transformer for HP-33C**

*Message #5 Posted by **Les Wright** on 26 Feb 2007, 6:47 p.m.,  
in response to message #1 by Jean-Michel*

North Americans frequently purchase travel adapters so they can use their shavers and hair dryers while travelling in Europe. I actually think I have one around here. Wouldn't they be safe to use as an interface between your North American Spice adapter and your French receptacles? They should be easy to get.

Les

## **Re: AC Transformer for HP-33C**

*Message #6 Posted by **Dave Shaffer** on 26 Feb 2007, 10:11 p.m.,  
in response to message #1 by Jean-Michel*

It might be simpler to just get an adapter transformer, as some have suggested.

However, if you are handy with a soldering gun, and/or eager to try something different, then consider this solution.

Since I am perhaps the ultimate cheapskate (a possible challenge to the calculator/geek crowd here - I get a feeling that these characteristics tend to run together!), I once conjured up the following circuit for a trip to Europe so I would not have to buy a transformer and adapter for my electric shaver. The idea is to drop the voltage from 220 to 110 with a series resistor.

The circuit should look something like this

```
<pre> R o-----^v^v^v^v-----o 220 VAC 110 VAC (European plug) (American socket) o-----
-----o </pre>
```

where the value of R depends on the current to be delivered to the 110 VAC output side.

By Ohm's law, you want the voltage drop to be 110 V across R so that the remaining 110V appears at the output. If you know the current to be delivered to the charger (let's call it I), then you can calculate R from

```
<pre> V 110 V R = ---- = ----- = 5.5 kOhm (as calculated with my trusty 41CV) I 20 mA </pre>
```

I'm not sure what the actual current is. Perhaps Randy can tell us. And, it shouldn't be too critical.

In cases like this, you also need to be a bit concerned about the power that will be dissipated in the resistor. That can be calculated as (I^2 R) or VI, where V is the voltage drop across the resistor. The power here will be 2.2 watts, so you need a modest sized resistor (which will be both heating your house and spinning the electric meter while you are charging your calculator!).

**Re: AC Transformer for HP-33C - OOPS**

Message #7 Posted by *Dave Shaffer* on 26 Feb 2007, 10:17 p.m.,  
in response to message #6 by *Dave Shaffer*

Well, I though I had the <pre> and </pre> OK, but I guess not! I have just been doing some HTML listing, where <> are necessary. But not here, I guess, where [] seem to be needed. So, how about this for the guts of my presentation:

The circuit should look something like this

where the value of R depends on the current to be delivered to the 110 VAC output side.

By Ohm's law, you want the voltage drop to be 110 V across R so that the remaining 110V appears at the output. If you know the current to be delivered to the charger (let's call it I), then you can calculate R from

```
[pre] V 110 V R = ---- = ----- = 5.5 kOhm (as calculated with my trusty 41CV) I 20 mA [/pre]
```

I'm not sure what the actual current is. Perhaps Randy can tell us. And, it shouldn't be too critical.

In cases like this, you also need to be a bit concerned about the power that will be dissipated in the resistor. That can be calculated as (I^2 R) or VI, where V is the voltage drop across the resistor. Message #8 Posted by *Dave Shaffer* on 26 Feb 2007, 10:19 p.m.,  
in response to message #7 by *Dave Shaffer*

Getting closer!

Here's the second formula:

$$R = \frac{V}{I} = \frac{110 \text{ V}}{20 \text{ mA}} = 5.5 \text{ kOhm (as calculated with my trusty 41CV)}$$

### Re: AC Transformer for HP-33C - OOPS, again

Message #9 Posted by [Paul Beijer](#) on 27 Feb 2007, 4:13 a.m.,  
in response to message #8 by Dave Shaffer

If you use this method you're risking destroying the calc. The voltage drop accros the resistor is current dependent. If the charge circuit inside the calculator does not draw a constant current the voltage will fluctuate. In the worst case when the charge circuit stops drawing current when the battery is full, the voltage will double. What you need is just a simple 230V to 10VAC transformer of say 3 to 5VA, which should be readily available in any electronics store.

### Re: AC Transformer for HP-33C

Message #10 Posted by [Tony Duell](#) on 27 Feb 2007, 5:15 a.m.,  
in response to message #1 by Jean-Michel

The internal charging circuit of the Spice (HP3xE, HP3xC) and Woodstock (HP2x) is much the same, and the charger units have the same characteristics, other than the output connector.

My first Spice series also came with the US charger. I cut the output cable and fitted a 2 pin connector to it (the polarity doesn't matter, the output of these chargers is AC). I did the same to a spare Woodstock charger (240V input). I could then plug the Spice cable into the Woodstock transformer unit and charge my Spice that way.

Looking at the other replies, it should be OK to run the US charger off a step-down transformer (either a double-wound transformer or an autotransformer), but I'd not use a series resistor. The primary current of the charger is no way constant, you run a serious risk of applying far too much voltage to the transformer primary, damaging it and also damaging the calculator, possibly.

Also watch out for 'travel converters' for heating appliances. They are not transformers, they are effectively lamp dimmer circuits (triac, etc) set to give the same power in a resistive load as you'd get if you connected said load to 110V mains. They do NOT work with transformers or electronic equipment, they will do a lot of damage.

### Re: AC Transformer for HP-33C

Message #11 Posted by [JLS](#) on 2 Mar 2007, 8:34 a.m.,  
in response to message #10 by Tony Duell

Hi Jean-Michel,

just go to an electronic parts supplier (like electronique diffusion in France) and buy a 10V/230V 1.8VA

transformer and a small plastic box, the only thing you have to do is solder 2 or 4 wires.

I did it for my HP-34C and it costs less than 5€!

### AC Adapters/chargers for vintage hp calculators

Message #1 Posted by [DBAX](#) on 26 Feb 2007, 2:31 p.m.

I have a hp 45 calculator, but have lost my AC Adapter. It appears this is one of the hardest items to locate for vintage hp calculators. Can anyone help with suggestions? Lacking the charger, I'd like to find where I can locate just the connector that plugs into the calculator. With this I'm hoping I could modify another 5VDC charger. Unfortunately, without an AC Adapter, my little beauty is virtually worthless. Help!

### Re: AC Adapters/chargers for vintage hp calculators

Message #2 Posted by [Hal Bitton](#) on 26 Feb 2007, 3:40 p.m.,  
in response to message #1 by DBAX

Well, the AC adapter from any of the classic series will work, and this would include the HP 67, of which there are usually a few up for auction (with AC adapters) on e-bay at any given time. I occasionally see just an AC adapter being offered also (but I admit not very often). If cashflow allows, you could buy one the 67's off of e-bay, keep the adapter, and re-sell the calculator. Or better yet, keep the 67 and enjoy it too! (that's what I'd do).

Best regards, Hal

### Re: AC Adapters/chargers for vintage hp calculators

Message #3 Posted by [Randy](#) on 26 Feb 2007, 4:02 p.m.,  
in response to message #1 by DBAX

The plug on your 45 is custom HP for which there is no substitute. 82002 chargers alone can be had on eBay on a fairly regular basis, \$30-\$40 is the average for a known good unit. All LED classics (35/45/55/65/67/70/80) use the same charger.

Buying an untested unit is a iffy proposition, 30% or more may have broken wires rendering them DOA. They can usually be fixed but it's a pain in the butt.

The 82002 contains two supplies, one current controlled 50 ma source to charge the batteries and a 4.5 volt supply to run the calculator.

You can run the calculator with a 5vdc supply alone and forgo the batteries if you're not a purist ;^)

### Re: AC Adapters/chargers for vintage hp calculators

Message #4 Posted by [Les Wright](#) on 4 Mar 2007, 3:26 a.m.,  
in response to message #3 by Randy

boy, I am an easy mark!

I have 4 classics and figure I need only two chargers (one to use, one spare), so I sold my third one to a fellow Forum peruser for 15 Canadian dollars plus shipping.

Maybe I should've held out for more, but it did gratify me to pass on a little of my bounty to another user.  
Call me the Anti-Coburlin ;)

### 10 B Calculator-Help!

Message #1 Posted by [Randy Jones](#) on 26 Feb 2007, 12:57 p.m.

How can you reset the number of payment periods from 12/yr. to 1,2,3,4/yr. etc... and then change back to 12/yr.?

Edited: 26 Feb 2007, 1:14 p.m.

### Re: 10 B Calculator

Message #2 Posted by [Miguel Toro](#) on 26 Feb 2007, 1:22 p.m.,  
in response to message #1 by Randy Jones

It is just:

number [SHIFT] [P/YR]

example: 3 [SHIFT] [P/YR] for 3 p/yr

In order to go back to 12 periods per year, it is just the same: 12 [SHIFT] [P/YR].

To validate the value inside this variable you do: [RCL] [SHIFT] [P/YR].

Regards,

Miguel

### 17bii+ bug update and Sum-Of-Digits

Message #1 Posted by [Bruce Bergman](#) on 26 Feb 2007, 12:03 a.m.

Don and I have been poking around the 17bii+, trying to determine if any of the bugs listed in older versions still exist, and well, trying to get used to the solver. ;-)

First, there are a couple threads in Forum Archive 14...

[part a here](#)

[part b here](#)

...which talk about bugs in the early 17bii+ units. I've tried a few of these and they all work correctly, as expected, on my version. For the record, my S/N is CNA 63401403.

Also, Don and I have been trading implementations for summing up the digits of a number (i.e.,  $123 = 1+2+3 = 6$ ). Here is the version that ultimately worked:

```
SOD:SUM=0xL(B:A)+sigma(I:1:LOG(A)+1:1:MOD(B:10)+0xL(B:IP(B/10)))
```

Don also has a version which uses the statistical lists to get the sum, assuming each digit is in a list (L1) item:

```
sod:sum=sigma(i:1:sizes(L1):1:Item(L1,i))
```

As we work through more, I may post some follow-ups. It's good to see that some of the ugly bugs have been fixed. Hopefully they're all good!

thanks, bruce

### Re: 17bii+ bug update and Sum-Of-Digits

Message #2 Posted by [Bruce Bergman](#) on 26 Feb 2007, 12:22 a.m.,  
in response to message #1 by [Bruce Bergman](#)

From Forum Archive 16, this bug:

Go into the FIN TVM menu and CLR DATA. Enter N=1; PV=1500; FV=-1750 Press OTHER and set P/YR=1 Press EXIT and I% YR

Appears to still be an issue on my 17bii+. That is, if I have more variables than appear on one menu, it requires two presses to get it to solve for that variable. HmMMM.

In the same thread, Chris Dean says:

Quote:

I have used the initialisation with the summation. I did use a separate equation for the initialisation

though. For example run the equation  $Y=AA+BB$  to initiate the variables. Press CALC and do not enter any variables then use  $L(AA:expr)$ ,  $L(BB:expr)$  and  $G(AA)$ ,  $G(BB)$  in your summation where ever you require them.

Try this for Fibonacci Numbers

$Y=A+B$  press CALC

$S=L(C:A+B)+ 0*(L(A:G(B)) + L(B:G(C)))$

Set  $A=1$  and  $B=1$  and successive pressing of S should show the next Fibonacci Number. series should be 1,1,2,3,5,8,13 .....

Good luck!!!

Chris

---

I'm not sure what Chris is saying here. Am I to enter TWO equations? One for  $Y=A+B$  to init, and then one for S to execute? Does anyone know more about what the point is here?

thanks, bruce

### Handheld Calculator Helps Solving Kahan's Integral Symbolically

Message #1 Posted by [Gerson W. Barbosa](#) on 25 Feb 2007, 1:12 p.m.

The Kahan's integral has appeared in some recent threads, like this one, started by Les Wright:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=104550>

Perhaps it should be more appropriately named Kahan/Woodyard Integral, as did Warren Anderson in a recent thread, since it was presented to Prof. Kahan for analysis by his electrical engineering colleague, Prof. J. R. Woodyard, as reported in Kahan's article [Handheld Calculator Evaluates Integrals](#), Hewlett-Packard Journal, Aug/1980, pages 23-32.

This is the famous integral:

$$I = \int_0^1 (\sqrt{x}/(x-1) - 1/\ln(x)) dx$$

The function is steep near 0: it is 0 when  $x=0$ , rises suddenly to 0.1177 when  $x=4.738E-3$  then decreases more smoothly to 0 as  $x$  approaches 1. This was troublesome for the HP Solver on the HP-34C, then on the HP-15C and even on the HP-32SII, at FIX 5 display mode. Those calculators give  $I = 0.03662 \pm 0.00001$ , instead of the correct result at this accuracy, 0.03649, an "error too small to be obvious and too large to ignore", in Kahan's words. However, at FIX 7 the problem disappears, but the HP-34 takes 23 minutes to display the right answer. Prof. Kahan then presents a technique to tame what he calls "wild integrals", which is detailed in his article. Even the newest HP-50G takes 37 minutes and 30 seconds to compute the integral in its original form to maximum accuracy. It places the result between 0.0364899739827 and 0.0364899739835, the lower limit being slightly above the exact answer as we will verify later.

Kahan's integran can be solved exactly with help of the EulerGamma or [Euler-Mascheroni constant](#). According to some references, its the third most important constant in Mathematics, after pi and e. It's represented by the greek letter gamma. Because the lack of this letter here, we'll represent it as simply E, for short.

It is defined as:

$$E = \lim_{n \rightarrow \infty} (1 + 1/2 + \dots + 1/n - \ln n)$$

$E = 0.577215664901533$ , to fifteen places. More about E at

[http://en.wikipedia.org/wiki/Euler-Mascheroni\\_constant](http://en.wikipedia.org/wiki/Euler-Mascheroni_constant)

That said, let's try to find an exact result for Kahan's integral. As mentioned in the references, E appears in various integrals. One of them is the classical form for Euler's constant, as shown in this paper (Formula 9, page 4):

[http://arxiv.org/PS\\_cache/math/pdf/0306/0306008.pdf](http://arxiv.org/PS_cache/math/pdf/0306/0306008.pdf)

$$E = \int_0^1 (1/\ln(x) + 1/(1-x)) dx$$

/0

Hence we can compute the second term in Kahan's integral, the one we cannot normally compute symbolically:

$$\int_0^1 (1/\ln(x)) dx = E - \int_0^1 (1/(1-x)) dx$$

Replacing this in Kahan's integral:

$$I = \int_0^1 (\sqrt{x}/(x-1) + 1/(1-x)) dx - E$$

This should be easy to integrate, but let's the HP-49G/G+/50G do it:

'\v/X/(X-1)+1/(1-X)' INTVX → '2\*\v/X+(-LN(\v/X+1)+LN(ABS(\v/X-1)))-LN(ABS(X-1))'

where \v/ is the square root symbol.

$$I = \left| 2 \sqrt{x} - \ln(|\sqrt{x} + 1|) + \ln(|\sqrt{x} - 1|) - \ln(|x - 1|) \right|_{x=0}^{x=1} - E$$

We should take care not to cancel the last two terms when replacing x by the integration limit 1. Instead, we should replace them by  $\ln[(\sqrt{x} - 1)/(x - 1)]$  and find that the limit when x tends to 1 is 1/2, by applying l'Hopital's rule, for instance.

