So  $x^2$  shifted is not so good in my eyes, but it is certainly a minor disadvantage, and for many others maybe an improvement over the 33s.

**Re: HP35S vs HP50g Keys**

Message #13 Posted by [Chris Haltiner](#) on 30 July 2007, 1:53 p.m.,  
in response to message #1 by Brad Davis

Quote:

How are the 35S keys compared to the 50g? I would rate my 48's keys as absolutely perfect.

I wrote about this in my 35s comments post earlier. I find the 35s key tactile feedback to be the closer to my 41CV than any other HP calculator I've owned since then. While the 50g keys are good, I can't make entries on it nearly as fast as I can on the 35s. (This was even after using a much lower keytime value on the 50g.) On the 50g, the harder physical key press as well as the greater key travel are probably factors.

I would say the 41CV keys are 10/10. I'd give the 50g a 7/10 and the 35s a 9/10.

**Re: HP35S vs HP50g Keys**

*Message #14 Posted by [Brad Davis](#) on 30 July 2007, 3:21 p.m.,  
in response to message #13 by Chris Haltiner*

Thanks to all you fellows for your replies.

It seems that I might need to add a 35S to my ever-growing collection.

22S, 28S, 33s, 48, 50...

I'm holding out hope that the 50 keys will soften, but I'm not optimistic.

### 35s Matrix

Message #1 Posted by [Vincze](#) on 30 July 2007, 10:16 a.m.

I no see any information so I need to ask. Does the 35s handle Matrix math?

### No

Message #2 Posted by [Valentin Albillo](#) on 30 July 2007, 10:25 a.m.,  
in response to message #1 by Vincze

Best regard from V.

### Re: No

Message #3 Posted by [Ed Look](#) on 30 July 2007, 12:06 p.m.,  
in response to message #2 by Valentin Albillo

Ah, to V (incze) and V (alentin) :

Now with so many indirectly addressable registers... what, 800+?... it may not be so hard to write a (small?) program to do matrix math.

In the 33S, 32SII, and other RPN HP calculators in the same class, scientific programmables, the relatively limited amount of storage registers and program space limited how big a matrix the calculator could handle, even if you wrote a program to do it. But now, with about 800, even if only indirectly addressable, storage registers...

... <o !!

### Datafile special issue on the 35s

Message #4 Posted by [Gene Wright](#) on 30 July 2007, 12:10 p.m.,  
in response to message #3 by Ed Look

contains a program giving the matrix utility programs from the HP41 PPC ROM modified to work with the 35s.

These provide a fairly easy way to write a Determinant and Inverse program for the 35s, which I had at about 95% done...just can't get back to it. :-)

However, given that Valentin says he has a 35s, I expect a program to do matrix wonders in about 1/2 the space and run time of anything I might attempt. :-)

### Re: Datafile special issue on the 35s

*Message #5 Posted by [Ed Look](#) on 30 July 2007, 12:21 p.m.,  
in response to message #4 by Gene Wright*

Um... Gene, forgive the stupid question:

where/how can I access this (or any) issue of Datafile?

### **Where and How**

*Message #6 Posted by [Valentin Albillo](#) on 30 July 2007, 2:20 p.m.,  
in response to message #5 by Ed Look*

Hi again, Ed:

Ed posted:

*"where/how can I access this (or any) issue of Datafile? "*

1. Where: [here](#)
2. How: [this way](#)

Best regards from V.

### **Re: Where and How**

*Message #7 Posted by [Vincze](#) on 31 July 2007, 11:15 a.m.,  
in response to message #6 by Valentin Albillo*

Good morning Valentin. If I join Datafile, does it allow me to view articles online? Also, how many pages is typical magazine? Is it also possible to see a preview magazine before purchase so I understand better what is in it?

### **Re: Where and How**

*Message #8 Posted by [Gene Wright](#) on 31 July 2007, 11:42 a.m.,  
in response to message #7 by Vincze*

Hi.

The magazine is automatically sent to members of the HPCC club, pretty much 6 times a year.

You don't buy the magazine. You join the club and the magazine is sent to members.

Some articles are put online for all to see the types of articles that are published, but electronic versions of the Datafile magazine are not available.

### **Re: Where and How**

*Message #9 Posted by [Vincze](#) on 31 July 2007, 3:15 p.m.,  
in response to message #8 by Gene Wright*

If I join HPCC, how soon would I see Datafile magazine?

**Re: Where and How**

*Message #10 Posted by [Giancarlo \(Italy\)](#) on 31 July 2007, 11:52 a.m.,  
in response to message #7 by Vincze*

Hi Vincze.

I apologise for jumpin' in, but I think I can put my experience on the table here :-)  
According to what is stated on the [Datafile page](#) :

Quote:

---

HPCC's policy is that current issues of Datafile are only available in printed form. For convenience, back issues up to and including 2003 are available on cd-rom from Jake Schwartz [here](#)

---

The "typical" magazine page number varies from issue to issue - due to the number of contributions from members.

As far as the contents go, please be reassured that they are worth every penny :-)  
In fact you'll find a lot of interesting articles about many different HP devices, hardware and software insights, reviews and many many other pieces of information. Last but not least, the thrill to receive, every month, a good old paper magazine, with that good smell of printed matter... A jump back to the future ;-).

Hope this helps.

Best regards.

Giancarlo

*Message #13 Posted by [Giancarlo \(Italy\)](#) on 1 Aug 2007, 5:42 a.m.,  
in response to message #12 by Antonio Maschio (Italy)*

Ciao Antonio.

In July/August 2006 I was not a member of HPCC yet, so I'm afraid I can't provide any insight about your curiosity (I haven't got any printed issue of the Datafile dating back to July/August 2006). But now I'm curious too to see how did you manage to \*write\* that article ;-) Best regards.  
Giancarlo

*Edited: 1 Aug 2007, 5:43 a.m.*

**Re: Where and How (\*my\* article)**

*Message #14 Posted by [Antonio Maschio \(Italy\)](#) on 1 Aug 2007, 8:38 a.m.,  
in response to message #13 by Giancarlo (Italy)*

Ciao Giancarlo.

What I can say is that here in this Forum I posted some notes about integer division on the HP-33s, noting there was something wrong.

Probably these notes resounded in someone's ears, and this someone (attributing the article to me) reported my observations.

I wasn't contacted for this, but I won't complain, since it's an honor for me.

But as for this, I'm curious to see:

- 1) the format of the article
- 2) its real content
- 3) \*\*\*My name in front of it\*\*\* !!!

I'm human, after all!

### **Still No**

*Message #18 Posted by [Valentin Albillo](#) on 30 July 2007, 2:16 p.m.,  
in response to message #3 by Ed Look*

Hi, Ed:

Ed posted:

*"Now with so many indirectly addressable registers [...] it may not be so hard to write a (small?) program to do matrix math.*

Vincze's original question is: *"Does the 35s handle Matrix math?"*, which I take it to mean whether it includes built-in matrix functions.

The answer is still "No".

Best regards from V.

### **Re: Still No**

*Message #19 Posted by [Frank Rottgardt](#) on 30 July 2007, 3:56 p.m.,  
in response to message #18 by Valentin Albillo*

A simple NO, BUT... is certainly of great interest if one asks for a build-in-function which does not exist. I mean we are talking about a programable scientific, so a nice work around in form of a neat little program might be a buying argument for somebody who absolutly need matrice math.

Of course a "NO" answer (in the subject line) was correct math. Like a very sufficient and byte-saving RPN-program ;-)

**Sorry, but No cigar**

Message #20 Posted by [Valentin Albillo](#) on 30 July 2007, 5:00 p.m.,  
in response to message #19 by Frank Rottgardt

Hi, Frank:

Frank posted:

*"[...] a nice work around in form of a neat little program might be a buying argument for somebody who absolutely need matrice math."*

There's no "neat little program" which can do decent NxN system solution, matrix inversion, or determinant computations if there's no built-in support for matrices, even if only at the level of row-manipulation primitives.

If "somebody absolutely needs matrice math", they would do well to have a look at other HP calc models much better suited to the task, such as all RPL models, the HP-71B/Math, the HP42S, the HP-41C/Advantage, or the HP-15C. Decent HP35s' matrix programs are never going to be "little" and certainly will be orders of magnitude slower.

Best regards from V.

**Re: Sorry, but No cigar**

Message #21 Posted by [Ángel Martin](#) on 1 Aug 2007, 5:01 a.m.,  
in response to message #20 by Valentin Albillo

Amen to that. Whilst the 35s may be a nice departure from HP's recent track record (deplorable?), let's not write home about alleged goodness that won't hold true.

No matrix, no cigar :-)

Best, AM.

### Error function 35s vs. 32SII

Message #1 Posted by [Thomas Radtke](#) on 30 July 2007, 9:38 a.m.

FYI, I implemented a simple program to calculate the error function on both the 35s and the 32SII.

Results (Argument 5, full precision)

32SII: 14.5 s  
35s: 22.3 s

OTOH, using the equation editor and integrate it (Argument 5, four digits precision) results in:

32SII: 5.87 s  
35s: 4.9

So, while RPL programs seem to run a lot faster on the old pioneer, at least one of the internal functions of the 35s is able to beat its grandfather.

### Re: Error function 35s vs. 32SII

Message #2 Posted by [Les Wright](#) on 31 July 2007, 3:04 a.m.,  
in response to message #1 by Thomas Radtke

Thomas, what algorithm do you use to calculate erf and erfc?

I have both a series and continued fraction implementation that are perceptibly slower on the 35s vs. the 33s, but a typical calculation doesn't seem to take any more than a couple or three seconds tops, even faster on the 33s. Haven't tested on 32sii but in my experience it runs about as fast as the 33s for most things.

22s, even 14s, seems a really slow way to compute this function.

Les

### Re: Error function 35s vs. 32SII

Message #3 Posted by [Thomas Radtke](#) on 31 July 2007, 3:56 a.m.,  
in response to message #2 by Les Wright

Dear Les,

I'm using the taylor series, argument 5 is completely unusual for most applications and takes 51 iterations. E.g., only 5 are needed for 0.1

Of course, the program can be improved (there's not even an error handling)

## Re: Error function 35s vs. 32SII

Message #4 Posted by [Les Wright](#) on 31 July 2007, 4:59 a.m.,  
in response to message #3 by Thomas Radtke

My routines start with series and continued fraction computations of the incomplete gamma function,

straight out of Numerical Recipes--indeed when I program continued fraction calculations I use the modified Lentz method in preference to the better known and very old Wallis method, for the reasons NR gives. I compute the left-sided incomplete gamma by series expansion, the right-sided by continued fraction. The error functions are of course special cases of the incomplete gamma functions, as are the normal distribution probability function (both cumulative and upper-tail) and the chisquare probability distribution (again, both cumulative and upper tail).

When I get a chance I will post this--I have code for everything except the chisquare stuff. All told just over 100 steps tops, but there is no error handling, and the user needs to decide which function (series or continued fraction?) is preferable based on his input and his knowledge of the properties of these calculations.

I agree that it is unusual to compute  $\text{erf}(5)$  by series expansion. It makes more sense to compute  $\text{erfc}(5)$  (about  $1.54e-12$ ), and compute  $\text{erf}(5) = 1 - \text{erfc}(5)$ . That said, my series routines don't take anywhere near over 20 seconds to compute  $\text{erf}(5)$  directly by series--maybe 4-5 seconds tops--but I should note that the result is off by 1 ULP-- $1.00000000001$ .

It also looks like you are using the alternating series expansion. The other series expansion I know is not alternating and has an exponential term out front. I don't know if it converges any faster.

Les

### Re: Error function 35s vs. 32SII

Message #5 Posted by [Les Wright](#) on 31 July 2007, 12:48 p.m.,  
in response to message #4 by Les Wright

Thomas, here is my offering. The reference is formula 7.1.6 of Abramowitz and Stegun, whereas you seem to use 7.1.5. The idea of each term being a recursion on the prior term I get from the Numerical Recipes code for the series computation of the incomplete gamma function.

```
(E001) LBL E
STO T
STO S
x^2
STO Z
1
STO D
RCL S
(E009) STO O
2
STO+ D
RCL Z
STO* T
2
STO* T
RCL D
STO/ T
RCL T
STO+ S
RCL O
RCL S
x#y?
GTO E009
RCL Z
+/-
e^x
*
2
*
PI
SQRT
/
(E033) RTN
```

5 XEQ E ENTER returns  $1.00000000002$  in a few seconds (certainly no more than 10), whereas the

actual 12-digit result should be 9.99999999998e-1. This should come as no surprise--rounding error is bound to crop up. For input greater than about 1.8, one should compute erfc by the continued fraction and get erf as the complement ( $\text{erf}(z) = 1 - \text{erfc}(z)$ )

But for smaller arguments, the above does very well--erf(1) is computed swiftly as 0.84270079295, which is completely accurate. erf(0.1) is even faster, giving 1.12462916019e-1 (the last digit should be an 8).

I guess what caught my attention is that I knew one could compute these series faster on the 33S and 32sii than what you were reporting. I must confess that the comparative sluggishness of the 35S (though still much faster than the 41 series, the 11C, the 15C, the Spice series, and even the 42S) is a disappointment. I love the speed of the 33S, despite its foibles, and really hoped this would port to the 35s intact. Alas, that hasn't happened.

I may port my continued fraction code for the incomplete gamma function, modified for the special case of erfc, and post it later if anyone is interested.

Les

*Edited: 31 July 2007, 12:49 p.m.*

## Re: Error function 35s vs. 32SII

Message #6 Posted by [Les Wright](#) on 31 July 2007, 3:29 p.m.,  
in response to message #5 by Les Wright

Here is that promised continued fraction computation for erfc:

```
(C001) LBL C
STO X
x^2
0.5
+
STO B
1/x
STO C
STO D
1e250
STO E
CLx
STO H
(C014) 1
STO+ H
STO+ B
STO+ B
0.5
RCL- H
RCL* H
STO G
RCL* C
RCL+ B
1e-250
+
STO C
RCL G
RCL/ E
RCL+ B
1e-250
+
STO E
RCL C
1/x
x<> C
/
STO* D
1
x#y?
(C040) GTO C014
```

```

RCL X
ENTER
x^2
+/-
e^x
*
RCL* D
PI
SQRT
/
(C051) RTN

```

This is best employed when input is greater than about 1.8. For example, 2 XEQ C ENTER returns 4.67773498102e-3 (the last digit should be 5) in a few short seconds. The routine gets faster as the input gets larger. Nonetheless, 1 XEQ C chugs along for a few seconds to yield 1.57299207048e-1 (the last digits should be 50 so it is off 2 ULP). Below that, if not sooner, the continued fraction really should give way to the series computation of erf and erfc(x) computed as 1-erf(z).

My routine started out as my port of the Numerical Recipes continued fraction computation of the incomplete gamma function, modified for the specific case of the complementary error function. The modified Lentz algorithm is used with TINY=1e-250 as required to avoid division by zero issues.

Les

### **Re: Error function 35s vs. 32SII**

*Message #7 Posted by [Thomas Radtke](#) on 1 Aug 2007, 6:56 a.m.,  
in response to message #6 by Les Wright*

Thanks for your code! This makes me wonder if there's a repository for such pearls somewhere? I fear, the work shown here quickly gets lost.

### **Re: Error function 35s vs. 32SII**

*Message #8 Posted by [Les Wright](#) on 1 Aug 2007, 10:18 a.m.,  
in response to message #7 by Thomas Radtke*

Thomas, my plan is eventually submit the incomplete gamma routine on which these are based, along with subroutines to compute the special cases of the error function, chisquare distribution, and normal distribution, to Dave for inclusion in the software library on this site. I also hope to port a somewhat long 42S program I have that computes the incomplete beta function, along with its special cases (t distribution and F distribution).

I mentioned in an earlier thread that I hoped the expanded flexibility of the 35s programming environment will make it easier to write meaningful programs. I find the line number addressing heaven sent. I have three programs in my 33S that use up almost all the labels right there. The 35s is now free of that limitation.

Les

### **Re: Error function 35s vs. 32SII**

Message #9 Posted by [Les Wright](#) on 1 Aug 2007, 12:37 p.m.,  
in response to message #3 by Thomas Radtke

Here, for completeness, is my take on the the Taylor series (formula 7.1.5 in Abramowitz and Stegun):

```
(T001) LBL T
STO T
STO S
x^2
+/-
STO Z
0
STO D
1
STO E
RCL S
(T012) STO O
1
STO+ D
STO+ E
STO+ E
RCL Z
STO* T
RCL D
STO/ T
RCL T
RCL/ E
STO+ S
RCL O
RCL S
x#y?
(T027) GTO T012
2
*
PI
SQRT
/
(T033) RTN
```

This converges rapidly and accurately for small values of input but once you get much beyond 3 results become not only inaccurate, but pretty meaningless.

For example, 4 XEQ T ENTER returns 1.00000031185 (whereas the actual result is actually about  $9.9999984583e-1$ ). I assume that with the alternating series, rounding errors accumulated, or, in the alternative, differences between terms begin to cancel out so the loop terminates too soon.

For this reason, I really think the non-alternating series is better in generally, though there is no doubt this series is very fast for smaller values of input.

Les

### Program question

Message #1 Posted by [Vincze](#) on 30 July 2007, 9:00 a.m.

I have very enjoyable weekend playing with new 35s. Based on one post on Friday about square root algorithm, I sat down and wrote program on 35s to calculate the square root. I had some problem with it, but it generally work ok. I also write program in C to do, and it much quicker that calculator, but that understandable. In C, it very fast for some numbers, but when number get over 20 digit long, it take long time to calculate.

I know we have sqrt function on calculator, but anyone know of way to write optimized program on 35s? I not very good with programing calculators, but I be interested in seeing how wiser person write.

Again, please excuse poor English mine.

### Re: Program question

Message #2 Posted by [Gerson W. Barbosa](#) on 30 July 2007, 10:28 p.m.,  
in response to message #1 by Vincze

Hello Vincze,

This is not optimized for the HP-35s (I haven't read the manual yet). As an exercise, I tried to use only the stack, although I am not sure if this will make to program run any faster on the 35s. It could be shorter, I think. This is the same algorithm in the TurboBCD program below, except it doesn't handle sqrt(0). The initial guess should be improve (the program will take longer to run for large arguments).

```
S001 LBL S
S002 0.5
S003 x<>y
S004 *
S005 ENTER
S006 ENTER
S007 ENTER
S008 LASTx
S009 ENTER
S010 Rv
S011 x<>y
S012 /
S013 x<>y
S014 +
S015 LASTx
S016 x<>y
S017 2
S018 /
S019 x=y?
S020 STOP
S021 x<>y
S022 ENTER
S023 /
S024 x<>y
S025 Rv
S026 x<>y
S027 *
S028 GTO S010
```

I am implementing some functions in TurboBCD. The square root function will be handy for inverse trigs.

Regards,

Gerson.

```
-----

Program Sqrt;

## Re: Program question

*Message #9 Posted by **Vincze** on 31 July 2007, 1:32 p.m.,  
in response to message #8 by Gerson W. Barbosa*

Thank you Gerson. I see I did have error in entry. I fix and try and it now work. It seem slow. I enter 999999999999 and it take about 8 seconds. I wonder how HP wrote algorithm for assigned sqrt key? I always wonder how a key could be faster than program can be. Granted, it must be written in machine language, so should be faster, but I wonder if anyone have knowledge of how calculator company does this.

## Re: Program question

*Message #10 Posted by **Gerson W. Barbosa** on 31 July 2007, 2:19 p.m.,  
in response to message #9 by Vincze*

Quote:

I enter 999999999999 and it take about 8 seconds.

This takes 4.5 seconds in mine. Perhaps you've missed one 9 here. It all depends on the initial guess. Change line K002 to 3E-7 and it will take 1.2 seconds. On the other hand, it will take 4.5 second for 9.

Quote:

I wonder if anyone have knowledge of how calculator company does this.

Well, not exactly from a calculator company (MS in MSX stands for you know what).

Quoting from "The MSX Red Book":

-----  
Address... 2AFFH

This routine is used by the Factor Evaluator to apply the "SQR" function to a double precision operand contained in DAC. The function is computed using the Newton-Raphson process, an equivalent BASIC program is:

```
10 INPUT"NUMBER";X
20 GUESS=10
30 FOR N=1 TO 7
40 GUESS=(GUESS+X/GUESS)/2
50 NEXT N
60 PRINT GUESS
70 PRINT SQR(X)
```

The above program uses a fixed initial guess. While this is accurate over a limited range maximum accuracy will only be attained if the initial guess is near the root. The method used

by the ROM is to halve the exponent, with rounding up, and then to divide the first two digits of the operand by four and increment the first digit.

-----  
 (Avalon Software. The MSX Red Book. Pangbourne: Kuma Computers, [c.1985].)

**Re: Program question**

Message #11 Posted by *Thomas Klemm* on 31 July 2007, 3:44 p.m., in response to message #1 by Vincze

Instead of calculating the square root of a number *d* the inverse of the square root may be calculated followed by the multiplication of *d*:

$$\text{sqrt}(d) = \frac{1}{\text{sqrt}(d)} * d$$

Use an initial value:

$$x_0 \sim 1 / \text{sqrt}(d)$$

and calculate *x*<sub>1</sub>, *x*<sub>2</sub>, *x*<sub>3</sub>, ... with the following formula:

$$x_{i+1} = x_i + x_i \frac{1 - d * x_i^2}{2}$$

This method has the advantage that only a division by 2 is needed.

Here's an HP-11c program:

```
01  LBL A           14  *
02  STO I           15  -
03  1               16  *
04  +               17  2
05  1/x            18  /
06  ENTER           19  RND
07  LBL 0           20  x#0
08  +               21  GTO 0
09  ENTER           22  +
10  x^2            23  RCL I
11  1               24  *
12  x<>y           25  RTN
13  RCL I
```

I guess it's easy to convert that into a program for the HP-35s.

Now let's suppose we want to calculate sqrt(5) only with paper and pencil using an initial guess *x*<sub>0</sub> = 0.4. At the beginning the multiplications are easy to perform since we have only few significant digits whereas at the end the numbers become smaller and smaller.

However there's a slight difference compared to the program above.

Since *x*<sub>*i*+1</sub> = *x*<sub>*i*</sub> + *dx* the square of the next value is calculated using the square of the previous:

$$(x_{i+1})^2 = x_i^2 + (2*x_i + dx)*dx$$

## Re: Program question

Message #12 Posted by [Vincze](#) on 31 July 2007, 4:50 p.m.,  
in response to message #11 by Thomas Klemm

Quote:

\_\_\_\_\_  
Credits to Newton for this marvelous algorithm.  
\_\_\_\_\_

I do like Newton's method, but I believe the Babylonian method to be better since it considered a quadratically convergent algorithm meaning that with each iteration, it get closer to final result.

On a side note, I do some research and see that most pocket calculator use routine to compute exponential function and the natural log in for of  $\sqrt{x} = e^{.5 \ln x}$  where  $x$  is the number you are trying to find sqrt of (I believe). I try this, but I have not had luck with yet on 35s.

Ok.. I figure out how to use exp ln method, and it work very fast. Here is how I write.

```
S001 LBL S
S002 ENTER
S003 LN
S004 0.5
S005 *
S006 ex (as is EXP(x))
```

That is it. I try with large number (63 9's) and it calculate instantly. I should have thought of this before with my experience with slide rule. That how we could find sqrt on slide rule (although good slide rule have ability to square and show square root too).

\_\_\_\_\_

Both algorithms converge quadratically with a good initial choice.

That's not the difference. Use the one I've mentioned above if for some reason division compared to

multiplication is expensive.

Quote:

... meaning that with each iteration, it get closer to final result.

Well, that's not exactly the definition of [quadratic convergence](#).

### Re: Program question

Message #14 Posted by [Vincze](#) on 31 July 2007, 8:55 p.m.,  
in response to message #13 by Thomas Klemm

Good evening Thomas. Yes you right that both quadratically convergent. I think that yours harder to do in head if wanting, but we not talking about doing in head, but in basic calculator program, so you have valid point. My apologies.

Please excuse my poor english.

### Re: Program question

Message #15 Posted by [Gerson W. Barbosa](#) on 1 Aug 2007, 12:19 a.m.,  
in response to message #12 by Vincze

Even shorter and faster:

```
S001 LBL S
S002 SQRT
S003 RTN
```

Just kidding :-)

Klemm's idea and mine was to present a *numeric* method for the square root function. Using logarithm to compute the square root is slower than computing it through those methods, so computer languages and calculator might use the latter, even though they have built-in logs.

Here is an improved version of the first algorithm, slightly slower but shorter despite handling zero:

```
L001 LBL L
L002 x=0?
L003 RTN
L004 ENTER
L005 ENTER
L006 2
L007 /
L008 ENTER
L009 REGZ
L010 x<>y
L011 /
L012 LASTx
L013 ENTER
L014 Rv
L015 +
L016 2
L017 /
L018 REGZ
L019 x=y?
L020 RTN
L021 Rv
L022 GTO L008
```

People who've read up the manual might come up with an even shorter routine :-)

## Square root digit-by-digit

Message #16 Posted by **Nenad (Croatia)** on 1 Aug 2007, 7:24 a.m.,  
in response to message #1 by Vincze

This is something I remember from elementary school, i.e. how we calculated the square root digit-by-digit, implementing pen-and pencil methods. It goes something like this:

SQRT(24378)=?

```
SQRT(2 43 78)=1 5 6,1 3...
  1 43 : 25 x5
    18 78: 306 x6
      42 00: 3121 x1
        10 79 00: 31223 x3
```

In each step you calculate a single digit x, by guessing it so that the present remainder added the two digits of the original number, divided by the doubled current result with the digit x, written at its end times x subtracted from the current remainder gives the new remainder...

OK, I admit that I have just got lost in this explanation, but hopefully the shown example may shed some more light.

Maybe, someone could write an RPN program to do this.

Until then I prefer the Gerson's solution for my faithful HP67: LBL A; SQRT(x); RTN

## Re: Square root digit-by-digit

Message #17 Posted by **Gerson W. Barbosa** on 1 Aug 2007, 9:24 a.m.,  
in response to message #16 by Nenad (Croatia)

Hello Nenad,

Quote:

\_\_\_\_\_

This is something I remember from elementary school, i.e. how we calculated the square root digit-by-digit...

\_\_\_\_\_

That's the way we computed square roots at school too. I remember once I forgot the algorithm when I needed it but I did remember the iterative method. I couldn't help remembering Isaac Asimov's short story "A Feeling of Power" ...

Quote:

\_\_\_\_\_

Until then I prefer the Gerson's solution for my faithful HP67: LBL A; SQRT(x); RTN

\_\_\_\_\_

Actually, I prefer just to press the SQRT(x) key, especially when it is a primary key as on the HP-35s. There are some side effects though... Read Asimov's short story :-)

Best regards,

Gerson.

## Re: Square root digit-by-digit

Message #18 Posted by **Vincze** on 1 Aug 2007, 10:13 a.m.,  
in response to message #17 by Gerson W. Barbosa

Good morning Gerson. The story you talk about is very important to mankind. I remember reading long time ago, and thinking it not possible that man forget how to do math. But when you see young people struggle with math, and even simple math like multiplication, it do seem very real, and very scary. This why I have fear of my son using calculator in high school. Calculator ok for checking, but I think too many child become calculator dependent that they know not how to think properly. I know I am not smartest person in world, but I also know that skills that I have need to be used to maintain them and calculator and computer only tool to help do math faster. I believe it is so important that child know math and not rely on calculator.

In Hungary, we no allowed to use calculator when I was in school. Has this changed since, I do not know. I need to write my brother and see as he have children my son age there. In fact, when I in university, slide rule was even frowned upon as a crutch, but much needed crutch for more advanced math. Main point though, all students at university understood concept of doing math with pencil and paper first.

Anyhow friend, thank you for reminding us of that short story. It is something all should read.

## Re: Square root digit-by-digit

Message #19 Posted by **Frank Rottgardt** on 2 Aug 2007, 7:54 a.m.,  
in response to message #18 by Vincze

Once the rifle and matches became common our hunting ancestors couldn't imagine how huamnity will survive without knowing the basics of archery and making fire. The most important part of hunting is a) to find the deer b) to sneak up and finally c) to kill it. Today only c) has changed. Skills a) and b) are still something each hunter need to know how.

Back to math: a) is to understand the problem, b) is to know wich mathematic tools are necessary and c) is to obtain the result

a) and b) is the same as for 100 years ago, only c) changed: calculator or PC. As long as our kids are familiar with a+b I can't see the end of the world. If your calculator should be broken, let's fetch a second one from the 2-3 each one has around. Or go to the next shop and buy a new one for 20 bugs or borrow one from your neighbour.

But I do agree in one point: It gives you a better feeling if you know to judge the calculator results since you are able to make a rough estimation by means of mental arithmetics. Also it looks better if you are able to check the bill at Walmart without pulling your calculator.

## Re: Square root digit-by-digit

### **The first HP 35s in Croatia**

Message #2 Posted by [Nenad \(Croatia\)](#) on 30 July 2007, 12:33 p.m.,  
in response to message #1 by [deleted](#)

Samson Cables sent it on 16th July, it cleared customs on Saturday 28th. It arrived today, Monday 30th, safe and sound. They did a great job, at least for me.

S/N is CNA 72101997

Yes, this is **the first HP35s in Croatia.**

I am absolutely, positively, with no doubt, sure about this, because Hrast told me that he did not order one yet :)

Just imagine that feeling to be the first proud owner of the beautiful HP35s in the whole Republic of Croatia. I've done it! I am the first one forever! This should be written somewhere in golden letters! Maybe, the Croatian evening TV news will have to say something about this, so I would certainly have to prepare myself for their interview.

If there exists somebody in Croatia (tourists do not count in) who can prove the opposite, we will be happy to acquaint yet another person interested in such gadgets.

IMHO, everything looks nice, except the serial number label on the back (slightly slanted). However, the LCD display is correctly aligned.

Now, start to RTFM ...

### **Congratulations!**

Message #3 Posted by [HrastProgrammer](#) on 30 July 2007, 3:09 p.m.,  
in response to message #2 by [Nenad \(Croatia\)](#)

Now, go to work - I am expecting the comprehensive report on my desk in a few days :-)

*Message #5 Posted by [Nenad \(Croatia\)](#) on 1 Aug 2007, 6:21 a.m.,  
in response to message #4 by Dave Colver*

Hi Dave,

How nice to hear from you after a long time.

Unfortunately (or luckily) I would still need my HP67 (works flawlessly after your help), as well as my 11C, 12C, 15C, 21, 25, 28S, 32S, 32SII, 33E, 33C, 34C, 41CV, 41CX, 42S, 45, 48SX, 48G, 71B, as well as my wife's 720 and my 728. Unluckily, there are many of similar items that I need, though I don't have them (yet!).

It seems that the near future will bring me a 32E.

BTW, I have to send you an e-mail (IOU).

### hp35S case

Message #1 Posted by [William L. Drylie](#) on 29 July 2007, 8:09 p.m.

Hi all; I have not got a look at the new 35S yet, and was curious as to what type of case hp supplied with it. Is it like the 33S or does it have a fold over top like the original leather case for the old 35?. Glad to see a lot of members still here. I have been away on a job for the last four years. It was pretty much seven days a week, twelve hours a day. My account here was gone, and had to register again. I am Verrrry glad to be home. I am going to take early retirement in January, will be working at home now till then, so I will be able to post now and again. I am reading all of the posts about the 35S, some are pretty interesting, but no matter what, I will buy two anyway. I hope another 15C comes out in the future, I really miss it. Mine burned out a long time ago. Take care all for now, it was really good to see alot of the old names here. Bill Drylie

### Re: hp35S case

### 35s -- Indirect Branching or Manual Mistake?

Message #1 Posted by [Katie Wasserman](#) on 29 July 2007, 5:48 p.m.

There's a section in chapter 14 of the manual called "Indirectly Addressing Variables and Labels" that implies in several places that you can address program labels indirectly. For example:

Quote:

The function (I) or (J) uses the value in the variable I to [sic] J to determine which variable, label, or register to address.

Aside from the typo, this reads to me like it is possible to address program labels indirectly, but I don't see how to do that. Am I missing something here?

-Katie

### Re: 35s -- Indirect Branching or Manual Mistake?

Message #2 Posted by [Valentin Albillo](#) on 29 July 2007, 6:33 p.m.,  
in response to message #1 by [Katie Wasserman](#)

Hi, Katie:

Katie posted:

*"Aside from the typo, this reads to me like it is possible to address program labels indirectly, but I don't see how to do that. Am I missing something here?"*

The term "label" in that sentence refers to the label used in SOLVE and INTEGRATE, which can be specified indirectly. But as for indirect GTO's or XEQ's, that's regrettably a big no-no, though something like 2.007 or -2.007 could have been used to indirectly specify GTO B007 or XEQ B007.

This shortcoming, along with the lack of functions to extract the real/imaginary parts of complex numbers (REPT and IMPT in the HP-71B) or the components of a vector, is among the worst omissions in the HP35s instruction set. Further, there seems to be no function to obtain the conjugate of a complex value either (CONJ in the HP-71B).

Best regards from V.

### Re: 35s -- Indirect Branching or Manual Mistake?

Message #3 Posted by [Antonio Maschio \(Italy\)](#) on 30 July 2007, 4:45 a.m.,  
in response to message #2 by [Valentin Albillo](#)

On the HP-32SII, if you have a program labelled "A", and you put 1 in the variable i, pressing XEQ (i)

executes the "A" program.

Wasn't this preserved on the newer 35s? (Actually I have no 35s yet to try, so I ask to those who have one.)

**Re: 35s -- Indirect Branching or Manual Mistake?**

*Message #4 Posted by [Don Shepherd](#) on 30 July 2007, 7:47 a.m.,  
in response to message #3 by Antonio Maschio (Italy)*

No. XEQ wants a label and line number.

**Re: 35s -- Indirect Branching or Manual Mistake?**

*Message #5 Posted by [Gene Wright](#) on 30 July 2007, 8:54 a.m.,  
in response to message #4 by Don Shepherd*

Manual mistake.

In my 35s review, I note that the XEQ and GTO indirect instructions are not present.

[ [Return to Index](#) | [Top of Index](#) ]**RE: 35s sorting routine challenge - Gene's Challenge***Message #1 Posted by [Miguel Toro](#) on 29 July 2007, 4:02 p.m.*

Hi,

This is an implementation of the "Insertion sort" algorithm. I find that it is reasonable fast and easy to program. This is my first try, but here it is for your consideration, though. It assumes that the numbers list begins always in register 0 and 10 items as the learning module, but it can be modified easily to follow Gene's requirements. I run it against the bubble program and it completed sorting in half the time or less. It was just fun to do it.

```

**Re: RE: 35s sorting routine challenge - Gene's Challenge (EDITED!)**

*Message #2 Posted by [Miguel Toro](#) on 30 July 2007, 10:30 p.m.,  
in response to message #1 by Miguel Toro*

2007-08-01: PLEASE SEE BELOW FOR UPDATED ROUTINE. THANKS

This is the program modified so it can take a number X.YYYY as input, specifying the first and last indirect registers of the list to be sorted.

I compared against the bubble sort, with a list of 100 elements and I got this results:

"insertion": 4 min. 26 sec.

"bubble": 16 min. 40 sec.

I think, it is not bad for a simple algorithm. I'll work the program more to see if I can make it shorter and maybe faster. If someone could make a test run, I'd be happy to get comments.

Here it is (RLDN -> roll down):

```
I001 LBL I
I002 IP
I003 STO B

**35S - AU\$141**

Message #1 Posted by [DaveJ](#) on 29 July 2007, 8:26 a.m.

Looks like the 35s will be going for a very pricey AU\$141 in Australia (US\$120), from this supplier at least:  
<http://www.expansys.com.au/p.aspx?i=151668>

Dave.

in response to message #1 by [DaveJ](#)

I am Canadian and between expedited shipping and taxes and fees at the border I ended up paying around \$90US (\$100CDN) including all costs. I really like the calculator so was quite happy to splurge. I have spent a hundred bucks on stupider things in the past.

It is not a perfect calculator, but considering how outrageously expensive the HP65 was in 1974 (and that is hardly a perfect machine either), it really is a bargain even at the outrageous markups outside the US.

Les

That sounds about what it will cost from [YorkU bookstore](#) at \$84.95 CDN with 6\$ shipping, PST and GST = \$102.84

Don't know if they actually have them, tho - if you click on the B/W image of the calculator for more info you get a JPG of a B/W scan of the back of the brochure - not even the PDF from HP's web site?

---

I got mine from York U. Slightly tilted LCD display, so buyer beware. But seriously, a nice calculator (to semi-retire my 32SII, due to more memory for programs). The display is by far the weak link in 35s. Next to my 20-year-old 32SII it is much inferior in contrast, even on highest setting. But I like the keys.

The HP-75C/D is neglected because, I think, of its younger, smarter brother, the HP-71B. I had a 75 several months before I got my first 71. It was lots of fun, what with all the software on the swap disks aimed at the platform. But my first 71B blew away the 75 in terms of memory and capability of the BASIC implementation. And there are depths to plumb on the 71 that either aren't there on the 75, or are far less capable. Still, it's almost possible to touch type on the 75's keyboard. And it's a capable HP-IL controller, with the addition of the I/O ROM.

It is very nice to see someone working on the platform. Thanks, Gileno!

Regards,  
Howard

### **HP75C/D vs. HP-71B**

*Message #6 Posted by **Valentin Albillo** on 30 July 2007, 7:30 p.m.,  
in response to message #4 by Howard Owen*

Hi, Howard:

I also had an HP-75C at the time it was released, and was able to use it a little and write programs for it, then the HP-71B was released as well.

The HP-75C had some very good things when compared to the HP-71B but ultimately many shortcomings as well, for instance:

- Good: an 8-bit Capricorn CPU, the same as the HP-85, which I already knew how to program directly in Assembler. Matter of fact, many of the internal routines were taken directly from the HP-85 internal ROMs, with nearly the same inputs and outputs, so I already could make sense of them. And it was pretty fast, nearly as fast as the HP-85 itself.

In contrast, the HP-71B had a new 4-bit Saturn CPU, which was a mystery to me at the time, and it was nearly 5 times slower than the HP-75C's.

- Good: larger display, nice and wide keyboard, versus the utterly insufficient 71B display and small, calculator-like keyboard.
- Bad: very large and heavy, required a briefcase at the very least and considerable tabletop room.
- Bad: Very little RAM, even with expensive add-ons such as the Pod, versus the 512 Kb address space of the HP-71B, which was enormous by the usual standards back then (16 Kb, 32 Kb, 64 Kb, ...)
- Bad: No PEEK/POKE built-in, which made LEX-programming bootstrap impossible. You needed a PEEK/POLE LEX somehow before you could do anything of the sort. On the other hand, you could enter LEX files on a bare-bones HP-71B with a program using just standard instructions.
- Bad: The all-important Math ROM functionality and design couldn't hold a candle to that of the HP-71B, most specially regarding complex number dimensioning and functionality.
- Bad: The BASIC dialect of the HP-71B was much better than the one in the HP-75C in many important aspects, and with the exception of the so-called IO ROM, the HP-71B had better ROMs and peripheral capabilities.

Best regards from V.

### **Re: HP75C/D vs. HP-71B**

Hi, Valentin,

Quote:

---

I also had an HP-75C at the time it was released, and was able to use it a little and write programs for it, then the HP-71B was released as well.

---

I actually never owned either until about three years ago. So, as in so many things having to do with HP machines, you were there way ahead of me.

Quote:

---

The HP-75C had some very good things when compared to the HP-71B but ultimately many shortcomings as well, for instance:

..

---

That's a very good list I would add one other thing the HP-75 had that the HP-71 lacked was an implementation of Visicalc. With the one line display and limited memory, it was a bit impractical as a spreadsheet. But you could call the Visicalc routines from BASIC, effectively giving you a language extension consisting of spreadsheet formulas.

Quote:

---

.. Good: an 8-bit Capricorn CPU, the same as the HP-85, which I already knew how to program directly in Assembler.

---

Does an assembler for the HP-75 exist, or did you cross assemble on the 85?

Regards,  
Howard

### **Re: HP75C/D vs. HP-71B**

*Message #8 Posted by [Valentin Albillo](#) on 31 July 2007, 8:08 a.m.,  
in response to message #7 by Howard Owen*

Hi, Howard:

Briefly, as I must go on a long trip right now:

1. Visicalc was a wonderful effort, but absolutely marred by the small one-line display and the utter lack of memory. Visicalc spreadsheets took large amounts of RAM for everything except trivial cases and forced you to do all kinds of tricks to be able to work with them in the limited RAM. The Pod was almost mandatory, a very expensive add-on to an already very expensive machine and very expensive Visicalc ROM. It was very difficult to justify so much expense.
2. I did cross-assemble in the HP-85. I don't remember the exact details, but I do remember it was quite convolute. After I while I got tired of it all, most specially when the HP-71B came out with its open IDS documentation and the Forth/Assembler ROM which made life considerably easier.

I have to go. "See" you all in 3 weeks.

Best regards from V.

**Re: HP75C/D vs. HP-71B**

Message #9 Posted by [Garth Wilson](#) on 2 Aug 2007, 2:56 a.m.,  
in response to message #8 by Valentin Albillo

Quote:

versus the utterly insufficient 71B display and small, calculator-like keyboard.

I touch-typed about 30wpm on the 71, versus about 45 on a full-size keyboard. Using a ton of LEX files that CHHU published from the Paris user group, I wrote a very feature-loaded text editor specifically for use with the tiny display, and I typed a lot on it until the 71 went out of production and I had visions of wearing out the keyboard and not being able to get any service for it. I wrote letters, took notes in meetings, etc.. The key (ie, secret) to making it do well with a small display is to think of the display as a keyhole through which you view your work, and make it so this keyhole can be moved around the work very nimbly.

Quote:

most specially when the HP-71B came out with its open IDS documentation and the Forth/Assembler ROM which made life considerably easier.

The 71 is where I learned Forth, although the Forth implementation in the Forth/Assembler ROM was a really bad one. Fortunately, since it is Forth, the user can improve it, and I was able to speed up many of the built-in words by a factor of up to 13 merely by re-writing them in Forth, not even assembly. (I never did learn the assembly language.)

**Inputting HEX numbers on a 35S**

Message #1 Posted by [Steve Myers](#) on 28 July 2007, 6:41 p.m.

Maybe I'm missing something simple here (hope so), but .. How does one prompt for HEX numbers in a program with the 35S?

I want to write some programs to try and add some of the functionality of my 16C, but can't get this to work.

If I prompt for a number, then try to append BASE 6, I get INVALID DATA. Doesn't matter if I'm in HEX or DEC mode, it still errors.

I can't believe that the only way to do this is to have enter the number then BASE 6 everytime I need to work with a HEX number in a program...

**Re: Inputting HEX numbers on a 35S**

Message #2 Posted by [Don Shepherd](#) on 28 July 2007, 8:31 p.m.,  
in response to message #1 by Steve Myers

Well, I tried it on mine, and you are right! You can't "program" the h, you've got to enter it with the number by using Base 6. Crappy!

**Re: Inputting HEX numbers on a 35S**

Message #3 Posted by [Steve Myers](#) on 29 July 2007, 2:14 p.m.,  
in response to message #1 by Steve Myers

Well, in the chance that maybe HP does read these forums, I have just one small request.

**Please release a simulator of the next calculator before releasing the design to China so these problems can be fixed before mass production.**

I don't think that in doing so HP jeopardizes any sales of its calculators because most all buyers of this type of product are not going to settle for running it on a PC, but people will point out the major flaws like this one in the firmware.

BASE problems like this one are deal-breakers for people like me.

I know there are going to be quite a few happy used HP sellers on EBay...

Hi, Trent --

Quote:

Minor beef: The RND (round) function doesn't work on a complex number as it does on the 42s; you get "INVALID DATA". The wrong shift key is indicated for the RND (round) function on page G-13 of the User's Guide.

Yep, I'd say that's either a bug, or the functional specification was undefined, so RND fell by default to "invalid for complex arguments".

Hmm, I'd never thought about that one, so I had to try it out:

RND for a complex number on the HP-42S rounds both components. This makes sense for its paradigm; to round only one component, use the following:

```
COMPLEX (RPL "C->R")
(x<>y for real)
RND
(x<>y for real)
COMPLEX (RPL "R->C")
```

On the HP-15C, RND operates only on the real component. This is consistent with its documentation on p. 24 of the Owner's Handbook, in that "Number Alteration Functions" operate only on the number in the display. This also makes more sense for its paradigm; to RND both parts, the following sequence is easier:

```
RND
Re<->Im
RND
Re<->Im
```

than for the user to separate and reassemble the components if only one component is to be RND'ed.

Another example of good thinking by those "A-team" H-P calculator engineers in the 1980's...

**An HP addict?**

Message #1 Posted by [Geoff Quickfall](#) on 28 July 2007, 2:05 p.m.

Yes, the last thing I need is a new calculator, but I NEED the 35S for something to entertain me on long flights. My collection includes the following all in restored or as new condition:

- 3 hp 01 including one complete with inner and outer boxes in NOS condition
- 1 hp 35 in plastic container with manuals
- 1 hp 25c (my first HP calculator for use)
- 4 hp 67, two in boxes complete, one of which is unused NOS.
- 1 hp 91
- 1 hp 97
- 1 hp 41c
- 1 hp 41cv (used at university as was the HP 41cx which explains the accessories)
- 1 hp 41cx with 2 printers, 1 floppy drive, one plotter, one wand
- 3 repaired card readers.
- 48g
- 48g+ and infrared printer

The HP 25c was my first intro to HP and was used during my undergrad years. This was followed by the 41CV with stats, nav, and time modules with all the accessories used in a lab during my post grad. Went to the cx version as a professional.

The HP 01 is used in the office (cockpit) and I swap between my HP67, HP41cx, and HP48G+ in the office also depending on my retro mood. Also took the HP 97 with me once but it takes up alot of room in the flight bag!

The gist of this is, do I really need a new calculator? NO!, but I will be getting the HP35s to lay down beside the HP 35 and to get to know in the office.

For those of you that think the weight is to light I would suggest the following:

**Go to the local 'fish bait and tackle shop' and pick up some lead. Form it into shape to fill the various voids in the calc case, there are a few there. Glue them in with silicon or some other adhesive. This will give the calc a 'critical mass' worthy of the older versions!**

;-)

Cheers, Geoff

### **Finally, the 35s arrived in Germany!**

Message #1 Posted by [Doctor Bubu](#) on 28 July 2007, 5:52 a.m.

Today it came as a normal parcel. It was shipped from Spain? So there where no custom-tax for me.

My first impression, because i had no time to play around, is that someone who sayd that the blister is one of the best are completly right.

And it feels very good, i am finally happy. I do not think that it is not havy enough. the weight, even of the older calculators, depends mainly on the batteries.

The serial Number is 72 10 20 10

Greetings from Germany Jürgen

### **Re: Finally, the 35s arrived in Germany!**

*Message #5 Posted by **Doctor Bubu** on 29 July 2007, 4:00 a.m.,  
in response to message #4 by Walter B*

Hallo Walter and Joan!

I ordered, as i told, at samson cable. with world wide express 52,99\$ + 43\$.

After a long cnversation via email the last mail from customer service was:

Jurgen,

I do apologize for the time taken to ship your order. The usual two- to three-day shipment to us of our deliveries from HP manufacturing was delayed, so we were unable to ship as planned. Because your order was from the European Union, it additionally required us shipping the calculators to Europe, from where the shipment is actually made to you. (Using our partner in Spain, shipping from Europe avoids you paying customs taxes, avoids shipping and customs problems, and simplifies delivery for our products because the shipments originate from within the EU.) Our European office received their shipment of 35S calculators on the 23rd, the day we gave them your order.

Because our shipments are done through Spanish mail through our partner, we do not have a tracking number. We have forwarded tracking numbers in the past to a few customers, but our experience with European mail is that although the mail service is reliable, the tracking numbers give little information.

Regards,

Karren

It really come from spain,

FZInformatica samson europa, Llaudez No.1 Bajo, Alicante

so i have not payed any furher tax. But the shipping costs from spain was only 13,20 Euro (around 18 \$) so i wonder how i will deal with the different amount i payed, (espacialy because it took 2 weeks not 2 days).

Has anyone an Idea?

Greetings Jürgen

### **Re: Finally, the 35s arrived in Germany!**

*Message #6 Posted by **Andreas Haack** on 29 July 2007, 9:11 a.m.,  
in response to message #5 by Doctor Bubu*

Hi Jürgen,

I get exactly the same Email from Karren. I ordered my 35s on the 07/15 ( 52.99\$ + 43\$ S/H). But unfortunately until today I don't get my calculator.

If the shipping cost are only 18\$ then I will not pay 43\$ for S/H.

Get you an invoice with the german VAT ?

Greeting from Berlin

Andreas

**Re: Finally, the 35s arrived in Germany!**

*Message #7 Posted by [Rafael Millán](#) on 29 July 2007, 9:31 a.m.,  
in response to message #5 by Doctor Bubu*

Hello Jürgen,

This is similar to the shipping method used by Amazon USA. All shipments to the European Union go to a partner in Germany which then distributes them into the EU. But custom taxes exist anyway, just they are processed/negotiated/payed in bulk by the European partner, instead of by each individual customer. I think that this is very convenient for us, as dealing with customs becomes easily a nightmare, at least in my experience. Also, some couriers can do it on behalf of the customer, but usually at very expensive prices.

So the custom taxes would not be included in the shipping cost from Spain, as they would have been paid before. I also received my two units in Madrid from the same company in Alicante, but not thru Spanish mail, but a local courier.

By the way, I could sell one of them to someone in the Madrid area. The price is the same I payed for it: 68 euro. Compare with [Nomatica.es](#) which is accepting preorders at 95.95 euro. Use the forum mail if interested.

Best regards, R.

*Message #8 Posted by [Eduardo Muñoz](#) on 31 July 2007, 8:43 a.m.,  
in response to message #7 by Rafael Millán*

Hello Rafael,

did you buy those calculators from Samson Cables or from F7informatica directly?. How many days went by between payment and reception of the calculators?. BTW i live in Seville. Email me privately if you want.

Greetings,

**Re: Finally, the 35s arrived in Germany!**

*Message #9 Posted by [Rafael Millán](#) on 31 July 2007, 6:22 p.m.,  
in response to message #8 by Eduardo Muñoz*

Hi Eduardo,

I bought the 35s from Samson Cables, I had not heard of F7informatica before. I ordered on 15th, they charged my credit card on 16th, and I received the calculators on 26th. I think that this timing has been typical for European buyers. I paid for "world-wide express 1-2 days", but my price per unit was not very bad because the shipping cost for two units didn't double, it was more like multiplying by 1.35.

Regards, R.

### **HP 35s - great opportunity?**

Message #1 Posted by *mark murphy* on 27 July 2007, 8:53 p.m.

Hmm - waiting for my next trip over to SFO to get hold of a HP35s - it would be a sin to break apart an HP41c - but the 35s hmm. It seems to have lots of room inside it. Isn't this the chance we've been waiting for to open it up and create a frankenstein monster based on Eric Smiths excellent previous work? Adding a mini usb and sd card should be simple - the CPU, well there are plenty of us around to get an open source version running ?

### 35s thoughts and a bug

Message #1 Posted by [Paul Dale](#) on 27 July 2007, 9:13 p.m.

Some quick initial thoughts before I go back to playing:

- Very light. I'm not sure if this is a plus or a minus just yet. I guess it will boil down to personal preference.
- The case seems decent enough, more like a gameboy case than a calculator one but I can live with that.
- Fast. I don't have a 33s so I cannot compare it with that but it feels a lot faster than my 32sii.
- What a poor selection of complex operations. I know they are the same as on the 32sii and 33s but those models lacked proper complex numbers. Why no x-th root of y, square root or square?
- Orange (left) shift C for off feels very unnatural. Luckily Blue (right) shift C does the same function.
- The keyboard layout will take a bit of getting used to but I'm fast warming to it.

And I think I found a bug. Enter a 999 line single label program. The calculator rightfully doesn't allow you to enter any more steps. However, it also doesn't allow you to enter a new LBL step either. Oops.

If you enter 998 steps, then the new label and then go back and fill in the 999th step, all is well. You also cannot create two programs whose combined length is > 999 steps and delete the LBL for the second, so some thought had been put into long program sizes.

- Pauli

Add 0i0 to y, then  $y^x$  will work. I do not understand how 15C/42S thinking and functionality got dropped.

My tests:

1.  $\sqrt{-1}$  returns: SQRT(NEG)
2.  $-1.5 y^x$  returns: INVALID  $y^x$
3.  $\sqrt{-1i0}$  returns: INVALID DATA
4.  $-1i0.5 y^x$  returns: 0i1, finally. It should not be this hard.

### Re: 35s thoughts and a bug

Message #3 Posted by [bill platt](#) on 28 July 2007, 6:14 p.m.,  
in response to message #2 by Egan Ford

I really don't see why you consider this to be such a bad thing.  $y^x$  is the most general form for \*any\* exponential, and that includes roots. The machine is designed so that the sqrt function is for reals only. Furthermore, for complex numbers, the machine merely "asks" that you provide valid arguments. Therefore, a "-1" is invalid--on this machine it is a real number. Simply provide the complex equivalent and use  $y^x$  and you can do all.

I don't see anything so terrible about keeping the real and complex argument results separate. It would be a royal pain in the neck if it parsed a -1 as a complex number automatically.

### Re: 35s thoughts and a bug

### Re: 35s thoughts and a bug

Message #5 Posted by [Rodger Rosenbaum](#) on 29 July 2007, 5:06 a.m.,  
in response to message #3 by bill platt

Bill, you say "...on this machine it (-1, that is) is a real number."

You also say "...the sqrt function is for reals only."

So if -1 is a real number and the sqrt function is for reals only, then there shouldn't be any problem with sqrt(-1), should there?

### Re: 35s complex-number functionality

Message #6 Posted by [Karl Schneider](#) on 28 July 2007, 8:00 p.m.,  
in response to message #2 by Egan Ford

Paul Dale posted,

Quote:

What a poor selection of complex operations. I know they are the same as on the 32sii and 33s but those models lacked proper complex numbers. Why no x-th root of y, square root or square?

Egan Ford posted,

Quote:

Add 0i0 to y, then  $y^x$  will work. I do not understand how 15C/42S thinking and functionality got dropped.

My tests:

1. sqrt(-1) returns: Sqrt(NEG)
2. -1 .5  $y^x$  returns: INVALID  $y^x$
3. sqrt(-1i0) returns: INVALID DATA
4. -1i0 .5  $y^x$  returns: 0i1, finally. It should not be this hard.

Addressing both of these insightful posts together:

Indeed, "15C/42S thinking and functionality" regarding complex numbers was the right target, but no other RPN calculator incorporated its three principles:

1. Complex-number functionality is provided for every transcendental mathematical operation for which it is defined.
2. The user is given the choice whether a complex-valued result or an error message is to be provided if no real-valued result is defined.
3. Complex numbers are handled as single entities for computation using *standard mathematical functions*, not special commands.

The first principle is self-explanatory, but few calculators fulfill it, even the ones that boast of "complex numbers".

On the HP-15C, the second principle was implemented by the status of Flag 8. On the HP-42S, it was implemented by the choice "RRES" (real result) or "CRES" (complex result).

The complex-number functionality of the HP-32S, HP-32SII, HP-33s, and now apparently the HP-35s, was essentially a porting of the HP-41 Math Pac's RPN routines. This set of routines was not mathematically complete, and could not fulfill the third principle due to design limitations.  $x^2$ ,  $\sqrt{x}$ , and  $x$ -th root of  $y$  for complex-valued  $x$  and  $y$  were not provided because they were not *absolutely* necessary:  $y^x$  can be used for those calculations.

It's apparent that  $y^x$  is defined in the complex domain on the HP-35s only when  $y$  is clearly identifiable as complex-valued. This is because

$$\begin{aligned} y^x &= e^{(\ln(y^x))} \\ &= e^{(x \cdot \ln(y))} \end{aligned}$$

and the second principle is not fulfilled. I'm sure that the same holds for all other transcendental functions that require natural logarithm of a complex-valued argument.

It seems that the main improvement was easier entry and one-line display of complex numbers. A more ambitious improvement that restored the capabilities of the HP-15C and HP-42S would have been the following:

#### [User-friendly complex-number calculations](#)

If you read the post, you'll see why I consider the omission of Rec->Pol, Pol->Rec, Cx->Re (disassembly of complex number), and Re->Cx (assembly of complex number) on the HP-35s to be blunders.

It cannot be said that we MoHPC'ers do not offer constructive product suggestions!

-- KS

### **Re: 35s complex-number functionality**

Message #7 Posted by **Paul Dale** on 29 July 2007, 5:23 p.m.,  
in response to message #6 by Karl Schneider

Quote:

$x^2$ ,  $\text{sqrt}(x)$ , and  $x$ -th root of  $y$  for complex-valued  $x$  and  $y$  were not provided because they were not *absolutely* necessary:  $y^x$  can be used for those calculations.

I really don't think this argument holds water. Following it merrily along, we also don't need any of the trig functions or even subtraction defined for complex arguments, they are available easily enough using other complex functionality.

Extend this argument to the real functions and we don't need both the hyperbolics and trig functions they relate naturally via complex numbers. LOG and LN? Why bother?  $e^x$ , use the constant  $e$  and  $y^x$ . I could go on and on.

The whole point of a calculator is to make life *easier*, providing a non-obvious but still complete set of functions doesn't gel with me.

- Pauli

Hi, Paul --

You stated:

Quote:

I really don't think this argument holds water. Following it merrily along, we also don't need any of the trig functions or even subtraction defined for complex arguments, they are available easily enough using other complex functionality.

Hey, don't blame the messenger! :-)

The HP-41 Math Pac was a "quick and dirty" 4 kB ROM released in 1980 or 1981, to provide some lacking functionality such as complex numbers and hyperbolics, as well as other useful applications such as triangle solutions and Fourier analyses. All functions were implemented as RPN keystroke programs. Sure, dedicated complex-valued functions for square root and square would have been useful on the Math Pac, but space limitations might have precluded that. (The Math Pac did provide real-integer and complex-valued powers and roots for complex-valued arguments as " $Z^N$ ", " $Z^{1/N}$ ", " $Z^W$ ", and " $Z^{1/W}$ ".

Certainly, complex-valued functions for square root and square, as a minimum, ought to have been implemented in microcode for the HP-32S, HP-32SII, HP-33s, and HP-35s, even if the original HP-41 Math Pac didn't have them as RPN routines. But, for whatever reason, they weren't.

### A historical parallel: The misbegotten US \$1 coins since 1971

Unfortunately, mistakes have a way of becoming immortal by perpetuation. Consider the US \$1 coin. The old ones from the early 20th century were quite large, when a dollar was worth a lot and

metals were less pricey by comparison. The 1971 Eisenhower dollar was the same size, but few people wanted to use it, and few vending machines accepted them. As a reaction to that, the next \$1 coin -- the 1979 Susan B. Anthony dollar -- was barely larger than, or distinguishable from, a quarter-dollar. It was rejected by the public, minted only in 1979, 1980, and 1999 as a lead-in to -- the 2000 Sacagawea dollar coin. This new coin was made the *same size as the Anthony dollar* for compatibility with the machines that accepted it. However, the Sacajawea was goldtone, smooth-sided, and rimmed in order to distinguish it from quarters. It still failed to achieve public acceptance, as Americans preferred their beloved \$1 paper "greenback".

Now, there's a new upcoming set of \$1 coins that commemorate presidents. They look more like medallions, and yes, they will be the *same size as Anthony and Sacagawea dollars*. If that is true, I predict general failure once again to achieve widespread *usage* (as opposed to um, "seigniorage-producing collecting activity").

[http://www.usmint.gov/mint\\_programs/\\$1coin/index.cfm](http://www.usmint.gov/mint_programs/$1coin/index.cfm)

[http://money.cnn.com/2005/04/27/pf/new\\_dollar/](http://money.cnn.com/2005/04/27/pf/new_dollar/)

[http://money.cnn.com/2003/05/13/pf/banking/currency\\_miscues/index.htm](http://money.cnn.com/2003/05/13/pf/banking/currency_miscues/index.htm)

So, the bottom line of all that: If only the \$1 coins from 1971 or 1979 had been made a reasonable and practical size -- not too big, but not just barely larger than a quarter -- and if the \$1 paper bill had been politely but firmly phased out, we'd be using practical, long-lasting coins for small low-tech transactions, as most Western countries do. Instead, we use low-value coins and problematic paper currency -- all because of unsound thinking, perpetuation of mistakes, and an unwillingness to make unpopular decisions or expend the effort for progress.

---

So today, if the HP-35s doesn't have a mathematically-complete set of complex-valued functions, that can be traced back originally to the compromises made in the HP-41 Math Pac 27 years ago -- and the unwillingness to research the product history, and to make the effort to rectify shortcomings.

-- KS

Hey, don't blame the messenger! :-)  
\_\_\_\_\_

I wasn't :-) Sorry if it came out that way.

My objection is that we've a good and proper complex type but the set of operations on it are woeful. As has been pointed out, having the calculator work out  $\sqrt{-1}$  takes several attempts to get right.

Certainly the HP-41 Math Pac can be excused for its lack of coverage. Likewise, I can forgive the 32sii and 33s. They all implement complex numbers poorly. If I've a real complex type, I want to be able to use it easily.

As a not really related aside: I've a scientific calculator bought from a discount shop for about A\$5 which includes a "complex" button. I've never been able to figure out what it actually does.

That would give it a more pleasant weight, but would add nothing to the structural strength or durability. Making the whole calculator of thicker, denser materials would be a much better solution.

### Re: 35s thoughts and a bug

Message #13 Posted by **Charles Bennett** on 29 July 2007, 12:42 p.m.,  
in response to message #1 by Paul Dale

OK... mine showed up on the 20th and I've had a chance to go over it. Just to be clear where I'm coming from: 34C, 15C, 32SII.

I like it. It's pretty. It could be heavier and thicker. I'm very happy to have BIG ENTER back since I won't buy a calculator without one. I'm twice as happy to have the south face of the keys back - I've always liked that.

I disliked the menus on the 32SII and I dislike them even more here. I'd gladly put 'f' and 'g' legends above the keys and take 'h' shifted functions on the south face.

Like everybody else said, the BASE capabilities are a disaster. The complex stuff is done quite nicely. Some features for packing/unpacking complex and vector types on the stack would have been nice.

Until I found XEQ foo ENTER, I was pretty cranky about XEQ foo 001 to get at programs. The programming/label paradigm has its ups and downs. Having line numbers being significant GTO and GSB destinations makes it really hard to develop programs in a text editor and then bang them in - this was much easier for the 32SII. On the other hand I use far fewer actual labels and internal labels take up no space. It feels a lot more like programming for HP33E.

More on this in a minute...

First thing I did was port one of my favorite programs from the 32SII:

```
# factor.hp35s
#   xeq a: factor REGX
#   xeq b: factor REGY, using known smallest factor in REGX
#
# X: number to factor
# Y: candidate factor
# Z: upper bound
#
# use:
#   REGX <- number to factor
#   xeq A enter
#
#   REGX <- number to factor
#   enter
#   REGX <- known cofactor
#   xeq B enter
#
# once it stops:
#   if REGX == 1: REGY holds your prime
#   else: REGX is smallest prime factor, REGY quotient
#
#   hit xeq B enter to find next smallest prime factor

# (A)
#   REGX: number to factor
#
A001   lbl A
A002   3                               # start search at 3

# (B)
#   REGX: known to be at least as large as any known factors of ...
#   REGY: number to factor
#
B001   lbl B
B002   fix 0                           # for rounding
B003   sto Y                             # start search here (REGX)
B004   Rv
B005   sto X                             # to be factored (REGY)
B006   2                                 # we always check 2, even if xeq B
B007   x >= y                             # REGX is 1 or 2
B008   gto B023                           # (Prime) signify!
B009   xeq B026                           # (Test) will stop if 2 is a factor
B010   rcl X                               # compute search upper bound
B011   sqrt
B012   rnd                                 # compensate possible rounding error
B013   sto Z                               # stash it

# (Loop)
#   main test loop
#
B014   rcl X                               # target
B015   rcl Y                               # candidate
B016   xeq B026                           # (Test) will stop if Y is a factor of X
B017   rcl Z                               # fetch upper bound
B018   2
B019   rcl + Y
B020   sto Y                               # increment candidate
B021   x <= y?
B022   gto B014                           # (Loop) not done, try next one

# (Prime)
#   REGY <- original number
```

```

#      REGX <- 1 to signal as prime, cheaper than eqn PRIME?
#
B023   rcl X
B024   1
B025   rtn                # all done

# (Test)
#      the factor test routine
#      REGX: candidate factor
#      REGY: the number we're trying to factor
#      halt if (REGY mod REGX) == 0
#
B026   rmdr                #
B027   x != 0?
B028   rtn                # scram, not a factor
B029   rcl X
B030   last x
B031   /                  # REGX <- quotient
B032   last x             # push factor
B033   stop

```

Runs pretty fast. I'm happy. Now for Gene, a word about the labeling paradigm:

```
B034   xeq B028
```

That's all for now.

For the guys at HP: Nice job. Many thanks.

### Re: 35s thoughts and a bug

in response to message #13 by Charles Bennett

What word about the labeling paradigm?

### Re: 35s thoughts and a bug

Message #15 Posted by [Charles Bennett](#) on 29 July 2007, 6:36 p.m.,  
in response to message #14 by Gene Wright

We're back to the days of GSB NNN - every line a subr destination. Once again we can write subrs with default args that we can jump into the middle of without burning a label...

Including an XEQ to a line that contains a RTN: provided you have subr levels to burn it's a slow NOP with no side effects.

### Some fun during lunch

Message #1 Posted by [Miguel Toro](#) on 27 July 2007, 7:15 p.m.

Reading complains about the 35s unable to separate real and imaginary parts from a complex number, I made these little and unambitious programs to "help" get them apart and to try some of the new features.

Usage:

- 1.- execute the program
- 2.- Enter complex number as xiy - R/S  
--> now you see the number in polar mode
- 3.- Enter angle - R/S  
--> you see the number in polar mode again
- 4.- Enter radius - R/S  
--> you get both x and y separated.

With programs A and B, they are in the X and Y registers, with program C you get a vector.

Program A

```
A001 LBL A
A002 STOP
A003 r@a      (polar mode)
A004 STOP
A005 x<>y
A006 STOP
A007 REGZ
A008 SIN
A009 x<>y
A010 *
A011 LASTx
A012 REGT
A013 COS
A014 *
A015 xiy     (rectangular mode)
A016 RTN
```

LN=56

Program B

```
B001 LBL B
B002 STOP
B003 r@a
B004 STOP
B005 x<>y
B006 STOP
B007 ENTER
B008 REGY * SIN(REGT)
B009 REGY * COS(REGT)
B010 xiy
B011 RTN
```

LN=61

Program C

```
C001 LBL C
C002 STOP
C003 r@a
C004 STOP
C005 x<>y
C006 STOP
C007 [ REGX*COS( REGZ ) , REGX*SIN( REGZ ) ]
C008 xiy
C009 RTN
```

LN=58

note: I am having fun like a little kid :-)

Well, pure RPN is smaller and faster (but speed does not really matters here) and this could be just the spark for someone to write a "real" converter.

Regards,

Miguel

### **P->R and R->P on the HP35s**

*Message #2 Posted by [Reth](#) on 27 July 2007, 10:10 p.m.,  
in response to message #1 by Miguel Toro*

Well this is my first attempt to deal with that problem :) I'm waiting for a real converter too

My program label S is dedicated for subroutines and here are the first ones:

```
S001      LBL S
S002      GTO S004
S003      GTO S015
S004      X<>Y
S005      SIN
S006      X<>Y
S007      LASTx
S008      COS
S009      X<>Y
S010      *
S011      X<>Y
S012      LASTx
S013      *
S014      RTN
S015      i
S016      *
S017      +
S018      ABS
S019      LASTx
S020      ARG
S021      360          ; optional, to get angles between 0 and 360
S022      RMDR        ; optional, to get angles between 0 and 360
S023      X<>Y
S024      RTN
```

If not obvious, XEQ S002 is equivalent of **theta,r -> x,y** on the HP-33s and XEQ S003 - of **x,y -> theta,r**

Cheers, Reth

### **Re: P->R and R->P on the HP35s**

*Message #3 Posted by [Les Wright](#) on 28 July 2007, 12:43 a.m.,  
in response to message #2 by Reth*

Reth, I think your steps S002 and S003 are redundant.

Take those out, and everything moves up two lines. One can call the polar->rect conversion with XEQ S001, or simply XEQ S ENTER, and the other conversion with XEQ S013.

This may even speed things up very slightly.

Les

### Re: P->R and R->P on the HP35s

Message #4 Posted by [Reth](#) on 28 July 2007, 1:40 a.m.,  
in response to message #3 by Les Wright

Sure Les, even XEQ S002 would do for the P->R routine reducing steps by 1 ;). I'm just trying to create permanent addresses for frequently used routines as list grows up for the expense of a few more bytes.  
thanks and best regards, reth

### Re: Some fun during lunch

Message #5 Posted by [Les Wright](#) on 28 July 2007, 12:37 a.m.,  
in response to message #1 by Miguel Toro

Miguel, I think that everyone here with a 35s is eventually going to need a short fast subroutine that returns the Re and Im parts of complex number. I have come up with one that does it in 14 or so steps, but I don't want to put it here yet because I really believe it can and should be briefer and faster. Fortunately, taking Re and Im components from the stack to create a complex number is much easier to program--a program with the equation  $REGY + i*REGX$  is just one way to do it.

One thing I do like--one has a choice of how one enters complex numbers on the 35S irrespective of whether one is in xiy or r@a mode, since both the i and @ keys are right there to choose from. Even on the 42s, the behaviour of a ENTER b COMPLEX is contingent on angle mode and whether one has set RECT or POLAR. I sometimes find this a nuisance.

I don't like ALG mode so I can't comment on x+iy mode with much intelligence.

Any takers out there regarding the smallest and fastest subroutine that returns the Re and Im parts of a complex number?

Les

*Edited: 28 July 2007, 12:38 a.m.*

### Re: Some fun during lunch

Message #6 Posted by [Les Wright](#) on 28 July 2007, 4:39 a.m.,  
in response to message #5 by Les Wright

Hi there, this is the shortest I have been able to come up with (at least the shortest in strict RPN). I would like to know if there are shorter and faster ways of decomposing a complex number to Re and Im parts

```
LBL I
ENTER
ABS
X<>Y
ARG
SIN
LASTx
COS
REGZ
*
```

```
X<>Y  
REGZ  
*  
RTN
```

Works simply. Place xiy (or the equivalent r@a) on the stack. XEQ I ENTER. And you get x in the Y register and y in the X register, just as though one executed COMPLEX on a complex number in rectangular mode on the 42S.

There is an annoying vulnerability to occasional rounding error. For example when executing the routine on 5i13, I get 5.00000000001 for the real part. If there is a work around for this I would be grateful. I want to blame the cosine bug, but since Arg(5i13) is approximately 70 degrees, and nowhere near the troublesome range between 89 and 90 degrees, I don't think it is the culprit in this example.

Les

*Edited: 28 July 2007, 5:07 a.m.*

### Re: Some fun during lunch

*Message #7 Posted by [Reth](#) on 28 July 2007, 5:18 a.m.,  
in response to message #6 by Les Wright*

Hi Les, that's shorter ;)

```
LBL I  
ABS  
LASTx  
ARG  
SIN  
LASTx  
COS  
REGZ  
*  
X<>Y  
REGZ  
*  
RTN
```

that's shorter too and doesn't depend on flag 10 :)

```
LBL I  
ABS  
LASTx  
ARG  
SIN  
LASTx  
COS  
ENTER  
R^  
*  
R^  
R^  
*  
RTN
```

to get rid of that 5.00000000001 I'd set the HP35s to say FIX 9 and then do RND after multiplications and finish with ALL

Cheers, Reth

### Re: Some fun during lunch

*Message #8 Posted by [Miguel Toro](#) on 28 July 2007, 5:37 a.m.,  
in response to message #6 by Les Wright*

Les,

You do not really need the first ENTER. Here:

```
I001 LBL I
I002 ABS
I003 LASTx
I004 ARG
I005 SIN
I006 LASTx
I007 COS
I008 REGZ
I009 *
I010 x<>y
I011 REGZ
I012 *
I013 RTN
```

Just one step shorter.

Miguel

Done!

### Emu28 MRU setup

Message #1 Posted by [Christoph Giesselink](#) on 27 July 2007, 5:48 p.m.

Configuration of the MRU (Most Recently Used) file list in [Emu28 v1.15](#).

By default Emu28 is using maximum 4 MRU files. This behavior can be changed from disabling the MRU list to the number of lines limited by your current desktop resolution.

To change this

1. close all Emu28 sessions
2. open the file Emu28.ini in your windows directory
3. goto the [MRU] section inside the ini file
4. change the number of the "FileCount=4" setting
5. save the ini file
6. restart Emu28 now using the new settings

Valid settings for "FileCount":

<0 = forbidden

0 = disable MRU list

>0 = maximum number of MRU entries in the "File" menu.

The MRU file list is saved in the MRU section of the ini file as "File1=", "File2=", ... When decreasing the number of MRU entries you should manually delete the become redundant "FileX=" lines.

Don't be sad, all other of my emulators will get the MRU file list also.

Cheers

Christoph

Message #2 Posted by [Egan Ford](#) on 27 July 2007, 6:24 p.m.,  
in response to message #1 by [Christoph Giesselink](#)

Thanks for EMU 28/42/48. Will we ever see a non-Windows version? Linux or Mac perhaps?

### Re: Emu28 MRU setup

Message #3 Posted by [Howard Owen](#) on 27 July 2007, 8:44 p.m.,  
in response to message #2 by [Egan Ford](#)

They all run fine under WINE. The Crossover flavor, at least. Since there's a version of Emu48 that compiles under gcc (MINGW?), I assume it's mainly UI code that would have to change. It's GPL, too..

Regards,

Howard

**Re: Emu28 MRU setup**

*Message #4 Posted by [Egan Ford](#) on 28 July 2007, 4:40 p.m.,  
in response to message #3 by Howard Owen*

That solves 1/2 of my problem (other half is non-x86).

Thanks.

**Re: Emu28 MRU setup**

*Message #5 Posted by [Christoph Giesselink](#) on 30 July 2007, 3:30 p.m.,  
in response to message #2 by Egan Ford*

Quote:

Thanks for EMU 28/42/48. Will we ever see a non-Windows version? Linux or Mac perhaps?

Sorry, definitely not. On business also in private I don't have connections or installed any Unix based operating systems any more.

Over 10 years ago in 1995 I installed Linux, because I wanted to use x48, the only existing free and working HP48 emulator at this time. But everything changed in 1997, Emu48 was getting free under the GPL and the forthcoming OS in business for office and control applications was NT4.0. The dice had been fallen.

Cheers

Christoph

### **Thread for those receiving 35s calculators to post what they think**

Message #1 Posted by [Gene Wright](#) on 19 July 2007, 10:51 a.m.

Now that these are making their way into lucky people's hands, what does everyone think?

Post good things and things you may not like. :-)

Gene

### **Re: Thread for those receiving 35s calculators to post what they think**

Message #2 Posted by [Monte Dalrymple](#) on 19 July 2007, 3:22 p.m.,  
in response to message #1 by Gene Wright

Great machine. But having to press the blue arrow, then 1 (base), and the 6 ("h" data type) gets old really fast when I am working with hex numbers. And you get "syntax error" if you forget to tag the number this way. I much preferred the 33s in this regard, where I could just press "enter" after the digit entry was done.

And I had to look in the manual to find which keys to use for the ABCDEF digits... it isn't labelled on the keyboard.

Monte

### **Re: Thread for those receiving 35s calculators to post what they think**

Message #3 Posted by [Eric Smith](#) on 19 July 2007, 9:32 p.m.,  
in response to message #2 by Monte Dalrymple

Just got the pair of 35s' I ordered from HP on Tuesday (paid a bit extra for overnight shipping). The first thing I did was switch into RPN mode, and the second was to try hex. I wasn't able to figure it out without consulting the manual.

The suffix approach (same as the 28/48/49/50) is **extremely** annoying when simply trying to do calculations on the stack, but I suppose it was necessary to support use of non-decimal bases in equations and such.

### **Re: Thread for those receiving 35s calculators to post what they think**

Message #4 Posted by [Monte Dalrymple](#) on 19 July 2007, 11:37 p.m.,  
in response to message #3 by Eric Smith

I agree. It gets very annoying, very fast. While I understand the rationale behind this requirement, I would have much preferred at least a "dedicated" mode that assumed everything in hex mode was hex.

I think that this is an example of making something general enough for all cases (like mixing bases on entry) that it interferes with the "normal" case. Kind of anti-KISS...

Monte

**Re: Thread for those receiving 35s calculators to post what they think**

*Message #5 Posted by **Howard Owen** on 20 July 2007, 12:40 a.m.,  
in response to message #4 by Monte Dalrymple*

The Datafile special issue on the 35s contains an article by Wlodek that gives a possible explanation for this and other misfeatures. Due to cost constraints, the ROM and RAM sizes were the same as the 33s. HP crammed a fair amount of new functionality into the same space the 33S code occupied. Wlodek doesn't mention the base weirdness to show how HP had to "cut corners." He points out that you can enter all sorts of nonsense on the command line without a problem. Only when you press ENTER do you get an error message. But the base stuff may also be a result of cutting corners to save bytes. And the Ax + Bi unavailability in RPN mode could also have the same cause. It would explain what otherwise seems to me to be a series of purposeless limitations or awkwardnesses in an otherwise well-conceived machine.

Regards,  
Howard

## Re: Video?

Message #11 Posted by [Howard Owen](#) on 19 July 2007, 8:06 p.m.,  
in response to message #10 by Howard Owen

Unfortunately, the video doesn't want to play on my laptop.

Other first impressions:

The keys are as advertised, nice and snappy. Their shapes are very reminiscent of older machines.

The manual seems well organized and thorough.

The case is not a traditional type, but a clamshell. One half of the shell has netting very much like a PSP case. The PSP uses mini CDs for which the netting is very useful, but I can't imagine what this is for in calculator terms. There is no quick reference guide supplied with the calculator, which might give the netting a reason for being. Note paper, perhaps? The other side of the clamshell is better thought out. It has two elastic bands strategically placed so you can put the calculator in the case facing either direction. One of the elastic bands will reach across the machine between the display and top row of keys. The other band stays unused beneath the calculator. In this mode the machine is usable while in the case. I give this arrangement fairly high marks.

I'm off to learn more about the features of the calculator, before writing my first program. I'll post more as I go.

Regards.  
Howard

Quote:

I give this arrangement fairly high marks.

Try it with the case opening to the left.. you will find (and likely be annoyed) that while the case is advertised as ambidextrous, changing the direction leaves the HP logo conspicuously upside down.

If they were going to make this arrangement, they should have put the logo on both sides (to be symmetric) and arranged them like this:

with both logos facing the zipper. ( relative position of the HP is somewhat irrelevant.. centered here to show orientation with respect to the opening.)

**More Nits**

Message #16 Posted by **Howard Owen** on 19 July 2007, 10:10 p.m.,  
in response to message #10 by Howard Owen

More impressions. Many of the following (and preceding) have been mentioned by others.

This calculator has some oddities whose causes aren't immediately apparent. For example, you can't use A+Bi format for complex numbers in RPN mode, but you can in ALG mode. The example for entry in

ALG mode is 'A + B i' which clearly won't work in RPN mode. But surely that can't be why it isn't supported?

A more egregious example of mysterious limitation is the hash made out of base number entry. Blue->base->6 to tag a number as hex is anti-ergonomic. If you are in hex mode, why not assume numbers are in hexadecimal? It's true that this way you can add 44h and 1000100b and get the result in the current base. But I'd far rather have easy entry of data than the ability to mix bases in calculations.

The manual is well organized and thorough, but it's full of errors. This can be expected for a brand new manual, but it detracts from the overall impression the calculator gives the new user.

Note that I'm quite pleased with this machine so far. I'm whining about things that are no big deal, in my view. But I can't help it, I'm a critic at heart.

Regards,  
Howard

Hi Howard.

As you read through the manual, please consider collecting errors you find and post them here. I have a list about a page and a half long that I will post soon of ones that have been found so far.

### Re: More Nits

Message #18 Posted by [Howard Owen](#) on 20 July 2007, 1:04 a.m.,  
in response to message #17 by Gene Wright

Sure thing, Gene. Here's one, not an error, but a style point. The typography of subscripted variables is poor, in at least one case. That is on on page 9-3, where the numbers in "z1 + z2" are much larger than the "z" characters. The number's base lines are lower than the z characters, yet the tops of both characters are aligned, so the numbers don't appear to be subscripts. The numbers are too large to be elegant looking as subscripts anyhow. Elsewhere, the same font sizes are used for superscripts, and that works fine. But in this case, the result is nearly illegible.

Howard

### Thoughts on Programming the 35S

Message #19 Posted by [Howard Owen](#) on 20 July 2007, 6:10 p.m.,  
in response to message #1 by Gene Wright

I just worked up a couple of subroutines on my new 35S in order to get a feel for how it is to program. Here's the commented code, followed by some additional thoughts.

This routine will prompt for four successive decimal numbers constituting 4 octets of an IP address. It will store them in a contiguous block of 4 registers starting with the register number passed in the X register.

```
I001 LBL I
I002 DEC          Ensure decimal entry
I003 SF 10       Inhibit evaluation of the "equation"
I004 ENTER OCTET RS 4 TIMES Long, hey?
```

```
I005 CF 10          1st octet entered is now in X
I006 (REGY+3)/1E3+REGY  ALG, complete with parentheses. Weird.
I007 STO I         Loop counter and address pointer
I008 x<>y         Get the first octet back
I009 STO(I)       STORe it in the base register
I010 ISG I        Second register is next
I011 DEG         No-op. Thanks Gene. 8)
I012 SF 10       Loop entry point
I013 NEXT OCTET  Not so long.
I014 CF 10       Octet is nw in X
I015 STO(I)     Store it in the next register
I016 ISG I
I017 GTO I012   My 1st line addressed GTO in 20 years. (Not really 8)
I018 RTN       Done
```

The following routine retrieves an IP address from registers whose base is pointed to by the number in X

```
I019 (REGX+3)/1E3+REGX  ALG here is more programmer-efficient
I020 STO I
I021 RCL(I)            The first octet
I022 ISG I
I023 DEG
I024 1E3              "E3" produces "INVALID DATA"
I025 X                Shift the IP 3 places to the left
I026 RCL(I)          Get the next octet
I027 +                And add it into the IP
I028 ISG I
I029 GTO I024
I030 RTN
```

The comment on line I006 says ALG mode is "weird." I mean that it feels weird to me in the context of an RPN program. The construct is far tidier than the corresponding RPN sequence would have been. I don't know if there are differences in execution time between the two forms. One of Gene's recent articles suggests that ALG may be less efficient. Nonetheless, these subroutines are not time critical, so even a large difference in execution time shouldn't matter. At the same time, fewer line numbers and succinct expression make it easier for this programmer to read the code, despite having to scroll right to see most equations. Six or seven fewer lines is a big advantage on a machine where you can only see two lines at a time, and can't print anything out.

It's also weird to be using indirect addressing for access to the main bank of storage registers. It makes the whole language feel more like assembly. I'm appreciative of the large jump in storage, but it has been implemented inelegantly, no doubt because of cost constraints. The same goes for line oriented GTOs. I actually have coded in line mode BASIC more recently than 20 years ago. (Last year in fact, on the 9816 and HP8X) but doing a GTO to a line number gives me a case of 1980s nostalgia. (I was miserable through the first two thirds of that decade, so nostalgia isn't a good thing. 8) Once again, the designers have found a creative way to address a shortcoming of the 33S, but constrained by cost to inadequate ROM space, they've had to compromise deeply to achieve it.

So, what will it take for HP to turn those very creative and skilled folks loose with a reasonable budget to create an RPN calculator without so many compromises? Is the HP 35S likely to change the economics of the calculator market and allow such a move? I hope so, but I fear not.

Regards,  
Howard

## Re: Thoughts on Programming the 35S

Message #20 Posted by [Namir](#) on 20 July 2007, 7:22 p.m.,  
in response to message #19 by Howard Owen

Howard,

I wrote the following program to test the speed of summing integers using pure RPN and hybrid AL/RPN

commands:

```
LBL A
INPUT N
0
STO I
STO S
LBL B
1
STO+ I
RCL I
STO+ S
RCL N
x>y?
GTO B001
RCL S
STOP
0
STO I
STO S
LBL C
I+1
STO I
I+S
STO S
RCL I
RCL N
x>y?
GTO C001
RCL S
RTN
```

When I enter 1000 at the prompt, the first loop takes about 31 seconds while the second loop takes 84 seconds. The ratio is about 2.8. Using ALG expressions slows down calculations.

Namir

PS: I used the timer of an HP41CX

*Message #21 Posted by [Howard Owen](#) on 20 July 2007, 8:01 p.m.,  
in response to message #20 by Namir*

Yes, that's what Gene's article reports too. That is a good reason to stick with pure RPN in time critical code.

I guess the difference must be due to the overhead of parsing the equation. That would imply they don't cache the decoded expressions.

Regards,  
Howard

## Re: Thoughts on Programming the 35S

Message #22 Posted by [Howard Owen](#) on 20 July 2007, 8:25 p.m.,  
in response to message #20 by Namir

Actually, it's not only ALG code that differs between the two approaches. In the RPN case, you are entering an increment value into X, then doing STO+ <var>. In the ALG case, you are recalling the value of the variable into X and incrementing in one step, then storing the result. Reads and writes between the alpha variable registers and the stack may not be equivalent in terms of the time they take.

It's not as easy as I first thought to formulate expressions in RPN and ALG that are equivalent with respect to register moves and so forth. The two models differ pretty sharply in how they use the stack in particular. If you have a RCL+ in RPN, for example, it will do the addition and *replace* the previous X contents with the result, without enabling stack lift. But if you do an ALG expression like 'I+1', the addition is carried out somewhere, and then the result is *pushed* on the stack. That necessitates an extra stack manipulation if you want to leave the number of iterations on the stack, like you can in RPN mode. (That is, you can do RCL+ <var> and then X?Y compare for loop control, since Y stays put.)

Regards,  
Howard

Message #23 Posted by [Gene Wright](#) on 20 July 2007, 10:19 p.m.,  
in response to message #19 by Howard Owen

Good job, Howard! Couple of thoughts:

- 1 ) NOP - DEG is good unless you need to do trig in radians of course. I'd be glad to have other options that are as easy to put in.
- 2 ) ALG mode use in RPN programs is very neat, particularly when it saves the RPN stack! It would have been much harder to write the indirect register store/recall program while saving the stack without the ALG tricks. By the way, anyone keyed that in to try it yet?
- 3 ) I do think this is about as good as it could get as an RPN calculator extension of the 32s line. Putting in these indirect registers and line number GTO and XEQs probably allowed the rom to be slightly changed, which allowed for faster development. Resources these days are scarce!
- 4 ) And you guys know this, but in most cases, there is no need to ever put a line like GTO B001 in a program. Execution can probably in most cases pick up at line 002 of the destination program. It will be a tad faster that way.

in response to message #19 by Howard Owen*

Howard, the NOP in line I011. Did you do this because you really only want to increment register I (without actually skipping anything), but you don't know the increment amount until execution time?

### **Re: Thoughts on Programming the 35S**

*Message #28 Posted by [Howard Owen](#) on 22 July 2007, 12:08 p.m.,  
in response to message #27 by Don Shepherd*

Yes, I do just want to increment, but no, I know in advance that the increment will be 1. I could use 1, STO+ I, but that would then require a RDN to restore the stack.

Regars,  
Howard

### **Re: Thoughts on Programming the 35S**

*Message #29 Posted by [Don Shepherd](#) on 22 July 2007, 12:55 p.m.,  
in response to message #28 by Howard Owen*

OK, I see your logic. I was thinking about that last night. I know that the HP-65 has a NOP instruction, but it is needed because an X=Y executes the next \*2\* instructions if true (because a Goto occupies 2 instructions in that machine). So if you only wanted to do one thing, a NOP was required.

It's kind of like the old BALR instruction on the IBM 360. That instruction was typically used at the beginning of the program, not to branch, but to initialize the index register.

### **More Fun With HP35 Programming**

*Message #30 Posted by [Howard Owen](#) on 21 July 2007, 1:36 a.m.,*

*in response to message #1 by Gene Wright*

OK, so now I want the input routine to either prompt as before, or else decompose a number in the form:

ABCDEFGHIJKL

Where the letters are the decimal digits of an IP address. For example, 192.160.20.1 would be encoded as 192168020001. This is a form I plan to use for manipulating addresses in various ways. I need a way to "explode" such a number into its octets. (I already have the routine to compose a number like that from its octets, the second one above.)

I'll use flag 0 to decide which mode to use on input. Flag 0 set will mean do the non-prompting routine. Conversely, flag 0 clear will do the original prompting method. I will make heavy use of ALG mode shortcuts in the new code, just to see if I can reach their limits. (Sneak peek: I can.)

To decompose a 10 to 12 digit number into "trigraphs" representing octets, I need to divide the whole number by a divisor that will leave the digits of interest lying just to the right of the decimal place. I will then take the fractional portion (FP), multiply the result by 1000, and take the integer portion. Hey presto! The octet is then left standing on its own. (This technique is surely not original, though I developed it independently. I have no idea who is responsible for the first use, or I'd give them credit here.)

So that means I need to compute the proper divisor to get the octet I'm interested down to the right of the decimal. What I have on hand is the loop counter in I. In the loop, which skips the first octet, since that is a special case, The loop counter's integer portion varies from B+1 to B+3, where B is the base register number passed in. What I need to start is the loop counter integer portion minus the base register value. The following ALG code gets me that:

```
IP(I) - B
```

Assuming the base is stored in B.

That gives me the following mapping of loop counters to three digit groups of interest:

```
000 000 000 000
      1   2   3
```

And what I need is a series of divisors, 1E9, 1E6 and 1E3. this equation gets me that:

```
ALOG( 3 + ( 3 - N ) * 3 )
```

Where ALOG() is what you get when you press 10^X in equation mode, and N is the loop counter normalized into the range 1..3.

Finally, I will implement the algorithm given above to isolate the octet of interest:

```
IP( FP(A/D) * 1E3
```

Where A is the IP address and D is divisor computed in the last step.

Now, what about ALG mode limits? Well, the preceding expressions could be combined (if I'm not mistaken, and heaven knows I might be,) into this:

```
IP( FP(A/10^( 3 + ( 4 - IP(I) + B ) * 3 ) ) * 1E3 )
```

What a mess! What does it do? Are the parentheses balanced correctly? RPN is *much* simpler. I might have errors in that expression, but since I'm not actually using it, I refuse to debug it! I'll implement the algorithm in its broken up form to save my sanity in working with the code later.

One last word before the code: I discovered (or rediscovered, actually,) the weaknesses in an auto-renumbering system that relies on the numbers as branch targets. Consider this code:

```
A001 FS? 0
A002 GTO A005
A003 SOMETHING OR OTHER (EQUATION)
A004 GTO A007
A005 ISG A
A006 GTO A005
A007 DEG
```

This is a two way branch skeleton waiting for the code to be filled in. I have a loop set up to go on line A005. But now I realize I need some set up before the loop, so I enter it. This is the result:

```
A001 FS? 0
A002 GTO A006
A003 SOMETHING OR OTHER (EQUATION)
A004 GTO A008
A005 STO A
A006 ISG A
A007 GTO A006
A008 DEG
```

Do you see the problem? Two out of three GTO lines renumbered as I expected. However the first one, on line A002, followed the ISG A command to line A006. I'll have to manually correct that one or leave a perhaps subtle bug in the code.

Now, the revised subroutine:

```
Subroutine to store the octets of an input IP Address
Copyright (C) 2007 Howard Owen
```

```
This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or
(at your option) any later version.
```

```
This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.
```

```
You should have received a copy of the GNU General Public License
along with this program. If not, see <http://www.gnu.org/licenses/>.
```

```
Input an IP address in one of two forms, and place its separated
octets in four contiguous registers starting at the base register in
X. If flag 0 is clear, prompt for each successive octet before
storing it. If flag 0 is set, decompose the 10-12 digit integer
passed in Y into its constituent octets. Store these in the same way
as the flag 0 clear code does.
```

```
The address in Y is formatted as follows. If the octets are labeled
from left to right as 1, 2, 3 and 4, then the packed decimal IP
address is: 111222333444. For example, '192.168.20.1' would be
encoded as '192168020001'.
```

```
I001 LBL I
I002 DEC Ensure decimal entry
I003 FS? 0 Set = don't prompt. IP address is in Y
I004 GTO I009
I005 SF 10 Inhibit evaluation of the "equation"
I006 ENTER OCTET RS 4 TIMES Long, hey?
I007 CF 10 1st octet entered is now in X, base in Y
I008 GTO I014
I009 STO B Non-prompting needs base (in X) and address (in y) saved.
```

```
Base register
I010 x<>y
I011 STO A          IP address encoded as a 10-12 digit decimal integer
I012 RDN           Base back in X
I013 IP(A/1E9)     Leftmost (first) octet in X, base in Y
I014 (REGY+3)/1E3+REGY  Back together. Compute loop control number
I015 STO I         Loop counter and address pointer
I016 x<>y          Get the first octet back in X
I017 STO(I)        STORe it in the base register
I018 ISG I         Second register is next
I019 DEG           No-op. Thanks Gene. 8)
I020 FS? 0         Loop entry point Non prompt?
I021 GTO I026
I022 SF 10         Do octet-at-a-time prompting
I023 NEXT OCTET   Not so long.
I024 CF 10         Octet is now in X
I025 GTO I029
I026 IP(I)-B       Loop counter normalized to the range 1..3
I027 ALOG(3+(3-REGX)*3)  Divisor to bring the current octet just to the right of the
decimal
I028 IP(FP(A/REGX)*1E3)  The octet, masked out from the IP address
I029 STO(I)        Back to common code. Store the octet in the next register
I030 ISG I
I031 GTO I020     NOT My first line addressed GTO in 20 years.
I032 RTN          Done
```

## Re: More Fun With HP35 Programming

Message #31 Posted by [Ralph](#) on 22 July 2007, 12:06 a.m.,

in response to message #30 by Howard Owen

I have had mine for a little over a day now.

I like: the keyboard; layout (mostly) and color scheme. the display; better decimal readability and the LCD layer does not float so high over the backplate to cast drop shadows that made reading the 33S screen difficult.

Jury's out on: case, I like slipcases personally. The wonky way to define the range of the indirect registers. I had to read the manual several times on that one. Shades of Casio's changing list and matrix dimensioning on each model it seems. still don't like the text tag setup but I have a 32SII, 33S and this one so I must just get over it.

It seems slow. It took over 6 minutes to crank out the benchmark test posted [here](#) longer than on the 32. That might just need some tweaking as it does my pet program as fast as the 33S.

I don't know if I like the current trend of putting the serial number on a sticky tape. Then I've never sent one back for repair so I can't say a permanent ID is all that either.

All in all I give it a thumbs up and hope it points to better things to come. I can't wait till the 70th year model for them to get it right again ;p

## 35s indirect addressing done wrong?

Message #32 Posted by [mjcohen](#) on 23 July 2007, 9:39 a.m.,

in response to message #1 by Gene Wright

(This is a copy of a post to comp.sys.hp48)

In the 33s, indirect addressing is done with an independent register called i, distinct from the regular variables A to Z. A value is stored into i (from 1 to 32), and you store or recall (i) to access what it points to.

In the 35s, the ordinary variables I and J are used for indirect addressing. Values are stored into I or J (-1 to -26 for A to Z, positive values for the newly available memory array) and (I) and (J) are used to store or recall

the location pointed to.

In my opinion, THIS IS A SERIOUS MISTAKE.

Essentially, this prevents any use of A through Z as an array if it includes I and J. As a simple example, consider trying to write code that copies A through Z to (1) through (26). What happens when you hit I and J?

Here are some examples of code I have written for the 33s that is no longer possible on the 35s:

- 1) Input values into A through L. This is for a 3x3 linear equation solver that stores the coefficients in A through L.
- 2) Solve the equations referred to above.
- 3) Sort the first n elements of A through Z. This can now only be done if  $N < 8$  (or 9 if J is used).

This architectural deficiency forces any code that needs an array to either put it in the (1) through (800) area or restrict its use of A to Z variables to A to H and K to Z.

Again, in my opinion, it would have been far better to have separate i and j indirect variables completely distinct from A through Z.

The current system makes the natural use of A through Z as an array difficult, if not impossible.

True, in the 3x3 solver referred to above, the coefficients could be stored in K through V, but, to me, A through L is much more natural. Also, how would you do a 4x4 system?

I would be quite interested to see how those more knowledgeable in programming the 35s would handle these problems.

Thank you,

Martin Cohen

### **Re: 35s indirect addressing done wrong?**

*Message #33 Posted by **Gene Wright** on 23 July 2007, 11:12 a.m.,  
in response to message #32 by mjcohen*

Gene: Hi Martin. Here's the reply I posted to comp.sys.hp48 to your post there which was identical to your post here. :-)

The way you would do these things on the 35s is that you would use indirect registers 0 through 15 or higher. You have to change your way of thinking and your past personal preferences to take advantage of the great new features of the 35s.

Don't use A through Z for things like this any longer. Use the numbered indirect registers. On the 35s, it will be possible to write a matrix program capable of finding the determinant of at least an 18x18 matrix. How would you do that using only A through Z? You wouldn't. You also couldn't do it at all on the 33s.

HP made the design choice to use I and J as they did. They also made the design choice to give us 801 indirect registers. IMO, it is not an architectural deficiency so much as a changed architecture. The fix is to quit using A through Z in this manner. Use the 801 indirect registers. Use A through Z to store final or intermediate results.

I discussed the indirect addressing space in the 35s review found here:

<http://hpcc.org/datafile/V26Special/the35s.pdf>

Early on, I had posted responses to you on comp.sys.hp48 pointing you to the review and other learning modules available in response to your posts on comp.sys.hp48, but never got a reply or email. I hope you saw those posts?

The matrix utilities program I have already converted to the 35s (and which is in the current 35s Datafile special issue) uses the indirect registers and is very easy. Once a port of the HP41 PPC ROM RRM matrix program is done, matrices will be amazingly easy to use on the 35s without using any of the A through Z variables.

It is often this way when new versions of calculators come out. When the HP41 arrived, many HP67 users were very upset that HP no longer used the primary/secondary register arrangement they were used to on the HP67, for example.

Would looping through A ... Z be easier if the I and J index registers were not in the middle of the address space? Sure. But having 801 indirect registers to loop through is better still, IMO. I'll take that change any day.

### **Re: 35s indirect addressing done wrong?**

*Message #34 Posted by [Thomas Radtke](#) on 23 July 2007, 2:58 p.m.,  
in response to message #33 by Gene Wright*

Btw, why did HP stick to specialized index registers anyway? Why not using an IND keyword as found on TI programmables? That, along with the ability to partition the available memory, was really an advanced feature.

Why not using an IND keyword as found on TI programmables?

Hallo Thomas,

you don't have to walk as far: also the 42s has this IND keyword, and you may use each and every register or variable for indirect addressing.

Grüße, Walter

### **Re: 35s indirect addressing done wrong?**

*Message #38 Posted by [Paul Dale](#) on 23 July 2007, 5:00 p.m.,  
in response to message #32 by [mjcohen](#)*

From the viewpoint of the keyboard and its layout, I'd prefer to have (I) and (J) on the keyboard than i and (i) even if it means one less directly addressable register. Wanting a second indirection capable register while programming has happened to me a lot of times over the years since my original 34c.

Of course an IND or equivalent would be better again...

### **Re: 35s indirect addressing done wrong?**

*Message #39 Posted by [Gene Wright](#) on 23 July 2007, 5:39 p.m.,  
in response to message #38 by [Paul Dale](#)*

It could have been many things.

Keyboard space and layout

ROM space

Preference of the designer even.

The way it was done allows for only 2 additional keyboard locations for (I) and (J) and does not require an additional 2 spaces for the store instructions to store the index value.

Yes, it does break any routines that want to loop through A ... Z, but it does seem a very small price to pay IMO for 801 indirect registers and two index registers.

Remember, on the 33s, the index was in the middle of the 33 registers which caused headaches trying to loop through only 30 something registers.

Now, on the 35s, you can loop through 801. Big improvement all around.

### **Re: 35s indirect addressing done wrong?**

*Message #40 Posted by [mjcohen](#) on 23 July 2007, 9:56 p.m.,  
in response to message #39 by [Gene Wright](#)*

imho, it is a real pain to not be able to use A..Z as an array. It is far easier to enter and recall values from A..Z than the indirect values.

E.g., rcl A is much easier than 1 sto I rcl (I).

### **Re: 35s indirect addressing done wrong?**

*Message #41 Posted by [mjcohen](#) on 24 July 2007, 1:19 a.m.,  
in response to message #40 by mjcohen*

How this could fit on the keys:

On one key have "IND" which brings up a menu of I, J, (I), and (J), where I and J are NOT part of A..Z. You could even have K and (K).

Then, on the other available key, have it COMPLEX which brings up a menu of REAL, IMAG, CONJ, ABS, ARG.

It is so stupid not being able to get the real and imaginary parts of a complex number, especially with the known bugs in COS.

Martin Cohen

*Message #42 Posted by [sjthomas](#) on 24 July 2007, 2:19 a.m.,  
in response to message #39 by Gene Wright*

Granted, two index registers are better than one, and 801 loopable registers are better than 26-ish, but I just don't see the programming issues which would preclude ANY register from being used as an index register. They had to program it for I and J. Why not any register?

*Message #43 Posted by [Valentin Albillo](#) on 24 July 2007, 6:02 a.m.,  
in response to message #1 by Gene Wright*

Hi, Gene:

After having used the HP35S for a while, I must say I am *very* pleased with it.

It certainly looks and feels much better than what I expected. It is light but firm, appears quite solid and well built, the colors and form factor are really attractive, the display has good readability with a decent decimal point, and the keys feel good and positive as well, except for the cursor keys which, in my unit, do have a different, rather stiff feel to them, but never mind, the bottom line is I really like it very much, it looks and feels better than expected, and I'm all for promoting it among my HP-aware friends.

I'll certainly write programs for it and articles about it, matter of fact I intend to dedicate my efforts to it in full for the next months, in an attempt to generate interest for the machine and provide some useful software for it.

All in all, I think the community is up to enjoy great HP-calc times again. HP certainly has done its part, in spades, by releasing such a nice machine as the HP35S, and we must now do our best to support their efforts by trying and generating enthusiasm among HP-fans. A new golden era is dawning and we're fortunate for it !

*"May you live in interesting times", as Russell said the Chinese say ... Indeed ! Count me in ! :-)*

Best regards from V.

First Impression:

WOW!

Not only do the buttons work, but they are noticeably better than the 33s. They have less bounce, but really nice pivot and snap action. Of course they feel different from a Singapore 48GX, but I think they are actually better than a voyager.

All of my "wishes" as it were circa "the end of the 32sii" have been fulfilled:

1. Keyboard 2. Display 3. Functions. 4. Reasonalbe size

All of these requirements have been met or exceeded. Only one function (for me) is missing: the "regualr" rectangular-polar conversion--which leaves real numbers in the stack. But this is minor and easily coded as a program.

I am very impressed.

### **Re: Thread for those receiving 35s calculators to post what they think**

*Message #47 Posted by [Greg Whitfield](#) on 26 July 2007, 12:46 a.m.,  
in response to message #1 by Gene Wright*

I received my HP 35s on Tuesday, July 24th from Wal-mart using the Site-to-Store method. The cost was \$49.99 plus local sales tax; shipping was free. The serial number of the calculator is CNA 72101939.

I haven't had much time to work with it yet, but overall I'd say that it appears to be solidly built and much more professional looking than many of HPs other recent calculators.

The first thing I did when turning it on was note the mode: it was RPN. Then I ran the self-test. It was on the first press of any key when I noticed that the annunciators seemed higher on the left than on the right. Apparently the LCD is crooked in my HP 35s, but not so much as to make me call HP on it. Has anyone else noticed this with theirs?

Also, I was initially a little confused by the left-shifted (yellow) and right-shifted (blue) function terminology in the user manual. The blue functions are on the bottom left side of the keys! The yellow functions are on the top center. It appears that the LCD of the HP 35s is identical to that of the HP 33s which had true left-shifted and right-shifted functions (and horrible colors). Apparently, the left and right shift symbols correspond to the annunciators and one must match the yellow and blue colors to the proper shifted keys. Perhaps it would have been better to leave the direction (left or right) out of the manuals and describe the keys in the documentation by color only.

Why did they use I and J for indirect addressing? Why not lowercase i and j? (the complex notation for i could have been a cursive type i like on the LCD)

Well, despite my minor complaints, I still am glad HP released this calculator and I plan to show it and RPN off whenever I can. However, I'm still looking forward to the 25th Anniversary HP 15c calculator and the successor to the HP 42s.

Cheers,

Greg

---

I've seen several people mention the shift keys being confusing, either because of the arrows pointing left and right, or because they both point upward. That confusion was surprising to me, because I've *always* used the color-coding to match functions with the shift keys on HP calculators. I'd always assumed that these keys were called "shift" keys as a reference to the shift keys on computer (and before that, typewriter) keyboards. Such keys are used to shift "upward" to upper-case letters, so it made sense to me for them *both* to have upward-pointing arrows (as the shift keys on many computer and typewriter keyboards do). Also, since the shift keys on calculators aren't physically located on the left and right sides of the keyboard, I thought the left- and right-pointing arrows were simply meant to be ways of distinguishing the keys from each other: "We know these keys are located one above the other, but this is the key that would have been on the left side if this were a typewriter keyboard, and that other key would have been on the right side." I thought that was the only reason for the "left-shift" and "right-shift" terminology.

It never occurred to me that the "left" and "right" designations had anything to do with how the labels were placed on the keys. But I just checked my HP48GX, and sure enough, the left-shifted labels are on the left, and the right-shifted labels are on the right! Funny that I never noticed that before. I just always matched the colors without paying any attention to the physical orientation of the labels.

I, also, use the colors as my guide. But some folks are color-challenged, so the arrows are the only thing they can use to distinguish between the two.

And under these circumstances, arrows pointing in the wrong direction are extremely confusing, as you can imagine. To use your terms, HP was quality-challenged in this detail ;-)

BTW, I love political correctness as it has grown overseas, e.g.: When the horizontally-challenged person in its best age could not keep his attention at an appropriate level (due to above-average long-wave radiation from above) next the urban area of the vertically-challenged people, they made him mobility-challenged by elongated textile products. I.e. when big old Gulliver slept in the sun next the city of the dwarfs, they tied him down with ropes.

In other languages you call such a person "color-blind", and that's what it is.

Most of us are not completely devoid of seeing any color.

It's more can't tell Red from Green, Blue from Purple (and I have no idea what Teal is..)

This is why we prefer it be Color Deficient, not Color Blind.

It's not being politically correct, just correct. :)

Message #52 Posted by [Walter B](#) on 26 July 2007, 4:52 p.m.,  
in response to message #51 by Steve Myers

Sorry Steve, that was the short and simple version. AFAIK the most frequent deficiency concerns red and green, and in fact it's called "rot-grün-blind" (blind for red and green). It was said to have been the reason behind some traffic lights not only showing different colors, but these also in different shapes. Nowadays, however, everybody knows green is at the bottom ;-)

So "blind" is a short word indicating some visual deficiency, not meaning I would see nothing at all.

---

No offence taken Walter.

I know it as "Top Stop, Low Go" but that doesn't work on those sideways lights in Texas..

The lack of seeing Red is why I can't tell Blue from Purple. Unless I've been lied to all this time, Purple is Blue+Red and I'm "blind" to the red part.

All my friends know when I do my own laundry. "Shirt looks grey to me", how would I know it's bright pink.

I'm happy its not so bad as I can still see the difference in the shift keys on my 32SII ;)

Fabulous! I loved the 33s (I had to get past its appearance) and so find the 35s a really welcome upgrade.

I share the woe of several regarding the BASE handling, and would rather the roll down & swap keys were adjacent to ENTER.

Taken as a whole, it's not as near-perfectly-realized as was, say, the 15c, but it's a *really* nice, *readily available*, programmable, shirt-pocket RPN calculator. Thanks to all involved!

## **Re: Thread for those receiving 35s calculators to post what they think**

Message #57 Posted by **Katie Wasserman** on 26 July 2007, 9:44 p.m.,

*in response to message #1 by Gene Wright*

My first impression is that I like it better than the 33S, but nowhere near as much as the earlier machines.

pros:

- The function set is good as is the memory access.
- The case seems like more thought went into it than for the 12C anniversary edition.
- The keyclicks are okay.
- The manual seems complete and well written.

cons:

- There's a lot of LCD segment shadowing on the display.
- The keys themselves are really cheap feeling.
- The calculator is too large -- why should it be any bigger than a 32SII?
- The window reflection is annoying.
- I really hate having to press ENTER after XEQ <letter> and <right arrow> before STO.
- The ALL display mode should not overflow the display area it should cut back on the number of places displayed in order to fit the exponent in. I view this as a bug, I see no advantage in it working the way it does.

Summary:

The prices of the 32SII on ebay are going to keep going up!

-Katie

**HP 35s... The Good, the Bad and the Ugly**

Message #1 Posted by [Chris Haltiner](#) on 27 July 2007, 2:35 p.m.

I have made some notes based on my first week with the HP 35s. Most of my observations deal with cosmetic aspects since I haven't had the time to really put the calculator to heavy use. The "good" are commendable features and qualities. The "bad" are design issues--material compromises, part selection, lack of quality assurance testing, or short-sightedness. The "ugly" are production issues and, basically, are inexcusable. The "indifferent" are items that I don't have strong feelings about either way.

**Good**

Appearance and ergonomics--this calculator looks great.

Body material. The plastic feels good although it could be prone to showing fingerprints.

Big enter key in the correct position.

Key-bound functions are intelligently grouped.

Key label colors are pleasing and easily discerned. The labels are symmetrically positioned relative to each other and on the keys themselves. Only a few of the blue shift labels exhibit any fuzziness--very, very slight, however.

Key tactile feedback. The best since the 1980s.

Key texture. The keys do not have a shiny, slippery feel, but, instead, have a nice barely perceptible coarse surface.

No key or cover rattles. The body, battery cover, and keys have a tight fit (I have one 12c that has loose, rattling keys).

Every key stroke has registered. After having to tweak the 50g key timing several times, I found this to be a relief.

Also, two thumb calculations are fast and accurate.

Solid and stiff body, no flex.

Good rubber feet and no rocking during data entry.

Display data (not the top row annunciators!) is easy to view under many conditions. The display still is not of the same quality seen in earlier HP models.

Quick calculation feedback with few busy signals. I entered a couple of simple programs and did a series of statistical tests and the performance was good.

Price seems equitable for what you're getting.

**Bad**

While the body plastic is good, it still somewhat soft and suprisingly easy to scratch. A textured plastic would have been better. The 41CV plastic was superior in this respect.

Base conversions. I'll give the designers a "SYNTAX ERROR" for this one. When you have to use the manual to figure it out and it's still clumsy to use, then the designers failed.

Reflective and soft (i.e. easily scratched) plastic display lens.

Top row display annunciators are too close to the upper edge of the display bezel. Shadows make these difficult to read.

No box. Putting a product in hard plastic packaging implies that it is temporary and disposable. Cheap cell phones still come in boxes--I'll be using this calculator far longer than any given cell phone.

**Ugly**

Display alignment. I had to disassemble the unit to realign the LCD glass against its metal backing.

Soldering holding the power wires to the system board was not consistently well done.

Why can't the Chinese find anyone who can stick a serial number label on straight?

### **Indifferent**

The carrying case is not as good as the 50g's, but it's still better than the TI-89 Titanium (a plastic sleeve that slides on either the front or the back).

Product manual seems to be accurate and effective, however, the paper quality is about par for manuals these days. A flat laying binding would be preferred so I don't have to wedge the book under things while working through examples. Regardless, I'll download the PDF version and use it when it's available.

I bought my first HP back in high school. It was a 41CV and I still get it out every once in a while to admire the craftsmanship and feel. Since then, I've bought an HP 28S, a couple of 12Cs, a 50g, and now an HP 35s. However, none of these have ever come close to the HP 41CV. While I don't really require a scientific calculator for my job as a software developer, I have always had an HP handy and the buzz surrounding the HP 35s was too much to ignore. And, just as I was losing faith in HP's ability to make a quality calculator, they introduced the 35s.

In summary, I find this to be an excellent calculator. I found the display alignment issue to be the worst aspect of my particluar unit--something annoying enough that I had to fix it. I hope this signals HPs return and future commitment to better quality calculators. Welcome back big enter key!

### More 35s Musings

Message #1 Posted by [Chuck](#) on 27 July 2007, 11:06 a.m.

The 35s arrived a few days ago, and all in all, it's a good little calculator. The only complaint so far is that the four arrow keys make a much more audible "plasticity" click than the other keys. It could get a little annoying if several students have these during a quiet test.

To get used to finding the various commands, I took out my 11C manual and converted the Moon Rocket Lander game for the 35s (a little geeky, but what the heck.) Works perfectly.

Also...I figured out what the little pouch is for... [Pickett N600](#) :)

and of course, I hade to make a [table stand](#)

Cheers, CHUCK

### Graphing Calculator suggestion

Message #1 Posted by [Vincze](#) on 27 July 2007, 10:57 a.m.

Good morning.

I find out from my son (Dezso), just now, that he will need a graphing calculator for his math class next year. School recommend a TI brand, but I do not like TI. What is good calculator by HP that have good feel and good functions for graphing calculator. Should I be looking for used calculator, or new. I would like to find the best one for him is possible, but I do not want to pay a fortune for it.

*Edited: 27 July 2007, 11:08 a.m.*

### Re: Graphing Calculator suggestion

Message #2 Posted by [Egan Ford](#) on 27 July 2007, 11:26 a.m.,  
in response to message #1 by Vincze

Go with what the school recommends. My 16-year-old uses a TI-83+, as does every student and teacher in her school. It is required. All the homework, tests, lectures, etc... assume a TI-83+. If she had a 50g and had a problem during a test, then she would be SOL. No other 50g around to borrow, no teachers for help, no peers for help. My kid's future could be at risk.

The best solution is usually the best supported (vendor, software, peers, community, etc...) solution, not always the best technical solution.

### Re: Graphing Calculator suggestion

Message #3 Posted by [Wayne Brown](#) on 27 July 2007, 8:36 p.m.,  
in response to message #2 by Egan Ford

Both my sons used their HP48GXes in high school, and both were the only ones in their classes with an HP of any kind. Neither had any problem adapting the TI-centric instructions and examples in their textbooks to their HPs.

Hello!

Quote:

... but I do not like TI.

Have a closer look at a Ti84, Ti89 or Voyage 200 (or the new nSpire, once it becomes available everywhere) and you may change your mind, much as I did mine. Ti have produced some, let's call them 'inferior', products

(especially regarding the keyboards!) in the 70ies and 80s, but those times are long over. There is presently no hp graphing calculator that comes close to the current Ti products in terms of build and keyboard quality, functionality and IO/connectivity. The Ti-GraphLink software also runs on MacOS which alone would be reason enough for me to choose Ti...

Second hand Ti graphing calculators can be found on eBay in large numbers and it should not be difficult to find a good '84 for less than 50\$/Euros and an '89 or Voyage for less than 100. (I paid 70 Euros for my Voyage 200 with graph-link cable included).

Greetings, Max

### **Re: Graphing Calculator suggestion**

*Message #5 Posted by [Jonathan Eisch](#) on 27 July 2007, 12:43 p.m.,  
in response to message #4 by Maximilian Hohmann*

I think the TI calculators have terrible keyboards. It feels like you're pressing them into oatmeal or soggy cardboard. I don't know how that qualifies as quality, especially compared to the HP-50g...

The TI-84 has the same interface as the 83, which is amazingly unintuitive to anyone. And the Voyage 200 isn't allowed on many standardized tests, at least in the US.

If you'll go with the 89, then your son probably won't be able to follow along key-for-key with the class, so there is no particular reason to choose a TI over anything else.

No idea how a HP-50g doesn't match on functionality with, as you listed a TI-84....? Seriously?

-Jonathan

\_\_\_\_\_

Of course, you cannot compare the hp-50G to the Ti-84. The hp-50G is a competitor to the Ti89/Voyage/nSpire. About standardised tests in the U.S. I know nothing, but they were not mentioned in the original posts.

Here in Germany we don't have much choice anyway, because it is the school who decides which calculator or CAS is to be used (and nowadays, they even provide them for the students much to the annoyance of my wife, an arts teacher, because the costs involved are taken away from her budget).

Greetings, Max

### **Re: Graphing Calculator suggestion**

*Message #7 Posted by [Jonathan Eisch](#) on 27 July 2007, 12:34 p.m.,  
in response to message #1 by Vincze*

If he'll continue in math through highschool or college, he would be best served with either a TI-89 model, or an HP-50g. If the school is suggesting a lower TI model than that then he'll want to upgrade in the future anyway, so why not get the TI-89 or HP-50g now?

Some will argue that getting a TI-83/84 is good because "everyone else will have it", but I found that not to be the case when I was in school (graduated high school in 2002). In lower level classes, the functions used are pretty limited, and finding them on the 89 or 50 is straight forward. I'd say I didn't miss any educational benefit by not being able to type "yellow button, window button, five button..." with the teacher.

As to which between the HP-50g or the TI-89, I'd certainly recommend the HP, but that's me. Which ever one he can get interested in enough to learn for himself would be the best. Beyond the interface, he won't run into the technical limitations of either (really I mean the TI) for quite some time.

That's my take on it, anyway. -Jonathan

If he'll continue in math through highschool or college...

\_\_\_\_\_

Well, he is a sophomore in high school and he wants to go to MIT when he goes to college. He is interested in computer science, so I think he will need a good calculator, but I don't see the need for graphing calculator in real world.

Well, I still puzzled as to what to do.

### **Re: Graphing Calculator suggestion**

in response to message #8 by Vincze*

If the school recommends TI, it is probably because the teachers are using TI and can give support. HP may be technically superior to TI, but take my word for it (as a middle school math teacher), if he can't get something to work and he has an HP, no one at the school will be able to help him. I've only met one public school math teacher who even knew what HP stands for, and even he used TI in the class. Face it, TI has that market locked up, and the TI-83 and 84 are not bad calculators and graphers.

*Message #10 Posted by [Chan Tran](#) on 27 July 2007, 1:45 p.m.,  
in response to message #8 by Vincze*

If he is willing to learn how to use the calculator then the 50G is good. I don't see any advantages from the 49, 49G+, 48GII. The 48GX may have some advantages over the 50G but it's no longer available new. But then the 50G has a lot more functions than the 48GX. However, I found that most students don't care to learn how to use their calculators and in such cases it's best to buy what the school recommended. To many students nowadays, calculators are just the necessary evil. Something they must have but they hate them.

## **Laziness brings struggle**

*Message #11 Posted by **Vincze** on 27 July 2007, 2:03 p.m.,  
in response to message #10 by Chan Tran*

And to think I went to Technical University of Budapest (BME) with a slide rule. I just shake my head that students need calculator in high school. Students NEED to understand how to do math, and how is calculator going to teach them that? Calculator necessary after you understand how to do math and it makes things solve quicker, but that should not be concern until in college.

We have saying in Hungary, Nem akarasnak nyoges a vege, which means laziness brings struggle. Maybe I to old school, but I do not want Dezsó to struggle like I have. I shall see. Maybe I give him slide rule and graph paper and say that is 100% Hungarian graphing calculator. Ha-ha, I think he would not like me for doing. :)

*Message #12 Posted by **Matthew W. Milligan** on 28 July 2007, 8:50 a.m.,  
in response to message #8 by Vincze*

Hi Vincze,

I am a long-time high school physics teacher and long-time HP calculator user and fan. My school also strongly recommends TI graphing calculators and it has been years since I saw a student carrying an HP. So I have been forced to learn how to use TI calculators and I am very familiar with the graphing models and spend a good deal of class time interacting with students as they use TI calculators. In the meantime I refuse to stop using HP so my students must think I am a freak (and are sometimes a little in awe) when I am brandishing my 48g or 49g+ (or soon my 50g).

On TI calculators: Over the years I have come to respect TI calculators. These are reliable, well designed machines. I believe TI calculators are easier to use for graphing than HP. The programming languages are fairly complete and easy to use - very similar to BASIC. In my mind there are really only a couple of disadvantages. The buttons are indeed "mushy" in a sense, because there is no "click" or "tactile feedback", if you will, as on HP models. On the other hand, I have never seen a TI graphing calculator that missed key strokes or doubled them as some recent HP's have been known to do. The biggest disadvantage to TI in my mind is the reliance on parentheses to enter complex calculations - I see it all the time, students missing problems for lack of or misplacement of parentheses.

On HP calculators: As I mentioned I am firmly an HP fan. (I may be unusual because I can find merits in TI.) Advantages for HP are the opposite of the disadvantages for TI mentioned above; the tactile feedback of the keys and RPN (or RPL) entry. In particular, based on your comments about truly understanding math and an interest in MIT, I would think the "HP way" would be desirable. As you probably well know, when solving a problem with RPN you must think about order of operations, you can see intermediate results, and you do not need parentheses. This forces one to really think about what the calculator is doing. The programming on HP is very different from TI. It is not BASIC but rather RPL, which is very similar to RPN in that you basically mimic the keyboard strokes that you would press on the calculator to achieve the desired result. One disadvantage is the rather steep learning curve for recent HP graphing models and lack of a comprehensive and well written manual. Also, as implied above, working with graphs is a bit awkward and counterintuitive (I hate to say it but I usually grab a TI if I need to do some graphing).

Now a few particulars. The TI 83/84 line is easiest for most students to use and these are solid well established calculators. The TI 89 and HP 49/50 calculators are tougher to learn how to use and also have Calculator Algebra Systems (CAS) that can solve equations, derivatives, integrals, series, etc. (Something I suspect you would frown upon based on your comments.)

**Re: Graphing Calculator suggestion**

Message #13 Posted by **Vincze** on 30 July 2007, 8:45 a.m.,  
in response to message #12 by Matthew W. Milligan

Good morning Matthew. Would you tell me more about the calculator algebra system? I have not heard this before.

Also, I looking online to maybe get a used 48gx. Is this good HP or would the 49 or 50 be better for Dezso?

**CAS and Graphing Calculator suggestion**

Message #14 Posted by **Matthew W. Milligan** on 31 July 2007, 7:32 a.m.,  
in response to message #13 by Vincze

CAS allows for symbolic solutions and manipulation of equations and algebraic expressions. For example type in equation  $3x^2-7x=17$  and tell the calculator to solve for x and you immediately get both solutions  $x=-1.484\dots$ ,  $x=3.817\dots$ . Or, enter  $ax^2 + bx + c=0$  and tell the calculator to solve for x and it will return the well known quadratic formula:  $x=(-b\pm\sqrt{b^2-4ac})/(2a)$ . And the ability to solve is not limited to polynomials. Likewise the CAS will "do" calculus and give numeric or symbolic derivatives, integrals, series, limits, etc.

The reason I mentioned it in the context of your original post is the potential impact of CAS on students. Here are my observations from the classroom. Students get in the habit of using the CAS to solve equations. It really is a very powerful tool. A common problem in physics is solving an elastic collision using conservation of momentum and energy which results in a nonlinear system of equations. The student with CAS can get the answer by simply typing in both equations and which two variables to solve for! I often accuse my students of becoming SOLVE addicts! (the name of the function on the calculator) Through all of my AP Physics C course (equivalent to 1st yr college) there are only one or two algebraic problems that CAS cannot solve. Likewise with the calculus problems in that course. Keep in mind that I teach a physics course, not algebra or calculus (well, yes physics IS all that too) so I don't really have a problem with students using CAS; I require them to show work. Also I think my best students are as good or better than ever, in spite of being SOLVE addicts.

However, I would think that CAS could indeed be detrimental in algebra or calculus classes - especially if the student is not disciplined enough to refrain from using it while doing homework. In this regard HP may have a slight advantage simply in the fact that its CAS is a bit harder to learn and harder to use than TI's CAS. I can imagine a student getting an HP 50g not really understanding all that it can do until several years later when the use of CAS is more appropriate.

As far as 48g vs 49g vs 50g (I have owned all three - just got my 50g the other day), I would just go with the 50g. It does everything that 48g does and more and it has a much better LCD display. Yes the original 48g is probably a little bit better made and has the big ENTER button . . . things that are more important to a long-time HP enthusiast than to today's students (it would seem to me).

**Re: CAS and Graphing Calculator suggestion**

Message #15 Posted by **Vincze** on 31 July 2007, 10:36 a.m.,  
in response to message #14 by Matthew W. Milligan

Does 48gx have CAS? I found someone I work with who own one and is willing to sell me

it. He say I can buy for \$50. Is that good price? He no have books, but I find online someplace and make my own.

I too worried that Dezso might "cheat" and use CAS to solve those type of equation. As me say before, I believe student should know math first by doing hard way, and avoid laziness (laziness lead to struggle). I do understand what you say though that it is not an issue since you teach physics and not math. I guess that go along with saying of use all tool available to you. In life, I use slide rule in college, but in work world I no longer use slide rule, I use calculator or computer as those tools available to help me.

Maybe I look at 50g. I think it ugly looking. 48gII look nicer, but looks not calculate. I think they all very expensive though.

So sorry for my bad english.

### **Re: CAS and Graphing Calculator suggestion**

*Message #16 Posted by [bill platt](#) on 31 July 2007, 12:26 p.m.,  
in response to message #15 by Vincze*

48GX does not have CAS; however the CAS for the 49G was developed from programs written for the 48GX as an independent programs: Erable and ALG48. Furthermore the shell in the 49G (and the later 50G) came from "Metakernel" which was also developed for the 48GX (by Jean-Yves Avenard).

If you buy two ram cards for the 48GX, you can load Metakernel, ALG48 and Erable as well as other stuff and you have the supercharged CAS-enabled 48GX.

BTW \$50 for a 48GX is a very good price.

The software is all free and available here: <http://www.hpcalc.org>

Holy Wow... I pay co-worker for 48GX yesterday and he bring in today. Wow... this monster calculator. He did find one of book. I think you need PhD to understand this

calculator. I can see why student may have trouble with this. He even show me that it have mine sweeper, and way to enter equations graphically. That very cool. It seem very hard to use though. Is 50g easier to use that 48gx?

### Re: Got 48GX Today

Message #19 Posted by [Dallas Osborne](#) on 2 Aug 2007, 10:24 a.m.,  
in response to message #18 by Vincze

Vincze, I would highly suggest taking a look at Thomas Barber's guide to the 48-50G series, *The Definitive User's Guide to the HP 48g/49/50g Calculators*. You can find this on the **Sampson Cables** website. For the price, this is one of the best explanations and guides to using this series of calculators. I would say neither the 50g or 48g are harder to use than the other; they have different approaches to certain types of problem entry, but both are outstanding RPL machines. I prefer the 48g series due to the well-placed ENTER key and the key pad layout and feel. Regards, Dallas

### Re: Got 48GX Today

Message #20 Posted by [bill platt](#) on 2 Aug 2007, 11:04 a.m.,  
in response to message #18 by Vincze

The 50G is not fundamentally different to use than the 48G--the 50G uses the same RPL language and paradigm.

The "quick start guide" is also good to read, as well as the original manuals. You can download them from [HTTP://www.hpcalc.org](http://www.hpcalc.org)

IT is RPL not RPN, so there are some small differences (such as if you want to SWAP the 1st two levels in the stack, you have to first ENTER to put the command line into level 1.)

You can make algebraic objects by typing the ' character first. The algebraic object lives on the stack, can be duplicated etc. If you push EVAL it will be evaluated....

You can save to variables, for instance:

123 ' [alpha alpha] VAR1 ' [alpha] STO

This will store the value 123 into a variable named VAR! into the current directory.

You can recall this variable. You can use it in algebraic objects or programs. The variable can be an equation or a program etc...

### Re: Got 48GX Today

Message #21 Posted by [Vincze](#) on 2 Aug 2007, 2:09 p.m.,  
in response to message #20 by bill platt

Good afternoon Bill. Thank you for the information. I am a bit confused at RPL as I have never seen it before. I was looking for R/S button for awhile, and then someone told me that there was not one because of RPL.

I like the fact that assigning variables is that easy, and it seem like RPN is there in the background with doing math.

I looked on the HPCALC site and did find the books. Thank you. The one came with the calculator, but the advanced one I do not have so that will help.

Is there something that describe main difference between RPN and RPL, like a short dummies guide? I know there must be quite a big difference, but it would be nice to see the main points.

### Re: Got 48GX Today

in response to message #21 by Vincze

There might be a guide for when the 28c was developed.

RPN = Reverse Polish Notation RPL = Reverse Polis Logic (or Lisp, or...?)

RPN is an input paradigm, of which RPL is related, but RPL is also a whole programming language.

### **Re: Graphing Calculator suggestion**

*Message #25 Posted by **Les Wright** on 27 July 2007, 4:04 p.m.,  
in response to message #1 by Vincze*

I can't figure out the programming language on my TI83+ to save my life, but I must admit the thing has grown on me for some things. The pretty fast and accurated Gauss-Kronrod integrator is superior to the Romberg routines found in HPs, up to and including the 35s, and sort of impressed me.

Maybe when he can more easily afford it he will have some choice--the calculator he must have in order to jump through the academic hoops, and the one he really would like to use just for himself.

As for further comments in this thread about calculators in math education, I must admit I struggle with this one. I love calculators, have since I was a kid and got some Novus 4-banger, now long broken and lost. But I at some point learned long division, multiplication, and addition of sums--heck, even square roots, but I can't remember the algorithm any more--with pencil and paper. So for me electronic calculators have never seemed a crutch or the lazy way. But I know my experience is exceptional. I have heard stories from teachers that every calculator in the class comes out when the kids are called upon to compute the simplest sum as part of an exercise.

Les

Today any calculator can be had for less than \$200 (except them collectible HP's), so the issue of affordability is not there.

### **Re: Graphing Calculator suggestion**

*Message #27 Posted by **Vincze** on 27 July 2007, 4:31 p.m.,  
in response to message #25 by Les Wright*

Good afternoon Les. I agree with you that a calculator is needed in the real world, but children need to have experience and exposure to numbers to they get a sense of number familiarity. They will develop recognition of patterns by doing math by hand. In fact, Dezso can very quickly find the square root to four decimal places very quickly (as can I). You say you do not remember algorithm no loger for finding square root, but it is so simple. All you do is estimate the square root to at least 1 digit, then divide this into the number whose square root you want to find. You then find average of the quotient and the divisor, and the result is your new estimate. When I learn this many years ago it was called the Babylonia method and is

truly very quick.

For example... let's try and find square root of 30. With calculator, I can see that it is 5.4772, but using my method here is how you would do. Let's make our first guess 10. We take  $30/10 = 3$ . We then take  $(10+3)/2=6.5$ . Now we use 6.5 as new guess, and  $30/6.5=4.6154$ . Get average of  $(4.6154 + 6.5)/2=5.5577$ . New guess is 5.5577 and  $30/5.5577=5.3979$ . Average of  $(5.5577+5.3979)/2=5.4778$ . Use new guess  $30/5.4778=5.4767$ . Average of  $(5.4778+5.4767)/2=5.4772$ . And there is our answer. Yes it takes a four guesses, but in four guesses I have it to four decimal places.

I bet you ask child in school now, and they have no idea how to figure square root without a calculator. Maybe I am wrong, my myself and wife teach Dezso how to do this in 4th grade and he caught on very fast because it just uses simple addition and division.

I don't try and knock people because they use calculator, as I use too, but I'm more concerned of children not understanding basic knowledge of math and I think that puts them at a serious disadvantage. I know I sound dumb because I don't have good English skills, and that's ok, but I want my boy to be smart, like me, even though I speak badly.

### **Re: Graphing Calculator suggestion**

*Message #28 Posted by [Don Shepherd](#) on 27 July 2007, 8:47 p.m.,  
in response to message #25 by Les Wright*

Les, it's just BASIC! Instead of typing the commands, however, you insert them via a menu, just like many systems. But it's actually much easier to write the BASIC code on the PC using TI-Connect software (which has always worked flawlessly for me) and then download it to the calc.

### HP32SII Keyboard fix

Message #1 Posted by [Ketih Shelley](#) on 27 July 2007, 3:01 a.m.

For those who know, the keys on the right side of the HP32SII tend to get extremely unresponsive after many years. Many year ago, I did a lot of hop-up mods to my HP41 calculators, permanent extra memory and doubled the processor speed. I've seen the disassembly instructions for the 32 and I don't care to get into all of that. The HP32SII would never be the same after so much maintenance. I read somewhere that if you press on the metal display frame just below the display, the right side keys will work with normal finger pressure. My quick and dirty repair implementation of that fix is you take two no.64 rubber bands and double wrap them around the lower section of the display frame. Then stick two of the batteries that the 32 uses under the rubber bands side by side on the front of the calculator on the metal display frame between the top row of keys and the display. Its not pretty, but now the keys on the right side of the calculator work with normal pressure as the other keys have always done.

### Re: HP32SII Keyboard fix

Message #2 Posted by [Curtis Tom](#) on 27 July 2007, 1:32 p.m.,  
in response to message #1 by Ketih Shelley

If you're willing to remove the calculator back, a much more elegant and permanent fix would be to tighten the lower three metal tabs that hold the LCD to the circuit board. Besides holding the LCD in place, the metal frame serves to compress the conductive rubber strip ("zebra strips") between the electrically conductive regions of LCD glass to the printed circuit board pads. GENTLY twist the tabs by 20 degrees or so (counterclockwise, with the back of the calculator facing you) to increase the compressive force and that should resolve the problem - hopefully! If the key pad contacts are dirty or damaged, this procedure will not help...

### Re: HP32SII Keyboard fix

> "... tighten the lower three metal tabs that hold the LCD to the circuit board."

I'm very interested in this, because mine has the same problem with the keyboard.

How can I find "the lower three metal tabs"? Do you mean that the calculator should be disassembled to access the metal tabs ?

Thank you very much in advance, Sincerely

**Pioneer touch-up paint**

Message #1 Posted by [Seth Morabito](#) on 27 July 2007, 2:26 a.m.

I have an early 42S with a paint chip and a few scratches around the LCD bezel. It's really very minor.

[http://www.loomcom.com/junk/42s\\_scratches.jpg](http://www.loomcom.com/junk/42s_scratches.jpg)

The practical and safe side in me says that I should ignore it, live with it, there's nothing I can do, and besides it's incredibly insignificant. It doesn't affect how well the calculator works, why should I care what it looks like?

But the irrational, obsessive-compulsive side of me is drawn to that paint-chip like a moth to a light bulb every time I pick up my calculator. My beautiful bezel, ruined!

If I were to be crazy enough to want to try to touch that chip up, what sort of paint would I use? Has anyone here ever done that?

**Re: Pioneer touch-up paint**

Message #2 Posted by [Namir](#) on 27 July 2007, 8:20 a.m.,

in response to message #1 by Seth Morabito

Seth,

My guess you had a parent or a caregiver that was very hard to please. I think the issue is not the paint chipped off the HP-42s. It's in your childhood. I suggest investing some of your energy and time there and leaving a good functional HP-42s be. Just have fun with the calculator.

Namir

PS: There is a lot of psychology behind our "love" or "obsession" with vintage calculators. I wonder why are we so attached to old machines when our current computers offer software (Excel, MatLab, Mathematica, Maple, SPSS, MINITAB, and so on) that we would have drooled over in the days of the old calculators. The vintage machines are kinda like songs that connect us with the past and what that era represented for us--most commonly an era full of promises and potential. Somehow we want to go back and relive the past, because ??? ? that's where each person fills in the blanks. Our unconscious mind is using vintage calculator to draw our attention to something ... not get us in more debt or get us hooked on buying stuff.

That's what happens when one visits Freud's apartment in Vienna. The place is still contagious!!! He may have died long time ago, but his energy is still there.

I don't think there's any mystery there.

It is not very convenient to carry around Mathematica in a pocket device, even if one is willing to spend several thousand dollars on a UMPC or OQO style device. I don't have to wait for my calculator to boot up, I don't need a stylus or an itty bitty "thumb keyboard" to operate it, and I don't need to recharge it after two hours of use.

Spreadsheets, Mathematica, Maple, etc. are great for some things, but when what I need is a calculator, they are a poor substitute. It's like using a BLU-82B to swat a fly.

### 35S Benchmark test

Message #1 Posted by [Ralph](#) on 27 July 2007, 1:40 a.m.

I ran the benchmark tests from the page on this [forum here](#). and got some odd results.

The 33S program fitted to the 35S ran very slow, about 471 seconds on my stopwatch. I read there is probably some internal work because of the vector math function added. It might add some overhead. OK I can accept this, it makes sense to me.

Then for grins I converted the 41/42 program to the 35S. 323 seconds. Slow but not as slow!?! I dug out the 33S and it runs it's test in 129 seconds. All to my stop watch and skills.

From the chart on the forum page, there are the following times:

42S 425 sec.

32S 262 sec.

32SII 344 sec.

And my timer:

33S 129 sec.

35S/33S 417 sec.

35S/42S 323 sec.

Next is to put the 42S version on the 33S. I'm guessing it should be faster if it fits.

### Re: 35S Benchmark test

Message #2 Posted by [Xerxes](#) on 27 July 2007, 6:30 a.m.,  
in response to message #1 by [Ralph](#)

Hi Ralph,

the 41/42 version of the benchmark was already tested on the 33S by Gerson, with some modifications of course, with 251 seconds.

The main reason for the different versions is the way how the calculators handle indirect addressing and the fastest way to increment or decrement variables. Considering the new concept of the 35S, I guess it is necessary to make an implementation especially for this calculator. As soon as the 35S is available in Germany, I will try it out and add the result to the data base.

Are you sure with the 42S result? In the table you will find the 42S with 732 sec (fast mode: 362 sec).

**35S Benchmark test**

Message #3 Posted by **Ralph** on 27 July 2007, 9:12 a.m.,  
in response to message #2 by Xerxes

Thanks. I didn't find the conversion but it was getting late last night. You are correct on the time for the 42S. I didn't search the page, just eyeballed it. And misread or typed, common for me. I know it's blazing fast on my HP4705 Pocket PC.

I think the use of the two indirect register variables, I&J plus using the ISG & DSE commands over the math make the 42 version run faster on the 35S. Given the calculator is said to check whether the math is conventional or vector.

The 42 code went in almost as written. I put a little bit in the front to set the index range so to not have to do it manually. Probably added a second or two.

I find these tests fascinating. For my use, my program runs at the same speed on the 33 or 35 as far as I can tell.

**Re: 35S Benchmark test**

Message #4 Posted by **Gerson W. Barbosa** on 27 July 2007, 9:19 a.m.,  
in response to message #1 by Ralph

Ralph,

Can you post both your 35s versions, or at least the fastest one? Just for reference.

Perhaps you'd like to take a look at these old threads:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=106865>

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=107447>

I've noticed Xerxes's article include a Lua version, but I wasn't able to run it in HP-Lua. Has anyone tried it?

Regards,

Gerson.

in response to message #4 by Gerson W. Barbosa*

Hi Gerson,

Can you explain the problem with HPLua please? I led from that the Lua version is usable for all lua interpreters.

**Re: 35S Benchmark test**

*Message #8 Posted by [Gerson W. Barbosa](#) on 29 July 2007, 9:13 a.m.,  
in response to message #7 by Xerxes*

Hi Xerxes,

By what I can remember, I reset the calculator after waiting for one minute or so. I'll try again later.

Regards,

Gerson.

**Re: 35S Benchmark test**

*Message #9 Posted by [Xerxes](#) on 29 July 2007, 4:39 p.m.,  
in response to message #8 by Gerson W. Barbosa*

The Lua version on the Casio ClassPad takes 110 seconds if you use the 100 iterations in the original listing. On what calculator did you test it?

**Re: 35S Benchmark test**

*Message #10 Posted by [Gerson W. Barbosa](#) on 31 July 2007, 7:50 p.m.,  
in response to message #9 by Xerxes*

Hi Xerxes,

HP-50g (HPLua version 0.4) -> 1000 iterations in 4 min 3.5 sec. That's 0.2435 seconds per iteration.

Regards,

Gerson.

**Re: 35S Benchmark test**

*Message #11 Posted by [Xerxes](#) on 1 Aug 2007, 5:44 a.m.,

### How to erase a RAM card in the 48GX?

Message #1 Posted by [Ron G.](#) on 26 July 2007, 10:44 p.m.

I want to completely erase a RAM card. How do you do it?

### Re: How to erase a RAM card in the 48GX?

Message #2 Posted by [Wayne Brown](#) on 27 July 2007, 7:44 a.m.,  
in response to message #1 by Ron G.

The easiest way is to remove the card from the calculator and remove the backup battery. Otherwise, you'll need to PURGE each individual file on the card.

If you remove the battery, you'll need to do PINIT after you put the card back in the calculator, or else you'll get an 'Invalid Card Data' error every time you turn it on.

### Re: How to erase a RAM card in the 48GX?

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 27 July 2007, 11:29 p.m.,  
in response to message #1 by Ron G.

I'm not sure how long a RAM card has to be left without power before it loses memory, but, as Wayne noted, that's no doubt the easiest way to clear one. Note that with the card inserted and the calculator turned on, the card gets its power from the calculator. Some SMI and TDS cards use a non-removable rechargeable battery (recharged by a turned-on calculator), which (if fully charged) should hold its charge for a month or so. For the 48GX's slot 1, be sure that port 1 is "free" (see below) before removing the card (or its battery).

Of course when a card is powered up again, it will contain random data. To easily "organize" the memory of all ports in a 48GX, use the PINIT command.

If you choose to clear the card by purging objects, of course first off, the card has to be write-enabled.

For the 48GX's slot 1, port 1 has to be "free", not "merged" with system RAM, to use it as an independent memory port. To check, do 1 PVARs; if this returns a list to level 2 and a number to level 1, then port 1 is already free. If 1 PVARs returns { } to level 2 and "SYSRAM" to level 1, then port 1 is merged. To free (and clear) a merged port 1, do { } FREE1 (or { } 1 FREE). Port 1 can be merged by the MERGE1 command (or 1 MERGE), but note that will also move anything that was in port 1 to port 0.

Port objects "in use", for example, referenced on the stack, by a local environment, a "user-defined" error message, or as an attached library, cannot be purged. A warmstart ([ON] and [C] together) may be the easiest way to make sure that nothing is referenced except auto-attaching libraries. For the libraries, maybe use the LIBS command to get a list of the attached libraries and the DETACH command (which can also take a list of library numbers as its argument) to detach all libraries in the port(s) that you want to clear. Note that if the 48 series is turned off (even an automatic turn-off) and back on again, then any library configuration routines will be run, and most libraries will auto-attach.

To purge a port variable ("backup object"), use its port-tagged name, for example :1:TEST PURGE. To

purge a library, use its port-tagged library number instead, for example, :1:999 PURGE.

The PURGE command can also take a list of port-tagged names and library numbers, and, with a free port, the PVARs command returns a list of the port-tagged names and library numbers of all objects stored in a given port to level 2, followed by its available capacity in level 1. So, for example, 1 PVARs DROP PURGE should clear everything in port 1, unless something there is still referenced, in which case it will stop purging with an "Object In Use" error.

The slot 1 card can have only a single port, but the slot 2 card of a 48GX may have multiple ports of 128KiB each. If you want to purge everything on a multi-port card, you could loop through all ports and clear them with one command line or program, but it may be just as easy to handle each one separately.

Some TDS cards have multiple banks of 128KiB each, but with only one bank at a time available as a port. These are intended for the 48SX, but they work in the 48GX. These cards include a SWITCH library, to control which bank is available as a port. For these, it may be best to leave a copy of the SWITCH library in each bank (unless the card is going to be stored without power). For these, start with bank 1, clear the port, then switch to the next bank and clear the port again, and so on. If you have one of these cards, then it's best to have the SWITCH library safely backed up to your PC at least.

Oliver Klotz makes (made?) a 4MiB (32-bank) card for the 48GX's slot 2, with 30 banks available at a time as ports 2 through 31, and a physical switch on the card to control which 2 banks are used as ports 30 and 31. Of course in this case you'd clear ports 2 through 31, and then toggle the switch and clear ports 30 and 31 again.

There's also a multi-bank Klotz card intended for the 48SX (but usable in a 48GX) with only one 128KiB bank (selected by physical switch settings) at a time available as a port. These can be treated much like the TDS multi-bank cards.

For a 48SX the above would mostly apply, except that its slot 2 is like the 48GX's slot 1, and the FREE1 and MERGE1 commands aren't available, so the FREE and MERGE commands would have to be used instead. The 48SX also doesn't include the PINIT command, so to "organize" a card's memory, just store any object in each port, after which the "dummy object" can be purged.

Regards,  
James

### How do I clean a 41CX display?

Message #1 Posted by [Egan Ford](#) on 26 July 2007, 8:20 p.m.

My very nice fullnut 41CX has dust on the display behind the *glass*. What is the best way to clean this? This 41CX is nearly flawless (just a bit of wear on the feet), so I want to be careful.

Thanks.

### Re: How do I clean a 41CX display?

Message #2 Posted by [db \(martinez, ca.\)](#) on 26 July 2007, 8:57 p.m.,  
in response to message #1 by Egan Ford

i think you should be able to un-solder the - about a dozen or so - contacts and lift out the lcd to access the back of the screen on a fullnut. i'm not sure if it will automatically got back in straight. if that sounds excessive then you could wait till the 22nd century and have the dust transported out.

### Re: How do I clean a 41CX display?

Message #3 Posted by [PeterP](#) on 28 July 2007, 1:26 a.m.,  
in response to message #1 by Egan Ford

Egan, I once read a thread where someone sugested to use an airblower on the side of the glass panel, I think just from the top.

I used that technique once with success, it blows the dust 'away', meaning out of sight. The thread also mentioned to be very careful to not have the air-can upside down as then liquid can seep under the display and that wont go away so quickly.

Maybe I can find the thread or info again and then I will repost it, but I know I have cleared a couple of full-nut(!) displays from dust (afair, this does not work for halve-nuts)

Cheers

Peter

### 35s initial thoughts

Message #1 Posted by [Egan Ford](#) on 26 July 2007, 8:16 p.m.

My 35s (S/N 1904) arrived from Walmart on July 21st. I just got home from a road trip. Today is the first day I got a chance to use it.

Thoughts:

1. The internal case nylon webbing used to hold whatever feels like sandpaper if you run your fingers over it. I am curious if this may rub off key paint. I am interested in other cases. My favorite is the 50g case, a mini version of that would be great. I find the 48,41,71 zipper cases catch on the keys often when being unholstered. However the 35s zipper case does not have this problem.
2. My screen is square, unlike a few others. However the annunciators at the top are too close to the edge, the wrong lighting casts a shadow that make them a bit hard to read.
3. I have missed 3 keystrokes. At least one other has reported this. Unsure if there is a physical problem or if I just need to learn how to use it. I have not had this problem with any other HP (12C,15C,16C,41CX,42S,48GX,50g,71B). Only happened within the first 30 seconds of use, perhaps my brain figured it out.
4. I have not finished the documentation, but I was surprised that the first page didn't start out with "Congratulations, ..." or "You have in your hand...". Nothing about the significance of the original 35 and the last 35 years. The manual just starts out with "Getting started". I like how the 12C manual starts, "Although the excitement of acquiring this powerful financial tool may prompt you to set this handbook aside and immediately begin 'pressing buttons,'..." How many of you did that? Where's the hype?
5. The orange letters are a bit difficult to read. And I have good eyes. The shade of orange used by the 50g is much better. White would have been good too.
6. Feels solid, almost as solid as my 15C. Little to no flex when twisted.
7. Value. Excellent. I got my 15C in 1984 for \$135. In 1984 this 35s would have been \$25. I would have taken it over the 15C for the savings.

---

These times have certainly gone. From a point of view of an ordinary person (not a HP addict) who nowadays needs a calculator, what should be so exciting and outstanding in buying one? Finally, 35s is nothing more than a calculator. In most cases calculators do not mean anything at all to the generation who is now e.g. 14 to 24 years old. They are much more interested in mobile phones, but this is another story.

We have to face these facts. Maybe, the manual of my dishwasher starts with "Congratulations!", but who knows. Nobody of us at my home have ever read the manual, just started to press buttons...

I wonder if the keys are being pressed too quickly, one after the other.

If you look closely at the display, you'll see the BUSY indicator (it's a B) come on each time you press a key, whether digit or ENTER or ...

Perhaps if the calculator is busy when you press the next keystroke, it isn't registering?

I have no idea what type of input buffer (if any) the machine has.

### **Re: 35s initial thoughts --> Lost keystrokes**

*Message #9 Posted by [Katie Wasserman](#) on 27 July 2007, 12:19 p.m.,  
in response to message #8 by Gene Wright*

I thought that might be the problem too, keying too fast. But there does seem to be a keystroke buffer and it is 5 characters in length. Try doing a long computation time function like: 300 ENTER 150 nCr. While the calculator is busy type 1 2 3 4 5 6 ... at a slow/normal entry speed and when the function ends you'll get 1 2 3 4 5. Now do the same thing but type in 1 2 3 4 5 6 .... really fast and you see that the calculator misses some of the digits and might show that you entered 1248 for example.

Admittedly this is not a normal thing to do, but I think demonstrates the missing keystroke problem. My guess is that the keyboard scanning routine isn't running fast enough to capture everything and the keystroke buffer isn't going to help this problem.

Try the same thing on a 32SII, and you'll find the keystroke buffer is just 3 characters in length, but the keyboard scanning routine never misses any keys.

-Katie

### 35s high-glare display

Message #1 Posted by [Alex](#) on 26 July 2007, 5:44 p.m.

I received my 35s yesterday and was enormously excited! However, when I took it to class and set it down on my desk, all I saw in the display was a perfect reflection of the overhead lighting. The display surface is amazingly reflective, and no matter where I moved my calculator all I saw was glare. The calculator was, in effect, rendered unusable, and I ended up having to shove it back into my pack and pull out my trusty 20s for my exam.

I've never noticed light reflecting off a calculator display before, so when I got home I checked all my other calcs. They all have matte finishes on their displays, and all of them diffuse reflected light quite nicely.

It's an inconvenience, not a deal-breaker... but I don't like inconveniences. This will only be a problem, obviously, when there is a light source at the proper angle. But I'll bet that light source will always seem to be in \*just\* the right place, and I'll have to position the calculator to some spot where it just doesn't feel natural.

On the positive side, if I get lost in the wilderness, it'll make a great signaling device!

Anyone else have any thoughts on this?

Thanks!

Alex H.

in response to message #1 by Alex

The 33s has the same display, and I agree it's annoying.

It's not unique, though: One of my 42S calculators, the earlier one, also has a glossy, reflective display. The later 42S model has a much nicer matte display.

If I wasn't sure I'd destroy it, I might take some very fine grit sandpaper to the 35S display to see what happens. But I predict I'd end up with an unevenly frosted, unreadable display. :)

in response to message #2 by Seth Morabito

There are protective foils for PDAs -- maybe this helps. At least it's better than sandpaper ;-) )

Egan posted in a different thread,

Quote:

However the annunciators at the top are too close to the edge, the wrong lighting casts a shadow that make them a bit hard to read.

Now, I don't expect that HP had scoured the MoHPC Forum for feedback and chatter about the HP-33s, but [I had mentioned these very problems three years ago](#), which have unfortunately been carried over without

remedy. An excerpt:

### Display:

- Tiny, virtually-indistinguishable decimal point and comma. Inexcusable!
- Shadowing when viewed at a sharp angle.
- Glary, reflective screen. (The 1990 Pioneer upgrades addressed that one.)
- Tiny, hard-to-read annunciators on the upper part of the display, in the shadows
- The display instantly changes to name of function when a key is pressed, instead of after a time delay when the key is held down, as on the 32S, 32SII, and 42S. It is disconcerting to watch the display flash each time an operation is performed.

(In fairness, most of the problems I described have been addressed, either with the revised HP-33s or the new HP-35s.)

Nonetheless, I plan to purchase an HP-35s soon, in a retail store if reasonably convenient. I also plan to attend the late-September HHC conference in San Diego, where I can point out a few things.

The HP-35s looks like a big leap in the right direction, but there's still room for improvement...

### Re: 35s function preview

*Message #10 Posted by [Gene Wright](#) on 29 July 2007, 8:07 a.m.,*

*in response to message #9 by Karl Schneider*

I don't believe the NULL will ever come back. I don't exactly understand the technical reasons why, but I don't believe we will ever see it.

Under those circumstances, it seemed a bit silly to have the function preview AT ALL so it was removed.

### **A way to get NULL on the HP-32S/II & HP-33S**

*Message #11 Posted by **Karl Schneider** on 30 July 2007, 9:32 p.m.,*

*in response to message #10 by Gene Wright*

If you want to preview a function on the HP-32S, HP-32SII, or HP-33s, then back out of executing it if desired, hold down the function key while pressing and releasing clear ("C"). The function will abort, but the stack x-register might be cleared as well. If so, it can be recovered with "LASTx".

Interestingly, only the scientific Pioneer-series models offered function preview -- not the algebraic models. The preview is also useful because some functions are abbreviated in the menus with ambiguous names: e.g.,

- "R" for "RANDOM" (random number generator)
- "r" for correlation coefficient
- "RD" for "RAD" (not "RND")
- "SD" for "SEED" (not standard deviation);
- "RND" on the keyboard is for rounding (not random number generator)

**Disappointed**

Message #1 Posted by [Vincze](#) on 26 July 2007, 2:39 p.m.

Jó napot everyone...

I received my HP-35s today, and I hate to admit this, but I am disappointed.

Yes, this a much better calculator than HP has made in some time, but it doesn't feel the same. I thought it would feel more solid, have a little more weight to it, would be made in the USA, and where is the S/n on it? All in all, it is very nice, considering what they have been producing, but HP can do much better than this. I hate to say this, but it feels cheap.

I don't know, just my thoughts.

Vincze

**Re: Disappointed**

Message #2 Posted by [bill platt](#) on 26 July 2007, 3:43 p.m.,  
in response to message #1 by Vincze

Well, it \*is\* cheap! :-)

**Re: Disappointed**

Message #3 Posted by [Vincze](#) on 26 July 2007, 3:51 p.m.,  
in response to message #2 by bill platt

I know, I should not be so critical.

One funny trick I have already found out is if (with the unit off) press yellow shift and OFF, it will turn calculator ON. If you then press blue shift and ON, it will turn calculator off. And lastly, if you just press C (clear button), it will turn it on, if it was off. I can see batteries advancing dead real fast.

**Re: Disappointed**

Message #4 Posted by [Dave Johnson](#) on 26 July 2007, 6:45 p.m.,  
in response to message #3 by Vincze

Please let me know what other calculator does not have an ON button? It has been a universal design (TI, HP, Sharp and Casio employ them) since slide switches went out...

**Re: Disappointed**

Message #5 Posted by [Namir](#) on 26 July 2007, 6:59 p.m.,  
in response to message #3 by Vincze

Pressing Left-Shift and then C turns the machine on and off. You get the same effect with the right-shift and the C buttons!!!

How interesting!

Namir

### **Re: Disappointed**

*Message #6 Posted by **Fred Lusk** on 26 July 2007, 8:09 p.m.,  
in response to message #3 by Vincze*

With the machine off, [left shift] doesn't do anything. Pressing [left shift]+[OFF} is really just [ON].

I did notice that either shift key followed by [OFF/C/ON] turns the machine off. I didn't see that in the manual.

Fred

### **Re: Disappointed**

*Message #7 Posted by **bill platt** on 27 July 2007, 8:08 a.m.,  
in response to message #3 by Vincze*

A little history is in order here.

It is the labelling that is confusing you; the functionality is perfectly legitimate.

The 32sii has exactly the same functionality of the lower left hand corner key (the on/c key).

1. If the machine is off, the On/C turns the unit on.
2. If the machine is on, pressing either shift key, followed by the On/C, turns the unit off.
3. With the unit off, pressing any key before the On/C has no effect.
4. With the unit on, On/C functions as either Cancel (or exit with save) or Clear depending on context.

Even on the 32sii, the yellowshift-On to turn off was undocumented. It was just one of those enjoyable little insider features:-)

Thank you for clarification Bill. I guess it strange to me that On may also mean off. I always thought On is On and Off mean Off, but now I have to think a little different which OK.

Also, please excuse my poor english. I from Hungary, and come to America a few years back and still trying learn english better.

### **Re: Disappointed**

*Message #9 Posted by **bill platt** on 27 July 2007, 9:27 a.m.,*

*in response to message #8 by Vincze*

Note that all the Voyagers (10c,11c,12c,15c,16c) have an "On" button but no "off" printed anywhere. The most common thing I hear from people whom I have allowed to use my 11c, 15c, 12c etc is, "where's the off button" and "how do I clear it".

Then after fumbling for a while they finally say, "it doesn't work right." (which is the RPN aspect).

### **Re: Disappointed**

*Message #10 Posted by **Vincze** on 27 July 2007, 9:47 a.m.,  
in response to message #9 by bill platt*

Ha.. I remember when I first come to USA, and I had never owned calculator before. I had used one before, so I had some understanding on how you use. I found a 16C at garage sale and bought for \$10. It not have book and not have battery, so I didn't know if it worked or not. I found battery for it and I remember how mad I was when I entered simple math problem and answer was not what I had expected. Luckily for me, a friend of mine was familiar with RPN and he show me how to use. I remember thinking that americans do math funny, and  $2+2$  does not = 4 in america. Im glad i was just misunderstanding how to use the calculator. Now I have 16C, 45, and now 35s. 45 is my favorite as 16c seem slow, and 35s I still get used to.

Vincze...

No need to apologize for your english skills. It's a tough language and you have made yourself very understandable.

I was born in the USA nearly 49 years ago and I'm still trying to improve my english skills. Perhaps it's a curse being an engineer.

Fred

### **Re: Disappointed**

*Message #12 Posted by **Eric Smith** on 26 July 2007, 8:26 p.m.,  
in response to message #1 by Vincze*

Quote:

\_\_\_\_\_

have a little more weight

\_\_\_\_\_

More weight would just be more expense, and wouldn't necessarily make it any "better". Some people like their calculators to be light. The important thing is whether it is rugged. The 35s seems OK in that regard; I'm not sure how it will compare in drop tests to a 1980s-vintage 41C, 12C, or the like.

Quote:

---

would be made in the USA

---

Expecting it to be made in USA is absurd. Very little consumer electronics is made in USA now. Making it in the USA would make it more expensive but not necessarily better in any measurable way. Where it is made doesn't matter to me in the least; I only care about the build quality. The 35s build quality seems to be fine, at least for the two I've purchased.

Quote:

---

and where is the S/n on it

---

A sticker on the back. Does yours not have one?

It's not obvious to me why you would care whether it has a S/N label. The S/N is generally only useful to the manufacturer for tracking units for warranty and repair purposes, and calculators haven't actually been repaired for almost two decades now.

If you want something that uniquely identifies your 35s in case it is misplaced or stolen, engrave your name and contact information on the back. That's far more useful to you than the serial number.

Quote:

---

I hate to say this, but it feels cheap.

---

I disagree. It feels fine. Better than I expected, actually. If Corvallis Division had introduced this in the 1990s, I wouldn't have thought there was anything seriously wrong with it. That's not to say that I have no criticism of it, but I didn't think Corvallis Division products were perfect either. There's always some room for improvement.

The 35s does have a different feel than the Pioneer series, but then the Pioneers had a different feel from the Voyagers, which had a different feel from the Spice series.

### **Re: Disappointed-not me**

*Message #13 Posted by **Ralph** on 27 July 2007, 12:55 a.m.,  
in response to message #12 by Eric Smith*

I like mine just fine. Like my old 33E in the keyboard department rather than my 41C in look and feel. Decimal point is better in the visibility department over the 33S and the readability of the key functions is fantastic over the 33S!

My only gripe is the sigma key should switch places with the R/S key in my opinion. But they don't have me on the payroll. ;)

Nothing a deal breaker.

The light weight means it's less apt to fall out of my shirt pocket if I bend over.

### **Re: Disappointed**

*Message #14 Posted by **pynnonen** on 27 July 2007, 1:12 a.m.,  
in response to message #1 by Vincze*

I am not disappointed at all. The HP-35s is a great calculator. It has the timeless classic HP look. It light, yet solid. It is a true shirt pocket calculator. The keys feel perfect and have worked perfectly for me. It has limitations, but for \$60 its a great calculator.

I am looking forward to a similarly designed upgrade to the HP-50g. I would like to see it USB rechargable, USB 2.0 High Speed support, color display for graphics, SDHC (SD card High Capacity) support, sound support, keyboard overlay support, JTAG debugging support for its ARM9 CPU, real-time clock, and other features. I would like to be able to use it for lab equipment control, vehicle communications (using the USB as an interface to a vehicle communication device). I would like to be able to use it for a basis of an embedded system.

But back to the topic, the HP-35s is a great calculator for the money and definitely not a disappointment, but a delight.

### HP 35s display misaligned

Message #1 Posted by [Dave](#) on 26 July 2007, 11:35 a.m.

I now have 2 35s and both have a crooked display. One is tilted slightly up from the left and the other slightly down. I thought I could ignore it, but my eyes are immediately drawn to it. Is there an easy way to correct this?

### Re: HP 35s display misaligned

Message #2 Posted by [bill platt](#) on 26 July 2007, 11:40 a.m.,  
in response to message #1 by Dave

return it?

Or hold onto it as a collector's item?

### Re: HP 35s display misaligned

Message #3 Posted by [Thomas Radtke](#) on 26 July 2007, 12:02 p.m.,  
in response to message #1 by Dave

How frequent ist this problem? If it's not another lie, my 35s has been shipped on the 24th and will arrive probably in four weeks (after having paid at the 15th). I'd hate to return it and wait another month for a replacement :-).

### Re: HP 35s display misaligned

Message #4 Posted by [ChristianB.](#) on 26 July 2007, 3:09 p.m.,  
in response to message #3 by Thomas Radtke

Thomas,

if I am right you live in Germany. You just have to wait and see. If you have a display misalignment you could send the calc to the authorized dealer in Germany "Bandermann GmbH" for a replacement instead of back in the states.

I did this with my HP49G+, which was bought from "dynatech.de", about six times. The woman from Bandermann I talked to, was very convenient.

Good luck

Christian B.

P.S.: This is the first dealer who has the 35s in Germany.

<http://www.nomatica.de/p.aspx?i=151668>

Seems a bit overprized with 88,- EUR, doesnt it?

---

**Re: HP 35s display misaligned**

*Message #5 Posted by [Thomas Radtke](#) on 26 July 2007, 4:41 p.m.,  
in response to message #4 by [ChristianB](#).*

Thank you for your hint, Christian! Fortunately, Chris Haltiner pointed out how to overcome this problem.

Indeed, 88 EUR seem to be much, too much for me actually. I have fond memories at the pre-Euro times where one could get HP calculators quite cheap elsewhere in Europe (Bought my 20S in France, the 32SII in the Netherlands). This is history now.

---

**Re: HP 35s display misaligned**

*Message #6 Posted by [Mike H](#) on 26 July 2007, 12:02 p.m.,  
in response to message #1 by [Dave](#)*

When you do a self test (hold down the ON button and XEQ) and press any button twice, you should see all of the superscript annunciators at the top of the display. Are they parallel with the top bezel or do they in fact tilt up or down?

Mike

Press ON and GTO to exit self test.

---

**Re: HP 35s display misaligned**

*Message #7 Posted by [Dave](#) on 26 July 2007, 12:54 p.m.,  
in response to message #6 by [Mike H](#)*

The tilt is quite noticeable in the self test, almost a pixel lower (or higher) on one end. After the second one arrived misaligned, I figured they were all that way, and a replacement wouldn't be any better. Unless I can fix it myself, I'll just live with it.

*Edited: 26 July 2007, 1:22 p.m.*

---

**Re: HP 35s display misaligned**

*Message #8 Posted by [Mike H](#) on 26 July 2007, 1:35 p.m.,  
in response to message #7 by [Dave](#)*

My display is correct S# 72103849. I would hope it is an isolated event.

Call HP and let them know. When I called HP about my 1st 33s, (small decimal point, bugs, etc.) they told me they would send me a new one, and I could keep the old one. They did. I gave the old one to a friend with a worn out 32S and better eyes.`

Mike

**Re: HP 35s display misaligned**

*Message #9 Posted by [Josh](#) on 26 July 2007, 12:44 p.m.,  
in response to message #6 by [Mike H](#)*

The display on my 35s is not crooked, but it does appear to be positioned slightly too close to the top of the window. The annunciators, etc. are all visible at the top, but are just a tiny bit underneath the edge of the window if viewed from a 90 degree angle.

### Re: HP 35s display misaligned

Message #10 Posted by [Kevin Kitts](#) on 26 July 2007, 2:02 p.m.,  
in response to message #1 by Dave

I have a 35s (bought directly from HP) with Serial Number CNA 72104204. I can detect a very slight tilt which goes up as you look at the display from left to right.

However, I'm not sure I would have ever noticed this if I had not run the self-test noted in this thread (so that all enunciators across the top are on at the same time). Also, everything is visible. I'm a bit of a perfectionist - and things like this tend to bother me - but this tilt is so small I don't think it would be worth the trouble to return. I don't think it will really bother me. Perhaps different units are affected a different amount - or more likely different people are more troubled by these kinds of things than others.

Just to show the kind of nut that I am - I noted that the serial number taped to the back slopes up going from left to right when I first got the 35s - and kind of wanted to pull it off and properly position it in the middle of the area it was intended to go in. It's a sickness... ;-)

### Re: HP 35s display misaligned

Message #12 Posted by [Chris Haltiner](#) on 26 July 2007, 2:25 p.m.,  
in response to message #1 by Dave

The display on my HP 35s exhibits the slight upward slant from left to right. The misalignment was apparent without using the self test. I opened the unit and shifted the position of the LCD glass which is glued to a metal backing. The glue is flexible, but also has some memory. After reassembling the unit, the display is basically level now.

One minor note about disassembling: the soldering holding the power wires to the system board appears to be of suspect quality, so any stress placed on the case front and backing while separating could break the connection. (Yes, I had to resolder one wire.)

Also, sorry, no pictures as I did this at the office.

### Re: HP 35s display misaligned

Message #13 Posted by [Dave](#) on 27 July 2007, 10:29 a.m.,  
in response to message #12 by Chris Haltiner

Thanks for the tip. I fixed mine just like you fixed yours (minus the soldering). As you saw, the problem is that the LCD is not placed squarely onto the metal backing. Holding the metal backing and twisting the glass into place does the trick, although you have to move it quite a bit to overcome the glue memory. It is a bit dangerous, since a little slip using such force could damage the glass or the ribbon cable. Perhaps HP will see this post and start doing QC checks on this part ;-). Thanks to all for your replies.

### **Re: HP 35s display misaligned**

*Message #14 Posted by [Les Wright](#) on 26 July 2007, 2:53 p.m.,  
in response to message #1 by Dave*

I have four Classic series calculators and in each one the middle LED package is slightly out of alignment with the first.

This means that in the LED display there is a discernable "step" between a couple of the digits. Subtle, but I have noticed it. Drove me nuts until Randy Sloyer reminded me that these gizmos were assembled at a bench by real human hands and such variances merely add to their charm. Besides, those LED packages are soldered in there pretty immovably, so there is no way to easily fix any perceived misalignment.

Maybe the variances in the 35s display will be know as charming one day?

Les

### **Re: HP 35s display misaligned**

*Message #15 Posted by [brianh](#) on 27 July 2007, 9:40 p.m.,  
in response to message #1 by Dave*

I am on my second 35S. The first arrived Tuesday and with great anticipation I opened the package (no small feat), installed the batteries, turned it on and... the LCD display misalignment was immediately noticeable and annoying. The last annunciator just about disappeared underneath the bezel, it was so badly aligned. How something so obviously defective could slip through QC is beyond me. I immediately called HP and to their great credit they overnighted a new one to me at no charge and told me to keep the defective one (which is not really defective, just misaligned).

Many have experienced the crooked LCD display issue and the annunciator row being too close to the top of the bezel. Hopefully these are all first generation issues that will be worked out as the manufacturer tweaks the production process. I'll most likely pick up another one in a year when the manufacturing process has matured and hopefully the display issues have been cleaned up.

### HP Pioneers Time Travelling!!!

Message #1 Posted by [Namir](#) on 26 July 2007, 10:23 a.m.

I was watching a program in the Science Channel the other day about time travel. I heard a comment from a prominent physicist that the law of physics that include time as a variable never state that time must move forward. We just take it for granted based on experience.

Well HP has **Invented** (true to their motto) time traveling and I have the proof. If you look at certain HP-32s calculators being sold on eBay you see that they have the 50th Anniversary. The new HP-35s (which came a few years after the HP-32s) celebrates 35 years!!! Oh my!! What happened? Something has set the time clock backward!!

I contacted my friend and confidant Carlos Mencia (who has a PHD in physics from New Mexico State University) and asked him what he thought. He said "Dee dee dee!! It's time travel hombre!! HP has done it!". Now I am a believer!

Namir

DISCLAIMER! DON'T BELIEVE A SINGLE WORD IN THIS POST!!!

in response to message #1 by Namir

Namir, I believe the 32Sii calcs are genuine, they celebrate HP's 50th anniversary, not 50 years of HP calculators. You might want to snap one up (if you are a collector).

### Re: HP Pioneers Time Travelling!!!

Message #3 Posted by [Namir](#) on 26 July 2007, 3:12 p.m.,  
in response to message #2 by Ren

Ren,

I was aware of the difference between what each anniversary meant. I was in a silly mood and I thought it was funny when one looks at an older machine celebrating 50 years and the new one celebrating 35 years (and deliberately ignoring the actual occasion being celebrated) .

Namir

in response to message #3 by Namir*

Namir, My humor is often missed by others too!

A few years back I had a cow-orker that owned a 50 Anniversary calculator. He wouldn't let me touch it, much less, buy it from him.

### HP41 CX Speaker Cable connectin to board

Message #1 Posted by [raudzus](#) on 26 July 2007, 6:30 a.m.

Hello,

I have a HP41 CX build in 1987. The speaker inside is fixed inside on the backside. When I opened the HP41 the two cables of the speakers are broken. Can you tell where I must connect the speaker cables on the board. Many thanks. Greetings Dieter

### Re: HP41 CX Speaker Cable connectin to board

Message #2 Posted by [Diego Diaz](#) on 26 July 2007, 10:08 a.m.,  
in response to message #1 by [raudzus](#)

Hi,

Please take a look at:

[http://www.clonix41.org/Maintenance/hp-41\\_PCBs.htm](http://www.clonix41.org/Maintenance/hp-41_PCBs.htm)

You'll find Halfnut board on the left-bottom of this page, there is a "big" brown capacitor (center bottom of the board) and a couple of pads to the right of said capacitor (between the cap and the [hp] logo on the board)

One of these pads is square (the rightmost) solder the black wire there, and the red wire to the round pad.

Hope this helps.

Diego.

**35s arrives safe and sound**

Message #1 Posted by [Fred Lusk](#) on 26 July 2007, 12:00 a.m.

My new 35s arrived today (please note that the "s" is lower case on the calc and documentation). It came this afternoon while I was at work. Had it shipped on time I would have gotten it last week, but once it did ship it matched the schedule promised on the tracking website. When I told my 22-yr-old daughter what I had bought, she just rolled her eyes. Hey, this is only my 11th HP. I don't have it nearly as bad as some of you other MoHPC'ers.

For those keeping track, the serial number on my machine is 72103808.

My first impressions:

-- That's the strongest, thickest plastic packaging I have encountered in quite a while. It put up a fight, but in the end I prevailed.

-- That's an awfully big door for button batteries. However, it is much easier to open and close and change batteries than on my 42S, 32Sii, and 10B.

-- The machine has a very nice feel. I think the quality of the case is up there with HP's best. The feel of the keys I would rate 9 out of 10. Not quite the near-perfect tactile feedback of the 41, but much quieter. I'm very happy that HP went back to the sloped front face like on the 41.

-- I like the placement of the rubber feet. On the 41, the top feet were too far south and pressing the ON/USER/PRGM/ALPHA keys too hard would pitch the machine forward.

-- This is one of the best looking machines HP has produced. The colors work really well, even with my aging eyes. It looks more powerful than my 42S, even though we all know it isn't.

-- I would have preferred to give up a digit to have a more easily seen decimal place like on the 42S.

-- I would have preferred in<>mm instead of in<>cm. The rest of the conversions are useful to me. I live in a metric-challenged country (USA), but I have done the site civil engineering for three federal prisons, and the Feds use metric.

-- I would have swapped R/S and Sigma+, but I understand how the keys are functionally grouped.

-- The case is OK. Not the best, but certainly not the worst. However, I don't have a use for the foam. Maybe I'll sell it :-)

-- I have only glanced at the manual, but it looks OK for a modern manual.

Now to play with my new machine.

Fred

*Message #2 Posted by [Fred Lusk](#) on 26 July 2007, 8:15 p.m.,  
in response to message #1 by Fred Lusk*

A couple of other points that came out of playing with this last night:

-- The display is too reflective, but the contrast is excellent. I think I may add a PDA screen protector as someone else mentioned in another thread.

-- The theta symbol look way too much like an 8. Good thing complex numbers don't turn up in storm drainage design.

-- I wish there was a feet<>meters conversion instead of mile<>km.

-- I would have placed X<> above x<>Y and moved VIEW and INPUT to the left.

Fred

*Message #3 Posted by [Les Wright](#) on 26 July 2007, 9:00 p.m.,  
in response to message #1 by Fred Lusk*

Got it today, and so far I love it.

It has a lot of the familiarity of the 33S, which I must admit I grudgingly loved despite its limitations.

But it looks gorgeous, and the keys feel very nice indeed.

I don't mind having to use the arrow keys to see the full result in ALL mode, since I really like all of the 12 digit mantissa there without using SHOW.

I almost didn't get it (see other thread) because I gave Samson the wrong address--off by one digit! Glad I caught it.

I am going to port over one of my fave 33S programs tonight and let all know what I think then.

Les

### HP 48GX Freezes with Cancel/On button

Message #1 Posted by [Brad Connelly](#) on 25 July 2007, 5:14 p.m.

Hello all "listeners",

I have a beloved HP 48GX that's 10 years old, and it recently started locking up on me. It turns on with a zero and a cursor, and when I hit "cancel", it freezes. I can hit "enter" and it displays a regular stack, and I can perform operations and access menus, but the calculator is very slow. But ultimately it locks up and I have to perform a hard reset or removed a battery to get it going again. It's basically inoperable, and I've ordered an HP 35S (already have a 33S which stinks), because I've pretty much written my 48GX off as dead.

Anyone had this happen and been able to revive theirs?

Brad

Message #2 Posted by [Randy](#) on 26 July 2007, 10:22 a.m.,  
in response to message #1 by Brad Connelly

The zero key is failing, that's why it appears when the unit powers up. While you might be able to get a few more miles out of it with several cycles through an ultrasonic cleaner (the only way to clean the key internals), but ultimately it is a lost cause as the key will short completely at some point and then it will no longer turn on.

### Re: HP 48GX Freezes with Cancel/On button

### **Duracell DC2400B4N Rechargeable Batteries, NiMH, AAA Size for Hp 50g?**

Message #1 Posted by [PhysicsNerd](#) on 25 July 2007, 3:14 p.m.

Will Duracell DC2400B4N Rechargeable Batteries, NiMH, AAA Size work well for my HP 50g?

Also, I've come across this thread: [http://groups-beta.google.com/group/comp.sys.hp48/browse\\_frm/thread/96e4695744e66f37/920cf0b84ab84d3c?lnk=gst&q=Re%3A+4+batteries+vs.+3+batteries&rnum=1#920cf0b84ab84d3c](http://groups-beta.google.com/group/comp.sys.hp48/browse_frm/thread/96e4695744e66f37/920cf0b84ab84d3c?lnk=gst&q=Re%3A+4+batteries+vs.+3+batteries&rnum=1#920cf0b84ab84d3c)

Someone on there said that replacing batteries when the low battery indicator comes on will cause the calculator to have a shorter battery life span. Is this true? If so, should I just change it when the batteries are dead? Will there be any negative affects on doing this (memory wiped out)?

### **Re: Duracell DC2400B4N Rechargeable Batteries, NiMH, AAA Size for Hp 50g?**

Message #2 Posted by [Les Wright](#) on 25 July 2007, 7:54 p.m.,  
in response to message #1 by [PhysicsNerd](#)

Hi 'Nerd--

I use 1000mAh Duracells in my 49G+ and love it. I monitor the level (roughly) with Cordoba's BatStatus. I have a quick charger and give them a rejuice when LowBat warning appears. Indeed, with NiMH's the window between LowBat and "dead" is brief.

The coin battery should preserve your memory for awhile, but better yet, maybe you should plug the 50G into the USB power option to preserve memory while you rejuice the batteries. Better yet, do regular backups of your HOME directory and flags to an SD card using the commands intended for the purpose (RCLF, STOF, ARCHIVE). I have a little applet that does that and thus back up obsessively.

Maybe NiMH battery life is diminished between rechargings, but I don't care. Anything is better than gobbling up all those alkalines. The 49G+ actually gets used now!

Finally, and I know you have been concerned about this before, a fully juiced set of NiMH's is more than enough to get you through an exam.

hth,

Les

Message #3 Posted by [PhysicsNerd](#) on 26 July 2007, 12:12 a.m.,  
in response to message #2 by [Les Wright](#)

I do not know why, but after I've replaced the old batteries with the new rechargeable ones, the low battery sign is still on? Is this some kind of error or do I have to replace the coin battery?

Btw, the batteries I've put in place of the old ones are brand new rechargeables.

Does anyone know if BatStatus will give interpretable readings on the 50G? If so, it could help you (look for it at [hpcalc.org](http://hpcalc.org)--it is a very tiny program and easy to run).

I don't want to insult your intelligence, but did you give the NiMHs a full charge before you put them in? If so, you may wish to drain them down and charge again--I understand it may take a few charge/discharge cycles to maximize capacity.

Les

Yes, but for some information on improving the constants for use on a 50g, and having the program check which model it's running on, see this [comp.sys.hp48](#) thread.

Maybe also check out other threads found by <http://groups.google.com/groups/search?>

[q=BatStatus+group:comp.sys.hp48.](#)

If you're going to always use rechargeables instead of alkalines, then it may be useful to add another tweak so that a fully-charged battery shows 100%.

I should note that the "percentage remaining" seems to assume that the voltage to energy stored ratio is linear over the operating range, which isn't quite true.

GaaK is supposed to have a 49g+/50g BatStatus library available on his web site, but at the moment, it seems that his bandwidth limit has been reached; maybe wait for it to show up on hpcalc.org.

Have you actually charged the "new" rechargeable batteries?

Rechargeable batteries do not come with much residual charge (they loose it through self discharge in a few months), unless you get the new technology Eneloop brand.

Dave.

Okay, I've charged the batteries and put them back in and now the low battery sign is gone. However, my text has reverted to default. Is this a memory erase? I've had this happen to me 2 times already when changing batteries. Why does this happen and how can I prevent it from doing so? Thanks again in advance.

### **Re: Duracell DC2400B4N Rechargeable Batteries, NiMH, AAA Size for Hp 50g?**

*Message #9 Posted by [Les Wright](#) on 26 July 2007, 4:17 a.m.,

On my 49G+ at any rate, putting batteries in after they are out seems to activate a soft reset, as though you hit ON+C

If I change my stack font to the 6 pt system font, then take out the batteries then put them back in, the stack font is restored to default 8 pt font.

This happens too when I do ON+C.

My variables are NOT deleted. This is not memory erasure.

I don't know how to prevent this resetting of the stack font size. I don't think display font is controlled by flag settings you can save then restore. Maybe someone else knows?

For me, this seems to happen only if I remove the battery while the calculator is turned on, or I press the ON key while the battery is removed. I'm not certain, but it might also occur if

the battery is left out for more than a couple of minutes.

Quote:

---

Quite so; it's what's usually known as a "warmstart", sometimes called a "system halt". Of course, if left without power (including from the CR2032 cell) indefinitely, then it will eventually lose the RAM contents, so a TTRM (Try To Recover Memory?) would occur when power is restored.

Quote:

---

I don't know how to prevent this resetting of the stack font size. I don't think display font is controlled by flag settings you can save then restore. Maybe someone else knows?

---

Flag -72 controls whether the current font or the mini font is used for the stack. Of course you can use the \->FONT command to set the "current font" to any built-in or user-defined font.

If you store a program in the reserved variable STARTUP, then it will be run at the end of every warmstart, and it can be useful for restoring your preferred modes and attaching/detaching libraries.

To prevent STARTUP and any library configuration routines from being run, hold down the backspace key while warmstarting.

### Will we see a vibrant exchange of 35s programs?

Message #1 Posted by [Les Wright](#) on 25 July 2007, 2:17 p.m.

I have noticed in the MoHPC software library we find precious few 33S contributions. This is not surprising--with the "hard cap" on storage registers and labels, it makes it hard to write really powerful programs of much complexity, even though one would think the speed of the 33S would encourage programming. I have one routine that computes the incomplete gamma function on the 33S in about a second or less. The same routine on the 42S is somewhat slower, the 41CV version is slower yet, and the 11C/15C version can take the better part of a minute for typical arguments.

I hope that the 35S will open up new vistas for RPN programming, with its 800+ registers and XEQ and GTO by line address and not just alpha labels. The programming environment isn't nearly as comprehensive and flexible as that of the 41 series or 42S, but the calculator is still a lot faster than its forebears (even if it is slower at times than the maligned 33S), and this I think should inspire a flurry of interest in porting routines from 41 series, 42S, 65, 67/97, the Spice series, etc., as well as creation of new ones.

The one drawback is the lack of I/O, and I can see that most will not want to key in a 500 step program. That said, there is a lot one can do in smaller programs--Gerson's recent cosine and tangent routine is an example of a tight fast program that is well suited to the 33S (and 35S too).

When I get my 35S, I will start the ball rolling. I have already pledged to Dave Hicks that I will contribute programs to compute the incomplete beta and gamma functions and well known special cases of these (like the error function, cumulative normal distribution, t distribution, F distribution, and chisquare distribution). I do have 33S versions of these but they gobble up almost all of the labels. I have in essence ported the routines from Numerical Recipes, and my work is therefore a little different from those offered by JM Baillard in the HP41 Software Library, though I give JM considerable credit for inspiring me to program the special functions in RPN, UserRPL, and SysRPL.

Is anyone else working on something with their 35S that they would like to share, either here, in an article, or in the Software Library?

Les

Hi, Les --

Quote:

\_\_\_\_\_

I have noticed in the MoHPC software library we find precious few 33S contributions...

I hope that the 35S will open up new vistas for RPN programming,

\_\_\_\_\_

Well, I certainly plan to port my "Two-bus AC Power Transfer" program to the HP-35s, after I get one. I have

posted four versions of the program to date, each one tailored respectively to the HP-32S, HP-32SII, and HP-33s (RPN mode and ALG mode):

<http://www.hpmuseum.org/software/software.htm>

Porting the program will be an interesting exercise, because the HP-35s handles complex numbers in a manner different from that of the three predecessor models.

### Stack preservation in the HP35S

Message #1 Posted by [Valentin Albillo](#) on 25 July 2007, 1:05 p.m.

Hi all:

In a different thread (Gerson W. Barbosa's "alternative cos(x) and tan(x) [HP-33S]"), Les Wright posted:

*"[...] Unfortunately the routines don't keep the entire stack in its original state, but this is a nice touch. One problem about RPN programs is they make a mess of the stack sometimes, unlike the internal routines."*

The HP35S' ability to mix RPN and algebraic equations in a single program in RPN mode can be used to perform what you want, i.e., program a complicated function that behaves as built-in ones, i.e., the argument is taken from ST X, ST X is replaced by the function's value, and the original argument is stored in LAST X.

For instance, suppose that you want to program a two-term version of Stirling's approximation to the factorial function X!, namely:

$$f(X) = (X/e)^X * \text{Sqrt}(2 * \text{Pi} * X) * (1 + 1/(12 * X) + 1/(288 * X^2))$$

and you want it to behave as a built-in function as far as stack behaviour is concerned. You can achieve that in the HP35S without using any auxiliary registers or variables with this simple trick, key in this little proof-of-concept program in your HP35S:

```
A001 LBL A
      ABS
      Roll Down
      (LASTx/e)^LASTx*SQRT(2*Pi*LASTx)*(1+INV(12*LASTx)+INV(288*LASTx^2))
A005 RTN
```

where I've used "/" to denote the division key and "\*" to denote the multiplication key, as well as "Pi" to denote the Pi key.

To run it, just key in you argument in ST X, and XEQ A [ENTER]: the result will be returned to ST X, the previous contents of ST X will be stored in LASTx, and the rest of the stack will be unaffected.

For instance, in FIX 4, press:

```
4 [ENTER] 3 [ENTER] 2 [ENTER]
5 [XEQ] A [ENTER] -> 120.0025
[ROLLDOWN] -> 2.0000
[ROLLDOWN] -> 3.0000
[ROLLDOWN] -> 4.0000
[LASTx] -> 5.0000
```

Perhaps this is a little slower than pure RPN, but quite convenient indeed. Of course the same trick will work with any f(X) you care to define as long as it can be defined as an equation.

I'll hope you'll like this little neat technique but if not, just stick to pure RPN and you'll be no worse than before :-)

Best regards from V.

### **Re: Stack preservation in the HP35S**

*Message #2 Posted by [Les Wright](#) on 25 July 2007, 2:25 p.m.,  
in response to message #1 by Valentin Albillo*

Another option would be to write a little subroutine that stuffs the Y, Z, and T register values into unused data registers and returns the values to the stack when you want to. The temp registers would need to be lettered registers I think, since if you try to access indirect registers putting the value of the index in X register before storing it in I or J will bump off the contents of the T register.

Just a thought.

Les

### **Re: Stack preservation in the HP35S**

*Message #3 Posted by [Gene Wright](#) on 25 July 2007, 3:27 p.m.,  
in response to message #2 by Les Wright*

Yes, that option would work, but then anyone wanting to use the routine would have to make sure the temporary registers you used to store the stack were not being used by their own programs.

Valentin's idea, and the similar ideas found in the 35s learning modules and datafile issue, make no such requirement. No other registers are affected and the stack is preserved.

### **Re: Stack preservation in the HP35S**

*Message #4 Posted by [Howard Owen](#) on 25 July 2007, 6:17 p.m.,  
in response to message #1 by Valentin Albillo*

That is PDK! (Pretty Darned Kewl.) And not at all obvious. For example, LASTx doesn't show up on the RDN menu in equation mode, since there is a dedicated key.

Thanks for that tip, Valentin! It is now part of my repertoire!

Regards,  
Howard

Message #2 Posted by [Les Wright](#) on 25 July 2007, 1:47 p.m.,  
in response to message #1 by [Geoff Quickfall](#)

Geoff,

I have gotten other HPs from Larry at auctions@techcomm.ca. He is in Oakville. He tells me he will get the 35S in stock. He is not bargain cheap, but will certainly be cheaper than the Canadian MSRP. Tell him I sent you.

York University Bookstore is on hp.ca as the official Canadian reseller of all HP models. But they are obscenely expensive. When they get the 35S, they will no doubt be overpriced.

I was impatient and ordered one from Samson Cables. Despite the grievances in the group mine seemed to leave the US in a timely fashion. I splurged on express mailing and am paying \$77US, or about \$83CDN. I expect the CBSA to assess another \$16CDN--\$8 for their admin fee, \$8 for the 14% GST/PST on the original \$52US purchase. So just under \$100CDN, or \$90US. A lot more than our American friends are paying, but less than those in Europe. Considering that the HP65 was about \$800US in 1974 money, I still think this is a bargain if it is good as people say it is.

Les North York

p.s. please look me up if you ever want to meet in person. I am on the lookout for HP lovers in the GTA. Also, you should know that the eminent Namir Shammas, a sort of legend in these circles, has family in Burlington and we hope to meet one day when he is next up from VA.

in response to message #2 by [Les Wright](#)

Les,

Many thanks for the info. I actually live in White Rock south of Vancouver. I was going to be in Toronto on Monday during the day while staying at the Westin Harbour Castle Inn and thought it would be a good day for a walk to a local retailer.

I know what you mean, the UBC bookstore will no doubt triple the value also so I might be relegated to the web for mine.

Current collection includes:

HP25c

Four HP 67, two in boxes with original papers etc and one NOS in box. All have been repaired in house for gummy wheels including the NOS!

One HP 97 restored

One HP 91 restored

HP 41C, CV, CX with plotter, printer, wand, floppy drive and 3 card readers also with gummy wheel problem corrected.

HP 48g and g+ which I currently use with a 67 as back up and of course

Three HP 01 including one in NOS condition with inner and outer box, pen and papers.

Cheers, Geoff

### [for Gene Wright] HP 35S speed

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 25 July 2007, 12:03 p.m.

Hi, Gene,

reading up your excellent HP-35S essay found through HPCC, I have a question for you:

You set the program for the HP-35S this way:

```
LBL A
+
GTO A002
```

and the program for the HP-33S this way:

```
LBL A
+
GTO A
```

My question (having no 35s to play with) is: what if you use the exact program of the 33S, that is using a call to label A?

Maybe some optimization occurs with labels calling.

It seems strange to me that the new machine is 2.5x slower than the 33S!

Thanks in advance.

-- Antonio

### Re: [for Gene Wright] HP 35S speed

Message #2 Posted by [Namir](#) on 25 July 2007, 12:23 p.m.,  
in response to message #1 by Antonio Maschio (Italy)

Antonio,

I did a test by using a loop like the ones you mentioned, but with one difference. I used the multiple operator. I start with a stack filled with the number of 2 and run the program. It took 30 seconds for the version with GTO A002 to display the OVERFLOW error message. The version with GTO A001 took 31.4 seconds. Not much difference for a loop that iterates about 1660 times.

Namir

*Edited: 25 July 2007, 12:23 p.m.*

### Re: [for Gene Wright] HP 35S speed

Message #3 Posted by [Gene Wright](#) on 25 July 2007, 12:25 p.m.,  
in response to message #1 by Antonio Maschio (Italy)

Thank you very much.

The 35s requires a GTO with a label-line number. GTO A by itself won't work on the 35s.

I tried the same program using GTO A001, and got these results:

LBL A

+

GTO A001

only counted to 3344 in 60 seconds. Putting the GTO A002 line back in increased the count to 3584. The differences to the count given in the review may relate to the amount of free memory in the unit now vs. then, or the current distance from the earth to the sun, for all I know. :-)

I don't know for sure, but I would suspect there is increased overhead given the new complex number and vector abilities of the 35s that show up when doing addition (and other math). After all, the 35s now has to check whether one of the values in X or Y is a vector rather than a real number. Just guessing.

### **Re: [for Gene Wright] HP 35S speed**

*Message #4 Posted by [Don Shepherd](#) on 25 July 2007, 2:59 p.m.,  
in response to message #3 by Gene Wright*

Gene, not to mention that for every memory or stack reference, it moves 296 bits (37 bytes \*8 bits) into the CPU, instead of (in olden days, anyhow) 56 bits. That's got to be costly.

### **Re: [for Gene Wright] HP 35S speed**

*Message #5 Posted by [Antonio Maschio \(Italy\)](#) on 26 July 2007, 3:14 a.m.,  
in response to message #4 by Don Shepherd*

Well, I didn't think about it, but I guess you're right. The 35S seems to deal with different entities than its ancestors, so a computational stress must be added.

Probably, this is not so important, as long as the calculator is fast enough.

Thanks for your efforts.

-- Antonio

### **Re: [for Gene Wright] HP 35S speed**

*Message #6 Posted by [Les Wright](#) on 27 July 2007, 11:25 a.m.,  
in response to message #5 by Antonio Maschio (Italy)*

Antonio,

I have noted that the 35s is perceptibly slower for some of my favourite 33s applications, and must share that at first this was a bit disappointing. The 33s has so many headaches and limitations, but at least it was the fastest HP RPN calculator hands down, and that won it a place in my heart. I had hoped that this speed would be inherited unchanged by the 35s.

But I must put this in perspective. Yes a one second calculation on the 33s seems to take about two on the 35s. But the similar program may take up to 30 seconds on the 41CV, and the better part of a

minute on the 11C or 15C.

Besides the flexibility introduced by indirect register access and line number addressing (so that alpha labels can be conserved) is fair compensation for the slowing.

I like the complex number capacity, which I find mostly easy to use. I have one routine that computes the sine and cosine integrals for larger arguments by complex continued fraction, and it seems to run faster than the 42S version. I miss the ability to simply decompose a complex number in rectangular form into its real and complex parts, but the proposed workaround ( $\text{Re}(z) = \text{abs}(z) \cdot \cos(\text{arg}(z))$  and  $\text{Im}(z) = \text{abs}(z) \cdot \sin(\text{arg}(z))$ ) is not hard to program.

The ability to recall certain stack levels directly by accessing REGX, REGY, REGZ, etc., by way of EQN Rv is reminiscent of RCL ST X, etc., of the 41 series and 42S and can be very useful at times, though I must I would have appreciated fully appointed stack register arithmetic like in those older machines. STO+ ST X is a great way to double the contents of the X register without molesting the stack, and I wish the 35S had that capacity.

I can get to like the vector capacity, but I think it is not straightforward to compose a vector from stack input. It can be done in an equation, and it may be prudent to write a subroutine to do this automatically. It is, however, easy to isolate a component--on simply dot multiplies the vector by the relevant unit vector--e.g.,  $[3,4,5] \cdot [0,1,0] = 4$ . Being able to isolate individual vector components like this is useful when one wants to increase storage capacity by put, effectively, three real numbers in each register.

So far, a real winner. I look forward to seeing how the special features influence programming style.

Les

## Re: [for Gene Wright] HP 35S speed

Message #7 Posted by [Katie Wasserman](#) on 27 July 2007, 12:42 p.m.,  
in response to message #6 by Les Wright

Simple program changes can make a dramatic difference on the 35s. In particular: DON'T USE CONSTANTS INSIDE LOOPS. Try a simple count test:

```
A001 LBL A
A002 1
A003 +
A004 GTO A002
```

This will count to 1442 in 60 seconds.

```
A001 LBL A
A002 1
A003 STO A
A004 RCL A
A005 +
A006 GTO A004
```

This will count to 2939 in 60 seconds (twice as fast).

```
A001 LBL A
A002 1
A003 STO A
A004 RCL+ A
A005 GTO A004
```

This will count to 5157 in 60 seconds (almost twice again as fast, but not a fair comparison

since there's one less instruction in the loop).

### Magnetic Cards/Strips

Message #1 Posted by [Kostas Kritsilas](#) on 25 July 2007, 11:20 a.m.

Hi,

I own two HP-97 calculators, and one HP-67. They all currently have the "gummy wheel" problem, which will be fixed shortly. My question concerns the magnetic strips/cards used in the various HP calculators, specifically, the HP-65, the HP-67/97, and the card reader on the HP 41 C/CV/CX.

1. Are the raw cards themselves the same? i.e. can the same card type be written and read on all the calculators, and by this I mean is there a difference in the heads/magnetic surface that the card readers in each of the calculators are designed for, or is there only one card type that is usable for all 3 machines/card readers?
2. I have read that the HP-67/97 cards can be read by the HP-41 card reader, and the HP-67/97 programs are translated in the card reader to allow them to be executed by the HP-41. Is this correct? Can the HP41 write onto the magnetic cards/strips that are readable or executable on the HP-67/97 (I am suspecting no, but would like confirmation)?
3. Can the HP-67/97 read or execute HP-65 programs? The recording density of the HP 67 is much greater, so I am assuming that the HP-65 cannot read the HP-67/97s cards.

Kostas

The same cards are usable in the 65, 67/97, and 41 series.

Quote:

2. I have read that the HP-67/97 cards can be read by the HP-41 card reader, and the HP-67/97 programs are translated in the card reader to allow them to be executed by the HP-41. Is this correct? Can the HP41 write onto the magnetic cards/strips that are readable or executable on the HP-67/97 (I am suspecting no, but would like confirmation)?

Correct on both counts. 67/97 programs can be read and executed on the 41 series with the card reader installed (the module contains routines like 7ISZ, etc, that replicate 67/97 commands). But not the other way.

Quote:

3. Can the HP-67/97 read or execute HP-65 programs? The recording density of the HP 67 is much greater, so I am assuming that the HP-65 cannot read the HP-67/97s cards.

Correct again.

Les

## **Re: Magnetic Cards/Strips**

*Message #3 Posted by **Tony Duell** on 25 July 2007, 1:21 p.m.,  
in response to message #2 by Les Wright*

A minor correction to (2). Although the HP41 with card reader will read HP67/97 cards, and contains the 'compatibility functions', there are a few features of the HP67 which are not available on the HP41+card reader

The main one is 'rapid reverse branching'. That does not work at all on the HP41 (I think it gives a NONEXISTANT error).

IIRC, there's a section of the HP41 card reader manual which gives the (few) changes needed to the HP67 application Pacs to get them to run correctly on the HP41. But of course for other programs (including the solution books), you are on your own.

in response to message #1 by Joerg Woerner

Wow. Only thing I can imagine is that they wanted to make it impossible to put the ROM from one into the other. If I understand correctly, one doesn't have symbolic calculations. Since we all know software locks can always be defeated. . . maybe separate HW was their solution? Concerns about test cheating?

Either that or all new units will use the same more recent HW.

\_\_\_\_\_

I haven't seen the NSpire up close yet, but for what it's worth, I don't think so. There appear (from the TI web-site) to be other physical and software differences, for instance the CAS version does not have the provision for the swappable TI-84-style keyboard, and therefore the internal software probably dispenses with the compatibility code to emulate the 84. (It also appeared to me that the keyboard swap feature was also used as a battery compartment cover for the non-CAS version -- I don't know what the CAS version uses. Maybe access from the back?)

### Re: TI-Nspire, TI-Nspire CAS, early Prototype

**35s sorting routine challenge**

Message #1 Posted by [Gene Wright](#) on 25 July 2007, 8:49 a.m.

In this learning module:

[Indirect sorting program](#)

A really, really bad sorting routine is presented in Example 2 (ok, I wrote it - that's why it's bad). I was in a hurry, etc. :-)

I'd like to challenge new 35s owners to work on developing a fast, short indirect register sorting program.

Input to the program should be a number like X.YYY, specifying the first and last indirect register to be sorted. I would assume ascending order.

All lettered registers are available for use, but try not to use many. :-)

Winner ought to be determined by the size x run time method used at HHC conferences.

For the sample matrix, I'll try digging up the old "Cheeseman" array used in the PPC Journal to test PPC ROM sorting routines. Might be fun to see how long it takes.

Regardless, now that we have some registers worth sorting, it is time to dramatically improve upon my pitiful effort!

Gene

*Edited: 25 July 2007, 8:49 a.m.*

**Re: 35s sorting routine challenge**

Message #2 Posted by [Valentin Albillo](#) on 25 July 2007, 9:02 a.m.,  
in response to message #1 by Gene Wright

Hi, Gene:

Gene posted:

*"Winner ought to be determined by the size x run time method used at HHC conferences."*

May I suggest that, for practical, real-life purposes other criteria would be more useful, namely (a) The shortest routine, running time a secondary consideration within reason, and (b) The fastest routine, size a secondary consideration, again within reason.

The rationale is that, usually, you are either constrained for space (because you need to be capable to process as much data as possible) in which case you'll certainly want to minimize program size above all, or else you're not specially constrained for space, in which case you'll want your sort to proceed as fast as possible.

The size x run time criterium seems to me to fulfill neither of those practical requirements and it was probably used just to ease the judges' cumbersome and difficult task of objectively selecting a winner.

As such, I'll propose that people accepting the challenge would submit either one or two routines, each individually optimized for the speed/size criteria. That's certainly what I'll do, as my primary goal is to produce maximally useful routines, not winning challenges. :-)

P.S.: Sorting methods also greatly vary in performance depending on the nature of the data being sorted, i.e., some methods that are nearly optimal for quasi-random data may perform abysmally if the data are already almost sorted or reverse-sorted.

So I would suggest that timings should be given for:

1. *A random-data array*, generated by using the HP35S' built-in random-number function starting from the seed **Pi**. This will guarantee repeatability and the same array for everyone.
2. *A perfectly sorted array*: 1, 2, 3, ..., n
3. *A perfectly reverse-sorted array*: n, n-1, ..., 3, 2, 1
4. *An array with all elements equal*: 1, 1, 1, ... , 1

I guess many participants will find that their routine does well with some of the array types but not so well with others. Depending on the real-life application this might be important, as having data which is almost perfectly sorted to begin with is quite common, actually.

Best regards from V.

I think, that for practical, real-life purposes nobody will ever enter large numbers of data into a pocket calculator with no I/O capabilities whatsoever with the intention of sorting them as quickly as possible ;-)

So I would rather consider this challenge as an intellectual exercise akin to solving a chess-puzzle and forget everything I ever knew about real-life issues while working at it...

Greetings, Max

### **Re: 35s sorting routine challenge**

*Message #4 Posted by [Gene Wright](#) on 25 July 2007, 10:14 a.m.,  
in response to message #3 by Maximilian Hohmann*

Quite good points, Valentin. The shortest routine would be nice as would the fastest, particularly with random data.

I do think these have a value. There are often times one needs to rearrange numbers in a program, even without I/O. It may only be 10, 20, or 30 numbers, but that's not unreasonable, IMO.

So, who will be first to dramatically improve upon my pitiful efforts? :-)

### **Re: 35s sorting routine challenge**

*Message #5 Posted by [Valentin Albillo](#) on 25 July 2007, 10:41 a.m.,  
in response to message #3 by Maximilian Hohmann*

Hi, Maximilian:

Maximilian posted:

*"I think, that for practical, real-life purposes nobody will ever enter large numbers of data into a pocket calculator with no I/O capabilities whatsoever with the intention of sorting them as quickly as possible ;-)"*

I beg to differ. I certainly don't do it very frequently, if at all, but can think of many instances where this could be desirable, from a surveyor out in the field (rough terrain) taking a number of measurements and doing some computations with them on the fly, to someone trying to come up with a solution to some "lottery numbers" challenge which requires sorting 6 numbers as fast as possible, say. The possibilities are limitless and there are incredibly varied users out there engaged in a myriad activities.

I think that a powerful, solid, and relatively inexpensive calc such as the HP35S will indeed get used for many real-life purposes, be they work-related, fun-related, or whatever. This being so, developing programs for it deserves to be taken with a professional attitude, as I'm sure most of us always strive for actually.

Thanks for your comments and

Best regards from V.

### Thank you HP for the 35S

Message #1 Posted by [Steve Myers](#) on 24 July 2007, 9:52 p.m.

Is it just me, or did anyone else basically go into a panic when HP started releasing calculators that looked like rejects from Casio ?

For me this is part of the reason why I was so upset over the problems /delays with the release of the 35S. Until I had one (make that 3) in my hands, I was very edgy.

What would happen if all HP ever came out with again were things like the 33S and the 50g ? I was thinking "Was HP really going to make me buy one of those and expect me to like it?"

When they started making Algebraic only models, I seriously got very worried. I have used RPN for so long, that's all I know.

Up until a few days ago I was spending way too much time on Ebay watching the prices for "real" HP calculators like the 32SII skyrocket and wondering if I should sell the farm and buy as many of them as I could while they were still available. Not to put them in some sort of collection but to have them to actually use as I go through life.

I don't consider myself a collector as I use these things everyday. Any "collector" would have a heart attack if they saw me sitting down in my chair with a 15C in my back pocket or when I bend down to reach for something and a 11C falls out sliding across the floor.

No, I consider myself an addict, not a collector.

A world void of a true user calculator... scary to even think about.

Thank you HP for the 35S....

I sleep better now.

Until then, I was quite careless about my 32SII. You know, there will always be some replacement \*sigh\*

Now there really is :-).

...and with lots of luck, I'll eventually get one from Samson \*another sigh\*

---

I'd still take mighty good care of that 32SII

I see this 35S as a day-to-day desktop calculator to replace maybe a 41-C.

Unlike the 32SII, it's too big for my shirt pocket.

*(hmmm...maybe it would fit if I didn't use my pocket protector... j.k.)*

Seriously, after thinking about this I did hop on EBay and plop down way too much money to buy a couple of 32SII's

Of course this time I was a bit more educated and made sure they were not coming from a particular company...

**Home made calculator**

Message #1 Posted by [Ricardo Guerreiro \(Argentina\)](#) on 24 July 2007, 5:23 p.m.

In this forum, it was discussed several times the feasibility of a home made calculator. The conclusion was that electronics are the easy part, and the case the difficult part. ¿Could it change in the near future? Take a look at [www.fabathome.org](http://www.fabathome.org), or [www.reprap.org](http://www.reprap.org)

If this technology arrives to a happy end, everyone could have a totally personalized calculator, according to their own desires (or necessities).

Ricardo

in response to message #1 by [Ricardo Guerreiro \(Argentina\)](#)

You can already do this yourself with the eMachineShop software <http://www.emachineshop.com/> Just choose the "rapid prototype" option, push a button, and your prototype case comes to you in the mail.

Dave.

in response to message #1 by [Ricardo Guerreiro \(Argentina\)](#)

Home made calculators have been built since 1972, when the first kits became available. If you are really into it, I'd suggest to grab some old TMS0105-based calculators with Klixon keyboard and desolder them, pick up an existing PCB layout and modify it to your needs. As the keyboard is the hardest part, the robust Klixon keyboard eliminates one of the most difficult parts in the construction. Case tooling is available online, or you might want to try on of those "instant molding" kits...

**HP 35s Case Alternatives?**

Message #1 Posted by [Dave](#) on 24 July 2007, 2:31 p.m.

I love the factory case, but there are occasions I'd like to travel lighter. For those of you 35s owners who may also have an older slip case from a 32s, 42s, 20s, etc., how does the 35s fit? According to the specs, it sticks out a bit more than a third of an inch. Does this still provide adequate protection? Apparently old 32s cases can still be had from some online vendors.

**Re: HP 35s Case Alternatives?**

Message #2 Posted by [Alex](#) on 26 July 2007, 5:05 p.m.,  
in response to message #1 by Dave

I had the same thoughts as you about slimness, so I did try the 35s in my 20s' case. It's an ever-so-slightly snugger fit, and it sticks out the top almost .5".

Overall I didn't really care for it... I'm on the lookout for some better alternatives.

I do love the stock case, especially for when there might be some knockin' around going on!

- Alex H.

**Re: HP 35s Case Alternatives?**

Message #3 Posted by [Paul Brogger](#) on 26 July 2007, 5:45 p.m.,  
in response to message #1 by Dave

The 33s case is a not-very-snug fit (the 35s wants to slide right out), but otherwise is perfect.

Maybe the inclusion of the quick reference card . . . (oh, rats!)

Maybe including something else will help it stay inside. But then, you won't be traveling any more lightly, as overall they're almost the same size.

**Re: HP 35s Case Alternatives?**

Message #4 Posted by [Dave](#) on 27 July 2007, 10:41 a.m.,  
in response to message #3 by Paul Brogger

Thanks, guys. So the 20s and 33s cases aren't the best solutions. If I ever run across anything, I'll let you know.

**Re: HP 35s Case Alternatives?**

Message #5 Posted by [Vincze](#) on 27 July 2007, 10:49 a.m.,

I understand now. I am stupid Hungarian, so I not get joke sometimes. It would be nice if quick reference card with calculator though. Maybe I make one and laminate it.

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #8 Posted by [Ed Look](#) on 27 July 2007, 12:28 p.m.,  
in response to message #7 by Vincze*

No, don't feel too bad; the joke is an OLD TIMER'S joke. HP calculators from a long time ago came in a box, had lots of literature in it including the manual, like a laminated quick reference card, extra application booklets, basic functions booklet in addition to full manual, etc.

I still have somewhere this stuff, except for the box, for my old 34C.

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #9 Posted by [Vincze](#) on 27 July 2007, 1:36 p.m.,  
in response to message #8 by Ed Look*

I see.

I really wish books that come with units now were spiral bound. Am I only one who think that spiral bound book much easier to lay flat and use than the type of binding they use now? I wonder why they switch?

I hope PDF come out soon for 35s as I want to print it and bind it in spiral bound so I can use it easier.

Since english is not my native language, sometimes words confusing and I have to look up in Magyar <-> English dictionary to find out what they meen. With spiral bound book, that is much simpler since book will stay flat. I would think this would be common desire for all users, and would think HP would realize this, or do they not think at sometimes?

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #10 Posted by [Gene Wright](#) on 27 July 2007, 2:26 p.m.,  
in response to message #9 by Vincze*

Spiral bound manuals are much more expensive than flat bound. Particularly when you add the incremental cost up by hundreds of thousands of copies.

That's why we don't get them any more.

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #11 Posted by [Vincze](#) on 27 July 2007, 3:08 p.m.,  
in response to message #10 by Gene Wright*

you sound as if you work for HP and have been said to say that. Yes, more expensive, be we all know that the cost passes onto the buyer, so why would HP care. That would be like saying, lets use junk for calculator and make it less good. Same thing with plastic container that calculator come in. It make it cheap, but box make it look more like quality. Cost is eventually passed to buyer, so why would HP care.

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #12 Posted by [Kevin Kitts](#) on 27 July 2007, 3:46 p.m.,  
in response to message #11 by Vincze*

Because HP needs to sell a certain volume to be profitable. If they make the price too high then they won't sell enough to make a profit and cover the costs of R&D and manufacturing.

They've likely calculated (no pun intended) the number of units they'll be likely to sell at a given price point and number of months that it will take them to reach the break-even point and start making a profit.

It may seem cruel and cold - but if they don't make a profit there is little incentive to make the next iteration of products.

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #13 Posted by [bill platt](#) on 27 July 2007, 4:01 p.m.,  
in response to message #11 by Vincze*

The Pioneers were the last machines to come with spiral bound manuals. Later in their production runs, they were bound like a book. For instance the 27s, 32s, 42s had spiral, but the 32sii had book-bound. The 12c of course started out spiral, and switched to book-bound. But don't forget that many of the 41c publications and manuals were not spiral bound.

The cost of making a manual (even spiral-bound) used to be a much smaller percentage of the cost of the calculator. In real terms, there was much more room for price in the old days. Today, the margins are slim, and the buyers are price-conscious to a fault. The current buyer doesn't look at the price and compare it to days of old in real terms: rather he compares it to other offerings on the shelf. There is only so much "premium" he is apt to be willing to pay for the HP quality.

Remember, while we are the "early adopters" and promoters, it is in much larger, more brand-neutral buyers that the market is won or lost.

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #14 Posted by [Vincze](#) on 27 July 2007, 4:45 p.m.,  
in response to message #13 by bill platt*

Good afternoon Bill. You bring up good points, as I forgot to include price elasticity of buyers. I only consider like minded people of here as buyers but you right that there are many other people out there that may be less elastic in price sensitivity. I still wonder though how much more price would be with spiral bound book. We will never know I guess.

But with quality they can't go less with. I remember days when ceramic chips used in computers and many were considered military spec. I remember using old AT&T 3B2 computer back in Hungary, and it was built like tank. I just think that HP should use high quality parts so unit last long time like my HP45. I hope HP did that with 35s. I guess time will tell.

Please excuse my poor english.

**Re: There is no HP-35s Quick Reference Card (I was joking.)**

*Message #15 Posted by [Paul Brogger](#) on 27 July 2007, 5:22 p.m.,  
in response to message #14 by Vincze*

I'll gladly excuse your (actually not-at-all) "poor" English, if you'll please excuse my non-existent Magyar.

**Re: There is no HP-35s Quick Reference Card (It was a joke)**

*Message #16 Posted by [Gene Wright](#) on 27 July 2007, 5:21 p.m.,  
in response to message #11 by Vincze*

Actually, I'm an author who has had his own work printed and bound with a spiral binding. My costs were \$1 more per book to use it.

Economics would say a higher price will lose sales.

**Re: There is no HP-35s Quick Reference Card (I was joking)**

*Message #17 Posted by [Paul Brogger](#) on 27 July 2007, 2:55 p.m.,  
in response to message #9 by Vincze*

. . . and I believe you would find that most of the contributors at this site agree with you: the old-style spiral-bound manuals are better.

*Edited: 27 July 2007, 2:56 p.m.*

**Re: There is no HP-35s Quick Reference Card (I was joking)**

*Message #18 Posted by [Dallas Osborne](#) on 29 July 2007, 4:53 p.m.,  
in response to message #17 by Paul Brogger*

Is there enough room to lop off the spine, punch and spiral bind it? If there is more

than 1 cm after using bulk paper shear (.1-.2 cm) to cut the spine, the late-night crew at a Kinko's may be talked into punching and running a spiral through the manual.

Just a thought; I have yet to get mine and scratch my head over how I am going to get this thing to lay flat. This isn't crucial but it is certainly nice.

Well, if you get it tomorrow, then maybe you'll feel better. Mine, shipped from Samson Friday evening, was last noted by UPS as being in Idaho on Saturday morning, and is due to arrive here in Connecticut this coming Friday (FRIDAY! WHAT ARE THEY DOING, DRIVING IT HERE ON A TRUCK? Oh yeah, UPS ground...). Ah well, I'm glad I can be patient about this -- if I'd been more emotionally invested in getting it NOW NOW NOW I'd be climbing the walls like the rest of the posters who ordered from Samson.

Nonetheless, this may not be "The Final Insult". There could be lots more insults pending! So cheer up! ;)

I think it will become a bit more difficult at customs! I think good coming from US needs to be cleared based on a proforma invoice! Normally customs ask the 'courier service' to declare the goods. Percentage to be paid on value!

Can anybody that receives the 35S let us know the complete story?

### **Re: Samson Cables - The Final Insult**

I'm not defending Samson Cables deceptive practices, but the ebay ad says it ships 7/27, that's July, not August.

**Re: Samson Cables - The Final Insult - Oh no! There's MORE!**

*Message #11 Posted by [Howard Owen](#) on 25 July 2007, 2:57 a.m.,  
in response to message #10 by Steve Borowsky*

That *does* make a difference! Instead of thinking that they are selling air, I'm back to my former opinion that they are just making a hash out of a supply problem from HP. Adding the insult of incorrect shipping to the injury of not shipping when promised just isn't smart business. The latter *might* be excusable, depending on the circumstances. But the former looks to me like an entirely optional dig under the fingernails of already annoyed customers.

On the bright side, we can hope these supply problems are caused by unexpected heavy demand. I don't know that they are. It could be a problem ramping up the pipeline to predicted volumes. But if customers are beating down retailers doors, then I'd say the features that make the 35S unique, like the styling and build quality, may become benchmarks for future calculators from HP. Nice thought.

Regards,  
Howard

**Re: Samson Cables - The Final Insult - Oh no! There's MORE!**

*Message #12 Posted by [koendv](#) on 25 July 2007, 5:24 a.m.,  
in response to message #11 by Howard Owen*

FYI: I have received my HP35s, ordered on July 15th. (=\$52.99) Shipping was USPS (=\$20.00). Later I received a mail from Samson cables, stating charges to Europe were higher, but included all customs taxes. "\$35.00 Standard mail, 2-4 week delivery" was chosen and an additional \$15.00 paid.

Total costs were \$87.99 - about 63.65€ Total delay in delivery was 8 working days.

"All good things come to those who wait".

regards,

koen

I have been fortunate.

Tracking on the usps website indicates that my parcel left O'Hare yesterday and is now in Canada. I should see it in a couple of days.

Apart from the initial shipment delay I haven't been too disappointed with Samson so far.

I wonder what's up?

Les

### **Re: Samson Cables - The Final Insult**

*Message #14 Posted by **Miguel Toro** on 25 July 2007, 7:23 p.m.,  
in response to message #13 by Les Wright*

So far, a good experience. I received my two 35s calculators today, here in Canada:

S/N:  
CNA 72102361  
CNA 72102362

Bought at Samson Cables, the 15th July at \$52.99 each (thank you Les, for tip).

My credit card was charged the 20th. I received a message from Samson the 21th, telling that the calculators had been shipped and I could track it, thanks to the code they gave me. My wife received the parcel today in the morning. One calculator is for me, the other is for my 12-year old daughter.

Now I am up to Gene's challenge...

Regards,

Miguel

### **Re: Samson Cables - The Final Insult**

*Message #15 Posted by **Les Wright** on 25 July 2007, 8:02 p.m.,  
in response to message #14 by Miguel Toro*

Miguel, did you have to pay any taxes or fees to claim them?

I am expecting that, at worst, I will have to fork over another \$13 to \$16CDN to claim mine. I am in Ontario, so that means 14% GST/PST on the CDN value (works out to about \$8CDN), plus the infernal admin fee (\$5 or \$8 depending on the situation).

What about you?

Les

P.S. you can use USPS tracking numbers to track parcel movement in Canada at Canadapost.ca--to my great pleasure they seem to use the same codes. My parcel is in town, having cleared customs, and I expect it tomorrow.

**Re: Samson Cables - The Final Insult**

*Message #16 Posted by Miguel Toro on 25 July 2007, 8:11 p.m.,  
in response to message #15 by Les Wright*

Hi Les,

To my surprise, I paid none. My wife even ask the postman and he told her there were nothing else to pay (?!?!). That made me happier, of course.

I hope it will be the same for you. Please tell, when you get yours.

**Re: Samson Cables - The Final Insult**

*Message #17 Posted by Les Wright on 26 July 2007, 8:51 p.m.,  
in response to message #16 by Miguel Toro*

Miguel, I got mine, but barely!

I have been tracking it very closely at Canadapost.ca. Delivery was attempted today. But I was home all day! No delivery attempt card left today.

The post office had it, but I had to do some fast talking and present my driver's license as proof.

You see, in my excitement I had mistyped my address in the Samson order form. The attempted delivery was to the neighbour at 32. I am at 22!

And, sadly, Canada Customs too another \$15.75CDN. Just about what I guessed they would!

Les

**Re: Samson Cables - The Final Insult**

*Message #18 Posted by Miguel Toro on 27 July 2007, 7:20 p.m.,

So, We Quebequers have some privileges...

; -)

**About to arrive!**

*Message #19 Posted by Gerson W. Barbosa on 26 July 2007, 6:23 p.m.,  
in response to message #13 by Les Wright*

Hello Les,

From USPS Track & Confirm page:

-----

Status: Arrived Abroad

Your item arrived in BRAZIL at 3:59 AM on July 25, 2007.  
Information, if available, is updated every evening. Please check  
again later.

-----

I just hope it doesn't get stuck at Customs. The 60% tax ought to be enough!

I ordered it on the 15th but I was never impatient about the delay. I will be impatient if it takes too much time to run program though :-)

Regards,

Gerson.

### HP-35s shipping price to Europe ?

Message #1 Posted by [Etienne](#) on 24 July 2007, 2:59 a.m.

Dear HP fans,

this is my first post although I have been reading this forum regularly for some time now. To introduce myself, I'm a 33-yo engineer living in Freiburg, Germany.

My interests include music, photography, aviation and science & technology in general.

Now back to the topic: I ordered a 35s from Samson Cables on July 15.

I paid \$52.99 + \$20 for shipping.

On July 17 they asked me for additional \$20 for shipping. I agreed so far.

Today I got an email requiring me to pay yet another \$15 for shipping. This seems a bit excessive to me. AFAIK there are other European members of the Forum who ordered a 35s from Samson Cables. Did all of you really pay \$55 for shipping ?

Thank you :-)

Etienne

### Re: HP-35s shipping price to Europe ?

Hi Etienne.

here follows a copy-and-paste of the confirmation e-mail from Samson Cables after my order I placed yesterday:

Ship From:  
Samson Cables  
1168 W. 11625 S.  
South Jordan, UT 84095-7809

Ship To:

Indesit Company SpA  
Giancarlo Mattioni  
Via L. Corsi, 55  
Fabriano (AN), Italy 60044  
ITALY

Items Ordered

(1) HP 35S RPN Scientific Calculator \$59.99

Sub Total: \$59.99

Shipping & Handling (US International Air Mail (2-4 weeks)): \$20.00  
UT State Sales Tax: \$0.00  
Total: \$79.99 (Pay Via: CreditCard)

As you can see, the S&H fees are 20.00 USD, and no additional fee has been required so far.

By the way, the shipping status reads "SHIPPED" as of today.

Hope this helps (and hope not to have any bad update ;-)

Best regards.

Giancarlo

### **Re: HP-35s shipping price to Europe ?**

*Message #3 Posted by [Bruce Bergman](#) on 24 July 2007, 1:29 p.m.,  
in response to message #1 by Etienne*

As much as I've had good results with them, THIS is definitely puzzling. I saw the other thread about this. I just can't understand why any company would ask for additional shipping fees and then jack it up AGAIN. I mean, aside from piss-poor business practice, and alienating their sole customer base, it just doesn't make sense. They should know up front what the costs are, or tell international customers to get a quote.

Really, I just don't get it.

thanks, bruce

### **Re: HP-35s shipping price to Europe ?**

*Message #4 Posted by [Nenad \(Croatia\)](#) on 24 July 2007, 2:32 p.m.,  
in response to message #1 by Etienne*

Willkommen Etienne,

For your information, I ordered the calculator from Samson Cables on 15th July at the price of 52,99 USD, choosing USPS Shipping & Handling (35 USD). After they charged my VISA card, they sent me an e-mail with the USPS tracking number. In accordance with the USPS information, the package left the USA yesterday morning from San Francisco on its way to Split, Croatia/Kroatien.

They did not ask me to pay any additional shipping costs.

MfG

*Message #5 Posted by [Diego Diaz](#) on 24 July 2007, 3:26 p.m.,  
in response to message #4 by Nenad (Croatia)*

Hi all,

Mmmm... Seems that they don't know much about international trading... Ok they're in the States thus they won't probably know of European regulations... but... they ask for \$15 in order to cover Euro-VAT expenses + S&H from their "European affiliate"...

Quote:

---

Diego,

The last email I sent you didn't seem to go through.

We are asking you to pay an extra \$15.00.

Because you are purchasing from one of the European Union countries, your order will ship from our European affiliate. All customs taxes (VAT) will be paid by us. In order to process your order, your payment needs to include the shipping, customs taxes, and handling charges according to the following:

El costo del envío incluye todos impuestos de la aduana (IVA). Le coût d'expédition inclut tous impôts de douanes (TVA). Il costo di spedizione include tutta le tasse di dogana (l'imposta sul valore aggiunto).

\$35.00 Standard mail, 2-4 week delivery (+ \$15 each additional item) \$45.00 Expedited mail, 2-3 day delivery (+ \$10 each additional item)

Please include phone number. This is required by international mail carriers.

Customer Support Samson Cables <http://www.samsoncables.com/> <http://www.hpcalculators.com>

---

Sure such "European affiliate" should have to know that Canary Islands (like Madeira or Açores) are excluded from VAT.

Whatever the case, what seems unconceivable is that they do behave with such a random procedure... asking for extra expenses to some customers while shipping others' orders... mostly once an order is marked as "PAID IN FULL"...

Still to see what they will say as I mail'em with this little Euro-taxes lesson... ;-)

Cheers!!

Diego.

Hi Diego,

in this case it is obviously an advantage (at least for me) that Croatia is not (yet) a part of EU. They shipped "my" HP-35s directly from the US. Now, I understand why they did not require any additional

costs.

Sometimes a disadvantage transforms into an advantage.

Best regards,

### **Where to find Optical Physics and laser dynamics/properties formulas for the 50G**

Message #1 Posted by [Scott Blakely](#) on 24 July 2007, 10:54 a.m.

Hi all,

So I have a 50G and it looks and feels really nice.

I am now trying to find some programs related to microscopy, etc for it before I take the time to write my own.

I have looked through the hpcalc.org stuff and 1) I haven't found much specific to this area of physics (yet) and 2) much of the stuff seems to have been written for much older calcs and I am not enough of a guru in the programming area to be able to tell which ones will run on the 50G.

So if anyone knows of a place that specialized in optical physics, etc. I would really appreciate knowing about it.

Thanks!

Scott

### **Re: Where to find Optical Physics and laser dynamics/properties formulas for the 50G**

Message #2 Posted by [Ed Look](#) on 24 July 2007, 12:44 p.m.,  
in response to message #1 by Scott Blakely

I have found that over the years, most programs or equations available, free or otherwise, are for engineering, surveying, and to a smaller extent, finance.

If you want ones more quickly and directly applicable to physics or chemistry, you may have to open your textbook or journal article and key it in yourself.

I needed a program to calculate Miller indices and a formula to quickly convert between eV and nm or angstroms and had to write or input them myself in both the 33S, 48G/G+, and 49G+. Fortunately, in the case of these five calculators, there is either a built in or downloaded constants library I could use to ease the writing.

### What Calculator Do You Think PC Uses in that Mac Commercial

Message #1 Posted by [Les Wright](#) on 24 July 2007, 7:06 a.m.

It is one of the familiar series--nerdy and anal-retentive PC shown up yet again by hip and relaxed Mac.

In the one in question, there is a flashback to the characters as kids. Young Mac wants to show Young PC a picture he produced. PC produces a calculator "to calculate how much time you've wasted."

The gag is reproduced by adult Mac and PC at the end of the commercial.

I wonder what calculator PC would use?

Les

### easy solution

Message #2 Posted by [Frank Boehm \(Germany\)](#) on 24 July 2007, 7:54 a.m.,  
in response to message #1 by [Les Wright](#)

As kids:

PC user: That's an easy one. It will most likely be a Novus 650 with low batteries. This one probably even has an A20 gate.

The Mac user will use - without doubt - a Sharp EL-8130. (Talk about round elements, brushed aluminium design and a keyless keyboard.)

As adults:

PC user: Windows calculator, using Win 3.11 skin

Mac user: iPhone calculator, not using any keys (still)

### Dual HP-IL adapter for HP-71B

Message #1 Posted by [Olivier \(Wa\)](#) on 24 July 2007, 3:47 a.m.

I just came accross [this](#) Dual HP-IL adapter HP82402A for HP-71B. Does anyone know what it is and what its purpose is ?

### Re: Dual HP-IL adapter for HP-71B

Message #2 Posted by [Rodger Rosenbaum](#) on 25 July 2007, 5:18 p.m.,  
in response to message #1 by [Olivier \(Wa\)](#)

It allows two HPIL modules to be controlled by a single HP71.

As an example of its use, one could connect an RS-232 adapter to one of the HPIL modules, and some other device to the other. Then the output of a debugger (say) could be sent to a monitor connected to the RS-232, while the other device performance could be tested with the debugger, completely independent of the IL loop sending debugger output to the monitor.

### Re: Dual HP-IL adapter for HP-71B

Message #3 Posted by [Garth Wilson](#) on 26 July 2007, 3:40 a.m.,  
in response to message #2 by [Rodger Rosenbaum](#)

Since you can put dozens, even hundreds, of things on one IL at the same time, the reason I was given for the dual IL module is that you could have the 71 be the controller on one loop and a device on the other at the same time. I think the maximum I've had on the IL at once was six or seven devices.

### HPCC club and Valentin Albillo

Message #1 Posted by [Wlodek Mier-Jedrzejowicz](#) on 24 July 2007, 12:29 a.m.

This posting is about Valentin Albillo's membership agreement with the HPCC HP calculator club, and criticisms of it. Some people have said this is a subject for the HPCC club only, not for discussion on the MoHPC Forum. Others have suggested they will leave the club because the club has made no official posting here. As so much has been written on this Forum, and because Valentin asked for it, here is a statement on behalf of the club. If you are not interested in goings-on at HP calculator clubs, feel free to skip the rest :-)

\* Valentin Albillo does NOT have a free membership of the club. That is Valentin's understanding of the arrangement, and that of most of the club Committee. After paying for membership in the usual way for 4 years, he offered to make payment instead by writing a guaranteed and regular set of articles for our journal, Datafile. The Editor liked the idea, the club Committee accepted it, the Annual General Meeting in 2005 approved the agreement, the AGM in 2006 confirmed it, and it's been running satisfactorily for two years and is now well into its third. Not everyone agreed, but this was an officially made agreement that Valentin paid by providing articles regularly, not a free membership.

\* An arrangement like this, where a regular supply of quality articles is guaranteed, is very valuable to an editor. It is like the difference between a journalist with a contract to provide a weekly newspaper column and bloggers who post when and what they like. The blogs might or might not be more interesting than the column, but they do not provide the guarantee an editor needs that pages will be filled in every issue. The HPCC Editor offered to make similar agreements with other members who could satisfy the Editor and the Committee that they would provide a regular supply of substantial articles of interest to HPCC members.

\* Two members of HPCC opposed this agreement, and voted against it at the AGMs, because the club works on the basis that all members pay money for their membership. As in most clubs, it would be considered wrong for the Treasurer or the Editor, for example, to get their membership in exchange for the work they do. The Committee recognized this concern, but considered Valentin's offer to be for the good of the club and voted to accept it.

\* Two other members have expressed some opposition, and one of them has recently suggested that the agreement is contrary to the club constitution. This objection has been made only after the agreement had been working successfully for more than two years. The Committee believes that the constitution allows it to make such special arrangements for the good of the club, but the question will be discussed at the next AGM, and appropriate changes will be made to the constitution if the AGM so decides.

\* The members who are opposed to the agreement have every right to continue in their personal opposition to it, but I ask them not to publicly misrepresent the position, and not to be rude to Valentin on this Forum, nor anywhere else for that matter.

\* Until the situation is discussed at the AGM, the Editor has withdrawn the offer of similar agreements. Further, to avoid any more arguments, Valentin has now paid with money for his membership for the rest of the current year. Despite this, he will hold to his agreement with the club and will continue to write for Datafile – he has already offered a set of articles about the new HP35s.

Apologies for the length of the above, but I hope it clarifies matters.

Wlodek Mier-Jedrzejowicz on behalf of the HPCC club Committee

**Re: HPCC club and Valentin Albillo**

*Message #2 Posted by [Geir Isene](#) on 24 July 2007, 3:27 a.m.,  
in response to message #1 by Wlodek Mier-Jedrzejowicz*

Would everyone be satisfied if Valentin paid his membership fee as usual and the club paid him the exact same money back for the guaranteed contributions? (on the chance that the club's constitution allows for paying contributors).

**Re: HPCC club and Valentin Albillo**

*Message #3 Posted by [Walter B](#) on 24 July 2007, 4:32 a.m.,  
in response to message #2 by Geir Isene*

IMHO this would make a simple agreement more complicated, and only feed the banks. Within the framework set by the HPCC constitution, majority rules. As Wlodek explained very well, the agreement was accepted regularly. This isn't mathematics, it's democracy. Hopefully, every member shall be able to accept this.

Just my 0,02 Euros.

**Re: HPCC club and Valentin Albillo**

*Message #5 Posted by [Wayne Brown](#) on 24 July 2007, 10:47 a.m.,  
in response to message #1 by Wlodek Mier-Jedrzejowicz*

Thank you very much for explaining it all so clearly. It seems a fair and equitable arrangement to me, and I would have no objection to it continuing for as long as Valentin and the Committee wish it. In any case, my chief concerns (the apparent secrecy surrounding this issue, and the lack of an official public statement that would put to rest the rumors) have been satisfied and I no longer have any hesitation about renewing my membership next year.

**Re: HPCC club and Valentin Albillo**

*Message #6 Posted by [Bruce Bergman](#) on 24 July 2007, 1:45 p.m.,*

*in response to message #1 by Wlodek Mier-Jedrzejowicz*

It's interesting to read some of the thought process and history from the club perspective, so thanks for that.

This whole thing got into the public eye in a weird way, so I'm not sure any of us even have the "right" to comment on any of this. Especially me, because I am not an HPCC member (but would really like to be, BTW). The workings of this really don't involve us.

However. ;-) I might offer an opinion or two, just to get on a soapbox for a second. Please take it with a grain of salt. ;-)

I personally think this situation was WAY too political. Maybe that's because of the make up of the group, or it being in the UK or whatever, but really guys, this is a **\*\*CLUB\*\***. You're not running a company, or leading the take over of a country, you don't have tens of thousands of members, it's not rocket science, etc. You basically have a group of folks who are enthusiastic about calculators. It doesn't HAVE to be this hard. In fact, it shouldn't be hard at all.

Everything that happened, according to Wlodek's recap, is wonderfully normal and appropriate. It appears just a few dissenters caused all the ruckus, and that's...unfortunate.

My humble opinion probably means nothing to anyone here, but I believe I have relevant background, both having been in the publishing industry as a columnist and editor, being involved with HP calcs for 30 years, and also in having helped start, govern, run and manage many non-profit organizations and clubs for over 15 years. In all that time, I've never seen something as small and petty as this get so many folks riled, and cause such lengths of procedure and process to be expended. It boggles the mind.

A technical journal like this is a heart and soul of a user community, and it stands to reason that getting quality content is one of the most important considerations. Exchange for (something else) is accepted, normal and highly ethical. In fact, I'd go so far as to say it is "necessary". I support that idea.

Dr. Laura has a really great perspective on disagreements like this. I wish more people took this advice. Simply said "just be polite".

Good luck to Wlodek (who I respect immensely), Valentin (who writes great stuff) and HPCC (who needs to send me a membership application). :-)

thanks, bruce

**Re: HPCC club and Valentin Albillo - thanks**

*Message #8 Posted by [Wlodek Mier-Jedrzejowicz](#) on 25 July 2007, 10:48 p.m.,  
in response to message #7 by John Cadick*

Many thanks to all who responded on this subject for your very positive reactions. My thanks as well to HPCC's journal Editor, Bruce Horrocks and to everyone in our club Committee who had to go through the experience. Thanks to Dave for providing this Forum, and special thanks to Valentin Albillo, for his enthusiasm, for his articles, and for his support of HPCC.

Politics are indeed unavoidable once a group sets out to achieve more than just meeting and talking. Groups can have written rules, unwritten rules, or a mixture - yet there will always be circumstances that are not foreseen by the rules. When that happens, some people will think the group is best served by sticking rigidly to the existing rules, while others will prefer a loose interpretation for the perceived good of the group. It usually takes some time to find out who was right in any particular case! Here we wanted to be circumspect, but we finally did decide to post a statement - and to discuss the matter again at the next Annual General Meeting of the club. Till then, I trust the matter is sorted out and I look forward to Valentin's coming articles.

Thanks again, Wlodek

## "Politics" and Calculators

Message #9 Posted by **Howard Owen** on 24 July 2007, 7:14 p.m.,  
in response to message #6 by Bruce Bergman

I don't want to rake the coals of this particular episode, but I felt I needed to respond to some of the general points you made. Please be assured that I don't undertake this, nor should it be interpreted as a personal attack. It's the ideas I want to discuss.

- Firstly, becoming "political" is what organizations with more than two members do unconsciously, and appropriately. If you want to avoid politics, don't write a charter or bylaws or anything like that. Politics is essential to those processes. Do you want to make a decision at a group level? Dust off the politics. Does a strong leader make the decision without consulting anyone? That's autocracy. Does the group informally decide? That's one form of democracy. Politics is simply unavoidable.
- You note that dissenters were the cause of this particular imbroglio. I'm not entirely sure about that. But that's the way people tend to be in groups greater than two in number anyway. Should you suppress the natural tendency in people to disagree, and to get annoyed behind those disagreements? I submit that it's not possible to do that anywhere over the 50% level in an organization that isn't tightly restricted to a single code of behavior and discourse. And even there, in military organizations for example, you *still* have dissent.
- You suggest that the common enthusiasm for calculators ought to be enough to avoid unpleasantness. As a thought experiment, imagine that there are two auto enthusiasts who happen to like the same cars. However, each one belongs to a different church, has different political affiliations, comes from a different corner of the world, speaks a different language, and so forth. Is it likely these two will agree on everything because of their shared interest in automobiles? It's not likely. And an organization made up of people who all share one another's opinions on everything strikes me as uninteresting, at best.

So I wouldn't disparage the political process in this case. After all, hostile viewpoints that resulted in significant harm to the community in question were reconciled by a political process. I count that as a very good thing.

Regards,  
Howard

Message #2 Posted by [Les Wright](#) on 23 July 2007, 10:59 p.m.,  
in response to message #1 by Gerson W. Barbosa

Thanks Gerson for sharing yet another version of your minimax polynomial approximations of some of the trigonometric functions.

For fussy budgets like me, this will be very useful, and I will enter them in my HP35S (the porting should be easy) when I get it.

I am actually more troubled by the persistence of the cosine bug than the inconvenient entry of hex numbers everyone seems so fussed about. The persistence of the digit loss for arguments approaching 90 degrees has accuracy implications for the sine of very small angles, the tangent function, complex number math, and of course rectangular-polar conversions.

FWIW, can someone with a 35S compute the cosine for 89.99, 89.999, 89.9999, and 89.99999, etc., degrees and let us all know?

Les

Hi Les (and all).

The 35s review at the hpcc.org site stated that the COS bug was still there. This was available the day the 35s was announced.

Quote:

I will enter them in my HP35S (the porting should be easy) when I get it.

Hello Les,

I think it will run with no modification on the HP-35s. But it will require three keystrokes to access the function, by what I've read: [XEQ] [L] [ENTER], for instance, instead of the more convenient [XEQ] [COS] on the HP-33s.

Best regards,

Gerson.

Gerson,

Your routines are very fast. Say what you like about the now obsolete 33S, but it does run keystroke programs with lightning quickness. I understand that in many cases the 35S may actually be slower!

I also like how you preserve the contents of the Y register for subsequent calculations. Unfortunately the routines don't keep the entire stack in its original state, but this is a nice touch. One problem about RPN programs is they make a mess of the stack sometimes, unlike the internal routines. RPL programs tend not to do this, unless you want them too.

Les

---

Too bad they don't run fast enough on the 35s: about 1.5 seconds. They appear to run 10 times faster on the 33s (no timing so far). Also, [XEG] [COS] [ENTER] is very inconvenient. And having to press [>] to see the exponent is pretty cumbersome. Didn't they realize the exponent is much more important than the least significant digits? I prefer ALL mode, not that I don't care about all those digits, but because I don't like integers being displayed with all those zeros. I am very inclined to getting rid of this 35s and getting another obsolete 33s...

Regards,

Gerson.

### First Impressions HP 35s

Message #1 Posted by [Richard Garner](#) on 23 July 2007, 7:04 p.m.

I got my 35s today. I ordered it from the HP website on the 13th. Here are my first impression of the 35s. The description on the website is a little misleading. It implies that the 35s is in box not a blister pack as it actually is. They should restate it to say what is in the package not what is in the box. But I can live with that.

The 35s is a nice size, it fits well in the hand. The keys work well and have a nice click to them. I would still have changed the Sigma and R/S keys. I am very pleased with the return of the double wide Enter key and it being back in its right place. The display is easy to read. Depending on the light source there is a slight glare. The overall color scheme is spot on. The overall design is very pleasing to the eye and it looks like something you would be proud to pull out of your pocket and use. That's all for now. I'm going to go play now.

\_\_\_\_\_

I've heard quite a few people now say it's a nice pocket size. What kind of pockets do you guys have??

15.8 x 8.2 x 1.82 cm is BIG in my book, too big to be called a pocket calculator IMHO.

It could fit in my lab coat pocket maybe , but not my shirt pocket.

Dave.

### Re: Pocket Size

Message #3 Posted by [sjthomas](#) on 23 July 2007, 11:19 p.m.,  
in response to message #2 by [DaveJ](#)

I too would like a decent RPN scientific calculator which is truly shirt-pocket size. Something about the size of the 35s' keyboard portion -- and a bit narrower. Back in the days when dinosaurs roamed the earth, I used to keep my 25c in my pants pocket most of the time (without its case).

The 35s is even taller than the 33s, yet it seems thinner (but it isn't).

## Re: Pocket Size

Message #4 Posted by **Richard Garner** on 24 July 2007, 12:27 a.m.,  
in response to message #2 by DaveJ

Pocket size that I speak of is dress shirt pockets. With out its case the 35s will fit in a dress shirt pocket with room to spare. Although I have recently bought some polo style shirts that have pockets that I could put 2 48gx in and still have room to spare. I don't care too much for the butterfly case that comes with the 35s. I will be looking for something smaller for pocket use or something for belt use. What would be nice, if some one would come out with an Astec type hard case for the 35s.

## Re: Pocket Size

That's just the opposite of my polo-style shirts compared to dress shirts. [Those who may scoff at this statement haven't seen me for a few years!]

Quote:

I don't care too much for the butterfly case that comes with the 35s.

Nor I, but I've used worse. I don't understand why it is a dual-ended zipper. This isn't necessary even though the case can (thoughtfully) be used either right- or left-handed. I yanked the dangling zipper-tab-thing off the lower zipper-end. It was just getting in the way. More recently, I have been using the case from my 33s; it's just faster. The 35s case looks nice though.

Quote:

What would be nice, if some one would come out with an Astec type hard case for the 35s.

Oh yeah! Would that an Astech case was made for every model of calculator!! Interestingly, hp refers to the 35s' case as a "hard" case -- I think that's pushing the meaning of "hard" a bit. It's certainly better than the thin plastic slip-covers they started including with the Pioneers though.

Well, the HP-35 was described as a pocket calculator. It was a tiny bit shorter and a *really* tiny bin

narrower than the 35S, but the latter is much thinner. Not to ignore your point that "pocket size" means smaller than that to you, but I think the benchmark ought to be the stereotypical engineer's shirt pocket. These are commonly thought of as lined with a pocket protector, and stuffed full of drafting pens, notebook and yes, an HP calculator. The 35s's thinness would be a positive boon in that sort of pocket. 8)

.. the stereotypical engineer's shirt pocket.. commonly thought of as lined with a pocket protector, and stuffed full of drafting pens, notebook and yes, an HP calculator.

---

Right now, the daily "gear" in my shirt pocket is a pen, mechanical pencil, small screwdriver, company photo-ID badge (w/ RFID chip for locked-door entry), and my 11C.

IMHO, the Voyager series is the only true "shirt pocketable" size calculator HP ever made. Everything else is either too tall, too thick, or too wide. This excludes the 6S, 8S, 9G, 9S, and 30S, which aren't "real" HP's anyway, now are they? While, the 10BII fits in a shirt pocket, I don't remember the last time I needed to amortize anything while troubleshooting a control system ;-)

Your friendly, neighborhood stereotypical engineer :-)

### Re: First Impressions HP 35s

Message #9 Posted by [Art Litka](#) on 23 July 2007, 10:10 p.m.,

*in response to message #1 by Richard Garner*

Received my 35s (CNA 72103883) from the HP store today too. I ordered it on July 13th and my first impressions are favorable as well. Opening blister packs is a real pain but this product seems to be heading HP back to the calculator reputation it once had; a big improvement over the 33s for sure. If I think as highly of it after some further practice, I will strongly suggest it to my calculus based physics students in the fall. I'd love to introduce RPN into the hearts and minds of today's engineering and science majors and this machine may be the vehicle to do it!

## **Sigma, R/S, and functional grouping**

Message #10 Posted by **Karl Schneider** on 24 July 2007, 4:56 a.m.,  
*in response to message #1 by Richard Garner*

Richard Garner posted:

Quote:

\_\_\_\_\_

I noted the same thing. The basic issue is *functional grouping*, a good thing which seems to have been followed here at the expense of practicality.

Sigma+ is a data-entry key that also belongs to statistics and probability. On the Voyager-series models (e.g., HP-15C, HP-11C, HP-10C), Sigma+ and Sigma- are adjacent to the main data-entry keys, and also grouped with the prob/stat keys on the bottom row. R/S is grouped on the left side with other keys for programming, such as GTO, GSB, and SST. R/S can be used to allow entry of data, but without prompting, usage is not very obvious.

However, on the programming-friendly HP-41, HP-42S, HP-32S, and HP-32SII, R/S is much more of a data-entry key -- used immediately following a number key. Hence, it took the place of Sigma+, which is seldom used anyway.

The HP-32SII and HP-33S use R/S for completing data entry in Equation mode, and with the INPUT command for programs. Sigma+ was placed on the top row along with the other prob/stat keys. This would have been worth preserving on the HP-35s. However, the cursor keys on the top row displaced the prob/stat keys, which were all moved toward the bottom along with Sigma+. R/S went to the upper-left corner along with other keys for programming. This is very much like -- the HP-15C!

So, the bottom line: Good functional grouping, but diminished practicality for this aspect of the HP-35s.

### hp 35s hexadecimal math....what were they thinking?

Message #1 Posted by [Tom Lianza](#) on 23 July 2007, 6:14 p.m.

Here's a line from the manual that we should take note of....

"In RPN mode, the keys sin, cos, tan, sqrt,  $y^x$  and  $1/x$  act as a short cut to enter the digits A to F. In ALG mode, press the RCL A,B,C,D,E,F to enter the digits A to F."

To finish an entry, you have to hit the base key again, use the down arrow key to append a "h" to the number and you are all done! You have to do that with each entry... I guess they want to punish the user for trying to do hexadecimal math...

### Re: hp 35s hexadecimal math....what were they thinking?

Message #2 Posted by [Monte Dalrymple](#) on 23 July 2007, 7:08 p.m.,  
in response to message #1 by Tom Lianza

Yes, this is a major PITA. But it gets even worse. If you forget to append the "h" one of two things will happen... If the hex number contains one of "ABCDEF" it will complain about a syntax error and leave the cursor under the first digit. But if the number does not contain one of "ABCDEF"... it will happily enter the number... and assume that the number is decimal and convert it to hexadecimal.

I end up cursing at least once for every time I try to use the hexadecimal, which is a large fraction of what I use a calculator for.

But the 35s is so much nicer to look at, with the ENTER key in the right place, that I haven't gone back to the 33s or 16c yet.

Monte

*Message #5 Posted by **Chuck** on 23 July 2007, 8:08 p.m.,*

*in response to message #1 by Tom Lianza*

I'll probably get completely raked over the coals for this comment; I'm ready for it.

How many users of "scientific calculators" actually use hexadecimal? I realize some programmers and computer techs may. But I'm talking engineers, chemists, physicists, mathematicians, statisticians, etc. I know a lot of people rely on binary, octal, and hexadecimal in their professions, but I'm curious to know a percentage of actual users who do. I'm guessing a lot fewer than 1%. Is the 16C not the preferred device for this group?

I'm more interested in a calculator that can operate in any base, including e, pi etc. Some extremely interesting mathematics occurs in these bases. I wrote a program for the 50g to do this. Maybe one for the 35s is the way to go. But I still have two days to wait for mine. :(

Let me have it! :)

CHUCK

### **Re: hp 35s hexadecimal math....what were they thinking?**

*Message #6 Posted by **Bruce Bergman** on 23 July 2007, 8:38 p.m.,*

*in response to message #5 by Chuck*

Coals? No -- you've asked a reasonable question.

As a programmer, I probably use hex or binary once a week or so. I probably do at least some sort of basic functionality in these bases that often, sometimes more. It's generally limited to switching between bases, but frequently includes basic math, and basic logic operations too.

Personally, I think the issue is less about how MUCH we need it, but more about how EASY it is to use.

I would really prefer to use the 16c for this work -- as you postulated -- but it is such a rare and valuable calc that I won't subject it to use at work; dust, spills, theft, etc., are all concerns. If the 16c's were still in production, or available in copious quantities, then yes, I would totally be using that calc instead. There has been nothing like it since it came out.

Since they aren't prolific, I rely on my "desk calc", whatever model that is, to do my occasional base work. Here lies the second half of the problem...

If it's difficult to use, or not obvious in how to do something, then I have a big problem with that calc. Partly because I want to be able to just pound out my answers, but also because I have to trust the numbers. If I have to really carefully watch as I type in each number, make sure I've pressed the right operation, check to see the number makes sense, no errors, etc., then I've worked too hard at it. Some would argue that I should \*always\* do that anyhow. True. But with the 16c, for example, I never have to doubt my work -- it was so intuitive that the results were rock solid. With the new 35s (and the 33s before it; the 50g which is still different yet; etc), I always had to make sure I clearly was doing the right thing and the answers were plausible in context. That sucks. It needs to be easy to use, and rock solid in what it does without making me doubt my work.

A good example is what someone already posted. Go into hex mode and enter a number. Notice that if you

enter "25c", it complains of syntax error. Ugh. If I just enter "25", it takes it and converts it. Dangerous. I have to go put a "h" at the end to make sense in that context (a multi-keystroke step). At that point, I'm working too hard. That's not even talking about math or logic -- that's just entering a number.

I still think a program to emulate the 16c behavior is needed -- or something of that sort. Anyone else have ideas or comments?

My \$0.02 anyhow.

thanks, bruce

I don't know how many, but I'm one of them. I'm actually a programmer by trade, who happens to want the "scientific" functionality because I'm also interested in math, physics, and whatnot.

If only they'd implemented bin/oct/hex like they did in the HP-42S! I use that functionality a lot, and in the 42S it never trips me up, and it doesn't annoy me by requiring lots of keystrokes. (Which is more than I can say for the RPL series, and, from what I hear, the 35S!)

- Thomas

Certainly agreed here: For bin/oct/hex and logic, I'd say that the HP-16C is most robust, the Pioneer-series models are well-conceived, and the RPL-based models are cumbersome. Here's a lengthy post of mine from the Archives, which morphed into a discussion of simulators vs. emulators:

I'm an electronics design engineer and I need both binary and hex capability (rarely care about octal). Not on a daily basis, but when I need it, I need it, and as a not often used function it must be easy and foolproof to use. I don't want to have to read the manual after 6 months to figure it out again.

For that purpose I find the way the base functions work on my 20S to be ideal. It's the same as the Casio models where the HEX, BIN, OCT, DEC keys put the calc into the required mode and automatically convert the current displayed number from whatever mode it was in. The SHOW button switches between groups of 8 bits in binary mode.

Dave.

### **Re: hp 35s hexadecimal math....what were they thinking?**

*Message #12 Posted by [Steve Myers](#) on 23 July 2007, 10:09 p.m.,  
in response to message #5 by Chuck*

No coal raking here...sounds like a legitimate question. Most people don't need this functionality everyday, but some of us do.

As an embedded device developer, I use Hex-Bin every day. This is the only way to make any sense of complex port register settings and controlling things like LED matrices.

Another big use is in explaining in my comments how the hex numbers being used in a program reflect the settings of bitwise flags, pointers and port control settings.

Also, I am an Engineer, both Computer Science and Electronics

Well in electronics and some programming I use hex and binary conversions to and from decimal now and then. I can do binary <-> hex in my head. I'm surprised it looks so clumsy on the new HP35S with those extra button presses needed and it can trip you up with some numbers if you just press enter (sounds like a recipe for disaster), my HP32Sii seems to be much more elegant.

For those who don't use hex: I hardly ever use statistic functions (or SIN COS and TAN) but I'd be disappointed if my shiny new HP calc didn't do them very well.

### **Re: hp 35s hexadecimal math....what were they thinking?**

*Message #14 Posted by [Howard Owen](#) on 23 July 2007, 10:41 p.m.,  
in response to message #1 by Tom Lianza*

I'm writing a subnet calculator suite. Hex mode has me so annoyed, I do all the binary math in decimal mode. I do switch to hex occasionally to do a quick conversion or to verify I have my masks working right. It's really awkward, but not nearly so as the native base modes are.

The one advantage I can see to tagging the integer on the stack is so you can do mixed-base calculations. But who needs to do integer math with numbers of different bases? The only other thing I can figure is that, for some reason, they couldn't use the current base as a clue for what base to put an entry into. I'd hate to think that this major annoyance was intentional and optional! I can see requiring the tag when you are in, for instance, binary mode, and want to do hexadecimal input. But the assumption of decimal input in base modes other than decimal is evil, evil, evil!

Regards,  
Howard

I'd be curious to see the rationale for having to add the trailing 'h'. The only justification I can see would be

that from a decimal mode, you can enter some 1s and 0s and decide it's a binary and hit BASE 8. But to enter an hex number, the HEX mode has to be active to access ABCDEF, so ENTER should be enough!

Easy to use (fast) logic operations are one of the main reasons I use a calculator.

I was trying to understand what was going on in the Base Logic function learning module, and now I understand... this is crazy. While I'm happy that the logic functions are there (I really miss them on the 33s), when I'm working in hex, I'm only working in hex, and my mind just switches as if decimal doesn't exist. I'm going to forget the little h, and it's going to be a mess.... Darn it!

Well, it doesn't help matters that I have a typo in the answer for problem 1, does it?

I've sent the correction off to HP to be replaced on the site.

At least the answer shown in the screen captures is correct.

### **Re: hp 35s hexadecimal math....what were they thinking?**

*Message #19 Posted by [Paul Brogger](#) on 26 July 2007, 12:17 p.m.,  
in response to message #1 by Tom Lianza*

Easily, the BASE handling is the most unfortunate aspect of an otherwise delightful 33s upgrade.

And why did they make the SIN, COS, etc. row serve as the hexadecimal A-F input keys?

I can see that many of the keys actually *labeled* A-F are assigned primary functions that should terminate number entry.

So why, then, not put the SIN, COS, etc. row across the top of the keyboard and label its keys A-F?

Well, yes, then the arrow keys would be one row lower, but would that have made any real difference?

So, let me get this straight: The roll down and swap keys are removed from logical proximity with ENTER, etc. -- to make room for a six-key row of real-number functions (SIN, COS, etc.) -- which can then run completely across the keyboard and *hint* at an otherwise unapparent A-F sequence -- so that the (some might say ill-advised) arrows may be placed immediately below the display?

My, what tangled webs we weave . . .

And the requirement for trailing bits of syntactic sugar ("h", "o", etc.)? Bummer!

I'm trying to remember what was the device or system for which the simple use of a leading zero during integer entry was the sole requirement for forcing conversion in the chosen alternate base rather than the default base 10 . . . There are simpler ways!

Even the lowly 33s had a much more straightforward implementation of the BASE feature.

--

This is, of course, a design critique benefiting from my total ignorance of any other pertinent issues there may have been, as well as something like 20/20 hindsight. Still, it does all seem more than a bit *strained*.

But, hey! The 35s is certainly a refreshing piece of work, otherwise & overall.

I don't know where that convention first appeared, but the C programming language has it, and it was inherited by several other languages (C++ of course, and also tcl, perl, Java, JavaScript...)

So, should they also add the **0x** prefix for hexadecimal? Do you think prefixes are better than suffixes? ;-)

- Thomas

### **Re: hp 35s hexadecimal math....what were they thinking?**

*Message #21 Posted by **Paul Brogger** on 26 July 2007, 4:15 p.m.,  
in response to message #20 by Thomas Okken*

No, what I remember is this:

- \* Entering something like "123" was assumed decimal.
- \* Entering something like "123A" was assumed hexadecimal.
- \* But if you wanted "123h", you simply entered "0123".
- . (No special character, no "x".)

Maybe it was WYLBUR, an obscure text editor / RJE facility on IBM mainframes. (I was the resident expert . . .)

### Finally got my HP-42S

Message #1 Posted by [Seth Morabito](#) on 23 July 2007, 3:39 p.m.

Actually, two HP-42S's, and I have a question about the difference between them.

One of them has a flat, glossy LCD (1990 serial number), while the other has a recessed, matte LCD (1993 serial number). The newer LCD seems to be a little higher quality, maybe. Both were made in Singapore. I haven't checked the software version on them yet, but I imagine the newer one has a higher ROM rev. Are there any other differences I should be looking for?

I have to say, I really can see why people love them so much. Both of the 42S's I got are in really good condition, and I've decided to make one of them my "daily calculator" (next to my new 35s) for a while to get used to it. So far I love it! It's like having a teeny tiny 41CV in my pocket. I can easily see it has such a cult status.

The only things I don't like about it are the LCD, which people have already discussed ad nauseum, and the alpha entry mode. Alpha entry isn't terrible, but it's certainly not as nice as the 41C.

Overall, impressive. I look forward to playing with it more!

### Re: Finally got my HP-42S

Message #2 Posted by [Mike Morrow](#) on 23 July 2007, 4:17 p.m.,  
in response to message #1 by [Seth Morabito](#)

Quote:

I haven't checked the software version on them yet...

I bought two 1993 versions that the local university bookstore still had in stock in 1997. Serial numbers start with 3328S.

Turn it on, push LN and EXIT, and the self-test will start. My units say the firmware version is HP-42-E.

Quote:

...It's like having a teeny tiny 41CV in my pocket.

It's much better than that. The HP42S is five times faster, has much greater precision, has many more built-in functions, operates naturally in the complex domain, manipulates matrices much easier, has built-in solve and integrate functions, etc. The HP-41C/CV/CX has none of these, and even a HP-41C with Advantage module leaves much to be desired in comparison. The only thing that I miss that's on my HP-41CX is the clock/calendar/time functions.

Quote:

The only things I don't like about it are the LCD...and the alpha entry mode.

I've no real complaints about the LCD. It is good for a 20-year old calculator design. And it really wasn't designed to be a text processor.

Quote:

Overall, impressive. I look forward to playing with it more!

Take a look at the information at:

<http://www.finseth.com/~fin/hpdata/hp42s.html>

The built-in memory scanner/debugger is described on that page. By poking the appropriate value in the appropriate location, you can double the speed, at least until the value gets re-initialized on the next machine reset. This is not all that useful, but it's fun to be able to play with the machine's internal settings.

Mike

### **Re: Finally got my HP-42S**

This isn't the firmware version.

To check the ROM revision recall the memory scanner of the calculator with

EXIT + LOG

<-

You see something like 023F5:710D... The address and content differs from ROM to ROM, then press the <.> key to evaluate this address. In the top left corner of the display you see one alphanumeric character. The character is the ROM Rev. of the ROM. Known ROM revisions are A, B and C.

Cheers

Christoph

### hp 35s price hike at Wal-M?

Message #1 Posted by [ECL](#) on 23 July 2007, 3:03 p.m.

Somehow, I seem to recall the online price at WalMart last week was \$49 and some change...

Now it's up to 59:

[http://www.walmart.com/catalog/product.do?product\\_id=6015793](http://www.walmart.com/catalog/product.do?product_id=6015793)

I'm bummed that I still can't get an in-person look at either Fry's, Circuit City, or WalMart.

Oh well...guess I'll have to resort to the online thing.

ECL

### Re: hp 35s price hike at Wal-M?

Message #2 Posted by [Howard Owen](#) on 23 July 2007, 4:41 p.m.,  
in response to message #1 by [ECL](#)

Well now, *that's* a bummer. I wonder what could be behind such a move by the world's leading exponent of "price rollbacks?" Perhaps they are finally getting pinched with supply problems?

Regards,  
Howard

Message #3 Posted by [John Ioannidis](#) on 23 July 2007, 4:54 p.m.,  
in response to message #1 by [ECL](#)

Is it really worth your time and effort to drive to Fry's just to save a couple of dollars?

I got mine at buy.com, \$52 with free shipping if I didn't mind the standard delivery (I didn't).

### Re: hp 35s price hike at Wal-M? + I'm not pinching pennies! :)

Message #4 Posted by [ECL](#) on 23 July 2007, 11:47 p.m.,  
in response to message #3 by [John Ioannidis](#)

I'm certainly not trotting to Fry's to save money on shipping, if that's what you were implying.

Its just been a long time since one could find a truly solid RPN calculator on the shelves. That implying a conservative-ish layout, solid color scheme, beckoning memory (mostly), native vector support, and a proud and functional ENTER key.

ECL

**PC Library Editor for HP 48/49/50**

Message #1 Posted by [Howard Boardman](#) on 23 July 2007, 1:38 p.m.

Is there a PC based library editor for libraries for the above calculators?

**Re: PC Library Editor for HP 48/49/50**

Message #2 Posted by [Howard Owen](#) on 23 July 2007, 10:47 p.m.,  
in response to message #1 by Howard Boardman

Hi, Howard,

There are some 48/49/50 experts here, but this forum is mostly about older HP calculators. The best place to post questions like that is the comp.sys.hp48 news group. If you don't use a usenet news reader, you can follow the group through [Google Groups](#).

Regards,  
Howard

**Re: PC Library Editor for HP 48/49/50**

Message #3 Posted by [Howard Owen](#) on 23 July 2007, 10:52 p.m.,  
in response to message #1 by Howard Boardman

I should note that the 35S is not an "older HP calculator," obviously. The excitement on this board is because it's brand new, and because HP returned to some of the things folks around here cherished in the older models.

Regards,  
Howard

**Re: PC Library Editor for HP 48/49/50**

Message #4 Posted by [Tim Wessman](#) on 24 July 2007, 12:39 a.m.,  
in response to message #1 by Howard Boardman

What do you mean by library editor? Do you mean a program that will (attempt) to automatically convert libraries from the 48 to the 49/50? Do you mean a tool to program and create libraries?

Both of those are available.

TW

**Re: PC Library Editor for HP 48/49/50**

### HP 33s programs compatible with HP 35s

Message #1 Posted by [Howard Boardman](#) on 23 July 2007, 1:26 a.m.

Are programs for the two calculators interchangeable?

### Re: HP 33s programs compatible with HP 35s

Message #2 Posted by [Namir](#) on 23 July 2007, 9:46 a.m.,  
in response to message #1 by Howard Boardman

Howard,

My first guess is that the HP-35s should be able to run most if not all HP-33s programs. The reverse is not true especially if the HP-35s program uses the indirect addressing feature, step-numbered GTO and XEQ statements, and so on.

One can deliberately write HP-35s programs that are void of new features and make them compatible with the HP-33s. This makes sense if you only have an HP-35s at hand and you need to write a program for someone else who only has the HP-33s.

So the bottom line is: Yes and No ... depending on the features used in the HP-35s.

Namir

### Re: HP 33s programs compatible with HP 35s

Message #3 Posted by [mjcohen](#) on 23 July 2007, 9:51 a.m.,

### **Coordinates conversion to bearing and distance**

Message #1 Posted by [rodj](#) on 23 July 2007, 12:43 a.m.

Hi,

I stumbled onto this forum while looking for an old calculation I used to perform with my HP11C back in my civil draughting days.

The quick calculation involved converting latitude and longitude coordinates into a bearing and a distance using only the functions on the 11C : hr/hms, sigma +/-, polar/vector.

The old 11C finally broke down and I now have a 32sII (- once an rpn user, always an rpn user -) but for the life of me I can't remember how to perform the conversion and was wondering if there was a forum member here that may know the correct way to do it??

I'm an avid fisherman and I'm keen to find the answer so I can use it for quick navigation purposes. Any help is greatly appreciated.

Apologies if this has already been discussed and answered.

Regards, Rod

### **Re: Coordinates conversion to bearing and distance**

Message #2 Posted by [Chan Tran](#) on 24 July 2007, 12:55 p.m.,  
in response to message #1 by [rodj](#)

I think the formula is in the 11C manual. I don't have the manual now but I remember that there is such a formula in the book. It would be easy to adapt it to the 32SII.

### [OT] It all began with them...

Message #1 Posted by [Olivier TREGER](#) on 22 July 2007, 8:49 p.m.

Hello,

Although we're all here for HP calcs, I thought some of you may be interested in seeing the other side of my humble collection: [slide rules](#).

This section still has to get some text since it's now only a list of the slide rules I own with specs but no history, no interesting text.

Thanks for your feedback, if you've got time to cruise on it.

Cheers, Olivier (\_from\_Paris)

### Re: [OT] It all began with them...

Message #2 Posted by [Namir](#) on 22 July 2007, 9:15 p.m.,  
in response to message #1 by [Olivier TREGER](#)

Olivier,

Slide rules are analog devices since they are always giving you all kinds of results--you pick which one you want. Calculators are digital devices. The two types are very different in many ways (accuracy, ability to chain calculations, memory, programmability).

I feel slide rules and calculators are as different as water and oil.

I used slide rules in high school and college. I also used scientific calculators in college. I was the only student on the engineering campus of Baghdad University who had a programmable HP calculator (at least until I graduated).

Namir

### Re: [OT] It all began with them...

Message #3 Posted by [Howard Owen](#) on 23 July 2007, 2:06 a.m.,  
in response to message #2 by [Namir](#)

Quote:

\_\_\_\_\_

\_\_\_\_\_

You make a good case for the difference between slide rules and calculators, Namir, but there is one similarity you may have missed. Both tools were used for the same purposes. The HP-35 made the slide rule obsolete. It was a better tool, but that just underlines the similarity. The HP-35 was specifically designed to do the same jobs a slide rule did. The fact that it did so faster, with better accuracy and

precision, and was easier to boot, are all differences in quality, not in kind. Later, when the programmable hand held calculator came along, you started into territory no slide rule could go. At that point, the distinction becomes clearer, in my mind.

Regards,  
Howard

**Re: [OT] It all began with them...**

*Message #4 Posted by **Hans de Moor** on 23 July 2007, 2:22 a.m.,  
in response to message #3 by Howard Owen*

I switched from a slide rule to an HP-45 in college and never looked back.

However, one thing that is very deceptive with a calculator is it can give you a false sense of precision. In most real world applications measurements are only known to two or three digits. For example, if I drive 110 km in 3.2 hours, my average speed would properly be stated as 34 km/hr, not 34.375 km/hr.

**Re: [OT] It all began with them...**

*Message #5 Posted by **Howard Owen** on 23 July 2007, 3:30 a.m.,  
in response to message #4 by Hans de Moor*

Are "significant digits" more apparent when using a slide rule? Or is it just that all those digits are there on the calculator, whether they are significant or not, whereas with a slide rule you have to continue manipulating to get successive digits?

Regards,  
Howard

**Re: [OT] It all began with them...**

*Message #6 Posted by **Bill (Smithville, NJ)** on 23 July 2007, 6:54 a.m.,  
in response to message #5 by Howard Owen*

While I don't collect slide rules, I do still have my original Post Log-Log slide rule I used in high school and college. I keep it out so that I am reminded of it and it's just fun to pick up and play with.

Several years ago I read an article about how the change from the slide rule to the calculator/computer has resulted in the loss of the ability to make accurate back of envelope estimates. Especially when dealing with orders of magnitude. Slide rules required you to normalize numbers and to know where you need to place the decimal point in the results. Fascinating article. I've observed this tenancy in some of the young engineers at work. They will believe the answers from the calculator or computer even when, with just a quick rough calculation, it can be shown that the results are way off base.

Bill

**Re: [OT] It all began with them...**

*Message #7 Posted by **Namir** on 23 July 2007, 9:40 a.m.,  
in response to message #6 by Bill (Smithville, NJ)*

Bill,

"Know Your Data" is a good motto to apply. The calculator, computer, slide rule, and so on are just tools that can (under whatever input and processing conditions) give wrong answers. So a person should have an idea of what the results are. If not, double checking the calculations is always a good idea.

I work with statistics a lot, and "Know Your Data" is a good concept to observe, because all these regression tools are not thinking for me, they are just crunching whatever input I give them.

Namir

**Re: [OT] It all began with them...**

*Message #8 Posted by [koendv](#) on 23 July 2007, 7:14 a.m.,  
in response to message #5 by Howard Owen*

I'd say a pocket slide rule has about the same accuracy as most physical values you come across: two digits and a reasonable guess at a third.

**Re: [OT] It all began with them...**

\_\_\_\_\_

From my experience a lot of engineers, back then as well as now, either don't pay attention to precision or forgot how important this is. With a slide rule you only calculate results to a limited precision. The HP-35 gave many more digits of accuracy.

HP must have realized this to be a problem. On the HP-45 they limited the precision at boot to 2 digits past the decimal point. One had to manually change the precision to something greater. I believe they did this through all of the Classics.

---

Booting the HP-35 was a fairly complex process actually. When turned on, the surge of current starts an oscillation in a DC-DC converter, and charges several capacitors to smooth out 3 different internal voltages. As those ramp up and become stable, a one-shot Schmitt trigger fires which turns on the Sync pulse - a synchronization heartbeat if you will, and resets memory. With Control & timing active the other IC's begin operations and the display drivers start operating.

;) )

**Math Challenge**

Message #1 Posted by [Chuck](#) on 21 July 2007, 10:40 p.m.

Something to keep your mind occupied whilst waiting for your 35s.

This may be an old problem for some, but still a nice challenge.

Three panes of glass are arranged parallel to each other. Each pane allows 70% light through, reflects 20%, and absorbs 10%. What percentage of light will pass entirely through all panes of glass? Assume a beam of light is emitted to the left of the three panes and exits to the far right; how much emits out to the right? Careful.

**Re: Math Challenge**

Message #2 Posted by [Scott Blakely](#) on 22 July 2007, 1:30 p.m.,  
in response to message #1 by Chuck

I admit I am being picky here, but can we assume the following while answering this question:

1) The beam of light is exactly perpendicular to the long axis of the panes of glass (really weak ND filters?) 2) That the beam of light is non-monochromatic? 3) That the beam of light is not polarized and that the "filters" are not polarizing the light passing through them?

I deal with these types of questions in microscopy all of the time, so I am a bit sensitive to the particulars, I guess ;)

**Re: Math Challenge**

Message #3 Posted by [Chuck](#) on 22 July 2007, 1:51 p.m.,  
in response to message #2 by Scott Blakely

Don't over-analyze the problem. It's intended to be a "simple" math exercise, not a twisted optical-microscopy head basher. Assume the percentage of light transmission, reflection, and absorption is the same in all directions regardless of frequency, polarization, etc.

Also, after a solution is devised, can it be evaluated on an HP calculator. (I did mine with Mathematica.)

**Re: Math Challenge**

Message #4 Posted by [John Gustaf Stebbins](#) on 22 July 2007, 2:57 p.m.,

### **Re: Math Challenge**

*Message #9 Posted by **ECL** on 22 July 2007, 2:11 p.m.,  
in response to message #1 by Chuck*

Ok, so it looks like a limit problem, where 0.7L passes through the first pane (p1), and then there is an infinitely decaying portion that is reflected between p1 and p2, and similarly between p2 and p3. I'm headed out to breakfast w/ my sweet wife (who is tapping her foot while standing at the door)...so at least I have some fun napkin-math at the table :)

I suspect that I can devise a series that will converge on the sum percentage (x) of incident light that may pass

through:  $x * L$

ECL

Message #10 Posted by **Chuck** on 22 July 2007, 3:13 p.m.,  
in response to message #9 by ECL

There's also light that will exit to the left and be lost. The light is zig-zagging back and forth infinitely; some is absorbed, some exits to the right, some exits all the way back to the left and is lost. That's what makes it a great problem.

Without giving too much away, my solution involves a couple of summations, a combination, and a limit. Crazy. But I'm very interested in other solutions. We'll have to request answers in a few days.

"Napkin-math". That's great. Many times my wife has caught me doing that during dinner. :)

### Re: Math Challenge.. Yuck.. infinite series..

in response to message #1 by Chuck

This is a straight-forward problem in linear algebra.

Draw a picture, work from the far right and set up the equations using the transmitted light and relected light from every pane. You'll end up with six equations with six unknowns. Using the equation solver for matrices in my HP-49g+ I found that the light transmitted out of the third pane is 38.03% of the original light.

I'll e-mail the solution if anyone likes.

Message #13 Posted by **Chuck** on 22 July 2007, 11:11 p.m.,  
in response to message #12 by Hans de Moor

Very nice Hans. I tried a matrix solution on my first attempt, but must have had something out of place. I went with the brute force method. Email me your solution, I'd like to see various methods. Hopefully we'll get a few more.

CHUCK

Message #14 Posted by [Arnaud Amiel](#) on 23 July 2007, 5:15 a.m.,  
in response to message #13 by Chuck

I tried the matrix approach as well and found a result for transmission a bit higher. I also got just above 30% reflected

Arnaud

## Re: Math Challenge

Message #15 Posted by [Katie Wasserman](#) on 23 July 2007, 5:47 a.m.,  
in response to message #13 by Chuck

5 equations suffice I think:

Picture the 3 panes of glass arranged left to right with the light source on the left.

let:

A = light transmitted from 1st pane to 2nd pane (left to right)  
B = light transmitted from 2nd pane to 3rd pane (left to right)  
C = light transmitted from 3rd pane on (left to right)  
(this is what we want to solve for)

X = light transmitted from 2nd pane back to 1st pane (right to left)  
Y = light transmitted from 3rd pane back to 2nd pane (right to left)

Then:

A = .7 + .2X  
B = .7A + .2Y  
C = .7B  
X = .2A + .7Y  
Y = .2B

It's pretty simple to solve these exactly:

A = .672/.902  
B = .7/.96 \* A  
C = .7 \* B  
C = 38.0266075388%

## Re: Math Challenge

Message #16 Posted by [Arnaud Amiel](#) on 23 July 2007, 6:20 a.m.,  
in response to message #15 by Katie Wasserman

What about light reflected back towards the source by the second panel and back again in the right direction by the first panel?

I believe the matrix approach takes care of this one.

Arnaud

Message #17 Posted by **Hans de Moor** on 23 July 2007, 9:50 a.m.,  
in response to message #15 by Katie Wasserman

Five equations are all you really need. I set up one additional for the light reflected back towards the source. It's really not needed for the solution but it allows you to get all the light paths.

Hans

Message #18 Posted by **Chuck** on 23 July 2007, 10:12 a.m.,  
in response to message #15 by Katie Wasserman

Katie. This is wonderful. It's VERY close to what I had originally, but had a Z (in your notation) for the light lost to the left, which gives a 6th equation (albeit unnecessary). When I solved it with a matrix I must have missed one of those darn negative signs.

CHUCK

## A Monte Carlo approach

Message #19 Posted by **Valentin Albiilo** on 23 July 2007, 6:48 a.m.,  
in response to message #1 by Chuck

Hi, Chuck:

Chuck posted:

*"Something to keep your mind occupied whilst waiting for your 35s"*

It's been a fair number of days since I got an HP35S but I'll take your interesting challenge anyway.

*"Three panes of glass are arranged parallel to each other. Each pane allows 70% light through, reflects 20%, and absorbs 10%. What percentage of light will pass entirely through all panes of glass? Assume a beam of light is emitted to the left of the three panes and exits to the far right; how much emits out to the right?" [...] Also, after a solution is devised, can it be evaluated on an HP calculator [?]"*

The symbolic solution for arbitrary parameters is pretty trivial from a purely mathematical point of view and writing a program to numerically evaluate it holds no difficulty either, just a little drudgery, so for a change and as this kind of 'physical/engineering' problem is ideally suited to simulation, here's a novel **Monte Carlo** approach which can be concocted in a very few lines, requires no mathematical knowledge whatsoever, can be adapted to run on the simplest calc models without requiring solvers or matrix operations, and delivers a fair approximation to the exact theoretical result.

The program simulates 10, 100, 1000, ..., 1000000 photons entering through the left side of the leftmost panel, one at a time, simulates their random interactions with each side of each panel, and duly counts how many of them do exit to the far right. The logic is crystal-clear ('P1L' stands for 'Panel 1, Left side', 'P1R' stands for 'Panel 1, Right side', and so on):

```
10 DESTROY ALL @ FOR D=1 TO 6 @ C=0 @ FOR N=0 TO 10^D-1
20 'P1L': R=RND @ IF R<.7 THEN 'P2L' ELSE 'NXT'
30 'P1R': R=RND @ IF R>.2 THEN 'NXT'
40 'P2L': R=RND @ IF R<.7 THEN 'P3L' ELSE IF R<.9 THEN 'P1R' ELSE 'NXT'
50 'P2R': R=RND @ IF R<.7 THEN 'P1R' ELSE IF R>.9 THEN 'NXT'
60 'P3L': R=RND @ IF R<.7 THEN C=C+1 ELSE IF R<.9 THEN 'P2R'
70 'NXT': NEXT N @ DISP USING "2(7D),5D.2D,A";N,C,C/N*100,"%" @ NEXT D
```

A sample (repeatable) RUN would be:

```
>RANDOMIZE PI @ RUN
```

| # Photons | Transmit | %      |
|-----------|----------|--------|
| 10        | 5        | 50.00% |
| 100       | 30       | 30.00% |
| 1000      | 367      | 36.70% |
| 10000     | 3755     | 37.55% |
| 100000    | 38068    | 38.07% |
| 1000000   | 380338   | 38.03% |

so it seems that some **38.03%** of the photons are transmitted, which agrees with the theoretical result to all four given digits.

The simulation can be easily adapted to coefficients other than 70%-20%-10% by changing the inline constants, and can also count the number of photons emerging at the *left* instead by inserting an incrementing counter at the proper place in the code.

The same approach will also work for any number of panels and for unequal panels (different coefficients for each panel and/or different coefficients for each side of a panel) by simply changing their inline constants. Thus, it's quite general in nature and, for a real-life engineering problem, would give decent, useable results with *very little intellectual effort* even in circumstances where the underlying math necessary for a theoretically exact result would quickly get tremendously complex or even possibly out of hand.

Best regards from V.

in response to message #20 by Chuck

Hi, Chuck:

Chuck wrote:

*"Valentin, you never cease to amaze me with your prowess."*

Thanks, very kind of you.

*"Unfortunately I have two more days to go until my 35s arrives [skrimped on postage :( ], but I may need those two days to decipher your method (excuse my programming naivety, but what is the language?)"*

As most of my posted productions, the program is written in HP-71B's native BASIC dialect, using plain-vanilla statements (no ROMs, etc), as it achieves the *perfect* balance between *power* (very short programs) and *clarity*, so that most people will be able to understand the underlying algorithms and port them to whatever other languages they might prefer (RPN, RPL, ...) with ease.

Thanks a lot for your *very* interesting challenge, keep them coming :-)

Best regards from V.

### Re: A Monte Carlo approach

Message #22 Posted by [Vincze](#) on 27 July 2007, 10:02 a.m.,  
in response to message #21 by Valentin Albillo

How would you do problem on 35s?

### HP35s conversion (was Re: A Monte Carlo approach)

Message #23 Posted by [Valentin Albillo](#) on 28 July 2007, 9:26 p.m.,  
in response to message #22 by Vincze

Hi, Vincze:

Vincze posted:

*"How would you do problem on 35s?"*

This is a trivial, on-the-fly straightforward conversion of my original HP-71B BASIC program:

```

LBL S
STO M          RCL V          100
STO N          X<Y?          RCLx C
0              GTO F002      RCL/ M
STO C          GTO B002      FIX 2
0.7            LBL D          RTN
STO U          RCL U
0.9            RANDOM
STO V          X<Y?
0.2            GTO B002
STO W          RCL V
LBL A          X<Y?
RCL U          GTO F002
RANDOM          LBL E
X<Y?          RCL U
GTO C002      RANDOM
GTO F002      X>Y?
LBL B          GTO E009
RCL W          1
RANDOM          STO+ C
X>Y?          GTO F002
GTO F002      RCL V
LBL C          X>Y?
RCL U          GTO D002
RANDOM          LBL F
X<Y?          DSE N
GTO E002      GTO A002

```

where "/" stands for the division key. Some sample runs:

```
Pi, SEED

      10, XEQ S [ENTER] -> 50.00 (%)
      100, XEQ S [ENTER] -> 30.00 (%)
     1000, XEQ S [ENTER] -> 36.70 (%)
    10000, XEQ S [ENTER] -> 37.55 (%)
```

You might want to optimize it by removing all labels except for the first one (LBL S), but in any case it runs much too slow in the HP35s to be of any use other than as a didactic example of a Monte Carlo simulation.

Notice that the results are exactly the same as the ones given by my original HP71B BASIC program, which strongly suggests both machines are using the *exact same* pseudorandom-number generator.

Thanks for your interest and

Best regards from V.

## Re: Math Challenge, 2 N panes solutions.

Message #24 Posted by **Egan Ford** on 26 July 2007, 7:18 p.m.,

in response to message #1 by Chuck

Quote:

---

Three panes of glass are arranged parallel to each other. Each pane allows 70% light through, reflects 20%, and absorbs 10%. What percentage of light will pass entirely through all panes of glass? Assume a beam of light is emitted to the left of the three panes and exits to the far right; how much emits out to the right? Careful.

---

Hello Chuck,

Since others already provided a solution for three panes, I worked on two N panes solutions. The first is calculated (quick, but needs RAM) and the other is simulated (low RAM, but needs time).

Calculated solution:

The following 71B program builds a  $2*N-1$  order sparse matrix to find the exact answer for any N (as long as you have enough RAM). The code should be easy to port to any other HP model with matrix support (sorry no 35S).

```
10 STD @ DESTROY ALL @ OPTION BASE 1
20 T=.7 @ R=.2
30 M=INT(SQR(MEM/2/8)) @ M=INT((M+1)/2)-1
40 INPUT "MAX N=",STR$(M);NO
50 FOR N=1 TO NO
60 DESTROY A,B,X
70 M=2*N-1
80 M0=MEM @ REAL A(M,M),B(M,1),X(M,1) @ M1=MEM
90 FOR I=1 TO M @ A(I,I)=-1 @ NEXT I
100 FOR I=N+1 TO M @ A(I-N,I)=R @ A(I,I-N)=R @ NEXT I
110 FOR I=1 TO N-1 @ A(I+1,I)=T @ NEXT I
120 FOR I=N+1 TO M-1 @ A(I,I+1)=T @ NEXT I
130 B(1,1)=-T
140 MAT X=SYS(A,B)
```

```

150 IMAGE "P(",2D,")= ",2D.10D,"% ",6D," ppm using",6D," bytes"
160 DISP USING 150;N,X(N,1)*100,X(N,1)*1000000,M0-M1
170 NEXT N
180 DESTROY ALL

```

Lines 10-40 setup the environment and prompts for the MAX N to calculate. The 71B, 48/49/50 matrix solver requires 2x the RAM used by the matrix. I assume that this is to preserve the original matrix. My 71B has ~64K free, so I am limited to ~32K for my matrix, or N=32.

Lines 90-120 setup the matrix, 140 solves.

### Output:

```

P( 1)= 70.00000000000% 700000 ppm using 62 bytes
P( 2)= 51.04166666667% 510417 ppm using 148 bytes

P(16)= 1.1455268133% 11455 ppm using 8212 bytes
P(17)= .8775487825% 8775 ppm using 9268 bytes
P(18)= .6722642349% 6723 ppm using 10388 bytes
P(19)= .5150036989% 5150 ppm using 11572 bytes
P(20)= .3945314511% 3945 ppm using 12820 bytes
P(21)= .3022410597% 3022 ppm using 14132 bytes
P(22)= .2315397822% 2315 ppm using 15508 bytes
P(23)= .1773772706% 1774 ppm using 16948 bytes
P(24)= .1358846583% 1359 ppm using 18452 bytes
P(25)= .1040981355% 1041 ppm using 20020 bytes
P(26)= .0797472129% 797 ppm using 21652 bytes
P(27)= .0610925284% 611 ppm using 23348 bytes
P(28)= .0468015997% 468 ppm using 25108 bytes
P(29)= .0358536442% 359 ppm using 26932 bytes
P(30)= .0274666640% 275 ppm using 28820 bytes
P(31)= .0210415888% 210 ppm using 30772 bytes
P(32)= .0161194843% 161 ppm using 32788 bytes

```

The first numeric column is the number of panes, the 2nd is the percentage of photons expected to make it through, the 3rd is the number of photons/million expected to complete the journey, and the 4th is the amount of RAM required for the matrix.

### Simulated (fun) solution:

```

10 DESTROY ALL @ RANDOMIZE PI @ OPTION BASE 1
20 FOR P=1 TO 5
30 T0=TIME @ L0=0 @ P0=0 @ DIM P0$[1000],P$[1000]
40 N=1000000 @ A=.1 @ R=.2+A @ C=0
60 FOR J=1 TO LOG10(N)
70 FOR I=10^(J-1) TO 10^J-1
80 T=0 @ D=1 @ L=0 @ P$=""
90 'A': IF D=1 THEN P$=P$&">" ELSE P$=P$&"<"
100 CALL PHOTON(D,T,A,R) @ L=L+1
110 IF T=P THEN C=C+1
120 IF T<P AND T>=0 THEN 'A'
130 IF T=P AND L>L0 THEN L0=L @ P0=I @ P0$=P$
140 NEXT I
150 IMAGE 2D,8D,8D,4D.2D,"% in ",5D.2D," sec LP:"
160 DISP USING 150;P,I,C,C/I*100,TIME-T0,L0
170 NEXT J
180 DISP "Longest Path:";L0;"Photon:";P0
190 T=0 @ D=1
200 FOR I=1 TO L0
210 T$=STR$(T)
220 IF T<10 THEN DISP " ";
230 IF P0$[I,I]=">" THEN DISP P0$[I,I];T$; ELSE DISP T$;P0$[I,I];

```

```

240 DISP " ";
250 IF MOD(I,18)=0 THEN DISP
260 IF P0$[I+1,I+1]=">" THEN D=1 ELSE D=-1
270 T=T+D
280 NEXT I
290 DISP @ DISP
300 NEXT P
310 END
320 SUB PHOTON(D,T,A,R)
330 X=RND
340 IF X<A THEN T=-1 @ GOTO 380
350 IF X>R THEN 370
360 IF D=1 THEN D=-1 ELSE D=1
370 T=T+D
380 END SUB

```

This is a lot longer that it needs to be because I wanted to track and display the longest path. The real work is done by lines 100-120 and 320-380. Lines 320-380 take the current direction and target and randomly determine the next target and direction. Lines 100-120 call PHOTON repeatedly until the target (0,1,2,...N-1) is -1 (i.e. right back at you or absorbed) or N (exited on the other side).

>26 >27 >28 >29 >30 >31 30< 29< >30 >31

```

The output is formatted number of panes, number of transmitted photons, number of photons that made it out the other side, percentage of escaped photons, simulation time, and the current longest path.

The funny output below chronicles the journey of the photon that took the longest path (in the output directly above that would be photon 698717). The > indicates forward (< backwards) movement and the number is the target. Above photon 698717 breezed through panes 0-9, bounced on 10 back through 9 and 8, bounced around the high single digit numbers and eventually make a break for the low 20s, then the low 30s, and eventually emerged a bit wiser (or a wiser bit).

Comparison of calculated to simulated:

| N  | Calculated | Simulated |
|----|------------|-----------|
| 1  | 700000     | 700309    |
| 2  | 510417     | 510826    |
| 3  | 380266     | 380791    |
| 4  | 286687     | 286649    |
| 5  | 217596     | 216278    |
| 10 | 56721      | 56891     |
| 32 | 161        | 162       |

Thanks for the challenge.

## Re: Math Challenge, 2 N panes solutions.

Message #25 Posted by [Valentin Albillo](#) on 27 July 2007, 6:30 a.m.,  
in response to message #24 by Egan Ford

Hi, Egan:

Once again, an awesome effort on your part, and that makes at least two in a row, I still remember your wonderful solutions to my latest S&SMC#19 challenge.

I want to thank you for taking the trouble to create those excellent solutions in the first place and, further, take the time and considerable effort to post them here, I really do appreciate them very much, collect them for future reference, and find them extremely interesting, so thanks a lot for doing it.

If I remember correctly, you mentioned in some of your posts that you weren't all that fluent in HP-71B BASIC, but it seems to me that you manage pretty well to write perfectly adequate code. Nevertheless (and please do not take this as any kind of criticism, far from it), it's true that your code

could at times be optimized to take less space and run faster, which in the case of the present simulation, can make quite a difference, even if only simple optimizations are attempted.

For instance, you have this subprogram that gets called a significant number of times:

```

320 SUB PHOTON(D,T,A,R)
330 X=RND
340 IF X<A THEN T=-1 @ GOTO 380
350 IF X>R THEN 370
360 IF D=1 THEN D=-1 ELSE D=1
370 T=T+D
380 END SUB

```

so any savings will make a fairly noticeable, worthwhile difference. You can trivially optimize it like this:

```

320 SUB PHOTON(D,T,A,R) @ X=RND @ IF X<A THEN T=-1 @ END
350 IF X>R THEN T=T+D ELSE D=-D @ T=T+D

```

this version will take less memory but, more importantly, will run appreciably faster as it doesn't have any GTO's, which are really slow in HP-71B's BASIC implementation, and there's also one IF statement less. Also, as you can see, no END SUB is ever necessary in a subprogram, any subprogram.

Similar trivial optimizations can be performed in a number of places with ease, which can be important for long-running programs or when you're squeezing every available byte of RAM to accommodate large matrices.

Best regards from V.

## Re: Math Challenge, 2 N panes solutions.

*Message #26 Posted by [Egan Ford](#) on 27 July 2007, 9:42 a.m.,  
in response to message #25 by Valentin Albillo*

Hello Valentin,

I initially dismissed the 71B/BASIC. I was once offered a free 71B and turned it down, but your code snippets caught my attention and ~4 months back I picked one up. Now equipped with MATH and HP41/FORTH ROMs, more RAM, and a little knowledge it is quite a machine.

Thanks for the tips. Keep them coming. Eventually I'll think BASIC, I still write prototypes in Perl or C, then port to BASIC without much thought.

OT: BTW, looking forward to your first 35s mini challenge.

Thanks again.

### Hp-50G- is it RPN "native"?

Message #1 Posted by [Scott Blakely](#) on 21 July 2007, 11:26 a.m.

Hi all,

What I mean by my question is this: Does the HP-50G run RPN as the default and is the documentation written primarily for the RPN user?

I have a HP-49G (one of the very first, with all of the issues). Frankly I didn't use it much at all because I quickly tired of beating my head against trying to parse the algebraic manual into the RPN key stroke equivalents.

I don't have the time to "argue" with my calculator. If the HP-50G makes using a graphing calculator in RPN essentially transparent to the RPN minded-user, then I will consider purchasing one (if I can find one \*anywhere\*).

I own 2 HP 32SII and a HP 20S, I don't use the 20S much either because it isn't RPN. It was a gift, and it is too good of a calculator to just toss. It stays in my truck to do quick calculations as I am very protective of my 2 32sIIs.

Alternately, if someone knows of a site where the HP 49G manual has been translated into RPN, then I would be interested in that as well. Although my HP-49G has the bad display, etc. An unfortunate result of my not using it enough to keep aware of the revisions and HP offerings early on.

### Re: Hp-50G- is it RPN "native"?

Message #2 Posted by [Matt](#) on 21 July 2007, 1:32 p.m.,  
in response to message #1 by Scott Blakely

The 50G is in algebraic by default.

The 'manual' is horrible, IMO.

Some functionality is described for ALG only, some for RPN only. It really is very poor. You get a printed user manual, which is full of typo's and is only 184 pages. If you hate trees, the 'proper' manual is nearly 900 pages.

You can download the manuals [here](#)

[Link to manuals](#)

If you can put up with those frustrations it's actually pretty good in RPN, but some inconsistencies in menu display do remain.

*Edited: 21 July 2007, 1:34 p.m.*

### Re: Hp-50G- is it RPN "native"?

Message #3 Posted by [John Keith](#) on 21 July 2007, 2:25 p.m.,  
in response to message #1 by Scott Blakely

Hi Scott,

The HP 50g does default to algebraic mode (a marketing decision no doubt) but is easily changed to RPN via the MODE key. The paper manual that comes with it is pretty useless, but the Advanced User's Manual,

available from HP or hpcalc.org, will have all the information you need.

There are some differences between the 50g and traditional HP calculators, mainly due to the 50g having an unlimited-depth stack, but most HP users have no problem adjusting.

You can get them from many on-line retailers including Amazon, or from hpcalc.org, which is a great site worth supporting. Of course, if you want a more traditional RPN calc, there's always the new HP 35s, which has been the subject of much recent discussion on this site.

John

### **Re: Hp-50G- is it RPN "native"?**

*Message #4 Posted by [Scott Blakely](#) on 21 July 2007, 3:31 p.m.,  
in response to message #3 by John Keith*

Thanks all,

So let me ask, as an example, how easy is it to convert units if the 50G is in RPN mode. The 49G really gave me a headache when it came time to do things like this.

I am often teaching and/or demonstrating and need to quickly access the built in functions. The 49G was a real bottle-neck for me in this area. Would you say the 50G is improved in this regard?

Thanks,

Scott

### **Re: Hp-50G- is it RPN "native"?**

*Message #5 Posted by [Matt](#) on 21 July 2007, 4:23 p.m.,  
in response to message #4 by Scott Blakely*

It's really nice to do this in RPN.  
Example..  
(Assuming you have soft menus enabled)  
R-shift 6 (to get the units menus)  
Put '10' on the stack, then choose a unit to attach to it (eg, inches)  
You would then see

```
1:                10_in
```

To convert to, say, metres, you just press...  
L-shift F1  
To get the conversion

```
1:                .254_m
```

And thats it.  
Much easier than doing it in ALG.

You might like to try this 50G emulator (for Windows)

<http://www.educalc.net/2140088.page>

Edited: 21 July 2007, 4:35 p.m.

### **Re: Hp-50G- is it RPN "native"?**

Message #6 Posted by [Scott Blakely](#) on 21 July 2007, 6:37 p.m.,  
in response to message #5 by Matt

That looks nice.

Also, a quick look through some sections of the user manual pdf show that there are dual instructions for ALG and RPN. That looks really good.

So I found one at a local Circuit City. A bit more than Amazon, but when you factor in shipping and sales tax it is not so bad.

I think I will go and get it tomorrow.

So that leaves the question of is there anyone out there that would like to buy a HP49G (early version) all docs and cable, but no cover - it went missing some time ago.

Thanks for all of the feedback.

Scott

Message #7 Posted by [Scott Blakely](#) on 21 July 2007, 6:42 p.m.,  
in response to message #6 by Scott Blakely

Okay, one more question,

Will most 48 and 49 programs run on the 50G?

### **Re: Hp-50G- is it RPN "native"?**

Message #8 Posted by [Bruce Bergman](#) on 21 July 2007, 7:12 p.m.,  
in response to message #7 by Scott Blakely

HP \*really\* did an awesome job with the units conversion functionality in the 48/49/50 family. I haven't seen a better implementation of that since it first came out in the late 80's. As with the example given above, you enter a value, then the units, and then convert to the other unit you want. You can even do math on the units (like taking cm and making cm<sup>2</sup> or that kind of thing). You won't be disappointed, I think.

As for programs, I'd say 70%-80% of the 48/49 programs will run on the 50. Where you have to be careful are compiled SysRPL programs and libraries, or where certain SYSEVALs are used -- those are all different per machine. User RPL programs will run with almost no problem though. Out of about 30 programs I found on the web for the 48/49 family, all but 3-4 worked fine on the 50. The ones I had problems with, I \*really\* had problems with (like locking up the calc, erasing memory, etc). As long as you're careful, and make backups from time to time, you can try just about anything.

James M. Prange (Michigan), who posts on this board, probably knows more about the 49/50 family than anyone I've ever met. Every post of his is comprehensive, enlightening and rock solid accurate. He can probably tell you exactly what to watch out for when considering 48/49 programs to run on the 50. He's truly a guru of this calc.

thanks, bruce

**Re: Hp-50G- is it RPN "native"?**

*Message #9 Posted by [Scott Blakely](#) on 22 July 2007, 4:40 p.m.,  
in response to message #8 by Bruce Bergman*

Very good.

Last (hopefully) question

It is a bit confusing from reviews I've been reading. You can upload programs to the 50G via the USB, correct?

**Re: Hp-50G- is it RPN "native"?**

*Message #10 Posted by [Matt](#) on 22 July 2007, 4:43 p.m.,  
in response to message #9 by Scott Blakely*

Yes, you can use the USB cable for uploading, downloading, screenshots, etc.

**50g on sale! (Was: Re: Hp-50G- is it RPN "native"?)**

*Message #11 Posted by [Bruce Bergman](#) on 22 July 2007, 8:52 p.m.,  
in response to message #10 by Matt*

You can use the USB, but the SD card is easier. Buy a \$9 512MB card, put your stuff on there and use it or install it that way. It's much easier, IMHO.

BTW, I see that Circuit City has the HP-50g on sale this weekend, at a low price of \$129. That's \$10-\$40 lower than other places, depending on where you buy it from. It's a great price.

thanks, bruce

**Re: 50g on sale! (Was: Re: Hp-50G- is it RPN "native"?)**

*Message #12 Posted by [Scott Blakely](#) on 22 July 2007, 8:57 p.m.,  
in response to message #11 by Bruce Bergman*

Actually the Circuit City website has them for 124.99.

I called the store and spoke to the manager. He said that if I bring a printout of the website, they will match the price.

I also have to pick up an SD card reader for my computer....

*Edited: 22 July 2007, 8:58 p.m.*

**Re: 50g on sale! (Was: Re: Hp-50G- is it RPN "native"?)**

*Message #13 Posted by [Dave Johnson](#) on 22 July 2007, 10:06 p.m.,  
in response to message #12 by Scott Blakely*

Well you can get them through Walmart for \$120 + tax

But I would use hpcalc.org myself....

*Edited: 22 July 2007, 10:07 p.m.*

**Re: 50g on sale! (Was: Re: Hp-50G- is it RPN "native"?)**

*Message #14 Posted by [Olivier \(Wa\)](#) on 22 July 2007, 11:39 p.m.,  
in response to message #13 by Dave Johnson*

Actually \$117.99 at Buy.com, with free shipping...

**Re: 50g on sale! (Was: Re: Hp-50G- is it RPN "native"?)**

*Message #15 Posted by [Bruce Bergman](#) on 23 July 2007, 12:31 a.m.,  
in response to message #14 by Olivier (Wa)*

WoW! Okay, so can anyone beat \$117?? :-)

thanks, bruce

**Re: 50g on sale! (Was: Re: Hp-50G- is it RPN "native"?)**

*Message #16 Posted by [Alex](#) on 26 July 2007, 5:23 p.m.,  
in response to message #15 by Bruce Bergman*

\$117.99 at Amazon, and their customer service is far superior to any other mass-marketer, in my experience!

ooh, so tempted...

Almost, but not quite.

[http://www.loomcom.com/junk/hpmuseum\\_isgreat.jpg](http://www.loomcom.com/junk/hpmuseum_isgreat.jpg)

How'd you do the lowercase "S"?

### Re: 35s - can you display this?

Message #4 Posted by [Namir](#) on 21 July 2007, 5:19 p.m.,  
in response to message #3 by Seth Morabito

Insert the standard deviation  $S_x$  and then delete the x to get the small s. Of course this has to be done in program mode using the EQN button.

### List of 35s lowercase letters and where they can be found

Message #5 Posted by [Gene Wright](#) on 21 July 2007, 7:41 p.m.,  
in response to message #4 by Namir

It appears that 20 of the 26 lowercase letters can be produced that I've found so far. Haven't found an f, j, l, q, v, or z yet.

The list of lowercase letters and where they can be found is shown below. These may not be the ONLY places to generate the lowercase letters, but these do work. Any suggestions on the missing letters?

```
a - CONST atm
b - L.R. b
c - CONST c
d - BASE d
e - CONST eV
f - ?
```

g - CONST g  
h - CONST h  
i - i key  
j - ?  
k - CONST k  
l - ?  
m - CONST Vm  
n - CONST Mn  
o - BASE o  
p - CONST mp  
q - ?  
r - L.R. r  
s - s,sigma - sx  
t - CONST atm  
u - CONST u  
v - ?  
w - x-bar,y-bar Xw  
x - SUMS Sumx  
y - SUMS Sumy  
z - ?

### Re: List of 35s lowercase letters and where they can be found

Message #6 Posted by [Howard Owen](#) on 23 July 2007, 2:05 p.m.,  
in response to message #5 by Gene Wright

The Z in 'Zo' looks like a capital, but it actually fits perfectly in the lower case "font."

Regards,  
Howard

### **Odd sign problem with HP-97**

Message #1 Posted by **Dan W** on 20 July 2007, 4:44 p.m.

I have an odd problem with the CHS key on my HP-97 I have never seen before.

When I enter a number and hit the CHS key, a minus sign shows twice, at the left where expected, and at the right where it is used for the EE component. However the number is still correct (a negative number). The extra minus sign stays after hitting ENTER.

If I do a calculation that results in a negative number, both sign segments show.

When I enter a number with an exponent and try to change the sign of the exponent, no minus sign shows, although the number is entered correctly. However even though the number has a negative exponent, the minus sign does not show.

Also if I do a calculation that results in a number with a minus exponent, the minus does not show, but the number is correct.

The problem is with the LED display only, the numbers print with the correct signs.

So it seems the problem has to be with the LED display drivers. Any ideas on how to debug this, and determine if it is an IC or a problem with a discrete component of the PCB? Anyone else ever seen such a problem?

Thanks,

-- Dan

### **35s manual corrections list**

Message #1 Posted by [Gene Wright](#) on 20 July 2007, 4:03 p.m.

I know there are some formatting issues. Here are the factual errors of which I am aware.

- 1) Page 4-9: In the table of constants, Impedance is misspelled as "impenceence."
- 2) Page 14-24: Note 1 indicates "See A014" but should say "See A016" since that is the line where the "INVALID (I)" message is generated.
- 3) Page 14-24: Point 3 should indicate a maximum of 801 indirect registers (0 through 800) and not "800".

Bruce, can you tell if your lcd is likewise misaligned as seen on that picture?

A second question, how would you rate the haptics of the keys? Soft, hard?

Thank you,

Thomas

### Re: Not celebrating 35 years

Message #5 Posted by [Bruce Bergman](#) on 21 July 2007, 7:04 p.m.,  
in response to message #4 by Thomas Radtke

The keys are really nice. Like the "old days". Tall, crisp and have a good feel. Not the best keyboard they've made, but certainly one of the best. It just looks good, with a nice, distinct appearance. Though the keys are close together, the height helps with the separation, and the labels are clear.

Really, it's a beautiful calc. I'm quite impressed so far. If I had anything to complain about, it would be the speed. I wasn't expecting it to be the fastest calc out there, but it turns out to be (in reality) one of the slowest calcs out there. :( Don Shepard, who posts here, also did some timing runs compared to the 17bxx family and it's even slow compared with those.

BTW, I'm not sure which picture you meant when you mentioned the askew LCD. I don't see any so far. My unit is right on level and perfectly aligned. I also don't have the problem that another poster mentioned about the display bleeding black for a few seconds when pressed.

thanks, bruce

### TI-Nspire dismantled - ARM 9 @ 150 MHz!

Message #1 Posted by [Joerg Woerner](#) on 20 July 2007, 11:52 a.m.

Hi calculator collectors,

I mentioned already that the TI-Nspire is available in Europe. Mine arrived and I disassembled one of them immediately. It is based on LSI LOGIC's ZEVIO architecture and features tons of memory for the Operating system, Files and User data. Booting after power-up takes 30 seconds when you switch between the keyboards...

Get your own impression here:

<http://www.datamath.org/Graphing/NSpire.htm>

(I was in a rush - the images are perfect but the text is not finished...)

Regards, Joerg

Quote:

Hi calculator collectors,

I mentioned already that the TI-Nspire is available in Europe.

I must have missed that. Where can they be purchased?

Quote:

Mine arrived and I disassembled one of them immediately. It is based on LSI LOGIC's ZEVIO architecture and features tons of memory for the Operating system, Files and User data.

But I'm sure the question most potential users want answered is 'is it powerful enough for a decent port of DOOM?'

Quote:

Booting after power-up takes 30 seconds when you switch between the keyboards...

Wow! Faster than XP then ;-)

Quote:

Get your own impression here:

(I was in a rush - the images are perfect but the text is not finished...)

Regards, Joerg

---

I like the screen size. But it really is a pig-ugly thing. But at least trig and exponential functions are 'primary', unlike the 89 How are they keys? they look a bit rubbery.

### **Re: TI-Nspire dismantled - ARM 9 @ 150 MHz!**

*Message #4 Posted by [Namir](#) on 20 July 2007, 6:40 p.m.,  
in response to message #1 by Joerg Woerner*

Joerg,

I feel you are truly blessed since you can read the German manuals of the TI Nspire. I think we need the manual(s) for a machine like the TI Nspire since I don't think it's trivial to operate and more importantly program.

I am very glad that you are attending HHC2007 and will be giving a talk. I think it's very open minded to have someone of your caliber and commitment to calculators be present. Rest assured that you will be among friends.

I am very much interested in buying one or two (not to mention possibly one for my son) TI Nspire. TI has done a good job marketing their graphing calculators. I think the Nspire software will be nice to use too.

Namir

### **Re: TI-Nspire dismantled - ARM 9 @ 150 MHz!**

**82240A maintenance?**

Message #1 Posted by [Seth Morabito](#) on 19 July 2007, 10:25 p.m.

I picked up an 82240A printer for \$35 last weekend at a swap meet. It's in good functional shape, and seems to work fine, but since it's mechanical, I'm curious if there's any kind of maintenance I should perform on it? Print head cleaning, lubrication? I couldn't find the maintenance manual on the MoHPC DVD, and the user's manual didn't have anything to say on the subject.

So far I'm pleased, it works fine with my HP 50g, 48gx, and of course my 48sx. I don't (yet!) have a 28s or 42s to try it out on, but soon... soon...

**Re: 82240A maintenance?**

Message #2 Posted by [Allen](#) on 19 July 2007, 10:35 p.m.,

in response to message #1 by [Seth Morabito](#)

You can pick them up on certain websites which encourage capitalism for around that price. I would suggest if it breaks that is not worth your time to fix. The only exception would be the chrome tabs in the battery box.. Keep them clean, as they are prone to corrosion, and very easy to replace if they do become damaged (if you can find clean replacements).

Eventually the feed motor will go out, but for all the fine screws, replacement parts, risk of further damage... buy another 82240A or get a used 82240B for the same price. See other discussions here on the difference.

### **Any HP35S retailers in Silicon Valley (San Jose/Sunnyvale area)????**

Message #1 Posted by **Bill Wiese** on 19 July 2007, 9:11 p.m.

Any HP35S retailers in Silicon Valley (San Jose/Sunnyvale area)????

I don't think they're on Fry's shelf yet, and WalMart is mailorder only.

Figured I'd just stop by a store on way home from work..

Bill Wiese  
San Jose CA

### **Re: HP35S (where to get)**

Message #2 Posted by **Frank E. Travis** on 20 July 2007, 9:01 a.m.,  
in response to message #1 by Bill Wiese

Bill I do not know if you remember me from a 2003 posting where you responded to my topic about Getting the U.S. to compete with overseas labor. I have an HP 35S on order with Calcpro website [www.calcpro.com](http://www.calcpro.com) Paul Nelson, its manager, has them on back order. I do not know when they will be in. I have had good dealings with Calcpro since it has been in business (about 1999).

### **HP-35S \$40.40 shipped w/rebate buy.com**

Message #1 Posted by [Mike Ingle](#) on 19 July 2007, 5:42 p.m.

Slick deal on the HP-35S from buy.com \$40.40 after rebate:

Go to buy.com and order a HP-35S. After adding to your cart click this link:

<http://www.greatcoupons-online.com/redeemcoupon.php?coupon=53617&afsrc=1>

(listed here: <http://www.greatcoupons-online.com/online-coupons/1035.html> )

That will get you \$5 off when you add it. When you checkout on buy.com you will be offered a magazine subscription. By declining the magazine you can get a \$10 mail-in rebate from "M2 Processing." PDF link is shown next to the magazine offer.

Choose budget shipping. Total comes out to \$50.40 with tax and free shipping. If the \$10 rebate works, it should cost \$40.40 plus a stamp. Best deal I have seen!

Mike

Message #2 Posted by [Ed Look](#) on 20 July 2007, 8:19 p.m.,  
in response to message #1 by [Mike Ingle](#)

Great ultimate price, Mike, and I almost went for it, but I didn't like their privacy policy, i.e., the way Buy.com collects and shares your personal data with third parties.

I'll try another source from which I won't worry too much about any potential spam.

### **Re: HP-35S \$40.40 shipped w/rebate buy.com**

Message #3 Posted by [Ed Look](#) on 22 July 2007, 11:40 p.m.,  
in response to message #2 by [Ed Look](#)

Well... I took the plunge. I did review their privacy policy again before committing to the purchase. I'll try to remember to let you all know if the rebate will take.

Thanks again for the heads up, Mike.

Incidentally, did anyone notice that at buy.com, the 49G+ cost more than the 50G? (It wasn't by much, just a few dollars, but it's still surprising.)

*Edited: 22 July 2007, 11:43 p.m.*

### **Re: HP-35S \$40.40 shipped w/rebate buy.com**

*Message #4 Posted by [Mike Ingle](#) on 25 July 2007, 5:30 p.m.,  
in response to message #2 by Ed Look*

I got my calculator and sent in the rebate. I did notice the receipt that came with the calculator did not show the dollar amount, while the rebate form says the receipt should show the dollar amount. It remains to be seen whether the \$10 comes.

I used a spammed-out email address.

**Re: HP-35S \$40.40 shipped w/rebate buy.com**

*Message #5 Posted by [Ed Look](#) on 28 July 2007, 12:15 a.m.,  
in response to message #4 by Mike Ingle*

Mike, I got mine today... didn't get to open it up and hold it in my hand until tonight. It came all right and is to my eyes to this point in fine shape. I have no idea what some of the other guys are complaining about.

Oh, by the way, I sent in my rebate even before it got here; I used to order confirmation.

**Re: HP-35S \$40.40 shipped w/rebate buy.com**

*Message #6 Posted by [Katie Wasserman](#) on 21 July 2007, 12:48 a.m.,  
in response to message #1 by Mike Ingle*

I signed up as a new user on buy.com and paid via Paypal with free shipping -- total cost \$46.99 (no rebate needed). I'm not sure how long it will take to get here but they sent me a UPS tracking number within 24 hours.

### HP-35s (Samson Cables does NOT have them)

Message #1 Posted by [George Bradford](#) on 19 July 2007, 5:01 p.m.

"The scheduled shipment from HP manufacturing of our order of 35S calculators has been delayed for arrival until tomorrow. Your order will then ship. Regards, Karren Customer Support Samson Cables"

Translation: Samson Cables does NOT have ANY 35S calculators.

When I purchased a 35S from Samson Cables (on 15 July), the website clearly stated that the 35S would ship on July 17th.

Currently (19 July), Samson Cables' website STILL states the 35S will ship on July 17th. On top of that, the web site currently states that the 35S is "now available" and "shipping now".

Their email (quoted above) reveals that NONE of these statements are true.

Internet resellers who do engage in this type of behavior.....

Earlier today I emailed Samson Cables requesting they correct these false statements. So far, they've ignored my inquiries.

In light of the above, IMHO this company has NO credibility when it says it will ship the 35S tomorrow.

:-(

### Re: HP-35s (Samson Cables does NOT have them)

Message #2 Posted by [Matt](#) on 19 July 2007, 5:11 p.m.,  
in response to message #1 by [George Bradford](#)

It's mentioned here, too

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=118704#118704>

In the UK we have laws against false advertising. What about you guys on the other side of 'the pond'?

I'm also more than a little angry that they have already taken payment for the non-existent item.

I will not, under any circumstances, be dealing with them again.

### Re: HP-35s (Samson Cables does NOT have them)

Message #3 Posted by [dbatiz](#) on 19 July 2007, 5:54 p.m.,  
in response to message #2 by [Matt](#)

Before I beat up a smaller vendor too badly, I'd like to mention my experience with buy.com.

When I purchased my 50g, the site said it was in stock. A week after the original shipping date had passed, I called customer service and was assured it would ship within the next two days. I was tired of waiting, so I decided to go online and cancel my order and buy elsewhere.

The site responded with a statment to the effect: Your cancelation REQUEST is being processed... we will notify you if your order is canceled.

This didn't sound right, so I contacted my bank and completely closed my charge card. The bank issued me a new one.

About 4 days later, the calculator shipped and the charge still processed through my bank.

I later went back to buy.com and read the fine print. Their policies are clear, and it's my fault for not being an informed buyer. No matter how good a deal they offer, I don't believe I'll ever do business with them again.

I wonder if Samson Cables would be willing to offer refunds for calculator orders that have not been filled? How is their customer service?

Very Respectfully, David

**Re: HP-35s (Samson Cables does NOT have them)**

*Message #4 Posted by [Alex](#) on 20 July 2007, 10:20 a.m.,  
in response to message #3 by dbatiz*

I ordered mine from Buy.com on Tuesday at 11:30 p.m. On Wednesday at 5:30 p.m., I got an e-mail from them stating that my order had been shipped!

Yay!

Even though I'm biting my nails I couldn't turn down free shipping, so it's not due to get here until next week.

- Alex

**Re: HP-35s (Samson Cables does NOT have them)**

*Message #5 Posted by [sjthomas](#) on 19 July 2007, 5:50 p.m.,  
in response to message #1 by George Bradford*

And HP said mine would ship on Tuesday, but didn't ship until today (Thursday).

Regarding Samson cables, they can't help it if they have not received their shipment. Perhaps their website SHOULD have said something like "expected to ship on July 17."

It's not worth getting worked up over <double dangling preposition notwithstanding>.

*Edited: 19 July 2007, 5:51 p.m.*

**Re: HP-35s (Samson Cables does NOT have them)**

*Message #6 Posted by [Matt](#) on 19 July 2007, 6:17 p.m.,  
in response to message #5 by sjthomas*

I completely agree with you.  
But I still think it's a bit cheeky to take payment before they have the goods.

\*When\* the calculator arrives, I will probably be so happy that this minor inconvenience will quickly become a distant memory.

I just wonder how long we'll have to wait until the next new HP calculator release. Then we can go through this again :P

### **Re: HP-35s (Samson Cables does NOT have them)**

Message #7 Posted by [Bruce Bergman](#) on 19 July 2007, 6:11 p.m.,

in response to message #1 by George Bradford

For what its worth, I've usually had good results with Samson. I've bought things from them in the past and they are generally up front and honest. I suspect this caught them off-guard too, but that's no excuse for leaving up incorrect information. I'd suggest giving them another day to pull their act together before coming to any conclusions.

MobilePlanet.uk.com is one of my "secret" sites. They tend to have stuff you can't get elsewhere. For example, that's how I ultimately got a HP-40gs (not sold in the USA). However, they are NOTORIOUS for posting dates and inventory volumes that are completely bunk. After placing my order, and promising next-day shipping, it took almost daily pestering over a course of more than a month to finally get my calc. Granted, they did credit me the shipping costs, and I honestly would have waited longer just to get it :-), but it still left a sour taste in my mouth.

That all being said, keep in mind that even HP's site has wrong information on it right now. They should also clean up their act. In this day and age, there's no excuse for not knowing exactly how many pieces you have in stock, when it moves from place to place, etc.

Oh, and finally, I \*totally\* agree about Buy.com. Good prices, great deals at times, but a really, really horrible company to deal with if ANYTHING goes wrong. They've lost me a couple of times. Unfortunately, I keep coming back like an addict ;-), mainly when they have super deals, but I really dislike that company. I can't recommend them to anyone.

thanks, bruce

*Edited: 19 July 2007, 6:19 p.m.*

### **Re: HP-35s (Samson Cables does NOT have them)**

Message #8 Posted by [mjcohen](#) on 19 July 2007, 7:49 p.m.,

in response to message #7 by Bruce Bergman

My experiences with buy.com have been pretty good. The stuff I have ordered has come when they said and malfunctioning stuff has been easily replaced.

Also, my experience with HP regarding the 35s has been as stated here earlier: I ordered it on the 15th, they did not have it on the 17th, but did get them on the 18th, and mine was shipped (or reportedly shipped) today, the 19th.

Martin Cohen

### **UPDATE Re: HP-35s (Samson Cables does NOT have them)**

Message #9 Posted by [Matt](#) on 20 July 2007, 4:51 a.m.,

in response to message #1 by George Bradford

It seems that you were correct in doubting their credibility to ship on the 19th.

This page

[http://www.samsoncables.com/catalog/prodDetail.cfm?Prod\\_ID=394](http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=394)

states

"New! Just released by HP! Begins shipping 7/23/07 (Sorry for the dissapointment to those that have already ordered. Our first shipment from HP manufacturing was delayed.)"

### **Re: HP-35s (Samson Cables does NOT have them)**

Message #10 Posted by [Thomas Radtke](#) on 20 July 2007, 4:59 a.m.,

in response to message #1 by George Bradford

If they don't have them, what do these invoice entries mean:

Invoice Date: 07/15/2007  
Order Status: 07/15/2007 Order received, 07/16/2007 Credit card charged, Shipped  
Ship Method: US International Air Mail (2-4 weeks)  
Payment Method: CreditCard  
Payment Status: PAID IN FULL  
Shipping Status: SHIPPED

(this is from the current order status!)

Edited: 20 July 2007, 5:00 a.m.

Can you say, "computer boilerplate"? It is no different from those Windoze error messages. Merely text that gets parsed--no "intelligence" in it.

### **Re: HP-35s (Samson Cables does NOT have them)**

Message #12 Posted by [bill platt](#) on 20 July 2007, 7:23 a.m.,

in response to message #1 by George Bradford

Give them a break already. It is a 1st issue, and they are probably getting bad info from the manufacturer.

### **Re: HP-35s (Samson Cables does NOT have them)**

Message #13 Posted by [Steve Myers](#) on 20 July 2007, 9:37 a.m.,

in response to message #12 by bill platt

"Shipping on the 23rd" is not the same as "Will Ship On July 17th."

They didn't learn their lesson yet as they should be saying "July 23rd expected shipping date"

Why not just call and cancel/refund the order and re-order from somewhere else like buy dot com... \$10.00 buck less expensive and free shipping.

The bottom line is "Will ship On July 17th" is a commitment and they failed to keep it.

### **HP-35s (Samson Cables do NOT have MINE any more)**

Message #14 Posted by [Nenad \(Croatia\)](#) on 20 July 2007, 3:00 p.m.,

in response to message #1 by George Bradford

...because they have shipped them to my address.

Quote:

"The scheduled shipment from HP manufacturing of our order of 35S calculators has been delayed for arrival until tomorrow. Your order will then ship. Regards, Karren Customer Support Samson Cables"

Translation: Samson Cables does NOT have ANY 35S calculators.

Maybe I am wrong, but a few hours after my (polite) enquiry I have obtained the same e-mail from Karren. Thought this was the end of the communication, but after another few hours they sent me another e-mail with the tracking number. Obviously, something positive is happening. I feel satisfied with their response.

**Re: HP-35s (Samson Cables do NOT have MINE any more)**

*Message #15 Posted by [Doctor Bubu](#) on 20 July 2007, 3:36 p.m.,  
in response to message #14 by Nenad (Croatia)*

I hav insist after the last answer and got the following answer:

Jurgen,

We did not intend to be misleading. Last Thursday, when we heard the 35S was in stock, we submitted a PO to HP manufacturing for the 35S. It takes two days to arrive to us once shipped. We planned on our shipment arriving Tuesday or Wednesday at the latest. For some reason they held our PO until this Wednesday. I can only guess they had much to do for this roll-out. I'm sorry for the delay. Your order will ship on Friday, Monday at the latest.

Regards,

Karren

**Re: HP-35s (Samson Cables do NOT have MINE any more)**

*Message #16 Posted by [Les Wright](#) on 20 July 2007, 4:21 p.m.,  
in response to message #14 by Nenad (Croatia)*

Same thing happened to me. I am told mine will ship tomorrow.

Les

**Re: HP-35s (Samson Cables do NOT have MINE any more)**

*Message #17 Posted by [Les Wright](#) on 22 July 2007, 4:11 p.m.,  
in response to message #16 by Les Wright*

I checked the USPS tracking number Samson sent me and it looks like yes indeed the parcel did ship from Salt Lake City yesterday.

Les

*Edited: 22 July 2007, 10:46 p.m. after one or more responses were posted*

**Re: Why is the HP 42s so expensive?**

*Message #18 Posted by [Matt](#) on 22 July 2007, 4:38 p.m.,*

*in response to message #17 by Les Wright*

Well it's nice to hear that some people are getting their tracking numbers :)

I'm still waiting, even after being told...

"The scheduled shipment from HP manufacturing of our order of 35S calculators has been delayed. Your order will then ship Friday the 20th. Sorry for any inconvenience."

Ho-hum <twiddles thumbs>

**Re: HP-35s (Samson Cables do NOT have MINE any more)**

*Message #19 Posted by [Les Wright](#) on 22 July 2007, 10:47 p.m.,  
in response to message #17 by Les Wright*

And USPS just sent me email confirmation (that I signed up for) that the parcel has shipped.

Les

In light of the above, IMHO this company has NO credibility when it says it will ship the 35S tomorrow.

:-(

\_\_\_\_\_

Neither does HP...

You all are too much in a hurry to get this new marvel (if ever it is). HP ain't what you used to deal with: all engineers are gone (compared to the past) and it's now driven by traders, like all other major US corporations.

[no flame intended]

Don't expect they deliver on schedule. I'm quite sure they will store all back-orders and then launch production.

Remember that, when ordering manufacturing to a Chinese or Taiwanese factory, you won't get even a unique copy of your product if your forecast were wrong. So the best way to get it right is to know the number of orders BEFORE manufacturing the product.

**Re: HP-35s (Samson Cables does NOT have them)**

Message #22 Posted by [Don Shepherd](#) on 22 July 2007, 9:11 p.m.,  
in response to message #21 by Olivier TREGER

Sorry, Oliver, I got my HP35s within a day of the originally promised delivery date by HP. And so did many others, judging from the forum.

**Re: HP-35s (Samson Cables does NOT have them)**

Message #23 Posted by [Kevin Kitts](#) on 22 July 2007, 10:58 p.m.,  
in response to message #22 by Don Shepherd

I didn't place my order (at HP) until Friday the 20th - I had a tracking number within two hours - and it had crossed several state lines within 24 hours. I have an estimated date to receive it of the 24th.

I think that they probably just had some initial problems getting the new item rolled out.

**Re: HP-35s (Samson Cables does NOT have them)**

Message #24 Posted by [Steve Myers](#) on 23 July 2007, 6:11 p.m.,  
in response to message #1 by George Bradford

Quote:

... In light of the above, IMHO this company has NO credibility when it says it will ship the 35S tomorrow.

\_\_\_\_\_

To make matters worse, they continue to flat-out lie about delivery.

In my case, I ordered and paid in full days before the "Will Ship On July 17th" date. I found out that they weren't shipping on-time from reading the posts here

I contacted Sampson and was told by Karren that they will ship on the 18th, one day late.(No panic here)

The next day I contacted them again and was told they will most defiantly ship on the 19th with zero chance of delay. (Getting a bit annoyed)

I then contacted them on the 20th and asked for the tracking number. I was told they did ship they would email me the tracking number in a few minutes. (OK, no big deal. They are on their way) This never happened and they closed up shop for the weekend.

Now it's the 22nd and I was told they have not shipped yet, but will ship sometime later today, this time they really mean it.(Back to being quite annoyed)

The only reason I'm no too concerned is I do believe that someday they will actually ship them. This and the fact that after I read a post here about buydotcom selling them for \$10.00 less, I ordered two from there and they already arrived.

*Message #25 Posted by **Walter B** on 23 July 2007, 6:57 p.m.,  
in response to message #24 by Steve Myers*

I hate I have to agree fully. I ordered on 7/15 for 52.99 + 20.00 for s/h. Got an order confirmation the same day (fine!). Got an e-mail next day due to a typo in my cc-data (ok, my fault!), which I corrected the same day. My order status didn't change, so I contacted SC on 7/18, asking what's the reason. Got an e-mail from Karren next day: "The scheduled shipment from HP manufacturing of our order of 35S calculators has been delayed for arrival until tomorrow. Your order will ship once we receive them." Nothing happened on 7/20 (feeling a bit annoyed). Today, I was getting another e-mail from Karren: "You need to pay at least \$15.00 more for shipping." Where am I? Is this a bunch of amateurs doing their first business?

Hallo Walter,

ordered the same day as you did but got the mail about the missing VAT right next day. So, used their form to transmit it via Visa in good faith. Yesterday, I got another two mails after inquiring. Karren asked if the difference in shipping costs could be charged from my card. Argh! Of course, the item haven't been shipped in opposite to what was stated in the order status. Anyway, yesterday I asked to check if the \$15 have been charged already and if not to charge the card now. No answer. I have no clue when the 35s will actually be shipped :-).

Thomas

\_\_\_\_\_

It may not be a scam, but their integrity is down the tubes as far as I'm concerned. I can only hope others will search and find this message trail before thinking of purchasing anything from Samson / HPcalculators(.)com

For the record, I ordered on July 13th, and today is **July 24th**...my units from Samson still have not even shipped yet.(Now I'm well beyond annoyed)  
I can understand delays in shipping, but this is now plain old-fashioned incompetence and terrible customer service.

I'm also sure they get a lot of mail, people thinking they are getting ripped-off usually don't like it.

-but-

Do you really think they get so many as to justify ignoring pre-paying customers they promised something then fell through of their own fault?

Well this is just a big scam really.  
Now Samson Cables are ignoring my emails.  
I was told my calc would ship Friday. Another lie.  
I think they're a bunch of crooks.

\_\_\_\_\_

On second thought, it is a scam and heres why.

I contacted Samson three days after the supposed ship date (20th). I asked them to cancel my order because they failed to keep their delivery date and other vendors were shipping from stock. Karren told me "no worries, I am shipping it as we speak and you will have it in two days" (I paid extra for UPS 2nd Day)

This order has **yet to even ship**. This is what I consider the definition of a scam to keep people from cancelling their orders to buy elsewhere.

I'm not impatient, I just don't like someone taking my money lying to me.

Hi,

I have no interest in this (HP35s are not generally available in Canada yet, and I can wait until they are), but I would suggest to all who have paid Samson Cables by credit card to immediately get in touch with their credit card company and cancel their order. You all have valid reasons for cancellation, from being promised shipment that never happened, to being treated unfairly. Calling the credit card company and having a bunch of cancelled orders will certainly get the message across to Samson a lot more forcefully.

I know this isn't a complaint board to vent on fraudulent HP Authorized Dealers, but I do have one last comment on this rip-off that hpcalculator(.)com / Samson is perpetrating. I say this because I wish the information found in this thread was available before I made my purchase (Of course, then there would have been no purchase.)

UPS is saying that this company is using their services in violation of stated agreements. What they are doing is filling out on-line shipping requests to obtain tracking numbers but not asking for pick-ups. This way they can send the "buyers" a tracking number but not ship anything. UPS is aware of this and is investigating.

Now, back to talking about HP,RPN, RPL, Hexadecimal Math and other, better things to think about.....

Matt:

It may be difficult going through Samson, in fact, it I can almost guarantee that it will probably be impossible.

However, if you have paid by credit card, the credit card company will reverse the charges, and you will get a refund. The credit card company and Samson then work

things out on their own. Most credit card companies take a very dim view of the tactics that Samson is employing, and will go out of their way to help their credit card holders.

Kostas

### HP-35, HP-65 .... reverse engineering latest news

Message #1 Posted by **Jacques Laporte** on 19 July 2007, 12:02 p.m.

What's new on my site ? <http://jacques-laporte.org>

- I started the HP-65's ROM exploration. A Java simulator is already running the HP-65 micro-code without problem, allowing to study how the program storage circuit is working ; its program memory symbolic addressing and its hardware label-searching mechanism are very original. <http://www.jacques-laporte.org/sim65.htm>

- The reverse engineering of the power units for the Classic (HP-35; HP-45) and Woodstock series (HP21, HP25) is published. This job has been completed with the precious help of Daniel WEED - ex-rocket scientist from Phoenix, AZ. Dan did a nice job deconstructing the power unit of the HP-45 and repairing one unit with modern discrete composants. <http://www.jacques-laporte.org/HP35%20power%20unit.htm>

- January 2007, I started to publish the HP-35 hardware pages. It is a kind of "black box" reverse engineering: you can't open a chip to see what's going on inside. But I had input and output signal traces on my scope and in mind the 1972 state of the art (sometimes though it is hard to follow, because of HP ingenuity for example the way they mixed PMOS chips and TTL logic, or the efficient inductive drive technique used for the LED display is great art! <http://www.jacques-laporte.org/HP%2035%20Control%20&%20Timing.htm>

- The HP 35 ROM Mapping is finally on line (a very hard work) : "The HP-35 firmware decoded & other mysteries". <http://www.jacques-laporte.org/ROM0%20mapping.htm>

Enjoy and please give feedback.

Message #2 Posted by [Monte Dalrymple](#) on 19 July 2007, 3:22 p.m.,  
in response to message #1 by Gene Wright

Great machine. But having to press the blue arrow, then 1 (base), and the 6 ("h" data type) gets old really fast when I am working with hex numbers. And you get "syntax error" if you forget to tag the number this way. I much preferred the 33s in this regard, where I could just press "enter" after the digit entry was done.

And I had to look in the manual to find which keys to use for the ABCDEF digits... it isn't labelled on the keyboard.

Monte

Message #3 Posted by [Eric Smith](#) on 19 July 2007, 9:32 p.m.,  
in response to message #2 by Monte Dalrymple

Just got the pair of 35s' I ordered from HP on Tuesday (paid a bit extra for overnight shipping). The first thing I did was switch into RPN mode, and the second was to try hex. I wasn't able to figure it out without consulting the manual.

The suffix approach (same as the 28/48/49/50) is **extremely** annoying when simply trying to do calculations on the stack, but I suppose it was necessary to support use of non-decimal bases in equations and such.

### **Re: Thread for those receiving 35s calculators to post what they think**

Message #4 Posted by [Monte Dalrymple](#) on 19 July 2007, 11:37 p.m.,  
in response to message #3 by Eric Smith

I agree. It gets very annoying, very fast. While I understand the rationale behind this requirement, I would have much preferred at least a "dedicated" mode that assumed everything in hex mode was hex.

I think that this is an example of making something general enough for all cases (like mixing bases on entry) that it interferes with the "normal" case. Kind of anti-KISS...

Monte

*Message #5 Posted by [Howard Owen](#) on 20 July 2007, 12:40 a.m.,  
in response to message #4 by Monte Dalrymple*

The Datafile special issue on the 35s contains an article by Wlodek that gives a possible explanation for this and other misfeatures. Due to cost constraints, the ROM and RAM sizes were the same as the 33s. HP crammed a fair amount of new functionality into the same space the 33S code occupied. Wlodek doesn't mention the base weirdness to show how HP had to "cut corners." He points out that you can enter all sorts of nonsense on the command line without a problem. Only when you press ENTER do you get an error message. But the base stuff may also be a result of cutting corners to save bytes. And the Ax + Bi unavailability in RPN mode could also have the same cause. It would explain what otherwise seems to me to be a series of purposeless limitations or awkwardnesses in an otherwise well-conceived machine.

Regards,  
Howard

## Re: Video?

Message #11 Posted by [Howard Owen](#) on 19 July 2007, 8:06 p.m.,  
in response to message #10 by Howard Owen

Unfortunately, the video doesn't want to play on my laptop.

Other first impressions:

The keys are as advertised, nice and snappy. Their shapes are very reminiscent of older machines.

The manual seems well organized and thorough.

The case is not a traditional type, but a clamshell. One half of the shell has netting very much like a PSP case. The PSP uses mini CDs for which the netting is very useful, but I can't imagine what this is for in calculator terms. There is no quick reference guide supplied with the calculator, which might give the netting a reason for being. Note paper, perhaps? The other side of the clamshell is better thought out. It has two elastic bands strategically placed so you can put the calculator in the case facing either direction. One of the elastic bands will reach across the machine between the display and top row of keys. The other band stays unused beneath the calculator. In this mode the machine is usable while in the case. I give this arrangement fairly high marks.

I'm off to learn more about the features of the calculator, before writing my first program. I'll post more as I go.

Regards.  
Howard

## HP 35s case

Message #12 Posted by [Don Shepherd](#) on 19 July 2007, 8:43 p.m.,  
in response to message #11 by Howard Owen

Quote:

\_\_\_\_\_  
Note paper, perhaps?  
\_\_\_\_\_

For documenting the the labels of programs you write, no doubt!

ALG mode is 'A + B i' which clearly won't work in RPN mode. But surely that can't be why it isn't supported?

A more egregious example of mysterious limitation is the hash made out of base number entry. Blue->base->6 to tag a number as hex is anti-ergonomic. If you are in hex mode, why not assume numbers are in hexadecimal? It's true that this way you can add 44h and 1000100b and get the result in the current base. But I'd far rather have easy entry of data than the ability to mix bases in calculations.

The manual is well organized and thorough, but it's full of errors. This can be expected for a brand new manual, but it detracts from the overall impression the calculator gives the new user.

Note that I'm quite pleased with this machine so far. I'm whining about things that are no big deal, in my view. But I can't help it, I'm a critic at heart.

Regards,  
Howard

Message #17 Posted by [Gene Wright](#) on 20 July 2007, 12:03 a.m.,  
in response to message #16 by Howard Owen

Hi Howard.

As you read through the manual, please consider collecting errors you find and post them here. I have a list about a page and a half long that I will post soon of ones that have been found so far.

### Re: More Nits

Message #18 Posted by [Howard Owen](#) on 20 July 2007, 1:04 a.m.,  
in response to message #17 by Gene Wright

Sure thing, Gene. Here's one, not an error, but a style point. The typography of subscripted variables is poor, in at least one case. That is on on page 9-3, where the numbers in "z1 + z2" are much larger than the "z" characters. The number's base lines are lower than the z characters, yet the tops of both characters are aligned, so the numbers don't appear to be subscripts. The numbers are too large to be elegant looking as subscripts anyhow. Elsewhere, the same font sizes are used for superscripts, and that works fine. But in this case, the result is nearly illegible.

Regards,  
Howard

### Thoughts on Programming the 35S

Message #19 Posted by [Howard Owen](#) on 20 July 2007, 6:10 p.m.,  
in response to message #1 by Gene Wright

I just worked up a couple of subroutines on my new 35S in order to get a feel for how it is to program. Here's the commented code, followed by some additional thoughts.

