I was in our university bookstore the other day and there is NOT ONE HP calculator for sale there. The wall is full of TIs. I asked my students last year to raise a hand if they used other than a TI, but not one did.

HP will figure out how to combat this kind of thing or they're going to be done for in a few years even if they come up with a GHz processor.

Yeah, but I'd guess that most of the buyers were older folks whose 11c, 15c, 32s, 42s, etc. had died and they didn't want a big 48 calculator. Also, I think a lot were 4-5 years out of school needing to take the PE test. I doubt many of those sales were at universities, but I'd be glad to find out I'm wrong.

The 50g keys are stiffer and have more travel than the 48g, however, since I usually use my thumbs, the keys difference doesn't matter as much to me. The reason I use the 50g is the better communication with modern lap-tops and higher capacity.

Quote:

\_\_\_\_\_

I should add that as far as calculators go the user experience and interface of the 48 IMHO is the best there ever was.

\_\_\_\_\_

I actually prefer the 50g, with its user interface a lineal descendant of the 48's. But in general, I agree with you on this.

Quote:

\_\_\_\_\_

Shrink the 48 down to 2 lines, lose the graphics, replace RPL with RPN, put it in a 42S size can and call it the ultimate RPN.

\_\_\_\_\_

I'm of two minds about this. On the one hand, I love the 42s as much as you seem to. It's not perfect, but it's as close as an RPN calculator ever got. I'd love to see an incremental improvement on the 42s running on modern hardware.

But on the other hand, I have this nagging feeling that hewing to that line could make us miss something novel and truly useful. This feeling has solidified since I began playing with the TI nSpire. This calculator has a killer user interface for education. The interface is a document broken into "problems." This is a set of pages, easily navigable with intuitive keystrokes. There's a tabbed interface, or, with a simple combined keystroke, a thumbnail view of the document. The controls work like a PC's do. ESC gets you out of where you are. CTRL modifies a key for its second function. These semantics are second nature to school kids today. On any page, you can place one of four applications. The applications are a calculation work area, a very nice and flexible graphing slate, a combined matrix editor and spreadsheet and a note taker. Variables have problem scope, so a lesson can link results, graphs, equations and notes together. The result is highly functional for presenting, practicing and testing mathematical knowledge. The display is super sharp and very attractive. It's the best greyscale LCD I've ever seen. And TI has done some very good design work with typography and other graphical elements.

I'm *not* saying that's the ideal interface for a professional calculator. But it sure is an innovative and

strikingly effective UI for education. Surely there's more that could be done with the time honored technical calculator interface? I'd like to see something that retained the stack, the postfix entry scheme, the keyboard look and, particularly, feel. But I want to see those elements applied to a revolutionary calculator design. TI has shown that such a thing is possible. I think the nSpire CAS is nothing short of brilliant for its target market. The field is clear to do some bold thinking with technical calculators. Please HP, surprise and amaze me!

Regards,  
Howard

What I would love is the ability to completely remap the primary keys, or at least the usual upper section of function keys. So I'd be able to have my ideal calculator key layout. I could get rid of those useless (to me) keys like HYP and put in the ones I want.

And by this I don't just mean a keypad overlay, I mean being able to easily swap the key themselves, so you get the molded keys in the positions you want them. They could supply a whole bag of keys with every calc, just pick and choose what you need. Now THAT would be innovation.

Dave.

That is about 15 years too late. I remember seeing a keyboard like that back in probably the early 90's with a tiny LCD on every keytop.

Dave.

Message #4 Posted by [Dave Shaffer \(Arizona\)](#) on 5 Sept 2007, 10:54 p.m.,  
in response to message #3 by Ivan Latorre

There are two ways you should start an ebay auction:

- 1) If you just want to get rid of something, start at \$0.99 or thereabouts. If it has any worth to somebody else, the price will rise rapidly (especially as you get to the end). Otherwise, you'll get rid of it for 99 cents (plus shipping).
- 2) If your item has some value (intrinsic, or maybe just something special to you), start it at the minimum you are willing to accept. It may or may not sell, but you won't feel that you lost money on it.

Seems to me that \$2.99 is reasonable under either condition for this one!

### Trade Answers for HP71B case Recommendation

Message #1 Posted by [RonHudson\(USA\)](#) on 5 Sept 2007, 12:17 a.m.

Yay! I just got a newish HP71B (just a crack in the glass, not the lcd) no roms, no rams, no card reader, no hp-il verry basic.

First my contribution (since I am new to the community).... I have a little case by Jansport, the number 520199E35040 appears at the top of the care tag. It's almost 11" x 6.5" It has a nice zippered pocket as the last layer on the left, perfect for the 71B. Lots of other pockets, zippered and not, for 'stuff'.

As I said I just got a real 71B from my brother who was not using it. and I have a few short questions:

- 1)key "q", "mod(" how do I tell the 71 I don't want a endline? Can I have it put "mod(<)" where < is an insert cursor?
- 2)Anyone have a listing of the flags? I can't quite afford the cdrom manual yet.. no job. In school for another year (ITT-Tech) Perhaps some of the important ones?
- 3)How hard is it to get an HP-IL module? (assuming I don't want to mess with e-pay. A Serial port?)
- 4)How will my 71B like it if I feed it nickel-metal-hydride batteries?

Thanks! ron.

Thanks, Vincze for the kind offer :^) , but, sorry, I must decline.

When I have the cash I will support the museum with a purchase of the CD-Roms needed. In the mean time I am building my own "quick reference" that mostly documents the differences between common basic and HP Basic in the 71. I have gathered quite a bit from the archives.

## Re: Trade Answers for HP71B case Recommendation

Message #6 Posted by [Alex L](#) on 5 Sept 2007, 11:47 a.m.,  
in response to message #1 by [RonHudson\(USA\)](#)

I was lucky and got a 71B with manuals. :)

Quote:

1)key "q","mod(" how do I tell the 71 I don't want a endline? Can I have it put "mod(<)" where < is an insert cursor?

key "q","mod%;" - the semicolon shows that the assignment is a typing aid. I don't think there's a way to position the cursor within a typing aid.

Egan's replies to 2&3 match what I would have answered.

Quote:

4)How will my 71B like it if I feed it nickel-metal-hydride batteries?

I've only had mine for a few weeks, but it seems very happy with a set of the new NiMH hybrid batteries - I'm using Uniross Hybrio, but they're also available as GE/Sanyo Eneloop, RayOVac Hybrid, and I think even a Radio Shack brand. The advantage of these is that they hold a charge much longer even when on the shelf. You can buy two sets, swap and charge/store as needed.

## Re: Trade Answers for HP71B case Recommendation

Message #7 Posted by [RonHudson\(USA\)](#) on 5 Sept 2007, 3:55 p.m.,

That just put a ";" on the screen... but

key "q","mod("; worked as desired.

Anyone know any other key magic?

## Re: Trade Answers for HP71B case Recommendation

Message #8 Posted by [Garth Wilson](#) on 5 Sept 2007, 12:57 p.m.,  
in response to message #1 by [RonHudson\(USA\)](#)

Quote:

4)How will my 71B like it if I feed it nickel-metal-hydride batteries?

Even fully charged, their voltage is just about low enough for my HP-71's to show "Low Batt". A set of alkalines probably lasted at least 6 months or a year when I was using the 71 heavily every day in the late

1980's. Now that I'm not using them so much, a set of alkalines probably lasts two or three years, even in the 71 with HPIL, Math ROM, Forth/Assembler ROM, CMT 64KB RAM, and CMT 96KB RAM. There's no reason to use rechargeables.

### HP-95LX Programming

Message #1 Posted by [Thomas Okken](#) on 4 Sept 2007, 10:24 p.m.

Hi all,

I've just won an eBay auction for an HP-95LX. I probably would never have bid on it if it weren't for the enthusiasm about those HP old school "pocket PCs" on this forum! :-)

Of course, I'll have to wait and see just what kind of condition that machine is in, but assuming it works OK, I think I would like to try programming it -- meaning: to port some of my existing C/C++ programs to run in its DOS environment. Can anyone recommend any tools I might be able to use for that kind of work?

I have used DJGPP and RHIDE for DOS development in the past, but I think those tools are targeted to the 386 or later, and the 95LX only has a 8086 (or is it a 80186? I don't even know how they differ...).

I'm not looking to run the development tools themselves on the 95LX; I'm just looking for something that will generate code that can run on one. A C++ compiler would be really sweet. :-)

- Thomas

### Re: HP-95LX Programming

Message #2 Posted by [Chuck](#) on 4 Sept 2007, 10:59 p.m.,  
in response to message #1 by Thomas Okken

I have Turbo Pascal and Turbo C running on my 200LX, but I'm not sure if those will run on the 95LX. The memory may be too small, and I had quite a bit of trouble getting a decent size flash card to work on my 95LX (my 200LX has a 256 MB crucial card--big enough for all my DOS stuff.)

I made the mistake of getting a 95LX first and not being able to do much with it. You may want to keep an eye out for a 200LX 2MB or 4MB model; quite a bit more versatile.

CHUCK

### Re: HP-95LX Programming

Message #3 Posted by [Chan Tran](#) on 4 Sept 2007, 11:05 p.m.,  
in response to message #2 by Chuck

Well you can run the Turbo Pascal and or Turbo C on a PC and then run the compiled program on the 95LX.

### Re: HP-95LX Programming

Message #4 Posted by [Egan Ford](#) on 4 Sept 2007, 11:09 p.m.,  
in response to message #1 by Thomas Okken

Try: <http://www.openwatcom.org/>

You can install on Windows and cross compile 16 bit binaries for DOS.

## Re: HP-95LX Programming

Message #5 Posted by **DaveJ** on 4 Sept 2007, 11:15 p.m.,  
in response to message #1 by Thomas Okken

I have not tried them on a 95LX, but Borland's Turbo C++ for DOS used to be hugely popular (almost a defacto standard), and it can target the 8086/80186: <http://dn.codegear.com/article/21751> It is now freeware and you could no doubt pick up the full version with manuals etc on eBay for next to nothing if you want.

There is also the freeware HI-TECH Pacific C compiler:  
<http://www.hitech.com.au/products/compilers/PACIFICc.php> but it's not ++

Dave.

## Re: HP-95LX Programming

Message #6 Posted by **Bill (Smithville, NJ)** on 5 Sept 2007, 7:08 a.m.,  
in response to message #1 by Thomas Okken

Hi Thomas,

Congratulations on your HP-95LX. That was my first PDA. I had the 512K version, then had HP upgrade it to 1 MB and then went to the HP-200LX and still use it.

I agree with Chuck that you'll probably want to eventually get the HP-200LX, but there is a lot that can be done on the 95LX.

I just went over my old copies of the HP Palmtop Papers on disk and found PCC, which is a C compiler that is supposed to run on the 95LX. It's shareware so I could send you a copy.

You don't say whether you getting manuals with it, but manuals can be found at:

[HP-95LX Manuals](#)

There's some good technical info at:

[HP-95LX Technical Information](#)

Definetly check out the Palmtop Paper:

[Palmtop Paper](#)

You'll want to browse the early issues which have lots of info on the 95LX.

Don't forget the SuperSite:

[SuperSite](#)

Do a search for 95lx and grab the SUNDRV files. These will let you use up to 32mb ATA flash cards with the 95LX. Otherwise, you'll need to get SRAM memory cards, which are limited to 2 MB.

Not sure if there was a 95LX developer's package. I do have the developers package for the 100/200LX which lets you create System Manager (EXM) compliant programs using Borland C++.

Have Fun.

Bill

*Edited: 5 Sept 2007, 7:12 a.m.*

### **Re: HP-95LX Programming**

Bill,

Special thanks to you (and the maintainer of the Australian HP Museum) for posting the Link to the 95LX User Manual!

This constitutes the "missing link" to LOTUS 123 documented features & commands left out from the 200LX Users Guide.

Best regards

Peter A. Gebhardt

### **Re: HP-95LX Programming**

*Message #8 Posted by **Anthony L. Mach** on 5 Sept 2007, 12:29 p.m.,  
in response to message #1 by Thomas Okken*

Nice purchase!

Well, I use Turbo Pascal 7.0 with mine. I do believe that Turbo 5.5 is still available for free from the Borland website (along with some other compilers). Set yourself up with an old computer and enjoy!

For porting, I ended up making a homebrew cable. I used the smaller end of a four pin CD-ROM to Soundcard (inside the computer) cable and wired it to a serial cable. Surely, the plans are out there somewhere. :) I never got the connectivity pack to work properly under windows. My guess is that you'll have to try some options. There is a program called DosBox that seems to work well - it might work with the connectivity pack. Unfortunately, I have have had the most luck with transferring files using Kermit (use Hyperterminal in windows).

Final thoughts: use good fresh alkaline batteries (watch the polarity carefully!!!) and a new CR2032 for the backup and it should run well.

Have fun!

Tony

### **Thanks!!**

*Message #9 Posted by **Thomas Okken** on 5 Sept 2007, 4:18 p.m.,  
in response to message #1 by Thomas Okken*

Thank you all for your replies. It looks like I'll have no problem getting my hands on some good development

tools!

I was also glad to hear that the manuals are available on-line, since I'm getting this machine without any of them.

One other thing that I'm not getting is a serial cable, but I've heard that the PC<->HP-48 cable is identical, and I do have one of those, so hopefully I'll have everything I need.

Thanks again!

- Thomas

I used my 48/49 cable to link up the 95LX. It should work for you.

### **Re: HP-95LX Programming**

*Message #11 Posted by **Christoph Giesselink** on 5 Sept 2007, 5:01 p.m.,  
in response to message #1 by Thomas Okken*

10 and more years ago I wrote some small programs for the 95LX with MS QuickC 2.0 or MSVC 6.0. Both allowed using inline assembler, but mostly I wrote external ASM files which I assembled with MS MASM 5.1.

The latest DOS mode compiler from MS was Microsoft Visual C++ Version v1.52c for DOS and Windows 3.1x development. This CD was also included in later 32bit MS Compiler packages.

What's the difference between the use of MS compiler on one side and the Turbo / Borland products on the other side?

The 95LX has internal applications. They are started by the "System Manager". With a development kit it was possible to create own applications called by the System Manager. These tools have used the Microsoft Assemblers / Compilers and Make tools. I found a small annotation that it's also possible to create such applications with the Borland compiler, but with more work.

Small excerpt from BORC2EXM.TXT :

Quote:

[...] Yes, believe it or not, you can use Borland tools to create System Manager compliant applications for the 95LX! Although this has been tested only with Turbo C++ and Borland C++, it should work for the whole Turbo C family. The two basic problems to work around are the startup code and the E2M program. [...]

The HP-95LX is using a Intel 8088 CPU core, a 8086 variant with an external 8 bit data bus. For those, in short and incomplete words, who don't know the difference between the 8086 and 80186, the 80186 has the additional real mode opcodes, but not the protected mode of the 80286 CPU.

Hope this helps,

Cheers

Christoph

Quote:

What's the difference between the MS compiler on one side and the Turbo / Borland products on the other side?

The former is from a company once led by a megalomaniacal marketing magician who couldn't stand to be second in anything, and yet was second for years. The latter company is the one that led the maniacs from micro-land with their development tools, starting with Turbo Pascal. This company was led by a self-aggrandizing megalomaniac who was famous for expensive stunts. (Actually, his proclivity for wasteful spending helped give Silicon Valley it's reputation for such things, even though this company was over the hill in Scotts Valley.) For example, he had a 1/5th scale model made of Stonehenge in England, and then shipped the pieces to his headquarters, where it got wrongly assembled by his minions. I worked in their headquarters for a time, in the latter days when the excesses and the megalomaniac were both long gone, and they had retreated to one building on the enormous campus. The company I worked for was leasing another building. It was a very nice place, with soccer field, Olympic pool and baseball diamond, and this subtly askew Stonehenge model.

But you wanted to know about *technical* differences? Well, in the DOS world, Borland's compilers were very, very, very quick. The name "Turbo" was not merely a marketing flourish. But Borland and MS got into a long term fight over the developer market, and it seemed the technical lead would waver, but mostly stayed in Borland's court while DOS was king. But after Windows was released, for some reason Borland couldn't deliver the goods quickly enough, and the quality suffered. I doubt this was due to the same sort of dirty tricks Microsoft was playing on Lotus, Stac, Novell, WordPerfect and a host of others during this same time. It's more likely Borland just forgot how to create developer tools. Amnesia, I would guess.

Be that as it may, my impression is that for DOS, Borland's tools are better, despite Microsoft's valiant attempts to *poison* Borland's devel... \* Ahem, I guess that would that would be slander, if it weren't satire. But for Windows, Visual C-- and its co-conspirators are better, if only for the fact that they've been market leaders so long, that most of the cool examples out there on the net are targeted at those tools.

Regards,  
Howard

EDIT:

Another big difference is that Borland's success began with Pascal, and they continued to support the language. They came out with an Object Oriented version that is in their Delphi products. You won't find comparable support for Pascal in Microsoft's toolbox.

Interesting that the only sign that "it's working" is the power LED. There aren't any pictures of anything on the screen.

Stefan

**Re: UAU ! :-)**

Message #6 Posted by [Namir](#) on 4 Sept 2007, 4:08 p.m.,  
in response to message #1 by gileo

I emailed the seller and asked him to "significantly expand" on his auction text to discuss the state of the different parts of teh computer, any repairs he did, any testing he did. I pointed out that for his asking price he

should give a lot of information to the bidders to assure them that they are not getting a dud.

I suggest other folks ask him similar question?

Namir

*Message #7 Posted by [Howard Owen](#) on 4 Sept 2007, 4:23 p.m.,  
in response to message #1 by gileno*

Check out his other auctions at the bottom of the listing: similarly outrageous prices on other random old hardware.

My prediction: he will go broke from listing fees before he sells one. "Garunteed!"

Regards  
Howard

**Re: UAU ! :-)**

*Message #8 Posted by [Alex L](#) on 4 Sept 2007, 6:02 p.m.,  
in response to message #7 by Howard Owen*

It's a Buy It Now or Best Offer listing. The massive Buy It Now price just means the seller will take a bunch of offers, and isn't obligated to sell at all. It's like having an auction without the commitment to actually sell.

**Re: UAU ! :-)**

*Message #9 Posted by [Howard Owen](#) on 4 Sept 2007, 7:13 p.m.,  
in response to message #8 by Alex L*

I take your point. However, people who know the true value of the stuff he is selling might be disinclined to bid. And folks who don't necessarily know the value are likely to be scared off. So I'd say he's either living in a fantasy world and believes the prices he's posting, or else he's going to be disappointed in the results for the reasons I just gave.

Coburlin sells at outrageous prices, but they are usually a multiple of 2 or 3 times above a reasonable price. Assuming a par price for an HP85 of \$600.00 (which is high, being the price that guy in So Cal is charging for a refurbished machine with a high density tape drive) this guy is selling at  $\$2700/\$600 = 9/2 = 4.5$  times the "high bluebook."

Regards,  
Howard

**Re: UAU ! :-)**

*Message #10 Posted by [Alex L](#) on 5 Sept 2007, 11:53 a.m.,  
in response to message #9 by Howard Owen*

Howard, I agree that the seller is likely to be disappointed on this listing. BUT - suppose he gets *some* offers, declines them all, then uses them to figure out a new Buy It Now price for the next Buy It Now or Best Offer listing. One that is still above the "book" value, but not so high as to scare off those in the know, and maybe, just maybe, low enough to snare that one shopper who just

has to have it and doesn't want to risk letting it fall to offers.

If you view it as an iterative non-auction auction process, it's labor-intensive but possibly effective.

[edited typo]

*Message #12 Posted by [Namir](#) on 4 Sept 2007, 9:27 p.m.,  
in response to message #11 by Bruce Bergman*

I am not a salesman (I studied engineering) but have observed over the years that some people sell at outrageous prices (here and on Amazon) based on (at least) of the following approaches:

1. High price says it's worth something and will appeal to buyers with big egos for whom money means nothing.
2. The seller has nothing to lose (or so he thinks) by asking a high price. Someone, some day, will bite!!

The above lines of thinking are detached from smart marketing that taps into supply and demand strategies. Instead such sellers are looking for the one buyer who clicks the BIN button and pays.

### run time type info on the hp-35s?

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 4 Sept 2007, 8:01 a.m.

Hi,

I know this may very well be RTFM question, feel free to tell me so or ignore, my only excuse (again) is that my manual is in the mail and no pdf of manual put up by the ordinary nice company HP.

Right... been programming the machine in head, one thing I'am wondering about is there a way to tell the dimension of a vector, if it is 2D or 3D vector, propper or trick?

The use I can think of is making user friendly programs; some problems are *similar* in 2D or 3D, it could then be userfriendly to have the same program solve both the 2D and 3D case even if need to compute differently: The program first looks at what the user has given: 2D or 3D input.

I expect this may not be possible, but perhaps?

Regards, Aha

### Re: run time type info on the hp-35s?

Message #2 Posted by [Thomas Klemm](#) on 4 Sept 2007, 9:05 a.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

Quote:

### **Re: Nope :-P [NT] --> an interesting problem**

Message #6 Posted by [Katie Wasserman](#) on 4 Sept 2007, 9:57 p.m.,  
in response to message #5 by Arne Halvorsen (Norway)

This is a tricky problem because there is so little you can do with vectors on the 35s but here's a code fragment that will return 1, 2 or 3 showing the number of elements in a vector:

assumes DEC mode and RPN mode with the vector in X.

```
CF 5      don't stop on overflow
1E499
*         cause an overflow, most likely
LASTx
*         make sure of an overflow!
HEX      produce a TOO BIG number
7FFFFFFFh
/         produce a vector filled with 7FFFFFFFh
LASTx
/         produce a vector filled with 1h
ENTER
*         dot product
DEC
```

unfortunately this has two problems:

1) It doesn't count elements of vectors that are exactly zero. 2) It will give a one for both 1-D vectors and scalars. Ideally you'd want this code to return a zero for a scalar, I would think.

Can anyone do better?

-Katie

*Edited: 6 Sept 2007, 10:35 a.m. after one or more responses were posted*

### **Re: Nope :-P [NT] --> an interesting problem**

Message #7 Posted by [Paul Dale](#) on 5 Sept 2007, 4:08 p.m.,

It also doesn't seem to work for complex numbers...

I've not been able to come up with anything truly discerning either.

- Pauli

**Re: Nope :-P [NT] --> an interesting problem**

Message #8 Posted by [Arne Halvorsen \(Norway\)](#) on 6 Sept 2007, 6:38 a.m.,  
in response to message #6 by Katie Wasserman

Looking forward to try your trick once I get the machine!

Thinking about that it does not work for  $[0, 0], [0, 0, 0]$ : May not turn out to be an issue in most problems. That vector has no direction or length will in many contexts be 'illegal'. The *positional* vectors  $[0, 0], [0, 0, 0]$  are ofcourse legal.

However there is not that much to be done for a single point, take for example a program that accepts a line defined by two points p and q and need to check if user is in 2D or 3D space. One of p or q may be the all zero vector but it will be illegal for q-p to be, so use your method on that vector (if  $\text{abs}(q-p)=0$  the user failed to give valid input anyway...).

*Edited: 6 Sept 2007, 6:41 a.m.*

**Re: Nope :-P [NT] --> an interesting problem**

Message #9 Posted by [Valentin Albillo](#) on 6 Sept 2007, 7:05 a.m.,  
in response to message #8 by Arne Halvorsen (Norway)

Hi, Arne:

Arne wrote:

*"Thinking about that it does not work for  $[0, 0], [0, 0, 0]$ : May not turn out to be an issue in most problems. That vector has no direction or length will in many contexts be 'illegal'."*

$[0], [0, 0]$ , and  $[0, 0, 0]$  are *not* the only vectors which won't work but actually *any* vector having one or more 0 components, such as  $[0, 3]$ ,  $[-1, 0, 7]$ ,  $[2, 0, 0]$ ,  $[3.14, 2.71, 0]$ , etc.

As soon as your vector has a 0 component, the reported dimension will be wrong. This will surely play havoc with the subsequent computations, unless the input to Katie's routine is guaranteed not to include 0 components.

Best regards from V.

**Re: Nope :-P [NT] --> an interesting problem**

Message #10 Posted by [Arne Halvorsen \(Norway\)](#) on 6 Sept 2007, 7:12 a.m.,  
in response to message #9 by Valentin Albillo

Sure, but you can do the  $\text{abs}(v)=0$  test first not caring about the dimension of v before trying to find out it's dimension, right? So if the '0' vector is illegal then method may be usable, I think...

Or are you saying method does not work if 'a' 0 in v? That would be show stopper, sorry do not have machine....

I see that I may have missed that... sorry...

*Edited: 6 Sept 2007, 7:16 a.m.*

### **Re: Nope :-P [NT] --> an interesting problem**

*Message #11 Posted by [Katie Wasserman](#) on 6 Sept 2007, 10:48 a.m.,  
in response to message #10 by Arne Halvorsen (Norway)*

Yes, that's correct *any* element of the vector equal to zero will cause this routine to return a value less than the actual size of the vector. For example [3.14, 2.71, 0] will return a value of 2 not 3.

The more I play with this problem, including complex numbers and scalars as well, the harder it seems. In thinking about this more and generalizing a bit...

A good test (ie, necessary function) for any programmable calculator that can handle more than one type of data is that it should be able to determine the type of data pragmatically. HP, please add this to your list of things to keep in mind for the next version of whatever.

### **Serendipity**

*Message #12 Posted by [Thomas Klemm](#) on 7 Sept 2007, 2:24 a.m.,  
in response to message #6 by Katie Wasserman*

So we still don't have the DIM? for vectors but your clever trick gives us a way to calculate the  $L^1$ -Norm  $|x|_1$  of a vector  $x$ :

```
N001 LBL N
N002 ENTER
N003 CF 5
N004 C
N005 !
N006 *
N007 LASTx
N008 *
N009 LASTx
N010 /
N011 x<>y
N012 *
N013 RTN
```

It doesn't work for complex numbers though!

PS: While searching for a simple way to produce an OVERFLOW I stumbled across the following phenomenon:

TANH(x) for  $30000 \leq x$  produces an OVERFLOW but gives 1 as a result.

What could be the reason for this special limit?

*Edited: 11 Sept 2007, 7:23 p.m. after one or more responses were posted*

### **Re: Serendipity --> Another HP35s bug -- TANH/SINH/COSH**

*Message #13 Posted by [Katie Wasserman](#) on 9 Sept 2007, 12:00 p.m.,  
in response to message #12 by Thomas Klemm*

Quote:

---

TANH(x) for  $30000 \leq x$  produces an OVERFLOW but gives 1 as a result.

---

I think that you found yet another 35s bug, congratulations (or condolences)!

The 32SII and the 33S don't generate this error message. Even if the answer is correct on the 35s, the OVERFLOW message is very misleading.

More investigation reveals genuine bugs for the SINH and COSH functions with large values. For example:

```
SINH 25000 = OVERFLOW --> 1E500  
SINH 30000 = OVERFLOW -- >3E499
```

What seems to happen when the argument is greater than 29999.999... is that the mantissa is kept and the characteristic is changed to 499.

The 33S behaves this way too (was this previously known?), although the 32SII does it right of course.

-Katie

*Edited: 10 Sept 2007, 11:41 p.m. after one or more responses were posted*

---

**Re: Serendipity --> Another HP35s bug -- TANH/SINH/COSH**

Message #14 Posted by [Karl Schneider](#) on 10 Sept 2007, 11:28 p.m.,  
in response to message #13 by Katie Wasserman

Hi, Katie --

Interesting findings. Of course, you are right that the HP-33s/35s responses are incorrect in two ways: Inconsistent "OVERFLOW" result value, and temporary display of "OVERFLOW" for a quotient-function value (TANH) that asymptotically approaches unity, even though each individual term of the quotient might represent "OVERFLOW" conditions.

The inconsistent "OVERFLOW" result values might be related to a bug in the HP-33s (corrected in later models), in which a combination or permutation that was too large ("OVERFLOW") displayed what might have been the last value in the running product, rather than 1E500. That is, an intermediate-step result was displayed in both cases instead of the correct "final value".

Those rock-solid Saturn-processor mathematical routines are to be appreciated.

### Great books that you'll enjoy

Message #1 Posted by [Paul Guertin](#) on 3 Sept 2007, 3:16 p.m.

I just ordered Jean-Michel Muller's book on Elementary functions, and am looking forward to reading it. Thanks to the poster who mentioned it (sorry, I can't find your name right now).

How about a topic for listing books that members of this forum might enjoy? I'll start with five:

1. **Astronomical Algorithms by Jean Meeus** Date of Easter? Precession in elliptical coordinates? Appearance of Saturn's rings? They're all in there.
2. **Hacker's Delight by Henry S. Warren, Jr.** A cookbook of non-obvious ways to mix logical and arithmetic operations in assembler. If you enjoyed MIT's HAKMEM, this is for you.
3. **Software Tools by Kernighan and Plauger** Despite the outdated language used (RATFOR), this remains one of the best books for learning good programming practice through examples.
4. **Threaded Interpretive Languages, by L.G. Loeliger.** Probably hard to find, this vintage book will teach you everything you need to write your own Forth-like language.
5. **Algebra by Michael Artin** (This is abstract algebra, not the linear kind.) This textbook has just the right balance between abstract ideas and concrete examples. If you've ever wondered about permutation groups, polynomial rings, and Galois theory, read this.

### Re: Great books that you'll enjoy

### Just why is the HP-35s so slooow?

Message #1 Posted by [Jeff Kearns](#) on 3 Sept 2007, 3:09 p.m.

Hi everyone,

I am a new poster, having only responded to a couple of other posts here and there but I visit the forum frequently. I received my new HP35s last week and was at first quite pleased that the display was not noticeably askew. I am somewhat disappointed however at the relatively slow speed of the calculator and would like some feedback on this issue. I know it has been discussed that the 35s is slower than the 33s (I managed to sell mine), but when I compare it to the trusty 32sii, it just doesn't measure up, especially for definite integral evaluation and I do not understand why. One example is the evaluation of Vardi's integral (you can find this and other great examples on the Wolfram Mathworld website under definite integrals) to 5 decimal places; the 35s takes 00:01:46 to evaluate this integral compared to 00:01:28 on the 32sii. It takes more than 20% longer on the 35s. I have had even worse results with other programs. What's the logic behind this lack of speed, when you consider that the 33s was quite a bit faster than the Pioneers. It still outperforms the 41CX and the 15C, mind you (except for matrices...). One poster mentioned that there is always a trade-off between speed and battery life, however I will gladly bet that my faster Pioneer will still be going strong on its years-old button cells after many battery changes in the 35s. Thanks, JeffK

### Re: Just why is the HP-35s so slooow?

Message #3 Posted by [Don Shepherd](#) on 3 Sept 2007, 3:30 p.m.,  
in response to message #1 by Jeff Kearns

Jeff, my theory on the slowness of the 35S is this. The register size is 37 bytes, to allow for all kinds of different data types, like vectors and so on. That means every operation involving a register must move 37 bytes into the CPU, versus maybe 8 bytes for an older series calculator that does not have this overhead. I think that must add up. I don't know this is the real reason, but my intuition tells me so.

### Re: Just why is the HP-35s so slooow?

Message #4 Posted by [Raymond Del Tondo](#) on 3 Sept 2007, 4:20 p.m.,  
in response to message #3 by Don Shepherd

Hello,

these 37 bytes are a virtual boundary only.

Since each so-called 'register' is preceded by a status byte, it isn't necessary to always read the whole 'three-in-one' quantity.

Register operations should be even faster than in the 33s,

since type checking can be done by reading a single byte.

Of course I don't know how they actually implemented it...

Maybe the read and write routines always access the whole '3-in-1' quantity of 37 bytes, even for real numbers, in a way like:

Write real number, then two or three times zero, and finally the marker byte, or alike.

That would be easy to implement, but plain dumb from a performance point of view.

Let's hope they lowered the CPU clock rate instead, to preserve batts;-)

Raymond

## Re: Just why is the HP-35s so slooow?

Message #5 Posted by [Karl Schneider](#) on 3 Sept 2007, 4:33 p.m.,  
in response to message #1 by Jeff Kearns

Welcome, Jeff --

Quote:

.. but when I compare (*the HP-35s*) to the trusty 32sii, it just doesn't measure up, especially for definite integral evaluation and I do not understand why. One example is the evaluation of Vardi's integral ... to 5 decimal places;

There's an unobvious, but important difference between the HP-32SII and the HP-33s/35s in the meaning of the display setting for specifying the "uncertainty" of the user's integrand function.

On the HP-35SII, "FIX 5" sets an absolute uncertainty of 0.000005 -- i.e., the fifth decimal digit is assumed to show the correct rounded function value. On the HP-33s and HP-35s, "FIX 5" sets a relative uncertainty of 0.00001 -- i.e., the uncertainty is the absolute value of the function multiplied by 1E-05.

So, if the magnitude of the integrand function is small (say, less than 0.1), "FIX n" specifies a tighter tolerance for the integrand on the HP-35s than on the HP-32SII. This will prompt more evaluations of the functions, and longer execution time for integration. Conversely, if the magnitude of the integrand function is large (say, greater than 10), the HP-35s, er, *might* be faster for a "FIX n" setting.

That difference having been acknowledged, the HP-35s does seem to be substantially slower for integration than the HP-33s. My favorite example is that of integrating

$$f(x) = \sqrt{x}/(x-1) - 1/\ln(x)$$

for x between 0 and 1.

(This problem was originally presented in the HP Journal article from 1980 describing the INTEG function on the HP-34C. The example was later presented in the HP-15C Advanced Functions Handbook, the HP-71B Math ROM manual, and probably others.)

With a "FIX 6" setting, the HP-33s and HP-35s return the same results (0.0364899763890 with estimated error 3.648998E-08). Representing f(x) as a keystroke program (not an equation), the HP-35s takes 4:05 minutes; the HP-33s takes 2:15 minutes.

Neither the HP-33s nor the HP-35s manuals explain the details of the integrand accuracy setting. I inferred it from comparisons with the HP-48G, for which the methods are explained and the results are identical. Please see the following article and thread:

[HP SOLVE-INTEG on all RPN-based models](#)

[Uncertainty and accuracy for numerical integration](#)

**MEMORYLOST the sweetest word ever!!!**

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 3 Sept 2007, 1:48 p.m.

Hi,

I probably should make this into some memory entry, but it happened right now and I just wanna share!

Some of you may have read this newbie's posts and know I am getting back in the game of hp rpn calculators because of the new 35s (in the mail).

Ok, my history with hp programmables are I started late primary school, my first programs (ever, I become a programmer) done on a HP-33E I \*think\* (at some point I sold it).

In high school I borrowed money from my brother and got me a HP-41cv, loved that machine. Wrote astronomic programs. After three years in high school it lasted through my 15 months mandatory military service. Then just about at the time going to university it fell to ground and would never more woke up!

I could not bring me to throw it away, but it got placed away somewhere...

All this 'hp35s I am going to have a big enter calc again' brought back memories, so this weekend visiting my parents place I did some snooping around... and under a ton of dust on top of a cabinet I found it... The calculator inside the holster so it was dust free, battery pack beside with some very old batteries in it...

Put it in and turn it on nothing... Ofcourse, these batteries are more 15+ year old...

I had to try, got out and got me four lr1 ones, brand new..., put it in...

Nothing... well, well...

Then after a minute or so, I tried again....

And suddenly... a word

>MEMORYLOST

And then

>0.0000

I tried

2 enter +

>4.0000

I am a bit emotional right now..., sure you guys understand...

**Re: MEMORYLOST the sweetest word ever!!!**

*Message #2 Posted by [Stefan Vorkoetter](#) on 3 Sept 2007, 2:32 p.m.,  
in response to message #1 by Arne Halvorsen (Norway)*

We understand!

I suspect when you initially dropped it that the plastic posts that the back screws into got cracked. It may be that it will once again stop working if there's not enough pressure pressing the logic board against the backplane. You might want to open it up (screws under the feet) and take a look.

Stefan

**Re: MEMORYLOST the sweetest word ever!!!**

*Message #3 Posted by [Arne Halvorsen \(Norway\)](#) on 3 Sept 2007, 6:11 p.m.,  
in response to message #2 by Stefan Vorkoetter*

Thanks, it sounds like you may have nailed it... The machine is ofcourse not ok; it was not power it ran out of all those years ago...

But it was working fine 10 or 15 min just me testing it in no prgm mode, then I tried to hit the prgrm key; no mode change.

But after some more prgrm key hits I did get into pgrm mode and enter a small program (thanks to the museum for providing basic 41 prgram info, I don't remember this stuff anymore!).

Then I started to get problems again with the power key...

But I am a bit excited! There seems to be 15+ year old live 41cv inside a broken shell. What do you experts say, sounds fixable? A job for the 'fix that calc' guys?

Yea, I know, I could get one on ebay if the point is just to have a working one, but there is the (silly) sentimental side, and the side that there could be one more live 41 in the world...

### HP50g (Vibration Analyzer)

Message #1 Posted by [Brad Davis](#) on 3 Sept 2007, 1:19 p.m.

I do vibration testing (single channel FFT and multi-channel modal analysis--pretty simple stuff as vibe testing goes) and had an interesting thought a couple of days ago.

Does anyone know of a vibration analyzer developed around the HP50g, single channel or otherwise? I searched briefly online and didn't find anything. Currently, analyzers are heinously expensive for the most part. There is one developed around a Palm device that is only a few thousand bucks, but the Palm has its own problems, IMO.

The 50g has FFT and IFFT and I have to think it's fast enough to at least work as a two channel input-only analyzer.

### Re: HP50g (Vibration Analyzer)

Message #2 Posted by [Donald Williams](#) on 3 Sept 2007, 1:24 p.m.,  
in response to message #1 by Brad Davis

What is your highest frequency of interest? Since you are stuck with serial data transfer, that would probably limit your frequency response - unless your sensor/data acquisition device had on board memory.

### Re: HP50g (Vibration Analyzer)

Message #3 Posted by [Brad Davis](#) on 3 Sept 2007, 1:36 p.m.,  
in response to message #2 by Donald Williams

20 Hz max, almost never > 10 Hz. Civil engineering applications, mostly floors.

### Re: HP50g (Vibration Analyzer)

Message #4 Posted by [Donald Williams](#) on 3 Sept 2007, 2:00 p.m.,  
in response to message #3 by Brad Davis

This is not a high quality device, but interesting. Cheap price.

[Here](#)

I think it can be interfaced to the 50G through a CBL, but I have not personally attempted this.

### Re: HP50g (Vibration Analyzer)

Message #5 Posted by [Jeff Kearns](#) on 3 Sept 2007, 2:48 p.m.,  
in response to message #4 by Donald Williams

The note on that page reads: "All Vernier products are designed for educational use only. Our equipment is not designed or recommended for research or any apparatus involved with any industrial or commercial process such as life support, patient diagnosis, control of a manufacturing

process, or industrial testing of any kind."

I would not recommend using this device for your application. They do refer you to a different website for industrial apps.

Regards,

JeffK

**Re: HP50g (Vibration Analyzer)**

*Message #6 Posted by **DaveJ** on 3 Sept 2007, 5:11 p.m.,  
in response to message #1 by Brad Davis*

The market for that would be ridiculously small, so I'd be very surprised if there is any commercial product. There is a Compact Flash one for Pocket PC's: <http://www.easylaser.com/MicroVibe.htm>

Dave.

**Re: HP50g (Vibration Analyzer)**

*Message #7 Posted by **Brad Davis** on 3 Sept 2007, 5:23 p.m.,  
in response to message #6 by DaveJ*

Yeah, no doubt it would be a small market. Then again, folks have done it for the Palm and I've heard of one that was software only that worked with a high-end notebook computer sound card.

I figured that somebody might've programmed one almost for fun.

Thanks everybody.

**Re: HP50g (Vibration Analyzer)**

*Message #8 Posted by **DaveJ** on 3 Sept 2007, 6:01 p.m.,  
in response to message #7 by Brad Davis*

Quote:

Then again, folks have done it for the Palm

Yes, but the Palm is a massive market compared with the 50G though. Plus it has a bigger more suitable screen, is more readily available, development tools are better etc

Quote:

and I've heard of one that was software only that worked with a high-end notebook computer sound card.

Yes, plenty of those around, even Freeware.

Quote:

I figured that somebody might've programmed one almost for fun.

Well, software ain't enough of course, you need a decent hardware front end.

Do you \*really\* want to see FFT's on that tiny 50G screen?

Dave.

### **Re: HP50g (Vibration Analyzer)**

*Message #9 Posted by [BruceH](#) on 3 Sept 2007, 6:21 p.m.,  
in response to message #7 by Brad Davis*

You need to get in touch with Brian McGuire at Saltire Software. They are developing [this](#). The prototype was demonstrated at last year's conference (HHC2006) and it was **excellent**. Sadly, nothing seems to have happened in the meantime.

He demonstrated an accelerometer attached to a wooden ruler which was "pinged" on the desk. So it is more than capable of picking up your 20Hz max frequency but you would have to ask about the sensitivity. (Although the instrument bit is interchangeable so you could always fit a more sensitive accelerometer.)

Please do get in touch with him (and hassle through Richard Nelson if you don't get anywhere) because if you were willing to be a real-life case-study then that might just give HP the impetus they need to give Saltire a poke and get things going again.

### **Re: HP50g (Vibration Analyzer)**

*Message #10 Posted by [Matt Kernal](#) on 4 Sept 2007, 5:20 p.m.,  
in response to message #9 by BruceH*

I want to second Bruce's opinion.. Brian McGuire's demo of the Saltire Data Streamer was **impressive!** I remember seeing, on more than one occasion, HP representatives talking with Brian outside of the main conference following his presentation. I was glad to see HP's interest in the product. Hopefully we'll see more this "Mobile Digital Laboratory" collaboration soon.

### **Re: HP50g (Vibration Analyzer)**

*Message #11 Posted by [Dave Shaffer \(Arizona\)](#) on 3 Sept 2007, 7:29 p.m.,  
in response to message #1 by Brad Davis*

Are you more concerned about price or size/portability?

As others have noted, the price could be quite reasonable if you use a PC sound card, or the Vernier unit referred to by Don Williams.

You'd still need an accelerometer of some kind, but you can get a very simple but adequate A/D convertor from folks like DATAQ (their 240 sample per second unit is well under \$100). I've played with it and like it.

By the way, the Vernier unit is part of a very large data collection and analysis system designed primarily for educational labs, and interfaced to either PCs or TI8x calcs (USB or serial). Their warning is mostly a CYA so that somebody (who'd have to be approaching brain-dead himself) doesn't use their stuff for life-critical purposes. For a testing lab, they should be quite OK (that's why they pay us scientists and engineers the big bucks: to decide what kind of lab/test equipment is suitable for the applications at hand!).

internal: CNA6213326 external: CNA61806979 NO TYPOS :) reth

**Re: 50g Serials**

Message #6 Posted by [John Keith](#) on 3 Sept 2007, 8:28 a.m.,  
in response to message #1 by Tim Wessman

External: CNA63802810

Internal: CNA6301349

Since the serial # format is YWWnnnn the only way they would be the same is if the calc is assembled the same week as the chip (ROM, flash?) is programmed, and even then the following digits are probably assigned sequentially and seem to have 4 digits internally and 5 digits externally. In other words, I doubt they would ever be identical.

John

### **Alt-Az accuracy with HP 35S**

Message #1 Posted by **Howard Lazerson** on 2 Sept 2007, 3:14 p.m.

We have had clear skies in S. Calif the past week allowing me to check out the accuracy of the alt az pgm posted a few weeks ago. The pgm delivers +- 1.5 degree theoretical accuracy with many objects less than one degree. This means if the scope is level [ a simple bubble level wii suffice ] and the az and alt circles well laid out, most objects should fall in or just outside the field of view of a wide fied eyepiece. This is exactly what happened using my 5" f5 refractor mounted on a simple wood fork mount. Objects were checked on both sides of the meridian at various altitudes. Regards, Howard

### Early HP 70

Message #1 Posted by [Michael Eckstein](#) on 2 Sept 2007, 2:46 p.m.

I present an information for HP calculators collectors, who may be interested in the information about lowest serial numbers of old calculators:

I have found HP 70 with early S/N. It's earlier than the earliest known HP 70 S/N here at this [Hpmuseum page](#)

That calculator was owned by the former HP manager working in HP at that time, so he could acquire it just at the first moment of the HP 70 release. Here are some images:

<http://members.chello.cz/eckstein/hp70-3.jpg> <http://members.chello.cz/eckstein/hp70-4.jpg>

### Web site update: A new article & more !

Message #1 Posted by [Valentin Albillo](#) on 2 Sept 2007, 11:57 a.m.

Hi all:

I've just updated [my HP calc website](#) to include some new goodies for you to freely download if interested, namely:

- **New PDF article online: "Long Live The HP-34C !":**

This is a 9-page article dedicated to the wonderful **HP-34C**, a landmark of vintage HP calculator design in many aspects, which introduced for the first time a number of state-of-the-art computing capabilities never before seen in any handheld device.

The article includes fond *personal remembrances* related to this model, as well as an *application program* taking full advantage of some of its most advanced built-in capabilities.

- **New Section: "My Challenges":**

This section will feature my "*Mini-Challenges*" and "*Short & Sweet Math Challenges*", as originally posted to the [Forum of The Museum of HP Calculators](#).

For this particular update, one Mini-Challenge and three S&SMC are now available in PDF format at my site.

I hope you enjoy them. Any and all comments are truly welcome.

Best regards from V.

### Re: Web site update: An HP-34C article & more !

Message #2 Posted by [Karl Schneider](#) on 2 Sept 2007, 4:02 p.m.,  
in response to message #1 by [Valentin Albillo](#)

Hi, Valentin --

A "congratulations" on the updated website, and a "thanks" for the new HP-34C article.

My remembrances of the HP models of that time were similar: I was enthralled by the HP-41 in 1980, but couldn't afford it. I was impressed by the HP-34C being used by another university student in 1981. Setting out to buy one in late 1983, I was steered by the young salesman to buy the HP-15C instead. It took some convincing to revise my plans and expectations.

One quibble: I realize that the article was meant to be celebratory, with minimal emphasis on problems. However, the phrase, "build quality suffered a little in the end, most specially delicate battery contacts" is misleading. As I'm sure you know, the late HP-34C's from 1982 corrected the main problem of the flawed

original design, which was the non-soldered circuit boards that relied instead on strong clamping pressure and a heavy metal backing. Key feel was also improved, with less travel and required effort.

The delicate battery terminals were probably OK as long as users stuck with the standard HP NiCd two-cell rechargeable battery packs. Unfortunately, the packs probably offered short operating time on a charge, and cost US\$12 to replace in the 1980's when they failed. Many users substituted the longer disposable AA cells, and broke the contacts.

It's certainly to HP's credit that they spent the money and effort in 1981-82 to remedy the HP-34C's design problems, before its 1983 discontinuation following the release of the HP-15C in late 1982. The HP-15C rendered the HP-34C obsolete -- except perhaps for field work particularly in cold conditions, for which the HP-34C's vertical layout and LED display were better suited.

-- KS

Although my first HP calc was the 25 (and 25c about a month later :-), I traded up to the 34c the next year. It was an amazing calc, and one that was well worth the upgrade. I still have it, and I'm quite surprised to find that there are features to it I STILL haven't seen or used. Either that or I've forgotten about it. ;-) In any case, it truly is one amazing calculator, and one of the best HP made around that time.

Fond memories...

thanks, bruce

**Free equation editor**

Message #1 Posted by [Bruce Bergman](#) on 1 Sept 2007, 4:59 p.m.

Not sure if people know about this site, but they have something today that might interest folks the here.

GiveAwayOfTheDay is a site that offers one normally-commercial program FREE per day. They make a deal with software vendors to help them release new programs, help them get word out about their software and company, etc. The software often ranges in value from \$10 to as much as \$249. The best part is that these are all legit and legal programs, fully enabled, all 100% free of spam, phishes, spyware, etc. You don't have to sign up for anything or even give them your name. The bad part is you sometimes have to sit through a run of silly screensavers or other junky programs to get to the jewels. I'd say about 20% of the time I find some really cool stuff from these guys -- I check them daily.

Anyhow, today they have a Windows-based Equation Editor/Solver. Check it out:

[GiveAwayOfTheDay.com](http://GiveAwayOfTheDay.com)

(I have yet to download it today, so I'll leave the reviews to those of you who are the experts in math...)

thanks, bruce

**Re: Free equation editor**

Message #2 Posted by [Dave Colver](#) on 1 Sept 2007, 5:20 p.m.,  
in response to message #1 by Bruce Bergman

Thanks Bruce - its rather fun!

Silly restriction on taking a factorial of a number greater than 20 though.

**Re: Free equation editor**

Message #3 Posted by [Walter B](#) on 1 Sept 2007, 6:01 p.m.,  
in response to message #2 by Dave Colver

Thanks Bruce! To all: there are only 9 hours left to get it for free ...

**Re: Free equation editor**

Message #4 Posted by [Raymond Del Tondo](#) on 1 Sept 2007, 7:24 p.m.,  
in response to message #1 by Bruce Bergman

Thanks for the link.

However, I won't download it.

One of the reviewers wrote that you have to run a program named activate.exe to be able to actually use the editor.

This rang my alarm bells.

For all others: Set a recovery point before installing the editor;-)

### **Re: Free equation editor**

*Message #5 Posted by [Ed Look](#) on 1 Sept 2007, 8:29 p.m., in response to message #4 by Raymond Del Tondo*

Raymond, what do you think activate.exe does?

### **Re: Free equation editor**

*Message #6 Posted by [Raymond Del Tondo](#) on 1 Sept 2007, 9:23 p.m., in response to message #5 by Ed Look*

I think it establishes an internet connection to a company I never heard of before, to retrieve the activation key.

This could have been achieved in a more passive way, either through email or via a web page the user has to visit to get the activation key.

Programs like 'download.exe' or 'activate.exe' are always suspicious these days, to contain some more code than needed.

Since I want to keep my PC free of trojans, viruses, or other malware, I don't download everything advertized as 'free';-)

### **Re: Free equation editor**

*Message #7 Posted by [Bruce Bergman](#) on 1 Sept 2007, 11:58 p.m., in response to message #6 by Raymond Del Tondo*

I have been using software -- and this web site -- for well over a year. I can tell you that in that period of time, even after almost daily checking to see what is knew and reading reviews, this group has only ONCE been caught off-guard. In that instance, the software included some questionable add-on executables by the manufacturer that could marginally be considered spyware. Within 30 minutes of being alerted to this by the community, the software was removed.

Yes, you must run activate.exe. All that does is connect to the GAOTD web site to retrieve the activation codes for the software you downloaded. As I said, these are full commercial software packages, and 99% of them require activation codes. When GAOTD makes a deal for one of the packages, they handle the activation for that 24 hour period. Once the 24 hour period is up, you cannot activate or register the software you downloaded. The activation does NOTHING more than connect, retrieve the code, validate the offer of the day, and then activate your software. While it might log your IP address, it never asks for emails, never pulls any other personal information.

They don't use passive methods because they verify that the software you download is within the 24 hour period of the offer. That's part of the deal they make with the manufacturers.

In fact, if you go read the policy and terms for the site, you'll see that they "guarantee" no spyware, no malware, ads, no viruses, etc. These guys go to great lengths to ensure that nothing untoward happens, and trust me, they'd lose their readership in 10 minutes if they ever did any shady.

I applaud caution in this day and age, and I definitely took care the first time I used this service, but this has been one of the few places that has EVERY TIME lived up to their word and been above board. Of course, it's your personal choice, but I'd recommend you give them a chance.

thanks, bruce

### **Re: Free equation editor**

*Message #8 Posted by **Ed Look** on 2 Sept 2007, 12:11 a.m.,  
in response to message #7 by Bruce Bergman*

This is all good to hear. I have installed it. It looks great, except I was a little surprised and disappointed to see that it only solves algebraic equations.

But hey, if I have a tough integral or differential expression, I guess I could always use a HP calculator... ;)

(More'n likely tho', I'd probably reach for a math table or some such to see if there is some "easier" analytical way out first.)

### **Re: Free equation editor - More Advice**

*Message #9 Posted by **Bruce Bergman** on 2 Sept 2007, 11:01 a.m.,  
in response to message #7 by Bruce Bergman*

A few other suggestions for new GAOTD readers:

- 1) Be sure to look at the thumbs-up vs. thumbs-down rating on the download page. That will give you a very quick idea of whether the software offered for the day is worthwhile or not.
- 2) Once you've glanced at the ratings, then read some of the comments. Especially if there is a high number of thumbs-down and it otherwise seems like a good download.

For example, the other day I saw an Apache Web Monitor program. Looked great, and I was excited. However it was (at that time) 45% thumbs-down, which surprised me. I checked and found out that it was of limited use, and only for Apache installations running on Windows boxes (a very small minority). While I was one of the few who had an Apache running on my box, the comments also said it had problems with large log files, it crashes occasionally, and there were other open-source alternatives. So I passed.

Use the ratings and the comments; they're usually right on.

- 3) When installing the software, make sure you install it first, run the activation program (if one is included; see next note) and THEN run the software. Sometimes if you run it before activation, it tries to get you to register, and that will result in a failure.
- 4) Some of the installs use the "new" method, which installs and activates in one step. Some use the "old" method, which has two executables in the zip file. In this case, consult the previous note to make sure you install things in the right order.

All Game GAOTD downloads use the "new" method where there is only one activation. However, right now, the Game GAOTD (GGAOTD!) is on vacation. It should come back in late September, and then you have two sites to visit. ;-)

- 5) Some activations come as a text window that opens up and gives you the registration code.

Just copy-n-paste it into the registration window once you start the app.

6) Every GAOTD download must be downloaded and activated in the 24 hour period. If you miss the deadline and a new offering comes up, you are generally out of luck on activation. Even if you have already installed the software, you have to activate it before the deadline.

That being said, there appears to be a loophole in this, related to timezones. Out here on the west coast, I can download one of the offerings and as long as I install it and activate it before 2am my time, the activation works. Even if there is a new offering on the main GAOTD page. I've done this a few times, when I didn't make it home before midnight, but a cool program was out. As long as I do the activation before 2am, I'm good. Note that you **STILL** must download the software before midnight though, or you miss it. I don't know if this is the same in other timezones, BTW.

Don't tell anyone else about #6. :-)

7) Some of the downloads are really big. There was one a while back that was over 600MB. Use the mirror site if you see performance problems on the main download site. Start your download early in the morning, so that you can come back later and install and activate it. Use trick #6 if you run out of time and are near the deadline.

8) As you can never activate a program after the deadline, once you've installed and activated it, you might as well delete the download file. If you want to buy more of what you got for free, you can always contact the manufacturer through Help->About. For all practical purposes, the original download file won't ever be useful to you again, and just takes up space.

thanks, bruce

**Size of BH's shirt pocket**

Message #1 Posted by [Peter Niessen](#) on 1 Sept 2007, 10:46 a.m.

Hi all,

this is maybe a question for the (elementary) math teachers here (or others who deal with rulers on a daily basis).

[The Wikipedia article on the HP 35](#) mentions

Quote:

The HP-35 was exactly 5.8 inches long and 3.2 inches wide. This was the size of William Hewlett's pocket, hence "pocket calculator".

[HP museum confirms these dimensions here](#). Now the question: Can you buy rulers which will have tick marks at these distances? If not, any idea how these numbers were determined?

Cheers, Peter.

I guess I should wish all the people who can potentially answer this a nice 3 day weekend.

**Re: Size of BH's shirt pocket**

Message #2 Posted by [Dave Shaffer \(Arizona\)](#) on 1 Sept 2007, 11:46 a.m.,  
in response to message #1 by Peter Niessen

Quote:

Now the question: Can you buy rulers which will have tick marks at these distances? If not, any idea how these numbers were determined?

You can readily buy engineering rulers which are triangular in cross section and a foot long, and have six different scales along the vertices (one along each side of each vertex): 10, 20, 30, 40, 50, and 60 divisions per inch.

So, measuring with 0.1 inch tick marks would have been no challenge, especially to a group of engineers in the 1970s.

"HOW" they actually did it, I've no idea! Probably measured Bill's shirt itself, with or without him in it.

**Re: Size of BH's shirt pocket**

Message #3 Posted by [db \(martinez, ca.\)](#) on 1 Sept 2007, 11:56 a.m.,  
in response to message #1 by Peter Niessen

They probably did it the same way engineers always get their data. They sent a surveyor to measure it for

them.

**Re: Size of BH's shirt pocket**

*Message #4 Posted by [Jesse Dodd](#) on 1 Sept 2007, 12:10 p.m.,  
in response to message #1 by Peter Niessen*

It's difficult to use a ruler to measure a three dimensional object. Most mechanical engineers would use a micrometer:

<http://en.wikipedia.org/wiki/Micrometer>

These devices are usually accurate to .005 of an inch.

**Re: Size of BH's shirt pocket**

*Message #5 Posted by [Hugh Evans](#) on 1 Sept 2007, 1:27 p.m.,  
in response to message #4 by Jesse Dodd*

For operations such as part inspection or QC, yes. But a shirt pocket? I'd just reach for a ruler.

**Re: Size of BH's shirt pocket**

*Message #6 Posted by [Fred Lusk](#) on 1 Sept 2007, 1:42 p.m.,  
in response to message #4 by Jesse Dodd*

Yes, but...these were electrical engineers, and EEs do almost everything as a schematic without reference to actual dimensions :-)

**Re: Size of BH's shirt pocket**

*Message #7 Posted by [Stefan Vorkoetter](#) on 1 Sept 2007, 1:31 p.m.,  
in response to message #1 by Peter Niessen*

I have several rulers that are graduated in 1/10 and 1/50 inch increments.

Stefan

**Re: Size of BH's shirt pocket**

*Message #8 Posted by [Walter B](#) on 1 Sept 2007, 3:50 p.m.,  
in response to message #1 by Peter Niessen*

Assume they have used a slide gauge. No problem to measure pocket with these.

**Re: Size of BH's shirt pocket**

*Message #9 Posted by [Peter Niessen](#) on 1 Sept 2007, 7:49 p.m.,  
in response to message #8 by Walter B*

Quote:

Assume they have used a slide gauge. No problem to measure pocket with these.

This sounds logical. The ones I've seen however are all scaled in  $(1/2)^2$ " [like this one](#).

However, I'll go to WalMart next possible opportunity and buy one of these rulers which Stefan V. mentioned. I should get some discount in the "back to school" department :-). Maybe they even have the nice ones with the little cats or ponies.

Cheers, Peter.

**Re: Size of BH's shirt pocket: No golden ratio here...**

Message #10 Posted by [Andrés C. Rodríguez](#) on 1 Sept 2007, 4:10 p.m.,  
in response to message #1 by Peter Niessen

I expected otherwise, but just checked and saw that BH's pocket was not governed by the golden ratio.

With some disappointment (and no math), Andrés

PS: Somewhere I read a story in which Sony CEO Morita challenged his engineers to create the first Discman (portable CD player). According to the tale, Morita kept a wood block as a physical specification of what he wanted, avoiding tricks with the targeted size.

*Edited: 1 Sept 2007, 4:11 p.m.*

**Re: Size of BH's shirt pocket: No golden ratio here...**

Message #11 Posted by [Bill \(Smithville, NJ\)](#) on 1 Sept 2007, 4:41 p.m.,  
in response to message #10 by Andrés C. Rodríguez

Quote:

According to the tale, Morita kept a wood block as a physical specification of what he wanted

This trick was used for many a great design.

Walter Zapp used a wood block to determine the size for the first Minox camera. the wood block still exists and there is a photo of it in the book "Spy Camera, the Minox Story".

Jeff Hawkins used a similar method in developing the Palm Pilot. From the "The Next Small Thing" at [Fastcompany.com](#):

Quote:

How small is small enough? His answer yielded the second principle: Small enough to fit in a shirt pocket. He paced the hallways at Palm headquarters, ruler in hand, measuring pocket sizes against small blocks of balsa wood.

Original Link to Full Article: [The Next Small Thing](#)

Tony

### Re: Strange calculator math?

Message #4 Posted by [Maximilian Hohmann](#) on 1 Sept 2007, 5:13 a.m.,  
in response to message #1 by Bruce Bergman

Hello!

Quote:

Found this on an auction site.

Thank you so much for this link, I've been looking for this thing quite some time and actually never seen one on eBay in Europe. Soon I will own one .-) (But there is one left with the seller right now).

But this calculator does not, unfortunately, have any kind of 'strange' math implemented. It is plain and simple

'AOS' (not really, because for true AOS, introduced by Ti when they brought out the SR-52, you need parentheses). They only placed the '=' on the '+' and '-' keys, thereby gaining a key for '%', 'sqrt' or whatever. The calculator 'knows' when to interpret the keystroke as '+' or '='. This practise was very common then and I think, that I have more calculators built like this than otherwise.

Greetings, Max

### OT - Dot Matrix Display

Message #1 Posted by [Oswaldo Rodriguez](#) on 31 Aug 2007, 2:42 p.m.

Has anyone ever had consistent problems with dot matrix display on calculators after not using the calculator for several months. I never have problems with HP or Casio calculators, however, several of my sharp and TI calculators; after being stored away for several months, I take them out to play with them again the some of the displays will have missing rows and columns of pixels. Typically I have to use them daily for a couple of weeks and the displays slowly come back. However, on some the displays just gets worst.

This has happened with the following models sharp pc 1350 sharp el-9000 sharp el-9900 Radio Shack ec-4033 And several low end TI models, like the TI-25 and TI-35/36

Oswaldo Rodriguez

### Re: OT - Dot Matrix Display

Message #2 Posted by [Ken Shaw](#) on 31 Aug 2007, 4:34 p.m.,  
in response to message #1 by Oswaldo Rodriguez

I have a Sharp EL-9000 from 1988 that I use only rarely. All the pixels work and I have never observed a problem with them.

### Re: OT - Dot Matrix Display

Message #3 Posted by [Giancarlo \(Italy\)](#) on 31 Aug 2007, 5:00 p.m.,  
in response to message #1 by Oswaldo Rodriguez

Hi Oswaldo.

I have a Sharp PC-1401 since my college days (a dozen years ago - sigh!) and all the rows and columns of pixels seem to work fine, but the "edge" of each square pixel seems not to be that "sharp" (no pun intended).

It is as the pixels started to "wear out".....

Hope this helps.

Best regards.

Giancarlo

### Re: OT - Dot Matrix Display

Message #4 Posted by [Antonio Maschio \(Italy\)](#) on 1 Sept 2007, 11:07 a.m.,  
in response to message #3 by Giancarlo (Italy)

Wow! I too used a PC-1401 as a calculation companion during my high school (final years of the liceo scientifico) and the first years of my Civil Engineering years (the most involved with math). It still works perfectly, and it's one the non-HP calculators I use more.

Think: I tried to substitute it with a Sharp PC-E500 during my job first year, but its gum keys tended not to

respond correctly, so I reverted to my (limited) PC-1401, which has a fine keyboard, though not comparable to the one of my HP-15C.

I used to keep the 1401 full of BASIC programs, which performed quite everything, from beam calculation to easter day determination, from statistical (short) programs to the calculation of stars magnitudo.

Once I bought the HP-32SII in 1998, it fell into oblivion, for a while, until I discovered the programs got lost because batteries ran out. No leaking, though, so it's perfect still today.

I've got a little nostalgia for old BASIC calculators: they were both calculators and small computers.

-- Antonio

P.S. can you report its Serial Number, and the year you bought it, if you remember?

### **Re: OT - Dot Matrix Display**

*Message #5 Posted by [Giancarlo \(Italy\)](#) on 3 Sept 2007, 2:32 a.m.,  
in response to message #4 by Antonio Maschio (Italy)*

Ciao Antonio.

My PC-1401's serial number is: 57049935

I purchased it around 1987 (more or less - can't remember exactly...) and it always worked flawlessly :-)

I too used to keep all sort of programs stuffed in it; I can still remember an amazing BASIC program that I regularly used for drawing Bode diagrams - a great help during the exam :-)

It still works perfectly, except for that strange "wear" of the pixels edge...

Did you ever notice the ""hissing" the 1401 was used to do when doing some long and hard calculation or program?

It could be heard just by putting the back of the calc close to the ear....

Best regards.

Giancarlo

No. To tell the truth, this is the first time I hear news about buzzes and hisses of the 1401 during (long) program executions. My unit works in perfect silence (of course, I may report a different thing in a few days - Murphy's law!)

Thanks for your data. I'll use them to retrieve the year when I bought it circa, since I forgot completely.

My HP-41CX used to do that, too. No sound when the machine was off, a very faint noise when it was on but idle, and a kind of "hissing" when it was running a program.

That's the fan. It kicks in when the CPU is under load. My notebook does the same. The 41CX is an incredible machine.

I've heard that *tin whiskers* are a problem with aging electronics. The leads of components on a circuit board get shorted by microscopic crystalline tin growths.

I think there was even something recently on the Discovery Channel here in the US about this phenomena. From what I understand, the conditions in which these occur aren't understood, but everything from satellites to calculators have succumb to its effects.

Given that what you're seeing develops over time, it would seem possible tin whiskers might be at fault.

Dan:

Very interesting reading. One of the articles is from HP, apparently they have a program where they train engineers to test for and identify whisker formation in electronics. Furthermore one of the articles mentioned in some situations low currents, those less than 10 mA can lead to permanent shorts, however, if you pass currents greater than 10 mA it may be able to melt the whisker and resume seminormal contact. As I mentioned, for some of the calculators, they problem begins to go away the more I use them. I'll keep reading.

Thanks

Oswaldo

*Message #11 Posted by [Dan Greil](#) on 31 Aug 2007, 11:07 p.m.,  
in response to message #10 by Oswaldo Rodriguez*

The first I'd heard of whiskers was in regard to the raised-floor tiles where I work. I was surprised that we contracted a firm to come in periodically, take out the tiles and clean them and the floor underneath. I asked why only to be told about zinc whiskers which grow on the tiles and when broken off can get ingested by air-cooled equipment. The effect is similar to tin whiskers but the source is air-borne instead of growth from within.

[NASA's Other Metal Whiskers Site](#)

Regarding the higher current remedy for tin whiskers, we're probably doomed there with LCD displays consuming mere micro or even nano-amps. Older calculators with LED displays would likely consume >10mA but that may be confined to the display circuit leaving the rest vulnerable.

Tin whiskers are only a problem with the new lead-free solders. I have two HP-71's from 20 years ago that have never had a problem of any kind.

Garth,

That's interesting. So when gaining RoHS certification (by being lead-free) components are now more vulnerable to tin whiskers.

Everything is a trade-off.

Message #14 Posted by [Garth Wilson](#) on 1 Sept 2007, 2:25 a.m.,  
in response to message #13 by Dan Greil

Our company has been watching this RoHS garbage carefully. So far our markets have not required us to go RoHS, but I've collected and read a lot of articles because I suspect we will have to convert at some point. We would just rather let other companies be the guinea pigs and get the problems figured out before we get into it.

There are a lot of disadvantages to lead-free besides tin whiskers, such as that lead-free solder does not wet as well, requires higher soldering temperatures that cause other problems, and it cracks a lot more easily. All of this, I believe, for nothing. I grew up in another country and all our drinking water came to us in lead pipes, and yet a high percentage of the kids in the grade school I went to became doctors and engineers. So did all that lead hurt our brains? Near me now is a local land fill with decades of electronics waste in it, and the water company sends a report on the ground water quality every year along with the water bill. The quantity of lead in it is about one-eighth as high as it would need to be to take action, and the suspected source is "erosion of natural deposits," not the landfill.

My understanding is that the Lead (pb) in solder prevents these tin whiskers, and that recent environmental laws have banned lead, so this should not be a problem with most things created before the laws if they are using tin/lead solder.

Message #16 Posted by [Osvaldo Rodriguez](#) on 31 Aug 2007, 9:45 p.m.,  
in response to message #1 by Osvaldo Rodriguez

I beginning to think if it is environmental. At first it only happened with the very low end TI's the TI-25 (which is a solar calculator) used to be like \$12 or less 10 years ago, but in the last couple of years it began with the sharp models. At first I tried to search on the net and did not find anything about this. I do have to say this though I do use my calculators, thus they do take a beating sometimes since I carry them with books and do leave my bag inside my car at times. Summers in west Texas can be upwards of 100 F. I should begin to pay closer attention.

Message #17 Posted by [Hugh Evans](#) on 1 Sept 2007, 12:22 a.m.,  
in response to message #1 by Osvaldo Rodriguez

I've seen it and heard about it. From anecdotal evidence my understanding is that the typical cause is

environmental stress (shock and temperature extremes). As I recall pulling the batteries and installing them again will often spontaneously resolve the problem. What conditions are these machines being stored in?

in response to message #17 by Hugh Evans*

My first and only AOS calc was A Casio progamable, f 602p. It was easy to prg but the keys were soft- no feed back and working complicated formulae was not easy. It has a nice dot matrix display which never degraded and something Ive never seen on a calculator- it has both upper and lower case letters! It still works as does its printer Howard

**Re: OT - Dot Matrix Display**

*Message #19 Posted by [Ed Look](#) on 1 Sept 2007, 8:33 p.m.,  
in response to message #18 by Howard Lazerson*

I don't know if the 48G series and later graphing calculators count, but they do both lower and upper case letters... even (some) Greek letters, but only lower case; I'm not sure I've seen capital Greek letters on them.

**Re: OT - Dot Matrix Display**

*Message #20 Posted by [Gordon Strickland](#) on 1 Sept 2007, 11:47 p.m.,  
in response to message #19 by Ed Look*

A comprehensive display of the characters that the HP48G and its successors can display is shown by pressing <RS> <CHARS>. These include numerous lower case Greek characters, and the upper case sigma, pi, and omega. Of course, a number of the other upper case Greek letters are the same as their English (or Latin) counterparts.

**Re: OT - Dot Matrix Display**

*Message #21 Posted by [Ed Look](#) on 2 Sept 2007, 12:13 a.m.,  
in response to message #20 by Gordon Strickland*

Oh yes, you are right! I haven't programmed my 48G's and 49G+ so long I forgot! It's almost as good, if I now recall properly, as the character tables in Windows or ANSI keyboard codes in a word processor!

Kudos to HP for including them in the 48's and 49's.

**Re: OT - Dot Matrix Display**

*Message #22 Posted by [Thomas Okken](#) on 2 Sept 2007, 12:11 a.m.,

Really? I didn't know that... I used to own a 41C, and later a 41CX, both of which I bought within months after they were introduced; both fullnuts... I didn't get into synthetic programming until after switching from the 41C to the 41CX, but on the CX, as I recall, character codes 102 through 122 all displayed asterisks. Do you know if there are any screen shots online that show those other lowercase letters?

Dang, maybe I should get a 41C again. It would be almost like owning an original VW Beetle. Ah, nostalgia. :-)

in response to message #25 by Massimo Gnerucci (Italy)

Hi Massimo,

Thank you for those screen shots! I think those letters look pretty decent, actually. I'm not sure I understand what you were saying about the Sandbox ROM, though; does that ROM somehow override the 41C's built-in character definitions? In other words, if I do 102 XTOA on a halfnut, will I only see the lowercase **f** if I have that ROM installed, and the usual asterisk otherwise?

Best regards,

- Thomas

### 41C lowercase charset

*Message #29 Posted by **Oswaldo Rodriguez** on 4 Sept 2007, 5:49 p.m.,  
in response to message #17 by Hugh Evans*

I must admit that I became a collector by accident. By the time I realized I had a few calculators piled up in different places. They have been stored in plastic containers placed in a closet. Dark, mostly dry place. The temperatures may get high during the summer, but not above mid 80's. As I mentioned before, it always happens from lack of use, and I have had it happened in older calcs, as well as new ones. The sharp EL-9900, is only about two years old. I had not used it in over a year. I pulled it out a couple of weeks ago and as soon as I placed batteries I noticed missing pixel lines both vertical and horizontal. I have been using it for the last two weeks and with the exception of two vertical lines, the other have "fixed" themselves.

Oswaldo

### **Re: OT - Dot Matrix Display**

*Message #30 Posted by **Frank Boehm (Germany)** on 4 Sept 2007, 10:22 a.m.,  
in response to message #1 by Oswaldo Rodriguez*

I would expect "natural corrosion" as the main cause. If the connection isn't soldered, humidity and H<sub>2</sub>S or SO<sub>2</sub> will do their work and create a thin layer of non-conductive stuff on the contacts. Disassembling the unit and cleaning the contacts (mostly flex strips) will probably help.

### Sad day for HP calcs at my lab

Message #1 Posted by [JaSon](#) on 31 Aug 2007, 2:17 p.m.

Today the lab we received our replacement calculators. Casio FX-300ES. Casios in a labratory filled with Hp GC/MS and Hp/agilent GC/MS equipment. There used to be Hp 32sii Calculators everywhere but the keys have slowly stopped working till just several are left. I admit, that the computers handle most calculations, but I still used the HP a least 10 times a day. To top it off the new calcs don't even have formula memory which is what I used the most. Management's main reasoning, Casios are cheap.

Unless HP starts making cheap RPN calculators as well as nicer quality calcs. (I don't consider the 9s an HP) They are going to just keep fading away like this.

### Re: Sad day for HP calcs at my lab

Message #2 Posted by [Chan Tran](#) on 31 Aug 2007, 2:26 p.m.,  
in response to message #1 by [JaSon](#)

I would disagree! The problem is that management tried to save money by buying cheap calcs. How much it really hurts the bottom line if they spent more for the calcs?

### Re: Sad day for HP calcs at my lab

Message #3 Posted by [Hal Bitton in Boise](#) on 31 Aug 2007, 2:35 p.m.,  
in response to message #1 by [JaSon](#)

Well, the good news is, the Casios will probably wear out in a matter of months (if not weeks) in an industrial environment, at which point your management may re-assess the wisdom of going the cheap route. I'm guessing of course that your old 32sii's lasted at least a few years.

Maybe there's a bevy of 35s's in your labs future....

Best regards, Hal

Message #4 Posted by [Frank Rottgardt](#) on 31 Aug 2007, 3:05 p.m.,  
in response to message #3 by [Hal Bitton in Boise](#)

Not to forget about the slow down this Casios will cause, when engineers and scientists suddenly need to learn how to handle parantheses.

Would be interesting to see if the managment guys also gonna buy Casios once their HP-12 stops working?

RPN is the best way to handle complex equations. But lets face the truth. AOS is here to stay and the world will not stop turning the day RPN will turn into RIP.

### Re: Sad day for HP calcs at my lab

*Message #5 Posted by [bill platt](#) on 31 Aug 2007, 4:01 p.m.,  
in response to message #4 by Frank Rottgardt*

RPN is great when you are calculating step by step or "in the head" but a full equation editor trumps it every time for a fully known or developed equation. Especially for solving repetitively, it is so much more sure than RPN. I use the equation editor all the time on the 48GX as well for this reason.

### **Re: Sad day for HP calcs at my lab**

*Message #6 Posted by [Eric Smith](#) on 31 Aug 2007, 4:38 p.m.,

It is not clear that the physical construction of the 35s is such that it will last longer than a Casio. Disassembly of a 35s is not indicative of the materials and construction being different in any significant way from a midrange Casio scientific.

The feel of the 35s keys, however, is much better than the Casio, IMNSHO. While it's not identical to the traditional HP keys, it at least seems fairly comparable, and a huge improvement over the 33s.

in response to message #1 by JaSon

It certainly sounds like your managers knows how to spend money on GC/MS equipment, which are many orders of magnitude beyond the cost of expensive calculators. I'd have to lean towards picking up a 35s, if your co-workers are used to RPN it should be enough to incite demand for a more suitable replacement.

I agree that HP should develop a limited/non-programmable scientific RPN calculator to compete in the ~\$20 range. That could easily be the equivalent of a 35s, without programming and the same build quality.

### Re: Sad day for HP calcs at my lab

Message #11 Posted by [Arne Halvorsen \(Norway\)](#) on 1 Sept 2007, 6:23 a.m.,

Yea, that was what I was hoping for when found the hp35s. However being a long lost fan I did find the hp35s price ok. But if low end rpn got out I could have choosen to get back in the game of programmable calcs/hp calcs by getting my a low end rpn and a hp50g.

### Re: Sad day for HP calcs at my lab

Message #12 Posted by [DaveJ](#) on 1 Sept 2007, 6:52 a.m.,  
in response to message #1 by JaSon

Since when has management ever dictated what calculator an engineer uses? In every place I have ever worked, engineers supply their own calc, or management pays for whatever calc you want as a basic office/stationary expense. If you don't like what they supply, ditch it and get whatever you like yourself.

Haven't you ever slipped a calc on a purchase order with a description like "industrial keypad" ;->

Dave.

I agree,

I have never used a company purchased calculator. Always my own HP (42S, then 48g, now 50g)

### Re: Sad day for HP calcs at my lab

Message #14 Posted by [Jean-Michel](#) on 1 Sept 2007, 1:50 p.m.,  
in response to message #1 by JaSon

Hi JaSon,

the CASIO fx-300ES is sold in France uder the name "fx-92 Collège" (except that it doesn't have the dual

power functionality). I bought one for my son who's entering high school this year, and learned how to use it to teach my son when necessary. I'd like to correct some points of your post, and posts from other readers:

- even if this isn't an RPN calculator, it's very user friendly, and has certain functionalities very useful. You'll probably discover them when you'll have received yours.

- this calculator DOES have a formula memory, and more to say, very easy to use.

- CASIO calculators, and this one also, are totally able to resist to an industrial environment, except if using it in a dusty atmosphere or any critical conditions. My fx-602P is still operating and I use it at my office quite every day since 1985 (in fact, I have several calculators, amongst which some HP's, and I use them all, depending on how far they are from my hand, and what I have to do with.)

HP calculators, especially the first vintage models, were better than other brands calculators in the past, but nowadays, they aren't. You have to face the reality as it is. It's probably sad for the HP enthusiasts, but if HP wants to recover its prominent place, they have to do a lot of work... The HP-35s is a good example of what remains to be done in terms of quality.

Just to finish : my '602P gives  $\sin(90) = 0$  in DEG mode, and  $\sin(\pi) = 0$  in RAD mode...in accordance with the mathematic rules.

To my opinion, one of the main points in which HP remains the "best", is the design of the calculators (except some models that we all know). And according to this point of view, the 35s is a very good step in the right direction ! (I say "best" because I find that the competition that some people set between calculators brands is kind of puerile to my opinion).

Kind regards.

Jean-Michel.

### Re: Sad day for HP calcs at my lab

Message #15 Posted by **Gerson W. Barbosa** on 1 Sept 2007, 2:58 p.m.,

Hello Jean-Michel,

Quote:

my '602P gives  $\sin(90) = 0$  in DEG mode, and  $\sin(\pi) = 0$  in RAD mode...in accordance with the mathematic rules.

My CASIO PB-700 evaluates  $\text{SIN}(\text{PI}) = 0$ , in RAD mode (ANGLE 1), which is nice.  $\text{SIN}(3.141592654)$  returns  $-4\text{E}-10$ , which is slightly worse than the HP-15C result,  $-4.1\text{E}-10$ . The actual 10-digit result for  $\text{SIN}(3.141592654_{\text{rad}})$  is  $-4.102067615\text{E}-10$ . What are the results on your CASIO calculators?

Regards,

Gerson.

looks like all the new models that aren't emulating the old code are in trouble here - oops!

lyuka has shown some good trig implementation from scratch, but it got me wondering if there's a way to "patch up" the existing stuff by transforming the input to part of the domain that doesn't suffer the defects, eg half or double angle formulae or somesuch?

### Re: The trigonometric bug is spreading !?

Message #3 Posted by [Peter Niessen](#) on 31 Aug 2007, 10:28 a.m.,

Quote:

```
cos(1.57079632)
```

Some calculation results on the calculators at hand.

```
hp 35s: 6.79489e-9
hp 32sII: 6.79489661923e-9
```

---

Quite natural. Since the quoted value 1.57079632 is  $6.8e-9$  away from  $\pi/2$  (or HPs representation of it), and since there

$\cos(\pi/2 \pm x) \sim \mp x$

I would say everything is fine.

Cheers, Peter.

in response to message #1 by Lyuka

My 12C with Valentin's "Tried & Tricky" trig program yields:

0.000037417 :-)

Values near  $\pi/2$  are known to be a problem, though.

Mac OS X's included Calculator.app gives:

0.0000000067948967

XCalc gives:

6.794896e-09

Google Calculator sez:

$6.79489671 \times 10^{-9}$

They agree to six decimal places, which is good enough for me

I guess I don't understand why you would not use the full accuracy provided by the calc...on my 15c, 29c, 41cx, 67 and 34c, if I key pi, then divide by 2, then take the cos, I get -205.00e-12, which is much closer to zero. I get the results you posted if I truncate pi/2 to 8 decimal places, but I don't understand why you do that and then evaluate the resultant lack of accuracy.

Best regards, Hal

### **Re: The trigonometric bug is spreading !? -> BCD arith. with Python**

*in response to message #6 by Hal Bitton in Boise*

This discussion reminded me that some time ago I toyed with Python and its 'decimal' library, which implements, well, true decimal arithmetic (after IBM's BCD library).

I have the beginning of an RPL interpreter (just basic arithmetic, SIN/COS/TAN and few stack functions), but it's fun to play with. The default precision is 28 digits.

Anbody interested, send me an email, I'll email back the code.

### **Re: The trigonometric bug is spreading !?**

*Message #8 Posted by [Lyuka](#) on 31 Aug 2007, 4:34 p.m.,*

*in response to message #6 by Hal Bitton in Boise*

I'm not talking about cos(pi/2) but cos(1.57079632000) which should be 6.79489661923e-9 in 12 digits accuracy.

35s's builtin trigonometric functions tend to lose its accuracy around pi/2 and so on, however, it shows accurate result for the value just next to pi/2 as follows.

```
cos(1.57079632679)= 4.89661923132e-12  
cos(1.57079632680)=-5.10338076868e-12
```

it seems strange to me.

regards,

Lyuka

Transcendental functions are very difficult to get right. HP has had errors in them in nearly every generation of their calculator math routines.

1st gen: HP-35 log/exp bug

2nd gen: HP-67/97 arcsin/arccos bug (also in early 19C/29C, not sure about 91)

3rd gen: HP-41C sin/cos of small angles bug

The bugs in the 67/97 and 41C trig crept in even though the algorithms by that time were well-understood. That was back when HP's calculator division had a large number of engineers and mathematicians on staff. Now they have only a few (perhaps only one?), so it is not surprising that recent HP calculators have more bugs. The high-end calculators such as the 49G+ and 50G use flash memory to facilitate firmware upgrades for bug fixes, but the current low-cost calculators (e.g. 33s, 35s) use masked ROM to reduce the manufacturing cost. It would not take very many product recalls of masked-ROM calculators for HP management to realize that the use of masked ROM may be a false economy.

Many people don't realize that even something as seemingly simple as argument range reduction can introduce large errors if it is done in a naive manner.

The best survey I've found of algorithms for elementary functions is [Elementary Functions: Algorithms and Implementation](#) by Jean-Michel Muller. The book gives detailed explanations of polynomial and rational approximations, shift-and-add algorithms (e.g., CORDIC), range reduction, correct rounding, etc.

It appears that the HP calculator dealer may have given you some incomplete information. The hp 9g and the much maligned hp 30s calculates the  $\cos(1.57079632)$  to  $6.794896619231321e-9$ . This is the correct answer to 16 significant figures making these the most accurate calculators to bear the HP logo.

## HP-30S and HP-9S accuracy

These models are able to do that because they use 80-bit extended-precision floating-point representations (good for 24 digits), not 12-digit binary-coded decimal (BCD). However, the number of correct digits in the result can vary, and these models will also round values extremely close to an integer to that integer, negating the extra accuracy in the interest of eliminating possible floating-point errors.

Try this: Enter pi using the marked button on an HP-30S, then reveal digits by subtracting the integer portion and multiplying by 10. You'll keep getting digits, but after a while, they'll be essentially random...

I'd rather get only 12 digits that I know I can trust.

Exactly what did you do to get this result?

I don't get this on my HP30S. If I type:

$\text{COS}(1.57079632)*1E17-679489661$  ENTER

I get .923035657 which is the result with the leading digits 679489661 missing.

So the actual result of  $\text{COS}(1.57079632)$  is:

$6.79489661923035657E-9$ , only 12 accurate digits.

---

"Accurate" in that they can carry more digits (up to 24), but the user never knows how many can be trusted, so what's the point?

Excerpt from the following link illustrates some pitfalls of floating-point math. It's definitely faster than BCD, but that advantage is best suited for computer programs.

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=24977>

*"...but try this in Excel: enter the equation =100-99.99-0.01 into a cell and hit Enter. Instead of ZERO, you should see 5.1156995306556E-15 ... As you can imagine, this can ruin a perfectly good test for ZERO..."*

*"Your "100-99.99-0.01" example shows exactly why HP and other calculators use BCD floating-point math and not binary floating-point math. It is also why many financial software packages use BCD math, and why BCD math libraries are available for some compilers (and BCD support is built into COBOL, for example).*

*Negative powers of 10 (.1, .01, .001...) are not exactly representable as a finite series of binary digits and are in fact the binary equivalent of 'repeating decimals' (like 1/3=0.3333333333...)"*

BTW, I got your result, even with multiplying by 1E17 instead of 1E5\*1E5\*1E7. Rodger may have made a mistake. Still, either way should always produce the same result in an accurate calculator.

-- KS

---

This is very strange. I typed in, very carefully:

COS(1.57079632)\*1E5\*1E5\*1E7-679489661

and I see in the display:

.923035657

I made sure the calculator is in radians mode. Can anyone think of a setting that might make

this difference? Is it possible that a later version of the HP30S came out with improved firmware?

The serial number of my unit is CN0019.

Karl,

There was a thread: <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=24977>

a while ago where we were playing around with the HP30S, and after your discussion of digit-revealing, I said:

Quote:

---

I wonder why you got the decimal digits corresponding to a 77 bit approximation to PI, and I got those for a 70 bit approximation. What I did to "retrieve pi" was to press the PI button just to the left of the "enter" button. That was my starting number for the process. Did you do something different?

Quote: The digit-revealing procedure after computing  $e^{(1)}$  on the HP-30S produces 2.7182 8182 8459 0452 018...

If I carry the process further, I get: 2.7182 8182 8459 0452 0181 7900 7609... which is the correct decimal re-conversion of a properly rounded 55-bit representation of e. Don't ask me why 55 bits instead of 80 bits. Or why the 77 bits and 70 bits for PI above. I've noticed this behavior before when investigating the internals of the HP30S.

---

I think there may indeed be more than one firmware in the HP30S. I must have a very early one. This could explain the different results we got in the earlier thread.

### **HP-30S threads?**

*Message #18 Posted by **Karl Schneider** on 1 Sept 2007, 11:30 p.m.,  
in response to message #17 by Rodger Rosenbaum*

Roger --

I remember that discussion, but it's not in the thread from 2002 that you posted. I thought I

had bookmarks to the HP-30S threads.

BTW, my HP-30S has a serial # of CN0303.

-- KS

### **Re: HP-30S threads?**

\_\_\_\_\_

I really agree with you, but I enjoy playing devils advocate because the best part about these forums is they make people think. All good calculators have guard digits beyond the digits that can be displayed. These guard digits can produce non-zero (but very close to zero) errors similar to the Excel example you showed even with BCD, because not all decimal numbers can be represented exactly. In the original post on this thread Lyuka was lamenting the fact that the hp 33s and hp 35s were not accurate in the displayed digits, and as you pointed out, this is a well know and uncorrected bug with these models. But at the end of the post he noted that:

"The new calculators except the graphing model may be getting to be hopeless."

Since the numbers he presented showed fewer digits for the 9g and 30s I assumed that he meant these (newer) machines were less accurate. I now realize that this is the total number of digits that these machines will display. I think the hp 9g and hp 30s use twenty-four digits internally to make sure that the displayed digits are always accurate. If you want to set an arbitrary limit of, say, 13 significant digits, then the 30s will be more accurate than the 50g and you don't have to worry about any digits that appear after the 13th. Using the popular calculator forensic test of

$\text{Arcsin}(\text{Arccos}(\text{Arctan}(\tan(\cos(\sin(9 \text{ degrees}))))))$ ,

the 9g and 30s are two of the very few calculators that return an exact answer of 9. I assume that the reason that they do so is because of the 24 digit internal calculations. Of course 13 digit accuracy is mostly academic because, for example, you can calculate the earth's orbit to within a single meter with 13 digits and this is far more accurate than the actual measured values.

### HP-30S accuracy?

Message #22 Posted by **Karl Schneider** on 1 Sept 2007, 11:45 p.m.,  
in response to message #21 by Jesse Dodd

Quote:

I consider the [forensic to be quite overrated](#) in its actual value. The "perfect" results HP-30S were discussed in a thread several years ago that I didn't bookmark. The HP-30S' performance is also attributable to its rounding of values extremely close to an integer to that integer. This helps to eliminate the floating-point computational errors, but can also provide results that are not strictly correct.

Please try a few of the " $\sin(\pi - x)$ " and " $\cos(\pi/2 - x)$ " calculations I tabulated, using your HP-30S. Enter enough digits of the input argument, and the result will always be zero, instead of the correct "missing digits" result.

---

I did as you suggested and entered  $\sin(3.14159265358)$  into the 30s and obtained the incorrect value of 0. Because I didn't read the posts from 2006, I never knew that the 30s played this slight of hand with near integers. Interestingly, the 9g give the correct answer to  $\sin(3.14159265358)$  even though I thought that it used the same algorithms as the 30s.

Just out of curiosity I tried

$\arcsin(\arccos(\arctan(\tan(\cos(\sin(8.999999999 \text{ deg}))))))$  and  
 $\arcsin(\arccos(\arctan(\tan(\cos(\sin(9.000000001 \text{ deg}))))))$

on the 9g and both answers were accurate to 18 figures as opposed to 12 on the 30s.

For  $\sin(3.14159265358)$  on my Casio FX-992s I get  $9.8e-12$ , but I get 0 if I use the inbuilt PI function.

Dave.

## Re: Accuracy and calculating in binary

Message #26 Posted by [Rodger Rosenbaum](#) on 6 Sept 2007, 12:28 a.m.,  
in response to message #24 by Jesse Dodd

Well, I went out and bought another HP30S.

My old unit has a serial no. of CN0019 and the new one has a serial of CN0143 .

The new one behaves differently. I get the same result as Karl and Jesse on the various tests we've been discussing.

I notice that on the old one, SIN(3.14159265358) returns 9.793238461E-12, whereas the new unit returns exactly zero.

I experimented around and found that they have done some more of that "purification" of certain results.

The HP30S can only accept 13 digits as keyboard input, so to perform calculations on 24 digit inputs, one must do arithmetic in the input string.

So, if I type:

```
sin(3.1415926535+7391741495627E-23)*1E17-1587582 enter
```

I get:

```
.3506383
```

which is more or less consistent with internal 80 bit (24 decimal digit) arithmetic.

But, if I type:

```
sin(3.1415926535+7391741495628E-23) enter
```

I get exactly zero. So, if you get close enough to PI on input, they return a result as if the input was exactly PI. The older unit doesn't do this for this particular calculation.

Also, I notice that the new unit returns a correct 24 digit square root. Joe Horn had noticed that the HP30S didn't return a result accurate to 24 digits when the calc was first released, but that has been fixed now.

So, the firmware has definitely been changed since the initial introduction of the HP30S. Whether it's an improvement or not depends on your point of view.

## HP-33s/35s trigonometric bug tabulated

Message #27 Posted by **Karl Schneider** on 1 Sept 2007, 1:58 a.m.,  
in response to message #1 by Lyuka

As you correctly point out in a subsequent post in this thread,

cosine of 1.57079632000 radians is 6.79489661923e-9 with 12 digits of accuracy.

This is easy to show:

$$\cos(y - x) = \cos(y)\cos(x) + \sin(y)\sin(x)$$

So,

$$\begin{aligned}\cos(\pi/2 - x) &= \cos(\pi/2)\cos(x) + \sin(\pi/2)\sin(x) \\ &= 0 * \cos(x) + 1 * \sin(x) \\ &= \sin(x)\end{aligned}$$

Let x represent the "missing" digits of pi/2. The calculation of cosine (pi/2 - x) in radians will yield sine (x),

which will be extremely close to  $x$  for very small values of  $x$ . Hence, cosine "fills in" the missing digits of  $\pi/2$ .

This calculation is very similar to  $\sin(\pi - x)$  for small  $x$ , where sine "fills in" the missing digits of  $\pi$ . I've discussed that one a few times as a good example of the algorithmic accuracy introduced with the Saturn processor for 1984 in the HP-71B.

Here's a discussion of the "cosine bug" in the HP-33s and HP-35s, in which the accuracy of cosine for arguments near 90 degrees is erratic -- losing significant digits one by one as the input gets closer to 90 (e.g., 89.9999), then suddenly becoming more accurate as  $x$  gets to almost 90 degrees:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103989#103989>

(See Bill Platt's post -- message #14 in that thread.)

Given those findings, it's reasonable that the calculation of cosine in radians mode also loses significant digits on these models as the argument nears zero, because an argument in degrees must be converted to radians. There's definitely a flaw in the algorithm; it seems to be terminating prematurely in some cases.

HP calculators with pre-Saturn microprocessors (e.g., HP-15C) and many modern calculators from other manufacturers (e.g, TI-82) sometimes give only two significant digits for the sine and cosine calculations described. I suspect that they calculate out to their internal precision of three guard digits, round the answer to the second guard digit and "call it good", without recognizing that even more digits could be calculated due to the small magnitude of the result. Example:

|                   |       |           |
|-------------------|-------|-----------|
| input             | guard | extra     |
| sin 3.14159265358 | 000   |           |
| = 0.00000000000   | 979   | 323846264 |

On any Pioneer-series model and some descendants, you get 9.79323846264e-12 as the result. On some newer 12-digit non-HP's, you might get 9.8e-12 as the result.

Here's a table of results for  $\sin(\pi - x)$  and  $\cos(\pi/2 - x)$  in radians:

| pi - x        | sin(pi - x)<br>HP-32SII   | ~x<br>HP-33s/HP-35s | ULP error |
|---------------|---------------------------|---------------------|-----------|
| 3.1           | 4.15806624333E-02         | 4.15806624333E-02   | 0         |
| 3.14          | 1.59265291649E-03         | 1.59265291648E-03   | 1         |
| 3.141         | 5.92653555099E-04         | 5.92653555096E-04   | 3         |

| 1.570796326   | 7.94896619231E-10         | 7.94896619231E-10   | 0         |
| 1.5707963267  | 9.48966192313E-11         | 9.48966192313E-11   | 0         |
| 1.57079632679 | 4.89661923132E-12         | 4.89661923132E-12   | 0         |

The patterns are remarkably similar: As the number of digits in the input increases, small errors in the lowest-order digits of the results occur and grow, then significant digits are lost, then finally the answers become correct.

Note that, for each result of less than 12 significant digits, the input and result combine for 15 digits that are not trailing zeroes. This probably stems from the 12 digits of the returned result and the three guard digits.

Quote:

One of the hp calculator dealer informed me about the calculation results of  $\cos(1.57079632)$  on various calculators.

<snip>

The new calculators except the graphing model may be getting to be hopeless. That's too bad.

It's not reasonable to want the same number of significant figures for everything, so there's no need to blame the calculator. As long as you're not putting a bunch of zeroes after the 1.57079632 input number, in real-life practical use you are saying the input could be anywhere from 1.570796315 to 1.570796325, so correct outputs of that range could go all the way from about 1.79E-9 to 1.18E-8, a ratio of more than 6:1. It's not hopeless, but rather the nature of the function. So if  $\text{COS}(1.57079632)$  gives you something around 7E-9 (yes, **one** significant digit), that's as good as you're going to get, regardless of how many digits the calculator has. Try it. My HP-71 says  $\text{ACOS}(5\text{E-}9)=1.57079632179$  and  $\text{ACOS}(6\text{E-}9)=1.57079632079$ . From a 20% change in input, the output stays the same for the first 9 digits, 1.57079632. If you want 12 digits of the COS, how many digits does that correspond to in the angle in this part of the circle? Maybe 40? (That's only a wild guess. I don't have an easy way to find out, so I'll leave it for someone else who has the computational resources.)

As far as it's specified, the accuracy itself is not a problem. But the lack of quality-control to pass through such kind of trivial bugs, which make me feel it's not reliable, at least as a tool for professionals.

regards, Lyuka

Hi, Garth --

Quote:

It's not reasonable to want the same number of significant figures for everything...

*And just why not?? :-)*

Seriously, an obvious design objective of the Saturn-processor mathematics microcode was to provide a result correct to 12 significant digits with three-digit exponent for every transcendental function, using any valid input argument. As far as I know, that objective was met -- not considering any bugs that might have been present in the earliest versions (e.g., HP-71B). Clearly, that objective has not been fully met for the HP-33s and HP-35s.

Granted, it is usually quite difficult to put 12 significant digits to effective practical use in "real-world" physical applications. However, it's all about the mathematics.

Quote:

As long as you're not putting a bunch of zeroes after the 1.57079632 input number, in real-life practical use you are saying the input could be anywhere from 1.570796315 to 1.570796325, so correct outputs of that range could go all the way from about 1.79E-9 to 1.18E-8, a ratio of more than 6:1.

How many significant digits the user intends or claims for the input is not considered by the calculator (with the notable exception of integrand-function uncertainty for numerical integration). The calculator treats each input argument as an exact value to its supported number of significant digits -- 10 or 12 for most HP's. 1.57079632 is treated as 1.57079632000 by any Pioneer-series or RPL-based model, HP-71B, HP-75, HP-33s or HP-35s.

The user may select a display specification that rounds the result to the justified number of significant digits, but the calculation is always "full rank", to borrow a term from linear algebra.

(Come to think of it, your example suggests a good application for "FIX/SCI/ENG I" and "delta-%" in a short RPN program: Accept a value and a number of decimal digits as input to a programmed function, then calculate the percentage difference between the extrema of possible output values for the display setting.)

The results for  $\cos(\pi/2 - x)$  for very small  $x$  are nearly zero, so a ratio of two close values can be very large indeed. Also,  $|d(\cos y)/dy|$  and  $|d(\sec y)/dy|$  are at maximum for  $y$  near  $\pi/2$ , so the results are sensitive to small changes in  $y$  and must be used with care. That's the user's responsibility, not the calculator's...

Quote:

However, it's all about the mathematics.

Mathematics is not an end in itself. Its value only extends to its application in real-world engineering, finance, etc.. I fear that math teachers forget that, getting too fascinated with math for math's sake.

If you take the COS of a number A near  $\pi/2$  that has 12 significant figures and get an answer B with only 2 significant figures correct, and then take the ACOS of B and get the original input A back again with all 12 significant figures identical, you must consider further digits in the intermediate answer to be unimportant, maybe even dangerous. Otherwise, your gizmo design can run into trouble because an uncontrollably small variation in input will mean a very low yield in production, or maybe great expense or even human deaths in the field. The concept cannot be sterilized for math enthusiasts. It's all about the application.

Being a circuit designer, I'm much, much stronger in math than most technicians, mechanics, etc.; but I'm not a mathematician like some of you guys are. I have however seen, too many times, where for example someone depended on certain precision for their design, only to forget that temperature variations in the field would throw that precision out the window and result in a constant string of expensive malfunctions in the field. In that one, I was given the job of redesigning the product. I looked over what had been done and saw the many things that all had to be accurate for the thing to work, and then took an entirely different design approach. With thousands of the new units in the field for the last 18 months, there have been zero reports of malfunction.

Slide rules had a precision limitation that was a big problem for some applications; but the slide rule did graphically illustrate the comparative value of various operations' precisions. What finally lured me away from the slide rule to the calculator was that I needed something programmable.

[ [Return to Index](#) | [Top of Index](#) ]**Mastering the HP48G Book - Thomas Adams - Any Reviews?***Message #1 Posted by [bink](#) on 30 Aug 2007, 11:57 p.m.*

I have seen this book for sale on eBay. Is it recommended? How much should it go for?

Is there a better introductory book to the HP48?

Thanks,

binky

**"The HP48G provides the lubrication..."***Message #2 Posted by [Allen](#) on 31 Aug 2007, 1:25 a.m.,  
in response to message #1 by [bink](#)*

I believe this is not a good book, and at least two [other people](#) agree. (scroll to bottom of linked page for reviews)

**The Good...**

None. See comments below.

**The Bad...**

- 1) "The HP48G provides the lubrication..." That is how Chapter 3 describes the function of the [CAS] in helping the struggling reader solve equations. I think you can safely judge the merits of the rest of the book (and the cheap quality printing) from those 5 words.
- 2) The 185 page book is obviously fluffed by large font size and obnoxious (too large, poorly placed, and injudicious) figures.. There are probably less than 100 pages of info. This could have been distilled further to a compact and useful reference if they had put useful figures instead of full page flow charts and cut-and-paste tables from some spreadsheet.
- 3) BAD narratives throughout! On p.51, the author starts a 5-page solver example with an unnamed article "The effect of mound temperature on mating habits of nesting Australian Brush Turkey." (I'm serious!)

**...and the Ugly.**

1) While they chose to use FIVE different fonts on the cover of the book, the author or publisher saw fit to print everything inside the same Times New Roman font (boring!). This makes finding and reading the sample programs more difficult than if they had formatted HP48 sections with a fixed-width font. (Ironic that the subtitle to the book says it's easy to read! The program examples look like this formatting example):

Example 1: LS,R,O,L,L,ENTER, G,E,T,SPC,S,W,A,P,1,+4,5%,<<>>,3,2,G,E,T,ENTER,P,U,T,F,R,O,M,+A,L,P,H,A,  
S,U,B,-  
,O,V,E,R,D,U,P,\*LS,R,O,L,L,ENTER,G,E,T,SPC,S,W,A,P,1,4,5%,<<>>,3,2,G,E,T,ENTER,P,U,T,F,R,O,M,+A,L,P,H,A,  
S,U,B,-,O,V,E,R,D,U,P,LS,\*-,R,O,L,L,+,+,ENTER,1,4,5%,<<>>,3,2,G,E,T,ENTER,P,U,T,F,R,O,M,+A,L,P,H,A,S,U,B,-  
,O,V,E,R,D,U,P,ALPHA,H,A,R,D,T,O,R,E,A,D,T,H,I,S,T,R,A,S,H,STO

**Alternative Reading**

As far as introduction to the HP 48, I recommend the 48G series Manual first and foremost. Two other excellent alternatives: HP48 Insights by Wickes (ISBN:0962525855) or HP48 Handbook by Donnelly (ISBN:1879828049).

### Help with 71emu

Message #1 Posted by **Chuck** on 30 Aug 2007, 7:27 p.m.

Since it doesn't look like I can compete with the daft ebayers for an actual 71B, I decided to install 71emu on to my trusty 200LX. Well, ... it works.... but what the heck do I do now? Can anyone here point me to some helpful sites for using the 71emu. I've searched around, and found a few programs to "load" (how?) but no real help to get started. It's most likely that one should start with an actual 71B, then to the 71emu, not visa-versa. Any suggestions?

Tack, CHUCK

### Re: Help with 71emu

Message #2 Posted by **Egan Ford** on 30 Aug 2007, 9:12 p.m.,  
in response to message #1 by Chuck

I started with EMU71 before getting a 71B. I would recommend that others do as well. Running EMU71 on Windows or Linux/DOSEMU allows for cut/paste to load up programs easily.

If you have a 71B the most effective way is HP-IL.

Your worse case scenario is to type it in.

I have not use EMU71 for the 200LX, but assuming it has emulated HP-IL support you have a few options:

1. Install EMU71 on a Windows or Linux PC, cut/paste, then store to :HDRIVE1 (virtual floppy drive). Then copy the virtual floppy drive to your LX200.
2. Copy the source as a text file to your LX200. Add EOF to the end and save as emu\_in.dat in your EMU71 directory. Then type:

```

10 DESTROY ALL
20 DIM A$(100)
30 INPUT "FILENAME: "; F$
35 PURGE F$
40 CREATE TEXT F$
50 ASSIGN #1 TO F$
60 ENTER :DOSLINK ;A$
65 IF A$="EOF" THEN CLEAR :DOSLINK @ END
70 DISP A$
80 PRINT #1;A$
90 GOTO 60

```

Save as DOS2TXT, then run it.

3. Type it in.
4. I have not done this, but you may be able to do a serial to serial transfer from PC running EMU71.

### HP 71B

Message #1 Posted by [Frank V](#) on 30 Aug 2007, 4:11 p.m.

I recently wanted to use my beloved HP 71B. I took it out of wraps and continued to install new batteries. I get no response at all upon hitting the ON key. I tried using another set of batteries to no avail. Any help would be much appreciated.

### Re: HP 71B

Message #2 Posted by [Maximilian Hohmann](#) on 30 Aug 2007, 6:21 p.m.,  
in response to message #1 by Frank V

Hello!

Quote:

... hitting the ON key ...

My 71B probably has the same problem, a very unresponsive ON key. 'Hitting' will not bring it to life, I always need to press gently (but firmly) for a couple of seconds before the machine will turn itself on. In the beginning, not even this technique would help, so I used compressed air spray to blow out dust from underneath the keys. You have to open the calculator to do this, otherwise you will not get close enough to the contacts. If nothing else helps, you can try the same with contact spray, but I would do this only as a very last resort. Once you start using contact spray, the end is near...

Good luck, Max

Hello!

Quote:

---

The end near... oh no, I better go to confession. :)

---

Wait till you have your 71B - when it refuses to work one day, after you have gotten used to it, you really think that this is the end of the world as we know it ;-)

But kidding aside: It is really my experience that once you start to use contact spray to get electronic devices back to work, they don't last very long afterwards. The intervals at which you have to re-apply the spray get shorter and shorter, and after some time, the spray/cleaner/solvent will not work any more. Probably because together with the oxide, also a little of the contact material (usually gold plating) gets removed as well. Also, the dissolved oxides, dust, sweat from underneath the keys get re-deposited elsewhere in the keyboard (out of reach!) and start new corrosion there.

Greetings, Max

When they sent it as an 'ordinary' parcel with the mail and not with one of the courier services like FedEx or UPS (very expensive and difficult to use for private persons here in Europe), it can take between three and six weeks in my experience. And if you bought it from Germany:

There are still school holidays in some regions, so the seller may not be home right now.

Greetings, Max

Hi, Frank:

Frank posted:

*"All is well now except when upon turning on the unit, it takes about 5 seconds for the cursor to go on."*

If you've got an HP-IL module plugged in, that's likely the cause. Just execute the command OFFIO from the command line and see if that solves the problem.

Whenever you need to do HP-IL I/O again, execute RESTOREIO. Don't forget to execute OFFIO once more when you're done with I/O.

Best regards from V.

### **New HP calculator videos online**

Message #1 Posted by [Gene Wright](#) on 30 Aug 2007, 3:02 p.m.

HP has made available several new videos for how to use their calculators.

Videos include:

Introduction to Finance

Power of the graphing series (39g+ and 39gs, 49g+ and 50g)

Pre-calculus using the HP 39g+ (and 39gs)

Pre-algebra and Algebra I using the HP 39g+ (and 39gs)

and

Calculus using the HP 49g+ (and 50g)

[Video link](#)

in response to message #1 by Gene Wright

Hi Gene,

in one video there is a typo:

Calculate the numerical integral of TAN (X/2) from 0 to Pi/6 in radian mode.....

Answer c) is wrong! Its a typo. It must be 0.06933.. (not 0.09633..)

I checked it with my 48GX. You know, the old fashioned reliable stuff ;-)

// Frank

Message #7 Posted by **Allen** on 8 Sept 2007, 9:02 p.m.,  
in response to message #1 by Gene Wright

Gene, Great idea! I like the training videos. The audio is a little undersampled, even for the readers low-pitched voice.

Of note: there is an audio error at the end of the 12c platinum cost estimation video. (may be at the end of the other cost estimation videos, too, not sure.)

In the final example:125,000 can produce how many chairs?

The reader states: "...the total costs would be 5755 dollars."

Should read "Estimated production from a cost of \$125,000 is estimated to be 5755 **chairs**."

Keep up the great work!, Allen

**SD card reader as cheap 50G accessory**

Message #1 Posted by [Norris](#) on 30 Aug 2007, 2:22 p.m.

This is probably old news to many users, but I suspect that others may not be aware that an SD card reader is an inexpensive and convenient accessory for the HP-50G (presumably the 49G+ as well).

The 50G comes with a USB cable and Conn4x software. So that's what I've been using to connect my 50G to my home PC. But more recently, I wanted a similar setup for my work PC.

My first thought was to buy a second USB cable and install Conn4x at work, just like at home. But I happened to see an SD card reader for \$9.76 at the local Wal-Mart, and decided to try that instead. It was in the digital camera section, by the SD cards. It looks similar to [this one](#), though mine doesn't have a cap to cover the card.

I have a 16M SD card for my 50G, which originally came with a Canon digital camera. A 16M card is ridiculously undersized for a camera, so I bought a 1G card for the camera instead. The 16M card was donated to the calculator, where it is plenty big.

The card reader is a little plastic device with a USB connector on one end and an SD card slot at the other. I can pop the SD card out of the calc and into the reader, then plug the reader into the USB port of a PC. Any reasonably modern PC seems to recognize and mount the card automatically (sometimes it takes a little longer the first time, but it goes quickly after that).

With the card reader, I can easily move files between the 50G and any of the desktops or laptops at work or home, without untangling cables or installing software. To install a library, for example, you just copy it from the PC to the card via the card reader, put the card back in the calculator, use the filer to copy the library to Port 2, and press On-C to reboot.

It's a pretty handy accessory for 10 bucks.

*Edited: 30 Aug 2007, 2:23 p.m.*

Message #2 Posted by [Tim Wessman](#) on 30 Aug 2007, 2:33 p.m.,  
in response to message #1 by Norris

Yup. The only reason to use the cable is if you need to take screenshots. Other than that, it is much quicker and easier to just use an SD card.

TW

**Re: SD card reader as cheap 50G accessory**

Message #3 Posted by [Bruce Bergman](#) on 30 Aug 2007, 4:41 p.m.,  
in response to message #1 by Norris

Another option (a better option, IMHO) is the SanDisk Ultra II PLUS SD cards. Note, this is NOT the Ultra II

devices -- the "PLUS" is significant. Basically, they took a standard SD card and embedded a full USB connector in the same package. It's a marvel of engineering, once you look at one...

When you want to use it with your HP-50g, just shove it in. When you need to put data on it, take it out, snap it in half (a little hinge in the middle allows this) and insert it directly into your USB port. Transfer the data, snap it back together and insert into your calc.

This card has pretty much revolutionized the market for transfer among SD devices and USB. The best part is that it's only a few bucks more than a traditional SD card. Well worth the money.

thanks, bruce

### **Re: SD card reader as cheap 50G accessory**

*Message #4 Posted by [Norris](#) on 30 Aug 2007, 5:01 p.m.,  
in response to message #3 by Bruce Bergman*

OK, now that is just too cool. And the 512M version is going for only \$12.44 (plus shipping) at [amazon](#). That may well be the best way to go.

### **Re: SD card reader as cheap 50G accessory**

*Message #5 Posted by [Ron G.](#) on 31 Aug 2007, 9:57 a.m.,  
in response to message #3 by Bruce Bergman*

I have a friend who has one of these. She has trouble getting good contact with the USB in her computer. W/o the alignment part of the USB connector, it's a little difficult to line it up properly. I haven't actually tried it myself; and honestly, while she's good at code stuff, she's not the most brilliant person otherwise. It may work well if you're able to tie your shoes.

Here's a link to a competitor - [Click](#).

### **Sandisk Ultra II SD Plus USB as cheap 50G accessory**

*Message #6 Posted by [Norris](#) on 31 Aug 2007, 1:40 p.m.,  
in response to message #3 by Bruce Bergman*

OK, since I was totally outgeeked with my card reader suggestion, I stopped by a local Circuit City store to see the SanDisk cards. Sure enough, they had the 512M version for \$18, so I got one.

It seems to work as advertised. In SD card mode, the 50G has no trouble with it. And if you fold it in half, you can stick it directly into a PC's USB port, no reader required.

The first time I used the card in my home PC, it took a minute or two for the PC to figure out what it was. But now the PC recognizes the card immediately.

So I have adopted this option, and would recommend it to others, with a few possible caveats:

- The "folded" card might not "plug in" to a computer with recessed USB ports (in this case, you would need a separate USB cable as an "extension cord")
- It's a bit tricky to "unfold" the card, and it might be more difficult if you were clumsy or had large fingers
- You have to watch whether the "folded" card is plugged in upside down (this is not possible with a standard USB connection).

**Re: Sandisk Ultra II SD Plus USB as cheap 50G accessory**

Message #7 Posted by [Gerry Schultz](#) on 31 Aug 2007, 2:48 p.m.,  
in response to message #6 by Norris

A slightly different answer is the thumb drive sized SD card reader. It's basically a wide USB thumb drive shaped SD card reader that you can plug in an SD memory card. On my 50G, that's how I move files back and forth to and from my PC or Mac. Very convenient.

Gerry

**Re: Sandisk Ultra II SD Plus USB as cheap 50G accessory**

Message #8 Posted by [Bruce Bergman](#) on 31 Aug 2007, 6:07 p.m.,  
in response to message #6 by Norris

Hi Norris ;-)

Yeah, I was a bit hesitant about being "rough" with my card too for a while, but then one evening, in the near dark, I was trying to snap it open and was really really "folding" it hard until I realized that it was upside down. Turns out the card itself didn't even blink. I think they put some kryptonite in it or something. ;-)

Since then, I've been pretty nonchalant with it and it's never even shown signs of wear or stress. That's not to say I recommend throwing it around and being mean to it, but it seems to handle almost daily abuse with no problem. I've had my 2GB card now for over a year and no problems with it whatsoever. It just SEEMS like it should be fragile, since it's so stinking small, but it is strong too.

As for shoving it in a USB jack (and as someone else pointed out), yeah, it may take a second longer to align it properly. Fortunately, there's nothing to short out on the underside, and I just look for the little green light. If it's on, it's inserted fine. If it's off, I either re-insert it or flip it over. I haven't experienced any tight USB jacks, but I suppose there are some that might be that way.

It's a very cool device though. Definitely gets the "wow" factor when people see it. ;-)

thanks, bruce

Message #9 Posted by [Norris](#) on 31 Aug 2007, 6:44 p.m.,  
in response to message #8 by Bruce Bergman

<< I just look for the little green light >>

Mine also has a tiny light, but it's blue. Maybe the 512 MB card has a different light than the 2 GB card.

And what do you put in a 512 MB card anyway ?? My HP-48GX has an old-school 512 KB card in Slot 2, and I actually did put a serious dent in that.

But 512 MB ?? Or 2 GB ??

*Edited: 31 Aug 2007, 6:54 p.m.*

*Message #10 Posted by [Bruce Bergman](#) on 31 Aug 2007, 7:38 p.m.,  
in response to message #9 by Norris*

I should have clarified, sorry.

I use my 2GB card for my Treo. On that, I keep backups of the Treo, games, e-books, music and more.

On the HP-50g, I use a 512MB like you. I have a ton of programs, mostly around statistics, plus about 15-20 utilities (backup programs, splitters, editors, database programs, etc) and a pretty big collection of games. I also keep a copy of each of the programs I have on the calc in its zipped form, in case a buddy says "hey, I want that one!". I can just pop the card out, transfer the zip file over and then they have it.

Still, it's not even half full. Maybe someday there'll be a music player for the HP-50g. ;-)

thanks, bruce

### Classic Calculators in the UK?

Message #1 Posted by [Bruce Bergman](#) on 30 Aug 2007, 12:58 p.m.

Just found this site by accident, while I was looking for a very specific HP part. Never heard of them before. I see they are selling the HP-35s over in the UK too. Does anyone know anything about them, or has anyone purchased anything from them before?

[Classic Calculators](#)

thanks, bruce

### Re: Classic Calculators in the UK?

Message #2 Posted by [Fred Lusk](#) on 30 Aug 2007, 7:23 p.m.,  
in response to message #1 by Bruce Bergman

Bruce...

I'm in California and have never ordered from Classic Calculators. However, several years ago they ran a contest through their website. The top prize was a BNIB HP-41CX, one out of a bunch they had found in a warehouse. I ended up winning the third prize, which was an HP-10B. It arrived in less than a week, which is better service than some U.S. vendors I have dealt with.

Fred

### HP 35s trigonometric functions alternative

Message #1 Posted by [Lyuka](#) on 30 Aug 2007, 9:11 a.m.

To all who might be interested, here is another trigonometric program specially for the HP 35s.

[HP 35s trigonometric functions \(sin, cos and tan\) alternative](#)

Quote:

The HP 35s's built-in trigonometric functions seems to lose its accuracy around  $\pi/2$ ,  $\pi/4$ ,  $\pi/3$  and so on. In some case its accuracy goes down to seven digits or less which is not acceptable as the scientific calculator that features internal 15 digits precision. Anyway as it was necessary, I wrote the alternative trigonometric functions for the HP 35s. [Aug. 30, 2007]

Best regards,

Lyuka

### Re: HP 35s trigonometric functions alternative

Message #2 Posted by [Ed Look](#) on 30 Aug 2007, 12:22 p.m.,

Impressive!

I applaud and appreciate your mathematical and coding passion.

### Re: HP 35s trigonometric functions alternative

Message #3 Posted by [Gerson W. Barbosa](#) on 30 Aug 2007, 3:28 p.m.,  
in response to message #1 by Lyuka

Congratulations!

Alternative trigonometric functions for the HP-35s are always welcome. Hopefully at least until the next ROM revision :-)

Saving the stack and the LastX register is nice. It's a pity the 35s is not as fast as the 33s. I'd like to know what your other references are, since you've used a different approach.

Best regards,

Gerson.

### Re: HP 35s trigonometric functions alternative

Message #4 Posted by [Lyuka](#) on 31 Aug 2007, 4:41 a.m.,

*in response to message #3 by Gerson W. Barbosa*

Thanks.

I really want the bug-fixed version of the HP 35s.

By the way, I have no other reference since it is a kind of my original. Taylor series, the continued fraction, Chebyshev approximation, and Pade approximation itself are all well known mathematical method. However, I thought a method that optimise only the coefficients of the parts which have smaller computational error sensitivity, based on rational Chebyshev approximation.

'pi' in my program is coded as builtin PI (3.14159265359) - 2.06761537357E-13 this yields 25 digits pi approximation 3.141592653589793238462643.

Regards,

Lyuka

### **Re: HP 35s trigonometric functions alternative**

*Message #5 Posted by **Gerson W. Barbosa** on 31 Aug 2007, 12:18 p.m.,  
in response to message #4 by Lyuka*

Quote:

Oops! I ought to have paid attention to the constant in line J078.

Thanks again for the very original contribution!

Gerson.

### **Re: HP 35s trigonometric functions alternative**

*Message #6 Posted by **Gerson W. Barbosa** on 30 Aug 2007, 10:01 p.m.,  
in response to message #1 by Lyuka*

Both your program and the built-in sine function give the same answer for

```
sin(3.1415926535)
```

```
-> 8.97932384626E-11
```

This means pi does not have to be hard-coded to 24 digits for this result to be possible, contrary to what I thought:

<http://64.233.169.104/search?q=cache:FdTXWPVCnGIJ:www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi%3Fread%3D122855+site:hpmuseum.org+DLF&hl=en&ct=clnk&cd=2>

The 2-second running time is very good. Too bad on the 35s at least THREE keystrokes are required before programs start running...

Regards,

Gerson.

Message #5 Posted by [Thomas Okken](#) on 30 Aug 2007, 8:36 a.m.,  
in response to message #4 by Howard Owen

Quote:

My goodness, how fast does Rijndael run on a Saturn? Have you tried that code on Free42, Thomas?

No, I haven't tried it myself. The author, Brett Stevens, submitted his code for the programs page on my web site, and I linked back to his page, that's all.

According to the author's documentation, he wrote the program as a proof of concept, to show that an

advanced algorithm like AES could be implemented on a limited architecture like the 42S. The author does not provide performance measurements, either, but of course you could run a few tests of your own... In case you'd rather not type in all that code by hand, there are \*.raw files on [my programs page](#). :-)

- Thomas

### Re: Rijndael on a 42s?!?

Is he trying to prove [Church's Thesis](#)? :-)

It basically says that "any calculation that is possible can be performed by an algorithm running on a computer, provided that sufficient time and storage space are available"

### Re: Rijndael on a 42s?!?

Message #7 Posted by [Howard Owen](#) on 30 Aug 2007, 12:53 p.m.,  
in response to message #5 by Thomas Okken

One of the requirements for AES was that it be easy to implement in hardware. That means several things, but in particular that the algorithm needed to have small memory requirements and a relatively low demand for CPU cycles. "Relatively" in this case probably meant with respect to low to medium speed embedded CPUs. I'm sure that speeds like those offered on the 42s (a Saturn at, what, 640 KHz?) weren't considered in scope. But in scope or not, the referenced program would seem to prove that rijndael algorithm, the eventual winner of the AES competition, truly has a tiny memory footprint.

It would be interesting to see how fast the algorithm runs on a real 42s. However that would require typing in a lot of numbers and program lines. If I get a free afternoon or so, I might attempt it. My 42s can be accelerated, so I could compare the two modes on something really computationally intensive relative to the machine. A comparison with Free42 would also be interesting, and wouldn't demand nearly so many keystrokes. 8)

Regards,  
Howard

### Re: Rijndael on a 42s?!?

Message #8 Posted by [Thomas Okken](#) on 30 Aug 2007, 2:21 p.m.,  
in response to message #7 by Howard Owen

Quote:

It depends on how the acceleration is implemented on the real calculator, and if that/those feature(s) are emulated in emu42. I agree it's less likely to be there.

That's a good suggestion, though. I'm leaning toward keying the program in, but I have a development project (basically, an airline time filler) underway. I don't know if the AES code would fit alongside my current stuff. If not, I'd have to move the programming up my priority list, or else just accept re-keying the program after doing the AES stuff. In the meantime, emu42 might serve as a stand-in for the real machine, at least for now.

Regards  
Howard

### Re: Rijndael on a 42s?!?

Message #10 Posted by **Thomas Okken** on 30 Aug 2007, 11:15 p.m.,  
in response to message #9 by Howard Owen

Quote:

It depends on how the acceleration is implemented on the real calculator, and if that/those feature(s) are emulated in emu42.

As far as I know, accelerated HP calcs simply have a modified master clock, which makes *\*everything\** run faster, i.e. all the hardware -- not like speeding up a PC by overclocking the CPU, where only the CPU runs faster, while memory and peripherals still run at the same speed as before. So, theoretically, an HP-42S whose clock has been cranked up by a factor  $x$  from the normal 1 MHz, should do *\*everything\** faster by a factor  $x$ . I don't know about the HP-42S' "**Fast Mode**", though -- that may well be different. Christoph, if you're listening, could you shed some light as to how that may work in Emu42?

Quote:

I don't know if the AES code would fit alongside my current stuff.

**aes.raw** and **aesprep.raw** are 3357 bytes together -- that's almost half the HP-42S' total user memory. Pretty darn big by HP-42S standards, but you should still be able to do a great deal even with those things loaded.

It should be possible to shave off some bytes by using a matrix to hold the constants from **aesprep.raw**, and writing a small program to load the required registers from that; in a matrix, each number takes up 8 bytes, while in a program, it can be significantly more (and the numbers in **aesprep.raw** are definitely more than 8 bytes each -- count 1 byte each for each digit, minus sign, decimal point, and exponent sign, plus one extra byte for the "null" byte that is automatically inserted in front of each number).

- Thomas

### **HP 12C: 1988 USA vs 1991 Brazil**

Message #1 Posted by [RandyL](#) on 29 Aug 2007, 3:09 p.m.

Would you consider these models to be of the same quality (build, tactile quality of keys, etc)? I understand that the models from the US and Brazil prior to 1995 are all pretty good. If so, would it make sense to buy the newer model to reduce the odds of having issues due to electronic corrosion etc? Thanks for any insight.

### **Re: HP 12C: 1988 USA vs 1991 Brazil**

Message #2 Posted by [marais](#) on 30 Aug 2007, 3:27 p.m.,  
in response to message #1 by [RandyL](#)

I have both an USA and a Brazil model and find them equivalent. Don't recall the manufacturing years though.

A.

### **OT: Mathamatics behind the perfect wiggle**

Message #1 Posted by [Vincze](#) on 29 Aug 2007, 1:01 p.m.

My friends, this is funny. I just reading article in the UK Telegraph that state they figured out how to find the perfect ratio of hips to waist to have proper strength to have perfect wiggle when she walks. They say perfect ratio is 7.0. So let me get this straight, if Godlilla has waist that are 250' and hip that is 360', he have perfect wiggle when he walk?

Here is link to story: <http://www.telegraph.co.uk/news/main.jhtml?xml=/news/2007/08/25/nwiggle125.xml>

### **Re: OT: Mathamatics behind the perfect wiggle**

### Now THIS is nuts!

Message #1 Posted by [Bruce Bergman](#) on 29 Aug 2007, 10:11 a.m.

Okay, so we all giggle about some unusually high prices for calcs on that auction site from time to time, but this one is crazy.

I was looking for a particular calc and there was this banner ad at the bottom of the page. Clearly targeting my needs, I thought I'd peak at it, and then I saw the price. I almost couldn't believe it!

#### [HP Paper](#)

So if my math is correct, that's only six rolls of paper. Are these guys for real? Don't they know I can get a 24-pack of new paper from Office Depot for like \$15.00?

Truly amazing.

### Re: Now THIS is nuts!

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 29 Aug 2007, 10:23 a.m.,  
in response to message #1 by [Bruce Bergman](#)

Hi Bruce,

I find things like this quite common on Amazon. Don't really understand how the vender comes up with their high price point.

Maybe they figure the Box adds value :)

You know \$6 for 6 rolls of paper and \$545 for the official HP box.

What's really interesting is there are TWO venders with exactly the same high price.

Thanks for the chuckle.

Bill

### Re: Now THIS is nuts!

Message #3 Posted by [Ren](#) on 29 Aug 2007, 11:28 a.m.,

Truly amazing.

Bruce, **THEY** probably know that, they might even be buying up OD rolls and repackaging them.

But what about some bureaucrat's assistant who was ordered, "Buy more paper for the HP calc's!!!" And when she/he called up GSA (Government Services Administration ( a US Gov't TLA) ) Helpdesk, she/he couldn't get a definite answer that the OD paper will work, so they go with what they know...

Or maybe a similar situation in the military, only here it is an E-3 (Enlisted, level 3 pay scale) who is also working on getting there GED (High School Equivalency Diploma) and the OD paper does have a MIL-SPEC number...

Hmm I have the box with only 5 rolls in it. Should I sell the box only as I have no use for it?

**eBay sure is a crazy place...**

*Message #5 Posted by [Randy](#) on 29 Aug 2007, 5:33 p.m.,  
in response to message #1 by Bruce Bergman*

It's been a while since we had an eBay dogpile. While I know it's not of interest to some here, once in a while you just gotta laugh at how stupid some of the auctions are. This one just screams SHILL SHILL SHILL. It's sad that eBay doesn't have better controls on this kind of nonsense. After all, how hard is it to compare IP addresses?

[A nice HP48G+ for \\$250](#)

PS: I put eBay in the subject line so those who wish to skip the post may do so - for fear they might waste some time or whatever it is about eBay posts that is offensive or whatever.

Definitely some interesting bidding going on. It's quite a coincidence that several of the bidders have such similar names.

**Re: eBay sure is a crazy place...**

*Message #7 Posted by [Ren](#) on 30 Aug 2007, 10:47 a.m.,  
in response to message #6 by Ron G.*

Yeah, sometimes I wonder if eBay is used for laundering money.

What if...

I put a RARE! MINT! NIB! watchamacallit up for auction, that typically sells for 1 Ducat. I notify my friend, Euclid, in Kanuckistan of the auction, (eh?). He in turn notifies his friend, Kwazymodo, of the

auction. The two of them get in a bidding war and Euclid buys my trinket for 998 Samoluskies. I get the money, and along with the watchamacallit he receives a kilo or so of fine Afghani snow.

What if I do it daily with dozens of "friends" around the world under dozens of seller accounts?

**Re: eBay sure is a crazy place...**

Message #8 Posted by **Ken Shaw** on 31 Aug 2007, 9:19 a.m.,  
in response to message #7 by Ren

The scary thing is that this idea has as much credibility as the idiot-buyer theory. We don't really have proof that the market for all these HP calculators hasn't been inflated.

**Re: eBay sure is a crazy place...**

Message #9 Posted by **Dave Shaffer (Arizona)** on 2 Sept 2007, 11:49 p.m.,  
in response to message #6 by Ron G.

Quote:

It's quite a coincidence that several of the bidders have such similar names.

I thought that, too - at first.

I have since seen such similar names on several other ebay auctions - i.e. names with a first and last letter or number and a bunch of asterisks inbetween. I think this is ebay's new bidder naming convention, replacing the "bidder1" "bidder2" etc. that they had recently begun using when the bid price got high enough (somewhere between \$100 and \$200, it appears).

**Re: eBay sure is a crazy place...**

Message #10 Posted by **Ron G.** on 6 Sept 2007, 12:19 a.m.,  
in response to message #9 by Dave Shaffer (Arizona)

Yes, you are correct. I just found this: *To protect bidder privacy, when the price or highest bid on an item reaches or exceeds a certain level, User IDs will be displayed as anonymous names... Note: Anonymous names may appear more than once and may represent different bidders.*

Anyway, eBay is not consistent on this policy, as I just saw a \$1000 bid on an item i was watching, and bidder names were still displayed. At the same time I saw two items at less than \$100, with anonymous bidders. So, whatever.

**Re: eBay sure is a crazy place...**

Message #11 Posted by **Frank Rottgardt** on 30 Aug 2007, 4:52 p.m.,  
in response to message #5 by Randy

Hi Randy,

that is really insane. For two weeks ago I got hold of an mint HP48GX with original box, blister, manuals, HP-connectivity kit incl. floppy disc and an additional 128 kB Calculus I ROM card for 43 USD (bought the set on internet, but not ebay!)

the calc is a 1994 Singapore made.

### **Re: eBay sure is a crazy place...**

*Message #12 Posted by [megarat](#) on 31 Aug 2007, 2:34 p.m.,  
in response to message #5 by Randy*

> After all, how hard is it to compare IP addresses?

Unfortunately this wouldn't work. Comparing IP addresses would create heaps of false positives, as there are many, many major providers that represent thousands of users with a single IP address, because of their router/firewall topology.

I would be quite upset if I placed a last-second bid on a beloved item, only to have eBay's shill-bot reject the bid, simply because the seller (or another bidder) and I shared the same ISP.

While I haven't given this much thought, the only meaningful way I can envision to sniff out shill bidders would be to (data-mining style) run some comprehensive queries on all the auction data, perhaps via machine-learning algorithm. For each auction, note the seller, the bidders, and probably some other behavior (like the bid increment amount, and time before auction close), and do a full comparison. The shilling IDs would (hopefully) be visible through bids on multiple auctions by the same seller.

Even so, this still wouldn't be perfect ... in an eBay niche like vintage calculators, people bid on multiple auctions by the same seller all the time, so you'd still get false positives, even if you use a smart-ish distinguishing criteria. I expect that there would be some obvious true positives, possibly by bid volume or other behavior, and perhaps public enforcement of these cases would scare everyone else straight.

Alas, this type of analysis isn't free, and since eBay stands to benefit from shill bids, I can't imagine they'd bother with something like this, unless the reputation of their marketplace was seriously at stake.

Still, it's a fun mental exercise.

-cam

### **Re: eBay sure is a crazy place...**

*Message #13 Posted by [Peter K](#) on 31 Aug 2007, 10:02 p.m.,  
in response to message #12 by megarat*

Actually, ebay *\*does\** some analysis to identify shill bidding. I was "caught" by ebay's safe harbor team, because a co-worker purchased an item on ebay from me. The same person purchased maybe 3-4 items from me over the course of the last two years, and never paid through PayPal (why would she, cash is king). Ebay made me go through a 30 minute online shill bidding tutorial, and my account was blocked from selling for 14 days.

Here is the thing, though: I always tell people at work when I am selling something. Sometimes they are interested, and they are likely to pay a bit more because there is no shipping involved, and I like it because they are no PayPal fees, but ebay does *\*not\** allow you to sell to co-workers. Even that is considered shill-bidding.

Ebay's suggestion: Cancel the bids and end the auction early - even if it's just minutes, then sell it off-line. Exactly what I am going to do from now on...

### HP-35s Samson online invoice

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 29 Aug 2007, 8:21 a.m.

I placed an order 08/23/2007 with Samson for the HP-35s. The status of my order still reads 'not processed'. Monday I asked them and got reply it would ship that day. Funny thing is it still read 'not processed'.

I probably will email them again, have a feeling things are ok (that I will be told it shipped), but anyone else with experience with their online invoice not updated?

Should I worry?

### Re: HP-35s Samson online invoice

Message #2 Posted by [Nenad \(Croatia\)](#) on 29 Aug 2007, 9:25 a.m.,  
in response to message #1 by Arne Halvorsen (Norway)

Quote:

Should I worry?

Not at all. I had the same situation with Samson Cables. It seems that they update their webpage tracking information slower than they do the real job.

Anyway, my HP35s arrived to me in exactly 7 days (Salt Lake City to Split) after my order was placed.

You should expect that everything will be OK. This is at least my experience.

### Re: HP-35s Samson online invoice

Message #3 Posted by [Arne Halvorsen \(Norway\)](#) on 29 Aug 2007, 9:33 a.m.,  
in response to message #2 by Nenad (Croatia)

That reasuring to hear.

Actual they have been *\*very\** promptly answering my emails, so that kindof balances things up.

Been pestering (litle and very polite) them a bit on this issue, because when they have this service I think they should make it work...

### Re: HP-35s Samson online invoice

Message #4 Posted by [Jim Creybohm](#) on 29 Aug 2007, 9:33 a.m.,  
in response to message #1 by Arne Halvorsen (Norway)

Hi Arne.

I had the same discovery with Samson. As stated above, the web page seems to be MUCH slower to be

updated than the actual order status. I wouldn't worry too much about it.

Jim

**Re: HP-35s Samson online invoice**

*Message #5 Posted by **Walter B** on 29 Aug 2007, 11:30 a.m.,  
in response to message #1 by Arne Halvorsen (Norway)*

SC may have a bit slow methods to handle the paperwork (i.e. "bitwork" nowadays) sometimes. Nevertheless they've shipped my HP35s properly. So if everything is clear from your side, you paid and you passed all necessary information, just wait. For Europe, I won't get nervous for 2 weeks after they claim they shipped.

HTH, Walter

**Samson US sold out...**

*Message #6 Posted by **Arne Halvorsen (Norway)** on 30 Aug 2007, 4:37 a.m.,  
in response to message #1 by Arne Halvorsen (Norway)*

Okey....

Now my order states both that it has been shipped and canceled!

And there is an email to me from them saying that they are sorry: They could not execute the order because the US party of HP-35s gone!

Okey:

1. Since I am in Europe I was supposed to get it from their European office. This for speed and not paying custom (they handle). 2. Monday they told me it was going out.

Well the good news in the mail is that now(!) it is being shipped from europe...

Lets hope I make it in on their European stock of 35s...

*Edited: 30 Aug 2007, 4:37 a.m.*

**Re: Samson US sold out...**

*Message #7 Posted by **Giancarlo (Italy)** on 30 Aug 2007, 8:37 a.m.,  
in response to message #6 by Arne Halvorsen (Norway)*

Hi Arne.

I think you should not worry - mine was shipped from Spain as well (Alicante, IIRC), even though they did not advise me before that.

I'm confident everything is going well :-)

Farvel.

Giancarlo

**Re: Samson US sold out...**

*Message #8 Posted by **Arne Halvorsen (Norway)** on 30 Aug 2007, 8:50 a.m.,  
in response to message #7 by Giancarlo (Italy)*

I am to.

But reading the latest the mail from Samson it seems a mistake was made so my order would have gone out from the states, BUT I was saved by the fact they run out of 35s state side! The importance aside from time to get it to me is I would have had to pay custom extra if transported over the drink.

I know have a very funny invoice :-) It says: Order canceled, shipped and fully paid!

One nice thing though is that it seems like the 35s sells like if numbers where going out of fashion!

### Question about HP48GX Manuals

Message #1 Posted by [bink](#) on 28 Aug 2007, 9:21 p.m.

Which manuals came with a new HP48GX??

I thought it was a Quick Start guide and a User Manual. However, I also saw one reference that said the Advanced User Guide came with it as well. Did this happen normally or ever?

Thanks

### Re: Question about HP48GX Manuals

Message #2 Posted by [bink](#) on 28 Aug 2007, 9:22 p.m.,  
in response to message #1 by [bink](#)

Here is the reference:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv010.cgi?read=28520>

The problem is that I have not seen this included with any HP 48GXs.

### Re: Question about HP48GX Manuals

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 28 Aug 2007, 10:23 p.m.,  
in response to message #2 by [bink](#)

The 48G series AUR was an "extra cost" option that had to be ordered as a separate item. The same was true of the 48SX *Programmer's Reference Manual*. If one of these happens to be included with a calculator, consider it a bonus.

Regards,  
James

*Edited: 28 Aug 2007, 11:22 p.m.*

Quote:

\_\_\_\_\_

(and on coarser stock with comb binding, on the one I have)

\_\_\_\_\_

I think that I've seen one like that, or perhaps it was the *48SX Programmer's Reference Manual*, and it appeared to be photocopied from the original so-called "perfect bound" manual. I think that HP may have done this after those models were already out of production and the stock of professionally published manuals was used up.

<https://www.calcpro.com/> lists an "HP 48 Advanced Users Reference Manual", Item# HP90136, for US\$29.95 under "Books - Sci. & Graphing Calc's", but as to which edition and binding type it is, I wouldn't know; one could ask though.

A scan of the AUG is available at <http://www.hpcalc.org/details.php?id=6036>

I bought both the "48SX programmer reference manual" and the "48GX Advance User Guide". They are both extra cost books.

## **Re: Question about HP48GX Manuals**

*Message #8 Posted by [Ed Look](#) on 29 Aug 2007, 12:43 p.m.,  
in response to message #5 by James M. Prange (Michigan)*

The version I received from Calcpro of the 48G AUR several years ago was bound much like the 35s manual, a glued, paper binding. I don't know what that's called in the trade, but it's certainly not spiral, if that's what some might expect.

The binding isn't important here; the contents of that 48G Series Advanced User's Reference guide are priceless.

### **Re: Question about HP48GX Manuals**

*Message #9 Posted by [Norris](#) on 29 Aug 2007, 8:02 p.m.,  
in response to message #8 by Ed Look*

During the 1998-1999 time frame, the AUR was distributed in a 3-ring binder. That's what I have. See previous discussion [here](#).

So it sounds like the AUR may have been issued in three different bindings at various times: glued, comb, 3-ring

*Edited: 29 Aug 2007, 8:06 p.m.*

### **Re: Question about HP48GX Manuals**

*Message #10 Posted by [Ed Look](#) on 29 Aug 2007, 11:46 p.m.,  
in response to message #9 by Norris*

Son of a gun!

You AND I both were in the discussion... and I FORGOT IT COMPLETELY!! Oh well, if you vouch for it, I'll believe it!

Anyway, on the lower left back cover in small pitch type, it says, "Printed in Singapore 12/94", and on the lower right, "Edition 4".

I'd be curious to know what yours... or anyone else's says.

### **Re: Question about HP48GX Manuals**

*Message #11 Posted by [Norris](#) on 30 Aug 2007, 12:39 p.m.,  
in response to message #10 by Ed Look*

My AUR has the same info on the back cover. In my case, the front and back cover pages measure 9.5 by 9.5 inches, and are inserted into pockets on the covers of a similarly-sized 3-ring binder. But the pages inside the binder are only 8.5 by 5.5 inches, the same as in the User's Guide.

The width of the binder, measured at the spine, is about 3.3 inches thick. Since the binder also has 9.5 by 9.5 inch covers, the sheer volume of the "binder" AUR is probably enormous compared to the volume of the "comb" or "glued" AURs.

My AUR also says "Printed in Singapore" on the bottom of the title page. On the reverse side of the title page, there is an "Edition History" table, which indicates the following:

Edition 1...July 1993

Edition 2...January 1994  
Edition 3...May 1994  
Edition 4...December 1994

I would guess that Edition 4 was the last one, and that every AUR printed after 12/94 had the same text, regardless of binding

in response to message #2 by [Walter B](#)

Guten nacht, Walter!

Your reply is a funny joke, as "mobile", in the famous aria you quoted, means "moody" (gramlich in German?), and in fact it goes on like "qual foglia al vento", that stands for "like a leaf in the wind" -

but it also means "piece of furniture", so "closing the circle" with the gift of my wife's (just a piece of furniture, i.e. a drawer :-)).

Nice (inadvertent?) joke!

Mit freindlichen grussen.  
Giancarlo

P.S.: sorry, but can't remember how to type umlauts :-)

*Message #5 Posted by **Walter B** on 29 Aug 2007, 5:13 a.m.,  
in response to message #3 by Giancarlo (Italy)*

Buon giorno, Giancarlo,

I must admit I did not think of the furniture when I posted the response :) In the aria, "mobile" is translated to "trügerisch" due to the same number of syllables. To reflect the meaning, "wankelmütig" would be better (corresponding to "today this way, tomorrow another way"). "Grämlich" sounds more like "sourly" and would not be fitting in the context, would it?

Anyway, as you pointed out, the four words could also mean "the lady and furniture ...". Here we are again: sometimes you have to know the context to understand the words right.

Saluti, Walter

**Re: My HP collection's at home !**

*Message #6 Posted by **Les Wright** on 29 Aug 2007, 7:55 a.m.,

in response to message #1 by Giancarlo (Italy)

I thought always that girlfriend express true love by allowing you to keep tooth brush and tooth powder at her house. :)

Now true love with wife is allowing you to store HP calculators in a drawer.

My friend, you should show us picture of calculator in drawer. It would be nice to see. You have most kind wife. My beautiful wife still think I strange for collecting calculator.

**Re: My HP collection's at home !**

Message #11 Posted by [Hal Bitton in Boise](#) on 28 Aug 2007, 9:46 p.m.,  
in response to message #1 by Giancarlo (Italy)

I think my wife (bless her heart) would prefer that my collection be in a drawer, out of sight, rather than in a glass case, in the living room, right next to her milk-glass collection. Whenever she shows one of her friends her collection, I invite them to also cast their gaze across my collection...I get many strange looks when I do this, and my wife usually rolls her eyes and shakes her head...but that's OK, she loves me anyway :)

Best regards, Hal

Hi Giancarlo,

Quote:

\_\_\_\_\_

I'd like to publicly acknowledge my wife for allowing me to use one of the drawers at home to store my entire HP calc collection!

\_\_\_\_\_

I guess most of us guys here are allowed to have one drawer for their collection. But this is by far no good deal, having in mind that the remaining three drawers are occupied with pairs of shoes our beloved wives possess. I don't even dare to think about how much more money must have been spend on their "collection" 8-)

//Frank

Well, I'm afraid my drawer is a little overfilled by now :-). All empty spaces in my wardrobe between the socks and the shirts are full. Even the boxes my wife buys her shoes in are full, as you can see here:

<http://www.bombie.de/tmp/CalcuMess.jpg>

I'm afraid, I will have to hire a barn or a garage somewhere for this stuff, as our son is going to move into my 'temporary calculator storage room' soon (as he is big enough now to safely use the steep stairs that lead up there).

Otherwise I'll have to sell everything and really only keep those calculatos that fit into my drawer... but which ones ...

Greetings, Max

### **Re: My HP collection's at home ! - (A Family Affair)**

*Message #15 Posted by **Chris McCormack** on 29 Aug 2007, 6:39 a.m.,  
in response to message #1 by Giancarlo (Italy)*

My 'collection' is spread across the family. I'm currently using the HP15C I bought as an undergrad. My wife has the HP11C she used in college. My daughter in college has the HP49G+. My high-school aged son an HP48G. The sixth-grader has an HP33S in his bag. That just leaves the fourth-grader out. (I guess he can use the HP6S in the drawer, but that doesn't really count, does it?)

The sad parts are my high-school HP29C that I no longer have, and the HP48GX that got lost on a business trip.

**Re: My HP collection's at home !**

*Message #16 Posted by **Ren** on 29 Aug 2007, 11:32 a.m.,  
in response to message #1 by Giancarlo (Italy)*

Giancarlo!

Get a lock on that drawer!

(If your 3 year old is ANYTHING like mine!)

Ren

dona nobis pacem

**Re: My HP collection's at home !**

*Message #17 Posted by **Ed Look** on 29 Aug 2007, 11:52 p.m.,  
in response to message #16 by Ren*

I'll second that.

Now, mine at that age never got to my precious HP calc (yeah, at the time, I only had one, not that I have too many now), but he did spill Diet Coke all over my roughly one week old Gateway 66 MHz 80486 computer's keyboard. (In case anyone wants to know that computer and exact keyboard is still in use, even if not at my house.)

But many years later now, even though he prefers his algebraic 39G, he still thinks that the red LED eyes of the 34C is "the coolest".

**Re: My HP collection's at home !**

*Message #18 Posted by **Giancarlo (Italy)** on 30 Aug 2007, 2:31 a.m.,  
in response to message #16 by Ren*

Hi Ren.

Good suggestion - I'll look into that :-)

But what about trying to get the kid on our side instead of "fighting" with him?

I mean: would you suggest showing him the calcs by purpose to try and have a young budding RPN calc fan ;-)?

(mmmh!...why I myself am not so convinced about what I just said....?).

Best regards.

Giancarlo

**Finally (HP 41CX)**

Message #1 Posted by [Seth Morabito](#) on 28 Aug 2007, 6:22 p.m.

At long last, I have a 41CX in my hands. It cost me more than I like to admit, but not as much as some of the 41CX's that I've seen sell on eBay recently. My goodness, those prices are getting as bad as 42S prices! I believe it was less expensive because it has several very faint, barely noticeable name inscriptions. I have to really look to see them, and I really don't mind. They add character. Besides that the unit is in flawless shape, no battery corrosion. In contrast, my 41C has really bad corrosion and worn contacts.

I've wanted a CX for a while because of the Extended Functions, Memory, and Timer modules built in. It'll be fun to use.

**Re: Finally (HP 41CX)**

Message #2 Posted by [Wayne Brown](#) on 28 Aug 2007, 8:01 p.m.,  
in response to message #1 by Seth Morabito

Congratulations. I still think it's the overall best compromise between size, power, features and usability of any calculator HP ever made (or probably ever will).

**Re: Finally (HP 41CX)**

Message #3 Posted by [Stefan Vorkoetter](#) on 28 Aug 2007, 9:27 p.m.,  
in response to message #2 by Wayne Brown

I've always wondered why they stopped making them. After all, with the module system, they're fully expandable, and I'm sure they could have come out with a 32Kb (or even 256Mb) module by now. They still make the 12C, so why not the 41CX (41CXSii or some newer yet compatible version). There's nothing in the 35s that the 41CX couldn't do, and there's a whole lot in the CX that the 35s can't do.

Stefan

*Message #6 Posted by [Chan Tran](#) on 29 Aug 2007, 8:52 a.m.,  
in response to message #5 by Seth Morabito*

HP replaced the 41CX with the 48SX. While different, I think the 48SX can do much of what the 41CX can do.

**Re: Finally (HP 41CX)**

*Message #7 Posted by [Jim Creybohm](#) on 29 Aug 2007, 9:37 a.m.,  
in response to message #6 by Chan Tran*

Without getting into a discussion about this calc vs. that calc - which everyone will have a differing opinion on, the 41 is a great calc. Yes, the 48 can do much of what the 41 can do, but the 41 is still "relatively" pocket sized. Because it is also RPN, for me it combines the best power per cubic cm volume.

I am sure that if I had learned to use the 48 first, I would feel the same way about it. (Except it is not shirt pocket portable)

**Re: Finally (HP 41CX)**

*Message #8 Posted by [Chan Tran](#) on 29 Aug 2007, 10:04 a.m.,  
in response to message #7 by Jim Creybohm*

I do understand what you mean. I started out with the 41CV in 1979 and then a CV because my 41C was stolen. I got a number of CX blank nut as well. And yes the 41 series is my favorite calc. I do feel that the 48SX is a good replacement for the 41 although it can not do all what the 41 can. The 41 series calculators came with a large case to accomodate the card reader so unless you carry the 41 without its case, it's the same size as the 48.

**Re: Finally (HP 41CX)**

*Message #9 Posted by [Seth Morabito](#) on 29 Aug 2007, 5:14 p.m.,  
in response to message #6 by Chan Tran*

It's funny you should mention that, because the HP-48SX was my first HP calculator. For that nostalgic reason alone, it is still my favorite. I got it as a present from my parents when I was in high school, a few months after it was released -- At that time, I had a Casio fx7000g and wanted more programmability. I had lusted after the HP-28S, but I never got one. When the HP-48SX came out, my poor parents couldn't stand to see me staring longingly at the calculator displays in the big department stores any more. They bought one for me for Christmas, bless their hearts. The price was a LOT of money for them, and I'm still grateful. It opened up a love of math and computers that I may not have otherwise had.

That 48SX was my daily calculator from 1991 until 2006. It still works fine, and I've always taken wonderful care of it.

---

Don't leave us hanging, what happened in 2006?

My father gave me a 48GX in 1993. It was my daily calculator, home and on-the-road. A few years back I looked at getting a 2nd (one for home, one for the bag) and was surprised how the calculator landscape had changed. To protect my 48GX I retired it last year and switched to a 50g. It's 100% UserRPL compatible and more importantly replaceable. SD card, case, and LCD are an improvement over the 48GX. It did not take long to adapt to the feel and layout of the keyboard. Human beings are amazingly adaptable.

Hello!

Quote:

\_\_\_\_\_

I have 71B on way from Europe. Hopefully here this week, but 41C is next model I would like to get.

\_\_\_\_\_

You will absolutely like the 71B, but as a pure calculator, you will like the 41 more. The 41CX has an internal stopwatch that keeps running even with the calculator turned off - good for aviation purposes. There are also aviation modules available, but quite rare and very expensive.

The 71 has a very weird 'CALC' mode, neither RPN nor truly algebraic, and the worst thing is that they forgot the 'Clear' key... The only calculator I ever saw without one! For programming and playing around it is by far the best calculator hp ever made.

The big disadvantage of the 41, from the collectors point of view, is the infinite number of accessories and third-party software that were made for it. You can spend a fortune and will never have a complete collection :-)

Greetings, Max

NB: If you want one, I have a spare 41CX here. I would trade it against a Hungarian calculator (any model! but not the paper&pencil version that you mentioned earlier) to complement my Polish, Bulgarian and Russian calculators...

### **Re: Finally (HP 41CX)**

*Message #16 Posted by **Egan Ford** on 29 Aug 2007, 6:57 p.m.,

Quote:

\_\_\_\_\_

The 71 has a very weird 'CALC' mode, neither RPN nor truly algebraic, ...

\_\_\_\_\_

Unless you get the HP-41 Translator ROM. For me this is a must. I can use it in native HP-41 mode, e.g.:

ENTER

2

+

Or in a hybrid mode somewhat like RPL calc:

2 2 +

And FORTH is a huge bonus. Faster than BASIC.

Sadly, very hard to find and cannot be burned (or so I read).

### Re: Finally (HP 41CX)

Message #17 Posted by [Garth Wilson](#) on 29 Aug 2007, 9:29 p.m.,

turned off  
\_\_\_\_\_

Yes, the 41 is better as a pure calculator. The 71 does have the timer resources that keep going when the computer is off, but you have to write your own programs for alarms and things to get the functions that are built into the 41cx. I've used my 71 as an alarm clock, stop watch, etc., but I had to write the programs.

Quote:

\_\_\_\_\_  
And FORTH is a huge bonus. Faster than BASIC.  
\_\_\_\_\_

The 71's Forth implementation is a very poor one. Fortunately, being Forth, you can get under the hood and modify even the compiler. Without using assembly language, I re-wrote a lot of the Forth words, in Forth, speeding them up by factors of anywhere from 4 to 13.

### Re: Finally (HP 41CX)

Message #18 Posted by [Vincze](#) on 30 Aug 2007, 9:09 a.m.,  
in response to message #17 by Garth Wilson

Well, if anyone have 41 that they wish to part with, you know how to reach me.

It look like they not too hard to find on ebay. Some more than others.

### HP35s Sorting Routine

Message #1 Posted by [Nenad \(Croatia\)](#) on 28 Aug 2007, 4:43 p.m.

Hello, world

**The following is a small step for a man, but even much smaller for the mankind!**

What is so important in the program that follows? The fact that this is the only sorting routine I fully understand. Why? Because I learned it first time in Fortran IV on IBM 1130 in 1977 (imagine dinosaurs walking around). As it worked correctly at that time, I did not give even a try to understand and/or learn any other sorting procedure, just ported this one from one computer to another.

This is how it looks like in HP Basic (if I typed here the original IBM 1130 program from my memory, who would care about it anyway):

```
! HP Basic Sorting Routine
DIM A(800)
INPUT "N=", N
REDIM A(N)
! Input unsorted data
FOR I=1 TO N
  DISP I
  INPUT A(I)
NEXT I
! Sorting
FOR I=1 TO N-1
  FOR J=I+1 TO N      ! edited, thanks Gerson
    IF A(I)>A(J) THEN
      TEMP=A(I)
      A(I)=A(J)
      A(J)=TEMP
    END IF
  NEXT J
NEXT I
! Output sorted data
FOR I=1 TO N
  PRINT I, A(I)
NEXT I
END
```

The presented listing in HP Basic serves to preserve talking too much about the HP35s program itself.

### HP35s program listing // edited, thanks all

```
*LBL S ! asterisk should have been omitted, but this reminds me of my HP-67 time
INPUT N ! # of data points
1
+
STO I
STO (I)      ! reserve variable space+1

## Re: HP35s Sorting Routine

Message #3 Posted by [Don Shepherd](#) on 28 Aug 2007, 6:46 p.m.,  
in response to message #1 by Nenad (Croatia)

Ahh, the bubble sort. It has always held a high place in my minimalist philosophy.

### Re: HP35s Sorting Routine

Message #4 Posted by **Thomas Radtke** on 29 Aug 2007, 6:11 a.m.,  
in response to message #3 by Don Shepherd

Doesn't look like bubblesort. AFAIR, bubblesort compares only adjacent entries and usually takes several runs.

### Re: HP35s Sorting Routine

Message #5 Posted by **Gerson W. Barbosa** on 28 Aug 2007, 7:46 p.m.,  
in response to message #1 by Nenad (Croatia)

Hello Nenad,

Quote:

```
! Sorting
FOR I=1 TO N-1
  FOR J=1 TO N
```

This should be

```
! Sorting
FOR I=1 TO N-1
  FOR J=I+1 TO N
```

shouldn't it?

Would you try the following classic variation for the bubble-sort algorithm and see how it would perform on the 35s?