Finally, we obtain:

$$I = 2 - \ln(2) + \ln(1/2) - E$$

or

$$I = 2 - \ln(4) - E$$

We are now ready to compute the numeric result of Kahan's integral. There is no EulerGamma in the HP-49G/G+/50G keyboard. But there is a special function under MTH menu, [digamma function](#), Psi. In this reference, we notice that

$$E = -\text{Psi}(1) \quad (\text{formula 16})$$

Thus,

$$I = \text{Psi}(1) + 2 - \ln(4)$$

On the HP-50G, we get

0.03648997398

On the HP-200LX we can compute

$$I = 2 - \ln(4) - 0.577215664901533 = 0.036489973978576$$

An approximation good to 12 digits for E is

$$E \sim 1/\sqrt{3} - 1/\sqrt{55192773}$$

We can check it on the HP-33S:

$$2 - 1/\sqrt{3} + 1/\sqrt{55192773} - \text{LN}(4) = 0.03648997398$$

Gerson.

P.S.: I am no expert in these topics to fully understand the references I have mentioned. My goal here was just to provide an exact answer to Kahan's integral.

## Re: Handheld Calculator Helps Solving Kahan's Integral Symbolically

Message #3 Posted by [Valentin Albillo](#) on 26 Feb 2007, 5:24 a.m.,  
in response to message #1 by Gerson W. Barbosa

Hi, Gerson:

First of all, excellent work ! And a truly didactic presentation, I'd say. Just a comment:

Gerson posted:

*"E appears in various integrals. One of them is the classical form for Euler's constant [...]"*

$$E = \int_0^1 (1/\ln(x) + 1/(1-x)) dx$$

Personally, I find this other integral form simpler and more aesthetically pleasing:

$$E = \int_0^1 -\ln(-\ln(x)) \cdot dx$$

where you have the curiosity of an iterated logarithm (the log of a log) and further, not only two logs but also two minus signs (and nothing else!), one of them applied to the argument of the outer log, which at first glance can trick you into thinking about logs of negative arguments, thus complex numbers, which isn't the case of course.

Best regards from V.

## Re: Handheld Calculator Helps Solving Kahan's Integral Symbolically

Message #4 Posted by [Gerson W. Barbosa](#) on 26 Feb 2007, 11:28 a.m.,  
in response to message #3 by Valentin Albillo

Hello Valentin,

Quote:

---

Personally, I find this other integral form simpler and more aesthetically pleasing:

$$E = \int_0^1 -\ln(-\ln(x)) \cdot dx$$

---

This is really an elegant form, and easier to remember. On the 48G/GX and the 71B, I think, it can be evaluated numerically to give the first nine digits of E (For plain ASCII text  $y$  might be a better notation).

Special functions and constants are interesting as they can provide closed form solutions to problems previously only being able to be solved numerically, as the HP-67 Math Pac I example in your excellent [HP-71B Math ROM Baker's Dozen](#) (Vols. 1 & 2) articles. Perhaps the next version of the HP-50G CAS should include Lambert's W-function.

Best regards,

Gerson.

### Need Graphics Programming Help (50G)

Message #1 Posted by **Chuck** on 24 Feb 2007, 7:56 p.m.

Fifteen years ago I was pretty adept at programming the 48SX. My, how time robs the memory. And it seems there are a few different commands with th 50G.

I am trying to create a program the clears the PICT (ERASE, I presume, or creating a blank 131x80 GROB and stored in PICT) then displays the graphic screen and runs through a loop displaying points (plotting a dynamical system using a 2x2 stochastic matrix).

Everything I try displays the graph AFTER it gets done plotting the points (or displays a blank graph and does nothing), but I want to see them plotted in real time. I know this is a simple matter and I did it 15 years ago, but it escapes me right now.

Thanks!!

CHUCK

You mean like this?

```
<< ERASE DRAW PICTURE >>
```

Grab the advanced users reference for complete command listing and more detailed programming info.

TW

### Re: Need Graphics Programming Help (50G)

Message #3 Posted by **Chuck** on 25 Feb 2007, 1:47 a.m.,  
in response to message #2 by Tim Wessman

Nope. That doesn't do it because I'm not graphing an equation, and without something stored in 'eq' it gives an error. All I need to do is activate the graphing window, and have my program provide the points to plot. I'll dig up my olde 48 manuals. Even the 800 page advanced manual for the 50G leaves out a lot of functions. I'll keep trying.

### Re: Need Graphics Programming Help (50G)

Message #4 Posted by **Chuck** on 25 Feb 2007, 2:11 a.m.,  
in response to message #3 by Chuck

Nevermind. I figured it out. Instead of

ERASE { } PVIEW

which centers the PICT variable, but doesn't interactively show you PICT, one needs to use

ERASE { # 0d # 0d} PVIEW

which places PICT in the upper left corner (equivalent to centering it) but, more importantly, actually shows the points being plotted instead of waiting until the end. Strange quirk if you ask me.

### Trigonometrics for Really Big Input

Message #1 Posted by [Les Wright](#) on 24 Feb 2007, 6:12 p.m.

In learning about the sine and cosine integrals, I learned that for really big  $x$  the cosine integral is very near to  $\sin(x)/x$ .

This led to my discovery that for really big  $x$ ,  $\sin(x)$  is wrong on all of my calculators.

$x = 1e50$  is a good example. On the 48G, 49G+, 33S, and 28S, in radians mode  $\sin(1e50)$  returns 8.68392787928e-2.

On the 10 digit calcs (HP41CV and CX, 15C, 11C, 33C, 34C), I get -0.132816215.

The venerable 45 returns 0.653432214.

The actual 12-digit value, according to Mathematica and Free42 Decimal (with 25 digits BCD precision) is -7.89672493429e-1.

I find this fascinating, since the "wrongness" is consistent depending on whether the machine has 10 or 12 digits.

Any ideas? I am sure it is a rounding thing and the limitations of reducing such a big angle to the desired range.

Les

Hi, Les:

Les posted:

*"On the 10 digit calcs (HP41CV and CX, 15C, 11C, 33C, 34C), I get -0.132816215 [...] I am sure it is a rounding thing and the limitations of reducing such a big angle to the desired range."*

That's correct. I'll discuss the 10-digit case (HP-15C, etc).

Big enough angles are internally reduced mod "Pi" to bring them to proper (small) size, in the proper quadrant. The internal value of "Pi" used to perform this reduction determines the result's accuracy and thus that of the final sine value.

In the 10-digit case, the internal value of "Pi" used for the reduction is 3.141592653590, which is the correctly rounded 13-digit value of Pi, i.e., three additional "guard" digits.

When this 13-digit internal value of Pi is used to reduce  $10^{50}$  to the proper quadrant, you get:

$$10^{50} - \text{INT}(10^{50} / 3.141592653590 + 1) * 3.141592653590 = -0.13320983018, \text{ exactly}$$

in response to message #4 by Eric Smith

Eric:

You found an excellent and graphic way to present this idea. I was just starting to wonder about the appropriateness of talking about a  $1e50$  angle, but your explanation closes the issue. Congratulations!

## Re: Trigonometrics for Really Big Input

Message #6 Posted by [Les Wright](#) on 25 Feb 2007, 4:50 p.m.,  
in response to message #4 by Eric Smith

I agree wholeheartedly.

I take note that in the Numerical Recipes treatment of the sine, cosine, and related Fresnel integrals, the accuracy of the routines for these special functions when the argument is large is limited by accuracy of the trigonometric library routines when the argument is really big.

I also note that in Stephen Moshier's double precision routine in the Cephes library, `sin.c` will return an ERROR when the argument is greater than  $2^{30}$  (about  $1e9$ ), at which point the relative error drops suddenly from around  $1e-17$  to  $1e-7$ . The code also warns that when the argument reaches about  $2^{49}$  (about  $5.6e14$ ) the results returned are "meaningless".

Since even the 12 digit calculators operate internally at a little less than 64 bit double precision, asking for a correct value of  $\sin(1e50)$  is a little unfair.

That said, I am impressed that `Free42`, with only 25 digits of internal precision, gets it right--at least the 12 digits that are returned in the display.

Thanks for the insight.

Les

*That said, I am impressed that `Free42`, with only 25 digits of internal precision, gets it right--at least the 12 digits that are returned in the display.*

`Free42`, or more precisely, the `BCD20` library, uses a 1060-digit approximation of  $\pi$  to do the  $\text{mod } 2\pi$  argument reduction. So, you can get incorrect results even out of `Free42`, by using arguments  $> 10^{1060}$ .

Getting the RAD mode trigs right for *\*all\** arguments would require using a 10000-digit approximation of  $\pi$ . A lot of effort with very little practical payoff -- much like the related case of making MOD return exact results for huge arguments...

- Thomas

Actually, you use the a 1060-digit approximation to  $1/(2\pi)$ , but I see the logic of this in any case.

Frankly, I thought the argument reduction was used with a 25-digit approximation to pi, so I am impressed it is so much more precise.

Les

Actually, Thomas, once  $x > 9.9e1027$ ,  $\sin(x)$  returns <Not a Number>.

Up to that point, compared to Mathematica, it seems to give pretty good results, i.e  $\sin(9.9e1027) = 0.936195810146$  in both settings. It seems you have set it up so that  $\sin(x)$  returns either the right answer or none at all. Very wise!

Les

---

The credit should go to Hugh Steers, who wrote the BCD code used in Free42. And of course any criticism that the modtwopi() function doesn't work all the way up to 1e10000 should also be directed at him. ;-)

Has anyone tested IEEE-754 implementations to see if their trigs are accurate when given ridiculously large arguments? Just curious...

### **Re: Trigonometrics for Really Big Input**

*Message #11 Posted by [hugh steers](#) on 27 Feb 2007, 2:19 p.m.,  
in response to message #10 by Thomas Okken*

ha! i knew that 1060 digit pi constant would be useful oneday :-)

when the argument is too big for the constant to return a sensible result, bcd20 returns nan as you've noticed. this is to prevent the result from being completely wrong. i'd rather people got nan as the answer rather than think it was correct.

for those interested in precision answers, you might like to run my "exact" engine. download exact.exe from <http://www.voidware.com> (downloads section). exact is a multiprecision engine that verifies its answers and is never wrong (claim!!)

also bcd20 is now deployed as the calculation engine underneath hplua 0.2 (<http://www.sf.net/projects/hplua>)

regards,

James Gosling discusses why correct argument reduction makes trigonometric functions slower in Java than in C++ [here](#). He says:

Quote:

---

As far as I know, the K5 is the only x86 family CPU that did sin/cos accurately. AMD went back to being bit-for-bit compatible with the old x87 behavior, assumably because too many applications broke. Oddly enough, this is fixed in Itanium.

---

Handling this is often a matter of giving correct results to meaningless input, but it is nice to leave it to the user/programmer to decide if a computation makes sense.

How to do this correctly was first described by [Payne and Hanek](#) in 1983, after the 8087 was developed, and after HP lost interest in making their calculators more perfect (or, after they got perfect enough for all practical purposes).

## Re: Trigonometrics for Really Big Input

Message #13 Posted by [Rodger Rosenbaum](#) on 1 Mar 2007, 1:30 p.m.,  
in response to message #12 by Gunnar Degnbol

On James Gosling's blog page, he quotes extensively from Joe Darcy, his local floating point God.

Darcy says:

"The implementation challenge is that sin/cos are implemented using argument reduction whereby any input is mapped into a corresponding input in the  $[-\pi/4, \pi/4]$  range. Since the period of sin/cos is  $\pi$  and  $\pi$  is transcendental, this amounts to having to compute a remainder from the division by a transcendental number, which is non-obvious. A few years after the x87 was designed, people figured out how to do this division as if by an exact value of  $\pi$ ."

He also says:

"The fix for this problem was figured out quite a long time ago. In the excellent paper 'The K5 transcendental functions' by T. Lynch, A. Ahmed, M. Schulte, T. Callaway, and R. Tisdale a technique is described for doing argument reduction as if you had an infinitely precise value for  $\pi$ ."

It sounds to me like Darcy is suggesting that a new technique has been discovered since the x87 was designed. I was eager to learn of this new technique.

I downloaded this paper from IEEEXplore and the only place where the authors mention range reduction for the sin function is on page 264, first column, where they say:

"The trigonometric functions reduce the domain of theta in  $[-2^{63}, 2^{63}]$  to a range of  $(-\pi/4, \pi/4)$  by subtracting integer multiples of  $\pi/2$  from the input operand.  $\pi/2$  is represented with up to about 256 bits depending on how much precision is required. The multiple precision arithmetic made handling such a precise value of  $\pi$  straight forward and efficient."

I don't see anything new here. What they have done is to use an approximation to  $\pi/2$  with a large number of significant bits up to a maximum of 256 bits.

The Saturn processor based HP machines use a 31 decimal digit range reduction constant. Since these return 12 digit results, the largest input argument to the SIN function for which we ought to expect correct 12 digit results is about  $10^{(31-12)}$ . On my HP50,  $\text{SIN}(1\text{E}20)$  (in radian mode, of course) returns a result that is correct to 12 digits.

The K5 SIN function presumably can return a double precision result (53 bit significand) to the user. If a 256 bit range reduction constant is used, then the SIN function with input arguments as large as  $2^{(256-53)} = 2^{203}$  (about  $1.286\text{E}61$ ) should return full accuracy on the K5. It would be interesting to see how the K5 SIN function performs when given a substantially larger argument, say  $1\text{E}90$ .

This paper was published in 1995, so when Joe Darcy says "The fix for this problem was figured out quite a long time ago." apparently he doesn't realize that the "fix" (as described in this paper anyway) was figured out even longer before 1995. Maybe he meant to refer to some other paper describing a truly new technique.

He said "Since the period of sin/cos is pi and pi is transcendental, this amounts to having to compute a remainder from the division by a transcendental number, which is non-obvious. A few years after the x87 was designed, people figured out how to do this division as if by an exact value of pi."

Non-obvious to whom? Certain other people figured it out no later than the early 80's (actually, I'm sure it was done well before that). Maybe he should have used HP calculators. The HP71 did this sort of thing (extended precision range reduction constant) in 1983.

I haven't obtained the ACM SIGNUM paper, but the abstract doesn't suggest that anything other than "reduction by division" (with a large range reduction constant) is being done. Multiple precision division is required, of course, and maybe the mechanics of doing that is the substance of this paper.

Were Payne and Hanek really the first to describe how to do it correctly? I wonder.

### **Re: Trigonometrics for Really Big Input**

*Message #14 Posted by [Gunnar Degnbol](#) on 1 Mar 2007, 2:19 p.m.,  
in response to message #13 by Rodger Rosenbaum*

Yes, the K5 paper disappointed me too. The method described by Payne and Hanek is much more interesting, and I believe this is what Hugh Steers has implemented in the BCD20 library.

The idea is that instead of taking the remainder of division by  $2\pi$ , you multiply by  $1/2\pi$ , take the fractional part and multiply that by  $2\pi$ . Since only the fractional part is used, any of the digits in the constant  $1/2\pi$  that only contributes to the integer part can be ignored. So, to compute the remainder of  $1E500$  divided by  $2\pi$ , you can ignore the first 500 decimals of  $1/2\pi$ , and it is possible to do the calculation with only a little more precision than the required result, instead of 500+ digit precision.

So the calculation can be done in a reasonable time for even the largest values, costing only the storage space for all the needed digits of  $1/2\pi$ .

### **Re: Trigonometrics for Really Big Input**

*Message #15 Posted by [Eric Smith](#) on 2 Mar 2007, 6:04 p.m.,  
in response to message #13 by Rodger Rosenbaum*

[Elementary Functions: Algorithms and Implementation](#) by Jean-Michel Muller, 2nd edition (October 2005) gives multiple algorithms for correct argument reduction for the trigonometric functions, as well as methods for producing correctly rounded results of those functions. I've found it to be a very useful book.