This routine will prompt for four successive decimal numbers constituting 4 octets of an IP address. It will store them in a contiguous block of 4 registers starting with the register number passed in the X register.

```
I001 LBL I
I002 DEC          Ensure decimal entry
I003 SF 10       Inhibit evaluation of the "equation"
I004 ENTER OCTET RS 4 TIMES Long, hey?
```

```
I005 CF 10          1st octet entered is now in X
I006 (REGY+3)/1E3+REGY  ALG, complete with parentheses. Weird.
I007 STO I         Loop counter and address pointer
I008 x<>y         Get the first octet back
I009 STO(I)       STOrE it in the base register
I010 ISG I        Second register is next
I011 DEG         No-op. Thanks Gene. 8)
I012 SF 10       Loop entry point
I013 NEXT OCTET  Not so long.
I014 CF 10       Octet is nw in X
I015 STO(I)     Store it in the next register
I016 ISG I
I017 GTO I012   My 1st line addressed GTO in 20 years. (Not really 8)
I018 RTN       Done
```

The following routine retrieves an IP address from registers whose base is pointed to by the number in X

```
I019 (REGX+3)/1E3+REGX  ALG here is more programmer-efficient
I020 STO I
I021 RCL(I)           The first octet
I022 ISG I
I023 DEG
I024 1E3             "E3" produces "INVALID DATA"
I025 X              Shift the IP 3 places to the left
I026 RCL(I)         Get the next octet
I027 +              And add it into the IP
I028 ISG I
I029 GTO I024
I030 RTN
```

The comment on line I006 says ALG mode is "weird." I mean that it feels weird to me in the context of an RPN program. The construct is far tidier than the corresponding RPN sequence would have been. I don't know if there are differences in execution time between the two forms. One of Gene's recent articles suggests that ALG may be less efficient. Nonetheless, these subroutines are not time critical, so even a large difference in execution time shouldn't matter. At the same time, fewer line numbers and succinct expression make it easier for this programmer to read the code, despite having to scroll right to see most equations. Six or seven fewer lines is a big advantage on a machine where you can only see two lines at a time, and can't print anything out.

It's also weird to be using indirect addressing for access to the main bank of storage registers. It makes the whole language feel more like assembly. I'm appreciative of the large jump in storage, but it has been implemented inelegantly, no doubt because of cost constraints. The same goes for line oriented GTOs. I actually have coded in line mode BASIC more recently than 20 years ago. (Last year in fact, on the 9816 and HP8X) but doing a GTO to a line number gives me a case of 1980s nostalgia. (I was miserable through the first two thirds of that decade, so nostalgia isn't a good thing. 8) Once again, the designers have found a creative way to address a shortcoming of the 33S, but constrained by cost to inadequate ROM space, they've had to compromise deeply to achieve it.

So, what will it take for HP to turn those very creative and skilled folks loose with a reasonable budget to create an RPN calculator without so many compromises? Is the HP 35S likely to change the economics of the calculator market and allow such a move? I hope so, but I fear not.

Regards,  
Howard

## Re: Thoughts on Programming the 35S

Message #20 Posted by [Namir](#) on 20 July 2007, 7:22 p.m.,  
in response to message #19 by Howard Owen

Howard,

I wrote the following program to test the speed of summing integers using pure RPN and hybrid AL/RPN

commands:

```
LBL A
INPUT N
0
STO I
STO S
LBL B
1
STO+ I
RCL I
STO+ S
RCL N
x>y?
GTO B001
RCL S
STOP
0
STO I
STO S
LBL C
I+1
STO I
I+S
STO S
RCL I
RCL N
x>y?
GTO C001
RCL S
RTN
```

When I enter 1000 at the prompt, the first loop takes about 31 seconds while the second loop takes 84 seconds. The ratio is about 2.8. Using ALG expressions slows down calculations.

Namir

PS: I used the timer of an HP41CX

*Edited: 20 July 2007, 7:23 p.m.*

## **Re: Thoughts on Programming the 35S**

*Message #21 Posted by [Howard Owen](#) on 20 July 2007, 8:01 p.m.,  
in response to message #20 by Namir*

Yes, that's what Gene's article reports too. That is a good reason to stick with pure RPN in time critical code.

I guess the difference must be due to the overhead of parsing the equation. That would imply they don't cache the decoded expressions.

Regards,  
Howard

## Re: Thoughts on Programming the 35S

Message #22 Posted by [Howard Owen](#) on 20 July 2007, 8:25 p.m.,  
in response to message #20 by Namir

Actually, it's not only ALG code that differs between the two approaches. In the RPN case, you are entering an increment value into X, then doing STO+ <var>. In the ALG case, you are recalling the value of the variable into X and incrementing in one step, then storing the result. Reads and writes between the alpha variable registers and the stack may not be equivalent in terms of the time they take.

It's not as easy as I first thought to formulate expressions in RPN and ALG that are equivalent with respect to register moves and so forth. The two models differ pretty sharply in how they use the stack in particular. If you have a RCL+ in RPN, for example, it will do the addition and *replace* the previous X contents with the result, without enabling stack lift. But if you do an ALG expression like 'I+1', the addition is carried out somewhere, and then the result is *pushed* on the stack. That necessitates an extra stack manipulation if you want to leave the number of iterations on the stack, like you can in RPN mode. (That is, you can do RCL+ <var> and then X?Y compare for loop control, since Y stays put.)

Regards,  
Howard

## Re: Thoughts on Programming the 35S

Message #23 Posted by [Gene Wright](#) on 20 July 2007, 10:19 p.m.,  
in response to message #19 by Howard Owen

Good job, Howard! Couple of thoughts:

- 1 ) NOP - DEG is good unless you need to do trig in radians of course. I'd be glad to have other options that are as easy to put in.
- 2 ) ALG mode use in RPN programs is very neat, particularly when it saves the RPN stack! It would have been much harder to write the indirect register store/recall program while saving the stack without the ALG tricks. By the way, anyone keyed that in to try it yet?
- 3 ) I do think this is about as good as it could get as an RPN calculator extension of the 32s line. Putting in these indirect registers and line number GTO and XEQs probably allowed the rom to be slightly changed, which allowed for faster development. Resources these days are scarce!
- 4 ) And you guys know this, but in most cases, there is no need to ever put a line like GTO B001 in a program. Execution can probably in most cases pick up at line 002 of the destination program. It will be a tad faster that way.

## Using GTO could be dangerous....

in response to message #19 by Howard Owen*

Howard, the NOP in line I011. Did you do this because you really only want to increment register I (without actually skipping anything), but you don't know the increment amount until execution time?

### **Re: Thoughts on Programming the 35S**

*Message #28 Posted by [Howard Owen](#) on 22 July 2007, 12:08 p.m.,  
in response to message #27 by Don Shepherd*

Yes, I do just want to increment, but no, I know in advance that the increment will be 1. I could use 1, STO+ I, but that would then require a RDN to restore the stack.

Regars,  
Howard

### **Re: Thoughts on Programming the 35S**

*Message #29 Posted by [Don Shepherd](#) on 22 July 2007, 12:55 p.m.,  
in response to message #28 by Howard Owen*

OK, I see your logic. I was thinking about that last night. I know that the HP-65 has a NOP instruction, but it is needed because an X=Y executes the next \*2\* instructions if true (because a Goto occupies 2 instructions in that machine). So if you only wanted to do one thing, a NOP was required.

It's kind of like the old BALR instruction on the IBM 360. That instruction was typically used at the beginning of the program, not to branch, but to initialize the index register.

### **More Fun With HP35 Programming**

*Message #30 Posted by [Howard Owen](#) on 21 July 2007, 1:36 a.m.,*

*in response to message #1 by Gene Wright*

OK, so now I want the input routine to either prompt as before, or else decompose a number in the form:

ABCDEFGHIJKL

Where the letters are the decimal digits of an IP address. For example, 192.160.20.1 would be encoded as 192168020001. This is a form I plan to use for manipulating addresses in various ways. I need a way to "explode" such a number into its octets. (I already have the routine to compose a number like that from its octets, the second one above.)

I'll use flag 0 to decide which mode to use on input. Flag 0 set will mean do the non-prompting routine. Conversely, flag 0 clear will do the original prompting method. I will make heavy use of ALG mode shortcuts in the new code, just to see if I can reach their limits. (Sneak peek: I can.)

To decompose a 10 to 12 digit number into "trigraphs" representing octets, I need to divide the whole number by a divisor that will leave the digits of interest lying just to the right of the decimal place. I will then take the fractional portion (FP), multiply the result by 1000, and take the integer portion. Hey presto! The octet is then left standing on its own. (This technique is surely not original, though I developed it independently. I have no idea who is responsible for the first use, or I'd give them credit here.)

So that means I need to compute the proper divisor to get the octet I'm interested down to the right of the decimal. What I have on hand is the loop counter in I. In the loop, which skips the first octet, since that is a special case, The loop counter's integer portion varies from B+1 to B+3, where B is the base register number passed in. What I need to start is the loop counter integer portion minus the base register value. The following ALG code gets me that:

```
IP(I) - B
```

Assuming the base is stored in B.

That gives me the following mapping of loop counters to three digit groups of interest:

```
000 000 000 000
   1   2   3
```

And what I need is a series of divisors, 1E9, 1E6 and 1E3. this equation gets me that:

```
ALOG( 3 + ( 3 - N ) * 3 )
```

Where ALOG() is what you get when you press 10^X in equation mode, and N is the loop counter normalized into the range 1..3.

Finally, I will implement the algorithm given above to isolate the octet of interest:

```
IP( FP(A/D) * 1E3 )
```

Where A is the IP address and D is divisor computed in the last step.

Now, what about ALG mode limits? Well, the preceding expressions could be combined (if I'm not mistaken, and heaven knows I might be,) into this:

```
IP( FP( A / 10 ^ ( 3 + ( 4 - IP(I) + B ) * 3 ) ) * 1E3 )
```

What a mess! What does it do? Are the parentheses balanced correctly? RPN is *much* simpler. I might have errors in that expression, but since I'm not actually using it, I refuse to debug it! I'll implement the algorithm in its broken up form to save my sanity in working with the code later.

One last word before the code: I discovered (or rediscovered, actually,) the weaknesses in an auto-renumbering system that relies on the numbers as branch targets. Consider this code:

```
A001 FS? 0
A002 GTO A005
A003 SOMETHING OR OTHER (EQUATION)
A004 GTO A007
A005 ISG A
A006 GTO A005
A007 DEG
```

This is a two way branch skeleton waiting for the code to be filled in. I have a loop set up to go on line A005. But now I realize I need some set up before the loop, so I enter it. This is the result:

```
A001 FS? 0
A002 GTO A006
A003 SOMETHING OR OTHER (EQUATION)
A004 GTO A008
A005 STO A
A006 ISG A
A007 GTO A006
A008 DEG
```

Do you see the problem? Two out of three GTO lines renumbered as I expected. However the first one, on line A002, followed the ISG A command to line A006. I'll have to manually correct that one or leave a perhaps subtle bug in the code.

Now, the revised subroutine:

```
Subroutine to store the octets of an input IP Address
Copyright (C) 2007 Howard Owen
```

```
This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or
(at your option) any later version.
```

```
This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.
```

```
You should have received a copy of the GNU General Public License
along with this program. If not, see <http://www.gnu.org/licenses/>.
```

```
Input an IP address in one of two forms, and place its separated
octets in four contiguous registers starting at the base register in
X. If flag 0 is clear, prompt for each successive octet before
storing it. If flag 0 is set, decompose the 10-12 digit integer
passed in Y into its constituent octets. Store these in the same way
as the flag 0 clear code does.
```

```
The address in Y is formatted as follows. If the octets are labeled
from left to right as 1, 2, 3 and 4, then the packed decimal IP
address is: 111222333444. For example, '192.168.20.1' would be
encoded as '192168020001'.
```

```
I001 LBL I
I002 DEC Ensure decimal entry
I003 FS? 0 Set = don't prompt. IP address is in Y
I004 GTO I009
I005 SF 10 Inhibit evaluation of the "equation"
I006 ENTER OCTET RS 4 TIMES Long, hey?
I007 CF 10 1st octet entered is now in X, base in Y
I008 GTO I014
I009 STO B Non-prompting needs base (in X) and address (in y) saved.
```

```
Base register
I010 x<>y
I011 STO A          IP address encoded as a 10-12 digit decimal integer
I012 RDN           Base back in X
I013 IP(A/1E9)     Leftmost (first) octet in X, base in Y
I014 (REGY+3)/1E3+REGY  Back together. Compute loop control number
I015 STO I         Loop counter and address pointer
I016 x<>y          Get the first octet back in X
I017 STO(I)        STORe it in the base register
I018 ISG I         Second register is next
I019 DEG           No-op. Thanks Gene. 8)
I020 FS? 0         Loop entry point Non prompt?
I021 GTO I026
I022 SF 10         Do octet-at-a-time prompting
I023 NEXT OCTET   Not so long.
I024 CF 10         Octet is now in X
I025 GTO I029
I026 IP(I)-B       Loop counter normalized to the range 1..3
I027 ALOG(3+(3-REGX)*3)  Divisor to bring the current octet just to the right of the
decimal
I028 IP(FP(A/REGX)*1E3)  The octet, masked out from the IP address
I029 STO(I)        Back to common code. Store the octet in the next register
I030 ISG I
I031 GTO I020     NOT My first line addressed GTO in 20 years.
I032 RTN          Done

## Re: More Fun With HP35 Programming

Message #31 Posted by [Ralph](#) on 22 July 2007, 12:06 a.m.,

in response to message #30 by Howard Owen

I have had mine for a little over a day now.

I like: the keyboard; layout (mostly) and color scheme. the display; better decimal readability and the LCD layer does not float so high over the backplate to cast drop shadows that made reading the 33S screen difficult.

Jury's out on: case, I like slipcases personally. The wonky way to define the range of the indirect registers. I had to read the manual several times on that one. Shades of Casio's changing list and matrix dimensioning on each model it seems. still don't like the text tag setup but I have a 32SII, 33S and this one so I must just get over it.

It seems slow. It took over 6 minutes to crank out the benchmark test posted [here](#) longer than on the 32. That might just need some tweaking as it does my pet program as fast as the 33S.

I don't know if I like the current trend of putting the serial number on a sticky tape. Then I've never sent one back for repair so I can't say a permanent ID is all that either.

All in all I give it a thumbs up and hope it points to better things to come. I can't wait till the 70th year model for them to get it right again ;p

## 35s indirect addressing done wrong?

Message #32 Posted by [mjcohen](#) on 23 July 2007, 9:39 a.m.,

in response to message #1 by Gene Wright

(This is a copy of a post to comp.sys.hp48)

In the 33s, indirect addressing is done with an independent register called i, distinct from the regular variables A to Z. A value is stored into i (from 1 to 32), and you store or recall (i) to access what it points to.

In the 35s, the ordinary variables I and J are used for indirect addressing. Values are stored into I or J (-1 to -26 for A to Z, positive values for the newly available memory array) and (I) and (J) are used to store or recall

the location pointed to.

In my opinion, THIS IS A SERIOUS MISTAKE.

Essentially, this prevents any use of A through Z as an array if it includes I and J. As a simple example, consider trying to write code that copies A through Z to (1) through (26). What happens when you hit I and J?

Here are some examples of code I have written for the 33s that is no longer possible on the 35s:

- 1) Input values into A through L. This is for a 3x3 linear equation solver that stores the coefficients in A through L.
- 2) Solve the equations referred to above.
- 3) Sort the first n elements of A through Z. This can now only be done if  $N < 8$  (or 9 if J is used).

This architectural deficiency forces any code that needs an array to either put it in the (1) through (800) area or restrict its use of A to Z variables to A to H and K to Z.

Again, in my opinion, it would have been far better to have separate i and j indirect variables completely distinct from A through Z.

The current system makes the natural use of A through Z as an array difficult, if not impossible.

True, in the 3x3 solver referred to above, the coefficients could be stored in K through V, but, to me, A through L is much more natural. Also, how would you do a 4x4 system?

I would be quite interested to see how those more knowledgeable in programming the 35s would handle these problems.

Thank you,

Martin Cohen

### **Re: 35s indirect addressing done wrong?**

*Message #33 Posted by [Gene Wright](#) on 23 July 2007, 11:12 a.m.,  
in response to message #32 by [mjcohen](#)*

Gene: Hi Martin. Here's the reply I posted to comp.sys.hp48 to your post there which was identical to your post here. :-)

The way you would do these things on the 35s is that you would use indirect registers 0 through 15 or higher. You have to change your way of thinking and your past personal preferences to take advantage of the great new features of the 35s.

Don't use A through Z for things like this any longer. Use the numbered indirect registers. On the 35s, it will be possible to write a matrix program capable of finding the determinant of at least an 18x18 matrix. How would you do that using only A through Z? You wouldn't. You also couldn't do it at all on the 33s.

HP made the design choice to use I and J as they did. They also made the design choice to give us 801 indirect registers. IMO, it is not an architectural deficiency so much as a changed architecture. The fix is to quit using A through Z in this manner. Use the 801 indirect registers. Use A through Z to store final or intermediate results.

I discussed the indirect addressing space in the 35s review found here:

<http://hpcc.org/datafile/V26Special/the35s.pdf>

Early on, I had posted responses to you on comp.sys.hp48 pointing you to the review and other learning modules available in response to your posts on comp.sys.hp48, but never got a reply or email. I hope you saw those posts?

The matrix utilities program I have already converted to the 35s (and which is in the current 35s Datafile special issue) uses the indirect registers and is very easy. Once a port of the HP41 PPC ROM RRM matrix program is done, matrices will be amazingly easy to use on the 35s without using any of the A through Z variables.

It is often this way when new versions of calculators come out. When the HP41 arrived, many HP67 users were very upset that HP no longer used the primary/secondary register arrangement they were used to on the HP67, for example.

Would looping through A ... Z be easier if the I and J index registers were not in the middle of the address space? Sure. But having 801 indirect registers to loop through is better still, IMO. I'll take that change any day.

\_\_\_\_\_

Hallo Thomas,

you don't have to walk as far: also the 42s has this IND keyword, and you may use each and every register or variable for indirect addressing.

Grüße, Walter

### **Re: 35s indirect addressing done wrong?**

*Message #38 Posted by [Paul Dale](#) on 23 July 2007, 5:00 p.m.,  
in response to message #32 by [mjcohen](#)*

From the viewpoint of the keyboard and its layout, I'd prefer to have (I) and (J) on the keyboard than i and (i) even if it means one less directly addressable register. Wanting a second indirection capable register while programming has happened to me a lot of times over the years since my original 34c.

Of course an IND or equivalent would be better again...

- Pauli

### **Re: 35s indirect addressing done wrong?**

*Message #39 Posted by [Gene Wright](#) on 23 July 2007, 5:39 p.m.,  
in response to message #38 by [Paul Dale](#)*

It could have been many things.

Keyboard space and layout

ROM space

Preference of the designer even.

The way it was done allows for only 2 additional keyboard locations for (I) and (J) and does not require an additional 2 spaces for the store instructions to store the index value.

Yes, it does break any routines that want to loop through A ... Z, but it does seem a very small price to pay IMO for 801 indirect registers and two index registers.

Remember, on the 33s, the index was in the middle of the 33 registers which caused headaches trying to loop through only 30 something registers.

Now, on the 35s, you can loop through 801. Big improvement all around.

### **Re: 35s indirect addressing done wrong?**

*Message #40 Posted by [mjcohen](#) on 23 July 2007, 9:56 p.m.,  
in response to message #39 by [Gene Wright](#)*

imho, it is a real pain to not be able to use A..Z as an array. It is far easier to enter and recall values from A..Z than the indirect values.

E.g., rcl A is much easier than 1 sto I rcl (I).

### **Re: 35s indirect addressing done wrong?**

*Message #41 Posted by [mjcohen](#) on 24 July 2007, 1:19 a.m.,  
in response to message #40 by mjcohen*

How this could fit on the keys:

On one key have "IND" which brings up a menu of I, J, (I), and (J), where I and J are NOT part of A..Z. You could even have K and (K).

Then, on the other available key, have it COMPLEX which brings up a menu of REAL, IMAG, CONJ, ABS, ARG.

It is so stupid not being able to get the real and imaginary parts of a complex number, especially with the known bugs in COS.

Martin Cohen

### **Re: 35s indirect addressing done wrong?**

*Message #42 Posted by [sjthomas](#) on 24 July 2007, 2:19 a.m.,  
in response to message #39 by Gene Wright*

Granted, two index registers are better than one, and 801 loopable registers are better than 26-ish, but I just don't see the programming issues which would preclude ANY register from being used as an index register. They had to program it for I and J. Why not any register?

### **Re: Thread for those receiving 35s calculators to post what they think**

*Message #43 Posted by [Valentin Albillo](#) on 24 July 2007, 6:02 a.m.,  
in response to message #1 by Gene Wright*

Hi, Gene:

After having used the HP35S for a while, I must say I am *very* pleased with it.

It certainly looks and feels much better than what I expected. It is light but firm, appears quite solid and well built, the colors and form factor are really attractive, the display has good readability with a decent decimal point, and the keys feel good and positive as well, except for the cursor keys which, in my unit, do have a different, rather stiff feel to them, but never mind, the bottom line is I really like it very much, it looks and feels better than expected, and I'm all for promoting it among my HP-aware friends.

I'll certainly write programs for it and articles about it, matter of fact I intend to dedicate my efforts to it in full for the next months, in an attempt to generate interest for the machine and provide some useful software for it.

All in all, I think the community is up to enjoy great HP-calc times again. HP certainly has done its part, in spades, by releasing such a nice machine as the HP35S, and we must now do our best to support their efforts by trying and generating enthusiasm among HP-fans. A new golden era is dawning and we're fortunate for it !

*"May you live in interesting times", as Russell said the Chinese say ... Indeed ! Count me in ! :-)*

Best regards from V.

*Message #44 Posted by [bill platt](#) on 25 July 2007, 9:24 a.m.,  
in response to message #1 by Gene Wright*

First Impression:

WOW!

Not only do the buttons work, but they are noticeably better than the 33s. They have less bounce, but really nice pivot and snap action. Of course they feel different from a Singapore 48GX, but I think they are actually better than a voyager.

All of my "wishes" as it were circa "the end of the 32sii" have been fulfilled:

1. Keyboard 2. Display 3. Functions. 4. Reasonalbe size

All of these requirements have been met or exceeded. Only one function (for me) is missing: the "regualr" rectangular-polar conversion--which leaves real numbers in the stack. But this is minor and easily coded as a program.

I am very impressed.

### **Re: Thread for those receiving 35s calculators to post what they think**

*Message #47 Posted by [Greg Whitfield](#) on 26 July 2007, 12:46 a.m.,  
in response to message #1 by Gene Wright*

I received my HP 35s on Tuesday, July 24th from Wal-mart using the Site-to-Store method. The cost was \$49.99 plus local sales tax; shipping was free. The serial number of the calculator is CNA 72101939.

I haven't had much time to work with it yet, but overall I'd say that it appears to be solidly built and much more professional looking than many of HPs other recent calculators.

The first thing I did when turning it on was note the mode: it was RPN. Then I ran the self-test. It was on the first press of any key when I noticed that the annunciators seemed higher on the left than on the right. Apparently the LCD is crooked in my HP 35s, but not so much as to make me call HP on it. Has anyone else noticed this with theirs?

Also, I was initially a little confused by the left-shifted (yellow) and right-shifted (blue) function terminology in the user manual. The blue functions are on the bottom left side of the keys! The yellow functions are on the top center. It appears that the LCD of the HP 35s is identical to that of the HP 33s which had true left-shifted and right-shifted functions (and horrible colors). Apparently, the left and right shift symbols correspond to the annunciators and one must match the yellow and blue colors to the proper shifted keys. Perhaps it would have been better to leave the direction (left or right) out of the manuals and describe the keys in the documentation by color only.

Why did they use I and J for indirect addressing? Why not lowercase i and j? (the complex notation for i could have been a cursive type i like on the LCD)

Well, despite my minor complaints, I still am glad HP released this calculator and I plan to show it and RPN off whenever I can. However, I'm still looking forward to the 25th Anniversary HP 15c calculator and the successor to the HP 42s.

Cheers,

Greg

---

I've seen several people mention the shift keys being confusing, either because of the arrows pointing left and right, or because they both point upward. That confusion was surprising to me, because I've *always* used the color-coding to match functions with the shift keys on HP calculators. I'd always assumed that these keys were called "shift" keys as a reference to the shift keys on computer (and before that, typewriter) keyboards. Such keys are used to shift "upward" to upper-case letters, so it made sense to me for them *both* to have upward-pointing arrows (as the shift keys on many computer and typewriter keyboards do). Also, since the shift keys on calculators aren't physically located on the left and right sides of the keyboard, I thought the left- and right-pointing arrows were simply meant to be ways of distinguishing the keys from each other: "We know these keys are located one above the other, but this is the key that would have been on the left side if this were a typewriter keyboard, and that other key would have been on the right side." I thought that was the only reason for the "left-shift" and "right-shift" terminology.

It never occurred to me that the "left" and "right" designations had anything to do with how the labels were placed on the keys. But I just checked my HP48GX, and sure enough, the left-shifted labels are on the left, and the right-shifted labels are on the right! Funny that I never noticed that before. I just always matched the colors without paying any attention to the physical orientation of the labels.

I, also, use the colors as my guide. But some folks are color-challenged, so the arrows are the only thing they can use to distinguish between the two.

**Re: Thread for those receiving 35s calculators to post what they think**

Message #50 Posted by [Walter B](#) on 26 July 2007, 10:54 a.m.,  
in response to message #49 by Don Shepherd

And under these circumstances, arrows pointing in the wrong direction are extremely confusing, as you can imagine. To use your terms, HP was quality-challenged in this detail ;-)

BTW, I love political correctness as it has grown overseas, e.g.: When the horizontally-challenged person in its best age could not keep his attention at an appropriate level (due to above-average long-wave radiation from above) next the urban area of the vertically-challenged people, they made him mobility-challenged by elongated textile products. I.e. when big old Gulliver slept in the sun next the city of the dwarfs, they tied him down with ropes.

In other languages you call such a person "color-blind", and that's what it is.

...In other languages you call such a person "color-blind", and that's what it is.

\_\_\_\_\_

Most of us are not completely devoid of seeing any color.  
It's more can't tell Red from Green, Blue from Purple (and I have no idea what Teal is..)

This is why we prefer it be Color Deficient, not Color Blind.  
It's not being politically correct, just correct. :)

in response to message #51 by Steve Myers

Sorry Steve, that was the short and simple version. AFAIK the most frequent deficiency concerns red and green, and in fact it's called "rot-grün-blind" (blind for red and green). It was said to have been the reason behind some traffic lights not only showing different colors, but these also in different shapes. Nowadays, however, everybody knows green is at the bottom ;-)

So "blind" is a short word indicating some visual deficiency, not meaning I would see nothing at all.

---

No offence taken Walter.

I know it as "Top Stop, Low Go" but that doesn't work on those sideways lights in Texas..

The lack of seeing Red is why I can't tell Blue from Purple. Unless I've been lied to all this time, Purple is Blue+Red and I'm "blind" to the red part.

All my friends know when I do my own laundry. "Shirt looks grey to me", how would I know it's bright pink.

I'm happy its not so bad as I can still see the difference in the shift keys on my 32SII ;)

Fabulous! I loved the 33s (I had to get past its appearance) and so find the 35s a really welcome upgrade.

I share the woe of several regarding the BASE handling, and would rather the roll down & swap keys were adjacent to ENTER.

Taken as a whole, it's not as near-perfectly-realized as was, say, the 15c, but it's a *really* nice, *readily available*, programmable, shirt-pocket RPN calculator. Thanks to all involved!

*in response to message #1 by Gene Wright*

My first impression is that I like it better than the 33S, but nowhere near as much as the earlier machines.

pros:

- The function set is good as is the memory access.
- The case seems like more thought went into it than for the 12C anniversary edition.
- The keyclicks are okay.
- The manual seems complete and well written.

cons:

- There's a lot of LCD segment shadowing on the display.
- The keys themselves are really cheap feeling.
- The calculator is too large -- why should it be any bigger than a 32SII?
- The window reflection is annoying.
- I really hate having to press ENTER after XEQ <letter> and <right arrow> before STO.
- The ALL display mode should not overflow the display area it should cut back on the number of places displayed in order to fit the exponent in. I view this as a bug, I see no advantage in it working the way it does.

Summary:

The prices of the 32SII on ebay are going to keep going up!

-Katie

### **HP-41 CV - Halfnut etc.**

Message #1 Posted by [ems22](#) on 19 July 2007, 9:48 a.m.

Hello, could anyone send me a picture or post a "working" link where I can see the difference between halfnut and all the others? I cannot imagine the difference. My HP-41CV has a Serial No.: 2137S11997

Thanks in advance

### HP-41 Full-nut, Half-nut

Message #1 Posted by [ems22](#) on 19 July 2007, 5:12 a.m.

Hello at all, I just but an old HP-41CV at ebay plus a Cardreader, an X-Funtions- and a Time-Modul. This machine was an old dream of my study times in the 80's and I am now very happy with it.

I have often read about half-nut and full-nut etc. but never senn a picture about this. I also have checked this forum, where I openede an account today. Does everyone has pictures about these different display types which he can send me by mail or an web-link?

Thanks a lot

Edgar Meyer-Schönfelder

### 35s: comma and fraction mark ??

Message #1 Posted by [ChristianB.](#) on 19 July 2007, 2:25 a.m.

Hi,

could someone with the new 35s show pictures of the display with 222,222.222 typed in.

I really would like to see, if there are improvements in the readability of the fraction mark / comma compared to my 33s (which I will sell soon on ebay).

Cheers

Christian

### Re: 35s: comma and fraction mark ??

Message #2 Posted by [Jeff O.](#) on 20 July 2007, 10:35 a.m.,  
in response to message #1 by [ChristianB.](#)

Does your 33s have the improved display? To my eyes, the display of my new 35s looks identical to the display of my 33s that has the improved display. For a visual comparison of the original 33s display to the improved 33s display, look [here](#).

Quote:

.....compared to my 33s (which I will sell soon on ebay).

I expect that the market will soon be flooded with used 33s's, and they can be had new for less than \$40, so their value on eBay probably won't be much.

### Temptation

Message #1 Posted by [Earl Kubaskie](#) on 19 July 2007, 12:34 a.m.

So far I have few posts here (sort of a lurker) but I've had 8 HPs along the line, starting with an HP-45 back when I was only 17.

I miss several, especially the 67 (stolen) and the 15C (the one that did NOT survive being run over by a car), but lately I've started to get the itch...

I have 4 now, and OF COURSE will get at least one 35S.

Anyway, 2 coworkers have 42S's, my neighbor has a 15C, my ex-boss an 11C, and just today I saw that another has a 28S. Every time I see someone whip out their calculator, I want to reach for my wallet!

I want them all, darn it! Is there a support group, or at least a calculator-junkie credit union?

### Re: Temptation

My wife has also asked (several times recently) if there was a support group for HP calculator addiction. My response was to get out my HP42 and calculate the odds are about 01 in 67 that there are 15 people living within 28 mile radius willing to attend 11 weeks of therapy. Counseling is only 45 percent successful at treating such problems..(um.. I mean passions) anyway.

Besides, I don't really have a calculator problem, do I?? GRIN

### Re: Temptation

Message #3 Posted by [ECL](#) on 19 July 2007, 2:06 a.m.,

in response to message #2 by Allen

Wow...sounds like you guys need to DROP that habit, or at least SWAP it.

Either way, if you are worried that you are becoming a USER, you could ENTER a support PRG, permitting they have SPC.

Those groups are usually full of odd CHARs, though.

Seriously, this is the support group. I suspect we'd prefer the term 'user group'?

ECL :)

PS It is hard to let go of technology that was state-of-the-art when our elder engineers set forth.

I want them all, darn it! Is there a support group, or at least a calculator-junkie credit union?

None of the people I worked with have a HP (except recently a 17BII owner who shared my office).

Nonetheless, I'm deeply addicted to these little marvels. I just had kept a 41CX and a 12C.

I started with the excuse that I wanted to get a 21 to replace the one stolen (to me) in high school. Afterwards, it came to a 34C that I used to own a couple of years later. And a 25C. And a 41C which was my very first 41 (before I get the CX) and [all the others](#) (check link).

And that makes a 4000 euros expense...

Fortunately, my wife loves me. Sometimes, I wonder if I deserve her...

### **Has anyone received their HP-35s from the HP S&MB site?**

Message #1 Posted by [Bruce Bergman](#) on 18 July 2007, 4:36 p.m.

I know there was a handful of us who used that unpublished link on the HP Small & Medium Business site to order the HP-35s. I'm wondering if anyone has received theirs yet?

My order status shows that there is stock available and allocated to me, and that the ship date is 17-Jul, with an expected delivery date of 18-Jul (today). That all being said, there was no tracking information there, and I have heard nothing from either HP, FedEx or my wife. ;-)

So, anyone??

thanks, bruce

Message #3 Posted by [George Bradford](#) on 18 July 2007, 4:50 p.m.,  
in response to message #1 by Bruce Bergman

On Sunday (15 July 07) I ordered TWO HP-35s with next day delivery. I ordered one (1) from HP's S&MB site. I ordered one (1) from Samson Cables. As of 4:50pm EST (18 July 07), neither website has confirmed shipment and neither HP-35s has been delivered to me in Atlanta, GA. I suspect the HP-35s really were not ready for shipment on 17 July as advertised..... :-)

Message #4 Posted by [Dave Boyd](#) on 18 July 2007, 5:50 p.m.,  
in response to message #3 by George Bradford

I ordered a couple from Samson Cables (via UPS ground, since I am patient/cheap), and, while I don't have a tracking number, the Order Status page cites the calc as "shipped".

Alas, I am in Connecticut, on the other side of the country from Utah, so I don't expect it tomorrow, either.

...did you receive your parcel?

What about the overall costs including taxes, shipping to germany/europe and so on? How long did you wait for it?

Due to the currency rates \$/€im planning to order mine, too.

Best regards

Christian from Hamburg

**Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #8 Posted by **koendv** on 19 July 2007, 10:23 a.m.,  
in response to message #7 by ChristianB.*

Ordered a HP35s. Received a mail from Samson cables, stating shipping costs to Europe:

Quote:

Europe (EU)--Charges include all customs taxes (VAT)

Your order will be shipped from Europe.

El costo del envío incluye todos impuestos de la aduana (IVA).

Le coût d'expédition inclut tous impôts de douanes (TVA).

Il costo di spedizione include tutta le tasse di dogana (l'imposta sul valore aggiunto).

\$35.00 Standard mail, 2-4 week delivery (+ \$15 each additional item)

\$45.00 Expedited mail, 2-3 day delivery (+ \$10 each additional item)

Please include phone number. This is required by international mail carriers.

Adding these to the basic price of a HP35s (\$59.99), the total cost becomes \$94.99 (standard mail, 69€) or \$104.99 (expedited mail, 76€).

Don't be angry if I have my numbers wrong; I have to make do with a Casio until the 35s arrives :)

regards,

koen

**Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #9 Posted by [Matt](#) on 19 July 2007, 11:04 a.m.,  
in response to message #8 by koendv*

I paid \$52.99 for the HP35S.  
Shipping was \$43.00 UPS World-Wide Express (1-2 Days)  
So \$95.99 works out at about 47 GBP. Cheaper than the 60 GBP plus postage that UK retailers will charge.  
As of now, 4pm, I'm still waiting. :(

**(UPDATE - Samson Cables) Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #10 Posted by [Matt](#) on 19 July 2007, 12:32 p.m.,  
in response to message #9 by Matt*

Just had this from their customer support.  
"The scheduled shipment from HP manufacturing of our order of 35S calculators has been delayed for arrival until tomorrow. Your order will then ship."

So much for my order status as showing 'shipped' >:(

Looks like next week at the earliest for some of us...

**Re: (UPDATE - Samson Cables) Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #11 Posted by [Doctor Bubu](#) on 19 July 2007, 1:44 p.m.,

Got the same mail today. Orderd my 35s last Sunday and was complaining because shipping status didn't change. So now we can play cards in the meantime :)

**Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #13 Posted by **Chuck** on 18 July 2007, 5:09 p.m.,  
in response to message #1 by Bruce Bergman*

I got contradicting info from HP SO/B. The invoice said ordered 7/13 with delivery on 7/18. But when I click on Line Item Detail it says Shipment on 7/18 with delivery on 7/23. I suspect it will ship out today, and therefore should have some tracking info shortly.

CHUCK

**Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #14 Posted by **Seth Morabito** on 18 July 2007, 5:11 p.m.,  
in response to message #1 by Bruce Bergman*

Same here -- order line item says "Qty Order: 1 ; Qty Allocated: 1 ; CTO Shippable: 0". The overall order says "Ship Complete: No".

The day before yesterday, it said "Qty Backordered: 1". Now it's 0. That's some progress! ;)

So I guess we'll all just have to be patient. Somehow!

**(UPDATE) Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #15 Posted by **Bruce Bergman** on 18 July 2007, 6:39 p.m.,  
in response to message #1 by Bruce Bergman*

Update for those interested:

I still saw no movement on the S&MB site, so I called a flunkie. He couldn't tell me why these haven't shipped yet, but he DID confirm that mine (at least) has not shipped yet. He sent an email to the warehouse to get an exact ship date, but no response yet.

He "felt" that the order would ship out in the next 1-2 days, and that I would receive it shortly after that.

For ordering DIRECTLY from HP, this pretty much sucks. ;-) Next time, I'm going to bypass and get it from Wal-Mart...

thanks, bruce

**Re: Has anyone received their HP-35s from the HP S&MB site?**

*Message #16 Posted by **Howard Owen** on 18 July 2007, 7:47 p.m.,  
in response to message #1 by Bruce Bergman*

I suspect that HP's emphasis is on getting units out to their channel. The fact that the prices on HP's website are always close to or equal to list also implies that they value their dealers and don't want to undercut them.

I ordered one 35S from Wal Mart with next day shipping. The expected arrival date was tomorrow or Friday, depending on processing time. I also ordered one direct from HP shortly after the news that you could do that hit on this forum. I'm pretty sure the Wal Mart order will show up first.

I didn't order direct because I wanted to get the machine quickly. I ordered direct from HP to "vote with my wallet" approving the direction they took with this calculator. I ordered from Wal Mart to get the best deal I could find on Tuesday, and to get the calc as quickly as possible.

Regards,  
Howard

I ordered Tuesday. It shipped out of Indianapolis a few minutes after midnight this morning.

The invoice page says it hasn't shipped but I clicked on the Tracking link at the bottom and it gave me a pop-up with a tracking number.

### **Re: 3 Serial numbers for HP 35S deliverd today**

*Message #18 Posted by [Allen](#) on 18 July 2007, 10:05 p.m.,  
in response to message #1 by Bruce Bergman*

Got three in this morning 8:00 am: Serial numbers:

CNA72103876,  
CNA72103897, and  
CNA72103896.

I assume the date convention for production in the 21st week of 2007 still holds?? or has that been dissolved since the Chinese took over production?

Couple of comments: 1. DONT press on the LCD... it is quite sensitive and becomes BLACK easily and takes several (8-10) seconds to recover from bruising in response to normal forces (no pun intended).

2. Not sure why the R/S and Stat key keep moving around so much with the 32s-42s-35s progression...

3. I was trying to read the manual while driving to work.. also not a good idea. It is certainly longer than any recent manuals.. we'll see in the next few days if they managed to get both quality and quantity in to the binding. (sorry, no spirals, just perfect bound).

4. Case is bulky.. I stuffed the 35s immediately into one of the Pioneer leather cases from the 90's.. much better fit without the cheesy PDA feel. With the vintage flap-top leather case it FEELS like an instrument, not some metrosexual clothing accessory that would work as well with my calculator as with an iPod (don't have one anyway and don't need one).

Direct from the factory. The tracking link HP sent was COMPLETELY worthless, and I would not have known at all when to expect delivery except that I tripped over the box on my way out the door.. subsequently dropped my bag, and with the door agape and proceeded to grab the closest kitchen knife and mutilate the tape and packing material, then the first blister pack. The other two will remain in their packs for now- and on display with my other 50 or so NIB HP calculators. GRIN.

My wife already endured my covering the kitchen table with every model made after 1985 to graphically demonstrate the 'direct heritage' from the Voyager series (11c/15c) to the Pioneer series (32s/32sii/42s), and after some delay.. the 35s!

IMHO bears little resemblance to the original 35, and probably would have been named a Thirty-SOMETHING simply because it succeeded the 33s flop. Any other release year and HP could have made the case to name it "32sii+" (precedence with the 17b/17bii/17bii+) or "34s", since I believe it is more closely related to either of those than the original HP35.

I think it would sell better under either 32sii+ or 34s name because those workers who LEARNED on the HP35 are now retiring, while the younger 34c/15c/32sii market is still young and vibrant.

Still I am pleasantly surprised, look forward to the future of HP calcs...

It isn't that rare. Most boxes of 50Gs we get have consecutive numbers. If you'd like me to sell you a couple of those in a row I'd be happy to sell you some. :-)

Anyway, my 35s has serial number: 711000118

I also have a 50G with: 61100015

Can anyone beat those?

TW

in response to message #30 by Gelnn Graf*

Very frustrating. Mine also has not shipped yet, despite the fact that the order still lists yesterday as the estimated delivery date. I suppose that patience is a virtue that I should exercise more often.

The ironic bit is that I work on Page Mill Road in Palo Alto, right across the street from the HP world headquarters (I can see them out my window). I'm half tempted to walk over there and start banging on doors until they either sell me a 35s or have me arrested ;-)

in response to message #30 by Gelnn Graf*

Knock on wood, but I called them again today. The guy who I talked to yesterday promised to update me when he had info from the warehouse, but I never heard anything. So I called back.

Today, a different rep told me that my calc HAS been shipped, and it even has a tracking number, but that the web site hasn't been updated with that information yet. Sounds a little fishy. He gave me the tracking number and I typed it into the FedEx site with no success. It's possible that it just got picked up, so we'll

see.

The suspense is killing me! ;-)

thanks, bruce

I \*almost\* feel ridiculous posting every minor change in my order here, but hey, I'm excited. ;-) This is almost as suspenseful as when I waited 17 hours in line last November for a Wii...

Anyhow, I checked my order header just now and found that a new line item was added: shipping. Once added, the tracking number and shipment information also appeared on the order. The "QTY Invoiced" column on both lines now shows "1" (previously showed "0"), so that's a good sign. It appears that as soon as that second line item shows up, the item is actually out of the warehouse.

Now I just need to wait for it to get into FedEx's system.

thanks, bruce

in response to message #1 by Bruce Bergman*

OK, according to my housemate, my HP 35s just arrived at my house. Woohoo! Can't wait to get home and play with it.

I ordered a second 35s from Buy.com on Wednesday, and they claim that it shipped on Thursday, but it hasn't arrived yet (I got free budget shipping on it, though, so it may take a week or more).

**(Update) Got both today! With Serial Numbers**

*Message #46 Posted by **Seth Morabito** on 20 July 2007, 5:59 p.m.,  
in response to message #45 by Seth Morabito*

Wooooops! Correction. About ten minutes after making my post, my second 35s showed up here at work. Hard to believe, but Buy.com really delivered. I'll edit this post with both serial numbers once I get home and see what the serial number of the HP direct order is.

From Buy.com: SN: CNA72101944

From HP: SN: CNA72104162

It's interesting that the one bought directly from HP has a higher serial number than the one bought from Buy.com.

### HP 12c

Message #1 Posted by [Ryan M. Lauper](#) on 18 July 2007, 1:32 p.m.

My calculator does not calculate accurately. In the display the word "Begin" appears at the bottom. I am not sure if this is part of the problem or not. Two questions: How do I remove the "Begin" from the display? How do I reset my calculator so that it computes accurately?

### Re: HP 12c

Message #2 Posted by [Maximilian Hohmann](#) on 18 July 2007, 4:17 p.m.,  
in response to message #1 by Ryan M. Lauper

Hello!

Quote:

How do I remove the "Begin" from the display?

Press 'g' and 'End' (shifted '8').

Quote:

How do I reset my calculator so that it computes accurately?

If the problem is related to financial calculations, pressing 'f' and 'Clear Fin' (shifted 'x<>' key) at the beginning of a new calculation should help.

The manual contains information about several tests that can be performed to check the correct operation of the calculator.

Greetings, Max

Hi, Ryan;

Maximilian has already answered both questions of yours, but I am still curious about what calculations did you carry out with the HP12C so it gave you wrong answers. If you still have problems, would you care for posting some details? Problem description and keystroke sequences, if applicable?

Thanks and success.

Luiz (Brazil)

**Re: HP 12c**

Message #4 Posted by [Jim Creybohm](#) on 19 July 2007, 1:28 p.m.,  
in response to message #1 by Ryan M. Lauper

One possible source of your wrong answers could be the fact that BEGIN was in the display. If I recall correctly (don't have the manual), begin refers to the date at the BEGINning of the pay period, or the END of the pay period.

For example, if you are calculating your mortgage payments, you could carry an extra month's interest at say 150 000 dollars at say 6%, because you choose to make the payment at the END of your interval.

EG w/ BEGIN FV=0, PV=150 000, n=25\*12, i=6/12 PMT=-961.64 w/ END PMT=-966.45

Hope this helps a little bit.....

### What about a real refitting of old 41s?

Message #1 Posted by [Geir Isene](#) on 18 July 2007, 7:56 a.m.

How about this:

The electronics of an old 41 refitted into a new metal case and with room for AA or AAA batteries instead of the dying breed of N-cells?

Is there anyone around here that could do such a job?

### Re: What about a real refitting of old 41s?

Message #2 Posted by [Bill Wiese](#) on 18 July 2007, 2:02 p.m.,  
in response to message #1 by [Geir Isene](#)

Um, I think you mean "41C" not 41S - unless that means I have to collect yet another model :)

The problem you speak of is what dogs any hobbyist production of a new calculator - the electronics/PCB and firmware are easy and acheivable in a garage.

But doing a nice case/keyboard costs huge \$\$\$\$ for a production run just even to get started. And I am assuming you mean something that looks/works properly, not a bunch of Radio Shack SPST pushbutton switches in/on an aluminum project box :)

That's the whole problem with the OpenRPN project, at least as far as I've seen - everyone's worrying about choice of CPU (irrelevant as even a competent 4-bitter can do a fine job) or tricky electronic designs or minor firmware issues, when the real issue is keytops and case.

Bill Wiese  
San Jose CA USA

Hallo!

Quote:

Um, I think you mean "41C" not 41S ...

No, I think that 41s is the plural of 41. Mathematically correct, he should have written:  $n * 41$  with  $n=1...infinity$  :-)

But the idea is not bad at all. If one would keep the electronics and keyboard together, a nice housing could be machined from a small block of alumiuim quite easily by a skilled craftsman. Even more easily

on a numerically controlled milling machine.

I would buy one (at a reasonable price, say 50 Euros?), because I have a 41 with corroded battery contacts that could do with a new housing with integrated AAA cells.

Greetings, Max

Max,

50Euros (~ \$80 US) for small-volume CNC mill work would be difficult to find I think. It takes some skill for setup etc. and would involve lost 'opportunity costs' for more profitable higher-volume projects.

It seems all our CNC shops that handle smaller volumes here are always busy - except for the right price, which'd be prohibitive for hobby projects.

The closest I can find for limited panel-type applications is <http://www.frontpanelexpress.com> ...

A friend is trying to start a firearm company for a new innovative rifle receiver (that is, not the whole rifle, just one fairly simple block that has only a few really critical holes/openings) and cannot get \*any\* time on CNC machines at firearms-authorized firms. Even if he were to go to a non-licensed machining firm and directly oversee production run day/night under his license, they're still booked up/cost too much.

Bill Wiese  
San Jose CA

*Message #5 Posted by **Dave Shaffer (Arizona)** on 18 July 2007, 11:41 p.m.,  
in response to message #4 by Bill Wiese*

Has anybody tried this gizmo for making calculator cases: the Sears Compucarve (<http://www.sears.com/sr/javasr/product.do?pid=00921754000>)

It is basically a cheap CNC machine. They claim it will work on wood and plastic. Maybe it would do OK on aluminum, too. I'm not sure how fine the detailing can be. It can be had cheaper (\$1700) if you are a member of the Craftsman Club! In any case, it's a lot cheaper than the Versalaser carbon dioxide "printer" which has similar capabilities.

Message #7 Posted by [ECL](#) on 18 July 2007, 10:38 p.m.,  
in response to message #6 by koendv

I'd disagree with Koen, the time necessary to create a CAD model uses the one resource that a hobbyist is plentiful in: personal voluntary time!

Hobbyists differ from businessmen in one key characteristic: The former will happily engage in a zero-ROV (financial) project simply because he/she enjoys it, or is nostalgic about a subject. We work for "free" through the night on hobby projects, and then wake up and work the daylight hours for profit.

The monetary cost is greatest when short-run, highly custom equipment is created using current/modern industrial fab shop tools that are not subsidized (for our benefit).

Even more curious is the desire to MAKE a calculator. Granted, this is a DIY culture (of which I am more interested in the numerical DIY aspect, ie. programming). I can appreciate it, but wonder that you all are not more interested in your day-jobs?

I can hardly wait to get to work in the mornings, and often put in 11-12 hours because I get caught up in my work. Lately, when I get home, I'm spent, and look forward to reading, or mentally revisiting current project issues in the evenings.

I am a structures analyst/design guy on a new suborbital space vehicle, so job-related excitement is par for the course, but I'm still somewhat startled that people are still pursuing these fab projects. Don't take this the wrong way, I don't mean any harm. I'd really like to know more of your perspectives on how being a tech-minded person (for those of you who are) has worked out wrt careers, etc.

---

Having just designed and built my own RPN calc from scratch, I can give you the reasons why I did it at least: 1) It's fun 2) What I wanted was not available commercially (old or new) so I simply did it myself. This is probably my main reason. 3) I'll hopefully get some kudos for it. 4) Did I mention it's fun?

Also, it's not much work either. My first prototype took around 30 hours of actual work from blank schematic and no C code, before I had it in my hands and could push the buttons and see calcs on the LCD. That of course doesn't include general procrastination, napkin sketches, and just thinking about stuff!

Dave.

Dave,

That's pretty impressive (and cool!)

I'm "for" doing what you did. 30hrs is quite rapid!

I should probably have been more clear in my earlier criticism. What appears somewhat futile (I know many disagree) is the pursuit of custom injection-molded 2X keys, etc.

But perhaps I'm just wrong here. There's certainly nothing wrong with dreaming (Howard), I do that too. I suppose it is the devotion to lust-ware (ie. multiple keyboard schemes, processor

trade-offs) that surprised me.

Then, I sit around and make paper/glue scale models of various aircraft wing layouts :)

Thanks for the thoughts,

ECL

---

Yes, you can get easily caught up in "the dream" and never achieve anything, that's why I forced myself to make some hard decisions up front and get that first prototype done and dusted.

I'm spending a bit more time now on the 2nd prototype which will hopefully be the final released product. Having that first prototype to play with quickly really showed me what's important and what's not, what works and what doesn't, and gives you confidence that you are on the right track.

Dave.

### **Re: What about a real refitting of old 41s?**

*Message #11 Posted by **Howard Owen** on 18 July 2007, 11:47 p.m.,  
in response to message #7 by ECL*

I think that DIY calculators are appealing to geeks like me because of two things. First, I have lots of ideas about how my ideal calculator should operate. Second, software simulations of classic calculators (some of which are closer to my ideal than anything on the market today) are less than

satisfactory because of the lack of a decent keyboard and portability. So I naturally dream of building the ideal calculator frame and filling it with the ideal calculator software.

Now, I'm a software guy. I started playing around with a soldering iron a couple of years ago just for fun. But I'd never be able to fabricate in the real world anything like what I have in mind. But that is all beside the point. Just because it isn't possible for me to build my ideal calc doesn't stop me from wishing I could, and dreaming about the result.

Regarding work/hobby balance, sometimes I don't get enough sleep. 8) Also, my software hobbies complement my day job as a systems engineer. That's not very balanced, but I've never been very good at balance anyway. 8)

Regards,  
Howard

eMachineShop is nice (and easy) but not that cheap. For the cost of a rapid-prototype case you could probably buy yourself another real 41 with a pristine case.

Dave.

For the cost of a rapid-prototype case you could probably buy yourself another real 41 with a pristine case.

Nah, it's plastic.

What I need is an aluminium case with the interior, the LCD, the keyboard and the ports from my 41CX. And it should take three AAA batteries. That's all I need. And I would be happy to pay USD 200 for it.

---

eMachineShop can do it in aluminium, or any other material you like. But for \$200ea you'd have to split the cost with quite few others.

Dave.

in response to message #1 by Geir Isene*

Quote:

---

The electronics of an old 41 refitted into a new metal case and with room for AA or AAA batteries instead of the dying breed of N-cells?

Is there anyone around here that could do such a job?

---

An interesting idea, but it's almost the opposite of what's really needed. Designing replacement electronics for the 41C is a relatively easy task. It's the case design and manufacturing that is difficult and expensive.

I've recently been learning the rudiments of industrial design with SolidWorks and a 3D printer. It's great for prototyping, but the cost is far too high for production use. A set of plastics for something similar to the 41C has a materials cost of about \$50 with a 3D printer (fused deposition modeling).

**Weird HP 97**

Message #1 Posted by [Kostas Kritsilas](#) on 17 July 2007, 10:14 p.m.

Hi,

I ended up with 2 HP 97s. Both work, and both print out nicely. However, one of them has a multi-color ribbon cable coming out of the back (through the same slot at the metal tab with the hole for a padlock/security device), that terminates in a DB-15 cable. Has anybody seen that before, or does anybody know if this is something the factory (or some part of HP) did?

Kostas

P.S. Both units were from eBay.

**Re: Weird HP 97**

in response to message #1 by [Kostas Kritsilas](#)

That is an HP-97S "I/O Calculator." It's fairly scarce. Congratulations!

[Museum page on the 97S.](#)

Regards,  
Howard

Edit: scratch that. I should read the pages I link to before replying. Your machine doesn't seem to match what is described in the referenced article. I don't know what it is.

Regards,  
Howard

Are they for sale? I want a 97. I have a HP45 in excellent condition.

### **Re: Weird HP 97**

*Message #5 Posted by [brianh](#) on 18 July 2007, 6:18 a.m.,  
in response to message #1 by Kostas Kritsilas*

I know that a number of HP 97s were modified by third party manufacturers as I/O units. I have two with pin connectors in place of the locking bar that were used to drive digital planimeters. For years I thought that was how all 97's were made until I started hanging around this forum :-)

*Message #7 Posted by [Kostas Kritsilas](#) on 18 July 2007, 11:06 a.m.,  
in response to message #6 by Chan Tran*

I did look at the Museum's HP 97S link, and while entirely possible that this is a HP 97S, the cable in the Museum's pictures is a round cable with a grommet, the cable on the unit that I have is a flat multi-colored ribbon cable. The cable end (that is inside the calculator) shown in the Museum's interior view of the HP 97S looks like it could have the correct 15 wires, but the rest of the cable is different. Might be that this unit was originally shipped as a plain HP 97, but then the cable modification was added later on, making it simpler to run the ribbon cable out through the security tab slot, than to try to cut up the back of the case for the round white wire (although this is all just speculation). Might also be true that this was a third party modification, as well.

Either way, I will try to get some pictures tonight, but I don't really know how to post them, so I would appreciate any help in that regard.

Kostas

in response to message #7 by Kostas Kritsilas*

Hi:

Here are photos as promised. Sorry about the blurriness, but they should get the basic ideas across.

I'd still appreciate any ideas regarding this particular HP 97, or any other opinions. The unit is actually pretty awkward with this cable coming out of the back, so unless there is a reason to keep it this way, I will be having it removed when I send it in to Randy at Fixthatcalc.com.

Hopefully, I did this right and the pictures are visible.

I think what you have there is a 97 modified to behave like a 97S. I have a similar beast myself, with a DIL14 connector and a ribbon cable leading to a second metal box under the calculator (looking quite professional) which carries the interface. I concluded that the 97 and 97S are basically identical, and that a 97 can be retrofitted to become a 97S, provided that the external interface electronics be connected. The nameplate of your machine, saying 97 instead of 97S, supports this claim. It would be interesting to know if somebody with schematics at hand could confirm.

Andreas

*Message #10 Posted by [Kostas Kritsilas](#) on 20 July 2007, 11:49 a.m.,  
in response to message #6 by Chan Tran*

Hi,

I sent the same pictures to Randy of Fixthatcalc.com, and he says that he has seen other HP-97s with the same modification. According to Randy, the cable is basically parallelling the keyboard, simulating a key press, and was used in data collection applications.

I will be having the cable removed when I send the calculator in to Randy for the gummy wheel fix to the card reader, and some general TLC.

### HP-35s I/O and Memory

Message #1 Posted by [Gerry Schultz](#) on 17 July 2007, 7:03 p.m.

To All:

I've been following the HP-35s discussions here with great interest. The 35s seems like a great machine for its price but I'm concerned about its lack of I/O and smaller memory footprint. I realize that HP is trying to keep the 35s from competing with the high-end calculators, like the 50g. But, with no I/O and smaller memory that's a bottleneck that could come back to haunt a user. Why didn't HP put 128K of memory in it? Memory is dirt cheap these days.

Specifically, if the 35s crashes and in doing a restart clears user memory, then you are screwed as the only way to put the programs back in is through the keyboard if you wrote down the latest updates to your programs. In my imagination, since I can't save a program and remove it from the 35s, its memory would build up over time with old programs. Given how much memory each step takes up, that would be a lot of programs; until you write one that needs a lot of data storage.

As I understand it, program and data memory is dynamically allocated. If you write a program that requires lots of data storage, you have lost that memory to programming. Depending upon how many programs you port from other calculators as well as new ones, this bit-bucket has a lot of space for lots of programs and data. In essence, mass storage for the 35s is your hand-written documentation. Isn't that a step backwards? Also, can you drive a printer like an 82240 via infrared from a 35s? If you can do that then you can print out your programs in for later re-inputing.

Also, as the 35s becomes loaded down with programs and data, does it slow down because of background housekeeping and memory packing? I would like to hear about how it handles these situations. Finally, what happens if you leave it sitting around for a few months and the batteries run down? If it does a "memory lost" I don't think an owner would be very happy. How long will the 35s hold its memory with the batteries removed? Is the battery compartment sealed to battery leakage to protect the rest of the calculator from damage? I hate it when batteries leak. I've got two HP-41Cs out for repair due to battery leakage. If I pull the batteries out of a 35s for long-term storage to protect it from battery leakage, how do I keep the calculator from losing its user programs?

It looks like a promising new calculator. With answers to these questions, I might very well buy one.

Thanks,

Gerry

*Message #3 Posted by [bill platt](#) on 18 July 2007, 7:22 a.m.,  
in response to message #1 by Gerry Schultz*

The 35s is a calculator, not a computer. The 50G (and the 48 series and the 41 before it) were/are miniature computers. Programming power on a calculator becomes a problem when the memory gets to be too big, as it then becomes a major chore to store/retrieve it. In this current world, anything that long will be written on a computer, if the user is rational about it.

There is no reason to put the "computer-like" features into a device that is designed for the niche of being a really good functional calculator. If you want miniature computer power, there are two other paradigms already available: the handheld, and the graphing calculator.

### **Re: HP-35s I/O and Memory**

*Message #4 Posted by [Kostas Kritsilas](#) on 18 July 2007, 11:33 a.m.,  
in response to message #3 by bill platt*

I would have liked to see an SD, or SD mini/micro slot on the HP35S. This would have fixed the memory size, need for backup, and communications with a PC, points in one shot. The SD, or SD Mini/micro cards are very cheap now, and any files required could be put onto the card with a card reader on a PC. And, of course, the card would be removable if the calculator needed to be hard reset. In addition, multiple cards could be used to hold different applications, as well as making it possible to sell software on ROM type SD cards (similar to the way the "Dark Side" used to sell software for their late 70s-Early 80s machines), a potential revenue stream for HP.

I don't buy the argument that this would compete with the 49G+/50G machines, as the 35s doesn't have graphing capability, nor would it have any I/O other than the card slot.

Kostas

### **Re: HP-35s I/O and Memory**

*Message #6 Posted by [bill platt](#) on 18 July 2007, 12:17 p.m.,  
in response to message #4 by Kostas Kritsilas*

But having this capability removes the major market: education. Having no I/O is desirable for a calculator that is to be used in a closed testing environment. And for engineering, it is silly to use a calculator for anything that really requires saving!

### **Re: HP-35s I/O and Memory**

*Message #7 Posted by [Donald Williams](#) on 18 July 2007, 12:27 p.m.,  
in response to message #4 by Kostas Kritsilas*

I have been thinking along those exact same lines. I think the lack of I/O decision may have been prompted by a concern about using the calculator in a testing environment. I don't think the addition of a

micro SD would cause any grief there. I confess that I am not fully acquainted with the arguments about this conflict.

I will take the idea one step further. Can you imagine developing your programs on the PC or the Calc, then storing them in the micro SD? Then you move the micro SD over to the HP or third party devolper's micro DAQ/Data Logger (battery powered of course) peripheral. The peripheral then runs programs (in calculator native code),collects the data,and stores the data on the micro SD. You do a quick check of the data integrity and statistics on the calculator in the field. When you return to the lab, pop the micro SD in the PC card reader, graph, document, backup the data, and email the results to all parties concerced.

Calculators are still more preferable than laptops for collecting data in the field. Would you rather lug your laptop in your backpack through the forests of the Sierra Nevada mountains, or your "HP 41S" in your shirt pocket. Sometimes serious "data collection" has to be accomplished before serious "engineering" can even begin.

I think this type of calculator would be the the answer to the abandoned 41CX community. This would be a cousin of the 50G, but running the simpler RPN system rather than than the RPL. RPL is wonderful, but the learning curve is much too steep compared to the RPN system in the 41 series and the power of RPL is wasted in a large majority of the "I need portablity" applications.

KISS!

Like the 41C system which was implemented in an amazing number of applications (that may have flown under the HP maketing radar),a system design similar to what is being discussed ( micro SD providing a non-traditional form of I/O) would only be limited by your imagination rather than by a crippled design.

The 50 G is the appropriate tool in the current environment.

If you really want to use 41C style code and RPN you can run an emulator on the 50G.

Otherwise, you can use the RPL :-)

Have HP ever made any kind of public statement as to why they discontinued the HP-42S? Given that they keep selling the HP-12C after 25 years, I'm inclined to suspect that the 42S was axed because it didn't sell well enough; that the vast majority of power users want the most powerful model they can get, whether that means they have to learn RPL or not. While there is a market for lower-end programmable calculators, which they've continued to serve with the 32Sii, 33S, and now the 35S, it isn't clear that there is much of a market for fancier RPN models, as much as it pains the HP-42S fan in me to admit this.

Adding hardware features like I/O or an SD slot to the 35S would probably only eat into HP's margins on the machine, while enticing only a handful of additional buyers. Just my \$0.02...

- Thomas

Thomas:

I agree that it will increase HP's costs, but I think that adding the SD slot would also result in a price increase for the machine, and from indications here (which, I will grant, are not indicative of the general population) would be acceptable for the added feature/ functionality. Personally, an added \$10-\$20 added on to the selling price of a 35S (resulting in a HP35SX/HP35SD/HP35MC/HP36, or whatever they want to call the model with the SD/SD micro slot) would be very acceptable. If this can be done on something as price sensitive as a cell phone, I don't see why it couldn't be done on a calculator. I do believe that a \$10-20 cost increase would improve HP's margins, not reduce them. I am also not hung up on SD/SD micro cards, the card used could be a Transflash/SD mini, SD-HC (probably overkill) or M2 Micro (Memory Stick Micro, Sony proprietary). The advantage of any of the micro flash card form factors is that they will take up the least amount of physical room, resulting in a smaller overall size. All of the mini/micro sized cards have capacities of at least 1GB, easily allowing for more storage than most would require, and for those who need more, buy a second (or third, or fourth, etc.) card. To keep the calculator acceptable in test environments, limit the card slot to memory usage only, do not allow SDIO type cards to be used.

This opens up a huge world of possibilities, even allowing program development on a PC/MAC with download to the flash card, or turn key software on ROM cards. This would still NOT cannibalize sales from the 50G, and allow the machine to stay smaller, and much simpler.

Just some thinking out loud (or in email, as the case appears to be).

Kostas

### **Re: HP-35s I/O and Memory**

*Message #11 Posted by [bill platt](#) on 18 July 2007, 3:12 p.m.,

increasing the cost would decrease sales.

While they might gain a new cat, it would only eat into the 50G which most would be happy enough to use for large mem apps.

Can't agree with you there. Fancy cell phones like the Motorola RAZR, BlackBerry Pearl, Nokia E70, and Samsung Blackjack, retail for \$300 or more (you may get them for free when you sign up for a wireless account at the same time, but that's only because the phone company folds the cost of the handset into the subscription fee). On a device like that, another \$10-20 isn't a big deal -- not that it matters; those devices *\*need\** external I/O in order to allow them to be backed up and updated using a PC.

On the other hand, adding \$10-20 to a \$50 calculator, for a feature that most of that calculator's potential customers will not be very interested in, is a very different proposition.

(Being able to back up your cell phone's address book and appointment calendar is a lot more critical than being able to back up a couple of 200-line programs from your calculator -- and most 35S users will never go beyond that.)

True, but a handful of frothing fanboys (myself included!) hardly make a compellingly large enough user base to justify R&D for a new product like that.

(All the same, I would have said the same thing about the 35s about a year ago. So one never knows.)

Also, somewhat OT: Personally, you know what would make me happy? Just moving the "Enter" key on the HP 50g back to traditional spot, like the 48S and 48G series. That's really all. Give me that and my RPL happiness meter would go right back to "FULL". I've had my 50g for almost a year now, and I **still** fumble sometimes when hitting Enter!

*Message #17 Posted by [Bruce Bergman](#) on 18 July 2007, 5:31 p.m.,  
in response to message #15 by Seth Morabito*

I agree with Seth -- it's hard to break the habit of looking for that big enter key, even after 30 years. What's perhaps worse is the tease that the 17bii+ (and ilk) have with the big INPUT key, right where there should be a big ENTER key -- that's almost painful to me. :-)

I remember how hard it was when they moved the +-x/ keys to the other side and flipped them upside down. In fact, looking at my poster, I see that they are all across the board with order of the math operators; oh well, time changes everything it seems.

thanks, bruce

Message #18 Posted by **Bruce Bergman** on 18 July 2007, 3:57 p.m.,  
in response to message #10 by Kostas Kritsilas

Some sort of memory card option might seem like overkill for a calculator at first thought, but keep in mind that this thing IS programmable, and HP went to fairly great lengths to expand the address space of the HP-35s so that people could enter longer programs and create more programs. If HP weren't shooting for that kind of enhanced programmability, they could have very easily just left it the same as with the HP-33s. They didn't, however.

The 15c, 11c, 12c, etc., were/are memory limited. You have far fewer program steps available than you do even with the 33s. The 41c, 48s and 49/50 families all had some sort of IO option. Of "recent" programmable calcs, only the 32 and 42 families didn't. Then there was the 33s, but its memory was small enough (or should I say, restricted enough) that if you lost a program, it wasn't a nightmare to re-enter it.

But with the 35s, you're looking at potentially big, long and multiple programs. LOTS of variable space. In fact, whereas the 33s had very few user-contributed programs, I fully expect that the 35s will have quite a few user-contributed programs in a short time. It begs to have some way to backup, restore or simply \*enter\* a program easily. Got a great program to do XYZ? Or play game ABC? Love it! But to enter it by hand -- in this day and age -- is almost enough to make me skip it completely.

I totally understand the lack of IR comms, as that would never fly with the testing agencies. The ability to IR print would have been nice, but that only addresses the "backup" side of things. A simple SD card slot, with a minimal Filer application, would be sufficient to fill all needs; it would allow backup, restore and ease of entry, and it would certainly increase the number of programs that users create and share. If not an SD card slot, then just a USB connection would be enough. Even the TI-89 has this ability.

HP wouldn't take a hit on adding that at all. Heck, virtually every HP product out there (laptop, PC, printer, etc) has some sort of SD card slot. Their cost for those must be mere pennies. I suspect there was another reason, which we may never know.

Or, maybe the future will tell...

I hope HP will follow up the 35s with a version that has some sort of communication option. I personally think it would go over very well with both casual user and collectors.

thanks, bruce

Why didn't HP put 128K of memory in it? Memory is dirt cheap these days.

Well, it still costs money.

I believe that the 35S uses a single-chip microcontroller with the RAM on board. Extra part = more complexity, inventory costs, more failure points (and failures), more complex PCB perhaps, possibly additional EMI/RFI susceptibility, etc.

It's also getting harder to find 'small' RAM chips that are not high-grade/high-speed as these small amounts of RAM show up on microcontrollers now.

Adding that \$0.75 - \$1.25 RAM chip raises the showroom cost of the calculator at least 3X that. The calculator might not fit in the right 'price slot' after that. Remember, lotta money is already burned up for case/keyboard (and apparently elevated quality), packaging (it's not a \$3 four-banger), and support.

*Message #20 Posted by [Kostas Kritsilas](#) on 19 July 2007, 5:13 p.m.,  
in response to message #19 by Bill Wiese*

I think that all it will take is for a few people to lose some large, or important, programs before the need for some form of backup/non power dependent storage method becomes obvious. Whether it is due to the need to do a hard reset, or loss of battery power, losing a program of 200 or more steps/lines gets old really fast (I used to own a TI-58 (non C version)) from my own personal experience. This would also be a really great way to do firmware updates should bugs arise (I have done this on my HP 49G+, works great).

HP 65s only had 100 program steps and had the magnetic cards for storage/backup, and the HP 67s had only 224 program steps. The HP 35S has up to 1500.

Quote:

...losing a program of 200 or more steps/lines gets old really fast ...

HP 65s only had 100 program steps and had the magnetic cards for storage/backup, and the HP 67s had only 224 program steps. The HP 35S has up to 1500.

Technically, the old models were the HP-65 and HP-67, which didn't even have continuous memory (to which you alluded in your mention of the TI-58). All programs and data were lost each time the power was switched off, rendering the magnetic cards a virtual necessity for practicality. HP-41, Voyager and Pioneer-series LCD models with continuous memory and CMOS circuitry could store information reliably, even through battery changes (excepting certain HP-42S models).

Let's hope that the HP-35S can do as well, because backup storage capability probably "ain't gonna happen", for reasons discussed earlier, despite the 31 kB of RAM.

in response to message #1 by Howard Owen

According to the [inflation calculator](#) \$395 in 1972 had the same buying power as \$1,965.07 today. Has anyone noticed \$54.99 is about 1/35th of the original HP-35 price?

### Re: Buy.com has the 35S

Message #3 Posted by [Jeff Kearns](#) on 17 July 2007, 6:21 p.m.,  
in response to message #2 by Gerson W. Barbosa

Gerson,

That online calculator assumes an inflation rate of 4.7%, which seems rather high. Maybe I am wrong but in many Time Value of Money calculations, the assumed inflation rate is closer to 2.5% - 3%. This puts the buying power between \$937 and \$1,111. Either way, it's a good deal, comparatively speaking.

Regards,

Jeff

### Re: Buy.com has the 35S

Message #4 Posted by [Gerson W. Barbosa](#) on 17 July 2007, 7:04 p.m.,  
in response to message #3 by Jeff Kearns

Hello Jeff,

On the HP-19BII I wrote the equation  $FV = PV \times (1 + I/100)^{(N-1)}$  and solved for I (PV=395, N=36 and FV=1,965.07). Indeed the average inflation rate is about 4.7% (4.690681415). It really looks high considering the average yearly American inflation, but other inflation calculators I checked gave similar results. Was inflation a little higher some years ago? In 1989 here (Brazil) we had about 80% in a month!, but you cannot imagine what was that like :-)

(I am sure there's no need to write any equation to solve this on a financial calculator, but I have yet to read - and understand - the manual.)

Regards,

Gerson.

You are off by a decade, if you are in the USA.

Inflation in the USA in the late 1970s averaged over 10 percent each year from 1977 to 1980. It was nearly 14 percent in 1979 alone. Inflation during the 1980s averaged well under 5 percent annually.

When a none-too-wealthy friend of mine at Ga. Tech bought an HP-45 new in 1973, I told him that he could have bought a decent used car (which he didn't have) for that. The HP-65 cost the equivalent of almost \$4000 in today's dollars.

As an old geezer who was a university sophomore in EE when the original HP-35 first arrived at the Ga. Tech bookstore, let me assure all here that a five-fold inflation rate very accurately characterizes the total inflation that has occurred in the USA since 1972.

Mike

**Re: Buy.com has the 35S - \$45inc postage**

*Message #8 Posted by **DaveJ** on 17 July 2007, 6:04 p.m.,  
in response to message #1 by Howard Owen*

Free postage with that, and an extra \$10 off if you use Google Checkout for the first time. That makes it \$45 delivered for you US folk.

Too bad they don't ship to Australia.

Dave.

### ISG/DSE behavior

Message #1 Posted by [Don Shepherd](#) on 17 July 2007, 3:39 p.m.

This is something that has bugged me for a long time, I believe since I bought my 16C back in the 1980's. It has to do with the behavior of ISG and DSE. Consider the BASIC loop:

```
For I = 1 to 4
```

```
Next I
```

This corresponds to setting I to 1.004 (on a 33s and, presumably, 35s) and doing the ISG at the end of the loop. The loop executes exactly 4 times, as you would expect.

Now, consider this BASIC loop:

```
For I = 4 to 1 step -1
```

```
Next I
```

This corresponds to setting I to 4.000 and doing DSE at the end of the loop. You can't make it 4.001 (which would be consistent with ISG) else it won't do the last loop iteration you want.

I think that if DSE had been implemented as "DSL", then ISG and DSL would be consistent and would work as in BASIC. But since DSL has another meaning these days, oh well.

Am I the only person in the world bothered by this? There are times when I wanted to loop down and have the final loop iteration be index 0, but that is not possible without manipulating the index within the loop, and the whole point of ISG/DSE is to not have to do that, right?

### Re: ISG/DSE behavior

Message #2 Posted by [Howard Owen](#) on 17 July 2007, 4:05 p.m.,  
in response to message #1 by [Don Shepherd](#)

DSE evolved from the earlier DSZ, decrement and skip if zero. If the loop counter has no fractional part, then DSE's behavior is consistent with DSZ. ISG was always ISG, I believe. So the inconsistency was built in from the beginning. It doesn't bother me any more than any other primitive programming construct in an RPN calc. I actually enjoy those sort of things. 8)

Regards,  
Howard

### Re: ISG/DSE behavior

Message #3 Posted by [John Limpert](#) on 17 July 2007, 5:01 p.m.,

*in response to message #1 by Don Shepherd*

I think the constructs are derived from assembly language on old minicomputers, not high-level languages like BASIC. Skip on condition code is a common instruction on many older systems. See the PDP-8 for an example.

### Plug and Play

Message #1 Posted by [RamLab](#) on 17 July 2007, 3:24 p.m.

Hi,

Today I finally got an HP-71B with an HP-IL interface (4K & MATH). When it was introduced it would have cost me nearly a month's salary, without the 4K & MATH. I got just for fun, because the HP3421A DAQ I have (with HP-IB option) was designed for HP-IL. It was fun to find out how simple the HP-IL link actually works, and that this nearly 25 year old HP equipment was already Plug and Play long before MS ....

### It's raining calculators?

Message #1 Posted by [Seth Morabito](#) on 17 July 2007, 2:42 p.m.

Out of the blue, I've stumbled upon a trading company in Indonesia who claims to have a fairly large supply of lightly used and New-Old-Stock HP 41CX and HP 42S calculators available.

The price for the 42S is \$150 per unit, minimum order quantity 30. I haven't asked about the 41CX, but the minimum order quantity is also 30.

Seems like a great opportunity for a reseller (which I am not -- I have neither the experience nor the time nor the money for such a large purchase). But if I could buy just one or two of each, I'd be a very happy man indeed.

### Re: It's raining calculators?

### Comparison of HP-49G+ and HP-50

Message #1 Posted by [Corkey Smith](#) on 17 July 2007, 12:59 p.m.

I have been trying to get some detailed comparison of the HP-49G+ and the HP-50. I presently own the HP-49G+. What significant differences are there that would warrant purchasing an HP-50?

### Re: Comparison of HP-49G+ and HP-50

Message #2 Posted by [Dave Boyd](#) on 17 July 2007, 3:40 p.m.,  
in response to message #1 by [Corkey Smith](#)

Well, I don't know about "detailed", but:

The software improvements can be had in the 49G+ by upgrading the ROM to the latest version.

Improvements in the 50G hardware:

You may prefer the color scheme. Or not.

The 50G uses one more "AAA" cell, but that may not affect battery life much, depending on your usage. It's slightly heavier.

It can be powered from the USB port, so if you connect it to, say, your computer, you can use it all day with no battery drain.

The keyboard is as good, and possibly is better, than the last generation of 49G+. It's definitely better than any early 49G+.

It has a serial port for communication with specialized devices like GPS units for surveying, or any other use you may have, as long as you have the required, not-supplied, special non-standard cable. It's still better to use USB for communication with most computers.

In other respects, there's not much noticeable difference; no speed improvements, no more RAM or Flash, same size and quality screen, etc.

In short, if your 49G+ breaks, you can feel a bit better about replacing it with a 50G. If you don't need the serial port, then there's probably no pressing need to upgrade. This is, of course, a matter of taste, so you may decide differently.

**hp 11c trouble shooting**

Message #1 Posted by [Gerald Klitz](#) on 17 July 2007, 7:43 a.m.

Hello and good morning, after several years of flawless use my 11c is acting up. Somehow I managed to accedently hit the user key and the display continously flashes 0.0000 user, I have removed the batteries several times tried new batteries and a static discharge across the battery terminals via a paperclip and my 11c continues with 0.0000 user flashing in a rapid pattern and I can not turn the machine on or off. I use this 11c on an almost daily basic and would be lost without it, does anyone on this forum know how to correct this problem.

Gerald Klitz

**Re: hp 11c trouble shooting**

Message #2 Posted by [Mike Ingle](#) on 18 July 2007, 1:03 a.m.,  
in response to message #1 by Gerald Klitz

With power off, hold down ON. Press and hold - (subtract.) Release ON. Release -. It should say "Pr Error."

Now turn it off and do same sequence with X (multiply) instead of subtract. It should say running then light all segments, meaning the calculator is good.

Test the keyboard: turn off, ON and divide, then press all keys left to right then top to bottom, pressing Enter once in each row. It should display 11 at the end.

Mike

**Re: hp 11c trouble shooting**

Message #3 Posted by [Mike Ingle](#) on 18 July 2007, 1:04 a.m.,  
in response to message #1 by Gerald Klitz

If you cannot turn it off, leave the batteries out overnight and make sure no keys are stuck down.

### Why is the HP 42s so expensive?

Message #1 Posted by [Seth Morabito](#) on 16 July 2007, 11:19 p.m.

OK, I give in! Why is the HP 42s so expensive on the used market? Prices between \$300 and \$400 seem to be very common on The Auction Site That Must Not Be Named. I've just been offered one for \$275, and honestly I'm sorry to say that I'm tempted, because anything that expensive must really be the bee's knees, right?

I've never used one -- I went straight to the 48SX -- so I'm at a loss. What makes the 42S worth so much? Are they really that good, or are they just inflated because people buy and sell them for the monetary value alone? (I prefer to use my calculators, rather than let them sit. They're only worth money to me if I find them a pleasure to use or play with)

### Re: Why is the HP 42s so expensive?

Message #2 Posted by [DaveJ](#) on 16 July 2007, 11:32 p.m.,

Buy it, resell on The Auction Site That Must Not Be Named, then use the profit to buy a shiny new HP 35S or two.

Dave.

### Re: Why is the HP 42s so expensive?

Message #3 Posted by [Bruce Bergman](#) on 16 July 2007, 11:55 p.m.,  
in response to message #1 by Seth Morabito

Good question! First, the 42s was the successor to the VERY popular (and some would say, industry-changing) 41 family. It sort of brought the best of all worlds to a much smaller form factor, and I think the intention was (at the time) to be the "ultimate" calculator in every way. Those who wanted all of the power of the 41 family -- without needing the expansion capabilities -- were in heaven. It was also a serious scientific calc, highly programmable, fast and it looked great. So it appealed to almost everyone.

Some will probably say that the 42s was the peak of perfection for the classic HP calcs. The 48sx went a completely different way, so it was hard to compare the two families. A different programming model, a completely different display, different approach, etc.

Also, the 42s is much harder to find than the 48 family, of which there are still zillions on the market. Scarcity makes for higher prices.

My all-time, pick-only-one favorite calc is probably the 19c; it's just way cool in a nostalgic way for me. Yet even with that said, and even owning 20+ other HP calcs all the way up to current models, I still think the 42s is one of my most favorite calculators. I would venture to say that a lot of people feel the same way. That's one reason why they are so expensive and highly desired.

My \$0.02 anyhow. :-)

thanks, bruce

### **Re: Why is the HP 42s so expensive?**

*Message #4 Posted by **Howard Owen** on 17 July 2007, 1:31 a.m.,  
in response to message #1 by Seth Morabito*

The 41C is still very popular, judging by the numbers that get posted to the nite that must not be samed. The 42S is compatible with the 41C at the user code level. There are many, many more 41Cs out there than 42Ses. Perhaps those two facts account for the premium price the latter commands.

If you just want to see what all the hubub is about, without laying out a lot of cash, go get Free42. It's a very nice and faithful software implementation of a 42S that runs on an incredibly wide set of platforms. Admittedly, clicking buttons on your screen is quite different from pressing keys on a real calculator. But aside from that, Free42 can give you an accurate picture of what the 42 is like to program and use.

I'm in the camp that says the 42S was the zenith of RPN keystroke programmable calculators. I need to revisit this opinion in detail with the recent release of the 35S, but my gut feeling is that the 42S still retains the crown. Even so, the 42S wasn't *perfect*. The lack of external I/O other than printing was the biggest flaw. But the 42S is also 20 years out of date now, and it's age shows in the slow CPU, small screen and limited memory. I'm still waiting for the machine that the lineal descendant of the 42S would have been, if the line hadn't abruptly veered off into RPL. The very nice HP35S gives me some hope I may see that one day.

Regards,  
Howard

### **Re: Why is the HP 42s so expensive?**

*Message #5 Posted by **Walter B** on 17 July 2007, 1:39 a.m.,  
in response to message #1 by Seth Morabito*

Let me say the 42s

- contains the most RPN calculating power per volume (cm<sup>3</sup> or milli-pint or whatever unit you prefer),
- is comfortably programmable (alphanumeric display of steps, sufficient memory, alpha labeling),
- has a very clean and elegant keyboard (almost hiding its power, comparable to Apple's iPod),
- lives many months with one set of tiny batteries,
- and is still shirt pocket size.

It's the *\*only\** calc offering all this! Reasons enough for prices going high. Only the 27s and 32s (not sii!) present the same clean surface, but the 27s this is neither RPN nor programmable, and the 32s has less power in many ways. RPL calcs offer more power and a lot more features, but are too large (not for normal shirt pockets anymore), and way too complex even for many willing people of the community (as has been discussed here many times). Pulling out an HP42s in a meeting is understatement, doing the same with an HP48 would be the opposite.

IMHO the 42s would be a *\*perfect\** pocket calc even nowadays if it had I/O and a better LCD. Any further upgrades would be just the cream on top, as people say here.

HTH, Walter

Have you read Valentin's [Long Live the HP42S!](#) article?

### **Re: Why is the HP 42s so expensive?**

*Message #7 Posted by [Les Wright](#) on 17 July 2007, 2:31 p.m.,  
in response to message #1 by Seth Morabito*

My first collector purchase last year was a 42S and I got really soaked on it--over \$300 for basically a field grade unit (name branding and a face plate that eventually needed flattening and regluing), but that included manual and box, which i am told drove up the price. It also works fine but I am forever disappointed with the wimpy display. I love Thomas Okken's Free42 and just had to have the real thing. I must confess I am glad I have the 42S as a collectible, but my main 42S work is actually done in Free42 on the computer or Palm--much faster, and there is I/O! I love the IDEA of the 42S, but I am just not in love with the real thing.

If that doesn't scandalize some here, I have a near mint 15C that I barely use. Just can't seem to get that fussed about it--and I paid a goodly sum for that too! I just can't get past the idea that, in benchmarking, it is so damn slow.

Let the indignant replies begin!

Les

### **Re: Why is the HP 42s so expensive?**

*Message #8 Posted by [Mike Morrow](#) on 17 July 2007, 2:32 p.m.,  
in response to message #1 by Seth Morabito*

I'm in the camp that considers the HP42S to be the best RPN calculator yet made. I bought my first HP (HP-67) in 1976, and I've collected some 30-odd other HP calculators in the interim, so I've used many HPs in the past 30 years. My 24-year old HP-41CX and 21-year old HP-15C don't come close to matching the functions contained in the HP42S, nor its speed (five times that of the HP41C or HP-15C) and precision.

Unfortunately I didn't decide I wanted one until 1997, two years after the HP42S was discontinued. Even then the HP42S was almost as unobtainable as it is today. I was really lucky to find two new units in stock at the nearby University of Alabama at Huntsville bookstore for \$114 each. They had been there unsold for four years, and had long dead batteries. You better believe I bought them immediately.

One of the best things about the HP42S is its full-spectrum support of complex number calculations. If a complex result is appropriate, it appears naturally. Try calculating the square root of -3, the arcsin of 1.5, the natural log of -5, etc. on most machines. The HP42S will return the appropriate complex domain answer.

The other thing I like is the ease of performing matrix operations.

These two categories of operations are far far easier on the HP42S, compared to the HP-41C or HP-15C. Complex number support of the HP32S, HP32SII, HP33S, and apparently the new HP35S is far inferior.

I have never found the 8K-byte RAM of the HP42S to be limiting in any practical sense. My largest program is a full-blown fourth-order Runge-Kutta differential equation solver, about 330 steps. I still have plenty of

RAM left with it and several other programs in residence.

Currently, the calculator I use most often is a HP49G+, whose capabilities far exceed the HP48GX and HP42S. But I much prefer programming in RPN on the HP42S, rather than the RPL of the HP49G+. I'd really like to have a HP50G type of machine that had a choice of programming models...either RPL or RPN.

Mike

### **Re: Why is the HP 42s so expensive?**

*Message #9 Posted by **Karl Schneider** on 23 July 2007, 4:35 a.m.,  
in response to message #8 by Mike Morrow*

Hi, Mike --

Good post (as well as those of Thomas Okken and others on this topic)...

Quote:

---

One of the best things about the HP42S is its full-spectrum support of complex number calculations. If a complex result is appropriate, it appears naturally. Try calculating the square root of -3, the arcsin of 1.5, the natural log of -5, etc. on most machines. The HP42S will return the appropriate complex domain answer.

---

A very good point. It should be noted that the user has a *choice* in the handling such calculations: Complex Result (CRES) mode will yield the primary complex-valued answer, whereas Real Result (RRES) mode will return errors. The HP-15C is similar, in which Flag 8 set corresponds to CRES mode, and Flag 8 clear corresponds to RRES mode. Gene Wright's article in Datafile indicates that the HP-35s does not have this sophistication.

Quote:

---

The other thing I like is the ease of performing matrix operations.

These two categories of operations are far far easier on the HP42S, compared to the HP-41C or HP-15C.

---

I also like the matrix-related functionality of the HP-42S better than any other model (especially the RPL-based models, with all those delimiters and the cluttered Matrix Editor), but certain things about the HP-42S were done better on the HP-15C:

1. The HP-42S allows a user to enter matrices into free RAM identified only by a stack-level dimension-only descriptor. From there, a user can then perform calculations and operations that destroy the painstakingly-entered matrices without an UNDO to recover them, if he did not save the matrices to a named variable beforehand. The HP-15C forces the user to specify a single-letter identifier for each matrix.
2. The lack of a name or letter identifier in the HP-42S matrix descriptor can cause confusion and erroneous results if the user is not careful. Only matrix addition is commutative, so the user's not remembering which input matrix is which, will be a problem.

On complex numbers, the HP-15C is almost as easy as the HP-42S, but a few functions and capabilities are not present. These include disassembly (RPL "C->R"), polar-mode calculations, and determinant of complex-valued matrices, among others. The HP-15C's display can show only one part of one complex-

valued number at a time, compared with *both* parts of *two* numbers at greater precision with the HP-42S.

### **Re: Why is the HP 42s so expensive?**

*Message #10 Posted by **Thomas Okken** on 17 July 2007, 4:32 p.m.,  
in response to message #1 by Seth Morabito*

Previous respondents have already mentioned some of the reasons why people like the HP-42S, but there are still a few things missing in their replies. Here's my attempt at a eulogy:

1. The simplicity of RPN and keystroke programming. While not as flexible and powerful as the RPL language of the HP-28 and 48/49/50 series, RPN and keystroke programming are easy to learn, and you'll be able to write interesting short- to medium-size programs within days.
2. Fully supports the (unextended) HP-41C instruction set, including unlimited separate programs, multi-character alphanumeric labels, the ability to use any register as an index register (including the stack registers), lots of flags, and powerful loop control instructions.
3. On top of the HP-41C programmability, the HP-42S has named variables, which can be used to store real and complex scalars and matrices, and 6-character alpha strings; all stack registers can hold all of these data types as well. The use of named variables can make programs easier to read, and it also works with the INTEG and SOLVE commands, which use menus much like their counterparts in the RPL series.
4. While you can limit yourself to the HP-41C instruction set (HP-41C programs run without modification), by using the programmable menu and variable menu, you can spiff up your programs with self-documenting user interfaces -- and all of this is remarkably easy to learn and use.

This combination of features beats all other keystroke-programmable RPN calculators hands down, at least in terms of programming power. Nitpickers may point out the HP-42S' lack of I/O, and one or two areas in which the HP-15C's complex and matrix functionality are superior, but then you gradually move into the area of religious debate. ;-) )

Gradually? Funny, I never though of micro and milli-second posting response times being a gradual thing :)

### **Re: Why is the HP 42s so expensive?**

*Message #12 Posted by **Jeff Kearns** on 17 July 2007, 7:44 p.m.,  
in response to message #10 by Thomas Okken*

You guys seem to have said it all.

Valentin's article on the Advantage ROM for the HP-41C series states that "you'll never, ever, look at 15C/42S users with "envious eyes" (or to any other model for that matter)". I tend to agree with this statement, however the 42S is a fantastic machine and worth acquiring at a reasonable price.

I 'almost' had a pristine 42S a couple of years ago; a secretary at work posted a lost and found message about a calculator. When I inquired, it was in fact a like-new 42S without a case that someone had left in a washroom of all places. She wouldn't give it up until a reasonable amount of time had passed to give the rightful owner a chance to reclaim it. I loved the interface and form factor of my 32Sii and really wanted that calculator! I offered to pay for it too.

I kept checking in with her periodically until a few months later when she proclaimed that a full year would have to go by until she could let me have it, just in case... Long story short: after a year had gone by, she told me that she had given it to her 13 year old son who didn't really understand it but wouldn't give it up, even for a top-of-the-line TI graphing calculator. Go figure.

I use the Free42 on occasion, but I am partial to the 41C (fully-loaded) and the 15C, despite their relatively slow speed compared to the 42S. The 15C is the one that got me through Mech Eng. Heck, for fast calculations, there is always the 49G+.

My recommendation is to buy that calculator. You will not regret it if you like HP calculators.

Regards,

Jeff

### **Re: Why is the HP 42s so expensive?**

*Message #13 Posted by [Howard Owen](#) on 17 July 2007, 9:33 p.m.,  
in response to message #10 by Thomas Okken*

Hear hear, Thomas.

The 42S is the absolute best of the programmable RPN models in terms of its breadth of functions and ease of programming. I just wish I could have one with unlimited memory that ran as fast as a modern PC. Oh.. wait.. 8)

Seriously, I kvetch about the lack of I/O and the slowness of the 42S, but I'm delighted to have mine. (It's one that can switch to "turbo" mode with a little hackery, so I get some of my speed need met.)

But I'm hard to please, so I keep wishing for a modern version. And as long as I'm at it, I wish for one whose design is driven by technical and aesthetic concerns, and not by the need to be a viable product in today's marketplace. At the same time, I wish this calculator were wildly popular, so that a large community of users would arise and bring back the glory days of the PPC, but with a GPL and web flavored modern twist.

It is all quite illogical. My id gets the better of me sometimes.

Regards,  
Howard

*Message #14 Posted by [Les Wright](#) on 18 July 2007, 4:31 p.m.,  
in response to message #10 by Thomas Okken*

Thomas,

You modestly forgot to mention that Free42 does all of this, and faster, and more accurately thanks to the 25-digit internal precision in the Decimal version. Also, whenever, behaviour of Free42 departs from the real calculator, you fix it quickly when you learn of it.

I have been able to import piles of HP41 programs effortlessly from the Software Library. If they aren't in RAW format already, hp41uc will convert the text listing with no hassle. I can't remember the last time I keyed in a program of any substance into my real 42S.

\_\_\_\_\_

Thanks for banging my drum for me. ;-) Of course I wrote Free42 because I like the HP-42S so much, but then again Free42 is not a calculator per se, just a piece of software that makes certain types of hardware \*act\* like a calculator, which is why I usually don't mention it when people start debating the merits of various HP models.

I'm actually very happy running Free42 on my Palm Z22, which gives me an HP-42S that is fast, has a ton of memory, and bidirectional I/O. Of course a touchscreen is not the greatest keyboard, but heck, for \$99 I have a nice calculator that also happens to be a fine PDA... And my real HP-42S rests safely in a drawer next to my equally unused HP-15C. :-D

Thor,

reading it again, I must admit my short post may be misunderstood. What I wanted you to ponder is to start a new thread for your question about the 15C. Unfortunately, this is called a "new topic" right here on top of this forum as you can see.

Why a new thread or topic? Because Seth started this thread asking for the merits of the 42s, as indicated by the subject line. You were the first one leaving that track immediately. So my modest proposal was you start something new like "Why is the 15C so expensive?" or whatever else may describe your intentions best, using the structures this forum offers (and attracting the 15C camp to your question).

I did not plan to attack you -- in fact I was surprised by your reaction: Thor's hammer hit me ;-) BTW, I searched the web, but was unable to find an emoticon for "cynical smile". Please help. Hope I will remember I must be \*very\* careful with you next time ;-)

*Edited: 18 July 2007, 5:02 p.m.*

*Message #24 Posted by [Mike Ingle](#) on 18 July 2007, 3:53 p.m.,  
in response to message #16 by Thor Lansen*

The 42s, 15c, 41cx, and 67/97 were all top-of-the line at the time. Each one is the best of its class, and so is still desirable. The 15c does an impressive amount in a one-line, key-per-function design, and is an amazing example of doing a lot with scarce resources.

The 11C is a basic scientific calculator with a decent programming capability. The 15C is unique in what it can do.

### The Menus Of HP35S

Message #1 Posted by [Walter B](#) on 16 July 2007, 12:12 p.m.

To those of us who have the privilege of owning and playing around with an HP35S already:

- What are the menus of this new calc?
- What is the menu structure?
- Which commands are in which menu?

Thanks for any info in advance (just can't wait).

### Re: The Menus Of HP35S

Message #2 Posted by [Gene Wright](#) on 16 July 2007, 12:37 p.m.,  
in response to message #1 by [Walter B](#)

Here's what I can give you for now.

L.R. - Linear regression and estimation.  
x-bar, y-bar - Arithmetic mean of statistical x- and y-values;  
weighted mean of statistical x-values.  
s,sigma - Sample and population standard deviation.  
CONST - Menu of 41 physics constants.  
SUMS - Statistical data summations.  
BASE - Base conversions (Base 2, 8, 10 and 16).  
INTG - Sign value, integer division, remainder, greatest  
integer, fractional part, integer part.  
LOGIC - Logical operators for base-n numbers.  
FLAGS - Functions to set, clear, and test flags.  
x?y - Comparison tests of the X-and Y-registers.  
x?0 - Comparison tests of the X-register and 0.  
MEM - Memory status (bytes of memory available); catalog  
of variables; catalog of program labels.  
MODE - Angular modes and operation mode  
DISPLAY - Fixed, scientific, engineering, full floating point  
display; radix symbol options; complex number display.  
Roll Down - Allows review of the 4-level stack in ALG mode or in an EQN  
CLEAR- Functions to clear different portions of memory

Message #3 Posted by [sjthomas](#) on 16 July 2007, 6:03 p.m.,  
in response to message #2 by [Gene Wright](#)

Gene, is there a Clear Stack (CLSTK) command?

### Clear commands (including a new one)

Message #4 Posted by [Gene Wright](#) on 16 July 2007, 6:27 p.m.,  
in response to message #3 by [sjthomas](#)

Yes, there is a clear stack, blue shift CLEAR 5.

The other clear commands are:

- 1 - CLx
- 2 - VARS (clears all lettered variables)
- 3 - ALL (prompts for a Y / N response)
- 4 - Sigma (stat variables)
- 5 - Stack
- 6 - CLVARx (prompts for a 3 digit number. Clears all indirect variable locations \*greater\* than the supplied prompt).

**Re: Clear commands (including a new one)**

*Message #5 Posted by [Bruce Bergman](#) on 16 July 2007, 6:55 p.m.,  
in response to message #4 by Gene Wright*

CLVARx. Interesting. I presume that's programmable too, eh? This would indicate to me that we would want to start putting near-temporary variables at the high end of the spectrum, and more permanent variables near the lower end of the bank. That way one could clear out the near-temporary variables in one sweep.

Can one store directly into some of the statistics variables?

thanks, bruce

**Re: Clear commands (including a new one)**

*Message #6 Posted by [Gene Wright](#) on 16 July 2007, 7:07 p.m.,  
in response to message #5 by Bruce Bergman*

Stat variables are indirect only, using -27 through -32 as the index.

Yes, CLVARx is programmable.

### HP-35S vectors

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 16 July 2007, 6:14 a.m.

Hi, sorry if this has already been treated, but I've been away for a week and something happened in the meantime, and I didn't find an answer in the Forum.

About vectors, a 2D vector like

$[[a_{11}, a_{12}], [a_{21}, a_{22}]]$

is accepted? It's matrix, of course.

And is it admitted a division like

$[c_1, c_2] / [[a_{11}, a_{12}], [a_{21}, a_{22}]]?$

This would solve linear systems.

Sorry, I don't have a HP-35S to play with, and living in Italy only God (and some guys at HP) know when it will be available. And sorry again if this is quite a stupid question (not so for the HP-15C)

Greeting and good holidays!

-- Antonio

### Re: HP-35S vectors

Message #2 Posted by [Gene Wright](#) on 16 July 2007, 7:55 a.m.,  
in response to message #1 by Antonio Maschio (Italy)

Nope vectors cannot be nested and can only contain real numbers.

You can have:

$[ 3 , 4 ]$

and

$[ 5 , 6 , 7 ]$

No nested vectors and no complex numbers in vectors.

### Re: HP-35S vectors

Message #3 Posted by [Antonio Maschio \(Italy\)](#) on 16 July 2007, 8:39 a.m.,  
in response to message #2 by Gene Wright

So 2D and 3D mean  $[a_{11}, a_{12}]$  and  $[a_{11}, a_{12}, a_{13}]?$

And if I had a vector containing 10 elements?

-- Antonio

**Re: HP-35S vectors**

*Message #4 Posted by [Gene Wright](#) on 16 July 2007, 8:46 a.m.,  
in response to message #3 by Antonio Maschio (Italy)*

Vectors can only contain either 2 elements or 3 elements. If you have more than that, you cannot use the 2 dimensional or 3 dimensional vector abilities of the HP 35s.

**Re: HP-35S vectors**

*Message #5 Posted by [Walter B](#) on 16 July 2007, 8:50 a.m.,  
in response to message #3 by Antonio Maschio (Italy)*

Buon giorno Antonio,

AFAIK the 35s does only support real vectors with 2 and 3 components. In parallel, you may only solve simultaneous linear equations with 2 or 3 unknowns using its standard features. This is \*no\* full vector and matrix support like in HP42s. Remember the 35s shall be the successor of the 33s, 32sii and 32s (in reverse order), not of the 42s. So no way for your vector in 10-dimensional space-time. But you may try to program.

**Re: HP-35S vectors**

*Message #6 Posted by [Antonio Maschio \(Italy\)](#) on 16 July 2007, 10:51 a.m.,  
in response to message #5 by Walter B*

Of course...

Thanks, everyone.

### HP-35S disassembly photos?

Message #1 Posted by [Scott Newell](#) on 15 July 2007, 7:42 p.m.

Has anyone opened up a 35S yet?

### Re: HP-35S disassembly photos?

Message #2 Posted by [Eric Smith](#) on 23 July 2007, 9:14 p.m.,  
in response to message #1 by Scott Newell

Yes. There are six screws: four in the battery compartment covered by round rubber plugs, and two under the wide rubber foot. After the screws have been removed, there are still four plastic catches holding the case together.

My good camera is dead, so I was only able to take photos using the terrible camera in my Treo 650 phone. I suppose that's slightly better than nothing. There are three photos [here](#).

The GeneralPlus microcontroller and the static RAM are both mounted chip-on-board under blobs of epoxy. I'd hoped that the SRAM might be a normal surface mount part, so that it might be possible to replace it with a daughterboard with the SRAM and a CPLD, to add some I/O capabilities. Oh well.

### Re: HP-35S disassembly photos?

HP35s is beautiful outside and inside...

Here is an CT topogram image of the HP35s I took this morning

Ok here is an image of the HP-35S I took with a CT scanner.

I do see alot of screws or other mechanical fastners etc.

Glenn

**Re: HP-35S disassembly photos?**

*Message #7 Posted by [ECL](#) on 24 July 2007, 11:35 p.m.,  
in response to message #2 by Eric Smith*

It seems fitting that the 35s is so full of mechanical fasteners (screws). After all, it commemorates the 35 which if I'm not mistaken was designed to be repairable.

25 screws to hold the main PCB to the case...

(Sigh!)

Back when I was repairing Televisions, I composed a "rule of thumb"

"The cheaper a television, the more screws hold the back panel in place."

RCA's and Sony's used 4 screws, off-brands had as many as 14.

### **Re: HP-35S disassembly photos?**

*Message #9 Posted by **Tony Duell** on 25 July 2007, 1:18 p.m.,  
in response to message #8 by Ren*

That reminds me of 'ARDs Law of DECSA Construction' (The DECSA -- Digital Equipment Communication Server Aparatus, or something like that -- was an early ethernet-X25/etc bridge, with a PDP11/24 CPU in the middle of it).

Anyway, the law states 'The lower the importance of a part of a DECSA, the more screws hold it in place'. It is illustrated by the fact that :

All the main PCBs plug in to the backplane without any fixing screws

The PSU(s) are held in by 2 screws each

The fan tray is held in by 4 screws

But the grille over the fan tray is held in by an amazing 28 screws (yes, I counted them all out and back again when I had to dismantle a DECSA for repair)

### **Re: HP-35S disassembly photos?**

*Message #10 Posted by **Eric Smith** on 25 July 2007, 5:26 p.m.,  
in response to message #8 by Ren*

The use of 25 screws is almost certainly because it significantly stiffens the case. If you remove most of the screws the case can flex much more. From the Woodstock series through the Pioneer series, the same thing was accomplished through the use of heat stakes. Apparently Kinpo must find it more cost-effective to use screws, though that seems counterintuitive, or they might want to be able to send an assembled calculator that fails final test back for rework, though that seems even less likely.

Given how many people in this forum have complained about heat stakes in the past, I'm surprised to find people now complaining about screws.

### **Re: HP-35S disassembly photos?**

*Message #11 Posted by **Walter B** on 25 July 2007, 6:21 p.m.,  
in response to message #10 by Eric Smith*

Eric, you're right: from our point of view as (more or less) educated users, screws are optimum. Nondestructive service becoming possible again after many years :)

### **Re: Screws vs. heat stakes?**

*Message #12 Posted by **Paul Brogger** on 26 July 2007, 11:23 a.m.,  
in response to message #10 by Eric Smith*

I wonder, would the choice of screws vs. heat stakes say something about the projected size of the 35s' production run? (Would the setup have been more expensive for heat stakes than it was for screws?)

Or how about the early units being put together with screws, with the option of converting to heat stakes at some point in the future?

With the chips encased in blobs of epoxy (or whatever), I doubt that much in the way of service is anticipated.

### **Re: HP-35S disassembly photos?**

*Message #13 Posted by **Ren** on 26 July 2007, 11:46 a.m.,  
in response to message #10 by Eric Smith*

Quote:

Given how many people in this forum have complained about heat stakes in the past, I'm surprised to find people now complaining about screws.

I'm not REALLY complaining, it was more of a smart-aleck observation.

### Making new ROM-files for the 41

Message #1 Posted by [Geir Isene](#) on 15 July 2007, 5:11 p.m.

Is there a simple How-to on making new ROM files for the HP-41?

Specifically I would like to create a ROM file with my own FOCAL programs (for inclusion in a Clonic or NoVram).

### Re: Making new ROM-files for the 41

Message #2 Posted by [DavidMY](#) on 16 July 2007, 12:48 a.m.,  
in response to message #1 by [Geir Isene](#)

Hi: For creating a FOCAL ROM you need the SKD41 package. You should be able to get this on "the other site." This is the HP package for creating ROM code. Unfortunately, there is no "simple" guide because HP never really intended the package for the casual user.

The process is [1] create a text file of FOCAL code using your favorite text editor -> [2] compile the code to ROM -> [3] link the code and create the directory. But...the SKD code is DOS based so you'll need...a Microsoft OS.

Actually, I've been able to run the SKD applications from the WinXP command line [and even Vista Business] and under Linux using WINE/DOS emulation.

The package should also have the HP manual for the programs which you really need to read through because the whole process can be confusing. But this package was what HP supplied to those who wished to create commercial ROMs and it does work.

### Re: Making new ROM-files for the 41

Message #3 Posted by [Christoph Klug](#) on 18 July 2007, 1:58 a.m.,  
in response to message #2 by [DavidMY](#)

For creating an own individual HP41 Focal Rom containing your user code software applications use EMU41 in combination with the HP-IL / PC Interface Card.

Than you are able to transfer the software from your real HP41 to EMU41. On EMU41 side you are working with a virtual RAM-Box emulation and if needed with other virtual plug in modules like CCD.

By executing the RAM-Box commands (W&W or Eramco or MBK Profiset operating system) or Hepax commands you create your own ROM solution = transferring the program code from main memory into the RAM page (= MLDLRAM.DAT file of EMU41).

In the next step you are able to test your finished Focal ROM inside EMU41 – including HP-IL support if needed. In the last step you convert the finished 4KByte ROM to your target hardware like ZEPROM, Clonix, NoVRAM or RAM-Box.

More detailed information and helpful tips about creating user code software ROM image files you find in my paper "HP41 & EMU41 Uploading plug in module ROM image files" :

Appendix IV = creating a user code software ROM for EMU41 Appendix V = creating a user code software ROM for Clonix Appendix VI = creating a user code software ROM for Zeprom

Furthermore this document describes software tools for converting the MLDLRAM.DAT ROM image file into the different existing file formats like .lst / .rom / .bin and RAM-Box = Zeprom / Hepax / MBK Profiset :

Part III = generating a .bin file Appendix V = generating a .rom file for Clonix / NoVram Appendix I = ROM file conversion Hepax / RAM box Appendix II = ROM file conversion MBK Profiset / RAM box Appendix III = ROM file conversion .bin / .rom

The "HP41 & EMU41 Uploading plug in module ROM image files" document is available at HP-Museum and HPC webpage. By creating and using an individual programmed user code software ROM (= Focal ROM) you extend your HP41 system. Now you are able to execute really voluminously program applications compared to the limited main memory size.

When selecting the XROM number (increment part, running from 01 up to 31) make this compatible to the other plug in module XROM numbers, check your HP41 port configuration (do not double XROM numbers).

The FAT for an Focal ROM is limited to 63 entrees (= XROM number fractional part). Therefore avoid not needed Alpha LBL's in your program code and replace them by numerical LBL's. Because from any Alpha LBL of your program code result an FAT entry.

With help of the CCD Module you are able to activate different user keyboard assignments for operating your own program solutions....

Best wishes from Germany- Christoph Klug

## Re: Making new ROM-files for the 41

Message #4 Posted by [Miki Mihajlovic](#) on 21 July 2007, 1:41 a.m.,  
in response to message #1 by Geir Isene

I have a fairly simple and clean way of creating the ROM file from your own FOCAL programs. You need two pieces of software: Leo Duran's **hp41uc** and HP's **SDS-II**. You can get them both on TOS. If you have trouble finding them let me know and I can send it to you. Further, you need to make a .BAT file that looks something like this (example for geometry ROM):

```
rem convert .txt files into .bin files (ucc files)
hp41uc /t=cirtgnt.txt /b=cirtgnt.bin
hp41uc /t=distlns.txt /b=distlns.bin
hp41uc /t=gridall.txt /b=gridall.bin
hp41uc /t=gridisc.txt /b=gridisc.bin
hp41uc /t=lninsec.txt /b=lninsec.bin
hp41uc /t=pnttngt.txt /b=pnttngt.bin
hp41uc /t=ptsline.txt /b=ptsline.bin
hp41uc /t=sinplt.txt /b=sinplt.bin
hp41uc /t=tapers.txt /b=tapers.bin
hp41uc /t=vnotch.txt /b=vnotch.bin
rem convert .bin files into .41t files (these can be put into ROM image)
read41p -u cirtgnt
read41p -u distlns
read41p -u gridall
read41p -u gridisc
read41p -u lninsec
read41p -u pnttngt
read41p -u ptsline
read41p -u sinplt
```

```
read41p -u tapers
read41p -u vnotch
rem buid ROM image
build geometry.def geomtry
rem rename geomtry0.41r to geomtry0.ROM
```

and your definition file .def should look like this:

```
&ROM#=17,HEADER=GEOMETRY.1B,PRIVATE
CIRTGNT
DISTLNS
GRIDALL
GRIDISC
LNINSEC
PNTTNGT
PTSLINE
SINPLT
TAPERS
VNOTCH
```

where 17 is an XROM number that you choose.

### Samson Cables now Taking Orders for 35S

Message #1 Posted by [Les Wright](#) on 15 July 2007, 12:02 a.m.

[Click here](#)

Their price is 5 bucks off MSRP. And, for my fellow Canadians, they do ship to Canada, though the postage is pricey. Ship to Europe too!

Carl just wrote me to answer a shipping question and let me know they will start shipping on Tuesday.

Les

*Edited: 15 July 2007, 12:02 a.m.*

### Re: Samson Cables now Taking Orders for 35S

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 15 July 2007, 12:17 a.m.,  
in response to message #1 by Les Wright

It's perhaps interesting that it shows "Retail Price: \$44.99", and "Our Price: \$54.99".

Regards,  
James

### Re: Samson Cables now Taking Orders for 35S

Message #3 Posted by [Les Wright](#) on 15 July 2007, 12:20 a.m.,  
in response to message #2 by James M. Prange (Michigan)

What's even more interesting is that when you place an order, as I just did, the price that comes up at checkout is \$52.99!!!!

I am assuming the webmaster made a typo some place. But I will gladly take it for the 53.

Les

*Message #17 Posted by **Walter B** on 16 July 2007, 8:54 a.m.,  
in response to message #16 by Thomas Radtke*

Let's wait and see.

**Re: Samson Cables now Taking Orders for 35S (shipping everywhere!)**

*Message #18 Posted by **Werner** on 17 July 2007, 11:53 a.m.,  
in response to message #16 by Thomas Radtke*

I don't know how things are in Germany, but in Belgium the situation is as follows:

- purchases over 22 EUR's worth are subject to VAT and import tax. Moreover, the postal service will charge you an extra 10 EURs because they have to present it to customs (... I'm pretty sure no other national postal 'service' charges a similar fee)
- \*gifts\* sent to you by \*friends\* are subject to the same regulation .. for items over 45 EUR.

Hello, friends!!

CHeers, Werner

### 48GX, TDS RAM Card, Low Batt Indicator

Message #1 Posted by [Ron G.](#) on 14 July 2007, 11:35 p.m.

When the TDS RAM card is put in the 48GX, the calculator indicates a low batter on the card (low batt P2). This is a card without a battery. The extra memory shows up on the calc, as expected.

Tried another to-battery TDS card, and there was no low batt indication. Can someone explain this to me? Many thanks.

### Re: 48GX, TDS RAM Card, Low Batt Indicator

Message #2 Posted by [James M. Prange \(Michigan\)](#) on 14 July 2007, 11:52 p.m.,  
in response to message #1 by Ron G.

Does it still show the low battery indicator with the card removed?

Do you mean a ROM card by any chance? If so, then maybe try a warmstart by holding down the ON key, pressing and releasing the C key, and finally releasing the ON key. If that doesn't help, you could try archiving user memory, then doing a user memory clear by holding down the ON key, pressing the A and F keys, then releasing first the F key, then the A key, and finally the ON key, and then pressing the NO menu key in response to the "Try To Recovery Memory?" message.

All RAM cards do have a battery, but I seem to recall that some cards use a non-replaceable battery, intended to last for the "life of the product". In other words, if you can't replace the battery in your RAM card, then it's lifetime is over.

Regards,  
James

### Re: 48GX, TDS RAM Card, Low Batt Indicator

Message #3 Posted by [Randy](#) on 15 July 2007, 10:51 a.m.,  
in response to message #1 by Ron G.

Quote:

\_\_\_\_\_

In other words, if you can't replace the battery in your RAM card, then it's lifetime is over.

\_\_\_\_\_

Not an accurate statement...

The later TDS and SMI cards that have internal batteries are charged by the GX when it is powered on.

Let your GX sit for a month or two without turning it on and you'll have the exact situation you just described.

The details from the TDS website: [HP48GX Memory card info](#)

Message #5 Posted by **James M. Prange (Michigan)** on 16 July 2007, 12:51 a.m.,  
in response to message #3 by Randy

Thanks for the correction, and the link to the relevant TDS page.

It seems that the card's lifetime isn't really over until its rechargeable battery fails to take a charge.

Quote:

---

The later TDS and SMI cards that have internal batteries are charged by the GX when it is powered on.

Let your GX sit for a month or two without turning it on and you'll have the exact situation you just described.

---

And I expect that the same would happen if the card were removed for a month or two.

Does anyone know which type of rechargeable battery is used in these cards?

TDS's method of setting a repeating alarm to keep the calculator turned on is good, but I'd add that it would be better to use a "control alarm" (such as the program \<< DROP \>> for the "message" instead of a character string) instead of an "appointment alarm", so that it doesn't sound the beeper. Also, since the automatic turn-off on the 48 series seems to be 10 minutes, I'd set up the alarm to repeat every 599 seconds instead of every 299 seconds. One could also add a control alarm to delete the repeating alarm after 24 hours. I'd prefer to try running this recharging procedure starting with fully-charged NiMH AAA cells.

---

Better yet, go ahead and use an appointment alarm (any character string for the message), but set flag -57 (Alarm beep off). Flag -43 should be clear (Reschedule alarm), the default state, so that the unacknowledged repeat appointment alarms will actually be repeated.

Stupid me, thanks a lot, Massimo!

Edit: My 32SII does the looping test in 15 seconds. Twice as fast as the 35s? I must have overlooked something.

*Edited: 14 July 2007, 5:43 a.m.*

### Re: 35s - how fast?

Message #4 Posted by [Eric Smith](#) on 14 July 2007, 2:25 p.m.,  
in response to message #3 by Thomas Radtke

The 33s and 35s use a GeneralPlus (formerly SunPlus) microcontroller with a 6502 core, which can run at up to 4 MHz, but is probably running slower in the calculator.

The 32SII used an HP Saturn core at about 650 KHz, if memory serves. The Saturn core was designed to do BCD arithmetic very efficiently; fixed point BCD addition or subtraction takes only a little more than one clock per digit, as does shifting. And of course floating point is performed in software by use of a lot of fixed point adds and shifts.

The 6502 takes many more cycles to do the same thing. It takes at least 3 cycles to do a binary add of a byte in memory to the accumulator, so to add two 15-digit floating point mantissas together (after

they've been aligned) will require a code sequence something like the following (which is completely untested), assuming that the operands and result are stored in zero page in packed form:

```

ADDM:   LDX #7
        CLC
L1:     LDA OP1,X
        ADC OP2,X
        STA OP1,X
        DEX
        BPL L1

```

That takes about 139 cycles on the 6502, while on the Saturn the equivalent takes about 19 cycles (with operands in the 64-bit processor registers).

Also, the 33s and 35s firmware is written mostly (or perhaps entirely) in C. The 6502 isn't a very good target architecture for C, so that doesn't result in efficient code. If the arithmetic routines are written in C, they may be much worse than hand-coded routines. In particular, the compiler is unlikely to infer the use of the 6502's decimal mode.

### Re: 35s - how fast?

Message #5 Posted by [Thomas Radtke](#) on 14 July 2007, 2:55 p.m.,  
in response to message #4 by Eric Smith

Thanks for giving some insights!

The museum [benchmarks](#) give more reasonable figures, so hopefully most meaningful applications won't run slower on the 35s than on the pioneer.

BTW, I have in mind implementing the error function which I often use and already implemented on the TI-59, PSION LZ and Sharp 1500 (the fastest!). At least, the 35s shouldn't evaluate it slower than the TI ;-)

### Re: 35s - how fast?

Message #6 Posted by [Andrés C. Rodríguez \(Argentina\)](#) on 15 July 2007, 2:50 p.m.,  
in response to message #4 by Eric Smith

There was an old saying which was more or less...

"Software becomes slower more rapidly than hardware becomes faster"

In this case, it is not only software, but also architecture (specialized vs. general purpose).

However, I like (mostly) the 35s, slow as it may be.

### Re: 35s - how fast?

Message #7 Posted by [hugh steers](#) on 17 July 2007, 6:44 p.m.,  
in response to message #4 by Eric Smith

hi eric,

the choice of the 6502 architecture i find perplexing. i understand that hp might not have had the luxury to change from the 33s, but that doesn't explain the 33s. the compiler point is important and i think that there are better choices than the 6502.

presumably there is not an ARM slow, cheap or low power enough to fit the bill. good compilers

were built for the old 8086 architecture which might make an alternative. dust down your old copies of turbo C, and return (const char FAR\*)FuManchu; well perhaps not.

but seriously, unless they're doing something really funky, i would expect the biggest limitation is a 64k address space. with 32k RAM, then you've only got 32K rom. this rules out adding a lot of extra function. which is why stuff might be missing already.

so better than segments might be our old friend the 68000, eg 16MHz dragonball like the palm had. flat architecture with mature compilers.

one thought; is there an architure licensing cost. for example is the 6502 now effectively free? when all others would require, at least some, license.

also, i had an idea about your ADD code.

Gene's article mentions 15 decimal internal precision and an 8 byte mantissa (without signs). if i had to write the code in C for the 6502 or something like that, i'd implement a base 100 decimal system with 2 digits per byte stored in binary. since without leveraging the decimal instructions of the 6502, arithmetic will be a shift and mask extravaganza or else write the math code by hand.

so with a base 100, you need a spare "padding" nybble that means 8 bytes gives you only 15 digits. which is what you've got, so maybe this is what they actually do.

im using the same idea in hplua but with base 10,000 each "digit" of 0 to 9999 stored in 16 bits. the idea is that i get to use 16x16->32 multiply and replace divide constants with inverted mul constants BUT the hit is that i waste 3 nybbles in this base. this isn't so bad because my floats are 16 bytes (compared to 35s 12 bytes). i also take a hit converting each 16 bit binary to and from decimal for IO, but this is not significant overall.

If I'm remembering correctly, the address space is way over 64k. There was quite a bit of mask rom in the CPU.

There are more space efficient packing mechanisms for decimals:

<http://www2.hursley.ibm.com/decimal/dbover.html>. All part of the IEEE-854 compliant

decNumber library <http://www2.hursley.ibm.com/decimal>. The actual computations are carried out in base  $10^n$  (n defaulting to 3, again from memory), so things are still relatively fast.

Using 12 bytes for reals that would easily fit into 8 is bording on criminal. Using 37 bytes for each register is just wanton wastefulness :-)

### Re: 35s - how fast?

Message #9 Posted by [hugh steers](#) on 18 July 2007, 9:59 a.m.,  
in response to message #8 by Paul Dale

the idea of using 10 bits for 3 digits is denser than Packed BCD, as you've pointed out. but i don't think things would still be relatively fast. i would expect this to be slower than a PBCD implementation because its more complicated. for example, one of the mantissa digits is stored in the exponent.

nevertheless, it does get close to binary efficiency, ie 16 decimal digits for 8 bytes.

Yes, of course, it must be slower than a pure PBCD implementation. In use, however, the performance loss doesn't seem to be such an issue. You unpack the numbers once, perform all your operations in what amounts to a PBCD format and repack at the end.

Quote:

nevertheless, it does get close to binary efficiency, ie 16 decimal digits for 8 bytes.

Yes, this was the bit that most surprised me. The packing is *\*very\** efficient and not too far from a pure binary equivalent. Plus it includes all the IEEE nicities like denormalised, NaNs, infinities and proper rounding.

Allow me to further the abuse-

I see there is no expandable memory capability on the 35S. So, can it be assumed still, as was the case on the 33S, that if one has too many programs, they might not all fit?

in response to message #1 by Don Shepherd

Hello!

Thanks for your report. After reading the report and looking at Ti's website, I fail to see any significant difference between the nSpire and the Ti89/Voyage 200, apart from the slightly larger greyscale display of the nSpire and the improved TiConnect software (hopefully also available for the Macintosh like the old one!).

Am I missing something?

Greetings, Max

NB: Anyway, I have no idea how a near-perfect calculator like the voyage 200 could ever be improved :-)  
(Well, two small items come to mind, a colorful OLED display and an Hp-logo...)

### 35s - fun algebraic tricks #2

Message #1 Posted by [Gene Wright](#) on 13 July 2007, 6:35 p.m.

Here's another type of fun algebraic trick that can be used in **\*\*RPN\*\*** programs.

Suppose you have a 3-digit positive number in X and you want to determine the "sum of the digits" of the number. The program below will do this and not destroy the stack!

LBL A

press EQN

```
RDMR(REGX,10)+RMDR(IDIV(REGX,10),10)+RMDR(IDIV(REGX,100),10)
```

RTN

The original stack is pushed to Y, Z and T. If you want to save Y, Z and T instead, then do a RDN after LBL A and change the RMDR line to point at REGT rather than REGX).

69 bytes used, but very handy to preserve the stack. I personally think these types of features will be very powerful in future programs.

RMDR is the remainder function, IDIV is integer division, and REGX is the way the 35s refers to the value in register X. REGT would point at the value in the T register.

When a function (like RMDR and IDIV) are presented in an algebraic context, it prompts the function name along with the open/close parentheses and a comma supplied (if needed to separate two arguments). To move across the comma to enter the second argument, you press the right arrow key. It's not hard to get used to at all. I'd better stop or this will be yet another learning module.

Gene

**The simplified 35s**

Message #1 Posted by [Gene Wright](#) on 13 July 2007, 3:39 p.m.

The strategy here was to minimize costs by reducing keys.

Way it would have worked is to push the button 1 time for a 1, 2 times for a 2...9 times for a 9, 10 times to add, 11 times to subtract...34 times for cosine, etc.

Development was halted when it was realized there was no way to input a zero using this approach.

[http://home.comcast.net/~genela/HP35S\\_one\\_button.jpg](http://home.comcast.net/~genela/HP35S_one_button.jpg)

Just kidding of course.

**Re: The simplified 35s**

Message #2 Posted by [Bruce Bergman](#) on 13 July 2007, 4:26 p.m.,  
in response to message #1 by Gene Wright

Zero? Maybe if you just didn't press anything for a while?? ;-)

**Re: The simplified 35s**

Message #3 Posted by [Paul Brogger](#) on 13 July 2007, 4:55 p.m.,  
in response to message #1 by Gene Wright

With a simple firmware change, it would be great for those users acquainted with Morse code. (That would presumably solve the "entering zero" issue, as well.)

You might consider a vocal interface. <<Wow! Idea: *Dial-a-calc*. Instead of the calculator "on" your cell phone, you simply dial 1-800-CAL-CULATE, speak in your values and operations, and have the results read back at you by a robotic voice.>>

Or maybe go the Wii route, and have people waving their calculator around as if they're swatting at hordes of invisible, flying insects. (That would do a lot for the public perception of the folks frequenting this site!)

### 35s, Global Labels, and GTO a program line from RUN mode

Message #1 Posted by [Les Wright](#) on 13 July 2007, 2:22 p.m.

I must admit I felt a twinge of disappointment to learn the 35s accommodated only 26 single character global alpha labels. I thought that this meant that only 26 user programs could be in the calculator at any one time.

On reflection I would like to suggest that the limitation is actually on the number of globally labelled program GROUPINGS, and that more routines than the limit of 26 are attainable are with a little ingenuity and admittedly a little hassle at the keypad.

For example, say that within the program grouping A there exist several smaller subroutines that function as programs in their own right, each ending with a RTN. Let's say one of them starts at step A025. Now lets assume the calc is in "run" mode. Is it not feasible to execute this subroutine directly as one can similarly on the 12c, with the keystroke sequence GTO .A025 R/S? Better yet, is it feasible save a few strokes and type XEQ .A025 directly in run mode? I hope that either of these strategies would execute the desired subroutine and stop at the appropriate internal RTN.

Gene, do you have any idea whether this is possible? It sort of is on the 33S, but since you need lettered labels even for internal branches and loops the strategy is pretty useless there. On the 35S it could be a great way to pack in lots of little programs. Of course, one would have to document their locations, etc.

Many thanks,

Les

Message #3 Posted by [Gene Wright](#) on 13 July 2007, 3:36 p.m.,

*in response to message #1 by Les Wright*

Hi. If you pull down the learning module showing the indirect register packing program, you'll see how this is used. The main store/recall routine starts at step 001, but the initialization routine starts at step 070.

There's also a program example of an indirect register sort routine in the main indirect register learning module. Granted, it is pretty bad as a sort goes, but hey...time was short!

Basically, the answer is yes, but I think it is a bit easier than you show.

The Matrix Utilities program to soon be published in Datafile has instructions like this:

"2 ) To execute routine "M1" – to interchange two rows, key the two row numbers (order is unimportant) into X and Y and press XEQ M001 or XEQ M ENTER. No stack registers preserved."

and

"3 ) To execute routine "M2" – to multiply row "i" by the constant "k," key "k" ENTER "i" and press XEQ M037. No stack registers preserved."

You do not need to type a decimal point if you wish to begin execution at a line number. No need for GTO . A025 R/S. Just type XEQ A then fill in the step prompt with 025 and execution will begin at program A, step 025.

The XEQ A ENTER shortcut was a good compromise rather than having to type XEQ A001 every time you want to start at step 001. At least, I hope people think that!

What I envision as one possibility is that a user might dedicate a label to be nothing but subroutines! Simply keep a list of where they start handy. Need another subroutine? Add it to the end of LBL S (for subroutines). Seems to work ok for me.

Message #10 Posted by [Werner](#) on 17 July 2007, 4:07 a.m.,  
in response to message #3 by Gene Wright

Gene - I guess the 'renumbering' doesn't work across global lables? If program A contains a step GTO B123, and I add a line in program B \*before\* line 123 - is the reference in program A still updated?

Even if it is, it would make sense to have (say) label S set aside for Subroutines, in a table fashion:

S001 GTO S020 /\* first subroutine \*/ S002 GTO S110 /\* second subroutine \*/ S003 GTO S153 /\* and so on \*/ .. S020 <first subroutine> .. S110 <second subroutine> .. S153 <third>

Then you can call them using XEQ S001, XEQ S002 etc from other global labels. That way, you'll never have to remember the exact (often changing?) line number your subprogram currently starts from.

Cheers, Werner

## Renumbering works \*globally\*

Message #11 Posted by [Gene Wright](#) on 17 July 2007, 10:09 a.m.,  
in response to message #10 by Werner

Actually, the renumbering works across all labels. It really is VERY useful.

Example:

LBL A

GTO B005

RTN

LBL B

ENTER

ENTER

ENTER

1/x

RTN

and then you insert a SIN instruction before the previous B005 line 1/x.

The original LBL A instruction of GTO B005 is dynamically changed to GTO B006.

The HP 35s really does have a lot going for it.

And, I like your suggestion for structuring a subroutine global label better than I had done. It is certainly better to remember XEQ S002 than XEQ S058 or such.

I really think that a global label devoted to nothing but subroutines is in the future of serious programmers' HP 35s.

Great idea! and Great Job HP! (IMO, of course).

## Re: 35s, Global Labels, and GTO a program line from RUN mode

Message #12 Posted by [Paul Dale](#) on 17 July 2007, 4:43 p.m.,  
in response to message #10 by Werner

Quote:

Even if it is, it would make sense to have (say) label S set aside for Subroutines, in a table fashion:

```
S001 GTO S020 /* first subroutine */
S002 GTO S110 /* second subroutine */
S003 GTO S153 /* and so on */
.
.
S020 <first subroutine>
.
.
S110 <second subroutine>
.
.
S153 <third>
```

Then you can call them using XEQ S001, XEQ S002 etc from other global labels.

---

I too thought of this scheme and also an extension whereby the gotos are labelled with an equation on the previous line. I.e. you goto the initial even numbered steps of S and the previous odd steps include short descriptions of what each does. Helps jog an aging memory :-)

- Pauli

### **Re: 35s, Global Labels, and GTO a program line from RUN mode**

*Message #13 Posted by **Werner** on 18 July 2007, 4:06 a.m.,  
in response to message #3 by Gene Wright*

If you're going to store matrices in a general way in the indirect registers, it may be best to store a 'descriptor' of some kind (eg a 3D vector holding the number of rows, columns, and a status indicator (LU decomposed or not, matrix 'packed' or not, real/complex.. )) \*after\* the matrix data, to prevent the automatic reclaiming of trailing zeroes.

Werner

**HP-8s calcs available on eBay**

Message #1 Posted by [Bruce Bergman](#) on 13 July 2007, 1:20 p.m.

Tipster:

For those collectors out there, keep an eye on eBay if you want to snag an HP-8s calculator. I've had an eBay search running for almost a year on ANY kind of HP-8s calculator, but haven't had a single hit until this past week. The first hit I got, I went out and did a buy-it-now before I was half awake. ;-)

I've since seen two others pop up. Don't know if that'll continue, but if you want one of these strange calcs, I'd recommend starting a search and keeping your eyes open.

thanks, bruce

Message #2 Posted by [Allen](#) on 13 July 2007, 1:35 p.m.,  
in response to message #1 by Bruce Bergman

I bought one a few weeks ago.. similarly surprised to see them for sale in Australia. Since they are not expensive, I would have bought one anyway just to complete the collection, but I'd recommend reserved expectations until you actually hold one and press the buttons.

IMHO both the manual and the actual hardware are fair at best. At least the 6S series was small...this one is capable with many scientific features, but is clearly aimed at the low price/low quality market in asia. That is to say this is the closest I have seen to TI. GRIN!

p.s. for the collectors: there is no easy way to remove the battery for long term storage. [CLICK HERE FOR CLOSEUP PICTURE](#)

Just loose the six screws on the back. At least that's what I remember I did since the two CR2032 are outside the calc right now...

BTW: I bought a second one a week ago but the seller is currently out of stock right now, I'll have to wait a couple of weeks.

Greetings,  
Massimo

Yeah, note that I didn't say the calc was all that GOOD -- I merely said it was available. ;-) I think it's definitely on par with the quality and uselessness of the 6s, but it definitely looks better and the keys actually depress, instead of float lightly beneath your finger.

I really wanted one just to say I had it, but it's fun to show around at work. :-D Besides, at \$15USD, it's a no-brainer.

thanks, bruce

**EMU71 (and EMU41) to go.**

Message #1 Posted by [Egan Ford](#) on 13 July 2007, 1:09 p.m.

The recent iPhone hype and Gene's quest for an RPN calculator got me thinking that I still do not have a usable calculator for my phone. Sure some exist, but so far they are pretty lame. I have looked in to porting Free42 and EMU48 to my Windows Mobile 5 Smartphone. But, it lacks a stylus, so some UI work has to be done and I just have not had the time.

I stumbled on PocketDOS and thought I'd give it a try. It works surprising well.

Screen shots:

<http://sense.net/~egan/pics/emu71.jpg>

My phone screen is just under 2" wide. 4.6cm to be exact. It can be hard to read even when the phone is not moving. Obviously this would be for emergency use.

There is a handy zoom function tied into the talk and volume control buttons, e.g.:

<http://sense.net/~egan/pics/emu71z2.jpg>

The zoom feature is nice for EMU41 since you really only need the left side of the screen, but you can shift to the right side if you need the reference page:

<http://sense.net/~egan/pics/emu41left.jpg>

**Amazing !! What about the speed ? [NT]**

~1/2 of real 71B. I have not seen if there are any tuning options. It is battery friendly, that's a plus.

**Re: EMU71 (and EMU41) to go.**

Message #4 Posted by [Howard Owen](#) on 13 July 2007, 3:00 p.m.,  
in response to message #1 by [Egan Ford](#)

Woohoo! It looks great on my XV6700 in landscape mode:

<http://egbok.com/images/PocketDOS-EMU41.jpg>  
<http://egbok.com/images/PocketDOS-EMU71.jpg>

Great find, Egan!

Regards,  
Howard

## Re: EMU71 (and EMU41) to go.

Message #5 Posted by [Howard Owen](#) on 15 July 2007, 10:18 p.m.,  
in response to message #1 by Egan Ford

To get an idea of the relative performance of PocketDOS, I ran the following program on my real 41CX, EMU41 under Windows Vista on a 2GHz processor, and in PocketDOS running under Windows Mobile 5 on a 417MHz PXA270 in my VZ6700 phone.

```
001 LBL 'BENCH
002 1.999
003 STO 00
004 TIME
005 LBL 00
006 1.5
007 SIN
008 RDN
009 ISG 00
010 GTO 00
011 TIME
012 X<>Y
013 HMS-
```

The times I got:

| Calculator | Platform  | Turbo? | Time                   |
|------------|-----------|--------|------------------------|
| EMU41      | 2Ghz PC   | Y      | 1 second               |
| EMU41      | 2Ghz PC   | N      | 8 minutes, 17 seconds  |
| EMU41      | PocketDOS | Y      | 4 minutes, 36 seconds  |
| EMU41      | PocketDOS | N      | 14 minutes, 11 seconds |
| HP41CX     | Native    | -      | 12 minutes, 52 seconds |

So EMU41 running in turbo mode on an Xscale processor emulating an 80286 (presumably) is more than three times faster running this user code than the native 41C. Pretty impressive!

Regards,  
Howard

## Re: EMU71 (and EMU41) to go.

Message #6 Posted by [Egan Ford](#) on 16 July 2007, 5:20 a.m.,  
in response to message #5 by Howard Owen

Its emulating an 80186. Check for numerical accuracy. Eg.:

```
WINDOWS EMU71 RADIANS @ SIN(5) = -.958924274663
POCKETDOS EMU71 RADIANS @ SIN(5) = -.960189148053
```

PocketDOS is based on DOSBOX. DOSBOX does not have this problem. Both DOSBOX and PocketDOS have problems with EMU71 clock skew.

So far EMU41 does not appear to have a problem with numerical accuracy or clock skew. EMU41/accelerated on my phone is 1:1 to a 41CX.

---

**Re: EMU71 problem with PocketDOS?**

*Message #7 Posted by **J-F Garnier** on 16 July 2007, 7:16 a.m.,  
in response to message #6 by Egan Ford*

Emu71 and Emu41 run the HP ROM code, and don't rely on the host CPU floating point capabilities. You should get no differences between Emu71 running on Windows or Pocket PC, except if there is a serious bug in 80x86 emulation in PocketDOS.

Emu71 uses my Saturn emulation engine based on hand-written, highly optimized assembly language. It uses for instance the decimal arithmetic support of the 80x86, specifically the DAA and DAS instructions, that may be not fully or correctly implemented in PocketDOS.

Emu41 uses more "usual" C routines to implement the HP decimal arithmetic, and is less sensitive to the quality of the underlying 80x86 emulation.

Thanks, Egan, for this interesting test report!

J-F

**Re: EMU71 problem with PocketDOS?**

*Message #8 Posted by **Egan Ford** on 16 July 2007, 8:01 a.m.,  
in response to message #7 by J-F Garnier*

If you load the PDOS\_DOSBOX\_CPU.dll plugin the problem goes away. However it cuts the speed by half. Screen writes are slow. Clock skew still exists. No clock skew with EMU41. Any ideas?

Thanks.

---

**Re: EMU71 problem with PocketDOS?**

*Message #9 Posted by **J-F Garnier** on 16 July 2007, 1:12 p.m.,  
in response to message #8 by Egan Ford*

I don't know much about PocketDOS. My guess is that the plugin improves the 80x86 emulation accuracy, at the expense of lower speed.

In case of clock skew, especially if the emulation speed is less than the original HP71, you can try the Emu71 option /s : "emu71 /s".

J-F

*Message #11 Posted by **PocketDOS** on 17 July 2007, 4:59 a.m.,  
in response to message #6 by Egan Ford*

Dear Sir,

PocketDOS is not based on DOSBox at all. We have compiled the DOSBox CPU code into a plug-in DLL which can be loaded under PocketDOS. PocketDOS' own CPU emulator is less complex (and hence much faster) than DOSBox. We will investigate the DAA and DAS instruction implementation to see if there is a problem with them that would cause accuracy issues.

Thank you for your interest.

### HP 35s Emulator Software

Message #1 Posted by [Richard Garner](#) on 13 July 2007, 9:45 a.m.

When the HP 33s came out HP also offered an emulator that teachers only could get. Will HP offer an emulator of the HP 35s as well? If it does I hope this time it will be available to everyone, not just teachers. I would think an emulator would be useful to everyone who owns one, not just for the very few who qualify.

### Re: HP 35s Emulator Software

Message #2 Posted by [Valentin Albillo](#) on 13 July 2007, 10:09 a.m.,  
in response to message #1 by Richard Garner

Hi, Richard:

Richard posted:

*"Will HP offer an emulator of the HP 35s as well? If it does I hope this time it will be available to everyone, not just teachers."*

Good luck with this. At the time, I did my best to try and get the HP33S emulator in order to be able to create programs for it and then write and publish articles featuring said programs, with the idea of ultimately making freely available a sizable amount of useful software for that newly introduced machine and provide some service to the community.

But, not being a teacher, it proved impossible. And of course there was no way I'd buy it, so the programs were never created and the articles about it were never written. A real pity, as I had so many useful self-developed math and engineering software for such machines as the HP-34C and the HP-67/97 which I intended to convert and upgrade for the HP33S and which might have proven useful to many ...

In other words, get a seat lest you'll tire of waiting for the "free-for-all" HP35S emulator.

Best regards from V.

V.

Do you anticipate that you might buy a 35s? I'm sure that all of us who are eagerly purchasing one would love to see your self-developed math and engineering programs ported to it, if you were inclined to do so.

Best Regards

**Re: HP 35s Emulator Software**

Message #4 Posted by **Valentin Albillo** on 13 July 2007, 1:59 p.m.,  
in response to message #3 by Jeff O.

Hi, Jeff:

*"Do you anticipate that you might buy a 35s?"*

Yes, I'm taking affirmative actions to get hold of one as fast as possible, no matter the price, precisely for the very purposes you suggest below.

I know for certain that it would be better to wait for the the next revision, when most important bugs eventually discovered will have been removed and perhaps some physical aspects have been improved, but for the purpose of upgrading my existing software or creating new routines expressly for it, an allegedly bug-ridden, flea-ridden Mark 1 version will do.

*"I'm sure that all of us who are eagerly purchasing one would love to see your self-developed math and engineering programs ported to it [...]"*

Thanks a lot for your interest and kind words, that's exactly the idea. I couldn't do it for the HP33S as it was my intention because I was unable to get hold of the emulator despite repeated attempts, and I certainly wasn't purchasing one no matter what (or even accepting one as a gift) as I really dislike it and didn't want that thing in my home.

But the HP35S is entirely another matter so as soon as I can get one I'll finally be able to fulfill that goal of mine ( ... does this rhyme with "gold mine" ? Oh well ...)

Best regards from V.

### Additional misc 35s notes

Message #1 Posted by [Gene Wright](#) on 12 July 2007, 3:36 p.m.

I do hope those interested will take the time to go through the learning modules on HP's site. However, there are a couple of things I'd like to point out.

1 ) The indirect data register packing program is really quite neat, if Jake and I say so ourselves. You allocate a number of indirect registers, which are initialized with 3-D vectors containing zeroes. To store a number into logical indirect register N, key the number, press ENTER key the register number N and XEQ the program label. To recall, simply enter N as a negative number. The other stack registers are preserved, so you can recall two numbers from the packed indirect registers sequentially and perform an operation on them. Why do this? Since indirect registers use 37 bytes EACH, using this program saves about 2/3 of that RAM for other uses.

2 ) The ability to use algebraic commands within RPN programs is really worth serious study by even the most diehard RPN-only programmer. For example, to multiply the value in X by 2 without losing the stack in a program, you can: perform a RDN, then the EQN REGT\*2 will do the trick. To enter the REGT instruction, press RDN after you are in equation mode and move the cursor over to point to the T register and press ENTER. Very handy. You can do many, many calculations in a single program line this way without altering the stack. Another example: the remainder function RMDR can be put on a program line as an equation/algebraic object so that RMDR(A+B-REGT,COMB(C,REGX)) would compute the result (of whatever that does) and keep the previous X, Y, and Z values in Y, Z and T. That's an amazing new ability to keep stack values.

3 ) Matrix functions? Not included. However, there's already an HP35s port of the M1 through M5 and BE and BX routines from the PPC rom. These matrix utilities can form the basis for a row reduced matrix program similar to the RRM companion program found in the PPC ROM manual. A determinant of a 28x28 matrix should be possible (but why would you want to try it?). If these programs were modified to use the indirect data packing approach mentioned above, even larger matrices could be worked on.

in response to message #2 by Thomas Radtke

Yes, they are painted. No injection moulding (and hasn't been for ages).

### Re: Additional misc 35s notes

Message #4 Posted by [hugh steers](#) on 12 July 2007, 5:39 p.m.,  
in response to message #1 by Gene Wright

thanks for the interesting review. its a pity there's no way to get programs on or off it like IR or SD/USB. presumably this has something to do with exam rules.

also, am i right in thinking that this now represents the only production keystone programmable scientific calculator?

*Edited: 12 July 2007, 5:40 p.m.*

### **Re: Additional misc 35s notes**

*Message #5 Posted by **Gene Wright** on 12 July 2007, 5:49 p.m.,  
in response to message #4 by hugh steers*

Might be no IO because of exams, might also be because of the model heritage this possesses (32s, 32s2, 33s series). Don't know.

As to whether it is the \*only\* one, depends on if the 33s is killed off. Don't know that either.

### **HP 35s I/O**

*Message #6 Posted by **Nenad (Croatia)** on 13 July 2007, 5:17 a.m.,  
in response to message #4 by hugh steers*

Please, do not misunderstand the opinion I would express below: with the exception of its I/O capabilities I find the present HP35s (hopefully, this is not a too strong expression) "simply beautiful".

IMHO, regardless of the HP35s programming capabilities, it is a big disadvantage not to have a possibility of programs input other than the keyboard. It would be much easier for me if I would be able to prepare the program implementing my favorite editor on a PC and somehow transfer it afterwards to my HP35s. If an USB cable were be required for this, the communication among the attendees of an exam (supposing that they are trying to cheat) would be prevented. The only thing a cheater can do, in such a "would be" situation, is to "cut and paste" a certain amount of text from the textbook into HP35s, forbidden on a closed-book-exam; but is this really the reason to omit I/O?

Another important issue is backup. OK, there is plenty of space in HP35s for many everyday necessary programs one could need, but what if I somehow lose what I have been entering for a long time? The reason may be a simple human error: somebody inexperienced presses some combination of "hard reset"; or similar.

Should we wait for HP35s+ or HP35sx: may be the same as HP35s, but with I/O?

### **Re: HP 35s I/O**

The next generation will be the HP-41S series -

Keystroke programming Unit conversion 48 style 42 menu style No CAS External Program Storage/Backup

Released on the 30th Anniversary of the 41C series - 2009!

So you will have to wait a bit longer...

I'd like to see a 42s+ to celebrate the 20th anniversary of the 42S in 2008 already. External I/O via USB or SD cards. Shape of keys taken over from 35s. LCD size 150% of 35s. Dot matrix considerably larger than 35s. Drafts of such a calculator have been shown here some times already.

*Edited: 13 July 2007, 11:09 a.m.*

I dunno. We're getting a 35th anniversary 35, so shouldn't we expect a 42nd anniversary 42 in 2030? I think I'm going to hold out for a 71st anniversary 71B in 2055.

-Jonathan

Fortunately I've never used a 9100A.....

**Re: HP 35s I/O**

*Message #12 Posted by **Walter B** on 15 July 2007, 1:39 a.m.,  
in response to message #11 by Jonathan Eisch*

After all, all the parts necessary are available already: take the LCD of any HP graphic calc, the SD port of 49/50, key molds of 35s, even the keyboard PCB layout may be taken over from the 35s. It may need a bit longer housing for the higher LCD and larger batteries - not too time consuming. And an extended function set, of course. But, as one of my bosses used to say, "that's only software"! So, if the 35s will sell well, why not?

**Re: HP 35s I/O**

in response to message #2 by Dave.Johnson

Can you post the URL? The only thing I see says, "Coming soon Please check back soon."

### Re: HP35s: just ordered mine!

Message #4 Posted by [Seth Morabito](#) on 12 July 2007, 2:08 p.m.,  
in response to message #3 by Mark W Paris

Hello Mark,

I wasn't able to find an "add to cart" link either, until I went to the "Training and Modules" page.

The link to buy the calculator can be found here:

<http://h30094.www3.hp.com/product.asp?sku=3587762&pagemode=ca>

I've ordered mine! With some luck, it'll be here next week. If not, I can be patient (really!)

### Re: HP35s: Thanks -- that did it.

Message #5 Posted by [Paul Brogger](#) on 12 July 2007, 2:22 p.m.,  
in response to message #4 by Seth Morabito

(Imagine: impatiently waiting, strumming fingers on desk . . . )

And, re: talking to salespeople -- If I've got it right, these online orders are being taken as "pre-orders" by H-P's Medium & Small Business unit. (Or is that "Small & Medium"?) The salesperson

I talked to tossed that off as if it was a known quirk of that unit's operation.

But as far as the salesperson was concerned, there was no way I was going to buy one soon over the phone.

(So, thanks again for the link!)

### **This HP-41c doesn't work --- what next?**

Message #1 Posted by [Mark W Paris](#) on 12 July 2007, 12:34 a.m.

Hi all,

I've recently come into possession of a non-functioning 41c. I have read a good amount of the available online repair guides and I feel like I'm getting my head around the issues. But I'm stuck and would be happy to hear your considered advice.

I have disassembled the unit. It took me some time to realize that those two 0.15" nuts (!! ) screwed onto the lower CPU board posts were someone else's repair attempt. Both upper posts are cracked. The lower ones look alright (not cracked, that is) except for the threads cut by the 0.15" nuts. If you squeeze the two case halves together you can get the screen activated but it only (alas!) shows jibberish. Incidentally, the unit is in excellent cosmetic condition and the battery compartment, in particular, and contacts look very good.

I've considered rebuilding the upper posts and keeping the nuts on the lower ones to see if that would do it -- but I'm skeptical that it would. I would have thought that by squeezing the two case halves together (firmly but accurately) at the upper and lower post points I'd be able to see something sensible on the display when turning it on. Can anyone comment on this point? Shouldn't squeezing by hand do it?

The next step, I suppose, is to cut out the middle-man and just go ahead and solder wires between the pressure contacts. But this seems like some good amount of work. And, being a pessimist, I'm assuming the electronics are fried anyway.

My question is: does anyone know how to check the chips? Can't I use a digital multimeter to check point-to-point resistances or voltages and compare to a chart of expected values? I'm stabbing in the dark here, clearly. But I think there should be some way to do this.

Your advice and comments are most welcome. Let me know if I should try something else. (I'm hoping to fix it myself -- sorry FixThatCalc -- or chop it for parts.)

Thanks in advance.

Mark

### **Re: This HP-41c doesn't work --- what next?**

Message #2 Posted by [Randy](#) on 12 July 2007, 11:53 a.m.,  
in response to message #1 by [Mark W Paris](#)

Upper posts being cracked - that's usually no big deal unless the screws don't tighten.

The nuts on the lower posts wasn't a repair attempt, it was the original method HP used to secure the logic board to the keyboard. It worked quite well until you removed and installed the logic board several times - at which point the post threads would fail and the nuts would no longer hold the board tight enough to make proper contact. HP did have undersized nuts (they were usually gold in color) for these cases but ultimately they would strip too.

Quote:

Shouldn't squeezing by hand do it?

No, it usually will not work. The logic board has to make (IIRC) 28 connections to work... and you simply can't apply pressure in the correct places.

Quote:

The next step, I suppose, is to cut out the middle-man and just go ahead and solder wires between the pressure contacts

DO NOT DO THIS!!! It is absolutely the wrong thing to do. There is NEVER a good reason to do this. It's a horrible mess which makes your 41 non-modular thus preventing any further testing by simple board swapping.

Quote:

My question is: does anyone know how to check the chips?

Yes, it's called the Service ROM. It's the only way.

Quote:

I'm assuming the electronics are fried anyway

That is *\*VERY\** pessimistic.

Bottom line: Remove the logic board, clean both sides with isopropyl alcohol and dry well. Re-install and use the nuts to secure the logic board if they hold. If not, you'll need to fashion some spacers in place of the nuts in order to apply pressure to the board. Check the soldered connections between the keyboard and display driver, resolder any fractured joints.

You'll probably find it works...

*Edited: 13 July 2007, 2:49 p.m. after one or more responses were posted*

## **Re: This HP-41c doesn't work --- what next?**

*Message #3 Posted by **Mark W Paris** on 12 July 2007, 1:32 p.m.,  
in response to message #2 by Randy*

Hi Randy,

Thanks for the advice. And for setting me straight on the nuts.

You said: Bottom line: Remove the logic board, clean both sides with isopropyl alcohol and dry well. Re-install and use the nuts to secure the logic board if the hold. If not, you'll need to fashion some spacers in place of the nuts in order to apply pressure to the board. Check the soldered connections between the keyboard and display driver, resolder any fractured joints.

I can do the cleaning and reassemble. Just to be clear -- the "soldered connection b/w the k/b and display" are the 16 (I think) steel looking metal bars at the top of the calc, right?

I'll work on it tonight.

Another question -- any feelings about using cyanoacrylate to repair the posts?

Mark

**Re: This HP-41c doesn't work --- what next?**

*Message #4 Posted by **Randy** on 12 July 2007, 4:11 p.m.,  
in response to message #3 by Mark W Paris*

Yes, I was referring to the interconnects at the top edge of the keyboard.

Quote:

Another question -- any feelings about using cyanoacrylate to repair the posts?

Yes, definite feelings. Don't do it. It will not work and it is irreversible. IMO, there isn't one 41 repair that should be done with cyanoacrylates. In general, keep the stuff away from calculators, it's not suited to the task. Any and all 41 plastic repairs should be done with plastic model welding solvent. This is NOT the stuff found in hardware stores used to join plastic pipe. You'll find it in hobby shops, it is used to assemble styrene plastic models and is sold in small glass bottles. It's a clear liquid, you brush it on and hold the parts together for a minute, then let cure overnight. It's the only way to repair cracked posts. Any other adhesive will fail.

I have to mention again that if the upper post screws tighten, don't bother with repairing, at least at this stage of the game. Cracked posts are very common and do no harm, it's not causing the improper operation.

*Edited: 12 July 2007, 4:17 p.m.*

**Re: This HP-41c doesn't work --- what next?**

*Message #5 Posted by **Mark W Paris** on 12 July 2007, 9:27 p.m.,  
in response to message #4 by Randy*

Hi Randy --

Can't thank you enough for your astute advice. Turns out my pessimism was, as usual, unwarranted.

I checked the interconnects by moving them with the tip of my needle-nose pliers. Turns out that one of them was loose. Soldering it back in place did the trick. I guess this unit took a good tumble at some point.

The case exterior looks great but you can see scratches on the plastic under the feet where someone used metal (?!) to pry them up. No worries there really, I only mention it because it makes it obvious that someone has mucked around with this unit at some point. Point is, the screw-head seat in the upper left screw-hole has been cracked and some plastic has broken away -- I'm guessing from the mucker cranking down on the screw in a misguided effort to "fix" the unit. Any advice for rebuilding this screw-seat? Worse comes to worse I can use a washer but that'd be ugly.

Thanks again.

Mark

## **Re: This HP-41c doesn't work --- what next?**

*Message #6 Posted by **Randy** on 12 July 2007, 11:30 p.m.,  
in response to message #5 by Mark W Paris*

Virtually all 41's that have been serviced have scars under the feet where the pads got lifted with small screwdriver... yours is in good company.

It's pretty common for the screw seats to get busted out or at least cracked. It probably happened when the unit took a dive off a desk which was in all likelihood why the display connection was fractured. Make sure that little strip of black plastic goes back into place along the top edge of the display. That prevents the display from moving when the case is closed. Leave it out and you'll find lots more of the connections fractured in a few years - due to the display flexing the solder joints.

This is where the plastic solvent cement comes to the rescue. You might have to piece it together in two steps but they always go back together. Just be sure to not rush the job and give it a minimum of twenty four hours drying time before putting screw pressure on the seat. Don't trust the label on the bottle that says a few minutes is all that is required. The solvent has to completely evaporate for the repair to reach maximum strength.

## **Re: This HP-41c doesn't work --- what next?**

*Message #7 Posted by **Mark W Paris** on 13 July 2007, 11:50 a.m.,  
in response to message #6 by Randy*

Hi Randy,

I probably should have asked your hourly consultant rate before we got into this...thanks again for the help.

I didn't quite follow your last comments.

Quote:

-----  
This is where the plastic solvent cement comes to the rescue. You might have to piece it together in two steps but they always go back together. Just be sure to not rush the job and give it a minimum of twenty four hours drying time before putting screw pressure on the seat. Don't trust the label on the bottle that says a few minutes is all that is required. The solvent has to completely evaporate for the repair to reach maximum strength.  
-----

I understand about giving the solvent ample time to cure -- I'm in no rush. But what are the "two steps" that you refer to?

My conceptual difficulty here is that the broken out screw seat appears to require significant reconstruction. If the seat were exposed, like a post, I think I could manage it (if I could figure out somewhere to get some (same color?) filler plastic and melt it down with some solvent...). But this screw-seat here is in a recessed hole. And to complicate matters, the cracked out part isn't exposed from the backside either. Any advice? (I could send a pic if my description is lacking.)

Mark

**Re: This HP-41c doesn't work --- what next?**

*Message #8 Posted by [Randy](#) on 13 July 2007, 2:46 p.m.,  
in response to message #7 by [Mark W Paris](#)*

I think I understand...

The bosses are exposed, from the inside of the case. I had assumed you had removed the port i/o block... I forget that sometimes they can seem as though they are one with the case bottom, but they're not. Remove the four port fillers or any modules and you should be able to lift the block off the case.

If the block is stuck in place, use a small flat screwdriver slid in from the module side under one corner of the block. Work the screwdriver over to middle and twist the screwdriver such that it lifts the block up and off the four retainers. It may give way with a loud snap but it should be okay, it had just fused itself to the retainers.

Once the block is out, it will expose the bosses and you should be left with the broken out pieces and the proper side to repair from. With the new perspective, all should be self-evident.

**Re: This HP-41c doesn't work --- what next?**

*Message #9 Posted by [Mark W Paris](#) on 19 July 2007, 5:48 p.m.,  
in response to message #8 by [Randy](#)*

Randy -- I haven't gotten a chance to follow your good advice. I'll have to get to it after vacation. Thanks, again. -Mark

### HP35s announced ... lots of detail inside (edited)

Message #1 Posted by [Gene Wright](#) on 12 July 2007, 9:20 a.m.

The HP 35s is finally announced! I've been using it for months and really like this new model.

On the HP 35s webpage found at [www.hp.com/calculators](http://www.hp.com/calculators), there are 55 learning modules for your download.

HPCC.org has graciously put up a link to my review of the HP 35s that appears in their special HP 35s Datafile issue which you can read/download on their website here:

<http://www.hpcc.org/datafile/V26Special/the35s.pdf>

Be sure to check out the review and all the other goodies in the special HP 35s issue of Datafile. Join now! :-)

Highlights of the HP 35s:

- \*\* Two index registers, regular variables I and J. Dedicated i register is gone.
- \*\* 801 indirect registers plus 32 other registers (A through Z and stat registers).
- \*\* Indirect registers dynamically allocated based on highest non-zero value containing indirect register.
- \*\* Each indirect register allocated uses 37 bytes of available program memory.
- \*\* Index values of 0 through 800 reference the indirect registers.
- \*\* Index values of -1 to -26 reference A through Z.
- \*\* Index values of -27 to -32 access stat registers.
- \*\* The index registers are no longer in the middle of the address space as on the 33s.
- \*\* 26 global labels with dynamic line number GTO and XEQ instructions.
- \*\* Transfer execution to any line number within any program.
- \*\* Add / delete a step and the GTO/XEQ instructions renumber themselves appropriately.
- \*\* They keep pointing where you want them to point.
- \*\* Programs "limited" to 999 lines per label now. A001 through A999, B001 through B999, etc.
- \*\* Since each program line uses at least 3 bytes, 1000 lines equals 3000 bytes. 26 labels x 3000 bytes is more than available memory.
- \*\* 20 subroutine levels now available.
- \*\* The stack can hold 4 full complex numbers.

- \*\* 2-D and 3-D vectors as a new data type.
- \*\* The stack can hold 4 vectors, 2-D or 3-D.
- \*\* No direct P->R or R->P conversions. Change display mode instead. Polar parts can be separated.
- \*\* Equations no longer limited to 255 characters.
- \*\* Ability for non-destructive editing of equations using left cursor.
- \*\* New LOGIC functions work on base-N numbers. OR, NOR, NOT, AND, XOR, NAND
- \*\* Algebraic mode equation/stack "tricks" work in RPN mode providing very useful stack methods.
- \*\* A program line of REGTxREGZxREGYxREGX will find the product of all four stack registers and store the result in X. Only T would be lost.
- \*\* If you roll the stack down, the program line of REGTx2 will double the value previously in X without losing any stack levels.
- \*\* Learning module available allowing for 2400 real numbers to be stored/recalled in indirect registers using 3-D vectors. Stack is preserved by this program. Shows many techniques for creating, modifying values in vectors and the indirect registers.
- \*\* Datafile article available showing program for translated PPC ROM matrix utilities programs M1, M2, M3, M4, M5 along with BE and BX. All that is needed now to find the determinant of a 28x28 matrix or the inverse of an 18x18 matrix is the equivalent RRM style program. (Yes, I've been working on one but it isn't finished yet!)
- \*\* Algebraic mode now operates much more like an equation operating system than the HP 33s algebraic mode did.
- \*\* Key a long calculation in ALG mode and press ENTER. To go back and revise one part of that calculation, press the left cursor key, go back and make your change, then press ENTER again.

For more, read the review!

Gene

The keys of the 35s look good, feel good and work good (ok, work well).

In the same way the HP50g keys work very well compared to the 49g+, the keys on the 35s do a good job too.

**Re: HP35s announced ... lots of detail inside**

Message #4 Posted by [Jake Schwartz](#) on 12 July 2007, 3:49 p.m.,  
in response to message #2 by S. Martin

Quote:

Gene,

How about a comment on one of the most important issues of recent HP calcs: The feel (response) of the keys.

Thanks, Steve

Having used a machine for a few months now, I can say that the keyboard feel is *\*very\** good. No lost keystrokes have been experienced and one can be pretty confident that what was pressed is what one gets.

Jake Schwartz

Message #5 Posted by [Howard Owen](#) on 12 July 2007, 10:53 a.m.,  
in response to message #1 by Gene Wright

At HHC 2006, I told HP that I didn't want them to bring back the HP-42S. I wanted the machine that the 42S would have become, if they had continued development on RPN along those lines. I also said "I want to be surprised by the innovations in keystroke programming you come up with." Well, this machine isn't a 42S successor, but it certainly is a worthy successor to the HP32. And the unlimited line based GOTO and XEQ surprised me. It strikes me as a novel (for an RPN calculator) method of solving the HP33s deficiency in the number of labels. Prior HP calculators had line number GTO instructions, but didn't automatically renumber in the case of addition/deletion of lines. A cynic might observe that we have now passed MBASIC and Applesoft BASIC, since neither of those did automatic line numbering. But I appreciate the effective solution to a problem that this community identified as a serious shortcoming of the 33s.

But that's not the only surprising thing about the 35s. There are tons of *extremely* interesting features mentioned in Gene's post. Imaginary numbers/2d vectors occupying one stack position is great, but the addition of 3d vectors is outstanding. New logic possibilities will make my work easier when designing IP networks. "Stack tricks" sound intriguing. My bottom line is that HP has clearly delivered a product that innovates on top of the solid base of its heritage in scientific RPN calculators. Way to go, HP!

I want one *now!* 8)

Regards,  
Howard

**Re: HP35s announced ... lots of detail inside**

Message #6 Posted by [Gene wright](#) on 12 July 2007, 11:12 a.m.,  
in response to message #5 by Howard Owen

Without the "dynamic" renumbering, line number GTO and XEQ instructions would not be very helpful at all. The 12c uses line numbers for GTOs and it is very painful when you have to insert or delete a step. The 35s solution, while not as nice as unlimited labels :- ) is a nice compromise, IMO.

**Re: HP35s announced ... lots of detail inside**

*Message #7 Posted by **Howard Owen** on 12 July 2007, 11:38 a.m.,

All this looks great, but the main reason (work in hex and conversions to DEC) I use a 33 or 32 over an RPL machine has gone! What a pity.

I will get a 35 anyway.

Arnaud

Gene, after looking through your review article and some of HP's learning modules I agree with your

conclusion. It's by far the most appealing RPN calculator emerged for 1.5 decades at least.

IMHO there is one thing, however, which ought to be improved \*very\* soon: the representation of **theta** in the dot matrix display is terrificly close to **8**. There, the designer must have been \*very\* tired. A simple solution may be to make **theta** two dots smaller vertically.

The error in formula 2 of the formula solver learning module part 2 will be far easier to correct.

The unit conversions (though totally obsolete IMO as you know ;-)) contain some surprising nice features. Programming technique sounds good. And we'll have simultaneous equations at least for up to 3 unknowns. Fine!

So I'll buy one asap. But I will not drop my 42s until HP will launch a successor for this calc, too, including all the features discussed in this forum several times. So please, HP, you know where to look...

In your article, I see the missing function on the beta unit's keyboard is the "->gal" function.

But the reciprocal ("->guy") isn't there either.

;-)

(Seriously, it's simply amazing that H-P sees fit to produce calculators *at all*, let alone one as promising as this.)

Perhaps I missed something, but is there any type of I/O?

### **Re: HP35s announced ... lots of detail inside**

*Message #13 Posted by [Gene Wright](#) on 12 July 2007, 4:32 p.m.,  
in response to message #12 by Egan Ford*

No I/O.

Keep in mind that this is a revision of the 32s, 32s2 and 33s line, not the 42s line.

As such, there are operating system limitations as to what can be done.

Wish there WERE I/O, but there isn't.

### **Re: HP35s announced ... lots of detail inside- no I/O**

*Message #14 Posted by [Donald Williams](#) on 12 July 2007, 6:11 p.m.,  
in response to message #13 by Gene Wright*

Thats too bad. I consider the lack of backup capability a major flaw in the design. I can't imagine anyone doing serious work with a device than has no backup.

I can already invision the calc imbedded in the dry wall above my desk the first time I get a "memory lost" condition. I think I will save my time, money, and patience.

I learn the hard way, but I learn.

**Re: HP35s announced ... lots of detail inside- no I/O**

*Message #15 Posted by [bill platt](#) on 13 July 2007, 7:15 a.m.,  
in response to message #14 by Donald Williams*

Lots of serious stuff has been done with the 15c and it has no back-up.

Really, no I/O is no big deal for calculating. If you want backup, use a computer.

: -)

Just having a new, well-made RPN with a readable keyboard, readable display, and yes, even the ENTER key in the right place, is every reason for me--even if it weren't programmable at all, I'd get one at this price.

**Re: HP35s announced ... lots of detail inside- no I/O**

*Message #16 Posted by [Howard Owen](#) on 13 July 2007, 7:50 a.m.,  
in response to message #15 by bill platt*

Lack of I/O hasn't prevented me from buying one. I intend to buy one more, in fact. But any device I leave the results of serious work on ought to be able to save those results on external media. I'm guessing that the intersection of certification hassles, design complexity and production cost accounts for the lack of I/O on this machine. But I can't pretend I'm not disappointed in that. Over all, of course, I'm delighted.

Regards,  
Howard

**Re: HP35s announced ... lots of detail inside- no I/O**

*Message #17 Posted by [Donald Williams](#) on 13 July 2007, 2:47 p.m.,  
in response to message #15 by bill platt*

My first post about I/O sounds a little harsh because I am a little frustrated about the lack of I/O (actually backup), but all comments are intended as constructive criticism.

"Lots of serious stuff has been done with the 15c and it has no back-up."

Agreed, but you may be comparing apples and oranges. I am not an expert on the 15C but AFAIK it does not have a reset button or a reset procedure. The 33 (the 35s predecessor) reset procedure is on page A4 and B2 of the user manual. I have had to use it twice so far. I don't imagine too many 15C users have had that experience. Otherwise, I am afraid that less serious stuff would have been produced.

These reset tools seem to exist almost universally across all the computing devices I have bought in the last 20 years regardless of the manufacturer. I accept them because I have to. To

me it is a tacit admission by the manufacturer that 1 of 3 things is true

1. This device has become so complex that that we are unable to test all possible permutations. (I suspect this is the case)
2. We are unwilling to spend the finances to insure that all possible permutations have been tested. (This may be the case)
3. We know from first hand experience that this device will crash and this is the only way out. (I hope this is not the case)

"Really, no I/O is no big deal for calculating. If you want backup, use a computer.

:-)"

Its no big deal if you have a device as "bullet proof" and reliable as a 15C. The proliferation of the reset capabilty may imply that this type of manufacturing is no longer possible. I am willing to accept that (Do I have any choice?) if I can protect my intellectual property. I would argue that if it requires a reset capability then it requires a back up capability

"Just having a new, well-made RPN with a readable keyboard, readable display, and yes, even the ENTER key in the right place, is every reason for me--even if it weren't programmable at all, I'd get one at this price."

I think you reflect the opinon of just about every enthusiast on this forum. I want this calculator to be a success in the maket place but I find it puzzling that a programmable device has no back up or documentation capability.

**Re: HP35s announced ... lots of detail inside- no I/O**

*Message #18 Posted by [Egan Ford](#) on 13 July 2007, 3:04 p.m.,  
in response to message #17 by Donald Williams*

The 15C does have a reset, however the memory is so limited that you can backup your 15C on paper (I have) and restore it during your lunch hour with time to spare for lunch.

**Re: HP35s announced ... lots of detail inside- no I/O**

*Message #19 Posted by [Donald Williams](#) on 13 July 2007, 3:34 p.m.,  
in response to message #18 by Egan Ford*

I guess I am just getting ahead of the curve again. I am complaining about backing up the 35s with pencil and paper and neither myself nor probably anyone else has done it yet. Might take the better part of the afternoon. Anyone for a long lunch break.

**Re: HP35s announced ... lots of detail inside- no I/O**

*Message #20 Posted by [Gene Wright](#) on 13 July 2007, 3:41 p.m.,

*Message #22 Posted by [Les Wright](#) on 12 July 2007, 8:25 p.m.,  
in response to message #1 by Gene Wright*

The use of 26 alpha labels as global labels and dynamically renumbered line-based GTO/XEQ within programs is not what I was hoping for (I really would've preferred the system in the 41 and 42S), but it is a hell of good compromise.

At first I thought 26 global labels weren't much for my purposes, but practically speaking I don't think I have anymore than a dozen or so user programs in my 41CX or 42S at any one time. Also, I am mindful that in the 33S my programming style gobbles up the local labels like crazy. Now, I can port those fast programs and use the line addressing.

Sounds like a real gem for only 60USD!!!

Les

### New HP35S - First FAQs

Message #1 Posted by [Giancarlo \(Italy\)](#) on 12 July 2007, 5:01 a.m.

Hi all.

You may find this post by Joe Horn interesting:

[14 HP 35s question & answers](#)

Seems like somebody has already got hands on it ;-)

Best regards.

Giancarlo

### Re: New HP35S - First FAQs

Message #2 Posted by [Walter B](#) on 12 July 2007, 5:27 a.m.,  
in response to message #1 by [Giancarlo \(Italy\)](#)

Buon giorno, Giancarlo,

that is really great news! Thanks a lot for finding and posting it here. This clarifies the storage register addressing. And it explains to some extent what's to be expected inside INTG. Does anybody know the menus already (and is allowed to share this knowledge)??

### Re: Greeting in one's original language (OT)

Message #3 Posted by [Giancarlo \(Italy\)](#) on 12 July 2007, 5:49 a.m.,  
in response to message #2 by [Walter B](#)

Guten Tag, Walter.

Your reply reminded me a comment I always had the intention to do but never did.

I find extremely polite and kind to try to greet someone else in his (her) own language, like you did.

It's a tiny effort (sometimes) that has, to me, a great meaning as far as politeness and good attitude goes.

Thanks to all who keep this "custom" alive.

Best regards.

Giancarlo

### Re: Greeting in one's original language (OT)

Message #4 Posted by [Valentin Albillo](#) on 12 July 2007, 7:12 a.m.,  
in response to message #3 by [Giancarlo \(Italy\)](#)

Hi, Giancarlo and Walter:

Walter is one of the very few people that goes that extra step in politeness. In a recent thread, his reply to a post of mine began with:

*"Buenas tardes, Valentin,"*

which is the correct Spanish salutation for the particular time, equivalent to "Buona sera" in

Italian, "Good afternoon" in English, "Bon soir" in French.

It's certainly much appreciated by us non-native English speakers, to be saluted in our own native languages. Kudos to Walter B ! :-)

Best regards from V.

### Re: New HP35S - First FAQs

Message #5 Posted by **Howard Owen** on 12 July 2007, 7:51 a.m.,  
in response to message #1 by Giancarlo (Italy)

Wow!

An unexpected reference to pre-41C programming rescues the 35s from the label poverty of the 33s! That is very cool.

Regards,  
Howard

### Re: New HP35S - First FAQs

Message #6 Posted by **Bill (Smithville, NJ)** on 12 July 2007, 8:43 a.m.,  
in response to message #5 by Howard Owen

Hi Howard,

I may be a little bit jaded. I never even held, let alone used, the HP-33, so I have very little to compare the new 35S to except for my trusted HP-42S. Maybe the features that Joe raves about in the FAQ are trully amazing when compared to the 33S, but really leaves me a little bit confused when I compare them to the 42S.

You wrote:

Quote:

rescues the 35s from the label poverty of the 33s! That is very cool

I must have missed something in the FAQ. In answer A4 the FAQ says:

Quote:

... However, each "program" (A through Z and the unlabeled one at the beginning of program memory) is artificially limited to a maximum of 999 steps each....

Not sure the "Label Poverty" has been corrected. I hope you're right, but... Looks like maximum of 27 programs could be in memory. Also only 26 labeled storage registers - actually only 24 if you want to use the indirect features of I and J.

Maybe you're referring to using the Program Label with the line number in the GTO statements for local flow control as helping with the "Label Proverty"?

Since it's fairly low cost, I'll probally pick one up when it comes out. But I don't think I'll be giving up my HP-42S any time soon.

But it is good to see that HP has gone back to the great keyboard.

Bill

**Re: New HP35S - First FAQs**

*Message #7 Posted by **Paul Brogger** on 12 July 2007, 9:00 a.m.,  
in response to message #6 by Bill (Smithville, NJ)*

Quote:

Not sure the "Label Poverty" has been corrected.

I'd say it has. With GTO and XEQ targets each specified by a line number (letter and three digits), available memory will provide the only practical limit to the number of separate "programs" that may be stored.

**Re: New HP35S - First FAQs**

*Message #8 Posted by **Patrick Rendulic** on 12 July 2007, 8:17 a.m.,  
in response to message #1 by Giancarlo (Italy)*

Regarding the [14 HP 35s questions & answers](#), the new calculator is indeed more than a copy of the 33s. It may be the missing replacement / upgrade of the 32sii, but it still does not reach the capabilities of the 41 / 42 series.

Anyway, the most important in my view is that the good old quality of the case and the keys (the "feeling") is back. It may be a good start for future calculators!

42siix, 50giix ... that would be wonderful ...

### Upcoming 35s question #2

Message #1 Posted by [Gene Wright](#) on 11 July 2007, 10:58 p.m.

The answer to question 1 was E. The early models did not have a lowered-ON key.

Question 2: In the spirit of guessing, how many full-precision real numbers can be stored in registers on the HP 35s?

No multiple choice this time.

### Re: Upcoming 35s question #2

Message #2 Posted by [Thomas Radtke](#) on 12 July 2007, 4:08 a.m.,  
in response to message #1 by Gene Wright

Let me say, as much as can be represented by floating point numbers within the limits of the machine :^).

(I was right on q#1, I can afford to fail this time :-)

*Edited: 12 July 2007, 7:19 a.m.*

### Re: Upcoming 35s question #2

Message #3 Posted by [Gene wright](#) on 12 July 2007, 9:26 a.m.,  
in response to message #2 by Thomas Radtke

Answer is well over 2400 floating point, full precision numbers.

### Re: Upcoming 35s question #2

Message #4 Posted by [Paul Dale](#) on 12 July 2007, 4:47 p.m.,  
in response to message #3 by Gene wright

That isn't exactly a precise answer to the question...

- Pauli

### Re: Upcoming 35s question #2

Message #5 Posted by [Gene Wright](#) on 12 July 2007, 5:24 p.m.,  
in response to message #4 by Paul Dale

Lol. Ok,

2514 is the actual, non-useful number.

$801 \times 3 + 26 \times 3 + 6 \times 3 + 5 \times 3$

which fills up all 801 indirect registers, all 26 lettered registers, all 6 stat registers (which have to be stored indirectly) and all 4 stack registers and lastx too.

Reality is that you can now have indirect registers 1 through 800 filled with 3-D vectors containing 3 full precision real numbers using the program supplied in the learning module.

That ought to do for now. :-)

**Re: Upcoming 35s question #2**

*Message #6 Posted by **Thomas Radtke** on 12 July 2007, 5:24 p.m.,  
in response to message #4 by Paul Dale*

Indeed, my answer was way better. You just have to read the question the right way ;-).

Message #3 Posted by [Seth Morabito](#) on 12 July 2007, 12:03 a.m.,  
in response to message #1 by y.miyata

"My God" is right. Those keys! They're positively HP-41-esque.

I still really don't understand "cm" vs. "KM", but I can live with a typo like that if the keys feel as good as they look.

HP, thank you for listening!

### Re: Hp35s photos (from Japan)

Message #4 Posted by [Maximilian Hohmann](#) on 12 July 2007, 2:33 a.m.,  
in response to message #3 by Seth Morabito

Hi!

Quote:

\_\_\_\_\_

I still really don't understand "cm" vs. "KM"...

\_\_\_\_\_

My guess is that they spelt "KM" and "MILE" in capitals to better distinguish "physically large" units from small ones like "in" and "cm". Ergonomics at work, so to say.

Greetings, Max

### Real Big Units

Message #5 Posted by **Walter B** on 12 July 2007, 3:00 a.m.,  
in response to message #4 by Maximilian Hohmann

: -))

So, after **mm** and **cm**, we shall write **KM** and **LIGHT YEARS**? Well, if this is the only way to convince USA to use SI units, one shall think about it ; -)

P.S.: I know the light year isn't SI, but it was the biggest unit at hand :-)

### Re: Hp35s photos (from Japan)

Message #6 Posted by **Olivier TREGER** on 12 July 2007, 3:50 a.m.,  
in response to message #3 by Seth Morabito

Quote:

"My God" is right. Those keys! They're positively HP-41-esque.

I rather see HP12C Platinum-like keys: Chinese manufacturing...

Although my 12CP is certainly 10 times faster than my good'ol 12C, there's no chance I drop the 12C in favor of the other one. Reason: the keys.

I'm afraid the 35s goes the same way.

### Re: Hp35s photos (from Japan)

Message #7 Posted by **Seth Morabito** on 12 July 2007, 12:33 a.m.,

**Upcoming 35s question #1**

Message #1 Posted by [Gene Wright](#) on 11 July 2007, 2:07 p.m.

In the spirit of guessing, which prominent, classical keyboard feature(s) does the HP 35s appear to bring back?

- A) Lowered ON key
- B) Raised keyboard frame
- C) BIG ENTER key
- D) Three of the above
- E) Two of the above
- F) One of the above

**Re: Upcoming 35s question #1**

Message #2 Posted by [Thomas Radtke](#) on 11 July 2007, 2:39 p.m.,  
in response to message #1 by Gene Wright

Since the classics had no on key but a switch, I figure the answer must be E)

: -)

**Re: Upcoming 35s question #1**

Message #3 Posted by [Howard Owen](#) on 11 July 2007, 2:55 p.m.,  
in response to message #1 by Gene Wright

I can't tell from the pictures whether or not the ON key is lowered with respect to the others. But I'm sure that the calculator includes a large ENTER key and a raised edge around the keyboard. The first is obvious from the photos, and the second is mentioned in the sales flyer.

So that would be two, or three of the above. 8)

Regards,  
Howard

**Re: Upcoming 35s question #1**

Message #4 Posted by [ECL](#) on 11 July 2007, 2:54 p.m.,  
in response to message #1 by Gene Wright

Well, feature 'A' is present on my 33s, 50g, and other recent machines, so that's out.

Features 'B' and 'C' are returning.

Thus, I say the answer is 'E'

ECL

### **Re: Upcoming 35s question #1**

*Message #5 Posted by [Paul Brogger](#) on 11 July 2007, 7:02 p.m.,  
in response to message #1 by Gene Wright*

If anyone has an active link to the picture of Cyrille deBrebisson's baby "using" an HP-35s, s/he may put to rest the 'Lowered ON key' question.

Assuming Gene is participating in a "Hype the 35s ahead of its imminent release" campaign (not that there's *anything* wrong with that, if he is), I suspect the answer is "D". (Why call attention to any negative aspects of the new calc, however insignificant?)

### **Re: Upcoming 35s question #1**

*Message #6 Posted by [ECL](#) on 11 July 2007, 10:14 p.m.,  
in response to message #5 by Paul Brogger*

If you interpret Gene's post strictly, a 'returning' feature would be one that has been absent in say the last three generations (or series) of HP calculators. (ie. the blue 49g, gold49g+, black 50g, 33s, 30s, etc.)

Even the 32sii, and 42s are "recent" in the eyes of some of our members...and both these machines had raised keyboard rims, large keys, and lowered ON keys.

Assuming you draw the datum plane at these machines, later machines have all been absent of the large ENTER key, and raised keyboard rim.

I rest on my first claim: only the raised rim and large ENTER key.

### HP35s's Parentheses

Message #1 Posted by [Walter B](#) on 11 July 2007, 3:18 a.m.

Hi, all,

Any idea why parentheses are placed so prominently on this "ultimate RPN" calc? Even 2 kinds of them! And we agreed so far there will not be a matrix functionality... :-?

Since it seems the keyboard will remain as seen first completely (i.e. with the blue shift arrow pointing up, and ">KM" instead of ">km"), it may be worth some speculation.

### Re: HP35s's Parentheses

Message #2 Posted by [DaveJ](#) on 11 July 2007, 4:07 a.m.,  
in response to message #1 by [Walter B](#)

Well, I guess an "Ultimate RPN calc" wouldn't have selectable algebraic mode now would it? ;-)

Once you decide to have algebraic mode, you gotta have a primary parentheses key.

Quote:

Yes, that Blue arrow key really bugs me. Someone left their brain out of gear on that one.

Dave.

Message #3 Posted by [Gene wright](#) on 11 July 2007, 8:12 a.m.,  
in response to message #2 by [DaveJ](#)

There is also equation mode to consider. Parentheses do figure rather prominently in a few equations.

These days, you probably can't have parentheses be a shifted function and be taken seriously as an ALG machine.

Who needs ALG users? HP does to sell enough units to make these goodies viable.

So be glad there are ALG users out there.

### Re: HP35s's Parentheses

It ain't just these days. Every ALG calculator bar a 4-banger needs parentheses as the primary keys, always has. Just as vital as say ROLL and SWAP on an RPN calc.

HP did the right thing in the case of the 35S, the parentheses key is good and it's in the right spot.

Dave.

### Re: HP35s's Parentheses

Message #5 Posted by **Walter B** on 11 July 2007, 9:34 a.m.,  
in response to message #2 by DaveJ

Hi Dave,

FYI: the "ultimate RPN" was a quote of HP's data sheet for the 35s :-)

### Re: HP35s's Parentheses

Message #6 Posted by **Paul Brogger** on 11 July 2007, 10:16 a.m.,  
in response to message #5 by Walter B

And, don't be surprised if "the Ultimate RPN Calculator" boots to ALG by default.

I wonder how many 33s' were returned to Wal-Mart because they "didn't work" when first turned on?

If they want the thing to be sold via a big-box retailer, they'll want it to default to ALG.

Quote:

... the blue shift arrow pointing up ...

That is quirky, but hey: they've returned to printing functions on the 2nd, angled faces of the keys! That's a MAJOR step forward (or backward, to where they used to be, or wherever . . . ) Too bad they didn't do that on the 50g.

Edited: 11 July 2007, 10:24 a.m.

**Re: HP35s's Parentheses**

Message #7 Posted by **Walter B** on 11 July 2007, 1:26 p.m.,  
in response to message #6 by Paul Brogger

Hi, Paul, I didn't complain, I just wonder ;-)

Anyway, you're right, printing on the angled faces of the keys is a major step (in any direction whatsoever) I welcome for sure. Nevertheless, I can imagine even nicer, cleaner arrangements still (see [here](#), for example).

**Re: HP35s's Parentheses**

Message #8 Posted by **Paul Brogger** on 11 July 2007, 2:19 p.m.,  
in response to message #7 by Walter B

Walter, I do hope H-P consults you if/when they design the layout of their next calculator. Leaving aside of alpha mode, graphical screen, and other major feature enhancements you've suggested, your choices for colors and placement of the keyboard legends have obvious merit.

(H-P: I suggest you immediately contract with "the Walter B. Design Bureau" and save yourselves much pointless distraction and diversion.)

**HP-97 Thermal Paper**

Message #1 Posted by [Kostas Kritsilas](#) on 11 July 2007, 12:51 a.m.

Hi,

I have just purchased a HP-97 from eBay (local seller), and I should be getting it within the next day or two. This brings up the question of paper for this calculator's printer section. Is there specific printer paper for this prenter still available from HP, or is there other printer paper that can be used? I remember seeing some old calculator printouts in blue, but don't remember if they were from an HP calculator, or from a TI-59 with its printer. Please let me know if anybody has found a solution to this.

Kostas

**Re: HP-97 Thermal Paper**

Message #2 Posted by [Patrick Rendulic](#) on 11 July 2007, 1:18 a.m.,  
in response to message #1 by Kostas Kritsilas

Any THERMAL print paper with the right width (57 mm or 2 1/4 inch) can be used. The newer the paper, the better the print quality.

I use paper from a local office supplier. I pay less than 1 EUR per roll.

**Re: HP-97 Thermal Paper**

Message #3 Posted by [Kostas Kritsilas](#) on 11 July 2007, 4:20 p.m.,  
in response to message #2 by Patrick Rendulic

Patrick:

Thanks for the response. Both Staples and Office Depot in Calgary carry 2 1/4" wide thermal paper. All I have to do now is figure out which length, which shouldn't be too difficult.

Kostas

**Re: HP-97 Thermal Paper**

Message #4 Posted by [Les Wright](#) on 11 July 2007, 5:22 p.m.,  
in response to message #3 by Kostas Kritsilas

I use the NCR paper, available at Staples in Toronto so it should be in Calgary too.

I buy the three pack of the big rolls and split each big roll into two little ones. I keep old plastic and cardboard cores for this purpose, but I suppose the demi-roll would work fine without a core.

Look for the black and white box. Price is about \$9CDN, so about \$1.50 plus tax per little roll.

Les

**Re: HP-97 Thermal Paper**

*Message #5 Posted by [Kostas Kritsilas](#) on 12 July 2007, 11:21 a.m.,  
in response to message #4 by Les Wright*

Les:

Thanks for the recommendation on the NCR paper. Do the long rolls not fit in the HP97 (I don't have mine yet, but should by the weekend)?

Kostas

**Re: HP-97 Thermal Paper**

*Message #6 Posted by [Les Wright](#) on 12 July 2007, 9:08 p.m.,  
in response to message #5 by Kostas Kritsilas*

I don't think the big rolls will fit. Believe me it really is no hassle at all to manually spool off half the roll onto a finger or spare plastic or cardboard spool.

Les

**Re: HP-97 Thermal Paper**

*Message #7 Posted by [Kostas Kritsilas](#) on 17 July 2007, 10:05 p.m.,  
in response to message #6 by Les Wright*

Hi,

Just wanted to confirm what Les said about the NCR paper; it works really well, and prints out nice and black. I ended up getting the 12 pack of 75' rolls, just to get things going. It came out to just under \$CAN15 at Office Depot. I'm sure the longer rolls that Les prefers would work just as well, and are a little cheaper, too. I'll keep the spindles from these rolls when the paper is used up, and go with the longer rolls at the next purchase.

Kostas

P.S. The HP 97 had a half used up roll of thermal paper in it when I got it, and it printed out blue instead of black. I would assume that this is the original HP paper. It printed out pretty unevenly, so I took it out. The NCR paper prints out black, but very evenly.

**Module conflict**

Message #1 Posted by [Geir Isene](#) on 10 July 2007, 7:01 p.m.

I must be missing something. Please shake my head to loosen a screw so that an answer may fall out.

My setup is a HP-41CX with NoV-32 with CCD-OSX in Page #C and Extended IO in Page #D. I have an AECrom in port 4 (Page #E and #F)

As long as I have the AECrom inserted, it behaves funny (locks up, hard to unlock and then flags are a mish-mash etc.). When I remove the AECrom, everything is fine.

Why? Can't see any XROM conflicts...

**Re: Module conflict**

Message #2 Posted by [Geir Isene](#) on 10 July 2007, 7:18 p.m.,  
in response to message #1 by [Geir Isene](#)

Head shaken and screw is loose: After testing the config with another CX, it seems the first calc has a faulty port 4. Oh well.

**Re: Module conflict**

Message #3 Posted by [Diego Diaz](#) on 11 July 2007, 5:31 a.m.,  
in response to message #2 by [Geir Isene](#)

Hi Geir,

Just to put it black on white: You've released me from a big load of headaches!!! Ha ha ha...

(Oh well... I know you knew that already... ;-)

Best wishes and keep enjoying your 41's

Diego

**RS-232 (Was: Module conflict)**

Message #4 Posted by [Geir Isene](#) on 11 July 2007, 6:59 a.m.,  
in response to message #3 by [Diego Diaz](#)

But the original problem was calc-agnostic ;)

It seems stable now with a fantastic module-combo:

CX w/NoV-32 (CCD OS/X & Extended I/O) + AECrom + double XM + HP-IL w/Video Interface, RS-232, 82162A printer in the loop. Now we are talking ;)

I only need the RS-232 to talk to my Linux laptop...

It seems to use a 25 pin parallell cable for serial communication. I have read something about a needed adapter to make it work. Anybody has any specifics?

**Re: RS-232 (Was: Module conflict)**

*Message #5 Posted by **Tony Duell** on 11 July 2007, 12:28 p.m.,  
in response to message #4 by Geir Isene*

I assume you're refering to the HP82164 HPIL-RS232 converter.

It has a standard 25 pin RS232 serial connector. For the record, the DB25 parallel printer connector and the DE9 serial connector are really PC-isms (the latter came in with the PC/AT). The RS232 standard specifies a DB25 connector.

There is a jumper block inside the interface that you can plug in either way round. One way, the interface has the pinout of a DTE (so will link directly to a modem), the other way it has the pinout of a DTE (so will link directly to a terminal or computer). But I find the only way to remain (in)sane while using it is to leave the jumper at the DTE position and wire up the external cable appropriately.

The problem with that interface is that HP seem to have read the RS232 standard, and nobody else did :-). Which means that if you want to use hardware flow control (and I strongly recomend it), you have to wire up a special adapter.

You can find the wirelist of the adapter and some linux-related software in the distribution mentioned on

[http://www.hpcc.org/datafile/hpil/lif\\_utils.html](http://www.hpcc.org/datafile/hpil/lif_utils.html)

### MLDL2000 Update

Message #1 Posted by [Meindert Kuipers](#) on 10 July 2007, 3:22 p.m.

I have made some improvements in M2kM, the user interface is a bit better, after input from users. Also the JTAG software for firmware updating is almost done. This was really complicated and is working perfectly now, I just want to make some improvements for making it really safe to work with.

When that is done there will be a new software release. Right now I have a business strip, vacation, and more business activities coming up. I expect to do the new release end August.

After the software release I will start on V2 of the MLDL2000, adding the USB Host interface and trying to get a prototype working. Details of the MLDL2000 V2 will be announced at the HCC Conference in San Diego, I am busy working on the paper, that will also serve as the specifications. If all goes well I will do a presentation (although I am not physically present) on the extra's in V2.

I have booked the weekend in London for the HPCC conference, where I want to do the same presentation, this time in person. I hope to see many of my friends there.

I wish a good summer to all of you!

Meindert

Yes, I'm curious to see what the exponent display is like.

HP have done some shockers in this area, like the 20S with it's large "E" which blends in very nicely with the other digits, you have to study the display closely to see if your answer has an exponent or not.

Dave.

## Exponent display

Message #7 Posted by **Karl Schneider** on 10 July 2007, 8:56 p.m.,  
in response to message #6 by DaveJ

Quote:

There's no reason to expect it to be different from the HP-33S display, with its individual dot-matrix characters.

As for the full-size "E" denoting a base-10 exponent on the HP-20S and HP-21S: With a uniform 12-digit 7-segment display, that was the only reasonable approach other than the one employed on all previous models, which was to right-justify the (two-digit) exponent on a 10-digit display.

"1.234567E-123" was deemed preferable to "1.234567 -123" or "1.2345678-123". Not all would agree.

The original HP-32S also used a full-size "E" and centered exponent sign, even though it had a more-versatile dot-matrix character display. Two small refinements were provided in the HP-32SII: A reduced-size "E", as well as a raised negative-exponent sign to distinguish it from a minus sign used in equations.

---

I certainly don't agree. It's Ok when you have a negative exponent like "1.234E-3" as the minus sign makes it stand out. But positive exponents just get buried like "1.234E5" (it's worse on the LCD screen), it's just awful, a really bad design decision IMHO. An underscore would have been much better, like "1.234\_5", or a small "L", or anything except "E"!

That, and the fact that there is no dedicated exponent key are my only two gripes with the 20S. All the same I currently use it as my daily calc at work.

Dave.

### **Exponent display: explanation & other methods**

*Message #9 Posted by **Karl Schneider** on 11 July 2007, 10:06 p.m.,  
in response to message #8 by DaveJ*

Quote:

An underscore would have been much better, like "1.234\_5", or a small "L", or anything except "E"!

---

I agree with you that "1.234E5" is not very legible on 7-segment displays; I preferred the original method (used on all 10-digit models) of one or more blank characters separating the mantissa and the exponent, with an exponent minus-sign occupying one of those separators.

Perhaps the intent for the Pioneer series was to utilize that generally-understood display method of Fortran, C, and other languages to represent exponentiated numbers using an "E". This was certainly reasonable for the mid-grade and high-end Pioneers featuring dot-matrix displays, so it was simpler to do the same for the low-end Pioneers (HP-10B, HP-20S, and HP-21S) with their 7-segment displays.

However, "1.234E5" is more legible in standard alphanumeric fonts than in 7-segment displays, due to curvature of the numerals. Also, a display utilizing spaces between a mantissa and exponent would be impractical for compiled code, because of difficulty in parsing.

Casio models typically display an exponent using two smaller, elevated digits at the far right of the display. This renders some of the display space unavailable, however.

Message #10 Posted by **ECL** on 11 July 2007, 10:22 p.m.,  
in response to message #9 by Karl Schneider

Dave commented on the problem with the 12.34E-5 convention for the case when the exponent is positive (12.34E5).

I'd suggest the simple (edited out: simply) and uniform solution would be to use this:

12.34E+5 for positive exp

12.34E-5 for negative exp

This is the convention followed in some engineering packages that I use/used.

ECL :)

-- KS

---

Yes "E" is a perfectly normal and excepted way to represent an exponent, no problems there. But it should never be used on a 7 segment display unless there is a space before the "E", but then you waste an extra digit.

I prefer the Casio displays, having the exponent as smaller raised digits. Very sensible and very obvious to look at a glance.

I do like the raised and centered "E" on the 42S though.

In fact I much prefer the fixed location of an exponent with the digits filling up right to left as on the Casios. I've always thought the left-to-right display which HP uses to be not as good. It means your attention is always darting back and forth around the screen which I find a tad more annoying.

Dave.

**Javascript RPN calculators?**

Message #1 Posted by [gene wright](#) on 9 July 2007, 11:56 p.m.

Hi all. Looking for Javascript (not Java) RPN calculators similar to the HP 35 javascript simulation on the simulation page of the museum.

Sadly, the simulation is a tad too big to fit into the screen of the device I'm using. (it has to fit in about 320x400 or so and it is about 80 pixels too tall).

Any ideas?

Gene (The device? An iPhone of course)

**Re: Javascript RPN calculators?**

Message #2 Posted by [Seth Morabito](#) on 10 July 2007, 1:34 a.m.,  
in response to message #1 by gene wright

You're in luck! A friend of mine has been working on exactly such a calculator for his iPhone.

<http://scicalc.belfry.com/>

It looks quite funky on non-iPhone devices, but I am led to understand that it looks pretty slick on the iPhone. Give it a whirl.

**Re: Javascript RPN calculators?**

in response to message #2 by Seth Morabito

That's perfect! Do you have his email or could you put me in contact with him? I'd love to stay in touch as he makes updates. :-)

Thanks!

Now, if only we had a new physical RPN calculator ...

in response to message #1 by gene wright

<http://xmission.com/~egan/35/calc.html>

Too small or too big?

### **Re: Javascript RPN calculators?**

*Message #5 Posted by [Gene wright](#) on 10 July 2007, 8:48 a.m.,  
in response to message #4 by Egan Ford*

That's the one I was using and it is just SLIGHTLY too big. Needs to be about 80 pixels smaller and it would be a wonderful widget for my iPhone.

### **Re: Javascript RPN calculators?**

*Message #6 Posted by [S. Martin](#) on 10 July 2007, 9:46 a.m.,  
in response to message #1 by gene wright*

Gene,

The current solution for app developers of the iPhone to use Web 2.0 technologies is IMO not adequate. I hope (and believe) that Apple will open the iPhone to developers at some point in the future, at which point we can natively port HP calculator emulators to the iPhone. A voyager series model would have a very good form factor (although a bit smaller) on the iPhone. I think a port of Eric Smiths Nonpareil HP 11C or 15C would be great. Especially since the back end engine could be taken as is and only the front-end would have to be re-written. I did toy with the idea of porting Nonpareil to javascript, but, there is the speed issue and the idea of having to launch the web browser to run the app is not very appealing.

Steve

### **Re: Javascript RPN calculators?**

*Message #7 Posted by [gene wright](#) on 10 July 2007, 10:53 a.m.,  
in response to message #6 by S. Martin*

Oh, I agree it isn't as easy to launch the web browser to run an app, but that's what is allowed at the moment.

Javascript is the game right now.

The RPN calc shown in an earlier response is really nice.

### Resources used by the HP-IL ISA card

Message #1 Posted by [PeterP](#) on 9 July 2007, 11:48 p.m.

Hi,

I have on of those famous cards from Christoph Klug to connect the HP-IL world with the PC. However, as my computer does not have an ISA port I was trying to find a way to use these cards with modern computers.

During my search I found the following company [Arstech](#) that provides ISA-TO-USB adapters. They provide the adapter, if necessary power-modules for the adapters and the software to redirect the resources from the ISA card expects to the USB and back.

I have not gotten it to work (especially as they have forgotten to send me the Software) yet from studying their descriptions [here](#) and [here](#) it is apparent that I will need a few bits and pieces of information. My hope was that someone can help me out:

- 1) Power and voltage need: from the description and looking at the pins that are used in the ISA-HP-IL card, it seems that the card does need 12V as well as the usual 5V. Is that correct?
- 2) The simple power-modul will supply 5V and 12V current up to 50 mA I believe. Question: Is that enough for the card or does the card need more?
- 3) what base port(s) is the card using?
- 4) what IRQ does it need?

I do not have an ISA computer where I could plug the card in and then simply look it up in the device manager, yet I hope that someone might know the answers or does have the card installed in an ISA computer and be willing to look it up for me.

Last but not least for Christop, Diego, Tony and the other HP-IL engeneers, it might be worth while looking at the company and their product, as they also offer a SDK for their card. IF we can get this to work, it might make the connection of HP-IL stuff via Christoph's card with modern computers much easier/possible. Their SDK is described [here](#)

Thanks a lot in advance

Cheers

Peter

### Re: Resources used by the HP-IL ISA card

Message #2 Posted by [Egan Ford](#) on 10 July 2007, 2:07 a.m.,  
in response to message #1 by [PeterP](#)

I have a 82973A, it is 5V only (no 12V required). Base I/O port can be configured with dip switches (default is 1700). I have not seen the Klug Card. If the card is exactly the same as the 82973A, read the 82973A docs for the I/O settings. There is no IRQ.

**NiMH batteries for HP-41 and 71**

Message #1 Posted by [PeterP](#) on 9 July 2007, 7:47 p.m.

Hi, just a quick info for those using the actual machines at least aside the fantastic EMUxx et al versions:

I found a good source for n-cell NiMH batteries PLUS a charger. The nice benefit is that the charger is for AAA cells (the one the 71b likes) and with a little space charges the N-cell batteries. Only problem - it is in the US and I do not know if the company has any EU or UK thing to sell.

Here is the link to the [charger and batteries](#)

Scroll down about halve way and you will see it: the part number for the charger is P/N 850-0047 and the part number for the batteries is P/N 850-0049 (4-Pack).

Additionally, the company is super responsive and fantastic with Customer Care!

Cheers

Peter

**Re: NiMH batteries for HP-41 and 71**

Message #2 Posted by [db \(martinez, ca.\)](#) on 9 July 2007, 11:58 p.m.,  
in response to message #1 by PeterP

that's a great find. sooner or later the n cell is going the way of the dinosaur. i have nicads and a charger but your find will probably kept a lot of 41s (and those gameboy thingers) on the job.

**Re: NiMH batteries for HP-41 and 71**

Message #3 Posted by [Les Wright](#) on 10 July 2007, 12:10 a.m.,  
in response to message #1 by PeterP

Wow!

I have been interested for a long time in rechargeables for the 41 calcs, and have never known the NiMHs even exist.

This seems like a great solution. I think one would need two sets, though, one set charged all the time. I believe the last bit of juice in an NiMH drops off fairly quick and you would want to pop in a fresh set ASAP to preserve constant memory while rejuicing the other set.

Les

**Re: NiMH batteries for HP-41 and 71**

Message #4 Posted by [Garth Wilson](#) on 10 July 2007, 2:05 a.m.,

*in response to message #1 by PeterP*

NiMH batteries are 1.2V each, the voltage at which my HP-41 says the batteries are low. New alkalines are about 1.6V, and a set lasts me a couple of years.

### **Re: NiMH bateries for HP-41 and 71**

*Message #5 Posted by **Les Wright** on 10 July 2007, 10:39 a.m.,  
in response to message #4 by Garth Wilson*

Thanks Garth,

I have found a Canadian distributor close to where I work, and was all set to spend CDN32 for the charger and CDN17 for 4 packs of the cells, plus taxes.

Alkalines last me about a year, but that is with pretty regular card reader use.

I have also found that when the low battery icon is in the display there is no way the card reader will function properly. Moreover, Randy Sloyer recommends changing the alkalines annually whether they are low yet or not.

The bottom line about the mimio N cells--I think I will hold off.

That said, I continue to be a strong advocate for using NiMHs in the 49G+ (and presumably the 50G when I get one). I have been thoroughly delighted with the performance of my formerly little used 49G+ since I got rechargeables for it. I was reluctant to use it much before since it consumed alkalines like mad. Now, the gold paint is beginning to wear off, I use it so much!

Les

### **Re: NiMH bateries for HP-41 and 71**

*Message #6 Posted by **PeterP** on 10 July 2007, 6:37 p.m.,  
in response to message #4 by Garth Wilson*

makes sense. Just FYI, I used those NiMH in my 41 with Cardreader with no problem. And it just 'feels' better for me to use rechargeable batteries.

### **Re: NiMH bateries for HP-41 and 71**

*Message #7 Posted by **Randy** on 10 July 2007, 8:54 p.m.,  
in response to message #4 by Garth Wilson*

Garth said:

Quote:

\_\_\_\_\_  
NiMH batteries are 1.2V each, the voltage at which my HP-41 says the batteries are low  
\_\_\_\_\_

True, NiMH cells are nominally stated as 1.2 volts. But, that's somewhat misleading as most NiMH cells reach 1.4 volts when fully charged. Referring to the 41 documentation, HP has this to say about the supply voltage:

*2-38: The power supply circuit monitors the input voltage level by comparing it to a reference voltage generated internally. A differential amplifier in the IC senses whether the voltage has fallen below 4.2V at*

*the IC, and if so, it grounds the LLD line connected to the CPU.*

4.2V distributed over the four cells would mean that the low battery indicator turns on at 1.05 volts per cell, well above the nominal 1.2 volt level of NiMH cells. But, it has been my experience that the 4.2V level in practice is a bit low as I see units turning on the BATT indicator at 4.4 and 4.5 volts which works out to ~1.12 volts per cell. All things considered, it's still well below the 1.2 volt level of a NiMH cell.

So, that works for me... and yes, I use both NiCD and NiMH N cells to test 41's. Even when buying case lots of alkaline N cells, those little monsters are still quite expensive.

### **Re: NiMH bateries for HP-41 and 71**

*Message #8 Posted by [Les Wright](#) on 10 July 2007, 9:40 p.m.,  
in response to message #7 by Randy*

Thanks Randy, I will reconsider then.

The only drawback is this could turn into a slightly more expensive proposition--the supplier in Mississauga is not going to wave his shipping charge, even though he is about 10 minutes from where I work, since he has to order the stuff from the US anyway!

Still, two sets of NiMH cells, the charger, and 15CDN shipping cost still works out to less that what some people are willing to pay to obtain and refurbish the original NiCad pacs for the 41 series.

I wonder if there is any way to fashion little conductive spring loaded sleeves for the little suckers so thay fit in NiMH chargers that accomodate AA and AAA cells? I really like the NiMH quick charger I use for the AAAs in my 49G+

Les

### **Re: NiMH bateries for HP-41 and 71**

*Message #9 Posted by [Randy](#) on 10 July 2007, 9:59 p.m.,  
in response to message #8 by Les Wright*

Quote:

\_\_\_\_\_

I really like the NiMH quick charger I use for the AAAs in my 49G+

\_\_\_\_\_

While it may be fine, the charge rate might be higher than what is required for the N cells. Most AAA's are around 850 mah, the N's are typically 400mah. If possible, compare the charger output with the cell charge rates - which are usually 1/10 the cell mah ratings. Quick charge rates can be as high as 1/rating.

Quote:

\_\_\_\_\_

I wonder if there is any way to fashion little conductive spring loaded sleeves for the little suckers so thay fit in NiMH chargers that accomodate AA and AAA cells?

\_\_\_\_\_

The springs are usually present in the charger, if so, all that is required is a conductive spacer. I cut wooden dowels to the required length that I stuck copper foil across. Crude but it works.

**Re: NiMH bateries for HP-41 and 71**

*Message #10 Posted by [Dave Shaffer \(Arizona\)](#) on 11 July 2007, 10:31 a.m.,  
in response to message #9 by Randy*

"I cut wooden dowels to the required length that I stuck copper foil across. Crude but it works."

Slightly less crude perhaps: what about making your spacer out of conductive material itself - a piece of copper or aluminum rod?

**Re: NiMH bateries for HP-41 and 71**

*Message #11 Posted by [Les Wright](#) on 11 July 2007, 10:57 a.m.,  
in response to message #1 by PeterP*

I really wish that mimio sold directly outside of the US.

I am finding that the supposed mimio authorized resellers in Canada offer at best a partial list of mimio products and their pricing is all over the place.

I am really keen on the 12-pack, which seems unavailable here.

Peter, at the risk of opening the floodgates to similar requests, if you place an order to mimio on the future and wanted to add a 12-pack of cells to the order to forward to me for fair price, I wouldn't say no :)

Les

**Re: NiMH bateries for HP-41 and 71**

*Message #12 Posted by [PeterP](#) on 11 July 2007, 6:47 p.m.,  
in response to message #11 by Les Wright*

:-)

I think it might be worth while to consider the following, as I have already all the cells and chargers I need (i ordered the 12-pack and a charger and they were so kind to send me two of the n-cell inlets to use their AAA charger for the N-cells, so I'm all set...)

Lets see if there is a greater interest outside of the US for those Nimh cells from Mimio. If so, I could make a bulk order and then ship the things to Canada. If there is interest, we can figure out the total shipping cost etc. However, I wonder if it would not be possible to send an email to them in the US and ask to buy those things in Canada. All people I contacted at Mimio have been outstandingly helpful (probably one my top 3 customer service experiences in my life). They might be willing to do something (I can provide my contact person if there is interest, just send me an email through here with MIMIO in the subject line)

Anyway, if there is some interest, I'd be certainly happy to be the conduit.

Cheers

Peter

### Battery Doors for Classic Series

Message #1 Posted by [Kostas Kritsilas](#) on 9 July 2007, 3:38 p.m.

Hi,

I'm new here, and I have checked the forum archives, but haven't yet been able to find an answer. I would like to know if the battery doors/covers for all of the Classic series units (HP35, HP45, HP65, HP55, and HP67 (not sure the HP67 is Classic series)) are all the same, or if the doors are specific to each model.

Kostas

### Re: Battery Doors for Classic Series

Message #2 Posted by [Gerson W. Barbosa](#) on 9 July 2007, 5:12 p.m.,  
in response to message #1 by [Kostas Kritsilas](#)

Kostas,

I have one HP-35, one HP-45 and one HP-67. The battery covers in the first two are exactly the same. I would guess they would fit in the HP-55 too. The HP-67, which does not belong in the Classic Series, appears to share the HP-65 battery cover.

Regards,

Gerson.

**Re: Battery Doors for Classic Series**

Message #3 Posted by **Walter B** on 9 July 2007, 5:17 p.m.,  
in response to message #1 by Kostas Kritsilas

Kalispera sou, Kostas,

there are 2 types of battery doors: 1 for 35, 45 (55, 70, 80?) - another one for 65 and 67.

(Just found Gerson did type faster than me. Parabems, Gerson!)

**Re: Battery Doors for Classic Series**

Message #4 Posted by **Dan W** on 9 July 2007, 11:06 p.m.,  
in response to message #3 by Walter B

I concur mostly. The door for the 35, 45, 80 are the same. The door for the 55 is the same except an olive drab color. The 70 is the same except an almond color. And the 65 and 67 are the same.

-- Dan

**Re: Battery Doors for Classic Series**

Message #5 Posted by **Kostas Kritsilas** on 9 July 2007, 11:45 p.m.,  
in response to message #4 by Dan W

Gerson, Walter, and Dan:

Thanks for clearing that up, doesn't really seem to be readily available anywhere I have been able to look. I remember a friend having an HP67, and another friend with an HP55, but didn't notice a difference in the battery door latches (horizontal on the classics, vertical on the HP65/67). Although I always wanted a HP, I ended up with a TI-58, but later moved onto a HP-15. I just recently started getting back into the older (i.e. non graphing) HP calculators, and have a particular affection for the classic models.

### Simpson's Rule on HP17b/19b/200LX anyone?

Message #1 Posted by [Peter A. Gebhardt](#) on 9 July 2007, 11:07 a.m.

Does anyone have available a routine which allows to integrate functions with Simpson's Rule (or even Romberg's algorithm ...) on one of the Solver-equipped calculator series (and it's newer siblings) above?

Hints for implementation or code snippets would be welcome!

Reason: To enter the function in question only once - as demonstrated in Ed Keefe's articles on Palmtree Papers, where he used an implementation of the Trapezoid Rule.

TIA.

Best regards

Peter A. Gebhardt

PS: <http://www.technoir.org/hplx/hplx-1/>

couldn't be reached - temporarily shutdown or gone forever ???

Any mirrors / backups available?

Peter,

If you have the HPMuseum DVD or CD's, then check out pages 36 thru 41 of the "HP-27S and HP-19B Technical Applications Step-by-Step Solutions" book.

It's a Solver example of Numerical Integration using Simpson's Rule.

This should also be usable for the HP-200LX and the HP-17BII.

Bill

## Re: Simpson's Rule on HP17b/19b/200LX anyone?

Message #4 Posted by **Peter A. Gebhardt** on 9 July 2007, 5:51 p.m.,  
in response to message #3 by Bill (Smithville, NJ)

Thx. a lot Bill!

I've already ordered the DVD from Dave today.

What bothers me conc. the implementation on the Solver is, how to get rid of the nuisance to enter the function several times (as demonstrated by  $y(0)$ ,  $y(i)$  and  $y(n)$  in the following code snippet:

Quote:

```
h = (xn - x0) / n
Integral = y(0)
For i = 1 To n - 1
  If i Mod 2 = 0 Then
    Integral = Integral + 2 * y(i)
  Else
    Integral = Integral + 4 * y(i)
  End If
Next
Integral = Integral + y(n)
```

An additional requirement:

Either achieving minimal error for a given number of function evaluations and/or computing an approximation having a given error bound, at minimal cost.

Best regards

Peter A. Gebhardt

PS: @Bill Platt, thank you too, for reminding me to express the problem in a way better to understand ;-)

*Edited: 9 July 2007, 5:58 p.m.*

## Re: Simpson's Rule on HP17b/19b/200LX anyone?

Message #5 Posted by **Bill (Smithville, NJ)** on 9 July 2007, 7:44 p.m.,

Hi Peter,

Quote:

I've already ordered the DVD from Dave today.

Great - be sure to set aside some time (a lot of time) for perusing them. They are a great resource.

Quote:

how to get rid of the nuisance to enter the function several times

The secret is to use the SUM function to loop. When you get the DVD and look at the Technical Applications Book, it'll all become clear (or, in my case, a little less murky). Using the Sum let's you enter the function only one time.

The Technical Applications book is a Must Read for anyone wanting to make good use of the Solver. It has a

great section on the Let and Get functions that I haven't found in any other reference book.

Bill

**Re: Simpson's Rule on HP17b/19b/200LX anyone?**

Message #6 Posted by **Peter A. Gebhardt** on 10 July 2007, 7:27 p.m.,  
in response to message #1 by Peter A. Gebhardt

Current status - I have a working solution, BUT:

The implementation of an algorithm (as an example this one here)

[http://www.damtp.cam.ac.uk/lab/people/sd/lectures/nummeth98/integration.htm#E\\_Example\\_of\\_numerical\\_integration](http://www.damtp.cam.ac.uk/lab/people/sd/lectures/nummeth98/integration.htm#E_Example_of_numerical_integration)

does work reliably only with  $N ==$  powers of 2. Using other multiples of 2 shows an oscillating behaviour of the results dampening out with increasing  $N$ . (clearly visible thanks to the PLOT function of the HPCALC Solver!)

Excuse me for asking for help still - I suppose that this is an effect of the used algorithm (the integration) as such - are there any enhancements, I should/can add?

It's about 40 years since I was used to calculus, so pls. could you point me to some information where I can find useful info targetted to the 200LX Solver capabilities. For example, solutions using arrays for intermediate storage are a no-no, because of the read-only characteristics of the .STA lists.

TIA

Peter A. Gebhardt

**Re: Simpson's Rule on HP17b/19b/200LX anyone?**

Message #7 Posted by **Bill (Smithville, NJ)** on 10 July 2007, 8:39 p.m.,  
in response to message #6 by Peter A. Gebhardt

Peter,

You might want to try MERCURY from the HP200LX SUPER Site. It's supposed to be a replacement for Borlands Eureka's program and can be run on the HP-200LX. It does Integration as well as many other equations. You can find it here:

[Mercury](#)

Bill

**Re: Simpson's Rule on HP17b/19b/200LX anyone?**

Message #8 Posted by **Peter A. Gebhardt** on 10 July 2007, 9:00 p.m.,  
in response to message #7 by Bill (Smithville, NJ)

Bill,

Thx. again for your help offered. Because of the advisory process I use, I can't leave the Solver (data has to be used with other equations later on), so your advice is very welcome, but not what I'm looking for.

As an example, part of my work requires solving an Exponential Reciprocal Gamma Function, where part of the function is the Integral over  $x^{(\alpha-1)} \cdot \exp(-x/\beta) dx$  (for what I'm wanting to implement the algorithm).

So I'm still looking for a solution which I can "integrate" (no pun intended!) into the Solver environment.

Best regards

Peter A. Gebhardt

**Re: Simpson's Rule on HP17b/19b/200LX anyone?**

Message #9 Posted by **Bill (Smithville, NJ)** on 11 July 2007, 1:02 p.m.,  
in response to message #8 by Peter A. Gebhardt

Peter,

I went through my set of The HP Palmtop Paper On Disk and found the following Solver Equation:

Integral  
!CALC Num'cal Integration from TECH APP booklet E.G. Set  
A=-1,B=1,X=1 N=20 and find the area of a circle(I)!

```
I=L( H:(A-B)/(-2*N))/3*
  SIGMA(R,
    0,
    2*N,
    1,
    0*L(X,A+R*G(H))+(SGN(R)+SGN(2*N-R)+2*MOD(R,2))*
    (! function goes on next line(s) !
    ! e.g. area under a line (right triangle)!
    ! X !
    (2*SQRT(1-X^2))
    !area in top and bottom of circle! )
  )
```

This is based on the one in the Tech App Guide.

You can just replace (2\*SQRT(1-X^2)) with your F(X).

Note that N=20 means 40 iterations.

Have Fun.

Bill

### Manual for HP-41 FORECAST I

Message #1 Posted by [Geir Isene](#) on 9 July 2007, 4:15 a.m.

Anybody has a manual for the module?

The programs are private, so reverse engineering what each does could prove to be a daunting task (or is there a way to unlock a private module?).

A funny thing about the module is that it is divided in two parts - one is the market forecaster (Cat 1 \*FORECAST), the other is an astronomy part (\*ASTRO)...

### Re: Manual for HP-41 FORECAST I

Message #2 Posted by [Meindert Kuipers](#) on 9 July 2007, 4:26 a.m.,  
in response to message #1 by Geir Isene

With the disassembler in the latest version of the MLDL2000 Manager (also works without an MLDL2000 connected) you will be able to list the user code. Of course you need to have the .ROM file of the module ....

... and I'm eagerly awaiting a MLDL2000 - when can I buy one?

### Re: Manual for HP-41 FORECAST I

Message #4 Posted by [Meindert Kuipers](#) on 9 July 2007, 1:38 p.m.,  
in response to message #3 by Geir Isene

Just a bit more patience. I am finishing a new release of the M2kM software, and after that I have my hands free (as far as my spare time allows) to work on the proto of the new MLDL2000. When that is running I will finish the design and start production. If you plan to give yourself a Christmas gift this year .....

*Message #7 Posted by [Ronald P](#) on 9 July 2007, 4:52 p.m.,  
in response to message #1 by Geir Isene*

Hello,

Are the programs normal usercode with the privat flag set?. In that case removing the flag with some synthetics tricks is easy to do. If it is however M-code than this is not applicable and you need to use the disassembler from the various projects like MLDL2000 etc.

Ronald

### comparing early flex circuit vs late rigid circuit series30 calculators

Message #1 Posted by [Which Dr.](#) on 7 July 2007, 10:47 p.m.

Hello, I am new at this HP calculator world. Here is my first question: can anyone tell me how to tell which version of the HP-38C series I have without taking off the back cover and cking? i.e is it the early (flex circuit) or late (rigid circuit) series 30 calculator that I have?

Perhaps you can you tell by the serial number if it is an early version or not?

Thanks in advance for any info!

### Re: comparing early flex circuit vs late rigid circuit series30 calculators

Message #2 Posted by [Hal Bitton in Boise](#) on 8 July 2007, 9:56 a.m.,  
in response to message #1 by [Which Dr.](#)

Hello,

The earlier flex PCB 30 series machines had 2 distinct characteristics:

1. They were rather heavy, as they had a steel plate inside to back up the flexible circuit boards.
2. The key detents were VERY firm with long travel (they used plastic snap domes).

One more thing

Because the flex circuit board machines were solderless, they were prone to having display segments blank out occasionally (a little twist on the housing usually brings them back).

Hope this helps.

Best regards, Hal

Message #3 Posted by [Etienne Victoria](#) on 8 July 2007, 10:31 a.m.,  
in response to message #1 by [Which Dr.](#)

Hello,

If weight=220 g or 7,76 oz => early version with pressed components.

If weight <= 220g => latest version with soldered components.

Best regards

Etienne

That's something I'm interseted in as well. If I find any, I'll let you know.

### **Re: welding tabs onto lithium batteries in san jose**

Message #3 Posted by [Anthony L. Mach](#) on 8 July 2007, 7:12 p.m.,  
in response to message #1 by [db \(martinez, ca.\)](#)

Hi all,

I had heard rumors that Batteries Plus was the place to go to get this done. They do the spot welding in-shop. Of course, finding one near you might be tough.

Question: Are you working with larger cells or coin cells? In the latter, I would try Mouser for pre-tabbed cells. Soldering them is just too risky!

Have fun!

Tony

### HP 50g stack control

Message #1 Posted by [rocco lagioia \(Italy\)](#) on 7 July 2007, 2:35 p.m.

ok....i had to write this again after i read the "term of use". Let's say that I was not too polite with the HP engineers!!!

I have been using the 28S for 20 years. I loved it. Unfortunately does not work any more. Two weeks ago I bought the 50g. I shall use british understatement: "it's not my favorite calculator" !!! Bulcky, heavy, big....

But what is even worst it seems I have to press 4 or 5 keys to manage to pick a number from the stack.

Is there any way to put the stack control commands in the function keys? This was normal with the 28S.

Anyone can help me? thanks

### Re: HP 50g stack control

Message #2 Posted by [Gerson W. Barbosa](#) on 7 July 2007, 4:18 p.m.,  
in response to message #1 by [rocco lagioia \(Italy\)](#)

Quote:

Just set flag -117:

-117 SF

or

[MODE] [FLAGS] then check 117 to change from *CHOOSE boxes* to *Soft MENU*. Then [Left Shift] [PRG] [STACK]

HTH,

Gerson.

*Edited: 7 July 2007, 4:21 p.m.*

### Re: HP 50g stack control

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 7 July 2007, 10:58 p.m.,  
in response to message #1 by [rocco lagioia \(Italy\)](#)

Quote:

Is there any way to put the stack control commands in the function keys? This was normal with the 28S.

---

???

Well, it's "normal" with the 50g too. LeftShift PRG followed by the STACK menu key give you a menu of the stack commands. Other than that, with the standard "stack display" (no "special environment" active), pressing the CursorUp key invokes an "interactive stack" environment, and even while in a "special environment", pressing the HIST key invokes an "interactive stack" environment.

As Gerson noted, you'll probably be more comfortable with flag -117 set, for "Soft MENU" instead of the default "CHOOSE boxes".

Of course, this applies to "RPN" mode; I wouldn't know about "ALG" mode.

Regards,  
James

---

### **Re: HP 50g stack control**

*Message #4 Posted by [Matthew W. Milligan](#) on 8 July 2007, 7:20 a.m.,  
in response to message #1 by [rocco lagioia](#) (Italy)*

I frequently use the PICK function to grab numbers from the stack. My solution is to use a CUSTOM menu that has my most used commands - one of which is PICK.

To create a custom menu you save a list of commands and/or functions with the name CST. Then left-shift MODE turns this list into your active soft menu for use with function keys.

### Letter to the Editor of Datafile

Message #1 Posted by [Eric Smith](#) on 7 July 2007, 5:22 a.m.

The following is a copy of a letter I just emailed to the editor of Datafile, the HPCC club journal:

It has been reported that an HPCC member has criticized the arrangement whereby Valentin Albillo (#1075) was given a free membership in exchange for the many articles he has written. As a result, that free membership has been eliminated.

Both Valentin and the member making the complaint have contributed dozens of articles to Datafile over the years. Rather than asking for Valentin's free membership to be revoked, perhaps a request for a similar deal could have been made. Even if that were not possible, it would have been more constructive to try to propose other possibilities, such as getting other members to contribute the membership fee.

I would like to see more articles from Valentin (and from the member who made the complaint, for that matter). I don't have any idea what Valentin's financial situation is. I have been unemployed for the last three months, and consequently am not exactly awash in loose cash. However, I have just sent £28 to the secretary to pay for a one year membership for Valentin, in the hope that he will continue to contribute articles.

Eric Smith #1028

### Re: Letter to the Editor of Datafile

Message #2 Posted by [Steve Borowsky](#) on 7 July 2007, 6:14 a.m.,  
in response to message #1 by Eric Smith

Geez, that's pathetic.

### Re: Letter to the Editor of Datafile

Message #3 Posted by [Howard Owen](#) on 7 July 2007, 1:42 p.m.,  
in response to message #1 by Eric Smith

Good going, Eric!

I hope the HPCC and Valentin can come to terms that will allow his continued contributions to Datafile. There are few authors whose articles I enjoy more. It would be a major loss to the community if this situation were the final state of affairs.

Regards,  
Howard

### [OT] Some pertinent explanations [LONG]

Message #4 Posted by [Valentin Albillo](#) on 7 July 2007, 2:49 p.m.,  
in response to message #1 by Eric Smith

Hi, Eric:

First of all, thank you *very* much for your interest in my HP-calc-related 'productions' and your kind support, which goes so far above and beyond 'the call of duty' that where other interested people just lurk in silence, in your case goes as far as to write a sympathetic letter to Datafile's editor, make it public here, and spend £28 of your hard-earned money in order to pay a subscription for me.

This leaves me with a bittersweet feeling. On one hand, I really *do appreciate* your extreme willingness to try and help.

On the other hand, I'm *saddened* by your taking the initiative to try and pay for a subscription for me without first getting in contact with me so that I would tell you the details of the initial arrangement and of the present controversy. This would have saved you from sending the money in the first place, because *this is not a matter of money*, at all. This being so, I expect that Datafile's Secretary will return you money uncashed, as I won't accept a membership for me at anyone's personal expense no matter how much I'm obliged by your gesture. So, I'll immediately contact Mr. Secretary and Mr. Editor via e-mail, formally asking for the money to be returned to you and to do likewise should other such attempts be made.

This said, and as I very much appreciate the kind and continuous support of my HP-related activities that many HPCC members and MoHP frequent visitors have demonstrated in the past, I think all of you deserve to be given a complete picture of the situation as I see it, which will be necessarily long but completely to the point, except I won't name names nor will I attempt to guess underlying personal motivations, let's everyone make their own minds on this. Here we go:

About my *commitment* to regularly provide articles and the 'membership offered in return', some people really have taken this arrangement so much at heart that it seems they won't stop at *anything* to see it *undone*. Initially they simply *anonymously* posted frequent public criticism in a most *unpolite* way each and every time I tried to promote Datafile or post about some new articles published there. It was really *unfair* to me and certainly attempted to *sabotage* my well-meant efforts to promote Datafile, but they were anonymous 'trolls' and that was it, nothing for me to do except stand it as well as I could.

Then the offensive scaled up one bit when I was told that some HPCC members had *violently opposed* this arrangement at public HPCC meetings, and some of them even went as far as to oppose in written form, by sending letters to the Chairman. This resulted in the topic being voted upon, and the majority decided to keep it as it was. It was even debated at some AGM, with the same result. That should have ended it all.

However, I was greatly surprised when one of my latest Datafile promotional posts at the MoHP was suddenly attacked *in the very same style and nearly the very same words* by some person which, far from being anonymous, is one of the most well-known HPCC members and further, *he's a member of the Committee* !

Thus we have the strange and unprecedented case of a member of the HPCC Committee who publicly *doesn't abide* by the very Committee's decisions and arrangements, and feels free to *ignore* their democratically voted decision and continue to publicly and unpolitely harass some other member who is just trying to help, and further, utterly sabotage his Datafile promotion attempts.

This, of course, was the last straw as far as my patience was concerned, so I formally requested an official, public statement by the Committee endorsing our agreement and supporting me against the unfair detractors. The Committee discussed the matter and the results were that they would do *\*nothing\**. They would *\*not\** reprimand the offending members, despite they unfairly attacking a fellow member and sabotaging his efforts to promote Datafile and despite they not abiding by an

official Committee agreement, and they would also post or publish *\*nothing\** in my support, not even simply just saying that it was true that we had an official, voted, approved arrangement and I was properly fulfilling my part of it. They would do *\*nothing\** of the sort, of any sort.

I was profoundly disappointed to realize that I had no support at all from an organization to which I had contributed so much (more than 30% of each issue on the average for a number of years), not even from some of the people who should be most grateful for it, and I certainly wouldn't *suffer* being treated like that, so I withdrew from the agreement and called it null, stopping my contributions to Datafile as a result.

How came this arrangement to be in the first place ? Well, it's quite simple. I've been a member of HPCC for *seven* years, and three years ago I saw that the club was heading *extinction*. It was losing membership at an alarming rate (already under 100), and besides the contents of Datafile were extremely poor, IMHO, with small 24-page issues which did only cover RPL models and scarcely at that, to the point where Palm coverage was attempted as well, in an effort to have something to fill those meager 24 pages with.

Seeing this, I decided this kind of contents were not of my interest, and further decided to *cancel my subscription*, as many of my friends had already done, because I didn't want to pay for those uninteresting contents that I wouldn't even read.

However, this saddened to me no end, as HPCC was practically all that was left of the golden PPC times, and I was very sore of seeing it go to extinction too. So I came up with the idea that the best way to help wasn't keeping an unwanted subscription for some unwanted materials, Datafile would decline all the same, but rather *contribute by developing, writing, and submitting good-quality articles for publication*, which would provide both quantity and quality, the kind of articles I loved to read back in PPC times, *the kind of articles I would love to read now*.

However, these articles of mine would be precisely the only ones who would interest me among all of the contents, the rest being uninteresting to me, and I would certainly not pay a subscription just to read an exact facsimile of my own articles (!), so I thus intended to cancel my subscription at once all the same. But this brings the problem that I certainly need to see how my articles appear in print, because a number of times errors do crept in during the editorial process, and I would have to warn Mr. Editor about them (formatting and such were the most common).

In order for me to be able to see the printed article, it would be utterly necessary for me to be sent a *printed copy of the relevant issue*. But I certainly didn't want to pay for it: after taking the considerable trouble, effort, and time to write 10-16 page quality articles, having to pay to get to see them in printed form would be like we in Spain say, "*hacer de p\*ta y poner la cama*", which roughly translates as one acting as a prostitute for free and, on top of having to perform that arguably disgusting activity, having to pay to do it. This obviously wasn't acceptable to me, so I contacted Mr. Editor and made him a proposal, namely I would *commit* to send *long, quality* articles on a *regular* basis, and I would get a free printed copy of each issue featuring one of my articles, for checking and reference purposes.

He thought it was a very good idea, which would alleviate a whole lot his continual, cronic *need* to try and get articles from whatever sources he could, thus making his already hectic editorial life much more pleasant to bear. He consulted the proposal with the Committee, which also agreed, and considered the arrangement as a "free subscription" in exchange for articles. Most probably, wording the arrangement that way was what prompted some people to *violently* oppose to it, on the basis that other people submitting articles weren't expected to receive any "payment" at all.

The truth, in a nutshell, is that I was about to end my subscription to Datafile in any case: I wasn't going to pay to read uninteresting (to me) contents, nor would I pay just to read my *\*own\** articles, so they would never get my money no matter what. I just offered them a solution to their

problem, out of a desire to help, though I knew it would be a *\*lot\** of work and there would be times when I wouldn't feel like writing anything because of workload, or grave familiar situations, or health problems. All I asked in return was to have a printed copy of each issue containing one of my articles, that's all I asked for, and that seemed reasonable enough to me.

It goes without saying that I could'nt care less for the few sterling pounds a yearly subscription costs, I spend twice as much twice a day, each and every day, just to get a taxi from home to work, so that is no money to me, it's peanuts. But, out of respect for myself, I'm *not* going to spend *80 hours each and every two months*, time and effort which I detract from my other hobbies and my family, to submit a publishable article for Datafile, then having to *\*pay\** to get to check it. No way I'm doing that. I'm the one helping them, not the other way around.

In fact, you've probably noticed the impact: the previous Datafile issues were 40- and 44- pages long, if I'm not wrong, with some long articles and all. The current issue, which features no article from me, is just 24 pages long, and most "articles" are extremely short and mostly focused on RPL models or obsolete hardware, with the one and only exception being an 8-page financial article for the HP-12C. I very much doubt Datafile will be able to subsist on that kind of contents for long, though fortunately for them the release of the new HP35S will mean a wealth of publishable materials which will help alleviate the situation for a while.

As for committing to write good-quality articles on a regular basis, you can't really know just *how much effort* some of them require. The latest one, "**Identifying Constants**", took me more than *4 hours a day, \*each\* and every day* for a whole month (that's about 100+ hours) to create, from the idea, to the programming, to the many, many well-chosen examples I had to laboriously create, to the setting and typesetting of the nearly 50 very complicated mathematical expressions, then writing it all in MS Word, checking it all by *typing by hand every line of code* and running every example on the actual calculator, etc, etc. There's no way a single, free 40-page printed issue (of which 16 pages are my own !) can pay for so much work. Not at my professional hourly rate anyway. :-)

Finally, after this nasty turn of events, I was very sorry for those people who might have joined HPCC after reading my promotional attempts, with the idea of getting first hand my articles, and felt morally obliged to lessen the impact on them of a situation they had done nothing to create and could do little to solve (I can only think of they *politely* writing the Committee expressing their opinion on this).

Thus, I fully intend to write the very same 4 articles I would have written and submitted to Datafile for publication this year, with the same formatting and quality, then send those articles in PDF format to each and every person who newly subscribed this year. All 4 are already written, in the sense of the corresponding program and examples already existing, but still need to be set up in MS Word and be exhaustively format-checked and run-tested.

Well, sorry for the extreme length of this post but I felt that all of you deserved a thorough explanation. It's been useful to me as well, I feel better now.

Thanks and best regards from V.

### **Re: [OT] Some pertinent explanations [LONG]**

*Message #5 Posted by [Eric Smith](#) on 7 July 2007, 4:06 p.m., in response to message #4 by Valentin Albillo*

Thanks for the detailed explanation. I would still prefer to pay for a year's HPCC membership for you than to get a refund, even though you've explained that the money is not the issue. However, if you're insistent on not accepting it as a gift, I will of course respect your wishes.

Eric

**Re: [OT] Some pertinent explanations**

*Message #6 Posted by **Walter B** on 7 July 2007, 4:22 p.m.,  
in response to message #4 by Valentin Albillo*

Buenas tardes, Valentin,

though I know only your side of the story now (audiatur et altera pars!), I must say the result is a real pity. I didn't check the archives for any names, which would be done easily. But what for? Well, I can only hope both sides (whoever is on the other side personally) may settle this matter like adults (by experience, such debates between men tend to end in kindergarten very often). Speaking for hopefully many of the members of this forum, a living Datafile is far better for all of us, the readers, than a tombstone claiming "I was right" (hope my limited English is sufficient to express my feelings).

Thanks for your promotional activities, and good luck for the necessary negotiations,

best regards,

Walter

**Re: [OT] Some pertinent explanations**

*Message #7 Posted by **Steve Borowsky** on 7 July 2007, 5:57 p.m.,  
in response to message #6 by Walter B*

I know this is really none of my business, and i'm not a significant contributor to this community, but I do consider myself a long-term member of the HP community here; i've probably been registered on this site for over ten years, so I feel justified in trying to express something of how I feel after hearing about this situation. When I posted my first response, I thought afterwards that perhaps I had been too harsh and quick to judgment, and that maybe there were other factors I wasn't seeing. But after reading Valentin's eloquent explanation, sadly I feel my criticism was inadequate. It's not only the behavior of the original HPCC member that I find pathetic and reprehensible, but the resulting actions of the HPCC leadership as well. I'm telling you, if I was walking around with that kind of head I think i'd have to kill myself.

**Re: [OT] Some pertinent explanations [LONG]**

*Message #8 Posted by **Fernando del Rey** on 7 July 2007, 5:59 p.m.,  
in response to message #4 by Valentin Albillo*

Hi Valentin!

As a long time friend of yours, and recent member of HPCC (per your recommendation), I'm really sorry for the state of affairs that has led to your decision.

While understanding and sharing your point of view on this matter, I can only ask you to reconsider your decision for the benefit of the HP calc fan community.

Keep in mind that there is always some reason for others to think or act differently from what we would expect. Please be forgiving when judging people's behavior.

Not being a contributor myself, nor practically active as an HP calc fan, I have nevertheless enjoyed and really appreciated reading your Datafile articles over the years. I wish to thank you for all those fun and

interesting materials, which surely you have dedicated long hard-working hours to produce.

If your decision with respect to Datafile is firm, may I suggest that you publish your future articles at the Articles Forum in this MoHP, or even better, why don't you think about gathering enough material for publishing a book.

Thanks for all you do for this community.

See you soon!

*Edited: 7 July 2007, 6:26 p.m.*

### **Re: [OT] Some pertinent explanations [LONG]**

*Message #9 Posted by **Wayne Brown** on 7 July 2007, 10:10 p.m.,  
in response to message #4 by Valentin Albillo*

This whole situation is very distressing. I guess I can see both sides (somewhat), and we *are* getting only one side of the story here. But it's hard to imagine that there could be any other information that would justify the way Valentin has been treated. If I put as much time and effort as he does into preparing free articles for publication, then the idea that I'd have to *pay* for the "privilege" of proofreading my own material would be not only ludicrous but offensive.

The thing I find most disturbing is the Committee's refusal to support -- or even *acknowledge* in public -- a good-faith agreement they made. The whole thing is unpleasantly reminiscent of the disrespect shown to Richard Nelson in the last stages of his involvement with PPC.

My first impulse on reading all this was a desire to resign my own HPCC membership immediately, but upon reflection I decided to wait and see what other facts, if any, come to light. However, I can promise that whatever happens will have a significant bearing on my decision at membership renewal time.

### **Re: [OT] Some pertinent explanations [LONG]**

*Message #10 Posted by **DaveJ** on 7 July 2007, 11:27 p.m.,  
in response to message #4 by Valentin Albillo*

Hi Valentin Although I have never read any of your articles or Datafile for that matter, but I am also a contributor of articles to other magazines, and I can certainly agree with how much effort goes into producing such articles. Those who haven't done it themselves can never appreciate just how much work is actually involved.

I agree that you should stand your ground on principle alone, and anyone who does not agree and has such spite as what is being displayed, simply does not deserve to be part of the "community".

I wish you all the best, and remember, there are always other ways to get your work out there *\*and\** get some financial reward for it.

Regards Dave.

### **Re: Letter to the Editor of Datafile**

*Message #11 Posted by **Bruce Bergman** on 8 July 2007, 1:35 a.m.,  
in response to message #1 by Eric Smith*

What's really pathetic here is that certain people just can't act like adults, and are either overwhelmed with jealousy and ego, or merely have a need to be petulant children. Sometimes I really wonder if there is some

sort of brain damage in our geek-full industry; I can't otherwise imagine why people can't just get along and act like mature adults and be considerate. Really.

I understand much of what was said, and I'm sure there is still a lot I don't understand. However, it's considered common practice -- literally common \*courtesy\* -- in the USA to send authors of published works in periodicals, free copies of the actual periodical once it is published. You write an article, long or short, and they send you at least one copy gratis, if not more. I have LONG worked in the publishing industry, and have not only written for journals and magazines, but also have written a monthly column in a major industry magazine for several years. While I DID get paid for my work, I \*also\* received free copies of the magazines and journals; that's expected and normal. I can't imagine what the hubbub is about simply doing something like that for Valentin. Like he said, it certainly doesn't make sense to write something and then have to pay for it -- that's idiotic. Granted, it's a different country, and maybe there are things I don't understand, but it certainly doesn't make sense to me.

Valentin, you're a stud for taking the high road. I personally think someone (else) needs to get their face slapped a few times and hopefully shake out some of that arrogance and jealousy.

Good luck,

bruce

## **Re: Letter to the Editor of Datafile**

*Message #12 Posted by **Tony Duell** on 8 July 2007, 5:13 a.m.,  
in response to message #1 by Eric Smith*

As one of the people who objected (and still objects) to the arrangement between HPCC and Valentin, I feel I have to respond.

Yes, I am on the HPCC committee. But when I post here, I only speak for myself. I don't claim to represent HPCC, I don't represent HPCC. And while I feel constrained to carry out club policy in as far as I asked to do so (a trivial example of this is that when the Datafile journals as posted, I would not have done anything to prevent Valentin's from being sent, even though I disagreed with the way he got membership), I do not feel I have to agree publically with everything the committee says or does. I would not remain a member of any club that expected that sort of behaviour from its members or committee members.

Eric mentions that he's been unemployed for 3 months. I've been essentially unemployed for, not 3 months, not 3 years, but 10 years. I'm a self-employed consultant, but very few people consult me. And yet I've paid my membership fee every year without question. I've been a member of HPCC for 15 years now....

In that time I feel I've contributed to the club. 10 years ago, shortly after my employment contract ending, I presented that HP48 I2C interface at the HPCC conference. To get that working, to be sure it was reproducible, to do all the demonstrations cost me, I estimate, over £1000. Since then, as some of you know, I've traced out schematics of many older HP calculators. In some cases (particularly handhelds), I borrowed the machines from trusting HPCC members. In others, I've had to buy the machines myself. I have given HPCC permission to sell CD-ROMs of said schematics, please note that I don't get a penny from this. All profits go to the club. I have no idea how many such CD-ROMs have been sold, but I believe it's enough to have easily covered my membership for the next 10 years or more.

And producing said schematics takes time. Valentin said he spent over 100 hours on one of his articles. Well, maybe I'm a slow worker, but producing schematics for the HP9100B took not 100 hours but, I estimate, over 10000 hours. It's a very difficult machine to make sense of.

You may not feel those schematics have any value. You are, of course, entitled to that view, but I don't think it's universally held. Just as views on the worth of Valentin's articles vary between people.

Other people contribute to the club in other ways. Or perhaps you think that accounts keep themselves, conferences organise themselves, journals edit themselves, other articles write themselves, and so on. As far as I know, none of them get any financial reward from the club. We all pay our membership fees every year.

And let me point out that while it may be common to give a free copy of the journal containing an article to each author, there is a big difference between getting Datafile and being a member of HPCC. The latter has considerably more perks.

Which brings me to my complaint. If it was HPCC policy that contributing to the club was rewarded by a discount in membership, I'd have no problem with that. If it was agreed that one form of contribution to the club, namely writing articles for Datafile, was rewarded (say 1/6th off the subscription for each article published), I'd have no problem with that. What I have a problem with is rewarding one person for his contributions while the rest of us put time and money into the club for no financial reward.

Yes, I am on the HPCC committee. But when I post here, I only speak for myself.

---

Of course; when anyone posts here, I expect that, unless otherwise stated, he's speaking only for himself, and not for any organization that he happens to belong to.

Quote:

---

---

But as far as I know (and I am an HPCC member), actually using those perks (other than receiving Datafile) would require travelling to London, which usually isn't feasible for many members. But that's okay with me; I was aware of it before I joined.

---

Well, I do understand your viewpoint, and of course Valentin's as well, but I don't think that this forum is an appropriate place to discuss internal HPCC matters; wouldn't it have been better to discuss this only within HPCC or published in a Datafile "member's letter"?

Regards,

James

That's the way it is for me, too. I had two reasons for joining HPCC:

1. HPCC is a close relative of PPC, and having an HPCC membership number gives me a symbolic connection to the PPC legacy. That was, and remains, my primary reason for wanting to be a member.
2. I like having a subscription to *Datafile*, though I seldom read any articles that don't directly involve the HP-16C, HP-41 or HP48.

So if there are any other "perks" for a being member outside the UK, I have never noticed or taken advantage of them.

I suppose most of the blame for having a discussion in this forum is my fault, for posting my letter to the HPCC editor here. I did that because I knew that many HPCC members do read the forum here, and because Tony had criticized the arrangement between Valentin and HPCC in this forum on multiple occasions.

I'm not trying to pin blame on anyone. I think it should be possible for HPCC to adopt policies that should satisfy both Valentin and Tony, and that helpful suggestions have already been made in this discussion thread. That is exactly what I was hoping for by posting here; if the discussion had been restricted to member letters in Datafile, it would drag on for years, rather than helping to reach a solution in a timely manner.

Eric

**Re: Letter to the Editor of Datafile**

*Message #16 Posted by **Tony Duell** on 9 July 2007, 1:18 p.m.,  
in response to message #13 by James M. Prange (Michigan)*

Unfortunately, Valentin seems to think I was speaking for the club when I commented on his free membership. I was not.

As regards other perks from being a member, there is nothing to stop HPCC holding meetings other than in London. If there's a sufficient number of HPCC members in another place, then a 'local' meeting would seem to be a good idea.

And finally, yes, this should really be discussed at HPCC. But when I am flamed publically, I feel I have the right to respond.

**Re: Letter to the Editor of Datafile**

*Message #17 Posted by **Howard Owen** on 8 July 2007, 9:17 a.m.,  
in response to message #12 by Tony Duell*

I'm sorry, but this just sounds like obsessive and childish adherence to unwritten law at the expense of the HPCC membership, and of the larger HP calculator community. And that's the best interpretation I can put on the matter.

My HPCC membership will lapse at renewal time. My four page paper (with 7 pages of associated Mcode) will be published here (after HCC 2007) rather than in Datafile.

Howard

According to Valentin's account, all he asked for was "a free copy of the journal[s] containing [his] article[s]." Was he ever offered that *instead* of a free membership?

**Re: Letter to the Editor of Datafile**

*Message #19 Posted by **Eric Smith** on 8 July 2007, 4:52 p.m.,  
in response to message #12 by Tony Duell*

Quote:

I've been essentially unemployed for, not 3 months, not 3 years, but 10 years.

I was aware of that general situation, though not the details. Had I been asked to do so, I would have been just as happy to pay your membership fee, as I certainly value your your contributions. I'm not going to debate how much value your contributions have relative to Valentin's or anyone else's. Each reader will get different value from different articles.

At this point, though, I won't pay for your membership while you are taking actions that, however justifiable, are preventing Valentin from receiving the author's copy of the publication he has requested. It seems that there should be a way for HPCC to adopt a uniform policy for authors that would address both your concerns and Valentin's, and if that were to happen I would certainly be willing to pay for any remaining membership expenses for you for the indefinite future.

Quote:

---

What I have a problem with is rewarding one person for his contibutions while the rest of us put time and money into the club for no financial reward.

---

I understand your position, and it certainly has some merit. I generally respect people that take a principled stand on issues they consider important. But I think most of us would have been more willing to compromise on this issue, as getting a complimentary printed copy of each issue that one of his articles appears in (which is apparently what he requested) does not seem like a "financial reward" to me.

Did you ask (as an individual member, not as a committee member) whether you, or other authors, could have the same deal as Valentin?

Quote:

---

If it was agreed that one form of contribution to the club, namely writing articles for Datafile, was rewarded (say 1/6th off the subscription for each article published), I'd have no problem with that.

---

That seems like a reasonable plan. Did you propose that to the committee? Were the other committee members opposed?

I respectfully request that you and the other committee members try to adopt that plan, or something similar that will address both your concerns and those of Valentin.

Eric

## **Re: Letter to the Editor of Datafile**

*Message #20 Posted by **Walter B** on 8 July 2007, 6:19 p.m.,  
in response to message #12 by Tony Duell*

Tony,

I'm aware of you weren't posting as representative of the HPCC committee. So feel free to forward my following opinion to your colleagues as one vote of a simple HPCC member:

IMO it is a matter of course to send a complimentary copy of an edition of a magazine to all the authors who contributed. As far as I understood Valentin, that's all he wants. No more. So it shall be easy to settle this matter, and there shall be one problem less in this world.

Regards, Walter

P.S.: Ref. to your post: 1) Also I can't see any perks for me as a HPCC member on the continent besides receiving Datafile. Of course I would be glad to visit any meetings, speaking face to face with some of the famous people I know from their writings only so far, but I will certainly not travel to London just for that - too expensive in many ways. If there are more perks, please specify.

2) 1E4 ENTER 8 / 365 / 7 \* 5 / results in 4.8 - so 1E4 hours correspond to almost 5 years working 8 hours a day (but weekends) on this topic. Hmmmh!?

I wonder if it isn't possible for an author outside HPCC to contribute and in return receive a voucher upon accepting the article. Sorry if I missed this information on hpcc.org.

### **Re: Letter to the Editor of Datafile**

*Message #22 Posted by [Forrest Switzer](#) on 8 July 2007, 9:07 p.m.,  
in response to message #1 by Eric Smith*

There are some clubs and non-profit organizations that have established rules (be they written or just understood) that no one is to be paid in any manner for any service without the approval of the Board. It seems to me that this may be one of those cases where someone decided to give out a membership without Board approval. (Just guessing.)

I belong to a club and have produced a monthly newsletter for over 600 members for approximately 5-years. The only help has been from volunteers that helped apply the labels and tape the newsletter closed. The only thing done by outside help was the copying and the posting (US Mail). I personally composed, all the content and folded every one of the 3,4, or 5 sheets in each issue. When I started that project, I did so to make sure the Club had a means to help it survive, and I understood the commitment. I didn't expect any remuneration, and I have never received any. I pay for my wife's and my memberships.

The absolutely only time when a member receives a free membership is when the member has contributed something material, like wood, steel, or something that would have cost the Club much more than the \$35 yearly membership that they are given.

But, in all cases that requires a Board action.

MY 0.02

Forrest

As I understand it, the "free" membership for Valentin was approved by the committee, though clearly not unanimously.

I assume that HPCC holds elections in which the membership votes for the committee positions, so the final recourse for members that disapprove of committee actions is to try to vote in a new committee.

### **Re: Letter to the Editor of Datafile**

Correct. It was voted on, IIRC, at the end of an AGM by the members present at the AGM. There was a majority in favour of giving Valentin free membership, but it certainly wasn't unanimous

Quote:

I assume that HPCC holds elections in which the membership votes for the committee positions, so the final recourse for members that disapprove of committee actions is to try to vote in a new committee.

Indeed it does. There is an election for the committee members at the AGM every year. IIRC, any member of HPCC who has renewed their membership at least once can stand for any committee post. I believe they have to find members to propose and second them, but that is not a problem normally.

**Surprisingly usefal Calc Stand**

Message #1 Posted by [Chuck](#) on 7 July 2007, 12:49 a.m.

I wasn't going to post this, but it turned out to be quite useful tonight, I figured `what the heck`. I was little bored in the workshop yesterday and made a little calculator stand for the Voyagers last night. Worked okay for the first one. I've got some incense cedar, purple heart, and mahogany to try a few more. This one is oak...not perfect, but never-the-less, okay; works good on the desk or the couch. [photo1](#)~~[Photo2](#)

I'll have to get a little more creative and start making a bunch of them this summer. Too bad these didn't come with the older models.

CHUCK

**HP-28 Annunciators**

Message #1 Posted by **Palmer O. Hanson, Jr.** on 6 July 2007, 11:17 p.m.

I was doing some complex manipulations on my HP-28s when a circle appeared at the left end of the annunciator line. I don't have a manual so I didn't know what it was. I finally got rid of it by using the limited reset technique described in Wlodek's book.

What causes the circle to appear and how do I clear it?

**Re: HP-28 Annunciators**

Message #2 Posted by **James M. Prange (Michigan)** on 6 July 2007, 11:28 p.m.,  
in response to message #1 by Palmer O. Hanson, Jr.

That's the "program suspended" annunciator, which serves the same purpose as "HLT" in the status area of the 48 and 49 series. To "get rid of it" (and resume the suspended program), press Shift CONT (over the 1 key on a 28 series).

Regarfd,  
James

### Two NCEES committees endorse HP-33S

Message #1 Posted by [Norris](#) on 6 July 2007, 6:02 p.m.

The National Council of Examiners for Engineering and Surveying (NCEES) currently requires examinees to use one of four approved calculators (including the 33S) on professional engineering and surveying examinations. However, NCEES has been considering standardizing on a single calculator model, and issuing it in the exam room. There has been speculation that NCEES would choose a Casio or TI, rather than the HP-33S, given its relatively high cost.

Both the Examinations for Professional Engineers (EPE) committee and the Examinations for Professional Surveyors (EPS) committee were asked about their calculator preferences. The results:

Quote:

The EPE and EPS committees also examined the Council policy allowing candidates to bring their own calculators to the exam site. The policy — which limits the approved calculators to four approved models — is the result of past work by EPE, EPS, and EPP to develop a system of calculator usage to reduce the likelihood of candidates using calculators to cheat on or compromise the test.

Both EPE and EPS surveyed exam development volunteers, providing calculators from the Council-approved list of four and asking for their preferences among the models. The EPS Committee favored adopting the HP 33S as the sole approved calculator due to its ability to convert angles to degrees, minutes, and seconds as well as its ability to work in algebraic and reverse Polish notation (RPN) modes.

The EPE Committee also favored the HP 33S for the same reasons, but noted that many exam development volunteers voiced strong preferences for the Texas Instruments and Casio models. The EPE Committee also pointed to an ELSSES survey of exam candidates that found preferences evenly divided among the HP, TI, and Casio models. Pointing to this, EPE does not support the idea of supplying candidates with a single calculator model. It instead recommends that at least two models be provided if NCEES decides to provide examinees with calculators.

Based on these results, it appears likely that the 33S (or its successor, the 35S) will continue to be approved for use on NCEES exams, even if NCEES decides to start supplying calculators to examinees. This would preserve a major market for the 33S/35S.

Reported in [June 2007](#) issue of *Licensure Exchange*

If these folks vote in favour of the terribly cluttered 33s, then the 35s will wipe out all competition in this field! Looking forward to the launch of this product (will have to wait for 24 more days maximum). Although NCEES is totally irrelevant for 95% of the world, nevertheless their votes may foster HP turning in the right direction. Any support is appreciated :-)

Quote:

Although NCEES is totally irrelevant for 95% of the world, nevertheless their votes may foster HP turning in the right direction.

You may be underestimating the impact of NCEES on 33S sales. My guess is that NCEES policies are the single most important factor driving the 33S market worldwide. I would bet (1) that the US is the most important country for 33S sales, and (2) that within the US, NCEES exams are the most important reason for 33S purchases.

Since the 33S is not widely available in US stores, it's likely that a high percentage of 33S sales are online, and through Amazon.com in particular. If you check [Amazon](#) for the 33S, you get a "**Better Together**" discount offer for an FE Exam Equations book. Furthermore, the "**Customers who bought this item also bought**" section features five other items: two FE exam manuals, two Civil PE Exam manuals, and a Mechanical PE Exam manual.

I wouldn't be suprised if Amazon is the single biggest retailer of the 33S in the US (if not the world). And Amazon clearly sees a close sales relationship between the 33S and NCEES exam study materials.

### Re: Two NCEES committees endorse HP-33S

Message #5 Posted by [Walter B](#) on 7 July 2007, 12:44 p.m.,  
in response to message #4 by Norris

Well, Norris, what you were telling us may be read as "Almost nobody buys an HP33s besides those folks who are going to undergo an FE/PE exam in the USA". That's totally d'accord with what I posted ;-)

This correlation isn't a real surprise - just look at a 33s. IMHO the market of the 35s will be considerably larger, i.e. it will exceed the regulated area by far. Thus, more countries with free markets will contribute to the sales figures, reducing the relative importance of regulated areas to its appropriate value.

Message #2 Posted by **Steve Leibson** on 6 July 2007, 6:35 p.m.,  
in response to message #1 by Chuck

"P.S. I hate knowing that I'm bidding against Microsoft people."

LOL.

Gordon Bell was one of the founders of Digital Equipment Corporation (DEC) in the 1960s, before Bill Gates got out of diapers. He and his wife Gwen started collecting computer antiquities when he realized that a lot of historic computer hardware, software, and documentation was going into landfills. First it was a private collection. However the Bells' tie to DEC meant that DEC competitors had problems donating material to the growing collection. So the Bell's helped to found the Computer Museum in Boston and infused the museum with their own collection.

Those artifacts have now migrated to the Computer History Museum in Mountain View, California. There's a massive HP calculator display at the entrance to "Visible Storage" where the on-display artifacts are kept. Visible Storage encompasses less than 10% of the collection, as the museum continues to collect donations so that it can open the throttle.

Gordon Bell may now work for Microsoft (working for DEC is no longer an option), but he hardly merits being tossed off as a "Microsoft People."

**Hp-46 printer problem**

Message #1 Posted by [Maximilian Hohmann](#) on 4 July 2007, 8:02 a.m.

Hello!

I have searched the archives already, but only found a reference to a possible power supply capacitor failure that might cause printing problems in an hp-46. If this is not the cause with my units (I will check it tonight), what other problems/solutions are known?

In my case, I have two otherwise fully working hp-46 calculators, both with the LED display option, that share the same printing malfunction: The paper advance only works sporadically, if at all. From the outside I suspect a worn drive roller or belt or non-engaging clutch. The working principle of the paper advance mechanism can only be guessed without disassembling the printer and I am a bit reluctant to do so, especially if there are no spare parts anyway...

Greetings, Max

NB: Sooner or later, because they take up too much space (says my wife) I will have to part with one of them - so if anyone is interested, watch the classifieds section! (I prefer trading to selling and could throw in a nice 41CX as well)

**Re: Hp-46 printer problem**

Message #2 Posted by [Tony Duell](#) on 4 July 2007, 1:51 p.m.,  
in response to message #1 by Maximilian Hohmann

You can get 'my' schematics of the HP46 from The Australian Site. The logic board diagrams show the circuit that operates the feed solenoid, you might just check that's working correctly, but I am pretty sure your problem is mechanical.

From what I remember (and it's been a few years since I've been inside the 46), the feed solenoid in the printer engages a follower on the main camshaft, and it's the force of that cam rotating that operates the feed ratchet. My guess is that there's hardened grease somewhere in the mechanism so that it doesn't snap over as sharply as it should. Unfortunately I've never stripped a 46 printer (I did a similar printer in a Fluke data logger about 20 years ago...), so I can't tell you just what to take off.

### Where to get crystal for an HP-45?

Message #1 Posted by [Mike Ingle](#) on 4 July 2007, 7:00 a.m.

Has anyone done the crystal mod on an HP-45? I got one today (1973 model) which has the timer, and might as well put in a crystal. The doc on the site says you need a 784 KHz crystal. Is this correct? It is not a standard value and is not in the Digikay or Mouser catalog that I can find.

Mike

Try [International Crystal](#).

### Re: Where to get crystal for an HP-45?

Message #4 Posted by [Steve Leibson](#) on 5 July 2007, 4:44 p.m.,  
in response to message #1 by Mike Ingle

It's possible that Colorado Crystal (<http://www.coloradocrystal.com/>) will have some old crystals on the shelf. The place is just down the street from the HP Loveland site (which may no longer have HP as a resident) and engineers there may have had some crystals made for their HP 45s many moons ago. Good Luck!

### EMU71 text file via DOSLINK

Message #1 Posted by [Egan Ford](#) on 3 July 2007, 11:58 p.m.

I am using the following BASIC program from (<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=85666>):

```
10 DIM A$(100)
20 CREATE TEXT "MYTEXT"
30 ASSIGN #1 TO "MYTEXT"
40 ENTER :DOSLINK;A$
50 DISP A$ ! just to follow the process, you can omit it
60 PRINT #1;A$
70 GOTO 40
```

And it does work (Thanks!), but I have a few problems:

1. After receiving the last line it just hangs there. I have to hit ATTN ATTN twice, then type STOP, then type CONTROL ON to get HP-IL virtual display working again.
2. I cannot use it again until exiting EMU71 and starting up again. It is as if there is an open file pointer at the end of the file. END, STOP, END ALL should close the file descriptor, but it appears it does not.

Can someone help me make this little program a bit more robust?

Thanks.

### Re: EMU71 text file via DOSLINK

Message #2 Posted by [J-F Garnier](#) on 4 July 2007, 6:43 a.m.,  
in response to message #1 by [Egan Ford](#)

You should use RESTORE IO, not CONTROL ON. Possibly RESET HPIL, then RESTORE IO.

When I'm importing large files (for instance large programs or large assembly source files I'm editing on PC), I add a final line like `"*EOF"`, and check for `A$="*EOF"` to properly exit the loop and close the file.

### HP-calc fans in Madrid ?

Message #1 Posted by [Valentin Albillo](#) on 3 July 2007, 8:23 a.m.

Hi,

Every other year or so, I use to post a request to see if there are any new (or old) HP-calc fans here in Madrid who would like to talk about this rather uncommon hobbie of us over a beer or two.

As of July 1st, I do have some spare time in the afternoons after work, so if you live in Madrid or can travel here and the above plan does suit you, please contact me through the MoHP and we'll arrange something.

Which is more, if you would be interested in getting some HP or SHARP calcs, I might have some spares to offer you as well. I'd rather see them in the loving hands of a true HP fan, whether user or collector, than spend their useful life utterly unused, stored away in a drawer.

Thanks and

Best regards from V.

### Re: HP-calc fans in Madrid ?

### On / Off topic

Message #1 Posted by [Matthias Wehrli](#) on 3 July 2007, 7:02 a.m.

I updated my website....

- [new HP-41 module list](#)
- [new photo gallery: HDR pictures](#)

Matthias

[www.hp-collection.org](http://www.hp-collection.org)

### Re: On / Off topic

Message #2 Posted by [Maximilian Hohmann](#) on 3 July 2007, 8:30 a.m.,  
in response to message #1 by Matthias Wehrli

Hello!

Quote:

... [new photo gallery: HDR pictures](#) ...

Very interesting pictures, somewhat unreal! Of course, it would be interesting to learn a bit more about the technical background! What camera/sensor/scanner did you use for taking them and how do you process the images?

Greetings, Max

### Re: On / Off topic

Message #3 Posted by [Matthias Wehrli](#) on 3 July 2007, 6:11 p.m.,  
in response to message #2 by Maximilian Hohmann

Hi

I use a Nikon D80 and a very heavy tripod. I normally take 11 pictures in 10MP: -5 to +5 I currently use .jpg quality as the .raw picture is much larger but the result isn't really better. The unsharpness is a normal result of this technic. It looks a bit misterious. Very interesting is the picture with the moving leaves.

Matthias

### Re: On / Off topic

Message #4 Posted by [Maximilian Hohmann](#) on 4 July 2007, 2:40 a.m.,  
in response to message #3 by Matthias Wehrli

Hello!

Quote:

Very interesting is the picture with the moving leaves.

Yes, definitely! Really looks like it was taken on a different world...

Just to play around a little bit, last night I re-processed a single raw-file of my camera (Sigma SD10 with Foveon sensor, which has a very good dynamic range) into a (pseudo-)HDR image and was impressed how much hidden detail this technique was able to reveal (for the price of increased noise in this case): [http://www.bombie.de/tmp/IMG08930\\_HDR.jpg](http://www.bombie.de/tmp/IMG08930_HDR.jpg)

BTW, have you come across Helicon Focus yet ( <http://www.heliconsoft.com/heliconfocus.html> )? It is a somewhat related technique, that combines images from the same scene taken at different focal planes into one super-sharp "impossible" picture that is in focus everywhere (ideally at least). When you dont have enough planes or if you get moving objects in your scene, the effect is somewhat similar to your ghostly leaves: <http://www.bombie.de/tmp/rapsfeld.jpg>

It is really fascinating to witness, how increasing processing power changes (amateur) photography, I only wish I had a little more time...

Greetings, Max

**Re: On / Off topic**

*Message #5 Posted by [Matthias Wehrli](#) on 4 July 2007, 4:35 a.m.,  
in response to message #4 by Maximilian Hohmann*

Hi

Your pictures shows a airplane. In true HDR this is not possible as HDR doesn't allow to take pictures of moving elements. How did you converted this picture into HDR?

Matthias

**Re: On / Off topic**

*Message #6 Posted by [Maximilian Hohmann](#) on 4 July 2007, 4:54 a.m.,  
in response to message #5 by Matthias Wehrli*

Hi!

Quote:

How did you converted this picture into HDR?

I processed one single raw-file with different contrast and brightness settings into four different images: One optimised for the moon, one for the aeroplane, one for the smoke and one for the diffuse clouds in the background, then I combined these four images into this HDR (or pseudo-HDR, whatever you want to call it) image. The imaging sensor of my camera ( <http://www.foveon.com> ) is said to have twice the dynamic range (but less pixels) than the more common "Bayer"-sensors, so it is possible to extract all this information from a single raw file.

Greetings, Max

**Re: On / Off topic**

*Message #7 Posted by [Meindert Kuipers](#) on 4 July 2007, 5:13 a.m.,  
in response to message #6 by Maximilian Hohmann*

I do have some more experience with this, although I cannot disclose any details. I have worked with Bayer sensors with 12-bit dynamic range (per pixel!) which have the possibility of tweaking the amplifier settings. By taking the raw Bayer images and applying other filters much more information can be extracted. Especially since the green has double the resolution and has most of the luminosity information nice tricks can be done with this.

But this is getting way OT ...

Meindert

**Re: On / Off topic**

*Message #8 Posted by [Maximilian Hohmann](#) on 4 July 2007, 5:30 a.m.,  
in response to message #7 by Meindert Kuipers*

Hello!

Quote:

\_\_\_\_\_

I do have some more experience with this, although I cannot disclose any details.

\_\_\_\_\_

Well, my experience with this is limited to something like 15 minutes... But what a pity that you can't tell us more! Quite a few years back I did my ph.d. on radar/microwave imaging and in the end you can sum it all up with "extract as much as you can from the raw data".

Hopefully, future raw-data converters that come with digital cameras will include some kind of HDR-function!

Quote:

\_\_\_\_\_

But this is getting way OT ...

\_\_\_\_\_

Well, if we write a little program that does the necessary calculations for HDR image generation on an hp67, then we are back on topic, aren't we :-)

Greetings, Max

in response to message #8 by Maximilian Hohmann*

re: "Quite a few years back I did my ph.d. on radar/microwave imaging"

Staying off topic (!), what exactly did you image? Was it single dish or synthetic

aperture? I do radio astronomy interferometry, and we, too, are always trying to get that last little bit of information out of the data (usually by worrying about Fourier components).

**Re: On / Off topic**

*Message #10 Posted by **Maximilian Hohmann** on 4 July 2007, 4:28 p.m.,  
in response to message #9 by Dave Shaffer (Arizona)*

Hello!

Quote:

what exactly did you image? Was it single dish or synthetic aperture? I do radio astronomy interferometry, and we, too, are always trying to get that last little bit of information out of the data (usually by worrying about Fourier components).

We did high-resolution multi-frequency synthetic aperture (and "inverse synthetic aperture" which corresponds more or less to computer tomography, but with microwaves instead of x-rays) imaging of natural targets like plants and soil samples. One aim was to obtain a radar signature database for classifying satellite based radar images of the Earth. The european satellite ERS-1 was launched while I did my work, so we actually could test some of our methods on its early raw data sets. The other aim was to develop and test concepts for three dimensional imaging through interferometry and 3-D-inverse synthetic aperture radar at laboratory scale ( <http://www-emsl.jrc.it/> )  
So there are some parallels to your work, especially the Fourier components :-)  
And we used mainly equipment of hp in our lab - to come back to the topic - but no pocket calculators I'm afraid!

Greetings, Max

**Re: On / Off topic**

Message #14 Posted by **Thomas Radtke** on 3 July 2007, 2:41 p.m.,  
in response to message #1 by Matthias Wehrli

Have your HDR pictures undergone something like unsharp masking? They look a bit equalized for brightness. Extremely tasteful and interesting to look at, though.

**Re: On / Off topic**

Message #15 Posted by **Chuck** on 3 July 2007, 4:22 p.m.,  
in response to message #14 by Thomas Radtke

"They look a bit equalized for brightness."  
=====

That's what HDR does. You take 3 or more photos at different exposures and combine them. The HDR process combines the best parts of all (shadows, midtones, highlights, etc) to make a picture that usually a single photo can't capture, but often it appears to be more like our eyes see it (because our pupils change).

**Re: On / Off topic**

Message #16 Posted by **Thomas Radtke** on 3 July 2007, 5:25 p.m.,  
in response to message #15 by Chuck

Ah, I thought there were already CCD chips capable for this range and that such a beast has been used :^).

Message #5 Posted by **DaveJ** on 2 July 2007, 6:37 p.m.,  
in response to message #1 by *KoenDV*

I just noticed that the new 10s has an ever-so-slight chevron shape to the bottom keys.

Dave.

**Re: HP35s is back**

Message #6 Posted by **Bruce Bergman** on 3 July 2007, 1:22 a.m.,  
in response to message #5 by *DaveJ*

I wonder if that's an artifact of the photo or something. I say that because -- to me -- it doesn't look so much chevron shaped as kind of just poorly aligned. Like how my pictures look when I freehand them. ;-) I can't imagine it to be that, but it also seems strange to have just the last two rows be chevron shaped.

Weird.

**Re: HP35s is back**

Message #7 Posted by **Eric Smith** on 3 July 2007, 3:29 a.m.,  
in response to message #6 by *Bruce Bergman*

I'm pretty sure he's right, that the bottom four rows of keys of the calculator in the photo are deliberately laid out on a slight curve, with the middle keys closer to the bottom of the calculator.

While I have been quite vocal in my criticism of the 33s key layout, the slight nonlinearity in the 10s in the photo wouldn't bother me at all. The lack of RPN, on the other hand, does keep me from having much interest in the 10s.

On the other hand, I expect to buy at least two HP 35s calculators, and quite possibly more. It will probably become my main everyday calculator, at least until the calculators Richard Ottosen and I are developing reach a more advanced stage. (I expect that we will have some stuff to show off at HHC 2007.)

**Re: HP35s is back**

The bottom 4 rows are chevron shaped, it is clearly deliberate and very symmetrical. Very easy to see in the big photo on the PDF, and still visible on the smaller photos (including the angled one) in the PDF.

Dave.

**Re: HP10s**

*Message #9 Posted by [Paul Brogger](#) on 3 July 2007, 1:25 p.m.,  
in response to message #5 by DaveJ*

Superficially, the 10s reminds me of the [SSC-200](#), a calculator briefly offered by Target stores [quite a while ago](#).

The shape and two-line display had me convinced I'd uncovered another case of HP re-badging, but a closer look leads me to doubt that. (Or, to put it more precisely, I now doubt that the SSC-200 is the calc that has been re-badged -- I've little doubt that the 10s is simply old wine in a new bottle.)

**Re: HP35s is back**

*Message #10 Posted by [Howard Owen](#) on 2 July 2007, 6:52 p.m.,

*Message #23 Posted by [Chan Tran](#) on 3 July 2007, 10:53 a.m.,  
in response to message #22 by Antonio Maschio (Italy)*

For sixty bucks, I think I am going to get one when they are available.

**Re: HP35s is back**

Message #24 Posted by [Wayne Brown](#) on 4 July 2007, 1:12 a.m.,  
in response to message #23 by Chan Tran

Quote:

For sixty bucks, I think I am going to get one when they are available.

I'd pay twice that for one without those cursor keys. But at least HP finally seems to be moving back in the right direction, so maybe the next model -- or the one after that -- will be something I could accept.

**Re: HP35s is back**

Message #25 Posted by [Chan Tran](#) on 5 July 2007, 7:43 a.m.,  
in response to message #24 by Wayne Brown

It would have been better without the cursor key. It would have been better if it has 35 keys like the original. It would have been better to have only the function on the original 35 but then I don't think that would happen. So I would settle for the 35s at \$60. At least that's one HP calc (or one calc of any brand) I want to buy in a long time.

**Re: HP35s is back**

Message #26 Posted by [Wayne Brown](#) on 5 July 2007, 11:02 p.m.,  
in response to message #25 by Chan Tran

Quote:

At least that's one HP calc (or one calc of any brand) I want to buy in a long time.

It's the closest HP has come in a long time to making anything I'd want to own, but it's not quite close enough.

**Re: HP35s is back**

Message #27 Posted by [Seth Morabito](#) on 6 July 2007, 3:00 a.m.,  
in response to message #26 by Wayne Brown

What is your favorite HP, and/or what do you use as a "daily calculator", curiously?

**Re: HP35s is back**

Message #28 Posted by [Wayne Brown](#) on 6 July 2007, 7:23 a.m.,  
in response to message #27 by Seth Morabito

I use my HP48GX daily; but most of the time I use it more as a personal organizer (appointment calendar, to-do list, phone directory, etc.) than as a calculator. For programming, I like my HP-41CX more than anything else. (I love playing around with synthetic programming, and that was my primary reason for buying the 41 in

the first place.) But my absolute favorite is my HP-16C, because it's so elegant, and unique; plus it was the first HP calculator I ever bought.

### Re: HP35s is back

Nostalgia is a big factor for me as well. My 48SX was the first HP I ever owned, and a gift as well. It's still my favorite as a result.

I was aware of the 41 series, but I never owned one when they were new. I recently picked up a 41C from eBay, since it was relatively inexpensive. I'm eagerly awaiting its arrival in the mail.

My first 41 (an HP-41CV) was purchased through one of the classified ads here at the Museum, back around 1998 or 1999 (nearly ten years after they were out of production). The things written about it here at the Museum were what motivated me to buy one. I liked it so well that I soon bought a 41CX from eBay and gave my 41CV to my son.

*Message #31 Posted by [Chan Tran](#) on 6 July 2007, 3:06 p.m.,  
in response to message #30 by Wayne Brown*

My daily use calculator believe it or not is the HP48GX emulator running on my PC's. My favorite calculator is the 41. My first calculator is the 25. Broke it and got a 34C for 1 week. Returned the 34C and get the 41C (but still lusting after the 97) and then time module, card reader, printer, want.. Lost the 41C and get a 41CV I still have still today. Bought a 32E, a couple of 11C to give away as gifts. Next calculator was the 28C and didn't like it. I gave it away to my sister. Got the 48SX and 48GX when they came out. Got 6 41CX blank nuts like new at surplus store. Gave away 3 and sold 2. Still have 1. Saw the 97 on the desk of the chief engineer at a company that I did some contract work for. I asked him to let me know when he wants to get rid of it. Two year later he called saying that he is retiring and give me the 97. I use the 97 when I want to have a printer calculator, i.e. totaling tax or credit card bill or balancing check book. I use the 41 for light duty scientific calculations. I use the 48's when I need a programable portable device.

Undoubtedly, my favorite is my HP-15C; but, to save it some usage, I use a HP-12C as a daily calculator, alternatively with my HP-32SII for scientific calculus.

At home, I like playing around with my HP-49g or my Casio fx-7700GB.

I own more than 70 calculators, by now, and so I could add: I like playing around with anyone of them!

Hello!

Quote:

What is your favorite HP, and/or what do you use as a "daily calculator",  
curiously?

I think I answered this question over ten times already, but I don't mind answering another 100 times :-)

My favorite hp calculator has always been the hp-25. It is just so cute and it glows in the dark and it can do everything I really need a calculator to do for me.

My most often "daily used" calculator is either the "Calculator Application" of my Apple PowerBook (in RPN mode of course!) or my "ASA CX-1 Pathfinder".

Greetings, Max

Trent, all,

You'll find quite some more lovers of the 25C here! As mentioned earlier several times (but <10), it was my first calc love, too. The Woodstock design still is most appealing to me. Such a beauty! If the 25C only had L.R., I had kept it - so I had to sell it some years later to replace it by an 11C. But I got a 25C again some years ago right when I started my modest collection :-)

Best regards, Walter

*Message #47 Posted by **Les Wright** on 5 July 2007, 1:13 a.m.,  
in response to message #45 by Walter B*

With the Canadian dollar rising against the US dollar, I expect the MRSP to be disproportionately higher than usual.

For example check [this](#) out. The York U bookstore is named on the HP Canada calculator page as the only official reseller of the complete calculator line. But look at the prices!!! \$230CDN for a 50G!!!! Even at 80 cents US on the dollar (as things were a year ago) that is overpriced. At 90 cents, the state of affairs today, that is just plain nuts, over \$200US. Outrageous when you think US buyers are finding them now for about 125US.

I suspect York U will carry the 35S and that it will be disproportionately overpriced as well.

Techcommint on eBay is based in Oakville, Ontario. Larry's prices are much more reasonable, and he carries the full HP line as soon as they are available. He may or may not charge shipping, given the situation, but will charge GST within Canada and GST and PST within Ontario. So that sort of stings. I recommend buying directly from him rather than thru the eBay store--he seems to have more flexibility in pricing that way.

When all is said, it may prove cheaper in the long run for Canadians to order from Eric Rechlin and pay shipping and Customs. I think the new 35S is going to be somewhat more costly for Canadians than Americans, and particularly pricey for Europeans and our friends in Australia and South America. But putting this in perspective--if it turns out to be a great calculator, I won't miss \$100CDN or so one bit.

Les

*Message #48 Posted by **Walter B** on 5 July 2007, 1:39 a.m.,  
in response to message #47 by Les Wright*

Thanks, all, so far. I'll be on a business trip to Canada next month and just thought I might save some bucks buying my 35s there instead of here in Europe. But it seems to be more favourable to use one of the sources you mentioned in the net.

Apparently HP makes a BIG fraction of its earnings outside of the USA :-? For my simple brain, letting some containers go from China to e.g. Australia can't be such more expensive than to California. Well, they won't make me start collecting financial calcs :-)

The shipping cost never is the reason for prices. If it was then they wouldn't make them in China in the first place.

**Re: HP35s is back / What will it cost outside of the USA?**

*Message #50 Posted by [DaveJ](#) on 5 July 2007, 8:06 a.m.,  
in response to message #49 by Chan Tran*

Lots of companies have different pricing structures for different regions on all sorts of products, and exports are strictly controlled to the benefit of various local sales divisions, distributors and other middle men etc. It's got nothing to do with the exchange rate or postage.

GPS receivers for instance are one classic example, there is the "US price" and the "rest of the world price", so everyone just buys though eBay or direct mail order from those US shops who turn a blind eye ;-)

Dave.

Somewhat, but for all RPL models, I believe that you'd do better asking on the usenet group comp.sys.hp48. In case you aren't using your own newsreader, you can access the newsgroup at <http://groups.google.com/group/comp.sys.hp48/>. Please keep in mind that it's best to search for an answer before posting a question.

Regards,  
James

**TI-Nspire available...**

Message #1 Posted by [Joerg Woerner](#) on 1 July 2007, 10:34 p.m.

Hello Calculator Enthusiasts!

And finally the TI-Nspire made it to the store shelves. You may find one either on eBay (auction 140133301918 for the TI-Nspire, auction 140133302305 for the TI-Nspire CAS) or from [www.dynatech.de](http://www.dynatech.de). They claim "delivery from stock" and I double checked with TI-Europe:

"Hello Joerg,

The first TI-Nspire units have been shipping to the distributors (wholesalers) since calender week 23, so the authorised dealers will now have received the first units...."

Hope it finds its way to the United States soon...

Regards, Joerg

**Re: TI-Nspire available...**

[ [Return to Index](#) | [Top of Index](#) ]**HP-15C Silver Anniversary! (Op-codes, synthetic matrices)**Message #1 Posted by [Karl Schneider](#) on 1 July 2007, 8:21 p.m.

tHP-15C fans --

After preparing this lengthy post over the past few days, I checked Craig Finseth's site, which states that 1 July, 1982 was the date of introduction for the HP-15C. Therefore, today is its **25th anniversary** of its public availability for purchase!

<http://www.finseth.com/hpdata/hp15c.html>

At the upcoming HHC conference in San Diego, we enthusiasts ought to hold an HP-15C silver anniversary observance as an "undercard" to the HP-35 35th anniversary theme.

The HP-15C offers exactly 700 programmable instructions stemming from well over 100 functions, all without benefit of *bona fide* alphanumeric. It is instructive to examine the fine engineering work that was done, more a quarter-century ago, to make this possible.

A complete instruction stored in program memory is identified by a unique operation code, or "op-code". These are not to be confused with key codes on 7-segment displays, which show the sequence of keystrokes for a programmed instruction using key identifiers that are usually numeric, but are sometimes a individual letter.

Relation and arrangement of op-codes to functionality is an important design consideration for a programmable calculator. Logically-selected codes facilitate testing and processing. Moreover, an insufficiency of available op-codes will restrict the amount of programmable functionality provided for the user.

First, some background: There are  $2^8 = 256$  unique one-byte op-codes. The "starting point" for the HP-15C -- namely, the HP-34C and HP-11C -- each use 255 codes for programmable instructions, with one spare code presumably by design, and a few possibilities omitted by necessity. For example, the HP-34C's sophisticated functions SOLVE and INTEG can be invoked with user-defined programs starting with labels A, B, 0, 1, 2, or 3, but not labels 4 through 9. This restriction due to insufficient op-codes caused William Kahan to make a selective statement in his fine article "Handheld Calculator Evaluates Integrals," in *Hewlett-Packard Journal*, 31:8, August 1980:

Quote:

*Some constraints ... are nuisances, such as 'Begin the f-program with a special label such as A'. The (INTEG) key is encumbered with no such nuisances. The f-program may begin with any of several labels...*

Left unsaid was, "but not all the labels..."

The HP-11C has only flags 0 and 1, omitting flags 2 and 3 that its predecessor HP-34C had. This saved six operations, to get the HP-11C under 256 programmable instructions. A concise list of differences between HP-34C

and the HP-11C programmable instructions is found in the following post within a long thread containing technical insights from Eric Smith:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=98494#98494>

Which brings us back to the HP-15C: With all the functionality of the HP-11C, plus SOLVE and INTEG from the HP-34C, pioneering matrix-based and complex-number functionality, as well as extensions of traditional functions, clearly the uniform single-byte op-code would not be sufficient. If the byte were to remain the standard unit of size, some op-codes would require two bytes -- similar to what was done for the HP-41C. Given the limited RAM of the HP-15C (a maximum of 448 bytes programming space), the two-byte codes would need to be intelligently selected, such that the most commonly-used instructions would have one-byte codes.

The complete set of one- and two-byte HP-15C op-codes was revealed in an excellent article published not long after the HP-15C's introduction in mid-1982: "Synthetic Methods on the HP-15C" by Allyn F. Tennant. *PPC Calculator Journal*, Volume 10, No. 1, January/February 1983, pages 49-53. An easily-created synthetic matrix pointing to base of the pool of allocatable memory (and not simply the storage of the matrix itself) allowed direct viewing of the operating codes of entered programming instructions. Here's an example:

1. Clear all program memory [CLEAR PRGM], clear matrix data [MATRIX 0], and exit complex mode [CF 8]
2. Set R19 as the highest-numbered register [19 DIM (i)]
 

(NOTE: A master clear -- turning on while holding down the "-" key -- would accomplish all of the above.)
3. Type 1.000000044, turn calculator off, then turn it back on while holding down the  $y^x$  key
4. Store the (non-letter) descriptor of the resulting matrix to the indirect register [STO I]
5. Dimension matrix A as 1x23 [1, ENTER, 23, DIM A]
6. Set the matrix pointer to 1,23: [1, STO 0, 23, STO 1]
7. Enter program mode and key in the following instructions: DIM I, GTO 0,  $x^2$ , DSE 0, RCL\*I, LBL 3
8. Exit program mode and display the register containing the programmed instructions using [RCL (i)]. In default display mode (FIX 4), the display reads

"4.4536 99"

9. View the mantissa by holding down [CLEAR PREFIX]. The display reads

"3PEo 82-r1"

The complete hexadecimal contents of the register are "03DECF82BA1099". Here is a complete breakdown:

| display | hex value | representing                               |
|---------|-----------|--|
| (N/A)   | 0         | Left nibble of "LBL 3" (1-byte code "03")  |
| "3"     | 3         | Right nibble of "LBL 3" (1-byte code "03") |
| "PE"    | DE        | 2nd byte of "RCL*I"                        |
| "o "    | CF        | 1st byte of "RCL*I"                        |
| "82"    | 82        | "DSE 0" (1-byte code)                      |
| "-r"    | BA        | $x^2$ (1-byte code)                        |
| "1"     | 1         | Left nibble of "GTO 0" (1-byte code "10")  |
| (N/A)   | 0         | Right nibble of "GTO 0" (1-byte code "10") |
| "99"    | 99        | "DIM I" (displayed in exponent field)      |

The "DIM I" instruction is displayable as the exponent of the full floating-point number. As stated, the left nibble of the "LBL 3" and the right nibble of the "GTO 0" instructions are not directly displayable. For numbers, these

nibbles contain signs for the mantissa and exponent (among other information, such as matrix identifiers and LU decomposition status).

Here's the principle of the synthetic matrix: The ON/y<sup>x</sup> processor-reset operation rotates the 56-bit content of the x-register 22 bits to the right. So,

1.000000044 (float) =

0000 0001 0000 0000 0000 0000 0000 0000 0000 0100 0100 0000 0000 0000 (DCB)

becomes

0001 0001 0000 0000 0000 0000 0100 0000 0000 0000 0000 0000 0000 0000 (DCB)

after rotation. The first "1" indicates a matrix descriptor; the second "1" is the matrix identifier, which is not among the standard set of A through E that are encoded correspondingly in hexadecimal. (The value "1" in the mantissa is included to prevent automatic normalization to an exponentiated value, which would change the bit pattern.)

The selection and arrangement of the complete set of HP-15C 1-byte and 2-byte op-codes found respectively in Figures 3 and 4 of the PPC article exhibit the thoughtful planning, logical grouping, and overall attention to detail also found in the [arrangement of the HP-15C keyboard](#). Here are some observations:

#### One-byte codes:

- If the right nibble is hex F, then the byte is the first of a two-byte instruction. This enables BST to find instructions quickly (an improvement over the HP-41), but eliminates 16 possible 1-byte op-codes, leaving 240 such codes still available.
- Instructions whose value, register, or label is 0-9 have the corresponding hex value 0-9 as the right nibble. This holds for LBL, GTO, GSB, RCL, STO, TEST, and the numbers 0-9.
- RCL and STO using registers .0-.9 have the corresponding hex value 0-9 as the right nibble.
- Instructions whose value or input argument is A-E have the corresponding hex value A-E as the right nibble. This holds for LBL, GTO, GSB, RCL, STO, RCL g, STO g, RCL MAT, RES, DIM, and RCL DIM.
- RCL MAT A-E uses five 1-byte codes because these instructions would be used routinely for matrix-based calculations. (STO MAT A-E would be used only for *copying* entire matrices, and are 2-byte codes.)
- x< >, DSE, and ISG using register number 0, 1, I, or (i) as an argument are included as 1-byte instructions, whereas the same functions using a different argument are 2-byte instructions. The R0, R1, and I registers, which are non-allocatable and don't store statistical summation values, are always available for these functions.
- Most transcendental-function commands are grouped in the op-code table in the same way that they are located on the keyboard.

#### Two-byte codes:

- There are a total of 460 2-byte op-codes, which exceeds the 256 codes that a second table would provide. Thus, the second byte of some 2-byte codes matches a 1-byte code, making the left nibble of the 1st byte necessary for uniqueness. With the right nibble of the 1st byte being hex F, the 2-byte op-codes are essentially 3-nibble codes, most of which are unused.

- All eight register-arithmetic commands can be used with 0-9, .0-.9, A-E, (i), and I. Because this creates a set of **216** unique instructions, the instructions are 2-byte -- which is justified anyhow, given that STO and RCL arithmetic functions encompass two or more simple instructions. (RCL arithmetic is unavailable on the HP-41 as well as the HP-34C and HP-11C, which offer only 44 register-arithmetic instructions: STO #0-9 and STO #(i), where # is an arithmetic operation).
- LBL, GSB, and GTO with arguments .0-.9 are basically extensions of the corresponding one-byte codes for the arguments 0-9, the only difference being the pre-pended 1st byte: hex FF.
- RCL and STO of matrix elements in user mode are 2-byte. The codes were selected so that the 2nd byte matches the single byte of the corresponding instructions outside user mode, the only difference being the pre-pended 1st byte: hex BF.
- Indirect matrix access using stack pointers -- RCL g (i), STO g (i) -- is encoded to correspond with "RCL g D" and "STO g D", the only difference being the pre-pended 1st byte: hex AF: i.e., AF5D and AF6D versus 5D and 6D.
- All SOLVE and INTEG commands are 2-byte. These are infrequent in programs, but account for 50 unique instructions, as they are usable with all 25 labels (not just a few, as with the HP-34C).
- Flag operations and display-mode settings are 2-byte, as these account for 66 unique instructions. (The HP-15C has 10 flags, with access through the indirect register I as well.)

NOTE: There is a list of two-byte instructions on page 218 of the HP-15C Owner's Handbook. This list, however, omits [GSB][.] label , x < > {A-E}, DSE {A-E}, and ISG {A-E} -- the only mistakes I've ever found in that manual.

---

Of course, a picture is worth a thousand words; the preceding discussion is much easier to follow with the PPC Journal article and its tables at hand. The article is well worth perusing, and there's much more in it than I have discussed -- including a demonstration synthetic program that displays "HELLO PPC" in the display!

The article, included within the PPC archives, is available as the 10154-kB file "v10n1.pdf" on CD #1 from Jake Schwartz at <http://www.pahhc.org/ppccdrom.htm>, or on the Extended Archive DVD available from another site.

Tables of op-codes for the HP-11C, HP-34C, and two-byte op-codes for the HP-15C are available at Eric Smith's web pages:

<http://www.brouhaha.com/~eric/hpcalc/>

[http://www.brouhaha.com/~eric/hpcalc/hp15c/two\\_byte\\_instructions.html](http://www.brouhaha.com/~eric/hpcalc/hp15c/two_byte_instructions.html)

## Re: HP-15C Silver Anniversary! (Op-codes, synthetic matrices)

Message #3 Posted by **Karl Schneider** on 3 July 2007, 1:37 p.m.,  
in response to message #2 by Antonio Maschio (Italy)

Hi, Antonio --

I was planning to respond to your reply from yesterday, which you apparently deleted and replaced with a new one. Thank you for the praise, which is admittedly difficult for me or anyone to truly fulfill...

:-)

In fact, it has been my intent to package the two "short essays" into a full-fledged MoHPC article with tabs. I'd like a little more feedback from others on the latest contribution.

One topic I'd like to be able to illuminate for readers concerns the engineering methods employed for the development of the HP-15C. I'm continually astounded how *perfection* in product development was nearly achieved -- no detail was overlooked, no feasible function that was necessary or useful was omitted, only one page of the manual contains errors, and only **one minor RPN bug** crept in -- a carryover from certain predecessor models, at that.

This excellence is more astounding, considering the pioneering functionality and fairly-short time of development. Obviously, it didn't happen by chance; some systematic, methodical engineering methods were employed, and I'd like to know what they were. I do have an idea how to find out more about them, but will discuss that when the time comes...

Best regards,

-- KS

The referenced article "HP-15C Synthetics" by Allyn Tennant, from PPC Calculator Journal V10N1, has been converted to HTML and is available [here](#).

Any errors in the HTML conversion are undoubtedly mine.

### **HTML conversion of HP-15C synthetics PPC article**

*Message #8 Posted by **Karl Schneider** on 9 July 2007, 9:24 p.m.,  
in response to message #7 by Eric Smith*

Eric --

Many thanks for posting the link to some diligent work you performed in 2004. Your HTML conversion of the 1983 PPC Journal article is much more accessible to people (and easier to read) than the small-print

scanned Journal article purchased from Jake Schwartz or "TOS".

I couldn't help but notice, though, that the link to the HTML file is a "deep link" that does not appear under <http://www.brouhaha.com/~eric/hpcalc/>. The user is prohibited from viewing the contents of <http://www.brouhaha.com/~eric/hpcalc/hp15c/>, where your HP-15C "two byte instructions" spreadsheet is kept.

Is this by intent?

### Porting HP41CX programs

Message #1 Posted by [Prabhu Bhooplapur](#) on 1 July 2007, 8:42 a.m.

I am trying to port my HP41CX programs to 41CX emulator V41R8 (of Warren Furlow). I am transferring my programs to a 720kB DD diskette via a HP9114B disk drive. I have an old pc running Win98 and using the 3.5" 720kB disk drive of this pc I am able to transfer my files from the diskette to a directory on the hard disk. I used the LIF utility and used the LIF to DOS command. But the files so transferred have no extension. What format are these? Are they .lif files? I want to convert these into .raw format so that I can upload these to the 41CX emulator. I tried the WIN41UC program and the resulting .raw program has the first line in the program the LBL instruction missing. Could any Gurus please tell me how to go about this? Thanks for your help. Prabhu

### Re: Porting HP41CX programs

Message #2 Posted by [Egan Ford](#) on 1 July 2007, 6:13 p.m.,  
in response to message #1 by [Prabhu Bhooplapur](#)

I am no expert, but this just worked for me:

1. Convert the diskette to a LIF image. I can think of two possible ways to do this from DOS/WIN98:
  - LIFUTIL (<http://hp41.claughan.com/files/LIFUTIL.zip>). Alternatively you may be able to extract the individual files and convert with HP41UC.
  - EMU41. I tested this. EMU41/EMU71 under DOS can read 9114 floppies. Copy the code to HDRIVE1. HDRIVE1.DAT will be a LIF image.
2. Once you have your LIF image use HP41UC (<http://hp41.claughan.com/files/hp41uc.zip>) to extract and convert to RAW, e.g. to extract SAV41 from the image and convert to RAW run:

```
HP41UC.EXE /l=HDRIVE1.DAT /r=sav41.raw SAV41 /k
```

UPDATE: Read the HP41UC docs, page 12 for step-by-step on how to do this with LIFUTIL/HP41UC. IANS, LIFUTIL can extract files in RAW format. V41 should be able to read as input.

**New HP42S**

Message #1 Posted by [ce25593](#) on 29 June 2007, 8:35 p.m.

I came across a new HP42S some time ago. It is still in the original plastic packaging material. The manual is still in the celophane wrap and has not been opened. The box is intact but showing some wear. What would this be worth today? I have a 42S at work I use all the time. I am trying to decide if I want to sell the new one or keep it as a spare.

Thank you.

Bob Haynes, San Diego

Message #4 Posted by [Mike Ingle](#) on 30 June 2007, 12:25 a.m.,  
in response to message #1 by [ce25593](#)

Where'd you find that? I found a new HP15C on craigslist awhile ago for \$50. It was a gift in a defunct relationship, from the story I heard. Even though it was new, it had two broken heat stakes I had to repair.

Mike

**Re: New HP42S**

Message #5 Posted by [Alexander Wassermann](#) on 4 July 2007, 9:31 a.m.,  
in response to message #4 by [Mike Ingle](#)

Hi,

how do you repair the heat stakes on a 15C. My 23 year old 15C has about 10 broken off. I have tried to glue them back on some years back, but they did not hold. I have now some foam behind the PCB to

support it from behind. Unfortunately by this method some of the keys still "rattle" when shaking the unit.

Any comments would be welcome.

Regards, Alexander

### **Fix HP15C, was re: New HP42S**

*Message #6 Posted by [Mike Ingle](#) on 5 July 2007, 5:54 a.m.,  
in response to message #5 by Alexander Wassermann*

Check the archives for fixthatcalc's response to my question.

I got some Loctite super glue with an activator pen. Put the machine face down on a washcloth or other padded surface. Remove the back, and remove all the broken mushroom heads. For each broken one, press the circuit board down so the keys are firm. Treat the stake and board with the activator pen, and put a very small amount of super glue (I used a toothpick) on the stake and board where they meet. Keep it pressed down for a couple of minutes. A few seconds is not long enough. After reassembling, use rubber cement to attach the feet.

The 15C and 41C series have a basic flaw in that they rely on constant tension, in an organic material, to keep them working. HP did not know they would be collectors' items in 20+ years when they made them.

Mike

*Message #7 Posted by [Seth Morabito](#) on 30 June 2007, 2:26 a.m.,  
in response to message #1 by ce25593*

Sigh! I have New HP Calculators on the brain, I'm afraid. I saw the subject line and immediately though "Oh, HP is releasing a new version of the 42S?!"

Alas, no. But you do seem to have a very sought after little gem there! If I were you I'd keep it, but then I am something of a hoarder. If you need the money, I'd be interested to see how much it goes for on eBay. I'd love a 42S myself to help fill out my LCD-HP collection, but alas they're far too rich for my blood right now.

Please do let us know what happens with it!

**Let's play with a 3D model of HP-41C**

Message #1 Posted by [Jean-Michel](#) on 29 June 2007, 8:49 p.m.

Hello Gentlemen !

While some of us here enjoyed discussing about the next HP-35S, imagining numerous variants of keypads and the related functions, or solve some mathematical and programming challenges, the idea came to my mind to materialize me too my interest for HP calculators.

As I have, as most of us I assume, a special relationship with what is probably a pillar of the Hewlett Packard building, I mean the beloved HP-41, I decided to make my way a sort of tribute to this fascinating machine, by doing a complete tri-dimensional model of it. This is not, of course, as interesting as an emulator, but visually speaking, it goes further and, in this way, this is complementary.

I took the dimensions on my '41, which is an early one (serial no : 1944A...), also called a "tall key", with square corners on the screen and gold-plated ball-bearings on the side of the battery compartment (to allow for a future AC adaptor that was never produced, as you can read in the MoHPC).

[http://perso.orange.fr/Jean-Michel.XEQ-41C/HP-41C\\_3D/hp-41c.jpg](http://perso.orange.fr/Jean-Michel.XEQ-41C/HP-41C_3D/hp-41c.jpg)

As you can see on the attached picture (I apologize for the poor quality of this picture), I think the result is not so far from the original model. I really had some fun by making the parts one by one, and by assembling them to give life to this project, and I hope you will enjoy playing with it at your turn, because that's what you'll be able to do ! (Please, be indulgent with me, I didn't disassemble my '41 to draw the PCB !)

I explain : you'll find [here](#) a small website I've quickly made to host the 3D-file and a link to a free software, a viewer of 3D files, eDrawings viewer 2007®, necessary to display this file.

Download and install the viewer, then download and open with the viewer the file HP-41C.easm, and play ! You can zoom, rotate the model, move the components, hide them or make them see-through : you will see your HP-41 closer than you never did !

This is totally useless, but absolutely necessary for who is HP-41 fanatic !

Kind regards from Jean-Michel.

### feeling old....

Message #1 Posted by [Les Wright](#) on 29 June 2007, 12:02 p.m.

I turned 43 on Wednesday and felt pretty good.

Then, in doing som SysRPL programming, I realized that that is 67 in hexadecimal.

I don't even want to think about dog years. Or binary. :)

Les

### Re: feeling old....

Message #2 Posted by [Gerson W. Barbosa](#) on 29 June 2007, 12:30 p.m.,  
in response to message #1 by Les Wright

Hello Les,

Happy Birthday! - albeit a little late...

Quote:

I turned 43 on Wednesday and felt pretty good.

Then, in doing som SysRPL programming, I realized that that is 67 in hexadecimal.

I fear there's a little mistake here, as  $\#67h = 6 * 16 + 7 = \#103d$ , isn't it? Actually, somehow you have converted your age to base **6** :-)

Best regards,

Gerson.

P.S.: Will turn 46 next Jul/22. That's #2Eh, which doesn't make me look any younger... Anyway, I was able to run 2510 meters in 12 minutes this morning :-)

*Edited: 29 June 2007, 12:35 p.m.*

### Re: feeling old....

Message #3 Posted by [Jeff O.](#) on 29 June 2007, 12:47 p.m.,  
in response to message #2 by Gerson W. Barbosa

At first I thought Les used base-6 also, but, of course he could not be 67 in base-6.

### Re: feeling old....

Message #4 Posted by **Gerson W. Barbosa** on 30 June 2007, 11:27 a.m.,  
in response to message #3 by Jeff O.

Oops! :-)

### Re: feeling old....

Message #5 Posted by **Paul Brogger** on 2 July 2007, 9:44 a.m.,  
in response to message #3 by Jeff O.

Even the *first* digit in **67** would be improper representing a value in base-six.

As we all know, when representing values in any base  $n$ , the value  $n$  appears as "10".

The numeral six ("6") shouldn't appear in any base-six value, just as the numeral eight ("8") doesn't appear in any octal representation, the numeral used for ten ("A") doesn't show in any decimal value, and the numeral that might be used for sixteen ("H") won't show in any hexadecimal value.

[End of pedantic rant/reminder.]

I (probably, all too predictably) remind folks at two oft-obsessed-over passages that:

$$40_{10} = 28_{16}, \text{ and}$$

$$50_{10} = 32_{16}$$

(I'm 55, which I might choose to represent as either  $37_{16}$ , or  $67_8$ .)

### Re: feeling old....

Message #6 Posted by **Gerson W. Barbosa** on 2 July 2007, 12:24 p.m.,  
in response to message #5 by Paul Brogger

Quote:

\_\_\_\_\_  
(I'm 55, which I might choose to represent as either  $37_{16}$ , or  $67_8$ .)  
\_\_\_\_\_

In order to avoid more silly mistakes, I will refrain myself from representing my age in bases others than 10. However, using Mars as a reference makes me look younger (only **24.42** martian years) and lighter (only **64.46** pounds. Mars wouldn't make me any taller than 5' 8" though :-)

### Re: feeling old....

Message #7 Posted by **Dave Shaffer (Arizona)** on 2 July 2007, 5:42 p.m.,  
in response to message #6 by Gerson W. Barbosa

"Mars wouldn't make me any taller than 5' 8" though"

Actually, depending on how you measure it, it would!

The meter was originally defined so that there were 10,000,000 meters from the equator to the pole (along the meridian through Paris - as opposed to those Brits, who preferred feet and yards and the Greenwich Meridian!). Since Mars is only about 60% as big (in diameter) as the Earth, a similarly-defined Martian meter would be 60% smaller than a terrestrial meter - so you would be 60% taller in Martian meters!!

**Re: feeling old....**

Message #8 Posted by **Dave Shaffer (Arizona)** on 2 July 2007, 5:45 p.m.,  
in response to message #7 by Dave Shaffer (Arizona)

Oops - not "60% smaller" but 60% as large!! But, since  $1/0.6 = 1.666$ , you would be more than 60% "taller."

**Re: feeling old....**

Message #9 Posted by **Gerson W. Barbosa** on 2 July 2007, 6:15 p.m.,  
in response to message #8 by Dave Shaffer (Arizona)

Good point! Hadn't thought of this. Being 2.88 Martian meters tall looks pretty good to me :-)

**Re: feeling old....**

Message #10 Posted by **Jeff O.** on 2 July 2007, 12:37 p.m.,  
in response to message #5 by Paul Brogger

Quote:

Even the first digit in 67 would be improper representing a value in base-six.

D'oh! So I guess Les is **111** in base-6. (He keeps getting older and older!)

Quote:

I (probably, all too predictably) remind folks at two oft-obsessed-over passages that:

$$\begin{aligned} 40_{10} &= 28_{16}, \text{ and} \\ 50_{10} &= 32_{16} \end{aligned}$$

Conjecture - If humans had 16 fingers instead of only 10, we would we all feel so much younger. (Probably not, actually.)

**Re: feeling old....**

in response to message #10 by Jeff O.

Quote:

---

Conjecture - If humans had 16 fingers instead of only 10, we would we all feel so much younger.

---

No need to go so far. Remember Mayas in todays Guatemala, Belize and Yucatan had a base-20 system. That would cover every reasonable human age, e.g. me showing up as a real twen -- feeling twice as elastic immediately :-)

BTW: 16 in base 16 would be G, if it would exist. End of pedantic correction.

Even the *first* digit in **67** would be improper representing a value in base-six.

---

Way back when, when I was first introduced to this stuff, we wouldn't have restricted the definition of a base six number as you do. We recognized that if the writer said that 67 was a base six number then the number was equal to decimal 43. We might have noted that the writer hadn't managed to perform all of the "carries" that were available.

When we used octal or hexadecimal representation as a shorthand for the ones and zeroes we recognized that the representation wouldn't have any digits greater than one less than the base. But, that's not really tied to the definition of base as I remember it.

### Re: feeling old....

Message #15 Posted by **Gerson W. Barbosa** on 2 July 2007, 9:41 p.m.,  
in response to message #14 by Palmer O. Hanson, Jr.

In fact, at least the first digit in **67** is not improper in this base-6 system:

[http://en.wikipedia.org/wiki/Bijjective\\_numeration](http://en.wikipedia.org/wiki/Bijjective_numeration)

Back to the usual definition of base, this Q&D HP-33s program might help me convert decimal numbers (up to 215) to base six correctly:

LBL N

```
ENTER
ENTER
6
INT/
x<>y
6
Rmdr
x<>y
ENTER
ENTER
6
Rmdr
x<>y
6
INT/
100
*
x<>y
10
*
+
+
RTN

43 XEQ N -> 111

the writer :-)
```

Message #16 Posted by [Les Wright](#) on 29 June 2007, 12:56 p.m.,  
in response to message #2 by Gerson W. Barbosa

Actually my logic in saying I am 67 is this:

$$67 = 4 * 16 + 3$$

I am using the decimal digits in the hexadecimal system to give the 67 numeral.

I know I have the logic backwards, but I thought it was funny.

Oh yes, it was ;) Will become worse with age...

### Re: feeling old...

Message #18 Posted by [Jeff O.](#) on 29 June 2007, 12:42 p.m.,  
in response to message #1 by Les Wright

Wouldn't you be (only) 2B in hex? I think you flipped your conversion, as if you were 67 in decimal, you'd be

only 43 in hex.

Quote:

I don't even want to think about dog years.

When I turned 40, a "friend" gave me a shirt on which appeared a cartoonish drawing of a crumbling dog skeleton and the message "In dog years, I'm dead." Not sure what that means, but sometimes I feel that way. At 43 you're still just a (quite alive) pup.

### Re: feeling old....

Message #19 Posted by **Peter Geiser** on 29 June 2007, 12:56 p.m.,  
in response to message #18 by Jeff O.

It is said that each year a dog lives compares to seven human years. So, a 7-year old dog has about the same age as a 56-year old human. With 40 dog years, you'd be around 280, which is not likely achieved.

But back to the first post: congratulations Les! Let's be glad that we count in decimal, not hex. I hope you feel rather 43(oct)-ish...

Best regards  
Peter

### Re: feeling old....

Message #20 Posted by **Woody Larkin** on 29 June 2007, 7:59 p.m.,  
in response to message #19 by Peter Geiser

Hi, A newer approximaton of a dog's age compared to a human's is as follows: Age: 1st 2 years = 25 years; each additional year = 4 human years.

A 15 year old dog would be equivalent to a 77 year old person.

A 43 year old man would be equivalent to a 4 1/2 year old dog which is still in its prime.

### Babbling

Message #21 Posted by **Palmer O. Hanson, Jr.** on 29 June 2007, 9:26 p.m.,  
in response to message #1 by Les Wright

From the vantage point of decimal 78 this thread looks a lot like what we used to call "the babbling of babes in the woods".

But, Happy Birthday anyway.

### Thinning out the harmonic series even more.

Message #1 Posted by [Rodger Rosenbaum](#) on 29 June 2007, 12:09 a.m.

Valentin's recent challenge involving the harmonic series caused me to run across a related series:

<http://mathworld.wolfram.com/HarmonicSeriesofPrimes.html>

and a fascinating modification to it.

If you delete from the harmonic series of primes those primes that contain each of the digits 0,1,2,3,4,5,6,7,8,9 at least once, the series converges.

A paper providing a proof of this was published in Mathematics Magazine in October, 1995.

But, the author didn't provide the value of the limit.

Can we find it with our calculators?

### Re: Thinning out the harmonic series even more.

Message #2 Posted by [hugh steers](#) on 30 June 2007, 6:50 a.m.,  
in response to message #1 by Rodger Rosenbaum

Lets call harmonic(x) the harmonic series with digit x missing, primes(x) the 1/primes series with digit x missing. Then we know primes(x) also converges since  $\text{primes}(x) < \text{harmonic}(x)$  which converges.

Your series is  $\text{primes}(0-9) = 1/\text{primes}$  striking out those terms missing at least one of 0-9. I think this is what you mean by, delete those containing "each" of 0-9. Ie those than contain all digits are removed. Otherwise if you mean any of 0-9 then clearly this is all terms!

So  $\text{primes}(x)$  is part of  $\text{primes}(0-9)$ , since x is missing and  $\text{primes}(0-9) < \text{primes}(0) + \text{primes}(1) + \dots + \text{primes}(9)$ , since the latter counts some terms twice, but the latter has a value so the former must converge. So there's a convergence proof and an upper bound. This also means  $\text{harmonic}(0-9)$  converges and could be calculated by egan's program. We also have  $\text{primes}(0-9) < \text{harmonic}(0-9)$  too.

### Re: Thinning out the harmonic series even more.

Message #3 Posted by [Rodger Rosenbaum](#) on 30 June 2007, 4:27 p.m.,

"striking out those terms missing at least one of 0-9" is not the same.

For example, your description would strike out 102345789 because it is missing the digit 6.

My description would not strike it out because it doesn't contain each of the digits 0,1,2,3,4,5,6,7,8,9 at least once; it doesn't contain the digit 6 at least once.

**Re: Thinning out the harmonic series even more.**

*Message #4 Posted by [hugh steers](#) on 30 June 2007, 5:02 p.m.,  
in response to message #3 by Rodger Rosenbaum*

i see.

i've noticed that my argument applies to your definition and not to mine! my previous definition was wrong. in fact the series made by striking out those missing one of 0-9 will be the series of those containing all of 0-9 which will be nearly all terms (after a while).

your series is then the opposite. you are striking about those containing all of 0-9 so the series primes(0-9) is 1/primes with at least one of 0-9 missing.

so then, primes(x) is part of primes(0-9) since if x is missing, it can't be struck off.

and then primes(0-9) <= primes(0) + primes(1) + .. + primes(9) as before.

### HP-41: a M-code question

Message #1 Posted by [JMBaillard](#) on 28 June 2007, 3:28 p.m.

Hi,

does anyone know how to program in M-Code  
an instruction like XEQ IND 00 ?

It seems that

?NCXQ  
24C7 is the entry point

with SETF7 for XEQ  
or CLRF7 for GTO

-But in what CPU register must be stored the address 00 ?

Regards,  
JMB.

### Re: HP-41: a M-code question

Message #2 Posted by [Howard Owen](#) on 28 June 2007, 4:27 p.m.,  
in response to message #1 by [JMBaillard](#)

User register 0 is not in a CPU register. It's in the user memory "peripheral." See pages 31-33 of "HP41 MCODE for Beginners" for a description of the layout of user memory. (Register 0 is at \$1FF of the user memory peripheral.) You access peripherals with the WRIT and READ instructions, after selecting the peripheral number with PRPHSLCT. HP41 user memory is peripheral 0.

Regards,  
Howard

### Re: HP-41: a M-code question

Message #3 Posted by [Meindert Kuipers](#) on 29 June 2007, 4:36 a.m.,  
in response to message #1 by [JMBaillard](#)

This is a bit strange entry point to be calling from Mcode, since it will call a numeric label in User Code, so this makes me a bit curious why you would want to do this. I have done something comparable in the past, a Mcode routine to skip a certain number of (User Code) lines with SKPLIN at 0x2AF9. Could be useful after a flag test or compare.

Meindert

### Re: HP-41: a M-code question

*Message #4 Posted by **JMBaillard** on 29 June 2007, 5:16 p.m.,  
in response to message #3 by Meindert Kuipers*

Hi ,

in fact, I'm not quite sure of this entry point but I would like to write a Gauss-Legendre integrator in M-code in which the constants could be inserted, thus avoiding the use of data registers to store these constants ( or very slow execution if they are in the "standard" program itself )

I've read in "Mcode for beginners" how to use status register c to find the absolute address of register R00, and I wonder if something like

```
... ( storing this absolute address in a proper CPU-register )
SETF7
?NCXQ
 24C7  would be equivalent to XEQ IND 00
```

Regards,  
JMB.

### **Re: HP-41: a M-code question**

*Message #5 Posted by **Doug** on 30 June 2007, 9:54 a.m.,  
in response to message #4 by JMBaillard*

I haven't tried that before. It does seem that f7 controls GTO/XEQ at that point. Looking @ ADRFCH 0004, it seems the register address is in the internal flag register, at 0008 it recalls it to C, clears the indirect bit then tests to see if it is a stack register (with ?FS 6, 5, 4).

If it is a stack register it stores the address in N then reads the register and returns with the unconverted LBL number (or text string) in C. Otherwise it's doing something with B in CHKADR.

A better way to implement such a thing might be to enter @ 24CC with the required LBL # or text string in C (in unconverted form), however, at that point R(X) controls the XEQ/GO choice. So one needs to execute SAVRC (27DF) before the above entry, or SAVRTN (27D3) if only XEQ is of interest.

It is not clear to me how you will use the function, SAVRTN will push the address located just after your function (actually the last byte of your function) in program memory, so it may be necessary to decrement the address twice before applying SAVRTN, yet then you are still presented with the problem of where you are at within the loop (no data are preserved within the CPU across user code calls). Initialize a counter in a ram register?

If you only want to execute a numeric LBL, time can be saved by skipping the BCDBIN call and just enter @ 24D1. Eg: something like:

```
XQNC GETPC 2950
```

```
XQNC DECADA 29CA
```

```
XQNC DECADA
```

```
XQNC SAVR10 27D5
```

```
LDI binary LBL number 0 to 63 (see the test @ 24D4)
```

GONC 24D1

Next time you see the process will be at your function entry point. So you will need some kind of counter in a ram register for branch purpose at entry to function, the fastest type counter would be a text string in say R00 that initializes to text null (simple increment in binary).

Another speed up would be to save the address of the found subroutine and your function call somewhere in ram register so no search is necessary after initial call. Both these addresses would fit in the high nibbles of R00 if R00(X) is used for the counter.

I haven't considered the problem of keyboard execution of the function, it may be impossible to "come back" or require exotic poll programming (how about we put it @4000 ? ,just kidding).

Best

**Re: HP-41: a M-code question**

in response to message #5 by Doug*

Hi,  
thank you all for these informations  
Best regards  
JMB.

**Re: HP-41: a M-code question**

*Message #7 Posted by [Doug](#) on 30 June 2007, 7:17 p.m.,  
in response to message #6 by JMBaillard*

Now you have me thinking about your interesting idea.

Why bother with a LBL at all? Here is an idea, say your function name is, for example, GAUSS9. Then follow the function with the integrand! In this case one already knows where the entry to the user supplied integrand is, it might look like: (for example;  
F(X)=X\*\*2+SIN(X))

store limits/step size/etc. at specified registers

```
CLA
ASTO 00
GAUSS9
SIN
LASTX
X^2
+
RTN
```

The execute address is already present in the user PC, the last byte of GAUSS ("fall into" the subroutine). One just needs to set up R(X) so that when RTN is executed it returns to the byte before GAUSS9.

Lots more details, such as where do we go when the function is done? etc. This could be the fastest integrator method.

Best

**Re: HP-41: a M-code question**

Message #8 Posted by **JMBaillard** on 1 July 2007, 5:21 p.m.,  
in response to message #7 by Doug

Hi,

I've tested the following M-code routine:

```
34D ?NCXQ
09C 27D3
378 READ13(c)
03C RCR3
270 RAMSLCT
038 READ DATA
331 ?NCXQ
090 24CC
.....
```

After storing the global label name in R00, it works,  
even if we SST the program in main memory.  
Unfortunately, the following M-code instructions  
( .... after ?NCXQ 24CC ) are NOT executed!

So it seems impossible to write a Gaussian integrator this way.  
I did it in another way with the Gauss 5-point formula  
after coding in M-code the 5 coefficients,  
but using 5 entries in the FAT just for numbers is wasteful,  
and it would be even worse for the 16-point formula...

Regards,  
JMB.

P.S: I've read your last post and I don't really understand  
how it works: the Gaussian formula needs to compute  
the function at several arguments, so I don't see  
how the M-code routine could change these arguments  
if it is inserted in the function itself.  
( sorry I'm only a beginner in M-code ... )

**Re: HP-41: a M-code question**

Message #9 Posted by **Doug** on 2 July 2007, 8:13 a.m.,  
in response to message #7 by Doug

```
"the Gaussian formula needs to compute
the function at several arguments, so I don't see
how the M-code routine could change these arguments
if it is inserted in the function itself."
```

Guess I am not being sufficiently clear: A user code subroutine cannot be called by a  
microcode function, it will never return.

Thus one needs to use a "trick". One possible trick is to push the address of the function into  
the user code return stack so that when a user code RTN is hit, it returns to the function. It  
will return to the microcode at the entry point of the function.

In this code:

```
CLA
ASTO 00
GAUSS9 your function
SIN user code subroutine, f(X)
LASTX
X^2
+
```

RTN            must end with RTN

SIN LASTX X^2 RTN is repeatedly executed until the integral is completed, for 5 point gauss with 10 sections it is executed 50 times. Your function must supply the value of X in X at each point and do your summation of the integral upon reentry (because at that point the result of the integrand, f(X), will be in X).

At entry to the function, it is necessary to determine which time we are going through the function, thus a ram counter is required, that's what the CLA ASTO 00 lines accomplish: initialize the counter (or use CLX STO 00).

At entry, READ e RCR 3 RAMSEL READ and the counter is now in C. If it's zero we know that this is the first time through (a result is not in X). Then increment the counter and WRITE (for next time through).

Except for the first time through: multiply f(X) (now in X) by the appropriate weight (determined by the counter) and sum it into a ram register. Every time through, except the last, using the counter, get the next abscissa and put it in X.

The function then modifies the user code return stack and falls into the user code subroutine. Here is what the exit from your function could look like (except for the last time through):

```
XQNC 2950 GETPC
B=A WPT            save address of PC for re-insert
XQNC 29C8 DECAD+1 backup two bytes
XQNC 29C8 DECAD+1
XQNC 27D5 SAVR10   it's our return address
GONC 24F3 XEQ20+1 put it in the user code return stack
```

For the last time through, one could simply recall the value of the integral and put it in X and stop. Or one could jump to the line following the RTN and use user code to recall the result. Here is one way to do that:

```
XQNC 2950 GETPC
LDI 085 (hex value of RTN line, there must be a RTN)
M=C
XQNC 2AF7 NXLSST
C=0 XS
A<>B
A=C X
C=M
?A#C X
JNC +3
A<>B
JNC -9 (NXLSST)
A<>B
GONC 232F PUTPCX
```

As far as generating the abscissas and weights one option to consider is using synthetic functions RCL N and RCL M. One uses a synthetic 14 character text string in program then the above lines get the full precision data into X, for storage into registers.

Or, the first time into the function, the data could be generated and placed into registers, that's a lot of load digit instructions! Anyway, for multiple sections, ram registers should be used to avoid generating the Xi and Wi repeatedly.

On the other hand, if you are determined to not use registers for the Xi and Wi, or to generate higher order coef, a table grabber could be used so that each word holds a byte, instead of LD which takes two words to load a byte. For 12th order the table would be 84 words and possibly 10 words for the grabber.

Best

### HP 50g DMS

Message #1 Posted by [Jeffrey Connor](#) on 27 June 2007, 9:20 p.m.

Hello All,

I just bought a 50g and cannot figure out how to input and return angles in DMS. I do this frequently and would like to have it readily available. Any suggestions?

Thank you very much,

Jeff

### Re: HP 50g DMS

Message #2 Posted by [Allen](#) on 27 June 2007, 9:52 p.m.,  
in response to message #1 by Jeffrey Connor

Read page 3-79 of the [advanced users manual](#).

### Re: HP 50g DMS

Message #3 Posted by [Matthew W. Milligan](#) on 29 June 2007, 4:17 p.m.,  
in response to message #2 by Allen

The function  $\rightarrow$ HMS converts a decimal hour (or degree) into a form HH.MMSS and the function HMS $\rightarrow$  converts HH.MMSS into a decimal value. As far as availability goes this function is found either in the CATALOG or in the TIME menu under tools. If you use it frequently consider making it a part of a CUSTOM menu or a user defined key.

### Re: HP 50g DMS

Message #4 Posted by [Trent Moseley](#) on 29 June 2007, 11:05 p.m.,  
in response to message #3 by Matthew W. Milligan

Lots of luck on a 31E with all its trig functions! Of course the function should be on the keyboard and not hidden in some menu somewhere ala the 42S.

tm

### Re: HP 50g DMS

Message #5 Posted by [Jeffrey Connor](#) on 4 July 2007, 8:51 p.m.,  
in response to message #1 by Jeffrey Connor

Thank you very much for your replies. I have put the DMS commands on my Custom menu.

How about entering and returning degrees, minutes, and seconds directly? I believe that you can on TIs by

entering each value followed by a symbol (e.g. ' for minutes). I believe that results can be reported in a similar fashion.

Any thoughts?

Thanks again,

Jeff

**Re: HP 50g DMS**

*Message #6 Posted by **Peter A. Gebhardt** on 5 July 2007, 5:26 a.m.,  
in response to message #5 by Jeffrey Connor*

Jeff,

in RPL mode enter HH <space> MM <space> SS <Custom Function>.

If your custom function has been built with (say as an example)

```
DEFINE('K(h,m,s)=h*3600+m*60+s')
```

in algebraic mode (which I suppose, because of your question), calling your custom function as described above will solve the RPL equation:

```
<< -> h m s 'h*3600+m*60+s' >>
```

and display the expected result.

For a description on DEFINE see Chapter 3 of the User Guide (the large pdf document on CD).

For a more user-friendly implementation, pls. look up the fine descriptions of - '30 MENU' usage in equations - to build custom menus. A lot of sophisticated samples of this technique are available at

[http://groups.google.com/groups/search?q=30+menu&qt\\_s=Search+Groups](http://groups.google.com/groups/search?q=30+menu&qt_s=Search+Groups)

Hope this helps!

Peter A. Gebhardt

### Extended Complex Number Calculations in SysRPL

Message #1 Posted by [Les Wright](#) on 25 June 2007, 7:50 p.m.

This follows up a back and forth I was having with James Prange in an earlier thread.

I have completed my SysRPL code to compute the sine and cosine integrals by complex continued fraction. The original Modified Lentz algorithm and formulae can be found in Numerical Recipes 2nd ed or later. Internally, the complex numbers are treated as two part entities, where each part is an extended real. The parts can be either the real or imaginary parts of rectangular form, or the modulus and argument of polar form. I have used NULLLAMs and stack manipulation. The complex arithmetic really is normal extended real number arithmetic on the constituent parts--I work in rectangular form for additions and subtractions, and polar form for multiplication, division, roots, and powers. The SysRPL functions %%R>P and %%P>R allow ready switch back and forth without getting bogged down in the trigonometry.

I have managed to keep track of everything and it works fine, but this is one case where the SysRPL code, albeit not yet optimized is perceptibly slower than my UserRPL version. However, the trade off can be construed as worth it--since the internal calculations are done to 15 digits, the 12 digit output is completely accurate provided that the input argument is of suitable size.

This leads me to a practical question, that I believe someone asked here earlier. When working in extended reals in SysRPL, what would you choose as a "machine epsilon" for the purpose of testing convergence? In double precision on my PC, I think machine epsilon is about 2.2e-16. In my program, the convergence test is when a particular multiplicative factor becomes unity and doesn't change in a subsequent iteration. In UserRPL, converging to actual equality works fine, but in extended reals in SysRPL, this expectation drags the computation out unnecessarily for some input. I have by trial and error settled on 2e-15 as my EPS. Any smaller and you might as well just converge to equality unnecessarily. So if variable del is the factor I want to be unity, the loop exits when LAM del %%1 %%- %%ABS %%2E-15 %%< returns True. Requiring LAM del %%1 EQUAL to be true consumes cpu time and offers no added benefit.

Any thoughts on this?

Les

### Re: Extended Complex Number Calculations in SysRPL

Message #2 Posted by [Les Wright](#) on 26 June 2007, 2:27 p.m.,  
in response to message #1 by [Les Wright](#)

There is potential for significant speed improvement here.

Though Dave has yet to add it to the HP41 Software Library, JM Baillard has shared with me a routine that computes the continued fraction from right to left by brute force for a predetermined number of terms. There is no futzing around with convergence tests, and flopping back and forth between polar and rectangular forms of the complex numbers is kept to a minimum. It is easy enough to determine the minimum argument size that will yield full precision for a given number of terms, and above that the extra terms are computed unnecessarily, but in a fast environment this shouldn't be that noticeable. Certainly it should be less noticeable than the delays in my own code due to convergence tests and frequent changes between polar and rectangular

mode. I should try to port that HP41 routine (which is, btw, less than 50 steps in length) and see how I make out. This may be one case where using the Modified Lentz algorithm is like using a shotgun to kill a fly!

Les

**Re: Extended Complex Number Calculations in SysRPL (JMBaillard take note!)**

*Message #3 Posted by [Les Wright](#) on 29 June 2007, 12:05 p.m.,  
in response to message #2 by Les Wright*

My port of JMB's code was a success, but it still isn't as fast as I would like. I gives results in around a second to full 12 digit precision for arguments greater than 5 (arguments less than 5 are well treated by a series summation which proceeds much faster). I may post my code here and in comp.sys.hp48 to see if I can get some optimization advice.

Les

### **From the HP-41C to the HP-48GX and a Broken 97**

Message #1 Posted by **Gerry Schultz (Los Angeles)** on 25 June 2007, 5:23 p.m.

To All:

Lately, I been having a lot of fun with old (new to me) calculators and I'm beginning to see the operational changes between my original HP-41C and the HP-48GX.

As mentioned in previous posts (thanks for the responses), I dropped using my HP-41C for a quite awhile until I bought an HP-48GX right when they came out. Thinking back, I remembered that I got interested in an Apple IIe as I needed to become more familiar with computers since work was going more and more that way. I then upgraded to an Apple IIGs and finally slipped over to a 486 with Windows 3.1. In '93, I got access to the Internet through dial up and I was lost for a long time.

I remember when I bought the GX as it was brand new and most available software was for the 48SX and I wondered if I had bought the right machine. When I started learning how to use it, I had a very hard time understanding all these new 'objects', an unlimited stack (oh, wow!) and 128K of storage (what is going on!?). I gave up a few times since the HP documentation didn't lift my cloud of confusion and only when 3rd party books started coming out explaining how the 48GX worked that it did began to sink in.

Now that I'm older and can afford to indulge my fetish, errr, interest in HP calculators, I recently purchased an HP-97, an HP-42s and an HP-28s. The 42s is great and as I started working through the Owner's manual, I could see how the old 4-position stack was moving over to HPL.

Now, with the 28s and it's great HP Owner's manual I really see how the 48GX became the calculator it is. Since the 28's manual goes step-by-step through the operation of the calculator, it is beginning to fill in all the missing little gaps of how this calculator works and along with it, the 48GX, the 49G, 49G+ and the 50G.

This going back and using these old calculators has helped me feel more confident with the newer ones. It also points out how poor HP's documentation is on it's present calculators. With the third party market for these calculators being so small, there aren't many books that explain how to use them. So, going back to these older machines and their documentation is as good as it gets.

I hope that when the HP-35s is released, that HP spends the time and money to write its manuals like how the 28s is written to help new-comers become more confident and make better use of their investments. HP makes some great calculators but if they don't help their customers master their machines, then only the smartest of us will make the full use of them.

Okay, enough reminiscing and complaining. I broke my 97 printer. I got a program that prints out prime numbers and I left it running last night printing out prime numbers. This morning the 97 printer was making a hi-pitched squeal and now doesn't work. I think the paper advance gears broke. Who works on 97 printers? I know the "Fixthatcalc.com" doesn't so whom else might?

Thanks for reading and indulging my lamenting of HP calculators.

Gerry

in response to message #1 by Gerry Schultz (Los Angeles)*

You might write FixThatCalc.com, I thought they were still repairing HP-97's. there is a guy on That Auction Site that is selling one he says they repaired back in 2003 anyway.

I haven't met a 97 printer I couldn't repair. Send me a private e-mail if interested.

### Red light left of display on Spice (32E)

Message #1 Posted by [Olivier TREGER](#) on 25 June 2007, 4:04 p.m.

Hello to all,

I have a great working 32E, at least it holds charge with a brand "from the HP factory" battery.

But there's also this annoying strong red light on the left of the display that remains lit all the time.

I've tried to cruise in the archive but I certainly didn't look properly.

Can anybody help?

Thanks, Olivier

in response to message #1 by Olivier TREGER

Is it a dot on the upper left?

I think that is the lowbat warning.

Perhaps the pack is not as good as it seems

I use standard size NiMH AAs in my 33C and 34C, with a thin strip of aluminum foil on the right to complete the circuit. Works fine, though inserting and removing cells needs to be done carefully since the fit is snug and the contacts can flatten and break.

Les

in response to message #3 by Olivier TREGER*

Hi,

I was the lucky recipient of a great-looking 33E that I got from a colleague at work a couple of years ago - for free. It had no batteries nor charger and one of the battery contacts needed to be soldered. I purchased a set of rechargeable batteries (cannot recall which type and I have not opened it to find out) and a charger on eBay, then I soldered the contact and the unit has worked flawlessly ever since.

It does have the red LED dot to the upper left of the display - but only when it is on batteries. The batteries have lasted for months between charges (intermittent use) and appear to be of good quality. I just thought it was a battery power indicator rather than low-bat.

Jeff

*Message #5 Posted by [Mike T.](#) on 26 June 2007, 6:13 p.m.,  
in response to message #1 by Olivier TREGER*

I've noticed when using my own SPICE series calculators that although they continue to function normally the low battery indicator can come on very soon after recharging when Ni-MH batteries are used. I haven't even thought about timing it but the low battery indicator doesn't seem to come on as soon when using Ni-Cad batteries, however these don't last nearly as long.

Although the nominal voltage of both type of cell is 1.2 volts I suspect that there is a small, but important, difference in the output voltage or impedance of these two different types of cell.

Can any one shed any more light (pun unintended) on this...

Mike T.

*Message #6 Posted by [Trent Moseley](#) on 26 June 2007, 9:03 p.m.,  
in response to message #5 by Mike T.*

There might be something to your observation. I notice the indicator, at times, but not all the time since I have been using nickel metal hydride batteries in my 31E. It works with no problems. Of course I don't use it that much but I haven't had to recharge the batts so far. tm

*Message #7 Posted by [Olivier TREGER](#) on 27 June 2007, 1:29 p.m.,  
in response to message #6 by Trent Moseley*

Just to put it back together:

I'm using original new-in-box HP batteries, freshly recharged although they can be defective.

The light is on whether it's on battery or charger, no difference.

I have a *great working* 32E...

---

Aaugh! Please don't use the favorite English phrases of "Coburlin"! :-)

You have a "32E that works fine", apparently. No greatness beyond 100% proper functionality is possible.

Quote:

---

...at least it holds charge with a brand "from the HP factory" battery.

...

I'm using original new-in-box HP batteries, freshly recharged although they can be defective.

---

Well, HP hasn't made Spice-series batteries for many years, so I'd say that never-used genuine-HP NiCd batteries are rather old, and are probably questionable due to chemical breakdown. They might appear to hold a charge, but will lose it quickly.

You should probably unwrap the battery pack, replace the old NiCd cells with fresh new 1.2V short cells (no + post), and re-tape.

If the battery terminals are already broken, you can squeeze in longer 1.2V NiMH cells with + posts that are rated 2000 mAh, jumpering the two cells with aluminum foil. These cells will go longer between chargings than NiCd cells.

Hello Karl,

I've done that on other Spices and it works well. However, I didn't suspect the genuine HP packs because they work in other calcs in [my collection](#).

Anyway, I think I'll follow your advice, too bad for the brand "new" HP batteries.

[ [Return to Index](#) | [Top of Index](#) ]**A Serious Scientific Instrument Revisited**Message #1 Posted by [Walter B](#) on 24 June 2007, 6:45 p.m.

Hi all,

After shifting keys around some time, I found a solution well within the keyboard of the coming 35S:

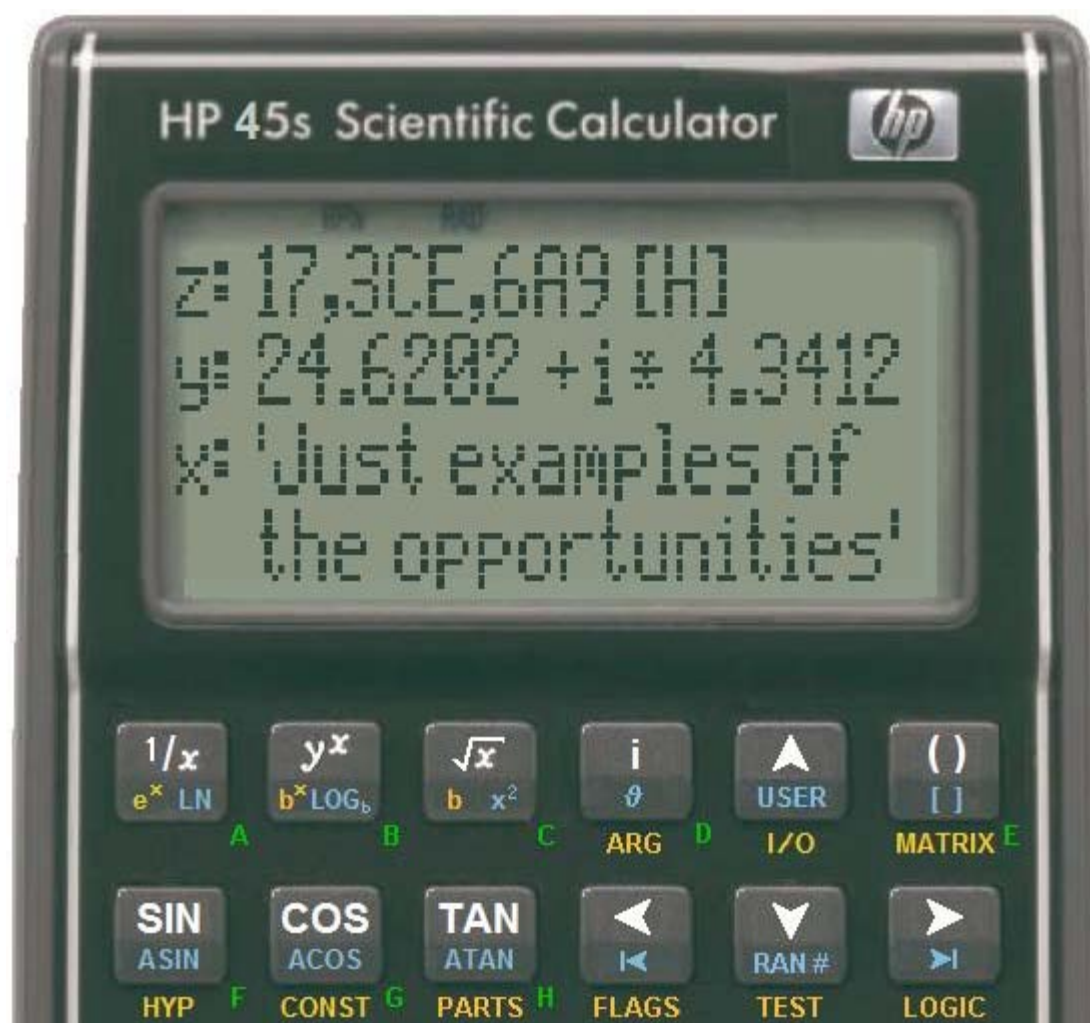

You'll find all the scientific functions in 2 lines of keys top left. Around ENTER, there is the classic layout of register and stack operations. On the right, below of the cursors, you find the keys for programming. The shifted keys 4 through 9 are for mode and base setting. Combined with the right arrow (unshifted GTO), they perform conversions.

This proposal allows for reusing at least the 35S housing and keys for some further development.

Oh, and for those members of this forum suffering from an allergy to diamonds, a slight modification may be more favourable:

However, this would leave the 35S's keyboard of course.

Both proposals would work with the poor old 2-line display of the 33S, too, but it would be a pity IMHO.

OK, now it's your turn again :-)) but remember, if you want different functions, please tell me what shall be omitted for them.

IMHO.

---

I gotta say, the (improved) 33s display has very nice contrast, and is very legible. Better, I think, than the graphical dot-matrix display as mocked up on your proposal.

So, I'd be happy either way.

Quite apart from display, alpha functionality, and the functions' arrangement, I do hope H-P will deign to pay attention to your suggestions re: keyboard colors and legend placement -- your images are *very* legible, indeed!

---

### Opening up a 32E

Message #1 Posted by [brianh](#) on 24 June 2007, 7:51 a.m.

Hello all!

I just received a HP32E in great cosmetic condition. However, it suffered the dreaded 'battery pack leakage'. I cleaned up the battery contacts but if I put in a known good battery pack the calculator will not turn on. I figure I have nothing to lose and want to open it up to see the extent of damage the leaking caused. I am able to remove the two screws in the battery compartment but the calculator is still held together by something along the bottom edge. Viewing some of the 'exploded' 30-series calculator views on this website I get the impression the bottom edge is not held together by screws but is somehow staked or slip-fitted. Is there a trick to getting the two halves apart? Thanks in advance!

Brian

in response to message #1 by [brianh](#)

When I first had to open my HP-34C I tried a couple of methods. This is the one that worked:

<http://voidware.com/calcs/spicerepair.htm>

Thank Hugh Steers for that tip :-)

Regards,

Gerson.

### Re: Opening up a 32E

Message #3 Posted by [Randy](#) on 24 June 2007, 12:52 p.m.,  
in response to message #2 by [Gerson W. Barbosa](#)

Yes, that method works... to rip the flex circuit of the battery connector right off the terminal board... when the case snaps free.

A simple precaution is all that is needed to prevent damage. The top right photo shows the back being removed with the unit face down. That's fine but: **you must lift the top of the case back off the battery connector board before applying pressure to disengage the bottom latch.** Again, pull the case bottom away from the battery connector leaving the connector attached to the front of the case. Once it is free, then apply pressure downward to disengage the latch. You need a fair amount of force to snap it free, once it lets go, that energy goes into pulling the board out of its slot and tearing the flex circuit is collateral damage.

Also, fifth row down, left photo: NEVER SCRAPE THE CONTACTS or you'll be looking for a

replacement keyboard. Clean well with isopropyl alcohol, clean the spring contact and re-lube lightly with a good white grease with teflon.

Well, I opened also a 33C using that method and I never had the flex circuit damaged. Either I was lucky or somehow I was careful enough. Anyway, thanks for calling our attention on this.

I opened them to change the decimal point to comma. I have another 33C which I never opened. One of these days it got me confused with a positive answer that was supposed to be negative. When I remembered to check the minus sign I noticed the minus segment was not working. I then let it fall from a one-inch height and it started working again. This was made in Brazil for local market, so the decimal point has been factory set to comma, therefore I didn't have to open it. But I am worried if I ever have to open it, as it is a solderless unit.

Regards,

Gerson.

Not knowing exactly where and how to squeeze the case halves to separate them, I devised this "dental floss" method several years ago, using it *thrice on two Spices* with no damage:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=22660>

### Re: Opening up a 32E

Message #6 Posted by **Jeff Kearns** on 24 June 2007, 9:33 p.m.,  
in response to message #5 by Karl Schneider

Greetings Brian,

I have successfully opened up my 33E twice using the voidware - spice repair technique mentioned above. It is true that you have to be a little cautious with the battery contact but the method works well.

I did try Karls' dental floss method but the floss I used may have been too flimsy as it kept breaking. Maybe you need heavy duty dental tape...

In any event, opening a spice should not be a big deal - especially if you have read the above posts. Good luck.

Jeff

*Message #7 Posted by [hugh steers](#) on 25 June 2007, 4:46 a.m.,  
in response to message #6 by Jeff Kearns*

i'd like to say that the credit for this technique goes to Tony Duell, who demonstrated this to me. i just made some pictures to help others.

glad that it has helped!

also,

i'd agree with the warning of never scraping the circuit board. in my case, i lightly scraped the back of the spring switch contact that had picked up a crust of corrosion of the years. the spring is all metal.

*Edited: 25 June 2007, 4:50 a.m.*

### **Re: Opening up a 32E**

*Message #8 Posted by [brianh](#) on 25 June 2007, 12:32 p.m.,  
in response to message #1 by brianh*

Thanks to all who responded! I did manage to get the case apart with no apparent damage and cleaned up everything inside, then reassembled. Unfortunately the problem did not get solved.

With a new battery pack installed, if I switch the calculator from 'Off' to 'On' there is no response. However, when I slide the switch back to 'Off' at about the mid-point between 'Off' and 'On' one of the LED segments in the upper left hand corner of the LED window glows faintly then fades out. This is the same behavior the calculator exhibited before I opened it up. I suspect corrosion got to the ribbon connector between the battery connectors and the circuit board but the traces still look good.

Anyone have any ideas?

### **On battery leakage**

*Message #9 Posted by [Palmer O. Hanson, Jr.](#) on 26 June 2007, 2:48 a.m.,  
in response to message #1 by brianh*

You wrote:

Quote:

---

... I just received a HP32E in great cosmetic condition. However, it suffered the dreaded 'battery pack leakage'.

What is interesting about all of the leakage problems is that there was a time back in 1972 when designers at both HP and TI understood that there was a potential problem with circuit damage from cell leakage and did something to prevent it.

You can see it in the HP product line in the Classic family where the assembled case provides a box around the battery pack. There was some of that in the Woodstock family. Any pretense of isolating the battery pack from the circuitry went out the window with the Spice family and the HP-41.

You can also see it in the TI product line in the Datamath machines. I recently purchased a TI-2500 (1972) -- the version with the six rechargeable batteries accessible through a trap door. I didn't have my Phillips head screwdriver with me but the device ran perfectly with the Adapter/Charger. I reasoned that there must not be any circuit damage from leakage so I bought it for a dollar. When I opened the trap door I found massive cell leakage. When I opened the calculator there was no circuit damage and I could see why. The case essentially formed a bathtub to enclose the cells and isolate any leakage from the circuitry. Any pretense of isolating the battery pack from the circuitry went out the window with the TI-30, TI-1XXX's, and the TI-5X's.

If the designers of the early machines at HP and at TI understood the need to isolate the circuitry from cell leakage then why did the later designers abandon the concept? Did they begin to believe the claims of the cell manufacturers for their "sealed" cells? Did they decide that since the cell manufacturers were offering to repair devices damaged by cell leakage then the user would suffer no economic damage from cell leakage? Any ideas out there?

### **Re: On battery leakage**

*Message #10 Posted by **Wayne Brown** on 26 June 2007, 1:40 p.m.,

It must have continued at least a bit longer, into the Voyager family. I never noticed it until a few years ago, when my beloved 16C suffered a leaking battery. I was horrified to see all that gunk in the battery compartment, but while cleaning it out I discovered that the batteries were surrounded by a "bathtub" arrangement such as you described above. The only metal bits which any of the chemicals were able to reach were the two battery contacts, which are spring clips that hang over the top edge at opposite ends of the "tub." A little careful cleaning with a brush dipped in white vinegar made them good as new. (I just now opened it up to check them, and they're still bright and shiny.) None of the corrosion made it out of the battery compartment itself, and my 25-year-old HP-16C continues to work as well as the day I bought it.

---

The only Voyager that I have here in North Carolina is a USA made HP-12C S/N 2636A64325 . There is a small possible path past the tab portion of the battery cover. How much leakage could get through would depend on how closely the tab fits into the slot which does appear to be a relatively close fit. I can see printed circuitry through the slot. In any case, a much better arrangement than the Spice family and the HP-41 since my experience suggests that somehow the leakage from a cell can tend to follow an electrical lead.

I have a HP-28S "Clamshell" here. I'm not going to fiddle with the world's worst battery cover design because I fear I may lose all my data.

I also have a representative of the Pioneers -- an HP-10B. It has a path for leakage out of the battery bathtub through the opening for the tab which is over twice as wide as the tab. Again, I can see printed circuitry through the opening.

**New 17bII+?**

Message #1 Posted by [Seth Morabito](#) on 24 June 2007, 4:36 a.m.

At the moment, the small thumbnail picture of the 17bII+ on HP's site sure looks different than the currently shipping product I've seen, or the close-up photos in the data sheet!

See:

<http://h10010.www1.hp.com/wwpc/us/en/sm/WF05a/215348-215348-64232-20036-215349-384708.html>

(I got a screen capture in case it reverts)

Looks like it has a wide ENTER key where it belongs, and an over-all design reminiscent of the alleged HP-35s!

Has anyone seen this model in the wild?

**EDIT, 26 June 2007:** Well, it looks like they've caught their error and reverted the thumbnail back to the currently shipping style. Ah well. I'll keep an eye out for the new design in stores.

*Edited: 26 June 2007, 3:59 a.m. after one or more responses were posted*

Wow!

It seems 'hp' finally wants the older fans to buy new units again, after nearly ten years of, hmmm, problems listening to users?

At least for me, the new models with this kind of keyboard layout, incl. the ENTER bar where it belongs, are much more interesting than the, errr,

kinda problematic doorstops of the past few years;-)

Maybe there's hope for a new high-end model with HP-48 keyboard layout?

Raymond

### Re: New 17bII+?

Message #4 Posted by [Namir](#) on 24 June 2007, 7:36 a.m.,  
in response to message #1 by Seth Morabito

Good eye Seth!! My next comment is that buying this new version of the 17BII+ may require some waiting. When I clicked on the "Find Resellers" link in the new 17BII+ web page, I got the picture of the **older** 17BII+ in a web page that lists resellers. It seems that HP is **beginning** to update. Like with other updates (HP-33sand HP-49G+) it's hard to request a specific revision when buying online or by phone. You have to walk into a store and actually see the new version.

Soooo ... now the question is one of sighting of the new version. If anyone sees it, please flag us here and tell us which store has them.

Namir

in response to message #2 by Gerson W. Barbosa

Gerson,

Thank you for the link. I missed reading those messages.

tm

### Re: Norm - Red LED's - and His 34C

Message #4 Posted by [Gerson W. Barbosa](#) on 28 June 2007, 1:39 p.m.,  
in response to message #3 by Trent Moseley

You're welcome, Trent!

By the way, after reading Norm's funny post in the Memories Forum ([HP-34C BETTER THAN S\\*X](#)) I got interested in the HP-34C because my first programmable calculators had LED displays (TI-51-III and TI-59). I eventually got an HP-34C but I am still looking for a mint one. I don't agree with everything Norm says there though ;-)

Best regards,

Gerson.

**Balky 34c On/Off switch**

Message #1 Posted by [Matthew W. Milligan](#) on 22 June 2007, 7:07 a.m.

I am a "first-time poster" but long-time hp calculator user and fan. I recently came across my old hp-34c and decided to try and revive it just for fun. I charged the batteries overnight and what do you know it works just fine! (I guess we're not too surprised by that, eh?) However, the ON/OFF switch has got problems. I have to play with it and slide it back and forth ever so slightly to find the one position where the calculator will function properly.

So my question is this: should I just be happy that it works and leave it well enough alone? Or, should I try to give the switch some attention? I have read through previous posts and found that a dielectric grease should be used to lubricate the contacts - but, I am very hesitant to take it all apart. In my experience corroded contacts in switches, sliders, pots, etc. will sometimes improve simply by getting some use.

**Re: Balky 34c On/Off switch**

Message #2 Posted by [Dave Johnson](#) on 24 June 2007, 5:42 p.m.,  
in response to message #1 by Matthew W. Milligan

The switches do often get balky over time. In early versions of this calc the chips are held with pressure to the circuit board. This makes reassembly difficult. you can tell which version you have by the weight and reference to postings on this forum.

**Re: Balky 34c On/Off switch**

Message #3 Posted by [Matthew W. Milligan](#) on 25 June 2007, 10:55 a.m.,  
in response to message #2 by Dave Johnson

Thanks for the info. I believe I will leave well enough alone until (and unless) it gets worse.

### How to speak the problem?

Message #1 Posted by **Olivier TREGER** on 21 June 2007, 12:19 p.m.

Hello all,

Despite my now decent collection of HP calcs, I must admit that, having left school quite early, I miss the necessary basis to figure out how to spell the following problem.

my daughter Agathe was asked to solve the following kinda sudoku by her teacher: let's say a square 3x3 boxes.

In each box a number (left to right, top to bottom) such as:  $a+b+c=96$   $d+e+f=315$   $g+h+i=12$  but also  $a+d+g=72$   
 $b+e+h=40$   $c+f+i=126$  PLEASE NOTE:  $e=5$

I suspect there's something to do with matrices but I ain't sure. I've tried to use Mathematica (don't laugh...) to modelize (?) a formula with no success.

I'm sure somebody around will tell me in three words where to dig.

Thanks for help Olivier

### Re: How to speak the problem?

Message #2 Posted by **Monte Dalrymple** on 21 June 2007, 12:40 p.m.,  
in response to message #1 by Olivier TREGER

There appears to be no solution.

The first three equalities say  $a+b+c+d+e+f+g+h+i = 423$

The last three equalities say  $a+b+c+d+e+f+g+h+i = 238$

... or is there a typo in your post?

Monte

### Re: How to speak the problem?

Message #3 Posted by **Walter B** on 21 June 2007, 12:42 p.m.,  
in response to message #1 by Olivier TREGER

Bonjour Olivier,

je pense que ... you need two more constraints. You wrote "kinda sudoku", so was there anything further required implicitly?

### Re: How to speak the problem?

Message #4 Posted by **Dave Shaffer (Arizona)** on 21 June 2007, 3:25 p.m.,  
in response to message #3 by Walter B

I agree with Walter: there are 9 unknowns, so you need nine equations or constraints to determine a unique solution. If this is a true sudoku, then each digit (1 through 9) should be used only once. That, plus the equations and constraint you gave provide only 8 of the necessary 9 conditions.

**Re: How to speak the problem?**

Message #5 Posted by **Olivier TREGER** on 21 June 2007, 1:22 p.m.,  
in response to message #1 by Olivier TREGER

I'm completely sorry...

Please replace "+" by "x"

I thought I was unable to count. I can't type either...

**Re: How to speak the problem?**

Message #6 Posted by **Massimo Gnerucci (Italy)** on 21 June 2007, 2:06 p.m.,  
in response to message #5 by Olivier TREGER

I believe the solution is:

|             |   |           |   |           |   |     |               |
|-------------|---|-----------|---|-----------|---|-----|---------------|
| 4           | * | 4         | * | 6         | = | 96  | (2*2*2*2*2*3) |
| *           |   | *         |   | *         |   |     |               |
| 9           | * | 5         | * | 7         | = | 315 | (3*3*5*7)     |
| *           |   | *         |   | *         |   |     |               |
| 2           | * | 2         | * | 3         | = | 12  | (2*2*3)       |
| =           |   | =         |   | =         |   |     |               |
| 72          |   | 40        |   | 126       |   |     |               |
| (2*2*2*3*3) |   | (2*2*2*5) |   | (2*3*3*7) |   |     |               |

Greetings,  
Massimo

**Re: How to speak the problem?**

Message #7 Posted by **Olivier TREGER** on 21 June 2007, 2:41 p.m.,  
in response to message #6 by Massimo Gnerucci (Italy)

That's one solution.

Mine was: 8\*4\*3 9\*5\*7 1\*2\*6

But my question was: how to create a model that would solve the problem?

**Re: How to speak the problem?**

Message #8 Posted by **Egan Ford** on 21 June 2007, 2:51 p.m.,  
in response to message #7 by Olivier TREGER

Was one of the constraints that you can only used each digit once (like sudoku)? If so I think you have the correct answer.

## Re: How to speak the problem?

Message #9 Posted by **Olivier TREGER** on 21 June 2007, 4:36 p.m.,  
in response to message #8 by Egan Ford

Quote:

Yes. I forgot to mention it (again).

But still, I can't figure out what method to be used to solve it as a generic problem.

## Re: How to speak the problem?

Message #10 Posted by **Egan Ford** on 21 June 2007, 5:16 p.m.,  
in response to message #9 by Olivier TREGER

Quote:

But still, I can't figure out what method to be used to solve it as a generic problem.

I can think of a few.

1. Brute force. There are only 40320 possible outcomes. Try them all. If you have access to a quantum calculator you can test all possible outcomes simultaneously.
2. Random guesses. Could be faster or slower than #1.

Both #1 and #2 can be easily parallelized across multiple calculators. #1 would need a unique domain for each calculator. #2 would just use different random seeds.

3. Search. Start with the column or row with the least number of possibilities (pairs) that meets the condition of the row/column with the most knowns (5 in this case). Push that on a stack, remove the 2 digits from a list of possibilities. E.g. start with def, it can only be 9,5,7 or 7,5,9, then beh, then abc, adh, etc... once you get to a point where none of the pairs will work, pop off the stack the last working pair, and try a different pair, move forward, etc... you may have to pop off multiple pairs. Eventually you'll end up with an answer.

#1 and #3 will allow you to predict the worse case number of operations.

## Re: How to speak the problem?

Message #11 Posted by **Olivier TREGER** on 21 June 2007, 5:27 p.m.,  
in response to message #10 by Egan Ford

That doesn't look like an industrialized method :)

What I don't understand is that when I push the 6 equations in Mathematica, it gives me back, it says:

```
Equations may not give solutions for all "solve" variables.
```

although a solution can be found by simple guessing.

Ain't there no way to build a standard algorithm to find out?

### Re: How to speak the problem?

Message #12 Posted by [Egan Ford](#) on 21 June 2007, 5:44 p.m.,  
in response to message #11 by Olivier TREGER

Can you also tell Mathematica  $a!=b!=c!=d!=e!=f!=g!=h!=i$ , a through i belongs to the set of positive integers, and  $e=5$ ?

### Re: How to speak the problem?

Message #13 Posted by [Olivier TREGER](#) on 21 June 2007, 5:59 p.m.,  
in response to message #12 by Egan Ford

Quote:

Can you also tell Mathematica  $a!=b!=c!=d!=e!=f!=g!=h!=i$ , a through i belongs to the set of positive integers, and  $e=5$ ?

I just tried:

```
{a,b,c,d,f,g,h,i}<9  
{a,b,c,d,f,g,h,i}>1
```

with no success either

### Re: How to speak the problem?

Message #14 Posted by [Egan Ford](#) on 21 June 2007, 6:09 p.m.,  
in response to message #13 by Olivier TREGER

Needs to be  $\geq$ , not just  $>$ . You also need to state somehow that each variable is unique.

### Multiplicative sudoku

Message #15 Posted by [Karl Schneider](#) on 22 June 2007, 1:29 a.m.,  
in response to message #10 by Egan Ford

Quote:

Brute force. There are only 40320 possible outcomes. Try them all. If you have access to a quantum calculator you can test all possible outcomes simultaneously.

An arithmetical problem solved by brute force (i.e., testing all possible arrangements of input values for solutions) and by more-intelligent means was discussed in this recent thread:

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=112157#112157>

As Walter pointed out, the problem cannot be solved directly, because there are eight "degrees of freedom" for the nine inputs, but only six equations. Standard linear-algebra techniques can't be used to simplify the problem, because the problem isn't linear (whereas a standard sudoku puzzle is).

-- KS

### Re: How to speak the problem?

Message #16 Posted by **Egan Ford** on 21 June 2007, 2:01 p.m.,  
in response to message #1 by Olivier TREGER

Is this what the problem looks like?

|  |   |   |                       |
|--|---|---|-----------------------|
| a  | b | c | = 96                  |
| d  | e | f | = 315                 |
| g  | h | i | = 12                  |
| <div style="display: flex; justify-content: space-between; align-items: center;"> <div style="border: none; padding: 0 5px;"> <span style="border: none; padding: 0 5px;">\</span> <span style="border: none; padding: 0 5px;">/</span> <span style="border: none; padding: 0 5px;">\</span> </div> <div style="border: none; padding: 0 5px;"> <span style="border: none; padding: 0 5px;">-&gt;</span> <span style="border: none; padding: 0 5px;">- - - - -&gt;</span> <span style="border: none; padding: 0 5px;">- - - - -&gt;</span> </div> </div> |   |   | = 126<br>= 40<br>= 72 |

### Re: How to speak the problem?

Message #17 Posted by **Olivier TREGER** on 21 June 2007, 2:39 p.m.,  
in response to message #16 by Egan Ford

Yes it does look like this

### Re: How to speak the problem?

Message #18 Posted by **Allen** on 21 June 2007, 8:39 p.m.,  
in response to message #17 by Olivier TREGER

Using this 48/49/50 program you can find the Divisors of each number:

```
<<
{ } OVER SQRT 2 SWAP
  FOR N
    IF OVER N /
      FP 0 == THEN N+ END
    NEXT
  DUP2 / +
  SORT
  DUP 10 < *
>>
' SETS UP RANGE TO RUN 2 TO SQRT(N)
' APPEND TO LIST IF DIVISIBLE
' APPEND LIST ALL DIVISORS > SQRT(N)
' CRUDE MASK TO HIDE ALL VALUES <=9
```

YIELDS THE POSSIBLE DIVISORS FOR EACH ROW:

|  |    |    |                       |   |                                 |
|--|----|----|-----------------------|---|---------------------------------|
| a  | b  | c6 | = 96                  | = [2 3 4 6 8]                                   | [2 8]                           |
| d9   | e5 | f7 | = 315                 | = [3 5 7 9]                                     | [solved]                        |
| g  | h  | i3 | = 12                  | = [2 3 4 6]                                     | [1 4]                           |
| <div style="display: flex; justify-content: space-between; align-items: center;"> <div style="border: none; padding: 0 5px;"> <span style="border: none; padding: 0 5px;">\</span> <span style="border: none; padding: 0 5px;">/</span> <span style="border: none; padding: 0 5px;">\</span> </div> <div style="border: none; padding: 0 5px;"> <span style="border: none; padding: 0 5px;">-&gt;</span> <span style="border: none; padding: 0 5px;">- - - - -&gt;</span> <span style="border: none; padding: 0 5px;">- - - - -&gt;</span> </div> </div> |    |    | = 126<br>= 40<br>= 72 | = [2 3 6 7 9]<br>= [2 4 5 8]<br>= [2 3 4 6 8 9] | [3 6]<br>[1 2 4 8]<br>[1 2 4 8] |

So you can conclude that:

Step 1

1. e must be 5 (given)
2. f must be 7 (no other common divisors except 126 and 315)
3. d must be 9 ( $=315/(5*7)$ )

Step 2

4. i must be 3 (only CD with 126 and 12 (step 2))
5. eliminate [1 2 4 8] as divisors of 126 b/c must be for 40 and 72
6. c must be 6 ( $=126/(7*3)$ )

7. either a or b must be 8.

Try a:

g must be 1, leaving  $96=8*2*6$  works

Try b:

g must be 4, leaving  $2*8*6$  ALSO WORKS.

Is there more than one possible solution? perhaps I am missing something

*Edited: 21 June 2007, 8:47 p.m.*

## Re: How to speak the problem?

Message #19 Posted by [Dave Shaffer \(Arizona\)](#) on 21 June 2007, 11:09 p.m.,  
in response to message #18 by Allen

"4. i must be 3 (only CD with 126 and 12 (step 2))"

No - a 6 works, too (to give Olivier's solution)!

(I had already prepared the following):

Actually, if we read between the lines, there ARE other constraints.

If this is a sudoku of the normal type, perhaps the most compelling constraint is that the values must be (positive) integers. And, as noted by others, they must lie between 1 and 9 and in fact include ALL the integers from 1 to 9.

So, let's try some educated guess work. First, note that  $abc=96$ ,  $def=315$ , and  $cfi=126$  tell us that none of a, b, c, d, e, f, i can be a 1. (If one of the variables in a triple product was one, the maximum product would be  $8*9=72$ .) Thus, we know already that either g or h must be 1.  $ghi=12$  tells us that the other two (the pair g and i or the pair h and i) must be either the pair 2 and 6 or the pair 3 and 4. (Turns out, both work.)

Now, since  $beh = 40$  and  $e=5$ , we know that  $bh = 8$ . If b and h are positive integers (between 1 and 9!), then b and h must be the pair 1 and 8 or the pair 2 and 4. Similarly,  $def = 315$  leads to the conclusion that  $df = 63$  and thus d and f are the pair 7 and 9. Since  $adg = 72$ , d must be a 9 (and f a 7), because if d was a 7, it would not divide evenly into 72.

We now have for sure:  $e = 5$  (given),  $d = 9$ , and  $f = 7$ .

Also, from  $adg = 72$ , and  $d = 9$ , we get  $ag = 8$ . We already ascertained that g must be 1, or 2 or 6, or 3 or 4. Since all numbers must be integers,  $ag = 8$  rules out  $g = 6$  or 3, so g must be 1 or 2 or 4.

Note, too, that  $cfi = 126$  gives  $ci = 18$  (because  $f = 7$ ). So, c and i are either the pair 2 and 9 or the pair 3 and 6. Because  $d = 9$ , c and i must be the pair 3 and 6.

At this point, try  $b = 1$  or 2 or 4 or 8, using  $abc = 96$ . Look for inconsistencies with the known

values. Do the same for other possible pairs.

When you are done, I think you will find that there are at least two solutions consistent with all the triple product conditions:

a b c d e f g h i = 8 4 3 9 5 7 1 2 6 (as reported by Olivier)

a b c d e f g h i = 8 2 6 9 5 7 1 4 3 (my alternate solution)

*Edited: 21 June 2007, 11:09 p.m.*

### **Re: How to speak the problem?**

*Message #20 Posted by **Olivier TREGER** on 22 June 2007, 2:36 a.m.,  
in response to message #19 by Dave Shaffer (Arizona)*

So...

If I read well all the answers, there seem to be no way to automate the search for a solution.  
Right?

Oh, by the way, many thanks to all of you for these explanations. It happens that I found a solution but it seemed to be a matter of chance.

### Why not making new 97?

Message #1 Posted by [Chan Tran](#) on 21 June 2007, 10:46 a.m.

I see a lot of interest in the 97. I hope that HP will make a modern version of it. Without the card reader and its gummy wheel of course.

### Re: Why not making new 97?

Message #2 Posted by [Namir](#) on 21 June 2007, 11:02 a.m.,  
in response to message #1 by Chan Tran

Chan,

Your request joins that of others who would like to see other vintage models, like the HP-15C, brought back into production. Since HP's calculator division is currently a tiny fraction of what it used to be, these calculator revivals simply will not happen. What **can happen** is a group of well-funded investors approaching HP to get legal blessing and bring back the models we all love to see revived. On a financial basis, this venture is pure risky business, since the actual number of models sold will be very low due to a (most likely) high cost of production.

So, the past is the past. Time travels in one direction ... forward.

Namir

Quote:

bring back the models we all love to see revived

Why would you want to increase supply? Supply up...value down, simply economics. I want my collection (also investment) to appreciate in value, therefore I would not want to bring back any of the old models. Keep supply low! Selfish? maybe... but economically sound.

Regards, Thor

*Message #6 Posted by **Namir** on 21 June 2007, 3:22 p.m.,  
in response to message #5 by Thor Larsen*

Thor,

Rest assured your collection will keep increasing in value. No one is bringing back the vintage model the way we know them. Eric Smith **may** bring an interesting variant of the vintage models.

Namir

**Re: Why not making new 97?**

*Message #7 Posted by **James M. Prange (Michigan)** on 21 June 2007, 3:44 p.m.,  
in response to message #5 by Thor Larsen*

Plausible counterfeits might bring the price of "collectible" items down, but I think that as long as the new items are distinguishable from the "vintage" items, there would be little (if any) effect on the price of the "genuine" collectible items.

Other than that, I expect that for many collectors, the "value" isn't defined by the market price.

Regards,  
James

**counterfeiting calculators**

*Message #9 Posted by **Eric Smith** on 22 June 2007, 1:25 a.m.,  
in response to message #8 by Namir*

It's not clear that any of them, even the HP-01, fetch enough money on eBay to justify someone investing the engineering expense to develop a replica that was not obviously distinguishable from the original.

What probably does make sense is to build replacement electronics, e.g., for the Woodstock

series, since many of those go bad. I've considered doing that. However, I had not previously thought about the problem that people might try to sell an old HP with new innards, but represent it as original. I don't think it would be cost-effective for the seller, though. The replacement electronics wouldn't be all that inexpensive; I'd estimate that the replacement electronics would have to sell for at least \$100 just to break even.

Still, I'd probably design in some way to distinguish it from the keyboard, e.g., turn on while holding a specific pair of keys, and a message would be displayed.  
Re: Why not making new 97?

As far as creating modern reproductions of vintage HPs goes, I would make them obviously similar, but not identical. I'm not sure which models are most in need of reproductions. The HP-92, HP-15C, and HP-16C might be the most plausible. Reproductions of the HP-15C and HP-16C could feature more memory than the originals.

*Message #10 Posted by [Namir](#) on 22 June 2007, 8:11 a.m.,  
in response to message #9 by Eric Smith*

Eric,

Your work in reproducing any HP calculator is the work of a craftsman. That's a fact!! I hope your project is still on because I still have your coupon that I won in HHC2006. In any case, having a SD card slot that can be used to read and write programs and data is highly recommended. We sure love to see some of the vintage machines back. Jazzing them up just a bit is more than welcome.

Namir

---

What I'd like to see are copies that are absolutely identical in every way except the serial numbers. The SN (especially the older YYWWC##### format) make it clear at a glance what year a calculator was manufactured. I think it would be great to have a brand-new HP-16C that even an HP engineer couldn't distinguish from my 1982 vintage HP-16C until he turned it over and looked at the SN.

### **Re: counterfeiting calculators**

*Message #16 Posted by **Egan Ford** on 22 June 2007, 4:20 p.m.,  
in response to message #15 by Wayne Brown*

My 15C has served me well since 1984. It is the perfect calculator in its class. I have a 1985 15C in the box as a replacement (just in case--BTW, what is the half-life of a 15C?). But, if HP were to make it again, I'd like some improvements.

15Cii:

Don't:

- Change the form factor.
- Change the keyboard.

Do:

- Add 2 line dot matrix display. User can select between classic single line or new dual line.
- In program/debug mode display alpha RPN statements. Obvious enhancement if you have ever programmed any Voyager. 12C platinum should have done this

(IMHO).

- Increase speed. Again user selectable between classic, 20-year battery life, and full speed 6-month battery life.
- Add memory.
- Add I/O. It is so cheap to add I/O. Bluetooth would be great. Industry standard I/O is what got me to switch to the 48GX in 1993. Look at the software selection and support available for the 41CX, 71B, and 48GX. I/O makes a difference. I/O builds communities.
- 42S complex number display (again user selectable).

### **Re: counterfeiting calculators**

*Message #17 Posted by [Eric Smith](#) on 22 June 2007, 11:56 p.m.,  
in response to message #16 by Egan Ford*

Battery life on a replica is likely to be \*much\* worse than the original. Although the 25 years of improvement in technology in theory makes it possible to build a Voyager with even lower power dissipation, the available technologies for low-volume production do not.

In other words, if we could spin an ASIC for the calculator, like HP did back in the early 1980s, but using 2007 technology, we could get even better battery life. But using a flash-based microcontroller running emulation will have worse battery life.

### **Re: counterfeiting calculators**

*Message #18 Posted by [Peter Monta](#) on 24 June 2007, 3:32 a.m.,  
in response to message #17 by Eric Smith*

I wonder how TI's MSP430 microcontroller series would compare with the original HP ASICs. One could run the MSP430 tickless (keypad event generates an interrupt), and some software effort could reduce the emulation hit.

Best would be hardware closer to the native instruction set, though. The world needs a submicroamp FPGA. Or maybe aggressive power switching could make do with a leakier device: MSP430 keeping state and briefly turning on, say, a flash-based FPGA to do the crunching.

Cheers, Peter Monta

---

There is more than one way to skin a cat, and you always have to ask do you even have to skin the cat...

With a little bit of extra circuitry (a FET power latch) you can make one of the switches a true ON/OFF switch so the micro is completely disconnected.

If you wanted to retain memory when the power switches off, then you could do it two different ways: Flash for storing programs, so never lose the contents when you change batteries. An external SRAM for storing the registers. RTCC chips often have a small amount of internal SRAM for this very purpose. So you could use a much lower power and optimised RTCC chip on permanent power and then completely disconnect the micro/FPGA.

Also, today's lithium batteries are greater capacity than those of years past. A 2032 cell is about 250mAh @ 3V, while an LR44 silver oxide cell (as used in the Voyagers and Pioneers) is about 170mAh @ 1.5V. So you can afford a lot extra drain for the same life.

Then of course it's all a big trade-off once you start talking power/processing grunt and what you actually need in this respect. I really wouldn't worry about it, pick the processor you want and live with whatever active current it gives you.

So in a new calculator design I'd put 0.1% effort into battery life, and 99.9% effort into the physical housing, LCD, and ease of development. It's too easy

to get caught on the diminishing returns curve for power consumption.

Dave.

## HP-15Cii

Message #22 Posted by [Karl Schneider](#) on 23 June 2007, 1:14 a.m.,  
in response to message #16 by Egan Ford

Hi, Egan --

Hmm, all without changing the form factor (which I assume to mean size and shape) or the keyboard of the HP-15C, incorporate the following list of improvements:

- *Add 2 line dot matrix display. User can select between classic single line or new dual line.*

*The only reasonable way that might be done is with a "single block grid" small-pixel display, a la the high-end Pioneer series, but more legible and less sensitive to viewing angle. Not impossible, but there would be a considerable cost in firmware development, as there would be two ways to display everything. That's why no such thing has been done before...*

- *In program/debug mode display alpha RPN statements. Obvious enhancement if you have ever programmed any Voyager. 12C platinum should have done this (IMHO).*

*"Debug", I assume, means single-step execution, though it would be nice to display the command with a sustained press of a button, as the HP-41, HP-42S, and HP-32S/SII did. A dot-matrix display would be required, but the HP-12C Platinum doesn't have one.*

- *Increase speed. Again user selectable between classic, 20-year battery life, and full speed 6-month battery life.*

*I certainly agree -- Saturn-processor speed as a minimum. I don't see a particular need for selectability. Higher speed is desirable for execution of programs, equations, and SOLVE/INTEG, but otherwise causes minor differences in battery life.*

- *Add memory.*

*Sure, but without a more-advanced programming paradigm (e.g., HP-41/HP-42S), matrix storage, and matrix editing, a large amount of additional memory would be difficult to utilize effectively. For example, would you want to store a large amount of programming, but not be able to organize it into directories or packages demarcated by alphanumeric external labels and "END" statements? Would you want to navigate a huge matrix element-by-element using two keystrokes each time, but not be able to store more than five matrices in a large amount of RAM?*

*If the modus operandi of the HP-15C were not to be changed at all, about 32 more registers would have been very useful (perhaps one extra R2D2 chip, cost and space permitting). This would have allowed solution of a 9x9 real-valued linear system, or solution of a 4x4 complex-valued linear system without fancy maneuvers (and clearing memory beforehand), or inversion of an 8x8 matrix without clearing*

*memory beforehand. However, the probable reason why 64 allocatable registers were provided was to make the latter two applications possible.*

- *Add I/O. It is so cheap to add I/O. Bluetooth would be great. Industry standard I/O is what got me to switch to the 48GX in 1993. Look at the software selection and support available for the 41CX, 71B, and 48GX. I/O makes a difference. I/O builds communities.*

*That would certainly require a new list of alphanumeric commands. The 41CX, 71B, and 48GX are all alphanumeric.*

- *42S complex number display (again user selectable).*

*I, too, like that display, but one should be mindful of the storage of variables in the registers, as well as the capability of the display to show abbreviated complex components having exponents, and complete mantissas as a minimum. Consider how "SHOW" (CLEAR PREFIX) would work.*

*The devil's in the details...*

*: -)*

*-- KS*

### **HP15Cii, IQ43SL, etc.**

*Message #23 Posted by [Walter B](#) on 23 June 2007, 2:50 a.m.,  
in response to message #16 by Egan Ford*

The 15Cii was discussed earlier several times already. Please see e.g. [here, where a tentative layout is given](#). I posted it then just to show the opportunities within the dimensions and with the keyboard of a Voyager :-)

With a dot matrix LCD, you may display any reasonable number of output lines as pointed out above, so 2 lines or only 1 line would be no problem at all. It would also allow to display menus and soft keys like in 27S, 42S, or 48, of course. You will find more about this searching the archives under "IQ43S".

I am not too concerned with counterfeited calculators. I am more concerned with people creating Frankencalculators - calculators created from parts of several calculators. One could mix and match parts from several broken calculators to create a working one. But the mix and match may not be historically accurate. One could for example, create an HP-35 with "The Bug" that had a late serial number, or was a type 3 or 4. This could cause mass confusion among the collecting community.

### **Re: counterfeiting calculators**

### **Re: Why not making new 97?**

*Message #28 Posted by [Chan Tran](#) on 22 June 2007, 4:25 p.m.,  
in response to message #27 by Giancarlo (Italy)*

I have a 97 and I don't care if its value goes down. I would like a modern version of the 97. I just like the way it looks. As we all know the problem with the card reader so I would want a better way for mass storage like flash memory card. The printer can be the same size but should be faster and quieter. The battery should last much longer. The display should display alpha character in program mode for easy viewing of the program. If a counterfeit works and looks as well or better than the original then it actually worths more to me than the orginal as I don't collect thing for rarity.

### Inefficient Market Theory for the HP collector

Message #1 Posted by [Mike Ingle](#) on 21 June 2007, 5:03 a.m.

HP-15C, new, with book, case, and manual, \$50 + shipping, required superglue on two heat stakes, rubber cement to replace feet, and is now perfect. Thanks FixThatCalc for the advice!

HP-42S, C rev, good used condition, with case, no manual, \$75 + shipping, required alcohol cleaning of keys and superglue under bezel, now works well.

HP-48GX, good used condition, R rev blue display, with books, case and cable, \$50 + gas

HP-19BII, good used condition, no manual, good side battery door, \$20 + shipping, required rubber cement on one foot.

HP-12C, 2002 model, with manual, \$10 + shipping, en route.

Do you want deals like this? Read on. I have most of the LCD models I want, and LED models are not showing up, so I might as well write this up now.

An efficient market is one in which (A) buyers can easily find sellers and (B) transaction prices are visible to all participants. Ebay is an efficient market.

An inefficient market is one where either A, B, or both are false. Garage sales are inefficient markets.

In efficient markets, collectors' items like HP calculators are expensive. The market quickly establishes a price range for each item, and it is hard to beat the market price. Anyone trying to buy a 15C or 42S on Ebay knows what I am talking about.

In inefficient markets, collectors' items can sell cheaply compared to the efficient market price, but you have to waste a lot of energy to find them. I got a good 11C for \$25 and a fixable 41CV for \$5 at thrift stores, but those were lucky finds.

What the buyer really needs is a market that is inefficient for most people, but efficient for him. There is such a market on the Internet: craigslist. Craigslist is stubbornly local. It provides no global search (A is false.) There is also no "completed items" search (B is false.)

However, there are third-party global searches for Craigslist which allow you to search all the sites, and you can use Ebay to check "market" prices. A and B are now true for you. I got all the deals above using this URL:  
<http://search.restrainingbolt.com/global.php3>

Search for "hp calculator" and "hewlett calculator". Sometimes the search fails partway through, but most of the time it works. You will see some calculators selling for Ebay prices, and some people posting want-ads for calculators. However, there are also some very good garage-sale prices. The search for "hewlett calculator" is particularly good, because people who don't put "HP" in the title get fewer buyers.

When you find a good deal, just email the seller and ask him to ship it. Most sellers are willing to ship calculators, and Priority Mail costs under \$5 for a calculator without manual.

Many users do not have Paypal. I have sent cash through the mail about 8 times now, and have not been burned yet. I have rejected two calculators which were in poor condition, and in both cases I got my money back. One seller offered a 200LX for \$30, and while the money was en route, looked online and realized his mistake. He sent me my cash back plus \$5 by way of apology!

These sellers are ordinary folk who value their good karma. Your mileage may vary, but I have had good luck. On the other hand, I had a scammer in China respond to an ad that I posted on hpmuseum.

Now I just need a source for a good HP-97.

Mike

### **Re: Inefficient Market Theory for the HP collector**

*Message #2 Posted by **Dan W** on 21 June 2007, 10:32 a.m.,  
in response to message #1 by Mike Ingle*

Good to know there is a search engine for Craigslist. But like you I have not had luck finding the LED models. I have had better luck on the Museum boards, and on eBay.

Regarding the 97, they can be had untested, or with known problems, on eBay for \$100-\$125. Unless you buy one refurbished, expect to repair both the card reader gummy wheel, and any number of problems with the printer. A refurbished 97 will run \$350-\$400 typically, more with accessories.

### **Re: Inefficient Market Theory for the HP collector**

*Message #3 Posted by **Kevin Kitts** on 21 June 2007, 3:07 p.m.,  
in response to message #1 by Mike Ingle*

I've noticed a similar thing when shopping for a computer. Craigslist has both outrageously high prices (people want the same price they paid 3 years ago for their computer) and a few low prices. A \*lot\* more variance in the prices. eBay prices seem to converge after a while at a price that is not much less than what you could get the item for new.

I've not had any luck finding old HP calculators on craigslist though...

### **Re: Inefficient Market Theory for the HP collector**

*Message #4 Posted by **Mike Ingle** on 21 June 2007, 3:32 p.m.,  
in response to message #3 by Kevin Kitts*

Here's one: HP-11C for \$25. I'd buy it except I have one already.

<http://sfbay.craigslist.org/pen/sys/356542074.html>

### **Re: Inefficient Market Theory for the HP collector**

*Message #5 Posted by **Seth Morabito** on 23 June 2007, 1:02 p.m.,  
in response to message #1 by Mike Ingle*

Shhhh, Mike, you're giving away all our best tricks! ;-)

But this does work. Today I picked up two calculators:

1. HP-48GX rev. R in almost perfect condition, including original shrink-wrapped manuals and box
2. HP-32SII in very good used condition, also including original shrink-wrapped manual and box (what is it with people who don't read the manual?!)

I got both for \$100 plus gas and the hassle of getting up at 7:30 on a Saturday morning thanks to Craigslist. So they're definitely out there, you just have to be vigilant to get them. And this is my first ever 32SII, so I'm a happy camper.

### **A Third Order Complex Linear Equation Solver for the hp 33s**

Message #1 Posted by [Palmer O. Hanson, Jr.](#) on 20 June 2007, 10:42 p.m.

In response to publication of my "Sixth Order Linear Equation Solver for the hp 33s" (Article No. 676) correspondent Gerson W. Barbosa wrote "... Now, a fourth or even a third order Complex Linear Equation Solver would be great, but that would be asking too much, I recognize."

I have written a third order complex linear equation solver for the hp 33s. It is much too long to be in the Forum so it has been posted as Article 722.

So far, I have only tested the program with three problems:

1. The test problem in Article 722.
2. The test problem in Article 722 modified to cause a determinant of zero which will trigger the "DIVIDE BY ZERO" abort.
2. The Simultaneous Equation problem from page 15-18 of the hp 33s User's Guide to demonstrate the capability to solve third order linear equations with real coefficients.

### **Re: A Third Order Complex Linear Equation Solver for the hp 33s**

Message #2 Posted by [Gerson W. Barbosa](#) on 21 June 2007, 7:37 a.m.,  
in response to message #1 by [Palmer O. Hanson, Jr.](#)

Quote:

In response to publication of my "Sixth Order Linear Equation Solver for the hp 33s" (Article No. 676) correspondent Gerson W. Barbosa wrote "... Now, a fourth or even a third order Complex Linear Equation Solver would be great, but that would be asking too much, I recognize."

Hey, thank you very much Sir!

Of course, when I said "asking too much" I didn't mean this was not feasible. I meant it was a difficult task to ask to someone who'd already given us a sixth order linear equation solver (and later even an eighth order one!). I am glad you have written this, even if it might not be so useful to you as it may be to some of us here. When I needed to solve complex linear systems at college, I relied on an HP-28S, but then I did write a program for the SHARP PC-1211 for a colleague, but the task was way easier in BASIC than it is in RPN keystroke programming.

Quote:

So far, I have only tested the program with three problems

I will try it later with a real problem I once had to solve at work.

Best regards,

Gerson.

## Mea Culpa

Message #3 Posted by [Palmer O. Hanson, Jr.](#) on 24 June 2007, 4:35 p.m.,  
in response to message #1 by [Palmer O. Hanson, Jr.](#)

I listed the command at step M0058 incorrectly as STO (I) which, of course, is not a valid command. The command should be STO (i) .

## Re: A Third Order Complex Linear Equation Solver for the hp 33s

Message #4 Posted by [Gerson W. Barbosa](#) on 4 July 2007, 3:41 p.m.,  
in response to message #1 by [Palmer O. Hanson, Jr.](#)

For a problem this long, perhaps it should be useful if you include a length and checksum table in your article, so that the user has an easy way to check if everything was keyed in correctly:

| LABEL | LENGTH | CHECKSUM |
|-------|--------|----------|
| L     | 45     | C89C     |
| M     | 432    | A45A     |
| D     | 210    | 038E     |
| V     | 150    | 9987     |
| X     | 27     | 6AB0     |

A preference for *roman numerals* when choosing the labels or just a coincidence? I haven't checked your program with other problems, so the table should be checked against your own.

By the way, my n-order complex equation solver for the CASIO PB-700 finds the same answers to your test problem in 14.5 seconds.

Best regards,

Gerson.

I used the labels I did because those were the ones which were available with two other programs on the machine. That may mean that I have a distaste for roman numerals, but I don't think so.

I match your lengths for all five programs. Unfortunately, I had to move my 33s programs around and had to use Label P instead of Label D. That means that the checksums for M and P are different.

I devised the original test problems with pencil and paper so using integers was an easy way to do it. But, I am always a little nervous until I have also run a program such as this with non integers. I was using my HP-28s for another problem when I belatedly discovered that it can divide a complex vector by a complex matrix. I have subsequently run several problems with values other than integers and the HP-28s results and the HP-33s results agree.

### **My HP-35 has a 1 second counter mode!!!**

Message #1 Posted by [oscarHPfanatic](#) on 20 June 2007, 1:33 p.m.

All,

I don't know if this has ever been seen before but the other day I was trying to find out why an old HP-35 with a serial No. 1302S xxxxx wasn't operating(I bought it inoperable for spare parts).

What I found was so cool that at first I thought it was a glitch. The HP-35, when raising the input voltage to approximately +6.1VDC enters a special "1 second counter" mode...This is how I found it:

I connected my benchtop variable DC supply to the battery input on the HP-35 and I initially set the voltage to +3.6VDC(which is the specified battery voltage). I found out that a wire from the power jack to the PCB was broken so I fixed it but by then I had increased the voltage to 6.5VDC and I unwittingly connected the supply to the HP-35 at around that higher voltage. As expected, the LED display was erratic then I noticed that I still had the supply at 6.5V so I began turning the voltage down slowly and then IT HAPPENED right at about 6.1VDC the LED display started counting from 0 up at a frequency of approximately 1 sec per count. This is how it looked :

000000000000.\*\* then 0000000000001.\*\* >> 00000000000002.\*\* >> and so on. I counted 10 minutes and it was still going. The counter at 10 minutes(my modern watch) was off on the HP-35 by 14 seconds so I'm assuming the crystal on the HP-35 is not that accurate by modern standards but then again back in 1973 who cared.

It's repeatable and I was amazed that the circuitry wasn't blown at this higher voltage (6.1VDC). By the way, for you techies and engineers, at this voltage the HP-35 was drawing 215mA...which seems excessive but then again I'm way out of spec on the voltage so anything can happen.

I'm thinking HP engineers added a factory counter mode to test the display and other circuits in the HP-35. This is so cool. My HP-35 still doesn't work but I know that at the very least I can enter my special "counter" mode and leave it on as an eye catching display.

Has anyone seen this before? I know it's not in the user manual for the sole reason that you're not supposed to be cranking up the voltage past 4V.

If anyone has any other questions go ahead and email me.

regards, Oscar

The HP-35 hardware and microcode has been studied thoroughly, and there is no factory test mode that does what you describe. What is happening is that your HP-35 malfunctions when operated out of spec. Some kind of glitch is causing it to enter a loop that happens to increment the B register, and because the loop was entered

abnormally, the usual termination condition for the loop is not met.

I'm not sure what you're seeing in the display that you've represented as "\*". You might not see the low order digits of the count in the B register because the A register is used as a display mask, for instance to prevent the exponent from being shown when the display is in fixed format (vs. scientific notation).

If there had been a factory test mode, it most certainly would not have been invoked by raising the voltage beyond spec.

The HP-35 doesn't have a crystal. Like most HP calculators up until the mid-1980s, it uses an LC oscillator, which has nowhere near the frequency stability of a crystal. The HP-55, HP-01, HP 82182A Time Module, and the time module portion of the HP-41CX do use a crystal.

### **Re: My HP-35 has a 1 second counter mode!!!**

*Message #3 Posted by [oscarHPfanatic](#) on 20 June 2007, 3:31 p.m.,  
in response to message #2 by Eric Smith*

If it is a glitch, it is a very repeatable glitch. The '\*' represents a fast changing digit. The right-most digit is basically a static blur, the 2nd digit is blurry but you can see that the frequency at which it changes is about 10Hz approximately. The third digit(I correct my earlier description) is a flashing "-" at a rate of 2 to 3 Hz. The fourth digit is where the count started at "0".

You are correct Eric, there is no crystal, I see that an LC circuit was utilized for that operation.

I haven't come around to checking the output voltages on the three internal supplies (should be +8, +6 and -12) but I have a feeling that they're likely higher than expected.

The fact still remains that this is a counter that is entered by a rising battery voltage at around 6.03VDC. As soon as I drop the voltage it exits this counter mode and if I raise it to 6.03VDC it enters the counter sequence. You're probably right, it's not a factory test mode but it's certainly repeatable.

Does anyone want to try this? I have a second HP-35 1143-0xxxx model of the first 10k units produced. It's a vintage and there's no way in heck I'm jacking up the voltage past 4.7VDC on that one. So if anyone has a spare HP-35 that's not operational maybe you can try this experiment to find out if it's repeatable in other units.

regards, Oscar

### **Re: My HP-35 has a 1 second counter mode!!!**

*Message #4 Posted by [Dan W](#) on 20 June 2007, 3:51 p.m.,  
in response to message #3 by oscarHPfanatic*

I saw this happen a few months ago. I had an AC Adapter/Charger I had just bought off eBay. Plugged it in to my 35 and saw a variety of strange sequences. Started with all zeros flashing, then some counting, then some randomness, more flashing.

I didn't leave it plugged in long because I thought it was going to self destruct. I put a multimeter to the charger and it showed right around 6.1V.

I agree, while interesting, it isn't a likely test mode of any sort, just a behavior at a certain voltage that causes certain signals to get crossed in a repeatable way.

The Classics do interesting things when operated out of spec. Have you ever heard of the HP-67 PPC

Black Box? Or NNN characters (Non-Normalized Numbers)?

**Re: My HP-35 has a 1 second counter mode!!!**

*Message #5 Posted by [Eric Smith](#) on 20 June 2007, 7:28 p.m.,  
in response to message #3 by oscarHPfanatic*

I expect you mean that the next-to-the-last digit changes at approximately 100 Hz. The rate of the "-" flashing is consistent with digit 2 of the A register cycling at 10 Hz. (My previous description in this thread had the A and B registers reversed; B is the mask.)

An approximate 1000 Hz count as you are seeing is thus what one would expect from an increment loop using three or four microinstructions.

I can't identify any specific code segment in the ROM that would easily be expected to show this behavior, but if the machine is malfunctioning due to elevated voltage, anything can happen.

The fact that it is reproducible just means that you are raising the voltage to the point where the "weakest link" starts malfunctioning. This may or may not be the same malfunction that would be seen in any other specific HP-35.

I don't recommend doing much experimentation with this, at least on any HP-35 that you would not want to damage.

**Re: My HP-35 has a 1 second counter mode!!!**

*Message #6 Posted by [Ren](#) on 21 June 2007, 5:09 p.m.,  
in response to message #1 by oscarHPfanatic*

Please don't put higher voltages into an HP calc!

I accidentally put 12 volts into my HP-22 and now it is a paperweight.

IIRC, decades ago an electronics magazine had an article about converting an LED calculator to read capacitance.

I think it involved changing the capacitor for the clock circuit with the DUT (Device Under Test), and some other modifications so that as the DUT charged a proportional number was displayed on the LED.

I don't think any HP's were harmed by the article, as it specified using CHEAP calculators!

**Reconditioning a 42S keyboard and bezel**

Message #1 Posted by [Mike Ingle](#) on 19 June 2007, 2:38 p.m.

The 42S I bought (S/N 32xx, ver C) had sticky keys. They did not stick down, but some keys resisted initial pressure then released with a click and pressed normally. It was usable but annoying. The metal front plate was also a bit loose on the right side, near the "RPN SCIENTIFIC" logo.

To fix the keyboard, I put enough 91% isopropyl alcohol on it to get some into the underside of the keyboard, then pressed the keys repeatedly. I wiped and shook out as much as possible. To dry the 42S I left it for several hours on a metal-cased fanless PC server, which gets quite warm but not too hot to touch. After two cleanings, the last one heated overnight, the stickiness is gone and all the keys work well. It remains to be seen if the repair lasts; has anyone done this?

The loose front plate is still a problem. I need to get some superglue under that bezel (1/2 mm crack or so) without getting any on the visible part of the calculator. Is there a known clever way to do that?

Mike

Don't know it's clever or not, but I'd try with a needle.

in response to message #2 by Walter B

If you go the needle route, a ready supply of syringes and needles is generally available at the local farm supply / feed store.

**Re: Reconditioning a 42S keyboard and bezel**

Message #4 Posted by [Les Wright](#) on 19 June 2007, 10:10 p.m.,  
in response to message #1 by Mike Ingle

My very loose faceplate eventually came off entirely, so I didn't risk further damage by removing it--the worst was done.

Sticking this sucker down with CYA make me queasy. Rubber cement was a temporary solution but lacked hold. I eventually found fabric glue is a good compromise--the hold is a bit more avid but the excess pills away harmlessly like rubber cement.

I think you may get good results prying the offending corner up a tiny bit, tucking a bit of fabric glue in the corner, apply a little thumb pressure, and when the excess that exudes from the crack dries rub it away gently.

My rogue faceplate is curling up a little bit towards the bottom, but it has stayed tacked down nicely elsewhere. This fix is a few months old now. I also find the some of the apparent unevenness has improved, as though being held flat by the fabric glue has shaped the plate back partially toward a more desireable flat appearance. Not like new, but better.

Les

### **Re: Reconditioning a 42S keyboard and bezel**

*Message #5 Posted by [Mike Ingle](#) on 20 June 2007, 8:20 p.m.,*

*in response to message #1 by Mike Ingle*

I ended up lifting the edge a bit more with a jeweler's screwdriver, putting a drop of superglue on a piece of paper, and moving the piece of paper under the bezel to get glue on the underside of the bezel. This can be done without getting the glue on the edge. Then press it down and hold it for a while.

### 50g - lower serial port bit rates

Message #1 Posted by [James M. Prange \(Michigan\)](#) on 18 June 2007, 10:04 p.m.

For anyone who'd like to use a 50g with a serial port bit rate lower than 2400bps, see this [comp.sys.hp48 thread](#).

Regards,  
James

### Re: 50g - lower serial port bit rates

Message #2 Posted by [Egan Ford](#) on 18 June 2007, 10:37 p.m.,  
in response to message #1 by James M. Prange (Michigan)

Do you know if there are any low cost cables?

### Re: 50g - lower serial port bit rates

Message #3 Posted by [James M. Prange \(Michigan\)](#) on 19 June 2007, 3:48 a.m.,  
in response to message #2 by Egan Ford

The last time that I checked, the site that originally marketed a serial cable/level shifter for the 50g had raised its original price for it considerably.

A few weeks ago, Eric Rechlin started [this comp.sys.hp48 thread](#), so there seems to be some reason to hope for a reasonably-priced alternative becoming available.

Other than that, as far as I know, it would be a do-it-yourself project.

Regards,  
James

*Edited: 19 June 2007, 4:05 a.m.*

### Re: 50g - lower serial port bit rates

Message #4 Posted by [Eric Rechlin](#) on 20 June 2007, 3:43 p.m.,  
in response to message #3 by James M. Prange (Michigan)

I'm still working on it, but things are going slower than expected. I expect the first boards should arrive from the manufacturer within a week so I can assemble the first prototypes.

If anyone else is still interested in testing, please contact me, and I will keep you informed directly with more information when I am ready.

### EMU41 2.4 ALPHA issue

Message #1 Posted by [Egan Ford](#) on 18 June 2007, 9:18 p.m.

I am new to EMU41 (I am using it for it's HP-IL support). When I press F4 for ALPHA I am only able to enter a,b,c,d,e, anything else is \*. It is as if all input is 41-shifted. F8-F4 (i.e. XEQ-ALPHA) does not have this problem. Has anyone else seen this?

Thanks.

### Re: EMU41 2.4 ALPHA issue

Message #2 Posted by [Howard Owen](#) on 18 June 2007, 10:42 p.m.,  
in response to message #1 by Egan Ford

Are you using the CX ROMs? Do you have the CCD module loaded? The CX ROMs are needed to have all the lowercase characters in ROM, of course. And the CCD ROM only does full lower case when USER mode is on.

Regards,  
Howard

### Re: EMU41 2.4 ALPHA issue

Message #3 Posted by [Egan Ford](#) on 18 June 2007, 11:36 p.m.,  
in response to message #2 by Howard Owen

Thanks. Unloading CCD fixed it. However, I didn't have USER mode enable. Thanks again.

### Re: EMU41 2.4 ALPHA issue

Message #4 Posted by [Raymond Del Tondo](#) on 20 June 2007, 12:18 a.m.,  
in response to message #3 by Egan Ford

Actually, the extended ALPHA mode of the CCD module is active when USER is OFF.

Apart from that, the CCD module and the CCD OS/X greatly improve the usability of the HP-41. Many user interface related things are much easier with the CCD OS Xtensions. My minimal config is CX/CY + CCD OS/X, of course;-)

### Short & Sweet Math Challenge #19: Surprise ! [LONG]

Message #1 Posted by [Valentin Albillo](#) on 18 June 2007, 8:14 p.m.

Hi all,

Almost 3 months have passed by since my latest *S&SMC #18: April 1<sup>st</sup>'s Spring Special*, so it's high time to indulge in a new Short & Sweet Math Challenge<sup>(tm)</sup>, this time's *S&SMC#19: "Surprise !"*, where an assortment of individual subchallenges are issued, all of them having in common a most unexpected, surprising result, and further they're *graded* according to their difficulty, from the easiest (**F**) to the hardest (**A**), so that all of you may try your hand to at least some of them, if not all.

Three optional variants are suggested to allow you to *upgrade* your mark to a **C+**, **B+**, or **A+**. I'll provide my original solutions plus extensive comments to all graded problems A-F (but not for A+, B+, C+, these are truly left as an exercise for the reader, though I'll provide the final results and some comments as well).

The usual rules do strictly apply, briefly:

- Do **not** *google* for the answers, that's *pathetically lame* and unworthy of you
- Giving just the numeric result is *worthless* as well and gets you *no grade at all*: you *must* supply **code** for your favorite HP handheld (other makes also allowed), which must be a calculator/handheld computer or emulator/simulator, no code for desktop/laptop PC-class machines or PDAs.

I'll post my original solutions within a week of sorts, so you'll have plenty of time to concoct and post your solutions. Enjoy ! :-)

---

## The Graded Challenge

---

### Grade F:

---

Write a program to compute (but not output) the  $N^{\text{th}}$  term for the following sequences:

$$\text{Sequence 1: } u_1 = 0, u_2 = 1, u_{n+2} = u_{n+1} + u_n/n$$

$$\text{Sequence 2: } u_1 = 0, u_2 = 1, u_{n+2} = u_n + u_{n+1}/n$$

where the number of terms  $N$  (which can be distinct for each sequence) is either hardcoded or input, your choice. After computing (but not outputting) the  $N^{\text{th}}$  term,  $u_N$ , your program must then compute and output just the following values:

$$\text{Sequence 1: } L = N \cdot 1 / (u_N)$$

$$\text{Sequence 2: } L = N \cdot 2 / (u_N)^2$$

Now use your program to help you *try and predict*, for each sequence, the corresponding theoretical exact limit of  $L$  when the number of terms  $N$  tends to infinity.

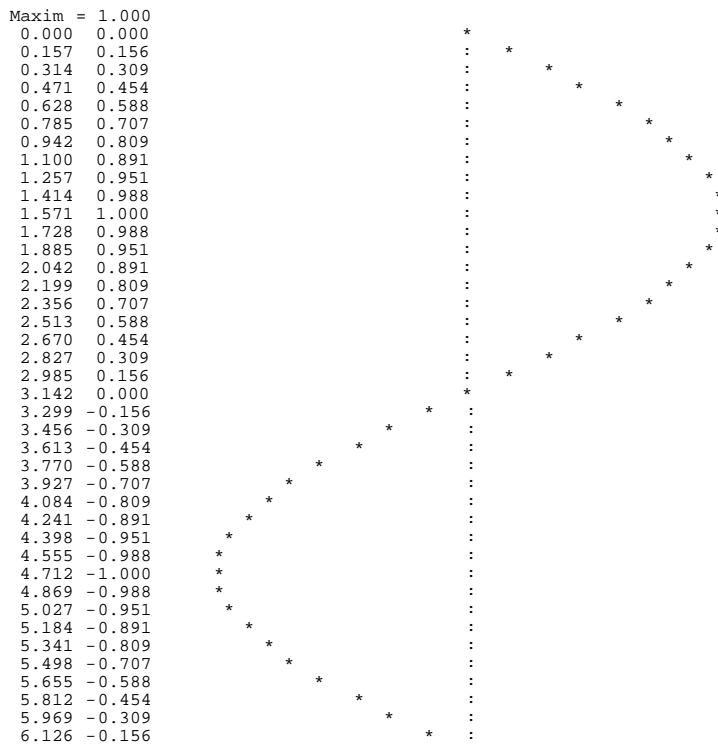

I'll give my solution for the HP-71B which is a *2-line program* which computes and outputs the corresponding values of  $L$  for  $N = 13$  and  $N = 13000$ , respectively.

### Grade D:

Using a model which either has built-in *graphics capabilities* or else can send output to a (perhaps emulated) *printer* (not necessarily graphical, alphanumeric output will do just fine), write a program which, given  $N$ , will autoscale, label, and plot the **ISin(X, N)** function, for arguments  $X$  belonging to the fixed interval  $[0, 2 \cdot \text{Pi}]$  at increments of  $\text{Pi}/40$ , say, where

**ISin(X, N)** is defined as **Sin(Sin(Sin( ... Sin(X) ... )))**

i.e., the iterated Sine of  $X$ , where  $X$  is assumed to be in radians, and  $N$  is a positive integer, which is the number of iterations. For instance, this could be the resulting output in an alphanumeric-only printer for the case of **N=1**:

which, of course, is **ISin(X, 1)** i.e. just **Sin(X)**. Notice the *auto-scaling* so that the plot takes the *whole width* of the output, the *labeled* and properly *rounded*  $X$  and  $Y$  coordinates, and the labeled *Maxim*, which is the maximum absolute value of the  $Y$  coordinate: you need to know it in order to autoscale the plot, so you might as well output it.

Once you've succeeded, run your program for various values of  $N$  such as **10, 100, 1000, ...**, (or **2, 4, 8, ...**), and, just by looking at the plots themselves and the values of *Maxim*, *try and describe what happens for increasing values of  $N$*  and *predict what happens in the limit when  $N$  tends to infinite*.

I'll give my solution for the HP-71B which is an *8-line program* which produces sample output like the above for any N.

### Grade C:

Find and output *all* values of  $N < 10000$  such that  $N$  is *prime* and

$$P(N) = S(N)$$

where  $P(N)$  gives *the number of primes*  $\leq N$  and  $S(N)$  gives *the sum of the factorials of the digits of*  $N$ .

For instance:

$$P(7) = 4, \text{ because there are 4 primes } \leq 7, \text{ namely } 2, 3, 5, 7$$

$$S(1234) = 33, \text{ because } 1! + 2! + 3! + 4! = 33$$

Your program must be *optimized primarily for speed*, then for program size, and it must exhaust the range, not stop altogether upon finding a solution.

I'll give my solution for the HP-71B, which is a simple *6-line program* which delivers the goods very quickly.

**Note: Get a C+ !**

Among the infinity of positive integers  $N \geq 10000$ , there's just *one and only one* additional solution. Find it !

### Grade B:

Given a positive integer  $N$ , write a program to compute and output the value of  $S$ , defined as

$$S = \prod_{n=1}^N \frac{1}{(r_n)^2}$$

where  $r_n$  is the  $n^{\text{th}}$  positive root of  $\tan(x) = x$ , where  $x$  is expressed in radians.

Your program must be *optimized primarily for speed*, then size, and must be efficient enough to allow you to compute  $S$  for *large* values of  $N$  in *reasonable* times. It must also take special care *not to miss* any roots in range or *misidentify* a pole for a root.

Once written, compute the value of  $S$  for  $N = 100, 200, \dots, 1000, 2000, \dots$ , then try and *predict what the exact limit value should be when  $N$  tends to infinite*.

I'll give several very short and fast solutions for the HP-71B, to illustrate some important points. Running on Emu71, they can compute and process up to, say, *1,000,000 roots*, in very reasonable times.

**Note: Get a B+ !**

If you manage to solve the above, you can get a B+ by computing and, most specially, *identifying* the exact sum but this time using

$$(r_n)^2 + 1$$

in the denominators instead of simply  $(r_n)^2$

### Grade A:

As you may know, the limit of the sum of the reciprocals of the natural numbers 1 to  $N$  does *diverge* when  $N$  tends to infinite:

$$S = \sum_{N=1}^{N \rightarrow \infty} \frac{1}{N} \rightarrow \infty$$

However, if we simply leave *out* of the sum just *those terms whose denominators include the digit 9* (such as 199, 34343900132, ...), the infinite sum then nicely *converges* to a finite value.

This said, you must write a program to compute *as accurately as possible* this finite value of the infinite sum. You must optimize your program for *both accuracy and speed*.

I'll give my original solutions for the HP-71B, which are 6- and 10-line programs. Both of them do compute the limit to a full 12-digit accuracy fairly quickly, but the longer one does it *60+ times faster*.

**Note: Get an A+ !**

Compute the limit value of the infinite sum excluding instead those terms which include the digit string '42', as in "HP42S" (i.e: 42, 78042998, 142883213044, etc). Also, see if you can *predict the approximate value* of the infinite sum when excluding terms which do include some given arbitrary non-periodic string of digits (say, 314, or 314159, or your phone number, etc)

That's all. Hoping you'll enjoy this S&SMC and waiting for your clever solutions ...

Best regards from V.

*Edited to correct a typo in the initial conditions of Grade F above, as pointed by Peter P. Thanks a lot, Peter ! :-)*

*Edited to add a C+ exercise for the reader*

### failed at F already

Message #2 Posted by **PeterP** on 18 June 2007, 11:37 p.m.,  
in response to message #1 by Valentin Albillo

Just got home and saw with great delight another S&SMC!

However, not surprisingly I stumble already on the first one. There is some slight hope for me that I don't fully understand the nomenclature of the challenge, but more likely I don't get it. Please give me kind nudge...

You write (replacing brackets for your subscript)

$$u(1) = 0; u(2) = 0; u(n+2) = u(n+1) + u(n)/n$$

Setting  $n = 1$  I interpret this as:  $u(1+2) = u(1+1) + u(1)/1$ . Substituting  $u(1)$  and  $u(2)$  gives me a  $u(3)$  of 0 which then in consequence means  $u(n)$  is zero  $\forall n$

Please someone be so kind and help me see what my mistake is!

Thanks for another challenge Valentin, I know my productivity level for tomorrow already (and thanks to my early stumble I will get some sleep tonight :-))

Cheers

Peter

### My Bad !! :-( Thanks, Peter ! :-)

Message #3 Posted by [Valentin Albillo](#) on 19 June 2007, 1:41 p.m.,  
in response to message #2 by PeterP

Hi, Peter:

Actually, it was a typo on my part: I was very busy keying in all of this rather long stuff late in the dark at 3 AM and despite my best efforts to ensure full correctness, a typo crept in.

I've already edited it out in my main post above, so please resume your efforts with the now corrected initial conditions for both sequences featured in **Grade F** (there were a couple of **0**'s where **1**'s should have been).

Thanks a lot for spotting it out and sorry for the inconvenience.

Best regards from V.

### My first 71b submission!

Message #4 Posted by [PeterP](#) on 19 June 2007, 3:32 p.m.,  
in response to message #3 by Valentin Albillo

Okay, here is my clunky 71b code - the first try for an official SSMC on the 71b for me! (hey, one has to treasure the small pleasures in life, right?) And I readily admit that the recursive capability of the 71b made this one much easier to program on the 71b than a similar attempt on the 41c would have been.

Those two harmless looking sequences do indeed seem to converge to surprising numbers (e and pi).

First sequence:

```
10 Def FNV(n)
20 If n = 0 Then FNV = 0 Else if n = 1 then FNV = 1 Else FNV = FNV(n-1) + FNV(n-2)/(n-2)
30 End Def
40 Input "N=?";n @ Disp n/FNV(n) @ Beep
```

even reasonably low  $n$  (e.g. 13 as suggested by Valentin) lead to fairly accurate representation of  $e$ . for  $N=13$  I get 2.71828182854

Second sequence:

```
10 Def FNV(n)
20 If n = 0 Then FNV = 0 Else if n = 1 then FNV = 1 Else FNV = FNV(n-2) + FNV(n-1)/(n-2)
```

```
30 End Def
40 Input "N=?";n @ Disp 2*n/(FNV(n))^2 @ Beep
```

This sequence seems to converge to pi, but MUCH much slower. I have not installed emu71 yet (I know, I know, sorry guys....) so I will not run it until 13000 in my physical 71b as Valentin seems to suggest, lest I miss my appointment with the end of the universe.

The max I dared was 13 again and that gave me 3.548026... Being this is pretty far from pi, I might go ahead and install emu71... :-)) and so how far we can get...

### Re: My first 71b submission!

Message #5 Posted by [Egan Ford](#) on 19 June 2007, 4:56 p.m.,  
in response to message #4 by PeterP

Quote:

This sequence seems to converge to pi, but MUCH much slower. I have not installed emu71 yet (I know, I know, sorry guys....) so I will not run it until 13000 in my physical 71b as Valentin seems to suggest, lest I miss my appointment with the end of the universe.

Recursion can be a bit slow (even on EMU71). Try something like the following for sequence 2:

```
10 N=13000
20 T=TIME
30 U1=0 @ U2=1
40 FOR I=3 TO N
50 U3=U1+U2/(I-2)
60 U1=U2 @ U2=U3
70 NEXT I
80 DISP 2*N/U3^2;"IN";TIME-T;"SEC"
```

```
EMU71 output: 3.14171348646 IN 1.48 SEC
71B output: 3.14171348646 IN 618.29 SEC
```

### F is for FORTH

Message #7 Posted by [Egan Ford](#) on 20 June 2007, 11:21 p.m.,  
in response to message #5 by Egan Ford

Quote:

```
EMU71 output: 3.14171348646 IN 1.48 SEC
71B output: 3.14171348646 IN 618.29 SEC
```

For fun I fabricated a fast 71B FORTH follow up. Given that this is a stack-based solution you

could easily use a forty one.

I must say that the 71B + Math ROM + JPCx + 41/FORTH ROM is becoming my favorite calc. RPN/FORTH/BASIC + I/O--very nice.

The code below works like my small basic post above, but ~2x faster.

```
: F1
CLOCK FTOI
0. 1.
13001 3 DO
  FENTER
  Z RCL
  I 2 - ITOF
  F/
  F+
LOOP
13000 ITOF Y RCL F/ F.
." IN "
CLOCK FTOI
SWAP - . ." SEC"
;
```

OUTPUT: 2.71828183554 IN 331 SEC

```
: F2
CLOCK FTOI
0. 1.
13001 3 DO
  FENTER
  I 2 - ITOF
  F/
  Z RCL
  F+
LOOP
FENTER F* 2 13000 * ITOF Y RCL F/ F.
." IN "
CLOCK FTOI
SWAP - . ." SEC"
;
```

OUTPUT: 3.14171348646 IN 324 SEC

## Grade C

*Message #8 Posted by **PeterP** on 19 June 2007, 10:23 p.m.,  
in response to message #4 by PeterP*

Another rather long program, which however works... And it brought me into contact with the JPC-rom...

the answer appears to be 6521, which is a prime number, has 843 as the sum of the factorials and there are 843 prime numbers lower than 6521.

the code below first generates  $p(x)$  up until the maximum relevant number <10000 (which is 6543, see below). It then loops through all possible numbers, calculates  $S$ , checks if  $N$  is prime and if  $s=p(n)$ , taking advantage of a few things.

Generally a digit needs to be 'worth' more than its factorial. So say  $5!$  is 120 yet that 5 occupies the first digit in the number  $n$ . it provides only  $p(5) \leq 5$  number of primes but contributes  $120 > 5$  to the  $S$ , the sum of the factorials. based on this general observation and the the handy function  $nprim(1,n)$  from the JPC-Rom we can quickly say that

a) no digits  $>6$  are allowed, as they 'contribute' too much via  $n!$  to  $S$  than what they can contribute

to N, even if they are the highest digit in N

b) for similar reasons, the second lowest digit can only go until 4 and the third lowest until 5.

c) the lowest digit can only go until 3. However, as N has to be prime we can also eliminate 2 here. this leaves us with  $(0 \rightarrow 6) \cdot (0 \rightarrow 5) \cdot (0 \rightarrow 4) \cdot (1,3) = 7 \cdot 6 \cdot 5 \cdot 4 \cdot 2$  or 1680 test we have to make.

d) given that this is much less than 10000 one could have also replaced the first loop which generates  $p(x)$  with the function  $\text{nprim}(1,N)$  for those 1680 iterations. It turns out that this is slower than generating  $p(x)$  for all 6543 numbers.

anyway, here is the listing

```

10 destroy all
20 dim p(6543) @ c=0
30 for j=1 to 6543
40   if prim(j)=0 then c=c+1
50   p(j)=c
60 next j
70 disp j;c @ beep !just for feedback
80 for b=0 to 6
90   if b>0 then b2=b*10^3 @ b3=fact(b) else b2=0 @ b3=0
100  for c=0 to 5
110   if b+c>0 then c2=c*10^2 @ c3=fact(c) else c2=0 @ c3=0
120   for d=0 to 4
130    if a+b+c+d>0 then d2=d*10 @ d3=fact(d) else d2=0 @ d3=0
140    for e = 1 to 3 step 2
150     n=b2+c2+d2+e @ s=b3+c3+d3+fact(e)
160     if p(n)<>s then 190
170     if prim(n)<>0 then 190
180     disp n;s;p(n)
190    next e
200   next d
210  next c
220 next b
230 destroy all
240 disp "Done!" @ beep 880

```

It runs approximately 5 sec on EMU71 (i got inspired and did install it. What a NICE piece of software!!!) and approximately 5 minutes on my real hp71 (side question: is there a similar speed-hack for the 71b as there is for the 41C?) One interesting side comment: I remember that there sometimes is a debate if 1 is a prime number or not. even the JPC-rom has different opinions here (i think the x-version says no, the e version says yes). If one were to claim 1 as a prime number, the solution would be 13, which has a factorial sum  $s(13)=7$  and 7 prime numbers (1,2,3,5,7,11,13).

This is fun!

Cheers

Peter

## Re: Grade C

Message #10 Posted by [Valentin Albillo](#) on 20 June 2007, 4:45 a.m.,  
in response to message #8 by PeterP

Hi, Peter:

Peter wrote:

*"Another rather long program, which however works... And it brought me into contact with the JPC-rom..."*

My, my, you're learning a lot, aren't you ? And having fun while at it ! :-)

*"the answer appears to be 6521, which is a prime number, has 843 as the sum of the factorials and there are 853 prime numbers lower than 6521."*

He, he, my time to correct your typo: you mean "there are 843 prime numbers lower than 6521", not 853.

*"It runs approximately 5 sec on EMU71 (i got inspired and did install it. What a NICE piece of software!!!) and approximately 5 minutes on my real hp71"*

There's something weird about those timings. I've found that a properly installed instance of Emu71 runs 250-350 times faster than a real HP-71B, so if it takes 5 minutes in the physical 71B, it should take approximately just *one second* when running under Emu71, not five, assuming you're using a 2 Ghz CPU or so. Perhaps you should check your installed Emu71 or stop other tasks while timing it, or check different hardware.

*"If one were to claim 1 as a prime number [...]"*

... you could claim as well that 3 is even, i.e., you *can't*. **1** is neither composite nor prime, it's a *unit* and that allows it an special status as regards to primality or compositeness. As such, **1** is *never* counted as a primer number.

*"This is fun!"*

I'm truly glad you're enjoying it. **I've added a C+ variant to the challenge** above, see if you dare to conquer it as well. It's not that easy, you know ... :-)

Best regards from V.

## Re: Grade C

Message #11 Posted by [PeterP](#) on 20 June 2007, 1:24 p.m.,  
in response to message #10 by Valentin Albillo

Thanks Valentin, I corrected my post. Turns out it was even worse, there was a slight typo in the listing as well...

C+ sounds daring, your looong time ago post about how to teach a 71 or 41 large number/high precision arithmetic rears its ugly head...

Cheers

Peter

**Re: Grade C**

Message #12 Posted by **Valentin Albillo** on 20 June 2007, 8:00 p.m.,  
in response to message #11 by PeterP

Hi again, Peter:

Peter wrote:

*"C+ sounds daring, your looong time ago post about how to teach a 71 or 41 large number/high precision arithmetic rears its ugly head..."*

Not so, fortunately. The only other solution is well within the normal range for REAL numbers in the HP-71B and, matter of fact, any other HP calculator ever produced.

A little sleuthing will allow you to easily set an upper limit and useful, time-reducing heuristics for the search.

Best regards from V.

**C+ solved**

Message #13 Posted by **PeterP** on 21 June 2007, 1:14 a.m.,  
in response to message #12 by Valentin Albillo

hmmm...

I new that my original approach to C would not work, so I changed it around. The following code delivers the first solution in ~1sec in EMU71 and a second solution(?) in ~14min.

5,114,903 seems to be another solution. There are 363035 prim numbers until it and the sum of its factorials is also 363035 unless I made a mistake, which is, alas, very likely.

The code below uses fprim from the JPC-rom to move from one prime to the next and then calculates the sum of the factorial using the string-access brackets. Given that for the second solution we knew we had to look for higher numbers it made sense to let the prim numbers lead the way rather than the factorials as in my original solution.

The nice thing is that this code is even shorter. If one were to take out the niceties like giving it a start-number, measuring the time etc it would be down to about 7 lines... (30,40+50,60,70,80,90,150)

```

10 Input "Start=?";S @ P=Nprim(1,S) @ C=0
20 A$=Time$
30 Loop
40 T=Fprim(S+1) @ P=P+1 @ S=T
50 T$=STR$(T) @ L=Len(T$) @ X=0
60 For I=1 to L
70 X=X+Fact(Val(T$[I,I])) @ If X>P Then I=L+1
80 Next I
90 If X=P Then
100 Disp "Found a solution!!
";"Prim=";T;"FactSum=";X;"NumOfPrim=";P
110 Disp "StartTime=";A$;" EndTime=";Time$
120 Disp "Press key to continue...";Keywait$

```

```

130 Endif
140 C=C+1 @ C>500 then C=0 @ Disp "Cur Prim=";T;"P=";P
150 End Loop

```

**Re: C+ solved**

*Message #14 Posted by [Egan Ford](#) on 21 June 2007, 2:11 a.m.,  
in response to message #13 by PeterP*

Quote:

5,114,903 seems to be another solution.

Actually I think its 5224903.

I have a 50g program that works the same way. A quick and dirty that runs slow.

Save this as 'DIGITFACT'

```

\<< 0 \-> X
  \<< DUP
    WHILE 0 >
      REPEAT DUP 10 MOD ! X + 'X' STO 10 / IP DUP
    END DROP X
  \>>
\>>

```

Save and run this:

```

\<< 843 \-> P
  \<< 6521
    DO NEXTPRIME DUP P 1 + 'P' STO DIGITFACT P
  UNTIL ==
  END P
  \>>
\>>

```

I came up with something so similar it is spooky. Just I use STO+ and INCR and my functions are called S and N.

If I have time this weekend I want to put some Assembly and sysRPL in there.

Arnaud

## Grade D

*Message #17 Posted by [PeterP](#) on 20 June 2007, 7:10 p.m.,  
in response to message #4 by PeterP*

Learned some more about string-handling, yet do not have the patience to make it as pretty as VA's plot. However, from running the pgm it would seem that the curve becomes more and more a rectangular step function with n increasing. The question is, if that 'rectangle' will eventually become a flat line. Here is my amateurs guess:  $\sin(x)=x-x^3/3$ . In the limit,  $x^3$  should converge faster to 0 than x so I'd say it stays a rectangle (meaning the integral of  $I\sin(x,n)$  over  $[0,\pi]$  is  $>0$  for  $\lim n \rightarrow \infty$ ). But that's just a guess.

Here is the rather boring and un-elegant code. (Side-comment: as a beginner/novice the 71b is so much easier to program that I see I do significantly less fiddling than when working with the 41. The outcome is that I gets results faster, yet the code is often less elegant or intriguing, more straight forward, yet easier to follow. Unless it is authored by VA, naturally... :-)

```
10 Destroy N,Y,P,D$,I,J,C @ Radians
20 Input "N=?";N @ Dim y(80) @ p=0 @ c=80 @ dim d${80}
30 Def fns(x,n)
40   t=x
50   for j=1 to n @ t=sin(t) @ next j
60   fns=t
70 end def
80 m1=100 @ m2=-100
90 for i=0 to 80
100   y(i) = fns(i*pi()/40,n)
110   m1 = min(m1,y(i)) @ m2 = max(m2,y(i))
120 Next i
130 d=m2-m1 @ s=d/c
140 disp "Min=";m1;'Max=";m2
150 for i=0 to 80
160   d$=space(c)
170   p=int((y(i)-m1)/s+0.5)
180   p=max(0,p) @ p=min(p,80)
190   d${p]="x" @ Disp d$
200   disp keywait$
210 Next i
220 Disp "Done!"
```

## Re: Grade D

*Message #18 Posted by [Dave Shaffer \(Arizona\)](#) on 21 June 2007, 6:48 p.m.,  
in response to message #17 by PeterP*

I, too, think you will approach a square wave (i.e. a line above and below zero, by the same distance). Whether it stays a square wave or goes to zero depends on precision limits on calculating  $\sin(x)$  where x is small. If for x small enough,  $\sin(x)$  exactly returns x, then the square wave amplitude will be the x value at which  $\sin(x)$  no longer gets any smaller.

For example, on my 42S, I find that taking a sine starting at 0.0004 requires some 50 key presses of the sin button until you get an answer that is not 0.0004 but rather 0.000399999 (remember:  $\sin(\epsilon) \sim \epsilon$ , for small epsilon). For larger values of x (i.e. where  $\sin(x)$  was bigger to begin with),  $\sin(x)$  will get smaller more quickly than for those values of x which

gave a smaller value of  $\sin(x)$  to begin with. Hence, the curve will flatten out more quickly where  $x$  was nearer to  $\pi/2$  or  $3\pi/2$ .

## Grade Bish

Message #19 Posted by **PeterP** on 21 June 2007, 1:33 p.m.,  
in response to message #4 by PeterP

### THIS IS A CORRECTED POST

my original post had an error in the if-then clause in Def FN due to a misunderstanding on my part on how the if-then with a followin @ works.

Now things are more 'surprising'. A little nifty free graphic package (its free, super easy and allows all sorts of graphs of functions, integrals, etc. It can be found [here](#) ) helped me see the periodicity in the roots (every  $\pi()$  with the first one after 0 being between  $1.25*\pi$  and  $1.5*\pi$ ) which I used for FNROOT.

The value for B seems to be 1/5th (I get 0.199989... for  $n=100000$ )

The value for B+ comes out to something like 0.194526... and I have no idea about the 'true' value.

Here is the now corrected code. However, WHY those are the correct answers, I could never figure out. I admit to cheating in the end and found the explanation - I would have NEVER found this one out!

```
10 Def FN(x)
20   f= tan(x)-x
30   if abs(f)<=1e-40 then f=0
35   fnf=f
40 end Def
50 Input "N=?";N @ S=0 @ Input "ad to square of root (0 or 1)",a
60 For i=1 to N
70   L=(i+0.25*PI() @ U=L+0.25*PI()
80   Y=FNROOT(L,U,FNF(FVAR)) @ S=S+1/(a+y^2) @ if mod(i,500)=0 then disp i,2*s
90 next i
100 s=s*2 @ Disp "Sum=";s
```

Cheers

Peter

*Edited: 21 June 2007, 7:06 p.m.*

## Re: Grade Bish ... not :-)

Message #20 Posted by **Valentin Albilló** on 22 June 2007, 5:51 a.m.,  
in response to message #19 by PeterP

Hi, Peter:

Peter posted:

*"THIS IS A CORRECTED POST"*

Most unfortunately, the corrections fell short of perfection, there are still a considerable number of errors in your listing. Please take what follows as well-meaning *advice*, not *criticism*, given solely to allow you to improve your skills:

First of all, there are many syntax errors in your listing:

```

10 Def FN(x)
      ^
      |-- It should probably be FNF(x), the F is missing

20   f= tan(x)-x
30   if abs(f)<=1e-40 then f=0
35   fnf=f
40 end Def

```

While correct, this is unnecessarily convoluted, and the simpler and obvious:

```

10 DEF FNF(X)=TAN(X)-X

```

would be both shorter and faster, not being a multi-line user defined function and not needing to use an additional variable, not to mention the gains of suppressing the unnecessary test.

Which is more, you can simply use **TAN(FVAR)-FVAR** directly in FNROOT, thus getting rid of the user-defined function definition, which will again save bytes and be much faster, as invoking user-defined functions is costly in the HP-71B.

```

50 Input "N=?";N @ S=0 @ Input "ad to square of root (0 or^
  1)",a
      ^
      |-- this must be a ";" instead of a ","

70   L=(i+0.25*PI() @ U=L+0.25*PI()
      ^
      |-- this parenthesis is never closed; besides,
      I don't quite get what PI() is intended to be,
      unless it's some ROM- or LEX keyword which
      does require that weird syntax; the built-in
      PI function does *not* admit "()"

80   Y=FNROOT(L,U,FNF(FVAR)) @ S=S+1/(a+y^2) @
      if mod(i,500)=0 then disp i,2*s
      ^
      |-- Whence came this 2 ?
      Also, y*y would be
much faster than y^2

100 s=s*2 @ Disp "Sum=";s
      ^
      |-- ditto, whence came this 2 ? No such 2 does
      appear anywhere in the challenge's infinite sum

```

I think most of these errors are due to you painstakingly typing the listing into the posted message, either from your HP-71B display or from the Emu71 listing. As such, you're prone to typos, uneven casing, etc.

May I suggest that you simply develop your solution in Emu71, then, once it runs fine, simply execute LIST to have the listing appear in Emu71's simulated 80-column display, then *\*copy\** the listing from Emu71's display and *\*paste\** it in your message's text area. That would ensure absolute correction, no typos whatsoever, and would be both much faster and less tiring for you.

Now, I've corrected the above mentioned typos, but nevertheless the corrected listing does not produce the values you mention, far from it. I've traced it and it doesn't seem to properly generate the roots, as it generates and adds to the sum the same roots many times, omits others, and at times generates poles instead of roots.

Perhaps my corrections weren't enough, or perhaps something else is missing from your listing. Please follow my advice on generating and copy/paste-ing listings directly from Emu71, and re-post your routine again. I hope that, in the end, this will be both fun and instructive for you.

Thanks a lot for your interest, and

Best regards from V.

**Re: Grade Bish ... not :-)**

*Message #21 Posted by **PeterP** on 23 June 2007, 1:33 p.m.,  
in response to message #20 by Valentin Albillo*

Valentin,

Thanks for your thoughtful comments and teaching, please know that yours (and all the others) kind advice is very much appreciated by me! I knew that I will open myself up to public failure when I decided to participate in this S&SMC with the 71b, where I can barely manage the 'novice' grade as of now. However, pretty much all in live for me is about learning so I'm just fine with 'failing' on the way.

Please find below some comments with regards to your advice. As you inducted already, there are a good many errors which happen due to me trying to type it in form my 71b. I took me a little while to figure out how to copy from a dos window (haven't used DOS in ages) but towards the end you will find the copy&paste original code from me (which actually does seem to produce the results mentioned). Using your suggestions, however, makes the code not only shorter but also run about twice as fast!!

Quote:

Which is more, you can simply use TAN(FVAR)-FVAR directly in FNROOT, thus getting rid of the user-defined function definition, which will again save bytes and be much faster, as invoking user-defined functions is costly in the HP-71B

This is an awesome trick, thanks a lot! On a general level (you also mention later on that  $y*y$  is faster than  $y^2$ ) is there anywhere a reference which shows the timing for various commands of the 71b and suggestions on how to improve execution speed. We had quite detailed lists for the 41 and knowing them makes a huge difference in final execution speed. Maybe you can point me in the right direction if there were such a list. Also, we could double the speed of the 41c on the hardware side and I wonder if there is a similar hack for the 71b available.

Quote:

I don't quite get what PI() is intended to be, unless it's some ROM- or LEX keyword which does require that weird syntax; the built-in PI function does \*not\* admit "()"

Thanks for pointing this one out. Funnily enough my 71b does not complain at all when I type pi(). When reading Joe Horn's book I misinterpreted the discussion he briefly has about PI and RES that PI is a function and hence needs the brackets. Clearly I was mistaken but

as my 71b (or EMU71) did not complain I was never made aware of my mistake. Until VA came along to the rescue :-)

Quote:

Whence came this 2 ?

I over-read the word "positive" in your challenge. As the code only sums up the right hand (positive) side, I multiplied by 2 to get the total. Clearly, as in first grade, reading the question properly is 50% of the battle to getting the answer right...

Quote:

May I suggest that you simply develop your solution in Emu71, then, once it runs fine, simply execute LIST to have the listing appear in Emu71's simulated 80-column display, then \*copy\* the listing from Emu71's display and \*paste\* it in your message's text area. That would ensure absolute correction, no typos whatsoever, and would be both much faster and less tiring for you.

Oh yes indeed, you may! It is not only buggy (as figura shows) but bloody damn annoying, too! Please find below a copy and paste version of my original code, which runs and brings the mentioned results, but does not include all your other corrections and suggestions.

```
10 REAL Y
20 DEF FNF(X)
30 F=TAN(X)-X
40 IF ABS(F)<=1.E-30 THEN FNF=0 ELSE FNF=F
50 END DEF
60 INPUT "N=?";N @ S=0 @ INPUT "ad to square root of (0 or 1)";A
70 FOR I=1 TO N
80 L=(I+.25)*PI() @ U=L+.25*PI()
90 Y=FNROOT(L,U,FNF(FVAR)) @ S=S+1/(A+Y^2) @ IF MOD(I,500)=0 THEN DISP I;2*S
100 NEXT I
110 DISP "Sum=";2*S
```

This code takes about 1min26sec for N=10000 while a code with your suggestions takes only 46sec! That's an awesome improvement, thanks for sharing it with me. This is especially interesting, as the only reason to do the multiline Def FN was the advice that can be found in the manual for the math-rom when discussing FNROOT. They suggest this if statement to avoid 'overly long' run times. Did you ever find an application where their statements is correct and how does one best decide when to use it and when to ignore?

Again, thanks a lot for your kind advice. Unfortunately I will be out of a computer for the rest of the weekend, but I will see what I can do for A on Monday. And I'm looking forward to more learning :-)

Cheers

Peter

## Re: Short & Sweet Math Challenge #19: Grade C 15C solution.

Message #22 Posted by [Egan Ford](#) on 19 June 2007, 11:55 a.m.,  
in response to message #1 by [Valentin Albillo](#)

Quote:

**Grade C:** Find and output *all* values of  $N < 10000$  such that  $N$  is *prime* and

$$P(N) = S(N)$$

where  $P(N)$  gives the number of primes  $\leq N$  and  $S(N)$  gives the sum of the factorials of the digits of  $N$ .

Answer: 6521

Time to solution: ~15 minutes\*

Time to completion: ~21 minutes\*

UPDATE: Normal speed 15C time to solution: ~9 hours, 40 minutes.

UPDATE: Normal speed 15C time to completion: ~14 hours, 45 minutes.

The program below will count up to 9999 checking for primes along the way. All numbers  $< 10000$  will have prime factors  $< 100$ . If prime and  $< 100$ , then cache the prime number for future checks. A matrix is used for the cache. As primes are discovered  $P(N)$  is incremented and  $S(N)$  calculated and compared to  $P(N)$ . If  $S(N)=P(N)$  and prime then display  $N$ , R/S, repeat, end at 10000.

\*NOTE: Do not input this in your 15C and run it. It will take a very long time. I used Nonpareil after increasing the frequency 4651 times (no, it does not run 4651 times faster, there are other factors). UPDATE: Measured ~38x faster with modified Nonpareil.

[Caveat reader: Off topic]

Hi, Thibaut:

Thibaut posted:

*"It happens that both of us enjoy HP calcs AND Mike Oldfield..."*

That's correct, last time I checked I had 100+ CD/DVD (about 2% of my whole CD/DVD collection) of his music, counting official releases, bootlegs, really really rare 'rarities', fan-made releases, the works !

*"So I'm looking forward to seeing a S&SMC combining maths AND Mike's music. Any inspiration ?"*

Intriguing request ... I think it might be possible, but would require people to also be aware of and pretty knowledgeable about specific works of Mike (say "Amarok", for instance) but the hard fact is he isn't known that well (if at all) in the US or most any other place in the world save Spain, UK, and some European countries, most regrettably.

100+ years from now, when he gets recognition as a true 'classic' genius 'a la Mozart' the situation will improve, hopefully.

Thanks for your appreciation of both my math efforts and most specially Mike's music, and

Best regards from V.

**Re: Short & Sweet Math Challenge #19: Grade D, the movie**

Message #30 Posted by [Egan Ford](#) on 22 June 2007, 7:16 p.m.,  
in response to message #1 by Valentin Albillo

Here is my Grade D 71B BASIC submission. Since you already demonstrated a vertical plot, I opted for a horizontal plot. You'll need EMU71 or an 80 Column HP-IL video adapter.

<http://sense.net/~egan/d.gif>

N=1 :

Hi, Egan:

What can I say !? Awesome idea, this video of yours ! :-)

It nicely demonstrates in a vivid way just what's happening and it would certainly make an excellent material to show to a class.

I do have a similar, video-producing script for Mathematica showing the same ongoing process (only in 3D), but I didn't entertain the idea of doing likewise for Emu71, way to go !

Thanks for your continued interest in my challenges, kudos to your outstandingly clever contributions, and

Best regards from V.

## Re: Short & Sweet Math Challenge #19: A--

Message #32 Posted by **Gerson W. Barbosa** on 22 June 2007, 11:07 p.m.,  
in response to message #1 by Valentin Albillo

Hello Valentin,

This is no solution and actually deserves an F--. It seems to converge indeed, but very slowly. I have tried to compute the summation for decades 2 through 6, that is, for  $N=100$  through  $N=1000000$ . I am not sure this eliminates all occurrences of digit 9. Anyway, this is not the way to go, as the HP-71B limits will be reached before the convergence is found. There has surely to be a clever way, but it is far beyond my very limited skills.

```

10 DESTROY ALL
30 FOR D=2 TO 6
40 N=10^D
50 S=LOG(N)+.577215664902
60 FOR I=1 TO N/10
70 S=S-1/(10*(I-1)+9)
80 NEXT I
90 FOR I=N/10+90 TO 9*N/10 STEP 100
100 FOR J=0 TO 8
110 S=S-1/(I+J)
120 NEXT J
130 NEXT I
140 FOR K=2 TO LGT(N)
150 FOR I=9*10^(K-1) TO 10^K-10 STEP 10
160 FOR J=0 TO 8
170 S=S-1/(I+J)
180 NEXT J
190 NEXT I
200 NEXT K
210 PRINT S
220 NEXT D

```

```

>RUN
4.77685709833
6.59022027355
8.54139178089
10.5158103624
12.4929996836

```

The results above are approximate. For exact results line 50 should be replaced, but this makes the program even slower:

```
50 S=0 @ FOR I=1 TO N @ S=S+1/I @ NEXT I
```

```
4.78184876505
```

6.59072019014  
 8.54144177977  
 10.5158153649

As always, I am looking forward to your and other people's smart solutions.

Best regards,

Gerson.

### Re: Short & Sweet Math Challenge #19: A--

Message #33 Posted by [hugh steers](#) on 23 June 2007, 7:18 a.m.,  
 in response to message #32 by Gerson W. Barbosa

hi gerson, i too have an F- solution :-)

my first step was to write a simple, add up the terms without 9s program to see how it went and get a feel for any convergence. however, it converges very slowly indeed. in fact, it looks like it grows just like the harmonic series, ie slowly but actually. but presumably it does converge. the program below runs on the HP50 using hplua and after 10 million terms it's up to 13.65 and still growing fairly well.

i think i need a more cunning idea to get further.

```
tens = {1,10,100,1000,10000,100000,1000000,10000000,100000000}
nines = {9,90,900,9000,90000,900000,9000000,90000000,900000000}
function inc(n)
  local v
  local i
  local l = #n
  for i = 1,l do
    v = n[i] + tens[i]
    if v != nines[i] then
      n[i] = v
      for i = i + 1,l do
        v = v + n[i]
      end
      return v
    end
    n[i] = 0
  end
  i = l + 1
  v = tens[i]
  n[i] = v
  return v
end
function sum()
  local s = 1
  local n = { 1 }
  for i = 1,100 do
    for j = 1,1000000 do
      s = s + 1/inc(n)
    end
    print(i, s)
  end
end
function go()
  sum()
end
```

### Re: Short & Sweet Math Challenge #19: A--

Message #34 Posted by [Gerson W. Barbosa](#) on 23 June 2007, 9:55 a.m.,  
 in response to message #33 by hugh steers

Hi Hugh,

Looks like there's something wrong with my program. It's correct for N=100 and N=1000 but I am not

sure about the rest. Perhaps some 9s have escaped. For N=10,000,000 I obtained 14.47; 13.65 seems to be more plausible. Since I am unable to find the solution, I thought of at least estimating the value the sum converges to by means of curve fitting:

| x | y     |
|---|-------|
| 2 | 4.78  |
| 3 | 6.59  |
| 7 | 13.65 |

I would need more data, though.

Regards,

Gerson.

**A-ish**

*Message #36 Posted by **PeterP** on 24 June 2007, 12:08 a.m.,  
in response to message #35 by hugh steers*

Hmm, I used a much shorter and much dumber code which takes about 13min for a sum of 10m terms. However it seems to be wrong as it gives a slightly different value than what you have posted. I was wondering though if your  $n=10m$  means a) that you summed up 10m terms or b) summed up all terms that exclude 9 and are  $\leq 10m$ ? Clearly a) would be a larger number than b).

My code is trying to compute b) and gives 12.2061531537 for  $n=10m$  which is slightly smaller than your value. Can you spot the error in my code?

```
10 INPUT "n=?";N @ S=0 @ C=0 @ T$=TIME$
20 FOR X=1 TO N @ IF POS(STR$(X),"9")<>0 THEN 40
30     S=S+1/X
```

```
40 NEXT X
50 DISP "Done! "; "Sum="; S; "X="; X; "Start="; T$; ", End="; TIME$
```

Clearly I have no clue about the final value. One way I was contemplating for a while but would have no chance of finishing without google (and even then it is doubtful) is to first calculate the value of  $1/n$  for all  $n$  (maybe there is a good way to get the value of the rieman function for integers only,  $s=1$  and up to a certain  $n$  in a smart way. There should be something like this around. And - wasn't Euler who originally came up with it in integer space??) and then subtract all values that have a 9 in it. But without a good idea to get  $\text{sum}(1/n)$  that is not very helpful.

The only good thing about my code (if it is correct) is that it can be easily adapted to A+ by changing the string we search for in line 20. So, for example, the value for  $n=10000000$  excluding all numbers that have '42' in them is 16.2113166917. This is, not surprisingly, much closer to the simple  $\text{sum}(1/n)$  than when we exclude all numbers with a 9.

As an adendum and maybe it is useful for others my idea mentioned above came about when I calculated the number of terms one has to exclude from the simple  $1/n$  sum with  $N$  increasing. This percentage is steadily increasing and seems to tend to 100% in the limit so the series does indeed seem to converge. yet to what number, I would not know. The first column is  $N$ . The second column is the 10% exclusion from having a 9 at the second place (e.g. 9000 for  $n=10,000$ ) which excludes 10% of all terms(not necessarily 10% of the value though...) The third column is the discount from the previous max  $N$  times the 90% and the fourth column is the total discount. Maybe in an example I can better explain what I tried to calculate:

```
N1=10. We only ignore 1 number (9) which is 10%
N2=100. We ignore all number from 90-99, which is 10%. From the remaining 90%
we ignore every one with 9 which is 10% (the final number from N1) for a total
of 10% + 90%*10% = 19%
N3=1000. We ignore all numbers from 900-999, which is 10%. from the remaining
90% we exclude 19% (see above from N2) for a total of 10%+90%*19%=27%
and so on and so forth
```

maybe this is helpful to people smarter than me to come up with a clever code idea...

hi peter,

your code looks good. the discrepancy, as you pointed out, is that my code does, in fact, calculate (a) and yours calculates (b).

yes, i am summing 10M terms of 1/X without 9s and you are summing 1/X for the first 10M integers without 9s :-)

**Re: A-ish**

*Message #38 Posted by [Gerson W. Barbosa](#) on 24 June 2007, 7:03 p.m.,

Hello Peter,

Quote:

-----  
Hmm, I used a much shorter and much dumber code which takes about 13min for a sum of 10m terms.  
-----

13 minutes at what clock? On my jurassic computer your program takes 7 minutes for the first one million terms. But at least your program works and has proved helpful for an estimate of the answer (unlike mine, which was wrong for decades greater than 3).

Quote:

-----  
Clearly I have no clue about the final value.  
-----

Well, we can use data from your program to get an estimate of the result. The idea is getting the sum up to the first decades. I was intending to compute until the eighth decade (100,000,000), but no result past nearly two hours... I use your program to calculate the first six decades sums and used your result for the seventh decade. I put the data on a spread sheet and did an exponential fit of the differences between successive sums. Then I used the fit equation to calculate the differences and from those I calculated the next sums. As you can see, the differences tend to zero as the decades grow and the sum appears to converge to something close to 22.9. The correlation factor is excellent, but some additional data might be necessary to confirm this result. You can noticed I discarded the first two sums to get a better correlation factor.

From the table, it's evident the direct summation would take ages to complete. Even if we went up to  $10^{100}$ , we would get four or five significant figures at most. So, there has to be another way...

Best regards,

Gerson.

**Re: S&SMC#19: A-ish**

Message #39 Posted by [Valentin Albillo](#) on 25 June 2007, 4:37 a.m.,  
in response to message #38 by Gerson W. Barbosa

Hi, Gerson:

*"[...] it's evident the direct summation would take ages to complete. Even if we went up to  $10^{100}$ , we would get four or five significant figures at most."*

Yes, it would take geological ages to get a few correct digits, and probably more than the whole life of the Universe to get 12 correct figures, which is what we must expect from 12-digit HP models.

Matter of fact, your last result from the exponential fit, 22.9329+, is about correct to just the four leftmost figures (22.93). Your fit overshoot the mark about  $D=71$ , which was closest to the actual sum even if still a little too high.

*"So, there has to be another way..."*

Indeed, there is. It is very easy to demonstrate that the sum of the harmonic series after taking out those terms including any given digit or sequence of digits, in any numerical base, always converges, if incredibly slowly.

But accurately finding the actual value of the sum to high precision is entirely another matter and the naive approach of simply adding up enough terms is doomed to fail. For this particular series, for instance, adding up all terms up to  $10^{29}$  (which would takes ages even on a very fast computer, if at all possible) still gets short of the final sum by more than 1.

Thanks for your interest in this challenge of mine, and most specially for your hard work, keen ideas, and very worthy results.

Best regards from V.

Hi Valentin,

Quote:

Yes, it would take geological ages to get a few correct digits, and probably more than the whole life of the Universe to get 12 correct figures, which is what we must expect from 12-digit HP models.

Yes, it appears we'd have to go as far as  $10^{280}$  to get 12 digits. How long would take this to be done on the HP-71B (or even on Emu71) and how much energy would be required for this task ? :-)

Quote:

For this particular series, for instance, adding up all terms up to  $10^{29}$  (which would takes ages even on a very fast computer, if at all possible) still gets short of the final sum by more than 1.

You're right! And even if we summed every term up to  $10^{50}$  we'd be still one tenth of a unit away from the answer, as we can see in the table.

Thanks for your encouraging words, but I think this was just an engineering approach to get an estimation of the result. I hope someone comes up with a really beautiful mathematical way of tackling the problem before you post the solution.

Best regards,

Gerson.

Hi, Hugh:

Hugh posted:

*"pathetically lame googlers present...."*

That's what you say!

*"I would prefer a nice way to calculate Apery's constant. ie zeta(3), but it didnt converge quick enough, so i settled for the ugly constant"*

You can get rid of it by the usual trick of improving convergence by subtracting the slowly-convergent part and applying a exponentially fast-converging series to what's left. Tatoeba, try an RPL-version of this one-liner:

```
10 SUB APERY(A) @ A=7*PI^3/180 @ FOR K=1 TO 3 @  
A=A-2/K^3/(EXP(2*PI*K)-1) @ NEXT K
```

```
>CALL APERY(A) @ PRINT A
```

```
1.20205690316
```

where you can increase the upper limit (3) to achieve whatever numeric precision you want in negligible time. The given value, 3, is enough to get you 12 correct digits in just 3 iterations.

Thanks for you interest and

Best regards from V.

Egan, Gerson et all,

Are you guys talking about [this paper](#)? I was just following your threads (having decided that without google I will not be able to do anything further. And in my little black book I already got further than I could have hoped for my first 71b challenge) when I saw you mentioning the 'fisher paper'. Could not find that one but the paper linked above has a good resemblance with the challenge we were faced, missing '9s', '42' and 314159 and all.

Please let me know if you have identified a better source to understand the challenge. Quite honestly, given the wide area of mathematicians that according to the paper have gnawed at this and only very recently, I did not feel too bad to not have come up with any idea...

The thing that I enjoy the most about this challenges is the tid-bits of mathematics that Valentin and you others allow me to learn. And in such a nice interactive environment. Really cool! Can't wait for Valentin to lift the veil even further for me!

Cheers

Peter

PS:Gerson - thanks for the tip on the Euler constant book - it has already made its way into an Amazon shopping basket :-)

yes, same here. the Fischer's part was the first and easier bit. i had got stuck on my own.

### **Re: S&SMC#19: A-ish**

*Message #48 Posted by **Gerson W. Barbosa** on 28 June 2007, 9:23 a.m.,  
in response to message #41 by hugh steers*

Hello Hugh,

I tried to port your code to RPL on my HP-28S, just to have an idea of the running time on a vintage calculator, but I got stuck at this part:

```
local b1 = {}
-- b0
nextBeta(b1)
```

Perhaps I ought to learn a little *Lua* first. So far the only thing I know it is the Portuguese word for Moon (Spanish & Italian: *Luna*, French: *Lune*) :-)

As of the apery or zeta3 constant, the algorithm provided by Valentin in fact requires only three terms for 12 digits. But in this case I'd simply type in the constant.

Congratulations for your nice work!

Gerson.

### **Re: S&SMC#19: A-ish**

*Message #49 Posted by **hugh steers** on 28 June 2007, 9:42 a.m.,  
in response to message #48 by Gerson W. Barbosa*

hi gerson,

lua has untyped variables. `foo = {}`, assigns the empty list to `foo`. you have to have a list to start inserting, otherwise `foo` is null.

some examples:

```
-- this is a comment
foo = {}
foo[1] = 12
foo[2] = "hello"
foo[3] = {}
```

```
moo = #foo -- gets length which is 3.
```

```
foo[#foo + 1] = 7 -- add to end, lists expand automatically
```

```
function addSomething(list)
-- lists passed by reference, we can modify it
list[#list + 1] = 42
end
```

```
addSomething(foo)
```

annoyingly lua lists start from 1 not zero. this is my biggest lua pet hate. so much that im thinking of adding a base mode (like 71b basic) for hplua.

so, the following, sets bl to be the empty list and the nextBeta function computes the next beta and adds it to the list.

```
local bl = {} -- b0 nextBeta(bl)
```

hope this helps,

*Edited: 28 June 2007, 9:43 a.m.*

### 71b version

*Message #50 Posted by [hugh steers](#) on 28 June 2007, 9:52 a.m.,  
in response to message #49 by hugh steers*

what i'd suggest for the 71b is to simply have a pre-sized array for the beta values because, for a given precision, you know how many you need.

in 71b basic, i'd just have a global array b[] and nextBeta filled in the next slot using the preceeding values.

Hi Peter,

Quote:

intrigued by the 0.57... number I went to google to find out what it means.

If you google for *site:hpmuseum.org EulerGamma* you'll find this has been discussed here recently. Just a few months ago I wasn't aware of it either (not that I have become an expert, but at least now I can recognize it when I see it :-)

You might find this book interesting:

[Havil, J. Gamma: Exploring Euler's Constant](#)

I haven't read it yet. The introduction in pdf format is available there. The rest seems to be worth reading.

Quote:

Definitely recommended. I read it when it came out, and IMHO it's one of the best college-level pop math books. In the same style, and also worth checking out, is Paul Nahin's *Dr. Euler's Fabulous Formula* about Fourier series and more.

**Re: Short & Sweet Math Challenge #19: A--**

*Message #55 Posted by [Gerson W. Barbosa](#) on 26 June 2007, 7:21 a.m.,  
in response to message #54 by Paul Guertin*

Thanks for the book recommendation, Paul. It's been quite a long time since the last time I ordered something from Amazon. Now that the Brazilian Real to American Dollar exchange

rate is below 2 (1 USD = 1.94 BRL), after having gone as high as 3.3 just a couple of years ago, it's time to go shopping :-)

Peter, for the same reason, I'm going to get a 2GHz+ notebook. They have never been so cheap here. I will only have to choose between HP and Dell. My desktop Pentium III 500Mhz is getting tired of running all those nice emulators and simulators :-)

Gerson.

*Message #56 Posted by **PeterP** on 26 June 2007, 10:56 a.m.,  
in response to message #55 by Gerson W. Barbosa*

Gerson,

IMHO I would avoid Dell. There has been a steady decline in customer support with Dell computers (there was a big blog story recently where a very disappointed customer started blogging his interactions with Dell - it got nicknamed Dell Hell and he became quite famous and Dell under a lot of pressure). I also do not like their keyboards (nothing beats the IBM/Lenovo keyboards for me, but that's just me and keyboard feel is something very personal.

For me, good sources of rankings and research can be found [here at PC World](#) and [here at PC Magazine](#) . My favorite place to buy, but I do not know if they ship to Brazil is [Newegg](#) where you can also find lots of customer reviews.

Thanks for all your tips, I always enjoy reading your posts here.

Cheers

Peter

**Re: Short & Sweet Math Challenge #19: Surprise ! [Edited with results]**

Message #59 Posted by [Arnaud Amiel](#) on 25 June 2007, 8:24 a.m.,  
in response to message #1 by Valentin Albillo

I didn't have much time as I am just moving into a new flat but I recognised that Grade F could be solved by a hp55. I had been waiting for along time for a SSMC that could be handled by the 55 so here it is:

This program takes the number of iterations as argument:

```

      2
      -
      STO 5
      0
      STO 1
      1
      STO 2
      STO 4
13    RCL 1
      RCL 4
      /
      RCL 2
      STO 1
      +
      STO 2
      RCL 4
      1
      +
      STO 4
      RCL 5
      X=Y 36
      GTO 13
36    2
      +
      RCL 2
      /
      GTO 00

```

For N=13, it takes about 20s to approximate e with a value of 2.944805312.

I knew I could not get N=13000 in a reasonable time so for the other serie I used SysRPL on my hp49g+

```

!NO CODE
!RPL
::
  0LastRomWrd!
  CK1NOLASTWD
  CKREAL
  1LAMBIND
  %0
  %1
  1GETLAM
  COERCE
  #2-
  ONE
  DO
  DUPUNROT
  INDEX@
  UNCOERCE
  %/
  %+
  LOOP
  SWAPDROP
  %SQ_
  1GETABND
  %2
  %X
  SWAP

```

π/  
;

This comes close to Pi (3.14219691996) in about 50s for N=13000. A very similar program gives 2.71849095023 for the first serie (N=13000).

Unfortunately I had no time for the other challenges for now. I will look later.

Arnaud

### Re: Short & Sweet Math Challenge #19: A+ for 71B

Message #61 Posted by [Egan Ford](#) on 27 June 2007, 3:07 p.m.,  
in response to message #1 by Valentin Albillo

Quote:

**Note: Get an A+ !**

Compute the limit value of the infinite sum excluding instead those terms which include the digit string '42', as in "HP42S" (i.e: 42, 78042998, 142883213044, etc). Also, see if you can *predict the approximate value* of the infinite sum when excluding terms which do include some given arbitrary non-periodic string of digits (say, 314, or 314159, or your phone number, etc)

Unlike A I do not see a requirement for *full 12-digit accuracy*. I can provide 10/11 digits however for any *given arbitrary non-periodic string of digits*. Well almost any, there is a memory/speed trade off. I.e. more digits = more memory = more speed. Each digit consumes ~1800 bytes of memory. You'll need extra memory in your 71B for strings > 8 digits.

I lost a lot of development time due to issues with DEF FN and scope. After switching to CALL SUB my mystery problems went away. This 164 line/2792 byte program is far from optimal or clean, and it is littered with hacks in the interest of my time.

The algorithm is based solely on <http://users.ox.ac.uk/~ball2009/SchmelzerBaillie.pdf>. Accuracy is approx 2/3 of machine accuracy. I.e. 10 of 15 digits on a 71B.

Accuracy:

| N   | 71B           | Actual        | Difference   | Rel Diff |
|-----|---------------|---------------|--------------|----------|
| 9   | 22.9206766194 | 22.9206766193 | 0.0000000001 | 4.36E-12 |
| 42  | 228.446304138 | 228.446304159 | 0.0000000021 | 9.19E-12 |
| 314 | 2299.82978273 | 2299.82978278 | 0.0000000005 | 2.17E-13 |

```

314159 2302582.33377 2302582.33386 0.0000000009 3.91E-16
phone 23025850932.6 23025850929.6 3.0000000000 1.30E-10

### Re: Short & Sweet Math Challenge #19: A+ for 71B

Message #62 Posted by [Dave Shaffer \(Arizona\)](#) on 27 June 2007, 7:23 p.m.,  
in response to message #61 by Egan Ford

Note that your largest value (23025850929.6 for the phone number) appears to be a power-of-10 multiple of the value of  $\ln(10)$ . My '41CX gives  $\ln(10) = 2.302585093$  and QuattroPro gives 2.302585092994 .

It appears that the longer the sequence of omitted numbers, the closer the sum gets to a multiplied value of  $\ln(10)$ . In fact, it looks like if you omit a sequence of numbers that is  $n$  digits long, the result approaches  $10^n$  times  $\ln(10)$ . Incredibly fascinating, and for which I have NO explanation!

What happens if you try this in a different base number system (such as octal, hexadecimal, ...)?

### Re: Short & Sweet Math Challenge #19: A+ for 71B

That's the 2nd part of A+, I forgot to point that out.

Read the PDF link above section 6 for an explanation.

Same, e.g.:

$$\begin{aligned} z(123456(\text{base}8)) &= 545107.239019 \\ 8^6 * \ln(8) &= 545113.123502 \end{aligned}$$

$$\begin{aligned} z(123456654321(\text{base}8)) &= 142898134658 \\ 8^{12} * \ln(8) &= 142898134647 \end{aligned}$$

*Message #65 Posted by [hugh steers](#) on 28 June 2007, 6:21 a.m.,  
in response to message #61 by Egan Ford*

Hi Egan,

Excellent stuff! i didnt have the time to go on and implement the full general algorithm, but im impressed with your 71b version.

so valentin, do you claim to also have a version of this for the 71b or do you have a completely different method?

### **Re: Short & Sweet Math Challenge #19: A+ for 71B**

*Message #66 Posted by [Egan Ford](#) on 28 June 2007, 10:52 a.m.,  
in response to message #65 by hugh steers*

Thanks. It took a lot longer than I expected. My BASIC/71B skills are weak, in hindsight I should have used UserRPL or Lua.

I am looking forward to Valentin's solution. I am sure it will be properly structured, efficient, and easier to read.

### **Re: Short & Sweet Math Challenge #19: A+ for 71B**

*Message #67 Posted by [Valentin Albillo](#) on 29 June 2007, 4:26 a.m.,  
in response to message #66 by Egan Ford*

Hi, Egan:

Egan posted:

*"I am looking forward to Valentin's solution. I am sure it will be properly structured, efficient, and easier to read."*

Thanks for your highly flattering confidence in my skills but, self-quoting from my original mail (#1) where I proposed the challenge:

*"I'll provide my original solutions plus extensive comments to all graded problems A-F (but not for A+, B+, C+, these are truly left as an exercise for the reader [...])"*

This thread is already too long as it is (what with a couple of gigantic postings by myself), and I don't think it proper to make it even more so by posting a longish piece of code. In general, all the solutions I post are always 10 lines or less (generally much less), that's why I call it "**Short** and [...]". Longer code is always left as an exercise.

There's also the fact that I wouldn't want to seem cocky by posting a shorter, more polished piece of code. This isn't meant as a competition between me and gentle contributors but as a way to have some fun, exercise our HP calc-programming muscles, and learn some interesting math facts on the way.

Your program works perfectly, you get the A+ grade, and this is perfectly fine as far as I'm concerned; my own implementation is based in exactly the same algorithm as yours and so it doesn't bring any new exciting ideas or techniques, it's just more of the same and it isn't worth posting here for the reasons mentioned above.

Thanks for your interest and

Best regards from V.

*Message #68 Posted by **Gerson W. Barbosa** on 28 June 2007, 9:08 a.m.,  
in response to message #61 by Egan Ford*

Really impressive work, Egan!

I am amazed at your understanding of the paper and your being skillful enough to provide a code for the HP-71B. A++ IMVHO :-)

Best regards,

Gerson.

### **Re: Short & Sweet Math Challenge #19: A+ for 71B**

*Message #69 Posted by **Egan Ford** on 28 June 2007, 11:46 a.m.,  
in response to message #68 by Gerson W. Barbosa*

I just wish I understood 71B/BASIC better. This was the longest BASIC program I have ever done.

### **Re: Short & Sweet Math Challenge #19: A+ for 71B**

*Message #70 Posted by **Egan Ford** on 28 June 2007, 11:40 a.m.,  
in response to message #61 by Egan Ford*

I found a fixed a few minor bugs with digit strings > 10 digits. I also fixed the formatting of T to look better with > 9 digits. Lastly I added  $10^{\text{LEN}(N)} \cdot \text{LOG}(10)$  as a comparison.

New code replaced old code in above post. New output:

DEPLETE: 123456789012

$$T = \begin{array}{c|cccccccccc} & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \\ \hline 1 & 1 & 2 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 2 & 1 & 2 & 3 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 3 & 1 & 2 & 1 & 4 & 1 & 1 & 1 & 1 & 1 & 1 \\ 4 & 1 & 2 & 1 & 1 & 5 & 1 & 1 & 1 & 1 & 1 \\ 5 & 1 & 2 & 1 & 1 & 1 & 6 & 1 & 1 & 1 & 1 \\ 6 & 1 & 2 & 1 & 1 & 1 & 1 & 7 & 1 & 1 & 1 \\ 7 & 1 & 2 & 1 & 1 & 1 & 1 & 1 & 8 & 1 & 1 \\ 8 & 1 & 2 & 1 & 1 & 1 & 1 & 1 & 1 & 9 & 1 \\ 9 & 1 & 2 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 10 \\ 10 & 11 & 2 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 11 & 1 & 12 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 12 & 1 & 2 & 0 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \end{array}$$

## S&SMC#19: My Original Solutions & Comments [LONG]

Message #72 Posted by [Valentin Albillo](#) on 28 June 2007, 12:38 p.m.,  
in response to message #1 by Valentin Albillo

Hi all,

Thanks to all of you who were interested in this S&SMC#19, most specially to the ones who worked really hard at the individual Grades and posted solutions. I'll give now my original solutions for the HP-71B (very easy to convert to other similarly capable models), plus additional comments.

### Grade F:

Write a program to compute the  $N^{\text{th}}$  term for the following sequences:

$$\text{Sequence 1: } u_1 = 0, u_2 = 0, u_{n+2} = u_{n+1} + u_n/n$$

$$\text{Sequence 2: } u_1 = 0, u_2 = 0, u_{n+2} = u_{n+1}/n + u_n$$

where the number of terms  $N$  (which can be distinct for each sequence) is either hardcoded or given, your choice. After computing the  $N^{\text{th}}$  term,  $u_N$ , your program must then compute and output the following values:

$$\text{Sequence 1: } L = N \cdot 1 / u_N^1$$

$$\text{Sequence 2: } L = N \cdot 2 / u_N^2$$

Now use your program to help you try and predict, for each sequence, the corresponding theoretical exact limit of  $L$  when the number of terms  $N$  tends to infinity.

My original solution for the HP-71B is the following trivial 3-line (135 byte) program which computes and outputs the corresponding values of  $L$  for  $N = 13$  and  $N = 13000$ , respectively.

```

1 DESTROY ALL @ STD @ K1=13 @ K2=13000
2 U=0 @ V=1 @ FOR N=1 TO K1 @ W=U/N+V @ U=V @ V=W @ NEXT N @ DISP N*1/U^1
3 U=0 @ V=1 @ FOR N=1 TO K2 @ W=V/N+U @ U=V @ V=W @ NEXT N @ DISP N*2/U^2

>RUN

2.71828182845
3.14195515673

```

As you may see, the sequences (very quickly) converge to  $e = 2.71828182846$  and (very slowly) to  $\mathbf{\pi} = 3.14159265359$ , respectively.

The *Surprise !* factor comes from the fact that both sequences are very, very similar (as can be seen both from their definitions and from the program listing above, where lines 2 and 3 are almost a slightly particularized copy-paste version of one another), yet one converges to the *uber*-important constant  $\mathbf{\pi}$ , the other to the no-less-important constant  $e$ , suggesting a certain symmetry, a relationship, a "common origin" for both constants.

Some of you went to also compute 13,000 terms for the first sequence. This does no good, as 13 terms are all that is needed to achieve full 12-digit precision. After that, rounding errors do accumulate and by the time the 13,000-th term is reached, most of the precision is gone.

## Grade D:

*Write a program which, given  $N$ , will autoscale, label, and plot the  $ISin(x, N)$  function, for arguments  $X$  in radians belonging to the fixed interval  $[0, 2*\pi]$  at increments of  $\pi/40$ , say, where*

$$ISin(x, N) = Sin(Sin(Sin( \dots Sin(x) \dots )))$$

*i.e., the iterated Sine of  $X$ , where  $N$ , a positive integer, is the number of iterations*

*Looking at the plot itself and the value of Maxim, try and predict what happens for increasing values of  $N$  and in the limit when  $N$  tends to infinite.*

Given this challenge's nature, I was absolutely expecting that HP graphics models would be put to good use here, much more so than non-graphics ones, so I was utterly surprised that *not a single RPL solution was posted at all*. Go figure ! ...

My original solution for the (non-graphics) HP-71B is the following simple 8-line (268-byte) program:

```

10 DESTROY ALL @ OPTION ANGLE RADIANS @ D=3 @ FIX D @ INPUT "N=";N
20 K=FNS(PI/2,N) @ DISP "Maxim =" ;K @ FOR X=0 TO 2*PI STEP PI/20
30 Y=FNR(FNS(X,N)/K,D) @ U=45 @ V=FNR(Y*25+45,0) @ DISP X;Y;
40 IF V>U THEN DISP TAB(U);":";TAB(V);"*" ELSE DISP TAB(V);"*";
50 IF V<U THEN DISP TAB(U);":" ELSE IF V=U THEN DISP
60 NEXT X
70 DEF FNR(X,N)=INT(X*10^N+.5)/10^N
80 DEF FNS(X,N) @ FOR N=N TO 1 STEP -1 @ X=SIN(X) @ NEXT N @ FNS=X

```

where  $FNS(X, N)$  is a user-defined function that can be used from the program itself or directly from the command line to compute the Iterated Sine of  $X$  with  $N$  iterations, for instance

```

>FNS(1,1)

.841470984808 ( = SIN(1) )

```

```
>FNS(PI/3,5)
```

```
.594535945122 ( = SIN(SIN(SIN(SIN(SIN(PI/3)))))) )
```

and **FNR(X, N)** is a convenience function that returns X rounded to N digits (where N can be *negative* to achieve rounding to the *left* of the decimal point), for instance:

```
>FNR(PI,3)
```

```
3.142
```

```
>FNR(100*PI,-1)
```

```
310
```

Running the program for increasing values of N we get plots like the following for N = 10:

```
Maxim = 0.481
0.000 0.000 *
0.157 0.314 :
0.314 0.565 : *
0.471 0.737 : *

| 5.655 | -0.998 | * | : |   |
| 5.812 | -0.995 | * | : |   |
| 5.969 | -0.987 | * | : |   |
| 6.126 | -0.946 | * | : |   |

and we see that the limiting waveform of nested **SIN** is *identically 0*, but if we keep scaling the function up, we get in the limit *a square wave*. If you've got a copy of *Mathematica* you can see it very clearly by looking at the "animation" created by this one-liner:

```
Do[ Plot[ Nest[Sin, x, n], {x, -2Pi, 2Pi}, PlotRange -> {-1, 1}, PlotLabel -> n ], {n, 1, 50} ]
```

where it's clear that what's happening is that the whole plot slowly *collapses* towards zero but *different parts collapse at different rates*, making the plot get more and more square. This is not difficult to prove by using a well-known theorem from real analysis that states that every bounded monotonic sequence approaches a finite limit.

The convergence to **0** is dreadfully slow, because for small arguments, we have with high accuracy:

$$\sin(x) \Rightarrow x - x^3/6$$

which means that when we replace **x** by **Sin(x)**, the only thing that gets us any closer to **0** is the term  $x^3/6$ , which, if **x** itself is small, it is a *much smaller* decrement indeed.

## Grade C:

*Find and output all values of  $N < 10000$  such that both  $N$  is prime and*

$$P(N) = S(N)$$

*where  $P(N)$  gives the number of primes  $\leq N$  and  $S(N)$  gives the sum of the factorials of the digits of  $N$ .*

*Your program must be optimized primarily for speed, then for program size.*

The following is my original solution for the bare-bones HP-71B, a plain-vanilla 6-line (220 byte) program which doesn't require any ROMs or LEX add-ons and trades RAM usage for speed to deliver the goods rather quickly:

```
10 DESTROY ALL @ OPTION BASE 0 @ M=5000 @ INTEGER P(M) @ P(1)=1
20 FOR N=2 TO (SQR(2*M)+1)/2 @ IF P(N) THEN 40
30 FOR K=2*N*(N-1)+1 TO M STEP 2*N-1 @ P(K)=1 @ NEXT K
40 NEXT N @ T=1 @ FOR N=2 TO M @ IF P(N) THEN 60 ELSE K=2*N-1 @ S=0 @ T=T+1
50 S=S+FACT(MOD(K,10)) @ K=K DIV 10 @ IF K THEN 50 ELSE IF S=T THEN DISP
2*N-1
60 NEXT N @ DISP "OK"
```

```

>RUN
      6521
OK

```

Lines 10-40 perform a fast sieving procedure to flag all odd numbers < 10000 as either prime or composite, recording the results in P, an integer array of adequate dimension.

This allows lines 40-60 to quickly scan the array, skipping all non-prime entries, and computing the Pi(N) function effortlessly by simply updating the prime count each time an element is flagged as a prime. This running value of Pi(N) is compared to the sum of the factorials of the digits of the current N (which is computed in a tight loop at line 50) and any solution found is then immediately output, resuming the search afterwards.

As it happens, **6521** is the only solution < 10,000, but there's just another one (and no more) in the range from 10,000 to infinity which some of you correctly and cleverly located, namely **5224903**.

If composite numbers were also allowed as solutions, there would be 23 solutions in all, starting at **6500** and ending at **11071599**. Among these, I find it interesting that **5854409**, **5854419**, and **5854429** happen to be both consecutive and in arithmetic progression.

This problem can be generalized to numerical bases other than 10, for example **6719<sub>10</sub>** is a solution in base 7 and **5378437<sub>10</sub>** is a solution in base 15.

## Grade B:

Given a positive integer  $N$ , write a program to compute and output the value of  $S$ , defined as

$$S = \sum_{n=1}^N \frac{1}{(r_n)^2}$$

where  $r_n$  is the  $n$ -th positive root of  $\tan(x) = x$ , where  $x$  is expressed in radians, as usual.

Regrettably, this very interesting challenge, which has a truly surprising result, didn't seem to catch the eye of the vast majority of you for whatever reason and was left largely untouched.

PeterP made a brave attempt at dealing with it, but his final version still has a number of fatal flaws (such as the fact that it doesn't properly separate the roots from the poles and mixes them at times while computing the sum, etc), and so the numerical result isn't accurate. As is my policy in these cases, when a challenge gets essentially no acceptable responses I simply forfeit it as well, lest its appeal would be wasted.

The "surprise" factor of this challenge is the extremely unexpected result you get. Having an infinite sum of the roots of a transcendental trigonometric equation with arguments in radians, one would expect to get some weird no-name irrational, possibly transcendental number related to Pi

in some way, say  $\pi/310$  or some such value. But nothing could be further from the truth because what you actually get absolutely defies intuition, and paradoxically enough, it is fairly easy to concoct a purely formal proof "*a la Euler*" to prove that this unexpected result is mathematically exact and correct. The value you get for the B+ variant isn't that big a surprise, but is also most unexpected in its very unique way.

By the way, one of the main difficulties of this challenge lies in the fact that you must compute a lot of roots (possibly thousands), very quickly, and very accurately, in the sense that all roots should be accounted for with no missing entries, in their proper order, and that no poles are mistaken for roots. This requires a very precise separation between poles and roots and, as it happens, they tend to become extremely close for larger values, which enormously increases the difficulty of separating them. Besides, as you know, HP built-in solvers have a very hard time telling apart a pole from a root !

## Grade A:

*The limit of the sum of the reciprocals of the natural numbers 1 to N does diverge when N tends to infinite:*

$$S = \sum_{N=1}^{\infty} \frac{1}{N} \rightarrow \infty$$

*However, if we simply leave out of the sum just those terms whose denominators include the digit 9 (such as 199, 34343900132, ...), the infinite sum then nicely converges to a finite value.*

*You must write a program to compute as accurately as possible this finite value of the infinite sum. You must optimize your program for both accuracy and speed.*

This has been the grade of choice for many of you, with excellent results. This series converges far too slowly for direct summation, as has been extensively commented in the thread, so better algorithms are definitely required.

As some of you pointed out, there's a PDF document titled "SUMMING A CURIOUS, SLOWLY CONVERGENT SERIES" by Schmelzer and Baillie, freely downloadable from various web locations, which discusses the problem at length and gives in sufficient detail a couple of algorithms: the simpler Fischer algorithm, which can give the sum for the original Grade A problem to high accuracy in very fast times (but which can't be used for the A+ variant as it does not generalize to other digits or sequences of digits), and a more convoluted but extremely general algorithm by the authors, which can be used for the generalized sum. See the paper for the details.

I'll give now my two original A solutions, both implementing the Fischer algorithm but one of them optimized mainly for size, the other for speed.

This is my shorter original solution, a 6-line (265-byte) HP-71B program:

```

1 DESTROY ALL @ OPTION BASE 0 @ M=11 @ D=10 @ DIM B(M) @ B(0)=D @ FOR N=2
TO M
2 S=0 @ FOR K=N TO 2 STEP -1 @ S=S+FNC(N,K)*(D^(N-K+1)-D^K+1)*B(N-K) @ NEXT
K
3 B(N-1)=(D*(11^N-D^N)-S)/N/(D^N-9) @ NEXT N @ H=D*LN(D)
```

```

4 FOR K=2 TO M-1 @ H=H-B(K-1)*FNZ(K)/D^K @ NEXT K @ DISP H
5 DEF FNC(N,K)=FACT(N)/FACT(K)/FACT(N-K)
6 DEF FNZ(X)=INTEGRAL(0,100,0,IVAR^(X-1)/(EXP(IVAR)-1))/GAMMA(X)

```

>RUN

22.9206766192 ( 6.83 seconds, Emu71 @ 2.4 Ghz, about 20 min in a real HP-71B )

and this is my longer (but 60+ times faster !) original solution, a 10-line (443-byte) solution for the HP-71B:

```

1 DESTROY ALL @ OPTION BASE 0 @ M=11 @ D=10 @ DIM B(M) @ B(0)=D @ FOR N=2
TO M
2 S=0 @ FOR K=N TO 2 STEP -1 @ S=S+FNC(N,K)*(D^(N-K+1)-D^K+1)*B(N-K) @ NEXT
K
3 B(N-1)=(D*(11^N-D^N)-S)/N/(D^N-9) @ NEXT N @ H=D*LN(D)
4 FOR K=2 TO M-1 @ H=H-B(K-1)*FNZ(K)/D^K @ NEXT K @ DISP H
5 DEF FNC(N,K)=FACT(N)/FACT(K)/FACT(N-K)
6 DEF FNZ(Z) @ IF Z=2 THEN FNZ=PI*PI/6 ELSE IF Z=3 THEN FNZ=1.20205690316
7 IF Z=4 THEN FNZ=PI^4/90 ELSE IF Z=5 THEN FNZ=1.03692775514
8 IF Z=6 THEN FNZ=PI^6/945 ELSE IF Z=7 THEN FNZ=1.00834927738
9 IF Z<8 THEN END ELSE S=1 @ T=0 @ N=2
10 S=S+N^(-Z) @ N=N+1 @ IF S<>T THEN T=S @ GOTO 10 ELSE FNZ=S

```

>RUN

22.9206766192 ( 0.1 seconds, Emu71 @ 2.4 Ghz, about 20 seconds in a real HP-71B )

Both results are identical and correct to 12 digits, but the longer version runs 60+ times faster. The only difference between them lies in the definition of the Riemann Zeta function:

- The shorter version implements it as a user-defined function, FNZ(X), which can compute the Zeta function for real arguments, not only integers, using integration. As such, it does require the Math ROM, and it's somewhat slow. For instance:

```
>FNZ(10), FNZ(PI)
```

```
1.00099457513 1.17624173838
```

- On the other hand, the longer version implements the same user-defined function but only for integer arguments, using theoretical constant values for arguments from 2 to 7 and the power series for integer arguments greater than 7, which converges quickly enough for such arguments. This results in much faster computation times when compared to the integral version and further does not require the Math ROM, a bare bones HP-71B will do nicely.

As for the A+ variant, Egan Ford has worked very hard and very successfully to implement the quite complicated Schmelzer-Baillie's general algorithm, with excellent results, my most sincere congratulations for his outstanding contribution and thanks a lot for his interest in this challenge.

---

That's all. I hope you've enjoyed this S&SMC (and even learned a math thingy and/or programming trick or two), I certainly did enjoy seeing your *truly excellent posts*, as clever and insightful as always, you're the best !

And last but not least, a fond welcome to PeterP, which finally got to try and solve some of the grades like a pro. See, Peter ? It wasn't that difficult, man ! :-)

Best regards from V.

**Re: S&SMC#19: My Original Solutions & Comments [LONG]**

Message #73 Posted by **Thomas Klemm** on 28 June 2007, 7:41 p.m.,  
in response to message #72 by Valentin Albillo

Hi Valentin

Instead of solving  $\tan(x) = x$ , I solved  $x = \arctan(x)$  using a fixed-point iteration which converges faster as  $N$  grows. This avoids the troubles you mentioned concerning the poles at  $\pi(n + 1/2)$ . Instead they are used as starting points.

Here's my HP-11C program:

```
STO I
CLx
STO 0
LBL 1
RCL I
PI
*
STO 1
LSTx
2
/
+
LBL 0
ENTER
ATAN
RCL 1
+
x#y
GTO 0
x^2
1/x
STO + 0
DSE
GTO 1
RCL 0
```

Yet the problem is that this is still running very slowly for large values of  $N$ . I must admit, that I've cheated and written a C-program to calculate values bigger than  $N = 1000$ :

|     |           |     |                        |
|-----|-----------|-----|------------------------|
| N = | 1         | S = | 0.04952768282755720119 |
| N = | 10        | S = | 0.09079018230840834005 |
| N = | 100       | S = | 0.09899682151630028929 |
| N = | 1000      | S = | 0.09989878003791599550 |
| N = | 10000     | S = | 0.09998986889474789056 |
| N = | 100000    | S = | 0.09999898679829559526 |
| N = | 1000000   | S = | 0.09999989867891767874 |
| N = | 10000000  | S = | 0.09999998986788264898 |
| N = | 100000000 | S = | 0.09999999898678817371 |

From this table I assume that the sum converges towards 0.1 which is in fact very astonishing.

Thanks for not letting out the cat from the bag yet.  
I do appreciate your S&SMCs very much.

Kind regards  
Thomas

in response to message #73 by Thomas Klemm

I had started a program and for 100 and 1000 it gave me the same answer as you got. I concluded my program is wrong. I will go back to it this weekend then.

Arnaud

Message #75 Posted by [Valentin Albillo](#) on 29 June 2007, 6:02 a.m.,  
in response to message #73 by Thomas Klemm

Hi, Thomas:

Thomas posted:

*"From this table I assume that the sum converges towards 0.1 which is in fact very astonishing."*

First of all, thanks for your interest in this particular subchallenge, actually it was my pet one of the lot and it was sad for me to see it go into oblivion.

Your assumption is correct, the exact value of the infinite sum is indeed  $1/10$ . This is most unexpected, to say the least, and just goes to prove even further that math is an inexhaustible source of beauty and amazement.

I guess there are many teachers and math professionals out there who know their trigonometrics and calculus inside out, yet not one of them would guess that an infinite sum of the infinite transcendental roots of a basic transcendental trigonometric equation involving no arbitrary constants and nothing special at all would come up to be *exactly* **0.1**.

Not some weird possibly transcendental value presumably involving Pi, not some irrational surd, but a simple, rational value which happens to be the exact reciprocal of a small number, **10**. No wonder we have 10 fingers and 10 toes and thus our number system is (mostly) based around 10, as 10 is such an important constant that you need to add up an infinite number of quantities ultimately related to Pi in order to beget it. :-)

*"Thanks for not letting out the cat from the bag yet. I do appreciate your S&SMCs very much."*

Don't worry, I'll let the cat in the bag for a little while, just to see what you come up with, and also to see whether other contributors get interested and join us as well.

After that, if there's been enough interest, I'll publish my original program for the HP-71B, plus comments and perhaps even my formal proof of this astonishing fact, in the same style of bold formal manipulations that Euler liked to indulge in. Not rigorous in any way but enlightening nevertheless, easy-to-grasp, and ultimately a lot of fun.

Thank you very much for your appreciation and interesting contribution (for the HP-11C no less ! Way to go !), and

Best regards from V.

Message #76 Posted by [Egan Ford](#) on 6 July 2007, 1:28 a.m.,  
in response to message #73 by Thomas Klemm

Quote:

Yet the problem is that this is still running very slowly for large values of N.

I thought I'd try this on my accelerated Nonpareil 15C.

N=1,000,000. ~15 hours later:

<http://sense.net/~egan/1m.jpg>

My alternative solution for B is based on an article by *Sidney Frankel, National Mathematics Magazine, Vol. 11, No. 4. (Jan., 1937), pp. 177-182.*

The following equation is an estimate of the  $n^{\text{th}}$  root of  $\tan(x)=x$ :

$$r_n = [1 + 1/a^2] [n\pi + \tan^{-1}a] - 1/a \text{ where } a = (2n+1)\pi/2.$$

71B output:

```
N =          1      S = 0.04951757574 IN .03 SEC
N =         10      S = 0.09077991548 IN .05 SEC
N =        100      S = 0.09898655469 IN .12 SEC
N =       1000      S = 0.09988851321 IN 1.15 SEC
N =      10000      S = 0.09997960207 IN 11.05 SEC
N =     100000      S = 0.09998871997 IN 108.07 SEC
N =    1000000      S = 0.09998962993 IN 1075.05 SEC
N =   10000000      S = 0.09998967228 IN 10171.28 SEC
```

This does not converge to 1/10, but it's close.

71B code:

```
10 RADIANS
20 DESTROY ALL
30 INPUT "MAX=" ;M
40 FOR I=0 TO M-1
50 X=0
60 T=TIME
70 FOR J=1 TO 10^I
80 A=(2*J+1)*PI/2
90 B=(1+1/(A*A))*(J*PI+ATAN(A))-1/A
100 X=X+1/(B*B)
110 NEXT J
120 STD
130 N$=STR$(10^I)
140 T$=STR$(TIME-T)
145 S$=""
150 FOR K=LEN(N$) TO 9
160 S$=S$&" "
170 NEXT K
180 FIX 12
190 DISP "N = ";S$;N$;"      S = ";X;" IN ";T$;" SEC"
200 NEXT I
```

## Re: S&SMC#19: My Original Solutions & Comments [LONG]

Message #77 Posted by [Thomas Klemm](#) on 6 July 2007, 9:15 a.m.,  
in response to message #73 by [Thomas Klemm](#)

1. Assuming that x is close to one of the poles of  $\tan(x)$  the difference dx can be estimated:

$$x + dx = (k + 1/2) * \pi$$

1

$$1 - \tan(x) * \tan(dx)$$

$$0 = \cot(x + dx) = \frac{1}{\tan(x + dx)} = \frac{1}{\tan(x) + \tan(dx)}$$

$$1 - \tan(x) \tan(dx) = 0$$

$$dx \sim \tan(dx) = \frac{1}{\tan(x)} = \frac{1}{x} \sim \frac{1}{(k + 1/2)*\text{Pi}}; \text{ since } dx \ll 1$$

Instead of using  $q = (k + 1/2)*\text{Pi}$  as initial value for the fixed-point iteration the value  $q - 1/q$  is used. Therefore lines 17-19 have been added to the program. This makes the program running about 20% faster.

(Or use <http://mathworld.wolfram.com/images/equations/TancFunction/equation2.gif> from [Tanc Function](#))

2. To estimate the remainder of the series I used the following formula I found [somewhere](#):

$$\frac{1}{x} \sim \frac{\text{Pi}^2}{6} - \frac{1}{N} + \frac{1}{2N^2} - \frac{1}{6N^3} + \frac{1}{30N^5} - \frac{1}{42N^7} + \frac{1}{30N^9} + \dots$$

k = 1

After a little magic I got:

$$\frac{1}{x} \sim \frac{1}{(2k+1)^2} - \frac{1}{4N} + \frac{1}{6N} - \frac{1}{8N^3} + \frac{1}{30N^5} - \frac{1}{42N^7} + \frac{1}{30N^9} + \dots$$

k = N

That's what lines 32 - 56 in the improved HP-11C program are for:

```

01 STO I      16 +          31 GTO 1      46 +
02 1          17 ENTER    32 RCL 2      47 *
03 +         18 1/x      33 x^2     48 RCL 3
04 1/x      19 -          34 ENTER    49 +
05 STO 2    20 LBL 0     35 ENTER    50 RCL 2
06 CLx      21 ENTER    36 ENTER    51 *
07 STO 0    22 ATAN     37 RCL 7     52 2
08 LBL 1    23 RCL 1    38 *        53 PI
09 RCL I    24 +        39 RCL 6     54 /
10 PI       25 x#y      40 +        55 x^2
11 *        26 GTO 0    41 *        56 *
12 STO 1    27 x^2     42 RCL 5    57 RCL 0
13 LSTx     28 1/x     43 +        58 +
14 2        29 STO + 0  44 *
15 /        30 DSE     45 RCL 4

```

As a prerequisite the registers 3 - 7 must be loaded with the following constants:

```

4 1/x
STO 3
-48 1/x
STO 4
160 1/x
STO 5
-31 ENTER 5376 /
STO 6
127 ENTER 15360 /
STO 7

```

Now I get the following improved values S':

|     |           |                            |                             |

## Re: S&SMC#19: Grade B [LONG]

*Message #79 Posted by [Valentin Albillo](#) on 10 July 2007, 10:31 a.m.,  
in response to message #78 by Egan Ford*

Hi, Thomas and Egan:

Thank you very much to both of you for your interest in this poor, orphaned part of my challenge, you've both produced superb theory and actual code to try and solve it and your solutions are of course correct and truly excellent. I'm very obliged for your outstanding efforts.

This is my original solution for the HP-71B (7 lines, 271 bytes):

```
10 DESTROY ALL @ OPTION BASE 1 @ RADIANS @ L=100 @
```

```

R=FNROOT(4,5,TAN(FVAR)-FVAR)
20 S=1/(R*R) @ FOR I=2 TO 500 @ K=1/I @ R=FNROOT(R+PI-
K,R+PI+K,TAN(FVAR)-FVAR)
30 GOSUB 60 @ NEXT I @ A=PI/2 @ B=1/PI @ C=2*PI @ D=1/4/PI+2/(3*PI3)
40 L=1000 @ FOR I=501 TO 71000 @ R=PI*I+A-B/I+1/(C*I*I)-D/(I*I*I)
50 GOSUB 60 @ NEXT I @ END
60 S=S+1/(R*R) @ IF NOT MOD(I,L) THEN DISP USING "6D,3X,Z.6D";I,S
70 RETURN

```

This basic transcendental equation (which does find its uses in Engineering) has an infinite number of positive roots. As there's the problem of proper root identification and separation, which gets more difficult as the roots grow larger since they tend to be extremely near the poles, with the subsequent danger of some root being skipped or some pole being mistaken for a root, my routine uses the Solver just for the first 500 roots, which can be properly separated by generating adequate initial guesses for each one.

After that, a simple asymptotic formula for the roots is used, which gives 12 correct decimal digits for each root and much faster than the Solver can. Thus, this formula does produce all remaining roots, from the 501<sup>th</sup> onwards. The crossing index, 500, has been chosen empirically because that's approximately the point where the asymptotic formula is accurate enough to take over the Solver. Were it not for the asymptotic formula, the Solver alone would begin to skip or misidentify roots around the 3,000<sup>th</sup> one given the currently generated initial guesses.

As written, my solution will generate and sum the first 71,000 roots (just edit the 71000 in the listing above if you want to generate and process more roots), like this:

>RUN

```

100 0.098997
200 0.099496
300 0.099663
400 0.099747
500 0.099798
1000 0.099899
2000 0.099949
3000 0.099966
4000 0.099975
5000 0.099980
6000 0.099983
7000 0.099986
65000 0.099998
66000 0.099998
67000 0.099998
68000 0.099999
69000 0.099999
70000 0.099999
71000 0.099999

```

and it does it in just 29 seconds under Emu71, some 2 hours on a physical HP-71B, with the final result being 0.099999 to six decimal figures, in perfect agreement with the theoretical value 1/10.

I'll give now a short & sweet proof I've shamelessly concocted to show that the correct theoretical sum is exactly 1/10. This proof of mine is admittedly in the spirit of some of the most celebrated Euler's ones, i.e., utterly non-rigorous, but it shows the correct solution which, once allegedly known, you can then proceed to rigorously prove either by other means or by strengthening this simple proof. Let's proceed:

1) Let's put the original equation in a more convenient form:

$$\tan(x) = x \quad \rightarrow \quad \sin(x)/\cos(x) = x$$

$$\rightarrow \sin(x) = x \cdot \cos(x)$$

2) Let's substitute  $\sin(x)$  and  $\cos(x)$  by their Taylor series expansions and collect all terms at the left side:

$$x - x^3/3! + x^5/5! - x^7/7! + \dots = x(1 - x^2/2! + x^4/4! - x^6/6! + \dots)$$

$$x^7/6! + \dots = x - x^3/2! + x^5/4! -$$

->

$$(1/2! - 1/3!)x^3 - (1/4! - 1/5!)x^5 + (1/6! - 1/7!)x^7 - \dots = 0$$

3) Let's divide both sides by  $x^3$  to get rid of zero roots:

$$(1/2! - 1/3!) - (1/4! - 1/5!)x^2 + (1/6! - 1/7!)x^4 - \dots = 0$$

4) and now, considering this as an "infinite-degree polynomial equation", we then have that the required sum of the (transformed) roots is, by the Vieta formulas:

$$\text{Sum} = (1/4! - 1/5!)/(1/2! - 1/3!) = 1/10$$

q.e.d

This all depends on the fact of whether the "infinite-degree polynomial equation"'s roots do sufficiently coincide with the appropriate transformation of the ones of the original transcendental equation. We can get some peace of mind by testing for various degrees  $N$ , to get a taste of what happens when  $N$  goes to infinity. The following short program asks for the degree  $N$ , does construct and truncate the above polynomial to the specified degree (only in  $X$  instead of in  $X^2$ ), and finds all its roots and their sum:

```

1 DESTROY ALL @ OPTION BASE 0 @ INPUT "N="; N @ DIM P(N) @ COMPLEX
R(N+1),S
2 FOR I=0 TO N @ P(I)=(-1)^I*(1/FACT(2*I+2)-1/FACT(2*I+3)) @ NEXT I @
MAT R=PROOT(P)
3 S=0 @ FOR I=0 TO N-1 @ S=S+R(I) @ DISP R(I),1/SQR(R(I)) @ NEXT I @
DISP S

```

Let's test with a 40th-degree truncation:

>RUN

N = 40 [ENTER]

...

```

(0.000780, -0.000329)      (33.696792,  6.813122)
(0.001299,  0.000000)    (27.747075, -0.000000)

```

```
(0.001344, 0.000000) (27.273576, -0.000000)
(0.001810, 0.000000) (23.503515, -0.000000)
(0.002410, 0.000000) (20.371987, -0.000000)
(0.003372, 0.000000) (17.220729, -0.000000)
(0.005054, 0.000000) (14.066195, -0.000000)
(0.008410, 0.000000) (10.904122, -0.000000)
(0.016756, 0.000000) ( 7.725252, -0.000000)
(0.049528, -0.000000) ( 4.493409, 0.000000)
```

```
(0.100000, 0.000000)
```

As you can see, all the roots add up to exactly 0.1, and taking the inverse of their square root (as they are the inverse of the squares of the original roots, as needed for the sum), we get a very good approximation of the first roots of the original transcendental equation, namely

```
4.493409, 7.725252, 10.904122, 14.066194, 17.220755, 20.371303,
...
```

so we find it easy to believe that for higher degrees the accuracy improves and in the limit, the result holds and the sum for the roots of the polynomial does coincide with the sum of the roots of the original transcendental equation.

Thanks again and

Best regards from V.

Hi Valentin

Your proof is cool, I like it!

And thanks to Egan for his posts which I read with much interest.  
It was nice to see my program transformed into another language.  
Now I even know some FORTH.

Kind regards  
Thomas

in response to message #79 by Valentin Albillo

Do you have any comments on B+ you would like to share? Computing yields 0.0972640247325, but it would take an enormous leap to see that as  $(e^*e - 7)/4$ . The masses without a proof would have to search text books and the web to find the exact answer (as I had [here](#)). I ask for your thoughts because of the teaser on your web site: Boldly Going - Identifying Constants.

Thanks for all the challenges, I enjoy the mental exercise.

### Re: S&SMC#19: Grade B [LONG]

Message #82 Posted by [PeterP](#) on 10 July 2007, 7:31 p.m.,

*in response to message #79 by Valentin Albillo*

was tempted to do this anonymously to hide in light of the much better mathematicians around (it now looks more like heresy that I even participate openly in those challenges next to you guys)

Anyway, great minds think alike - [this short paper](#) has a similar proof as Valentin and then goes on to extend it to a more general class of transcendental equations and gives some examples. Maybe this is interesting to some so I thought I post it. Please forgive it this is 'old news' to all of you already.

Cheers

Peter

in response to message #72 by Valentin Albillo*

Valentin,

Thanks for all your encouraging and friendly prodding, it was great fun. And indeed, it was not only a lot of fun but was going easier with time and more practice!

As for B, I fully appreciate you'd like to keep things under wraps for a later point in time. Maybe however you can give me offline at my email some tips and pointers. As I mentioned in my post, after I had programmed something and got stuck in trying to explain the result, I ended up finding a paper which explains it and indeed shows that  $1/10$  is the right value. So it seems that my program is wrong yet still delivers a somewhat correct result... Your insight and guidance would be most appreciated!

All the best and thanks for providing me (and us I daresay) with lots of fun and learning!

Cheers

Peter

### **A message from Thomas Schmelzer to all S&SMC#19 A/A+ participants.**

*Message #85 Posted by [Egan Ford](#) on 29 June 2007, 9:45 p.m.,  
in response to message #1 by Valentin Albillo*

Thomas Schmelzer ([SUMMING A CURIOUS, SLOWLY CONVERGENT SERIES](#)) asked me to post this on his behalf:

Quote:

Hoi zame,

I am pleased you have attacked the harmonic series omitting certain digits. To implement this kind of code on an old HP calculator is certainly challenging and geeky! Well done. It seems this problem provided some fun and this was exactly the intention of the paper I wrote with Robert Baillie.

Best wishes,

Thomas

Post your replies here and I will send him the link. Thanks!

**Re: Short & Sweet Math Challenge #19: Surprise ! [LONG] B+ Solution**

Message #87 Posted by [Egan Ford](#) on 6 July 2007, 12:29 a.m.,  
in response to message #1 by Valentin Albillo

Quote:

**Note: Get a B+ !**

If you manage to solve the above, you can get a B+ by computing and, most specially, *identifying* the exact sum but this time using

$$(r_n)^2 + 1$$

in the denominators instead of simply  $(r_n)^2$

Exact sum:

$$S = \sum_{n=1}^{\infty} \frac{1}{(r_n)^2 + 1} = \frac{e^2 - 7}{4}$$

Inspired by Thomas Klemm's amazingly short and sweet 11C program I thought I would do the obvious and add one to the denominator and see what I got:

```
N =          1   S = 0.04719044923 IN .05 SEC
N =         10   S = 0.08805677133 IN .02 SEC
N =        100   S = 0.09626084957 IN .18 SEC
N =       1000   S = 0.09716280477 IN 1.27 SEC
N =      10000   S = 0.09725389363 IN 11.99 SEC
N =     100000   S = 0.09726301153 IN 115.13 SEC
N =    1000000   S = 0.09726392341 IN 969.29 SEC
N =   10000000   S = 0.09726401460 IN 8463.29 SEC
```

The above output was generated by the *Klemm-like* 71B FORTH program at the end of this post. I selected FORTH because it is faster than BASIC (well faster than *my* BASIC) and porting RPN to FORTH is easy.

As you can see each digit of precision takes ~10x longer to run. Extra digits would have cost a day, then 10 days. Another problem is that the larger terms are too close to zero.

Like Thomas I did resort to a small C program (64-bit ints, 128-bit floats) to get a few more digits:

```
N =          1   S = 0.0 4719044922581127794
N =         10   S = 0.0 8805677132930494860
N =        100   S = 0.09 626084957021318412
N =       1000   S = 0.097 16280477399029997
N =      10000   S = 0.0972 5389362741386840
N =     100000   S = 0.09726 301153095815560
N =    1000000   S = 0.09726 392341158023534
N =   10000000   S = 0.0972640 1460054520640
N =  100000000   S = 0.09726402 371945072695
N = 1000000000   S = 0.097264024 63133223744
N = 10000000000  S = 0.097264024 71681260679
```

I have two sources I check when presented with mystery numbers. First, the book *Mathematical Constants*. Second, *Plouffe's Inverter* (<http://pi.lacim.uqam.ca/eng/>). The later scored a hit (several hits actually). The most interesting was:

$$9726402473266255 = (m414) \ 1/\ln(\exp(1))*DuboisR2*\sqrt{5}^2$$

Odd result. You can simplify in your head and get  $DuboisR2*5$ . The same *Inverter* page has a link to the constants.  $DuboisR2$  is the **2<sup>nd</sup> Du Bois Reymond constant**.  $DuboisR2 = (e^2 - 7)/2 = 0.1945280494\dots$ , so  $DuboisR2*5 = 0.97264024\dots$ , therefore  $DuboisR2*5/10$  or  $DuboisR2/2 = 0.097264024\dots$

The **2<sup>nd</sup> Du Bois Reymond constant** is defined in pages 238-239 in the book *Mathematical Constants*. An interesting read (books.google.com if you do not have this book):

Paraphrased - "Let  $r_1, r_2, r_3, \dots$  denote all positive solutions of the equation  $\tan(x) = x$ . Then

$$c_m = 2 * \prod_{j=1}^{\infty} \frac{1}{((r_j)^2 + 1)^{m/2}}$$

"

It is not too hard to see that  $c_2/2$  equals the B+ problem. Since  $c_2 = (e^2 - 7)/2$  then  $c_2/2 =$

$$\frac{e^2 - 7}{4} = 0.097264024\dots$$

The solution to problem B is also mentioned in *Mathematical Constants* (page 239).

Additional **Du Bois Reymond Constants** info:

<http://mathworld.wolfram.com/DuBoisReymondConstants.html>.

## HP Forum Archive 17

[ [Return to Index](#) | [Top of Index](#) ]**revised: the 4 banger+**Message #1 Posted by [Paul Dale](#) on 18 June 2007, 7:08 p.m.

I've been fiddling around with the super 4 banger that got mentioned a few weeks back. The items in question are down near the end of the [Sneek Preview: Anniversary Edition](#) thread.

Using my ugly ASCII art approach, the main keyboard I've come up with is:

```

ENTER^   X<>Y   CHS   Clx
7         8         9     /
4         5         6     *
1         2         3     +
0         .       shift  -

```

and the shifted keyspace:

```

LASTx    Rv     EEX    CLREG/CLPRG
n!       sqrt   1/x    PGRM
ln       e^x    y^x    SST
STO     INTG   TEST   GSB
RCL     PI     shift  R/S

```

What I've ditched are the trigometrics and HMS functionality. In their place I've added factorial (gamma?) and integer part functions and some degree of programmability. Basically, I tried to maintain as much of the 12c's non-financial instructions as I could.

Anyway, some details:

- Mathematics are supplied by the decNumber library (IEEE 854, 16 digit decimal arithmetic).
- There are 255 registers. STO and RCL take a three digit argument ranging from 000 through 199. They can optionally be followed by the four arithmetic operators and/or shift (for indirection).
- Program mode supports 1000 steps and each function occupies exactly one step (merged keystrokes).
- GSB doubles as GTO (via the . key) and branches are to step numbers (as per the 12c). GSB and GTO can also operate indirectly using a register for the step number (again by pressing shift before entering all the digits).
- RET is entered as GSB 000
- END is entered as GTO 000
- Subroutine nesting depth is sixty four.
- There are twelve conditional tests supported testing the x register against either 0 or the y register. Enter tests by following the TEST command with a single digit. Enter . to test against y instead of 0.

