The only disadvantages are its somewhat higher price, and the size. Due to this size I have to redo the layout of the MLDL2000 from scratch, but it will be worth it. Imaging controlling an ethernet port from your HP41 (yes, there will be an RJ45 port on the MLDL2000 V2)!

Have a look at the mbed website, if you have any ideas let me know,

Meindert

Re: MLDL2000 update

*Message #2 Posted by **Håkan Thörngren** on 27 Sept 2010, 2:38 a.m.,*
in response to message #1 by Meindert Kuipers

The possibility of having TCP/IP and USB connectivity is very appealing. While the HP-41 is a bit slow, the ARM could be used as a smart device to speed things up.

However, my initial impression is a little bit concerned about the business model. They model their tools around a cloud, meaning you need to sign up to use their website. The tools are executed on their side and what does that mean for the future? We are running very old orphaned hardware and would probably like to do so for some considerable future.

How long will that website exist and how long will it support the hardware we choose? What about the pricing model, is something that might change at any time in the future? Pay for each build?

Can we keep the project home to have full control over it?

Re: MLDL2000 update

*Message #3 Posted by **Meindert Kuipers** on 27 Sept 2010, 12:24 p.m.,*
in response to message #2 by Håkan Thörngren

That was also one of my concerns first. The community has several threads about offline compiling (see here for example), and that, plus the ease of use convinced me.

Re: MLDL2000 update

*Message #4 Posted by **Håkan Thörngren** on 29 Sept 2010, 2:39 a.m.,*
in response to message #3 by Meindert Kuipers

Then I feel relieved.

I wonder, how do you plan to interface to it? Will it be possible to write some firmware for it to implement our own devices, i.e. support PFAD=C, C=REGN and REGN=C instructions to keep the standard low level interface?

Would it also be possible to draw I/O flags like the time module do (flag 13 when something is up, and then only draw secondary flags when that particular device is selected)?

This could really open up for a lot of possibilities!

Re: MLDL2000 update

*Message #5 Posted by **Meindert Kuipers** on 29 Sept 2010, 7:24 a.m.,*
in response to message #4 by Håkan Thörngren

Keep in mind that the MBED module will be an (optional) expansion to the existing MLDL2000 structure (although in a completely new layout), meaning that the MBED module will talk to the MLDL2000 through a communication path. The plan is to have a communication interface based on register I/O, such that your HP41 sees a register (somewhere in the ROM memory map) and can send commands and data to the MBED, and receive data back.

It is not my intention to expose the HP41 interface signals to the ARM processor, although that is not impossible. Generation of the I/O flag will be prepared in the hardware, just waiting for a possible use case.

Disadvantage of the MBED module is the current consumption (up to 200 mA), so in practice you always need an external power supply. For those who wish to use the SD card interface only an alternative will be offered, the new MLDL2000 will also support the GHI uALFAT module (embedded micro SD card controller).

Meindert

Re: MLDL2000 update

*Message #6 Posted by **Håkan Thörngren** on 30 Sept 2010, 2:36 a.m.,*
in response to message #5 by Meindert Kuipers

Sounds good in any case. I think being able to control FI 13 in hardware is the important thing, how the rest of the low level interface looks is not important. Even the secondary FI flags are not important as that status should be possible to obtain by just reading suitable interface registers.

Sad repair job on HP48

*Message #1 Posted by **Han** on 25 Sept 2010, 5:48 p.m.*

This HP48GX was apparently "manufactured" without any card ports...

Some of the more subtle refurbs include a double-molded keyboard that was never used in the Indonesian models with the screen and the back cover of an Indonesian HP48GX.

But seriously... if you are going to sell a refurbished HP48, at least make sure to match up the parts.

Re: Sad repair job on HP48

*Message #2 Posted by **db (martinez, ca.)** on 25 Sept 2010, 6:11 p.m.,*
in response to message #1 by Han

at least the parts didn't get thrown away.

the 48 series was real popular in peru's neighbor, bolivia. i taught English in la paz in 98 at the engineering college of the public university and nearly all my students had a 48 of some type. most knew their stuff too. they were downloading programs off the internet and writing their own too. i think they might have had a better grasp of the subject than the average american, getting answers off a canned suite of routines on a PC. they fix everything down there, so this g/gx may have a real complicated origin.

Re: Sad repair job on HP48

*Message #3 Posted by **Martin Pinckney** on 25 Sept 2010, 8:53 p.m.,*
in response to message #1 by Han

At first, I thought the seller just meant to write: "No Ram Cards [In] Ports". But I see your point, could be a G in a GX case.

> Quote:
>
> Some of the more subtle refurbs include a double-molded keyboard that was never used in the Indonesian models with the screen and the back cover of an Indonesian HP48GX.

How can you tell all this from the small photos?

Re: Sad repair job on HP48

*Message #4 Posted by **Han** on 25 Sept 2010, 9:08 p.m.,*
in response to message #3 by Martin Pinckney

If the photos are small, you generally cannot. However, the molded keys have a very crisp, sharp font. These keys were only installed on the Singapore models (for the GX). Take a look at this page:

http://www.thimet.de/CalcCollection/Calculators/HP-48GX/Contents.htm

Click on the photos for larger views. What you should notice is a clear difference in the fonts in the enlarged views. Now, when you look at the smaller photos, notice the y^x and alpha buttons have much "thicker" labels. Despite the smaller views, the Singapore keyboards still have a crisper font relative to the Indonesia keyboard.

I was referring to the auction photos in your OP.

Re: Sad repair job on HP48

*Message #6 Posted by **Han** on 26 Sept 2010, 9:30 a.m.,*
in response to message #5 by Martin Pinckney

Sorry for the confusion. In my OP, I was referring to other refurbished calculators I had seen in the past (not the calculator in the link). As for this particular calculator, though, its keyboard is likely from Indonesia (based on the alpha and y^x key), but the back cover appears to be from Singapore based on the engraved serial number.

Luiz;

*Message #7 Posted by **db (martinez, ca.)** on 26 Sept 2010, 11:17 a.m.,*
in response to message #6 by Han

Luiz; I might be remembering this wrong, but didn't you once post a picture of a left-over parts frankencalc you made with a Novus keyboard & screen miscegenating the body of a commedore? If that was you - could you repost that picture to show these folks what a really scary repair looks like.

Repair/Replacing an HP 11C LCD

*Message #1 Posted by **Jerry** on 25 Sept 2010, 5:08 p.m.*

Is it possible to repair or replace a HP 11C display or interchange it with a HP 12C display?

Re: Repair/Replacing an HP 11C LCD

*Message #2 Posted by **Martin Pinckney** on 25 Sept 2010, 9:44 p.m.,*
in response to message #1 by Jerry

Jerry,

Many of the "experts" are at HHC, so you may have to wait to get your answers. I am not an expert, but from reading posts over the years, I think the answer is "yes", provided you use a 12c from the same production era. See this as a start.

You may be able to find the complete answer you need by searching the archives.

Re: Repair/Replacing an HP 11C LCD

*Message #3 Posted by **aj04062** on 26 Sept 2010, 8:02 a.m.,*
in response to message #1 by Jerry

Yes it is. I did it on a unit I own. This was my first attempt. The re-assembly process takes some practice and patience to get all LCD to operate correctly.

This was on a later unit with the single PCB. Earlier units with 2 PCBs are easier, I've heard (you need to swap parts from same to same)

Before:

2 disassembled units

After:

HP-41CY emulation for NoV-64 (also for Halfnuts)

*Message #1 Posted by **Diego Diaz** on 25 Sept 2010, 3:33 p.m.*

Hi all,

Few months ago I published the NoV-64CY.HEX file which was intended to replicate HP-41CY functionality (at normal speed) using a NoV-64 module.

I only had a Coconut CX with me and the file worked as expected.

However, several users reported that the emulation doesn't work at all on Hafnuts.

Once I get back home I confirmed these reports. Regrettably some other personal issues prevented me for getting back to this issue until now.

The new version is available here.

This time I've brought both Coconut and Halfnut and tested it accordingly.

The emulation keeps the "RAM shadowing" feature of the CY (allowing any physical module to hide the RAM page(s) it occupies when inserted) as well as its unique Bank-switching scheme (PG01, PG10 & PG<> functions) of the W&W RAMBOX-64K.

Enjoy your 41's :-)

Cheers.

Re: HP-41CY emulation for NoV-64 (also for Halfnuts)

*Message #2 Posted by **Angel Martin** on 26 Sept 2010, 2:48 a.m.,*
in response to message #1 by Diego Diaz

Another milestone in your record Diego, you've squared the circle and then come back again! The 41 community ows you tons, so glad you're there!

Re: HP-41CY emulation for NoV-64 (also for Halfnuts)

*Message #3 Posted by **Diego Diaz** on 26 Sept 2010, 9:59 a.m.,*
in response to message #2 by Angel Martin

Thanks a lot for your kind words Ángel.

Believe me when I say that I'm most happy to offer to this awsome community a small part of the satisfactions received along these years.

I'm also aware that none of the projects I've built could have never reached a successful end without the cooperative and knowledge-sharing spirit of many HP enthusiasts; which list would be too long to post

and, of course, includes yourself in the highest positions... :-)

Will keep on posting as new developments become available (stay tuned...)

Cheers from the (now sunny) Caribbean.

Diego.

Re: HP-41CY emulation for NoV-64 (also for Halfnuts)

*Message #4 Posted by **J-F Garnier** on 26 Sept 2010, 4:40 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

Just by curiosity, what was the cause of the failure with the halfnut machines? Is it related to what was discussed here ?

J-F

Re: HP-41CY emulation for NoV-64 (also for Halfnuts)

*Message #5 Posted by **Diego Diaz** on 26 Sept 2010, 10:33 a.m.,*
in response to message #4 by J-F Garnier

Hi J-F,

In fact it wasn't.

There were two points in my previous code for NoV-64CY which caused the Halfnuts to fail.

The first one was a Phi2 sincronization on puse #32. Apparently, Halfnuts processor generates a slightly larger Phi clock pulse width. Which eventually causes its falling edge being erroneously detected generating a sinchro-glitch. From this point ahead the whole thing crashes.

The second one (may also be related to Phi pulses width) was detected after fixing the first. It looks like Halfnuts are a bit more critical regarding DATA and ISA timing.

So the new code needs to makes sure that both lines (when driven by the NoV-64) keep the appropriate level (H or L) along the whole Phase (from Phi2 rising edge to next Phi2 r.e.).

Coconuts are just "happy" if they find the correct level at Phi1 rising edge.

On my previous projects (Clonix, NoVRAM...) these lines were driven from Ph2 to Ph2 so they work as expected both with Coconuts and Halfnuts. But since I had to replicate the "RAM shadowing" feature of the CY I wrote a new output routine which shorten the presence of the ISA and DATA signals between pulses. Which, in the end, causes the failure.

The bug was fixed once the routine was recoded to allow both: RAM shadowing and signal presence along the whole phase length.

As usual things are far more easy when one goes down to the bit level... :-)

Best wishes.

Diego.

Programming Challenge

*Message #1 Posted by **Namir** on 25 Sept 2010, 12:18 p.m.*

Hi All folks who are NOT attending HHC 2010,

Since you are not busy at the HHC, I thought you can handle the following worthwhile challenge.

The Viete's formulas allow you to calculate the coefficients of a polynomial given it's roots. For example for quadratic polynomials:

x1 + x2 = - b / a

x1 * x2 = c / a

Giving the polynomial a x^2 + b X + c. Choosing a = 1 simplifies things.

In the case of a cubic polynomial you have:

x1 + x2 + x3 = - b / a x1* x2 + x1 * x3 + x2 * x3 = c /a x1 * x2 * x3 = -d / a

Giving the polynomial a x^3 + b x^2 + c x + d. Choosing a = 1 simplifies things.

Wikipedia shows the general equations for the Viete's formulas here.

All polynomials (order 2 ad higher) have the following in common:

1) The coefficient of the n-1 term (n being the polynomial order) is calculated as:

sum(x(i)) = - b / a, for i = 1 to n

2) The constant term is calculated as:

product(x(i) = (-1)^n * constant_term / a for i = 1 to n

Your challenge is to write a program in RPN, RPL, BASIC or any other popular language (for calculator or for PC) that can calculate the coefficients of any polynomial given the array of roots. Using coefficient a as 1 simplifies things a bit.

The solution requires that you handle a number of n equations to calculate the coefficients of a polynomial of order n.

Namir

AWOL from HHC 2010 and hiding in the south of France!! Merci Sarkozi!!!

Edited: 25 Sept 2010, 12:31 p.m.

Re: Programming Challenge

*Message #2 Posted by **Thomas Klemm** on 25 Sept 2010, 5:03 p.m.,*
in response to message #1 by Namir

The HP-48GX has this function built in:

```
[1 2 3] PCOEF -> [1 -6 11 6]
```

You may consider it the inverse operation of PROOT.

Best regards
Thomas

Re: Programming Challenge

*Message #3 Posted by **Namir** on 25 Sept 2010, 5:38 p.m.,*
in response to message #2 by Thomas Klemm

You are not implementing a solution using Viete's formulas. I am aware of function PCOEF and PROOT.

Namir

Re: Programming Challenge

*Message #4 Posted by **Han** on 25 Sept 2010, 5:59 p.m.,*
in response to message #1 by Namir

Are we shooting for program size, speed, or simply an implementation of the formula? =)

Han

Re: Programming Challenge

*Message #5 Posted by **Han** on 25 Sept 2010, 6:24 p.m.,*
in response to message #1 by Namir

I didn't implement Viete's formula directly, but the algorithm does (in the end) do the exact multiplication and addition used in Viete's formula.

Given a list of roots: { x1 x2 x3 ... xn } it computes the list of coefficients.

```
<<
  DUP SIZE -> r n
  <<
    { 1. } 0. n 1. -
    FOR i
      0. OVER + r n i - GET NEG *
      SWAP 0. + SWAP ADD
    NEXT
  >>
>>
```

If anyone would like to see the math behind it, I can post that as well.

Re: Programming Challenge

*Message #6 Posted by **Thomas Klemm** on 25 Sept 2010, 7:32 p.m.,*
in response to message #5 by Han

Same idea but using STREAM:

```
\<<
  {{1}} SWAP +
  \<< \-> p x
    \<<
      p 0 +
      0 p +
      x * -
    \>>
  \>>
  STREAM
\>>
```

Best regards
Thomas

Re: Programming Challenge

*Message #7 Posted by **Namir** on 25 Sept 2010, 8:42 p.m.,*
in response to message #6 by Thomas Klemm

Thomas,

Your solution works great too (input has to be a list of roots).

Cool!!

Namir

Re: Programming Challenge

*Message #8 Posted by **Namir** on 25 Sept 2010, 7:55 p.m.,*
in response to message #5 by Han

Sure! Please do! I am very impressed with your solution.

You solution works great! Thanks!

Edited: 25 Sept 2010, 8:48 p.m.

Re: Programming Challenge

*Message #9 Posted by **Han** on 25 Sept 2010, 9:16 p.m.,*
in response to message #8 by Namir

The idea can be easily seen with the following example. Suppose our roots are 3, 5, and 7. Then the polynomial can be written in factored form is:

(x-3)(x-5)(x-7)

First multiply the first two factors (x-3)(x-5).

(x-3)*x + (x-3)*(-5) = (x^2 - 3x) + (-5x + 15)

If we use vector (or list) notation, what we are essentially doing is taking { 1 -3 } (which corresponds to the polynomial x-3) and "shifting" it by a power of x (to get x^2 - 3x). So in list form, this is { 1 -3 0 }. Then, we compute (x-3)*(-5) which gives us the list { 0 -5 15 }. We need a 3-element list though, since ADD requires same list sizes. Lastly, we add the two lists via element-wise addition. This is

essentially the sum of two polynomials: one whose coefficient is { 1 -3 0 } and the other is { 0 -5 15 }. So the sum is { 1 -8 15 }, or the polynomial x^2 - 8x + 15.

Now, just repeat this process with the final factor: (x-7). It's really just distribution of x and the root x_i (negated).

This is best seen when using the DBUG feature of the HP48/49/50.

Han

Edited: 25 Sept 2010, 9:22 p.m.

Re: Programming Challenge

*Message #10 Posted by **Han** on 25 Sept 2010, 9:33 p.m.,*
in response to message #9 by Han

This reminds of another challenge of computing f(n) for some given number n, where f(x) is a polynomial using an RPN calculator that only has 2 levels of stack.

The idea is to rewrite the polynomial in a "recursive" manner. For example, if we have 3x^2-5x+6, we can view this as:

(((x * 3) - 5) * x) + 6

So to compute f(4), for example, we would do:

4

3

*

5

-

4

*

6

+

Re: Programming Challenge

*Message #11 Posted by **Namir** on 26 Sept 2010, 6:14 a.m.,*
in response to message #10 by Han

I see .. so you are doing the polynomial multiplication approach. This is the easy route. I was able to write a version of PCOEF in Matlab (similar to Matlab's ROOTS function).

The Viete's formulas are a bit tough to code. Hence the challenge!!

:-)

Namir

Re: Programming Challenge

*Message #12 Posted by **Olivier De Smet** on 26 Sept 2010, 11:20 a.m.,*
in response to message #1 by Namir

Hi,

Here is a brutal solution of Viète formula (non optimized, lot of room for optimizing I think) for HP86/7 with nice display of sums.

Olivier

```
10 DISP "Viete's formulas" @ OPTION BASE 0
20 DIM x(99),a(99),ik(99)
30 RESTORE 1000 @ READ n@ FOR k=1 TO n @ READ x(k)@ NEXT k @ a(n)=1
40 FOR k=1 TO n @ s=0 @ FOR i=1 TO k @ ik(i)=i @ NEXT i @ l=k @ DISP "S";n-k;" =";
50 p=1 @ FOR i=1 TO k @ p=p*x(ik(i)) @ DISP ik(i);@ NEXT i @ s=s+p
60 ik(l)=ik(l)+1 @ IF ik(l)<= n-k+l THEN DISP "+";@ GOTO 50
70 l=l-1 @ IF l=0 THEN 200
80 IF ik(l)=n-k+l THEN 70
90 j=ik(l)+1 @ FOR i=l TO k @ ik(i)=j @ j=j+1 @ NEXT i @ l=k @ DISP "+";@ GOTO 50
200 a(n-k)=s*((-1)^k) @ DISP "" @ DISP "a(";n-k;")=";a(n-k) @ NEXT k
999 END
1000 DATA 5,1,2,3,4,5
```

Re: Programming Challenge

*Message #13 Posted by **Namir** on 26 Sept 2010, 1:26 p.m.,*
in response to message #12 by Olivier De Smet

Olivier,

Quoting the famous French mathematician Bernoulli, let me say "I recognize the lion by its tale!"

The quote comes from when Bernoulli challenged the mathematicians of Europe to solve a problem. At that time, Newton was sick, so Bernoulli did NOT send him a copy of the problem. After waiting several months, Bernoulli got frustrated and upon hearing that Newton's health was better, he mailed Newton a copy of the problem. Upon receipt Newton looked at the problem and mailed THE SOLUTION THE NEXT DAY!!! When Bernoulli got an envelope from England that quickly (relative to speed of mail at the time), he knew it was from Newton and said, before opening the envelope, "I recognize the lion by its tale!"

I am not surprised that you solved it, since it takes a first class programmer like yourself to solve a tough problem like implementing the Viete's formulas!

Thanks!!

Re: Programming Challenge

*Message #14 Posted by **Olivier De Smet** on 26 Sept 2010, 2:13 p.m.,*
in response to message #13 by Namir

Thanks a lot for your nice comments Namir.

Just a little remark ... could it be "paw" in place of "tale" in the quote of Bernouilli ? (see cite)

Paw (as "patte" in french) seems better I think.

Anyway thanks again for your kind comments.

Olivier

Edited: 27 Sept 2010, 2:07 a.m.

Re: Programming Challenge

*Message #15 Posted by **Namir** on 26 Sept 2010, 5:50 p.m.,*
in response to message #12 by Olivier De Smet

I typed in your solution in the EMU71 (I have no physical 71B with me while I am on vacation). I changed the name of the array ik() to i1() (a letter and a digit) to make the code work. Other than that the code is a beauty!

I am impressed on how you were able to use a two-level nested FOR loops to manage calculating the various Viete's summations (and consequently the related polynomial coefficients). I kept thinking that the solution needed more nested loops.

Cool!

Namir

Edited: 26 Sept 2010, 5:56 p.m.

Thanks!!! I was able to translate the 71B code into Excel VBA. Had to watch for those zigzagging GOTOs!!

Here is the VBA code:

```
Option Explicit
```

```
Option Base 0

' Version 1.1

Sub CalcCoeff()

  Dim N As Integer, S As Double, P As Double
  Dim I As Integer, J As Integer, K As Integer, M As Integer
  Dim Root(99) As Double, Coeff(99) As Double, IK(99) As Integer
  Dim bJump As Boolean, Row As Integer, Col As Integer
  Dim aStr As String

  N = 2
  Do While Cells(N, 1) <> ""
    Root(N - 1) = Cells(N, 1)
   N = N + 1
  Loop

  N = N - 2 ' number of roots
  Coeff(N) = 1
  ' display Coeff(N)
  Cells(2, 2) = Coeff(N)
  Range("B3:Z1000").Value = ""
  Row = 3
  ' main loop
  For K = 1 To N
    Col = 3
    S = 0
    M = 1
    IK(1) = 0
    ' Line 40
    Do
      J = IK(M) + 1
      For I = M To K
        IK(I) = J
        J = J + 1
      Next I
      M = K
      ' Line 50
      Do
        P = 1
        For I = 1 To K
          P = P * Root(IK(I))
          aStr = Cells(Row, Col)
          If aStr = "" Then
            Cells(Row, Col) = "r" & CStr(IK(I))
          Else
            Cells(Row, Col) = aStr & "*r" & CStr(IK(I))
          End If
        Next I
        S = S + P
        ' L60
        IK(M) = IK(M) + 1
        ' move column for Viete's terms to the right
        If IK(M) <= N - K + M Then Col = Col + 1
      Loop While IK(M) <= N - K + M
      bJump = False
      Do
        M = M - 1
        If M = 0 Then
          bJump = True
          Exit Do
        End If
        ' move column for Viete's terms to the right
        If IK(M) <> (N - K + M) Then Col = Col + 1
      Loop While IK(M) = N - K + M
      ' jump out of outer loop?
      If bJump Then Exit Do
    Loop
    ' Line 200
    Coeff(N - K) = S * ((-1) ^ K)
    ' show the coefficient value
    Cells(Row, 2) = Coeff(N - K)
    Row = Row + 1
  Next K
```

```
End Sub
```

I replaced variables l, x() and a() with M, Root() and Coeff(), respectively. I also added the variable Row to display the polynomial coefficients in a descending power order. The program expects the roots to appear in column 1 starting with Row 2. The output polynomial coefficients appear in column 2, starting with row 2. Row 1 for columns 1 and 2 are reserved for labeling the columns. The output places the coefficients of the polynomial in a descending power order. Row 2 has 1 (the term for X^n), row 3 has the coefficient for X^(n-1), and so on. Row n+2 has the constant term.

The above code also shows the different terms in Viete's formula. These symbolic terms appear in columns C, D, and up. Each cell contains a set of root products. The variable Col controls which column each root product group appears.

HP 35s - Choosing Initial Guesses for SOLVE problem

*Message #1 Posted by **Pablo P (Spain)** on 24 Sept 2010, 7:11 p.m.*

Hi all! I have a problem when I use SOLVE with some equations that have two roots.

For example, consider the equation X^2 = 1. As you know, it has two solutions (x1 = 1, x2 = -1). HP 35s always shows me 1. Even when I choose the initial guesses for the negative root as described in the manual (section 7-8).

The same problem with the equation 0.5 = (1 + (%pi / LN(X))^2)^-0.5. It has two solutions (x1 = 0.16303353482158, x2 = 6.133707406236229) and I always get x2.

On the contrary, there are other equations that work well. For example: X^2+X-6=0. With that one, I can get the two solutions (x1 = 2, x2 = -3).

I do not know if I am doing something bad. Any idea?

_____

Notes:

%pi = Number PI

Edited: 24 Sept 2010, 7:22 p.m.

Re: HP 35s - Choosing Initial Guesses for SOLVE problem

*Message #2 Posted by **Karl Schneider** on 25 Sept 2010, 12:19 a.m.,*
in response to message #1 by Pablo P (Spain)

Pablo --

You've discovered for yourself a somewhat-dubious "feature" of the HP-33s and HP-35s. Please see this thread from about a month ago; my post at the bottom of it provides a link to a thread from 2004.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=171095#171095

In the equations X^2 = 1 and (1 + (pi / LN(X))^2)^(-0.5) = 0.5, the variable X appears only once. The calculator's equation parser enables direct solution of X, executing inverse operations in reverse order. Using principal roots of all math functions, the same answer is returned every time, no matter what the starting points were.

Calculated answers for the second equation:

```
X = exp(pi/sqrt(3))  = 6.1337074062362276
X = exp(-pi/sqrt(3)) = 0.1630335348215805
```

In the equation X^2+X-6=0, the variable X appears more than once, so the 'algebraic' techniques are forgone and numerical iteration is used instead.

Thanks Karl, I did not read the thread from about a month ago because I was on holidays. The solution you pointed there works perfectly. And yes, it is a (very) dubious "feature"... :)

Re: HP 35s - Choosing Initial Guesses for SOLVE problem

*Message #4 Posted by **Karl Schneider** on 3 Oct 2010, 8:35 p.m.,*
in response to message #3 by Pablo P (Spain)

There is value to the direct-solution method, as it should always return a solution if one exists, even if either initial guess value will produce a math error upon evaluation, or if a subsequent evaluation point does the same. I learned a few years ago that the celebrated HP-17B/HP-27S solver includes a similar direct-solution method.

Still, a well-designed solver should return a valid solution that lies within the range of two user-specified initial guesses, instead of a directly-calculated solution *outside* that range. The calculator cannot know what root(s) is/are of interest in the user's equation.

*Message #5 Posted by **Conny A** on 25 Sept 2010, 5:03 a.m.,*
in response to message #1 by Conny A

The calculator is in near mint condition. I would like to say mint, but it has been used. The electronics is also old, so there is no guarantee that the electronics will last for a long time if the plan is to use it.

I have tested the electronics using the electrical test programs and all seems in good condition.

It has been stored in normal room conditions, that is around +20 degrees C. No smoking or other contaminations.

I will post some photos later.

Mini-Challenge: Zip Code

*Message #1 Posted by **Thomas Klemm** on 23 Sept 2010, 4:52 p.m.*

The following challenge is based on an arithmetic problem I found in a mathematics book for elementary school. Contrary to other countries we use only a four digit zip code in Switzerland.

These are the steps necessary to create the next zip code:

1. Select the zip code of a Swiss location.
2. Compose the maximum number of the four digits.
3. Compose the smallest possible number of the four digits.
4. Calculate the difference.

Example

1. Start with 4153
2. The maximum number made of these four digits is: 5431
3. The minimal number made of these four digits is: 1345
4. The difference is: 5431 - 1345 = 4086

Analysis

Write a program for the HP calculator of your choice that returns the next zip code. What is the behavior if you iterate this? Make a speculation.

Proof

Try to proof your assumption. Can your calculator be of any help?

Solution

I will add my solution for the HP-15C here within a couple of days.

Hope you have as much fun as I had.
Thomas

PS: And where will all this lead us?

Re: Mini-Challenge: Zip Code

*Message #2 Posted by **Chuck** on 24 Sept 2010, 12:33 a.m.,*
in response to message #1 by Thomas Klemm

Question: does it always require to be four digits. That is will a zip of 12 (or 0012) transition to 2100-0012 = 2088

If so, I'm getting just about nothing but cycles. Sadly I'm not using an HP, though.

CHUCK

Re: Mini-Challenge: Zip Code

in response to message #2 by Chuck

> Quote:
>
> That is will a zip of 12 (or 0012) transition to 2100-0012 = 2088

The authors of the book don't mention this special case but I did the same as you: add leading zeros whenever needed to get a four digit number.

> Quote:
>
> Sadly I'm not using an HP, though.

At least to me that was part of the fun.

Best regards
Thomas

Re: Mini-Challenge: Zip Code

*Message #4 Posted by **Chuck** on 24 Sept 2010, 10:23 a.m.,*
in response to message #2 by Chuck

Aack. Egg on my face. It was too late last night and I forgot the "make the smallest" and "make the largest" number part. (I was just reversing the original number, doh.) Should be any easy fix with my program.

Re: Mini-Challenge: Zip Code

*Message #5 Posted by **Thomas Klemm** on 27 Sept 2010, 2:05 p.m.,*
in response to message #2 by Chuck

It appears that Wikipedia and MathWorld (or rather Sloane) disagree on the values that will lead to 0.

Wikipedia:

> Quote:
>
> The only four-digit numbers for which Kaprekar's routine does not reach 6174 are repdigits such as 1111, which give the result 0 after a single iteration. All other four-digits numbers eventually reach 6174 if leading zeros are used to keep the number of digits at 4:
>
> ```
> 2111 – 1112 = 0999
> 9990 – 0999 = 8991 (rather than 999 – 999 = 0)
> ```

MathWorld:

> Quote:
>
> Exactly 77 4-digit numbers, namely 1000, 1011, 1101, 1110, 1111, 1112, 1121, 1211, ... (Sloane's A069746), reach 0.

The question is whether 999/0999 is considered a 3- or a 4-digit number. As I didn't read Kaprekar's original paper I don't know which position is correct. However the Online Kaprekar script returns:

```
9990 - 0999 = 8991
9981 - 1899 = 8082
8820 - 0288 = 8532
8532 - 2358 = 6174
```

After all this your question seems fairly reasonable.

Best regards
Thomas

in response to message #1 by Thomas Klemm

> Quote:
>
> Write a program for the HP calculator of your choice that returns the next zip code

I pretended I had a 71B (which I don't) and wrote a BASIC program.

I won't give too much away, but it does converge (fairly quickly), but not to anything I might have guessed.

If you have ZIP codes which have 4 digits of the same value, such as 5555, it converges/collapses very quickly of course, to 0000.

Re: Mini-Challenge: Zip Code

*Message #7 Posted by **Thomas Klemm** on 24 Sept 2010, 2:39 a.m.,*
in response to message #6 by Dave Shaffer (Arizona)

The only possible Swiss ZIP codes made of the same digits are:

- 4444 Rümlingen
- 8888 Heiligkreuz

> Kaprekar's constant

I didn't know that is what it is called, but my little BASIC program did converge to the right value.

(Patrice - bonjour. Did you get to Arches Park?)

Re: Mini-Challenge: Zip Code - Casio fx-5800P

*Message #11 Posted by **Marcus von Cube, Germany** on 24 Sept 2010, 1:02 p.m.,*
in response to message #1 by Thomas Klemm

Programming the Casio isn't as funny as it could be, but finally, I've arrived:

'->' is a single char, entered with STO, indentation and comments added for humans.

```
4->N:?N:                '# of digits
Lbl 1:"NUMBER"?Z:       'ask for number, show last result
0->DimZ:N->DimZ         'create (and clear) Z[1]..Z[N]
For 1->I To N:          'cut number in N digits
 Z-Int(Z/10)x10->A:     'get right most digit
 For 1->J To N:         'find proper place for digit
  If Z[J]<A:Then
   A->B:Z[J]->A:        'stored digit is smaller
   B->Z[J]:             'swap with current digit
  IfEnd:
 Next:
Next:
0->A:0->B:              'A is high number, B low number
For 1->I To N:          'A,B construction loop
 Ax10+Z[I]->A:          'shift A and add next digit to the right
 Bx10+Z[N+1-I]->B:      'same as above but in reverse digit order
Next:
A-B->Z:                 'new number Z as difference of A and B
Cls:"\
\                       'press EXE twice
":                      'clear screen and position cursor
Locate 1,1," ":
Locate 1,2," ":         'remove unwanted control chars on screen
```

```
Locate 17-N,1,A:
Locate 17-N,2,B:       'show both numbers
Goto 1                 'show (and get new) number
```

It's a bit clumsy to produce a nice screen display with this calculator, because 'Locate' does not position the cursor for the next input statement and the EXE key leaves an arrow symbol on the screen.

Edited for typo in code.

Edited: 26 Sept 2010, 2:03 p.m.