```
! HP Basic Sorting Routine
DIM A(800)
INPUT "N=", N
REDIM A(N)
! Input unsorted data
FOR I=1 TO N
  DISP I
  INPUT A(I)
NEXT I
! Sorting
FOR I=1 TO N-1
  K=I
  FOR J=I+1 TO N
    IF A(K)>A(J) THEN
      K=J
    END IF
  NEXT J
  IF I<>K THEN
    TEMP=A(K)
    A(K)=A(I)
    A(I)=TEMP
  END IF
NEXT I
! Output sorted data
FOR I=1 TO N
  PRINT I, A(I)
NEXT I
END
```

Regards,

Gerson.

*Edited: 28 Aug 2007, 7:47 p.m.*

### Re: HP35s Sorting Routine

Message #6 Posted by [Paul Dale](#) on 28 Aug 2007, 7:48 p.m.,  
in response to message #5 by Gerson W. Barbosa

Quote:

\_\_\_\_\_

This should be

```
! Sorting
FOR I=1 TO N-1
  FOR J=I+1 TO N
```

shouldn't it? [/pre]

\_\_\_\_\_

This makes it more efficient but it works either way.

By the way, it *isn't* bubble sort.

Message #10 Posted by [Don Shepherd](#) on 28 Aug 2007, 9:13 p.m.,  
in response to message #6 by Paul Dale

Sure looks like bubble sort to me. You are working your way through the array, swapping cells side-by-side so the larger is on the right, and ultimately the larger cells "bubble" to the top.

**Re: HP35s Sorting Routine**

Message #11 Posted by [Paul Dale](#) on 28 Aug 2007, 9:17 p.m.,  
in response to message #10 by Don Shepherd

My mistake, the original is bubble, just coded funnily. Gerson's is selection.

- Pauli

**Re: HP35s Sorting Routine**

Message #12 Posted by [Don Shepherd](#) on 28 Aug 2007, 9:36 p.m.,  
in response to message #11 by Paul Dale

Thanks Pauli. Now I am spending my evening reminiscing about sort strategies from 30 years ago! We are such creatures of the past.

I remember in school we always talked about how \*bad\* the bubble sort was, although it was great in its simplicity. Then one day I found out about the quicksort, and that seemed much more efficient.

The sad truth is, in all my jobs, I never had the need to implement a sort routine; there was always one already there!

**Re: HP35s Sorting Routine**

Message #13 Posted by [Vincze](#) on 29 Aug 2007, 8:50 a.m.,  
in response to message #12 by Don Shepherd

Yes, I recall to. It be interesting if we could test other sort data structures and see which is quickest on 35s. We all know that Bubble sort is not most efficient, but it is simple. It look like Nenad's bubble sort is the more enhanced one that adds some efficiencies. (all elements in position  $\geq n-i$  are already in proper position after iteration  $i$ . And step to determine when everything in order to prevent unnecessary iteration).

It be nice if we can try quicksort or Shell sort, or even Radix sort. I am not sure if these would be possible in RPN, but it would be interesting to try.

My friend, Nenad, I hope you write this sort up and submit to Datafile to share with others. It is nice work.

**Re: HP35s Sorting Routine**

Message #14 Posted by [Ed Look](#) on 29 Aug 2007, 1:17 p.m.,  
in response to message #5 by Gerson W. Barbosa

I need a routine to sort from twenty to oh, say a hundred numbers, and then do some basic statistics on them, like average, median, etc., and have been intending for a couple of weeks now to code it in my 35s (and then 33s)

I'll try to find some time... probably between the end of baseball on TV and bedtime (what, about twenty minutes??) and come up with something.

I will also NOT look at these posted programs and then I'll probably revive this thread and compare to see how poorly mine looks in relation to yours.

But, I did see something that has given me a big hint to start with- I might just try a FORTRAN sorting routine first (or maybe a 48G+ RPL routine first) and then translate to 35s RPN keystrokes! That might be easier than just doing it cold from the 35s keyboard.

### **Re: HP35s Sorting Routine**

*Message #15 Posted by [Don Shepherd](#) on 29 Aug 2007, 2:28 p.m.,  
in response to message #14 by Ed Look*

Ed, the 17bii or 17bii+ can do it all without programming! I realize you probably want to write a program, though.

### **Re: HP35s Sorting Routine**

*Message #16 Posted by [Vincze](#) on 29 Aug 2007, 3:26 p.m.,  
in response to message #15 by Don Shepherd*

How can 17bii do it without program? Are you talking just statistics functions, or sorting as well?

**\*\*EDIT\*\*** Never mind, I go out to HP site and download manual for 17BII, and yes, it can sort list of numbers AND do statistical calculations. That too cool.

**Re: HP35s Sorting Routine (EDITED)**

Message #20 Posted by [Nenad \(Croatia\)](#) on 29 Aug 2007, 9:18 a.m.,  
in response to message #1 by Nenad (Croatia)

Thank you all for your posts and comments, they are really appreciated. I have edited my original post upon your comments. Just forgot to add the following to the edited post:

```
LBL S
LN=225
CK=4BA1
```

(the CK info might be useless, who knows)

Gerson: You are perfectly right. The correct statement in HP Basic program is (and was intended to be):

```
FOR J=I+1 TO N
```

All: In my original post I have made two essential mistakes: the one above and the one in the HP35s program. In the latter the loop above began at J=I instead at J=I+1.

It is obvious that I still remember the original FORTRAN IV routine correctly, but I was a bit careless transcribing my original post from my notebook (not a computer, but a real notebook, that I carry with me down to the seashore to write down such thoughts;)

Never mind, my post is now corrected, though not very useful. Imagine somebody entering up to 800 numbers into the HP35s, just to sort them (as he/she cannot transfer these data to something else, because of the lack of I/O, but this is another story).

**Re: HP35s Sorting Routine (EDITED)**

Message #21 Posted by [Arne Halvorsen \(Norway\)](#) on 29 Aug 2007, 9:26 a.m.,  
in response to message #20 by Nenad (Croatia)

Have you tried to sort 800 numbers on the hp35s :-) Fun to know how long time program would use.

I guess you could write a small program to fill it up with random numbers to be sorted.

Actual, if there would be a use of a sorting numbers on the hp35s it would be results of other programs I guess.

Edited: 29 Aug 2007, 9:27 a.m.

Hello!

Quote:

Have you tried to sort 800 numbers on the hp35s :-)

There is a very nice animated comparison (+ background information) about various sorting algorithms to be found here:

<http://www.cs.ubc.ca/~harrison/Java/sorting-demo.html>

Saves you the hassle to enter all those numbers into the 35s, that is really not the right machine for this kind of stuff.

Greetings, Max

### **Re: HP35s Sorting Routine (EDITED)**

*Message #23 Posted by [Vincze](#) on 29 Aug 2007, 11:06 a.m.,  
in response to message #22 by Maximilian Hohmann*

My friend Max, it took this Hungarian a little time trying to figure out how to make animations work. I kept clicking on links and get java code, but finally this Hungarian wise up and click on picture.

That is very cool indeed.

You also very right that HP35s not proper tool to sort large numbers (or even small number set). In real life, I would use SQL server to do that, or Excel spreadsheet for small set (or my own brain). I think this is an excellent study though by our friend Nenad on how indirect variable are used. I know, I learn much from his program on how to implement this on 35s.

### **Re: HP35s Sorting Routine (EDITED)**

*Message #24 Posted by [Gerson W. Barbosa](#) on 29 Aug 2007, 12:07 p.m.,  
in response to message #22 by Maximilian Hohmann*

Thanks for the link!

I thought *QuickSort* was tops, now I see there is *Fast QuickSort*. What will come next? *Rapid Fast QuickSort*? :-)

Regards,

Gerson.

### **Re: HP35s Sorting Routine (EDITED)**

*Message #25 Posted by [Vincze](#) on 29 Aug 2007, 11:27 a.m.,  
in response to message #21 by Arne Halvorsen (Norway)*

My friend Arne, I not try 800 items, but as an exercise, I try 100 items. I let calculator run for 10 minutes and it still running. I abort program as I needed calculator for something, but I would imagine 800 would take considerable amount of time with simple bubble sort algorithm.

### **Re: HP35s Sorting Routine (EDITED) - Look at current month Datafile**

*Message #26 Posted by **Gene Wright** on 29 Aug 2007, 1:48 p.m.,  
in response to message #25 by Vincze*

I have been printing sorting routines in Datafile for the 35s.

The sorting routine (I put) in the 35s indirect module is a very bad implementation - of course, I wrote it! :-)

I then used an updated sort from Miguel in the current month along with some tests for speed. Random, sorted, reverse sorted, to see how the timings went.

Used a specified seed of 0.123456789 and filled the first 100 indirect registers with the random numbers generated.

Should be repeatable and a good test to see how a sort works.

Timings for Miguel's routine were:

Random list of 100 from 0.123456789 seed: 230 seconds

Resort of sorted list: 17 seconds

Worst (?) case of inverse sorted list: 420 seconds

Much better than the one I used in the module. :-)

### **Re: HP35s Sorting Routine (EDITED) - Look at current month Datafile**

*Message #27 Posted by **Vincze** on 29 Aug 2007, 3:50 p.m.,  
in response to message #26 by Gene Wright*

My friend, Gene, I normally just skip article you write in Datafile. I just kidding my friend. :)  
Actually, I have not studied current issue much, but I will look at it when I have chance.

### **Re: HP35s Sorting Routine**

*Message #28 Posted by **Drago Pejic** on 30 Aug 2007, 7:37 a.m.,  
in response to message #1 by Nenad (Croatia)*

Without any intension to make any commercial advertisement or expose a big ego, I am sure that Data Integrity Institute Inc. has developed and owns the world fastest and most efficient sort algorithm. It is non comparison sort, something very remotely related to radix sort, but it is not radix sort or any academically described.

Remember all quick sorts are so called comparison sorts where you have two kinds of comparisons:

- active comparison, where each item is compared (of course respecting the item type, like integer, float, string, etc.) to others, sometime several times

- passive comparison, where the item position (which is always an integer) in the array and eventually in the file is compared and check that is inside boundary

It is apparently that any comparison will tremendously slow down sorting process. Data Integrity Institute Inc. sorting algorithm does not perform either active (item) comparison or passive (position of the item) one. That allows Data Integrity Institute Inc. Copula Application Specific Enterprise ETL Appliances to process any, does no matter how big and complex data vault, within 3 hours.

Data Integrity Institute Inc. sorting algorithm requires least 512 MB of memory per CPU core in the 32 bit environment and least 128 GB of memory per CPU core in the 64 bit environment. If there is no such memory in the 64 bit environment, efficiency of 64 bit will be several times better than 32 bit, but not such significantly as it could be if there is enough memory available, when it really blasts.

I would like to discuss this, but I am not sure if it is appropriate here. I do not want distract anybody. Also, I can not disclose any secret detail about Data Integrity Institute Inc. sorting algorithm, because it is our most valuable asset and competitive advantage. I can tell that I had two major revelations, something like religious bliss, in ten years while I was obsessed with sorting problem. One was when I went behind quick sort and comparison, and another when I discover how to handle resources in an perfect arrange, which is major obstacle why is radix sort only an academic category.

To Nenad from Croatia:

Puno pozdrava Nenade.

Drago Pejic, M. Sc., F.L.M.I.

Sound cool... What are the complexities; average case and worst case? As for quick sort but with less overhead?

*Edited: 30 Aug 2007, 8:12 a.m.*

### **Re: HP35s Sorting Routine**

*Message #30 Posted by [Drago Pejic](#) on 30 Aug 2007, 8:48 a.m.,  
in response to message #29 by Arne Halvorsen (Norway)*

Data Integrity Institute Inc. Copula Application Specific Enterprise ETL Appliance processes data record that is composed from one or more fields of any type of data, usually previously almost ordered, but not every time, of course, so it always performs as worst case.

The advantage of the algorithm is that ignores any scenario and processes what is there, as is.

Source data records are stored in the file, or part of file. The one sort task can handle  $2^{31}$  files (or described part of file, ignoring rest), each file size of  $2^{63}$ , simultaneously.

Target data are stored in the specified file or array of files.

The sort process takes a chunk of the file into memory, process that and store in the target file structure. It is not in place sort so source data will be preserved.

All SQL engines (DB2, Oracle, etc.) utilize a comparison sort (quick sort, heap sort, merge sort) that are similarly efficient. They are designed for transactional processing (account update, flight reservation, etc.) that handles one record at time. Now, everybody wants to use an SQL engine for analytical processing (data warehouse, business intelligence, data mining) where millions or records need to be

handled simultaneously. It is hard to explain that SQL, designed for transactional processing, can not efficiently do that. Mayor problem is comparison sort (you compare each item to others plus you check the item position in the array every time) and so called B tree indexing where in order to locate the item in the index you have to travel for each item along many tree branches. B tree is great concept to locate a single item, but not for massive simultaneous processing.

Drago Pejic, M. Sc., F.L.M.I.

<http://www.dataintegrityinstitute.com>

### **Re: HP35s Sorting Routine**

*Message #31 Posted by [Arne Halvorsen \(Norway\)](#) on 30 Aug 2007, 9:01 a.m.,  
in response to message #30 by Drago Pejic*

Pretty interesting... slightly related to what you address, just installed latest mysql for a data analysis app and performance just dropped! Thing is ofcourse now default installation uses a database engine that implements transaction. Reconfigured to use good old non transact engine and performance back.

Real force of mysql is that you can choose!

### 35s -- I know this is "piling on", but . . .

Message #1 Posted by [Paul Brogger](#) on 28 Aug 2007, 1:43 p.m.

. . . I can't resist.

I was just now daydreaming -- looking at the 35s in my office, admiring its overall elegance; feeling grateful for the return of an acceptable (if still buggy) RPN (non-RPL) programmable; reminding myself that this *particular* unit's display is nicely aligned; smiling wryly at the recollection of its mis-aligned serial # label . . . I close the case and - hey, wait a second! What's *this*?

The "HP" logo on the front of the case is mis-aligned. Listing a bit to starboard (as I look at it). It's not an optical illusion caused by the slanted letters in the logo -- I carefully placed a ruler along the top edge of the logo and there's definitely a right-side-down slant -- maybe 5 degrees or so.

Has anyone else noticed that? On top of the other mis-alignments, it's amusing, at least. (All of the positive aspects mentioned above are still true, as far as I'm concerned.)

*Edited: 28 Aug 2007, 3:55 p.m. after one or more responses were posted*

Message #3 Posted by [Paul Brogger](#) on 28 Aug 2007, 1:50 p.m.,  
in response to message #2 by Dave Johnson

I've been leaning to the left for a *long* time, now.

;-)

AND, it just now occurs to me what great "wisdom" there was in the 33s' keyboard design. (It would sure be hard to detect any misalignment on *that* thing!)

Which reminds me of Henry Petroski's observation (in, I think, his book "Small things considered: why there is no perfect design") on the design of a glass tumbler, into the thick base of which a rather large bubble had been deliberately introduced. (You've probably at some point seen and held an example of this style of drinking glass.) The bubble's purpose: to distract the eye from what otherwise would be glaring imperfections in each tumbler's realization.

So, what do you do to a calculator to distract the eye from otherwise glaring defects ("acceptable variances") in manufacture? I'll bet the highly regular layout of the 35s (and virtually every other H-P model) is much harder to consistently produce without noticeable variation than is a design with

deliberately-introduced curves or angles.

**32sII keyboard key noise**

Message #1 Posted by [Michael Barry](#) on 28 Aug 2007, 10:49 a.m.

My calculator has been used heavily. Over the course of time, the 'C' and blue shift key have developed a clicking or snapping sound when pressed. I believe it's due to the keys no longer being held under tension and when depressed, they travel a little until they come in contact with something which causes this audible noise. I'm sure some folks here have run across this problem. Does anyone have any suggestions for fixing this? I can live with it, but I find it irritating.

**Re: 32sII keyboard key noise**

Message #2 Posted by [Bruce Bergman](#) on 28 Aug 2007, 10:55 a.m.,  
in response to message #1 by Michael Barry

I have the same thing on my old Woodstock HP-25c occasionally (granted, a different keyboard...). It's like a brief hesitation, followed by a firm click. Makes the key noticeably louder, but otherwise functions the same. I'm more prone to accidentally not pressing it fully if I'm not paying attention.

I'm assuming something just got in between the key and the board, but I'd love to hear if others have solved this problem.

thanks, bruce

### Permutation Typo?

Message #1 Posted by [Vincze](#) on 28 Aug 2007, 9:40 a.m.

I do search and not see this before, so I am looking for clarification. I have to do a permutation this morning and when I look on page 4-15 of 35s manual, it is my understanding that to find a permutation, I must type N (number of items) first, then press nPr and then r (number of items at a time). If I follow this instruction, I get INVALID DATA message.

Am I correct in thinking that I must enter n into calculator and hit ENTER, then enter r and press nPr? This seem to give correct result. Did I misread manual?

*Edited: 28 Aug 2007, 10:16 a.m.*

### Re: Permutation Typo?

Message #2 Posted by [Gene Wright](#) on 28 Aug 2007, 10:21 a.m.,  
in response to message #1 by Vincze

Check the "Note" in the box on page 1-10 of the manual.

The go back to page 4-15.

While I'm not a big fan of this approach, it is what it is.

### Re: Permutation Typo?

Message #3 Posted by [Vincze](#) on 28 Aug 2007, 10:44 a.m.,  
in response to message #2 by Gene Wright

That would seem to indicate that when the check is seen, they are showing it in RPN. That still does not make sense as my calculator in RPN.

### Re: Permutation Typo?

Message #4 Posted by [Chuck](#) on 28 Aug 2007, 10:57 a.m.,  
in response to message #3 by Vincze

Quote:

That would seem to indicate that when the check is seen, they are showing it in RPN. That still does not make sense as my calculator in RPN.

A minor typo possibly; they gave the ALG instructions. But as always with RPN, two arguments THEN the operation, ie., 15 nPr 5 should be entered 15 ENTER 5 nPr. I've seen the blue check in various places it shouldn't be.

**Re: Permutation Typo?**

*Message #5 Posted by **Vincze** on 28 Aug 2007, 11:02 a.m.,  
in response to message #4 by Chuck*

Thank you my friend for the clarification.

Mt friend Gene, did you write this page? ;)

**Re: Permutation Typo?**

*Message #6 Posted by **Gene Wright** on 28 Aug 2007, 11:41 a.m.,  
in response to message #5 by Vincze*

No, I did not.

I'm not a big fan of the check mark approach.

I would rather see instructions given in both logic systems all the time.

**Re: Permutation Typo?**

*Message #7 Posted by **Thomas Radtke** on 28 Aug 2007, 12:30 p.m.,  
in response to message #4 by Chuck*

It would be wrong even if ALG was meant. It just does not work this way.

**Re: Permutation Typo?**

*Message #8 Posted by **Don Shepherd** on 28 Aug 2007, 1:43 p.m.,  
in response to message #1 by Vincze*

Good find, Vincze. Seems an update to the manual is in order.

**Re: Permutation Typo?**

*Message #9 Posted by **Vincze** on 28 Aug 2007, 1:48 p.m.,  
in response to message #8 by Don Shepherd*

I going to assume Combinations on same page wrong too. It has same input format.

I wonder why HP decide to use check mark approach on this? I wonder if other check mark examples flawed too. I also wonder if just certain technical writer ones who do check mark examples, and other do other way?

It sure be nice to have PDF of manual.

**Re: Permutation Typo?**

*Message #10 Posted by **Gene Wright** on 28 Aug 2007, 1:59 p.m.,  
in response to message #9 by Vincze*

Oh my! Too close to things - my only defense.

Yes, this language looks like a portion where the original description for the HP33s was kept by mistake.

The HP35s uses a more Equation Operating System style flavor of algebraic compared to the HP33s.

As such, algebraic functions are prefix functions now (except for factorial, which still doesn't make sense to me).

But, the manual appears to be based upon the 33s manual and this was missed.

FYI, I don't know why the PDF of the manual is not up yet.

**Re: Permutation Typo?**

*Message #11 Posted by [Vincze](#) on 28 Aug 2007, 2:06 p.m.,  
in response to message #10 by Gene Wright*

I take it you get in trouble if you shared PDF version?

**Re: Permutation Typo?**

*Message #12 Posted by [Gene Wright](#) on 28 Aug 2007, 3:16 p.m.,  
in response to message #11 by Vincze*

What PDF version? Don't know what you are talking about.

**Re: Permutation Typo?**

*Message #13 Posted by [Vincze](#) on 28 Aug 2007, 3:30 p.m.,  
in response to message #12 by Gene Wright*

PDF version of 35s manual. From your message it seem to indicate that there is one.

### Coin flip program

Message #1 Posted by [Vincze](#) on 28 Aug 2007, 8:45 a.m.

Last night, I get funny idea to make program to simulate coin flip on 35s. This because wife and son say I not flipping coin right to see who win something.

Anyhow, I figure if I make program, it should be fair and not influence by human and odds should be 50/50. I also tell my son that on true false test, there is a 50/50 chance on getting answer correct, but there is a 90% chance you will pick the wrong answer (that was joke in Hungary).

```
F001 LBL F
F002 0.5
F003 RANDOM
F004 X>Y?
F005 GTO F008
F006 EQN HEADS
F007 GTO F001           // I DO THIS SO IT KEEP RECYCLING IF NEEDED
F008 EQN TAILS
F009 GTO F001
F010 RTN               // NOT SURE IF THIS NEEDED, BUT IT HERE JUST IN CASE
```

I put RTN at F010, even though program should never get there. I just think it better programing practice to always end program formally.

I would be interested to hear what others say about that though.

### RPL version

Message #2 Posted by [Vincze](#) on 28 Aug 2007, 2:53 p.m.,  
in response to message #1 by Vincze

My friends, I thought I try this simple program and convert to RPL, but I have hard time with. Here is what I have.

```
<< IF RAND > .5 THEN
      'HEADS'
    ELSE 'TAILS'
    END
>>
```

When I run it always head. Do I need store the random number to a variable?

Also, it display this is stack

```
'HEADS' > .5624896409...
```

That seem strange if you ask me.

### Re: RPL version

Message #3 Posted by [Raymond Del Tondo](#) on 28 Aug 2007, 3:16 p.m.,  
in response to message #2 by Vincze

Hello,

please don't forget it's RPL;-)

The syntax of your IF clause should be as follows:

```
<<
IF RAND .5 >
THEN 'HEADS'
ELSE 'TAILS'
END
>>
```

HTH

Raymond

### Re: RPL version

*Message #4 Posted by [Vincze](#) on 28 Aug 2007, 3:32 p.m.,  
in response to message #3 by Raymond Del Tondo*

Okay, so THEN and 'HEADS' must be on same line. I look at example I have in RPL guide and it have it differently. I will give this a try.

Thank you.

**\*\*EDIT\*\*** no, still always HEADS. I will look into assigning to variable first and see if that issue.

**\*\*Edit 2\*\*** I see what I do wrong. I not read your message properly and see that .5 come before greater than sign. Yes, Vincze, Reverse Polish Lisp. Think reverse.

Okay, now it work nicely. Thank you my friend.

*Edited: 28 Aug 2007, 3:37 p.m.*

### Re: RPL version

*Message #5 Posted by [James M. Prange \(Michigan\)](#) on 28 Aug 2007, 9:25 p.m.,  
in response to message #4 by Vincze*

It would be better to return character strings than global names, so I'd use "HEADS" and "TAILS" instead of 'HEADS' and 'TAILS'.

Assuming that the AUR manual is correct, RAND returns a value in the range  $0 \leq x < 1$ , so for true 50/50 probabilities, use something like:

```
%%HP: T(3)A(R)F(.);
\<< IF RAND .5 \>= THEN "HEADS" ELSE "TAILS" END \>>
```

or:

```
%%HP: T(3)A(R)F(.);
\<< IF RAND .5 < THEN "TAILS" ELSE "HEADS" END \>>
```

In the above, "%HP: T(3)A(R)F(.);" is an "ASCII transfer header" that would allow you to copy and paste the source code to a file for transferring to a calculator. It tells the calculator, first off, that it is an ASCII transfer, then which translation mode (0 through 3) to use, then which angular

mode (DEG, RAD, or GRAD) to use, and which of period or comma is the "fraction mark". For small programs such as these, one would likely just key in the program, but the transfer header tells just how to key it in, although the angular mode doesn't matter for these particular cases.

"\<<" and "\>>" represent the UserRPL program delimiters, and "\>=" represents the "greater than or equal to" symbol.

In RPL source code, a "line" is pretty much meaningless, except that a LineFeed code always ends any comment. You could put everything on a single line, use one line for each "word", indent some lines, or whatever you choose. If a source code delimiter doesn't already do so, then "separators", such as spaces, ASCII control codes, semicolon, or whichever of period or comma isn't the fraction mark, tell the compiler where one "word" ends and the next begins. Such source code "formatting" is up to the programmer, and each tends to use his own particular formatting "style"; for example, with a longer program, I'd use something like:

```
%%HP: T(3)A(R)F(.);
\<<
  IF
    RAND
    .5 \>=
  THEN
    "HEADS"
  ELSE
    "TAILS"
  END
\>>
```

Getting back to RAND, it would be possible to cheat with your program by setting the seed with the RDZ command. With any given seed, the numbers returned by a series of RAND commands is repeatable, although rather difficult to "predict" without actually trying it, thus you could "preview" the sequence of "HEADS" and "TAILS" returned after "initializing" the seed with the RDZ command.

Regards,  
James

in response to message #5 by James M. Prange (Michigan)

If we're going to dig in and alter the code, I'd do it this way:

```
<< "HEADS" "TAILS" RAND .5 < IFTE >>
```

Smaller, faster and less easy to understand :-)

- Pauli

---

IFTE?? IF Than Else?

Yes, much smaller and very not easy to understand, but yes efficient (I think).

[ [Return to Index](#) | [Top of Index](#) ]**Surveying program for the HP-71B**Message #1 Posted by [Gerson W. Barbosa](#) on 27 Aug 2007, 10:32 p.m.

The following program computes the area of an n-side irregular polygon, given the side-lengths and the internal angles. The coordinates are also calculated. An automatic misclose adjustment is provided.

Actually, I know nothing of surveying. I just turned a surveying sheet into a CASIO PB-700 BASIC program, from which this version came from.

Messages are in the original Portuguese but the examples might be easy to follow. Just for an idea, for an equal-sided triangle enter 3, 10, 60, 10, 60, 10, 60, 90 as requested (side = 10 length units). The result should be 43.301 area units and the coordinates for plotting it on a Cartesian plane would be (0.000, 0.000), (10.000, 0.000) and (5.000, 8.666).

gerson- fortunately; english and portugese both got their words for mathematical concepts from latin, so they abbreviate about the same. thanks for the post.

**Re: Surveying program for the HP-71B**

Message #3 Posted by [Gerson W. Barbosa](#) on 28 Aug 2007, 8:46 p.m.,

in response to message #2 by [db\(martinez,ca\)](#)

The QBASIC version gives the same results, except for occasional differences of one second.

I'd like to check them upon an authoritative software, but I don't have any.

Gerson.

### Stats programs for the HP-35s sold on eBay

Message #1 Posted by [Bruce Bergman](#) on 27 Aug 2007, 8:50 p.m.

Take a look at this link:

[Stat Pac for HP-35s](#)

Someone is making some bucks off selling a port of the StatPac for the HP-35s platform.

Interesting...

thanks, bruce

### Re: Stats programs for the HP-35s sold on eBay

in response to message #1 by Bruce Bergman

Some poor soul buys this for \$45 then finds out he has to key in 7,550 lines of code! Why do I see some irate buyers?

### Re: Stats programs for the HP-35s sold on eBay

Message #3 Posted by [Stefan Vorkoetter](#) on 27 Aug 2007, 9:22 p.m.,  
in response to message #2 by Don Shepherd

Not only that, but did you notice the section that says all the programs have a consistent interface, and then lists the XEQ labels needed for common operations? This of course implies that the programs are designed so that only one of them resides in the calculator at a time, which means you need to re-key these programs whenever you need one.

Of course, anyone buying this has got to realize they need to key in the code, since there's no other way to get it into the calculator.

Stefan

OK. Namir is free to do so, and probably more qualified than most.. what is the issue?

**Re: Stats programs for the HP-35s sold on eBay**

*Message #8 Posted by [Howard Owen](#) on 27 Aug 2007, 10:49 p.m.,  
in response to message #7 by Allen*

That's unlikely to be a rip-off of any another "stat-pac." Given that Namir is an expert statistician and an HP calculator enthusiast, I'd say odds are good you would get reasonable value out of the purchase.

You still might end up with sore fingers, however. 8)

Regards,  
Howard

*Message #10 Posted by [Les Wright](#) on 29 Aug 2007, 7:41 a.m.,  
in response to message #7 by Allen*

Looking at the eBay listing, it seems our good friend has essentially written a book. I know that he is scrupulous about notions of copyright and intellectual property issues, so I would expect the work is original and thus he is free to give or sell it away as he sees fit. I also fully expect that anyone who purchases this document knows full well that the code goes into the calc by fingers.

I think Namir has a great deal of credibility in this regard. Some of you may remember that about 1985 he was the single most prolific contributor to the HP41 Users' Library. He is a highly skilled RPN programmer, and if he wants to seek a little remuneration for his work, good for him. He has the credentials to back this up. I also expect he will fully support his work and make adjustments and respond promptly to feedback and bug reports.

Les

Yes, but there where one criticism raised earlier in this thread about the user interface indicates that only one program can be in the machine by the design.

After implementor found to be one of 'us' no more discussion on this topic has been (granted, it may not been discussed either way).

Statistic is not my field but I guess anyone in need of these functions of a calculator need first to find out if HP-35s is the right machine for her.

Does this indicate for example that the memory of the machine is to limited for this type of work?

Is this genuine design flaw in the code?

Are we misreading the implication of the software's description?

### **Re: Stats programs for the HP-35s sold on eBay**

*Message #12 Posted by [Seth Morabito](#) on 28 Aug 2007, 1:08 a.m.,  
in response to message #1 by Bruce Bergman*

I think this is excellent news. More applications means more utility for more users, and that means more sales for HP, and that means more money for calculator development. It's capitalism at its finest!

### **Re: Stats programs for the HP-35s sold on eBay**

*Message #13 Posted by [Pal G.](#) on 28 Aug 2007, 1:54 a.m.,  
in response to message #12 by Seth Morabito*

Well, there is nothing wrong with capitalism. However, if HP is smart they pay the author a couple thousand bucks and make the statistics programs open source, or should I say free, to the public. As mentioned, there is quite a bit of key pressing to do for those would be statisticians. If HP were to make all those statistics apps public many more people would buy hp 35ses and load 'em up. Otherwise, I am afraid all of Namir's work is for a stark few who are "looking for statistics applications for their new 35s on ebay"??

I would have never known those apps existed if I hadn't read it here, and I imagine not too many present

and future hp 35s owners know about this forum or search ebay for statistics applications.

Cheers, Pal

I not familiar with Stats pack, but I do have one question. Is/was this copyrighted material for different calculator? If so, there may be issue with copyright holder (or was Namir author of programs?)

### **Stravinsky said....**

*Message #15 Posted by [Les Wright](#) on 29 Aug 2007, 7:50 a.m.,  
in response to message #14 by Vincze*

A professor of mine likes to quote Stravinsky, who basically said that great composers steal from each other all the time.

I expect that Namir drew inspiration from the original HP41 Stat Pac as well as various Users' Library Solutions in the statistics realm. Still, I suspect he had a lot of work to do to adapt algorithms to the 35s. Also, it seems that he uses the 35s 3D vector type to maximize matrix storage capacity. This is an entity unique to the 35s and it would take some clever and innovative porting to get things to work.

I think in our own programs we borrow others' tricks, techniques, and motifs all the time. Is this plagiarism, or is it simply benefitting communally from the shared expertise of the group?

Les

### HP cancelling #82240B printer, what does double-width enter key 17bii+ print to?

Message #1 Posted by [Mike Oferrell](#) on 27 Aug 2007, 6:08 p.m.

The picture that was posted about a week ago of the yet to be released 17bii++ has prt and printer as keys on the keyboard but HP is discontinuing the #82240B. Anyone know anything else this maybe able to print to?

### Print to LaserJet maybe with IR??

Message #2 Posted by [Vincze](#) on 27 Aug 2007, 7:25 p.m.,  
in response to message #1 by Mike Oferrell

I thought I see printer that not HP model that it can print to on ebay once. I forget who make it, but I would think HP would still offer some printer. Maybe new model.

One other thing, I sorry I not research this first, but I know HP make IR port for laser jet printers. Can calculator print to these? I have HP IR thingy for my printer and that would be nice with 48gx.

**\*\*EDIT\*\*** Okay, I find link to compatible printer [here](#)

*Edited: 27 Aug 2007, 7:42 p.m.*

### Re: Print to LaserJet maybe with IR??

Message #3 Posted by [Vincze](#) on 28 Aug 2007, 9:03 a.m.,  
in response to message #2 by Vincze

I talk to co-worker yesterday, and he tell me that he was able to get HP calculator with IR port to print to HP Laserjet printer with FIR port on it. He said he had to do something with calculator to get it to work, and he was not sure off top of his head. If this true, I think it wonderful.

I wonder how this would handle trace printing though.

*Edited: 28 Aug 2007, 9:03 a.m.*

Howard

**Re: HP cancelling #82240B printer, what does double-width enter key 17bii+ print to?**

*Message #6 Posted by [Mike Oferrell](#) on 27 Aug 2007, 10:10 p.m.,  
in response to message #5 by [Howard Owen](#)*

I guess as I follow on I would then ask how does HP test there new models of calculators? If this model is so near to being released that a retail store had a picture you would think someone has handled one specifically the printing.

**Re: HP cancelling #82240B printer, what does double-width enter key 17bii+ print to?**

*Message #7 Posted by [Howard Owen](#) on 27 Aug 2007, 10:43 p.m.,  
in response to message #6 by [Mike Oferrell](#)*

A picture of the 35s appeared three months before the calculator was available. I don't know if that time line will apply to the new 17bii+. If so, it begs the question: if there is a new printer in the works, where are the pictures of *it*?

On the other hand, perhaps the calculator has USB host capability, and can therefore use any USB printer. Or maybe it's standard USB, but you can print through a PC host application.

Wild speculation is my specialty. 8)

Regards,  
Howard

**Repair of 82002A Classic Series Charger**

Message #1 Posted by [Gerry Schultz](#) on 27 Aug 2007, 4:03 p.m.

To All:

Okay, I really need some help here. I own an old HP-55 calculator that I just spent a lot of money on refurbishing and buying a new battery for it. The unit looks and works great due to Richard Anthony's efforts.

My problem is that it that I can't recharge the battery. Being an electronics guy, I know I could figure out what's going on with the charger since the battery ran the 55 just fine when I first got it about 2 months ago. I found some old schematics for the classic charger in 65 notes (V2N9P24) and the PPC Journal (V7N2P25) but they are not the same. As it turns out, my charger matches the schematic in the PPC Journal and I determined the transformer strapping for 120 VAC and I checked for continuity between the 3-pin connector and the circuit board and it's good. Also, the calculator runs fine on the charger. Also, as a precaution, I replaced the original 400uF filter cap given it was some 30 years old. Afterward, I checked its value and it was over 420uF, so it was still in good shape.

**WARNING:** With the charger out of its case, there are open circuits that have 120VAC exposed so if you don't know what you are doing, please don't try this.

I did a circuit board layout and matched it to the PPC Journal schematic. Q1, which feeds about 4 vdc to the calculator works fine. In testing the charger circuit, I found my problem. The calculator battery was dead, it measured about 1.1v. I hooked it up to the charger and the collector of Q3 showed about 2.2 vdc and it started to charge the battery. But, when the battery reaches around 2.2 vdc, the collector doesn't go any higher so the battery stops charging. Now, I know that Q2 and Q3 make up a constant current source of 50 mA to trickle charge the battery. Since Q3's collector voltage isn't climbing higher than the battery voltage to maintain the 50 mA current, one or both of those transistors is bad.

Okay, now the transistors are marked as follows (that these old eyes could read):

Q2 M924 2-274

Q3 M952 3-338

Both transistors are PNP and the "M" specs a Motorola transistor. Is this a 2N924 or is it something else? Given the age of the charger, I would not be surprised if these transistors were no longer available. So, what would be good substitutes for these two transistors that are available?

I hope someone knows since I've been googling for these numbers without success. I'm 9/10 of the way to fixing this and I hope someone can identify these parts so I can order replacements.

Thank you all for your help,

Gerry

**Re: Repair of 82002A Classic Series Charger**

Message #2 Posted by [Vincze](#) on 27 Aug 2007, 4:21 p.m.,

*in response to message #1 by Gerry Schultz*

I sure you already think of this, but why not just get new charger?

### **Re: Repair of 82002A Classic Series Charger**

*Message #3 Posted by [Gerry Schultz](#) on 27 Aug 2007, 6:37 p.m.,  
in response to message #2 by Vincze*

Vincze:

The HP-55 has a very sentimental place in my heart as it is the 2nd HP calculator I have owned and I bought it when it was new. I sold my HP-45 to get the 55 and I couldn't afford the HP-65 at the time. So, instead of discarding the charger I've had for over 30 years, I would like to fix it. If I can't figure out where to get the parts and no one knows here, I may have no choice but to replace it. International Calculators and Computers want \$60 for a charger and they don't have any in stock right now.

It's a simple matter to repair the charger if I can get the right parts. I've had a lot of my calculators refurbished lately (including the 55) because I want to keep these things around for a long time. I would rather repair than replace as it means there is one less HP calculator in the world.

Thanks,

Gerry

*Message #4 Posted by [Vincze](#) on 27 Aug 2007, 7:23 p.m.,  
in response to message #3 by Gerry Schultz*

is there not a calculator repair site that I see on site some time ago? Maybe they have parts to fix charger.

### **Re: Repair of 82002A Classic Series Charger**

*Message #5 Posted by [Katie Wasserman](#) on 27 Aug 2007, 9:18 p.m.,  
in response to message #1 by Gerry Schultz*

Tony's schematics of this charger are [here](#). Although he doesn't note the part number of any of the transistors, none of them look critical. Given the minimal voltages and currents involved I'd probably just try some general purpose silicon ones like use a 2N2222 and a couple of 2N2907's.

### **Re: Repair of 82002A Classic Series Charger**

*Message #6 Posted by [Dave Colver](#) on 27 Aug 2007, 9:41 p.m.,  
in response to message #5 by Katie Wasserman*

The car charger uses an MJE800 and an 1853-0393...if i'm reading the diagram right...

### **Re: Repair of 82002A Classic Series Charger**

*Message #7 Posted by [Katie Wasserman](#) on 27 Aug 2007, 11:35 p.m.,  
in response to message #6 by Dave Colver*

Here's a link to a gigantic [HP part number XREF](#). Sometimes HP abbreviated their part numbers on devices so the "3-338" might be something like a 1853-0338 (not sure if that's a real part number or

not, but you get the idea).

## Re: Repair of 82002A Classic Series Charger - the Results

Message #8 Posted by [Gerry Schultz](#) on 28 Aug 2007, 2:04 p.m.,  
in response to message #7 by [Katie Wasserman](#)

To All:

Thank you for your responses. Katie, thanks for the HP parts listing. I did some searching through it but I found nothing conclusive. I should note that that part numbers were on the transistors themselves, so I'm sure their manufacturer part numbers, in this case, Motorola. Also, when I formatted my original posting, Q2 was on the first line just as a label for me, M924 was on the second and 2-274 was on the third line, which is how it is typed on the face of the transistors, but they all got put onto one line when it was posted. In my experience, the M924 is Motorola's shortened part number and the 2-274 represents the manufacturing date code. The layout for Q3 was the same. I didn't notice until later the formatting change.

Given Katie's good suggestion that there's not much being demanded of these transistors substituting generic PNPs should work out fine. My concern was that the case is sealed so there is no air flow and I didn't want either one to overheat. Also, not knowing the Hfe or other specs for those transistors, I wasn't sure if it would deliver the same current as the original parts.

So, I decided to throw caution to the wind and I went down to Radio Shack and bought some 2N3906 and a TIP42 transistors. The TIP42 is overkill for what I needed and it's larger size makes it a careful fit in the plastic case and not having its heatsink on top touch the AC transformer core, but it should stay cool. Also, the TIP42's pinout is different that the original transistor so I had to be careful.

I replaced both transistors early this morning, (my wife pointed out the tail end of the total Lunar eclipse this morning, it was beautiful!) and I found out that the original Q3 had an open base-to-collector. After installing the parts, my charger is now charging my batteries. I did some calculating and the current looks close to 50 mA, which is good. After letting it charge my old, old battery pack for a while, neither of the transistors or the battery pack are getting warm, it looks good and the battery is now properly powering the calculator by itself. It appears to be fixed!

Thank you all for your help. I hope this post will help someone else who is trying to fix their classic charger.

Thanks,

Gerry

## Re: Repair of 82002A Classic Series Charger

Message #9 Posted by [Maximilian Hohmann](#) on 28 Aug 2007, 8:34 a.m.,  
in response to message #1 by [Gerry Schultz](#)

Hello!

Quote:

... make up a constant current source of 50 mA to trickle charge the battery.

50mA for a typical 500mAh classic NiCd battery pack is the nominal charging current (1/10 of the capacity for

14 hours), so be careful not to exceed the 14 hours otherwise the batteries get damaged!

If you can't find the replacement transistors, there are two easy solutions I can think of:

1. Buy a ready-made miniature 50mA constant current source like the one in this example:

[http://www.dotlight.de/shop/product\\_info.php/cPath/100\\_106/products\\_id/304](http://www.dotlight.de/shop/product_info.php/cPath/100_106/products_id/304)

2. A 'quick&dirty' solution would do it the same way as it is done in cheap chargers: Use an LED as pseudo constant current source (or rather 'current limiter'). You have to look for an LED that draws approximately 50mA, this can either be a vintage red LED or a modern blue or white one. To limit the voltage drop over the LED, a series resistor will be required: The fully charged battery pack has a voltage of  $3 \times 1.4V = 4.2V$ , the drop over the LED is around 2V, so difference between these 6V and the unregulated supply voltage (16V according to the schematic posted above) results in a 200 Ohm resistor that will be required. Not elegant, but it works. And it is safe, because in case something goes wrong, it will be the LED that fails and not your batteries.

Greetings, Max

**HHC2007 HP Handhelds Conference News Update**

Message #1 Posted by [Jake Schwartz](#) on 26 Aug 2007, 10:38 p.m.

Hi,

For those on the fence regarding the HHC2007 conference in San Diego on September 29-30th, things are looking really good with 4 HP calculator-division people scheduled to speak, along with our 15 others who have expressed their desire to give presentations. We are still expecting also to show Steve Liebson's new video interview with Dave Cochran, one of those who were instrumental in bringing the HP9100 desktop and HP35 pocket calculators to life. There are currently over 60 people registered to be in attendance.

\*\*\*Also, if you haven't yet made hotel reservations, the special \$99.-per-night conference discounted rate is only available if you register with the Holiday Inn before September 1st, so hurry. \*\*\*

In the "HP and HHC News" section, a new announcement has been posted regarding the HP Calculator Division's new GM. In addition, on the main page check out version 4 of the door-prize list, which has now grown to allow for at least one prize for every currently-registered attendee.

Also check out the section called "British HPCC Users Conference", covering some aspects of the upcoming HPCC 25th-Anniversary conference at the Imperial College in London on October 13-14th.

Consult <http://holyjoe.net/hhc2007/> on the web for all the details.

See you at the end of September,

Jake Schwartz

Jake,

Thanks for the update.. only a month to go!

Regarding the new [General Manager](#) of HP's calculator Division, it appears that [Mr. Wing Cheung](#) went to the University of Oregon (Eugene, OR), which is only [a hop, skip, and a jump](#) from Oregon State University (Corvallis, OR), where HP designed all the great calculators in the late-70's to mid-90's (I'll bet Mr. Cheung is probably too young to have been there during that era - see bottom right [photo](#)).

Matt  
Beaverton, OR

### Calculator Keyboard standards?

Message #1 Posted by [Vincze](#) on 27 Aug 2007, 2:21 p.m.

I apologize if this asked before, as I did check but did not see anything talking about this.

I have older HP45 calculator, and one thing I notice with the 45 is the operator keys in different order than on all/most modern calculators. I have two questions. 1) Why was old format (- + x /) changed to current one (/ x - +)? 2) Was some guideline set that spell out how current operator layout should be or was it just industry adopting all the same standard?

### Re: Calculator Keyboard standards?

Message #2 Posted by [Eric Smith](#) on 27 Aug 2007, 2:32 p.m.,  
in response to message #1 by Vincze

The original layout was based on research and recognized that addition and multiplication were typically more commonly used than subtraction and division, and thus placed them nearer to the center of the numeric pad.

At some point in the early 1980s, they apparently either forgot about that, or decided that it was unimportant.

AFAIK, there are no official standards for calculator keyboard layout.

Hi, Eric --

I can't agree with either statement. I'd say that HP made a deliberate decision to adopt the arrangement that TI already used. I, for one, find the present arrangement much more logical than the original one. Maybe HP "saw the light", too.

The present arrangement debuted with the horizontal-layout Voyager series in 1981, and was carried over to the HP-71B and the vertical-layout HP-28C and Pioneer series later in the 1980's.

Original                      Present

|   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|
| - | 7 | 8 | 9 | 7 | 8 | 9 | / |
| + | 4 | 5 | 6 | 4 | 5 | 6 | * |
| * | 1 | 2 | 3 | 1 | 2 | 3 | - |
| / | 0 | . |   | 0 | . |   | + |

"One-handing" a calculator is (certainly to me) an awkward way to use it, and a good way to drop it.

90% of users are right-handed. If a user places an "original-arrangement" calc on a desktop or holds it in the left hand, and presses keys with the dominant right hand, the number keys can be concealed by the right hand when an arithmetic key is pressed. This makes it difficult to immediately enter the next number.

With the present arrangement, the right hand does not obscure or conceal the number keys when an arithmetic key is pressed with that hand.

Note also that the present arrangement groups the functions consistently: '/' above '\*', and '-' above '+'. The most common, '+', is conspicuous in the lower-right corner, just like adding machines. No similar-looking arithmetic symbols are adjacent to each other.

Of course, for absolute *perfection* in thoughtful keyboard arrangement, consider [the HP-15C... :-\)](#)

I can't agree with either statement.

\_\_\_\_\_

You can disagree all you like, but nothing you have written gives any evidence that either of my statements were incorrect. At best you have given a few possible justifications for the eventual change in key layout, but those justifications do not contradict my statements.

With regard to my first statement, it is a FACT that when HP introduced the FIRST handheld scientific calculator in 1972, they were NOT copying the key layout of any existing (non-scientific) TI calculator. In their early calculators, TI put addition and subtraction to the right of the numeric pad, and multiplication and division above the numeric pad.

With regard to my second statement, no matter how many other justifications you can come up with for moving the arithmetic keys around, they wouldn't have done it unless either they had forgotten why the original layout was chosen, or they decided that the reason for the original layout was (relatively) unimportant.

Quote:

\_\_\_\_\_

"One-handing" a calculator is (certainly to me) an awkward way to use it, and a good way to drop it.

\_\_\_\_\_

Almost every engineer I've ever seen use a Woodstock, Spice, or HP-41C/CV/CX routinely used it one-handed. I've done that for over 30 years, and never dropped one in the process. (I've dropped them at other times, but never in the midst of a one-handed calculation.)

Quote:

\_\_\_\_\_

the number keys can be concealed by the right hand when an arithmetic key is pressed. This makes it difficult to immediately enter the next number.

\_\_\_\_\_

I don't understand how it makes anything difficult. Are you unable to retain a mental image of where you saw the numeric keys a fraction of a second previously? Are you really making a conscious effort to search for the specific numeric key you want to press? "Hmmm... where did that four key go?"

Quote:

\_\_\_\_\_

Note also that the present arrangement groups the functions consistently

\_\_\_\_\_

As Emmerson said, a foolish consistency is the hobgoblin of small minds, but the arrangement you prefer is no more 'consistent' than the way HP did it earlier on. In the early HP calculators, '+' and '\*' were nearer the center, and '-' and '/' were adjacent to (and farther from the center) than those. Neither arrangement is "inconsistent" with any mathematical principle, though one might be more consistent with someone's preconceived notions after using another brand of calculator.

Quote:

\_\_\_\_\_

The most common, '+', is conspicuous in the lower-right corner, just like adding machines.

\_\_\_\_\_

That argument might make some sense for a financial calculator, but not for a scientific. Many engineers would have moved from an earlier HP to a newer HP, but few would have moved directly from an adding machine to a newer HP.

Quote:

\_\_\_\_\_

No similar-looking arithmetic symbols are adjacent to each other.

\_\_\_\_\_

Um, who cares? Any confusion over which arithmetic function is which might last all of two minutes from first use of the calculator. I've never heard anyone claim that the symbols for the arithmetic functions are difficult to visually distinguish. Those with visual impairments might have trouble initially, but will quickly learn which function is where, regardless of what the symbols look like.

Quote:

\_\_\_\_\_

for absolute perfection in thoughtful keyboard arrangement, consider the HP-15C

For a horizontal form factor, it's a good keyboard layout. I won't claim that I could do better, but I certainly wouldn't go so far as to claim that it had achieved perfection. You're far too quick to throw that word around.

## Re: Calculator Keyboard standards?

Message #5 Posted by [Karl Schneider](#) on 30 Aug 2007, 1:48 a.m.,  
in response to message #4 by Eric Smith

Eric --

Hmm, your responses seemed a tad argumentative. That's OK; I've been known to be the same...

We had a [debate about the HP-10C more than three years ago](#).

Eric said:

Quote:

*"At some point in the early 1980s, they apparently either forgot about that, or decided that it was unimportant."*

*"You can disagree all you like, but nothing you have written gives any evidence that either of my statements were incorrect."*

It's quite difficult to refute or disprove any statement that includes the word "apparently". My view is that HP reconsidered the design, deciding that the arrangement used by TI perhaps made more sense for most users and adopted it -- not specifically to be consistent with TI, which, needless to say, would be clearly unimportant.

Quote:

*Almost every engineer I've ever seen use a Woodstock, Spice, or HP-41C/CV/CX routinely used it one-handed.*

Are you guys burly field engineers with huge hands? I can't span the keyboard comfortably even on an HP-34C. That divide key is almost impossible to reach. Good thing it isn't needed all that often, or else it would have been centered within that region of the keypad. :-)

Quote:

*Are you unable to retain a mental image of where you saw the numeric keys a fraction of a second previously?*

No, but why visualize when you could actually see?

But you might have a point: Visualization, or "eyes on the display, not on the keypad" was expected, as with typing in era prior to word processors or even IBM Correcting Selectric typewriters. That's why there was a raised dot on the HP-35's "5" key.

Quote:

---

*As Emmerson said, a foolish consistency is the hobgoblin of small minds*

---

Ralph Waldo Emerson's famous quote, "A foolish consistency is the hobgoblin of little minds" is a *non sequitur* here. Division is to multiplication as subtraction is to addition -- both are pairs of inverse functions. There's nothing foolish about keeping a consistent positional relationship between them.

Quote:

---

*That argument ("The most common, '+', is conspicuous in the lower-right corner, just like adding machines.") might make some sense for a financial calculator, but not for a scientific. Many engineers would have moved from an earlier HP to a newer HP, but few would have moved directly from an adding machine to a newer HP.*

---

That's another *non sequitur*. '+' (on a large key) was placed in the lower right corner for conspicuity and less-encumbered access because addition is the most commonly used arithmetic function for adding machines. That's probably also true to a lesser extent for scientifics.

Quote:

---

*For a horizontal form factor, (the HP-15C has) a good keyboard layout. I won't claim that I could do better, but I certainly wouldn't go so far as to claim that it had achieved perfection. You're far (too) quick to throw that word around.*

---

"Far too quick"? The HP-15C has been out for 25 years, and I've had one for 24 of those. During that time, numerous models of calculators that just don't measure up as well in certain fundamental aspects have been introduced by HP and other manufacturers. Er, how much longer should I have waited?

Of course, anything can be judged only within the context of what it actually is or was, not whatever else might be subsequently developed. The HP-15C is a horizontal-layout, compact and affordable advanced scientific calculator with a 10-digit, 7-segment display and modest processing speed, ROM, and RAM space. There was hardly any room for improvement of any kind in the execution of its functional specification.

At least you must admit that I offered plenty of evidence in the archived post for the "perfect keyboard arrangement" argument... :-)

### Re: Calculator Keyboard standards?

Message #7 Posted by [Gene Wright](#) on 27 Aug 2007, 2:58 p.m.,  
in response to message #6 by [Richard Ottosen](#)

Short answer?

TI (and all the other makers) won the wars by having more calculators sold.

HP was the about only manufacturer who put their function keys in that order and on that side of the machine.

Eventually, someone at HP (edit: had to have) decided to avoid being that different from the 95%+ market share of everyone else. (I'm guessing on the market share # but if I'm wrong, I'd guess HP's share was smaller than 5% of the total).

Might be the same someone who seemed to think it was a good idea to either a) downplay or b) eliminate RPN on some models.

Thankfully, things seem to be different today...but I'm not sure the functions will ever move back to the other side or change order.

Too much water under the bridge. Gene

Quote:

I have a similar question. Why did the same keys (- + X /) move from being on the left of the digit keys to being to the right of those keys?

Good question. I would think that one could do math easier with on left because one hand could input number and other could enter operator.

### Re: Calculator Keyboard standards?

Message #9 Posted by [Eric Smith](#) on 27 Aug 2007, 3:23 p.m.,

Quote:

I would think that one could do math easier with on left because one hand could input number and other could enter operator.

I don't understand your point. Why can't you do that with the arithmetic function keys on either the left or the right?

Personally, I prefer to operate a calculator one-handed. The Woodstock series and 41C were great for that.

### **Re: Calculator Keyboard standards?**

*Message #10 Posted by [Vincze](#) on 27 Aug 2007, 3:32 p.m.,  
in response to message #9 by [Eric Smith](#)*

With math function keys on left, you would use left hand to do operators and right to do numbers (more quickly). With math function keys on right, you could use left hand for numbers and right for functions, but with most right handed people this may seem awkward as you may be slower with number keys and or less accurate since you using your left hand.

If doing one handed mode, it make more sense to have on right side so thumb not have to travel as far. If using finger, I guess it does not make difference.

### **Re: Calculator Keyboard standards?**

*Message #11 Posted by [Eric Smith](#) on 27 Aug 2007, 3:47 p.m.,  
in response to message #10 by [Vincze](#)*

Thanks for the clarification.

I'm right handed, but I've used calculators for so many years one-handed in my left hand that I don't even recall ever having had any trouble doing so.

The purpose of one-handed use is to leave the other hand (ideally, the dominant hand) free for typing, writing, drawing, etc. I do NOT want to pick up the calculator, do a few calculations, set it down, pick up a pen, do some writing or drawing, set down the pen, and repeat.

As I mentioned previously, the Woodstock series and 41C were great for that. While I liked the Voyagers (especially the 15C and 16C), they were generally unsuited for one-handed use due to the horizontal layout.

### **Re: Calculator Keyboard standards?**

Well, sure, but I don't see any particular advantage to that. It doesn't help me accomplish anything more easily or quickly. And it certainly doesn't help me avoid the need to set down the calculator to type/write/draw.

### **Re: Calculator Keyboard standards?**

*Message #14 Posted by [Howard Owen](#) on 27 Aug 2007, 5:49 p.m.,  
in response to message #13 by Eric Smith*

Quote:

Well, sure, but I don't see any particular advantage to that. It doesn't help me accomplish anything more easily or quickly.

It's just one more style. Arguing whether one style is more efficient than another sort of misses the point. Individuals adapt their tools in individual ways.

For example, I was coding on my 42S yesterday on the plane. I held the calculator in my left hand, with my glasses (whose reading lenses don't work for really close viewing) wedged between my left index and middle fingers. In my right hand I held the program listing stretched between index and middle fingers at the top, and thumb and ring finger at the bottom. To "scroll" the listing, I would slip the top or bottom of the listing under my left thumb, wedge it between that thumb and the calculator, and then pull the listing in the desired direction. To compare the calculator screen and the listing, I would either scroll with my left thumb on the up and down arrow keys, or use my right index finger (with the listing loose at the top briefly) to key the arrows. To make changes I would mainly use my right index finger in that mode. As long-winded as this explanation is, I actually adopted this usage style without thinking about it. It felt quite natural and useful to me. I only took conscious note after I had completed a fairly complicated series of moves, and it struck me that I was doing quite a lot with my hands with very little effort.

So that was very efficient for me. Would it be for you? Maybe not. It's not just a matter of how the calculator is placed in your hands and how you manipulate it there. It's also, perhaps principally, a matter of how that all works with your individual human *brain*. And how that guy is wired is still a scientific mystery, but surely differs from individual to individual.

Regards,  
Howard

---

I operate my HP41C the same way and for the same reasons. I got started doing this with an HP25. Its case fits the hand much better than any of the others I have used. The HP41C is just barely usable this way. It is a stretch for some keys.

The HP32S and HP32SII are too wide and have the function keys too far from my thumb to be comfortable, even for my large hands.

---

To further confuse things I think it is worth noting that most 10-key adding machines have the number keys the same layout as the early HP calculators. But, 10-key adding machines tended to have the function keys to the right of the number keys.

So, HP kept the number layout but moved the function keys to the left of the number keys. Interesting.

Message #17 Posted by **Doctor Bubu** on 27 Aug 2007, 3:40 p.m.,  
in response to message #1 by Vincze

Hallo Vince!

I think that it is more ergonomical.

If you type with one hand the numbers than, in a natural move back right (ok it works only for right-handed people), you pass the operation-keys and the last down right is the most used +.

Not only the newer calculators and TI used this arrangement. If you look at older calculators f.e. out of the 50's or 60', you'll find this keyboard layouts.

Greetings Juergen

I also love the old HP arrangement, even when it is not so comfortable.

## Proposal for the future HP45s

*Message #18 Posted by **Nenad (Croatia)** on 27 Aug 2007, 4:25 p.m.,  
in response to message #1 by Vincze*

Vincze,

There is also another interesting issue with calculator keyboards layout, compared to mobile phone keyboards. This was discussed a few years ago in the Forum. A typical calculator keyboard layout is:

```
7 8 9
4 5 6
1 2 3
0 .
```

Whereas a typical mobile phone keyboard layout is:

```
1 2 3
4 5 6
7 8 9
* 0 #
```

On the basis of HP35s experience (its positive side), we may be pretty sure that design engineers in HP read this forum, at least sometimes. Many of us certainly got used to classic mobile phone SMS typing and can type SMS messages very fast.

One day the new HP45s, manufactured in China, Vietnam, North Korea, or somewhere in Africa, as the successor of the "best of the bests" (HP42s) will see its dawn and enlighten this world. It will have wonderful I/O capabilities, such as wireless USB 5.0 connection, 10 TB memory card to save/restore programs/data, voice data/commands input, etc. etc. Variables and labels in HP45s will certainly not be restricted to a single letter only.

For those old-fashioned ones like myself, I would like to propose its keyboard layout now (at least, the alphanumerical part of it):

```
7      8      9
      abc    def

4      5      6
ghi    jkl    mno

1      2      3
pqrs   tuv    wxyz

0      .
```

This would be some mixture between old calc and classic mobile.

Yes, I know that the qwerty layout would be better (at least there is one on my SHARP PC-1262, sized about the same as HP 11C/12C/15C, meaning fits into a shirt pocket easily), but it is a boredom when you have to

type e.g. SIN letter by letter.

On the other hand, in the present (or past) HP42s it is not easy to accept its keyboard layout nowadays anymore, though number of keystrokes needed to input a single letter is certainly lower than in a mobile phone.

Interesting thoughts for the series, how about the HP65 or 67S with actual card slots and I/O

### **Re: Calculator Keyboard standards?**

*Message #20 Posted by [htom trites jr](#) on 28 Aug 2007, 11:24 a.m.,  
in response to message #1 by Vincze*

If you're old enough, you learned to "touch type" a numeric keyboard, leaving your middle finger on the "5" key. The reach to the left with the index finger or thumb (this is a right-hand centric world, after all) is easier than the reach to the right with the ring finger or pinky finger. Arithmetic operators are keyed more often than functions, so they go to the left.

Your other hand was used for manipulating the paper.

### HHC2007 HP Handhelds Conference News Update

Message #1 Posted by [Jake Schwartz](#) on 26 Aug 2007, 10:38 p.m.

Hi,

For those on the fence regarding the HHC2007 conference in San Diego on September 29-30th, things are looking really good with 4 HP calculator-division people scheduled to speak, along with our 15 others who have expressed their desire to give presentations. We are still expecting also to show Steve Liebson's new video interview with Dave Cochran, one of those who were instrumental in bringing the HP9100 desktop and HP35 pocket calculators to life. There are currently over 60 people registered to be in attendance.

\*\*\*Also, if you haven't yet made hotel reservations, the special \$99.-per-night conference discounted rate is only available if you register with the Holiday Inn before September 1st, so hurry. \*\*\*

In the "HP and HHC News" section, a new announcement has been posted regarding the HP Calculator Division's new GM. In addition, on the main page check out version 4 of the door-prize list, which has now grown to allow for at least one prize for every currently-registered attendee.

Also check out the section called "British HPCC Users Conference", covering some aspects of the upcoming HPCC 25th-Anniversary conference at the Imperial College in London on October 13-14th.

Consult <http://holyjoe.net/hhc2007/> on the web for all the details.

See you at the end of September,

Jake Schwartz

in response to message #1 by Jake Schwartz

This is turning out well. Looking forward to the conference, 35S/50G/49G+/ and all fo the HP calcs and all.

### Re: HHC2007 HP Handhelds Conference News Update

Message #3 Posted by [Matt Kernal](#) on 27 Aug 2007, 1:59 p.m.,  
in response to message #1 by Jake Schwartz

Jake,

Thanks for the update.. only a month to go!

Regarding the new [General Manager](#) of HP's calculator Division, it appears that [Mr. Wing Cheung](#) went to the University of Oregon (Eugene, OR), which is only [a hop, skip, and a jump](#) from Oregon State University (Corvallis, OR), where HP designed all the great calculators in the late-70's to mid-90's (I'll bet Mr. Cheung is probably too young to have been there during that era - see bottom right [photo](#)).

Matt  
Beaverton, OR

### HP calculator in the comic strips?

Message #1 Posted by [Bruce Bergman](#) on 27 Aug 2007, 1:52 p.m.

Did anyone read "FoxTrot" in Sunday's comic section? I love that strip; the kids are so...familiar. ;-)

Anyhow, in the strip, Jason introduces his new calculator. One with two other keys and an "ENTER" key. Sound familiar?

Check it out. At least for today, it's located here: <http://www.foxtrot.com/>

;-)

thanks, bruce

### Re: HP calculator in the comic strips?

Message #2 Posted by [Vincze](#) on 27 Aug 2007, 2:06 p.m.,  
in response to message #1 by Bruce Bergman

Ha Ha, boy in hat sound like my son saying Dad "I thought you said calculators are for wimps."

### Re: HP calculator in the comic strips?

Message #3 Posted by [Ren](#) on 27 Aug 2007, 2:22 p.m.,  
in response to message #1 by Bruce Bergman

Thanks for the link!

I think the cartoonist (Bill Amend) probably violated his NDA (Non-Disclosure Agreement) with HP by releasing this information on the HP-16Cs before HP's official announcement. Perhaps he isn't going into "semi-retirement", maybe HP has muzzled him!

Ren

dona nobis pacem

### Re: HP calculator in the comic strips?

Message #4 Posted by [Don Shepherd](#) on 27 Aug 2007, 2:46 p.m.,  
in response to message #1 by Bruce Bergman

And I'll bet they don't have to put a \*b\* after the binary zeroes and ones to let the calc know it is binary!!

### Re: HP calculator in the comic strips?

Message #5 Posted by [Walter B](#) on 27 Aug 2007, 4:10 p.m.,  
in response to message #1 by Bruce Bergman

Thanks, Bruce! The calc even features a WIDE enter :) And there is another German word merging into American: "über", just without the 2 dots because American typist don't have them, became part of "uber-cool" ;)

### **Re: HP calculator in the comic strips?**

*Message #6 Posted by [Karl Schneider](#) on 28 Aug 2007, 4:22 a.m.,  
in response to message #1 by Bruce Bergman*

Thanks for providing the link, Bruce. I read the Sunday strip and thought about posting a link, but didn't look it up.

Presumably, Peter will press the two number keys on the three-button binary calc to display "10", not "01"...

Bill Amend has regularly featured modest math and calculation tasks in his Sunday "Fox Trot" comic strips -- none that would challenge us, but are probably unfamiliar to most Americans, alas.

### NOP Revisited

Message #1 Posted by [Jeff O.](#) on 27 Aug 2007, 1:09 p.m.

Has anyone suggested using RPN as a NOP instruction? Seems like that ought to be pretty benign, among this crowd at least. (My apologies if someone has already suggested this. I did search for all of the NOP discussions and did not find it, but I certainly could have missed it.)

### Re: NOP Revisited

Message #2 Posted by [Bruce Bergman](#) on 27 Aug 2007, 1:15 p.m.,  
in response to message #1 by Jeff O.

I thought of that too, but I can't take credit for thinking of it first. Someone else in a discussion a couple weeks back came up with it before me. It's a bit of an issue for AOS types, but \*I\* personally think it's great. ;-)

thanks, bruce

### Re: NOP Revisited

Message #3 Posted by [Jeff O.](#) on 27 Aug 2007, 10:10 p.m.,  
in response to message #2 by Bruce Bergman

Quote:

Someone else in a discussion a couple weeks back came up with it before me.

Yes, I also thought I'd seen it before, but like I said, my search did not reveal it. Actually, it seems like I dimly recall it being mentioned some years back (maybe by Paul Brogger?) in reference to the 33s.

### Re: NOP Revisited

Message #4 Posted by [Paul Brogger](#) on 28 Aug 2007, 11:04 a.m.,  
in response to message #3 by Jeff O.

Not I.

It's a fine choice, though. For my use, it's the instruction *least* likely to alter the state of the machine.

### Re: NOP Revisited

Message #5 Posted by [Katie Wasserman](#) on 28 Aug 2007, 7:48 p.m.,  
in response to message #4 by Paul Brogger

I previously suggested "RADIX." or "RADIX," as the perfect NOP. This should work well for all but the most internationally traveled among us :)

### **Re: NOP Revisited**

*Message #6 Posted by **Jeff O.** on 29 Aug 2007, 8:57 a.m.,  
in response to message #5 by Katie Wasserman*

"RADIX." is fine choice, except for the somewhat schizophrenic display of the programmed instruction. Of course, if the user is in a position to use RADIX as a NOP, then this should not matter.

### **Re: NOP Revisited**

*Message #7 Posted by **Giancarlo (Italy)** on 28 Aug 2007, 2:23 a.m.,  
in response to message #1 by Jeff O.*

Hi Jeff.

May you please explain a little bit to a non-english native (i.e. myself ;-) what "NOP" stands for? I also read it in some past threads, and could not get to understand what it referred to.... Thanks in advance.  
Best regards.  
Giancarlo

### **Re: NOP Revisited**

*Message #8 Posted by **Garth Wilson** on 28 Aug 2007, 2:34 a.m.,  
in response to message #7 by Giancarlo (Italy)*

Quote:

May you please explain a little bit to a non-english native (i.e. myself ;-) what "NOP" stands for?

"No operation," a do-nothing instruction that holds a place in program memory and takes a minimal amount of execution time.

### **Re: NOP Revisited**

*Message #9 Posted by **Trent Moseley** on 28 Aug 2007, 2:54 p.m.,  
in response to message #8 by Garth Wilson*

Everone should remember: the HP-25 has such a key.

tm

### **Re: NOP Revisited**

*Message #10 Posted by **Bruce Bergman** on 28 Aug 2007, 4:03 p.m.,  
in response to message #9 by Trent Moseley*

It did, and I love it for that. ;-)

Does anyone remember the old Burroughs mainframe computers? You had to execute the HALT assembly instruction three times in a row to actually stop the processor. HALT HALT HALT. I'm pretty sure it was the Burroughs, but now I'm starting to get fuzzy on the ancient details. Well, anyhow, we always used to joke that you had to do three NOP instructions in a row to do nothing. ;-)

thanks, bruce

**Re: NOP Revisited**

*Message #11 Posted by [Trent Moseley](#) on 28 Aug 2007, 10:52 p.m.,  
in response to message #10 by Bruce Bergman*

Bruce-

I must digress here regarding the NOP key. My first HP calc was the HP-25C which I purchased through a mail-order house's magazine ad in the "Scientific American" in 1978. I waited in anticipation as I poured over the picture in the ad of the calc for all the various functions. I had a fairly good idea about all of them but what the heck was NOP!

tm

**Re: HP-25 NOP -- What purpose?**

*Message #12 Posted by [Paul Brogger](#) on 29 Aug 2007, 12:18 p.m.,  
in response to message #9 by Trent Moseley*

Well, yes, I know: No OPeration.

But why was it deemed necessary to have a NOP on the HP-25? Did it serve as a placeholder for GTO destinations? (Was the program editor primitive enough that the NOP was especially useful?)

I don't remember a NOP on my HP-29C. (My 2nd H-P and overall favorite -- Geez I had fun with that thing!)

**Re: HP-25 NOP -- What purpose?**

*Message #13 Posted by [Trent Moseley](#) on 29 Aug 2007, 2:34 p.m.,  
in response to message #12 by Paul Brogger*

The NOP has to do with changing a line in a program without retyping the subsequent instructions. You can't insert a line in a HP-25 program, you can only write over.

tm

**Re: HP-25 NOP -- What purpose?**

*Message #14 Posted by [Giancarlo \(Italy\)](#) on 30 Aug 2007, 2:36 a.m.,  
in response to message #13 by Trent Moseley*

Now I see what it was all about!  
Thank you Trent for your spark of light :-)  
Best regards.  
Giancarlo

**Re: NOP Revisited**

*Message #15 Posted by [Don Shepherd](#) on 28 Aug 2007, 4:31 p.m.,  
in response to message #1 by Jeff O.*

Why is a NOP needed on the 35S? On the HP65 (any maybe 28, I don't know), after a conditional test it skipped 2 lines (because a GOTO required 2 lines), so I can see the need there. Why on the 35S (except for holding your place if you delete/insert lines that are the objects of GOTO's.

**Re: NOP Revisited**

Message #16 Posted by [Jeff O.](#) on 28 Aug 2007, 6:34 p.m.,  
in response to message #15 by Don Shepherd

Quote:

Why on the 35S (except for holding your place if you delete/insert lines that are the objects of GOTO's

That is the context in which the need for a NOP was brought up recently, and I was just proposing a non-destructive or passive option that I had not seen suggested. There may be other reasons of which I am unaware.

**Re: NOP Revisited**

Message #17 Posted by [Andrés C. Rodríguez \(Argentina\)](#) on 28 Aug 2007, 10:14 p.m.,  
in response to message #16 by Jeff O.

One use of NOP is as a placeholder for a "to be entered" routine, because the HP25 had absolute addressing (GTO stepnumber), no labels, and no automatic renumbering of steps via insertion/deletion. For instance, in the Newton's Method program to solve for  $f(x)=0$  (a very primitive solver program), there were some steps where  $f(x)$  was to be coded, the remaining steps (if any) were filled with NOPs. Also NOP may be a replacement for a debugging-time PAUSE: after testing your program, you replace the PAUSE with NOP to obtain faster execution, albeit without the intermediate results display. And NOP also may be used to "fine tune" the execution speed of a program. For instance, the program

```
00
01  NOP
02  NOP
03  NOP
04  NOP
05  NOP
06  +
07  GTO 01
```

ran after filling the stack with "1"s, worked as a timer on my HP25. Certainly not quartz-based, but the display showed the elapsed time (in seconds) between two R/S presses.

In more modern machines NOP was not needed, but sometimes you may want to use a ISG or DSE function to increment a register without testing and branching upon the result. Since NOP was no longer an option  $X\langle\rangle ST X$  was a good substitute, as close to neutral as possible.

*Edited: 28 Aug 2007, 10:15 p.m.*

**Re: NOP Revisited**

Message #18 Posted by [Don Shepherd](#) on 29 Aug 2007, 12:10 a.m.,  
in response to message #17 by Andrés C. Rodríguez (Argentina)

Now I recall, another poster used it for that purpose on the 35S (ISG 4, NOP) to increment a register. Of course, 1 STO+4 uses the same amount of storage, but does alter the stack.

**Re: NOP Revisited**

*Message #19 Posted by [Paul Dale](#) on 29 Aug 2007, 4:27 p.m.,  
in response to message #18 by Don Shepherd*

On the 35s the '1 STO+' equence uses quite a bit more memory than 'ISG NOP'. Same number of steps though. Check the free memory from the MEM menu. Don't trust the LN= values for programs, they are bogus.

- Pauli

### **Re: NOP Revisited**

*Message #20 Posted by [Don Shepherd](#) on 29 Aug 2007, 5:31 p.m.,  
in response to message #19 by Paul Dale*

Thanks, Pauli. So, one program step uses a different number of bytes than another? I guess I'm used to the Voyagers where each step used the same number of bytes, AFAI remember.

### HP35s - problematic INPUT(I) and INPUT(J)

Message #1 Posted by [Nenad \(Croatia\)](#) on 27 Aug 2007, 11:58 a.m.

Trying to port a simple (cannot be simpler) BASIC program to "the buggy little beast", such as:

```
INPUT N
DIM A(N)
FOR I=1 TO N
  INPUT A(I)
NEXT I
END
```

I have faced the situation that the INPUT(I) does not work correctly in a HP35s program. It gives INVALID (I) regardless of the fact that the I points to an existing indirect variable.

The following example describes this situation:

```
LBL Z
10
STO I
STO (I)
VIEW I
PSE
VIEW (I)          // Survives this step, showing (37) 10
PSE
INPUT (I)         // Message: INVALID(I)
RTN
```

When I execute VIEW (I) directly from the keyboard after the program crashes, the program responds with:

```
(10) 10
```

which seems to be correct.

Maybe, I missing something here. If not, this may be very serious. Why (37) instead of (10)? Why INVALID(I) and crash for INPUT(I), when VIEW(I) does not cause crash.

The same happens if I is replaced by J in the routine-the response changes into INVALID(J).

Within the Forum I could not trace out if this situation has already been described elsewhere, simply because since HP35s arrived the amount of the posts in the Forum became enormous for me to follow properly as I used to.

To Katie: If this proves to be another bug (though I remember a similar problem with INPUT(I) already described), I feel that I will be ready to teach the beast how to dive in the Adriatic (I am beginning to hate the BLB). Yet another proof that I am not a better person than you.

*Edited: 27 Aug 2007, 2:40 p.m. after one or more responses were posted*

### Re: HP35s - problematic INPUT(I) and INPUT(J)

Message #2 Posted by [Don Shepherd](#) on 27 Aug 2007, 12:13 p.m.,  
in response to message #1 by [Nenad \(Croatia\)](#)

Nenad, you cannot INPUT (I) to positive values for I, only negative 1 through negative 26 (registers A-Z). The documentation in the manual is in error. INPUT (I) if I=-4 is fine.

### Re: HP35s - problematic INPUT(I) and INPUT(J)

Message #3 Posted by [Gene Wright](#) on 27 Aug 2007, 1:11 p.m.,  
in response to message #1 by Nenad (Croatia)

Replace INPUT (I) with something like this:

```
RCL I R/S STO(I)
```

within your loop. This will prompt with the value of I into which the next keyed number will be stored.

The (37) being displayed instead of (10) is a quirk of the remapping of the indirect registers from starting at 0 and the A through Z going to negative numbers. Relatively harmless, but a quirk nonetheless.

INPUT (I) does not work with the numbered indirect registers. Only -1 through -26.

Gene

### Re: HP35s - problematic INPUT(I) and INPUT(J)

Message #4 Posted by [Nenad \(Croatia\)](#) on 27 Aug 2007, 2:47 p.m.,  
in response to message #3 by Gene Wright

Replacing the INPUT(I) with something similar to that what Gene suggested was my first thought, but I was rather disappointed that such a simple request cannot be done in a straightforward way. I also couldn't figure out the easiest way to keep the prompt stating "which I" is to be input.

Thank you both, Don and Gene.

### Re: HP35s - problematic INPUT(I) and INPUT(J)

Message #5 Posted by [Paul Dale](#) on 27 Aug 2007, 4:41 p.m.,  
in response to message #1 by Nenad (Croatia)

I've added this to the bug list.

Even more interesting is that the error only appears if the PSE instruction is included. Leave it out and the program stops and works properly. I.e.

```
LBL Z
10
STO I
STO (I)
VIEW I
```

- Pauli

### Re: HP35s - problematic INPUT(I) and INPUT(J)

Message #6 Posted by [Miguel Toro](#) on 28 Aug 2007, 3:07 p.m.,  
in response to message #5 by Paul Dale

Pauli,

I do not have this behavior in my '2361. Both versions, with and without PSE, work just fine. Maybe a

Reset is necessary :-)

Miguel

**Re: HP35s - problematic INPUT(I) and INPUT(J)**

*Message #7 Posted by [Miguel Toro](#) on 28 Aug 2007, 4:03 p.m.,  
in response to message #6 by Miguel Toro*

Now I see: It is VIEW (I), not VIEW I in Pauli's example.

Sorry.

**Re: HP35s - problematic INPUT(I) and INPUT(J)**

*Message #8 Posted by [Don Shepherd](#) on 28 Aug 2007, 3:25 p.m.,  
in response to message #5 by Paul Dale*

Maybe I am misunderstanding the problem, but I think the problem is in the INPUT (I). Your code does not have that.

**Re: HP35s - problematic INPUT(I) and INPUT(J)**

*Message #9 Posted by [Gene Wright](#) on 28 Aug 2007, 3:56 p.m.,  
in response to message #8 by Don Shepherd*

Two issues here, one is with the INPUT (I) itself, the other with the VIEW (I).

When you do a VIEW (I) in a program followed by a pause, the prompt shown by VIEW is off by 27 units.

Where it should show "(10)=", it actually shows "(37)=".

It is off by 27.

**Re: HP35s - problematic INPUT(I) and INPUT(J)**

*Message #10 Posted by [Gene Wright](#) on 28 Aug 2007, 3:59 p.m.,  
in response to message #9 by Gene Wright*

Not having a good day.

That snip of code now does appear to work correctly, but I have seen the value for (I) be off by 27 units.

As I say, I'm having a bad day.

**Re: HP35s - problematic INPUT(I) and INPUT(J)**

*Message #11 Posted by [Paul Dale](#) on 28 Aug 2007, 4:15 p.m.,  
in response to message #5 by Paul Dale*

Sorry guys, I got the program wrong:

```
LBL Z
10
STO I
```

```
STO ( I )  
VIEW ( I )
```

That is the last line has brackets around the I.

- Pauli

### HP 35s, keyboard buffer, bug, feature or what?

Message #1 Posted by [Patrick Rendulic](#) on 27 Aug 2007, 11:07 a.m.

I just made the following interesting discovery. I used my 35s to add the following numbers:

$$2 + 3 + 2 + 2 + 1 + 2 + 2 + 1 + 2 + 2 + 0.5 + 1 = 20.5$$

When doing such an operation, I use my left thumb for keying in the numbers and my right thumb for pushing the "+" key. I can do that really fast without looking at the keyboard. My 32sii gives the correct answer, always, regardless how fast I am. But on the 35s it is pure luck to get the right answer. Here are some answers: 4323.04; 38.5; 4937.04; 20.5; 20.5; 39; 20.5; 57

It seems that there is a problem with the key buffer, or the machine responds too slow. When operating the keys too fast, the "+" operation is not executed.

Am I the only one with this problem ?

### Re: HP 35s, keyboard buffer, bug, feature or what?

Message #2 Posted by [chris Dean](#) on 27 Aug 2007, 11:17 a.m.,  
in response to message #1 by Patrick Rendulic

I had no problem with this. I repeated the calculation three times and constantly got the correct answer.

### Re: HP 35s, keyboard buffer, bug, feature or what?

Message #3 Posted by [Thomas Radtke](#) on 27 Aug 2007, 11:57 a.m.,  
in response to message #1 by Patrick Rendulic

Quote:

It seems that there is a problem with the key buffer, or the machine responds too slow. When operating the keys too fast, the "+" operation is not executed.

Am I the only one with this problem ?

Nope. Pressing and releasing the binary operator keys real fast results in missed strokes. The numeric keys don't seem to have that problem. I noticed this some days ago.

However, that was just a test, the speed necessary to miss the operator is beyond what I actually use.

### Re: HP 35s, keyboard buffer, bug, feature or what?

Message #4 Posted by [Bruce Bergman](#) on 27 Aug 2007, 12:16 p.m.,  
in response to message #1 by Patrick Rendulic

I tried that sequence on my 35s (and a 17bii+ I had nearby) with no problems other than the occasional fat-fingering it on my part. I did the run several times so that I could get it pretty fast, and even after multiple attempts, I got the correct result.

Are you REALLY REALLY REALLY fast?? :-) Just too fast for any modern calc?

thanks, bruce

### OT: Card Reader Repairs for TI-59

Message #1 Posted by [Kostas Kritsilas](#) on 27 Aug 2007, 10:26 a.m.

Hi,

Sorry if this post offends. I am looking to find a source of repairs for a TI-59 card reader, similar to the wonderful folks at Fix That Calc, but for a TI-59 (and even better if they also could handle an SR-52. Does anybody know of such a source?

Kostas

### Re: OT: Card Reader Repairs for TI-59 - ebay source

Message #2 Posted by [Gene Wright](#) on 27 Aug 2007, 5:49 p.m.,  
in response to message #1 by [Kostas Kritsilas](#)

I have not purchased this kit and have no knowledge of the seller, good or bad!

But, take a look here:

[ebay ti-59 card reader repair kit](#)

### Re: OT: Card Reader Repairs for TI-59 - ebay source

Message #3 Posted by [Kostas Kritsilas](#) on 27 Aug 2007, 8:25 p.m.,  
in response to message #2 by [Gene Wright](#)

Gene:

Thanks for the link, but the parts are not the issue, it is eyesight and dexterity. My eyes are pretty bad (severe astigmatism, so severe that I have to wear hard contacts as glasses will not provide the correct amount of correction), and my dexterity is not great either, but I can solder real well. This is why I would prefer to find somebody that provides a Fix That Calc type repair service for the older TI units. Appreciate your efforts, though; thank you.

Kostas

### HHC2007 HP Handhelds Conference News Update

Message #1 Posted by [Jake Schwartz](#) on 26 Aug 2007, 10:38 p.m.

Hi,

For those on the fence regarding the HHC2007 conference in San Diego on September 29-30th, things are looking really good with 4 HP calculator-division people scheduled to speak, along with our 15 others who have expressed their desire to give presentations. We are still expecting also to show Steve Liebson's new video interview with Dave Cochran, one of those who were instrumental in bringing the HP9100 desktop and HP35 pocket calculators to life. There are currently over 60 people registered to be in attendance.

\*\*\*Also, if you haven't yet made hotel reservations, the special \$99.-per-night conference discounted rate is only available if you register with the Holiday Inn before September 1st, so hurry. \*\*\*

In the "HP and HHC News" section, a new announcement has been posted regarding the HP Calculator Division's new GM. In addition, on the main page check out version 4 of the door-prize list, which has now grown to allow for at least one prize for every currently-registered attendee.

Also check out the section called "British HPCC Users Conference", covering some aspects of the upcoming HPCC 25th-Anniversary conference at the Imperial College in London on October 13-14th.

Consult <http://holyjoe.net/hhc2007/> on the web for all the details.

See you at the end of September,

Jake Schwartz

### Re: HHC2007 HP Handhelds Conference News Update

in response to message #1 by Jake Schwartz

This is turning out well. Looking forward to the conference, 35S/50G/49G+/ and all fo the HP calcs and all.

### Re: HHC2007 HP Handhelds Conference News Update

Message #3 Posted by [Matt Kernal](#) on 27 Aug 2007, 1:59 p.m.,  
in response to message #1 by Jake Schwartz

Jake,

Thanks for the update.. only a month to go!

Regarding the new [General Manager](#) of HP's calculator Division, it appears that [Mr. Wing Cheung](#) went to the University of Oregon (Eugene, OR), which is only [a hop, skip, and a jump](#) from Oregon State University (Corvallis, OR), where HP designed all the great calculators in the late-70's to mid-90's (I'll bet Mr. Cheung is probably too young to have been there during that era - see bottom right [photo](#)).

Matt  
Beaverton, OR

### OpenRPN Development Update

Message #1 Posted by [Hugh Evans](#) on 26 Aug 2007, 9:40 p.m.

OpenRPN is back online under a new host, so unlike the past it will be there when you go looking for it. The big difference that you'll notice is that, at least for now, it's just a wiki (formerly known as "the documentation site"). It's a good medium for development reference, project status, and general news.

To any software developers who have worked on OpenRPN in the past, I would love to have you back. Additionally, if you are interested in contributing your programming skills please take a look through the wiki and [SourceForge](#). Feel free to contact me via e-mail with any questions, comments, and/or feedback.

Best Regards, Hugh

### Re: OpenRPN Development Update

Message #2 Posted by [Jeff Kearns](#) on 26 Aug 2007, 9:53 p.m.,  
in response to message #1 by Hugh Evans

Hugh,

My antivirus program alerts me to shut down my browser when I visit your site as it is a "phishing" website. What gives?

Jeff

### Re: OpenRPN Development Update

Message #3 Posted by [Frank Boehm \(Germany\)](#) on 27 Aug 2007, 10:00 a.m.,  
in response to message #2 by Jeff Kearns

That is certainly false alarm. I checked the HTML source, no creepy bugs in there.

### Re: OpenRPN Development Update

Message #4 Posted by [Walter B](#) on 27 Aug 2007, 2:44 a.m.,  
in response to message #1 by Hugh Evans

Hugh,

1 - So OpenRPN is still alive after all. Fine! :)

2 - May the participants of HHC 2007 expect to see some physical, touchable proof for the existence of OpenRPN as announced many months ago? (Don't be afraid, I will not attend).

2 - Many (most?) links of level 2 of your site seem to be not connected. IMHO this is one of the necessary points to check before (re-)starting a website :( But maybe this is just a problem I experience. Any more observations?

Good luck, Walter

## Re: OpenRPN Development Update

I haven't encountered any problems along those lines. There are quite a few dead image links I need to clean up, but that's nothing emergent.

### Is it safe to buy the 35s now?

Message #1 Posted by [Luke Hoffmann](#) on 26 Aug 2007, 6:00 p.m.

Hi all. I've finally done all the research I possibly can and have decided between the TI-89, HP-50g, and the HP 35s. I am going to go with...drum roll please...the Hp 35s and 50g. 50g seems relatively easy to find in store, but I can not find the 35s in any store. Is it only available on line? If so, what is the best place to order one. (Will I get the "fixed" calculator from the HP site?). Any comments on any of this, especially whether I should wait on the 50g in the hope of a 35s restyling of the it would be appreciated. Thanks.

Luke Hoffmann

### Re: Is it safe to buy the 35s now?

Message #2 Posted by [Vincze](#) on 26 Aug 2007, 7:51 p.m.,  
in response to message #1 by Luke Hoffmann

My friend Luke, I not know what fixed with fixed model, but I sure you find good 35s where ever you go. I not know where best to buy. I bought mine from Walmart.com, I know some buy from Samson Cable, and some from HP. I sure where ever you go, you be okay.

### Re: Is it safe to buy the 35s now?

Message #3 Posted by [Dan Greil](#) on 26 Aug 2007, 8:17 p.m.,  
in response to message #1 by Luke Hoffmann

Luke,

I purchased my 35s from the *HP Home and Office* web site a couple of weeks ago and am perfectly happy with it (no liters to liters misprint, no mis-aligned display).

HP shipped quickly - had it in three days. I bought a 50G at the same time as it was discounted to \$119.95 shipping included. Unfortunately that sale ended.

-Dan

### Re: Is it safe to buy the 35s now?

Message #4 Posted by [gteague](#) on 26 Aug 2007, 8:19 p.m.,  
in response to message #1 by Luke Hoffmann

well, the perennial whingers can carp all they want about the 35s and its many faults and bugs, but this is the first hp calculator i've owned in 15-20 years that i could pull out in front of someone else knowledgeable about calculators and not have to apologize for some egregious quality flaw.

i remember when the first singapore calculators came out and everyone said hp had gone completely down the hill--hit rock bottom quality-wise. little did we know then that we would soon be paying premium ebay prices for these very calculators while hp found unplumbed depths to their quality trough.

now if hp will only bring something like the 35s from the stone age into modern times with more internal and flash card (sd, mine- or micro-) memory, a usb port and a win/mac/unix connection utility.

/guy

**Re: Is it safe to buy the 35s now?**

*Message #5 Posted by **Bruce Bergman** on 27 Aug 2007, 12:19 p.m.,  
in response to message #4 by gteague*

/guy, I wanted to say that you hit one nail right on the head. Even with all the issues with this unit right now, this is the first HP calc in at least 10 years (with the exception of the high end HP-50g) that I am really proud to show to anyone who is curious, even old HP calc users at my company.

It shows great, it works great, and it's back to that "oooh" factor that HP models have always had.

Good characterization there...

thanks, bruce

**HP-35s LCD Discoloration**

Message #1 Posted by [revertTS](#) on 26 Aug 2007, 5:33 p.m.

Is it common for the LCD screens on calculators (in this case the HP-35s) to have discoloration? Mine has a yellowish area; is there a known fix for this? Anyone know the causes?

**Re: HP-35s LCD Discoloration**

Message #2 Posted by [Robissimo](#) on 26 Aug 2007, 10:23 p.m.,  
in response to message #1 by revertTS

I've read here of at least two other people complaining of yellowing lcds, and I noticed three days after purchase that mine was yellowed as well.

But that is all I know and I don't think that it's been discussed enough for a consensus to have formed.

**Re: HP-35s LCD Discoloration**

Message #3 Posted by [bill platt](#) on 27 Aug 2007, 7:42 a.m.,  
in response to message #1 by revertTS

My 35S is (and was at purchase) green everywhere except along the lower edge, where it is yellowish.

One of my 48GX calculators is more blue in one area where the LCD was "bruised".

**Re: HP-35s LCD Discoloration**

Message #4 Posted by [Howard Boardman](#) on 27 Aug 2007, 9:51 a.m.,  
in response to message #1 by revertTS

One thing I noticed last night... when comparing a 35s to a 33s is that the 33s has a better display (noticeably clearer when compared side by side). The 35s display has never bothered me though.

### Incomplete gamma function et al. for 35s

Message #1 Posted by [Les Wright](#) on 26 Aug 2007, 4:00 p.m.

Here is a long promised contribution. It is sort of long, and perhaps should eventually be reworked as an article or software library submission.

The gamma function for real numbers is, as we all know, an extension of the factorial function.  $\Gamma(a)$  is the integral of  $\exp(-t)*t^{(a-1)}$  as  $t$  goes from 0 to infinity. If we split this interval of integration at some point  $x$ , we get two incomplete gamma functions, where the left-sided  $\gamma(a,x)$  takes the integral from 0 to  $x$  and the right sided  $\Gamma(a,x)$  takes it from  $x$  to infinity. Obviously,  $\Gamma(a) = \gamma(a,x) + \Gamma(a,x)$ .

The incomplete gamma functions may not be of great interest to most here, but certain of their familiar special cases--the error functions and the normal and chi-square probability functions--possibly are.

The following listing computes the incomplete gamma functions  $\gamma(a,x)$  and  $\Gamma(a,x)$ . The code is adapted from the series and continued fraction routines given in Chapter 6 of Numerical Recipes. I just give the listing here and describe use below:

```

a ENTER x XEQ G002 gives  $\gamma(a,x)$ . Best used when  $a < x$ . For  $a > x$ , compute  $\gamma(a,x) = (a-1)! - \Gamma(a,x)$ .

a ENTER x XEQ G023 gives  $\Gamma(a,x)$ . Use for  $a > x$  usually. For  $a < x$ , use  $\Gamma(a,x) = (a-1)! - \gamma(a,x)$ .

x XEQ G076 gives  $\text{erf}(x)$ . I use for  $x < 1.8$ , and prefer for  $x > 1.8$   $\text{erf}(x) = 1 - \text{erfc}(x)$ .

x XEQ G081 gives  $\text{erfc}(x)$ . I use it for  $x > 1.8$ , and prefer  $\text{erfc}(x) = 1 - \text{erf}(x)$  for smaller values.

z XEQ G089 gives the lower tailed normal probability associated with a standard normal variate z--i.e., the probability that a normal variate takes on a value less z. I use it for  $z < 2.3$ . For larger values, I prefer to compute 1 - the upper tailed probability.

z XEQ G103 gives the upper tailed probability associated with a standard normal variate z--i.e., the probability that variate takes on a value exceeding z. I use it for  $z > 2.3$ , and for smaller values compute 1 - lower-tailed probability.

nu ENTER x XEQ G115 gives the lower tailed probability associated with a chi-squared variate x at nu degrees of freedom. Works best for  $\text{nu} < x$ . For  $\text{nu} > x$ , compute 1 - upper-tailed probability.

nu ENTER x XEQ G118 gives the upper tailed probability associated with a chi-squared variate x at nu degrees of freedom. Use for  $\text{nu} > x$ . For  $\text{nu} < x$  compute 1 - lower-tailed probability.

Here are some examples:

5 ENTER 4 XEQ G002 gives  $\gamma(5,4)$  as 8.90791255566. The last digit should be an 8.

5 ENTER 6 XEQ G023 gives  $\Gamma(5,6)$  as 6.84135600761. The last digit should be a 0.

1 XEQ G076 gives  $\text{erf}(1) = 8.42700792945\text{e-}1$ . The last two digits should be 50.

2 XEQ G081 gives  $\text{erfc}(2) = 4.67773498102\text{e-}3$ . The last digit should be a 5.

1.5 XEQ G089 gives  $9.33192798730\text{e-}1$  as the probability that a standard normal variate will be less than 1.5. The

last digit should be a 1.

2.5 XEQ G103 gives  $6.20966532587e-3$  as the probability that a standard normal variate will exceed 2.5. The last two digits should be 77.

4 ENTER 3 XEQ G115 gives  $4.42174599629e-1$  as the probability that a chisquare variate at 4 df is less than 3. All digits are correct here.

2 ENTER 7 XEQ G118 gives  $3.01973834223e-2$  as the probability that a chisquare variate at 2 df exceeds 7. All digits are correct here.

A few caveats are in order. First of all, I don't do sign checking, so make sure that input for all functions is positive and meaningful. I am assuming that anyone with an interest in these functions is going to be aware of the usual reflection and complementary formulae. Second, the user needs to know about the basics of the computation to judge whether one launches a routine that enters a series computation or a continued fraction computation. This is very much a matter of judgement and personal taste--I give only rough guidelines. Finally, keep in mind that due to rounding and digit loss due to subtraction in some cases it is uncommon to expect all twelve digits to be correct. Indeed, I find that in general the twelfth digit is usually off a bit, and occasionally even the eleventh. In general, I think at least 10 digits are good the vast majority of the time, at least within 1 or 2 ULP.

Sadly, these routines, while pretty fast, and certainly much faster than equivalents I have for the 41CX and 42S, are slower than on the 33S. Regrettably, they don't fit the 33S paradigm as neatly, since they would gobble up oodles of those precious labels with the various entry points and GTOs etc.

Enjoy this work, and let me know what you think.

Les

A couple, three seconds tops in most cases, as far as I can tell.

Computing these functions by their series or CF expansions is typically much faster than integrating under the curve.

Les

True. Its all about cost-benefit. Given how infrequent I would use the incomplete gamma function on

my 35s, 38 seconds is not too bad. If I used it frequently I would invest the time to key in your wonderful routine. Its a pity that the 35s has no I/O, imagine all the code we could all share.

### **Re: Incomplete gamma function et al. for 35s**

Quote:

Its a pity that the 35s has no I/O, imagine all the code we could all share.

Yet there were some cheap SHARP organizers that used to come with a simple serial interface. The cable was optional, but it was easy to build: one 9-pin RS-232 plug in one end and one stereo plug in the other. I wonder adding a mini-USB port to the 35s would not cost so much. Also, I don't think this could be a reason for banning the calculator during tests. Who is willing to fill up the 32KB RAM with programs and data just to have to enter them again in case of a crash?

They probably thought that this would sell only to hardcore old-timers who ain't even using cell phones :-)

Worked on me... (got a phone, but it's an ancient Nokia)

---

Several years ago, I got an "ancient" Nokia (model with documentation copyrighted 2002) pay-as-you-go cell phone for infrequent use. The youngsters at a recent family gathering remarked how it brought back memories...

Recently, network upgrades soon to be implemented have compelled its replacement, so now I must learn a new one and transfer the stored numbers.

This wasn't a problem with our HP calc's...

### Cash Flow Analysis for the HP 35s

Message #1 Posted by [Miguel Toro](#) on 26 Aug 2007, 3:26 p.m.

This has been a great learning experience. With this program you can make Net Present Value and internal rate of return analysis and it is very simple to use. I made a lot of learning of how the HP 35s solver works and I'll talk about that in an article I am preparing for Datafile. Of course I was able to develop it thanks to these two great features of the calculator: vectors and indirect addressing. The program is based on the NPV formula found in the "HP 15c advance functions handbook".

IRR analysis takes a little time but I think is quite acceptable. With this one and the TVM already published, we have already a little financial pack for our HP 35s. :-)

Please test it and give me your comments.

Regards,

Miguel

Comments:

```

XEQ C      -> enter CASH FLOWS
XEQ C024   -> Calculate NPV
XEQ C030   -> Calculate IRR
XEQ R052   -> Change values of a cash flow already entered
XEQ R068   -> Review the cash flows already entered. The routine is circular.

```

```

R001      -> IRR routine
R042      -> convert content of x,y stack registers into a vector [y,x]
R049      -> extract content of a vector [y,x] into registers x,y

```

- To finish entering cash flows enter 0 and then R/S.
- Interest is always by period, so if for exemple, you have monthly cash flows and a annual interest rate, divide this by 12 to enter the monthly rate.
- You can enter any number of cash flow: the limit is the memory available.
- You can change or correct any of the cash flows entered with routine R052.
- To enter a cash flow: write the amount, press ENTER, write the number of occurences and press R/S.

Program:

```

C001 LBL C
C002 SF 10
C003 (EQN) AMOUNT, OCCUR
C004 PSE

**35s: Crash and weird behavior**

Message #1 Posted by [Mike Mander](#) on 25 Aug 2007, 9:22 p.m.

Since posting my photo gallery and noting the unreliable nature of R/S (and ON/C) when interrupting a loop, I have had a few interesting things happen.

I was programming the 35s and testing some routines and goto-ing between differing labels when suddenly the calculator froze with only the "RPN" and "PRGM" annunciators lit - I had just done an XEQ label to start running my test program. No amount of R/S, ON/C or ON/C-GTO keypresses would make it responsive again. I looked in the manual for further keystrokes but it was basically locked up. Nothing I could do would bring it back to life. After leaving it for 10 minutes and trying again in vain to reset it from the keyboard, a paperclip reset finally rebooted it, but also cleared memory. Not 100% sure if it was supposed to clear memory but it did.

After that incident, I was doing some looping speed tests to compare it to some other HP calculators and suddenly noted that the R/S and ON/C \*did\* work reliably now after the reboot/reset. No more flaky behavior - every push of the R/S key or ON/C would instantly interrupt the program, just as it had on all my previous HP's. Suddenly, totally different behavior from before! Very interesting...

Then, a little later, I was trying to mess around with vectors and for the life of me, could not get the 35s to accept vector input (the first time I had tried). If I typed, for example, [12,35] and pressed ENTER, the calc would come back with SYNTAX ERROR with the curser placed on the 3 after the comma. Didn't matter what display mode, angle mode anything... it would never accept any sort of vector I tried to input. If I recall (not 100% sure), it maybe would accept a single element vector, but for sure never 2 or 3 element vectors.

I then tried to enter a vector ([12,35] for example) as an equation. The editor happily accepted the vector but then gave the same syntax error when I pressed ENTER to evaluate the equation. I also tried [REGY,REGX] as an equation, to build a vector from the stack, but got the same SYNTAX ERROR.

In frustration, I then wrote a quick program which would generate a vector (just [12,35]) and, lo and behold, that worked and placed the desired vector in the X register! Without really looking further at the manual, I thought maybe vectors could only be used in programs (silly, I know) and wrote a trivial program to generate a vector from the X and Y registers - basically just the same [REGY,REGX] equation I had tried in the equation list before. This worked so I happily played with vectors for a few minutes and then tried keying one in directly again. This time it worked!!!

So from that point onward, the calculator has always accepted vector entry as it should, both directly keyed and in the equation list. Very strange. Almost as though something was corrupted in the calculators OS, both initially after installing the batteries for the first time and then again after a reset. Somehow running the vector equation program "fixed" the glitch and it has behaved as expected since then.

Since the calculator was so flaky right after installing the batteries (weird R/S and ON/C behavior) and then giving me the hard crash, it might be wise for any new user installing the batteries for the first time, to do a paper-clip reset immediately before something glitches and causes a loss of calculator memory. Obviously I can't really be sure if an initial reset would have helped in my case...

Just thought you all would be interested in hearing about this.

Regards, Mike Mander

### Re: 35s: Crash and weird behavior

Message #2 Posted by **Raymond Del Tondo** on 25 Aug 2007, 9:42 p.m.,  
in response to message #1 by Mike Mander

Let's hope this flaky behaviour was only a side effect...

Do the R/S and ON/C keys still work as expected?

Any difference regarding the other bugs, like checksum?

I haven't done testing of the 35s that intensive as you,  
since I still don't like the programming model;-)

However I did some calculations by hand,  
and surprisingly had not a single missed key stroke so far!  
This is totally different to my 33s,  
which has a very unreliable and bouncing keyboard.  
No wonder, the orthodox HP RPN addicts would say,  
since the 33s doesn't have a keyboard, and no ENTER bar...

Regards

Raymond

### Re: 35s: Crash and weird behavior

Message #3 Posted by **Mike Mander** on 25 Aug 2007, 10:19 p.m.,  
in response to message #2 by Raymond Del Tondo

Yes, since the hard reset, the R/S and ON/C keys have worked as expected. I have not looked at the whole checksum issue. Some very long threads I have to digest first and then key in some programs I suppose.

It does have the COS bug (angles close to 90 degrees) but have not really looked for any others.

I did some looping speed tests and "NOP" speed tests. Takes a little getting used to the programming model and although gotos get renumbered as one adds and deletes lines, if one deletes a line that is a target of a goto, things get messed up as noted elsewhere. I tested a few commands that might be used as a "NOP" target for a goto. I believe using DEG was suggested somewhere but that might be problematic if a program uses trigs. I tried using the "RADIX." command (LS DISPLAY 5) as a NOP, and it seems benign as it will never cause any unexpected program behavior like DEG could. Of course if you are in a different part of the world and use "RADIX," ... then use that as a NOP!

Speed tests:

```
A001 LBL A
A002 RCL+ C
A003 GTO A002
```

Store 1 in C, CLx XEQ A001: this gives a count of 5096 after 1 minute of execution.

```
A001 LBL A
A002 RADIX.
A003 RCL+ C
A004 GTO A002
```

Same 1 minute run, this time counts to 4934. Not too much of a "NOP" penalty. The same program with DEG in place of RADIX. counts to 4363 after a minute - definitely slower.

Simple loop-speed counting comparisons (1 minute execution):

```
-----
A001 LBL A
A002 RCL+ C
A003 GTO A002
```

Loop-count: HP-15C (278), HP-32SII (5,004), HP-33s (10,688), HP-35s (5,096)

```
-----
B001 LBL B
B002 RCL C
B003 +
B004 GTO B002
```

Loop-count: HP-15C (216), HP-32SII (3,919), HP-33s (7,379), HP-35s (2,913)

```
-----
C001 LBL C
C002 1
C003 +
C004 GTO C002
```

Loop-count: HP-15C (219), HP-32SII (3,620), HP-33s (7,081), HP-35s (1,443)

Very interesting speed differences. On LBL B and C, the old 32SII trounces the 35s, let alone the 33s which just annihilates it on all tests!

Yep, excellent keyboard and all, a slightly faster 35s would have been kind of nice...

Regards, Mike Mander

### **Re: 35s: Crash and weird behavior**

*Message #4 Posted by [Mike Mander](#) on 26 Aug 2007, 1:30 a.m.,  
in response to message #3 by Mike Mander*

I just searched some older 35s postings in the archives and came across a mention of the vector bug and Katie's suggestion at using RADIX. as a NOP. I was trying to think of a way to use a non-destructive programmable operation as a NOP and came up with RADIX... but maybe I only thought of it subconsciously because I had read the earlier posts at some point? In any case, I have not been able to come up with a better NOP suggestion...

I didn't bother benchmarking the DISPLAY 7 and 8 functions (1,000 and 1000) for NOP use, since their appearance in a program listing can be very deceiving. In fact the DISPLAY 8 function (1000) looks exactly like the number 1000 in a program listing!

In any case, next time I'll have to search some older postings before bothering to repeat information. Sorry...

Regards, Mike Mander

### **Re: 35s: Crash and weird behavior**

*Message #5 Posted by [Katie Wasserman](#) on 26 Aug 2007, 10:28 a.m.,  
in response to message #4 by Mike Mander*

Mike,

I've had the same vector entry syntax bug several times on my 35S. It seems to happen after a Memory Full error message but I haven't been able to pin down the circumstances. In any event, clearing the memory array seems to fix it.

The major program speed issue with the 35s compared with the 32sII is that constants cause the 35s to go into its line parsing routine -- which is very slow. Avoid all constants inside loops and it's reasonably fast.

The 35s doesn't parse any program line that starts with a number or a vector until run time. So you can type many-dimensional vectors and crazy looking numbers into programs without syntax errors. I don't see much use for this and the cost is having to invoke the line parser at run time. This seems to have been a bad engineering decision like many HP made on this calculator.

### **Re: 35s: Crash and weird behavior**

*Message #6 Posted by [Mike Mander](#) on 26 Aug 2007, 2:27 p.m.,  
in response to message #5 by [Katie Wasserman](#)*

Katie,

Thanks. Yes many bad design decisions. I had read about the base-conversion entry quirk and didn't think it would be too bad. But what a pain actually! Can't believe the 35s forces you to append an 'h' to a number entered when you are in HEX mode, for example. Sheesh. It should assume any number entered is already in the current base mode unless specified otherwise. Luckily I don't use non-DEC bases too often.

I guess the only advantage in have the line-parser invoked at runtime is maybe, just maybe, someone will stumble across something that might glitch the 35s and allow some form of synthetic programming - probably very unlikely though!

I'm kind of glad I was able to get out of the vector entry bug without clearing memory as I would have been rather upset at that - twice in a day would have been too frustrating! If it happens again, I'll see if my trick of putting a vector in a program helps again. I presume you must have tried that too though, so I was probably just lucky...

Mike

### **Re: 35s: Crash and weird behavior**

*Message #7 Posted by [JoseL](#) on 27 Aug 2007, 10:54 a.m.,  
in response to message #3 by [Mike Mander](#)*

Hi,

Yesterday I tested the java RPN programmable calculator - software "Calc" in my K610i phone.

Running the program:

```
> LBL1 > 1 > + > GTO1
```

Loop-count for 60 sg execution = 693938 loops (480x faster than 35s) :-)

Why is Hp35s so slow?????. We are in XXI century (I ask it myself)

Best regards

---

**Re: 35s: Crash and weird behavior**

*Message #8 Posted by [Bruce Bergman](#) on 27 Aug 2007, 12:23 p.m.,  
in response to message #7 by [JoseL](#)*

Yeah, we all (painfully) know. ;-)

There was a posting a couple weeks back that talked about the slow CPU and compared the HP-35s to other calcs. I think it was in relation to Casio, but you might search for "timing", "speed" or "casio" and see what you can find. There was a very interesting link to a site that has timing numbers for every calculator imaginable. It was good reading.

thanks, bruce

*Message #10 Posted by [JoseL](#) on 28 Aug 2007, 5:34 a.m.,  
in response to message #9 by [Raymond Del Tondo](#)*

Hi

You are right Raymond.

I really do not need to execute the programs quite often.

And when I use them, I prefer that they are quick. Its consumption of battery is not a problem for me.

Jose

### RPN versus ALG in programs

Message #1 Posted by [Thomas Klemm](#) on 25 Aug 2007, 9:07 p.m.

Just recently I stumbled across Katie Wasserman's fine article [99 Digits of Pi on an HP 32SII](#) which I appreciated a lot. It made me have a look again at the different algorithms to calculate Pi. After implementing a RPN-version of the Gauss AGM algorithm for the 35s I was curious on how to do the ALG-version. Here's the result of both:

| RPN           | ALG                  |
|---------------|----------------------|
| G001 LBL G    | H001 LBL H           |
| G002 1        | H002 1>A             |
| G003 STO A    | H003 3>I             |
| G004 3        | H004 SQRT(0.5>P>S)>B |
| G005 STO I    | H005 S-SQ(A-B)*P>S   |
| G006 0.5      | H006 2*P>P           |
| G007 STO P    | H007 (A+B)/2         |
| G008 STO S    | H008 SQRT(A*B)>B     |
| G009 SQRT     | H009 REGY>A          |
| G010 STO B    | H010 DSE I           |
| G011 RCL- A   | H011 GTO H005        |
| G012 $x^2$    | H012 SQ(A+B)/(2*S)   |
| G013 RCL* P   | H013 RTN             |
| G014 STO- S   |                      |
| G015 RCL A    | LN=115               |
| G016 RCL+ B   |                      |
| G017 2        |                      |
| G018 STO* P   |                      |
| G019 /        |                      |
| G020 x<> A    |                      |
| G021 RCL* B   |                      |
| G022 SQRT     |                      |
| G023 STO B    |                      |
| G024 DSE I    |                      |
| G025 GTO G011 |                      |
| G026 RCL+ A   |                      |
| G027 $x^2$    |                      |
| G028 RCL/ S   |                      |
| G029 2        |                      |
| G030 /        |                      |
| G031 RTN      |                      |

LN=100

*(inspired by algorithm 7.5 from Arndt & Haenel, Pi-unleashed)*

Now if you run both variants you will find that H is about 4 times slower than G. Also H seems to use more memory than G. On the other hand H might be easier to read. But you have to scroll to be able to read the whole lines.

What I don't understand is why is H so slow? I mean both are kind of slow but H is really bad. Hey, there are only 3 iterations and it takes about 4 seconds!

Being curious about the performance I implemented the same algorithm for my 11c as well:

|          |         |
|----------|---------|
| 01 LBL A | 21 SQRT |
| 02 3     | 22 x<>y |
| 03 STO I | 23 R^   |
|          | 2       |

```

04 2          24 x
05 1/x       25 RCL 1
06 STO 0     26 *
07 STO 1     27 STO- 0
08 SQRT      28 RDN
09 ENTER     29 2
10 ENTER     30 STO* 1
11 ENTER     31 /
12 1         32 DSE
13 LBL 0     33 GTO 0
14 -         34 +
15 R^        35 x2
16 LSTx      36 RCL 0
17 +         37 /
18 R^        38 2
19 LSTx      39 /
20 *         40 RTN

```

Not to my surprise it's considerably slower taking about twice the time of H. But when I ran the same program on a 42s I was amazed: Though it's slower than G it beats H by far.

Twenty years later and not much improvement concerning the speed! Does anybody know why? Is it so difficult to construct a fast calculator?

I must admit that I'm quiet happy with the 35s in spite of the issues already mentioned in this forum. But I'd really like to have a calculator that is fast, e.g. counts to a million in less than a second.

In other interpreted languages it's possible:

```
> time perl -e 'for ($i=0; $i<1e6; $i++) {}'
```

```

real    0m0.219s
user    0m0.199s
sys     0m0.003s

```

So why can't we have that in a calculator as well?

Thomas

## Re: RPN versus ALG in programs

*Message #2 Posted by [Jeff Kearns](#) on 25 Aug 2007, 9:31 p.m.,  
in response to message #1 by Thomas Klemm*

Agreed. Calculators are still too slow for many 'routine' operations considering the fact that we are in 2007. I tried your interesting 11C program out on my 15C and have the following comment regarding step 32.

Quote:

---

Being curious about the performance I implemented the same algorithm for my 11c as well:

```

01 LBL A          21 SQRT
02 3              22 x<>y
03 STO I          23 R^
04 2              24 x2
05 1/x           25 RCL 1
06 STO 0         26 *
07 STO 1         27 STO- 0
08 SQRT          28 RDN
09 ENTER         29 2
10 ENTER         30 STO* 1
11 ENTER         31 /
12 1             32 DSE
13 LBL 0         33 GTO 0
14 -             34 +
15 R^            35 x2

```

|         |          |
|---------|----------|
| 16 LSTx | 36 RCL 0 |
| 17 +    | 37 /     |
| 18 R^   | 38 2     |
| 19 LSTx | 39 /     |
| 20 *    | 40 RTN   |

---

Step 32, above should read

032 - 42, 5,25 DSE I - at least in order to work on my 15C. Regards,

JeffK I

in response to message #1 by Thomas Klemm

Speed costs you in power.

Every time one of those CMOS gates changes state, a bit of your battery charge disappears. I guess you could have a faster machine, but you might have to change the battery more often than you'd appreciate. All those 11Cs and 15Cs that lasted for 15-20 years on the same battery weren't just dumb luck!

### Re: RPN versus ALG in programs

Is it so difficult to construct a fast calculator?

---

Power consumption is roughly proportional to processing speed, the tradeoff has to be made somewhere. And on top of that, the 35S is no doubt written in C, probably with a deal of thought toward code portability and re-use (that usually means bigger code), so that costs you in performance in two ways alone. Whereas the older machines were most likely hand coded in assembler and hence gave better bang-per-bucks on each clock cycle.

Dave.

### Re: RPN versus ALG in programs

Message #5 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 27 Aug 2007, 4:16 a.m.,  
in response to message #1 by Thomas Klemm

Hi, Thomas;

(here I am at 4:50 AM feeling insomnia...)

many of us who not only use and deal with HP calculators but also try to go further to their 'guts' have probably read that RPN structures were achieved mostly in search of a resident 'proto', portable operating system that could fit in less ROM, OR could offer the most in the same available ROM space. So, RPN offers many interesting features BUT math precedence. I like to say that math precedence in RPN calculators must be provided by the user, who must master math prior to use an RPN calculator. That is why I think RPN is

educative, but I'd rather not going ahead with that in order to avoid setting fire in extinguished fireplaces...

To achieve algebraic operation, it is mandatory to have at least a few registers to store the first keyed-in number and the code of the operation to be performed (for two-number sequences) so you can key in the second value and press [=] key. Keep in mind that there is no way to count on system 'memory' to hold necessary data if this memory has not yet been provided, meaning that, in any digital device, data must reside somewhere, and this 'somewhere' needs a very well defined address and physical circuits... Sorry if you already know about this.

RPN calculators demand no structure for precedence operators because whenever the operation key is pressed, the number(s) over which such operations will be performed must exist in the stack (in programs it happens the same). So they are already stored in X and Y registers and the system only needs to retrieve a copy of them and go ahead with the operations.

Consider line H008 `SQRT(A*B)>B` in your listing. You see, prior to get the resulting value from `SQRT(A*B)`, the system must store the codes for:

```
SQRT( (a code for calling it, not the routine itself)
A
*
B (in RPN/ALG HP calculators, shares X-register address)
```

A total of four registers taken from somewhere in RAM, meaning that it actually uses more memory as you noticed, indeed. When the ')' is found, the whole sequence is 'unloaded' and the result is found.

The system uses some cycles (clock) to store the intermediate codes, some others to 'unload' them and the actually necessary cycles to perform them. It may take almost three to four times more time when compared to the RPN version.

I may have left some considerations behind, but I guess the most important facts are described here already.

Hope this helps.

My 2¢.

Luiz (Brazil)

### Deciphering a HP 48G Serial Number

Message #1 Posted by [Jeff Kearns](#) on 25 Aug 2007, 6:06 p.m.

I recently came across an immaculate second-hand 48G on Craigslist and bought it (without manuals) for \$40CDN. A nice addition to my modest collection! The serial number however, is non-standard: SG72704563. Beyond being made in Singapore, can anyone tell me when this unit was manufactured? Many thanks,

Jeff Kearns

### Re: Deciphering a HP 48G Serial Number

Message #2 Posted by [Seth Morabito](#) on 25 Aug 2007, 6:12 p.m.,  
in response to message #1 by [Jeff Kearns](#)

Hi Jeff,

This serial number follows the post-1996 standard.

SG = Singapore.

7 = one-digit year code, 1997

27 = two-digit week code, 27th week of 1997

04563 = 4,563rd unit manufactured that week.

Interestingly, I thought that all manufacturing had moved to Indonesia by 1997. I guess not!

HTH,

Seth

### 35s storage

Message #1 Posted by [Howard Lazerson](#) on 25 Aug 2007, 4:35 p.m.

I was wondering if there was anyway to store and recall a series of numbers which represent coordinates of objects commonly observed thru a telescope. I wrote the alt/az pgm on this forum 8/20/07 and would like to put a list of about 100 objects numbered 1 thru 100 in memory. Since the pgm already uses up several alpha registers, I'm not sure how to do this. Each object notation will look like so; 1, 87.5, 56.2 ; The one [1]=object #1, 87.5= right ascension, and 56.2= declination. This saves time having to refer to a list while observing. Any help would be appreciated, Thanks, Howard

### Re: 35s storage

Message #2 Posted by [dbatiz](#) on 25 Aug 2007, 6:12 p.m.,  
in response to message #1 by Howard Lazerson

Have you considered saving the list in the following format:

NNN.RRRDDD

It would take a small subroutine to decode the object and make the components available to your program, but it shouldn't be too tricky.

Depending on the indexing available, the index number could be the object number then you'd only have to decode RRR.DDD.

Good luck Howard, I'd be interested to see your solution,

Very respectfully,

David

### Re: 35s storage

Message #3 Posted by [Howard Lazerson](#) on 25 Aug 2007, 10:43 p.m.,  
in response to message #2 by dbatiz

sounds reasonable, I will give it a try, thanks for the help, Howard

### Re: 35s storage

Message #4 Posted by [Alain Mellan](#) on 25 Aug 2007, 7:45 p.m.,  
in response to message #1 by Howard Lazerson

Quote:

Each object notation will look like so; 1, 87.5, 56.2

How about storing the data in 3D vectors? E.g. for the set above, use the sequence:

```
100 STO I
[]
1
(yellow) ,      (the "0" key)
87.5
(yellow) ,
56.2
STO (i)
```

will store a 3D vector in register 100. Then 1 STO+ I, and repeat...

Hope that helps.

### Re: 35s storage

*Message #5 Posted by [Howard Lazerson](#) on 25 Aug 2007, 10:46 p.m.,  
in response to message #4 by Alain Mellan*

I never would have thought of that, will try that option also, thanks for your suggestion, Howard

### Re: 35s storage

*Message #6 Posted by [Earl Kubaskie](#) on 25 Aug 2007, 10:55 p.m.,  
in response to message #4 by Alain Mellan*

If you have a list with Item 2, Item 5, Item 203, Item 1425, etc. then Alain is right on the money. The vector method he advised especially allows you to use higher accuracy in your ascension/declination values than 1 decimal place.

But are your item numbers a continuous 1, 2, 3, ... etc. series? If so, your program could encode the item number into the register number, allowing the 3rd portion of the 3D vector to be used or reserved for additional data.

### Re: 35s storage

*Message #7 Posted by [Howard Lazerson](#) on 25 Aug 2007, 11:24 p.m.,  
in response to message #6 by Earl Kubaskie*

The item #s- 1 thru 100 each represent an object, the additional numbers following that number represent its coordinates so when running the pgm if one wants to locate say object #39, there should be an easy to rcl 39 , observe the values and then input these values either manually or with a subroutine into the pgm. Also n.n accuracy is sufficient for the coordinates. Thanks, Howard p.s. I have been using HP calculators for several years TO CALCULATE , programming them is new for me!

**HP 94 Battery Pack**

Message #1 Posted by [Donald Williams](#) on 25 Aug 2007, 3:35 p.m.

I suspect that my HP 94 battery pack has some dead cells. I wonder if anyone else has opened one of these packs before? I would rather not do any more damage than is necessary. The case may split easily, but I am going to hold off, in hopes that someone else may have more information.

Katie, have you had to deal with this problem yet?

**Re: HP 94 Battery Pack**

Message #2 Posted by [Katie Wasserman](#) on 25 Aug 2007, 9:52 p.m.,  
in response to message #1 by Donald Williams

I've rebuilt a couple of 94 battery packs, they take some time.

The way I did it was to peel off the rubber grip, cut out a large section of the housing where the grip was using a tiny Dremel circular saw. Then I replaced the cells with 4 AA ni-cads because it was too hard to fit the original 2/3 C cells into place within the opening that I cut. Finished by gluing the removed section back into place and put the rubber grip back on. I used carpet tape to put the grip on with, it's a really sticky double-sided tape and exactly the right thickness.

The packs look untouched when completed because the rubber grip hides all the ugliness.

**Re: HP 94 Battery Pack**

Message #3 Posted by [Donald Williams](#) on 25 Aug 2007, 10:31 p.m.,  
in response to message #2 by Katie Wasserman

I used carpet tape to put the grip on with, it's a really sticky double-sided tape and exactly the right thickness.

I guess you are telling me the case is somehow heat staked or heat sealed, so cutting is the only option? My preliminary inspection led me to this conclusion but I was hoping for a miraculous cure.

Thanks for the information. It will be a back burner project. I can power it up with a lab supply for the time being if necessary.

**Re: HP 94 Battery Pack**

*Message #4 Posted by [Katie Wasserman](#) on 26 Aug 2007, 10:35 a.m.,  
in response to message #3 by Donald Williams*

Yes, cutting seems to be the only option in the 4 battery packs that I've seen. Clearly they were assembled in two halves with a longitudinal seam, but I have been unable to open them along this seam.

**Re: HP 94 Battery Pack**

*Message #5 Posted by [Donald Williams](#) on 26 Aug 2007, 11:34 a.m.,  
in response to message #4 by Katie Wasserman*

Did you cut the front face, back face, right side, or all of the above?

**Re: HP 94 Battery Pack**

*Message #6 Posted by [Katie Wasserman](#) on 26 Aug 2007, 5:25 p.m.,  
in response to message #5 by Donald Williams*

I cut out pretty much the entire area underneath the rubber grip as just one large u-shaped piece.

**Re: HP 94 Battery Pack**

*Message #7 Posted by [Donald Williams](#) on 26 Aug 2007, 5:57 p.m.,  
in response to message #6 by Katie Wasserman*

That was my plan.

Once again, thanks for the information.

**Poll**

Message #1 Posted by [Thor Lansen](#) on 25 Aug 2007, 2:36 p.m.

I propose a ban on math related topics. This forum is for discussion of HP calculators including usage, repairs, sources of replacement parts, general information. The way I see it math is not part of the forum discussion topics listed. In any case, there is no need to discuss math, you can find math related information in zillions of references materials, everything is somewhere for one to find it (if you are asking a math related question you are just being lazy). Bottom line, I have a heart condition and it stresses me greatly to look through the treads trying to avoid math related topics and I do not like it.

Regards, Thor

**Re: Poll**

Message #2 Posted by [Valentin Albillo](#) on 25 Aug 2007, 2:47 p.m.,  
in response to message #1 by Thor Lansen

Agreed.

Best regards from V.

**Re: Poll**

Message #3 Posted by [Thor Lansen](#) on 25 Aug 2007, 3:06 p.m.,  
in response to message #2 by Valentin Albillo

Gracias Valentin, love your website!

**Re: Poll**

Message #4 Posted by [Valentin Albillo](#) on 25 Aug 2007, 3:14 p.m.,  
in response to message #3 by Thor Lansen

Hi, Thor:

Thank you very much, very kind of you !

I also love your insightful posts and I'm doing the best I can to avoid indulging in the trait you explicitly state in other well-populated thread below, with encouraging results so far.

Best regards from V.

**Re: Poll**

Message #5 Posted by [Walter B](#) on 25 Aug 2007, 3:08 p.m.,  
in response to message #1 by Thor Lansen

No problem, Thor.

P.S.: I don't know, just a feeling: is your post to be taken seriously? Or is it just "tit for tat" because of the poll I proposed earlier today?

### **I Disagree!!!!**

*Message #6 Posted by **Namir** on 25 Aug 2007, 3:14 p.m.,  
in response to message #1 by Thor Larsen*

Thor,

Nobody is forcing you to read math-related threads. So why are you forcing your interests on others? Math topics are important for me and I look forward to threads that are related to math, statistics, and numerical algorithms in general.

I don't read every thread. I pick and choose those threads that appeal to me. Consequently I don't impose on others what they should and should not write about. Sounds logical to me!

Namir

*Edited: 25 Aug 2007, 3:23 p.m.*

### **Re: I Disagree!!!!**

*Message #7 Posted by **Geir Isene** on 25 Aug 2007, 3:58 p.m.,  
in response to message #6 by Namir*

I fully agree.

And one of the reasons I (and possible many others) use calculators is because of maths. So, it seems logical to discuss what feeds the use of calculators in this forum.

### **Re: I Disagree!!!!**

*Message #8 Posted by **David Smith** on 25 Aug 2007, 4:55 p.m.,  
in response to message #7 by Geir Isene*

I agree as well. The most immediate purpose in buying a calculator for most is the need to do math. This site is prominent among those dealing with HP calcs. Certainly, as shown by this site, there are many who are interested in collecting, but for most the need to do at least some math is paramount.

It would perhaps be better to offer a forum strictly tied to a collectors needs and others that encompass the needs of new/returning users, such as myself, for information tied to the functional use of our calculator(s).

### **Re: I Disagree!!!!**

*Message #9 Posted by **Hugh Evans** on 25 Aug 2007, 4:15 p.m.,  
in response to message #6 by Namir*

Agreed. In addition, the vast majority of math related questions around here directly involve the use and operation of a calculator.

### **Re: Poll**

Message #10 Posted by [Donald Williams](#) on 25 Aug 2007, 4:27 p.m.,  
in response to message #1 by Thor Lansen

Thor, with all due respect I think you need to read the " General Terms of Use" for this forum as stipulated by the owner and moderator Dave Hicks listed below

"Users of this site will conduct themselves with responsibility and decorum, and will discuss topics of interest to our community. This should be a fun place to visit and all community members should feel welcome. The topics of these forums, include just about anything listed in the Museum pages. These include HP calculators, early HP computers, **general math** , calculating machines, computer history, tips on buying, finding, repairing, or using old HPs etc. Off-topic items may be deleted (or not) at the sole discretion of MoHPC."

Edited: 25 Aug 2007, 4:30 p.m.

## Re: Poll

Message #11 Posted by [Maximilian Hohmann](#) on 25 Aug 2007, 4:40 p.m.,  
in response to message #10 by Donald Williams

Hello!

Quote:

... you need to read the " General Terms of Use" for this forum...

Yes, but maybe the outcome of this poll will lead to a change of these terms? I hate maths too and the first thing I always do with every new (old to be precise) calculator that I buy, is to remove the '+', '-', 'x' and '/' keys because they remind me of it :-)

Greetings, Max

NB: I have a heart condition too - it won't stop beating - even removing the battery and shorting the battery terminals does not help...

Edited: 25 Aug 2007, 4:42 p.m.

## Enlightening... d8^)

in response to message #11 by Maximilian Hohmann

N.T.

## Re: Poll

Message #13 Posted by [Howard Owen](#) on 25 Aug 2007, 5:05 p.m.,  
in response to message #11 by Maximilian Hohmann

Quote:

Yes, but maybe the outcome of this poll will lead to a change of these terms?

Maybe, but also in the terms of service:

Quote:

Forum rules are not up for debate. This is not a democracy, but rather a private forum.

So then again, maybe not.

I propose that we stop talking about calculator programming. These old machines are too obsolete, and talking about programming them just rots your brain.

I think we should restrict ourselves to nice, non-controversial topics like the weather. Oh.. wait..

Regards,  
Howard

### **Very well noted, Donald.**

*Message #14 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 25 Aug 2007, 4:47 p.m.,  
in response to message #10 by Donald Williams*

Hi, Thor;

If we discuss calculator usage, what else but math (and any other related science, like physics, statistics, engineering and so...) and programming (if applicable) should be discussed? In many other discussions related to ban this or that subject, the majority (AFAIR) voted not to ban anything, instead to count on contributors and visitors ability on dealing with such liberty.

My thoughts, though.

Best regards.

Luiz

*Edited: 25 Aug 2007, 4:52 p.m.*

### **Re: Poll**

*Message #15 Posted by [Juergen Rodenkirchen](#) on 25 Aug 2007, 5:35 p.m.,  
in response to message #1 by Thor Larsen*

Fully agreed! I'm Mathematician, PhD, and I do deeply love the Queen of science ;-). But, it's clearly not Mathematics what I'm looking for when visiting the forum.

### **Re: Poll - don't ban math discussions**

*Message #16 Posted by [Dave Shaffer \(Arizona\)](#) on 25 Aug 2007, 7:37 p.m.,  
in response to message #1 by Thor Larsen*

I enjoy the math discussions, along with just about everything else here.

I usually learn something, especially from Valentin's challenges.

### **Re: Poll - don't ban math discussions**

*Message #17 Posted by [Jeff Kearns](#) on 25 Aug 2007, 9:15 p.m.,  
in response to message #16 by Dave Shaffer (Arizona)*

Interestingly, Valentin seems to agree with the ban on math related topics.

I also support the open forum discussions that include technical issues regarding calculator usage and math problems with creative solutions. Great poll!

JeffK.

### Re: Poll

Message #18 Posted by [Eric Smith](#) on 25 Aug 2007, 7:54 p.m.,  
in response to message #1 by Thor Lansen

Furthermore, it is very easy to get information on common HP models, such as the 12c, 17bii+, 28S, 33s, 35s, 41C, 49g+, 50g, etc., so there is really no reason to discuss them here. The rules should be amended to exclude discussion of such models. Only HP's lesser-known calculator models such as the 46, 81, 94D/E/F, 95C, and 9805A should be discussed in this forum, and then only with regard to using them for non-mathematical purposes.

For example, the 46, 81, and 9805A make fantastic paperweights. They can hold down an enormous amount of paper. And unlike that rare Klingon Christmas snow globe [\*], it's unlikely that one of your coworkers will steal an HP-81. For one thing, it's far too big to fit in a coat pocket.

Eric

[\*] The works of Charles Dickens are **so** much better in the [original Klingon](#)

This is America.

\_\_\_\_\_

Well, lots of us are posting from America, the site is hosted on American servers, the curator is American and we speak American English, mainly.

But there are a *few* participants from other places, so discussions here sometimes have an un-American flavor. I propose we ban discussion of anything not clearly American in cultural origin. That would include not only mathematics but language itself, of course. So I'll shut up now.

Regards,  
Howard

### Re: Poll

Message #24 Posted by [Jeff Kearns](#) on 25 Aug 2007, 9:52 p.m.,  
in response to message #21 by Vincze

Hi Vincze,

I am also a relative newcomer to this site - but I have been lurking for some time... My take on the matter is that no one asked you leave and only one private message to you suggested that your posts were not always up to snuff so to speak; rather someone simply suggested (in what was supposed to be a helpful email) a more tempered approach to certain strings in the forum - instead of participating in every single string. So what? If you read the replies, most folks really appreciated your questions and found the ensuing discussions enlightening. I agree. You are a delight to read. Keep posting.

Forums have a certain etiquette that people follow and adopt over time. This one is no exception, but it is a very nice forum with a lot of interesting contributors. Everyone has the right to an opinion and as long as that opinion is expressed respectfully, there should be no problem. This particular discussion is just a poll. Good to see you back!!

JeffK

**Re: Poll**

Message #25 Posted by [Brian Healy](#) on 25 Aug 2007, 9:55 p.m.,  
in response to message #21 by Vincze

Vicze, I totally agree with you, and disagree with the proposal to ban math topics.

Those who don't like a certain topic don't have to read it. Let's allow free speech to happen here.

**Re: Poll**

Message #26 Posted by [Thomas Okken](#) on 25 Aug 2007, 10:19 p.m.,  
in response to message #21 by Vincze

Wow, socialism and death in Hungary? Where did that come from? For what it's worth, I'm from Western Europe, (The Netherlands, to be exact), and I have seen socialist and capitalist governments come and go more times than I can count, and they both have their good and bad sides. I can't help noticing that, while Europeans tend to take home smaller paychecks than Americans, they do seem happier overall. Oh, well.

Sorry if that seems OT, but I do have a point. Between asking someone to do their homework, and encouraging someone to ask questions, both of which I think are legitimate viewpoints, somewhere there is a balance, and some people may feel that we move too far away from that balance sometimes. So be it! We're all entitled to our opinions. As for you personally, Vincze, you complain about all the "crying" in this group, but you appear not to have noticed that for every posting that was critical of you, there were many times more that were supportive.

- Thomas

**Re: Poll**

Message #27 Posted by [Howard Owen](#) on 26 Aug 2007, 12:16 a.m.,  
in response to message #21 by Vincze

Hi, Vincze,

One of the hardest things to translate between cultures is *humor*, since it often depends of specific cultural references. Take the proposal to ban discussion of mathematical topics. That is *probably* a humorous suggestion because:

1. Mathematics is one of the three main topics you will see discussed around here, often at length and with great enjoyment
2. The subject is pretty well inseparable from the discussions of the calculators themselves, since they are tools to do numeric and symbolic math.
3. The curator's Terms of Use specifically call out math as a topic that is appropriate for discussion in this forum.

If the suggestion wasn't intended to be humorous, it is funny anyway because of the reasons above. So some of the discussion you are reacting to is probably intended to be funny.

Second, this community, like every other voluntary community I've ever participated in or am aware of, periodically goes through spasms of debate about what really defines the community. For an online discussion group this usually, as here, takes the form of complaints about recent content of posts. Debates like this were apparently (before my time here) responsible for the ad section being split off from the main discussion threads, and in the ad forum being presented in two forms, one with auctions, and one without.

More recently, we engaged in a long discussion over the topic of eBay. There is a large minority that dislike discussions of eBay and who would prefer to see them split off. We took an informal poll, and it turned out that the majority felt that these discussions were often relevant to collecting, so the curator did not create a separate area for those. These were both good, appropriate outcomes, that took into account the majority view on matters, despite what Dave Hicks says about this not being democracy. (I suspect he says that so that he can reserve his right, as the presenter of the museum content *and* this forum, to take actions he believes are right despite what a majority might feel at any given time.)

Unfortunately, this time around, you were the "lightning rod" for a particular complaint many people have had here over the years. Forum members are encouraged to do research before asking questions. Somehow, some folks apparently got the idea that you weren't doing enough of that kind of research. Personally, as I said in the original thread where you reported getting an email telling you to stop "dumbing down" the forum, I think that simple questions benefit me because I get to revisit stuff I learned a long time ago. At a minimum, this refreshes the knowledge, and since it's knowledge about topics I love, that's a pleasure. But sometimes I learn something unexpected in the process, or even find out that something I thought I knew was mistaken. I *really* value those sorts of experiences.

I also think that your questions weren't all that simple, most of the time. In fact, I suspect that it may be the way that they are conveyed that annoys some people. That is, your command of written English isn't up to the usual standard around here. That's not a problem for me - I can understand you just fine - but it may be for others. (Apologies if I'm misreading anyone's state of mind on this.)

In any case, I wouldn't worry too much about the opposition this has stirred up. As someone pointed out, you have quite a bit of support here. I think your best course would be to try to adopt some of the more helpful suggestions, and do as much research as you can. And then ignore the stuff that seems hateful or unfair to you. See how that works out. Perhaps that will be all it takes to mollify some of your critics.

As to the "socialist" nature of the discussions, that is a very loaded term coming from a Hungarian, of course. It has a different connotation in Western Europe, where quite a few democracies adopted socialist economic and social policies. In the US, the term is fraught with years of cold war rhetoric, and full of echoes from recent and ongoing political struggles. In all three cases, the term is likely to ring different bells in the minds of the reader. Exactly because of that, the term "socialist" in your second sentence tends to push buttons you probably didn't intend to. So let me offer my interpretation of what you meant. You think that some of the comments sound like they are coming from (soviet style) political commissars who want to control your behavior for the "good of the community?" Is that right?

If so, I have a couple of suggestions. First, given who you are and where you grew up, you may be more sensitive to that sort of thing, especially when criticism is directed at you personally, as was so unfortunately done here. There may not actually be quite so much of this "socialist tendency" you are seeing. Second, none of the criticisms I have seen carry the weight of power that the old apparatchiki had. In other words, you don't have to follow any of this advice if you don't want to. Dave Hicks, our curator, is the only guy who could actually kick you off the board. He's actually a pretty benevolent dictator. If you stick to those terms of use, you are probably safe from any action he might take. Third, there's that Eastern/Western European split on the value of socialist thinking. Some folks actually *do* sign on to that sort of thinking. But they do so in a democratic context in their home countries. In other words, I believe that none of them expect to have their way unilaterally. They would all probably accept a consensus one way or the other, and that consensus would be shaped by your supporters as well as your detractors.

In conclusion, I'm glad you are still hanging out here. If I were you, I'd go back to posting your questions and engaging in discussions like you were before all this flared up. You can try to be more aware of sensibilities that say you should do more leg work before you post, but I wouldn't take that to extremes. For example, even without a manual, pushing buttons on your 35s or other HP is a great way to figure out how it works. What you are aiming at is something I heard you remark on in an earlier thread: the ability to conceptualize what is going on inside the calculator. That will come with practice, and discussions on this

board. It's worth trying for, in my opinion, and I support you in the effort.

Regards,  
Howard

### Re: Poll

Message #28 Posted by [Ed Look](#) on 27 Aug 2007, 11:32 a.m.,  
in response to message #21 by [Vincze](#)

This thread may no direct (or any) bearing on HP (or any) calculators, but is still valuable in itself.

We should let people post as they please, because just about everyone, if not exactly everyone, here is basically an educated, polite person interested in HP calculators. (Notice I left out "vintage" because, using myself as an example, I was drawn here because of my affection for my old Spice, I remained because of discussions pertaining to HP calculators I've recently bought and are still using!)

And, the discussions always swing back to topics that pertain to HP calculators.

Further, math, science, philosophy, language, even many other things, do tie into calculators and computers, even if not HP branded. And even if we ignore this, these things stimulate thought, the lack of which would retard use of and interest in (HP) calculators.

So, folks, POST ON! I trust the collective sense of propriety here; none of us are stupid, after all, not even the Hungarian guy! :D

in response to message #31 by Maximilian Hohmann*

Hi,

Sorry if I am going to offend someone and may be out of place being newbie here, but my advice is for us not to get all this silliness out of hands.

One observation: Suspect the creation of the HP-35s brings new people to this community (how I got here), something thats a good thing.

Propably not a good thing then to scare new ones away by the forum found flooded with all this. My guess is you will loose the best ones...

Regards, Aha

Sorry if offended with 'the best one' remark, may sounded more elitic than meant, heaven knows I don't counted myself in that set.

---

Don't worry, I am (almost) impossible to offend (went through the hard school of growing

up as a german kid in a foreign country 40 years ago when the war memories were still fresh - no internet discussion is ever going to offend me!). Anyway, I am rather a lurker here myself posting a stupid question every now and then.

I was rather curious which regular posters on this forum are regarded as 'the best' by newbies and for what reason? You must not answer, of course, as I will not answer this question myself :-)

Quote:

---

I think MoHPC is a great site and the forum is I guess \*the\* HP calc forum and I am sure that it will continue to be that.

---

It certainly is and it certainly will. Mathematics included :-)

Greetings, Max

### Re: ???

*Message #36 Posted by [Arne Halvorsen \(Norway\)](#) on 26 Aug 2007, 9:20 a.m., in response to message #35 by Maximilian Hohmann*

One contributor that is rather inspiring is Valentin Albillo and the way he does it; organizing his material on his own website and inform on updates with posts here.

Think this pattern is something other also could consider in these times when starting a blog is done 1,2,3. I don't mean that you have to match Valentin's effort!

Personal I have started a project where I will try develop HP-35s code using java and then to use this framework to implement a geometric library for the calculator. I will not flood the forum with details, code and progress but do that in my java blog and make short post here when something new in my blog.

Another poster here that has helped me is Jim Creybohm who pointed me to the Samson shop.

*Edited: 26 Aug 2007, 9:21 a.m.*

### Re: ???

*Message #37 Posted by [Thomas Radtke](#) on 26 Aug 2007, 10:19 a.m., in response to message #35 by Maximilian Hohmann*

Quote:

I really hope so!

---

Well, Les' interesting Thread about the incomplete gamma function and its applications is actually gone as it seems.

### Re: ???

*Message #38 Posted by [Arne Halvorsen \(Norway\)](#) on 26 Aug 2007, 12:01 p.m., in response to message #37 by Thomas Radtke*

Damage count so far after the 'friendly advice...' post:

People offended to the degree that stated will leave:

\*Vincze

\*Will Hartung (if I get his post right)

Content deleted:

\*One Incomplete gamma function

Personal I did not think Don's or Thor's posts were something to get that upset about. You got to be able to take some criticism sometimes and a joke.

Well, guess things calm down now, it all will slide over the '2 days forum view event horizon' soon... if we want to...

*Edited: 26 Aug 2007, 12:04 p.m.*

### Re: Poll

Message #39 Posted by [Thomas Okken](#) on 26 Aug 2007, 12:02 p.m.,  
in response to message #30 by Les Wright

Hi Les,

I hope you put your submission back!

I assume that Thor, and everyone who agreed with the No Math proposal, was joking. Even if they weren't, it's not up to them to make the rules around here.

- Thomas

### Re: Poll

Message #40 Posted by [Les Wright](#) on 26 Aug 2007, 2:04 p.m.,  
in response to message #39 by Thomas Okken

I believe Valentin has some utility that takes snapshots of the Forum and preserves posts that even are deleted. Maybe he has a copy of my post?

If not, I will retype the listing and commentary.

I had no idea the poll was a joke. I have been sick and my sense of humour is shot, I think!

Les

### LOL!! Thor, Valentin: you made my day!

Message #41 Posted by [Hans Brueggemann](#) on 26 Aug 2007, 8:57 a.m.,  
in response to message #1 by Thor Larsen

it is so funny to see how forum visitors behave like their calculators.

for example, try just a few keystrokes:

01 "BAN MATH"

02 [ASTO]forum

---> "CONTENANCE LOST"

cheers,  
hans

## Re: Poll

*Message #42 Posted by [Thor Lansen](#) on 26 Aug 2007, 1:18 p.m.,  
in response to message #1 by Thor Lansen*

Well, a day has gone by and I am glad my ban proposal has NOT passed. Thank you very much to all the participants.

Special thanks to Valentin Albillo, for his great math challenges, great restraint, and good sense of humor.

Vincze, welcome back, please stay.

Maximilian Hohmann, man, take care of that heart condition, ASAP!

Less, please, take it easy or you are going to have a heart attack! I like math, put your submission back!

Walter B, no hard feelings.

Regards, Thor

*Edited: 26 Aug 2007, 1:26 p.m.*

## Re: Poll

*Message #43 Posted by [Karl Schneider](#) on 26 Aug 2007, 5:19 p.m.,  
in response to message #42 by Thor Lansen*

The content of the above thread was practically dumbfounding.

Post something informative, and quite often there is minimal response. Post something silly, on the other hand, and a veritable beehive of ultimately insignificant discussion ensues.

We should remember that the Forum postings get archived by MoHPC, and are subsequently included in sales of CD/DVD sets. It's best to keep the Forum a *forum*, not a banal chatroom. Breezy statements such as these are not helpful toward that end:

*"If looks like a duck, walks like a duck, quacks like a duck ... "*

*"Some people just simply can't do that, I think it has something to do with having an anal retentive personality."*

I, for one, support those who advocate, publicly or even privately, in the interest of quality. The points of Don Shepherd and James Prange resonated with me.

## CIVILITY?? Re: Poll

Message #46 Posted by **Vincze** on 26 Aug 2007, 7:31 p.m.,  
in response to message #45 by Don Shepherd

Quote:

thanks to everyone who supports civility ... on the forum.

I sorry, but I have to comment. Civility? So you have civility? You basically decided on your own that I do no research before I post? Sure, so of my posts my seem trivial to you, but you have no idea what I try to find out before I post. I come to forum looking for wisdom, because this group of wise people, and you decide that I should sit down, be quit and not ask question. You say I make unnecessary posts. You tell me not to post a response to every post. Who say you allowed to make this commandment? If someone think it worth making post, then I think it worth my post to answer or follow-up their post.

You tell me to pick up pencil and paper to work through program. You not even know what my problem is with program. It not with how program work, or what in x, y, z, t, but with what certain command mean. How is pencil and paper going to help me?

You an not one I have most issue with Mr Don. I think you were trying to be civil and helpful, and maybe just did not convey message properly. I know I guilty of that with some of my posts (not getting question across properly). I have clarified my question behind scene with person who respond, so you not priveledge to see, so I can forgive that.

What I most upset about is HATE mail I receive to my email. I have email from some of you who tell me very mean and vulgar things. I get people telling me to go back to Hungary and leave this group alone. I get people telling me Don say what I want to say but he not go far enough. I have someone say "Go to h\$ll you mother f\*c\*ing foreigner". How you think this make me feel? I sure this not intent of your post, and I understand. But it not easy being me. I get made fun of quite often because I not talk good English. I see people killed when they ask question and told to be quiet. I know this not what you want or wish. I know you want civility, but what I experience last two day not civil.

Here is what I propose. Let all of us drop this. I try with all I have to do what other wish and do more research before I post. I know some may think I never do enough, and I sorry I can please all, but I try. I ask all you to be more tolerant of me. I not wish to receive any more unlike me mail.

Mr Don, I sorry for being mad at you. I know you not know I was, but it wrong for me to me mad at you. I hope you can forgive me. For those of you who wish bad things of me, I hope you forgive me to for things I think of you.

Vincze

Message #47 Posted by [Don Shepherd](#) on 26 Aug 2007, 7:53 p.m.,  
in response to message #46 by Vincze

Vincze, I did not know that you were getting such vulgar emails privately. Anyone who uses that kind of language deserves to be removed from our community. I strongly urge you to report those people to Mr. Hicks, and I would hope that he would take whatever action he deems appropriate. Anyone who sends emails like those does not deserve the privilege of being in this community.

Your language is fine, I never have trouble understanding you. Your English is certainly better than my Hungarian (because I have no knowledge of that language).

Vincze, I want to publicly ask you to remain in this forum community. It was never my intent that you should go away, and I do not desire that. You do bring a perspective to the forum that I think we need.

your friend, Don Shepherd

Ah, I misunderstood and thought you lived in Hungary. Yes, you are as American as I am, if not more so since this is your country of choice.

All the more reason to be disgusted with people telling you to go back to Hungary. You belong here more than they do. But I'm sure you know this.

Quote:

\_\_\_\_\_  
 You have no idea what it like in other country. Be thankful for what you have.  
 \_\_\_\_\_

I'm not one of the "provincial boors". :-) I have lived elsewhere, and I fully appreciate that things like running water, especially *hot* running water, should not be taken for granted, nor should free speech, freedom of/from religion, etc. Still, I'm embarrassed by my government (the past two administrations plus the clowns in Congress during that time) and I'm tired of having to explain that I had nothing to do with it.

Mostly I feel a lot less *safe*. I hope things take a turn for the better, but it looks like the Chekists are winning. Habeas corpus is dying, and we will soon be be hearing strong echoes of *Ihre Papieren, bitte!* at, of all places, national parks (yes, a passport will be required for travel to certain places *inside* the U.S. -- or a federally approved ID card which is the same thing).

Now, back to what I thought were some pretty interesting math questions, Vincze. The parts I understood, anyway. :-)

### **Re: CIVILITY?? Re: Poll**

Real trolls from Norway? Interesting, I not know that. So person accusing me of being troll might be one. I just kidding. :)

As far as Romanian comment, in Hungary we associate gypsy with Romania. We tend to look down on them as a lower class. In fact as child, parents tell child that gypsies from Romania come and kidnap them is they do not do what they are told. Sort of like 'boogie man' in USA. That was not nice of me to say and I apologize.

### HP 32Sii Troubleshooting - Does not turn ON

Message #1 Posted by [recnadniar](#) on 25 Aug 2007, 10:35 a.m.

I've had my 32Sii for nearly 10 years now, and it has worked without fail until just a few days ago.

when I pressed the ON button the screen was very dim. I tried to adjust the contrast,I put in a set of fresh batteries, tinkered with it, all to no avail.

Anyways, I found a simple fix to the problem. I used a fine grit sandpaper to scour the battery terminals. the terminals looked clean, and shiny so I did not think it would actually work, but miracle, my trusted HP32Sii came back to life.

Hope this will help somebody with a similar problem.

It did.

I warmly thank you, my HP 22S wasn't working anymore until I used a rubber to *clean* the battery terminals.

It turned out to be working perfectly afterwards!

### **Time Value Money program for HP 42s**

Message #1 Posted by [John Dagis](#) on 25 Aug 2007, 6:51 a.m.

I've restored my old programs back on my HP 42s, after they were erased when it malfunctioned recently.

I also decided I would like to program in the Time Value Money program from pages 192/193 of the HP 42s user manual, but it doesn't work. I've checked out my configuration to the manual's example, and can find no errors on my part.

Maybe this particular program was one of the ones that I have read about as being erroneous on HP's part in their user manuals?

If somebody knows of any corrections, would they be kind enough to post them.

Thanks in advance —John D

I just entered it and it seems to work fine with the example given. When you say it doesn't work, could you give me an example of data you're entering and I'll enter it here to see if it works.

I used the Edition 4 March 1990 manual.

Bill

Message #3 Posted by [John Dagis](#) on 25 Aug 2007, 9:03 p.m.,  
in response to message #2 by Bill (Smithville, NJ)

Thanks for the responses, My manual is the 7th edition 1992. The TVM program is on page 193, and I think the problem may be with line 14 STO ST T

The HP 42s catalog has no ST T, and if I type the letters in, they appear as “ST T” with quotation marks around them, whereas the manual shows no quotation marks.

Doing the problem at the end of the program, the PV and PMT come up with the same result of 5750, in the case of PMT it is -5750. As the ST T doesn't appear in the catalog, I figure that's where the problem lies.

I am not an academic, and use the calc for construction and office work, so I'd appreciate any help given. :)

### **Re: Time Value Money program for HP 42s**

*Message #4 Posted by [Jeff O.](#) on 25 Aug 2007, 11:11 p.m.,  
in response to message #3 by John Dagis*

To enter a STO ST T instruction, press STO, then the decimal point. That brings up a menu which allows indirect storage as well as storage into the stack and the Last X registers. Stack T is the last one on the right.

*Message #6 Posted by [Jim Creybohm](#) on 25 Aug 2007, 10:38 a.m.,  
in response to message #1 by John Dagis*

Hi John. I did the same thing on my 42 a while ago, and I found that while the example from the manual worked, when I tried to solve for some FV and time values, the answers were all over the map.

I did double check the data entry, and it is entered correctly. Having said that, the program is very fussy when it comes to input data.

I have not yet gotten good agreement between the program and my 12C. I haven't looked at the problem for a while, but perhaps tonight I'll dig my 42 out and go through it again.

### New update of my calc website

Message #1 Posted by [Valentin Albillo](#) on 24 Aug 2007, 9:27 p.m.

Hi, all:

I've just updated (well, Laura did it) [my calc website](#) with some new items freely available for download should you feel interested, namely:

1. *A new PDF article: "Know Thy Foe: A New Contender"*

This is a 12-page article in PDF format which confronts two great contemporary, ground-breaking machines of the early 80's: The **HP-41C** versus the **SHAP PC-1211** !

The article includes six excellent side-to-side pictures comparing specific key design features of both models, and a thorough description of their differences, as well as two test-case programs, *each* of them written for *both* models, to better see them in action while attacking the very same task using their unique programming paradigms.

Finally, no less than *four* additional sample programs for the SHARP PC-1211 are featured, all of them less than 10 lines long, yet successfully dealing with fairly complex tasks with ease.

2. *A new image for the Gallery: HP-16C*

A great 1024 x 768 image of one of the **HP-16C** in my collection, in splendid frontal view. It's really mint and it shows !

3. *Mystery Extra Goodies: !?*

You'll have to see by yourself, please don't ask (and I mean it).

Hope you'll like them. Thanks for your interest and

Best regards from V.

Wow! What can I say?

¡Muchas gracias Valentín!

(From a real fan :-))

### Re: New update of my calc website

Message #3 Posted by [Valentin Albillo](#) on 25 Aug 2007, 12:21 a.m.,

*in response to message #2 by Miguel Toro*

¡ De nada, Miguel ! :-) { i.e.: "you're welcome !" }

Thanks for your kind appreciation, I'm glad you find them interesting/useful.

Best regards from V.

## **Re: New update of my calc website**

*Message #4 Posted by [Will Hartung](#) on 25 Aug 2007, 2:28 a.m.,  
in response to message #1 by Valentin Albillo*

I think the observation about being able to see the entire equation on the screen versus what you last typed in regards to an AOS is spot on.

In an involved calculation, an AOS style calculation was almost guess work, especially when the key being hit doesn't change the display (like a open perentheses on a TI-58/9).

But when you can type out the entire equation "just like in the book", the dynamic changes completely, and the ease of straightfoward translation makes the machine very intuitive and easy to use.

Another thing you sort of mention regarding the SHARP was the fact that it was sold by Radio Shack. You really can't discount the effect Radio Shack had on the computer market of the day, and the visibility of having something like the SHARP in their catalog, or at a neighborhood store is quite important vs the smaller market and distribution of HP. (And personally, their Model 100 is simply one of the finest machines of its type ever made.)

My father had I think all 3 of the "Pocket Computer" models from Radio Shack. I had to snicker when I saw expresions like "AA" and "AAA" in your SHARP examples. It reminded me of one of the frustrations my father had with normal BASIC. In normal MS-BASIC, obviously AA doesn't mean "A\*A", rather it's the variable AA.

But my father commented on how he had problems with his programs because he'd "run out of variables" in MS-BASIC. He'd use A, then AA, then AAA. In MS-BASIC, only the first two letters mattered -- so AA == AAA.

But you can imagine what the code looked like (especially by todays standards) being scattered with essentially meaningles variable names like A AA B BB CC Q XX etc.

## **Re: New update of my calc website**

Which the difference between PC1211 and PC1212. I have them but I don't have the manuals

### **Re: New update of my calc website**

*Message #8 Posted by [Valentin Albillo](#) on 25 Aug 2007, 12:02 p.m.,  
in response to message #7 by gileno*

Hi, Gileno:

Gileno posted:

*"Which the difference between PC1211 and PC1212. I have them but I don't have the manuals"*

There's no difference at all as far as their capabilities are concerned, both have the same RAM, ROM, and most of their specifications are exactly the same. The only difference is the dot-matrix LCD display technology: the pioneering PC-1211 has a yellow-type LCD display, which is less durable and has a tendency to permanently blacken-out, most specially if exposed to sunlight.

So, when the technology improved, SHARP issued a new version, the PC-1212, this time featuring a new grey-type LCD display, which is less sensitive to sunlight and to blackening. This kind of display was then used for all subsequent models and the yellow-type one was abandoned for good.

However, I find the yellow display very pleasing aesthetically, and if properly stored and kept away from sunlight, it will last for decades without noticeable blackening.

Best regards from V.

### **Re: New update of my calc website**

*Message #10 Posted by [Valentin Albillo](#) on 25 Aug 2007, 1:24 p.m.,*

*in response to message #4 by Will Hartung*

Hi, Will:

Will posted:

*"My father had I think all 3 of the "Pocket Computer" models from Radio Shack."*

First of all, thanks for your appreciation of my article and your comments, they're most welcome.

Radio Shack actually produced 8 "Pocket Computer" models, but only 3 of them were exact SHAP clones, the rest being Casio's.

*"In MS-BASIC, only the first two letters mattered -- so AA == AAA."*

That's the case with SHARP's subsequent BASIC dialects, they did allow for long name variables (say PRICE) but only the first two characters were 'significant' (so PRICE and PRICE2 would be considered the same variable). Further, the name should not coincide with or include as part of it any of the BASIC reserved words and identifiers, which forced you to carefully select your names and be aware of this limitation, lest you would then afterwards be very puzzled as to why some seemingly correct program line was resulting in a wholly unexpected syntax error at execution time.

*"But you can imagine what the code looked like (especially by today's standards) being scattered with essentially meaningless variable names like A AA B BB CC Q XX etc."*

Yes, I can imagine it and I've actually *seen* it at the time, but you have to consider the expectations back then. I mean, if you're used to 2007's high-level languages which all of them allow identifiers such as "Article.Cost\_of\_production.Pounds", you're bound to find "AA", "QX", and "C7" quite unacceptable.

But if you were in the late 70's and early 80's, having to program your variables as registers 00, 08, 23, 14, 87, etc., then the ability of *mnemonically* calling them I for index and P for Price, say, or even PRICE and TOTALPRICE later, was a *real godsend* which made source code immensely more readable as compared to the numeric-only register addresses, not the nuisance it seems now.

Everything's relative and oftentimes seemingly preposterous practices come to be much more understandable when put in context.

Best regards from V.

**Mystery HP41 CX**

Message #1 Posted by [Dave Colver](#) on 24 Aug 2007, 8:20 p.m.

Hi All

One of the nice things about being a collector is occasionally coming across a mystery custom machine. Its a 41CX with a double DIP switch on the opposite side to the charger port, it has been double speeded (determined by the BEEP tone). The DIP switch appears to make either the Navigation Rom or ZenRom change visible in CAT 2 (or both).

So the questions

- (1) Whose mod might this be
- (2) Is there a way of uploading new software ROM's to it?

Thanks in advance

Dave

**Re: Mystery HP41 CX**

Message #2 Posted by [Winfried Maschke](#) on 29 Aug 2007, 7:03 a.m.,  
in response to message #1 by [Dave Colver](#)

Most likely the PCBs of the two modules are build inside the 41. The switch connects the ISA-line of the modules to the calculator.

If the switch is turned on, the build in module is hardwired to one of the HP41 ports and you cannot use this port for another ROM module.

Beside some others I did such kind of mods for many people in europe. You could even buy a PCB to build in 4 modules. [Here is a picture..](#)

There ist no way to upload other software as it is a hardware mod with ROM modules.

**Re: Mystery HP41 CX**

Message #3 Posted by [Dave Colver](#) on 29 Aug 2007, 8:39 p.m.,  
in response to message #2 by [Winfried Maschke](#)

Hello Winfried

Thank you for your informative reply, I \*may\* open the machine up to see whats going on now...and which ports it overlays (though i could of course test that with a module too)

Dave

**35s - Simple Complex Quadratic Root Finder (1st try)**

Message #1 Posted by [Dallas Osborne](#) on 24 Aug 2007, 7:43 p.m.

If I am doubling someone else's work, I apologize. Before tinkering with this, I briefly searched the forums for a simple quadratic root finder with complex compatibility and didn't find much; my search techniques may be seriously lacking, though. I have need for a rapid fire quad finder with complex and didn't want to work my finder tips raw getting that massive version in. So, enough said. Clearly this is limited to quadratics:

Q001 LBL Q

Q002 INPUT A

Q003 INPUT B

Q004 INPUT C

Q005 SQ(B)-4XAXC (AS EQN)

Q006 ROLLUP

Q007 2

Q008 X

Q009 STO D

Q010 X<>Y

Q011 X<0?

Q012 GTO Q016

Q013 SQRT

Q014 STO S

Q015 GTO Q021

Q016 +/-

Q017 SQRT

Q018 i

Q019 X

Q020 STO S

Q021 (-B+S) / D (AS EQN)

Q022 (-B-S) / D (AS EQN)

Q023 RTN

CK = E46A (for what it's worth) LN = 98

So... let the tomatoes fly; my skin is thick.

;)

## Re: 35s - Simple Complex Quadratic Root Finder (1st try)

Message #2 Posted by **Gerson W. Barbosa** on 24 Aug 2007, 8:45 p.m.,  
in response to message #1 by Dallas Osborne

Quote:

my search techniques may be seriously lacking, though.

Using *site:www.hpmuseum.org quadratic-solver* as the search-key in Google returns 21 results. On the other hand, not having found them has proved useful, as you had the chance to come up with your own solution, which is good.

Program-size is not so important nowadays, as you see can see in Palmer's article (1st result). However, a shorter program is possible, based on a 15C program by Thomas Klemm (3rd result) :