```

0         x=0?
1         x!=0?
2         x<0?
3         x<=0?
4         x>0?
5         x>=0?

```

I've coded pretty much all of this in C (command line/terminal window). I'm still finding bugs but if you want the code...

One thing I'm yet to code include shortcuts to GSB to the low program addresses via pressing GSB followed by one

of the top row of keys possibly shifted. This will be implemented via a jump table and it will give easy access to eight user defined functions. Which happens to be enough to support trigonometric operations if desired.

Thoughts?

- Pauli

Message #2 Posted by **Walter B** on 19 June 2007, 2:28 a.m.,  
in response to message #1 by Paul Dale

Paul,

nice exercise! And your ASCII art approach (AAA) is perfectly sufficient to see your intentions. However, as you may have expected, there are some questions. Please take everything as MHO:

- Basically, do we really want to load such a small keyboard with such a big function set, now even including programmability? Remember this thing started as a 4-banger.
- You invented quite some tricky keystroke combinations to overcome the hard key space limits. But cui bono? One more line of keys will be significantly better.
- You need key sequences like **TEST 2**, which I'll have to look up on the calc's back (my bad memory, I know ;-). I expect something similar for **INTG**. Seems outdated for me in the era of soft keys and menus.
- 256 registers! Who shall remember all these locations and their contents?
- There's an SST, but no BST. Even very old HPs featured more.
- Please revert "+" and "-".

Summary: IMHO, you're running in the wrong direction. I'd recommend to ditch programmability for this model. Let it be a cute little scientific gadget. Include trigs on the keyboard. Cut the overhead. 10 or 20 registers are enough by far for quick and dirty applications.

Just my 0,02 Euros :-)

Just my 0,02 Euros :-)

Precisely what I think also. It should just be a nice simple non-programmable scientific.

I'd be happy with just the one memory register on a basic scientific.

Dave.

**Re: revisited: the 4 banger+**

Message #4 Posted by *Klaus* on 19 June 2007, 5:39 a.m.,  
in response to message #2 by Walter B

Yes, a simple keyboard is desirable. My solution: What does a keypress mean? In classic HPs, the keycode has been used as an address in the ROM to execute the function. Nowadays ROM is cheap; you can implement many scientific functions in your simple calc. In contrast to that, keyboard space is scarce.

My approach would be to create overlays (paper or plastic) for your keys. These overlays would include some metal contacts (that work like hardwired jumpers) that select the function of some keys. Now you can keep your keyboard small, while the user can heavily customize her/his calc. You want the basic arithmetic (+-\*/) on the left side? No problem! You need logs & trigs? Just use the right overlay!

[Edited to correct some typos]

Message #5 Posted by *Maximilian Hohmann* on 19 June 2007, 7:47 a.m.,  
in response to message #2 by Walter B

Hello!

Quote:

Summary: IMHO, you're running in the wrong direction.

Agreed... Either you build a single-seater sailplane (to use an example from my world), or a 500-passenger supersonic vertical-takeoff transport aeroplane with worldwide range. You can't have both within the same package, I'm afraid.

But of course, one could think of an expandable 4-banger like Mr. Bango here (sorry, my image editing capabilities are somewhat limited):

<http://www.bombie.de/graphics/MrBango.jpg>

(Please note the beautiful luminous display and the ':' time entry key without which this thing is a no-go-item for me :-))

At home or in the office, you connect your little shirt-pocket four banger to its expansion unit, that has gotten as many keys as you wish (scientific, financial, alpha, whatever...), the solar cells for recharging the batteries of the portable unit (a tribute to the soft orange glowing display) and the USB connection for remote storage and/or printing (look at the 'Ti-Connect' software that comes with Ti CAS systems to see, what's possible).

<http://www.bombie.de/graphics/ExpandedBango.jpg>

For people who would rather have a multi-digit display on their desktop, an alternate expansion unit like this one here could be devised:

<http://www.bombie.de/graphics/BangoExpander.jpg>

Just kidding of course ;-)

Greetings, Max

Really great design! And so customer-oriented! Next to perfection!! :-D

**Re: revisited: the 4 banger+**

*Message #8 Posted by **Paul Dale** on 19 June 2007, 5:06 p.m.,  
in response to message #2 by Walter B*

Good points. There is reason behind my madness...

Quote:

- You invented quite some tricky keystroke combinations to overcome the hard key space limits. But cui bono? One more line of keys will be significantly better.

Fiddling with this from my computer keyboard leads me to believe that the tricky keystroke combinations aren't so bad. My current program gives you feedback on every keystroke, doesn't care about the ordering and most of the modifiers are reversable i.e. it is fairly flexible about entry.

An extra line of keys would be better but that wasn't the point :-)

Quote:

- You need key sequences like **TEST 2**, which I'll have to look up on the calc's back (my bad memory, I know ;-).

Isn't this the same method use by the "almost perfect" 15c for both the test and matrix functions? This is one feature of the 15c user interface that I don't much like but there isn't any other obvious way to get the functionality there or here.

Quote:

- Please revert "+" and "-".

Oops, sorry. Don't know how that got mixed up again :-)

Quote:

programmability for this model. Let it be a cute little scientific gadget. Include trigs on the keyboard. Cut the overhead. 10 or 20 registers are enough by far for quick and dirty applications.

I actually agree my direction here is somewhat skew, I didn't design this with the intention of seeing it in production (although I will admit that that would be kind of neat). I designed it as a first step towards the realisation of something closer to a traditional scientific programmable.

To this aim, I needed it to be programmable so my emulator could handle that aspect. I needed a few representative functions so I could build the framework for them. I needed some kind of input state machine to handle prefixes etc. I also wanted to keep it relatively simple and still retain some measure of "complete" functionality.

- Pauli

### **Re: revisited: the 4 banger+**

*Message #9 Posted by **Walter B** on 19 June 2007, 5:35 p.m.,  
in response to message #8 by Paul Dale*

OK, after reading your post I don't understand what's your design goal (I am only knowing what's \*not\*), but I don't have to ;-)

Just one point: Maybe just such sequences like **TEST 2** are the reason for the 15C being only "almost" perfect. IMHO the 15C is a very nice little calc with a perfect function set **for its time** 25 years ago. No less, no more. You will find stronger believers in the eternal power of the 15C in this forum. Once upon a time, we had a project with the objective to create a modern calc with about the same outer dimensions. I do not remember anything like **TEST 2** in its function set, but my bad memory, you know ;-)

Best regards, Walter

*Message #10 Posted by **Egan Ford** on 19 June 2007, 11:27 a.m.,  
in response to message #1 by Paul Dale*

Where is the 'on' button? Solar? Always on? How about hold-shift for on/off?

I have to agree with the others, there is no need for INTG or programmability. I think the BANGO-EXPANDER is a bit extreme, but the right idea. My thoughts were that the device have some form of I/O. Many embedded processors have a serial device. It would be easy to add, say, Bluetooth. The "Expander" would be a very nice emulator/debugger for your desktop. All programming and testing would be there, then BT downloaded to the BANGO. This would also enable others to share data/code with other BANGOs. If your mobile phone was BT-enabled, then your BANGO could get code/data online (iRPN, iCode, iCalc?)

Since few want to carry around, yet-another-device, I would suggest that you create Windows Mobile (PDA and Smartphone), Blackberry, Symbian, and Palm versions first.

For a few extra bucks, add a jack, miniSD slot, dot matrix display and play tunes on it.

I'd also like it to float and be water resistance to 1M (like my GPS).

Message #11 Posted by **Maximilian Hohmann** on 19 June 2007, 3:58 p.m.,  
in response to message #10 by Egan Ford

Hi!

Quote:

Where is the 'on' button?

Ooops, I forgot about that one... Here it is (press 'CLX' for more than a second and it wakes up without clearing anything, auto-power off after 5 minutes with no loss of stack contents of course), together with the red status LED that will start flashing when the battery gets low. And the waterproof cast titanium housing :-). The whole thing could also have a simple USB connector so that one could use his existing PC/Macintosh keyboard to access the 'invisible' functions.

<http://www.bombie.de/graphics/MrBangoMod.jpg>

Greetings, Max

NB: On Apples support pages a software called 'Dashcode' can be downloaded for free that allows the development of little applications for the iPhone that will soon be released. The ideal platform for testing little hp-lookalikes!

in response to message #1 by Paul Dale

Quote:

I've been fiddling around with the super 4 banger that got mentioned a few weeks back.

Here is my interpretation of a "super 4 banger", meaning (for me) a basic, non-programmable scientific calculator.

I tried to keep it as simple as possible while including most common functions (common for me). I limited myself to a 20-key pad, since physical size was an important constraint.

Some notes:

1. There is no on/off key. To turn it on, push any key. To turn it off, hold SHIFT down for a couple seconds (or wait 10 minutes).
2. Note the INV function (on the 4 key), applicable to SIN, COS, TAN, LN, LOG, R->P, ->DMS, D->R and SQRT to compute the inverse function. It can also be applied to  $y^x$  to compute  $y^{(1/x)}$  (saving one keystroke). There is of course no need to use the shift key again after INV. E.g., push SHIFT then 4 then 1 to compute the arcsine.
3. There is only one memory. STO and RCL do not take an argument.
4. Fractional numbers can be input in 32S-like syntax (e.g., 3.1.2 for 3 and a half, or 9..7 for nine sevenths), but they are immediately converted to floating point. There is no FDISP equivalent.
5. I like the idea of having a 2-line display, but I'd rather have a sharper, numbers-only display instead of the

42S bitmapped display pictured here.

6. The DISP key is used to set the display mode (normal/scientific, number of digits displayed) and also the angular mode (degrees/radians).

7. Designing keyboards for imaginary calculators is a great way to waste time!

Nice model! Three remarks only:

Quote:

3. There is only one memory. STO and RCL do not take an argument.

Why not more? I'd like to have 10 registers. And with your keyboard, e.g. **SHIFT STO + 0** is easily accomplished.

Quote:

4. Fractional numbers can be input in 32S-like syntax (e.g., 3.1.2 for 3 and a half, or 9..7 for nine sevenths)

Hope they use **.9.7** to enter nine seventh. Else I need an extra push in logics.

Quote:

7. Designing keyboards for imaginary calculators is a great way to waste time!

Great indeed! :-))

Quote:

I'd like to have 10 registers. And with your keyboard, e.g. SHIFT STO + 0 is easily accomplished.

I hesitated between the ease of use of one register and the power of ten. In the end, simplicity won, mostly because I rarely use more than one register. This can of course be changed without any modification to the keyboard if you prefer more registers and register arithmetic.

Quote:

Hope they use **.9.7** to enter nine seventh. Else I need an extra push in logics.

The input formats are a.b.c to enter a + b/c, or a..b to enter a/b. So both .9.7 and 9..7 can be used to enter 9/7.

I think one register is enough on a calc like this. I rarely use more than one myself. Having to select the register number every time would be a bit annoying for me.

I really like this calc, and I think it has more merit than any other "theoretical" calc proposed on here that I've seen. Compared with all those Voyager and HP35S variations etc, I'd buy this one instead!

Dave.

Message #16 Posted by [DaveJ](#) on 23 June 2007, 8:31 p.m.,  
in response to message #12 by Paul Guertin

Excellent! I would make a few changes:

I would have had the exponent key unshifted in place of the X-Y key.

I would also swap the SHIFT and X-Y keys.

R-P but no P-R?, or is that a typo with D-R?

I would remove the INV shift function on the 4 key and rely on a double press of SHIFT to enable the inverse functions.

An ENG and <ENG function would be really nice!, drop the factorial or D.MS keys if needed.

Yes, a super 4-banger would of course use a more readable segmented LCD instead of dot matrix.

I would so want one of these!

Dave.

Thank you for your insightful comments.

Quote:

I would have had the exponent key unshifted in place of the X-Y key.

I probably use scientific notation less often than most potential users of this calculator. Your suggestion has a lot of merit. What do others think? If you had to choose only one, which would you make unshifted:  $x \langle \rangle y$  or EEX?

Quote:

I would also swap the SHIFT and X-Y keys.

I'm confused because as per your suggestion above, there would not be an  $X \langle \rangle Y$  key. Do you mean put the new EEX key at the bottom?

With the SHIFT key at the bottom, it is close to often-used functions such as SQRT and RCL. Keeping it there seems to minimize finger travel.

Quote:

R-P but no P-R?

INV R-P gives P-R. The other two conversions can also be inverted.

Quote:

I would remove the INV shift function on the 4 key and rely on a double press of SHIFT to enable the inverse functions.

It's like you were reading my mind. I had the same idea this morning, and already modified my picture with it. This allowed me to free the 4 key and use it for a pet function which I had to leave out in the first version: area under the normal curve (and its inverse).

Quote:

An ENG and  $\langle$ ENG function would be really nice!,

An ENG display mode could be set up using the DISP key. What is  $\langle$ ENG?

one, which would you make unshifted:  $x \leftrightarrow y$  or EEX?

---

Yep, just my preference. As an electronics engineer, most calculations I do involve the EXP key.

Quote:

---

Quote: I would also swap the SHIFT and X-Y keys.

I'm confused because as per your suggestion above, there would not be an  $X \leftrightarrow Y$  key. Do you mean put the new EEX key at the bottom?

---

Yes, sorry for the confusion. I just prefer it in that position, just like they have on the Casio's, I think it's a more sensible location. Kinda makes the key more important and prominate in that location.

Quote:

---

With the SHIFT key at the bottom, it is close to often-used functions such as SQRT and RCL. Keeping it there seems to minimize finger travel.

---

You'll never be able to suit everyone with this! For me the EXP key would be more frequently used than the shift key functions.

Quote:

---

Quote: R-P but no P-R?

INV R-P gives P-R. The other two conversions can also be inverted.

Of course. \*embarrassed look\*

Quote:

---

Quote: An ENG and  $\langle$ ENG function would be really nice!,

An ENG display mode could be set up using the DISP key. What is  $\langle$ ENG?

---

No, I'm not talking about an ENG display mode, I'm talking about an ENG display "function" that operates like the Casio calcs. i.e. scientific display is the normal "mode", but if you press ENG you convert that display into engineering notation. Press it again and the display shifts an extra 3 digits. Next operation causes the display to revert back to the usual display mode.  $\langle$ ENG is ENG in the other direction. I discussed this in one of the recent HP35S threads, the new HP35S has ENG and  $\langle$ ENG. I could live without  $\langle$ ENG, but ENG is essential on any calc IMHO.

BTW, the calc would of course not be as tall as the pictured unit, it would stop just at the top of the display.

Dave.

Keep the  $x\langle\rangle y$  unshifted. I use this significantly more than EEX (which I do use fairly often).

This opens a realm of new possibilities. Not only freeing up the 4 key position by removing the need for INV, but we'd also gain roll up (shift shift  $X\langle\rangle Y$ ) and we can free up one of the shifted - or + keys since STO is the inverse of RCL :-)

*Message #22 Posted by **Paul Guertin** on 25 June 2007, 12:25 a.m.,  
in response to message #12 by Paul Guertin*

Here's a new version.

<http://img514.imageshack.us/img514/7901/hp4siixj0.jpg>

## Changes (hopefully improvements) from the 4S:

1. Smaller size. Still need to work on the display, though.
2. INV is now shift-shift instead of shift-4. So to compute an arcsine, push shift TWICE, then 1. Pushing shift three times cancels shifting. An indicator on the LCD shows the shift status.
3. EEX is now a primary function; I reordered +/-, EEX and CLX to conform to other models.
4. There is still only one memory register, but two memory operations have been added. As before, shift-sto and shift-rcl store and recall from the memory register. In addition, shift-shift-sto adds X to the memory register, and shift-shift-rcl swaps X and the memory register.
5. The Q function on 4 computes the area under the normal curve from -infinity to x.
6. Use and abuse of the INV (shift-shift) function:
  - INV is applicable to the following functions and computes the obvious inverse: SIN, COS, TAN, Q, LN, LOG, r->p, ->dms, d->r, SQRT, Rdown.
  - INV  $y^x$  computes  $y^{(1/x)}$ , the xth root of y.
  - INV  $x!$  computes (y choose x), the binomial coefficient.
  - INV / computes  $y \bmod x$ , the remainder.
  - INV +/- returns pi. Strange place to put it, I know, but space is tight. An alternative would be to put it on . (double-shifted) but then we'd lose  $x^2$ , and sometimes it's nice to do  $x^2$  without losing T.

Another idea I've seen on another calculator is to overload the EEX key with pi. If typed at the beginning of entry, the key means pi. Otherwise it means EEX. That would mean that powers of ten such as 1000 would have to be entered as 1 EEX 3 and not EEX 3. It would also mean that we'd need to do 2 ENTER Pi \* to compute  $2\pi$ , instead of just 2 Pi \* (but this would actually save one keystroke, since Pi would be primary instead of double-shifted). What do y'all think?

## 7. ENG display function

Similar to the Casio and the upcoming HP-35S, there is no ENG display mode, but shift-ENG displays x in engineering notation, and multiple presses add 3 to the exponent. Double-shifted, it does <ENG.

## 8. Use of the DISP function (which is now double-shifted ENTER):

- DISP followed by + toggles between degrees and radian mode
- DISP followed by . toggles between . and , for decimal separator
- DISP followed by 0 to 9 sets FIX 0 to FIX 9
- DISP followed by EEX 0 to EEX 9 sets SCI 0 to SCI 9
- DISP followed by ENTER shows the whole mantissa while held down

## IAQ (Infrequently asked questions)

1.  $x \leftrightarrow y$  or EEX as a primary?

That's probably the most difficult choice I had to make. Good arguments can be made for either.

$x \leftrightarrow y$  as a primary means all the functions necessary for a basic 4-banger are accessible without SHIFT. EEX as a primary makes life easier for engineers. I guess the question boils down to: Is the 4S a 4-banger with some scientific functions, or a basic scientific calculator? It started life as a "4-banger plus", but the more I play with it, the more I tend to think of it as a scientific.

2. Why not HYP / HYP<sup>-1</sup> instead of Q / Q<sup>-1</sup>?

I don't have anything against hyperbolic functions but I like Q, and I feel it is unjustly discriminated against in modern scientific calculators, so Q stays. Anyway, computing hyperbolics is easy once you have  $e^x$  and  $\ln$ , which are already provided.

3. Why not STO as INV RCL?

I don't want STO to be buried too far, it's a useful function. Also, by doing it this way, SHIFT SHIFT STO for STO+ and SHIFT SHIFT RCL for  $x \leftrightarrow m$  really improve the usefulness of the memory.

4. I want one.

That's not a question.

I like the looks and size, but ...

All those key combinations go against the idea of a "simple" 4-banger. If this is supposed to be simple, the average idiot (who is smart enough to know RPN!) should be able to pick it up and use it to its fullest without having to read the manual or ask somebody "what key do I press to get arcsin?" I don't find the concept of "The Q function" particularly simple/necessary, either. I've done a lot of scientific analysis and I never felt the urge to have normal curve integrals available on my calculator.

The longer I look at it the more it reminds me of the Sinclair Scientific: cute package design, extraordinary small, extensive use of SHIFT and INV. IMHO such a user interface will limit this model to a conspiratorial community of enlightened monks, who will press **SHIFT SHIFT . SHIFT SHIFT +/- \* SHIFT SHIFT ENTER EEX 4** humming happily to calculate the area of a circle with 4 decimals. Ommmmmmh ;-)

What about exchanging  $\ln$  &  $e^x$  and  $\log$  &  $10^x$  then we've got  $e^x$ ,  $10^x$  &  $y^x$  next to each other and the inverse  $\ln$ ,  $\log$  &  $\log$ -base- $y$  next to each other too.  $y^{(1/x)}$  isn't the inverse of  $y^x$  after all.

I'm tending to agree with Walter on the complexity of entry...

Still, I might look into implementing it :-)

**Brightness display HP65**

Message #1 Posted by [Ronald P](#) on 18 June 2007, 3:33 p.m.

Hello,

I have a HP65 in repair this moment. There was one element in the Led burned out so I had to replace that led unit. It works 100% now for all digits. But now the brightness is different between the units.

I know HP did match the brightness at production for the 3 units, but unfortunately I had only on spare unit, so no option to match brightness.

Is there a way to make a unit less bright, can I put a (small) resister somewhere, or lower the value of the inductors affecting only one unit ?

Thanks

Ronald

*Edited: 18 June 2007, 3:34 p.m.*

**Re: Brightness display HP65**

Message #2 Posted by [Dan W](#) on 18 June 2007, 7:20 p.m.,  
in response to message #1 by [Ronald P](#)

The cathodes of each digit are all tied together, so there are 5 cathode lines. You would need 5 resistors. Theoretically it could be done if you can find room to attach them.

The anodes for each segment are tied together too, but they are also tied to the anodes of the segments in the other chips. A resister in the anode line would dim the segments in all of the chips.

Good luck! if you get it done, let us know. Also I've heard replacing the LED chip is quite difficult. If you have some tips from your experience, please post them!

**Re: Brightness display HP65**

Message #3 Posted by [Ronald](#) on 19 June 2007, 4:01 p.m.,  
in response to message #2 by [Dan W](#)

Hello Dan,

Thank you for the the tip.

Removing the led unit was actually not that difficult. I used desolder litze (is that the correct word, a lot of twisted thin copper wires). This literally sucked out 95% of the solder for each joint. After that I used an L

shaped tweezer which I put between the board and Led unit and applied a little bit of careful force to pry it out. After that you touch with iron the joints that did not came clean completely and its done. 5 minutes max.

I will let you know on the resistors.

Br

in response to message #2 by Katie Wasserman

Thanks for the Version 6 link. I went ahead and pre-ordered the DVD v6.

And speaking of pre-orders, there is a new edition of Numerical Recipes (Cambridge Press) coming out in early August. If I am allowed one Numerical Analysis book, this is the one I choose. You can order it online (Amazon and the like). The new version also uses C++ source code but the code is more object-oriented than the one in the currently sold edition. The publisher is also making available an electronic version of the book (for pay). There is also a CD with all the source code of the various editions that will be offered. To find out more [click here](#).

Most of my recent UserRPL and SysRPL programming efforts have been grateful adaptations of NR code. Indeed, I must admit that the structure of RPL is indeed well suited for such translation. Even though it is tougher at first to learn vs. RPN keystroke programming, I am glad I have taken the time. Right now, my 49G+ is my most used calculator. A few months ago, I barely touched it.

**rpn stack drop**

Message #1 Posted by [K. Stefan Jansson \(IL, USA\)](#) on 17 June 2007, 12:28 p.m.

I am relatively new to rpn, but after having used the hp48, I wonder why such calculators as the 15c or 32s don't do stack drop when you perform a clx.

**Re: rpn stack drop**

Message #2 Posted by [allen](#) on 17 June 2007, 1:40 p.m.,  
in response to message #1 by [K. Stefan Jansson \(IL, USA\)](#)

I believe the consensus you will find here is that the 3rd Generation Calculators (28s, 48g, 50g) are not pure RPN, rather RPL. See this [recent thread](#) for more discussion. This is one of many in recent months. Hope this helps.

**Re: rpn stack drop**

Message #3 Posted by [Howard Owen](#) on 17 June 2007, 1:49 p.m.,  
in response to message #1 by [K. Stefan Jansson \(IL, USA\)](#)

The short answer is that CLX is not DROP. On the RPN models, the X register (level 1 in RPL-speak) is where digits are entered. When data entry is begun, the X register is normally pushed on the stack, but see below for exceptions. On RPN machines, if you are entering digits (or alpha data on the 41/42), the back arrow key deletes your last character and backspaces. If you are not entering digits, then CLX (for CLear X) is executed. If CLX has just been entered, then stack lift is disabled. So I can delete the X register value and key a new one without pushing the T register (level 4 in RPL) into the bit bucket. On the RPL models, there is an entry line separate from the stack. The back arrow works the same way when entering data. But on all RPL models except the 28C and 28S, back arrow executes DROP when not in data entry mode.

Why the differences? I think its probably more useful to ask why RPL changed the preexisting RPN conventions. If you think about the mechanics of RPL, most operations take operands from the stack and consume them, i.e. they remove the operands from the stack as they are used. The idea seems to be that all operations with the stack are explicit and consistent. So one function that doesn't drop the stack is DUP, which is what the enter key does when not in RPN mode, or a true enter when in data entry mode. In both cases, there is no implicit manipulation of the stack. But RPN models don't have an extra data entry register. Data goes implicitly into level one, or the X register. The inconsistent stack lift behavior is dictated by the four level stack; you don't want to lose T if you don't have to. The RPL stack can grow arbitrarily, so there is no need for this stack conserving behavior. Also, the RPL stack is far more central than the RPN stack. The former can hold any object, so behavior with respect to the stack needs to be more consistent. The mechanics of the RPN stack are dictated by limited memory and conventions developed for the HP9100 and the HP35.

So the answer to your question is CLX is not DROP, and CLX came first.

Regards,  
Howard

(Edited to remove trailing stuff I didn't intend to post)

### **Re: rpn stack drop**

*Message #4 Posted by [K. Stefan Jansson \(IL, USA\)](#) on 17 June 2007, 4:49 p.m.,  
in response to message #3 by Howard Owen*

I understand that rpn and rpl don't work the same way.

But stack drop on clx is useful. It seems stupid to just put a zero instead of dropping the stack.

Let's say you enter two numbers "2" and "3". You then decide that you don't need 3, so you clx. If the stack drops, then you can do single argument functions on 2 like sine, or sqrt. If instead you want to enter another number, "4" instead of performing a function on "2", then the stack lifts.

So dropping the stack with clx is more functional, and makes more sense. To me it seems pretty annoying to have to do a rolld or  $x \langle \rangle y$  after doing a clx.

It just seems like a silly oversight on otherwise refined machines.

### **Re: rpn stack drop**

*Message #5 Posted by [Namir](#) on 17 June 2007, 4:58 p.m.,  
in response to message #4 by K. Stefan Jansson (IL, USA)*

Keep in mind that RPN stacks are fixed four-register stacks that **always** contain values. By contract, RPL stacks are dynamic. They can contain zero (that is, they are empty) or more values. So Clx with an RPN stack replace the old contents of X with 0 and sets the entry mode flag, since the RPN stack is fixed. This means that when you key in a number right after Clx, your input **replace** the 0 created by the Clx. If you perform an operation right after Clx, the calculator uses the 0 as the argument for the function.

Namir

### **Re: rpn stack drop**

*Message #6 Posted by [K. Stefan Jansson \(IL, USA\)](#) on 17 June 2007, 5:11 p.m.,  
in response to message #5 by Namir*

yes, but instead, they can simply drop the stack, but instead of replacing the value, then it can simply push the stack.

Like

t: 0 z: 0 y: 2 x: 3 then a clx leaves: t: 0 z: 0 y: 0 x: 2

at which point you can do sine cos sqrt etc. on the 2. But if you want to enter another number, then the following will occur:

t: 0 z: 0 y: 2 x: 4

instead, the 15c does this after a clx:

t: 0 z: 0 y: 2 x: 0 How does this help? To do a function on 2, you must either rdn or x<>y.

But I reiterate, in order to make the clx stack drop effective, though, you also have to make the stack push when you enter another number, as opposed to doing a function, which will operate on the 2.

### Re: rpn stack drop

Message #7 Posted by [Howard Owen](#) on 17 June 2007, 5:18 p.m.,  
in response to message #6 by K. Stefan Jansson (IL, USA)

I guess the assumption is that if you have cleared the last value in X, you intend to replace it with another. That's why stack lift is disabled after CLX. (And *not* otherwise. i.e. RDN<key numbr> doesn't overwrite the X value, but pushes it back to Y) If I want a new operand in X, I just key it in. If I **do** want to operate on Y, and assuming X isn't bogus, I will X<>Y, do the operation and X<>Y again.

This is all pretty silly. The calculators do what they do, and no amount of discussion on our part will change that. Plus it's a matter of taste which you prefer. Why argue about it?

I don't want to argue, I just want to be understood.

The whole idea is that with stack drop/stack push, you CAN enter a new value, because it PUSHES the stack, but does not overwrite the former y.

But the convenient things is that you can ALSO perform a function on the former y register contents because it dropped into the x. Because only when you enter a new number does the stack push.

It just seems like a silly oversight on otherwise refined machines.

---

My new RPN calc project has (I think) the best of both worlds here. CLR<sub>x</sub> clears the currently entered number in the Xreg and prevents stack lift when you next enter the digit. But if you press CLR<sub>x</sub> a second time (when Xreg is 0) then the stack gets dropped.

I think it's a very sensible way to do it so that's how I implemented it in my design.

Dave.

Why not just drop stack the first time?

### Re: rpn stack drop

Message #12 Posted by **DaveJ** on 17 June 2007, 8:55 p.m.,  
in response to message #11 by K. Stefan Jansson (IL, USA)

I initially found it distracting on the two line screen to constantly have everything move up and down the stack every time. Seemed much neater to simply clear the Xreg, after all, you started entering a number for a reason. I figured that you would more often want to simply clear an incorrect keystroke or number than clear the operation by dropping the stack.

But it's all subject to change, after I use it for some time I might find it better to simply drop the stack, or even have it as a user definable option.

Dave.

So dropping the stack with clx is more functional, and makes more sense. To me it seems pretty annoying to have to do a rolld or x<>y after doing a clx.

As Namir explained, the stack has a fixed depth of four elements, so a "dropped" value would be replaced by *something*, one way or another.

If "you then decide that you don't need (*the*) 3", and don't want to replace it with something else, the best thing to do is roll down (RDN), which will place the unwanted value on the top of the stack (t-register) and drop the 2 to the x-register, so that operations can be performed. Stack-lift will remain enabled for entry of a new value to the stack -- which would push the unwanted value off the top of the stack.

If the 3 is simply to be replaced by a different value in the x-register, then CLx or DROP followed by the new value work equally well because CLx disables stack-lift: The new value, whether entered from the keyboard or recalled from memory, overwrites the place-holding zero in the x-register.

Quote:

(*From your subsequent post*): I don't want to argue, I just want to be understood.

A "words of wisdom" wall poster I've seen has the following statement:

*"Seek first to understand, then to be understood."*

: -)

Trust us -- these things were "thoroughly thought through" when implemented on the original HP-35 in

1972, and were slightly refined for successor RPN-based models.

\_\_\_\_\_

Leaving the stack unchanged after **CLX** makes perfect sense to me. Dropping the stack would change the contents of the **Y** and **Z** registers. The purpose of **CLX** is to clear the **X** register (hence the name), so why should it affect other registers? The way the HP48 does it has always seemed a little strange to me, but at least the key is labeled **DROP** to indicate what it does. If I want the stack to drop on a genuine RPN machine, I'll use **RDN** to do it; there's no need for the calculator to do it for me, and I'd prefer that it leave the choice up to me rather than trying to guess what I want.

### Re: rpn stack drop

Message #16 Posted by [K. Stefan Jansson \(IL, USA\)](#) on 17 June 2007, 9:09 p.m.,  
in response to message #15 by Wayne Brown

But stack drop with stack push does not affect the user in any way except to give more options, that is, to give the user the option of performing functions on the previous contents of the y register instead of leaving a useless zero.

Bill Wickes wrote an article called "hp41 to hp48 transitions" where he talks about this exact issue. He said clx leaves a zero because of a psychological issue:

"many people, especially if they're used to algebraic calculators (which typically require you to press the clear key to start new calculations), like the sense of a "clean slate" suggested by a zero."

Personally I don't think a psychological reason is good enough. Functionality needs to take precedence. And for me it's not a psychological reason, because I don't like it that way. Nor do I like algebraic syntax.

Here's an analogy: If you're going to use psychological reasons to design a calculator, you might as well get rid of rpn, because there are plenty of people who prefer algebraic entry to RPN out of ignorance. By ignorance, I mean, they've simply never tried using RPN.

If all you want is a zero, then it's just as easy to press the zero key.

### **Re: rpn stack drop**

*Message #19 Posted by [Karl Schneider](#) on 17 June 2007, 10:12 p.m.,  
in response to message #18 by K. Stefan Jansson (IL, USA)*

Stefan --

Quote:

*I guess my saying that in the first place could have avoided confusion.*

Carefully reasoning your statements is conducive to being understood.

Quote:

*They should do an automatic rdn, instead of the user having to do it.*

I generally oppose the idea of software/firmware doing things that I neither requested nor wanted. It's one of the primary complaints against Microsoft products.

Quote:

*But stack drop with stack push does not affect the user in any way except to give more options.*

---

The RPN stack is of fixed depth. What would fill behind a "dropped" element? If CLx always performed a "clear x-register" followed by RDN, then a zero would be placed in the t-register.

The previous t-register may have been wanted, because RPN will retain the t-register contents for operations that produce one result from two inputs (e.g., arithmetic "+"):

| reg | before | "+" | after |
|-----|--------|-----|-------|
| t   | 1.00   |     | 1.00  |
| z   | 2.00   |     | 1.00  |
| y   | 3.00   |     | 2.00  |
| x   | 4.00   |     | 7.00  |

This feature is handy for constant arithmetic, or evaluation of polynomials by Horner's Method (described in the manuals for the RPN HP-15C and HP-34C), as an endless supply of a value can be automatically produced if desired.

Quote:

---

*If all you want is a zero, then it's just as easy to press the zero key (instead of using CLx).*

---

Ah, but that will push the stack, leaving the unwanted value between the zero and the previous "stack y" value.

Also, as Howard said: RPN and its "CLx" are what they are, and they preceded (by 14 years) RPL and its "DROP", which are different but not necessarily better in the opinions of many.

Please take that wall-poster saying to heart. You seem wont to debate and express your own positions, instead of investigating and examining the explanations of others who made the efforts.

## **Re: rpn stack drop**

*Message #20 Posted by [K. Stefan Jansson \(IL, USA\)](#) on 17 June 2007, 10:47 p.m.,  
in response to message #19 by Karl Schneider*

My point in quoting William Wickes is that I have done research, and the designer of the HP 48 knows the origins of the clx better than you do, I'm willing to bet.

He says that the absence of stack drop with a clx comes from a psychological hang up of algebraic calc users.

And as far as the stack thing goes, stack drop would do the same thing as addition as far as the t register goes, so the duplication of the t would occur. I

was mistaken, when I said its the same as rdn.

You said:

"I generally oppose the idea of software/firmware doing things that I neither requested nor wanted. It's one of the primary complaints against Microsoft products. "

Well the T register duplicates when the stack is full without you asking it to do that and the calc reallocates matrix memory and registers when you have not asked it to do so. The 15c does many useful things that you don't ask it to do. Doing a stack drop when you clx would be another usefull thing.

Message #24 Posted by **Walter B** on 18 June 2007, 7:56 a.m.,  
in response to message #23 by Thor Lansen

OK Thor, one point for you! But with such a pass ...

What I did mean was: RPN started the scientific pocket calc and got a lot of competition in the following years. So if there had been anything wrong with CLx, it would have been corrected in the early years for sure. See  $x^y$  for example.

---

---

**Re: rpn stack drop**

Message #25 Posted by **Karl Schneider** on 18 June 2007, 2:52 a.m.,  
in response to message #20 by K. Stefan Jansson (IL, USA)

Quote:

---

My point in quoting William Wickes is that I have done research, and the designer of the HP 48 knows the origins of the clx better than you do, I'm willing to bet.

---

Huh? That's a *non sequitur*, but as Howard and others have already responded, I'll let it pass...

Quote:

---

He says that the absence of stack drop with a clx comes from a psychological hang up of algebraic calc users.

---

I say that CLx "zeroes out" the x-register and leaves others unmodified is that the stack depth is fixed at four elements, requiring that some placeholder fill in for a "deleted" element. What better than zero -- blanks?

Quote:

---

Well the T register duplicates when the stack is full without you asking it to do that

---

No, the t-register generally retains its stored value, until some stack-lifting operation replaces that value with the previous contents of the z-register, or RDN replaces the value with the contents of the x-register.

One exception to that is the numerical-integration function ("INTEG") offered on the HP-34C, HP-15C, HP-32S/SII, and HP-33S. On the HP-34C and HP-15C, INTEG (and SOLVE) as a convenience will automatically load the stack with the latest input value of the variable of integration or rootfinding, prior to each execution of the program defining the user's function. This is OK, because these special functions are designed to "process" only one variable. Other necessary inputs to the

user's function can be retrieved from storage registers.

Upon completion of INTEG, each of these models will return four values to the stack:

```
t    lower limit (restored from input)
z    upper limit (restored from input)
y    estimate of maximum error
x    estimate of integral
```

This also is OK, because the original stack contents when INTEG was invoked had been repeatedly overwritten anyway...

Quote:

---

and the calc reallocates matrix memory and registers when you have not asked it to do so.

---

I don't quite understand that statement. It's not true of the HP-15C, which has only manual memory allocation. The HP-15C will utilize free registers from the "pool" as necessary to store a matrix result, but that is perfectly acceptable.

The HP-11C and HP-34C -- which lack matrix functionality -- will automatically delete data registers as necessary to accommodate more programming instructions entered by the user, but I don't consider that a desirable attribute.

Quote:

---

The 15c does many useful things that you don't ask it to do.

---

I do agree with that statement. Those are *thoughtful features* which never cause the user consternation, as opposed to irritating distractions.

Please see above for an example.

Quote:

---

Doing a stack drop when you clx would be another usefull thing.

---

I vehemently disagree with that, and if you don't understand why, you weren't earnestly *reading* the responses from me and others. Why do you keep hammering away at this issue, which was certainly significant to product design, but is rather trivial in the grand scheme of things? Is it because you enjoy the argument and seek to be understood before all else?

Quote:

---

Bill Wickes wrote an article called "hp41 to hp48 transitions"

---

If you read that book, then you know that William Wickes *designed* RPL. Of *course* he's going to prefer the way RPL does it. He wrote it! Plus, meaning no disrespect for Dr. Wickes, he wasn't speaking with the authority of someone who had been around in 1972 when the design of the RPN stack was created. He rose to prominence in the late 1970's, as one of the folks most responsible for synthetic programming on the HP41. He was the first to put together a complete description of SP. I learned SP from his book in 1984. I don't believe he was working for HP even then. He was hired as a leading light in the HP calculator community to design the next generation of calculators. So that was probably in 1985 or so.

Anyhow, your statement below that Doctor Wickes "knows the origins of the clx better than you do, I'm willing to bet," is factually dubious and *rude*. We have a nice, collegial atmosphere here. We have vigorous debate, but without personal statements like "better than you do." I recommend you look into some of the archives to see how those are handled.

Howard

Quote:

---

But stack drop with stack push does not affect the user in any way except to give more options, that is, to give the user the option of performing functions on the previous contents of the y register instead of leaving a useless zero.

---

Yes, it certainly does affect the user in other ways. For instance, if I write a program that depends on certain things being in certain registers, and issue a **CLX**, then I can count on everything in the registers other than **X** remaining exactly as they were. Under your plan, I'd need to take extra steps to put things back like they were before the **CLX** was executed, which is silly for a command whose only purpose is to alter one specific register. Even when I'm just entering things manually from the keyboard, I have to keep a mental picture of the stack and where everything is. The less often things move around, the easier it will be to keep track of where they are.

Quote:

---

Bill Wickes wrote an article called "hp41 to hp48 transitions" where he talks about this exact issue.

---

I have a great deal of respect for Bill Wickes; however, I'd have even more respect for him if he had stuck to extending and improving RPN rather than transforming it into RPL. As much as I love my 48GX, I'd like it a lot more if it worked more like my even more beloved 41CX.

### Re: rpn stack drop

Message #29 Posted by [James M. Prange \(Michigan\)](#) on 18 June 2007, 6:14 p.m.,  
in response to message #16 by K. Stefan Jansson (IL, USA)

Actually, Bill Wickes wrote a **book** named *HP 41/HP 48 Transitions*. A scanned .PDF copy of it is available on the current HP Museum CD-ROM set / DVD-ROM.

Although I certainly have a great deal of respect for Bill Wickes, I'm surprised at that statement from him. I suppose that "starting with a clean slate" might be a reason for some to use the CLX key, but I'd be surprised if that were a common practice for most Classic RPN users. Certainly this "use" of CLX had never occurred to me. After all, pressing CLX as the start of a new problem simply means that a zero in register X will be replaced (without changing anything else) instead of whatever already happens to be in register X being replaced (discarding the contents of T and lifting the contents of the previous X, Y, and Z to Y, Z, and T). Certainly if the user cares about the contents of Y, Z, or T, then he's going to take care of that. Why waste the extra CLX keystroke?

If one really wants to "start with a clean slate", then CLST (on a 41) would seem to me a more reasonable choice, as it loads zeros into all stack registers, possibly saving the user the trouble of pushing zeros into all of them. Of course, depending on the model and what the user intends to do next, there may be other areas (such as statistics data) that the user may want to clear for a "clean slate".

Using CLX seems to me analogous to using the CE key instead of the C key on an algebraic entry model. Certainly using CE doesn't prevent such "features" as "constants operations" on an algebraic model; if you want the "clean slate", then you use the C key.

It seems to me that a much more reasonable primary reason for using CLX would be for when the user realized that he's entered the wrong value, and wants to replace it with the correct value without disturbing anything else, much like using a CE key on an algebraic input model.

Bill Wickes also mentions CLX in various other places in *Transitions*; notably, "CLX is primarily intended for replacing the contents of X with a new value. By disabling stack lift, the zero CLX enters can be overwritten by a following entry."

On an RPL model, a CLX key would seem rather silly. First off, a stack level can point to any type of object, so replacing the contents of level 1 with the real number zero wouldn't be such an obvious choice. More importantly, on an RPL model, one never writes directly into level 1, so to replace a "zeroed-out" level one, one would have to edit the level 1 object in the command line editor and enter the edited contents. It's easier to simply remove level 1 with a DROP, key in a new value (which automatically activates the command line editor), and enter the new value. Of course, if one wants to abandon the command line editor (discarding any contents), then the CANCEL (or ATTN) key is pressed.

Regards,  
James

Hi, Antonio --

DROP = [CLx][+] or [CLx][-]

Indeed, I belatedly thought of this last night after I'd logged out as a solution to the functionality that Stefan seemed to favor. Your post would have beaten mine even had I gotten back to it.

I've used this sequence to "purge" a value from the x-register while preserving the t-register for replication. However, CLx should not perform in that manner for reasons already stated.

## Re: rpn stack drop

Message #35 Posted by [Valentin Albilló](#) on 18 June 2007, 6:29 a.m.,  
in response to message #1 by K. Stefan Jansson (IL, USA)

Hi, K. Stefan Jansson:

K. Stefan Jansson posted:

*"I wonder why such calculators as the 15c or 32s don't do stack drop when you perform a clx."*

In the HP-15C, CLX is used to allow you to independently modify/clear the real and/or imaginary parts of a complex value in the X register without disturbing the rest of the stack. By using it, you can: conveniently alter one without altering the other, clearing just the real part or just the imaginary part, enter or modify a complex number in the X-register without disturbing the rest of the stack (not possible in the HP42S, for instance), and recall a complex number from storage registers into X without disturbing the rest of the stack:

These useful operations wouldn't be possible if CLX did a stack drop (or would be much more convoluted), and would thus require some other specific functionalities instead in order to be able to achieve the aforementioned purposes.

All of this is thoroughly discussed in pages 125-130 (six pages nos less !) of the HP-15C Owner's Handbook.

Best regards from V.

## RPN stack drop: HP17BII and HP19BII

Message #36 Posted by [Vieira, Luiz C. \(Brazil\)](#) on 18 June 2007, 7:02 a.m.,  
in response to message #1 by K. Stefan Jansson (IL, USA)

Hi, Stefan;

The HP17BII and the HP19BII are two examples of calculators with variable size RPN stack (in RPN mode, in this case). They actually have as many stack levels as arguments you enter, in a maximum of four. If you clear the stack, only the X-register exists. For example, if you enter 2 and 3, either [Rv] (roll-down) or [x<>y] (X-exchange-Y) cause exactly the same effect, showing 2 or 3 each time they are pressed. In any case, CLX will actually replace the X-register contents for 0 (zero), but will not cause the stack to 'drop it out'.

I am not sure if there are other RPN calculators that do so. Maybe the HP17BII+, could not test.

Cheers.

Luiz (Brazil)

## **Re: RPN stack drop: HP17BII and HP19BII**

*Message #37 Posted by [bill platt](#) on 18 June 2007, 12:58 p.m.,  
in response to message #36 by Vieira, Luiz C. (Brazil)*

Good point Luiz.

To further clarify:

on the 17bii, if you [shift] [clear data] the stack empties and grows to suit your needs as Luiz stated above.

Hoever, note that stack lift and drop are considered: so that if you do:

```
4
[ENTER]
5
x
```

the resulting stack will be:

```
t {not exist}
z {not exist}
y {not exist}
x 20
```

During the operation, you used the y-register, but it dropped back to the X-register.

Similiarly, if you do

```
3
[enter]
2
[enter]
1
+
X
```

you will get 9, and no stack.

You can tell that the stack is non-existent because roll-down does not bring any zeroes or other numbers.

However, once you actually use the t-register, then the stack becomes a standard 4-register stack--it will not collapse, and all further operations will function as a 4-level stack as usual.

*Edited: 18 June 2007, 1:11 p.m. after one or more responses were posted*

### HP Calculator Video

Message #1 Posted by [Kevin Kitts](#) on 16 June 2007, 11:54 p.m.

Is this old news to everyone - nice video from HP about calculators including an appearance by the HP Museum curator himself... ;-)

[http://h20331.www2.hp.com/Hpsub/downloads/HP\\_35\\_years.wmv](http://h20331.www2.hp.com/Hpsub/downloads/HP_35_years.wmv)

### Re: HP Calculator Video

Message #2 Posted by [Walter B](#) on 17 June 2007, 1:25 a.m.,  
in response to message #1 by Kevin Kitts

Kevin,

Thanks for the link. It was new for me at least. - The video contains some clear commitments of today's HP. Let us wait and see what real objects come out of them.

Dave,

you are looking much younger than I imagined :-)) So the future of your (and our) museum looks brighter now than I feared. And my hope for a more complete coverage of the Pioneers and 48g rose ;-)

Best regards,

Walter

*Edited: 17 June 2007, 4:20 a.m.*

### Re: HP Calculator Video

Message #3 Posted by [Karl Schneider](#) on 17 June 2007, 3:04 a.m.,  
in response to message #1 by Kevin Kitts

Kevin --

Thanks for the link. It was new to me, and I enjoyed watching the video.

I had some problems downloading the video directly at the URL you provided, but the following procedure worked:

Go to [http://h20331.www2.hp.com/Hpsub/cache/457246-0-0-225-121.html?jumpid=ex\\_r2845\\_go/35celebration/calculators](http://h20331.www2.hp.com/Hpsub/cache/457246-0-0-225-121.html?jumpid=ex_r2845_go/35celebration/calculators)

and then do "save target as" on the text "35th Anniversary Video" or the photo above it.

Notes:

1. The 7-minute, 35-second \*.wmv (Windows Metafile Video) is 27.8 MB, not 8.6 MB as indicated.
2. There is no mention of the excellent HP-15C, unfortunately.

-- KS

### 80 col video interface to PC LCD Monitor

Message #1 Posted by [PeterP](#) on 16 June 2007, 1:56 a.m.

Hi,

I recently acquired the 80 col mountainview/HP video interface hoping there will be a way to connect it to a standard PC LCD monitor. I searched in the archives yet the best idea I was able to find was to get a TV-tuner card, most of which have a video composite in plug and use that to display on the PC.

Unfortunately I have one of those mini-PC from Shuttle (I live in NYC and my shoebox aka apartment does not allow for those fullsize beige boxes...) and I do not have an extra slot. And my graphics card does not have a composite video in.

I also googled a lot and tried to find an adapter yet with no real luck. So I now come to the place where I should have gone maybe first and ask if anyone knows of a good solution to this problem?

Thanks a lot in advance!

Cheers

Peter

### Re: 80 col video interface to PC LCD Monitor

Message #2 Posted by [Egan Ford](#) on 16 June 2007, 3:30 a.m.,  
in response to message #1 by [PeterP](#)

What is the output? Composite? If so Google for: "composite to vga converter"

E.g. <http://www.ramelectronics.net/html/video-vga-gvm-2000.html>

### Re: 80 col video interface to PC LCD Monitor

Message #3 Posted by [PeterP](#) on 16 June 2007, 12:34 p.m.,  
in response to message #2 by [Egan Ford](#)

Thanks Egan, that is very helpful. I guess that was part of my problem. From studying the old posts it was not quite clear to me if it is the same as today's composite. It is a yellow cinch out plug which points in that direction. However Diego Diaz mentioned something about the synchronization frequency that might be different (I'm not that familiar with video signals). Would you guess that the composite signal from the 80s is the same as the one today?

Thanks so much for your help!

Cheers

Peter

---

**Re: 80 col video interface to PC LCD Monitor**

*Message #4 Posted by [Diego Diaz](#) on 16 June 2007, 3:02 p.m.,  
in response to message #3 by PeterP*

Hi Peter,

How are you doing?

Must confess I don't recall when did I wrote about sync signals but it doesn't come to the point whatsoever... :-)

So you've got a means to produce video signals (composite) from your HP-80... lucky guy!!

Display options: a) your TV (easiest) and b) your PC (not so easy)

Let us know if your TV has a composite video input (or which inputs does it have). Also which video inputs (if any) does your PC have.

Depending on that you may set your connection up in defferent ways.

More likely your new Mountain 80 col. box is supplying composite video signal according to NTCS standards. This will show up on any U.S. TV set (as well as most modern TV's worldwide, even if they're not NTSC... -say PAL-) provided it has a composite video input (usually an RCA -yellow-connector).

To send that video signal into your PC will require a more complicated (not much though) work around.

Let's know of your progress.

Best wishes.

Diego

**Re: 80 col video interface to PC LCD Monitor**

*Message #5 Posted by [PeterP](#) on 17 June 2007, 12:30 a.m.,  
in response to message #4 by Diego Diaz*

Diego, good to hear from you.

Yes I got lucky with that Mountainview 80 col display :-)

My TV would not help me, it is hanging on the wall with its connectors rather hidden and difficult to reach. So it will have to be my PC Monitor... My Graphics Card is a NVIDAI 7900 GTX which has two DVI(?) connectors and no composite ones. So I guess it would be hard to go through the PC (getting a e.g. All-In-One Wonder card with TV-tuner was one of the suggestions in the forum archive...)

I just want to find a way to connect the mountainview to my LCD monitor. Well, I guess the devil lies in the word 'just' ;-)

Thanks for any help you can offer!

Cheers

Peter

**Re: 80 col video interface to PC LCD Monitor**

*Message #6 Posted by [Diego Diaz](#) on 19 June 2007, 5:39 p.m.,  
in response to message #5 by PeterP*

Hi,

In order to use your PC monitor as an HP-41 display, I also think that video capture board is the best approach (as stated above).

Just make sure you get one with analog composite input (RCA connector) and you'll have it into a window. Synchronism timing shouldn't be a problem.

Enjoy your toys!! ;-))

Diego.

**Re: 80 col video interface to PC LCD Monitor Found a Solution!**

*Message #7 Posted by [PeterP](#) on 19 June 2007, 11:38 p.m.,  
in response to message #6 by Diego Diaz*

Diego et al,

thanks for all your guys help. In the end I got very lucky - on uBid someone sold a car-video solution to show VHS videos on a 5" LCD monitor. And the input was via composite! And the price - 1 USD...

Needless to say, that I bought that and now use it as a small and even portable monitor (not that the Mountainview thing is portable...) ONLY thing, due to the small size, I can only use 40x25 if I want to be able to read it easily. But it was a cheap and easy solution!

Thanks again for all the help

Cheers

Peter

**HP41CV Dead**

Message #1 Posted by [colhind](#) on 15 June 2007, 11:52 p.m.

I have an HP41CV that was stored for about four years with battery left in it. I recently decided to resurrect it but find that I cannot breath any life into it. It was working when stored but is now as dead as an Auk.

I also have another 41 that works fine so I tried swapping bits back and forth to determine which part is faulty. It turns out that everything in it works except the keyboard/display unit.

In other words the problem isn't related to any of the usual things like crook battery contacts, poor contact between the printed circuit boards, etc. It would appear that something on the display/keyboard unit has died in its sleep. Either that or there is something that needs to be reset.

Any ideas will be greatly appreciated.

Cheers, Ron

**Re: HP41CV Dead**

Message #2 Posted by [Ralph](#) on 16 June 2007, 8:12 p.m.,  
in response to message #1 by [colhind](#)

I had a 41C expire many years ago. I didn't store it with batteries but I did store it in a hand made leather case my Uncle made for it. The leather dyes and chemicals and the humidity in the pouch destroyed the flimsy interface gizmo between the boards. For a while I had it running with a crude solder job but the wires were too big and stiff for the task at hand. Check the board interface for clean contacts and that the coil assembly is not damaged. I can't recall the proper name for the little thing.

also check the mount posts to see that they are not broken. Then the boards won't make contact either.

**Re: HP41CV Dead**

Message #3 Posted by [colhind](#) on 20 June 2007, 2:42 a.m.,  
in response to message #2 by [Ralph](#)

Thanks for the tip.

Sadly, deterioration of the conductive strip connecting the two boards isn't the problem. I wish it was for I would rapidly solve it with my trusty soldering iron and a few strands of enamelled wire. No; by a process of elimination I have found that whatever the problem is, it is related to the keyboard/display printed circuit board.

I set out to try to awaken it by means of operating the card reader but alas I cannot try that until I fix the confounded drive wheel which I now find has turned to mush. Now where did I put those little O rings?

Anyroad I am still hoping for suggestions.

Cheers, Ron

**Re: HP41CV Dead**

*Message #4 Posted by [Marco Schriek](#) on 4 July 2007, 4:36 p.m.,  
in response to message #3 by colhind*

Maybe a stupid question but how do you open a HP41CV? My 2-key is playing tricks with me and I want to clean the calculator on the inside. My HP41CV is about 26 years old and still working pretty good until some month ago. The problem is getting worse. Any suggestions.

**Re: HP41CV Dead**

*Message #5 Posted by [Randy](#) on 4 July 2007, 7:01 p.m.,  
in response to message #4 by Marco Schriek*

Remove the four rubber feet. Be careful when peeling them off, they have two layers. Make sure you get both layers together or they will not stick again. Remove the four phillips screws that appeared under the feet. Lift off the rear cover. On Fullnuts, lift off the logic board and then the battery shield.

Another specific Fullnut issue: Later units have two 0.015" white teflon washers on the lower posts. If your unit has them, don't loose them! They go on top of the logic board.

**[Cleaning intermittent 41 keys](#)**

If you remove the battery/port connection block from the case bottom, be sure to remove the four port covers or modules first. Removing the block with covers in place can tear the thin conductive foil.

### HP50G

Message #1 Posted by [Marcus Neville](#) on 15 June 2007, 2:40 p.m.

It's a great calculator. How about hpmuseum devote some space to it?

### Re: HP50G

Message #2 Posted by [Gene](#) on 15 June 2007, 2:55 p.m.,  
in response to message #1 by Marcus Neville

Usually, the museum only looks at calculators once they are discontinued and old enough. That's why it is a museum. :-)

The HP50g has been out about a year. Doesn't fit either category, so it's not in the museum proper.

Some people here discuss the 50g and RPL, but others don't like to do so for the reasons given above.

You can always try the usenet newsgroup comp.sys.hp48 for discussions about the 50g.

### Re: HP50G

Message #3 Posted by [Walter B](#) on 15 June 2007, 3:53 p.m.,  
in response to message #1 by Marcus Neville

The museum doesn't even devote some space to the 48gx, though production was discontinued some years ago already. Look at [this place in the museum](#) and you'll find many calcs of the last 2 decades treated quite shortly. So I guess the 50g will have to queue there for years at least ;-)

### Commemorating the Pioneer series

Message #4 Posted by [Karl Schneider](#) on 16 June 2007, 2:20 a.m.,  
in response to message #3 by Walter B

Hi, Walter (and Dave!) --

I'd say that a new, dedicated section for the Pioneer series is the foremost "missing content" that the MoHPC ought to have. However, one should remember that only volunteer labor is employed in the MoHPC. I'd be willing to prepare a few sections if guidelines and templates are provided. I also own at least one of every Pioneer-series model.

### Comparing data sheets - 33s and 35s

Message #1 Posted by [Hans de Moor](#) on 15 June 2007, 1:40 p.m.

Comparing the 33s data sheet with the prematurely released (and maybe not even right) 35s data sheet shows that these calculators are very close siblings:

1. The processor (SPLB31A), memory (31k), and batteries (2 x CR2032) are the same. The display is the basically the same (2 lines x 14 char) but it may have some annunciator differences.
2. The 33s has 48 keys while the 35s has 43.
3. The firmware is obviously different because the 35s has 800+ registers vs 27, imaginary numbers are handled differently, and the 35s has 42 constants while the 33s has 40.

The 35s data sheet also says it is the only scientific calculator available that can do algebraic and RPN entry. This implies the 33s will be taken off the market.

My only gripe with the 33s has been the keyboard form and cluttered layout, so I am very happy to see a revised version that actually looks and hopefully feels like a traditional HP calculator. I'll probably buy three. One for the office, one for home, and one that will remain unopened until one of the other two fails after 2027. If I only bought three HP-11c's in 1987 for the same purpose ...

\_\_\_\_\_

In 1983 I bought one HP-15C for myself and one HP-11C for one of my brothers. Both still work nicely. If I had bought another 15C as a spare, it would be still in its package. But who would have thought of this back then? Firstly, they were supposed to last a lifetime; secondly, they were too pricey!

The HP-11C appears to be particularly appreciated by some scientists, as we can see here:

<http://muller.lbl.gov/pages/nemch1.htm>

Scroll down the page and take a look at the second to last paragraph. Will there ever be a touching mention of the HP-35S in a scientific paper? :-)

**HP 48 GX**

Message #1 Posted by [Emily Lane](#) on 14 June 2007, 10:41 p.m.

I need help in cleaning the key pad, does anyone know how to take the calculator apart? Do I need specific tools? where can I get the tools? Emily

**Re: HP 48 GX**

Message #2 Posted by [allen](#) on 15 June 2007, 7:29 a.m.,  
in response to message #1 by Emily Lane

Odds are 100 to 1 you'll do more damage than you are trying to fix, and in the process ruin and scar an otherwise dirty (but functional) calculator. I've opened several, and the kindest method is still very destructive.

**Re: HP 48 GX**

Message #3 Posted by [Patrick R](#) on 15 June 2007, 8:29 a.m.,  
in response to message #1 by Emily Lane

Two years ago, I opened a definitely broken 48 GX just to see how it looks inside. The calculator can indeed not be opened without damage. On hpcalc.org there are several instructions with photos available, but I would definitely not do that to a working calculator with minor flaws.

**Re: HP 48 GX**

Message #4 Posted by [Bob](#) on 15 June 2007, 8:54 a.m.,  
in response to message #1 by Emily Lane

Just what symptoms is your keypad displaying? ...sticky keys, null keys, wobbly keys, etc?

It might help folks here to come up with a faster, less damaging way of correcting your problem.

**Re: HP 48 GX**

Message #5 Posted by [Ron](#) on 15 June 2007, 9:27 a.m.,  
in response to message #1 by Emily Lane

Yes, you can take it apart; but for a sticky keypad, a good cleaning in distilled water is probably what it really needs.

With batteries removed, submerge it in DISTILLED water, in a GLASS dish. Push each key several times. Let it soak a while, then take it out. With the calc face down, press all the keys several times to get rid of the now dirty water. Repeat the whole process with a new bowl of distilled water. Then, let it dry THOROUGHLY before installing batteries. I let mine dry about three days in a warm dry place. Over my heater vent in winter was a good place.

I've done this, as have several other people here. If this doesn't work, then you can take it apart. After you get

it apart, it seems like the keypad is heatstaked to the frame; I can't remember, but someone else here will.

**Re: HP 48 SX**

*Message #6 Posted by [kenedy mondesir](#) on 15 June 2007, 10:53 a.m.,  
in response to message #1 by Emily Lane*

I an HP 48 SX I am looking to find a user manual for it wher i can find one or what web site i can download it from. Please send advise and web pages.

thank

kenedy

### HP-41CX at HP Virtual Museum

Message #1 Posted by [Gerson W. Barbosa](#) on 14 June 2007, 9:48 p.m.

Do you remember this thread started by Gileno?

[HP 41 in the site of HP !!!!](#)

It appears HP hasn't found a better HP-41CX to date...

I can hand them one unused unit (2819S) for a photo session provided they send it back to me with a couple of HP-35S as a token of gratitude :-)

### Re: HP-41CX at HP Virtual Museum

Message #2 Posted by [Gerson W. Barbosa](#) on 14 June 2007, 9:54 p.m.,  
in response to message #1 by [Gerson W. Barbosa](#)

Quote:

\_\_\_\_\_

one unused unit (2819S)

\_\_\_\_\_

Oh, I see. They would need one with a serial number starting with 23...

Anyone?

### Re: HP-41CX at HP Virtual Museum

Message #3 Posted by [Jan](#) on 15 June 2007, 9:00 a.m.,  
in response to message #1 by [Gerson W. Barbosa](#)

I am both curious and worried about the new 35S. I like what I have seen until now, but a picture on an official HP-website like the one addressed in this thread gives me unpleasant feelings about HP's attention for product quality nowadays. Especially the earlier thread you referred to is quite disturbing.

### HP 67 Emulator

Message #1 Posted by **Chuck** on 14 June 2007, 5:27 p.m.

I'm not sure if this has been mentioned before (I can't find it using search), but I was exploring the Apple website and came across this emulator for the HP67. I can't comment on it because I'm stuck with Winders (However, the new Safari browser for windows is slick, so far).

[HP 67 Emulator](#)

Edited: 14 June 2007, 10:04 p.m.

### Re: HP 67 Emulator

Message #2 Posted by **Chuck** on 14 June 2007, 11:59 p.m.,  
in response to message #1 by Chuck

The download was at 3000 four hours ago...now it's over 11,000. There's quite a few HP fans out there. I think HP will do okay when they release their newest surprises.

### LXVII is a simulator

Message #3 Posted by **Mike (Stgt)** on 15 June 2007, 5:52 a.m.,  
in response to message #1 by Chuck

:quote.A faithful simulator of the original hp-67 calculator [...] compatibility with the hp-67 in button layout and programmability ....:equote.

If you have access to Windoze only try **Nonpareil**. BTW, there exist emulators to run Mac OS on Win-XYZ. Some specialists made Mac OS X work on none-Apple-machines without an emulator. Don't give up to soon. (And Safari is \*not\* beta, just a better alpha. In addition, IMHO the compass-logo is a misdeed: it's background shows the coastline of Nort- and South-America, but for "safari" you go to Africa.)

Ciao.....Mike

Well, an other misdeed was to call this continent America and not Columbia, respecting the discoverer Columbus. It was the error of a cartographer from the very south of Germany... <VBG>

### Remember When....

Message #1 Posted by **Chuck** on 14 June 2007, 12:37 p.m.

...HP was tops in education? I was cleaning up my garage office and came across these publications from 1989. Forgot I had them.

Cover with 22s

<http://home.wavecable.com/~stevensc/photos/22s.jpg>

Cover with 32s

<http://home.wavecable.com/~stevensc/photos/32s.jpg>

and an advert inside for the 28s overhead...

<http://home.wavecable.com/~stevensc/photos/28s.jpg>

A 1990 edition had an advert for the TI81. How things quickly changed after that. :(

*Edited: 14 June 2007, 10:05 p.m. after one or more responses were posted*

### Re: Remember When....

Message #2 Posted by **Jerry** on 14 June 2007, 7:08 p.m.,  
in response to message #1 by Chuck

Sure things changed. They always do. But remember that TI is just out to make the \$\$\$\$. HP still make the best calcs. If they could get their marketing on track, they could clean up. Nice scans :)

### 28S Overhead Adapter??

Message #3 Posted by **Howard Owen** on 14 June 2007, 8:38 p.m.,  
in response to message #1 by Chuck

That projector must be a great rarity. I've never seen it on eBay. In fact, I've never even heard of it. (It's not mentioned in the [Museum's 28C/S page](#) or it's [associated feature list](#).) The ribbon cable in the picture appears to terminate in the LCD display area. In a normal clamshell of course, there's no easy way to remove the LCD. I suppose the connector on the LCD end could contain a CCD camera. The flat ribbon cable is consistent with that idea. But more likely it's a specially modified 28S. At the price they were charging, that would have been feasible. does anyone know more about this setup? Did you ever see one?

Regards,  
Howard

### Re: 28S Overhead Adapter??

Message #4 Posted by **Chuck** on 14 June 2007, 9:03 p.m.,  
in response to message #3 by Howard Owen

You're right Howard. The calculator and overhead are a single unit. I tried getting one of these in 1990 when I started teaching, but the \$500 was a little steep for the department. I haven't seen one around ever either.

Chuck

### **Re: 28S Overhead Adapter??**

*Message #5 Posted by **Eric** on 14 June 2007, 9:37 p.m.,  
in response to message #4 by Chuck*

I've seen a HP 28S on Ebay with pin connectors where the LCD should have been. It was discussed some time ago in these forums. I don't believe we ever deduced what the anomaly was- I think this solves it.

No other overhead display was sold with it- only the apparently HP modified calculator.

### **Re: 28S Overhead Adapter??**

*Message #6 Posted by **Frank Boehm** on 15 June 2007, 3:00 a.m.,  
in response to message #5 by Eric*

I'm the current owner of this one. My understanding was, that it has been used to test different kind of LCDs, the connector would exactly match the picture though. It looks like the "real" 28 is inside the box and only the keyboard is in the 28 housing.

I'll try to put up a picture later today...

### **Re: 28S Overhead Adapter??**

*Message #7 Posted by **Frank Boehm** on 15 June 2007, 11:10 a.m.,  
in response to message #6 by Frank Boehm*

### **Re: 28S Overhead Adapter??**

*Message #8 Posted by **Howard Owen** on 15 June 2007, 12:10 p.m.,  
in response to message #6 by Frank Boehm*

That does indeed look like an engineering prototype. But you can see that they probably had to do exactly zero engineering on the calculator itself in order to implement the overhead adapter. They already had the external display adapter as part of the prototypes.

I'll bet the overhead thingy is quite rare, but I'll bet your prototype is rarer still.

Regards.  
Howard

### **Re: 28S Overhead Adapter??**

More than "a little steep" for most departments. Predatory pricing is exactly why HP didn't survive in the education market.

### **Re: 28S Overhead Adapter??**

Message #10 Posted by [bink](#) on 16 June 2007, 1:41 a.m.,

---

Palmer, if HP priced in a predatory way it would now rule the education market! Predatory pricing refers to low prices that undercut competitors and drive them out of business. Maybe you meant to say "Premium pricing"?

### **HP and High Prices**

Message #11 Posted by [Howard Owen](#) on 16 June 2007, 2:36 a.m.,  
in response to message #10 by [bink](#)

How about "not very smart and quite ineffective pricing?" 8)

I think they must have been used to ruling the market and charging high prices for everything. That they would get undercut by TI, with machines that were clearly inferior technically and quality-wise must have seemed unlikely to them.

Back in the day, all their stuff was expensive, from instruments to calculators to computers. It must have been a hard transition for them to make competing in commodity businesses. They finally got it, to judge by the printers and PCs - the two major businesses they retained in the transition from the old HP to the new. But I can't help thinking that the old quality approach and the steep prices were different aspects of the same phenomenon.

Regards,  
Howard

### **Re: HP and High Prices**

Message #12 Posted by [Steve Borowsky](#) on 16 June 2007, 4:35 a.m.,  
in response to message #11 by [Howard Owen](#)

They probably priced it based on expected sales: "We'll probably sell about 1000 units, so the price will have to be \$500.00 per unit."

"How do you figure we'll only sell 1000 units?"

"Well, at \$500.00 a unit, that's all we can realistically expect to sell."

### **Re: HP and High Prices**

in response to message #3 by Howard Owen

Yes, I've seen one, and there was a cable where the LCD would normally be. No camera.

### **Re: Remember When.... [HP edu materials]**

Message #16 Posted by [Karl Schneider](#) on 15 June 2007, 12:19 a.m.,  
in response to message #1 by Chuck

Chuck --

Nice scans; thanks! I never knew of these publications.

As for the overhead-projecting HP-28S, though, I'd say that using those tools to teach calculus would have been a waste of effort and money. It takes valuable instructional time to learn how to enter symbolic equations on the HP-28 or any other device. Because of the small screen and no Equation Writer, the entered expression doesn't match what is on the board or in the textbook. The wrapped-around single-line results obtained on the calculator are hard to read, with nested parentheses and lack of sub- and superscripting.

I suppose the point is to be able to check one's answers after doing the symbolic calculus by hand, but, well...

And the price! Assuming no educational discount, 30 x \$235 = \$7050 in 1989 dollars was the minimum "entry fee" for getting the special projecting unit at no additional charge. Hope that none of those pricey calculators disappeared or got broken.

One of the HP-28C's I won on eBay several years ago was in mint condition with the original packaging. The price tag on the box showed \$220 or so. I suppose that the hapless buyer expected a modernized HP-41, and found it to be something completely different that (s)he had no idea how to use.

**HP 41C premature turn off**

Message #1 Posted by **Ron** on 13 June 2007, 11:47 p.m.

G'day,

I have an HP 41CV that has developed the nasty habit of automatically turning off prematurely. Instead of waiting 10mins it turns off at any random time between 10 seconds and 10 minutes.

On the assumption that the problem might lie with a leaky capacitor I have swapped the electrolytic capacitors with new ones and even tried tantalum caps but to no avail. Does anyone have a solution for this irritating behaviour?

Also on the PCB there is a device resembling an electrolytic capacitor encapsulated in unlabeled grey heatshrink. The device appears to be slightly waisted as might be the case if you applied heatshrink to a bobbin. It is about 10 mm long and about 6 mm Dia excluding the leads. It has two leads extending from one end. Does anyone know what this device is?

Cheers, Ron

**Re: HP 41C premature turn off**

Message #2 Posted by **Diego Diaz** on 14 June 2007, 3:28 a.m.,  
in response to message #1 by Ron

Hi Ron,

Please check this previous thread in this forum, it may help. ;-))

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=113311#113311>

Cheers.

Diego.

**Re: HP 41C premature turn off**

Message #3 Posted by **Randy** on 14 June 2007, 10:06 a.m.,  
in response to message #1 by Ron

Quote:

\_\_\_\_\_

Does anyone know what this device is?

\_\_\_\_\_

That would be an inductor in the PSU. Nothing at all to do with your turn off problem.

Thoroughly clean both sides of the logic PCB sides with isopropyl alcohol. Let it dry well before reinstalling. Various cooties and flux are the main cause of premature turn-off.

**Re: HP 41C premature turn off**

*Message #4 Posted by [colhind](#) on 15 June 2007, 11:43 p.m.,  
in response to message #1 by Ron*

Thanks everyone. Problem solved. It was due to poor contact between the printed circuit boards and the conductive rubber sandwich strip.

Should have guessed this as I have had trouble with similar devices that make the connection between LCDs and PCBs.

Yes I also think it is an inductor of some description but I was afraid of damaging the coil so didn't opt for removing the heatshrink.

Cheers, Ron

### 11C Serial Number 2900A

Message #1 Posted by [Ron](#) on 13 June 2007, 6:09 p.m.

The 11C was last produced in 1989. The first two characters indicate the year, so the 29 indicates 1989 production. The second two characters indicate roughly the week of the year. Would 2900 indicate it was made before the production crew came back from the New Year holiday? ;^)

Has anyone else seen an SN like this (XX00A)?

### Re: 11C Serial Number 2900A

Message #2 Posted by [Egan Ford](#) on 13 June 2007, 6:27 p.m.,  
in response to message #1 by Ron

I see two options.

1. Week one could start with 0. Not uncommon to see arrays start with 0.
2. Model from Santa's workshop. You must have been a very good boy.

### Seeking Some RPL Tutelage

Message #1 Posted by [Les Wright](#) on 13 June 2007, 12:26 p.m.

I have an interesting request for the Forum, which I know is somewhat OT given the mandate here, but I think it is still a well-posed question for this setting.

I find I learn the basics of a new language from examples, and indeed at first this is often more helpful than plowing through exhaustive treatises on syntax and whatnot in quest for my specific solution.

To this end, I was seeking some specific help with SysRPL. I was hoping that someone could offer an example of a simple UserRPL program and its SysRPL version. I am seeking to translate some of my UserRPL math programs to SysRPL, so program examples that use local variables, DO...UNTIL loops, and IF...THEN...ELSE branching with less-than, greater-than, or equality conditional tests are particularly relevant. Translation of UserRPL that uses stack manipulation (PICK, ROLL, OVER, etc.) is interesting to me, but I must admit that I find that style of UserRPL programming tougher to master so programs that track intermediate results in local variables rather than on the stack are more accessible to me. At this point I am not interested in funky graphics or symbolic manipulation or nifty input forms and windows. I am simply interested in routines that take numeric arguments (which can be complex) from the stack, work their magic on them in the SysRPL or UserRPL code, and return a numeric result (which again can be complex). Dealing with vectors, arrays and lists is the next step once I get a grasp of this.

I am hoping that someone has done this sort of work in the past and has some relevant examples they could share without a major investment of time, though if anyone wants to view this a sort of fun project that is great.

Please keep in mind that I am requesting this to supplement my personal efforts in review the copious didactic material out there on SysRPL programming, not merely replace or totally shortcut it. So calls to RTFM are not needed here. Don't worry, I am doing that too. I have learned how to access the MASD on the HP49G+ and the need for an extable (after discovering that a sample program wouldn't compile without one!), so I can readily compile the code I am presented with without needing much coaching on that.

many thx in advance,

Les

in response to message #1 by [Les Wright](#)

Hi Les.

Unfortunately I'm not entitled to give you any tutelage...

But have you already seen this:

[James M. Prange's comparison](#)

I found it extremely interesting (as always JMP's posts are).

Moreover, on the good ol' hpcalc.org you can find:

[SysRPL Programming Examples](#)

that is:

Quote:

---

Example programs from the second edition of the free on-line book "Programming in System RPL", a 640-page tutorial and reference for System RPL programmers. These examples are ready to be loaded onto your calculator. By Eduardo M. Kalinowski and Carsten Dominik

---

I do hope this helps a bit - but I'll be eagerly reading any further feedback on this topic.

Best regards.

Giancarlo

### **Re: Seeking Some RPL Tutelage**

Message #4 Posted by *Les Wright* on 13 June 2007, 1:33 p.m.,  
in response to message #3 by deleted

Thanks. James's comparative example should be more informative once I get it on the calculator and see what it actually does.

I have downloaded the Kalinowski/Dominik examples and will experiment with them. I have also begun to crack the Kalinowski/Dominik book, and so far I have one criticism--the practicalities of compiling a program on the calculator are relegated to an appendix, and it took some wading through lots of info before I appreciated the need for extables and different versions of SysRPL code. I was trying to compile the example first.s from the Kalinowski example and got no where until I stumbled across the stuff about extables. This basic stuff would've been helpful right at the front of the book.

Here is an interesting point--Kalinowski/Dominik claim that Libraries 256 and 257 are not attached by default. In both my 49G+ and in a fresh instance of Emu48, I find that indeed they are--I get to see proper softkey menus via 256 MENU and 257 MENU without having to explicitly attach the libraries first via 256 ATTACH and 257 ATTACH. Perhaps calling the menus attaches the libraries automatically? At any rate, I was tickled to find the compiler right where the manual said it was.

Les

### **Re: Seeking Some RPL Tutelage**

Message #5 Posted by *Giancarlo (Italy)* on 13 June 2007, 5:56 p.m.,  
in response to message #4 by Les Wright

Les,

I myself am trying to do just the same - i.e. going through that forrest of information that is Dominik&Kalinowski's book.

Indeed, it would deserve much more effort, time and continuity than those I'm able to get in my little spare time :-(  
However, I resound with you when you point out that some "basics" were not placed in the right "light" and in the right "place" according to their importance...  
As far as I can recall, libs 256 and 257 are auto-attached with the latest ROM version(s) for the 49G+/50G.  
I do hope that some more knowledgeable people here around will have the patience and good-will for sharing some insights.  
All the best.  
Giancarlo

## Re: Seeking Some RPL Tutelage

Message #6 Posted by **James M. Prange (Michigan)** on 13 June 2007, 6:25 p.m.,  
in response to message #4 by Les Wright

Quote:

James's comparative example should be more informative once I get it on the calculator and see what it actually does.

Something that I think will be useful for anyone who writes UserRPL source code in his favourite text editor.

For those who don't want to mess around with compiling the SysRPL version, remember that the UserRPL version accomplishes the same thing.

But it's pretty simple step-by-step stuff. No tests or conditional execution, only one loop, a little stack manipulation, but no variables.

I'm definitely not an expert at either SysRPL or Saturn assembly language. Yes, I can use them, but I usually can't just sit down and write a program in them without some reference material at hand. Often I just want to check the spelling or which order the arguments should be in, but then I notice another command that might be better....

Quote:

I have downloaded the Kalinowski/Dominik examples and will experiment with them. I have also begun to crack the Kalinowski/Dominik book,

I take it that you mean *Programming in System RPL, Second Edition*, by Eduardo M Kalinowski and Carsten Dominik? I don't think that anything better than that for learning SysRPL is available.

Also see RPLMan (it should be available from [hpcalc.org](http://hpcalc.org)). It was written when the 48SX was the current model, so it's a bit out of date, but other than adding some new object types and commands and the entry points changing, the RPL language hasn't changed all that much. What's in there still applies, although of course it doesn't cover the newer additions.

For the development library (including compiler features and syntax), see "Masd Documentation".

Note that a lot of the additions in the 49 series (including the development library) came from the "Meta Kernel" (or "MetaKernel" or "MK"), originally developed for the 48 series, so any documentation for it might be helpful.

Debug4x may be useful to you, although other than the included emulators being very useful, I've never much cared for it. But many others think that it's great.

Also install the OT49Plus library (available from [Wolfgang's site](#)) on your 49g+ (or 50g); I think that it makes some of the development library tools easier to use. Wolfgang is another SysRPL expert; it's as if he could write excellent programs in his dreams. A criticism is that in his programs, almost everything else, other than actually working as intended, has a much lower priority than program size. Wolfgang has taken a break from his RPL programming hobby to work on his other interests, but his tools for the 49g+ should work on the 50g as well.

Look at and try to understand SysRPL programs that others have written. Okay, very often the source code, let alone any commenting, isn't published, but you can decompile an RPL program with the `\->S2` command (or OT49's `Sys~` command).

The Nosy library is a very useful tool. It lets you see the programs that make up the built-in commands and follow the logic of how the ROM is written (what calls what and under which condition). You might notice some cases where the ROM code could be "improved" (made faster or smaller) easily enough, but changing something might inadvertently move an entry point (thus breaking anything that uses it), and "don't fix what ain't broken" isn't such a bad policy.

For that matter, Nosy can also be used for investigating any other program.

Browse and search the `comp.sys.hp48` usenet group. One problem is that some of the discussions are among experts, so beginners may well be baffled by those. But there are plenty of "beginner questions" (and answers) too.

Try setting flag `-85`. This lets you see the stack (well, however much of it is visible) decompiled to SysRPL syntax. Note that to make much sense of a lot of it, `extable` will have to be installed. That said, if you use anything else to view an object, you'll see it in UserRPL syntax.

Quote:

---

and so far I have one criticism--the practicalities of compiling a program on the calculator are relegated to an appendix, and it took some wading through lots of info before I appreciated the need for extables and different versions of SysRPL code. I was trying to compile the example `first.s` from the Kalinowski example and got no where until I stumbled across the stuff about extables. This basic stuff would've been helpful right at the front of the book.

---

I think that part of the problem is that the authors are real experts in SysRPL, and may find it rather difficult to remember that beginners don't necessarily know all of the essential "basic stuff".

First scan through the document quickly to get an idea of how it's organized and what information is available, then read it more thoroughly, but just scanning through the command and built-in ROM objects references, and finally use it as a reference for particular topics.

A problem with trying to explain SysRPL is that there are so very many commands, often combining what would typically be thought of as two or more commands into one, many of which accomplish **almost** the same thing. Basically, it seems that if the system developers found something to be useful for developing the operating systems, then they built it into the ROM, and if they thought it to be particularly useful to 3rd-party developers, then they made it a "supported" entry point. Sometimes a SysRPL command is poorly named, but once a name is assigned, it tends to stick; hey, it doesn't have to make sense to ordinary users, as long as the developers know what it does. Anyway, there are usually several perfectly good ways to accomplish something, and what's "best" is very subjective.

"Unsupported" entry points may well change with any ROM revision, so are best avoided. But Jean-Yves mentioned some ranges of entry points that won't move, and these are the "unsupported but stable" entry points that are **probably** okay to use. He isn't employed by HP any more, but they haven't moved yet. But if HP releases another series of RPL models, even the "supported" entry points may move.

There are also certain RAM locations that, although perhaps not "supported", still have the same purpose in the 50g as in the 48SX. I've found some of these useful for external I/O. By the way, I had to look at things written with the 48SX in mind to find out about some of these in the 49 series.

In trying to explain something to a real beginner, the difficult question is "where to start"; what basic stuff that "everybody knows" does he really need to know first? For trying to explain something to someone who seems basically competent in the subject, the questions become "what essential knowledge is he lacking for this topic", along with "what does he already know and doesn't need to be told".

You may have to slowly and painfully accumulate knowledge until it reaches a "critical mass" for you and the learning curve suddenly starts to level off and it becomes much easier to learn more.

Quote:

---

Here is an interesting point--Kalinowski/Dominik claim that Libraries 256 and 257 are not attached by default. In both my 49G+ and in a fresh instance of Emu48, I find that indeed they are--I get to see proper softkey menus via 256 MENU and 257 MENU without having to explicitly attach the libraries first via 256 ATTACH and 257 ATTACH. Perhaps calling the menus attaches the libraries automatically? At any rate, I was tickled to find the compiler right where the manual said it was.

---

That's a good point. These built-in ROM libraries aren't attached by default, and executing 256 MENU and 257 MENU doesn't attach them, but you can use the menu keys for operations even if the libraries aren't attached; to use them for commands, the libraries have to be attached. That is, if, with them detached, you press a menu key, it works just fine, but if you use it to get the source code into a program, you'll find that it's compiled as a name instead of as a command. But if you compile a program with the commands (with the libraries attached), the program still works even with the libraries detached (as long as the program isn't decompiled and recompiled from source code). To experiment with this difference, just use 256 DETACH and 256 ATTACH.

But my guess is that you installed an extable library (which happens to be a self-attaching library), which automatically attaches libraries 256 and 257 as well. The same holds true for OT49 and perhaps some others. If you find "Development Library" in the list when you press the APPS key, then it's attached.

By the way, the library 257 commands are called by the library 256 commands. The usual recommendation is that you use the library 256 commands instead of using the library 257 commands directly.

Regards,  
James

*Message #7 Posted by [Giancarlo \(Italy\)](#) on 13 June 2007, 6:52 p.m.,  
in response to message #6 by James M. Prange (Michigan)*

Hi James.

Thanks for your attitude towards the beginners :-)

Besides all the references you mention, I also had a look to some of the many patents that concern(ed) the HP calculators logic and architecture

(they can be found at: [Eric Smith's HP Patents Repository](#)

I found especially interesting the no. 4868745 (1.1 Mb .pdf file):

Quote:

\_\_\_\_\_

Data processing system and method for the direct and indirect execution of uniformly structured object types

\_\_\_\_\_

Of course that was not intended with knowledge dissemination in mind - it's a strictly technical paper

but it may help to grasp some logic behind SysRPL mechanisms (for example: environment stacking or inner loop).

Or, maybe, I just chose another original way of self-punishment ;-)

Best regards.

Giancarlo

## **Re: Seeking Some RPL Tutelage**

*Message #8 Posted by [James M. Prange \(Michigan\)](#) on 13 June 2007, 10:32 p.m.,  
in response to message #7 by Giancarlo (Italy)*

Thanks, that is indeed a "good pointer". I think that I'll have to print the patent out to fully grasp it (and perhaps not even then), but it does explain the basic structure of RPL objects, why they're structured the way they are, and how they're executed.

As a "companion piece" for it, I suggest RPLMan, say, oh, 2.2 through 2.5.

I don't think that the patent information is really "must know" information for an RPL programmer, but it is very basic to RPL, and I like to understand some of the "magic" that the system is doing behind its "smoke and mirrors".

But it seems to me that sooner or later a serious SysRPL programmer is probably going to want to embed some assembly language code within a SysRPL program, and this information seems very relevant for assembly language programming on the RPL models.

Quoting Section 2. of RPLMan:

### 2. RPL Principles

(The following material was excerpted from "RPL: A Mathematical Control Language", by W. C. Wickes, published in "Programming Environments", Institute for Applied Forth Research, Inc., 1988)

That's a document that I'd really like to read.

Regards,  
James

James,  
quoting your quote:

Quote:

Quoting Section 2. of RPLMan: 2. RPL Principles

(The following material was excerpted from "RPL: A Mathematical Control Language", by W. C. Wickes, published in "Programming Environments", Institute for Applied Forth Research, Inc., 1988)

That's a document that I'd really like to read.

I also was very curious about that document and googled a lot, but with no luck :-(  
Maybe somebody can provide a good pointer to that...

Best regards.

Giancarlo

## Re: Seeking Some RPL Tutelage

Message #10 Posted by [Les Wright](#) on 14 June 2007, 10:37 p.m.,  
in response to message #6 by James M. Prange (Michigan)

Thanks, James, as always for a rich and informative reply.

I am learning that one can "decompile" a UserRPL program object to a string in SysRPL syntax, where all of the UserRPL commands and symbols are prefixed by x to indicate that a UserRPL command is being invoked. I believe that as I learn more about SysRPL commands and syntax it will be a matter of converting as many of these "x" commands to their native SysRPL equivalents, where they exist, as well as converting the rest of the code to proper SysRPL syntax throughout so it recompiles not as a UserRPL object but a SysRPL object.

I am learning that there are some commands I need that don't seem to have SysRPL versions so I am obliged to use the x version. For example, the UserRPL sequence '**del**' **STO**\* would be rendered in SysRPL as '**LAM del xSTO**\*'. Similarly, if I want to call the MTH menu special function Psi, which I use, I have to invoke it with xPsi--there seems to be no SysRPL specific alternative.

But here is a question I have--does using these "x" commands slow things down? Does a program that uses them effectively become a UserRPL program anyway? Would I be better off writing my first example as **LAM del %\*** '**LAM del STO**'?

Apart from these curiosities, I think it should be feasible for me to write SysRPL versions of some of my little programs. I will let you know how I do.

Les

## Re: Seeking Some RPL Tutelage

Message #11 Posted by **James M. Prange (Michigan)** on 15 June 2007, 1:39 a.m.,  
in response to message #10 by Les Wright

Quote:

---

Thanks, James, as always for a rich and informative reply.

---

You're welcome.

Quote:

---

I am learning that one can "decompile" a UserRPL program object to a string in SysRPL syntax, where all of the UserRPL commands and symbols are prefixed by x to indicate that a UserRPL command is being invoked. I believe that as I learn more about SysRPL commands and syntax it will be a matter of converting as many of these "x" commands to their native SysRPL equivalents, where they exist, as well as converting the rest of the code to proper SysRPL syntax throughout so it recompiles not as a UserRPL object but a SysRPL object.

---

Yes, as I've mentioned before, the UserRPL commands are "special cases" of SysRPL commands. The UserRPL command programs have built-in names for use by the UserRPL compiler, "mark" the stack for the sake of error handling, check for the required arguments, and "dispatch" to the entry point appropriate for the arguments (or cause an error if acceptable arguments aren't on the stack). In SysRPL source code, the UserRPL command names always start with "x", but I've noticed a few non-UserRPL commands that also start with "x"; I'm not sure, but I think that the beginning "x" may mean that the command has the argument checking and so on built-in.

Quote:

---

I am learning that there are some commands I need that don't seem to have SysRPL versions so I am obliged to use the x version. For example, the UserRPL sequence '**del**' **STO\*** would be rendered in SysRPL as '**LAM del xSTO\***'.

---

The **LAM del** indicates that 'del' is a local name (from LAMbda variable). If 'del' were a global name, then it would decompile to **ID del**.

Yes, the UserRPL command **STO\*** doesn't seem to have any SysRPL equivalent without the "check and dispatch" code built-in. Using Nosy, I find that **STO\*** requires two arguments and, depending on the argument types, dispatches (on my 49g+) to the routine PTR 2F2AF, PTR 2F2B0, PTR 2F30C, PTR 2F2B4, or PTR 2F30D. Now, since the entry points show up as pointers instead of SysRPL command names, they aren't in my extable library (I think Carsten's extable2), so are "unsupported" entry points. You could use a tool like Nosy to find the entry points in your ROM and use whichever one is appropriate for your arguments, but if it's unsupported, then there's a risk that it could be different in a different ROM revision.

Quote:

---

Similarly, if I want to call the MTH menu special function Psi, which I use, I have to invoke it with xPsi--there seems to be no SysRPL specific alternative.

---

Using Nosy, this seems to be a case similar to STO\*, except using one argument and dispatching to FPTR 7 133, FPTR 7 135, or FPTR 7 11F. However, searching progsysrpl.pdf for "Psi", I also find ^SYMPsi, ^SYMPsin, and ^%%Psi. I see that Psi is a digamma function, and searching for "digamma" finds these same three entries, one of which might be appropriate for your use.

Starting the name with "^" is a convention indicating that the entry is a "flashpointer", and to use it, you have to prefix the name with FPTR2, for example, FPTR2 ^SYMPsin. Another convention is that "rompointer" entries start with "~", and to use one you have to prefix it with ROMPTR.

Quote:

But here is a question I have--does using these "x" commands slow things down?

Yes, using them means that for each such "x" command, its "check and dispatch" code will be used, which does take a little time.

Quote:

Does a program that uses them effectively become a UserRPL program anyway?

Yes, if your SysRPL program uses only these "x" commands. In most cases, decompiling them to the command line editor will show the UserRPL command names.

Quote:

Would I be better off writing my first example as **LAM del %\* ' LAM del STO?**

Maybe; that would increase the program size, but it might run a little faster, which may be important if, for example, it were within a loop or a frequently used subroutine. I suggest trying it both ways to find out whether one method has any significant advantage.

Quote:

Apart from these curiosities, I think it should be feasible for me to write SysRPL versions of some of my little programs. I will let you know how I do.

I wish you the best of luck with this.

Regards,  
James

## **Re: Seeking Some RPL Tutelage**

*Message #12 Posted by [Les Wright](#) on 15 June 2007, 3:39 a.m.,  
in response to message #11 by James M. Prange (Michigan)*

Thanks James.

I really want to do some work in SysRPL with the extended real type so that when my

results are converted back to the real type and returned to the stack they are more likely to be fully accurate since the guard digits absorbed rounding error.

But I think I will have to approach the question of convergence differently. In my UserRPL numeric programs, I can cavalierly specify exact equality of a final and penultimate result as a stopping criterion, since results are rounded from 15 to 12 digits when returned to the stack BEFORE comparison so rounding error and "wobble" in the least significant digits occurs internally in the guard digits. But if I work with extended reals internally, I think that could be an unrealistic goal--the 15 digits you work with are IT. I am guessing that 5E-15 a good epsilon to work with for the extended real type. Does anyone have much programming working with the extended real type within SysRPL programs?

Les

### **I did it!**

*Message #13 Posted by [Les Wright](#) on 15 June 2007, 4:45 a.m.,  
in response to message #11 by James M. Prange (Michigan)*

Quote:

\_\_\_\_\_

I wish you the best of luck with this.

\_\_\_\_\_

I have an admittedly not complex routine that computed the incomplete gamma function using the modified Lentz algorithm on the continued fraction. Indeed, the UserRPL routine is ported straight out of the Numerical Recipes in C version.

I managed to port the entire thing to SysRPL, using just a few key concepts--LAM local variables, a BEGIN..UNTIL loop, and a couple of IT conditional tests. I conducted all of the internal math in extended reals, which probably slows things a tiny bit. But, it works fine, and in comparison a few results with Maple, all 12 digits always seems to match, while the original UserRPL version is often off one or two ULP. And it seems perceptibly faster too, though this is hard to tell since the UserRPL version isn't so slow.

My next tasks are to go over it to see if I can make it more concise (user RPL has quite a few compound commands that I could capitalize on), and to add input checking in case I try to run it on anything that will make the calc crash.

But so far, when it comes to using SysRPL to write quick accurate numerical algorithms on the 49G+/50G, I think I have become a believer. Good for me!

Les

*Edited: 15 June 2007, 4:46 a.m.*

### **Re: I did it!**

*Message #14 Posted by [Les Wright](#) on 15 June 2007, 10:36 a.m.,

My next tasks are to go over it to see if I can make it more concise (user RPL has quite a few compound commands that I could capitalize on), and to

add input checking in case I try to run it on anything that will make the calc crash.

---

In particular, if the calc is not in Approx mode, both arguments need to be entered as approximate numbers (including a decimal point even if integers) otherwise the thing just hangs! I am sure there is a SysRPL command to check for that...

So much to learn, but I am positively tickled that I have written a working SysRPL program that is perceptibly superior to its UserRPL equivalent. Being able to tap into the extended reals is a great find for me--I am interested more in numerical work than symbolic work, so getting full 12-digit accuracy in the final results is very exciting indeed.

If anyone is interested in this sort of math programming, I can post what I have turned out once I reformat the source code file to make it more readable.

Les

*Edited: 15 June 2007, 10:39 a.m.*

### **Re: I did it!**

*Message #15 Posted by [James M. Prange \(Michigan\)](#) on 16 June 2007, 8:21 p.m., in response to message #14 by Les Wright*

Congratulations! I'm glad to read that.

Quote:

---

In my UserRPL numeric programs, I can cavalierly specify exact equality of a final and penultimate result as a stopping criterion, since results are rounded from 15 to 12 digits when returned to the stack BEFORE comparison so rounding error and "wiggle" in the least significant digits occurs internally in the guard digits. But if I work with extended reals internally, I think that could be an unrealistic goal--the 15 digits you work with are IT.

---

Even in UserRPL, equality wouldn't be such a good stopping criterion, because changing the input may well result in a larger change in the result, so the smallest possible input change may result in a change of sign in the result with a difference of zero not being achievable.

To get really fussy about it, several consecutive numbers may result in a difference of zero, so perhaps if a zero is achieved, one could check on both sides of the input value for the smallest and largest inputs that results in zero, and average them.

Quote:

---

I am guessing that 5E-15 a good epsilon to work with for the extended real type.

---

Ah, determining an appropriate epsilon (what's "close enough") is a very interesting question.

It seems to me that epsilon ought to be related to the magnitude of the value.

If you're converting the result from an extended real to a real, then I'd base epsilon on the real.

Maybe (for a real) make epsilon 10 to the power of (exponent-11)? I'm referring to the exponent of the smaller of two successive values. UserRPL has the built-in EXPN command (%EXPONENT in SysRPL). There doesn't seem to be any RPL command for getting the exponent of an extended real though.

I'll think about this, and perhaps post more on it later.

Quote:

---

I conducted all of the internal math in extended reals, which probably slows things a tiny bit.

---

I don't know for certain, but I'd expect operations with extended reals to be slower because they use two Saturn registers instead of only one, so it may take more cycles to process them. Other than that, the body of a real is 16 nibbles (the size of a register), but the body of an extended real is 21 nibbles, and of course I/O between memory and the processor is one nibble at a time (the bus is 4 bits wide), so it makes sense that the 5 extra nibbles would take more time. Of course the 3 extra digits in the mantissa and 2 extra digits in the exponent result in a finer resolution and increased range, so may well be worth it.

Quote:

---

And it seems perceptibly faster too, though this is hard to tell since the UserRPL version isn't so slow.

---

For comparing the execution time of different programs, on the 49 series, you can use the UserRPL command TEVAL (Timed EVALuation). Note that if you execute an object by name, the time to find and retrieve the variable will be included in the timing, so I recommend putting the object itself on the stack and then running the timing command.

In earlier ROMs, TEVAL had a bug in that it used the current wordsize, which, if too small, caused an erroneous result, but that's been fixed in the current ROM. Strangely enough, TEVAL now temporarily forces a wordsize of 60. I don't know how this particular value was chosen; the system time is 52 bits, so a wordsize of 52 would've been large enough, and going all the way to the maximum wordsize of 64 would've worked just as well, but 60 does work.

TEVAL still has a relatively minor flaw in that it doesn't compensate for the time required to get the system times or the time to store the initial system time, so it slightly overestimates the execution time of the object, but that doesn't affect finding the difference in execution time of different objects.

For a UserRPL timing program that uses a compensation time (but you have to determine it for the particular calculator yourself and edit it into the program), see my [EVAL TIMER package](#), which also works on the 48 series, and includes versions for the 28 series.

Bill Wickes's timing program in *Insights*, which was the original basis of my programs, checks the type of an argument, and if it's a name, then recalls the object to the stack before starting the timing, thus eliminating the time to resolve the name and recall the object to the stack. The way I see it, one might want to include that time, so I eliminated that code for my program; I can always put the object on the stack myself.

Repeated timings usually show very slightly different results, so you may want to repeat the timing a few times and average the results.

Quote:

---

My next tasks are to go over it to see if I can make it more concise (user RPL has quite a few compound commands that I could capitalize on),

---

Yes, programs can often be optimized. The usual goals are some combination of smaller size and faster execution, which often (but don't always) go hand-in-hand. This often makes a program more difficult to read and understand though; you may well want to save the source code with comments as a PC file, while it's still fresh in your mind (if you didn't write it on the PC in the first place).

Quote:

---

and to add input checking in case I try to run it on anything that will make the calc crash.

---

Yes, unless you're certain that you'll never run a SysRPL program without the proper arguments, using the "check and dispatch" code at the beginning of the program is essential

Quote:

---

In particular, if the calc is not in Approx mode, both arguments need to be entered as approximate numbers (including a decimal point even if integers) otherwise the thing just hangs! I am sure there is a SysRPL command to check for that...

---

I'm sure that there is, or to convert an exact to a real, for that matter, but this can be taken care of in the check and dispatch code. CK&DISPATCH0 looks for argument permutations and causes an error if valid arguments aren't available, but with CK&DISPATCH1, if valid arguments aren't found, then it strips all tags from the arguments and converts exact to reals, and then checks again.

Quote:

---

Being able to tap into the extended reals is a great find for me--I am interested more in numerical work than symbolic work, so getting full 12-digit accuracy in the final results is very exciting indeed.

---

Good point! I usually neglect to mention this, but the extended reals (and extended complex numbers) are indeed an important advantage to writing your own SysRPL programs.

If you really want to, you can leave the result on the stack as an extended real, and set flag -85 to read it.

Regards,  
James

\_\_\_\_\_  
(and extended complex numbers)  
\_\_\_\_\_

Funny you should mention this!

I have been chagrined to learn that in HP49 SysRPL there seem to be no commands to do basic complex arithmetic on extended complex numbers. Indeed, there don't seem to be ones to do basic arithmetic on even regular complex numbers! I have checked both the 2nd edition of Kalinowski and Dominik and the most recent version of the HP49G Entry Reference. No luck.

In a recent thread in comp.sys.hp48 I have raised this very issue. Raymond del Tondo replied to indicate that there are indeed such commands (C% $C+C$ , C%% $C/C$ , C%% $*C$ , C% $C-$ , etc.) for HP48 SysRPL. They are listed in the first edition of Kalinowski and Dominik as unsupported entry points, but I can find no mention of them in any stuff on HP49 SysRPL.

So I am at a loss at how to do basic arithmetic with regular complex numbers, never mind extended ones! For regular complex numbers, I guess one resorts to the UserRPL arithmetic functions  $x+$ ,  $x*$ ,  $x-$ ,  $x/$ , but as for extended complex numbers--well, I guess I just have to write code that adds or subtracts the real and imaginary parts separately and performs multiplication, division, and exponents and the like on the polar versions of my numbers.

There must be a better way! How do other people program extended complex numbers in HP49 SysRPL?

Les

Indeed, there don't seem to be ones to do basic arithmetic on even regular complex numbers! I have checked both the 2nd edition of Kalinowski and Dominik and the most recent version of the HP49G Entry Reference. No luck.

---

It seems that I should've checked on what's actually available before posting!

Okay, also try searching for "C%" or "C%" in progsysrpl.pdf (2nd edition), and in Carsten's entry points table for the 49 series.

There seem to be very few commands for extended complex numbers, and even some that would seem rather basic for complex numbers don't seem to be available (for complex numbers only).

Note that the extable libraries also provide the GETNAMES and GETNEAR library commands, but GETNEAR will also find "POPC%" and "PUSHC%", which are routines intended for use in Saturn assembly language, not for use in SysRPL.

As I mentioned before, the use of some SysRPL commands may be an exercise for the student, possibly including experimentation. Of course, this may result in memory corruption, so having a recent back-up is essential.

Try to remember that much of the documentation of SysRPL, particularly for the 49 series, is due to the efforts of unpaid volunteers. Of course, if they didn't have much knowledge of a particular topic, then they didn't provide much information about it.

Quote:

---

In a recent thread in comp.sys.hp48 I have raised this very issue. Raymond del Tondo replied to indicate that there are indeed such commands (C% $C+C$ , C% $C/C$ , C% $*C$ , C% $C-$ , etc.) for HP48 SysRPL. They are listed in the first edition of Kalinowski and Dominik as unsupported entry points, but I can find no mention of them in any stuff on HP49 SysRPL.

---

Well, Raymond seems to be sticking to the 48 series, so probably assumed that SysRPL commands available in the 48 series are still available in the 49 series. Actually, I expect that these unsupported 48 series entry points still have (perhaps moved) unsupported entry points in the 49 series, but no one has bothered to publish names for them.

Of course, the 48 series has been discontinued, so we can be confident that even "unsupported" entry points aren't going to change in some future 48 series ROM version (although they may have moved in existing ROM versions), but for the 49 series, even if an unsupported entry point hasn't already moved, it may indeed change in any future 49 series ROM revision.

Quote:

---

So I am at a loss at how to do basic arithmetic with regular complex numbers, never mind extended ones! For regular complex numbers, I guess one resorts to the UserRPL arithmetic functions  $x+$ ,  $x^*$ ,  $x-$ ,  $x/$ ,

---

If one wants the program to be portable to other ROM revisions, that indeed seems the best method. The disadvantage is that for these UserRPL entry points, at least part of their check and dispatch code will be executed, taking some time.

Other than that, you can use Nosy to see what these commands dispatch to for a pair of complex numbers (probably an unsupported entry point) and use that, but it may not work with a different ROM revision.

Quote:

---

but as for extended complex numbers--well, I guess I just have to write code that adds or subtracts the real and imaginary parts separately and performs multiplication, division, and exponents and the like on the polar versions of my numbers.

---

Although you might be able to use Nosy to find commands that convert complex numbers to extended complex numbers and then find entry points that use the extended complex numbers, I guess that converting to extended reals and dealing with the real and imaginary parts separately would probably be the best method.

Quote:

---

There must be a better way! How do other people program extended complex numbers in HP49 SysRPL?

---

I don't know; most of the programs that I've seen don't use complex numbers at all, and I don't think that I've ever seen one that uses extended complex numbers. My guess is by converting them to pairs of extended real numbers.

Try to remember the purposes of SysRPL. First and foremost, to make it easier for HP's own developers to write firmware for new calculator models without writing in assembly or machine language so much. Second (and seemingly as an after-thought), for 3rd-party developers to write relatively small and fast external applications for RPL-based calculators. With the 49 series, HP advertises the (more or less) built-in SysRPL and assembly language capabilities of these models, but note that these are really intended for "advanced users" ("developers"), HP doesn't provide much (if any) documentation for them, and (as you've found) using them isn't always easy.

Regards,  
James

---

Well, looks like I have myself a fun little project then!

JM Baillard's HP41 code for cosine and sine integrals by complex continued fraction moves back and forth between rectangular and polar mode, since complex numbers are readily added in rectangular form but multiplied, divided, and raised to powers in polar form.

I love math. Could be fun.

Les

P.S. I am getting better at optimizing my little SysRPL programs. Right now in some code I have gotten rid of named local variables and have used NULLLAMs--the speed gain is remarkable. My next step is to rely even less on local variables and try to keep what I need on the stack as much as possible. The most artful UserRPL programs I have seen don't use local variables at all, and I would gather their SysRPL translations are quite fast.

### **Re: I did it!**

*Message #19 Posted by **Les Wright** on 21 June 2007, 1:37 a.m.,

JM Baillard's HP41 code for cosine and sine integrals by complex continued fraction moves back and forth between rectangular and polar mode, since complex numbers are readily added in rectangular form but multiplied, divided, and raised to powers in polar form.

---

This turns out to be fairly easily implemented in SysRPL after all.

At first I thought I would need to also produce from scratch an extended precision way of computing the arctangent function, which of course is required in computing the argument of the polar form of the complex argument from its cartesian form. There are no extended precision versions of the inverse trig functions in HP49 SysRPL, at least not that I can find.

BUT, even better, there ARE extended precision polar-rectangular

conversions! %%R>P and %%P>R are there, and in testing some simple inputs the functions seem to work quite well. (Of course, this means that there is indeed an extended arctan function present, but only indirectly. arctan(x) is simply the second piece of the output of R>P acting on rectangular coordinates (1,x) or some multiple of these.)

So this is going to be not so hard after all. When adding two full precision complex numbers, I simply add the real and imaginary parts. When multiplying (or dividing) them, I do the conversion to polar form via %%R>P, carry out the binary operation using the usual rules (multiply moduli together and add the arguments) and convert back to rectangular form as required via %R>P. Powers, square roots and inverses can all be handled by De Moivre's rule acting on the polar form.

So it can be done, and not so onerously at that. May not be perfectly swift, but at least it is feasible, and the innards are not so horrid to contemplate after all, especially with those extended precision rectangular polar conversions. And even though extended precision inverse trigs are not there, %%SIN and %%COS, which I need, are very much alive and well and living at stable addresses in the HP49.

I will let you know how far I get. If programming basic arithmetic on extended precision complex numbers is not commonplace for the 48 or 49 series, this could be a new little adventure!

Les

*Edited: 21 June 2007, 7:52 p.m. after one or more responses were posted*

### **Re: I did it!**

*Message #20 Posted by [James M. Prange \(Michigan\)](#) on 21 June 2007, 7:08 p.m.,  
in response to message #19 by Les Wright*

Quote:

Right now in some code I have gotten rid of named local variables and have used NULLLAMs

I expect that Les has already discovered at least most of this, so the following is mostly for the benefit of anyone else who's curious.

Of course all local variables do have names (otherwise they wouldn't be variables), but they can have the "null local name".

A lam (local name) object consists of the 5-nibble prologue address, followed by a 2-nibble character count, followed by 2 nibbles for each character in the name, thus a lam's size (in bytes) is 3.5 plus the number of characters in the name.

We can have a valid lam with a character count of zero (and no nibbles following), which would take 3.5 bytes, and such an object is already built in to ROM, and the built-in object can be accessed by a 2.5 byte pointer.

An interesting point is that we can have as many local variables with the same name (even in the same local environment) as we choose, however, if we use a name to access a local variable, then we can access only the most recently created local variable with that particular name.

So how can we access other local variables with the same name? Well, in SysRPL, several commands for binding null lams to objects (thus creating null-named local variables) and for accessing local variable by position are provided, with the most recently bound having the position 1.

Quote:

---

--the speed gain is remarkable.

---

And the (compiled) code size is reduced too. Of course the disadvantage is that the programmer has to keep track of the current positions of his local variables, similar to the chore of keeping track of stack levels.

Quote:

---

My next step is to rely even less on local variables and try to keep what I need on the stack as much as possible. The most artful UserRPL programs I have seen don't use local variables at all, and I would gather their SysRPL translations are quite fast.

---

In general, keeping objects on the stack is faster than using ordinary named local variables (assuming efficient stack manipulation), but I expect that this is largely due to the time required to handle the names, particularly searching local environments for particular names. I don't know how much (if at all) faster using the stack instead of null-named local variables would be; maybe try it and compare execution times.

Note that the built-in commands use them quite often, so it seems that the HP developers didn't think that they were too bad.

Quote:

---

This turns out to be fairly easily implemented in SysRPL after all.

---

Well, I'm glad that you found some extended real functions that are very useful for your purposes. Maybe searching the documentation for "%%" would find more?

Just speculating, but maybe their existence helps explain why the developers apparently didn't feel a pressing need to include very many supported extended complex functions?

Of course, you may find it useful to make sub-routines for frequently used sequences.

Quote:

---

At first I thought I would need to also produce from scratch an extended precision way of computing the arctangent function, which of course is required in computing the argument of the polar form of the complex argument from its cartesian form. There are no extended precision versions of the inverse trig functions in HP49 SysRPL, at least not that I can find.

BUT, even better, there ARE extended precision polar-rectangular conversions! %%R>P and %%P>R are there, and in testing some simple inputs the functions seem to work quite well. (Of course, this means that there is indeed an extended arctan function present, but only indirectly. arctan(x) is simple the second piece of the output of R>P acting on rectangular coordinates (1,x) or some multiple of these.)

---

Hmm, using Nosy on "%%R>P", I find:

```
::
PTR 10594
3UNROLL
%%ANGLE
;
```

Following PTR 10594, I find:

```
::
2DUP
PTR 0FF94
%%SQRT
;
```

Following PTR 0FF94, I find:

```
::
DUP
%%*SWAP
DUP
%%*
%%+
;
```

Of course, following %%\*SWAP, I find:

```
::
%%*
SWAP
;
```

So, in 100% supported SysRPL, %%R>P could be replaced by:  
[pre]  
::

```

::
  2DUP
  ::
    DUP
    ::
      %%*
      SWAP
    ;
    DUP
    %%*
    %%+
  ;
  %%SQRT
;
3UNROLL
%%ANGLE
;

```

Of course there's no need for nesting the secondaries in the above, so we could use:

```

::
  2DUP           (copy both arguments)
  DUP           (square copy of 2nd argument)
  %%*
  SWAP         (move copy of 1st argument down)
  DUP         (square copy of 1st argument)
  %%*
  %%+         (add the squares)
  %%SQRT      (square root of sum of squares)
  3UNROLL     (move original argument pair down)
  %%ANGLE     (ATAN of level 1 divided by level 2?)
;

```

Does that make sense? I'm guessing that the arguments are  $x$  on level 2 and  $y$  on level 1, but perhaps they're reversed from that. Anyway, I think that %%ANGLE (but taking 2 arguments as the denominator and numerator of a rational number) is the substitute for the desired %%ATAN (taking 1 argument as a decimal rational number).

But what does the result of %%ANGLE represent? An angle, but in radians, degrees, or grads? Of course you can (and should) experiment, but I also see %%ANGLERAD and %%ANGLEDEG, and my guess is that maybe it represents the angle in the current mode.

Quote:

---

I will let you know how far I get.

---

When you get programs that you're proud of, please consider submitting them to [hpcalc.org](http://hpcalc.org). Preferably include the source code, and even better, commented source code.

Quote:

---

If programming basic arithmetic on extended precision complex numbers is not commonplace for the 48 or 49 series, this could be a new little adventure!

---

I really don't know how commonplace it is; maybe search at [hpcalc.org](http://hpcalc.org).

**Re: I did it!**

*Message #21 Posted by [Les Wright](#) on 21 June 2007, 7:49 p.m.,  
in response to message #20 by James M. Prange (Michigan)*

James, it will take me a little time to fully digest your post, but I did stumble across %%ANGLE and, indeed, its existence really does make redundant need for an extended precision %%ATAN. As you have intuited, if x is on level 2 and y is on level 1, %%ANGLE returns arctan(y/x) in the angle mode of the calculator. For example, the code :: 2%>%% %%ANGLE ; when compiled and acting on input 3 ENTER 4, will return %% 9.27295218001615E-1 radian, which is almost exactly the correct 15-digit result for arctan (4/3) (the last digit should be a 2). In normal precision computing on the actual calculator, 4 ENTER 3 / IShift ATAN returns .927295218, whereas the proper 12-digit answer should be .927295218002. I haven't experimented yet with %%ANGLEDEG and %%ANGLERAD, but I gather they force the specified mode in the output irrespective of the calculator's angular mode.

Using null lams in non-nested code is pretty straightforward. In nested code, keeping track of the numbering when binding new null lams without unbinding old ones can be tricky. If I have to go this route I will make sure that internal subroutines that use null lams close with ABND where possible to ensure there isn't numbering conflict with the main code.

I didn't search hpcalc.org too closely for SysRPL routines that compute with extended precision complex numbers. I guess I was really looking to do the programming myself.

Thanks as always for your detailed and astute contributions.

Les

Not complex and not hpcalc.org but I did do a little with extended precision reals (log to any base and harmonic mean from memory) back on comp.sys.handhelds probably fifteen years ago.

- Pauli

### Re: I did it!

Message #23 Posted by [Les Wright](#) on 21 June 2007, 9:42 p.m.,  
in response to message #21 by Les Wright

Quote:

In normal precision computing on the actual calculator, 4 ENTER 3 / IShift ATAN returns .927295218, whereas the proper 12-digit answer should be .927295218002.

I should emphasize of course that this is NOT a bug in the calculator. .927295218000 radian is indeed the correct 12 digit approximation to the arctangent of 1.33333333333, which of course is not exactly 4/3. Alas, applying ->NUM in exact mode to ATAN(4/3) seems to reduce 4/3 to the 12 digit decimal approximation first, then takes the arctangent, so you get the arctangent of the approximation, not the original exact fraction. To get the exact arctan of 4/3 without a SysRPL program, (3,4) ARG returns the correct 12 digit result. Indeed, in situations where high accuracy is desired, this is probably the way to do it.

I have long been interested in maximizing accuracy in floating point calculation on calculators, even though this is not necessary in the real world usually. Free42 Decimal, with its 25-digit internal digits always accessible to the user, has been one way to do this. Now, extended reals in SysRPL is another, only this time on a "real" calculator and not a simulator. Neat....

Les

James, the Kalinowski and Dominik opus, along with its companion listing of HP49 Entry Points, provides only scanty info on the use of so many functions. One has to often infer it from the stack diagrams. As you have seen, this most of the time seems not to be too abstruse. Les

### HP-32Sii purchased from Ebay not working

Message #1 Posted by [Mike Barry](#) on 12 June 2007, 10:38 a.m.

I know, I know, caveat emptor. I just assumed that if one is going to list a calculator, it would be pretty obvious to state that it doesn't work, if in fact it doesn't work! The box that I received the calculator in was in good shape and I don't hear any loose parts rattling around inside the calculator. That being said, I tried powering it up with good batteries, tried pressing "C" and "LN" to reset, tried pressing "C" and square root and e to the x to clear memory, tried shorting the terminals to drain the caps... All with no luck in powering it up. Any suggestions? I emailed the seller yesterday and haven't yet got a response. What is the best way to go about getting this resolved? Any suggestions from experienced Ebay folks would be appreciated.

Best regards, Mike

### Re: HP-32Sii purchased from Ebay not working

Message #2 Posted by [Ron](#) on 12 June 2007, 1:25 p.m.,  
in response to message #1 by Mike Barry

Did you pay with PayPal? I don't know if it matters, or not. The eBay Standard Purchase Protection Program went inactive in January, and has been replaced with PayPal "protection" (didn't work for me). See item "c" below:

13.11 Significantly Not As Described. To the extent that we provide reimbursement for losses for items that are Significantly Not as Described when received by the buyer ... Here are some of the reasons that an item may be considered Significantly Not as Described: . . .

(c)The item is unusable and was not disclosed as such. For example, if there are missing major parts or components, will not function or turn on or is spoiled or past a relevant date. This applies to the item in its received state, no matter what the condition when it was shipped. . . .

Here's the page: [PayPal](#)

### Re: HP-32Sii purchased from Ebay not working

Message #3 Posted by [Rav](#) on 12 June 2007, 4:59 p.m.,  
in response to message #1 by Mike Barry

Did you have it pay for it or have it delivered through USPS? If so there may also be some protection that way.

Make sure that you keep copies of everything that you send. Also if you don't receive a response in a week or so send a letter with tracking through the USPS.

Settle down and expect this to be a long haul. I had something similar happen and it took nearly four months to sort out.

Good luck,

Rav.

*Message #4 Posted by [Steve Borowsky](#) on 12 June 2007, 5:14 p.m.,  
in response to message #1 by Mike Barry*

Did the seller state that it was working, or show an active display? Maybe a link to the auction would help determine if you have any recourse.

**Re: HP-32Sii purchased from Ebay not working**

*Message #5 Posted by [Gene](#) on 12 June 2007, 6:08 p.m.,  
in response to message #4 by Steve Borowsky*

IMO, unless the seller stated that it was in "working condition" or showed a picture where the display was on and working, you probably have no recourse.

Saying that something is "in good condition" does not imply anything about whether it works or not, unfortunately.

If you buy something on ebay and the seller does not specifically say "this works! See the picture?" then you're taking your chances, as Steve says.

Sometimes you get lucky. Sometimes not.

Now, whether paypal will help you is hard to tell. Sellers have had their money taken from them by paypal when a bidder claims to have received a brick instead of the advertised good. Since the seller cannot prove what the buyer actually received, sellers can often be at a loss, since you cannot prove a negative. No matter what pictures you have, documentation you have, you cannot prove before the box was sealed that you did not put a brick into it rather than that never opened red-dot HP 35.

Search the web and you find many people who have been ripped off by buyers this way. Sure, it may not have happened to anyone here. Doesn't mean it hasn't happened to more people than you might think.

Primary reason I don't take paypal. Avoid the risk, even if it means lower sale prices. Oh well.

Good luck!

*Message #6 Posted by [Tom UK](#) on 13 June 2007, 9:53 a.m.,  
in response to message #5 by Gene*

Well if you describe something as a 'calculator' it should calculate something, otherwise it is not as described - if it doesn't work it is really a collection of plastic and metal in the shape of a calculator and should be sold as "spares or repairs". Need to see the ebay listing to see the details.

Best of luck with resolving the issue.

In the UK if you sell a 'car' it must do things a car is expected to do unless you expressly say it will not.

**Re: HP-32Sii purchased from Ebay not working**

*Message #7 Posted by [Mike Barry](#) on 13 June 2007, 10:37 a.m.,  
in response to message #5 by Gene*

Hello all, Thanks for all of the good suggestions. Gene is correct and I should have been more careful. Unfortunately, the seller never explicitly stated that the calculator works. I have yet to hear from the seller, so I think my only recourse is through PayPal. Yikes! I did try the other suggestions regarding the contrast and jump starting the calculator - with no luck. I have a very nice looking electronic brick.

Thanks again, Mike

*Message #10 Posted by [JB](#) on 14 June 2007, 12:02 a.m.,  
in response to message #7 by Mike Barry*

I've purchased a few 32Sii's like this but have worked after squeezing the front and back halves together, just below the screen. The pressure required varied on each but in my cases it seems the contacts to the display had lightly disconnected. My 'permanent' fix was to split the cases and add some filler to hold the connection tighter. Still working today, as always though your mileage may vary.

**Next step: Contrast and troubleshooting.**

*Message #11 Posted by [allen](#) on 12 June 2007, 6:52 p.m.,  
in response to message #1 by Mike Barry*

On some 32sii models, the contrast is dynamic enough to make the calculator appear OFF when at the lowest setting. Don't forget to press the [ON] key and [+] several times to be sure it is not a contrast issue. You could also measure the current while you believe the unit is working. The current spikes on key-press will indicate that the CPU and keys are working (at least marginally). The easiest way to do this in situ is to put [Copper Tape](#) on [both sides](#) of a small piece of index card. Isolate the two sides of tape, Then connect/solder the tape ends to your two ammeter leads. Stick the small card-stock or business card anywhere in the battery train to break the circuit with the ammeter lines. You should get around 100 uA in [standby](#) and around 2.5 mA during [Key Press](#).

*Message #12 Posted by [Stefan Katletz](#) on 13 June 2007, 4:56 a.m.,  
in response to message #1 by Mike Barry*

Mine was also not working on arrival, after pressing resets etc. and removing the batteries for some time my only solution was to insert them in reverse (only for a second) - and voila, it is still working till today. I know this is risky and I wouldn't recommend it, but if you have tried everything and you think you have a brick already, what do you loose? (Mine was sold as "in working condition", so something happened to it during sending, and it was not insured...)

**data sheets for Sunplus microcontrollers?**

Message #1 Posted by [Eric Smith](#) on 12 June 2007, 4:19 a.m.

Does anyone know where datasheets on the various Sunplus 6502-based microcontrollers (e.g., SPLB20D2, SPLB22A, SPLB30A, SPLB31A, as used in some HP calculators) can be found? They used to be on the Sunplus web site.

Sunplus seems to have fissioned into several companies, none of which seem to claim to offer those parts.

**Re: data sheets for Sunplus microcontrollers?**

Message #2 Posted by [J-F Garnier](#) on 12 June 2007, 6:29 a.m.,  
in response to message #1 by Eric Smith

I found this from Generalplus company: [GPLB31A](#) (pdf file).

**Re: data sheets for Sunplus microcontrollers?**

Message #3 Posted by [DaveJ](#) on 12 June 2007, 8:26 a.m.,  
in response to message #2 by J-F Garnier

It is a most puzzling choice indeed by HP. It's not the worlds greatest micro, scalability to different products is limited, and it's an obscure brand so presumably 3rd party tools would not be nearly as mature, and supply longevity would have to be questionable. Although if it is truly 6502 compatible then that would solve the tool issue.

Perhaps the choice came down to price?

Anyone know if HP would code their calculators in C or assembler?

Dave.

**Re: data sheets for Sunplus microcontrollers?**

Message #4 Posted by [Eric Smith](#) on 12 June 2007, 1:51 p.m.,  
in response to message #3 by DaveJ

Yes, price. And Kinpo was already using it for that reason.

They write the software in C. The 6502 isn't a great choice for C code (or most compiled languages), so the object code size is fairly large.

**Re: data sheets for Sunplus microcontrollers?**

Message #5 Posted by [Bill Wiese](#) on 13 June 2007, 2:18 p.m.,

*in response to message #3 by DaveJ*

Quote:

---

It is a most puzzling choice indeed by HP.

---

That statement astounds me. Surely you know HP did not make the choice of CPU??

They went out and looked for calculator mfgs with certain competencies and volume and pricing, and said, "we want a calc that looks like <this> and does <that>". Part of <that> would include power consumption/battery life considerations, and some measure of operational speed (PRGM mode instructions per second, max times for some of the more complex functions, etc.)

If Kinpo decided to use a (mythical) ultrafast 4-bitter HP wouldn't care. If, say, Kinpo decided that a VAX emulation layer was appropriate, fine - just as long as cost & power considerations are met. These level details are left to ODMs/OEMs now; HP buys a 'package'. High-level price/power/operational targets are all that matter between the 'name brand' and the ODM vendor. Most of the design in fact was done by Kinpo, with the 'styling'/arrangement/packaging 'feel' done by HP in cooperation with a product design house like IDEO or Frog-something or SmartDesign. (They do this for their inkjet printers, which they make a helluva lot more money from...)

Quote:

---

It's not the worlds greatest micro,

---

Again, who cares? Absolutely irrelevant.

BTW, in terms of volume shipped, 6502 derivatives are way up there. \*Tons\* of modems, tons of toys, etc. have 'em. Mitsubishi has their MELPS 37000/57000 8 and 16 bit versions (their 16 bitter is roughly like the 65C816 that was in the Apple IIc) that ran Nissan engine control computers in the mid thru very late 90s (and probably beyond) vehicles. Many many VCRs and TV sets and some microwave ove

Many chip selections are made not for architecture, but simply for pricing, availability, power consumption, I/O driving or even package choice - even if the chosen register/instruction set makes a programming task more difficult.

Quote:

---

scalability to different products is limited,

---

Again irrelevant? This is not an academic school project with grade based on how ultraportable code, etc. It's about getting the job done at minimum cost.

Many of these type of designs are treated as one-shot products with no intention of code reuse, update, etc. As it is, the coding for the calc is most likely in C so that's "portable enough". Any portability concern is more toward doing the same product on a new chip if there are supply concerns, than reusing the code base for a new, different product. As it stands, they could do an initial re-port over to an 8051 or 6805 or H8 design in a few days max.

Quote:

---

and it's an obscure brand so presumably 3rd party tools would not be nearly as mature, and

supply longevity would have to be questionable.

Obscure? The fact you haven't heard of them doesn't mean they don't ship in volume. I imagine there's could be 100 - 500 million shipped products with various Sunplus chips in them, and that could be on the low side. Calculators, translators, alarm clocks, talking & automated toys, cheaper appliances, etc. all use Sunplus CPUs.

Supply longevity to get thru a sequence of production runs is good enough. No one cares about 2 years from now.

Quote:

Although if it is truly 6502 compatible then that would solve the tool issue. [/quite]

Again irrelevant. Any CPU vendor will supply tools to a volume customer. They either create the tools themselves or have a relationship with a tool provider (like HiTech, who makes C compilers for various micros) It's almost a given - C compiler, assembler, linker and (maybe) some sort of debugger or monitor. Otherwise you can't sell your chip. [Maybe JTAG support added on bigger chips.]

[quote]Perhaps the choice came down to price?

Dude, it ALWAYS comes down to price - sometimes prior working relationships help, as Kinpo and Sunplus (or Sunplus') successor have had an ongoing relationship for some years.

Quote:

Anyone know if HP would code their calculators in C or assembler?

HP doesn't code anything anymore for this kinda product. Kinpo would be doing the work. 99% chance it would mostly be in C - some startup code in assembly, maybe some optimized I/O driver stuff, although I know it could readily be done all in C. A 1MHz 65C02 can reliably even 100% \*emulate\* an HP41C calc at full speed or more. Perhaps there some optimized BCD math routines in assembler, but there's probably not that much reason for it.

Having just about everything in standard C (plus or minus a few compiler+architecture dependent features) pretty much means architectural considerations are moot.

*Message #7 Posted by **Eric Smith** on 12 June 2007, 2:00 p.m.,  
in response to message #2 by J-F Garnier*

Thanks, that explains the mystery. That portion of Sunplus is now Generalplus, and the datasheets are available on their [web page](#).

I'd still like to get the datasheet for the SPLB20D2, which appears to have been obsoleted by the GPLB20D3.

### **Re: data sheets for Sunplus microcontrollers?**

*Message #8 Posted by **Bill Wiese** on 13 June 2007, 2:41 a.m.,  
in response to message #7 by Eric Smith*

Eric,

Various Sunplus controllers are 'nominally' 6502 compatible. It's been awhile, I'm betting there may be some but not all 65C02 instructions on board.

The lesser-capability Sunplus CPUs used in things like KBs and mice may lose a register (I think the .Y register) and associated instructions.

Bill Wiese  
San Jose, CA

### **Re: data sheets for Sunplus microcontrollers?**

*Message #9 Posted by **Eric Smith** on 13 June 2007, 11:47 p.m.,  
in response to message #8 by Bill Wiese*

Unfortunately it turns out that the Generalplus data sheets basically only have a block diagram and electrical specs. They apparently have Programmer's Guides and User Guides, but they don't make them available online. Sigh.

in response to message #1 by Eric Smith*

Does anyone know what CPU is used in the 12C Platinum 25th Anniversary edition?

Thanks.

## **Re: data sheets for Sunplus microcontrollers?**

*Message #12 Posted by [Eric Smith](#) on 19 June 2007, 2:23 a.m.,  
in response to message #11 by Jeff*

I think it is a Generalplus GPLB31A, but I haven't seen anything definitive.

The 12C Platinum was originally claimed to use the Sunplus SPLB20D2, but they had to increase the ROM size when they upgraded the 12C Platinum to new firmware based on the 17BII+ code base. They did not revise the data sheet.

The 12C Platinum Anniversary Edition and the 12C Prestige are believed to share the same electronics and firmware with the revised 12C Platinum.

### What to start a collection with

Message #1 Posted by [Vince Horvath](#) on 11 June 2007, 5:47 p.m.

I currently don't own any HP calculators, but I have often really liked them and the HP quality. I have played with a few and I think I understand the RPN nature.

My question is, what are some good models to start a collection with? Should I go with some of the really early models first, or should I go with something that is newer (10C series).

Any help would be appreciated.

Vince

### Re: What to start a collection with

## **Re: What to start a collection with**

*Message #6 Posted by **Egan Ford** on 11 June 2007, 6:47 p.m.,  
in response to message #1 by Vince Horvath*

Get a few emulators to start with. Figure out what you like.

Windows (all free):

1. Debug4x will give you 48GX, 48GII, 49, 49G+, and 50g. Start with the 50g since you can buy them new today.
2. Free42 is a very cool HP 42S simulator.
3. V41 is a very complete HP 41CX emulator.
4. Nonpareil emulates about 20 older HPs including LED models. Run the original HP 35.
5. EMU71 and EMU41 are CLI-based 71B and 41CX emulators. For 41CX I prefer Nonpareil and V41. For 71B EMU71 rocks.

Linux (all free):

1. Debug4x. You'll need to setup WINE (assuming x86 or x86\_64 box)
2. x48 is a 48GX/SX emulator.
3. Free42.
4. Nonpareil.
5. EMU71 and EMU41. Install DOSEMU (x86/x86\_64 only) or DOSBox (any arch).

Mac (all free):

1. Debug4x. You'll need to setup Parallels, WINE or something similar.
2. There is an older EMU48 around. No 49G+ or 50g support.
3. x48.
4. Free42.
5. Nonpareil.
6. EMU71 and EMU41. Install DOSBox.

50g: (Just too cool, but if you get the 50g and want to spend some \$ check out <http://www.hrastprogrammer.com/>)

1. 71X: 71B emulator.
2. 41X: 41C emulator.
3. 42X: 42S emulator.
4. 11E: 11C emulator.
5. 12E: 12C emulator.
6. 15E: 15C emulator.
7. 16E: 16C emulator.

I am more of a user than a collector. IMHO as a user you cannot go wrong with a 15C or any programmable

RPN/RPL for that matter.

On eBay the 15C, 42S, 41CX, 71B, 67 are usually the most in demand (expensive).

Think twice about the 41CX and 71B. They are expandable with many options. More so if you go the HP-IL route. Be prepared to quickly get addicted and spend a lot of cash.

Lastly I only started collecting in 2006 when I couldn't get a decent RPN calculator. I still had my original 15C and 48GX, and I realized they would be hard to replace. But with the 50g and now the new 35S, there may be little need to collect (if you are a user).

## **Re: What to start a collection with**

*Message #7 Posted by [Kevin](#) on 11 June 2007, 8:15 p.m.,  
in response to message #6 by Egan Ford*

I've tried a bunch of emulators on PC, Linux and Palm and one of my favorites is the P41CX emulator that runs on the Palm OS. If you happen to have a Palm (especially if you have one that will do 320x480 resolution) then P41CX is just great. It emulates the HP-41CX - and it also comes with a free emulation of the HP-41CX add-on module called the "Advantage" roms, which has a bunch of very useful programs. P41CX also emulates a printer that can be attached to an HP-41CX - results of printouts from the calculator go to the Palm OS "Memo" application where you can review them. Some of the HP-41CX modules make use of a printer - to do things like amortizations of a mortgage - it is very neat to run these in the emulator. You can find out more about P41CX here:

[Palmgear P41CX](#)

The version you pay for includes access to a multitude of other add-on module emulations and only costs \$11.00.

In any event, I highly recommend running a bunch of the emulators and reviewing documentation on this site to get an idea of how the calculators work before you decide which real calculators you'd like to buy.

Good Luck,

Kevin

## **Re: What to start a collection with**

*Message #8 Posted by [Karl Schneider](#) on 13 June 2007, 12:26 a.m.,  
in response to message #6 by Egan Ford*

Many sound suggestions were given in this thread. One statement by Egan compels a follow-up:

Quote:

On eBay the 15C, 42S, 41CX, 71B, 67 are usually the most in demand (expensive).

There's a good reason for that: These are among the most impressive models ever made by HP.

My list of "best" models (for one reason or another): HP-67/97, HP-41CX, HP-15C, HP-71B, HP-42S, HP-17BII, HP-32SII, HP-48GX

My list of "most distinctive" models (for one reason or another): HP-34C, HP-16C, HP-27S, HP-28S

Most of the above are somewhat expensive (US\$150+) on eBay, but a few (e.g., HP-17BII, HP-28S) are more affordable.

-- KS

Yeah, decisions, decisions.... We all can only relate to our own background and experiences... When I began my collection I was mainly focused on what I could use and I saw a real desire for a desktop scientific and there were none outside of the old classics. I was focused on getting a 97 to sit on my desk and be a collector's item and also useful... I began to study this site, EBay, etc. for prices and quality etc. At the time I did not look forward to sending \$\$\$\$ and getting a broken POS... I found a posting on this site for an HP-45 for \$100 and sent the money and waited... What I received was wrapped in a brown paper bag from a supermarket .. the HP-45, case, and battery, no box, or protective padding outside of the case. On opening it turned out to be absolutely mint condition, as if it had never been used (both case and calculator). This hooked me big time into my collection that has all but the Hp-70. I never got a calculator in as good a condition as the first HP-45 (though close)... I was in high school when the Hp-35 came out so I have memories of all the pocket calculators during the early models. I think the LED models provide the best memories of the early development. Certainly the HP-41 was the peak of performance and capabilities before they became commodities and computational power drove to PC dominance (the market for calculators was then driven by the educational market)

Good Luck and happy shopping, hope you are lucky!

### **Re: What to start a collection with**

*Message #11 Posted by [Dan W](#) on 11 June 2007, 11:24 p.m.,  
in response to message #10 by Dave Johnson*

I agree. The 67 and 97 is a great combo. I use the 97 at home and the 67 at the office. I use the mag cards to trade data and programs. The display is much easier on over 40 eyeballs. And the printer is great for documenting programs or debugging in trace mode.

I was too young to afford any of the Classic series; but I was envious of those who could. The 11c was my first HP. Now I collect Classics. I think they are more interesting historically. And the card readers are great. Plus my other hobby is electronics, and repairing the Classics is relatively easy.

### **Re: What to start a collection with**

*Message #12 Posted by [Eric Smith](#) on 11 June 2007, 9:55 p.m.,  
in response to message #1 by Vince Horvath*

Start with what you can get without spending a small fortune. Older HP calculators sometimes show up at thrift stores (though that's becoming less common), garage sales, estate sales, etc.

### **Re: What to start a collection with**

*Message #13 Posted by [Maximilian Hohmann](#) on 12 June 2007, 4:00 a.m.,  
in response to message #1 by Vince Horvath*

Hello!

My advice: Be patient, first of all! (Unless, of course, you have access to unlimited funds :-))  
As others already said, good HP calculators do not necessarily need to be expensive. Even on eBay, bargains can be found from time to time. With patience, of course...

But one model that is a must for every collector, whatever his interest may be!, is certainly the hp-35!

Greetings, Max

### **Re: What to start a collection with**

*Message #14 Posted by [Howard Owen](#) on 12 June 2007, 4:20 a.m.,  
in response to message #13 by Maximilian Hohmann*

The HP-35 is the first scientific hand held calculator. It's cool to have one, but I did without for quite awhile. I didn't take the plunge until this year, it being the 35th anniversary of the HP-35. The reason I held off is that the 35 is no great shakes as a calculator. It's not programmable, and has just a basic set of functions. To be sure, those were revolutionary in the package HP delivered in 1972. But I'm an enthusiast (what Egan calls "a user") first, and a collector second. I like to *do* stuff with my calculators. I also like to buy machines I used when I was starting out. For me, that meant the 41CX first.

Egan has given you a very nice survey of what's available. His tastes match mine pretty closely, I've noticed. So for me, an expandable, programmable system has an edge. The 41CX matches this description, and so does the 71B. The 50G has PC connectivity, and SD card memory expansion. It is also the absolute geekiest of HP calculators, in terms of programming, and mathematical diversity. That also means that is the most challenging machine to use effectively. That's a plus for me, since I do that sort of thing for entertainment.

One other machine captured my heart. That was the HP-97. I just love the look of that machine, and its ease of use. It sits on my desk, and gets almost daily use.

My best advice is follow your heart, but don't leave your head out of the conversation. That's been my approach, and it has served me well.

Regards,  
Howard

I agree 100 percent with this statement :-) The '97 was the first hp calculator in my collection and is still one of my favourites (beside the '25 and the 71B, the only LCD calculator that I really like to use). Many years back, I even used an hp-97 at work, but that wasn't mine then.

In my daily business, I have not much use for a pocket calculator, but for playing around, I prefer either a Curta or the almighty Ti Voyage 200, that beats everything that hp has ever made in every respect. Sad but true...

Greetings, Max

*Message #16 Posted by **Vince Horvath** on 12 June 2007, 10:59 a.m.,  
in response to message #1 by Vince Horvath*

Thanks everyone for your comments. I have seen the HP-97 and it is really cool looking. That may be a bit much for me though to start out with.

I guess the one thing I kept seeing in the posts is be patient. Sounds like what my folks used to always say about not buying the first car you see, or marry the first girl you meet.

My Dad does have a HP 15C I think (either that or the 11C.. one of those). I also do like the 41C series, but those look like they are quite expensive. I remember a friend of mine having one in college and I fell in love with it and wanted one badly, but just could never part with that type of money.

Tell me a little more about the programing (sorry, I know that is a loaded question). What exactly can it do? Is it easy to understand? I have looked at my dad's book that came with his, and it seem's kinda tough to understand as it does not resemble C or any of those languages. Yes, it has subroutines, but it just seems a bit odd. Do the larger machines like the HP97 program more like a computer or is it sort of the same?

Thanks again!

Vince

*Message #17 Posted by **Egan Ford** on 12 June 2007, 11:21 a.m.,  
in response to message #16 by Vince Horvath*

Most models are RPN. RPN is keystroke programming. Start here:

<http://www.hpmuseum.org/rpn.htm>

The 28/48/49/50 series introduced UserRPL. Some models support SysRPL and C. UserRPL meets most needs. UserRPL is somewhat keystroke somewhat structured (think FORTH/LISP).

<http://www.hpmuseum.org/rpl.htm>

The 71B has BASIC with optional RPN and FORTH. Assembly is also a possibility.

Some examples below:

Savage Benchmark in BASIC, RPN, FORTH, RPL:

**BASIC (71B):**

```
10 DESTROY ALL @ STD @ RADIANS
20 S=TIME
30 A=1
40 FOR I=1 TO 2499
50 A=TAN(ATAN(EXP(LN(SQRT(A*A)))))+1
60 NEXT I
70 DISP A;"IN";TIME-S;"SEC"
```

**RPN (41CX, 71B):**

```
01 LBL "S"
02 RAD
03 FIX 9
04 TIME
05 HR
06 STO 01
07 2499
08 STO 00
09 1
10 LBL A
11 X^2
12 SQRT
13 LN
14 E^X
15 ATAN
16 TAN
17 1
18 +
19 DSE 00
20 GTO A
21 TIME
22 HR
23 RCL 01
24 -
25 3600
26 *
27 X<>Y
```

**FORTH (71B):**

```
: SAVAGEF
  RADIANS STD
  CLOCK
  1.
  2499 0 DO
    X^2 SQRT
    LN E^X ATAN TAN
  1. F+
  LOOP
  F. ." IN "
  X<>Y CLOCK X<>Y F-
  F. ." SEC"
;
```

**RPL (48/49/50 series):**

```
<<
  TICKS
  1
  1 2499 FOR I
    SQ SQRT LN EXP ATAN TAN 1 +
  NEXT
  SWAP
  TICKS SWAP - B->R 8192 /
>>
```

IMHO, you'll be most productive with the 50g--it's my everyday calculator. Multiply studies correlate

screen size with productivity. I find the 71B + 41 Translator ROM (gives you RPN and FORTH) the most fun. But, almost nothing compares to the joy of getting the 15C with its limited memory and speed to solve very difficult problems (probably true for any pre-15C model).

P.S.

I forgot to add. Lua is available for the 50g. If you want a C++/Java like interpreted language check out HPLua. HPLua example:

```
a=1
for i=1,2499 do
  a=math.tan(math.atan(math.exp(math.log(math.sqrt(a*a)))))+1
end
print(a)
```

Okay... really dumb question, but why do they have these different languages? Were they seen as improvements over time. Also, what does the benchmark program do, and what does RPL stand for? Reverse Polish Language? Can anyone also give me the highlights of what is the difference with RPL and RPN and what may or may not be the advantages to both.

Sorry for all the dumb questions gang.

Vince

in response to message #19 by Dia C. Tran*

I second that Dia!

Egan... don't you think the 50G is a bit of overkill? I mean, I have the 48GX, and it is a very fine machine, but I think for the most part it is just overkill and very complicated to use.

For pure scientific, I love my 15C, and for pure business, I love my 17BII. These were great simple to use calcs (well, more simple than the 48gx). I think outside the classroom or academic area the 50G might be just too robust.

Just my thoughts.

- John

I was recommending it because it is the best scientific HP you can buy today new. I would never recommend the 33S. As for the 35S. Yes, I'd start there too when it releases. It will be cheaper and easier to program. For my needs I require the 50g (but I also carry my 15C). Too bad the 35S does not have a size advantage, its not much smaller than the 50g.

## **Re: What to start a collection with**

*Message #22 Posted by **Egan Ford** on 12 June 2007, 1:53 p.m.,  
in response to message #18 by Vince Horvath*

Read the links I provided above on RPN and RPL.

BASIC was getting popular in the late 70s, early 80s. BASIC was my first language. I learned it on my first computer--the Apple II+. Sharp and Tandy also released 71B-like machines in 1982 (HP had the 75 in 1982).

FORTH is a popular fast embedded platform (more popular in the 70s/80s). Not a bad fit for the 71B with I/O capabilities. FORTH is still used today (Got a PPC Mac? You got FORTH in the BIOS).

C is obvious. Speed. C became very popular in the 80s and is very popular today.

Lua. Well, its small and fast like FORTH, but is structured like C++/Java (both popular now). FORTH is more like RPN/RPL/Postscript, i.e. stack oriented. Most nubee programmers fear the stack.

Use the right tool for the right job. No single tool will solve all problems efficiency. IANS, there are no universal concepts.

As for the benchmark, read: [http://www.technicalc.org/tiplist/en/files/pdf/tips/tip6\\_50.pdf](http://www.technicalc.org/tiplist/en/files/pdf/tips/tip6_50.pdf)

## **Re: What to start a collection with**

*Message #23 Posted by **Howard Owen** on 12 June 2007, 3:38 p.m.,  
in response to message #18 by Vince Horvath*

Quote:

.. why do they have these different languages?

The early programmable models all ran some variant of RPN, or else ran BASIC. RPN programming isn't monolithic either. There is a great deal of variation in what different models of

calculator can do, although they all bear a close resemblance to one another in terms of programming structure. I think this is because HP invented pocket calculator programming, and was continuing to refine that, and the calculators themselves over time. By the time they released the 41C, they had started to give some thought to backward compatibility. If you bought the card reader for the 41, you could load 67/97 programs - the previous generation - right into the 41. The calculator would translate some instructions into ordinary HP-41C code, and some into special compatibility instructions that the card reader brought along with it.

The principle benefit of RPN programming is that is as close as possible to just entering the keystrokes you would use to solve a problem manually. This "keystroke programming" model is preserved today in the HP-33S, although in a flawed manner. (Search this site with Google to find out more.) The as yet unannounced HP-35S appears to be based on the 33S, but with at least one of the two major flaws of the 33S corrected. It allows "more than 800" data registers, which gives you something to do with the 32K of RAM. Whether it also allows more than 26 labels isn't known at this time We probably won't know for sure until the machine is released. That's rumored to be August 1.

As far as BASIC goes, there were two small machines that ran variants of BASIC. These are the HP-75 and HP-71B. BASIC was an obvious choice for small computers back then. Most would support a BASIC variant and assembler. The 71B had those, plus Forth, the ultimate "postfix" language. As Egan mentioned, the later addition of the 41C translator added RPN to the programming repertoire, although you couldn't do keystroke programming. (You had to create your program in an editor and then convert that into something the emulator could run.)

The RPL calculators were the result of a major change in HP's calculator software. This became visible to HP's customers in 1986 with the release of the HP-28C. Egan's links point you to the excellent treatment of this subject here at the museum. There was no provision for backward compatibility in these machines. But that was the standard approach in the industry in the 1980s.

Quote:

\_\_\_\_\_

.. and what does RPL stand for? Reverse Polish Language?

\_\_\_\_\_

Very close. It's "Reverse Polish Lisp."

Quote:

\_\_\_\_\_

Can anyone also give me the highlights of what is the difference with RPL and RPN and what may or may not be the advantages to both.

\_\_\_\_\_

This is a very deep subject, on which members of this forum have divergent views, to say the least. Superficially, RPN is about keystroke programming and RPL is about structure. they bear a spiritual relationship to one another in that a leading exponent of RPN, Dr. William Wickes, led the development of RPL. His book about RPN to RPL transition is enlightening in this regard. It's available on the Museum DVD. There is something close to a consensus that RPL is more difficult to learn, though a leading RPL expert who hangs out here disagrees. I love RPL because it has great depth and expressive power. But I had to pay several weeks of effort to learn it. I'm a systems engineer, with dozens of languages under my belt. But I'm also a guy that learned HP41 RPN as my very first programming language. Those facts are relevant to the time I took to learn RPL. I also wanted to learn RPL in some depth, which you may not have to do if you just need the calculator as a tool.

Quote:

*Message #24 Posted by [Josh](#) on 12 June 2007, 5:51 p.m.,  
in response to message #23 by Howard Owen*

Is there a good book that explains RPL?

**Re: What to start a collection with**

*Message #25 Posted by [Howard Owen](#) on 12 June 2007, 11:36 p.m.,  
in response to message #24 by Josh*

The [HP49+ and HP48gII Advanced Users Reference](#) contains a good tutorial on User RPL. [This document on hpcalc.org](#) is a PDF from 2000 that covers user RPL with examples. I haven't read it through, but it looks pretty good at a glance.

There are books available for programming RPL, mostly on the HP48. But the 50g is close enough - nearly identical in RPL syntax and structure - so that the books are still useful with today's high end calculators. [Samson Cables](#) still carries many of these books. You can sometimes find the same titles on eBay for less, but the supply is spotty. I have [Graphics on the HP48G/GX](#) and [An Easy Course in Programming the HP48G/GX](#)

I like the former more than the latter, but that may be because I knew most of what the second book had to offer by the time I got my hands on it, whereas I was ignorant of 48G graphics. The User RPL graphics are nearly identical to the implementation on the 50g, allowing for the larger screen on the newer machine.

Regards,  
Howard

**Re: What to start a collection with**

*Message #26 Posted by [Maximilian Hohmann](#) on 12 June 2007, 4:22 p.m.,  
in response to message #18 by Vince Horvath*

Hello!

Quote:

Can anyone also give me the highlights of what is the difference with RPL and RPN and what may or may not be the advantages to both.

If you ask me, both have no real highlights, at least compared to programming languages that you might be familiar with from "real" computers (like Basic, Fortran, C or Java - some of them with user-friendly intuitive interfaces like MS Visual Basic, full-screen colour-coded editors and

debuggers).

RPN is very similar to machine-code programming. You need paper and pencil to keep track of your register and memory contents and program flow. Debugging is nearly impossible without a printer and in most cases, it is quicker and easier to type in your program again than to hunt the bug.

About RPL I cannot say much, I'm afraid, because this "programming language" - or whatever one might call it - completely escapes me. My way of thinking (which was good enough to gain me a ph.d. in aerospace engineering) is totally incompatible with this thing. Not, that I did not try, but after working my way through the first 100 pages of the 500(!) pages of the hp-48 programming guide, I threw in the towel. No way am I ever going to write a single line of RPL code, and especially since I have little miracle-gadgets like a Ti Voyage 200 that I can easily program without having to look in the manual once.

Greetings, Max

### **Re: What to start a collection with**

*Message #27 Posted by [Howard Owen](#) on 13 June 2007, 12:18 a.m.,  
in response to message #26 by Maximilian Hohmann*

Quote:

My way of thinking (which was good enough to gain me a ph.d. in aerospace engineering) is totally incompatible with this thing.

It's true that neither of these languages are remotely similar to standard 3rd, 4th Web 1.0 or Web 2.0 generation programming languages. But others find they can wrap their minds around one, the other or both programming systems. I admit, I had a lot of difficulty in learning RPL. (I've had extended discussions about this on this forum. Search with Google if you are interested.) But I finally cracked that nut. But my education and career experience is in computer systems and networking, though nowhere near at the PHD level. I think this background helped a lot with my struggles with RPL.

On the RPN side, it sounds to me like you were trying to program one of the non-printing LED models and/or a 10, 12, 11, or 15C. Those have no alphanumeric capability, and you have to decode numeric representations of the keystrokes in order to read the "source code." The coding used keystroke "coordinates." On the HP-67 for example, the STO key is in the third row and the third column, so its coordinate is 3,3. Decoding those numbers is feasible, but difficult, so I can understand your frustration at trying to program in that environment.

But I first learned RPN keystroke programming on the HP41C. This calculator was the first to include nearly full alphanumeric capability. (Not all the lower case letters were available, at first.) This allowed program listings to be viewed one line at a time in the calculator's display, and the commands had names instead of keystroke coordinates. This made it more feasible, but still not ideal, to debug a program on the calculator. And yes, I frequently resorted to paper and pencil to grasp what was going on with my code, or someone else's. But you know, some allowance has to be made for the fact that those calculators embody 1970s and 1980s technology. The comparison that makes sense for the 41C is with Applesoft BASIC, not Java or Visual BASIC. (Gods of computing, please forgive me for mentioning VB and Java in the same sentence. Aak! I did it again!)

RPL strikes me as obtuse. But there are those on this forum and elsewhere who swear that they find RPN hard and RPL easy. I think its not a matter of intelligence but of style. You see this

sort of divide all over Computer Science. In the world of Unix/Linux scripting for example, the folks that like tidy code in a clean object oriented style go for Python. Those who want a tool that can adapt to their personal style, no matter how quirky or cluttered choose Perl. (That's a gross oversimplification, of course.) Then there is the famous vi vs. emacs split. Examples abound, and I think we are faced with another one here. For RPL, it helps immensely if you are used to *and like* Forth, which to this day is widely used in embedded systems. The stack oriented, postfix style of Forth is very similar in style to RPL. I would say that RPL is actually more readable than Forth! RPL can still be tough to write and especially, to read. Using the stack for arbitrary object means you can have all these anonymous globs of data hanging out there. It's your job to keep track of which is what and so forth. (Ouch! Forth is worse in this regard, you can have arbitrary *numbers* of stacks in Forth.) Some folks don't mind the mental gymnastics required to keep track of the stack, but it gives me a headache. You don't have to code this way in RPL, as a matter of fact. You can use named local variables to improve readability at a slight cost in performance.

Anyhow, I hope you take this in the spirit of mutual understanding that it is offered in. Two equally smart people can disagree about what is difficult and what is easy in a programming language, or indeed, on a whole host of other issues.

Regards,  
Howard

## UserRPL Savage benchmarks

Message #28 Posted by [James M. Prange \(Michigan\)](#) on 13 June 2007, 1:18 p.m.,  
in response to message #17 by Egan Ford

Quote:

RPL (48/49/50 series):

```
<<
  TICKS
  1
  1 2499 FOR I
    SQ SQRT LN EXP ATAN TAN 1 +
  NEXT
  SWAP
  TICKS SWAP - B->R 8192 /
>>
```

Certain things about the above caught my eye, and I decided to "improve" on it.

- In RPL, the square root command has the symbol for its name; SQRT would be compiled as a global name, not as the square root command.
- A FOR...NEXT loop is used, but its index variable is never used, so it would be better to use a START...NEXT loop.
- The stack manipulation for the initial system time is handled a bit clumsily, using two moves where only one move is needed.
- The result is very likely to differ depending on whether the angular mode is RAD, DEG, or GRAD, so this should be forced.

When I force a mode, I usually prefer to restore the original mode.

- For the 49 series, operations with "real numbers" are generally faster than operations with "exact integers", so let's use real numbers only.

For an integer value -9 through 9, the compilation of either a real number or an exact integer is to the address of a ROM object, so 2.5 bytes. Otherwise, real number objects are 10.5 bytes, and exact integer objects are 5.5 bytes plus 0.5 byte per digit.

- Binary integers are truncated to the current wordsize when you do a mathematical operation on them, so a sufficiently large wordsize should be forced.
- Substituting DUP \* for SQ saves a tiny bit of execution time, although it uses 5 bytes instead of 2.5 bytes. In this case of a loop that repeats 2499 times, I'd prefer to sacrifice the 2.5 bytes and save a little execution time.
- A tiny bit of execution time can be saved by disabling last arguments.
- We want to see the result in full precision, so let's force STD display mode and leave it in STD even after the program ends.
- Regarding the timing, first off, the resolution on an RPL model is 1 "tick" (1/8192, or about 0.000122, second).

The TICKS command itself takes some time, so the apparent execution time of operations between two TICKS commands is an overestimation by the time that it takes to perform one TICKS operation. This varies among the models, and in any case, timings vary among units of the same model and even among repetitions of the same program, and I choose to neglect this minor inaccuracy.

If you want to correct the inaccuracy, then run the program

```
\<< TICKS TICKS SWAP - B\->R \>>
```

a few times, average the result, and edit my program to subtract this average from the result of the B\->R command.

Depending on free memory, a "garbage collection" may be needed, so for timings, a garbage collection is usually forced first. Of course, this doesn't guarantee that garbage collection won't be needed anyway, but it often makes the timings more repeatable.

To free up more memory, last stack (UNDO) and last command lines saves can be disabled, but remember to restore them to your default modes when finished. These operations of disabling/enabling these two modes are not programmable.

- Some other modes, particularly those which affect the CAS on the 49 series, might have an effect.

The following program can be copied and pasted to a file to be downloaded to any 48 or 49 series, but in case you prefer to key it in, "\<<" and "\>>" represent the UserRPL program delimiters, "\v/" represents the symbol for the square root command, and "\->" represents the right arrow character. Don't bother keying in the trailing "decimal points", but for the 49 series, enter this program in "approximate" mode. Anything starting with an "@" character through the next "@" character or the end of the line, whichever comes first, is a comment; don't bother keying in any comments.

```
%HP: T(3)F(.);
@ "Savage benchmark" for 48 and 49 series.
@ 48 series checksum: # ECAh
@ 48 series size:      159
@ 49 series checksum: # B0C9h
@ 49 series size:      159.
\<<      @
STD      @ Force standard display mode.
RCLF     @ Get original flags.
-55. SF  @ Force last arguments disabled.
64. STWS @ Force wordsize.
RAD      @ Force radians mode.
MEM DROP @ Force a GC.
TICKS    @ Initial system time.
1.       @ Initial value.
1. 2499. @ Loop start/stop values.
```

```

START          @
  DUP *        @ Square.
  \v/         @ Square root command.
  LN          @
  EXP         @
  ATAN        @
  TAN         @
  1. +        @
NEXT          @
TICKS         @ Ending system time.
ROT          @ Move initial time to level 1.
-            @ Elapsed time.
B\->R        @ Convert binary to real.
"Ticks"      @
\->TAG       @
DUP          @
8192. /      @ Convert ticks to seconds.
3. RND       @ Round to 3 decimal places.
"Seconds"    @
\->TAG       @
4. ROLL STOF @ Restore original flags.
\>>         @

```

The 28 series doesn't have a built-in TICKS commands, any tagged object capability, its RND command works differently, and the system flags differ from the 48/49 series, so the above program won't work on them.

Depending on the ROM version, one of the following can be used as a substitute for the TICKS command:

The 28C must be in HEX binary display mode for these SYSEVAL addresses, and that's a good idea for the 28S as well. Double-check that the address is correct before executing SYSEVAL; a wrong address may very well clear the calculator's memory.

```

Model 28C ROM version 1BB: #123E SYSEVAL
Model 28C ROM version 1CC: #1266 SYSEVAL
Model 28S ROM version 2BB: #11CAh SYSEVAL

```

As far as I know, these were the only ROM versions ever released for the 28 series.

To find the ROM version of a 28C, with the calculator's binary display mode HEX, use #A SYSEVAL, or for a 28S, #Ah SYSEVAL also works.

I'll use a character string to "tag" the timing values. The ":" character isn't easily keyed in on a 28 series (unless you already have that string stored), so I'll use "=" instead of ":".

Instead of 3 RND, I'll use 3 FIX RND.

Last arguments disabling is forced by 31 CF.

Of course you can't transfer anything to a 28 series, but I choose to use the same character translations as for the 48/49 series, and what I wrote about comments also applies to the 28 series.

```

@ "Savage benchmark" for 28 series.
@ A 28C must be in HEX mode when this program is entered to ensure
@ that the correct address is supplied to SYSEVAL!
\<<          @
  STD        @
  RCLF       @ Get original flags.
  31 CF      @ Force last arguments disabled.
  64 STWS    @ Force wordsize.
  RAD        @ Force radians mode.
  MEM DROP   @ Force a GC.

@ Uncomment the binary integer in one of the following 3 lines.
@ #123E @      @ For 28C ROM version 1BB.
@ #1266 @      @ For 28C ROM version 1CC.
@ #11CAh @     @ For 28S ROM version 2BB.

```

```

SYSEVAL      @ Initial system time.

Quote:

Do the larger machines like the HP97 program more like a computer or is it sort of the same?

The 97 (and all the classics) are keystroke programmable. Essentially, if you can run the calculator well enough manually to solve your problem, you can do keystroke programming. There is no language or syntax to worry about. To record a program, you just use the same keystrokes you would use to solve the problem manually, and the calculator just records them into program memory.

Augmenting this simple programming logic was conditional branching, which allowed the calculator to make comparisons and jump to different program steps based on the results of those comparisons. The classics had eight conditional branch tests: greater than, less than, equal to, not equal to, which could be used to compare the x register to the y register, or the x register to zero. This of course increased the programming power dramatically, allowing iterative loops to be implemented.

Since you can take right off writing programs, keystroke programming quite a lot of fun, and you can write some pretty capable subroutines. This forum is frequented by some wizards in keystroke programming, so I'm sure I'm not alone in my affinity for it.

Best Regards, Hal

### Integration function on the 50g?

Message #1 Posted by [Hal Bitton](#) on 11 June 2007, 5:44 p.m.

Hi everybody. I'm having trouble figuring out to symbolically evaluate and display the integral of a function on my 50G.

Consider the very simple expression:  $F(x)=x^2$ .

On my 48gx I simply choose "integrate" from the symbolic menu, which brings up a wonderful (and simple) form where I can enter my function (in this case  $x^2$ ) and the upper and lower limits of evaluation. I am also presented with the option of choosing a symbolic or numeric answer. If I choose the symbolic option and run the integration, I get the symbolic solution in level 1 of the stack. Within this solution, the integral of my function (in this case  $x^{(2+1)/(2+1)}$ ) is clearly visible.

After pouring through the 50G users guide, I can find no such functionality on the 50G. I can get a numeric result by keying the integral into the equation writer, and then evaluating it, but a symbolic solution continues to elude me. I have "step by step" checked in the CAS options.

So in short my question is this: On the 50G how can I integrate the function  $x^2$ , and see somewhere in the solution the symbolic integral of this function, namely  $x^{(2+1)/(2+1)}$  ?

Any help from you 49/50 series experts out there would be much appreciated.

Thanks and best regards, Hal

### Re: Integration function on the 50g?

Message #2 Posted by [Gene](#) on 11 June 2007, 5:57 p.m.,  
in response to message #1 by Hal Bitton

Check the learning modules for the 50g on the 50g webpage.

You can do this in the Equationwriter application for instance.

Key  $X^2$ , then select it.

Choosing INTVX will integrate it to  $X^3/3$ .

You can do this in the stack the same way, depending somewhat on your flag settings.

Look here:

[http://h20331.www2.hp.com/Hpsub/downloads/50gSymbolic\\_integration\\_of\\_polynomials.pdf](http://h20331.www2.hp.com/Hpsub/downloads/50gSymbolic_integration_of_polynomials.pdf)

Good luck, Gene

### Re: Integration function on the 50g?

Message #3 Posted by [Hal Bitton](#) on 11 June 2007, 6:18 p.m.,  
in response to message #2 by Gene

Thanks for your response, Gene.

When I key  $x^2$  into the equation writer and then choose INTVX, I get INTVX( $x^2$ ) displayed in the equation writer. Any attempts to evaluate it (whether in the equation writer or on the stack) gives me the goofy result:

$x^2$   
rational fraction  
 $x^2$

displayed in the equation writer. I have no idea how to interpret this.  
What do you suppose I'm doing wrong?  
Thanks again, Hal

### Re: Integration function on the 50g?

Message #4 Posted by [Massimo A. Santin](#) on 11 June 2007, 6:07 p.m.,  
in response to message #1 by Hal Bitton

Quote:

So in short my question is this: On the 50G how can I integrate the function  $x^2$ , and see somewhere in the solution the symbolic integral of this function, namely  $x^{(2+1)/(2+1)}$  ?

Using INTVX (not in approx mode). Using RPN mode

' $x^2$ ' ENTER INTVX ENTER

or using algebraic mode

INTVX( $x^2$ )

INTVX is in CALC/DERIV & INTEG. menu but you can use SYMB, CALCULUS, INTVX.

### Re: Integration function on the 50g?

Message #5 Posted by [Hal Bitton](#) on 11 June 2007, 6:33 p.m.,  
in response to message #4 by Massimo A. Santin

Thanks very much, Massimo.

That worked. It seems I was stopping one (ENTER) keystroke too soon. Still the intermediary result " $x^2$  rational fraction  $x^2$ " puzzles me, but at last now I can get the predicted and correct end result.

While I've got you one more question if I may...the user's guide speaks of the function INT, which will let me evaluate an integral for any variable, not just the default CAS variable. I can't seem to find this function, however. Is it called something else in the softkey labels?

Best regards, Hal

### Re: 50g Integration

Message #6 Posted by **Happy HP User** on 12 June 2007, 12:18 a.m.,  
in response to message #5 by Hal Bitton

To symbolically integrate with regards to variables other than X, such as s,t,x... use the RISCH command, which uses a partial implementation of the Risch algorithm, example:

2: COS(t)

1: 't'

RISCH

1: SIN(t)

### Re: 50g Integration

Message #7 Posted by **Hal Bitton** on 12 June 2007, 2:29 a.m.,  
in response to message #6 by Happy HP User

Worked like a charm.  
Once again, thanks very much.  
Hal

### Re: 50g Integration

Message #8 Posted by **Norris** on 12 June 2007, 6:54 p.m.,  
in response to message #7 by Hal Bitton

Quote:

Still the intermediary result "x^2 rational fraction x^2" puzzles me

If you uncheck the "Step/Step" option in MODE CAS, then

'X^2'  
ENTER  
INTVX

should return:

1/3 x X^3

immediately, without the message.

RISCH works like INTVX, except that you have to specify the independent variable; it doesn't look for one in VX, e.g.

'Y^2'  
ENTER  
'Y'  
ENTER  
RISCH

### Re: 50g Integration

*Message #9 Posted by **Ron Allen (Fairhope)** on 12 June 2007, 11:58 p.m.,  
in response to message #8 by Norris*

The "rational fraction" method is the method used for integrating  $x^2 dx$ . try integrating  $1/\cos(x)$  using the free x with CAS. keep the step-by-step on and watch the messages for those interim solutions, like "trig substitution  $u = \sin(x)$ ," etc. For this solution with notice of steps, i.e., full info, do the following.

I call this the "Show your work, student" method turn on the EQW to write the equation, use back cursor arrow to select and highlight the entire equation, press left shift (white), then CALC (under the 4), press 6 to highlight INTVX AND OK. CUE on the menu line looing for the ok isolated bottom left of the screen and press ok when it presents itself, alternately press EVAL when ok is crowded out of the menu. When there remains no further improvement, ENTER and the stack will hold all of the steps it recorded in process, assuming that's what you want. If the final answer is all you want, follow the other's instructions. By pressing the one line clear you can read off the evolution of the process in reverse.

$1/\cos(x)$  integrated has at least three solutions with the same final result. There are ways to get the symbolic results with or without the notes, even the old 48gx way setting the parameters of integration to 0 through x which forces the symbolic solution.

The notes of various methods include trig substitution with " $u = \text{something}$ ", too bad they don't give you  $du$  and  $f(u)$  modified after the  $u$  is extracted, but I guess you can't have it all, rational fractions, partial fractions, integration by parts, even plain old antiderivatives, etc. The point is, you can use this powerful feature to give up or hide all or none of the work and present you what you want, even numericals. I have yet to fail to integrate an equation, which doesn't mean there aren't any, I just haven't run across one in the normal course.

Keep trying,

Ron

### **Re: 50g Integration (errata)**

*Message #10 Posted by **Ron Allen (Fairhope)** on 13 June 2007, 1:31 p.m.,  
in response to message #9 by Ron Allen (Fairhope)*

Sorry for the inconvenience, but the system won't allow the editing of the previous message, so this errata.

In the original I refer to the "ok" at the bottom left of screen - should be right instead of left.

In the original I refer to the extraction of " $u$ " meant " $du$ "

apologies,

Ron

### **How will the 35S affect the value of your collection?**

Message #1 Posted by [Jim Creybohm](#) on 11 June 2007, 3:49 p.m.

First, I am anxiously awaiting the 35's release. Buy one? Absolutely! Probably two or three if the keyboard is any good. (crosses fingers, toes and eyes)

However, if the 35 is of the great quality that one might hope for, what happens to the value of HP's on the unmentionable auction (Ebay) site? By and large the value of my collection is based upon the value to me; that is as a sentimental favourite, but also based upon the fact that I can't replace it easily for work - I simply can't stand the 33. Would you purchase a used 10/11/12/15/39/48 if the 35 were available?

So, how will the release of a new high quality HP affect the value of used RPN's? Will there be a softening of the price on the unmentionable auction (Ebay) site as buyers find the 35? Or, will the market go up as new kids come onto the 35 product and discover the HP world?

### **Re: How will the 35S affect the value of your collection?**

Message #2 Posted by [Eric Smith](#) on 11 June 2007, 3:54 p.m.,  
in response to message #1 by Jim Creybohm

Yes.

### **Re: How will the 35S affect the value of your collection?**

Message #3 Posted by [Frank Rottgardt](#) on 11 June 2007, 4:35 p.m.,  
in response to message #1 by Jim Creybohm

The first time I really got in contact with HP and RPN was when I freshman, will say when I was in my twenties. So its never to late. I hope that todays students will learn to love RPN and its advantages. But I guess its still the professional sector which counts. Engineering courses and the like. The educational sector is hopeless lost to TI. And its hard to crack the AOS-front. Not even a good (knock on wood) HP-35s will change that. Most of todays youngsters don't even know what RPN is! So why should the buy such a strange machine, with a rather weak AOS implementation? Sad...do the know what they gonna miss?

The old HP-calculators are gone for good. The HP-33s is not that bad. The HP-35s maybe even better, but certainly still miles away from what it could be. Today I use a 33s für daily work. For a week or so I pulled out my old 28s and made some calculations. It took me only 2-3 key strokes and I was sold again! After 15 year the keyboard sensitivity and the tactile feedback is still superior compared with the fairly rockhard and only 6 month old 33s keyboard.

The 35s seems to be OK, far better than the 33s. But will it effect the value of old HP classics? - Never! You will see 42s and 15c getting even more expensive with time.

### **Re: How will the 35S affect the value of your collection?**

Message #4 Posted by [Bob](#) on 11 June 2007, 5:37 p.m.,  
in response to message #3 by Frank Rottgardt

Quote:

Although I am not a collector, per se, and do not plan on selling any calcs, I tend to agree. They still feel better than anything out there. They were just built differently in a different time with different priorities by a different culture. They represent the high water mark in calculator technology to many folks.

Did classic car values go down in value when the cruiser knockoffs came out?

Besides, they aren't making any more and, as just about anyone who has several of these around the house can tell you, there is an emotional element to owning/using one of these high quality classic machines as well.

*Message #12 Posted by [Seth Morabito](#) on 13 June 2007, 9:08 p.m.,  
in response to message #1 by Jim Creybohm*

Personally, I collect HP calculators because I love them. I don't care about the price, in fact I wish they were cheaper and more plentiful, so more people could enjoy them! But that doesn't answer your question.

With luck, some prices will go down a bit, but I don't see any kind of price plunge. Maybe the 32SII will see a slight price drop, but all in all I think things will be pretty constant.

### **Re: How will the 35S affect the value of your collection?**

*Message #13 Posted by [John Ioannidis](#) on 18 June 2007, 2:52 p.m.,  
in response to message #1 by Jim Creybohm*

That's like saying that every time the post office prints a new stamp, older stamps lose their value.

### **Re: How will the 35S affect the value of your collection?**

*Message #14 Posted by [db \(martinez, ca.\)](#) on 19 June 2007, 12:54 a.m.,  
in response to message #13 by John Ioannidis*

John; no kidding.

i have about 45,000 bucks worth of instrument and (garbage) carlson alegro banging around the truck, plus all the computational power in the office and on this thing i am typing on. on saturday i needed to figure grades on twentysome points for this morning. i grabbed my 41. it needed to be done right.

it's like last year. the only time the screaming midget i used to work for would shut his face hole was when he needed me to figure something he wasn't sure he could do. i couldn't do it either but my 41 could.

i'll buy the 35s and put it in my vest because i like new toys, but the cx stays in it's qsack on my belt in case i need to think.

in response to message #1 by [DaveJ](#)

Silly me, just saw the text on the main page. "Available 6th August, taking orders now."

Also, a supplier has leaked the release date of the 35S as being August 1st.

Dave.

in response to message #1 by [DaveJ](#)

I still wonder why the HP 8s wasn't introduced worldwide. It seems like a decent enough calculator for an inexpensive non-RPN scientific. I was only able to get one by winning it as a door prize at a conference.

### Why can't we buy a beginners RPN calculator

in response to message #5 by [Sam Levy](#)

Market share.

And there is a beginners RPN: the 33s and soon the 35s, and you could say a used 12c.

There is even a beginner's RPL: a used 28c or 48S.

**Re: Why can't we buy a beginners RPN calculator**

*Message #7 Posted by [John V Nelson](#) on 11 June 2007, 8:45 p.m.,  
in response to message #6 by bill platt*

I think what Sam ment is why can't people buy a beginners RPN at the same price point as the one he mentions. The ones you mention are all fine calculators, but the price point is higher.

I think it would really be nice for HP just to come out with a simple, but not overly complicated RPN at the \$10 -\$15 range. No real fancy functions, no R/S mode, just a simple calculator that can do what most basic calculators could do.

I'm sure there may be some people who would not buy them because they are a glorified 4 banger, but then I think some would because they are a less complicated RPN. I know my wife likes RPN, but she feels intimidated with all the other buttons. Anyone else know of anyone out there like that? I'm curious.

\_\_\_\_\_

I'd buy a few to give away, just to introduce people to RPN. HP really missed the boat by not making an extremely inexpensive RPN model and giving away tens or hundreds of thousands of them to schools.

No way are the 33s or 35s "beginners" RPN calcs. They are much too complex.

A "beginners" or "general use" calc has basic scientific functionality and that's it. No programming capability, lots of dedicated keys, and an uncluttered key overlay.

A 4-banger would be almost useless, but a basic scientific with a "familiar look" to the average person would be terrific.

Dave.

The Aurora fn1000 is still available for about \$25, though it is officially a discontinued item. I have been carrying one for 8 months now in my shirt pocket and have dropped it numerous times on a hard surface and it keeps on ticking. It hit hard enough to knock the clamshell cover off several times. It is a 12C clone and has very mushy keys, but I am impressed with the ruggedness and functionality.

Don

Casio, like hp, no longer makes their own calculators, but instead relies on an OEM. I don't remember which one, but I'm sure hp could also get similar calculators made by the same OEM (or possibly duplicated by another).

Maybe you didn't follow the [earlier discussions](#). The material about the HP-35s was posted by a *foreign-distribution partner* (not HP), which likely "jumped the gun" by announcing a product that wasn't to be available until sometime in summer. I don't know how "final" the specs and image were. The distributor's site is still up.

The material was removed at the initiative of either the distributor or HP, likely due to the chatter and inquiries resulting from the leak, which certainly rejuvenated discussion in MoHPC Forum.

But it really should have the  $x^y$  key for inverse log...

### Re: HP 35c "Classic" Red Dot Anniversary Edition

Message #4 Posted by [Raymond Del Tondo](#) on 10 June 2007, 5:03 p.m.,  
in response to message #1 by Jason

Nice one.

But the design of the keys does not reflect the design of the original HP-35, as the original HP-35 did not have slanted keys, and so the surface could be flat, and the imprints full-sized.

However, as I see the photos of the modified 35s again, I still don't like the arrangement of the modified cursor keys. If I had to choose between these and the 'original' cursor key arrangement and form factor as hp indicated, I'd choose the hp 'diamond shape' version, since the arrangement is much more natural (like a cursor cross) .

Raymond

Nice, but calculators and their features have progressed somewhat since the original 35S.

A few extra features would not only make it look better (i.e. more "technical") but make it a much more valuable calc for everyday use. I know the point is to make it look like the original, but give me at least some progress over nostalgia any day.

Dave.

Ohhh yes :-)

And the whole thing built into a cast-titanium housing (about as technologically challenging as a scientific pocket calculator in 1972) with a large dot-matrix (O)LED display. Powered by an advanced polymer battery with near-infinite cycles, that gets charged by invisible solar cells behind the translucent keyboard, which in turn is automatically backlit in low-light environments... (mind you, this is not sci-fi, but there are watches that work that way!)

I at least would be ready to pay the same amount in today's Euros/Dollars for such a calculator as was required to buy the original thing in 1972. But I'm afraid I'll have to wait for the 50th anniversary for it to happen...

Greetings, Max

Have you seen how much top-of-the-line very low volume HP/Agilent test equipment sells for?

You often don't get any change out of 6 figures, with nothing being under 5 digits. Would you pay a few thousand dollars for a calculator? Developing a calculator like this in a big company like HP costs millions of dollars, and if you only sell a thousand, well, do the math with regards to break-even after profit margin etc...

Dave.

---

The closest thing to what you described would be a 15" Macbook Pro running the latest version of Mathematica. The newest Macbook has many of the features you described, and the cost would be very close in constant money to that of the HP-65 or 67 (Which had state-of-the-art I/O) back then.

A bit bulkier than the HP-35, of course, but the point is that the HP-35 in 1972 was a cutting-edge technological product which filled an unmet need for working scientists and engineers. Any new machine will have to do that or it will not be profitable, and it will not be made.