Re: Mini-Challenge: Zip Code

*Message #12 Posted by **George Litauszky** on 26 Sept 2010, 4:54 a.m.,*
in response to message #1 by Thomas Klemm

Hi Thomas and hi everybody!
This is a simple HP 50g solution for your challenge. My stack diagram is: (Level(n), Level(n-1), ...Level(1))

Prg ZCODE:
Input: 1432 ; For example

```
 DUP           (1432, 1432)                    ; Save input for comparsion
 1 3
 FOR N
  10 IDIV2
  SWAP
 NEXT          (1432, 2, 3, 4, 1)              ; The order isn't significant.
 4 ->LIST      (1432, {2 3 4 1})
 SORT          (1432, {1 2 3 4})
 DUP           (1432, {1 2 3 4}, {1 2 3 4})
 REVLIST       (1432, {1 2 3 4}, {4 3 2 1})
 EVAL          (1432, {1 2 3 4}, 4, 3, 2, 1)
 NBUILD        (1432, {1 2 3 4}, 4321)         ; See below.
 SWAP          (1432, 4321, {1 2 3 4})
 EVAL
 NBUILD        (1432, 4321, 1234)
 -             (1432, 3087)                    ; The input and the first result.
```

Prg NBUILD:
Input: (1, 2, 3, 4)

```
 1 3
 FOR N
  SWAP          (1, 2, 4, 3)
  10 N ^        (1, 2, 4, 3, 10)               ;If N= 1 then 10^1= 10
  *             (1, 2, 4, 30)
  +             (1, 2, 34)
 NEXT
```

The result: The Kaprekar's constant after some iterations. Hungary also uses four digit postal (ZIP) codes.

George

It's the easier challenges that I'm more likely to attempt, and I always seem to learn some new trick by trying it. For example, by stealing liberally from Thomas's 15C code I was able to shorten mine considerably and also eliminate use of any registers.

```
01 LBL "ZIP2"
02 1 E4
03 /
04 XEQ 01
05 XEQ 01
06 XEQ 01
07 STO L       'Maybe I went to too extreme lengths to
08 CLX         ' eliminate any registers
09 10
10 ST* L
11 CLX
12 RCL L
13 X>Y?       'Slightly improved sorting code from Thomas's code
14 X<>Y
15 RDN
16 X>Y?
17 X<>Y
18 RDN
19 X>Y?
20 X<>Y
21 R^
22 X>Y?
23 X<>Y
24 R^
25 X>Y?
26 X<>Y
27 RDN
28 X>Y?
29 X<>Y         'Here's where I'm most disappointed at not
30 -            ' figuring out the answer was 999(d-a)+90(c-b)
31 90
32 *
33 X<>Y
34 R^
35 -
36 999
37 *
38 +
39 RTN
40 LBL 01
41 10
42 *
43 INT
44 LASTX
45 FRC
46 RTN
47 END
```

Re: Mini-Challenge: Zip Code

*Message #15 Posted by **Thomas Klemm** on 28 Sept 2010, 11:34 a.m.,*
in response to message #14 by Mark Storkamp

Hi Mark

You could remove line 46 RTN as the following line 47 END does the same.

I also tested your idea of dividing the entry first by 10^3:

```
001 LBL A
```

```
002 EEX
003 3
004 ÷
005 GSB 0
006 GSB 0
007 GSB 0
(...)
038 LBL 0
039 INT
040 LASTx
041 FRAC
042 RCL × 0
043 RTN
```

It uses the same amount of bytes, is one line longer and might be a little faster. However entering numbers is usually rather slow. So I'm not sure.

Cheers
Thomas

Re: Mini-Challenge: Zip Code

*Message #16 Posted by **Mark Storkamp** on 28 Sept 2010, 4:18 p.m.,*
in response to message #15 by Thomas Klemm

I don't have RCL arithmetic at my disposal, and in a first quick go at it I couldn't get the number decomposed without using a register unless I divided by 1E4 first. That way I was left with integers for all but the final digit.

I could probably redo it now without the divide if I ended up with 0 - 0.9 on the stack, and used 9990(d-a)+900(c-b). And the last CLX RCL L could be replaced with an X<>L. But I'm not sure if all 41s could do that, or only the CX.

Re: Mini-Challenge: Zip Code

*Message #17 Posted by **Thomas Klemm** on 29 Sept 2010, 10:56 a.m.,*
in response to message #16 by Mark Storkamp

> Quote:
>
> I don't have RCL arithmetic at my disposal

One of the reasons why I chose HP-15C.

> Quote:
>
> And the last CLX RCL L could be replaced with an X<>L.

Yes, it can:

```
01 LBL "6174"
02 E3
03 /
04 XEQ 01

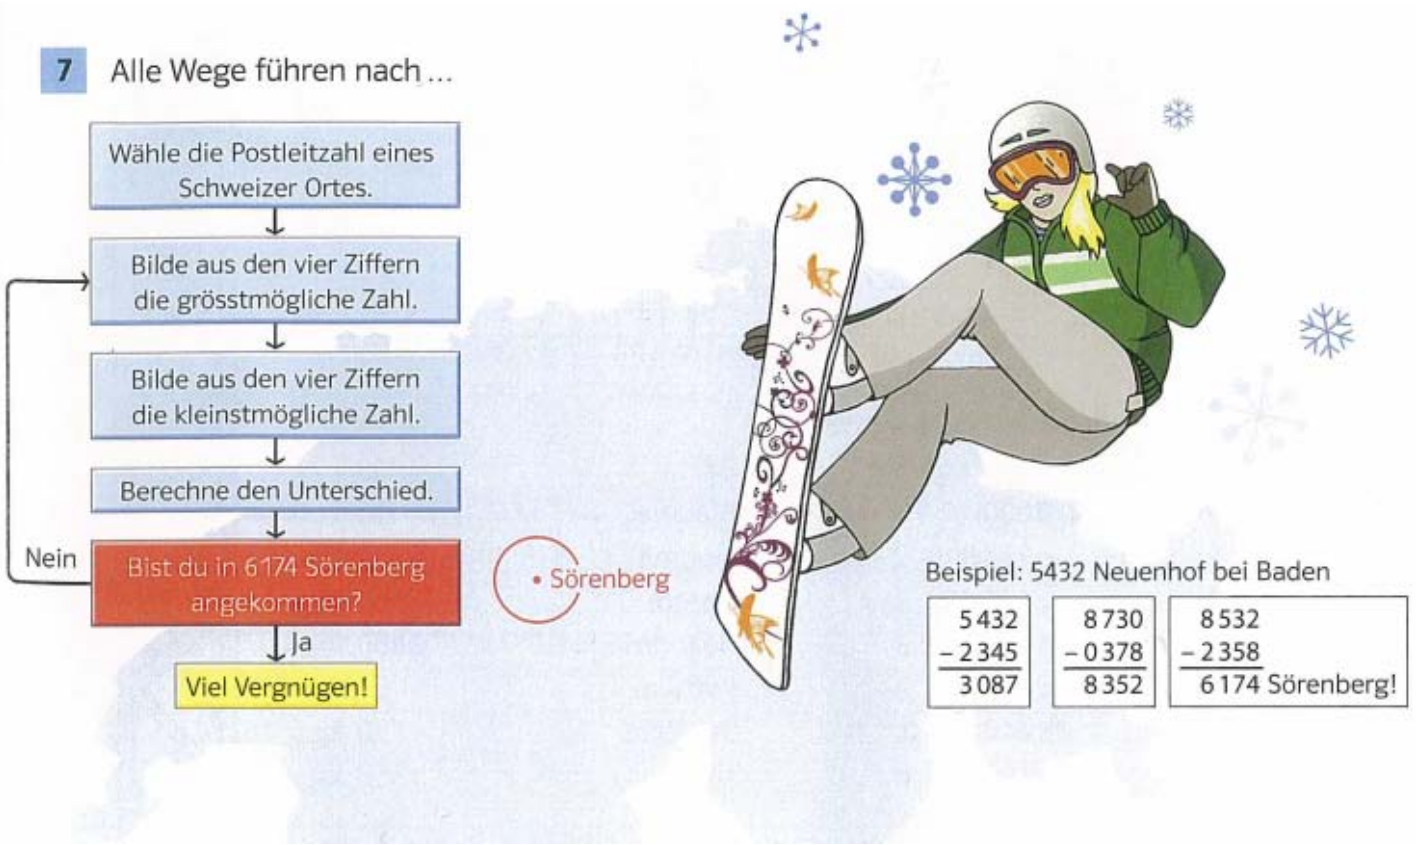
in response to message #1 by Thomas Klemm

Quote:

The following challenge is based on an arithmetic problem I found in a mathematics book for elementary school.



Quote:

I will add my solution for the HP-15C here within a couple of days.

Initialization:

```
10 STO 0
```

```
001 - 42,21,11   LBL A
002 -    32  0   GSB 0
003 -    32  0   GSB 0
004 -    32  0   GSB 0
005 - 43,30, 7   TEST 7
006 -       34   x<>y
007 -       33   R-v
008 - 43,30, 7   TEST 7
009 -       34   x<>y
010 -       33   R-v
011 - 43,30, 7   TEST 7
012 -       34   x<>y
013 -   43  33   R-^
014 - 43,30, 7   TEST 7
015 -       34   x<>y
016 -   43  33   R-^
017 - 43,30, 7   TEST 7
018 -       34   x<>y
019 -       33   R-v
020 - 43,30, 7   TEST 7
021 -       34   x<>y
022 -       30   -
023 -        9   9
024 -        0   0
025 -       20   ×
026 -       34   x<>y
027 -   43  33   R-^
028 -       30   -
029 -        9   9
030 -        9   9
031 -        9   9
032 -       20   ×
033 -       40   +
034 -   43  32   RTN
035 - 42,21, 0   LBL 0
036 - 45,10, 0   RCL ÷ 0
037 -   43  44   INT
038 -   43  36   LASTx
039 -   42  44   FRAC
040 - 45,20, 0   RCL × 0
041 -       34   x<>y
042 -   43  32   RTN
```

> Quote:
>
> What is the behavior if you iterate this? Make a speculation.

Most numbers will end up with 6174. Only numbers composed of the same digit will end up with 0.

> Quote:
>
> Try to proof your assumption.

My observation was the same as described in Mysterious number 6174. (cf. "Which way to 6174?") So I guess I don't have to repeat that proof here. However I didn't ignore possible duplicates of the 55 numbers that remain after the first iteration.

> Quote:
>
> Can your calculator be of any help?

Here's a small program that produces the 55 numbers left after the first iteration:

Initialization:

```
9 STO 1
EEX 3 / STO 2
```

```
043 - 42,21,12   LBL B
044 -    45  1   RCL 1
045 -        9   9
046 -        9   9
047 -        9   9
048 -       20   ×
049 -    45  2   RCL 2
050 -   43  44   INT
051 -        9   9
052 -        0   0
053 -       20   ×
054 -       40   +
055 - 42, 6, 2   ISG 2
056 -   43  32   RTN
057 - 42, 5, 1   DSE 1
058 -   43  20   x=0
059 -   43  32   RTN
060 -    45  1   RCL 1
061 -       26   EEX
062 -        3   3
063 -       10   ÷
064 -    44  2   STO 2
065 -       33   R-v
066 -   43  32   RTN
```

Now you can switch between the two programs A and B:

```
B: 8991
```

```
A: 8082
A: 8532
A: 6174

B: 9081
A: 9621
A: 8352
A: 6174

(...)

B: 0
A: 0
```

The data was then used to create this graph.

There's a direct proof in the same article as well. (cf. "Only 6174?")

Again the HP-15C can be used to solve the system of linear equations:

```
|  1   0   1  -1  |   | a |     | 10 |
|  1   1  -1   0  |   | b |     |  9 |
|  0   1  -1  -1  | * | c |  =  |  1 |
|  1  -1   0  -1  |   | d |     |  0 |
```

The solution is: [a b c d] = [7 6 4 1]

I must admit that I wasn't aware of Kaprekar's constant. I just saw this arithmetic problem in that book which made me wonder why. So thanks a lot to Paul Dale for pointing this out.

I know it wasn't a hard problem but still an occasion to use your best loved machines. Nevertheless I hope you enjoyed the contest.

Cheers and thanks for your contributions
Thomas

> Quote:

Re: Mini-Challenge: Zip Code

*Message #19 Posted by **Thomas Klemm** on 27 Sept 2010, 3:18 p.m.,*
in response to message #1 by Thomas Klemm

Another solution for the HP-48:

```
\<<
  SORT DUP REVLIST
  SWAP -
  IF DUP 2 GET
  THEN { 0 -1 9 10 }
  ELSE { -1 9 9 10 }
  END ADD
\>>
```

Start with a list of 4 digits, e.g. { 4 1 5 3 }.

IR Link to PC

*Message #1 Posted by **Eddie Goodridge** on 23 Sept 2010, 12:08 a.m.*

I figured it was worth a shot, so here it goes...

I make motors and such for Radio Control Cars. IN the Early 90s, Competition Electronics produced an item called the Turbo Dyno. This device allowed us to test our motors to see which was the most powerful, efficient, etc. There was an option with this dyno to print the results using the Hewlett Packard model 82240B IR Printer.

After doing some research, I found that HP produced this printer to print stuff directly from the HP series of calculators...while they also released its source code, so it could be used by other companies products (so far, I only found one other, a battery tester). I am assuming the Dyno outputs code similar to the calculators (kermit?)

I need to replace the printer, I've gone through 3 of them due to them getting dirty and I need the ability to present the dyno info in a much nicer manner than a small slip of paper.

I've researched up and down on the net, to find numerous programs of ways to simulate the printer on your computer and use a regular printer. The problem lies that they all assume I can use the rs232 interface. I can't. My dyno simply has the IR and that's it. I need a way to recieve the data on the computer, even if its just to a text file or something.....once there, I can figure a way to print it, even if I have to copy and paste it in excel or something. Is there a way to make an IR reciever, that will receive the dyno data?

Any help would be great.

Thanks for your time

Eddie

Also a ballistic chronograph, and perhaps others.

> Quote:
>
> Is there a way to make an IR reciever, that will receive the dyno data?

Yes, I'm sure there is, although I'm not the one to tell you how, but there are folks on here that can.

Pretty sure the info can be found somewhere on http://www.hpcalc.org

Wait until tomorrow, you'll get some responses.

Re: IR Link to PC

*Message #3 Posted by **Katie Wasserman** on 23 Sept 2010, 2:38 a.m.,*
in response to message #1 by Eddie Goodridge

There are many portable devices that made to use this printer, here's one for example.

You'll find a ton of information on the protocol that this printer uses if you follow all the links starting here and here

HP's document on interfacing to the printer is here.

However, pretty much everything that you'll find on the 'net is not what you really want. Most people are interested in sending data to this printer not replacing it with a serial feed into a computer. I don't know of any commercial product that does this. But someone here may well have developed a system to do just that.

-Katie

p.s. Take a look at the 82240 emulators for the hp-48,49,50 series calculators. I think that this will give you want to need. In particular, use this program along with an HP-48 calculator acting as the IR receiver hooked up to a PC.

There's more info here.

Re: IR Link to PC

*Message #4 Posted by **M. Joury** on 23 Sept 2010, 10:42 a.m.,*
in response to message #3 by Katie Wasserman

Hi Katie,

Lots of good information there. Thanks for getting it all together in one post.

On a related topic, there was a program that was part of the 41C emulator card for the 48SX that captured output from the 41C IR module as a method for transferring programs to the 48SX emulator environment. Is there any such program for the newer calcs (48G/GX, 49g+, and 50g) that would allow the capture of IR printer output as a simple string?

Thanks,

MJ

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 23 Sept 2010, 7:21 a.m.,*
in response to message #1 by Eddie Goodridge

Many years ago, Steve (Australia) posted a detailed article about receiving, decoding and printing the IR stream from HP calculators (i.e., HP42S, which has no RS-232). He hooked a phototransistor to the audio input of a PC sound board, IIRC. You may find it on the MoHPC archives.

BTW, the protocol is unidirectional, and it's different from Kermit.

*Message #6 Posted by **Bill (Smithville, NJ)** on 23 Sept 2010, 9:50 a.m.,*
in response to message #1 by Eddie Goodridge

I remember that Educalc sold an adapter that converted the HP IR signal to a parallel signal for use with a standard parallel printer. I had one a long time ago and I seem to remember it working with the HP-95LX. Not sure if it would work with the calculator IR signal.

Just looked it up and it was called JetEye. See following link:

JetEye

*Message #7 Posted by **db (martinez, ca.)** on 23 Sept 2010, 8:19 p.m.,*
in response to message #1 by Eddie Goodridge

OR: if you can stand to still use that slip of paper:
you could contact randy at fixthatcalc.com in Pennsylvania or don at internationalcalculator.com - the oldest computer store in the world, in florida. one of them may be able to fix your printer. if you have three carcasses to trade in - that will probably get you a bit of a deal.

if that HP-48 idea of Katie's sounds good and you don't already have one (or all seven of those); i have seen an ugly 48sx and the 48s & 48g go fairly cheap. it's the gx and nice sx models that are pricey. the 49 can have keyboard issues. the 50 is still going to be expensive for just a transfer device because it is also the best calculator ever made, or maybe the best goofy looking calculator ever made.

Re: IR Link to PC

*Message #8 Posted by **M. Joury** on 24 Sept 2010, 11:44 a.m.,*
in response to message #7 by db (martinez, ca.)

Actually I have been playing around with that idea (using the HP48 as an I/R receiver) and have not been able to get it to work. Either it is harder than it appears or (more probably) I am doing something wrong. But that is why I asked about the program that was made available with the HP41C Emulator card.

Edit:

Found it. INPRT (Goodies Disk #9)

HHC Early Arrivers and gauging Interest in RMNP Trip?

*Message #1 Posted by **Tim Wessman** on 22 Sept 2010, 12:57 p.m.*

Hello,

If anyone is arriving before Friday and would like to get together (lunch, just to talk, whatever), feel free to send me an email (myname@hp.com - no spaces, underscores or dots) with your phone # and I will give you a call or something.

Also, I am trying to gauge interest in driving up to the high alpine road in Rocky Mountain National Park. It seems if there are enough people early enough, I could take a load in the Minivan on either Thursday evening, Friday evening, or Sunday evening. We'd need to be leaving at 4pm by the latest to get up top with enough light to see, and then the sun set at 630 or so. Provided it doesn't close due to snow before then, I can do that if there are enough interested people.

Any substitute for HP 41C series????

*Message #1 Posted by **Larry Estatico** on 22 Sept 2010, 11:11 a.m.*

I understand to celebrate the 35th anniversary of the HP 35 - the company released an update called the 35S which is alpha Numeric and RPN.

I wish they would re-introduce the HP 41C series!

My question is for those familiar with both the HP 41C and the new 35S:

Can the HP 35S be considered a substitute for the 41C? In which ways does it fit the bill, fall short or exceed. I realize that the peripherals will not work etc -- I am more concerned with main unit functions.

For example -- the simplicity of the 41c Keyboard: The toggle switches for Alpha, user etc made it much more convenient then calcs with multi-tiered menus/catalogs that I find frustrating.

something like this?

*Message #2 Posted by **Frank Boehm (Germany)** on 22 Sept 2010, 11:33 a.m.,*
in response to message #1 by Larry Estatico

A 41S on the 41st birthday of the 41C (which would be in 2020)

Re: Any substitute for HP 41C series????

*Message #3 Posted by **Ron Ross** on 22 Sept 2010, 11:44 a.m.,*
in response to message #1 by Larry Estatico

If all you need is a SIMPLE programmable calculator, the Hp35s can substitute for an Hp41c.

If you need long variable names or a clock/timer and I/O, the Hp35s fails to deliver.

If you do not need trig, the Hp17bii is readily available and its solver more than makes up for its lack of programming for most types of applications. And an added caviate is that the solver doesn't interfer with normal math operations ie you can be using the solver and using the calculator simultaniously vs an Hp 48/50G doesn't allow you to use the calculator while using the solver.

I woould suggest an older original Hp17Bii over anything else. Is one of the best statistical calculators available due to using list based statistics too.

Re: Any substitute for HP 41C series????

*Message #4 Posted by **M. Joury** on 22 Sept 2010, 12:07 p.m.,*
in response to message #3 by Ron Ross

Good point. I forgot the timer functions in the 41C/CV with timer module and the 41CX. He did say that peripherals were not a big concern but I am not sure whether that included the time capabilities of the 41C.

As to the 17bII, I really do like that calculator and as stated it offers a lot of capability.

I own both the 17bII and the *new* (latest) 17bII+ and I like them both. Looks are very different but functionality is the same although the 17bII+ has way more RAM. I never used the earlier 17bII+ but the latest one has a nice keyboard (at least I have had no issues with it) and is also readily available.

Re: Any substitute for HP 41C series????

*Message #5 Posted by **Martin Pinckney** on 22 Sept 2010, 3:51 p.m.,*
in response to message #3 by Ron Ross

I don't know about the 50g, but my 48sx does allow you to use the calculator while the Solver is active.

*Message #6 Posted by **M. Joury** on 22 Sept 2010, 12:02 p.m.,*
in response to message #1 by Larry Estatico

Hi Larry,

The 35S is more a replacement of the 32S / 32SII line than of the 41. There are numerous differences between the 35S and the 41C beyond the expandability. I'll list some of them below.

1. No separation between programs in memory. Programs share the same space and therefore labels are not reusable. You have 26 alpha labels to work with (A..Z) but the 35S unlike the earlier 32 calculators and the 33S does allow for offsets from the primary label so you can say GOTO A035 so you can (in theory--it makes editing a little harder) have 26 programs in memory and the 32K available becomes more usable unlike the 33S.

2. Like labels, registers are addressed by alpha letters A..Z with I and J being available for indirect addressing. You also have several hundred numbered registers that can be indirectly addressed through I/J. These are limited by available memory.

3. The keyboard is more like the 32S/33S with 2 shift keys plus alpha which are activated by function (STO/RCL/LBL/etc.)

4. Unlike the 41C you do have a solver but IMHO it does not have quite the ease of use of the solvers in the graphing calcs or the 17bII+. You are also limited to single character names in the solver.

5. The 35S is much, much faster but for my needs I never had a problem with the speed of the 41.

6. No reassignable keys. Not even the top row like in the 42S.

7. Much more memory (32K) but harder to utilize fully because of the shared program space and the lack of numeric and multi-character labels.

8. Supports fractions

9. Has a limited set of built-in conversions

10. I believe that there are ways to get alpha prompts by using the solver to build the prompt string. I have never tried this and it is certainly not as easy as with the 41.

These are just some of the differences. There are others and I'll try to come up with a more complete list over time.

The positives in the 35S (as I see them) are:

1. Nice keyboard and classic HP layout. Unlike others I have never had a keyboard issue with either of my 35S's

2. Relatively easy to use. If you have used (and like) the 32S you will feel right at home.

3. Nice looks

All-in-all a decent scientific calculator but without some of the features that made the 41C and 42S favorites of mine.

Hope this helps a little.

Cheers,

M. Joury

Re: Any substitute for HP 41C series????

*Message #7 Posted by **Larry Estatico** on 22 Sept 2010, 12:54 p.m.,*
in response to message #6 by M. Joury

Thank You.

This is helpful. Ultimately I need to have one in my hands to test out or just go ahead and buy one.

BTW - I have the V41 simulator on every Windows Computer I own! You can enter and save your favorite programs in it too! Of course you lose the feel of the calc and using a Mouse does slow you down, but you still have access to your programs if your 41c is down or if you do not want to carry it. I consider my 41s to valuable to carry routinely.

So many 41 users still call it their all time favorite calculator -- I do wish HP would seriously roll out a "41S" that does justice to the original and not wait to 2020!

For expandability I know the 50s are using USB, SD cards etc and I would NOT expect them to make it compatible to the old 41 peripherals.

Edited: 22 Sept 2010, 1:24 p.m.

Re: Any substitute for HP 41C series????

*Message #8 Posted by **Pablo P (Spain)** on 22 Sept 2010, 1:14 p.m.,*
in response to message #6 by M. Joury

I will add other differences:

```
 - The 35s displays x and y registers simultaneously. 41c only displays x register.
Some people think that it is confusing but I like this feature of the 35s.
 - The 35s lacks I/O. (If only it would!)
```

I would like to complete some information:

```
 10. To get alpha promts in the 35s, first set flag 10 and then insert any text as an
equation. Easy.
```

IMHO the hp 35s has a lot of features for its price. And you can start using those features very quickly.

About the negatives: 35s bugs

Re: Any substitute for HP 41C series????

*Message #9 Posted by **Crawl** on 22 Sept 2010, 12:42 p.m.,*
in response to message #1 by Larry Estatico

It sounds like your main problem with the HP50g would be its use of menus for commands, but bear in mind that that calculator also lets you define a USER keyboard, so you might be able to avoid menus.

Re: Any substitute for HP 41C series????

*Message #10 Posted by **Crawl** on 22 Sept 2010, 12:52 p.m.,*
in response to message #9 by Crawl

AND you might not necessarily be able to get away from using menus with the 35s anyway. Some functions (for example, statistics and linear regression) are in menus.

I know you didn't ask, but I think the 50g is 100x the calculator the 35s is.

>
> I know you didn't ask, but I think the 50g is 100x the calculator the 35s is.

I'll 2nd that. If I had to replace a 41CX with something that was in production today it'd be the 50g for the following reasons:

1. The 50g can run all my 41C programs. See: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=802.
2. The 50g has I/O for transfers and programmable I/O. With 4 options (SD, Serial, USB, IR). Programmable I/O example: http://sense.net/~egan/skb/.
3. The 50g firmware can be upgraded.
4. The 50g has a huge library of code: http://www.hpcalc.org.
5. The 50g can be programmed in RPN (see #1), RPL, UserRPL, Saturn ASM, ARM ASM, C (http://sense.net/~egan/hpgcc), and C++.
6. The 50g has a clock.
7. The 41C* was really a hand-held computer as so is the 50g. The 35s is just a calculator.
8. The 50g can be powered via cable or battery.
9. The 50g has two free emulation options. Debug4x(Windows/WINE): http://www.debug4x.com/ and x49gp(OS/X and Linux): http://x49gp.svn.sourceforge.net/viewvc/x49gp/README.QUICKSTART.

10. The 50g is relative expensive--just like the 41C*, i.e. status symbol. :-)

Re: Any substitute for HP 41C series????

*Message #12 Posted by **Michael de Estrada** on 22 Sept 2010, 12:48 p.m.,*
in response to message #1 by Larry Estatico

Apples and oranges. As a basic scientific calculator, the HP 35S is great; as a programmable calculator it sucks. The single letter variables and lack of Greek alphabet symbols severly limits its entry of equations. For example I have an equation programmed into my HP 50G in rpl, which has 5 variables that all begin with the letter "T" that are timt,tima,temt,tema and theta(Greek symbol). They appear on a soft menu that is accessible from the top row of keys that are definable. Basically, the HP 41C can do this, but the HP 35S cannot. Then there's the problem of loading or saving programs with external media. The HP 50G has USB and serial RS232 interfaces and the HP 41C has an accessory card reader or cassette tape drive, but the HP 35S has no such interfaces. The HP 41C was perhaps the greatest innovation that HP ever developed, and there really are no equivalents in modern designs.

*Message #13 Posted by **Larry Estatico** on 22 Sept 2010, 1:46 p.m.,*
in response to message #12 by Michael de Estrada

To Esp Michael and Egan,

Thanks for all the help. I do not think I would be happy with the 35s. As for the 50g, it maybe the answer. I actually called HP and they did NOT recommend the 50g! Rather they said "there is nothing that directly compares....the 35s would be the closest". I quoted the shortcomings and given above to which they had no answers.

This has my wondering why they would not recommend the 50g. How does the alpha work in comparison?

On a practical level, I do not know who stocks these things so I can 'try before I buy'. I need to know a 50g or whatever is right for me before I buy.

*Message #14 Posted by **Norman Dziedzic** on 22 Sept 2010, 2:01 p.m.,*
in response to message #13 by Larry Estatico

Probably your only option for Try before Buy is to find someone you know that has the calculator. At most any stores now, all the calculators will be in plastic clam shells that the store will not want to open.

If you give up the "try" for keyboard feel, you can use the aforementioned 50g emulators for that. Before I got my real 35s I paid for an emulator from HP (I think they will give them to teachers for free) but I can't find the link for that anymore.

*Message #15 Posted by **Ron Ross** on 22 Sept 2010, 2:25 p.m.,*
in response to message #13 by Larry Estatico

Sadly, I don't know of any outlet that has an Hp calculator out of a blister pack that I can try before I

buy. And I live in the good ole US of A.

If you don't need trig, I still suggest the Hp 17Bii.

If you need a scientific calculator to replace or augment your Hp 41, the Hp 35s will do fine.

If you want a calculator to replace and surpass your Hp 41, the Hp 48Gii or 50G will do that. Their drawbacks are 10X more complexity and 2X size increase. They are bricks in comparison to the elegance of a calculator (although the Hp35s aint that small either). Many here would complain about the small ENTER key, but if you do use it awhile, you will likely over come this. If fact you will have to reacclimate yourself to any new keyboard as the 41 series has the function keys on the left, all new Hps are now on the right.

Another consideration that I suggest you consider, an older Hp48g series calculator. Similar quality to your Hp41 and now fairly cheap as Hp's new calculators are now available. It is what I have at my (or in) desk, along with an Hp 17bii.

My reasoning: I do need to use trig on occasion (Elect Eng), but most often, I just need to bang out numbers and the solver on the Hp 17bii is superior to an Hp48G solver for normal work. If I need to travel or review designs, the Hp 17bii is satisfactory and an understated calculator that has what I need (okay, if I am going to be cornered by a technical herd of nerds, I bring the Hp 42s to beat them down!!!)

*Message #17 Posted by **M. Joury** on 22 Sept 2010, 4:05 p.m.,*
in response to message #15 by Ron Ross

I have been trying to pick up a HP 48GX on TAS and they are actually MORE expensive than a new 50g. Several have gone for well over $100 and some are listing for over $300. So if money is an issue you would be better off with the 50g or the 48gii which can be had for less than $50. If you want the classic (or at least closer to classic) look and feel than the 48s/x 48g/x are the way to go.

Re: Any substitute for HP 41C series????

*Message #18 Posted by **Ron Ross** on 22 Sept 2010, 5:12 p.m.,*
in response to message #17 by M. Joury

I would actually recommend a 48G or better, a 48G+ over a 48GX for the typical 41c user who has no experience with the older 48g series. Why? 1st: Cost, 48g approx $50, 48G+, maybe $100 max.

2nd: he may not like it at all as it is big, blockie and RPL and overly complex. Admittedly the 48g has limited (32K) RAM and the 48G+ has 128K of Ram which is much better, but still no expandability. Since RAM (or ROM) cards for the 48Gx are now very scarce and very expensive, over paying for an expansion slot that you cannot fill is foolish when you can buy the 48g+ for less than $100 and have the same calculator minus the two expansion slots.

Re: Any substitute for HP 41C series????

*Message #19 Posted by **M. Joury** on 22 Sept 2010, 5:29 p.m.,*
in response to message #18 by Ron Ross

Good points. I am looking for a backup and so have the cards and therefore was not thinking about that aspect. Yes, a 48G+ would do nicely although they are a little harder to find. But that would give you 128K and I/O and, as you stated, cards for the GX are ridiculously priced.

Where do you live? Someone nearby has to have a 50g you can play with. My local University bookstore has all their calculators unwrapped for testing.

As for HP not recommending, I'm sure Tim will have something to say about that.

Re: Any substitute for HP 41C series????

*Message #21 Posted by **Martin Pinckney** on 22 Sept 2010, 3:59 p.m.,*

Quote:

> As for HP not recommending [50g]...

This is not so unreasonable. The 41c series is a classic HP RPN calculator, albeit the most sophisticated of the lot. If you know anything at all about RPN, you can pick it up and use it right away. Programming, at least for simple programs, is also very straightforward.

Not so the RPL machines. They are so feature-rich and complex, they can be very confusing and intimidating to use at first.

Re: Any substitute for HP 41C series????

*Message #22 Posted by **M. Joury** on 22 Sept 2010, 4:00 p.m.,*
in response to message #12 by Michael de Estrada

I am in full agreement with all the comments made on the 50g. My two complaints are size (it is a graphing calculator after all) and I, personally, hate the enter key. I have gotten used to it but it just feels wrong to

me even after a couple of years with the HP 49g+ and the HP 50g. However, if you really want power, and full alpha names (and Mike is absolutely right about the naming limitations), and I/O there really is only one way to go (or perhaps two if you include the 48gII). As I stated in my original post, the 35S is not, and never was intended as, a replacement for the 41. The 50g, descendant of the 48 series, is.

Re: Any substitute for HP 41C series????

*Message #23 Posted by **Norman Dziedzic** on 22 Sept 2010, 4:34 p.m.,*
in response to message #22 by M. Joury

A word about the 48gii.

Be aware (or beware) that there are two versions of this calculator.

The original version:

- has less memory
- Does not have USB, only RS232
- does not include the built in Equation Libraries
- takes only 3 AAA batteries vs. 4 on the latest model
- does not handle units in the multiple equation solver
- has a cheap slip style leather-like pouch instead of hard plastic sliding cover
- has an inferior keyboard

I don't know if it is true for all version but my original 48gii has blue paint in the hp logo and the 2nd generation has black paint in the hp logo.

Along the left and right sides, my original version 48gii has an hp logo near the top and my 2nd generation 48gii has an hp logo near the bottom. Also, on the 2nd generation version the slot for the sliding hard plastic cover is clearly visible.

Re: Any substitute for HP 41C series????

*Message #24 Posted by **M. Joury** on 22 Sept 2010, 5:07 p.m.,*
in response to message #23 by Norman Dziedzic

Thanks Norman,

I should have mentioned that. I would think that unless you are buying used any machine bought today would be the new version?

To answer my own question: No, the older models are still out there selling as new units.

Re: Any substitute for HP 41C series????

*Message #25 Posted by **David Hayden** on 22 Sept 2010, 5:20 p.m.,*
in response to message #22 by M. Joury

Expanding on what Norman said about the 48gii:

- You can distinguish the two in the retail package. The new packaging mentions USB support. When looking at the calculators themselves, examine the top edge. The old version has one connector (serial) and the new one has two (serial and USB).
- You can get the original version on ebay for quite cheap - under 60 US dollars. This makes it

worth considering instead of a 50g in my opinion, especially if you are a casual user who won't be loading a lot of programs or writing a lot yourself.

Comparing the newer 48gii to the 50g, the 50g has:

- A larger screen
- More memory
- An SD card. As someone once pointed out, a 128MB SD card is like infinity on a calculator.
- Better keyboard (or maybe that's just my particular units).
- Different color scheme. In my opinion the 50g looks cooler but it's harder for my 47-year-old eyes to read.
- Faster processor
- Probably other features that I can't recall at the moment.

I own and use all 3 models. The old 48gii is a great calc for the money. For programming, I use the new 48gii or the 50g because of the USB connection (other than trivial programs, I do development on a PC and download to the calculator as needed). It's also very handy to have all the software I might need on the SD card.

in response to message #1 by Larry Estatico

Here's a novel idea: just buy a used 41! They are certainly plentiful, although not what you would call cheap, they are also not so expensive, either.

Re: Any substitute for HP 41C series????

*Message #27 Posted by **Larry Estatico** on 23 Sept 2010, 11:18 a.m.,*
in response to message #26 by Martin Pinckney

I started this thread and I DO have a 41cx working as well as a card reader and other stuff. But I long since gave up on OEM rechargeable battery packs. I have a supply of NiMh size N rechargeables that I charge in a full size Nicd charger using small 1/4 sockets to take up the space difference between an "N" and a "AA".

I do not want to lose my programs or risk a non-survivable drop of the machine. And if a 50G self for $150, (Ok - the 48's can be cheaper I will consider that too) to me it would be worth having and carrying instead of risking the original 41's.

I did get my existing on Ebay and know they can be found -- but why risk someone else's headache or pay good money for an OLD machine, even though it is excellent. I DO want something new that I do not have to treat as 'an irreplaceable fossil' - LOL

A quick look found a 41c for $152 and still bidding and another with a 41c with'buy it now' of $179 -- just get the 50g at that point! Both seem to be the base C model

---

On a side note: It is easy to get one's hands on an inexpensive TI or non-HP calculator. I HATE THEM! I cannot stand doing anything more than simple math on them and even that only if I have no other choice! Why? RPN!

Someone helped my older brother who is a civil engineer get an ORIGINAL HP 35 when they were new

and he was in College. He let me try it. I got so used to RPN right away!

Later, when I started college, I found a Novus programable RPN Calculator. Friends needing to borrow one soon learned not to ask me, since they could not be bothered with RPN. Later, when the great Ronald Reagan let me actually make some money AND buy some gas - I was able to buy the 41C. That original bounced one time

more than it could stand and was replaced by current 41 machine. But to this day I have the original box and misc.

I vaguely recall seeing a Russian made RPN calc advertised, but not in person. I guess I am preaching to the choir!

I think HP made a wise decision in making great machines with CHOICE of RPN, Algebraic, textbook. This way they keep the superior RPN alive for us addicts w/o losing market share on those whom are not converted to RPN.

Wonder how many HP owners out there stick with the Alternatives and never master RPN?

For me, I will never master algebraic!

Hi Larry,

Interestingly enough it sometimes appears that the base model will go for more than a CV. Specially if it is one of the older ones. The CV often seems to be the sweet spot in 41 series pricing on TAS.

Cheers,

MJ

Yeah, I've had similar discussions many times on this forum. People say "I want something in current production so I can replace it easily."

To which I reply, how much easier can you get when hundreds of the older model you *really* like are sold on Eb** each year?

Personally I like Pioneers. I tried the 35s and ultimately did not like it. Why should I bother with a current production HP, when the older ones do what I want, have the old school HP quality, are readily available, and are reasonably priced?

Checking recently closed auctions for 41cx's, they varied from $133 to $365. Yes, more than a 50g. For me they are everyday tools I use in my work.

Agree to all points above. I recently obtained a 41CX on TAS for $275, *and*, it included an Advantage module. So I felt like I got a pretty good deal.

I greatly prefer my HP 42S over my HP-41CX.

Re: Any substitute for HP 41C series????

*Message #34 Posted by **M. Joury** on 7 Oct 2010, 4:00 p.m.,*
in response to message #33 by Mike Morrow

My one BIG problem with the 42S is that there is no way to save programs or data. The 41 was vastly superior in this regard with all sorts of options available.

Beyond that I prefer the keyboard layout and the complete reassignability of keys (not just the top row), the availability of the time module (or the CX), and, in general, the

extreme versatility of the system. The 42S is a great machine but when it really matters (a serious program that I will need long term) I always pick up the 41.

The 41 had a *huge* advantage in I/O, with HPIL and the interface converters to HPIB, RS-232, parallel, text video, etc., which could all be used at once too. The 42 can't touch it.

Re: Any substitute for HP 41C series????

*Message #36 Posted by **Jim L (OHIO)** on 8 Oct 2010, 1:40 p.m.,*
in response to message #33 by Mike Morrow

I'm confident that this topic has been covered before, but this thread just makes it easy for me to wax nostalgic about it again. Certainly everyone has their favorite calculator(s), so I won't banter about the merits of each (after all, they are personal favorites). What I would like to point out is that there seems to be an analog to another interest of mine: classic cars. Going to any number of car cruise-ins and shows, I see the muscle cars of the 60s-70s well represented as well as newer incarnations of them. In practically every case, the newer cars would smoke the originals in any performance category (acceleration, top speed, braking, cornering, etc.). Yet the enthusiasm of the owners of the originals can't be denied.

In some sense, my own nostalgia for the 41C may be due to something similar and comes in part due to the fact that it was introduced and endured during what has been arguably called the "golden age of calculators." My 41C was far from my first (nor last) HP calculator, but it was clearly the best and most powerful. Yet the 42S has more functionality in several ways—making it more powerful in some aspects.

Beyond the nostalgia however, I have a visceral reaction to the two calculators in this discussion. It occurs to me that while the 42S is very capable, from a distance, it may be mistaken for some other calculator (like my HP32SII). Even my HP12C, a classic in it's own right, can't be distinguished from an HP10, HP11, HP15, or HP16, from a distance. The same can't be said for the HP41—it's literally in a class by itself. Looking at this post, I realize that it fits better in the memories section of the museum, but I just hope that folks will indulge me here.

Re: Any substitute for HP 41C series????

*Message #37 Posted by **Martin Pinckney** on 8 Oct 2010, 5:25 p.m.,*
in response to message #36 by Jim L (OHIO)

Excellent post, Jim.

Even though I do not own one, and probably never will, I agree with you about the 41C series being in a class by itself, in many ways other than instant recognition.

I just think the Pioneers are a lot more practical calculator for the kind of, well, calculations, that one typically uses a calculator for (as contrasted with using a computer for more intense number-crunching or more sophisticated output).

OTOH, but I am using my 48SX more and more at my desk, just because of the richness of features in one unit.

I don't understand why some posters here get so worked up attacking a particular HP calculator model or someone else's choice.

You are right, it's all about personal favorites.

HP Calc chips and parts - who needs them?

*Message #1 Posted by **Jim Horn** on 21 Sept 2010, 4:59 p.m.*

While digging through storage I've found the original RAMs for my HP-41C as well as a spare set of HP-41CV ones. The former are the 1LA7 0002 through 1LA7 0005 with solder still on their pins. My HP-41 worked fine when it had them in it.

The latter are the 1LE7 01 through 1LE7 04, with there being two of the '03 parts. They are new and unused.

There are a few dozen 1919-0335 LEDs, used in the HP-65 and later along with a variety of HP-65 ICs that are probably dead (they were removed from boards and tossed, later finding their way to me). The latter are probably of visual interest only.

A few other items will probably go to next year's HHC: an "I Build The Standard HP-41C" button, an HP-41 style keychain and a "HP-41C Enter Key for Tie Tac, Pin, Etc. Courtesy of HP" from one of the very early conferences. Oh - and a power cord for one of the three-pin power input Classic calculators (without the wall wart), good for making a classy HP-67 "Black Box".

Still more boxes to sort. Thanks to all for a great group here!

Jim Horn (misses the old PPC issue stuffing parties at Richard's house - but really likes the Web a lot better)

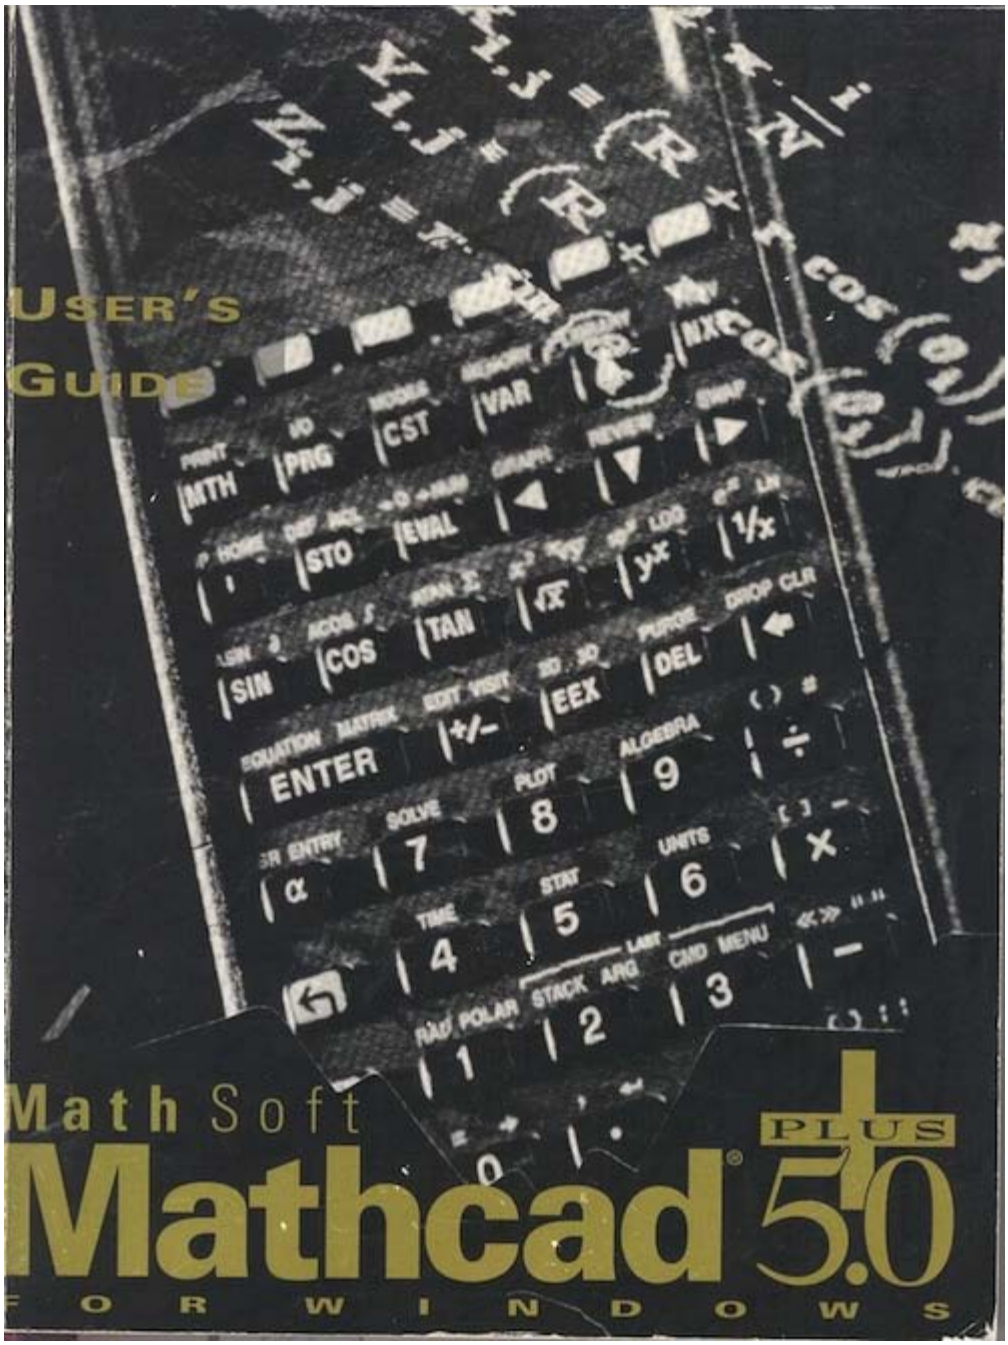
Mathcad user guide

*Message #1 Posted by **Maarten Ambaum (Reading, UK)** on 21 Sept 2010, 4:46 a.m.*

I thought I'd share this image with you. A colleague of mine cleared out his office and came across this 1994 book about Mathcad, a mathematics package for WIndows PCs. For some reason they felt it appropriate to display a 48 (I don't know which flavour) on the front cover, instead of something that actually has to do with the software package. Perhaps at that point they still thought that computational mathematics is best represented by an advanced calculator.



Cheers, Maarten

in response to message #1 by Maarten Ambaum (Reading, UK)

Maarten,

I agree, that's odd. Perhaps trying to suggest that at last a computer program as powerful as an HP calculator?

By the way, it's 48S or SX. Can't tell which w/o seeing logo. Definitely not G series.

Martin

OT: CP/M-68K for HP 9000 Series 200 computers

*Message #1 Posted by **Juergen Keller** on 21 Sept 2010, 3:00 a.m.*

I'm looking for a copy of CP/M-68K for HP 9000 Series 200 computers. Anybody out there who can help me?

Thank you, Juergen

Re: OT: CP/M-68K for HP 9000 Series 200 computers

*Message #2 Posted by **Alejandro Paz (Germany)** on 21 Sept 2010, 12:56 p.m.,*
in response to message #1 by Juergen Keller

Out of curiosity... didn't they run some early version of HP-UX ?

Re: OT: CP/M-68K for HP 9000 Series 200 computers

*Message #3 Posted by **Juergen Keller** on 21 Sept 2010, 4:41 p.m.,*
in response to message #2 by Alejandro Paz (Germany)

As far as I know not all 9000 Series 200 computers were able to run HP-UX. At least that's my conclusion from what I found on the Internet. But if anyone can shed some light on this I would highly appreciate it.

Re: OT: CP/M-68K for HP 9000 Series 200 computers

*Message #4 Posted by **Raymond Del Tondo** on 21 Sept 2010, 6:36 p.m.,*
in response to message #3 by Juergen Keller

The latest issue of the HPCC Datafile includes a very nice article from Tony Duell about the HP9000 Series 200 machines. IIRC those units with a MMU were able to run UX.

*Message #5 Posted by **Juergen Keller** on 22 Sept 2010, 5:25 p.m.,*
in response to message #4 by Raymond Del Tondo

Good hint, thank you!

Re: OT: CP/M-68K for HP 9000 Series 200 computers

*Message #6 Posted by **Olivier De Smet** on 22 Sept 2010, 10:09 a.m.,*
in response to message #1 by Juergen Keller

OT, is it possible to get a dump from a boot rom of an HP9000 series 200 (3.0 or 3.0L) ?

(I already got a dump from a series 425, but it's too recent for my taste)

I'm interested for some project ...

Olivier

50g and Windows 7

*Message #1 Posted by **John Cadick** on 20 Sept 2010, 6:38 p.m.*

I am trying to get my 50g to communicate with my Win7 computer (32 bit). I installed HP Connect (ver 2.3 Build 2439) and it went flawlessly. I plug the 50g into the computer (USB) and win7 sees it and starts looking for the driver which, of course. It cannot find.

When Win7 gets tired it let's me try to install the driver manually. Now things get confusing. win7 gives me a list of hardware types to choose from. Which one do I choose? Win7 won't let me install a driver without telling it the type of hardware.

My Internet search for an answer has found nothing.

Help.

John

Re: 50g and Windows 7

*Message #2 Posted by **Jerry Raia** on 20 Sept 2010, 8:46 p.m.,*
in response to message #1 by John Cadick

You didnt mention this so I thought I would ask. Did you start the server on the 50g?

Re: 50g and Windows 7

*Message #3 Posted by **John Cadick** on 20 Sept 2010, 10:52 p.m.,*
in response to message #2 by Jerry Raia

Thanks for the suggestion, Jerry. I did have the server turned on , but with no driver installed it didn't work.

Anyhow, Tim gave me the link to the correct server.

John

Re: 50g and Windows 7

*Message #5 Posted by **Tim Wessman** on 20 Sept 2010, 10:25 p.m.,*
in response to message #1 by John Cadick

You need to download an updated driver, but the driver has not yet been flagged as supporting 32 bit also and so it doesn't show up on the Win 7 32 bit page. If you select Windows 7 -64 bit on the support page, it will download an installer that installs either 32 or 64 bit. I am going to link there directly, but it may not be a static link.

[OT] "Space" symbol on a keyboard

*Message #1 Posted by **Tim Wessman** on 20 Sept 2010, 5:16 p.m.*

I recently took the plunge and switched to a smart phone (a galaxy-S for those interested) and I was kind of interested to see that the one screen keyboard has a nice fat space bar, but in addition it has that "space" symbol that has become increasingly used on cell phones. It is the symbol that looks like an underscore with two small upward lines on the end, similar to this:

|_____|

I just happened to be cleaning my desk today (in case any of you HHC folks come by. . . can't have you seeing things you shouldn't!) and found a TI-84 in the pile of competitor's units and noticed that it uses the symbol instead of the word SPACE also. I started thinking about that and began wondering how universal is that symbol.

Can those from other countries chime in if your cell phones there use that same symbol? If anyone has a good picture of it, or knows any information about it (such as the name or something) I'd be curious to know that also.

Thanks!

TW

Re: [OT] "Space" symbol on a keyboard

*Message #2 Posted by **Walter B** on 20 Sept 2010, 5:39 p.m.,*
in response to message #1 by Tim Wessman

Tim,

this symbol is on my cell phone, too (Nokia E50, not very smart but only traditional keys). It's printed on the "0" key.

Re: [OT] "Space" symbol on a keyboard

*Message #3 Posted by **Chuck** on 20 Sept 2010, 7:40 p.m.,*
in response to message #1 by Tim Wessman

For what it's worth, I found out it is unicode U+2423, character "OPEN BOX". Wikipedia lists it as a graphic for space. I've always seen it on the TI calcs but never gave it a second thought until you brought it up. Hmmmm.

Re: [OT] "Space" symbol on a keyboard

*Message #4 Posted by **Tim Wessman** on 20 Sept 2010, 10:07 p.m.,*
in response to message #3 by Chuck

Nice. I thought it would be in unicode somewhere as everything else is, but had no idea where to even start looking. Thanks!

TW

Re: [OT] "Space" symbol on a keyboard

*Message #5 Posted by **Egan Ford** on 20 Sept 2010, 8:12 p.m.,*
in response to message #1 by Tim Wessman

I found an old Sony Ericsson T610 in my office with that symbol on # key. My home phone is really a Nokia mobile phone and it also has that symbol on the 0 key. Both phones have the classic 12 button phone keypad. The space symbol is clearly for texting.

My wife's WinMo QWERTY phone actually has the word "space" printed even though its the largest key and is clearly the space bar (never can be too safe).

Re: [OT] "Space" symbol on a keyboard

*Message #6 Posted by **Tim Wessman** on 20 Sept 2010, 10:05 p.m.,*
in response to message #5 by Egan Ford

I just saw one that has a big wide key, the word SPACE and then the symbol on it. . .

At this rate, you'll soon have written on there "PUSH ME TO SEPARATE A WORD" :-D

TW

Re: [OT] "Space" symbol on a keyboard

*Message #7 Posted by **David Hayden** on 20 Sept 2010, 8:51 p.m.,*
in response to message #1 by Tim Wessman

This reminds me of the way "Enter" has replaced "Return" or "Carriage Return" on keyboards. :)

I assume the usage of the icon instead of "Space" on things like cell phones is to allow the same keyboard to be used in non-English speaking countries.

Re: [OT] "Space" symbol on a keyboard

*Message #8 Posted by **Mark Harman** on 21 Sept 2010, 3:11 a.m.,*
in response to message #7 by David Hayden

Mac keyboards still have a return key; however, the numeric keypad does have an enter key (that is, on models with numeric keypads). Interestingly enough, the Mac OS X Calculator app has an RPN mode.

Regards,

Mark

*Message #9 Posted by **Joerg Woerner** on 20 Sept 2010, 9:07 p.m.,*
in response to message #1 by Tim Wessman

Tim,

I have an engineering sample of the TI-81, manufactured in 1990. Guess what - the [__] symbol is already printed on the "0" key ;-))

Regards, Joerg

Re: [OT] "Space" symbol on a keyboard

*Message #10 Posted by **Paul Guertin** on 22 Sept 2010, 6:47 p.m.,*
in response to message #9 by Joerg Woerner

I remember seeing that |___| symbol for space in computer books and magazines of the eighties, the ones that had BASIC programs for the reader to type in. They were used when the number of spaces was significant (DATA statements, strings, and so on).

Another symbol sometimes used for a space (mostly in older books, it seemed) was a b overstruck with a / (Unicode U+2422, BLANK SYMBOL). According to decodeunicode.org, it dates back to the IBM 1401 printer in the 1960s.

Re: [OT] "Space" symbol on a keyboard

*Message #11 Posted by **Marcus von Cube, Germany** on 27 Sept 2010, 4:59 a.m.,*
in response to message #10 by Paul Guertin

My Nokia E61 has the |__| Symbol on its double width space bar:

The b/ makes me think about another question: What is the difference between a 'blank' and a 'space'?

The symbol with the upturned ends is used on all my TI graphic calculators from the TI-80 through the TI-89 with one exception. The ALPHA menu for the TI-73 uses a simple underline without the upturned ends.

The Voyage 2000 only has a simple space at the center of the bottom of the QWERTY keyboard layout.

It seems that the old TI-68 should have a way to enter a space but I haven't been able to find it.

Palmer

Re: [OT] "Space" symbol on a keyboard

*Message #15 Posted by **BruceH** on 22 Sept 2010, 9:04 p.m.,*
in response to message #1 by Tim Wessman

It was common back in the days when programs were written by hand on coding sheets (and then entered into the mainframe by a team of ladies in a typing pool) to use this symbol to indicate a space. Needless to say, the ladies weren't programmers so if you missed a space out they wouldn't know to add it. Not good when the turn around for an edit was at least a day so you made sure that you indicated spaces where they were needed.

Re: [OT] "Space" symbol on a keyboard

optimized prime factor finder for 12c+

*Message #1 Posted by **Don Shepherd** on 20 Sept 2010, 2:31 p.m.*

Well, Dave Britten started this ball rolling here with a prime factor finder for the 32sii and 20s based upon an original program for the 67. Tim Wessman used this as a model for the 30b in message number 30 of that thread. I made a few modifications here for the 32s, a very nice machine. But I always wondered if this basic algorithm could be done on the 12c, and especially the fast 12c+.

At first glance, it would appear unlikely because of the heavy reliance on subroutines, which the 12c does not have. But the more I looked at the code, the more I believed that it should be possible to somehow implement this algorithm on the 12c+. Yesterday I figured out how to do it, essentially using indirect addressing via the Rcl CFj command with the cash flow registers.

The code is listed below. The 12c+ is rather slower than the 30b for this application: the 30b determines the primality of 300,000,007 in 9 seconds versus the 12c+ 38 seconds. But this algorithm represents a significant improvement over a brute-force algorithm that eliminates only multiples of 2 from the trial factor pool; that version takes 57 seconds on the 12c+.

The fact that an algorithm that is so subroutine-intensive can be done on the 12c+ at all is a testament to the greatness of the design of the 12c. No wonder it is the most successful calculator HP has ever produced.

Edited on 9/20/2010 to implement Katie Wasserman's suggestion to use Nj in addition to CFj so that no preloading of registers is necessary, a brilliant suggestion.

```
Prime factors program for 12c+

Eliminates multiples of 2, 3, and 5 from trial factor pool

These are the trial factor increment values that are stored
via cfj and nj in R2 to R7:
6,2,6,4,2,4,2,4,2,2,1,2

Enter number to factor, R/S
R/S after each factor displayed
0 indicates done

maximum number to factor = 999,999,999

Register usage:
R2 - R7 (and corresponding nj) = trial factor increments, begins at R7
R0 - number to factor
R1 - current trial factor
n  - used to control indirect addressing
i  - flag for returning to the right location from
     the routine at line 56

Mem command = p-71  r-11

01 sto 0        number to factor
02 clr sigma    clears R1 for trial factor use
```