### **Re: Trigonometrics for Really Big Input**

*Message #16 Posted by [Karl Schneider](#) on 25 Feb 2007, 7:32 p.m.,  
in response to message #4 by Eric Smith*

Hi, Eric --

Quote:

---

A good case can be made that any value between -1.0 and 1.0 is the correct result for  $\sin(1e50)$ .

---

*(NOTE: Edited for better phrasing, based on comments from Eric Smith)*

"Correct" using an argument based upon significant digits, but then the result returned would be absolutely meaningless.

However, calculators treat input values as exact, and then generally return the best possible result. With a modern calculator, the result returned for  $\sin(1E+50)$  degrees or grads will be exactly correct. (Radians is subject to roundoff error in the internal MOD, as pointed out previously.) Calculations for cases like these are not very practical, but precise results are possible when an input value can be represented exactly within 12 significant digits.

In a similar vein to what Les posted, it would not be unreasonable for a modern high-end calculator to restrict valid real-valued arguments for trig functions to  $\pm 999,999,999,999.00$ . This is more than adequate for practicality, and would help to ensure accurate, meaningful results in any angular mode.

If the user really wants to know what the sine of  $2.456 \times 10^{23}$  degrees is, the user can do  $\text{MOD}(2.456 \times 10^{23}, 360)$  first, then take the sine.

In fact, there is already a long-standing precedent for such a restriction on HP calculators. Since both input arguments to combination or permutation must be non-negative integers, these functions restrict the two inputs to values verifiable as such -- not exceeding 9,999,999,999 (pre-Saturn) or 999,999,999,999 (Saturn). Trigonometric arguments, of course, need not be integers, but the same principle of exactitude perhaps ought to apply.

-- KS

*Edited: 26 Feb 2007, 12:14 a.m. after one or more responses were posted*

## **Re: Trigonometrics for Really Big Input**

Message #17 Posted by **Eric Smith** on 25 Feb 2007, 9:40 p.m.,  
in response to message #16 by Karl Schneider

All calculations performed by the calculator use a finite (and small) number of significant digits. The calculator doesn't "assume" that when you enter 1E50, that it is exact. It just performs operations based on the first ten (or twelve, or whatever) digits being a one followed by zeros. The only assumption it makes is that the first truncated digit doesn't cause the last digit present to be rounded to a different value.

Anyhow, unless you can cite an example of a physical value on the order of 1E50 known to have an exact value to 51 places, I'll stand by my assertion that any value between -1.0 and 1.0 is the correct result.

Quote:

---

but then the result returned would be absolutely meaningless.

---

Yes. That's the point. That's why many IEEE floating point implementations will return a NaN rather than a numeric value.

### **Edits for phrasing (previous post)**

*Message #18 Posted by [Karl Schneider](#) on 26 Feb 2007, 12:12 a.m.,  
in response to message #17 by Eric Smith*

Eric --

You're right; there was some poor phrasing in my previous post. Calculators don't really think to "assume". I edited my previous post and added some new material.

in response to message #1 by John Garza

Very interested. How do you work it?

### Re: HP67 Black Box (NNNs, etc.)

Message #3 Posted by [John Garza](#) on 24 Feb 2007, 12:16 p.m.,  
in response to message #2 by Geir Isene

Basically, there are sections of memory in the HP67 that cannot be accessed unless under certain conditions. You may have also noticed the calculator has limited alpha capability (Crd, Error, etc.). These characters can be assembled by the user to make strings of psuedo-alphanumerics. These are called Non-Normalized Numbers (NNNs for short). Much of the work done researching the HP67 NNNs later evolved into Synthetic Programming on the HP41C. It uses the old trick of moving the program pointer to the data area - so then you can "program" new data.

Anyone familiar with the TI-59 remembers how it can repartition program space vs. data registers. Same principle, the TI-59 just made it easier. I recall writing code on the 59 that would literally reprogram itself by storing data in registers, then repartitioning that data to be program lines and then executing them. But that's a tale for another group.

This device has 5 parts:

1. A plug that fits the power connector of the HP67
2. A black Mode Select button
3. A red Crash Recovery button
4. A coarse tuning knob (upper)
5. A fine tuning knob (lower)

To operate, you insert the plug in the HP67, switch the HP67 ON and in W/PRGM mode, and start hitting the Mode Select (black) button while tweaking the knobs. You're looking for a display of (000 84) or (99x

84). depending on which display you get, you can then proceed to entering keystrokes that you have devised to display the proper pseudo-alpha string (sometimes called a Word/Phrase/Graphic).

The box must be tuned to each HP67 and requires quite a bit of finesse and patience.

Although it's meant for use with the HP67 calculator, the NNNs produced can be written to a magnetic card and then displayed on an HP97. However, certain NNNs may burn out the HP97 print head when printed! So care must be taken.

Most of the original work in NNNs was done by Lou Cargile and others of the PPC club back in the 70's.

-John

in response to message #8 by Geir Isene*

Schematics can be found in 65 Notes, Volume 4 Number 5 (June 1977). Schematics, mechanical plans, a parts list, and operating instructions can be found in PPC Journal, Volume 5 Number 9 (November 1978).

Yes, but the one for sale is vintage. I'd expect a recently built one to go for about \$50. Sorta reminds me of the fellow making new Altairs and selling them for 80% the cost of a genuine one. And he wondered why they didn't sell...

I was thinking of making some more Black Boxes too if my original one sells well. I'm looking no so much at the highest bid, but the number of watchers/bidders - (I broke 20 watchers the first day). That tells me people are interested in it. I wouldn't mind seeing a mini-revival in the HP tinkering that I enjoyed so much! Some helpful hints if you're going to make your own:

1) Use knobs/case with markings - it would help a great deal to know the "settings" 2) Use a case small enough that it fits your palm nicely. 3) Swap out the 10 Ohm fine tuning pot for a 20 Ohm with a 20 Ohm fixed in parallel - it's easier to tune.

If you're REALLY technically inclined and don't mind soldering your main logic board; try a phase 1 interrupt switch (V5N1P16). I have a 67 with one of these. It's a tiny glass reed switch just under the case on the right side. Just pass a magnet over the spot, and voila!

And needless to say, you DON'T keep the magnet in your card wallet.

**Books for HP 71**

Message #1 Posted by [PeterP](#) on 24 Feb 2007, 1:05 a.m.

Hi,

I recently decided to follow the advise from one of the esteemed and regular posters here and acquired an HP 71 and now I'd like to learn how to program it. (the only other HP I own and know a little bit how to use is the 41)

From searching the forum archives it seems that there are two books that would be tremendously helpful in this regard:

1) HP-71 BASIC Made Easy by Joseph K. Horn 2) The Basic HP-71 by Richard Harvey

I have posted in the 'ad' section my interested to buy those books, yet with no success so far. So now I am wondering if there might be someone in our community who would be willing to *lend* me one/both of those books for say 2 weeks(tight) or 4 weeks (generous). I'd naturally pay all shipping charges and also be open to discussing some kind of security the owner would like in case he/she feels the need.

It would be most appreciated if one of you can be so kind and help me out, I hear those two books are most informative and enjoable to read.

Thanks so much for you kind consideration

Cheers

Peter

So your 71 didn't come with the manuals? The HP manuals are by far the best I've ever seen. You just start at the beginning, and knowledge is layered on knowledge, until you get to the end and feel like you know the machine, without ever having gotten to "the hard part." You can get them (plus the various volumes of the internal design specifications, manuals for the various modules, and a lot more) on the CDs from this website.

Message #3 Posted by [Howard Owen](#) on 24 Feb 2007, 9:58 p.m.,  
in response to message #2 by Garth Wilson

The HP manuals from that era are excellent; all hail the ancient HP.

What's missing for the 71 in the public corpus (i.e, on the Museum DVD) are nice "friendly" docs beyond the manuals. The 71 came out in an era when consumers were getting their first ever opportunities to buy computers. BASIC was supposed to be a *beginner's* language. In the US, the Apple II, Commodore 64, Tandy CoCo and others all had "Introduction to BASIC" books available. It looks like the referenced titles may have been just such books for the 71.

I don't think it's unreasonable for someone to ask for access to that on this board. We've all painstakingly garnered our knowledge over the years from lots of sources. I know I can attribute most of my knowledge to hugely generous people who encouraged and guided my efforts over the years. I've tried to pass some of that on out of gratitude to those folks.

I've also known users who wouldn't take any action on their own behalf, preferring instead to ask question after question, each revealing that the last answer hadn't been acted on in the interim. I tend to turn people like that away with advice to read the friendly manual. But I *never* assume a newbie is in that category until he or she has been around a while. There truly are no stupid questions, unless you count those that get repeated by users of the second kind above. But the first couple of times you hear them, you can't tell the two types apart.

Food for thought,  
Howard

Howard,

I think you took my "So your 71 didn't come with the manuals?" comment to be sarcastic. I apologize, as I didn't mean it that way. I hate it when manuals get lost or tossed instead of kept with the equipment, and then someone like the OP does not get the benefit of those good manuals that should have been sent right along with the computer. Unfortunately it's all too common. He may also have gotten just the reference manual and not the owner's manual, and not realized there *even was* an owner's manual. That's not his fault of course. Either way, I wanted him to know the manuals are available on the CDs, so he's not stuck.

Garth

The books you refer to are quite rare. I have seen the Horn book on eBay a couple of times in the last two

years.

But Joe Horn is still with us. He attends the HHC meetings regularly. His [hobby page](#) has a section for the 71B, but alas, no reference to the book you seek. You may be able to contact him via that website, however.

Regards,  
Howard

(Changed "HPCC" to "HHC" above. Just got my newsletter, and the acronyms got scrambled. 8)

*Message #7 Posted by [PeterP](#) on 25 Feb 2007, 1:30 a.m.,  
in response to message #6 by Howard Owen*

Thanks a lot guys, I will get the manual and owners book from Dave's wonderful DVD and I also sent an email to Joe Horn - thanks for the link to his webpage.

When I re-bought an 41CX a couple years ago, I also went out and tried to locate and buy all the books that have been written about this wonderful machine. From Wlodek's Red Bible to the Wickes and Jarett books and down to Dodin's book on Machine coding. I also got from Dave's, TOS's and Jake's DVD and painfully printed out and sorted all PPC, HHPC, CHUU etc articles and sorted them into math, tools, games, synthetic and machine coding. I just love reading and learning about those machines as much as possible - even got myself Meinderts MLDL and a HEPAX (that was my luckiest buy ever, what a fantastic module that one is) and learned a bit of machine coding. Not that my brain will ever allow me to play in the ranks of the grandmasters here on the forum but I simply enjoy the process of learning and getting better a little bit every day.

So my interest in the those books is genuine and they will (hopefully the right tense) be read and carefully followed through page by step (I did all exercises from Wlodek in the Red Bible, although I failed on a couple).

Anyway, I will start with printing out the manuals and follow them, and maybe by the time I am through with them, somehow there might be a way for me to learn from those two books as well. I have also recovered from the HHPC Datafile most articles about the 71, either from Jake's DVD or from Valentin's webpage (thanks for that Valentin). After the manual I should be in much better shape to understand them ;-)

Thanks again and please let me know of any other advice you can offer to me in learning this new machine.

Cheers

Peter

in response to message #1 by Don Shepherd

It works on both the HP-200LX and HP-17BII. It seems there is (or there was) a problem with L() and G() on the HP-17BII+ :

Message #3 Posted by [Don Shepherd](#) on 24 Feb 2007, 10:59 a.m.,  
in response to message #2 by Gerson W. Barbosa

Thanks Gerson.

Yes, I had noticed some of those threads before, and I guess I just hoped that the problems were fixed by now. I should have known better. You know, the beauty of computers and programming is (supposed to be) that they work the same way every time, with consistency, and according to their documentation. In my 33 years of programming on IBM, Univac, and DEC mainframes, that has been true. The only two cases where it was not true was with HP calculators; the original 12cp with 400 program steps that you could use only if you had no GTO's, and now the 17bii+. When a hobby is just frustrating, it's not a hobby anymore.

I am returning to my 16c and my Martin guitar.

When HP calculators become KinHPo calculators, sadly the attention to detail and quality simply

evaporated.

Buying a real 17bii is your only real option.

That's quite true!

Quote:

The only two cases where it was not true was with HP calculators; the original 12cp with 400 program steps that you could use only if you had no GTO's, and now the 17bii+.

At least that 12CP bug has been solved. If you want another example of lack of consistency between the 200LX and the HP-17BII solvers, consider this equation:

$$\text{COS} = 0 * \text{L}(X : (-1)^{\text{L}(Q : \text{IP}(\text{ABS}(\text{L}(X : \text{MOD}((90 - X) : 360))) / 90)) + \text{FACT}(\text{G}(Q)) * ((180 * (\text{G}(Q) - \text{IP}(\text{G}(Q) / 2))) - X)) + \text{L}(Y : \text{SIGMA}(N : 0 : 5 : 1 : (-1)^N * (X * \text{PI} / 540)^{(2 * N + 1)} / \text{FACT}(2 * N + 1))) * (3 - 4 * \text{SQ}(\text{G}(Y)))$$

The HP-200LX has no trouble solving for X, given COS. However, the HP-17BII returns the complement of the expected answer. It started working only when  $+0 * \text{L}(X : 90 - X)$  was appended to the equation. This kind of thing is really frustrating.

Regards,

Gerson.

### EE Calculations, some not obvious

Message #1 Posted by [E Samuel Levy](#) on 23 Feb 2007, 11:25 p.m.

HEWLETT PACKARD CALCULATIONS I used HP RPN pocket calculators for electronic solutions, and I wanted to find a fast way to solve common problems using as few keystrokes as possible, and getting maximum information during the process. This method uses the repeating t register. Formulas now in use were derived for pen and pencil mathematics, totally outmoded by the calculator. This is the keystroke procedure for quick solutions. Resistive Dividers; when calculating from known resistors, enter the lower resistor repeatedly. Key in the top resistor, and add, the result is the total resistance, then divide, the result is the fractional output voltage of the divider. Then multiply and subtract to see the output resistance from the divider tap. To design such a network, key in the output resistance desired, and enter repeatedly. Key in the division fraction, and divide to see the upper resistance. Divide again to restore the fraction, key 1, subtract, change sign, divide, and see the lower resistor. The relation between the upper resistor and the output resistance is the fraction of the divider. 1 minus the fraction is the relation between the output resistance and the lower resistance. Given the fraction and either resistor, the other value may be found. I have used this method to find the added end resistors for setting particular potentiometer control ranges. The difference between the two potentiometer fractions desired at the potentiometer ends, relates the potentiometer resistance to the total resistance. Thus a particular value of potentiometer may be used to obtain the desired range of fractions. EXAMPLE: It was desired to use a 1K potentiometer to adjust a power supply to vary between 24 and 16 volts. The IC regulated at 4.75 volts from the potentiometer. It is desired to calculate the end resistors needed to set the correct range.  $4.75/24 = 0.2$  store 1.  $4.75/16 = 0.3$  store 2. Recall 1, subtract, see 0.1, key 1000 swap X&Y, divide, see 10105, the total resistance. Enter several times. Recall 1, multiply, see 2000, the resistance when the pot is at the lower extreme, add 2000 ohms to the lower end of the pot. Cl X, recall 2, multiply, see 3000, this is the sum of the pot resistance and the pot lower end resistor. The upper end resistor must be 10205 minus 3000 = 7105. Some compromise values may be used. Transistor bias; I was solving for a transistor bias divider, and wondered how to account for the base current drop in the divider. I thought to divide the divider output resistance by Beta and add it to the actual emitter resistor. To do this procedure, solve the bias divider resistors, storing the divider fraction. With R0 in the register key Beta, divide, and see the emitter resistor equivalent to be added. Key the actual emitter resistor and add, see the total emitter resistor, accounting for the bias source drop. Key the source voltage; recall the fraction, multiply and see the divider voltage. Key 0.7, subtract, see the emitter voltage. Interchange X&Y and divide, to see the emitter current: check by multiplying by the collector resistor, to see the collector resistor drop.