John

---

No, no, not really. I was rather thinking of a calculator equivalent to a classic Leica-rangefinder-camera ([http://www.leica-camera.co.uk/photography/special\\_editions/leica\\_m7\\_titanium/](http://www.leica-camera.co.uk/photography/special_editions/leica_m7_titanium/)): These things have a very basic functionality, but are made from the best materials using state-of-the-art craftsmanship and are designed to last a lifetime - or even longer. Where far-east products are made from plastic, are full of bells-and-whistles and sell by millions at ridiculously cheap prices, Leicas are manufactured by thousands at best, are awfully expensive and yet the company has its faithful customers since three or four generations.

So that's what I'm dreaming of: An anniversary edition calculator that I can use every day for the rest of my lifetime and about which my grandchildren (should I ever have some...) will start a fight in case I forget to explicitly mention it in my last will :-)

Waterproof, solid titanium housing, eternal power supply (Citizen guarantees that their "eco-drive" watches last for a minimum of 20 years, so HP, take up the challenge!), unbreakable keys and display, basic functionality (for programming and fancy extras everybody has a personal computer anyway). All inside a beautiful soft-leather pouch designed by Prada and I bet that I will not be the only one who would spend in excess of 1000 Euros for it. "The last calculator you'll ever need to buy" would be the appropriate sales slogan!

Greetings, Max

This could be either OLED (organic LED) displays, that give excellent brightness and contrast at reasonable levels of power consumption or LED backlit inverse (white-on-black) liquid crystal displays. Both kinds of display are fairly common now with mobile phones, mp3 players, car radios, digital cameras and similar battery-powered portable devices. Proven technology, so to say...

Yes it would be possible with todays high efficiency LEDs, but depends on your definition of "reasonable". You can get decent brightness these days on sub-1mA per LED, so for say a 12 digit display that would be under 100mA worst case total for direct drive (which you wouldn't use anyway). On a set of AA's that would equate to roughly 30hours use worst case.

PWM and multiplexing techniques could of course substantially improve on this. It would be possible to get <10mA draw for the entire display, giving you roughly 300 hours continuous use worst case. That's almost a years use at 1hr/day on AA's. I think that's pretty reasonable.

The OpenRPN project could offer an LED display as an option perhaps?

Dave.

---

I collect LED watches and i'm always on the lookout for a modern watch with a modern display that looks like an LED watch. There is one. It's an LCD display that has red numerals on a black background. It doesn't look exactly the same of course because it isn't self-luminous but it's the closest i've seen, and I don't think it uses any more power than a traditional LCD. It's the one on the left in the picture.

### Pr Error HP-34C

Message #1 Posted by [MikeG](#) on 9 June 2007, 3:11 p.m.

After spending some time and rummaging three HP-37E's I finally got my HP-34C working (somewhat). The unit passes the self-test, RAM is functioning and program storage works fine, though I had to implement a make-shift battery clip since the best battery terminal I had still had a missing terminal due to corrosion.

What's happening now though is that every time I shut the unit off and wait more than a minute generally, the unit will power back on with the PR Error displayed. Is this a failed cap?

Thanks in advance.

### Re: Pr Error HP-34C

Message #2 Posted by [Les Wright](#) on 9 June 2007, 3:24 p.m.,  
in response to message #1 by MikeG

I use a 34C with normal AA NiMH cells with the circuit completed on the right side of the compartment with a thin strip of aluminum foil. I found the old battery clip was too snug with regular AA cells and this works fine. It also makes it easy for me to pop out the cells and charge them in an NiMH quick charger. The Spice power adapter was intended for NiCads and will work with the NiMHs but takes forever to charge fully.

I was erasing my memory occasionally when removing batteries and it took time for me to realize that if I wasn't careful the foil strip would zip across the compartment and touch the contacts and discharge memory that way.

So I am wondering if your homemade clip could be the issue? Is the circuit being closed someplace it shouldn't be?

If your clip indeed is not the problem and the batteries are fine then I fear it could be the electronic innards and I hope someone here can guide you!

Les

### Re: Pr Error HP-34C

Message #3 Posted by [MikeG](#) on 9 June 2007, 4:27 p.m.,  
in response to message #2 by Les Wright

Thanks for the response. The battery I'm using is the standard HP rechargeable for the spice units, in good condition. The make shift terminal is the - clip on the ribbon terminal.

I did make sure that the clip isn't shorting out anything and yet I still get the error. Again, this error is produced if the unit is left off for > 30sec

### Re: Pr Error HP-34C

*Message #4 Posted by [MikeG](#) on 9 June 2007, 5:58 p.m.,  
in response to message #2 by Les Wright*

OK, I think I may know why the error is being generated. Question is the PSU board for the 37E the same as the 34C? for this is the replacement I used.

**Re: Pr Error HP-34C**

*Message #5 Posted by [Eric Smith](#) on 9 June 2007, 8:41 p.m.,  
in response to message #4 by MikeG*

No. The "C" models use a different PSU to provide standby power to one of the three 8-pin chips (the one closest to the display).

If you have the wrong PSU, or hae the 8-pin chips in the wrong order, you don't get continuous memory.

### 50G--the accumulated experience to date?

Message #1 Posted by [Les Wright](#) on 9 June 2007, 2:44 p.m.

I believe the 50g has been out the better part of year. I haven't got one, since my 49G+ has been until recently underused and still works fine, but I would be interested on the collective experience of the 50g.

I get the impression that 50g is basically the 49G+ with some extended I/O and powering capabilities. It is considered by most to be more visually appealing. And I also get the impression is is mechanically more sound--indeed, I haven't read here over the past few months any complaints of keyboard failures of the type that have plagued some lots of the 49G+.

I ask this not because I want a 50g at this time. Rather, I am hoping the improved quality of 50g will be reflected in the much anticipated 35s. Also, have the manufacturing improvements transfered to newer production for the 12c, 12cp, or 17bii+? I get the impression that my recently made 17bii+, although lightly used, is really better made than reports here would lead me to expect. Yet my 12cp is a bit older and has a mildly fussy keypad.

Les

in response to message #1 by Les Wright

I can report that my 50g, an early production model (SN CNA 61807135) has held up great under moderate use. With about the same amount of use, my 49g+ was showing the strain, with some keys going "mushy" and others having the legends partially rubbed off. None of those symptoms have appeared on my 50g. Its keys are all still "snappy" and the key legends appear completely unaffected by being repeatedly pressed by my grimy fingers for a year. Also, the annoying debounce problems of the 49g+ are completely absent on my 50g.

I just replaced my first set of batteries in this machine. The four alkaline AAA cells lasted quite a bit longer than the three AAA cells of the 49g+. That's what you would expect, of course, but I think that the USB power feature also played a role. I spent lots of time with the calculator tethered to the PC as I did programming.

Regards,  
Howard

Quote:

my 49g+ was showing the strain, with some keys going "mushy" and others having the legends partially rubbed off.

In my first year of ownership my 49G+ got little use since I found it to be a battery hog and I found UserRPL to be a little inscrutable.

Since getting good rechargeable batteries and a quick charger, plus developing an interest in UserRPL, I have spend a lot of time with the 49G+ over the past few weeks. No key failures yet, but the gold paint, which frankly I thought was an attractive look even though it was not the most popular colour scheme here, is beginning to wear and pit around the edges. Legends remain intact, but the gold paint is becoming irregular around them.

Plus, I have some dust and a single cat hair stuck under the display plastic. A bit distracting, but I have no idea how to safely pry the plastic up to blow the lint out.

I really have grown to like the 49G+ and when it dies, which I am led to believe it will, I look forward to replacing it with a 50g.

Les

Thanks! The suction cup trick is exactly what I need. I believe my partner has some around the house sticking cut decorations on windows, etc.

Since I have your attention, where would you recommend I go for discussion about HPGCC programming? is the hp48 newsgroup a good place to start?

Les

Hi Les.

I think that

<http://groups.google.com/group/comp.sys.hp48/topics>

and

<http://hpgcc.org:8080/pebble>

might be a pair of good places to discuss about HPGCC.

Hope this helps.

Best regards.

Giancarlo

in response to message #1 by Les Wright

As with most new machines, I usually wait for a significant length of time to let the bugs get worked out of the system and uncover weaknesses. That is why I have asked for a new 50G for Father's Day. That is about enough time, I imagine.

A new machine may still have manufacturing issues. Even an identical process, installed and started up next to the old one can have problems, much less a new design on a new production line with new people. There are many potential reasons why this can be so.

in response to message #1 by Les Wright

I have had a 50g since January, and use it daily (though sometimes only to play Tetris ;-). The keyboard and the aesthetics are definitely much improved and I am quite happy with it.

My only complaint is that they keep changing the color of the @#%! shift keys! I am hoping that the next version they will go back to good ol' blue & gold and stick with them.

NOOOOOOOOOO! I don't know if it is just me (I'm strongly red/green color blind) but I find it almost impossible to distinguish between the shift key colors on my 48gx and my new 33s. I love the color layout on the 50g. Easy for my old broken eyes to distinguish. Can we keep it, please? Please?

*Message #10 Posted by [John Keith](#) on 10 June 2007, 11:33 p.m.,  
in response to message #9 by brianh*

Actually, the 48GX and the 33S use purple and green for the shift keys, which is even worse. Especially on the 33S, the purple is so dark, it is hard to distinguish it from the black background. The 50g is definitely better in that respect, I just wish they would be more consistent.

John

*Message #12 Posted by [brian haren](#) on 11 June 2007, 9:54 p.m.,  
in response to message #11 by Walter B*

Walter,

The color choices look good, easy to differentiate. I also feel the arrows on the color keys are a source of confusion. If you use well differentiated colors you don't need directional arrows. Always seemed kind of goofy to me.

As for the function selection and layout, I'll have to defer to wiser folks. Whatever the layout, I'll be buying at least one...

Brian

Brian,

Thanks for your feedback. You can find the results in said other thread.

**Re: 50G--the accumulated experience to date?**

*Message #14 Posted by [Ron Allen](#) on 10 June 2007, 1:40 a.m.,  
in response to message #1 by Les Wright*

My 50g is at build 92 which I believe is the current supported version.

There was a bug in the previous version with LINSOLVE() as it is illustrated on page 11-41 in the "User Guide." This still doesn't work at build 92. I never tested the bug extensively because of other active people involved, so I'm now sure about the symptoms, but it does feel a little different from my limited exposure to the earlier version. If there's been one, I missed the announcement about anyone dealing with this bug.

I thought I had a bug with symbolic calculus, but I had set the flag on in the configuration I had setup. The settings of flag 117 on created a situation during the step-by-step process which gave me one or more extra steps over the normal in some integration. The problem was that it changed access through the sequence causing opportunities to crash before getting started. The welcome extra steps in some of the patterns helped in the analysis since the integrator likes using rational or partial fractions when it can. When there are other approaches available I like to see them.

For example, try integrating the secant of x several ways. I start with the reciprocal of cosine(x). I say x which works best with the calculator.  $\int(1/\cos(x))dx$  is solved in at least three different ways by pencil and paper, and one each by the 50g and by Mathcad 13. FYI, the 50g usually gives the easiest response to follow of the three and it is fast enough to compete with the other two, a real advantage in the field when you are competing for the assignment.

I have had trouble with the memory manager and linkage via the devices offered (conn4x, etc. I am afraid the common denominator is me rather than the 50g. I am very happy to see the luck everyone is having with the SD card! There's a lot of opportunities for improvement there like the ability for multiple directories, etc.

The keys are definitely superior in quality over the original 49g. Enough said there. Also, I keep two sets of batteries charged for the unit. May seem like overkill, but mine have never run down.

I have not run benchmarks with the interpreter level, but will trade any "slowness" for a calculator that supports customized everything like your own input forms design capability. With that one gig SD card or 2 gig, you can have several differnt custom calculators in one little package including mass storage.

\*\*\*\*\*

Now, I would like some information from those of you who are currently informed in other areas. I am not familiar with the total programming picture here, but assume that there are at least 3 ways to use the 50g: the RPN interpreter as it comes in the box, a medium compiler, probably using p=code on a virtual machine with some added features over the basic interpreter and a machine level language limited compiler. In addition there are probably ways to use C++ for very efficient customerization.

How do I get my hands on the next level above RPN, suppose that would be like RPL? Can RPL run under emulation for developing custom routines - on a PC? Are most RPL routines able to run on either? Will RPN routines all run on the basic system?

Thanks for everything you do,

Ron

### **Re: 50G--the accumulated experience to date?**

*Message #15 Posted by [bill platt](#) on 10 June 2007, 10:07 a.m.,  
in response to message #14 by Ron Allen*

The 48g, 49g, 49g+ and 50G (as well as the earlier 48s) are all RPL machines. They are not RPN. They behave almost like RPN with direct calculations, yet they are slightly different. There is an infinite stack, there is an input buffer in addition to the first stack level (which would be "x" in an RPN machine) and most importantly, there are multiple datatypes.

RPL machines behave more like a line interpreter--the user is free to put an infinite number and combination of invalid information into the input buffer. In RPN machines, invalid input is finite, as the selection of inputs is limited, and you don't have a separate input buffer--you write directly to the x register.

An example of the difference in behavior is easily demonstrated with taking the square of a number using the stack:

| ----- RPN ----- | ----- -----        | -----RPL-----                           |
|-----------------|--------------------|---|
| INPUT           | STACK<br>(x,y,z,t) | STACK<br>(1,2,3,4...)                   |
| 4               | 4,_,_,_            | _,_,_,_... {sitting in input buffer}    |
| enter           | 4,4,_,_            | 4,_,_,_...                              |
| X               | 16,_,_,_           | 4,_,_,_... "* Error: Too Few Arguments" |

To square a number in RPL, you have to enter *\*twice\** in order to push the input into both the 1st and 2nd levels of the stack.

User RPL programming is directly accessible from the keyboard simply by typing the << >> characters, which have the programming delimiters. There is no separate programming space as in RPN. Programs can be recalled to the stack, edited etc. You EVAL a program to execute it, or you save it into a variable, and simply select the variable from the softkey to execute it.

System RPL is a larger set of instructions which is also directly accessible to the user, but the coding is more machinelike. It is the underlying language that USER RPL is built from. The hazard of SYSRPL is that the inexperienced user can easily freeze the machine and dump all memory, as SYS RPL does not check for valid data, as USER RPL does. USER RPL is robust for an end-user programmer.

When the 49G+ came out, the SATURN processor was emulated by a newer chip, and in doing so, that opened up the possibility of hacking into the base level of that machine code, which was successfully carried out less than a year after the 49G+ was released. In addition, there have been a number of people working on C programming for it but I don't know the details.

The 49G+ and the 50G are the same in their basic architecture and language and processor--just the 50G addressed a number of issues in the hardware especially.

## Re: 50G--the accumulated experience to date?

Message #16 Posted by [Howard Owen](#) on 10 June 2007, 11:22 a.m.,  
in response to message #14 by Ron Allen

To add to what Bill has written, the C language system is HP-GCC ([Linux](#) and [Windows](#) versions, [project home page](#)). This consists of a translator from the elf format produced by the GCC arm code generator, a shim to enable loading and running the results on the calculator, and libraries for accessing the features of the machine from C code. If you want native 75Mhz ARM speed on the 50g, this is the way to go.

Regards,  
Howard

## Re: 50G--the accumulated experience to date?

Message #17 Posted by [Ron Allen](#) on 11 June 2007, 2:24 a.m.,  
in response to message #16 by Howard Owen

Thanks, Bill and Howard for clarifying the RPN/RPL thing. I suppose those benchmarks on speed are for 50g and others recorded under RPL. Would that be "User RPL" or native interpreter?

I plan to write up the photography questions for DEPTH OF FIELD and others using multiple equations. I believe they will be ideal for INPUT FORMS similar to the financial screen.

I take it that the development software is available through HPCALC'

Thanks again

## RPL (long)

*Message #18 Posted by **James M. Prange (Michigan)** on 11 June 2007, 2:11 a.m.,  
in response to message #14 by Ron Allen*

Certainly UserRPL isn't "Classic RPN" as implemented in other HP RPN models, but with the exception of program structures, UserRPL is quite consistent in following the RPN (Reverse Polish Notation) model, that is, any arguments first, followed by the operator; it's a strictly postfix notation. I'd say that UserRPL is an implementation of RPN, although not the same as Classic RPN.

As a logical/mathematical notation, RPN doesn't impose any inherent limit on the number of arguments waiting to be operated on. Classic RPN has the limitation of 4 stack registers, plus other registers which can be copied to or from the stack. For the UserRPL models, the only limit to the number of stack levels is the amount of available memory, so in this respect, I'd say that RPL comes closer to being truly RPN than Classic RPN does.

For the RPL models, assuming that vectored ENTER isn't in effect, when ENTER (or a key that invokes an implicit ENTER) is pressed, source code keyed into the command line editor is parsed, and, assuming valid syntax, compiled and combined into a secondary (SysRPL program), which is placed on the stack and executed. For source code "quoted" between UserRPL program delimiters, the evaluation of the delimiters and their contents is to a program object.

The contents of the command line amount to the source code for the contents of a program waiting to be parsed, compiled, and executed, and the contents of a UserRPL program could be considered the compiled unevaluated equivalent of a valid command line.

Note that an ENTER operation always compiles the command line's (or other editor's) source code to some type of RPL object. The "stack" is really a stack of pointers to objects elsewhere in memory, and the "objects" that you see on the stack are really decompiled character string versions of the objects pointed to. For the stack display, this decompilation and the display update takes place only just before the system is ready to accept keyboard input, not while a program is running.

Similarly, editing, the \->STR command, transferring in "ASCII" ("Text") mode, or printing decompiles the object to a character string (source code) equivalent, and in the case of transfers or printing "via wire", optionally with non-ASCII codes "translated" to pure ASCII sequences.

This compiling explains why all formatting ("white space" and line-breaks) and commenting is lost as soon as you press ENTER. If you want to preserve your formatting and comments, then either write your source code within a character string or else write it on your PC and transfer it to the calculator.

Note that for the RPL models, when in the "standard stack display" (no command line or other "special environment" active), pressing the ENTER key does **not** invoke an ENTER operation; it's simply a "keyboard shortcut" that invokes a DUP command.

The UserRPL commands are actually special cases of named SysRPL programs that include argument checking intended to prevent the user from doing anything that would corrupt user memory. SysRPL commands are unnamed on the calculator itself (unless a special library is installed), and SysRPL commands are actually SysRPL (or in some cases, machine language) programs that, in most cases, contain other SysRPL commands and often have embedded machine language code. Of course, ultimately, it's machine language code that ends up being executed. If you want to investigate, then I recommend a library

named "Nosy", available from [hpcalc.org](http://hpcalc.org).

For all RPL models, the ordinary user does have access to SysRPL objects numerically by the use of the UserRPL commands SYSEVAL, LIBEVAL (48G and newer only), and FLASHEVAL (49G and newer only). Care must indeed be used with these commands. For example, SYSEVAL does check that it has a user binary integer for its argument, but other than that, it doesn't do any argument checking; it simply causes execution to jump to that address, whether it makes any sense to do so or not, and misuse of these commands may very well cause memory corruption. Also note that "unsupported" entry points may well change with different ROM revisions, and even "supported" entry points often change with a different series of models (48S, 48G, or 49). If you want to use one of these operations frequently, then I'd suggest that you write a small named program that first checks for the required arguments, followed by the numeric argument and the SYSEVAL, LIBEVAL, or FLASHEVAL command, and then execute the program by name. If you want to embed one of these commands within a UserRPL program, then make sure that the program will definitely ensure that any required arguments for the sequence are available on the stack first.

For the 48 series, HP provided tools for writing SysRPL and Saturn assembly language programs on a PC, and 3rd-party external libraries were developed to do this on the calculators themselves. For the 49 series, a SysRPL/assembly language compiler (MASD, or the "Development Library"), including assembly language mnemonic keywords, is built-in, although "out-of-the-box", only numeric SysRPL codes can be used. To use mnemonic SysRPL keywords with the "Development Library", an extable library has to be installed.

For the ARM-based models (49g+, 48gII, and 50g), the Saturn processor is emulated, but note that the emulated Saturn processor has additional (apparently "unsupported", but, I hope, stable) machine language opcodes and, for the Development Library, their matching assembly language mnemonic keywords, and it's often referred to as the "Saturnator" or the "Saturn+ processor".

SysRPL and assembly language programming are intended for "developers", not for "ordinary users". In general, the results of a mistake are often dire enough that most of us (Wolfgang and perhaps a few others are exceptional) shouldn't attempt to use them for ad hoc programs where development time is an important consideration. That said, with the 49 series, (or a 48 series with a RAM card installed), archiving and restoring all of user memory (which may very well be corrupted in case of a mistake) isn't very difficult, and the compiler is built-in on the 49 series with an extable library easily installed, so it isn't unreasonable for an "advanced" user who's willing to take the time to learn how to do so to write his own "development language" programs.

The advantages of SysRPL programming are, first, that there are a lot more commands available than with UserRPL, and second, most SysRPL commands don't spend any time doing argument checking. Of course, the disadvantages are that the lack of argument checking means that the developer has to be more careful, there's a lot more that can be learnt (much of which is "an exercise for the student"), and with so many more ways to accomplish the same thing, choosing which way to do it may be more difficult.

The advantages of assembly language programming are that you can do things in it that would be difficult or impossible in RPL, and a well-written assembly language program should be faster than an RPL program that accomplishes the same thing. A disadvantage is that it often takes several assembly language commands to accomplish what could be done with just one RPL command, so assembly language programs are typically larger. Of course, a mistake in an assembly language program can be just as disastrous as in a SysRPL program.

Note that assembly language (or machine language) code sections can be embedded within SysRPL code.

With the ARM-based models, it's possible to access the underlying ARM processor, and indeed HPGCC has been developed for using C++ code with these calculators. That said, I've never experimented with this.

Of course the 49 series also have an ALG mode, and programming in this mode seems to be what HP means by "hp basic" in regards to these models. Note that this "hp basic" is not related to BASIC (Beginner's All-purpose Symbolic Instruction Code). The only thing that I've bothered to figure out how to do in ALG mode is switching to RPN mode; if I'd wanted an algebraic model, then I would've bought a "Brand X" model.

SysRPL is also the underlying "development language" for many of the algebraic-only models that use the Saturn processor, beginning with the 18C. In some cases it's possible to write and compile a SysRPL / assembly language program and transfer it to an algebraic-only model. I don't have any of the algebraic-only models, and I have no personal experience with this.

The comp.sys.hp48 usenet group certainly seems a better place to discuss the RPL models; many RPL experts frequent that newsgroup and are generally very helpful, although of course it's best to "do your homework" and try to avoid repeating the "Frequently Asked Questions". I prefer to participate in that newsgroup by using Thunderbird with my ISP's news server, but it can also be accessed through <http://groups.google.com/group/comp.sys.hp48/>. The entire newsgroup archive, all the way back to 1991, can be searched from [http://groups.google.com/advanced\\_search?](http://groups.google.com/advanced_search?) (which also works for any "Google Group" or any usenet group that Google has archived).

The current HP Museum CD-ROM set / DVD-ROM includes lot of information about the RPL models, including documentation for the 48SX Equation Library card, which is useful for using the Equation and Periodic Table libraries on the current models. I particularly recommend the books by William C. Wickes. See <http://www.hpmuseum.org/cd/cddesc.htm>.

Certainly any 49g+/50g user should have the 48gII/49g+ Advanced User's Reference Manual, available from HP's site.

Note that a version of the current 49g+/50g "ROM" without the optimizations for running faster on an ARM-based model is included with Debug4x. With minor tweaks to a copy of a 49G .KML file, this can be used with the 49G emulator and transferred to a real 49G with the ROMUPLOAD command. Except for the execution speed and hardware-dependent operations (including Saturnator-only opcodes and accessing the ARM processor), you can make the 49G behave very nearly the same as the 49g+ and 50g, with the latest ROM revision.

Note that emulators for the 48GX and all 49 series models are included with Debug4x, but also note that it's the "Hardware Saturn" that's emulated, not the ARM processor with a "Saturnator". See <http://www.debug4x.com/>.

Alternatively, a 3rd-party Version G Revision #2.10-7 ROM, with some bug fixes and additional capabilities, can be found at <http://www-fourier.ujf-grenoble.fr/~parisse/english.html> (or <http://www-fourier.ujf-grenoble.fr/~parisse/francais.html> if you read French). This version includes the Equation and Periodic Table libraries for the 49 series. Information on the 49 series CAS can also be found from there.

The most recent Equation and Periodic Table libraries for the 49 series can also be found from <http://www.hydrinx.com/Download/Hp/>.

Of course, any RPL user should be familiar with <http://www.hpcalc.org/>.

"Training modules" for the 50g are available at <http://h20331.www2.hp.com/hpsub/cache/383680-0-0-225-121.html>.

Other useful on-line resources for RPL models include <http://membres.lycos.fr/ekalin/>, <http://hp.giesselink.com/>, <http://staff.science.uva.nl/~dominik/hpcalc/>, <http://page.mi.fu-berlin.de/raut/>, <http://holyjoe.net/hobbies.htm> (also <http://holyjoe.net/hp/tiotable.png>, <http://holyjoe.net/hp/types4.htm>, and perhaps various other files at <http://holyjoe.net/hp/>), <http://alaska.magpage.com/~jakes/>, and

<http://m.webring.com/hub?ring=hp48>.

Each new RPL implementation is mostly a superset of the previous implementation, and the documentation for earlier models is often better, so don't ignore something just because it's written for a different model; it may well apply to your model as well.

Take anything that you read with a grain of salt. If you want to know how someone else (including an HP technical writer) thinks something works, then read whatever information is available about it; if you want to know for certain how it works, then experiment for yourself.

Regards,  
James

in response to message #18 by James M. Prange (Michigan)*

James, what a wealth of knowledge, people, places, technical and non-technical things you share with us! Thank you for being so generous. Between this letter from you, the treatment you provided with the explanation for "COMPILED LOCAL VARIABLES," you recently gave me I feel that I have short-circuited a lot of work.

I will take your advice seriously and will be avoiding any development activities above UserRPL for some time, if not forever. Besides, I just had great response to a question about Lorentz transposes used in Relativity, especially the advice from Plastics Guy. I expect to be too busy trying to derive them with my own differential equations and another summer project to design INPUT FORMS to work with photography.

Thanks again for your contributions,

Ron

### **Re: RPL (long)**

*Message #20 Posted by [James M. Prange \(Michigan\)](#) on 11 June 2007, 9:06 a.m.,  
in response to message #19 by Ron Allen*

I really didn't mean to discourage anyone from trying the "development languages", but trying them does mean that the calculator's memory should be backed up first, and extra care is needed, and yes, some study and sometimes experimentation is required, and you're still likely to occasionally crash your calculator and need to clear and restore memory, at least until you "get the hang of it". That said, you don't need to know or use every feature of SysRPL programming or every SysRPL command to write a useful SysRPL program, any more than you need to know or use every feature of UserRPL programming or every UserRPL command to write a useful UserRPL program.

I do recommend waiting until you're reasonably comfortable with UserRPL programming before venturing into SysRPL programming, but SysRPL really isn't all that much different from UserRPL.

A comparison of the source code for a UserRPL program and a SysRPL program that end up accomplishing the same thing, but the SysRPL program is much smaller (70 bytes versus 116.5 bytes) and faster (about 2.09 seconds versus about 6.30 seconds on a 49g+):

```
%%HP: T(3)A(D)F(.);  
@ For 49 series only.  
@ Arguments: None
```

```

@ Download or enter in exact mode.
@ Checksum: # A162h
@ Size:      116.5
\<<
"
 128 255
FOR n
  "\010"
  n
  " "
  OVER R\->B
  OVER +
  PICK3 CHR
  PICK3
  OVER
  # 2F34Eh SYSEVAL      @ KVIS for 49 series.
  + + + + +
NEXT
"\010" +
\>>

```

```

%%HP: T(3)A(D)F(.);
@ For 49 series, MASD syntax.
@ Extable library required for compiling.
@ Arguments: None
@ Checksum of source code string: # 469Eh
@ Size of source code string:      280.
@ Checksum after compiling: # 7E4Fh
@ Size after compiling:           70.

```

```

"!NO CODE

PTR 33B55  
PTR 032C2  
PTR 2F34E  
PTR 05193  
PTR 05193  
PTR 05193  
PTR 05193  
PTR 361DA  
PTR 07334

;  
@"

To compile that last SysRPL source code string on any 49 series, even without an extable library installed or the development library attached, with the string in level 1, execute 256.06 MENU, and then press the menu key labelled ASM.

What that SysRPL program looks like as a string of hex digits, after compiling:

```
D9D202926293B3333733706337F370122708813077F527DB532C230CC9500CFE239150  
7DB533223057A505AA7355B332C230E43F239150391503915039150AD16343370B2130
```

(Treat the above 2 lines as 1 long line.)

Saturn assembly language isn't too difficult either, although it seems to me that it has some "quirky" limitations on which registers can be used with each other and with which instructions, and using it tends to be tedious.

But UserRPL is quite powerful enough for most purposes, and when keeping development time low is important, seems the best of these languages for almost all users.

I recommend restricting "development language" programming to when you have some spare time to work on it.

Regards,  
James

\_\_\_\_\_

That is where I am at right now, and I must admit that even the yellow-belt level is pretty gratifying.

I have recently developed an interest in writing routines for special functions that are not built into the calculator--the incomplete beta function, the incomplete gamma function, and the sine, cosine, exponential, and Fresnel integrals, to name a few. Right now, the code looks an awful lot like the C, Fortran, Pascal, or Basic templates I am cribbing from (be they from Numerical Recipes, Cephes, Netlib, or GSL, for example)--lots of local variables, for example, and the RPL equivalents of common operations in other languages. For example, the C statement "term \*= fact/k" would appear in my program as "fact k / 'term' STO\*" and "d = 1/d" would get rendered as "'d' SINV" -- that sort of thing. So far, I have produced a few neat little programs that give good results and run much more quickly than their RPN counterparts on the 41CX, 42S, or even the rather fast 33S.

My next goal is to develop an awareness of stack in order to write UserRPL routines that don't use a single local variable, but rather control the stack and manipulate it with PICK, ROLL, OVER, DROP, DUP, etc. to generate and track interim results. I expect such versions would be smaller in size and perhaps a little faster.

Then, if I ever have time, I will try to learn a thing or two about SysRPL.

Les

This is interesting, as you can see an eclecticism in the design of the 48 series: A pretty complete and very robust \*structured\* programming language, as well as a pseudo machine-code-line-interpreter stack-based paradigm. The former is easier to read, perhaps easier to debug, logical and pretty transferable as you demonstrated with your examples of "cribbing", whereas the latter seems to be an inescapable exercise in programming elan if nothing else. One would think that the structured approach would win out and leave the stack concept behind, and yet there is something so versatile about the stack, and the genius of having both a stack and structured tools is what is to me the quintessential nature of the Champagnes and their offspring.

Quote:

With the ARM-based models, it's possible to access the underlying ARM processor, and indeed HPGCC has been developed for using C++ code with these calculators. That said, I've never experimented with this.

I am not a C or C++ wiz, but I have downloaded HPGCC and will give it a try.

So far, I have been able to get the ARMTtoolbox successfully on my calculator. I have been able to "make" the examples that come with the installation and figured out how to convert, on the calculator, those files to native executables that run with a keypress so yo don't have to invoke the ARMTtoolbox PrRUN function.

There seem to be math libraries that carry out computations in double precision floating point. This is very intriguing to me--it seems possible to write math programs with increased accuracy.

Neat!

## **Re: 50G--the accumulated experience to date?**

*Message #24 Posted by **brianh** on 10 June 2007, 9:57 a.m.,  
in response to message #1 by Les Wright*

I purchased one last week and spent the last several days playing with it's capabilities. I am comparing this to the 'classic' HP calculators, not the recent Kinpo mfg. models:

Good:

1. Build quality. Seems quite good. Solid, little case flex. Seems almost as rugged as the 48 series.
2. Keys. Good key color choices. Makes finding/differentiating functions easy. The keyboard is not too cluttered. Good key response. The arrow keys are a bit sloppy (you can wiggle them around) but otherwise all seems well built. While these keys have a good mechanical click they are not the same feel/response you will get from a 48-series machine. Still, all-in-all, pretty good!
3. Display. Better than the 48-series but can still be difficult to read in many lighting conditions.
4. Access to functions. I actually find the 50g easier to navigate around than the 48-series. For a time I was put off by the 'labrynthine' (is that a word?) 48gx menu structure. The 50g menu structure seems easier to work with and a bit more logical.
5. Expandability. I stuffed a cheap 1 gig SD card in mine and instantly had more storage space than I know what to do with.
6. Connectivity. USB, Serial and IR. Once I got the USB xmodem thing figured out everything went just fine. With the help of some forum members I was even able to get the calculator to talk to my old 82240B printer. Now I just wish there was a native 'trace' mode for printing...
7. Support. HP, on their website ([www.hp.com/calculators](http://www.hp.com/calculators)) already has a wealth of special purpose tutorials that take you through some of the more complex functionality. I've only looked at a few, but they seem to be well structured and documented. There is also a 50g-specific forum on the HP website but it's not too well populated yet (most HP savvy folks seem to turn to the HPMuseum website for help).

Bad:

1. Documentation. Folks in the HP calculator division need to be forced to read some of the classic HP calculator documentation (like for the 11C) to re-learn how to properly document a calculator. For example, there are two books that come with the 50g; the paper User's Manual and the User's Guide on CD. The paper User's Manual makes oblique references to the User's Guide but never explicitly states that the User's Guide is

in PDF format on the CD. A first year technical writer could have done a better job with layout and content. Don't get me wrong - most of what you are looking for is in the User's Guide but all I can say is 'Thank heavens for the search feature in Acrobat Reader!'

2. Documentation

3. Documentation

(do you get the idea that I'm not too impressed with this calculator's documentation?)

.. (most HP savvy folks seem to turn to the HPMuseum website for help) ..

Actually, this site focuses on older HP calculators primarily. The real center for HP 50g support is the Usenet news group [comp.sys.hp48](#) (link is to Google Groups.) As you have seen, you will probably get useful answers to HP50g questions here. But the folks who wrote the system software hang out on the news group, and they are backed up by an army of experienced RPL hackers.

I'm sure you're aware of it, but here's a link to Eric Rechlin's [HPCalc.org](#). That site is the mother lode for RPL calculator knowledge and software.

Quote:

The paper User's Manual makes oblique references to the User's Guide but never explicitly states that the User's Guide is in PDF format on the CD.

Also buried in the guide and manual are citations of the *real* manual, the [HP-49G+ Advanced Users Reference \(AUR\)](#)

Thanks for the mention, Les.

For a way to implement user-customized print trace modes in the 48/49 series, see some of my posts in [this thread](#).

The Museum Forum lacks a way to conveniently search all of its archives at once. A work-around is to use a Google advanced search, and for the "Domain" line, specify:

```
[Only] return results from the site or domain [hpmuseum.org]
```

\_\_\_\_\_

I have a 128MB card that was a throw in for a digital recorder. It holds only a few minutes of 96kHz WAV file stereo recording, and thus is pretty useless for serious use, so I got a 2GB card which accommodates an hour, and much more time in MPG formats. But the 128MB is positively huge as far as the 49G+ is concerned. And since I have a multimedia card reader on my PC, I can readily and quickly back up the card contents to my PC and not have to fuss with USB or serial connectivity.

Les

I know I feel kind of funny going into a meeting with my very portable 50g with the choice of 900 pages of printed documentation (2 volumes of 3-inch double sided paper,) or a laptop to read the pdf files. Kinda ruins the image you were trying to project about handy programming power in the field.

Have fun!

Ron

### 50g Connectivity Issues

Message #1 Posted by [brianh](#) on 9 June 2007, 1:23 p.m.

Hello all! It's been a long time since I've posted here, but your (generally) positive reviews of the 50g drove me to add one to my HP collection.

However, there is one nagging issue with my calculator that forces me to seek help on this forum.

I can not get my 50g to connect with either of my two computers, each running WinXP. I have installed and uninstalled the Conn4x software and drivers multiple times on each machine, with no luck. Also, when connected my XP resources window in My Computer does not recognize the calculator as a USB device.

I am using Conn4x v2.3, build 2436 and the USB driver that came with the calculator. All I get is the error message 'Error. No device detected. Check cable connections and the calculator'

I've scoured the calculator documentation and the HPMuseum form, but I can't figure out what's up. Since this is a subject that has not received a lot of attention I'm beginning to think I've got a bum calculator.

So, any help or suggestions would be appreciated. Anyone out there experience the same 'issue' and have a solution? As always, thanks in advance.

Brian

### Re: 50g Connectivity Issues

Duh (sound of head banging on heavy wooden table)

Right shift/right arrow

(sound of more banging)

OK, let me further expose my inability to solve my own problems...

Will the 50g print to my old 82240B IR printer, or has that capability been phased out with the 49 series?

Again, thanks in advance...

Brian

### Re: 50g Connectivity Issues

---

Surely, but don't forget to check flag -33 [MODES, FLAGS]. The printer has to be closer to the 50g, when compared to the 48G series, no more than one inch apart I think.

Regards,

Gerson.

### **Re: 50g Connectivity Issues**

*Message #4 Posted by **James M. Prange (Michigan)** on 11 June 2007, 5:53 a.m.,  
in response to message #3 by Gerson W. Barbosa*

Make that flag -34 for Print via IR / Print via wire.

Flag -33 is for Transfer via wire / Transfer via IR.

For the 48 series, "Print via IR" is the default, but for the 49 series, the "screen capture" capabilities of the "connectivity kits" require "Print via wire", so that's the new default.

Of course on the 49G, clearing flag -34 (Print via IR) has the effect of disabling printing, and setting flag -33 (Transfer via IR) has the effect of disabling all external I/O.

Regards,  
James

Great post Brian. I just got a 50G last night. It is still in the package, but I was sooner or later about to attempt your same error. Whatever you can do wrong, I can do wrongger. ( wrongger - sure it's a word, it's a verb, I have been practicing it all my life.)

### **Re: 50g Connectivity Issues**

*Message #6 Posted by **Les Wright** on 9 June 2007, 2:33 p.m.,  
in response to message #2 by brianh*

Quote:

---

Will the 50g print to my old 82240B IR printer, or has that capability been phased out with the 49 series?

---

It sure will. I use it with my 49G+ to print out program listings all the time. Keep in mind the IR range is much shorter than the 48 series--a few inches at best--but save that it works pretty well.

I haven't gotten much feedback on this, but I have raised the point in the past that SD card storage capacity makes direct PC connectivity less essential than it was in the 48 series. I have gone so far as to even declare that at this time there is really no good reason for a serious user of the 49G+ and 50G calculators

NOT to have an SD card in the calculator at all times. 512MB are the smallest size widely available and run 20 to 30 dollars, cheaper when on sale. You may have family or friends who have, say, a 128MB card that has proved too small for camera or MP3 use, but is more than enough for a 50G where the objects to be stored are comparatively tiny. I routinely create program objects on my pc as text files, transfer them to SD card then calculator, then do on the calculator a little refinement so various symbols are rendered in the appropriate form. Works beautifully. And backing up the memory contents and flag settings is breeze thanks to a small program I wrote to execute the instructions in a single key press.

I don't use Conn4x or equivalents much, as a result, but am interested in being persuaded why I should. This all said, I am glad you got your setup to work.

Les

### **Re: 50g Connectivity Issues**

*Message #7 Posted by [James M. Prange \(Michigan\)](#) on 11 June 2007, 5:28 a.m.,  
in response to message #2 by brianh*

I'm glad that you got Conn4x to work for you, but I recall that some problems were reported for the version originally shipped with the 50g. If you have any trouble with build 2436, then try the latest build (currently 2439), available from [HP's site](#). Actually, I think that Conn4x is identical for all supported MS Windows versions, but "choose your poison". It seems to me that I've read that it also works with MS Windows Vista.

Alternatively, you could try the older Build 2353, which seems to work okay, and I think is still available at [hpcalc.org](#).

Personally, I find it easier to use an MMC or SD card for transfers.

Of course you can't use an 82240A/B with a 49G (which lacks the IR hardware), but except for the drastically reduced range, the 49g+ and 50g work just fine with the infrared printers.

Regards,  
James

*Message #8 Posted by [Egan Ford](#) on 11 June 2007, 10:21 a.m.,  
in response to message #2 by brianh*

Since you are running XP you may want to install Debug4x (basically Emu48+ with ROMs and development tools). At a minimum you get a 50g emulator out of it.

You can also use Conn4x with with Emu48+. Although Emu48 has primitive cut/paste. I find that I can keep the two in sync easier with Conn4x. You'll need something like <http://com0com.sourceforge.net/> to create the virtual connection. I created a pair of virtual null modem cables. One for Emu48+/50g and the other for Emu48/48gx.

**Paypal problem**

Message #1 Posted by [Don Shepherd](#) on 9 June 2007, 12:15 p.m.

People on this forum have complained about Paypal in the past, but I had never had any problems with them, until now.

This past week I won an auction, paid for it with Paypal using funds from my checking account (which I have done many times in the past), then waited to hear that the seller had shipped my item.

She wrote today and said she was waiting for the funds to "clear." I thought, what is that crap, when I pay from my checking account I thought the funds were instantly transferred to the sellers account. So I checked my Paypal account and it says the status of the transaction is "uncleared" with the expected clearing date one week after the close of the auction.

Needless to say, I won't be using Paypal in the future.

CUSTOMER SUPPORT?????

Really, are you kidding? This must be a joke :-)?

PayPal has no support- simply morons who send off pre-set replies in answer to everything...

If you call them, you will be on hold for hours, and be told there is nothing they can do (if you ever get a rel person to speak to) Even simple things are beyond them.

I ceased using them long ago... If you MUST use it, then only use it for amounts you can throw away and miss- when it goes wrong (which it inevitably will). Their so-called insurance is a total fraud as well.

As far as I am concerned, their eBay connection and shady banking system are a type of monopoly that should be broken. My choice is to use Western Union with sellers that have good feedback.

**Re: Paypal problem**

*Message #4 Posted by **Raymond Del Tondo** on 9 June 2007, 10:17 p.m.,  
in response to message #3 by Tadeyev*

Hi,

this is not a joke.

At some time a few years ago I had a question regarding my PP account, which I could not find an answer for in the FAQ, so called their support. They could clarify the question, so the support worked, at least for me.

Other than the above, I never had any problems with my PayPal account. Of course everyone should take reasonable care with \*every\* online payment method.

Interesting thing, slightly OT:

I opened a PayPal account some years ago only because there were various U.S. eBay members who insisted to pay (or to be paid) via PayPal, nothing else.

Raymond

**Re: Paypal problem**

*Message #5 Posted by **Don Shepherd** on 10 June 2007, 4:39 p.m.,  
in response to message #3 by Tadeyev*

Paypal customer support did respond (on Sunday no less). I don't know if it is a "canned" response or not, but the writer identified himself as Roel and he explained that the Automated Clearing House (ACH) or checking account transfers typically take 4 business days. I guess that has always been true, I never noticed the delay before because usually I use Visa with Paypal which, as another poster said, does provide instant funds transfer.

In future auctions, if I don't want to use Visa (and sometimes I don't), I'll just send a postal money order in the mail. It will be quicker than using Paypal with a checking account.

**Re: Paypal problem**

*Message #6 Posted by **James M. Prange (Michigan)** on 10 June 2007, 8:01 p.m.,  
in response to message #5 by Don Shepherd*

If I'm not mistaken, for an "instant transfer", you have to have both a primary funding source and a back-up funding source, for example, a bank account backed up by a credit card, and otherwise you have to wait for the transaction to clear.

Perhaps your bank account was previously backed up by a credit card, but the credit card is no longer valid, or perhaps the expiration date has changed?

Regards,  
James

## Re: Paypal problem

Message #7 Posted by **Don Shepherd** on 10 June 2007, 9:17 p.m.,  
in response to message #6 by James M. Prange (Michigan)

James, you know more about this than the Paypal customer service people do! In fact, the expiration date on my credit card did change recently, because a new credit card was issued. I guess I notified everyone of the new expiration date except Paypal.

One might wonder why Paypal would not notify someone whose expiration date has just expired....

thanks for the answer Don Shepherd

## Re: Paypal problem

Some years ago I was banned from TAS because Postal Money Orders take more than 3 weeks to scrawk slowly from Europe to the US. A Canadian seller shot me for non-payment, a few days before receiving the payment, and after a couple of messages from me stating that the PMO was very slow. Of course he never negated his complaint.

So I'm not using PMOs any more, because some people are just plain stupid.

Paypal is very far from perfect, but can work when other ways don't. I don't like it, either...

Switch to using a VISA Checkcard on the same bank account. It's instant.

**Re: Paypal problem**

Message #11 Posted by **Don Shepherd** on 9 June 2007, 7:20 p.m.,  
in response to message #10 by Egan Ford

Thanks, guys.

Yes, I emailed their customer support but have not heard back yet (but it is Saturday so I'll cut them some slack). When I do hear, it will probably be a canned response.

Yes, I have used Visa in the past with Paypal, and I guess that is the only "instant" way that works. I don't think I will ever use my bank account with them again, though. It's faster to send a money order to the seller!

On a good note, because of the delay, the seller found the original manual and box (the auction was for the calculator only, a 17bii) while cleaning up today, so she will send those too. Sometimes bad things turn out good!

**Re: Paypal Is The Problem**

Message #12 Posted by **Happy HP User** on 10 June 2007, 9:57 a.m.,  
in response to message #11 by Don Shepherd

PayPal is eBay's secondary goldmine, generating additional fees with every eBay transaction it's used with. In agreeing to PayPal's terms, users give control of their bank account to PayPal. PayPal users also sign away all rights customary with banking and credit card. It's no wonder that PayPal is a primary source of fraud, generating countless scams. The solution is relatively simple: fully investigate buyers and sellers. If previous performance is unsatisfactory, don't do business with them. For payment, money orders and cashier's checks work well. For all my eBay transactions, for both buying and selling: No PayPal.

### **Displaying part of my collection at the San Diego County Fair**

*Message #1 Posted by [Victor R.](#) on 8 June 2007, 2:47 p.m.*

If anyone is in the San Diego, CA area between now and July 4th, I will be displaying my collection of HP Classic and Woodstock calculators at the San Diego County Fair in Del Mar. Just look in the Home and Hobby section.

### **Re: Displaying part of my collection at the San Diego County Fair**

If you have a 65, 67 or 97, have it running a program in an infinite loop. The random flashing display will attract people, and I think the kids will find it mesmerizing.

**My Ideal Calculator is Impossible**

Message #1 Posted by [Howard Owen](#) on 8 June 2007, 1:45 p.m.

I think that each of us has a unique idea of what the "ideal" calculator would be. I also think we all probably realize that our ideal machines are unlikely to materialize in the real world. Another reason why my ideal machine can't happen has just occurred to me. I enjoy the machines themselves a great deal. But that enjoyment would be sterile without a community of more-or-less like minded enthusiasts such as this one. My ideal calculator is impossible precisely because it is *my* ideal. If I had the only one in the world, I couldn't share the fun of using the darned thing.

Thanks for being here, everyone.

Regards,  
Howard

Well said Howard. I've never found my ideal calculator either, and the practical design engineer side of me says I never will either, as my "ideal" also changes depending upon how I want to use it.

For instance, sometimes I just want the smallest and simplest calc I can get as I'm always moving around. Other times I want one optimised for my electronics calculations, so I want all the commonly used keys (including parallel) as main buttons. Then when I want to do some repetitive calculations I want a nice easy to use and edit solver, and the list just goes on and on... No wonder I have 3 calculators in my drawer at work...

As someone who is currently designing and building their own calculator, I've lost count of the number of times I've changed the design and had to reluctantly accept various practical trade-offs. And I'm only trying to please myself! I'll be happy if everyone just says, "hey, that's cool!".

Dave.

## **Re: My Ideal Calculator is Impossible**

*Message #3 Posted by **Paul Fox** on 9 June 2007, 5:05 a.m.,  
in response to message #2 by DaveJ*

Hey! Thats cool Dave.

My ideal calculator is the rubbish TI I had when i was 8? When the calculator was powered by pure magic and I got to type:

1 + 1 = = = = = etc

Since then, as a techie, i know how they work and I want to discover more and more stuff but in the end find I have no use for any of it :-)

My ideal calculator is beginning to look like the RAON Everun machine - a big fat PDA which happens to run XP (yuck!) but for w-hich i can run any app i care to install - maths, reading, web, games etc, and be able to use whilst out shopping with the wife (outside changing rooms), and have that "Eureka!" moment where i can tell my wife about how to draw cool 3D graphs of temperature vs voltage, and she will just say "Gee! Sure! Whatever!" ...

:~)

### HP-91, HP-97 Printer Service - common issues

Message #1 Posted by [Dan W](#) on 8 June 2007, 1:37 p.m.

Hi all,

For you collectors of the HP-91 or 97, I would like to correspond with people who have refurbished the printer - probably off-board. What common problems have you seen and how can they be fixed? What thermal paper is available now that works well?

I have one 97 with the spur gear problem and read Katie Wasserman's article on that. What other problems are common?

Cheers,

-- Dan

### Re: HP-91, HP-97 Printer Service - common issues

Message #2 Posted by [marais](#) on 9 June 2007, 7:51 a.m.,

in response to message #1 by Dan W

I've had the following problems with my various 97 printers:

- a broken plastic gear wheel, for which a metal replacement part was suggested on this forum. Good fix!
- the white rubber wheels on the transport mechanism, which become flat if the printer is not used for a long time. If they do, the printer feed mechanism occasionally advances paper less than an entire line. I think this the most common problem, and I have not found a fix for this issue
- a broken printer head flex cable - one fellow in this forum successfully soldered it, but my attempt to do so failed. I will give it another try one day
- uneven printing. On one printer, cleaning the head arranged things, on another one, the problem remains.
- too light printing. There is one article on the forum explaining how to adjust print density by replacing a resistor, but I found that the most likely cause is just old thermal paper.

Anything I forgot?

Andreas

Message #3 Posted by [Katie Wasserman](#) on 9 June 2007, 10:52 a.m.,  
in response to message #2 by marais

Good list! I'll just add one problem:

The tiny plastic rails that hold the clear plastic print window in place are sometimes broken and that the print window is often missing when you find an old calculator (potentially because of the broken rails).

-Katie

**Re: HP-91, HP-97 Printer Service - common issues**

Message #4 Posted by [marais](#) on 10 June 2007, 8:07 a.m.,  
in response to message #3 by Katie Wasserman

So we made the list of known problems - but what about the fixes?

**Re: HP-91, HP-97 Printer Service - common issues**

Message #5 Posted by [Dan W](#) on 10 June 2007, 2:57 p.m.,  
in response to message #4 by marais

There are some recommended fixes in this list. What we're missing is a detailed take-down guide like we have for the gummy wheel.

As I fix mine I'll log some notes and take pictures. Perhaps later I'll submit such a guide to the Museum library.

Hi!

The reed switch that commands the print head moves sometimes fails or breaks.

It can be replaced but final adjustment is quite difficult.

Cheers.

Etienne

**Re: HP-91, HP-97 Printer Service - common issues**

*Message #8 Posted by [Dan W](#) on 10 June 2007, 1:09 a.m.,  
in response to message #1 by Dan W*

Thanks for your comments! I have two 97's with printers to repair. One makes a whining noise whenever I turn on the calculator. One has the broken spur gear. I've ordered the spur gear replacement from PIC Designs per Katie's article. But they're rather slow on shipping - that was 2 weeks ago.

Does anyone know where to get replacement thermal paper? Especially with blue printing?

Regards,

-- Dan

**Re: HP-91, HP-97 Printer Service - common issues**

*Message #9 Posted by [Katie Wasserman](#) on 10 June 2007, 1:41 a.m.,  
in response to message #8 by Dan W*

Blue printing paper might be hard to find, but black printing paper is easy. I use NCR's 2 1/4" x 85', you can buy this on ebay for next to nothing: [\(24\) THERMAL PAPER CREDIT CARD ROLLS 2 1/4" X 85 FEET](#)

### stop moving the keys

Message #1 Posted by [Sam Levy](#) on 8 June 2007, 12:44 p.m.

I do dislike the strange keys on the 33S, I don't mind the smaller ENTER key. I am distressed by the 33S not having a dedicated STO key. What I think we would appreciate is not having a new key arrangement in every new model to come out. It is akin to every new computer having a new keyboard arrangement. I use the 32II and 33S at different locations and it takes a readjustment each time. I think loyalty should be rewarded by a commonality in key location. The power to make decisions is ever far from the problem. Every executive a Michelangelo. Sam

### Re: stop moving the keys

Message #2 Posted by [Patrick R](#) on 8 June 2007, 1:09 p.m.,  
in response to message #1 by Sam Levy

A good idea !

Some of the proposed key-rearrangements seem justified, but let's wait for an official release to start the flames.

The HP35s hasn't officially been announced and people already discuss the 35si, 35sii, the 35sx, 35sxi and the 35smcx. Just let's be patient and don't forget, the HP42s almost has it all!

### Re: stop moving the keys

...all except state-of-the-art display and I/O..

\_\_\_\_\_

And a fast processor, and lots of memory and ..

Like I said at last year's HHC. I don't want HP to bring back the 42S, I want them to come out with what a top of the line RPN calculator would have been today, if the 42S had represented the direction HP took instead of the 28C and RPL.

More impossible dreams. 8)

Regards,  
Howard

### **Re: stop moving the keys**

*Message #5 Posted by [Howard Owen](#) on 8 June 2007, 2:01 p.m.,  
in response to message #1 by Sam Levy*

I think that you have good idea there. But perhaps it shouldn't be strictly applied. There's a tension between stability and innovation. If you are going to add features, where do you put them if the keyboard is static? But a basic set of arithmetic and scientific functions, the numeric keys, enter, roll down, last x, x<>y and perhaps a few others could be standardized to the great benefit of loyal users.

Regards,  
Howard

### My thinkings about HP35s keyboard layout and main capabilities

Message #1 Posted by *Patrice* on 8 June 2007, 12:37 p.m.

this is my idea of the way to make the HP35s as a scientific calculator for general purpose and worldwide use.

Diferences with 4x series: (so they don't compete)

- no graphics.
- no I/O but a way to print with IR. no memory card, no saving or loading of programs.
- limited kind of value handled: numeric, complex, matrix, alpha, binary.
- no units attached to values.
- no RPL programming, mainly 41C RPN programming.
- short list of functions: the user manual is not a dictionary of thousand of functions, quick/little learning.

Characteristics:

keyboard usage: like on the HP41C

- short key press : execute the key.
- medium key press: display function name and execute.
- long key press: : display function name, display NULL and do nothing.

Keyboard labelling consistancy:

- unshifted function labelled on main part of the key.
- yellow shifted function over the top of the key.
- blue shifted function on sloped par of the key.
- alpha mode on bottom/right of the key (including space).

Keybord organisation: to respect as much as possible

- as many as possible usefull (in everyday usage) functions on unshifted keys.
- complementary or associated function is shifted on same key when possible
- programming functions on shifted key.

Clock/SW

- Same as the Time module for the HP41C.
- Having a clock with multi-alarms is cool.
- Stopwatch permit to record fast laps (with a single key press) to registers and do analys after.

User mode: since it is general purpose, the user mode is a way to meet everyone's need (by assinging functions and programs to keys).

Letters on evrey key of first row:

- In a program, it permit to map local Lbl to keys

My fisrt keyboard layout: to be completed and improved

O is Over, F is Flat, S is sloped, A is alpha

Row1

|   |       |     |      |        |       |     |
|---|-------|-----|------|--------|-------|-----|
| O | X^2   | LN  | log  | XsqrtY | L.R.  | E-  |
| F | sqrtX | e^X | 10^X | Y^X    | 1/X   | E+  |
| S | !     | nCr | nPr  | S,o    | mX,mY | ClE |
| A | A     | B   | C    | D      | E     | F   |

Row2

|      |        |       |         |       |        |         |
|------|--------|-------|---------|-------|--------|---------|
| O    | asin   | acos  | atan    | Pi    | R up   | %Chg    |
| F    | sin    | cos   | tan     | i     | /\     | %       |
| S    | Alg    | RPN   |         | Rho   | Const  | Time/SW |
| A    | G      | H     | I       | J     |        |         |
| Row3 |        |       |         |       |        |         |
| O    |        |       | FN=     | Logic | R down | Matrix  |
| F    | Sto    | Rcl   | =       | <     | \/\    | >       |
| S    | Solve  | Intg  | Mode    | Flag  | Mem    | Display |
| A    | StoA   | RclA  |         |       |        |         |
| Row4 |        |       |         |       |        |         |
| O    | Alpha  |       | Xswap   | Abs   | ()     | ClX     |
| F    | Enter  |       | XswapY  | +/-   | EEX    | <-      |
| S    | user   |       | Mod     | Rnd   | [ ]    | Undo    |
| A    | K      |       | L       | M     | N      | ClA     |
| Row5 |        |       |         |       |        |         |
| O    | Asn    | IP    | Cpx>X,Y | D>Rad | P>R    |         |

**HP 35 S with coloured Keys**

Message #1 Posted by [Doctor Bubu](#) on 8 June 2007, 10:50 a.m.

What do you think about my changes? They are not so good as Walters (n wich it based) but i hope some will enjoy it.

<http://www.doktor-bubu.de/Bilder/HP35SJR.jpg>

**Re: HP 35 S with coloured Keys**

Message #2 Posted by [Bob](#) on 8 June 2007, 11:39 a.m.,  
in response to message #1 by Doctor Bubu

I really like the white keys. Although you will have to change the intensity of the yellow and blue to show up well, I think it adds a bit to the "classic" or "anniversary" theme.

**Re: HP 35 S with coloured Keys**

Message #3 Posted by [Howard Owen](#) on 8 June 2007, 12:08 p.m.,  
in response to message #1 by Doctor Bubu

I think the blue actually shows up fine, but the yellow contrast with white is awful.

Overall, I like the contrast of the numeric keys. It's a lot like an adding machine, though, which might annoy a purist.

Regards,  
Howard

**Re: HP 35 S with coloured Keys**

Message #4 Posted by [Bob](#) on 8 June 2007, 1:04 p.m.,  
in response to message #3 by Howard Owen

I wonder how a white "Enter" key would look?

**Re: HP 35 S with coloured Keys**

Message #5 Posted by [Walter B](#) on 8 June 2007, 1:51 p.m.,  
in response to message #4 by Bob

White :-))

**Re: HP 35 S with coloured Keys**

Message #6 Posted by [Howard Owen](#) on 8 June 2007, 2:04 p.m.,  
in response to message #5 by Walter B

At least at first.

### **Re: HP 35 S with coloured Keys**

*Message #7 Posted by **Howard Owen** on 8 June 2007, 12:10 p.m.,  
in response to message #1 by Doctor Bubu*

So the easy solution to the yellow contrast problem is to move these labels off the keys and down on to the keyboard itself.

Regards,  
Howard

### **Re: HP 35 S with coloured Keys**

*Message #8 Posted by **Walter B** on 9 June 2007, 3:54 p.m.,  
in response to message #1 by Doctor Bubu*

Hallo Jürgen, sieht gut aus! Wirft aber m.E. mehr Probleme auf (Farben, Logik der Labelanordnung) als es an Nutzen bringt. Außerdem erinnert es mich mehr an aktuelle TI- als an HP-Rechner. Summe: optisch sehr nett, aber ich würde es so nicht übernehmen.

*(Looks nice! Causes more problems (colors, labelling consistency), however, than benefits IMHO. BTW, it reminds me of the color schemes of recent TI calcs more than of HP. Summary: very nice looking, but I won't adopt it.)*

### **Re: HP 35 S with coloured Keys**

*Message #9 Posted by **Donald** on 9 June 2007, 4:21 p.m.,  
in response to message #1 by Doctor Bubu*

I found abandoned in a drawer at work, an old HP 29c. It's once white keys are grey, grubby and tarnished.

So I would vote against this idea.

### Timer with splits

Message #1 Posted by [Sam Levy](#) on 8 June 2007, 10:11 a.m.

I Googled timer with splits and found this from the dark side; <http://splits.brokenski.com/> I found the concept of multiple splits useful for timing machine responses, like the timing of elevator operations. It would be useful for any time and motion study. Sam

### Re: Timer with splits

Message #2 Posted by [Karl Schneider](#) on 9 June 2007, 3:12 p.m.,  
in response to message #1 by Sam Levy

Hi, Sam --

Quote:

I Googled timer with splits and found this from the dark side; <http://splits.brokenski.com/> ... It would be useful for any time and motion study.

The TI-89 program found at the link seems to be a good, practical application. I should note that a similar timing capability was provided within our "bright side" long ago -- namely, the HP-41 Time Module, which was incorporated into the HP-41CX. Of course, the output of a similar skiing application program wouldn't look as nice on an HP-41, with its one-line 14-segment LCD.

I think, it won't even look nice on the Ti-89, because at typical skiing temperatures, the display will show just uniform grey ;-)

Greetings, Max

**Yet another HP35S question**

Message #1 Posted by [Jim Creybohm](#) on 7 June 2007, 2:12 p.m.

I almost hate to ask this question seeing as how the poor HP35S has already been autopsied even before birth, but does anyone know if it has a clock/stopwatch? I found this to be the greatest help in my day job, and would dearly love for it to be included.

I also suspect that the 35S picture that has been released is different that what we will see in the end. As a result, I am not sure that spending a lot of time re-designing different functions is an exercise of anything more than fancy. I mean, HP would be giving the competition a lot of information if they released this calculator's sales material first and the calculator six months later. Even the pictures of it with the baby (cute baby, BTW) don't clearly show the keys.

Just a thought.

**Re: Yet another HP35S question**

Message #2 Posted by [Dave Johnson](#) on 7 June 2007, 2:21 p.m.,  
in response to message #1 by Jim Creybohm

I do not believe the 35s will have many more capabilities than the 33s (maybe more storage registers and if they are nice more program labels). There is debate about matrix ability. I doubt very much there will be a stop watch. I am not aware of too many calculators with stop watches (of course the old 55 and 45 many moons ago) and the 33s does not have that capability.

Message #3 Posted by [ECL](#) on 7 June 2007, 2:51 p.m.,  
in response to message #2 by Dave Johnson

Possibly you could write a program that performs an operation and loops until you break it.

Then, calibrate how long it takes for each loop by averaging over a measurable time interval using a regular stopwatch. Have it track the number of iterations (a counter), and simply multiply the counter by a time conversion constant as the final operation?

Just an idea for a workaround.

ECL

...or you could get a digital stopwatch for a few bucks and use that instead. A good one is pretty cheap nowadays. I bought one at a sporting goods store for about \$15 over 10 years ago and it still works great. We got one in a McDonalds Happy Meal a few weeks ago for free and it has all the same features of the 10 year old stopwatch. (...and has a magnifying lens on the front to make it easier to read.)

I also use a Sunbeam kitchen timer that I got for \$4 from Walmart a couple of months ago. It measures in seconds, counts up, or counts down (in minutes only, up to 20 hours) It also gives count-down beeps at 10 and 5 minutes before sounding the alarm at 0. Depending on how fine your measurement needs are, it could work.

Besides, will the calc will let you use it for it's intended purpose while the clock is running?

### Re: Yet another HP35S question

Message #7 Posted by [Fred Lusk](#) on 7 June 2007, 9:18 p.m.,  
in response to message #5 by bill platt

The HP-55 had a quartz crystal controlled stopwatch. That and the better statistics is why I bought it over the newer HP-25 (the 25c hadn't come out yet). My dad had a 45, and the local HP rep showed him how to access the faux stopwatch with a three finger salute.

The stopwatch in HP-55 was very useful in college physics for timing experiments. Also, one time in surveying we had to find our latitude/longitude by doing sun shots with a transit. The stopwatch allowed me to synchronize with the time signal from WWV (from a shortwave radio), walk it over to the transit, and work for a long period with very accurate times to record with our angles. Our group was the only one within thirty miles of the correct location, and we were less than half a mile off (mostly in the E-W direction; our N-S was almost dead on).

Oh, it was also uesful for measuring the hang time of punts during football games I was watching instead of doing my homework.

Fred

in response to message #5 by bill platt*

The 28C/S has an hidden clock feature. It runs in the background and doesn't interfere with calculations, as it should. May I add that I love the 28's form factor (many many keys...). In other brands, I recall only the TI65 with a whole second resolution clock capable of running in the background.  
The best clock and timing integration IMHO remains the HP41 Time Module.

### **Re: Yet another HP35S question**

*Message #10 Posted by **Les Wright** on 8 June 2007, 11:06 a.m.,  
in response to message #2 by Dave Johnson*

Quote:

\_\_\_\_\_

I do not believe the 35s will have many more capabilities than the 33s (maybe more storage registers and if they are nice more program labels).

\_\_\_\_\_

Jeepers, I hope there are more labels! With all of those registers, being restricted to 26 measly labels is like being in a candy store with all of the goodies inaccessible, under lock and key, expect for a few choice morsels at a time.

Quote:

\_\_\_\_\_

There is debate about matrix ability.

\_\_\_\_\_

I have an abundance of optimism that the the mysterious (i) and (j) key labels may actually refer to matrix element addresses under certain conditions. Even if there is no intrinsic matrix abilities, if there are adequate registers and labels it should be feasible for a geeky sort with too much spare time to port, say, the MATRIX routine from the HP41 Math Pac module to the 35S paradigm. This could be challenging if i and j are the only indirection registers available--remember on the 41 any of the 319 registers can be used for indirect addressing. But if it worked, it should be pretty fast--cut up the 33S if you will, but there is no doubt that it is somewhat faster than the 42S and much faster than the 41 or 15C, and the 35S should inherit this speed. Of course, only the most determined sorts will want to enter the 500+ steps into the 35S, but it should be a labour of love for the truly nerdy.

For the busy and practically minded, I expect computer software will just have to do for matrix work, or the 15C, 42S, or one from the 48 or 49 series for those who have them. But I do think the 35S will prove

excellent for routines that iterate over a series of computations to convergence and produce a single result, as in the computation of special functions. My 33S is loaded with routines I have written (or borrowed and adapted) for the incomplete gamma functions, which in turn can be called to compute the error functions, the cumulative normal distribution, and the chi-square distribution. They are really zippy and I look forward to transferring them to the 35S.

Les

The reason for having a clock in a programable calculator isn't so much for checking the time but is very useful to do calculations based on current time without having to enter the time and also it can be programmed to run program based on time.

### Clock/stopwatch? [HP35S question]

Message #13 Posted by [Karl Schneider](#) on 8 June 2007, 12:46 a.m.,  
in response to message #1 by Jim Creybohm

Hi, Jim --

Quote:

\_\_\_\_\_

... does anyone know if (*the Hp-35s will have*) a clock/stopwatch?

\_\_\_\_\_

As others have pointed out, the Pioneer-series HP-17B/BII and HP-27S, as well as the HP-48/49/50 models, have a clock. The HP-41 Time Module (built into the HP-41CX) has both a clock and stopwatch functions.

However, the Pioneers include this feature for business and financial purposes (alarms and calendar functions), the HP-41 can be a controller of peripherals, and the others are top-of-the-line RPL models. The HP-35s will not have these functions and attributes that would justify clock and stopwatch functions.

A potential problem is the thin CR-2032 "coin" cells that the HP-35s will likely use. They don't hold much charge, and would not last if employed to drive a clock.

As for stopwatch functions on wristwatches, that's not a given. It seems that the main choices in stores are convoluted multifunction digital "sport" watches or analog dress watches that offer little except HMS and a mechanical date display. That's why I still wear a 26-year-old Seiko model with a versatile digital display (including time, alarm, day/date, and stopwatch) above an analog HMS display.

\_\_\_\_\_

The watch our wrists seems to manage for a year using one such battery. A real time clock module is not going to draw a significant current : something in the 500nA region.

Not including one is a feature/cost/product-positioning choice alone.

\_\_\_\_\_

I don't think so: In my small collection, I have several calculator/clock/worldtime/alarm-gadgets that run on a single CR2032 cell for years with the clock display always on!

Quote:

\_\_\_\_\_

As for stopwatch functions on wristwatches, that's not a given. It seems that the main choices in stores are convoluted multifunction digital "sport" watches or analog dress watches that offer little except HMS and a mechanical date display.

\_\_\_\_\_

That seems to be one of the strange differences between the US and Europe: Here, you have a very wide variety of analogue watches with stopwatch function, with prices varying from very cheap quartz watches (like some "Swatch-Chrono"s <http://www.swatch.com/>) to quite expensive mechanical ones (e.g. <http://www.fortis-watch.com> <http://www.breitling.ch/en/> both brands are very popular amongst aviators). I myself don't like to wear a watch (nor any other kind of metal stuff on my body) but still I have accumulated several such watches over the years ("as a pilot, he certainly needs a pilots watch...").

Greetings, Max

\_\_\_\_\_

What you both say about the current consumption seems reasonable. I, too, have a wristwatch whose single CR2032 cell lasted for a few years, even with the display always on.

However, I and others got very short life from the original twin CR2032 cells in the HP-33S, despite sparing use. I've also noted substantially shorter battery life of the three 13/44/76/357 "button" cells in my Pioneer-series models with running clocks, also used very sparingly. (I now store them in "coma" mode by turning them off with the keys in the upper and lower right-hand corners pressed.)

I haven't researched any tech specs for disposable batteries (and these are generally not given on the package), but I'd surmise that the shape of the CR2032 precludes it from storing very much energy. The cell doesn't bend easily, so the outer shell must be proportionally thick. The overall thinness of the cell is its main attribute, especially for slim wristwatches and the like. I just doubt that it's well-suited for a calculator with significant power demands.

-- KS

**Re: Clock/stopwatch? [HP35S question]**

Message #18 Posted by [Dave Shaffer](#) on 9 June 2007, 6:26 p.m.,  
in response to message #17 by Karl Schneider

Our always-on wristwatches run on highly task-specific low power CMOS logic, running at pretty low clock rates (I think most watches count down from a 32768 Hz crystal). Our newer calcs run a lot faster (I suspect even in whatever clock mode they might have) and the power consumption of CMOS (and other logic) depends on the clock rate.

**Re: Clock/stopwatch? [HP35S question]**

Message #19 Posted by [Donald](#) on 9 June 2007, 6:56 p.m.,

\_\_\_\_\_

Spot on: that's why many embedded processors have dedicated real time clock hardware ( either internal or external ) running of a 32KHz crystal, with the processor core running at a different rate. The main processor can power down or sleep while the real time clock hardware still ticks over.

**Re: Clock/stopwatch? [HP35S question]**

Message #20 Posted by [DaveJ](#) on 9 June 2007, 7:13 p.m.,

\_\_\_\_\_

Correct.

Lithium coin cells actually have very high energy density for their size and weight, typical capacity of a 2032 cell is 235mAh @ 3V

Low power ASICs like that used in purpose designed watches can last for the shelf life of the battery. A new range of Casio watches claim 10 years battery life.

It is possible to add a Real Time Clock chip to any microcontroller (if it doesn't have one internally) that will last for many years. So it would have been easy to add such functionality to the 33S, but they chose not to for some reason (cost, perceived need etc).

My new calculator has dynamic processing speed, speeding up when it needs to, and slowing down when it's not doing much like waiting for user input.

Dave.

### **Re: Yet another HP35S question**

*Message #21 Posted by [Jim Creybohm](#) on 8 June 2007, 12:01 p.m.,  
in response to message #1 by Jim Creybohm*

Thanks to all who responded. As some correctly identified, my purpose in wanting a stopwatch/clock built in to the calculator is that it makes for a nice addition to the laboratory. I can write a program that also initiates the stopwatch, and takes the splits, etc., and uses them as input variables for the same program. I am using my beloved 41 for this now, but I am concerned the day it dies of age.

Sadly, it does not look like the 35 will have that capability. Oh well, perhaps I can write a routine to work off the ticks of the crystal.

It is almost like anticipating Christmas.

### **Re: Yet another HP35S question**

*Message #22 Posted by [bill platt](#) on 8 June 2007, 12:31 p.m.,  
in response to message #21 by Jim Creybohm*

There is really a pretty simple solution to the problem of the 41c getting old:

Replace in with a 50G.

I believe that Hrastprogrammer has even written his HP41C emulator for the 50G.

Or you can use the 50G (or 48GII) and write RPL code for it. It has the clock and I/O built-in.

### **Re: Yet another HP35S question**

*Message #23 Posted by [Don Williams](#) on 8 June 2007, 1:47 p.m.,  
in response to message #22 by bill platt*

I found that becoming proficient with any of the HP RPL calcs from the 48 series on, will provide you an activity that will last till the end of your life. Those of us who are overly fond of the 41 series calcs are usually just looking for simple practical solutions for the problem at hand. Call me lazy. I don't want to study a manual for longer than 10 minutes to solve a problem.

### **Re: Yet another HP35S question**

*Message #24 Posted by [Walter B](#) on 8 June 2007, 2:10 p.m.,  
in response to message #23 by Don Williams*

Fully agreed! For this purpose, RPN is superior to RPL. The latter is better for real geeks, but also I won't reach this level anymore :-)

### HP-42S I/O

Message #1 Posted by [Gerry Schultz](#) on 7 June 2007, 1:33 p.m.

Okay, I just got my 42 and it works great. Now, I have some questions. I've read previous discussions here about the 42 and limited I/O but what's the deal? After looking at memory management in chapter B, it looks like the maximum available memory in the 42 is about 6977 bytes, about the same as a 41CV or CX. With my 41, I had magnetic data cards, tape drives and even 3 1/2 disk drives for mass storage. There's no way to load or store 42s programs!?

I find this unbelievable. Part of the success of the 41 line was its great selection of peripherals. I don't get it; what happened? This must be a doozy of a story given the 42 was suppose to be the replacement for the 41. I would think that HP would have wanted 41's peripherals to work with a 42. Oh, don't tell me, to save money. Boy, I hope not.

I do have an HP 82240B printer that I bought for my 48GX and it should work fine with the 42 but I'll have to test it. The 42 is a fascinating machine in that it seems to bridge the gap between how the classic HP calculators and the newer RPL calculators are designed. Even with the I/O limitations, I'm interested in using this machine.

As I mentioned in a previous post, I got an HP-97 and I just finished reading the owner's manual. Yes, I do read the manual. My boss thinks I'm nutty and he prefers the "poke around until it works or breaks" method.

Anyway, as an old PPC member, I have all the back copies of the PPC manual on paper and since the PPC was originally founded on the 65 and 67/97 calculators, its pages should be full of programs for me to try on the 97. Do any of you have a favorite to share from the old PPC? This is where I learned about NNNs. Thanks, Valentin Albillo for your warning.

Since I lost contact with the PPC or the HPPC after the 41, did these user groups ever publish 42 programs? If they did, where can I get copies of these issues? Are they on CDs or DVDs in PDF like the files here at HP museum?

Thanks for the feedback, guys.

Gerry

### Re: HP-42S I/O

Message #2 Posted by [Dave Johnson](#) on 7 June 2007, 2:14 p.m.,  
in response to message #1 by Gerry Schultz

Your right - there is no input for the 42 and only printer output (though with some tricks I believe you can get memory dumps via IR transfer but not quick or easy...) I am sure it was hotly debated within HP whether the 42S should ever be released and it is not really a follow up for the 41 series. The debate was won by supporters of limited calculators such as the 32 series with limited memory, functionality and no menus. I'm sure it was disconcerting for true calculator supporters within HP at the time.

### Re: HP-42S I/O

Message #3 Posted by [Thomas Okken](#) on 7 June 2007, 4:27 p.m.,

*in response to message #1 by Gerry Schultz*

The HP-42S is not the successor of the HP-41. It is the successor of the HP-15C: small but powerful with a rich set of functions -- and it just happens to be designed around the HP-41 programming model. Rumor has it that the 42S was initially supposed to have bidirectional I/O, but that that was scrapped in order to prevent it competing with the HP-48 series -- and in terms of being a hand-held computer that can interface with the outside world, the 48 series is the true successor of the 41.

- Thomas

More than two decades ago, just after I had started work after my graduation, I read "Surely, You must be joking Feynmann" and was immensely fascinated by his personality and subsequently read his other works including some of his lectures. Three weeks ago I gave the book (Surely...) to my son who is pursuing his research interests in Physics related electrical engineering at an American university. I am sure he will quite appreciate it. Feynmann is a must read for people interested in science and technology.

### Re: HP-42S I/O

Message #8 Posted by [Karl Schneider](#) on 8 June 2007, 2:29 a.m.,  
in response to message #1 by Gerry Schultz

Hi, Gerry --

You stated:

Quote:

... the maximum available memory in the 42 is about 6977 bytes, about the same as a 41CV or CX. With my 41, I had magnetic data cards, tape drives and even 3 1/2 disk drives for mass storage. There's no way to load or store 42s programs!?

Part of the success of the 41 line was its great selection of peripherals. I don't get it; what happened? ... I would think that HP would have wanted 41's peripherals to work with a 42.

Thomas Okken stated:

Quote:

Rumor has it that the 42S was initially supposed to have bidirectional I/O, but that that was scrapped in order to prevent it competing with the HP-48 series.

The other "high-end" Pioneer-series models (namely, the HP-17B/BII and HP-27S) also have 7 kB of RAM, but no I/O except the IR output to printer.

I believe that the primary reasons for lack of full I/O are engineering-based physical and practical considerations. Bidirectional IR would be convenient, but those users who would exchange programs and data via I/O would certainly demand reliability and low error rate. This dictates hardwire I/O and inexpensive batteries with adequate energy storage for the demands of data transmission.

Remove the translucent red cover on a Pioneer model, and what do you see? Three 13/44/76/357 1.5V "button" cells in a row, a place for the IR transmitter (present or not), *barely* enough room (given a minor redesign) for the IR receiver, but insufficient room for a robustly-constructed 4-pin hardwire plug, such as that used on the original HP-48S/G series.

The HP-48 had three bigger and higher-capacity "AAA" batteries placed in a different location within its much larger package. The Pioneers, however, had no other place for its button cells inside its slim package. The

costly button cells -- designed for medical devices -- don't leak, but also don't hold a great deal of charge. Use of the HP 82240A/B printer will shorten battery life considerably, as will keeping the clock running on the HP-17B/BII or HP-27S.

Space could have been made available in the front by using thin "coin" cells placed side-by-side elsewhere (such as the two CR2032 cells in the HP-33S), if these were even available in the 1980's. However, the limited mAh capacity and cost per mAh would have been further exacerbated.

As for the HP-42S' lack of support for HP-41 peripherals, the obvious problem is the lack of space in the Pioneer package for the peripherals' plugs, even if a suitable adapter could be designed. Another engineering problem is power consumption, as some peripherals -- such as the card reader, wand, and HP-IL -- draw their power from the HP-41's batteries. The broader issue, however, is that PC's became available and increasingly affordable in the 1980's, enabling them to usurp the niche of peripheral control filled by the HP-41 and HP-71B.

-- KS

## Re: HP-42S I/O

Message #9 Posted by [Christoph Giesselink](#) on 10 June 2007, 5:59 p.m.,  
in response to message #1 by Gerry Schultz

Some aspects don't mention from the authors before.

Memory limitation to ~7000 bytes.

The 8KB and 32KB 8 bit static RAM chips have a quite similar pin layout. The PCB of the High-End Pioneers is prepared for the use of both chips. So it's possible to replace the RAM chip with the 32KB on all high end pioneers. 2nd part are the MMU mask fuses in the Lewis chips. These are programmed for a memory device at address #50000 with a size of 32KB on all High-End Pioneers.

But why only the HP42S can make use of this additional memory getting ~31500 bytes of free memory whereas on the HP17B or HP27S there's no difference?

The answer is very simple. Only the HP42S firmware contain code expecting more then the usual 8KB of RAM (history repeats). So we can say that HP thought about HP42S with more memory but never sold them.

Now to the limited I/O capabilities of the High-End Pioneers. Therefore we have to go back into Saturn history. The HP71B, the first calculator with the Saturn CPU, was build out of several modules, display driver, ROM, RAM, ... made the complete thing quite expensive. On the other hand we have had a powerful mobile CPU (Saturn) which was predestinated for further use. The HP18C used this CPU but now in connection with a more integrated customer chip (1LP2 Centipede) containing reset control, oscillator, RAM, display driver, timer, input/output, ... reducing the amount of necessary chips to build a calculator. But from history we can see that this was still too expensive too, because only the HP18C and HP28C used this hardware.

Now my short comment to "history repeats". The HP28C was sold with 2KB of RAM (from the two integrated Centipede chips). But Educalc sold versions with more than these 2KB of RAM. The HP28C hardware was prepared to add HP71B RAM module chips and the HP28C firmware was adding this additional found RAM to it's memory pool. I don't know if HP ever thought to sell memory upgraded HP28C by themselves, but HP added code to the firmware to exactly do this without firmware change.

The successors, the High-End Pioneers and Clamshell calculators, use the Lewis chip. In a very very simple view the Lewis chip is a combination of the Saturn CPU and the Centipede customer chip. From the I/O side

the Lewis chip inherit the I/O capabilities of the Centipede chip, nothing more, nothing less.

This is in fact a single bidirectional Input/Output pin. On the HP42S and on all other calculators with the Lewis chip this hardware pin was used to drive the IR transmitter LED.

I verified this on a HP28S (also using two Lewis chips), where I removed the IR transmitter LED and connected a simple hardware to adjust the calculator logic level to RS232C level. The interface is mostly powered by the PC RS232C interface, the power consumption out of the calculator battery is  $< 4 \mu\text{A}$ . The rest for the RS232C communication between HP28S and PC is software.

Cheers

Christoph

### Complex number on HP 35s

Message #1 Posted by [Marcel Pelletier](#) on 7 June 2007, 9:41 a.m.

On the PDF data sheet we have, I remark that the HP 35s was on RPN mode whit a strange number that I think is a new way to enter a complex number on the stack.

For exemple, the number  $(5+15i)$  is enter like this:

enter 15 press "i" key enter 5 press "enter" key.

Then you have 15i5 on the stack!

So this method permit to have a whole complex number in a register.

The HP 35s can now have a new COMPLEX MODE like the HP 15c!

What do you think of that?

### Re: Complex number on HP 35s

Message #2 Posted by [Doctor Bubu](#) on 7 June 2007, 10:21 a.m.,

---

I hope it's better than the 15C's:

If the HP35s stack supports data types, i.e. assuming good design based on the HP28/48/50 series, the complex numbers, bit-types, and alpha prompts etc. should all be directly storeable in memory and not just stack registers.

On the HP15C splitting and storing complex numbers into two registers is a pain, partitioning gets even worse when dealing with complex matrices.

Has the 35S's stack depth been mentioned yet ? It's unclear to me if the classic 4 deep stack is used or a deeper RPL like stack, or even a flag to switch between those 2 modes.

### **Re: Complex number on HP 35s**

*Message #5 Posted by [bill platt](#) on 7 June 2007, 2:16 p.m.,  
in response to message #4 by Donald*

I think it is quite safe to bet that:

1. There will not be an RPL kernel and no advanced "datatypes" on the stack. Perhaps they will have a complex datatype, but that will be it (for stack types). Programs have labels, also equations and equations as comments in same fashion (via flag) as the 32sii.
2. Stack depth is almost certainly 4 deep. This model, in addition to being celebration of the classic RPN of the 35, is also most likely to be compatible with the earlier kin--the 32sii and the 33s.
3. HP already has the 50g for the top of the line RPL, and the 48GII for the lower-cost RPL, and the 39G+ for the algebraic RPL. I don't see why they would make this machine RPL--it would merely reduce its sales potential to those looking for a "scientific" rather than a graphing, and it would rob sales from the RPL models.

### **Re: Complex number on HP 35s**

[ [Return to Index](#) | [Top of Index](#) ]**A Serious Scientific Instrument**Message #1 Posted by [Walter B](#) on 6 June 2007, 7:54 p.m.

Thanks for your numerous reactions and comments after [my last proposal](#) (the equivalent amount of thanks goes to you). Based on these, I got many ideas to ponder: Why is there more response for some minimal cosmetic changes than for efforts to improve an instrument in total? Why does one create more excitement by changing 3 colors or (not and!) reshaping 4 keys? What kind of keyboards do people have allowing them to delete by moving a cursor to the left? How big is the fraction of melapetrophils in this honorable forum? What happened to all those members striving for the optimum? Etc.

Nevertheless, I won't give up so easily, but try again with a more "serious" and cleaner outfit:

Don't be afraid, that's it. No repelling explanations nor frightening requests for comments and the like. Just a picture. Don't bother. Everything is calm and peaceful and quiet. Good night :-)

### Re: A Serious Scientific Instrument

Message #2 Posted by [ECL](#) on 6 June 2007, 9:41 p.m.,

Walter,

I'll try to rise to meet your challenge :)

On your handsome keyboard, and while I haven't scrutinized it, I'd point out that your UP key is the only alpha key. This could be frustrating when modifying programs or editing equations (the 48 series has this problem).

ECL

### Re: A Serious Scientific Instrument

Message #3 Posted by [Egan Ford](#) on 6 June 2007, 10:07 p.m.,  
in response to message #2 by ECL

The 48/50 have letters on STO/RCL. I do not see an issue with that given that this new keyboard has an alpha key. That would push Z up to 3. You could add a comma. Since symbols are used infrequently consider a few on the arithmetic operators. I would also consider the darker (or lighter) bar under menus unless all CAPS is how you distinguish them.

### Re: Alpha key most unlikely

Message #4 Posted by [Paul Brogger](#) on 7 June 2007, 10:11 a.m.,

*in response to message #3 by Egan Ford*

I suppose you're consciously divorcing your speculation from reality, and with that in mind, it's a fine exercise. (I do like the overall result!)

The alpha key is, I think, the proposed feature *least* likely to be realized in a 35s. Apparently built upon the 33s, the 35s will no doubt impose very strict limitations on the nature of any alpha entry, relying upon keystroke context for automatically entering alpha mode.

Explicit manual control of alpha mode implies more of a 42s- or 48g-style alpha capability, with lengthy variable and program names, etc. Fundamentally different, and not gonna happen. (If only to insure the test-use certifications, let alone the software redevelopment and testing costs.)

But in its layout, legend placements, and color choices, your re-imagining of the 35s is *beautiful!*

H-P: there is much wisdom here, worthy of your consideration!

## **Re: A Serious Scientific Instrument**

*Message #5 Posted by **Patrice** on 6 June 2007, 10:19 p.m.,  
in response to message #1 by Walter B*

Hello,

I think this keyboard is better with the cursor keys à la HP48.

I see 2 flow in this keyboard.

First, I don't see how you swith between normal and user keyboard, my proposal is to put it on the alpha/assign key.

Second, I think that the logic/binary keys are specific to the logic/binary mode and have nothing to do there, many floating point keys are meaningless in that case. With the HP41C, this kind of problem is solved with a keyboard overlay. On the HP41C, when you enter the stopwatch mode, you have a specific keyboard and an overlay.

In binary mode, an overlay should bring us something like the key board of an HP16C with shifts, rotates, word size ...

Last thing, I know it is guessing with capabilities, but I see nothing related to time/stopwatch/alarm

Happy flaming :-) Patrice

## **Re: A Serious Scientific Instrument**

*Message #6 Posted by **Hugh Evans** on 6 June 2007, 10:26 p.m.,  
in response to message #1 by Walter B*

Walter,

Very nice work, as always. My only major suggestions are to put the alpha labels on the same level as the lower yellow labels. In addition, I think the yellow labels should ALL be placed under the keys rather than next to the blue labels occupying the same space. Not only would that improve clarity, it would also make the use of overlays feasible. It also appears that there is ample space for a set of soft keys beneath the LCD so a nice 42s style menu system could be implemented.

Keep up the good work!

-Hugh

## Re: A Serious Scientific Instrument

Message #7 Posted by **Karl Schneider** on 6 June 2007, 11:30 p.m.,  
in response to message #1 by Walter B

Hi, Walter --

Well, that's an earnest graphic effort for which you may be commended. The "goal" also seems ambitious, beyond what the HP-35s is intended to be -- perhaps more like an "HP-45s".

It looks elegant, but there's a certain amount of, er, *inconsistency* in the layout -- sometimes, the yellow legends are below the key, and sometimes they are on the sloped face. Sometimes they are in capitals, and sometimes in title case. Pi,  $x^2$ ,  $e^x$ , and  $|x|$  are barely visible -- somewhat of a carryover from HP's own graphic.

(Remember that the original concept was that the yellow legend was to be centered *above* the key and the blue legend was to be centered on the sloped lower part of the key, leaving the large main legend centered between them.)

How practical is modern I/O (hardwire or IR) on a calculator that uses low-charging-capacity 1.5V cells? The three 13/44/76/357 button cells of the Pioneer (and Voyager) lines were poorly-suited for such use in 1988; this, and limited open space on the front, is probably why bidirectional hardwire I/O was not provided on the HP-17B/27S/42S. The thin CR-2032 cells used by the HP-33S seem to be even worse in that respect.

There's a "MATRIX" legend, but have you given thought to how it should work? (I'm still pondering it.)

Is the display unit well-suited for a full ALPHA mode?

---

As for me, I'd like to learn more details about how the HP-35s will actually work, as well as experiment with one, before I make detailed suggestions about how to improve it. I guess that we'll just have to wait...

-- KS

*Edited: 6 June 2007, 11:36 p.m.*

## Re: A Serious Scientific Instrument

Message #8 Posted by **Hugh Evans** on 6 June 2007, 11:53 p.m.,  
in response to message #7 by Karl Schneider

Actually, a great idea would be to keep those gold labels above the keys and center the green alpha labels below them. One way to make overlays even more versatile would be to put the gold labels above the keys, the blue labels below the keys, and green alpha labels on the lower sloped face of the keys. I think that would be a pretty slick way of handling it.

As far as the batteries are concerned using coin-cells in a calculator that's ~0.7" thick is just plain dumb. The 33s isn't in mass production yet, so I hope they will be smart enough to use 3 or 4 AAA's to power the thing and get 10 years of battery life.

I think Walter's current layout is much closer to something along the lines of a 41sx... Although for that purpose I hope they go with a 2sx

## Re: A Serious Scientific Instrument

Message #9 Posted by **db (martinez, ca.)** on 7 June 2007, 12:32 a.m.,  
in response to message #8 by Hugh Evans

Hugh; i am guessing the batteries will be set up like the 33s. you can change one at a time and not have to risk loosing the memory like in a 32, 42, or the time/date settings on the 41. there's no reason to worry about how long the batteries last if changing them doesn't affect the memory. it will probably be a good design.

## Re: A Serious Scientific Instrument

Message #10 Posted by **Dave Shaffer** on 7 June 2007, 12:45 a.m.,  
in response to message #1 by Walter B

I don't recall this being discussed in all that's appeared about alternate keyboards:

It seems to me that it makes more sense to put log and  $10^x$  together on one key and ln and  $e^x$  on a different key, rather than having the two log functions on the same key and the two exponentiations on a different key. All (most?) other keys, where it's logical, put inverse operations together, such as rad  $\leftrightarrow$  degrees; hms  $\leftrightarrow$  h.hh; Rec  $\leftrightarrow$  Pol; sqrt  $\leftrightarrow$   $x^2$ ; etc.

My '11C, '41CX, and '48GX have logs and exponentiation the way I like them (the "old" way, let's say). My 32Sii has them the "new" way (i.e. ln and log together). Anybody know why this changed between models? Which makes more sense to you?

I'd also prefer pi as an unshifted key. As an astronomer using angles all the time, I use pi a WHOLE lot more than many other functions on the keys. Perhaps pi could be the primary function of what is now the () and [] key (makes sense to have them with MATRIX, though)

Other functions not so necessary(?): roll up (almost, but not quite, of course, the same as ENTER); complex roots (I think the way somebody else put it: take the reciprocal of the root and then do  $y^x$ ; RAN # (what do you really need this for?!); % and delta% (again, just about any user of a calculator like this can probably do % calculations faster by keying them in than he/she can remember the details of how the % key works! - see recent discussion about this matter).

Glad to see that ON is a single push. I think it was (yellow?) shifted in the original version (at least it was in one of the cached versions). OFF should then be a yellow shifted (rather than blue shifted) ON (i.e. immediately above ON). I suspect most of us turn our calcs off more often than we clear the summation registers!

## Re: A Serious Scientific Instrument

Message #11 Posted by **Paul Guertin** on 7 June 2007, 11:08 p.m.,  
in response to message #10 by Dave Shaffer

Quote:

I like the 32Sii way (unshifted  $e^x$  and ln side by side) because, as a math teacher, I use the natural log much more often than log base 10.

I wish my calculator had "log\_b" and "b^x" keys instead of "log\_10" and "10^x", with the value of b settable by the user in a special register. I'd set mine to base 2, since I use it more than base 10. This is admittedly a minor point, since base-2 logs are easy to compute with 3 extra keypresses.

### Re: log\_b and b^x

I wish my calculator had "log\_b" and "b^x" keys instead of "log\_10" and "10^x", with the value of b settable by the user in a special register.

I think *that* is by far the coolest idea I've heard in a LONG time! Excellent thinking!

I'll be implementing that as standard routines on my 33s. It would indeed be *very* cool if such was available on the 35s.

Great idea!

in response to message #11 by Paul Guertin

Quote:

I wish my calculator had "log\_b"

It's a pity  $x|/y$  (xroot) will be a shifted function on the HP-35S. On the HP-33S  $\log_{x,y}$  can be obtained with only three keystrokes:

[LN] [ $x|/y$ ] [LN]

For instance:

32 ENTER 2 LN  $x|/y$  LN -> 5 ( $\log_2 32$ )

Quote:

On the HP-33S  $\log_x y$  can be obtained also by:

32 LN 2 LN / -> 5 (log<sub>2</sub>32)

This is not  $\log_x y$ , in the sense  $x$  and  $y$  refer to stack registers, as on the key labeled  $y^x$ .

Actually, the sequence I presented simulates a hypothetical  $\log_x y$  key. This might be more interesting programatically though. For instance, assuming  $a$  in stack-register  $Y$  and  $b$  in stack-register  $X$  try to write a shorter RPN program than the following to compute  $\log_b a$ :

```
L0001 LBL L
L0002 LN
L0003 x|/y
L0004 LN
L0005 RTN
```

(15 bytes on the HP-33S; 7.5 bytes on the HP-32SII)

Regards,

Gerson.

Message #17 Posted by [Walter B](#) on 7 June 2007, 7:36 a.m.,  
in response to message #16 by Antonio Maschio (Italy)

Thanks for the feedback! So you shall get some, too:

- yellow print on the keyplate is for menus - this explains most of your remarks
- HYP is a menu containing 6 items
- there are 3 blue menus on the keys 1, 2, 3
- everything else is a function

- Patrice, you are right with USER mode - I'll think about it
- Dave S., I agree on your remark about LOG/LN. The reason I distributed it this way was simply the space available. A solution may be to abbreviate the decimal log with "LG". OK?

I'll come to your other remarks later. Promised!

Hallo Walter! It looks great.

But what do you think about colouring the Number-Keys and the Arithmetic-Keys in a other colour like older HP (Spice, Woodstock, Champion and so on).

I think this will give it a kick, doesn't it?

Thanks Jürgen

## Re: A Serious Scientific Instrument

Message #22 Posted by [Vieira, LC \(Brazil\)](#) on 7 June 2007, 10:50 a.m.,  
in response to message #1 by [Walter B](#)

Hi;

all 'n all we want either to present our best shot about what we call the best calculator ever or we are getting back to rebuilt an old HP successful calculator. Many attempts to get such combinations failed so far, and HP (the ACTUAL HP) offered a bunch of solutions that worked in many areas.

From time to time in this forum we experience the chance to answer to surveys about our favourite HP calculator (In some surveys, our favourite calculator despite brand). Well, if there is such unique model that satisfies all needs, no survey is needed, right?

When the HP28C was introduced, I felt as if HP was ahead of time, showing us what we WOULD need and never considered possible. The whole 48/49/50 series was a consequence of such vision. At that time, I wrote a book about such changes ('Da HP41 para a HP48', or 'From the HP41 to the HP48') and I intended to guide former RPN users into the new RPL usage/programming paradigm.

I feel as if the message has been lost, though. Not that I disagree with the RPN-driven models, I actually believe RPN helps students to understand calculus subjects. It is something like the abacus users when they actually see it (as a visual reference) instead of touching the device itself; reasoning over the RPN stack and operating structure seems to force the brain to understand the problem and find a solution in a different perspective. I remember that some classmates of mine actually got the main ideas in the many subjects after trying them out with an RPN calculator. Creating a program to solve the problems was a passage to understanding both problem and solution. I actually experienced this.

Did not have the chance to go ahead with RPL, because I was no longer a student when the HP48SX was introduced. The HP28 was not so often seen, but I remember joining a group of about ten students with HP28C's that wanted to know how to use it the best way possible in algebraic environment. My only and last HP28C class...

Time has gone and now HP seems to listen to us, users, prior to introduce a new product. Interesting, we all had to wait till HP decided to show us what it was hiding that was astonishing, new and desirable. Now we are trying to get from HP what we believe is mostly important, and there are many close, yet different proposals. If I'm there I'd be confused, because it seems to me that HP would need to offer some different versions of the HP35S to satisfy some of us. I myself would add a few suggestions, but based on the gigantic thread that followed the first appearance of the HP35S in this forum, I felt I'd not add significant contribution, though.

Please, read this as my private view of the rare chance we are (supposedly?) having to interfere in HP's choice of features to be offered in a new calculator. If there are so too many suggestions, maybe none of them will be caught, neither considered, and frustration may arise after the sensation that we were not heard after all.

I'd not be surprised if the HP35S is introduced exactly as it was shown in the first place, no changes applied. And we know what happened with the first HP12C Platinum and also with the HP49G+. Both carried many problems and had a negative impact, being replaced by their new versions.

I think we should support fewer suggestions, only one if possible, a consensual proposal. I do not know which one, because I have my own needs for a personal computing device, but I'd surely try to support the one with more people supporting.

I just want a new, good-looking, reliable, resourcefull RPN calculator. It seems to me that the HP35S will match my needs.

Sorry writing too much... (did not spell check, though)

Suggestions? Flames? Blames? Etc?

Cheers.

Luiz (Brazil)

## **Re: A Serious Scientific Instrument**

*Message #23 Posted by **Howard Owen** on 8 June 2007, 3:45 p.m.,  
in response to message #22 by Vieira, LC (Brazil)*

Quote:

---

.. I remember that some classmates of mine actually got the main ideas in the many subjects after trying them out with an RPN calculator. Creating a program to solve the problems was a passage to understanding both problem and solution. I actually experienced this.

---

I did too, in a different sphere. For several years after learning to program a computer, I would turn to the 41 to help me understand abstract problems that came up. These problems would entail algorithms I hadn't seen before, or new constructs in a new language or - especially - algorithms I would have to invent to solve a particular problem. In either case, I would code the problem in Forty One Calculator Language (FOCAL) and the answers would become clear to me. Since it was the first device I ever programmed, the 41Cs user language was like my native tongue. And moving data around registers, manipulating stacks and so forth *are* very concrete activities. For one example, when I first encountered pointers in Pascal, and then in C, I thought to myself "Aha! Indirect addressing."

Quote:

---

Time has gone and now HP seems to listen to us, users, prior to introduce a new product. Interesting, we all had to wait till HP decided to show us what it was hiding that was astonishing, new and desirable. Now we are trying to get from HP what we believe is mostly important, and there are many close, yet different proposals. ..

---

I think that "HP" is both listening to us and not listening to us. I believe that the first order of business for HP is to make a profit on the new machine. (It was a surprise to me to hear that the 33S led its market category in sales.) That means they need to listen to *all* their users. Thus we see features designed to increase acceptability with test administering bodies.

I have always thought - and I still do - that we enthusiasts represent a small segment of the pool of potential customers for HP's calculators. It's true that we tend to have strong opinions, and we like to think that others we come in contact with are positively influenced by those opinions, so it may be that we have a little more leverage in the marketplace than our numbers would indicate. But I don't think that's the reason why we are listened to at HP, if indeed we are.

So are we listened to? Well, we just saw a case and keyboard design that incorporated many elements that are near and dear to our hearts. We also know that Sam and Cyrille are aware of this community. So it's tempting to make the leap into believing that the 35s is the way it is due to our direct influence. But Sam, Cyrille and others at HP are not empty vessels to be filled up with our concepts of what is right and proper in an RPN machine. I think Sam listened to us, and to others, trying to garner good ideas. I think he heard some, but also that many of those ideas resonated with what *he* believed was right and proper. I think that he then turned around and applied his ideas to the real-world problem of producing a calculator that

embodied them.

Quote:

\_\_\_\_\_  
..I'd not be surprised if the HP35S is introduced exactly as it was shown in the first place, no changes applied..  
\_\_\_\_\_

I think that's right, for two reasons. First and foremost, I think that it must be too late to add features to the design. Remember there would be software development and testing, as well as keyboard and case retooling to do, all some three months before the machine is scheduled to ship. Second, I think that what we see in the 35S is HP's best compromise between *their* idea if the ideal machine, and the realities of bringing such a product to market.

Quote:

\_\_\_\_\_  
I just want a new, good-looking, reliable, resourcefull RPN calculator. It seems to me that the HP35S will match my needs.  
\_\_\_\_\_

Once again, I think that is exactly right.

Regards,  
Howard

John, what is "F & G" ??

### **Re: A Serious Scientific Instrument**

*Message #27 Posted by **Gene** on 7 June 2007, 11:56 a.m.,  
in response to message #26 by Walter B*

Sadly, that's what 98% of everyone who would buy a machine with "f" and "g" keys these days would say.

WE all know what they are, but the majority of purchasers would wonder if the "f" key was broken...imagine the calls to tech support "What is this "f" key and why doesn't it do anything?"

**Re: A Serious Scientific Instrument**

*Message #28 Posted by **Ren** on 7 June 2007, 12:06 p.m.,  
in response to message #27 by Gene*

Gene, and others who miss the f 'n g keys...

Maybe the f and g could be printed on the shift keys along with the curvy arrow, maybe on the lower bevel, the same color as the function.

Hmmm, maybe they could make the key tops holographic, depending on the viewing angle, it would show the curvy arrow or f 'n g.

**Re: A Serious Scientific Instrument (Summary & Poll)**

*Message #31 Posted by **Walter B** on 8 June 2007, 2:13 a.m.,  
in response to message #25 by John Nelson*

Thanks a lot for your kind responses and valuable critics. As Luiz rightfully suggested, there shall be one

proposal at the end. So let me sum up the open points and wishes:

- "f" & "g" will appear along with the curved arrows as Ren proposed, Nelson.
- USER mode will be selectable, Patrice. I'd put it on "g" "UP".
- MATRIX menu shall work as in 42s, Karl.
- I/O: I thought of an USB socket.
- SOFT KEYS like in 27s, 42s, 48 would be very nice to have, but would require a different LCD. I didn't want to redesign that much, but keep as much as possible of the 35s HP showed us. Well, I failed with the cursors already... ;-)
- ALPHA keys: I must admit I had an 48sx on the desk. Nevertheless, I'll follow ECL's arguments, and will have alpha-free cursors. To make up for this, I'll put letters on STO/RCL as Egan suggested. Paul (B.), you're right, I'm longing for a 42sx more than for a 33sII - IMHO the 42s was (and still is) far superior to the 32s, 32sII, and 33s. And if there will be a 35s for NCEES tests very soon, HP is free to put something serious on top of it :-). It's still a very limited alpha feature.
- GENERAL FUNCTION SET & KEYS: there were different wishes, so we have a list of candidates and a drop list below.
- GENERAL LABELLING: Going way back in history, an HP21 looks far cleaner than a 31e or a 10c. The 32sII put it to the extreme negative. Thus, labelling itself will stay as proposed for sake of clarity. Please also see my explanations posted earlier in this thread.
- COLORS OF KEYS: Jürgen, I agree this may give it a kick, but unless there is a broad majority wanting this and agreeing on the colors, I won't do it.
- OVERLAYS: For user- or application-specific reassignments, overlays with flaps may be used (the flaps covering the slanted front of keys, but may be cut away). I vote against overlays for parts of the standard function set. Instead, there shall be as much as possible directly accessible from the keyboard.

Candidates: Pi unshifted (Dave S.), EQN unshifted (Bill),  $e^x$  & LN unshifted, LOG\_b &  $b^x$  (Paul G.), stopwatch (assume >1 function, Patrice), ALL YOUR BASE ARE BELONG TO US (sorry, Frank, I see low chances for this important operation ;-), %T (Carlos).

Drops: Binary & logic functions (Patrice),  $x\_SQRT\_y$ , R\_UP, RAN#, %, %CHG (Dave S.). (If there isn't a space problem, I won't drop anything.)

Anyway, right now the keyboard is full. So, whoever wants a candidate included must say which function shall be replaced (i.e. deleted from the keyboard or moved to another location). Paul G. already told us he wants LOG\_b &  $b^x$  replacing LOG\_10 (= LOG = LG) &  $10^x$ .

Hope I didn't forget anybody's contribution. Else please remind me. In either case, it's your turn again :-)

Addendum: Most probably the 35s will be released as published. So whoever is completely satisfied with the 35s as is, you'll get it. I'll buy one for sure, too. And I'll continue "tuning" (or dreaming ;-). Just imagine. "Maybe I'm a dreamer, but I'm not the only one!"

Edited to update the candidates and drops. Added the last paragraph.

*Edited: 9 June 2007, 3:33 p.m. after one or more responses were posted*

## Re: A Serious Scientific Instrument (Summary & Poll)

Message #32 Posted by **Maximilian Hohmann** on 8 June 2007, 3:08 a.m.,  
in response to message #31 by Walter B

Hello!

Quote:

---

Hope I didn't forget anybody's contribution. Else please remind me. In either case, it's your turn again :-)

---

I havent contributed yet, but i will do now, with a reminder :-)

This thing is supposed to be a reborn HP-35. A very simple (by todays standards) scientific calculator. With no shift key. Simple and clear.

For me, the HP-35S should be just the same: Simple and clear. No need to read the manual, no need to install communication software on my Mac (that HP will never supply anyway, other than Ti :-), no need to press "XEQ Alpha Letter Letter Letter Alpha Enter" to invoke a command like on the '41 (horrible, terrible, unergonomic nightmare of a user interface!), no need to hassle with menus and cursor keys. Sine of 31 Degrees? "3 1 SIN" is all I ever want to have to type into any pocket calculator to do that.

A simple machine for quick and simple calculations is all it should be. For the not-so-simple calculations absolutely nobody (apart us nutters!) has used a pocket calculator in the last 30 years anyway...

Therefore I would suggest to wait with all these ideas and improvements for the 35-years-jubilee-version of the '41....

Greetings, Max

---

Dave, you will get it, just you tell me what I shall drop for it. Referring to "retro" I suppose you'll be not satisfied with the original function set of HP35A, will you?

*Edited: 8 June 2007, 2:24 p.m.*

### **Re: A Serious Scientific Instrument (Summary & Poll)**

*Message #35 Posted by [Maximilian Hohmann](#) on 8 June 2007, 2:56 p.m.,  
in response to message #34 by Walter B*

Hello!

Quote:

---

Referring to "retro" I suppose you'll be not satisfied with the original function set of HP35A, will you?

---

Well, I at least would be completely satisfied with the original function set. For everything that requires more functions than that, I wouldn't use a pocket calculator anyway. I live in the year 2007 and get paid for 2007 work, so I am not able (nor are my employers!) to afford the luxury of doing this work with a toy, whatever sophisticated this toy might be, when the competition uses proper tools to do the same work.

Come to think of it, the calculator that gave me the biggest satisfaction ever was the Privilege basic scientific machine (D-883) that I got for Christmas when I was 13 or 14. Somehow, I am still after the same degree of satisfaction, and I don't feel that matrix operations and triple-nested menus will bring that back to me...

Greetings, Max

### **Re: A Serious Scientific Instrument (Summary & Poll)**

*Message #36 Posted by **Dave Shaffer** on 8 June 2007, 10:56 p.m.,  
in response to message #34 by Walter B*

"Referring to "retro" I suppose you'll be not satisfied with the original function set of HP35A, will you?"

Well, like Maximilian, that would meet most of what I use a calculator for. I just dragged out both my original '35 and my '41CX. Other than the summation+ key, which I've used on a few occasions (mostly when teaching physics labs) for linear least squares fitting, there aren't any other new keys on the 41 that I use (except for those few times when I actually programmed the 41 - which I did in the field back before the days of laptop PCs, which I would probably take now). Similarly for my 32Sii and 42S - there isn't much new there that I need.

As has been mentioned elsewhere in the Forum, one could imagine a split between simple calcs (the 35S) used for simple purposes, and the heavy iron (a 50G) used for more complex problems.

### **Re: A Serious Scientific Instrument (Summary & Poll)**

*Message #37 Posted by **Walter B** on 9 June 2007, 2:41 p.m.,  
in response to message #36 by Dave Shaffer*

Quote:

---

one could imagine a split between simple calcs (the 35S) used for simple purposes, and the heavy iron (a 50G) used for more complex problems.

---

Agreed for the 35s. With 50g, the one and only problem for me is it is RPL instead of RPN. As others in this forum, I see a gap left by the late 42s and even 41c. I hope for a midrange calc with some (limited) possibility to exchange data with the rest of the world (e.g. with a PC), especially for program loading and backup. Else, several kilobytes of memory are of very limited use. If we call it "45s", we may believe we won't have to

wait for the 41 anniversary ;-)

### **Re: A Serious Scientific Instrument (Summary & Poll)**

*Message #38 Posted by [Carlos Lacroze](#) on 9 June 2007, 11:15 a.m.,  
in response to message #31 by Walter B*

Although our wishes may only help for future developments or just to fantasize, I would never drop the "x\_SQRT\_y, %, %CHG" keys in a scientific calculator. What is more, I would even consider a "%T" key for recurrent calculations. Just my 2 cents.

### **Re: A Serious Scientific Instrument (Summary & Poll)**

*Message #39 Posted by [Walter B](#) on 9 June 2007, 3:06 p.m.,  
in response to message #38 by Carlos Lacroze*

Buenas tardes, Carlos, I put your suggestion into the summary. Though you did not tell us what shall be dropped for %T.

### **Re: A Serious Scientific Instrument (Summary & Poll)**

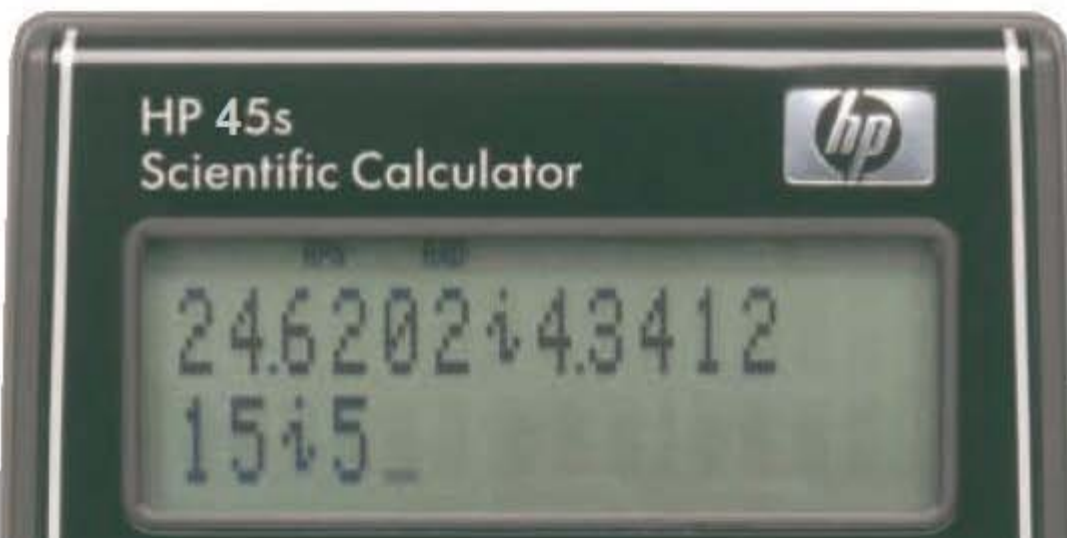

*Message #40 Posted by [Carlos Lacroze](#) on 11 June 2007, 4:44 p.m.,  
in response to message #39 by Walter B*

Thanks Walter for your reply. I should have chosen to drop a shifted key like <-ENG-> or the blue shifted computer terms like XOR, etc. but I wouldn't like to be murdered :) by my dear fellow colleagues who claim them for their own reasons, because I preferred a more comfortable way of dividing numbers (for prorating). That said, let me point out that I found the delta percent and percent functions, sharing the same key place, mostly interesting, as well as the elegant proposal for logs in any base.

### **A Serious Scientific Instrument (Version 1.1)**

*Message #41 Posted by [Walter B](#) on 10 June 2007, 2:12 a.m.,  
in response to message #31 by Walter B*

Here we go:

Please see the keys K, L, M, where the logs were rearranged (thanks to Dave S.), and a log to base "b" is introduced (thanks to Paul G.). The base may be stored and recalled via "STO b"/"RCL b" using the SQRRT-key. The function xSQRTy was deleted because I needed the space for "b" and the operation may be reached as fast via "1/x" "y^x". The shift keys now show f & g (thanks to John Nelson). Besides, I relocated some keys for better grouping (especially for EQN, thanks to Bill P.).

In alpha mode, the cursor keys are "alpha-free" now (thanks to ECL). Some symbols are on the arithmetic operators (thanks to Egan). The keytop functions of *those keys attributed with a green character* may be accessed via "g" + the respective key (thus, the normal g-shifted operations shall be not accessible in alpha mode, except GTO and LASTx; f-shift may be used, however).

Thanks to everyone who contributed! Comments, critics etc. are most welcome 8)

*Message #42 Posted by **DaveJ** on 10 June 2007, 3:26 a.m.,  
in response to message #41 by Walter B*

The Backspace key is *\*still\** there :- ( It is simply not needed when you have a left arrow key that can be used as a backspace key in normal RPN entry mode.

Get rid of the backspace key forever, move the 1/X key down, and give LOG it's own key.

Then I'll be able to sleep at night!

Dave.

**Re: A Serious Scientific Instrument (Version 1.1)**

\_\_\_\_\_  
Simple, you have backspace (or delete digit) as a shift function. Guess it comes down to whether or not you want the keyboard optimised for matrix operations or basic scientific functions. For me, I'd use basic scientific functions 99.9% of the time so would rather have the extra keys for that purpose. I just think it's smarter to combine the left arrow and backspace functions for normal operation, gaining an extra valuable key. And in my opinion matrices are not "normal" operations, so a shift function would suffice. But of course, YMMV.

I could complain about the other "wasted" keys, but I'll let that slide! :->

Dave.

And why do 48 and 42s have cursors and backspace?? (you see I'm trying hard to act like a 4-year old)

And what are the other "wasted" keys? Why?

**Re: A Serious Scientific Instrument (Version 1.1)**

*Message #46 Posted by **DaveJ** on 10 June 2007, 6:48 p.m.,  
in response to message #45 by Walter B*

Quote:

And why do 48 and 42s have cursors and backspace?? (you see I'm trying hard to act like a 4-year old)

Because they are more complicated calculators. I agree with Maximilion above when he said the 35S should be a \*simple\* scientific calculator. That means lots of keys dedicated to simple everyday functions.

If I want to edit matrices I'll do it on a nice big 4 line screen thanks, not a pokey one or two line display.

Quote:

And what are the other "wasted" keys? Why?

A simple calc shouldn't even have dedicated cursor keys, so there is 4 wasted keys for starters. I won't go into the others!

OMG, I just notice the ENG and <ENG shifted function are now gone! Every basic (or even complex) scientific calc should have a dedicated ENG button. I was even happy with the shifted versions on the original 35S, at least they were in a nice prominent position.

These changes make this calc almost useless for me for everyday use. Just like big graphing calcs are useless to me for everyday use.

Dave.

## Re: A Serious Scientific Instrument (Version 1.1)

Message #48 Posted by *Karl Schneider* on 11 June 2007, 1:50 a.m.,  
in response to message #46 by *DaveJ*

Hi, Dave --

Quote:

---

If I want to edit matrices I'll do it on a nice big 4 line screen thanks,  
not a pokey one or two line display.

---

I'd prefer a PC screen with Matlab or similar, but for a calculator, I actually prefer the "single element plus menu" display methods of the HP-42S over the methods of the RPL-based 48/49/50, with their four or five lines. I think it's best to display one complete datum -- real or complex -- than to try to cram as many elements as possible into a small display.

Quote:

---

A simple calc shouldn't even have dedicated cursor keys, so there is  
4 wasted keys for starters.

---

Including the abominable "raised silver bar", the HP-33S has five more keys than the proposed HP-35s -- 48 versus 43. You're right that including four cursor keys will eliminate some desired primary-function keys. However, the cursor keys could be put to very effective use:

- Program navigation: Up/down scrolls by line; left/right could jump to adjacent labels.
- Equation navigation: Up/down jumps to adjacent equation in memory; left/right could scroll cursor within an equation (a feature missing from the HP-22S/32SII/33S, but present in the HP-17B/BII/27S).
- Menu navigation: Up/down jumps to next screen or level; left/right moves to different selections
- Matrix navigation: If matrix capabilities were present, the cursor keys would allow the easy navigation provided for the HP-42S and RPL-based HP-28/48/49/50.

Quote:

---

Every basic (or even complex) scientific calc should have a  
dedicated ENG button.

---

I like Casio's way of doing things, which may have been adopted for the HP-35s. Use "<-ENG" and "ENG->" to place the display in ENG mode and to move the decimal point for scaling the value as desired. There is no need to include ENG by itself as a separate mode setting under the DISP menu, because it is equivalent to SCI except that the exponent is an integer multiple of three. "ENG n" versus "SCI n" also makes no difference if used as an integrand-uncertainty setting.

"ENG n" versus "SCI n" also makes no difference if used as an integrand-uncertainty setting.

---

Indeed. As an electronics engineer the ENG key is my most used key after the 4 functions and EXP, as I am always dealing in M,k,m,u,n,p etc, I can't imagine any scientific calculator without this key. I'm happy with <ENG as a shift function, but ENG simply must be a dedicated key on any calculator that claims to be suitable for engineering use. On more complex calcs like the original proposed 35S, shift functions for both are a reasonable compromise. HP had the good sense to not only add them, but make them prominent.

And before anyone mentions it, ENG mode is *\*not\** the same thing as an ENG key. Having everything always display in ENG mode can be incredibly annoying, and I always want the option of pressing the ENG key when needed. Simple and effective, the way it should be.

Dave.

**Re: A Serious Scientific Instrument (Version 1.1)**

Message #50 Posted by **Antonio Maschio (Italy)** on 11 June 2007, 11:06 a.m.,  
in response to message #49 by DaveJ

No one of you seems aware of the following fact:

the xROOTy key is essential when the operand is negative; I have a HP-32II in front of me:

```
27
ENTER
+/-
3
xROOTy
```

yields (correctly) -3.0000, because the function  $x^3$  is reversible. The result is obviously correct because  $-3 \cdot -3 \cdot -3$  is -27. Try with, say -27.3 as operand and you'll get -3.0111, which is correct.

Now:

```
27
ENTER
+/-
3
1/x
y^x
```

returns "INVALID y^X", because the function  $a^x$  (with  $x$  real) admits only positive values for "a", and its graphic (similar to the exp case) shows this.

So it's simply not true that the  $[1/x]$   $[y^x]$  sequence is equivalent to the  $[xROOTy]$  key.

Message #51 Posted by **Walter B** on 11 June 2007, 12:28 p.m.,  
in response to message #50 by Antonio Maschio (Italy)

Antonio, you will get the same result on a 42s unless you allow complex results. Is there a way to do this with a 33s?

BTW, I count on  $y^{(1/x)}$  being identical to  $xROOT(y)$  - else you force me to read my old math books again ;-)

*Edited: 11 June 2007, 12:32 p.m.*

**"x\_root\_y" and real vs. complex roots**

Message #52 Posted by **Karl Schneider** on 12 June 2007, 3:45 a.m.,  
in response to message #50 by Antonio Maschio (Italy)

Hi, Antonio and Walter --

Antonio seems to have replied to the wrong post, but I'll address it anyway.

This topic was discussed more than a year ago, but I haven't made the effort to look up the thread.

"x\_root\_y" is not absolutely essential, but is somewhat useful, as it allows the real-valued odd-integer root of a negative real value to be calculated without cumbersome special code to ascertain odd integer  $x$  and negative  $y$ . (Checking for  $\text{MOD}(x, 2) = 1$  is probably the best way to verify an odd-valued integer.)

"x\_root\_y" is also sometimes a bit more accurate than  $[x < > y][+/-][x < > y][1/x][y^x][+/-]$ , probably because full internal precision is maintained throughout, rather than rounding the result of  $[1/x]$  to 12 digits.

In the strictest mathematical sense, the "correct" cube root of -27 is  $1.50(1 + i\sqrt{3}) = (1.50 + i2.59808) = 3.00 @ 60 \text{ degrees}$ . This is the "primary" root, which has the lowest angle on the complex plane, measured counterclockwise from the positive real axis.

This can be obtained on the HP-33S (or HP-32S/SII) by the following procedure:

```
0
ENTER
-27
ENTER
0
ENTER
3
CMPLX1/x
CMPLXY^x
```

CMPLX"x\_root\_y" is not supported.

thing as an ENG key. Having everything always display in ENG mode can be incredibly annoying, and I always want the option of pressing the ENG key when needed. Simple and effective, the way it should be.

---

I think what you mean is that ENG should function as implemented by Casio for years, allowing a value to be displayed to the nearest ENG exponent using a single keystroke, and to have that exponent shifted using one or two keystrokes. The "=" key cancels ENG mode.

My 1981 Casio fx-3600P and 2005 fx-115MS operate in exactly that fashion, which I also find convenient. However, both are algebraic and non-programmable, and perhaps "therein lies the rub." IF ENG is treated only as a temporary display mode (like SHOW), it could be nonprogrammable. Maybe SHOW (in addition to FIX/SCI/ALL) could cancel ENG, and the left and right cursor arrows could provide ENG-> and <-ENG (if not used for matrix navigation)...

---

What I mean by "basic scientific" is non-programmable. Non-programmable scientifics range from the basic early ones like the HP35 through to say the Casio FX-991ES which is about as advanced as you can get without having programmability. I call them all "basic scientific" calc, although some are obviously a lot more advanced than others and can have a solver etc.

But once that programability option goes in then you have to start dedicating keys and having menus etc. That to me becomes an "advanced" scientific calc.

How do others classify and categorise various calcs like this?

Quote:

---

I think what you mean is that ENG should function as implemented by Casio for years, allowing a value to be displayed to the nearest ENG exponent using a single keystroke, and to have that exponent shifted using one or two keystrokes. The "=" key cancels ENG mode.

---

Yes, I'm talking about the Casio's, I love the way they implement the ENG mode, to me it's just perfect. I've never liked the ENG "mode" used on the HP's.

Dave.

### Re: A Serious Scientific Instrument (Version 1.1)

Message #55 Posted by [asdf](#) on 10 June 2007, 7:55 p.m.,  
in response to message #42 by DaveJ

The cursor keys in addition to the backspace are extremely useful when you need to edit an equation or if you are in (gasp) algebraic mode. This has always been one of the most serious shortcomings of the 33s.

### Re: A Serious Scientific Instrument (Version 1.1)

Message #58 Posted by [bill platt](#) on 10 June 2007, 10:18 a.m.,  
in response to message #41 by Walter B

Much better.

But I have one suggestion:

"i" is still wasting a primary, and the equation mode is still buried. Do the following:

the "i" key comes "EQN" as primary, and the --> key becomes SOLVE as primary. The --> and the "i" go to secondary positions on the 0 and the comma key. Additionally, why is the comma primary?

And what is the --> key for, anyway?

Hi, Bill --

Quote:

\_\_\_\_\_  
"i" is still wasting a primary, and the equation mode is still buried.  
\_\_\_\_\_

I disagree, and believe that HP's concept should be retained. Those of us who use complex numbers regularly would appreciate having  $i$  unshifted, with the angle symbol blue-shifted on the same key. I also believe that a menu of functions germane to complex numbers (not ARG, which I believe is like ATAN2) should be the yellow-shifted function for the key. Please see the following post from 2004:

"User-friendly complex numbers" at <http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=63415#63415>

Quote:

\_\_\_\_\_  
And what is the --> key for, anyway?

*Message #60 Posted by **Walter B** on 10 June 2007, 5:49 p.m.,  
in response to message #59 by Karl Schneider*

Bill & Karl,

Quote:

\_\_\_\_\_  
And what is the --> key for, anyway?  
\_\_\_\_\_

Well, you could have read in [my earlier post](#):

Quote:

an unshifted -> is introduced to allow double use of mode keys also for conversions (e.g. blue-shift 6 sets hexadecimal mode, while -> blue-shift 6 converts to hex display); this makes the menu BASE obsolete

This shall work for the keys "4" through "9".

@Karl, I second you keeping "i" as primary key. BTW, I'm slowly approaching the state where I can quote my older posts, too ;-)

@Bill

Quote:

why is the comma primary?

So far, the decimal separator has been primary always :-). Of course you may also set the calc to use a point as decimal separator. However, the layout chosen has an advantage in alpha mode: there is a point available already via "f" "\*" (the function DOT outside alpha), so we save one key by using the comma as default decimal separator. And AFAIK it's the default for the majority anyway.

Why? (remember the 4-year-old ;-)

**Re: A Serious Scientific Instrument (Version 1.1)**

*Message #63 Posted by [Dave Shaffer](#) on 11 June 2007, 4:29 p.m.,  
in response to message #62 by [Walter B](#)*

well, if I was a 4-year old too, I would just pout and say I want it that way ....

But, in a more measured tone, I would say that's the way it is (not necessarily the color code, but the functionality of the key immediately above the ON button) on at least the 32, 33S, 42S, and 48 calcs. Plus, it seems most obvious and convenient to turn it OFF by pressing the button immediately above the ON, rather than the button two rows up.

**Re: A Serious Scientific Instrument (Version 1.1)**

Message #64 Posted by **Walter B** on 11 June 2007, 6:37 p.m.,  
in response to message #63 by Dave Shaffer

:-D OK, Dave, you can have it! FYI, I made it blue because it shall invert the primary function of this key (like blue SIGMA-,  $x^2$ , R\_UP, ASIN etc.). I did not have any yellow inversions of primary functions so far. But, for sake of convenience, and to prevent you from pouting... ;-)

**Re: A Serious Scientific Instrument (Version 1.1)**

Message #65 Posted by **Dave Shaffer** on 11 June 2007, 8:11 p.m.,

Message #69 Posted by **Gerson W. Barbosa** on 13 June 2007, 8:16 p.m.,  
in response to message #67 by Walter B

Actually, I don't see the need of wasting a key position just to allow for logs of other bases, since this easily accomplished, either manually or by means of a very short program. Anyway, if this is really needed, the proposed solution might lead the user to errors in case the base (b) is accidentally changed. On the HP-33S it's quite common /c is involuntarily changed from its default value (4096).

Regards,

Gerson.

Hello Walter,

Quote:

BTW, for sake of consistency, this function shall be **LOG<sub>y</sub> x** instead of  
**LOG<sub>x</sub> y**.

For the sake of consistency, I would keep **LOG<sub>x</sub> y**. In  $y^x$ , for instance, *first* we enter the number and then the power to which we want it raised. Likewise, entering the number and base, in this order, appears to be more natural to me. Another matter for voting :-)

In order to avoid cluttering and exceptions you dislike, what about using lower case letters for those functions? I mean **log**, **ln** and **log<sub>x</sub> y**.

Best regards,

Gerson.

**Logarithms (was: Version 1.1\*)**

Message #72 Posted by **Walter B** on 14 June 2007, 11:56 a.m.,  
in response to message #71 by Gerson W. Barbosa

Ola, Gerson,

Quote:

I would keep **LOG<sub>x</sub> y**. In  $y^x$ , for instance, *first* we enter the number and then the power to which we want it raised. Likewise, entering the number and base, in this order, appears to be more natural to me.

I can argue for **LOG<sub>y</sub> x** the same way: first enter the base and then the number which should be analyzed versus this base.

Quote:

Another matter for voting :-)

Agreed.

Quote:

... what about using lower case letters for those functions?

Fine idea. You can see it above already. However, many people seem to be inclined (?) to CAPITALS. Therefore, I confined lower case to variables and to modes so far (needing the space in **Rec Pol** and **Deg Rad**, and writing **Cx Re** consistently). And I started to use it for functions on the keyplate to indicate the difference to menus. And even lower case **log<sub>x</sub> y** will not fit nicely on the key.

Quote:

I mean **log**, **ln** and **log<sub>x</sub> y**.

IF the universal logarithm shall be called **log<sub>x</sub> y** or **log<sub>y</sub> x** (which is perfectly OK for me) THEN the decadic logarithm can't be named **LOG** again but needs a different name, e.g. **LG** as proposed above.

Com os melhores cumprimentos,

Walter

### [HP-35s] For Thee -- Lovers Of The Morning Star

*Message #73 Posted by **Karl Schneider** on 14 June 2007, 10:38 p.m.,  
in response to message #67 by Walter B*

"I feel, I feel, I feel ... I feel like a morning star"

Sorry -- it just reminded me of that. (Those who don't get the reference can Google it.)

Seriously, I've decided to wait until I have my own HP-35s before expressing detailed suggestions for improvement. I probably won't depend upon a "surprise in San Diego"; that way, I'll arrive at HHC with well-formulated constructive input, both suggestions and criticisms.

In addition to the implementation of complex numbers, the main mystery to me is how the "800+ registers" would be addressed, and whether and how two-character variables are supported without an ALPHA mode. Any major improvements would have to wait for an HP-35sii or HP-45s to be developed. Take note: The "morning star" would be great for matrix editing.

### A Serious Scientific Instrument (Version 1.2)

*Message #74 Posted by **Walter B** on 17 June 2007, 9:23 a.m.,  
in response to message #41 by Walter B*

As many of you already suggested, such a calculator will be more useful and really fun with a slightly bigger display. Keeping the given outer dimensions it may look like this:

With the coarse resolution of the 33s/35s this would allow for 4 lines. Using something a bit more advanced, 6 lines are possible with a font still perfectly readable for the true old fans of HP. And their (hopefully many) coming successors could go up to 8 lines easily. With a good display resolution the number of lines may be user-settable within a given interval. Either way the cursors make more sense than before.

For the logs: I think this version keeping **b**, **b<sup>x</sup>**, **LOG<sub>b</sub>** is still better than the alternative with the universal LOG, **10<sup>x</sup>**, **LG** for at least 2 reasons:

- a) easier error correction,
- b) I expect users to stay with a specific base for some calculations, so it's more efficient setting the base once instead of having to enter it for each and every operation.

And for those folks who will never need any other base than 10? They will just stay with the startup default of **b = 10** and never change it :-)

As usual, do not spare with comments and critics! 8)

(Edited to update the picture: LCD + cursor print)

Quote:

---

Well, I did not find your vote in this thread above.

---

Firstly, I'm just stating a preference, not "voting." I don't see the point of a vote, since I highly doubt the result will have any influence on what HP does. Secondly, I'd already stated my preference earlier, and saw no need to repeat it. The rest of the discussion has centered on details that don't matter much to me. But for the record, **all** of your versions that have "normal" cursor keys are acceptable to me, and **none** of the versions with the "diamond" pattern keys are.

Quote:

---

And I recommend you find some more votes for this, else I fear you will not end as majority leader ;-)

---

As I said, I don't see the point of voting, because I expect that even 100% agreement here will make no difference in the outcome.

### **Re: A Serious Scientific Instrument (Version 1.2)**

*Message #78 Posted by **Walter B** on 18 June 2007, 5:47 a.m.,  
in response to message #77 by Wayne Brown*

So there's no mercy even for black diamonds ;-) So far I assumed you had a color problem with the 35s's diamond, but now I know. Thanks for your explanation.

Ref. to "voting": I know HP is free to (and will presumably not) take anything from these proposals, regardless how many forum members stand behind them (free of charge, anyway). Nevertheless, I'm interested in the opinion of the educated majority of these members. And I make it visible, so we can talk about a concrete model instead of pondering wishlists which's combined effects blast any design. IMO we had too many easy wishlists in the past, and very few people made a serious effort to check them at least by modelling. As people say here: "The devil hides in detail!"

Thanks again for making your opinion clear.

in response to message #74 by Walter B*

I love the big display.

Now give it graphing features and a CAS, plus a thoroughly revised and evolved RPN programming environment, and we'll have the flagship RPN calculator that HP would have produced by now if it had never taken the left turn into RPL. 8)

Regards,  
Howard

**Re: A Serious Scientific Instrument (Version 1.2)**

*Message #81 Posted by **Walter B** on 19 June 2007, 12:39 p.m.,

**Re: A Serious Scientific Instrument (Version 1.2)**

*Message #82 Posted by **Walter B** on 21 June 2007, 6:14 a.m.,  
in response to message #74 by Walter B*

FYI, the picture in [my earlier post](#) is updated to show how a 7 line display may look like. Luiz's 42s-font was used (thanks!).

IMO such a display is still clearly readable in full natural size, even above 50 :-). Principally, as long as you can read the yellow and blue print, you shall be able to read this display as well. And you may set the LCD to 6, 5, and 4 lines for bigger letters, but I cannot give you a bigger print ;-)

*Edited: 21 June 2007, 5:11 p.m.*

*Message #83 Posted by **bill platt** on 7 June 2007, 1:01 p.m.,  
in response to message #1 by Walter B*

Nice work. It must have taken you a lot of time to do that!

However I must comment on it.

1. I do not think that your design matches the features which are likely to be included in the 35s. This is especially the case for the 41x type stuff you have included such as ASSIGN.

2. I feel that you have smothered one of the key features of the 32sii-333-35s family: equations. The controls for them are all shifted (except parentheses) and scattered all over the keyboard.

Considering that the equation feature, especially if improved with full editing, is a forward-looking feature with equal to superior algebraic handling to that of "algebraics" it really ought to take a primary role in the keyboard layout.

But your waork is very nice and I am grateful for the effort and the chance to criticize :-)

### NoVRAM Module

Message #1 Posted by [Jeff Davis](#) on 6 June 2007, 7:47 p.m.

I wanted to see if anyone knows how to program and upload the files to the NoVRAM Module. The NoVRAM-h.exe software is there and I presume is used just like the Clonix6p software. Can I use the icprog software and use the F8 function to read the existing contents of the NoVRAM module? I wanted to ask before trying this so I do not damage the NoVRAM Module. When I tried the NoVRAM-h.exe I end up with 4 different files. romimg0H, roming1H, mappingH and sgnaturH. How do these files work with the icprog software? Thanks for your help.

### Re: NoVRAM Module

Message #2 Posted by [Vieira, L. C. \(Brazil\)](#) on 6 June 2007, 10:18 p.m.,  
in response to message #1 by [Jeff Davis](#)

HI;

please, forgive me if I am heading the answer prior to wait for Diego's post. I have both NoVRAM and NoV32 modules, and I have programmed them many times. Some days ago I reprogrammed my NoV32 a few times prior to match my needs.

Quote:

Can I use the icprog software and use the F8 function to read the existing contents of the NoVRAM module?

Yeap! Just configure the ICPROG to work with the 18F252 and, after reading (there is a button to read contents, too) you'll see the current configuration (.ROM file names) in the lower, small window.

Quote:

I wanted to ask before trying this so I do not damage the NoVRAM Module.

I use the programmer sold by Diego, and had no problems so far. It is a good idea to read all documents related to both Clonix and NoVRAM. The procedures explained in the Clonix manual apply to the NoVRAM as well, added the complementary explanations found in the NoVRAM manual.

Quote:

When I tried the NoVRAM-h.exe I end up with 4 different files. romimg0H, roming1H, mappingH and sgnaturH. How do these files work with the icprog software?

What I actually do is to prepare the configuration with the novram-h.exe, save it and wait till the ICPROG opens automatically. Then I have the NoVRAM programmed. You see, the 16KRAM only make sense when you use some sort of software to handle it, like HEPAX, David Assembler... You probably know about this, sorry, just to make sure. I configured my NoV32 to run HEPAX and David Assembler with the additional

label ROM, and it works fine (I cannot access the second 16KRAM page, though, but this is another story...) So, when I want to use the HEPAX emulation with NOVRAM, novram-h.exe must be used to create the necessary files. I think that some of the files you mention are used as temporary buffers (the H might be related to hex coded data), because only the NOVRAM-H.HEX file seems to be used. As mentioned in the Novram manual, it is possible to invoke the ICPROG with a command line that specifies the .HEX file you want to use instead of the default NOVRAM-H.HEX. I have also executed ICPROG directly and then I explicitly opened another .HEX file and programmed the module. Worked fine as well.

I hope I did not miss anything. Anyway, it would be wise to wait for some extra help.

Success!

Luiz (Brazil)

(Tomorrow is a Holliday here, so I found some time to write a few words in some posts today. Feels good...)

### HP-41 CV Repair/Battery Contacts

Message #1 Posted by [Kevin](#) on 6 June 2007, 4:03 p.m.

Hi All, I have a HP-41CV calculator over 20 years old. I made the mistake at some point of putting some cheap Radio Shack batteries in it - and one of the battery terminals suffered somewhat minor damage. I attempted to gently clean the terminal with some baking Soda mixed with just a little water and to gently dry and buff the area to remove the green crud. However, I could not get it completely clean and I hesitate to clean more vigorously as it looks like the metal is starting to separate just a little.

When I replaced the batteries with new ones 0.0000 appears briefly and then fades out. I took the batteries out and put them back in a couple of times and now it appears to be working fine. But I suspect that the battery is not making perfect contact with one of the terminals. Incidentally, the other three terminals look shiny/new and are in perfect condition.

Is there are very minor repair that I could do to the 1 slightly damaged battery terminal?

Thanks,

Kevin

### Re: HP-41 CV Repair/Battery Contacts

Message #2 Posted by [Ralph](#) on 10 June 2007, 11:17 a.m.,  
in response to message #1 by Kevin

I picked up a 41CX at Goodwill a couple of weeks ago for \$2.99. It had a corroded battery contact point and would only work if the pack was jiggled in a certain way. I went to Fry's Electronics and picked up a circuit writer pen from the ProGold people (Caig Labs Inc.). It is a silver based paint marker like thing that leaves a conductive coating on the circuit trace that is still there. Seems to be holding up just fine so far.

I stick to Duracells. I have had some bad luck with Radio Shack and Energizer cells in several devices.

**15C program question**

Message #1 Posted by [John Nelson](#) on 6 June 2007, 9:26 a.m.

I was looking at the programs we have here, and in the longer quadratic program, it lists a command that I am not familiar with.

026 RCL: 1

I understand the RCL and the 1, but what does the colon signify and how do I enter that on the 15C?

- John

**Re: 15C program question**

Message #2 Posted by [Valentin Albillo](#) on 6 June 2007, 9:32 a.m.,  
in response to message #1 by John Nelson

It probably is a "division" operation, so just press the RCL key, the division key, and the "1" key.

Best regards from V.

**Re: 15C program question**

Message #3 Posted by [John Nelson](#) on 6 June 2007, 9:35 a.m.,  
in response to message #2 by Valentin Albillo

Thanks... that's odd... normally you will see / for division.

Thanks again for the heads up.

**Re: 15C program question**

Message #4 Posted by [Donald](#) on 6 June 2007, 10:51 a.m.,  
in response to message #1 by John Nelson

is it RCL <decimal point> 1 i.e. RCL 11 ?

**Re: 15C program question**

Message #5 Posted by [John Nelson](#) on 6 June 2007, 1:31 p.m.,  
in response to message #4 by Donald

No... it is a colon.

**Re: 15C program question**

Message #6 Posted by [Egan Ford](#) on 6 June 2007, 2:52 p.m.,

*in response to message #5 by John Nelson*

If you are referring to <http://www.hpmuseum.org/software/15cquad.htm> then it should be RCL/, not RCL:.

<http://upload.wikimedia.org/math/3/e/a/3ea647783b5121989cd87ca3bb558916.png>

Register 1 contains 2a, so RCL/ 1 is required to get the correct answer.

### **Re: 15C program question**

*Message #7 Posted by [John Nelson](#) on 6 June 2007, 3:38 p.m.,  
in response to message #6 by Egan Ford*

Well, I treated the colon as a divide, so it really wouldn't matter. Is there something else the colon can stand for as I have seen it before, but then a few lines below I would see them use the forward slash so it was as if they were using it interchangeably, which does not make any sense.

### **Re: 15C program instruction question**

*Message #8 Posted by [Karl Schneider](#) on 6 June 2007, 10:01 p.m.,  
in response to message #1 by John Nelson*

Quote:

026 RCL: 1

I understand the RCL and the 1, but what does the colon signify and how do I enter that on the 15C?

As Valentin and others have stated, I think it's supposed to be "divide". The original intent was probably to superimpose ":" on "-", to make a divide sign. A capital theta can similarly be formed by superimposing "-" on a "0".

### User RPL speed

Message #1 Posted by [Xerxes](#) on 6 June 2007, 9:01 a.m.

For sure some of you remember the thread about the [Calculator Benchmark](#). A legitimate criticism was not having a structured version of the test algorithm for languages without GOTO command or if slower with unstructured code. Meanwhile I have added an accurate structured version of the test using the same algorithm as the unstructured one. If a language allows both versions, you will find the faster version in the table now.

This is the accurate User RPL implementation:

```
<< 8. 0. 0. 0. { } -> R S X Y A
<< CLEAR TICKS
  1. R START 0. NEXT R ->LIST 'A' STO
  DO
    'A' 'X' INCR R PUT
    DO
      'S' INCR DROP
      X 'Y' STO
      WHILE Y 1. > REPEAT
        A X GET A 'Y' DECR GET -
        IF DUP 0. == SWAP ABS X Y - == OR THEN
          0. 'Y' STO
          'A' X A X GET 1. - PUT
          WHILE A X GET 0. == REPEAT
            'A' 'X' DECR A X GET 1. - PUT
          END
        END
      END
    END
  UNTIL Y 1. == END
  UNTIL X R == END
  TICKS SWAP - B->R 8192. /
  S
>>
>>
```

After running the program, it returns the test value of 876 for correct executing and the time needed, if I am right that 8192 ticks are one second on all RPL calculators. The typical execution speed of the HP-50G is 90.3 seconds after 10 runnings.

It would be nice, if somebody can test a RPL calculator with other hardware.

Hardware Overview:

```
-----
Saturn 0.640 MHz: HP-28C
Saturn 1 MHz: HP-28S
Saturn 2 MHz: HP-48 S/SX
Saturn 3.7-4 MHz: HP-48 G/GX/G+
Saturn 4 MHz: HP-49G
ARM9 48 MHz: HP-48GII
ARM9 75 MHz: HP-49G+ / HP-50G
```

*Edited: 6 June 2007, 9:04 a.m.*

### Re: User RPL speed

Message #2 Posted by [Frank Rottgardt](#) on 6 June 2007, 9:11 a.m.,  
in response to message #1 by [Xerxes](#)

I own a HP-28s. TICKS is new to me. Is it implemented in first generation User-RPL or is only available via Sys-RPL?

### Re: User RPL speed

Message #3 Posted by [Gerson W. Barbosa](#) on 6 June 2007, 10:06 a.m.,  
in response to message #2 by Frank Rottgardt

On the HP-28S you should use #11CAh SYSEVAL. For instance, in interactive mode,

```
#11CAh SYSEVAL ENTER
#11CAh SYSEVAL ENTER
SWAP - 8192 /
```

will return the elapsed time between the two ENTER presses.

Regards,

Gerson.

P.S.:

I think replacing TICKS with #11CAh SYSEVAL in Xerxe's program might work.

*Edited: 6 June 2007, 10:10 a.m.*

### Re: User RPL speed

Message #4 Posted by [Xerxes](#) on 6 June 2007, 12:02 p.m.,  
in response to message #2 by Frank Rottgardt

If Gersons tip doesn't work, you can try this version using a stopwatch:

```
<< 8. 0. 0. 0. { } -> R S X Y A
<< CLEAR
  1. R START 0. NEXT R ->LIST 'A' STO
  DO
    'A' 'X' INCR R PUT
  DO
    'S' INCR DROP
    X 'Y' STO
    WHILE Y 1. > REPEAT
      A X GET A 'Y' DECR GET -
      IF DUP 0. == SWAP ABS X Y - == OR THEN
        0. 'Y' STO
        'A' X A X GET 1. - PUT
        WHILE A X GET 0. == REPEAT
          'A' 'X' DECR A X GET 1. - PUT
        END
      END
    END
  END
  UNTIL Y 1. == END
  UNTIL X R == END
  440. .1 BEEP
  S
>>
>>
```

*Edited: 6 June 2007, 12:03 p.m.*

### Re: User RPL speed

Message #5 Posted by [joey Bernard](#) on 6 June 2007, 10:27 a.m.,  
in response to message #1 by Xerxes

Well, I just ran it on my 48SX, and I got the following output

```
2:          368.674194336
1:          876
```

I assume that the first time is the number of seconds used?

### **Re: User RPL speed**

*Message #6 Posted by [Xerxes](#) on 6 June 2007, 11:18 a.m.,  
in response to message #5 by [joey Bernard](#)*

Thanks for testing. I have updated the table with your result.

Yes, the 876 means that the program works correctly and the second value on the stack is the execution time in seconds. Note that it is important to use the decimal point at all constants in the program for faster execution.

### **Re: User RPL speed**

*Message #7 Posted by [Joey Bernard](#) on 7 June 2007, 10:11 a.m.,  
in response to message #6 by [Xerxes](#)*

Yup. I typed it in exactly as presented above.

### HP 35S US Pricing

Message #1 Posted by [John Nelson](#) on 6 June 2007, 8:14 a.m.

Has anyone seen what the prospective US pricing will be for the new HP 35S?

One thing I wish they would have done with the design was to spell out Hewlett \* Packard on the bottom of the unit. Otherwise, it's nice to see that HP is listening. I wonder if it will come in a nice box with a printed user manual in a spiral bound format?

### Re: HP 35S US Pricing

Message #2 Posted by [Frank Rottgardt](#) on 6 June 2007, 9:02 a.m.,  
in response to message #1 by John Nelson

My guess is that the 35s will be in the same range as the 33s, will say around 50-60 US\$ If the 33s is discontinued the 35s will become HPs next exam-approved calculator. Already today the 33s is expensive compared to its competitors. Increasing the price would not be very smart. For most of the students the 33s (35s) is the second calculator next to the more powerful machines the usually work with. So the 35s will be an oncost for the exams only.

In Europe HP calculators are usually more expensive. You can get a 33s for around 60 Euro = 80 US\$.

### Re: HP 35S US Pricing

Message #3 Posted by [John Nelson](#) on 6 June 2007, 10:12 a.m.,  
in response to message #2 by Frank Rottgardt

Quote:

For most of the students the 33s (35s) is the second calculator next to the *more powerful* machines the usually work with. So the 35s will be an oncost for the exams only.

When you say more powerful above, are you referring to graphing calculators?

### Re: HP 35S US Pricing

Message #4 Posted by [Frank Rottgardt](#) on 6 June 2007, 10:58 a.m.,  
in response to message #3 by John Nelson

Quote:

When you say more powerful above, are you referring to graphing calculators?

Yes. I think most of them uses calculators like the 49 / 50 or maybe the TI8x. More powerful means simple bigger number of functions, graphing, matrices, decent complex number handling, unlimited stack, USB, SDcard etc.

Personally I need a small scale calculator without graphing. I/O would be great. I use a 33s in my daily work, but will swap to the 35s when it becomes available (for optical reasons). As student back in the early 90's I used a 28s which at that time really was among the best you could get. I hadn't enough in my budget to buy a 48SX. But I think the set of functions was almost identical. The 28s was a kind of "poor mans" 48SX.

If I would be student today, I certainly wouldn't buy a 33s/35s, except for the exams, if I can get a 50 to work with the rest of the time.

### Re: HP 35S US Pricing

Message #5 Posted by [Dia C. Tran](#) on 6 June 2007, 11:28 a.m.,  
in response to message #4 by Frank Rottgardt

if I am a student today the 35s seems like what I want to use for exam. The rest of the time I would use some sort of math software running on the PC.

### Re: HP 35S US Pricing

Message #6 Posted by [Frank Rottgardt](#) on 6 June 2007, 12:21 p.m.,  
in response to message #5 by Dia C. Tran

OK, MathCAD, Excel etc. are comfortable to work with. And if you have enough money to buy you one of these cute little micro-laptops you could use this software in your courses or in the lab. Otherwise a "handheld" device like a 50 is a powerful alternative at a much lower cost.

Using a 33s (35s) in an exam? OK, in the US there are not many alternatives. But the lack of matrix-functions would be a big disadvantage for me. Doing matrix calculations manually is error-prone and not so easy when it comes to bigger equation systems. I remember once I had a test (gearbox-design) where I needed to solve a 7x7 system to calculate stress. I was very happy to have my 28s solving it easily. Many classmates, owning "simple" calculators w/o matrices devoloped the equations correctly, but failed when solving the system manually. But maybe the 35s allows for more independet lables. Thus you could program a matrix routine able to solve more than 3x3 systems as on the 33s.

### Re: HP 35S US Pricing

Message #7 Posted by [bill platt](#) on 6 June 2007, 12:36 p.m.,  
in response to message #6 by Frank Rottgardt

Geez, in my graduate school, they didn't want to over-bog the arithmetic in the exams. I seem to remember the numerical answer per se being worth a small fraction of the grade. Showing the logic was more important. This was in the mid 90s in engineering school.

### Re: HP 35S US Pricing

Message #8 Posted by [Les Wright](#) on 6 June 2007, 12:47 p.m.,  
in response to message #6 by Frank Rottgardt

Frank, your scenario raises some fascinating philosophical and educational questions regarding the use of computational devices in test settings. I am not an engineer, physicist, chemist, or the like, but I have a graduate degree in adult education have have formulated some pretty strident opinions about traditional approaches to test taking.

There is a lot of discussion here about about "approved" calculators for the professional engineer certification exams in the US. I assume that the equivalents in Canadian provinces have similar rules. The common sense and educator parts of me ask, "What is the point in making the number crunching part of problem solving so onerous? In real life, a practicing professional is going to use her ingenuity and any resources at her disposal to solve problems, isn't she?" Such an approach to candidate evaluation is outmoded, divorced from real life, and is probably poorly correlated with actual ability and competency in the field. Isn't there a better way to examine people's qualifications? Certainly! But the traditional pencil and paper time-limited examination is so ingrained in the culture of universities and professional bodies there is no way it will be abandoned any time soon in favour of evaluation procedures that are more organic and realistic and respectful of the special requirements of the adult learner. It just boggles my mind that a 25 year old professional engineering candidate is required to perform on a test under similar conditions that a 15 year old has to when taking an algebra test. It is silly.

I am glad you had your 28S in your test and were able to use the best device at your disposal to fully solve the problem. But I ask, who in their right mind would expect anyone to manually solve a  $7 \times 7$  matrix problem under such bizarre and artificial conditions? Professionals in the field would have more resources, the ability to consult, and hopefully the time, to do it in a real life setting.

Les

### **Education**

*Message #9 Posted by **Gene** on 6 June 2007, 1:05 p.m.,  
in response to message #8 by Les Wright*

That's why in my career as a teacher, I tend to give open book take home tests. They must sign an honor code statement that they didn't cooperate, but they could use their book, their notes, calculators, etc.

I always thought a closed-book test didn't approximate the "real world" (of which I'm a part as an adjunct instructor for 15+ years who had a "real job").

People often spent 15+ hours working on the tests, but it was more real world than others.

Did cheating occurred? Well, my students certainly weren't making 100 on the tests. I always reserved the right to go to closed book tests if scores all started being 100, 99 or 98 on a take home test. :-)

### **Re: Education**

*Message #10 Posted by **Wayne Brown** on 6 June 2007, 2:02 p.m.,  
in response to message #9 by Gene*

In my son's Algebra III & Statistics class this past semester the students each had to do a project (worth 300 points). They were given a large number of word problems and each student had to choose 15 problems. For each problem they had to derive the correct equation (or system of equations) and solve it. They also had to list and define all variables in the context of the problem, list all steps used in solving the equations, explain each step (in complete sentences), illustrate with appropriate charts, diagrams and/or graphs, and write a concluding statement explaining the solution in terms of the original problem.

The problems were graded on several different characteristics, with a correct answer being the *least* significant factor in the grade. It was far more important for the students to understand the problem, find the right equation, find and follow the best approach, and explain clearly what they were doing (and how and why they were doing it) at every step from start to finish.

Andrew ended up getting a perfect score, but he could have gotten every answer wrong and still gotten a high score if he did everything else correctly.

## **Re: Education**

*Message #11 Posted by **John Nelson** on 6 June 2007, 2:08 p.m.,  
in response to message #9 by Gene*

As for me, I use my 15C as my daily driver when doing computations. As someone in the IT industry, I will at times bring out my 16C to switch between decimal and binary or HEX, but most of the time I use the 15C. It does what I need, is quick to use, and is small.

I agree with what others have said too about testing. I have two graduate degrees. One in computer science and also an MBA. During both of those studies, we hardly ever had a closed book exam. They were take home exams that would take quite some time, and we knew that if we were caught cheating, the punishment could be up to expulsion from the program. The main rigor of the tests though were to test our understanding of what is behind the numbers and how you get to your final decision. Yes, it is important to understand how you figure the equation out, but, IMO it is a far greater challenge to understand what the result of that equation or expression tells you. Sure, I can tell you how to find the highest point on a profit maximization curve by using some very basic calculus, but what does that point really mean to me or my company. Same thing with finding roots and many other problems. Many people can memorize the formula to figure that out, but what does it mean.

Many of my professors stressed the understanding, and I think that gave me a far better education than some of my counterparts where I work. One co-worker attained her MBA from a good school, but all she was concerned with was getting the correct answer to the formula. Her class didn't discuss what it meant, and that boys and girls is what I think separates the better schools from the ones that are not as good.

Now don't get me wrong, there are many good schools out there that are not ivy league schools that teach the why, and frankly, there are some ivy league schools that don't teach the why either. I just think though that the propensity to ask "why" is greater at some of the higher schools.

I am finding it fascinating though at my children's high school they are teaching the "why" with calculus. How many of you remember sitting in calculus in H.S. and wondering why the heck are we figuring this out and what does it mean to me?? Calculus is hard when you don't understand the why. When I went to college though, one of my first classes the professor asked us if anyone knew why we were doing calculus. Besides the "we have to graduate" answer, nobody really knew why. Thank heavens he explained the why that morning, and after that, calculus was easy, because I finally understood why we were doing it.

The classes I taught were business math (TVM stuff), business statistics (inferential stuff), then principles of finance and managerial accounting.

In the business math class, I always wanted the students to know how to evaluate an answer returned by their TI BAIL plus calculators (or sometimes, the HP10B or HP12c, but that's another story).

They would punch things in the 5 TVM keys, but when they got an answer, "Is it reasonable or nuts?" was my first reply.

Often, if you're wrong on something, it will be WAY off if something were input wrongly.

That's the approach I took when writing my business math textbook (on amazon but I only have 1 left...and not sure if I'm doing a reprint). :-)

I remember in 2004, Valentin posted a great little didactic [problem](#) that looked at compounding interest and a great gold disc growing in size. I think these are the types of questions professors should be using to quiz their students. It is a perfect example teaching a concept with a problem. Does anyone remember this post? I thought it was great!

---

In my high school days back in the 1940's very few high school students were exposed to calculus. In college I was introduced to calculus in parallel with mechanics during physics class. That made it easy to understand why I needed to learn calculus. Leonardo da Vinci was right when he wrote:

*Message #16 Posted by **Frank Rottgardt** on 6 June 2007, 3:24 p.m.,  
in response to message #8 by Les Wright*

There were no limitations during our tests regarding calculators, only the use of laptops was prohibited. But at that time not even many of our professors owned such a piece of hardware as far as i recall. But there existed several rules what kind of books and notes/compendium one was allowed to take to the test room. For most of the tests we could use a formulary written by ourselves plus some standard literature.

Half of the class used to work with HPs. One guy had a 42s, I was the only one with a 28s and the rest were proud owners of a brandnew 48SX. I never figured out how they could afford them. There were also many really big-sized grey SHARP calculators which could be programed in BASIC. Can't remember the exact modell. And a minority of students used simple scientifics w/o programs. So I guess it was not very fair against these guys.

A typical test lasted 4 to 5 hours, and mostly we had to solve real world problems. Like dimension a gearboxshaft, the gears, certain parts of a pump, choosing the right bearings, making thermodynamic caculations etc.

The professors then gave us points for A) the right approach B) the right results. Depending on the amount of computation needed to get the result, you often could get more points for the approach which I thing was fair.

After each test I felt like after a long-distance run. Really tired and exhausted, but not able to get calm since we students immediately started discussions about how everybody solved the problems and what the right results were. But the hardest part of it was that the tests were always concentrated in the last week before the summer break, and the first week after. So sometimes one had to wait for ten long weeks until you knew if you passed or not. That could make your summer somtimes hard to enjoy.

There is a lot of discussion here about about "approved" calculators for the professional engineer certification exams in the US...The common sense and educator parts of me ask, "What is the point in making the number crunching part of problem solving so onerous? In real life, a practicing professional is going to use her ingenuity and any resources at her disposal to solve problems, isn't she?"

You misunderstand the reasons for the calculator restrictions on these exams.

High-end calculators weren't banned because of their number-crunching capabilities. They were banned because NCEES perceived them (rightly or wrongly) as threats to exam security. Their concerns are that calculators with alphanumeric keyboards and text editing capabilities could be used to copy and store actual exam questions, and that calculators with wireless I/O capabilities could be used to communicate within the exam room.

NCEES doesn't care at all if you exploit the number-crunching capabilities of your calculator. The 33S, for example, is legal for NCEES exams, and it can be packed with as many programs or equations as you can fit in. Several vendors openly advertise and sell commercial 33S exam software for exactly this purpose.

The reality is that NCEES exams don't require a great deal of onerous number crunching. For most questions, the hard part is to make the correct assumptions and select the correct equations; actually crunching the numbers is relatively easy. The exams are designed so that you can pass them with \$15 non-programmable scientifics, and people regularly do so. A pre-programmed 33S can facilitate solving certain problems, but it's only a convenience, not a necessity.

### **HP-15C anecdote and calculations for tests**

*Message #18 Posted by [Karl Schneider](#) on 6 June 2007, 10:43 p.m.,  
in response to message #6 by Frank Rottgardt*

Hi, Frank --

Quote:

But the lack of matrix-functions would be a big disadvantage for me. Doing matrix calculations manually is error-prone and not so easy when it comes to bigger equation systems. I remember once I had a test (gearbox-design) where I needed to solve a 7x7 system to calculate stress. I was very happy to have my 28s solving it easily. Many classmates, owning "simple" calculators w/o matrices developed the equations correctly, but failed when solving the system manually.

In 1991, I was taking an exam in a junior-level EE circuits course. One problem on the exam was to solve numerically for various quantities in a three-loop AC ladder circuit. Of course, this can be approached by "collapsing the ladder" from the outside toward the voltage source to obtain the equivalent circuit impedance and current, then re-expanding the circuit to obtain the other values. However, this was rather tedious.

Instead, I solved the problem on my HP-15C as described in the Owner's Handbook --

namely, writing three loop equations and entering those as a 3x3 complex-valued matrix (which is represented on the HP-15C as a 6x6 real-valued matrix after using built-in transformation functions). I made short (and correct) work of that problem, and felt that I had an advantage over students whose calculators did not have that capability, or who didn't know how to use it.

Numerically solving a 7x7 real-valued system seems beyond what ought to be considered reasonable in an in-class exam, unless all students had adequate tools to calculate the result.

BTW, the HP-15C -- a *pure calculator* from 1982 -- has just enough memory to solve a 7x7 real-valued system  $Ax = b$ , while retaining the vector "b". If the solution "x" is allowed to overwrite "b", then eight allocatable registers will be available for other uses.

### Re: 42s Screen problem

Message #1 Posted by [Alan](#) on 6 June 2007, 2:33 a.m.

Hi, some of you may remember I posted [this thread](#) regarding a full black patch forming on my 42s screen. At that time, I thought the machine was dead as I put in CHEAP CHINA MADE batteries and there was nothing. So, I concluded that the screen was having some problems and was causing the calculator not to display anything. Thinking the 42s was dead, I happily open up my 42s(yes, I used a screwdriver to pry it open :( ) just to play with it and later found that the case couldn't be shut anymore.

Today, of of curiosity, I went to buy some JAPAN MADE PANASONIC batteries (not cheap), put it in the calculator, and guess what, it came to life, even though there's a black patch on the screen, the screen still works as per normal. Though it's harder to read the display now because of the black patch.

So now, I'm using rubberbands to shut the calculator case and the sides of the case are marred:

<http://img155.imageshack.us/img155/4886/img008yk4.jpg>

Lesson learnt: never buy cheap batteries.

Just asking: Anyone have any ideas to shut the case?(besides using rubberbands)

### HP35 with "The Bug" - latest s/n and version?

Message #1 Posted by [Dan W](#) on 6 June 2007, 12:21 a.m.

Anyone know the latest known serial numbers of HP-35's with "the Bug"? Also were buggy HP-35's seen in the 3rd version (with the 35 on the HP logo plate)?

TIA

-- Dan

### Re: HP35 with "The Bug" - latest s/n and version?

Message #2 Posted by [Jeff O.](#) on 6 June 2007, 8:51 a.m.,  
in response to message #1 by Dan W

I have never see a version 3 HP-35 with the ln bug. The latest version 2 that I have is 1143A58xxx, and it has the bug. While I don't know for sure, I believe that the next batch of version 2 HP-35's started with 1230A, indicating that production of this batch began around the last week of July 1972. I have a photo of the letter that HP sent out to owners describing the bug and offering to repair their calculators. Unfortunately, the letter does not seem to have a date on it. It does state "We have taken immediate steps to correct the problem, and will have replacement read-only-memories available sometime after the first of the year." Presumably, that was after January 1, 1973. Dave's list of serial numbers indicates the earliest version 3 started with 1302A. This is consistent with the above letter and the conclusion that they corrected the roms and started producing the version 3 bug-less models in early 1973. My version 3 unit is S/N 1302A98xxx, no bugs in sight.

### Re: HP35 with "The Bug" - latest s/n and version?

Message #3 Posted by [Dan W](#) on 6 June 2007, 7:11 p.m.,  
in response to message #2 by Jeff O.

Thanks. that's helpful and interesting. I found an HP35 with the bug at a garage sale, date code 1230A But it had been opened, so one never knows what may have been swapped in or out.

I opened it up and found a datecode on the mainboard: 1218.

I've noticed that some datecodes show up a lot, like 1230, 1302, 1143. It seems to me the datecodes changed more with some revision than with the dates.

Also some early HP35's have a 2 piece center plate with 10 screws and later ones have a 1 piece with 8 screws. Anyone know when this change took place?

I've noticed that some datecodes show up a lot, like 1230, 1302, 1143. It seems to me the datecodes changed more with some revision than with the dates.

---

The common serial number explanation is that the first two digits are the year of manufacture (minus 1960), the second two are the week number within that year, the letter indicates country, then the last five digits are the individual sequence numbers. So, the first four can be called the date code, and as you say, some date codes show up a lot. I have no direct evidence, but I do not believe that hp changed the date code at the beginning of each new week. I think it was changed only when certain events occurred, such as:

1. they produced 99,999 copies with a particular date code (assuming they would not produce a unit with a sequence number of "00000".)
2. a fairly major design change was implemented, such as the updated roms between versions 2 and 3, or the keyboard design change between versions 3 and 4.

Quote:

---

Also some early HP35's have a 2 piece center plate with 10 screws and later ones have a 1 piece with 8 screws. Anyone know when this change took place?

---

My version 2 units are all 1143A and all have the 2-piece center plate with 10 screws. My 1302A version 3 has a single piece center plate, and presumably only 8 screws, although I have not disassembled it. Does your 1230A unit have a 1-piece or 2-piece center plate? If it is 2-piece and if I had to conjecture, I would say that the 2-piece to 1-piece center plate change coincided with the version 2 to version 3 change.

### **For all of HPs (semi)-recent misgivings...**

*Message #1 Posted by [ECL](#) on 5 June 2007, 11:05 p.m.*

When I became "serious" about HPs, programming (in general), and efficient calculator programming (late 2001 or so) I caught notice of a special-edition 'employee's only' HP calculator (33 or 32sii was it??). (some of you know of my childhood explorations with my 42s (who was the go-to nerd of my 6th grade class?))

Well, when you grow up cataloging magstrips for your engineer-father there is a certain 'likely outcome' at work. Well, as much as we have griped about the stray HP that we used to love there is something that is worth mentioning-

How many 'edition' calcs has TI released in the past x years? We've had the 33 (or 32s), 12cp anniversary, and now the 35s.

That's pretty cool. Just a brief look through other eyes: It is not cool to look forward to "Special Edition" calculators! While we get amped about these things, it is uncommon (therefore not the best business model) to pander to us. So, here's to us techies and nerds that "get" these machines!

ECL

### My Brief Comments on 35S as shown

Message #1 Posted by [bill platt](#) on 5 June 2007, 9:18 p.m.

1. The cursor keys use a lot of real estate, yet have only single shifts--apparently to menus. Why not put blue-shifts on them?
  2. If MODE is used merely for switching RPN and ALG, it is a big waste of direct keys.
  3. Neither LN nor  $e^x$  are primary. This really ought to be rectified. Both should be there in my opinion. Of course we have precedents that vary: 41c with both LOG and LN primary, shift for exponents, and the 11c, which was exactly opposite, and finally the 32sii which is as I suggest.
  4. It is rather interesting to see "i" as a primary key. In the past, on all the models I have used, I and i or (i) have always been shifted and it really hasn't been a problem. Furthermore, it appears that all the indirect addressing is using either a primary key or a shifted function. On the 32sii, these were actually quaternary functions--they didn't even use up a shift! Here on the 35s, only the (i) and (j) appear to be quaternary.
  5. Similarly, the SPACE was always a quaternary. If the letters are quaternary, why can't the space be--shared with R/S--as it was on the 32sii. When writing an equation or a note, R/S is meaningless anyway, so it is a good use. Heck, even the 41c did this after a fashion.
  6. Moving the Equation List as well as brackets, to primary keys seems good to me--it opens up the equation feature to prominence, rather than an apparent buried add-on (which it was) on the 332sii.
  7. I do hope the the equation list is fully editable with those cursors. It sure better have all the functionality of the 17bii in that respect--being able to edit rather than backspace over an equation. Indeed, it would be nice if they implemented the softkeys of the 17bii equations, but I would bet that is not going to be the case. Just as long as you can edit the equations though--that would be a big improvement. [Perhaps it would be difficult to implement softkeys, when the equations are valid both on their own as well as in programs. The parser would have to understand to disable softkeys when in programs.
- Another wish-list item for equations would be the ability to copy equations for editing, and also the ability to pull equations that are in the List into RPN programs, though both of these features start to sound like RPL features don't they?
8. For additional primary key real estate, GTO could be shifted if need be. We accepted it as such on the 32sii, even though it is used for navigation as well as programming.

*Edited: 5 June 2007, 10:25 p.m.*

### Re: My Brief Comments on 35S as shown

Message #2 Posted by [Chuck](#) on 5 June 2007, 11:20 p.m.,  
in response to message #1 by [bill platt](#)

I had some similar thoughts about the wasted spaces with respect to a few functions. For instance

(1) the square root is shifted requiring 2 key strokes. This can be done by  $2 x^y$ , also two strokes, (and also, ENTER \*, again two strokes, but not as useful in a program).

(2) the x-root option shouldn't be necessary for anyone using a scientific. Radicals, bah! 7th root is just  $7 \frac{1}{x} x^y$ . No need for a dedicated x-root button.

OT. I played around with a TI-36 that was left in my class today. A lot of neat features on this little guy. A few of them I'd like to see incorporated into the 35s (I still don't like any TI's). [TI 36X](#)

### Re: My Brief Comments on 35S as shown

Message #3 Posted by [ECL](#) on 6 June 2007, 12:38 a.m.,  
in response to message #2 by Chuck

Chuck,

I've been having recurring thoughts along those lines.

In fact, I don't recall ever using the y, x, root(y,x) key. I always key in coefficient, exponent,  $1/x$ ,  $y^x$ .

I do this for everything on my 33s, including squaring a number. I laughingly approached it as an experiment that caught on. As you pointed out,  $y^2$  is just a common case of the  $y^x$ . So it can only reduce efficiency to keep track of two special cases ( $y^2$ ,  $y^3$ ) when running numbers. I am, however, very happy for the return of the  $x^2$  and root(x) sharing the same key.

When using my 32sii, I became so fluent with keystrokes that I consciously evaluated the "form" of my motions, feeling an affinity for certain fluidity.

To illustrate: Square the number 5

1. Index finger (5)
2. Thumb (shift)
3. Middle finger ( $x^2$ )

With a fluid rhythm. It was a bit of a dance or art to smoothly navigate nested expressions.

Keyboard quality with the 49g and \*+ really struck close to home. The 50g is a solid step in the return of HP, and if the actual 35s product follows the cues of the pre-release pictures, while improving/maintaining the 33s & 50g keyboard qualities, we'll have something nice to look forward to.

ECL

### Re: My Brief Comments on 35S as shown

Message #4 Posted by [Walter B](#) on 6 June 2007, 1:27 a.m.,  
in response to message #1 by bill platt

Hi Bill,

agree with most of your comments. To add, I suspect "i" to be used for complex number input and indirect addressing. However, there's little space left for primary functions like LN and  $e^x$ .

Please look at [this link](#). I'm most willing to take proposals for blue-shifted cursor functions. Your comments, please :-)

### HP-97 and HP-42

Message #1 Posted by [Gerry Schultz](#) on 5 June 2007, 8:10 p.m.

I am really excited about some new calculators I got from that unmentionable website. I purchased an HP-97 which arrived today and I'm looking forward to using it. It works great and is just what the seller promised. When the 97s first came out around 1975, I couldn't afford one but I always wanted one. Finally, after some 30 years I actually have one in my hands. I've never seen a 97 in real life, only in pictures and it's not as big as I expected it to be.

It's funny how those desires stick with you through your life. It's a fond memory that's finally been fulfilled. Now I can see first hand how the 67/97s works and not just what I saw in the program translation firmware built into the 41C card reader.

Now, that I have it, I'll have figure out how I'm going to show my wife without getting shot. I know the first question she'll ask me, "How much?" But, she's also a good sport and will understand my need as long as it makes me happy.

I also purchased a HP-42 but I haven't received it yet. Being the successor to the 41, it will be interesting to see how different it is from the 41. I stopped collecting HP calculators after the 41 until the 48GX. It was such a change going from the 41 to the 48GX that it took me a long time to understand how the 48GX worked.

My first HP calculator was an HP-45 which I sold to buy an HP-55. I didn't get the 67/97 since it was too expensive but I ended up buying a 41C when they first came out. Then a 41CV and finally I bought a 41CX last year. After a long gap in my interest in HP calculators, I got a 48GX right after they first came out. I ended up buying just about every book I could find on the GX just to figure out how it worked.

I still have all this stuff even though my wife wonder's why. The 49G+ and the 50G are great calculators but in many ways, beyond me. The 97 is a much simpler calculator and I'm looking forward to playing in that much smaller playground.

Gerry

### Re: HP-97 and HP-42

Message #2 Posted by [Valentin Albillo](#) on 5 June 2007, 8:28 p.m.,  
in response to message #1 by [Gerry Schultz](#)

Hi, Gerry:

Congratulations for your newly acquired HP-97. It's indeed a truly fine machine and a pleasure to use, what with that large, easy-to-read red LED display and the equally large and comfortable buffered keys, which will allow you to key numbers and operations in advance, for faster results.

Just two comments/advices:

1. \*Never\* try to print NNN's (Non-normalized-numbers). They can be read from data cards, usually generated using an HP-67, where they can be made on purpose to create quasi-alphanumeric messages, and are also used for timers and such. If you're given such a data card, it would be wise

to either never read it at all, or in any case, never try to print the NNN you're seeing in the display. Doing that will probably result in a burned-out, utterly destroyed printhead.

NNN's can also be accidentally created by means of sudden low or peak voltages. If you happen to see some funny display, showing some strangely malformed number or letters in mid-number, \*do not attempt to print it\*, it's most probably some NNN and thus printing it can hopelessly ruin your printhead.

2. With a little programming you can make your HP-97 emulate other Topcat models, such as the financial functions of the HP-92. Programs to compute and list mortgages, for instance, can easily fit in a single card and will duplicate the HP-92 financial results. Perhaps you could show such a program, listing all periods of a mortgage, to your wife for she to appreciate the real, practical usefulness of your new acquisition ! :-)

I sincerely hope you enjoy your new machines !

Best regards from V.

Message #3 Posted by [Sam Levy](#) on 5 June 2007, 8:34 p.m.,  
in response to message #1 by Gerry Schultz

Gerry, I appreciate the simpler commands of the earlier calculators, I didn't have to learn a lot new. I remember the 32, I read the book through twice before it all fell into place, The later graphical calculators don't fill my needs, and the 35s, who wants a calculator without a STO key, Sam

### Re: HP-97 and HP-42

Message #4 Posted by [Don Shepherd](#) on 5 June 2007, 9:17 p.m.,  
in response to message #3 by Sam Levy

Sam, the "proposed" 35s does have STO, it is just shifted. Wouldn't make sense to have a RCL without a STO!

### Re: HP-97 and HP-42

Message #5 Posted by [Jim Creybohm](#) on 6 June 2007, 10:54 a.m.,  
in response to message #1 by Gerry Schultz

Wow Gerry, I could have been reading my own history. The only difference would be that where you found the 97 to be enjoyable and desirable, my choice was the 67. And I finally found one, with full documentation.

I also purchased a 42 and compared it to the 41 (which is my only true love). The 42 is very nice however. I only wish I could have purchased one when they were new. I don't like the alpha process however, with every letter taking at least two key strokes. (you pick the letter from a menu). I also find the screen to be annoying in that it does not offer the greatest contrast unless it is viewed at 45 degrees.

I too find that the 48 and 50 (and indeed RPL) are way beyond my needs and possibly my understanding.

If the calculator was good enough for the space program - it should meet my needs.

Using your playground analogy, more real estate also means more garbage to pick up. I like a smaller yard too.

### HP35s - This how it should have looked - modified arrow keys.

Message #1 Posted by [Jason](#) on 5 June 2007, 1:41 p.m.

The classic look HP35s.

I modified the proposed design of the HP35s to show how it could have been made to look even more "classic":-

<http://www.flickr.com/photos/8771575@N08/531755750/>

If someone with access rights wants to upload this picture directly into this thread for visual convenience, feel free to do so.

Cheers Jason

### Re: HP35s - This how it should have looked - modified arrow keys.

Message #2 Posted by [Howard Owen](#) on 5 June 2007, 1:55 p.m.,  
in response to message #1 by Jason

You can do that yourself, Jason. Just hit the button marked "Link" in the editor, and fill in the URL and what you would like the text to say. The code to do what you want is then included at the bottom of your posting.

[Here's your link done up that way.](#)

The code for that is:

```
[link:http://www.flickr.com/photos/8771575@N08/531755750/]Here's your link done up that way.[/link]
```

Regards,  
Howard

in response to message #2 by Howard Owen

Awesome work, it is much better now IMHO. Congratulations.

### Re: HP35s - This how it should have looked - modified arrow keys.

Message #4 Posted by [Frank Rottgardt](#) on 5 June 2007, 3:08 p.m.,  
in response to message #1 by Jason

We are focusing to much on the keyboard, hey - there is also a back side of this neat little thing waiting to be filled with information.

When talking classic design features like a chrome border and the like, why not adding the good old back side

labels!

### Rear label - HP35 - german

Look at these arrows! Gives the whole thing a kind of ENIGMA touch. Imagine the next time a friend wants to borrow a calculator and you give him/her your brandnew HP-35s. When he/she is still wondering what the he.. this big ENTER key is good for and where the = key got lost, you simply say: "there is a short-manual on the back side." This finally will put him/her over the edge!

### Re: HP35s - This how it should have looked - modified arrow keys.

Message #5 Posted by [Hal Bitton](#) on 5 June 2007, 3:12 p.m.,  
in response to message #1 by Jason

Hi Jason,

Forgive me, but I'm just not seeing the logic in your improved arrow keys. Both of the arrows point up. It seems to me the yellow shift key should have an arrow that points straight up (indicating the above key function), and the blue shift key's arrow should point straight down (for the bottom side of the key function), with no left of right bends in the arrows at all. Something akin to the arrows on the up and down cursor keys would be perfect IMHO.

Are you sure you posted the right picture?

Best regards, Hal

### Re: HP35s - This how it should have looked - modified arrow keys.

in response to message #5 by Hal Bitton

Hal,

Jason was talking about the *cursor* keys. The *prefixes* you mentioned have been addressed [here](#).

### Re: HP35s - This is how it should have looked - modified blue & gold shift keys and cursor keys

Message #7 Posted by [Jason](#) on 5 June 2007, 5:10 p.m.,  
in response to message #1 by Jason

I modified my previous image to remove the arrows from the blue and gold shift keys - is now similar to the HP42 :-

<http://www.flickr.com/photos/8771575@N08/532162815/>

Another option is to add "f" and "g" to the blue and gold shift keys similar to the HP25 :-

<http://www.flickr.com/photos/8771575@N08/532162821/>

Cheers Jason

### Re: HP35s - This is how it should have looked - modified blue & gold shift keys and cursor keys

Message #8 Posted by [Sam Levy](#) on 5 June 2007, 8:06 p.m.,  
in response to message #7 by Jason

I have no problem with the cursor or shift keys, I am disappointed by the lack of a STO key, giving precedence to less used keys. I don't understand this at all. Love your imagined layouts, Sam

### STO key

Message #9 Posted by [bill platt](#) on 5 June 2007, 8:38 p.m.,  
in response to message #8 by Sam Levy

I agree with the STO key as a primary. It is much more important than  $x^2$  for instance, I think. Of course RCL is even more important in my opinion.

Decisions on keys are never easy. Look at the transition from 11c to 32sii:

GTO moved to shifted,

clearing x, regs or sigma moved to shift and a menu so one extra step,

$10^x$  went to shifted, but an improvement (to me) was moving LN to primary,

SST was moved to shifted,

One reason for these changes was that the 32sii actually had two fewer keys--37 instead of 39! It also has more functions, but the menus pretty much make up for that--and the change in HYP handling--only one HYP key rather than a  $\text{Hyp}^{-1}$  key as the 11c had. Perhaps this was part of the original Pioneer design concept of a simplified clean keyboard with menus (32s, 42s, 22s? 17b).

### Re: HP35s - "STO" unshifted?

Message #10 Posted by [Karl Schneider](#) on 7 June 2007, 12:02 a.m.,  
in response to message #8 by Sam Levy

Quote:

I am disappointed by the lack of a STO key, giving precedence to less used keys. I don't understand this at all.

STO need be used only once for a given value, while RCL can be used many times. Hence, RCL is unshifted on the conceptual HP-33s. I also prefer STO unshifted, but the aren't very many free keys.

Naturally, the reverse of this arrangement is found on the HP-28/48/49...

No, [this](#) is what I want (but not as a calculator).

### Re: HP35s - This is how it should have looked - modified blue & gold shift keys and cursor keys

Message #19 Posted by [Wayne Brown](#) on 6 June 2007, 9:29 a.m.,  
in response to message #12 by Gene

You must have a reading comprehension problem. I've said several times that I *prefer* certain things, but there's a difference between what I *prefer* and what I'll *accept*. Jason's latest version is completely acceptable.

You *really* haven't been paying attention if you think I want a "wedge" of anything. I *prefer* perfectly straight lines and perfect right angles, which means a rectangular solid, not a wedge. Also, I don't want metal, but something with the look and feel and weight of marble. Plastic would do (if the internal components are sufficiently heavy), but a black ceramic material would be even better.

But, as I said, I'd buy Jason's design right away if HP had the sense to build it.

### Re: HP35s - This is how it should have looked - modified blue & gold shift keys and cursor keys

Message #20 Posted by [Walter B](#) on 6 June 2007, 1:05 a.m.,  
in response to message #7 by Jason

Hi Jason,

prefix-wise, I like your keyboard with the pure colors best. To *write* about shift keys in manuals and wherever else is easier with f and g. And they are looking good, too.

More generally speaking, I've no problem with the cursors HP has shown. I see them as a tribute to modern times. And they are more ergonomic than the patterns you offer.

What hurts me (and others) more is the shifted STO, the dislocation of  $x \langle \rangle y$ , the waste of space for <-ENG/ENG-> and the like. My attempt to get this solved is found and explained [in this previous post](#) (BTW: another example of an automated link). I would adopt your f and g if you allow.

### Re: HP35s - This is how it should have looked - modified blue & gold shift keys and cursor keys

Quote:

More generally speaking, I've no problem with the cursors HP has shown. I see them as a tribute to modern times.

And *that* is precisely what I dislike about them most. I want something that's more a tribute to [this](#) and [this](#), or at least [this](#).

### Re: HP35s - This is how it should have looked - modified blue & gold shift keys

### **and cursor keys**

*Message #22 Posted by **Walter B** on 6 June 2007, 12:09 p.m.,  
in response to message #21 by Wayne Brown*

Oh yes, I remember the ones of your last picture very well: I learned computing on them and later developed a "fast" data acquisition system on a pdp 11 with 64kB and a total of 5MB disk space, using a 1600bpi MagTape. I'll look how I can approach your needs, though I'll probably be unable to fulfill them completely.

### **Re: HP35s - This how it should have looked - modified arrow keys.**

*Message #23 Posted by **Raymond Del Tondo** on 6 June 2007, 3:39 a.m.,  
in response to message #1 by Jason*

Hi,

I'd prefer the cursor keys to be arranged like in the HP-48.  
So the MODE key would go the the top right,  
the left-arrow key would go one pos left,  
the downarrow key would go where the left-arrow key was,  
and the i key would go up one row, where the MODE key was.

The GTO key could be shifted, to make room for an unshifted STO key.

Regards

Raymond

### **Re: HP35s - This how it should have looked - modified arrow keys.**

*Message #24 Posted by **Dave Johnson** on 6 June 2007, 3:19 p.m.,  
in response to message #1 by Jason*

I am missing something.. What benefit do you gain? You don't gain any more keys and you lose the natural directional nature in the proposed HP design. Why would you not position arrow keys as HP did? The 48 series and 28C/S series did not offer an optimal keypad layout wrt the arrows.

### **Re: HP35s - This how it should have looked - modified arrow keys.**

*Message #25 Posted by **Wayne Brown** on 6 June 2007, 3:49 p.m.,  
in response to message #24 by Dave Johnson*

\_\_\_\_\_

What benefit do you gain?

\_\_\_\_\_

In my case, the benefit would be not having to use the calculator with my eyes closed, or trying to shield it to keep people around me from seeing me use it.

### **Re: HP35s - This how it should have looked - modified arrow keys.**

*Message #26 Posted by **Dave Johnson** on 6 June 2007, 4:38 p.m.,  
in response to message #25 by Wayne Brown*

I still do not understand. Why would you not want the arrow cursors arranged in a rational manner as

opposed to the 48 / 28 scenario (I don't think the original posters arrangement is as bad as the 48 / 28 series but I don't see it being optimal..) Why would you need to shield your calculator from view?

**Re: HP35s - This how it should have looked - modified arrow keys.**

Message #27 Posted by [Wayne Brown](#) on 6 June 2007, 5:11 p.m.,  
in response to message #26 by Dave Johnson

Quote:

Why would you not want the arrow cursors arranged in a rational manner as opposed to the 48 / 28 scenario...

I think the "48 / 28 scenario" *is* rational and also looks much better. The diamond-pattern keys seriously offend my aesthetic sensibilities; they make the calculator look like a trivial bit of "consumer electronics" (like a game or a TV remote or a cell phone) rather than a serious scientific instrument.

Quote:

Why would you need to shield your calculator from view?

I'd be embarrassed to let anyone see me using it -- just as much as if it were pink and covered with fluffy bunnies and kittens. (Maybe I shouldn't be giving HP any ideas. :-)

**Re: HP35s - This how it should have looked - modified arrow keys.**

Message #28 Posted by [Steve Borowsky](#) on 6 June 2007, 7:43 p.m.,

Quote:

I'd be embarrassed to let anyone see me using it -- just as much as if it were pink and covered with fluffy bunnies and kittens. (Maybe I shouldn't be giving HP any ideas. :-)

I hope you realize that the negative associations you have with certain arrangements of keys are subjective, that is, they're in your head.

**Re: HP35s - This how it should have looked - modified arrow keys.**

Message #29 Posted by [Wayne Brown](#) on 6 June 2007, 11:22 p.m.,  
in response to message #28 by Steve Borowsky

Quote:

I hope you realize that the negative associations you have with certain arrangements of keys are subjective, that is, they're in your head.

OK, look at it this way: Which cursor-key style do *you* think looks more modern, up-to-date, in keeping with current styles? And which do *you* think looks "old" (or at least, "old-fashioned")?

Which would a teenager or twenty-something be more likely to consider "cool" and "in style?" Well, *that's* the one I don't want. Something the average person considers "modern" or "trendy" or "in style" is what I would consider a "negative association."

**Re: HP35s - This how it should have looked - modified arrow keys.**

Message #30 Posted by [Raymond Del Tondo](#) on 6 June 2007, 7:15 p.m.,  
in response to message #26 by Dave Johnson

Hi,

the HP-48 and the HP-28 have a total different cursor key arrangement. The layout on the HP-48 (Upside-down T) is very common, nearly every PC keyboard uses this layout, whereas the cursor key arrangement on the 28C/S is not very good IMHO.

The arrangement and implementation as seen on the unmodified 35s pictures isn't bad in itself, but the cursor keys shape doesn't fit very well compared to the other keys. The cursor keys look cheap IMO.

Raymond

### Paravirtualisation

Message #1 Posted by **Mike (Stgt)** on 5 June 2007, 10:50 a.m.

VM (Virtual Machine) is not a new concept to build an interface to real HW. Everyone who logically rebuilt a CPU to interpret some firmware with it as close as possible to real HW programmed a Virtual Machine (Simulation or Emulator). New are the terms used for old processes: "Paravirtualisation" is called the method when a guest-OS may know it's not running on a real machine and gets access to it's host's HW, the really real HW. If you use an HP-50G with an ARM inside to emulate (simulate?) a Saturn-CPU but (AFAIK) that "new" OS calls now and then native ARM routines you have an **"ARM based Saturn-emulator running a paravirtualized OO-OS"** at hand. (OO-OS = Object Orientated Operating System, hence '3OS'.)

Reminds me the last words in "Paradigm", a song of (from? with??) Prince interpretet by George Clinton: **"... and virtual is real!"**

Ciao.....Mike

**HP-25C repair**

Message #1 Posted by [MikeG](#) on 4 June 2007, 8:28 p.m.

I have one HP-25C that exhibits a lack of programming storage, for example entering any key code in program mode results in <01 1 00> in run mode the unit stores and recalls correctly, also using Sigma+ works correctly.

I have kept the unit running without any signs that would be indicative of the clock skewing issue. I haven't tried putting a 20K resistor across data line 11 and ground though.

Is this a problem with the ACT or RAM IC?

**Re: HP-25C repair**

Message #2 Posted by [Eric Smith](#) on 4 June 2007, 8:34 p.m.,  
in response to message #1 by MikeG

I'd guess that you have a unit with two RAM chips (most likely 1820-1630 or 1820-1843), and that the second has gone bad. Check whether Last x works, as it is stored in the same RAM as the user program.

**Re: HP-25C repair**

Message #3 Posted by [MikeG](#) on 4 June 2007, 10:18 p.m.,  
in response to message #2 by Eric Smith

Thanks, that's it. I do have 1843 RAM. I have another 25C that has other issue but I would like to try the RAM off of it, do you know if the RAM 1820-1610 is pin compatible with 1843?

**Re: HP-25C repair**

Message #4 Posted by [Eric Smith](#) on 5 June 2007, 2:14 a.m.,

### That's great, but...(the 35s)

Message #1 Posted by [ECL](#) on 4 June 2007, 4:04 p.m.

We're like a group of good professors, always pushing their students (that's great, but did you consider THIS case?? ) :)

I'm greatly looking forward to the new 35s. Here's one detail that I hope is addressed:

I'd hope (in addition to the requisite matrix support, and other oft mentioned capabilities) for the 35s to not carry over the lingering 'operation' trait that the 33s has. What I'm referring to is the response to a keypress where the operation name is shown on the screen (x^2 for example) for the duration of the time the key is depressed. I've always been annoyed by that on the 33s.

ECL

### Re: That's great, but...(the 35s)

Message #2 Posted by [Richard Ottosen](#) on 4 June 2007, 4:21 p.m.,  
in response to message #1 by [ECL](#)

Quote:

Message #3 Posted by [TomF](#) on 4 June 2007, 4:43 p.m.,  
in response to message #2 by [Richard Ottosen](#)

In fact, with USER mode on the 41, it is a very useful, (almost required) feature that I rely on. With my 33s, it would be useful if it had the same implimentation that the 41 does in that if the keypress is held long enough, the command is canceled.

### Re: That's great, but...(the 35s)

Message #4 Posted by [Hal Bitton](#) on 5 June 2007, 2:56 p.m.,  
in response to message #2 by [Richard Ottosen](#)

On my 41CX, the display responce is just slow enough that you don't see the function preview when the key is held for what I would consider a "normal" duration. Not so with the 33S and it's faster display.

IMHO, that's the difference (in addition to the 41's null option).  
Best regards, Hal

*Message #5 Posted by **Howard Owen** on 4 June 2007, 7:37 p.m.,  
in response to message #1 by ECL*

In fact, with the 41, (and others,) the function will cancel if you hold it long enough. That's super useful if you sometimes make errors. The 33S previews, but won't cancel. So you get to sit there like an idiot, with disaster staring you in the face in the form of a function that will kill all the work you did today, not daring to lift your finger, but having to use it for something else, like dialing the phone for example.

Of course, *I* don't make errors, but my evil twin does. He just loves this wonderful preview capability on the 41.

---

Hi, ECL --

In fact, I mentioned that one in 2004. From

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62029#62029>:

*"The display instantly changes to name of function when a key is pressed, instead of after a time delay when the key is held down, as on the 32S, 32SII, and 42S. It is disconcerting to watch the display flash each time an operation is performed."*

The "null" feature of the HP-41 and HP-42S (also in the HP-15C matrix navigation) that others mention in this thread would also be desirable.

-- KS

### **Look to the 33s for answers (and "800+ registers"?)**

Message #10 Posted by **Paul Brogger** on 5 June 2007, 11:03 a.m.,  
in response to message #9 by Karl Schneider

The 35s is obviously a retooled 33s, with some of the major shortcomings addressed (appearance, data storage). So, when in doubt about what behavior to expect, I'd look to the 33s and assume something like that, until we actually have the 35s in hand.

What about those "800+" registers? Two-alpha (alpha-alpha: "AA", "AB", "AC" ... "ZZ") naming would allow for 26\*26 or almost 700 separately addressable registers. Alpha-alphanumeric ("AA", "AB", ... "AZ", "A0", "A1", ... "A9") would allow 26\*36, or over 900 addresses. I wonder where "800+" comes from?

### **Re: Look to the 33s for answers (and "800+ registers"?)**

Message #11 Posted by **TomF** on 5 June 2007, 11:28 a.m.,  
in response to message #10 by Paul Brogger

I think Valentin Albillo came up with a senerio that works for the 800+ registers. Of course we'll not know for sure unless one of the HP folks reading this forum responds or we finally get or grubby little

fingers on one...

<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=114858#114858>

Message #12 Posted by **Paul Brogger** on 5 June 2007, 11:46 a.m.,  
in response to message #11 by TomF

Thanks for that. (I've been away, and only just now found out about the 35s -- I haven't had time to read through everyone's observations.)

I've been able to get past the 33s' looks and limitations, and have enjoyed it immensely. I certainly am looking forward to getting 'hold of my 35s!

Quote:

I've been able to get past the 33s' looks and limitations, and have enjoyed it immensely.

I do to! I have peaceably lived with the HP33s's more embarrassing bugs, like the errors involved when cos and tan take arguments close to 90 degrees. I am looking forward to the increased register number. But I am especially hoping that the restricted number of program labels is rectified, perhaps with an alphanumeric labelling system akin to how the registers are directly addressed.

If the 35s uses 33s processor electronics, or better, then I am particularly looking forward to its speed. I have a number of special function routines that basically iterate a series or continued fraction to convergence. They are agonizingly slow on the otherwise revered 15C, a bit faster on the 11C, a bit faster still on the 41CX, somewhat quicker on the 42S, but quite peppy on the 33S. I really hope for more labels and registers so I can easily port some of my favourite 41C programs and watch them run much faster.

Indeed, despite its many flaws, it is the speed of the otherwise maligned 33s that makes the revered 15C, for example, seem embarrassingly archaic and irrelevant in comparison. If the 35s extends the strengths of 33s and incorporates the improved quality observed in the 50G, then we could have a pretty darn good RPN programmable scientific.

Les

Quote:

- 
- The 800+ storage registers might be addressed like this:

|                            |   |               |
|----------------------------|---|---------------|
| Register 00 to Register 99 | = | 100 registers |
| Register A to Register Z   | = | 26 registers  |
| Register AA to Register ZZ | = | 676 registers |
| Register (i) and (j)       | = | 2 registers   |
|                            |   | -----         |
|                            |   | 804 registers |

---

The above may be very close to how it will be done, but the fact that the numeric keys 1 through 9 also have letters R through Z, and 0 has (i) on it, will complicate things a bit. For example, how will the calculator know the difference between RCL 89 and RCL ST? My preference might be to dispense with the letter designations altogether. Just give it 3 digit memory addressing, which would be typed in fully for three digit numbers, such as RCL 123. To access registers 1 through 99, you'd terminate with ENTER, e.g. RCL 1 ENTER recalls register 1, RCL 11 ENTER recalls register 11, etc. That paradigm would yield 999 registers plus (i) and (j) for a total of 1001, so I doubt that is correct either.

---

**Re: "800+ registers"?**

Message #16 Posted by **Paul Brogger** on 5 June 2007, 2:13 p.m.,  
in response to message #15 by Jeff O.

I see the "(i)" and "(j)" functions, but no "i" or "j". (Yes, there's an "i" key, presumably for imaginary number entry, but no obvious way to store or retrieve directly the *i* & *j* registers.)

There must be some new contextual method of distinguishing "STO *i*" from "STO (i)".

Yeah, I'm interested . . .

Message #1 Posted by **Juergen Richter** on 4 June 2007, 8:11 a.m.

I Have a 32 e wich works well (circuits, display, Keys)but it is realy bad condition. Broken screws corrosion at the batterycontacts and so on. It is one of the unsoldered versions. So I think about buying an broken one to repair it.

Did someone know the year in which the change from unsolderd to solderd Circuits in the spice series take place.

### HYP, ARC and the rest

Message #1 Posted by [Antonio Maschio \(Italy\)](#) on 4 June 2007, 6:07 a.m.

On modern (and less modern) calculators, you have the trig functions on three separate and contiguous keys, with their arc functions on the same shifted key (e.g. arcsin on sin). The hyp key is generally shifted, so you have to digit (typically):

shift hyp shift sin

to get arcsinh. This configuration, while common, uses three keys and four shifted keys, totaling seven key-positions.

No one, as far as I know, has ever thought to a simpler way to accomplish the same task:

HYP ARC SIN COS TAN

on five adjacent keys which can perform every trig and hyp function:

SIN for sin

ARC SIN for arcsin

HYP SIN for sinh

HYP ARC SIN (or ARC HYP SIN) for arcsinh.

This configuration uses five main keys, but nothing else, leaving two extra key-positions with respect to the previous configuration.

I think (but you may have a very different opinion) that trig (and possibly hyp) functions are those that are far more used after LN, EXP, LOG, and the other classics (the four basics, root, square, and so forth), that usually are more or less in an easy position and don't need any help, while trigs and hyps would (and deserve).

And, thinking to some older TI model, the ARC function could even be used in conjunction with LOG (or LN) to get EXP or vice-versa, or to root to get square, and so forth, making more room for other functions, or to put more functions on the main keys, or to reduce the total keys amount. People who need a scientific calculator should easily understand and use such ARC key!

I'd want your opinion on this subject, which is a minor subject, I know.

This configuration uses five main keys, but nothing else, leaving two extra key-positions with respect to the previous configuration.

---

What is the difference between ARC SIN and INV SIN using the normal inverse key? Exact same number of presses and you save one key. Seems silly to have a dedicated ARC key, INV is more logical in my opinion, and is already on practically every calc.

Quote:

---

I think (but you may have a very different opinion) that trig (and possibly hyp) functions are those that are far more used after LN, EXP, LOG, and the other classics (the four basics, root, square, and so forth), that usually are more or less in an easy position and don't need any help, while trigs and hyps would (and deserve).

---

The HYP key is one of my pet hates, to me it is the most useless key on a scientific calculator. I have never used it. But hey, that's just me.

Now there are just some keys that simply \*must\* be on dedicated keys on a good scientific calculator in my opinion. My list of keys (with there INV functions) is: EXP +/- ENG (INV ENG) Log (INV  $10^X$ ) Ln (INV  $e^X$ ) SQRT  $X^2$   $1/X$   $X^Y$  (X SQRT)  $X \leftrightarrow Y$  STO (or Min) RCL (or MR)

Note that I didn't list  $X^2$  as an inverse function to SQRT, both are vital to have on their own key.

Any calc that expands those INV functions onto their own keys gets extra bonus points in my book.

Other silly keys that often get their own key are the fraction key and the Sexagesimal key. I would not shed a tear on any calc that lost those keys.

Dave.

Gene: But that's just silly. Hyperbolic functions have many uses and it is not wise to leave it off a scientific calculator in this day and age.

Applications for hyperbolic functions include: catenary curves, design of many structures (nuclear cooling towers, buildings at Dulles, etc), gears with skewed axes, even the shape of a shadow cast on a wall by a lampshade, etc, etc, etc.

<http://www.pen.k12.va.us/Div/Winchester/jhhs/math/lessons/calc2004/apphyper.html>

Giving a scientific calculator the abilities to do these things at the expense of one shift key location seems

very reasonable.

Saying "I don't like it because I have never used it" is short-sighted, IMO. What if I never use base conversions? Should I have the inclusion of BASE and LOGIC as a pet peeve? Or should I recognize that many people DO use them?

Sorry, I should have been clearer, I didn't mean leave HYP off the calculator completely, just not give it a dedicated key. A shift function is perfectly adequate. The thing I hate it that probably the majority of scientific calcs I've seen dedicate a key to HYP.

Dave.

Sorry, I should have been clearer. I am not saying leaving off the HYP function altogether, just don't dedicate a key to it.

I am sure there are a far greater number of calculator uses who do \*not\* use HYP on a regular basis than those who do. Yet probably the majority of scientific calcs have a dedicated HYP key. Casio are famous for it, and indeed in the older models it is a such a protected and revered key that it often does not have any other shift function associated with it.

Dave.

The majority of Casio calcs operate the same way, and have a dedicated HYP key next to the TRIG keys. And all the ones I have accept the HYP and INV in any order, so you can use either: INV HYP SIN or HYP INV SIN

And come to think of it, it's probably the reason why most of the older Casio calcs don't have any extra shift function on the HYP key.

Dave.

The very first scientific handheld (HP35) was the only HP I know of with an ARC key as you propose. The very first programmable scientific handheld, the HP65, used a prefix  $f^{(-1)}$  to invert f-shifted functions. These keys were never observed again in an HP pocket calc thereafter.

One reason may be these are very specialized keys: ARC (and HYP as well) makes sense only for SIN, COS, TAN. But they will take 5 keys! INV sounds more flexible, but eventually is rather restricted compared to an universal shift key.

Today's calcs are so packed with functions, key-space is a major issue. Take the HP35s, for example: it has 43 keys. Sounds a lot. But: You need 16 dedicated keys just for the basic inputs (ON/OFF, digits, ., ENTER, E, +/-, <-), 3 for stack and memory handling (x<>y, RDOWN, RCL), 4 for arithmetic, 6 for transient functions, 4 cursors and 2 prefixes, 3 keys for programming incl. program execution, and one each for MODE, statistical summing, complex input, EQN, and (). This sums up to 43 (surprise!). So, if you want ARC and HYP unshifted, you have to take 2 keys off the list to become shifted instead. Sounds easy. Try it!

IMHO proper function grouping on small keyboards is not easy at all. And a block of 5 adjacent keys will not make it easier.

Just my 0,02 Euro.

One keytop, "Trig" that leads to the menu: Hyp Inv Sin Cos Tan.

I don't know if I'd like it, though. It could be argued that the hyperbolic functions should be with the other exponentials, and powers and roots with the trigs.

In log hsin hcos htan

$x^2$   $y^x$  sin cos tan

Message #12 Posted by [Gene](#) on 4 June 2007, 10:55 a.m.,  
in response to message #10 by Walter B

Having INV or ARC keys is more associated with the Dark Empire (TI) than with HP.

HP adopted a more direct "key for each function" approach when compared to TI. In general, on most HP scientifics until recently, if you wanted a function, there was a place on a keyboard to press it. The HP41 developed the catalog idea, but you could still assign a function to a key to directly press it. Later, menus gave the ability to get to a function fairly quickly.

Compare that to the TI models. The TI 58/59 series took this to an extreme with 40 OP Codes enterable using the OP function. Mean was available with 2nd x-bar, but to get standard deviation, TI adopted the terrible INV 2nd x-bar!

That obtuse thinking is something HP never went for and I'm very glad.

I really don't like having an INV key that applies to many many functions. Perhaps it is ok for the trig functions, perhaps not. But I really don't think we want to go back to the ways of the DARK EMPIRE to do INV LN to get  $e^x$ , as was the case on the SR-52 model.

### Re: HYP, ARC and the rest

Message #13 Posted by [GE](#) on 5 June 2007, 5:41 a.m.,  
in response to message #12 by Gene

Well on the HP65 the [f-1] key performs the 'inverse' function, and it seems easy to understand. It applies to trigonometrics, logs, square root, fractional part, and probably others (can you guess what [f-1][+] could be ?).

On the HP15C, you don't have a [HYP] key, which makes sense as these are not used that much, but instead a row of :

```

HYP
[ ] [Sin] [Cos] [Tan]
HYP-1 Sin-1 Cos-1 Tan-1

```

Which give :

- direct access to sin, cos, tan
- inverse trigonometry with [g]
- hyperbolics with [f][HYP]
- inverse hyperbolics with [g][HYP]

It sounds almost optimal (direct hyperbolics could be done with only one prefix key if there was an [HYP] key, which is not desirable).

So I think this solution is optimal in practice.

### Re: HYP, ARC and the rest

in response to message #13 by GE

...as usual, the 15C is, definitely, the best calculator! ;-)

Yes, I forgot this when considering the 15C. It has a wonderful feature, the "Abbreviated Key Sequences", that makes obvious, after a prefix, what a user would press, avoiding pressing other (annoying) prefix keys.

I thank you and all others for your observations. Mine was a first thought, and probably more experience in calculators (like yours) and more thinking by my side would prevent me from starting topics like this.

Thanks again.

Do not be afraid! IMO a good part of this forum is for the questions you (and me) always wanted to ask, but did not dare to ask so far. Continued questions lead to continuous improvement. Else, the knowledge about such matters will be extincted in some years.

### **HP-15C: HYP, ARC and the rest**

*Message #16 Posted by **Karl Schneider** on 6 June 2007, 12:53 a.m.,  
in response to message #13 by GE*

Hi, all --

I agree with GE's summary of HYP and HYP<sup>-1</sup>, and note Antonio's mention of the HP-15C's thoughtful abbreviated keystroke sequences.

It should also be noted that the context-specific abbreviations and the HYP<sup>-1</sup> prefix were necessary in order to avoid four-keystroke sequences that don't include a ".", as the numeric keycodes for such sequences would not fit in the PRGM display.

As such,

[f][HYP][g][SIN<sup>-1</sup>]

and

[RCL][f][MATRIX][f][A]

would not have been not only cumbersome, but also unworkable.

### **I loved OP codes**

*Message #17 Posted by **Palmer O. Hanson, Jr.** on 5 June 2007, 10:38 a.m.,  
in response to message #12 by Gene*

Gene:

As you well know I did a lot of work on the so-called "dark side" so I can't let your comments go by without a response.

Quote:

HP adopted a more direct "key for each function" approach when compared to TI. In general, on most HP scientifics until recently, if you wanted a function, there was a place on a keyboard to press it.

That led to three second function keys, yellow, blue and black, on the HP-67 and a horribly cluttered keyboard.

Quote:

The TI 58/59 series took this to an extreme with 40 OP Codes enterable using the OP function.

I loved most of the OP codes! Eight of them provided alphanumeric printing -- not to be available in RPN-land until the HP-41 arrived. Twenty of them (OP-20 through OP-39) provided the capability to increment or decrement data registers 0 through 9 without messing with the Dsz register or with bringing a one into the stack. That feature was invaluable when doing matrix manipulation. Four of them (OP-12 through OP-15) provided linear regression using sums in the statistics registers. With the HP-67 you had to implement those functions in user memory.

### **Re: I loved OP codes**

*Message #18 Posted by [Gene](#) on 5 June 2007, 11:53 a.m.,  
in response to message #17 by Palmer O. Hanson, Jr.*

Hi Palmer! the Dark Side was meant as a good natured jab. After all, in the TI-58/59 days, I was a member OF the Dark Side. I bought a TI-58c when it came out long before I ever owned an HP.

The OP Codes did allow for functionality, but they are a horrible user interface issue. A calculator ought to be a key-per-function approach. Having a list of 40 op codes that are only useful if the user remembers them or has them written down is not very friendly.

The never released TI-88 took this to another extreme. How many Op Codes was that supposed to have? Hundreds? Why not have a machine then with only 20 keys and an Op key. Need to do addition? That's OP 01. Need to do a SIN calculation? OP 29. Need to convert from base 2 to Base 16, Op 221, etc.

The TI 58/59 really did have some bad user interface decisions, IMO. The INV 2nd x-bar for standard deviation really did set a low point. The standard deviation is in now way an inverse function of the mean, but that's the key sequence you had to press.

Ah, the good old days. :-)

Hope you're feeling well. Thanks for the card! It was great!

### **Re: I loved OP codes**

*Message #19 Posted by [GE](#) on 5 June 2007, 12:03 p.m.,*

*in response to message #18 by Gene*

Funny that it all started with a TI58C back "a few" years ago for me too... I still have that machine sitting mint in box at the best viewing point in my storage area. Actually my first machine was a Radofin 2200, a wonderful 4-banger which was dismantled to bits by young me (I still keep the pieces). TI was the only affordable choice at the time (for me), plain and simple, and these machines were really good - **\*\*too\*\*** !!!

Hi, Wayne:

Wayne posted:

*"I can understand that. The HP-41 provides something similar (via synthetic programming) with the eG0BEEP codes."*

Yes, you're right. I did study eG0BEEP decades ago and submitted a detailed report which was published in the Australian "PPC Technical Notes". Months later, the PPC Journal proper featured a whole issue dedicated to the Australian Chapter of PPC, in which my report was again included.

Talking from memory, as I don't have the relevant issues at hand right now, I remember that filling up the prompt with various combinations of numeric addresses plus indirect addresses and other variants would execute (in RUN mode) or enter into a program (in PRGM mode) a certain XROM mm,nn instruction, with mm and nn both depending on the values entered at the prompt.

This was intrinsically useful, as you could enter that XROM instruction as a program line even if you hadn't the required ROM plugged in at the moment, but further, some of the XROM instructions belonged to very useful ranges, so that you could then execute a number of common instructions with a single key assigned to eG0BEEP plus filling in the prompt. This would save you a great number of assignments or having to spell out the alpha name, and it's extremely similar to the OP codes operation.

You can check either PPC Technical Notes or PPC Journal ("From Australia with love" issue) for the exact details, including all supported ranges for any given

prompt and comments.

Best regards from V.

Yes, that's the way I use it. I have **eG0BEEP** assigned to [SHIFT][CHS] on my HP-41CX and I keep a list of the relevant codes in the case (along with a plastic synthetic programming quick reference card from SYNTHETIX). So I can enter READSUB (XROM 28,11) by pressing **eG0BEEP** and entering **11** at the prompt, VERIFY (XROM 28,16) with **eG0BEEP 16**, PRFLAGS (XROM 29,11) with **eG0BEEP 76**, etc. It saves a lot of typing for HP-IL and printer functions, and I can use one key assignment to do the work of 89 others.

### Re: I loved OP codes

Message #23 Posted by [Valentin Albillo](#) on 6 June 2007, 11:09 a.m.,  
in response to message #22 by Wayne Brown

Hi again, Wayne:

Wayne posted:

*"It saves a lot of typing for HP-IL and printer functions, and I can use one key assignment to do the work of 89 others."*

Come to think of it, it would have been a *\*great\** feature for power users if the HP42S had included an "OP"-like function as a primary key (in addition to the existing catalog, menu, and assignment functionalities, not as a replacement).

Pressing this [OP] key and filling up a 3-digit (say) prompt would execute *\*any\** available instruction, from ABS to %CHG, say, very quickly and conveniently, without having to navigate menus, use the catalog, spell out the alpha name, or assign anything.

Newbies would tend to ignore it at first, but once they became more proficient with the machine's instruction set they could and no doubt would derive a large benefit from this feature, in terms or enhanced useability. I for once would have loved it.

Best regards from V.

### HP-34C Intermittent Display

Message #1 Posted by [Robert Hollyer](#) on 4 June 2007, 1:39 a.m.

I have an HP-34C with an intermittent display. My 34C accepts keyboard inputs and passes the self test. However, frequently when I first turn on the calculator and start inputting data, various LED segments will not light correctly. I have noticed that a sharp tap to the back side of the calculator corrects the problem and data as previously entered is displayed correctly. Since this is a repetitive problem it would be nice to repair the calculator.

I opened the HP-34C and determined that it is the earlier solder-less design. Since I don't have prior experience with the Spice series, I haven't disassembled it further. I have tested the display PCB by moving it slightly from side to side and the intermittent problem is easily replicated. Observing the backside of the LED PCB it is obvious that the through hole pins have no solder. However, before I proceed to solder the display PCB pins or disassemble the unit further, I am curious if there are any recommendations or suggestions. For example is it likely that soldering the display will correct the problem? Is there a down-side to soldering the display?

thanks-Rob

### Re: HP-34C Intermittent Display

Message #2 Posted by [Vieira, L. C. \(Brazil\)](#) on 4 June 2007, 7:09 a.m.,  
in response to message #1 by Robert Hollyer

Hi;

I'd strongly suggest NOT to solder the display. I'd rather go for a cleaning procedure. I have two HP38 with solderless assembly, and they work pretty fine.

I used liquid metal polisher and let the PCB and the display contacts shinning (must be careful using it without 'contaminating' unnecessary areas). After that, I allowed a thin coat of micro-oil to remain in their surface, so it would reduce oxidation occurrences. It does not interfere in the normal operation because the pressure of the assembling components is enough making sure the necessary electrical contact to happen.

In any way, I'd avoid, by all means, to solder it. The flex PCB would not resist higher temperatures, and even if you have the necessary equipment, you should align it correctly to fit in the molded chassis. And, as a final remark... if it would work better as soldered assembly, chances are it would come this way, though.

Success!

Time's up... running back to normal life, though. Cannot check for spelling, sorry.

Luiz (Brazil)

### Re: HP-34C Intermittent Display

Message #3 Posted by [Robert Hollyer](#) on 4 June 2007, 6:57 p.m.,

*in response to message #2 by Vieira, L. C. (Brazil)*

Luiz, just curious about some details. The 34C LED display PCB appears to be typical FR-4 material so it shouldn't be damaged by soldering. From the 34C battery compartment view, the through hole pins are not soldered. Did HP solder these pins on the opposite side of the PCB (the LED side) or did they rely on some type of pressure contact?

The row of LED display PCB pins fold 90 degrees and then are fed into the hard plastic backbone. I assume this is where the display pins contact the flex circuit and where you are recommending against soldering?

### **Re: HP-34C Intermittent Display**

*Message #4 Posted by **Vieira, L. C. (Brazil)** on 5 June 2007, 6:42 a.m.,  
in response to message #3 by Robert Hollyer*

Hi, Robert;

Quote:

Did HP solder these pins on the opposite side of the PCB (the LED side) or did they rely on some type of pressure contact?

AFAIK, I have never seen explicitly soldered terminals in these Spice LED assy. In one particular case, I remember having a damaged unit and I tried to remove one of these terminals. I got it loose after some effort, but it seemed not to be soldered.

Quote:

The row of LED display PCB pins fold 90 degrees and then are fed into the hard plastic backbone. I assume this is where the display pins contact the flex circuit and where you are recommending against soldering?

The whole flex PCB, IC's and PSU flex contacts are hold together by both metal clamps on each side of the set. The display may be removed and placed back without the need of disassembling it all. After removing the LED assy, you'll see that the only contacts are the ones in the position you are mentioning, opposed to the plastic backbone. You see, the Spice soldered version has another kind of plastic backbone, and there is room for the remaining solder mass on each terminal for each IC. The area under the LED assy contacts has a different cut, though.

My primary concerns about soldering refer to the fact that the soldered LED assy will add stress to the flex circuit surface, and you may have broken copper tracks in the future. Depending on what is used to solder the LED display, the copper tracks may be detached from the flex surface, enhancing the problem.

Sorry to be such a Devil's advocate... d:8^(

Success!

Luiz (Brazil)

### **Re: HP-34C Intermittent Display**

*Message #5 Posted by **Robert Hollyer** on 6 June 2007, 12:56 a.m.,*

*in response to message #4 by Vieira, L. C. (Brazil)*

Luiz,

Thank you for the advice. All of your comments were correct.

As you suggested, I removed the 34C sandwich assembly from main body, but did not need to disassemble the metal sandwich clips. At this point the LED display PCB was easily removed from the sandwich connector. The LED PCB through hole pins are not soldered. They rely on a very tight compression fit and were rigidly located. However, the LED PCB to sandwich connector had a very loose fit. Possibly due to aging of the sandwich foam which has decreased the compression force. Although the LED assembly pins and the sandwich receptacle appeared corrosion free, I lightly cleaned the areas. I then reassembled the LED PCB slightly offsetting the LED pins to take advantage of the sandwich locations that have thicker plastic. I expect this was not HP's original assembly intent, but it seems reasonable now.

I reassembled the 34C and it is working perfectly. However, there is a certain irony. I own two Spice models. The 34C and a 31E. Both models are of the non-soldered style. While searching for the 34C charger, I decided to use the 31E. Whoops, the 31E died while in storage. No life signs whatsoever. Presumably similar non-soldered issues, and another project.

Rob

### **Re: HP-34C Intermittent Display**

*Message #6 Posted by **Vieira, L. C. (Brazil)** on 6 June 2007, 7:33 a.m.,  
in response to message #5 by Robert Hollyer*

Hi, Robert;

good news, indeed! At least, mostly.

Hope you succeed fixing your HP31E. I had two working units, but I decided sending one as a gift to one of our contributors, in fact, an e-friend. And if you check for its value, the HP31E is somehow rare, it's worth bringing it back to life.]

One small advice: IIRC, there are two different Spice chargers, and I remember reading that it is not a good idea to use one of them with the 'other kind'. I am not entirely sure about this, but it is something related to clamping diodes used to protect their internal circuits. This subject has been discussed here last year, but I did not check the messages. Chances are that some Spices had their internals put in risk with different chargers...

Best regards and success!

Luiz (Brazil)

### **Re: HP-34C Intermittent Display**

*Message #7 Posted by **Robert Hollyer** on 7 June 2007, 1:37 a.m.,  
in response to message #6 by Vieira, L. C. (Brazil)*

Luiz,

Thanks for the advice regarding the charger. Fortunately, I have the 82087B which is the

recommended 34C charger. The prior Spice discussion centered around some extra Zener clamping diodes present in the 82087B but missing in the 82087A. It would be interesting to have the charger development history from an HP engineer. And interesting to disassemble both models.

I will let you know how the 31E progresses.

thanks, Rob

### HP 35s

Message #1 Posted by [Jan](#) on 3 June 2007, 4:23 p.m.

At last! A new HP scientific that looks well (or is it the vague resemblance to the classics that attracts me). Back are the trapezoidal keys (indeed the most efficient way of attributing multiple functions to a key). Nice "old" colours as well. The red for the alphanumerical characters may be somewhat difficult to read but it improves the esthetics. After all: why should only financial experts have calcs that look "professional"? Here's the new good looking choice for the scientists and engineers. Now HP: get rid of that 33s asap!

### Re: HP 35s

Message #2 Posted by [Frank Rottgardt](#) on 3 June 2007, 4:42 p.m.,  
in response to message #1 by Jan

Agree. But lets hope the engineers have made their homework. Please no dead keys or keylables that get worn after one years usage and the like. It has always been the complete package of classic design, functionality and excellent mechanics which made us fans proud owning and using an original Corvallis-calculator which nobody else around knew how to use. At least that satisfying feeling will last even with the HP-35s :-)

Frank

*(I took some liberties to make minor corrections to grammar, punctuation, and spelling, where they differ from that of German.)*

I would add that, if the functional specification is not finalized yet, I hope that the HP designers address (or have *already* addressed) some things that we have found and dicussed here -- namely, the "IP", "FP", and "P<->R" functions, which appear to be missing if they are not within menus.

**Re: HP 35s**

*Message #5 Posted by [Jan](#) on 3 June 2007, 6:07 p.m.,  
in response to message #2 by Frank Rottgardt*

You're absolutely right. I share your initial scepticism. W.r.t. quality too many bad things have happened recently with HP calculators. I guess also the new 35s will be made in china and that in itself bears a certain risk when it comes to quality and durability to my point of view, moreover because it reveals a certain attitude towards product quality at HP. The Corvallis days are really over but let's hope the engineers have prevailed in this case and the 35s will still be a true tribute to the classic 35.

### **broken 67 - \_ (underscores) on the screen**

*Message #1 Posted by [Matthias](#) on 3 June 2007, 11:54 a.m.*

Hello,

I just bought an old non-working HP67 in a garage sale yesterday, and i'd REALLY like to revive it. I kinda got attached to it even after one day :)

It seems like the battery leaked into the PCBs, most of them (mainly the one with the main controller) were corroded. I cleaned what I could very carefully, and changed the battery (with standard 3 AA batteries).

The screen now displays a line of \_ (underscores) characters, except one digit (which might be broken). The keys have no action, neither has the prgm/run switch.

Does someone know what makes it display \_, and what that indicates? Which part might be working/broken, so I can narrow down my search to the defective part. Is there hope? What do you think? Could you give me general advices on repairing this beautiful little toy?

Note: I wasn't so careful in the cleaning of the card reader part (the motor is even unplugged). Can it be the cause of the \_?

Thanks in advance,

--Matthias

### **Re: broken 67 - \_ (underscores) on the screen**

*Message #2 Posted by [Matthias](#) on 3 June 2007, 12:10 p.m.,  
in response to message #1 by Matthias*

Wow, sorry for this very quick update...

After letting it on just the time of writing my last message, the display just changed (i was just pushing buttons randomly): It now displays: -00000000000 That's it. Is the controller dead? or can it still be caused by a bad connection? Or a broken discrete component? The enigma is still full.

PS: Seeing it display actual numbers just gave me even more motivation to repair it. Please help me!

--Matthias

### **Re: broken 67 - \_ (underscores) on the screen**

*Message #3 Posted by [Randy](#) on 3 June 2007, 8:40 p.m.,  
in response to message #2 by Matthias*

Quote:

\_\_\_\_\_

Is the controller dead?

That is very difficult to say without an oscilloscope.

Quote:

can it still be caused by a bad connection?

Very likely if there is significant corrosion.

Quote:

a broken discrete component?

Unlikely, unless someone worked on it before you.

The best method to troubleshoot would be to install a known good processor board to verify the display and keyboard PCB are good or place the suspect processor into unit with a known good keyboard/display PCB. Bad LED's and display drivers can cause all manner of strange behavior so it is easiest to divide the problem causes in half.

If the corrosion has actually gotten onto the processor board (pretty rare), look for damaged traces and corrosion on the connector pins.

Any chance of some photos so we can see the extent of the damage?

*Edited: 3 June 2007, 8:42 p.m.*

## **Re: broken 67 - \_ (underscores) on the screen**

*Message #4 Posted by **Matthias** on 4 June 2007, 10:11 a.m.,  
in response to message #3 by Randy*

Sure, here are some photos:

<http://www.flickr.com/photos/mqtthiqs/tags/hp67/>

Quote:

The best method to troubleshoot would be to install a known good processor board to verify the display and keyboard PCB are good or place the suspect processor into unit with a known good keyboard/display PCB.

Of course but I don't have another one to test this. In case someone around here lives in Paris, FR and have one...

Quote:

If the corrosion has actually gotten onto the processor board (pretty rare), look for damaged traces and corrosion on the connector pins.

I can't see any when I look though the proc PCB with a strong light, but the broken track could be hidden under an IC. I have to buy a multimeter to test them thoroughly (anyway I don't know how I

lived these first 25 years of my life without one).

Another idea is to unsolder all components, clean the PCB and re-solder them. Do you think it would make sense? What should I do first?

Thanks for your advices!

PS: Is there any good reverse-engineering material about this calculator out there? With the exact pinouts of every component, I could test them more efficiently...

**Re: broken 67 - \_ (underscores) on the screen**

*Message #5 Posted by [Maximilian Hohmann](#) on 4 June 2007, 10:22 a.m.,  
in response to message #4 by Matthias*

Hello!

Quote:

Another idea is to unsolder all components, clean the PCB and re-solder them.

Don't do that! Unless you have access to professional unsoldering equipment (you can get several working hp-67s for what that costs!) you will only fry your integrated circuits to death and damage the PCB. From the photos, the PCB dosen't look too badly corroded anyway. But the keyboard is probably beyond repair, so fixing the circuits will not restore this calculator to working condition anyway :-(

Look out for a better '67 and keep this one for spares, just in case.

Greetings, Max

**Re: broken 67 - \_ (underscores) on the screen**

*Message #6 Posted by [Klaus](#) on 4 June 2007, 10:44 a.m.,  
in response to message #4 by Matthias*

There is an article about the HP-67 in the article-section of this website:  
<http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=394>

**Re: broken 67 - \_ (underscores) on the screen**

*Message #7 Posted by [Randy](#) on 4 June 2007, 12:17 p.m.,  
in response to message #4 by Matthias*

It would appear there is a fair amount of corrosion under the keys on the bottom half of the display circuit board. I would check for shorts between the columns and rows of the keyboard. Any leakage from the corrosion can cause display problems. Pinouts can be found at [67 Internals](#)

A good method to remove the corrosion is to stand the board on end in vinegar for about a half hour. Rinse several times and dry in a warm place.

**Re: broken 67 - \_ (underscores) on the screen**

*Message #8 Posted by [Matthias](#) on 4 June 2007, 3:10 p.m.,  
in response to message #7 by Randy*

Thanks to you all for the advises. Maximilian: Thanks, but i'll try to repair it anyway. I can't help it.

Randy:

Quote:

\_\_\_\_\_

A good method to remove the corrosion is to stand the board on end in vinegar for about a half hour.

\_\_\_\_\_

Wow, I didn't know that one! Do you submerge it totally? What type of vinegar do you usually use? The red one or the white one? Do you dissolve it?

**Re: broken 67 - \_ (underscores) on the screen**

*Message #9 Posted by **Randy** on 4 June 2007, 3:56 p.m.,  
in response to message #8 by Matthias*

White is best, full strength right from the bottle. Put it in a jar so that you can stand the board on end in the vinegar. You only want to submerge the key strips and contacts, not the IC's or LED's at the top of the board.

**Re: broken 67 - Epilogue**

*Message #10 Posted by **Matthias** on 5 June 2007, 8:06 a.m.,  
in response to message #1 by Matthias*

Hello,

I'm beginning to give up. This is where my electronics skills stops.

I did what Randy told me, I went actually even further: I cleaned the whole keyboard and logic PCBs with vinegar (it worked amazingly well), and I checked every connections I could with a multimeter. Everything seems to work fine, and power seems to arrive into the logic PCB. But then I can't see any current arriving in the ICs. I think the voltage converter on the logic PCB is dead (and I really don't know how to fix it): as soon as I put the battery in, one of the transistors in the upper-left corner overheats very fast.

If someone has another idea, something I should try or change before giving up totally, please tell me.

I'm VERY disappointed, but now I have to overcome this and think about getting a normal life back. This little toy was so cute! Maybe one day when I have courage, I'll try to replace the PCB with some microcontroller and write a HP67 emulator for it.

Thanks to all of you for your wise advises!

### New HP-35s ranking

Message #1 Posted by [Frank Rottgardt](#) on 2 June 2007, 6:26 p.m.

Hi,

the new HP-35s specifications are known by now. Also its design, color-scheme and keyboard-layout. If you should give it a ranking from 0 to 100 in the range of (old and current) HP-calculators, where would the new HP-35s end up?

Criteria could be: - Man-Machine-Interface / Ergonomics - bang for the buck (lets say we are talking about the same price as for a HP-33s) - build quality (hard to judge by now) - emotional factor (do you think it would be FUN to use?)

Of course a ranking is by nature always very personal depending on ones expectations and needs. I passed my engineer exam for many years ago. So graphics are not longer that important to me. A simple but yet powerfull number crunching machine is what I prefer.

I am curious where the community places the new HP-35s.

Personally I'll give it 70 out of 100 (wherby 100 stands for the HP-42s)

Functionwise the HP-35s is more a 60. But I gave it 10 more points for the low price compared to old school HPs which used to be really expensive.

Frank

### Re: New HP-35s ranking

Message #2 Posted by [John](#) on 2 June 2007, 6:46 p.m.,  
in response to message #1 by Frank Rottgardt

Personally, I would not give the HP42s a 100. The user interface is terrible for alpha, IMO.

### 42S ranking

Message #3 Posted by [Howard Owen](#) on 3 June 2007, 4:04 a.m.,  
in response to message #2 by John

For me, it would depend on what exactly was being rated. If the 100 represented "the best keystroke programmable calculator HP ever produced, neglecting I/O" then I would have to give the 42S a 100. (With I/O and expandability considered, I'd go with the 41 as the best.) If the scale included the best RPN scientific keystroke programmable I could imagine at the 100 spot, I'd probably give the 42s a 40, and the 33s a 20.

I agree that the 42S sucks in a number of ways, including the cumbersome alpha input. Although that "pick board" arrangement is workable, if you practice some, I'd prefer voice input or better - sub-vocalization. (Or in an even more whimsical vein, direct brain-wave reading - a technology not that far off, judging by current research.)

What I mean by all that is that the form factor severely limits your choices. "Typing" on the 50g sucks too, just a little less than the 42S. A QWERTY arrangement in a small form factor works really well, in comparison. I've had several portable devices with that approach. The most successful in my opinion are the "clamshell" Sharp Zaurus line. But of course, we want keyboards optimized for calculation, not alpha input, so that means what you really need is a full size keyboard with number pad, and a generous amount of real estate for mathematical functions. You just can't get all that in a calculator form factor. The 200LX has a nice little keyboard which fits the bill feature-wise. But that's a "palmtop," not a calculator. And even though the keyboard is well built, it doesn't hold candle to the finest Corvallis produced for the 200's smaller brethren.

While I like the shape of the characters on the 42S better than the 33S, I agree that the contrast of the former's screen is poor in comparison.

So assuming the 42S is 100 - neglecting I/O remember - then I'd put the 33s at 50, and a 35s that met all my expectations at 75 or so. In economic terms, it doesn't matter at all, since I will certainly buy at least one of the 35s when they come out.

Regards,  
Howard

**Re: New HP-35s ranking**

*Message #4 Posted by [Richard Garner](#) on 3 June 2007, 4:37 a.m.,  
in response to message #2 by John*

I think Frank's ranking is a good rank using the 42s as a basis. I agree that there are things about the 42s that could be better, but if you use a known quantity as a base for comparison the base would have to be the maximum on the scale.

I too hold the 42s in high regards and will use it as my base to compare the new 35s with a maximum score of 100 points.

I will break my comparison up in several criteria:

All are assumptions from the description and image given in the fact sheet.

Display 100 (characters look to be well separated and readable.) Key design 80 (directional keys take up too much space.) Keyboard layout 70 (some heavily used commands are now shifted and require more key strokes to use.) Color Scheme 100 (case, keys, and shifted function colors are well defined.) Function List 60 (alphanumeric entry function list could be increased.) Size 90 (would fit shirt pocket better if slightly shorter and narrower.) Memory 100 Battery Life 50 (without IR battery life should be much greater.)

Overall Score 81.25

**Re: New HP-35s ranking**

*Message #5 Posted by [Bruce Bergman](#) on 2 June 2007, 11:28 p.m.,  
in response to message #1 by Frank Rottgardt*

I'd give it a 78.

thanks, bruce

**Re: New HP-35s ranking**

*Message #6 Posted by [Steve Borowsky](#) on 3 June 2007, 12:54 a.m.,  
in response to message #1 by Frank Rottgardt*

I'll give it an 80, although I don't know whether to add or subtract 10 points due to not actually having used it yet, so I'll do both.

**Re: New HP-35s ranking**

*Message #7 Posted by [Les Wright](#) on 3 June 2007, 1:02 a.m.,  
in response to message #1 by Frank Rottgardt*

I am going to wait until I actually get one.

I must admit that I like the looks of the prototype in the photos with Cyrille's son. The size and shape, including the taper, is reminiscent of the Classics, Woodstocks, Spice and 41 series. The colours are attractive. We will need to wait and see if the concerns about certain missing functions is borne out--they may be concealed in menus like the statistical functions on the 33s.

The promised 800 registers makes me very optimistic indeed. However, I am really hoping that number of available labels is substantially greater than the measly 26 available on the HP33s. The 33s has gobs of memory yet with so few labels, that cannot be reused in different programs, programs cannot achieve anywhere near the level of complexity that all the memory could theoretically allow. The limited label paradigm works beautifully on the limited memory 32sii, but seems incongruous and unnecessary restrictive on the 33s. I hope the 35s corrected this limitation. If the processor speed matches the 33s, I would like to port certain 41 series routines that are painfully slow on the original calculator. Indeed, the one thing that I love about the 33s is its speed. It would be great for the 35s to have a more flexible programming capacity so that those of us who wish to program the calculator can take advantage of it.

As for the 42S, I must admit I love the IDEA of the calculator more than the actual machine. I use Free42 extensively on my Palm TX, and the ability to save and import programs as files makes it easy to use and create 41-style keystroke programs that execute very quickly. But I rarely take the trouble to enter them into the actual 42S. Keystroke entry is cumbersome, and I really don't like the wimpy contrast of the display. The 35s will have the disadvantage of no flash media storage, but a sharper display and quick processor may make it otherwise gratifying to use. I hope!

At any rate, the 35s will be priced about the same as the 33s, so there really is not much to lose. This isn't 1975, when the HP65 sold for what would be a months salary for many people in this Forum.

Cheers,

Les

Quote:

Hi,

the new HP-35s specifications are known by now. Also its design, color-scheme and keyboard-layout. If you should give it a ranking from 0 to 100 in the range of (old and current) HP-calculators, where would the new HP-35s end up?

Criteria could be: - Man-Machine-Interface / Ergonomics - bang for the buck (lets say we are talking about the same price as for a HP-33s) - build quality (hard to judge by now) - emotional factor (do you think it would be FUN to use?)

Man-machine interface is let down by the redundant backspace key, incorrect Blue Function key, and excessive keys dedicated to programming (ok for some, not ok for me). I would have preferred a few more keys dedicated to often used functions like Log, X<sup>2</sup> and ENG.

Big pluses are ENG and <ENG support, not wasting a key on HYP (a pet hate), and good colour contrast on key legends.

LCD contrast looks ok for a dot matrix type, but I want to know what the exponent symbol looks like.

Arrow keys I've decided to stay neutral on. I would prefer keys that look the same, but I know the new arrangement is more practical. But I could also say a scientific calc doesn't need cursor keys.

Gets a 75 on Man-Machine interface.

Emotional Factor - I just like it, it's old-school, it's a beautiful piece of engineering to look at, it looks like it belongs on an engineers desk and not a students desk, and it's got cool looking stripes.

Gets a 95 on the Emotional factor.

Dave.

Gets a 95 on the Emotional factor.

BTW, I knocked the 5 points off for it not having a 35th anniversary logo or something like that on it. Maybe a nice "The HP Way" written along the bottom, or make it a Bill Hewlett signature edition, that would be cool.

Dave.

Hello!

35 of course ;-) but only, if it has a decent keyboard! And 35 Euros I would bid for it on eBay. Nothing with a grey LCD will ever get more than 50 from me, the full 50 going to the Ti Voyage 200.

The closest to 100 for me so far are hp-67 and hp-97.

Greetings, Max (hopelessly old-fashioned)

Why on earth does anyone need a colour screen (or even two of them!) on a cellphone? And yet, no cellphone came without one in the last five years...

But it is not really a colour screen that I would like to see, but any kind of display that glows in the dark, just like the real hp-35. Either a true LED display or a backlit LCD or a modern OLED display. In my working environment, this feature really makes a difference!

Greetings, Max

Greetings, Max

I'd rather have a longer battery life, thanks!

What is wrong with your lighting condition that a nice high contrast black segmented LCD that draws almost no power can't be seen properly?

Dave.

With two rechargeable AAA cells, a two-line dot-matrix OLED display should last for many, many hours.

Quote:

What is wrong with your lighting condition that a nice high contrast black segmented LCD that draws almost no power can't be seen properly?

Reddish night-time cockpit lighting makes almost anything unreadable... and having to shine a flashlight at the calculator with one hand all the time can be a real pain. The best thing to do calculations with when flying at night is actually a cellphone, believe it or not! Illuminated keys, illuminated screen and mine has even a very complete units coverter.

But apart from the actual useability, for me a pocket calculator (that no-one really needs any more, to be honest) must be an aesthetic device with a large fun-factor. And since LCDs are neither aestetically pleasing nor funny in any way, 50 points is all an LCD calculator will ever get from me :-)

It is with great pleasure that I see the renaissance of the LED watch (just look at eBay!) and I am sure, that within this year, we will also see the rebirth of the LED calcualtor. It is a pity, that it will not come from hp...

Greetings, Max

Ah, ok, a very specialised case indeed.

Quote:

I'll completely disagree on that. One of my biggest gripes is that no one makes a truly \*small\* scientific calculator, they just get bigger and bigger every year, it's getting ridiculous. You just can't carry calcs of today around in your shirt pocket or your lab coat pocket, they are too big and too heavy. My desk space is limited enough without having to make room for a big silly looking calc. It's harder to balance a big calc on an open book or catalog on your desk, or hold it on your hand and carry it around the office etc. Smaller is better.

The most useful calculator I ever owned was a Casio CFX-400 Scientific calculator watch.

Won't happen. Most people don't care about calculators, and the people who do want long battery life.

Quote:

With two rechargeable AAA cells, a two-line dot-matrix OLED display should last for many, many hours.

Some of my calcs last for 10+ years on the one set of batteries, some with a little help from their solar cell. Changing batteries is a truly horrible experience.

Watch out for the limited display life of OLED displays, they don't last forever.

Reflective LCD's have a simplistic elegance about them!

Dave.

Not necessarily. Example: HP-15c, it has matrices and full complex in a very small form factor. OK, its not so comfortable to enter matrices with an one-line-LCD only. But it works. In my opinion matrix-calculations are one of the most important things I expect from a *mature* scientific calculator. Even today (it is years ago I was freshman) it happens that I need to solve a system of equations. And each time this happens I am gladly putting away the 33s to reactivate my 28s. Matrices, even with objects and complex numbers, are a piece of cake for this machine.

HP - do you copy me? Please give the 35s a decent build-in matrix function! Its not even hardware - only software - and you have lots of ROM. Let's do it.

I fully agree with your sentiment. The following issues would need to be addressed:

- Matrix identification
- Resolution of ambiguity between scalars and matrices
- Editing (ideally, make use of the cursor keys)
- Placing matrix-specific functionality (e.g., transpose, determinant, norms, residual)

A good implementation would borrow from both the HP-15C and HP-42S, while utilizing the two-

line display.

That's not an excuse, it is just lazy engineering that makes them larger, and/or lack of a specification to keep it small.

Extra firmware functions take no room except in ROM Extra keys can take up no more room is you trim a few thou here and few thou there. Even my smallest scientific calc has ample room between the keys.

Dave.

### Re: New HP-35s ranking

Quote:

I hear what you are saying, but I disagree, in part.

The HP Journal article than introduced the 41C began with a discussion about the problem of proliferating functions. The then current top-of-the line pocket calculator was the HP-67. That machine has quite a "busy" keyboard, with two shift keys, and labels on the key top, key face and keyboard background. The problem was that each function had to be accessible via simple combinations of keystrokes - there was no menu capability for less frequently used functions.

But that isn't what the HP engineers came up with for a solution on the HP-41C. Instead, they used the alphanumeric capability to invoke functions by spelling out their names. This allowed them to greatly expand the CATalog of functions. One problem with this approach was that each decision made about which function to leave on the keyboard, and which to relegate to the CATalog was likely to annoy somebody. However, they apparently were aware of this problem, because they implemented a completely redefineable keyboard. This allowed users to get around the annoyance by defining their own set of trade offs between completeness and keyboard accessibility. (I know that USER mode on the 41 had other reasons to exist besides this.) I remember that despite nice features like programmatic redefinition of the keys, which became fully general with synthetic programming, and later with the CX and Xfunctions module, it was still a hassle for me to juggle between different keyboard modes with the various ROM modules and programs I had written. But I was grateful on balance for the rich feature set, and accepted the hassle as an inevitable consequence of that abundance.

With the 42S, having a two line display, HP moved to using menus with redefineable soft keys. This was more convenient because it grouped related functions together under a single menu key. This made the functions more "discoverable," and less a matter of wading through a long CATalog listing (or six!) to find that obscure function you had forgotten the name of.

But of course, things didn't stop with the 42s. The high end calculator line moved on to the 28c, with its double keyboard allowing even more functions on the keyboard *combined* with menus. The feature set continued to explode through the 48s, 48g, 49g and 49g+ machines, with each nw machine offering expanded feature sets, and a new take on how to access all that functionality. The current top

of the line is the HP-50g. This machine has added hardly any features to those offered by the 49g+, but it hardly needed to. Between the Metakernal and the CAS, the machine has an enormous vocabulary of built in words.

It's interesting to compare the 50g side by side with the 67, to see how the keyboard has come full circle since 1979. The 50g is much larger, of course. it's something under an inch taller than the 67, but most of that comes from the comparatively huge display. The keyboards of the two machines are actually about the same height. The Y axis height of the keys and their spacings on the 50g are less, on average, than those on the 67, so the former squeezes in 10 rows where the latter has only 8. Remarkably, the calculators are about the same width. But the same factors that pack the vertical dimension are also at work in the horizontal, allowing for an extra column on the 50g as compared to the 67. But then the 50g adds cursor keys (and makes very good use of them throughout the implementation, btw) which subtracts from the number of columns in the upper half. But in total, the 50g sports 51 keys while the 67 has 35, just like its progenitor, the HP-35. So much for the differences. On the similarity side, both calculators have two shift keys, and both crowd an enormous number of functions into the available space. But the 50g adds the alpha key as a third shift key. For that reason, and because there are more keys, and their labels are smaller and closer together to fit, the 50g's keyboard looks a lot more cluttered than the 67s. One last difference: the 50g has tons of menus, too.

The menu implementation on the 50g is pretty good. It provides soft labels that can be left or right shifted, providing three functions per soft key. With the addition of KeyMan, you can also assign long hold and double press actions to any key, including a soft key. Speaking of redefining keys, the 50g, like the 48 and 49s before it, has a completely redefineable keyboard like the 41C had. So your options for accessing the mind bogglingly large feature set of the HP-50g combines bright ideas from practically the entire heritage of HP calculators - and boy, do you need them!

Let's see. I want to debug this user RPL program I'm working on. I have the code saved to a soft key in the VAR menu. So first, I set up the stack with my input parameters, Then I hit:

```
VAR ' A LSHIFT EVAL UP ENTER A B B B
```

That translates to "Go to the VAR menu, (VAR) hit the single quote key (') which actually enters two single quotes and leaves your cursor sitting between them. Hit the first soft key (A). Ordinarily, pressing A when in the VAR menu would execute the function assigned to that key. But since I'm between those single quotes, the name of the function gets entered instead. So now I go to the PRG menu (LSHIFT EVAL) where I select the DEBUG entry (UP). DEBUG is the last entry in the PRG menu, so UP wraps around and selects it in the list box) Now pressing ENTER activates the DEBUG menu. Now I press the DEBUG soft key (A) and the debugger starts. It uses the program name on level one (X for us RPN types) as input, so that's the program I'm now debugging. I can now single step (SST - the B soft key) and try to figure out what's not working.

So that is complicated. Of course, I've memorized the sequence, so it takes much more time to describe than to actually perform it. But the calculator has hundreds upon hundreds of such sequences. If I have to do something I don't have memorized, it's likely to take me a while to get to the actual thing I need. This is the main drawback of a menu system traversing a tree hierarchy. You can only see the local structure, so its hard to navigate to separated parts of the tree. You run into the same problems with a windowing file manager, but since there is lots of screen real estate on a PC, you can get more of the global view. On Unix, I just use find.

So this started out as a partial refutation of the idea that complexity in a calculator interface is due just to laziness on the part of the designers. I think that far from being lazy, those designers are straining mightily to balance usability with the demands of the specs they are given for features on the calculator. I think that these two items have an inverse relationship to one another, and that the genius of HP over the years has been to find ways to fudge the balance. I think that result is less than ideal\*, as my example above should show, but I think it may be nearly optimal in a real device. I, for one, am not willing to give up features in a high end machine like the 50g in order to improve the balance.

On a machine that doesn't aspire to be the "all singing, all dancing" top-of-the-line mega-calculator, I don't mind dropping features to achieve a better balance with usability. But the laughing devil in the details is this: my optimal compromise doesn't match yours. This is the conundrum that makes those "lazy" designers work overtime.

Regards,  
Howard

\* I've written elsewhere that I would prefer a brainwave connection as my ideal interface to a computing device. for me, this is ideal, but not optimal, since such a thing doesn't exist - yet. 8)

Perhaps the 35th Anniversary Edition version of the 35S will have LED/OLED. That would be a nice touch and a valuable limited edition.

### HP 35SX ?

Message #24 Posted by [Donald](#) on 4 June 2007, 1:53 p.m.,  
in response to message #23 by Egan Ford

Quote:

Perhaps the 35th Anniversary Edition version of the 35S will have LED/OLED.

Before the HP35S data-sheet appeared, I was thinking that might have been a possibility ( even hinted at - those requests to show up at HHC 2007 with LED displays glowing in the dark ).

But it would need a prismatic Li-ion cell and a USB port to charge it.

The 2x2032 coin cells would not supply the current ( 210mAh, 15mA max pulse current ).

However, an otherwise almost identical ( apart from the 35th Anniversary logo ) HP35SX with backlighting, a user replaceable Li-ion battery and a USB port for data and charging would be possible.

A small cell-phone style microSD card ( for backup and the matrix library ) could also hide under the cover next to the battery.

HP35s score 65

HP35SX score 80

HP41CX score 85

HP15C score 85

**Area under normal curve**

Message #1 Posted by [Paul Guertin](#) on 2 June 2007, 10:32 a.m.

I wonder who decided that hyperbolic functions and their inverses would be standard on basic scientific pocket calculators (not only HP but other brands, too), but Q and Q<sup>-1</sup> (area under the normal curve and its inverse function) would appear on only a few select models. Shouldn't they be considered basic, useful and common functions?

**Re: Area under normal curve**

Message #2 Posted by [Namir](#) on 2 June 2007, 12:02 p.m.,  
in response to message #1 by Paul Guertin

I agree. The Student-t probability distribution function and its inverse should also be included. Together with the inverse normal, the inverse Student-t are used to calculate confidence interval. Of course including the Chi-square and F distributions makes the set complete.

**Re: Area under normal curve**

Message #3 Posted by [Les Wright](#) on 3 June 2007, 2:29 a.m.,  
in response to message #2 by Namir

I have written 41C routines, also readily usable on the 42S, that compute the incomplete gamma and incomplete beta functions using series or continued fraction expansions, as appropriate. In the case of the continued fraction calculations, I use the Modified Lentz algorithm as spelled out in Numerical Recipes-- seems to be faster and converges more reliably than the familiar 300-year-old Wallis method.

The error function and cumulative normal and chi-square distributions are special cases of the incomplete gamma function. The t and F distributions are special cases of the incomplete beta function. I would hope that if the processor is fast as in the 33s and the programming paradigm is flexible enough it will be easy to adapt these routine to the 35s. The inverse normal and t distributions can be found using the corresponding cumulative distributions and the Solver. I have a routine for the 33s that computes the cumulative normal distribution fairly quickly (it is a direct routine that is not mediated through the incomplete gamma function), and I can use the Solver to find z scores associated with given percentiles fairly quickly--a few seconds at most in the typical case.

**41s**

Message #1 Posted by [Hugh Evans](#) on 1 June 2007, 12:22 p.m.

Alright, so the 35s isn't even out yet, but even so it's a good platform for making modifications partially due to its' thickness. Here is my proposal of what we should do with it to make it better:

Gut the electronics, keep the LCD, make a new PCB with either an arm7 or arm9TDMI, give it about 512KB of SRAM, USB, SD/MMC card support, and load it with the command set of the 41c. We can give the keyboard a new set of labels with an overlay and silk-screen the keys.

If there's enough room it could even be fun to add 2 to 4 41c expansion module sockets.

Since the enclosure will be ready to go, producing the rest of a modification kit will cost under \$50. Anyone interested in bringing back the 41 in a more powerful form?

-Hugh

The form factor of the 35s is a better match for the 41. I think one of the products from OpenRPN will satisfy your desire for a 42sx.

in response to message #6 by DaveJ

Judging by the specs of the 35s, we're going to have tons of room to work with inside. There are enough engineers around here to create a standard modification procedure. Even if it entails major surgery we can figure it out. I'm just happy to have a good enclosure and set of keys to work with.

**Re: 41s**

Message #10 Posted by **Don Williams** on 1 June 2007, 9:09 p.m.,  
in response to message #1 by Hugh Evans

While everyone else is going "gaga" over the new 35S, I am a little disappointed in the "expected" lack of I/O. So any attempt to create it, however the means, would interest me.

**Re: 41s**

Message #11 Posted by **Hugh Evans** on 1 June 2007, 11:31 p.m.,  
in response to message #10 by Don Williams

I suspect you are not alone in your opinion. I'm viewing the 35s as a nice enclosure, set of keys, and lcd we can use to make something much better. Making electronics is much easier than the other parts. This has the potential to be an exceptionally cool project.

**Re: 41s**

Message #12 Posted by [Bill Wiese](#) on 2 June 2007, 12:35 a.m.,  
in response to message #11 by Hugh Evans

There's really little need for the horsepower of an ARM.

Packaging suitable for the casing, as well as power considerations and I/O appropriate for the existing HP LCD should be chosen first.

A TI MSP430 or PIC or other CPU along with an SPI serial flash memory (up to 2MB) and SPI serial RAM can work just fine to emulate an improved existing calc.

I'm betting the HP 35S uses low-cost COB (chip-on-board - chip bonded to PCB, covered with a glop of silicone) mounting, and that the PCB is heat-staked to the case.

A thin 'sub-PCB' will prob need to be fabricated, and existing CPU disabled somehow (foil cuts?). Tapping into PCB where existing chip is will be a bitch - there may be better places (test connector?) to get access without doing a whole new main PCB.

We really won't know until we can see the innards of a 35S.

Quote:

---

There's really little need for the horsepower of an ARM.

---

I'm sure the horsepower could be utilised in one form or another. I wouldn't go so far as CAS and possibly not even to full on matrix support.

However, there is plenty of scope to make the mathematics more accurate and/or faster. E.g. using something like medium precision reals via the [MPFR library](#). Knowing your answers are correct is comforting.

Likewise being able to add new native functions (i.e. fast) via the inbuilt programming would be a major boon.

Alright, so the 35s isn't even out yet, but even so it's a good platform for making modifications partially due to its' thickness. Here is my proposal of what we should do with it to make it better:

Gut the electronics, keep the LCD, make a new PCB with either an arm7 or arm9TDMI, give it about 512KB of SRAM, USB, SD/MMC card support, and load it with the command set of the 41c. We can give the keyboard a new set of labels with an overlay and silk-screen the keys.

---

I would add IrDA to that.

Dave.

### 35s - English Conversions

Message #1 Posted by [Jeff O.](#) on 31 May 2007, 1:51 p.m.

I'll start by stating that I am fairly stunned by the 35s, and if it is produced exactly as it looks in the first view, with the presumed function set, no I/O and no matrix functions, I'll probably buy two or three. However, as a point of discussion, I was wondering what others thought of the lb $\leftrightarrow$ kg, F $\leftrightarrow$ C, l $\leftrightarrow$ gal, mile $\leftrightarrow$ km and in $\leftrightarrow$ cm functions. I don't recall seeing any discussion of the inclusion of these conversions. I realize that the 33s has such conversions, but the 35s actually expands on them by adding a second distance conversions, mile  $\leftrightarrow$  km. (I guess now I won't have to remember how many inches are in a mile.) I'll readily admit to still thinking in and using feet, miles, pounds and degrees Fahrenheit, so those conversions may be useful to me and a few others. However, I don't require the rest of the world to make any concession or suffer any detriment because of the continued use of English measurements in the US. So the prominent inclusion (shifted functions on **five** keys) of such conversions on a product that will be sold internationally seems like a waste of keyboard space. I'd be perfectly happy with an Engl $\leftrightarrow$ SI function (or similar) that would bring up a menu of those conversions. That would free up a shifted function on one key and two shifted functions on four more keys. Maybe Int $\div$  and Rmdr on one key, FP and IP on another, and ??? and ??? on the third and fourth. As for the other shifted function for the first key, I'd go with MATRIX for a menu of matrix functions.

edited to reflect the fact that there are **five** conversion keys - missed the liters to gallons conversions the first time around.

### Re: 35s - English Conversions

Message #2 Posted by [Egan Ford](#) on 31 May 2007, 2:00 p.m.,  
in response to message #1 by [Jeff O.](#)

I though about raising that issue as well. I think it is a waste of space. A better solution would be a UNIT menu with 48/49/50 like units support. I think this is critical in a sci calc. My 8th grade Chem teacher beat in to me the notion of always calculating with units. It has saved me a few times. Would have saved others as well.

The freed up space could support Matrix, R $\leftrightarrow$ P, more integer and string functions. STO could be restored.

*Message #5 Posted by **Patrice** on 31 May 2007, 3:22 p.m.,  
in response to message #3 by Hugh Evans*

If you look carefully at the pictures, you will see that it is units conversion, not units attach to the values.

So it is not even usefull to what you say.

Patrice

### **Re: 35s - English Conversions**

*Message #6 Posted by **Hugh Evans** on 31 May 2007, 4:06 p.m.,  
in response to message #5 by Patrice*

Exactly, that's why I'm saying that I don't have any big problems with it. Having a quick unit conversion is more useful to me than attaching the units to stack objects. It's a feature I don't think HP will change on the 35s. At the very most we may be able to convince them to make a few changes to the layout and hopefully the label colors, but I wouldn't bank on them changing too much else.

-Hugh

### **Re: 35s - English Conversions**

*Message #7 Posted by **Patrice** on 31 May 2007, 3:18 p.m.,  
in response to message #1 by Jeff O.*

Hi all,

I don't remember having used english units conversion more than once every two years (or even less).

Those keys are really a waste of space.

By the way I am in France

Patrice

### **Re: 35s - English Conversions**

*Message #8 Posted by **Jürgen (CH)** on 31 May 2007, 3:31 p.m.,  
in response to message #1 by Jeff O.*

For those using SI units (some of them use also this strange umlaut characters) these conversion functions are not very useful. I would put them into a menu and use the keys for other (more generally useful) stuff. Personally, I also dislike the light grey of the cursor keys; the light color is too attracting and disturbs the otherwise very nice design. Anyway, it's by far the most interesting calculator HP presented in the last few years. I definitely would buy one.

Cheers, Jürgen

### **Re: 35s - English Conversions**

*Message #9 Posted by [Steve Borowsky](#) on 31 May 2007, 4:01 p.m.,  
in response to message #8 by Jürgen (CH)*

These conversions have become standard fare on scientific calculators, probably as a concession to grammar school usage. In light of this, the reason for having them on the keyboard and not in a menu is so that when the calculator is hanging on a shelf next to all the TI's, Casio's, and Sharp's which have them on the keyboard the HP isn't passed by for lack of them. Hp has given us most of what we wanted in the 35s, but they have to draw the line somewhere! Just my opinion, of course.

### **Re: 35s - English Conversions**

*Message #10 Posted by [Egan Ford](#) on 31 May 2007, 4:13 p.m.,  
in response to message #9 by Steve Borowsky*

I would agree if the 35s were the same price as the Casio/TI. Grammar school kids do not need a \$65-\$75 programmable calculator. IMHO, professionals do not need a handful of trivial conversions.

### **Re: 35s - English Conversions**

*Message #11 Posted by [Jürgen \(CH\)](#) on 31 May 2007, 5:07 p.m.,  
in response to message #9 by Steve Borowsky*

Steve,

I see your point. Often, we have to find a compromise between sales/marketing and engineering requirements. But doing things the same way as others is not very innovative. Perhaps HP can do better than others? But, as I said above, the conversion functions are not a major problem for me. I will definitely buy a 35s!

Best Regards, Jürgen

in response to message #12 by Les Wright*

I would expect it to be around the cost of the 33s.

### **How about overlays and User key assignment**

*Message #14 Posted by [Donald](#) on 31 May 2007, 5:20 p.m.,*

*in response to message #1 by Jeff O.*

Quote:

... So the prominent inclusion (shifted functions on **four** keys) of such conversions on a product that will be sold internationally seems like a waste of keyboard space. ..

Less useful functions could be depreciated, if a USER mode with key assignments was included on the calculator.

Now there are raised edges on the keyboard sides, it's once again possible to have HP41/HP48 style overlay sheets - so you can write your own yellow shift layout.

Plus, I wonder if there's a flag which sets English or American conversions for gallons.

*Edited: 31 May 2007, 5:28 p.m.*

### **Re: How about overlays and User key assignment**

Less useful functions could be depreciated, if a USER mode with key assignments was included on the calculator.

Well, if they included user key assignments, then they've obviously placed the conversions there intentionally so that we would have some keys to reassign without having to bump anything useful off the keyboard. HP is back baby!

### **Re: 35s - English Conversions**

*Message #16 Posted by [Paul Dale](#) on 31 May 2007, 6:02 p.m.,  
in response to message #1 by Jeff O.*

I like having the metric-imperial conversions on the keyboard. This is arguably the main reason I bring out my 32SII these days. Well when I don't do the conversions in my head.

I'm in Australia and we officially switched to metric some thirty years ago. I started learning imperial units in school but switched to metric part way through. I am, however, much more conversant in metric. Despite this, imperial units still seem to crop up moderately frequently especially in the building industry.

Working for a parent company that is American also promotes the need for these functions.

- Pauli

### **Re: 35s - English Conversions**

*Message #17 Posted by [Walter B](#) on 31 May 2007, 6:30 p.m.,  
in response to message #16 by Paul Dale*

If the HP35s shall have (at least almost) the same quality as the original HP35, we have a good chance USA will switch to metric within the lifetime of this calc, and these keys will become absolutly obsolete

outside of fantasy novels. Uh, oooh, why do you throw tomatos?!? d;-)

### **Re: 35s - English Conversions**

*Message #18 Posted by [blurdybloop](#) on 31 May 2007, 7:49 p.m.,  
in response to message #17 by Walter B*

Ahem. The US has been officially metric for the past 150 years.

All those US measures with similar names to imperial units are actually defined in US law in terms of metric units. For example, a US inch is exactly 2.54cm, not whatever the old imperial inch happened to be.

The difference is that, unlike most other countries, the US government does not attempt to force its citizens to use metric units; and Americans gravitated to whatever units are most convenient for the task at hand. To a lesser extent, this is also done in the UK and Canada. Even "all-metric" countries like Japan retain traditional units of area measure.

The advocates of mandatory metrification base their arguments upon faith rather than reality. Metric is, in many ways, just as arbitrary and unscientific. The origin of the meter is a flawed 18th century understanding of the circumference of the earth -- a flaw that was known back when when it was defined, but they went with it anyway! The kilogram is even more embarassing, as it continues to lose mass over time.

For some calculations, the use of order of magnitude unit levels is more convenient. In others, it is less convenient; base 10 handles negative powers of 2 poorly, and is even worse with other common fractions.

The standard argument is the difficulty in doing arithmetic with measures that mix inches/feet/yards, ounces/pints/quarts/gallons, ounces/pounds/tons, etc. That argument is bogus, because nobody does such arithmetic. These are contrived examples.

For what it's worth, I'm equally comfortable in both metric and US units, and use whatever unit is most suitable for the task at hand.

### **Re: 35s - English Conversions**

*Message #19 Posted by [John Gustaf Stebbins](#) on 31 May 2007, 8:18 p.m.,  
in response to message #18 by blurdybloop*

Most countries that are all metric have had the advantage of not having significant industrial activity prior to adoption of SI or have needed to rebuild industry after war or catastrophe. Hopefully, we in the US will continue to struggle with mixed units well past my lifetime.

There is a great book by Underwood Dudley called "Mathematical Cranks." He points out that the English system was actually derived with computational ease in mind. It is complicated in that we have not kept all the units, so conversions are 4 or 8 or 2, but origianally most of the unit sets had units for all powers of two. Thus any computation could be done through unit shifting and simple binary procedures. Much simpler for merchants in the day when a calculator was called an abacus, and it was a fancy new machine from Asia that they really didn't know how to work.

-jgs

### **Re: 35s - English Conversions**

*Message #20 Posted by [bill platt](#) on 31 May 2007, 10:12 p.m.,  
in response to message #19 by John Gustaf Stebbins*

Yes, that is an interesting point about mental calcs.

For instance, a dozen (which is after all essentially the word for "twelve" in french) is evenly divisible by 2 3 and 4 and 6, whereas the metric "10" is evenly divisible by 2 only!

Similarly, base 60 (which is after all a base 12 relative) has many convenient divisions.

Even the old English money system was very interesting and useful for division--it was a rich mixture of base 12 and base 20 which made possible dividing into thirds.

If we would calculate in a duogesimal number system today, you would be perfectly right. But mankind has chosen decimal some centuries ago.

There are few survivors of ancient times, most prominent is HMS. You even find "quatrevingt" in French, pointing to an old base-20 system. But all such are well countable exceptions in the sea of decimal.

### **Re: 35s - English Conversions**

*Message #24 Posted by [blurdybloop](#) on 1 June 2007, 6:04 p.m.,

Quote:

Most countries that are all metric have had the advantage of not having significant industrial activity prior to adoption of SI or have needed to rebuild industry after war or catastrophe. Hopefully, we in the US will continue to struggle with mixed units well past my lifetime.

The real issue is not Americans struggling with mixed units -- few actually have any "struggle" at all! -- but rather that non-US companies resent having to having a second set of tooling if they want to make non-OEM parts for US products. It makes it more expensive for them to compete with American makers; and they see our use of non-metric units as an anti-competitive measure.

### Re: 35s - English Conversions

Message #25 Posted by *bill platt* on 31 May 2007, 10:27 p.m.,  
in response to message #18 by *blurdybloop*

Some metric units are annoying for their lack of reality. Celsius is too coarse for instance, and "goes negative" in perfectly normal weather. Degrees F on the other hand goes 0 to 100 in temperate climates--and 0 and 100 are pretty much the extremes for much of the temperate world's populations. Furthermore, celsius doesn't get absolute zero any better than Rankine.

Luckily for metric, some of its units happen to mesh quite closely with our traditional measures:

\*\* A meter is very close to a yard, and 2 meters isn't too far off from a fathom (an arm-spread).

\*\* A metric ton (1000 kg) is almost the same as a Long Ton--they differ by only 36 pounds out of 2240.

And the fact that a cubic meter of fresh water weights essentially 1 tonne is also useful.

But metric unit naming is stupid. What lame-brain decided to name all the derived units after people? How the hell are you supposed to remember what a Pascal is? And what about the Bar? Why confuse everything! In "english units it is easier: psi or ksi for pressure--and that's "metric" scaling!--or "atmosphere". The Bar isn't quite an atmosphere but who's quibbling.

At least the Newton can be remembered through the fabled apple incident!

Of course I am being sarcastic, yet truthful too. Just as it is difficult to swat a fly with a sledgehammer, it is sometimes awkward to use certain units in certain circumstances and there is nothing inherently superior about one unit over another.

Have I used metric? Heck, that is the one language that American (engineers) are bi-lingual in!

### Re: 35s - English Conversions

Fully agree. Each metric unit per se is as arbitrary as any Imperial unit. So, why bother? One difference is easier scaling (by powers of 10, never heard of kiloyards so far), but the main advantage is the SYSTEM. Of course, this shines most brilliant in physics, while the carpenter may still live well with his home units (as long as he doesn't have to go from length to area or volume or weight frequently).

---

Metric area is particularly bad in this respect. Nobody uses the standard unit of metric area (the are). People either use square meters for smaller areas, or the hectare (100 are or a bit more than 2 acres) for larger areas. Metric measures also don't divide by successive powers of two very well.

That's why many countries continue to use non-metric measures for land measurements, even when they are otherwise metrified.

As for Celsius silliness...the whole reason why 98.6F is supposed to be "normal" human body temperature is that that value is a even 37C. Not that the human body has ever paid attention to metrification!

**Re: 35s - English Conversions**

Message #31 Posted by [Walter B](#) on 2 June 2007, 12:18 a.m.,

Bullshit. The standard unit for area is m<sup>2</sup>, of course.

The "ar" , though fitting in the system (1 ar = 100 m<sup>2</sup>), is not. It's seldom used. More popular is the "hektar" (= 100 ar = 10,000 m<sup>2</sup> - "hekato" means hundred in Ancient Greek) in agriculture or large scale building.

Have you seen the conversion constants? That's the difference in daily life!

But sometimes it is a good idea to use only a single unit system (or doing at least proper conversions), remember the lost of Mars Climate orbiter. So for NASA the HP 35s would be a good choice because every engineer would be reminded to this problem when looking at its calculator.

Quote:

\_\_\_\_\_

Mars Climate Orbiter (September 23rd, 1999)

The 125 million dollar Mars Climate Orbiter is assumed lost by officials at NASA. The failure responsible for loss of the orbiter is attributed to a failure of NASA's system engineer process. The process did not specify the system of measurement to be used on the project. As a result, one of the development teams used Imperial measurement while the other used the metric system of measurement. When parameters from one module were passed to another during orbit navigation correct, no conversion was performed, resulting in the loss of the craft. <http://mars.jpl.nasa.gov/msp98/orbiter/>

*Message #36 Posted by [bill platt](#) on 2 June 2007, 10:15 a.m.,  
in response to message #35 by Walter B*

Well, "Imperial" (whatever that may mean) may not be a system, yet there are most definitely consistent sets of units that are not metric.

ft-lb-slug-second and it's derivatives is consistent, as is inch-lb etc.

Note that 1 lb accelerates 1 slug at 1 ft/sec<sup>2</sup>, just as one Newton accelerates one kg at 1 meter per second<sup>2</sup>.

Of course depending on the scale of the problem, one may choose to use lb-mass and pounds, or inches, or kips instead of lbs etc, but this is not fundamentally different from choosing Mks vs cgs etc in metric.

To say "it" (meaning non-metric) is not a system is quite inaccurate.

It is important (especially for the metricified) to understand that "customary" measure is not the same as "non-metric" or "imperial" and that there are perfectly rational unit systems for science and engineering that are not SI. Frankly imperial is meaningless to me, as I am 'merican.

It is so easy to poke fun at the non-SI of the U.S. but frankly it is myopic to be so disdainful. So much excellent work has been published in non-SI that it behooves the scientist or engineer to be open to the idea of working in many different units. It is after all a trivial exercise but one which for some reason creates a tremendous amount of trepidation.

*Message #37 Posted by [Mike T.](#) on 1 June 2007, 6:03 p.m.,  
in response to message #18 by blurrybloop*

Nobody does mixed unit calculations...? Hmm.. what about Hours Minutes and Seconds then - this sort of mixed unit arithmetic seems destined to stay quite popular for some time (excuse the pun).

On a more relevant note I think that unit conversions originally appeared on the HP31E and HP32E, however even though I still think in gallons and fuel is now sold in the UK in litres I find the gallon to litre conversion function on my HP32E less easy to use than I might as it converts to US gallons not imperial gallons, I wonder if the European versions of the HP35s will use a different conversion factor?

Overall I'm impressed by the my first impressions of the HP35s, it doesn't look at all bad, is has enough functionality to keep most people happy most of the time, it looks like it retains the simplicity of 'single key' function entry, and above all it is RPN.

The key question remains - is there enough demand for an RPN calculator to ensure the 35s is a success..?

in response to message #42 by Trent Moseley

Well, the 31E was VERY hampered by having a very small function set. They were only going to have one shift key on that unit, since it was the low end machine. So, what to put in and what to put out?

I've been told that is how PI ended up as a shift function on the top row of keys. Keyboard wars.

I imagine some of the people involved in those decisions wanted the HMS function set, but lost.

Bill; I think you and blurdlyboop could sit around drinking liters (or quarts) of beer and agreeing about the metric/english thing. I work in both here in California because Caltrans and some other public money jobs require it, this week. It changes.

Most "fine" construction work like carpentry, cement forms and steel is measured in eighths of an inch or hundredths of a foot. They are almost the same thing. 96 eighths = a hundred hundredths. Carpenters know that minimum fall is 1/4 inch per foot without realizing that by definition that is 2%. Centimeters are too coarse and millimeters are too fine for this.

Dirt work: slopes, excavations, building pads, sub grades under roads-railroads-freeways and the like are done to the tenth of a foot. Lots of things are designed and drawn to even inches (1/12 of a foot). Centimeters are too fine and decimeters are too coarse. Most heavy equipment can dig or move a half foot of dirt at a pass. I can hold five fingers down and the operator knows i mean cut 5 tenths. I would have to take off a shoe to do that in France.

Most people can pace even 5 footers with a bit of practice and most mens feet in a shoe are about a foot long. My nose to tip of middle finger is a yard. Surveyors in the US use feet because we are here, and decimal because it works.

I'm not saying that the english system is completely superior but it is based on realistic distances which one can relate to and communicate easily. The metric system makes sense but the scale is off. We'd have been better off basing it on the furlong and gunters chain:

6600 ft = manly mile

660 ft = furlong

66 ft = gunters chain

6.6 ft = basketball player

all the way down to the microfurlong, which a machinist who owns a 41 once told me would be as sensible as thousandths of an inch for his job.

I like working in decimal and feel like i am being punished for something i didn't do wrong if i have to use inches but basing a system of measurement on how far it is from Paris to Santa Clauses House is as bad as using the length of the kings finger joints.

I think you all miss the point, which is that the SI system is DECIMAL. I don't care if the unit is appropriate (example : Farad is much much too big for normal use).  
What is appropriate in the DECIMAL system is that when you write a number you usually use also the decimal system (base 10), so it works very conveniently, NO conversion in one's head needed.  
Example : 0.00002548756 F is 25 micro Farads, 487 nano Farads and 560 pico Farads. No remembering arbitrary divisors or even calculating at all !! Remember the ENG key.  
Splitting evenly in whatever number of equal parts is done by division and not limited to a handful of integer. Do you ALWAYS divide by 2 or 3 ? I sometimes use other numbers... And again, division by 10 needs no actual calculation in the SI System.  
Last point, I'd rather use units named after Newton, Einstein (too late for this one), Pascal or other great minds rather than Madonna, Tiger Woods or Spiderman. Your opinion may be different.

Yes, I think the mile conversion is a total waste: 1.6 / will suffice!

Celsius - Fahrenheit is most useful--it is the sort of conversion that is a pain (because it requires both multiplications and addition) so it is good to have.

lb-kg is internationally useful, as is inch-cm (though inch-mm might be better.)

I actually find myself storing 0.3048 somewhere (0 or Z etc) as converting feet to meters I find more useful than centimeters to inches. Heck, 10 cm is basically 4 inches, and a foot is basically 30 cm (in hard conversions).

Frankly I liked the printed on the back conversions of the 11-c even better.

I don't do a lot of litre conversions. Maybe that one is useful, except that there are different kinds of gallons and so I would nix that one too.

The thing about the conversions is that if they are buried in menus, then they are worthless anyway.

I can type 25.4 / faster than I can dig through menus.

**Re: 35s - English Conversions**

Message #57 Posted by **Peter Geiser** on 1 June 2007, 4:16 p.m.,  
in response to message #56 by bill platt

Which gallon are you referring to? Not even in America is a gallon always the same:

U.S. liquid gallon is 231 cubic inches, or 3.785411784 litres  
U.S. dry gallon is 268.8025 cubic inches, or 4.40488277086 litres  
and the Imperial (UK) gallon: 4.54609 litres (defined)

Even worse is the pound:

Metric pound: 500g  
Avoirdupois: 453.59g  
Troy/ap.: 373.24g  
Tower: 349.91g  
Merchant: 437.39g  
London: 466.55g  
Wool: 453.07g  
Jersey: 489.94g  
Scottish: somewhere between 21 to 28 avoirdupois ounces

In Europe, there was a clear economic reason to abandon the old variety of systems: reduce transaction costs, and thereby increase wealth. But for a mainly self-centric economy such as America this seems to be less of a concern than the concern about the switching costs that would be enormous (see the switch from the old European currencies to the Euro.)

Best regards  
Peter

Message #59 Posted by [Sam Levy](#) on 1 June 2007, 5:20 p.m.,  
in response to message #57 by Peter Geiser

A swiss engineer told me he was to solve a spring and mass resonance problem. He converted the english units to metric and solved the matter in one page. His boss said you can't do it that easily, he took 3 pages and made several mistakes. The major reason for using metric units is they are not randomly based, but represent a consistent system. I found the kilometer a much more human based unit than the mile, I liked the 100 meter posts on the roadways. I think conversions could easily be accomplished in the constants information stored so the user could multiply or divide by the constant stored. Pi could also be a stored constant. Teach metric and use metric and the old will die off. We could hope!

### Gallons

Message #60 Posted by [bill platt](#) on 1 June 2007, 5:37 p.m.,  
in response to message #57 by Peter Geiser

Actually in the U.S., only one gallon is used in any great quantity: the Liquid gallon. Things that are sold dry are generally sold in pecks or bushels rather than gallons, or sold by weight. In agriculture there are all sorts of non-metric customary units which are very specific and as they are specific, there is no great need to re-standardize.

For pounds it is even easier: only the Avoirdupois has any widespread use. While the others are fascinating and have some marginal uses, they are not used in normal trade, nor in customary measure.

### Re: Gallons

Message #61 Posted by [Norris](#) on 1 June 2007, 6:41 p.m.,

The legal definition of the "foot" varies slightly in different US states, a point of significant [practical importance](#) to surveyors. This is why the HP48 series has both the "ft" and "ftUS" units, as well as both the "mi" and the "miUS" units.

### Re: Gallons

Message #62 Posted by [blurdybloop](#) on 2 June 2007, 5:56 p.m.,  
in response to message #61 by Norris

Wrong. You're thinking about "survey feet", which has nothing to do with state laws.

Before 1959, there was no standard definition of the meter vis a vis the foot, or vice versa. In that time, surveying was done with the definition of a foot being 1200/3937 meter. In modern times, the foot is defined as exactly .3048 meters (30.48cm, 304.8mm,

take your pick).

The difference between the two is small;  $6.09601e-7$  meters. But when you take into account that surveys cover large areas, that microscopic difference actually makes a difference.

Hence the survey foot. Now, some states have survey feet specified for their plane coordinate system, and a few have standard feet, leading to the myth that the foot is different in different US states. A foot is .3048 meters in every US state; the question of survey feet is only on SPCs.

The federal government only publishes SPCs in metric, so feet are calculated from the metric values. It's trivial to determine whether these are survey feet or standard feet. I haven't seen much usage of survey feet in new work.

### **Re: Gallons**

*Message #63 Posted by [Norris](#) on 2 June 2007, 8:45 p.m.,  
in response to message #62 by [blurdybloop](#)*

The point is that there are two different types of "feet" in the US, and that this issue is of sufficient practical significance to affect the units included in HP calculators.

Note also that while the US accepted the "international foot" in 1959, the standard US definition of the "acre" was *not* revised at that time. The standard acre is still based on "survey feet", as you can verify with your HP.

It is commonly assumed that 1 acre is 43,560 square feet, or 1/640 of a square mile. But if you try to convert the "acre" unit on an HP calculator into "ft<sup>2</sup>" or "mi<sup>2</sup>", you will get slightly different results. You can only get the expected results by converting the "acre" to "ftUS<sup>2</sup>" or "miUS<sup>2</sup>".

You may not see the "survey foot" in new work, but I'll bet you still see areas measured in "acres", which are based on the "survey foot".

*Edited: 2 June 2007, 8:48 p.m.*

### **Re: Gallons**

*Message #64 Posted by [blurdybloop](#) on 3 June 2007, 6:50 p.m.,  
in response to message #63 by [Norris](#)*

I doubt very much that you will find any acre sized parcels of land anywhere in the world that are exactly 43,560 square feet, whether in survey feet (4046.87260987 square meters) or standard feet (4046.8564225 square meters). Between the two, we're talking about a difference of about 162 square centimeters or about 25 square inches.

Nobody, and I mean nobody, will define either parcel as being more, or less, than one acre.

Furthermore, the definition of 43,560 square feet is for convenience only; 43,560 is simply  $5280 * 5280 / 160$ . An acre, by definition, is a 1/640 part of a section. Not all sections are perfect square miles; I doubt there is any section anywhere in the world which is a perfect square mile.

Any calculator which assumes that an acre is defined by survey feet (or standard feet) is defective by design.

Survey feet are an historical curiosity. For most calculations survey feet can be disregarded entirely; they are necessary only in doing metric conversions with some SPCs over large distances (and much of the time you discover that the survey used standard feet so you can disregard that). A far bigger concern is the effect of elevation on SPCs.

## Re: Gallons

Message #65 Posted by [Norris](#) on 3 June 2007, 7:24 p.m.,

## Re: Gallons

Message #66 Posted by [Norris](#) on 3 June 2007, 8:46 p.m.,  
in response to message #64 by [blurdybloop](#)

Quote:

Any calculator which assumes that an acre is defined by survey  
feet (or standard feet) is defective by design.

The definition of the "acre", as implemented on HP calculators, is fully consistent with that specified by NIST.

According to [NIST](#), 1 acre = 43 560 square feet, and 640 acres = 1 square mile. NIST further states that "In these tables where foot or mile is underlined, it is survey foot or U.S. statute mile rather than international foot or mile that is meant."

## Acres

Message #67 Posted by [James M. Prange \(Michigan\)](#) on 3 June 2007, 10:23 p.m.,  
in response to message #64 by [blurdybloop](#)

Quote:

---

Furthermore, the definition of 43,560 square feet is for convenience only; 43,560 is simply  $5280 \times 5280 / 160$ . An acre, by definition, is a  $1/640$  part of a section. Not all sections are perfect square miles; I doubt there is any section anywhere in the world which is a perfect square mile.

---

That's interesting; I've seen the acre described as 160 square rods, 4840 square yards, 43560 square feet, 10 square chains, 160 perches (defined as square rods), as equivalent to 4 rods (a rood is 1 furlong by 1 rod), a rectangle 1 furlong by 1 chain, or 40 rods by 4 rods, or 660 feet by 66 feet, and I've often enough seen the square mile described as 640 acres, and occasionally the acre as  $1/640$  square mile, all of which are perfectly consistent descriptions, but I've never before read any suggestion that any of these were "approximate" conversions, and never before seen the acre described as a fraction of a section.

For that matter, neither have I seen the section defined in terms of acres, although I think that it's fairly well known that a section was intended to be **approximately** 1 mile by 1 mile square, although clearly a spherical surface can't be tiled with squares.

By the way, for the conversions that Norris quoted from NIST (which does, after all, have the responsibility for U.S. standards of measure), they're listed by NIST as "exact" conversions.

What about the U.S. National Geodetic Survey? In a [glossary](#), I find:

acre - A unit of area in the English system of measure, defined as 10 square chains (1 chain equals 4 rods or 66 feet). An acre is exactly equal to 43,560 square feet or 4,840 square yards, and is approximately equal to 4047 square meters. There are 640 acres in a square mile. By an ordinance of Edward I in 1303, the acre was defined as the area contained in a rectangle 40 rods long and 4 rods wide. With the rod defined as  $5 \frac{1}{2}$  ulnae (yards), as defined by the Edward I iron standard for the ulna, the acre is again 4,840 square yards. The term "square acre" is meaningless and should not be used.

Regards,  
James

## Feet

Message #69 Posted by [James M. Prange \(Michigan\)](#) on 3 June 2007, 6:34 p.m., in response to message #62 by [blurdybloop](#)

Quote:

Wrong. You're thinking about "survey feet", which has nothing to do with state laws.

Before 1959, there was no standard definition of the meter vis a vis the foot, or vice versa.

Wrong. In 1866, the U.S. Congress defined the relationship of 1 meter being equivalent to 39.37 inches. See <http://lamar.colostate.edu/~hillger/laws/metric-act.html>.

So (within the U.S.) 1 meter would be 3937/100 inches, and if we accept that 1 foot is 12 inches, then it follows that 1 meter would be 3937/1200 feet, and if we also accept that 1 yard is 3 feet, then it also follows that 1 meter would be 3937/3600 yard.

In 1866, the U.S. foot and inch would've been defined in terms of the U.S. yard, first adopted by the Treasury department in 1832 and then slightly changed to agree with new standards in 1856. This U.S. yard was intended to be equal to the British Imperial yard.

Eventually, Congress delegated its power to fix the standard of weights and measures to federal agencies. Judging from its performance regarding weights and measures other than coinage, it was probably a relief to shift its responsibility elsewhere.

In 1875, the U.S. was one of the 17 countries signing the Metric Convention, which founded the International Bureau of Weights and Measures. In 1890, the U.S. received its copies of the international meter standard, and a comparison against the U.S. standard didn't show the legal definition of 1866 to be incorrect; that is, they agreed within the error of measurement.

In 1893, the "Mendenhall Order" established the meter as the fundamental unit of length for the U.S., so, based on the 1866 legal relationship, the U.S. yard was redefined as 3600/3937 meter, and therefore the U.S. foot became 1200/3937 meter, and the U.S. inch became 100/3937 meter, and for a time, any attempts to maintain the U.S. yard as equal to the British Imperial yard were abandoned.

Quote:

In that time, surveying was done with the definition of a foot being

1200/3937 meter.

Well, presumably, until the U.S. yard was adopted in 1832, the definition of a foot would've been 1/3 British yard, and then would've been 1/3 U.S. yard from its adoption until 1893, and even then still 1/3 U.S. yard, but with the U.S yard being redefined as 3600/3937 meter, the foot would be 1200/3937 meter.

Quote:

In modern times, the foot is defined as exactly .3048 meters (30.48cm, 304.8mm, take your pick).

Well, English-speaking countries which used them had slightly different definitions for the yard and avoirdupois pound and units based on them, which, with the increasing needs for accuracy, increasingly caused difficulties, until in 1959, the directors of the national standards laboratories of Australia, Canada, New Zealand, South Africa, the United Kingdom, and the United States entered into an agreement establishing uniformity for them. The equivalents 1 yard=0.9144 meter and 1 avoirdupois pound=0.453449237 kilogram were adopted for each of these national laboratories, effective July 1st, 1959. So based on that, 1 international foot=0.3048 meter and 1 international inch=0.0254 meter.

But an exception was made for the definitions for the U.S. Coast and Geodetic Survey. I don't know whether other countries made such exceptions.

Measurements expressed in feet and published as a result of geodetic surveys in the U.S. would retain the relationship of 1 foot=1200/3937 meter, and this foot would be referred to as the U.S survey foot, and continue to be used for that purpose until such a time as it becomes desirable and expedient to readjust the basic geodetic survey networks in the U.S., after which the ratio of a yard, equal to 0.9144 meter, would apply.

Has such a time arrived? Or maybe it's already past, and it would be more desirable and expedient to just skip to always using the meter itself for those purposes?

Quote:

The difference between the two is small; 6.09601e-7 meters.

Approximately; the exact difference is 3/4921250 meter. Another way of looking at it is that 1 international foot is exactly 499999/500000 (or .999998) U.S. survey foot.

Quote:

But when you take into account that surveys cover large areas, that microscopic difference actually makes a difference.

Hence the survey foot.

Quite so. Converting all land records from the "old" foot defined as 1200/3937 meter to the "new" foot defined as 0.3048 meter would be an awful lot of work (especially before computers or even electronic calculators were generally available), so the old

foot was designated the "U.S. survey foot" and the new foot was designated the "international foot", and such units as the rod (or pole or perch), chain, furlong, U.S. survey mile ("statute mile"), acre, and fathom still retain their definitions based on the U.S. survey foot (at least, within the U.S.).

Note that there isn't a "U.S. survey inch" or a "U.S. survey yard".

For more on the relationship between the U.S. survey foot and the international foot, search within <http://physics.nist.gov/Document/sp811.pdf>, and good references for the history of the relationship of the metric system to the U.S. customary units include <http://lamar.colostate.edu/~hillger/> and <http://physics.nist.gov/Pubs/SP447/>.

Quote:

---

Now, some states have survey feet specified for their plane coordinate system, and a few have standard feet, leading to the myth that the foot is different in different US states. A foot is .3048 meters in every US state; the question of survey feet is only on SPCs.

---

Hmm, in every state, and anywhere else in the world for that matter, a "U.S. survey foot" is always 1200/3937 meter, and an "international foot" is always 0.3048 meter; these definitions don't vary. But just a "foot" can leave me wondering which definition of foot is intended, at least when it's used in land measurement.

It seems to have been left up to the various states to choose which units to use within their own state plane coordinate systems, and apparently some haven't even bothered to choose.

Quote:

---

The federal government only publishes SPCs in metric, so feet are calculated from the metric values. It's trivial to determine whether these are survey feet or standard feet. I haven't seen much usage of survey feet in new work.

---

I thought that it was up to the various states to choose which unit to use? It seems bad enough that the states use different units, but surely it would be madness for different surveys within a state to use different definitions of a "foot".

Actually, as Norris wrote, the standard U.S. definition of the acre is still based on the survey foot, and since land area is normally stated in acres in the U.S., it strikes me as rather insane to use international feet for land measurement. Let's see, 1 acre is exactly equivalent to 660 by 66 U.S. survey feet, thus 43560 square U.S. survey feet. So 1 acre equals exactly  $43560 \cdot (500000/499999)^2$  square international feet, which works out to exactly  $10890000000000000/249999000001$  (about 43560.174240522721) square international feet; who wants to work with a crazy conversion factor like that?

Suppose that I'm looking at a property description; how do I know which definition of "foot" is being used? But I grant that for the size of a property, I wouldn't be too worried about the difference; after all, 1 square international foot would be exactly  $249999000001/250000000000$  (or .999996000004) square U.S. survey foot, not enough of a difference for me to lose much sleep over.

Note that the definition of the meter has changed over time too; see <http://physics.nist.gov/cuu/Units/meter.html>. That said, as far as I can tell, each new definition of the meter merely reduced the uncertainty in its realization, rather than actually changing its length.

Regards,  
James

Those things are up to 3000 ounces? No wonder obesity is so rampant.

### Pounds/ounces (weight)

Message #72 Posted by **Karl Schneider** on 2 June 2007, 8:22 p.m.,  
in response to message #60 by bill platt

Hi, Bill --

Quote:

For pounds it is even easier: only the Avoirdupois has any widespread use. While the others are fascinating and have some marginal uses, they are not used in normal trade, nor in customary measure.

Of course, the lighter troy ounce is used instead of the Avoirdupois ounce for jewelry and precious metals. Therefore, the answer to Peter's question is "hamburger". :-)

## Re: 35s - English Conversions

Message #73 Posted by **Fred Lusk** on 1 June 2007, 8:55 p.m.,  
in response to message #1 by Jeff O.

Although I like my HP-42S better than my HP-48G+ for everyday use, one thing I really like about the 48 is the ability to append units to numbers. It's much more useful to me than simple conversions. However, if HP is going to include conversions on the 35S, why not the most useful conversion of all: furlongs per fortnight to/from parsecs per picosecond ???

Fred

BTW: 1 parsec/picosecond =  $1.854 \times 10^{32}$  furlongs/fortnight

Fred;  $10^{12}$  fics = 1 Terafic /  $10^{-6}$  fish = 1 microfiche /  $2 \times 10^3$  mockingbirds = 2 kilomockingbirds  
and  $10^{-18}$  boys = 1 attoboy

## Re: 35s - English Conversions

Message #76 Posted by **Peter Geiser** on 2 June 2007, 5:47 a.m.,  
in response to message #73 by Fred Lusk

Pretty useful, but what about:

Today's stock market index => tomorrow's stock market index

Obviously, this would be a one-way conversion only. But I still would love it.

Best regards  
Peter

## HP-35s : Metric<->English and Conversions

Message #77 Posted by **Karl Schneider** on 2 June 2007, 7:55 p.m.,  
in response to message #1 by Jeff O.

There's been quite a bit of discussion about the merits of SI/Metric and Imperial/English measurement -- too many to address individually.

John Gustaf Stebbins made an astute observation:

Quote:

---

Most countries that are all metric have had the advantage of not having significant industrial activity prior to adoption of SI or have needed to rebuild industry after war or catastrophe. Hopefully, we in the US will continue to struggle with mixed units well past my lifetime.

---

Without delving into much detail, I'll state the following:

- SI/Metric is the language of science and most engineering, for good reason: It is a structured, consistent, *system* of units and measures. Imperial/English is more of a *set* thereof.
- The main attribute of Imperial units is that they are generally are "right-sized" by design for practical use, and given short names with one or two syllables. Combining them can be a hassle, so decimal values are often employed.
- The "ton" and "pound" adopted for metric use are certainly better than "megagram" and "half-kilogram", aren't they?
- The Fahrenheit scale was probably designed for ambient temperature at the Earth's surface, and it remains better than Celsius for that purpose. There are 1.8 Fahrenheit degrees per Celsius degree, providing greater precision without a decimal digit. Moreover, triple-digit Fahrenheit readings ( $\geq 100$  degrees F) indicate hot conditions, but not *impossibly* so (as a triple-digit Celsius reading would indicate). Single-digit negative Fahrenheit readings indicate seriously cold conditions, rather than merely uncomfortably cold.
- Celsius is better for aviation, because negative readings indicate the potential for icing.
- The acre is generally a better-sized measure than the hectare for residential real estate.
- The millimeter is a fine measure for short distances that are visually perceptible. It's better-suited for sizing wrenches than fractional inches (given to the nearest 1/32 inch). This is why an inch $\leftrightarrow$ millimeter conversion might be more useful than inch $\leftrightarrow$ centimeter -- particularly with the fraction-arithmetic planned for the HP-35s that is present in the HP-32SII and HP-33S.

---

So, back to Jeff O's original topic:

It's nice to have routine, simple conversions easily accessible on the keyboard with two keystrokes. However, the five pairs of metric $\leftrightarrow$ Imperial measurements apparently intended for the HP-35s takes ten valuable keyboard positions. I certainly hope that the rectangular $\leftrightarrow$ polar conversion that was displaced to make way for miles $\leftrightarrow$ kilometers will be retained. To omit that would be a serious blunder.

-- KS

*Edited: 2 June 2007, 8:50 p.m.*

---

## **Re: HP-35s : Metric $\leftrightarrow$ English and Conversions**

Message #78 Posted by **Walter B** on 3 June 2007, 3:11 a.m.,  
in response to message #77 by Karl Schneider

Some additions:

Quote:

---

The Fahrenheit scale was probably designed for ambient temperature at the Earth's surface, ...

---

AFAIK, Fahrenheit took the lowest temperature on earth known at his time as zero. Very arbitrary.

Quote:

---

... and it remains better than Celsius for that purpose. There are 1.8 Fahrenheit degrees per Celsius degree, providing greater precision without a decimal digit. Moreover, triple-digit Fahrenheit readings ( $\geq 100$  degrees F) indicate hot conditions, but not impossibly so (as a triple-digit Celsius reading would indicate). Single-digit negative Fahrenheit readings indicate seriously cold conditions, rather than merely uncomfortably cold.

Celsius is better for aviation, because negative readings indicate the potential for icing.

---

Depends on where you were raised. For me, nasty weather is below 10C, 20C is a comfortable ambient temperature, hot weather starts at 30C, hot surfaces  $>60$ C are dangerous to touch, boiling hot is 100C. Negative Celsius readings are also important for drivers. I enjoy skiing at -10C, but I have to take my warm clothes. Etc.

BTW, most people here are not scared by decimals. While it's perfectly legal to talk about "half a degree", these folks are not only able to divide by 2 (e.g. good and evil), but can handle divisions by 10 easily. So if they are really sick, they may "have 39.3C fever".

Quote:

---

The acre is generally a better-sized measure than the hectare for residential real estate.

---

Another nice example for personal bias. Here, only farmers own hectares of land. Residential real estate is measured in  $m^2$ , and  $1,000m^2$  is unaffordable in populated and/or attractive areas.

Quote:

---

The main attribute of Imperial units is that they are generally are "right-sized" by design for practical use, and given short names with one or two syllables. Combining them can be a hassle, so decimal values are often employed.

The "ton" and "pound" adopted for metric use are certainly better than "megagram" and "half-kilogram", aren't they?

---

See above. There are more of these "right-sized" weight units like a "Zentner" for 50kg or a "Doppelzentner" for 100kg. They may be used or not, in either case they fit nicely in the system. And nobody finds it difficult to talk about kilometers frequently, so 4 syllables are no problem here.

Oh, and there are 2.5cm per Inch, providing greater precision without a decimal digit. d:-))

## Re: HP-35s : Metric<->English and Conversions

Message #79 Posted by *Maximilian Hohmann* on 3 June 2007, 1:18 p.m.,  
in response to message #78 by Walter B

Hello!

Quote:

---

BTW, most people here are not scared by decimals.

---

On the contrary: I am really scared by fractions and mixed-units-measurements that are so common in the "imperial" unit system (like "1 3/16" bolts or 7-feet-8-inches body heights...)

My business (aviation) over the years has made the biggest mess of units that one can imagine. People die (maybe not every day, but every week or month) because of this nonsense. And all this despite the fact, that since 1965 the ICAO (International Civil Aviation Organization) does everything it can to ensure, that SI units are made mandatory worldwide. Must I say which country has so far undermined all these efforts?

Greetings, Max

Aviatic measures are another retreat area of feet and the like. In Russia and former Soviet republics, however, aviation flies metric. Perhaps in Eastern Europe, too.

## **Re: HP-35s : Metric<->English and Conversions**

*Message #82 Posted by **Maximilian Hohmann** on 4 June 2007, 8:29 a.m.,  
in response to message #80 by Karl Schneider*

Hi Karl,

Quote:

\_\_\_\_\_

Hmm, mine, I guess... :-)

\_\_\_\_\_

Not entirely wrong, your guess!

Quote:

\_\_\_\_\_

I assume that visibility measurements are given in hundreds of meters in European aviation, while in the US, fractional miles are still used. Are ceilings given in feet in Europe?

\_\_\_\_\_

Yes, horizontal visibilities are given in metres and kilometres throughout Europe (even in the UK, believe it or not!), while vertical visibilities are given in metres or feet depending on the country (France and former Eastern Block countries have metres, the rest uses feet, generally speaking, with some exceptions though...).

On the other hand, we have nothing on board to correlate the metric visibilities with: The airspeed indicators and distance readouts (apart from France again) display either nautical miles/knots (nautical miles per hour) or miles/mpH (American statute miles per hour, even in the UK where the mile is slightly different from the US, I'm told). There are even airspeed indicators with two scales: One in knots, the other in mph. One airplane that I regularly fly has an airspeed indicator on the left side with a main scale in knots indicated and a subscale with knots true airspeed and a knots/mpH indicator on the right hand side. Whenever you swap seats, you have to be very, very careful to get your speeds right, very dangerous nonsense indeed!

Greetings, Max

## **Re: HP-35s : Metric<->English and Conversions**

*Message #83 Posted by **Karl Schneider** on 3 June 2007, 5:20 p.m.,  
in response to message #78 by Walter B*

Quote:

\_\_\_\_\_

AFAIK, Fahrenheit took the lowest temperature on earth known at his time as zero. Very arbitrary.

\_\_\_\_\_

It didn't seem very plausible to me that an 18th-century German scientist would have been unaware of climatic conditions (if not quantitative records) in Moscow and continental central Europe. So, I found

the English- and German-language Wikipedia reference, which gives some unreferenced background:

<http://en.wikipedia.org/wiki/Fahrenheit>

[http://de.wikipedia.org/wiki/Grad\\_Fahrenheit](http://de.wikipedia.org/wiki/Grad_Fahrenheit)

Both articles reference the lowest temperature in Danzig/Gdansk in the winter of 1708-09, which may have established the zero-degree point. I believe that the lowest temperature recorded in Seattle, USA remains 0 degrees F (in January 1950), and there are many locations outside the tropics that have never experienced sub-zero Fahrenheit temperatures. (Incidentally, Seattle's all-time high was 99 deg F until several years ago.)

Just a clarification: Of course, I meant "ambient air temperature at the Earth's surface."

Quote:

---

BTW, most people here are not scared by decimals. While it's perfectly legal to talk about "half a degree", these folks are not only able to divide by 2 (e.g. good and evil), but can handle divisions by 10 easily.

---

The point, really, is to avoid half-degrees and to reserve negative and triple-digit readings as indicators of extreme conditions. My US-specification BMW's ambient temperature display shows integer Fahrenheit readings, and Celsius readings as "nn.0" or "nn.5".

Quote:

---

*The acre is generally a better-sized measure than the hectare for residential real estate.*

Another nice example for personal bias.

Here, only farmers own hectares of land.

Residential real estate is measured in m<sup>2</sup>, and 1,000m<sup>2</sup> is unaffordable in populated and/or attractive areas.

---

It's pretty much the same in North America, except that larger lots are more obtainable outside those "populated and/or attractive areas". Even here, though, a one-acre (about 0.40469 hectare) urban or suburban lot is large.

Ah, but farmers own *agricultural* real estate.

If residential real estate is measured in m<sup>2</sup>, I assume it's generally for a few *ares* of land directly underneath their own townhouses, not including a surrounding yard.

-- KS

## **Re: HP-35s : Metric<->English and Conversions**

Message #84 Posted by **Walter B** on 3 June 2007, 6:13 p.m.,  
in response to message #83 by Karl Schneider

Karl,

one big point for you for the Fahrenheit-(hi)story! My version was what I remembered from school some 40 years ago. Anyway, zero degF remains very arbitrary.

Quote:

---

The point, really, is to avoid half-degrees and to reserve negative and triple-digit readings as indicators of extreme conditions. My US-specification BMW's ambient temperature display shows integer Fahrenheit readings, and Celsius readings as "nn.0" or "nn.5".

---

WHY avoid decimals?? And negative as well as triple digit readings are interpreted according to your environment and education as I pointed out above. The temperature display of your BMW is set the way you observed, because (1) it is sufficient for ice warning next to 0 C (every other indication is just for fun IMHO, meaning it allows to report your friends the morning temperature), (2) it reflects the precision of the sensor, (3) showing every tenth of a C would bring no benefit.

Quote:

---

If residential real estate is measured in m<sup>2</sup>, I assume it's generally for a few ares of land directly underneath their own townhouses, not including a surrounding yard.

---

Lots may be as small as 200m<sup>2</sup> in towns, 400-600m<sup>2</sup> in suburbia nowadays, and bigger in the villages. A "surrounding yard" becomes possible with some 500m<sup>2</sup>, depending on local regulations, and looks better the more area you own. As mentioned, the "ar" is hardly used.

*Message #87 Posted by [Frank Rottgardt](#) on 6 June 2007, 10:14 a.m.,  
in response to message #1 by Jeff O.*

The 33s has 40+ constants in a special menu. It shouldn't be so complicated to give the 35s a decent build-in unit conversion function. You could have one single conversion key starting such a routine. As a first step the 35s asked you for the kind of unit you want to convert, e.g. "Volume, Length, Mass" etc. 2nd step is to refine the choice from a special submenu only containing units of the chosen kind, e.g. "kg, t, g, mg" if your choice was "mass". 3rd step is to enter the actual value, 4th step is to go through the same process for the target-unit.

**Re: 35s - English Conversions**

*Message #88 Posted by [Frank Rottgardt](#) on 6 June 2007, 10:20 a.m.,  
in response to message #87 by Frank Rottgardt*

Of course you wouldn't need to specify the kind of units for the target value, will say if you have chosen to convert "mass", specified "kg" then the 35s could automatically display the right choice of possible target units as "lbs, stone ...."

**Re: 35s - English Conversions**

*Message #89 Posted by [Patrice](#) on 6 June 2007, 9:23 p.m.,  
in response to message #87 by Frank Rottgardt*

You are in RPN, so the first step is type the value, then go in the conversion menu cascade!

### My minor 35s modifications

Message #1 Posted by [Hugh Evans](#) on 31 May 2007, 1:16 p.m.

Considering there is probably time left to make a few changes before mass production, I figure it's worth a shot to put together a slight change in the keyboard layout to make the stack manipulation keys more accessible. In addition, I applied the colors that I selected for OpenRPN. They are the end result of my research on human optics and included sources such as NASA's guidelines for man-machine-interfaces.

If anyone from HP wants any information from me on these colors I will be more than happy to furnish them with everything they could want to know. I can also suggest a better typeset if desired.

Feedback from the community is welcome.

[Edit: Far left- My first set of modifications, Middle- My modifications plus suggested dark cursor keys, Right- Unedited HP image -HDE]

Get rid of kg/lb, mile/kg, etc...

Add Matrix ops, Floor, Ceiling, Mod, Round, String manipulation, P<>R. Restore STO.

### Re: My minor 35s modifications

Message #3 Posted by [Hugh Evans](#) on 31 May 2007, 2:14 p.m.,  
 in response to message #2 by [Egan Ford](#)

My intention is to make modifications that are minor enough for HP to implement without too much effort prior to mass production.

Save the other ideas for the modification community.

### Re: My minor 35s modifications

Message #4 Posted by [Jürgen \(CH\)](#) on 31 May 2007, 3:23 p.m.,  
 in response to message #3 by [Hugh Evans](#)

For those using SI units (some of them use also this strange umlaut characters) these conversion functions are not very useful. I would put them into a menu and use the keys for other (more generally

useful) stuff. Personally, I also dislike the light grey of the cursor keys; the light color is too attracting and disturbs the otherwise very nice design. Anyway, it's by far the most interesting calculator HP presented in the last few years. I definitely would buy one.

Cheers, Jürgen

How about changing the shift keys to have arrows that point up and down rather than left and right, as someone pointed out before?

### Re: My 35s modifications

Message #7 Posted by [Walter B](#) on 4 June 2007, 6:07 p.m.,  
in response to message #2 by Egan Ford

OK, let's try:

<http://home.insightbb.com/~hdevans/35s.jpg>

What is modified?

- there is an ALPHA key
- STO is unshifted
- we would have the opportunity to ASSIGN CAtalog functions to keys
- IP and FP are visible
- a MATRIX menu is provided
- an I/O menu is provided
- LBL, RTN, ISG, and DSE are collected in a menu FLOW
- an unshifted -> is introduced to allow double use of mode keys also for conversions (e.g. blue-shift 6 sets hexadecimal mode, while -> blue-shift 6 converts to hex display); this makes the menu BASE obsolete
- the 4 basic logic operations are on the keyboard
- unit conversions are collected in a UNITS menu
- there is a MODulo operation on the keyboard

- nPr, nCr, x!, and SEED are collected in PROB
- x?y and x?0 are merged in TEST
- INPUT and PSE are collected in X.FCN, where more special operations may be hosted
- I cleaned the key plate; all yellow print there is for menus now (not so sure for ARG); the blue print on keys 1, 2, 3 is for menus, too – everything else are just functions
- etc.

You are invited to criticize 8)

Best regards, Walter

Edited to include the HP35s's published keyboard for direct comparison (thanks, Hugh). Edited to correct the picture address.

in response to message #8 by Wayne Brown*

Wayne, you are perfectly right :-)

Please consider: if we change this, we will need at least a new punching tool for the key plate and a new PCB design. By keeping this feature we save this money for whatever good. Please decide where you want to spend the bucks - and remember you can do so only once d:-)

Wayne,  
Would you buy the 35s if it had this arrangement for the cursor keys?:

Or would it take this one?:

Edited: 5 June 2007, 8:31 a.m.

in response to message #10 by Jeff O.

Why cater to him at all? It still isn't shaped like a brick with edges sharp enough to peel an orange.

Partial :-)) there, but not much of one.

### Re: My 35s modifications

Message #12 Posted by **Jeff O.** on 5 June 2007, 12:59 p.m.,  
in response to message #11 by Gene

Gene,

I wasn't necessary trying to or suggesting that hp cater to Wayne. I decided to create the images with the revised keyboards just to see how they might look. Having done so, I figured I'd see if that might be enough to please Wayne, or if another deal-breaker would come up. It will be just fine with me if the 35s is produced with the cursor keys exactly the way they were presented originally.

### Re: My 35s modifications

Message #13 Posted by **Donald** on 5 June 2007, 11:01 a.m.,  
in response to message #10 by Jeff O.

looks superb - much better than HP's attempt.

The first is probably better - fewer accidental hits of the MODE key.

The 'i' complex key is moving rather far away from the other numeric keys - how about swapping the, redundant in RPN, '( )' with 'i' . Even in algebraic the <> would be used in conjunction with ( ).

### Re: My 35s modifications

Message #14 Posted by **John** on 5 June 2007, 11:56 a.m.,  
in response to message #13 by Donald

You shouldn't call the parentheses keys redundant. They are used heavily in the equation mode on the 33s.

And, if you don't make the calculator friendly to use in algebraic mode, sales will be hurt. Sure, none of us may use the 33s in algebraic mode, but you can't make algebraic extra difficult or sales won't be good.

Thanks for the compliment on the looks. I mostly did it just to see what it might look like. I restrained myself from trying to optimize the keyboard.

### Re: My 35s modifications

Message #16 Posted by **Wayne Brown** on 5 June 2007, 1:34 p.m.,  
in response to message #10 by Jeff O.

I'd prefer the second arrangement, but the first would be OK too. In fact, I wouldn't mind an arrangement like  $\langle \rangle \vee \wedge$  as I use the **h j k l** keys on my computer keyboards all the time in exactly that way for cursor movement. The main point is to avoid anything reminiscent of keys on a cell phone, game, TV remote, or other non-technical "consumer" device.

Where did that picture come from? Much more detailed than any previous picture.

### **Re: My minor 35s modifications**

*Message #20 Posted by [Hugh Evans](#) on 31 May 2007, 2:53 p.m.,  
in response to message #19 by John*

It came from HP's PDF. My guess is that it looks better to your eyes now that the labels have much better contrast... Which is exactly the point I'm trying to get across to HP.

*Edited: 31 May 2007, 2:56 p.m.*

### **Re: My minor 35s modifications**

*Message #21 Posted by [John](#) on 31 May 2007, 3:18 p.m.,  
in response to message #20 by Hugh Evans*

No, that wasn't my point at all. The green gets lost next to the blue, so the color looks worse.

The resolution looked higher than I have extracted from the PDF, so I wondered where you got it. Looking at the original PDF now and it is clearly different.

### **Re: My minor 35s modifications**

*Message #22 Posted by [Hugh Evans](#) on 31 May 2007, 3:27 p.m.,  
in response to message #21 by John*

Well, the PDF is my source. I updated my original post for a side-by-side comparison.

The red alpha labels are nearly impossible to see, and the green color I selected has a good degree of difference from the nearby blue (90° difference in lab coordinates). The only other logical alternative would be to make the alpha labels white.

-Hugh

The red are perfectly visible.

How about you start a new thread asking for a vote?

Red vs. Green?

### **Re: My minor 35s modifications**

*Message #24 Posted by [Hugh Evans](#) on 31 May 2007, 5:30 p.m.,  
in response to message #23 by John*

Maybe to your eyes. The red color HP has chosen has a much lower luminance score, 20-30 points lower than my green. That just means \*much\* better contrast. As far as I can tell HP did not put any thought into their color selection aside from approximating colors from the voyager series (which weren't perfect either).

Red is a lousy color to work with against a dark background anyways. I'm sticking with green, you're welcome to your opinion... But my solution is correct.

### **Re: My minor 35s modifications**

*Message #25 Posted by [Dennis Trafananko](#) on 31 May 2007, 11:17 p.m.,  
in response to message #24 by Hugh Evans*

Another color possibility for the Alpha labels is a magenta shade (diametrically opposed to the green), with a brightness (value in HSV) to be visible against the dark background. The green appears to clash with the other colors in the pictures, it just looks out of place.

### **Re: My minor 35s modifications**

*Message #26 Posted by [Hugh Evans](#) on 1 June 2007, 11:31 a.m.,  
in response to message #25 by Dennis Trafananko*

Yeah, I spec'd a color like but would prefer not to use it. Here's a copy of the optimal color palette I defined. HP was very close to perfect on early pioneer models such as the 48sx, they clearly did their homework. The green and purple colors I defined are what the should have used on the later 48g.

[http://home.insightbb.com/~hdevans/Color\\_Set.jpg](http://home.insightbb.com/~hdevans/Color_Set.jpg)

Green looks much better than red IMHO. I hope it makes it to the production model, but it is very probably too late.

**Re: My minor 35s modifications**

*Message #30 Posted by **Bob** on 31 May 2007, 4:44 p.m.,  
in response to message #1 by Hugh Evans*

I would love to see some basic TVM/financial functions since so much of engineering, project management, and science require some level of financial justification or evaluation on top of the technical work.

The financial solver on the 48GX, or similar, would work fine. I don't even care if it is buried in a menu somewhere.

**Re: My minor 35s modifications**

*Message #31 Posted by **Chuck** on 31 May 2007, 5:00 p.m.,  
in response to message #30 by Bob*

One equation in the solver can calculate all the needed TVM's, including annuities, loan payments, future values, present values, etc. I have a version on most of my programmable calcs that don't have a built in TVM solver. But a built in TVM shouldn't be that hard to include.

**Re: My minor 35s modifications**

*Message #32 Posted by **Chuck** on 31 May 2007, 4:55 p.m.,  
in response to message #1 by Hugh Evans*

My eyes don't spot an "ALPHA" key. I wonder how one would store a value into a lettered register (unless it automatically switches mode, a feature I don't like.)

**Re: My minor 35s modifications**

*Message #33 Posted by **Hugh Evans** on 31 May 2007, 5:08 p.m.,  
in response to message #32 by Chuck*

I'm confused about that exact problem myself.

**Re: My minor 35s modifications**

*Message #34 Posted by **John** on 31 May 2007, 5:28 p.m.,  
in response to message #33 by Hugh Evans*

If this is like the HP33s, then you press STO and the key a letter is on.

Hugh, have you even owned an HP32s, HP32sII, or an HP33s? That's the series of machines since 1988.

That's how HP has done this in that time period.

Your yellow on the images is different, so your not comparing apples to apples. If the yellow

contrast/color is different, then you can't know what reality would be.

### **Re: My minor 35s modifications**

*Message #35 Posted by **Hugh Evans** on 31 May 2007, 5:37 p.m.,  
in response to message #34 by John*

I know my colors are different. They are also better tuned to the human eye. I'm not comparing apples to apples, I'm comparing my solution to HP's. Sure, my renderings are not under photographic conditions but tweaking the color scheme for natural light isn't much of a challenge.

### **Re: My minor 35s modifications**

*Message #36 Posted by **Norris** on 31 May 2007, 5:42 p.m.,  
in response to message #34 by John*

On the 33S, pressing STO, RCL, or LBL automatically toggles alpha mode. This mode only lasts for a single keystroke, because the variables and labels on the 33S are restricted to a single letter.

If you are entering equations, such as "A = B + C", then you have to hit STO or RCL before entering each letter. When you enter equations, the STO and RCL commands don't do anything except toggle the alpha mode. You can store brief text strings as dummy "equations", but you have to press STO or RCL before every letter; there is no "alpha lock" mode.

I believe the 32S and 32SII are similar, and the 35S probably is too. It sounds like the 35S may recognize two-letter variables and labels, but even in this case, there might not be a need for a dedicated alpha key.

### **Re: My minor 35s modifications**

*Message #37 Posted by **John** on 31 May 2007, 5:25 p.m.,  
in response to message #1 by Hugh Evans*

Of course, this is hardly fair, given the green you used wasn't actually photographed under real lighting.

### **HP35s: Keyboard errors**

*Message #38 Posted by **Patrice** on 1 June 2007, 4:51 p.m.,  
in response to message #1 by Hugh Evans*

Hi all,

The pictures on top are showing miswritings.

The problem is with metric units writing, they don't follow the rules.

kilogram is Kg, kg is wrong ! kilometer is Km, KM is wrong ! centimeter is cm, which is right !

As I already said, I don't like spending so much place on keyboard for conversion functions that I will almost never use, and not having others like FP, IP and modulus.

If they let them on keyboard, they should at least write them right.

Patrice from France

## Re: HP35s: Keyboard errors

Message #39 Posted by [Maximilian Hohmann](#) on 1 June 2007, 5:15 p.m.,  
in response to message #38 by Patrice

Hello!

Quote:

\_\_\_\_\_

kilogram is Kg, kg is wrong ! kilometer is Km, KM is wrong ! centimeter is cm, which is right !

\_\_\_\_\_

Not quite: In the international system of units (SI) (\*), lowercase "k" stands for kilo or thousands and uppercase "K" for Kelvin.

So "kg" is indeed the correct way to abbreviate kilograms, but kilometers are neither "Km" nor "KM", but "km" instead.

And like you, I also think that these conversions are quite useless on a general-purpose scientific calculator. I would rather like user-defineable conversions (labelled maybe as "C1" ... "C5") that can be used for whatever the individual user needs to convert (from currencies to nanoAngstroems)

Greetings, Max

(\*) see here: <http://www.bipm.org/en/si/>

Quote:

> Reminds me of my all time favourite unit: Potatoes per Ångström ...

Isn't that a constant?

No, it's a unit for an area. A standard potatoe represents a volume of  $187.0815 \text{ cm}^3 = 187.0815 \cdot 10^{-6} \text{ m}^3$ , an Ångström equals  $10^{-10} \text{ m}$ , so a P/Å equals  $187.0815 \cdot 10^4 \text{ m}^2 = 1.870815 \cdot 10^6 \text{ m}^2 = 1.870815 \text{ km}^2$ . Enjoy! d;-)

This reminds me of my favorite (?) unit: inverse acres

Useful for the mileage that you get with your car: miles/gallon, which is length/length<sup>3</sup>, or 1/length<sup>2</sup> which has the same dimensionality as inverse acres. (Determining the actual conversion factor is "left to the student" and his/her favorite HP calculator.)

NEXT
>> ( 2368.5 bytes / #57545d )
```

\*\*\* PURGE 'ERROR' before the first execution.

4 inputs are needed:

level 4: a program ( or its name ) that computes the derivative  
of the (n+1)-vector [ x y1 ... yn ]  
Since  $dx/dx = 1$  the first component is always 1

level 3: the stepsize h

level 2: the number of steps N

level 1: the initial value [ x y1 ... yn ]

-For example, to solve the system

$$\begin{aligned} dy/dx &= -yzu & y(0) &= 1 \\ dz/dx &= x(y+z-u) & z(0) &= 1 \\ du/dx &= xy-zu & u(0) &= 2 \end{aligned}$$

with h = 0.1 , N = 10:

```
<< OBJ-> DROP -> X Y Z U
<< 1 Y Z U * * NEG
   Y Z + U - X *
   X Y * Z U * - 4 ->ARRY
>>
>> ENTER
0.1 ENTER
10 ENTER
[ 0 1 1 2 ] and press the [RK8E9] key
```

-It yields ( in 137 seconds ) in level 1

```
[ 1 0.258207906449 1.15762398084 0.842178311722 ]
```

and 'ERROR' contains [ 0 2.7631E-11 3.27392E-11 7.636E-11 ]

## Re: Runge-Kutta-Verner method with error-estimate

Message #2 Posted by [Les Wright](#) on 2 June 2007, 10:32 p.m.,  
in response to message #1 by [JMBaillard](#)

JM, this is an excellent bit of work as usual.

Your sample problem is somewhat faster on my 49G+, and I would expect similar performance on the 50G.

I find in some examples I have worked with that the error estimate is a little optimistic. This is understandable--users will know that the error estimates of the Runge-Kutta methods are based on the higher derivative terms of Taylor series expansions, and the assumption that these derivative values remain roughly the same across each subinterval is often not a reasonable one. Moreover, the estimated error is typically used in more sophisticated routines to adjust stepsize--do better than a desired tolerance at the step, increase the stepsize, do worse, decrease it.

Your routine raises some interesting questions about the pros and cons using higher order methods vs. repeated application of lower order methods. In which case is the computational work load best balanced by the performance? I believe that the 48 and 49 series calcs use RKF45 as the basis of an adaptive stepsize routine.

One day, perhaps after all of the hubbub regarding the 35s dies down , I will post some thoughts on this, and perhaps issue a challenge on how to best find results to some challenging nonstiff IVPs.

**Re: Runge-Kutta-Verner method with error-estimate**

*Message #3 Posted by **JM Baillard** on 4 June 2007, 5:37 p.m.,  
in response to message #2 by Les Wright*

Hi,

the error-estimates are algebraically added after each step.  
Adding the magnitudes could be a less optimistic alternative:

```
Simply add      OBJ-> EVAL ->LIST ABS OBJ-> ->ARRY
```

```
just before    1 0 PUT 'ERROR' near the end
```

I was worried when I saw that some coefficients of this Runge-Kutta-Verner method were of the order of 600: I thought it was going to produce great roundoff errors, but fortunately, the corresponding k-value ( namely k12 ) is weighted with a small 3/7280 and indeed, the results are usually satisfactory, even in the last decimal:

For instance:  $y' = -2xy$  ,  $y(0) = 1$

```
h = 0.1 gives y(1) = 0.367879441185
h = 0.05 ----- y(1) = 0.367879441171 ( exact )
h = 0.025 ----- y(1) = 0.367879441171 ( still exact! )
```

At least, 'RKV8E9' gives an idea of the obtained accuracy with 16 evaluations of the function per step, instead of  $11+2*11=33$  evaluations if one uses 'RK8' with h and then with h/2. This may be an advantage if the functions are complicated.

In "Numerical Recipes" they don't seem to like high-order Runge-Kutta formulas. On the other hand, they praise Bulirsch-Stoer methods ( "Runge-Kutta is for ploughing the fields, Bulirsch-Stoer is a high-strung racehorse" ) and it is a little contradictory: though quite fantastic, these methods require more than 11 evaluations per step to achieve an 8th-order formula! Moreover, roundoff errors are also greater.

I've always been fascinated by Runge-Kutta methods, especially if they are compared to the Taylor's method and the huge amount of calculus they require! And the size of the non-linear systems that must be solved to find high-order formulae! It seems like a touch of magic!

Of course, the classical 'RK4' is probably enough for an HP-41, but we can try more accurate formulae with a 49G or 50G.

In fact, I wrote 'RK8' and 'RKV8E9' for completeness, perhaps it will be useful. However, I must say that, even now, I still prefer the HP-41 programming language with its direct arithmetic in the 4-level stack, and all the trickeries we can ( must? ) find to create neat programs.

Speed may be a problem, but thanks to Warren Furlows and his excellent V41, HP-41 programs can run faster than HP-49 programs!

But I stop here my "philosophical" point of view...

Regards,  
JMB.

### HP 71B - HP41 Emulator Module

Message #1 Posted by [Alexander Wassermann](#) on 30 May 2007, 7:41 a.m.

Hi Forum, my first post here but hopefully not my last as I am slowly blending into where I could not afford to be 30 years ago when calculators by HP were just a dream...

I am owner of the HP41 Emulator for the HP71B. I have also the overlay card. Apart from starting the program, and removing it from memory I have not been able to emulate anything near to a 41C. Is there a place to get a copy or scan of the manual. On my copy of the Museum DVD I cannot find one and from what I have found elsewhere on the net neither.

Any suggestions welcome. Alexander

Welcome! Your story is similar to mine and many others here. I had only a HP-15C from 1983-2002, when I started collecting.

Quote:

Is there a place to get a copy or scan of the (*HP41 Emulator for the HP71B*) manual. On my copy of the Museum DVD I cannot find one and from what I have found elsewhere on the net neither.

Look for the file "71-41TR.PDF" (10544 kB) on your MoHPC DVD.

I just bought one of those ROM's myself more than a week ago. (In fact, we might have bought from the same seller.) Its official identifier is the "5061-7269 HP-71 41 Translator".

Message #3 Posted by [Alexander Wassermann](#) on 31 May 2007, 8:53 a.m.,  
in response to message #2 by Karl Schneider

Interesting, seems like not only a similar but nearly identical story. My first was a 15C too in 1984. Then a 48SX from 1990. I've gone back using the 15C again and started collecting 2 years ago. Thanks for the tip on the manual, I will see if I can find it on my version of the Museum DVD (it is not the last one

available). Alexander

Message #2 Posted by [Antonio Maschio \(Italy\)](#) on 30 May 2007, 1:17 p.m.,  
in response to message #1 by Trent Moseley

yep, I agree.

But undoubtly, we should wait until the renewal of the economic branch of HP calculators (say the present HP-9S series). Once, the minor and less powerful Hp calculator was the HP-10C!

-- Antonio

### **Re: Mr.Hurd viz-a-viz the forthcoming HP-35s**

Message #3 Posted by [Eric Smith](#) on 30 May 2007, 4:39 p.m.,  
in response to message #1 by Trent Moseley

I could be wrong, but I doubt that the 35s is even on the radar of HP's upper management. What I do credit HP upper management for is creating (or allowing the creation of) the current calculator operation, after having pulled the plug on ACO. That happened a few years before Hurd took over, though.

in response to message #2 by Tim Wessman

Casio fx-5800p. Decent calc, except: - complex math is incomplete. No complex matrices, no roots of complex numbers, for instance. - the serial port can be used to transfer programs only. This makes it less suitable for surveyors etc., who wish to transfer data to a pc.

### Re: HP 33s "best seller scientific programmable calculator"

Message #4 Posted by [Norris](#) on 30 May 2007, 11:46 a.m.,  
in response to message #3 by kdv

According to [Casio](#), the "selling area" of the FX-5800P is "Europe , International (Asia , Oceania , Central & South America , Mid-East & Africa)". It is apparently not distributed in North America. In the US market, the 33S is probably the only player in the "scientific programmable" niche.

In the US, the term "programmable calculator" is now virtually synonymous with "graphing calculator". The major niche for the 33S, as a "scientific programmable", is on professional licensing exams where "graphing calculators" are prohibited.

### Correct VAC Output for HP-97 AC Adapter?

Message #1 Posted by [Dan W](#) on 29 May 2007, 9:22 p.m.

I have an HP-97 but no AC Adapter/Charger. So I'll probably make one. I am not sure of the correct output voltage. The HP Museum says 8 VAC, but the Service Manual says it is 12.8 VAC (Section 2-42 pg 2-5).

Can someone with an adapter perhaps measure it for me and tell me what it really is?

Thanks

-- Dan W.

### Re: Correct VAC Output for HP-97 AC Adapter?

Message #2 Posted by [Les Wright](#) on 29 May 2007, 9:44 p.m.,  
in response to message #1 by Dan W

I don't have a voltmeter, but I have three 82059 adapters.

The all have engraved on them 8VAC 3W MAX.

Does this help?

### Re: Correct VAC Output for HP-97 AC Adapter?

Message #3 Posted by [Egan Ford](#) on 29 May 2007, 11:50 p.m.,  
in response to message #1 by Dan W

I have the same adapter as Les. Printed is 8 VAC. However I measured the output as 12.7 VAC. Hope this helps.

### Re: Correct VAC Output for HP-97 AC Adapter?

Message #4 Posted by [db \(martinez, ca.\)](#) on 30 May 2007, 12:31 a.m.,  
in response to message #3 by Egan Ford

Egan: Your 12vdc would be the unloaded value. In series with a battery it would probably be more like the nominal 8vdc.

Dan: Making that plug is going to be a drag. I have a spare. Do you live near me?

*Edited: 30 May 2007, 12:31 a.m.*

### Re: HP 33s "best seller scientific programmable calculator"

Message #2 Posted by [Norris](#) on 29 May 2007, 9:22 p.m.,  
in response to message #1 by Miguel Toro

Quote:

The HP 33s Scientific Calculator is rated the "Best Seller" in the Scientific Programmable Calculator category in both units and dollar share

This is probably true, but only because there is no competition. Companies like TI, Casio, and Sharp don't bother to sell "scientific programmable calculators" anymore, at least in the US. The market for "graphing calculators" is far larger and more lucrative.

In the US, the primary market for the 33S is probably among engineers and surveyors taking professional licensing exams. People favor the 33S in this situation, but only because "graphing calculators" are explicitly banned.

This leads to the question of whether NCEES will approve the 35S for use on FE/PE and FS/PS exams. They are scheduled to announce a new list of "approved" calculators for 2008 in November.

*Edited: 29 May 2007, 9:27 p.m.*

### Re: HP 33s "best seller scientific programmable calculator"

Message #3 Posted by [Thomas Okken](#) on 30 May 2007, 4:10 p.m.,

One hopes that HP have been working with the NCEES to make sure the 35s will be approved. The machine sure looks like it could replace the 33s in terms of functionality, but if it can't be used on licensing exams, it's hard to see who would buy one, apart from us HP Forum nerds.

(I'm really curious about what kind of support it has for named variables and named labels!)

- Thomas

**Re: HP 33s "best seller scientific programmable calculator"**

*Message #4 Posted by [Norris](#) on 30 May 2007, 5:05 p.m.,  
in response to message #3 by Thomas Okken*

In theory, the 35S should be acceptable to NCEES. The 33S is OK because it lacks I/O and significant alphanumeric capabilities. I don't see any reason to suppose that the 35S would be any different.

In practice, though, I could see a couple of potential issues.

First, NCEES wants to keep their list of approved models to a minimum, to simplify enforcement. So they might be reluctant to add the 35S to the "approved" list, as long as the 33S is still available.

Second, NCEES is seriously considering a plan to standardize on a single calculator model, and to issue the selected calculator in the exam room. If this occurs, it seems possible that they might prefer to standardize on an "approved" Casio or TI model, given their low cost (\$10 - \$20) relative to HPs (~ \$50 for the 33S, ? for the 35S).

### Where is HP Going in the Calculator Marketplace?

Message #1 Posted by [Howard Owen](#) on 29 May 2007, 3:39 p.m.

With the new calculators being revealed, we can see that HP is continuing the change in direction that was hinted at with the release of the 50g. That machine restored some degree of the old attention to detail in the manufacturing process. What that produced was a machine whose look and feel, while not identical to older machines, was at least reminiscent of the past, and most importantly, one that didn't suck.

The new calculator appears to have been the result of at least some degree of additional engineering on HP's (or a contractor's) part. The functionality has evolved to some (as yet only hinted at) extent over the 33s, and in a direction many here (hi Karl!) have asked for. The large enter key may be a feature intended only for this anniversary machine, or it may regain its place as the default for RPN machines. But in any case, it's a visible symbol of HP's recognition of the value in their calculator legacy. That message is sure to warm the hearts of people around here.

But my question now is, to what degree do you think these changes will help HP in selling calculators? Besides warming the cockles of the vintage HP calculator enthusiast's heart, how will a large enter key, for example, convince people to buy a 35s and not one of the many alternatives from TI, Casio and others? A related question: what should HP do to keep the ball rolling? How can they combine innovation with the preservation of traditional values to produce machines that can win in the marketplace? Finally, what about the new machine from TI? It appears to be a radical - and very interesting - departure from the traditional idea of a calculator. Does HP need to respond to that in order to have a chance of gaining credibility?

Awaiting you collective wisdom.

Regards,  
Howard

### Re: Where is HP Going in the Calculator Marketplace?

Message #2 Posted by [Donald](#) on 29 May 2007, 4:49 p.m.,  
in response to message #1 by [Howard Owen](#)

Good question:

The early calculators were the 'killer application' of their day.

I was doing circuit analysis on my 41CX and 48SX at the time when there were no Personnel Computers - only a couple of shared workstations.

The symbolic+graphics calculator was the 'killer app' for maths students. Now laptops must be as common as the high end graphics calculators. Laptops have the color and user-interface advantage.

So HP need to reinvent themselves, and find a market niche with high ROIC.

Do they continue to follow the high volume competitive, low margin ?, student-teacher market.

This will catch students, who will hopefully keep using HP in later years ( remember how we used to aspire to owning super expensive professional HPs).

The traditional market, was us ( mathematical recreational users ) with a professional background or aim in life. They now seem to be tackling quality necessary for this market.

Now I feel they need to target applications and features that will add value to the end user. These must be something that's truly done better off the cluttered PC screen.

In the past we had the superb application books to learn from. These showed us how our jobs could be easier using a HP calculator.

I would like HP to re-discover the technical manual.

Well, for one thing, it might help influence some of us to stop telling our friends and acquaintances, "Get a TI, or a Casio, or *anything* except an HP. HP hasn't made anything but overpriced junk in years."

## Re: Where is HP Going in the Calculator Marketplace?

Message #4 Posted by **Alain** on 29 May 2007, 6:44 p.m.,  
in response to message #3 by Wayne Brown

It may be that HP as a whole has realized the importance of quality industrial design and looks. They have announced recently a new line of PCs (a quick search gave me this link:

<http://h50043.www5.hp.com/ENP5/Public/Content.aspx?contentID=21070&portalID=367&pageID=1>) that emphasizes industrial design, and a black finish.

Apple is using the black color for the "high end" stuff, e.g. with the 8GB iPod Nano or the top of the line MacBook

The 35s is black, and looks professional. The 33s looks like a gadget. I know which one I'm going to buy ;-)

-- alain.

There's no question, the 35s is **far, far** better-looking than the 33s. I hope it *buries* the 33s in the

market quickly.

### **Re: Where is HP Going in the Calculator Marketplace?**

*Message #6 Posted by **Bob** on 30 May 2007, 1:53 p.m.,  
in response to message #5 by Wayne Brown*

Quote:

I hope it *buries* the 33s in the market quickly.

I don't. I hope that the 33S fills a niche and enjoys continued success. Professional engineering exams are one example where the 33S is approved and additional features would likely knock it off of the list. It might make sense if a less robust RPN scientific is brought out to fill the niche, but I would not drop it until then.

I also hope that the new calc finds a robust and profitable market waiting for it.

If a sibling product get buried in the marketplace, it reduces the chance that they would take a chance on another. It could also reduce the cash flow which will fund additional future models.

Besides, we all need more than one calc. :-)

### **Re: Where is HP Going in the Calculator Marketplace?**

*Message #7 Posted by **Howard Owen** on 30 May 2007, 3:31 p.m.,  
in response to message #6 by Bob*

Quote:

Professional engineering exams are one example where the 33S is approved and additional features would likely knock it off of the list.

The sales brochure for the 35S says that it is approved for the following exams:

Quote:

SAT<sup>®</sup> Reasoning and SAT<sup>®</sup> Subject Tests<sup>™</sup> in Math 1 & 2, ACT,  
PSAT/NMSQT, AP Chemistry/Physics, PLAN, EXPLORE<sup>®</sup>

I don't know if the exam you are thinking of is on that list, but they have at least expended some effort to certify it up to that point. (Or maybe not. The flier was obviously not meant to be released. It may be that those are the certifications planned for the release, not ones they have actually obtained.)

The product lineup on calculators-hp.com also was missing the 33S, but included the 35S. (I haven't checked to see if its the same today or not.) I think that means that the 35s is planned to replace the 33S. But if that's so, and if the speculation that HP's leadership in that niche (which surprised me, btw) is due to exam acceptability is correct, then they'd be crazy not to ensure that the same exams would continue to accept the 35S.

There is a similar, parallel discussion just a few lines up regarding this very subject...

in response to message #7 by Howard Owen*

Actually, it doesn't take that much effort to "certify" it. Almost any scientific/graphing calculator without a qwerty keyboard, stylus, electrical outlet, etc. is approved.

Some comments on the place of the new 35s in the market:

1. There's no saying that the 35s reflects a new direction (it's an anniversary edition, essentially-no?). Although, the 50g also made similar improvements over the 49g+...

2. If the 35s remains in production (which makes business sense), then it will replace the 33s. From the PDF documentation:

Quote:

The 35s Scientific Calculator includes all of the features of the 30s, plus the following:

3. Being as yet unreleased, I wouldn't expect the NCEES to have pre-approved the 35s. Thus they (HP) can't advertise it. But, I'd bet that it will be approved (since HP has already stopped the inflow of 33s machines at Fry's and Walmart longsince). Either that, or NCEES will permit only Casio and Ti (hope not...)

4. I certainly expect that SOME of the text on the marketing brochure will be polished/revised before we see it in the stores. Consider this statement:

Quote:

Simplify physics with 42 built-in physical constants...

I don't ever recall working a physics problem while cursing the darn constants. It was more like 'why can't this be an ODE instead of a system of PDEs?!'

I'm not coming down hard on HPs engineers, (I'm very grateful and excited about the new machine!) I just find (as an engineer myself) some of those bullet points to be humorous:

Quote:

Handle the heaviest workloads with ease using 31kb of memory...

Ipods' are about 1/4th the size, and have 4GB, and furthermore, my PC at work sometimes balks at the heavy workloads (input cases) that we submit! ;)

Just some eager rantings. Looking forward!

ECL

I know stuff like this has been discussed before, but I think it's worth mentioning in the context of these questions.

- I'm looking right now at the HP-97 sitting on my desk. I just love this calculator. The "springy" keyboard notwithstanding, it's the easiest calculator to use in my collection. It has nice big keys, so "fat fingers" are less of a problem. And of course it has that gorgeous LED display, with digits big enough for my old eyes. It works great as a simple RPN adding machine, yet it has all sorts of advanced mathematical and programming features. Like I say, I love this machine.
- Technical professionals no longer use calculators for serious mathematical work. The processing capability, generous displays and wide software selection of the PC trump portability in most cases.
- Portable calculation power still has some utility, nonetheless. Field data collection is also an application the calculator can (\*ahem\*) excel at.
- What else that's essential is missing from the PC mathematical picture that the calculator is strong in? Duh, *it's the keyboard.*

I want to use my HP-97, or something like it, to drive the math applications on my PC. Someone else might prefer a voyager style keyboard, or a pioneer, or a 41C or..

So here's my ideal "futurecalc."

- It's a portable computing module with the very best compromise between mathematical power and electrical power consumption available at the time of its creation.
- It's designed with standard keyboard and display interfaces.
- It has removable storage on board
- *It has wireless networking.* It speaks a standard math application protocol over TCP/IP and the wireless network
- It plugs in to a wide variety of casings and docks, each optimized for a particular purpose
- It *rocks* around the **clock!**

The use cases for this thing are too numerous to cover here. But a few of the really interesting ones are:

- Plugged in to a PC mathematical input device shaped like an HP97. 8)

- Plugged in to a portable calculating device shaped like a [Pioneer|Voyager|Clamshell|41C|67|TI89|\*]
- Plugged in to a total station, collecting and reducing survey data.
- Plugged into a [Gas Chromatograph|NMR|Mass Spectrometer|\*] collecting data
- et *cetera!*

The economic model would be like the PC: build a standard hardware platform and give away the specs. Make a killing doing higher level engineering on the platform, both hardware and software.

- There's no reason I can see this thing couldn't power a PDA or phone as well..

Regards,  
Howard

I have access to all sorts of high end structural design software which I use all of the time. I also use my 42s all of the time, including its programing capabilities. I use the 42s to verify software output, for preliminary design, and to design small projects. I don't know how you define serious mathematical work, but I definitley use my calculator to perform useful mathematical work. I see a continued use for number crunching calculators, and it seems to me that your idea of a futurecalc may be too complicated. Actually, meaning no disrespect, it sounds like you are describing a tricorder from Star Trek.

Quote:

.. it sounds like you are describing a tricorder from Star Trek.

I get what you mean from one perspective. But the description could also apply to a laptop or small PC. That isn't what I'm talking about, but reread the descriptions with that in mind, and see if you don't agree.

I think the science fiction aspect of my proposal is not in the technology itself, but in the economic model. In order to establish an "ecosystem" for that sort of device, a very large company, or consortium of companies, would have to make very large long-term investments in technology they would be giving away to all comers. And despite the example of the PC, I don't think there's a directly analogous story in the history of computing that has succeeded. The story of the PC differs in at least two respects from what I have in mind, First, it was "given away" by IBM by accident, in the case of the hardware, and by reverse engineering on the part of Compaq in terms of firmware. Second and most important, the PC platform gained its success in the face of very little competition, at least in comparison with what a proposal like this would face today.

As far as the utility of calculators, I absolutely agree they are still useful. My point (and it's been made earlier, and better, by others in this forum and elsewhere) is that they are far less *essential* than they were in HP's calculator heyday. I do think that portable computing power in general has a great future. My proposal is aimed at preserving use cases like yours, where calculators continue to offer unique advantages. But I would give you the option of extending the utility of what you do. For example, you