```
03 2            load trial factor increment values into cfj/nj
04 sto n        registers R2 to R7
05 6
06 cfj
07 2
08 nj
09 6
10 cfj
11 4
12 nj
13 2
14 cfj
15 4
16 nj
17 2
18 cfj
19 4
20 nj
21 2
22 cfj
23 nj
24 1
25 cfj
26 2
27 nj
28 0            loop begins here to get next series of trial factor increment values
29 sto i        flag so you return to the correct line number from routine at line 56
30 rcl nj       get the next trial factor increment value
31 goto 56      check to see if this is a factor
32 1
33 sto i        flag to return to the correct line number from line 56 routine
34 rcl cfj      get the next trial factor increment value
35 goto 56      check to see if this is a factor
36 rcl n        when n gets to 2, an iteration of loop is done
37 3
38 x<=y
39 goto 28      loop not done, so continue loop with next increment
40 rcl 0        if num to factor is 1, you are done factoring
41 ln           will be 0 if num to factor is 1
42 x=0
43 goto 00      display 0 and exit program
44 6            reset indirect pointer to 6 for second
45 sto n        and all subsequent loop iterations
46 rcl 0        number to factor
47 rcl 1        current trial factor
48 enter
49 x            no x-squared key on 12c so this does it
50 x<=y         continue loop until you get to
51 goto 28      the square root of the number to factor
52 rcl 0        the final factor is in R0 now so display
53 R/S          it, then display 0 and stop
54 0
55 goto 00
56 sto+1        beginning of routine to see if this is a factor, increment trial divisor
57 rcl 0        current number to factor
58 rcl 1        current trial divisor
59 /
60 frac         frac part will be 0 if R1 is a factor of R0
61 x=0
62 goto 67      if a factor
63 rcl i        0=return to line 32, 1=return to line 36
64 x=0
65 goto 32
66 goto 36
67 rcl 1        factor found, so update number to factor
68 sto/0        update number to factor
69 r/s          display factor wait for user to press r/s
70 0            don't increment trial factor, might be same factor again
71 goto 56      see if current trial factor is again a factor
```

Edited: 21 Sept 2010, 1:00 p.m.

Re: optimized prime factor finder for 12c+

*Message #2 Posted by **Dave Britten** on 22 Sept 2010, 9:17 a.m.,*
in response to message #1 by Don Shepherd

Very cool. I shied away from doing it on a 12c because of the lack of subroutines. Getting it running on the algebraic 20s was enough of a challenge. :)

I might have to try this on my standard 12c and see how much more slowly it runs.

Re: optimized prime factor finder for 12c+

*Message #3 Posted by **Don Shepherd** on 22 Sept 2010, 12:13 p.m.,*
in response to message #2 by Dave Britten

Yeah, given the extensive use of subroutines in the algorithm, for a long time I thought it was just not possible to consider it on the 12c. But when I thought about the indirect addressing using Cfj, I thought there might be a way, and I found one! But it originally required loading all 12 of the trial factor increment values prior to running the program, which was definitely not cool. Then Katie said that if you use Nj in addition to Cfj you would need half as many registers and the extra program space that would free up would probably be adequate to initialize the registers you do need, and she was right. What a brilliant suggestion.

Katie also had the idea of stuffing all 12 increment values into one register using the 10-digit number and 2-digit exponent. That would free up all kinds of registers for program lines, but the mechanics of decoding that single register each time, including the exponent, would probably impact the execution speed, and I thought the Nj was a better method, so I did that.

It runs very quickly on the 12c+, not as fast as the 30b, but certainly acceptable. I've also got it running on my original 12c from 12 years ago, and it is sssslllllooooooowwwww on that machine, predictably.

But the challenge was to do that algorithm at all on the 12c, and I am happy with the result.

Yes, I did appreciate your algebraic solution on the 20s, that was very clever. And I do like the display on that machine, very clear.

So thanks Dave for resurrecting this old 67 code. I've also got it running on my 65, which handles the subroutines very well, of course.

Don

HP50g and GPS reciever

*Message #1 Posted by **Matthew Krotzer** on 19 Sept 2010, 1:45 p.m.*

I'm considering the purchase of an hp50g that I do not need but will prove to be useful microcomputer for future. I'm not much past a basic calculus course but have the opportunity to learn linear algebra on the side with a professor in preparation for undergraduate research in sociology. I absolutely love RPN on my only hpcalc (35s)

A personal project: I would like to interface the hp50g with an gps receiver and have a programmable gps unit to measure m/s and act as a trip log. Ultimately I want something for measuring speed during a skateboard trip and for long automobile trips. I think the calculator route is best because it will allow me to display and process the data as I see fit.

Would these modules be suitable for the project?

http://www.futurlec.com/GPS.shtml

I've looked at the software at hpcalc.org and things look promising for me. As you can tell from my post I am a newbie to hp and know very little about gps units.

Matthew

Re: HP50g and GPS reciever

*Message #2 Posted by **Tim Wessman** on 19 Sept 2010, 2:22 p.m.,*
in response to message #1 by Matthew Krotzer

The only way to do it easily is to have a unit that can output a RS232 signal. That way you can use a cable from hpcalc.org to interface to the 50g. Note that is a special serial cable and not just a direct wired connection.

I personally would just recommend a simple unit that has a built in 9 pin serial.

If you want a hardened box with space for external batteries, and a place to mount extra internal components, take a look here. I helped develop the software and that device for land surveyors, and I'm sure you can buy one of the plain yellow boxes for a decent price if desired.

in response to message #2 by Tim Wessman

Quote:

> I personally would just recommend a simple unit that has a built in 9 pin serial.

Thank you for the reply. I failed to recognize that the units I linked to where not standard rs232. By "simple unit" do you mean one of the commercial gps units like a garmin e-trex?

Re: HP50g and GPS reciever

*Message #4 Posted by **Tim Wessman** on 19 Sept 2010, 3:04 p.m.,*
in response to message #3 by Matthew Krotzer

I meant something that doesn't have a screen, and is supposed to interface with another device like a PDA or laptop. I haven't looked for years at those though. I know there are plenty of bluetooth ones, and used to be plenty of serial enabled devices also. Something like this possibly: http://www.amazon.com/Garmin-18x-GPS-Navigator-Unit/dp/B0016NYHVS/ref=sr_1_3?ie=UTF8&s=electronics&qid=1284923071&sr=8-3

You can probably get a GPS with a screen and software that also supports serial. Then you could use either depending on what you want to do.

Why not just get a GPS unit made for bicycles. They already have things like trip distance, travel time, average speed, maximum speed, elevation gained or lost, etc., etc., with plenty of memory that can be downloaded to a computer to graph the speed, elevation, grade, heart rate, and so on.

HP-41 in the dark; A home made Porta-Lite

*Message #1 Posted by **Geir Isene** on 19 Sept 2010, 4:12 a.m.*

Some time back, you guys asked for a picture of the little hack I did when I made a LED module for my 41.

Here are the details and pics

Re: HP-41 in the dark; A home made Porta-Lite

*Message #2 Posted by **Paul Dale** on 19 Sept 2010, 5:02 a.m.,*
in response to message #1 by Geir Isene

Isn't this a little bit wasteful of the expensive N cell batteries :-)

Otherwise, a nice mod.

- Pauli

Re: HP-41 in the dark; A home made Porta-Lite

*Message #3 Posted by **Geir Isene** on 19 Sept 2010, 8:51 a.m.,*
in response to message #2 by Paul Dale

As long as I can get hold of a refurbished rechargeable battery pack, I'll be fine (tried to make one, bot a botched-up soldering job led me to place a WTB-ad in the classifieds section).

Re: HP-41 in the dark; A home made Porta-Lite

*Message #4 Posted by **Brian Walsh** on 20 Sept 2010, 1:36 a.m.,*
in response to message #1 by Geir Isene

What a flashback. Tom Hooper made and sold the Port Lite (or was it the Port-X-Lite?) back in the early 80s for the 41. It had a switch on the exposed side of the module. Mine is buried away in a box somewhere.

Re: HP-41 in the dark; A home made Porta-Lite

*Message #5 Posted by **Raymond Del Tondo** on 20 Sept 2010, 3:26 a.m.,*
in response to message #4 by Brian Walsh

Yes, that one had been offered to me back in the early eighties by my favourite HP dealer, Buero Hansen in Bonn, Germany, for those who remember;-)
I should have bought at least one unit, but back then I had to save some money for my first X-Functions module...
Later, when I had some spare funds for toys, the lites weren't available anymore.

Re: HP-41 in the dark; A home made Porta-Lite

*Message #6 Posted by **Alejandro Paz (Germany)** on 20 Sept 2010, 11:03 a.m.,*
in response to message #1 by Geir Isene

I thought it was a LED display :(

Re: HP-41 in the dark; A home made Porta-Lite

*Message #7 Posted by **Diego Diaz** on 21 Sept 2010, 3:09 p.m.,*
in response to message #6 by Alejandro Paz (Germany)

Nice gadget. I also recall the referred unit from the eighties...

Just some thoughts from the HW side of my brain:

-Is its power connected to the BAT or to the +V line in the module? (I would recommend the BAT since the +V will load the DC/DC converter chip with some unnecessary extra mAmps)

Just my two cents... :-)

Best wishes from the Caribbean Sea.

Diego.

Searching for a 9120A drive belt

*Message #1 Posted by **Richard Wilder** on 18 Sept 2010, 1:26 p.m.*

Hi All, Forum noob here looking for a drive belt for my recently aquired 9120A printer (with 9100B calculator & 9125A plotter). I can't find the service manual for the 9120A so I don't know what the HP part number or original manufacturer is. Any help finding a belt, part number or manufacturer would be greatly appreciated.

Thanks!

Back to the question of 0 as a power or divisor

*Message #1 Posted by **John Mosand** on 18 Sept 2010, 10:41 a.m.*

I just happened to remember a joking argument by Donald Knuth:

If n/0 = inf.

Then n = inf. * 0

IOW, any number is a product of infinity and 0.

Re: Back to the question of 0 as a power or divisor

*Message #2 Posted by **hugh steers** on 18 Sept 2010, 2:58 p.m.,*
in response to message #1 by John Mosand

also,

HP's latest calculators have 0^0 = 1.

[result for the 30b]

Re: Back to the question of 0 as a power or divisor

*Message #3 Posted by **Martin Pinckney** on 18 Sept 2010, 3:31 p.m.,*
in response to message #2 by hugh steers

> Quote:
>
> HP's latest calculators have 0^0 = 1.
>
> [result for the 30b]

Does 48sx qualify as *latest* ?

This 0^0=1 seems to be the accepted mathematical convention today. How about it, Don?

Re: Back to the question of 0 as a power or divisor

*Message #4 Posted by **Chuck** on 18 Sept 2010, 4:27 p.m.,*
in response to message #3 by Martin Pinckney

Accepted only as a limit as you approach 0 from the right. In every other maths it is undefined (in my opinion).

Re: Back to the question of 0 as a power or divisor

*Message #5 Posted by **Don Shepherd** on 18 Sept 2010, 4:49 p.m.,*
in response to message #3 by Martin Pinckney

In middle school, we usually just say it's "undefined," like division by zero. The kids accept that. Some calculators may give other answers, but I think the TI-83 family gives you an error message when you do 0^0.

Re: Back to the question of 0 as a power or divisor

*Message #6 Posted by **Thomas Okken** on 18 Sept 2010, 5:09 p.m.,*
in response to message #5 by Don Shepherd

> Quote:
>
> In middle school, we usually just say it's "undefined," like division by zero. **The kids accept that.**

(Emphasis mine)

The kids may accept that, but that doesn't necessarily mean it makes sense. When I was in high school, I once had a discussion with a few classmates about the value of 0!. We'd been told that 0! = 1, and that that was "just how it was defined".

I argued that there was no need to treat 0! as a special case:

> Quote:
>
> How many ways are there to sort 3 items? answer: 3! = 6. (everyone nods)
> How many ways are there to sort 2 items? answer: 2! = 2. (everyone nods)
> How many ways are there to sort 0 items? answer: 0! = 1. (everyone disagrees, saying there are 0 ways to sort 0 items)

It's not an issue to get worked up over; while I felt a deep sense of disconnect at that point of the discussion, this is still obviously not something that's going to seriously trip anyone up later in life. But still, I felt then, and I still feel now, that the notions of an "empty sum" and an "empty product" are useful, and they make some borderline cases like x^0 and 0! fall into place quite nicely, without introducing any new problems; an "empty sum" is a sum with no terms, equalling the additive identity, 0; an "empty product" is a product with no factors, equalling the multiplicative identity, 1. No need to treat 0^0 or 0! as special in any way; they're both empty products, hence equal to 1. The fact that there really is exactly one way to order 0 items, and the fact that 0^0 = 1 makes sense from a continuity point of view (everything else to the zeroth power equals 1; why should 0 be an exception?) is just a bonus. :-)

Edited: 18 Sept 2010, 5:21 p.m.

Re: Back to the question of 0 as a power or divisor

*Message #7 Posted by **Crawl** on 18 Sept 2010, 5:58 p.m.,*
in response to message #6 by Thomas Okken

Yes, it makes total sense that 0!=1. x! is a continuous function and it even continuously approaches 1 as x approaches 0. There are dozens (or millions, who knows) of ways of defining the factorial function, and they all give 0!=1.

It mostly makes sense that 0^0=1.

To be specific, for any functions f and g that are analytic at 0 and for which f->0 and g->0 as x->0, (and if f is not the constant 0), then f(x)^g(x)->1 as x->0

Of course, that theorem gives you hints of how you can find f^g->0^0 that does not tend to 1.

Say, f=e^(-1/x^2), g=x. Then f^g will tend to 1 as x approaches 0 from positive numbers, but will tend to infinity as x approaches 0 from negative numbers. (Of course, f only ->0 as x->0 when x is on the real line, anyway. In the complex plane, the limit doesn't exist, which is why the function isn't analytic.)

Re: Back to the question of 0 as a power or divisor

*Message #8 Posted by **Crawl** on 18 Sept 2010, 6:07 p.m.,*
in response to message #7 by Crawl

Err, it tends to 0 as x ->0 from positive numbers. One thing that example is supposed to show, sort of, is that f^g=0^0 can equal 0, like 0^x, if f tends to 0 much faster than any analytic function.

Re: Back to the question of 0 as a power or divisor

*Message #9 Posted by **David Hayden** on 19 Sept 2010, 8:58 a.m.,*
in response to message #7 by Crawl

For my money, Crawl's explanation really hits the nail on the head, so to speak. Math is full of instances where we define values of functions based on convenience for the mathematical model rather than a provable theory. For example, x^n is well defined for integers. You can further define it for rational numbers, but for irrational numbers, we simply say "uh, k^x when x is irrational is the value that makes f(x) = k^x continuous."

I think the same is true with x!. It's a continuous function, but only because we've dictated that it should be and because there is a continuous function that equals x! (gamma(x+1)).

As for 0^0, at first glance you could say it equals any number (0^0 = 0^k / 0^k = 0/0; 0/0=x; 0=0*x; x = any number). We decide to pick the one that makes the most sense, which is the one that the limit approaches as Crawl describes.

Re: Back to the question of 0 as a power or divisor

*Message #10 Posted by **Crawl** on 19 Sept 2010, 10:03 a.m.,*
in response to message #9 by David Hayden

There is a theorem that states how unique the usual continuous extension to the factorial function is.

So, you could define it with an integral, or with Euler's product formula, or whatever, but however you do it, you're gonna get the same thing.

Re: Back to the question of 0 as a power or divisor

*Message #11 Posted by **Crawl** on 20 Sept 2010, 12:06 p.m.,*
in response to message #10 by Crawl

Here are maybe some "controversial" definitions:

We should only use the factorial function. Everyone should drop using the Gamma function like a bad habit. That stupid argument offset helps nothing.

B(1) (the 1st Bernoulli number) should equal +1/2, not -1/2. Note that the HP50g's IBERNOULLI function gives the "wrong" answer for this argument.

Re: Back to the question of 0 as a power or divisor

*Message #12 Posted by **Don Shepherd** on 18 Sept 2010, 6:34 p.m.,*
in response to message #6 by Thomas Okken

I agree, it's not an issue to get worked up over, and believe me the kids don't get worked up over it. In middle school, we teach the kids rules. One rule says that 0 to any power is 0. Another rule says that anything to the zero power is 1. Now, unless I bring up the conundrum about 0^0 seemingly falling between the cracks, few kids will even be aware of it. Kids, amazingly enough, aren't intrigued by these things! Sometimes I bring it up, to get them thinking. And I usually leave it that it's like division by zero, not allowed.

In middle school, we measure success by kids actually knowing their times tables and the basics of algebra. 0^0 isn't worth worrying about.

0^0, once again...

*Message #13 Posted by **Karl Schneider** on 21 Sept 2010, 1:20 a.m.,*
in response to message #3 by Martin Pinckney

> Quote:
>
> This 0^0=1 seems to be the accepted mathematical convention today.

Of course, this has been debated here a few times over the years, but I did not bookmark any threads...

I insist that it's incorrect to declare that "0^0=1 by definition", because:

1. To evaluate it directly causes a DBZ or logarithm error.
2. No unambiguous limit exists, as

$$\lim_{x \to 0+} 0^x = 0$$

$$\lim_{x \to 0-} 0^x = \text{DBZ } (+\infty)$$

$$\lim_{x \to 0} x^0 = 1$$

In most cases, however, letting 0^0 = 1 is more useful and fits the problem. It's essentially implicit as the first term in the Taylor series for cos(x) and e^x, expanded about a = 0 (the last of the three limits is taken for the two derivations).

Re: Back to the question of 0 as a power or divisor

*Message #14 Posted by **Martin Pinckney** on 18 Sept 2010, 6:11 p.m.,*
in response to message #2 by hugh steers

There was a previous discussion of this issue in this thread.

It seems HP calculators had 0^0 return an error (undefined) in all pre-RPL models, and 0^0=1 in RPL models, seemingly in accordance with an IEEE standard for computer languages.

I am definitely out of school here, but that's the way I see it.

Re: Back to the question of 0 as a power or divisor

*Message #15 Posted by **Tim Wessman** on 18 Sept 2010, 9:18 p.m.,*
in response to message #14 by Martin Pinckney

Well, the new math library has a flag that can either cause 0^0 to return an error (ER0pow0) or 1. :-)

*Message #8 Posted by **Namir** on 18 Sept 2010, 8:22 p.m.,*
in response to message #6 by Michael de Estrada

Nope! It's another site dedicated to the HP41C.

Re: HP-21 sells for nearly $400 on TOS!

*Message #9 Posted by **Han** on 18 Sept 2010, 11:35 a.m.,*
in response to message #1 by Michael Meyer

Looks like a bid war between two guys who felt they had to have a mint HP-21. If it were the case that 40 of those 60 bids were from unique buyers, then I would feel regretful about cannibalizing those HP-21 calculators.

Just my 21 cents.

Re: HP-21 sells for nearly $400 on TOS!

*Message #10 Posted by **Michael de Estrada** on 18 Sept 2010, 11:52 a.m.,*
in response to message #9 by Han

I didn't see this particular auction, but in the past it seems that the HP 21 has been a pretty common Woodstock, and rarely if ever have I seen them sell for over $200. I have one that is pretty minty that cost me less than $100. Had this been an HP 27 or 29C or maybe even a 25C I could understand it if they sold for such an amount, but the HP 21 and 25 should not. As you said, it was just a bidding war between two big egos or perhaps a shill at work here?

Re: HP-21 sells for nearly $400 on TOS!

*Message #11 Posted by **Juergen Keller** on 18 Sept 2010, 12:52 p.m.,*
in response to message #1 by Michael Meyer

Well, there might be HP-21s that are quite rare and might be worth $400, like this one: Yokogawa HP-21

Re: HP-21 sells for nearly $400 on TOS!

*Message #12 Posted by **Michael de Estrada** on 18 Sept 2010, 12:58 p.m.,*
in response to message #11 by Juergen Keller

Not for me, but OTOH the HP-41CY Turbo, absolutely!

Re: HP-21 sells for nearly $400 on TOS!

*Message #13 Posted by **Juergen Keller** on 18 Sept 2010, 6:05 p.m.,*
in response to message #12 by Michael de Estrada

That's one of my Holy Grails, but that's another thread :-)

Re: HP-21 sells for nearly $400 on TOS!

*Message #14 Posted by **Michael Meyer** on 20 Sept 2010, 3:57 p.m.,*
in response to message #11 by Juergen Keller

Juergen: That IS very cool.

Edited: 20 Sept 2010, 3:58 p.m.

Voyager hp-15c logo gone missing..

*Message #1 Posted by **uhmgawa** on 17 Sept 2010, 11:19 p.m.*

I just purchased a 15c which appears to have lost the logo button somewhere between the seller and I..

Anyway I thought to create an aluminum replacement, either cast or CNC engraved. To that end I'd really like to work from a high resolution scan of a 15c logo in pristine condition. A scan is preferable to a digicam from an image linearity perspective, but getting a reflective surface to render on a scanner can be involved and beggars can't be choosy.

I did find this in the archives:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=108478

Which is certainly helpful but it is easier to work from a image taken normal to the surface.

Alternatively I can create a mold from a "spare" 15c logo to cast a replacement if anyone has suggestions where/how to find one in reasonable shape. But that doesn't scale too well for others who may also be in need of the same. Assuming the replacement aluminum logo doesn't wander off to the land of no return, it shouldn't suffer the wear out of the chrome (painted) original. Sort of makes one wonder why somebody hasn't surfaced selling these yet on EEEbay..

Re: Voyager hp-15c logo gone missing..

*Message #2 Posted by **Paul Dale** on 17 Sept 2010, 11:55 p.m.,*
in response to message #1 by uhmgawa

If you do manage to reproduce the logo, I'd be interested in one for my 15c.

Maybe not necessarily. Here is a 16c logo jpeg captured via canon a630 digicam. The image barrelling lessens considerably by backing off a bit. This was just a quick handheld attempt so I needed to rotate the cockeyed image a tad in gimp which resulted in some minor aliasing:

The relief on the surface of the icon recesses is enough to catch the incident light and form a usable outline which should work well -- assuming the prospective 15c logo is pristine enough to still have a complete reflective surface.

Anyone with a museum quality 15c who would be willing to offer a jpeg to the less fortunate? ;)

Thanks!

Sadly it isn't the budget which I hit as a limitation but rather available time.

I know this thread must sound trite to some but the glaring omission of the logo looks like hell against the balance of the 15c which is in surprising good condition.

> wow, if this is something easy for you to do, I would like to get a custom one done for a highly modded voyager project that I am doing.

It is essentially straightforward to do. Being "easy" is more subjective but after rattling around with this for about a day I can see three approaches:

1. Directly mill it from Al sheet. This can be via CNC or even a one-off dremel in a pantograph following a hand cut template fabricated in more relaxed dimensions.

2. Create a mold from an existing logo in either plaster or thinned joint compound. Getting the master logo is likely the rub but one could also be created from a softer material such as delrin or even machinable wax. I think this has some merit as the engraving operation potentially needs to be performed only once and assuming the finished logo external perimeter is also part of the casting the remaining work can be limited to some minor dimensioning with a simple sand paper jig.

3. Chemically etch the pattern/relief. The familiar laser toner transfer may work here. I'm concerned about undercut etching particularly given a deep 0.2mm relief but some simple experimentation might be worthwhile. FeCl eats Al with spectacular aggression so it may be entertaining as well. The artwork can be created with any suitable CAD/drawing tool.

Note you don't need particularly pristine cast/milled surfaces initially in the logo. The relief is painted in flat black, and when finishing the logo, its display surface will likely be cut in abrasively to remove the surface paint overspray and true it flat and parallel to the base. You can likely get a mirror surface if that's what you're after. I'd probably leave some brushed texture on it to hide the inevitable wear as it projects beyond the bezel and is a magnet for scuffs and dings. Then again the solid Al body isn't going to have anywhere near the fragility of the original painted/plated ABS gem.

I'll get around to it at some point. I'll certainly create a mechanical drawing and post it here. If others are inclined to poke at it before I, please do share your results.

> Quote:
>
> If you don't already know, the original badge is a hollow injection moulded piece, affixed with a piece of double-sided foam tape.

Interesting. The new 15c casualty and my existing pristine 16c seem to have remains of an RTV type compound on the body in the perimeter of the logo. Would have dismissed it on the 15c alone as a repair attempt. Dunno.

I still cannot understand why HP didn't put a little more thought into this cosmetic Achilles Heel of the voyager series, given it carries their logo. Even an Al die stamped version would have been routine manufacturing back then IIRC.

BTW your mention of a "highly modded voyager" up there caught my curiosity. Might you have a pointer or otherwise mind describing what you've done?

Thanks!

> BTW your mention of a "highly modded voyager" up there caught my curiosity. Might you have a pointer or otherwise mind describing what you've done?

Sure; a couple projects glommed together about a month back. I had often thought of making a 'cryptographic calculator', and since I always loved the Voyager's physical design, I decided to take a 12C, and re-brain it.

Its for fun mostly, but it will probably have 15 and 16 emulations in addition to my cryptographic functions. To add some baroqueness, I will probably put in a hardware RNG, an Atalla 8150 emulation, and a DUKPT PIN Pad.

Physically, I would like to anodize the bezel purple or blue, but I don't really know any local platers here. And I would love to have a logo, which I intended to be a 'dl' stylized like the 'hp', and the number 13C since there was never an HP13. A friend of mine will embroider the slip case, and another buddy should be able to silkscreen the plates and hopefully the keys too.

I'll be happy to send you my extracted 12C badge so you can do measurements, especially if you think you can produce about 5 of the 'dl 13C' badges ;). I can provide artwork for the logo.

I have been chronicling the project with a journal and photos, however I haven't made a web page for it. At this point I have totally broken down the unit (removed all the plates, etc), found a new display (which is non-ideal, alas, but I'll have to come back to finding a better one later), and am about ready to take the Dremel to the PCB to make room for the new LCD.

That's generally how I wound up here. Having admired the voyager's footprint but wanting to add features of personal interest. The other dimension of insanity, considering to manufacture a near form factor voyager replica, grew out of my early shock, awe, and disgust of the auction prices for a 15c specimen on EEEbay.

> Quote:
>
> I'll be happy to send you my extracted 12C badge so you can do measurements..

I have a 16c, a recent version 12c, and the sad void where a logo used to be on the 15c. I've drawn preliminary measurements for 15c artwork but it isn't yet complete. Note the bezel void which accepts the logo measures a square 9.4mm on the old voyagers but about 9.32mm on the new 12c.

The display is the royal PITA here. While the dumbed-down 7 segment voyager display seems a little dated, it does the job and the lower multiplex ratio yields superior contrast compared even to the 4:1 ratio of later voyager lcds. But you won't find anything close to a usable numeric lcd off the shelf.

So I looked at matrix character displays (yawn) as well as lower resolution graphic modules (122x32) which conceptually should work for main numeric + annunciators. But the contrast isn't anywhere near equivalent due to the higher multiplex rate. The power consumption is horrid due to use of relatively high current resistive dividers in the voltage ladder, and most are transreflective to accommodate backlighting which isn't needed here and

further worsens contrast.

The best compromise I found was a 16 character x 2 line character reflective display, where I removed the low impedance resistive divider, replacing it with a 1000x higher impedance divider buffered by ultra low current opamps. Doing so I was able to tame the display on+idle current under 100uA IIRC. The modern 12c has an entire system idle current (which admittedly is mostly due to lcd scan) somewhere around 20uA (again IIRC).

Still in the end it is a character display and the UI needs some massaging as interdigit "." and "," now consume a full character position. And annunciators are going to be big and ugly. Mechanically though it happens to bond the glass to driver via a conductive heat seal tape connector which minimizes z-axis bulk. Most off the shelf lcd modules with integral driver use an elastomeric zebra strip to connect the glass and driver pcb which requires a compression frame to make the shebang work. That's likely why you wont find anything resembling a commercial display module in any mass produced calculator.

in response to message #10 by uhmgawa

Haha, well, you clearly know your stuff. My approach in this project is to make it work at the expense of making it be the thing I would ultimately dream it to be. You will puke when you see my LCD compromise. I think I know of the driver-on-glass unit you mention -- works great for thickness but will cut into the keyboard according to my measurements.

Anyway, you inspired me to stick what I have done on the web here: daves ridiculous calculator This is essentially cut-and-paste from my Word file with which I am journaling. Up to this point I have merely disassembled and selected components. Now I am getting into the real surgery... And codeing... (codeine?)

> Quote:
>
> You will puke when you see my LCD compromise.

There really isn't any happy compromise between off the shelf stuff which was never designed for the requirements of a calculator or paying for cu$tom lcd glass. I'll bet if one located the manufacturer producing the display glass used in the new voyager 12c it might be pretty cheap to acquire a small sample lot. Well, unless HP has their head in a vise contractually which it may.

You mention interest in a 24 character display. There is a 24 char x 1 line Wintek lcd which has been around in surplus for quite some time and although wider than the voyager display aperture can be made to fit. The downside it the controller drive is configured to operate from 5V only (yet the controller logic is characterized down to 2.4v). The good news is you can talk to it via i2c.

> Quote:
>
> Anyway, you inspired me to stick what I have done on the web here:

Huh. I didn't realize the displays of old 12c models used a zebra + compression frame. The new 12c uses a 30 conductor heat seal tape with the funky anisotropic conductive compound.

> Quote:
>
> daves ridiculous calculator

This is very useful information. Thanks for sharing it.

There seems to be a common need between restoration/repurposing (here) voyager key legend and bottom panel bezels, and simply making legend bezels for completely original work.

Given the level of commodity color inkjet and laser printing the technology is certainly in place. What is needed is a durable means to wrap it up for use generating legend bezels. Printable plastic film exists which could be overlaid with a second protective lamination layer. The result could be machined in whatever form is needed. The only issue is how well the resulting lamination joint would be such that it was sealed against contamination, moisture, delamination, etc..

Restoration purists may scorn the notion of replacing an original Al bezel with a plastic laminate. But it would certainly be far more abrasion resistant than the original and the fact one can print/machine replacements as needed makes me get over that real quick.

Yes, and since I'm not restoring, it doesn't matter to me. The brushed Al faceplate is also the bane of the unit's cosmetics over time. Steel would probably have stood up better.

Will have to look at the Wintek display; if it fits, that might be even better than the Hantronix I found.

If you still have access to the innards, could you put a caliper on the upper case body heat stake posts and get a diameter measurement? I believe they are 1.6mm (62.5mils for those of us still stuck in the stone age). Unsure about the diameter of the mating holes in the PCB but they appear to give a healthy clearance (~84mils) and are probably easiest to measure using a drill bit shank as a gauge. I'm thinking to cobble together a jig for restoring the stake length after pcb extraction such that they can be (re)set similar to that used during manufacture.

Thanks!

in response to message #15 by David

> Quote:

> confirmed on stakes. My PCB has holes approx 70 mil -- tighter than yours.

That was my estimate of eyeballing the one odd stake which appears unset during fabrication of every legacy voyager I've seen thus far. It is in the north-east corner of the PCB (as viewed from the bottom) and I took a guess at the PCB hole with a caliper and jeweler's loupe. Could be manufacturing variation or I may certainly be off. From that, it seems the unseated stakes sat proud of the PCB by about 108mils to provide the bulk of the head which were seated thermally AFAICT by a concave spherical cap die.

One other question if you have the patient handy is the diameter and vertical height of the snap domes at rest? I've measured the actuation forces of the 15/16/12C units here which average ~150gm. The latest ARM7 12Cs have a more distinct tactile action by comparison. Circular snap domes were used in the legacy voyagers which tend to have a softer threshold action compared to the legged domes in the current ARM7 12Cs. I believe the actuation force itself however was comparable.

[Edited for clarity]

fascinating on the 'unset stake'. all of mine were set fer shur (oh fur shur, I had to carve them all). this is a 1994 unit. If curious I can also check a 1988 12c and a 1984 11c.

Anyway, snapdisks. d = 0.3590 h = 0.0170 (w/film)

unsolicited info: PCB pad dia 0.3825 film thickness ~ 2.5mil (hard to measure and then there's glue)

Interesting about the newer 12c snapdisk design. I don't have any way of measuring the force.

Yea that unset stake seems to exist in all voyagers I've inspected. The most recent of which is a 12C Malaysian mfg unit with "99.11.10.1" hand written on the PCB, and shares only the housing configuration with the earlier units. Seems reasonable as there probably wasn't any reason to retool molds for the case. This incidentally is the 3x LR44 cell transient design with a single lqfp-80 package 1RR2 CPU/ROM/RAM/LCD controller: 4.5V and keyboard scan in, LCD drive out. No bus to sniff nor drive so it isn't very interesting beyond mechanical spare parts.

> Quote:
>
> Anyway, snapdisks. d = 0.3590 h = 0.0170 (w/film)

Thanks. Looks like a 9mm dome might work. I'll put a digital/dial gauge on a dome to

measure deflection when I free the board. But I expect that isn't critical.

> Quote:
>
> unsolicited info: PCB pad dia 0.3825 film thickness ~ 2.5mil (hard to measure and then there's glue)

Besides the domes fatiguing there also is the issue of the hard gold plating wearing due to scrubbing from dome actuation. That's a bit more involved to repair but I believe nickel plate should be possible and is commonly used as a hard PCB contract treatment for snap domes.

> Quote:
>
> Interesting about the newer 12c snapdisk design. I don't have any way of measuring the force.

I picked up a cheap digital jewelery scale back when I was evaluating snap domes. Not the most exact measurement technique but it far exceeds the end use variation in actuation force between identical snap domes. I found +/- 10% variation to be relatively common. I believe to a user the width of the actuation threshold is more noticeable than the actuation force itself (within reason).

BTW on your retrofit, did you need alphanumeric capability or could you have lived within the numeric + annunciator segment constraints of existing LCD?

Thanks.

This project is just a lark for me, and so it's not really critical either way. Ultimately for me it's a balance of fun against aesthetics. Using the original display would look authentic, but I'd have to make an LCD driver, and then too the alpha capability gives me some functional richness.
Actually that reminds me -- I'm ready to do some dremmelling of the PCB now since I have (most) parts in...

I have made logos for an 11c out of silver. There are a few extremely small differences, but I am getting better at casting.

Here is a link to my caveman initial attempt. My newer attempts are much more successful.

If anyone is interested in 11c logos, I have about five left from my newer batch.

For those interested in 15C logos, please send me an email at my registered email and we can discuss the details. I will need a high-quality model to create a mould from. I don't care if it has any metal on it, all black would work just

fine.

Photos from initial run from a very POOR model.

EDIT: fixed the link

Cool. That's near exactly where I was heading with my thought to cast an aluminum version. I figured it was close to crossing over into jewelery making.

I've been looking for one. Unfortunately when available they are typically attached to the rest of a hp-15c which I suppose in the bigger picture isn't all that bad. ;)

Even if the logo has physical (vs. cosmetic) wear, to some entent this can be carved out of the mold with some care. As you're going to recut the top surface anyway it shouldn't be too terribly critical.

Re: Casting?...Like this...

*Message #22 Posted by **Dallas Osborne** on 20 Sept 2010, 12:34 p.m.,*

Okay, this is not quite how I imagined it to go.

They are all gone save one. For all those who have them on the way, I will be painting and polishing tomorrow morning and should have them posted Thursday or Friday.

I believe I need to discuss any future work with HP. For some strange reason, the "HP" trademark might be important to folks in suits. Once I get this secured - and it may take a long time - I will let folks know. Until then, I will be looking 10C, 15C, and 16C logos in good dimensional condition, though the metallic surface can be worn to any state. If you have one for donation, I will replace yours with a silver one for free.

But I will hold off any further reproduction in the hopes of avoiding a cease and desist letter arriving at my post box.

(To whom it may concern, your request for an HP 13X logo is under consideration. Since the "HP" portion is still there, I have to take care of that issue first before I get my Pro-E guru working up a model.)

Re: Casting?...Like this...

*Message #26 Posted by **uhmgawa** on 23 Sept 2010, 5:02 p.m.,*

Quote:

I believe I need to discuss any future work with HP. For some strange reason, the "HP" trademark might be important to folks in suits.

Considering the money they've dumped into grooming that corporate logo, and more importantly their corresponding investment in copyright and trademark protection for it, they probably won't take too kindly to any revenue derived from it without license.

Then again they may not care. You could claim to be offering a restoration service and attempt to circumvent the issue arguing you're maintaining the conservation of voyager logos, by not adding to the number in circulation on the planet. A fatigued ABS casualty arrives and a new logo is sent in its place. But I'm not sure I'd want to spin that roulette wheel against the litigation resources of HP.

Quote:

Once I get this secured - and it may take a long time - I will let folks know.

It can't do any harm to again hear of prospective customers for this forgotten product line. As well as the extremes some of the loyal following are willing go to restore the old units.

Quote:

But I will hold off any further reproduction in the hopes of avoiding a cease and desist letter arriving at my post box.

IANAL but it seems to me if I have an HP calc which is in need of logo repair, there isn't any legal prohibition for myself as the owner to restore it cosmetically including creation of a logo. Dunno what that might mean if I sold the unit but I'd hazard empirically HP won't give a hoot. Outright selling their logo is where I'd get nervous.

Re: Casting?...Like this...

*Message #27 Posted by **Garth Wilson** on 23 Sept 2010, 5:48 p.m.,*

I expect that as long as you're increasing the value of their product, they should be happy. I have, on occasion, posted quotes from various books on forums, with exact enformation on the name and author of the book, the publisher, and where to buy the book, and although it could be seen as a copyright violation, I expect the owners are glad that I'm giving people a reason to buy the book, and they have never asked me to stop.

Green Ride vs Super Shuttle

*Message #1 Posted by **Bruce Bergman** on 17 Sept 2010, 11:25 a.m.*

And no, this isn't the latest Marvel comic book to come out... ;-)

I'm wondering if anyone has experience with these two methods of getting to the HHC2010 conference hotel. Would you recommend one more than the other? Is one faster (more direct, with less stops)? Price isn't my concern as much as I'd prefer not to drive all around just to get to the hotel.

thanks!

Bruce

Re: Green Ride vs Super Shuttle

*Message #2 Posted by **Tim Wessman** on 17 Sept 2010, 2:07 p.m.,*
in response to message #1 by Bruce Bergman

I am not very familiar with either, but I suspect they operate in a similar manner.

My wife's mom came up on Super Shuttle last time. Basically they just drove north on I-25, got off the freeway at major cities, and then those going to those cities loaded into smaller vans for individual drop off. The hotel is near the first Ft. Collins exit, so I would expect it would be the first drop off point.

It takes 50-65 mins in a car, and it took her in the shuttle about 75 to get to our house with 3 other people being dropped of before her in Fort Collins.

Tim,

Major style points are awarded to sons-in-law who go fetch mothers-in-law from the airport. Plus in your case you would have scored 650 bonus points for "Commute More Than 25 Miles" (5 points per mile x 65 miles x 2 trips (x4 trips is she leaves)).

Now, if you were very busy finalizing the firmware for the soon to be revealed HP 15c+, or an HP 43S, next time let the Forum rent your wife's mum a limousine.

hp50g stack

*Message #1 Posted by **Sok-khieng Chum Hun** on 17 Sept 2010, 7:10 a.m.*

Hello everyone,

Do any of you know an application that displays the calculation while in rpn mode on the 50g like it does when in algebraic mode?

Thank you :)

Re: hp50g stack

*Message #2 Posted by **Crawl** on 17 Sept 2010, 2:24 p.m.,*
in response to message #1 by Sok-khieng Chum Hun

Um, it depends on exactly what you want to do? In my opinion, this is not the sort of thing that needs an "application". It is too simple a problem.

Often the easiest thing to do if you want a record of your calculation AND a numerical result is to just hit ENTER, then ->NUM. Then the unevaluated expression is in level 2 and the number is in level 1.

Say you're working completely with numbers, though. Then everything will be evaluated as you enter it, right?

Here's a trick around it: Enter the first step as an algebraic object.

Let's say you want to enter sin(1+2*(3-4)^(1/2)).

Hit ' 3-4 Enter. You should have '3.-4.' on the stack. Alternatively, enter 3-4 with the equation writer.

Then you can use RPN normally. The rest of the steps:

2 1/x ^ 2* 1 + sin

you will then have

sin((3.-4.)^(0.5)*2.+1.)

on the stack.

Hit Enter and then EVAL. The equation will be in level 2, the result in level 1.

A couple of caveats: You must be in approx. mode. (Also, for this particular example, complex mode)

Also, sometimes square roots, for whatever reason, trigger an EVAL. That's why we raised to the 0.5 power instead.

Re: hp50g stack

*Message #3 Posted by **Sok-khieng Chum Hun** on 17 Sept 2010, 5:54 p.m.,*
in response to message #2 by Crawl

Wow! That trick is cool! Now I can even work on my 48gx and my university team mates won't doubt about my calculations!

Thank you alot :)

Re: hp50g stack

*Message #4 Posted by **Martin Pinckney** on 17 Sept 2010, 8:33 p.m.,*
in response to message #3 by Sok-khieng Chum Hun

Indeed, that is cool, Crawl. Even works on my 48sx dinosaur! Once the whole equation is on the stack, just press [VIEW] to see it in Equation Writer (similar to Textbook), then hit [ATTN] to return to where you were.

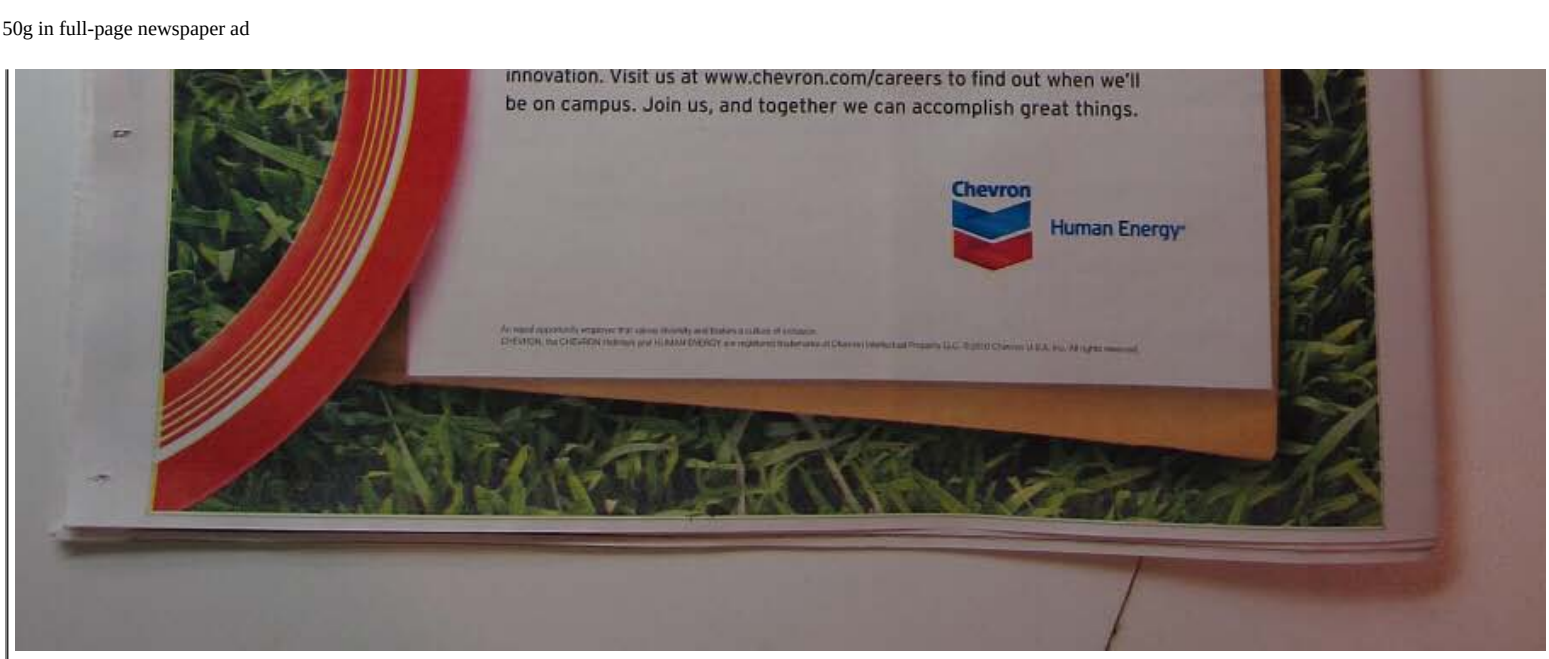
HP 50g in full-page newspaper ad

*Message #1 Posted by **Eric Rechlin** on 17 Sept 2010, 1:06 a.m.*

I just noticed a very large 50g in a full-page ad that Chevron is putting in college newspapers. The photo has been doctored (HP logo and 50g nomenclature removed and color slightly shifted to dark gray) but it's pretty unmistakable.

Was quite surprised to see an HP calculator so prominently displayed!



Eric

HP-35 red dot confirmation

*Message #1 Posted by **Giovanni Jimenez** on 16 Sept 2010, 10:46 p.m.*

I own an HP-35 Red Dot, but I have no way of validating that this is an original / genuine Red Dot and not a fake.

Is someone in this forum with enough experience in these models and some spare time, willing to take a look at the calculator (even open it if necessary) and confirm if this is in fact a genuine Red Dot ?

I pay of course shipping both ways, but as for the actual validation work, think of it as a favor to a fellow MoHPC member:)

I would prefer someone in the US.

Thank you !

Re: HP-35 red dot confirmation

*Message #2 Posted by **Katie Wasserman** on 17 Sept 2010, 12:31 a.m.,*
in response to message #1 by Giovanni Jimenez

If I wanted the best possible validation of red-dottedness (to coin a phrase), I would want a collective opinion on this not just one person's. Why not post some very good close up pictures of the top and bottom of your calculator on this forum and let all of those who claim expertise on the subject offer comments. You can then draw your own conclusiion based on the responses, hopefully there will be a clear consensus.

This should cost you nothing if you have access to a digital camera and almost certainly get a much faster response -- while at the same time offering us more grist for the mill :)

-Katie

Fake HP calculators on eBay?

*Message #1 Posted by **Peter Matthews** on 16 Sept 2010, 10:20 p.m.*

I just bought an 11C over eBay and received it.

It looks pretty "fake" to me. I have an 11C which I bought originally in the 1980s.

This "mint" one I just received seems to work functionally but the whole thing looks fake.

I could be totally wrong, but first impressions are important right?

Does anyone have any experience with this?

The HP calculator cover is too new. And it has the HP logo on both sides. The material is too rubbery.

The 11C itself is too clean for such an old calculator. I can't really tell but the keys don't SEEM to be double-shot to me. I don't have my original 11C with me right now but I am comparing it against a vintage 12C and it just does not look "right" to me.

I am wondering if there's a market now for knocking off these vintage calculators by creating them from the factory that makes the modern 12C and sell them for high prices on eBay.

I don't want to rip out the rubber feet to open it and check the insides but it also feels slightly heavier than the 12C and what I remember of my original 11C.

Pictures, man!

in response to message #1 by Peter Matthews

Take a camera and upload some good pics. Show us.

Re: Pictures, man!

*Message #3 Posted by **Peter Matthews** on 16 Sept 2010, 10:37 p.m.,*
in response to message #2 by gene wright

I need to get my proper camera and a tripod. Will post later. But I don't think you can see much from photos because it will probably look just right. If it IS a knockoff job I can tell you they did it super good but probably it would not be too hard using the 12C tools that are currently operational.

The color of the gold labeling looks a little too bright orange, methinks.

Re: Pictures, man!

*Message #4 Posted by **Katie Wasserman** on 17 Sept 2010, 2:43 a.m.,*
in response to message #3 by Peter Matthews

What batteries does it use: 3 x 357, 1 x CR2032 or 2 x CR2032?

The current 12C (from some reports here) and 12C+ (definitely) use 2 x CR2032.

Also, is it the same speed as your original 11C, or much, much faster?

-Katie

Re: Pictures, man!

*Message #5 Posted by **Peter Matthews** on 17 Sept 2010, 5:55 p.m.,*
in response to message #4 by Katie Wasserman

Speed seems the same. I made a few simple programs and it feels the same (same slowness haha). Anyone got a complex routine I can program in to check (but which won't take me half an hour to input! :-)

Photos!

http://picasaweb.google.com/ajann67/ScoreOrScam?authkey=Gv1sRgCK7osJ2Ogd3CKQ&feat=email#

or

http://bit.ly/cWA4T9

A few things to point out:

I compare the 11C with a vintage 12C.

The "A" of the USA on the 11C looks badly stamped. I don't think HP had such poor quality in the 1980s right? You can see the huge difference with the 12C stamp. The 12C has a strong, clear impression.

The spacing between the USA and the battery compartment differs.

The sleeve looks too new. I don't have a modern 12C. Is this the modern 12C sleeve? Both sides have the HP logo. It feels too rubbery and thick compared to the vintage one I had (which disintegrated over the years).

Batteries are the same but one plastic flap is missing (not as big a deal as the weird USA serial number stamp IMHO).

Take a look at the COS-1 label; under magnification you can see a bit of the blue is scraped off; this ain't gonna happen with double-shot.

My question is: Did the 11C production CHANGE over its product life?

Anyway, WHADDY'ALL THINK???

Re: Pictures, man!

*Message #8 Posted by **Michael de Estrada** on 17 Sept 2010, 7:27 p.m.,*
in response to message #6 by Peter Matthews

What I think is you've got an original HP 11C and sleeve from 1985, which looks exactly like my HP 15C, which I bought new from Ulrich's book store in 1982. The fact that it doesn't look like an HP 12C, just means that they were made differently. I also have a vintage HP 12C from 1987, and the "USA" stamp is indeed a different size and in a different location. The serial numbers are also in a different location. My HP 15C sleeve is still in like new condition, and has the logo embossed on both sides. So, I don't see any fraud here and like others have pointed out it would make no sense, since the HP 11C is not some super rare collectable.

Re: Pictures, man!

*Message #9 Posted by **Peter Matthews** on 17 Sept 2010, 8:34 p.m.,*
in response to message #8 by Michael de Estrada

Thanks for your observations.

Re: Pictures, man!

*Message #10 Posted by **Michael Bromm** on 17 Sept 2010, 8:46 p.m.,*
in response to message #6 by Peter Matthews

That looks pretty unfake to me. The case is similar to that on my old 12c, and the rest of the thing looks pretty much like standard HP issue.

Re: Pictures, man!

*Message #11 Posted by **Katie Wasserman** on 17 Sept 2010, 11:34 p.m.,*
in response to message #6 by Peter Matthews

I'm quite sure this was really made by HP, and yes they changed some small things on the calculators in this series of the years. Perhaps not on the 10c -- I haven't seen enough of these to notice any difference -- but on the other 4. For example, the contacts in the battery compartment, some of the lettering as you noticed, etc..

Re: Pictures, man!

*Message #12 Posted by **uhmgawa** on 18 Sept 2010, 2:55 a.m.,*
in response to message #11 by Katie Wasserman

> Quote:

> For example, the contacts in the battery compartment, some of the lettering as you noticed, etc..

That's an interesting comment. The 15c I just bought has a completely different battery compartment than the close vintage 16c I've owned. Namely the 16c has leaf spring style contacts for both terminals where the 15c arrived with a coiled spring for the (+) terminal and what appears to be a small brass block for the (-) terminal. Is this an HP manufactured configuration or have I received something "special".

Re: Pictures, man!

*Message #13 Posted by **Katie Wasserman** on 18 Sept 2010, 10:23 a.m.,*
in response to message #12 by uhmgawa

The coil spring and brass block arrangement was used in all the Voyagers from mid 1984 (IIRC) forward for at least several years. Prior to that they use a thin metal leaf spring.

You almost certainly have a real HP 15C.

Re: Pictures, man!

*Message #14 Posted by **George Bailey (Bedford Falls)** on 18 Sept 2010, 2:23 a.m.,*
in response to message #6 by Peter Matthews

This is so absolutely fake, you were so totally scammed! Why would anybody sell or buy a pristine 11c when it is so easy to just make one yourself? Right! Nobody would! Ever!

To prevent you and everybody else from loosing even more money, please contact us at honest.george@calcgenuinetest.org for details how to send the fake calculator in. We will destroy it and bury its remains in a completely unholy Casio-TI-area, to make sure the fake HP-soul can not be revived anymore, everever!

Re: Fake HP calculators on eBay?

*Message #20 Posted by **Martin Pinckney** on 17 Sept 2010, 9:33 a.m.,*
in response to message #1 by Peter Matthews

I don't understand how this would work.

Convert a modern 12c+ to 11c? Would any crook have the expertise/take the effort to re-purpose a 12c+ and produce new legends for the keytops and faceplate?

Manufacture brand new fakes? What, Kinpo has some side deal with a shady character?

If HP can't produce a 15c+ economically (according to some) how can some scammer make fake 11c's?

Curious.

I doubt it is a fake.

*Message #21 Posted by **Frank Boehm (Germany)** on 17 Sept 2010, 11:11 a.m.,*
in response to message #1 by Peter Matthews

The cover has certainly been revised over the years; maybe it doesn't belong to the 15C (but to a later 12C).
The argument "it looks shiny new, so it must be a fake" is void - I have seen 40 year old calculators with a brand-new, scratch-free look, like they have been made the very same day.
Best thing is: it is not possible to fake a 11C with economical gain, however it might be possible to swap parts between same/different models. Take three defective cals and create one working Frankencalc. But that's tough on these 10C/11C/12C/15C.

To my knowledge, late production units might not have double-shot-moulded key, there are even some units with overprinted keys.

Re: I doubt it is a fake.

*Message #22 Posted by **Peter Matthews** on 17 Sept 2010, 5:51 p.m.,*
in response to message #21 by Frank Boehm (Germany)

I hope you guys are right. Like I said, I could be totally wrong, but that was my immediate impression upon seeing and holding it for the first minute.

I don't have my original 11C with me here (it is in a safe deposit box in another city) but I did compare it with my vintage 12C.

Anyway, photos coming real soon. I need to make sure I white balance properly so you can see the colors (although since nothing is calibrated, including your screens, you can't really go by the photo colors for exact comparison).

PS - the economical aspect: Wouldn't it be profitable to churn out X number (say, 1000) extra 12C base calculators on the sly (i.e., workers in the HP/contract factory) and sell them each for, say, $200 a pop? Those calculators probably cost $20, $30 to make? Most of the economies of scale are already taken care of by the 12C tooling.

Yes they are. All which is needed are printing of alternate voyager 1xC key legends, key matrix bezel, and back bezel. Oh and there is the remolded logo to crown the achievement. Sufficient code exists today to do legacy firmware emulation on the ARM7 so that should be straightforward.

Even aftermarket retrofit is not out of the question. Although the repurposing effort of the new 12C seems to have stalled, and I haven't poked at the deployed 12C's AT91SAM7L128 in terms of whether

it can be reflashed via the 6-pin service connector, I believe it is possible. The 12C's lcd is functionally identical to the legacy voyager's so there doesn't appear to be much of a hurdle.

IMHO the only thing better than a 15C is an open design 15C. And given the requisite pieces are just lying around waiting to be assembled it is pretty tempting. I've even investigated the possibility of small scale manufacturing of a open project chassis mechanically closer to the traditional voyager vs. the rewarmed 12C but using an ARM7 uC and (as long as we're going to fab a PCB) an SPI battery backed SRAM similar to the hp-35s. The biggest hurdle in a ground-up scenario is that of an lcd source in such quantity, assuming keeping the voyager numeric display is a goal. Otherwise a greater number of options exist but that puts the effort on a slippery slope with temptation to best what is arguably a model engineering effort near 30 years later.

Alas it boils down to such an undertaking either having marketing justification (unlikely), enthusiast critical mass (possible), or someone with abundant free time and resources (:P).

Re: I doubt it is a fake.

*Message #25 Posted by **Peter Matthews** on 17 Sept 2010, 10:28 p.m.,*
in response to message #24 by uhmgawa

I honestly do not think it is actually worth the effort. Fact is, RPN users are a... fading breed. Someone closer to the academic community can probably give better insight but my guess is all the kids are on algebraic these days.

The 12C is different because of the rich Wall Street bankers who follow the herd and also are trained by their MBA professors to use the 12C RPN. They won't have need for a SIN function on their calculators, and much less a MATRIX function or binary conversion.

Reflashing modern Voyager is an interesting concept and probably can be made cheap by the sale of "stick on" key labels. Ugly yes, and reminds me of the 1980s attempt at DVORAK stick-ons, but can be cheaply done, with a similar stick-on overlay (a-la 41C series).

Regarding the LCD display, it is a KILLER APP for me. The clarity of that screen is way way more important for me than dot matrix modern displays. If I wanted fancy graphics, heck, I would just fire up my Mac or hack out my own iPhone program in Objective-C and load it up.

I just want to grab a physical calculator and punch in numbers quickly (tactile, not touch screen).

(My 11C in a safe deposit box is not so hard core whenever I worry that some time in the future we won't even be able to buy working used vintage RPN *scientific* units in the Voyager form factor; I intend to live several more decades... ;-)

I studied your pics fairly closely. I don't see anything obvious on the calc which screams out fake. The sleeve looks a bit different compared to the disintegrating 16C's garb I have here. Then again I just bought a 15C which arrived in a sleeve too good for the number of years it has presumably been on the planet, so go figure. The heat sealed edge on the mouth of your sleeve looks to be spaced a tad far from the open edge compared to what I've seen, but that's hardly conclusive.

> Quote:
>
> The HP calculator cover is too new. And it has the HP logo on both sides. The material is too rubbery.

The "new" 12C vinyl sleeves sport an HP logo on both sides. But the material itself is nothing like the vintage voyager sleeves and IMHO could easily have been recycled from "free gift" Harbor Freight duffel bags.

> Quote:

AFAICT for the legacy voyagers, the double shot mold is that of the key body and the white central legend. The blue sub-legend is printed on a key's diagonal facet. Get a 10x jeweler's loupe (which is probably a required tool at this point) and have a close look at a key. You can clearly see the molding seam between alternate mold injected portions, contrasted with the surface deposited blue paint of the lower legends.

Compare to that to the current vintage 12C which has been cost reduced to the point of criminality, where all legends are printed.

> Quote:
>
> I am wondering if there's a market now for knocking off these vintage calculators by creating them from the factory that makes the modern 12C and sell them for high prices on eBay.

I hope so, as I'd like to buy a few at the presumed knock off prices. Particularly if China, Inc. produced an accurate knock-off of a 15C build on a 12C AT91SAM7L128 frame. I doubt that wish will be realized as sadly there just aren't enough voyager geeks to justify a market.

> Quote:
>
> I don't want to rip out the rubber feet to open it and check the insides but it also feels slightly heavier than the 12C and what I remember of my original 11C.

Toss it on a jewelery scale and quantify it. I don't have an 11C but this is what I can offer for those I do:

hp-15C: 117.95g hp-16C: 115.05g hp-12C: 120.66g (new ARM7/CR2032x2 version)

All the above are with batteries as I didn't want to risk nailing the SRAM. But that shouldn't add too much uncertainty.

Re: Fake HP calculators on eBay?

*Message #27 Posted by **Peter Matthews** on 17 Sept 2010, 8:33 p.m.,*
in response to message #26 by uhmgawa

OK many thanks; I think I am put at ease. I did not realize that the 11C production varied (I just figured it would have varied among countries but thought all USA-made units would be exemplary, as was my vintage 11C).

On the economical aspect, again I think there IS a market for this. Just because an extra $250,000 profit is a drop in the bucket for today's HP does not mean it isn't a justified operation for, say, 10 people, given that on a DAILY basis I see a market for this on eBay.

So THEORETICALLY I think it's still a viable "business" for some people to create knock-offs and yes, I agree that even if they were knock-offs, many of us would still pay to get something that quacks and walks like the Voyagers.

I'll be interested to hear what other comments folks have from my photos but in any event, it has been a fun, ah, TANGENT to undertake for my little "new old" scientific calculator.

I guess I should celebrate this weekend, having scored a great condition 11C!

:-)

Re: Fake HP calculators on eBay?

in response to message #26 by uhmgawa

"I hope so, as I'd like to buy a few at the presumed knock off prices."

We can hope :-)

"HP has informally shown a "15c+" prototype at a conference in September 2008, but as of July 2009 has not announced it as a product. However, HP has introduced 12C and 15C simulators running on Windows and on the Apple iPhone, and some have speculated that part of the rationale for the 15C simulator may be to [gauge] interest in the possible reintroduction of the 15C."

http://www.brouhaha.com/~eric/hpcalc/voyager/variants.html

(HP sells the 15C simulator for the iPhone for a whopping $30 which is crazy. I'll wait for a "real" 15C selling for $90 and put the cash toward that instead...)

I have a great deal of respect for HP of yesteryear to the extent I'm disappointed not to have been part of that engineering history. I don't know much about contemporary HP but I doubt having it cater to the surviving creaky antiques, wanting a 30 year old product brought back in a market flooded with 400MHz ARM cellphones, is going to be worth the wait.

Haven't seen HP's simulator but I'd be surprised if it can offer anything over Eric's work. Aside from the technical achievement, Nonpareil is opensource which IMHO makes it a vastly preferable, portable technology.

Re: Fake HP calculators on eBay?

*Message #30 Posted by **Peter Matthews** on 17 Sept 2010, 10:19 p.m.,*
in response to message #29 by uhmgawa

Mostly IMHO the HP branded iPhone simulators are REALLY GOOD LOOKING but I would not pay $30 just for the graphic. There are other HP calculators on iPhone and functionally they are equivalent; just aesthetics. I have a $0.99 11C simulator, a 12C simulator and a 45cx simulator (the latter one is a very very good).

We've hashed over these these arguments so many times... while I believe there is a huge market for retro calculators right now, you are right that it won't last forever. If HP wants to do a 15c+, they better do it while the baby boomers are still around...

Re: Fake HP calculators on eBay?

I agree fully. The used calculator market is well upwards of $1.5M annually, but the later TI/HP models, calculators-on-calculators or calculators-on-phone and general technological progress are making retro models much less appealing- and there is attrition, of course, but that's a given.

Yes!

*Message #1 Posted by **Michael Meyer** on 16 Sept 2010, 7:06 p.m.*

I received an HP-33C in the mail... was only $33 on TOS. It was advertised as having a faulty switch. I didn't even test it before I disassembled it and cleaned and tightened the switches. It's in mint condition... not a scratch on it, seemingly unused feet, and absolutely no corrosion. It works perfectly. Yes!

Re: Yes!

*Message #2 Posted by **Michael de Estrada** on 16 Sept 2010, 7:29 p.m.,*
in response to message #1 by Michael Meyer

Great find! So many Spices have issues with corrosion, broken battery contacts, bad keyboards, cracked cases etc, that it's hard to find one in good condition, especially at that price. Does yours have the soldered keyboard / circuit board? I've got one of each, and I'm constantly having problems with the non-soldered unit.

Edited: 16 Sept 2010, 7:30 p.m.

Re: Yes!

*Message #3 Posted by **Michael Meyer** on 16 Sept 2010, 8:56 p.m.,*
in response to message #2 by Michael de Estrada

Oops. I was so focused on getting the inner assembly out and gazing at it's perfect keypad that I didn't even notice. If I remember correctly, I guess I could weigh it.

Re: Yes!

*Message #4 Posted by **Michael de Estrada** on 16 Sept 2010, 9:23 p.m.,*
in response to message #3 by Michael Meyer

If the first two digits of the serial number are 19 (1979) or lower, then almost certainly it is unsoldered, 21 (1981) or later soldered. If it is 20 (1980), then I've seen both types. Anyways, the feel of the soldered keyboard is totally different, much more refined with short, easy and very positive clicks.

Re: Yes!

*Message #5 Posted by **Michael Meyer** on 16 Sept 2010, 9:36 p.m.,*
in response to message #4 by Michael de Estrada

It's SN 1943Aetc. And it has good heft to it, so it's probably unsoldered. Fortunately, it had absolutely no corrosion and appears to be functioning perfectly. Thanks!!!

Re: Yes!

*Message #6 Posted by **Michael Meyer** on 16 Sept 2010, 9:38 p.m.,*
in response to message #4 by Michael de Estrada

The key travel is fairly long, and takes a firm press, but the click is perfect.

Re: Yes!

*Message #7 Posted by **Michael de Estrada** on 16 Sept 2010, 10:47 p.m.,*
in response to message #6 by Michael Meyer

When brand new they work pretty well, but deteriorate with use. I had two in the late 1970's, an HP-32E and HP-34C, and they both lasted about a year with heavy work use before falling apart. Anyway, unless you use yours heavily, it should be good for quite some time. The best one I have is an HP-38E that appears to be practically new, complete in its box with all accessories.

Re: Yes!

*Message #8 Posted by **Michael Meyer** on 17 Sept 2010, 1:12 p.m.,*
in response to message #7 by Michael de Estrada

In this condition? No, I won't use it all except to show it off in the collection. Not being an engineer, I rotate use from HP-25's (everyday simple math), to a 19C, and my 97 for taxes. Occasionally will use others just for fun, but not much heavy use. Onward to find a cheap 27S, 21S, and maybe, if I'm lucky, an affordable 70....

Re: Yes!

*Message #9 Posted by **Michael de Estrada** on 17 Sept 2010, 8:11 p.m.,*
in response to message #8 by Michael Meyer

I'm not sure there is such a thing as "an affordable HP 70." There have been plenty of auctions this year, and all the nice ones have sold for over $500. There's a reserve auction going on right now, which is the first I've ever seen that includes the original printed manual, so I'd expect this auction to be no different.

hp 30b LCD Rainbow mark

*Message #1 Posted by **JoeGeller** on 16 Sept 2010, 2:22 p.m.*

When my new hp 30B is viewed at normal angles from a desktop I get a rainbow pattern in part of the display. It is much more dominant in lower light. In dim office light, the mark reduces to a gray darkened half circle. In bright light it sometimes is not visible. There is no visible crack or break in the display.

See pics at http://www.flickr.com/photos/28209719@N00/sets/72157624845312599/

It was an eBay buy, but the hp 30b was new in a sealed package. (4CY02400091) There was no visible damage to the package before it was opened.

Otherwise, the calculator works fine. The numbers are always visible, but sometimes the rainbow/gray area is annoying.

Is it a damaged LCD? Have others seen this on an hp 30B ?

Re: hp 30b LCD Rainbow mark

*Message #2 Posted by **Martin Pinckney** on 16 Sept 2010, 2:40 p.m.,*
in response to message #1 by JoeGeller

You can get this effect on any LCD screen if you apply pressure directly to the screen. I wonder if the LCD on your 30b is somehow stressed by a warped case or something like that?

Re: hp 30b LCD Rainbow mark

*Message #3 Posted by **Raymond Del Tondo** on 16 Sept 2010, 3:19 p.m.,*
in response to message #1 by JoeGeller

Yes, the LCD cover of the brand new 30b I had for a few days showed the same rainbow effect. The unit had not suffered any stress. It's a production/material design problem, similar to that of the early 49g units. Someone tried to save some money at the wrong place...

Re: hp 30b LCD Rainbow mark

*Message #4 Posted by **Giovanni Jimenez** on 16 Sept 2010, 10:39 p.m.,*
in response to message #3 by Raymond Del Tondo

Had the same problem with my 30b. It is pretty much gone now.

*Message #3 Posted by **Ujval** on 16 Sept 2010, 5:08 a.m.,*
in response to message #2 by Walter B

Tried it before posting - it seems to lead to the HP website page that does not have any support information on the 30b once I accept the terms listed on http://ftp.usa.hp.com/

Am I still missing something obvious?

Re: HP 30b full pdf manual

*Message #4 Posted by **gene wright** on 16 Sept 2010, 7:29 a.m.,*
in response to message #3 by Ujval

When I clicked the FTP link in that other thread, I see a .welcome file and the PDF of the manual.

Looks like it is right there to me.

Re: HP 30b full pdf manual

*Message #5 Posted by **Ken Shaw** on 16 Sept 2010, 9:42 a.m.,*
in response to message #3 by Ujval

Use the ftp protocol, not http.

ftp://ftp.usa.hp.com/

Re: HP 30b full pdf manual

*Message #6 Posted by **Martin Pinckney** on 16 Sept 2010, 9:55 a.m.,*
in response to message #5 by Ken Shaw

But if I use that address, I get a username and password request. Using the link Walter referred to, I get right in to the site where the manual can be downloaded.

ftp://hp2030ma:Waxlike3@ftp.usa.hp.com/

Re: HP 30b full pdf manual

*Message #7 Posted by **Sujith Abraham** on 16 Sept 2010, 12:26 p.m.,*
in response to message #1 by Ujval

Download HP 30b User's Guide [PDF] There is also the HP 30b Learning Guides which are more application/practical oriented.

The web version of the learning modules is not really recommended for printing. I am not hot-linking the file, but you can find HP 30b Learning Modules [.zip] in pdf from hpcalc.org page.

hpcalc.org has both the files in PDF but not HP! :(

(at) Ujval If you are still having trouble, contact me. I will send it as an attachment or I could upload to some other public server :)

Edited: 16 Sept 2010, 12:51 p.m.

HP-97 Aluminum Printer Gear

*Message #1 Posted by **aj04062** on 15 Sept 2010, 9:18 p.m.*

I saw a few days ago a listing on tha auction site for a replica idler gear for these printers. The price was reasonable when compared to Katie's method (given the mods required)

I was going to buy one tonight but the listing is gone. I don't know if it just expired or he is done selling. Has anyone bought one and has this guys contact information?

Thanks in advance.

Re: HP-97 Aluminum Printer Gear

*Message #2 Posted by **M. Joury** on 15 Sept 2010, 9:49 p.m.,*
in response to message #1 by aj04062

You might be able to get the info you need by searching completed auctions.

Re: HP-97 Aluminum Printer Gear

*Message #3 Posted by **Michael de Estrada** on 15 Sept 2010, 10:22 p.m.,*
in response to message #1 by aj04062

The seller's eBay name is davehal2001 and his real name is Dave Bowman, dmbowman@mchsi.com. I have one of those idler gears, and it works perfectly. I also bought a perfectly restored HP 97 from him. I recommend him without reservation.

Michael

Re: HP-97 Aluminum Printer Gear

*Message #4 Posted by **Ignazio Cara (Italy)** on 16 Sept 2010, 2:18 a.m.,*
in response to message #1 by aj04062

Hello, I wish to confirm what we said Michael, gears supplied by davehal2001 are the best. Some time ago a French friend (hello Etienne) gave me two brass gears, good but noisy, then I bought a German company. I sold several HP-97, and plans to sell other, all with this particular gear. I have so many original plastic (?) idle gears in good condition: if anyone is interested can contact me directly. Greetings to all

Ignazio

A little programming chalenge

*Message #1 Posted by **Patrice** on 15 Sept 2010, 7:22 p.m.*

Hello all,

Here is a little programming chalenge (no prices). I will present my solution at HHC 2010.

It is all about optimization: be as fast as possible.

The goal is to fill as much as possible places in a figure while respecting the rule.

The figure is a square or a rectangle.

The rule is that there must be no more than 3 consecutive places filled in a row, a colomn or a diagonal.

Here is a 4*4 square :