Summing network; The resistive divider can be extended to a more general case. I needed to design a telemetry output that combined several signals, to a common output, having a 10 K output resistance. The signal of interest was a +/- 12 volt VCO control voltage. The telemetry output was to be 0-5 volts, using the range 0.5 to 4.5 volts normally. The centering voltage was 2.5 volts from a regulated 12 volts supply. A third resistor to ground gave the desired output resistance. I found a general solution. Each resistor is determined by the fraction of its input voltage contributed to the output sum, thus the telemetry signal was to output 1/6th of its signal. The resistor was then 10K times 6 or 60K. The centering voltage was 2.5 volts derived from +12, a ratio of 4.8 times, 48K. The third resistor was found by subtracting the other two fractions from 1:  $1 - 1/6 - 1/4.8$ , a fraction of 0.625 and dividing the output resistance to get a resistance of 16K. Some compromise values were used, which proved satisfactory. RC frequency corners; the process may be simplified as  $2\pi fRC=1$ . The known values are multiplied, and the product inverted to give the missing element. For constant frequency solutions enter  $2\pi f$  repeatedly. Tuned circuits; here intermediate results in the solution give other useful information. Key in L, then C, and store C in a register, divide and take the square root; this is the impedance of the resonant elements. Recall the capacitance value and multiply, then multiply by  $2\pi$  and invert to see the frequency in Hertz. This is the frequency corner formula using R0 as the R value. Q if

known may be used to compute the resonant impedance, or the Q may be found by dividing the parallel circuit damping resistance by the impedance, or the impedance by the series circuit resistance. The square root of L/C is also the output resistance of a simple LC filter, such as a power supply, and can be used to estimate transient voltages from current changes. Resonant values; When using a constant frequency, resonant values may be calculated quickly. Key in  $2\pi f$  and enter it repeatedly. Then key in either L or C , multiply twice, and invert to see the other resonant circuit element. When  $2\pi fL$  is shown, it is the reactance of the circuit values. This procedure gives quick trials of various circuit values, give impedance values for filter and by-pass elements, and value choices for a given Q. Ohms law; this may seem simple, but can be used as a rapid verification of dissipation and the voltage and current relation. Remember the little circles of voltage E divided by the IR product. Key in the voltage repeatedly, and divide by either I or R to see the other value, as in  $E=IR$ . The power in a resistor can be found by keying in the resistor and dividing to get I, then multiplying to get EI. It can be used to solve  $W=EI$ , by keying in power repeatedly, and dividing to get either E or I. These methods allow such rapid solutions; they will increase your ability to investigate possibilities in your designs. Practice will allow fast and sure answers to a wide range of problems. Familiarity will allow you to extend these methods to your particular problems. I trained one tech to calculate time payments faster than they could be found in a book. E. Samuel Levy, 754 Temple St. San Diego 92106, 619-223-6292 designnut@cox.net

### 33s: parentheses within program

Message #1 Posted by [Adam Price](#) on 23 Feb 2007, 11:20 p.m.

I am new to the 33s - just got it yesterday so I will be comfortable with it by the time my FE exam rolls around next year. I imagine it would be handy to be able to do both linear systems and vector math on the FE, so I set right in to keying in the routines given in the manual. Besides having to change some conflicting labels between the two routines, it went well - until the dot product loop. The program doesn't work and the checksum is wrong. I double checked everything and it looks right, so I stepped through. It gives me an "Invalid equation" error on lines D0021 and D0026 - the two parentheses. Here's what it looks like in the book:

```
D0018 RCL W
D0019 y,x -> Q,r [yes, that's a theta]
D0020 STO E
D0021 (
D0022 RCL D
D0023 RCL/ R [that's a division sign :- with the line slid left]
D0024 / [again, the division sign]
D0025 RCL E
D0026 )
D0027 ACOS
```

....etc The only way I could find to get the parentheses to appear was to enter them with purplearrow-EQN purplearrow-( That makes the eqn annunciator come up whenever I scroll past those two lines. Perhaps that is not the right way to enter parens? I tried just purplearrow-( but that didn't do anything.

Any suggestions?

### Re: 33s: parentheses within program

Message #2 Posted by [Vieira, L. C. \(Brazil\)](#) on 24 Feb 2007, 8:34 a.m.,  
in response to message #1 by Adam Price

Hi;

would that be possible to scan the book's listing and allow us to have a look at it?

I do not use the HP33S in Algebraic mode, and I do not have mine in hands right now, so I cannot tell about how does it handle parenthesis in RPN mode.

So, my suggestion is: should you try algebraic mode? At least I am considering the fact that you are using it in RPN mode, the default one.

Best regards.

Luiz (Brazil)

### Re: 33s: parentheses within program

Message #3 Posted by [Les Wright](#) on 24 Feb 2007, 8:57 a.m.,  
in response to message #2 by Vieira, L. C. (Brazil)

for those of us with the manual a page number is good too.

Message #4 Posted by [Adam Price](#) on 24 Feb 2007, 9:57 a.m.,  
in response to message #2 by Vieira, L. C. (Brazil)

Quote:

should you try algebraic mode?

Ah. Now that you ask I see that that is written at the top of the page. That seems to fix it - mostly. Now I get the same results as the sample routines given in the book. My checksum is still off, though. Hopefully that is a mistake in the given checksum?

I don't have a scanner, but this section of the program in question is on page 15-6 of the manual, which can be found online at <http://h10032.www1.hp.com/ctg/Manual/c00059731.pdf> If someone else could key in D0001-D0030 and confirm the checksum, that would be great.

Thanks for the help, everyone - This is a fun calculator - I know it can't do as much as my 48gx, but since I have the manual for this one, I am already learning to use a much higher portion of its capabilities. (to me, the 48g is like a black box, so to speak)

**Re: 33s: parentheses within program**

Message #5 Posted by [Les Wright](#) on 24 Feb 2007, 10:02 a.m.,  
in response to message #4 by Adam Price

If you had to relabel things to avoid label duplication, the checksum would change, since the program isn't an exact duplicate of the listing that generated the original checksum.

**Re: 33s: parentheses within program**

Message #6 Posted by [Adam Price](#) on 24 Feb 2007, 1:05 p.m.,  
in response to message #5 by Les Wright

Relabeling - I relabeled everything in the linearsystem routine, once I got it working, then typed in this one exactly as it reads in the book.

Thanks for the link on the other!

I retract that claim. I thought it was working, but it wasn't. To get it to work, I had to go back into the program and re-enter the parentheses lines while in ALG mode - which was much easier than it was in rpn mode. I assume that my other entry technique must have left some invisible whitespace or something that was causing problems.

Now it is /really/ working. Just wish I didn't have to switch to ALG mode to use it.

Thanks again, everyone,

Adam

### **Re: 33s: parentheses within program (LONG, but COOL alternative)**

*Message #9 Posted by [ECL](#) on 24 Feb 2007, 8:28 p.m.,  
in response to message #8 by Adam Price*

Adam,

I definitely echo your frustrations with the lack of matrix support on the 33s.

I have successfully used the Gauss-Seidel method on my 33s. It is a numeric-iterative approach to solving linear systems. Using it does, however, require you to consider a few characteristics about the system that you wish to solve [you have to think :)]

You must consider the dominant diagonal, the initial value (usually try setting all to zero), among a few others. Don't try to "get it" the first time you read this post, just read through it, and then re-read it (perhaps after googling Gauss-Seidel).

Now, here is one insight...on systems that are appropriate (ie. diagonally dominant, etc) in other words, academic problems that are designed to be solved, you can usually expect a convergence on the correct solution vector.

Anyway, the approach is essentially like this:

1. Take a system, say 4 variables, and algebraically solve each one for one of the variables. So, you solve the first equation for X, the second one for Y, etc.
2. Now, key these in as a 33s keystroke program.

Actually, let me just give a pseudo-code to illustrate it:

say we have the following:

$$Ax + By + Cz = D$$

$$Ex + Fy + Gz = H$$

$$Ix + Jy + Kz = L$$

here's the pseudocode:

1. store your coefficients

INPUT A, INPUT B, INPUT C, etc..

2. Solve the first eqn for X:

RCL D, RCL Z, RCL \*C, -, RCL B, RCL \*y, -, RCL /A, STO X

3. Solve the second eqn for Y:

RCL H, RCL Z, RCL \*G, -, RCL E, RCL \*X, -, RCL/F, STO Y (Note that this equation uses the approximation for X that you just obtained previously...likewise, Step 4 will use both that X and also the Y that you are currently solving)

4. Solve the third eqn for Z, following the above approach.

So the idea is that each subsequent equation in the system gets the most current approximation. If you enter a good system, you can expect convergence. This may at times mean reordering your system (like Gauss-Jordan with pivoting). This essentially means that you flip columns and rows (before entering the coefficients) so that you have a diagonally-dominant system.

At this point you want to consider looping through this again, since you will get closer to the actual answer each time you iterate. How to decide when you are happy with the result? Well, consider putting in a check, like compare the new X with the previous X, and set a tolerance like  $X_0 - X < 0.01$ . This will let the calculator terminate the loop when it begins to split hairs.

As you may realize, there's remains some coding on your part for this to run on your 33s. If it had the USB support like the 50g I'd have posted a link for you. But I'm not up to typing in the whole routine (plus I assume you'd have more fun figuring it out).

The nice thing is that I believe I can run this using at MOST two labels (meaning you don't eat up the volume of registers as the HP code listing does). This leaves more labels for you to store other stuff. You can do this for as large a system as you can squeeze variables. There are tricks like freeing up variables once you've used them to permit a larger system, or even having the code prompt the user for stack entries on the fly to let you run a huge system.

This is why I love machines like the 33s...they really force you to get creative! But, alas as engineers we need problems solved, and must often resort to computers for things like finite element methods. Still, its never a crime to stretch your brains as a student (when many problems are solvable with limited resources) or simply to "pull it off".

Have fun. (To all the detractors of my earlier post regarding the 42s, hope this message warms your hearts and makes you happy that I'm a contributor)

ECL

PS. I'll now "HAVE" to type my aforementioned code out and submit it to D.H. so it can join the program listings on this site.

## Re: 33s: parentheses within program

Message #10 Posted by *bill platt* on 24 Feb 2007, 9:13 p.m.,  
in response to message #8 by Adam Price

One of the "quirks" (well, actually it is not a quirk, it is more a consistency thing) on the 33s is that

ALG features (such as the parenthesis) only function while in ALG mode (of course they also function in equation mode even if RPN is active).

When editing programs, you do need to be aware of what mode you are in while editing. Of course you also need the machine to be in the appropriate mode before running the program.

Note that setting the mode is a \*programmable\* function, and so you can design programs that first set the mode, and then operate in that mode. But you still have to be 'manually aware' of your mode setting while you are 'manually' editing a program.

I HTH.

regards,

Bill

### Is there a command to total all matrix elements?

Message #1 Posted by [Reuben](#) on 23 Feb 2007, 8:54 p.m.

I've got a 5x6 matrix and I need to add all the elements together. I didn't want to have to decompile the matrix and perform '+' 29 times though. I've looked in the matrix section in the user guide a few times, and can't find anything that will do this.

Thanks in advance! --Reuben

### Re: Is there a command to total all matrix elements?

Message #2 Posted by [allen](#) on 23 Feb 2007, 11:24 p.m.,  
in response to message #1 by Reuben

(Revised from earlier post)

You could just take the dot product with unity matrix:

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix} \text{ dot } \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix} = 45$$

which is  $1+2+3+4+5+6+7+8+9=45$

Edited: 24 Feb 2007, 10:19 a.m.

### Re: Is there a command to total all matrix elements?

Message #3 Posted by [John Keith](#) on 25 Feb 2007, 7:49 p.m.,  
in response to message #2 by allen

A little longer but faster:

```
OBJ-> OBJ-> DROP * ->LIST \Sigma\LIST
```

John

### Re: Is there a command to total all matrix elements?

Message #4 Posted by [allen](#) on 26 Feb 2007, 8:25 p.m.,  
in response to message #3 by John Keith

John, Right you are, your method is at least twice as fast as the method I posted above. My original response was much closer to your objobj method, but I revised it because it did not address the question.

Reuben's question had "opportunities for learning" in programming (trying to sum a list by +,+,+,+,+,+,+) and in mathematics (not knowing that the DOT product already does sum the elements

in a vector/matrix). So I thought it more fitting to address only the mathematics issue, hoping that he would take some initiative and figure out the rest. (e.g. a simpler, faster, better... way)

### Modified HP-28S seen on eBay

Message #1 Posted by [Ken Shaw](#) on 23 Feb 2007, 7:00 p.m.

Here is an HP-28S that just sold on eBay.

[Item #130080704876](#)

It appears to have a 28-pin connector where the display should be and came with a matching ribbon cable!

Anybody have a clue what this might be used for?

- KDS

### Re: Modified HP-28S seen on eBay

Message #2 Posted by [Bill Wiese](#) on 23 Feb 2007, 11:59 p.m.,  
in response to message #1 by Ken Shaw

Possibly some kind of overhead display conversion?

Another (perhaps a tad larger) matrix LCD without backing and see-through could be placed on a transparency projector for classroom display...

Bill Wiese  
San Jose CA

### **I need help: string as variable name on 48G? How?**

Message #1 Posted by [Reuben](#) on 23 Feb 2007, 12:57 p.m.

I'm working on calorie-counting and meal time tracking capabilities on my 48G, and I've hit a wall:

I need to store a string containing the nutritional data in a variable named by the time of day. I've figured out how to extract the time out of the TSTR cmdnd, but it returns a string, which I cannot use as a variable name. Is there any way I can turn this string into a valid variable name? Any Ideas?

I can post code if anyone is interested, but it's pretty laughable, I'd bet.

### **Re: I need help: string as variable name on 48G? How?**

Message #2 Posted by [Ivan Nejgebauer](#) on 23 Feb 2007, 3:13 p.m.,  
in response to message #1 by [Reuben](#)

Quote:

I've figured out how to extract the time out of the TSTR cmdnd, but it returns a string, which I cannot use as a variable name. Is there any way I can turn this string into a valid variable name?

With the string in level 1, the following snippet

```
"" DUP ROT + SWAP + OBJ\ ->
```

will produce the appropriately named variable (algebraic object.)

```
OBJ\ ->
```

alone would also work, but only if you don't already have such variable in the current directory -- in that case you'd get its contents.

i.

### **Re: I need help: string as variable name on 48G? How?**

Message #3 Posted by [Reuben](#) on 23 Feb 2007, 8:52 p.m.,  
in response to message #2 by [Ivan Nejgebauer](#)

Well, that is very clever. Thanks very much!