```
Q001- LBL E
Q002- ENTER
Q003- R^
Q004- /
Q005- R^
Q006- LSTx
Q007- /
Q008- -2
Q009- /
Q010- ENTER
Q011- ENTER
Q012- x^2
Q013- R^
Q014- -
Q015- 0.5i0
Q016- y^x
Q017- -
Q018- x<>y
Q019- LSTx
Q020- +
Q021- RTN
```

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=114345>

Quote:

So... let the tomatoes fly; my skin is thick.

;)

Quite the contrary. Congratulations!

Gerson.

### PC application HPCALC.EXE

Message #1 Posted by [Donald Williams](#) on 24 Aug 2007, 3:39 p.m.

Another thread about solvers and the 200LX prompted me to ask this question which may be a little too off topic for that thread.

I have an old application called HPcalc.exe that I have faithfully migrated to every PC I have dealt with for the past 15 years or so, and I cannot remember where it originally came from. It is obviously an old Win 3.1 era application but amazingly it still works on every MS OS down through the years. If you use Help, About you get the message

HP Financial Calculator V 1.02 8/31/93 Copyright Hewlett-Packard 1993

The name is misleading since this is a full scientific application with a great solver. It has options for RPN or Algebraic. It actually has 6 applications Arithmetic, TVM, Business, Solver, Conversion, and Math. Actually now that I think of it, this is probably the "Calculator" that I use the most. Old habits are hard to break.

Could it be that this was the 200LX emulator and I have just forgotten that is where I aquired it?

Anyone else still use it?

It just bothers me that I cannot remember where I originally got the application. It is antiquated compared to modern emulators but quite simple and very useful. And get this! It uses a whole 250 KB of disk space.

### Re: PC application HPCALC.EXE

Message #2 Posted by [Bruce Bergman](#) on 24 Aug 2007, 4:06 p.m.,  
in response to message #1 by [Donald Williams](#)

Yeah, that's part of the 100lx/200lx sync pack. I had the same thing with the 100lx I bought years ago. I used it to access some old custom databases I built with the db app.

Funny, I didn't even THINK of going back and finding that to have it running on my desktop! I should go find my disk and mess around with it, if only for nostalgia. ;-)

thanks, bruce

### Re: PC application HPCALC.EXE

Message #3 Posted by [Donald Williams](#) on 24 Aug 2007, 4:53 p.m.,  
in response to message #2 by [Bruce Bergman](#)

I wrote many equations for radar and antenna problems intended to be used on the 200LX. Unfortunately MS decided to wrap some mystery layers in the OS so syncing the 200LX device eventually became impossible. Surprisingly the PC application still works and the equations are all still there. I just continue to copy from PC to PC.

If you cannot locate your disks and but still remain interested let me know, and I can send you a copy.

( Is this the perfect oppurtunity for me to once again start my rant about calculator I/O? About how HP-IL was the only I/O conceived for calculators and the only I/O that could talk to computers but still provided mass storage independent of a computer, so your investment of time and money was not hostage to the capriciousness of an OS provider or a vendor who wasn't interested in updating their software. No! I will stifle myself.)

Thanks for the info.

EDIT: Actually posted this message before I read Bills response. So I don't know if CPACK 200 would still run or not. I once owned an omnibook so I guess thats how I obtained it. Glad I did. Now I wonder if the CPACK 200 would also run.

*Edited: 24 Aug 2007, 5:01 p.m.*

## **Re: PC application HPCALC.EXE**

*Message #4 Posted by **Bill (Smithville, NJ)** on 24 Aug 2007, 9:37 p.m.,  
in response to message #3 by Donald Williams*

Hi Donald,

Yep, CPACK200 runs in a dos window. On my system it always goes to full screen and refuses to run in a smaller window. Don't know if it can can actoolly access the com ports that way, but you can have all the features of the HP-200LX on your WIN XP machine.

I have a shortcut on my desktop to CPACK200 so I can run it whenever I need to.

Bill

## **Re: PC application HPCALC.EXE**

*Message #5 Posted by **Bill (Smithville, NJ)** on 24 Aug 2007, 4:14 p.m.,  
in response to message #1 by Donald Williams*

Hi Donald,

Quote:

I have an old application called HPcalc.exe that I have faithfully migrated to every PC I have delt with for the past 15 years or so

I have done the same. It's on all my PC's.

It originally came installed on the HP Omnibook OB-300, 425, 430, 530, 600c and 600CT. It may have also come with some other Omnibook models. Those systems also came with HPPIM.exe which was compatible with the Phone Book and Address Book of the HP-200LX.

Quote:

Could it be that this was the 200LX emulator and I have just forgotten that is where I aquired it?

Nope - they are not the 200LX emulator. The LX emulatotrs are CPACK95, CPACK100 and CPACK200.

While HPCALC does include a solver, it's not as complete or as full featured, as the solver in the HP-200LX. Not exactly sure what it lacks, but I know some test equations that I entered would not run on it - while they ran fine on the 200LX and the 19BII.

Bill

---

**Re: PC application HPCALC.EXE**

*Message #6 Posted by **Peter A. Gebhardt** on 25 Aug 2007, 1:48 p.m.,  
in response to message #1 by Donald Williams*

Donald, Bill & Bruce,

It does run in VirtualPC (5.3.582.32)in a small Window on XP2 on my Notebook PC just as I'm typing this ...

The version data of CPACK200 (which is in turn part of the already mentioned Sync-Package) are as follows:

HP 200LX Connectivity Pack

Version 1.02

(c) 1990, 1994 HP

(c) 1991, 1993 Lotus

(c) 1993, 1994 Intuit

Best regards & a sunny weekend for all of you!

Peter A. Gebhardt

PS: My Desktop-Shortcut points to the stored session of Virtual-PC, which contains the last session of HPCALC - of course ...

### HP-65 or 67 Spaceflight Program

Message #1 Posted by [Stefan Vorkoetter](#) on 24 Aug 2007, 2:18 p.m.

When I was a kid, I remember perusing an issue of Popular Electronics magazine (I think) in which was presented a program for an HP programmable (65 or 67 if I remember correctly). Unlike the typical "Lunar Lander" program, this one would simulate an entire flight from Earth launch to Moon landing (in two dimensions). The user would enter a fuel burn vector (strength and direction) and the program would calculate the spacecraft's next position and velocity. It was up to the user to plot his/her flight on a sheet of graph paper.

Does anyone else remember seeing this program? Does anyone have a copy of it?

Thanks, Stefan Vorkoetter

### Re: HP-65 or 67 Spaceflight Program

Message #2 Posted by [Eric Smith](#) on 24 Aug 2007, 5:33 p.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

I haven't heard of that one. If I recall correctly, In 1979 Byte published a program for the HP-67 to do a 3D simulation of a trip to Mars.

Message #3 Posted by [Andrés C. Rodríguez](#) on 25 Aug 2007, 12:57 p.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

I think I have it, it was oriented to the HP25.

### Re: HP-65 or 67 Spaceflight Program

Message #4 Posted by [Stefan Vorkoetter](#) on 25 Aug 2007, 10:07 p.m.,  
in response to message #3 by [Andrés C. Rodríguez](#)

That may be. At the time, I was too young to notice exactly which calculator it was. Is there a way I can get a copy of the article from you? If so, I'd be glad to transcribe it and put it on my web site to share with all.

Now that you mentioned that it was for the HP25, I did a Google search and found a reference to the program. In fact, I found a huge list of calculator programs published in magazines. Has anyone else seen this list: <http://nleindex.com/index.php?pID=HTDI&sID=BrowseIndex&tID=E/255>

Stefan

Here's the reference:

**"Six programs written especially for the HP-25 programmable calculator. They are (1) Battle the dive bomber, (2) football, (3) blackjack, (4) space flight, (5) biorhythm forecast and (6) test your ESP." POPULAR ELECTRONICS [1] Jun 1977 (v.11#6) pg. 39.**

I have a photocopy of that article around here somewhere. I'll try to dig it up for you.

"Space Flight" involves two planetary bodies and a rocket ship. The calculator gives you position (which you graph) and velocity. By giving thrust commands (magnitude and direction) you try to establish a stable orbit around the two planets, or if you are daring, try to de-orbit and land.

I remember trying these programs on my friends HP25C when they were published. Out of the six, I found "Battle the Dive Bomber" the most interesting. I used to run that on my HP29C, and ported it for later models.

\_\_\_\_\_

Is there a way to "bump" threads on this board so they don't fall over the horizon? Otherwise I may never get a chance to test my daring, by attempting to de-orbit and land.

Funny that my mind is wanting to read the article even though I have MS Flight Simulator, Celestia, and a entire lineup of "expensive" applications on my laptop.

<http://www.shatters.net/celestia/>

Thanks, Pal

I wish someone would make space shuttle simulator. That would be nice.

\_\_\_\_\_

Try this one here: <http://www.x-plane.com/>

You can chose different stages from the full re-entry (about 20 minutes) to the final approach (about one minute). Apart from the shuttle, X-Plane is the most realistic (in terms of aeroplane behaviour) flight simulator for the PC, and the only one for the Macintosh. There are hundreds of very good aeroplanes available for free from an excellent internet community: <http://www.x-plane.org/>

Greetings, Max

Perhaps you can use this:

<http://www.yousendit.com/>

No sign up is required. It works like a charm. You can upload files up to 100 meg. The file sits on a server for 7 days. The recipient receives a link in an email from which to download the file. I used a yahoo account with not problem.

If you do not wish to collect email addresses from everyone I would be happy to host the pdf for you on the internet if you send it to me. Then I'll just put a link here for anyone to download the file at their leisure..

Cheers, Pal

### **Solver question -- versions -- which is the "best"?**

Message #1 Posted by [Bruce Bergman](#) on 24 Aug 2007, 2:09 p.m.

I'm moving this question out of being buried in the other discussion below, because I don't think anyone will answer otherwise. ;-)

What version of the solver application do folks think is the, for lack of a better word, pinnacle of that tool?

There seems to be a lot of differing opinions on this subject. I am pretty happy with the 17bii+ solver (I know, that's heretical to some of you, what with its bugs), while others say that the 19bii or 17bii was the best. However, lately I've been seeing posts that seem to imply that the 200lx solver was clearly the best, most powerful, most accurate solver.

I'd be interested in hearing opinions, and where possible, examples of why you think that one is the best. Maybe in descending order of "bestness" too?

thanks! bruce

### **Re: Solver question -- versions -- which is the "best"?**

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 24 Aug 2007, 2:43 p.m.,  
in response to message #1 by [Bruce Bergman](#)

Hi Bruce,

I guess the question is "best" for what - speed, power, correctness, ease of use, etc.

For power and ease of use, I'd have to say the HP-200LX. It has a full, if small, keyboard for entering the equations. Multiline screen for editing. Can save/load equations. Easy to transfer to a pc for editing large complicated equation. Full L() and G() implication. Can do graphs. Can be used in a 1-2-3 worksheet.

In the calculator realm, I'd have to go with the HP-19BII. Multiline display, the full keyboard helps on entering equations.

Second on the calculator side would be the HP-17BII. Mainly for the pocket size.

The above is order I would develop a complicated formula - I'd start with the HP-200LX or the PC emulator of it. Debug it there. Then type into the HP-19BII. Ensure it works there. And, if I need smaller form factor, enter the final debugged complicated equation into the HP-17BII.

As far as I know the solver is the same on all three of these. The HP-200LX, of course, has some additional features.

I can't comment on any of the newer calculator, since I don't have any of them.

Bill

*Edited: 24 Aug 2007, 2:43 p.m.*

## **Re: Solver question -- versions -- which is the "best"?**

*Message #3 Posted by **Peter A. Gebhardt** on 25 Aug 2007, 2:11 p.m.,  
in response to message #1 by Bruce Bergman*

Bruce,

I second Bill's comments very much, but like to add another wrinkle on the "Quest for the Best Solver in Town" - that is the one about the "whole package".

As you know from my last postings, I'm mostly a 200LX convert already. In this process what made me a "convert" was not so much the already known compatibility problems of the 17bII+ "package" compared with the others, but mainly the lack of being able to "save & restore" my development work!

I think you eventually would agree, once you spent hours on development and the "battery exchange demon" shows up his ugly face ...

Add to this the integration with Lotus 123 & the 200LX Application Manager's Macro capabilities - and you have very unique & tremendous capable solution for anything but eventually complex math & calculus.

So my recommendations for the "Finals" ranking are:

1. 200LX
2. 19BII (with a strong battery door ;-))
3. 17bII (tie with 17BII+ once it's software has been fixed)
4. 27s (Edited as of Karl Schneider's posting below - sorry, my fault!)
5. 18c (battery door ...)

Best regards

Peter A. Gebhardt

PS: Availability of N-Cells might be an issue too, which is in favour off the NIMH 2700 mA Rechargeable powered 200LX ...

*Edited: 25 Aug 2007, 4:00 p.m. after one or more responses were posted*

## **Re: Solver question -- versions -- which is the "best"?**

*Message #4 Posted by **Karl Schneider** on 25 Aug 2007, 3:35 p.m.,  
in response to message #3 by Peter A. Gebhardt*

There's nothing wrong with the HP-27S battery door; it's a Pioneer-series model, just like the HP-17B/BII and HP-42S.

I'd rate the HP-27S solver above that of the HP-17BII, because the HP-27S has more mathematical functions available. RPN, of course, is not an issue.

The HP-35s may deserve a mention, because it now has in-line editing and limited implicit multiplication.

-- KS

*Edited: 25 Aug 2007, 3:36 p.m.*

## **Re: Solver question -- versions -- which is the "best"?**

*Message #5 Posted by **Peter A. Gebhardt** on 25 Aug 2007, 4:09 p.m.,  
in response to message #4 by Karl Schneider*

Karl,

the only reason I've put down the 27s, was what Finseth's Solver Chart said here on the 27s (and as far as I remember - reading that in the 27S Owner's Manual):

Quote:

... The solvers on the -17B, 17BII, -18C, 19B, and 19BII do algebraic simplification: this feature was removed from the -27S in order to save space. ...

Which (as I must assume, because I don't possess an 27S) means iterative solution search each and every time ...

Best regards

Peter A. Gebhardt

PS: The 27S lacks IRR, NPV, NFV & NUS too!

*Edited: 25 Aug 2007, 6:25 p.m.*

## **HP-27S Solver**

*Message #6 Posted by **Karl Schneider** on 25 Aug 2007, 6:27 p.m.,  
in response to message #5 by Peter A. Gebhardt*

Hi, Peter --

Quote:

*The solvers on the -17B, 17BII, -18C, 19B, and 19BII do algebraic simplification: this feature was removed from the -27S in order to save space....*

Which (as I must assume, because I don't possess an 27S) means iterative solution search each and every time ...

I have the HP-17B, HP-17BII, and HP-27S. I'm not sure offhand how or whether those models performed symbolic algebraic simplification as the HP-48 series did.

However, I verified that the HP-27S solver does indeed use direct-solution methods. This capability was ported to the HP-33s and HP-35s solvers. I am not entirely pleased with the logic as implemented:

[HP-33s solver direct methods](#)

At the time of that post, I believed that direct solution was a new capability, not one that was borrowed from earlier models.

**friendly advice for Vincze**

Message #1 Posted by [Don Shepherd](#) on 24 Aug 2007, 9:55 a.m.

Vincze, please accept this advice in the interest of making this forum of maximum interest and enjoyment to the most number of people.

I am not the forum police, gosh knows, and I am reluctant to make this post, but frankly the quality of this forum has markedly decreased recently, due in large part to the number and types of posts you are making. This used to be a great place for exchanging information for HP fanatics, but when I see 20 new threads and one person making unnecessary posts to ALL of them, it makes me want to visit here less. It is not necessary to post a response to every thread. If you will notice, no-one else does that. We post when we have something to add or have a legitimate question that we have researched already but need help with. Most of your posts requesting information would not have been necessary had you done your research. Use Google or other search engines, they will answer a large portion of your questions.

Do what most all of us did at first: lurk awhile. Just read what is posted and learn from it. Most posters will go out of their way to help those with legitimate questions; I do too. But we all expect folks to try to find the answer themselves first. Another poster recently told you, when you asked how a program worked, sit down with paper and pencil, list the stack registers X, Y, Z, T, and registers, and step through the program line by line and update the register contents, and see what happens. It is called desk checking, and no-one should be asking questions about how programs work until they have done that critical step.

I think you will find this is a great place to be, and there are people in this forum who are absolutely amazing (I'm not one of them). But we would all be served better if you did not post so many messages each day.

Please accept this advice in the manner I intended, to make this forum even better for all of us.

Don Shepherd

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 24 Aug 2007, 10:58 a.m.,  
in response to message #2 by [Vincze](#)

Vincze, I don't believe that there's any reason for you to leave, but do some research on your own before

asking a question. Things like "Read The Fine Manual", look over the resources right here on the MoHPC site (including, but not limited to, this forum), read through any "Training modules" from HP's site that seem as if they might be relevant, and so on. Use Google to search for an answer, and note that the search can be restricted to this site only. Experiment a bit for yourself. You may well want to invest in the MoHPC DVD set.

Many of us do like to help, but posting an accurate and useful reply sometimes takes considerable thought, sometimes some research, and time, so frequently asked questions, or other questions that it seems that little or no research was done on before asking, might not be appreciated.

Of course, keep it clean; treat this as a forum that you wouldn't mind having children read. Abide by the forum's "Terms of Use".

Regards,  
James

### **Re: friendly advice for Vincze**

Of course, nothing forces me or anyone else to respond to any post. If I feel that a question isn't worth the bother of answering, then I generally just ignore it or else try to point out how or where the answer can be found.

Regards,  
James

### **Re: friendly advice for Vincze**

*Message #5 Posted by **Thomas Radtke** on 24 Aug 2007, 11:07 a.m.,  
in response to message #2 by Vincze*

Your conclusion is certainly not right. I surely speak for most of us when I say we're always glad to have new members and you'll find rarely any RTFM comment on even the most basic on-topic FAQs.

Don has just stated his point about smalltalk and very basic questions that are more or less off-topic here (programming, math). I'd recommend to give his post a second read and stay with the finest people you can find ;-).

### **Don't go!**

*Message #6 Posted by **Maximilian Hohmann** on 24 Aug 2007, 11:57 a.m.,  
in response to message #2 by Vincze*

Hello Vincze,

Quote:

I go now.

please don't! I think your contributions have given a lot of life to this forum recently, that has been very quiet and "dry" for a long time. During the last weeks, it has grown from an average of two postings per day to something like 100, I wish the same would happen to my bank account...

Some of your very basic or low-level questions - naive or not - have made me rethink a lot of things that I took for granted until now. Just yesterday, your question about symbolic differentiation on the programmable calculator made me remember my first encounter with 'Macsyma' in the early 80ies and the incredulous 'ahhhs' and 'oohhs' of me and my fellow students when we were shown its capabilities. How far we have come since then! Last night I played with my Ti Voyage 200 and let it do some real difficult differentiations and integrations (BTW Valentin, if you listen: It can also do matrix square roots :- ) ).

So just keep asking 'silly' questions about things that we need to be reminded of now and then anyway.

Greetings, Max

NB: In the beginning, I thought that you were one of the regular contributors 'in disguise' who posed as the 'stupid Hungarian' just to wake up everybody else. I am still not fully convinced that this is not the case ;-)

*Edited: 24 Aug 2007, 11:59 a.m.*

### **Re: friendly advice for Vincze**

*Message #8 Posted by [Giancarlo \(Italy\)](#) on 24 Aug 2007, 10:28 a.m.,  
in response to message #1 by Don Shepherd*

Why? Why? Why?

Now some "whys" are needed, definitely!

We do we lack that minimum amount of tolerance, sympathy, altruism?

In summary: why do we like so much to hurt ourselves and to spoil the friendly feeling that used to be there in this Forum?

Why?

Vincze, \*OUR\* friend, please revert your decision to leave!

Saddened regards.

Giancarlo

### **Re: friendly advice for Vincze**

*Message #9 Posted by [Bruce Bergman](#) on 24 Aug 2007, 11:18 a.m.,  
in response to message #8 by Giancarlo (Italy)*

G, I think we're still the same friendly forum as always... We welcome new folks and we try to help out almost everyone. New posters arrive all the time, and discussions are good, even when they're bad. ;-)

I've seen a lot of forums (not calc forums, mind you) that are very hostile places to exist, and which tend to be run by a bunch of power-hungry types. I don't see that here. Yes, there is the usual amount of techie ego at work, much to my dismay, but even that isn't as bad as other places on the net. I think we have a nice community here.

I have to agree, however, with some of the comments posted. One learns the ins-and-outs of every community by time spent listening and observing. Little mistakes and breeches of etiquette are common, but should serve as learning moments. Our intrepid newbie has a tendency to respond to almost every post, which can kind of wear some of us out. :-) And as someone else pointed out, hasn't searched through the archives to see if a question was already answered, or if someone else had the same comment, before posting.

I suspect the motivation for this thread was a "hey, here's a friendly tip" type of comment. The kind two adults can share while they are casually talking. No offense intended.

Certainly, no one is suggesting that Vincze leave the forums or anything like that. Some of his stuff is good food for thought and brings up useful discussion. If friendly words are offending in his culture, then there's not much we can do except ask him to reconsider. I would be glad to see Vincze stay and contribute meaningfully, and hopefully he'll take this to heart.

My \$0.02 anyhow.

thanks, bruce

## **Re: friendly advice for Vincze**

*Message #10 Posted by **Massimo Gnerucci (Italy)** on 24 Aug 2007, 11:18 a.m.,  
in response to message #8 by Giancarlo (Italy)*

Giancarlo, my friend ;)

I think that a considerable *amount of tolerance, sympathy, altruism* has been shown in the past weeks and don't see anything detracting from the usual *friendly feeling* in Don's post.

As Don and James have already pointed out some among us think that you should do a little homework before asking for help; their advices sound acceptable to me...

Vincze could have been bitten, and excited, by the *neophyte* bug: finding a place where our interests are shared. I don't think he should leave, of course, just read a little more refraining from replying each and every time... as we all did and many still do.

So please, Vincze, stay with us and enjoy the forum and the many different, funny, interesting people who make it what it is.

Greetings,  
Massimo

Bruce, Massimo, my friends ;-)

of course I don't wanna act as the counsellor of anybody...

I must admit I reacted a bit too quick to Don's post - I apologise with him and with all of you for that. I just felt like some sentences stated something well beyond the helping attitude that is usual in our Forum.

Next time I'll be better off counting up to 100 before replying ;-)

However, I'd like to remark my attitude, that is proner to repeat things already repeated if there's even a possibility to help somebody to understand.

Maybe that was the major bias that drove my reply...

Sorry, and let's look forward :-)

Best regards.  
Giancarlo

### **Re: friendly advice for Vincze**

*Message #14 Posted by [bill platt](#) on 24 Aug 2007, 11:11 a.m.,  
in response to message #1 by Don Shepherd*

I think it is worth noting that some of the threads that V. started that may have seemed un-researched, lead to

very interesting results. Look for example at the derivation on 35s thread. Sure, if Vincze had had a manual, he might have known it to be impossible, but then there would have been no post, and no thread!

### **Re: friendly advice for Vincze**

*Message #15 Posted by **Walter B** on 24 Aug 2007, 11:44 a.m.,  
in response to message #14 by bill platt*

There are companies paying people to ask them dumb questions in regular intervals. The dumb questions shall bring the company to THINK again, also about some seemingly basic stuff everybody thinks (s)he knows by heart.

Of course, the questions must not be too dumb, or these people will be expelled. To assess their questions may need a lot of intelligence and research. Nevertheless, the best effect is reached if they sound really simple. Vincze, I wish you all the best to select the right questions for this forum, based on the necessary homework.

BTW: To ask such questions can become a profession. Those people are called auditors ;-)

### **Re: friendly advice for Vincze**

*Message #16 Posted by **Bruce Bergman** on 24 Aug 2007, 12:32 p.m.,  
in response to message #15 by Walter B*

Honestly, I don't think Vincze's questions were dumb in any way, shape or form. We've almost ALL asked the same questions. The difference is that we all asked them *previously*. :-) No, in fact, his questions are pertinent and useful.

I would not have even followed the derivative discussion, nor would have thought of it, unless someone started the discussion.

So in that regard, the result has been positive.

thanks, bruce

Bruce,

nor do I think Vincze asked stupid questions. However, I learned in this very forum some months ago that our (German?) sign for relativized "sayings" (you get it? Yes, the "!"!) is read as an amplification here by many members. So I had no other way but to trust in the intelligence of the readers ... ;-)

in response to message #1 by Don Shepherd

Given that there is a simpler remedy than trying to stifle a newcomer's enthusiasm - namely ignoring the posts you don't like - I think that this advice is off-base. I recognize that large number of forum members don't agree. I just wanted to register my opinion.

Some of us actually enjoy watching a newbie learn stuff we already know. I find that I often learn something new looking at old information through new eyes.

Regards,  
Howard

### Bits of knowledge... (was: friendly advice for Vincze)

Message #20 Posted by **Massimo Gnerucci (Italy)** on 24 Aug 2007, 1:09 p.m.,  
in response to message #19 by Howard Owen

Quote:

Given that there is a simpler remedy than trying to stifle a newcomer's enthusiasm - namely ignoring the posts you don't like (...)

True, but not so easy, since seldom the subject gets changed at all, and I often find useful bits of knowledge interspersed among unrelated threads... So I read everything gets posted here.  
Given this I do repeat: Vincze, please stay!

Greetings,  
Massimo

### Agree with Don: Vincze should follow his own advice

Message #22 Posted by **allen** on 24 Aug 2007, 8:05 p.m.,  
in response to message #1 by Don Shepherd

None of Vincze questions have been dumb- I have read and learned from the posts and hope they continue. Several days ago in [this](#) thread Vincze said he wanted his son to learn Math *before* learning calculators because:

Quote:

lazines brings struggle

The principle behind Vincze's lesson (with which I agree) is to learn the basics before learning the shortcuts. That takes time and hard work.

I think Don is suggesting that Vincze is more than welcome here, but he should follow his own advice to learn the basics from the manuals before taking shortcuts by posting questions here.

### **Re: friendly advice for Vincze**

*Message #23 Posted by [Will Hartung](#) on 25 Aug 2007, 3:07 a.m.,  
in response to message #1 by Don Shepherd*

I'm just gob smacked.

I was under the impression that folks here actually liked to talk about using these things, rather than just basking in how shiny and scratch free their latest ebay purchase was.

Vincze asked some very good questions, provided some nice content (his aviation stuff for example), and prompted very interesting discussion (The deg/rad discussion with H.MS thrown in is actually quite subtle, IMHO).

This forum gets pretty much zero traffic, at least compared to most every other place I visit. I'm curious how busy it was before the 35s came out, but I wasn't around then.

Things like email and web forums are fine for presenting information, but LOUSY for "communication". It's the lowest bandwidth mechanism we know. Then you throw in a language barrier, and it's just a disaster. People take written text very literally even though more times than most, it's not written that way. A phrase typed in a web forum can be interpreted completely different from the exact same phrase spoken to someone. But most folks "speak" to themselves when they type and think that "speech" gets mixed in with the text. And then they get confused why the other person doesn't "get it" when it's "obvious".

Vincze isn't spamming, he's on topic (best as I can tell, but then, apparently, he's not, is he?), and produces good content.

But I guess he rained on someones parade. Walked in to a room and the murmur just hushes to silence.

I'll take my leave. Now I know where not to go to ask a question regarding these things less I spoil the mood.

I can't abide a quiet room.

Hi, we're not in kindergarten anymore, so we ought to behave like grown ups. If I got the message correctly, there was some request here

**anyone shall ask questions in this forum only after this person has checked all other sources of information at hand.**

So this forum is meant to be the last exit before despair. Regardless of me sharing this opinion or not, can we agree on this as a preliminary rule? Since nothing else seems to help, I propose a poll. Everyone who is in favor of this tentative rule, please vote. Dave will then know whether this was the majority of the community or not.

HTH, Walter

anyone shall ask questions in this forum only after this person has checked all other sources of information at hand.

\_\_\_\_\_

This isn't the point at all!! After resources are provided, It is reasonable to expect those seeking information to do **SOME** effort to find the answer by self-study.. it need not be an exhaustive search, nor a last-ditch effort, nor something regulated by policy.

It is not a common problem anyway in this forum, but I do think it is **very** clear, such as in these threads from PhysicsNerd: (1 ,2 ,3 and especially 4) when someone is making **ABSOLUTELY NO** effort to learn on their own given any reasonable amount of help/encouragement/hand-holding/spoon-feeding.

It is dissappointing, knowing that they have some of the best product manuals available and choose not to use them.

### **A couple of thoughts from the new 35s' bonus video**

Message #1 Posted by [Giancarlo \(Italy\)](#) on 24 Aug 2007, 9:45 a.m.

Hi all.

I have just received my brand new 35s from Samson (all went well after some initial concerns and with some patience on my side :-)

I was just watching the bonus video that comes with the calculator (nothing more than the video we already could download

from HP site some weeks ago, recorded on a DVD) when I noticed a couple of things I'd like to share with you and have your thoughts about:

1 - one of the testimonials is Mark Olsen (Director, Program Management, frog design).

I thought they could have contributed to the design choices of the new calc, so I went to their website

(<http://www.frogdesign.com/>)

but I could not definitely find any reference either to HP as a customer of theirs or to their participation to the celebrating video....

Kinda strange or am I that "conspiracy-biased" ;-) ?

2 - in a brief section of the video, a guy using a 3-D drawing software is showed; he's rotating what seems to be sort of "clamshell" device -

please see these pictures:

[Frame #1](#) [Frame #2](#) [Frame #3](#) [Frame #4](#)

Do you think it's one of those "fake performances" usually made when an institutional video is being shot or is it a clue to anything ?

Thank you in advance for your enduring patience with my "Sherlock Holmes' rants" ;-) and for any feedbacks.

Best regards.

Giancarlo

### **Re: A couple of thoughts from the new 35s' bonus video**

Message #2 Posted by [Walter B](#) on 24 Aug 2007, 10:40 a.m.,

in response to message #1 by [Giancarlo \(Italy\)](#)

Buona sera, Giancarlo,

my answers to your questions are:

1 - I know companies which do not want to be mentioned as a reference on a website. Maybe applies here, too. The bonus video is shipped to customers only (well, not really, because it was published here, but perhaps the marketing guys thought it for a somewhat limited audience?).

2 - Probability is almost 100% that's a dummy model.

HTH

**Re: A couple of thoughts from the new 35s' bonus video**

Message #3 Posted by [Dave Hicks](#) on 24 Aug 2007, 11:40 a.m.,  
in response to message #1 by [Giancarlo \(Italy\)](#)

#1 Frog lists HP on their clients page. That page isn't complete though. I can think of two companies they've worked for that aren't listed there.

#2 I made a similar comment before they filmed it and based on their reactions, I couldn't tell whether they were thinking "Uh oh!" or "Hah! They're all going to be fooled!" ;-)

**Re: A couple of thoughts from the new 35s' bonus video**

Message #4 Posted by [Giancarlo \(Italy\)](#) on 24 Aug 2007, 11:55 a.m.,  
in response to message #3 by [Dave Hicks](#)

Hi Dave.

Quote:

\_\_\_\_\_  
#1 Frog lists HP on their clients page  
\_\_\_\_\_

You're right, and even twice:

HP Strategic Design Relationship (Consumer Software category)  
HP Halo Video Conferencing User Interface (Communications category)

Do anyone of those two refers to the HP video? Thanks for pointing that out.

Best regards.

Giancarlo

### 71B case question

Message #1 Posted by [Vincze](#) on 24 Aug 2007, 8:52 a.m.

The 71B that I purchased is on its way but it is minus a case for it. Will 48gx soft case fit it? I am not sure of true size of 71B, so if you are familiar with 71B and 48gx please let me know (or of any other case that may fit it).

### Re: 71B case question

Message #2 Posted by [Dave Johnson](#) on 24 Aug 2007, 9:33 a.m.,  
in response to message #1 by Vincze

No, the 71B had its own case, a large version of the style used in the Woodstock series

### Re: 71B case question

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 24 Aug 2007, 11:27 a.m.,  
in response to message #1 by Vincze

Note that <http://www.hpmuseum.org/hp71.htm> lists the 71B dimensions as 7.8" x 3.9" x 1", and <http://www.hpmuseum.org/dim48.htm> lists the 48 series dimensions as 7.1" x 3.2" x 1.1", so it seems that a 48 series case would be too narrow for a 71B.

For at least the current models, the dimensions can be found on HP's own site.

If you can find a model with all dimensions the same or slightly larger than the 71B's, then its case ought to work.

### Re: 71B case question

Message #4 Posted by [Maximilian Hohmann](#) on 24 Aug 2007, 12:42 p.m.,  
in response to message #3 by James M. Prange (Michigan)

Hello!

Quote:

\_\_\_\_\_

If you can find a model with all dimensions the same or slightly larger than the 71B's, then its case ought to work.

\_\_\_\_\_

I don't think that there is an hp calcaultor that resembles the 71B in size even closely... The unusually sized 19C is still smaller (and harder to find than the 71 anyway), even the 200 LX is smaller!, and the 75 and 91/92/97 are much larger.

The only calculator that I can think about now that is about the size of the 71 is the Psion Series V palmtop. There are quite a few third-party pouches for Psions to chose from, but I would try it first in the shop.

Greetings, Max

BTW: I have the same problem with my 75C - no case and a very, very unusual size!

I am surprised Coburlin did not see it first

**Re: I don't believe. :-)**

*Message #11 Posted by [Bruce Bergman](#) on 24 Aug 2007, 12:39 p.m.,  
in response to message #10 by Thor Lansen*

I was thinking the same thing. I saw an auction he had last week for a ridiculous amount for one calc. It was shocking.

You know, what amazes me most about his auctions is not that he's bold, or that he privately contacts sellers to consummate a deal before anyone else can get it (low balling it in the process). What bugs me about his auctions is that he jacks up the selling prices **SO HIGH** that they are almost, literally, unbelievable.

He probably reasons (maybe even rightly so) that if he waits long enough, some poor shmuck will come by and pay it, but that's really preying on those who don't know any better. It's what scam artists do to other people, but I don't know that we could quite classify him as a scam artist just yet. He's CLOSE, though. :-)

thanks, bruce

**Re: I don't believe. :-)**

*Message #12 Posted by [Bruce Bergman](#) on 24 Aug 2007, 12:41 p.m.,  
in response to message #10 by Thor Lansen*

Ethical debate:

If this exact item was up originally, under the same conditions, would a "Couburlin" buyer let the seller out of the transaction once the seller realized their mistake? Or would a "Couburlin" buyer take advantage of the situation and make the seller complete it under the terms specified?

thanks, bruce

**Re: I don't believe. :-)**

*Message #13 Posted by [Robissimo](#) on 24 Aug 2007, 12:44 p.m.,  
in response to message #12 by Bruce Bergman*

By definition a "couburlin" buyer would take advantage of the situation and hold the seller to the terms of the auction!

**Re: I don't believe. :-)**

*Message #14 Posted by [Howard Owen](#) on 24 Aug 2007, 1:07 p.m.,  
in response to message #13 by Robissimo*

Good on you for not acting like that, Robissimo, though I know it must have been painful!

Regards,  
Howard

**Re: I don't believe. :-)**

*Message #15 Posted by [Howard Owen](#) on 24 Aug 2007, 1:05 p.m.,  
in response to message #12 by Bruce Bergman*

Practically, the seller could return the funds and refuse to sell. Negative feedback could be appealed to eBay with a fair chance of being reversed. Even if it stood, an explanation of the circumstances in reply would likely satisfy anyone looking at the feedback later.

Regards,  
Howard

**Re: I don't believe. :-)**

*Message #16 Posted by **Wayne Brown** on 24 Aug 2007, 10:15 p.m.,  
in response to message #15 by Howard Owen*

Regardless of how it might have turned out, I think it was very gentlemanly of Robissimo to accede to the seller's wishes gracefully.

**HP 42s resurrection—so simple!**

Message #1 Posted by [John Dagis](#) on 23 Aug 2007, 9:46 p.m.

My 42s had two keys die recently—the number 2 key and the exit key. I had to remove the batteries and short out the terminals to get it going, but the two dead keys still didn't work. I also lost all the data I'd programmed in when I shorted out the terminals.

After numerous attempts to revive my old faithful of fifteen years, I sent an email to fixthatcalc to see if it could be repaired. They replied that it couldn't be fixed because of the keys not operating.

I bought the latest HP50G calculator to replace it, but was not impressed with the extra keystrokes I had to do for simple operations, compared to the 42s. I really wanted my old 42s back, so bought a HP17BII (pioneer body) on ebay, to swap the keypad mechanisms over.

While waiting for the 17BII to arrive, I bought a spray can of solvent based cleaner/lubricant for switches, and sprayed in the gap around the faulty keys of the 42s, and voila!! it started up straight away, passed the self test and is still operating nicely today. If I had have known this, I wouldn't have shorted out the terminals and lost all my data.

Hopefully some of you who have faulty 42s calcs can revive them by this method—I'm still grinning, and quite happy to spray some more lubricant in if it stops again.

john dagis Australia

**Re: HP 42s resurrection—so simple!**

Message #2 Posted by [Dave Colver](#) on 24 Aug 2007, 7:10 a.m.,  
in response to message #1 by John Dagis

I used isopropanol alcohol (probably similar to your switch cleaner) on an unreliable ON key on a 41C a little wiggling of the button and it worked.

I suspect this wouldnt work for keyboards with a plastic sheet under the keys though.

Well done! :)

My friend Giancarlo, you say 50G emulator. Where does one find link for this as I would like to see how it work.

**Re: Did it...**

*Message #6 Posted by [James M. Prange \(Michigan\)](#) on 24 Aug 2007, 9:04 a.m.,  
in response to message #5 by Vincze*

Hi Vincze,

I'm not Giancarlo, but emulators for, if I recall correctly, the 48G, 49G, 48gII, 49g+, and 50g are included with Debug4x. Well, properly speaking, perhaps only one emulator, but with ROMs and .KML files (which define the keyboard and appearance) for all of them.

A limitation for the emulators for the 48gII, 49g+, and 50g is that it's the hardware Saturn processor that's emulated, not the underlying ARM processor, so they can't use the new assembly language instructions, or invoke any ARM processor operations. But as long as you stick to UserRPL, SysRPL, or legacy hardware Saturn code, they should give you a good idea of how the actual calculators work.

See <http://www.debug4x.com/>.

Regards,  
James

Thank you my friend!

**Re: Did it...**

*Message #8 Posted by [Giancarlo \(Italy\)](#) on 24 Aug 2007, 9:50 a.m.,  
in response to message #6 by James M. Prange (Michigan)*

Hi Vincze.

In addition to what James already suggested, you may want to try these Educalc resources:

[HP All-in-1 Graphing Calculator Emulator: HP 38G, HP 48G and HP 39G, HP 49G, HP 50G](#)

[HP 3-in-1 Graphing Calculator Emulator: HP 39GS, HP 40gs and HP 50G](#)

Hope this helps.  
Best regards.  
Giancarlo

**50g keyboard oddity**

Message #1 Posted by [joan cardenas](#) on 23 Aug 2007, 5:35 p.m.

Hello,

Probably is a well known behaviour but i've notice a couple of things about the "improved" 50g's keyboard:

1. Very easy to slowly depress a key and miss the register. 2. While the key is down, if you keep pressing it you get multiple registers.

Saddly enough I've been testing this in all the rest Hp's and any of them behaves in that way. Even that blue thing can do it better, and the bloody 33s much better!

Probably is a boring question..but any theories ?

NaCIU2.

**Re: 50g keyboard oddity**

Message #2 Posted by [Bruce Bergman](#) on 23 Aug 2007, 5:45 p.m.,  
in response to message #1 by joan cardenas

I don't have my HP-50g here at work to try it out, but I don't ever remember having this problem. The default KEYTIME value is pretty high, and I've always set it lower (about 2000), so that might help.

Honestly, sounds like maybe you just got a bad unit.

I'll try mine when I get home tonight.

thanks, bruce

**Re: 50g keyboard oddity**

Message #3 Posted by [Tim Wessman](#) on 23 Aug 2007, 9:43 p.m.,  
in response to message #2 by Bruce Bergman

2000? That is very high. If i remember right the default is like 1260 or something.

I have hundred of people using my surveying device which sets it to 360 (convenient built in sysRPL number) and nobody's ever complained.

TW

**Re: 50g keyboard oddity**

Message #4 Posted by [Bruce Bergman](#) on 23 Aug 2007, 9:54 p.m.,  
in response to message #3 by Tim Wessman

Hey Tim --

Yeah, I think you're right. It sounded right when I didn't have it at hand, but I could be wrong. I'll check in a bit.

thanks, bruce

**Re: 50g keyboard oddity**

*Message #5 Posted by [dbatiz](#) on 23 Aug 2007, 6:38 p.m.,  
in response to message #1 by joan cardenas*

You are absolutely right. Mine does the same. And my backspace key feels dull and needs a little extra push.

If I have it sitting flat on a desk, I get reliable results. If I'm holding it in my hand, I need to be mindful and check my entries often,

Very respectfully,

David

**Re: 50g keyboard oddity**

*Message #6 Posted by [papaknush](#) on 23 Aug 2007, 7:03 p.m.,  
in response to message #5 by dbatiz*

I have my keytime set at 500 and haven't had a problem in using the 50g normally.

**Re: 50g keyboard oddity**

*Message #7 Posted by [Jeff Kearns](#) on 23 Aug 2007, 9:10 p.m.,  
in response to message #1 by joan cardenas*

What is your current KEYTIME? Try setting it to 512 TICKS or 1/16th of a second and see if you still have the problem. If you need help for KEYTIME, let us know.

**Re: 50g keyboard oddity**

*Message #8 Posted by [Bruce Bergman](#) on 23 Aug 2007, 10:15 p.m.,  
in response to message #1 by joan cardenas*

Okay, my KEYTIME is 400. Shows you what I remember. ;-)

Interestingly enough, I don't see the problems you mentioned. If I go as slow as I can, I still get the key pressed. Granted, in a couple of the cases, it seemed like there was a bit of a delay, but it showed up nonetheless. I tried number keys and function keys.

Which key(s) did you get this behavior on? And exactly how slow WERE you pushing it? ;-)

Also, I didn't get the multiple keypress problem either...

thanks, bruce

**Re: 50g keyboard oddity**

*Message #9 Posted by [joan cardenas](#) on 24 Aug 2007, 4:16 a.m.,*

*in response to message #8 by Bruce Bergman*

My Keytime is 250, but I think this has nothing to do with the problem. When I say I can get multiple registers I mean that leaving the key down and pressing it harder and without releasing it pressing harder again you can get the many registers you want. That doesn't happen in any other hp's I've test.

And what I want to mean when I say slow is when trying to feel when the dome is down very carefully, apparently in some cases the dome or something else need an extra pressure to reach the "contact", you know what I mean.

I've been using the unit for a while and in normal use the keyboard is reliable and it doesn't miss any keystroke, but I find the mentioned behaviour a bit odd.

Best regards.

### Derivative on 35s

Message #1 Posted by [Vincze](#) on 23 Aug 2007, 2:16 p.m.

I know on HP 48gx, it fairly easy to find derivative of an equation where the slope equal 0 and determine if it the low point of curve or high point of curve. I know how to do manually, with chain rule, set to zero and solve, but is there easy way to have 35s do this?

### Re: Derivative on 35s

Message #2 Posted by [Peter Niessen](#) on 23 Aug 2007, 2:56 p.m.,  
in response to message #1 by Vincze

Doesn't the SOLVE set a flag when it hits a minimum/maximum instead of a root?

### Re: Derivative on 35s

Message #3 Posted by [Vincze](#) on 23 Aug 2007, 3:11 p.m.,  
in response to message #2 by Peter Niessen

I don't know. Are you saying, let it iterate until it hit zero?

### Re: Derivative on 35s

Message #4 Posted by [Peter Niessen](#) on 23 Aug 2007, 5:23 p.m.,  
in response to message #2 by Peter Niessen

Try solving for the root of, e.g.  $(x-2)^2+1$ :

```
LBL F
RCL X
2
-
x^2
1+
RTN
```

then

```
FN=F
SOLVE X
```

will give you "NO ROOT FOUND", but a 2 in the display.

Of course, as soon as your function has a root, this method will not work.

You probably could do (limited) symbolic derivatives using RPN, using the indirect array, since differentiating in RPN is easier than in ALG:

e.g.  $x^2$

```
X x^2
```

can be diff'd by replacing  $x^2$  by  $2 *$ .

Addition and subtraction just stays the same (+ and -).

Product rule is a bit more advanced: You have to replace

$X Y *$

by

$X Y' * X' Y * +$

and have to evaluate  $X'$ ,  $Y'$  by recursion.

All what's left is to find a suitable representation of the symbols as numbers in the indirect registers, but that's a triviality :-)

Cheers, Peter.

*Edited: 23 Aug 2007, 5:24 p.m.*

### Re: Derivative on 35s

Message #5 Posted by [Gene Wright](#) on 23 Aug 2007, 3:15 p.m.,  
in response to message #1 by Vincze

Yes, but unfortunately, you have to put the derivative formula in the solver and solve for zero. :-)

### Re: Derivative on 35s

Message #6 Posted by [Vincze](#) on 23 Aug 2007, 3:40 p.m.,  
in response to message #5 by Gene Wright

So if  $dy/dx = 3x^3 + 4.2x^2 - 15$ , find  $9x^2 + 8.4x$  and then set to 0 or  $9x^2 + 8.4x = 0$ , and just enter that in solver? That easy enough...duh :) Been long week I guess.

What if you had a complex equation that not as simple as one above though, is there easy way to differentiate it and solve? Something like:

$$dy/dx = (\sqrt{(43x^3/52x+5)} * 654.2^2 - 54/458) / \sqrt{(675^2+98)}$$

### Re: Derivative on 35s

Message #7 Posted by [Gene Wright](#) on 23 Aug 2007, 3:54 p.m.,  
in response to message #6 by Vincze

If you can express the derivative as an equation on the 35s, then you can solve for a zero.

### Re: Derivative on 35s

Message #8 Posted by [Vincze](#) on 23 Aug 2007, 4:26 p.m.,  
in response to message #7 by Gene Wright

No, I think you nem understand what I asking. Let me think about how to explain this better.

Only reason that we set to zero, is to find out if it minimum point or maximum point on curve. We must find 1st derivative first. Solving for zero is very easy, and I understand, but sometime finding first derivative is not so easy. Is there way that 35s can do that? Such as if I type in  $3x^3+4.2x^2 - 15$  it find  $9x^2+8.4x$  is first derivative. Or if I type in  $(\sqrt{43x^3/52x+5}) * 654.2^2 - 54/458 / \sqrt{675^2+98}$  it tell me what 1st derivative is. It should return a formula, not a value. I guess I asking if it can differentiate.

### Re: Derivative on 35s

Message #9 Posted by [Gene Wright](#) on 23 Aug 2007, 4:28 p.m.,  
in response to message #8 by Vincze

It cannot symbolically differentiate like you suggest. The graphing models with a CAS can, but not the 35s.

### Re: Derivative on 35s

Message #10 Posted by [Vincze](#) on 23 Aug 2007, 4:37 p.m.,  
in response to message #9 by Gene Wright

That not answer I was wish for my friend. :( Well, I have 48gx that can do it I guess, but I rather leave that calculator at home. I wonder how hard it would be to write program to differentiate? It would have to ask for variable you wish to differentiate. Hmmm, I must think about. I have feeling though it would not be easy to symbolically manipulate equation.

I wonder if our friend Valentin could do? He probably say I eat too much paprika and it going to my head and rusting brain cells.

### Re: Derivative on 35s

Message #11 Posted by [Dave Shaffer \(Arizona\)](#) on 23 Aug 2007, 4:41 p.m.,  
in response to message #10 by Vincze

You can always calculate the derivative numerically:

evaluate  $[f(x+dx) - f(x)]/dx$

You may have to play with the size of dx, and there may be unstable regions, of course - just as we learned in Calc I .

### Re: Derivative on 35s

Message #12 Posted by [Vincze](#) on 23 Aug 2007, 4:51 p.m.,  
in response to message #11 by Dave Shaffer (Arizona)

Yes, but how would you do that on the 35s? I do not have my manual with me (Gene, when we going to have PDF of manual?) Honestly though, I prefer symbolic result as it show me more.

### Re: Derivative on 35s

Message #13 Posted by [Stefan Vorkoetter](#) on 23 Aug 2007, 5:18 p.m.,  
in response to message #12 by Vincze

Quote:

---

Yes, but how would you do that on the 35s? I do not have my manual with me (Gene, when we going to have PDF of manual?) Honestly though, I prefer symbolic result as it show me more.

Then the HP 35s isn't the calculator you want. The 35s is purely numeric.

Stefan

## Re: Derivative on 35s

Message #14 Posted by [Stefan Vorkoetter](#) on 23 Aug 2007, 5:16 p.m.,  
in response to message #11 by [Dave Shaffer](#) (Arizona)

You can use this in conjunction with the solver then, solving a program instead of an equation. For example, to find the minimum/maximum of  $3*x^2+2*x+1$ .

```
F001 LBL F
F002 EQN 3*X^2+2*X+1
F003 RTN
```

```
D001 LBL D
D002 RCL D
D003 STO+ X
D004 XEQ F001
D005 x<>y
D006 STO- X
D007 x<>y
D008 XEQ F
D009 -
D010 RCL/ D
D011 RTN
```

Program F implements the function you want to find the minimum/maximum of.

Program D computes  $F'(x)$  using the approximation  $(F(x+dx)-F(x))/dx$ , where you pre-specify  $dx$  in register D.

Now use SOLVE:

```
FN= D
0.001
STO D
SOLVE X
```

This yields  $X=-0.3338$ .

You can now easily determine  $F(X)$  by just pressing:

```
XEQ F
```

Which yields  $F(X)$  is 0.6667.

Checking this symbolically, the derivative is  $6x + 2$ , which is 0 for  $x=-1/3$ .

The difference in the answer is due to the approximation to the derivative. Using a smaller value in D will result in a more precise answer.

Stefan

## Re: Derivative on 35s

Message #15 Posted by **Dave Shaffer (Arizona)** on 23 Aug 2007, 6:25 p.m.,  
in response to message #14 by Stefan Vorkoetter

Very slick. Thanks for implementing my suggestion!

### Re: Derivative on 35s

Message #16 Posted by **Vincze** on 24 Aug 2007, 8:30 a.m.,  
in response to message #14 by Stefan Vorkoetter

That work to show you values, but in business you need to see the curve (or understand it). This used many time to solve for profit maximization of cost minimization curve. Your example yes tell me where point is (0.3338), and it also tell me that it is cost minimization curve from value 0.6667 which positive which mean that curve is increasing after zero.

I guess that could work if you need value. Okay, I was just hoping it could show symbolically some how too.

What I don't understand though is your formula. Any you can explain steps in D program.

### Re: Derivative on 35s

Message #17 Posted by **Peter Niessen** on 24 Aug 2007, 9:18 a.m.,  
in response to message #16 by Vincze

Hi Vincze,

in the good old days, one would take a piece of paper, write down the registers

```
T
-----
Z
-----
Y
-----
X
-----
```

and the variables

```
D
-----
X
```

and fill in the values they assume after each program step. I hope you will find this instructive. Best of all, you can do it yourself immediately and don't have to wait for a reply from some forum.

Cheers, Peter.

*Edited: 24 Aug 2007, 9:18 a.m.*

### Re: Derivative on 35s

Message #18 Posted by **Vincze** on 24 Aug 2007, 9:45 a.m.,  
in response to message #17 by Peter Niessen

That very good tip, thank you my friend. I have question about two steps though. What is difference between D004 and D008? Do they not do same thing? If I understand correctly, after you hit SOLVE X, it go to line D001, which run through D program and call F program on line D004 and line D008?

*Edited: 24 Aug 2007, 9:47 a.m.*

### Re: Derivative on 35s

*Message #19 Posted by [Howard Owen](#) on 24 Aug 2007, 1:47 p.m., in response to message #18 by Vincze*

If you key that into an HP35s, the D008 line will become 'XEQ F001' so yes, they are identical.

Regards,  
Howard

### Re: Derivative on 35s

*Message #20 Posted by [Stefan Vorkoetter](#) on 24 Aug 2007, 9:35 a.m., in response to message #16 by Vincze*

The fact that  $F(x) > 0$  where  $F'(x) = 0$  doesn't mean that  $F(x)$  is increasing after zero.

Consider the curve,  $G(x) = -3x^2 - 2x + 1$ .  $G'(x) = 0$  at  $x = -1/3$ ,  $G(-1/3) = 4/3$ . Here too  $G(x) > 0$  where  $G'(x) = 0$ , yet  $G(x)$  decreases to either side of this point.

As far as the D program goes, here it is with comments:

```
D001 LBL D
D002 RCL D
D003 STO+ X                // add value of D to value in X
D004 XEQ F001             // compute F(x+D)
D005 x<>y                 // bring D back into the x stack
register
D006 STO- X              // subtract from value in X to restore x
D007 x<>y                 // bring F(x+D) back into x stack
register
D008 XEQ F               // compute F(x)
D009 -                   // compute F(x+D) - F(x)
D010 RCL/ D              // compute (F(x+D) - F(x)) / D
D011 RTN
```

This could probably be made shorter, but I didn't want to make it too unclear.

Stefan

### Re: Derivative on 35s

*Message #21 Posted by [Vincze](#) on 24 Aug 2007, 9:52 a.m., in response to message #20 by Stefan Vorkoetter*

Thank you my friend, this very interesting. I find it fascinating how effortlessly you conceptualize what calculator need to do and how calculator work. I still struggle with that.

Quote:

---

The fact that  $F(x) > 0$  where  $F'(x) = 0$  doesn't mean that  $F(x)$  is increasing after zero.

---

I beg to differ my friend. When you set to zero and solve if you get positive, it mean you find minimum point on curve, and if you find negative, it mean maximum point on curve. At least that how we learn in Hungary, but result is still the same

In your examples if you plot out you will see. In first example, we get positive result when we solve for  $x$  when set to zero and the plot show curve going up after point where  $x=0$ . In second example, when we set to zero and solve for  $x$ , we get negative number. When we plot, you see that curve going down after point where  $x=0$ .

Regardless of this minor error in analyzing result, your program is very good and I kindly thank you!

*Edited: 24 Aug 2007, 10:04 a.m.*

### Re: Derivative on 35s

*Message #22 Posted by [Alain Mellan](#) on 24 Aug 2007, 10:06 a.m., in response to message #21 by Vincze*

As a good exercise: modify the program above to compute  $(F(x+d)-F(x-d))/2d$

Numerical Recipes says it has better accuracy than  $(F(x+d)-F(x))/d$

*Edited: 24 Aug 2007, 10:06 a.m.*

### Re: Derivative on 35s

*Message #23 Posted by [Stefan Vorkoetter](#) on 24 Aug 2007, 10:54 a.m., in response to message #22 by Alain Mellan*

Tried that, and you're right, it works better. Intuitively this makes sense, because you're estimating the derivative based on two points on either side of  $x$ , instead of  $x$  and a point further along.

I had to add a fair bit of extra code to D to make it work though. Unfortunately, the routine one passes to SOLVE isn't allowed to mess up the value of the register one is solving for, hence there's code that has to put it back the way it was. The revised D program is:

```
LBL D
RCL D
STO+ X
XEQ F           // compute F(x+D)
X<>Y
ENTER          // compute 2D
+
STO- X
X<>Y
```

```

XEQ F      // compute F(x-D)
-
x<>y      // setup to divide by 2D
+
RCL D      // restore X to original x value
STO+ X
x<>y      // leave (F(x+D)-F(x-D))/2D on stack
RTN

```

Stefan

**UNDOing Program deletion**

Message #1 Posted by [Chuck](#) on 23 Aug 2007, 1:29 p.m.

I perused the manual but I don't think it specifically says this (although it may be in there somewhere). Experimenting with the UNDO key, I discovered that if you CLEAR a program label in MEM (ie. delete a program) the UNDO key will retrieve the program. The manual states it can UNDO a line of program, register, equation, or cleared value, but not specifically an entire program. FYI.

Chuck

**Re: UNDOing Program deletion**

Message #2 Posted by [Bruce Bergman](#) on 23 Aug 2007, 1:34 p.m.,  
in response to message #1 by Chuck

Whoa! If that's true, that's a big plus! Great find.

thanks, bruce

**Re: UNDOing Program deletion**

Message #3 Posted by [Stefan Vorkoetter](#) on 23 Aug 2007, 1:50 p.m.,  
in response to message #2 by Bruce Bergman

Seems to be true! Note that it can only do this if you haven't yet left the program list, and haven't deleted another program. I suspect that the program isn't actually deleted until you perform one of these other actions, and hence it's easy to undo.

Good feature!

I wonder if there's a way to UNDO the lack of R->P and P->R keys? :-)

Stefan

**Re: UNDOing Program deletion**

Message #4 Posted by [Vincze](#) on 23 Aug 2007, 2:18 p.m.,  
in response to message #3 by Stefan Vorkoetter

Now that would be nice trick. ;)

**Re: UNDOing Program deletion**

Message #5 Posted by [Katie Wasserman](#) on 24 Aug 2007, 11:01 a.m.,  
in response to message #1 by Chuck

You can UNDO \*anything\* immediately after a CLEAR. Even an UNDO after a CLEAR ALL works. All

programs, memories, equations the stack and the program pointer come back! The only thing that you can do between a CLEAR and a successful UNDO is turn off the calculator and turn it back on, anything else will void the UNDO.

## **Re: UNDOing Program deletion**

*Message #6 Posted by **Bruce Bergman** on 24 Aug 2007, 11:27 a.m.,  
in response to message #5 by Katie Wasserman*

Interesting. A virtual delete followed by a commit later, huh? ;-)

Thanks for experimenting and finding the limit, Katie. I have to say, this would seem to be a key feature that HP should highlight better in the manual. Maybe there's a resistance to become "liable" for mistakes, but wow, being able to UNDO a CLEAR ALL is a hugely important feature that shouldn't be glossed over.

Reason: I tend to memorize a lot of the 33s/35s style of choice menus such that I just hit the appropriate number key instead of navigating to the item and hitting ENTER. Let's say I'm not at the top of my game today, and I go to the CLEAR menu, planning on clearing all the stats registers, but then find that I've hit 2 instead of 4 -- clearing the variables instead of stats. It is a great feature to know that I can do an UNDO and get them back!

thanks, bruce

**variable question**

Message #1 Posted by [Vincze](#) on 23 Aug 2007, 8:48 a.m.

In recent Datafile, Joe Horn state that program run quicker on 35s if you store the number in a variable that if you just have it in the program. Anyone understand why? I would think it would be the other way around as you do not need to recall something.

**Re: variable question**

Message #2 Posted by [Dave Johnson](#) on 23 Aug 2007, 1:19 p.m.,  
in response to message #1 by Vincze

There is overhead associated with keystroke programming each digit is handled and processed into a storage register to come up with the final number. Recalling a number can be less overhead (may be equivalent if the # of digits input is low but is not for larger number of digits.

### Question about the hp35s

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 23 Aug 2007, 8:27 a.m.

Sorry about asking this question, but my excuses are: HP has for some reason choose not to put out pdf of manual, Norway not getting any hp-35s soon, I am curious!:

One feature (aside from the BIG ENTER KEY) that makes the machine interesting for my purposes are the 2D and 3D vector types. Working with computer graphics I could make use of this feature I hope (do a lot of checking result from vector calculations while debugging).

Question: What are the operations for addressing, unpacking (say into x,y,z) vector's components?

Kind of asking I guess: 'How practical are these types': They seems handy for input/presentation, but how are them to program linear algebra with.?

Grateful for any info to one who is counting on his fingers to just order the thing from abroad :-)

*Edited: 23 Aug 2007, 8:28 a.m.*

### Re: Question about the hp35s

Message #2 Posted by [Valentin Albillo](#) on 23 Aug 2007, 8:35 a.m.,  
in response to message #1 by [Arne Halvorsen \(Norway\)](#)

Hi, Arne:

Arne asked:

*"Question: What are the operations for addressing, unpacking (say into x,y,z) vector's components?"*

None. There's no built-in operation to disassemble a vector into its 1,2, or 3 components nor to extract a component from a vector. You need some programming to do it and it's quite an slow and cumbersome procedure.

*'How practical are these types': They seems handy for input/presentation, but how are them to program linear algebra with.?.*

I would need to work with them a lot more to be able to give a qualified answer but judging from what I've seen up to now, they seem to be greatly unpractical for most uses, including linear algebra. There are very few instructions that work with them, mostly basic arithmetic, and accessing their components is quite tricky and involved, as mentioned above.

Also, it's been mentioned that they might be somewhat buggy.

Best regards from V.

**Re: Question about the hp35s**

Message #3 Posted by [Arne Halvorsen \(Norway\)](#) on 23 Aug 2007, 8:47 a.m.,  
in response to message #2 by Valentin Albillo

Thanks a lot!

Had a feeling this could be the case...

What it sounds like is that a program that would work on a problem would access vector components stored as individual values in normal registers.

At least the results can be presented in vector form since it is easy to make a vector(s) (training stuff shows that) after computations.

**Re: Question about the hp35s**

Message #4 Posted by [Valentin Albillo](#) on 23 Aug 2007, 9:04 a.m.,  
in response to message #3 by Arne Halvorsen (Norway)

Hi again, Arne:

Arne posted:

*"What it sounds like is that a program that would work on a problem would access vector components stored as individual values in normal registers."*

For maximum speed, that's the way to go indeed until someone comes up with a SYSEVAL call or some hidden function to extract the individual components.

"Maximum speed" here means up to 100 times faster than resorting to some packing/unpacking program to get at the components.

Best regards from V.

**Re: Question about the hp35s**

Message #5 Posted by [Arne Halvorsen \(Norway\)](#) on 23 Aug 2007, 9:14 a.m.,  
in response to message #4 by Valentin Albillo

Well, the good thing about this is that I got pretty much enough information to design and simulate my programs before get the machine...

**Re: Question about the hp35s**

Message #6 Posted by [bill platt](#) on 23 Aug 2007, 9:17 a.m.,  
in response to message #2 by Valentin Albillo

I think the tried and true for vectors is the 48 series and its descendants--the 50G.

**Re: Question about the hp35s**

Message #7 Posted by [Chris Dean](#) on 23 Aug 2007, 11:51 a.m.,  
in response to message #6 by bill platt

Arne

From my experience if you are working in graphics then get a graphical calculator i.e. HP50G. It is so much easier to develop algorithms and see/visualise the results.

### **Re: Question about the hp35s**

*Message #8 Posted by [Arne Halvorsen \(Norway\)](#) on 23 Aug 2007, 12:17 p.m.,  
in response to message #7 by Chris Dean*

Yea, well... I must say it has crossed my mind after been thinking about getting hp35s...

I had original NOT been planning to take up my youthfull passion for programming calculators (HP41CV, rip wherever you are now...), what I been missing (but I borrow a hp15c a lot) is a simple rpn to add, sqrt to check program output.

A thing I am worried about by getting something as powerfull as the 50g is that I may be absorbed by it..., propably enjoy every second of it though...

Maybe....

### Bugs- Bugs and Bugs!!

Message #1 Posted by [Diehl-Peshkur](#) on 23 Aug 2007, 6:48 a.m.

I've read the list of bugs in the 35s posted and discussed at length here; of course, one would expect a new HP to be free of bugs. But, I can't get really upset about it as nearly every complicated product will have them. I also suspect that the known bugs are not going to result in airplane crashes or world incidents either - only irritation perhaps :-)

But was DOES interest me, is how the 35s compares to its bretheren. I have never even owned a TI or Casio, after having been bitten by the RPN bug in the '80's and haven't a clue as to whether the 35s scores better or worse than the others.

So, do any of you have bug lists of other brands so that we can compared them to our beloved 35s in the meantime?

I think that would make quite interesting reading, either positive or negative!! All the best! T

### Re: Bugs- Bugs and Bugs!!

Message #2 Posted by [bill platt](#) on 23 Aug 2007, 7:40 a.m.,  
in response to message #1 by [Diehl-Peshkur](#)

Quote:

\_\_\_\_\_

of course, one would expect a new HP to be free of bugs

\_\_\_\_\_

Really? And why would one expect that?

How about the original HP-35 trig and exponential bugs? And the HP 32sii fraction bugs? Early HP-41C small-angle SIN bug, out of range indirection bug, CLP bug, and a host of others in the early 41C...67/97 ARCSIN & ARCCOS erroneous results for specific arguments, HP-75C file renaming lockup bug and other bugs.

Even the 42S (in early ones and in later ones but not middle of production) had a bug--Comb or Perm with backwards arguments that you then SWAP to correct order will not work.

If you started life on a HP-15c where there were no bugs, you can have hi expectations. But even the 11C had a bug--the "backspace over decimal and increment by one" bug!

So what was that about expectations?

### Re: Bugs- Bugs and Bugs!!

Message #3 Posted by [Valentin Albillo](#) on 23 Aug 2007, 8:13 a.m.,  
in response to message #2 by [bill platt](#)

Hi, Bill:

Bill wrote:

*"If you started life on a HP-15c where there were no bugs, you can have hi expectations. But even the 11C had a bug--the "backspace over decimal and increment by one" bug!"*

Actually, the HP-15C has at least \*one\* bug, which was discovered and posted in this forum a few months ago.

And the HP-71B, which is a most marvelous handheld model if there ever was one, had a bug list *several pages long* for its 1BBBB released version, and not precisely trivial ones. Even the 1CCCC release had to be quickly updated when a very serious, memory-corrupting bug was introduced *anew* which didn't exist in the previous 1BBBB model.

Best regards from V.

### HP-35s photo gallery

Message #1 Posted by [Mike Mander](#) on 23 Aug 2007, 2:51 a.m.

Hi all,

Just received my 35s here in Vancouver, Canada. Before getting the new machine all grungy (it is destined to be my day-to-day work calc), I thought I should take a few photos of it. Unfortunately I don't have my SLR (sold it in anticipation of a new Canon model coming in early September) but I managed some halfway decent shots with my point & shoot Canon Pro1.

#### [New HP-35s Gallery](#)

I will say that the 35s looks far more handsome in person that it did to me on the photos I had seen previously. I very much like the styling and am not too bothered by the cursor keys. I won't bother adding too much since this calculator has been reviewed "to death" already, however there are a couple of things I would like to mention...

- 1) No comma separators when keying in a number! Argh... one of the best features of the older "pure" RPN calculators and something I have always missed on my 49g+ and 50g. Now that's also missing from the 35s. Too bad...
- 2) No question, a vastly superior LCD when compared to my first-generation 33s. Better contrast and much more visible off-axis, as well as having comma separators that are clearly distinct from the decimal point. Compressed font is not as esthetically pleasing as the almost square-pixel one on the 33s, but it is readable so I can't/shouldn't really complain!
- 3) Excellent keyboard but I had an off-kilter 5 key. I grabbed and twisted it a little and now it is almost flat and level with the others. Love the big ENTER key of course!
- 4) Surprised to see that R/S doesn't interrupt a loop as reliably as older machines. Sometimes you can press it over and over before it responds. Not a hardware contact problem though. Pressing the ON/C key will interrupt and halt a program instantly though.
- 5) LCD is perfectly straight AFAICT and an almost straight s/n label is also nice to see.

Probably won't do too much programming on it since my 50g fulfills that need nicely. Don't think I can get used to a 4 level stack, no local vars, no non-GOTO based looping constructs, no proper I/O, no non-trivial labels or many of the other things I had been taking for granted on the RPL machines.

Still, I very much like the 35s and it will be a challenge to port over some of my astronomy programs and such - it does have some very interesting features to mess around with. It is also certainly far more svelte than my bulky 50g and thus easier to carry around.

Regards, Mike Mander

P.S. Now, bring on the 43s!!!

**Re: HP-35s photo gallery**

Message #2 Posted by [Arne Halvorsen \(Norway\)](#) on 23 Aug 2007, 4:35 a.m.,  
in response to message #1 by Mike Mander

Nice! Great work done for us that lives in country not getting any before next year...

Two pictures I liked the most: The practical case, look like it may be practical to work from it and the close up of the enter key (I was not dreaming, the BIG KEY is back!).

**Re: HP-35s photo gallery**

Message #3 Posted by [Jim Creybohm](#) on 23 Aug 2007, 10:19 a.m.,  
in response to message #2 by Arne Halvorsen (Norway)

Hi Arne.

Canada is not getting any 35's either, however I ordered mine from Samson Cables (and I assume a lot of other people did as well). I would think that you could obtain one a lot quicker than Christmas by going that route.

I have heard SOME negative comments, but the people at Samson were first class as far as I was concerned.

**Re: HP-35s photo gallery**

Message #4 Posted by [Arne Halvorsen \(Norway\)](#) on 23 Aug 2007, 10:34 a.m.,  
in response to message #3 by Jim Creybohm

Wow, they have em in Switzerland and UK but not in Canada (which last time I visited had USA borders...)!!!

Well, it is probably I may find a way to get one before end of year somehow. My company has coworkers working in the states and they visit, one being a math professor at Oak Ridge <- perfect guy to smuggle hp35s over borders :-), really like the USA price..., doubt the local price will be in the 60\$ neighbourhood... :-)

Thnks for shop tip, look nice!

**Re: HP-35s photo gallery**

Message #5 Posted by [Stefan Vorkoetter](#) on 23 Aug 2007, 10:37 a.m.,  
in response to message #3 by Jim Creybohm

I'm in Canada and ordered mine from the York University book store (which sells to anyone, not just York students).

<http://bookstore.yorku.ca/>

Their price is a bit higher than the US prices (\$85 Cdn), but shipping is only \$6. By the time you add shipping from a US source and do the exchange rate thing, it's about the same.

Stefan

**Re: HP-35s photo gallery**

*Message #6 Posted by **Jeff Kearns** on 23 Aug 2007, 4:11 p.m.,  
in response to message #5 by Stefan Vorkoetter*

Was your display straight or did it have that wonky angle towards the upper right side, noticeable with all the annunciators lit. I have an opportunity to have mine inspected by them (York University Bookstore) before they ship. What specifically should I ask of them during their inspection? I couldn't care less about the serial number sticker, but I do care about the display and the keys, case etc. Thanks,

Jeff

**Re: HP-35s photo gallery**

*Message #7 Posted by **Mike Mander** on 23 Aug 2007, 10:17 p.m.,  
in response to message #3 by Jim Creybohm*

Hi Jim,

Nothing wrong with Samson - I have bought from them myself and was very happy with the service...

However Canada does now have stock on the 35s! I work in a camera store but have also been known to sell HP calculators. My HP distributor currently has five in stock in Richmond, BC (just outside of Vancouver) and I can order in and resell them for \$69 CDN each. I do orders with this supplier on a fairly regular basis so there would be no extra charge if I can order a calculator along with one of my regular purchase orders. If I order below the prepaid \$1000 threshold with this supplier, there would be a \$15-\$20 extra shipping/handling fee roughly. We are not really set up for web/phone orders though, so it would have to be for walk-in customers only. Sorry...

If anyone in the Vancouver area wants to contact me, my work email is:

digital [AT] beaphoto [DOT] com

If you are elsewhere in Canada and have a preferred computer store, they can contact Synnex Canada and if they have an account with them, the store should be able to order any current model HP calculator in for you. The first batch of 35s calculators just came in a couple of days ago. At present Synnex's Toronto warehouse only has one unit available though. Note that Synnex is a distributor and will not sell directly to end users.

Hopefully no one takes offense at this note. If the moderator would like to delete this message, then please do so!

Regards, Mike Mander

*Message #8 Posted by **Jim Creybohm** on 25 Aug 2007, 7:59 p.m.,  
in response to message #7 by Mike Mander*

Thanks Mike! Glad to hear that we frostbacks got the 35's. I based my comment on an internet search, and I couldn't find one anywhere. So, naturally, being an engineer - I gave up.

Er, no, actually I went to HP.ca, and they still have not listed the 35S on their website (at least as of yesterday).

I am very pleased to hear your store is stocking them, and I hope you don't mind if I keep your email address in my contact list. I have a few more to get for friends and family.

**Re: HP-35s photo gallery**

*Message #9 Posted by [Mike Mander](#) on 25 Aug 2007, 9:32 p.m.,  
in response to message #8 by Jim Creybohm*

Hi Jim,

I certainly don't mind you keeping my email in your contact list - please do!

Just to be totally clear, my store is not actually keeping them in stock (we are a pro camera shop), however a distributor we deal with on a regular basis is keeping small numbers of all current HP's calculators on hand, so we can generally bring one in for someone fairly quickly.

Regards, Mike Mander

**Re: HP-35s photo gallery**

*Message #10 Posted by [Jeff Kearns](#) on 25 Aug 2007, 9:37 p.m.,  
in response to message #8 by Jim Creybohm*

Hi Jim,

I have a friend who works at HP here in Ottawa and he can't even get his hands on one through the HP Employee shopping site. They are told by HP Canada to go through the York University Bookstore in Toronto just like everyone else. I gave up and ordered mine through York U a couple of days ago. I just hope the display isn't crooked...

Regards,

JeffK

Awesome, thanks. Great wallpaper for my MacBook Pro..

Now all I need is an hp 35s..

Cheers, Pal

### **Re: HP-35s photo gallery**

*Message #17 Posted by **Mike Mander** on 23 Aug 2007, 2:11 p.m.,  
in response to message #1 by Mike Mander*

A few more notes:

My server is on port 8008 since my ISP is blocking port 80. A humble little Apple iMac (swing-arm "iLamp"

model) is acting as my web-server and I only have a relatively slow DSL uplink speed. Also, within minutes of posting the message, my modem's activity light went nuts and looking at my server log, there a tons of people accessing the gallery! Sorry for any issues people are having seeing the images...

Regarding the R/S versus ON/C responsiveness, actually ON/C is not 100% reliable at stopping fast loops either - better than R/S though it seems.

To the person who wanted wallpaper, I will try to post a larger version of the requested file when I am home from work tonight.

Regards, Mike Mander

**Re: HP-35s photo gallery**

*Message #18 Posted by **Bruce Bergman** on 23 Aug 2007, 2:25 p.m.,  
in response to message #17 by Mike Mander*

You might want to think about 8080. That's considered the "second" tier port for web servers. A fair amount of blocked firewalls will still permit activity on 80 and 8080, in addition to https connections.

I wonder if I could run a web server on my Treo? ;-)

thanks, bruce

**Re: HP-35s photo gallery**

*Message #19 Posted by **Mike Mander** on 23 Aug 2007, 2:46 p.m.,  
in response to message #18 by Bruce Bergman*

Well I used to run it on 8080 but then had several complaints... so thought I'd try 8008, which is also listed as an alternative port for web-servers. Oh well... you can't win.

Thanks for the tip though... maybe I'll change it back to 8080.

**Re: HP-35s photo gallery**

*Message #20 Posted by **Bruce Bergman** on 23 Aug 2007, 4:59 p.m.,  
in response to message #19 by Mike Mander*

Naturally the moment you change it back to 8080, someone will recommend trying it on 8008. ;-)  
It's a no win situation when you aren't on 80...

thanks, bruce

**Re: HP-35s photo gallery**

*Message #21 Posted by **Ed Look** on 23 Aug 2007, 3:32 p.m.,  
in response to message #1 by Mike Mander*

Beautiful pictures! (Nice table... oh, er, ah, nice calculator, too.)

Your "5" key only looks the slightest bit out of line if I stared at it hard.

I had a slightly different problem when I got mine. It didn't have to do with the calculator itself; rather, the upper (righties') strap inside the case was attached on the left side only by, like, a few fibers! I had to stretch that end a little more and epoxy that stretched over quarter inch region to the side of the case. (I used 5 minute

epoxy.)

After about five minutes, it dried and hardened enough that I can now use it as if it was originally sewn (or glued) on properly.

I sort of wish my issue with it was just a slightly slanted key!

**Re: HP-35s photo gallery**

*Message #22 Posted by [Mike Mander](#) on 23 Aug 2007, 9:32 p.m.,  
in response to message #21 by Ed Look*

Thanks!

I tried my best to straighten out the 5 key before taking most of the photos. Here is a closeup of the crooked key before I straightened it out: [crooked\\_five.jpg](#)

When I first got it, I did not notice the five key being askew... only after closely looking at the first few photos did I see it!

Regards, Mike Mander

[ [Return to Index](#) | [Top of Index](#) ]**Symbols for scientific notation***Message #1 Posted by [JoelB](#) on 23 Aug 2007, 12:15 a.m.*

I am looking for a new calculator and I like what I see in the HP 35s, but I have two concerns.

My current calculator has scientific notation prefix symbols from atto to exa and I value these. Without these I would be entering many zeroes or exp, n, +/-, which is an extra keystroke I can do without. Does the 35s offer an easy way to do this?

Secondly, how is the screen's aspect ratio in practice? I am used to something closer to the 33s.

**Re: Symbols for scientific notation***Message #2 Posted by [Walter B](#) on 23 Aug 2007, 2:44 a.m.,  
in response to message #1 by JoelB*

1. No.

2. The LCD is identical with the one in the 33s.

**Re: Symbols for scientific notation***Message #3 Posted by [DaveJ](#) on 23 Aug 2007, 5:45 a.m.,  
in response to message #1 by JoelB*

That would be engineering notation. Not many calcs offer this, and all that I have seen are just standard scientific calc's, not programmables like the 35S. Come to think of it, has any HP calc ever offered it?

Some of the Casio's have it.

Dave.

**Re: Symbols for scientific notation***Message #4 Posted by [Thomas Radtke](#) on 23 Aug 2007, 6:32 a.m.,  
in response to message #3 by DaveJ*

Casio's fx-4500p had it, plus it was programmable. Of course, no match for the 35s which is far easier to use and likewise powerful.

Actually, my old FX-61F has it and it is actually keystroke programmable.

Of the current casio programmable models available, only the FX4500PA has it: <http://edu.casio.com/products/program/fx4500pa/>

The FX-5500LA has "Engineering symbol calculations" but not engineering notation entry.  
<http://edu.casio.com/products/program/fx5500la/>

Dave.

in response to message #5 by DaveJ*

I've been using the fx-580 [link](#) for more than 15 years now. (It's taken one too many coffee spills and now despite best efforts I've lost part of the display.)

My main use is in electronics/physics calculations.

I'm not sure I need it to be programmable but I like the idea of storing my most used formulas.

The things I like from reading about the 35s are the solid build, the sensible styling, and I have to admit I'm a little RPN curious. I have used RPN calculators before but not as an engineering tool.

Being used to a basic algebraic scientific like the FX-580 for so long, I suspect that you may find the 35S frustrating for everyday use. The 35S is optimised as a powerful programmable calculator, hence the keyboard is designed as such. That means less dedicated keys that you use in everyday calculations. If you think you'll miss the engineering notation entry, then the lack of basic primary keys like ENG and LOG might be enough to drive you up the wall.

Then of course there is the RPN hurdle.

By all means get a 35S to play with, but I would also get one of the new casio scientific's to replace your old faithful as your everyday calc.

If you are into electronics then you may like to check out the old Casio FX-61F which is optimised for electronics calcs. They still come up on eBay occasionally. It has engineering notation entry, impedance modes, and a very handy parallel key.

Dave.

Interesting!

I've never seen that Casio model before. Casio seems to have a never ending supply of different calcs out there, even in current production. Every once in a while I spot a new one and am intrigued by the diversity (or similarity, in some cases) of their line.

Very interesting (read: strange) company, they are...

thanks, bruce

in response to message #12 by Bruce Bergman

It may be a typical case of "process oriented" company (Casio) vs. "result oriented" company (HP).

Asian companies tend to have a refined process, that allows them to churn out incrementally improved models very quickly. Especially when it comes to consumer electronics it seems. Western companies usually tend to be more "result oriented", and come out with new models only in big steps, and not very often.

I wish HP would be a little bit more like Casio in some respects: fix the bugs quickly and ship a new version of the machine. Then add P->R, R->P, IMG, RE, etc, and ship yet a new version ...

### HP 9815A repair

Message #1 Posted by [frankabc](#) on 22 Aug 2007, 11:38 p.m.

We need assistance in diagnosing our HP 9815A calculator computer. If anyone can help us fix ours or locate a replacement HP 9815A, we will be VERY appreciative. Thank you. Frank Simpson, fbsimpson@pharmacy.wisc.edu , tel. 1-608-849-3382.

### Re: HP 9815A repair

Message #2 Posted by [Tony Duell](#) on 23 Aug 2007, 4:33 a.m.,  
in response to message #1 by frankabc

You can get 'my' schematics of the HP9815 from the Australian site. Somewhat strangely for an HP calculator, the 9815 is based on a standard microprocessor, a 6800. There are a few 'surprises' in the electronics, but nothing too strange.

You don't give us much to go on. What does the machine do? Do you get anything on the display? What experience of electronics troubleshooting do you have? What test gear do you have access to?

### Re: HP 9815A repair

Message #3 Posted by [frankabc](#) on 23 Aug 2007, 3:55 p.m.,  
in response to message #2 by Tony Duell

Thank you, Tom, Our misbehavin' HP 9815A does a few interesting things. Run Mode: First, when you key in 2, 2.00 enters automatically. When you try to key in 25, you cannot, because it will display 2.00, and then 5.00. Though the enter key DOES work, and can be used, it is not necessary to hit enter to do arithmetic. So you can now key 2, 5, +, and the result, 7, appears on the display. Normal RPN would be 2, ENTER, 5, +, display 7. Auto Start mode: When you flip the power-on switch, the 9815A will attempt to load a program from a DC100A tape cartridge. This seems to be working. Unfortunately our tapes are 20 years old, and we fear that they might not have readable programs any longer. The printer prints "file not found" or, on more encouraging attempts, "Checksum error". But we cannot tell if the tapes are good, or not, because we do not know if the computer is good, or not. The cartridge drive itself seems to be working. Program mode: One cannot simply enter the program mode with the switch. If I go through the following mindless steps, I can enter the program mode, every time.

Switch in run mode turn power on 1 Store 1 . rcl 1 . then switch to program mode.

Once in the program mode, the display reads 0000 on the left, and 0136 on the right. There should be 432 programmable steps, minimum, not 136. Furthermore, our machine has the 001 memory and 002 I/O options. The 001 option should increase memory to 2008 steps. Again, not 136. On good days, I can program a few steps. For example, I can key in steps to recall numbers stored in A -> J registers, multiply, end, etc. But when I switch back to run, she does not run. The printer prints "memory overflow", on almost every interaction. I have attempted to clear the memory by the protocol in the manual, and sometimes I can clear it. I have pressed the list button, and the printer prints the memory steps and contents, usually to 136 steps, but on one occasion, out to 216 steps. On that 216 day I was able to reallocate the 80 store

registers to programmable registers by the protocol in the manual. Note that  $80 + 136 = 216$ . I only have gotten 216 programmable steps once, and have never again been able to repeat it. I also have wondered why the printer prints "memory overflow" even after only turning power on in run mode. Isn't the memory supposed to clear when power is turned off, and then back on? Well, I decided to press list, immediately after turning the power on. The print out informed me that memory really was already full of all sorts of stuff. That is about as far as we have gotten. In answer to your questions. I have an electrical engineering friend who is going through the machine. Don used to repair electronics for our Biochem Department. We have a digital volt meter, and that is about it. Don has a logic probe at home. We have all of the manuals, including the service manual. We have found the Utilities and Test Cartridge Tape (09815-10004), but we are not sure if it is still readable. It yielded "no file found" when inserted into the tape drive. It would be nice to obtain a known-to-be-good copy of the Utilities and Test Tape from someone. We also cannot locate the 9815A Test ROM Assembly plug-in (98140-66501). It would be very beneficial for us to find these two troubleshooting aids. We are wondering if Digital Signature Analysis is possible with the 9815A. It looks like HP was developing Signature analysis around 1980. We also are wondering where your web site is with the schematics of the HP 9815A. We greatly appreciate any assistance and suggestions that you may offer. Thank you, Frank Simpson fbsimpson@pharmacy.wisc.edu 608-849-3382 (messages)

---

That '136' steps left is clearly wrong. I suspect a RAM problem. Now, had it been a 9815S, I'd have immediately suspected the RAMs on the CPU board, as they're 2114s in that machine, and a more unreliable chip I've yet to see. But in the 9815A, they're 2111s I think (256 locations of 4 bits each).

Given that it's a 6800 system, it's likely that system variables are stored in page 0, since there's a shorter, faster way to access locations there. So I'd replace those RAMs first.

### **Re: HP 9815A repair**

### Programming "AND" of two flags in the non RPL machines

Message #1 Posted by [Peter Niessen](#) on 22 Aug 2007, 11:06 p.m.

Hi,

how to program an "AND" of two flags? I can come up only with

```
0
FS? 0
1
FS? 1
1
*
X!=0?
```

Is there a better way?

Thanks, Peter.

### Re: Programming "AND" of two flags in the non RPL machines

Message #2 Posted by [Paul Dale](#) on 22 Aug 2007, 11:11 p.m.,  
in response to message #1 by Peter Niessen

Slightly smaller is:

```
PI
FS? 0
IP          ; Integer part
FS? 1
FP          ; Fractional part
x=0?
```

- Pauli

### Re: Programming "AND" of two flags in the non RPL machines

Message #3 Posted by [Valentin Albillo](#) on 23 Aug 2007, 8:59 a.m.,  
in response to message #1 by Peter Niessen

Hi, Peter:

Peter asked:

*"How to program an "AND" of two flags? I can come up only with [... (a 7-step solution) ...] Is there a better way?"*

If your program is intended to run in an HP-41C/CV/CX, an HP42S, or some suitably compatible model or emulation, and you don't care for the status of flag 00 (or 01) after the test, I can come up with a 3-step solution, namely:

```
FC? 01
```

```
CF 00
FS? 00
```

You can exchange flag 00 for flag 01 in the above solution if you can't afford clearing flag 00 but don't mind clearing flag 01 instead.

Also, not only is my solution shorter, but significantly faster as well and the cherry on top is that it also preserves the whole RPN stack, LASTX included.

Best regards from V.

I guess I not understand something. What is flag checking?

### **Re: Programming "AND" of two flags in the non RPL machines**

Message #5 Posted by [Giancarlo \(Italy\)](#) on 23 Aug 2007, 9:19 a.m.,  
in response to message #4 by Vincze

Hi Vincze.

If your question arises from the "FC" or "CF" acronyms, then they stand for "Flag Clear" and "Clear Flag" respectively.

"Clearing" a flag basically means "unsetting" it (i.e., setting its value to "0");

"Setting" a flag, obviously, means the opposite ;-)

"Flag checking" is just the checking for the flag status (set/clear).

If you mean "*what is this strange mess with flags?*", then very synthetically: many functions and settings of HP calcs

(at least of the most recent and powerful ones) are customizable by means of those "flag settings", which "set" the "operational environment" of the calc itself.

Hope my humble explanation was not more confusing to you ;-)

Best regards. Giancarlo

*Edited: 23 Aug 2007, 9:20 a.m.*

### **Re: Programming "AND" of two flags in the non RPL machines**

Message #6 Posted by [Vincze](#) on 23 Aug 2007, 9:30 a.m.,  
in response to message #5 by Giancarlo (Italy)

I guess I more interested in what is flag setting all about. I know of 15C, there is flag setting to enter complex mode. But on 35s, I not understand when book says flags 0 - 4 mean whatever you want them to mean. Is it like it store boolean value for later use?

### **Re: Programming "AND" of two flags in the non RPL machines**

Message #7 Posted by [Stefan Vorkoetter](#) on 23 Aug 2007, 9:49 a.m.,  
in response to message #6 by Vincze

Exactly. Flags are just boolean values. On the 35s, flags 0-4 happen to have their state

displayed in the annunciator area, which makes them useful to visually indicate some sort of status. Some flags are also used to control settings of the calculator, such as setting flag 10 to inhibit equation evaluation.

Stefan

## Re: Programming "AND" of two flags in the non RPL machines

Message #8 Posted by [Stefan Vorkoetter](#) on 23 Aug 2007, 9:56 a.m.,  
in response to message #3 by Valentin Albillo

Another solution that preserves the stack and LASTx uses a third flag. So if you're testing flags 0 and 1, the following will set flag 2 to the AND of flags 0 and 1, and then test the result:

```
SF 2
FC? 0
CF 2
FC? 1
CF 2
FS? 2
```

Likewise, the following does OR:

```
CF 2
FS? 0
SF 2
FS? 1
SF 2
FS? 2
```

Alternatively, if all you're interested in is branching somewhere if the AND is true, you could write:

```
FC? 0
GTO N
FC? 1
GTO N
LBL A
...stuff to do if flags 0 and 1 are set

LBL N
...stuff to do if one or both of flags 0 and 1 are not set
```

Stefan

## Re: Programming "AND" of two flags in the non RPL machines

Message #9 Posted by [Peter Niessen](#) on 23 Aug 2007, 2:54 p.m.,  
in response to message #3 by Valentin Albillo

Had one only FC? on the 3Xs machines... (where X=2,3,5).

Thanks for these answers! Learnt something for today and should go home.

Cheers, Peter.

### **HP-41CX printer prints characters with white streaks. Why?**

Message #1 Posted by [Clark H Lewis](#) on 22 Aug 2007, 7:54 p.m.

I just started using my HP-41CX with external printer after being set aside for a long time. When I began printing recently, the characters were faint even though the intensity was set on normal to dark. The paper was very old, but the characters were generally well formed. As I printer the Catalog 3 a few times, the characters began to have white streaks in them. And now, the more I print, even with 3 different rolls of paper, the streaks are getting worse. While the characters are somewhat faint, because of the old paper, it is getting difficult to read them because of the increase/intensity of the streaks.

What causes the streaks, and what can be done to remove the streaks and improve the characters??

Thanks.

### **Re: HP-41CX printer prints characters with white streaks. Why?**

Message #2 Posted by [Randy](#) on 22 Aug 2007, 9:07 p.m.,  
in response to message #1 by Clark H Lewis

Why? Because it probably has a twenty year old battery and paper in it for starters.

White streaks? As in not printing in those areas? Could be many things but most likely it's one of the two things already mentioned... or both.

The first thing you need is a known good battery. The printer will not work properly without one. If the battery that is currently in the unit is a 1980's original, it's very doubtful it will print properly. The normal problem is irregular width printed lines but anything is possible. The printer is a real current hog in a big way and a marginal battery will cause all manner of weirdness.

Once you know the battery is good, get some fresh paper. Any 2-1/4" wide X 85' rolls thermal paper rolls will fit.

Then see what comes out...

### **Re: HP-41CX printer prints characters with white streaks. Why?**

Message #3 Posted by [Clark H Lewis](#) on 23 Aug 2007, 9:44 a.m.,  
in response to message #2 by Randy

Thanks for your comments.

The battery is old but was fully charged before installing in the printer. The voltage measured just prior to installing was 5.49 v.

I tried some old blue (82045A) and black (82175A) paper AND a new roll of OfficeMax 2.25" x 85' (OM98105) paper. If anything, the printout on the old rolls was better than the new roll -- though as noted, the streaks existed in all 3 rolls.

The streaks appear not to have anything printed in them. They are small, but often 2 streaks across the characters.

Hope this clarifies what I used in the tests.

Thanks again.

### **Re: HP-41CX printer prints characters with white streaks. Why?**

*Message #4 Posted by [Wayne Brown](#) on 23 Aug 2007, 5:33 p.m.,  
in response to message #3 by Clark H Lewis*

Are the streaks consistent, that is, do they always appear in the same places on the characters? I've seen streaks like this caused by an old print head with "burnt out" spots on it that no longer could heat the thermal paper enough to form dots in certain positions. Since you had it put away for a long while I suppose it also could be caused by dust or other contaminants that stuck to the print head while you weren't using it. You might try blowing gently on it to see if that helps. Perhaps others here will know of a safe way to clean the delicate print head; personally, I'd be afraid of making things worse.

### **Re: HP-41CX printer prints characters with white streaks. Why?**

*Message #5 Posted by [Eric Smith](#) on 23 Aug 2007, 5:47 p.m.,  
in response to message #3 by Clark H Lewis*

Quote:

The battery is old but was fully charged before installing in the printer. The voltage measured just prior to installing was 5.49 v.

\_\_\_\_\_

Unfortunately that doesn't really tell much about the state of the battery, other than that it isn't completely dead. But it can be in poor condition and still show a good voltage under no load.

I usually test the 82143A and 82162A printers by hooking up a lab power supply to the battery terminals, with the supply set to 5V. Just make sure you don't get the polarity reversed.

### HP 35s: Complex to Rectangular to Polar Revisited (long)

Message #1 Posted by **Jeff O.** on 22 Aug 2007, 7:25 p.m.

The absence of rectangular to polar, polar to rectangular and related functions on the HP 35s has already been discussed at length, and I believe that various routines are due to soon be included in the software library. Rather than wait, I attempted to go through the various threads to see if I could pull out the best routines for each function. However, I found it a bit tricky to follow the threads and various routines that were presented. To try to get a handle on things, I went back to the basics of the problem and tried to work my way forward. The following likely rehashes a lot of the previous discussion, and I make no claims of originality. So, at the risk of beating a dead horse (and exposing a blatant lack of understanding of some point or another), from the beginning.....

As I see things, there are seven basic functions related to the entry, display and conversion of complex numbers that the 35s lacks. For the sake of the following discussion, "Complex" means a complex number residing in a single stack level on the 35s, "Real Rectangular" means a complex number represented in rectangular form as two real values in two stack levels, and "Real Polar" means a complex number represented in polar form as two real values in two stack levels. The seven missing functions are:

1. Complex to Real Rectangular Form conversion - Decomposition of a complex number into its real and imaginary components, with those values placed in the stack x and stack y registers, respectively.
2. Complex to Real Polar Form conversion - Decomposition of a complex number into the magnitude and angle of its polar form, with those values placed in the stack x and stack y registers, respectively.
3. Real Rectangular Form to Complex conversion - Formation of a complex number in stack x from real and imaginary components initially in the stack x and stack y registers, respectively.
4. Real Polar Form to Complex conversion - Formation of a complex number in stack x from a magnitude and angle initially in the stack x and stack y registers, respectively.
5. Real Polar to Real Rectangular Conversion - Conversion of a polar representation of complex number in stack x (magnitude) and stack y (angle) to a rectangular representation in stack x (real) and stack y (imaginary).
6. Real Rectangular to Real Polar Conversion - Conversion of a rectangular representation of complex number in stack x (real) and stack y (imaginary) to a polar representation in stack x (magnitude) and stack y (angle).
7. Complex Conjugate - Conversion of a complex number in stack x to its complex conjugate in stack x.

Ideally, routines to perform the above functions would leave the stack (including Last x) exactly as if they were built in functions. Before discussion of how they should operate, a few definitions are in order:

```

Re      :a value representing the real component of a complex number
Im      :a value representing the imaginary component of a complex number
Mag     :a value representing the magnitude of a complex number when
        expressed in polar form
Ang     :a value representing the angle of a complex number when
        expressed in polar form

```

A, B, C :specific pre-existing values in the stack  
 Re i Im :a complex number held in a single stack level displayed in rectangular form  
 Mag  $\angle$  Ang :a complex number held in a single stack level displayed in polar form  
 -- :the most recent value in the Last x register, to be overwritten

With the above said, I believe that the previously described seven functions should perform as follows:

#### 1. Complex to Real Rectangular

| <u>Stack Before</u>            |    | <u>Stack After</u>                  |
|--------------------------------|----|-------------------------------------|

| y: A                           | -> | y: A                                |
| x: Re i Im or Mag $\angle$ Ang | -> | x: Re i -Im or Mag $\angle$ -Ang    |
| Last x: --                     | -> | Last x: Re i Im or Mag $\angle$ Ang |

Having come this far, I went ahead and developed seven routines to accomplish the above functions. I used many ideas and techniques developed in the previous discussion, and I don't know if I exactly replicated any of the routines presented previously. If so, due credit is given to the original developer. I decided to place them all under one label, rather than having different labels for each. (In earlier threads, I found the labelling a bit confusing. Does Label P convert to Polar, from Polar, convert a complex number to real polar form, etc.?) I chose Label Z, for a couple of reasons. I intend for the program to be always resident on the calculator. Since Z is the last label alphabetically, I can easily remember that it is unavailable for general programming. Also, the letter Z is used to represent complex impedance in electric power engineering, which is my primary application for these functions, so it seemed natural to use it for this suite of functions. Each routine has an equation at the beginning that labels the function to be performed. It is set up to pause, display the function name, then execute the routine when each routine is called. It is **not** independent of flag 10, which is set to display the function label, then cleared in each routine. So flag 10 will be cleared after each routine, regardless of its setting prior to execution. The routines use only stack manipulation and equations, no general storage registers are used. With the above caveats, my program to implement the suite of Complex-Rectangular-Polar functions is as follows:

```

Z001   LBL Z
Z002   SF 10                               :Entry point for Complex to Rectangular
Z003   Eqn CPLX->RECT
Z004   PSE
Z005   CF 10
Z006   ABS
Z007   CLx
Z008   eqn ABS(LASTx)*SIN(ARG(LASTx))
Z009   eqn ABS(LASTx)*COS(ARG(LASTx))
Z010   RTN
Z011   SF 10                               :Entry point for Complex to Polar
Z012   Eqn CPLX->POLAR
Z013   PSE
Z014   CF 10
Z015   ARG
Z016   LASTx
Z017   ABS
Z018   RTN
Z019   SF 10                               :Entry point for Rectangular to Complex
Z020   Eqn RECT->CPLX
Z021   PSE
Z022   CF 10
Z023   ABS
Z024   Roll down
Z025   Roll down
Z026   Eqn LASTx+i*REGT
Z027   Eqn REGZ
Z028   Roll down
Z029   RTN
Z030   SF 10                               :Entry point for Polar to Complex
Z031   Eqn POLAR->CPLX
Z032   PSE
Z033   CF 10
Z034   ABS
Z035   Roll Down
Z036   Roll Down
Z037   Eqn LASTx*COS(REGT)+i*LASTx*SIN(REGT)
Z038   Eqn REGZ
Z039   Roll Down
Z040   RTN
Z041   SF 10                               :Entry point for Polar to Rectangular
Z042   Eqn POLAR->RECT
Z043   PSE
Z044   CF 10
Z045   ABS
Z046   Roll Down
Z047   Roll Down
Z048   Eqn LASTx*COS(REGT)+i*LASTx*SIN(REGT)
Z049   ENTER
Z050   Roll Down
Z051   Roll Down

```

```

Z052   Eqn  ABS(REGZ)*SIN(ARG(REGZ))
Z053   Eqn  ABS(REGT)*COS(ARG(REGT))
Z054   RTN
Z055   SF 10                               :Entry point for Rectangular to Polar
Z056   Eqn  RECT->POLAR
Z057   PSE
Z058   CF 10
Z059   ABS
Z060   CLx
Z061   LASTx
Z062   Roll Down
Z063   Roll Down
Z064   Eqn  REGZ+i*REGT
Z065   ENTER
Z066   Roll Down
Z067   Roll Down
Z068   Eqn  ARG(REGT)
Z069   Eqn  ABS(REGT)
Z070   RTN
Z071   SF 10                               :Entry point for Complex Conjugate
Z072   Eqn  CPLX CONJUGATE
Z073   PSE
Z074   CF 10
Z075   ABS
Z076   CLx
Z077   Eqn  SQ(ABS(LASTx))/LASTx
Z078   RTN

```

And, for what it's worth,

CK = F440

LN = 541

## Re: HP 35s: Complex to Rectangular to Polar Revisited (long)

Message #2 Posted by [Alain Mellan](#) on 22 Aug 2007, 8:48 p.m.,  
in response to message #1 by Jeff O.

Great work!

One minor comment though: I would add a jump table at the beginning:

```

Z001 LBL Z
Z002 GTO Z019
Z003 GTO Z028
...

```

This way, it's easier to remember what is what. XEQ Z002 for the first conversion, Z003 for the second, etc.

## Re: HP 35s: Complex to Rectangular to Polar Revisited (long)

Message #3 Posted by [Jeff O.](#) on 27 Aug 2007, 3:43 p.m.,  
in response to message #2 by Alain Mellan

In case anyone is interested, I took Alain's advice and added a jump table. I also changed the order of the routines to make it easier to remember. (I could have done that with the jump table with the original program, but I wanted the routines to be in the same order within the program as the order in which they appear in the jump table.) Unfortunately, I can't start the jump table with the jump to the first routine at Z001, as that's where the program label is. I have to start with the jump to routine 1 at label Z002. So remembering which jump goes to which routine would require a mental conversion to remember to add one to the number of the routine, which for me would be bound to result in errors when I subtract one instead of adding. With the reordering of routines, I find it easier to remember that those routines that are "rectangular-centric", i.e.  $C \Rightarrow R$ ,  $R \Rightarrow C$  and  $R \Rightarrow P$ , are the even numbered labels Z002, Z004 and Z006, and the "polar-centric" routines ( $C \Rightarrow P$ ,  $P \Rightarrow C$  and  $P \Rightarrow R$ ) are the odd labels Z003, Z005 and Z007. (Of course, the definitions of "rectangular-centric" and "polar-centric" are subject to debate, i.e., you might swap my definitions of  $R \Rightarrow P$  and  $P \Rightarrow R$ ). Complex Conjugate is the last routine, I'll just have to remember

that it's no. 8. To help picture things, the jump table is as follows:

|   |                |   |     |             |
|---|----------------|---|-----|-------------|
| <b>Complex to Real Rectangular Form</b> | <b>C=&gt;R</b> | : | XEQ | <b>Z002</b> |
| <i>Complex to Real Polar Form</i>       | <i>C=&gt;P</i> | : | XEQ | <i>Z003</i> |
| <b>Real Rectangular to Complex</b>      | <b>R=&gt;C</b> | : | XEQ | <b>Z004</b> |
| <i>Real Polar to Complex</i>            | <i>P=&gt;C</i> | : | XEQ | <i>Z005</i> |
| <b>Real Rectangular to Real Polar</b>   | <b>R=&gt;P</b> | : | XEQ | <b>Z006</b> |
| <i>Real Polar to Real Rectangular</i>   | <i>P=&gt;R</i> | : | XEQ | <i>Z007</i> |
| Complex Conjugate                       | C=>C*          | : | XEQ | Z008        |

**Rectangular-centric routines shown bold**

*Polar-centric routines shown in italics*

The new code listing is as follows:

```

Z001      LBL Z
Z002      GTO Z009           :jump to Complex to Rectangular
Z003      GTO Z018           :jump to Complex to Polar

Of course, lines Z002 through Z008 are GTO Z009, GTO Z018, etc.

Just for any newbies who read this post and wonder how to put a GTO 9 into the program. :-)

Message #6 Posted by [Karl Schneider](#) on 28 Aug 2007, 12:08 a.m.,  
in response to message #3 by Jeff O.

Hi, Jeff --

I haven't tested it yet, but it looks like fine work. Other functions to include might be:

- "Re" (complex number replaced with its real part)
- "Im" (complex number replaced with its imaginary part)
- "Neg" (negate both rectangular parts or shift the angle by a half-circle)

Let's all not forget, though: These are functions that should have been built-in. I aim to convince HP to rectify the matter with an HP-35sII or HP-45s.

**Re: HP 35s: Complex to Rectangular to Polar Revisited (long)**

Message #7 Posted by [Jeff O.](#) on 28 Aug 2007, 12:29 p.m.,  
in response to message #6 by Karl Schneider

Hi Karl,

Yes, I considered the Re and Im functions, but then I would have to remember *nine* jump labels! Seriously, since those are easily obtainable after executing a C=>R conversion, I guess I did not feel a great need to create routines that would provide just the real or just the imaginary part while preserving the stack and Last x. However, if a group of conversions is included on a future model, by all means Re and Im should be included. As for a "Neg" function, doesn't the + / - key do as you suggest (negate both rectangular parts or shift the angle by a half-circle)? Do we need a "Neg Re" key to negate just the real part, i.e., do to the real component what complex conjugate does to the imaginary? I found that it can be accomplished using almost the same technique that you presented for complex conjugate, as follows:

```
ENTER
ABS
x2
+ / -          (new step)
x<>y
/
```

Regardless of how it is done, does the act of negating the real part of a complex number have a name or any utility in complex number operations?

Quote:

Let's all not forget, though: These are functions that should have been built-in. I aim to convince HP to rectify the matter with an HP-35sII or HP-45s

Yes, they certainly should have. As far as a 35sII, from what Gene says, the 35s absolutely maxed out the architecture (or whatever) of the original 32s platform, such that adding new functions would require deleting others. If we adopt "Re", "Im" and "Neg Re", that makes 10 functions, which can conveniently be grouped as 5 complementary functions that would make good yellow-shift/blue-shift combinations. Hmm, where can we find five keys with 10 functions that we don't need? Oh yeah, how about the mostly useless SI to English conversions that use up the yellow and blue shifted functions on 5 keys, plus the ROM space required to implement them? Implementation might look like this:

Feel free to use the above in your pitch to hp :-)

in response to message #7 by Jeff O.

Hi, Jeff --

Quote:

As for a "Neg" function, doesn't the + / - key do as you suggest (negate both rectangular parts or shift the angle by a half-circle)?

Hmm, I guess it does. The HP-28C has a "NEG" function that negates both parts of a complex number, just as CHS does. Without checking the manual, I'm not sure why it was provided. "NEG" notwithstanding, the HP-28 offers a fine example of a utility-function menu for complex numbers.

Quote:

Do we need a "Neg Re" key to negate just the real part, i.e., do to the real component what complex conjugate does to the imaginary?

Nah, I doubt it. No practical application comes to mind.

## Re: HP 35s: Complex to Rectangular to Polar Revisited

Message #10 Posted by **Karl Schneider** on 22 Aug 2007, 11:55 p.m.,  
in response to message #1 by Jeff O.

Hi, Jeff --

Pretty good work. I fundamentally agree with what you stated, but your functional specifications differ from what has been implemented previously.

Mostly, you are describing the complex-number composition/decomposition functions "R->C" and "C->R" on the RPL-based models. These are quite similar to the vague "COMPLEX" function on the HP-42S, but I've noted a subtle but *very important* difference:

On the HP-48/49 models, "R->C" and "C->R" assume arguments in rectangular form:

```
3 ENTER 4 ENTER R->C
```

will always compose  $3+i4$ . If the calc is in polar mode, it will display that value in polar form.

However, on the HP-42S in polar mode,

```
3 ENTER 4 COMPLEX ("R->C")
```

will compose

```
3 ∟4
```

This is the way it ought to work.

Note that the imaginary part is in the x-register and the real part is in the y-register for both RPL models and the HP-42S.

I plan to prepare a detailed short paper about complex numbers and other issues related to improvement of the HP-35s, and deliver it to HP prior to the HHC conference. I hope to get an opportunity for private discussion with HP's calc team during the visit.

Here's the basis of the complex-number discussion, consisting of one exchange between you and me, three years ago:

## Re: HP 35s: Complex to Rectangular to Polar Revisited

Message #11 Posted by [James M. Prange \(Michigan\)](#) on 23 Aug 2007, 1:20 a.m.,  
in response to message #10 by Karl Schneider

Quote:

On the HP-48/49 models, "R->C" and "C->R" assume arguments in rectangular form:

```
3 ENTER 4 ENTER R->C
```

will always compose 3+i4. If the calc is in polar mode, it will display that value in polar form.

True, that's how the 48/49 series works, and it's never seemed quite right to me either.

However, for something that works as you'd like R\->C to work, set flag -19 and use \->V2 instead, and for something that works as you'd like C\->R to work, use V\-> instead.

You could write a program:

```
%%HP: T(3);
\<<
  RCLF
  ROT ROT @ or 3 ROLLD, or, on the 49 series UNROT
  -19 SF
  \->V2
  SWAP
  STOF
\>>
```

as a replacement for the R\->C command and name it whatever you want. On the 49 series, you could use either the filer's RENAME operation to change its name to C\->R, or use the development library's S~N operation to create an otherwise invalid name from a string.

On either the 48 or 49 series, to create an otherwise invalid name from a string, you could use the SYSEVAL command with the entry point for the SysRPL \$>ID command. For reference, this would be

#5B15h SYSEVAL for both the 48 and 49 series.

For the C\->R command, you could write the program:

```
%%HP: T(3);
\<<
  V\->
\>>
```

and using the same techniques, rename or store it with the name C\->R.

Of course, when keying in a complex number within the ( ) complex numbers delimiters on the command line (or other source code, such as an ASCII file or a string to be compiled), it's treated as polar notation if the angle symbol is used, or rectangular notation if any other separator is used.

Regards,  
James

in response to message #10 by Karl Schneider

Karl,  
Thanks for your review and comments.

Quote:

...your functional specifications differ from what has been implemented previously.

Agreed, they do differ from the manner in which a complex value is "built" from two stack levels in the 15C, 42S and RPL models. If that is the only way to get a complex number into the calculator, I wholeheartedly approve of keying in real, then imaginary or magnitude, then angle and then executing the function to build the complex number. However, my routines are not intended for use to enter complex numbers in which the components are to be keyed in. The i and theta keys (of which we were long, I'll say pioneering, proponents) allow you to just key them in. No need to put them into stack registers and build the complex number. My routines are for cases where through some sequence of calculations you end up with values in the stack x and stack y registers that represent the real and imaginary components or magnitude and angle of a complex number. You don't want to have to re-key in those numbers (which would likely require writing one of them down) to get them into complex form. For this situation, I chose the convention that the imaginary component (or angle) goes in stack y, and the real component (or magnitude) goes in stack x. This conforms to the "classic" conventions used for the Rectangular to Polar and Polar to Rectangular functions on every hp calculator with those functions since they were introduced

on the HP-45. I then used that convention for all of the functions to which it applied. In any case, if you prefer the other convention, my routines could be easily modified.

I agree that the 42S did things the right way, especially as compared to the RPL models and entry of polar form numbers. The 42S figured you knew what you were doing, i.e., if it was in polar mode, whatever you entered was considered to be in polar form. Of course if you were in polar mode and had a rectangular form number to enter, you could do so, then execute  $\rightarrow$ POL. Again, the 42S figured you knew what you were doing and dutifully performed the conversion using the components of the complex number treated as Real and Imaginary even though they were displayed as Magnitude and Angle. (I'm quite sure you are aware of all this Karl, I'm just providing a complete answer.) In any case, this situation is also made moot by the  $i$  and theta keys.

Quote:

---

I plan to prepare a detailed short paper about complex numbers and other issues related to improvement of the HP-35s, and deliver it to HP prior to the HHC conference. I hope to get an opportunity for private discussion with HP's calc team during the visit.

---

I look forward to seeing that paper (assuming you will make it public here or at the conference) and I hope you get HP's ear. I certainly remember our previous exchanges. While I would still like to see your original or a similar proposal implemented, the 35s is about 80 to 90% of the way there for me. If it had the seven functions I presented, the SHOW function presented the full precision of both components in the two lines of the display, and my Option 3 angle symbol (like the 42S) was used to separate the magnitude from the angle in the display, I'd be pretty well satisfied.

Best Regards,  
Jeff

## Re: HP 35s: Complex to Rectangular to Polar Revisited

Message #14 Posted by [Karl Schneider](#) on 24 Aug 2007, 1:08 a.m.,  
in response to message #13 by Jeff O.

Hi, Jeff --

All in all, it's probably a good idea to redefine "R $\rightarrow$ C" and "C $\rightarrow$ R" as you specified. There's no pressing need for consistency with the methods of the HP-42S and HP-48/49 (I can't speak for the HP-50). With your definition, the following sequences would give the same results for converting  $3+i4$  to polar form as a pair of reals and as a complex (rectangular input mode assumed):

```
3 ENTER 4 x<>y  $\rightarrow$ POL
```

```
3 ENTER 4 x<>y R $\rightarrow$ C  $\rightarrow$ POL C $\rightarrow$ R
```

Quote:

---

The 42S figured you knew what you were doing, i.e., if it was in polar mode, whatever you entered was considered to be in polar form. Of course if you were in polar mode and had a rectangular form number to enter, you could do so, then execute  $\rightarrow$ POL. Again, the 42S figured you knew what you were doing and dutifully performed the conversion using the components of the complex number treated as Real and Imaginary even though they were displayed as Magnitude and Angle.

---

Hmm, perhaps that's the reason that  $\rightarrow$ REC and  $\rightarrow$ POL operating on a complex number didn't change

between "i" and "angle symbol" appropriately. I'd always felt that it was a bug or oversight. However, since the HP-42S offered no means of directly entering a complex number of the form opposite of its current mode setting, then the value-changing conversion was indeed useful. The alternatives were to change mode twice, or to convert a pair of reals with appropriate  $x < > y$ .

Quote:

---

I look forward to seeing that paper (assuming you will make it public here or at the conference)

---

My planned approach was to submit the paper privately to HP, in order to give them a chance to review and respond. I might make it generally available after the conference. I probably won't have it done in time to meet the deadline for presentation, anyway.

### HP-35s bug list

Message #1 Posted by [Daniel Diggelmann](#) on 22 Aug 2007, 5:03 p.m.

I'm working in the R&D department of an aircraft manufacturer. I have ordered a larger quantity of HP-35s for our engineers. While talking to the main importer for Switzerland I mentioned that a few bugs have already been found. The importer had heard about the bugs and had a meeting with HP where HP told them that this was all just negative publicity, possibly spread on the internet by their competitors. What do you guys think of HP's position here?

The importer offered me to pass a buglist to HP if I could provide it. I know of the  $\cos(x)$  bug for  $x =$  near to 90. I have also heard about the checksum error. Could we please collect all known bugs in this thread and I'll pass them to HP. I also made them clear that in aviation industry there's little room for errors. If we find out the HP-35s has unacceptable bugs I'll return them all to HP. I'm quite a HP fan but since about 10 years we have been let down with lousy hardware. The hardware of my personal HP-35s feels very good to me. But I can't believe that HP haven't fixed known bugs since the HP-33s. I understand that the HP-35s would have never been realised without a lot of pressure from the enthusiasts here. Now I think we should keep the pressure up in order to get back the quality we expect.

Thanks for all your contribution.

Daniel Diggelmann

### Re: HP-35s bug list

Message #2 Posted by [Paul Dale](#) on 22 Aug 2007, 5:21 p.m.,  
in response to message #1 by [Daniel Diggelmann](#)

I've put this list up as an [article](#) and will try to keep that current rather than editing here all the time. Check the [article](#) for the current state of affairs.

---

Here is a quick list I've made up. Feel free to expand and/or correct these:

1. Vector input bug has been mentioned and very weird behavior shows up but I'm not aware of this being isolated or repeatable. I do have enough trust in the people reporting problems to believe there is something to them.
2.  $\cos(x)$  for  $x$  near 90 is dud.
3. Checksums are meaningless. Seems to be related to numbers in programs but nothing definitely proven yet.
4. Program sizes are also meaningless. Again seems to be number related and again nothing proven.
5. Bad error message on indirection on J. You get "INVALID (I)" error message if done from the

keyboard, from a program it gives the correct message: 1000 ; STO J ; x<>(J)

6. Bad radix. If you are in RADIX, mode and you enter RADIX, in program mode it is displayed as RADIX.
7. Program entry bug for large programs. Create a 999 step program and then try to enter a new LBL. You're not allowed. Delete one step, create the LBL and put the step back and all is fine.
8. GTO.a ENTER doesn't work as expected. GTO.a000 does.
9. INPUT (i) for  $i \geq 0$  doesn't work. Strictly this is documented in the manual and so isn't really a bug.
10. Poor choice for the graphic for the "theta". It is much too close to the graphic for "8". Again, not strictly a bug.

This probably should go up as an article rather than being lost in the forum section.

- Pauli

<edited to include checksum and program size bugs>  
 <edited to include theta vs 8 discrimination problems>  
 <pointed to the article in progress>

Message #6 Posted by [Alain Mellan](#) on 22 Aug 2007, 6:18 p.m.,  
in response to message #2 by Paul Dale

10. Theta sign in complex display mode is hard to differentiate from an eight.

11. Missing re/img extraction may be considered as bug?

**Re: HP-35s bug list**

Message #7 Posted by [Paul Dale](#) on 22 Aug 2007, 6:24 p.m.,  
in response to message #2 by Paul Dale

I've put the list into an [article](#).

I'll keep it updated as new bugs are found and errors in the list reported.

I've also split the list into genuine bugs and annoyances that are harder to classify as bugs. Feel free to dispute my classifications.

- Pauli

**Re: HP-35s bug list**

Message #8 Posted by [Thomas Radtke](#) on 22 Aug 2007, 6:44 p.m.,  
in response to message #7 by Paul Dale

It has already been mentioned that only improper fractions can be entered, i.e., the expression a..b, resulting in a/b on the 32SII, cannot be entered. I'd consider this a design flaw.

Edit: Not quiet correct, of course 0.a.b can be entered but this seems to be unnecessarily laborious.

### Re: HP-35s bug list

Message #13 Posted by [Gerson W. Barbosa](#) on 22 Aug 2007, 9:26 p.m.,  
in response to message #12 by DLF

Nope, at page 4-4 they say  $\sin(\pi)$  is not equal to zero because  $\pi$  is represented internally with fifteen places (although the computed answer appears to have been taken with  $\pi$  to only twelve places). In fact,  $\sin(3.14159265359 \text{ rad}) = -2.0676153735661672045\text{E-}13$ , to 20 places, whose first 12 digits agree to the answer given by the 33s, after rounding.

The point here is  $\cos(x)$  -- and  $\tan(x)$  -- not being correctly computed for  $x$  near 90 degrees. For instance,  $\cos(89.999)$  returns  $1.745329091\text{E-}5$ . The correct result at this precision is  $1.74532925191\text{E-}5$ . Even worse,  $\tan(89.99999)$  returns  $5,729,578.122$  instead of  $5,729,577.95131$ . These mistakes might not affect practical applications, but should not occur in a XXIst-century calculator...

Gerson.

### Re: HP-35s bug list

Message #14 Posted by [DLF](#) on 23 Aug 2007, 12:42 a.m.,  
in response to message #13 by Gerson W. Barbosa

Thanks for the clarification; I just assumed it was a related "rounding error." And it appears that  $\pi$  is definitely \*not\* 15 places internally, but only the 12 places that you noted is actually being used.

So the documentation is wrong about that. (As a technical writer myself, I never like discovering that!)

### Re: HP-35s bug list

Message #15 Posted by [Raymond Del Tondo](#) on 23 Aug 2007, 3:26 a.m.,  
in response to message #14 by DLF

The Saturn-based calcs, like the original HP-32S and HP-32SII, have an internal accuracy of fifteen digits plus sign.

But please note that the 35s is not a Saturn-based machine, and thus it isn't necessarily 100 percent compatible.

Maybe the docs haven't been updated accordingly...

Raymond

### Re: HP-35s bug list

Message #16 Posted by [Gerson W. Barbosa](#) on 23 Aug 2007, 9:26 a.m.,  
in response to message #14 by DLF

In fact, it's been shown that pi is a double-precision constant in all Saturn-based calculators. This is true on the HP-35s as well. Do the following, in RAD and in ALL display mode:

```
pi
9E-11
-
ENTER
SIN
1E22
*
```

You'll get

```
3.1415926535
897,932,384,626
```

That's pi to 23 digits:

```
3.1415926535897932384626
```

This was already discussed here, some years ago:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62301>

When pi is shown in the display, it is rounded up to 12 digits. Therefore the calculator's answer for sin(pi) is equivalent to sin(3.14159265359 rad), which is absolutely correct.

Regards,

Gerson.

Edited 4 grammar.

Gerson --

Maybe I'm just dense then, but (ignoring symbolic-mode calculators for a moment) why is  $\sin(\pi)$  on a "double-precision" 35s equiv. to  $\sin(3.14159265359 \text{ rad})$ , and not  $\sin(3.1415926535897932384626 \text{ rad})$ ?

-- DLF

### Re: HP-35s bug list

Message #18 Posted by **Gerson W. Barbosa** on 23 Aug 2007, 10:54 p.m.,  
in response to message #17 by DLF

I think I didn't make myself clear, sorry! When I wrote  $\sin(\pi)$ , I meant  $\pi$  rounded up to 12 digits, not the internal double-precision constant used in the trigonometric routines to ensure better accuracy.

An example might help us understand how this works:

Let's consider the HP-15C, whose internal  $\pi$  constant is 3.14159265359. So on the HP-15C  $\sin(3.141592654)$  will return  $-\sin(3.141592654 - 3.14159265359) = -\sin(4.1\text{E-}10) = -4.1\text{E-}10$ . In the third quadrant,  $\sin(x) = -\sin(x - \pi)$ . If the argument is the second quadrant, for instance,  $x = 3.14159265$  then  $\sin(x) = \sin(\pi - x)$ . In this case, the HP-15C returns  $\sin(3.14159265359 - 3.14159265) = \sin(0.00000000359)$ . For very small arguments,  $\sin(x) = x$ . So, what we get here are the last three digits of the 12-digit internal  $\pi$  constant: 3.14159265359. Had the HP-15C a double-precision  $\pi$  internally, we would obtain 0.000000003589793239, that is, 3.1415926535897932385 - 3.14159265.

Gerson.

Message #21 Posted by **Gerson W. Barbosa** on 22 Aug 2007, 10:25 p.m.,  
in response to message #2 by Paul Dale

Not exactly bugs, rather a feature. Anyway, suggestions for improvement:

- 1) XEQ [label] ENTER is rather cumbersome. Also, since XEQ stands for 'execute', ENTER appears to be redundant. Besides, the ENTER key always seems to be so far far away to me :-)... Why not simply XEQ [label]? XEQ [.] nnn should be used for a particular line.
- 2) In ALL mode, the mantissa should be properly rounded so that the exponent fits in the screen, a la 32S, 32Sii, 33s, etc... Or, at least, a flag should be provided for this option.
- 3) 2\*2 lin. solve and 3\*3 lin. solve look strange. 2x2 and 3x3 seems better. I would guess that was the original idea, but then some 'translated' that  $x$  as  $*$ .
- 4) Exchange the positions of Sigma+ and R/S keys.

Regards,

Gerson.

Message #22 Posted by **Raymond Del Tondo** on 23 Aug 2007, 3:19 a.m.,  
in response to message #21 by Gerson W. Barbosa

For your first note:

AFAIK they made the XEQ work the way it does because you can use it to jump to a specific program line in another program.

Consider you're in line A012, and want to call a specific line in program B, say B056.

Then you will enter XEQ B056, followed by pressing ENTER.

I still don't like the programming model, which is a blown-up 32S/33s programming model, but at least you can call code slices which you otherwise could not reach.

Besides, IMHO the ENTER bar is in the perfect position;-)

Raymond

Hi, Gerson --

Quote:

Why not simply XEQ [label]? XEQ [.] nnn should be used for a particular line.

Good idea, but we'd need XEQ [.] Lnnn, where L is a letter label.

Quote:

In ALL mode, the mantissa should be properly rounded so that the exponent fits in the screen, a la 32S, 32Sii, 33s, etc

Or in any mode for which the display length is too short to accommodate the full number. I, too, preferred the "legacy" method (which actually pre-dates Pioneer models) because it shows the full exponent, providing the magnitude of the number that cannot be overlooked.

However, the HP-35s, with its 14 display positions, cannot display a complete "longest-possible" complex number, even if the mantissa were rounded to only one digit. 15 display positions would be required to show such a number, e.g.:

$$1.01111 \times 10^{-234} + i * 5.0555 \times 10^{-432}$$

would have to be displayed as

$$-1E-234i-5E-432$$

The HP-42S did not have this problem; it could display up to 22 characters on one line, with each decimal point requiring a position.

Hello Karl,

Quote:

Quote:

Why not simply XEQ [label]? XEQ [.] nnn should be used for a particular line.

Good idea, but we'd need XEQ [.] Lnnn, where L is a letter label.

That was a typo. Thanks for pointing out the mistake! Anyway, I don't think an extra keystroke in these cases should be a problem because they will not occur very often. Also, it's unlikely anyone will use all 26 labels in a calculator which has no I/O system. Chances are only a few programs will reside in memory at a time, so there will be plenty of letter labels left. If M contains some matrix routines for determinant, inverse matrix, etc., it would be better using XEQ D, XEQ I, etc., instead of XEQ .M065, XEQ M.110, etc., for instance.

Quote:

The HP-42S did not have this problem; it could display up to 22 characters on one line, with each decimal point requiring a position.

On the other hand, some consider the tiny characters in the HP-42S a weakness. I like the larger characters in the HP-35s, so that's ok for me. Perhaps providing a way to use both display lines to show a complex number could be offered as an option:

```
1.0111111E-234
i5.0555555E-432
```

The user would know this is only one complex number, otherwise the bottom display line would show

```
0i5.055556E-432
```

Also, as someone has suggested, HMS-> should be changed to ->H.

Regards,

Gerson.

Dear colleagues,

Thanks very much for all your responses to the bug list. I've passed them on the importer which has already passed them to HP Europe. Let's hope they fix them in the next series.

Regards from Switzerland, Daniel

Message #31 Posted by [gteague](#) on 27 Aug 2007, 5:53 a.m.,  
in response to message #1 by Daniel Diggelmann

is this a bug?

p5-4 & 5-5 of the manual say that you can show the value of the maximum denominator '/c' by issuing the commands: '1 (f) /c'.

i cannot get this to work in alg mode although entering a number between 2-4095 works and entering 0 works to set the default of 4095. entering a '1' seems to have no effect whatsoever.

in other words, i can issue '64 (f) /c' in alg mode, then switch to rpn mode and issue '1 (f) /c' and the display will show '64'.

i could not find a sequence of commands that would show the value of '/c' in alg mode.

### HP33s has more programing power than one might think

Message #1 Posted by [Howard Boardman](#) on 22 Aug 2007, 12:06 p.m.

...if you consider the equation solver. I came up with an equation that calculates the area of circular segment after asking the middle ordinate and radius of a circle. This is a common problem on geometry exams and NCEES type tests where you need to find the volume of liquid in a cylindrical tank on its side. Its an ugly equation but the 33s handles it. Of course things like this are unnecessary with the 35s and its GTO line ability. Just a thought though. It seems that if you structure an equation right with your parenthesis in the 33s it can solve just about everything and in effect is capable of some pretty daunting equations which typically would be programs. Furthermore it is able to solve for any variable. As of right now the 33s is still the only RPN programmable calc allowed on NCEES tests, hopefully the 35s will be added.

### NCEES and the 35S

Message #2 Posted by [Norris](#) on 22 Aug 2007, 12:47 p.m.,  
in response to message #1 by [Howard Boardman](#)

NCEES updates its calculator policy annually, on November 15. The updated list applies to the coming calender year. So the "approved calculator list" for 2008 should be posted on November 15, 2007.

The current "approved" list was posted on November 15, 2006 for 2007; it includes the 33S, but not the 35S (since nobody knew about the 35S in 2006). So it appears that the 33S will remain the only approved HP for the October 2007 exams. There are still people buying the 33S, even though the 35S is obviously the better option, for this reason.

It seems likely that the 33S will be discontinued in the near future, and that NCEES will add the 35S to the approved list for 2008. The question is whether NCEES will keep the discontinued 33S on the 2008 approved list. It wouldn't surprise me if they did drop the 33S; NCEES wants to keep the approved list as short as possible, to facilitate enforcement.

The licensing process typically requires multiple exams over a period of a few years. If the 33S is dropped from the list, there will be a loud chorus of protest from exam candidates who invested \$50 for a 33S in 2006 or 2007, but who now will have to pay another \$60 to replace it with a 35S for 2008.

So the NCEES announcement on November 15 could significantly affect 35S sales:

- If NCEES adds the 35S and drops the 33S, then 35S sales will probably jump immediately. In this case, literally thousands of existing, 33S-owning exam candidates will be forced to buy the 35S as a replacement. And many new exam candidates will want the 35S as well. There could be a 35S shortage.
- If NCEES adds the 35S but keeps the 33S, then 35S sales will still go up, but not as dramatically. New candidates will buy the 35S for the 2008 exams, but those who already own the 33S won't be obliged to replace it.

## Re: NCEES and the 35S

Message #3 Posted by [Bruce Bergman](#) on 22 Aug 2007, 1:24 p.m.,  
in response to message #2 by Norris

With a dedicated (read: captive) crowd of NCEES students potentially swapping for the HP-35s, I wonder if it would be worthwhile to cater somewhat to them. For example, provide some sort of "RPN/HP-35s primer for NCEES students" guide, similar to the educational modules. I think that would be a good way to welcome them and encourage them to use the calc AND RPN.

Maybe provide a handful of solver examples like the one above, a couple of representative solutions taken from the study materials, etc.

That would be kinda cool, if I were in that group...

thanks, bruce

## Re: NCEES and the 35S

Message #4 Posted by [Norris](#) on 22 Aug 2007, 4:58 p.m.,  
in response to message #3 by Bruce Bergman

Note that there are already several vendors that market 33S exam products:

- [PPI](#) sells three different "Essential Equations" guidebooks for using the 33S on the FE exam, the Civil PE exam, and the Mechanical PE exam
- [Newcalc](#) sells three different guidebooks for using the 33S on the FE exam, the Civil PE exam, and the Electrical PE exam
- [HP33Ssurveyor](#) offers a guide for using the 33S on the FS and PS (surveying) exams
- [Software by D'zign](#) also offers a guide for the use of the 33S on surveying exams

Obviously these products promote the 33S and the use of 33S programming. I haven't used any of them myself, and don't know if they encourage the use of RPN.

Certainly seems like more commercial calculator software is being generated for NCEES exams than for any other purpose.

## Re: NCEES and the 35S

Message #5 Posted by [Dallas Osborne](#) on 22 Aug 2007, 6:23 p.m.,  
in response to message #4 by Norris

I purchased the 'Essential Equations for the 33s' and have used the equations in it while taking FE practice exams.

Since the book uses the [EQN] function of the 33s to store equations; it doesn't really promote either entry system.

The advantage of the 33s for these tests is really just the ability to fill up the memory with equations for rapid solving...once you know what you are solving for. Just enter the variable you are looking for, punch in the knowns and POOF: \*an\* answer.

I have found that I spend slightly less time looking for any particular equation in the NCEES supplied handbook as I do scrolling through the equation library I built. However, the equations in the handbook are clearly labeled. Those in the calculator are not; many equations start to look the same as time-stress works on my brain (and limited labels/variables doesn't help). Knowing what equations to manipulate and what the answer *\*should\** look like is far more important. And this is takes time leaning over practice tests.

Most of these guides assist test takers but don't provide as an amazing edge as some claim.

### **Re: NCEES and the 35S**

*Message #6 Posted by [Fred Lusk](#) on 22 Aug 2007, 9:51 p.m.,  
in response to message #5 by Dallas Osborne*

Dallas...

I'm long past the PE exam (1982), but I have a suggestion for entering equations that will help you determine which one is which. Above every equation I make a fake equation that is the name of the equation on the next line. My equation list looks something like this:

EQN LIST TOP

2\*2 lin solve

3\*3 lin solve

CIRCLE

$A=[\pi]xSQ(D)/4$

PUMP HP

$P=(QxH)/(3960*E)$

...and so on

Of course, I can't properly show pi or divide here, but I think you get the idea.

Fred

**RPN for Kids.**

Message #1 Posted by [Doctor Bubu](#) on 22 Aug 2007, 10:10 a.m.

Hallo!

Some folks did thinking about new HP calculators and they think about High End.

I make my own thoughts and I wonder why nobody thinks about the low end. How did we learn to use a calculator, with SOLVE or with Matrix or with Statistic?

No, we used  $+ - / x =$  and some other keys. But did we learn to ENTER first? No our first calculator was Algebraic, and I looked around. What calculator I would give my two Children in School?

There is no simple Calculator with RPN.

That's what we need. A simple HP 35 or HP 21, for the first steps. But I don't want to give them an HP 35 A. How long did it work under that terrible conditions?

A simple Calculator based on the very good looking of the 35s with a good keyboard like the 35s and (it is very important for the survival of the calculator in school) a good hardcase like the 35s. But only with capabilities of the 21 or the 31.

What do you think about that that idea.

Greetings Juergen

Message #3 Posted by [Ed Look](#) on 22 Aug 2007, 10:57 a.m.,  
in response to message #2 by Chan Tran

But it should include the RPN option, so that in the future, assuming a calculator manufactured under today's paradigm can survive until the student matures some more, he can explore RPN.

**Re: RPN for Kids.**

Message #4 Posted by [Bruce Bergman](#) on 22 Aug 2007, 11:58 a.m.,  
in response to message #1 by Doctor Bubu

Actually, I think it's a great idea. I've had some similar thoughts (I seem to be on a bandwagon to get HP's back into the educational market, for some sadistic reason ;-)) and I would like to see something like that materialize.

It would also satisfy those who have been asking for a basic 4-banger with RPN functionality.

My main concern, however, is acceptance. HP would need to do a GREAT job of not only marketing it and showing it off well, but providing educational materials included with it. Remember, the \*parents\* are typically the ones buying calculators, and unless THEY understand what the benefit is, they have no motivation to diverge from the norm. Put a great, short example on the back of the packaging and maybe it might survive.

It's a great idea -- just tough to realize.

thanks, bruce

## Re: RPN for Kids.

Message #5 Posted by [Maximilian Hohmann](#) on 22 Aug 2007, 2:45 p.m.,  
in response to message #1 by Doctor Bubu

Hello!

Quote:

What do you think about that that idea.

Honestly, I am one of the heretics that do not believe in the inherent superiority of RPN. Rather, I am a Darwinist who believes in the survival of the fittest, and obviously RPN is not amongst those when it comes to education. Using RPN calculators at school would be a bit like teaching people to drive cars with right-side steering wheels in a country where one drives on the right hand side of the road. Anyway, it is not going to work simply because teachers do not understand RPN because most of them have ever seen it before.

And it is far more important to understand the mathematical problem then to punch numbers into a little box - the way the numbers are entered is of even less importance.

Gretings, Max

NB: The first calculator I gave our little son is neither RPN nor 'algebraic', but a 'Little Professor' that asks the children for the correct numbers and not the other way round :-)

I tell my son to memorize! Bah, I not buy him calculator until about year ago. He sophomore in high school. He tell me this year he want graphing calculator as all other kids have. I tell him I get him graphing Hungarian calculator. It consist of slide rule, pencil and graph paper. There his graphing calculator. He say he not happy, I say it NOT my job to make him happy. My job to see that he get educated and smart. Laziness bring struggle and I will not allow lazy son. If teacher think he need graphing calculator, then I go talk to teacher, and educate teacher. If teacher insist, then I make teacher buy graphing calculator, and pay for his college education too. He smart boy and I not want him to be lazy. He can do square roots very

quickly in head. I don't think any of his friends can do that. Sure, he have calculator now, and I very mad when I told he must have one, but I do not want him to get sucked into lazy culture of do everything easy. Life not easy, so he need to get used to it.

I come to this country with little money, and now I have two homes, cars, boat and airplane. That come from hard work, same hard work I wish him to do so he is proud of himself. When he is proud of himself and can say he is successful, then I know I did my job as his father. If he struggle because of laziness, then I failure as father.

in response to message #6 by Vincze*

Hi Vince!

On one side i accept your opinion, some times i do the same with my kids, but on the other side dont force your son to go the same way as yours, (it was a other time and a other place).

Let him stand upon your shoulder and he can reach much higher you ever think.

Greetings Juergen

**Re: RPN for Kids.**

*Message #10 Posted by **Dan Greil** on 22 Aug 2007, 10:18 p.m.,  
in response to message #5 by Maximilian Hohmann*

To me...

It's not about preserving RPN via the classroom because we're convinced it's more efficient. It's not about Darwinian survival of the fittest notation. It's about presenting an opportunity for students to learn an alternate method to something they take for granted.

That said, I doubt RPN should be made a part of general curriculum in high schools (or their equivalent). For many that are math-challenged, anything that gets in the way of an already limited mathematical intuition will serve only as an unnecessary distraction.

On the other hand, as expressed in another post, by all means introduce RPN to students that excel at math. These are the ones that will likely benefit from the choice of notations - and likely pursue careers where that choice will have an impact.

This approach doesn't require schools to adopt RPN calculators en masse in place of ALG models (which we all know will never happen). Instead, the exposure would be limited to advanced, college-prep math courses and more capable instructors.

### **Re: RPN for Kids.**

*Message #11 Posted by **Fred Lusk** on 22 Aug 2007, 10:20 p.m.,  
in response to message #5 by Maximilian Hohmann*

Max...

Better does not always survive. It is often overwhelmed by the sheer weight of mediocrity. Why else would my favorite baseball team be in last place, while their arch rivals are in the hunt for a playoff spot? :-)

When my son took high school calculus a couple of years ago he was the only student with an HP (I let him borrow my HP-48G). All the other kids had TI-89s or some such. The teacher was basically forced to teach a TI-centric curriculum because that is what was available to him. However, the teacher was actually thrilled that my son had an HP because the teacher's calculator of choice was a 48GX.

My son is no calculator nerd (he's a computer nerd), but he learned how to use the HP pretty well and could run rings around the kids with the newer, faster TIs for that reason. The key is that he learned how to use the tool (unlike his peers) and he learned it because he liked the way it operated, starting with RPN. Previously he showed no interest in my modest calculator collection, or the fact that I use an HP-42S every day at work. He had a simpler TI calc for Algebra II and Trig and his two older sisters had TI graphing calcs. However, after trying out his sister's calcs he asked to borrow my HP instead and decided to learn how to really use it. He turned down a chance to have a NEW electronic toy AND to be the oddball in his class. Certainly not a normal choice for a teenager.

I realize that this is the exception, not the rule, but there is still a market for the intellegent calculator user for RPN.

Fred

*Message #12 Posted by **Bruce Bergman** on 23 Aug 2007, 1:46 p.m.,  
in response to message #11 by Fred Lusk*

Fred --

You, and your son, are making my point beautifully. You son had a choice. He chose to use RPN. That decision alone doesn't make him a genius or anything, but it shows someone who is truly willing to work a bit harder for something that might even only be personally rewarding. He balanced going with the norm against perhaps really finding out something unique, and that was a great, mature decision.

Bravo! I wish there were more kids like your son in this world.

thanks, bruce

in response to message #1 by Doctor Bubu

Hi, Juergen:

Juergen posted:

*"There is no simple Calculator with RPN. That's what we need."*

It's arguable whether we need it or not, but our children certainly *don't*.

I see no reason to handicap them in class just because of their father's private hobby.

Best regards from V.

**Re: RPN for Kids.**

Message #16 Posted by **Bruce Bergman** on 22 Aug 2007, 4:09 p.m.,  
in response to message #15 by Valentin Albillo

Wow Valentin, that's pretty harsh. I don't believe learning, or using RPN, is a handicap -- whether it be in school or career. In fact, if I had your attitude, I wouldn't teach anything but Java or C++ in universities because they are the dominant languages. I'd skip needless other programming languages.

A good engineer, a good programmer, a good mathematician or whatever, uses a toolbox of options and choices. The answer to a problem should be the best tool for the job, not some "religious" belief that one

way is better than the other, or just because it is all that is taught, it is the only style to be used. To constrain oneself to learning one way of doing something is rather narrow minded.

Algebraic may be the dominant methodology today. And RPN might be a past bygone. But it is, by no means, a handicap. Take a look at those kids in the Texas Math Challenge (thread elsewhere on this page) and how they have grown and expanded their mind by using RPN.

Whether it is my hobby or my father's is irrelevant.

thanks, bruce

## RPN for Kids: Why it's WRONG !

Message #17 Posted by [Valentin Albillo](#) on 23 Aug 2007, 7:13 a.m.,  
in response to message #16 by Bruce Bergman

Hi, Bruce:

Harsh or not, my assessment is an accurate one and I'll give some reasons why I think this is so:

- Nowadays, next to *noone uses RPN calculators in class anymore*: not certainly most teachers, not certainly most pupils. For efficiency reasons, the teachers need to *standardize* and due to a number of important factors, not the least of which is the fact that *all mathematical texts use standard algebraic notation*, they chose algebraic calcs. This is a fact, and going against it is comparable to driving by the wrong lane, you're going to crash and burn.
- There's also the fact that, due to market pressure and other factors, *the number of RPN models in the market is very small*, a negligible minority in the calculator market to say the least. Essentially, only one company still makes them, and there are very few models to choose from, namely the HP-12C, HP33S, and HP35s, if we stick to classic RPN, *all of them subject to some serious limitations* such as an absolute lack of I/O, for instance. So if you're used to classic RPN or want to introduce it to your children, your options are few and, mostly, relatively expensive compared with the algebraic offer.

There's also the distinct possibility that the only company making them decides that they're not worth the effort, their sales aren't enough to justify the costs, and so the powers-that-be might as well decide to write them off the market, thus completely terminating their actual, precarious availability for good.

- It's also a proven fact that RPN tends to generate what could be termed as '*addiction*', in the sense that once some people are exposed to it, they'll get hooked to the point where *they won't feel comfortable at all* having to use any normal, non-RPN calculator, and would be *highly inefficient* using them, if at all, and would do whatever it takes to avoid using them, as they simply can't cope with algebraic machines anymore, at least not without feeling extremely uncomfortable while doing it.

If these people were then to be *forced* to use an algebraic model (because class regulations make it mandatory, for instance) they would automatically be in *great* disadvantage *and* severely *upset*, with both factors potentially capable or seriously *damaging* their assimilation of the subject matters being taught.

- Combining all of these factors, you can see that by introducing your children to RPN, you

risk they getting hooked on a paradigm which *doesn't* resemble what they see printed in their books, *doesn't* coincide with the procedures and keystrokes taught in class, and forces them to either adapt and convert on the fly what's being taught to their RPN ways, or else *burden the teacher* with the task of dealing with them and their RPN way of doing things, thus generating inconvenience for everyone there: the teacher, the rest of the class, themselves.

Also, once they're hooked, they'll have to confront the fact that, in the near future, there may be no RPN calculators easily available, and they'll *really, really resent* having to use an algebraic model, thus suffering a kind of *abstinence syndrome* for the rest of their lives. I know of *\*many\** people, friends of mine and colleagues alike, that suffer from the RPN bug: they simply *\*can't\** use an algebraic calculator with any decent proficiency, to the point that they'd rather take their NIB collectible HP-15C out from the box and into the dusty construction site if necessary if contemplating the possibility of being forced to use any algebraic calc.

I see this sheer reliance on an *obsolete paradigm* which surely faces extinction as a dangerous and unnecessary *niche adaptation*, which can be no good in the long run for the person afflicted with it.

- Also, there's the *myth* of RPN being perceived as "superior" to algebraic systems, offering this or that "advantage", which "absolutely compensates" and overcomes any alleged disadvantages.

As I've posted in several threads in years past, this is essentially a *myth*, mostly based in the fact that it was indeed true in the very early times, when calculators had a single-line, numeric-only display, extremely little RAM, and working with an algebraic machine essentially meant that you worked through your expression *blind*, seeing only one number or result at a time, not seeing the operators, not seeing the whole expression, not being able to ascertain whether you had opened or closed that parenthesis or not, not being able to ascertain just where you were in the process and continually risking getting lost and having to restart it all over again.

Compared to that, RPN and its 4-level stack was really the much more elegant, superior paradigm, by far, there was no contest at all, anyone could clearly see it. But 35 years have passed by, and while *classic RPN hasn't barely changed one iota*, algebraic models have experienced authentic *quantum leaps*. You can now see your whole expressions as you type them, in clear alphanumerics, you can edit them, re-evaluate them, the parentheses are automatically closed for you, ... yet people hooked on RPN still rely on comparisons from the earlier times: "If RPN was so utterly superior then, it surely still is, right ?" Dead wrong ! They simply adamantly *refuse to acknowledge* the advances in the algebraic camp, and in many cases can't be even bothered to try them or put them to the test on their own.

- Lastly, one of the usual arguments in favor of teaching RPN to kids (or of using RPN in general) is that it allows you a more intimate *understanding* of the expression you're evaluating: you can see intermediate results, you can check them on the fly, the fact that you must frequently pre-decide the order of evaluation makes you more aware of it all ...

In reality, *this is akin to making virtue of necessity*. It's *not* that you *can* do that with RPN, it's that RPN *forces* you to do things that way: you *must* see intermediate results, whether you want or need them or not, you *must* spend time and effort to *pre-decide the order* of evaluation whether you want it or not, lest you risk losing items out of the top of the stack, ....., which can happen nevertheless if you chose the *wrong* order. In which case, you'll have to restart from the beginning, as used operators (and probably most of the intermediate

results) are not recoverable.

This is similar to the arguments rised in favor of doing calculations with slide rule when the first electronic calculators arrived: many insisted that doing them with the slide rule required a more thorough understanding of the problem, what with re-scaling being constantly needed, and that forced you to think about your numbers and prevent mistakes or erroneously scaled results.

Those arguments seemed very solid in theory, but in practice they quickly died away, and I don't think that any parent would insist in their children going to school armed with slides rules because that would "enhance their understanding" of how results are computed and their accuracy. It might *sound* good, but it would *be* absolutely *handicapping*.

The bottom line is: who cares about the calculations ? About whether intermediate results are seen or not ? About how we do our operations, whether algebraic and parentheses or RPN and stack ? The important thing is that the children *understand the problem, understand the algorithms used to solve it, and can correctly write down the necessary expressions that get the results from the initial data.*

How these expressions are evaluated is *absolutely irrelevant*. It could be by hand, with an abacus, with a slide rule, with an RPN calculator, with an algebraic calculator, or by saying aloud "Computer: evaluate this, please" in a near future. Who cares !?

*The important thing is the understanding* of the problem and how to produce the expressions required to correctly solve it, *not* the mechanics of actually *evaluating* the resulting expressions. And as things are right now, I won't be the one to burden and handicap my children with obsolete \*evaluation\* paradigms, which are irrelevant to the definition and understanding of the problem, and which surely will be gone in a few years.

I'd rather have them dedicate their class time to understanding the problem and algorithms, rather than wasting precious time trying to adapt on the fly what is being taught to some obsolete "evaluation" paradigm.

Best regards from V.

## **Re: RPN for Kids: Why it's WRONG !**

*Message #18 Posted by [Maximilian Hohmann](#) on 23 Aug 2007, 8:02 a.m., in response to message #17 by Valentin Albillo*

Hello!

Didn't I say all this in one sentence yesterday already :-) ?

To quote myself:

Quote:

\_\_\_\_\_

And it is far more important to understand the mathematical problem then to punch numbers into a little box - the way the numbers are entered is of even less importance.

\_\_\_\_\_

Back at school and university, in mathematics and physics exams we would get around 4/5 of our points for writng down the correct solution (in terms of formulae etc.) and only about 1/5 for the

correct numerical result. And especially at university, the problems to solve were difficult enough so that most students couldn't even produce the correct solution in the time given, so usually the calculators didn't get turned on at all during the exams.

Greetings, Max

Hi, Maximilian:

Maximilian posted:

*"Didn't I say all this in one sentence yesterday already :-) ?"*

All of it, no; just about 16% or so. But probably the essential 16% ... :-)

*"Back at school and university, in mathematics and physics exams we would get around 4/5 of our points for writing down the correct solution (in terms of formulae etc.) and only about 1/5 for the correct numerical result.*

Same here, at my university getting the wrong numerical result would detract *nothing* from your mark as long as the exposition was sound and the relevant resulting expressions to be evaluated were correctly arrived at.

Best regards from V.

Valentin,

A counter argument for teaching RPN (at least in comp sci courses) it shows how Post Fix Notation is used with stacks. Understanding that fundamental can lead to more efficient programming.

**Re: RPN for Kids: Why it's WRONG !**

Message #24 Posted by [Bruce Bergman](#) on 23 Aug 2007, 1:33 p.m.,  
in response to message #17 by Valentin Albillo

Quote:

Hi, Bruce:

Harsh or not, my assessment is an accurate one [...]

Your **opinion** it might be, but I disagree that your assessment is accurate.

Quote:

For efficiency reasons, the teachers need to standardize and due to a number of important factors, not the least of which is the fact that all mathematical texts use standard algebraic notation, they chose algebraic calcs. This is a fact, and going against it is comparable to driving by the wrong lane, you're going to crash and burn.

Instructors (and schools) clearly need, and benefit from, standardization. There is a huge value in that, both in instruction and in merely saving money. However, textbooks are not as "standard" as you think.

In fact, the recent trend in higher-ed math/stat/finance textbooks is to offer "how do I do this with my calc". They list a couple of different ways of accomplishing examples using 2-3 calculators as the model of choice. There's no reason why HP couldn't aggressively and actively court the textbook publishers to include HP calcs using RPN as an option. Mostly, the publishers and authors just want someone to write that for them. They resist putting HP calc explanations in there because (1) up until recently, HP shunned the educational market, publishing included, (2) they don't have the time or incentive to write each example themselves, and (3) they don't know the technique of RPN. BUT! If you offer to write it for them, they're all for it. I contacted an author of a statistics text for higher-ed last year and discussed it with him, and he was quite open to me submitting an HP-

specific approach to the examples. The publisher appeared to be open as well, although I never followed up on it (um, I got busy elsewhere, unfortunately).

Going against the flow of traffic isn't a BAD thing if you are talking of concepts. Use of algebraic isn't a fact of nature, or of law. We're talking about concepts and ideas here. If everyone went with the flow, we would have ONLY Microsoft software in the world, now wouldn't we? Instead, we have Linux, or replacements for Microsoft Office. We have Firefox instead of MSIE. We have the Mac instead of Windows XP.

Quote:

---

o There's also the fact that, due to market pressure and other factors, the number of RPN models in the market is very small, a negligible minority in the calculator market to say the least. Essentially, only one company still makes them, and there are very few models to choose from, namely the HP-12C, HP33S, and HP35s, if we stick to classic RPN, all of them subject to some serious limitations such as an absolute lack of I/O, for instance. So if you're used to classic RPN or want to introduce it to your children, your options are few and, mostly, relatively expensive compared with the algebraic offer.

---

I agree that the numbers are small, and choices aren't the best. But, it CAN change, as we are seeing with the HP-35. In addition, I notice that you conveniently excluded the HP-50g/49/39 families, which have extensive I/O functionality. And compare favorably to the upper-end TI calcs with applets.

Did you even read the Texas Math Challenge posts earlier this week? Those kids go out and buy used calcs from eBay and craigslist, and use those when the "current" models aren't what they want. A lot of them use the 33s and 50g models. Yes, there aren't as many HP calcs as Casio or TI, but if you want to use RPN, you can certainly find a wealth of options.

Quote:

---

There's also the distinct possibility that the only company making them decides that they're not worth the effort, their sales aren't enough to justify the costs, and so the powers-that-be might as well decide to write them off the market, thus completely terminating their actual, precarious availability for good.

---

It's a risk, I admit. At one time in the past, I thought HP **did** give up on the market. I hope they never do in my lifetime. I choose, however, not to scare myself into using one platform simply because of the *possibility* of something happening.

Quote:

---

o It's also a proven fact that RPN tends to generate what could be termed as 'addiction', in the sense that once some people are exposed to it, they'll get hooked to the point where they won't feel comfortable at all having to use any normal, non-RPN calculator, and would be highly inefficient using them, if at all, and would do whatever it takes to avoid using them, as they simply can't cope with algebraic machines anymore, at least not without feeling extremely uncomfortable while doing it.

---

And this is a reason NOT to use RPN? C'mon, you're reaching... A "proven fact"? I'd love to see the clinical research study you are referring to. Could you please send it to me?

Quote:

---

o Combining all of these factors, you can see that by introducing your children to RPN, you risk they getting hooked on a paradigm which doesn't resemble what they see printed in their books, doesn't coincide with the procedures and keystrokes taught in class, and forces them to either adapt and convert on the fly what's being taught to their RPN ways, or else burden the teacher with the task of dealing with them and their RPN way of doing things, thus generating inconvenience for everyone there: the teacher, the rest of the class, themselves.

---

I don't buy it. Even as much as I respect you and love your comments, challenges and articles, this one has me puzzled. It's such a short-sighted, narrow-minded attitude. I am really surprised that your opinion is as you outline it. Sure, you've got some good points here. Some of which I agree with. But I just don't feel the same way as you and I'm kind of surprised that someone as smart as you is so obviously dissing RPN. Choice is good! I'm not a over-the-top RPN fanatic, but I feel strongly that this "choice" needs to get right back into the thick of things in the education market.

Look at it this way: Darwin is right, in that the stronger will survive. The ultimate survivor of this question **may** be algebraic. But I am not willing to concede the fight this early on. I say we give it to the kids, and let them decide the outcome. I'm willing to trust what comes out over the long run. Give them the choice and let them decide with an educated decision.

You may say "we've already done that!" and yes, that's partially true. But it *\*has\** survived, even after being beaten down and almost exterminated. And it seems to be getting a second chance. I don't give up on my beloved football team simply because they didn't do well the past five years. Give them the opportunity to try again.

Quote:

---

I know of *\*many\** people, friends of mine and colleagues alike, that suffer from the RPN bug: they simply *\*can't\** use an algebraic calculator with any decent proficiency, to the point that they'd rather take their NIB collectible HP-15C out from the box and into the dusty construction site if necessary if contemplating the possibility of being forced to use any algebraic calc.

---

I know the same kinds of people. I think, however, if you dug deep enough into their head, you'll find it's not a function of "can't" use it, it's that they don't WANT to use it. Big difference. I don't WANT to use TI calcs, and I don't have any in my house. I would prefer to use HP calcs with RPN, and it does annoy me when I have to borrow an algebraic calc. But I can certainly use them, and proficiently. I just choose not to. There's a big difference.

If, tomorrow, someone took away RPN from every written word, and magically erased every RPN calc from the world, I somehow thing all your friends and mine would manage just fine. They might not like it, but they'd get along.

Quote:

---

I see this sheer reliance on an obsolete paradigm which surely faces extinction as a dangerous and unnecessary niche adaptation, which can be no good in the long run for the person afflicted with it.

---

And sliding right down that slippery slope with you, I should give up on Linux, because it can't possibly replace Windows. And I should only learn one or two current programming languages

because the others will be extinct in a few years. And I should stop sending emails now because the younger generation says that email is dead and text messaging is going to be it in the future.

Whoa. Pretty free-thinking opinion there...

Quote:

---

o Also, there's the myth of RPN being perceived as "superior" to algebraic systems, offering this or that "advantage", which "absolutely compensates" and overcomes any alleged disadvantages.

---

Truly a myth. I don't tell my folks to use RPN because it is superior, but because it's a different way of doing something, and a way that they might find not only easier, but more helpful. I never say to them that it is superior, because that only breeds arrogance and resentment towards RPN.

Quote:

---

As I've posted in several threads in years past, this is essentially a myth, mostly based in the fact [...]

---

I agree.

Quote:

---

But 35 years have passed by, and while classic RPN hasn't barely changed one iota, algebraic models have experienced authentic quantum leaps.

---

Classic algebraic is the same as it was 35 years ago too. The advances you speak of are -- in some cases -- much like that 4-deep stack. There are accelerators to help with expressions. You can see more on the screen, but that's not a change to algebraic.

What about the changes we've experienced in RPL, or in solver equations? Or that both classes of calcs have seen with CAS? Those "model" changes are as quantum as any of the TI calcs.

Quote:

---

o Lastly, one of the usual arguments in favor of teaching RPN to kids (or of using RPN in general) is that it allows you a more intimate understanding of the expression you're evaluating: you can see intermediate results, you can check them on the fly, the fact that you must frequently pre-decide the order of evaluation makes you more aware of it all

...

---

I don't necessarily push these aspects either, but it's just as easy to come up with "usual arguments" as to why *algebraic* is better, and that doesn't make it any more right either. In fact, you were using many of them yourself. They are not necessarily wrong, but they are not necessarily right. Same for algebraic. I don't see these as big factors in the discussion anyhow.

Quote:

---

In reality, this is akin to making virtue of necessity. It's not that you can do that with RPN, it's that RPN forces you to do things that way: you must see intermediate results, whether you want or need them or not, you must spend time and effort to pre-decide the order of evaluation whether you want it or not, lest you risk losing items out of the

top of the stack, .....

---

Algebraic "forces" you to use parenthesis, doesn't it? Algebraic "forces" you to ignore intermediate results, doesn't it? For almost every necessity you can say RPN requires, algebraic has one too.

Quote:

---

This is similar to the arguments rised in favor of doing calculations with slide rule when the first electronic calculators arrived: many insisted that doing them with the slide rule required a more thorough understanding of the problem, what with re-scaling being constantly needed, and that forced you to think about your numbers and prevent mistakes or erroneously scaled results.

---

Agreed. I remember those very same discussions when the first calcs came out, and I agree that those discussions are similar to the whole "RPN helps you understand the math" arguments. I don't buy them any more than I bought the slide rule vs calc arguments back then. I had a slide rule and understood it as well as any other basic slide rule user, but I dumped it in a heartbeat for the calc. Not because it was archaic and handicapping, but because the calc was a more productive tool. I'd rather be more productive, getting more done, with more powerful tools, than to say that I "understand" the math more. The TI calcs aren't necessarily any more productive than the HP calcs. Sure, they do some things easier, but I can find a half-dozen things that the HP calcs do more productively.

Quote:

---

The bottom line is: who cares about the calculations ? About whether intermediate results are seen or not ? About how we do our operations, whether algebraic and parentheses or RPN and stack ? The important thing is that the children understand the problem, understand the algorithms used to solve it, and can correctly write down the necessary expressions that get the results from the initial data.

---

I don't care about the calculations either. I DO care about choice. About giving kids the ability to push their envelopes, even if it isn't the norm. I'm not saying every kid should learn RPN, or that it should be the standard taught in school. I AM saying that it should be an option.

Quote:

---

How these expressions are evaluated is absolutely irrelevant. It could be by hand, with an abacus, with a slide rule, with an RPN calculator, with an algebraic calculator, or by saying aloud "Computer: evaluate this, please" in a near future. Who cares !?

---

In all of those cases, I agree with you. In many others, I hear cynicism and...something else. Not sure what. Not pleasant though. I just hope and pray that our next generation of students don't have the same narrow-minded attitude that you appear to have.

Now THAT is harsh.

thanks, bruce

### **Re: RPN for Kids: Why it's WRONG !**

*Message #25 Posted by **Valentin Albillo** on 23 Aug 2007, 4:38 p.m.,  
in response to message #24 by Bruce Bergman*

Hi again, Bruce:

First of all, thanks for you detailed and initially interesting reply to my e-mail, much appreciated. Now some brief comments to specific points of it:

Bruce posted (*italics* are Bruce's original sentences, all underlining is mine):

*"Your opinion it might be, but I disagree that your assessment is accurate."*

So far so good ... Now for assorted "pearls":

- *"I don't buy it. Even as much as I respect you and love your comments, challenges and articles, this one has me puzzled. It's such a short-sighted, narrow-minded attitude [...]*
- *I'm kind of surprised that someone as smart as you is so obviously dissing RPN [...]*
- *And sliding right down that slippery slope with you, I should [ ... {lots of absurd, ad-hoc non-sequiturs} ...] Whoa. Pretty free-thinking opinion there ... [...]*
- *In all of those cases, I agree with you. In many others, I hear cynicism and...something else. Not sure what. Not pleasant though. I just hope and pray that our next generation of students don't have the same narrow-minded attitude that you appear to have. [...]*

Now that's crossing the line as far as I'm concerned. After a decent beginning, you seem to become hotter and hotter by the minute till you resort to a bunch of ad-hominem attacks, adscribing to me all sorts of negative opinions and attitudes which you see fit, including the string of preposterous non-sequiturs (after "slippery road" in your original message) as if I would agree with such nonsense, and finally accusing me of "cynicism" and "something else" which also happens to be "not pleasant", plus "narrow-minded" attitude, and what else.

That I consider akin to name-calling and a blatant disrespect to me and my stated points, which you might not share or even positively dislike but in a civilized argument you are required to respect, both.

I don't remember having included in my posted message a single word about you, your frame of mind, or your attitudes, good or bad, so I don't quite see why a supposedly intelligent and educated person such as you would have to resort to such low levels to discredit an opinion you don't agree with.

*"Now THAT is harsh."*

Indeed. This argument is finished as far as I'm concerned and I would ask you to please refrain from using my name to put in my mouth or mind opinions which I haven't explicitly uttered or contemplated, as you do several messages below in this same thread while replying to some other message.

Also, in so far as you don't seem to have an attitude of respect towards me and my ideas, even if you don't share them, I would be obliged if you would refrain from referring to me or my ideas or the ideas you imagine I have. I'll do the same with you.

Thanks in advance and

Best regards from V.

### **Re: RPN for Kids: Why it's WRONG !**

*Message #26 Posted by **Bruce Bergman** on 23 Aug 2007, 5:21 p.m.,  
in response to message #25 by Valentin Albillo*

Everyone is entitled to an opinion, even me. Maybe its your choice of words, or the way you wrote it or whatever, but your statements often make it sound like what you say is fact, and what others think (or say) differs from that fact.

"...my assessment is an accurate one..."

Why is my assessment not an accurate one too? Am I not allowed to discuss your message, point-by-point, and offer a differing opinion?

"...it's a proven fact that RPN..."

I'm not aware of that fact, and you still haven't told me where you got that from. Why must I assume your fact is correct? I have the right to ask for clarification or proof. All of my comments were expressing an opinion, and sharing information, not coming to a conclusion.

None of my examples were any more non-sequiturs than yours, since you were the one who chose certain examples such as driving on the wrong side of the road, etc. You brought up the slippery slope that once you introduce RPN to kids, they risk getting hooked, which leads to adaption, etc. Where did THAT line of logic reasoning come from? If you're allowed to jump to conclusions, I certainly can too.

Heck, maybe you just don't like someone pushing back on you, expressing a different opinion and trying to point out other things to consider. None of those were attacks on you (whether you think so or not), and in fact I went out of my way to tell you that I respect you and always have. I still do. I just have a different opinion, and I have the right to express it.

I will certainly honor your request, and I won't put words in your mouth. I will always, however, reserve the right to respond in kind to postings -- yours or others -- using original words, and expressing my own opinions. Perhaps I prefer to be more blunt in my replies at times. It's just as easy for someone to express a "tone" in messages that achieve a similar result. I prefer to just say it and lay it on the table. Let everyone make up their own mind, you know?

thanks, bruce

By the by, I'd be more than pleased to buy you a pint at the conference and we can laugh at all this, if you're up for it. No harm intended.

thanks, bruce

**Re: RPN for Kids.**

*Message #28 Posted by **Ren** on 23 Aug 2007, 11:02 a.m.,  
in response to message #16 by Bruce Bergman*

Programming languages?

You mean you straddle your students with a dead language like Pascal because you aren't innovative enough to teach them C, C++, Java or other current languages? What does Pascal offer that can't be taught in the other languages? Data structures? Nope... Variables? Nope... Ease of learning? Hah!

It is past the time for Computer Science teachers to let go of some "teaching languages" and start TEACHING LANGUAGES!

I didn't have to learn Ancient Hebrew, Ancient Greek, or Latin to learn how to speak English. So why fill up your students brains with Pascal before you teach them something that is useful in the job market?

(Now I do admit that learning the ancestral languages of my tongue is helpful in better understanding English, but I don't feel it should be a pre-requisite for kindergarten).

Sure you can teach them MIPS or 68K as assembly languages, for there is a growing market for programming embedded devices.

The oft used rebuttal by comp sci teachers is, "its easier to teach Pascal". Why is it easier, is it because that is what the teacher learned, and they are quite comfortable in their ivory tower?

Okay, I'm through ranting...

(for now)

Ren

dona nobis pacem

**teaching programming languages**

*Message #29 Posted by **Don Shepherd** on 23 Aug 2007, 11:14 a.m.,  
in response to message #28 by Ren*

Ren, regarding teaching programming languages, I would make a distinction between teaching students who aspire to be programmers versus other liberal arts students who just want an introduction to programming, but won't make it their living. For the programmers-to-be, I'd teach the popular languages plus show the kids some older languages so they get an appreciation for how programming has evolved over time. For the non-programmer who just wants to see a little of what programming is about, Kemeny and Kurtz had it right in 1964: BASIC. Kids can learn the essentials of vanilla BASIC in an hour, and use it productively in a short time.

**Re: RPN for Kids.**

*Message #30 Posted by **Bruce Bergman** on 23 Aug 2007, 12:21 p.m.,  
in response to message #28 by Ren*

Ren --

I think you confused me with someone else. I do NOT teach Pascal, and I have resisted that abominable language since the day it was taught to ME back in college. In fact, I resent your comment that I "straddle" anyone with things that aren't "innovative". I don't know how you got that from my post, but maybe you have some pent-up aggression towards instructors in your past??

My point was that if mere dominance is the reason for selection of what to teach in higher-ed, then we would have schools ONLY teaching Java and C++. Fortunately, that's not the case. To be so narrow minded as to teach one or two styles of programming would be a travesty of education, and it does nothing for upcoming programmers.

Many universities now teach other programming languages like Visual Basic, C#, ColdFusion, Perl, Python, PHP, Ada, PL/SQL and others. True, they are not the dominant languages, but by getting students exposed to them, the pros and cons, the trials and tribulations, etc., the student starts to understand why there are CHOICES in the world.

There were a ton of Pascal programmers on the market after the 1980's, and that was because it was the language being taught. AND it resulted in some piss-poor code out there. The reason why we HAVE languages like C++, Java and C# is because finally people started understanding what was wrong with the older versions, and realizing that there are choices. I.e., make it better.

I "collect" programming languages like other people collect calculators. I know more than 34 programming languages, and I'd say I'm more than fluent in at least 8-10 of them. One of the reasons why I got as far in my career as I did is because I can offer clients that breadth of knowledge -- that breadth of CHOICE -- to pick the right solution with the right tools. If my toolbox only had two options in it (or, sadly, as Valentin would want: ONE choice), I am limited in what I can do.

I won't go into a discussion of why it's valuable to learn the historical languages (both spoken and programming) if you want to truly understand more modern languages. In my mind, that argument doesn't apply to all students -- it applies to those who are truly heading down the computer science path, not the IT path. It's easy enough to get a career as a decent programmer when you only know a couple languages and don't desire to dig deeper. But when I want someone who is a compiler designer, or who writes code generators or run-times, I do NOT seek those IT people out; I search out someone with a computer science background, who HAS gone and studied those old languages and understands why decisions are as they are today.

I know I'm kind of mixing calcs with programming, but I draw a parallel between the two. If we provide kids with only one way of learning to do math, they only know that one way. If we offer them the choice -- even if it is a less-used choice -- then some of them are going to have a lightbulb moment and move beyond their peers.

If I were teaching math to teens, I could be happy/content with teaching the vast majority of them the things they need to succeed, using TI calcs. But... It is the rare kid who brings in that HP calc to class who I would spend extra time with. That kid is likely to be the one who makes a difference in this world. Instead of blending into the woodwork of normalcy, that kid is probably going to be the one who stands out in our world. NOT because he or she has an HP calc, but because he or she chose to try a different road.

For example, in one of my music classes recently, a student asked if she could write her term papers in poetry instead of straight prose. The prof thought for a moment and asked her to write an

example of what it would look like with the topic being how the piano had evolved over the years. She did, and he was VERY impressed. It wasn't a flippant work, just trying to be cute or artistic. It conveyed exactly what he asked, with factual content, and yet it was written in a poetic (??) style. She got her wish and wrote all of her papers in that style.

She took a stance to try something out of the box. It was probably much harder than a traditional paper. Yet because she had CHOICES and didn't feel like she had to do it one particular way, she made a difference to all of us in class, including the prof. She is the kind of person who I expect will stand out in our world.

Giving up on RPN simply because algebraic is the dominant tool is sad to me. Not for nostalgic reasons, but because I believe it is short-sighted, and shows me that people would rather -- as YOU put it -- go the "easier" route. Personally, I'd rather challenge myself, and my students, and give them the option.

thanks, bruce

---

I had a teacher like that. This was in about 1980, and I had a programmable calculator (a TI SR-52, not an HP unfortunately). We were learning how to solve systems of equations, and I had programmed the algorithm (Gaussian elimination) into the SR-52, from scratch. It worked for 2 or 3 equations (since there wasn't enough memory to hold the coefficients for more than 3), but it was implemented to solve the general case. I asked him if I could use it (and the program) on my math tests, and he agreed. Another student overheard this and objected, to which my teacher responded, "if he understands the method well enough to program the calculator to do it, he deserves to be able to use it."

Basically, instead of forcing me to conform to the way everyone else did it, he let me take advantage of the skill and initiative I'd shown. That was probably a more valuable lesson than knowing how to solve systems of equations.

Stefan

*Message #32 Posted by [Bruce Bergman](#) on 23 Aug 2007, 1:39 p.m.,  
in response to message #31 by [Stefan Vorkoetter](#)*

Good point. In fact, back when I was in high-school (same timeframe!), using calculators of ANY kind wasn't permitted, let alone HP calcs. I finally successfully argued with one of my

teachers to let me use my HP-25c in class because if I knew the algorithms and technique well enough to program it, I certainly could do it on paper. After showing him how I did it, he agreed.

Like you, I think this was one of the more valuable lessons learned.

Did we go to the same school? ;-)

thanks, bruce

*Message #33 Posted by **Ren** on 23 Aug 2007, 2:23 p.m.,  
in response to message #30 by Bruce Bergman*

Bruce,

When I saw the phrase in your earlier posting "teaching languages", I went ballistic (too much caffiene). After I'd posted, I re-read your post and saw it for what you intended. While I didn't mean to attack you personally, it was your posting that triggered me to hit the reply key. Reading your follow-up to my rant, I agree with much of what you wrote.

I humbly apologize for not reading your post clearly before replying, and I'm sorry I made you look guilty of lazy teaching (of which you are not).

Over the years of being a student, I've gotten touchy (over-sensitive) to instruction that didn't make sense to me, busy work as it were, for students, work that distracted from underlying goal of the course. Often when instructors were challenged about that, the "we've always done it this way" reply was common.

On the subject of BASIC, well I suppose in the form of Visual BASIC it can be argued (ooh, I'm good at arguing today!) that BASIC is NOT a dead language. (I also think the embedded processor BASIC-stamp further supports that BASIC is alive). I'm not opposed to teaching BASIC, but it too was the first language I learned, and so I don't want my prejudice for it (I have a few you may have noticed B^) to automatically impose it on any possible student, just because it would be the easy route for me to teach. Again, I'm not criticizing BASIC, or your response, just doing a bit of self evaluation.

*Message #34 Posted by **Bruce Bergman** on 23 Aug 2007, 2:31 p.m.,  
in response to message #33 by Ren*

Thanks, Ren. I figured you might have had some pent-up anger ;-), and I fully understand it in relation to Pascal.

I, like you, was always confused and driven crazy by the push to teach Pascal as if it were the panacea for all programming. In reality, it was inconsistent, slow, painful and sadly missing many important concepts that existed in other languages at the time.

I'm sure there were reasons at the time, but I never bought into them. It still bugs me when a university teaches Pascal.

I totally agree about work done merely because it has always been that way, or to just "rote" people into doing things. The profs who spend the time to teach a subject and make sure you understand it, and then use it as a leap to other things, are worth their weight in gold.

BTW, I love mutzing with the Basic Stamp. Brings me back to my old embedded systems days, and it just feels so...fun! :-)

thanks, bruce

My first calculator was an RPN four-function model, the Novus 650 "Mathbox". It had a six digit LED display, and basically only did integer arithmetic (there was a permanent decimal point displayed between the second and third digits from the right). I think it cost \$20. I don't recall exactly when I got it, but it was some time between the 4th and 7th grade (1973 to 1976).

I turned out just fine, thank you very much.

in response to message #15 by Valentin Albillo

Buenas tardes, Valentin,

your post shall be taken with a grain of salt. IMHO, the average student (i.e. escolar, Schüler) shall get what the teacher recommends and/or the majority of his/her classmates use. This is to guarantee optimum support during lessons. Nowadays this will be some TI or Casio.

If, however, you know you have a little math genius at home, who enjoys math instead of struggling with it, why not show him/her something which will make calculating life a little easier for the price of another way of thinking? Remember the translation of "Mathematika" is "learning to think".

The average student (i.e. estudiante, Student), however, should be sufficiently mature to select the best tool supporting his/her studies, whatever it's logic system may be.

Just my 20 Milli-Euros.

BTW, what bothers me: How do you Americans differentiate between students and students (please see above)??

Güten nacht (or is it morgen there now?), my friend Walter. This is easy. There are two type of student in America. Those that have to be, and those that want to be. The later have a light in there eyes that is different. Most likely much like yours, mine and the rest of those in this group. The former, is more like the student who just want to get done with school so "life is no a hassle" and realize it really is just beginning for them (hassle that is). The most later student I pray for, the former, I thank God for.

**Re: RPN for Kids.**

Age?

Level? (Secondary or postsecondary or graduate?)

For secondary "students", often another word can be used, "pupils". In some instances, and you'll have to read the (American) English context, "student" means one studying to be a scholar. I suspect, at least in America, you may generally need a master's (wow!) or doctorate degree (holy smoke, what's he, crazy??) to be called a scholar. If only a baccalaureate, I think it's just "college grad".

Maybe you need to master (or in the case of some our posters here who own screwdrivers and soldering irons, doctor) a HP RPN scientific programmable calculator? Yeah, I like this one.

**Re: RPN for Kids.**

*Message #40 Posted by **Valentin Albillo** on 23 Aug 2007, 7:24 a.m.,  
in response to message #37 by Walter B*

Buenas noches, Valentin,

after reading the major part of it, I hope you did not mean that this very personal discussion above "equally well applies to what you say in your post". But maybe I took the wrong answer? Anyway, I'm not in the mood of arguing, so I let you get away with it today. Sleep well!

**Re: RPN for Kids.**

*Message #42 Posted by **Valentin Albillo** on 24 Aug 2007, 6:20 a.m.,  
in response to message #41 by Walter B*

Hi, Walter:

Walter posted:

*"After reading the major part of it, I hope you did not mean that this very personal discussion above "equally well applies to what you say in your post". But maybe I took the wrong answer?"*

No of course it does *not* apply to you and yes, it seems you've read the wrong answer. I was specifically referring to message #17, my *second* post in this thread (my first one, to which you replied initially, is #15).

You've probably read my *third* post in the thread, (in which I regretted the non-sequiturs and ad-hominem attacks issued by some other poster) instead of the *second* one, in which I elaborated my points in much greater detail, specially when compared with my terse, 2-line initial message.

If you then go on to read my second message (#17 it was) and have any further comments, please don't hesitate to let me know. Thanks for your continued kindness and

Best regards from V.

**Re: RPN for Kids.**

*Message #43 Posted by **Walter B** on 24 Aug 2007, 5:13 p.m.,  
in response to message #42 by Valentin Albillo*

Buenas tardes, Valentin,

besides the danger of "addiction" you claim, I do not see in your response #17 too much difference to my post above - besides you like to write longer posts than me.

I would rather claim people get accustomed to RPN than addicted. And, the older we become the less we like (or are able) to change our dear customs. Nevertheless, I'd still rate RPN being "better" than ALG, provided the stack size is set to 6 levels for real "sans soucis"

calculations. But, to repeat it, I would not force an average pupil to use it.

Once again, just my 20 Milli-Euros :)

Dr B...

Actually, I started with RPN, not algebraic. The first calculator I ever used was my dad's HP-35, which he got in late 1972 when I was in 9th grade. RPN is so natural, it took almost no time for either of us to learn how to use it. Natural? Sure, once you realize that it is impossible to perform an operation on one or two numbers without first having the numbers, then postfix becomes natural. All other syntactical methods must "store" the operation waiting for the number.

Fred

### **Re: RPN for Kids.**

*Message #45 Posted by [bink](#) on 22 Aug 2007, 10:36 p.m.,  
in response to message #44 by Fred Lusk*

I agree. I started out with a simple 4 function calculator, but when it was time to step up at age 13, I bought an HP 41CV and learnt how to use it and program it by myself. I sometimes had to use an algebraic calculator because no-one knew what an HP 41 was, but I still think RPN is much easier to use.

My GF needed a financial calculator so I offered her my spare HP 12C, but she thought RPN was too complicated (having never used it). So I bought her a TI Business Analyst. After seeing me use the HP more quickly, she has given up on it and wants an HP 12C as well.

I really do think that RPN is easier to use and more in tune with how mathematics is. Algebraic is better for those who don't understand, and simply want to key in formulas exactly the way they see them on the page. The latter people then tend to trip up when they don't have access to a calculator.

### **Re: RPN for Kids.**

And that's where algebraic diverges from actual life & work in engineering. Schools focus too much on memorizing equations and not on understanding what's behind them. Very often *there won't be a formula written down!* I find myself usually having to think through what's actually happening *while* punching buttons, and it would take me *longer* if I had to form a complete equation before beginning the calculation or writing a short program. If I use my HP-71 as a calculator instead of the 41, I use the cursor keys a lot to go forward and back as I form the equation, and then I have to be careful about the

pile of parentheses. (I hate the 71's "calc" mode too, and never use it.)

B^)

I'm sure you had learned math[s] algebraically long before the 9th grade.

Come to think of it, we ALL probably learned RPN without knowing it. For instance, take the problem of adding, subtracting or multiplying two "large" numbers (to a third grader), i.e., 23 and 146. First, we write down the two numbers stacked:

$$\begin{array}{r} 23 \\ 146 \\ \hline \end{array}$$

THEN place the appropriate symbol for the problem,

$$\begin{array}{r} 23 \\ +146 \\ \hline \end{array}$$

However, I agree with Valentin...I'm "forced" to use TI calcs in class since they have the best overhead for classroom demonstrations, 29 of 30 students have a TI, and a used TI-84 can be found for \$30 (a VERY capable calculator). It's not until I teach differential equations or linear algebra that I start taking my HP into class making a few converts. But again, in ANY class the understanding and correct synthesis of the problem is more important than the precisely correct answer.

Chuck

in response to message #1 by Doctor Bubu

From what I've seen with my grandniece and grandnephew, they found using RPN calculators much more intuitive than the algebraic models that they'd used before. Of course, they were just getting started with using calculators for anything more than basic arithmetic, so they weren't yet too indoctrinated into using any sort of algebraic interface.

My two concerns with children learning to use RPN models would be first that it may well be difficult for them to get help in using them, and second that RPN models may stop being manufactured at some time in the future.

Personally, my first experiences with "calculators" were with "adding machines".

*Message #52 Posted by [Patrick Rendulic](#) on 23 Aug 2007, 4:57 a.m.,  
in response to message #1 by Doctor Bubu*

6 years ago I started working as a physics teacher at a high school in Luxembourg. The young people I am teaching physics to are aged from 14 to 20.

Up to now, no one, absolutely no one of the pupils/students I have worked with had an RPN calculator!

The calculators that ore most used are the basic scientifics from Casio and TI. Some students have Casios with the "Natural Textbook Display". They like it a lot because it is so easy to copy written problems to the display of the calculator. No way to worry about parentheses and above all, the meaning of what they are calculating.