```
.  *  *  *
*  *     *
*     :  *
*  .  *  *
*  *  *  .
```

Since the amount of calculus grows quickly, the programming can be done on a PC.

If you are under a minute of runtime, just make the figure bigger: 4*4, 4*5, 5*5, 5*6, 6*6, 6*7, 7*7 and so on.

To compare the results, give the size of your figure, the number of time you have try to fill a place, the timing in seconds, and the language for advice :

4 4 12 0 D

Be smart guys :-)

Patrice

Edited: 16 Sept 2010, 1:30 a.m. after one or more responses were posted

Re: A little programming chalenge

*Message #2 Posted by **David Hayden** on 15 Sept 2010, 9:50 p.m.,*
in response to message #1 by Patrice

Thanks for posting this Patrice. I always like programming challenges.

I think there may be more to the problem than you're stating. For example, if I leave all of the places on the board unfilled, that would meet the rules that you've stated. So are we trying to fill in as many places as possible?

Thanks. See you at HHC2010!

Dave

Re: A little programming chalenge

*Message #3 Posted by **Chuck** on 15 Sept 2010, 10:50 p.m.,*
in response to message #2 by David Hayden

I don't think that would satisfy the "fill as much as possible" rule.

Re: A little programming chalenge

*Message #4 Posted by **Patrice** on 16 Sept 2010, 1:40 a.m.,*
in response to message #3 by Chuck

You right, Chuck !

> Quote:
>
> The goal is to fill as much as possible places in a figure while respecting the rule.

This sentence is not clear enough ?

well ! I don't know when I will this forum again, I take plane in 6 hours.

Patrice

Re: A little programming chalenge

*Message #5 Posted by **David Hayden** on 16 Sept 2010, 6:21 a.m.,*
in response to message #4 by Patrice

Oops! I don't know how I missed that the first time around.

Re: A little programming chalenge

*Message #6 Posted by **Patrice** on 24 Sept 2010, 1:52 a.m.,*
in response to message #1 by Patrice

Hi all,

Just arrived in Fort Collins.

Anyone working on the chalenge ?

Patrice

Re: A little programming chalenge

*Message #7 Posted by **David Hayden** on 24 Sept 2010, 6:45 a.m.,*
in response to message #6 by Patrice

I thought about it a little and tried playing with it on paper, but didn't get much beyond that. One problem I found was figuring out when I had an optimum answer.

Re: A little programming chalenge

*Message #8 Posted by **Egan Ford** on 24 Sept 2010, 10:34 a.m.,*
in response to message #6 by Patrice

I cannot make HHC this year (too much work), I just canceled yesterday, so I may have time this weekend to work on it.

Re: A little programming chalenge

*Message #9 Posted by **Steve Perkins** on 24 Sept 2010, 5:25 p.m.,*
in response to message #6 by Patrice

I thought about it for a while.

It's a worthy challenge.

I thought it was pretty easy, then I read it again and noticed the "diagonal" requirement.

I'm interested to see the results folks get.

Re: A little programming chalenge

*Message #10 Posted by **Egan Ford** on 25 Sept 2010, 8:42 p.m.,*
in response to message #1 by Patrice

> Quote:
>
> Be smart guys :-)

My first not-so-smart pass (quick and dirty):

```
4 4 12 0 C
* * * .
  * * *
. * *   *
* . * *

4 5 15 0 C
  * * *
. * * *
*   * *
* * .  *
.  * * *

5 5 18 0 C
* * *  . *
  * * *
. * *    .
*   * * *
* * .  * *

5 6 22 1 C
* * *  . *
*   * * *
  .  * * *
. * .  * *
* * *  .
* * *    *
*  .  * * *

6 6 26 14 C
* *  . * * *
* * *  . * *
*   * .  * *
  . * *  . . .
. * *    * * *
* * .  * * *
* * *  .
```

```
6 7 31 234 C
* * *   * *
* *   . * *
* * *   * *
      .
    *
. . .   . .
* * *   * *
* *   . * *
* * *   * *
      .