Now I have another question though... Is there a single command that can add up all the values in a matrix and return 1 result?

Thanks, --Reuben

### **Re: I need help: string as variable name on 48G? How?**

*Message #4 Posted by **James M. Prange (Michigan)** on 23 Feb 2007, 10:16 p.m.,  
in response to message #2 by Ivan Nejgebauer*

Actually, with the string in level 1, the code can be reduced to:

```
" " SWAP + OBJ\->
```

This works because the compiler treats 'string' the same as 'string'.

STR\-> could be substituted for OBJ\-> in this case, and should be very slightly faster.

There's also a SysRPL command \$>ID that converts a string object to a global name object, and this command could be invoked with a SYSEVAL command, but I don't, offhand, know the entry point address.

Regards,  
James

### Watch out for Alexandra Carter (eBay seller)

Message #1 Posted by [Vassilis Prevelakis](#) on 23 Feb 2007, 8:04 a.m.

Anybody done business with eBay seller Alexandra Carter (alexandracarter)?

She used a very neat trick on me.

I bought an HP 5036A Microprocessor Lab 8-Bit Computer from her (eBay 160080545681) and paid for it with a money order which was received on Feb. 3, 2006 (USPS tracking number 0103 8555 7499 5332 2386).

She then claimed to have sent the HP 5036A via USPS but has not produced a tracking number despite the fact that I specifically had asked for one.

Anyway, when I pressured her about the item, **she filled a non-payment dispute against me, to prevent me from posting negative feedback on her.**

This is despite the fact that on Feb 9, she sent me an eBay message (sitting in my eBay messages folder) confirming receipt of payment.

So **watch out for Alexandra Carter** despite her 98.3% feedback rating.

\*\*vp

### Re: Watch out for Alexandra Carter (eBay seller)

Message #2 Posted by [Ron](#) on 23 Feb 2007, 8:57 a.m.,  
in response to message #1 by [Vassilis Prevelakis](#)

My rule of thumb for people with high feedback, is to be careful if they have less than 99.5%. It seems to me that, you should be able to deal with 200 people, without offending/cheating over 1, and I think this is being lenient. Someone with low feedback can get knocked way down by one or two negs, but an established seller should have any systematic problems resolved. 98.6% tells me that this person consistently (over 7000 feedback) has trouble dealing with 1.4% of her customers.

Thanks for alerting us to the trick though. It could come in handy sometime. ;^)

*Edited: 23 Feb 2007, 8:59 a.m.*

### Feedback...

Message #3 Posted by [Gene](#) on 23 Feb 2007, 9:40 a.m.,  
in response to message #2 by [Ron](#)

Feedback is a very difficult thing to evaluate consistently.

Take me for instance. I have 2 negative feedbacks over 10 years of using ebay.

One was from an idiot who posted negative feedback when an email he sent me bounced. When I asked why he didn't at least try two emails, he said and this is a quote "I figured the negative feedback would get your attention".

The other was from a strange case involving a very nice Italian man who was buying something from me and it involved neither of us getting emails from the other. The emails were getting lost in cyberspace somehow on both our accounts. Very weird. So, after a month of not hearing from him, I hit him with a negative feedback. The NEXT DAY his payment arrived. So I certainly regretted my feedback. :( I boxed up his item, sent it off and \*emailed\* him that it was on the way. Of course, from HIS perspective, my feedback claiming to have never received payment looked like I was trying to rip HIM off. So, he posted negative feedback on me.

Hence my 99.7% positive feedback. One idiot and one bizarre circumstance.

Now I know my % is above your cut off level, but it can be difficult to know all the time.

Add to that the increasingly common practice where sellers or buyers leave retaliatory negative feedback anytime it is left on them, and it is easy to understand some of the ways people can get negative feedback.

However, I tend to look through the feedback comments and see if there is any consistent thread...Slow to ship...item not as described...not communicative, etc. before making decisions.

Just my 2 cents and worth that much. :-)

### **Re: Feedback...**

*Message #4 Posted by **Ron** on 23 Feb 2007, 10:08 a.m.,  
in response to message #3 by Gene*

I agree 100%, Gene. I just meant that I am extra careful if the % is not really high on an established seller. I get on my toes to detect tricky wording or missing information, etc... And like you, I read the negs.

I know there are people who just can't wait to say something bad about someone, and will leave a neg for some non-issue. I often check out the neg-leavers, and find out they have 10x as many negs as the seller I'm checking out (presumably because they like to leave negs, and end up getting them in return), which would lead me to discount the neg they left for my seller. And I've noticed that the people with many negs often have lots of transactions with other people with many negs. It's like a little congregation of highly negative people 8^). Oh well - I'm starting to ramble.

### **Re: Feedback...**

*Message #5 Posted by **jbssm** on 23 Feb 2007, 11:24 a.m.,  
in response to message #4 by Ron*

Yup, I completely agree.

I have 2 negatives ... one from a seller the sold me a completely broken PDA (the thing didn't power on and was severely scratched although he described it has "nice condition and working") ... after trying to return it, the guy always refuse stating that the auction said "all sales are final" ... well the auction also said nice condition and working. So I had to leave him negative feedback although I knew he would retaliate ... and he did.

The other one was from a buyer ... I completely described everything that went with the calculator I was selling ... and I sent the unit without batteries since I never said it would take batteries (I mainly

do this because of reducing shipping, batteries were cheap AA). The guy left me negative because I didn't sent the batteries stating that in my auction pictures the unit was tuned ON :S ... so much for idiots in this world.

**Re: Feedback...**

*Message #6 Posted by [bill platt](#) on 23 Feb 2007, 12:22 p.m.,  
in response to message #5 by jbssm*

I think a seller who does not immediately give positive feedback to the buyer once the money clears, is essentially being slightly less than straightforward. As far as I can see, all the buyer owes you is the money.

So I give feedback to a buyer once she pays.

And I will not give any feedback to a seller until he gives me feedback. Unless of course something goes wrong and he doesn't come clean.

**Re: Feedback...**

*Message #7 Posted by [bill platt](#) on 23 Feb 2007, 12:25 p.m.,  
in response to message #5 by jbssm*

They guy who negatived you for the batteries should have had the courtesy to contact you directly first! Jeez, I'm sure if I'd been in that situation (as the seller) I would have simply credited him \$2 for the freakin' batteries.

Some people are so combative.

And so nowadays I think it pays to review the feedback record of your winning bidder, too. Of course sometimes they have zero feedback.

**Re: Batteries**

*Message #8 Posted by [Ron](#) on 23 Feb 2007, 12:34 p.m.,  
in response to message #7 by bill platt*

I would never ship a calc with batteries! I received a very nice CX once, but it wouldn't power up. Turns out a battery had leaked in transit (best I could tell), causing significant corrosion. In fact, the post office discourages (bans?) shipping batteries, as corrosive agents.

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #9 Posted by [Anthony L. Mach](#) on 23 Feb 2007, 12:02 p.m.,  
in response to message #2 by Ron*

Well, try my quick-and-dirty trick:

Ask the seller in advance if you can come and pick up the item (regardless of where you live). If they hit you with a resounding "NO", then you have every right to be suspicious.

Tony

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #10 Posted by [Dia C. Tran](#) on 23 Feb 2007, 4:01 p.m.,  
in response to message #9 by Anthony L. Mach*

I have many ebay sellers refused local pickup and all of these are near me. At one time I bid on one and won but the seller refused to let me pick it up so I didn't pay and he posted a negative feedback on me. However, many people told me that the sellers did have legitimate reasons not to allow local pick up. Security is usually cited as the reason.

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #11 Posted by [Eric Smith](#) on 27 Feb 2007, 4:39 a.m.,  
in response to message #10 by Dia C. Tran*

I can understand sellers not wanting to give out their home address, but I'm perfectly willing to meet them at their place of employment, a local burger joint, or whatever. It irritates me when sellers insist on charging me to ship something less than twenty miles to me. Oh well.

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #12 Posted by [David Smith](#) on 23 Feb 2007, 11:34 a.m.,  
in response to message #1 by Vassilis Prevelakis*

I bought an HP logic analyzer probe from her, paid with a check. Payment cleared a few days later. After several weeks she filed non-payment. I emailed her an image of the cashed check, etc. After two more weeks of hassel, I only got my item after I emailed her copies of the federal mail fraud forms I was preparing.

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #15 Posted by [Patrick R](#) on 23 Feb 2007, 12:22 p.m.,  
in response to message #14 by gilen0*

Couldn't one argue, in this case, that the seller sells an item that no longer belongs to her? So she sells a "stolen" item?

My ebay experience is the following: most problems occur with power-sellers and people who sell an item they are not familiar with. I try to avoid these sellers.

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #16 Posted by [Eric Smith](#) on 23 Feb 2007, 3:26 p.m.,  
in response to message #15 by Patrick R*

She originally listed five of them at the same time, and only one sold. I doubt that she's reselling one that already sold.

I bought one item from her about four years ago, and didn't have any problem with that transaction.

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #17 Posted by [Ron](#) on 23 Feb 2007, 12:28 p.m.,

That's interesting.

**Re: Watch out for Alexandra Carter (eBay seller)**

*Message #18 Posted by [Ruben](#) on 23 Feb 2007, 2:57 p.m.,  
in response to message #1 by Vassilis Prevelakis*

I would begin with the Postal Service. I believe what she is doing constitutes mail fraud. I would also call the police in her area and report it as theft. She had a contract, you paid money, and can prove it, and she is not only holding your item, but trying to sell it again.

Reading feedback, this isn't the first time she's done this, and won't be the last till someone comes down on her for it.

**Re: Watch out for Alexandra Carter (eBay seller)**

Can you really believe someone who overcharges and expects to stay around? It would be something a wiseguy teenager might say to defend something stupid he was doing...

**Re: Watch out for Alexandra Carter (resolved)**

*Message #26 Posted by [Vassilis Prevelakis](#) on 27 Feb 2007, 12:24 a.m.,  
in response to message #1 by Vassilis Prevelakis*

I feel bad for starting this thread, because the machine arrived today. The postage stamp indicated that it had been posted on February 16 (more than ten days ago -- so I was making all this fuss when the machine was already on its way).

Having said that, Ms Carter is really mad. If she had simply given me the date she posted the package instead of filing the non-payment report I wouldn't have blown my top.

Anyway, thanks to everybody for their support and helpful suggestions.

Or Georgia Tech, or maybe some other "Tech" that is not commonly known. It's true that Caltech (California Institute of Technology) and MIT (Massachusetts Institute of Technology) are more prestigious than all the the others.

Quote:

I learned to program my calculator by hacking around in the dark. This made me a better programmer, as I was forced to get creative first, only to learn of commonplace techniques after the fact.

I'm not sure that I'd have patience for that approach. I prefer to learn things the "right way" first, then to explore. This is even more important when doing car repairs -- read the manual first!

It takes a bit of mettle to succeed. If someone can't take a bit of criticism or tolerate light turbulence...well, then do you really want to serve as a beacon to attract more?

I'll amend my comment on hacking around in the dark: Yes, by all means, read what you have at your fingertips...but like many programmers will tell you (I'm an aero engineer, not programmer) is that you need a 'problem' to solve in order to get going in programming. That is to say, you need to try to try/fail/retry/accomplish things rather than lounge in a tome all day.

This is by my own experience, however. I was never handheld through my education, except for during one internship. That one was BORING, because I felt that I wasn't being held accountable. So...a long OT ramble...but what I really intended was to pour the coals on a bit to get 'tech alum' sparked up and into a DIY mode, because that's how I learned (and it worked).

**composition of calculator cases**

Message #1 Posted by [Rob Stratton](#) on 22 Feb 2007, 11:05 p.m.

Does anyone know what type of plastic was used for the cases of older hp calculators, specifically the 42s and the 48G/GX.? Thanks

**Re: composition of calculator cases**

Message #2 Posted by [Eric Smith](#) on 22 Feb 2007, 11:22 p.m.,  
in response to message #1 by Rob Stratton

Traditionally HP used ABS. AFAIK, that's what the 42S and 48G/GX used.

**Re: composition of calculator cases**

Message #3 Posted by [Alan Firth](#) on 22 Feb 2007, 11:29 p.m.,  
in response to message #1 by Rob Stratton

I know you can melt 'em!

**Re: composition of calculator cases**

Message #4 Posted by [Eric Smith](#) on 23 Feb 2007, 1:17 a.m.,  
in response to message #3 by Alan Firth

Just about anything solid will melt, burn, or sublime if you get it hot enough.

**Re: composition of calculator cases**

Message #5 Posted by [Juan J](#) on 23 Feb 2007, 10:01 a.m.,  
in response to message #1 by Rob Stratton

Hello,

HP always used ABS on its calculator, and took pride of it every once in a while. Back in 1978 an article pointed out that "ABS, the same material used in football helmets [...] is used for the calculators' cases..."

ABS does melt. Otherwise, it could not be formed. As with almost all polymers, it will melt if heated to the right temperature. Phase transitions (e.g., solid to liquid) do not involve heat only but pressure as well.

My two cents.

**Re: composition of calculator cases**

Message #6 Posted by [bill platt](#) on 23 Feb 2007, 10:30 a.m.,  
in response to message #5 by Juan J

Hi Juan,

You said, "as with almost all polymers, it will melt if heated to the right temperature."

I think this is a bit misleading, in the sense that "almost all polymers" is meaningless.

Certainly all thermoplastics will melt, but many thermosets will not.

Examples of polymers that will not melt, but rather will decompose:

epoxy  
phenolic  
crosslinked styrenated unsaturated polyester--"boat resin"  
vulcanized rubber  
cross-linked PVC  
teflon (fluoropolymer)

On the subject of HP calculator cases, I damaged the case of a 15-c with acetone--it dissolved it enough to round off all the edges. It behaved as if it were styrene, but I don't know whether ABS may in fact dissolve in acetone, too. ABS is a terpolymer but is not cross-linked, correct? Therefore it could be dissolved or melted.

### **Re: composition of calculator cases**

*Message #7 Posted by **Randy** on 23 Feb 2007, 1:59 p.m.,  
in response to message #6 by bill platt*

Quote:

It behaved as if it were styrene

It's in that family of polymers... ABS = Acrylonitrile Butadiene Styrene

It is used over basic styrenes due to its higher impact strength, especially at lower temperatures. Better stress crack ratings are also a factor.

It is resistant to (most):

- Alkalis
- Acids
- Salts
- Oils and fats

It is **\*NOT\*** resistant to:

- Aromatic hydrocarbons
- Esters
- Ethers
- Ketones

and various chlorinated hydrocarbons (examples):

- Methylene chloride
- Ethylene chloride
- Trichloroethylene

## **Re: composition of calculator cases - Slightly OT**

*Message #8 Posted by **Juan J** on 24 Feb 2007, 9:02 a.m.,*

*in response to message #6 by bill platt*

Hello Bill,

Yes, it is a bit misleading. I was thinking of thermoplastics when I wrote my post.

Thermoset polymers usually crosslink during polymerization, and the final product has a structure usually impervious to chemicals and/or the external environment. Instead of long polymer chains you have crosslinked chains that form a grid. Depending on the monomers you use, the end polymer can be either very tough or very flexible. And when heated, as you noted, they decompose.

About teflon, "decomposing" is not exactly what happens. Teflon is usually sintered (the powder is heated to about the melting point temperature) and when heated above the melting point, it first turns into long fluorocarbon chains that in turn become the monomer at about 900 degrees (I am getting the temperature from memory, and it may be wrong.) The process is interesting enough and has been researched extensively, but that is another story.