For me it is impossible to introduce RPN calculators in my course:

- All students have their cheap 10 to 15 Euro basic calculator. They are not willing to spend some extra 60 to 100 Euro for an RPN calculator that is hardly available in stores here in Luxembourg.
- They don't know RPN and cannot understand the advantage of not having parentheses. The problem is that you have to know some basic rules of mathematics in order to use a RPN calculator. Or for most of them, mathematics is something they don't want to learn, no way!
- The main problem is, that they should have to learn RPN earlier, at least at the beginning of their high school career when they are 12 years old. Or there we have another problem. Most mathematics teachers I know don't even use RPN! Most of them even think that it is too complicated! This really is the wrong start.
- Nevertheless, many of my students are amazed how fast I can calculate with those strange machines at the blackboard!

So a simple RPN calculator for kids would be a good start towards illumination of those dark minds!

**Re: RPN for Kids.**

*Message #53 Posted by [Ed Look](#) on 23 Aug 2007, 12:07 p.m.,  
in response to message #52 by Patrick Rendulic*

I must admit, right before I decided to spend the then (a looonngg time ago) \$124 USD for a HP-34C, the decision did require a bit of persuasion.

The major reason for any resistance was the relative higher cost of the HP machines over the TI ones (which seems to be less true today). But some very intelligent graduate students who happened to be also my instructors and supervisors convinced me (a professor also had the same high opinion of HP's RPN calculators, but was far less persuasive than the grad students) of the superior power of RPN once it was mastered and the superior quality of HP construction (then VERY true).

I am glad I listened to them; I still enjoy using RPN programmables.

**Re: RPN for Kids.**

*Message #54 Posted by [Chan Tran](#) on 23 Aug 2007, 3:43 p.m.,  
in response to message #53 by Ed Look*

If the expression is already written down somewhere I found that a calculator with "text book entry" is the easiest to use. If I am solving something like a word problem and I have not written down an expression then RPN or RPL is easiest. The algebraic type is OK but I often forgot the extra parenthesis when I have an expression that use the bar for divide or one that use the radical sign.

## **Re: RPN for Kids.**

*Message #55 Posted by [dbatiz](#) on 23 Aug 2007, 6:35 p.m.,  
in response to message #1 by Doctor Bubu*

My humble post will not compare to the comprehensive and eloquent discussions above. I only would like to add the following observation:

I've tutored many children and adults, all of whom used TI hardware, through algebra (Junior High, High School, and College Algebra). Many of them had used their TI for several years before entering the course. All were very proficient at manipulating their calculators, but none of them, not a single one, knew the order of operations.

I have seen algebraic entry systems used in education become a crutch over and over again.. For the few kids who actually get it, more power to them. But the vast majority learn how to get the "Answer" never having a clue what the "Solution" is.

In the hands of a person with sound math skills, the RPN/Algebraic choice is truly a matter of personal preference. But for a student, I believe algebraic provides way too much automation.

I'd never presume to speak for all children, but my boy will carry an RPN until he's able to buy his own. If he encounters a professor that requires other hardware, he'll carry both. I don't mind automation lifting the arithmetic burden, but I insist that he does the MATH.

I recently read Mr. Albillo's story, "Time Voyager". I enjoyed it immensely. If I may, I have a question for the author: If the story featured an algebraic machine, which one would it be and why?

Very respectfully,

David

[ [Return to Index](#) | [Top of Index](#) ]**Suggestion for an Emulator/Simulator***Message #1 Posted by [Chan Tran](#) on 22 Aug 2007, 8:59 a.m.*

Instead of a emulator or a simulator of a real HP calc I think what would be very useful is a software calculator. I know there are many of them out there. My idea is one that has the capabilities based on the 48, 49 and 50G. It won't be as powerful and expensive like Mathematica. It would have all the functions of say a 50G but taking the advantage of large display, large keyboard and large memory of a PC. For example, the plotting capabilities of the 50G is quite good but the screen is too small to be of much use, a large screen on a PC would make it much more useful. The calculator would be able to display large equation with the equation writer without scrolling. It would be able to display many levels of stack. We can simply have pull down menu, computer style, instead of the kind of menu we have on a hand held calc. I would be willing to pay the price of a 50G for such a software package. Another nice thing is that now I can pick nice hardware to run it on or if I don't care I can run it on a cheap PC. What do you think?

**Re: Suggestion for an Emulator/Simulator***Message #2 Posted by [hugh steers](#) on 22 Aug 2007, 3:14 p.m.,  
in response to message #1 by Chan Tran*

this is the kind of thing ive been working on. basically make a virtual calculator and host it anywhere, like on the 50g platform for example.

ive been showing people the idea of a virtual calculator running on a real calculator and they think i'm cookoo. but it makes sense because all the buttons are there.

insofar as a programming language i thought that rather than adding a programming language to a software calculator, i'd add a software calculator to a programming language! i have extended LUA to have a expression evaluating command line and to have a choice of number systems for different purposes. i have some graphic demos too, but they're not finished right now.

i'm going to talk more on these ideas at this years HHC/HPCC conferences.

### **Re: Suggestion for an Emulator/Simulator**

*Message #4 Posted by [hugh steers](#) on 22 Aug 2007, 6:32 p.m.,  
in response to message #3 by Howard Owen*

hi howard,

i'm interested to know if there's a way to call out to the built in functions of the 50g. if this were possible, then it would automatically give all the functions of the 50g plus a new programming language.

someone somewhere must know how to call parts of the rom from cold. since luacalc works in decimal it would be easy to convert to and from my internal number format without a big overhead.

then you would have your calculator.

### **Re: Suggestion for an Emulator/Simulator**

*Message #5 Posted by [Howard Owen](#) on 22 Aug 2007, 8:21 p.m.,  
in response to message #4 by hugh steers*

What you need are hooks into System RPL from your implementation, right? I assume your LUA interpreter is compiled with hpgcc. The libraries that come with that package aren't enough? [The folks that wrote the libraries](#) might be interested in what you are doing. Their [hplib documentation](#) states that it contains "[a]n exposed interface to the underlying KOS operating system calls (for advanced users only)." I assume that means the ARM based kernel. From there you would have to access the Saturn emulator. It sounds like it might be difficult to do, but you probably wouldn't have to go it alone.

Regards,  
Howard

### **More on hplib**

*Message #6 Posted by [Howard Owen](#) on 22 Aug 2007, 8:37 p.m.,  
in response to message #4 by hugh steers*

A quick perusal of that documentation shows me that they have gone at least part way down the path to a general interface to the Saturn emulator. They have stack manipulation pretty well nailed, and data type conversions too. Finally, there's a Saturn file system header file. I see they also have a basic math library. I wonder if that's a reimplementaion, or calls the on-board math stuff? The advantage for the latter approach would be compatibility with native HP50g results. The former would be better for speed, of course.

Regards,  
Howard

### **Re: More on hplib**

*Message #7 Posted by [hugh steers](#) on 23 Aug 2007, 4:21 a.m.,  
in response to message #6 by Howard Owen*

yes there is stuff to manipulate the RPN stack and get to the file system, but AFAIK nothing to call builtin functions. I can push onto the stack, but i can't call anything. i need some help on this.

the math library is a softfloat ieee754. i'm not using the hpgcc math lib. instead i have my own BCD code in there.

*in response to message #4 by hugh steers*

Mr. Steers,

I am wondering if you caught this very recent thread at comp.sys.hp48. It seems two programmers over there are getting serious about Lua on the hp 50g, so I thought I would let you know, as I thought you might be interested.

The thread has grown quite a bit, and there is some bickering about using some "ancient" languages to program for the hp 50g (Ada and Fortran were mentioned!), but if you weed through those posts, later in the thread you will find two people, "Claudio" and "manjo" discussing Lua.

There is the thread:

[http://groups.google.com/group/comp.sys.hp48/browse\\_thread/thread/f766a3eb68e61200/ba0bdb574b4ed387](http://groups.google.com/group/comp.sys.hp48/browse_thread/thread/f766a3eb68e61200/ba0bdb574b4ed387)

I hope this helps somehow.

Cheers, Pal

### **Re: Suggestion for an Emulator/Simulator**

*Message #9 Posted by [hugh steers](#) on 23 Aug 2007, 4:36 a.m.,  
in response to message #8 by Pal G.*

thanks! they are refering to my 50g hplua port. i've made a lot of changes since the last release and these are not yet on sourceforge mainly because i need to do a proper tidy up before checking it all in.

i've rehosted hplua in a new graphical front end which is capable of international characters, greek etc and also general graphics, lines pictures etc. right now i have to tweak the fonts somewhat. but basically there is unicode coverage. later i hope to display formulae.

### **Re: Suggestion for an Emulator/Simulator**

*Message #10 Posted by [Pal G.](#) on 23 Aug 2007, 10:35 a.m.,  
in response to message #9 by hugh steers*

Ok, I saw your response to the thread c.s.hp48. Good deal. I suspected from the thread they were aware of your port and were not discussing starting from scratch..

I am a fan of Lua as well, having written several programs in Plua (Palm OS port). I have not tried your port yet, but have been keeping an eye on it. I have school, work, and kids, thus little time.

Can you tell me what you mean by "rehosted" hplua? Have you moved from a console interface to a frame-buffered graphical application interface (which can print text or graphics)?

Cheers, Pal

*Message #12 Posted by [Chan Tran](#) on 23 Aug 2007, 3:37 p.m.,  
in response to message #11 by [hugh steers](#)*

Actually my idea was for a program that run on the PC and has the mathematical capabilities of the 50G with the exception of a very large screen, large keyboard and lots of memory. I found that the 50G has sufficient capabilities in both numerical and symbolic as well as graphing except that its screen is too small to be very useful especially in graphic. Data entry is also slower because it doesn't have a good keyboard nor a mouse.

### **Re: Suggestion for an Emulator/Simulator**

*Message #13 Posted by [hugh steers](#) on 24 Aug 2007, 5:02 a.m.,  
in response to message #12 by [Chan Tran](#)*

i agree with you about the screen size - and what kind of wombats make a screen with an ODD width!

the 131x80 screen is pretty pathetic for graphing and display of any kind of interesting formulae. its also slow and not in colour. if i try to display any movement, i get a horrible blur a bit like looking into a bowl of hot porrage (due to the bogus dithering).

im trying to make the best of it tho' :-)

### HP 35s - my first thoughts

Message #1 Posted by [Patrick Rendulic](#) on 22 Aug 2007, 6:13 a.m.

I finally got my first HP35s through Samson Cables s.n. CNA 72105985. As I live in Luxembourg/Europe it was still a very good deal. It only costed 63 Euro, including shipping.

Here are my first thoughts concerning the physical appearance and some functions of the calculator :

- I think that the form factor is too big. In comparison to the Pioneer or the Voyager series, the calculator is too thick and too large for a comfortable fit in my shirt pocket. It should be 1 or 2 cm (an inch) shorter and thinner, just like an HP32 for example.
- The built quality of the case feels cheaper than that of the Pioneer series.
- My unit shows some cosmetic defects out of the horrible blister case. The color of the LCD screen is not uniform. The lower left part has a more greenish tint than the rest of the screen. Some dirt was on the outer side of the right top part of the screen; I managed to remove it. A minor scratch (less than half a mm) in the paint is located below the screen bezel. The visibility of the top annunciators is not very good.
- The key click is good, but not as "sharp" as on a HP 41. In comparison to a HP 48 the keys feel a bit softer. Nevertheless I think that the keyboard is quite acceptable.
- In complex mode it is very hard to distinguish "Theta" from the numbers.
- Concerning vectors, there should be a cross-product function, the dot-product is there.
- The implementation of complex numbers should be better.

Considering the price, the HP35s remains a wonderful deal although HP certainly can do better! It is a good step in the right direction, but they must evolve!

But now I have to start playing around.

### Re: HP 35s - my first thoughts

Message #2 Posted by [Stefan Vorkoetter](#) on 22 Aug 2007, 10:18 a.m.,  
in response to message #1 by Patrick Rendulic

Quote:

In complex mode it is very hard to distinguish "Theta" from the numbers.

\_\_\_\_\_

Agreed! I did some work with complex numbers, and the first time I did, I thought it wasn't working, since I was getting numbers like 5.12383.456. Then I realized the "8" was actually the theta. There's only a 2-pixel difference between the "8" and the theta. They should have made the theta less tall.

Stefan

### Re: HP 35s - my first thoughts

Message #3 Posted by [Chuck Sommer](#) on 22 Aug 2007, 10:39 a.m.,  
in response to message #2 by Stefan Vorkoetter

The Theta is a real problem. In the Display selection menu (hp-35S) the selection for polar coordinates uses a "lower case Theta". That Theta would have been great to use.

In the HP-48G,49G and 50G there is a similar situation with exponential notation and the E used for numbers like 3.14159E0, since the E is the same size as the digits my eye does NOT spot it as quick as I would like. The smaller E used on my HP-35S is very easy to spot.

### Re: HP 35s - my first thoughts

Message #4 Posted by [Peter Niessen](#) on 22 Aug 2007, 12:01 p.m.,  
in response to message #3 by Chuck Sommer

Hi,

there's also a small bug connected with the E key: older models (like the 32S) would show 1E\_\_ when pressing E, but the 35S puts just E\_\_, which will result in a syntax error.

Cheers, Peter.

### Re: HP 35s - not a bug

Message #5 Posted by [Gene Wright](#) on 22 Aug 2007, 12:37 p.m.,  
in response to message #4 by Peter Niessen

That's not a bug, as the manual describes it working in that manner.

It is different than it used to be, true, but it is not a bug.

The command line on the 35s is much more like a command line found on the 50g than the earlier line of machines.

Gene

Message #9 Posted by [Stefan Vorkoetter](#) on 22 Aug 2007, 3:44 p.m.,  
in response to message #8 by Pal G.

Exactly like the "8", but with the left and right middle-line pixels filled in.

**Re: HP 35s - my first thoughts**

Message #10 Posted by [Jeff O.](#) on 22 Aug 2007, 4:47 p.m.,  
in response to message #8 by Pal G.

Sure:

**Re: HP 35s - my first thoughts**

Message #11 Posted by [Stefan Vorkoetter](#) on 22 Aug 2007, 3:46 p.m.,  
in response to message #6 by Jeff O.

The OPTION 1 looks too much like an "e". I know that the calculator doesn't display scientific notation using a lowercase "e", but it could still cause confusion.

**Re: HP 35s - my first thoughts**

Message #12 Posted by [Vincze](#) on 22 Aug 2007, 7:11 p.m.,  
in response to message #11 by Stefan Vorkoetter

Agreed

**Re: HP 35s - my first thoughts**

*Message #13 Posted by **Walter B** on 22 Aug 2007, 6:45 p.m.,  
in response to message #6 by Jeff O.*

Thanks, Jeff, for making the difference visible. If I had to vote for one, I'd vote for your #3, because its next to the notation in HP42S - and there is no need to reinvent the wheel.

**Re: HP 35s - my first thoughts**

*Message #14 Posted by **Jeff O.** on 22 Aug 2007, 7:07 p.m.,  
in response to message #13 by Walter B*

Quote:

Thanks, Jeff, for making the difference visible.

You are very welcome! I seem to enjoy creating such things, so I'm glad someone found it helpful.

Quote:

If I had to vote for one, I'd vote for your #3

I agree, I like that one best myself. I'm probably kidding myself, but it seems like of all of the changes to the 35s that have been wished for, this one should be the easiest to implement. (No new functions, no ferreting out and correction of bugs, just "light up" a different set of pixels when a certain character is displayed.)

**Re: HP 35s - my first thoughts**

*Message #15 Posted by **Vincze** on 22 Aug 2007, 7:08 p.m.,  
in response to message #13 by Walter B*

My fiends, I have to agree with Walter. Number 3 I think is most distinguished, and Stefan also bring up good point too.

**Re: HP 35s - my first thoughts - Theta**

*Message #16 Posted by **JoeFrisco** on 22 Aug 2007, 8:14 p.m.,  
in response to message #13 by Walter B*

Uuugggh

I am glad Buy.com cancelled my hp-35 order( even though they took 3 weeks to credit my charge card). The big 8 is just wrong. It should have been designated as unacceptable from a human factors standpoint. It just does not look right. Ptewey. I want "natural" numbers to stand out on the calculator. The big 8 causes them to smash together. It is terrible. I want to see "a+ib" or "A<B" not "A8B" I really have to really re-think my future purchase of this devcice. This is in many ways, for me, is a vanity/collecting purchase. I like to sit down with a collection of pens, paper, calculator, books and aimlessly study math, physics etc. Everytime I take a log or exponent of the "natural" numbers and have to look at the big 8 will just detract from the experience.

All three options are much better, but my vote is for #3.

Thanks for taking time to create and capture the graphics

*Edited: 22 Aug 2007, 8:15 p.m.*

Same here. I don't have a 35S myself, but that big 8 should have been smacked on the head at the prototype stage, it is awful, truly awful.

The "big E" on my 20S to represent the exponent is not quite as bad, but it still just scrapes into the awful category too. Does no one at HP see these things and even think "that just doesn't look right"?

Dave.

### **Re: HP 35s - (angle symbol)**

*Message #18 Posted by **Karl Schneider** on 22 Aug 2007, 11:04 p.m.,  
in response to message #13 by Walter B*

I'd also vote for the #3 "angle symbol" not only because it looks best, but there's also a more fundamental reason:

Theta is the greek letter most commonly used to identify an angular value. It is not the generic symbol for an angle, which is an indicator and not a numeric value such as *i*.

In rectangular mode, it is the accepted standard to display

3.1415-i2.7182 instead of 3.1415i-2.7182

However,

3.1415∟-2.7182 is preferable to 3.1415-∟2.7182,

where ∟ is the angle symbol.

-- KS

*Edited: 22 Aug 2007, 11:22 p.m.*

### **Re: HP 35s - (angle symbol)**

*Message #19 Posted by **Walter B** on 23 Aug 2007, 3:12 a.m.,*

*in response to message #18 by Karl Schneider*

Hi, Karl,

just for sake of clarity:

Quote:

Theta is the greek letter most commonly used to identify an angular value.

Almost. AFAIK, usually alpha is taken for an arbitrary angle. Just for cylinder coordinates, theta is most common. And for polar, it's theta and phi.

Quote:

It (theta) is not the generic symbol for an angle, which is an indicator and not a numeric value such as i. ...

3.1415 $\angle$ -2.7182 is preferable to 3.1415- $\angle$ 2.7182

?? It is quite obvious it doesn't make sense to add an angle on a distance. In any consistent system, you must not add apples on pears. Thus, the 2nd notation is not "less preferable", but simply wrong. On the other hand, **i** is no unit like Meters or Degrees or Chinese Li, but a pure number, though in a direction we usually do not have in the **real** world ;)

HTH, Walter

## Re: HP 35s - my first thoughts

*Message #20 Posted by **Thomas Klemm** on 23 Aug 2007, 5:38 a.m.,  
in response to message #1 by Patrick Rendulic*

Quote:

Concerning vectors, there should be a cross-product function, the dot-product is there.

The discussion about Rect/Polar conversion showed us how we can do that (for 3-dim vectors):

```
X001 LBL X
X002 ABS
X003 CLx
X004 LASTx
X005 RDN
X006 RDN
X007 [
      [0,[0,0,-1]*REGT,[0,1,0]*REGT]*REGZ,
      [[0,0,1]*REGT,0,[-1,0,0]*REGT]*REGZ,
      [[0,-1,0]*REGT,[1,0,0]*REGT,0]*REGZ
    ]
X008 REGZ
X009 RDN
X010 RTN
```

Lines 2-4 and 8-9 could be omitted. They copy T to Z and X to LASTx.

Line 7 is a nightmare to edit I now. But don't blame me for that. I hope it's easier to read spread over five lines.

RDN means Roll down.

### HP-97 Printer parts and repair

Message #1 Posted by [Clark H Lewis](#) on 21 Aug 2007, 6:17 p.m.

I am new to the Museum Forum, but I have HP-41CX and HP-97 calculators. I am now trying to repair the "Gummy Wheel" problem in the 97, and I would like to repair the 97 printer or better yet replace the printer. I have looked at the Forum and Museum site, but I only found one post which addressed a gear problem in the 97 printer.

Comment/suggestions on printer parts and repairs would be appreciated.

Thanks.

### Re: HP-97 Printer parts and repair

Message #2 Posted by [Giancarlo \(Italy\)](#) on 22 Aug 2007, 7:53 a.m.,  
in response to message #1 by Clark H Lewis

Hi Clark.

I think that a look at the MoHPC's [Repair Section](#) would prove helpful.

In particular you may find:

[HP-65 HP-67 HP-97 "Clutch" Fix](#)

[Repairing the HP-97 Card Reader](#)

[HP-67 / HP-97 card reader repair hints \(wheel & clutch\)](#)

[HP-97 printer ribbon repair](#)

[HP-97 Printer Gear Replacement](#)

Hope this helps.

Best regards.

Giancarlo

### Re: HP-97 Printer parts and repair

Message #3 Posted by [Clark H Lewis](#) on 22 Aug 2007, 7:35 p.m.,  
in response to message #2 by Giancarlo (Italy)

Thanks, but I have decided the repair task is above my skill level, and I am going to send the card reader off to get some expert help.

The printer repair looks even more demanding, so I will live without a working printer in the 97.

Thanks again for your comments.

### Re: HP-97 Printer parts and repair

Message #4 Posted by [Gerry Schultz](#) on 22 Aug 2007, 10:23 p.m.,  
in response to message #3 by Clark H Lewis

Clark:

I just had my HP-41C, CV, 41 card reader, my 82143A printer, my HP-55 and my HP-97 calculator repaired by Richard Anthony and he did a fantastic job. On my recently purchased 97, a printer gear broke and he replaced it and it works like new. If you are interested in contacting him, let me know and I will forward you his email address. My email address is gerald.schultz@fox.com.

**Yet another simulator**

Message #1 Posted by **Mike T.** on 21 Aug 2007, 6:01 p.m.

Some of you with long memories may just about remember [this](#) earlier post.

It has taken a bit longer than I planned to tidy up the code and release another version, probably because once I had a tool that was 'good enough' for my own needs I didn't have such a strong incentive to release another version in a hurry.

However, I didn't forget about it and though I finished up rewriting just about everything in order to get the code in to a presentable state for public release I finally have a new version of the simulator ready, or at least I thought I did until a couple of days ago, and Dave has very kindly placed a copy of a ZIP file containing it [here](#).

In some ways it is a retrograde step as this release does not include the original HP33C simulation - the changes to the code were extensive enough to force me to test them using a simpler model. On the plus side though the current code can simulate both the HP21 and HP31E, and the code has been structured to make it easier to reuse. There are some differences between the simulations and the real thing, for details see the readme file included or the source code.

Unfortunately while using the simulator since uploading the file I've found a few really annoying bugs, so this defiantly isn't a finished piece of work even in the limited form presented here. I've already fixed most of the problems and I'm busy working on getting these changes into the next version. This should also include simulations of the HP25C and HP33C and possibly the HP10C as well. (I'd really like to be able to simulate the HP32E but don't know how to approach the Q and Q-1 functions on this model as I'm not much of a mathematician).

Hopefully it won't take so long to this time!...

Note - I have already changed the interfaces to clsRPNcalc so the next version will not be compatible with this one.

Feedback is welcome but I already know I have a few issues to fix and it is quite possible some of the original problems may have found their way back into the code during the rewrite. Obviously I should have tested this for a longer period of time before uploading it but I really wanted to release something before I go on holiday this year and probably jumped the gun a bit as a result.

**Please treat this as a BETA release, for use entirely at your own risk.**

Mike T.

### **HHC2007 in San Diego now up to 60 registered attendees!**

Message #1 Posted by [Gene Wright](#) on 21 Aug 2007, 4:54 p.m.

Wow! This is really shaping up to be the biggest HHC conference in years!

Four speakers from HP are expected.

San Diego, CA. Last weekend in September.

If you plan to attend, register now and we'll see you there!

### **Re: HHC2007 in San Diego now up to 60 registered attendees!**

Message #2 Posted by [Howard Owen](#) on 21 Aug 2007, 5:34 p.m.,  
in response to message #1 by Gene Wright

That's great!

Attendance has been growing steadily, going by the holyjoe.net HHC sites. Add the 35S, and that's what you get: almost a 50% increase year over year.

So, what about the possibility of firing up a new national HP calculator club? Is Richard completely jaded on the idea?

Regards,  
Howard

P.S. If the bad connotations have had enough time to fade, maybe we could call it "PPC". Or would that be tempting fate?

P.P.S. HP has four people involved with the calculator division now?

### **Re: HHC2007 in San Diego now up to 60 registered attendees!**

I use [Metcheck](#)

If you allow that you wont notice rainfall at or below .1mm its normally pretty accurate.

**Re: HHC2007 in San Diego now up to 60 registered attendees!**

*Message #6 Posted by [Bruce Bergman](#) on 22 Aug 2007, 9:46 a.m.,  
in response to message #4 by hugh steers*

Well, aside from being somewhat facetious, I do have San Diego's almost perfect record of great weather to rely on.

San Diego usually maintains an average temperature of about 76 degrees F somewhere around 300 of 365 days of the year. We haven't had any noticeable rainfall in almost seven months, and September is usually one of our hotter months.

So, while I'm betting that I'm right, the odds are with me. ;-)

thanks, bruce

Yup, Loren has been around a LONG time. Nice guy.

My weather person is Aloha Taylor. She's the cousin of my wife's uncle. In Hawaii, almost everyone is

related to everyone else somehow. ;-)

thanks, bruce

## **Re: HHC2007 in San Diego now up to 60 registered attendees!**

*Message #9 Posted by **Dan Greil** on 23 Aug 2007, 1:10 p.m.,  
in response to message #1 by Gene Wright*

I won't be able to attend but would really like to have someone that can go ask the questions that pop up here on this forum:

- Does HP utilize focus groups for new calculator designs? How does HP create these groups, from a general public sampling or from niche areas like engineers, CPAs, instructors, etc?
- Describe the beta testing of prototypes and pre-production units. Is it all done in-house or do they utilize non-HP beta testers for math/logic validation, user experience feed-back, etc?
- How can MoHPC forum members contribute to design and pre-production quality control processes? Is there a formal way they can be involved in focus groups or become beta testers? The forum, as great as it is, only provides feed-back *after* a model goes into production.
- Describe HP's market strategy. Do they, for example, plan to focus on competing with TI in the education space, Sharp in the low-end retail space or are they shifting focus back to their roots - engineers and accountants?
- Given that the 12c is still in production and doing well, why doesn't HP re-release the 15c which shares so many components with the 12c? This would seem a no-brainer - simply start manufacturing something for which HP already possesses the design and manufacturing capabilities. Or, is there a Voyager 15c+ in the works and re-releasing the old 15c would under-cut that model's intended market?
- Would HP consider publishing 'release notes' for calculators so there is an official list of bugs (and work-arounds for things that are more quirks than bugs)? If these devices are to be relied upon in civil, aeronautical, and related fields where lives are at stake, it would appear to be the responsible thing to do. It would also buy credibility within those fields by HP showing it takes bugs seriously.

I'm sure other forum members have questions they'd like represented at HHC2007.

For those that have gone in the past, does HP make attendees sign non-disclosure agreements so that what is announced cannot be repeated (on this forum for example)?

-Dan

## **Re: HHC2007 in San Diego now up to 60 registered attendees!**

*Message #10 Posted by **Gene Wright** on 23 Aug 2007, 3:12 p.m.,  
in response to message #9 by Dan Greil*

The problem will be that if you want to hear the answers to these questions, you'll have to attend.

HP sessions require those in attendance to sign a non-disclosure agreement.

Anything HP might say in answer to these questions would have to remain private between the attendees and HP.

So far, in the 3-4 years this has been asked for by HP, no one present has objected to signing the form.

If someone really does not want to sign the form, they are free to wait in another area during HP's presentations. In this case, they would miss out on 4 HP speakers, but that is their choice.

Especially this year, since the conference itself will be held at an HP facility used by the calculator group in San Diego.

I'm also glad to say that I have not seen anyone who attended a past HHC meeting who broke their NDA. That helps HP trust those who attend even further.

So, bottom line, if you want to know the "scoop", you have to attend in person.

Sorry about that!

**Re: HHC2007 in San Diego now up to 60 registered attendees!**

*Message #11 Posted by **Wayne Brown** on 23 Aug 2007, 5:52 p.m.,

*Message #12 Posted by **Bruce Bergman** on 23 Aug 2007, 6:00 p.m.,  
in response to message #11 by Wayne Brown*

Wayne, I'm curious... For you, is this a matter of principle, or does it literally cause a conflict (say, with an employer)? I don't like signing NDA's any more than the next chap, but it seems a pretty good trade-off for getting insight into an otherwise private operation.

This is the norm for businesses who have concerns about industrial theft, especially intellectual property.

I'm not casting any aspersions on your choice; I'm just trying to understand what would cause you to feel this way.

thanks, bruce

**Re: HHC2007 in San Diego now up to 60 registered attendees!**

*Message #13 Posted by **Gene Wright** on 23 Aug 2007, 6:03 p.m.,  
in response to message #12 by Bruce Bergman*

Where I work, visitors who want to see the warehouse have to sign an NDA as well. Common practice in business. Period.

Wayne, come to HHC2007. You'll just have to stand in the hallway for a couple of hours while the rest of us hear many good things. :-)

**Re: HHC2007 in San Diego now up to 60 registered attendees!**

*Message #14 Posted by **Wayne Brown** on 24 Aug 2007, 10:37 p.m.,  
in response to message #12 by Bruce Bergman*

I wouldn't object to an NDA from any other company. But with the way HP has behaved over the last 15 years or so, I think it's insulting for them to ask for an NDA or anything else. I think they should be on their hands and knees, begging for the privilege of being allowed to attend at all, rather than having the impudence to impose conditions on other attendees.

If I were to attend, it would be to spend time with HP enthusiasts like those on this forum. I have no interest in meeting with HP company representatives; in fact, I'd be more likely to attend if HP were forbidden from participating at all. But there's no way I'd go anywhere near it if I had to wait outside while the HP flacks were allowed inside!

*Message #16 Posted by **Dan Greil** on 23 Aug 2007, 8:02 p.m.,  
in response to message #10 by Gene Wright*

Gene,

Thanks for that insight. I surmised NDAs were necessary but now you've confirmed it. I can live with that.

But now you have my curiosity piqued! I am in need of a vacation...

I just finished reading "The HP Way" by Dave Packard and realized that the *HP Journal* was probably discontinued for the same reason - i.e. not disclosing trade secrets. The *HP Journal* was published (according to the book) in response to General Radio Company's publishing of the *Experimenter*. Back then, these publications were a marketing tool. Now, the information in those would be considered trade secrets.

Thanks,

Dan

### HP35s / RPN Calculator Simulator in Excel / Java?

Message #1 Posted by [Thomas Chrapkiewicz](#) on 21 Aug 2007, 3:42 p.m.

Has anyone seen (or perhaps already done) a RPN calculator/simulator in Excel(VBA) or Java?

My particular interest has been picqued by writing code for the HP35s and wanting to be able to see the data memory as the algorithm was executing.

While there are several simulators(even bit-accurate emulators) out there for various machines, I was thinking it would be nice to have a simulator, for example the HP35s where one could not only see the full stack, but all (or many - perhaps 100) data memories while code is executing to see the movement of data while the algorithm executes. I've begun this process (in Excel97) and was curious if perhaps this has been done already - or if anyone else out there would have a need for such a piece of code. Certainly, Java would be more universal, but I'm currently more conversant in Excel(VBA).

Thoughts and opinions appreciated,

Tomcee ( I also posted in comp.sys.hp48)

### Re: HP35s / RPN Calculator Simulator in Excel / Java?

Message #2 Posted by [Arne Halvorsen \(Norway\)](#) on 21 Aug 2007, 4:28 p.m.,  
in response to message #1 by [Thomas Chrapkiewicz](#)

I am not joking...

I am trying to write one right now (java) as I type (well not \*exactly now\*...).

And my reasons are yours! Thing is, I got ideas for HP35s programs, not gonna have it for months it seems, so need simulator...

Well, writing simulators are tedious stuff... AND to get it right you need very exact documentation and time to study it... I dont have that :-)

So my approach is to \*try\* write a generic rpn hp calculator with the stuff I need for my programs AND try to match it according to what I can understand of the machine by online doc.. (HP, anytime now would be ok for that manual pdf to be posted).

Propably fail, but if not will put stuff up as open source...

What as a simulator/emulaotor wannabe would like would be a database of hp calc operation normalized by name, brand and description (exact) operation.

Well, nuff posting, back to hacking...

Message #4 Posted by **Thomas Chrapkiewicz** on 21 Aug 2007, 5:07 p.m.,  
in response to message #3 by Raymond Del Tondo

Ray: Thanks. Yes,these are fine simulators - even bit-accurate in most all cases.

My need here is more driven - not so much by an absolutely accurate model of the machine - but by being able to watch the machine perform while executing steps in a program. I am writing some code for the HP35s to do Matrix operations, and ascertaining that my code is using data memory properly, I need to 'see inside' the machine while the data is being moved around and modified. Checking that a 5x5 or 10x10 matrix has been moved and/or operated on via the HP35s display is a bit tedious. I can see all 100 or so memories simultaneously on a spreadsheet.

I've gotten the basic code done for stack and data operations done. Doing the program interpretation is going to be significantly more tedious.

TAFYH, TomCee

### **Re: HP35s / RPN Calculator Simulator in Excel / Java?**

Message #6 Posted by **Namir** on 21 Aug 2007, 6:37 p.m.,  
in response to message #1 by Thomas Chrapkiewicz

Thomas,

I am working on an **RPN2** simulator in Excel (and Excel VBA). This is a version of RPN that support paged variables (single variables and matrices), global labels, and local labels. The result is the ability to write subroutine that have their own variables that don't necessarily clash with other routines that use variables with similar names (but associated with a different page name). I designed RPN2 to allow a routine to switch page name (as many times as you wish) and access variables in different pages. Also, RPN2 has global and local level labels, goto commands, and subroutine commands.

My intent is to create a new version of a programmable RPN engine that can compete with RPL.

RPN2 supports single numeric variable, flags, strings, and also matrices. I am tapping into Excel's commands to support matrices without slowing down the interpreter.

I am working on the documentation and that will take a while.

Namir

**Re: HP35s / RPN Calculator Simulator in Excel / Java?**

*Message #7 Posted by [Thomas Chrapkiewicz](#) on 23 Aug 2007, 7:30 a.m.,  
in response to message #6 by Namir*

Hello Namir:

Your project sounds most interesting!!! Would like to know more as it becomes ready.

My current project is very simple - only real numbers (for now - I really do need smooth complex number handling). I anticipate that extending it to 3D vectors as the 35s does will not take too much effort. My demand was driven to 'see' what is going on inside my HP35s while solving matrices and manipulating significant blocks of memory.

I am using Excel97 and VBA. Thus the application will run across many (more modern) Excel platforms. Should speed become an issue, I may use VB4 or VB6.

Regards, Tomcee

### Hoping for a new high-end RPN calculator

Message #1 Posted by [John \(Corvallis\)](#) on 21 Aug 2007, 3:28 p.m.

I'm hoping for a new high-end RPN calculator. It might be called the HP 45s or 65s for historical reasons, as was the new 35s. But it would draw inspiration mostly from the 41CX, 42S, 35s, and 50g. It would continue or improve on the newly-rediscovered (35s, 50g) traditional, professional look and quality key-feel.

It would have alphanumeric capability for globally naming programs (and variables?), as well as for constructing prompts and labeling outputs. It would have local numeric labels.

It would have modern I/O, such as USB for direct connect to computers and peripherals (such as a small printer), as well as an SD card slot.

It would have a large memory, a large function set (including time functions), and be fast.

How powerful can/should a top-of-the-line RPN calculator be? What features do you want in such a machine?

### Re: Hoping for a new high-end RPN calculator

GPS functionality might be useful in surveying. GPS plus timer functions would be great for geocaching competitions. A rugged, rain-proof case would be helpful for all outdoor applications.

How about a large display, perhaps square for distortion-free plotting and graphics? Perhaps the display could be faster, higher-resolution, and even color.

### **Hoping for a new ^H^H^Hold high-end RPN calculator**

*Message #13 Posted by [Howard Owen](#) on 21 Aug 2007, 8:41 p.m.,  
in response to message #12 by Tim Wessman*

Not all of us can go out and design/build a cool system extension for the 50g, Tim. 8)

Although, that's a darned good point. We know that the 50g is capable of doing microcode simulation of the HP41, the Voyagers, the 71B, and 42S. Why not turn it into the ultimate RPN keystroke programmable calculator, not through emulation but with a new implementation. Why wait for hobbyist hardware (sorry, Eric) when you've got a fairly stable mainframe that is flash upgradeable, has a choice of targetable architectures (i.e. ARM or Saturn, C/C++, User or System RPL,) and a solid keyboard, though with an under-endowed ENTER key? (What do you want to bet that the follow-on high end machine will remedy that deficiency?) You get flash, a large RAM and SD out of the box. And with your nifty enclosure, Tim, it could have bluetooth too. (Dual bluetooth, right?)

I wonder if a collaborative project to build software for something like that could work? OpenRPN seems to have made quite a bit more progress on the software side than the hardware, for example. And you wouldn't be breaking new ground as to the development or distribution models. It could be hosted on Source Forge, for cryin' out loud!

I vote for 50rpn as the project name. 8)

Regards,  
Howard

**Re: Hoping for a new ^H^H^Hold high-end RPN calculator**

*Message #14 Posted by **Howard Owen** on 21 Aug 2007, 8:48 p.m.,  
in response to message #13 by Howard Owen*

50g features that could be made available to an RPN OS running on the machine:

- Nice display
- Solid keyboard, though busy.
- Secure Digital Storage
- Sorta-kinda RS-232
- USB slave
- Bluetooth via Tim's surveying case
- Flashable OS
- Lots of RAM
- Anything else?

The form factor isn;t what most people here would like to see, but check out how well the above tallies with the rest of the wish list!

Regards  
Howard

50g features that could be made available to an RPN OS running on the machine:

\_\_\_\_\_

But the 50g already has an "RPN OS" built-in!

Perhaps you'd like to handicap it with a 4-level stack? Require line numbers for each program step? Require GOTO instructions instead of using program structures? Add more restrictions to what names can be used?

I don't think that the RPL models are perfect, but any of the above seem to me like steps in the wrong direction.

If anyone feels up to the task of writing a new OS for the 50g, suit yourself; no doubt the hardware is capable of quite a lot.

Regards,  
James

## **Re: Hoping for a new ^H^H^Hold high-end RPN calculator**

Message #16 Posted by **Will Hartung** on 22 Aug 2007, 12:16 a.m.,  
in response to message #15 by James M. Prange (Michigan)

Actually, I was sort of toying around with this idea.

Someone, somewhere, here, earlier mumbled something about having a "generic calculator" platform to develop, well, calculators. The "Generic" or "Blank" Calculator.

And, frankly, modulo the form factor, the 48-50g series is, essentially, exactly that.

Anyone so motivated can make those machines do most anything.

There is a line crossed by the RPL machines when they crept away from being "keystroke" programmable. I mean, I guess you could program these things using all of the soft keys and what not, but it doesn't take long for one to drop that and simply key the program in on the alpha keyboard.

What makes keystroke programmables nice is their coarseness and simplicity. Keystroke programs start as little more than "watch me" macros, which makes it much easier for someone trying to replicate a complicated equation. Obviously folks can take it far beyond that, but more casual users can more easily program a keystroke programmable simply because doing so is little more than what they would normally do on the calculator.

So, for some, that's what makes something like the 35s more compelling than a behemoth like the 50g. That keystroke ease of use.

But it would be interesting for someone to try and convert a 50 into a keystroke machine, rather than a RPL machine. At the core, all of the capability is there. The 50 series will pretty much do anything a calculator can do, and has all of the core routines. So, the game isn't so much function and algorithm design, rather it's a design of user interface.

Realistically, that's all a calculator is today. A compromise between functionality and interface. How to cram usable and friendly power and functionality into a bunch of buttons and 1 or 2 lines of text.

There are other non-functional requirements, mostly battery life and performance, but the balance and elegance of a calculator is pretty much all interface.

An interesting example of this comes from an industrial application I wrote for the 48 series several years ago. This fellow was working on a design for resource tracking, and he started out with a bar code scanner. It was interesting to see how his design expanded until the user was expected to run around with a bunch of double sided flip cards packed to the gills with bar codes to scan. Eventually, he was even considering giving them a single card with 10 barcodes (one for each digit) on it and a list of code to be scanned in, digit by digit, with the scanner.

I asked him "So, you expect the users to basically key in numbers using a bar code scanner?"

Yea, it does sound silly. But with the bar code scanner as the hammer of the day, that was how the design was progressing. At that point the bar code scanner was

obviously the wrong tool for the job.

But the core problem we found wasn't the data, or the process, but it was all form factor and interface.

Turns out that a 48 with a serial port, those bright orange nylon pouches, and some custom software, and a bit of "White out" and a ball point pen for some custom keys was the hot, outside the box solution to the problem.

And interface is what defines a calculator, and separates the good from the bad.

Back to the 50, as I said all of the math is there. But also, all of the interface is there as well. You can reprogram (even from just User RPL) pretty much every key on the keyboard. Most likely the ON and R/L Shift keys may not be available from User RPL, but every other one is. And with a bit of Sys RPL, those too may be up for grabs. You can address every pixel on the display, and make the thing sing Yankee Doodle Dandy. I/O, clocks, gobs of RAM.

So, to me, it seems that the 50, with a little bit of software to handle some infrastructure, would be a calculator hackers dream experimenters tool.

The truly motivated could obviously reflash the entire machine from the core with compiled code. But so much is available to even the "lowly" User RPL user.

No doubt, much of this work would be done with an emulator, but the samples can then be downloaded to the machine to try out in real life. Heck, strip the case and make some custom dry transfer labels for your custom key sets. A little paint and a steady hand can redo the keys themselves (though they may not last).

Basically, for folks motivated to reinvent the calculator, there's a machine out there that's reinventable: The HP 50. (I dunno if the TI's are as flexible)

### **Re: Hoping for a new ^H^H^Hold high-end RPN calculator**

A bridge to HP-IL would be cool, though (reuse of all HP-41/71 equipment)...

### **50g as emulator platform**

*Message #20 Posted by [James M. Prange \(Michigan\)](#) on 24 Aug 2007, 12:17 p.m.,  
in response to message #16 by Will Hartung*

Quote:

---

There is a line crossed by the RPL machines when they crept away from being "keystroke" programmable.

---

Well, with all the operations available on the RPL models, even with the various shift keys, you'd need an awful lot of keys to make them truly "keystroke programmable". When you have too many operations to fit on the available key combinations, you pretty much have to use alternative entry methods such as menus or named commands keyed in from the keyboard for some operations.

Quote:

---

I mean, I guess you could program these things using all of the soft keys and what not, but it doesn't take long for one to drop that and simply key the program in on the alpha keyboard.

---

True, RPL models give you some choices as to which method to use. If I'm going to use commands found on one or two menus several times, then I'll probably use the menus, and otherwise simply key in the command name from the keyboard.

Quote:

---

What makes keystroke programmables nice is their coarseness and simplicity. Keystroke programs start as little more than "watch me" macros, which makes it much easier for someone trying to replicate a complicated equation.

---

So with the RPL models, instead of simply recording keystrokes, you're recording named commands keyed in from the keyboard or a menu. What's difficult about that?

Quote:

---

Obviously folks can take it far beyond that, but more casual users can more easily program a keystroke programmable simply because doing so is little more than what they would normally do on the calculator.

---

It seems to me that a casual user ought to be able to write a simple UserRPL program simply by starting the command line editor with the UserRPL program delimiters, pressing whatever keys he normally would for the problem, and then pressing ENTER.

Of course using program structures for branching and so on takes more thought, but isn't the same true of using labels, GOTO instructions, and so on the Classic RPN models?

Quote:

---

You can reprogram (even from just User RPL) pretty much every key on the keyboard. Most likely the ON and R/L Shift keys may not be available from User RPL, but every other one is.

---

Even those can be assigned, if you really want to do so, with either the ASN or STOKEYS command. Offhand, I don't think that I'd want to make any assignments to the ALPHA, LeftShift, or RightShift keys, or combinations that include them, but in case you're not actually using them as shift keys, why not? But do leave yourself an easy way to switch out of user mode.

Certain of the "Shift Hold" key combinations could be assigned, but wouldn't be usable: 70.41 (hold down ALPHA and press ALPHA), 80.21 (hold down LeftShift and press LeftShift), 80.51 (ALPHA hold down LeftShift and press LeftShift), 90.31 (hold down RightShift and press RightShift), and 90.61 (ALPHA hold down RightShift and press RightShift).

Other than the above, including the various "Shift" and "Shift Hold" combinations, each key can have as up to 11 user key assignments.

The ON key, including all six key "planes" and the "shift hold flag", can be assigned however you wish. In case you assign anything to 101.10, with the calculator off, pressing ON simply turns it on, and with the calculator already on, pressing ON invokes the assignment.

But would you want to assign anything to the ON key? Well, you could replace the standard 101.10 assignment of the CANCEL operation (which beeps and displays an "Interrupted" message box if a program is running) with the program `\<< #DFFh DOERR \>>`, which is normally used to abort any execution to run a control alarm, and seems less annoying. If you have a STARTOFF program, then you might want to replace the standard 101.30 assignment of the OFF command with the reserved variable name 'STARTOFF', so that the program will run with

you manually turn the calculator off, instead of when it does an automatic turnoff.

What can't be assigned are the various "hold down ON" key combinations.

You can also use the DELKEYS or STOKEYS commands to suppress some or all standard key assignments while in user mode; pressing an unassigned key simply causes a "bad keystroke" beep.

Note that you can get yourself into a situation where you can't easily get out of user mode because 70.20 doesn't have its standard assignment, or even have all keys disabled while in user mode, so that you can't even use -62 CF. If this occurs, to get out of user mode, invoke a warmstart by holding down ON while pressing C, or use the "paperclip reset".

Wolfgang's Keyman library, among other things, adds the ability to assign to "double-click" and "long-pressed" keys; see <http://page.mi.fu-berlin.de/raut/WR49/index.htm#Keys>.

KEYEVAL is a somewhat related command that can invoke whatever operation is assigned to a keycode. While in user mode, if a positive keycode is used, then the user key assignment is invoked, and if a negative keycode is used, then the standard key assignment is invoked. When not in user mode, the standard key assignment is invoked, regardless of whether the keycode is positive or negative. This could be used to invoke non-programmable operations, but do so with caution; there may be a very good reason for not making such an operation a programmable UserRPL command.

Regards,  
James

*Message #21 Posted by [Howard Owen](#) on 22 Aug 2007, 1:03 a.m.,  
in response to message #15 by James M. Prange (Michigan)*

Hi, James.

We've been down this road before, have we not? 8)

Regardless of what you implement, the point is that the 50g offers a great deal of flexibility in how to go about the implementation. You could use ARM targeted C code for performance critical routines, and SysRPL calls to leverage what is already on the machine. You could add hooks to UserRPL so that your simpler RPN programming environment could call UserRPL subs and be called by it. That would allow this to be an extension of the current OS.

My imagination about where to go with this would tend one way, and yours might tend another. But surely you have some idea of how you would improve the OS, if you had a bunch of help to rewrite code in C and create new stuff? If the 50g isn't "perfect" then that implies you would like to make changes, right?

Regards,

Howard

Quote:

OpenRPN seems to have made quite a bit more progress on the software side than the hardware, for example.

The OpenRPN software is (was) aimed at making \*fix which is essentially a beefed up RPL so it isn't going to be directly relevant to a key stroke programmable environment.

I had some nefarious ideas on how to implement key stroke programming under \*fix without interpreting stored key codes. See sflib/rpn.sfix from the repository for details.

*Message #25 Posted by **Hugh Evans** on 25 Aug 2007, 2:12 p.m.,  
in response to message #24 by Paul Dale*

It was discussed and even attempted on the 49g+ but as I recall there were some issues getting code compiled and running on that platform. In terms of long-term goals I want to see \*fix running on an HP someday.

For more details on \*fix and OpenRPN check out [www.openrpn.org](http://www.openrpn.org) in the coming weeks. The project has picked up a new host, so the site will be up all the time. Short-term plans are to restore the wiki and implement a simplified main webpage.

-Hugh

*Message #26 Posted by [Hugh Evans](#) on 25 Aug 2007, 2:21 p.m.,  
in response to message #13 by Howard Owen*

You've basically described the concept behind the \*fix core, which is a minimal subset of commands that provide the necessary foundation for all other commands. That way you can use it to build RPL, keystroke RPN, BASIC, or whatever else you please without too brutal of a learning curve.

If current 50g c++ development tools are up to the task I think it would make a great platform for the testing and development of \*fix, with a great potential to generate more interest within the HP community.

given its size and weight it should do a lot better than that ;)

**Re: Hoping for a new high-end RPN calculator**

*Message #28 Posted by [Thomas Chrapkiewicz](#) on 21 Aug 2007, 4:02 p.m.,  
in response to message #1 by John (Corvallis)*

While some of these thoughts may be mutually exclusive, I'll continue:

1. Package size of HP42s (i.e. 32sii)-truly shirtpocket size.
2. Some sort of I/O - preferably wireless.
3. Memory Card Slot.
4. Clock / Calendar.
5. Beeper (some sort of audible output).
6. Graphic Display (not too big - perhaps like the 42s).

Further thoughts:

Actually, having a Memory Card slot would defeat part of the reason for the I/O - this card would be used to get programs in and out of the machine. Of course the output for an 'Execution-Time' printer is handy. On that note, thermal printer mechanisms are so ubiquitous these days (credit card machines, gas-station printers), that it would seem someone could make a HP IR style printer quite cost effectively. Thus perhaps just an IR I/O like the 42s would be sufficient. I would suspect that Bluetooth or 802.11 would be cost and power prohibitive.

Message #31 Posted by [Seth Morabito](#) on 22 Aug 2007, 12:48 a.m.,  
in response to message #1 by John (Corvallis)

I've said this before, but I'll repeat myself...

My perfect high-end HP calculator already exists, and it's called the HP-50g ;^) The only things I would do to improve it would be as follows.

1. Replace the keys with the same type used on the HP 35s.
2. LARGE ENTER KEY!
3. *Optional* Higher resolution display. Maybe the same as the TI-89, 160x100 pixels.
4. *Optional* Move the SD card slot to the top, for easier use with SD expansion options such as SD GPS cards.

Note that these are very minor and simple changes. Nothing too crazy here. I don't want it to toast my bread, walk my dog, hover, pick up the kids after school, and tell me it loves me while brushing my teeth. I just want it to be a great calculator. The 50g is already a great calculator, and a 50gII with 1 & 2 (and optionally 3 & 4) would just be that much better!

\* Caveat: I grew up with RPL. I learned it first, on my HP 48SX. Pure 4-level-stack RPN is new to me, and while it is very fun, it's still not as natural to me as RPL is. So your milage may vary!

in response to message #31 by Seth Morabito

I don't agree that HP calculators need a double-width ENTER key. For a given keyboard layout design with a single-width ENTER key, substituting the double-wide key would result in the loss of one key with its several functions. I would like to see a high-end RPN machine as well as future even-better RPL machines, but I personally prefer a single-wide ENTER key in the easy-to-find lower-right corner, like the 50g.

Are the same folks who would seemingly kill to keep a double-wide ENTER key the very \*same\* folks complaining about the lack of R->P and P->R function keys?

Just curious which people would rather see/have to use regularly.

### **Re: Hoping for a new high-end RPN calculator**

*Message #37 Posted by **papakanush** on 22 Aug 2007, 1:28 p.m.,  
in response to message #32 by John (Corvallis)*

I have recently upgraded from the 48g to the 50g. Sorry everyone, but the double wide enter key is not that big of a thing to me. In fact, if you enter information with two thumbs while holding the calculator with both hands, the enter button at the lower right corner is actually more convenient to me.

I've really enjoyed using the 50g so far. Durability, of course, remains to be seen whether it will last as long as my 48g (which still works fine by the way).

### **Re: Hoping for a new high-end RPN calculator**

*Message #38 Posted by **Kostas Kritsilas** on 22 Aug 2007, 3:12 p.m.,  
in response to message #37 by papakanush*

Just my own personal opinions:

1. Use the basic 35S shell, but add one row of soft keys.
2. Make the display 4 lines; default would show all 4 levels of the stack;

3. Add a SD slot capable of SD I/O, open up the programming interface so that device drivers could be written for various SDIO cards, and make the slot SDHC compatible as well.

4. Think about changing the battery pack to a rechargeable pack of some sort, with the ability to use AAA batteries. The rechargeable pack could be optional.

5. Address the software bugs, and fix the base conversion and complex math/Polar-Rectangular irritations. Possibly add Matrix math capabilities.

Try to get all this done for \$100-\$120. The 50G has a graphical display; this would be an RPN calculator that fits above the current 35S, NOT as a replacement for the 50G.

Kostas

Kalinichta sou, Kostas,

we have something almost in line with your proposal [here already](#). What you cannot see, of course, is the SD slot and the socket to connect the charger ;-)

### **Re: Hoping for a new high-end RPN calculator**

*Message #40 Posted by [Kostas Kritsilas](#) on 23 Aug 2007, 3:13 p.m.,  
in response to message #39 by Walter B*

Walter:

I think most people would still want a set of soft keys, perhaps as the top row of keys. Could also be used as alphanumeric keys when not being used for calling programs/routines. The additional keys would allow for the base conversion to be added as shifted functions to the other keys, as well as the complex math/matrix functions. It would be a nice to have to have a really fast CPU, but the HP-35s hasn't really generated many complaints regarding execution speed. Another nice to have would be more on-board RAM, to allow even larger programs to execute. I would think that the bracket keys could also be dispensed with, making this a true, RPN only, calculator.

The 45s concept is really good, and a very nice keyboard layout.

Kostas

PS. Have a nice day (Kali Mera Sas).

### **Re: Hoping for a new high-end RPN calculator**

*Message #41 Posted by [Seth Morabito](#) on 22 Aug 2007, 3:44 p.m.,  
in response to message #37 by papakanush*

In all honesty, I think my desire for the wide ENTER key is a matter of familiarity and tradition more than anything else.

I find it difficult to get used to a calculator that has a small ENTER key in the lower right, because I've been using HPs for so long that my motion memory just expects it to be above and to the left

of the number keys, as it is on the classics, spices, coconuts, pioneers, and 48s. It's just what I'm used to, so that's where my finger goes by default.

I could probably retrain my brain, and it's really not a deal-breaker. I can live with an small enter key. But I greatly *prefer* the big enter key :)

## **Re: Hoping for a new high-end RPN calculator**

*Message #42 Posted by **James Biddlecombe** on 23 Aug 2007, 6:00 a.m.,  
in response to message #1 by John (Corvallis)*

I definitely DON'T want a machine with a large screen like the 50g. I want a machine with the feature set of the 42s plus I/O (e.g. usb) that I can fit into my shirt pocket.

I want the keyboard feel of the new 35s.

I also want it to have base conversion that works in the base currently selected that I don't always have to prefix when I enter a hex number.

In fact there is probably scope for 2 new machines. The first as I have described above and the second which would eventually replace the the 50g, if required, which would be a large screen graphic calculator.

I want a proper high end CALCULATOR, not something that's competing with my mobile phone or laptop, e.g. with GPS, Java (read sloooooow, etc).

Cheers, James.

### Only a couple of months ago . . .

Message #1 Posted by [Paul Brogger](#) on 21 Aug 2007, 2:51 p.m.

. . . I would have said my favorite day-to-day calculator was the 33s. I recently had occasion to pick one up again, to compare some function or other with that of the 35s.

What a difference a new model makes! I was long ago able to get past the 33s' legendary and superficial chevron keyboard design (in its way somewhat successful, I must admit, in that my teenage son carried a 33s to school with pride -- albeit in ALG mode). But upon renewed acquaintance, its perverse and seemingly *random* function assignment had me flummoxed.

The 35s layout isn't perfect, but it's *such* an improvement as to render the 33s (for me at least) (at *last*?) all but unusable.

(It's amazing what one may grow accustomed to!)

I am not a fond proponent of algebraic modes but the HP-35s algebraic mode is a tremendous improvement over the 33s. It let me give my son the calculator to learn about RPN but works in algebraic mode. I could not give my son a 33S as it was not possible to use the algebraic mode to write equations (the stupid combination prefix and postfix input system). The 35s is far better and though not perfect a great improvement!!!!

Message #3 Posted by [Ed Look](#) on 21 Aug 2007, 3:49 p.m.,  
in response to message #2 by Dave Johnson

I gave my son a 39G.

For a short while, he was into it. However all his teachers and classmates use TI graphing calcs in class, so that's what he uses in class; I didn't buy him one- he just borrows the school units.

However, I've just printed and bound for him he 39G/G+ AUR and got him (on sale at Samson Cables) the 39G-PC cable. So, the long and short of this is that he's going to go algebraic for a while more.

On advice a long time ago, I believe from our legendary Norm Hill, I'm holding off REALLY teaching him to use RPN until just a bit later... if for no other reason than just that at this age, all his peers and instructors are TI-bots.

Also, for a younger child, there may be no patience for RPN, especially if they've just mastered PEMDAS not too long ago.

But when it's time, I plan to show him the 33s. What do you all think, 33s or 35s? (Norm recommended the 32E; I'd love to, but can't afford the exorbitant collector prices for such a lovely unit.)

### Re: Calc for ALGophiles

Message #4 Posted by [Paul Brogger](#) on 21 Aug 2007, 4:19 p.m.,  
in response to message #3 by Ed Look

The first, best destiny of the 33s was simply to appeal to appearance-oriented teenagers. Given that, the optimum use of a 33s may be to capitalize on its "attributes": set MODE to ALG and hand it to a high- or middle-schooler (or maybe even a *high* middle-schooler ;-). If the kid happens to ask something like "What's this RPN thing all about?" then offer a 35s replacement.

It will probably be flexed to death in an overloaded backpack anyway. (I had a 28s de-part in that manner!)

Where before I snapped up a couple extra 33s in case they'd be the last RPN keystroke programmable to be made, I now doubt I'll even save one for my "collection" (such as it is). (Maybe the newer units will be useful as sources of replacement LCDs for the 35s.)

Hmmm. If they've just mastered PEMDAS and then start using an ALG calculator, they'll quickly forget PEMDAS because the calculator automagically does it for them, with no indication that it's doing so.

With RPN on the other hand, they have to remember PEMDAS because order of operations is completely up to the user in RPN, just as it is with pencil and paper.

Stefan

### Why do we collect HP calculators

Message #1 Posted by [Stefan Vorkoetter](#) on 21 Aug 2007, 11:36 a.m.

As a casual collector of HP calculators (I have a 19c, 32e, 34c, 41cx, 42s, and now a 35s), I found myself asking "why?"

Why do we spend the time to collect and/or play with old (or in the case of the 35s, wannabe old) HP calculators?

Stefan

### Re: Why do we collect HP calculators

We had a guy active on this forum for a while who often proclaimed he had Asperger's.

### Re: Why do we collect HP calculators

Message #4 Posted by [Gerson W. Barbosa](#) on 21 Aug 2007, 1:06 p.m.,  
in response to message #3 by bill platt

Yes, I do remember him. However, he had only one HP-41CV, if I am not wrong.

I think I keep some out of nostalgia (HP-15C, HP-28S and HP-48GX - they were there when I needed them most), and some because they were well engineered (HP-35, all those functions in only 960 bytes of ROM!, HP-41CX, HP-42S, HP-15C, etc...).

Gerson.

(Pretty normal guy: only 22 HP-calcs, but will get rid of a couple, only deciding which... and a small banknote collection, but only 40 bills and no progress in the last two years :-)

*Message #6 Posted by [Dallas Osborne](#) on 21 Aug 2007, 12:11 p.m.,  
in response to message #1 by Stefan Vorkoetter*

For starters, we like to be different than the herd. It is, however, good that the means to our ends allows for such subtle, yet powerful, user adaptation.

The second most common reason is a combination of awe and nostalgia; we recognize the impressive bounds made by the teams of engineers that initially designed these devices and enjoy the fact that many of these units were so close to apex. Few, if any, newer units from any manufacture have ever come close to those made within HP's first twenty years.

At last, the ease of programming from the simple to the complex, and especially the ability to share these programs with others, has allowed us to enjoy greater solution development than we ever would alone.

Edit: Yes, I definently have aspergers ;) ... or something else... But you should really have a look at my fine collection of vintage can openers.

Not trying to be too much of a contrarian, but how exactly does rampant consumerism (and really, that's what collecting is) differentiate yourself from the herd?

Buy the calculators; enjoy playing with them (god knows I do). But please don't fool yourself into thinking that purchasing something mass produced establishes yourself as a non-conformist.

### **Re: Why do we collect HP calculators**

*Message #8 Posted by [Dallas Osborne](#) on 21 Aug 2007, 12:53 p.m.,  
in response to message #7 by Kelly Huckman*

I concede; you have an excellent point. This is especially true for the current line of HP calculators.

I was trying to referring to the collection of the older units. Some would say paying hundreds of dollars for a calculator some twenty to thirty years old is rather odd. I have never really considered the group that does this to be large enough to be considered a herd.

### **Re: Why do we collect HP calculators**

*Message #9 Posted by [Maximilian Hohmann](#) on 21 Aug 2007, 3:09 p.m.,  
in response to message #6 by Dallas Osborne*

Hello!

Quote:

For starters, we like to be different than the herd.

Not me, I don't care about the herd. Even if everybody else would start collecting calculators - I would still do it :- ) (As I like Madonna just like (mostly) everybody else...)

But why collect calculators (not just HP in my case, I like different brands too) at all? Maybe, because in my childhood/youth days, these were miraculous and incredibly expensive, therefore unattainable, devices that were obviously very useful (from a schoolboy's point of view, who lost entire afternoons doing tedious maths homework) and therefore highly desirable.

Now, that they are commonplace items found in every supermarket, this schoolboy fascination is no longer there, but seeing the dark red glow of an early LED display brings back some of the old memories. Therefore, I really only collect older models and buy LCD calculators only if I can get them very cheap for the sake of completing the collection. Or if they are really powerful or special in one way or another like the latest Ti CAS models.

Greetings, Max

I speak only for me, not "we"...

I happen to enjoy both calculators and collecting things. Then earlier this year, I lucked into an estate's worth of HP calcs for a rock-bottom price (11c, 12c, 15c, 28c, 28s, 19BII, 48s, 48g, 42s). I found corrections in the 11c manual made by the original owner; the widow who sold the calculators was touched to know that I had connected in a small way with her husband.

I played with the calculators and was instantly hooked on RPN. Now I'm a collector (much to my wife's chagrin).

I think that the reasons we collect are not nearly as interesting as the stories of our collections.

-A

*Message #15 Posted by [Howard Owen](#) on 21 Aug 2007, 2:07 p.m.,  
in response to message #1 by Stefan Vorkoetter*

Well, I don't know about Asperger's. I'm borderline autistic, myself. 8)

Seriously, I collect calculators because I like to play with them. I'm a systems engineer and programmer, and I love computer systems and networks. Seeing how these earlier examples were set up is endlessly fascinating to me. Then too, I started computing on an HP-41C in 1982, so I have a good deal of nostalgia for that platform. Since it is a complete system, with networking and everything, the 41C combines my two motivations in one platform. The 71B does that too. And I love programming the 42S, 48gx and 50g, though I know mentioning those in the same breath is tantamount to heresy, or at least esthetically dubious. 8)

I sort of collect languages, too. I've always been like that, learning tons of computer languages whenever I had a spare moment, for no better reason than intrinsic fascination. Several of those languages turned out to be fairly lucrative and career enhancing, but once again, that's not why I learned them. I just love systems. That has made for a pretty enjoyable career so far.

Regards,  
Howard

in response to message #16 by Gerson W. Barbosa*

I'm not at all sure, but perhaps I might have given up a science career because repeated advanced college level calculations by hand got too tedious and took me too long into the early hours of the morning.

But I was saved by a HP-34C- it was programmable, had advanced hard-coded functions right on the keyboard, had lots (for then) of memory, AND CONTINUOUS MEMORY!!!

### **Re: Why do we collect HP calculators**

*Message #18 Posted by **Gerson W. Barbosa** on 21 Aug 2007, 6:12 p.m.,  
in response to message #17 by Ed Look*

Now I have an HP-34C. I like it (it's been useful to show me where the HP-15C, my first HP calculator, came from). I am sure I would have liked it even more in 1982. Then I was in my first year as a Physics student, and had only a TI-51-III to play with. I was able to write a 32-step numerical integration program on it, although it would integrate only the built-in functions. The HP-34C, with SOLVE and Integrate keys would have been very nice, if I were only aware of it...

Turns out I was fascinated with calculator programming and changed to Computer Science. But then I discovered punching cards with COBOL and even Pascal codes was no fun and I changed again to EE. I guess I wouldn't have made it without my 15C, and later, my 48GX... I eventually graduated some years ago but I am still in the military. Hearing stories of succesful careers started or changed due to programmable calculators, like yours and Howard's, is always interesting.

Regards,

Gerson.

Because I like using them... (and possibly because after so long I can't get used to a 'normal' calculator).

Mike T.

### **Re: Why do we collect HP calculators**

*Message #21 Posted by [dbatiz](#) on 21 Aug 2007, 2:32 p.m.,  
in response to message #1 by Stefan Vorkoetter*

Collector isn't the best word to describe me since I only have two. Protagonist may be a better word. Over the years I've given as gifts an 11C (x2), 49g+, and 50g. My interest in them is strictly utilitarian. My wife once said gift shopping for me is difficult. I responded, "If it helps me fix or build something, it's a hit!" All of my HPs have helped both causes. An HP has helped me make everything from bed frames, scale model solar systems, dark field reflectors, a barn, chicken coops, book cases, and even art work. The least likely thing I've ever made with an HP is a genuine curiosity in math for my niece who had learned to dislike the subject.

For curiosity sake, I'd love to have a collection of vintage calcs. But for day to day use, I'll always reach for the one I'm most familiar with. These days, when I need to get the job done now, right, and fast, I reach for my 50g.

Very Respectfully,

David

in response to message #21 by dbatiz*

I think it's an addiction. I remember when I got my first 48 [after owing a 41cx] and I was now starting my collection of survey programs, my wife told me "I wish I was an HP calculator, then maybe you'll play with me". :-) Most people feel it's weird collecting calculators. That's why I like this forum. It's a place where people who love HP calculators get to share their joys (35S), and sorrows (49G+) and hopes (42SX).

### **Re: Why do we collect HP calculators**

Quote:

---

Why do we spend the time to collect and/or play with old (or in the case of the 35s, wannabe old) HP calculators?

---

This question has certainly been posed before in the MoHPC Forum, but here's an earnest list:

1. Nostalgia, and the desire to obtain now what was coveted but unaffordable in one's youth -- much like classic cars
2. The desire to appreciate and operate practical products that are well-engineered in virtually every aspect
3. Particularly for us "natives", the importance of preserving the artifacts of an American corporation that exemplified engineering-driven excellence in a not-too-distant era
4. Costs of collecting are not exorbitant; required space is minimal
5. Required effort to repair, refurbish, and maintain is quite low -- particularly for LCD models

-- KS

### HP35s - The Buggy Little Beast (Report to Hrast)

Message #1 Posted by [Nenad \(Croatia\)](#) on 21 Aug 2007, 7:22 a.m.

Sergeant-Major, Sir, the requested report is on your desk, Sir.

If I may speak freely, I think it deserves emulation on something else (e.g. 50g) after the ROM is available.

### Re: HP35s - The Buggy Little Beast (Report to Hrast)

Message #2 Posted by [HrastProgrammer](#) on 21 Aug 2007, 9:25 a.m.,  
in response to message #1 by [Nenad \(Croatia\)](#)

OK, soldier. Good work. I will read your report when I'll be back because I am outside of Croatia at the moment ...

### Re: HP35s - The Buggy Little Beast (Report to Hrast)

Message #3 Posted by [Dallas Osborne](#) on 21 Aug 2007, 11:35 a.m.,  
in response to message #2 by [HrastProgrammer](#)

Young user shouts,

" **Recognizing** that I volunteered as an RPN Zealot, fully knowing the hazards of my chosen technique, I will always endeavor to uphold the prestige, honor, and high esprit-de-corps of my RPN/RPL sect.

**Professing** the fact that an RPN Zealot is a more elite user who arrives at the cutting edge of solutions by keystroke, program, or sheer cheek, I accept the fact that as an RPN Zealot my sect expects me to think further, faster and solve harder than any measly algebraic user.

**Never** shall I fail my comrades. I will always keep myself mentally alert, physically strong, and morally straight and I will shoulder more than my share of the task, whatever it may be, one hundred percent and then some.

**Readily** will I show the world that I am a specially gifted user who wields a well-engineered tool. My courtesy to superior users, efficiency of memory, and care of equipment shall set the example for others to follow.

**Perspicuously** will I meet the tribulations of my profession. I shall defeat them with speed of solution for I am better trained and will solve with all my might. Surrender is not a an RPN Zealot word. I will never leave a fallen unit to fall into the hands of the internet price hikers and under no circumstances will I ever embarrass my sect.

**Loyally** will I display the intestinal fortitude required to solve on to the RPN Zealot objective and complete the mission, though I be the lone survivor.

**Reversers leads the way!"**

Sergeant-Major hardly glances up, "Excellent; dismissed."

Howard

**Re: HP35s - The Buggy Little Beast (Report to Hrast)**

*Message #14 Posted by [HrastProgrammer](#) on 22 Aug 2007, 1:15 a.m.,  
in response to message #11 by Howard Owen*

Just to make the first two posts clear:

Nenad and I were just joking. He made a post some time ago about being the first one to have a HP-35S here and I said that I am expecting a report on my desk in a few days. So, the report is now on my desk :-)

We were talking about a possibility to develop an HP-35S emulator for HP-50G and (as usual) I said that we only need to extract the ROM, which isn't a simple task at all. This is the meaning of "I think it deserves emulation on something else (e.g. 50g) after the ROM is available" ... Don't take it too serious.

To Howard: Did you receive my last mail (with some attachments) few weeks ago?

*Edited: 22 Aug 2007, 1:40 a.m. after one or more responses were posted*

### hp-35s in Norway

Message #1 Posted by [Arne Halvorsen \(Norway\)](#) on 21 Aug 2007, 5:12 a.m.

Just in case any Norwegians goes here that wonder when one could stroll down to the local hp pusher to pick up a HP-35s: Talked with one shop that contacted their supplier (that would be hp Norway?) and it will NOT be in BEFORE Xmas this year... Sigh,... well at least it is comming...

### Re: hp-35s in Norway

Message #2 Posted by [John Mosand](#) on 21 Aug 2007, 7:33 a.m.,  
in response to message #1 by Arne Halvorsen (Norway)

Skuffet? Whenever it appears, I would like to see it and, like with a car, "try it before I buy it". So far, I'm quite satisfied with a 10C in my shirt pocket and a 48SX on my desk. So, we'll see... BTW I just discovered that my 10C has the same downward slanting display as the 35s. I hadn't noticed it before :-). And the 10C is still working without a change of batteries!!

### Re: hp-35s in Norway

Message #3 Posted by [bill platt](#) on 21 Aug 2007, 7:38 a.m.,  
in response to message #2 by John Mosand

I don't understand how anyone has a voyager go 20 years on a set of batteries. I regularly ran out of juice in my 11c back in its early days--more or less on a yearly basis.

However my wife's sharp elsi-mate made over 15 years on the original alkaline AA cell!

### Re: hp-35s in Norway

Message #4 Posted by [John Mosand](#) on 21 Aug 2007, 11:16 a.m.,  
in response to message #3 by bill platt

The MoHPC indicates that there may be several 10C's running on the original batteries. I admit that my 10C has been used a lot less than the 48SX, which I bought when it was introduced. I have changed its batteries only once.

PS Jeg er trønder...

### Re: hp-35s in Norway

Message #5 Posted by [Arne Halvorsen \(Norway\)](#) on 21 Aug 2007, 11:41 a.m.,  
in response to message #4 by John Mosand

Allo, allo Trønder..., Bergenser her.. :-). Make some sound if you observers some hp-35s up there in NTNU land before seen elsewhere!

## **Re: hp-35s in Norway**

*Message #6 Posted by [Arne Halvorsen \(Norway\)](#) on 21 Aug 2007, 7:56 a.m.,  
in response to message #2 by John Mosand*

Well, my hp calculators died a long time ago, even before got out of schools. Having lived all those years without a usable calculator I should be able to hold on some more months... :-)

Actual, right now I am pretty much able to borrow my boss' old hp15c whenever in need to check those numbers my programs produces...

Skuffet? Nae, great to see hp still can do it (right)!

### Alt-Az coordinates Part 2 for35s

Message #1 Posted by [Howard Lazerson](#) on 20 Aug 2007, 10:46 p.m.

Thanks Gerson for making pgm readable! This pgm is designed to convert right ascension & declination of any celestial body into simple altitude and azimuth. You therefore need to make/copy /draw a 360degree az circle on the mount base and a 0 to 90 degree scale for alt, 0 being level, 90 pointing straight up. Marking every 10 degrees is sufficient since its easy to interpolate. The # 6.619 is a constant and changes yearly, for2008 = 6.603, for 2009 =6.654. U is GMT for Calif, 10PM this August =5.0 , when daylight sav ends it is 6.0, use decimal minutes, 9:30 PM= 4.50 GMT. Latitude & longitude of your site are decimal degrees. Day number - add date to this # so for August 20= 212 + 20 = 232. Jan=0, Feb=31, March = 59, April=90, 120, 151, 181, 212, 243, 273, 304, and 334 for Dec. Right & declination are also input in decimal degrees. To get accurate results, the scope must be LEVEL- I mounted a bullseye level on my portable scope which works well. Sight Polaris [north star] and set Az to read 0 degrees, use a red light preserves nite vision ], look up RA & Dec of object, run pgm to get alt/az and slew scope to these coordinates. Use a widefield-low power eyepiece initially since there is a 1 to 3 degree offset in position- slowly slewing from the calculated position will locate object quickly. One really appreciates this pgm with objects Over 50 degrees high-no more on your knees squinting up while your back complains. Howard

### Re: Alt-Az coordinates Part 2 for35s-addendum

Message #2 Posted by [Howard Lazerson](#) on 21 Aug 2007, 12:44 p.m.,  
in response to message #1 by Howard Lazerson

Part 2 addendum ; For leap years, add 1 day to D starting with March thru December. Howard

### Re: Alt-Az coordinates Part 2 for35s-addendum

Message #3 Posted by [Gerson W. Barbosa](#) on 21 Aug 2007, 6:40 p.m.,  
in response to message #2 by Howard Lazerson

Perhaps these time and date routines might be useful somehow. They should be adapted to your needs and converted to the HP-35s, in order to save labels. They are based on a program that came in the Master Library Module, for the TI-58/59.

Regards,

Gerson.

### **Spiral Bound 35s Manual - FYI**

Message #1 Posted by [Chuck](#) on 20 Aug 2007, 7:42 p.m.

Liking what Dallas did with his 35s manual at Kinkos, I took mine to OfficeMax for spiral binding. They lopped of the glue binding, and spiraled in a new one for \$2.99. A definite must. None of the text was comprimised, but maybe three of the blue check marks in the margines were punched. I don't mind. :)

### **Re: Spiral Bound 35s Manual - FYI**

in response to message #1 by [Chuck](#)

Just did mine too, at Kinkos. Turned out great! Reminds me of the HP 42s manual (in binding, not content).

in response to message #1 by [Chuck](#)

I get mine bound today, and I had them add a clear plastic cover and back to help protect covers. It looks great!

### Altitude/Azimuth pgm, Part 1 for35S

Message #1 Posted by [Howard Lazerson](#) on 20 Aug 2007, 6:59 p.m.

pgm converts RA & DEC of celestial objects to Altitude & Azimuth. I use it for a small scope I take on vacation. Each command is separated by a comma below. lbl H,fix 2, input U,input D, input L, 6.619 , rcl D,0.0657, \* , +, rcl U, 1.0027, \* , +, rcl L, 15, /, -, 24, X exchange Y, X less equals Y, -, STO W, input R, rcl W, rcl R, -, 15, \*, sto X, rcl X, sin, stoY, input C, sin, rcl T, sin, \*, rcl C, cos, rcl T, cos, rcl X, cos, \*, \*, +, asin, sto V, rcl V, sin, rcl C, sin, rcl T , sin , rcl V, sin, \*, -, enter, rcl T, cos, rcl V, cos, \*, /, acos, rcl Y, X greater or equal 0 ?, xeq Eoo1, Roll down, xeq foo1, lbl E, roll down, 360, X exchange, -, sto W, lbl F , sto Z, view Z, rcl V, view V, rtn , Z=azimuth in decimal degrees, V= altitude in dec degrees, U= GMT in decimal minutes, ie 4hours 15 minutes=4.25, D = day number, L = longitude of observor,T = latitude of observor, R= RA, C = declination-both in decimal degrees. In part 2 I will explain how to use pgm. I am not an engineer etc so I am sure people will come up with shorter/faster changes- also I cant actually label the various names like I CAN IN MY 42S , HOPEFULLY someone can show us how to do this on the 35s?! I have used this pgm for past 3 weeks and it gets me within a few degrees of the object.  
Howard

### Valentin - Still interested in HP 33s Emulator?

Message #1 Posted by [Oswaldo Rodriguez](#) on 20 Aug 2007, 6:06 p.m.

A few months (years?) ago Valentin offered to translate some of his programs to work with the HP 33s if someone could provide him with an emulator. As some of you may recall that went nowhere fast. I was always surprised at all the comments against having Valentin translate his programs. Regardless, I know that Valentin now has an HP 35S, so the HP 33s may pose no interest to him.

Nonetheless, a few months ago I was able to get an emulator from HP, as a chemistry instructor. I get permission to install it on three computers, I have used it for my laptop and desktop.

Thus, Valentin, if you are still interested, let me know and I will forward to you the program so you can play with it or do what you wish with it.

Oswaldo

\_\_\_\_\_

That's a generous offer, but are you sure that the permission HP granted extends to installing it on a computer belonging to a third party?

Based on statements made by HP employees at past HHC conferences, I expect that if Valentin asked HP for the emulator, they would likely make it available to him.

### Re: Valentin - Still interested in HP 33s Emulator?

Message #3 Posted by [Bruce Bergman](#) on 20 Aug 2007, 6:54 p.m.,  
in response to message #2 by [Eric Smith](#)

I don't know if I'd go THAT far. For some reason, HP seems VERY protective of their educational emulators program. I know people who are truly educators who have been turned down. Those of us on the fringe don't even get the courtesy of a reply.

I agree, however, about watching the usage clauses.

thanks, bruce

### **Re: Valentin - Still interested in HP 33s Emulator?**

*Message #4 Posted by **Vincze** on 20 Aug 2007, 7:51 p.m.,  
in response to message #3 by Bruce Bergman*

Why they not want people to have emulator? With advent of 35s, it seem to me that 33s on the way out, and production more than likely has stopped already. I sure they just trying to flush distribution channels at this point.

### **Re: Valentin - Still interested in HP 33s Emulator?**

*Message #5 Posted by **Oswaldo Rodriguez** on 20 Aug 2007, 8:59 p.m.,  
in response to message #2 by Eric Smith*

Eric:

I will point you to the original thread about 2 years ago

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=80196>

[pre] Towards the bottom you will see Valentin's response to a similar answer to yours. The great Valentin wrote:

"Thanks a lot for your kind, supportive words but I don't think anybody at HP gives a damn about what I may or may not do in this forum or elsewhere, and if someone actually does, I doubt they can pull the necessary strings to accomplish even such a minor feat as letting me have an HP33 simulator."

Now I do not want to get anyone in trouble or do I want to repeat the type of discussion on that original thread, which became very heated. However, I believe, that the HP community missed on a great opportunity to have Valentin port some amazing and exciting programs to the 33s. I know that he is probably enjoying the 35s too much to have a desire to play with the 33s, but I just thought of offering.

The following link has the terms of use:

[http://www.hp.com/calculators/emulators/otheremulator.html?jumpid=reg\\_R1002\\_USEN](http://www.hp.com/calculators/emulators/otheremulator.html?jumpid=reg_R1002_USEN)

Now, I may be picking, however, in terms of use, it seems to me that only students are not allowed to use the software. Receiving the software by cd is restricted to educators. HP sent me the software by download link. I'll let you draw your own conclusions. If illegal, oh well, I won't do it. Nonetheless, as mentioned before, this may all be a moot point, since the interest may not be there anymore.

Oswaldo

### **Re: Valentin - Still interested in HP 33s Emulator?**

*Message #6 Posted by **Ed Look** on 20 Aug 2007, 9:14 p.m.,  
in response to message #5 by Oswaldo Rodriguez*

If it is the 33s emulator that appears on the screen as a life sized image of the 33s calculator, I have it on my work computer and students have seen it there and have watched me use it, especially when I'm too lazy to reach into my briefcase for the real 33s.

It seems, alas, none of them were too interested at all, except in the results, and how it compared to theirs.

I suspect they won't care at all that the emulator is RPN.

Someone here posted just a few days ago maybe that HP should give away RPN calculators, or even their algebraic ones to students, especially high school ones, to cultivate a greater appreciation of RPN machines, or at least, any HP calculator product. Letting them at the emulator software might even have a similar effect. But as of right now, the kids wouldn't even care to steal it. Not flattering at all.

McAfee did this a long time ago, giving out free versions of their anti-virus engine and updating it every week or so. They had me hooked until recently, when they made accessing their site and getting support so difficult.

HP, at least, has continued their rather good support and I think that if they were willing to so invest, they might reap many customers in years to come.

### **Re: Valentin - Still interested in HP 33s Emulator?**

*Message #7 Posted by [Bruce Bergman](#) on 21 Aug 2007, 4:04 p.m.,  
in response to message #6 by Ed Look*

You know, the lack of a 33s emulator MIGHT be because HP knew the 35s was coming out in a year or so (surely they have at least that long a lead time on building something like that). I mean, if \*I\* were in HP's shoes, knowing that something truly better was coming out in a year or so to "replace" (my finger quotes...) the 33s, I certainly wouldn't expend any energy on building something like that. I'd focus on building something for the 35s instead.

That's my guess, anyhow.

thanks, bruce

### **Re: Valentin - Still interested in HP 33s Emulator?**

*Message #8 Posted by [Osvaldo Rodriguez](#) on 22 Aug 2007, 10:05 p.m.,  
in response to message #7 by Bruce Bergman*

The problem is not that there is not 33s emulator the problem is the availability of the emulator. Hp has emulators for the 10BII, 12c, 17BII+, 39G+, 48GII, 49G+, and the 33s. However, they only make them available to educators. I had to provide a copy of the syllabus that I use for my students and in the syllabus I had to require or recommend the use of the model that I was requesting. In addition you can only request one emulator regardless of the classes or types of classes that you teach. For my students I recommend the hp 33s if money is tight, however, I recommend the 48GII or hte 49G+ if they can afford it. Nonetheless, when requesting the emulator I had to choose and I chose the 33s. I must say that it works just like the calculator and it is fun to use.

Osvaldo

### **Re: Valentin - Still interested in HP 33s Emulator?**

*Message #9 Posted by [Eric Smith](#) on 21 Aug 2007, 1:55 p.m.,  
in response to message #5 by Osvaldo Rodriguez*

Quote:

If illegal, oh well, I won't do it.

\_\_\_\_\_

I wasn't saying that it was illegal, and I'm sure you weren't intending to offer anything that wasn't strictly above-board. I was just concerned that it \*might\* be a violation of an EULA, and that if it was, you might not be aware of it. Not having seen the EULA, I have no idea whether the proposal would violate the EULA terms or not.

## Re: Valentin - Still interested in HP 33s Emulator?

Message #10 Posted by [Valentin Albillo](#) on 21 Aug 2007, 5:45 a.m.,  
in response to message #1 by [Osvaldo Rodriguez](#)

Hi, Osvaldo:

Osvaldo wrote:

*"[...] if you are still interested, let me know and I will forward to you the program so you can play with it or do what you wish with it."*

Thank you very much for your extremely kind offer and further your kind appreciation but, regrettably, once my vacations are over I find myself with a severe lack of free time and so I have to correctly arrange my priorities.

At the time I posted the original request for an HP33S emulator, that was the one and only easily-available RPN calc, and further it was one of the approved models for NCEES exams, so it found a market and generated quite a lot of interest among the HP calc-fan community.

Thus, though I profoundly disliked its physical incarnation (not the programming model, mind you), I saw it as a service to the community to port some of my best unpublished (or published) technical or mathematical programs written at their time for such machines as the HP-34C, HP-67, etc, which would perfectly run in the new HP33S within its maximum data register constraints, and would provide a base foundation of useful software. I didn't want the physical machine at all (even to the point of rejecting it as a gift) so an emulator was the way to go.

Much to my surprise, my request went finally unfulfilled and that was the end of it. Now the new HP35s is available, and it absolutely supersedes the HP33S in most every aspect, while being highly upward-compatible with it, so the HP33S is rendered utterly obsolete and I can see many owners getting rid of them for whatever they can get in order to buy the HP35S as soon as they can.

This being so, it surely would be a waste of time and effort to try and port old programs to an already obsolete, superseded model when there's even more scarcity of basic materials for the newer model. So I'm redirecting all my present efforts to the HP35s which means three brand-new programs (with corresponding articles) will appear in the next issue of Datafile.

Converting old programs isn't as good an idea now, as RAM restrictions have been mostly removed and so it's better to simply write new programs to take advantage of the fact instead of porting old programs created around the 26-register limitation which had to jump through all kinds of hoops merely in order to cope with it, thus resulting in tricky, convoluted, slow-running code. This was unavoidable in the case of the HP33S, but the new HP35s gets that drudgery wholly out of the picture.

Anyway, thanks again for your kind offer and

Best regards from V.

**Re: Valentin - Still interested in HP 33s Emulator?**

Message #11 Posted by [Oswaldo Rodriguez](#) on 21 Aug 2007, 12:56 p.m.,  
in response to message #10 by Valentin Albillo

Valentin:

I figured as much, as the saying goes a dollar short and a day late. Anyways I look forward to your publications on the 35s, and your challenges are always, well a "challenge". I'll finish by saying that it would have been quite a sight to see a 7 x 7 matrix handled on the 33s.

Ed:

My students are the same way, only interested in the final answer and many times without paying attention to the actual process. Several months ago there were several threads on how TI calculators were dummy proof, that you did not need to pay much attention into how the problem is entered. I never answered in that post even though I wanted to share some opinions. However, I have had students that regardless of how "dummy proof" the calculator is they always find a way to key in the process wrong. Somehow it becomes a challenge for some students to use the exponent key instead they type  $x 10^{\wedge}$ . In many stoichimetric problems it ends up messing up the sequence. This is a problem every semester, and even after I tell them repeatedly to use the exponent key, half way through the semester there are always a handful of students still getting wrong answers for not using the proper input keys.

Oswaldo Rodriguez

Quote:

... Somehow it becomes a challenge for some students to use the exponent key instead they type  $x 10^{\wedge}$ ...

This one is especially troubling, that they can't figure this out just by looking at the keyboard... of ANY calculator!

Quote:

... In many stoichimetric problems it ends up messing up the sequence...

... Oswaldo Rodriguez

It will mess up any problem. It doesn't get better when they somehow trudge forward up to equilibrium problems. By then, it's clear it's not the calculator!

However, I still believe that even today's better student can benefit (greatly) from using instead (HP's or any) RPN calculator; it just seems to stimulate more thinking and realization on the part of the user.

### **Newer HP 17BII+ with double-width Input/Enter key?**

Message #1 Posted by [bt\\_schmidt](#) on 20 Aug 2007, 3:20 p.m.

Hi,

My original Aug 5 2007 [posting](#) included an image of a newer HP 17BII+ with a double-width Input/Enter key, as served off of the OfficeDepot.com website.

Unfortunately Office Depot has reverted the image to that of a standard, gold & black HP 17BII+. So anyone reading that original thread will be confused as rather than side-by-side comparison images, they now see side-by-side images of the identical, gold & black, HP 17BII+.

I'm assuming that OfficeDepot had 'jumped the gun' when they posted an image of the newer HP 17BII+ with the double-width Enter key **before** HP had announced the calculator. Thanks to the Curator hosting the original image, here it is again. I know I will be in line to buy one when HP officially releases it.

...bt

FWIW, I saw the new version at Angus & Robertson on George St in Sydney, Australia about a month ago!!!

### **Double-width Input/Enter key? Why input? Why not ENTER?**

Message #4 Posted by [Gene Wright](#) on 20 Aug 2007, 4:48 p.m.,  
in response to message #1 by [bt\\_schmidt](#)

Here's a good question for the group...

Can anyone make a good case for this key saying INPUT?

It certainly comes from the past link to the original HP 17B, but that probably dates from some previous HP marketing person trying to break from HP's RPN heritage.

So, a vote...

PLEASE PUT IN THE SUBJECT OF YOUR REPLY...

ENTER

or

INPUT

for the Enter/Input key on the 17b.

Gene

P.S. This is purely a poll for fun. I ain't got nothing for you.

### **Enter**

*Message #5 Posted by [Vincze](#) on 20 Aug 2007, 5:17 p.m.,  
in response to message #4 by Gene Wright*

I would not buy one unless it match quality of Pioneer series 17BII. I saw cheapo 17bii+, and it look like joke. I don't think you ever see a business person be proud to pull that put at meeting.

### **Neither...**

*Message #6 Posted by [Thomas Okken](#) on 20 Aug 2007, 5:23 p.m.,  
in response to message #4 by Gene Wright*

How about [SAVE](#) instead? :-)

*Edited: 20 Aug 2007, 5:24 p.m.*

### **So that's an ENTER vote?**

*Message #7 Posted by [Gene Wright](#) on 20 Aug 2007, 5:40 p.m.,  
in response to message #6 by Thomas Okken*

Don't confuse things. :-) Be good to see a long list of ENTER or INPUT.

### **Re: So that's an ENTER vote?**

*Message #8 Posted by [Egan Ford](#) on 20 Aug 2007, 6:04 p.m.,  
in response to message #7 by Gene Wright*

ENTER should only be ENTER. This has nothing to do with legacy or RPN, just common sense. Look at any PC, it is an ENTER key, not an INPUT key, it is convention. (Well my Apple ][+ did have a RETURN key and so does my kids MacBook (but ENTER is printed above RETURN)). I think the argument still stands. ENTER.

### **OK, "ENTER", then...**

*Message #9 Posted by **Thomas Okken** on 20 Aug 2007, 10:14 p.m.,  
in response to message #7 by Gene Wright*

But only if it has an upward-pointing arrow next to it.

HP-25 Forever. :-D

(The HP-25 just happens to be **my** first HP, and I got it when I was 12 years old (thanks Dad!!!). That's an impressionable age... So there.)

*Edited: 20 Aug 2007, 10:19 p.m.*

### **Re: Neither...**

*Message #10 Posted by **Walter B** on 20 Aug 2007, 6:31 p.m.,  
in response to message #6 by Thomas Okken*

I second Thomas, SAVE is the only appropriate key print for a business calc :)

### **ENTER**

*Message #11 Posted by **Vincze** on 20 Aug 2007, 7:43 p.m.,  
in response to message #10 by Walter B*

Güten nacht my friend Walter. [SmartA\$\$Mode] Why not dummy it up and make it say OK. :)  
[/SmartA\$\$Mode]

Why you say Save? Was that not only one calculator that have that? If we say save, why not commit? That at least more liking computer term as you must commit SQL statements. My only concern is if we have commit or save, Mr Gates would get in picture and and say to have popup box that say "Are you sure you wish to save? Yes, No". And then after that, it say "Are you really, really sure?" ;)

Personally, I think it should say Belép, which mean Enter in Hungarian. :)

I never understand why 17BII have INPUT. That not make sense to me. Input where you put food in baby.

### **Re: Double-width Input/Enter key? Why input? Why not ENTER?**

*Message #12 Posted by **Bruce Bergman** on 20 Aug 2007, 6:50 p.m.,  
in response to message #4 by Gene Wright*

ENTER

### **Re: Double-width Input/Enter key? Why input? Why not ENTER?**

*Message #13 Posted by **Peter A. Gebhardt** on 20 Aug 2007, 7:19 p.m.,  
in response to message #4 by Gene Wright*

Pls. keep INPUT - it's better to avoid redesigning the manual!

Instead HP should invest into the SW so that L() & G() would be working properly again ....

Best regards

Peter A. Gebhardt

### **fix the solver please**

*Message #14 Posted by [Don Shepherd](#) on 20 Aug 2007, 7:42 p.m.,  
in response to message #13 by Peter A. Gebhardt*

Here here!

### **Definitely ENTER**

*Message #15 Posted by [Bruce Bergman](#) on 21 Aug 2007, 1:05 p.m.,  
in response to message #13 by Peter A. Gebhardt*

I agree about getting L() and G() working -- no question! I think all of us that use, and are fond of, the 17bii+ want that fixed.

But why would you want to keep INPUT the same just to not fix the manual? I mean, the manual is the EASIEST thing to change. It's a matter of someone going through a document and doing a search and replace (in the simplest case) or slightly more. There's probably some proofreading too, but that also pales in comparison to other changes.

The result would be *\*another\** appealing calc for HP fans and users alike. It would also make it more consistent with the rest of the current HP offerings. Even the HP-12C has an ENTER key...

thanks, bruce

### **INPUT**

*Message #16 Posted by [Thomas Radtke](#) on 20 Aug 2007, 7:49 p.m.,  
in response to message #4 by Gene Wright*

My first HP calc was a 20S. I had no clue about RPN (besides a little Forth) until I *\*accidently\** bought the 32SII. So, INPUT just reminds me on having had a great time in France, where I bought it ;-).

But...the HP-80 SAVE also looks great. I'm tempted to vote for it.

Has anyone mentioned that the new housing looks like that from the 35s? Can we expect the same great keyboard?

### **Re: INPUT**

*Message #17 Posted by [Raymond Del Tondo](#) on 21 Aug 2007, 12:25 a.m.,  
in response to message #16 by Thomas Radtke*

> Has anyone mentioned that the new housing looks like that from the 35s?

>

Yes, when I saw the first photo sme weeks ago;-)

The display and upper right corner keys are different, too.

I still hope they make an HP-42S anniversary model.

Raymond

### **Re: INPUT**

*Message #18 Posted by **Thomas Radtke** on 21 Aug 2007, 4:09 a.m.,  
in response to message #17 by Raymond Del Tondo*

...not to mention that a whole row of keys is missing :^).

I don't believe in a 41/42 successor. It will probably not be approved for the various exams and if it would, it could very well cannibalize the 35s.

### **Re: INPUT**

*Message #19 Posted by **Raymond Del Tondo** on 21 Aug 2007, 4:30 a.m.,  
in response to message #18 by Thomas Radtke*

> ..not to mention that a whole row of keys is missing :^).

>

Now that you mention it...but that's compatible with the Pioneer series.

Actually the 35s has one additional row...

I fear they won't make a new 42S, but the hope is still there;-)

The programming model of the 35s is so limited in comparison to the 42S,  
it just doesn't make fun to program the 35s IMHO.

It would also be a nice idea to have the 17bII+ in the new housing,  
equipped with Flash updateable ROM, and black faceplate,  
and a suitable SDK to built an own calculator.

Raymond

### **Rationale for ENTER, plus other changes (dreaming)**

*Message #20 Posted by **Bruce Bergman** on 21 Aug 2007, 1:14 p.m.,  
in response to message #4 by Gene Wright*

The 17bii+ can output programs (solver equations) to the printer, so it's marginally better than the HP-35s in that sense! I like that it has a good combination of features and functions.

Putting the ENTER label back on would be useful because it would justify what you can already do. I.e., in RPN mode, you can use the INPUT key like an ENTER key. In RPN mode the stack operations are also the face functions of the parenthesis keys.

While we're at it, I'd like to see HP put some other basic math functions into the MATH menu. Right now it has LOG,  $10^x$ , LN, EXP, N! and PI, which is great. But it has no SIN, COS, TAN, etc. If there were room in the ROM, it would seem to make sense to add those basic math functions.

There are solver equations that provide those functions, but it's not the same. There are even DEG->RAD solver equations. But it would be so much easier to have them in the ROM.

Also, I notice there is no yellow shifted function under STO. What about putting some functions under there? How about base conversions, or some simple conversions? Heck, if we're dreaming, I'd LOVE to see the E+ (sigma+) key back on the face of the calc, and if it were there, you could use it to create SUM lists automatically. Man, NOW we'd be talking! :-)

thanks, bruce

## **Re: Rationale for ENTER**

*Message #21 Posted by [Jake Schwartz](#) on 21 Aug 2007, 4:20 p.m.,  
in response to message #20 by Bruce Bergman*

Hi,

ENTER is to HP as the scroll wheel is to the iPod. It is their "bread and butter"...it is their trademark...it represents, as Gary Tenzer once put it, an expression of their unique "brand". Although the HP80 key said "SAVE", the HP70, HP22, HP27, and all business-oriented machines which used RPN had ENTER leading up to the hp12c in 1981. As I stare at Rick Furr's HP Calculator Poster (check it out at <http://www.vcalc.net>), it looks like "INPUT" first started with the HP18C in Summer of '86 and stayed on ALL algebraic-logic machines, business or scientific. When the 17BII and 19BII came out with the RPN or algebraic option, they left the wide key with "INPUT". Since the 18C, all HP business machines were exclusively algebraic (like the 10BII) or offered both logic options (like the 17BII+). With the exception of the 12C Platinum, those others all used INPUT. If the 35s represents HP's return to its roots, then I vote that they all say ENTER from now on, as long as they offer RPN as a logic option.

Jake Schwartz

## **Re: Rationale for ENTER (ban all INPUT keys)**

*Message #22 Posted by [Bruce Bergman](#) on 21 Aug 2007, 4:24 p.m.,  
in response to message #21 by Jake Schwartz*

Hear, hear! A vote for no more INPUT anywhere!

Well said, Jake.

thanks, bruce

## **Re: Rationale for ENTER, plus other changes (dreaming)**

*Message #23 Posted by [Peter A. Gebhardt](#) on 22 Aug 2007, 12:43 p.m.,  
in response to message #20 by Bruce Bergman*

Bruce,

may I add some more dreams?

Whats about:

- numerical integration & differentiation
- GAMMA distribution & GAMMA function for non-integers
- UTPN & other statistical relevant distributions

...

All of the above required, once you do some "serious" retirement or life-cycle planning.

Best regards

Peter A. Gebhardt

### Writing DEG/RAD mode-insensitive code

Message #1 Posted by [Stefan Vorkoetter](#) on 20 Aug 2007, 12:34 p.m.

A lot of times, I see programs that depend on the calculator's angle mode being set in a particular way. Or, the program sets the angle mode based on what it needs. I gave some thought as to how to write programs that do trig, but don't depend on the angle mode being set properly. Two approaches came to mind:

1. Determine the angle mode at program start, change it as needed, and then change it back upon completion.
2. Determine the angle mode at program start, and then do conversions as necessary during processing.

Suppose we want to write a program that works in degrees (such as an aviation related program). First let's look at option 1:

Determining the angle mode is easy. We can then use a flag to remember what it is. The following sequence of instructions determines the angle mode, and sets flag 0 if it is radians. Then it sets the mode to degrees:

```
CF 0
4
SIN
X<0?
SF 0
DEG
```

To restore the initial angle mode later, we just need to do:

```
FS0?
RAD
```

For option 2, we use the same initial sequence as option 1, except we omit the DEG instruction at the end.

Then, just before any function that expects an angle as an argument, we do:

```
FS0?
D->R
```

After any function that returns an angle, we do:

```
FS0?
R->D
```

At the end of the program, there's nothing to do, since we didn't change the calculator's angle mode setting at all (although we could clear the flag just to clean things up).

Of course, using this method trades making one change to the calculator's state (the angle mode) for a different change (the setting of a flag), but the latter is probably less likely to interfere with something.

Thoughts?

Stefan

## Re: Writing DEG/RAD mode-insensitive code

Message #2 Posted by [Vincze](#) on 20 Aug 2007, 12:58 p.m.,  
in response to message #1 by Stefan Vorkoetter

My friend Stefan, that very interesting. So if we were to do this with my aviation programs, what would my program look like? Which would effect size of program less.

One thing I not like with my code is that if you break out of distance program, calculator stuck in RAD mode, and unsuspecting user may forget and be fooled by results.

\_\_\_\_\_

Hi, Stefan --

I regularly use a celestial-object program, "Sky map and compass" for the HP-41, originally written by Tom Sherman in 1986, and improved by Geir Isene. It requires inputs in degrees, but neither version included a DEG instruction to set the proper mode. I've gotten a few incorrect results that way.

It's worth mentioning that the HP-41 and HP-42S retain the angular-mode setting in system flags 42 and 43. Thus, the user can check the setting without having to infer it through calculation, store it as appropriate (perhaps as a variable or user flag), and reset it later.

Flag 42 set = grads mode; Flag 43 set = radians mode. These are not directly user-settable.

-- KS

## Re: Writing DEG/RAD mode-insensitive code

Message #4 Posted by [Gerson W. Barbosa](#) on 21 Aug 2007, 2:13 p.m.,  
in response to message #3 by Karl Schneider

Detecting the initial angle mode, setting it to degrees and then getting back to the original mode appears to be to best way to do it. Another way is computing the conversion factor and using it throughout the program. For example, the following program returns  $\sin(30)$  and  $\text{atan}(1)$  in degrees, regardless the angle mode:

```
LBL A
1
ASIN
90
/
```

```
STO K
30
RCL* K
SIN
1
ATAN
RCL/ K
RTN
```

This method would be useful only for calculator on which the angle mode cannot be changed programmatically. This is not the case in any HP calculator, by what I can remember...

Gerson.

## Re: Writing DEG/RAD mode-insensitive code

**HP Journal**

Message #1 Posted by [Vincze](#) on 20 Aug 2007, 10:05 a.m.

I stumble across website last night on HP site that house all old HP Journals. It very nice to read some of these. It look like it go up to 1998, but then stop. What happen to the journal, did it just stop being made?

**Re: HP Journal**

Message #2 Posted by [HrastProgrammer](#) on 20 Aug 2007, 3:15 p.m.,  
in response to message #1 by Vincze

The answer is on the same site:

*"The HP Journal was published from 1949 - 1998, earning a well-respected tradition of excellence."*

**Re: HP Journal**

Message #3 Posted by [Vincze](#) on 20 Aug 2007, 4:05 p.m.,  
in response to message #2 by HrastProgrammer

Why they stop publication?

**Re: HP Journal**

Message #4 Posted by [Stefan Vorkoetter](#) on 20 Aug 2007, 4:21 p.m.,  
in response to message #3 by Vincze

Perhaps 1998 was when they stopped doing anything interesting, thus having something interesting to write about?

An interesting coincidence that 49 and 98 were the number of steps of program memory in several of the early HP programmables.

Stefan

**Re: HP Journal - It's Back (sort of)!**

Message #5 Posted by [Katie Wasserman](#) on 20 Aug 2007, 11:54 p.m.,  
in response to message #4 by Stefan Vorkoetter

Stefan, are you a numerologist? :)

Well yes, in fact HP did stop doing anything interesting about then because they were about to spin off Agilent and Agilent Labs -- the source of most of the stuff in the journal and almost all the interesting things that HP did. I don't know why Agilent didn't keep the Journal running, perhaps they just didn't have the funding to do so.

.... after searching the internet a bit.....

Curiously, they seemed to have just recently revived the journal as [Agilent Measurement Journal](#). It's a shame that the calculator division isn't part of Agilent.

*Edited: 20 Aug 2007, 11:58 p.m.*

### **Back from vacation and 4 new articles online ! :-)**

Message #1 Posted by [Valentin Albillo](#) on 20 Aug 2007, 6:58 a.m.

Hi all:

Just came back from my summer vacations I've spent in a little, rural village where neither Internet nor email access were possible in any way. Quite refreshing, if a little isolated. It will now take me quite a long time to read the tons of threads newly posted here, I see you all have been pretty busy, vacations or not.

Speaking of vacations, among many other things I've taken advantage of the free time and quiet environment I've enjoyed to write \*three\* new articles, all of them focused in the new HP35s (which I carried with me as my sole computing device in order to familiarize myself with its pros and cons), which will be promptly submitted to Datafile for their eventual publication in the very next issue, so you'll be able to have a look at them there come October (subject to Mr. Editor's kind approval of course).

Meanwhile, thanks to the invaluable help of my 15-year old daughter Laura (who got a Nintendo DS plus assorted game cards for her considerable efforts), [my humble HP calculator site](#) boasts a brand-new aspect and layout, and to commemorate the occasion I've just uploaded there and made freely available for download the following four articles of mine which were previously featured in Datafile, all of them in PDF format:

#### ***Long Live the HP-35 !***

This 5-page article, belonging to my ongoing "Long Live ..." series, is intended as a commemorative article for the HP-35's 35th anniversary, and I think you'll agree it's quite an original approach to it. It does include three sample applications featuring four small programs, addressing such topics as root finding and numerical integration, as well as providing the appropriate historical context and a few personal anecdotes to spice it all.

#### ***Boldly Going - Matrix Square Root***

This 6-page article is the first of a new series of articles, the "Boldly Going" series which, as its name implies, is intended to effectively go "... where no HP calc has gone before ...", and so they will be dealing with unusually difficult programming tasks in a straightforward manner, thus expanding the limits of what you can do with your HP model and how simply can you do it.

To provide a taste for the series, this first article deals with this task of finding the matrix square root of square matrices. Two full programs are featured: a 7-line subprogram for the HP-71B which can deal with real- or complex-valued  $N \times N$  matrices, and a 45-step routine for the HP-15C which will find the square root of real-valued matrices up to  $4 \times 4$ . Full examples are provided, with comments and notes, as well as the underlying algorithm.

#### ***Boldly Going - Identifying Constants***

This is a 14-page article which includes a truly awesome (if simple) program which allows ye goode olde HP-71B to perform some rather impressive 'symbolic' feats. The program does not require any additional ROMs or files, just a bare bones HP-71B, and can be converted to any other suitably fast

HP model or emulator with minimum effort.

It's a relatively simple program which provides basic functionality for an advanced, very useful and most impressive feature which is nevertheless absent in our beloved machines' built-in instruction sets, namely identifying numeric constants, i.e., the capability of, given some real, numeric value, to try and identify its exact symbolic form if possible, and that failing, to provide an approximate symbolic expression of user-specified relative accuracy.

This will allow us to perform some pretty nifty feats, such as give exact, symbolic results for definite integrals (even if they can't be expressed in terms of elementary functions), finite or infinite summations, and specific values of transcendental functions, among other uses.

The full 14-page article boasts more than 40 worked out examples, as well as three detailed extensions, the last being an 'exercise' for the reader, solution included ! :-)

### ***Small Fry - Primes A'counting***

This 1-page article belongs to the new series "Small Fry", which is intended to feature very \*small\* articles (maximum 1 page), while still keeping all the flavour and bite of the usual longer ones.

This first article deals with the topic of prime counting, i.e., finding out how many prime numbers there are up to a given limit N. For large N, generating all primes up to N and returning the count is prohibitively expensive in terms of running time and/or memory usage. What can we do about it when N goes sky-high (say 1010, 1015, or more) ? The article features an 8-line user-defined function for the HP-71B to accomplish the feat very quickly, as well as several comparative examples against other well-known prime counting procedures.

That's all for now, you can download them for free at my site, and I sincerely hope you'll enjoy them and will consider them good read for these quiet summer evenings (26 pages in all, nearly a full regular Datafile issue !). Any and all comments are really welcome, thanks in advance for them and

Best regards from V.

Hi, Hugh !

Hugh posted:

*"excellent! i like the site improvements, especially the calculator image branding. "*

I'll pass you comments on to Laura, she'll be *\*very\** happy ! She's a fledgling "web designer" and is very eager to get feedback for her very first "professional" work, so thank you very much for providing it.

Also, I hope you'll enjoy the 26-pages worth of articles :-)

Best regards from V.

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #4 Posted by [Vincze](#) on 20 Aug 2007, 8:41 a.m.,  
in response to message #1 by Valentin Albillo*

My friend, it appears you page must be broken. The main image in the center is 404 and it redirects to Lycos, and the items on the side, look like broken images.

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #5 Posted by [Valentin Albillo](#) on 20 Aug 2007, 10:09 a.m.,  
in response to message #4 by Vincze*

Thanks for the warning, Vincze, but it works Ok to me.

¿ Perhaps some configuration problem in your browser and/or your firewall, such as forbidding popups or adds to appear ?

The free, french Lycos server I'm using to host my pages does include some adds and such, like most other free services, but that should present no problems at all.

Anyway, should you still be unable to reach some of the articles, just tell me which are you interested in and I'll send them to some public e-mail account of yours or else post the direct links.

Best regards from V.

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #6 Posted by [Vincze](#) on 20 Aug 2007, 10:14 a.m.,  
in response to message #5 by Valentin Albillo*

I disable everything and nothing. Only thing I see on page is your counter, and the menu on left. I try and click on link for each menu item, but it just shows "Page non trouvée" and then go to main Lycos page. Very strange.

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #7 Posted by [Valentin Albillo](#) on 20 Aug 2007, 10:21 a.m.,  
in response to message #6 by Vincze*

Strange indeed ... I've tried just now (IE 6.0) and this is approximately what you should see:

<http://i18.tinypic.com/61oaidc.jpg>

Best regards from V.

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #8 Posted by [Alain Mellan](#) on 20 Aug 2007, 10:22 a.m.,  
in response to message #6 by Vincze*

I get the same "Page non trouvÃ©". It seems the main page references other pages with ...calc\main.htm (a backslash) instead of ...calc/main.hm (a regular, forward slash). Typical of a web site prepared on a Windows machine ;-)

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #9 Posted by [Valentin Albillio](#) on 20 Aug 2007, 10:24 a.m.,  
in response to message #8 by Alain Mellan*

Thanks a lot, I'll have Laura look into it ASAP.

Best regards from V.

*Message #13 Posted by [bill platt](#) on 20 Aug 2007, 11:17 a.m.,  
in response to message #11 by Vincze*

Aha!

That's it! (I couldn't get it to work either). The IE Windoze thing again :-)

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #14 Posted by **Vincze** on 20 Aug 2007, 11:39 a.m.,  
in response to message #13 by bill platt*

I just add IE render to Firefox, and then turn on flux capacitor, and all is fine in Firefox. Anything to upset Mr Gates.

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #15 Posted by **Dave Shaffer (Arizona)** on 20 Aug 2007, 4:23 p.m.,  
in response to message #14 by Vincze*

Valentin's page also shows up fine with Netscape 8.1 (I'm a real dinosaur when it comes to browsers, and I, too, will do almost anything to not use Micro\$oft products!)

In fact, those of you who have never tried WordPerfect instead of Word should give it a try!

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #16 Posted by **Ed Look** on 20 Aug 2007, 4:38 p.m.,  
in response to message #15 by Dave Shaffer (Arizona)*

Anybody remember AmiPro (by Lotus) in the days of Windows 3.1?

I was cleaning out some old manuals and the like and I found literature for AmiPro. I liked it much better than Word or WordPerfect then... and I think that's a bit of high praise from me as I preferred the DOS command line WordStar, maybe WordPerfect, over any GUI based word processor.

Yeah, I found the old WordStar manuals, too. I even found some literature on using VMS (ugh!... what horrible memories... ) on some old mainframe.

But none of this is older than my HP-34C with its Cylonic red LED eyes, and its spiral bound manual that could double as a high school or college math text. Yeah, it's also got that laminated quick reference card!

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #17 Posted by **Vincze** on 20 Aug 2007, 5:23 p.m.,  
in response to message #16 by Ed Look*

I remember AmiPro. I hate to say this, but I really did not like it.

I have OpenOffice at home, and it very nice and free. I also have M\$ Office too, but I wanted to see what OpenOffice like and it very nice. I can use documents from both system back and forth just fine. Again, to upset Mr Gates.

**Re: Back from vacation and 4 new articles online ! :-)**

*Message #18 Posted by [James M. Prange \(Michigan\)](#) on 21 Aug 2007, 12:49 a.m.,  
in response to message #8 by Alain Mellan*

With Firefox 2.0.0.6, the page looked just fine the first time that I loaded it. However, if I use Tools > Options... > Content, and uncheck "Load images automatically", of course I get the "broken images". I suspect that any problems with viewing this page with Firefox is a matter of browser configuration. Something else to check would be the configuration of extensions, such as Adblock.

Regards,  
James

**FIXED ! It should work now. Please try and tell me. [NT]**

*Message #19 Posted by [Valentin Albillo](#) on 20 Aug 2007, 5:22 p.m.,

in response to message #21 by Valentin Albillo*

Hi Valentin, welcome back :-)

Now it works fine also on Opera 9.22, which is the browser I currently use.

Thank you and your daughter for this nice improvement and articles!

Best regards.

Giancarlo

Hi, Giancarlo:

Giancarlo wrote:

*"Thank you and your daughter for this nice improvement and articles!"*

Thanks to you for your feedback and kind appreciation. I'll let her know and she'll be delighted: it is her first "professional" attempt, and as is my educational stand that children must be encouraged to attempt and solve real-world situations, I formally issued her a letter asking for her services in revamping my web page, with full specifications, and demanding to know cost and schedule. She complied, and all the process was treated with utmost "seriousness", conflicts and all, till the final result was delivered, accepted, put into production, and the payment fulfilled.

That's a way for she to gain experience and training to deal with real professional demands well in advance. And after all the hard work, lots of googling for site creation tutorials, desperation when something didn't work as it should, excitement when finally the bulb did light up, and satisfaction with the final product being duly accepted by the "demanding customer" (i.e., me), she's more than happy with herself and convinced she can overcome non-trivial difficulties, learn a lot in the process, and enjoy her new Nintendo DS plus game cards of her choice.

The bottom line is both her knowledge and her self-esteem have increased immensely with this "real world" little stratagem of mine.

And she's asking for more work ... ! :-)

Best regards from V.

in response to message #1 by Valentin Albillo*

In the first paragraph of your new article, "Boldly Going...Matrix Square Root", you say "...nor can programmed solutions be found."

You must have missed my post in the thread:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=66526>

which contains a programmed solution for the matrix square root problem. It requires the EGV function found on the HP48G and descendants.

The program gets the same solution you do for all your examples.

### **Re: Back from vacation and 4 new articles online ! :-)**

*Message #25 Posted by **Valentin Albillo** on 22 Aug 2007, 4:22 a.m.,  
in response to message #24 by Rodger Rosenbaum*

Hi, Rodger:

Rodger wrote:

*"You must have missed my post in the thread: [...]"*

First of all, thanks for the feedback, much appreciated. As for the thread you mention, it's from nearly three years ago. In that much time, there are tons of long, math-related threads posted here and the archives searching mechanism isn't particularly adequate to research them for a given topic.

Besides, my last posted message in that thread was #21 while your first posted message was #32, so I had already stopped reading the thread by the time you first posted and thus your post went utterly unnoticed by me.

*"[...] which contains a programmed solution for the matrix square root problem. It requires the EGV function found on the HP48G and descendants."*

I'm not familiarized with the HP48G (and descendants) instruction set at all as I don't like RPL models, but I guess EGV stands for "EiGenValues" and so must be some built-in function that returns either the eigenvalues or eigenvectors (or both) of a given matrix, either general or of some special type.

If that's correct, I think it might be the case that your approach only works for the special case of diagonalizable matrices. All the examples in my article deal with diagonalizable matrices, which explains why you get the same results. It might be the case that for some non-diagonalizable matrix my approach would still work but yours won't.

Thanks again and

Best regards from V.

---

Yes, the HP48 program does require the matrix to be diagonalizable, but even though this is a "special" case, it isn't a rare case. Most matrices that arise from physical problems will be diagonalizable, for example.

There is a method which would be applicable to non-diagonalizable matrices. It uses the Schur decomposition, but it is more complicated. The HP48G program I've already given is very short and often will work.

While it is possible that your method may work with some non-diagonalizable matrices, it doesn't even work with some diagonalizable matrices that the HP48G program handles properly.

Your HP71 program doesn't seem to be able to find a square root of these matrices:

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$$

and

$$\begin{bmatrix} -9 & 2 & -6 & 3 \\ 5 & 1 & 5 & 7 \\ 6 & 0 & 3 & 1 \\ 3 & -2 & 3 & -1 \end{bmatrix}$$

Do you know why? I let it go for 900 iterations for both of them, and there was no sign of convergence.

Message #27 Posted by **Valentin Albillo** on 23 Aug 2007, 7:21 a.m.,  
in response to message #26 by Rodger Rosenbaum

Hi, Rodger:

I'll have a look into it if I find the time. The first matrix is obviously singular, at first glance.  
Can you post your computed square roots for both of them so that I can compare ?

Best regards from V.

**Re: Back from vacation and 4 new articles online ! :-)**

Message #28 Posted by **Rodger Rosenbaum** on 23 Aug 2007, 8:52 a.m.,  
in response to message #27 by Valentin Albillo

For the first one:

$$\begin{bmatrix} (.449756, .762279) & (.552622, .206796) & (.655487, -.348687) \\ (1.01852, .0841513) & (1.25147, .0228293) & (1.48442, -.0384932) \\ (1.58729, -.593976) & (1.95032, -.161138) & (2.31335, .271701) \end{bmatrix}$$

and the second one:

$$\begin{bmatrix} (.215101, 2.95788) & (-.183078, -.489361) & (.215101, 1.22583) & (.343944, -1.07186) \\ (1.71776, -.117905) & (1.29884, .0448131) & (1.71776, -.117905) & (2.49701, .0332699) \\ (.566935, -.973341) & (.541642, -.264916) & (.566935, .758709) & (.813907, .511870) \\ (.457715, -1.30388) & (-.478761, .495577) & .457715, -1.30388) & (.739943, .367923) \end{bmatrix}$$

I've only shown 6 digit results, although the calculator returned 12 digits. When the 12 digit results are squared, the error is out in the 11th or 12th place.

**Thanks a lot, I'll check it. [NT]**

**35s Availability?**

Message #1 Posted by [Ken Cambier](#) on 19 Aug 2007, 8:09 p.m.

Am I just being neurotic or is the 35s harder to find? I got mine about 2 months ago from buy.com for \$51.95 and free shipping. When I went back they don't even list a 35s anymore. I checked at HP and they were on back order. There are not even any on eBay or at Amazon. You would think that just before the start of school in September they would be bunches of them on the market. Anyone else notice this or are the 60's finally catching up with me?

in response to message #11 by James M. Prange (Michigan)*

Quote:

I don't know whether these units have the "cosmetic" problem, whatever that may turn out to be.

Because the halt in 35S sales was so short in duration (less than two weeks), I'm thinking the only thing that could've occurred was for HP to issue instructions to their re-sellers to "inspect and remove" any 35S's in their inventory that had the mislabeled "->l" printing (to make sure all remaining stock had the correctly labeled "->gal" conversion markings).

Gene showed an example of this in a photo he posted a little while back. Who else has one of these unique models?

Certainly, there couldn't have been enough time to do any other sort of mass cosmetic modifications.

Just some random synapses firing,  
Matt

### 71B questions

Message #1 Posted by [Vincze](#) on 19 Aug 2007, 7:33 p.m.

I still looking for 71B very badly. One question I have though is I never see slip case for it. Did it not come with one. Also, I see many time modules for 71B. Where do these modules go? I know on 41C series, there are ports on the north side of unit, but 71B look like big/long 15C.

### Re: 71B questions

in response to message #3 by Vincze

Hello!

Quote:

\_\_\_\_\_

Okay, so case look like 41C case?

\_\_\_\_\_

Yes, very similar, but the size is different (bigger, but less thick).

Quote:

What are other covers on bottom of machine?

The biggest in the middle is the battery door (4 AAAs), under the second goes either the card reader or a RAM extension (like "Corvallis memory") and the third one is the optional HP-IL interface. BTW: It needs no time module, because it has an internal clock!

Greetings, Max

## Re: 71B questions

Message #5 Posted by **Egan Ford** on 19 Aug 2007, 7:54 p.m.,  
in response to message #1 by Vincze

The 71B has a 41CX looking zipper case, about as long but a bit wider. Here is a sold eBay listing with a picture of it:

[http://cgi.ebay.com/ws/eBayISAPI.dll?](http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=120146780352&ssPageName=STRK:MEWA:IT&ih=002)

[ViewItem&rd=1&item=120146780352&ssPageName=STRK:MEWA:IT&ih=002](http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=120146780352&ssPageName=STRK:MEWA:IT&ih=002)

On the North side there are 2 ports, one is for a HP-IL only, the other is for the card reader or RAM module. IMHO, HP-IL is a must IF you have something to connect it to (PC, 9114 floppy drive, or HP-IL/RS232 bridge). I do all my development on EMU71 and then HP-IL it to my 71B via an HP-IL PC ISA card.

On the South side there are 4 general purpose RAM/ROM ports. I would recommend that you get a Math ROM.

I mentioned this before, but try the classifieds:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/adforum.cgi>

Post a Want To Buy (WTB).

If you look now there is a FSBO HP 71B starting at \$75.

## Re: 71B questions

Message #6 Posted by **Vincze** on 19 Aug 2007, 8:23 p.m.,  
in response to message #5 by Egan Ford

I email person selling, but I not know who he is. I am not sure I like buying from someone who I do not know. All other calculators I buy I actually got to see. Someone else email me that they have one too. I guess I need to put some trust in people.

## Re: 71B questions

Message #7 Posted by **Egan Ford** on 19 Aug 2007, 8:33 p.m.,  
in response to message #6 by Vincze

Quote:

I guess I need to put some trust in people.

---

I trust the people here more than eBay.

Ask for pictures with the device powered up. Ask for a return policy. If you use Paypal you can leverage their dispute engine (never tried it).

IMHO, the rewards outweigh the risks.

### Re: 71B questions

Message #8 Posted by **Vincze** on 19 Aug 2007, 8:09 p.m.,  
in response to message #1 by Vincze

Thank you all. I wonder why does it need math module if it has BASIC and calculator built in. Also, I not sure I understand IL module. Is that like a IO port? What type of connector does it accept?

Lastly, they not all come with card reader? On card reader, is it one use only, or can one overwrite it with new program like disc?

### Re: 71B questions

Message #9 Posted by **Maximilian Hohmann** on 19 Aug 2007, 8:17 p.m.,  
in response to message #8 by Vincze

Hello!

Quote:

---

I wonder why does it need math module if it has BASIC and calculator built in.

---

The MATH module adds some additional functions (like matrix calculations) that you would have to program yourself otherwise. But even without this, the calculator has all functions that one really needs.

Quote:

---

Also, I not sure I understand IL module. Is that like a IO port? What type of connector does it accept?

---

Yes, it is a closed-loop serial connection. It has two special kinds of HP-IL connectors (in and out - like MIDI, only that MIDI uses the same connector for everything) that you will find nowhere else.

Quote:

---

Lastly, they not all come with card reader? On card reader, is it one use only, or can one overwrite it with new program like disc?

---

The card reader was an option. It is not really practical, because in the early 80ies, RAM sizes were growing fast and you needed heaps of cards to store the contents of the calculator memory (I think they hold 512 k each). I don't know for sure, because I don't have a card reader in my 71, only one in the '75, but that may be slightly different. The cards can be overwritten just like floppies. They are very hard to find and are differnt from the '65, '67, '97 and '41 cards, that are all the same and therefore in plenty supply.

Greetings, Max

Hi,

> [..Mag cards for HP-71..]

> (I think they hold 512 k each)

>

You certainly mean 512 bytes ;-)

Apart from that, according to the hpmuseum,  
it was about 650 bytes per track,  
or about 1300 bytes per card.

HTH

Raymond

### Re: 71B questions

Quote:

\_\_\_\_\_

I wonder why does it need math module if it has BASIC and calculator built in.

\_\_\_\_\_

You do not need it, but you may want it. E.g. complex numbers, matrix operations. In 41CX terms think of it as an Advantage ROM, sans TVM.

Quote:

\_\_\_\_\_

Also, I not sure I understand IL module. Is that like a IO port? What type of connector does it accept?

\_\_\_\_\_

Yes. Read <http://en.wikipedia.org/wiki/HP-IL>. Bottom line it is proprietary and expensive, but fun.

Quote:

\_\_\_\_\_

Lastly, they not all come with card reader? On card reader, is it one use only, or can one overwrite it with new program like disc?

\_\_\_\_\_

Less than 1/2 (eBay) of them come with card readers. Yes you can reuse the cards. AFAIK, you cannot use the cards with a 41 or a PC, so its only useful to backup programs and share with others that have a 71B+card reader.

### Re: 71B questions

*Message #12 Posted by **Howard Owen** on 20 Aug 2007, 3:32 a.m.,  
in response to message #8 by Vincze*

Quote:

\_\_\_\_\_  
Lastly, they not all come with card reader?  
\_\_\_\_\_

No, not by a wide margin. The card readers are fairly rare, and pretty expensive when you do find one.

I think there are three reasons for this. First, as Raymond and Egan have said, the card reader was a pain to use because of the small capacity relative to the calculator's memory size. (You can get the cards on eBay pretty easily, by the way.) Second, the "card reader" port was actually used by lots of companies to take RAM/EPROM expansion modules. My main 71B has 128K in that port. Finally, the availability of HP-IL meant that you could use several faster and higher capacity devices for storage. In particular, the 9114(A/B) floppy drive is quite usable from the 71B. It beats the cards hands down for both speed and capacity.

Regards,  
Howard

Ok, so IL device best bet it sound like. how hard it to find IL cables?

### **Re: 71B questions**

*Message #14 Posted by **Maximilian Hohmann** on 20 Aug 2007, 5:39 p.m.,  
in response to message #13 by Vincze*

Hello!

Quote:

\_\_\_\_\_  
how hard it to find IL cables?  
\_\_\_\_\_

Very hard, I'm afraid. I have quite a few IL devices (printers, micro-cassette-tape-readers and a video interface), but only one set of cables, so I can only use one at a time. In all the years I am after these things, I have only once seen IL cables on eBay and they went for a price that would have earned me a divorce if I had spent so much on so little... Maybe in the States the situation is different? (Same as with the "long" magnetic cards for the 71 and 75 that are almost impossible to find here.)

Greetings, Max

### **Re: 71B questions**

*Message #15 Posted by **Egan Ford** on 20 Aug 2007, 5:53 p.m.,  
in response to message #14 by Maximilian Hohmann*

1m cables average \$10-\$20 each on eBay. You will need at least two unless you are talking to an 41C only, the HP-IL adapter for the 41 has cables hardwired.

**Re: 71B questions**

Message #16 Posted by [Vincze](#) on 20 Aug 2007, 9:04 p.m.,  
in response to message #15 by Egan Ford

Why need two? I just wish to talk to my laptop which have rs232 port. Do I still need two?

**Re: 71B questions**

Message #17 Posted by [Egan Ford](#) on 20 Aug 2007, 9:53 p.m.,  
in response to message #16 by Vincze

Please read:

<http://en.wikipedia.org/wiki/HP-IL>

<http://www.hpil.hp.com/hpjournal/pdfs/IssuePDFs/1983-01.pdf>

IANS, HP-IL is not RS232. You need a gateway/bridge to get from HP-IL to your laptop. Your options are:

1. HP-IL PC ISA card in a old PC with network support (this is what I do and it works great and is very easy to do with Linux+EMU71 and/or EMU41)
2. HP-IL to RS-232 (cumbersome, one program at a time)
3. 9114 HP-IL floppy drive (floppies can be read/written from Linux).

All three options require at least two HP-IL cables--its a loop.

#1 is clearly the best way to go. Take an old PC (with ISA slots), install an HP-IL adapter, install Linux+DOSEMU, install EMU71 (registered version), and install a network adapter. Now you have an HP-IL appliance. It emulates 2 virtual floppies (9114), can emulate a HP-IL to RS-232 device, a printer, and an 80 column display. Do all your development on your laptop with EMU71, then copy the virtual floppy image to your HP-IL appliance (no need to restart EMU71), then from your 71B you can directly access the virtual floppy drive using easy 71B commands. Get fancy and export the DOSEMU directory, mount on your laptop and share the virtual floppy drive.

#2 is a more work, not as flexible or simple.

#3 is easy. But the diskettes can only be formatted in the 9114 (not Linux, DOS OK) and the diskettes can only be read/write from DOS or Linux (no Windows).

**Re: 71B questions**

Message #18 Posted by [Vincze](#) on 21 Aug 2007, 9:33 a.m.,  
in response to message #17 by Egan Ford

My friend Egan, how hard it to find the IL ISA card? One other issue. My laptop not have floppy drive. Just CD and flash drive, so I would have to have PC that can read flash drive. Hmm... This getting more complicated. :(

My friend Egan, how hard it to find the IL ISA card?

Very hard. I have never seen one on eBay. However, there is one for sale now (check the Classifieds).

Hmmm... This getting more complicated. :(

The 71B is 22 years old. You are going to need an old PC if you want to use HP-IL/ISA. Perhaps HP-IL -> RS/232 is the answer for you.

Okay, that explain. I did not aware that there was box between PC and 71B. I thought cable went direct between 71B and computer. Now I understand.

So with ISA card, there no box between PC and 71B. You have two wires from 71B and PC that connect, yes? Wow... this seem like a lot just to transfer program, but I see value of backing up 71B.

Well, now I wait for my 71B to arrive. I just happy that I able to find one.

How hard Math module to find, and how much they normally go for?

No very. ~\$100. Optionally you can post a WTB for a burned ROM with Math+JPC. Or you can install a 32K RAM module put it there (but you will need HP-IL to do that).

*Message #46 Posted by [Howard Owen](#) on 21 Aug 2007, 1:50 p.m.,  
in response to message #24 by Vincze*

The math module is pretty hard to find, and expensive when you do find one.

The alternative I took was to send a CMT 64K front port EEPROM module I had acquired on eBay to Mike Davis. He has a programmer for those devices. I asked him to put the math module and the JPC ROM images on mine. I now have the functional equivalent of both those very rare modules in a single front port module. Mike occasionally sells similar EEPROMs on eBay, along with the burning service. The 64K version goes for \$100.00 or so.

Another possibility is to acquire a large RAM expansion module. You can then configure it as a detached memory, and fill it with the math module image and whatever else will fit. The images for most of the historical modules for the 71B are all on the swap disks. This won't work for the FORTH/Assembler or HP41 Translator modules. These modules take over the OS of the 71B at a lower level, and can't be configured to run out of a detached RAM or EEPROM. Those modules are therefore expensive when they come up on eBay. \$300.00 or so is typical.

Also, with respect to the HP-IL cables, I got most of mine by acquiring 71B and 41C bundles from eBay. Generally speaking, a large lot of equipment is a far better deal on eBay than single item auctions. I'm not sure why, but people seem not to bid as high for

lots as they do for the single items. That's how I got my CMT  
EEPROM and other goodies as well.

Regards,  
Howard

### "Irrational Exuberance"?

Message #1 Posted by [Steve Fennell](#) on 18 Aug 2007, 6:55 p.m.

There are two HP 42S currently up for auction, described as new, with prices nearing \$500. Doesn't this seem ridiculous? I was thinking of bidding but it may be an emotional auction.

Has anyone seen this model go for this high of a price before? It's a great calculator I'll admit, but I'd rather buy a couple of new 35s than pay that much.

### Re: "Irrational Exuberance"?

Message #2 Posted by [Thomas Okken](#) on 18 Aug 2007, 7:46 p.m.,  
in response to message #1 by Steve Fennell

To paraphrase a Dutch saying, "anything is worth what a fool is willing to give". :-)

A few years ago, I paid \$170 for an HP-67. Maybe I spent more than I had to, but I really wanted one, and I could afford to spend that amount... I'm happy, and I suspect the seller is, too.

The HP-42S is the subject of many discussions on this forum, and the prevalent opinion appears to be that it is the best keystroke-programmable RPN calculator ever made. (Maybe that's exaggerating things, but not by much.) Even so, given the fact that calculators like the HP-50g cost only \$150 or so, brand new, and also considering the fact that most of the tasks that people used to use calculators for are done using cheap laptop and desktop PCs nowadays, spending \$500 on an HP-42S seems extreme... It's certainly more than the calculator is worth in any practical sense, but we're all human, and sentiment (nostalgia?) is always a factor. And of course, there's always good old-fashioned insanity. Again my Dutch compatriots seem to know something about that; if you haven't heard of it yet, you may be interested to read about the 17th century [Tulip Mania](#).

I suspect the HP-42S craze may turn out to be just another market bubble... But I'm **NOT** selling mine. :-D

- Thomas

[ [Return to Index](#) | [Top of Index](#) ]**HP35s meaning of indirect address 0/hp32sii keyboard***Message #1 Posted by [Peter Niessen](#) on 18 Aug 2007, 4:38 p.m.*

Hi Forum,

proud owner of the new 35s since a few days, I'm a bit puzzled by the indirect variables 0-800. I came across the VIEW(I)/VIEW(J) bug, but that was already described earlier in

[the 48g forum](#)

I'd also like to apologize if this has been brought up before, but I could not find it back in the forum. It seems that some editing took place, e.g. [for this message](#).

Now, I wrote the little program to delete all indirect variables

Length=30, CHKSM=EE33

```
C001 LBL C
C002 0.800
C003 STO I
C004 0
C005 STO (I)
C006 ISG I
C007 GTO C004
C008 RTN
```

to obey the point 2. on page 14-24 of the manual. However, after running the program, the number of variables is still > 700 according to the MEM menu, and only after saying

```
0
STO I
STO (I)
```

(which takes .5 seconds or so) the memory used by indirect variables is gone. (memo to HP: in the HP35Sii, there should be a CLR INDIRECT or so in the MEM menu.)

So, is there a special meaning for (0)?

On another point: I bought the 35s, which appeared at the right moment, as a replacement for my 32Sii, whose keys started to fail. I took it apart following

[these instructions](#)

an will glue in a little slice of rubber to make the case press against the board.

On that occasion, I noticed that the 32S can also display messages using equations and flag 10. Was this a documented feature?

Thanks for reading this up to here,

yours sincerely, Peter.

**Re: HP35s meaning of indirect address 0/hp32sii keyboard**

*Message #2 Posted by [Reth](#) on 18 Aug 2007, 5:33 p.m.,  
in response to message #1 by Peter Niessen*

I made that point (about clearing indirect registers) before, but the post seems to disappeared... Assuming we've got 50 in reg 50 that makes MEM to report 51 indirect regs. As you've noticed those can be cleared and memory reclaimed at once only if you did store 0 in reg 0 \*after\* doing so for the rest of them ???

This works:

```
U001 LBL U
```

```
U002 50
U003 STO I
U004 CLSTK
U005 STO(I)
U006 DSE I
U007 GTO U005
U008 STO I
U009 STO(I)
U010 RTN
```

Cheers,  
Reth

p 1-5 CLVARx to clear indirect bank.

### Re: HP35s meaning of indirect address 0/hp32sii keyboard

Message #6 Posted by **Reth** on 18 Aug 2007, 5:42 p.m.,  
in response to message #5 by Dave Johnson

I've missed that, thanks; MEM still reports 1 indirect register available - the \*0\* one :) so - back to

```
0
STO I
STO(I)
Cheers,
Reth
```

and also CLVARx does not work in a program... so - back to the above :)

*Edited: 18 Aug 2007, 5:46 p.m.*

### Re: HP35s meaning of indirect address 0/hp32sii keyboard

Message #7 Posted by **Gene Wright** on 18 Aug 2007, 5:49 p.m.,  
in response to message #6 by Reth

Yes, CLVARx clears the indirect registers GREATER than the number given to it as an argument.

So, give it a 0 and it clears 1 and up.

It is mentioned on page two of the indirect register learning module found here:

[Indirect register learning module for the 35s](#)
**Re: HP35s meaning of indirect address 0**

Message #8 Posted by [Reth](#) on 18 Aug 2007, 6:24 p.m.,  
in response to message #7 by Gene Wright

Thanks, Gene, but that's not the point; The point is (given we have 50 in reg 50) - after :

```
Q001 LBL Q
Q002 0.05
Q003 STO I
Q004 CLSTK
Q005 STO(I)
Q006 ISG I
Q007 GTO Q005
Q008 RTN
```

MEM reports 50 regs and :

```
49
STO I
RCL (I)
```

doesn't give an error message

Regards, Reth

*Edited: 18 Aug 2007, 6:30 p.m.*

**Re: HP35s meaning of indirect address 0**

Message #9 Posted by [Will Hartung](#) on 18 Aug 2007, 6:48 p.m.,  
in response to message #8 by Reth

To be fair, having the calculator report 50 registers makes complete sense.

When you store a value in to a register, the indirect register memory block is essentially a contiguous array of values.

If you stored a value in register 50, the calc allocates a block of memory up to and including 50. That's why you don't get an error for accessing register 49 -- it's already there (I dunno if you would get an error for 51, I've not played with a 35s).

Otherwise it would have to keep track of not just stored values, but "dirty" values, which would simply consume yet more memory, and access would be even slower than it may be now.

If the calculator kept track of individual registers, it would need to track their number and their location in memory. If you wanted to fetch the value, the calculator would then have to look up the list of "used" registers for the register you wanted, and look up it's actual address, and finally the value. That's a lot of looking up!

Instead, HP traded memory for speed, being conscious of the fact that most folks would be doing most of their register dancing at the lower limits (who uses register number 743 in normal work anyway?), and that they'd most likely use contiguous blocks of registers (since they're easily leveraged as arrays).

This technique simply gives better performance, a reasonable trade off, and makes overall memory management much easier.

**Re: HP35s meaning of indirect address 0**

Message #10 Posted by [Reth](#) on 18 Aug 2007, 6:55 p.m.,  
in response to message #9 by Will Hartung

You've missed the point - 0 has been stored in all indirect registers and still the system reports their existence. Storing 0 in I and 0 in (I) fixes it, system reports 0 indirect registers.

**Re: HP35s meaning of indirect address 0**

Message #11 Posted by [Gene Wright](#) on 18 Aug 2007, 7:47 p.m.,  
in response to message #10 by Reth

Hmm. Yes, I had seen the point you were making. I was just commenting on the CLVARx portion. :-)

Try this...do the loop counting down rather than up and see if that does it differently.

**Re: HP35s meaning of indirect address 0**

Message #12 Posted by [Reth](#) on 18 Aug 2007, 8:01 p.m.,  
in response to message #11 by Gene Wright

I did, just look a few posts up; Looping down lives 1 register intact - reg 0; Looping up leaves all 50; In both cases if you don't store 0 in I and then indirectly 0 in (I) \*at the end of the process\* you don't get the expected 0 indirect regs. That makes me and the original poster to think about "special" meaning of the 0 register, features, bugs, misprints etc, etc, etc... :)

cheers,

reth

Message #14 Posted by [Vincze](#) on 20 Aug 2007, 9:41 a.m.,  
in response to message #1 by Peter Niessen

I have question about indirect variables. I read manual, but I little confused. It say it variable that not defined beforehand. Is this like temp variable in programming that only there when program run and gone after. Or is this like not declaring a variable? Then further in manual it say is useful for controlling loops. So is it like array?

I guess I just not understand what I and J be. Can someone give me simple explanation and why I might use it.

**Re: HP35s meaning of indirect address 0/hp32sii keyboard**

Vincze,

You might enjoy reading about programming on the HP-41C. There was a link not long aog here to a complete HTML facsimilie of the manual.

The 41 makes large use of "indirection" as it is known. It is useful for more than just getting to the "extra" registers.

Best regards,

Bill

**Re: HP35s meaning of indirect address 0/hp32sii keyboard**

Message #22 Posted by **Vincze** on 20 Aug 2007, 1:01 p.m.,  
in response to message #21 by bill platt

My friend Bill, thank you for that suggestion. Yes, I do remember that link, and I shall see if I can track it down and look into that. It would be nice to conceptualize why I might use indirection on calculator. In programming I have used many times, but I just can't grasp why I would use on calculator.

**Re: HP35s meaning of indirect address 0/hp32sii keyboard**

Hi Vincze,

Quote:

It would be nice to conceptualize why I might use indirection on calculator. In programming I have used many times, but I just can't grasp why I would use on calculator.

Indirection is great to use to pass a parameter of several memory locations to a subroutine.

For example:

Several years ago, I was writing a program to calculate the psychometric properties of air. I had several subroutines that would be called for each of the air streams - Outside Air, Room Air and Mixed Air. Instead of trying to pass all the variables on the stack, I would pass only the single index value. For example, 10 for Outside air, 20 for Room Air and 30 for Mixed air.

For each of the air streams, the parametes were stored in sequential memory locations - R11-15, R21-25, and R31-35. The subroutine would then use the index variable to extract and work on the respective air stream. The results could be stored in R16-19, R26-29, R36-39.

A similar method was then used to printout the results - a single subroutine that used the index to determine which air stream to print.

It worked great. Unfortunately, I got sidetracked about halfway through the project and never finished the program. Still want to get back to it one of these days.

Bill

*Message #24 Posted by [Peter Niessen](#) on 20 Aug 2007, 5:14 p.m.,  
in response to message #23 by Bill (Smithville, NJ)*

Hi Vince,

another use of the indirect variables is to use it as a parameter stack when recursively calling a subroutine. (Like a higher language does for you in the background.) As an example, see

[Towers of Hanoi on the HP32s](#)

(I apologise for this self-promotion)

which shifts around the towers of Hanoi using a recursive prescription:

```
void move (int n, int source, int target) {
  if (1 == n) {
    std::cout << "Move disk from " << source << " to " << " target
      << std::endl;
    return;
  }
  move (n-1, source, 6-target-source);
  move (1, source, target);
  move (n-1, 6-target-source, target);
}
```

Or, maybe a bit simpler: Factorials:  $n! = n * (n-1)!$

```
[pre] int factorial (int n) {
if (n <= 1) // we're done and know the answer return 1;
return n * factorial (n - 1); }
```

Of course, these are more academic examples, in real life things might be done differently.

Other (more down to earth application) could be a chi-square test

[\(wiki article here\)](#)

where you use the indirect variables to represent a histogram with a previously unknown number of bins.

Cheers, Peter.

### **OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

Message #1 Posted by [Paul Brogger](#) on 17 Aug 2007, 6:07 p.m.

I feel like Rip Van Winkle. I happened upon a Fry's ad insert from the local paper. It offers, among other things, a 1.5 **farad** (as in, *not* microfarad) capacitor with a digital voltage display. (A "digital capacitor" of all things.) I guess they're used to supplement the car's electrical supply when that monster stereo wants to pump a loud bass note through those enormous sub-woofers.

Man! I know it's been a while since my "hardware days" in school, but I've been *seriously* out of touch! (I'd never seen anything like that at the old Radio Shack.)

Now . . . I wonder: to what creative uses might such a component be put, hmmm?

Farad caps have been out for a few years now. One company called CAP-X makes an interesting assortment that can source 20A of current, initially at 4.5V. Pretty interesting stuff-- though they could suck a set of Pioneer batteries (3x LR44) dry in about 20 seconds! GRIN.

**Re: OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

Message #7 Posted by [Eric Smith](#) on 17 Aug 2007, 8:01 p.m.,  
in response to message #6 by allen

In fact, you can now get "ultracaps" that are rated in the hundreds and even thousands of farads, though generally at not more than 2.7V. You can put several in series to raise the voltage, though that also lowers the capacitance. However, if you want to increase the voltage rating by n, you need more than n capacitors in series, because they won't share the voltage equally.

I'm not convinced that the ones being sold for car stereo use are anything other than a clever new way to part a fool from his money.

More than one vendor brags about using hybrid capacitors combining the characteristics of electrolytic capacitors and carbon capacitors. They claim specs like 5 farads and 0.002 ohm ESR. However, IMNSHO that's basically fraudulent, because it's just a low-capacitance low-ESR capacitor in parallel with a series chain of 6 or more high-capacitance high-ESR (e.g., 0.1 ohm) capacitors. When your amplifier tries to draw 80A from it, you're not going to actually get that 0.002 ohm ESR, because the carbon capacitor with the low ESR isn't actually storing much energy. Almost all of it will actually have to come from the electrolytic stack, with its 0.6 ohm ESR.

While 0.6 ohms might not sound like much, at 80A that will drop 4.8V out of your nominal 13V. That sort of voltage drop is exactly what installing the capacitor was supposed to fix.

**Re: OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

Message #8 Posted by [Katie Wasserman](#) on 18 Aug 2007, 2:07 a.m.,  
in response to message #7 by Eric Smith

There are some hybrid switching power supplies that make use of several large capacitors combined with a low current switching PS. They're recommended for ham radio use in CW or SSB mode that need high transient currents but low average currents. The test results I've seen indicate that they are doing their job to deliver 20+ amps peak from a 5 amp continuous PS @ 13.8 volts with no significant voltage drop.

For example:

[Here's one that runs from 120VAC.](#)

So I think that they can be engineered to work well, but you're probably right about the stuff they sell to people who's goal is to go deaf while driving.

*Message #10 Posted by [Eric Smith](#) on 18 Aug 2007, 1:42 p.m.,  
in response to message #8 by Katie Wasserman*

Yes, using capacitors to reduce voltage sag for high-current transients is a valid concept. What is wrong with the "hybrid capacitors" being sold for car audio is paralleling a high-capacitance high-ESR chain of ultracaps with a low-capacitance low-ESR capacitor, and then claiming that the result is high-capacitance low-ESR. That does NOT work as claimed.

If you really had a 2 farad 0.002 ohm ESR capacitor, it could supply a peak of a hundred amps with less than 1V sag for more than 10ms. The "hybrid capacitor" they're selling won't do that. If you're lucky, you might get a microsecond, which is clearly not long enough to have any beneficial effect on audio frequencies. It's snake oil -- just another way to part a fool from his money.

*Edited: 18 Aug 2007, 1:43 p.m.*

### **Re: OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

*Message #11 Posted by [John Noble](#) on 18 Aug 2007, 4:09 p.m.,  
in response to message #10 by Eric Smith*

I was working as a car audio installer back when these came out, and I agree that they are mostly snake oil.

*However...*

If you want to construct a theoretical model, you have to include the whole power supply chain to the amplifier(s).

Here's a typical chain:

Alternator -> Battery B+ -> Short length of #4-#00AWG -> Fuse or Circuit Breaker -> 10-20 ft. #4-#00AWG -> Distribution Block Input -> Fuse -> 2-4 ft. #10-#8AWG (Sometimes #4) -> Amplifier B+ Terminal -> [amplifier power supply, amplifier circuit, speaker(s), etc.] -> Amplifier B- Terminal -> 1-2 ft. #10-#8AWG (or sometimes bigger) -> Vehicle's steel body -> 1 ft. #6-4AWG Ground Strap (unless upgraded) -> Battery B-

As you can see, there are a lot of potential voltage drops. Depending on where you put the capacitor it could make a difference, especially if the car's charging system is operating near its limit.

There are demonstrable gains to be had, but the only people who will really notice are those with very powerful systems (more than 1-2kW) or people competing in maximum SPL events where winning margins might be a dB or less.

### **Re: OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

*Message #12 Posted by **Eric Smith** on 18 Aug 2007, 10:48 p.m.,  
in response to message #11 by John Noble*

I'm not disputing that adding a capacitor will help. Done right, it certainly can.

I'm only asserting that the specific "hybrid capacitor" approach that many are using to claim low ESR is essentially fraudulent. The real ESR of the hybrid capacitor when delivering tens of amps will most likely be more than half an ohm, rather than the 0.002 ohms they claim in their specs.

The digital voltmeter they attach isn't going to tell the customer the real story, either, as it will (by design) respond far too slowly to show the actual voltage sag during high-current transients.

They call it digital because of the digital voltmeter they've attached to it.

The voltmeter is intended to make the purchaser think that the capacitor is doing its job, but in actuality DVMs do not respond to fast transients, so it doesn't really prove that the capacitor is making a difference to the car audio system.

**Re: OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

\_\_\_\_\_

Back in tech school (late '70's) an electronics instructor showed us that a linear voltage regulator (a voltage regulator that had a transistor in series with the load) was comparable to having greater than 1 Farad capacitors in a passive voltage regulator.

Hmmm, maybe that has nothing to do with a "Digital" capacitor...

I'm not sure if those kids who "pimp" their automobile audio systems use "Digital" capacitors or not, if they do, it may just be a marketing term.

But 1+ Farad capacitors used as SRAM backup have a slow discharge rate, unlike conventional electrolytic capacitors, because rapid discharge is not needed for those circuits (even undesirable). Maybe that is what is meant by a digital capacitor- a capacitor designed to be used as a backup for digital circuitry.

Quote:

\_\_\_\_\_

But 1+ Farad capacitors used as SRAM backup have a slow discharge rate,

\_\_\_\_\_

The discharge rate is a product of the capacitance and the resistance of the circuit. Over a given period of time, this combination will discharge a given percentage of the available charge, and voltage does not figure into this calculation.

Quote:

\_\_\_\_\_

Back in tech school (late '70's) an electronics instructor showed us that a linear voltage regulator (a voltage regulator that had a transistor in series with the load) was comparable to having greater than 1 Farad capacitors in a passive voltage regulator.

\_\_\_\_\_

Yes. When an active device (transistor) is sensing and negating variations in available voltage, it appears to the circuit loading it as if it were a source with low impedance, such as a large capacitor.

However, a capacitor has an impedance which varies with frequency, so one needs to be specified.

## **not so OT**

*Message #22 Posted by [Meindert Kuipers](#) on 18 Aug 2007, 3:42 a.m.,*

*in response to message #13 by Andrés C. Rodríguez*

This is not so OT after all. My MLDL2000 for the HP41 uses a 1.0F/5.5V capacitor (also called supercap or goldcap) for keeping SRAM contents for many weeks. It is about the size of 5 stacked 10 Eurocent coins (smaller than a \$ quarter??). I have also played with 0.1 F supercaps, which are smaller than an HP16 battery.

Meindert

## **Re: OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

*Message #23 Posted by [Hal Bitton in Boise](#) on 18 Aug 2007, 10:24 p.m.,*

*in response to message #1 by Paul Brogger*

Well, when I went to school (late '70s) a 1 farad cap was about as big as a horses leg, and any circuit

boards/componentry were strapped to it (rather than vice-versa). As for applications... reducing the ripple voltage on a **BIG** TR/power supply comes to mind.

Hal :)

**Re: OT (as in Out of Touch) -- 1.5 Farad (!) Capacitor???**

---

Good to know. I may do the same after I receive the new color PDFs (still waiting on my DVD).

I just returned from Kinko's. The \$4.26 to spiral bound the 35s manual was more than worth it. The original binding was very stubborn (more than usual for that type of binding), as if it did not want to reveal it's contents. IMHO, manuals should not require two hands to operate.

Kinko's said that requests to spiral bound existing paper bound books is not uncommon. The machine that prepares the book for spiral binding also does the cropping of the glue binding. Sadly only black plastic is available. I have some older manuals that would look better with white. The process of inserting the spiral binding is manual (I've watched them before). I speculate that you could order any color, size, and type (metal or plastic) online and put it on yourself.

---

Yes, I have seen done too. Not with plastic spiral though, but plastic coated metal I believe, and then use needle nose pliers to put slight bend so spiral do not come out. I guess you could always have them bind for you with black, and when you get white spiral, you could remove black, and insert yourself.

### More 35s First Impressions

Message #1 Posted by [Dan Greil](#) on 17 Aug 2007, 2:54 p.m.

First impressions may be old news now that everyone is moving on to bug hunting but they bear stating (or repeating) for those that are still trying to decide whether to buy. It is also my customer feedback to HP product development, should they be monitoring the forum.

So here's my take based on SN 72103313:

- My display is not skewed at all but the annunciators are **barely** within the window when viewed perpendicularly. This seems unnecessarily close given the free space at the bottom of the display they've allowed for viewing at an angle. This is not unique to mine as even the unit pictured on the User's Guide has the annunciators obscured by the shadow of the window.
- Display pixels have a 1:2 aspect ratio making for some very rough looking digits. I would have preferred a 1:1 pixel aspect ratio – like the 28s or 42s – for smoother characters.
- Excellent keyboard. So thankful for the return of the beveled keys and large enter key. I would have used yellow and blue plastic keys for the left and right shifts ala Voyagers as the silk screened colors may not wear well on these more heavily used keys. I don't notice the key stops (the tabs below the metal mask that keep the keys in place) on the 35s. These were very visible with the 42s and 48G. Cosmetic yes, but the larger gap around the keys of the latter meant larger entry point for debris. The printed labels on the 35s keys have very crisp characters unlike those of a lot of late model 12c's where the edges appear to have bled.
- No PDF manual (yet). The 49g+ and 50G had the PDF manuals on the included CD and are also available on-line. If HP is going to produce a DVD, then it should include the User's Guide and all the training modules (55 of them). PDF manuals are important because I keep the manuals at home and use PDFs at work.
- Nice case. I was not a fan of the Coconut zippered cases because it was difficult to get the calc into the case without zipper contact. The 35s has a clam-shell zippered case that will open 360 degrees. It is also semi-rigid so it will protect the calc better. The elastic band that retains the 35s surprisingly doesn't detract from its appearance or use.
- Nice balance of key functions versus functions available by menus. Key functions I like that I haven't seen before are the <-ENG and ENG-> (engineering notation decimal shift by 3 digits down or up with a corresponding change in exponent).
- The annunciators for flags 0 through 4 are present. These were great for 41C program debugging and I'm glad to see them on the 35s.

Overall, the 35s has the engineering-driven design all of us die-hard HP fans of the past crave. No attempt was made to cater to the commodity consumer electronics market as was done with the 9s, 30s, 33s, etc. – i.e. nothing 'stylized' just for marketing purposes. THANK YOU HP!

### HP35s Features, or not

Message #1 Posted by [JayL \(MD, USA\)](#) on 17 Aug 2007, 12:48 p.m.

Hi all

I just got my hp35s the other day to replace the hp32sii I seem to have lost and while I really like it, I'm surprised that square roots and logs of negative numbers produce an error when the calculator is designed to handle complex numbers (my hp28s handles these conditions). Anyone else surprised/annoyed by this?

I'm also a little disappointed that there is no vector cross product function.

Oh well, it's still a good calculator with a great feel.

### Re: HP35s Features, or not

Message #2 Posted by [Seth Morabito](#) on 17 Aug 2007, 1:31 p.m.,  
in response to message #1 by JayL (MD, USA)

Quote:

I'm surprised that square roots and logs of negative numbers produce an error when the calculator is designed to handle complex numbers

There has been some discussion about this, but after all it's an evolution of the 32S platform, not the 42 or 28/48 platforms. On my 32SII, square roots and logs of negative numbers also produce errors, even though the 32SII has complex support. The only difference between the 32SII and the 35s in that regards is that complex numbers take up two stack registers on the former, and only one on the latter.

I do wish the complex support were more like the 42S, but I'm still very pleased with the 35s overall!

### Re: HP35s Features, or not

Message #3 Posted by [Miguel Toro](#) on 17 Aug 2007, 3:10 p.m.,  
in response to message #2 by Seth Morabito

There is a post about this but I could not find it. At least, you can get the square root of a negative number this way:

1. enter the number as a complex, example:  $-5i0$
2. enter 0,5 and do  $x^y$ , complete exemple:

```
5 +/- i 0 enter
0.5 x^y
0.0000i2.2361
```

regards,

Miguel

**"cheat sheet" idea**

*Message #5 Posted by [Vincze](#) on 17 Aug 2007, 10:54 p.m.,  
in response to message #4 by JayL (MD, USA)*

Yes, very good. These should be things, like figuring out how to go from P->R and back that we should archive and add to list of things to include in "cheat sheet" to keep with 35s.

### My Aviation programs for 35s

Message #1 Posted by [Vincze](#) on 17 Aug 2007, 11:15 a.m.

Okay, here is my listing of Aviation programs for the 35s. It is only for two two calculations right now, but I plan on extending it for others. It take me a while to write as I had a lot to learn about calculator, and also it takes me longer to write so it does not sound like a fool who does not speak english well wrote it. Here you go. Please let me know if there are any ways to optimize the programs.

Aeronautical Functions on the 35s

Vincze

Aeronautics has many calculations that the pilot uses when flying. For many decades, many pilots have relied upon the tried and true E6-B flight computer to do these calculations. The E6-B is nothing more than a fancy slide rule device that can compute such as time, speed and distance problems, fuel consumption, conversions, altitude and speed corrections, wind and heading issues and a few more calculations.

A disadvantage of the E6-B is that it is a manual process, and takes a bit of concentration while in flight. In recent years, computerized E6-B's have come out that can perform some of these tricky manual calculations very precisely, and quickly. In fact, the HP41C series calculators had an expansion pack that could do these very nicely.

My thought is why not use our trusty and inexpensive 35s to do these. I will present here, two of the programs that I have programmed on my unit.

True Heading and Ground speed conversion

When flying, just because you choose a certain course, it does not mean that is the true course that you must fly to reach your destination. Many factors affect the true heading that you must steer, and the true ground speed. One of the major factors is the wind direction and velocity. In this program, there will be four variables that you must know to determine the true heading and the ground speed. They are true wind direction, wind velocity, true course and true airspeed (TAS). I will indicate these as variables D, V, C, and T respectively.

Program Listing

```

H001   LBL H
H002   CLVARS
H003   SF 10
H004   WIND VEL
H005   PSE
H006   INPUT V
H007   TAS
H008   PSE
H009   INPUT T
H010   WIND DIR
H011   PSE
H012   INPUT D
H013   COURSE
H014   PSE
H015   CF 10
H016   INPUT C
H017   -

```

```

H018 STO A
H019 SIN
H020 RCL V
H021 *
H022 RCL T
H023 /
H024 ASIN
H025 STO+ C
H026 RCL A
H027 X<>Y
H028 -
H029 SIN
H030 RCL A
H031 SIN
H032 /
H033 RCL T
H034 *
H035 RCL C
H036 X<>Y
H037 RTN

```

Notes On lines H004, H007, H010, and H013 you will notice text. This is entered by pressing the EQN key, then RCL and the alpha key until the text is entered. After the text entry, press ENTER to exit EQN mode. More information may be found on pages 13-16 – 13-18 of the manual.

SF 10 is set with left shift, 2.0. The . will input a 1. CF 10 is set with left shift, 3.0. If you need more explanation, see page13-17 or 14-11 in the manual.

Example Let us assume that the Wind direction is  $240^\circ$ , the wind velocity is 38 knots, the true course is  $300^\circ$ , and the TAS is 165 knots. [One note, it does not matter if your wind speed or air speed are in knots, MPH, KMH, all that matters is that you are consistent between the two.] So,  $V = 38$ ,  $T = 165$ ,  $D = 240$ , and  $C = 300$ . When we run the program, we will notice that in the Y register, we have 288.49, this represents the True Heading in degrees, or what we must adjust to in order to compensate for the wind if we wish to have a true course of  $300^\circ$ . In the X register, we see 142.68, which is our true ground speed, with the effects of the wind.

### Distance Between Two Latitude/Longitude Points

When planning a flight between two points, one must know the actual distance, in nautical miles, that you must fly. This is essential for fuel planning, time in flight and filing you flight plan. There are a number of ways that you can do this, but one thing that we must do is use great circles since the earth is round. Two formulas are generally relied upon. The first being the Haversine formula which tells us great-circle distances between two points. It is a bit more complicated, and we will not use it here. The second formula is the spherical law of cosines, which gives well conditioned results down to distance as small as 1 meter. The exact formula is:

### Spherical Law of Cosines

Where  $d$  is the distance, and  $R$  is the earth's radius, (we will use nautical miles). Lat and Lon will be in the format of ddd.mmmsss (or degrees.minutes seconds), so if our Latitude is  $33^\circ 57' 00''$ , we would enter 33.5700. This should all be entered in the degree mode, as the program will convert everything to HMS and radians.

### Program Listing

```

D001 LBL D
D002 CLVAR S
D003 RAD
D004 SF 10
D005 LAT1
D006 PSE
D007 INPUT A
D008 HMS ->
D009 ->RAD
D010 STO A
D011 LON1
D012 PSE
D013 INPUT B

```

```

D014 HMS ->
D015 -> RAD
D016 STO B
D017 LAT2
D018 PSE
D019 INPUT C
D020 HMS ->
D021 -> RAD
D022 STO C
D023 LON2
D024 PSE
D025 CF 10
D026 INPUT D
D027 HMS ->
D028 -> RAD
D029 STO D
D030 RCL A
D031 SIN
D032 RCL C
D033 SIN
D034 *
D035 RCL A
D036 COS
D037 RCL C
D038 COS
D039 *
D040 RCL D
D041 RCL B
D042 -
D043 COS
D044 *
D045 +
D046 ACOS
D047 3440.065
D048 *
D049 DEG
D050 RTN

```

You will notice in line D047 that there is a constant there. This will apply the answer towards the mean radius of the earth in nautical miles. If you wish to use kilometers, then the constant would be 6371. You will notice that there are four variables. They are defined as follows:

A = Lat1, B = Lon1, C = Lat2, D = Lon2.

### Example

Let us assume we are flying from LAX to JFK. LAX is located at 33° 57' 00" N, 118° 24' 00" W. JFK is located at 40° 38' 00" N and 73° 47' 00" W. Our variables would therefore be:

A = 33.5700                      B = 118.2400              C = 40.3800                      D = 73.4700

When entered into the program, it will return an answer of 2,145.17 nm. If you wish to convert that to km, then you would multiply that by 1.852 to get the kilometers.

### Special Thanks

I would like to thank a number of people who have helped this Hungarian better understand how the unit works. Because I am fearful that I may forget someone, I will just say thank you to the folks over at moHP who have helped. They know who they are, and I thank you sincerely.

## Re: My Aviation programs for 35s

Message #2 Posted by [Stefan Vorkoetter](#) on 17 Aug 2007, 11:33 a.m.,  
in response to message #1 by Vincze

Nice!

Just one suggestion on using text prompts:

If you're going to prompt with a message, then I wouldn't use INPUT after that. I would do either:

```
INPUT W
```

or:

```
SF 10  
EQN "ENTER WIND DIR"  
CF 10  
STO W
```

but not both:

```
SF 10  
EQN "ENTER WIND DIR"  
PSE  
CF 10  
INPUT W
```

In the last example above, you're not likely to see the text prompt anyway, since it's only displayed briefly.

By the way, to see how the wind calculations are done on the two different types of slide rule devices, take a look at my article: [A Tale of Two Whiz Wheels](#)

Stefan

### Re: My Aviation programs for 35s

Message #3 Posted by [Vincze](#) on 17 Aug 2007, 11:50 a.m.,  
in response to message #2 by Stefan Vorkoetter

I was not aware you could do that. That make more sense for input.

### Re: My Aviation programs for 35s

Message #4 Posted by [Jeff Kearns](#) on 18 Aug 2007, 7:35 p.m.,  
in response to message #3 by Vincze

Hi Vincze,

The following shortens the True Heading and Ground speed conversion program by 4 steps and takes advantage of the point Stefan made. It works as-is on my 32sii (I do not have a 35s... yet).

```
H001 LBL H H002 CLVARS H003 SF 10 H004 WIND VEL = H005 STO V H006 ENTER TAS  
H007 STO T H008 WIND DIR = H009 STO D H010 COURSE = H011 CF 10 H012 STO C H013 -  
H014 STO A H015 SIN H016 RCL V H017 * H018 RCL T H019 / H020 ASIN H021 STO+ C H022  
RCL A H023 X<>Y H024 - H025 SIN H026 RCL A H027 SIN H028 / H029 RCL T H030 * H031  
RCL C H032 X<>Y H033 RTN
```

Regards,

Jeff

### 35s (what else)

Message #1 Posted by [Diehl-Peshkur](#) on 17 Aug 2007, 8:10 a.m.

Hi all, 72105702 and 72105701 arrived today (finally). Straight LCD, no problems. The crooked serials don't bother me at all.

Thank you HP for making keys with the same feeling as my 10c, 15c and 11c!!! It is like a visit from the past...All the noted problems aside, this is a keeper for me as a daily calculator, and a breath of fresh air after the 33s...

Speaking of the past, any reactions from you guys about the included DVD ? (ok, let's ignore the PR hype aspect)...  
Ciao, Tadeyev

### Re: 35s (what else)

Message #2 Posted by [Mark Crispin](#) on 17 Aug 2007, 1:25 p.m.,  
in response to message #1 by [Diehl-Peshkur](#)

I bought mine on August 9 and seem to have a relatively early serial number: CNA 72101920. Yes, the serial number sticker is on crooked, but who cares.

The included DVD is a definite keeper.

A design element that I miss from the classic (35/45/55/65/70/80) series was the use of multiple colors on keys. The 35s has the blue key, the gold key, and the four grey arrow keys, but otherwise the keys are black and hard to distinguish.