7 7 36 0 Just thought about it.
* * *   * * *
* * *   * * *
      .
* * *   * * *
      .
. . .   . . .
* * *   * * *
      .
* * *   * * *
      .
* * *   * * *
```

I have a rather large project due. So, I'll try for a smart solution next weekend.

Edited: 25 Sept 2010, 9:22 p.m.

Re: A little programming chalenge

*Message #11 Posted by **Patrice** on 26 Sept 2010, 6:50 p.m.,*
in response to message #10 by Egan Ford

Nice beginning Egan,

Brute force attack ?

Too bad you were not at HHC.

I have not presented my solution to the problem at the conference because schedule was too tight. I have done it only on reduced comity after the end of the conference.

I will post my solution in another treat on the forum, so that, you can continue your search and device a solution on your own.

Patrice

Emu48 skins

*Message #1 Posted by **Martin Pinckney** on 15 Sept 2010, 5:51 p.m.*

Just started to use Emu48 to experiment with programs before loading them into the real calculator. I prefer the realistic skin.

Problem is, on my laptop (also on the auxiliary screen I use when at home or the office) with modern screen resolution, the realistic skin that came with the downloaded Emu48 is so tiny, I have to get close to the screen to read it! (About half size).

Has anyone found a larger realistic skin, or otherwise solved this problem?

Thanks.

Re: Emu48 skins

*Message #2 Posted by **Richard Garner** on 15 Sept 2010, 7:00 p.m.,*
in response to message #1 by Martin Pinckney

You can find many different skins at hpcalc.org. There are several nice realistic skins there. I know that may of the skins come in verying resolutions.

Re: Emu48 skins

*Message #3 Posted by **Christoph Giesselink** on 15 Sept 2010, 8:07 p.m.,*
in response to message #1 by Martin Pinckney

Hi Martin,

Yes, you're right. The old skins delivered with Emu48 are getting too small on modern displays. Most of these one are created around the LCD Zoom 2 size.

I recently bought a 24" monitor and the only satisfied resolution was the natural one of 1920x1080. And and this resolution the Zoom 2 size skins are still readable, but I agree, they should be larger. But the only way to get larger ones, is to write them. Best IMHO will be a skin based on the LCD Zoom 3 setting.

I don't know any realistic skins at the moment, which base on LCD Zoom 3 setting. Non realistic skins can be grabbed from the Emu48 Pocket PC project. Most of the skins for VGA or WVGA resolution are Zoom 3 ones.

Example for HP48SX and HP48GX:

http://hp.giesselink.com/Emu48/Kmlppc/Wombat3.zip

Example for HP49G:

http://hp.giesselink.com/Emu48/Kmlppc/HP49VGA.zip

Writing new KML scripts is a highly time consumptive job. I recently rewrote a realistic Zoom 2 to a Zoom 3 skin of a Saturn based calculator, it took me about 2-3 hours.

Regards

Christoph

*Message #4 Posted by **Martin Pinckney** on 15 Sept 2010, 10:15 p.m.,*
in response to message #3 by Christoph Giesselink

Thanks, Richard, Christoph.

Right now I am using 48SX_STD, by Leszek Ulman, which is at least the same shape and layout of the calculator, if not strictly realistic. And it is maybe 95% of full size on my laptop screen; 105% on my auxiliary screen, so size-wise a good compromise.

What if you downgrade the display resolution of your laptop? (Maybe not so good if you are switching around between a bunch of programs.)

Re: Emu48 skins

Yes, this could work for the duration of a session using the emulator.

Re: Emu48 skins

For the calculator nuts: Free42

*Message #1 Posted by **Geir Isene** on 14 Sept 2010, 3:36 p.m.*

Nothing new for you guys... just wanted to inform you that in my enthusiasm for the Free41, I had to blog about it, tweet it and send it to my friends on Facebook - reaching a couple of thousand people.

Thanks Thomas - it's an excellent product.

Link to blog post.

Re: For the calculator nuts: Free42

Jim, did you use the **File -> Preferences -> Map "Calculator" key to Free42** feature, or did you use some other means to re-map that key? I'm asking because I've always wondered whether anyone actually uses that feature... I'd use it myself, but I can't, because these retro keyboards I use don't have any keys to spare. :-)

Re: For the calculator nuts: Free42

*Message #6 Posted by **Dallas Osborne** on 17 Sept 2010, 9:50 a.m.,*
in response to message #5 by Thomas Okken

Yes, I do use the key map feature; I use the rows Q-Y, A-H, and Z-N for the upper section. It is obviously only active when the program is active, but this seems to work great for me. I did this a couple of years ago (it seems) but it took a few months to get used to, but now I rarely miss a key. (A&S have the same function as the little finger on the number pad of my keyboard.) The only time I use the mouse interface is to access any of the menu options in the lower half of the keyboard.

I do use the iPhone one as well and find it quite nice, actually.

12c+ Firmware

*Message #1 Posted by **Michael Bromm** on 13 Sept 2010, 10:52 p.m.*

I've got a 12c+ with firmware version 2009-07-02. I understand that there are some bugs with this firmware.

I have searched this forum and I have seen discussions in which it appears that people have upgraded their firmware, but I can't seen to see a "how-to". So I have two questions: (1) Is there a "how-to"? If not, (2) how to?

Me culpa in advance if I have missed it, and thanks in advance to anyone who will help.

Re: 12c+ Firmware

*Message #2 Posted by **Katie Wasserman** on 14 Sept 2010, 1:06 a.m.,*
in response to message #1 by Michael Bromm

You need a special serial cable that plugs into the 6-pin connector inside the battery compartment. The HP guys here (Tim and Cyrille) can comment on the available of these and the availability of updated firmware.

As far as I know you can't buy this cable anywhere, however it would be possible to make one yourself and the circuit has been described in detail here. Then you'd need to find the latest firmware somewhere, but I don't think that HP has that freely available for download.

This issue has come up with the 12C+ before and potentially with the 20b and 30b too since they all share the same ARM processor, programming connection and firmware update method. It would be great if HP (T & C) could contract with a place that can sell the cable and host the firmware for download. Eric Rechlin already sells a HP-20b "hackers kit" and similar things on his commerce site, perhaps he'd want to carry these cables and firmware.

-Katie

Re: 12c+ Firmware

*Message #3 Posted by **Michael Bromm** on 14 Sept 2010, 10:14 a.m.,*
in response to message #2 by Katie Wasserman

Katie, many thanks for your helpful response. I know that the bug(s) are relatively minor, but this is my 3rd 12c and, I had hoped, the bestest. Certainly the feel of it (especially the keypad) is much better than it has been on recent iterations, and it's obviously a lot faster. Now if I can get the firmward updated, I will be content.

I will wait to see what the HP fellows on this board have to say. I assume I could send the thing in for service, but of course then I wouldn't have it, would I?

Re: 12c+ Firmware

*Message #4 Posted by **Tim Wessman** on 14 Sept 2010, 10:47 a.m.,*
in response to message #3 by Michael Bromm

Nope, it can't be sent in for service. Send me an email.

TW

Re: 12c+ Firmware

*Message #5 Posted by **Sujith Abraham** on 14 Sept 2010, 1:51 p.m.,*
in response to message #2 by Katie Wasserman

I think this is the interface cable: Segger ARM7 JTAG Emulator for the 20/30b. (Please correct me if I am wrong) However, obtaining the updated ROMs are difficult.

Those ports are there for people with hacking spirit. Not for us, mere mortals :(

Re: 12c+ Firmware

*Message #6 Posted by **Tim Wessman** on 14 Sept 2010, 7:10 p.m.,*
in response to message #5 by Sujith Abraham

>However, obtaining the updated ROMs are difficult.

Not really. . .

TW

Re: 12c+ Firmware

*Message #7 Posted by **Michael Bromm** on 14 Sept 2010, 7:53 p.m.,*
in response to message #6 by Tim Wessman

Just a public nod of thanks to Katie, for her quick and helpful response, and Tim, for solving the problem.

Re: 12c+ Firmware

*Message #8 Posted by **Mark Harman** on 14 Sept 2010, 7:55 p.m.,*
in response to message #5 by Sujith Abraham

That is just one solution if you solder on a JTAG connector. Personally, I wouldn't go that route as it would leave an unsightly hole on the back of the calculator. Even on the 20b or 30b, I think it would bad. Some ultra-hobbyists might not mind a hole in the back of their calcs, but the thought makes me ill.

There is already a connector that works via a cable that has a 9 pin RS-232 on one end (computer end) and a 6 pin Pogo plug (calculator end) on the other. The pogo connector is right below the batteries. No modification of the calculator is necessary and you can flash or repurpose the calculator easily with the correct cable. However, I think you need to either make the cable yourself or make an arrangement with either Tim or Cyrille to obtain the cable.

Regards,

Mark

Edited: 14 Sept 2010, 7:59 p.m.

Re: 12c+ Firmware

*Message #9 Posted by **Katie Wasserman** on 14 Sept 2010, 9:56 p.m.,*
in response to message #8 by Mark Harman

On the 12C+ you have no choice but to use the 6-pin connector since there is no place to tap into the JTAG interface on the PCB.

Re: 12c+ Firmware

*Message #10 Posted by **Mark Harman** on 14 Sept 2010, 10:23 p.m.,*
in response to message #9 by Katie Wasserman

Katie,

Thanks for letting me know that. I had no idea. I thought the 12c+ had a similar paradigm because it used the same processor. I learn something new every day.

Thanks,

Mark

Re: 12c+ Firmware

*Message #11 Posted by **Michael Bromm** on 15 Sept 2010, 10:49 p.m.,*
in response to message #1 by Michael Bromm

I can now report as follows:

I first raised the issue yesterday morning. Less than 48 hours later, Tim has taken care of the issue and I now have the firmware updated to the 2009-08-03 version. That is by a wide margin the fastest and most helpful response I have ever had from any company representative. Add to that the fact that he's in Colorado and I'm in Vancouver, and it's that much more impressive.

Many thanks, Tim!

Re: 12c+ Firmware

*Message #12 Posted by **M. Joury** on 16 Sept 2010, 10:10 a.m.,*

Ideas for new 41 roms

*Message #1 Posted by **gene wright** on 13 Sept 2010, 8:02 p.m.*

Monte's upcoming 41CL got me to thinking...what other ROM ideas are possible?

here are some suggestions for those of you who know how to do this!

1) ROM(s) containing all the FOCAL programs from the HP solution books. I know those are available in .raw files at TOS. Perhaps these could be converted into some ROM images? This would be great and maybe not THAT difficult since they would not have to be keyed in?

2) A fixed PPC ROM module? The module had a bug where a global GTO BE instruction was the loop GTO in the Block Exchange routine. Be nice if that could be fixed so the PPC rom in the 41CL could be perfect. :-)

3) Are there any already developed MCODE routines for a variable TONE and / or Variable Length pause? These were a couple of the potential functions that almost made the PPC rom but were pulled out at the last minute. Any actual MCDOE routines for these exist out there?

4) How about a rom image of "Dungeon of Doom" from Datafile a few years ago? One of the better dungeon games and a royal pain to key in. Should run nice and fast in 41CL turbo mode. The barcode is in a Datafile issue.

5) A rom image would be a nice place to have Roger Hill's ultimate 41 calendar printer program since space is not an issue. :-)

6) Some of the routines from John Dearing's 41 Tips and Routines book might be nice to have in a rom.

Again, these are just ideas. :-) Of them, #1 above is the one that I suspect might be most useful.

P.S. One reason I'm asking about this now is that it would be nice if some of these things are done before the 41CL starts being sold..which I hope is soon.

Edited: 13 Sept 2010, 8:08 p.m.

in response to message #1 by gene wright

How about all the programs here: http://hp41programs.yolasite.com/

User library routines are plentiful too.

- Pauli

Re: Ideas for new 41 roms

*Message #7 Posted by **Ángel Martin** on 14 Sept 2010, 5:26 a.m.,*
in response to message #6 by Paul Dale

There are already three modules made using the programs from Jean-Marc's Baillard excellent site:

- JMB_Math (8k)
- ASTRO_2010 (12k)
- JBM_Matrix (8k)

Available at TOS.

Cheers, ÁM

Re: Ideas for new 41 roms

*Message #8 Posted by **Ángel Martin** on 14 Sept 2010, 5:23 a.m.,*
in response to message #1 by gene wright

Gene, I've been putting together a few 41 ROMs for the last couple of years, some of them related to your bullet points below.- My comments:

1. FOCAL programs from solution books.- Not sure that the ROM format is the best way for them. They'll require multiple FATs and perhaps interdependencies. Besides, many programs date from the early days of the 41C system and don't make use of advanced programming techniques, nor extended functions either. BTW, J-F Garnier put together the "Advanced Applications" ROM, with the Grapevine programs using the Advantage Module - that's a very good one.

2. As much as I like the PPC Module I think that by the most part it's superceded by many other advanced modules using MCODE, so I wouldn't put efforts in changing it.

3. The function TONEXY allows for variable frequency and time inputs for TONE. IT's available on several modules, like ALPHA, 41Z (called TONEZ there) and Games Library.

4. I'd gladly add "Dungeon of Doom" to the games libray Modules if somebody provides me with a RAW file (I don't have the datafile issue). Ditto about the Calendar programs.

5. Tips&Routines don't lend themselves well to the ROM format: too many of them (FAT entries are limited) and too short code for an effective usage of the ROM space.

Cheers, ÁM

Re: Ideas for new 41 roms

*Message #9 Posted by **gene wright** on 14 Sept 2010, 8:11 a.m.,*
in response to message #8 by Ángel Martin

Hi Angel!

1) Regarding solutions books, perhaps you are right. However, on the 41CL there is **plenty** of room for rom images, and the solution books are a big source of solutions and the code is already in the proper format.

2) Agree with the PPC module, however the code fix is very easy and the code is all FOCAL. Just seems a shame to have the original rom version with this one tiny little bug in it that is so easily fixed be placed into the 41CL. ;-)

3) Thanks for the direction here.

4) Does **anyone** have Dungeon of Doom in raw format?

5) True true. Perhaps I can at least go through the book and see if there are any worth putting in due to length and features.

As I understand it, even with **all** the roms from TOS loaded, the memory space is about 1/2 empty on the 41CL.

So, there is a LOT of extra room for ROMs to be put in. The idea of carrying around every rom and every solution book is an attractive one (to me).

Thanks all.

Re: Ideas for new 41 roms

*Message #10 Posted by **Ángel Martin** on 14 Sept 2010, 8:57 a.m.,*
in response to message #9 by gene wright

Hi Gene, for sure I too agree the idea is a good one - it's just that it requires some work to put the stuff together in the proper way, even if the programs are somehow all "ready to go".

For instance, the programs would need to be transferred to V41 (nowdays this is the easiest way to do it, thanks to Meindert's MLDL2k manager SW) - which means creating RAW files for them. Then there's the question of the FAT and catalog setup (XROM numbers, etc). I'd reckon it'd take about a full week per module.

W.r.t. the Dungeon program, you could maybe use a wand to get the program on the 41, then use MLDL2k with Hepax emulation to create a ROM image that can be loaded to V41 -> work done ;-)

Cheers, ÁM.

Then all we need are some volunteers!

*Message #11 Posted by **gene wright** on 14 Sept 2010, 10:38 a.m.,*
in response to message #10 by Ángel Martin

Since I hope a large number of people here will want one of the 41CL's for themselves, everyone will benefit with as many ROM images available as possible.

How about a list of volunteers? :-)

Re: Then all we need are some volunteers!

*Message #12 Posted by **Meindert Kuipers** on 14 Sept 2010, 1:53 p.m.,*
in response to message #11 by gene wright

The 41CL looks really great to me, but why the hurry? I hope it is possible to put your own ROM images in the 41CL?

Meindert

Re: Then all we need are some volunteers!

*Message #13 Posted by **gene wright** on 14 Sept 2010, 2:56 p.m.,*
in response to message #12 by Meindert Kuipers

From what I understand, that will not be easy.

It is a replacement CPU board and will be in place inside the 41c.

No usb port. It does have a serial port, but you would have to attach wires and have them come through the HP 41 case.

Most probably won't do that.

So, it will not be as easy to upload new material to the 41CL as it would be to upload material to the MLDL2000 or NoVRAM solutions, if I'm understanding it correctly.

Re: Then all we need are some volunteers!

*Message #14 Posted by **Monte Dalrymple** on 14 Sept 2010, 5:48 p.m.,*
in response to message #13 by gene wright

There is a function in the 41CL that can be used to transfer from a Port into the internal

RAM. From there it can be written to the Flash. So if you have something that plugs into a Port (like a MLDL2000 or NoVRAM) the transfer isn't any more difficult than getting the image into the MLDL2000 or NoVRAM. The only issue with this is that only Bank 1 can be transfered this way. The problem is control of the state of the Bank select for the page being transferred. This just means it's a little more complicated: you'll have to transfer one bank at a time and then assemble them in the RAM for aggregation into the Flash. I expect that anyone willing to go through this route won't be intimidated by the details. And you can always just leave it in RAM too.

Re: Then all we need are some volunteers!

*Message #15 Posted by **Geir Isene** on 14 Sept 2010, 6:17 p.m.,*
in response to message #14 by Monte Dalrymple

I missed the details on the 41CL; and can't find it in the archives. Could you fill me in on the details as to ETA and price?

Link

*Message #16 Posted by **gene wright** on 14 Sept 2010, 7:11 p.m.,*
in response to message #15 by Geir Isene

41CL link including technical manual PDF

Re: Then all we need are some volunteers!

*Message #17 Posted by **Monte Dalrymple** on 14 Sept 2010, 8:08 p.m.,*
in response to message #15 by Geir Isene

The details are in the appendices of the NEWT techincal manual at this point. At some point I will do a separate manual for the 41CL. ETA is a sore point right now. The chip that is needed to translate the 6 volt signals has a 26 week lead time, and my scheduled delivery date isn't until next July. Unfortunately it is only made by Texas Instruments and there is no real substitute. I can't comment on price yet. The quotes I have for getting the PCBs assembled seem excessive to me. Monte

Re: Ideas for new 41 roms

*Message #18 Posted by **Geir Isene** on 16 Sept 2010, 4:35 a.m.,*
in response to message #10 by Ángel Martin

Angel; Do you have a complete write-up of how you produce these FOCAL roms that you are now so eminently churning out?

Re: Ideas for new 41 roms

*Message #19 Posted by **Angel Martin** on 17 Sept 2010, 2:18 p.m.,*
in response to message #18 by Geir Isene

Glad you asked Geir.- I wish I had, as I'll be the first one to follow it because every time I need to put another one together I end up having to rethink the whole process :(

Oh well, it's not so complex after all. I use MLDL2k Mananger to disassemble the contents of the HEPAX RAM memory. Such contents may get there either from RAW files using V41 or

by means of Wand, reading the barcodes for the programs. The beauty of MLDL2k Manager is that it effectively merges both the real and the vistual worlds, as the same ROM file works on both.

Once it's disassembled I use my own programs to create ROM files from ASCII listings, then MLDL2k manager again to compile the MOD files. Done.

Hope this helps, let me know if you need more details and I'll be glad to elaborate further.

Cheers, 'AM

Re: Ideas for new 41 roms

*Message #20 Posted by **Geir Isene** on 18 Sept 2010, 1:54 a.m.,*
in response to message #19 by Angel Martin

I have never used the MLDL2k Manager.

It would be cool to have a baby-step-by-baby-step article describing the procedure :)

Re: Ideas for new 41 roms

*Message #21 Posted by **Angel Martin** on 17 Sept 2010, 2:20 p.m.,*
in response to message #9 by gene wright

Got the Dungeon of Death in RAW format - thanks to Pauli who provided the barcodes.

We're one step closer now :)

Re: Ideas for new 41 roms

*Message #22 Posted by **Giovanni Jimenez** on 15 Sept 2010, 9:40 a.m.,*
in response to message #1 by gene wright

Do you know if there was ever a ROM created for Fuzzy Logic or Neural Networks computations ?

I haven't seen it available for the i41CX+, so I doubt it.

That would be e nice addition.

Re: Ideas for new 41 roms

*Message #23 Posted by **Giovanni Jimenez** on 16 Sept 2010, 10:41 p.m.,*
in response to message #22 by Giovanni Jimenez

If there is a Stats module for the HP-41, why is a Fuzzy Logic one so outrageous ?

I'd like a Bluetooth module. OBEX should be implemented for easy code/data exchange. It should support HEPAX exchanges as well. SPP would also be nice so that I can replace my HP-IL/RS232 setup.

Hmmm... Eventually one could define a native HP-IL over BT profile.

Hmmm... A very small USB port should be added to flash/maintain the BT module. Of course since there will be a USB port on the module you might as well add some type of USB support for the 41Cs.

Hmmm... If you have the space add a Time Module so that when I upgrade to a CL I'll have a universal module for BT, USB, and TM.

Hmmm... Next to the mini USB port you could add an LED so that I can also use my 41CX as a flashlight.

Egan, you forgot the "paperweight ROM" - made of a solid piece of lead that when plugged into the 41 turns it into the perfect, inmovable, reliable anchor for all your desk documents. :)

Re: Ideas for new 41 roms

*Message #26 Posted by **Walter B** on 16 Sept 2010, 3:43 a.m.,*
in response to message #25 by Ángel Martin

Olá Ángel,

you know lead (Pb) being a pretty dense form of condensed matter. Since Steve Hawkings we know matter = information. So you could store some 10^23 bits (= 100 G TB !) of programs and data in the spin states of the lead electrons and have the paperweight ROM included for free ;)

Maybe you'd need a little bit of He-cooling, but you'll manage this - it's trivial engineer's work ;)

Corvallis Division - DIV.39

*Message #1 Posted by **Joerg Woerner** on 13 Sept 2010, 2:07 p.m.*

I tested yesterday a nice Canon X-07 for that auction site and found folded in the box two interesting shipping documents:

1) The unit was purchased in Japan by the company Yokogawa-Hewlett-Packard and sold to Hewlett Packard in Palo Alto, CA.

2) Shipping address was Corvallis Division - DIV.39.

Any idea about the responsibility of DIV.39 in 1983? Skunkworks?

Second question: The "Handy Personal Computer" states Canon X-07, the box reads X-07R. Any idea what the "R" is for? Not for rechargeable batteries...

Thanks for your help.

Regards, Joerg

HP-IL Chips (1LB3-0003) and other goodies - what to do with them?

*Message #1 Posted by **Jim Horn** on 13 Sept 2010, 1:24 p.m.*

Hello - In going through my old things I found three unused HP 1LB3-0003 HP-IL chips. Those are the DIPs that were used in many of HP's HP-IL devices to provide that interface. As I dig further into the old storage unit I'm emptying, I should be able to find the documentation including the design notes I still have from then.

Also found my HP-110 Portable in its leather case and complete set of manuals (and with its memory boosted to 512k instead of 288k and CPU replaced with an 8MHz NEC V-30, roughly doubling its speed), my HP-9114A disk drive and other toys.

Anyone still interested in using these? Shall I arrange to get them to HHC2010 if I can't make it?

Jim Horn, Hood River, Oregon, USA (PPC 1402, etc.)

Re: HP-IL Chips (1LB3-0003) and other goodies - what to do with them?

in response to message #1 by Jim Horn

I would be interested in the ILB3-0003 chips, do you have the pulse transformers that go with them? I would also be interested in the HP-110 but suspect it may be expensive to ship it across the continent.

Re: HP-IL Chips (1LB3-0003) and other goodies - what to do with them?

*Message #3 Posted by **Jim Horn** on 14 Sept 2010, 12:39 a.m.,*
in response to message #1 by Jim Horn

Hi, Paul - Chips are yours if you want them. I don't think I have any transformers but will continue to dig through the storage. Pulse Electronics probably has some that will serve just fine.

Egan Ford - The HP Portable, 9114A and documents are saved for you.

All - I'm still digging through storage that's been away for years which includes stuff from 10 years at HP ('79 - '89). Things that aren't "valuable" to the rest of the world but of interest to this group will appear here as I find it for those who want it. No charge.

Best to all - this is a *tremendous* group!

Jim Horn (Hmmm - what to do with a still sealed in the box Versatron Foot Mouse?)

has anyone had any luck repairing calculator keys?

*Message #1 Posted by **hpnewbie** on 12 Sept 2010, 3:37 p.m.*

I've had an hp 50g for going on two years now... it's been a good calculator, mostly. The keyboard hasn't been the best however - though to be fair it does live in my backpack and probably gets pretty beat up. Since a month or two after I bought it, the 3 key has been loose and wobbles back and forth and is mushy. Actually, strangely enough, that has improved with time... it's still wobbly but the mushiness is less. Recently though the enter key has gone mushy and kind of collapsed down, and it's really annoying. You have to jab down on it with greater force than the rest of the keys and you can never really tell when it registers or not. I was wondering if anyone here knows if it's possible to fix problem keys like these or has had any experience doing it... could you give me any pointers?

Thanks so much

Re: has anyone had any luck repairing calculator keys?

*Message #2 Posted by **Han** on 12 Sept 2010, 9:34 p.m.,*
in response to message #1 by hpnewbie

To open the calculator, you first need to pry up the plastic screen guard. There is a video of this on youtube.

Here is one such link.

Once you have the screen guard off, you will then need to be careful with how you open it. After removing to screws at the top, you should be able to simply pry the two halves apart with your hands. (This is actually hard to do, but with a LOT of patience, it will separate.) Do NOT pull the halves apart too quickly as the speaker wire connects the two halves. You can pry the speaker apart (it's merely glued to the battery half) and then safely separate the two halves.

Once you have completed this, unscrew the mini screws and also cut through the plastic rivets that hold the PCB to the keyboard. What I did was simply drill away at the top with a hand drill and this was enough to defeat the rivets yet still leave enough of it to use the screws to keep the PCB in place.

What has likely happened is that the "peg" underneath the [3] key got bent, broken, worn, etc. Or, the metal dome has gone kaputz. If, however, the problem is that the key's "hinge" has broken, you can probably fix it with some flexible epoxy. You may as well throw on an epoxy layer for the other keys while you're at it to prevent future problems. If you look at the photos, you can see how poorl even the most current keyboard design is. The little pegs underneath each key are simply to thin/small and their strength is easily compromised from normal usage. (Those pegs are at least 4 times as thick on the HP48 series) Moreover, the keys nearly puncture through the thin layer of rubber foam that is used to give the keys a soft feel upon pressing them.

Here are some photos which you may find useful:

Photo 1

Photo 2

Photo 3

Photo 4

Photo 5

The photos won't be up for long.

New to HP, RPN and Rotate and Click.

*Message #1 Posted by **Sujith Abraham** on 11 Sept 2010, 11:03 p.m.*

I am new to HP Calculators. I got a 35s and 30b recently. Somehow the keys feel rigid and uncomfortable. I believe this is not the feel many people have come to love about HP.

Will it loosen up and feel more easy as I use it more often? What was your first feeling about this type of keys? (Just curious)

Edited: 11 Sept 2010, 11:05 p.m.

Can you tell clearly when a key has been pressed? do you heara click and get tactile feedback? That's what mostof us expect from a HP keyboard. What is it you wish?

Re: New to HP, RPN and Rotate and Click.

*Message #3 Posted by **Walter B** on 12 Sept 2010, 2:40 a.m.,*
in response to message #1 by Sujith Abraham

Let your finger rest on a key. Nothing happens. Decide to press it. As soon as it "clicks" you *know* it's registered. Direct feedback to your finger - you don't have to watch the display for reactions. That's the way it should be. BTW, it's comparable with computer mice: do you want a mouse not clicking? Why not? Now you know :)

Try this with any other calculators (Casio, Sharp, etc.) and you'll feel the difference immediately.

This feature will last until your HP calc dies.

Edited: 12 Sept 2010, 2:44 a.m.

Are you saying that you actually **prefer** having the keys feel mushy?

Re: New to HP, RPN and Rotate and Click.

*Message #5 Posted by **Tim Wessman** on 12 Sept 2010, 11:28 a.m.,*
in response to message #4 by Eric Smith

I have heard similar things from other people before.

The issue generally boils down to that they are used to a mushy key, and so they mash it down as hard as they can. The HP key clicks and then stops, while on a TI you push hard, it bottoms out and there is some squishy "give" at the end to absorb the press.

in response to message #7 by Tim Wessman

Hmmm, Tim... I wonder where you heard that from? Just kidding. I know that I personally mentioned this to you on the phone last week. :D

To be fair to the BA II Plus Pro, though, even though its clicky keys don't always register (especially with rapid entry), they do get much better after a very long break-in period. When I was going through my bachelor's and the beginning of my MBA programs, I always had to double-check to makes sure presses register properly. Some owners have had far worse experiences with the BA II Plus Pro's keyboard than me.

Quite honestly, compared to other TI keyboards, the BA II Plus Pro is a joy to use. However, since I got my 30b a month ago, I no longer use my BA II Plus Pro (except to make side-by-side comparisons of features). Of course, there really is little comparison. The HP smokes the TI in a ridiculous number of ways.

Hands down, the 30b has the BA II Plus Pro beaten by a great deal. It would take a monumental effort from TI to improve the BA series to the point where it is comparable to the 30b. I don't think this will happen anytime soon.

This would indeed be hard to understand. I started calculator life with a TI-59. It had positive click keys, although I'm sure, not as good as the HP's of that day. It's only when the keys began to register erratically that I got rid of it. After trying a TI with mushy keys, I got my first HP (20s - which I still have and use regularly).

New to HP, RPN and Rotate and Click.

> Are you saying that you actually prefer having the keys feel mushy?

I don't have any problem with soft keys of Casio *fx991ms*, if that kind of keys are what you are referring as "mushy."

Maybe this feeling is because I am used to it and wasn't exposed to alternatives.

Now that I am exposed to an alternative, the resistance to embrace it might be because of my familiarity with the prior input method!

Yes the computer mice analogy makes sense :)

> Quote:
>
> Try this with any other calculators (Casio, Sharp, etc.) and you'll feel the difference immediately.

For the sake of correctness, I got my Casio and placed my fingers on it. It is registering keystrokes. Sure, an HP won't behave like this .

This exact feature is *my "problem."* I feel it requires a more conscious effort to input a number. OTOH on a Casio, I am used to a feather touch.

> Quote:
>
> The HP key clicks and then stops, while on a TI you push hard, it bottoms out and there is some squishy "give" at the end to absorb the press.

I have to say I have only used a TI while I was in 10+2. I don't even know the model number (It wasn't written on it. Mine was the only TI in the entire school!). It was an awful calculator for a scientific calculator, but not because of the keys. I think it was a solar only model and its solar panel was really nice (You can work in even indoors if lighting is OK outside,but there were times when I couldn't use it in cloudy atmosphere)

Tim: But we don't have to press as hard on a soft key. That's exactly what I am missing. I have to press harder than what I am used to!

As of now, I have used it only for doing examples in the manual. I think I will get used to it after using it for some time in real use environment.

But there are some things rotate-and-click keys are not suitable; the directional keys/arrows are a perfect example. It is taking the usability out of it.

In ALG mode, slow arrow keys makes it nearly useless and frustrating. If I can't move rapidly using arrow keys, I am getting disheartened; it is slower than what I am used in a calculator with a mushy keypad. :(

What do you guys think about excusing the directional keys from the rotate-and-click implementation?

Sorry if I sounded too whiny. Thank you for taking time to respond :-)

Edited: 13 Sept 2010, 8:33 a.m.

Re: New to Rotate and Click - Mushy Keys

*Message #14 Posted by **Dave Britten** on 14 Sept 2010, 1:02 p.m.,*
in response to message #13 by Sujith Abraham

Find an old 49g (the blue one) and use it for a while. You practically need a running start to depress the keys on that one. Any other HP's keys will feel light as a feather after using a 49g for any length of time!

As for my opinion, I think the 35s is among the nicest-feeling keyboards HP has produced, even if the plastics feel somewhat cheaply made. Shame that the software on that model is so awful, though.

Re: New to Rotate and Click - Mushy Keys

*Message #15 Posted by **Sujith Abraham** on 14 Sept 2010, 9:52 p.m.,*
in response to message #14 by Dave Britten

I have a 30b and a 35s, but I feel 35s is missing some strokes.

Getting used to the hp-keys feel now. Only problem now is the trouble RPN is throwing up now and then.

I guess its been my familiarity with soft-keys that caused this. Even now, I don't feel that soft-keys need to be bashed that much by rotate-click fans

:-)

Re: New to Rotate and Click - Mushy Keys

*Message #16 Posted by **M. Joury** on 14 Sept 2010, 10:39 p.m.,*
in response to message #15 by Sujith Abraham

Wait a while... Until you get REALLY comfortable with the feel of HP keys AND RPN, and THEN try to go back to what you are used to today. I don't know about others, but trying to use any non-RPN calc with mushy keys ends up with me doing the math by hand. At least if it involves more than 2 numbers. I can generally remember to do X + Y but then I will invariably key in the third number and THEN hit the operator and well, that just don't work <g>.

Re: New to Rotate and Click - Mushy Keys

*Message #17 Posted by **Sujith Abraham** on 16 Sept 2010, 1:02 p.m.,*
in response to message #16 by M. Joury

Feel of the keys is not a big issue now. I am bit uncomfortable with RPN though, mainly the parts were reusing already inputed data etc.. I am also a bit fearful that I might push the numbers into the oblivion by failing to properly keep track of the stack status :(

Does it come to you naturally as you get more acquainted with RPN? Any tips for me?

Re: New to Rotate and Click - Mushy Keys

*Message #18 Posted by **designnut** on 16 Sept 2010, 1:26 p.m.,*
in response to message #17 by Sujith Abraham

I never experienced anything but RPN with the original 35 as my first calculator. I liked to see the results of each operation so I could mentally check the result. If I made a mistake I could reverse it on the spot. If I were in the wrong units I could change them during the calculation. I have a horror of algebraic where everything is entered and obscured, and then you get one answer only, I could get many answers during the proiblem solution with RPN. Using the repeating t register I could execute a series of fast calculations, i'm not sure how to do this in algebraic. I learned to use the 4 stack and have never needed a larger stack. Having started with RPN I do not understand anyone using algebraic. The book formulas did not fit the capability of the calculator so I changed them to leystroke routines. I had linited storage in the 35 and I learned to solve common problems within it's limitations.

Re: New to Rotate and Click - Mushy Keys

*Message #19 Posted by **Martin Pinckney** on 16 Sept 2010, 2:21 p.m.,*
in response to message #18 by designnut

> Quote:
>
> I have a horror of algebraic where everything is entered and obscured, and then you get one answer only...

Sam, depends on which type of "algebraic" we are talking about. The more recent renditions of algebraic do only give the final answer, but certainly do not obscure anything; just the opposite: its all right there on the screen. I guess you might call this "true" algebraic. Examples would be the 38g, and 48 series when evaluating algebraic objects. These types do allow you to go back and review what you entered, either by using SHOW (38g), or just examining the object on the stack (48 series). You can then make corrections.

Some of the older algebraics, often criticized by RPN aficionados for not being true algebraic, *do* give intermediate results, every time you either close a parenthesis or proceed to an operator that would allow a partially completed result, based on math hierarchy. In other words, these do provide some of the benefits you cite for RPN. Example: 27s.

> Quote:
>
> ...I do not understand anyone using algebraic. The book formulas did not fit the capability of the calculator so I changed them ...

I think you just answered your own question.

Re: New to Rotate and Click - Mushy Keys

*Message #20 Posted by **M. Joury** on 16 Sept 2010, 2:49 p.m.,*
in response to message #17 by Sujith Abraham

Hi Sujith,

I switched over many, many years ago when I purchased my first HP 41C back in college. I had already played around with a friend's HP 67 and before that with another friend's HP 35 and already knew how RPN worked. I can't remember how long it took to become second nature but now it is completely natural. I never have a problem with pushing things off the

stack, I mentally keep track of what is where and find that it is extremely rare to run out of stack space and need to use storage registers. Of course with the newer graphing calcs and their unlimited stack this never happens (but you also lose the ability to do quick repeating calculations with a single number (T duplicates itself when it drops)--I guess that is what short programs are for).

I guess the one thing I learned to do early was "work my way out". By that I mean that my eyes naturally finds the most inside set of parens or the highest precedence operator(s) and I start working the calculation from there.

Give it time, it will become second nature with practice. As I mentioned in my earlier post I really can't use an algebraic any longer (neither can my wife) I invariably screw up along the way unless I am really concentrating and then the tool becomes a hindrance rather than a help. I am quite fanatical about RPN and am now trying to get my middle-school-age daughter to use it because I really do believe that it is an easier way to work.

Good luck!

M. Joury

A friendly word of advice from a middle school math teacher: don't let your fanaticism with RPN affect your daughter. At that age, she needs to learn math the way the teacher teaches it. Middle school math is hard enough on the kids, don't make it harder than it needs to be for her. When she's in college, tell her about RPN.

Re: New to Rotate and Click - Mushy Keys

*Message #22 Posted by **M. Joury** on 16 Sept 2010, 5:17 p.m.,*
in response to message #21 by Don Shepherd

Thanks Don,

I'll keep that in mind. She happens to be pretty good at math and seems to be finding it easy so far but I would not want to get in the way, so maybe I'll have to have an algebraic lying around after all... She is also an electronic toys nut so maybe she will pick it up on her own--anything that has buttons, a screen and makes noises...

Cheers,

M. Joury

Re: New to Rotate and Click - Mushy Keys

*Message #23 Posted by **Don Shepherd** on 16 Sept 2010, 5:39 p.m.,*

in response to message #22 by M. Joury

Middle school math has changed from when I was in "junior high school" in the 60's. Most of the concepts are the same, but some have different names.

- Borrowing is now regrouping
- Simultaneous equations are now a system of equations
- Box and whiskers plots are taught (against my better judgment)
- Stem and leaf plots are taught (also against my better judgment)

Oh, and 1 is not prime.

:)

Don

Re: New to Rotate and Click - Mushy Keys

*Message #24 Posted by **M. Joury** on 16 Sept 2010, 6:22 p.m.,*

in response to message #5 by Johnny Bjoern Rasmussen

Glad you liked them! I took a Konica Hexar film camera to the meeting, and got the film developed and scanned, then sent the scans to our webmaster to put up - that's why it took a few days. I proably shan't have time to put up a report now till I get back from HHC2010.

Is there any trend to HP calc release dates?

*Message #1 Posted by **ravwalia** on 10 Sept 2010, 11:40 a.m.*

Hello All,

In my quest for a new calculator, it's beginning to seem that for me to be comfortable with it RPN is the way to go. I've tried some of the excellent suggestions in the previous thread, but of those that I could find local to me the HP35s is the winner, though after using it for a while it's going to take me some time to get used to the keyboard layout as it's so differet to the HP32sii I'm used to.

With that said, I'll get used to it if I have to, but knowing my luck, when I buy one HP will release something better. Is there a general trend of when HP releases new calcs, near the conference time, back to school, holiday season, etc. I know that no one can really say for certain and judging how the 50g has been out for a while with no replacement, should we just think that we'll have the HP35s for a long while too?

Thanks.

Edited: 10 Sept 2010, 11:41 a.m.

Re: Is there any trend to HP calc release dates?

*Message #2 Posted by **Namir** on 10 Sept 2010, 12:46 p.m.,*
in response to message #1 by ravwalia

Just buy a new HP calculator and when HP releases a new one (soon after your purchase), sell the first calculator on TAS or Amazon. This way you can influence when new calculators come out, at a moderate cost to you. Of course you will have a wonderful prestige and respect on this web site. And there is NOTHING wrong with that!

:-)

Namir

Edited: 10 Sept 2010, 12:47 p.m.

Re: Is there any trend to HP calc release dates?

*Message #3 Posted by **ravwalia** on 10 Sept 2010, 1:32 p.m.,*
in response to message #2 by Namir

Wouldn't it be so funny if that did happen!

Re: Is there any trend to HP calc release dates?

*Message #4 Posted by **M. Joury** on 10 Sept 2010, 4:11 p.m.,*
in response to message #3 by ravwalia

What Namir said. Only in my case I would keep the first one! To paraphrase a poster from an earlier thread: I believe in redundancy!

BTW, the best price I have been able to find recently is on Amazon (am I allowed to say that?) And the HP site has them for $50.99 with free shipping (but you have to pay tax).

I bought a third one recently because of all that I have been reading about flaky keyboards. I wanted a spare just in case one of my original 2 went nuts. Just FYI, I have never had a keyboard issue with either one!

Cheers,

M.J.

OT: Ti-01? (RF microcontroller watch)

*Message #1 Posted by **Matt Kernal** on 9 Sept 2010, 7:18 p.m.*

Anyone have a one of these: TI EZ430 Chronos sports watch?

Quite a bit of hardware/software for $49.

Be sure to watch the .wmv on this Page

Re: OT: Ti-01? (RF microcontroller watch)

*Message #2 Posted by **Bruce Bergman** on 9 Sept 2010, 8:50 p.m.,*
in response to message #1 by Matt Kernal

Yup, I bought it this past spring, but admit I haven't done much with it. I can tell ya, the firmware is BEGGING to be re-written! Even WITH the manual, I am still stumped as to some of the modes it gets in. Weird.

Development kit is surprisingly sparse. The watch, a CD-ROM with the software, a USB programmer and something else (can't remember at the moment). I bought it hoping to re-write it into something interesting (there is a VERY cool door opener app that communicates via RF to an electric door lock). Just haven't had time to play.

If anyone else is messing with it, let's collaborate!

thanks,

Bruce

*Message #3 Posted by **Martin Pinckney** on 9 Sept 2010, 9:26 p.m.,*
in response to message #1 by Matt Kernal

Ugly. What can you actually do with it? (We can assume it tells time).

Re: OT: Ti-01? (RF microcontroller watch)

*Message #4 Posted by **Bruce Bergman** on 9 Sept 2010, 10:36 p.m.,*
in response to message #3 by Martin Pinckney

A completely programmable, custom watch for $49? That doesn't sound all that ugly to me! You can do anything you want with it. You could make it tell time in Klingon, set off alarms ever 3.14152653 minutes or even have it talk to your HP calculator to display results on your wrist. Basically, anything you WANT it to do, limited only by the hardware and software (which you write).

Re: OT: Ti-01? (RF microcontroller watch)

*Message #5 Posted by **Martin Pinckney** on 9 Sept 2010, 11:22 p.m.,*
in response to message #4 by Bruce Bergman

Ugly appearance.

> Quote:
>
> You can do anything you want with it... limited only by the hardware and software ...

Sounds like two *big* limitations to me.

7-segment display?

*Message #6 Posted by **Frank Boehm (Germany)** on 10 Sept 2010, 4:25 a.m.,*
in response to message #1 by Matt Kernal

Uh, sounds like a lot of things one could do there. Why not add 5 bucks to the costs and use a 80x80 pixel display instead. Now *that* would be useful for quite a couple of applications.

Re: OT: Ti-01? (RF microcontroller watch)

*Message #7 Posted by **DaveJ** on 11 Sept 2010, 9:44 a.m.,*
in response to message #1 by Matt Kernal

Yes, I have one. Have not played with it yet though.

Much thicker than I expected (15mm). My uWatch2 designs can easily beat that.

The inverted display I also find hard to read.

I also have a Timex USB Datalink which is another programmable watch. I even have a scientific calculator app in it!

Dave.

Re: OT: Ti-01? (RF microcontroller watch)

*Message #8 Posted by **Bruce Bergman** on 11 Sept 2010, 11:59 a.m.,*
in response to message #7 by DaveJ

Ah, good point. I too have a really hard time with those inverted displays. I mean, good in bright light, but MOST of the time I am not in a place where it helps. Now, if it were switchable, that would be awesome. ;-)

I have a beautiful Nixon watch with an inverted display and I have the same problem...

thanks,

Bruce

What is your Holy Grail, and do you own it?

*Message #1 Posted by **Michael de Estrada** on 9 Sept 2010, 9:58 a.m.*

I am directing this question to those of you who regard yourselves as calculator collectors. In building my collection, I have focused on RPN LED/VFD pocket / hand held calculators, and for me the HP-35 Red Dot represents the Holy Grail as the first of the first of this genre. Several years ago I was very fortunate to acquire one of these as a complete set in perfect working condition, including all documentation tracing it to its source. Although my collection will never be complete, I feel fulfilled in owning the ultimate item.

So, I ask you, what is *your* Holy Grail and do you own it.

Re: What is your Holy Grail, and do you own it?

*Message #2 Posted by **Han** on 9 Sept 2010, 11:10 a.m.,*
in response to message #1 by Michael de Estrada

My holy grail, unfortunately, does not exist. It would be the concept of the HP50G with the casing of an HP48GX. Said another way, imagine taking an HP48GX and giving it an ARM CPU, SD card support, USB support, flash rom, and more built-in RAM.

Some long time ago, there were folks who were working on an RPN calculator casing to do more-or-less what I described above (openrpn.org?) Unfortunately, it has since disappeared.

Re: What is your Holy Grail, and do you own it?

*Message #3 Posted by **Martin Pinckney** on 9 Sept 2010, 1:41 p.m.,*
in response to message #2 by Han

Han, I would agree except in a 48sx case! However, I believe the OP is about collectibles, not what we would like to see.

Re: What is your Holy Grail, and do you own it?

*Message #4 Posted by **M. Joury** on 9 Sept 2010, 11:10 a.m.,*
in response to message #1 by Michael de Estrada

Boy, thats a tough one! I don't know that I can choose. I like the early card reader calcs (65 / 67), the 41 (of course), and I have a special liking for the HP34C (don't ask me why, I know the 15 was a better calc but I really like the looks of the 34 and the feel of it in my hand). For the same reason I like the 29C.

In general I collect all / any of the RPN scientific calculators. At the moment I am missing the following:
1. HP21
2. HP25C (I have a 25)
3. HP97
4. HP32E
5. HP11C

Cheers,

M.J.

*Message #7 Posted by **Jimi** on 20 Sept 2010, 5:18 p.m.,*
in response to message #5 by Norman Dziedzic

Same here. The only one I really want is the HP-41C that I had back in HS. Unfortunately for me, the last pics I had went with a bad Seagate HD years ago, so I don't even know the serial... :cry

Is there more than one Holy Grail?

*Message #8 Posted by **Frank Boehm (Germany)** on 9 Sept 2010, 11:48 a.m.,*
in response to message #1 by Michael de Estrada

35 red dot - owned a complete one plus many prototype parts - sold
Busicom LE-120A plus a couple of other Busicoms - own them
Sinclair Sovereign "Silver Jubilee" - own it
Sterling silver encased TI-1750 - own it
Sterling silver encased Sharl EL-8009 (once belonged to Arthur Charles Nielsen) - own it
ARISTO M27 without CE key - still looking for it
2 BRUNSVIGA prototype calculators - own them
9 Faber-Castell calculators, some boxed - own them
plus about one hundred "Made in Germany" calculators :)

Re: What is your Holy Grail, and do you own it?

*Message #9 Posted by **Walter B** on 9 Sept 2010, 3:29 p.m.,*
in response to message #1 by Michael de Estrada

The last model I got - and thus the one which was hardest to achieve for me - was a working 91. Now I'm almost through with the objects I wanted, just very few are missing still: a working 29C, a 41C Blanknut, a working cassette drive, and last not least a 35 Red Dot (though this seems to be just one of the most expensive holes). Waiting for some extra money to spend and/or a good opportunity.

Re: What is your Holy Grail, and do you own it?

*Message #10 Posted by **Joerg Woerner** on 9 Sept 2010, 4:47 p.m.,*
in response to message #1 by Michael de Estrada

TI's '8' series!

People in China traditionally associate luck with numbers. As a rule in day-to-day life in China, it is customary to regard even numbers as being more auspicious than odd numbers. Eight, 'Ba' in Chinese has a similar sound to 'Fa', which means to make a fortune. All business men favor this number very much. However, for Texas Instruments the "8" in the type designation was not always a fortune.

TI-18: Own it

TI-38: Own it

TI-78: Own it

TI-88: Own it

Regards, Joerg

Re: What is your Holy Grail, and do you own it?

*Message #11 Posted by **db (martinez, ca.)** on 9 Sept 2010, 8:28 p.m.,*
in response to message #10 by Joerg Woerner

Joerg: I can see why your list ends with the incredible TI-88. It would have been a very impressive machine if it would have been sold (and with a better keyboard). But it wasn't, because hp introduced the real Holy Grail; the 41 series.

Re: What is your Holy Grail, and do you own it?

*Message #12 Posted by **Manatee** on 9 Sept 2010, 5:04 p.m.,*
in response to message #1 by Michael de Estrada

For me it's the 25C. It was my first HP, when I was a teen. I lost track of it sometime after it stopped working. I didn't realize at the time that it would hold such meaning for me.

I've picked up a bunch of other HPs over time -- 65, 67, 41CX, 12C among my favorites, but I haven't managed to hit on a 25C in the condition I'd like. The Woodstocks in general are my favorite series, and the only one I have is a lowly 21. Seems there just aren't many survivors.

Re: What is your Holy Grail, and do you own it?

*Message #13 Posted by **Bruce Bergman** on 9 Sept 2010, 8:53 p.m.,*
in response to message #12 by Manatee

I agree Manatee! (rhymes, doesn't it?)

The 25c was my first "personal" HP calculator, and although I have a fondness for many other HP calculators, I somehow bonded with that first HP and always get teary-eyed when I pull it out. Fortunately, mine is still working.

I do like the 34c too, and of course, my favorite collectible was my 19c (also still working and prints).

Fond memories.

Thanks,

Bruce

*Message #14 Posted by **Palmer O. Hanson, Jr.** on 9 Sept 2010, 5:48 p.m.,*
in response to message #1 by Michael de Estrada

I have five:

The first is my K&E Log Log Duplex Decitrig purchased in 1947.

The second is my Addometer, a rotary adder manufactured by Reliable Typewriter and Adding Machine Co. Built like a truck!

The third is my Faber-Castell 67/22R which is a 12.5 cm slide rule with an Addiator on the back.

The fourth is my Canon Pocketronic which uses a paper taper output and was based on TI's Cal Tech. Mine came with a Hi-speed Battery Charger -- would you believe 20 amperes! Unfortunately, my unit isn't operational due to some substantial cell leakage.

The fifth is my Radio Shack Model 100. Fourteen digit arithmetic and a 240x64 pixel LCD plotting capability long before the advent of the fx-7000G or HP-27C.

*Message #16 Posted by **Michael Plant** on 9 Sept 2010, 8:20 p.m.,*
in response to message #14 by Palmer O. Hanson, Jr.

HP-42s - own two, one MIB
HP-41CV - own it
TI-55II - own several. This was THE calculator when I was in middle school and I wanted one desperately. I thought my father was nuts going on about the HP-15c at the time

Casio fx-603p - own it

Aristo 0972 - own it
Dietzgen N1725 - own two
K&E 4081-3 - own three (two circa 1947 and one circa 1955 -
scales are different)

Still on my list an HP-65 or a 67, and an HP-71b.

If I had to pick two Holy Grails, though, they'd be the Aristo 0972 and the Casio fx-603p. I waited a long time for each of them.

This was a useful exercise. I own 82 electronic calculators and 43 slide rules and having to pick the most important to me means that I can see that there are an awful lot of them that I could probably divest myself of if I weren't so darned lazy...

Didn't you have problems with the keyboard? TI eventually had a program where one could send in a 55II, and with no questions asked, get a 55III with an improved keyboard in return.

I have two K&E 4081-3's but hadn't noticed a difference in the scales. I will have to look at them when i am in Florida next week. My serial numbers are 365144 (the one I purchased in 1947) and 279673 (which I purchased at an estate sale) which I assume was an earlier model due to the lower serial number.

I forgot to mention one holy grail that I don't have -- a Friden which calculates square roots. I have two other earlier Fridens including one manual.

Palmer

Re: What is your Holy Grail, and do you own it?

*Message #18 Posted by **Michael Plant** on 10 Sept 2010, 12:27 a.m.,*
in response to message #17 by Palmer O. Hanson, Jr.

Hi Palmer,

My two 1940's vintage 4081-3s both have the following scales:

Front: LL0, LL00, A, [B, T, ST, S,] D, DI, K Back: L, LL1, DF, [CF, CIF, CI, C,] D, LL3, LL2

The serial numbers are 382813 and 414326 and they date to 1945/6. Both these slide rules have solid celluoid covered edges.

The other one is serial number 393487 (apparently K&E reset the serial numbers every so often) and it has mahogany edges with inlaid celluloid - what Walter Shawlee at Sphere Research calls "relieved wood" edges (there's a picture of this here http://www.sliderule.ca/ken408e.jpg). The Dietzgen 1734 and N1725 have the same edging. The scales on this slide rule are:

Front: LL01, L, K, A, [B, T, SRT, S,] D, DI, LL1 Back: LL02, LL03, DF, [CF, CIF, CI, C,] D, LL3, LL2

BTW, when dating a K&E slide rule, you have to look at the serial number, the scale sets, and the patent dates:

http://www.sliderulemuseum.com/?PHPSESSID=f37c9f3c94a451c50eb872a57e936cf6 (see K&E entry)

and

http://www.mccoys-kecatalogs.com/Dating.htm

Regarding the TI-55II, yes, I don't have a single example of ANY of the TI's from that era (TI-57 LCD, TI-54, TI-55II) with a 100% functioning keyboard. The TI-55III that I have still works flawlessly, but it is lighter, smaller, and doesn't have the solid "quality" feeling that the TI-55II has... Funny, the Casio fx-570 that I had in middle school, and which I used grudgingly while salivating over a friend's TI-55II, looks and functions like it's new. Comparing them now, it seems to be more feature rich, too! I was quite disappointed when I finally got a TI-55II a couple of years ago and couldn't actually use it!

It looks like the ATN function was not accurate for arguments close to (2-sqrt(3)) and 1, unless there was an improved ROM:

```
print 12*atn(2-sqr(3));4*atn(1)

 3.1415926524007  3.1415926531932
```

My old MSX computer, which had more a recent Microsoft Basic version, returns

```
 3.1415926535908  3.1415926535898
```

Forensic result:

```
10 CLS
20 K=ATN(SQR(3))/60
30 F=ATN(TAN(COS(SIN(9*K)*K)*K))/K
40 X=F: GOSUB 200: F=X
50 X=F: GOSUB 100: F=X
60 PRINT F
70 END
100 X=ATN(X/SQR(1-X*X))/K
110 RETURN
200 X=ATN(SQR(1-X*X)/X)/K
210 RETURN

 8.9999999712261
```

On the MSX I get

```
 8.9999999710834
```

Gerson.

The problem with that method is that you are evaluating the ATN function AND the ability of the machine to calculate 2 - sqrt(3). I don't have my Model 100's here but consider the results from two machines of similar vintage, the HP-41 and TI-59. If you just do the equivalents of 12*atn(2-sqr(3)) on those machines you will get

```
pi    3.1415 92653 58979 ...
HP41  3.1415 92649
TI59  3.1415 92653 6
```

But 2-sqr(3) = .26794 91924 3112 ... and if you enter the first ten digits into the display register of either machine, take the atn and multiply by 12 you will get

```
pi   3.1415 92653 58979 ...
HP41 3.1415 92654
TI59 3.1415 92653 24
```

and if you enter thirteen digits into the TI-59 display register by entering .2679491924 + 3.11E-11 = you will get

```
pi   3.1415 92653 58979 ...
TI59 3.1415 92653 588
```

I will have access to my Model 100's next week. The serial numbers are 30208973 and 309012942. The

unit with the first serial number was one of the first Model 100's to be made available in our county.

Palmer,

> Quote:
>
> The problem with that method is that you are evaluating the ATN function AND the ability of the machine to calculate 2 - sqrt(3).

You are right, 12*ATN(.2679491924311) is better, albeit only slightly:

```
 3.1415926547795
```

However, there is indeed a problem with ATN( ) in Model 100, at least in the ROM version Virtual T Emulator currently uses. That's why I had to resort to ATN(SQR(3))/60 for pi/180 instead of ATN(1)/45.

When the emulator is set to Model 102, I obtain the same results I get on the MSX computer:

```
                4*ATN(1)   ->  3.1415926535898

  12*ATN(.2679491924311)   ->  3.1415926535896

        12*ATN(2-SQR(3))   ->  3.1415926535908
```

Gerson.

You are correct in that there is a problem of some magnitude with ATN. I had successively used 4*ATN(1) in radian mode as a way to generate pi with a number of BASIC implementations, but it didn't yield the accuracy that I needed on the Model 100. I found another method but can't for the present remember what it was. I will find it next week and post it here.

Re: What is your Holy Grail, and do you own it?

*Message #23 Posted by **Gerson W. Barbosa** on 12 Sept 2010, 9:41 p.m.,*
in response to message #22 by Palmer O. Hanson, Jr.

Palmer,

I found the problem: someone made a small mistake when typing one of the coefficients of the arctangent polynomial. It should be -0.14285708554884 instead of -0.14285**6**08554884. PEEK(13247) returns 86 (56h), it should return 87 (57h). The fix should be easy (just a matter of changing the content of memory address 33BFh from 56h to 57h), but I don't know if a compatible 32K ROM or EPROM is still available.

http://upload.wikimedia.org/wikipedia/commons/5/55/TRS-80_Model-100_Inside.jpg

When I edited the Model 100 ROM in the emulator, the results mached those of the MSX computer. Likewise when I changed the corresponding memory address (2E54h) in the MSX computer from 57h to 56h the arctangent function started behaving exactly like it does on the Model 100.

Gerson.

*Message #24 Posted by **Gerson W. Barbosa** on 21 Sept 2010, 1:02 a.m.,*
in response to message #22 by Palmer O. Hanson, Jr.

Palmer,

Here is a workaround:

```
10 CLS:INPUT TH
15 PI=2*ATN(3E13):SR3=1.7320508075689:S1=SGN(TH):X=ABS(TH)
20 IF X<1 THEN K1=0:S2=1 ELSE X=1/X:K1=PI/2:S2=-1
25 IF X>(2-SR3) THEN X=(X*SR3-1)/(X+SR3):K2=PI/6 ELSE K2=0
30 Y=S1*(K1+S2*(K2+ATN(X)-1E-6*X^7))
35 PRINT Y
```

It should give correct results all through the valid range, except for |TH| = 1 and 1-10^-14:

```
     TH            ATN(TH)
    0.00     0.00000000000000
   -0.15    -0.14888994760950
    0.20     0.19739555984988
    0.30     0.29145679447789
    0.60     0.54041950027057
 1-1E-13     0.78539816339739
    1.05     0.80978357257017
   -3.75    -1.31019393504750
    8.15     1.44870718939760
-1000.00    -1.56979632712820