ABS is usually a combination of either polyacrylonitrile/polystyrene and polybutadiene or polystyrene/polybutadiene and polyacrylonitrile (again, I am taking this from memory, it has been a long time since my Polymer Science class, and I might be missing something) that yields a uniform terpolymer.

Another two cents, and please excuse my mistakes.

### Re: Valentine's Day MC: A few modest insights, n! digits - part 3, anyone?

Message #1 Posted by [Gerson W. Barbosa](#) on 22 Feb 2007, 6:05 p.m.

Hello Valentin,

I have noticed these two discrepancies between your HP-15C and HP-71B programs, when checking against the HP-200LX:

| N        | HP-15C    | HP-200LX  | HP-71B    |
|----------|-----------|-----------|-----------|
| 44315509 | 319615034 | 319615033 | 319615033 |
| 54336595 | 396700506 | 396700505 | 396700506 |

This suggests the HP-15C fails for N=44315509 and the HP-71B fails for N=54336595.

The 200LX equation is the following:

$$\text{NDF} = \text{INT}(\text{N} * \text{LOG}(\text{N} / \text{EXP}(1)) + \text{LOG}(2 * \text{PI} * \text{N}) / 2 + 1)$$

On the HP-200LX, the second result is 396700505.9999999. It appears to be one of the cases the guard digits are not enough... This should be checked with more digits, though. Apparently, these are the only two discrepancies in the range [1..100,000,000].

Best regards,

Gerson.

### Re: Valentine's Day MC: A few modest insights, n! digits - part 3, anyone?

Message #2 Posted by [Valentin Albillo](#) on 22 Feb 2007, 7:14 p.m.,

in response to message #1 by [Gerson W. Barbosa](#)

Hi, Gerson:

Gerson posted:

*"I have noticed these two discrepancies between your HP-15C and HP-71B programs, when checking against the HP-200LX [...] This suggests the HP-15C fails for N=44315509 and the HP-71B fails for N=54336595 [...] This should be checked with more digits, though."*

Seems to me you're right. Checking with my SHARP PC-1475 produces:

N=54336595

396700505.99999998701

N=44315509

319615034.00000004201

which are absolutely correct to the 20 digits shown. I haven't checked that these are the only cases in the range, but this kind of off-by-one results isn't exactly a surprise since they are to be expected when working with transcendental functions with large inputs/outputs near the maximum significant digit limit of the computing device.

In these cases even two or three internal guard digits just aren't enough and either you restrict the range or else you use a double-precision capable handheld such as the SHARP PC-1475 or the SHARP PC-E500/E500S just like I did to test the anomalous cases above.

Thanks for sharing your interesting findings and

Best regards from V.

### **Malfunction of LCD segments on 41 display**

Message #1 Posted by [Jean-Michel](#) on 22 Feb 2007, 2:50 p.m.

Hi everybody,

some segments of the LCD display of my 41 doesn't light on when the calculator is just turned on, but a few minutes after, they operate correctly, with sometimes another malfunction during a few seconds. ((They flash slowly). Could anyone tell me what's hapenning and if it's possible to do something to repair without changing the whole display. (I fear it's not !) As this occurs on the right of the 7th digit, it doesn't disturb me too much, but when a "1" must be displayed there, nothing appears !

Another thing : could anyone post here two pictures to show me the difference between tall keys (41) and the other keys ? (Or a link to a previous discussion on this subject).

Thanks.

### **Re: Malfunction of LCD segments on 41 display**

Message #2 Posted by [Eric Smith](#) on 22 Feb 2007, 7:36 p.m.,  
in response to message #1 by [Jean-Michel](#)

I would expect that to be caused by either a mechanical intermittent connection between the right display driver chip and the actual glass, which I'm guessing goes through an elastomeric connection, or (less likely) by a failure of the right driver chip.

Unfortunately a failure of the interconnection between the main PCB and the display, while it would be much easier to fix, would not result in the described symptoms.

### 50g and 49g+ Library Transfer and Install

Message #1 Posted by [cfh](#) on 22 Feb 2007, 11:39 a.m.

Ladies and Gentlemen --

Just recently received my 50g, and wanting to configure it in the same way as my 49g+.

Managed to update ROM to v92 on both.

Now here is the weird part, keeping me from doing proper work:

I can't transfer the EqnLib.lib, EqnData.lib nor PerTbl.lib - Conn4x "flashes" that the calculator is busy (only managed to read that as I took a screen dump!).

I can delete variables on the calc, but not transfer those libraries. Help!

To make things worse - I transferred them to an SD card, but could not install them! I stored them in port 0, 1, 2, warmstart and also HOME 229 ATTACH, but only con an error message.

So, nothing works?

Must say that updating ROM was not at all that easy as the "manuals" or "guides" said, the best help was on [hpcalc.org](#).

1) Transfer via usb - why is hte transfer cancelled?

2) Attaching those libraries, step-by-step guide for a complete idioto (that's me)?

desperate cheers --

cfh, \*weeps\*

### Re: 50g and 49g+ Library Transfer and Install

Message #2 Posted by [Giancarlo \(Italy\)](#) on 22 Feb 2007, 11:58 a.m.,  
in response to message #1 by [cfh](#)

Hi cfh.

You'll have certainly read what HP states for updating the libraries:

Quote:

Equation Library: If you have the equation library installed on your calculator, you **MUST** update it with the new version of the equation library as the old version is **NOT COMPATIBLE** with the ROM 92 and can cause memory lost. To do so:

>>> on the calculator, press left shift FILES, select 2: FLASH (using up and down) press OK,

select the 2 EQLIB files (EQLIB: Equation L226 and EQLIB: Equation L227) using the up and down keys and the Enter key to 'select' them (a number will appear in front of these files). Press NXT and then PURGE and ALL to erase the files.

>>> Use the connectivity kit card to download the files into the HOME directory. Then use the file manager to copy the files from home to the Port 2 (Flash) following the instructions in the user manual.

>>> Alternatively, you can copy the 2 files on a SD card and then copy them in Port 2 (Flash) directly using the file manager

---

In particular, be sure to purge the old libs before installing the new ones.

By the way, what is exactly the error message you get?

Hope this helps.

Best regards.

Giancarlo

P.S.: the link for the above quoting is:

<http://h20000.www2.hp.com/bizsupport/TechSupport/SoftwareDescription.jsp?lang=en&cc=us&prodTypeId=215348&prodSeriesId=3235173&swItem=ca-31429-4&prodNameId=3235174&swEnvOID=181&swLang=8&taskId=135&mode=4&idx=0>

*Message #3 Posted by [cfh](#) on 22 Feb 2007, 12:07 p.m.,  
in response to message #2 by Giancarlo (Italy)*

Hi, thank you for the answer.

But \*sigh\* still no solution.

- 1) How do I see I have the "right" Eqlib and Pertbl for latest ROM?
- 2) Is there a utility for installing libraries, as I can't just use STO or ATTACH...

I feel so stupid asking these questions that have so many answers just by googling - and still, nothing works!

/red-eyed cfh

### **Re: 50g and 49g+ Library Transfer and Install**

*Message #4 Posted by [cfh](#) on 22 Feb 2007, 12:20 p.m.,  
in response to message #2 by Giancarlo (Italy)*

Error on PC:

---

The calculator is busy, please wait for it to complete the commands.

You may press CANCEL to stop the PC side of the connection but the calculator will continue on its own.

---

Error on HP:

---

ATTACH Error: Bad Argument Value

---

and 227 (=library number) is left on stack.

Sigh, on my 49g+ I have 12-18 libraries installed (since 2 years or more) but now I can't install those Equation Libs or Periodic table on neither the 50 nor the 49. I am so (!) frustrated.

-- cfh

Edit: Why is the formatting so very Foobar?!

### **Re: 50g and 49g+ Library Transfer and Install**

*Message #5 Posted by [cfh](#) on 22 Feb 2007, 12:34 p.m.,  
in response to message #2 by Giancarlo (Italy)*

Hi again. No success.

Current state 50g:

Port 0: totally complete empty

Port 1: dito

Port 2: dito

Port 3: SD card full of libraries and backups from my old 49g+. However, please note, that the OLD Equation library and Periodic table have now been replaced on the SD, and purged on both calcs.

Basic question that drives me nutzkrazy: How do I attach libraries 226, 227 and 229?

I am not going to sleep until this is resolved. ;-D

--- cfh

### **Re: 50g and 49g+ Library Transfer and Install**

*Message #6 Posted by [cfh](#) on 22 Feb 2007, 1:25 p.m.,  
in response to message #1 by cfh*

Have I solved the problem?

The Eqn Lib and Per Table are available under APPS. Is this it? Are those libraries "special" ones that can not be detected by eg LibMan? I downloaded the manual 887 pages, and on p 783:

Follow these steps for solving an equation using the Equation Library. 1. Press [APPS UPARROW ENTER EQLIB EQNLI] to start the Equation Library.

\*sigh\* Was that it? No hints that those libraries are "not as the other ones"... ?

cheers

--cfh

(Why is the text never displayed as I enter it in the Message: box when writing it? Good ole plain text rules)

### **Re: 50g and 49g+ Library Transfer and Install**

*Message #7 Posted by [Tim Wessman](#) on 22 Feb 2007, 2:48 p.m.,  
in response to message #6 by cfh*

If I remeber right, libman only goes from a certain library number foreward. Otherwise you'd include all the built in libraries that conatin caluclator commands. The eq lib and the periodic table are in the "HP Only" library area and so won't be included.

It is simple to see if you have the latest. If it crashes, you don't!

TW

## **Re: 50g and 49g+ Library Transfer and Install**

*Message #11 Posted by [James M. Prange \(Michigan\)](#) on 22 Feb 2007, 3:46 p.m.,  
in response to message #9 by Tim Wessman*

Are you saying that you and I are idiots? ;-)

Also, if you've downloaded them to the calculator via wire or IrDA, be sure to move the library to a port instead of just copying it. Leaving a library object in home or its subdirectories can interfere with the memory recovery routine in case you answer "YES" to a "Try To Recover Memory?".

But if you used a MMC/SD card to transfer the library, then it's safe to leave a copy of it on the card.

Regards,  
James

### Difference between Voyager and HP-48G

Message #1 Posted by [James Biddlecombe](#) on 22 Feb 2007, 6:50 a.m.

Guys, I've recently got back into HP calculators after owning an HP-41 for over 20 years. Since then I've acquired a few off ebay, but have a question concerning a percentage calculation, for example, on the HP-41 and 48G:

Example calculation:

100 Enter 15 % +

produces and answer of 115 on the HP-41 and Voyager models, but an error on the 48G as the 100 seems to be removed from the stack after the percentage calculation. Can anyone explain why this is different and if there is some kind of 'trick' in performing this on the 48G without entering 100 twice.

Thanks, James.

### Re: Difference between Voyager and HP-48G

Message #2 Posted by [Giancarlo \(Italy\)](#) on 22 Feb 2007, 7:11 a.m.,

in response to message #1 by James Biddlecombe

Hi James.

The 42S (Pioneer) operates as you say on the Voyagers.

I'd say the different behaviour of the 48G is related to its being an RPL model rather than a "pure" RPN...

But I'd expect some deeper suggestions from more knowledgeable forum people :)

Just my two cents.

Best regards.

Giancarlo

### Re: Difference between Voyager and HP-48G

### **Re: Difference between Voyager and HP-48G**

*Message #4 Posted by [Dia C. Tran](#) on 22 Feb 2007, 8:43 a.m.,  
in response to message #3 by Bram*

For the older calculators it's for convenient as you already know. For the 48, it's for consistency.

### **Re: Difference between Voyager and HP-48G**

*Message #5 Posted by [Les Bell](#) on 22 Feb 2007, 7:13 p.m.,  
in response to message #1 by James Biddlecombe*

Quote:

\_\_\_\_\_

Can anyone explain why this is different

\_\_\_\_\_

I'm pretty sure it's down to RPL being designed to be as "pure" and orthogonal as possible. The % operator is designed to consume two levels of the stack and return its result in one, just like all other binary operators. Leaving a copy of an original value behind might be convenient, but it's not mathematically kosher - a function can't return two values.

To my mind, the 41C, like all the other RPN calcs, is an arithmetic tool. The 48 and the other RPL calcs are mathematical tools, which is what makes them awkward for those back-of-envelope calculations.

Best,

--- Les

[<http://www.lesbell.com.au>]

### **Re: Difference between Voyager and HP-48G**

*Message #6 Posted by [Cameron Paine](#) on 22 Feb 2007, 7:15 p.m.,  
in response to message #1 by James Biddlecombe*

Quote:

\_\_\_\_\_

Can anyone explain why this is different...

\_\_\_\_\_

The behaviour of ENTER WRT stack lift differs between RPN and RPL calculators. On RPN machines,

ENTER terminates digit entry and duplicates X into Y. If the very next thing you do is press a digit key, the value in X is overwritten. However if the very next thing you do is invoke a function that consumes the value in X, the stack will drop, leaving your original value in X.

The RPL calculators terminate digit entry when ENTER is pressed and copy the content of the input buffer into X (AKA level 1). If the next thing you do is press a digit, the value in the input buffer is overwritten. If however you invoke a function that consumes the level 1 value, the stack will drop leaving whatever was in level 2 in level 1.

I believe that the % function consumes the level 1 value on both architectures.

HTH

Cameron

Edit: no sooner had I posted than I realised that % must consume two stack levels. Which renders my explanation irrelevant. What I describe above explains why 100 ENTER sqrt + produces 110 on an 11C and an error on a 48 (if both start with an empty stack). Unfortunately that's not what we were discussing here.

Sorry for the noise. <red face>

*Edited: 22 Feb 2007, 7:34 p.m.*

## **Re: Difference between Voyager and HP-48G**

*Message #7 Posted by [Antonio Maschio \(Italy\)](#) on 23 Feb 2007, 2:43 a.m.,  
in response to message #6 by Cameron Paine*

I guess this means that

with RPN the display and register X are the same, and while inputting a number we're affecting both; pressing Enter pushes the number down 1 position to Y (keeping the value in X); as a side effect, we have two copies of the input number.

with RPL, the display is not the same as register X, it's kind a level higher so, when we're inputting a number, we are not affecting register X, but only the input buffer; pressing Enter pushes the number again down 1 position to X (clearing the input buffer).

Right?

-- Antonio

*Edited: 23 Feb 2007, 2:44 a.m.*

## **RPL command line entry**

*Message #8 Posted by [James M. Prange \(Michigan\)](#) on 23 Feb 2007, 9:54 p.m.,  
in response to message #7 by Antonio Maschio (Italy)*

Quoting Bill Wickes:

Quote:

\_\_\_\_\_

The fundamental definition of the HP 48 operation ENTER is:

*Take the text in the command line, check it for correct syntax, then treat it as a program*

*and execute the objects defined there.*

---

With RPL, when you're typing in source code (for a number, other object, series of objects, whatever), you're inputting it to an "editor" (command line, equation writer, matrix writer, etc.), which could be considered a "buffer"; it has no effect on the stack until an ENTER operation is invoked. In the case of the command line editor in particular, when you press ENTER, ordinarily the source code is parsed and checked for syntax errors, and assuming no errors, all objects from the command line are combined into a compiled "secondary" (SysRPL program) which is placed on the stack and executed, and when finished, the display is updated.