I also **detest** white lettering on a black background. It is harder to read, especially for those of us getting on in years.

Here's what I would like to see, based upon comparing the 35s to my classics:

The numeric and decimal keys should definitely be white. I keep on expecting them to be right-aligned (as on the classics) when they are centered in the 35s.

The four arithmetic keys should be a medium grey. Possibly also ENTER, +/-, E, <-, and C.

The top row keys should be the same color as the four direction keys; and this in turn should be a different color from the other keys (second and third row, (), EQN, and sigma +). In keeping with tradition, I suggest black for the former and darker grey for the latter. It's alright for the relatively few programming keys to be the evil white-on-black as long as the majority of keys are not.

Note that *all* of these are cosmetic changes only. I could quibble a bit with the layout as well. For example, I would prefer to have (as on the classics) LOG and  $10^x$  be the gold and blue for one key, and LN and  $e^x$  be the gold and blue for another key. However, I'm less of a power user on calculators these days and I assume that there were good reasons for the layout. So I don't really want to push these arguments.

I think that my suggested color changes would make the calculator more attractive and intrinsically easier to

use. I guess that someone with a drawing application could come up with an image mockup of what I'm talking about. Hint, hint...

### **35s display glare - solutions thus far?**

Message #1 Posted by **Thomas Radtke** on 17 Aug 2007, 6:13 a.m.

I remember having read about two ideas to reduce the 35s display glare using (i) an eraser and (ii) a PDA protection film. Some time has passed now and I wonder if those methods were successfully adopted by other users. In particular, can the protection film be applied below the tin faceplate?

Maybe, the display glass can be replaced by a differently structured glass?

Any results or further ideas thus far? It turns out, that, especially after more or less closing the R <> P case, this glare is the most distracting property of the 35s.

Thanks a lot,

Thomas

### Compiling Free42 for Linux under Ubuntu (64-bit)

Message #1 Posted by [Les Wright](#) on 17 Aug 2007, 4:49 a.m.

After expermenting a bit for several hours deleting and reinstalling my Ubuntu virtual machine on the iMac, I have come to the conclusion that the following steps allow for the successful compilation of Thomas Okken's code:

1. Install Ubuntu 7.04, and when prompted install the updates. 2. After reboot, in Synaptic Package Manager search for and select: libgtk2.0-dev, lesstif2-dev, libxpm-dev, and libxmu-dev. 3. After installation of these packages enter either the motif or gtk subdirectories of the free42 directory tree and make the binary version by simply typing "make", and the decimal version by "make -e BCD\_MATH=1".

I have found that using the lesstif package seems simpler than motif since the package manager in the former case seems to magically install as well some necessary X Windows development stuff that Motif does not. You have to find and install them manually, and in the spirit of overkill I probably grabbed a bunch of disk wasting stuff I don't need since I don't know for sure what is needed. Instead, choosing the above 4 dev packages above will select a total of about 40 packages that seem to be a minimal installation required to compile this excellent program in this flavour of Linux.

Thank you to Thomas and others for guiding me in this little adventure, and for the forbearance of the forum in indulging this discussion that is at best incidental to its main mandate of "real" vintage HP calculators. I hope other newbie Linux programming amateurs who start out with something like Ubuntu will benefit from my recent adventures.

Les

Ubuntu is a very nice package, for graphical Linux. I must admit though, I like non graphical Linux/Unix better.

### Re: Compiling Free42 for Linux under Ubuntu (64-bit)

Message #3 Posted by [Thomas Okken](#) on 18 Aug 2007, 3:49 a.m.,  
in response to message #1 by [Les Wright](#)

Hi Les,

While I'm sorry we didn't get Free42 to build as a 32-bit application under 64-bit Ubuntu, it's good to hear that the 64-bit build was successful without too much trouble. My own experience building a 32-bit version under 64-bit Fedora was painless by comparison, but I suspect that a lot of credit for \*that\* goes to the sysadmins at my office who do an excellent job of setting up everything-but-the-kitchen-sink Fedora installations for us spoiled developers. One can't expect that kind of thing with a Linux For The Masses like Ubuntu, perhaps. ;-)

Your troubles building the Motif version of Free42 are mostly a sign of the times; while Motif has been the standard for building GUI applications in Unix environments for many years, it has been eclipsed by GTK and other newcomers in recent years, and right now the only thing keeping it from oblivion are a few legacy applications that haven't been ported to newer toolkits yet. Getting a Linux installation ready for Motif-based development is getting to be more and more of a pain with each passing year. Sic transit gloria mundi.

Well, enough of all this Linux talk; back to our HP calculators, be they real or simulated. :-)

- Thomas

### 35s - inputting to indirect registers

Message #1 Posted by [srayb](#) on 17 Aug 2007, 1:09 a.m.

Hi,

I am trying to create a program loop to enable me to enter values into the indirect registers 11 to 15. I am able to VIEW(I) these values using the ISG loop technique, but cannot use INPUT(I) with the same technique (results in an "INVALID (I)" error).

Here's the code that works for VIEWing (LBL C), followed by the code that doesn't work for INPUTing (LBL B):

```
C001 LBL C
C002 11.015
C003 STO A
C004 RCL A
C005 INTG
C006 STO I
C007 VIEW(I)
C008 ISG A
C009 GTO C004
C010 RTN
```

```
B001 LBL B
B002 11.015
B003 STO A
B004 RCL A
B005 INTG
B006 STO I
B007 INPUT(I)
B008 ISG A
B009 GTO B004
B010 RTN
```

Many thanks for any help with this!

*Edited: 17 Aug 2007, 1:14 a.m.*

Ah, another BUG, I mean LIMITATION, I mean FEATURE of the 35s. Oh well, it's still a cool calculator! :-)

Thanks for the info!

### Re: 35s - inputting to indirect registers

Message #4 Posted by [Don Shepherd](#) on 17 Aug 2007, 1:54 a.m.,  
in response to message #3 by [srayb](#)

I agree, it's cool. Per Gene, this is probably a manual (documentation) error.

### Re: 35s - inputting to indirect registers

Message #5 Posted by [Stefan Vorkoetter](#) on 17 Aug 2007, 11:36 a.m.,  
in response to message #1 by [srayb](#)

I guess you could always input into one of the named registers, and then STO (i) the value.

Stefan

### Re: 35s - inputting to indirect registers

Message #6 Posted by [Gene Wright](#) on 17 Aug 2007, 12:04 p.m.,  
in response to message #5 by [Stefan Vorkoetter](#)

Or just do something like this in a loop.

```
RCL I
STOP
STO ( I )
```

This prompts with the value of the indirect register into which the value will be stored. Then it is stored into the proper indirect register.

### Re: 35s - inputting to indirect registers

Message #7 Posted by [Ralph](#) on 18 Aug 2007, 6:22 a.m.,  
in response to message #6 by [Gene Wright](#)

I just input to a regular variable and then pull it to the stack and store it.

```
INPUT D
RCL D
STO( I )
```

Not as elegant as INPUT(I) but functional.

### 35s Polar-Rectangular Conversions

Message #1 Posted by [Trent Moseley](#) on 16 Aug 2007, 10:24 p.m.

I want to thank Reth, Thomas Radtke, Paul Dale, and Gene Wright for helping us all with their programs and helpful guidance regarding these conversions on the HP-35s.

tm

### Re: 35s Polar-Rectangular Conversions

Message #2 Posted by [Vincze](#) on 17 Aug 2007, 8:37 a.m.,  
in response to message #1 by Trent Moseley

It would be nice if we had one article that summarized these conversions and maybe Mr Hicks would be so kind to post that to his site someplace.

### Re: 35s Polar-Rectangular Conversions

Message #3 Posted by [Kelly Huckman](#) on 17 Aug 2007, 8:54 a.m.,  
in response to message #2 by Vincze

Yep, it would be nice. Until then you can find the programs [here](#), just in case you missed the thread the first time around.

Thanks to those involved from myself as well.

### x+iy and apply ARG

Message #4 Posted by [Vincze](#) on 17 Aug 2007, 9:27 a.m.,  
in response to message #3 by Kelly Huckman

Strange, as I thought in different post, someone say x+iy and apply ARG to get P -> R conversion. Not sure though how you would go back.

### Re: x+iy and apply ARG

Message #5 Posted by [Kelly Huckman](#) on 17 Aug 2007, 9:44 a.m.,  
in response to message #4 by Vincze

ARG returns the polar angle and ABS returns the magnitude.

That's basically what's happening in this line of Paul Dale's code:

```
P006 eqn [ATAN(REGT/REGZ),SQRT(SQ(REGT)+SQ(REGZ))]
```

This is just better because you don't lose the Z and T registers.

### **Re: x+iy and apply ARG**

*Message #6 Posted by [Vincze](#) on 17 Aug 2007, 9:50 a.m.,  
in response to message #5 by Kelly Huckman*

So to get it back to P, I just do X+iY ABS? Why does that not make sense?

I guess the point I try to make before though, is it would be nice to have summary of program or key stroke that do this. With the link you provide, you must read through all posts to figure out which one most efficient.

Even now, I look at listings and not sure which one to use. I just know x+iy ARG give me R

One thing I do not understand in his post if when he enters SF 10? How do you get the question mark?

Also, I see next to his line numbers sometime an \*. What does this indicate? I see this in other listings too.

### **Re: x+iy and apply ARG**

*Message #9 Posted by [Gene Wright](#) on 17 Aug 2007, 10:49 a.m.,  
in response to message #8 by Vincze*

There should be no question mark after a SF 10 instruction.

There IS a question mark if you are testing the flag using a FS? 10 instruction.

The asterisk indicates that the line number the asterisk is next to is the destination of a GTO or XEQ from somewhere else in the program.

This has been manually typed into the program listing to help find the step number when reading the program.

It does not show up in the 35s itself.

Sorry for this Les, but I a stupid Hungarian. ;) I misread what was typed. I feel so stupid.

**Re: 35s Polar-Rectangular Conversions**

*Message #11 Posted by [Paul Dale](#) on 19 Aug 2007, 5:02 p.m.,  
in response to message #2 by Vincze*

I have submitted the conversion programs to the MoHPC software library. It will turn up eventually.

I didn't think writing an article as well would add anything. Although it would be available a little more quickly.

### Aviation Programs

Message #1 Posted by [Vincze](#) on 16 Aug 2007, 8:45 p.m.

I have written two programs for aviation use. I like to send them to Datafile to be published, but I want to make sure I have them optimized, and also that my English is good in article. May I post them here first and get feedback before I send to them?

Also, must you be member of Datafile to submit, as I am not yet.

If okay to post here, I will post tomorrow, as programs are done, but I need to clean up wording of document so it is well written.

### Re: Aviation Programs

Hello!

Quote:

\_\_\_\_\_

If okay to post here, I will post tomorrow...

\_\_\_\_\_

If you ask me: Yes it is OK to post them here! I am always interested in aviation programs and because I do not receive this datafile thing, I would miss them otherwise. Of course I can also have have a closer look at them and give you some feedback if necessary. As for the language, I can be of no much help though, because I could only replace Hungarian-English by German-English ("Denglish" we call it)...

Greetings, Max

### Re: Aviation Programs

Message #3 Posted by [Vincze](#) on 17 Aug 2007, 9:43 a.m.,  
in response to message #2 by Maximilian Hohmann

Will do once I get the wording all fixed up.

What type of equipment do you fly? I see from user info you are a pilot.

### Re: Aviation Programs

Message #4 Posted by [Maximilian Hohmann](#) on 17 Aug 2007, 4:19 p.m.,  
in response to message #3 by Vincze

Hello!

Quote:

---

What type of equipment do you fly? I see from user info you are a pilot.

---

I started this flying thing quite late and do it part-time besides my engineering job, so I never aimed for the big airlines. As a flying instructor, I mostly teach future airline pilots in the simulator and on single- and twin-engine airplanes the "art" of instrument flying. Myself, I do air-taxi/company flights in twin-engine piston airplanes (Cessna 421 Golden Eagle and Piper Seneca), express cargo with a Cessna 404 Titan Courier and just started my conversion course on the Fiarchild/Swearingen Metro 23 twin turboprop (had my first 2 1/2 hours training yesterday, what a machine :- ) ! ) that my company also uses for express freight. And sometimes I also spray silver iodide into thunderstorm clouds to prevent the formation of hailstones (but don't tell this my wife).

Regarding your programs: I had a quick look and as was already stated by someone else, without text prompts, they are very difficult to use, especially when one is in a hurry and has more important things on his mind (as is always the case once in the air). There should also be a provision for using default values (especially for wind and true air speed) when calculating different legs of a flight, because otherwise you have to re-enter the same values many times. This is exactly the reason why dedicated hardware (like the ASA pathfinders, Jeppesen Techstars or Sporty's electronic E6Bs (I have all of these in my collection :- ) ) have replaced programmable calculators long, long ago.

This distance-between-coordinates thing is a nice exercise, but of no real use to a pilot, because every aircraft (at least every one I know) has a GPS receiver with a navigation database that will do this for you without the need to enter co-ordinates manually. And in the office, we have dedicated flight planning software (our company uses PPS by the Danish company Air Support <http://www.airsupport.dk/productsandservices.htm> ) that will provide you with a complete flight briefing (including real-time wind and weather data) in less than two minutes, that even with the best pocket-calculator software will take you more than an hour to produce :-)

But what I really miss in my daily routine is a universal conversion program, not just the (useless!) mm->inch conversion that some calculators offer, but something like Pounds (fuel) -> Litres, that is always difficult to calculate and error-prone, when you are in a hurry.

Happy landings, Max

### **Re: Aviation Programs**

*Message #5 Posted by **Vincze** on 17 Aug 2007, 4:42 p.m.,  
in response to message #4 by Maximilian Hohmann*

I thought Sporty's E6B had that built in? I don't have mine here so I can not check. That easy calculation in states with standard airplane fuel. 6lbs per gallon. (or about 6.7lbs for jet fuel I believe.)

### **Re: Aviation Programs**

*Message #6 Posted by **Maximilian Hohmann** on 18 Aug 2007, 6:00 a.m.,

I thought Sporty's E6B had that built in? I don't have mine here so I can not check.  
That easy calculation in states with standard airplane fuel. 6lbs per gallon. (or about

6.7lbs for jet fuel I believe.)

The E6B has a quite arbitrary marking at 0,77 kg/l that is neither correct for AVGAS (0,72 kg/l) nor for JetA1/Kerosene (between 0,75 and 0,84 kg/l). The most popular aviation slide rule in our part of the world, the Aristo (now Pooleys) Aviat has two dedicated subscales for the whole range of densities encountered with different fuel and oil types, both in kilograms and in pounds (see this foto here that I found through google (I would show you a photo of my own Aviat, but I have no idea where I have it, last time I used it must be over ten years ago) [http://personal.telefonica.terra.es/web/jcvilchesp/reglas/imagenes/139\\_aristo\\_617\\_a.jpg](http://personal.telefonica.terra.es/web/jcvilchesp/reglas/imagenes/139_aristo_617_a.jpg) ).

Anyway, the real-life task is not just a simple conversion, but a little bit more complicated and error-prone:

After landing, we are usually met by the refueller, who wants to know how much fuel we need to uplift. And in a hurry, because there are other customers waiting for him... To compute the required amount in the unit he uses, usually litres, rarely imperial gallons, we need to start from the fuel remaining on board (displayed either in pounds, gallons, litres or kilograms, depending on the aeroplane), the expected flying time to the next destination, an average fuel consumption (again in lbs/hr, gals/hr, l/hr or kg/hr, sometimes not even in the same units that are shown on the fuel gages!) and the fuel type (Avgas or Jet, at 0,72 kg/l or around 0,8 kg/l). Many of these inputs are constants for a certain aeroplane, so it would be an unnecessary complication to re-enter them every time.

Real-life tasks like the one described above really require a calculator with a multi-line display and a menu-system, because they have to be programmed in a fool- and error-proof way that allows for real quick data entry. Also one must be able to see at a glance, if all his inputs are correct (especially the units!). Therefore, tasks like these are now ususally performed with notebook computers or tablet PCs running dedicated software. I once programmed this into my hp-71B, but found that it is not user-friendly and safe enough for the job. It might be different for a private pilot who flies once per week and can spend the rest of the week playing around with his toys, but in commercial operations with multi-sector flights and quick turnaround times, programmable calculators really have become a thing of the past just like everywhere else, I'm afraid.

Greetings, Max

*Message #9 Posted by [Don Shepherd](#) on 19 Aug 2007, 10:30 a.m.,  
in response to message #8 by Maximilian Hohmann*

Max, great screen shot! How easy it is to read the spreadsheet at regular size? My major disappointment with the 89 Titanium is its very small font size. It is so small that it us frequently unreadable to my eyes.

I seem to recall an incident in Canada years ago that resulted from a mixup of refueling units. I forget if it was liters/gallons or pounds or whatever, but the plane ran out of fuel because of the mixup. It did land safely, though, as I recall. On an unused dragstrip!

---

I could have transferred the screen content alone with the Ti-Connect software and cable, but I wanted to show the name&brand of the calculator, so I took a photo with my digital SLR camera and macro lens.

I have no Ti-89 for direct comparison, but the pixel count is 160x100 for the 89 and 240x128 for the 200. The physical screen size of the 200 is 89mm x 49mm (or 3.5in x 1.9in), you would have to measure the size of your 89 screen in order

to calculate the relative pixel sizes.

I find the spreadsheet font very easy to read, but when I try to read equations in the normal calculator mode, subscripts and superscript are very hard to read. But overall, the Ti200 has a far better (by orders of magnitude!) display than a classic hp-48.

Quote:

---

I seem to recall an incident in Canada years ago that resulted from a mixup of refueling units. I forget if it was liters/gallons or pounds or whatever, but the plane ran out of fuel because of the mixup. It did land safely, though, as I recall. On an unused dragstrip!

---

Yes, this is the famous "Gimli glider" (an Air Canada Boeing 767 that landed on a disused military airfield called Gimli) where they messed-up kilograms and pounds upon refuelling. But then, aviation has made the biggest imaginable mess of units over the years, that it really is a miracle that this kind of incident doesn't happen more often! (See e.g. here: <http://www.wadenelson.com/gimli.html> )

Greetings, Max

*Message #11 Posted by **Vincze** on 19 Aug 2007, 12:58 p.m.,  
in response to message #8 by Maximilian Hohmann*

That very cool. Interesting that it has built in spreadsheet. I have never seen TI voyager calculator.

I own a Columbia 400 SL with E-Vade. In fact I was to fly to Virginia this weekend, but plans change and I never went. I am thinking of upgrading plane to have climate control as well and my family and I go to some warmer areas, and it would be nice when on the ground or at lower levels to have less humid cockpit. It is no rush though.

### **Re: Aviation Programs**

*Message #12 Posted by **Maximilian Hohmann** on 19 Aug 2007, 3:51 p.m.,  
in response to message #11 by Vincze*

Hello!

Quote:

---

I own a Columbia 400 SL with E-Vade.

---

Wow! This is on my shopping list once I win the lottery :-). Does the E-Vade system work well? This really is a big advance over de-ice boots and TKS!

Quote:

---

One other thing, I glad I not own plane you fly in that program as at

700 lbs an hour, that a lot.

The 700 lbs figure is typical for the Metroliner, but that carries 19 passengers at around 280 knots. A more modern design (with modern powerplants) should be able to do the same with less than 500 lbs/hr, but there are no modern aeroplanes in that category.

Quote:

It would be nice to be able to have solver...

The fuel calculation above could indeed be handled by a solver, because there is always only one value to be computed. I have played around with different HP calculators with solvers on this (48, 28, 33s, 17bII). The advantage of using a solver is that you have to enter your constants (like fuel flow, conversion rates) only once, yet they do not become part of the formulas and can easily be changed when necessary.

The more interesting (in terms of formulas involved) wind calculations can hardly be done with solvers though, because there is always more than one resulting value.

A good calculator for this kind of thing is the hp-28 (C or S does not matter much) because it is nearly indestructible (good when carrying it around in the flight bag), can handle long variable names and as many variables as there is memory, has a proper alpha keyboard and a multi-line display. And since nobody likes them, you can find them very cheap on eBay (usually under 20 Euros). But they have one big disadvantage: The RPL programming language, that makes them almost unusable. I think I could quicker learn Hungarian or Irish Gaelic than RPL ;-)

Greetings, Max

### **Re: Aviation Programs**

*Message #13 Posted by **Vincze** on 19 Aug 2007, 3:59 p.m.,  
in response to message #12 by Maximilian Hohmann*

I have only had to use the E-vade a few times because I purchased the unit in June, and have not flown in too many bad situations. Living more up north though, I felt that would do myself and family better than the climate control. It is a lovely airplane with glass cockpit and all. Very nice to travel in.

I do have a 28C, but I have not yet figured out how to use it much. You are right that it is very rugged. Only problem I have is corrosion in battery compartment. I have been meaning to fix that, but have not had time yet. It is no big deal though as my plane provide most information that I need, and I have a old E6B that I could use, and PDA with Sporty's E6B on it as well.

### **Re: Aviation Programs**

*Message #14 Posted by **Pal G.** on 19 Aug 2007, 6:32 p.m.,*

*in response to message #13 by Vincze*

Greetings,

I have been following this thread. That Voyager screenshot was nice, but do either of you own an hp 50g? I do not own an hp 35s yet, but based on my experience with my hp 50g, I know nice aviation programs may be written. (RPL though).

In fact, while I was writing this post I thought to search hpcalc.org and found this:

<http://www.hpcalc.org/details.php?id=167>

It was ported to hp 49g (I assume from the hp 48xx series), so it should work on the hp 50g. Also, the person who ported it is a *\*very\** active contributor to comp.sys.hp48, where there is much discussion regarding hp 35s and hp 50g. I would assume fuel calcs could be added easily.

comp.sys.hp48:

<http://groups.google.com/group/comp.sys.hp48/topics?lnk=gschg>

Cheers, Pal

### **Re: Aviation Programs**

*Message #15 Posted by **Vincze** on 19 Aug 2007, 6:59 p.m.,  
in response to message #14 by Pal G.*

Thank you very much my friend. No, I do not have HP50, but I do have HP 48GX, I just get actually, well not long ago. The program look very nice, but I have no idea how I would load that onto the 48. It has connector on unit, but I no have cable for it. Someone tell me old serial mouse cable can be used somehow, but he does not know how.

I wonder if someone here may know how that work?

### **Re: Aviation Programs**

*Message #16 Posted by **Vincze** on 19 Aug 2007, 1:04 p.m.,  
in response to message #8 by Maximilian Hohmann*

One more thing. I'm not sure I follow the formulas that you have to equate the values you have. It say you have 800 lbs remaining, with a burn rate of 700/hr. How is it you have 2.7 hours left of flying? Or is that something you key in and then it compute values below.

Either way, I would be interested to see formulas, as this looks very nice.

**\*\*EDIT\*\*** Never mind, I see what you are doing. You are calculating the  $B5 = B3 * B2 - B1$ , and then apply weight to litre conversion. Very nice.

This is where I wish 35s could handle variable longer than one character. It would be nice to be able to have solver, or program work like Pioneer series where you could

make variable name longer. When I play with 17Bii emulator, it nice that you can do this as it could handle the fuel components. I guess, if you make program though, you could do a line that say EQN Fuel Remaining, EQN Flt Time, etc. It be pain though as you would have to enter fuel flow each time, unless you fly same equipment all the time, and then that could be hard coded in. Still, TI Voyage look very nice. I never see one before. I would think PocketPC could do same thing, but not have QWERTY keyboard on PocketPC.

One other thing, I glad I not own plane you fly in that program as at 700 lbs an hour, that a lot. Mine only do about 105 on average. Sometime less, sometime more.

Again, thank you for sharing Max, it very enlightening.

**41CX repair advice.**

Message #1 Posted by [Egan Ford](#) on 16 Aug 2007, 7:10 p.m.

I just purchased a very good looking 41CX, but it is flaky. It took a while to get it to power on. It will not power on with the advantage ROM installed (my other 41CX does). After removing the advantage ROM I have to press enter a few times with the batteries out before it will power up again. Memory Lost is not reported after this however. My HP-IL adapter also does not work with the 41CX, I can power up, but get transmit errors. If I fail to get a refund from the seller, what do you all recommend for troubleshooting this device?

Thanks.

**Re: 41CX repair advice.**

Message #2 Posted by [Raymond Del Tondo](#) on 16 Aug 2007, 7:47 p.m.,  
in response to message #1 by Egan Ford

Most common problems are corroded battery contacts and contact springs, then the connection between the case halves (kwd zebra stripe) then a dried capacitor.

If it's not a hardware problem, just initiate a cold start.

Sometimes it also helps to clean the port contacts from dust with a Q-tip...

HTH

Raymond

Contacts all look clean.

41CX just decided to not power on anymore.

Cold start? How?

Thanks.

**Re: 41CX repair advice.**

Message #4 Posted by [gregp](#) on 16 Aug 2007, 10:36 p.m.,  
in response to message #3 by Egan Ford

Press On and <-

My 41CX started to freak out a few years ago. Can't remember what triggered it now. I press On and nothing happens. I press On and <- and the summation+ symbol is displayed along with BAT. I press a key and it changes to NULL (and BAT). The batteries are fresh and no BAT annunciator on my 41C with that same battery pack.

I tried what I could, but gave up. Sent it in to [fixthatcalc.com](http://fixthatcalc.com) and awaiting repair. Hopefully its fixable. If not, I'll cry. Bought it in college about 20 years ago and had served me very well up until the day it broke (2001-2002).

I picked up the 41C a couple of years ago, to try to take the place of the 41CX. Not the same as the CX, altho it came with a card reader, quad memory, advantage pac, and time module. The 41C still works. Best of all, got it free. Friend was moving across country and didn't need it anymore. Was digging around his full garage full of "junk" and saw the carrying case. At first glance, I nearly had a heartattack and ran over to it. Opened it up and saw what was better than a bar of gold. A couple other friends were rummaging around and they just stared at me. Good, no competition.

Just bought up a 35s (arrived Wed, 8/15). Compared to my 41C/CX and 15C, that thing is fast. (yeah, I've read the other threads on the 35s... good & bad). So far, I'm happy with it and will take that with me to work. Afraid of my lone 41C getting lost/stolen. I esp like the dec-hex-oct-bin conversions. 41C has the bin/hex in the adv pac.

Would be kinda nice if HP made a modern version of the 41C, with goodies from today while keeping the original flavor. Designed, engineered, and built by HP, not farmed out. Wish HP would bring all of that back in house.

**Equation suffix**

Message #1 Posted by [Vincze](#) on 16 Aug 2007, 1:24 p.m.

I'm not sure what this is called, so I apologize if title confusing. Is there a way on HP35s to show the result of a program with a suffix indicating the units it is being displayed in? Meaning, if program return 1000 and this represents km, can I display 1000 km somehow?

I see in manual that you can display text by using the EQN and the flag settings, but I am not sure if you can concatenate a variable result and text. If anyone knows how, please let me know as I am trying to write some programs for aeronautical calculations that I plan to share, but I would like to include this with the program.

**Re: Equation suffix**

Message #2 Posted by [Gene Wright](#) on 16 Aug 2007, 1:33 p.m.,  
in response to message #1 by Vincze

No, you can't concatenate them.

Sorry!

**Re: Equation suffix**

Message #3 Posted by [Vincze](#) on 16 Aug 2007, 1:43 p.m.,  
in response to message #2 by Gene Wright

átok ez! I say in Hungarian as it not nice. It okay Gene, not your fault calculator can't do what I want it to.

**Re: Equation suffix**

Message #4 Posted by [bill platt](#) on 16 Aug 2007, 2:01 p.m.,  
in response to message #1 by Vincze

However, if you are really clever with flag 10 and the PSE and/or STOP commands, you might be able to have a message stored as an equation in the program and that message would say "km" or something, and so the answer come up, and then you press r/s and the units (the message stored as equation) come up afterwards.

Just a thought.

BTW Gene and or somebody else started a thread which showed how many different small letters could be generated on the 35S--you may manage to parse them into an equation-as-message!

**Re: Equation suffix**

Message #5 Posted by [Vincze](#) on 16 Aug 2007, 2:12 p.m.,  
in response to message #4 by bill platt

Actually, I am doing that with the inputs so people don't have to memorize what silly variable letters mean,

and then PSE and then INPUT. With answer though, I would rather it be all on one line, that way, I can display two lines of information with Y and X reg.

### Re: HP-35s Equation suffix

Message #6 Posted by [Karl Schneider](#) on 16 Aug 2007, 2:12 p.m.,  
in response to message #1 by Vincze

Quote:

That's a reasonable thing to want, and I've wondered about it.

Concatenation of strings and conversion of numbers to strings are not possible on the HP-35s. You can display a text message such as "AIRSPEED (KT)" followed by the value, using the Equation functionality and appropriate flags.

The long-discontinued RPN HP-42S and HP-41 (with X-functions?) could do those things, and the RPL HP-48/49/50 series actually allow units to be appended to value for use in calculations and display.

...and the RPL HP-48/49/50 series actually allow units to be appended to value for use in calculations and display.

I have 48GX, and it take insane person to understand how to program that. I go insane first with 35s, then I will try and fall over that one.

### Re: HP-35s Equation suffix

Message #8 Posted by [Ed Look](#) on 16 Aug 2007, 2:43 p.m.,  
in response to message #7 by Vincze

It took me many, many weeks, maybe several months, a few days a week, a hour or two a day to finally get a program to actually successfully run on the 48G and 48G+. And, I could NOT have done it without the 48G Series Advanced Users' Reference guidebook. The DEBUG function on the 48G series machines helped greatly, too, of course.

The 35s was/is easy (easier?) for me only because as a college boy, I used a 34C, and in those days, I was more able to read and understand things better... and the abject need of programming longish physical chemistry calculations so that I could get at least three to five hours of sleep at night! So,

perhaps a little urgency might help you too, whatever it may be! :D

*Message #9 Posted by [bill platt](#) on 16 Aug 2007, 2:53 p.m.,  
in response to message #8 by Ed Look*

I found it very easy to write easy programs on the 48--as long as they were strictly or nearly strictly keystroke-saver type programs (no looping or conditionals)--it really isn't any different from RPN keystroke except that you save it to a variable with a name, and you have to decide whether to have internal or external variables.

Once you decide to have any sort of sophistication or I/O, then you have to learn the structured paradigm or RPL rather than merely using its keystroke analog.

You also have the ability to program entirely with algebraic objects rather than RPN equation representation--the algebraics are easier to read and debug and this is a great advantage of both the 48 (RPL) series as well as the 35s.

That being said, I use the RPN machines for Ad-Hoc as well as standard programs quite a lot.

I also have Hrastprogrammer's 41C emulator on the 48.

### **Re: HP-35s Equation suffix**

*Message #10 Posted by [Vincze](#) on 16 Aug 2007, 3:25 p.m.,  
in response to message #9 by bill platt*

I try someday. It would be interesting to see a simple 35s program converted to 48gx for simple keystroke saving. I do have advanced user manual and regular manual (I find online). Maybe there is easy example in one of those two books that I can follow.

Then again, learning to program 35s like getting earache in my eye, so I can only imagine what learning 48gx is like. ;)

*Message #11 Posted by [Raymond Del Tondo](#) on 16 Aug 2007, 2:56 p.m.,  
in response to message #6 by Karl Schneider*

Hello,

the HP-41 could display ALPHA messages without the X-Functions module, of course. The X-F added some more functions for manipulating ALPHA.

Slightly OT: There was an HP-41 module which featured unit-management, I think (but I'm not sure here) it was the Petroleum Fluids Pac.

Another module, the AECROM, added kinda 'expression evaluation' to the HP-41!

Raymond

A FOCAL language parser--taking alphanumeric input and parsing to an ad-hoc RPN program?

### **Re: HP-35s Equation suffix**

*Message #13 Posted by [Jim Creybohm](#) on 17 Aug 2007, 11:32 p.m.,  
in response to message #11 by Raymond Del Tondo*

You are correct Raymond. The Petroleum Fluids pac does have unit management.

For example, you could convert from lbf/in<sup>3</sup>-Pa/m<sup>3</sup> and XEQ CON. interestingly, if you wanted to convert the inverse, you would XEQ INCON. (or acre\*ft-m<sup>2</sup>\*cm)

What a powerful tool for the budding engineer! It was miles ahead of the competition (TI, Casio, Sharp etc had nothing even close), and I am certain was the primary reason I made it through petroleum thermodynamics.

And I continue to use it today. The PC just seems so clunky.

### HP41CV Check X-Memory?

Message #1 Posted by [ems22](#) on 16 Aug 2007, 3:08 a.m.

Hello, I have a HP41CV with TimeModul, X-Functions and Card-Reader. I just bought a X-Memory-Modul at ebay. How can I check the function of this modul?

Greetings,

Edgar

### Re: HP41CV Check X-Memory?

Message #2 Posted by [Patrick Rendulic](#) on 16 Aug 2007, 7:03 a.m.,  
in response to message #1 by [ems22](#)

Install the X-Functions module without the X-Memory module.

Type: XEQ ALPHA EMDIR ALPHA, the calculator displays the content of the extended memory and leaves the number of available registers (= X) on the stack.

Install the X-Memory module and type again XEQ ALPHA EMDIR ALPHA. The display shows the new size of the extended memory (= Y).

You should have  $Y = X + 238$

*Edited: 16 Aug 2007, 7:14 a.m.*

### Re: HP41CV Check X-Memory?

Message #3 Posted by [Raymond Del Tondo](#) on 16 Aug 2007, 7:05 a.m.,  
in response to message #1 by [ems22](#)

Hello,

just perform EMDIR without the additional X-Mem module,  
note the amount of free registers will be returned to the X register.

Then turn off the HP-41, plug the module in,  
turn on the calc again, perform EMDIR again.

Then do  $X \leftrightarrow Y$ , then -, and you have total of free registers in the X-Memory module.

This amount should be between 234 and 238 registers initially.

HTH

Raymond

### RPL Information overload

Message #1 Posted by [David Smith](#) on 15 Aug 2007, 10:46 p.m.

Ok, so I bought a 50g to play with, and I guess in a way to finish what I started when I bought my 28s so long ago. So here I am with **loads** of RPL info. I printed the entire 50g User's Guide, the first 120 pages of the 49G+ AUM (which covers RPL). I also have the 49g AUR and the Programming in System RPL book (which I assume will work for the 50g since it also covers the 49G). All together about 2,000 pages of information, much of which I assume will be redundant.

I wasn't looking for a new career, just trying to finally do something I had tried and failed at in the past (mostly due to a lack of motivation). But my question is this: How much of all this stuff really necessary? I feel more than a bit overwhelmed.

### Try this progression: 28s -> 48g -> 50g

Message #2 Posted by [allen](#) on 15 Aug 2007, 11:54 p.m.,  
in response to message #1 by David Smith

Greetings David! I can certainly see where going from a 28s to 50g would be a shocker! In one step you are skipping more than 15 years of HP calculator innovation (and stagnation if you include the dark years of Kinpo).

May I recommend learning the 48g before FULLY tackling the 50g? I believe this will bridge the RPL complexity gap as you follow the core RPL components through their natural evolution.

The most complete calculator in each family is 28s -> 48g -> 50g, but there is not a natural jump straight from 28 to 50. (I am purposely skipping the 48s, 48sx, 48g+, 48gx, 49g, and 49g+ in the chronology and maturity because by analogy:

1. the 49g/49g+ is to the 50g what the 28c is to the 28s,
2. also, the 48s is to 48g what the 28c was to the 28s,
3. you really don't need the extra expense of the 48SX/48g+/48gx to learn the RPL language for the 48 series calculator)

Others' opinions may differ, but I started RPL with the 48g and found it very easy to port the lessons learned both ways to the 28s and the 50g. If I had tried only both extrema, I fear I may have given up.

*Edited: 16 Aug 2007, 12:03 a.m.*

I am doing mostly financial stuff, so I have just purchased a 12c (longing for my original 11c, but, well, financial), and a 19b II (same problem.) I sold the 28S a long time ago, but nostalgia is starting to get expensive!

Anyway, if I am understanding you correctly I should go get a 48G to learn RPL before I try to tackle it on my 50G? It looks like I could get on at a reasonable price, and I just bought a printer that has auto duplex, so the manuals wouldn't be a problem.

Thanks to all for the doc links, I will look at them as well.

## Lexicography and Language Learning

*Message #4 Posted by [allen](#) on 17 Aug 2007, 12:32 a.m.,  
in response to message #3 by David Smith*

Quote:

---

Anyway, if I am understanding you correctly I should go get a 48G to learn RPL before I try to tackle it on my 50G?

---

That would be my recommendation because of it's centrality between your newest RPL and the one you learned back in the day. Again, others may have a different opinion. You can also use the integral TVM (TVMROOT) features of the 48g if your 12c is out of reach.. just bear in mind the treatment of annual/periodic interest rates are different for each HP model.

Best of luck in your financial project.. unfortunately the best financial calc (17bii) is neither RPL nor programmable. :(

Regarding your original question:

Quote:

---

How much of all this stuff really necessary?

---

These calculators are powerful enough (especially the 50g), that I am comfortable saying that these are solutions looking for problems. You can get into as little or as much of the RPL as you like. Most of it I find completely worthless. Really! HP advertises over 2300 built-in functions. Compare with studies in [Lexicography](#) (link has good references for numbers), that show one can have 75% coverage of an entire written language by using only 1000 words. (By contrast, the venerable 42s offered around 600 functions.)

Any thoughts from the forum on applying the [Nation/Waring](#) conclusions to deciding how many RPL 'words' are sufficient?? GRIN.

*Edited: 17 Aug 2007, 12:55 a.m.*

### **Re: Lexicography and Language Learning**

*Message #5 Posted by [Ed Look](#) on 17 Aug 2007, 1:16 a.m.,  
in response to message #4 by allen*

Fascinating!

I was under the impression that one needed more words in one's vocabulary to have the "coverage" of the language that the paper(?)in the link listed.

However, there are functional differences between a real, human language and a computer "language", which really is the use of words from one's language to name operations and conditions strictly for use in defining, broadly, algorithms.

As such, it should require "only so many" "words" to define any set of similar algorithms. Now, should a user need to define more algorithm types, then he needs more or new words.

Therefore, perhaps "most people" may only need to know a small set of RPL commands or functions, but as one needs to apply his 28S, 48S, 48G, 49G, or 50G to more types of problems or uses, then his need for a more comprehensive command of RPL grows, as well.

I mean, the occasional need by a scientist would require less of a knowledge of RPL than perhaps the more extensive need of a technical student to solve homework problems, etc.; but which differs from the more intensive need maybe of the engineer who may have a less wide but deeper set of applications.

Oh... don't let this out to kids in school; they're lazy enough as it is. If word gets out they only need x number of words to master English or Spanish or German 80%, then I suspect they will begin to study only 80% or less as hard as they might've otherwise! ;)

### **Re: Lexicography and Language Learning**

*Message #6 Posted by [Don Shepherd](#) on 17 Aug 2007, 1:22 a.m.,  
in response to message #4 by allen*

Quote:

\_\_\_\_\_

\_\_\_\_\_

Oh, Hudendai! See Article 712. I wouldn't call the solver the world's best programming platform, but it does have some features that make it \*minimally\* acceptable. This is especially true for the original 17bii. The + solver has some issues.

### **Re: Lexicography and Language Learning**

*Message #7 Posted by [allen](#) on 17 Aug 2007, 8:12 a.m.,

Quote:

\_\_\_\_\_

I wouldn't call the solver the world's best programming platform,

I agree 100%.

I think it is the best financial calc, and explicitly not programmable- even the solver tricks aren't what I would call minimally acceptable- at least not for programming. A good example: if you try an amortization in the (all?) pioneer solver, the result is MUCH slower than the 12c. Should I need to program anything, it is easier to go to another (RPL) platform or 42s.

## Re: RPL Information overload

Message #8 Posted by **Tim Wessman** on 16 Aug 2007, 12:33 a.m.,  
in response to message #1 by David Smith

Wow. I can still remember downloading this file from hpcalc.org all those years ago.

<http://www.hpcalc.org/details.php?id=1771>

This is a nice little tutorial about programming. You'll learn more about the system and using it by doing these examples than you'd ever get by reading manuals. I ran through this tutorial back in . . . i think it must have been 8th grade. Later moved on to sysRPL and never really looked back.

TW

## Re: RPL Information overload

Message #9 Posted by **Will Hartung** on 16 Aug 2007, 1:33 a.m.,  
in response to message #1 by David Smith

No reason to master everything on day one.

I'd seriously punt on the SYS RPL stuff until you REALLY think you need it. User RPL is dangerous enough as it is.

When writing code, write lots of little functions. They're easy to debug and test. Just place a few bits on the stack, and work it until it's done. Then build up from there. You don't have anywhere near the memory constraints on these machines as you do on the normal calculators. They pretty much support "unlimited" everything.

Also, they have a really nice single stepping trace/debug mode built in. That's a wonder.

As with anything, just work on whatever application or utility you want rather than trying to use all of the features.

Developing on these machines I found very organic, and I never used a PC or anything to work on them -- just for transferring files. Some folks use tools to use PCs to edit or even use as a terminal to these things. I never bothered, easier to just flump on the couch and code away. But I never did any SYS RPL or assembly stuff. I can easily see folks doing that on a PC.

So, work on your application that you want. No reason to master it all -- just what you need.

## Re: RPL Information overload

Message #10 Posted by **Ed Look** on 16 Aug 2007, 11:46 a.m.,  
in response to message #9 by Will Hartung

That's the best way to get started. Unless you code every week with it, you'll forget some things, but like bike riding, you can't forget the basic approaches and structure. And this is where the AUR is most useful, as a reference guide for commands and structure.

### **Re: RPL Information overload**

*Message #11 Posted by [Chan Tran](#) on 16 Aug 2007, 3:24 p.m.,  
in response to message #10 by Ed Look*

As far as programmin in RPL the 50G is almost the same as the 48G/GX. And not too far from the 28C. I think you can pretty much run UserRPL programs for the 28c on the 50G.

### More about Checksum

Message #1 Posted by [Miguel Toro](#) on 15 Aug 2007, 9:16 p.m.

Hello,

I entered the insertion sorting routine as written by Gene Wright in Datafile V26 N4, in both HP 35s (CNA 72102361 and 72102362) to verify if I got the same checksums. They were different compared between them and compared to Gene's. I deleted one instruction at a time backwards until line I015: there, the checksums were exactly the same! The culprit in this case: line I016, putting '1' in the stack. Beginning with this instruction the checksums of both calculators disagreed. You could try and see if you obtain the same behavior:

```

I001 LBL I      ----> CK = 4254
I002 STO K
I003 IP
I004 STO B
I005 ISG K
I006 RCL K
I007 STO I
I008 RCL (I)   ----> CK = D522
I009 RCL I
I010 IP
I011 STO J
I012 RCL B
I013 x=y?
I014 GTO I026
I015 RDN      ----> CK = 5E0A
I016 1       ----> CK = 0B9E ('61) CK = 8136 ('62)
I017 -
I018 STO I
I019 x<>y
I020 RCL (I)
I021 x<=y?
I022 GTO I027
I023 STO (J)
I024 x<>I
I025 GTO I011
I026 RDN
I027 x<>y
I028 STO (J)
I029 ISG K
I030 GTO I006
I031 RTN

```

1.- The calculators have different content 2.- I made GTO .. in both before entering the program.

Regards,

Miguel

### Re: More about Checksum

Message #2 Posted by [Paul Dale](#) on 15 Aug 2007, 9:25 p.m.,  
in response to message #1 by Miguel Toro

Does a replacement of steps 15 and 16:

```

I015 RDN      ----> CK = 5E0A

```

I016 1 ---> CK = 0B9E ('61) CK = 8136 ('62)

with

I015 CLx  
I016 e^x

cause the checksums to match again?

I'm pretty confident that it is numbers that are causing the problems with the checksums and size calculations. This alternative code avoids the number. It should also be smaller and slower.

I don't understand your point. If memory serves, every positive real number has two real roots of any even positive integer order, and n complex roots of any integer order n.

### Re: More about Checksum

Message #6 Posted by [Paul Brogger](#) on 16 Aug 2007, 10:00 a.m.,  
in response to message #3 by Bruce Bergman

Maybe if someone knows something about 35s internals, (s)he could offer a more informed opinion. In my ignorance, I can only speculate whether the 35s' new capacity for vectors and complex numbers might be

related. If uninitialized (and unused) vector storage is incorporated in the checksum calculation for programs when simple numbers are being entered, that might explain how differing checksums result.

-- <appended>-----

FWIW (and in case it hasn't been made clear yet), the User Manual's example programs are *not* immune. The first three suspect programs from the manual that I entered (chosen because each includes at least one number entered on the stack) all came up with checksums that differ from those listed in the manual:

```
LBL S -- page 16-13 -- CK=DDC4
LBL F -- page 16-14 -- CK=8C04
LBL I -- page 16-19 -- CK=2159
```

## Re: More about Checksum

Message #9 Posted by [Vincze](#) on 19 Aug 2007, 7:27 p.m.,  
in response to message #8 by Paul Dale

1 is not boring, but it is the loneliest number. ;)

Why would number throw checksum off though? That I not understand. Every didgit and keystroke I

would assume have an ascii code in the system, or something similar that it would be assigned. Why would a number on one person machine be different than another persons? I wonder though, if program typed in on one mode, and then typed in on different mode yield different checksum? Meaning, if you type in on one calculator in degree mode, and on different calculator in radian mode, I wonder if that be different. Or maybe with different base, although I not sure it would let you do the later. Hmm, maybe on some calculator, 1 is larger than on others. You know,  $1 + 1 = 3$  for very large value of 1.

### 48GX serial number - Build quality

Message #1 Posted by [Frank Rottgardt](#) on 15 Aug 2007, 5:11 p.m.

I am into buying a used 48GX for 50 USD. But the manuals are missing. I asked the seller to send me a picture of the serial number. I couldn't believe it. But if I'm right this calc must be one of the very first GX batches ever produced? Please confirm that this one is made year 1993 week 25.

Recently I read in this forum that 48 made before mid 1994 does not have a reinforced LCD (additional plastic sheet underneath display). So the risk that the LCD might break is somewhat higher compared to later models. Is that true?

When was the 48GX SOP in Singapore? June 1993 ?

[http://www.schweden-ferien-haus.de/images/serial\\_48GX.JPG](http://www.schweden-ferien-haus.de/images/serial_48GX.JPG)

### Re: 48GX serial number - Build quality

Message #2 Posted by [Randy](#) on 15 Aug 2007, 5:33 p.m.,  
in response to message #1 by [Frank Rottgardt](#)

Why worry about manuals when it is \$50?

While it is an early GX, the Museum lists 3321 as the earliest non-prototype GX's. Yes, the LCD lacks the reinforcing plate but that is a relative thing - you'd have to hit the screen for it to make a difference. Honestly, I don't think the margin of safety is that much better with the reinforcing plate simply because that is a mighty big, thin piece of glass. The real issue IMO is the fact that those early LCD's have lower contrast than later displays.

But for \$50, it's still a bargain.

### Re: 48GX serial number - Build quality

Message #3 Posted by [Frank Rottgardt](#) on 15 Aug 2007, 5:47 p.m.,  
in response to message #2 by [Randy](#)

Thanks Randy,

yes, 50 bugs is a strong argument. I really hope I can get hold of this baby. Tomorrow I should know.

I only have a 1990 28s LCD as reference. Will an early GX display have a similar contrast level or better/worse?

// Frank

### Re: 48GX serial number - Build quality

Message #4 Posted by [Seth Morabito](#) on 15 Aug 2007, 6:42 p.m.,

*in response to message #3 by Frank Rottgardt*

Good luck!!!

I have two 48GX's and one 48G myself. One of the GX's and the G are from 1994, made in Singapore, and the other GX is from Indonesia, made in 1999. The Singapore calculators are significantly nicer feeling, for what its worth. The Indonesia made GX has painted keys and the plastic is of very slightly different and poorer quality.

And I got all of them for under \$50 each, which makes me very happy indeed -- yes, they are out there, and if you're patient you can find good deals on G and GX's!

**Re: 48GX serial number - Build quality**

*Message #5 Posted by [Juan J](#) on 15 Aug 2007, 8:02 p.m.,  
in response to message #4 by Seth Morabito*

Hello,

From my experience, 48GX's made in Singapore before 1996 were solid and almost immune to static electricity.

48GX's made from 1997 on in either Singapore or Indonesia need frequent static electricity discharge. Otherwise, they reset themselves and you lose all memory contents.

My first 48GX's serial number was 3330S... After this I had one with serial number 3720S... and an Indonesian model. Both had this nasty behavior occurred when I least expected it, and it was not until when Luiz showed us how to make an ESD that I was able to get rid of that.

You are lucky. The 48 you got is a very good bargain.

**Re: 48GX serial number - Build quality**

*Message #6 Posted by [Randy](#) on 16 Aug 2007, 8:32 a.m.,  
in response to message #3 by Frank Rottgardt*

Worse. The 28 series used a black polarizer that provided better contrast than the 48's blue color. The GX and G+ finally switched to black in 2001 - to match the 49G.

**Re: 48GX serial number - Build quality**

*Message #7 Posted by [Chan Tran](#) on 16 Aug 2007, 4:31 p.m.,  
in response to message #6 by Randy*

I found my 48SX version C and 48GX version P are of very good quality but the display is low contrast especially the 48SX.

**Re: 48GX serial number - Build quality**

*Message #8 Posted by [Seth Morabito](#) on 16 Aug 2007, 8:02 p.m.,  
in response to message #7 by Chan Tran*

Yes. I think of all my calculators, my 42S and my 48SX have the worst contrast.

They're still quite usable, just not as good as what we have today.

**Re: 48GX serial number - Build quality**

*Message #9 Posted by [HrastProgrammer](#) on 17 Aug 2007, 1:11 a.m.,  
in response to message #6 by Randy*

I don't think that contrast is everything and I actually prefer the green LCD with blue pixels. When I was buying my three 48GXs few years ago, I asked for green LCDs because I like them much more than gray LCDs with black pixels.

Regarding Singapore vs. Indonesia quality: I am looking at 1997 SG HP-48G model and 1999 ID HP-48GX model, side by side, and I really cannot decide which one is of a better quality. Key paintings/moldings are different a little but I cannot say that SG keyboard is better or that SG model feels/is better overall ...

### **New toy, but no HP emulator yet**

Message #1 Posted by [Meindert Kuipers](#) on 15 Aug 2007, 2:59 p.m.

Last week I got my new toy: the Nokia N95. It has almost everything I would like in portable device, except that I did not find an emulator or simulator for an HP calc yet. My old Palm Treo at least had P41CX. Any tips, at least for something that talks RPN? The N95 uses Symbian and runs the S60 platform software.

Meindert

### WOODSTOCK Questions/Observations

Message #1 Posted by [Mike T.](#) on 15 Aug 2007, 1:54 p.m.

I don't remember noticing this mentioned here before but I recently noticed some 'odd' behaviour on my HP25 (s/n 1603\*\*\*\*\*).

An arithmetic operation that results in an overflow results in, as expected

' 9.9999999 99 '

However when a register operation results in an arithmetic overflow then, rather than the expected error message, the calculator displays

' 0F '

As my HP21 behaves in the same way I presume that this is intended, but as I don't have the manual I can't double check this. (I find it interesting is that unlike the normal error conditions the register value is updated and the error state is cleared if CHS is pressed).

The questions I have are

-Does the HP29C' behave in the same way..?

-Are there any other 'odd' error codes..?

-Does the HP29C return an error number as well as the error message..?

-How is the i register used to indirectly address store and (I assume) program locations..?

Thanks

Mike T.

### Re: WOODSTOCK Questions/Observations

Message #2 Posted by [Hal Bitton in Boise](#) on 15 Aug 2007, 3:38 p.m.,  
in response to message #1 by Mike T.

Hi Mike, My 29C just gives me "error" in the display when I attempt an operation that would overflow one of the registers. Any key clears the error message, and a review of the register reveals that the offending operation was not performed. There are no other odd error codes that I can see. On the 29C, register zero serves as the indirect register. Sto or Rcl (i) will access the register number (0 thru 29) stored in zero...outside that range gives an error. Register arithmetic will also work this way...Sto + (i) for instance. Registers 16 through 29 can only be accessed indirectly, and are volatile. 0 thru 9 stored in zero will go directly to the so named program label when GSB (i) is executed. If that label doesn't exist you get error in the display. And finally rapid reverse branching...If you store a negative number (<-99) in register zero and execute GSB (i), the program counter will go backwards from it's present location that many steps and resume operation from that point. If less than -99 is in zero when you try this...you guessed it...error in the display.

One more thing...there are ISZ and DSZ functions as well, which will increment or decrement reg zero by 1, skipping the next program step if the resultant contents of register zero is 0. These two commands can be invoked programmatically or manually from the keyboard. Best regards, Hal

## Re: WOODSTOCK Questions/Observations

Message #3 Posted by [Stefan Vorkoetter](#) on 15 Aug 2007, 3:41 p.m.,  
in response to message #1 by Mike T.

My HP 19C (same as the 29C, but with a printer), gives "9.9999999 99" on overflow, (e.g. 1 EEX 55 ENTER x) and "Error" on register overflow (e.g. 1 EEX 55 STO 1 STOx 1).

There's no error number, just the message "Error".

Regarding register "i", there isn't one. Executing STO i or RCL i uses register 0 as the indirection register. (i.e. STO i on the 19C/29C is equivalent to STO IND 00 on the 41C).

Executing GTO i or GSB i does one of two things:

- 1) If register 0 contains 0 to 9, branches to that label.
- 2) If register 0 contains -1 to -99, branches backward that many steps.

Stefan

in response to message #1 by Mike T.

Many thanks to those who have already responded, hopefully I will be able to put this information to good use shortly - just out of interest has anyone tried this on an HP25/25C or HP21..?

Just for completeness and in case any one is interested I generated the register overflow using the following key sequence:

```
1
EEX
5
0
STO 0
STO x 0
```

Mike T.

## Re: WOODSTOCK Questions/Observations

*Message #6 Posted by [Katie Wasserman](#) on 16 Aug 2007, 8:52 p.m.,  
in response to message #5 by Mike T.*

The 25, 25C and 27 show "OF" on overflow during storage register arithmetic. This is documented in the manuals.

The 19C, 29C, 67 and 97 give "Error" which is also documented.

The 21 and 22 don't give any indication that you've overflowed a storage register and this is not documented in the owners manual.

### Radians Question

Message #1 Posted by [Vincze](#) on 15 Aug 2007, 9:59 a.m.

Have a question. If I take the Lat and Long of let's say LAX Airport(33deg 57min N, 118deg 24min w) enter into 35s and convert to RAD I get following.

```
33.57
->RAD
Answer = .585907
```

But if use longer manual formula of

$$(\text{LatDeg} + \text{LanMin}/60) * \text{PI}/180$$

I get:

$$(33+57/60) * \text{pi}/180 = .592539$$

Why are these not the same? I know the manual calculation is correct, so I am figuring that I am doing something wrong with the calculator. This seem only like small issue, but this translate into bigger issue when run through calculations that I need to do.

### Re: Radians Question

Message #2 Posted by [Dave Johnson](#) on 15 Aug 2007, 10:22 a.m.,  
in response to message #1 by Vincze

$$33.57 = 33 \text{ degrees and } 34.2 \text{ minutes } 33.57 * \text{pi}/180 = .585907$$

### Re: Radians Question

Message #3 Posted by [Vincze](#) on 15 Aug 2007, 11:18 a.m.,  
in response to message #2 by Dave Johnson

Okay, maybe I am entering information wrong. How should I enter 33deg 57 minutes N? I thought it would be 33.57

### Re: Radians Question

Message #4 Posted by [Vincze](#) on 15 Aug 2007, 11:23 a.m.,  
in response to message #3 by Vincze

Never mind, I figure out...

```
33.57
HMS ->
->RAD
Answer = .592539
```

Stupid Hungarian me.

### OT: Labels (non-calculator)

Message #6 Posted by [Ed Look](#) on 15 Aug 2007, 12:19 p.m.,  
in response to message #4 by Vincze

Vincze, since you insist on using that label, I'll mention that there used to be a baseball player, a pitcher, Al Hrabosky, who called himself "The Mad Hungarian", in an effort to strike fear into opposing hitters. When he was younger and pretty good, he didn't need nor have the nickname. When he was older and less able, the "scary" name didn't help. But many fans remember him as The Mad Hungarian.

*Edited: 15 Aug 2007, 12:51 p.m.*

### SIN on 35s not same as SIN in Excel

Message #8 Posted by [Vincze](#) on 15 Aug 2007, 1:36 p.m.,  
in response to message #7 by Vincze

Here a funny thing. I do find sin of say 100 on hp35s and I get .984808, but in MS excel, it come out as -.50637. Is something different in Excel?

### Re: SIN on 35s not same as SIN in Excel

Message #9 Posted by [Les Wright](#) on 15 Aug 2007, 1:42 p.m.,  
in response to message #8 by Vincze

the Excel worksheet function expects the argument to be in radians.

change your 35s to radians mode and check!

Les

**Re: SIN on 35s not same as SIN in Excel**

Message #10 Posted by [Vincze](#) on 15 Aug 2007, 1:57 p.m.,  
in response to message #9 by Les Wright

What if I already convert to radians though? Meaning:

```
33.57
HMS ->
->rad
sin
ANSWER = .010342
```

but Excel show .558469

If I take .010342 and ->rad I get .000180, which still wrong.

**Re: SIN on 35s not same as SIN in Excel**

Message #11 Posted by [Les Wright](#) on 15 Aug 2007, 2:10 p.m.,  
in response to message #10 by Vincze

[quote] What if I already convert to radians though? Meaning:

```
33.57
HMS ->
->rad
sin
ANSWER = .010342
```

You are taking the sine of an angle in radians but your calculator is still in Degree mode.

If you want the right answer with the keystrokes you have, put your calculator in Radians mode first--MODE 2 on the 35s. You get the right answer like magic.

Les

*Edited: 15 Aug 2007, 2:11 p.m.*

**Re: SIN on 35s not same as SIN in Excel**

Message #12 Posted by [Vincze](#) on 15 Aug 2007, 2:39 p.m.,  
in response to message #11 by Les Wright

I try it that way, but final outcome is not correct still. Let me illustrate what I have in Excel.

```
VARs:
LAT1 // Latitude 1
LON1 // Longitude 1
LAT2 // Latitude 2
LON2 // Longitude 2
```

```
=ACOS(SIN(Lat1)*sin(Lat2)+COS(Lat1)*Cos(Lat2)*Cos(Lon2 - Lon1))
```

All Latx and Lonx use (Deg+Min/60)\*pi/18 so if: [pre] Lat1 = 33 deg 57 min  
= 0.592539281 Lon1 = 118 deg 24 min = 2.066469834 Lat2 = 40 deg 38 min  
= 0.709185453 Lon2 = 73 deg 47 min = 1.2877621 [/pre]

Based on this, Excel calculate 0.623584645 Radians

I guess where I confused is I believe I need to convert all Lat and Lon from HMS to decimal (HMS->), yes? And then I thought to Radians with ->RAD. When I try in RAD mode, and just convert from HMS and not also to RAD, I still get wrong answer. I hope it just me not knowing how to use 35s, and me not be dummy about this.

**never mind I give up with dumb calculator. I to dumb to use.**

*Message #13 Posted by [Vincze](#) on 15 Aug 2007, 2:52 p.m.,  
in response to message #12 by Vincze*

I to dumb to use

**Re: SIN on 35s not same as SIN in Excel**

*Message #14 Posted by [Les Wright](#) on 15 Aug 2007, 2:55 p.m.,  
in response to message #12 by Vincze*

Listen, I don't know exactly what you are trying to do, but this seems to be an angular mode issue. One thing you need to know is that Excel trig functions accept radians as arguments, and the arc trig functions return radians. No exception. If you want to get the same results on your 35S, you have to make sure the MODE is set to RAD and that all of your angles are converted first to radians in both Excel and the calculator.

Am I missing something here? I think you believe there is a serious bug in the 35s trigonometrics. Apart from the cosine bug near 90 degrees, I don't think there are. I think you are simply getting bogged down in going back and forth between radians and degrees. This is, respectfully, a high school math issue, not a calculator or Excel issue. Sort that out and all of your results should fall into place.

**Re: SIN on 35s not same as SIN in Excel**

*Message #15 Posted by [Vincze](#) on 15 Aug 2007, 3:18 p.m.,  
in response to message #14 by Les Wright*

No, I know problem not with calculator, but with me. I too stupid to use it. I sorry to have bothered you all and thank you Les and others for wasting your times trying to help me.

*Edited: 15 Aug 2007, 3:29 p.m.*

**Re: SIN on 35s not same as SIN in Excel**

*Message #16 Posted by [Les Wright](#) on 15 Aug 2007, 2:58 p.m.,  
in response to message #12 by Vincze*

Quote:

When I try in RAD mode, and just convert from HMS **and**

**not also to RAD**, I still get wrong answer.

I have bolded your error.

Of course you have to convert your angles to radians if you are in radians mode.

I don't think the 35s is different from any other HP in this regard.

Les

### **Re: SIN on 35s not same as SIN in Excel**

*Message #17 Posted by **Les Wright** on 15 Aug 2007, 3:12 p.m.,  
in response to message #12 by Vincze*

Here is my final hint, and then I am going to let you wrestle with this yourself:

1. Put the calculator in radians mode
2. Enter LAT1
3. Convert it to decimal mode via HMS->
4. Convert those degrees via ->RAD
5. Store it in a variable or write down the result (which is LAT1) in radians.
6. Repeat 2 thru 5 for each of LAT2, LON1, LON2
7. Compute your desired angle with your formula. It is in radians, and should agree with Excel
8. If you want to see the result in degrees, execute ->DEG

Alternately, you can keep the calculator in degree mode and skip steps 4 and 8 and you will get the result in degrees.

For Excel to agree, compute everything in radians but change the result cell to =ACOS(SIN(Lat1)\*sin(Lat2)+COS(Lat1)\*Cos(Lat2)\*Cos(Lon2 - Lon1))\*180/PI

Les

*Edited: 15 Aug 2007, 4:09 p.m.*

### **Re: SIN on 35s not same as SIN in Excel**

*Message #18 Posted by **Stefan Vorkoetter** on 15 Aug 2007, 3:53 p.m.,  
in response to message #12 by Vincze*

There's a difference between converting to radians, and being in radian mode.

When the calculator is in radian mode, it expects all arguments to trig functions to be in radians, and it returns the answers to all arctrig functions in radians.

It does **not** automatically convert numbers you enter from degrees to radians, because it has no way of knowing that the numbers you are entering are in degrees.

So if you are in radian mode, you must convert all your degrees to radians

before using the trig functions on them.

The ->H.MS and H.MS-> keys have nothing to do with degrees vs. radians. They always convert between hours/minutes/seconds and decimal hours (or degrees/minutes/seconds and decimal degrees).

Since aviation formulas are generally intended to be used in degrees, just leave your calculator in degrees mode and do everything in degrees. Forget about radians.

In Excel, you still need to convert to radians, and then convert the answer back. Excel is permanently stuck in radian mode.

Stefan

### **Re: SIN on 35s not same as SIN in Excel**

*Message #19 Posted by [Alain Mellan](#) on 16 Aug 2007, 1:59 p.m., in response to message #18 by Stefan Vorkoetter*

Quote:

There's a difference between converting to radians, and being in radian mode.

That's actually an interesting problem. Why is this acting differently from the BIN/DEC/HEX mode? With these modes, it's changing the display of a number to a different base.

Same thing, it's still the same complex number whether we are in x+iy or r,theta display.

What if when we change mode, it does the DEG/RAD conversion? Would that be an improvement?

Any thoughts?

### **Re: SIN on 35s not same as SIN in Excel**

*Message #20 Posted by [Stefan Vorkoetter](#) on 17 Aug 2007, 11:50 a.m., in response to message #19 by Alain Mellan*

Because BIN/DEC/HEX mode and real vs. complex affect all numbers. Degrees vs. radians affects only angles. Consider calculating the value of  $2+\sin(45)$ . You'd enter:

```
2
ENTER^
45
sin
```

The calculator should obviously not convert the 2, since it's not an angle.

As for the 45, you might want the calculator to convert it from

degrees to radians if you're in radian mode, but how is it supposed to know that you've entered it in degrees? Perhaps you **meant** 45 radians!

Stefan

## Apology

*Message #21 Posted by **Vincze** on 16 Aug 2007, 9:31 a.m.,  
in response to message #1 by Vincze*

Someone send me e-mail telling me to stop posting such "ignorant" questions as I am dumbing down the group. I apologize for this, and that was not my intention. Because of this, I wish to apologize to group and let all know that I will not post any further questions unless they are considered "worthy", or unless I have "worthy" comment.

I am very sorry, but I wish to thank all of you who help me yesterday and in previous days. I sometime get stuck with manual (I wish they had Hungarian version) as I am very old school with things, and I know that makes me a bit slower than many of you.

Take care.

## Re: Apology

*Message #22 Posted by **Gene Wright** on 16 Aug 2007, 10:19 a.m.,  
in response to message #21 by Vincze*

I'd like to apologize to YOU for the ignorant person who sent you that email.

That is/was inexcusable.

We are all at varying levels of knowledge about a great many things.

Asking questions, particularly where a language difference exists, should always be welcome.

Certainly if a previous question or two have had a readily available answer in available manuals, it is always a good idea to read through the relevant manuals and other materials before asking a second or third question. That might have saved a couple of the questions you have asked, but is it that big a deal? To me, no.

But I too am guilty of asking questions here first and then thinking to go read the manual, so accuse me as well.

Again, I'm sorry that someone emailed you with such comments. Keep your chin up!

## Re: Apology

*Message #23 Posted by **Thor Lansen** on 16 Aug 2007, 11:03 a.m.,  
in response to message #21 by Vincze*

Do not worry about it, I was always told there isn't a stupid question, keep on asking, this is how we learn. What I think it deserves to be made public is the name of the "genius" coward who send you an e-mail instead of doing it on the board.

Regards, Thor

in response to message #31 by bill platt

Well can I ask a stupid question? I read but I am not sure that whether Sin(X) on the 35s and Sin(X) in Excell give the same result or not?

### Re: Apology

Message #33 Posted by [Vincze](#) on 16 Aug 2007, 8:51 p.m.,  
in response to message #32 by Chan Tran

Chan, my friend, I give short answer. Yes and No. :)

If I put calculator in RAD mode, then I get same result in Excel. It appear Excel convert on the fly to Radians. I never knew this. It makes me wonder what high level programing languages do as well, as I have never really tested either, but I would think it would be same as Excel.

In mathematics, the trigonometric functions are always defined in terms of radians. This is because radians are the most "natural" unit for those functions. For example, in radians,  $d(\sin(x))/dx = \cos(x)$ , while in degrees,  $d(\sin(x))/dx = \cos(x) * \pi / 180$ . High-level programming languages all follow this convention; this is true in BASIC, Pascal, C, C++, Java, and Excel, just to name the ones I'm personally familiar with.

This means that Excel doesn't **convert** its arguments to radians on the fly; it **treats** the arguments to its trigonometric functions **assuming they are in radians**. The only times when

arguments get converted "on the fly" is when you are using trigonometric functions **on calculators, while they are in DEG or GRAD modes.**

I think what got you confused was when you were trying to use the Great Circle Distance formula, where you actually have *\*two\** conversions to worry about, namely the conversion between degrees-minutes-seconds (which is used in navigation) and decimal degrees, and then the conversion between decimal degrees and radians. As long as the calculator is in DEG mode, all you need to do is the H.MS -> H conversion before applying sin or cos; if the calculator is in RAD mode, you need to do H.MS -> H, and then DEG -> RAD, before applying sin or cos.

Why, though, if you are in RAD mode, do you have to convert from DEG -> RAD? Is it because I am placing information that is in degrees? Meaning 35 degrees 24' 00"

### Re: Apology

The calculator does not **know** if the number you enter is in degrees or radians. It is just a number. When the calculator is in DEG mode, the trigonometric functions **assume** that the value in the X register is in degrees (decimal degrees, not degrees-minutes-seconds). When the calculator is in RAD mode, they **assume** that the value is in radians.

Sometimes we take many things for granted and sometimes we need simple questions to help us rethink those things and discover something new. Worthy members of this community have given you (and me, by the way!) the best answer to your apology.

Keep those questions coming...I am learning too.

Regards,

Miguel

I have to admit I was getting a little grouchy because your dilemma seemed so clear to me and I was at a loss as to try to explain it more clearly. Regrettably, I would not make a good high school math teacher.

That said, I think you have the right and privilege to post whatever you like of even passing relevance to the aims of the Forum. If someone doesn't want to read your stuff, they don't have to.

I have to scold you for this "stupid Hungarian" insult you heap on yourself whenever you bump up against something you don't know. I can't imagine it is a very pleasant experience to so harshly and inaccurately criticize yourself for something so human as not knowing everything. If I called myself a "moronic Canadian" everytime I bumped into something that stumped me, I would be so depressed from the self-abuse I wouldn't be able to get out of bed in the morning.

Take care of yourself, and enjoy the 35s.

Les

*Message #41 Posted by [Vincze](#) on 17 Aug 2007, 8:43 a.m.,  
in response to message #40 by Les Wright*

I not mind calling myself "stupid Hungarian". It my way of laughing at myself. It really no different than when I work on something and I struggle with it for hours and then finaly figure it out and say, "Vincze, you dumb a\*s".

Now if someone call me stupid Hungarian, yes that would hurt and diminish my self worth. I know I am only human, and I know that I not know everything, so until I know everything (which never will happen) I am a stupid Hungarian.

### **Re: Apology**

*Message #42 Posted by **Juan J** on 18 Aug 2007, 9:07 p.m.,

Hello Vincze,

Lanczos, Eotvos, Von Neumann, Eugene Wigner and Edward Teller, notable physicists and mathematicians, as well as my longtime friend Philip, who taught me a thing or two about computers and life, come to my mind when I think about Hungarians. Yours is a land of remarkable, if not gifted people, so there is no such thing as a stupid Hungarian who should not post here.

You are anything but stupid, Vincze, and you should keep posting. For occasional posters like me in particular and all the other contributors in general it is good to read from people like you.

However, in the 1950s there was a "theory," so to speak, circulating amongst the non-Hungarian colleagues of some of the people I mentioned above: Hungarians are from Mars. The reasons: 1. They are very smart. 2. The Hungarian language is different from all the other languages in Central Europe (and presumably on Earth.) 3. They are like gypsies (the reason why they came from Mars in the first place.) You can find the whole story in "The curve of Binding Energy", by Roger (or it was Richard?) McPhee. The point is, beyond saying "stupid Hungarian" as a way to express one's inability to grasp the obvious, ther is no such thing.

Please keep posting and disregard the occasional idiot who e-mails you advising otherwise.

My two cents.

Wise people claim there is some relationship between these two languages, and Japanese next. AFAIK Finnish, that must a pretty loose connection. But Vincze knows better for sure.

If you are looking for a *\*very\** special language in Europe, turn to the Basque people living in northern Spain and southwestern France. Their language is supposed to be a remainder of the oldest languages of this continent (for US-American readers: I'm talking about some *\*thousands\** of years :).

I think most ethnic people are like this. One thing about Hungarians, is they really like jokes. They also take very seriously math and science. You may or may not know that we invent BASIC language, the ballpoint pen, atom bomb, and other things. Granted, these were not all invented in Hungary, but by Hungarians.

Also, most Hungarians are very giving. We give you shirt off our back if you need. Sometime people say this our downfall and we get taken advantage because of. With me, I don't see it that way. I rather give, and try and help person. Sure, someone may take

advantage of me sometime, but most time, I helping someone and not take advantage of me.

We also very proud of our food. It very bad manner if you offered food from Hungarian and you not take. Many time it best not to ask what is in food. ;)

**Re: Apology (edited to add missing part)**

*Message #47 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 17 Aug 2007, 6:36 a.m.,  
in response to message #21 by Vincze*

Hi, Vincze;

(additional stuff) the most important words I forgot (writing in a rush has such effect... Sorry!). I would have answered to your posts promptly, as many others did and would have done, if the chance was given, without any additional comments or off-line e-mails. I actually did not read them in time to add something that other contributors had not yet add, so I just read them. Also, I do not own an HP35S (yet, at least), so I would never be sure if my answers were accurate. As others have already mentioned, we love helping people to use their HP calculators, and you are no exception at all. And thanks for your kind words, Hrast... (end of additional stuff)

I am not posting too very often here because of private, personal reasons. I really like this Forum's environment and neighborhood, people are friendly and handy... BUT not all of the ones that actually visit this forum (mostly read, seldom post) follow some simple, common decorum rules.

I wrote about this a few times before: I'm a guest here, both as a foreigner (I'm from Brazil, as I mentioned beside my name) and as a contributor (in fact, Dave Hicks is the only one that can tell 'I'm not a visitor' in this particular way...), so I believe I must behave accordingly. Even if it is only to deserve staying amongst all of these good people, sharing so too many good and important information. (In fact, I cannot think of behaving differently in real life, wherever I am, whoever I'm dealing with)

I'm also a teacher (some guys are also tired of reading about this, too...), and I cannot consider a dumb person the one that tries to learn. In fact, I tell my students: 'There is no such thing as a dumb question; there are, indeed, dumb people that cannot give a question the deserved answer and respectfull attention'. Well, sometimes I shorten this to lesser words, though...

Anyway, as you can see (and read) from the others who followed your post up (some of the current finest representatives of this forum's contributor staff), people here care for each other. Could it be better? I guess not. I myself feel I'm home here, no pun intended at all.

Now it is my time to go ahead and deal with my daily stuff. I just could not leave without posting this time.

Best regards.

Luiz (Brazil)

Message #53 Posted by **Gerson W. Barbosa** on 19 Aug 2007, 8:33 p.m.,  
in response to message #50 by Vincze

Hello Vincze,

From some of your previous post, it's clear that most of your problems stem from the fact that your handbooks are written in English, rather than Hungary. You're right, manuals written in a language not our own sometimes look Greek to us (I wonder how the Greek would say that :-)

I hope the following expresses this feeling correctly :-)

*Once there was a freak  
Who was always up the creek.  
Surely knowledge-hungry  
Was this guy from Hungary.  
But, alas, his books were 'n Greek!*

Don't worry about the word *freak*. Once someone said we're all freaks here. My knowledge of English is not better than yours, but I think this shouldn't be considered offensive, quite the other

way around. I am just a guest here, like everyone else, but I ask you please to stay :-)

Best regards,

Gerson.

*Edited: 19 Aug 2007, 8:35 p.m.*

**Re: Apology (edited to add missing part)**

*Message #54 Posted by **Vincze** on 19 Aug 2007, 9:03 p.m.,  
in response to message #53 by Gerson W. Barbosa*

You know, I remember onetime being with Hungarian friend in America, and I overheard a couple who were Asian, talking their language, and I ask my friend, "I wonder if we sound as goofy to them as they sound to us?" It funny what we think is normal sounding and what not. Yes you are right, reading English is a bit challenging at times. I can talk it well, but writing and reading have always been hard for me. My wife keep asking me why I try and get MBA since I have done well in life, but I want American degree, not just MBA. I'm sure I could get MBA in Hungary very easily, but getting degree in USA very hard sometimes.

Anyhow, thank you for kind words my friend.

**Re: Apology (edited to add missing part)**

*Message #55 Posted by **Giancarlo (Italy)** on 20 Aug 2007, 8:49 a.m.,  
in response to message #54 by Vincze*

Hi Vincze.

Of course I fully agree with what others already said about the importance you ignore the \*real stupid\*

people that sent you that e-mail, AND you go on posting whatever question you may have,

and for a couple of reasons, at least:

1. often, those \*stupid\* questions make somebody else say to himself "that's what I would have liked to ask, but don't know if I ever would have the courage..."

So thanks to that Hungarian guy!"

2. you have not joined the forum since a long time, but did you notice how was lively and bright the debate after your inputs?

Now, Vincze, my friend (I hope you don't bother if I borrow your nice expression :-)) and my neighbour (well, almost...) please keep on contributing with your "thirst for knowledge" ;-)

Warmest regards.

Giancarlo

**Re: Apology (edited to add missing part)**

*Message #56 Posted by **Vincze** on 20 Aug 2007, 8:56 a.m.,  
in response to message #55 by Giancarlo (Italy)*

Giancarlo, my friend. I not mind at all you using my saying. We are all friends here, and I always think it nice to say to people.

I will continue posting. I not notice one thing you said though, that everything lively

after I post. I wonder why that is. I am just a humble man who want to be student of life. I know many things, but many I do not know. I assume when I die, and am blessed to meet my Maker, than maybe I will be gifted by Him, and know everything. Until then though, I am happy with only knowing a little.

Any ever come to midwest?

\_\_\_\_\_

Please check the HHC2007 website at <http://holyjoe.net/hhc2007/> where you will find a list of virtually all previous English-language HP calculator-related conferences. A direct link to this chart is <http://holyjoe.net/hhc2007/conflist.html> if you are interested. You will find that one of the most popular sites to host the conference has been the Chicago-Area CHIP group, which hosted in 1980, 1989, 1990, 2001 and 2005. They also hosted special calc meetings in conjunction with the no-longer-held Summer Consumer Electronics Shows in Chicago nine times between 1986 and 1995. (The CES is now only held in January in Las Vegas.)

Interested in watching video of any of these? All meetings and conferences since 1986 have been videotaped and are available on DVD at <http://www.pahhc.org/video.htm> .

### 48GX VS 50g VECTOR TREATMENT

Message #1 Posted by [Hal Bitton in Boise](#) on 15 Aug 2007, 2:57 a.m.

Hi folks.

I wonder if anyone can wax philisophically for a moment as to why the 50G maintains no (apparrant) distinction between vectors and complex numbers (visually or functionally), whereas the 48gx treats the two like apples and oranges...(putting them in different type brackets, and bestowing limited functionality upon vectors, etc).

I really like being able to use the  $\rightarrow V2$  command in the vector menu (on either machine) to input the real numbers in the bottom two registers directly as polar arguments, but it seems I'm penalized when I do it on the 48GX.

I'd be very interested to hear any thoughts or theories on this.

Best regards, Hal

### Re: 48GX VS 50g VECTOR TREATMENT

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 15 Aug 2007, 6:32 p.m.,  
in response to message #1 by Hal Bitton in Boise

It could be that the 49 series CAS causes some differences in the ways that vectors or complex numbers are treated. Maybe experiment with different CAS modes.

Regarding whether  $\rightarrow V2$  builds a vector or a complex number, that's determined by flag -19; clear for vectors, and set for complex numbers.

For  $\rightarrow V2$  to treat the arguments as polar coordinates, the calculator has to be in a polar mode (either CYLIN or SPHERE), that is, flag -16 must be set.

Regards,  
James

### HHC2007 HP Handhelds Conf News Update - New Video To Be Premiered

Message #1 Posted by [Jake Schwartz](#) on 14 Aug 2007, 8:29 p.m.

Hi,

The HHC2007 HP Handhelds Conference to be held September 29-30 at HP's facility in San Diego is further shaping up to be a blast. We now have commitments of at least four HP presenters from the calculator group and the number of registrants has recently passed the 55 mark. Also, we have just received a commitment from EDN Magazine's Steve Leibson to allow us to premier his new video: "Interview with Dave Cochran: A Keystone for the HP 9100 and HP 35 Calculators" In Steve's own words, "Dave Cochran....developed all of the algorithms for the HP 9100A/B desktop calculators in the late 1960s and was instrumental in developing the HP 35 hardware and software."

Please check out the continuing news updates on the main conference web page at <http://holyjoe.net/hhc2007/> , along with the growing list of "door prizes" which will be distributed at the end of the conference. Also, go to the "HP & HHC News" page and check out two new items: the information on the HP/Saltire "Data Streamer" device shown by Brian Maguire at last year's HHC2006 in San Jose; and the first color scan of the June 1981 article "Calcunuts" from the ill-fated Wall Street Journal Magazine, which featured our buddies Bill Wickes, Henry Horn, Valentin Albillo and numerous others. It's a trip down memory lane worth twice the price of admission :-)

See you there,

Jake Schwartz

Extraordinarily reasonable. I am looking forward to it!

**Re: HHC2007 HP Handhelds Conf News Update - New Video To Be Premiered**

*Message #8 Posted by [Gene Wright](#) on 15 Aug 2007, 7:54 a.m.,  
in response to message #7 by Seth Morabito*

I believe the fee will be between \$35 to \$50 this year.

An announcement should be made shortly. Keep in mind that this cost is truly the smallest component of the conference anyway...and that in most years, there is a small deficit.

The conference committee has a couple of surprises up our sleeves. Gene

### ATAN2 on 35S

Message #1 Posted by [Vincze](#) on 14 Aug 2007, 4:07 p.m.

Can the 35s perform the ATAN2 function as a built in function? I have not found it and I am in need of it.

### Re: ATAN2 on 35S

Message #2 Posted by [Gene Wright](#) on 14 Aug 2007, 4:09 p.m.,  
in response to message #1 by Vincze

Not as a built-in function.

You'll have to use several lines of code.

Edited: 14 Aug 2007, 4:35 p.m.

### Re: ATAN2 on 35S

Message #3 Posted by [Thomas Radtke](#) on 14 Aug 2007, 4:12 p.m.,  
in response to message #1 by Vincze

You could construct a komplex number  $x+iy$  and apply ARG. This is what I do in my R > P implementation.

### Re: ATAN2 on 35S

Message #4 Posted by [Vincze](#) on 14 Aug 2007, 4:22 p.m.,  
in response to message #3 by Thomas Radtke

I don't think I follow you. For example, if  $X = 10$  and  $Y = 15$ , ATAN2 of those should be 0.982794.

So you say to do following in RPN:

```
i15 - ENTER -
10
ARG
```

When I do that, it yield 56.309932. Am I not understanding something?

### Re: ATAN2 on 35S

Message #5 Posted by [Thomas Radtke](#) on 14 Aug 2007, 4:28 p.m.,  
in response to message #4 by Vincze

Your calc is in DEG mode while you brain works in RAD ;-). Just do a ->RAD conversion.

### Re: ATAN2 on 35S

Message #6 Posted by [Vincze](#) on 14 Aug 2007, 4:33 p.m.,  
in response to message #5 by Thomas Radtke

okay... that make sense.

**MOD on 35S**

*Message #7 Posted by Vincze on 14 Aug 2007, 4:47 p.m.,  
in response to message #6 by Vincze*

Sorry, but I have one more question. Can 35s do MOD (Modular arithmetic)? Such as a float be x and I solve for MOD(x,2\*PI).

**Re: MOD on 35S**

*Message #8 Posted by Thomas Radtke on 14 Aug 2007, 5:27 p.m.,  
in response to message #7 by Vincze*

I suppose you have the remainder in mind. Have a look at Chapter 4-2.

(INT menu, 3Rmdr)

**Re: MOD on 35S**

*Message #9 Posted by Vincze on 14 Aug 2007, 5:33 p.m.,  
in response to message #8 by Thomas Radtke*

No, more like lets use simple clock example.

Let say start time is 20:00 on 24 hour clock, and you need to add 5 hours to that, but you wish to have wrap around math, so with normal math you state  $20:00 + 5:00 = 25:00$ , but that does not make sense on clock. With modular math, you would say  $20:00 + 5:00 \text{ mod } 24 = 1:00$ , meaning if you start at 8pm, and you need to add 5 hours to it, you would finish at 1am. In Excel the formula would be =mod(Start + End, 24).

This used in aviation to work out degrees and the like.

I will look at chapter you state and see if that give me a clue

*Edited: 14 Aug 2007, 5:35 p.m.*

**Re: MOD on 35S**

*Message #10 Posted by Thomas Radtke on 14 Aug 2007, 5:43 p.m.,  
in response to message #9 by Vincze*

That's just the usual modulo, same menu, 2INT/

**Re: MOD on 35S**

*Message #11 Posted by Vincze on 14 Aug 2007, 7:21 p.m.,  
in response to message #10 by Thomas Radtke*

That does not work. See for example.  $20:00 + 12:00 \text{ mod } 24 = 08:00$

If I enter the following on calculator:

20  
ENTER

```
12
+
24
INTG 2
```

answer is 1 which is not correct.

Time is easy to deal with, but when you dealing numbers that wrap around when reaching the modulus of  $2 * \text{PI}$ , it a little harder to deal with. For calculation that I am doing, I need to simulate the  $\text{Mod}(x,y)$  function.

*Edited: 14 Aug 2007, 7:48 p.m.*

**Re: MOD on 35S**

*Message #12 Posted by [Don Shepherd](#) on 14 Aug 2007, 8:11 p.m., in response to message #11 by Vincze*

It's INTG 3 (remainder)

**Re: MOD on 35S**

*Message #13 Posted by [Vincze](#) on 14 Aug 2007, 8:13 p.m., in response to message #11 by Vincze*

I think I figure out, at least with clock.

Here is what I do. Let say we have  $21:00 + 10:00 \text{ mod } 24 = 07:00$

35S work this way...

```
21
ENTER
10
+
24
/
INTG 5
24
*
```

which yield 7.

I have to now try this on other calculation that use strange mod and see if this will be correct. I guess I could make short program that could do this.

*Edited: 14 Aug 2007, 8:17 p.m.*

**Re: MOD on 35S**

*Message #14 Posted by [Karl Schneider](#) on 15 Aug 2007, 2:31 a.m., in response to message #13 by Vincze*

Quote:

Let say we have  $21:00 + 10:00 \text{ mod } 24 = 07:00$

The 35S works this way...

```
21
ENTER
```

```
10
+
24
INTG 3 (Rmdr)
```

which yields 7.

-- KS

**Re: MOD on 35S**

### more iMac rambling, this time a little more OT

Message #1 Posted by [Les Wright](#) on 14 Aug 2007, 12:12 p.m.

Fusion has allowed me to install a Linux virtual machine as well, and I have discovered Ubuntu. I find that Thomas Okken's Free42 precompiled Linux binaries run beautifully--both Motif and GTK versions. Alas, I haven't been able to compile his source code myself in that OS--I am assuming I am missing in Ubuntu some key packages and libraries. I know there is nothing wrong with the source code files--I happen to have an overly complete implementation of Cygwin (i.e., more packages than I will ever use) in my XP virtual machine and Thomas's code compiles beautifully there by simply typing `make` or `make -e BCD_MATH=1` in both `gtk` and `motif` subdirs. If anyone has any advice about compiling Thomas' source code in Ubuntu Linux 32-bit I would be grateful. Keep in mind I am a real Linux virgin, but still I would like to learn more. I have been able to compile the Free42 code in VC++ too, and it is indeed fun to tinker with some of the math algorithms. I am really liking this Ubuntu too--pretty spiffy for a free OS!

I have learned that my new iMac has an empty memory slot--the 1GB in situ. My Apple retailer has extra 1GB RAM in stock, and it is pretty cheap too! I am finding that 1GB is still a bit sluggish if I want to get good performance out of my XP virtual machine. It would be nice to have more RAM available to dedicate to the virtual machine. Unfortunately the 2GB sticks are still pretty expensive, so it will be a while before I upgrade to 3GB or 4GB.

The Free42 Mac widget is not bad, but I must say I prefer the appearance of the Windows and Linux versions.

With this new computer, I have been neglecting my new 35s!

Les

### Re: more iMac rambling, this time a little more OT

Message #2 Posted by [Thomas Okken](#) on 14 Aug 2007, 12:42 p.m.,

in response to message #1 by [Les Wright](#)

I'm not familiar with Ubuntu -- I use Fedora myself and I'm too stubborn to change, the hype be damned. ;-) However, if you send me the output from **make** I might still be able to figure out which packages are missing, though I wouldn't be able to tell you their exact names. The smart money is on missing development libraries and headers, though (in Fedora, those are typically recognizable by package names including the word **devel**) - - from what I recall of the few occasions I played with Ubuntu's Live CDs, development stuff is not part of the basic Ubuntu install.

The Free42 MacOS widget is missing some event handling code, which causes running programs on it to fail. Unfortunately, Jeff Dionne hasn't gotten around to fixing this yet, and I don't have a Mac so I can't do it either. Just so you know -- if you plan on running programs in Free42 on the Mac, I'd recommend compiling the Unix version for MacOS; it will run as an X client on the Mac desktop. If I remember correctly, it takes a little configuration twiddling to get the X server going (I don't think it is run by default), and to run the build, you'll need the Mac versions of gcc etc., available for free at [developer.apple.com](http://developer.apple.com); you may want to read [this document about porting Unix applications to MacOS](#) to get the big picture before you dive in.

- Thomas

## Re: more iMac rambling, this time a little more OT

Message #3 Posted by [Les Wright](#) on 14 Aug 2007, 2:34 p.m.,  
in response to message #2 by Thomas Okken

Thomas, I do have gcc in Ubuntu (needed it to configure VMware Tools), and it effectively compiles simple text based C programs, but when I get into anything graphical the compiler error output is inscrutable to me.

I know that Cygwin is not a real Linux, and that programs compiled there won't run on true Linuxes, but I have liked it since the distribution includes an absurd number of packages, so I just decided to install them all to be sure I have what I need. Maybe one day I will just spend the money for Red Hat, which seems expensive. I am having a heck of a time wrapping my brain around this--I thought many good Linuxes were free, but save Ubuntu and a basic version of Mandriva I am not having much luck here!

many thanks,

Les iMac 2.4GHz Intel w/1GB RAM

## Re: more iMac rambling, this time a little more OT

Message #4 Posted by [Kevin Kitts](#) on 14 Aug 2007, 2:58 p.m.,  
in response to message #3 by Les Wright

I've used both SUSE and RedHat in the past - but I think that their support for the free versions of Linux they provide has waned somewhat from the early years. They are putting more effort and resources into the versions that they sell to corporations - their "enterprise" versions. Who can blame them, I guess...

Ubuntu was founded by an "internet millionaire" - who, I think, has already made his fortune and, it seems, is starting to capture a little more of the spirit that linux started with. I've just gotten the latest Ubuntu CD but have not installed it yet. I couldn't believe that they don't even charge for shipping! That's not right - you know that they have mailing costs...

BTW, I have bootcamp on a Mac Pro laptop (you boot either windows XP or Mac - but not both at the same time). It is free from Apple and works great - very impressive piece of software.

## Re: more iMac rambling, this time a little more OT

Message #5 Posted by [Thomas Okken](#) on 14 Aug 2007, 3:08 p.m.,  
in response to message #3 by Les Wright

Hi Les,

Quote:

Thomas, I do have gcc in Ubuntu (needed it to configure VMware Tools), and it effectively compiles simple text based C programs, but when I get into anything graphical the compiler error output is inscrutable to me.

...but maybe not to me. Hey, I'm a pro. ;-) Feel free to capture the output in a text file and email it to me. Be sure to do it like this:

```
make -e BCD_MATH=1 2>&1 | tee logfile.txt
```

so you really will capture everything (standard output and standard error). The important bit is the **2>&1**, which merges the standard error stream (file descriptor 2) into the standard output stream (file descriptor 1). Welcome to the Unix command line! :-)

Re: Favorite Linux flavor: I use Fedora, which is Red Hat's free offering, and I believe they also use it as a test bed for their commercial distro, which means it tends to be bleeding-edge. I find it very developer-friendly. Newbies may find it less appealing, though. Anyway, like I said it is free; I just [download](#) the ISOs from one of the many mirrors every blue moon and burn my own CDs.

- Thomas

### **Re: more iMac rambling, this time a little more OT**

*Message #6 Posted by [Kelly Huckman](#) on 14 Aug 2007, 3:28 p.m.,  
in response to message #1 by Les Wright*

You'll need GTK+, possibly Motif/Lesstif to compile Free42.

Navigate to System > Administration > Synaptic Package Manager. Look for GTK+ and install it, then try to build.

### **Re: more iMac rambling, this time a little more OT**

*Message #7 Posted by [Les Wright](#) on 14 Aug 2007, 3:58 p.m.,  
in response to message #6 by Kelly Huckman*

In cygwin I find I like the GTK version better over the Motif, so I will look for that package tonight.

I decided to remove the Ubuntu virtual machine (for an unrelated reason) so I will need to reinstall it. I have both the 32-bit and 64-bit ISOs. Fusion will let me install both. I assume Free42 needs the 32-bit.

FWIW, the thing I like about Ubuntu is that the VMware tools permit seamless movement between it and the Mac OS. However, installing VMware tools in Ubuntu is a chore, though I did find one link that was spot on.

Kelly, if you have any luck compiling Free42 in your implementation of Ubuntu I would be glad to know it can be done.

Les

*Message #8 Posted by [Thomas Okken](#) on 14 Aug 2007, 4:15 p.m.,  
in response to message #7 by Les Wright*

Quote:

\_\_\_\_\_

I assume Free42 needs the 32-bit.

\_\_\_\_\_

I have compiled it successfully on an AMD x86-64 machine running Fedora 6, so I guess in principle you should be able to get it to work under 64-bit Ubuntu as well. If it doesn't work, you can always tell the compiler to generate 32-bit code; that code will also execute on a 64-bit machine. I'd say don't bother with the 32-bit OS unless you specifically need it for something.

- Thomas

**Re: more iMac rambling, this time a little more OT**

*Message #9 Posted by [Les Wright](#) on 14 Aug 2007, 4:28 p.m.,  
in response to message #8 by Thomas Okken*

Thanks Thomas!

I will do that, then.

When I get home tonight I will install the 64 bit version, try to add those packages like Kelly suggested, and see if I have any luck

The good thing about setting up a virtual machine in Fusion is that if I muck it up one just goes into the virtual machine folder on the Mac and delete the package in question. This is one thing I am liking about the Mac--it doesn't seem to splash system files all over the place in mysterious ways and things are easy to find to take off. Not so in windows--you often can't tell from file names what a DLL or EXE is for!

I have found that your precompiled Free42 Linux binaries run beautifully in Ubuntu, so I don't want to get fancy yet trying to do a Unix build for Mac OS. Maybe some day.

Fedora core is a huge download, BTW!

Les

**Re: more iMac rambling, this time a little more OT**

*Message #10 Posted by [Thomas Okken](#) on 14 Aug 2007, 4:51 p.m.,  
in response to message #9 by Les Wright*

Kelly's probably right; Free42 doesn't have any external dependencies other than GTK and Motif/Lesstif, so as long as the development packages for those toolkits are installed, you should be OK. Building the Motif version can require some Makefile twiddling because the exact set of libraries to be linked differs between the many Unix and X11 versions, but building the GTK version should cause no such problems.

Quote:

\_\_\_\_\_

Fedora core is a huge download, BTW!

\_\_\_\_\_

Yes, unless you have a decent broadband connection, you're probably better off buying their CDs -- the download page for which I gave you the link earlier also has links to companies that sell Fedora CDs at a reasonable price. If you *\*do\** have a good DSL or cable connection, you can grab the ISOs and install from them into a VM without even burning any CDs.

True; the Macintosh Way has been, right from the first, that applications (and all their baggage) get installed in their own directories, while the System Folder was basically off-limits to anyone except Apple.

Even though I have had a major soft spot for Apple for a long time (i.e., since I bought my first Macintosh back in 1984), I'm not going to give Apple too much credit for this MacOS "tidiness" aspect, though. One of the main things that tends to make Windows (and to a lesser extent, also Unix) such a mess, is how applications are built using libraries, which in turn are potentially shared between several apps. MacOS is a latecomer to the whole notion of shared libraries... Once you start thinking about how to manage software installs/upgrades/uninstalls in a shared-library environment, you'll realize how very hard it is to get that right. Longtime Linux users can sing you sad, sad songs about failed attempts to upgrade their systems because of inter-package dependencies... Bottom line: Linux tries to cope but doesn't do so very well; Windows leaves the coping to third-party installers so Microsoft can always deflect the blame when things get messed up; and MacOS simply doesn't deal with the issue at all. Now that personal computers all have hundreds of megabytes of RAM, and many gigabytes of disk storage, and ridiculously fast CPUs, the whole notion of shared libraries actually starts to feel like a bit of an anachronism -- it solves a problem that isn't really a problem any more, and it introduces problems that no one has yet figured out how to solve.

My apologies to everybody for this 100% off-topic post. I will cease and desist on this thread, unless someone re-introduces the HP Calculator topic somehow. :-)

- Thomas

### **Re: more iMac rambling, this time a little more OT**

*Message #13 Posted by [gteague](#) on 14 Aug 2007, 5:34 p.m.,  
in response to message #12 by Kelly Huckman*

i downloaded the 64-bit ubuntu version 7.04 (feisty fawn--what a name!) from their website last night and created an os image using vmware fusion. i had quite the time getting the vmtools to install and i got a couple of error messages along the way, but i think perhaps the vmtools don't completely support 64-bit. i'm just happy the tools worked at all--vmware is the first emulator that i've run that has supported such niceties for any non-windows os.

i used to run a redhat server 24/7 and hosted my website on it until mac os x with its unix underpinnings arrived, so i no longer have to depend so much on a separate linux distro.

in any case, ubuntu runs great under vmware. i also have parallels and both virtualization products have their pros and cons, which is why i run both.

i have a 64-bit version of win xp coming from newegg (hopefully) this afternoon and i'm going to use it as my bootcamp os. i understand some 64-bit drivers are missing, but from the research i've done so far they are mostly minor--for laptop support and things like the brightness keys on the keyboard.

/guy

### **Re: more iMac rambling, this time a little more OT**

*Message #14 Posted by [Kevin Kitts](#) on 14 Aug 2007, 6:09 p.m.,  
in response to message #13 by [gteague](#)*

I've run the 64 bit version of SUSE Linux and found that it was really more trouble than it was worth. I didn't really see any performance improvement and while 99% of 32 bit software works just fine with the 64 bit linux there were just a very few compatibility issues that I ran into that made life difficult. I eventually went back to 32 bit linux.

I've heard of a lot of 64 bit driver issues with windows... you might consider 32 bit...

but if you do 64 bit linux and windows... let us know how it goes. Good Luck... ;-)

### **Re: more iMac rambling, this time a little more OT**

*Message #15 Posted by [gteague](#) on 15 Aug 2007, 7:27 p.m.,  
in response to message #14 by [Kevin Kitts](#)*

kevin: i could have just used your conclusion and saved myself about 14 hours of pain and frustration!

my bootcamp install of 64-bit xp pro was a very mixed bag indeed. i used the bootcamp assistant to burn a driver cd and partition off 20gb of my startup drive for windows. i then inserted my xp pro cd and told the assistant to install.

it booted into windows and started the setup process which took maybe 45 minutes. but once a last restart brought up the familiar windows desktop the problems started.

first problem was noticed when i inserted the windows drivers from apple on the cd the assistant had helped me burn. it said that it would only work on xp or vista 32-bit with sp2. i checked my system panel and, sure enough, my xp pro install was only showing as having sp1 installed in spite of the fact that newegg sold this as an sp2 version. i just got off the phone with them and they are allowing me to exchange my disk for one with sp2.

silly me, i thought it would be as easy as just downloading and installing the sp2 upgrade after tracking the 64-bit version down on the labyrith microsoft site, but no, even after that was accomplished, i was still unable to install the apple drivers.

well, most of you know the drill i went through then. took nearly 6 hours because i had no network on the windows install so i had to boot back and forth from mac to pc in order to make a slipstream cd. and roxio toast on the mac would not create a bootable cd, so i had to

get a free windows utility to finalize the cd as bootable. luckily i had a parallels vm image of xp so i was able to do most of the slipstream work on it or i would have had to boot back and forth quite a few times. also very helpful was that i had formatted the windows partition as fat32 so my mac could see the files.

but even after i did all that the drivers would not install automatically or manually. without networking it's not a fun experience hunting down drivers. back on my mac i searched forums for solutions but not a single driver i downloaded from intel and other places would work.

bottom line is that the 64-bit xp pro installs, boots and runs fine. but the 64-bit drivers needed are not to be found on a semi-casual search and without network and graphics drivers you might as well not bother.

so i'm going to put my tail between my legs and install a 32-bit version of windows and save the 64-bit for when vista forces more 64-bit driver development.

/guy

wow, great link wes! i sure wish i had that before i installed.

yeah, it took me awhile to realize that i would have to manually ungzip and compile/make on the vmtools, so i fumbled around there until i hit on the formula.

anyone wanting to install 64-bit ubuntu needs to print off the instructions at that link.

thanks,

/guy

### **Re: more iMac rambling, this time a little more OT**

*Message #18 Posted by [Les Wright](#) on 15 Aug 2007, 2:37 a.m.,  
in response to message #12 by Kelly Huckman*

Thanks Kelly.

I got the libgtk2.0-dev package + dependencies, installed (actually, the synaptic package manager did it for me), and Thomas' gtk version compiles beautifully, both binary and BCD versions.

Not so lucky with the Motif version. I got libmotif-dev and its dependencies, but still wild errors on attempted compilation. No luck when I try lessstif as well.

I do indeed like the gtk version better, but it is the principle of the thing. If Ubuntu is a reasonably functioning Linux, albeit free, it should be no hardship to find and install the right packages to compile the Motif version too.

If you have any luck let me know!

Les

p.s. I opted for the 64 bit version of Ubuntu. Could that explain it?

Thomas, I am suspecting that the compiler is not finding the desired X11 headers where it wants them. My Ubuntu Linux is missing some key ingredient here?

Les

### **Re: more iMac rambling, this time a little more OT**

*Message #20 Posted by [Les Bell](#) on 15 Aug 2007, 7:08 a.m.,  
in response to message #19 by Les Wright*

Les, I run Centos 5, rather than Ubuntu or Fedora, for reasons that aren't important here. The two missing header files your compiler is complaining about are installed from libXmu-devel-1.0.2-5 and libXpm-devel-3.5.5-3 (on RH/Fedora/Centos-style distributions, the -devel RPM packages contain the header files and libraries necessary to compile applications that use that subsystem).

You should look for similarly-named packages on Ubuntu and use Synaptic or apt-get to install them, and then you should be able to build Free42 successfully.

Best,

--- Les

[<http://www.lesbell.com.au>]

[Lots of Linux articles on my site, btw]

*Message #21 Posted by [Les Wright](#) on 15 Aug 2007, 8:34 a.m.,  
in response to message #20 by Les Bell*

I have alas installed all these by now and even though the header files are found the errors regarding the loss of precision typecasting error persist and the build still stops early.

weird.

Les

### **Re: more iMac rambling, this time a little more OT**

*Message #22 Posted by **Thomas Okken** on 15 Aug 2007, 11:48 a.m.,  
in response to message #21 by Les Wright*

Quote:

the errors regarding the loss of precision typecasting error persist and the build still stops early

Oops, I forgot to discuss those in my previous reply.

Those errors require changing **int** to **long** in shell\_main.cc, lines 1851 and 2272 -- 4 changes in total. The reason: in the 64-bit world, pointers are 8 bytes, but int apparently is still 4 bytes, so casting a pointer to an int causes 4 bytes to be chopped off. On 32-bit systems, the size of an int is usually the same as the size of a pointer, which is why I have been getting away with those casts until now.

I'm a bit surprised that gcc considers this loss of precision an error and not a warning (and, for what it's worth, this particular code would still work, despite the loss of precision, because those pointers I'm casting to ints actually happen to contain ints (see shell\_main.cc, lines 1568, 1579, 2143, 2201, 2254, and 2265)).

Anyway, try making those changes in lines 1851 and 2272 and let me know how it goes; if it works, then I'll change the code so it automatically uses long instead of int on 64-bit systems.

### **Re: more iMac rambling, this time a little more OT**

*Message #23 Posted by **Les Wright** on 15 Aug 2007, 12:13 p.m.,  
in response to message #22 by Thomas Okken*

Thomas,

I won't get to test this until I get home tonight, but I will try the fix and get back to you.

Alternately, I will also set up 32-bit Ubuntu as a virtual machine to see if the errors turn up there.

As I mentioned before, in finding and installing the recommended packages the failure to find those headers has resolved.

Could it be that if I "fix" this code for 64-bit and shell\_main.cc compiles similar stoppages would occur when the compiler moves on to other source files? If I lot

of this happens it may be wise for me just to make 32-bit Ubuntu my choice.

I spent a few hours funding downloading and installing the various packages in 64-bit. Knowing where to look will save me time in 32-bit.

Les

P.S. As far as a free OS and programming environment go, I really like Ubuntu so far. I liked Cygwin too when I have played with it, but now being able to compile "real" Linux programs makes me feel like a slightly more accomplished amateur.

P.P.S Did I mention recently how much I love this computer? :)

Thomas, is there perhaps a compiler directive or instruction or option that will generate only a warning here rather than an error? That would save you having to fix code that really isn't broken. Only the makefile would need to be a little different.

Les

### **Re: more iMac rambling, this time a little more OT**

*Message #25 Posted by [Thomas Okken](#) on 15 Aug 2007, 1:13 p.m.,  
in response to message #24 by Les Wright*

I'm not aware of any gcc option that turns the "loss of precision" error into a warning. It is possible that there may be more of those errors lurking in files other than motif/shell\_main.cc, but since you mentioned being able to build the GTK version, any problems would be limited to the source files in the motif subdirectory. I can't think of any reason why I would have used pointer/int casting anywhere in the Motif shell apart from the two places you stumbled into (I just took a quick look at the code and I couldn't find any); the only other place that springs to mind where I do tricky stuff with pointers is in the code that reads and writes the state file -- so if your GTK build starts and exits without crashing, and remembers programs and all variable types correctly, everything should be fine.

Generally speaking, you shouldn't have any need to keep a 32-bit image around if the 64-bit OS is working fine for you; even if you try to compile a program that has tons of 64-bit incompatibilities, you can always tell gcc to generate 32-bit code (using the **-m32** switch). That should work for Free42, too, if all else fails.

Just out of curiosity, I tried compiling on one of the 64-bit machines at work (Intel Xeon), and interestingly enough, the compiler only issued \*warnings\* for those two pointer-to-int casts (and only those two; there were no other warnings, although the link failed due to Motif/Lesstif not being present).

This machine runs CentOS 4.5; obviously gcc is configured a bit differently under Ubuntu. For what it's worth, `g++ --version` returns "g++ (GCC) 3.4.6 20060404 (Red Hat 3.4.6-8)".

That could be worth trying too!

I suppose that one would simply adjust the Makefile so that calls to gcc or g++ include the `-m32` switch?

---

Yes, just add it to CXXFLAGS.

I'm curious how much of a speed difference there would be between the 32-bit and 64-bit versions. Free42 only uses 8-byte integers in a small number of places (mainly for binary functions, i.e. the BASE menu), but if the compiler is smart enough to use the wider data path to speed up struct and array copy operations, there could be some benefit. And of course I know you're just chomping at the bit to write your first 2,147,483,648-byte program. ;-)

## Re: more iMac rambling, this time a little more OT

Message #28 Posted by [Les Wright](#) on 15 Aug 2007, 6:47 p.m.,  
in response to message #27 by Thomas Okken

It gets weirder!

I added the -m32 switch. The good news is that \*.o compilation is successful.

When the linker is invoked, there are a bunch of warnings from /user/bin/ld advising that the " i386 architecture of input file `shell\_main.o' is incompatible with i386:x86-64 output". I think this is okay--the compiler tells us we are making a 32-bit program in a 64-bit environment, right?

But this is where we hit errors:

```
core_commands2.o: In function `generic_loop_helper':
/home/shrinkiel964/free42/motif/core_commands2.cc:543:
undefined reference to `__divdi3'
core_commands5.o: In function
`docmd_basediv(arg_struct*)':
/home/shrinkiel964/free42/motif/core_commands5.cc:203:
undefined reference to `__divdi3'
bcdfloat.o: In function `BCDFloat':
/home/shrinkiel964/free42/motif/bcdfloat.cc:245:
undefined reference to `__moddi3'
/home/shrinkiel964/free42/motif/bcdfloat.cc:247:
undefined reference to `__divdi3'
/home/shrinkiel964/free42/motif/bcdfloat.cc:245:
undefined reference to `__moddi3'
/home/shrinkiel964/free42/motif/bcdfloat.cc:247:
undefined reference to `__divdi3'
collect2: ld returned 1 exit status
make: *** [free42dec] Error 1
```

Now this tells my tiny mind that there is some library dealing with modular arithmetic and integer division that it just can't find!

Funnily enough, when I add the -m32 directive to the gtk makefile, I get similiar undefined reference errors, only a lot more of them.

My next step is to change the Makefiles back and and try your original advice of changing those int declarations to long. I will report back!

Les

---

Actually the difference is between the binary and decimal builds, not gtk and motif this time. The binary builds generate a boatload of undefined reference errors to `_divdi3` and `moddi3`, BCD build only a handful.

The diagnostics is interesting, eh?

Les

### **Re: more iMac rambling, this time a little more OT**

*Message #30 Posted by [Les Wright](#) on 15 Aug 2007, 7:08 p.m.,  
in response to message #29 by Les Wright*

Thomas, I went with your original fix.

Those four "int"s are changed to "long"s, and both binary and decimal motif versions compile beautifully.

I still like the gtk interface better, but I am grateful this could even be done!

Les

*Message #31 Posted by [Thomas Okken](#) on 15 Aug 2007, 7:52 p.m.,  
in response to message #28 by Les Wright*

It sounds like it's trying to link your 32-bit \*.o files to 64-bit libraries. The `_divdi3` and `_moddi3` are extended-precision integer functions, I'm guessing to do division and remainder on 64-bit integers -- operations that the 64-bit C library won't have since 64-bit CPUs have built-in functions for those.

I'm at home right now, meaning firmly in the 32-bit world :-D so I can only give generic (read: vague) advice on what needs to be done next. First, make sure you have 32-bit versions of all required libraries (I don't know about Ubuntu's filesystem layout, but IIRC, in Fedora the 64-bit libs are under `/usr/lib64` and the 32-bit libs are under `/usr/lib`. Also, you may have to tell the linker to *\*use\** those libraries in preference to the 64-bit ones; whether there is a switch for that (I don't think `ld` recognizes `-m32`, but maybe there's something else) or you need to use a `-L` switch to force it to look in `/usr/lib`, I don't know.

Good thing this is academic, I guess. I'll change shell\_main.cc so those two troublesome lines automatically use long instead of int when sizeof(int) < sizeof(void\*). I'll update the source package on my web page shortly.

UPDATE: It's done; the revised code now casts to a long, \*then\* casts to an int. The loss of precision is not a problem as long as it happens while casting between integer types. I updated the Free42 source package and the project history; I didn't release any new binary packages since this code change doesn't affect any of the existing release builds.

## Re: more iMac rambling, this time a little more OT

Message #32 Posted by **Thomas Okken** on 15 Aug 2007, 7:16 a.m.,  
in response to message #19 by Les Wright

Quote:

---

Thomas, I am suspecting that the compiler is not finding the desired X11 headers where it wants them. My Ubuntu Linux is missing some key ingredient here?

---

Yes, that's what it looks like. The warning about XK\_MISCELLANY being redefined is interesting but probably harmless; what's also noteworthy is that it indicates that at least \*some\* of the headers \*are\* found, but in a different location than specified by the -I directive; in the Makefile, CXXFLAGS has -I/usr/X11R6/include, but the compiler indicates that it has found X11/Xutil.h, X11/Intrinsic.h, Xm/Xm.h, and X11/keysym.h under /usr/include.

It looks like, the X headers no longer live under /usr/X11R6/include, and that some of them have been moved to /usr/include (which is automatically searched by the compiler and does not need to be explicitly specified using a -I option)... But not everything was moved there; the compiler is issuing a warning that it can't find X11/Xmu/Editres.h, which causes the error message about \_XEditResCheckMessages later on; also, it is issuing a warning that it can't find X11/xpm.h, which causes the error message about XpmCreatePixmapFromData.

You could try searching for Editres.h and xpm.h:

```
find / -name Editres.h -o -name xpm.h -print 2> /dev/null
```

...it will take a while, but if they exist, this will find them. The **2> /dev/null** bit suppresses the zillions of error messages that **find** will print whenever it tries to recurse into directories for which you do not have read permissions.

If Editres.h and xpm.h are found, you should change the -I option in the makefile to point to the directory they're in, or, to be precise, to the directory that contains X11/Xmu/Editres.h and X11/xpm.h. Note that you can use multiple -I options, if necessary.

If Editres.h and/or xpm.h are not found, you're missing some X11 development packages; I don't know how Ubuntu's X11 packages are structured, but you're probably looking for

something called "Miscellaneous Utilities" (containing Editres.h and the libXmu library) and "XPM" (containing xpm.h and the libXpm library). If in doubt, just install everything with X11 or XFree86 or Xorg in its name, and if that still doesn't work, Kelly or some Ubuntu expert should be able to answer these questions easily (Usenet Is Your Friend). :-)

UPDATE: Looks like the packages you need are **libxmu-dev** and **libxpm-dev** -- Google "Ubuntu libXmu" and "Ubuntu libXpm" and the first hit in each case is the relevant page at [packages.ubuntu.com](http://packages.ubuntu.com).

Hope this helps!

- Thomas

### 9825 assembler/ROM programming

Message #1 Posted by [Bohemia House](#) on 14 Aug 2007, 12:03 p.m.

Does somebody know how to program, to develop a new ROM for HP 9825 ???

### Re: 9825 assembler/ROM programming

Message #2 Posted by [Eric Smith](#) on 14 Aug 2007, 1:19 p.m.,  
in response to message #1 by [Bohemia House](#)

I don't recall there being an supported assembly development system for the 9825. It uses the same processor as the 9835 and 9845, so you could use the assembler ROM for those. However, the language interpreter on the 9825 is much different, so you'd have to figure out how to interact with it. US patents 4,075,679 and 4,437,156 might be helpful.

### Re: 9825 assembler/ROM programming

Message #3 Posted by [Klaus](#) on 15 Aug 2007, 2:23 a.m.,  
in response to message #2 by [Eric Smith](#)

The relative addressing of the 9825 is different from the 9835/45. You will find in the patent of the 9825 two modes of relative addressing selected by the CPU pin RELA. To quote one of the developers of the 9825:

Quote:

to answer your first question regarding the function of RELA, it's a hardware selection used to determine Absolute vs Relative addressing mode calculation, tied low in the hp9825 to accomodate code destined for rom's (allows access to any word within a page), the pin is tied high in hp9835/45 to accomodate relocatable code segments.

And to be quoted further:

Quote:

there is a binary that i wrote for the 9825 that implements a bpc assembler and reverse assembler that proved to be very useful at the time, also, after meeting up with steve i put some work into creating a macro package for TeX that aims to implement a modern assembler for the bpc source so that the listing files (that i have in paper form) can be reproduced

After a discussion about the 9825 on this forum, this developer contacted me and answered many of my questions. I think these details will eventually show up on hp9825.com. There is a useful simulator of the 9825 available from one of our forum members.

### Re: 9825 assembler/ROM programming

*Message #4 Posted by **Eric Smith** on 16 Aug 2007, 1:03 a.m.,  
in response to message #3 by Klaus*

Quote:

---

The relative addressing of the 9825 is different from the 9835/45.

---

IIRC, the 9825 does not have relative addressing, but rather uses the BPC in page addressing mode similar to the 21xx and 98x0.

Quote:

---

There is a useful simulator of the 9825 available from one of our forum members.

---

I must have missed the announcement? I've only seen Achim's hp9800e, which (AFAIK) doesn't simulate the 9825.

### **Re: 9825 assembler/ROM programming**

*Message #5 Posted by **Klaus** on 16 Aug 2007, 2:33 a.m.,  
in response to message #4 by Eric Smith*

Quote:

---

IIRC, the 9825 does not have relative addressing, but rather uses the BPC in page addressing mode similar to the 21xx and 98x0.

---

I think the patent mentions 2 modes of "relative" addressing (depending on the RELA-Signal), so I count that as "relative" addressing. Anyway, the addressing mode of the 9825 differs from the 9835/45, so I don't think you can use the Assembler ROM of the 9835 to create new commands.

And yes, I meant Achim's hp9800e, as far as I know, simulating the 9825 is on the TODO-list.

Impressive, indeed. I was tempted at one point to give the HP-42S manual the same treatment, but as long as HP don't release those manuals into the public domain, there's the risk that such a project would never reach its intended audience. I notice that the word "permission" is conspicuously absent from Mr. Groenendijk's site.

### Base of Natural Logarithms

Message #1 Posted by [Vincze](#) on 13 Aug 2007, 7:35 p.m.

Is there programmatic way to calculate the base of natural logarithms (or Euler Number) if the function of "e" were not available. I know what the formula is for "e", but how would one pro grammatically find this on say a 35s, or other similar calculator?

*Edited: 13 Aug 2007, 7:37 p.m.*

### Re: Base of Natural Logarithms

Message #2 Posted by [Brad Davis](#) on 13 Aug 2007, 8:10 p.m.,  
in response to message #1 by Vincze

Does the 35s not have  $e^x$ ?

You could use a series expansion.

### Re: Base of Natural Logarithms

Message #3 Posted by [Chuck](#) on 13 Aug 2007, 8:34 p.m.,  
in response to message #1 by Vincze

Do you want to have unlimited accuracy? or is this close enough?

$$\frac{848456353}{312129649} = 2.71828182845904523(4757)$$

That's close enough for most calculations.

Or use a simple loop to find the sum of  $1/n!$  as n goes from 0, 20. This gives 2.7182818284590452353(39784).

*Edited: 13 Aug 2007, 8:41 p.m.*

### Re: Base of Natural Logarithms

Message #4 Posted by [Lyuka](#) on 14 Aug 2007, 2:02 p.m.,  
in response to message #3 by Chuck

9242691/3400196 (within 7 digits, error <  $9.4e-14$ ) this is also enough for 35s.

49171/18089 (within 16 bit, error <  $1.02e-10$ ) may be used in a micro controller.

### Re: Base of Natural Logarithms

Message #5 Posted by [Katie Wasserman](#) on 13 Aug 2007, 8:39 p.m.,  
in response to message #1 by Vincze

This is a pretty simple program to write, just a few lines. You can also compute it in the equation solver in several different ways. But it doesn't need to be computed at all on this machine, it's now in the constants menu.

### Re: Base of Natural Logarithms (OT)

Message #6 Posted by [Chuck](#) on 13 Aug 2007, 8:58 p.m.,  
in response to message #5 by Katie Wasserman

Here's the problem I have with the programming required of some calculators. To do a loop from 1 to 20 of  $1/n!$  stored in a register, this is the best I can come up with ...

```
S001 LBL S
S002 -1.02
S003 STO I
S004 ISG I
S005 GTO S007
S006 RTN
S007 RCL I
S008 INTG
S009 !
S010 1/x
S011 STO+ E
S012 GTO S004
```

This seems like a ridiculous number of steps for a simple loop.

CHUCK

### Re: Base of Natural Logarithms (OT)

Message #7 Posted by [Paul Dale](#) on 13 Aug 2007, 9:57 p.m.,  
in response to message #6 by Chuck

One step less by running the loop backwards. Also better numerically.

```
E001 LBL E
E002 20
E003 STO I
E004 1
E005 RCL I
E006 !
E007 1/x
E008 +
E009 DSE I
E010 GTO E005
E011 RTN
```

### Re: Base of Natural Logarithms (OT)

Message #8 Posted by [Chuck](#) on 13 Aug 2007, 10:06 p.m.,  
in response to message #7 by Paul Dale

I now see that the STO+ was an unnecessary step (since the values remain on the stack), but why would backwards be better numerically? Non comprehendo.

### Re: Base of Natural Logarithms (OT)

Message #9 Posted by [Paul Dale](#) on 13 Aug 2007, 10:57 p.m.,  
in response to message #8 by Chuck

It is more stable backwards because you're adding like sized terms the whole time and generally maintaining full precision as well.

Going forwards starts with a 1 term and by the time you're near the end, most of the significant digits are beyond the precision of the sum.

The difference will likely be at most a digit or two in the last place but it doesn't take any extra effort to work from the small terms to the large.

- Pauli

### Re: Base of Natural Logarithms (OT)

in response to message #7 by Paul Dale

Use Horner's Method (p. 13-26 in the User's Guide) to avoid factorial:

```
E001 LBL E
E002 STO I
E003 1
E004 RCL/ I
E005 1
E006 +
E007 DSE I
E008 GTO E004
E009 RTN
```

```
20 XEQ E001
```

### Re: Base of Natural Logarithms

Message #11 Posted by [Thomas Klemm](#) on 14 Aug 2007, 5:23 a.m.,  
in response to message #5 by Katie Wasserman

Quote:

\_\_\_\_\_

You can also compute it in the equation solver in several different ways.

\_\_\_\_\_

I've tried to solve the following equation:

```
ABS(E^(Pi*i)+1)=0
```

I would have expected to get:

```
NO ROOT FND
```

Instead I got:

```
INVALID y^x
```

Any ideas why?

It seems that somehow E becomes 0, though this case (i.e. 0 with complex exponent) isn't mentioned in the user's guide as a possible reason for that message.

What a pity you don't get more information, or is there a way to find out what was the last value of E in case of an error?

However it works if 0 is replaced in the equation by 1E-11.

Message #13 Posted by [Thomas Klemm](#) on 13 Aug 2007, 8:50 p.m.,  
in response to message #1 by Vincze

On the 35s:

- use the constants menu
- use the solver with  $\text{LN}(X) = 1$
- iterate the following steps a few times with initial value 1:

```
ENTER
LN
2
x<>y
-
*
```

- calculate  $(1 + 1\text{E-}6)^{1\text{E}6}$
- $\text{SINH}(1)+\text{COSH}(1)$
- ...

Just a few ideas.

Message #14 Posted by [Thomas Okken](#) on 13 Aug 2007, 9:29 p.m.,  
in response to message #1 by Vincze

Erm, I'm not sure if I understand what you're asking here. You say that you know the formula for e, but you can't figure out how to write a program to compute that value?

$$e = 1 + 1/1 + 1/(1*2) + 1/(1*2*3) + 1/(1*2*3*4) + 1/(1*2*3*4*5) + \dots$$

Hint: if you number the terms like 0, 1, 2, 3, etc., then for all terms numbered 1 and greater, term  $n$  is a factor  $n$  smaller than the one before. Just keep summing until adding a term no longer changes your result; thanks to the limited precision of most calculators, that won't take long.

If you're going to ask for an actual program, I'm going to start suspecting you're a student asking us to do your homework. ;-)

**Re: Base of Natural Logarithms**

Message #15 Posted by [Vincze](#) on 14 Aug 2007, 8:41 a.m.,  
in response to message #14 by Thomas Okken

But formula is  $\lim_{n \rightarrow \infty} (1+1/n)^n$ . What I don't understand is how you deal with infinity. I guess you could loop a couple hundred times to deliver accuracy, but how was this calculated in past, when e not available.

I guess reason I ask is I try and better understand programming on HP calculator, so I thought this would be a good test to see how something like infinity be handled.

### **Re: Base of Natural Logarithms**

*Message #16 Posted by **Thomas Okken** on 14 Aug 2007, 9:34 a.m.,  
in response to message #15 by Vincze*

Dealing with infinity can be tricky, and there is no one answer for all situations. In the case of the series for e, the key insight is that the terms get progressively smaller as n increases, and that in fact, they shrink so quickly that you only need to sum a few in order to reach maximum precision.  $1/16! = 4.78e-14$ , which is too small to affect the value of e when working with 12-digit precision -- so after summing only 16 terms, you're done. If you're working with higher precision, you'll need more terms, of course.

You can work out in advance when the terms will become too small to affect the result any further, or you can simply compare each iteration's result to the previous one, and terminate the loop when there is no further change. And if you want the best possible accuracy, you can sum the series from smallest terms to largest (that requires working out which is the smallest term in advance), to minimize the effect of round-off error on the final result.

Note that the series for e (or generally speaking, for  $e^x$ , and the related series for sin and cos) have the nice property that the terms shrink very quickly, but this is not true for all series, like the notoriously useless  $\tan(x) = 1 - x/3 + x/5 - x/7...$  In such cases you'll have to look for a more clever approach.

*Message #17 Posted by **Vincze** on 14 Aug 2007, 10:02 a.m.,  
in response to message #16 by Thomas Okken*

Okay, but how you write program to do this? I no student in school, but I am student of life, and want to learn how to do something like this.

I try some programming but I still very green as you say in America, and still trying to grasp concept of RPN programming.

If this was in C, cobol, or assembler, I would know what to do, but I baffled with programming on 35s. Maybe it too simple and that my issue.

### **Re: Base of Natural Logarithms**

*Message #18 Posted by **Don Shepherd** on 14 Aug 2007, 10:11 a.m.,  
in response to message #17 by Vincze*

Vincze, you need to get the museum DVD. It has the manuals of almost all HP calculators, and you need to read the programming sections of those manuals. That will teach you how to program in RPN.

**Re: Base of Natural Logarithms**

Message #19 Posted by [Vincze](#) on 14 Aug 2007, 11:15 a.m.,  
in response to message #18 by [Don Shepherd](#)

But I have HP35s and its manual, but it not explain the programming and looping and loop testing, etc. If I want to loop something say 20 times, how would I control that in 35s and take final value and display? It talk about very little in manual. I have friend who has older version of CD's from here. What would be good manual to look at that explain this better than current 35s manual.

**Re: Base of Natural Logarithms**

Message #20 Posted by [Don Shepherd](#) on 14 Aug 2007, 12:48 p.m.,  
in response to message #19 by [Vincze](#)

Vincze, how can you say the 35s manual does not discuss programming and looping? Part 2 of the manual is about nothing but programming. Loops are described on pages 14-16 to 14-18. You really need to read these sections and play around with it.

**Katie Wasserman's "buggy little beast" sigma function**

Message #21 Posted by [Miguel Toro](#) on 14 Aug 2007, 8:00 p.m.,  
in response to message #1 by [Vincze](#)

You also could use this:

$$(IDIV(I,18)-1)/A = (1-IDIV(I,18))/A + 0*(E+1/I!STO E) + 0*(I+1STO I)$$

Solve for A  
I=0 R/S  
E=0 R/S

RCL E

or still:

$$(IDIV(I,18)-1)/A = (1-IDIV(I,18))/A + 0*(E/(20-I)+1STO E) + 0*(I+1STO I)$$

Solve for A  
I=0 R/S  
E=1 R/S

RCL E

Just amazing! enjoy.

Miguel

### converted 32sii program for 35s

Message #1 Posted by [gteague](#) on 13 Aug 2007, 7:25 p.m.

[mods, if this is inappropriate for the forum, please let me know]

going through the software archives to find some programs for my new 35s i came across this netmask calculator which will really help me as i'm taking my ccna test in the next month or two.

all i basically did was substitute 'goto line#' for the labels (original labels are noted to the right). i'm not enough of a programmer to condense it further although i see some possibilities using the indirect or index registers perhaps.

here is the original copyright notice:

This program is Copyright © 2001 by Borja Marcos and is used here by permission. This program is supplied without representation or warranty of any kind. Borja Marcos and The Museum of HP Calculators therefore assume no responsibility and shall have no liability, consequential or otherwise, of any kind arising from the use of this program material or any part thereof.

Overview: This is my first 32Sii program, so don't blame me ;-) It calculates the netmask from the number of bits. For example, 24 gives 255.255.255.000.

To run it, type the number of bits and "XEQ M". Enjoy it. Who said calculators aren't useful when you end college? ;-)

and here is the converted (for 35s) program:

```

001:   LBL M
002:   RPN
003:   STO B           'LBL M'
004:   0
005:   STO R
006:   STO M
007:   9
008:   STO E
009:   RCL B           'LBL A'
010:   8
011:   x>y?
012:   GTO M015
013:   8
014:   GTO M016
015:   RCL B           'LBL B'
016:   STO M           'LBL C'
017:   STO- B
018:   2
019:   RCL M
020:   y^x
021:   1
022:   -
023:   2
024:   ENTER
025:   8
026:   RCL M
027:   -
028:   y^x
029:   X
030:   RCL E
031:   10^x

```

```
032: X
033: STO+ R
034: 3
035: STO- E
036: RCL B
037: x>0?
038: GTO M009
039: RCL R
040: RTN
```

check:

```
LBL M
LN=129
CK=F049
```

/guy

**HP 10S**

Message #1 Posted by [DaveJ](#) on 13 Aug 2007, 6:04 p.m.

Anyone got the new 10S yet?

I like the big rubber feet on the bottom: <http://www.educalc.net/1200484.page> They claim it's available in Singapore already.

Dave.

**Re: HP 10S**

Message #2 Posted by [Raymond Del Tondo](#) on 13 Aug 2007, 7:29 p.m.,  
in response to message #1 by [DaveJ](#)

It seems the 10s is nothing more than a repackaged 8s,  
with additional solar panel.

I already have an 8s, so I won't waste another twenty bucks;-)

The 8s is a nice machine for the price,  
but virtually nothing compared to even a 35s,  
which costs about 3 times of an 8s,  
but is a hundred times more powerful.

And very important for me:

The 35s is the first 'HP'-like calc they made since about ten years IMHO... (except for the bugs;-)

**HP 50G keys**

Message #1 Posted by [Vincze](#) on 13 Aug 2007, 12:42 p.m.

Just curious, as I have never had the pleasure to play with a 50G, but what are the 50G keys like? Do they have same feel as 48GX or are they mush, like?

**Re: HP 50G keys**

Message #2 Posted by [Chan Tran](#) on 13 Aug 2007, 12:48 p.m.,  
in response to message #1 by Vincze

Just got one yesterday. The keys are not bad and not so mushy but not as good as those on the 48S/G. The calculatr as a whole doesn't have the same quality as the 48 series.

**Re: HP 50G keys**

Message #3 Posted by [Seth Morabito](#) on 13 Aug 2007, 1:48 p.m.,  
in response to message #1 by Vincze

The 50g keys are very firm and clicky. They do not have the same feel as a 48 SX/GX however. The plastic feels different, and the key tops are not rounded.

I don't mind the keys, though I prefer the keys on the 35s. I hope that there is a new version of the 50g in the works that will use the 35s keys. If the 50g had a wide enter key and sloped 35s style keys, I think it would be my favorite (currently made) calculator. It's really a very nice product even as it is.

**Re: HP 50G keys**

Message #4 Posted by [Brad Davis](#) on 13 Aug 2007, 7:46 p.m.,  
in response to message #1 by Vincze

I've been using my 50g for a month or so now. To me, the keys feel similar to the 48G's (which are perfect, IMO), but harder. They're a bit too hard for my tastes, but I'm getting used to them. I have a big hairy equation that I use as a benchmark. It takes me 27 sec. on my 48G, but 30 on my 50g. It also takes 30 sec. on my 33s and its keys are about as hard as the 50g's. I doubt I'll ever be as fast with the 50g, although will probably get to 28-29 sec. after I use it longer.

It's such a darn nice calculator overall, though, that I think I'm willing to stick with it. I find myself using a lot more of its advanced features than I thought I would.

I agree that it doesn't have that same quality feel as the 48G, but time will tell if it is tough enough. My biggest quality gripe is the battery compartment cover. It's not a monumental disaster (28S for example), but opens way too easily. A little piece of tape secures it.

**Re: HP 50G keys**

Message #5 Posted by [Tim Wessman](#) on 13 Aug 2007, 11:11 p.m.,

*in response to message #4 by Brad Davis*

In my opinion, the major difference is the distance the key has to travel. On the 48, this distance is about a third less, and thus a much "snappier" feel on that compared to the 50g.

TW

### **Re: HP 50G keys**

*Message #6 Posted by [Brad Davis](#) on 14 Aug 2007, 12:46 p.m.,  
in response to message #5 by Tim Wessman*

I think you're right. I find myself pushing a key, finger moving toward the next one, and realizing that the previous one didn't register. That probably is more of a travel distance issue than stiffness.

BTW, where the heck did you get 1/3 less? Did you measure that? Now THAT would be some extreme calculator scrutiny, LOL.

### **Re: HP 50G keys**

*Message #7 Posted by [Hal Bitton in Boise](#) on 13 Aug 2007, 11:49 p.m.,  
in response to message #1 by Vincze*

Hi Vincze

The key detents on my 50G are a bit more subtle than on my 48GX, but still very nice...they actually feel about the same as the keys on my 15C.

All in all, the 50G seems a very good machine...some very powerful functionality topped off with a fantastic display. The ability to display the entire stack in textbook format is really nice...and as I've said before, this lets you build an equation right on the stack using RPN keystrokes...much easier (IMO) than the algebraic logic required in the equation writer environment.

Best regards, Hal

### quality vs. commodity

Message #1 Posted by [megarat](#) on 13 Aug 2007, 12:15 p.m.

Hey all,

I have a lingering question I'd like to throw to the group. It may seem trollish, but I'm actually hoping for a serious discussion.

It's the 21st century; you can get a seriously powerful computer that fits in the palm of your hand for less money than you'd spend on a one-way plane ticket; you can do some mind-boggling operations on a laptop, desktop, or cluster computer. In the past, HP made some calculators of astonishing quality, but nowadays you can pick up a surprisingly feature-rich calculator in the check-out line at Walgreens for only \$15, even though its quality might be wanting.

Here are my questions:

- (1) For those who routinely use calculators, how much is "that old-time HP quality" really necessary in their function?
- (2) Does anyone feel that they would be better-served if HP also served the commodity calculator market?

I.e., does the world need quality calculators anymore? Do *\*we\** need quality calculators anymore?

Sharp and Casio make some killer calcs in the sub-US\$20 price point, with a feature set that surpasses that of many classic HPs; I would love to see HP throw their hat in this arena: make an HP 32s equivalent -- complete with squishy keys, no constant memory, and a small photovoltaic panel, small and light and disposable, light on the memory and programming capacity (but with RPN, of course) -- for US\$20 or thereabouts. If they did this, I'd pick up a six-pack.

Right now HP seems to have a product line that doesn't know its target market. They're trying to maintain their reputation of creating industry-leading calculators, and ride that out for as long as they can, but realistically they've ceded the market to TI more than a decade ago, and honestly, the last HP calculator that shook the world was the 48sx (released circa 1990). By straddling the line between "quality" and "commodity", HP is looking schizophrenic and indecisive, as if they've lost their grip on reality.

I would love it if HP took a stand and created perhaps three lines of calculators: (1) Engineer-Grade: a serious piece of equipment, the calculator we're all lusting after, such as a true next-gen 42s with IO, the quality of yesteryear, more industrial engineering than you can shake a stick at, but costing >US\$200 since it's catering to such a small market. (2) Student-Grade: i.e., the 50g and its successors. ~US\$100. Nuff said. (3) Commodity-Grade: US\$25 or less. Equivalent in function to the Sharp EL-506W, with both algebraic and RPN. A calculator that, if the dog eats it, you would pick up a replacement at the pharmacy.

I'd buy one of the engineer-grade calcs for work, and a handful of commodity calcs to keep around the house. Even if HP didn't create an engineer-grade calculator, I'd be happy with that classic quality being a driving part of my nostalgia, as long as it meant that HP would be making lots of calculators for a long, long time.

Mind, I'm only a nerd, I don't have the access to the same market-research data that HP has, and my suggestions

above are ignoring HP's current breadwinners like the 12c so I'm not trying to claim that I think I know exactly what HP should do. That said, HP's current behavior in the calculator market is reminiscent of other "companies in trouble", e.g., SGI, so I'd just like to see them try something different, since the strategy of "desperately clinging to past success while producing new products of compromise" doesn't seem to work, for both the company and the customer.

(I also speculate that calculators are an endangered species -- that the market is going toward more generalized computing devices and that future school kids will have their classroom calculators as a software module in their mobile phones and MP3 players -- but that's a topic for another post.)

Cheers, -cam

### **Re: quality vs. commodity**

*Message #2 Posted by [Vincze](#) on 13 Aug 2007, 12:34 p.m.,  
in response to message #1 by megarat*

Isn't that not what HP been doing the past few years? Making commodity calculators? My honest opinion is I like to keep using favorite calculator for a long time, so it help if calculator is well built. You want a cheap HP calculator, then get a six pack of 30s or 9s, both under \$20. And what about cheap photo voltaic calculator that people keep talking about that HP making, that be out soon.

Personally, I do not think this wise direction for HP to go. Maybe they should make a few cheap calculators to sell to the masses, but they must also have quality calculator presence.

That just my two Hungarian forint, for what it worth.

### **Re: quality vs. commodity**

*Message #3 Posted by [Chan Tran](#) on 13 Aug 2007, 12:50 p.m.,  
in response to message #2 by Vincze*

If I buy a calculator it must be of good quality. Even with the simplest 4 function one, it's the quality that makes me use it. There are so many alternatives to a calculator, it doesn't make much sense to have a calculator of low quality.

### **Re: quality vs. commodity**

*Message #4 Posted by [Bruce Bergman](#) on 13 Aug 2007, 2:28 p.m.,  
in response to message #1 by megarat*

HP does have some of those commodity calcs, although they aren't truly HP models (they're rebranded). The 6s was solar, and aside from having an icky keyboard, it was something like \$6 in cost. I almost got a handful to give out as gifts at work, but it really wasn't all that great. The next closest would be the HP-8s. Not available in the USA (normally), but it is a low-end education calc that has some impressive features in a very small package. You can get one on eBay occasionally from overseas sellers for about USD\$25.

In answer to your question, though, I think quality is important to a certain degree. Very much so at the engineer-grade level. We expect it from HP, and the proof is in the pudding. I firmly believe that, even with the bugs in the HP-35s, it will outsell the HP-33s. Not because it has that many more features, but because of the quality. They took the time to address remarks from long-time HP users for years.

Commodity-wise, I'd like to see them make their OWN HP-8s (not a rebrand), with RPN built in, and then -- like you -- I'd buy a handful. That would be a good calc to just toss in the car, trailer, backpack, whatever. Mind you, the 35s is *\*almost\** to that point; I'm thinking of getting more. The 33s was overpriced for the

value, and I will not get any more of those.

Education-wise, I think the 50g and the 40gs models are truly great calcs. Could use a few tweaks here and there, but...awesome. Probably the first in years to give due credit to the HP-48xx family name. Maybe fix some things, produce some in different colors and they could (COULD) make a run on the education market again. Especially with the HP-35s in the secondary.

(As an aging HP calc user, I came to the conclusion last year that if I had ONE goal in my remaining life, it is to see HP calcs take back the predominant spot in the education market. Obviously, I can't control or help HP with the calcs, but I can certainly do all I can to push them in the education market, tell friends, profs, make deals, create web sites, offer help, etc.)

The quality will always need to be there, IMHO. Maybe not as much as in the heyday of HP dominance, but it needs to be there. I won't be interested in some crummy little calc. Like you said, if you want a cheap and reasonably powerful calc, TI and Casio both have them. And now with the new Ativa (?) brand from Office Depot, there are three low-end challengers. So I COULD go get one. Would I? Probably not. I'd rather pay a few bucks more for quality.

thanks, bruce

## **Re: quality vs. commodity**

*Message #5 Posted by [George Bradford](#) on 13 Aug 2007, 4:27 p.m.,  
in response to message #1 by megarat*

I would be served if HP delivered a solid RPN calculator in the commodity market. I'd buy them by the dozen and hand them out as gifts to every student (elementary, secondary, college) I know (nieces, nephews, mentees).

I believe HP has lost (at least) a generation of calculator users. One way to reverse this would be putting an RPN calculator into the hands of as many users as possible. RPN sells itself to serious math, science, engineering and finance users. But HP must do a better job delivering it to them. A low cost RPN machine would address this.

More RPN users = more HP customers. More HP customers = more HP research, development, improvement, advancement. And this would serve me and my personal interests.

The "stand alone" calculator has been threatened by PCs, PDAs, Handhelds, mobile phones and declining math literacy (in the USA). But the calculator has survived and in many ways thrived.

Today's calculators are more powerful and reliable than their ancestors. Future advancement in micro processing, battery technology and manufacturing will continue the calculator's evolution.

I believe there will always be a need for quality calculators. Certainly academics will demand them. Industry will as well. Particularly in fields requiring accurate math and analysis, top quality calculators will be necessary.

The great irony of technological progress is that the items that threaten the calculator (the PC, PDA, handheld, mobile phone, etc.) are disposable consumer goods. They are technologically obsolete the moment the consumer acquires them. It is accepted that they will be replaced by a "better" product in 2 - 3 years (if not sooner).

A quality calculator never needs to be electively replaced. I've used my HP 15c for over 20 years. I can't count how many PCs, Palm Pilots and mobile phones I've replaced during that time period. But my HP 15c is still dependable, accurate and capable of handling anything I throw at it.

I've purchased two of the new HP 35s machines. After a long downhill slide, it's a step in the right direction. A direction I hope HP pursues.

I'll be the first to admit that the HP 35s doesn't hold a match to the HP 15c. But I firmly believe the HP 35s is the absolute best scientific calculator currently manufactured and sold.

For me "that old time HP quality" is absolutely necessary.

Just my two cents....

I don't think this is specifically a HP problem, rather more of a general corporate mentality problem:

I don't think the board members, executives, and managers at HP pay much mind to the opinions published on this site. As someone has already posted, those of a like mind to us here have moved on in HP. In fact, what we might have recognized as HP is now Agilent, producing equipment more along the lines of things many of us might use. Unfortunately, calculators have been designated as a consumer item, not research equipment, not analytical equipment and so was retained by the "corporate-ized" portion that also retained the company name.

Until they return to the old American mentality from this current American mentality with respect to business, we will continue to see products that either trail or at most keep pace with the market, rather than lead it or define it.

So, things as they are, I'm happy they made a 35s, and not another 9s or some such (even the 33s really was a decent product given today's context, even if the visual design could have been... otherwise).

### **Re: quality vs. commodity**

*Message #7 Posted by [Dave Johnson](#) on 13 Aug 2007, 5:29 p.m.,  
in response to message #6 by Ed Look*

It is obvious to me that the corporate execs have listened to this site (and others). Of course they are really listening to some internal champions... The 35s would never come about unless there was a perceived need to return to their roots. Of course it had to be developed in the context of HP's position in the calculator market and could not be a tremendous capital investment. It appears they are on the right track focusing on the key characteristics, incorporation of the ENTER key in the classic location and maximizing the key stroke programming ability. If they had more resources I am sure some of the bugs would not be there, but part of our 'fun' is finding, dealing with these devices... Thank goodness they modified the algebraic system as their 33S was not usable (Try explaining to anyone why it is sometimes prefix and sometimes postfix and entering algebraic expressions as written). The benefits of RPN are all understood but if expressions can be viewed and edited, algebraic or function entry can be practical.

### **Re: quality vs. commodity**

*Message #8 Posted by [Vincze](#) on 13 Aug 2007, 7:19 p.m.,  
in response to message #5 by George Bradford*

Major problem. Current student see calculator as disposable item. They also see calculator come with Windows or Mac OS, so why buy.

I do not agree with that stand, but I think that is reality. We all know that computer not fit nicely in pocket, but phone or PDA do, so as student, why I need nice calculator? That problem we face. We all know that HP make very good calculator, and back in 1970's they were cutting edge, but let face it, calculator is "old school" as kids say now. Calculator go way of Atari, and other old school thing and only used when mandated. It sad but so true. I think in coming years, we may not see quality calculator. I think we see disposable calculator, graphing calculator, and financial calculator. Of those, I only think HP will be selling one of three.

### **Re: quality vs. commodity**

Message #9 Posted by [Kelly Huckman](#) on 13 Aug 2007, 9:06 p.m.,  
in response to message #5 by [George Bradford](#)

Speaking as a current EE student, I think I've seen perhaps 2 HP calculators besides my own, and they were both used by professors. On a certain AC circuits exam, the professor restricted calculators, but let the students come up to use his 32sII for the last problem. The students were bewildered by RPN, and scoffed at the calculator. I love the 35s, warts and all, but HP is going to have a tough time convincing current students to purchase a \$60 non-graphing calculator when they can get one from casio (that does definite integrals and is solar powered) for \$17.

There are typically two types of students currently. There are those who have \$15 calculators who would find the prospect of spending \$60 on a scientific HILARIOUS, and then there are those with TI 89s (soon to be NSpire CAS). From my vantage point, it seems that HP has all but lost the calculator war with the coming of the NSpire CAS. If they want to get back into the game, these are the two fronts that TI needs to attack on. Commodity RPN calculators to get the cheapos (better students, almost to a man) hooked and feature-rich, expensive graphing calculators with symbolic CAS for those willing to put down \$150 on a calc. It's going to be virtually impossible to convince a student to buy a 42s caliber scientific for \$150-200 if it doesn't have graphing capability. Why spend the same or more on a calculator that, upon first inspection, does less than the competitor's graphing solution?

It's only when they get out of school that students will want a nice portable solution like the 42s, but they're going to go to TI for a \$20 scientific because that's all they know. I would love for HP to come out with a new 42s so that I wouldn't have to spend \$400 on ebay for an end-all scientific, but it simply isn't good business at this point. The only people who would buy them are professionals with nostalgia. Kids would buckle over laughing at the prospect of paying graphing calculator prices for a scientific.

Quote:

I believe there will always be a need for quality calculators. Certainly academics will demand them. Industry will as well. Particularly in fields requiring accurate math and analysis, top quality calculators will necessary.

\_\_\_\_\_

The sad truth is that this need is filled by TI. The 89 is a wonderful machine, and the NSpire looks amazing. If only they had an RPN mode the HP calculator division could finally fade away.

Message #10 Posted by [John Limpert](#) on 13 Aug 2007, 4:38 p.m.,  
in response to message #1 by [megarat](#)

A large feature set does not equal usability. That's my main gripe with Japanese calculators. They are cheap and have plenty of features, but I find them difficult to use. It doesn't help when the manual is poorly written, set in tiny type, and printed on a large sheet of paper.

A quality keyboard and display are essential, as are legible markings on the keyboard. If the user interface sucks, I don't care how cheap it is.

Calculators are still important. The ability to run Mathematica on a laptop is irrelevant if you can't afford Mathematica or a good laptop.

Quote:

(1) For those who routinely use calculators, how much is "that old-time HP quality" really necessary in their function?

In my opinion, no. I just want something that has the intended functions I need and works they way I want expect it too. People talk about HP quality, but every one of my Casio's I've had for 20+ years are still working just great, so they can't be bad quality either.

Quote:

(2) Does anyone feel that they would be better-served if HP also served the commodity calculator market?

They are already trying to do this with the new 10S and other low end models.

Quote:

I.e., does the world need quality calculators anymore? Do \*we\* need quality calculators anymore?

Quality is hard to measure, and people's ideas of what quality is is different.

Quote:

Sharp and Casio make some killer calcs in the sub-US\$20 price point, with a feature set that surpasses that of many classic HPs; I would love to see HP throw their hat in this arena: make an HP 32s equivalent -- complete with squishy keys, no constant memory, and a small photovoltaic panel, small and light and disposable, light on the memory and programming capacity (but with RPN, of course) -- for US\$20 or thereabouts. If they did this, I'd pick up a six-pack.

A programmable calc requires a lot more development effort than a scientific calc, someone has to pay for that somewhere. And little things like extra memory easily add up in the final retail price.

I suspect HP aren't geared up as well as casio to churn out a good low end calcs like say the FX-991ES or EL-

506W.

Quote:

---

Right now HP seems to have a product line that doesn't know its target market. They're trying to maintain their reputation of creating industry-leading calculators, and ride that out for as long as they can, but realistically they've ceded the market to TI more than a decade ago, and honestly, the last HP calculator that shook the world was the 48sx (released circa 1990). By straddling the line between "quality" and "commodity", HP is looking schizophrenic and indecisive, as if they've lost their grip on reality.

I would love it if HP took a stand and created perhaps three lines of calculators: (1) Engineer-Grade: a serious piece of equipment, the calculator we're all lusting after, such as a true next-gen 42s with IO, the quality of yesteryear, more industrial engineering than you can shake a stick at, but costing >US\$200 since it's catering to such a small market. (2) Student-Grade: i.e., the 50g and its successors. ~US\$100. Nuff said. (3) Commodity-Grade: US\$25 or less. Equivalent in function to the Sharp EL-506W, with both algebraic and RPN. A calculator that, if the dog eats it, you would pick up a replacement at the pharmacy.

---

Maybe I'm strange, but my idea of an "engineer-grade" calc is *\*not\** a high end programmable one! I don't need programming on a daily basis at all, but I do need lots of good primarily functionally, sensible dedicated key, a nice easy to use solver, and a nice small case I can *\*really\** slip in my pocket.

I would love to see a low end calc specifically targeted at engineers, like say the way the Casio FX-61F was targeted at electronics engineers. There could be one for electronics, mechanical, surveyors etc.

Dave.

in response to message #1 by megarat*

Quote:

\_\_\_\_\_  
(1) For those who routinely use calculators, how much is "that old-time HP quality" really necessary in their function?  
\_\_\_\_\_

Critical. The ability to quickly enter calculations, have confidence that all keystrokes registered, and that the result is correct is of the utmost importance. There is a reason I always have an HP calculator nearby at work, at home, and in my briefcase.

Quote:

\_\_\_\_\_  
(2) Does anyone feel that they would be better-served if HP also served the commodity calculator market?  
\_\_\_\_\_

I believe so. Mind share is market share.

Quote:

\_\_\_\_\_  
I.e., does the world need quality calculators anymore? Do \*we\* need quality calculators anymore?  
\_\_\_\_\_

I hope so. This is why the 35s is refreshing. Sure, I can use Excel or code to solve many problems, but sometimes the calculator can answer the question much faster. I find the calculator essential for meetings. (RPN is such a spoiler for the uninitiated that reach for your calculator...)

Quote:

\_\_\_\_\_  
make an HP 32s equivalent -- complete with squishy keys, no constant memory, and a small photovoltaic panel, small and light and disposable, light on the memory and programming capacity (but with RPN, of course) -- for US\$20 or thereabouts.  
\_\_\_\_\_

As is, I'm going to have to give each of my kids a 35s for RPN at a minimum.

Quote:

\_\_\_\_\_  
Right now HP seems to have a product line that doesn't know its target market.  
\_\_\_\_\_

Agreed. Although, I think the 35s may reflect a course change for the better.

Quote:

\_\_\_\_\_  
[m]y suggestions above are ignoring HP's current breadwinners like the 12c...  
\_\_\_\_\_

At least the 12c is holding its own.

I just wish there was a non-graphing HP calculator that combined the 35s and 12c in either form factor since I use both (and a 50g too--although that's overkill for my needs).

I guess a 48 or 50 is an overkill for at least 80% of us. The rest is 5% professionals dealing daily with really HEAVY math, and 15% students going through all pleasures of engineering science the rest of us hardly remember. On college I really needed most of the functions on my 28s. Today (33s) graphing is not needed. I use the solver, trig, statistical functions and rather seldom the numerical integration.

But isn't it a real nice feeling to have a BIG calc around knowing one is prepared only in case of...?

### **Re: quality vs. commodity**

*Message #17 Posted by [Ed Look](#) on 15 Aug 2007, 12:02 p.m.,  
in response to message #16 by Frank Rottgardt*

Yeah.

I keep it either in my drawer or briefcase. ;D

Really though, this is because either at home or at work, it's going to be the 35s, 33s, or 32SII that's used most of the time!

But that is only about 75% true, seriously- there are times I need the 48G, G+, or 49G+ because of their superior STORAGE capabilities. That is, I often store lots of constants or need one of the big programs, like Chem48 by Arnold Moy, either because I am not near or don't have a reference book at the time.

Fortunately for me, most of my programming needs can be filled by a programmable scientific. However, I'll admit that now I've learned a little user RPL, programming a 48 or 49 series machine may be easier if I have a somewhat more complex program. But I still like the simplicity and convenience of RPN keystroke programming in the HP scientific programmables.

### **Re: quality vs. commodity**

*Message #18 Posted by [Frank Rottgardt](#) on 15 Aug 2007, 4:45 p.m.,

For me the opposite is true. My very first HP calc was the 28s. Hence User RPL became my natural mother tongue. Now, dealing with an 33s since some month ago, I have to learn the "simple" keystroke language.

### **Re: quality vs. commodity**

*Message #19 Posted by [Ed Look](#) on 15 Aug 2007, 4:56 p.m.,  
in response to message #18 by Frank Rottgardt*

Very interesting!

Perhaps it was just my prejudices; I had assumed that since the HP scientific programmables' programming methods required only one or just a few keystrokes per step, that it would be easier for everyone.

However, I learned FORTRAN first above any other programming method. Keystroke programming still seems easier than that. Maybe HP's old calculator manual was a better teaching instrument than my programming texts and professor. ;)

### **Re: quality vs. commodity**

*Message #20 Posted by [Frank Rottgardt](#) on 15 Aug 2007, 5:32 p.m.,  
in response to message #19 by Ed Look*

OK, the keystroke method actually is simple. But I need to get used to GTOs and the special loop programing.

The last time I used GOTO was in the early 80s when I teached myself BASIC on a C64. With RPL it is easier to handle subroutines which can be adressed simply by giving them real names, not only single characters or line numbers.

### **Re: quality vs. commodity**

*Message #21 Posted by [Ed Look](#) on 16 Aug 2007, 12:05 a.m.,  
in response to message #20 by Frank Rottgardt*

Others here disagreed, but I was struck by how FORTRAN-like User RPL was to a fair degree. Less so, except in the looping features, was the use of ISG and DSE in RPN keystroke programming. They really remind me of FORTRAN DO loops...

... and there's lots of GTO (GO TO) in FORTRAN...

... but most computer languages and programming methods share lots of commonality.

*Message #22 Posted by [Tom Frank](#) on 16 Aug 2007, 1:49 a.m.,  
in response to message #15 by Chris Haltiner*

HP still makes the 12c...if one takes a look at the prices the 15c commands on eBay, it seems to me that they could reintroduce the 15c and be back in the game instantly.

Once you leave college, does anyone ever use the graphing functionality again? I've been an engineer for 22 years, and never felt the need to use such a capability (I've got a 48 and 49; foolishly replaced my 41cx), nor have I noticed any of our new hires using them. Unique to my experience, or common?

What I would like is a bigger, easier to read display (we're not all in our twenty's anymore). I like the idea of using OLED and a backlight keypad I read in the archives :-)

Off to order a 35...

## **Re: quality vs. commodity**

*Message #23 Posted by **Will Hartung** on 17 Aug 2007, 10:26 a.m.,

*HP still makes the 12c...if one takes a look at the prices the 15c commands on eBay, it seems to me that they could reintroduce the 15c and be back in the game instantly.*

That's the interesting thing to me.

One thing about calculators, specifically mid-range calculators, is that, frankly, the technology curve has flattened out.

That fact that you can get a capable and powerful CASIO for \$15 just reinforces that.

The 12C is an anachronism. It's a "BMW" business calculator. I think that the only reason that the 12C costs as much as it does is because it can be sold for that much, and it can be sold for that much unrelated to its actual functionality.

It's valuable because of its history and the broad general knowledge surrounding it. I'm not in that field, but if you're selling a 25 year old calculator design (Now it PLATINUM!), there must be a lot of users to provide an ad hoc support network.

Materially, there's no reason a 12C should cost what it does. HP made its money back on the research, development, and tooling on that machine a LONG time ago. The real "cost" of a 12C is prestige and branding.

It's a fine calculator, but even HP sells competing ones for far less, yet the 12C is there on the shelves of every Office Mart in the US.

A run of 15Cs would sell quite quickly I think. There are a lot of Dads out there sending kids to college that cut their teeth on this calculator, and I think they could be made easily, and cheaply. Would it really be that hard to retool the 12C line to start stamping out some 15Cs?

While calculators can and do advance, we're at the stage where they don't need to. They're commodity items, many based solely on looks rather than functionality (witness the recent styling attempts from HP to appeal to a younger market).

Why not sell a 42S again? Beyond fixing any known bugs, what's wrong with the designs they already have on the shelves?

What is nice about the 35s is that it's got a handy size, and it's programmable with good storage. And it's keystroke programmable (or, at least, menu programmable). I've not seen one yet (it, alas, ISN'T on the shelf of every Office Mart in the US). But keystroke programming I think is more user friendly than RPL for most folks, as it's basically a macro language. "Watch me do this calculation."

My father, a 15C fan, laments his 48 over his old 15C and some Commodore calcs before that, specifically for that reason.

But basically, I don't see why HP couldn't sell the 15C today for \$30. They'd sell a bunch I'd think, and not just to collectors.

## **Re: quality vs. commodity**

*Message #24 Posted by **Walter B** on 18 Aug 2007, 4:38 p.m.,  
in response to message #23 by Will Hartung*

Hi Will,

I do not know how long you join this forum already. IF you are a seasoned member, THEN GOTO *next paragraph*. ELSE please scan the archives for keywords like "15C" or "42S" and you'll be drowned. To survive, you may filter using "bring back the 15C" or "42Sii" and the like. There were many extended (!) discussions about this topic, and I think almost every aspect has been covered at least once. Long story made short: It's not so easy for todays (!) HP to just resurrect any of the vintage calcs we all love so well, and to make money with it. Please proceed at *conclusion*.

*next paragraph*: Please accept my apologies for not remembering you. My brain is getting older every day :)

*conclusion*: IMHO it will be easier to use an existing platform of today and develop a new calc on this basis. The 35s may be a good mechanical platform (take the housing and keys without the print) to set up an advanced model. The 12C Anniversary may be another one but has 2 keys too less IMO. In either case, new displays are necessary to cope with the requirements and expectations of the "advanced" users of today.

Just my 20 Milli-Euros.

in response to message #25 by Ed Look*

Even Nobel Prize winners have been kids once :)

Seriously: In the time of PDAs and mobile phones, LCDs featuring comparable resolution and briskness should go without saying with mid-range calculators, too. They will allow for state-of-the-art alphanumeric display of constants, matrices, equations etc. IMO the LCD of HP33s, recycled in HP35s, will be no more tolerable in an HP45s.

### **Re: quality vs. commodity**

*Message #27 Posted by [Karl Schneider](#) on 18 Aug 2007, 10:21 p.m.,  
in response to message #23 by Will Hartung*

Will --

Please read Walter B's post about the HP-15C and HP-42S.

There are two obstacles for resurrecting the HP-15C: Its microprocessor code and engineering documentation has probably been lost; also, its 7-segment display precludes alphanumerics -- a limitation that would not be tolerated by today's buyer of an upper mid-grade calculator.

The HP-42S is too complicated to resurrect as a calculator, with palmtop computers available and affordable.

That said, both calculators are examples of engineering excellence.

Quote:

---

That fact that you can get a capable and powerful CASIO for \$15 just reinforces that.

---

I suppose you mean the fx-115MS. I bought one to get an example of a "modern" product. I agree that it has an impressive amount of functionality for the price, but it's not very intuitive to use, or well-integrated. It's more like a learning aid for a schoolkid's "lesson *du jour*", rather than a tool for professionals and serious students.

### [My archived comments about the Casio fx-115MS](#)

Quote:

---

The 12C is an anachronism. It's a "BMW" business calculator.

---

What does that mean? BMW is still a leader in the automobile industry, although I can't stand their styling of recent years, which other manufacturers -- e.g., Honda/Acura -- have emulated. I've got an older, traditional-looking one.

Quote:

---

I think that the only reason that the 12C costs as much as it does is because it can be sold for that much, and it can be sold for that much unrelated to its actual functionality.

It's valuable because of its history and the broad general knowledge surrounding it. I'm not in that field, but if you're selling a 25 year old calculator design (Now it PLATINUM!), there must be a lot of users to provide an ad hoc support network.

---

The appeal of the HP-12C has been its compact size, desktop-oriented horizontal layout, and elegant appearance. Being a *de facto* standard for so many years certainly helps. It's admittedly not a good functional value for the money.

---

The FX-115ES has replaced the MS for some time now. Also known as the FX-991ES in some countries.

It's my current daily use calc and I find it superb. I love the "table" mode, which is basically a solver that can give you spreadsheet-like tabulated results of a range of values for a variable.

One of my major gripes with it is the lack of rubber feet, it just has plastic dimples which give it even less desk grip.

Dave.

Hi,

It's not new, but the [rskey.org](http://rskey.org) is a nice site and certainly something for [hpmuseum.org](http://hpmuseum.org) to consider adding to [Links to other sites](#).

I think it was also this site where I first came across the caution on powering up woodstock era (HP 21-29c) calculators w/o their batteries, [viz](#):

"Unfortunately, the construction of the [woodstock] calculators provided for the uneven heating of the batteries during charging, leading to premature battery wear. The design of the charging circuit also made it possible for the calculator to receive excessive voltage when a battery pack was not properly inserted, causing the calculator's sensitive MOS circuits to fail."

...although I don't think the above caution is unique to the [rskey.org](http://rskey.org) site.

...b

### HP50G Memory

Message #1 Posted by [Chan Tran](#) on 13 Aug 2007, 10:12 a.m.

Just got a 50G. Found out that the memory that matter most is limited to 240kB. I have the 48GX and with an expansion card I have a max of 256kB. So I can't create nor transfer a larger GROB on the 50G than on the 48GX no matter what I do.

### Re: HP50G Memory

Message #2 Posted by [hugh steers](#) on 13 Aug 2007, 10:20 a.m.,  
in response to message #1 by Chan Tran

is this some saturn architectural weirdness? i'm seeing 400k free under hpgcc.

### Re: HP50G Memory

Message #3 Posted by [Tim Wessman](#) on 13 Aug 2007, 12:38 p.m.,  
in response to message #2 by hugh steers

Yes, it is some saturn architectural weirdness. Saturn only has 5 nibble addressing, so it can only address 512k at once. Main RAM (HOME) is 256k, but part is used for stack, hidden directory, etc.

In HPGCC you are seeing main RAM, hidden ram (~90K - the leftover from the 128k bankj reserved for the ARM OS) and IRAM (port 1) turned into one contiguous block. It is a 512k RAM chip, but part is reserved for the ARM emulator so you never have the full 512.

### sum list in 17bii solver equation

Message #1 Posted by [Don Shepherd](#) on 13 Aug 2007, 9:34 a.m.

I don't think this is possible, but is there any way to change the value of a sum list item within a solver equation?

### Re: sum list in 17bii solver equation

Message #2 Posted by [Vincze](#) on 13 Aug 2007, 9:37 a.m.,  
in response to message #1 by Don Shepherd

I have only played with a 17BII once, but I thought you could navigate though the list with the up and down arrows, and then delete the item and then reenter a new item for the changed value. Actually, I think you can just type over the item value that you wish to change.

### Re: sum list in 17bii solver equation

Message #3 Posted by [Peter A. Gebhardt](#) on 14 Aug 2007, 9:11 a.m.,  
in response to message #1 by Don Shepherd

Don,

I hope I understand your question correctly - did you try the following snippet?

Quote:

```
SIGMA( i: 1: n: L(step:<EXPRESSION>): 0*L(variable:G(variable)<OPERATOR>
<EXPRESSION> .... ) )
```

<OPERATOR> == \*,/,-,+ ... <EXPRESSION> == any valid expression in the solver context

Best regards,

Peter A. Gebhardt

### Re: sum list in 17bii solver equation

Message #4 Posted by [Don Shepherd](#) on 14 Aug 2007, 10:06 a.m.,  
in response to message #3 by Peter A. Gebhardt

Peter, I should have phrased my request better. By \*sum list\* I mean a named list associated with the Sum function from the main menu. You know, press Sum and start entering values in the list, and when you are done you can name the list. You can \*read\* these sum list items with the ITEM function in a solver equation, but you cannot \*write\* or update them within the solver, at least I have not been able to do that and I have a feeling you cannot do it.

L(ITEM(MYLIST:1):123) does not work.

### **Re: sum list in 17bii solver equation**

Message #5 Posted by [bill platt](#) on 14 Aug 2007, 10:26 a.m.,  
in response to message #4 by Don Shepherd

To be able to do that would be way too cool and would border on black magic! :-)

### **Re: sum list in 17bii solver equation --> 35s solver**

Message #6 Posted by [Katie Wasserman](#) on 14 Aug 2007, 12:23 p.m.,  
in response to message #5 by bill platt

True you can't do this on the 17bii but you \*can\* do it on the 35s with the expression fragment: 0x( aaa STO I + bbb STO (I)). aaa is the array index location, yyy is whatever you want to store in that array location. (You can, of course, you J and (J) if you'd like too.)

You can use this to control looping on the 35s too [there's more here](#).

Edited: 14 Aug 2007, 12:25 p.m.

### **Re: sum list in 17bii solver equation --> 35s solver**

Message #7 Posted by [bill platt](#) on 14 Aug 2007, 2:44 p.m.,  
in response to message #6 by Katie Wasserman

Holy cow, how did I miss that thread!

Nice work. When I read about the sto rcl inside the equation list I must admit I was excited too, but I hadn't thought of anything concrete--it was just a feeling like, "now \*that\* will be useful!"--and so it is!:-)

### **Re: sum list in 17bii solver equation**

Message #8 Posted by [Peter A. Gebhardt](#) on 14 Aug 2007, 1:17 p.m.,  
in response to message #4 by Don Shepherd

Don,

as Bill Platt already stated - sorry (currently?)not ...

Something Bob McGuire, Tony Hutchins any many other great contributors to this Forum already missed very much.