In "immediate entry" mode (neither PRG nor ALG displayed in the status area), pressing an immediate entry key effectively appends the key object to the command line and then invokes an "implicit ENTER".

In the case of just a data class object such as a number, the effect of pressing ENTER is to put the object (or actually, a pointer to the object in temporary memory) on stack level 1 (moving anything already on the stack up one level), and then update the display.

But suppose that you open the command line with RightShift ENTRY (over the ALPHA key) to invoke PRM entry mode, then type in 1 2 +, and then press ENTER. In this case the number 3 is placed on the stack before the display is updated.

Or if you type 1 2 into the command line and then press + (which invokes an implicit ENTER), 3 is also placed on the stack.

Or if you already have 1 on the stack, then type in 2 and then press +, the 1 is replaced by a 3 before the display is updated.

In general, the command line could be considered source code for a program to be executed immediately.

Note that when in the standard stack display (no command line or other "special environment" active), pressing the ENTER key doesn't invoke the ENTER operation; it invokes a DUP command instead.

For more details, see section 4.3 (pages 83-90) of *HP 48 Insights Part I: Principles and Programming HP48G/GX Edition*, available on the current MoHPC CD-ROM set / DVD-ROM.

### Re: protecting oneself from paypal

Message #1 Posted by [db \(Martinez, California\)](#) on 21 Feb 2007, 10:31 p.m.

Howard; I didn't state clearly the type of card I used. It seems that i stupidly gave paypal both my debit and credit card numbers though probably not at the same time. You know how they are always fishing for your private info. The calculator was paid for with the Visa credit card and the DVDs came out of the debit card (which says Visa on it too). So to get this fixed; i dealt with two different Wells Fargo offices that administer two different accounts. I canceled the credit card and opened a new one with a different number. I am watching the debit account.

So anyway, after i got my money back, paypal wrote me and said, in part: "Recently, our Account Review Team identified some unusual activity in your account. In accordance with PayPal's User Agreement access to your account will be limited." Then they commenced to fishin'. I imagine they don't phone people because they got tired of hearing what they can do to thier mothers.

in response to message #1 by [db \(Martinez, California\)](#)

DB, I'll bet a million dollars that email did NOT come from Paypal. It came from some jerk who is trying to get your personal information. NEVER click on links in those emails. Instead, forward those messages to [spoofo@paypal.com](mailto:spoofo@paypal.com) (or [spoofo@ebay.com](mailto:spoofo@ebay.com) for ebay solicitations) and they will shut those jerks down.

### Re: protecting oneself from paypal

Message #3 Posted by [db \(Martinez, California\)](#) on 22 Feb 2007, 2:26 a.m.,  
in response to message #2 by [Don Shepherd](#)

Don; That may be, which is a good reason for me to not have answered it, and i didn't. However this one came to my inbox and 95% of paypal/ebaby related garbage goes automaticaly to the junk mail folder. I seldom open any of it but this time the timing and title seemed to have something to do with the refund they were forced to give me. Sure enough; it was a typical paypal vaguely-threatening-demand for more of my personal information that they have no need or right to have. I think that paypal used to be a service. Then ebaby bought them. Now they just want to *service* us.

btw: Was that a convoluted first sentence or what. What tense was it in anyway? And to think: I used to teach impressionable young Bolivians to speak English. Well, to talk American anyway.

That mail was absolutely, incontrovertibly a scam email from some Windows PC infected with a virus. PayPal may be more or less predatory, but they never ask for information in those terms.

In any case, your resentment over their treatment of you led you to do the right thing. 8)

At the risk of stating the obvious, strange spelling, faulty grammar, weird tenses, and threats to shut you down are typical phishing characteristics. If you have any doubts about your account, type "www.paypal.com" yourself, login and check your status. No bank would ever ask for your details in an e-mail. I would be doubtful about a similar request on the phone - even if they say that they are "Barclays Bank", don't give them your login details or your pin. There is a good tutorial about all this on eBay itself. Another giveaway (but not necessarily always the case), is that they send the same message to millions of people: "dear PayPal user" rather than "dear pierre\_12\_xx".

### **Re: protecting oneself from paypal**

*Message #6 Posted by [Dave Shaffer](#) on 22 Feb 2007, 2:14 p.m.,  
in response to message #2 by Don Shepherd*

I agree with Don and the others - you just happened to get a phishing expedition at a coincidental time.

You can verify (and marginally amuse yourself) that these are fake messages by mousing over the reply/go to URL (which at face value looks like it points to eBay or your bank) and seeing that it is not a real eBay (or whatever) URL. There may be an eBay-like part in the name, but the rest of the URL will be different words, and/or point to a country like Russia ( .ru at the end), or it may be just a bunch of IP address numbers - something like 12.34.56.78 .

This kind of things has become weirdly common on eBay lately: Try to search for any cell phone or pda. I'm not talking about rare and exotic stuff, or items only available in some remote part of the world, I'm talking about perfectly ordinary and widely available devices, for example a Treo 680. Why pay 450\$ for a (even if slightly) used Treo 680 which I can easily get new from the online palm store for \$399? What's the deal? What am I missing?

### **Re: protecting oneself from paypal**

*Message #10 Posted by **Ron** on 23 Feb 2007, 9:05 a.m.,  
in response to message #9 by Chris Roccati*

People are getting used to using eBay, and assuming they will have the lowest prices. Plus, it's convenient to sit at your keyboard - Click buy it now, pay by PayPal, and wait for you phone to arrive.

The gift cert though - ??????????!!

I was needing a cheap, used 15" or so LCD monitor. No problemo, snag one on Ebay for \$50, right? All attempts to get one on Ebay went for over \$100. A brand new 19+ inch analog/digital one can be had for less than \$120.

### **Re: protecting oneself from paypal**

*Message #12 Posted by **Ruben** on 23 Feb 2007, 3:01 p.m.,  
in response to message #9 by Chris Roccati*

If you're talking about cellphones, people will frequently pay a lot more than they can buy them for at the Cingular Store for example, because they can buy them, and aren't locked into a contract. With GSM phones, you can typically pop the SIM card out of your Nokia for example, and into your later model Motorola, and have a working new phone with no contract BS. I've done this a few times.

Still, I've seen people paying a lot more for things than they can get them for at a store new. Who knows why.

### HP 33S constants

Message #1 Posted by [E SAMUEL LEVY](#) on 21 Feb 2007, 4:22 p.m.

There is a list of physical constants that are accessed by the cursors, selecting one by underlining and pressing enter. I found that if I keyed the number 1 through 6 counting from the left, it entered that constant into X immediately.

### Re: HP 33S constants

Message #2 Posted by [bill platt](#) on 21 Feb 2007, 7:46 p.m.,  
in response to message #1 by [E SAMUEL LEVY](#)

Cool discovery!

I tried it with 7, 8, etc and that doesn't work (obvioulsy you did the same).

Di you accidentally do this? I'm curious \*how\* you made this discovery.

*Edited: 21 Feb 2007, 7:48 p.m.*

### Re: HP 33S constants

Message #3 Posted by [Norris](#) on 21 Feb 2007, 8:58 p.m.,  
in response to message #1 by [E SAMUEL LEVY](#)

Quote:

\_\_\_\_\_

I found that if I keyed the number 1 through 6 counting from the left, it entered that constant into X immediately.

\_\_\_\_\_

Interesting. This trick also works in the SUMS menu, if there is data entered into the statistics registers.

Of course, it works in the MODES, DISPLAY, MEM, CLEAR, X?Y, X?0, BASE, and FLAGS menus as well, but you would expect it to work in those cases, because in these cases the menu items are explicitly numbered. The menu items \*aren't\* numbered in the SUMS or CONST menus, yet the numbers work anyway.

Quote:

\_\_\_\_\_

I tried it with 7, 8, etc and that doesn't work (obvioulsy you did the same).

\_\_\_\_\_

The CONST key actually brings up a series of eight different menus, which you can scroll through using UP-ARROW, DOWN-ARROW, [right-shift] CONST, or [left-shift] CONST. The number 1-6 trick seems to work on each separate menu.

So you can't get constant #7 (i.e., the first constant in the second CONST menu) with [right-shift] CONST 7. But you apparently can get it by holding down [right-shift], pressing CONST twice while [right-shift] is down (which scrolls to the second CONST menu), and then 1.

This procedure works for the two SUMS menus too.

*Edited: 21 Feb 2007, 9:06 p.m.*

## **Re: HP 33S constants**

Message #4 Posted by **Karl Schneider** on 23 Feb 2007, 2:10 a.m.,  
in response to message #1 by E SAMUEL LEVY

Quote:

There is a list of physical constants that are accessed by the cursors, selecting one by underlining and pressing enter. I found that if I keyed the number 1 through 6 counting from the left, it entered that constant into X immediately.

Nice shortcut. This essentially makes the "point-and-click" menus work like the ones with numbers, but the user must manually advance from one screen to the next.

I also found that many of the physical constants in the HP-33S (released in 2004) don't match those in the HP-49G, which was designed in the late 1990's. It turns out that further scientific research has produced revisions to many values. Here are several links to Constant Data (CODATA) of internationally recommended values, from the US National Institute of Science and Technology.

NIST CODATA 1998: <http://www.physlink.com/Reference/PhysicalConstants.cfm>

NIST CODATA 2002: <http://physics.nist.gov/cuu/pdf/chart1.pdf>

A slight error in the HP-33S: The magnetic permeability of a vacuum ( $\mu_0$ ) is exactly  $4\pi \times 10^{-7}$  H/m, but the constant's value is missing the "4" in the last significant digit.

**HP-41 Quiz (big, contains pictures)**

Message #1 Posted by [Juergen \(CH\)](#) on 21 Feb 2007, 1:51 p.m.

Recently, I stumbled across a strange HP-41CV. It has no LCD display, the battery compartment is closed with a fawn cover, and on the side, there is a cable with a plug at the end (labeled 82106A memory module):

[http://www.fjk.ch/images/hp41/hp41\\_quiz1.jpg](http://www.fjk.ch/images/hp41/hp41_quiz1.jpg)

[http://www.fjk.ch/images/hp41/hp41\\_quiz2.jpg](http://www.fjk.ch/images/hp41/hp41_quiz2.jpg)

After thinking some minutes what this device is all about, I found the solution. It is a .... STOP. I know the folks here likes quiz games :-). And this one is not too difficult. But the only prize I can offer is a picture of the inside of this device.

Enjoy, Juergen

**Re: HP-41 Quiz (big, contains pictures)**

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 21 Feb 2007, 1:59 p.m.,  
in response to message #1 by Juergen (CH)

Hi Juergen,

Okay, I'm game - here's two guesses:

1. Ports expander.
2. Memory expander.

Bill

**Re: HP-41 Quiz (big, contains pictures)**

Message #3 Posted by [Randy](#) on 21 Feb 2007, 2:01 p.m.,  
in response to message #1 by Juergen (CH)

(semi)-remote keyboard?

**Re: HP-41 Quiz (big, contains pictures)**

Message #4 Posted by [Howard Owen](#) on 21 Feb 2007, 10:59 p.m.,  
in response to message #1 by Juergen (CH)

OK, Here's what I think we know:

1. Fawn colored cover on the back where the batteries go
2. Cable emerging from AC power port

3. No display
4. Cable terminates in a module reading "82106A"

OK, so #1 #2 and #3 clearly point to a homebrew project of some kind. In light of that, #4 is a red herring, since a hacker could implement just about anything inside an 82106A case. (Hi, Diego!) #3 clearly implies that processing for local consumption is not a feature of this device. #2 says the same thing. So what's inside the box that could be a resource for an external 41C? Probably not another 41C. I doubt the 41C electronics would be happy running without an LCD, so I'd guess that the case is just an enclosure for something.

What could that be? Well, if you replace the PCBs, practically anything. But what is a 41C case good at holding, other than the PCBs, keyboard etc? Ah, the modules. You haven't shown us the ports, have you? 8)

Regards,  
Howard

### Re: HP-41 Quiz

Message #5 Posted by [Bram](#) on 22 Feb 2007, 6:09 a.m.,  
in response to message #4 by Howard Owen

I thought of a second processor thing, like the Acorn BBC used to support, but on second thought I also bet on a port replicator.  
But then, why would the LCD have been removed?

### Re: HP-41 Quiz

Message #6 Posted by [Howard Owen](#) on 22 Feb 2007, 10:12 a.m.,  
in response to message #5 by Bram

Because the PCB is gone, not just the display?

### Re: HP-41 Quiz (big, contains pictures)

Message #7 Posted by [Frank Boehm](#) on 22 Feb 2007, 8:00 a.m.,  
in response to message #1 by Juergen (CH)

Two guesses I know, that's cheating ;)

1) using the 41 "framework" (electronics removed) as a cheap keyboard 2) using the 41 with a speaker box instead of a display for blind people

### Re: HP-41 Quiz (big, contains pictures)

Message #8 Posted by [Ron](#) on 22 Feb 2007, 9:10 a.m.,  
in response to message #1 by Juergen (CH)

It doesn't do anything. You see it, you get curious, you open it up, and a spring snake jumps out. 8^)

### Solution

Message #9 Posted by [Juergen \(CH\)](#) on 22 Feb 2007, 1:42 p.m.,  
in response to message #1 by Juergen (CH)

Thank you all for your guesses which show, on the one hand, your expertise and, on the other hand, your good sense of humor. I enjoyed the ideas of remote keyboard, dual-core 41, 41 for the blinds, etc. Now it's time to

disclose the secret (well, it's not so secret anymore; you already found the solution): it is a port replicator. when opening the calculator, I saw that there was no PCB, too:

[http://www.fjk.ch/images/hp41/hp41\\_quiz3.jpg](http://www.fjk.ch/images/hp41/hp41_quiz3.jpg)

[http://www.fjk.ch/images/hp41/hp41\\_quiz4.jpg](http://www.fjk.ch/images/hp41/hp41_quiz4.jpg)

This might mean a second life for many "cannibalized" HP-41. Unfortunately, I cannot open the plug because it is glued and I borrowed the calculator from a friend of mine. Thus I cannot provide the exact connections but probably they can be deduced from information in the HP-41 service manual.

Best Regards, Jürgen

Message #1 Posted by [Les Wright](#) on 21 Feb 2007, 10:16 a.m.

The problem I am having now is getting it to replicate the example problem with JM Baillard's simplex routine in our 41C program library on the site. Returns not the correct answer but "problem infeasible".

Either I am setting up the problem wrong, or the 49G program can't cope with equality constraints--just less-than and greater-than.

I will do a little more homework on linear programming and see what I come up with. It really is cool, though, to have an LP routine on a handheld device.

### Re: protecting oneself from paypal

Message #1 Posted by [Jeff O.](#) on 21 Feb 2007, 9:13 a.m.

The one time I had a problem with a seller not delivering after I paid with paypal, I first tried to get the bank to reverse the credit card charge. They refused, with some sort of lame excuse to the effect that they could not reverse the charge since I had authorized it. I did not read the fine print of the cardholder "agreement", but my guess is that different banks offer different levels of service for refunds in cases where you did indeed authorize the charge but are dissatisfied with the purchase. (Miraculously, the seller had not cleaned out his account, so we used paypal's dispute resolution process to get the money back - less paypal's \$25 fee, of course.)

Regarding protection with debit cards vs. credit cards, this [FTC page](#) gives the basics. Debit cards do offer less protection against unauthorized charges. I believe that some banks voluntarily offer the same protections, but it is not required. Which brings me to another question (caution - curmudgeon alert): just exactly what is the advantage of using a debit card? If the money comes directly out of your checking account as you use it, then one must obviously have the money in the account to pay the charges. So why not just charge everything to a credit card and pay the bill in full every month from that same checking account? That way you will get the credit card protections. (For those that might be inclined to build up a huge balance on their credit card rather than pay it off, I suppose that the debit card forces some financial discipline.) Debit cards seem to me to just be a way to essentially give money to the banks and credit card issuers for them to allow you to use your money, with zero risk to them. (Don't get me started on how the price of virtually everything is inflated by 3% or more to account for the credit card holdback fees and that anyplace that accepts credit cards should be **required** to give a discount if you pay in cash or cash equivalent.)

### ot: debit cards

Message #2 Posted by [bill platt](#) on 21 Feb 2007, 2:13 p.m.,  
in response to message #1 by [Jeff O.](#)

I never use the debit card feature. In fact when they started that nonsense, I started getting annoyed that I now had to answer the question, "debit or credit?" It's a freakin' credit card fercrissake!

I put the debit card in the same category with check cashing establishments. Only people with zero credit and often zero sense will flock to them.

As far as the % charged for credit card transactions, I agree that it is obnoxious that the Credit Card Companies manage to bully their patrons into a one price structure. Interestingly it used to be that gasoline stations got away with a two-tier structure, and I offer a rebate for money orders on Ebay--even though it is a "violation" of their rules (read: monopoly practices on financing--therefore ebay is \*not\* an auction site but rather a 21st century sharkfest.)

Paypal plus Ebay charges chews up some serious margin.

### Re: ot: debit cards

Message #3 Posted by [Bill \(Smithville, NJ\)](#) on 21 Feb 2007, 3:37 p.m.,  
in response to message #2 by [bill platt](#)

Hi Bill,

Quote:

It's a freakin' credit card fercrissake!

Welllllll - maybe not. It all depends.

I think we're talking two different types of cards here (or maybe it's three or four types).

First, there is the standard credit card - visa, mastercard, Amex, etc.

Second there is the Debit Card (or in my Area MAC). This is the old card that was tied directly to your bank accounts and for many years was only usable at a bank machine.

Third is the combination Debit card. This one can come in two flavors:

Flavor One - It's still a standard debit card but can be processed through two different transaction methods. Method one is to use it as a standard debit card where the money is withdrawn directly from from the bank account and a PIN number is used. Method two is still a debit transaction, but the transaction takes place through the Credit Card Company. Only a signature is require. But the money is still taken directly from your checking account. The key difference is that the merchant is charged very different transaction fees. The Debit version is charged a per transaction cost while the credit debit is charge a varying percentage of the transaction.

Flavor Two - It's both a standard debit card and a credit card. In this case when debit is used, the money comes directly from the bank account and when credit is used, it is charged as regular credit card trasaction and appears on the credit card statement which you then pay.

Quote:

I put the debit card in the same category with check cashing establishments. Only people with zero credit and often zero sense will flock to them.

Well I use a debit card where ever I might be paying by cash anyway and I definetly don't have zero credit or (I hope) zero sense. :)

Bill

### **Re: ot: debit cards**

*Message #4 Posted by **bill platt** on 22 Feb 2007, 7:41 p.m.,  
in response to message #3 by Bill (Smithville, NJ)*

When Mellon first came out with the debit idea, I read the fine print, and I declined it. I used my MAC card until they expired it, then I gave it up. The fine print turned the MAC card into a non-secure credit-card-access-directly to your bank account. I didn't want to have any part of that nonsense.

Hi, Gerson:

Very nice !

Thanks, Gerson, and

Best regards from V.

### Re: Valentine's Day MC: A few modest insights, n! digits - part 3, anyone?

Message #2 Posted by [Gerson W. Barbosa](#) on 21 Feb 2007, 7:20 p.m.,  
in response to message #1 by [Valentin Albillo](#)

Hello Valentin,

Quote:

Very nice !

Thanks, but those two lines of mine are not nearly as nice as the other 17 ones of yours!

Here is my first attempt for the HP-12C. Took more than 5 minutes though :-)

```
01  ENTER
02  LN
03  LST x
04  .
05  5
06  +
07  *
08  x<>y
09  -
10  1
11  1
12  12/
13  +
14  1
15  0
16  LN
17  /
18  1
19  +
20  INTG
```

```
2 <= n <= 100,000,000 (wrong! see update below)
```

```
N = INT(1 + ((n + 1/2)*ln(n) - n + 11/12)/ln(10))
```

```
ln(sqrt(2*pi)) = 0.918938533
```

$$11/12 = 0.916666667$$

20 steps! Not so bad, considering the 12C lacks pi and common logarithm...

Best regards,

Gerson.

-----

Update:

Unfortunately, 11/12 is not good enough. The results are one unit less for N=197, 216, 1944, 2512, etc. 34/37 would raise the upper limit to 165534. And 1213/1320 would raise it to 2064172, but in this case it would be better go back to the original formula and start over. Approximating pi as 355/113 (8 steps) would not be of much help...

### Touching up a scratched Voyageur

Message #1 Posted by [Les Wright](#) on 21 Feb 2007, 8:23 a.m.

I have been spending some time trying to improve the appearance of my working grade 11C.

I have found that pretty coarse sandpaper (180 grit) followed by a buffing with a fresh scotch brite kitchen pad got rid of scratches and restored a pretty convincing brush finish to the bezel.

Several small scratches on the key deck that did not cut across lettering were convincingly touched up by a black Sharpie. It isn't perfect, and you can see the ink dots if you look at the key deck in glancing light, but face on it is much more attractive than the silver colour of the metal shining through. The back label was particularly scratched around the edges and painting along the scratches with the pen made it a little less ugly. The pen is easier to use than a small brush and model paint, and if it wears off it is easily redone.

My next project is getting some sort of silver colouring back on the logo. I am going to try a silver ink gel pen. Some women friends are also heavily involved in stamping and scrapbooking, so I may seek their advice on how to get colouring onto the outside parts but not in the grooves.

Thought I would share that with you. The pleasure I get out of my 11C is much greater now that it looks, to my eye, a little better than when I got it. True collectors may object to my methods, but I am not selling it!

Les

in response to message #1 by [Les Wright](#)

Hi Les,

Quote:

I have been spending some time trying to improving the appearance of my working grade 11C.

---

Reading about you cleaning up your "working grade 11C" made me pick up my 11c from my desk. What a sorry state it is - it is always on my desk, usually under a pile of papers, gets exposed to all kinds of dirt and dust, but just keeps on working and working. The only cleaning it gets is occasionally wiping a wet finger across the display. The feet are almost worn away.

About four years ago, I did send it to Randy and had him do a complete cleaning of it since several keys were getting problematic. It's been in daily use every since and is a real work horse for doing daily calcs.

Who knows how long it would last if I took a page from your book and cleaned it up a little bit.

Great work Les and enjoy the 11C.

Bill

### **Re: protecting oneself from paypal**

*Message #1 Posted by [Gene](#) on 21 Feb 2007, 7:29 a.m.*

Sometimes, there is no money in the seller's account and nothing for Paypal to recover from them.

This seems to be when they do nothing.

After all, they aren't going to pay you out of THEIR monies.

If a seller is stupid enough to give paypal a checking account link, then paypal can always recover money because they will take it from your checking account.

Even if you get a chargeback from a buyer that is fraudulent. A quick check of google will turn up cases where paypal has frozen funds in sellers accounts for months with little explanation, where paypal gave a refund to a buyer with no requirement for the buyer to send back the goods - they end up with your product AND their money back, etc.

Hearing from people who say "I've used paypal for years without any problems" doesn't really address the poor people's plight who get hit by this buzzsaw.

And, if you sell and take paypal, you could be next. You have little to no protection.

If you buy and use paypal, use funds from a credit card. It's the only real protection you have.

### **Re: protecting oneself from paypal**

*Message #2 Posted by [Katie Wasserman](#) on 21 Feb 2007, 8:56 a.m.,  
in response to message #1 by Gene*

I agree completely -- use a credit card. My one instance of ebay fraud, in over 900 transactions almost all of which were via Paypal, ended with a full refund from my credit card company. I never even filed a Paypal complaint just made one phone call to American Express and they took care of it. It took about 6 weeks but they told me it would take some time up front and they informed me in writing of their progress in getting my refund.

### **Re: protecting oneself from paypal**

*Message #3 Posted by [Gene](#) on 21 Feb 2007, 11:59 a.m.,  
in response to message #2 by Katie Wasserman*

Agreed. NEVER give paypal your bank account information. Period.

### **Re: protecting oneself from paypal**

in response to message #3 by Gene*

Remove Bank Account Confirmation

[Back to Profile Summary](#)

You are about to remove the following bank account from your PayPal account:

Bank Account Name:  
Bank Name:  
Bank Account Number:

This is your only confirmed bank account on file. If you remove it now, your account status will instantly become unverified. Becoming unverified means you can no longer add funds via electronic funds transfer, your credit card charge limit is reinstated, and you lose protections safeguarded under PayPal's Buyer and Seller Protection Policies.

Are you sure you want to remove this bank account from your PayPal Profile?

Note: After removing this bank account it will no longer be possible to complete PayPal payments by bank transfer or by Direct Debit or Bank Funding. If you add this bank account to your PayPal account again, you'll need to repeat confirmation and authorization to use these payment methods.

And here are the differences in fees for various withdrawals. Note that bank transfers are free.

| Options                             | Processing Time               | Cost          |
|-------------------------------------|-------------------------------|---------------|
| Transfer funds to your bank account | 3-4 Business Days             | Free!         |
| Request a check from PayPal         | 1-2 Weeks                     | \$1.50        |
| Shop with a PayPal debit card       | Instant (once you get a card) | Get cashback! |
| Get cash out of an ATM              | Instant                       | \$1.00        |
| Buy from over 42,000 PayPal Shops   | Instant                       | Free!         |

Add Funds

You can transfer funds from your checking or savings account to your PayPal account using Electronic Funds Transfer.

Transfer money into your PayPal Money Market account and earn a competitive return. As of 1/3/2007, you would be earning 5.02 percent on your PayPal balance!\*

| Options   | Processing Time   | Cost  |
|---|-------------------|-------|
| Transfer Funds From a Bank Account in the United States | 3-4 Business Days | Free! |

*Edited: 22 Feb 2007, 1:35 p.m.*

**Agreed, but not having someone steal my money is more important**

Message #5 Posted by [Gene](#) on 22 Feb 2007, 2:42 p.m.,  
in response to message #4 by *Disadvantages of no bank info to Paypal*

When they can come take funds from my bank account when a fraudulent buyer says he/she didn't receive an item, that is too much of a disadvantage.

If that means I can't pay because of a limit, whatever.

Do a google search where people report the things paypal has done.

Let the user beware.

[9815A Link - Ebay](#)

### Re: HEWLETT PACKARD 9815A Sale !!!

Message #2 Posted by [Jean-Michel](#) on 21 Feb 2007, 1:22 p.m.,  
in response to message #1 by [gileno](#)

You break my heart by showing this 9815... When I was 18 (in '85), my father came back one evening with a big thing he put onto my desk saying "It was in the trash at my office, I took it for you but I don't know what you can do with this big calculator..." (He knew I was already interested in). Guess what it was : a HP-9815A with its printer and its tape recorder, fully operating ! It stayed onto my desk a couple of years without I really used it, because I didn't have the User's Manual, and one day my parents moved from their home to a smaller flat when I was gone for my studies. When I came back, I never saw again the "big" HP... back to the trash definitely ! (I didn't tell my father my deep interest in calculators and especially HP to keep him without too much regrets !)

Now, I could buy it, but it won't be the same as having the other for all these years...

## Re: Significant digits -- well, yes and no...

Message #1 Posted by [Massimo Gnerucci \(Italy\)](#) on 21 Feb 2007, 2:49 a.m.

Quote:

HP-42S:  $\sin(3.14159265358 \text{ rad}) = 9.79323846264 \times 10^{-12}$  -- correct result to 12 significant digits

HP-41:  $\sin(3.141592653 \text{ rad}) = 5.9 \times 10^{-10}$  -- correct result to 2 significant digits

Sorry Karl, shouldn't that be:

HP-41:  $\sin(3.141592654 \text{ rad}) = -4.1 \times 10^{-10}$  vs  $-4.10206761537 \times 10^{-10}$  ?

Greetings,  
Massimo

## Missing pi digits calculation

Message #2 Posted by [Karl Schneider](#) on 21 Feb 2007, 3:47 a.m.,  
in response to message #1 by Massimo Gnerucci (Italy)

Hi, Massimo --

Quote:

Sorry Karl, shouldn't that be: HP-41:  $\sin(3.141592654 \text{ rad}) = -4.1 \times 10^{-10}$  vs  $-4.10206761537 \times 10^{-10}$  ?

That also is a correct calculation, but my point was to reveal the ensuing digits of pi by calculating a truncated (not rounded) value of pi in radians mode. I've gone through the exercise several times in the Forum, but didn't save a bookmark to those posts:

$$\begin{aligned}
\sin(\pi - x) &= \sin(\pi) \cdot \cos(x) - \cos(\pi) \cdot \sin(x) \\
&= 0 \cdot \cos(x) - (-1) \cdot \sin(x) \\
&= \sin(x)
\end{aligned}$$

x represents the truncated digits. For very small x,  $\sin(x) \approx x$ , so the result produces a limited string of those digits.

The excellent mathematical routines developed for the Saturn microprocessor (debuting with the HP-71B) were ported to the Pioneer-series calculators. No other calculator I own matches the quality of the Saturn mathematics, although the TI-89 *might*. It also seems likely that Valentin's vintage Sharp pocket computers could meet or exceed the accuracy.

-- KS

## SHARP accuracy

Message #3 Posted by [Valentin Albillo](#) on 21 Feb 2007, 5:15 p.m.,  
in response to message #2 by [Karl Schneider](#)

Hi, Karl:

Karl posted:

*"It also seems likely that Valentin's vintage Sharp pocket computers could meet or exceed the accuracy."*

Likely. These are your results as computed by my SHARP PC-1475, rounded to 12 digits:

$$\sin (3.14159265358 \text{ rad}) = 9.79323846265\text{E-}12$$

$$\sin (3.141592653 \text{ rad}) = 5.89793238463\text{E-}10$$

$$\cos (89.9999999 \text{ deg}) = 1.74532925199\text{E-}09$$

Matter of fact, this last result actually comes out in full precision as:

$$\cos (89.9999999 \text{ deg}) = 1.7453292519943295760\text{D-}09$$

which has all its 20 significant digits absolutely correct.

Best regards from V.

## Re: SHARP accuracy

Message #4 Posted by [Karl Schneider](#) on 23 Feb 2007, 1:39 a.m.,  
in response to message #3 by [Valentin Albillo](#)

Hi, Valtin --

Quote:

These are your results as computed by my SHARP PC-1475, rounded to 12 digits:

$$\sin (3.14159265358 \text{ rad}) = 9.79323846265\text{E-}12$$

But, V! The last mantissa digit should be a "4", whether it's the actual digit or rounded. Who was responsible for the rounding? :-)

Seriously though, 20 significant digits was quite impressive for the era. I safely considered the 12+ digit performance "likely" from your photos I had previously viewed, at least one of which depicted a Sharp "PC" with many digits showing in its display.

Best regards,