The only hope is, that HP at some future time would bring us a new type of financial calculator with the best of the HP19b/27s Solvers combined with the urgently needed enhancements requested so often already.

What I discovered playing around with the offered code snippet on an 200LX is, that

- loop variable "i" does show up in the custom menu, if used in an expression

- "i" is not the same as L(i, ...), so g(i) to supress it showing up on a custom menu doesn't work - so TWO VARIABLES "i" (or a second "instance" of ANY loop variable), are apparently possible!

Best regards,

Peter A. Gebhardt

**Re: sum list in 17bii solver equation**

*Message #9 Posted by [Don Shepherd](#) on 14 Aug 2007, 3:13 p.m.,  
in response to message #8 by Peter A. Gebhardt*

Peter, you are probably right.

As a programmer, the idea of 2 different variables with the same name makes me just want to go find a tropical island somewhere and get away from it all!

Katie's insights into the 35s solver are nothing short of brilliant. I'm still trying to comprehend it all.

**71A?**

Message #1 Posted by [Annie S.](#) on 13 Aug 2007, 7:51 a.m.

Does anyone know anything about the HP-71A? I know there's a B, but what happened to the A version?

I have searched this site and find no mention. I have searched the internet and find no mention. It has really piqued my curiosity. I'm hoping someone can shed some light! Thank you

**Re: 71A?**

Message #2 Posted by [Eric Smith](#) on 13 Aug 2007, 12:54 p.m.,  
in response to message #1 by Annie S.

There wasn't an A suffix. The project that resulted in the 71B never intended to call it 71A. There may have been other designations used during product development before 71B, but as far as I've ever heard, they did not include 71A.

The 75 story is more complicated. The 75 designation was going to be used for two variants, the 75C and 75D, with 8K and 16K of internal memory respectively. However, at release, only the 16K version was introduced, and given the 75C designation. At least one photo of a unit with the 75D designation slipped out.

The later 75D model was not part of that original plan. It was a 75C with the standard 16K of memory, with an added port for a bar code wand.

The 75 had at least one earlier pre-release designation, which IIRC was 1000CX, not related to the later palmtop with that designation.

**Re: 71A?**

Message #3 Posted by [Raymond Del Tondo](#) on 13 Aug 2007, 5:28 p.m.,  
in response to message #2 by Eric Smith

Hello,

IIRC, the manuals shipped with the HP-71B show the upper right corner of an 'HP-71'...without any additional character.

Maybe this could be taken as an indicator that at least they wanted to keep the option for another designation character?

Raymond

**Re: 71A?**

Message #4 Posted by [Matthias Wehrli](#) on 14 Aug 2007, 3:07 p.m.,  
in response to message #2 by Eric Smith

Addition here too.. there is also a HP-75CX... ;)

**Re: 71A?**

*Message #5 Posted by [Matthias Wehrli](#) on 14 Aug 2007, 3:07 p.m.,  
in response to message #1 by Annie S.*

To be a bit more exact....

Before the 71B got his name it was designed as a 44(C?). I have a nonworking unit where the mainboard is labeled 00044-xxxxx. As I said, unfortunately nonworking.

Matthias

### new 35s triggers hp nostalgia

Message #1 Posted by [gteague](#) on 12 Aug 2007, 10:38 p.m.

rec'd a 35s a couple of days ago and found my way to this forum. the display \*might\* be tilted a half-pixel down at the right, but it might be my imagination from reading all the posts on the topic. [g] also, my checksums match the book examples perfectly. my dislikes are not being able to use more than one character in variable names, how different input is going from rpn<>alg and back and the fact they didn't use the 2nd line for 'soft' functions ala the 27s.

that out of the way, i really like the overall quality, the tactile feedback of the keys, and i really like the form factor and the solid feel of the calculator. even i'm not old enough to have been able to afford the original hp35--my first hp calc was the hp55 with 49? program slots and some sort of multi-timer function. around 1975 or 1976 i'd say--i was in navy communications stationed at gtm. five or six hundred dollars was quite a sum from my pay as an e4 in the 70's!

but i was hooked after that. i helped a roommate build the ur pc--the altair 8800--and owned nearly every major scientific and programming calculator model from hp and ti from 1975 until today. ti's were of laughable quality compared to hp's for many many years and i was much saddened when the first hp calculator built in singapore or malaysia appeared--they just seemed like junk compared to the early hp models: 35/45/55/67 &c.

my reason for this much detail is that up until i came across this forum, i hadn't realized how much those 'junk' calculators were going to be treasured after hp went even further down the toilet. tragically, about 3-4 years ago i just tossed out about 4 or 5 old hp calculators including a 20s and and 32s or 32si and some other models i can't remember. all of them that thin, plastic form factor though, like the 27s.

i did save one from the trash though--my 27s. although it has two huge major flaws i still find it one of the most innovative and easy-to-use calculators hp has ever made, although i'm sure some would claim that its stretch to be all things at once was its downfall.

it has about as many business as scientific functions and a clock and timers and appointments. and an i/r printer link also. the big innovation though was a two-line display which used soft function keys which made having to dip into the reference manual nearly superfluous. it had a solver/equation writer which included let and get functions which let you write quite powerful program/equation lines. and a technical manual with further program examples was published with it.

and the warts? abysmal battery life--just a couple of weeks with alkaline batteries whether being used or not. the manual recommended mercury batteries, but never having found any, i'm not sure how much longer they would last. and the other problem was a dim, low-contrast display that was hard to read in any light. and i'm sure this wasn't just the sample i had, since, even today you can tell from the pictures that none of this model had a crisp display.

anyway, i noticed someone selling one of these on ebay for \$199! i'm glad i kept at least this one out of the batch i threw away.

so after owning all these calculators over the years, what would be my vision of an ideal calculator? the one in the hp 200lx palmtop computer. i've never seen one to even approach it, much less equal it. give me that calculator in

the form factor (or close to it) of the 35s and add symbolic manipulation (cas?) and i'd pay nearly any amount for it.

/guy

Not minutes, but seconds... Or place a high enough bid early that nobody is going to outbid anyway, if you really desperately want the thing. Or bid on defective units that nobody else wants to buy and try to fix them (this is how I get most of my calculators).

Greetings, Max

### Oooh! Off Topic eBay Bidding Secrets! Warning!

Message #7 Posted by [Howard Owen](#) on 13 Aug 2007, 4:20 a.m.,  
in response to message #1 by Vincze

Now that I've averted your attention ..

Placing a bid at the last possible moment is called "sniping." It's the only way to avoid the stupid herd mentality created by the modified auction setup that practically guarantees you will lose or else pay too much - thereby losing as well.

With sniping, you decide in advance what your maximum bid will be for the item in question. If the item is higher than that in the last minute of the auction *you don't bid*. Raising your bid at that point will pull you in to the eBay psychology that tends to favor sellers - who are the real customers of eBay. (What are buyers to eBay? *Products*.)

Placing a snipe bid in time can be tricky. If you bid too soon, some fool is apt to outbid you. If you wait too long, your bid won't be accepted. In the former case, you might also be tempted to raise your bid again. To avoid all these problems, I use a sniping service. There are several of these. The one I use is eSnipe, though I don't know if they are better or worse than any of the many other such services. (Google is your friend.) eSnipe takes a small percentage of the final auction value, only if you win. If I see something I want on eBay, I decide what I want to pay, and place a bid with eSnipe. I then forget about the whole thing until I get an email telling me what the result was. This is usually a week or more later, and always comes as a slight surprise - often a pleasant one. Using eSnipe, I have never lost a bid because someone else sniped faster than I did. If I lose, it's because someone outbid me *before* the end of the auction.

Nowadays I don't buy off eBay too often. When I was building my collection, I did a whole lot more, and eSnipe saved me lots of money toward the latter part of my spending spree.

Best of luck.

Regards,  
Howard

### Re: Oooh! Off Topic eBay Bidding Secrets! Warning!

Message #8 Posted by **Maximilian Hohmann** on 13 Aug 2007, 6:23 a.m.,

Hi!

Quote:

\_\_\_\_\_

To avoid all these problems, I use a sniping service.

\_\_\_\_\_

If the auction we are talking about here is the one I think it is, then it was on eBay Germany. The rules of eBay Germany explicitly forbid the use of sniping services. Using them anyway means willingly breaking the contract between seller and bidder, thereby committing fraud, which is a criminal offence in this country. Maybe difficult to prove, but illegal anyway, therefore I don't do it and therefore I am one of the "fools" who place their high bids early.

Greetings, Max

### **Re: Oooh! Off Topic eBay Bidding Secrets! Warning!**

Message #9 Posted by **Howard Owen** on 13 Aug 2007, 7:25 a.m.,  
in response to message #8 by Maximilian Hohmann

In my opinion, you aren't the fool. The guy that (inevitably) comes along and says "Well, gee, this guy must know something I don't!" and then places a bid \$100.00 above your already high bid has a much better claim to the dishonor. In my experience, he or she is always out there, somewhere. It's cool if you are a seller.

Regarding legality, sniping is *not* illegal in the U.S. I always log on to www.ebay.com, the U.S. eBay site. I therefore don't worry about the laws of other countries, at least insofar as the actual bidding goes, since the goods are being offered on a U.S. site to a U.S. customer. I admit that legal matters can get murky when dealing with varying national laws as regards commerce carried out on an international, yet casual basis, such as the Internet has allowed us to do on a large scale for the last 15 years or so. But I think I'm on pretty firm ground here.

Regards,  
Howard

### **Re: Oooh! Off Topic eBay Bidding Secrets! Warning!**

Message #10 Posted by **Eric Smith** on 14 Aug 2007, 8:28 p.m.,  
in response to message #9 by Howard Owen

There's a difference between eBay German saying that you can't use a "sniping service", and saying that you can't snipe. If they say you can't use a sniping service, that doesn't have anything to do with whether you can place a bid yourself in the last few seconds of an auction. Presumably they're not going to claim that you can't snipe, since a snipe is just a perfectly normal bid.

It also seems unlikely that they could ban using sniping software on your own computer, or that they would want to do so.

If they really wanted to ban sniping entirely, they could just program their servers not to accept any bids in the last 30 seconds of the auction. Guess what would happen?

I think they arguably have a legitimate basis for wanting to ban sniping services, as a security issue. They don't want you to give your eBay password to a third party.

**Re: Oooh! Off Topic eBay Bidding Secrets! Warning!**

Message #11 Posted by [Howard Owen](#) on 15 Aug 2007, 2:43 a.m.,

\_\_\_\_\_

What, the sniping would move to the last 60 seconds? 8)

Quote:

\_\_\_\_\_

I think they arguably have a legitimate basis for wanting to ban sniping services, as a security issue. They don't want you to give your eBay password to a third party.

\_\_\_\_\_

Yes, it takes a certain puckering to give control of your bids to a third party. However, I haven't been abused by the service I chose. And I don't think that really would concern eBay too much unless it were a statistically significant problem. Even then, it would be self-correcting. People would learn.

No, I think ebay's dislike of sniping is due to the fact that it short-circuits their quite clever and millennially profitable con game on the buying public. To judge by my experience, it tends to hold down final auction values, which hits their bottom line directly. I'm wracked with regret and sorrow over that. 8)

Regards,  
Howard

**Re: Oooh! Off Topic eBay Bidding Secrets! Warning!**

Message #12 Posted by [Thomas Okken](#) on 13 Aug 2007, 10:35 a.m.,  
in response to message #8 by Maximilian Hohmann

Given an auction format where the auction will end at some predetermined time, sniping is the only logical approach from the buyers' perspective. Bidding significantly before the end of the auction only broadcasts your interest to everyone else, with the effect of raising the price.

Making sniping services illegal seems a bit childish -- I think if you really want to take the sting out of sniping, they should introduce a cooling-off period (dang, just like a "real" auction -- no way to patent \*that\* idea, I guess!), so that an auction would stay active for at least, say, 1 minute after the last bid.

Me, when I go to eBay, I always snipe, and I always do it by hand. If nothing else, it's more exciting that way. :-)

- Thomas

**Re: Oooh! Off Topic eBay Bidding Secrets! Warning!**

Message #13 Posted by [megarat](#) on 13 Aug 2007, 11:11 a.m.,  
in response to message #12 by Thomas Okken

I'd like to add that placing an early bid (albeit for only the minimum bid above the current value) can help you win the item in the possible event of a tie between bidders. To break ties, eBay defaults to the bidder who first bid in that auction.

Odds are slim it will do anything for you, but it's helped me win two auctions in the past, so if I really want the item I give it a small, early bid.

(I'm also a sniper, but I do it by hand. I keep two windows of the auction open: one with my bid set up and ready to deploy, the other of the auction itself, to gauge the available time left.)

-cam

*Message #14 Posted by [Raymond Del Tondo](#) on 13 Aug 2007, 7:09 a.m.,  
in response to message #7 by Howard Owen*

Hi,

I have to admit that I never used a sniping service.  
I'm sure many eBayers do, as can be seen by their bid history.

But using a sniping service is one of the things which make the whole thing unfair,  
and pulls off the fun.

I know there are various other unfair methods used on eBay,  
but this is one of the worst IMHO.

'Sniping' an auction is not a problem in itself,  
and if you do, be man enough to do it by hand,  
not through an automated service!

Just my 2 Eurocents;-)

Raymond

### **Re: Oooh! Off Topic eBay Bidding Secrets! Warning!**

*Message #15 Posted by [Howard Owen](#) on 13 Aug 2007, 7:35 a.m.,  
in response to message #14 by Raymond Del Tondo*

Quote:

But using a sniping service is one of the things which make the whole thing unfair,  
and pulls off the fun.

Bidders who always top a reasonable bid because they think you must know something they don't take *all* the fun out of eBay, for me.

And as far as "fair" goes, eBay is set up to favor the seller. The site charges sellers a significant amount for access to all those buyers - that's you and me most of the time. The higher the final value of the auction, the more eBay rakes in as a percentage. That means it is in eBay's interest to pump up the final values. The fact that you can't retract a bid, and that you are encouraged to bid high both explicitly and implicitly is a huge tilt of the playing field in the direction of the seller, and it is quite deliberate. Far

from being unfair, sniping actually redresses the balance between buyer and seller, so that it becomes something closer to a real free market, instead of a phony one.

Regards,  
Howard

Hi Howard,

Quote:

\_\_\_\_\_

Bidders who always top a reasonable bid because they think you must know something they don't take all the fun out of eBay, for me.

\_\_\_\_\_

Of course, this begs the question "What constitutes a reasonable bid?"

I may think \$100 is a reasonable bid for a particular item - you may think \$25 is a reasonable bid and that my \$100 is outrageous. It all depends on which side you are on.

While there are times I may have *Bidders Regret* for not bidding high enough and losing out, I much prefer that to having *Purchasers Regret* for Bidding too high and actually winning an item I should have stayed away from.

Bill

**Re: Oooh! Off Topic eBay Bidding Secrets! Warning!**

*Message #17 Posted by **Howard Owen** on 13 Aug 2007, 8:39 p.m.,  
in response to message #16 by Bill (Smithville, NJ)*

The third or fourth 42S I bid for on eBay went for \$450.00 when I had placed a "can't top it" bid of \$440.00 or thereabouts. On the one hand, I was quite happy to have been outbid at that price, but on the other, I couldn't help but question the sanity of the bidder who won the auction. On reflection, I had to question my own sanity for placing such an outrageous bid, but that's the nature of the psychology on eBay. I eventually bought a very nice 42S for around \$250.00 - which is more in line with the average on eBay - by sniping the auction.

So when I call other bidders "idiots" for behavior like that, I'm doing so from the knowledge that I have been guilty of the same idiocy. I also know that the system eBay has set up tries to manipulate buyers into placing larger bids than they might otherwise. The thinking goes "If I bid higher than I know the item is worth, I'll probably win. And I probably won't have to pay my top price, anyway." My experience has shown me that this thinking is completely wrong on both counts. Sniping gets rid of the coercive psychology that tracking an auction on eBay engenders, and restores some sanity to the process.

Regards,  
Howard

*in response to message #14 by Raymond Del Tondo*

Quote:

I know there are various other unfair methods used on eBay, but this is one of the worst IMHO.

Why?

People tend to forget that the highest bid "wins" the auction, not the last one. It may be seen as unfair if you place your bid according to the current highest bid and not to what the object is worth in your opinion. But then, \*that's\* unfair to those who cannot afford the prices resulting from bid wars.

> not the last one.

>

That's what I wrote in my first posting;-)

However I still think using eBay sniper programs is simply cheating.

It's a difference if you place your bid personally,  
regardless if you do it a few seconds before the auction end,  
or if you let a machine do the job.

'Sniping' an auction is not a problem in itself,  
and if you do, be man enough to do it by hand,  
not through an automated service!

Good man :-)! In this case you really deserve your prey.

Occasionally, I have also done some 'manual sniping', but due to the nature of my job, I often can't be in front of the computer when the interesting auctions end. Which means that I have to bid early and see what comes out.

Greetings, Max

I don't think this is the place nor that Ebay would listen to my idea but I think.. If at the end of auction time, ebay would allow anyone to submit a higher bid for the next 1 minute or so and then if there is a bid in that amount of time then the auction is extended for another minute. It would not make the end of auction very long but let the true highest bidder win and ebay collects a higher fee.

in response to message #21 by Chan Tran

I also don't understand why eBay doesn't do that, since that is the norm with physical auctions.

Also, if the value of an item is uncertain, then theory suggests that bidders overpay in auctions. Basically, if you assume that individual estimates of value are normally distributed, then the highest bidder will have exceeded the true value of the item. This is known as the Winner's Curse.

I've "sniped" (only by hand) a few times, as a way of making it like a sealed bid. Usually I don't get what I bid for, which is fine-- I made my decision and bid as much as it was worth to me, and I wasn't going to reconsider and bid more even if someone else outbid me. Making it like a sealed bid, we don't see each other's bids until it's too late to respond. I hate bartering.

Quote:

\_\_\_\_\_

But using a sniping service is one of the things which make the whole thing unfair,

\_\_\_\_\_

Your definition of "fair" must be much different than mine.

It is fair if the seller and auction system do not do anything to preclude every bidder having the same

opportunity. Everyone has the opportunity to (try) to place a bid in the last few seconds, whether they do it by means of a sniping service, sniping software on their own computer, or by "hand".

As far as I can tell, neither eBay nor the sellers do anything that prevents all bidders from having that opportunity.

It's possible that a particular bidder can't afford to pay a sniping service, or has a slow internet connection that makes placing a bid in the last few seconds unreliable. Neither situation would be the fault of eBay or the sellers.

in response to message #7 by Howard Owen*

I use AuctionSniper. I have tried manual sniping, but it is a complete waste of time and I do not like the excitement or the drama of constantly leapfrogging over another bidder. I set my max price and forget about it. It saves me a lot of time and money (mostly by losing by not getting emotional). Many call it cheating or unfair. Bottom line many snipe (look at the bid history of everything you've lost), and if you want to win you need to play their game too.

For more sniping info start here: [http://en.wikipedia.org/wiki/Auction\\_sniping](http://en.wikipedia.org/wiki/Auction_sniping)

Quote:

Analysis of actual winning bids on eBay (Yang and Kahng, 2006) suggests that winning bidders are more likely to have placed a single bid late in the auction, rather than placing multiple incremental bids as the auction progresses.

The Yang/Kahng paper has a lot of math (enjoy!) and can be had here:  
[http://arxiv.org/PS\\_cache/physics/pdf/0511/0511073v1.pdf](http://arxiv.org/PS_cache/physics/pdf/0511/0511073v1.pdf)

Vincze, you can always use EMU71 until you score a 71B. And do not forget to post a WTB. I usually try WTB first, many are interested in selling, but do not want to deal with eBay. I have found WTB to offer fair prices, most offer pricing below eBay current wins, others are much lower. Twice I ended up working out a trade that benefited both much more.

The keyboard mapping should be explained in the associated \*.doc file.  
To get started, you should take a look into the HP-71B manuals,  
which are available through the hpmuseum site.

For manual related questions, you could also drop me a mail...

in response to message #1 by [Vincze](#)

There are deals to be had on the auction site. I purchased a 71B on that site last month for \$80, near-mint (only the slightest wear on the rubber feet), with case, manuals, template, etc, in box. Yes, really.

I am not yet willing to reveal my secrets, as I'm still looking, but I will hint:

In order to find the best deals, you must change how you look for them. I promise that searching for "HP Calculator" with default search settings is the worst possible way to find a deal.

Good luck!

in response to message #32 by [Vincze](#)

Look for "Hewlett Hewlitt Hewllet" and so forth. That's an old trick. It often results in a buyer taking unfair advantage of a seller who has misspelled the name of his goods. Mis-categorized items are also

often good bargains. This is how Coburlinfaratu gets a lot of his deals.

### **Re: HP 71B**

*Message #42 Posted by [Alex L](#) on 14 Aug 2007, 12:36 p.m.,  
in response to message #33 by Howard Owen*

Look at ALL the search options. Manipulate them to your best advantage.

If you're lucky, you'll search in a way that few others use and you'll be able to snap up some great

deals before anyone else even knows they're there. The 71B I bought had a page view counter in the listing; when I viewed & bought it, the counter was at 00002. This requires some luck, too.

If you're really lucky, you'll find some searches that work even better than what I use. That's the other reason I'm not going to just spell it out... you may do better than I have!

Again, best of luck and best wishes.

Vincze,

What about looking for an 200LX on ebay (still plenty of them available!) and use "emu71" on it?

Quote:

Emu71 is a software emulator of the HP-71B machine. Main features: - runs under DOS or in a command box in Windows (95,98,2000,NT, ...). - text mode application consistent with the HP-

71B system look and feel. - can emulate any numbers of ROM or RAM modules. - very fast emulation engine written in optimized assembly language, - runs correctly even on slow 186 (e.g. HP200LX), 286 systems although at reduced speed. - FREEWARE: free for non commercial usage, (a short mail with your opinion to the author would be appreciated), - NEW: emulation of the HP-IL loop and 6 HP-IL devices (one video display, three mass storage units, one printer interface, one DOS interface), - NEW: direct access to LIF image file archives, - NEW: supports 43/50 lines video modes (very convenient!), - Optional control of external HP-IL loop from Emu71, and/or communication with an external HP-71B (Emu71 version available after registering to the author).

<http://www.hpcalc.org/details.php?id=3658>

Best regards

Peter A. Gebhardt

**Re: HP 71B**

*Message #48 Posted by [Vincze](#) on 16 Aug 2007, 8:36 p.m.,  
in response to message #47 by Peter A. Gebhardt*

I have emu71 on computer, and it okay, but it is not 71B. I want really want a 71B, as the hardware is what intrigue me most. Just like emulators are nice to see how something work, it just not the same. I guess it is the wow factor that is nice. I pull out my 15C, and I say WOW.

### My First Five Minutes with a TI nSpire

Message #1 Posted by [Howard Owen](#) on 12 Aug 2007, 1:10 a.m.

I have a non-retail CAS version, sans desktop software. The user interface is striking. I haven't decided whether it's useful or not, yet.

### The Keyboard

The keyboard is guaranteed to repel a classic HP calculator enthusiast on first sight. There are two "banks" of keys. The primary bank contains the numeric keys, arithmetic, logarithmic trigonometric functions and exponential functions, plus a few others. These keys are oddly shaped, but arranged in a reasonable grid. They have a small amount of tactile feedback, or click, though nothing like what I would consider adequate. The keys are dark gray with the primary functions in white, and shifted (ctrl) functions in light gray. The latter legends have poor contrast, the former very good contrast. The keys are low-profile, rising from the surrounding case by about 1/8".

The *secondary* bank lives on the interstices of the grid formed by the primary bank's keys. The keys are small, round, and raised above the primary bank by about 1/8". All these keys have only one function labeled on them. Most of the keys are alphabetic characters from A-Z. These are colored *green* with white labels. The contrast is adequate. The keys that are not alphabetic are arranged outside the primary grid, and are colored very light gray with black labels. The contrast is again adequate in my opinion. These keys contain a grab-bag of functions such as single and double quotes, punctuation marks and some functions of mathematical significance such as =, <, >, EE, theta, pi and i. The tactile feedback of these keys is somewhat stiffer than the primary keys.

Above the two banks of keys are six "function" keys and a five-way navigation disk. The "function" keys have fixed functions, hence the quotes. The primary functions are esc, tab, ctrl, home, menu and <-.

Together, the two banks of keys are remarkably functional. The shape of the primary bank keys becomes clear when you consider that they fill out the space between the secondary bank keys. The result is that you can key the primary keys, or the secondary ones, with your eyes closed. The secondary keys serve as guides for the primary ones when using the latter. When keying the secondary bank, staying on the higher plane is easy using touch alone. I still don't know how well this arrangement will work in actual use, but I'm impressed that a new approach to a hand held calculator keyboard has been demonstrated on this new machine.

### The Display

Wow!

I think others have mentioned the original Macintosh when discussing this display. The comparison is apt. This grayscale LCD panel looks great. It's about one half inch taller and about the same width as the display on the 50G. And while the dark font on the 50g makes for better contrast, the grayscale screen and anti-aliased graphical elements on the nSpire are spectacular. This display will no doubt be the benchmark for devices of this type going forward.

### The Interface

This machine is targeted squarely at the educational market, and its user interface reflects that fact. The basic abstraction is the "document." This is a collection of applications, problems and notes that you access via a directory browser. Selecting a file with the five way navigation disk is intuitive if you are used to PC operating systems. Considering that students in the US and Europe are guaranteed to be familiar with this metaphor makes the choice seem logical. The similarities to PC interfaces extend to shortcuts for copy/paste and undo/redo. These are the same as the standard keystrokes in Windows, Gnome and KDE.

The document is presented in a series of tabs across the top. each tab is a "page" and each page can contain an application, a problem or a note. The applications are things like "Calculator," "Lists and Spreadsheets" and "Graphs and Geometry." Switching between pages is accomplished with ctrl-right and ctrl-left on the navigation disk. Paging is ctrl-down and ctrl-up on the same disk. Without ctrl, these functions scroll one character or line as the case may be.

My quick read on the interface is that it is limited enough to not suffer from clutter and confusion, but powerful enough to get the job done. The collection metaphor isn't new, but its application on this machine seems like a good choice.

## Programming

What programming? The user guide doesn't mention the word. The reference manual documents control structures and logic functions very similar to a structured BASIC, but I saw no applications of these in a quick browse of the user guide. There is quite a bit of discussion of automation, but all in the context of specific applications, such as the graphing slate. I can't tell yet if this is an effective pushing of programming into the background behind the real work the calculator is designed to do, or if it's just a gap in the docs. Time, and more effort on my part, will tell.

## Using the Applications

I haven't done much of this so far. As is typical for me, I'm more interested in the system aspects than the applications. But these apps look interesting enough to hold my attention for a while, so I'll probably have more to say on the topic later. The integration between applications and between the hand held and the PC desktop is supposed to be a prominent strength of the nSpire, so that will also spur me to look at that area.

## Sync Software

Nothing special here. There's a nice screen shot facility, and the usual backup/restore functions. One interesting thing is that the link software is bundled with a Java runtime. It's possible that this app could run on OSen other than Windows. As I say, I don't have the desktop CAS software. But if it too is in Java, there might be a hope of it being cross platform as well.

## Preliminary Conclusions

This machine is for real. None of the features I tried appear to be merely "gimmicks" to draw a buyer in. Stuff that looks gimmicky, like the keyboard, actually turns out to be well thought out and functional. There are a couple of new elements in the machine, and more existing features that haven't been applied to calculators before. I can't say for sure without getting up to speed on all the apps, but this machine may represent a genuine breakthrough in hand held calculation, at least for the educational market. At the very least, it is food for thought about what such a device can be.

Regards,  
Howard

## Re: My First Five Minutes with a TI nSpire

Message #2 Posted by [Don Shepherd](#) on 12 Aug 2007, 8:45 a.m.,  
in response to message #1 by Howard Owen

Howard, great review. Let me add a few points based on my experience with this calculator (the non-CAS version) about a month ago.

The keyboard. Yes, it's a piece of work all right. It is nice to not have to press a shift key to use alpha characters, but the keys are pretty tiny, and with my stubby fingers I often miskeyed entries. I think it just takes some getting used to. The intended market (high school kids) will probably find it easier than I did.

The display. I agree, it is very good. I had (and still have) trouble with the resolution. You really have to position it at just the right angle in order to see things, and it works best when you have a strong light source. At the conference I attended, I could barely see my screen because they turned the lights down in the classroom to use the viewscreen on the overhead projector, and in that dim light situation the unit was almost unusable. I hope TI comes up with a better version.

The interface. If you remember the [website](#) TI setup it shows a teenage girl dragging images around a \*screen\* by pointing with her finger. If they had actually built it that way, I agree that this would be some kind of revolutionary product. But the pointing and dragging is done with keys, not your finger, and my experience in doing this was that it kind of takes the fun out of it. It's going to be a really steep learning curve for kids to learn how to do that effectively, without getting frustrated because the click just didn't take. And kids don't have a lot of patience anyhow. A touchscreen would turn this into a revolutionary product. A TI rep at the conference mentioned that some research is occurring regarding using a mouse with the calculator. Short of a touchscreen, that would be a tremendous help.

Programming. Programming on this calculator is functions only. You don't \*run\* a program; you write a function, then invoke the function with the desired input parameters. You normally do this on the calculator page, using the menu command Function Logic in the Tools menu. You can include BASIC-like things like if..then and loops. Once defined, the user function can be invoked on the other types of pages (spreadsheet, geometry/graphing) as well. I think TI did programming this way because functions is something that high school students should learn, and this lets them quickly build their own functions and try them out. Pretty cool.

The NSpire is an interesting product. The integration of the four basic \*pages\* (calculator, geometry/graphing, spreadsheet, and notes) is great, and I think this calculator will be a terrific tool to help kids learn math.

Message #3 Posted by [dbatiz](#) on 12 Aug 2007, 10:56 a.m.,  
in response to message #2 by Don Shepherd

As I read your comments, I imagined a blue tooth style mouse that may be used with the device. But the additional desk space, and carrying around another battery powered widget, made me think re-think things.

Imagine this, put an optical mouse sensor under the n-Spire itself. Then, as you use it, you can slide it on the desk, like a mouse, to make changes on screen.

I wonder how well that would work,

Very respectfully,

David

*Message #4 Posted by **Don Shepherd** on 12 Aug 2007, 1:25 p.m.,  
in response to message #3 by dbatiz*

David, the NSpire is not a voyager-sized thing. It is a bit larger and heavier than the normal TI graphing calculators (83, 84, titanium, etc.), so I think using it as a mouse would tend to get tiring. It also would probably be difficult to look at the screen as it is moving!

Much better would be a stylus, to select an object on the screen and manipulate it, drag it, etc. The human finger would probably be too big to use this way, but a stylus would be great.

### **Re: My First Five Minutes with a TI nSpire**

\_\_\_\_\_

I suppose doing such things is not in the true spirit of the forum. It states at the top of this page-

"This forum is for discussion of HP calculators including usage, repairs, sources of replacement parts, general information etc."

but lets face it, there are a lot of calculator enthusiasts reading this forum. At one time if you wanted to keep abreast of the best in calculator innovations then you only needed to discuss HP products. Currently TI and Casio are competing fiercely in the market place and are beginning to innovate themselves.

I am always curious about the other forum members experience with these devices. They tend to cut through the "hype" and share some good information. Unless Dave thinks this is an abuse, I hope it continues.

### **Re: My First Five Minutes with a TI nSpire**

in response to message #7 by Vincze*

Quote:

.. it just puzzle me why such find discussion group about HP talk about TI.

This machine strikes me as the first really new approach to portable mathematics in years. If the nSpire has staying power, then it will be part of the world view HP will have when they bring out their next innovation in calculators. Having recently seen the fruits of the current HP calculator group's efforts at recapturing some of their legacy in calculators, I have little doubt that they *will* try to innovate in the space. When they do, the results will inevitably be compared against the nSpire.

Besides, I'm a gadget head, and this is a cool gadget! 8)

Regards  
Howard

### A Sigma Function in the 35s Solver!

Message #1 Posted by [Katie Wasserman](#) on 12 Aug 2007, 12:27 a.m.

OK not really but close!

Although I said I was going to stop playing with this "buggy little beast" (thank you Nenad) I apparently have not.

In rereading Gene's review I was struck by the ability to store into variables within an equation and thought that I might see what could be done with this. A good exercise would be to try to fill the indirect array with data by just using the solver, then take this one step further and add a way to control the endpoints.

First we some way to keep the solver running indefinitely, this little equation works well:

$1/A = -1/A$   
(that's a unary -)

Using this, the ability to STO I, STO(I) and adding a stopping condition we get:

$(IDIV(I,N)-1)/A = (1-IDIV(I,N))/A + 0x(I+1 > I > (I))$

(Here the ">" represents the filled in ">" that you see when you press STO in an equation.)

Enter this and press SOLVE. Solve for A, enter the starting value for I and the ending value for N and the "buggy little beast" will fill the array locations I thru N with the values I thru N! Actually because the solver wants to confirm that it found a zero (by doing an extra iteration) and because of the way I wrote the equation it will start at I+1 and fill to N+2, but you can easily make the needed adjustments.

This opens up the possibility of doing all sorts of calculations in the equation solver that would normally be done with SIGMA on a 17BII (for example), even more when you consider that you have an array that can be read/write addressed. Here's a really serious challenge: write an equation that uses the solver to calculate a few hundred digits of pi.

### Re: A Sigma Function in the 35s Solver!

Message #2 Posted by [Don Shepherd](#) on 13 Aug 2007, 8:08 a.m.,  
in response to message #1 by [Katie Wasserman](#)

Katie, educate me here. I'm trying to better understand the internal behavior of the solver, especially the 17bii+ solver in relation to the 17bii solver, but I am intrigued by your 35s example.

How does your equation cause the solver to iterate from a specific starting point to a specific stopping point?

### Re: A Sigma Function in the 35s Solver!

Message #3 Posted by [Katie Wasserman](#) on 13 Aug 2007, 10:45 a.m.,  
in response to message #2 by [Don Shepherd](#)

The 17BII and 17BII+ have a Sigma function in the solver that forces it to specifically iterate over a defined interval (see below for more). There is no such function in the 35s. Solver iteration in the 35s is determined by the internals of how the solver works and is generally not controllable. On the other hand, you can trick the solver into running for a really long time by giving it an equation that it can't solve yet slowly converges, something like:  $INV(A) = -INV(A)$ .

However, the 35s does have a STO function that seems identical to the L() function in the 17BII and 17BII+, this allows for incrementing a variable: e.g., I+1 STO I. Using these two pieces we can get the solver to run while for an incredibly long time while incrementing a variable. If you tell it to solve:  $INV(A) = -INV(A) + 0x(I+1 \text{ STO } I)$ , solve for A and give it a starting value of I=0 and A=1, it will run for about 2400 iterations on the 35s. After that point the solver will end up solving the equation by coming up with  $A \approx 1E499$ . 2400 is pretty much all the iterations you'd ever want to do on this calculator -- it ain't that fast -- I'll call it a near-infinite number of iterations for our purpose.

Here's how the rest of it works ... if 'T' is not the target of the solver, then the solver will prompt for the starting value. That leaves just the ending value and the need to use this ending value as a way to halt the solver's near-infinite loop. In the equation I wrote above this is done by,  $1-IDIV(I,N)$ . This will have a value of 1 when 'T' is less than N and of 0 when I becomes N (and until 'T' becomes 2N). Using this on both sides of the "=" the equation becomes  $0 = 0$  when 'T' becomes N, thus achieving the stopping condition for the solver.

The other element in the equation is: I STO (I). This is just to demonstrate that the controlled loop can do something useful: fill addressable memory with incremental values. You could just have well specified:  $0x(I+1 > I + RAND > (I))$  to fill memory (from the initial value of I to N) with random numbers.

This is all pretty non-obvious stuff and I've just begun to experiment with it, but it's amazing what just the STO function in the solver opens up. You won't find anything about this in the manual (or anywhere else as far as I know).

I don't have a 17BII+ but on the 17BII you can do the same thing in the solver:  $INV(A) = -INV(A) + 0xL(I:I+1)$ . Start with I=0 and A=1, solve for A and RCL I when it finishes and you'll find that I has a value of about 2400, showing that this many iterations have been done. Unfortunately you can't 'STO (I)' on the 17BII because it has no way to write to an array (although you can read the items in a list from within the solver). Of course you would never really do this on the 17BII you'd use:  $X = \text{Sigma}(I:1:N:1, \text{whatever you want to do})$ . Note that 'Sigma' is the summation sign and 'whatever you want to do' will be evaluated N times and the results will be summed and returned in X.

*Message #4 Posted by [Don Shepherd](#) on 13 Aug 2007, 1:03 p.m.,  
in response to message #3 by [Katie Wasserman](#)*

Wow!

It will take me a while to digest what you said. On first reading, I think I understand most of it, but I've got some playing around to do. You have really done some good work here, and I congratulate you.

I wish there was a book called "Everything you always wanted to know about the inner workings of the solver, but were afraid to ask." I'm still trying to figure out why the 17bii+ solver does not work like the 17bii solver (and it doesn't, believe me, especially with the sigma function).

Thanks Katie.

**Re: A Sigma Function in the 35s Solver!**

Message #5 Posted by **Thomas Klemm** on 14 Aug 2007, 11:43 p.m.,  
in response to message #1 by Katie Wasserman

Quote:

Here's a really serious challenge: write an equation that uses the solver to calculate a few hundred digits of pi.

When I first realized that we have about 800 registers to waste I was thinking what could I do that wasn't possible with my HP-11c?

Now with your challenge in mind I transcribed a C-program which uses the spigot algorithm for the digits of pi:

```
P001 LBL P      P018 FS? 0      P035 INT/
P002 STO N      P019 GTO P022     P036 DSE J
P003 4          P020 RCL(J)    P037 GTO P017
P004 INT/      P021 GTO P023     P038 ENTER
P005 STO I      P022 2E3      P039 CF 0
P006 CLx       P023 RCL* F    P040 RCL F
P007 STO D      P024 +          P041 INT/
P008 STO E      P025 1          P042 RCL+ E
P009 1E4        P026 RCL J      P043 STO P
P010 STO F      P027 ENTER     P044 VIEW P
P011 SF 0       P028 +          P045 x<>y
P012 14        P029 x<>y      P046 RCL F
P013 RCL* I     P030 -          P047 RMDR
P014 STO J      P031 RMDR     P048 STO D
P015 DSE J      P032 STO(J)    P049 STO E
P016 RCL D      P033 x<>y      P050 DSE I
P017 RCL* J     P034 LASTx     P051 GTO P012
```

40 XEQ P001

```
P=
 3141
 5926
 5358
 9793
 2384
 6264
 3383
 2795
 288      <<< mind the missing 0
4197
```

Though untested it should be possible to calculate a little more than the the first 200 digits. Using vectors could lead to even more digits.

But when I tried to write an equation for that algorithm I wondered how should I handle the inner and the outer loop? We can't use the solver within the solver, do we?

Probably I have to use a different approach then.

The C-program was taken from:  
Pi Unleashed.  
Jörg Arndt, Christoph Hänel

## Re: A Sigma Function in the 35s Solver!

Message #6 Posted by **Katie Wasserman** on 15 Aug 2007, 3:40 a.m.,  
in response to message #5 by Thomas Klemm

That's a pretty neat algorithm for pi and fits in a limited program space, nice work!

Like you mention it's at the expense of variable space and (I think) there's a risk of not working if there is a 99999... sequence somewhere in the first so many digits of pi that the program generates. (I know that the original Rabinowitz and Wagon program had this problem.)

However, the convergence is pretty fast and this might fit more easily into an solver equation than some more conventional methods. It's possible to simulate nested loops in the solver by doing something like:

```
(1-IDIV(C,N^2))*INV(A)=(IDIV(C,N^2)-1)*INV(A)
+ 0*
(C+1 STO C +
IDIV(C,N) STO I +
RMDR(C,N) STO J +
....
```

I and J could now be used as row/column indicies into a matrix (if only the 35s had matrices) or whatever.

I haven't yet tried to write an equation to solve for pi in the 35s solver, but some time ago I did it in the solver in the HP 200LX using a similar technique and storing/reading values from an list in the built-in Lotus 1-2-3 application. Look at the end of [this thread](#) to see how complicated it is. Without a better equation editor in the 35s I wouldn't want to try using this technique.

-Katie

## Re: 35s Sigma Function -- have you considered . . . ?

Message #8 Posted by **Katie Wasserman** on 16 Aug 2007, 1:04 p.m.,  
in response to message #7 by Paul Brogger

Paul,

I'm flattered by your comment but have to admit that this "hidden" solver functionality just adds up to little more than a curiosity. Because you can use the solver on a program, there's nothing that you can do within an equation that you can't do pragmatically; programs are also faster, more readable and more easily changed.

The only somewhat useful things I can think of given the ability to use STO in an equation are:

- (1) It provides a shortcut to re-typing an subexpression (not involving the target variable) that appears more than once in an equation.
- (2) You can store intermediate results and view these after the solver finishes. This might allow you study how your equation converges, see how errors accumulate or save side-effect results in a calculation.
- (3) Using a simple counter (C+1 STO C) allows you to determine the number of iterations the solver takes.

Of course all of the above are really just shortcuts, nothing that can't be programed.

-Katie

### **Re: 35s Sigma Function -- have you considered . . . ?**

*Message #9 Posted by **Paul Brogger** on 16 Aug 2007, 4:13 p.m.,  
in response to message #8 by Katie Wasserman*

Thank you for your thoughtful inclusion of a clear explanation.

I wonder whether H-P might be interested in including the feature (and maybe more straightforward nested looping) in all of their SOLVE-capable machines. Then, even the ones that aren't strictly "programmable" might have greater capability than they might have otherwise.

### **Re: 35s Sigma Function -- have you considered . . . ?**

*Message #10 Posted by **Stefan Vorkoetter** on 17 Aug 2007, 11:54 a.m.,  
in response to message #8 by Katie Wasserman*

Quote:

\_\_\_\_\_

(1) It provides a shortcut to re-typing an subexpression (not involving the target variable) that appears more than once in an equation.

\_\_\_\_\_

That strikes me as dangerous. How can you know that the instance of the sub-expression that does the STO gets executed before you use the STO'd value? Is there any guarantee that it executes from left to right?

Stefan

### **Re: 35s Sigma Function -- have you considered . . . ?**

*Message #11 Posted by **bill platt** on 17 Aug 2007, 12:44 p.m.,  
in response to message #10 by Stefan Vorkoetter*

In the 17b/19b/27s family, the direction of execution is spelled out clearly and the functions (L)et and (G)et are provided for this purpose. Katie is merely applying the same principle to the 35s--and it should be checked out but it just may work the same!

### **Re: 35s Sigma Function -- have you considered . . . ?**

*Message #12 Posted by **Katie Wasserman** on 17 Aug 2007, 1:09 p.m.,  
in response to message #11 by bill platt*

You're correct. Since the STO function is not documented there is now way to know for sure where it stands in order of precedence, nor even if it has the same precedence in all situations. My simple trial evaluations show that it has the lowest level of precedence and works left-to-right. But there's certainly no guarantee of this and it should be used with great caution.

(To take caution a step further, and given the checksum bug, it's even possible that STO might get different results each time the function is evaluated depending on the state of the machine.)

## **Re: A Sigma Function in the 35s Solver!**

*Message #13 Posted by **Thomas Klemm** on 20 Aug 2007, 7:48 p.m.,  
in response to message #6 by Katie Wasserman*

After playing a little more with the solver I realized that *SGN* could be used as well to count down. Due to the lack of a conditional branch within the solver I wanted to use two equations. First initialize the elements of the array to 2000 and then perform the inner loop.

Initialze registers I ... 0 to 2000:

```
0*(2000>(I))+SGN(I-1>I)/A+SGN(I)/A
```

Calculation of the inner loop:

```
0*(I+I-1>G)*  
(RMDR(D*I+(I)*1E4>D,G)>(I))*  
(IDIV(D,G)>D)  
+SGN(I-1>I-1)/A+SGN(I-1)/A
```

But alas the result was wrong!

It was only after a longer debugging session when I realized that *RCL (I)* doesn't behave as I had expected.

The following equation may be used for some tests:

```
0*(S+(I)>S)+SGN(I-1>I)/A+SGN(I)/A
```

Solve for A, set S=0 and I=10 and see what happens.

You might expect to find in S the sum of the values of the registers 0 - 10 but instead you get 11 times the value of register 10.

It seems that when recalling an indirect register from within an equation the index isn't updated for each iteration. Instead (I) refers always to the same register.

However when storing a value into an indirect register the solver behaves as expected. That's why the initialization with 2000 works fine.

You may call it a bug. On the other hand why would somebody want to do such a strange thing?

With this behavior of the solver I suspect it's quiet impossible to calculate a few hundred digits of pi. Or maybe it's only now that I realize the real dimension of your challenge.

## **Re: A Sigma Function in the 35s Solver!**

*Message #14 Posted by **Katie Wasserman** on 21 Aug 2007, 12:11 a.m.,  
in response to message #13 by Thomas Klemm*

Thomas,

You reached the same conclusion as I did after some further experiments -- recalling (I) or (J) is not predicable in the solver. When I suggested the "pi challenge" I wasn't sure if this problem could be overcome or not, but since then I haven't found a way around it. [I was getting very frustrated trying to write a sort function in the solver.] But there might be some hidden function like the G() function in the 17Bii solver that no one has found yet.

Gene, how did you know about the STO function, inside knowledge or did you just stumble upon it?

-Katie

### **Re: A Sigma Function in the 35s Solver!**

*Message #15 Posted by [Alain Mellan](#) on 21 Aug 2007, 1:25 a.m.,  
in response to message #14 by Katie Wasserman*

Quote:

But there might be some hidden function like the G() function in the 17Bii solver that no one has found yet.

In the beginning (before reading the manual :-), I didn't know how to enter the REGX, REGY, functions, so I tried RCL R, RCL E, RCL G, RCL X. And it worked. Same thing for example for SIN(X): instead of the easy way: SIN RCL X, use RCL S, RCL I, RCL N, (), RCL X. It works.

In other words, it seems EQN actually parses the command line edited under EQN mode. Maybe there are some hidden functions in there, for which there is no keyboard shortcut?

\*edit\*: I just tried G(REGX), and it didn't give me the usual SYNTAX ERROR!

\*edit 2\*: It seems A(REGX) is equivalent to RCL A \*

### **Re: A Sigma Function in the 35s Solver!**

*Message #16 Posted by [Katie Wasserman](#) on 21 Aug 2007, 9:19 a.m.,  
in response to message #15 by Alain Mellan*

G(X) is just an implied multiply of G times X in the 35s solver.

RCL whatever is simply the way to enter any variable in the solver.

The get, G(), function I was referring to is a special function in the 17bii solver (and several other HP calculators going back to the 27S) that recalls the value of a variable each time it's encountered. When used in combination with the let, L(), function it allows for side-effects in the solver. The 35s solver apparently has the L() function (in the form of STO) but not the G() function, or so it seems.

### **STO function in 35s Solver!**

Once you go Mac, you never go back.  
\_\_\_\_\_

I was a Mac user almost from the first -- since August 1984, to be exact -- but I defected to the Unix (SunOS) and Windows world nine years later... But that was mainly because I was frustrated that Apple wasn't moving MacOS to a Unix base; they finally did so with MacOS X, but that was 10 years later than necessary, in my opinion.

I've always kept fond memories of the Macintosh, though. Their UI has always been the best, and their hardware, while not cheap, is usually excellent also. Lately I've been ogling the Mac Mini... Looks like a nice machine, especially if I set it up with a KVM switch so I wouldn't even have to worry about migrating all my Windows and Linux stuff.

But then again, maybe I should spend the \$600 on a short vacation instead. ;-)

*Message #8 Posted by **Les Wright** on 12 Aug 2007, 7:11 p.m.,  
in response to message #7 by Gene Wright*

Fusion is new and there may be some glitches to work out, but so far I am so impressed. My Windows XP virtual machine runs faster and more reliably so far than my original PC. The main hassle I had was activating XP on installation--I have a valid OEM copy from a computer I don't use--but even still the automated service at the Microsoft toll free number was quick and worked!

Fusion has something called the Unity mode where you can run Windows programs right on the Mac desktop on their own (i.e., out side of a Windows window), and they even minimize to the dock like real Mac programs! And drag and drop from mac to windows environments is excellent.

I have a USB hard drive chassis so getting my old PC files over is a cinch. My plan in the next few days is to sort that out.

Just wish the thing had a multimedia card reader and more USB ports, but I am sure a hub and an external reader can be had easily.

What have I been waiting for all this time?

Les

**Go Texas Math!**

Message #1 Posted by [dbatiz](#) on 11 Aug 2007, 4:53 p.m.

My introduction to HP calculators was in the University of Texas Interscholastic League (UIL). I used to compete with my trusty HP 11c.

I doubt these tests would be a challenge to folks on this forum, but just for fun (and a chance to break in a new HP 35s), I provide the following link:

<http://www.texasmath.org/>

Click "Downloads", then Calculator "Application Tests".

Notice the cover art on the tests.

I'm working through them on my HP 50g.

Today, my speed is in the dumper, but my accuracy has improved. Considering the company here, please forgive me if I do NOT post my latest score.... ;) If anybody is interested, I'm sure I can dig up the rules for scoring these tests. Did anybody else do competitive math in school?

In Texas, competitive math starts in elementary school. I wish more states would have a UIL like program.

Very respectfully,

David

in response to message #1 by [dbatiz](#)

How long do the kids have to do this? A fixed time, or does quickness count, too? The credit for each (correct) answer must depend on the problem, too, since some of these are MUCH harder (well, as least more complicated) than others.

You also have to know some physics (or at least how gravity and constant acceleration work) for some questions, such as the ball bounce problem (as well as lots of conversion factors).

Did you bring your own calculator? Were you allowed to program it ahead of time for expected problems?

A pretty comprehensive set of questions.

IIRC, a previous contributor here (Ben Salinas) was one of the Texas school boy whizzes, and he LOVED his HP32 for this test.

Message #3 Posted by [dbatiz](#) on 11 Aug 2007, 6:55 p.m.,  
in response to message #2 by Dave Shaffer (Arizona)

Yikes, the rules have changed. It seems they only grade as far as you got in the test. They award five points for correct answers and deduct 4 points for wrong/empty responses. Contestants are allowed 30 minutes to work on the test.

I wonder if the SILENT requirement would disqualify a 50g? Is there any way to disable the BEEP completely?

For detailed explanation, please see the link below:

[http://www.uil.utexas.edu/academics/elem\\_jrhigh/calc\\_appl.html](http://www.uil.utexas.edu/academics/elem_jrhigh/calc_appl.html)

Very Respectfully,

David

## Re: Go Texas Math!

Message #4 Posted by [Ben Salinas](#) on 12 Aug 2007, 3:10 a.m.,  
in response to message #1 by dbatiz

Yep... I did these.

To clarify scoring is as follows: Multiply the last number attempted by 5. Then subtract from this, the number missed (or left blank, up until the last one completed) multiplied by 9 (essentially, you get 5 for every one done correctly and minus 4 for each one missed, although it only goes up until the last one completed).

Each answer should have 3 significant figures (unless otherwise noted), so most people kept their scientific calculator on "SCI 2". (Problems involving dollars should be to the nearest cent and problems asking for integers should be, well, integers) Calculators did need to be cleared before the competition (I think).

To give you an idea of where people scored: The winning people in the state (definitely not me) would finish the test and miss just a few (if any). It was not unusual to see scores in the 350-390 range. (You can also compare your scores to those from around the state by looking at the scores posted on the above list)

Texas does have a very large academic competition league (UIL), which can be good or bad. While it gets some students interested in math, it also gets students caught up in competition math. Of course, without UIL, I would have never seen an HP calculator.

Message #5 Posted by [allen](#) on 12 Aug 2007, 1:36 p.m.,  
in response to message #4 by Ben Salinas

I also got started with HP calculators because of Texas UIL math competition. Until our Algebra teacher invited us to a competition I was content with my TI-36X. After a terrible score on the first few tests (ironically missing from the link above), I started training with a 32sii borrowed from the school. I soon bought my own calculator. It is still sitting 1 meter from me in it's HP leather holster. :-)

Interesting links, guys! I had never heard of this before.

I found it particularly fascinating to go into the forums on that site and read what the younger crowd says about RPN versus AOS-type calculators, and how it helps their scores. Really enlightening.

One comment that occurred frequently, which disturbed me, was that they felt the TI calculators were more "accurate". In my experience, HP calcs were always the most accurate.

Another comment had be laughing AND shaking my head at the same time. This person wrote:

Quote:

P.S. Our sponsor is really old and has lots of HP32SII's just laying around. For those of you not in such a convenient situation, the old HP's cost around \$200 dollars on the internet. So taking cost into consideration, you can either go with a 33S, which I find unwieldy, or an algebraic notation calculator like a TI.

"lots of HP32SII's just laying around"?? Now that's my kind of school! ;-)

Anyhow, it's an interesting read. You can go directly to the forums by going here:

Vincze,

I became involved with the UIL in high school, grades 9-12. I've found study material for contests in the elementary school and middle school levels, grades 5-8. It is ran by the University of Texas, but the contests are for highschool and below.

I have family who were educated in Mexico. When they came to the States and enrolled in school, we backed them up 1 year so they could have time to learn English. They were surprised that the material, especially in math, seemed several years behind the Mexican schools.

IMHO I beleive US schools offer as much opportunity as any schools from any country, but the fewer kids have the desire to take advantage of it.

Very respectfully,

David

Quote:

They were surprised that the material, especially in math, seemed several years behind the Mexican schools.

I agree 100% with that statement. I am shocked at how "scared" students are of math and science in United States. Yes, some school really push math and science, but vast majority of schools seem not to. This is a big shame because we are losing pace with the rest of the world in these areas.

### **Re: Go Texas Math!**

I give one page of test to my son who will be sophomore this year, and he do very good on it. I also test myself, and I make a couple of stupid mistakes on very simple problem, but do well on harder ones. Duh... ;)

### **Re: Go Texas Math!**

*Message #11 Posted by **Tony David Potter** on 14 Aug 2007, 1:11 a.m.,  
in response to message #1 by dbatiz*

Thanks to all that visited my site (<http://www.texasmath.org>)

Texas is one of the few states that has academic contests between schools (in addition to athletics) and both here are governed by the UIL (University Interscholastic League, <http://www.uil.utexas.edu>)

The Calculator Applications contest evolved from the Slide Rule contest that UIL developed in response to World War II demand for mathematicians and engineers. The UIL considers the Calculator Applications contest to be a predominately engineering contest, hence all the involved physics word problems and surveying-type geometry problems.

The current incarnation of the test is a thirty minute, seventy problem test. Students are only graded on what they attempt, that is, problems skipped past the last problem attempted aren't counted wrong. Scoring is five times the last number attempted minus seven times each problem skipped or missed up to that point.

When I first started competing in this contest, I used an 11C. Since becoming a coach, I've indoctrinated dozens of kids into using 32SII's, 33S's, and just purchased my first 35S a few weeks ago. Students have told me of their "frustration" trying to use "other" calculators after training on the HP's, and I've given plenty of 48's (graciously donated from members on here) as "graduation presents" so they could continue to benefit from RPN (and return my 32SII's so I can teach the next batch.)

In additon to coaching Calculator Applications, I also coach UIL Number Sense and Mathematics, as well as work with students in the American Mathematics Contests (had my first USAMO qualifier last year), the Junior Engineering Technical Society TEAMS contest, and the Trig\*Star contest hosted by the National Society of Professional Surveyors. I enjoy teaching students to "think outside the box" that modern education has forced them into.

I'm glad people found my site interesting. If you have any questions, let me know.

Tony David Potter

*Message #12 Posted by [Chan Tran](#) on 14 Aug 2007, 10:16 a.m.,  
in response to message #11 by Tony David Potter*

Taking a look at one test and I found that the algelbaric calculator can do just as well if not better (I am talking about the advanced model that let you enter the expression as is) for the problem where they just ask you to evaluate an expression. For the word problem I think the RPN or RPL calculator would be much faster. The reason is that I would not have to write down any expression in order to solve the problem. The RPN calc allows you to solve for the small part at a time.

### **Re: Go Texas Math!**

*Message #13 Posted by [Ben Salinas](#) on 14 Aug 2007, 4:22 p.m.,  
in response to message #12 by Chan Tran*

The general consensus among competitors (and this is not shared by everyone) is that the calculations can usually be solved faster by using RPN because you don't have to think about parentheses. Some of my classmates who prefered using their TI-89 (and used it very well) tried the test and had a great deal of trouble because of how deep the parentheses go.

Once I got my 49g+, I would occasionally try using the algebraic mode there (which autocompletes parentheses), but I still haven't become used to that calculator.

Earlier in this thread there was a link to a thread on the TexasMath forum in which a few students (one of which I know, I think) stated they prefered using their 89's, so this is not an opinion shared by all.

### **Re: Go Texas Math!**

*Message #14 Posted by [James M. Prange \(Michigan\)](#) on 15 Aug 2007, 7:31 p.m.,  
in response to message #12 by Chan Tran*

Well, where it's a matter of evaluating a given algebraic expression, with the RPL models you could just enter and EVAL an "algebraic object". To be sure, to enter it from the command line, one may have to add some parentheses, and of course all multiplications must be explicit. On the 48/49 series,

setting flag -53 makes the calculator display extra parentheses that normally wouldn't be needed due to precedence rules.

Also, on the 48/49 series, you can view an expression in "equation writer" format, to check whether it matches the the given expression. But using the equation writer to enter the expression would probably be too slow, at least on the 48 series. For that matter, on the 49 series, expressions on the stack can be displayed in "Textbook" format.

Of course, for a "word" problem using an RPL model, an RPN sequence would typically be fastest because an algebraic expression wouldn't have to be developed.

Regards,  
James

**Re: Go Texas Math!**

*Message #15 Posted by [Chan Tran](#) on 20 Aug 2007, 7:31 a.m.,  
in response to message #14 by James M. Prange (Michigan)*

And the problems that I encounter would generally be word problem although most are relatively simple.

### Re: 35s SEED (& previous implementations)

Message #8 Posted by [Karl Schneider](#) on 11 Aug 2007, 4:50 p.m.,  
in response to message #1 by Thomas Radtke

SEED is the function name used by Pioneer-series (e.g, HP42S and HP-32S/SII) models onward for setting the seed value for generating pseudo-random numbers. The random-number generator and seed-setting were made available in the HP-11C introduced in late 1981, implementing those functions as "RAN#" and "STO RAN#". The HP-15C added "RCL RAN#", which allowed the user to retrieve the current seed value, which was most likely the value produced by "RAN#" or stored using "STO RAN#".

I noticed that the HP-35s manual mentioned that its random-number generator met a test stated in a 1981 book. I wondered if material in the book provided the basis for the HP-11C/15C function. While the HP-35s gives the same random numbers as the HP-42S for a given seed value, those numbers do not match the ones provided by the HP-11C and HP-15C. 12-digit versus 10-digit mantissas might account for the differences.

With all that having been stated, SEED and RAND are seldom-used functions that don't really deserve their prominence on the HP-35s keyboard, although they are clearly grouped with the other functions for probability and statistics.

### Re: 35s SEED - Long (but I hope interesting, with a little theory)

Message #9 Posted by [Andrés C. Rodríguez](#) on 11 Aug 2007, 8:03 p.m.,  
in response to message #8 by Karl Schneider

Pseudo-random number generators were a "hot topic" some decades ago. The ability to use a randomized variable was a desirable feature to be used in software, from games to simulators to statistics methods (such as MonteCarlo). However, for such random features, there were some concerns: how to implement them, and how "good" they are at, well, randomness.

At that time, hardware resources were scarce and expensive, and sophisticated functions may be prohibitive in terms of execution time. One of the preferred models was the congruential generator, which takes a seed (a number between 0 and 1) and generates the next number in a pseudo-random sequence, by means of a multiplication, an addition and a fractional-part operation.

If the random-sequence numbers are called  $s(1), s(2)...s(i)$ , the generator works as:

$$s(i+1) = \text{FRAC} \{s(i) * A + B\}$$

In the HP25 and HP41 application programs manuals, there were programs with examples for such generators, because those calculators lack an internal random function.

A classic RPN program looked like

```
LBL "RANDOM"
RCL 0      ; recall the seed or the last number in the sequence
9821
x          ; multiply by A
.211327
+          ; add B
FRAC      ; take fractional part...
STO 0     ; ...keep it as the next number in the sequence...
RTN      ; and return it in X to the user convenience.
```

So a program to simulate a dice was as simple as

```
LBL "DICE"
XEQ "RANDOM"
6
x          ; multiply by six to obtain a number from 0 to 5.999
1
+          ; add one to offset it to the 1 to 6.999 range
INT       ; finally, just keep the 1 to 6 integer value
RTN
```

And a MonteCarlo example which slowly converges to Pi looked like

```
LBL "PI MC" ; Pi by MonteCarlo
0
STO 1      ; Initialize iterations counter
STO 2      ; Initialize hits counter
LBL "LOOP"
XEQ "RANDOM" ; Obtain two random numbers between 0 and 1
XEQ "RANDOM" ; and use them as the components of a vector,
R > P      ; obtain the vector module
1
STO + 1    ; Increment the iterations counter...
x > y?     ; and, if the vector module is less than one,
STO + 2    ; ...increment the hits counter too.
RCL 2
RCL 1      ; Obtain the hits to iterations ratio...
/          ; ...which should converge to Pi / 4,
4          ; as you may notice, thinking about the raindrops
x          ; falling on a square tile of unit side.
VIEW X     ; Show the current approximation and
GTO LOOP   ; ...keep looping!!
```

Note that these programs intend to be clear to understand, and are not optimized for speed.

The random number generation was one important part of Donald Knuth's "The Art of Computer Programming, Vol II: Seminumerical Algorithms". There, Knuth shows how a frequent mistake was to "choose a random method to create random numbers". He dramatically illustrates the point, presenting a program that does a lot of complex permutations and operations on a number to obtain the next in a pseudo-random sequence... only to show that the program soon falls in a very short sequence which repeats itself forever. Hardly random, indeed.

Then he goes a long way presenting methods to assess the "goodness" of a random number generator routine; the most powerful (and very hard to understand) was the Spectral Test, which HP claims to pass with the abovementioned routine included in the HP41 Standard Pac.

Later calculator models incorporated built-in pseudo-random functions, which also depend on an initial value, called the seed. However, for the same seed, we get the same sequence; this may be good for debugging and testing purposes, but not desirable in true operation. The same happened in the BASIC computers of those years, and hence a RANDOMIZE statement appeared, which initializes the seed with a so-considered random value, unknown to the user, and so attaining an acceptable random behaviour. In HP calculators, a value of 0 for the seed causes a similar initialization. The "randomized" seed is usually taken from some timer or counter inside the processor, which value changes very rapidly all the time, and which is not correlated to the program operation.

For real randomness, some die-cast engineers resort to auxilliary circuits that sampled the thermal noise of a diode junction or similar devices. Thermal noise circuits are as close as "random" as we may meet in a whole life.

My memory tells me that Knuth introduced the subject with a statement something like this:

ANYONE WHO USES NUMERICAL METHODS TO GENERATE RANDOM NUMBERS IS IN A STATE OF SIN

### **Re: 35s SEED - Long (but I hope interesting, with a little theory)**

*Message #11 Posted by [Andrés C. Rodríguez](#) on 11 Aug 2007, 9:37 p.m.,  
in response to message #10 by [Palmer O. Hanson, Jr.](#)*

Knuth's introduction to the subject includes such statement, which in fact is a quote from John Von Neumann, dated 1951.

All my previous post was improvised and from memory, but for this quote I needed to look for the actual book which, fortunately, rests just a couple of meters from my PC.

### **and yet another rand# generator**

*Message #12 Posted by [Bram](#) on 13 Aug 2007, 4:48 a.m.,  
in response to message #9 by [Andrés C. Rodríguez](#)*

Quote:

Pseudo-random number generators were a "hot topic" some decades ago.

It surely was. Back then I used the following routine on my HP-29C:

```

LBL 0
RCL 0
Exp(x)
Exp(x)
FRC
STO 0
RTN

```

It could cope with a starting value of zero and it's about the shortest I could come up with, although it does take some time to perform.

Many years later I discovered that it is not quite a uniform distribution between 0 and 1, but it would do for the applications in question.

## Re: 35s SEED - Long (but I hope interesting, with a little theory)

Message #13 Posted by **Mike T.** on 14 Aug 2007, 10:28 a.m.,  
in response to message #9 by Andrés C. Rodríguez

See below for a very similar random number generator for the HP25/25C , HP33C/E, or HP10C.

(I think I originally saw this routine in the HP97 user manual - but I could be wrong as it is over 20 years since I last used an HP97.)

```

01 - .
02 - 5
03 - 2
04 - 8
05 - 4
06 - 1
07 - 6
08 - 3
09 - f PSE
10 - 9
11 - 9
12 - 7
13 - x
14 - f FRAC
15 - GTO 09

```

Mike T.

### Question for Thomas Okken. A Free35 Simulator?

Message #1 Posted by [Namir](#) on 11 Aug 2007, 8:27 a.m.

Thomas,

You gave us the wonderful Free42 simulator. How about a Free35 simulator (free or for pay)? Such a piece of software will allow folks to save and load their programs very easily.

Namir

*Edited: 11 Aug 2007, 8:28 a.m.*

### Re: Question for Thomas Okken. A Free35 Simulator?

Message #2 Posted by [Thomas Okken](#) on 11 Aug 2007, 11:47 a.m.,  
in response to message #1 by [Namir](#)

Hi Namir!

Quote:

How about a Free35 simulator (free or for pay)?

Short answer: Sorry, no.

Long answer: The HP-42S is a truly excellent calculator, and I consider the 1000+ hours it took me to write Free42 to be time well spent; partly because it means that I will always have a virtual HP-42S available to me, even after all the real ones have given up the ghost or ended up sitting unused in collectors' display cases, and also because the fact that many other people are able to use Free42 on their PCs and PDAs gives me a warm and fuzzy feeling. (I'm tempted to say "proud", but living in the USA has given me a mild allergy to that word, so I'll settle for "happy" instead. <g>)

I have been asked to write simulators for other HP models before, but unfortunately, with every new simulator I would have to start almost from scratch...

An HP-35s simulator would probably be less work than Free42 was, but it would still amount to hundreds of hours of research and coding, and that doesn't seem worthwhile, just to simulate a calculator that is inferior to the HP-42S in almost every way. It would take a \*lot\* of donations to make me seriously consider such a project. :-)

- Thomas

### RPN2 Engine

Message #3 Posted by [Namir](#) on 11 Aug 2007, 12:03 p.m.,  
in response to message #2 by [Thomas Okken](#)

Thomas,

Thank you for your answer. I know writing emulators takes a lot of time and effort. A few years ago I wrote one for the HP-67 and I am in the process of developing RPN2 which is an VBA/Excel-based application that implements a programmable RPN engine that supports module-type of labels and paged variables (i.e. variables with namespaces). The RPN2 interpreter also supports matrices, vectors, numerical variables, flags, and string variables. I intend RPN2 to compete with RPL, because you can write libraries that have their own set of variables (named or numbered) and their own labels that don't clash with other routines or the main module that use same names (with different namespace).

While the RPN2 runs as an Excel application it makes good use of spreadsheets to store single variables, vectors, and matrices. Also the RPN2 implementation makes use of Excel commands to manipulate matrices and manage variables.

Namir

### **Re: Question for Thomas Okken. A Free35 Simulator?**

*Message #6 Posted by [Les Wright](#) on 12 Aug 2007, 8:30 p.m.,  
in response to message #2 by Thomas Okken*

Namir,

I have to agree with Thomas. The Free42 simulator does just as much as 35s simulation could and more. I would far rather see Thomas dedicate his simulator program energies to what he does now--a vigilant and quick response to all bug reports (at least mine) and an attitude of continuous improvement.

For me, Free42 is the best HP calculator simulator out there for Palm OS, among other things. I run it on my Palm XT in the ARM version, and even the old 68K version performs fairly well (certainly faster than the real 42s) on my now obsolete Sony Clie. (I really like Power48 too, but that is a work in progress and I believe Robert Hildinger has gotten busy and I think that project is on hold indefinitely.)

35s is a decent calculator, and certainly an improvement over some of HP's recent work, but it isn't so excellent that it deserves simulation. The 42S had it all except for lightning speed (though it was still much faster than the 15C or 41), and is well worth of being perpetuated in Thomas's excellent simulation.

Les

I don't see myself using the 35s emulator. Other emulators including the 42s would be a better emulator to use. The 35s is a good calculator because it's one that you can buy a real unit, new and not for a lot of money. I found myself using the 48 emulator a lot often.

### HP 35s on sale in Switzerland

Message #1 Posted by [Juergen Keller](#) on 11 Aug 2007, 5:32 a.m.

Besides cheese, chocolate and mountains, you get now also the amazing HP 35s in Switzerland:  
[HP 35s at taschenrechner.ch](#)

Pricing: CHF 129.- (which is around USD 108.-(!) at the current exchange rate)  
 French manual versions in stock,  
 German available end of August,  
 English end of September.

A colleague ordered the calculator on Aug, 6, and received it on Aug, 9; serial no. 72100162(!), boxed with French manual. I also got my hands onto this HP 35s, and I must say, it's by far the best new calculator since a long, long time! The only flaw is a hardly noticeable misalignment of the display.

Regards, Juergen

The only flaw is a hardly noticeable misalignment of the display.

\_\_\_\_\_

The underlying flaw is a careless design and implementation. It's full of bugs and missing features. The fraction insanity (you always have to enter an improper fraction), the inability to compose/decompose polar coordinates from/to stack are just two design flaws that immediately come to mind.

Of course, the hardware has problems, too, not just the misalignment. The glare is horrible, the annunciators unreadable, the color scheme is not well elaborated...

I'm glad I haven't sold my 32SII :-)

### Re: HP 35s on sale in Switzerland

Message #3 Posted by [Juergen Keller](#) on 11 Aug 2007, 11:26 a.m.,  
 in response to message #2 by Thomas Radtke

Thomas,

you have to be realistic: time has changed, and you will never see such well designed and high quality calculators as we had many years ago. Today, nobody (except some HP enthusiasts) would pay CHF 600.- (!) for an HP-41C as I did in 1982. And yes, I'm also happy that I didn't sold my HP-41C :-)

But when you look at the calculators that HP produced over the last years, the 35s is really a substantial progress, and it makes me hope that there will be even better HP calculators in the future! Personally, I do not want to goof on the 35s because I respect HP's efforts to get back on the right track :-)

Juergen

in response to message #3 by Juergen Keller*

I'm sure you're right with everything you wrote. But then, where does the road lead to when the 35s is the best machine that can be produced? I very much hope for a 35sII, considering all the flaws mentioned here.

### **Re: HP 35s on sale in Switzerland**

*Message #5 Posted by **Juergen Keller** on 11 Aug 2007, 2:39 p.m.,  
in response to message #4 by Thomas Radtke*

A 35sII would be great! I think it will depend on two things:

- 1) HP has to get new confidence that they can do good business with calculators
- 2) HP has to remember that people go for brands providing an extra value (like good design, outstanding quality, valuable support, ...)

Unfortunately, many management guys only want short-term profit to fill their own pockets. But that's definitely not what the calculator business is about. If you are a student and you (or your father) buys you an HP calculator and you say "WOW, this calculator is amazing!", then there is a good chance that you will later buy an HP laptop, computer or PDA, just because you already know that HP produces cool and useful stuff, not that crap you find everywhere.

Probably the most important reason why we can't buy calculators like the good ol' HP devices anymore is the "Geiz ist geil" (don't know how to translate that to English, something like "stinginess is cool") attitude of most people. As long as the price is more important than quality, usability etc. the companies will continue to produce crap predetermined for the bin.

Amen!

Juergen

Hello!

Quote:

Probably the most important reason why we can't buy calculators like the good ol' HP devices anymore is the "Geiz ist geil" (don't know how to translate that to English, something like "stinginess is cool") attitude of most people. As long as the price is more important than quality, usability etc. the companies will continue to produce crap predetermined for the bin.

Well, I think we have had this discussion before (maybe not here?), but still: Yes, the "masses"

seem to care more about low prices than quality. But there is a growing (!) market for high-price quality products as well. And there is a lot of money to be earned with high-quality stuff, even if the production numbers are low. Just look at Porsche in Germany: With a production run in the order of magnitude of thousands of (very expensive) cars per year, they were finally able to buy out Volkswagen who sell (medium/low end) cars by millions...

So nobody tells me that there is no profit in quality products, if one really wants to make them. I myself prefer to buy good expensive stuff (so long as I can afford it) that lasts for so many more years, that in the end it turns out to really save money. Be it Cameras, Computers (Apple :- ) , shoes or washing machines.

So faced with the decision to buy a high-quality 400\$ all-metal hp-35s or the bug ridden 50\$ plastic thing that it has turned out to be, I would always buy the former. In fact, I am not going to buy this 35s as it is now other than for 10 Euros on eBay (not to use it, but for completing my collection), and therefore, hp is not going to make any money at all from me. Nothing or 400\$? HP, the choice is yours!

Greetings, Max

But there is a growing (!) market for high-price quality products as well.

Let's hope that HP decides to (re-)enter this market!

Quote:

So faced with the decision to buy a high-quality 400\$ all-metal hp-35s or the bug ridden 50\$ plastic thing that it has turned out to be, I would always buy the former.

Me, too. As Frederick Henry Royce (one of the founders of Rolls-Royce) said: *"The quality will remain long after the price is forgotten."*

One additional note to Apple: I really like their innovative, well-designed products, but their products have "flaws", too. Greenpeace says: *"[...] So why do Macs, iPods, iBooks and the rest of their product range contain hazardous substances that other companies have abandoned? A cutting edge company shouldn't be cutting lives short by exposing children in China and India to dangerous chemicals."*

So as always in life, there is not only black and white but many gradations in between...

Juergen

---

The tricky thing about this is that one hardly dare to spend many bugs on stuff you can be damn sure will be old and pretty useless trash in about three years time when better stuff will be available for half the money. So many times I tend to buy the second best stuff from less known (but not bad for that) brands for less money.

And if there would be more producers offering (decent) scientific RPN-calculators I would not hesitate a second to betray HP. In the end its "bang for the bug" which I put first on my list as long as quality doesn't drop below a certain level. Competition is the best engineer and brings products forward.

### **Re: HP 35s on sale in Switzerland**

*Message #9 Posted by **Larry Holmes** on 12 Aug 2007, 6:22 p.m.,  
in response to message #6 by Maximilian Hohmann*

I've worked for HP. They do, or at least, they did, consider all the things which are mentioned here and elsewhere. But, as with most companies "these days", when considering what to do with their development dollars, there are many competing choices. With pressure from shareholders on the board to make high profits, this gets passed down to senior managers, and on down the line to every employee. This produces the mindset which we have seen for quite some time now, that is, low selling prices mean everything, and, we must compete with others on their level, rather than set standards for THEM to compete against.

Another important consideration is: which project will produce the greatest return on our investment? Their thinking would then be: "why should I put those dollars into a "low volume" product when I can put them somewhere else and have higher volumes, higher margins, and thus, more income and profits? My performance evaluations and bonuses are not determined by what the board expects to happen in the future; they are determined by what the balance sheet says I am doing NOW. So, I will choose that which produces the best results for me, and not for HP's customers; I won't be around when all this impacts the "future".

I have always believed that a company will reflect the values and especially, the profession and orientation of its leaders, right down to the "lowest" employee. If the company's leaders and managers are accountants, for example, the company will be run mostly by what happens to the balance sheet near term. If they are of another profession, the company will be run to satisfy different values. The founders of HP were both PhD engineers, so HP was mostly and engineering company; most of their original product lines were, in fact, made FOR engineering and similar applications. Once HP began entering mass markets, with high volumes and lower profit margins combined with lower revenues due to much lower selling prices per unit, it was inevitable that changes would come about. And the HP we have today is very big in computers, which seems to get most of the attention, even though they still make a lot of engineering instrumentation, etc.

When HP was founded, and up to the time when Bill and Dave retired, HP was run by, and thus dominated by, engineers. They tended to think more like we do here, and that is what

made HP successful. Once they were gone, the professional managers and accountants began to have more and more influence, hence, their professions and their values became HP's driving forces, which are much different from the high quality, perfectionistic values which drive the "engineering types", such as myself. That is when HP began straying away from its core values, and more toward what was being taught in business management classes in universities, etc., which is where most of the new people at HP come from. Throughout the electronics industries, this change happened. (Look at Microsoft, for example; they don't innovate much and certainly don't produce software that meets the requirements being suggested for HP calculators, yet, they are almost worshiped by professional managers for their success in spite of this....).

I don't know if the current management of HP is more like engineers or more like "managers" (not to debase management; it is necessary, but it is not the same thing at all as LEADERSHIP. A bank needs a financial manager more than an engineer....). I quit following HP when the F person became president, and sent HP down the path to oblivion. I hope HP learned from that and will veer back toward the kinds of decisions and attitudes that originally made them so successful! I am sure we all do, as there really isn't another company in this market, and many others, who can do what HP could do if they had the right leadership. Perhaps the 35s is the first try at returning to their roots; if so, I applaud it, and will try to understand what made them do what they did with the 35s. Since HP is "populated" by new individuals, it may take them a while, but if they are pursuing the founder's values, more or less, they will get there.

We can only hope...

*Message #10 Posted by [Frank Rottgardt](#) on 12 Aug 2007, 7:34 p.m.,  
in response to message #9 by [Larry Holmes](#)*

Hi Larry,

that you say is so true! Most founders of today's big player companies were engineers or scientists with a vision they wanted to become reality rather than business men.

Customers will be pretty much aware of real innovative products and willing to spend some extra money. Old proven logic says that one first has to SPENT money before you actually can EARN money. Today too many companies try to cut down investments and to maximize income. An equation which always will prove being wrong in the long run when this strategy starts to kill the innovative spirit of a company.

Even if I try to save my bugs, I am still willing to pay some extra dollars on things if I can see a real value in it. The old-fashioned HP calculators of the 70s and 80s were such things giving you that extra-value. Innovations like the solver, numerical integration, matrices, complex number math etc were something an engineer really wanted to have. All that combined in a functional yet nice and rigid case with an excellent keyboard made us customers open our wallet wider than any marketing expert could imagine.

There is a saying: "You can always make an engineer becoming a good business economist, but never an economist becoming a good engineer"

My hope is based on the assumption that a redesign, which takes probably less effort than the 32S to 32SII transition, can be done quite cheaply. And there's time for an extensive beta test :-).

Oh, I have a second hope: A trade-in of the 35s for the new model :^)

Now, is that asked too much?

\_\_\_\_\_

Reading the post of Thomas I must point out that there is always a second opinion. For only CHF 129.- you get a nice HP calculator, with a decent colour scheme, proper ENTER key, tactile key feedback, still in production, that we have been seeking for here in moHP for a long time.

If it didn't have any bugs, what would have we been looking for? Up to now, nobody came out with a bug finding that the HP35s incorrectly calculates something (except those COS very near 90 deg)...

## Re: HP 35s on sale in Switzerland

>  
According to other threads, the checksum for programs doesn't seem to be reliable.

Actually, I suspect it to be a pointer or counter problem,  
at least the first example in the programming 'learning module'  
yields the correct checksum.

And that reminds me of a 49g+ bug, where port 2 objects  
will be partially overwritten under certain circumstances.

Or of an early, but long lasting and severe 49g bug,  
which caused a memory leak when copying port objects to main RAM.

As you wrote, the 35s looks and feels much better  
than most of the crap from the last eight or nine years.

But it wasn't only me who hoped that they'd debug  
the anniversary calculator at least to a certain level:-)

### **Re: HP 35s on sale in Switzerland**

Better enjoy as-is and buy them till HP can get some revenue to pay for the investment. It's a bona fide miracle and a tribute to everyone here along with the calculator toting geeks everywhere that this thing was even produced. Pretty unprecedented at this price. Look at Schwinn bicycles prices vs. when some got them new in the 60's. If we want the next gen of something else, this one will need to sell! Guess the mainstream retailers won't put them on the shelf since not a mainstream graphic calc and costs half as much as one but 6x a standard scientific.

### Conjugation on the HP-35s

Message #1 Posted by [Karl Schneider](#) on 11 Aug 2007, 5:27 a.m.

As many of us know, the HP-35s offers easy entry of new complex numbers from the keyboard, but is missing basic functionality for manipulating or disassembling complex numbers, or for assembling them from previously-obtained values.

Here's a reasonable workaround for the complex-conjugate function (i.e., negation of the imaginary component):

The product of a complex number and its conjugate is its magnitude squared,

$$ZZ^* = |Z|^2$$

$$\text{So, } Z^* = |Z|^2 / Z$$

With a complex number in the x-register,

```
ENTER
ABS
x2
x<>y
/
```

will give its complex conjugate.

### More Results with Rodger's Test

Message #1 Posted by [Palmer O. Hanson, Jr.](#) on 10 Aug 2007, 10:39 p.m.

I have been intrigued with the possibilities of Rodger's calculator tests using back-to-back reciprocals and the square of the square root. I have now completed the tests on all of the programmables in my possession. The following table combines my new results with those in the table I previously published. The table also includes a corrected entry for the square root test with my Model 100 where, inexplicably, I somehow managed to forget to include the ABS part of the equation in my previously published result. Finally, the table includes two entries in the square root squared column for the H-P machines and for some others where the results for the square root multiplied by the square root are not the same as the square root raised to the second power using exponential techniques.

|            | Reciprocal |        | Square of the Square Root  |            |

### Some Comments:

For the HP-33C, HP-38C, HP-41 and HP-11C/12C the results for the reciprocal test and the square root test are the same and are equal to Rodger's expected values. The square root test results are the same whether one uses  $\text{sqr}(i)\text{x}\text{sqr}(i)$  or  $(\text{sqr}(i))^2$ . The results when using the sequence  $\text{sqr}(i) 2^y x$  are not quite equal to the expected value and are different for the different machines. For the HP-33C absolute differences of  $1\text{E}-07$  from the square root - squared result occur at 39, 62, 65 and 91. For the HP-38C absolute differences occur at 39 and 65. For the HP-41 and HP-11/12 the only absolute difference occurs at 39. I suspect that this implies some evolution in the exponential function as the ten digit hp product line matured. I wondered if the higher density of differences was maintained over a larger range so I tested my HP-67 and HP-41 over the range from 1 to 10,000. There were 66 differences with the hp-67 but only 25 with the hp-41. There were only six numbers for which the difference occurred on both machines: 39, 3446, 6221, 6430, 7421 and 7560. One of the things that impressed me during the exercise was just how slow those old machines were. Doing the sum of the errors and counting the errors for the exponential test over the range from 1 to 500 took eighteen minutes on my HP-67. It took only 30 seconds to run the same program on my hp 33s.

It is possible to use the TI-59 (which uses thirteen digits without rounding and has the famous multiplication anomaly) to emulate the ten digit HP machines for the square root case. All one has to do is perform the EE-INV-EE function after each mathematical operation. If you do so you will find that the emulated ten digit machine yields

a sum of 3.2127E-05 (the correct value) with 206 zeroes when doing the square root times the square root, but yields a sum of 3.2227E-05 (an incorrect value) and 205 zeroes when doing the square root raised to the second power using the  $y^x$  function. The difference comes from different results when the input integer is 423 where the square root of 423 times the square root of 423 yields 423 but the square root of 423 raised to the second power yields 422.9999999. Doing the calculations without the final EE-INV-EE sequence will yield 422.9999999505 which rounds to 423 with the square root times the square root calculation but 422.9999999498 which rounds to 422.9999999 for the square root raised to the second power calculation.

The CC-40 and TI-74 (base 100 machines) yield the same result for the reciprocal test but different results for the square root test. I suspected that the difference would occur at only four input values in a manner similar to that seen with the second square root tests with the HP machines. It turns out that is not the case. There is another interesting phenomena in these machines. For both machines the sum when running the square root test from 1 to 99 is the same as when running from 1 to 500, or when running from 1 to 999.

A user can get the non-zero sums in the second line for the Durabrand 828 by transferring each intermediate result to a memory location before using it again. For example, for the reciprocal case use the sequence  $1/i \rightarrow M : 1/M \rightarrow M : S + \text{Abs}(i - M) \rightarrow S$ . This process essentially changes the result to that which would be obtained with a twelve digit machine which truncates rather than rounds. One caution: It turns out that there are two versions of the Durabrand 828 out there. One version, the version that I have, provides sixteen digit arithmetic. The other version, which I don't have, does NOT provide sixteen digit arithmetic. Since I don't have that version I can't say what the results would be with it.

The Sharp PC-1201 yields the correct results for ten digit machines. But when I changed the sequence for the square root test from square root squared to square root  $y^x 2$  the sum is zero.

With the Sharp PC-1261 a user can use a technique similar to that described above for the Durabrand 828 to yield the non-zero sums on the second line. This essentially changes the machine to a ten digit machine with rounding at each calculation. But, the sum for the square root test is in error by 1E-09 due to a non-zero result when  $i = 10$ .

For the two Casio machines the first square root results (2.7E-09 for each machine) were obtained using the formula  $\text{Abs}(i - (\text{Sqr}(i) \times (\text{Sqr}(i))))$ . The only non-zero values occur at 207 (1.8E-09) and 327 (9E-10). The second square root results were obtained using the formula  $\text{Abs}(i - (\text{Sqr}(i))^2)$ .

thanks, bruce

At 78, no longer able to play tennis or golf due to back surgery and arthritis, and unwilling to settle for bocce, I do have time on my hands.

I had hoped to use some of it this summer workng with the hp-35s, but with all the bugs, I think I'll wait.

in response to message #5 by Egan Ford

You can search Archive 17 for "More on Testing Calculators and Computers" of 9 May 2007 or go to

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=113412#113412>

There was some earlier material which should be in Archive 17 but I haven't been able to locate it.

in response to message #6 by Palmer O. Hanson, Jr.

On some Basic programmable Casios there is a not documented command. MODE 10 means rounding (default mode) and MODE 11 truncating for arithmetical operations.

| Reciprocal test | MODE 10  |     | MODE 11   |     |
|-----------------|----------|-----|-----------|-----|
| FX-730P         | 2.38E-08 | 498 | 6.672E-08 | 408 |
| Z-1GRA          | 4.47E-09 | 495 | 6.644E-09 | 401 |

| Square test | MODE 10       | MODE 11        |
|-------------|---------------|----------------|
| FX-730P     | 4.956E-07 469 | 1.34165E-06 26 |
| Z-1GRA      | 3.326E-08 478 | 1.18235E-07 30 |

### HP 35s musings

Message #1 Posted by [Donald Williams](#) on 10 Aug 2007, 7:50 p.m.

I got off the 35s bandwagon rather early. When I saw check sums and line entries, I know the drill. I finally found my old HP 65 code pads, but before I got very far, I decided that this was a piece of nostalgia I could do without.

I did work through most of the manual and had an overall favorable impression of the calculator. However the lack of I/O left me with no means of saving my work. Lets face it, the batteries will go dead sooner or later. This is of course of no concern to many but it was important to me and possibly a few others.

Just before giving up, I had the idea of somehow acquiring the emulator. My reasoning was if I kept the emulator and calculator synchronized then in a "round about way" I had achieved backup. Tedious yes, but no more tedious than code pads, check sums and lines. This proved impossible since apparently mere mortals cannot buy or possess the emulator.

The 35s was laid aside. Having come into sudden cash wealth from a recent 60th birthday (they really feel sorry for you when you get this old) I ventured into other calculator venues.

I am currently exploring another device. (I will not mention the name anymore, because I now realize I probably sound like I am on the payroll. I'm not). This vendor sells an emulator application. Not cheap either. Almost the same cost as the calculator. The interesting thing about the emulator is the key code editor. As you use the virtual calculator the editor creates a key code file. If I chose to share a program, function, list, or whatever, I could just forward a keystroke file to the recipient. Likewise they could do the same for me. You can easily load the file and even single step the key strokes and watch the emulator highlight the keys as they execute. (Some people are shaking their heads saying "where has this guy been", but be patient, this is all new to me).

So what am I trying to say?

If I had an HP 35s emulator that created keystroke files I think the following would be true.

1. I would have a "form" of backup without I/O. If I maintain the emulator, which to me is no more demanding than creating a paper trail.
2. I could easily exchange programs, data, lists, etc using keystroke files. I think this is actually less error prone than typing posts.
3. Paper documentation, check sums, and lines would become moot.

The present 35s emulator may be capable of this but I don't know. Can anyone tell me?

If this capability were somehow made available I would be an aficionado rather than a detractor

in response to message #1 by [Donald Williams](#)

I thought about an online keystroke capture the day I got my 35s. Thought I'd give it a go when I get back to work (in six weeks), but hopefully someone will beat me to it. :)

CHUCK

*Message #3 Posted by [Nenad \(Croatia\)](#) on 11 Aug 2007, 4:49 a.m.,  
in response to message #1 by Donald Williams*

Hi, Donald,

Supporting your opinion, I think that we may have a similar situation with calculators where simulators or emulators already exist, e.g. with HP42s. This is also a machine with no input, other than its keyboard. AFAIK, excellent Thomas Okken's Free42 simulator behaves pretty the same way as the real machine does.

Though I have never tried to do this with HP42s/Free42, maybe it would be also possible in a combination of HP41CX/ttCalc (also a simulator).

Okay, I promise this last question topic. My nephew come to stay night tonight and he very inquisitive boy. Are there any fun game I can program on one of three calculators listed above for him. I think I remember seeing someplace games for 15c, but I do not have any. I would love to let him use new 35s, but I doubt game have been figured out yet for that.

**Re: Games on 35s, 48gx or 15c***Message #2 Posted by [allen](#) on 10 Aug 2007, 7:46 p.m.,  
in response to message #1 by Vincze*

See this [link for some great 48gx games](#) (hpcalc).. Kids these days won't tolerate the MOONLANDER 'games' from years past. Get the arcade games. I Especially recommend ICECUBE. I have not beaten it in 10 years.

**Re: Games on 35s, 48gx or 15c***Message #3 Posted by [Wayne Brown](#) on 10 Aug 2007, 7:46 p.m.,  
in response to message #1 by Vincze*

If you visit [hpcalc.org](http://hpcalc.org) you'll find a lot of software for the HP48GX, including a whole section on games.

**Re: Games on 35s, 48gx or 15c***Message #4 Posted by [Vincze](#) on 10 Aug 2007, 7:50 p.m.,  
in response to message #3 by Wayne Brown*

It look like I have to load somehow. Do they not have simple game I can enter on keyboard? Or is it true that there some way to take serial mouse cable and hook up to 48gx to transfer program?

**Re: Games on 35s, 48gx or 15c***Message #5 Posted by [allen](#) on 10 Aug 2007, 8:16 p.m.,  
in response to message #4 by Vincze*

Your nephew will certainly not be impressed with HP calculators if you show him a game you can type in 5 minutes. If you dont already have a a serial cable (e.g. from Samson cables), I'd recommend impressing him with your HP math skills and not HP programming skills.

You all right. My nephew tell me this boring! :) oh well, I think it is fun. I try and write space lander maybe tomorrow on 35s.

## Re: Games on 35s, 48gx or 15c

Message #8 Posted by [Paul Dale](#) on 12 Aug 2007, 4:50 p.m.,  
in response to message #1 by Vincze

Here is one game for the 35s which I submitted to the software library last week (but which isn't up yet). Apologies in advance for the length. The program is formatted to fit an 80 column printout.

I wrote this for my children to play which they will do next time the "I'm bored" comes out...

No checksums since they are wrong. No LN either since it is bogus too. The actual size is just under 8kb.

- Pauli

A dragon has kidnapped the beautiful princess and you are tasked with her rescue. You will have to brave all manner of nasty beasts on your quest.

The quest is a series of meet monster, kill or run away from monster cycles. When you kill a monster you will usually gain some treasure and possibly a magic item. You might also get healed. The difficulty of the monsters generally increases with your abilities. Once you defeat the dragon, you win the game. If you've accumulated sufficient treasure, you'll marry the princess as well.

When displaying numbers they are viewed via registers:

```
E = experience (your total and current earnings)
H = hit points (both damage and your total)
G = gold
L = level
S = spells
```

Periodically you'll be asked one of two questions:

```
"attack or flee"      (0=ATK 1=FLEE)
"sword or spell"     (0=SWD 1=SPELL)
```

In each case enter a zero number and press R/S for the first and enter a non-zero number and press R/S for the second. By default a zero will be entered for you so you only actually need to press R/S in that case.

in response to message #8 by [Paul Dale](#)

WOW! A 700 step program on a calculator that you couldn't have had for more than a month. I'm really impressed with your programming effort, efficiency in entering most of the constants as vectors and your use of just one alpha label.

Did you code this directly on the calculator, on a spreadsheet or on paper first? Or perhaps, you are one of the lucky ones that has the emulator that HP won't release?

(I'm also very reluctant to enter such a long program into my machine since I don't yet trust that it will not need a reboot to reset some bug I step on -- like the vector input problem.)

-Katie

Thanks, I've had my 35s for just over two weeks now.

Vectors seem to use the same amount of memory as a single numeric constant so they seemed like a natural way to go. Plus there aren't a lot of stack levels so I saved a lot of STOs this way. I also coded subroutines for the common constants since a call takes three bytes as opposed to 38 for an inline constant and the calculator is definitely fast enough to not care most of the time. I did trial building the constants up e.g. 2 is built from 1+1, 4 from 2^2 etc. This slowed things too much even though it saved a decent amount of memory.

The alpha labels are pretty much irrelevant except as entry points for humans to remember, we can address (almost) any line in calculator memory via a GTO or XEQ statement so a program doesn't care. See if you can guess which steps are not directly addressable.

Quote:

Did you code this directly on the calculator, on a spreadsheet or on paper first?

Some on the calculator at first but that proved too painful so I wrote an assembler that let me ignore the line numbering difficulties and wrote it as a text file on my laptop. Couldn't run it there of course and it took a few iterations between laptop and calculator to get right.

If anybody wants the assembler *source code* or the game's slightly commented source, I'm happy to email either directly. Both are larger than I'd like to post to the forum. The assembler is written in C, has little error checking but is adequate for what I wanted.

Quote:

Or perhaps, you are one of the lucky ones that has the emulator that HP won't release?

I wish :-)

- Pauli

As for the unreachable steps question I posed earlier, if you have an unlabelled program at the start of program memory you cannot branch to any step there in. Or at least, I'm not aware of how to do so.

*Message #11 Posted by [Pal G.](#) on 16 Aug 2007, 10:21 a.m.,  
in response to message #10 by Paul Dale*

"If you've accumulated sufficient treasure, you'll marry the princess as well"

This sounds about right! <grin>

...

I would love to see your assembler code and your 35s commented code. I do not have an hp 35s yet, but I am studying CS and would like to study your efforts.

Please send to green chile 505 at yahoo dot com

Thank you, Pal G.

### HP41 Question

Message #1 Posted by [Vincze](#) on 10 Aug 2007, 7:23 p.m.

Sorry for all questions. I keep seeing reference about wand reader or bar code reader for HP 41 series. Is this for a specific application, like supermarket or something for recording information, or does it serve other purpose?

### Re: HP41 Question

Message #2 Posted by [allen](#) on 10 Aug 2007, 7:39 p.m.,  
in response to message #1 by Vincze

It is to save time typing in key strokes... The wand is used to enter programs into the memory. There are other uses such as points of sale.. If you have the MoHP dvd, there are some good manuals.. I'd recommend looking at the WAND manual, The PLOTTER Pac manual, and lastly the printer module. With these three items, you can create, read, and print your own bar codes. You may be interested in the [Paper keyboard](#) that can emulate the keyboard entry with only the bar code reader.

Edited: 10 Aug 2007, 7:41 p.m.

### Re: HP41 Question

Message #3 Posted by [Dave Colver](#) on 10 Aug 2007, 7:43 p.m.,  
in response to message #1 by Vincze

It can be used as a program input device, programs were published as very long barcodes  
The device was a barcode 'pen' where the user provided the movement across the barcode, whereas supermarket scanners self scan using a mittor and a laser.

### Calculation Radioactive Isotope decay rate

Message #1 Posted by [Vincze](#) on 10 Aug 2007, 7:07 p.m.

I hope someone can help me with this. I have programmers working on something for work, and I need to check their work. I know how to calculate the radioactive isotope decay rate, but I hoping someone can help me program it into my calculator so I can solve for faster. I have 48gx and 35s, 15c, and 28C that I can use. I prefer not use 28c because I have not fixed battery problem yet and I do not feel like losing program after I power it off.

I define formulas for you, but first let me define variables:

$A_i$  = initial activity/radioactivity of isotope  $t$  = elapsed time (hours)  $A$  = current radioactivity (what we solve for)  $H$  = half-life of radioisotope (hours)

Formulas:

$$A = A_i(1/2)^{t/H}$$

$$t = (H \ln (A/A_i))/(\ln (1/2)) \ll - \ln \text{ be natural logarithm}$$

I sorry if this overly complicated, as I can do manually, but I would like to program and I am not sure how.

### Re: Calculation Radioactive Isotope decay rate

Message #2 Posted by [Juan J](#) on 10 Aug 2007, 10:02 p.m.,  
in response to message #1 by Vincze

Hello Vincze,

You can use the 48's solver. Press [Right Shift] [Enter] to activate the Equation writer. Enter the first equation; When you're done, press [Enter] to save it to the stack. Then save it as a function, typing a name, such as Activ: ['] [Alpha] [Alpha] ACTIV [STO]

Repeat the process for the second equation, and save it: ['] [Alpha] [Alpha] TIME [STO]

Now go to to the Solver menu, using [Right Shift] [SOLVE] You will see a menu: use the cursor keys to select SOLVE EQUATION and press [Enter] You will get the HP Solve screen, which will prompt you to select an equation. Look for ACTIV and press [Enter] The variables will be created automatically and you can start entering values. After you complete data entry, use the arrow keys to set the cursor in the variable you want to solve and press SOLVE.

The procedure is the same for the other equation.

Hope this helps.

### Re: Calculation Radioactive Isotope decay rate

Message #3 Posted by [Vincze](#) on 11 Aug 2007, 7:06 p.m.,

*in response to message #2 by Juan J*

Juan, thank you so much my friend for the help. I know how to program solver but I wonder how it might be done with program to run. I still try and figure out program of calculator, and sometimes it confuse me. I guess solver is easier and for most case, do just fine, as I can solve for any variable, but it would be nice to see how to program the same problem.

Thank you again though.

## **Re: Calculation Radioactive Isotope decay rate**

*Message #4 Posted by **Oswaldo Rodriguez** on 12 Aug 2007, 12:34 p.m.,  
in response to message #1 by Vincze*

Vincze

One of the beauties of RPN and keystroke programming is that you program just as you would work out the problem. For Radioactive Decay, I prefer to use the integral form of first order reactions. All radioactive decay follows first order kinetics, which means that the following equations apply...

$$\text{rate} = k \cdot [A]$$

upon integration you obtain

$$[A]_t = [A]_0 \text{Exp}(-k \cdot t)$$

where  $[A]_0$  is the initial concentration  $k$  is the rate constant which can be found by  $\text{Ln}(2)/\text{half life}$   $t$  is the time of reaction and  $[A]_t$  is the amount left after time  $t$  has passed by.

For the HP 28c and the 48gx the programming is the same. Using local variables "a" for  $[A]_0$ , "b" for half life and "c" for time you can enter the program as follows.

```
<< -> a b c << 'a * EXP ( - ( LN(2) / b ) * c ) ' >> >>
```

save it as 'decay' then enter the values into the stack and press 'decay' from the user menu.

for this program the values have to be  $[A]_0$  , half life and time in that order into the stack.

if you do not want to use local variables a shorter program would be

```
<< 2 LN SWAP / * NEG EXP * >>
```

save it as 'dacey' or any name you want to give it then enter  $[A]_0$ , time and half life into the stack in that order. The program will return the amount left over. This last program should also work for the 35s, even though I do not have one, I believe you just need to change SWAP for  $x \leftrightarrow y$  and NEG for  $+/-$ .

Good luck

Sorry I had to edit to fix the formatting

### Repairing the 9820 printer platten -- Thanks!

Message #1 Posted by [Tony Duell](#) on 10 Aug 2007, 1:34 p.m.

I would like to post a public 'Thank You' to David Smith and Katie Wasserman.

Some time ago I asked about repairing the platten roller in an HP9820 internal printer (same mechanism as in a 9810), and they both suggested 3M 'Cold Shrink', a material I'd never heard of before.

Recently I got round to ordering some from RS Components (this is not Radio Shack, it's a large industrial components distributor in the UK). I discovered that the smallest diameter that RS sell is, in fact the same Cold Shrink as the next size up, but the kit also includes a couple of rubber sleeves that you put on first. It's this kit that's ideal for this platten.

After dismantling the printer and cleaning off the goo, force the 2 rubber sleeves onto the original spindle (so that they touch -- a single longer sleeve would be better, but that's what you get). Then clamp the spindle in a vice, put the Cold Shrink over it, and start pulling out the 'support helix'. When you've put about half the length down, cut it round with a knife, slide the remainder over the bit you've just put on, then pull out the rest of the 'support helix'. In the end you have the spindle covered by the rubber sleeves and two layers of the Cold Shrink.

Then all (!) you have to do is trim it to length. I put the spindle in a lathe, and while turning the lathe by hand used a sharp knife, guided by the toolpost, to cut it. If you do it that way, don't even think of turning it 'by power' unless you want bits of knife embedded in you!

Anyway, the result is a roller of almost exactly the right diameter, which grips the paper well.

Pity I've now got printhead problems, but that's another story..

### Re: Repairing the 9820 printer platten -- Thanks!

Message #2 Posted by [Vincze](#) on 10 Aug 2007, 7:34 p.m.,  
in response to message #1 by Tony Duell

So is the cold shrink like a rubber material?

Also, for those who have thermo printers for like 28C, 29C, 19B, 48GX, etc, is it easy to find thermo paper for it or must one look for surplus. Meaning, can I go to office supply super store and get paper?

### Re: Repairing the 9820 printer platten -- Thanks!

Yes. Not all stores have this in stock, but you can get it from their web sites. Any thermal 2-1/4" x 85' roll should work fine, I've been using the [NCR brand](#) .

**Re: Repairing the 9820 printer platten -- Thanks!**

### 35s checksum problem

Message #1 Posted by [Lyuka](#) on 10 Aug 2007, 10:05 a.m.

Hi, folks.

This would have never be mentioned before, HP 35s may have a checksum calculation problem.

I bought two HP 35s, one for office use, others for home use, of which serial number differs at last two digit (CNA 721049xx).

Then I wrote program (to solve transmission line parameters) and entered it into each calculators, to find the same program shows different checksum.

It seems to be HP 35s' problem, since the line length, calculation result, and line by line comparison shows no difference.

For confirmation of the problem, I wrote very simple program as shown below.

```
LBL G
1.4
LBL C
1.4
LBL K
```

One shows,

```
LBL G, LN= 9, CK= D23F
LBL C, LN= 9, CK= 18BC
```

The other shows,

```
LBL G, LN= 9, CK= 7886
LBL C, LN= 9, CK= 18BC
```

While using (include programming) the first one, its checksum had been changed to the different value, as

```
LBL G, LN= 9, CK= 5966
LBL C, LN= 9, CK= 1427
```

How about your 35s?  
(Please allow my poor English.)

### Re: 35s checksum problem

Message #2 Posted by [bill platt](#) on 10 Aug 2007, 11:41 a.m.,  
in response to message #1 by [Lyuka](#)

Miner are different:

```
G-->535D
C-->532C
K-->2436
```

Entering another program doesn't change the sums, nor does changing to Hex.

### Re: 35s checksum problem

Message #3 Posted by **Katie Wasserman** on 10 Aug 2007, 12:43 p.m.,  
in response to message #2 by bill platt

Mine are different from the others already mentioned too:

C = 700E  
G = 8A28

Looks like the checksum is no longer a useful function.

Am I the only person here that feels like this is the buggiest calculator HP has made since the 49G. The nicer keyboard and more usable memory aside, everything else about this machine seems to be a giant step backwards.

It's time to stop playing with the 35s until there's a decent version released. Every time I pick it up to try something on it I run into another bug, it's just no fun. (OTOH, the Casio fx-9860G Slim looks like it might be a fun machine to program.)

Am I the only person who doubts that there *will* be release of "a decent version"? They stuck with the 33s, and the 35s and 50g represent further development, but it's hard to believe this is worth the company's time.

The 35s seems part of the recent wave of nostalgia that includes rebuilding "The Garage". I wonder how much effort (and how much money) they'll be devoting to support *this* symbolic reminder of past glory?

*Edited: 10 Aug 2007, 1:28 p.m.*

### Casio fx-9860G Slim

Message #5 Posted by **Donald Williams** on 10 Aug 2007, 1:30 p.m.,  
in response to message #3 by Katie Wasserman

I have had it for 3 days now and am becoming quite fond of the device. If you are a power user with a requirement for complex matrices you will be disappointed. I am a "light weight", just give me a good solver and a programming environment for the rest of my needs, and I am happy. The calculation "history" is a new experience for me, and I really like that feature.

### Re: 35s checksum problem

*Message #6 Posted by **Bruce Bergman** on 10 Aug 2007, 3:03 p.m.,  
in response to message #3 by Katie Wasserman*

I tend to agree with you, Katie.

What's perhaps most frustrating for me is that HP doesn't appear (or won't) include beta testers in the production process. Yeah, I get the whole thing about company proprietary information, keeping secrets and making sure the competition doesn't find out about new calcs, but THIS fiasco is exactly why they need to break out of that mold. Hopefully Sam can wield some power in this and sees the value in having more folks beta test future calcs, even if only to look for bugs. I'm quite sure that had 20 of us in this group had the calc for two weeks, we would have found **\*\*ALL\*\*** of these bugs and given back to HP a really valuable contribution in terms of quality.

Lessons from the software world need to be applied here. Beta testing is good. Especially with more and more complex systems.

\* \* \*

I still like this calc. I will play with it and enjoy it, but it has lost some of the "shine" due to these bugs. I just hope they fix them and listen to the truly enthusiastic users.

You know, this reminds me of something Disney did a while back. Let me tell you a story...

After Disney killed the Electric Light Parade, they needed to replace it with something similar but new and fresh. They hired a Hollywood guy to create "Light Magic" in 1997, a parade with even more lights, and kind of themed after fairies.

They had a one night premier for cast members only. It didn't go over so well. A lot of cast members disliked it, and thought it wasn't up to standard. The cast members suggested that the Annual Passholders (AP's) check it out. Disney considered.

A week later, they offered Annual Passholders a chance to view the parade. My wife and I went up to Anaheim and saw it twice on the night it was first out. Disney gave out comment cards and asked for input. Aside from written comments, AP's \*lined up\* outside the customer relations building to complain about the parade. It was HORRIBLE. It was whiny, the music sucked, there was no story, no tie-in to old Disney characters and some of the fairies were downright evil and scary looking. Literally, children cried when it went by. Some people were just stunned. With an overwhelming majority of dedicated AP's complaining, Disney decided to delay the opening by six weeks to "make repairs".

The parade opened six weeks later, with virtually no changes (!), and was panned in the press. People hated it. It lasted all of three months before it was killed, and the Disney head who created it was fired. Now, you can barely find mention of "Light Magic" anywhere in Disney-dom. It has been blacklisted. It was incredibly painful for Disney.

The lesson here was that Disney failed to realize who their TRUE fans were and they didn't let them HELP. No one is more dedicated to Disney than the AP's. These are the people who spend hundreds and thousands of dollars every year on passes. They talk up Disney with friends, family and anyone who will listen. Like my wife and I, we would visit Disneyland 2-3 times a month. Some people we know go every other DAY.

These people truly are the hardcore Disney fanatics. Probably not one naysayer in the group. Yet when that same fan base said "wow, this parade really sucks! I mean REALLY!", Disney discounted it. They had -- at their ready disposal -- almost everything they needed to fix the parade, but were too proud to call upon outside help.

Suggestions were coming in left and right. Those were the same suggestions that made it into the New Electric Light Parade three years later (that everyone loves now, BTW). But instead of taking advantage of those who love Disney and are working FOR them, they chose not to. Greed, pride, whatever. It could have been different.

Now, to be fair, HP has never said they WANT input from us hardcore types prior to release. But it would seem to make a lot of sense. Don't stress about 20 more people knowing about a new calc because they have a pre-release version -- JUST DO IT. I don't think we'd be in this situation today had HP given some hardcore users an opportunity to test out the HP-35s prior to announcement.

Anyhow, I somehow climbed up on a soapbox, so now I'd better get off... ;-)

thanks, bruce

I think you sum it up very well Bruce. This is very sad for HP users. HP either need to decide if they wish to stay in calculator market, or just get out. Don't sell junk, because we don't want junk. Don't follow Bill Gates model and rush to market with lots of bug and expect users to like it. Take time and bring quality to market with everything. With product, with feel, with instruction book, and yes, even with packaging.

It's time to stop playing with the 35s until there's a decent version released. Every time I pick it up to try something on it I run into another bug, it's just no fun.

---

As an admirer of your excellent posts, this time I would have to disagree. You are right, this is obviously a serious bug. IMHO, your words quoted above show an anger of a perfectionist against the obviously too early released HP35s.

However, may I suggest to put it this way? Checksum function, though very important, did not exist on the HP35 (there was even not any sum there to be checked;). Further on, the same applies to HP67 (my dearest), HP41, ... The checksum came out with later sophisticated models, as a very practical way to find out if the program was correctly input (meaning identically to the pattern), or not.

Would it be better, once we are sure that the checksum function on HP35s is incorrect, to check the correctness of the program by means of a real life test example, supplied by the program? A computer science specialist of your format would certainly say: "No way. You cannot pass through all the branching combinations in a program by a single test example". An engineer in me says: "I would be

happy to know that this program works correctly for the presented example, as I expect that my particular problem would not differ too much of it". All in all this is how it was done when there was not a checksum available at all.

Meanwhile, I am happy to see the ENTER key in the right place, nice click keyboard, two line display (mine is not slanted), RAD indicator on the display, etc. If we look again at our posts during the last three or four years, almost all of us here were thinking that after HP48GX even the ENTER key would never come back to its place.

What I can see from what you said, despite the strong bad feelings you have against your machine, you still keep on playing with your brand new, still in production, nice looking, but sometimes strange behaving, HP35s.

Let us love this buggy little beast (at least until the new one comes)! You may check my biography to see how I did this since 1978.

### **Re: 35s checksum problem**

*Message #9 Posted by **Bruce Bergman** on 11 Aug 2007, 10:59 a.m.,  
in response to message #8 by Nenad (Croatia)*

I do love this calc, but...

The lack of a checksum function for programs was one of the major complaints about the 33s. You couldn't tell if your program was entered correctly or not. HP obviously listened and brought it back in the 35s, but I'd submit that this is truly a very important part of the calc.

thanks, bruce

### **Re: 35s checksum problem**

*Message #10 Posted by **Brian Healy** on 11 Aug 2007, 3:58 p.m.,  
in response to message #9 by Bruce Bergman*

Has anyone established that the programs are giving incorrect results with differing checksums?

For me, the apparent checksum bug is no problem at all. All of my programs are written myself, and I always test them by solving a few different problems whose results I know. I never bother with checksums.

While not perfect, I think the 35s is a significant step in the right direction. I remember posts from a couple of years in the past where several people confidently predicted there would never be a large enter key again, that there would never be a successor to the 33s. Well, here it is, and many of the 33s complaints were addressed. Overall I am happy with the 35s, (but I won't be selling my 42s or 32sii on ebay).

With that said, it would have been better for HP to delay release until HP had identified these bugs and corrected them. There is less tolerance for these bugs after the bad taste that the 33s left in everyone's mouth. This is not the first HP to be released with bugs, and hopefully they will be corrected in time.

### **Re: 35s checksum problem -- short list of bugs**

*Message #11 Posted by **Katie Wasserman** on 11 Aug 2007, 2:42 p.m.,  
in response to message #8 by Nenad (Croatia)*

Nenad,

You're a better person than I! I'm not sure that I can

Quote:

---

love this buggy little beast

---

because I don't trust it to show me the correct results. I also feel like HP has made a semi-conscious decision to not put the time/money needed into properly engineering this and has left it up to us, the HP fans, to do the testing for them at no cost (even better they make money by selling to us).

If I define "bug" \*very\* conservatively to be: something that causes the calculator to display a wrong or misleading result and that I (personally) can reproduce, here's a short list:

- (1) in a program:  
VIEW (I)  
PSE  
this will show the wrong value of I
- (2) X<>(J)  
will show INVALID(I) if J has an invalid address in it.
- (3) the checksum bug (the circumstances leading to this error are still unknown)
- (4) SYNTAX ERROR when entering vectors that are valid (the circumstances that lead to this error are still unknown).  
This one bothers me the most because it requires at least a memory variable clear to correct, maybe a full memory clear.
- (5) the cosine near 90 miscalculation
- (6) in a program:  
"RADIX."/"RADIX," display change based on the display mode.

Note that these are all bugs that have nothing to do with differences between the calculator and the manual.

-Katie

Katie,

you said:

Quote:

---

Nenad,

You're a better person than I!

---

This is simply not true! I personally know this when you sent me a piece of something to repair something else, what I did without a problem;) You are a real friend! Thanks again, this time in public.

Your previous post stating the 6 (up to now) bugs found in our lovely "little beast" proves this once again. It must be appreciated when you approach the buggy 35s problem without any negative feelings, but just stating pure facts.

I am sure that if HP invent produced an excellent calculator (say HP45s) in all aspects (not to point them out again) and releases it after a year of beta testing by 99 posters to the moHP, the 100th poster would come out with a bug finding. This proves something about the competence of our community here.

### **Re: 35s checksum problem -- short list of bugs**

*Message #13 Posted by [Paul Dale](#) on 12 Aug 2007, 4:41 p.m.,  
in response to message #11 by Katie Wasserman*

I'll add two more bug to the list.

The LN= display is bogus for programs that contain inline numbers (& possibly for equations).

Also insertion of a label at the end of a 999 step program isn't allowed.

### **Re: 35s checksum problem**

*Message #14 Posted by [Ed Look](#) on 10 Aug 2007, 10:39 p.m.,  
in response to message #2 by bill platt*

Forgive me. Let me see if I can succinctly state the issues with the checksum (just so I can understand any ramifications) :

The checksum for a particular program varies from unit to unit for the 35s model.

The checksum for the same program further changes after the program is run.

\*

Now let ask, aside from identification and verification of the similitude of the program (either on different 35s units or on the same one after execution on the calculator), does this affect any other function on the calculator?

### **Re: 35s checksum problem**

in response to message #1 by Lyuka*

Lyuka, here are the results after keying in the same programs on my two HP35s calculators:

First 35s: CNA 72101944

LBL G, LN= 9, CK= 10D7  
LBL C, LN= 9, CK= ADAE

Second 35s: CNA 72104162

LBL G, LN= 9, CK= 8A28  
LBL C, LN= 9, CK= D6F8

Very interesting. This seems like a real bug!

### Re: 35s checksum problem

Message #16 Posted by [Paul Brogger](#) on 10 Aug 2007, 12:45 p.m.,  
in response to message #15 by Seth Morabito

CNA 72102370

LBL G -> LN=9 CK=8A28  
LBL C -> LN=9 CK=D6F8

[snide]Now, what was that checksum to be used for?[/snide]

(I still love the calc, but this will make more difficult the sharing of any significant programming.)

Message #19 Posted by [Gene Wright](#) on 10 Aug 2007, 1:17 p.m.,  
in response to message #18 by Paul Brogger

I would like to ask people who will take the time to do so to key in the indirect data register packing program from this learning module:

[indirect register packing program](#)

and see if the checksum matches what is in the module. In addition to seeing if the checksums come out the same, you'll get a chance to play with a really fun program, even if I say so myself. :-)

The checksum for this program is the same on different machines that I have tried it on.

In my 35s review for datafile:

[35s review](#)

I note on page 11 that MEM does not change at times when I think it should.

Perhaps this is related?

Gene

P.S. I too get a different checksum for the short program shown here. But, I get the same checksum for the indirect data register packing program on different machines.

### **Re: 35s checksum problem - another test**

*Message #20 Posted by [Dave Johnson](#) on 10 Aug 2007, 1:48 p.m.,  
in response to message #19 by Gene Wright*

I have 2 HP-35s calcs (3 if you include the one I sent to Germany with my son...)

I entered the indirect register packing program and it appears to function perfectly, but does not have the same checksum. It reports 42C8 versus the expected C4F6.

Serial # CNA 72101735

I will try it on my second unit when I get a chance.

I entered and double checked the program in my second calculator. It works fine but yields a checksum of 1A09...I only utilized the EQN key to enter the stack register functions...

The second calc serial number is # USA 72103834

I cleared both calculators and entered the program from scratch - This yielded E9F8 on both. I had a simple program that did some register calcs and one sub call to a line number and if I enter that program on its own has a checksum of 90F4 but if it is entered after the indirect access routine it has a checksum of 85D0.

*Edited: 12 Aug 2007, 11:16 a.m.*

### **Re: 35s checksum problem - another test**

*Message #21 Posted by [Paul Brogger](#) on 10 Aug 2007, 1:56 p.m.,  
in response to message #19 by Gene Wright*

On CNA 72102370 I get LN=338 and CK=E9F8. (It appears to run fine.)

What's dismaying, of course, is that I don't *really* know now whether I've made some subtle mistake in entry, or whether the checksum is truly different. We don't really know whether I've provided any useful diagnostic information.

It kinda' pulls the rug out from beneath the whole program sharing process, doesn't it?

Bummer!

(I'll perform a line-by-line comparison of the program and the listing again . . . )

-- Edited-----

It still looks & acts fine, and I still get CK=E9F8 (FWIW).

Paul, that is VERY strange. I have a version of this program just prior to release that gave a checksum of E9F8. Hard to believe that is coincidence.

### **Re: 35s checksum problem - another test**

*Message #23 Posted by **Paul Brogger** on 10 Aug 2007, 2:28 p.m.,  
in response to message #22 by Gene Wright*

Well it is a deterministic machine. We just don't know all the influences that "determine" the checksum. (To state the obvious, apparently there's at least one more factor involved than we'd expect!)

FWIW,

I entered the program from top to bottom, and noticed a different checksum.

Reviewing it, I found one of the equations had been entered "IDIV(REGT-3,3)". (I don't remember whether it was the IDIV or RMDR equation, however.)

I corrected that, and got CK=E9F8. I can find no obvious mistakes remaining.

Checking on one possible source of confusion, I changed one of the equation minus operations to the unary minus (the "+/-" key). That changed the checksum, but also gave me a SYNTAX ERROR upon execution. I changed it back, and still have E9F8.

I deleted the only other program in the machine, and that didn't change Program Y's checksum. Neither did any of the CLEAR options (other than ALL, of course).

Again, FWIW.

"Deterministic machine"

Aha. That should be true.

Sometimes I really don't believe that anymore with windose machines though ;-)

**Re: 35s checksum problem - another test**

Message #25 Posted by [Lyuka](#) on 10 Aug 2007, 2:42 p.m.,  
in response to message #21 by Paul Brogger

It seems that the inline number affect the checksum to go wrong.

Other test programs, which use no inline numbers, like as shown below, shows the same checksum, so far.

LBL K, LN=57, CK=D0B7

```
LBL K
CLx
ENTER
ENTER
ENTER
-
*
SIN
+
COS
SQRT
1/x
x^2
LN
10^x
Y^x
PI
/
RTN
```

*Edited: 10 Aug 2007, 3:09 p.m. after one or more responses were posted*

**Re: 35s checksum problem - another test**

Message #26 Posted by [Paul Brogger](#) on 10 Aug 2007, 2:54 p.m.,  
in response to message #25 by Lyuka

Interesting . . .

I formerly entered the four vectors (on lines Y032, Y034, Y036, Y071) into the program using only the "[" key.

Now I've changed all four entries to EQN, then [], then the numerals and commas.  
Result: LN=338 CK=0978.

Gene: Does your "EQN" annunciator show when scrolling past any of the four vector entry lines?

*Edited: 10 Aug 2007, 3:01 p.m.*

**Re: 35s checksum problem - another test**

Message #27 Posted by [Gene Wright](#) on 10 Aug 2007, 3:03 p.m.,  
in response to message #26 by Paul Brogger

EQN only shows up for lines that use the stack registers, like REGT.

That would be lines:

```
Y012
Y018
Y024
```

Y051  
Y064  
Y066  
Y068

which agrees with the keystroke instructions on page 4 of the learning module.

There is no need to use EQN for lines Y032, Y034, Y036 and Y071. These can be directly keyed without the EQN key.

### **Re: 35s checksum problem**

*Message #28 Posted by **Paul Brogger** on 10 Aug 2007, 4:22 p.m.,  
in response to message #27 by Gene Wright*

Right -- I know there is no "need" to use EQN. But in entering numbers (or, it turns out, vectors) directly on the stack, one may use EQN or not. (You may remember that on the 33s one may save a number of bytes by using EQN rather than direct numeric entry in programs.)

Regardless, in light of what Lyuka has just reported, it would be interesting to note whether everyone gets the same checksum (0978) by using EQN for the four vector entry lines (Y032, Y034, Y036, Y071) rather than simple direct entry.

It's a long shot, but what else have we got? Discovering certain rules of entry (like using EQN wherever possible) that would guarantee consistent checksums would be a useful workaround until H-P comes out with a spruced-up version.

-- Edited (again) -----

Just in case, a couple more points of comparison:

Entering programs G & C as shown in Lyuka's original problem report, but using EQN for each "1.4" line, I get:

LBL G -> LN=9 CK=0A3A

LBL C -> LN=9 CK=C145

*Edited: 11 Aug 2007, 5:09 a.m.*

### **Re: 35s checksum problem -- EQN didn't help**

*Message #29 Posted by **Paul Brogger** on 11 Aug 2007, 5:16 a.m.,  
in response to message #28 by Paul Brogger*

As indicated above I'd briefly hoped, assuming the problem was indeed related to directly-coded numerics within programs, that coding those as EQNs would somehow fix things.

I substituted EQNs for each of the four vector "direct-entry" lines in the indirect register packing program on two different machines, and got different results. The checksums differed also for the trivial programs "G" and "C" in the post that started this thread, when treated the same way.

Apparently, EQN is not going to help here.

Hi Gene,

When I enter the indirect data register packing program, I get the following

LBL Y  
LN= 338  
CK= C174

At first I wondered if spaces made any difference, so I changed line Y068 from:

```
Y068 REGTx[0,0,1]
```

to:

```
Y068 REGTx[ 0, 0, 1 ]
```

But of course that changed the LN as well, from 338 to 342. So I don't think that has anything to do with the checksum problem.

Very odd indeed. HP, help!

## Re: 35s checksum problem

Message #37 Posted by [Miguel Toro](#) on 10 Aug 2007, 6:46 p.m.,  
in response to message #1 by Lyuka

Hi,

I would like to know if someone has the same checksum as me, entering the [TVM routine](#). CK=7940

Thanks,

Miguel

## Re: 35s checksum problem

Message #38 Posted by [Jeff O.](#) on 11 Aug 2007, 11:17 a.m.,  
in response to message #37 by Miguel Toro

I get CK=D073. Example results match yours exactly.

## Re: 35s checksum problem - Test

Message #39 Posted by [Miguel Toro](#) on 11 Aug 2007, 1:34 p.m.,  
in response to message #38 by Jeff O.

Hi Jeff,

Could you please try these, if you still have TVM on your calculator:

1.- Recalculate Checksum.

- a) Clear all variables (direct and indirect variables).
- b) Erase the last RTN of the program and reenter it.
- c) read the checksum (mine = 23A5).

if that does not work:

2.- Machine reset and recalculate.

- a) Push the reset button in the back hole of the calculator.
- b) As previous Erase last RTN and reenter it.
- c) Read the checksum.

When I entered TMV in both my, 35s the checksum was different (23A5 and 7940 respectively). I made a machine reset (it is not destructif) and after that, erasing the last instruction made them to recalculate and show the same checksum. Once reentering the last instruction (line T038 RTN) both showed the same checksum = 23A5)

Thanks for your help,

Miguel

## Re: 35s checksum problem - Test

Message #40 Posted by [Jeff O.](#) on 11 Aug 2007, 7:06 p.m.,  
in response to message #39 by Miguel Toro

The checksum of your program stubbornly remained D073 after each of the actions you requested. Do you have any other programs in your calculators?

**Re: 35s checksum problem - Test**

*Message #41 Posted by [Miguel Toro](#) on 11 Aug 2007, 8:32 p.m.,  
in response to message #40 by [Jeff O.](#)*

In one I only have it, in the other I added Gene's program (CK=E9F8)and the checksums for the tmv remained the same in both calculators. I thought I was into something but I think the mistery is deeper...

Thanks Jeff.

**Re: 35s checksum problem**

*Message #42 Posted by [Mark W Paris](#) on 13 Aug 2007, 11:59 p.m.,

### HP Program Development Link for the 50G???

Message #1 Posted by [Chan Tran](#) on 10 Aug 2007, 8:25 a.m.

Editing user RPL with a text editor alone is rather difficult because of the special characters used in the HP calculators. I wonder if I can use the PDL software I have for the 48 series to edit User RPL programs for the 50G?

### Re: HP Program Development Link for the 50G???

Message #2 Posted by [Dave](#) on 10 Aug 2007, 10:30 a.m.,  
in response to message #1 by Chan Tran

Not sure about using the old PDL, but try [THIS](#) .

### Re: HP Program Development Link for the 50G???

Message #3 Posted by [Larry Holmes](#) on 12 Aug 2007, 5:52 p.m.,  
in response to message #2 by Dave

Any chance there is something like this in English?

### Re: HP Program Development Link for the 50G???

Message #4 Posted by [Dave](#) on 12 Aug 2007, 9:26 p.m.,  
in response to message #3 by Larry Holmes

Install and run it, and you can change to English in the menus. If you see any errors in the translation, please post them in this thread.

### Re: HP Program Development Link for the 50G???

Message #5 Posted by [Chan Tran](#) on 13 Aug 2007, 12:57 p.m.,  
in response to message #4 by Dave

I downloaded it. It works quite well but I can't transfer the program to the calculator. I just can't connect to the calculator.

### hp 49g+ and hp 38G talking

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 10 Aug 2007, 3:05 a.m.

Hi,

I recently came across a hp 38G and I wonder whether it and my hp 49g+ they can share documents through the SEND and RECV commands.

I tried without success, but there's a chance I didn't manage things correctly.

Any help?

-- Antonio

### Re: hp 49g+ and hp 38G talking

Message #2 Posted by [Marcus von Cube, Germany](#) on 10 Aug 2007, 9:46 a.m.,  
in response to message #1 by Antonio Maschio (Italy)

As a side note: I'm back! :-)

To my knowledge, the 38g and 49g can't talk directly to eachother, at least not without some SysRPL programming. I once had the idea to make my 50g and 39g/40g(s) talk to eachother for the exchange of lists or matrices.

IIRC, the only success I had was to send something from the 40gs that arrived as a binary string on the 50g, using XModem or Kermit. So you definitely need some glue logic in SysRPL to let either side recognize the other sides data formats.

With help of a PC and some manual cut&paste, you may have more success.

Marcus

Hallo Thomas,

danke für das Bild. Beeindruckend! Leider kann ich viele der geschifteten Funktionen nicht lesen. Kannst Du sie etwas deutlicher machen? Oder gab's früher schon eine Funktionsliste?

(thx for the image. Impressing! However, I can't read all functions. Is/was there a clearer information available?)

**Re: Thomas Radtke, where are you? Remember this? Prophetic!!**

Message #7 Posted by **Thomas Radtke** on 10 Aug 2007, 8:20 a.m.,  
in response to message #6 by Walter B

Thanks, Walter :-) I had a concept in mind, but no list of functions. About the lables, I don't remember them any more. The model has gone bye bye a few month ago.

However, my only intention was to design something that retains some classic elements (topmost display, beveled bottom edge) but look modern enough to sell these days. BTW, the keys should reproduce the 32SII keys. After using the 35s now for quite some hours, I find their style superior. Especially with the color scheme used, the 35s letters and "down shift" fuctions are hard to read. HP should have made them yellow / white for better reflection.

### Got 50G. Now what do I do?

Message #1 Posted by [David Smith](#) on 9 Aug 2007, 9:28 p.m.

Well it looks like I have an actual collection starting. Bought a 17BII+, promptly found this site, and discovered I couldn't stop my Amazon shipment. Had the bug for a calculator with all the bells and whistles and bought the 50G (with some Amazon store credits it was actually pretty cheap). Well I gotta say it's got more bells and whistles than I could ever hope for. But being the self-aggrandizing individual I am I can't very well send it back (or to anyone else, so don't ask).

So now what do I do? I would love to learn how to program the beast (er, device), even with basic business stuff beyond TVM. But I have no clue where to go to get references. Anyhow any clues as to where I can go to get more info would be appreciated.

Thanks.

### Re: Got 50G. Now what do I do?

Message #2 Posted by [Ed Look](#) on 9 Aug 2007, 9:55 p.m.,  
in response to message #1 by David Smith

I'd recommend, only after truly getting the hang of it with the user's manual, to look up or download the HP-48G Series Advanced User's Reference Manual, or AUR, as we lovingly call it here (one site I know it's available on: <http://www.hpcalc.org/hp48/docs/misc/hp48gaur.zip>).

This great manual originally from HP was the way I learned anything at all about (user) RPL programming and much fuller use of my 48G and 48G+. (As it turns out, RPL programming is somewhat intuitive, if you've had any experience with any computer programming language.)

Having a book-form copy is much better, in my opinion, and it appears to still be available from [www.calcpro.com](http://www.calcpro.com) for \$30 USD. (Same as I paid for it from there a few years ago!)

*Edited: 9 Aug 2007, 10:01 p.m.*

### RE: Got 50G now what.

Message #3 Posted by [Ralph](#) on 9 Aug 2007, 11:11 p.m.,  
in response to message #2 by Ed Look

I agree with the last post. I still use my 48 AUR. I also picked up a guide book on plotting and graphics years ago that was helpful. It's on my desk at work so I can't help much on the title.

I prefer the book over the PDF version because it seems more handy to me.

Spend some time at [hpcalc.org](http://hpcalc.org), here and [comp.sys.hp48](http://comp.sys.hp48) for lots of info.

I think based on my observations the HP users community has a better defined base of people and sites for information. For the other calculators the people are helpful but there isn't much substance there beyond

flashy websites and games.

**Re: RE: Got 50G now what.**

*Message #4 Posted by [Chan Tran](#) on 10 Aug 2007, 7:54 a.m.,  
in response to message #3 by Ralph*

HP has a new AUR for the 49G and 48GII posted on their website which I think is closer to the 50G than the AUR for the 48G/GX.

**Re: RE: Got 50G now what.**

*Message #5 Posted by [Ed Look](#) on 10 Aug 2007, 11:39 a.m.,  
in response to message #4 by Chan Tran*

I'm not too sure, although I confess I haven't seen it, that this newer 49G AUR is as comprehensive or complete with respect to its coverage of RPL programming as the older 48G Series one.

**RE: Got 50G now what.**

*Message #6 Posted by [Ralph](#) on 11 Aug 2007, 7:08 a.m.,  
in response to message #5 by Ed Look*

I downloaded a copy of it but for some odd reason in my little mind I like a hard copy book. I'm odd that way. Tried reading E-books several times before but like real paper.

**Re: Got 50G. Now what do I do?**

*Message #7 Posted by [Larry Holmes](#) on 12 Aug 2007, 6:29 p.m.,  
in response to message #1 by David Smith*

There is an excellent "tutorial" book on ebay; I cannot remember the name of the author, but it is usually posted for sale there, for about \$20 I believe. I will try to find out the particulars and post them here, though you could go to ebay and do a search for it. It was originally meant for the HP48 series, but it is very good for the 50 also. I have a copy also, so I can find out the information from there, as soon as I find it (it got "put away" somewhere devious when we moved last fall.....)

### Yet Another 35s Bug

Message #1 Posted by [Katie Wasserman](#) on 9 Aug 2007, 4:47 p.m.

Here's a really obvious one:

```
1000
STO J
x<>(J)
```

You'll get an "INVALID (I)" error message!

While:

```
RCL(J)
```

Shows the correct error message: "INVALID (J)"

### Re: Yet Another 35s Bug

Message #2 Posted by [Vincze](#) on 9 Aug 2007, 4:51 p.m.,  
in response to message #1 by [Katie Wasserman](#)

How do you do x<>(J)? Is it just the X<>Y?

### Re: Yet Another 35s Bug

Message #3 Posted by [Paul Brogger](#) on 9 Aug 2007, 4:55 p.m.,  
in response to message #2 by [Vincze](#)

It's

x<> == yellow-shifted RCL key

followed by

(J) == decimal point key

### 35S Yet another bug

Message #4 Posted by [Ralph](#) on 9 Aug 2007, 7:40 p.m.,  
in response to message #3 by [Paul Brogger](#)

It's Latin I think. I is used for J

It's like Visual Basic 6's error message telling me I'm out of ram when in fact I'm trying to save to a floppy and haven't put it in the drive.

More exactly I think they planned on only one indirect pointer and added J later. BTW I'm happy they did.

---

## Re: Yet Another 35s Bug

Message #5 Posted by [Gregg Bergman](#) on 11 Aug 2007, 7:14 p.m.,  
in response to message #1 by Katie Wasserman

Maybe not so obvious:  
While in a program.

```
A001 LBL A
A002 1000
A003 STO J
A004 x<>(J)
A005 RTN
```

Shows the correct error message: "INVALID (J)"

---

## Re: Yet Another 35s Bug

Message #6 Posted by [Katie Wasserman](#) on 11 Aug 2007, 10:39 p.m.,  
in response to message #5 by Gregg Bergman

This is even more disturbing.

---

## Re: Yet Another 35s Bug

Message #7 Posted by [Larry Holmes](#) on 12 Aug 2007, 5:55 p.m.,  
in response to message #1 by Katie Wasserman

I wonder if this has to do with the use of J instead of I in engineering parlance, to represent the imaginary part of a complex number? Is it possible that, by using a different paradigm, this could make sense, and not really be an error? I am not sure how to do that just yet; I plan to buy a 35s and go through some of the errors, etc., to examine these kinds of possibilities, but don't have much to say right now, except to mention ideas like this one.

### 17b2+ solver and the GCD/LCM formula (Don?)

Message #1 Posted by [Gene Wright](#) on 9 Aug 2007, 12:25 p.m.

Back in February, Don posted the reply below about the GCD/LCM formula from the 27s/19b Technical applications book not working on the 17b2+ model.

Did anyone ever figure out why that did not work? I know there had been an issue with the sum of digits formula which was worked out, but did anyone figure this one out?

The GCD portion seems to work, but the LCM portion diverges.

Gene

=====

unsuccessful with lcm/gcd and factor program Message #9 Posted by Don Shepherd on 20 Feb 2007, 12:57 a.m., in response to message #5 by Bruce Bergman

Bruce, I entered the two solver equations from the 27s/19b applications book for finding lcm/gcd and prime factors, and neither would work on the 17bii+. I double-checked to make sure I entered them correctly, but they do not give correct results. So I'm thinking maybe there are some differences in capability between the solver in the 27s/19b and 17bii+. Don't know, but disappointing.

### Re: 17b2+ solver and the GCD/LCM formula (Don?)

Message #2 Posted by [Bruce Bergman](#) on 9 Aug 2007, 2:20 p.m.,  
in response to message #1 by Gene Wright

Don can pipe in here, but I think he didn't get it working either. Both of us spent a fair amount of time scratching our heads on why they didn't work. From what I understand, they work perfectly on the 17bii (not the + model), but for whatever reason, they don't fly on the + model.

Don and I have had several conversations about this. There appears to be either some flaws or design choice differences in the 17bii+ solver application. It doesn't behave exactly like the 17bii. You can tweak some of the programs and it does fine, but it does need tweaking. I don't know that I'd call it a bug, per se, but it behaves differently.

Don has examples of the SOD program for both models. He can probably explain more. Also, check article 712 for some additional data.

thanks, bruce

### Re: 17b2+ solver and the GCD/LCM formula (Don?)

Message #3 Posted by [Peter A. Gebhardt](#) on 9 Aug 2007, 3:03 p.m.,  
in response to message #1 by Gene Wright

Besides the differences of the 17bII+ to the earlier models in handling G(et) and L(et), some other potential reasons could apply:

1. Ambiquity in "Evaluation Order" (see top of p.22 in 27s/19b TM)
2. Differences in 17bII+ ROMs

I'll try it out on serial #CNA42903649 and report later.

Best regards

Peter A. Gebhardt

(9:23pm GMT+1): Tried it - failed with LCM too. I keyed in the equation as in manual. GCD started iterating. Then I solved a "dummy" equation:  $a*b*a1*b1*z=0$  first. GCD calculated correctly. LCM still failed "iterating". Got rid of "=if(...)" by replacing "=" with "-" to put all G & L terms on one side of the equation. Tried again as described above - same "no go" result for LCM!

*Edited: 9 Aug 2007, 3:24 p.m.*

### **Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #4 Posted by [Don Shepherd](#) on 9 Aug 2007, 3:43 p.m.,  
in response to message #1 by Gene Wright*

Gene, Bruce is right. I could never get the lcm/gcd program or the prime factor program (both from the 27s/19b Technical Apps Manual) to work on the +. There was some discussion by several folks about how the solver on the + does not really work like the solver on the original bii, and that is true. The recommendation was that if you want it to work like it really should, get a bii, which I did. And both equations work fine on the bii.

As to why they don't work on the +, I often wondered about that, but I never discovered the answer, at least explained to my satisfaction. I remember writing a little routine on the + and it would not give the obvious answer, but I can't remember exactly what that was (I guess I don't save things that DON'T work!).

I will say that the bii solver works as a programmer would expect it to. It is also faster than the + at solver equations containing the sigma function.

### **Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #5 Posted by [Peter A. Gebhardt](#) on 9 Aug 2007, 3:56 p.m.,  
in response to message #4 by Don Shepherd*

Sigh ...

So we can only "pray" that the "new & improved" HP17bII plus does come with a functioning solver in place (I would like to see the full-fledged 19BII solver in "sheep's clothes" ... - "I have a dream" ... )

Best regards

Peter A. Gebhardt

### **Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #6 Posted by [Thomas Okken](#) on 9 Aug 2007, 4:32 p.m.,  
in response to message #5 by Peter A. Gebhardt*

What's the difference between the 17BII solver and the one in the 19BII? I thought they were identical (or so [Craig Finseth's site](#) claims).

Thanks!

- Thomas

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #7 Posted by [Peter A. Gebhardt](#) on 9 Aug 2007, 4:59 p.m.,  
in response to message #6 by Thomas Okken*

Thomas,

The differences are the "missing" functions like RAND, TRIGs etc., the TVM(.) functions (with 5 variables like the ones in EXCEL) and Rectangle/Polar conversion. The interface of the Solver to the PLOT routines in the 19bII, is not applicable to the 17bII+ "plus", because of different screen/LCD characteristics.

Otherwise - you are right here - there are no differences to the SOLVER logic according to Finseth.

Sorry, that I was somewhat unspecific in my comment. Hope I covered it all, because I draw my knowledge mainly from the 27s/19b & 200LX manuals and from Coffin's "An Easy Course in Using the HP 19BII".

Best regards

Peter A. Gebhardt

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #8 Posted by [Thomas Okken](#) on 9 Aug 2007, 8:17 p.m.,  
in response to message #7 by Peter A. Gebhardt*

Hi Peter,

Thanks for clearing that up! I was worried with the 17BII I would be missing something. :-)  
But trig functions on a business calculator? That's neat. I wonder, is that a nod to the geeks in finance, or are there actual financial applications for those functions?

- Thomas

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #9 Posted by [Peter A. Gebhardt](#) on 10 Aug 2007, 3:10 a.m.,  
in response to message #8 by Thomas Okken*

Thomas,

Yes there could be financial applications, like using them for "on the fly" calculation of the "weights" for a Gaussian Quadrature in numerical integration and other stochastic applications.

<http://www.voidware.com/gaussint.htm>

Best regards

Peter A. Gebhardt

*Edited: 10 Aug 2007, 3:13 a.m.*

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #10 Posted by [Don Shepherd](#) on 9 Aug 2007, 4:32 p.m.,  
in response to message #5 by Peter A. Gebhardt*

OK, this simple solver formula demonstrates the erroneous behavior of the solver on the hp-17bii+:

$A=0x\sigma(I:1:10:1:L(S:S+I))$

Enter the formula into the solver, press CALC, do a Clear Data (to insure S is 0), press A softkey, it will (correctly) say that A=0, then press RCL S, it will show S=110. The correct answer is (or should be) S=55, which is what you get if you run it on the 17bii.

As to how S gets to be twice what it should be, I don't know!

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #11 Posted by [Bruce Bergman](#) on 9 Aug 2007, 6:43 p.m.,  
in response to message #10 by Don Shepherd*

Don and I had some discussions about why this was happening. I don't know enough about the internals of the 17bii+, but I first noticed the unusual behavior doing the Sum Of Digits program. If you just changed around the variables, used another L() and G(), it seemed to work.

I suspect there is some difference in how variables are represented (or accessed) in the bii versus the bii+ models. I don't know if the 17bii behaves the same as the 19bii in this regard. It would be interesting to get the following calcs lined up and run the same programs on each:

19b 19bii 17b 17bii 17bii+ (and the new silver 17bii++?)

If we could somehow document the differences in how the solver functions on each machine, at least we could hand that out as a cheatsheet for those trying for portability amongst that family. I know it would have saved me a big headache a year or so ago...

thanks, bruce

Gene, can you post original formula. I would like to see what it is to analyze what might be problem. I have been unable to find it in the archives.

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #13 Posted by [Don Shepherd](#) on 9 Aug 2007, 8:14 p.m.,  
in response to message #12 by Vincze*

Vincze, this is the formula that works on the hp-17bii, but not on the hp-17bii+. It calculates the sum of the

digits of input n:

```
sod=sigma(i:0:log(n):1:mod(n:10)+0*L(n:div(n:10)))
```

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #14 Posted by [Vincze](#) on 10 Aug 2007, 7:59 a.m.,  
in response to message #13 by Don Shepherd*

Thank you. I guess if I understood english better I would know what GCD/LCM mean. Can someone please explain.

Can you explain also the different parts of the formula. Also, what are the colons for?

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #15 Posted by [Don Shepherd](#) on 10 Aug 2007, 8:05 a.m.,  
in response to message #14 by Vincze*

Vincze, GCD is greatest common divisor, and LCM is least common multiple. The GCD of two numbers is the largest number that divides into the numbers evenly, and the LCM is the smallest number that is a multiple of both numbers.

You need to look at the HP-17bii+ manual, which is on the museum DVD and probably HP's site, to understand the formula.

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #16 Posted by [Vincze](#) on 10 Aug 2007, 9:33 a.m.,  
in response to message #15 by Don Shepherd*

Thank you... okay, I understand what greatest common divisor and least common multiple are. I was just not aware of the abbreviations.

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #17 Posted by [Vincze](#) on 10 Aug 2007, 3:48 p.m.,  
in response to message #15 by Don Shepherd*

So I don't understand one thing. How does SOD tell me GCD or LCM, or is this part of another program that do that?

BTW, I ask friend if I can buy 17BII that he let me borrow. He tell me to go do something to myself that I don't think is possible. ;-)

*Edited: 10 Aug 2007, 3:50 p.m.*

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #18 Posted by [Don Shepherd](#) on 10 Aug 2007, 4:00 p.m.,  
in response to message #17 by Vincze*

The SOD (sum of digits) program has nothing to do with GCD or LCM. GCD/LCM is another solver program, available on the museum DVD in the HP 27S/19B Technical Applications manual.

Message #19 Posted by **Vincze** on 10 Aug 2007, 5:08 p.m.,  
in response to message #18 by Don Shepherd

Okay... I thought I was going stupid or something.

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

Message #20 Posted by **Peter A. Gebhardt** on 10 Aug 2007, 8:11 a.m.,  
in response to message #14 by Vincze

Vincze,

GCD == Greatest Common Denominator (Größtes gemeinsames Vielfaches)

LCD == Least Common Denominator (Kleinstes gemeinsames Vielfaches)

The colons (:) are delimiters to separate the parameters of the function call properly - like in f(a,b, ...,z).

Best regards,

Peter A. Gebhardt

PS: Excuse me for offering a German translation as well, but I suppose German could have been part of your education, because of the historical relations between Hungary and Austria.

Guten Morgen Peter und danke. Es ist mir bekannt welche Deutsch, aber nicht jene menge noch mehr. {I hope I said that correctly;} I guess I remember more than thought I did. }

I have not used it for very long. An older man in village where I grew up spoke it, and I learned from him and others. Believe it or not, many people now speak English, at least in larger cities like Budapest. Main language is still Hungarian, but most people know enough English.

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

Message #22 Posted by **Vincze** on 10 Aug 2007, 12:02 p.m.,  
in response to message #13 by Don Shepherd

When I try on 28C, it says invalid equation. Friend have 17BII and I try there and same issue.

You have equation as:

$sod = \sum_{i=0}^{\log(n):1:\text{mod}(n:10)+0} L(n:\text{idiv}(n:10))$

Does it need to be  $sod = \sum_{i=0}^{\log(n):1:\text{mod}(n:10)+0} L*(n:\text{idiv}(n:10))$

Actually, after it says error, it goes right after sigma and flash on the left (

## Re: 17b2+ solver and the GCD/LCM formula (Don?)

Message #23 Posted by [Peter A. Gebhardt](#) on 10 Aug 2007, 12:21 p.m.,  
in response to message #22 by Vincze

Vincze,

According to Graig Finseth, the 28c DOES NOT have L() & G() commands available in it's solver  
- only the 27s, 19b, 17b, (the palmtops) 95,100,200LX.

Sorry for you :-((

Quote:

---

For the 28c:

RPL28:

Similar to algebraic, except that different keystrokes are used:

<value> stores the value in the variable <value> '<name>' STO stores the value in the  
variable Shift-<name> solves for the variable '<name>' RCL recalls a value from the  
variable '<name>' EVAL recalls a value from the variable and evaluates it

---

For the "Business Line":

Quote:

---

Algebraic:

This solver is similar to TVM5, except that it has been generalized to handle any  
equation.

<name> stores the value in the variable STO <name> stores the value in the variable  
<name> (2nd in a row), solves for the variable RCL <name> recalls a value from the  
variable

The solvers on the 17BII, 19B, 19BII, and -27S also have L(et) and G(et) functions.

The solvers on the -17B, 17BII, -18C, 19B, and 19BII do algebraic simplification: this  
feature was removed from the -27S in order to save space.

The solver on the 17BII / 19B / 19BII is the best one of the set.

---

<http://www.finseth.com/hpdata/solvers.html>

Why it doesn't work on the 17bII is not clear to me. I tried your first equation on an 200LX (my  
reference, because I don't possess any other "reference" besides a 17bII+) and it works fine. The  
200LX solver is being regarded as a perfect clone of the 19bII solver.

Best regards

Peter A. Gebhardt

in response to message #23 by Peter A. Gebhardt*

On 17BII, it look like Error right after Sigma. Do I just spell Sigma out, or is the symbol someplace that I need to enter? I apologize for being such stupid Hungarian.

*Edited: 10 Aug 2007, 12:33 p.m.*

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #25 Posted by **Peter a. Gebhardt** on 10 Aug 2007, 12:40 p.m.,  
in response to message #24 by Vincze*

Vincze,

Never ever regard yourself as stupid when asking questions - there are no stupid questions - only stupid answers!

Your suspicions are right: Very often we post Solver programming examples (for the business line) using "sigma" instead of the greek symbol for sigma.

So pls. press the right-most soft-menu button (alpha) 4 times (when in EDIT mode on the 17bII) and you wil see the required symbol.

Best regards

Peter A. Gebhardt

**Re: 17b2+ solver and the GCD/LCM formula (Don?)**

*Message #26 Posted by **Vincze** on 10 Aug 2007, 12:50 p.m.,  
in response to message #25 by Peter a. Gebhardt*

Thank you so much my friend! It now work.

Again, I sorry for dumbing down group. I know you say I no stupid, but I wish I was smart like rest of you. I am more programmer, and not as fancy with math and physics. My Papa was big shot physics person. Back in 1970's men come for him to have him help them with something very secret. Papa would not help them and they bound him up, and my mother up and laid them on train tracks. They kept asking for his help, and he say NEM! to them. So they kill Papa and my mother by driving train very slowly over them. He was very smart man, but I swore that I would not go into physics because of what happen to him. Computer science seem more safe that physics and nuclear things.

Thank you again for putting up with me. I consider you all very good friends.

### HP 35s on sale in the UK

Message #1 Posted by [Matt](#) on 9 Aug 2007, 11:08 a.m.

[Here](#)

[And here with EU shipping](#)

[And also here](#)

So that's about £60, which is about \$120!  
Do the American's here think the 35s is worth \$120?

### Re: HP 35s on sale in the UK

Message #2 Posted by [Ed Look](#) on 9 Aug 2007, 12:33 p.m.,  
in response to message #1 by Matt

Perhaps! the HP-32SII back when it was still manufactured was sold for \$70 USD (although I got mine for for \$60 ; ) ).

Now, the 35s is clearly superior to the 32SII in terms of number of storage registers and programming space, but remarkably very similar in most other ways.

If we account for inflation, and I am no expert at the rates, and accounting for the functional improvement, and that a full featured forearm length graphing calculator from any company costs well over \$100 USD, I am surprised HP did not recommend between \$80-\$90 USD for it... though I am very happy they did recommend it for \$60!

### Re: HP 35s on sale in the UK

Message #3 Posted by [frank skipwith](#) on 9 Aug 2007, 1:01 p.m.,  
in response to message #1 by Matt

The price of £60 or \$120 seems to include shipping and Value Added Tax (VAT) at 17.5%. If you strip these costs out for a fair comparison the price comes out at about \$94 which is still high compared to the USA

But In the UK everything is expensive! Petrol (Gas) costs about \$2 per Litre, a small 2 bedroom house will cost \$400,000 (a lot more in London), a New Ford Focus basic model costs around \$25,000 Most electronic goods seem to be twice the US price, If it costs \$50 dollars in the USA it usually seems to cost £50 pounds in the UK

### Re: HP 35s on sale in the UK

Message #4 Posted by [Ed Look](#) on 9 Aug 2007, 2:07 p.m.,  
in response to message #3 by frank skipwith

There may be a bit of marketing psychology here; imported stuff in any country seems to cost more.

(Unfortunately, too many things have to be imported which used to have a domestic source.) I suppose the cost of farming out the manufacturing of (in this case) HP-35s's may save HP in costs over manufacturing it in the U.S., even if shipping and other importing costs are avoided.

### **Re: HP 35s on sale in the UK**

*Message #5 Posted by **Dave Shaffer (Arizona)** on 9 Aug 2007, 5:30 p.m.,  
in response to message #4 by Ed Look*

Quote:

imported stuff in any country seems to cost more.

Everybody except those of us in the USA seem to get screwed! Since the 35S is, in fact, imported to the USA, it's VERY hard to argue that shipping cost is the reason. It can't cost that much more to run a boat or airplane to any point on the globe. Moreover, it doesn't make much sense to "import" it first to the US and then "import" it AGAIN to the next country on the list.

I think we Americans have low taxes and tariffs compared to just about anybody else. The true effect of this on our economy is debatable - i.e. do we gain or lose because the Chinese now make almost everything we use? Prices are better, but we lose jobs and experience. I guess that's why we have Republicans (free trade, damn the social costs) and Democrats (damn free trade, to preserve jobs) - a somewhat simplified view, but not too far off.

We're now rather far off-topic, but I'd be interested in hearing from non-US folks their perception on their country's balance between taxes, tariffs, and social costs. i.e. do you feel it "worth it" to pay twice as much for your HP 35S because there is a great social umbrella protecting your society?

### **Re: HP 35s on sale in the UK**

*Message #6 Posted by **Les Bell** on 9 Aug 2007, 8:21 p.m.,  
in response to message #5 by Dave Shaffer (Arizona)*

This kind of thing is traditionally down to "transfer pricing". In other words, the US head office charges international subsidiaries a high "wholesale" price. The intention originally was that international subsidiaries should have low margins and hence low profit, to avoid paying high tax rates, and the real profit is effectively repatriated tax-free.

In practice, international subsidiaries and distributors have to show a healthy profit anyway these days, so we get slugged twice.

Best,

--- Les

[<http://www.lesbell.com.au>]

### **Re: HP 35s on sale in the UK**

*Message #7 Posted by **James Biddlecombe** on 10 Aug 2007, 4:50 a.m.,  
in response to message #6 by Les Bell*

Well I'm in the UK and wouldn't pay the prices they are charging here on principle. I'll either get one sent over from the US with the cheapest postage I can or get somebody to bring one back for me. Even if pay \$20 postage it's still cheaper. I was almost thinking of starting another thread on here to see who has the world's most expensive 35s advertised. I think the UK dealers

must be in with a reasonable chance of winning!

In fact I hope most people buy from the US, so when HP see the low foreign sales they might just realised that people are fed up getting constantly fleeced. As someone has mentioned earlier, they are not made in the US so there is no transport cost specific to the UK, taxes are a fraction of the extra cost, etc.

As for the calculator itself it looks great, although the criticism of the way the base conversion works does concern as me since the functions I use the most on a daily basis as percentages and decimal/binary/hex conversions.

Cheers, James.

### **HP 35s at 60 USD, 60 GBP, 60 EUR**

*Message #8 Posted by **Nenad (Croatia)** on 9 Aug 2007, 3:14 p.m.,  
in response to message #3 by frank skipwith*

Quote:

\_\_\_\_\_

If it costs \$50 dollars in the USA it usually seems to cost £50 pounds in the UK

\_\_\_\_\_

Yes, that's the point. It's always 60 of something. I've received mine here for a total of 60 EUR;)

This reminds me of a scene in the film "Dogs of War" w. Christopher Lambert in the title role. After the leader of the team selects the weapons (necessary for a coup-d-etat in an African country) to buy from a weapons dealer, they agreed the price as follows.

Leader: "Is this still 100,000?"

Dealer: "Certainly, as always. 100,000 pounds"

Leader: "No, I thought 100,000 marks"

Dealer: "OK, let it be 100,000 dollars"

Leader: "OK"

### **Re: HP 35s on sale in the UK**

*Message #9 Posted by **AJ** on 10 Aug 2007, 12:25 p.m.,  
in response to message #1 by Matt*

Now i have some sympathy with this thread but not a massive amount as I am afraid most of us live in this thing called the real world.

In reality you can pick the HP35s up today in the UK for £54.95,(less in some cases as I hope some other UK buyers will mention) given that it came out about 5 minutes ago I am sure this will be down to around £49.95 within a week or too as online etailers begin to compete on price. Strip out the 17.5% VAT and you are talking £42.5 or \$85 equivalent based on the exchange rates that are currently working in our favour in the UK. Now I know this is still more than the US but this is for many many reasons and I have listed but a few below.

1. A little thing called economy of scale - the total UK market is around the size of California's. It costs more per product to ship in small amounts than it does in large amounts and if the disty in the US is buying 100 times more than the disty in the UK - I'm guessing he's going get a better price.

2. In the EU we have implemented a 2 year warranty, this costs money (quite a lot of money in the case of some recent HP calculators...)
3. In the EU we have had to implement WEEE regulations and ROHS regulations again all at a cost.
4. The cost of fuel in the UK is about the equivalent of liquid gold in the US.
5. The distribution channel in the EU is very different to that in the US, we have a longer supply chain in Europe, this means more logistical costs are added, the reasons for this I don't have time to go into here but you have to accept this and that without the longer supply chain the product wouldn't be available in many EU countries at all.
6. The RRP in the UK has not fluctuated with Currency exchanges, what had an RRP of £60 when it was 1.5\$ to the pound still has an RRP of £60 when it is \$2 to the pound, and will still have a RRP of £60 when it is \$1.5 to the pound again.
7. The internet dealers you quoted are all HP enthusiasts and calculator specialists it seems a little unreasonable to compare their sell prices to Walmart and Staples in the US, their prices are based on volumes sold and ironically the more UK buyers buy in the US the worse this will be.
8. Transfer pricing - I am sure this is true to and makes up an element of the extra cost. At the end of the day The US sets the base price for it distributors based I am sure on what it believes makes the best business sense not on a one price for all strategy.
9. BECAUSE EVERYTHING IS CHEAPER IN THE US, ALWAYS HAS BEEN AND ALWAYS WILL BE.

So James - you buy your product in the States, support the US economy and not your own, avoid paying the legally due VAT, and thus help to sustain the very thing it is you are complaining about!!!

I hope yours arrives in pieces having been bounced across the Atlantic for 3 weeks by a US carrier charging you \$35 for the privilege and HP Europe refuse to help you. Still at least you may have saved a tenner.

Rant over - nerve ending repaired ;-)

### 28C corrosion

Message #1 Posted by [Vincze](#) on 9 Aug 2007, 9:03 a.m.

On way into work today, I saw some people setting up for a garage sale. I stop and asked if they minded if I looked while they were setting up. I came across a HP 28C calculator that was for sale. It was marked \$30. I tried to turn it on, but it did not come on right away. I fiddled with it a bit and it finally came on with the message Memory Lost. I ask the guy if he would sell it for \$15, and he said sure because it only worked some of the time. I took the batteries out and I saw why it only worked some of the time as there was white powder on battery from some corrosion. I figure I could fix it.

Since battery compartment is strange for the 28C, what is the best way to get the corrosion out of there. I would think that a paste of baking soda and water would help neutralize the buildup, but moisture may get into case of calculator, and I don't think that would be a good thing.

Has anyone dealt with this before, and if so, how.

### Re: 28C corrosion

Message #2 Posted by [Ed Look](#) on 9 Aug 2007, 10:23 a.m.,  
in response to message #1 by [Vincze](#)

It's never too easy, but most leaked electrolytes are water soluble and while they may either be decidedly acidic or basic (alkaline), there is no real need to neutralize it.

I just take a wet but not dripping piece of paper towel and take my time with wiping out the crust. It should dissolve. But be sure to get the stuff stuck in corners, cracks, etc. A toothpick may be soft enough on the plastic and hard enough to dislodge the leaked material.

Also, be sure to wipe the metal contacts as clean as you can with the wet paper towel.

And for the sake of the metal, visibly dry the battery compartment well and then leave the battery door off and let the compartment dry for at least several hours or overnight.

If you are worried about the corrosiveness or toxicity of the leaked chemicals, you can wear thin rubber gloves, but that's not really necessary- just don't eat the stuff and wash your hands afterward!

### Re: 28C corrosion

Message #3 Posted by [Vincze](#) on 9 Aug 2007, 10:50 a.m.,  
in response to message #2 by [Ed Look](#)

Quote:

\_\_\_\_\_

If you are worried about the corrosiveness or toxicity of the leaked chemicals...

\_\_\_\_\_

I'm not so worried about that with my hands or the like, but I would think I need to neutralize the

chemicals so they do not continue to crud up the metal in there, or have you not had issues with that?

Thank you again Ed!

**Re: 28C corrosion**

*Message #4 Posted by [Ed Look](#) on 9 Aug 2007, 1:33 p.m.,  
in response to message #3 by Vincze*

No real need to worry about that- it's like the argument with antibacterial hand soap, whether it's really necessary. The real answer is that it's not, for washing away germs is as good as killing them on your skin (and let's not even go into the whole issue of antibiotic resistance).

Besides, you can't really determine exactly how much dried electrolyte you have in the battery compartment, so you may respond with too little or too much base/acid (depending on whether the electrolytic paste was acid or base) and you then have the same problem again.

Most of this stuff is at least moderately soluble in water, so wiping away with a wet paper towel, then finally wiping with a good clean wet one, before drying is all you need. But water is corrosive for most metals, especially ferrous ones, so drying is very necessary.

And in the future, if there is more crud, it means that either your new batteries are leaking or there is stuff from behind the battery compartment you couldn't see the first time, which would require the more radical step of performing calculator surgery and opening the case.

**Re: 28C corrosion**

*Message #5 Posted by [Vincze](#) on 9 Aug 2007, 1:43 p.m.,  
in response to message #4 by Ed Look*

Quote:

\_\_\_\_\_  
...which would require the more radical step of performing calculator surgery and opening the case.  
\_\_\_\_\_

And from looks of case, it does not look like it would be easy to open. In fact, I don't see any clues as to how it may even be opened.

Okay my friend, I will try your method and report what happens. For \$15, I can't complain.

**Re: 28C corrosion**

*Message #6 Posted by [Dave Colver](#) on 9 Aug 2007, 8:04 p.m.,  
in response to message #1 by Vincze*

I'd use 'just-damp' cotton buds (erm sticks with little cotton balls on the end?) to swab out the battery compartment - they just have the reach. Careful they dont shred though...

Hope this helps

Dave

Every person with an HP calculator in their collection should treat the battery terminals with DeoxIT® GOLD or similar product from CAIG Industries. I treat my calcs with this to prevent corrosion.. very effective. -- Apply it with one of the 5-6cm lint free brushes you can get from the same company.. don't mess with cotton swaps and baking soda.

### 3x3 matrix operations for the HP-12C Part II

Message #1 Posted by [Kalevipoege](#) on 9 Aug 2007, 3:25 a.m.

I posted the Cramer's rule for the HP-12c on February 2005. <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=68690>

Now I have played with matrices and the HP-12C again.

My old 12C can find the inverse of the 3x3 matrix and pretty quickly too.

Here is my procedure. You may wonder that there is no GTO command in this program. Yes, that's true. It wasn't necessary.

```

01 RCL 5      21 RCL 8      41 RCL 8      61 /
02 RCL 9      22 *          42 *          62 R/S
03 *          23 RCL 5     43 -          63 RCL 5
04 RCL 6      24 RCL 7     43 RCL 0     64 RCL 8
05 RCL 8      25 *          45 /          65 RCL 2
06 *          26 -          46 R/S         66 STO 8

### **I think I know what the faceplate "issue" is**

Message #1 Posted by [Miguel Toro](#) on 8 Aug 2007, 6:50 p.m.

This is my second HP 35s. I have not really used it until now. When I took it out of the package it was fine, but the faceplate detached slowly day after day. There, where it is detached it is where exactly the little ground spring is. They said that the issue was in some few units. I think this is one of them.

[http://farm2.static.flickr.com/1423/1054405913\\_3db36f7b21.jpg?v=0](http://farm2.static.flickr.com/1423/1054405913_3db36f7b21.jpg?v=0)

### HP Resumes Selling 35s

Message #1 Posted by [George Bradford](#) on 8 Aug 2007, 2:17 p.m.

Just checked HP's websites and discovered they were selling the 35s again.

The HP Home Website has the 35s listed "In Stock: Ships within 24 hours if order is placed before 10pm (EST)."

The HP SMO site lists the HP 35s as "In Stock: usually ships within 24 hours."

### Re: HP Resumes Selling 35s

Message #2 Posted by [lindguini](#) on 8 Aug 2007, 2:59 p.m.,  
in response to message #1 by [George Bradford](#)

I also noticed that the 35s is shipping again from HP. By the way, coupon code SV1063 will get you \$10 off \$50 at the HP store (good through 8/15). I ordered one this morning.

### Re: HP Resumes Selling 35s

Message #3 Posted by [Palmer O. Hanson, Jr.](#) on 10 Aug 2007, 2:28 a.m.,

As soon as I receive the one I ordered today from HP, I will compare it to the one I received previously from SC. If there are any differences, I will post them here.

### **Re: HP Resumes Selling 35s**

Message #8 Posted by **lindguini** on 8 Aug 2007, 4:03 p.m.,  
in response to message #6 by Vincze

Based on all the forums and debates I've read, I think too many people have gotten their hopes up that HP pulled the 35s from shipment in order to physically inspect each device for display alignment, serial number decal alignment, or to correct alleged functional bugs. This is not practical. At best, I believe HP performed a visual "through the blister pack" inspection to weed out any faceplates that had the "convert liter to liter" errant conversion marking posted elsewhere in this forum and found on only a handful of early units. This would be the cosmetic defect HP spoke of.

The calculators are not worth enough for HP to perform individual inspections of display alignment, etc. If HP was correcting this problem, they would have pulled ALL stock, trashed them, and waited for a new production run from China that fixed these problems. That can't happen in one, two, or three weeks.

Expect HP to continue shipping product with 721x and 725x serial numbers. At some point in the future, I'm sure they'll address the minor manufacturing issues that some people have noticed. Remember the 33s decimal point? They did finally improve this after many complaints but it took at least a year after production started on that model.

### **Re: HP Resumes Selling 35s**

Message #9 Posted by **Paul Brogger** on 8 Aug 2007, 6:48 p.m.,  
in response to message #8 by lindguini

I wonder whether, with the use of polarized or laser light and/or a polarizing filter (or *whatever*), they might have performed a non-invasive check of display alignment? Any ideas?

I could NOT tell, by looking through the packaging at a turned-off display, whether my second unit was mis-aligned, and so gave up & opened the thing.

### **Re: HP Resumes Selling 35s**

### Chances of a bug-fixed 35s?

Message #1 Posted by [Bruce Bergman](#) on 8 Aug 2007, 2:07 p.m.

This is merely for discussion -- I'm not proposing anything, nor am I planning on returning my new 35s. ;-)

What do you think the chances are that HP will be releasing a cleaned up version of the 35s? Just the software bugs, not anything like keyboard, labeling or display issues?

There have only been a handful of bugs, but the list is growing, and I suspect we haven't seen the last of them. The 33s had a couple of bugs too, and I believe they cleaned them up about a year later, about the time they fixed the period/comma issue.

Another discussion topic: who does HP rely on for testing these calcs? I mean, they can't cover all the bases strictly using automated testing or regression testing -- you'd think they have to send them to actual users for beta testing and then fix bugs as they are found. With the possible exception of Gene Wright, I don't know of anyone who got a "beta" model to test, so that leads me to believe the test group (if there is one) is miniscule. You'd think HP would want to get together a group of hard-core users and have them test out the next new version, under non-disclosure of course, to get a good coverage...

Musings from a slow Wednesday...

thanks, bruce

### HP 48GX ON key

Message #1 Posted by [Marco Luna](#) on 8 Aug 2007, 10:03 a.m.

Hi, I have a HP 48GX that helped me throw collage so you must have an idea how please I'm with this calculator. For several reasons I had to put it away for a couple of years and now that I need it I found that my ON/CANCEL key isn't working. I have already try the key test and failed. The only way I can make it work is If I apply a lot of pressure and in some times work and others doesn't. I leave in Mexico and HP had told me that they do not have services for calculators. I believe that if I open it and clean the pad the problem is going to be solve, but... I don't know how to open it or if it's a good idea. Can some one help me. GRACIAS!

### Re: HP 48GX ON key

Message #2 Posted by [Vincze](#) on 8 Aug 2007, 12:11 p.m.,  
in response to message #1 by Marco Luna

Good afternoon Marco. Have you tried to adjust contrast on calculator? Maybe it reset itself when sitting so long and need to adjust contrast. I believe I remember reading that if you turn on and then hold ON and + (plus key) it make contrast darker, and ON and - (minus key) it make it lighter.

Also, stupid question, but have you tried new battery? Does the ((\*)) stay lit on the display?

### Re: HP 48GX ON key

Message #3 Posted by [Marco Luna](#) on 10 Aug 2007, 12:40 p.m.,  
in response to message #2 by Vincze

Vincze,

Its not the contrast, actually is in excellent setting (you are correct ON + plus key it make it darker and the other way around). The problem is that some times it works fine the button (ON/CACEL) and some time it doesn't respond at all. I haven't figured it out if a lot of pressure makes or not a difference. Batteries are new and the clac except this problem is working fine. Thanks for your reply.

### Re: HP 48GX ON key

Message #4 Posted by [bill platt](#) on 8 Aug 2007, 12:32 p.m.,  
in response to message #1 by Marco Luna

Try gently pressing on the faceplate just above the "F" key, and then press "ON". If this makes it work, then do a search of the Archives here to learn more about it.

regards,

Bill

### Re: HP 48GX ON key

### **should I return the HP35S from Walmart and wait for one from Samson Cables?**

Message #1 Posted by [andrewj](#) on 8 Aug 2007, 9:21 a.m.

I just received the HP-35S after ordering it from Walmart on August 2, 2007 (after reading the New York Times article).

After reading posts about the misaligned screen, I wonder if I should return the Walmart one and reorder it from Samson Cables? (I haven't opened the box yet.) Is the misaligned screen in all the ones shipped from Walmart or just an isolated few? Or do people think the misaligned screen is blown out of proportion?

### **Re: should I return the HP35S from Walmart and wait for one from Samson Cables?**

Message #2 Posted by [Kevin Kitts](#) on 8 Aug 2007, 11:44 a.m.,  
in response to message #1 by [andrewj](#)

It seems very likely that the misaligned screen problem happens in differing amounts. The mis-alignment on my unit was so small that it did not really bother me - all of the "annunciators" at the top are still visible.

It seems the range of misalignment ranges from none to bad in a somewhat random manner. I bought my unit directly from HP, for example. I don't think a clear pattern has emerged that units bought from certain vendors (or even serial number ranges) has yet really emerged.

In short, it's a crap shoot. Unless you want to wait a few months for HP to re-release the 35s - I'd say open it and take a look and see what you've got. You may find that it is just fine. If you find that it is bad I think Walmart and/or HP will take it back and give you a new one once they correct the manufacturing problems.

Good Luck,

Kevin

### **Re: should I return the HP35S from Walmart and wait for one from Samson Cables?**

Message #3 Posted by [Paul Brogger](#) on 8 Aug 2007, 1:21 p.m.,  
in response to message #2 by [Kevin Kitts](#)

Right -- keep your packaging & receipt, but go ahead & play with it. (Check with them to be sure, but I think you have 90 days for a return.)

I got one of mine from Wal-Mart -- it's absolutely fine.

Besides, if H-P has suspended sales, who knows when it will be available again?

### **Re: should I return the HP35S from Walmart and wait for one from Samson Cables?**

*Message #4 Posted by [andrewj](#) on 8 Aug 2007, 10:43 p.m.,  
in response to message #3 by Paul Brogger*

I wonder...now that it's in stock again at hp.com, if these "newer" units will have the faceplate issue resolved. Alas, if I were to open up the one I have from Walmart, it may be difficult to return!

**Re: should I return the HP35S from Walmart and wait for one from Samson Cables?**

*Message #5 Posted by [Ed Look](#) on 8 Aug 2007, 11:50 a.m.,  
in response to message #1 by andrewj*

Unless it's really a huge slant up to the right (or left, though I haven't heard of any of those) and bothers you no end, I'd keep it. I got mine via Buy.com and there is an ever so slight misalignment up toward the upper right corner, but as many say, it's really only noticeable if you run the self-test and all the annunciators show up on the screen. In fact, I didn't even notice it until I read the posts in this forum!

I have a slightly different problem, though, my case is slightly defective: the upper strap inside when the case is right side up came incompletely sewn onto the case on the left.

**Re: should I return the HP35S from Walmart and wait for one from Samson Cables?**

*Message #6 Posted by [Ren](#) on 8 Aug 2007, 11:50 a.m.,  
in response to message #1 by andrewj*

### HP35s Radix, bug

Message #1 Posted by [Nenad \(Croatia\)](#) on 8 Aug 2007, 10:56 a.m.

In another thread Katie suggested RADIX. or RADIX, to be used for instructions whose line numbers are to be referred to from other instructions (GTO, XEQ or similar) to avoid these being deleted. This is a nice proposal, in Katie's brilliant style.

However, trying this revealed me a (stupid) bug that a user who uses dot as a radix could never figure out. However, the first thing I do when I receive a HPcalc is to change the radix dot (.) into radix comma (,) and to enable thousands separator (dots, not commas). This is how we write numbers here.

The BUG: if in RADIX. mode you switch to PRGM and select DISPLAY or MODE RADIX, everything is normal. The program step is RADIX. or RADIX,

If you do the same in RADIX, mode when you select 6, (meaning RADIX,) the program instruction entered becomes RADIX. instead of RADIX,

In preselected RADIX, mode when you select 5. (requiring RADIX.) you obtain RADIX, in program listing.

Yes, yes, I know that this is a completely useless information, but I really cannot think about this as a feature rather than a bug.

This would, hopefully, be my contribution to the bug hunting season.

### Re: HP35s Radix, bug

Message #2 Posted by [Katie Wasserman](#) on 8 Aug 2007, 11:46 a.m.,  
in response to message #1 by [Nenad \(Croatia\)](#)

Nenad,

Interesting find, bug, whatever.

Another way to state this that would not qualify it as a bug is: the calculator is treating "RADIX" as a function of one argument, the radix point. It then shows the radix point in whatever notation you've selected.

But the manual presents them as separate commands (not functions) "RADIX," and "RADIX." so that's what you would expect to see on the display regardless of the display mode. I agree with you, it's a bug!

-Katie

Edited: 8 Aug 2007, 11:47 a.m.

### Re: HP35s Radix, bug

Message #3 Posted by [Miguel Toro](#) on 8 Aug 2007, 12:32 p.m.,  
in response to message #1 by [Nenad \(Croatia\)](#)

Interesting. And it seems like it is just a display bug, the instruction does what it is intended to do: so if you entered "RADIX," even if it is displayed "RADIX." it executes a "RADIX," as expected.

I also use "," as decimal separator.

### 35s vs. 33s speed for identical programs

Message #1 Posted by [ECL](#) on 7 Aug 2007, 5:10 p.m.

I wrote a program for my 33s that computes area moment of inertia and centroid for composite cross-sections based on n rectangular elements.

I keyed this in on my new 35s, and was surprised to find the 35s slower. I'm an engineer, but know very little about electronic hardware.

Any thoughts?

If anyone would like a program listing of it, I can post later.

ECL

### Re: 35s vs. 33s speed for identical programs

Message #2 Posted by [Gene Wright](#) on 7 Aug 2007, 5:21 p.m.,  
in response to message #1 by [ECL](#)

The 35s is slower than the 33s in some areas.

This is discussed in the free 35s review from Datafile. Find it on [hpc.org](http://hpc.org)

It appears that there is a speed penalty for some looping AND when numbers are entered on the stack...possibly due to the new data types of vectors and complex numbers (37 bytes put on the stack compared to 12).

### Re: 35s vs. 33s speed for identical programs

Message #3 Posted by [bill platt](#) on 7 Aug 2007, 5:22 p.m.,  
in response to message #1 by [ECL](#)

Someone else mentioned this in an earlier thread--and it was suggested that the additional features (vectors, complex) may increase the overhead demands on the processor.

Message #5 Posted by [ECL](#) on 8 Aug 2007, 12:45 p.m.,  
in response to message #4 by [Howard Boardman](#)

Here is the code listing (as requested) for the area moment of inertia and horizontal neutral axis for a composite body that is discretized with rectangles:

I001 LBL I

I002 SF 10

I003 EQN IXX and Neutral Axis **\*\*enter the text as an eqn\*\***

I004 CF 10

I005 CLVARS

I006 INPUT N

I007 INPUT B (note: I have omitted line numbers from here on)

INPUT H

RCL H

2

/

RCL +T

RCL B

RCL \* H

\*

RCL +Q

STO Q

RCL B

RCL H

\*

RCL +R

STO R

1

RCL +V

STO V

RCL Q

RCL / R

```
RCL - C
X^2
RCL *A
RCL + I
STO I
RCL T
RCL H
2
/
+
RCL Q
RCL / R
-
X^2
RCL *B
RCL *H
RCL H
3
Y^X
RCL *B
12
/
+
RCL + I
STO I
RCL Q
RCL / R
STO C
RCL B
```

RCL \* H

RCL + A

STO A

RCL T

RCL +H

STO T

RCL V

RCL N

X>Y?

GTO I007

I= **\*\*This is the value of composite Ix for your cross-section\*\***

C= **\*\*This is the location of Xbar, ie the X neutral axis\*\***

RTN

LN=220 CK=704D

Here is an example for an I-beam:

XEQ I

ENTER

**\*\*screen will read: IXX AND NA (hit R/S to continue)\*\***

N=3 **\*\*number of sections\*\***

R/S

B=5 **\*\*width of bottom flange\*\***

R/S

H=0.25 **\*\*height of bottom flange\*\***

R/S

B=0.5 **\*\*width of web\*\***

R/S

H=8 **\*\*height of web\*\***

R/S

B=3 **\*\*width of upper flange\*\***

R/S

H=0.25 **\*\*height of upper flange\*\***

R/S

(Program halts to VIEW the area moment of inertia, units length<sup>4</sup>)

R/S

(Program halts to VIEW the location of the x centroidal axis)

R/S

The result should be

I = 54.6660 (units = length<sup>4</sup>)

C = 3.9063 (units = length, measured from base)

Enjoy! I realize that this may now be shortened a bit, particularly in light of the new programming capabilities gained with the 35s. In progress!

### Re: 35s vs. 33s speed for identical programs (LONG - code li

Message #6 Posted by [Les Wright](#) on 8 Aug 2007, 4:01 p.m.,  
in response to message #5 by ECL

Can you edit your post to put [pre] [/pre] around the code listing? This will shorten listing and make code more readable. You can also put in the occasional line number (say every tenth one) to help one to check entry errors.

Les

## Re: 35s vs. 33s speed for identical programs

Message #8 Posted by [Gerson W. Barbosa](#) on 7 Aug 2007, 7:05 p.m.,  
in response to message #1 by ECL

Even though someone has provided a 35s-optimized version, the HP-35S is about 2.5 times slower than the HP-33S in [Xerxe's Benchmark](#). When running the HP-32S/SII/33s version the HP-35s is even slower. It appears everytime new features are added to the same hardware there is a decrease in performance (HP-32S -> HP-32SII, HP-48G -> HP-48GX, for instance).

Quote:

---

If anyone would like a program listing of it, I can post later.

---

It would be great. Better yet you might want to submit it to the Software Library (HP-33 section), where it would be permanent and easier to find. BTW, once I wrote a similar program for the HP-49G/G+. It defaults to Portuguese but there's a command to change all messages and screens to English:

<http://www.hpcalc.org/details.php?id=4446>

Gerson.

### Re: 35s vs. 33s speed for identical programs

Message #9 Posted by [Bruce Bergman](#) on 7 Aug 2007, 7:09 p.m.,  
in response to message #8 by Gerson W. Barbosa

Someone seriously needs to do a tear-down on this puppy and see if it is underclocked, and if so, why. It might be possible to bump it.

Just a thought.

### Re: 35s vs. 33s speed for identical programs

Message #10 Posted by [Gerson W. Barbosa](#) on 7 Aug 2007, 7:21 p.m.,  
in response to message #9 by Bruce Bergman

I was expecting the HP-35s to be slower than the HP-33s, but not that slower. I would say underclocking makes a bit of sense but it seems the battery life expectancy is the same in both specs...

### 35S slower

Message #11 Posted by [Ralph](#) on 7 Aug 2007, 11:05 p.m.,  
in response to message #10 by Gerson W. Barbosa

I found that the 41/42 benchmark was a little faster than the 33S. I have a little trig program that doesn't do much math and it is almost in lock step when run side by side with the 33S. I'm guessing my little tiny amount of math programming is not complex enough to show the true difference.

I have a little stat based program I think I will see if I can convert to see the differences there if any. That'll be a pain to convert as I relied heavily on the two index pointers, I&J. I'm off for another week due to arm surgery so I need something to take my mind off Daytime TV. I wrote it first for the 41C and it is very slow there. But I could not use the built in deviation command on the 41C because my number of samples and the possible deviation of samples was too small and I had to do it longhand. It's not bad on the 35S.

I don't use mine for complicated calculations so I don't see the speed loss to the degree others may.

*Edited: 7 Aug 2007, 11:57 p.m.*

### **35S slower**

*Message #13 Posted by **Ralph** on 8 Aug 2007, 9:33 a.m.,  
in response to message #12 by Gerson W. Barbosa*

It should be but my particular program is two little calculations and 90% screen output so the speed difference is lost under the display outputs and pauses. The stat program has a nice lump of number crunching done on four sets of data so the speed difference will definitely show.

One thing about processing speed is that it gets lost in significance if the machine spends time waiting for operator interaction. The more interactive the application, the less the speed factors in.

### **OT: Machines getting slower as they get niftier**

*Message #14 Posted by **Thomas Okken** on 7 Aug 2007, 11:10 p.m.,  
in response to message #8 by Gerson W. Barbosa*

Hi Gerson!

Quote:

It appears everytime new features are added to the same hardware there is a decrease in performance (HP-32S -> HP-32SII, HP-48G -> HP-48GX, for instance).

I'll admit that I'm not really an HP-48G expert, but from what I've read, the reason that the HP-48GX is slower than the HP-48G, in some situations anyway, is because the GX's additional memory requires bank switching to access. As long as you keep your code within the 48G memory space (I guess that means port 1?), the two should be identical in terms of speed.

OT: 15 years ago, I experienced a similar phenomenon when I upgraded my Macintosh II by adding a 68851 PMMU chip. The upgrade meant that programs could work in a 32-bit address space, as opposed to the 24-bit address space of the original Mac II -- but the PMMU's address translation overhead meant that some memory-intensive programs were significantly slower after the upgrade than before.

If the HP-35s hardware is more or less the same as the HP-33s', then the slowdown that people have been mentioning here is probably due to a simplistic implementation of the Complex and Vector types. The HP-42S, by comparison, can deal with non-real types with little or no speed penalty, but it uses a more sophisticated memory management scheme, where objects (real, complex, or matrix) are used by reference instead of by value -- this is a bit trickier to implement, but much more efficient; it only uses as much memory as is actually needed for each type of value, and it can perform copy operations by copying just a pointer, rather than having to copy dozens of bytes for the whole value each time.

I suppose the HP-35s designers were more concerned with functionality than performance, which is probably reasonable... If they had been able to use a Saturn (or an ARM-based Saturn emulation), they could have used the HP-42S code, and no one would have complained about performance at all.

Did I mention I think they should bring back the 42S? ;-)

- Thomas

*Message #15 Posted by [Walter B](#) on 8 Aug 2007, 12:22 a.m.,  
in response to message #14 by Thomas Okken*

God dag, Thomas,

thanks for the information! I was thinking about the memory organisation in the 42S just yesterday and \*guessed\* it must be by reference, because all those different data types could be held in simple registers and on the stack. Now I \*know\*, thank you.

Regards, Walter

**Re: OT: Machines getting slower as they get niftier**

*Message #16 Posted by [Thomas Okken](#) on 8 Aug 2007, 12:22 p.m.,  
in response to message #15 by Walter B*

Guten Tag Walter!

I don't remember offhand where I found out about the HP-42S memory management -- I think it was either mentioned in the manual or in the Programming Examples and Techniques book. No details, mind you, just the general idea of using references and copy-on-write.

You can easily see the effect of this architecture by observing what happens when you recall a large

matrix to the stack (MEM drops by only a few bytes, regardless of the size of the matrix) and then multiply it by 1 (MEM drops by slightly more than rows\*columns\*8 bytes (twice that for a complex matrix)). If there isn't enough memory to allocate the new matrix, this means that the multiplication will fail with an Insufficient Memory error message.

- Thomas

### **slowness explained (Gates Law)**

Message #18 Posted by **Vincze** on 8 Aug 2007, 12:02 p.m.,  
in response to message #14 by Thomas Okken

My friends, I take it you never hear of Gates Law (or maybe you forget about)? Meaning hardware seem to run slower even though processor, memory, etc is faster. It all due to programming. It happen in three steps normally.

First step is that program is written in assembler. You have to be really dumb to write slow assembler code, but it can be done, but very very hard as assembler is very efficient.

Next step, is applications are written in some other language that has more overhead (like C with a computer). They use more memory than assembler because of reuse of processor resources , subroutines, etc. program are larger, because more memory available.

And step three introduces new programming language (C++ or C#) with even more lack of efficiency because of excessive reuse of objects, managing more overhead operations, and it gobbles up even more memory and more processor. Programmer though not care, because he knows he has more memory and faster processor to work with, so this okay to him (or her... sorry ladies)

The reason that developers though go through these steps though is to make more features to us. Take a look at an x386 computer running DOS6, and a Pentium4 running Vista "double dog" ultimate version with "flux capacitor". Does pentium 4 computer boot up faster than x386 computer running DOS6? Nem! x386 boot up much faster, but it also have much less features. Now we must figure out what we want. Do we want more feature, or fastest booting machine? Same true with calculator. Do you want 48GX with more memory, better graphics, more prompts, but take longer to get to solution, or do you want to have a simpler calculator that is a little more hard to use, but very fast at getting you answer because it managing less overhead?

Take for example, I have program that I load on my 15C last night that calculate roots of a polynomial. I also can use 48gx to do. With units both starting off, it is quicker on 15C to find roots than on 48gx (assuming I already enter program on 15C and I am at the input screen for the 48gx.) On 15C, I enter

values into stack and hit R/S, on 48gx, I have to manipulate input screen, navigate a few times, and then press solve. Much more key strokes with 48gx, and more overhead make 48gx all work and no play (and slower). ;)

### **Re: slowness explained (Gates Law)**

\_\_\_\_\_

Actually, it's very easy to write inefficient assembler code. Assembler is not efficient; it just makes it possible to write efficient code. In my experience, a good C compiler generates better code than an "average" assembler programmer. To write really good assembler code, you have to really understand the machine and know all the "tricks".

Been there, done that.

Stefan

This is an interesting point and very useful.

### **Re: slowness explained (Gates Law)**

*Message #21 Posted by [Bruce Bergman](#) on 9 Aug 2007, 3:32 p.m.,  
in response to message #19 by Stefan Vorkoetter*

As someone who used to write code generators for high level languages (most notably, Ada), I can vouch for Stefan's point. Assembly is \*potentially\* the most efficient language, but it is very easy to write crummy assembly language code.

If you are solidly familiar with the target device, then you learn how to optimize and write good assembly code. The result can be very fast and very efficient. But it's all too easy to get complacent, or lose track of the big picture (especially in big programs) and that will result in poor code.

A well-written code generator for almost any high level language will usually out perform any hand-written assembly code. Note I stress "well-written". A crummy code generator implementation is about as bad as crummy hand-coded assembly. Compilers have been getting better and better over time, though, and most modern HLL compilers will easily produce great code.

Um, now is anyone going to write a C cross-compiler for the 35s? ;-)

thanks, bruce

**Re: slowness explained (Gates Law)**

*Message #22 Posted by **Vincze** on 9 Aug 2007, 4:12 p.m.,  
in response to message #21 by Bruce Bergman*

Problem is, most programmers now days coming out of university have never even touched assembler code, and many university do not educate on writing well thought out code. Programmer then write sloppy high level code.

Best programmers that I have seen have been those who are familiar with assembly, and also know high level language.

Regardless of this, I think the summary of what I was trying to say above is that HP is building more overhead into the calculator, and thus the calculator is slowing down even though the hardware is faster... thus Gates Law.

Speaking for myself, that's not my experience at all! Software development tools, Microsoft Office, image manipulation software, all run much faster on my current 1.4 GHz P4 laptop, than their primitive 1980s versions ever did on my (then top-of-the-line) Macintosh II. Even if it wasn't for things like Eclipse and DVD ripping/transcoding software, that simply won't run at all on the PCs of yesteryear, I still wouldn't want to go back. I enjoy nostalgia as much as the next person, but progress rocks! :-)

*Message #26 Posted by [ECL](#) on 8 Aug 2007, 12:53 p.m.,  
in response to message #8 by Gerson W. Barbosa*

Gerson,

Will do. I ported it already to my 35s (and took advantage of the GTOxyz capability to eliminate the use of flags).

I'd like to try to optimize it a bit too, but...

I may have gotten my inspiration from your RPL code on hpcalc.org back in 2005 for this program!

I was frustrated by the keyboard on my 49g+, and decided to write a single-register program on my 33s to give me Ixx and centroidal info.

ECL

### **Re: 35s vs. 33s speed for identical programs**

*Message #27 Posted by [Gerson W. Barbosa](#) on 8 Aug 2007, 10:14 p.m.,  
in response to message #26 by ECL*

Nice work and well fitted to this particular need! Easier to enter than { 0 0 5 .25 1 2.25 .25 2.75 8.25 1 1 8.25 4 8.5 1 } :-) But the answers agree with your program (54.666015625 and 3.90625 on the 50g, and 54.6660156249 and 3.90625 on the 35s).

I wrote the first version of the program out of necessity the night before an examination. Well, sort of, as I misunderstood the professor's statement: we had to write a report about the programs we intended to use during the examination, not to write them ourselves... The RPL code is far from optimized but I won't get back to it because the HP-50g is fast enough. Besides, I don't have to use it anymore :-)

Regards,

Gerson.

### **Re: 35s vs. 33s speed for identical programs**

*Message #28 Posted by [Frank Rottgardt](#) on 8 Aug 2007, 7:04 p.m.,  
in response to message #8 by Gerson W. Barbosa*

[\)Calculator Benchmark List](#)

Interesting to find the HP 50g (User RPL) not being faster than the C64 (1982) 8 bit with a 6510? CPU at 1 MHz (interpreter-Basic)

I don't know at which speed the 50g runs (ARM-processor?). But if I wouldn't seen it here I would have believed the 50g being much faster than a C64 if somebody had asked me.

Isn't the 33s / 35s processor a 6502 clone, thus a close relative of the C64 (ok, the CPU-surrounding architecture certainly plays a decisive role)

**Re: 35s vs. 33s speed for identical programs**

*Message #29 Posted by [Xerxes](#) on 8 Aug 2007, 8:25 p.m.,  
in response to message #28 by Frank Rottgardt*

An extract of the QueenBench:

```
- 90.3 HP-50G User RPL / 75 MHz
-
- ~67 HP-50G User RPL / Fast Mode x1.3 (75->203 MHz)
-
- ~64 C64 Basic / 1 MHz
```

There are three reasons for the speed of the C64. The Basic in the ROM is a very light interpreter and not as complex as UserRPL is. The ARM have to emulate the Saturn CPU instructions. The 6502 instructions need less cycles than most other CPUs of its time and even later that makes it fast in comparison.

Assuming that all CPUs are clocked at 1 MHz, the QueenBench in Assembly language would produce approximately following results:

```
- SC61860 611 msec
-
- LH5801 397 msec
-
- HD61700 284 msec
-
- Z80 283 msec
-
- SC62015 262 msec
-
- 80188 251 msec
-
- 68000 220 msec
-
- 6502 100 msec
```

O.T. This was one reason why the 6502 was so popular for chess computers.

in response to message #1 by Trent Moseley

The aim is to establish the procedure for polar/rectangular conversion that works the same way as on almost any vintage HPcalc

Polar to rectangular:

```
y ENTER x
->P (on HP35s: XEQ P ENTER)
r x<>y phi
```

Rectangular to polar:

```
phi ENTER r
->R (on HP35s: XEQ R ENTER)
x x<>y y
```

requiring that the components (x,y) or (r,phi) are entered/obtained in a separated way, i.e. x in x-register, y in y-register, r in x-register, phi in y-register.

I would prefer the following solution, re-typed directly from my HP35s (regardless of the fact that someone could have already proposed the same in another thread):

```
LBL P
X<>Y
i
X
+
ARG
LASTx
ABS
RTN
```

```
LBL R
X<>Y
COS
X<>Y
LASTx
SIN
X<>Y
X
X<>Y
LASTx
X
RTN
```

Anybody is welcome to improve this. At the end we would have a consensus, containing the best solution we were able to find out together.

### Re: HP-35s ->P and ->R conversions

Message #5 Posted by [Trent Moseley](#) on 7 Aug 2007, 2:30 p.m.,  
in response to message #4 by [Nenad \(Croatia\)](#)

That's nice but you lose the contents of the Z and T registers. I know you can store the contents, but then here we go again.

tm

### Re: HP-35s ->P and ->R conversions

Message #6 Posted by [Reth](#) on 8 Aug 2007, 5:16 p.m.,  
in response to message #5 by [Trent Moseley](#)

Preserving Z and T registers can be done using 1 storage register (don't know about speed penalty) and no EQ's

```
LBL P
STO D
Rv
SIN
LASTx
COS
RCL* D
X<>Y
RCL* D
RTN
```

```
LBL R
STO Y
Rv
i
RCL* Y
+
ARG
LASTx
ABS
```

RTN

Rv here is Roll Down

Cheers,  
Reth

*Message #7 Posted by [Trent Moseley](#) on 8 Aug 2007, 11:17 p.m.,  
in response to message #6 by Reth*

Reth,

Thank you so much. It's nice to get simple answers to simple questions! I'm looking forward to using your routines in some of my programs tomorrow on the "Incredible HP-35s".

tm

**Re: HP-35s ->P and ->R conversions**

*Message #8 Posted by [Reth](#) on 10 Aug 2007, 3:26 a.m.,  
in response to message #7 by Trent Moseley*

You're welcome :) BTW I checked and there is no speed penalties for using external storage register so I guess this is the way to go.

Cheers,  
Reth

**Re: HP-35s ->P and ->R conversions - updated versions**

*Message #9 Posted by [Gene Wright](#) on 7 Aug 2007, 3:12 p.m.,  
in response to message #4 by Nenad (Croatia)*

For LBL P, try this:

```
LBL P
RDN
RDN
REGZ x i + REGT
RUP
X<>Y
RDN
RDN
ARG(REGZ)
ABS(REGT)
RTN
```

Press EQN before the entering the lines containing the REG instructions. Z and T are preserved.

Something similar can be done for LBL R.

```
LBL P
RDN
RDN
REGZ x SIN(REGZ)
REGT x COS>LastX)
RTN
```

Press EQN before the entering the lines containing the REG instructions. Z and T are preserved.

**Re: HP-35s ->P and ->R conversions - updated versions**

Message #10 Posted by **Charles Bennett** on 7 Aug 2007, 3:26 p.m.,  
in response to message #9 by Gene Wright

Like what Gene said (untested):

```
R001   lbl R
R002   RDN
R003   RDN
R004   EQN [ REGT x SIN(REGZ), REGT x COS(REGZ) ]
R005   [ 1, 0 ]
R006   x<>y
R007   X
R008   EQN lastx X [ 0, 1 ]
R009   RTN

P001   lbl P
P002   RDN
P003   RDN
P004   EQN [ ATAN(REGT/REGZ), SQRT(SQ(REGT)+SQ(REGZ)) ]
P005   GTO R005
```

I really like being able to put stack registers into equations...

ccb

**HP-35s ->P and ->R conversions**

Message #11 Posted by **Nenad (Croatia)** on 7 Aug 2007, 5:58 p.m.,  
in response to message #10 by Charles Bennett

Quote:

```
P004   EQN [ ATAN(REGT/REGZ), SQRT(SQ(REGT)+SQ(REGZ)) ]
```

Appreciating everyone's response it may be noticed that we are obviously moving forward, instead of murmuring against the lack of Pol/Rect conversions in HP35s in an "old fashioned way".

In the above quoted equation, would the first vector component lead us into a problem in case REGZ=0 or both REGZ=0 and REGT=0?

A single ATAN would not be enough to determine the quadrant of the polar angle? AFAIK, "long long ago in a galaxy far far away" there existed a function ATAN2 instead of ATAN to deal with such a situation.

IMHO, it would be great if we finally accept the solution avoiding equations, implementing pure "old fashioned" RPN, but preserving the contents of T and Z registers. I cannot figure out one, yet.

Katie, Valentin, Namir, all others - I am certain someone can do it perfectly, to leave this matter behind us.

Quote:

```
_____
```

AFAIK, "long long ago in a galaxy far far away" there existed a function ATAN2 instead of ATAN to deal with such a situation.

You might use <http://mathworld.wolfram.com/images/equations/Tangent/inline29.gif>  
<http://mathworld.wolfram.com/images/equations/Tangent/inline30.gif>  
<http://mathworld.wolfram.com/images/equations/Tangent/inline31.gif> which yields something like:

$$r = \text{SQRT}(x^2 + y^2)$$

$$\text{arg} = 2 * \text{atan}\left(\frac{y}{r + x}\right)$$

Then only a problem occurs for  $r + x = 0$  which means  $\text{arg} = \text{Pi}$ .  
 However I don't know if it's possible to avoid to calculate  $r$  twice.

### Re: HP-35s ->P and ->R conversions - updated versions

Message #13 Posted by [Reth](#) on 7 Aug 2007, 4:52 p.m.,  
 in response to message #9 by Gene Wright

Well one has to decide what's more important, preserving stack content, speed (given STO & RCL are slower) or necessity of checking/clearing status of flag 10...

Cheers,  
 Reth

### Re: HP-35s ->P and ->R conversions

Message #14 Posted by [Paul Dale](#) on 8 Aug 2007, 7:44 p.m.,  
 in response to message #4 by Nenad (Croatia)

[EDIT: I posted an improved version immediately below this message, don't use this code if you want the flag independence - Pauli]

Rectangular Polar conversions aren't something I use but, nonetheless, I thought I'd have a go at this little programming exercise.

My program preserves the Z and T stack registers, it honours the current trigonometric mode and handles the degenerate cases. It doesn't do the right thing with LASTx but we can't have everything. At least not yet. It seems to produce the same values as my 15c but I've not tested it extensively.

First up the commented programmer friendly listing:

```

1      # Convert radius, theta -> x, y
2          LBL R                      # r, t, ?, ?
3          Rv
4          Rv                          # ?, ?, r, t
5          eqn [REGZ*SIN(REGT),REGZ*COS(REGT)] # [x,y], ?, ?, r
6      unpack: [1,0]                  # ?, ?, [x, y], [1,0]
7          x<>y
8          *                            # ., ?, ?, x
9          EQN LASTx*[0,1]
10         RTN
11
12     # Convert x, y -> radius, theta
13         LBL P                      # x, y, ?, ?
14         x=0?
15         GTO degen
16         Rv
17         Rv                          # ?, ?, x, y

```

```

18          eqn [ATAN(REGT/REGZ),SQRT(SQ(REGT)+SQ(REGZ))]
19          GTO unpack
20
21      # Degenerate cases
22      degen: Rv          # y, ?, ?, 0
23             x=0?
24             GTO d2      # 0, ?, ?, 0
25             x>0?
26             1
27             x<0?
28             -1
29             ASIN        # t = +/- PI/2, y, ?, ?
30             Rv
31             Rv          # ?, ?, t, y
32             eqn [REGZ,ABS(REGT)] # [], ?, ?, t
33             GTO unpack
34      d2:   R^          # 0, 0, ?, ?
35             RTN

```

Of course, that isn't a lot of use when entering it into a calculator so here is a calculator friendly version after running through my little assembler:

```

R001 LBL R
R002 Rv
R003 Rv
R004 eqn [REGZ*SIN(REGT),REGZ*COS(REGT)]
R005* [1,0]
R006 x<>y
R007 *
R008 EQN LASTx*[0,1]
R009 RTN
P001 LBL P
P002 x=0?
P003 GTO P008
P004 Rv
P005 Rv
P006 eqn [ATAN(REGT/REGZ),SQRT(SQ(REGT)+SQ(REGZ))]
P007 GTO R005
P008* Rv
P009 x=0?
P010 GTO P020
P011 x>0?
P012 1
P013 x<0?
P014 -1
P015 ASIN
P016 Rv
P017 Rv
P018 eqn [REGZ,ABS(REGT)]
P019 GTO R005
P020* R^
P021 RTN

```

where:

R^ is roll up

Rv is roll down

eqn marks the beginning of an equation and shouldn't be entered.

Checksums and sizes are:

```

LN=  checksum
R   74  BE75
P  123  8999

```

I hope somebody finds this useful.

- Pauli

## Re: HP-35s ->P and ->R conversions

Message #16 Posted by **Thomas Radtke** on 14 Aug 2007, 7:17 a.m.,  
in response to message #15 by Paul Dale

Thanks for the code, Paul! I used exactly yours for ->P and the following ->R:

```

LBL P
Rolldown
Rolldown
(EQN) REGZ+i*REGT

```

```
ENTER
ARG
x<>y
ABS
RTN
```

Short and Z,T preserving :-)

**Re: HP-35s ->P and ->R conversions**

*Message #17 Posted by [Paul Dale](#) on 14 Aug 2007, 4:09 p.m.,  
in response to message #16 by Thomas Radtke*

Much nicer. Code can always be improved.

In equation mode, press Rv and you'll be greeted with a short menu containing the stack registers. These insert REGX, REGY, REGZ and REGT into the current equation and when executed, they evaluate to the appropriate stack register. A neat way to access the stack from algebraics.

- Pauli

**REGZ etc**

*Message #24 Posted by [Gene Wright](#) on 14 Aug 2007, 9:14 p.m.,  
in response to message #22 by Trent Moseley*

These are mentioned in the learning module:

[Accessing the stack registers](#)

and in the 35s review:

[35s review](#)

They are also mentioned in the printed 35s manual in appendix B on page B-7 and also on page 10-8.

*Message #26 Posted by **Les Wright** on 7 Aug 2007, 3:42 p.m.,  
in response to message #1 by Trent Moseley*

I note that the HP49G+ and HP50G do not have directly accessible P->R and R->P conversions, though I do understand that they are available as SYSEVAL calls, and there are even extended precision versions in SysRPL for real keeners.

But one typically toggles between the rectangular, polar, cylindrical, and spherical renderings of complex numbers and vectors by changing the MODE settings in question.

Mmmmm, this does sound a little familiar, does it not? ;)

Of course, the 49G, 49G+, and 50G make it very easy to extract the real and complex parts from a complex number, and to decompose a vector or list of any length to its elements.

Despite this, the danged 35s is starting to grow on me, and like the great reviewer who shares my surname I am keen to defend its under \$60 outsourced Chinese honour.

I just wish the thing were as fast as the 33S! Shortly I will post some code that presents much more elegantly and cleanly on the 35S, thanks to line number addressing, but runs so much faster on the 33S, even though with all of the internal jumps and subroutines it gobbles up most of my labels!

My first programmable was a TI57. It has the much mourned P<>R conversions too!

Les

### **Re: The Incredible HP-35s**

*Message #30 Posted by **John H Meyers** on 8 Aug 2007, 7:26 a.m.,  
in response to message #26 by Les Wright*

Quote:

---

I note that the HP49G+ and HP50G do not have directly accessible P->R and R->P conversions

---

They instead have directly accessible  $V\rightarrow$  and  $\rightarrow V2$  and  $\rightarrow V3$ , which are more general versions of the same thing, suitable for also handling complex-number objects, as well as both 2D and 3D vector objects, none of which formerly existed in older calculators having only individual real-valued stack levels (and no 3D coordinate system conversion at all).

In addition (which to some extent may apply to HP35s), all HP48/49/50 can display complex and vectors (both 2D and 3D) automatically as "polar," to full precision, by simply changing display mode to CYLIN/SPHERE, and can convert polar coordinates to rectangular automatically, as they are being entered.

During all complex (or vector) object display and data entry, an angle symbol prefixes each angular value, unmistakably eliminating ambiguity.

So most of the point of having explicit "conversion" commands on HP48/49/50 can be considered unnecessary -- the "polar" coordinates are always external (on the display or in the data entry area), the internal objects remain rectangular always, and can always be added etc. without conversions, as well as without risk of forgetting which mode the coordinates are in, nor accidentally adding the polar coordinates, etc.

But one can use  $V\rightarrow$  and  $\rightarrow V2$  on HP48/49/50 to get the same effect as old P->R and R->P anyway; when you do this, however, you can no longer freely add objects when they have been internally changed to polar coordinates, and you no longer have unambiguous angle symbols that prevent misinterpretation

(or forgetting in which state you left the results,  
or repeating the same conversion twice the same way, instead of undoing it).

Programs for all HP48/49/50:

```
@ Two-level input, two-level output:
@ real x, real y <==> real r, real theta
\<< -16 SF \->V2 -16 CF V\-> \>> 'P\->R' STO
\<< -16 CF \->V2 -16 SF V\-> \>> 'R\->P' STO

@ One-level input, one-level output (Vector or Complex):
@ [real x, real y] <==> [real r, real theta]
@ (real x, real y) <==> (real r, real theta)
\<< V\-> -16 SF \->V2 -16 CF \>> 'p\->r' STO
\<< -16 SF V\-> -16 CF \->V2 \>> 'r\->p' STO
@ Note that you must keep flag -16 always cleared

@ Programs to use whichever of the above
@ applies to the type of object(s) on the stack:
\<< IF DUP TYPE OVER TYPE 28 \=/ AND
  THEN p\->r ELSE P\->R END \>> 'PtoR' STO
\<< IF DUP TYPE OVER TYPE 28 \=/ AND
  THEN r\->p ELSE R\->P END \>> 'RtoP' STO

@ But often we want only to be able to display either way,
@ or to toggle back & forth, as was thoughtfully provided
@ by the POLAR keyboard command on the HP48[S/G][X/+]
@ which affects all complex numbers, or 2D/3D vectors:
\<< -16 DUP IF FS? THEN CF ELSE SF END \>> 'P~R' STO

@ Note that nothing is really converted internally at all here,
@ but only changes appearance in the display, and also note
@ that *all* stack objects change appearance simultaneously!

@ Here is the corresponding RAD[ian] angle mode toggle,
@ which again converts nothing internally, but only changes
@ the units in which angles are displayed or initially entered:
\<< -17 DUP IF FS? THEN CF ELSE SF END \>> 'D~R' STO
```

Aren't the latter much more convenient (and foolproof) than the way things used to be done?

Does the HP35s work in any similar fashion?

Old discussion on comp.sys.hp48:

That's obviously one of the special cases in which you do need to separately convert dd.mmss to pure degrees, and then combine it with the other coordinate -- or create a program to do it for you.

The issue is specific to the degrees angular mode, and has no counterpart in radian or grad angle mode, so it is not surprising that there is no single built-in command for it; calcs that have a "dms" key that does "on the fly" conversion while typing might be able to accommodate this anyway, but even that style of data entry has its own pitfalls to consider.

### **48/49 series polar/rectangular conversions**

*Message #33 Posted by [James M. Prange \(Michigan\)](#) on 8 Aug 2007, 10:19 p.m.,

*Message #35 Posted by [Jeff O.](#) on 10 Aug 2007, 8:36 a.m.,  
in response to message #31 by SMcmullin*

I may have missed the point of this thread, but are you asking how to convert an angle in H.MS format to decimal degrees, then get that as the angular portion of a complex number on the 35s (i.e., not the 48, 49 or 50) without having to key in a magnitude, press theta, then re-key in the angle? If so, the following keystrokes will do it:

| <u>keystroke</u> | <u>Comments</u>                                     |
|------------------|---|
| HMS->            | Converts your H.MS angle to decimal degrees         |
| ->RAD            | Converts decimal degrees to radians                 |
| i                | the i key, 2nd row, 4th key                         |
| *                | multiply  |
| e <sup>x</sup>   | raise e to the power of the value in the x register |

The above will give you a complex number with a magnitude of 1 at your original angle. If you have a magnitude hanging around that you wanted as part of this complex number, enter that and multiply to get a complex number with that magnitude at your original angle. (Credit to Les for presenting this technique [in this message](#).)

### 48/49 series polar/rectangular conversions

Message #36 Posted by [James M. Prange \(Michigan\)](#) on 8 Aug 2007, 10:07 p.m.,  
in response to message #30 by John H Meyers

I'll add that  $\backslash\rightarrow V2$  returns a 2-element vector if flag -19 is clear, or a complex number if flag -19 is set.

Also,  $V\backslash\rightarrow$  can be used to convert a complex number to a pair of real numbers, respecting the coordinate system and angular modes, regardless of the state of flag -19, as well as for converting a vector to reals.

Note that since vectors and complex numbers are always stored using rectangular coordinates, approximations due to rounding may apply when converting to or from polar coordinates, including when editing a complex number or vector when in polar mode. For example:

[ 1. 1. ] DEG CYLIN displays [ 1.41421356237  $\backslash\langle$ 45. ], and  $V\backslash\rightarrow$  on that returns 1.41421356237 and 45., and  $\backslash\rightarrow V2$  on those returns [ 1.41421356237  $\backslash\langle$ 45. ], but now RECT displays [ .999999999998 .999999999998 ] instead of the original vector.

Another example:

Enter [ 1. 1. ] DEG CYLIN to display [ 1.41421356237  $\backslash\langle$ 45. ], then execute EDIT to put [ 1.41421356237  $\backslash\langle$ 45. ] in the command line, then press ENTER to put it back on the stack, and RECT will show it as [ .999999999998 .999999999998 ] instead of the original vector.

The second example also applies to ASCII (Text) mode transfers from and back to the calculator.

Regards,  
James

### HP 17BII+ not "geeky" enough

Message #1 Posted by [David Smith](#) on 6 Aug 2007, 11:56 p.m.

Greetings to all, I just joined.

This is probably going to sound strange, but I just bought a 17BII+ calculator and, well, it just doesn't feel HP "geeky" to me. I first discovered, and fell in love with, HP's in college in the late 80's. Started with an 11c, moved up to a 28s for the ability to program (which saved me on a final). But let's say that higher math and I don't get along well and I moved into other areas.

Recently I opened a business of my own, and after a year of leaning how to not get completely lost I got completely lost. So I am working on learning more about business finance. I've read the threads about finance calculators so there isn't much need to cover those models strengths and weaknesses.

My problem is this: I am also a hopeless gadgeteer (I waited in line for four hours for an iPhone if you need an example). And I have to admit, graphing is way cool. I look at the higher end calculators and wonder should I go with one (A graphing calculator! Yeah!) that has the financials and simply add the calculations I need. So should I buy a 17bII and/or a 12c off ebay and settle on one, stick with the one I have, get the really cool calculator that graphs and has lots of buttons I will rarely use, or buy the fancy calculator and call it the beginning of a collection. ;-)

### Re: HP 17BII+ not "geeky" enough

Message #2 Posted by [Bill \(Smithville, NJ\)](#) on 7 Aug 2007, 4:03 a.m.,  
in response to message #1 by David Smith

Hi David,

I have a simple response:

You Wrote:

*So should I buy a 17bII and/or a 12c off ebay - YES to Both*

*stick with the one I have, get the really cool calculator that graphs and has lots of buttons I will rarely use - YES*

*buy the fancy calculator and call it the beginning of a collection. ;-)* - YES YES YES

Actually, for the price you'll be paying for the iPhone during the next two years, you could have a start on a really great HP Calculator collection :)

Bill

### Re: HP 17BII+ not "geeky" enough

Message #3 Posted by [Dave Colver](#) on 7 Aug 2007, 10:56 a.m.,

*in response to message #1 by David Smith*

Hi David

I have to say that the solver on the 17bII range is a thing of beauty and possibly under represented. Dont be fooled by the sparse keyboard - theres a lot in there. As a historical placeholder it represents a great deal of refinement.

The 12c is a nice machine - but whatever you want to do its easier on the 17...

Just my .02 GBP :)

Dave

---

**Re: HP 17BII+ not "geeky" enough**

*Message #4 Posted by **Bruce Bergman** on 7 Aug 2007, 1:50 p.m.,  
in response to message #3 by Dave Colver*

I have to agree with David. While I don't use a financial calculator on a daily basis, I was always somewhat frustrated with the 12c. I got my hands on a 17bii+ last year as a lark and it was light years better than the 12c. My 12c now sits in my "collection" pile, and I've used the 17bii+ more than I ever expected. It really is a great calc.

thanks, bruce

### I played with a Casio fx9860 today

Message #1 Posted by [Bruce Bergman](#) on 6 Aug 2007, 11:54 p.m.

We talked about this calc in the forum a few months back. Looks like it's available commercially now, as I just spotted it in my local Staples. \$99, so about par with the non-clam-shell version.

I have to admit, it's really engaging. The screen is crystal clear solid; no shadows whatsoever, dark black characters and it almost looks like a Sony PrintScreen (or whatever those eBook things are called) in terms of clarity. In some respects, I think they have room to dial up the resolution, as it was SO clear that at times it seemed too blocky.

Anyhow, it seems to function a lot like a TI-8x model, with some cool features and usability enhancements. The light is a nice touch, for those late night under-the-blanket study sessions. ;-) The clam shell is very cool, although a bit thick. It opens easily, closes nicely and makes the calc very nice to hold.

I know nothing about Casio calc programmability, but it did have a PRGM function and put me into something resembling a text editor. Not sure what to do there, but it was kinda neat.

Anyone know anything more about this thing? Good, bad? Interesting, boring?

thanks, bruce

---

I love that, too. The IBM PC/AT keyboard is the best ever made - I have 4 of them, one on every PC (and some times plugged into my laptop via a USB adapter). And, they have the function keys on the left, where they belong, so that I can do more, more quickly, with WordPerfect for DOS!! Your hands never leave the keyboard. I can select, cut, and paste a column in WP for DOS before a Windows user can even begin to get his mouse moving!

### **Re: I played with a Casio fx9860 today**

*Message #9 Posted by [Xerxes](#) on 7 Aug 2007, 6:16 a.m.,  
in response to message #1 by Bruce Bergman*

The FX-9860G uses a Basic like formula programming language. This programming model was used at the first time by the FX-7000G and FX-4000P both from 1985. In later models Casio added some instructions for structured programming. In addition a C Cross Compiler is available. If you are interested in some examples, have a look [here](#).

An important difference to the previous non CAS models is the hardware. Instead of a 8-bit proprietary CPU a Hitachi/Renesas SH3 CPU @ 20 MHz (up to 80 MHz by software) is used, that's what makes the FX-9860G very fast.

The FX-9860G Slim reminds me to the FX-7500G from 1988.

### **Re: I played with a Casio fx9860 today**

*Message #10 Posted by [Bruce Bergman](#) on 7 Aug 2007, 2:11 p.m.,  
in response to message #9 by Xerxes*

Wow, very interesting! That is one really fast calc. I can see that it beat almost everything out there in each sub-category. I was pleasantly surprised to see that the HP-50g held its own throughout each group too. Go HP! :-)

Sadly, I'm sure the HP-35s will come out near the bottom -- man, the more I play with this thing, the slower it seems...

thanks, bruce

### **Re: I played with a Casio fx9860 today**

*Message #11 Posted by [Ed Look](#) on 7 Aug 2007, 2:40 p.m.,  
in response to message #10 by Bruce Bergman*

Ah, well, I think the 35s was designed with different objectives in mind than a 50g. Some are obvious, like being \$60, and I guess the use of a less powerful processor and simpler circuit design may in practice translate out to be a bit slower.

### **Re: I played with a Casio fx9860 today**

*Message #12 Posted by [hugh steers](#) on 7 Aug 2007, 2:55 p.m.,  
in response to message #10 by Bruce Bergman*

im fairly pleased with the CPU performance of the 50g for my cross developments and regard it as a hardware platform. when using hpgcc, im switching off the "slow" mode to get the full speed. presumably the slow mode is also off for normal use - or is the machine underclocked by default. if so that could be interesting.

i suspect that HP would have used a slower processor if they hadn't needed the saturn emulation. so from their point of view, the use of a 75MHz ARM9 was an unavoidable mistake. i have always thought that hp calculators were too slow. this time around, i see the "mistake" as an advantage in that the calculator is, at last, not too slow and can actually do some really interesting stuff. more ram would be useful too :-)) hopefully hp will begin see their "mistake" as an asset and intentionally posit cheap/low power and fast cpus.

i agree that the 35s is too slow, embarrassingly underperforming its predecessors in some tests. this has let down, otherwise, quite a nice calculator. many casios now perform formerly tricky problems like numerical quadrature with newer algorithms and some quantity of clout. it would have been nice to see the 35s do this too - with the clout. with only improved speed, at least those methods could be programmed and accommodated by the now capacious memory.

i think hp are missing a trick here and i don't really buy the increased cost or battery life arguments, because even the 35s isn't really that cheap (compared to other makes) and it could have easily taken a couple of AAA cells if that was necessary (which are cheaper anyway).

?

### **35S Serial number**

*Message #13 Posted by [Ralph](#) on 7 Aug 2007, 11:18 p.m.,  
in response to message #12 by hugh steers*

I like the 9860 clamshell. It is very fast. They use a nice big screen that is not "fine" like the 50G because the pixels are just larger. Casio does not have quite the range of drawing tools the HP does (no arc command comes to mind), It also has a backlight function, the first I've seen on a calculator. Clamshell version only.

It does a lot of things, not as many possibly as the HP's The multiverse menu system on the Casios were the hardest thing I had to warm up to. I like a calculator that comes on to calculate when I press that "ON" button.

### **Re:Casio FX-9860**

*Message #14 Posted by [Donald Williams](#) on 8 Aug 2007, 10:57 a.m.,  
in response to message #13 by Ralph*

I purchased the clamshell also. I was intrigued by the back lighting and the help functions. Both are very useful. The screen is top notch, but I found it annoying that the screen is so much heavier than the base. The calc will tend to tip over backwards if you try to use it on a soft surface. It seems quite fast. Initially I discounted the spreadsheet application as a mere marketing gimmick, but now I find, that since I am so accustomed to this metaphor from years of PC work, I seem to be doing a lot of exploring in this module. The downside is the typical Casio keyboard and minimal documentation. I wish the emulator used the clamshell layout rather than the other design. No experience with the SDK for the moment.

There's a 600 page reference manual on this machine [here](#). Did they not include this with the calculator?

## **Re:Casio FX-9860**

*Message #16 Posted by **Donald Williams** on 8 Aug 2007, 12:46 p.m.,  
in response to message #15 by Katie Wasserman*

I stand corrected. All the important documentation is available on the CD that comes with the product. Very complete as far as I can tell.

However your first experience "out of the box" is with the quick start guide. A 17 page introduction, which I was unable to read without the aid of a magnifying lamp. When the fonts get that small I cannot read the key operation instructions.

In all fairness though, this is an operator flaw.

## **Re:Casio FX-9860**

*Message #17 Posted by **Bruce Bergman** on 8 Aug 2007, 12:54 p.m.,  
in response to message #14 by Donald Williams*

Yeah, I agree about the keyboard; it's icky. Soft mushy keys. A couple of times I wasn't sure I hit them. Maybe I'm just too used to the HP keys.

I didn't notice the screen weight/balance issue, but then again I was holding it in my hand. I can see where if you tilt it out and try to set it down, it will flop over. A simple pull-out back brace might have fixed that.

I don't at all like how the calc approaches operation, but it's an intriguing toy. I might buy one eventually, just to muck around with it and see how it works.

Do anyone know anything about the software? Seems very similar to the TI software. Have they licensed it from TI, or were they just mimicing it as much as they could?

thanks, bruce

## **Which came first?**

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 8 Aug 2007, 1:50 p.m.,

Which came first, the chicken or the egg?

When Casio put the first graphing calculator, the fx-7000G, on the market it had a new "true algebraic" system which was more like higher order languages such as BASIC and FORTRAN than it was like TI's traditional "algebraic operating system" known as AOS. Several years later when TI put it's first graphing calculator, the TI-80, on the market it used an "Equation Operating System" known as EOS. (Or, did the TI-81 come before the TI-80? My memory get shakier year by year.) EOS was remarkably similar to the Casio "true algebraic" system. The operating systems for the graphing calculators from the two product lines have had a lot of similarity ever since.

**Re: Which came first?**

*Message #19 Posted by [Bruce Bergman](#) on 8 Aug 2007, 2:16 p.m.,  
in response to message #18 by Palmer O. Hanson, Jr.*

Good question!

But is that similarity a "functional" similarity or merely a "visual" similarity? What got me thinking about this was a class I was taking where the recommend unit was a TI-83 or better calc. I, naturally, used my 50g instead, but I did suffer from examples the prof did on the TI. I was thinking that if the software was functionally the same as the TI software, I'd much rather play with this unit and do the examples, than to actually buy a TI calc (something that won't happen in MY household! :-).

thanks, bruce

**Re: Which came first?**

*Message #20 Posted by [Donald Williams](#) on 8 Aug 2007, 4:13 p.m.,

Plant the seed now with young students and give free calculator to professors, and I bet we will see another wave of dedicated users in 5 - 10 years who will help sustain the users community.

Penetrating a market which as been dominated by another vendor will be a lot harder than that. For example, consider the secondary school market where teachers have been supported by TI for almost twenty years and HP doesn't even have a presence. Mermbers of the HP community may think that addition of an RPN machine to the classroom would be an asset. To the teacher it will probably seem more like a classroom distraction.

To understand the lack of "presence" of the HP product line in the educational market you need to consider the recent sales tax holidays for educational supplies in states such as Florida and North Carolina. Wal-Mart, Staples, etc., had extra "back-to-school" displays for TI and Casio. Wal-Mart even had a "back-to school" display for LeWorld! HP was not present except in one Wal-Mart where I saw a couple of ten-B-Twos -- but they were actually behind some Casios.

### 35s GTO . label issue

Message #1 Posted by [sjthomas](#) on 6 Aug 2007, 10:49 p.m.

I haven't read all of the programming chapters in the manual yet, so this may be a feature rather than a bug. If one wants to move to a particular label immediately (that is, not entering a program step) using GTO . label, pressing ENTER after the label's letter does not supply the default 001 to end the prompt -- it must be keyed in manually.

### Re: 35s GTO . label issue

Message #2 Posted by [Les Wright](#) on 7 Aug 2007, 12:20 a.m.,  
in response to message #1 by [sjthomas](#)

Yup. GTO .letter 000 will get you there too.

### Accurate TVM for HP 35s

Message #1 Posted by [Miguel Toro](#) on 6 Aug 2007, 9:12 p.m.

Hi,

I wrote this program for my HP 42s. I wanted to adapt it for the HP 35s and here is the routine. You have to assign the routine with FN= and then to solve for the variable you want. As you know, the Hp 35s has no LN(1+x) function included, so I implemented what is defined in the HP-15C Advanced Functions Handbook:

```
if u= (1+x)
ln(u) = x          if u = 1
          ln(u)*x/(u-1)  if u <> 1
```

References:

Hugh Steers' [TVM page](#)  
 HP-15C Advanced Functions Handbook, page 181  
 Tommi's [Accurate TVM for HP 42s](#)

Variables:

B: present value or "base" value  
 P: payment  
 n: periods  
 i: interest rate in %  
 E: end/begin modes  
 F: future value

Equation:

$$B*(1+i)^n + P*((1+i)^n - 1)/i + F = 0$$

$$(1+i)^n = e^{(n*\ln(1+i))} = i'$$

$$\rightarrow B*i' + P*(i'-1)/i + F = 0$$

Routine:

```
T001 LBL T
T002 INPUT N
T003 INPUT I
T004 INPUT B
T005 INPUT P
T006 INPUT F
T007 INPUT E
T008 RCL I
T009 100
T010 /
T011 ENTER
T012 ENTER
T013 1
T014 +
T015 LN
T016 x<>y          !switch x with y
```

```
T017 LASTx
T018 1
T019 X<>Y?      !x not equal to y?
T020 -
T021 /
T022 *
T023 RCL* N
T024 e^x
T025 RCL* B
T026 LASTx
T027 1
T028 -
T029 RCL* P
T030 RCL I
T031 100
T032 /
T033 1/X
T034 RCL+ E
T035 *
T036 +
T037 RCL+ F
T038 RTN
```

```
LN=123
CK=7940
```

I tried the following examples to compare against the 35s manual's equation, my HP 12C (made in USA) and my HP 12cp 25th anniversary:

Example A:  
 N= 365x24x60x60  
 I= 10%/N  
 B= 0  
 P= -0.01  
 E=0  
 F=?

Example B:  
 N= 32  
 B= -999,999  
 P= 0  
 F= 1,000,000  
 E= 0  
 I= ?

| Program              | Examples       |                  |
|----------------------|----------------|------------------|
|                      | A              | B                |
| HP 35s with routine  | 331,667.006689 | 3.125014111x10-6 |
| HP 35s with equation | 331,559.383308 | 3.125500000x10-6 |
| HP 12c               | 331,667.0067   | 3.125004736x10-6 |
| HP 12cp 25th Ann.    | 331,667.006691 | 3.125001000x10-6 |

All improvements are welcome as well as other examples to test it.

Regards,

Miguel

Great job, Miguel!

Now, right this up and submit it to Datafile as well and you'll be a published author in the magazine too. :-)

in response to message #1 by Miguel Toro*

Is this listing correct? I've proofed my input of this program three times and it matches the posted listing, but I get CK=D44E and LN=127 and the program errors with an OVERFLOW when I run it.

### **Re: Accurate TVM for HP 35s**

in response to message #3 by sjthomas*

You are correct. I did not write the last version, but I put the checksum of it. I corrected the listing and It should work.

Thanks,

Miguel

### **Re: Accurate TVM for HP 35s**

*Message #5 Posted by [ECL](#) on 7 Aug 2007, 12:12 p.m.,  
in response to message #4 by Miguel Toro*

Miguel,

I also tried keying it in, and get:

Checksum 45DC LN = 123

Also, I'm not quite sure if I understand the methodology behind your INPUTs. How can I decide which variable to solve for?

I'll mention that I am not new to programming on HP machines, just forgive me if I've missed a fundamental point.

Also, as of now I also get OVERFLOW when I XEQ it.

Thanks,

ECL

### **Re: Accurate TVM for HP 35s**

*Message #6 Posted by [Miguel Toro](#) on 7 Aug 2007, 12:49 p.m.,  
in response to message #5 by ECL*

I keyed the program and it is correct as it is in the post. Please verify lines:

T0016 x<>y this is switch x and y.

T0019 X<>Y? this is compare if x is different than y.

The confusion may come from there.

To solve the program just assign it to FN= and next you solve it. You do not XEQ it!. See the

keystrokes:

```
[LS] [FN=]
      T
[SOLVE]
```

The solver will ask for the unknown variable for which you want to solve, and it will ask for values for the rest of the variables.

Regards,

Miguel

## Re: Accurate TVM for HP 35s

*Message #7 Posted by [Vincze](#) on 7 Aug 2007, 9:37 a.m.,  
in response to message #1 by Miguel Toro*

Good Morning Miguel. This is very interesting. One question I have though is was reason you store as FN= so you could choose what variable you wish to solve for? Can you store multiple FN or just one?

Also, there are about 10 (if I remember correctly) TVN formulas for different things (future value of lump sum, present value of annuity, etc), and then based on various criteria (annual compounding, compounded n times per year, and continuous compounding). I think I might and try and tackle those as a starter to learn how to program with 35s. I working on my MBA (is that funny. Stupid Hungarian working on MBA when he can not even speak language very well).

## Re: Accurate TVM for HP 35s

*Message #8 Posted by [Miguel Toro](#) on 7 Aug 2007, 12:28 p.m.,  
in response to message #7 by Vincze*

Hi Vincze,

You have to tell the calculator which program you want to solve. You do that by selecting the program label with the "FN=" key. The solver will continue to use the program selected as long as you do not change to another program (with another FN= assignment for a different label).

Once called, Solver will ask for the unknown variable and it will ask for values for the rest of the variables that have INPUT instructions.

Also, most of the things that you mention can be solved already with this routine, so you just have to enter the data as it is needed by the problem. That is the beauty of this equation.

Example 1: Future value of a lump sum. If John invests \$1,850 today in an asset earning a 10% rate of return (compounded annually), how much will he have after two years?

Keystrokes:

```
[LS] FN=
      T           This is just to do once if you are to do several problems with the
same program.
[RS] CLEAR 2
[RS] SOLVE
SOLVE
      F           The unknown
N?
```

```

2      [R/S]
I?    10  [R/S]
B?    1850 [R/S]
P?    0    [R/S]
E     0    [R/S]
F=   -2238.50

```

**Example 2: Present value of annuity.** How much should you invest now so that, starting one year from today, your daughter can receive \$6,000 per year for the next five years? Assume the discount rate is 15%.

Keystrokes:

```

[RS] CLEAR 2
[RS] SOLVE
SOLVE
B           The unknown
N?    5     [R/S]
I?    15    [R/S]
P?    6000 [R/S]
F?    0     [R/S]
E     0     [R/S]
B=   -20112.93

```

And so on...

Regards,

Miguel

## Re: Accurate TVM for HP 35s

*Message #9 Posted by [Vincze](#) on 7 Aug 2007, 12:59 p.m.,  
in response to message #8 by Miguel Toro*

Miguel, thank you my friend for the example. I see now how FN= work now. One question I do have though is what is the formula i' for? In MBA, I aware of  $P/i*(1-(1+i)^{-n})+F*(1+i)^{-n}+B=0$  to solve for TVM, assuming that this loan payment and payment at end of period and not beginning. For beginning (or lease generally) there different formula. Yours account for that nicely, but I do not understand the i' formula. I would think that if not needed, program might be shorter and more efficient. Let me think through and I will post back.

## Slightly Shorter TVM program

*Message #10 Posted by [Vincze](#) on 7 Aug 2007, 4:00 p.m.,  
in response to message #9 by Vincze*

Okay, I try my hand at first program. I must admit, harder than I thought. Let me state up front though, that this getting wrong answer **\*\*EDIT:(the below program has been corrected)\*\***, so I need help of members to see where I go wrong.

First, I use the following formula:

$$P/I * (1 - (1+I)^{-N}) + F * (1+I)^{-N+B}$$

I then collect like terms and get:

$$(1 - (1+I)^{-N}) * P/I + (1+I)^{-N} * F + B$$

Variables are same as above program, but I is in the factor of %/(n payments per year), so if interest be 5% and 12 payments per year, then

$$.05/12 = .004167 = I$$

My **\*\*CORRECTED\*\*** program steps are below:

```

T001 LBL T
T002 INPUT I
T003 INPUT N
T004 INPUT P
T005 INPUT B
T006 INPUT F
T007 1
T008 RCL + I
T009 RCL N
T010 +/-
T011 Y^X
T012 1
T013 X<->Y
T014 -
T015 RCL *P
T016 RCL /I
T017 1
T018 RCL +I
T019 RCL N
T020 +/-
T021 Y^X
T022 RCL * F
T023 RCL + B
T024 +
T025 RTN

```

I wonder if I have order of operator error someplace. I look, but sometime it better if fresh eyes look at to see my mistake.

If the following variables are entered, the result should be -1588.9920 when solving for P.

```

I = .004167
N = 360
P = ?
B = 296,000
F = 0

```

...but with above formula, I get -1233.432.

**\*\*EDIT\*\*** Corrected formula yields correct value of -1588.9920.

*Edited: 7 Aug 2007, 4:51 p.m. after one or more responses were posted*

## Re: Slightly Shorter TVM program

Message #11 Posted by [Miguel Toro](#) on 7 Aug 2007, 4:39 p.m.,  
in response to message #10 by Vincze

Try this:

```

T001 LBL T
T002 INPUT I
T003 INPUT N
T004 INPUT P
T005 INPUT B

```

```

T006 INPUT F
T007 1
T008 RCL + I
T009 RCL N
T010 +/-
T011 Y^X
T012 1
T013 X<->Y
T014 -
T015 RCL *P
T016 RCL /I
T017 1
T018 RCL +I
T019 RCL N
T020 +/-
T021 Y^X
T022 RCL *F
T023 +
T024 RCL +B
T025 RTN

```

And try to solve for the extreme cases from my original post. What do you get? :-)

Miguel

in response to message #11 by Miguel Toro

Yes, I see my error on line T015, and was going to post correction, but you beat me to it. I forgot to multiply there.

With your extreme case example, I don't think you would use this formula normally for continuous compounding (first example), and with second example, yes it extreme, but not realistic.

### Re: Slightly Shorter TVM program

Message #13 Posted by [Miguel Toro](#) on 7 Aug 2007, 6:07 p.m.,  
in response to message #12 by Vincze

The point is that with the program I posted you maintain enough precision to be sure of obtaining accurate results, even in extreme cases where you have too small an interest rate that it can lose decimals because of the precision of the calculator. That is why we make the change in the formula using:

$$(1+i)^n = e^{(n*\ln(1+i))}$$

$\ln(1+i)$  lets us to preserve accuracy, so the hp 35s can come closer to dedicated calculators as the hp 12c and expands its usefulness.

in response to message #13 by Miguel Toro*

My friend Miguel, I mean no disrespect, but I think your program very good, but again unrealistic in real world situation. Yes, if we have continuous compounding with continuous funding, it does do better than mine, but the basic TVM formula has not changed much in the last 100 years. The reason being is that interest rates have not reached minimal numbers like your program simulate. Yes, in theory it is possible, but not realistic. I think your program a very good example of what we call didaktikus in hungarian (I apologize, I do not have hungarian english dictionary with me to find english same word). It mean example, or teaching. Again it possible to have money continuously grow and add .01 cent continuously, but what bank could ever do that? I think for most real world example, it might be a bit more than need and if I be banker I may want shorter program that be faster. Just my opinion.

I hope there no hard feeling. I still interested though in your formula, as I have never seen the I' portion as when I plan continous equations we do it much differently with much shorter formula.

Thank you again my friend though for enlighten me in different way of doing same thing and letting me get feet wet in HP programming.

Paul, I look in my dictionary this morning and it does not have didaktikus in there to translate to english, but when I look up the word "didactic", the definition is very close too what I mean, so they must be related.

I will email someone who has better Hungarian / English dictionary to double check. Thank you for your help. I see I learn new English word today. Yesterday I learn "ameliorate", or to make better.

Hi Vincze,

In my original post, you can click on two excellent links that explain the matter further. You can also see the page 181 of the HP 15c "Advanced functions handbook" for this specific subject, or the entire chapter "Accuracy of numerical calculations" for discussions about different types of problems. If you do not have the book, the best alternative is the DVD from the museum, of course. :-)

My friend Miguel, I just read the 15C book example. So what it sounds like is that this deals with convexity and duration vector. Very interesting.

It should be noted, that TVM calculation are basically just estimates. Granted, banks want these as accurate as possible, but I think even with convexity and duration vectors, it will still be an estimate, but obviously much better. The TVM calculation is basically a polynomial, as because of that it will have roots (yes, plural. financial calculators only will find the one, but if you solve the formula and use the standard quadratic equation to solve for the unknowns, you will see what I mean). I wonder if there is a way to harness the polynomial in a different way to get an *even* more accurate solution.

Very interesting my friend. Thank you for the enlightenment.

## Re: Slightly Shorter TVM program

Message #20 Posted by [John H Meyers](#) on 9 Aug 2007, 4:51 a.m.,  
in response to message #13 by Miguel Toro

Quote:

The point is that with the program I posted you maintain enough precision to be sure of obtaining accurate results, even in extreme cases where you have too small a interest rate that it can loose decimals because of the precision of the calculator. That is why we make the change in the formula using:

$$(1+i)^n = e^{(n*\ln(1+i))}$$

$\ln(1+i)$  lets us to preserve accuracy, so the hp 35s can come closer to dedicated calculators as the hp 12c and expands its usefulness.

I don't know how 35s does internal computations, but on most past HP-designed series,

$$(1+i)^n$$

is calculated more accurately than

$$e^{(n*\ln(1+i))}$$

because it is using exactly the same formula internally anyway, but is retaining extended precision, which is lost when the intermediate "user" results are rounded to lesser precision.

In particular, on a calculator which always keeps the same number of digits in intermediate results, the moment we add 1 to a very small value of  $i$ , only the leading significant digits of the original  $i$  remain, and we have already lost any chance to get a completely accurate final result from the remaining steps.

This happens no matter which way we try to calculate the expression above, but it's worse when we take the log and multiply etc. ourselves, because then our intermediate results get rounded to "user" precision at each step, including the log and multiply, whereas when the calc does it, it can do the log, multiply and final EXP using greater internal precision than we can.

To retain precision for very small " $i$ " and large " $n$ " one really needs the special internal LNPI and EXPM functions, which for small arguments use series expansions that omit the first term. I'm working on a bit longer document about this, at least as it would apply to numerical methods on older series; perhaps 35s uses different internal numerical recipies, and if so, any experiments which shed light on that would be of interest.

## TVM equation principles

Message #21 Posted by [John H Meyers](#) on 9 Aug 2007, 5:31 a.m.,  
in response to message #20 by John H Meyers

This long-winded excursion explores the merits of different equations upon which a TVM solver could be based, if instead of the closed-form solutions available for all variables except interest, we seek a single suitable formula to use with numeric root-hunting algorithms, to solve all cases of the common five-variable TVM application.

Some principles to consider:

- o Reasonable initial guesses should always send the root hunter in the right direction, to locate a true and meaningful root, for all "shapes" of problems, initial guesses, and when solving for any variable.

Suggested formulas of general type 'f(n,i%yr,PV,PMT,FV,PYR,Begin?)=0' often differ from one another by having both sides multiplied or divided by some expression -- the right side, of course, always remaining zero under these transformations.

Sometimes we see the FV term having no other variables in its coefficient, and sometimes the PV term is chosen to have the honor instead; each of these has a characteristic which is particularly good if the cash flows are "loaded" towards one end or the other of the time line, but may turn out disadvantageously in an oppositely "loaded" case.

Solving for N can also produce a surprise, when for some initial guesses, the shape of the entire function, plotted vs. N, may send the numeric solver off in the wrong direction, heading away from the real answer, flying out towards infinity in a vain effort to make the left side zero.

Among the versions of this formula which I have tried, the best resistance to that effect in all collected problems I could throw at it was obtained when the coefficient of the "middle" PMT term (the "cash flow over the central region of the problem") was made independent of i (at least when payments occur at end of periods), rather than the very first (PV) or very last (FV) term, in which case the PV and FV terms each have coefficients involving "i", remaining in the ratio  $(1+i)^n$  to one another, as they always are anyway, in all forms of the equation.

But in this form of the equation, unlike some other forms, there is a certain resemblance of these "end region" terms to one another, and anomalies involving poor initial guesses seem to be reduced, for cases that have the largest cash flow "at the wrong end" for whichever "unbalanced" equation was otherwise chosen.

A final tweak which seemed to improve solving for N was to multiply the entire equation by N, which tends to discourage the numeric solver from getting attracted to exploring distant galaxies when solving for N :)

- o It's useful to confine the search for an interest rate to values which are logically possible, which are  $i > -100\%$  (there is no limit in the positive direction).

However, the numeric solver isn't conscious of this, and can at times wander into an alternate financial universe itself,

announcing -157%, say, as a mathematically correct (but meaningless) answer.

If a new variable is introduced, say  $j = LN(1+i)$ , and then the equation is expressed in terms of  $j$ , the legitimate range for  $j$  is now from  $-\infty$  to  $+\infty$ , which neatly and perfectly re-maps the range for  $j$

Another rather elegant feature of this remapping is that if you were to run time backwards, exactly reversing the sequence of cash flows of an original problem, the result is still a valid cash flow sequence, in which  $j$  simply changes sign (and payments flip between "beginning" vs. "end" of their respective periods), making the problem symmetrical.

A very small rounding error may have to be accepted as a trade-off for some of these strategies, in return for other forms of robustness in the ability of the overall algorithm to take on all conceivable cases.

o Cases involving large  $N$  and small  $I$  present a special challenge to accuracy.

In those cases, directly computing such expressions as  $(1+i)^{n-1}$  tends to lose precision, because significant digits drop off immediately when adding 1 to small  $i$ , and subtracting 1 at the end may also cause another loss of significance (also keep in mind that ' $i$ ' can legitimately have negative values, producing different extreme ranges for the final result).

Rewriting  $(1+i)^{n-1}$  as  $'EXPM(n * LN P1(i))'$  and  $'1 - (1+i)^{-n}'$  as  $'-EXPM(-n * LN P1(i))'$  avoids that loss of significance, whenever the given calculator implements these as built-in functions, which are mutually inverse and pass thru the origin (0,0); this technique was apparently introduced way back at the time of the HP22 financial model, although the EXPM and LN P1 functions were not then made directly available to the user.

Note also that with the above-suggested change of variable, we have  $j = LN P1(i)$ ,  $(1+i)^{n-1} = EXPM(n * j)$ ,  $'1 - (1+i)^{-n} = -EXPM(-n * j)'$  and  $i = EXPM(j)$ , giving the equation complete symmetry, in the fact that a reversal of time corresponds to a change in the sign of  $j$ , whose valid range remains  $-\infty$  to  $+\infty$ .

If anyone would like to try out various equations on a "breadboard rig," before investing in detailed implementations:

@ Testing equations on HP48/49/50 (ignoring the built-in TVM solver :)

@ TVM Equation in terms of I (valid only  $I > -100\%$ )  
 @ favoring linear middle term and balanced end terms:  
 $'(PV * I / -EXPM(-N * LN P1(I)) + PMT * (1 + B * I) + FV * I / EXPM(N * LN P1(I))) * N'$   
 $'TVMI' STO$

@ More symmetrical version in terms of J ( $-\infty$  to  $+\infty$ )  
 @  $'EXPM(J) = EXP(J) - 1'$  for calcs not having built-in EXPM  
 $'(PV * EXPM(J) / -EXPM(-N * J) + PMT * (1 + B * EXPM(J)) + FV * EXPM(J) / EXPM(N * J)) * N'$   
 $'TVMJ' STO$

```
@ Sample problem (B?=1 if payments occur at beginning of periods)

Modern HP financial calculators, as you know, actually have a slightly different set of variables in their TVM menu, consisting of N, I%YR, PV, PMT, FV, PYR and BEG[in] mode, where I%YR is the annual interest rate in percent and PYR is the number of payments per year, so that what we were calling I is actually '(I%YR/PYR)/100';

I use this same set of values in my HP32Sii and HP42S formulas, of course having to choose non-mnemonic single letters on 32Sii to distinguish Payment from Present value, and from PYR :)

I was going to append my HP32Sii formula and HP42S program, but I can't seem to find where I wrote them down, so I'll post this now, and perhaps come back later, if ever I do find where I hid those listings...

## Re: Accurate TVM for HP 35s (one line "program")

Message #22 Posted by **Chuck** on 7 Aug 2007, 5:13 p.m.,  
in response to message #1 by Miguel Toro

This isn't a program, but this is what I came up with a few weeks ago while camping. It's slightly different than the example from the owners manual; this is the form that I have the compounding interest formula and annuity formula memorized.

Press EQN, then enter the equation...

$$Q \times (1 + R/N)^{(N \times T)} + P \times ((1 + R/N)^{(N \times T)} - 1) / (R/N) + B$$

Directly above this equation you could enter the "Equation" TVM as a title to the TVM formula.

- Q = present value
- P = periodic payment
- R = decimal annual interest rate
- N = number of compoundings per year
- T = time in years
- B = balance

This is only for annuities due, (ie, end on period compunding) for simplicity.

Pull up the equation, press solve, the letter, and enter the known values as prompted.

CHUCK

Hello Miguel,

I am not interested in financial calculators, unless they're programmable and miss trigonometric functions. But I will keep this one until one friend of mine confirms he wants to trade it with something else.

An HP-35s with your TVM program might be enough for all my modest financial needs :-)

Best regards,

Gerson.

### Rubber feet on 35s and general 1st impressions

Message #1 Posted by [ECL](#) on 6 Aug 2007, 6:51 p.m.

Just got my 35s from e-walmart.

The display is slightly misaligned (no need to view all annunciators to draw attention to it).

CN: ...226 for those who care

Good to see the return of the continuous rubber foot at the bottom. Hope they finish this off with the upper feet on future revisions.

It sure is a pretty compact device (nice). Form factor is right on, minus the arrow keys. Slips right into shirt pocket, unlike the 33s due to its bulky foot pads.

Sure can't wait to see what the UNDO operation does. Hope it isn't supposed to enable the undoing of a basic operation like:

5 ENTER 4 X

Because, it certainly doesn't :)

Most keys feel fairly good and responsive. Seems not to suffer from the missed keystroke ailment of past.

Not intuitive how to cross two vectors though. ...wait...vector support DOES mean it can do that right?

Perhaps the user guide in my vehicle will shed more light.

### Re: Rubber feet on 35s and general 1st impressions

Why do you prefer that? I liked the individual feet of the 41C and Voyagers better, though I don't have that strong a preference.

### Re: Rubber feet on 35s and general 1st impressions

Message #3 Posted by [Hans de Moor](#) on 6 Aug 2007, 7:23 p.m.,  
in response to message #1 by [ECL](#)

Page 1-11 explains UNDO. Actually, a rather useful command. It recovers a deleted entry rather than

reversing an operation. For example:

123 <- (clears the 3)

<- (clears the 2)

UNDO restores the 3

UNDO restores the 2

### **Re: Rubber feet on 35s and general 1st impressions**

*Message #4 Posted by **Hans de Moor** on 6 Aug 2007, 7:25 p.m.,

*Message #5 Posted by **Bruce Bergman** on 6 Aug 2007, 8:21 p.m.,  
in response to message #1 by ECL*

I'm seeing a trend here, with the displays and S/N's. Just based on the big thread elsewhere about S/N's, and the prevalence of mis-aligned displays, I'd surmise that:

- Wal-Mart used their leverage on HP to get the very first batch of 35s units. Literally. Almost all of the really low numbers seem to be from Wal-Mart purchasers.
- The first batch or so had an alignment problem.
- The second batch went out to other smaller retailers (perhaps Samson, for example), and was a mix-n-match of mis-aligned and perfect aligned.
- The third batch was kept at HP and used to fulfill direct SMB orders from their website. There was perhaps another mix-n-match batch, but more perfect aligned units than in batch 2, and truly far fewer problems.
- Later batches seem to be just fine.
- Batch sizes are unknown, but seem to be in 500-1000 unit range.
- "Batch number" did not correlate to ship date. In other words, my unit came from batch 3, but my unit still arrived before some purchasers in batch 1.

Just educated guesses, but interesting nonetheless. If I'm right, it makes me wonder why they stopped selling them if the later batches were alright? Intriguing...

thanks, bruce

Unfortunately, as I had mentioned in another post, I have already fixed the problem and didn't take any pictures before or during the disassembly. (Curiosity and eagerness to fix the problem...)

The display had a left to right upward slope. The rise was about one pixel. The right side annunciators were just barely being covered by the gasket between the LCD glass and the outer plastic display cover.

My friend Walter. I tell you what. I teach you a word of Hungarian. "Nem" means "No". So, nem, I do not mind it being called Hungarian method. Actually, I am honored. :)

In fact, it take me a while to figure out what you mean by "statically determined body", but then it made sense to me what you were saying (in Hungarian, we would call it literally a passive immutable body... yours sound better though). It amazing how words may be different with different language, but in math and physics, language really all the same, just different words to express same things things.

BTW, I found out about "statically determined bodies" when I was a child and could not figure out why three legged stool my aunt had would not wobble. My uncle was very mad at me when I saw off almost 10cm from it. Good thing I was cute little boy then or I may have not survived uncle Jozsef being upset at me. :)

*Message #18 Posted by **Ed Look** on 7 Aug 2007, 2:21 p.m.,  
in response to message #17 by Vincze*

Sometimes, especially scientific or technical ones, terms are clearer in one language over the other, especially with English:

As an American, I've always been taught and used the term, "potential" for the "E" part of Ohm's law,  $E=IR$ , or less properly, "voltage".

But the German, "Spannung", which literally translated to English is "tension" is really a better word picture, a more accurate description I would say, than either "potential" or "voltage". I mean, it's weird to say, "There was (potential/voltage) between the pitcher and the hitter", unless both were standing where there will be an atmospheric electrical discharge in a few minutes.

Boy, I wish they'd fix the (English) terminology in quantum mechanics...

### **From Rubber Feet on 35s to English Quantum Mechanics (OT)**

*Message #19 Posted by **Walter B** on 7 Aug 2007, 6:30 p.m.,  
in response to message #18 by Ed Look*

Hi, Ed,

IIRC there were signs warning for "high tension" at power poles. Did they change it to "high voltage"?

Quote:

*Message #24 Posted by **Eric Smith** on 7 Aug 2007, 5:55 p.m.,  
in response to message #15 by Vincze*

That doesn't explain why a wide rubber foot on a calculator is a good idea.

A stool with two normal legs, spaced  $x$  cm apart, and a third leg  $x$  cm wide (and perhaps  $2x-3x$  cm from each of the other two) will definitely be able to wobble.

### **Re: Rubber feet on 35s and general 1st impressions**

*Message #25 Posted by **Walter B** on 7 Aug 2007, 6:41 p.m.,  
in response to message #24 by Eric Smith*

That is what a former older colleague called the "intelligence of matter": Since rubber is softer than table tops, any small protruding parts will "adapt" under pressure, i.e. deform and/or wear down fast until the broad foot will rest flat on the table top (remember the most pressure is at the bottom, where the keys are pressed). - Quite similar behaviour may be observed with wrought-iron cafe-tables put on a gravel terrace.

*Edited: 7 Aug 2007, 6:44 p.m.*

### **Re: Rubber feet on 35s and general 1st impressions**

*Message #26 Posted by **Eric Smith** on 7 Aug 2007, 7:51 p.m.,  
in response to message #25 by Walter B*

That reasoning still doesn't seem to apply, for two reasons:

- 1) If it does wear/compress to sit flat in one particular position and orientation on the uneven surface, it will not sit flat in some other position and orientation on the same uneven surface.
- 2) There's no reason why the same wear/compression wouldn't happen with four feet, rather than two "normal" and one "long" foot.

### **Re: Rubber feet on 35s and general 1st impressions**

*Message #27 Posted by **Vincze** on 7 Aug 2007, 9:21 p.m.,  
in response to message #26 by Eric Smith*

I think in simpler Hungarian terms, what Walter trying to say is rubber will not wear, but conform to contour of surface. If you have four small pad, like 15C, unit will wobble with uneven surface. Now with three pad (even with one very long) unit more stable. Now yes it possible that with very uneven surface it will wobble, but that is outside of (I can't think of word...Walter can you help?)...well what we can and can not deal with.

**Re: Rubber feet on 35s and general 1st impressions**

Message #28 Posted by **Eric Smith** on 7 Aug 2007, 9:32 p.m.,  
in response to message #27 by Vincze

I've never had a problem with a 15C or 41C wobbling on a surface on which the "long foot" calculator wouldn't.

The calculators I'm designing will have four feet. I suppose anyone that doesn't like that is welcome not to buy my calculators. :-)

*Message #33 Posted by [Paul Brogger](#) on 8 Aug 2007, 1:34 p.m.,  
in response to message #30 by Walter B*

I don't see how separate 3rd & 4th feet are in any way inferior to a very wide 3rd foot, with regard to stability.

The tripod analogy becomes inappropriate once one of the "points" of contact spreads to a line of contact (and one every bit as long as the spread between the other two points).

Take your camera tripod out on uneven ground, and rigidly attach a board at its midpoint to the end of one leg, perpendicular to that leg, and parallel to (and with a length equal to) a line connecting the feet of the other two extended legs. You'll find it no more stable than a "quadpod" with four equal-length legs.

With such a wide third pad, the question becomes moot.

### **Re: Rubber feet on 35s and general 1st impressions**

*Message #34 Posted by [ECL](#) on 7 Aug 2007, 3:05 p.m.,  
in response to message #14 by Walter B*

Walter,

I agree fully. The 32sii had broader upper feet, but the style was in line with the lower foot (pad).

Students who fail statics go on to design tables for cafes'. Particularly outdoor tables. Of all places (flooring) one would expect to find out-of-plane inconsistencies it would be a cobbled sidewalk cafe :)

ECL

### **Re: Rubber feet on 35s and general 1st impressions**

*Message #36 Posted by [Steve Cote](#) on 8 Aug 2007, 8:55 a.m.,  
in response to message #35 by Thomas Radtke*

I looked closely at the lower foot pad on my 35s. I noticed that even though the foot runs the width of

the calculator it is not flat, only the (2) ends will rest on a surface. The center of the foot is warped inward toward the calculator. So, even though it has (3) feet, it behaves as if it had (4) feet. This must be due to a special de-wobblelization treatment of the lower foot to ensure it doesn't warp the other way :)

**Re: Rubber feet on 35s and general 1st impressions**

Message #37 Posted by [Thomas Radtke](#) on 8 Aug 2007, 11:41 a.m.,

Message #39 Posted by [Vincze](#) on 8 Aug 2007, 11:37 a.m.,  
in response to message #35 by Thomas Radtke

Okay.. although I am not native American, let me Let me try this again today when my mind is clear and not so tired and full of wine. A three legged dog walks into bar... no wait. Wrong explanation.

Okay, I try again. A three legged stool or table will not wobble because the end of legs always form a plane. It that simple, but I know this a sophisticated group who not accept simple "Hungarian Method", (as Walter so nicely state this is) as answer.

To look at this mathematically, a three legged stool or table solves for a system of three equation in three variable, while a four leg table will change mind about which three of four equation to solve for the same three variable.

Pretend there a three legged stool or table sitting on three legs. Now add a fourth leg on some line out from the top of the stool to the floor. There is only one single length which will now just reach the floor. If the fourth leg is a little too short, then the leg will not contact, and the stool will pivot about two of the legs (wobble), or as in mathematical equation, it will change it's mind about which three of four equations to solve for. Also, if one leg a little to long, or floor is uneven, then when fourth leg come in contact with ground the stool will have to lift one of the other three legs off the floor making stool wobble.

Now let say that you have stool that had four \*exactly\* equal legs forming a square on the bottom of the stool, but now the floor is uneven. Now, there will be some way you should be able to adjust stool so that all legs (4) touch the ground and there will be no wobble. This like intermediate value theorem.

Now, one thing we also have to remember is that three legged stool not always very stable. So how do we offset this. One way is to extend out legs so that it very hard to tip over. Or, as HP do, they make one leg (rubber foot pad) very wide, and others small. This will prevent instability, except in most severe situation with sever angles, in which case, legs (or rubber feet) need to be longer (taller) respectively. That look funny on calculator though.

I hope that make sense, if not, I give up. :)

*Edited: 8 Aug 2007, 12:43 p.m.*

### **Re: Rubber feet on 35s and general 1st impressions**

*Message #40 Posted by [ECL](#) on 8 Aug 2007, 2:56 p.m.,  
in response to message #39 by Vincze*

Also note that the problem of wobble will not necessarily be repaired even if the feet of a four legged chair or table are made to be perfectly co-planar...because the chair or table will invariably be placed on imperfect surfaces!

### HP35s - Default number of decimal places

Message #1 Posted by [Ivan Latorre](#) on 6 Aug 2007, 4:45 p.m.

What is the default configuration (factory settings)? Some days ago I changed the display format and now I don't remember which was the default number of decimal places...

Is there any way to make a reset without pressing the reset hole?

Thanks in advance

### Re: HP35s - Default number of decimal places

### HP48gx....alpha....alpha...won't work?

Message #1 Posted by [George Mundell](#) on 6 Aug 2007, 12:28 p.m.

I have two of these HPgx's both with a Land surveying TDS Cogo GX/SX card and no ram cards (calculator used for cogo only not a data collector)...and neither one will allow me to access my survey program...and even without the cards in the slot...the command of alpha alpha won't perform... I press alpha once and the symbol comes on, then when I press for a second time nothing happens..no second alpha symbol..third press and the first alpha symbol goes off....all performance tests prove ok...tried the reset with paperclip with no avail.....Anybody know what is going on?.....Help....

### Re: HP48gx....alpha....alpha...won't work?

Message #2 Posted by [Dave Hicks](#) on 6 Aug 2007, 12:57 p.m.,  
in response to message #1 by George Mundell

Your description of alpha sounds normal. The second alpha just causes alpha to stay on while you type a string but it doesn't change the annunciator.

### Re: HP48gx....alpha....alpha...won't work?

Message #3 Posted by [Ron G.](#) on 6 Aug 2007, 1:29 p.m.,  
in response to message #2 by Dave Hicks

What Dave said.

With Survey card in port 2, turn on the clac, and key in [alpha], [alpha], tds48, [alpha], [enter]. This installs the program. Turn the clac off, move the survey card to port 1, and install a RAM card in port 2. Turn the calc on, and again key in [alpha], [alpha], tds48, [alpha], [enter]. This should get the program up and running.

### Re: HP48gx....alpha....alpha...won't work?

Message #4 Posted by [George Mundell](#) on 6 Aug 2007, 2:35 p.m.,  
in response to message #3 by Ron G.

Ron.....I agree with your response..I found a Important Notice in my paper work that said just what you said...I will be getting a ram card and additional software later...I just want to play around with this calculator and make it a data collector for a robotic total station.

### Re: HP48gx....alpha....alpha...won't work?

Message #5 Posted by [George Mundell](#) on 6 Aug 2007, 2:31 p.m.,  
in response to message #2 by Dave Hicks

Thanks...Dave.....I thought the second alpha had to stay on the display for it to allow a string to be typed in....Duhh!!!!and when I pressed for a third time it took it out of alpha mode... thus not working.....

### **HP48G screen contrast adjustment.**

Message #1 Posted by [Chan Tran](#) on 6 Aug 2007, 8:51 a.m.

I do know how to adjust the screen contrast on the 48G, ON+ or ON-. However I couldn't find this procedure any where in the manual. Where is the instruction for this?

### **Re: HP48G screen contrast adjustment.**

Message #2 Posted by [Gerson W. Barbosa](#) on 6 Aug 2007, 9:33 a.m.,  
in response to message #1 by Chan Tran

The ON/+ procedure is mentioned in page A-9 of the User's Guide. This should be tried several times in case the display is blank. Information on how to adjust the display contrast is provided in page 1-3 of the Quick Start Guide. Perhaps this information ought to have been duplicated in the first chapter of the User's Guide (The Keyboard and Display), so it appeared in the index.

### 35S INPUT (I) bug

Message #1 Posted by [Ralph](#) on 6 Aug 2007, 7:57 a.m.

I did a search and did not find this.

Here is a snip of code I tried to work yesterday. It is at the top of my program and has only two inputs before it:

```
70
STO i
1
STO (I)
..
a couple of direct inputs
..
55
STO I
LBL C
INPUT (I)
```

According to the manual (FWIW) I should be able to do it. I get Invalid I instead. Or J if I swap index pointers. My Upper limit is set to 70 previously so I am in range.

This works however:

```
55
STO I
LBL C
INPUT D
RCL D
STO (I)
```

Anyone else trip over this?

### Re: 35S INPUT (I) bug

Message #2 Posted by [Don Shepherd](#) on 6 Aug 2007, 9:38 a.m.,  
in response to message #1 by [Ralph](#)

Ralph, I get the same thing. Looks like they goofed the INPUT (i) function.

### Re: 35S INPUT (I) bug

Message #3 Posted by [Thomas Radtke](#) on 6 Aug 2007, 10:11 a.m.,  
in response to message #2 by [Don Shepherd](#)

After the P<>R disaster, I would think a lot more bugs will be unveiled. If one is that careless about the design, how crappy might be the implementation?

### Re: 35S INPUT (I) bug

*Message #4 Posted by **Thomas Radtke** on 6 Aug 2007, 12:33 p.m.,  
in response to message #3 by Thomas Radtke*

Sorry all, that was a bit harsh :-(

**Re: 35S INPUT (I) bug**

*Message #5 Posted by **Reth** on 6 Aug 2007, 10:20 a.m.,  
in response to message #2 by Don Shepherd*

INPUT does not work for indirect registers, only for A to Z e.g. -1 to -26

**Re: 35S INPUT (I) bug**

*Message #6 Posted by **Don Shepherd** on 6 Aug 2007, 12:14 p.m.,  
in response to message #5 by Reth*

Reth, that's good to know, and I imagine that will be sufficient for most folks' purposes. But the manual is misleading.

**Re: 35S INPUT (I) bug**

*Message #7 Posted by **Ed Look** on 6 Aug 2007, 12:25 p.m.,  
in response to message #6 by Don Shepherd*

Someone in this forum mentioned that the manual seems like a rework of the HP-33S manual, which was a rework of the 32SII manual.

I guess if you photocopy a photocopy of a photocopy, the picture becomes less clear.

I suspect if they had a new team in place to write a new manual from scratch, we might be paying more than \$60 USD for it.

Honestly, though, it appears to me that most of us have been somewhat jumpy, as in jumping at the first hint of HP design negligence, real or imagined.

Since Reth posted that INPUT does not work for the indirect register addresses, it sure does look like a design decision to make it (leave it?) that way. We might discuss whether it was a good or bad design segment, but I think we might be just a little more circumspect in declaring bugs.

**Re: 35S INPUT (I) bug**

*Message #8 Posted by **Thomas Radtke** on 6 Aug 2007, 12:31 p.m.,  
in response to message #7 by Ed Look*

I guess INPUT was declared that way after finding out that it doesn't work on indexed registers. A design decision like that makes no sense to me.

**Re: 35S INPUT (I) bug**

*Message #9 Posted by **Don Shepherd** on 6 Aug 2007, 1:06 p.m.,  
in response to message #7 by Ed Look*

Ed, what is a bug? If the manual says that something works a certain way, and it doesn't, that's a bug. Page 14-22 of the manual clearly states that indirection includes any number from -32 to 800, and page 14-23 clearly shows INPUT (i) and (j) as valid instructions. Nowhere does it

state that indirection for the INPUT command is limited to -32 to -1.

I think members of this forum need to feel free to discover these \*bugs\* and point them out so that we all know the real limitations in this device.

**Re: 35S INPUT (I) bug**

*Message #10 Posted by **Gene Wright** on 6 Aug 2007, 1:27 p.m.,  
in response to message #9 by Don Shepherd*

It could also be a mistake in the manual.

I do agree that people should publicize things that do not appear to work as indicated, certainly.

Keep in mind that the manual might also be mistaken, as it appears to be in this case.

Hey, not everyone will like the 35s.

**Re: 35S INPUT (I) bug**

*Message #11 Posted by **Don Shepherd** on 6 Aug 2007, 1:41 p.m.,  
in response to message #10 by Gene Wright*

Gene, this raises an interesting point. If I program INPUT A, the top line of the display shows A? as a prompt for the user. How would it prompt for INPUT (I) if I was, say, 46? Would it say 46? That would be weird.

**Re: 35S INPUT (I) bug**

*Message #12 Posted by **Ed Look** on 6 Aug 2007, 1:56 p.m.,  
in response to message #11 by Don Shepherd*

True that...

... but I suppose if they wanted to, there'd be some kind of scheme, like [46] or .46 or some such.

And your point about bug discovery is well taken; it IS a very public service!

**Re: 35S INPUT (I) bug**

*Message #13 Posted by **Thomas Okken** on 6 Aug 2007, 1:58 p.m.,  
in response to message #11 by Don Shepherd*

It could say **R46?** -- that's what happens when you do this on the HP-42S.

- Thomas

**Re: 35S INPUT (I) bug**

*Message #14 Posted by **Gene Wright** on 6 Aug 2007, 2:02 p.m.,  
in response to message #11 by Don Shepherd*

I would guess it would prompt as "(46)?" if that functionality were included.

Weird? maybe. Different? Yes, but that's at the benefit of having all those indirect registers available.

I can't tell you guys how excited I was when I first realized we'd have 800+ registers available.

I also can't tell you how excited I was when the indirect data packing program worked so well. It actually takes fewer keystrokes to store and recall indirectly using the indirect data packing program in the learning modules than doing it manually.

Line number GTO and XEQs that STAY will the instruction when a program is edited? Wonderful!

There is much to like in this machine!

Are there some things I wish were improved? Sure, but by the time I'd be finished offering suggestions for improvement, I'd have spec'd out an HP42s replacement machine...

which is not what the 35s is intended to be. It is from the 32s, 32s2, 33s line.

I'll gladly use it compared to those guys. Gene

### **Re: 35S INPUT (I) bug**

*Message #15 Posted by [Ed Look](#) on 6 Aug 2007, 2:07 p.m.,  
in response to message #14 by Gene Wright*

Yes, Gene, it does have that 32SII-ish feel to it: a similarity in features, a similarity in visual appearance... at least in the geometric layout of keys, thin, lightweight... I must say though that I like the colors of the 35s more even than the scheme used on the 32SII.

Is it fair to say that with the inclusion of the 33S constants and equation libraries and expanded memory capabilities, it is a bit more powerful than the 32SII (which I still love to use)?

### **Re: 35S INPUT (I) bug**

*Message #16 Posted by [Don Shepherd](#) on 6 Aug 2007, 3:07 p.m.,  
in response to message #14 by Gene Wright*

Thanks Gene. I agree with you, there is VERY much to like about this machine. I never took much interest in the solver before, but I have been playing around with it with some quadratic and cubic equations, and it gives me the right answer no matter what I throw at it. And the 800 registers open this machine up to many problems that would have been impossible on a machine with, for instance, 20 registers (like my venerable 12c). I'm planning on rewriting a BASIC program for solving a cube puzzle for the 35s.

I think the thing I like best is discovering uses that I don't even know about now, based upon discoveries by all the forum folks. I imagine I speak for many when I say we are looking forward to learning all there is to know about this device.

### **Link to 12c programs/games from HHC2006**

*Message #17 Posted by [Gene Wright](#) on 6 Aug 2007, 3:19 p.m.,  
in response to message #16 by Don Shepherd*

Since someone asked for the 12c articles from the HHC2006 gathering and since the 12c programming style is similar (somewhat) to that of the 12c, here is part of my presentation on the 12c.

[HHC 2006 12c](#)

and a short one page "How to..." for the 12c platinum.

[12c basics](#)

There are ALWAYS lots of presentations much more enjoyable than this one was at HHC gatherings. :-) Registration is still open! We're nearly at 55 registered attendees for HHC2007 held at HP's calculator division itself!

Lots of great information and fun.

### **Re: 35S INPUT (I) bug**

*Message #18 Posted by [Katie Wasserman](#) on 6 Aug 2007, 3:12 p.m.,  
in response to message #14 by Gene Wright*

Quote:

Line number GTO and XEQs that STAY will the instruction when a program is edited? Wonderful!

While this is true in most cases, it's not true when you edit (delete/add) a line that is the target of a GTO or XEQ. In that case the GTO's and XEQ's all have to be reexamined and most likely changed. This wouldn't be so bad if you knew all the target lines of GTO and XEQ instructions so you'd know if a reexamination is in order -- but you don't know which they are and you can't flag them as such.

I've been extremely frustrated by this and it makes program editing as difficult as not having the auto line number changing feature. Sometimes it's worse, so I'm back to mostly using the limited 26 labels that existed before.

-Katie

*Edited: 6 Aug 2007, 3:14 p.m.*

### **Re: 35S INPUT (I) bug**

*Message #19 Posted by [Gene Wright](#) on 6 Aug 2007, 3:24 p.m.,  
in response to message #18 by Katie Wasserman*

Sorry to hear that, Katie.

Compared to the 12c way of things, the 35s is a godsend. I'd bet you'd agree to that...

It is the ONLY way I would ever want to program with line number GTO

and XEQ statements.

Yes, yes, local labels would be much nicer, but that just wasn't in the cards given the legacy platform of this machine. Not going to happen. Period.

So, either 26 labels as before, or a very good compromise that has already allowed for much more complicated programming than would otherwise be possible.

As you say, it can always be ignored and just programmed as if only global labels were available.

But, the only time I have seen a problem is when you need to change the function at the destination of a GTO or XEQ. Does that really happen all that often with programs you write? It hasn't with me. Usually it is in the body of a calculation that I find something left out.

But then, I also write out my programs on paper if they are longer than 20 or 30 lines, and work through the GTO and XEQ destinations that way.

:-)

Gene

### **GTO / XEQ line destinations**

*Message #20 Posted by **Gene Wright** on 6 Aug 2007, 3:40 p.m., in response to message #19 by Gene Wright*

Another thought. The destination instructions could be default instructions that never need to be deleted.

If a program isn't going to use the angle mode, make the instruction at all GTO/XEQ destinations be DEG or RAD.

That way, it would never be deleted. Sure, uses an extra 3 bytes but big deal.

Or, some other harmless instruction. Kinda a Pseudo-label.

Just a thought.

### **Re: GTO / XEQ line destinations**

*Message #21 Posted by **bill platt** on 6 Aug 2007, 3:53 p.m., in response to message #20 by Gene Wright*

Very clever. Wish I thought of that ! :-)

### **Re: GTO / XEQ line destinations**

*Message #22 Posted by **Paul Brogger** on 6 Aug 2007, 4:25 p.m., in response to message #20 by Gene Wright*

I've suggested something like the following for the 33s. Of course it takes more memory, and assumes that Flag 10 is clear. But it provides

a clear GTO/XEQ destination, and documents it to boot.

```
E...
E102 FS? 10
E103 COMMENT, ENTERED IN EQN MODE
E...
```

-----

Addendum:

Some other NNOP (Nearly No-Operation) candidates:

FS 6

FS 9

FC 10

-- depending upon your program requirements.

I've long thought that the COMMENT is the fundamental statement of any programming language, and the NOP is the fundamental operation of any CPU. They're just too darned useful to be left out.

-----

We might also consider what would be the *worst* command to use as a NNOP. I nominate "DSE (I)".

*Edited: 6 Aug 2007, 6:23 p.m.*

### **Re: GTO / XEQ line destinations**

*Message #23 Posted by [Katie Wasserman](#) on 6 Aug 2007, 5:04 p.m., in response to message #20 by Gene Wright*

Gene,

As you suggested, I thought about using NOP-like instructions for exactly that purpose. They would do the trick then could be deleted once the program is complete and (I think) the calculator would auto-renumber GTO's and XEQ's to the right place. A "RADIX." or "RADIX," instruction would probably be a good choice for a NOP. It's hard to imagine a program that ever needed to use them.

Ultimately, using paper for longer programs is probably the way to go though. I'm usually able to do 32Sii programming entirely on the calculator because the space is sufficiently limited that 26 labels is more than enough. OTOH even though the program space on the original 12C is smaller I still need to write programs on paper first.

-Katie

### **Re: 35S INPUT (I) bug**

*Message #24 Posted by [Paul Dale](#) on 6 Aug 2007, 4:30 p.m.,*

*in response to message #18 by Katie Wasserman*

I too have been stung by this very behaviour a multitude of times over the past week :-)

Also got stung badly last night when I decided to add a chunk of code at the start of my program. All the forward references were valid at the time of entry and got merrily relocated :-) I gave up and cleared memory and started typing anew. And yes, I wrote this out first -- in fact I've written a mini-assembler that lets me write code out and it fills in the line numbers for me.

However, as Gene pointed out, it is **much** better than traditional line number based programming.

- Pauli

### **GTO/XEQ ...**

*Message #25 Posted by **Gene Wright** on 6 Aug 2007, 5:39 p.m.,  
in response to message #24 by Paul Dale*

I do believe it is much better than traditional line number based programming...

and I believe it is much better to have this \*option\* compared to the 32s, 32SII and 33S programming style.

Is it as nice as the HP41 / HP42 style?

No.

### **Insertion before jump target**

*Message #26 Posted by **Thomas Okken** on 6 Aug 2007, 4:57 p.m.,  
in response to message #18 by Katie Wasserman*

When inserting a line, you can avoid grief as follows. Say you want to insert a line between lines 100 and 101. If you're sure that line 101 is not currently a GTO/XEQ target, there's nothing to worry about. If line 101 is a GTO/XEQ target, then you have to ask yourself whether the line you're inserting should become the target of those GTOs/XEQs or not; if not, again, nothing to worry about; if the new line \*should\* become the jump target, then

- 1) Insert the new line \*after\* the current jump target
- 2) Re-enter the current jump target \*after\* the line you just created
- 3) Delete the original jump target

It's a little bit awkward, but since the calculator has no way of knowing how to treat insertion before a jump target, you have to help it a little bit anyway. (It would be perfect if the calculator would detect insertion before a jump target, and then ask the user what to do!)

UPDATE: Of course you'd still be in trouble if you are dealing with a jump target that is reached by multiple GTO/XEQ instructions, and you want the inserted instruction to be reached by some of those, but not others. On a

calculator with labels, that would be analogous to inserting an instruction between two labels. To cope with this kind of thing reliably, you'll have to use pseudo-labels (NOP instructions) as jump targets exclusively, as others have already suggested.

- Thomas

### **Re: Insertion before jump target**

*Message #27 Posted by **Ed Look** on 6 Aug 2007, 6:03 p.m.,  
in response to message #26 by Thomas Okken*

I just completed a port of my XRD Miller indices program from the HP-48G to the new 35s.

Ignoring (rather, taking into account!) the limitations in the four-level stack 35s calculator as compared to the open stack of the RPL 48G calc, I saw now firsthand the automatic GTO line number changes as I edited the program.

It was slightly alarming and somewhat annoying to me at first, but if the program isn't too long (mine really isn't) then you can keep in mind where all your redirection statements are and then go back and check to see if the target lines are indeed the ones given on the branching command line. I did have to go back and change a few of them... more than once.

Maybe I am a naive programmer, but so far, this seems mainly to be a slight annoyance rather than a major distraction.

What do you all think?

### **Re: 35S INPUT (I) bug and more**

*Message #28 Posted by **Reth** on 6 Aug 2007, 5:04 p.m.,  
in response to message #11 by Don Shepherd*

I guess the prompt would be similar to the output of VIEW -

```
(46)=
123.456
```

The manual says on p.14-23 "you can not solve or integrate for unnamed variables or statistic registers" and INPUT should be included; also INPUT() and VIEW() shouldn't be grouped together in the sentence on p.14-22 which I miss to understand anyway.

All in all I don't see that as a big problem cause I wouldn't by punching in dozens of numbers in those indirect registers.

Another interesting thing I noticed. Suppose you've allocated 51 registers 0-50 and run the following code in order to free the memory.

```
LBL E
0.05
STO I
CLSTK
STO(I)
```

ISG I  
GTO E005  
RTN

before the first run system reports 51 regs, after it - 50 (only 50th unavailable) and after the second run - 0 as expected. Am I missing something?

Cheers,  
Reth

**Re: 35S INPUT (I) bug**

*Message #29 Posted by [Paul Dale](#) on 6 Aug 2007, 4:25 p.m.,  
in response to message #5 by Reth*

Nobody seems to have bought this up yet, but the calculator lets you enter INPUT (I) as an instruction. Which then fails to work. I don't see how this can be classified as anything but a bug in the calculator. Either the instruction should have been omitted from the machine or it should operate properly. Either way bug in calculator.

- Pauli

[edit to fix typo "but" -> "bug"]

Ah, now THAT does look like a bug...

**Re: 35S INPUT (I) bug**

*Message #31 Posted by [Don Shepherd](#) on 6 Aug 2007, 4:56 p.m.,  
in response to message #29 by Paul Dale*

Paul, INPUT (I) works in a program, but only if register I contains a value between -26 (register Z) and -1 (register A). The manual, as Gene pointed out, is erroneous by implying that all 800 indirect registers can be used with INPUT (I).

**15C fails keyboard test**

Message #1 Posted by [Ron G.](#) on 6 Aug 2007, 12:27 a.m.

I have a 15C that fails the keyboard test. The keys seem tight and quite responsive, and they seem to work as they should. What would be the cause of the failure? It doesn't fail on the same key every time, but I've not yet made it all the way across the top row.

Any suggestions on correcting this situation?

**Re: 15C fails keyboard test**

Message #2 Posted by [Sondre K. Selnes](#) on 6 Aug 2007, 4:39 a.m.,  
in response to message #1 by Ron G.

Hello !

When performing the key-test, do You remember to hit the Enter-key twice - ? First time for the 'R/S'-row and second for the 'ON'-row.

If that dosen't work, try remove the battery for about 20 minutes...

Best regards Sondre K. Selnes

**Re: 15C fails keyboard test**

### 35s mem seems weird

Message #1 Posted by [Paul Dale](#) on 5 Aug 2007, 7:54 p.m.

On my 35s, I've noticed that the amount of memory used does seem to correspond with the sizes of the programs I've got stored.

Currently, my calculator is reporting 24535 bytes of free program memory. I've a single program D which has a claimed length of 1954 and no variables.

$24535 + 1954 = 26489$  which is way off from the total memory on the device. I've forgotten the exact memory empty size but it is over 30000 bytes.

Where has the memory gone? I'm pretty sure the program is larger than the quoted size...

Should this be counted as a bug?

Pauli

### Re: 35s mem seems weird

Message #2 Posted by [Gene Wright](#) on 5 Aug 2007, 10:09 p.m.,  
in response to message #1 by Paul Dale

How many indirect variables do you have allocated?

When you go into MEM, what does it show on both sides?

### Re: 35s mem seems weird

Message #3 Posted by [Paul Dale](#) on 5 Aug 2007, 11:43 p.m.,  
in response to message #2 by Gene Wright

Quote:

How many indirect variables do you have allocated?

None that I'm aware of. I did clear vars to check.

Quote:

When you go into MEM, what does it show on both sides?

```
1VAR    2PGM
0       24,525
```

pressing 2 brings up:

LBL D  
LN=1954

There are no other programs.

- Pauli

### **Re: 35s mem seems weird**

*Message #4 Posted by **Paul Dale** on 6 Aug 2007, 12:09 a.m.,  
in response to message #3 by Paul Dale*

Further investigations.

Memory at start 24525. Enter:

LBL A  
123

Memory now 24484 (i.e. 41 bytes used). MEM 2 for LBL A has LN=9.

Entering:

LBL A  
123  
456

Gives me 24446 bytes and LN=15. Changing the 456 to 4567 in the this example yields 24446 and LN=16.

I'm guessing that the LN figure is being calculated as three bytes per operation plus one byte per character in the number and the mem figure is a flat 38 bytes per number. A quick look at equations seems to indicate that they follow the same rule as far as the LN= bit.

### **Newer HP 17BII+ with double-width Input/Enter key?**

Message #1 Posted by [bt\\_schmidt](#) on 5 Aug 2007, 1:24 p.m.

In a recent thread, "[Re: Looking for advice on financial calculators](#)", Thomas Okken observed that there is an image of an HP 17BII+ with a double-width Enter or Input key, on the Office Depot website:

- [www.officedepot.com/ddSKU.do?level=SK&id=784928](http://www.officedepot.com/ddSKU.do?level=SK&id=784928)
- [784928\\_sk\\_lg.jpg](#)

This potentially creates confusion if there are now two versions of the HP 17BII+ and you want #3, the one with the double-width Input key, viz:

1. HP 17BII (discontinued)
2. HP 17BII+ (readily available)
3. newer HP 17BII+ with double-width Input key

Does anyone have additional information on this newer HP 17BII+?

thank you,  
...bt

Message #2 Posted by [David Smith](#) on 5 Aug 2007, 3:45 p.m.,

in response to message #1 by [bt\\_schmidt](#)

The HP part number is the same as the current gold/black version, and gold/black is listed as the case color on the OfficeMax site. But suddenly HP is offering an instant \$20 discount on their website on the gold/black version.

I would guess this is one of those occasional goof-ups by an online vendor. The SKU and description are the same so somebody linked to the new jpg too soon.

And I have one of the "old" (?) ones coming on Monday. Darn.

### **Re: Newer HP 17BII+ with double-width Input/Enter key?**

Message #3 Posted by [Matt](#) on 5 Aug 2007, 3:55 p.m.,

in response to message #2 by [David Smith](#)

Interesting.

What with this and the big enter key on the 35s, I wonder if we can expect a remodelled 50G soon? Also, the faceplate on that 'new' 17bii+ looks metal. In fact the whole thing is rather nice, IMO.

*Edited: 5 Aug 2007, 3:57 p.m.*

### Connectivity Issues with 48G series

Message #1 Posted by [Ed Look](#) on 4 Aug 2007, 11:26 p.m.

I have both a HP-48G and a 48G+. I used to be able to connect to them oh-so-easily. Ever since Win XP, I can easily connect to a 49G+, but neither of the 48G series babies can connect.

The error message always says that no calculator or no device is found on COM2. I hope the only old fashioned serial port on my PC is COM2, as my link cable is 48G proprietary four pin to serial.

Are there any of you here who are able to consistently connect successfully their 48G series machines to their PC? I'd love to get my 48G and G+ back onto the PC.

### Re: Connectivity Issues with 48G series

Message #2 Posted by [Allen](#) on 4 Aug 2007, 11:40 p.m.,  
in response to message #1 by Ed Look

RS232 ports when native on the motherboard usually default to COM1 unless you specify otherwise. Check your settings in the START-> Control panel -> Hardware device manager.

If nothing else, get a USB to serial converter. This will allow you to configure the COM ports more easily compared to a hardwired RS232. As a side note, many manufacturers are not FULLY supporting the Rs323 interface at the specification level w/r/t the DTR and other important signals- this is especially prevalent in Laptop computers where the pins may LOOK like Rs232, but they do not fully behave RS232.

### Re: Connectivity Issues with 48G series

Message #3 Posted by [Ed Look](#) on 4 Aug 2007, 11:57 p.m.,  
in response to message #2 by Allen

Why, thank you for the insight!

I appear to have three ports listed in the Device Manager: COM1, COM2, and LPT1.

I don't see a way to reconfigure the ports and there is only ONE such port on my motherboard. Bleagh.

If I use a USB to serial converter, it looks like I'll use one yet another USB port... but may be worth it. I'll look into that, too.

### Re: Connectivity Issues with 48G series

Message #4 Posted by [Thomas Okken](#) on 4 Aug 2007, 11:52 p.m.,  
in response to message #1 by Ed Look

My HP-48G and my laptop have no problem talking to each other. On the PC end I use Windows XP Home and Conn4x; the machine has no serial ports built-in but everything works fine with an external USB-to-serial converter.

- Thomas

### **Re: Connectivity Issues with 48G series**

*Message #5 Posted by **Ed Look** on 4 Aug 2007, 11:59 p.m.,  
in response to message #4 by Thomas Okken*

I see. It appears more and more this is the way to go. Legacy stuff; bah. Yeah, yeah, I know... just like the rest of us here, I'm a "legacy" calculator nut...

... but how does this converter work?

If I connect the serial end of the converter cable to my serial port, I have a USB end left; not usable on the 48G.

If I connect the USB end to a USB port, I have a serial end left; still unusable on the 48G...

... unless the serial end of my existing 48G to serial cable connects to the converter which then plugs into a USB port...

... right?

*Edited: 5 Aug 2007, 12:21 a.m.*

### **Some kind thoughts about HP's new direction**

Message #1 Posted by [Seth Morabito](#) on 4 Aug 2007, 9:36 p.m.

I've been watching the recently released [HHC 2006 DVDs](#), and they've really reassured and excited me. I've never been to an HHC event, but I'm very much looking forward to going to HHC 2007 next month.

Listening to Cyrille de Brebisson and Sam Kim on the HHC 2006 video has made it clear to me that they're very passionate about bringing quality, reliability and good design back to HP calculators. They really listen to the community that uses them. It's also reassured me that there's more good stuff to come -- we've already seen a few accidentally leaked pictures of the new HP 17bII+ design, and I suspect we'll see other changes that bring more of the calculators into line with what we've seen on the 35s. Pure speculation on my part, but I think very well reasoned speculation.

The response to the 35s has been overwhelmingly positive. You can't please everyone, so there are bound to be some people who don't like it, but I'll agree with what seems like the majority sentiment that this is the best handheld calculator HP has sold in almost a decade. I love my 35s, it's an excellent RPN calculator in the 32s lineage, and I'm happy as a clam to have my wide "Enter" key back. THANK YOU HP!

### **Re: Some kind thoughts about HP's new direction**

Message #2 Posted by [Ed Look](#) on 4 Aug 2007, 9:49 p.m.,

I agree with you that "this is the best handheld calculator HP has sold in almost a decade." However, I still don't think it is good enough yet.

### **Re: Some kind thoughts about HP's new direction**

Message #4 Posted by [Brad Davis](#) on 4 Aug 2007, 11:53 p.m.,  
in response to message #3 by Wayne Brown

Step 1 would seem to me to be a >4 line stack to make those of us who learned RPL first happier.

Would that actually *hurt* RPN users in some way?!?

### **Re: Some kind thoughts about HP's new direction**

Message #5 Posted by [Ed Look](#) on 5 Aug 2007, 12:01 a.m.,  
in response to message #4 by Brad Davis

Nah. It would eat up more physical system resources and might get underutilized by those of us who are used to the good ol' four stack system. ;D

### **Re: Some kind thoughts about HP's new direction**

*Message #6 Posted by **Walter B** on 5 Aug 2007, 12:03 a.m.,  
in response to message #4 by Brad Davis*

How about a settable fixed stack size? You may set it to 4 levels minimum ("compatibility mode" for all the good old programs) and to **n** levels maximum. I proposed **n = 16** in an earlier post here I'm too lazy to excavate now (maybe KS would do).

### **Re: Some kind thoughts about HP's new direction**

*Message #7 Posted by **Wayne Brown** on 5 Aug 2007, 12:28 a.m.,  
in response to message #6 by Walter B*

That would be the way to go if the stack were expanded. I personally wouldn't want more than 4 levels plus LASTX, but more would be OK as long as it could be limited to 4 by the user, and the "T" level copying worked the same as on the "real" 4-level machines.

### **Stack compatibility and VLS ( Very Large stack)**

*Message #8 Posted by **Allen** on 5 Aug 2007, 12:51 a.m.,  
in response to message #6 by Walter B*

I can't think of a good reason for a scientific calculator without matrix or parallel list processing features to have  $n \gg 4$  level stack or VLS (very large stack).

The vast majority of USER and SYS RPL stack commands only manipulate the bottom 6 regs for a reason: If the calculator has enough system resources to support VLS, it is easier to dump intermediate results into a different data structure (list, matrix, array, vector....) or store them in a variable (direct or indirect).

Also, once the stack depth exceeds 6 or so, the top is no longer DIRECTLY accessible. Only indirect use via the ROLL or PICK command will allow the top to be used in calculation. As a result, VLS data structures are in essence indirect registers with access control.

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #9 Posted by **Walter B** on 5 Aug 2007, 4:08 a.m.,  
in response to message #8 by Allen*

Hi, Allen,

I think I have to clarify a bit.

Quote:

\_\_\_\_\_

I can't think of a good reason for a scientific calculator without matrix or parallel list processing features to have  $n \gg 4$  level stack or VLS (very large stack).

\_\_\_\_\_

IIRC " $n \gg 4$ " means  $n$  being at least 40. IMHO this would be a VLS already. This was not proposed.

To allow you to tackle every strange equation you meet without the need for storage of intermediate results,  $n = 4$  falls short.  $N = 6$  may be sufficient. Let's add 2 levels for safety (remember Minneapolis), so  $n = 8$  may be a good maximum if each stack level may contain any kind of object (incl. matrices). This size is still easy to control.  $N = 16$  might be too much, agreed, but e.g. MathUPro works with that number.

*Edited: 5 Aug 2007, 4:13 a.m.*

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #10 Posted by [Brad Davis](#) on 5 Aug 2007, 9:04 a.m.,  
in response to message #9 by Walter B*

I wouldn't care about a VLS. 6 or 8 would be all I'd care about. The reason is that I got into the habit of punching equations through left to right using RPL. I use quite a few equations that require 5-6 registers to do that.

Over the last few days, I've started re-training myself to start inside and work my way out.

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #11 Posted by [Frank Rottgardt](#) on 5 Aug 2007, 1:46 p.m.,  
in response to message #10 by Brad Davis*

The same here. I started my HP "career" rather late as a fresh men back in 1990 with a RPL 28s. I had never to think about the limitations of a four level stack. Today, using a 33s for my daily tasks, I still have to remember myself of the rule "work from inside to the outside". But I get used. Anyway, a 6-8 level stack would be very nice.

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #12 Posted by [Brad Davis](#) on 5 Aug 2007, 7:49 p.m.,  
in response to message #11 by Frank Rottgardt*

LOL, I'd say that there are quite a few of us out there.

For what it's worth, I'm trying to learn to do things in true RPN now. I have a specific benchmark equation that I use to judge my speed. Today, I punched it through in 30-32 sec. with my 50g from inside out. Also 30-32 sec. with my 33s. The best I could do left to right with my 50g was 38 sec. I'm now convinced that I should go inside->outside, so the stack size isn't an issue any longer.

I'm almost sure I've done it in 27 sec. with my 48 because the keys are so much nicer. I let a TI-using friend borrow it for a couple of weeks in a conversion attempt, so I can't verify that number.

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #13 Posted by [Vincze](#) on 6 Aug 2007, 9:10 a.m.,  
in response to message #11 by Frank Rottgardt*

I think four level stack force user to be more concise with code (equations). This hard for some new programmers in the real world because memory is cheap. I know I play with 35s this weekend trying to write a few programs based on two theory. One, use as many like as I need. Two, limit it to four level stack use. The second

theory, much harder as you really have to think, but you make much more efficient code in my opinion.

I think unlimited stack is very good thing, but it allow you to be lazy and build out larger program which not necessarily a good thing. I see in my work, many younger programmer out of university who write bloated programs that could be more efficient. Unfortunately at university they do not teach them how to write compact code. That is a shame.

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #14 Posted by **Walter B** on 6 Aug 2007, 3:41 p.m.,  
in response to message #13 by Vincze*

Shall the calculator be part of the problem or part of the solution? For a dedicated educational calc, one may limit the features artificially to force people to use a certain stile of problem solving. But for a professional tool, I'd prefer not to be educated. Just my personal opinion.

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #15 Posted by **Gunnar Degnbol** on 6 Aug 2007, 4:22 p.m.,  
in response to message #13 by Vincze*

I think the main issue with larger stacks is access to all the new stack levels. With four levels, none of the stack registers are more than 2 keypresses away. More than four, and you "need" all those RPL stack manipulation commands that nobody can remember.

### **Re: Stack compatibility and VLS ( Very Large stack)**

*Message #16 Posted by **James M. Prange (Michigan)** on 7 Aug 2007, 6:20 a.m.,  
in response to message #15 by Gunnar Degnbol*

Quote:

More than four, and you "need" all those RPL stack manipulation commands that nobody can remember.

Can you remember just DEPTH, ROLL, PICK, and DROPN? Those are all that are really **needed** in RPL. The rest of the UserRPL stack commands are useful, but with some extra keystrokes or programming, these four can do everything that the others can.

Regards,  
James

*Edited: 7 Aug 2007, 6:43 a.m.*

### **Settable RPN stack size**

*Message #17 Posted by **Karl Schneider** on 6 Aug 2007, 2:26 a.m.,  
in response to message #6 by Walter B*

Hi, Walter --

Quote:

---

How about a settable fixed stack size? You may set it to 4 levels minimum ("compatibility mode" for all the good old programs) and to n levels maximum. I proposed n = 16 in an earlier post here I'm too lazy to excavate now (**maybe KS would do**).

---

I fully agree that a settable fixed stack size would be the way to go.  $x < > y$ , R\_dn, and R\_up would work exactly the same. The minimum and default stack size should be 4, for compatibility and usability. The maximum could also be 9 or 19 for a natural setting operation; e.g., "STKD 9" or "STKD .9". Hexadecimal (e.g., E for 15) would be a bit counterintuitive.

As for "excavating", I don't do that on a routine basis. Once in a while, I plow through the Archives for informative or detailed posts, in particular my own where I wrote a "short essay" or provided an explanation for an analyzed problem. I then make bookmarks for those posts, which tend to offer suitable responses for topics that come up repeatedly.

*Message #18 Posted by [Howard Owen](#) on 5 Aug 2007, 12:30 a.m.,  
in response to message #1 by Seth Morabito*

Sam Kim seemed very credible to me at HHC 2006. He has the old-line HP calculator nut credentials for one thing. And he just seems like an honest guy for another. Time has shown me that my judgment of him was correct - everything he said HP would do, HP has done with the 35S.

In that vein, I suggest that Sam's statements on the DVD that accompanies the 35S bear careful scrutiny. There, he promises that future HP calculators will all embody the things that users love about HP calculators. He gives the solid build quality and keyboard tactile feedback as examples. But he also says that HP will lead with new technology, and that their aim is to make calculators easier to use. I might have misgivings about that, but combined with the first statement, I think that means that the geeky old interfaces, such as RPN and RPL, will still be there. But so too will be some form of GUI or other interface abstraction on top.

All-in-all, I think we are in for some interesting times.

Regards,  
Howard

GUI on a calculator?? What would that accomplish?

### **Re: Some kind thoughts about HP's new direction**

*Message #20 Posted by [Howard Owen](#) on 5 Aug 2007, 12:51 a.m.,  
in response to message #19 by Ed Look*

I have two answers to that. First, why does the 48/49/50 series need a GUI? Second, check out the

nSpire.

I'm not saying that's ideal. And I did say "GUI or other interface abstraction." But my hope would be that HP, operating with an awareness of its traditions, would come up with something that would be genuinely useful. What exactly that might be, I can't say.

Regards  
Howard

GUI on a calculator...

Take the TI89 Titanium and the TI Voyager. They are basically the same thing apart from the Voyager having a QWERTY keyboard and larger display.

So I'd be interested in your opinions on when does a calculator stop being a calculator and start becoming a handheld computer?

And is the distinction very important?

### **Re: Some kind thoughts about HP's new direction [I'm going OT a bit]**

*Message #22 Posted by [Howard Owen](#) on 5 Aug 2007, 6:29 a.m.,  
in response to message #21 by Matt*

I think at least three things distinguish a calculator from a hand held computer.

1. Mathematical functions are primary on a calculator.
2. A calculator keyboard is designed for calculation first, rather than text first.
3. A calculator is designed to have long battery life.

I suppose that there are other differences that wouldn't fit into those categories. But I do think those are the main points. Items like the display differences come under the heading of low power consumption.

The distinctions could get blurry as technology advances. If battery technology improves significantly, we could see machines that were obviously calculators sporting displays like today's hand held computers. The keyboard issue can be dealt with creatively. The Hydrix project did that. And the new nSpire features a snap on keyboard in the low end model. You could go farther down those lines and provide a device that could be configured as a calculator or a computer. And the mathematical focus is really a software issue. Given flexible hardware, you could make the software just as flexible and appropriate for the current configuration.

Oh, yeah, calculators tend to be *cheaper* too. 8)

Regards,  
Howard

I have another distinction:

My calculators are permanent (assuming they don't break). I'm sure I won't be typing on this notebook computer in 3 years.

Quote:

"this is the best handheld calculator HP has sold in almost a decade."

I fully agree. Since the release of the HP48 series HP has only produced rubbish. That's the reason why the HP48 was my last HP scientific calculator. Now with the 35s HP is back again. I have only two complaints about this great calculator:

- Plastic quality. Below HP48's plastic case
- S/N not engraved (misaligned sticker)

Anyway, a step in the good direction.

Rubbish as far as physical quality goes, no argument there. That is unfortunately due to the realities of modern outsourced manufacturing. But let's not forget what they've managed to do with practically no staff. They were able to save the 48 line by creating the Saturn emulator running on modern hardware. And they saved the 32 line by porting it to modern hardware on the 33S. Those are pretty big accomplishments. Sure they had problems along the way and lost a lot of loyal customers. But at least now they seem to be listening to their users again, instead of moronic focus groups which likely resulted in the 33S styling, among other things. The current state of HP calculators is excellent again, finally.

This is due to the HP management decision to shut down the Corvallis group. Unbelievable how much expert knowledge of excellent calculator design vanished this way. Ok, maybe the calculator business wasn't that good at that time. But TI proved it is possible to survive even bad times by being innovative and discovering the educational market for consistent sales volumes.

I use a 33s and never really understood how purple or turquoise letters against a silver background could be a selling argument. It is simply a crime against good engineering practise.

Anyhow, the turnaround seems to be there and I hope for consistent better calculators.

Btw, in other forum threads everybody is talking about blister packaging. The HP35s comes in a good box, at least the edition for Spain and Portugal (and quite heavy due to the two user's guides, in Spanish and Portuguese). The calculator was inside a plastic bag. I hope that the 'American edition' that I have bought at Samson Cables also comes boxed.

Yes, unfortunately the American version comes encased in what can only be described as a brick of solid adamantium, impenetrable without the aid of a high-power laser cutting system or CNC milling machine. If you do attempt to open it with anything as mundane as a pair of household scissors, it deflects the attack and instigates countermeasures, defending itself with razor-sharp plastic shards designed to penetrate human skin like a hot knife through butter.

Message #31 Posted by [Bruce Bergman](#) on 7 Aug 2007, 2:02 p.m.,  
in response to message #29 by Seth Morabito

Aside from Seth's very accurate, and very funny :-), depiction of how tough the 35s plastic blister is (and yes, I DID get stabbed by a shard of that stuff; it HURTS!), there's one very big reason for the blister packaging: visibility.

Shoppers nowadays are used to seeing a product, and they won't even think twice about walking by a nicely closed box with a picture on it. The days of the old HP "christmas present" boxes are gone. It just wouldn't sell. They need to put the calculator on display, and the blister packs do that very very well.

thanks, bruce

*Message #32 Posted by [Ed Look](#) on 7 Aug 2007, 2:35 p.m.,  
in response to message #31 by Bruce Bergman*

Bruce, when I bought my HP-34C as a kid, the office electronic supply store (do such things still exist??) had one unit of every model they carried on display, with descriptions, etc., though the descriptions would have been enough for me. Any design beauty would be an extra goodie.

But I really wanted to concur about today's blister packaging. Yes, it may be very effective at thwarting many of our thieving Americans, but I too have been stabbed or cut by that very stiff material. There are those saw-like "cut-everything" scissors that'll safely cut that blister packaging material, more easily than a pair of normal scissors.

I miss my old 34C box; it fell apart many years later and my mother tossed it (along with my treasure horde of old comic books and baseball cards that would now have made me a multibillionaire... and my even more treasured cache of Science Times articles on the space shuttle). Now I have to protect my 32SII box (a much flimsier thing) from my wife! But the subsequent calculators came in blister packs and they, of course, get thrown out or recycled, depending on the material with which it was made.

My wife's dad threw away her Barbie collection after she went to college. She came back and found them all gone. As a collector for years, she estimates that the value (today) of those Barbie dolls at about \$30,000. Ugh. She can barely talk about it today. ;-)

The only good thing that came from that is that \*I\* am not going to throw away any of my kids stuff unless I check with them first! ;-)

thanks, bruce

### **Why the blister?**

*Message #36 Posted by **Don Shepherd** on 5 Aug 2007, 7:05 p.m.,  
in response to message #27 by Ivan Latorre*

Since the blister packaging, presumably, is to thwart dishonesty in the retail stores, but the 35s is (at least, currently) not being sold in retail stores, why the blister? I guess we can expect to see it on Walmart shelves eventually. But even the 33s never made it to the shelves of Office Depot or Staples, AFAIK.

### **Re: Some kind thoughts about HP's new direction**

*Message #37 Posted by **Jake Schwartz** on 6 Aug 2007, 10:33 p.m.,  
in response to message #26 by Frank Rottgardt*

Quote:

\_\_\_\_\_

This is due to the HP management decision to shut down the Corvallis group. Unbelievable how much expert knowledge of excellent calculator design vanished this way.

\_\_\_\_\_

For those who weren't there....in 1993 around the time HP48GX was being released, the Corvallis division was at a fork in the road with that facility producing both laptops (Omnibooks, if I remember correctly) and handhelds (both calculators and the LX palmtops). We were told at the time that senior management felt Corvallis should concentrate on just one of those two - and they chose laptops. As a result, handhelds went to Singapore, where they worked seemingly 99% of the time on palmtops and 1% on calculators. At the 1995 and 1996 conferences in Minneapolis and Anaheim respectively, the Singapore head of handhelds, Kheng Joo Khaw, basically indicated that palmtops were "where it's at" and calculators did not need to be emphasized at that time. We calculator supporters disagreed, of course. The only new unit of any significance was the release of the algebraic hp38G in '95. We also saw the DOS-based palmtops end with the 200LX and the beginning of the 300LX-and-onward Windows CE machines. It was a strange time.

We thought HP calcs were done until in 1997, the Australian ACO group was formed with Chris Wallin speaking at the HPCC British conference and promising us that things would return to a strong position again. Their early products (48G+, hp6S and 6S Solar, hp10BII in the new case and hp30S) were underwhelming, with the 6S and 30S representing the first time hp put their name on

machines which they essentially did not design. Finally, new development seemed to resurface with the hp49G in 1999. Although the case colors, keyboard and key arrangement were strange, the functionality was a nice step forward from the 48 series. I firmly believe that if the developers of the HP48 Metakernel software had not done their thing in 1997, the hp49G, 49G+ & 50G would not have been built, calcs would have faded into oblivion and the current San Diego group would not have formed to ultimately attempt a 35S and any return to HP's "roots". So, many thanks to Cyrille, Jean-Yves, Gerald and the gang :-)

**Re: Some kind thoughts about HP's new direction**

*Message #38 Posted by [Frank Rottgardt](#) on 7 Aug 2007, 1:44 p.m.,  
in response to message #37 by Jake Schwartz*

Hi Jake,

Quote:

So, many thanks to Cyrille, Jean-Yves, Gerald and the gang :-)

Thanks, even from my side. I guess it must be very hard to design a nice piece like the 35s seems to be (I don't have one - not yet) It's even harder if a project leader has to supervise a big part of his team from the opposite side of the pacific.

My main concerns with the recent HP-calcs are still the mechanical quality HP used to stand for. Good haptics is something important to me. There are things I daily use without paying great attention to them. Like my coffee machine or my razor.

But it happens even after years of use that I hold up in my work when using my old style 28s and think to myself for a second or two "nice craftsmanship, fun to look at and fun to use - always precise, always reliable"

It is this alround-package "unobtrusive design, excellent mechanic, software and 100%-reliability" which I still do miss.

But in the end I do understand that the golden calculator age is gone. Today there are simply too many alternative tools around. Palms, Pocket PCs, laptops ..... Hard to justify big investments for "only" an non graphing straight-forward RPN machine. From this perspective the 35s is really impressive.

But the greatest thing I respect HP for is to stick with RPN. Otherwise us guys needed to get used to AOS. Of course only those who are still more than 30 years away from retirement. Since that seems to be the "at least" lifespan of an HP calculator made in 1972.

**Re: Some kind thoughts about HP's new direction**

*Message #39 Posted by [Ed Look](#) on 7 Aug 2007, 2:24 p.m.,  
in response to message #38 by Frank Rottgardt*

Isn't your 28S algebraic? Do you prefer it over a RPN calculator?

**Re: Some kind thoughts about HP's new direction**

*Message #40 Posted by [Frank Rottgardt](#) on 8 Aug 2007, 9:28 a.m.,*

*in response to message #39 by Ed Look*

I used my 28s as RPN only. Can't cope with AOS. But lets face reality. The vast majority of people using calculators don't even know about RPN. So thats why I think it is so positive seeing HP still making calculators with an RPN-option at least.

Today my 28s is almost retired and I use it only sometimes at home. At work a 33s became my new work horse. Not perfect, but usable.

### **Re: Some kind thoughts about HP's new direction**

*Message #41 Posted by **James M. Prange (Michigan)** on 8 Aug 2007, 4:06 p.m.,  
in response to message #39 by Ed Look*

The 28C and 28S are UserRPL models. Like the 48 and 49 series, "algebraic objects" can be used, but the user interface and operating system are basically a variety of RPN. Unlike the 49 series, the 28 and 48 series do not have an ALG mode.

Internally, algebraic objects are composite objects with an RPN sequence, much like a program, but with a different prologue, additional syntax rules, and entered and displayed in algebraic syntax.

For example, where  $\sqrt{\quad}$  represents the square root symbol, the algebraic object:

```
'R=\sqrt{(3^2+4^2+12^2)'
```

is compiled to a composite with (internally) the RPN sequence:

```
'R' 3 2 ^ 4 2 ^ + 12 2 ^ + \sqrt/ =
```

Regards,  
James

### Looking for advice on financial calculators

Message #1 Posted by [Thomas Okken](#) on 4 Aug 2007, 9:20 p.m.

Hi all,

I'm thinking of buying a financial calculator. I have basically ignored financial planning for most of my life, living from day to day as they say, but I'd like to take control of these things a bit more, and being a geek, buying a new calculator seems a nice way to usher in this new era. ;-)

I'm inclined to get an HP-12C, being a fan of old-school HP calculators, but I'm also interested in hearing what others have to say about the relative merits of other models. I'd also be interested in financial packages for the HP-48G, or even for PCs.

Any thoughts would be greatly appreciated.

Thanks!

- Thomas

### Re: Looking for advice on financial calculators

Message #2 Posted by [allen](#) on 4 Aug 2007, 9:39 p.m.,

in response to message #1 by Thomas Okken

Get the 17bii. There are more functions than the 12c and can be both RPN or Alg. for those so inclined. While not programmable, the 17bii is a superior calculator. I personally like it better because:

- 1) The speed can't be beat
- 2) It can print to an IR printer
- 3) Interest rates are ANNUAL rates rather than periodic rates.
- 4) Cashflows are much easier to enter and manipulate
- 5) Two line display
- 6) much more memory
- 7) Closest financial calc to a 42s
- 8) much quieter keyboard (less colors and shift keys).

The last point will be refuted because the 17bii many submenus replaced the keyboard-accessible 12c features, but I would estimate most folks here don't use keyboard laden features of the double-shift models (12c, 32sii, 48gx) for every day calculations.

Quote:

\_\_\_\_\_

...financial packages for the HP-48G, or even for PCs...

\_\_\_\_\_

Forgot to mention.. the 48G has TVM (Time value of money) native under SOLVE -> TVM. That is by and large the only useful 'financial' feature for those outside banking/brokerage profession. All the other Bond Values, ROI, SOYD, percents, and depreciation ... are trivial formulae for engineers/computer scientists to remember, even if used infrequently. (Besides, if you need the latter features more than once a year you are into TAX planning, not Financial planning and no calculator will make that painless!!! GRIN!)

Regarding PC packages, MS Excel is also fully equipped with TVM features, that is if you can stomach the help files. The few that are not there can be added with a quick VBA SUB.

*Message #5 Posted by [Thomas Okken](#) on 4 Aug 2007, 10:04 p.m.,  
in response to message #2 by allen*

Allen, thanks for your detailed reply! One question, though: are you talking specifically about the 17bii, or also the 17bii+? I noticed the former seems to be pretty easily available still, and it has a higher rating on Amazon.com.

Being an HP-42S fan, I like the looks of the 17bii, but I would imagine the 17bii+ will be faster... Not sure that would be important, though...

(I also noticed that the picture of the 17bii+ on the Office Depot web site looks different from the one on HP's web site. The Office Depot version has a different color scheme and a double-width INPUT key. Strange! I wonder which one is newer?)

## 17bii: Perfect Pioneer -vs- 17bii+ " Golden Wart"

Message #6 Posted by [allen](#) on 4 Aug 2007, 10:21 p.m.,  
in response to message #5 by Thomas Okken

"The golden wart" That is what I call the 17bii+. AKA Cheap Chinese piece of excrement. I strongly recommend against getting one. Therein you will find repeats of the mistakes learned from the 10b to 10bii transition (including an awful keyboard).. This is a relic of the dark days of HP. I have nearly half-decade gap in my collection from that same period (49g, 17bii+, 10bII...) because I was not a fan or patron during that brief time due to poor QC.

I have no experience with the NEW, new design with the double width key.. some folks are going to get frustrated when trying to buy a NEW grey one when they end up with "the golden wart" instead.. HP should have just changed the model number. (This is worse than the Confusing Clamshell Controversy between 18B business consultant -> 19b business consultant II -> 19bii- Business consultant II)

Edited: 4 Aug 2007, 10:35 p.m.

## Re: 17bii: Perfect Pioneer -vs- 17bii+ " Golden Wart"

Message #7 Posted by [hugh steers](#) on 5 Aug 2007, 6:35 a.m.,  
in response to message #6 by allen

i would agree with all the 17bii reasons and the 17bii+ reasons. ie don't get a 17bii+ !

however, you might consider getting instead a 19bii. these can be had for a reasonable price in very good condition often with all the manuals. i always thought the 19 was a bit silly until i got one, after that i found out how cool it is. you have to be a bit of a fan of the clamshell style though:

case for the 19:

- not silly priced
- clearer screen (the 17bii screen can be a bit faint)
- 4 lines of display
- scientific functions
- +/-e499 exponents.
- alpha keyboard= much easier to program
- more memory
- able to really use the solver
- suave :-)

## Re: 17bii: Perfect Pioneer -vs- 17bii+ " Golden Wart"

Message #8 Posted by [Allen](#) on 5 Aug 2007, 8:33 a.m.,  
in response to message #7 by hugh steers

You are right on these three regarding the pros of the 19bii

- \* 4 lines of display
- \* scientific functions
- \* alpha keyboard= much easier to program

But the other points..

Quote:

---

not silly priced

a 19bii in in similar condition and sold in a similar manner sells for at least twice a 17bii

Quote:

clearer screen (the 17bii screen can be a bit faint)

This is often a contrast issue and can be adjusted on both models by pressing the [ON] key and either [+] or [-]. Since they are both LCD, it is not possible to have true contrast were 1= BLACK and 0= CLEAR. There can also be significant screen variations between two calculators of the same make and model.

Quote:

+/-e499 exponents.

The 17bii has the same exponent range. Generally not applicable for financial functions or MOST Terran science.

Quote:

[19bii has] more memory

17bii has 6750 "bytes" (manual p. 216) slightly MORE than the 19bii 6600 "bytes" (manual p. 37)

in response to message #8 by Allen*

hi allen,

thanks for your corrections. i hadnt realised the 19 has actually less memory than the 17. also, i had a feeling that the +/-499 was the same in the 17, but this is really part of the whole 17/19 argument over a different model.

there is the point about the size, although i find the 19 nicer to use, the 17 is slimmer and will carry much easier in a pocket. so this could be an issue.

i have a suggestion for thomas:

why not add financial functions to free42 to be accessed like they might have been had they really been available on a 42s? this could be free42sii. ok, a bit silly but could be quite cool.

TVM and CF would be a doddle, i even have debugged versions of these that pass all the borderline cases - well almost, that i'd be happy to supply.

anybody care to comment on where they might go on the 42s?

---

Apart from the laziness factor -- erm, I mean, being too busy -- the whole thought of adding functionality to Free42 makes me a bit uneasy... I like that it is an accurate simulation of the HP-42S, and any additions would take away from that accuracy some way or another.

Having said that, there is at least one [extended version of Free42](#) out there, with special functionality for surveyors added. (I'm not affiliated with Underhill and only found out about their version of Free42 by accident. :- )

---

Maybe at some point in the future, it would be nice to do that, or to create **Free17** -- but it's a \*lot\* of work, so don't hold your breath... I think a set of user programs for the 42S or 48G would be a good compromise.

*Message #11 Posted by **Kevin Kitts** on 6 Aug 2007, 2:34 p.m.,  
in response to message #10 by Thomas Okken*

I once tried to run the the HP-41 "Financial Decisions" Pac on Free42. It is close to working - there were some prompts or something that were not quite right.

If some of the HP-41 Pacs could be updated to work flawlessly on Free42 that would be neat. And it would not have to change Free42 at all. I realize that there are some HP41 microcode stuff that could probably not ever be ported. But pacs that were just keystrokes like the Financial Decisions, Real Estate, etc probably could, right?

### **Re: Financial functions for Free42**

*Message #12 Posted by **Thomas Okken** on 6 Aug 2007, 9:24 p.m.,  
in response to message #11 by Kevin Kitts*

The HP-41 Finance Pac contains only user code, and it doesn't use any functions that the HP-42S doesn't have, so it should work on the HP-42S and Free42; there could be problems but those would probably be caused by well-known differences between the HP-41 and 42S -- 12-digit mantissas instead of 10-digit; 44-character ALPHA register instead of 24-character, etc.

Since The Other Site has the Finance Pac, and the MoHPC CD/DVD set has the manual, I guess that means I have a nice collection of financial software at my disposal right away. :-)

The HP-41 Real Estate Pac seems to contain two machine code functions, called START and CLK (only one of which, START, is called from the Pac's user code). In order to use that pac on the HP-42S (or Free42 or Emu42), one would have to figure out what those functions do; it shouldn't be too hard to implement user code replacements for the 42.

Most of the HP-41 ROMs published by Hewlett-Packard are mostly or entirely user code (the Advantage Pac being the major exception), so they could be converted pretty easily to work on the HP-42S (or on an HP-42S emulator/simulator).

### **Re: Financial functions for Free42**

*Message #13 Posted by [Les Wright](#) on 7 Aug 2007, 4:04 p.m.,  
in response to message #12 by Thomas Okken*

Thomas, at one point I converted some of Finance Pac to a RAW file for use on Free42. Works pretty well with some tweaking. The conversion routine I use is get the MODule file from TOS or with the emulator from that site, convert it to a ROM file with your rom2raw utility, then import it into Free42 and clean it up there. At that point I like to split off various routines into separate RAW files since they are converted correctly by hp41uc. I have discovered that if I try to convert to TXT a RAW file that has one or more internal ENDS, hp41uc will stop converting after the first END it sees.

Using this approach, I have been able to extract and use favourite routines from the Math Pac and PPC ROM, among others. In fact, I prefer the PPC ROM IG routine to the built in Free42 integrator--it is as fast, and produces interim results. I have also lifted the Runge-Kutta DIFEQ routine, though JM Baillard has written routines that are better. And, for the heck of it, the 566 steps of the Math Pac MATRIX routines convert and work fine, even though the intrinsic matrix capability of Free42 is so much more intuitive to use.

In short, the conversions can be done, but as you know they clutter the heck out of the menu.

I believe there is a Finance.raw file on your own website that seems to reproduce a lot of the behaviour of the 17bii. Have you tried it?

Les

I would also add that the 17bii is smaller and the battery door is not as prone to breaking/falling off as the 19bii.

But, you have me thinking, though about the trig functions.. That may be worth it simply because you don't have to carry TWO calculators if you are figuring Mortgages and triangles in the same meeting. Well in that case, I would take a 48GX anyway and hope we don't get into SOYD. GRIN!

I'm curious. Since several of you feel strongly that the 17bii is better than the 17bii+, I'd like to see a few reasons why. Don and I have talked about this offline, but other than the solver being a bit more "in spec" on the 17bii, I haven't seen many compelling reasons to get the original versus the much more widely available remake.

So, tell me why!

thanks, bruce

in response to message #1 by Thomas Okken*

Thomas, if you are considering programming the calculator you get, then by all means, get a 17bii, not the plus. The solver is programmable and you can really do a lot with it. See my article 712 under articles.

By the way, in all the timing tests I have done between the two, the bii is much faster!

### **Re: Looking for advice on financial calculators**

*Message #20 Posted by [Thomas Radtke](#) on 5 Aug 2007, 5:28 a.m.,  
in response to message #1 by Thomas Okken*

Hi Thomas,

I can recommend three models that do the job and are quite cheap to have: 18C, 19B (both algebraic) and 95LX.

I've started to do my financial stuff on the 18C and, although I later got the other models, too, stick to it.

I find the solver essential since all these models are targeted to the US market, ignoring simple interest between interest compoundings. A short solver calculation before TVM compensates for this omission.

LG,

Thomas

*Message #21 Posted by [bink](#) on 5 Aug 2007, 6:54 a.m.,  
in response to message #20 by Thomas Radtke*

I recommend the 12C because it has direct access to functions (rather than the 17B sub menus).

Even when the 17 and 19 series were around, I always saw finance people using the 12C.

Regarding annual/periodic rates, this is easily done on the 12C - I always think in terms of rate per period anyway.

### **Re: Looking for advice on financial calculators**

*Message #22 Posted by [Thomas Radtke](#) on 5 Aug 2007, 7:09 a.m.,  
in response to message #21 by bink*

TVM5 is simply not capable to recognize simple interest for fractions of a compounding cycle. Of course, you could just program the various formulas to calculate the effective payment (in contrast to the effective interest), but it is easier to do so with the solver.

But I have to admit, I do not own a Voyager at all ;-).

YOU may, but have you EVER walked into a bank and seen a sign for 0.6875 %/month home loan?

### **Re: Looking for advice on financial calculators**

*Message #24 Posted by **bink** on 7 Aug 2007, 6:18 p.m.,  
in response to message #23 by **Allen***

Allen,

The 12C has shifted functions on n (g n multiplies the number of periods by 12 and stores in n) and i (g i divides the rate by 12 and stores in i) which allow for easy calculations of any rates which compound monthly (such as mortgages, or which you used in your example).

So even, if you don't think in terms of monthly (or whatever periodic) rates rather than annual, it is an easy conversion.

The advantage of thinking in terms of periodic rates (if you are a professional user, or even want to really understand TVM calculations) are that it makes conversions easier and more intuitive. e.g. converting a quoted bond rate to an annualized equivalent, or vice versa.

Professional bodies (such as the CFA Institute, which provides the Chartered Financial Analyst) designation allows the use of the 12C (or TI Business Analyst) in exams, but not the 17B. Maybe this is why I see finance professionals using the 12C.

Note also that Microsoft Excel uses the rate per period in its TVM calculations.

Thinking in terms of rate per period is the norm in professional usage. One reason financial institutions adopt various compounding conventions is to obfuscate the true rate for uninformed consumers.

My thought is if you are doing financial planning, get MS money or Quicken. Calculator nice, but these software packages much better in planning and what if scenario.

### **Re: Looking for advice on financial calculators**

*Message #26 Posted by **Jeff Kearns** on 5 Aug 2007, 11:28 a.m.,  
in response to message #25 by **Vincze***

Hi Thomas,

The real question is: What do need the calculator to do for you exactly? There is no shortage of excellent advice on this forum and everyone has a valid opinion but what really matters is your requirement. This

last post makes a lot of sense - buy Quicken!! I have been using it for a decade and find it very useful for managing investments, creating what-if scenarios for debt repayment and managing day-to-day finances. Also, you may wish to buy the book: "Smoke and Mirrors" to help you determine your retirement needs and cut through the crap. What you need is a sound plan - and a good calculator never hurts...

If all you need is the ability to calculate mortgage/loan payments, Future Value of money invested at a particularly interest rate for some period of time with or without period payments, and the power to determine what interest rate would be required to achieve a particular financial goal; then any HP non-financial calculator with a Time Value of Money (TVM) implementation or even a program/equation of the TVM formula may suit your needs. I use the HP-41C Advantage Pac TVM implementation, the HP-50g Finance feature, and the TVM formula itself in the 15C, 32sii and 33s (these last three are a little less accurate due to a rounding error that can be significant for very large N and small PMT). A good way to remember the five variables (N, I, B, P, F) in the TMV equation is "No Interest Before Payment of Funds". Good Luck!

## **Re: Looking for advice on financial calculators**

Message #27 Posted by **Peter A. Gebhardt** on 5 Aug 2007, 11:56 a.m.,  
in response to message #1 by Thomas Okken

Thomas,

Once struggling with the 17bII+, I'm now a proud owner of several 200LX's (hopefully lasting longer than my median remaining lifetime ;-)

What made me stay away from the 17b/17bII and 19b/19bII calculators, was their tendency to loose hours of work of stored programs, due to battery change (first experienced with the 17bII+).

If size/weight constraints don't exist and you fear loosing your calc's memory (or keeping it ON inadvertently, because of the lack of a secured ON switch), then you should look at the auction sites.

There you usually will find a 200LX in good used condition!

You will receive a lot of addtl. benefits - especially an Organizer, that keeps powered up longer than any other comparable PocketPC I know about.

Best regards

Peter A. Gebhardt

PS: (Aug 9th, 2007, 11:42 GMT+1)

At least for the pouch shipped with the 17bII+ there seems to be a feasible solution to "stiffen" the bottom edge of the pouch. By using a ca. 1/3 inch (somewhat more than 1 cm) thin, bendable metal sheet (U-shaped) placed into the bottom of the pouch and covered with a layer of scratch-avoiding clothing, one could minimize the chance of switching the calculator on inadvertently (say by placing a book on top of the pouch enclosing the calculator).

## **Re: Looking for advice on financial calculators**

Message #28 Posted by **JDonley** on 5 Aug 2007, 7:59 p.m.,  
in response to message #27 by Peter A. Gebhardt

I have the 19B11 and use it for serious financial work and solved the battery door problem with a small

piece of electrical tape. Door has never come off since then and the tape is hardly noticeable. I also have a 17B11, but rarely use it. The 10B (discontinued) is a very good cheap financial calculator and is available on EB.. at reasonable prices.

The Aurora FN1000 is a 12C emulator and has the advantage of being in a clamshell case. It has been discontinued but available still for about \$25 at several online stores. I have carried one in my shirt pocket every day since last October and have not managed to destroy it yet. Mushy keys and o.k. documentation.

If I had to have only one financial calculator it would be the 19B11. It is the Lexus of financial calcs....but do yourself a favor and buy an FN1000 also. I think you will be impressed.

Don

### Comparison of HP41C features to HP35s

Message #1 Posted by [Abq Steve](#) on 4 Aug 2007, 3:53 p.m.

The last calc I bought was an HP41C. At the time, I figured it was about the best HP made, and I now have 4 of them on my various desks and work stations. I still think it's a great calc, but being that I can sell the CX and CV models and all of my attachments for a lot of money on ebay, I'm thinking about buying a couple of relatively cheaper 35s models and spending the leftover money on beer. Before I do that, though, I wonder if you who are experienced with the 35s can answer a couple of questions. I've looked through the archives and don't think these have been asked before.

1) With the HP41C, whenever you press most non-numeric keys, their function is displayed on the screen. If you see that you have pressed the wrong key, you can continue to press it for about 1/2 second, until the word 'NULL' will be displayed and the keystroke will not take effect. This is especially useful for user-defined keys that don't have the function printed on them. Does the HP35s have this feature?

2) And speaking of user defined keys, does the 35s allow you to assign programs or functions to keys?

I'm sure the manual would tell me these things, but HP doesn't appear to have the full manual available for download at their site.

Thanks for your replies.

1) NO 2) NO

I wouldnt sell your HP41s.

### Re: Comparison of HP41C features to HP35s

Message #3 Posted by [Egan Ford](#) on 4 Aug 2007, 5:12 p.m.,  
in response to message #1 by [Abq Steve](#)

1. No

2. No

Add to that no I/O and no expandability. However, its dirt cheap (relative to 41C), replaceable, faster, and for many *good enough*.

IMHO, 41CX + Advantage + HP-IL >> 35s. So, I'd keep at least one around just in case.

### Re: Comparison of HP41C features to HP35s

*Message #6 Posted by [Dave](#) on 4 Aug 2007, 6:46 p.m.,  
in response to message #5 by Namir*

You're comparing apples and oranges. The 50g is the ultimate successor to the 41. If you want a full featured programmable, save your beer money (or sell one of your 41's) and get a 50g. If you only want a basic calc similar to a 15C, keep your 35S. And to be fair, the 33S had function preview but it was removed from the 35S apparently due to complaints.

### **Re: Comparison of HP41C features to HP35s**

*Message #7 Posted by [Dave Boyd](#) on 6 Aug 2007, 4:28 p.m.,  
in response to message #6 by Dave*

You compare the 35S to the 15C. I think a better comparison would be to the 11C. The 15C was easily the most function-rich non-expandable calc HP made when it was introduced, the high end of that market niche; the 11C was the middle.

The 35S is likewise the middle of the scientific programmable segment. It compares favorably to the 11C, not so favorably to the 15C, which still has features it lacks.

This prompts the question, what is the high-end scientific? HP doesn't currently sell one, and there probably isn't sufficient market for it, but recent developments like the 35S give me some hope.

I'll echo the wishes of some other posters, and wish for a HP-43S, and maybe also a HP-15C Platinum... or a combination of the two...

It's only too bad that we'll never see big, fat, bold numerals like the Voyagers had. The 12C Platinum stepped away from them, and I somewhat doubt that any new calc will step back toward them...

### **Re: Comparison of HP41C features to HP35s**

*Message #8 Posted by [Dave](#) on 6 Aug 2007, 5:05 p.m.,  
in response to message #7 by Dave Boyd*

Comparing it to a 15C does give the 35S a bit too much credit, but it does have quite a few more advanced features than the 11C such as solve, integrate and complex (although limited). AFAIK, it only lacks matrices and more complete complex support compared to the 15C (granted that's a very big difference). And it has several features the 15C lacks, like more memory, bases, unit conversions, constants, menus, fractions, algebraics, etc. I too would rather see something equal to a 42 or 15, but at least it's a step in the right direction, which we haven't seen in a long time. And I'm

very happy to see the 15C style keys and colors return.

### **Re: Comparison of HP41C features to HP35s**

*Message #9 Posted by **Walter B** on 6 Aug 2007, 5:32 p.m.,  
in response to message #7 by Dave Boyd*

Quote:

We won't see them again, because we want \*alphanumeric\* displays. And the easiest (and cheapest) way to get these nowadays are dot matrix LCDs, which have improved a lot since the time of the 42S.

### **Re: Comparison of HP41C features to HP35s**

*Message #10 Posted by **Donald Williams** on 4 Aug 2007, 7:36 p.m.,  
in response to message #1 by Abq Steve*

It's only \$60.00, so I would call it a cheap experiment. Try it for yourself. I am also an avid HP 41 user, so I can predict the outcome. You will sell the HP35s long before you sell your HP 41.

I bought 2 HP 35s. One for the collection and an extra for personal use. One is still in the collection. The other one I have already given away to a co-worker.

I also have all the 48, 49, and 50 series calcs. The "logical"? successors to the HP 41. Compared to the HP 41 they have the user friendliness of a sabre toothed tiger.

*Edited: 4 Aug 2007, 7:47 p.m.*

### **Re: Comparison of HP41C features to HP35s**

*Message #11 Posted by **Dave** on 4 Aug 2007, 10:56 p.m.,  
in response to message #10 by Donald Williams*

As for user friendliness, I have the opposite view. Having learned the 48 before the 41, the 48 is much easier for me. As for successor, between the 50g and 35S, the 50g is the only one that has anywhere near the capabilities of the 41. Also since the original poster wants user defined keys, the 50g is the only way to go. However, I don't dispute that the programming environment of the 35S is obviously much closer to the 41. The 48/50 is a totally different paradigm. I too love the classic 41, but it is unfortunately the sable toothed tiger here - they are both extinct.

## **Re: Comparison of HP41C features to HP35s**

*Message #13 Posted by [Abq Steve](#) on 5 Aug 2007, 1:03 p.m.,  
in response to message #1 by Abq Steve*

OK, it appears to be almost unanimous- I will remain sober and hang on to my HP41C's. I must admit that the magic number 35 had influenced me, because I was a very early buyer of the original 35 'red dot' model, complete with bad firmware.

I should have mentioned earlier that I don't require advanced programming ability any more. There are a few short routines that I use, such as the calculation of parallel resistances and other simple electronics formulas, but I no longer have a need for much of the power of the 41, so I thought I could live without it. Still, I would hate to give up those previously mentioned features that I have come to appreciate.

I suppose I'll eventually buy a 35s, but I'll hang on to the 41's for at least a few more years.

Thanks for everyone's input.

Steve

**difference between TI-Nspire and TI-Nspire CAS**

Message #1 Posted by [Don Shepherd](#) on 4 Aug 2007, 12:23 p.m.

The CAS version of this calc does these additional things:

- solves systems of equations
- does derivatives and integrals
- more complex number functions
- expands expressions
- solves expressions, returns all roots
- factors expressions and large integers
- finds the max and min for a function over a specified interval
- find zeroes for a function

It may do more. This is from a cursory comparison of the reference guides for the two products.

**Re: difference between TI-Nspire and TI-Nspire CAS**

Message #2 Posted by [Namir](#) on 4 Aug 2007, 1:24 p.m.,  
in response to message #1 by [Don Shepherd](#)

Don,

Thanks for the list. You gave me several good reasons to only buy the CAS version.

Namir

Message #3 Posted by [Don Shepherd](#) on 4 Aug 2007, 2:43 p.m.,  
in response to message #2 by [Namir](#)

You're welcome, Namir.

If you don't care about TI-84+ compatibility, there is no reason to buy the nSpire non-CAS.

**Re: difference between TI-Nspire and TI-Nspire CAS**

Message #4 Posted by [Namir](#) on 4 Aug 2007, 2:52 p.m.,  
in response to message #3 by [Don Shepherd](#)

Don,

I thought the non-CAS TI-nspire did not do symbolic amth, but did solve systems of linear equations, find zeros of functions, and find minima/maxima of functions. I feel it's quite the scaled down version. Sure it has the cool interface but ...

I found out today that the tables have spreadsheet-like features where you can calculate the value of a cell using values from other cells. And then, you can copy and paste that equation onto cells below. the TI-nspire will adjust cell references ... in a manner similar to Excel.

I have also realized that it's worth it to read through the manual and learn details about operating the calculator.

Namir

*Edited: 4 Aug 2007, 2:54 p.m.*

## **Re: difference between TI-Nspire and TI-Nspire CAS**

*Message #5 Posted by [Don Shepherd](#) on 4 Aug 2007, 6:55 p.m.,  
in response to message #4 by Namir*

Namir, the non-CAS version does not solve systems of equations like the CAS version does. The non-CAS version does have the RREF function, so I guess that could be used to solve a system of equations if you translate the coefficients to the matrix. But the CAS version has specific templates for solving systems of equations. I have not used them (don't have the CAS version yet), but I would imagine you just type your equations in as-is and tell it to find the values of your variables.

To find zeroes of a function, or maxima or minima, on the non-CAS version I think you have to graph the equation on the geometry screen and then observe where the function crosses the x-axis (for zeroes), and for maxima and minima you do a Trace near that point on the graph and when you hit the maximum point on the curve a M is displayed next to the graph, and when you hit the minimum point a lower-case m is displayed (there are no CALC...MAX...MIN functions like on the TI-83 series, unfortunately). On the CAS version, there are specific functions for fmin, fmax, and zeroes, and I imagine you don't even need the graph for those, you just type in the equation and specify an interval and it gives you the answer.

You are right, the spreadsheet function is nicely integrated into the rest of the system, even to the point that it will populate a column with values while you drag part of a graph, then use the generated values in the column for a separate scatter-plot. Very nicely done.

I'm going to get the CAS version when it is available. At the conference I went to last month they estimated October availability for the CAS version, although it seems some companies are offering it now.

### **correction to last post**

*Message #6 Posted by [Don Shepherd](#) on 4 Aug 2007, 8:01 p.m.,  
in response to message #5 by Don Shepherd*

Namir, you don't do the Trace function (on the non-CAS version) to find zeroes, minima, and maxima. You create a point on the curve (point on function), drag it along the curve and when it gets to the maximum, minimum, or zero point, a M, m, or Z appears (correspondingly). Kind of funky, but it works. Personally, I'll use the real functions of the CAS version instead of monkeying around dragging points on a graph.

### **Link to order the TI-Nspire**

*Message #7 Posted by [Namir](#) on 5 Aug 2007, 12:44 a.m.,  
in response to message #5 by Don Shepherd*

Don,

Thanks for the clarification of the non-CAS version. I like to have functions that work on teh CAS. I did play with the fmin and nSolve functions.

Try [this link](#) to order a TI-nspire (both versions and their software).

Namir

*Edited: 5 Aug 2007, 12:45 a.m.*

**Re: Link to order the TI-Nspire**

*Message #8 Posted by [Don Shepherd](#) on 5 Aug 2007, 7:41 a.m.,  
in response to message #7 by Namir*

Thanks Namir. I see the cost is \$217 for the CAS handheld and the Windows software, and \$137 for just the handheld. At the conference I attended, sponsored by TI, each attendee got a non-CAS handheld and Windows software, free. I would definitely want the Windows software because it is much easier to develop \*apps\* for these calcs using the PC and mouse, and download to the unit.

I wrote the regional TI rep about getting the CAS version from TI, as a teacher. We'll see.

### Question about SOLVE on hp 35s

Message #1 Posted by [Matt](#) on 4 Aug 2007, 7:30 a.m.

Using EQN, I have entered two equations:-

$(X+2)*(X-2)$

and

$X^2-4$

Next, I input

```
3 STO X
EQN (then 'select' (X+2)*(X-2))
SOLVE X
And the output is X=2.0000
```

I repeat the process with  $X^2-4$  and get the same result.

Now, I input

```
-3 STO X
and repeat the above steps.
For (X+2)*(X-2) I get the result X=-2.0000 as expected.
But for  $X^2-4$  I get X=2.0000.
I cannot seem to obtain X=-2.0000 as a root of  $X^2-4$ .
```

Why is this?

### Re: Question about SOLVE on hp 35s

Message #2 Posted by [Antonio Maschio \(Italy\)](#) on 4 Aug 2007, 7:36 a.m.,  
in response to message #1 by Matt

Same behavior of the HP-33s.

Look in the Forum.

in response to message #2 by Antonio Maschio (Italy)

Thanks.  
I never had a 33 so I wasn't aware of the behaviour.

### Re: Question about SOLVE on hp 35s

Message #4 Posted by [Gene Wright](#) on 4 Aug 2007, 9:35 a.m.,  
in response to message #3 by Matt

See example 2 in the 35s learning module "Formula solver part 2" found here:

[Link](#)

When a variable shows up only once in an equation such as  $X^2-4=0$ , the solver finds a direct solution if possible and ignores any user supplied guesses. That's a carryover from the 33s.

Example 2 suggests the workaround.

### Re: Question about SOLVE on hp 35s

Message #5 Posted by [Sondre K. Selnes](#) on 4 Aug 2007, 9:20 a.m.,  
in response to message #1 by Matt

Tried your equation / SOLVE at HP-15C, which gives  $X= 2.0000$  and  $X= -2.0000$ .

Maybe the correct answer of HP35s is found in another register...

Edited: 4 Aug 2007, 10:21 a.m.

### Re: Question about SOLVE on hp 35s

Message #6 Posted by [Karl Schneider](#) on 4 Aug 2007, 12:53 p.m.,  
in response to message #1 by Matt

Matt --

Here's the link to the thread in the Forum Archives:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62665#62665>

The link is my proposed solution (obviously not adopted); scroll to the top to find a very similar discussion for the HP-33S.

It turns out that the "direct solution" logioc seems to have been lifted from the HP-17B/HP-27S from 1988; I didn't know that at the time.

### Re: Question about SOLVE on hp 35s

Message #7 Posted by [Gene Wright](#) on 4 Aug 2007, 1:02 p.m.,  
in response to message #6 by Karl Schneider

And, again, I am still sorry for the shortness of that title back then in my response to you. :-)

This "direct solve" approach is considered a feature. You don't take features away...anyone knows that. :-)

Short answer: if you have a polynomial that is missing a term, add the term with a 0 coefficient.

$X^2-4=0$  would be entered as  $x^2+0x-4=0$ .

Then the solver will not try a direct solution. That is the way it is.

## **Re: Question about SOLVE on hp 35s**

### HP 35s -> MILE / -> KM key

Message #1 Posted by [Stefan Vorkoetter](#) on 3 Aug 2007, 1:40 p.m.

I was just looking at the photos of the HP 35s in HP's brochure. Being a stickler for details, I immediately noticed that the "5" key, which has mile and km conversions on it, spelled "km" as "KM" (i.e. in capitals). Did they really do that, or is the calc in the brochure a mockup, and they fixed this blunder on the real thing?

### Re: HP 35s -> MILE / -> KM key

Message #2 Posted by [Matt](#) on 3 Aug 2007, 2:36 p.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

On my 35S...  
5 has MILE above and KM below.  
Maybe this is the mysterious 'cosmetic defect'!

### Re: HP 35s -> MILE / -> KM key

Message #3 Posted by [bill platt](#) on 3 Aug 2007, 2:36 p.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

It's Like That, and That's the \*Way\* it Is, huh!"

### Re: HP 35s -> MILE / -> KM key

Message #4 Posted by [Vincze](#) on 3 Aug 2007, 3:15 p.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

Quote:

"km" as "KM" (i.e. in capitals).

Good observation. Maybe that mean Kelvin Megabytes. Thats a new one to me. Interesting, that one mile equal 1.6093 Kelvin Megabytes. Im not even sure how one would interpret that. The temperature of one megabyte when traveling one mile is what it must be. See HP on cutting edge of new unit of measurement. :) Wonder if I need to put a degree symbol on it? :~)

### Re: HP 35s -> MILE / -> KM key

Message #5 Posted by [Etienne Victoria](#) on 4 Aug 2007, 6:51 a.m.,  
in response to message #1 by [Stefan Vorkoetter](#)

They marked it this way to avoid confusion with km being kilomole of course :-)

the mole is just another IS unit.

Cheers

Etienne

**Re: HP 35s -> MILE / -> KM key**

*Message #6 Posted by **Walter B** on 4 Aug 2007, 7:50 a.m.,  
in response to message #5 by Etienne Victoria*

Bonjour Etienne,

you wrote:

Quote:

the mole is just another IS unit.

I'm a bit confused by your statement. Did you mean SI? I thought a mole equals the atomic weight in g, so it would be just a pure number, not a unit. Or did you refer to the mere ontological existence ("IS") of the little, cute, furry animal digging under your lawn? In the latter case, you may need (estimated) 200 moles for 1 kg, i.e. 1 Kilo mole (as people would say here -- ou en francais: 1 kilo de ...) :-)

**Re: HP 35s -> MILE / -> KM key**

*Message #7 Posted by **Etienne Victoria** on 4 Aug 2007, 2:18 p.m.,  
in response to message #6 by Walter B*

Hello Walter,

Yes I meant SI, sorry.

And mole must be a quantity of matter (and I think it is a SI unit since 1972) because I have no garden & therefore no lawn ;-))

Cheers

Etienne

**Re: HP 35s -> MILE / -> KM key**

*Message #8 Posted by **Ed Look** on 4 Aug 2007, 8:07 p.m.,  
in response to message #7 by Etienne Victoria*

No, gentlemen: a mole, all jokes aside, is a number of objects, an Avogadro's number of objects, which, according to my HP-35s constants library is  $6.02214199 \times 10^{23}$  objects.

So if you take one group of this many objects and use it as a standard, then it could be considered a unit, just like twelve of anything is a dozen... or thirteen in bakeries... the good ones, anyway.

**Re: HP 35s -> MILE / -> KM key**

*Message #9 Posted by **Walter B** on 4 Aug 2007, 11:44 p.m.,  
in response to message #8 by Ed Look*

Yes, gentleman: as stated above

Quote:

I thought a mole ... would be just a pure number

Thanks for the confirmation.

**Re: HP 35s -> MILE / -> KM key**

*Message #10 Posted by [Etienne Victoria](#) on 5 Aug 2007, 4:56 a.m.,  
in response to message #8 by Ed Look*

Yes gentlemen,

I know very well it's the equivalent of a number but it is used as a SI unit along with the candela, km... [as explained here](#).

Many thanks for your answers and cheers.

Etienne

### HP 35s display misalignment?

Message #1 Posted by [Matt](#) on 3 Aug 2007, 12:56 p.m.

[Take a look](#)

Tilted?

(I know the actual scan is tilted. My apologies).

(Sorry about the last scan)

[This should be better](#)

There is a very tiny tilt (as some of you have noticed). But it is not bad at all. In fact, in normal use I just don't see it unless I look for it. I'm hoping that someone with a very noticeable tilt could post a scan of theirs. Then we could compare.

*Edited: 3 Aug 2007, 2:00 p.m. after one or more responses were posted*

### Re: HP 35s display misalignment?

Message #2 Posted by [Gene Wright](#) on 3 Aug 2007, 1:08 p.m.,  
in response to message #1 by Matt

The display shows no noticeable tilt to me.

Of course, the entire calculator appears tilted! :-)

Seriously, I'd like to see a scan/picture of a real 35s that has what its owner considers a bad tilt.

### Re: HP 35s display misalignment?

Message #3 Posted by [Steve Leibson](#) on 3 Aug 2007, 1:24 p.m.,  
in response to message #2 by Gene Wright

From what I can see, the top row of words in the display is clearly disappearing under the bezel as you move from left to right.

### Re: HP 35s display misalignment?

Message #4 Posted by [Ed Look](#) on 3 Aug 2007, 1:53 p.m.,  
in response to message #3 by Steve Leibson

Steve, you are right, but the tilt is ever so slight, and on mine, it's ever so slightly more than that, but I think this amount of misalignment is really nothing to quibble about...

... not that I think you are quibbling here... just shooting my mouth off again...

### Re: HP 35s display misalignment?

*Message #5 Posted by [Gene Wright](#) on 3 Aug 2007, 1:55 p.m.,  
in response to message #4 by Ed Look*

Perhaps, but I can't imagine this is going to cause any **\*\*real\*\*** grief (just my opinion here).

It is SO slight that it wouldn't cause me a second thought.

Certainly, it isn't a 5 degree angle or anything. :-)

### **Re: HP 35s display misalignment?**

*Message #6 Posted by [Chris Haltiner](#) on 3 Aug 2007, 2:14 p.m.,  
in response to message #5 by Gene Wright*

The display on mine was off by a full pixel and easily noticed by a coworker who also has a 35s. If the misalignment had been like this one, I would have not bothered to disassemble and realign my unit.

### **Re: HP 35s display misalignment?**

*Message #7 Posted by [Greg Whitfield](#) on 3 Aug 2007, 5:10 p.m.,  
in response to message #5 by Gene Wright*

I only noticed the misalignment on my HP 35s because the self-test was the first thing I did on the unit after I noticed that it defaulted to RPN mode. I was staring intently at the display when it had all of the annunciators showing and spotted it. It wasn't very bad or anything I was going to contact HP about. I probably wouldn't have noticed it otherwise.

Gene said:

Quote:

Perhaps, but I can't imagine this is going to cause any **\*\*real\*\*** grief (just my opinion here).

I haven't yet read what cosmetic defect caused HP to halt HP 35s shipments. If it was some sort of display misalignment, it must be much worse than what mine has. The fact is that something caused HP employees some **\*\*real\*\*** grief in order to make that decision. I'm sure it's not the display reflectivity (since someone has stated that this is identical to that of the HP 33s) or the serial number stickers.

### **Re: HP 35s display misalignment?**

*Message #8 Posted by [Ivan Latorre](#) on 4 Aug 2007, 8:19 a.m.,  
in response to message #7 by Greg Whitfield*

The annunciators are too close to the window edge. Just compare with the hp33s [here](#).

Probably that's the reason why HP is withdrawing the calculator. I don't know if that can be called 'misalignment', the LCD is aligned but the digits are very close to the upper window edge while there's plenty of space between them and the lower window edge.

HP 35s display misalignment?

### **Inverting Matrix by Row Transformation for HP 35s/33s?**

Message #1 Posted by [Howard Boardman](#) on 3 Aug 2007, 12:39 p.m.

Since these calculators can't handle matrices, has there been any programs written to speed up the process? Perhaps a program that will transform a row when entered into the calculator? Thanks

### **Re: Inverting Matrix by Row Transformation for HP 35s/33s?**

Message #2 Posted by [bill platt](#) on 3 Aug 2007, 1:51 p.m.,  
in response to message #1 by Howard Boardman

If you can do it by hand, you can write a program to do it. Simple as that--make the computer remember the steps, that's all.

### **Re: Inverting Matrix by Row Transformation for HP 35s/33s?**

Message #3 Posted by [Howard Boardman](#) on 3 Aug 2007, 3:33 p.m.,  
in response to message #2 by bill platt

Thanks for the "obvious" answer. Just wondered if it had been done before. Perhaps I should have asked if there is other known software archives besides the big ones like on this website.

### **Re: Inverting Matrix by Row Transformation for HP 35s/33s?**

Message #4 Posted by [bill platt](#) on 3 Aug 2007, 4:03 p.m.,  
in response to message #3 by Howard Boardman

Did you find any for the 33s? It would work on this calculator too.

### **Re: Inverting Matrix by Row Transformation for HP 35s/33s?**

Message #5 Posted by [Gene Wright](#) on 3 Aug 2007, 4:35 p.m.,  
in response to message #4 by bill platt

Anything for the 33s would be quite limited given the memory constraints of that model.

I think it is only a matter of time until someone completes a matrix determinant and inverse routine using the indirect registers on the 35s.

As previously mentioned, Datafile has an article with many matrix utilities already published. Just need a shell program written around them to call the routines and do a bit of other math.

### **Re: Inverting Matrix by Row Transformation for HP 35s/33s?**

Message #6 Posted by [Howard Boardman](#) on 4 Aug 2007, 11:10 a.m.,  
in response to message #5 by Gene Wright

Wouldnt be too hard to write a program that would handle a 2x2 or 3x3... my programing knowledge is not good enough yet to handle something bigger. I think you'd be limited anyway because of the storage capacity of variables.

**Re: Inverting Matrix by Row Transformation for HP 35s/33s?**

*Message #7 Posted by [Gene Wright](#) on 4 Aug 2007, 11:25 a.m.,  
in response to message #6 by Howard Boardman*

Storage capacity shouldn't be a problem on the 35s.

With 801 indirect registers, you can store quite a bit of information.

I remember the old TI-59 LED calculator could do an 9x9 determinant and the HP41c could do a 14x14 (if I remember correctly).

I think the 35s could do those of that size once the program is done. Now WHY you'd want to do one that big is another question. :-0

**Re: Inverting Matrix by Row Transformation for HP 35s/33s?**

*Message #8 Posted by [Ed Look](#) on 4 Aug 2007, 8:10 p.m.,  
in response to message #7 by Gene Wright*

(Super)String Theory.

Why anyone would want to stick with that is another question. :-0

---

I have 72104204.

I ordered directly from HP - but not when they first came out - I waited awhile to see the general reaction/reviews from people that got them... ;-)

My display is ever so slightly misaligned. It tilts up as you look from left to right. But since all annunciators are still visible I don't think I will ever bother to return it.

**Re: HP 35S Serial Number list**

*Message #6 Posted by [srayb](#) on 3 Aug 2007, 10:10 p.m.,  
in response to message #5 by Kevin Kitts*

CNA 72500718

LCD display slightly skewed, goes up to the right. Everything else seems fine.

*Message #7 Posted by [Miguel Toro](#) on 3 Aug 2007, 12:16 p.m.,  
in response to message #1 by Vincze*

Hi,

CNA 72102361 and my LCD is well aligned, but the serial number is not :-)

**Re: HP 35S Serial Number list**

*Message #8 Posted by [Fred Lusk](#) on 3 Aug 2007, 9:37 p.m.,  
in response to message #7 by Miguel Toro*

I already posted my cereal :-) number, but since this is a thread dedicated to such esoterica, here it is again: 72103808.

I purchased direct from HP on July 13 and received it on the 19th.

Like Miguel, my screen is OK, but the sticker is crooked.

Fred

*Message #9 Posted by [Matt](#) on 3 Aug 2007, 12:17 p.m.,  
in response to message #1 by Vincze*

CNA 72102344

Bought from Samson Cables, USA. Shipped from Spain.

Possible misalignment of about 1/2 a pixel (it really is barely noticeable).

Serial number is crooked (no big surprise).

CNA 72101928, both pretty straight.

**Re: HP 35S Serial Number list**

Message #14 Posted by [Dave](#) on 3 Aug 2007, 6:41 p.m.,  
in response to message #12 by Greg Whitfield

I got the one right before yours. Right end of display tilted down more than a full pixel. SN: CNA 72101938 from walmart.com

Got another one direct from HP, slightly misaligned on the opposite end. Don't have it handy, so no SN to report there.

The LCD is glued to a metal plate. It seems to me that when the LCD floats on this blob of glue it may be skewed one way or another either when first placed on the plate or by moving a little before the glue sets. The metal plate itself is always dead on since it fits securely in the molded plastic case. It's difficult to correct the skew by hand since the glue is very rubbery and bounces right back to it's original shape.

Message #20 Posted by [Chris Haltiner](#) on 3 Aug 2007, 2:06 p.m.,  
in response to message #1 by Vincze

CNA 72103814

Ordered from HP. Display was misaligned, but I have corrected it. Everything else seems to be ok. Crooked serial number (of course). I have another unopened 35s ordered from Buy.com--serial number not visible.

Quote:

On back of plastic box, on top left, they will have serial number for you to see.

Teach me to look at my packaging before putting it away. Ok, I pulled the second one back out and the serial number on the box is 72500450.

Interesting to see a new numbering scheme 725x as opposed to 721x.

What's perhaps stranger (or certainly more scary) is that Howard and I bought our calcs from completely different sources (his: Wal-Mart; mine: HP SMB) and they are sequentially one number apart. Here's the scary part: Howard and I sat next to each other at HHC2006 last year, and now our calcs are sitting next to each other (in spirit).

:-D

thanks, bruce

Maybe it's not so strange.

I saw somewhere on the Wal-Mart site re: items delivered "site-to-store" a suggestion that, should I fail to pick up the item, refuse it, or return it, the item is "returned to the manufacturer".

That struck me as odd, and it probably shouldn't be taken as gospel. But I wouldn't be surprised if, consistent with "just in time" inventory, etc., that the online stores outsource the storage and fulfillment to the manufacturer. (Heck, perhaps even H-P SMB outsources that to some specialty outfit.)

They may have come from the same location. (Do you both have your shipping labels?)

Virtual warehousing! Pretty cool!

-- Edited-----

Actually, Cerritos, CA appears to be the location of a UPS station. I suppose either H-P or Wal-Mart could have a warehouse nearby, so this doesn't prove anything. (I could find no specific mention of Cerritos on either company's web site.)

Incidentally, I note that H-P has a presence in Bentonville, AK, according to its careers site.

So Richard (using my best lawyer impersonation), did you, or did you not, have to pay shipping for this so-called "site-to-store" transfer of merchandise? Don't forget, you're under oath.

Since I work within two miles of one Walmart, and four miles from another, I wanted to use

that "shipping" method too, but couldn't find (didn't see?) that choice. I ended up thinking it wasn't an option because the 35S is an "On-line Only" item.

In any case, good find.

Matt

Quote:

\_\_\_\_\_

did you, or did you not, have to pay shipping for this so-called "site-to-store" transfer of merchandise?

\_\_\_\_\_

I did not pay shipping. This would have gotten the calculator delivered directly to me but would have cost \$6.97 US.

I did, however, have to pay local taxes of \$3.80.

My Walmart is just over two miles away so I chose the free shipping to there and paid the taxes for a savings of \$3.17. :-)

I got my order in before the price increase so the total cost for the calculator was \$53.79.

*Message #55 Posted by **Jeff O.** on 9 Aug 2007, 7:31 a.m.,  
in response to message #54 by Richard Ottosen*

I'm guessing you would have paid local sales tax even if delivered straight to you. Since Walmart has a physical presence in your state (as they are virtually omnipresent), sales/use tax laws would almost certainly require them to collect the tax on direct deliveries too. So you saved \$6.97. But you did have to drive and go in to a Walmart.

My HP35S serial number is CNA 72501069 which I received in the UK on 14th August 2007.

I think it looks good, is a great shape, has a good weight and no cosmetic faults. I am very pleased with my new purchase.

All I need now is an excuse to use its programming capabilities.

Regards

Chris

S/N 72101948

Ordered July 17, 2007 from e-walmart using "site-to-store". Arrived at local store on July 20, 2007.

The display is about 1/2 pixel higher on the right side than the left side. Not noticable in normal use.

Richard

Got my 35s parcel today:-))

Came over Spain from Samson Cables.  
Paid for on 29th of July.  
s/n 72105740 and 72105746 .  
Both are prepended by 'CNA', of course...

I have opened the 72105740 blister.  
The display is aligned properly.

I haven't checked for bugs yet.  
Is there a non-destructive way  
to retrieve the revision info?

From what I can tell so far, this is the best looking  
'HP' branded calculator since at least ten years!

Rubber only were it belongs, as the feet.

The tactile feedback of the 35s keyboard is *\*much\** nicer  
than that of the 33s, which was too hard and loud IMHO.

Apart from that, the older 33s was a really ugly beast anyway...

Raymond

in response to message #47 by bill platt*

For the archive:

72105741 72105739 72105744

Shipped by Samsoncables on 31st of July. Arrived in Switzerland 2nd of August. Calculators were shipped in the the original sealed HP cardbord box. Print on it reads:

HP35S (1P) Product: F2215AA (30P) Option: ABA Quantity: 3 Date: 190607 (the date is actually stamped and therefore seems to be the packaging and/or production date) MADE IN CHINA

The serial stickers which can be found on the back of the calculator and the blister packaging are also stucked to the outside of the cardbord box.

I thought somebody would be interested in that.

Regards,

Matthias

Message #74 Posted by [Walter B](#) on 11 Aug 2007, 8:04 p.m.,  
in response to message #47 by bill platt

Another one for the record: S/N CNA 72105835, arrived today from Samson Cables directly via USPS Air Mail. Was ordered 7/15 (for US\$52.99 + US\$20.00 for S/H), shipped 7/30 (late shipping due to some arguments about SC's attempt to charge additional shipping costs). Anyway, I paid 10.06 Euro VAT today, and that was it :)

First impressions:

LCD is correctly aligned, even the S/N sticker is ;- ) Now to the less important stuff:

Strong points: Nice shape, very nice keys (thanks, HP!!), reasonable keyboard colors (after more than a decade!), comfortable ways to enter complex numbers. In total the best RPN calc produced since 2001 (though the calculating power per cubic cm decreased). Seems HP understands better now why their vintage calcs looked the way they looked.

Weak points: Silver cursor keys really look like on a TV remote control, plastic housing feels cheap (a more structured surface would have been better IMHO), keyboard space wasted for <-ENG, ENG-> (hey, that calc was meant for professionals - who cannot do these operations by heart, is no), misleading shift keys, glossy LCD window, theta looks like 8 in the LCD.

And the case is way too big to contain just such a calc, but I can add some travel documents ;-)

To be investigated: Function set & grouping, menu contents, benefit of UNDO (??), how to work with this device in practice ...

Summing up: A real lot better than the 33s, still a long way to go for a 42sii. Go on, HP!

Edit: (1) To open the blister pack, I needed my Swiss Army Knife \*and\* brute force! (2) I've to check for all the software bugs reported here. (3) The handbook chapters about SOLVE and INTEGRATE seem to be unchanged for 25 years now. (4) Mechanical HW-wise, the 35s may be a nice platform for some custom projects (Eric? Pauli? Richard? OpenRPN (R.I.P.)?)

## Re: HP 35S Serial Number list

Message #75 Posted by [lindguini](#) on 15 Aug 2007, 12:00 a.m.,  
in response to message #74 by Walter B

HP 35s CNA 72102596

Ordered from HP Home on 8/8, arrived 8/11.

Display is aligned; serial sticker a bit crooked.

Overall Impressions: The 35s has recaptured the best elements of HP's classic handhelds. The key design, tactile feel, markings, ENTER key, and body clearly indicate that HP has listened to its (dwindling?) user community. Congratulations for daring to return to your roots, HP!

After retiring my 10C (1983-1992) and 42s (1992-2005) for concerns that they would get stolen or damaged, I reluctantly took up relations with the 33s (2005) and it's been a compromise the whole way. The guts were good but the presentation was misguided. I wanted to like it more than I did. And then, this summer, I thought I'd see if HP had anything in the pipeline and...presto! Here's the 35s! Was it a cruel marketing joke? The 35s looked too good to be true. It's everything the 33s should have been.

Of course, it's a big risk for HP since the 35s will likely appeal mainly to HP diehards who've owned several models over the years (and years, and years). But then again, the classic HP design philosophy and RPN combine to make a powerful statement for those willing to convert. Hopefully, this is just the start of HP's re-examination of how they can re-capture a market soundly dominated (and deservedly so) by TI and Casio.

The HP 35s simply strikes the right chords. Sentimental, perhaps, but a long time coming. As for overall value, I'll go an extra mile (and \$\$) for RPN any day. The 35s comes with an excellent \*printed\* user's manual and a high-quality, padded, zippered case that allows you to use the calculator without removing it from the case...brilliant. The whole 35s package simply says "quality, with no compromises".

Keep up the good work, HP.

### A new product introduction

Message #1 Posted by [Giancarlo \(Italy\)](#) on 3 Aug 2007, 3:46 a.m.

Hi all.

That story of HP "holding all orders of HP 35s models until the issue is fully researched and remedied" really impressed me....

I'm employed in a company that produces consumer goods, and, to be competitive and profitable as a company, we had to set up a well structured process for New Products Introduction (be they really "new" or a restyling of existing ones).

That procedure provides a stage-by-stage feasibility and development flow, going through some major "milestones" where some "steering committee", seen the outcomes of the previous steps, decides a GO/NO GO for the project.

I mean: we're talking, roughly, of the following steps:

1. mock-ups for aesthetical sanction and for "face value tests";
2. first (few) prototypes - not made with definitive tools - for preliminary tests and design reviews;
3. first (limited) batch, made with definitive tools, aimed at "freezing" the project and make deeper tests (for example: early failure, reliability, life tests, field tests);
4. first production run (limited quantity) to test the capability of the real production process in terms of work cycles, ergonomics of work places, production checks and quality checks (either in-process or end-of-line tests).

Now, it's really difficult for me to understand how an issue would escape a structured procedure (and I \*do\* believe HP has got even a more structured and paced one)

so that to compel the company to a "recall campaign" ('cause that's what we're really looking at) just 3 weeks after the market launch...

Should I mention the disappointment of the customers, their complaints about the company, the lack of image etc., all of these amplified by the huge expectations?

I strongly suspect that, in the process of introduction of the new 35S, having in mind the extreme level of expectations of the HP market target for that product, somebody over there failed to go through some serious Design FMEA or test session - otherwise, how could such a flaw escape?

Apologise for my rants, but as my daily job is focused at the "quality" of the products, I just can't understand "how it could happen" to such a company.... But maybe I'm just picturing it bigger than it deserved to be ;-)

Best regards.

Giancarlo

I suspect something simply went wrong with the final production. You can have the best structured approach in the world, all the pre-production you like, and all the beta testers in the world - but when you push that final production button, there are countless little things that can go wrong that can slip through all of your final production QA.

Dave.

*Message #3 Posted by [Giancarlo \(Italy\)](#) on 3 Aug 2007, 5:13 a.m.,  
in response to message #2 by [DaveJ](#)*

Hi Dave.

Maybe just a well-designed QA check-list would have proved helpful...

How to get such a check-list? As a "by-product" of well-structured Design FMEA and/or Process FMEA, and there we go again...

I suspect that the difference relies on that "countless": they have to be countable (English?) at least not to oblige the company to stop deliveries within the first month of market launch....

Thanks for your feedback.

Best regards.

Giancarlo

Sure, you can always 100% check everything to your hearts content. Six-Sigma is achievable!  
However, that all costs money, and on a \$60 retail calculator which is actually a fairly complex and  
interactive piece of equipment, that could be a hard ask.

Want to check if the LCD is aligned properly? - either: 1) you have to design it so it can't be mis-  
aligned in the first place 2) you have automated vision inspection equipment do the job. 3) you rely on  
human visual checks and good work practices by some worker in China earning a dollar a day

#1 is not always possible, #2 is expensive and hard to justify, so that often leaves you with door #3!

Want to check that label is aligned?...

Want to check every key for "that tactile feel"?...

Manufacturing tooth picks or paperclips is a far easier business! :->

Dave.

## **Re: A new product introduction**

*Message #5 Posted by **Giancarlo (Italy)** on 3 Aug 2007, 7:24 a.m.,  
in response to message #4 by DaveJ*

Hi Dave.

Quote:

you can always 100% check everything to your hearts content

No, no, no: I was not aiming at a 100% check, but at a statistically significant test,  
aimed at the critical characteristics of the product / process that must have been previously  
analyzed.

Quote:

that all costs money

Yup, despite all legends, Quality \*is\* a cost (maybe "quality" is not ;-)

Quote:

on a \$60 retail calculator

Do you think that the unit margin over that 60 USD is really that tiny to justify a poorly designed quality plan? ;-)

Quote:

Want to check if the LCD is aligned properly? ... Want to check that label is aligned?...  
Want to check every key for "that tactile feel"?

Yes, yes, and yes IF those are features the company has evaluated as key to the customer (yes, I know - that requires a knowledge of its own customers ;-)

Quote:

Manufacturing tooth picks or paperclips is a far easier business!

I'm afraid "business" is seldom "easy", even when it comes to toothpicks or paperclips (see the importance of a paperclip for a hard reset of a 50G, for example ;-)).

Thanks for your contribution.

Best regards.

Giancarlo

#1 is not always possible, #2 is expensive and hard to justify, so that often leaves you with door #3!

Working in Quality, too, for many years please let me comment:

Forget #3 (you'll always have a slip in the order of a few % using visual inspection). And even #2 is a mere excuse for not having done #1 properly. So a US\$60 product must be \*designed\* it can be sold for this amount and still makes money (incl. complaint handling!). Or, to quote a saying I've seen posted in a production plant:

"Quality does not cost money at all -- the lack of quality costs money!"

HTH, Walter

## **Re: A new product introduction**

*Message #7 Posted by [Giancarlo \(Italy\)](#) on 3 Aug 2007, 12:01 p.m.,

Hi Walter.

I resound with you, and to reinforce what you state:

Quote:

---

...and still makes money (incl. complaint handling!)

---

in my experience it's far too common for a company (be it big or small) not to take into the correct account the so-called "non-quality costs", that, instead of being used to calculate the \*real\* unit margin are put into a "pot" and irreparably mixed with lots of other different costs... Of course, when I said "Quality" costs, I was meaning that the first and most important \*cost\* is in terms of attitude - beginning with the people that design products, and proceeding with all the other along the development, engineering and production stages. Thank you for your contribution. Best regards. Giancarlo

"Quality does not cost money at all -- the lack of quality costs money!"

---

Good afternoon Walter. I must make a comment about your quote. You are very correct in what you say, and it makes me wonder, and I hope I do not offend you. I don't know you or where you are from, but that statement sounds very Germanic in nature. I say that as a compliment as I believe that Germans tend to focus very much on quality, both in past and present, with their engineering and building of things. This is not to say that American made, or British made, or Chinese made, or Hungarian made are not focused on quality too. It just seems to be more of a trend in Germany to concentrate on high quality engineering and building the best, darn everything else. I hope HP sees your quote and take it to heart, and what ever they build next they take the same take, and build darn best calculator.

### TI-30 user looking for a change.

Message #1 Posted by [Luke Hoffmann](#) on 3 Aug 2007, 2:50 a.m.

Hello all. I found this website while on an odyssey of calculator searching. I am entering the math and physics programs at Purdue University in a couple of weeks (finally realized Poly Sci wasn't going to cut it) and I'm looking to upgrade my calculator. Calculators are not allowed in any of the upper level courses, but I would still like one for homework, personal use, concept reinforcement, etc. I have been looking at the TI-89, HP-50G (49.5 from what I've gathered) and the 35-S. I am a little unsure as to what to buy...but in using the RPN calculator on HP's site, I must admit, I have become quite intrigued. So, any relevant thoughts any one has on graphing calcs (remembering they are verboten at my school generally) and the 35-S would be very much appreciated. Sorry for the long post; I will try to keep it shorter in the future.

### Re: TI-30 user looking for a change.

Message #2 Posted by [Howard Boardman](#) on 3 Aug 2007, 10:00 a.m.,  
in response to message #1 by Luke Hoffmann

My advice: get a Hp 50g for homework and out of class work. It will handle calculus and physics stuff quite well. At least if I had one in my engineering curriculum for my 3 semesters of calculus and physics it would have greatly helped. And it sure helped in my major classes which were loaded with math. If you can use a 35s on tests, that would be the way to go. Very powerful in the way you can program it. So get one of both if you can.

### Re: TI-30 user looking for a change.

Message #3 Posted by [Thomas Radtke](#) on 3 Aug 2007, 10:10 a.m.,  
in response to message #1 by Luke Hoffmann

Your request is quite general. How about deciding first whether you really need a graphing model? If you can live w/o graphics and CAS, the 35s is very versatile and quite a bit easier to use. I doubt you'd find another recent non-G that powerful.

### Re: TI-30 user looking for a change.

Message #4 Posted by [Walter B](#) on 3 Aug 2007, 10:26 a.m.,  
in response to message #1 by Luke Hoffmann

Quote:

\_\_\_\_\_

remembering they are verboten at my school generally

\_\_\_\_\_

Hmmh, why did you spell this German? ;-)

IMO, the step from a TI30 to a graphic calc is a pretty big one. Since I finished my studies decades ago, it's hard to guess how the kind of homework was adapted to the ubiquitous (?) availability of high power calcs and PCs. Anyway, there are loads of tasks where a calculator isn't any help at all, and if I were a professor, I'd like

to emphasize this side.

Nevertheless, to get some support for the pure (and stupid) mechanics of mathematics, I'd recommend you look for a scientific calc featuring matrix handling, solving systems of linear equations, and able to work with complex numbers nicely. It should feature an (almost) complete set of scientific functions, i.e. incl. hyperbolics. For physics, you'll need sample statistics incl. linear regression additionally. Some programming capability will allow you to tackle repetitive tasks like solving the same equation for several sets of parameters.

Of the calcs I know and being available today (also at auctions ;- ) , I'd recommend the HP 42S if you want a small and light calc you can carry everywhere easily -- if you don't mind carrying a big cannon, then take an HP 48anything. You are young, so you will adapt to any reasonable OS. The 35s is nice and new, and features everything \*but matrices\* (crucial for your applications IMHO). The 50g will do everything a calc can do, but may be too much overhead.

Just my 20 Milli-Euros

P.S.: There is a very nice and capable emulator of the HP 42S available for free, called Free42 (just search the archives or google using this name and Thomas Okken as keywords). I will run on your Laptop and PDA.

*Edited: 3 Aug 2007, 10:34 a.m.*

### **Re: TI-30 user looking for a change.**

*Message #5 Posted by [Ed Look](#) on 3 Aug 2007, 11:57 a.m.,  
in response to message #4 by Walter B*

Luke, Walter, (or anyone else!), Walter's advice is generally sound, but from direct experience, the 48G (or G+ or GX) is a bit fragile. It certainly IS a great calculator, or as MoHPC calls, a "do-everything" calculator, but to be that and yet still stay small and light enough to be portable as a calculator, it may not stand up to being tossed in a backpack every morning, whipped out several to very many times a day, tossed on a desk or table, wagged at friends to underscore that your answer might be "more better", and worst of all, dropped. I dropped my 48G only once, and it was still in its case, and now I have a blank row of pixels across the third stack position, unless I strap a rubber band around the top.

So, if you get a 48G series machine, use it at home or in the dorm. The same would apply to a 50G. I mean, these are EXPENSIVE little babies. If you are going into math and physics, you won't need any in class graphing on your calc anyway. So, I'd counsel the use of a 35s or even 33S (which really despite my and others' complaints is a pretty good calculator, but the 35s has more programming space) for class.

I got by (very well, actually) with the then-equivalent of the 33S or 35s (now that it's out), the 34C, a scientific programmable. In actuality, today's two HP scientific programmables are superior in terms of capability; mine was superior only in feel of the keys, weight of calculator and... ahem... appearance. Something about red... LEDs.

I think you might need a graphing calculator not so much at all for its graphing capability, but its much greater programmability and memory capacity.

### **Re: TI-30 user looking for a change.**

*Message #6 Posted by [Ren](#) on 6 Aug 2007, 12:16 p.m.,  
in response to message #5 by Ed Look*

First of all,

A TI-30 variant (SR-40) was my first calculator (Fall 1979), I still have it but haven't applied power in

years. I couldn't afford the HP-2x a classmate had, and I wasn't smart enough mathematically to understand RPN anyway. ( The first day of class the instructor made a comment how some students didn't know how to add fractions. I sheepishly raised my hand and asked, "How do you add fractions?" .)

Secondly, I now carry a HP-48G in my backpack. To protect it from some of the daily bangs, it is in a rubber "holster" designed for the TI-8x series. It is a tight fit, but the holster only cost \$1 at Goodwill.

Ren

dona nobis pacem

### **Re: TI-30 user looking for a change.**

*Message #7 Posted by [Ed Look](#) on 6 Aug 2007, 12:36 p.m.,  
in response to message #6 by Ren*

I had a TI SR-40 before I got my first HP, the 34C.

In fact, the poor quality and limited capability of the SR-40 caused me to seek out the 34C. Needless to say, it was a huge jump in quality and capability for me. I have to admit though, that the SR-40 had to be almost unusable before I spent the \$124 (before tax) dollars of those days for the 34C. The SR-40 actually didn't last long; the keys went just about totally bad before I dug out the money for the 34C. I sort of wish I kept the malfunctioning SR-40. I tossed it as soon as I brought the 34C home.

Interestingly, if the TI SR-40 didn't break down and kept working through college, it is possible I may never have looked for a better calculator and would never have become like you guys, a calc nut. It was the 34C that launched me on this path!

### **Re: TI-30 user looking for a change.**

*Message #8 Posted by [Matt](#) on 3 Aug 2007, 10:27 a.m.,  
in response to message #1 by Luke Hoffmann*

If you can afford the 50G then it is the most powerful calculator around (though the TI-Nspire may have something to say about that). CAS have their drawbacks on calculators, mainly due to the small screen size. Most ODE solutions will require more than one screen and the way the 50G handles arbitrary constants is not the most attractive. So you will have to learn how to read the output. The 3D graphing is quite slow and maybe not all that useful.

But why not try out some models?

[Here is one emulator](#)

[And here is another](#)

The other thing to bear in mind is that something like the 50G will take a long time and no small effort to get the most out of it. Do you think you'll have that time?

Concept reinforcement is a tricky thing. My idea of that is consulting another textbook. Will you use software in your course? That will be more powerful than a handheld. A nice OpenGL plot of some function can be helpful, but handheld's aren't quite there yet.

It's a tough choice you'll have to make.

**Re: TI-30 user looking for a change.**

*Message #9 Posted by [Brad Davis](#) on 3 Aug 2007, 11:11 a.m.,  
in response to message #1 by [Luke Hoffmann](#)*

That is a very tough one. I started using HPs during my sophomore year in 1990, so the 28S was the big thing back then. I used it quite a bit to solve equations, solve definite integrals, and create little functions, but never used it for serious programming or plotting.

To be honest, I've tried plotting with my 28S, 48, and 50g and it's such a pain that I'd rather use Excel or some other program. I just don't see the point in a calculator that plots. The plots are tiny and much more difficult to read and manipulate on that little screen with the limited controls. Even if you can see it, it's not practical to copy it to a report, your HW submittal, etc. You also can't plot lots of different things with different colors, markers, scales, etc. 3D plots are hard to deal with on a computer screen, much less a tiny calculator screen.

You'll have your computer for everything but tests. During tests, if you spend time (you'll usually have very little) monkeying around with your calculator, you're probably toast, LOL.

The 50g's keys are so hard that my hand gets physically tired by the time I get through a page or two of calcs. And no, I'm not a wuss with little weak finger, LOLOL. I've read here that the 35s keys are better. You'll spend a nauseatingly huge amount of time punching those keys in engineering school and your time spent on basic calcs will be hundreds of times more than your time spent using the more advanced functions. Actually, you'll probably use your computer for them anyway.

I think I'd get the 35S. I am thinking of buying one of those and keep my 50g as more of a personal museum piece simply because the keys are so hard.

*Message #10 Posted by [bill platt](#) on 3 Aug 2007, 11:31 a.m.,  
in response to message #9 by [Brad Davis](#)*

In engineering grad school, I used a 32sii happily. Most others had simple little sharps, casios, TI, not graphing.

The 48GX is cool and I like it more and more as a working calculator, but it really is overkill and I agree about the time wasted thing. If I had put all the time into calculators while I was in school, I'd never have learned what I really needed and wanted to.

(Now that I am a grown-up, I can spend time on them for the fun of it:)

Ironically becoming a collector is completely opposite why I liked HP calcs from the beginning: The HP helped to \*minimize\* the time I spent using, buying, replacing or thinking about calculators. Heck, a single 11C served me for 13 years!

*Message #12 Posted by [Luke Hoffmann](#) on 3 Aug 2007, 12:32 p.m.,*

*in response to message #11 by Ed Look*

I'd like to thank everyone for their input. I'm going to ask a couple more questions on this topic and then I'll put this to rest. 1)The general consensus is that the graphing calculators are often more complex than I'll need (given that calcs aren't allowed on any test at Purdue...and for the real tough stuff I'll be using MATLAB, etc.) I just want to confirm this point. 2)The 35s is a return to simple and powerful HP functionality. 3)There isn't a better scientific calc...TI, Casio, or HP don't offer any scientifics that solve any greater amount of problems.

I guess to clarify my post a bit...I don't give a hoot about graphs necessarily, I feel that is what paper is for at the level of math I am at, but I would like something that could solve more advanced things than my TI-30. Derivatives come to mind.

I am new to the calc rounds, and higher math in general, so please keep the kid gloves on when tearing my post to shreds ;)

Thanks for all of your input and help.

*Message #13 Posted by **Walter B** on 3 Aug 2007, 3:33 p.m.,  
in response to message #12 by Luke Hoffmann*

Luke, assuming these were 3 new questions, here are my answers:

1) Yes.

2) Yes - at least it's a major step in this direction.

3) Depends. There were numerous discussions about the "best" nongraphic scientific HP calc in this forum already (and for sure there will be more). You'll find them browsing older posts. Many forum members agree the HP 42S was/is the most powerful RPN calc ever made. You'll find reasons for this verdict in said posts. For assessments of non-HP calcs, other sites may be better suited than this one here, which is a bit biased - of course :-)

One note I would like to make. Even though I do not have 42s, I do think it was one of the best calculators that HP ever made (I have used emulator of it and like very much). One thing though, is they are very expensive when you find one. A better alternative, and much less expensive more often would be a 15C. I think it would do everything you have asked about (I don't have one, but I have used the emulator quite a bit) including Matrix math.

*Message #15 Posted by **Brad Davis** on 3 Aug 2007, 4:12 p.m.,  
in response to message #12 by Luke Hoffmann*

As for comparisons to other brands, the bottom line from my standpoint is RPN/RPL vs the alternative: algebraic nonsense.

After you get used to it, you will be able to punch through equations much faster with RPN/RPL than with an algebraic calculator. Some HPs only have 4 stack registers and some have many more. I personally like the ones with many more because they let me start at the left end of an expression and proceed to the right. With only 4 registers, you have to start on the inside of some expressions and work your way out. This isn't how I learned, so is unacceptable to me. The 50g has many registers and I \*think\* the 35s does too. The 33s, for example, is limited to 4. I bought one and it's collecting dust.

I have a funny story. Last fall, I taught a junior level engineering design course. Every single student used a TI calculator. On one of their exams, they had to punch through an equation that took up an entire line and had 3 square roots, 2 of them nested. Of 37, about 3-4 of them made it from one end of that to the other without making a mistake. They were trying to write it out in 3-4 steps, etc.--chaos! I knew they'd complain about this, so I used a stopwatch to test my speed with my HP48. I punched it through 3 times without a mistake, averaging 22 sec./try. Of course they got some hazing in the next class when they complained about that equation, LOL.

Are you sure about that, Jeff?

I thought the hp info clearly stated that it had 800 registers. Was that referring to something else?

**Re: TI-30 user looking for a change.**

*Message #18 Posted by **Ed Look** on 3 Aug 2007, 11:35 p.m.,  
in response to message #17 by Brad Davis*

Jeff was referring to the IMMEDIATE four "registers" (well, I guess they really are, too; they are kind of like the command line plus the "scratch disk" of a VMS operating system on an old mainframe) that the calculator uses as you enter figures, operate on them: when you turn on the machine, you are looking at the X register contents on the bottom of the LCD display and the Y stack level (register) contents are right above it. There are two further stack levels that are unseen, as well, unless

you use the ROLL DOWN (or blue SHIFT ROLL UP) key to access them, the Z and T in that order (that the Z is so named is obvious; the T is so called because it is the "top" level).

This means that you can enter four values in the 35s (or any of the pure RPN calcs; the RPL calculators, as the 48G series, 48S series, etc. have an unlimited stack) before losing your first entered figure "out the top". The T stack level has also the property of being replicated, i.e., the value in it is copied for further use, if necessary.

So that is the stack.

Now, the storage memory is comprised of what are more properly called "registers" and as promised in the literature (including the manual), there are 26 directly accessible ones (A-Z) and 801 accessible by using indirection via the I and J registers.

A very cool system methinks. (I had to make an effort to get used to the infinite stack of the RPL machines when I got one. Personally I still prefer the four level stack system of the HP RPN programmable scientifics.)

If you've got more questions on the stack vs. storage registers, there are smarter, more qualified guys here who can easily chip in.

### **Re: TI-30 user looking for a change.**

*Message #19 Posted by [Jeff O.](#) on 4 Aug 2007, 12:35 a.m.,  
in response to message #17 by Brad Davis*

Perhaps I answered a bit too succinctly. Although you mentioned registers in your post, from your discussion and reference to the 33s I decided that you were talking about the 4 level operational stack, which Ed explained quite well. The 33s had a 4 level stack and 32 or 33 storage registers. The 35s has over 800 storage registers, but still has the 4-level stack, which I also prefer to the unlimited RPL stack. (Sometimes a 5 or 6 level stack might be handy, but unlimited just never felt right to me.)

### **Re: TI-30 user looking for a change.**

*Message #20 Posted by [Brad Davis](#) on 4 Aug 2007, 1:12 a.m.,  
in response to message #19 by Jeff O.*

Thanks for setting me straight before I bought a 35S.

I learned mostly on my 48 and go strictly from left to right. Some of our longer equations need 6 stack levels for that, so it would take some work for me to deal with 4. I bought a 33S and don't like it for that reason.

### **Re: TI-30 user looking for a change.**

*Message #21 Posted by [ECL](#) on 3 Aug 2007, 12:41 p.m.,*

*in response to message #11 by Ed Look*

Regarding the use of \*any\* graphing calc at such an early stage (calculus, physics):

I am a recent grad, and would strongly recommend that you forget the calculators. There will be huge returns for monkeying with your pencil and paper (or just taking mathematical strolls).

Plus, you may be advised in school to get a copy of matlab, (or similar) for small projects or investigations.

Just be sure to dive into the theory, not ebay looking for calculators. Once you get to your second year, or maybe 5th semester, you may want to begin relying on small programs that you write. For those, a 33s, 35s (or graphing if you really want it) will suffice.

In my physics courses, we had to have our calculators personally inspected by the prof. He'd prohibit even programmable SCIENTIFICS!

In my maths (Calc I,II,III,IV,diff eq) there were NO calculators. Once I got to numerical methods, I began using my 33s to scream through repetitive iterations.

Now, if you are disciplined, and can keep a fancy calc in the back pocket for free-time exploration, by all means. Just beware of the danger of losing serious time if you go overboard. Programming can be very addictive!

Best luck, great school! ECL

**Re: TI-30 user looking for a change.**

*Message #22 Posted by [Vincze](#) on 3 Aug 2007, 4:38 p.m.,  
in response to message #21 by ECL*

Very good advice ECL.

Luke, when I study at BME university in Hungary, we were not allowed to use calculator on test at all. We were allowed to only use slide rule. Now Hungary is not as advanced (in some ways) like USA, but it was not a big disappointment that we could not use electronic calculator, because we used to doing math with pencil and paper. I tell my son that pencil, paper and slide rule is Hungarian graphing scientific calculator. He not think I very funny, but ECL is very correct when he say it will help you better understand concept behind everything.

In real world, yes you will use computer or calculator, but you must understand concept before you automate it. As I always say to people laziness bring struggle. Don't be lazy, and it will pay off for you many times.

Best of luck to you my friend. Purdue is a very good school. Your parents must be very proud of you.

*Message #26 Posted by [Luke Hoffmann](#) on 4 Aug 2007, 1:29 a.m., in response to message #25 by Walter B*

\*Smiling\* Thanks everyone for the input. I actually called up TI and HP today, and from what I've heard from both I've made my decision. I'm going to go with the 35s when it is re-released (the fellow at HP said it will be between two and three months, but they are *not* cobwebbing it as I've seen a couple of people post.)

The guy at HP also said that HP has 'retaken' control of the calculator unit and that they are looking to a return to the HP of 10-15 years ago. Again, I am only quoting this guy, but he said they are looking to get back to double sized enter key as standard and they are going to slowly eliminate the kid-colors (the shift keys will stay colored apparently).

So, as all of you have said, I need to stay to the pencil and paper...but I think the 35s will be a great supplement (and fun to learn I think). In really thinking about it, I will wait for a return to form for an HP graphing calculator just for giggles if nothing else. Finally, when I spoke to TI and asked them what they had comparable to the 35s, the man laughed and said that they didn't have any 'legacy' models and that RPN was

'impossible' to use. I love my TI-30 single line, and I'll always have one floating around...but I think I've hopped the fence permanently.

Thanks again for everyones help and commentary...I look forward to annoying everyone with dumb questions once I finally get my 35s. Have a great night.

### Thinking of buying a 35S

Message #1 Posted by [Matt Agajanian](#) on 3 Aug 2007, 2:29 a.m.

Hi all.

First, a few things come to mind:

1--Since this is the 35th anniversary of the legendary HP-35, did HP know they were releasing a new resurrection of the "35" moniker?

2--Is HP planning a commemoration of the 35th anniversary of the HP-35 from 1972?

3--What happened to the trademark ENTER^ key label. In other words, why is the UP arrow omitted on the ENTER key label?

Now for my question:

I've read the other posts regarding the display flaws and HP's holding off on releasing the 35S due to cosmetic glitches. So, should I postpone my purchase for a month or so?

Thanks

*Edited: 3 Aug 2007, 2:30 a.m.*

I bought two immediately upon release. The one I took out of the package has no cosmetic flaw. HP claims the flaw is in a minority of the machines out there, so if you are a gambler, the odds are probably in your favor buying now. If I were buying now, I would (reluctantly) wait until the problems were sorted out.

Regards,  
Howard

2) [Have a look here](#)

If HP have stopped production, you may have a hard time getting hold of a 35s for a while.

### **Re: Thinking of buying a 35S**

*Message #5 Posted by [George Bradford](#) on 3 Aug 2007, 11:28 a.m.,  
in response to message #1 by Matt Agajanian*

I received my HP 35s a couple of days ago (after several false starts, broken promises and unpleasant delays).

It was worth the wait (and disappointments). This is a solid tool worthy of the HP legend. It's not perfect. But for a company that has neglected (and mismanaged) its calculator line, the 35s is a step in the right direction.

In fact, I was so pleased with the 35s that I promptly ordered another one (for back up) only to find out it's been recalled and my order placed on hold.

I wish HP would re-issue the HP 15c. For me the 15c was the ultimate calculator. But until they do (probably never) the HP 35s is a very strong machine that I will enjoy using.

If you can find a 35s, buy it. You won't regret it.

Put it this way: If HP offered me a full refund PLUS a free 33s to return my 35s I'd laugh at them. The 35s is the best scientific calculator HP has put out in a long time.

### HP statement on HP 35s

Message #1 Posted by [George Bradford](#) on 2 Aug 2007, 2:26 p.m.

Directly from HP's Website:

"HP Calculators have a legacy of quality, reliability and accuracy. Our goal is to only sell products that meet these exacting standards. Unfortunately a small percentage of our newly launched HP 35s Scientific calculators have been found to have a cosmetic defect. For this reason, HP is holding all orders of HP 35s models until the issue is fully researched and remedied. We are happy to take pre-orders and notify you when the new products are available. Thank you for your patience and loyalty."

### Re: HP statement on HP 35s

Message #2 Posted by [Matt](#) on 2 Aug 2007, 2:31 p.m.,  
in response to message #1 by [George Bradford](#)

Well that's not exactly helpful is it?  
Wyy can't they just come clean and tell us exactly what the 'cosmetic defect' actually is?

### Re: HP statement on HP 35s

Message #3 Posted by [Gene Wright](#) on 2 Aug 2007, 2:36 p.m.,  
in response to message #2 by [Matt](#)

Guessing: It's either the display alignment or some sort of assembly issue that puts pressure on the display or some other cosmetic issue.

Don't know.

But complaining when they admit something might tempt them to be less informative in the future. Slight :-)

### Re: HP statement on HP 35s

I have two with a crooked display. When I called HP about an exchange, I was told to ship them to Oregon at my cost, then upon receipt I'd get replacements in two weeks. Years ago, they'd send you a prepaid return box and a replacement in just a couple of days. I ended up fixing them myself, so it's too late to post any pictures.

How did you fix the alignment? Is it very difficult? I've got one that's slanted, but really like the calculator and would like to keep it (as well as not have to go through problems with the return procedure).

Thanks!

This is what I did, although you risk voiding your warranty or breaking something. One poster said he broke the power wires and had to resolder them. I learned from his mistake and didn't do any damage.

- Remove the battery cover and the 4 rubber plugs. I had to kind of dig them out with a needle.
- Remove the 4 screws under the plugs. - Carefully peel off the rubber strip at the bottom and remove the 2 screws under it. - You can snap the case open at this point (there are 3 plastic catches - Lift up the LCD, turn it over, hold the metal plate, and give the glass a good hard twist. - Drop the LCD back in, check alignment and repeat twist (several times). - When you're

satisfied, put everything back the way you found it.

Good luck.

I think I was one of the first here to place an order through Samson Cables--indeed, I think I brought the availability there to the Forum's attention. Despite other folk's problems I got my 35s reasonably on schedule and in good shape. LCD is straight, and I have had no bad keypresses, though some have reported that.

I was hoping the statement would've acknowledged some of the functionality issues we have noted here--the persistence of the cosine bug, the loss of direct polar conversions, an incomplete set of commands to work with complex numbers, and, for the coding geeks in the group, the major headaches in entering hex numbers.

Apart from that, I am glad the HP is noting and responding to some perceived problems. For under 60USD, I think it is a damn fine calculator. I must admit I haven't enjoyed a calculator quite so much since the excitement of my first 41CV in 1984. (Actually, not true--since I have discovered SysRPL the 49G+ has gotten a great workout.)

I hope this community supports the manufacture of this machine so there will be some motivation for an improved version in the near future.

Les

*Message #13 Posted by [Jim Creybohm](#) on 2 Aug 2007, 6:44 p.m.,*

*in response to message #1 by George Bradford*

I noted that, in mine anyways, the LCD tends to bleed when touched. At first I thought it was poor quality materials, but then I noted that it only bled on the right hand side. The left hand side was more "rigid".

I suspect that as others have noted, it is the display. Other than that and the stick on serial number (mine is crooked, too) I really like the unit. If only it could do timed/calendar functions and had grater textual abilities. That's OK, its still a step up from my 12c.

### **Re: HP statement on HP 35s**

*Message #14 Posted by [Earl Kubaskie](#) on 2 Aug 2007, 10:21 p.m.,  
in response to message #13 by Jim Creybohm*

I got mine from buy.com a couple days ago. The display is aligned well, but I noticed it has a glossy face, and reflections make it hard to see the display sometimes. All my other HPs are matte.

### **Re: Glossy Faceplates??**

*Message #15 Posted by [Ron G.](#) on 3 Aug 2007, 12:04 a.m.,  
in response to message #14 by Earl Kubaskie*

Now that could be a real design issue with the faceplate!

Other early birds, are your faceplates glossy, or matte?

### **Re: Glossy Faceplates??**

*Message #16 Posted by [Seth Morabito](#) on 3 Aug 2007, 12:11 a.m.,  
in response to message #15 by Ron G.*

I doubt this is it. The screen is EXACTLY the same as on the 33s. No more or less glossy.

### **Re: Glossy Faceplates??**

*Message #17 Posted by [Ron G.](#) on 3 Aug 2007, 8:46 a.m.,  
in response to message #16 by Seth Morabito*

Woops... I would withdraw my earlier comment, but that would leave everyone wondering what was said.

I originally thought Earl was saying the faceplate was glossy, not the display. I was saying an irregularly glossy faceplate could be an actual design flaw with the faceplate, as HP has mentioned as the reason for the halt. I don't actually have a 35S yet, so I am only going on what others are saying, and in this case, I kissed a snake (made a mistake).

It seems it would have to be something pretty major to cause HP to stop selling. Based upon their offerings of recent years, I would tend to think that a slightly misaligned display is within HP's bounds of acceptable quality. Of course they could be trying to turn over a new leaf.

### **Re: HP statement on HP 35s**

*Message #18 Posted by [Paul Brogger](#) on 3 Aug 2007, 10:35 a.m.,  
in response to message #13 by Jim Creybohm*

Hmmmmm . . .

Mine from H-P's SMB store is fine.

The one from Wal-Mart Online is still in the package, and I can't tell whether there's an alignment problem.

Re: return -- I'd paraphrase something about having to pry it from my "cold, dead fingers", but that would be overstating things a bit.

Good morning. I am writing this very slow, so I hope my english is more readable.

I am very lost as to what is going on. In reading the threads today it seems as if HP issued a recall on the 35s, not just a stop in the sales of them. Is this true? Also, it seem that they have disclosed what the issue is, and have announced what the issue is. Pardon my ignorance, maybe I have missed it here, but what is the issue? I have seen posts about glossy displays (no big deal to me), glossy face plates (no big deal to me), but can anyone confirm what the issue really is from HP's perspective?

How was that? Easier to read and not so broken up sounding?

## Re: HP statement on HP 35s

Message #22 Posted by [Matt](#) on 3 Aug 2007, 12:09 p.m.,  
in response to message #21 by Vincze

I think your English is fine :)  
There is confusion about what is going on.  
The person who created this thread suggests HP have said something, but I can't find any such statement on their website.  
Is it a recall, or a suspension of production? It's not clear from what I've seen.

[Samson Cables have this on their site](#)

Most vendors now have 35S's as being 'out of stock'.  
And thats about as much info as we have until someone can provide an actual link to something 'official' from HP.

So I don't think anybody can confirm anything.  
Sorry I can't be of more help than that.

'The truth is out there...'

## Re: HP statement on HP 35s

Message #23 Posted by [AJ](#) on 3 Aug 2007, 12:49 p.m.,  
in response to message #22 by Matt

I'm tending to agree with Matt here,

1. I see no evidence at all of a product recall - and this would be pretty obvious so can people stop saying this.
2. I see no statement from HP as to any problem whatsoever other than them being out of stock. Where is the official statement saying they are 'withdrawing' the product? No where me thinks.
3. What I do see are a handful of users with some minor problems, some with real issues and some with at best constructive moans.
4. Statements made by third parties quoted on this forum are not statements from HP so I would suggest again they are at best someones opinion, with motivations i can only begin to guess at.

HP have created a good product which most of their loyal users have been waiting for - for ages, it might not be perfect but guess what - NOTHING IS.

I can't understand why a community of HP enthusiasts are so eager to stick the knife into a new HP product, guys and gals if I am missing something here please let me know, and again - I ask if anyone can direct me to any official HP release then by all means do so and I will eat my words.

(i'm not sure how I do this electronically but I 'm sure someone will suggest a method)

AJ

You are right!

But some people, even [ ;) ] among HP calc enthusiasts are absolute perfectionists.

I just hope they allow their HP calculator enthusiasm to outshine their perfectionism...

... I mean yeah, they should have made the 48G out of case hardened steel, thick glass windows, with vibration damping springs to hold the breadboards in place so that when I'm dumb enough to drop it, only the floor... or someone's toe... is dented, and not my LCD display.

Nah, I think the 35s is fine as is, unless there are some really annoying software or firmware bugs like pressing TAN gives you sine or something like that.

### **Re: HP statement on HP 35s**

*Message #25 Posted by [Greg Whitfield](#) on 3 Aug 2007, 5:54 p.m.,  
in response to message #1 by George Bradford*

Where is this statement on HP's website?

I've taken phrases from this statement and searched for it in all of HP U.S. Here is an example of one of the search results:

No search results were found that match "Our goal is to only sell products that meet these exacting standards".

I checked the HP Newsroom and it's not there. I've looked on the replacement programs and product recalls page and there is no mention of it.

Home and Home Office shows that the HP 35s is out of stock. Small and Medium Business is still taking orders and currently shows a shipping date of 8/8/2007.

There is no evidence on any HP website that I looked at of some sort of temporary HP 35s product withdrawal.

Please provide the URL where this statement comes from.

Thank you.

### **Re: HP statement on HP 35s**

*Message #26 Posted by [Steve Cote](#) on 3 Aug 2007, 8:44 p.m.,  
in response to message #25 by Greg Whitfield*

I saw HP's statement about holding orders for the HP-35s early on Aug. 2 on their website. I went to the HP-35s section and clicked on 'BUY' and the statement in George B. post at the top of this thread was displayed. The statement has since been removed from HP's site.

### **Re: HP statement on HP 35s**

*Message #27 Posted by [George Bradford](#) on 3 Aug 2007, 10:38 p.m.,  
in response to message #25 by Greg Whitfield*

Indeed, the text quoted at the top of this thread was posted by HP on their S&MB site. When I attempted to order another HP 35s directly from HP's S&MB site on August 2nd, that was the message HP posted.

I don't fabricate. And I'm not that creative.

I PLAGIARISED it word for word from HP.

### the biggest flaw of the 35s: lack of i/o

Message #1 Posted by [John Ioannidis](#) on 2 Aug 2007, 2:11 p.m.

With 32K of memory, things would be really bad if, say, the batteries fell off and I had to rekey everything.

How much can a mini-MMC slot or whatever it is that mobile phones use these days cost? Probably less than the silly zip case!

Still, I'm very happy that there exists again a usable RPN calculator.

/ji

Can't help with the micro-SD addition, but give CalcPro a call (800-677-7001) and order the 33s slip case (about \$11 + shipping); it's much more convenient than the zipper job.

Edited: 2 Aug 2007, 2:32 p.m.

Message #3 Posted by [Eric Smith](#) on 2 Aug 2007, 2:32 p.m.,  
in response to message #1 by John Ioannidis

I expect the rationale for not including a memory card slot includes many factors. Technical reasons include:

- 1) Not enough ROM space in the microcontroller to implement the FAT file system. (They could use the next larger version of the GeneralPlus chip, but it would cost more.)
- 2) Not enough RAM in the microcontroller to implement the FAT file system. A typical implementation of FAT, even if only one file will be open at a time, requires at least two sector's worth of buffer space (1024 bytes). The GeneralPlus chips don't have much RAM, even in the variants with lots of ROM. Off-chip RAM could be used, but it would take away from the RAM available to the user.
- 3) A few more I/O pins would be needed, and might not be available.
- 4) A regulated power supply would be required. The 33s and 35s run directly from the unregulated battery voltage, but the operating voltage range of the battery is not within spec for any of the SD and MMC variants.
- 5) Battery life would suffer unless components to switch power to the memory card were added, e.g., a PFET. Just using the enable input of a boost regulator isn't good enough, because it will still pass unregulated battery voltage through when the regulator is disabled.
- 6) Additional ESD protection components would probably be required.

7) The memory card socket itself isn't exactly inexpensive (possibly over \$1.)

Non-technical reasons:

8) They already make other calculators with memory expansion and I/O. The 35s is intended to be a low-end programmable, not high-end.

9) If it had expansion capability, it probably wouldn't be allowed on tests.

Adding a memory card slot might increase the BOM cost by as much as \$5, which might translate to a \$20 increase at the retail level.

### **Re: the biggest flaw of the 35s: lack of i/o**

*Message #5 Posted by [Gene Wright](#) on 2 Aug 2007, 2:33 p.m.,  
in response to message #1 by John Ioannidis*

Several people have explained reasons why this is probably not in the cards.

1 ) Testing. One of the biggest markets for the 33s (and presumably the 35s) is the testing market. Adding I/O to this level machine will promptly put it on the Not Allowed list, substantially lowering sales. For every one of us who would buy a machine because it had I/O, I'd expect 10 lost sales because of it not being on a test list.

2 ) Cost of the parts. Yes, it might only cost \$1, \$2, \$3 (have no idea) to put the I/O into the physical machine, but multiply that by the number of units made for HP's incremental cost then ask yourself how many incremental sales would occur to offset the cost (see item 1 in this list). That's a very tough sell to whomever reviews these decisions.

3 ) Architectural legacy. This is a machine based off the HP32S line (HP32s, HP32s2, HP33s). That line does not have an OS designed in any way for I/O. Makes it much more involved for the limited resources to design such a machine from scratch. So, what other projects might HP have in the works that they now have to delay to add I/O to the 35s OS and lower sales of the unit at the same time?

I just don't see this happening.

If we're going to get any type of 42s style machine with I/O, it will take a lot of doing and convincing.

Note that this does not make me happy, but I believe reality is usually important to understand. :-)

### **Re: the biggest flaw of the 35s: lack of i/o**

*Message #6 Posted by [Egan Ford](#) on 2 Aug 2007, 5:15 p.m.,  
in response to message #5 by Gene Wright*

The SPLB31A (<http://w3.sunplus.com/ShowFeature.asp?body=SPLB31A>) has a UART. A serial port is possible and may be easier than SD to implement. Without a case mod Bluetooth would be a possibility. If implemented as a serial provider only (i.e. PC -> 35s only), then this removes the possibility of 35s <->

35s for those concerned about cheating. Store the BT PIN in a register, connect with PC, dump/restore state.

## **lack of i/o is not a flaw**

*Message #7 Posted by [bill platt](#) on 2 Aug 2007, 5:24 p.m.,  
in response to message #1 by John Ioannidis*

Lack of I/O isn't a flaw at all.

This is the 1st calculator (rather than handheld computer) that HP has designed since the 27S/42s that has essentially \*unlimited\* memory within its paradigm of operation. That paradigm being programming and solving power for Ad-hoc programs.

I/O makes for a completely different paradigm.

In the 32sii, you had so little memory that equations would quickly use up the memory, so you'd have to erase ad-hocs or useful regular routines in order to do anything.

In the 35s you don't have to worry about that.

In the 33s, the equations were limited to 256 characters. In the 35s, there is no limit.

I/O is available in other (RPL) machines. No need to have it in a calculator.

The biggest flaws are doubtless:

1. No easy decomposition/composition of complex numbers 2. difficult to use base system 3. cos near 90 degrees 4. Others?

I wouldn't call lack of I/O a flaw at all.

## **Re: lack of i/o is not a flaw**

*Message #8 Posted by [Donald Williams](#) on 2 Aug 2007, 6:33 p.m.,  
in response to message #7 by bill platt*

"I/O is available in other (RPL) machines."

RPL based machines have too much "sweat equity" (learning curve) to attract users longing for I/O. TI and Casio have made this standard fare for their medium and high end calculators for some time. TI even has USB OTG on their TI 84 & 89.

The HP 50G attempt to provide I/O is quite simply inept. To blatantly advertise that port as "RS-232 capable" is unexcusable.

"No need to have it in a calculator"

This is news to all the HP 71 & HP 41 users who spent years writing programs and developing HP-IL portable systems for remote field work. These devices were referred to as calculators, but in many instances they were used as portable battery operated controllers. This capability greatly added to HP and RPN's widespread popularity and commercial success. The next generation replacement of the HP 41, the HP 48, was wholly unsuited to a controller task since it possessed only one serial port, which meant the controller could only communicate with one device at a time.

I think an RPN (not RPL) calculator with I/O and some controller capability would be widely appreciated

by the community. I know I have been waiting for the last 20 years to find something more capable than my HP 41 and HP-IL. I have an HP 35s and I know for sure that it will not replace it.

The next generation replacement of the HP 41, the HP 48, was wholly unsuited to a controller task since it possessed only one serial port, which meant the controller could only communicate with one device at a time.

---

It may be wholly unsuited to a controller task in terms of connecting DIRECTLY to multiple devices, but it's certainly more than capable of connecting to a device that acts as an HP-IL controller module.

The serial interface has been a defacto interface to just about any peripheral on the planet for 20-30 years. I think most users are much happier that they could connect their HP 48s to their PCs and heavens knows what else than having the ability to connect to HP-IL.

If HP-IL connectivity was that important to the community, a serial <-> HP-IL adapter would have shown up filling the gap. The power, capacity, and capability of the 48g series dwarfs the 41 by pretty much all measures, so I'd think there'd be a lot of drive to help the platform so folks could upgrade from the 41.

I mean, heck, today if you wanted a serial interface for devices, I think most folks wouldn't mind access to I2C anyways. And now, instead, we have USB.

The USB handles the 99.99% of cases where people want I/O on the calculator: saving and loading data and files from host computers. For the other .01% of folks, having the, albeit "weak", serial port is a cheap solution for custom interfacing. Interface direct to the signals and strengths it provides, or amplify them to make it compatible with the RS-232 spec. Boosting the signal is not difficult and I think it seems clear the compromise of having the weakened serial port is better than not having any serial, save USB, at all.

Quote:

Quote:

If HP-IL connectivity was that important to the community, a serial <-  
> HP-IL adapter would have shown up filling the gap.

It's been available for over 30 years: 82164A.

I got the FSA164A which is almost identical but has two RS-232 ports on it and, for those who didn't mind the extra cost, could have up to 8 RS-232 ports on it.

To comment on several other posts above and below this one: I also got the HP82169A HPIL-to-HPIB (IEEE488) interface converter. HPIL was basically a serial implementation of HPIB, and with the 82169A, the thousands, yes, thousands, of different models of lab equipment instrumentation available with HPIB interfaces appeared to an HPIL controller to be on the loop. The commands were the same.

As the entire engineering department of a tiny six-person company, I set up our first automated production testing using the HP-41cx as the controller, having a half dozen pieces of equipment connected, most of it rented, and running a 20-page program. At the time, I and my wife lived in a small apartment, and, although the test equipment at work was large and heavy and AC-powered, it was very practical for me to take just the 41 back and forth between home and work in my attache case and work on programs or other things with it, without having to have a bigger computer at home. It was also much quicker to get a test set-up going with the 41 than it was with a PC anyway.

As the company quickly grew, the 41 was replaced with an HP-9000-series 68000-based computer; but since the controller spent time waiting for filters to settle and instruments to respond, the bigger computer's speed was less than double that of the 41, the boot-up and load time were very long (unlike the instant-on 41), and it took longer to re-write the test program for the bigger computer than it had taken for the 41.

My lament about USB is that contrary to its name, it is not a bus, and one port can only go to one device unless you use external hubs. That's pretty mickey-mouse if you ask me. Sure it's a lot faster than HPIL, but the HPIL idea could have been taken to much greater speeds too if allowed to grow with technology.

Yes, and I think this made some of the other divisions unhappy. I am convinced that in the case of HP-IL that little Corvallis group was a victim of its own success. I think they stepped out of the bounds of their "charter" and cut into the sales of desktops, which probably had a higher profit margin.

If HP wanted to, they could have easily integrated HP-IL on the HP 48G, but instead they "dumbed down" the I/O, stopped the sales of HP-IL peripherals and discontinued the battery operated instrument line.

The proliferation of those HP 41 controllers were like mushrooms in the desktop garden. I think the demise of HP-IL was deliberate and intentional.

"If HP-IL connectivity was that important to the community, a serial <-> HP-IL adapter would have shown up filling the gap."

Not exactly true. The HP-IL story is kind of ugly. If you recall the HP 41 and HP-IL devices ceased production shortly after the introduction of the HP 48. I believe this was a conscious and perhaps prudent decision by HP to move their user base over to the new paradigm product. Here is the caveat you may not realize. The HP-IL bus was proprietary. HP refused to support it ( stopped production), refused to license it (force customers to adopt our new product), and refused to put it in the public domain(at least at the time. I actually don't know the current status). If you were accustomed to the advantage of controlling up to 31 devices on a bus, HP's answer was - Tough Luck! Needless to say the only survivors of that market segment were the surveyors who only need to talk to a one device (a theodilite) at a time.

HP-IL would of course be inadequate in todays enviroment. It is however, unfortunate that the interface was abandoned. I am sure if it had been allowed to mature and improved it would still have many adherents today.

---

Perhaps, I don't know. I would argue that it suffered a premature unnatural death rather than a natural death. I could find no evidence of lagging sales or excess inventory in the supply channels. I recall that, in fact, parts were back ordered most of the time. This was also about the same time decisions about operations moving to Singapore were probably being made, and I am guessing that HP-IL products and support did not make the transition cut. I suppose some tough decisions had to be made at that juncture.

Were microcomputers a threat? Certainly.

Was the market place better served? Well, served at least, but better served is perhaps in doubt.

Which begs the question "Does the market place know what it wants?" Well no, not always. I don't think the market place anticipated or wanted things like the HP 35, or HP-IL, until they saw it. I think both ideas were so new and bold that neither one could have survived a focus group or marketing survey. If the published history is correct it was a simple matter of someone just saying " build it".

Sorry, please excuse the ramblings. I am just an old guy wishing that things were like they used to be.

The answer is of course a resounding NO! Markets only exist after ideas, not before them....

**Re: lack of i/o is not a flaw**

*Message #19 Posted by [Dave Shaffer \(Arizona\)](#) on 3 Aug 2007, 4:32 p.m.,  
in response to message #15 by Donald Williams*

Somewhere along about this time, HP developed the HP Interface Bus (HPIB) for controlling the broad line of HP scientific instruments (counters, spectrum analyzers, etc.). This was pushed on the community as a broader standard and became IEEE 488. It was PC compatible (you could buy interface cards, or talk to an HP interface box with your RS232 serial PC port - which all PCs had at this epoch), and you could also control many, many instruments because each had its own address (usually set with rocker switches on the instrument).

This was for serious control and data gathering, with data amounts and speeds way beyond what you would/could want to do with a '41 and HPIL. And the "product" was in your PC when you wanted to analyse it. I have no idea if there was any kind of HPIL<->HPIB interface hardware.

**Re: lack of i/o is not a flaw**

*Message #20 Posted by [Donald Williams](#) on 3 Aug 2007, 5:32 p.m.,  
in response to message #19 by Dave Shaffer (Arizona)*

Yes there was an HPIB to HPIL interface. I happen to have 2 of them. You could think of an HPIL bus as a slower cousin to HPIB, but with a ring topology. The commands went from the controller around the ring, and then back to the controller. I have used an HP-41 as an HPIB controller, but it is not appropriate in most situations. HPIB instruments usually require AC power. HP-IL was primarily focused on battery powered instruments.

If you are unfamiliar with the bus or more interested see

<http://en.wikipedia.org/wiki/HP-IL>

It was quite sophisticated and well supported with instruments at one time.

*Message #21 Posted by [Will Hartung](#) on 4 Aug 2007, 2:59 a.m.,  
in response to message #15 by Donald Williams*

But in truth, HP-IL really wasn't abandoned. The names have changed, the protocol has shifted, but the functionality remains and had gotten much, much, better.

I don't think anyone praised HP-IL on its protocol, but rather it's format and functionality. Like the ability to control several devices on a single bus.

If anything, today, they'd lament one of it's physical aspects: the loop. Having to loop the equipment would probably be off putting to some folks, much like we used to have to terminate ethernet cables or tap those thick nasty cables at specific intervals. Compared to today's RJ-45 jacks and twisted pair, no one is looking back and saying "them were the days".

But serial protocols flourish today, and are the dominant form of communication by a wide margin. And, whoo boy, are they fast. Offering all of what HP-IL offered and more.

So, HP-IL itself may be dead, but it's spirit lives on and shines bright.

Calculators are spectacularly challenged today. The amount of power available today is astounding, but it's the form factor of the calculator that keeps us coming back.

I mean, look at the iPhone. That thing has 700MB of software on it. 700MB! For a PHONE!

But it can't do what this 35s does, I/O or no I/O. It has no staying power, needing to be recharged often. And it's got a lousy form factor compared to the 35s. No doubt someone will come out with some kind of better calculator application for it, but no one will use it. Anyone who's serious about using a calculator for anything more than calculating a dinner check will get a real calculator. The 12C sells for a reason.

And you won't see the vertical applications for the iPhone like you do calculators, particularly HP calculators. Notably solution packs, or things like surveying, etc. Again, the platform doesn't work. Do you see workers taking the iPhone in to the field? Middle of a dusty plain, trying to make it function with gloves on? Nope. No way. Buttons are good. Calculators are strong, they're durable. They're also cheap.

Folks will be using their 35s 10 years from now. The iPhone will be dead and in the landfill by then (and, well, maybe the Smithsonian, but that's a different topic...).

Today there is a lot of motivation that folks feel like they need to cram everything they can in to the "hand held computing device". I think the high end calculators of today really take it about as far as it can go. They'll never stop surprising me of course. They can always make them faster. Add more capacity, etc. The motivation is there because it's so easy. CPU horsepower is practically free today.

I recall when the Game Boy Advanced came out. They wanted to be able to play original Game Boy games on it. But the GBA was an ARM chip, and the GB was a Z80. Did they give up? No. Did they emulate a Z80? No. They bundled a Z80 core into the machine. What's a Z80, 10,000 transistors? Pah! Childs play today. Drag and Drop in a VLOG editor. And that's cheaper and faster than the FLASH space for a Z80 emulator.

Calculators tho, they have to achieve balance. I look at some of the Casios at the local Office Mart. Solar powered, immortal, large LCDs, a zillion functions, and -- wait for it -- and ONE memory register. ONE! Uno! M+, M-, MR, MC. WHAT??? You can perform quantum physics on this thing but only save one value? What are they thinking?

Well, for one, they're \$10. For another, that's what their market does. They do calculating, not so much computing. Kids doing homework. Sold by the pallet with free pencils.

The 35s is all about balance. As someone else mentioned, it's got as much memory as it needs. It simply, as architected, can't use anymore. All of the machine limits hit at 32K. And that memory is designed more so for macros, really, than applications. Shortcuts folks incrementally develop for the machine as they use it. For folks who go "Boy this calculation is a bear, it would be nice to not have to do it again", and sure enough you really don't have too (well, once more as you type it back in). Keystroke programming is the classic "watch me" macro recording process.

But kids doing homework, they're not redoing calculations. They do "work" with a calculator as much as they do exercises. And most of them will praise the day that they don't have to do ANY calculation again, much less the SAME calculation again. So, programming is much less important.

I do agree that it would be a shame to have a lot of work in the machine and lose it to a battery failure. It would have probably been nice to have a back up button battery. I imagine it has SOME lifespan without the batteries (I know my 15C is like that, to survive battery changes), but for safety, it would be nice to have some back up like that.

32K of RAM is a not really a lot to type back in, but it's a lot to lose.

I love my 48gx and 49g. Just incredible machines. I love the 15C, it's form factor is, bar none, the finest ever. It's handiness and perfect "thumbabiity". Unfortunately, the 15C form factor can't handle the bigger LCD, or take more buttons (even tho the 15C had 3 less than the 42S). So, they just can't seem to cram as much as is necessary (apparently) today in to a 15C form factor.

I think form factor of the 35s is pretty good, and it's lack of I/O is not an issue. It's a calculator in all its glory (though the infrared printer would have been nice).

Its hard today to keep a calculator a calculator. Designers can pretty much do anything they want with the days technology, but go too far and you end up with something that's not a calculator. It loses its focus and comprimises what a calculator is used for by the people who use them. And that's a crime against both the users and the calculator.

The 35s is a calculator, and boy does it seem like a really nice one.

I wouldn't call lack of I/O a flaw at all.

\_\_\_\_\_

Opinions differ, obviously. I don't think the lack of I/O is a flaw in the HP-35S *per se*. That's because the calculator is aimed at a specific market in which I/O is forbidden. But I pine for a modern, RPN calculator

without the obvious compromises that constrain the HP-35S. It's no doubt a vain hope, but I'd like to see a flagship scientific in the niche the HP-41 used to occupy, at the top of the product line. In *that* machine, lack of I/O would definitely be a flaw.

Regards,  
Howard

**Use of newer, very high power calculators?**

Message #1 Posted by [Brad Davis](#) on 2 Aug 2007, 12:22 p.m.

I have what might be kind of a strange topic. This is one of those pointless "around the water cooler" topics, LOL, but I'm stuck at home babysitting today and am bored.

The TI Nspire thread got me thinking about this. I went and watched the demo videos for that calculator and I have a new HP50g.

Am I the weird one because I don't really see the usefulness of many of the advanced features of these calculators? I watched the TI videos and really couldn't see a single one of their fancy features that I would ever use. I bought my 50g because I've had my 48S for about 8-10 years and was just bored and wanted a new toy.

I have Matlab, Mathematica, and Mathcad on my notebook computer and I can guarantee that they do a LOT better job at displaying plots, running programs, FFTs, manipulating algebraic expressions, etc. I can also print results, copy results into technical reports, etc. using those programs.

I use my calculator when doing manual calcs, usually to understand a topic well enough to program it or check someone else's program. Programming my calculator would defeat this purpose because I learn what's going on by watching how the numbers come out the old fashioned way. The only advanced function I use is the occasional definite integral during virtual work calculations. I basically want my calculator to be screamin' fast at punching through big hairy equations with lots of nested radicals and other crazy stuff. The extreme superiority of RPL is why I use HPs.

As background, I'm a structural engineer (research-oriented, not design any more) in my mid-30s. In the past, mostly in undergrad, I spent time programming my (then) 28S and 48S. Turns out that I think that was a mistake too. It helped my grades, but I am not as good at doing a lot of that stuff by hand now as I should be.

Anyway, maybe I'm missing something: some other way to use my HPs to be more efficient. Do you guys use the more advanced features? How and why do you use them instead of tools on your computers? Maybe I can learn something from how you use it.

Message #2 Posted by [Don Shepherd](#) on 2 Aug 2007, 1:00 p.m.,  
in response to message #1 by [Brad Davis](#)

Hi Brad.

At the risk of drawing ire from those who think that calculators have no place in the public school math classrooms, let me tell you why some educators see their value. The simple fact is that many kids just don't get the math, despite teachers' best efforts at teaching it. Some kids may come to understand slope a little easier if they can see the graph of  $y=2x$  and see how the slope changes as they drag the equation line to different angles, which the TI Nspire lets them do. Or they may understand the relationship between a circle's circumference and diameter if they draw a circle and make it bigger or smaller by dragging it and seeing that,

while circumference and diameter change, the relationship between them ( $\pi$ ) stays constant. Some kids learn graphically, and the Nspire builds upon that. I don't think the Nspire is terribly useful outside of the educational environment, but it certainly has value within it, in my opinion.

It's just another tool, but it helps some kids learn.

### **Re: Use of newer, very high power calculators?**

*Message #3 Posted by **Ed Look** on 2 Aug 2007, 1:26 p.m.,  
in response to message #2 by Don Shepherd*

Don, that may be true, what you said about seeing the slope of a line as you drag it all around the x-y plane, but it is still better to give the kid a pencil, AN ERASER, and ample paper to plot the equation and then mathematically tweak the equation and then plot it manually to see the changes... and there is great value in making mistakes, too! You then get to see how things do vary with whatever and the limitations of methods and techniques.

I know, I know, what (American) kid today will sit and do all this? Even "back in the day" we actually hated it and wished for one of those computers like we read about in science fiction stories to make homework easier. I only know the value of that old fashioned stuff now.

### **Re: Use of newer, very high power calculators?**

*Message #4 Posted by **Brad Davis** on 2 Aug 2007, 6:49 p.m.,  
in response to message #3 by Ed Look*

Ed, I see this more as you do. TI's new toy is obviously intended to maximize the visual aspects of learning. I'm not so sure this is a good thing.

I attended a teaching workshop a few weeks ago and learned about learning styles. One of the major learning dimensions is the visual<--->verbal dimension. Most modern students apparently lean heavily toward the visual end and have great trouble learning from verbal input only. This shows up partially in the lecture style and the newfound desire to get as much visual input as possible. Traditional lectures are probably 90%+ verbal. I guess that PREVIOUSLY worked ok. We all like to see pictures and diagrams, but apparently, modern students are skewed VERY far toward the visual side. One of the strategies in our workshop was to try balance out the students' learning styles, not just go with whatever style they learn best with.

I'd speculate that the shift away from verbal learning styles probably goes back to what kids do nowadays. I am just barely old enough to NOT have had more than 13 channels on the TV and Pac Man was about as good as the video games got. I read literally dozens of books by the time I was 10. We really push reading for our son, but I'm sure he hasn't read 1/4 of what I did years ago. There's just too much other stuff to do.

Just like estimation skills dropped dramatically when the HP35 replaced slide rules in 1972 (or so my advising professor says), so will the ability to learn from verbal stimuli. I'm not a doom-sayer, but one has to wonder where all that ends up someday.

### **Re: Use of newer, very high power calculators?**

*Message #5 Posted by **Don Shepherd** on 2 Aug 2007, 9:53 p.m.,  
in response to message #3 by Ed Look*

Ed, the trick is getting the kids attention. I guess that's always been the trick. In today's classrooms, we teachers are competing against Walkmen (oops, I guess I'm out of touch), Ipods, cell phones, xboxes,

now iphones, all kinds of (in our opinion, I'm sure) crap. But that's the world of many of these kids, and if we can capture their attention with a calculator and teach them some math in the process, so be it. It's just another tool, like my electronic Jeopardy game I use to review units with them.

So many kids don't know the basics, and I try to teach them, but I don't reach every kid, unfortunately. I was a software guy for 28 years then went back to school to become a middle school math teacher. I would not recommend that to any of you engineers out there who are sick of status reports and unit meetings, however. The reality is this: if you are a principal, would you hire a new teacher fresh out of college with a BA who will make \$24,000 per year, or a guy like me with 2 Masters degrees who must make (according to the salary schedule) \$45,000 per year? Had I realized that reality a couple of years ago, I might have made a different choice.

**Re: Use of newer, very high power calculators?**

*Message #6 Posted by [Ed Look](#) on 2 Aug 2007, 10:37 p.m.,  
in response to message #5 by [Don Shepherd](#)*

Ah, Don, I only teach my kids at home... well, I try to. I do teach college level chemistry and physics, but even there I see this very frightening erosion of:

estimation skills, calculational skills, increased difficulty with things abstract

GameBoy, Xbox, PS2, TV, even calculators add to this. I truly wish the elementary and middle school... even high school curricula would just resist scratching the itch and not include the use of calculators.

There was once here a very bright high school poster to this board, Ben Salinas, I believe, but kids like that are rarer than we'd like to think, and yes, he and some of his friends benefited from using HP 32SII's, 49G's, etc., as they already knew how to handle equations, integration, problem solving, etc. But most other kids will simply use it... and the computer... to lighten the load and skip the drudgery, without realizing that the drudgery IS the gold.

If I'm honest with myself, I'd admit that at that age, even though computers were room-sized affairs, home computers were science fiction, and video game???... you mean pinball down in the arcade? ... I'd just use an electronic calculator as a crutch, just like that.

Fortunately for me, I first was able to obtain (at great personal cost; my folks were not interested in paying relative megabucks for this calculating thing) a calculator very late in high school and did not get my programmable scientific HP until college. At least by then, I wanted to learn stuff. But earlier? I was a kid, like today's.

My vote- calcs out of school until late high school.

**Re: Use of newer, very high power calculators?**

*Message #7 Posted by [Don Shepherd](#) on 2 Aug 2007, 10:50 p.m.,  
in response to message #6 by [Ed Look](#)*

Ed, I graduated high school in 1968, before calculators hit the market. My first was a Victor MEC portable, 12 digit LED, 4 functions with memory, probably cost \$300 around 1970. Ah, those were the days. But you are right, if I had had it in high school I surely wouldn't have learned as much.

**Re: Use of newer, very high power calculators?**

*Message #8 Posted by **Ed Look** on 2 Aug 2007, 1:15 p.m.,  
in response to message #1 by Brad Davis*

Ah, the use of particular features is most often strongly influenced by your background and needs. I am a chemist, research and some teaching, and while I bought my HP 32sII for an industrial position, it turns out that its demands on the 32sII were not nearly what I expected. Research seemed to make somewhat heavier demands and for me requires the use of most of the features I think folks here ordinarily use, as the trig functions, light to moderate use of the statistical functions, light to medium programming for spot calculational needs for specific problems. Any conversions I need are not pre-hard wired in, so they have to be programmed in, though I'd hardly call that programming, use good use of the constants library :) . Granted, the mathematical and plotting programs you mentioned are of a different league, a (especially a recent model) HP calculator weighs almost nothing and are conveniently small.

Anyway, I am more used to banging it out on a (RPN) calculator than setting up a program on a computer (from the days of long job submission lines to the central mainframe) and so if I don't have some huge set of hairy equations good only enough for theoreticians, my first impulse is to reach for the calculator, even if I have to do some medium to heavy programming.

Soooo... I use the program functions and memory registers quite a bit, trig and stat functions, constants library, and I have yet to master the use of storing and using equations in the equation library, as that is newer to me... but it's my next target to acquire!

### **Re: Use of newer, very high power calculators?**

*Message #9 Posted by **John Ioannidis** on 2 Aug 2007, 2:29 p.m.,  
in response to message #1 by Brad Davis*

I agree that students have different uses for a calculator than "professionals". There appear to be lots of niche markets for professional calculators, that sell quite cheaply. There are even calculators for cooks, and that can't be that big a market!

Rather than try to produce the end-all-be-all of calculators, or end up with compromises that will annoy someone, why not produce a blank calculator (I'm thining HP-41 Opt 001, here, aka "Blanknut"), and an application to mix and match your own functions (and hopefully write your own in "mcode", or whatever it's called these days), print an overlay (offer it as a service for \$5-\$10 a piece?), and you're done. The 35S seems to have gotten the form-factor almost right: a double-width ENTER key, clicky keys, arrows, high-contrast colors, a more-than-one line display.

I \*love\* the calculator form factor. I love the programmability, but I find most user-level programs to be too slow. And I never use 90% of the functions.

That's what I've done on my new calculator design. The keypad overlay is completely replaceable.

Don't like the key arrangement I picked? - change it. Want Algebraic instead of RPN? - change it. Don't like how the soft key menus work? - change it.

It's just a bit of code and a new keypad overlay in any case.

Dave.

*in response to message #1 by Brad Davis*

Brad,

Couldn't help to reply when I read about your background. I'm a structures guy too. I'm currently in aerostructures, and have fallen into a similar trap (ie. less proficient in hand-calcs due to the past lure of programming it in to excel on exams).

I most appreciate being able to hammer out convoluted expressions on my old 32sii...and never need to concern myself with missed keystrokes, etc.

I'm leaving my job here for two years worth of graduate research funding in VA. Specifically, I'm tied to AOE at VT, but will be doing my work in Hampton. I'll be working on my aero M.S.

I'm very tempted to shelf my 50g in favor of my 33s (or 35s when I can finally get my hands on one!)

From your profile and post, I'd be tempted to guess you're at VT? If so, perhaps our paths will cross at some point!

Yep, you guessed it! I'm at VT doing research. Good luck w/ your program. I'm sure it will be fun.

### **Re: Use of newer, very high power calculators?**

*Message #13 Posted by [DougT](#) on 3 Aug 2007, 9:44 a.m.,*

*in response to message #11 by ECL*

Yet another VT AOE Structures guy here! As much as I appreciate its capabilities, my 48GX tends to gather dust in my HP collection. For years I've been using a beat-up 11C at work. Now a new (non-crooked LCD) 35s is on my desk. I'd love to use the 15C I bought while at school in the early '80s, but it's too valuable to expose to Diet Coke Big Gulps, hydraulic fluid, etc.

For my application of high-tempo aerospace repairs, a simple RPN programmable scientific can't be beat. If it gets too hairy for hand calcs and short programs, I pass the problem to the Stress group and move on to the next forest fire...

### **Re: Use of newer, very high power calculators?**

*Message #14 Posted by [Matt](#) on 2 Aug 2007, 6:49 p.m.,*

*in response to message #1 by Brad Davis*

Good question.

I guess it depends on your line of study/work.

I find I have little use for calculators or computers in relation to my studies.

The 50G is a capable machine. But it won't help me with the kind of eg, Sturm-Liouville, problems I need to solve.

I found Mathematica to be little help with complex integration and infinite Fourier series.

The TI-Nspire seems very good at showing relationships. But, if you don't 'get it' by looking at the equations, then maybe you are on the wrong course.

I think that's enough.

---

If you're weird then I am too! I'm an electronics design engineer and have essentially zero need for a programmable calculator. The most complex feature I ever use is the solver.

That is why my daily use calculators are (and have been for the last 20 years or so) simple scientific's like the HP20S or Casio's like the FX-61F, 991ES, FX-100 type etc. My programmable 28S and 48SX sit in the draw gathering dust because they are next to useless for daily use.

That is why I'm pretty disappointed that the new 35S is optimised as a programmable calc. So those who want all those basic scientific functions on primary keys miss out big time.

Dave.

### HP35s Vector Data Entry Bug?

Message #1 Posted by [Charles Bennett](#) on 2 Aug 2007, 11:38 a.m.

I've gotten my 35s into a state where pressing:

g [] 2 f , 2 enter

yields SYNTAX ERROR with the cursor on the start of the second 2.

I can enter single-element vectors but absolutely no-go on 2D or 3D.

RPN, RAD, FIX 4 modes.

Has anybody else gotten here?

### Re: HP35s Vector Data Entry Bug?

Message #2 Posted by [Gene Wright](#) on 2 Aug 2007, 12:24 p.m.,  
in response to message #1 by Charles Bennett

Someone posted that they had seen this on their 35s.

Following the procedure in the manual to reset the calculator (in an appendix I think) seemed to fix the problem.

Give it a try. Note that you will lose any programs and data...

### Re: HP35s Vector Data Entry Bug?

Message #3 Posted by [Matt](#) on 2 Aug 2007, 2:29 p.m.,  
in response to message #1 by Charles Bennett

I can't replicate the error on mine.  
[Others](#) have mentioned vector problems.

### Re: HP35s Vector Data Entry Bug?

Message #4 Posted by [Rafael Millán](#) on 2 Aug 2007, 3:35 p.m.,  
in response to message #1 by Charles Bennett

I had the same problem once. The 35s didn't accept 2- or 3-dimensional vectors. It did accept 1-dimensional vectors however. The problem went away without resetting the machine. I don't recall doing anything harder than clearing the stack and entering/exiting program mode.

Surely unrelated, but the next day I saw a "LBL ;" at the top of the program catalog. I deleted a line "0001 RTN "(three zeros) I was not aware of, and the label went away. I tried re-entering the line, but the label didn't reappear.

Mysteries to be unveiled...

R.

### **Re: HP35s Vector Data Entry Bug?**

*Message #5 Posted by [Katie Wasserman](#) on 7 Aug 2007, 1:50 a.m.,  
in response to message #4 by [Rafael Millán](#)*

There does indeed seem to be a vector input bug. I just found that I can enter 1-D and 2-D vectors but 3-D vectors now give a syntax error. They had been working fine up until now.

The only way I've found to fix this is a full memory reset. I'm trying to figure out the circumstances that lead to this bug but so far no luck.

### **Re: HP35s Vector Data Entry Bug?**

*Message #6 Posted by [Thomas Radtke](#) on 7 Aug 2007, 4:19 a.m.,  
in response to message #5 by [Katie Wasserman](#)*

Mine originally worked. I just tried after reading your post and also got this SYNTAX ERROR. Clearing all variables helped.

### **Re: HP35s Vector Data Entry Bug?**

*Message #7 Posted by [Charles Bennett](#) on 8 Aug 2007, 9:38 a.m.,  
in response to message #5 by [Katie Wasserman](#)*

I had this problem for a while. Clearing program memory set me straight.

I tried reentering my programs to try to reproduce it but it hasn't come back.

I know it's a real bug. I had thought it might be related to having programs with literal vectors being built from stack elements (REGX, ..., REGT) in EQN statements but that intuition is not panning out. Unless it's that \*and\* something else.

### HP withdrawing HP35S

Message #1 Posted by [Chris Dean](#) on 2 Aug 2007, 11:00 a.m.

I have had a HP35S on order from Samson Cables and I emailed them to find out when it is being delivered. They replied quickly saying

Quote:

Yesterday HP announced that the 35S calculator is being pulled off the market while a minor design flaw on the faceplate is being corrected. If you have already paid for your 35S, your PayPal or credit card account is being credited for the purchase. We will re list the 35S when HP again releases it for sale.

I have posted this to inform other buyers and to find out if anybody has noticed this design flaw. I now feel pretty cheesed off as I was eagerly awaiting my new calculator.

Regards

Chris

### Re: HP withdrawing HP35S

Message #2 Posted by [Katie Wasserman](#) on 2 Aug 2007, 11:19 a.m.,  
in response to message #1 by [Chris Dean](#)

Although I haven't seen any other mention of this, I guess that a lot of people are finding that the LCD display is not aligned with the faceplate. I sure hope that they take this stop in production to fix some of the firmware issues with this machine but I doubt that they will.

It figures that this would happen today just as the HP-35s made it into the [NY Times](#). Wouldn't it be great if HP issued a recall notice to fix \*all\* the problems with the 35s like they did with the original HP-35 and the trig/log bugs -- then they'd have a real anniversary calculator!

-Katie

### Re: HP withdrawing HP35S

Message #3 Posted by [BruceH](#) on 2 Aug 2007, 4:15 p.m.,  
in response to message #2 by [Katie Wasserman](#)

"... minor design flaw on the faceplate..."

Perhaps HP have just realised they forgot to put the words "Anniversary Edition" on it?

;:-)

## Re: HP withdrawing HP35S

Message #4 Posted by [Katie Wasserman](#) on 2 Aug 2007, 5:08 p.m.,  
in response to message #3 by BruceH

Quote:

Perhaps HP have just realized they forgot to put the words "Anniversary Edition" on it?

Maybe they'll do exactly that when they fix the alignment problem. If HP's statement of "a small percentage" of calculators being affected is true it can't just be the missing words. This would, of course, make the existing non-anniversary labeled calculators quite rare and 35 years from now they'll be selling for zillions on ebay! :)

## Now, any halfway-decent conspiracy theorist might suggest . . .

Message #5 Posted by [Paul Brogger](#) on 3 Aug 2007, 10:49 a.m.,  
in response to message #4 by Katie Wasserman

. . . that, in an attempt to reestablish H-P's quality cache` of yore, their marketers *deliberately* introduced some problem units, and then issued a recall before such would be too costly.

Results: A couple of weeks' interruption in sales; mostly-positive publicity about H-P's "return to quality"; and minimal risk of actual returns from the maniacal early adopters.

(But it's probably just a problem with their Chinese supplier. Anyhow, I gotta keep those conspiracy-formulation muscles toned up & ready for action!)

Hallo Chris!

Would that mean, that the HP35s delievered till now, are collectables in some years? ;-) Great deal, or?

Greetings Juergen

**Re: HP withdrawing HP35S**

Message #14 Posted by [Matt Kernal](#) on 2 Aug 2007, 2:10 p.m.,  
in response to message #13 by Doctor Bubu

I'm going to be brutally honest in the next paragraph:

Because I don't have a pressing need for one, I was going to wait on buying a 35S until after next month's HHC2007 to see if I would end up with a freebie 35S from HP. At two of the three previous HHC's I've attended, HP gave attendees free calculators (the original 49G in 1999, and 25th. Anniversary 12CP at last year's conference).

But now, with today's withdrawal of the 35S, I noticed HP Shopping, Samson Cables, and Buy.com are Out-of-Stock. Amazon.com doesn't list the 35S either (don't know if they ever did).

So I just decided to take my chances, and ordered one from Walmart.com while they are still In Stock.

Am I shallow (greedy, presumptuous) or what? Take your pick :-)

Matt

### **Re: HP withdrawing HP35S**

*Message #15 Posted by [Jeff O.](#) on 2 Aug 2007, 7:45 p.m.,  
in response to message #14 by Matt Kernal*

Quote:

So I just decided to take my chances, and ordered one from Walmart.com while they are still In Stock.

I briefly considered doing the same, but restrained myself. One "collectable" unit ought to be enough, plus I'm still a little honked off that Walmart raised their price \$10 to capitalize on the early demand.

Quote:

Am I shallow (greedy, presumptuous) or what? Take your pick :-)

No, just hopeful, I'd say. HP set the precedent, after all. Actually I figured they'd had out ones with the "Celebrating 35 Years" written on them to the HHC attendees.

### **Walmart's Interactive 35S Image**

*Message #16 Posted by [Matt Kernal](#) on 2 Aug 2007, 8:49 p.m.,  
in response to message #15 by Jeff O.*

Quote:

I'm still a little honked off that Walmart raised their price \$10 to capitalize on the early demand.

I didn't realize that! >:-)

While squeezing HP for the lowest possible wholesale prices (as they do to all their suppliers - or so the legend goes), I assume they paid somebody for this zoomable, panable image of the [35S](#). I don't see any cosmetic flaws in this picture.

But certainly not worth the extra \$10 surcharge/price-of-admission.

If Walmart pulls the 35S before I get mine (maybe they already have - but their web designers haven't got the word yet), I'm no worse off than before I placed the order. Actually, I am worse off - now they have my personal/financial info.. the \*#@\$?%'s!

In reality, I hope the \*real\* reason for HP pulling the 35S is to fix some software issues, with the anniversary silkscreening reason being a convenient cover to buy some time for bug extermination.

Still shallow,

Matt

p.s. Walmart's image reminds me of something.. did Gene ever come clean on that 35S emulator he's using?

## Re: HP withdrawing HP35S

Message #17 Posted by **Karl Schneider** on 2 Aug 2007, 7:59 p.m.,  
in response to message #14 by Matt Kernal

Hi, Matt --

Quote:

Because I don't have a pressing need for one, I was going to wait on buying a 35S until after next month's HHC2007 to see if I would end up with a freebie 35S from HP.

I considered that approach, too, but wanted to have one so that I could prepare feedback in time for the HHC conference.

On Tuesday, I checked with local retailers, who didn't know when they'd be getting them on their shelves. So, I ordered one directly from HP with two-day shipping, and received it today via Federal Express (FedEx), on my doorstep while I was gone.

The timing may have been fortuitous. I guess Tuesday was the last day to get one from HP!

Mine has no conspicuous cosmetic flaws; the display is only very slightly misaligned.

-- KS

## Re: HP withdrawing HP35S

Message #18 Posted by **Matt Kernal** on 2 Aug 2007, 8:55 p.m.,  
in response to message #17 by Karl Schneider

Karl,

Can we presume a full, thorough report on your new 35S is forthcoming (or whenever you can get around to it :-)

## Future "report" on HP35S

Message #19 Posted by **Karl Schneider** on 3 Aug 2007, 2:29 a.m.,  
in response to message #18 by Matt Kernal

Matt Kernal posted,

Quote:

Can we presume a full, thorough report on your new 35S is forthcoming (or whenever you can get around to it :-)

I suspect that I'll prepare some detailed material and suggestions that mainly focuses on the troublesome complex-number and base-number functionality, and transmit that information to HP personnel (hopefully with discussion) at the HHC conference.

-- KS

### **Post-Recall purchase of 35S has been "Shipped"**

### **HP35s red dot for sale**

*Message #21 Posted by [Nenad \(Croatia\)](#) on 2 Aug 2007, 3:03 p.m.,  
in response to message #13 by Doctor Bub*

Yet have to see yet where the "red dot" is located (when HP announces this) and then **she** goes for \$1500.

Second thought: this is the first one that crossed Croatian border, no cosmetic flaws, perfectly aligned LCD display, only a minor flaw: slightly slanted serial number label (but due to the lack of P-R conversions cannot calculate the actual slant angle). She goes for \$15000 (minus 5% for the mentioned flaw).

Third thought: I am an HP calculator addict, so I will not part with her at any price.

End of story.

### **Re: HP35s red dot for sale**

*Message #22 Posted by [Gerson W. Barbosa](#) on 2 Aug 2007, 6:54 p.m.,  
in response to message #21 by Nenad (Croatia)*

Quote:

Interesting. It would be nice if somebody would post a photo of one of the defective 35s's.

**Re: HP withdrawing HP35S**

*Message #28 Posted by [Ed Look](#) on 2 Aug 2007, 1:33 p.m.,  
in response to message #27 by sjthomas*

Well, I wouldn't dream of returning my 35s, as it seems to work just fine and looks great, though if I stare at the annunciator line with the last (right most) manually activatable annunciator on, it does seem to leave less space between the top of the characters and the upper window edge than with the RPN (left most) annunciator.

The difference is not really even worth mentioning, except that the topic has come up now in this way.

However, my case is defective though; one of the straps inside came only partly sewn on to the edge on one side. Fortunately, the real defect was not with the calculator itself.

**Re: HP withdrawing HP35S**

*Message #29 Posted by [Chris Dean](#) on 2 Aug 2007, 1:55 p.m.,  
in response to message #28 by Ed Look*

I suppose the units you all have are collectors items already!

Quote:

\_\_\_\_\_  
Maybe they were supposed to put "Celebrating 35 Years" on all of them?  
\_\_\_\_\_

I tend to lean towards this logic. I think it definitely qualifies as a "minor design flaw on the faceplate" although I would've left out the word "design." I'm not sure about the display alignment problem people mentioned in the other posts as the HP of today would not be that quick or responsive to fix such a problem even if it exists. For one thing, there aren't enough units in the hands of users yet and you know they wouldn't do anything unless there's a large outcry about it. Think "early HP-49g+'s keyboard."

I think they were shipping the early units without this "all-important" phrase. Mine doesn't have it (I got it last week). It would be like shipping the 25th Anniversary version of the HP-12C without the "25th Anniversary Edition" phrase painted on the faceplate.

Another thing, on the back of the 35s it said "Product of China" in English. All the other languages (French, Spanish, Portuguese) roughly translated to "Made in China". I don't know if this has to do with anything. I'm no linguist or semanticist but I think there's a difference between something being a "product of" a country and "made in" a country.

John

### Article?

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 2 Aug 2007, 4:10 a.m.

Well, I suppose my request was buried too deep into [this](#) thread, so I'm gonna repeat it here.

Some time ago (at least one year) I posted into this Forum some notes about integer division on the HP-33s, noting there was something wrong.

Probably these notes resounded in someone's ears, and this someone (attributing the article to me) reported my observations onto the Datafile review as an article ("Integer Division On The HP 33S", HP33S, Antonio Maschio, V25N4P12).

I wasn't contacted for this, but I won't complain, since it's an honor for me and I'm grateful (dead) to this guy.

But as for this, I'm curious to see:

- 1) the format of the article
- 2) its real content
- 3) **\*\*\*My name in front of it\*\*\* !!!**

I'm human, after all!

So please: could anyone having a copy of this review set a link to a downloadable pdf page in which this article appear? One page only. The page.

-- Antonio

P.S. Well, excuse me for the Dead citation: they are one of my favorite bands!

### Charge Batteries with USB cable safe?

Message #1 Posted by [PhysicsNerd](#) on 1 Aug 2007, 10:53 p.m.

If you plug the USB cable to the computer, does it charge your batteries or just your calculator? Is it safe to do this or do you recommend only switching the batteries?

Also, people've been telling me that the Batstatus doesn't work properly on the hp 50g. Why does it not function properly and is it still helpful to download?

Are these codes there to fix the problem?:

[http://groups.google.com/group/comp.sys.hp48/browse\\_thread/thread/453d77ac9ecbf7e1/7e4a078619e44ad9?lnk=st&q=BatStatus+group%3Acomp.sys.hp48&rnum=8#7e4a078619e44ad9](http://groups.google.com/group/comp.sys.hp48/browse_thread/thread/453d77ac9ecbf7e1/7e4a078619e44ad9?lnk=st&q=BatStatus+group%3Acomp.sys.hp48&rnum=8#7e4a078619e44ad9)

How are you suppose to use the codes on your calc? Sorry that I'm a newbie on these things but there must always be a beginning. =/

### Re: Charge Batteries with USB cable safe?

Message #2 Posted by [PhysicsNerd](#) on 2 Aug 2007, 12:32 a.m.,  
in response to message #1 by [PhysicsNerd](#)

Also, what's up with people saying that replacing batteries when the low battery indicator comes on will reduce your calculator's battery life? Is this true? When should I replace my batteries then? when the calculator is completely dead? Will that erase my calc's memory in any way? Thanks in adv.

Message #3 Posted by [Arnaud Amiel](#) on 2 Aug 2007, 3:53 a.m.,  
in response to message #1 by [PhysicsNerd](#)

Batstatus will not work on a 50G because it is designed for a 3 battery calculator so it will return a wrong result with 4 batteries, as the voltage of rechargeables is lower, it does not work very well with those either: it gives me 54% with newly recharged batteires. The code you pointed to will work on the 50G but you need to know how to do sysRPL to compile it. If you look you will find instructions.

Unfortunately it is not possible to recharge batteries through the USB. This is to protect against chargeing non rechargeable batteries.

Lastly some batteries have memory and discharging them partially all the time will reduce their usefulness. This is less true with the most modern batteries.

I hope this helps.

Arnaud

### Re: Charge Batteries with USB cable safe?

*Message #4 Posted by **Chan Tran** on 2 Aug 2007, 7:45 a.m.,  
in response to message #3 by Arnaud Amiel*

Does the 50G really eat batteries? I would never think of using rechargeable in my 48SX and GX as the alkaline last a very long time. How long the alkaline batteries last in the 50G. I am thinking of buying one but if the battery life is short then it's not so good. Battery life in HP calc was short with the red LED models. But then the HP41 came and after that it never made sense to use rechargeable in any of the newer HP calcs. May be with the 50G, battery issue is back?

**Re: Charge Batteries with USB cable safe?**

*Message #5 Posted by **Giancarlo (Italy)** on 2 Aug 2007, 8:02 a.m.,  
in response to message #4 by Chan Tran*

Hi Chan.

I had already thought to contribute with my two cents about the subject, and your post gave the last kick ;-)

My experience with 50G's batteries says: bought the calc on 2008, Aug 31st, changed its alkalines just yesterday!!!

OK, I'm not a very heavy user, not fiddling on the calc each and every day (you know, the emulator is soooo comfortable to play and mess around with ;-)  
but one year of battery life is one year ! :-)

Hope this helps.

Best regards.

Giancarlo

### FLAG-BUG on HP-35S!!?!!

Message #1 Posted by [dietmar13](#) on 1 Aug 2007, 4:45 p.m.

hello, it is not possible to set (SF), clear (CF), or test (FS?) flags >9, because only the input of one digit is allowed with this commands (in RPN mode or inside programs)! - ALG not tested. BUG! or knows someone how to do this...

### -no- FLAG-BUG on HP-35S

Message #2 Posted by [dietmar13](#) on 1 Aug 2007, 4:51 p.m.,  
in response to message #1 by dietmar13

found the answer, you have to use ".0" and ".1" for "10" and "11" a little annoying, and not very intuitive

### Re: -no- FLAG-BUG on HP-35S

Message #3 Posted by [bill platt](#) on 1 Aug 2007, 5:09 p.m.,

Hi, Bill --

Quote:

\_\_\_\_\_

This (*identifiers > 9 entered as ".n", n = 0-9*) goes back to the 32s guys. No gripes allowed ;-)

\_\_\_\_\_

For storage registers, it goes back farther than that: to the HP-34C at least. I think it's clever -- the first 10 registers 0-9 can always be addressed using a single-digit number, and the next (and final) ten registers with one additional keystroke. The HP-15C offered more (indirectly-addressible) registers, but these were rarely used.

The HP-41 and 42S offered 100 directly-addressible registers, so each one was identified by a two-

digit number. That's why the HP-41 offered a shortcut to the first 10 registers using the top two rows of keys.

No gripes allowed ;-)

For storage registers, it goes back farther than that: to the HP-34C at least.

It goes back way farther than that: the HP-19C/29C used this scheme for addressing the statistics registers (registers 10-15, addressed as .0-.5), and before that, the HP-55 used this scheme for addressing registers 10-19. Also, more recently, the HP-41 series used a similar trick, using the EEX key, to allow GTO to jump to line numbers > 999 (GTO . EEX 234 => goes to line 1234).

So, it's a venerable HP tradition. What kind of newbie does not know this? ;-)  
(Waiting for someone to point out an even earlier model with this feature...)

- Thomas

Message #9 Posted by [Gene Wright](#) on 2 Aug 2007, 2:59 p.m.,  
in response to message #8 by Vincze

:-) Don't say that! You are the almost the only Hungarian I know, but if you are even remotely "average", they are a very smart nation of people!

**Re: HP35s Equation Mode**

Message #10 Posted by [Vincze](#) on 2 Aug 2007, 4:25 p.m.,  
in response to message #9 by Gene Wright

Well thank you very much Gene. My Sicilian wife tell me that I am abbeey normal sometime, but she mostly joking (I think). My son tell me I sound stupid when I talk but I have to remind him that I grow up in Hungary and I no think in english so it take me a little to translate. My goal this year to make my english better and not so choppy. If I take my time in writing, I think I can do.

Many Hungarians are smart, except when we drink Pálinka, and then we can do some stupid things. I always stay away from that stuff as I remember my grandma used to put a shot of it in her wash water when she would scrub her floor. She would say it would help take wax off the floor. But that a whole nother story which off topic so I will not bore you. You may know some famous Hungarians such as Ern&#337; Rubik, who invent Rubik cube, Leó Szilárd és Edward Teller who both work on Manhattan project. Actually, they say Teller was the father of the hydrogen bomb. I think they are all smarter than me though.

Hungarian, Finnish and Estonian (not sure)?

### **Re: HP35s Equation Mode**

*Message #14 Posted by **Vincze** on 3 Aug 2007, 11:46 a.m.,  
in response to message #12 by Howard Owen*

Howard, yes a little a like, as I believe both are uralic in nature. but I don't know finnish, so I really can not say. I know in magyar (hungarian), almost all words have emphasis on the first syllable, I am not sure if finnish is the same or not. I think they may have all originated from the same group of people way back in time (some place in Russia), and maybe a common, or shared language components. In magyar, we do not assign gender to things as much as other European languages do. I know in italian, for example, certain words are manly and certain words are womanly. Also do not normally have possessive pronouns. This was hard for me when I first came to USA as you use possessive pronouns quite a bit.

### First Impressions of the TI-nspire

Message #1 Posted by [Namir](#) on 1 Aug 2007, 10:03 a.m.

Yesterday I walked into a grocery store in southern France, with my son. We immediately faced the school supplies row. The calculators for sale caught my eyes and I moved towards them looking for a graphing Casio with SD card reader. As I told my son what I was looking for, he interrupted me saying "Dad! I think you would want to look up!" There they were. The two TI nspire models!!! Without any hesitation my hands grabbed 2 units. I quickly learned that my son wanted one too!! I did mention to him a new version of the TI-89 Titanium on the shelf, but that seems moot with the TI-nspire at hand.

I opened the TI-nspire today and started playing with it. TI uhas implemented an unusual keyboard by adding small and elevated buttons to the regular set of buttons. The small buttons re keys to things like =, >, <, EE, the comma, and other operations. It's a document oriented machine and packs a lot of power. The statistical calculations alone are very impressive. As a regression junkie, I was more than impressed--they had all kinds of models you can fit and plus multiple regression. The machine saves the results to a structured variable. You can review the values later too. Moreover, it creates a function for you to use to project for teh dependent variable. They have a whole set of calculations for probability distribution functions, their cumulative values, and inverse values. The TI-nspire is meant to take NO PRISONERS!!

I was also able to write custom functions, one of which used program steps. Editing such a function is easy. The TI-snpire OS has a good diagnostic for detecting syntax errors.

I drew a graph and was able to use the navigation keys to select an area of the graph to zoom in on.

The math and calculus side is very impressive too, as expected. The CD that comes with teh machine has the documentation files that you need to work with the TI-nspire. The machine has a learning curve, given how much power it packs.

Is the TI-nspire superior to the HP-50g. Yes!! TI has put a lot of effort into the machine.

Well, I need to focus on my project at hand. I will play with the TI-snpire when I have some spare time.

Namir

*Message #15 Posted by **Namir** on 2 Aug 2007, 1:36 a.m.,*

*in response to message #13 by Brad Davis*

TI does not support RPN. The programming language for the TI-nspire is BASIC-like.

### **Re: First Impressions of the TI-nspire**

*Message #16 Posted by **Vincze** on 2 Aug 2007, 8:32 a.m.,  
in response to message #13 by Brad Davis*

Does TI even know how to spell RPN?

### **Re: First Impressions of the TI-nspire**

*Message #17 Posted by **Namir** on 2 Aug 2007, 12:13 p.m.,  
in response to message #16 by Vincze*

Sure! They had an RPN module or program for the TI-59.

TI feels that RPN is not mainstream and is directing its designs to produce calculators where the user can enter expressions in a manner that is similar to writing them on paper.

Namir

### **Re: First Impressions of the TI-nspire**

*Message #18 Posted by **Vincze** on 2 Aug 2007, 2:03 p.m.,

### HP48GX units problem

Message #1 Posted by [Noël Cotter](#) on 1 Aug 2007, 8:14 a.m.

If on my HP48GX I do the following:

1000 Hz 1E-6 F \* INV jç §Ù

I get 1000\_§Ù

Where as the correct answer is:

(0,-159.154943092)\_ §Ù

First, it's obvious the calculator has not made the conversion from Hz to radians/sec.

Next, if I type:

(0,2) §Ù

I get an error message °Bad Argument Type;± so apparently the units cannot be appended to a complex number. But 1 / (1 Hz \* 1 F) does NOT equal 1 §Ù even if we neglect signs or complex numbers.

### Re: HP48GX units problem

Message #2 Posted by [bill platt](#) on 1 Aug 2007, 9:49 a.m.,  
in response to message #1 by Noël Cotter

This might be worth a search through archives of comp.sys.hp48

### Re: HP48GX units problem

Message #3 Posted by [Noël Cotter](#) on 1 Aug 2007, 5:36 p.m.,  
in response to message #1 by Noël Cotter

I see that the text was garbled when I posted it. I'll try editing it in and see if it will make more sense.

If on my HP48GX I do the following:

1000

Hz

1E-6

F

\*

INV

I get:

1000\_Ohm

(Ohm symbol does not post correctly)

Where as the correct answer is:

(0,-159.154943092)\_Ohm

First, it's obvious the calculator has not made the conversion from Hz to radians/sec.

Next, if I type:

0,2)

Ohm

I get an error message, "Bad Argument Type", so apparently the units cannot be appended to a complex number. But  $1 / (1 \text{ Hz} * 1 \text{ F})$  does NOT equal 1 Ohm even if we neglect signs or complex numbers.

There, that makes a little more sense.

### Best font for keypad legend?

Message #1 Posted by [DaveJ](#) on 1 Aug 2007, 6:04 a.m.

I'm currently designing a calculator keypad overlay and was wondering what font looks best for keypad legends? (and why) The text will be quite small, about 1.5mm in height, if that makes a difference.

I can of course simply pick one I like, but just wondering if there is a type commonly used, and the reasons behind it.

Thanks Dave.

### Re: Best font for keypad legend?

Message #2 Posted by [Ivan Nejgebauer](#) on 1 Aug 2007, 8:45 a.m.,  
in response to message #1 by [DaveJ](#)

Quote:

I'm currently designing a calculator keypad overlay and was wondering what font looks best for keypad legends? (and why)

As a rule, small inscriptions are more readable if set in a sans-serif font -- serifs would add too much clutter. The "best" font is, readability aside, often a matter of designer's taste and the message meant to come across. E.g., the HP-35s labels are set in Futura, a really beautiful geometric sans-serif font which was hugely popular in the '60s, which is probably a subtle part of the calculator's "retro" styling.

Practically speaking: use a sans-serif font. Futura may seem too "retro", various Gothic (Franklin Gothic, News Gothic) typefaces are probably a better fit.

i.

Message #3 Posted by [Walter B](#) on 2 Aug 2007, 1:12 a.m.,  
in response to message #1 by [DaveJ](#)

After all, ARIAL seems suitable for most applications. Remember it is just a minimal modification of HELVETICA (AFAIK, only to avoid paying license fees - so much about fair trade in this direction), so the original will do it, too.

To my experience, ARIAL UNICODE will allow you almost everything you may wish, including Greek, Math symbols and arrows, and even x-hat (for FCSTX)!

HTH, Walter

### HP 35s Cheat Sheet / Reference Card?

Message #1 Posted by [Daniel Vollmer](#) on 1 Aug 2007, 5:01 a.m.

Being a new user of the 35s, I was wondering whether there already is some form of reference card that would fit inside the calculator case, a bit like the useful "HP 48 Pocket Book" by James Donnelly. Some things are quite different from what I'm used to from my 48GX, and are not entirely "discoverable" without the manual (e.g. flag meanings, EQN R(down arrow) for stack variables, or the format of variables for ISG or DSE, format of programs for SOLVE or INTEGRATE, ...)

All in all, I'm quite fond of the calculator itself, and the manual was a good read (though it felt a bit inconsistent at times, as if they were written at different times and with different expectations of the default mode / flags the calculator shipped with, especially in the way that it mostly treated RPN but sometimes had examples in ALG). Seeing the "First Edition — February 2007" also made me wonder a bit.

The only scary moment was when I missed the included batteries in the (awful) blister packaging. I just couldn't believe they wouldn't include the batteries... ^\_^

in response to message #1 by Daniel Vollmer

Quote:

... "HP 48 Pocket Book" by James Donnelly...

I am interested in this book. I look online for, but I do not see. Is this something that is freely download, or something users must buy.

I too think something simple should be made for 35s. Book ok, but big to carry around with calculator. I rather have three fold sheet that offer most important items.

It was available for sale when I bought my 48GX in 1996. If I recall correctly I mail-ordered it from [Educalc](#) back in the day. [Amazon Link](#), but it'll be hard to get, I should think.

Quote:

---

---

Yes, a reference card should do fine, a whole book would be overkill! :)

As an aside, I'm still not sure which is the most efficient way to loop on the HP 35s; judging from the HP 33s Datafile review, it's not DSE / ISG, but should I use RCL+, STO-, or ...

### **Re: HP 35s Cheat Sheet / Reference Card?**

*Message #4 Posted by [Giancarlo \(Italy\)](#) on 1 Aug 2007, 10:38 a.m.,  
in response to message #2 by Vincze*

Hi Vincze.

You can find the book on [CalcPro](#)

You have to press the "Search" button on the left, then use a convenient search string, such as:  
"48 pocket book"

and you get the book listed for 6.95 USD (shipping & handling fees to be added).

Hope this helps.

Best regards.

Giancarlo

### **Re: HP 35s Cheat Sheet / Reference Card?**

*Message #5 Posted by [Vincze](#) on 1 Aug 2007, 10:52 a.m.,  
in response to message #4 by Giancarlo (Italy)*

Ciao Giancarlo! Thank you so much for the information. I will check it out. Any idea how many pages this little book is?

Also, what part of Italy are you from? I met my wife in Sicily while I was on holiday. I think it funny that a Hungarian man marry a Sicilian, but she is beautiful woman.

### **Re: HP 35s Cheat Sheet / Reference Card?**

in response to message #5 by Vincze*

Vincze,

"unfortunately" I live in the middle of the Adriatic coast, quite far from Sicily :-(  
But I hope I'll have a chance to go there on holiday in the very next future :-))

Viszlát (I hope it's correct ;-)

Giancarlo

### **Re: HP 35s Cheat Sheet / Reference Card?**

*Message #9 Posted by [Vincze](#) on 1 Aug 2007, 11:19 a.m.,  
in response to message #8 by Giancarlo (Italy)*

Ha ha ... close enough. Actually, it viszlát, but I know what you intended.

Why you say unfortunately you live in middle of Adriatic Coast? Adriatic sea is very beautiful.  
I was at Ancona once with friends on holiday while in college and it very beautiful.

*Edited: 1 Aug 2007, 11:25 a.m.*

### **Adriatic Coast**

*Message #10 Posted by [Nenad \(Croatia\)](#) on 2 Aug 2007, 3:27 a.m.,  
in response to message #9 by Vincze*

Hi Vincze,

Quote:

Why you say unfortunately you live in middle of Adriatic Coast?

Maybe, because there are also places, such as Split, where I live, which may be described as "middle of Adriatic Coast", but located on the other (eastern side) of Adriatic.

The Adriatic is a better place along the Croatian side of Adriatic, than the Italian one, owing to a lower rate of industrialization. You Hungarians certainly know this fact very well, as many of your fellow (former) citizens come here to spend vacancies.

Croats from the inland say to us: "Fortunately, you live on the Adriatic Coast".

Nevertheless, it is obvious (at least Giancarlo and I may prove) that HP vintage calculators grow perfectly well on both sides of the Adriatic;)

### **Re: Adriatic Coast**

What about a new HP "ACO" - Adriatic Coast Owners ? ;-))

Best regards.

Giancarlo

### **Re: Adriatic Coast**

*Message #12 Posted by **Nenad (Croatia)** on 2 Aug 2007, 5:54 a.m.,  
in response to message #11 by Giancarlo (Italy)*

Hi Giancarlo,

Quote:

---

What about a new HP "ACO" - Adriatic Coast Owners ? ;-))

---

Perfect idea! Organizing a meeting of the new club would not be difficult at all, one year in Split, another one in Ancona. Regardless of the number of its members it would certainly be an international club ;)

AFAIK, the SNAV's hydrofoil craft takes less than 4 hours coast-to-coast. Beginning of ferragosto it is full of Italians. After they get of the ship, in streets of Split you can hear only Italian. And that happens about ... just now!

### **Re: Adriatic Coast**

*Message #13 Posted by **Vincze** on 2 Aug 2007, 8:36 a.m.,  
in response to message #10 by Nenad (Croatia)*

Quote:

---

The Adriatic is a better place along the Croatian side of Adriatic, than the Italian one, owing to a lower rate of industrialization.

*Message #14 Posted by **bill platt** on 1 Aug 2007, 12:13 p.m.,  
in response to message #1 by Daniel Vollmer*

The manuals inconsistencies may stem from the history of the manual: it is the 33s manual re-worked, where the 33s manual was a re-worked 32sii manual. Some of the original 32sii stuff that was taken out of the 33s manual has made its way back in, in modified form.

### Low Battery Warning Sign After Replacement?

Message #1 Posted by [PhysicsNerd](#) on 1 Aug 2007, 4:42 a.m.

I've recently (3-4 days ago) replaced my batteries when the low battery warning sign went on with Duracell rechargeable batteries (fully recharged when I put them in).

However, now the low battery sign is on again. Are the batteries out already or is it signaling the coin battery? How do I know which one it is talking about? Should I recharge my batteries again (maybe because they are new and this is the first time using them?)? Thanks.

### Re: Low Battery Warning Sign After Replacement?

Message #2 Posted by [PhysicsNerd](#) on 1 Aug 2007, 10:20 a.m.,  
in response to message #1 by [PhysicsNerd](#)

I've just woken up and to my surprise the low battery sign is gone! ...however, it came back after about 10 minutes. Does anyone know what is happening here? Should I download the batstatus 1.3 from <http://www.hpcalc.org/search.php?query=batstatus> ? Is this program compatible with the 50g and where can I read a tutorial on how to download programs into my calculator from my computer? Does it show the battery status of both the 4 AAA and the coin battery? Thanks.

### Re: Low Battery Warning Sign After Replacement?

Message #3 Posted by [Rodger Rosenbaum](#) on 1 Aug 2007, 11:07 a.m.,  
in response to message #2 by [PhysicsNerd](#)

I posted some information on this subject: <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=112318#112318>

As a Physics Nerd, you should have access to a digital voltmeter. Open up the back of your HP50G and touch the voltmeter probes to the ends of each cell to check its voltage. Do this with the calculator turned on. See if any one of the cells is substantially lower in voltage than the others. You may have a bad cell.

If you have access to a variable power supply as well, you can do the test I did. Connect the supply in place of the battery. Slowly adjust the supply from 4.5 volts to lower voltage. Make a note of the voltage when the low battery indicator comes on. Divide this number by 4 and that will be the per cell voltage that just causes the low battery indicator to come on. You can compare that number to the result I got.

As I mention in my post referenced above, on the HP50G that I have, the low battery indicator comes on when the NiMH cells are about 70% discharged. This has the obvious disadvantage that if you replace (and charge) them at that time, you will only be getting about 70% of the use per charge. But, it has the advantage that you have ample warning to replace (charge) them. This is good because normally NiMH and NiCAD cells have a very rapid drop in voltage when they are about dead, and you could only have a few minutes left when the low battery indicator comes on if it was set to come on when the cells were 99% discharged.

Have you been giving your HP50G especially heavy use since you switched to rechargeable cells?

*Edited: 1 Aug 2007, 11:11 a.m.*

### **Re: Low Battery Warning Sign After Replacement?**

*Message #4 Posted by [Dave Colver](#) on 1 Aug 2007, 10:26 a.m.,  
in response to message #1 by [PhysicsNerd](#)*

You didnt mention which handheld your using nor what sort of rechargeable cells your using. If your machine has a backup cell then I'm guessing its a 48/48/50 series. If your using NiCd (nicad) then a low battery status is to be expected as they have a significantly lower voltage to start with (1.2-1.25V). You may fare better with NiMH (Nickle Metel Hydride cells) which start at 1.5V. If you insist upon using rechargeables do make sure you have a good backup cell in place as the discharge characteristics of most rechargeables means the backup cell will be needed.

### **Re: Low Battery Warning Sign After Replacement?**

I have a hp 50g and I'm using Duracell AAA Rechargeable batteries NiMH, 1.2 V each, 1000 mAh.

I charged them before I put them in my calculator. After I wait a few hours and then turn on my calc, the low battery warning sign disappears. I turn it off and then on again, still no sign. However, if I use it for a while, turn it off and on, it appears! The process starts over...

### **Re: Low Battery Warning Sign After Replacement?**

*Message #7 Posted by [PhysicsNerd](#) on 1 Aug 2007, 10:42 p.m.,  
in response to message #6 by [PhysicsNerd](#)*

This is post from the website link you gave me:

Quote:

---

In powering our data collection system (www.pssllc.com) we've learned lots about batteries.

Most interesting is that certain units respond differently to the same sets of batteries. Some calculators appear to respond with a low voltage message much earlier than others.

One in particular, will give 8 full hours of use after the first low voltage warning. That is powering two long range (up to 1700' working range!) Bluetooth adapters and an external communication circuit board. The same set of batteries, charged in the same manner, will only last 3 hours past the warning on other units.

Some units will run for 3 days consistently moving in and out of the "low voltage" warning level, and then moving above the threshold.

In short, I've learned never to replace the batteries until the calculator refuses to turn on. I often get several more days out of my rechargeables on my "non" data collector units.

TW

---

Does that mean the low battery warning on my calc is not really an indicator that my batteries need to be changed? Will it gradually disappear?

---

### Reading the New HP Museum DVD disks

Message #1 Posted by [Gerry Schultz](#) on 31 July 2007, 7:44 p.m.

I got version 6 of the HP Museum late last week and when I put DVD disk one in my iMac G5, the Superdisk spit it back out which indicated it could not read it at all. Then I put the disk in my Dell Inspiron 8500 DVD burner and Windows XP showed the disk in the drive and upon opening it, I got a file list. But, when I tried to open start.htm under IE7, it hung up in a loop of trying to open the startup file. Hummm, now that's strange.

So, I took it to work and put it in my XP machine and IE 7 opened up the disk and I could browse it with no problems. I also checked DVD disk 2 in all three machines and I could browse without a problem. Has anyone else had a problem with their HP Museum disks?

BTW, I should mention that I love all the new material on the disks. It's great. When the DVDs arrived in the mail, my wife looked at me and said, "What did you order now"? I showed it to her and explained to her what was on them and all she did was roll her eyes. More geek stuff. She let's me have this and I let her have her catalogs. It works out well.

Thanks for the feedback,

Gerry

Sounds like a neat arrangement. Just don't give her a 35s for your next wedding anniversary. It sounds like a marginal disk. I'm sure Dave will send you a replacement if you explain the problem.

### Re: Reading the New HP Museum DVD disks

Message #3 Posted by [Greg Whitfield](#) on 31 July 2007, 8:28 p.m.,  
in response to message #1 by Gerry Schultz

I also have a problem with the HP Museum version 6 DVD disk 1 on my MacBook (May 2007 version) with the 8x double-layer Super Drive. I was attempting to copy DVD disk 1 to my hard drive and about halfway through the process it went into a loop where it sounded like the drive was spinning loudly, almost like my fan

kept stopping and starting. It kept doing that until several minutes after I had pressed the "X" to cancel the copy. DVD disk 2 copied to my hard drive without any problems.

I contacted Dave Hicks and he quickly responded that he had contacted the DVD duplicating company and they were investigating the problem. I'm sure that Dave will do his best to see that this issue is resolved.

I wish to thank Dave for his devotion and wonderful work on hpmuseum.org and in putting these disks together. It's an invaluable service to those of us who have a strong interest (or strange obsession as my wife might put it) in HP calculators.

Thank you,

Greg

in response to message #1 by Gerry Schultz*

Good evening Gerry. All I can say is remind wife that staying home and looking at HP DVD better than going to bar and getting in trouble.

I not have any of the DVD so I can not help with that. I sorry.

### **Re: Reading the New HP Museum DVD disks**

*Message #5 Posted by [Gerry Schultz](#) on 1 Aug 2007, 6:48 p.m.,  
in response to message #4 by Vincze*

To All:

Thanks for your responses. Steve, I would never give my wife a 35s for our anniversary. I was thinking a vacuum cleaner ;-). No, I actually bought a vacuum cleaner for an old girl friend when I was very young. I learned quickly that for birthdays and anniversaries, I'm to get something romantic and frivolous (is that the engineer in me?) to commemorate the occasion; ESPECIALLY if she says it's alright, she doesn't need anything. Lastly, I'm saving the good stuff, like a 35s for ME! When it's my birthday and she comes pleading with me about a week before asking me what I want, that's when I get the good loot!

Greg, I second my gratitude to Dave for the herculean effort it takes to publish these DVD disks. I enjoy them very much and simply offer my thanks.

Gerry

### **Re: Reading the New HP Museum DVD disks**

*Message #6 Posted by [John Limpert](#) on 1 Aug 2007, 6:57 p.m.,  
in response to message #1 by Gerry Schultz*

I didn't have any problem reading the discs on my PowerMac G4 with a Pioneer DVR-110D. The first disc appears to be dual-layer, which can cause difficulties for some DVD drives.

I really like the new color scans of the manuals. There's a lot of great stuff on the discs.

### **Re: Reading the New HP Museum DVD disks**

### **Re: Reading the New HP Museum DVD disks**

*Message #9 Posted by [Christoph Widmer](#) on 5 Aug 2007, 3:02 a.m.,  
in response to message #1 by Gerry Schultz*

Both of my DVD's unfortunately arrived completely scratched. While I managed to copy the first one to harddisk, the second one is definitely a no-go (I tried on three different DVD-burners). The problem in my case lies in the packaging, it does not keep the DVD's firmly in place - so during shipping they turn loose and move all over the place, becoming badly scratched. As normal cleaning did not help I will try a special CD cleaning paste which should get rid of light scratches, before I will bother Dave with a replacement request. I would like also to seize the opportunity to thank Dave for his incredible effort to put all this material together!

Chris.

### **Re: Reading the New HP Museum DVD disks**

\_\_\_\_\_

Yes, you're right. The DVD holder on the left side of the packaging is also broken on my shipping (haven't found the broken part inside), but I have the luck that disc2 has only scratches on the painting, whereas disc1 has scratches only on a spot near the middle on the laser reading side.

So the broken holder seem not to be an exception like I thought first.

Cheers

Christoph

### **Re: Reading the New HP Museum DVD disks**

Quote:

but I have the luck that disc2 has only scratches on the painting, whereas disc1 has scratches only on a spot near the middle on the laser reading side.

You may not have the luck you think (although if you can read them now, you are OK this time)! But, in general, scratches on the "laser reading side" (by which I presume you mean the clear, or down, side) are generally NOT a problem unless they are fairly severe. The information on the disk is actually encoded just below the printed side, i.e. on the top side of the plastic disk material just below the printed label. Light from the reading beam enters the bottom side in a relatively wide beam that is in the process of being focussed into a spot at the top. So, a scratch on the "top" side will cause problems if it extends through the label into the information material layer.

That said, I, too, have suffered from serious scratching on the clear side of an audio CD. I managed to cure the problem by polishing the plastic with a gentle rubbing using toothpaste.

### **Re: Reading the New HP Museum DVD disks**

*Message #12 Posted by [Christoph Giesselink](#) on 6 Aug 2007, 3:03 p.m.,  
in response to message #11 by Dave Shaffer (Arizona)*

I agree in cases when scratches on the painting side go through the near-by underlying reflection plate.

CD's or DVD's with such a defect are unreadable and unrepairable.

Cheers

Christoph

### **Re: Reading the New HP Museum DVD disks**

*Message #13 Posted by [James M. Prange \(Michigan\)](#) on 7 Aug 2007, 8:35 a.m.,  
in response to message #11 by Dave Shaffer (Arizona)*

Quote:

The information on the disk is actually encoded just below the printed side, i.e. on the top side of the plastic disk material just below the printed label.

True for CDs, but not for DVDs.

Assuming single-sided DVDs, you'd have to have damage (from the "label" side) more than half way through to affect the data on a single-layer DVD, and almost half way through to affect the data on a dual-layer DVD.

For some diagrams of the physical structures of DVDs, see [http://www.divxland.org/dvd\\_formats.php](http://www.divxland.org/dvd_formats.php) or chapter 3 page 3 of <http://www3.toshiba.co.jp/dvd/e/whats/index.htm>.

I believe that the HP Museum version 6 DVD set is one DVD-9 (single-sided dual-layer) plus one DVD-5 (single-sided single-layer).

The direction of a scratch makes a big difference. If the scratch is radial, then there's a good chance that between the data interleaving and error correction codes, the disc drive will be able to correct the errors. If the scratch is tangential, or worse yet, parallel to the track, then too long of a stretch of data may be corrupted to make a correction. If you try to polish out a scratch, then be sure to rub radially. For polishing, Brasso or NEVR-DULL metal polishes seems to work well, although some mildly abrasive toothpastes should work, and there are products marketed specifically for CDs and DVDs.

Regards,  
James

### Rectangular to Polar on the HP35s

Message #1 Posted by [Howard Boardman](#) on 31 July 2007, 12:27 p.m.

I have some surveying programs I'm trying to put into the 35s. They were originally written for the 33s. One of the steps is a rectangular to polar conversion. There is no "y,x->è,r" button on the 35s. What is the equivalent sequence of this on the the 35s? I am just confused by the manual. Thanks for your help.

### Re: Rectangular to Polar on the HP35s

Message #2 Posted by [Gene Wright](#) on 31 July 2007, 12:45 p.m.,  
in response to message #1 by Howard Boardman

The HP35s does not convert P->R and R->P the way previous HP calculators have done. There is no provision that does this exactly the same way.

The 35s has a DISPLAY option which changes the 5i5 style complex number (rectangular) to the magnitude THETA angle style complex number (polar).

If you're just showing results one way or the other, change the display mode.

If you need the magnitude and angle of a rectangular complex number, then the ABS function will grab the magnitude and the ABS function will grab the angle portions of a complex number, even if the display mode is "rectangular".

If you need the X and Y coordinates of a polar form complex number, then it is a bit more complicated.

First, find the magnitude and angle as described above.

Then transform these into the X and Y coordinate as:

$X = \text{magnitude} \times \text{COS theta}$

and

$Y = \text{magnitude} \times \text{SIN theta}$

Be aware that for arguments VERY close to 90 degrees, the COS function is less accurate than for other angles. Rather than 9, 10+ decimal positions being accurate, it drops to 4 or 5 positions.

You can read more about this in the learning module found here:

[Complex numbers 2](#)

You can see all the learning modules available for the 35s by going here:

### **Re: Rectangular to Polar on the HP35s**

Message #5 Posted by [Gene Wright](#) on 31 July 2007, 1:36 p.m.,  
in response to message #4 by Howard Boardman

It is essentially a RCL stack level Z instruction.

You enter it by pressing:

EQN

then

RDN (the roll down key)

and then move the cursor under the Z stack level and press ENTER.

### **Re: Rectangular to Polar on the HP35s**

Message #6 Posted by [Alain Mellan](#) on 31 July 2007, 5:08 p.m.,  
in response to message #5 by Gene Wright

I didn't know about that (should have RTFM :-), so I entered REGZ as EQN RCL R RCL E RCL G RCL Z ENTER ... and it works.

I would seem that equations are really parsed. So I tried entering RE and IMG without much success. :-) But who knows? there may be some hidden function there?

-- alain.

### **Re: Rectangular to Polar on the HP35s**

Message #7 Posted by [Les Wright](#) on 1 Aug 2007, 10:44 p.m.,  
in response to message #4 by Howard Boardman

Despite my little routine, I really lament the lack of a fully range of commands to handle complex numbers and rectangular-polar conversions.

Restoring the familiar P->R and R->P commands would be a good start. xiy to rthetaa display change is nice, and the abs and arg commands can let you get the r and theta values of the vector in polar form. It is also easy enough to create the required complex number from elements of the stack--if Re(z) is in

y and Im(z) in x, i \* + does the trick. So this sequence would replicate the 33s y,x -> @, r command.

```
x<>y
i
*
+
ARG
LASTx
ABS
```

But there seems to be no easy way to create a polar form complex number from stack elements that I can feed into my little routine to give the real and imaginary components of the rectangular form. One seems to have to enter it manually. For example, if I want to create 5@60, I have to enter 5 theta 60. I can't put 5 ENTER 60 on the stack and automate the procedure easily to do it for me. In the 42S, I would simply make sure I was in polar mode and execute 5 ENTER 60 COMPLEX.

If anyone has a painless way to replicate the @,r -> y,x conversion from the 33s, I would be grateful!

I really would vote for a more logical command set in this regard in the 35sii. If ROM is a premium, the calc can really afford to lose those keyboard clogging metric/imperial conversions.

Les

## Re: Rectangular to Polar on the HP35s

Message #8 Posted by [Les Wright](#) on 1 Aug 2007, 11:02 p.m.,

in response to message #7 by Les Wright

Actually, I revisited my basic complex analysis books and I think I have a solution for the @,r -> y,x conversion. This assumes the angle is in the y register and modulus in the x, just as it would be for the 33s function:

```
x<>y
COS
LASTx
SIN
i
*
+
*
```

(send off to my little routine or hopefully a better one to decompose to Re and Im, returns Re in y register, Im in x)  
x<>y (to put x component in x register and y in y, as is done on 33s)

This alternative assumes the calc is in degree mode:

```
x<>y
->RAD
i
*
e^x
*
(decompose to Re and Im as you wish)
x<>y
```

Let's say the first one is under LBL P. I try this in degree mode:

```
3 ENTER 4 / ATAN 5 XEQ P ENTER
```

and I get 4 returned in the x register, 3 in the Y, exactly as it should be!

Cumbersome, but the programs involved are very short, and it seems to work except when rounding error or the damned cosine bug compromises accuracy in certain cases.

Les

**Re: Rectangular to Polar on the HP35s**

Message #9 Posted by [Les Wright](#) on 1 Aug 2007, 11:51 p.m.,  
in response to message #8 by Les Wright

Actually, that last one was way to complicated.

I prefer this:

```
x<>y
COS
LASTx
SIN
REGZ
*
x<>y
LASTx
*
```

There is no point in computing the modulus and argument back and forth when you have it in the first place!

In short the following two little subroutines, which I put under the same label P, replicate the 33S polar-rectangular conversions, and I think most succinctly answer the OP's question:

```
(P001) LBL P
x<>y
i
*
+
ARG
LASTx
ABS
(P009) RTN

(P010)x<>y
COS
LASTx
SIN
REGZ
*
x<>y
LASTx
*
(P019) RTN
```

Examples (in degrees mode):

4 ENTER 3 / ATAN 25 XEQ P002 returns 20 in the y register, 15 in the x.

8 ENTER 6 XEQ P010 returns 53.130123542 (degrees) in the y register, 10 in the x--exactly what you would expect for a Pythagorean triple of 6-8-10.

I think the absence of the well loved conversion routines will inspire most serious users of the 35s to have subroutines like these in memory, and I hope that revisions of the machine rectify this. And, of course, that nuisance cosine bug!

Les

## **Re: Rectangular to Polar on the HP35s**

*Message #10 Posted by [Howard Boardman](#) on 2 Aug 2007, 1:58 a.m.,  
in response to message #9 by Les Wright*

Thanks to all for the subroutine advice. So far I did a little modification of the little subroutine and it seems to work fine. I'm doing surveying programs for traversing, area by coordinates and so on. The following seems to work quite well for rect. to polar, although I get a negative azimuth when in the 4th quadrant (-x,y) which is entirely fine:

S001 LBL S

S002 i

S003 \*

S004 +

S005 ABS

S006 LASTx

S007 ARG

S008 360

S009 RMDR

S010 90

S011 -

S012 +/-

S013 x<>y

S014 RTN

A few extra steps I realize but for the programs I had created it was easier to modify this one than to modify the others. Atleast HP had the sense to allow XEQ and GTO within programs. Its hard to make a calculator to please all professions, but at least with subroutines we can be creative and work around short-commings.

### **W&W Rambox battery change?**

Message #1 Posted by [Dave Colver](#) on 31 July 2007, 7:47 a.m.

Hi All Any ideas on changing the battery on a W&W Rambox please? Its been unplugged for some years so I dont have much hope of recovering the OS.

Carefully parting the upper 3 circuit boards from the battery/connector board reveals the huge cr2450E cell mounted on a board that appears to run down to the finger connectors. Is there enough flexibility in the board to grasp the board and just pull or is there another technique?

Thanks in advance Dave

### **Re: W&W Rambox battery change?**

Message #2 Posted by [Tony Duell](#) on 1 Aug 2007, 4:19 a.m.,  
in response to message #1 by [Dave Colver](#)

Is this the one in the card reader case?

If so, you can unclip the top part of the HP41 connector section (after separating the case and removing the upper PCBs). Then the bottom board just lifts out.

It's the same as removing the main PCB from an HP41 card reader if you've ever done that.

Alternatively, if you can wait just over a week, bring it to the next HPCC meeting and I'll show you.

### **Re: W&W Rambox battery change?**

Message #3 Posted by [Dave Colver](#) on 1 Aug 2007, 6:46 a.m.,  
in response to message #2 by [Tony Duell](#)

Hello Tony I just knew I should have asked you first :) Actually I managed to get around to testing the battery and its 3.06v - so much for assumptions eh? (Pretty impressive for a 20 year old battery) Now to see if the OS is hiding in there somewhere. I just found the English translation of the W&W manual too which i must scan for posterity :) Dave

**HP 35s**

Message #1 Posted by [Ken Cambier](#) on 30 July 2007, 2:56 p.m.

Just got a new 35s and it works nice. It actually comes close to the 11c and 15c. Only one problem. Is it just me or are the yellow and blue function keys goofy? They seem refer to the keyboard layout of the 33s. Shouldn't they just be arrow-up for yellow and arrow-down for blue? Any thoughts?

**Re: HP 35s**

Message #2 Posted by [bill platt](#) on 30 July 2007, 3:05 p.m.,  
in response to message #1 by Ken Cambier

Yes they are goofy that way. Lots of babble about that already.

You should search through the threads here, there is a lot already in discussion that you might find interesting.

**Re: HP 35s gold & blue keys (and arrows)**

Message #3 Posted by [Andrés C. Rodríguez \(Argentina\)](#) on 30 July 2007, 10:13 p.m.,  
in response to message #2 by bill platt

Perhaps someone has already noted this, but is clear for me that, since the LCD mask has been developed for other models like the 33s, the shift symbols in the keyboard must match the LCD indicators. Hence, the arrows. Of course, I would have preferred shift keys with no arrows or, for a stronger retro look, marked as "f" and "g".

### HP35s - the minus sign

Message #1 Posted by [Nenad \(Croatia\)](#) on 30 July 2007, 2:46 p.m.

-888 (the proper position of the minus sign)

It should be normal that the minus sign in negative numbers is positioned centered with respect to the height (i.e. at the half height). In HP35s display font it is positioned as the "underscore character upside down". This may be also seen in other HP calculators (e.g. in HP32SII, I suppose). This is something that I really don't like.

I am not sure if anybody has already mentioned this as something he/she dislikes. Simply, why wasn't the minus sign positioned in a "normal" way? Obviously, the HP35s font could withstand this.

Please, do not find this as an over criticism of a lovely machine (really, I do not want to be seen by others as one of the two elder gentlemen in Muppet Show, who criticize every performance from its very beginning).

### Re: HP35s - the minus sign

Message #2 Posted by [bill platt](#) on 30 July 2007, 3:11 p.m.,  
in response to message #1 by [Nenad \(Croatia\)](#)

What you are noting is the "unary minus" which is different from the minus sign. This is unfortunately one rather inconsistent solution (going from model to model). It was a real problem on the 32sii with respect to equations--actually had a buggy behavior (see Finseth's HPdatabase). The 33s dramatically improved the unary minus issue, but I haven't looked in detail of how the 35s is handling it, except to note that there was at least one place in the manual that specifically directs the use of the unary minus.

On other machines, for instance those with an RPL kernel, there isn't the same distinction, as a the minus is simply parsed and that is the end of it. If you have a 27s or 17b handy, and a 48 series, you can explore the similarities/differences in the handling of the minus, as well as differences in the function of the +/- key.

### Re: HP35s - the minus sign

Message #3 Posted by [Nenad \(Croatia\)](#) on 31 July 2007, 2:34 a.m.,  
in response to message #2 by [bill platt](#)

Bill,

Thank you very much for your explanation. AFAIK, in "pencil-and-paper" mathematics there is no need to distinguish between the negative number sign and the subtraction operator. So, I could not figure out (and still cannot) why did the calculator software designers have the need for this.

As a mechanical engineer, dealing with marine engineering in a shipping classification society, I really don't remember a situation where "-" and "-" should be distinguished.

### Re: HP35s - the minus sign

Message #4 Posted by [bill platt](#) on 31 July 2007, 7:36 a.m.,

*in response to message #3 by Nenad (Croatia)*

Hi Nenad,

Yes, I have the same feeling about the "unary minus" as a rather bizarre calculator artifact.

I believe it stems from the difficulty of minus as an *\*operator\** as compared to minus as a *\*condition or state\**. Depending on how you design your command interpretation, that can be an issue. In the original RPN paradigm, CHS is in fact an operation and we avoid the whole issue--we "operate" on a stack object one step at a time, and as such there are no issues with precedence etc.

However once you joint the world of "algebraics" this all changes and the issue of what to do about sign operations becomes a problem. In the case of the 32sii there is no difference in the display of a "unary minus" in the 1st position and yet it exists in the paradigm and further causes a problem:

```
-3^2
          is evaluated to:
9
          on the 32sii equation list.
          Compare this to
1-3^2
```

```
          which evaluates to:
-8.
So, the 32sii treats a unary minus without anything
before it as being inside an imaginary set of
parenthesis:
```

```
(-3)^2. Note that the manual for the 32sii states that
"unary minus" takes precedence over exponentiation, but this was a bad idea and
wasn't consistently implemented, for it
it were, then 1-3^2 would have been equal to 10.
```

```
Note however that in the 32sii, you can use either the "-"
or the "+/-" to write the unary minus, and furthermore
in all but the 1st position, there is a different appearance
between the "unary minus" and a minus, and yet they do *not*
all parse the same way!
```

Take these examples:

```
1-3^2 evaluates to -8
1+-3^2 evaluates to 10
1+^-3^2 (with the high position unary minus) evaluates to 10
```

```
Note that you can type in the regular looking minus
using either the +/- or the - *before* typing "3", or you can
put in the high minus by pressing the +/- after pressing the
"3".
```

```
This is bad behavior of the 32sii equation list was a real
problem until you figured out how to deal with it.
It is totally different from the 48 or the 27 or the 17b.
```

But regardless of how the "unary minus" looks

On any other algebraic parser from HP,

```
-3^2

          evaluates to:
```

-9.

On the new 35s, this bug is eliminated; however a unary minus requires a different syntax--achieved through the "+/-" key in order to parse successfully.

Furthermore on the 35s, you cannot successfully parse odd constructions such as  $1+3^2$  and so the bad behavior of the 32sii equation list avoided.

I don't have my 33s in front of me and although I wrote about this aspect of it some years back, I can't remember now how it handles this aspect.

**HHC2007 hotel reservation fiasco**

Message #1 Posted by [Eric Smith](#) on 30 July 2007, 2:38 p.m.

I booked my hotel reservation online, and they charged the full amount for my stay to my credit card in advance. That's new to me; usually they just run an authorization, and don't actually run the charge until you arrive (or depart)?

When I noticed this in my online banking account status, I looked at the confirmation that Holiday Inn emailed me. Sure enough, it says that to qualify for some special rate, it had to be prepaid, and was NON-REFUNDABLE in the event of cancellation OR changes.

That might have been in the fine print on the web site, but I didn't see it, and I'm not at all happy about it. I didn't intend to pay them two months in advance, and I might want to change my return date.

Besides which, they charged me \$112+tax per night, rather than the \$99 HCC2007 rate. (I'd tried to book the reservation by phone to get that rate, but when that didn't work I used the web site instead.)

**Update, 2-AUG-2007:**

The manager changed my reservation to the correct rate and refunded the undesired prepayment.

I'd suggest that everyone make their reservations by phone rather than online, to avoid such problems.

*Edited: 2 Aug 2007, 1:52 p.m. after one or more responses were posted*

**Re: HHC2007 hotel reservation fiasco**

Message #2 Posted by [Dave Hicks](#) on 30 July 2007, 3:05 p.m.,  
in response to message #1 by Eric Smith

When I booked, the 800 number, the hotel front desk and the hotel manager didn't know what HHC 2007 was but the manager did vaguely know what a "Hewlett Packard something something" was but he claimed that "they" had never talked to the hotel about a room rate or a room block and he only knew about it from others asking for it. Well the HHC page did say that the hotel may or may not know about an HHC room rate when you call but that's what you'll eventually get, so I'm still hoping for the best.

I don't know if I've been charged already.

**Re: HHC2007 hotel reservation fiasco**

Message #3 Posted by [Dave Hicks](#) on 31 July 2007, 4:22 p.m.,  
in response to message #2 by Dave Hicks

I just got a call from the hotel telling me that my room had been lowered to the HHC rate.

**Please Reserve HHC2007 Hotel Rooms ASAP**

*Message #4 Posted by [Jake Schwartz](#) on 1 Aug 2007, 11:29 a.m.,  
in response to message #3 by Dave Hicks*

Hi,

Richard Nelson had a discussion with the Holiday Inn people yesterday and we believe that the issue regarding honoring the originally promised \$99. rate has been resolved. The requirement is that rooms must be reserved by September 1st in order for the rate to be honored. We have a guarantee of 15 rooms at that rate and if those are filled, we should get more but the sooner the reservations are made, the better. Additional details may be obtained at [http://holyjoe.net/hhc2007/Update\\_1.pdf](http://holyjoe.net/hhc2007/Update_1.pdf) on the web. Thanks for the patience of those who already made their reservations.

Check out the full HHC2007 conference details at <http://holyjoe.net/hhc2007> and don't forget to click on the small images of the hp35A and hp35S for further "goodies". We are now over fifty registrants.

Jake Schwartz

**Re: Please Reserve HHC2007 Hotel Rooms ASAP**

*Message #5 Posted by [sjthomas](#) on 1 Aug 2007, 7:48 p.m.,  
in response to message #4 by Jake Schwartz*

Are they still billing one's credit card for the entire stay at the time of reservation?

**Re: Please Reserve HHC2007 Hotel Rooms ASAP**

*Message #6 Posted by [Eric Smith](#) on 2 Aug 2007, 1:50 p.m.,  
in response to message #5 by sjthomas*

I spoke to someone at the Holiday Inn yesterday, and was told that the manager had changed my rate to the conference rate, and refunded the prepayment to my card. Today I can confirm the credit in my online account status.

In order to avoid such a problem, I'd suggest booking the reservation by phone rather than online.

32sii SHOWs 1.200000000000

### Re: SHOW on HP35S and others

Message #4 Posted by [Karl Schneider](#) on 30 July 2007, 11:58 a.m.,  
in response to message #1 by [dietmar13](#)

Dietmar --

No. SHOW displays the 12 digits of the mantissa, which start with the first non-zero digit -- not 12 decimal digits. Unless something is different about the HP-35s from the HP-32SII and HP-33s, 123.345675346246 can't be entered.

As for the decimal point, it seems that there was a simple rule for all mid-grade Pioneer models: SHOW will display the decimal point if possible; that is, if the mantissa is of a magnitude such that the actual value can be displayed without an exponent.

High-end Pioneer models can show the full 12-digit mantissa and exponent, so do not need to omit the decimal point with SHOW.

Spice-series, Voyager-series, and low-end Pioneers with their 7-segment LCD's do not show the decimal point with, respectively, MANT, CLEAR PREFIX, or SHOW.

The HP-41 didn't *have* the mantissa-displaying function.

You can enter that value, but only 12 digits will be maintained.

### **Re: HP35S - BUG or FEATURE?**

Message #6 Posted by [Karl Schneider](#) on 31 July 2007, 2:42 a.m.,  
in response to message #5 by Gene Wright

Hi, Gene --

Quote:

\_\_\_\_\_  
You can enter (123.345675346246), but only 12 digits will be maintained.  
\_\_\_\_\_

Well, *that's* no good! Why the change from long-established sound practice? All of my HP's (even the KinHPo 33s) refuse extra mantissa digits; the mid-grade Pioneers even give a "!"-inside-a-triangle annunciator.

The user should be able to trust that the calc is accepting the value entered unless indicated otherwise; it should never accept invalid input, then give an error message.

-- KS

### **Re: HP35S - BUG or FEATURE?**

Message #7 Posted by [Gene Wright](#) on 31 July 2007, 8:34 a.m.,  
in response to message #6 by Karl Schneider

The 35s now has the command line type of approach, as has been noted before.

That's why you can enter a number with fractional exponents, etc and it won't error out until it is parsed.

This is shown in the Datafile 35s review under the Quirks paragraph.

Similar thing with the RPL machines. It seems as if the command line of the 35s is similar in many ways to that found on the graphing machines.

### HP35S vs HP50g Keys

Message #1 Posted by [Brad Davis](#) on 30 July 2007, 11:23 a.m.

I just bought a HP50g to go along with my trusty 48. I REALLY like it except for one thing (well, actually 2--the battery cover is very poor, IMO, a half a step up from a 28S battery cover. Well maybe a whole step: at least I can use tape to help w/ the 50g...).

The keys are just a little too hard for my tastes.

How are the 35S keys compared to the 50g? I would rate my 48's keys as absolutely perfect.

Also, off the topic: What the heck is up with having  $x^2$  as a second function anyway?!?!?! That was one of the reasons I bought a 33S, but I can't stand only having 4 registers.

### Primary key: $x^2$ or Square root

Message #2 Posted by [Gene Wright](#) on 30 July 2007, 12:08 p.m.,  
in response to message #1 by Brad Davis

I'm sure this was a tough decision for the design team.

The considerations include:

In RPN,  $X^2$  can be accomplished by ENTER x, which is two keystrokes and loses a stack level. Having  $X^2$  as a primary key allows for it to be computed with one keystroke, which is more efficient.

However, which function is used more often? is Square root used more than  $X^2$ ? I have no idea, but if Square root is used more often, then it ought to be the primary function rather than  $X^2$ .

So, part of me wants  $X^2$  to be primary to save a keystroke for efficiency, but if users need Square root 80% of the time, perhaps it should be the primary function.

So, what do you guys think?

Which is probably used more often?  $X^2$  or Square root?

Well, we'll all have our opinions, of course. I'm sure the team looked at lots of different options. I am happy overall--just never understood this one little detail. Of course, other users undoubtedly use their wonderful calculators somewhat differently.

My take on it: I think I use  $x^2$  about as often as  $\sqrt{x}$ , so I like both as first functions. In this case, I think X should've remained an alpha function and  $x^2$  should go there. Having X as a first function only helps for writing equations faster. I speculate that I'm typical in that I probably spend 10x more time punching through equations than programming equations.

Other candidates for second functions to make room for  $x^2$ : I use  $x^2$  probably  $>10x$  more often than EEX and a little more often than  $1/x$  and  $x^y$ . I rarely use SPC and SYMB. I speculate, of course, that I'm more typical than folks who make big time use of those.

I could be wrong, though--would be far from the first time.

Maybe a future model will allow the user to change the functions.

I never use my calculator for programming or plotting (I have Mathcad and Matlab for that), so its primary purpose is punching through big nasty equations. Of course RPL is ideal for that. I use integrals sometimes during virtual work calcs, but that's about it. Of course, this completely skews my perspective. I speculate that many others use them similarly.

BTW, I've been using RPN/RPL for 16 years and I'd never thought of duplicating and hitting X again--DUH!! Thanks for mentioning that. I'll just start doing that. It's two keystrokes, but two very fast and convenient ones!

The HP-67 had a blue shifted  $x^2$  as well, so this is nothing new. Its just what ends up happening when there are far more functions than keys. The HP-67 had 3 function keys (f yellow, g blue, and h black).

The square root was a non-shifted function, but that got over-ridden if a program was read in from a magnetic card, and then also became a shifted function (so did  $1/x$  and  $y^x$ ).

Kostas

Without a doubt, square root should be primary, for the simple reason that it is the "difficult" one that you "need" a function for!

LOL, guys, I went back and looked and verified that I didn't technically suggest replacing  $\sqrt{x}$  with  $x^2$  !

I like them both as first functions and see several others that I personally don't use as much.

Brad, I was really talking about the key layout for the 35s, not the 50g.

The 50g is an entire additional story about layout of keys. :-)

On the 35s, I'm not sure what primary key function I would move to a shifted function.

Certainly, I would not move  $1/x$  or  $y^x$  to be shifted functions. The parentheses key really HAS to be primary function not only because making them a shifted function would be a slap in the face to any algebraic users (HP needs those to sell the unit despite what we RPN people might think) but also because of their use in EQN mode.

in response to message #7 by Gene Wright

Yeah, I agree and I sidetracked completely onto the 50g.

My only idea is to move ( to the Sigma+ location. Then again, somebody somewhere probably loves the Sigma+ key as a first function! I'm sure the design team spent many hours debating this kind of thing--it could go on forever.

I don't care about the issue as much now that you mentioned to hit Enter, X to square something. Still can't believe I didn't think of that at some point.

That's the problem with programmable calcs like the 35S, the designer has to choose whether to optimise it for programming, or optimise it for general calculations. The 35S has obviously been optimised for use as a programmable calc, so your basic scientific calc keys get shifted and replaced with programming keys and arrow keys.

If the 35S had been designed as primarily a scientific calc (as it should have been IMHO for a HP 35 anniversary edition), the keyboard layout would have been a lot different, and more like the 33S, which (chevron issues and big ENTER aside) is a pretty good layout.

Dave.

in response to message #2 by Gene Wright

More to the point, I'd put other functions on primary status ahead of  $x^2$ :

STO

Ln

$e^x$

**Re: Primary key:  $x^2$  or Square root**

Message #11 Posted by [Brad Davis](#) on 30 July 2007, 3:18 p.m.,  
in response to message #10 by bill platt

Yeah, I agree that many would see  $\ln(x)$  and  $e^x$  as higher priority.

I didn't think of those because they don't show up very often in my particular line of work.

$x^2$  as shifted function was one thing that hits me directly when I saw the first pictures of the 35s key layout. On my 33s I am happy with  $x^2$  being primary.

Back then when I was working as surveyor the Pythagoras formula was something I used many many times each day. This in mind  $x^2$  as primary function is very useful.

Now, working as mechanical engineer I still have the feeling  $x^2$  occurs more often in formulas than SQRT.