 1-1E-14      0.78539816319912   (0.78539816339744)
       1      0.78539816359578   (0.78539816339745)
```

Further tests may be required.

The 35 without that silly red dot ;-). Really, I'm satisfied with my used and not-so-rare sample. It is in its original hard case and with all accessories, which was a must when I wanted to get one.

Still wondering how to present it on the shelf in its case half opened without destroying the case.

Based on recent history, I'd say that an HP-35 Red Dot that is authentic (there have been fakes), fully functional, original (not repaired or modified) and with all original accessories will fetch at least $1000 on the world market. However, since there have not been any public auctions such as TAS for several years, next time this happens the price could be much higher. It all depends on how much any collector is willing to pay. I've seen the HP-01 sell for over $5000 USD, and to me the HP-01 is a less significant milestone than the HP-35 Red Dot.

Hello Jean-Marc,

Obviously the "True keyboard" of a "True" HP41 cannot be beaten in any way : I fully agree with you on this point.

However, and from experience five years ago then, I can state that after just a couple of weeks of regular use ("far too long a transition time" might you quite rightfully think) I have become as fluent with the HP48 keyboard than with the HP41 "ideally perfect" one. I had no choice then : either quit or continue with HrastProgrammer's HP41X/Y/Z Emulator !!!

Anyway, it is absolutely wonderful to observe how much enthusiam such a wonderful machine keeps raising all over the world !!!

Have a great and sunny day and

Best Regards to all

Antoine

I own almost every model of HP calculators. I finally got a 10C just today. Still missing an HP-70 and a 75 and a 92 and a 33C and 21S and 27S.

My Holy Grail? Still the HP-25. My, "first love." I "lusted" after HP's and girls when I was in 8th grade. It was a time of discovery and imagination. My HP-25 was stolen after I got my TI-59. Today I have about 6 HP-25's (assembled from the best parts of many more). I just can't resist buying and restoring them.

I doubt my wife would let me collect any girls.

*Message #41 Posted by **Thomas Okken** on 11 Sept 2010, 2:43 a.m.,*
in response to message #1 by Michael de Estrada

Aren't "having a Holy Grail" and "being a collector" somewhat contradictory? I mean, either you want one item in particular, or you want them all -- those seem like very different kinds of motivation to me.

I consider myself a big fan of HP calculators, but I'm not much of a collector. My "Holy Grails" are the HP-25 (my first!), HP-67 (really, really wanted one back in the day but couldn't afford it), HP-42S (best RPN ever), and the HP-48G (truly a hand-held computer).

I have one of each of those holy grails. I love the HP-67 the most, even though I never use it. :-)

> motivation to me.

I see no contradiction. I want to collect many noteworthy vintage calculators, but I rank one above the rest as being the most significant historically. I don't want all the calculators ever made, but most of those that fit a certain category. In my case that category is RPN, pocket / hand held. I value most those that represent milestones, such as the HP 35 Red Dot (first of the first), HP 65 (first programmable with storage), HP 25c (first CMOS memory), HP 41C (too many firsts to list here). I value them all, but I regard the HP 35 Red Dot as the most significant and essential to a proper collection. My collection is complete in some areas and not so in others. I have all the Classics, Woodstocks and Spices, but am missing many of the later models. I will continue to collect, however, I do not have a compulsion to acquire at any cost, whereas, if I did not have my Holy Grail, I would have an almost insane drive to find one at any cost.

Difficult for me to decide between the HP29C or the HP67, but if I had a the option I would probably choose an HP29C - unfortunately I own neither..

It isn't all bad though I do own an HP10C which I brought in 1986 to replace my first HP33C when it broke, and I did eventually manage to get another HP33C which I still use regularly.

I did find that when it came to programming the HP10C was always a bit of a disappointment, even though it had more program steps available than the HP33C.

I own the HP 29C and HP 67, as well as the HP 33C. I use the HP 29C a fair amount, but have ported all my HP 67 programs via card reader to my HP 41CV. The HP 33C doesn't get used much, since I have an HP 34C. I've never owned an HP 10C, since I've had an HP 15C for 28 years, and have never seen the need for an HP 10C.

I don't think anybody has a need or use for a 10C... that's why it's somewhat rare and needed to complete a collection of Voyagers. I use a beat-up, $40 15C, but the mint one is 'with the Voyagers.' (I guess that might differentiate a collector/user from a user... the collector/user uses the less pristine example and keeps the "good one" put away...)

Hello!

I have thought about this answer for quite some time. To me, a holy grail is something that is highly desirable, but (probably) nonexistent in reality. Something, that I will be chasing for the next 50 years (or whatever time I have left).

Therefore, _my_ holy grail is the one (vintage) pocket calculator with a green LED display. We have been discussing this topic before, but there must be one somewhere. At least a prototype!

Of my other holy grails in terms of mobile computers (certainly not a pocket computer!) at least six lie uncollected and unclaimed on the surface of the moon, ready to be picked up: The Apollo Guidance Computer. I would trade my house for one of them (but don't tell my wife...)! And I would trade even more for the ride to go up there and search for it.

Regards, Max

Max, was the AGC stored in the descent stage? That's the only thing that was left on the moon, right? Wouldn't the astronauts have needed the AGC to rendevous with the command module after landing on the moon?

If so, then those computers (in the ascent stage of the LM) have either burned to a crisp during eventual Earth re-entry of the ascent stage or are still orbiting the Earth somewhere.

You'd have better luck stealing one from a museum!

Unfortunately, they were part of the ascent stages. One of them Aquarius/Apollo 13 has burnt up in Earth atmosphere, but six others (Apollo 11, 12, 14, 15, 16 and 17) have impacted the moon in more or less well known locations. The units were quite solidly packaged (http://ed-thelen.org/comp-hist/TheCompMusRep/TCMR-V02-P05b.jpg), but of course the impacts occurred at high speed (1.5

km/s). But aren't we well trained to combine the remains of several defective calculators into a single working one ;-) ?

Don't forget about Snoopy (LM-4) from the May 1969 Apollo 10 mission.

The LM-4 ascent stage is still in solar orbit, presumably intact, after more than 41 years. It's the only flight LM that's still in flight. Though LM-4 did not land on the moon, its descent stage was allowed to impact the surface and the upper stage was put in solar orbit.

The Apollo Guidance Computer (AGC) is a fascinating device.

There was one AGC in the Command Module and one in the Lunar Module. So several more AGCs should still exist, one where ever any of the returned CMs are located today.

Oh, OK, thanks Max. From the Apollo 13 movie I knew that jettisoning the LM was the last thing they did prior to re-entry, but of course that's because they needed the LM to get home! After 13, I wonder why in later missions they didn't keep the LM attached until approaching Earth, in case the command module had some sort of problem.

> After 13, I wonder why in later missions they didn't keep the LM attached until approaching Earth, in case the command module had some sort of problem.

That's a good question. My hope is that they evaluated all possible failure scenarios and

determined that the LM ascent stage would do no good in any of them and/or outweigh any risks of keeping the LM attached. Scenarios that come to my mind:

1. Service Module main engine fails to burn to get them out of lunar orbit and on their way back to earth. LM ascent engine too weak and/or not enough fuel to do the job, crew is doomed anyway, so jettison LM.
2. Service Module main engine gets them out of lunar orbit and on their way back to earth, but then fails so it cannot make any needed course correction burns for safe re-entry. LM ascent engine too weak and/or not enough fuel to do the job, crew is doomed anyway, so jettison LM.
3. Service Module suffers some problem, let's say it's punctured by a micro-meteor, on their way back to earth. Presume this prevents it from being used for re-entry, so even if they could use the main engine to get into earth orbit (I have no idea if the main engine had the capability to do this), probably not enough oxygen left on board to keep them alive in the LM long enough to mount a rescue mission from earth, crew is doomed anyway, so jettison LM.

Note that for 1 and 2, I do not know the capabilities of the LM engine, I am just postulating.

...

Your definition is good. But the Holy Grail is also something that changes its shape over time. In the beginning, it is something not so rare, and after you have found your first Holy Grail, there is suddenly another which is, of course, harder to find. And so on, and so on. After a long collector's career, you end up like Max who has to build its own rocket and fly to the moon to find another Holy Grail, just to realize that there is something even more interesting than an Apollo Guidance Computer ;-)

Anyway, one thing is for sure: searching for the Holy Grail is MUCH fun!

Enjoy, Juergen

Undoubtedly one of the most elusive vintage HP models. I was lucky enough to find one about a year ago that was in perfect working condition, but that had been butchered by the previous owner with engravings on the case and display. The case was easily swapped out with a clean one from another Woodstock, but I have to live with display engraving, which fortunately is small and below the line of sight to the led's. IIRC, another clean and working HP-27 sold about a month later as part of a very large collection for close to $500. Just a short time ago, an HP-70 sold for $680, making it another highly coveted vintage HP model. The only model I don't own that I'd really want is the HP-95C, but I think I'd have be part of the inner circle of HP enthusiasts that inhabit this forum to get my hands on one.

Another HP 27 auction

*Message #62 Posted by **Michael de Estrada** on 14 Sept 2010, 4:36 p.m.,*
in response to message #61 by Michael de Estrada

Just as I finished speaking of the rarity of the HP-27, another one pops up on TAS. I truly love the seller's description:

"You are bidding on an Hewlett Packard, HP-27, Financial Calculator with case. It appears to be in really nice shape. However, I do not have the power supply to test it. My experience is that these were built like tanks and always work."

Re: Another HP 27 auction

*Message #63 Posted by **Mark Edmonds** on 20 Sept 2010, 5:29 p.m.,*
in response to message #62 by Michael de Estrada

Doesn't seem much interest in the early desktops - holy grail for me is a 9100B with printer but a full collection of all the 98xx desktops would make me pretty happy! Sadly funds totally preclude any collecting at the moment and I doubt anyone is throwing out 9100s! I still check the charity shops though :) (And would be decent about it if lightning did strike).

*Message #68 Posted by **Juergen Keller** on 22 Sept 2010, 3:21 a.m.,*
in response to message #67 by Walter B

Hi Walter, it's done by the coloured plastic of the display (or a coloured foil mounted to the display, I don't remember exactly) and two simple light bulbs. When I touched the bulbs the lower part (the screw thread) just crumbled due to age. Thanks to eBay I got some new ones, and of course some spare ones. If you pass by the Bodensee, you are welcome to play with my 'babies' :-) Best Regards, Juergen

Re: Another HP 27 auction

*Message #69 Posted by **Mark Edmonds** on 26 Sept 2010, 12:53 p.m.,*
in response to message #68 by Juergen Keller

Looks like a great unit Juergen :)

I've never seen that rack unit before - is that the memory expansion? Seems a bit large for it even by that vintage.

Re: Another HP 27 auction

*Message #70 Posted by **Juergen Keller** on 26 Sept 2010, 3:18 p.m.,*
in response to message #69 by Mark Edmonds

Yes, it is the HP 9101A Extended Memory unit. And it has to be that large because it provides additional 3472 program steps or 248 data registers ;-) (the 9100B has 32 storage registers built-in, which are 392 program steps).

Re: Another HP 27 auction

*Message #71 Posted by **Mark Edmonds** on 29 Sept 2010, 8:15 a.m.,*
in response to message #70 by Juergen Keller

OK, thanks :) I don't suppose you've taken any pictures inside the memory expansion unit? That could be amazing to see!

"While supplies last."

*Message #1 Posted by **Jon S Canale** on 8 Sept 2010, 11:30 p.m.*

HP Solve Newsletter for August seems just to have been posted. Mention of the 300s at Staples USA and the HP30b at Office Depot USA and Staples Europe both make a point of stating "while supplies last".

What is with this? Did HP just make a short run of these calculators and then we'll never see them again?

More and more, it just doesn't look like HP is really serious about the calculator market. If it says it is, it's the craziest marketing strategy that I've ever seen!

Re: "While supplies last."

*Message #2 Posted by **Tim Wessman** on 9 Sept 2010, 12:53 a.m.,*
in response to message #1 by Jon S Canale

Nah, 30b is in Office Depot now. (Hurrah!)

I think the staples thing is a special shipper - one of those stand up display things for back to school time frame. I might be wrong on that. That is probably what is meant by while supplies last I would guess.

I hope they are serious! Otherwise I will be out of a job. :-(

in response to message #2 by Tim Wessman

Tim,

Hope you keep your job! And I hope HP wakes up and starts putting some effort into the calculator market!

Re: "While supplies last."

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 10 Sept 2010, 5:45 p.m.,*
in response to message #3 by Jon S Canale

HI;

I think WE (all of us who actually can) should make an effort into the actual calculator market, I mean, professionals in the scientific and educational areas (mostly educational) who are committed on doing the right thing. I know that it will cause argument fighting (and should), but once possible calculator users do not care too much developing their own skills in professional acting (hence no need for calculators to help them so) chances are that they prefer enhancing their skills in using any calculating

devices, and I mean all kinds (computers and pocket wizards with all kinds of software).

When HP was about to present the Expander, somehow the market signalized something else. I miss the time the market used to eagerly wait for new scientific developments do find its way ahead; today we see that scientific development is stuck in the marketing lack of ability to identify its own way ahead.

Cheers.

Luiz (Brazil)

Did I miss something durimg Labor Day Weekend?

*Message #1 Posted by **Joerg Woerner** on 8 Sept 2010, 9:00 p.m.*

Hello HP community,

I just returned from a trip to North Carolina and browsed that auction site with the "e"...

I found:

HP Charger 82026A $119.97

HP Charger 82002A $179.97

HP Charger 82041A $179.97

Was there a steep inflation during Labor Day? Was the exchange rate of the US dollar adjusted to the Mr. Hurd's severence package?

I plan to list this Saturday a working HP 34C - what Buy-It-Now price do you suggest?

1% severence pay?

Five times a TI-150?

Ten times a dumb power supply?

Have a good evening!

Regards, Joerg

in response to message #1 by Joerg Woerner

As far as this group goes, you did not miss much. Kinda quiet.

As far as the referenced auctions, the same seller has many wall chargers of all kinds for sale from $30 up.

I must have a fortune sitting in a box, with 40 or so chargers I've kept from all kinds of equipment that died. Anyone interested? (sorry, only 2 HP calculator ones, which I already sold. For about $20 each).

in response to message #1 by Joerg Woerner

We built an entire economy on the presumption of rising real estate prices. Holland built an economy on rising tulip prices. Both turned out rather badly.

(In the US, but I don't know about other places, real estate is actually the *worst* long term investment. It loses money. All you have to do is go to the poor neighborhoods of any old city to discover that the houses of the rich of the past are now the houses of the present poor.)

Maybe this is a bit oblique, but I see similarities...

*Message #7 Posted by **Michael de Estrada** on 9 Sept 2010, 8:47 a.m.,*

in response to message #1 by Joerg Woerner

Those any many other fixed price BIN auctions have been around since the dawn of time, and those items rarely if ever sell. There is an infamous TAS BIN seller, whose name begins with the letter "C" whose listings have been on TAS for many years, and almost none have ever sold. I doubt that the actual selling prices of vintage calcs and accessories have changed much over the years, as the supply and demand remains fairly constant. The wall warts that you've listed are common as dirt, and I have bushel loads of them, the vast majority acquired along with the calculator itself. It will be a cold day in hell when I pay such absurd prices for such common items.

in response to message #1 by Joerg Woerner

Hello Joerg!

> Quote:
>
> Was there a steep inflation during Labor Day?

We didn't have Labor Day over here, but the German branch of our favourite auction site had the second "free weekend" (no fees for sellers) in a row. So "our" auction site is cluttered (or better: littered!) with similar inflationary offers. This really takes the fun out of it. I think I collect Rolex watches and Ferraris in the future, saves a lot of money!

Regards, Max

Re: PIL-Box - communication with external HP71B

*Message #1 Posted by **Roland Storz** on 8 Sept 2010, 1:31 p.m.*

Jean-Francois,

following you instruction I did not succeed with copying files from HP71b (HPIL ERR: Invalid Mode). Quite honestly, I'm lost and have no idea what to do next.

Any further advice.

Roland

Re: PIL-Box - communication with external HP71B

*Message #2 Posted by **J-F Garnier** on 8 Sept 2010, 3:51 p.m.,*
in response to message #1 by Roland Storz

I assume you tried this:

My recommended method for reliable communication between Emu71 and HP71 with the PILBox is to use the IL-Per software (available on my PIL-Box page): do not declare any XIL in Emu71.ini and use IL-Per as a gateway by sharing the hdrive1.dat file: You can now copy files between Emu71 and HP-71B. Do 'COPY file TO :HDRIVE1' on the one side, then do 'COPY file:HDRIVE1' on the other side. Fast and efficient.

The error "HPIL ERR: Invalid Mode" means the HP-71B is in device mode and you attempt to do a command requiring that the HP-71B is the loop controller - such as the COPY command above. So do CONTROL ON, then RESTORE IO (just to be sure), and try again...

In case of HP-IL problem with the HP-71B, it is always a good idea to do RESET HPIL then RESTORE IO. It solves a lot of abnormal HP-IL situations, that can happen very easily with this machine.

Do not hesitate to contact me directly if you have problems with the PIL-Box.

J-F

A perfect stranger gave me a HP-41CV today.

*Message #1 Posted by **hecube** on 7 Sept 2010, 6:40 p.m.*

This is not a joke but there's a back story.

We can post personal ads on the intranet at work and I posted several months ago an ad asking for old HP calculators donation.

I completely forgot about it until today when someone came by my desk to give me a HP-41CV with Surveyor pac. The calculator is in very good condition and works perfectly.

Re: A perfect stranger gave me a HP-41CV today.

*Message #2 Posted by **Mike T.** on 7 Sept 2010, 6:54 p.m.,*
in response to message #1 by hecube

You lucky ...

Though to be truthful I was given an HP100LX in similar circumstances.

Have fun.

Mike T.

in response to message #1 by hecube

Where ya been, hecube? Stirrin' things up somewhere else? I've missed you.

Re: A perfect stranger gave me a HP-41CV today.

*Message #4 Posted by **hecube** on 7 Sept 2010, 8:01 p.m.,*
in response to message #3 by Martin Pinckney

Well thanks!

Last year was a funny time for me. There was the commemoration of Apollo XI's 40th anniversay (I'm a big space nerd), the fact that my main hobby (playing guitar) was not satisfying (I had just quit my band) and the fact that I needed to throw myself into something all led me to become much more active in this forum.

I made a big push to acquire a small calculator collection. However, at the end of the summer I thought about where I was going and it became obvious that the calculator collection was not going to sustain my interest as much as my passion for guitar. I decided to only keep calculators that were in relation with space exploration, sold back the rest and I jumped back into guitar.

That's about it!

Re: A perfect stranger gave me a HP-41CV today.

*Message #5 Posted by **aj04062** on 7 Sept 2010, 10:00 p.m.,*
in response to message #4 by hecube

I'm with ya on the guitar!

However, I think I'm still going to keep the collecting going. I'm sure my wife wants the collection cut down.

You made me remember the "laser art" pictures I got when I was a kid. I remember writing to NASA for these things. I still got about 20 of them, including some cool patches from Apollo 13.

Re: A perfect stranger gave me a HP-41CV today.

*Message #6 Posted by **Michael Plant** on 8 Sept 2010, 12:21 a.m.,*
in response to message #1 by hecube

I got jealous and made caustic remarks until I remembered that my own 41CV came to me in similar circumstances. Last year, I posted a note on my one of my favourite boards about my calculator obsession and noted that I had bought a 35s because I couldn't afford a 41. I wasn't posting to request giveaways or items for sale, but a board member sent me a mint one and wouldn't even accept money for postage. My favourite calculator!

Sudoku

*Message #1 Posted by **KC** on 7 Sept 2010, 1:11 a.m.*

No, I am not talking about sophisticated programming techniques to solve sudoku puzzles. I like to solve by myself, but what I find out is that most of my solving time is "wasted" on figuring out what numbers are still available to be used on a particular cell. For example, if the row has 1 3 5, column has 1 4 6, the 9-square cell has 1 5 7, then I know that 2 8 9 is still available. One day I was sitting and thinking about writing an rpn program that, when I input those numbers already appeared (i.e. 135146157) (bear in mind that the same number may appear more than once), the program would return 289. I intially thought it would be easy (just counting numbers,right?), but then after some thoughts, I found it was not as easy as I originally thought!

If somebody thinks it is just simple programming stuff and have some of your precious time to spare, would you please help me by providing me the program codes? Thanks a lot.

KC

I intially thought it would be easy (just counting numbers,right?), but then after some thoughts, I found it was not as easy as I originally thought!

Quick'n'dirty: accumulate the sum of 10^(every digit of the input number); zeroes in the result denote unoccupied positions. The program is for the 15C, but won't work for arbitrary input values, since you simply can't enter a number longer than 10 digits.

in response to message #1 by KC

This is what I came up with on the 35s.

The test number is stored in A and B is cleared. B will hold the result number. Then indirect registers 1 through 9 are zeroed.

Divide the test number modulo 10 to get the last digit and increment the indirect register based on this digit. Then divide the test number by 10, take the integer part and store back in A.

At this point, indirect registers are filled with the frequencies of digits in the test number.

Then loop through the indirect registers adding a digit to the output if the frequency is > 0. Use multiplies by 10 to shift left a digit.

KC

Re: Sudoku

*Message #7 Posted by **David Hayden** on 11 Sept 2010, 4:41 p.m.,*
in response to message #1 by KC

Here's a version in user RPL. You put a number containing the existing digits on the stack and then run the program. It replaces the top of stack with a number containing the digits not in the input number:

```
@ Given a number N, create a number with all
@ digits not in N
« STR 0.  N result «
  1 9 FOR i @ for each digit
    IF N i STR POS NOT THEN
      result 10. * i + 'result' STO
    END
  NEXT
  result
  »
»
```

Note that in a real sudoku solver it's much faster to store the possibilities as bits in a binary number and then use binary operations for logic like this. For example, in C code, you can gather up digits that are in a row like this:

```
int i;
int existingDigits = 0;
for (i=0; i < 9; ++i) {
    /* row[i] contains the digit in cell i of the row.
       zero means no digit in that cell.  "=" is the
       assignment operator. "|" is binary "OR" operator
       "<<" is arithmetic shift left operator.
    existingDigits = existingDigits | (1<< row[i]);
}
```

Experienced C programmers will recognize that this can be further simplified by using the "|=" operator.

Now that you have existingDigits, it's easy to get the missing digits, it's just the binary NOT of the existingDigits:

```
int missingDigits = ~existingDigits;
```

Note that this sets the bits that don't represent digits (e.g. bit 12).

Re: Sudoku

*Message #8 Posted by **Norman Dziedzic** on 12 Sept 2010, 12:56 a.m.,*
in response to message #7 by David Hayden

David,

You blew me away for efficiency. I haven't done any RPL programming so as an exercise, I put together a version of the 35s program that works with integers so no 12 digit limitation. I'll post it anyway for yucks. Start with a number on the stack, returns digits not in that number.

```
<< 0 -> n s
   << 9 1 ->LIST 0 COM
      WHILE n 0 > REPEAT
         n 10 MOD 1 PUT
         n 10 IQUOT 'n' STO
      END

      1 9 FOR k
         IF 0 == THEN
            10 's' STO*
            k 's' STO+
         END
      NEXT
      DROP
      's' RCL
   >>
>>
```

Re: Sudoku

*Message #9 Posted by **David Hayden** on 12 Sept 2010, 10:28 a.m.,*
in response to message #7 by David Hayden

Here it is in C code for HPGCC. This takes a real or integer number on level 1 and replaces it with an integer containing the digits that aren't in the input number. Because it converts the number to a 64 bit binary number internally, integer inputs can be no more than 19 digits.

Mostly, this is just a plug for the hpobjects library :).

```
// C program to figure the digits missing from a sudoku row/column/box.
// Given a number on level 1, this replaces it with an integer containing
// the digits not in the number.

#include <hpgcc49.h>
#include "hpobjects.h"

// Given a Saturn integer or real, return a C long long. Minimal error checking
long long  getInt(SatAddr obj)
{
    long long result = 0;

    if (isREAL(obj)) {
        double d;
        REALdecode(obj, &d);
        result = d;
    } else if (isZINT(obj)) {
        ZINTdecodell(obj, &result);
    }
    return result;
}

int main()
{
    long long N;                /* number of primes to find */
    int i;                      /* counter variable */
    int digits=0;               /* If bit X is set, then digit X is in N */
    int result = 0;             /* the resulting number */

    // pop the stack and convert the ZINT or REAL to a long long.
    N = getInt(STACKpop());
```

```
    // Set "digits" to indicate which digits appear in N.
    while (N) {
        i = N % 10;
        digits |= (1 << i);
        N /= 10;
    }

    // Flip the bits in "digits" so it indicates if a digit is NOT in N:
    digits = ~digits;

    // Now set "result" to indicate digits not in N. Note that we don't
    // care if zero appears since it isn't a valid in sodoku
    for (i = 1; i < 10; ++i) {
        if (digits & (1 << i)) {
            result = 10*result + i;
        }
    }

    // Convert "result" to a ZINT in tempOb and push it on the stack
    STACKpush(ZINTencodell(result, 0));
    return 0;
}
```

Re: Sudoku

in response to message #9 by David Hayden

David,

Can I use hpgcc on a 48gii or only on a 50g?

Thanks

HPGCC on a 48gii

*Message #11 Posted by **David Hayden** on 13 Sept 2010, 10:22 p.m.,*
in response to message #10 by Norman Dziedzic

Hi Norman,

Yes, you can get HPGCC to generate programs for a 48gii! If you do, then you and I will probably be the only people on the planet to have done it successfully. Here is how you do it:

First, you need HPGCC version 1.1. You can get it from the sourceforge page here

Install HPGCC 1.1 on your computer. In the rest of this message, I've assumed that you installed it into c:\arm-hp.

I had to add c:\arm-hp\libexec\gcc\arm-elf\3.4.6 to my path so the compiler could find cc1.exe. I'm not sure if that was a problem with my installation. To make this easy, I created the following file called env.bat in the directory where I installed hpgcc (c:\arm-hp):

```
set HPGCC=C:\HPGCC1-1
PATH %HPGCC%\bin;%HPGCC%\libexec\gcc\arm-elf\3.4.6;%HPGCC%\arm-elf\bin;%PATH%
```

The sat_createtemp() function that comes with HPGCC 1.1 doesn't work properly so you need to replace it with the one from HPGCC2.0 and rebuild the libraries. Here is the replacement file:

```
// These functions replace sat_create_tempob() in HPGCC 1.1.  They are taken
// from HPGCC 2.0.  The ones in 1.1 don't work with the 48gii.
// Copy this file over c:\hp-arm\sources\hplib\saturn\sat_createtemp.c
// and then rebuild the library.

#include <hpgcc49.h>

unsigned int
sat_map_a2s(unsigned int arm_addr)
{
    int f;
    unsigned int a=arm_addr&0xfffff800;

    for(f=0;f<256;++f) {
        if(_saturn_cpu->Read[f]==a) return (f<<12)+((arm_addr&0x7ff)<<1);
    }
    return 0xffffffff;
}

// AUXILIARY FUNCTION
// FINDS PAGE CLOSEST TO RSKTOP USED BY HPGCC
// RETURN 0xffffffff IF NONE.

unsigned __find_main_ram_start(int rsktop)
{
  int f;
  extern unsigned _mmu_table_addr,_mmu_table_entries;

  int *ptr=(int *)_mmu_table_addr;
  int minaddr=sat_map_s2a(rsktop);
  unsigned int page=0xffffffff,a;

  for(f=0;f<_mmu_table_entries;++f) {
      a=ptr[f]&0xfffff000;
      if(a>minaddr && a<page) page=a;
  }

  return page;
}

// AUXILIARY FUNCTION, RETURNS THE AMOUNT OF USEABLE TEMPOB IN NIBBLES

int sat_getfreetempob()
{
    int rstk=sat_peek(SAT_RSKTOP,5);
    int freeend;

    freeend=__find_main_ram_start(rstk);

    if(freeend==0xffffffff) {
        // C PROGRAM IS NOT USING MAIN RAM
        return sat_peek(SAT_DSKTOP,5)-rstk-11;
    }
    freeend=sat_map_a2s(freeend);

    return freeend-rstk-11;
}

int
sat_createtemp(int objsize)
```

```
{
    // CREATETEMP IMPLEMENTATION
    // objsize=size of object including prolog
    // in nibbles

    int ttop=sat_peek(SAT_TEMPTOP,5);
    int rstk=sat_peek(SAT_RSKTOP,5);
    int size=rstk-ttop;
    int freemem;
    int ptr;

    // check for enough room here
    if(objsize>sat_getfreetempob()) {
        // insufficient memory to create object
        return 0;
    }

    // make room in memory
    sat_moveup(ttop,ttop+objsize+6,size);

    // adjust tempob chain
    ptr=ttop+1+objsize;
    sat_poke(ptr,objsize+6,5);

    // adjust pointers

    // RSKTOP
    sat_poke(SAT_RSKTOP,sat_peek(SAT_RSKTOP,5)+objsize+6,5);

    // TEMPTOP
    sat_poke(SAT_TEMPTOP,sat_peek(SAT_TEMPTOP,5)+objsize+6,5);

    // adjust free memory
    freemem=sat_peek(SAT_DSKTOP,5)-sat_peek(SAT_RSKTOP,5);
    freemem/=5;
    sat_poke(SAT_AVMEM,freemem,5);

    // return addr to prolog of new object
    return ttop+1;
}
```

Copy the above text into c:\arm-hp\sources\hplib\Saturn\sat_createtemp.c, replacing the existing file.

Edit c:\arm-hp\sources\hplib\hpmath.h and replace this line:

```
#define _fabs(x) ( (x) < 0.0 ? (-x) : (x) )
```

with this:

```
#define _fabs(x) ( (x) < 0.0 ? -(x) : (x) )
```

also replace this:

```
#define abs(a) ((a) < 0 ? (-a) : (a))
```

with this:

```
#define abs(a) ((a) < 0 ? -(a) : (a))
```

Now rebuild the libraries as follows:

1. Start a command window.

2. Cd c:\arm-hp\
3. Run env.bat to set up environment variables to use hpgcc
4. Cd c:\arm-hp\sources\hplib
5. Type “make clean”
6. Type “make”. This will rebuild the libraries, including the new copy of sat_createtemp.c
7. Type “make install” to copy the new version of libhplib.a to the right place.

There are separate versions of the ARMToolbox for the HP48 and HP 49. You need to install c:\arm-hp\ARMToolbox\LIB275-48.lib on your calculator. Note that you'll want to rename this library first because LIB275-48.LIB is an invalid variable name on the calculator.

It looks like the ArmToolbox's "S->exe" command isn't supported on the 48gii. You can only run programs via the PrRUN command. This means you can't create stand-alone programs on the HP48 - they require the ARMToolbox to be installed.

HP-67 Auction

*Message #1 Posted by **aj04062** on 6 Sept 2010, 9:50 p.m.*

http://cgi.ebay.com/Vintage-HP-67-Calculator-HP-67-/170537031368?pt=Calculators&hash=item27b4cc96c8

Does anyone agree with me that the possible reason why this calculator works as describes is because it doesn't have the battery?

Re: HP-67 Auction

*Message #2 Posted by **Michael de Estrada** on 6 Sept 2010, 10:49 p.m.,*
in response to message #1 by aj04062

No, I do not agree. An HP-67 or HP-65 will work fine powered from the ac adapter w/o a battery present. The card reader sensor may be damaged, affecting card reader operation, but the main logic circuitry and display will not be affected.

Re: HP-67 Auction

*Message #3 Posted by **aj04062** on 7 Sept 2010, 6:34 a.m.,*
in response to message #2 by Michael de Estrada

Thanks, Looks like it may be more trouble than its worth!

HP30b

*Message #1 Posted by **Antonio Maschio (Italy)** on 6 Sept 2010, 5:51 a.m.*

Hi,

I must confess it's been a long time since last time I visited this site, though I set it as my starting page; it's because I've recently being involved in projects not related to calculators, and this set aside my mind.

I recently read on this Forum about the "new" HP30b; it seems to be a very good calculators, the most scientific among the financial ones, and thus useful for both worlds.

What puzzles me is that no reference of it is present on the Italian, French, Uk, Spanish, Russian (and maybe other countries) HP site still today.

Questions:

1. Is it a USA-only calculator?
2. Do you know when (the date) it has been issued for the first time?

Forgive me for these (quite stupid and) useless questions, but since I planned to buy one, I'd avoid the overprice of the transoceanic delivery...

Thanks in advance.

-- Antonio

in response to message #1 by Antonio Maschio (Italy)

Ciao Antonio,

answers AFAIK:

1. No. It's also available in Germany, for example.
2. Please search the forum.

Cordialmente!

Re: HP30b

*Message #3 Posted by **hpnut** on 6 Sept 2010, 11:53 p.m.,*
in response to message #2 by Walter B

Ciao Antonio,

The HP30b is on sale in Malaysia. You can't use the HP website as a guide as to what is available.

For example, the PDF manual for the 30b is not there. I had some members sent me the softcopy.

Re: HP30b

*Message #4 Posted by **Antonio Maschio (Italy)** on 7 Sept 2010, 5:56 a.m.,*
in response to message #3 by hpnut

Thanks both. The fact you can't rely on HP site is another sign of HP decadence.

Ciao!

HP-71 matrix methods (LU decomp?)

*Message #1 Posted by **Karl Schneider** on 5 Sept 2010, 8:13 p.m.*

A recent post noted a bug in the HP-71B (ROM 1BBBB and earlier) in which some leap years were incorrectly identified. J-F Garnier responded that it was a known bug, but did not cite his own web page listing them:

http://www.jeffcalc.hp41.eu/emu71/bug71.html

At the bottom of the page are listed some inexact results of matrix arithmetic using the HP-71 Math ROM. E.g., the calculated determinant of the matrix

```
[ 1  2 ]
[ 3  4 ]
```

is not quite an integer (-2.00000000001 instead of -2), and the elements of the calculated inverse similarly are not quite exact. Also, the calculated determinant of the singular matrices

```
[ 0  1 ]  and  [ 0  0 ]
[ 0  0 ]       [ 1  0 ]
```

are returned respectively as 0 with a message "WRN: Overflow", and -0 (with no message).

I suspect that the HP-71B (1983) and its Math Pac ROM (1984) utilizes linear-algebra methods similar to those of the 1982 HP-15C (with its 10-digit Coconut processor), adapted for the 12-digit Saturn processor. These methods seem to have been refined further for the Saturn-based HP-28C (1986), HP-42S (1988), HP-48S (1990), and HP-48G (1993), which do not exhibit all of these minor flaws.

Valentin Albillo has explained that the functionality contained in the HP-71 Math ROM was removed from the base HP-71 ROM in order to make room for other features (i.e., support for the IEEE floating-point standard that was then a proposal and was later adopted). So, time might have been short for incorporating all refinements in the HP-15C to the HP-71's new Saturn processor.

For reasons of RAM size and execution speed, the HP-15C performs an LU decomposition of a square matrix A (larger than 1 x 1) prior to calculating determinants, inverses, and system solutions. The Doolittle algorithm is used, producing a lower-triangular unit matrix L having ones on the main diagonal, while the upper-triangular matrix U has non-zero values. The permutation matrix P performs any necessary row transpositions, and is an identity matrix if none are required:

$$PA = LU \quad => \quad A = P^{-1}LU$$

$$det(A) = det(P^{-1}) * det(L) * det(U) = (-1 \text{ or } 1) * 1 * det(U)$$

where det (U) is the product of its main-diagonal entries, and det (P^{-1}) is odd for an odd number of row transpositions.

It follows that

$$A^{-1} = P^{-1}LU^{-1}$$

```
A   = (P  LU)   = U  L  P
```

On the HP-15C, L and U are composed "in place", and row-swap information is stored in spare bits (no P matrix is stored). L and U can be inverted in place, and the resulting inverses can also be multiplied together in place.

In the case of a singular or near-singular input matrix, the HP-15C will also modify elements slightly to allow the necessary LU decomposition without divide-by-zero or overflow.

The Saturn-based models use a Crout algorithm, which produces an *upper*-triangular unit matrix U. Otherwise, it appears that all of these models take the same basic approach as that of the HP-15C. The HP-71B's methods are stated on pp. 86-88 of the Math Pac Owner's Manual.

For the matrix

```
A = [ 1  2 ]
    [ 3  4 ]
```

the following can be extracted from the HP-15C calculation of determinant or system solution:

```
P = [ 0  1 ]  L = [ 1             0 ]  U = [ 3               4 ]
    [ 1  0 ]      [ 0.3333333333  1 ]      [ 0    0.6666666668 ]
```

The "LU" command of the HP-48G returns the following:

```
P = [ 0  1 ]  L = [ 3               0 ]  U = [ 1  1.33333333333 ]
    [ 1  0 ]      [ 1  0.666666666667 ]      [ 0               1 ]
```

It is easy to see where these methods may produce non-integer or inexact values in determinants and inverses. However, the HP-15C, HP-42S, and HP-48G did produce 'cleaner' results, as listed below:

A^{-1} =

```
exact, HP-48G       HP-71B, HP-28C, HP-42S, HP-48S(?)         HP-15C
[ -2     1   ]   [ -1.99999999998   0.999999999994 ]  [ -2  0.9999999999 ]
[  1.5  -0.5 ]   [  1.49999999999  -0.499999999997 ]  [  1.5         -0.5 ]
```

As J-F Garnier pointed out, and as is documented on page 88 of the HP-71B Math Pac Owner's Manual, inverses can be computed more accurately by using the linear-system command MAT X = SYS(A,I) with an identity matrix as I. In this case, an exact inverse is returned by the HP-71B (but not by the HP-42S "SIMQ" command).

It seems possible that some algorithmic refinements in the HP-15C did not get incorporated into the HP-71 Math ROM. For example:

1. Not adjusting elements of the singular matrix A might explain the "overflow" messages that likely occurred during LU decomposition.

2. Some inexactitude in the calculations using elements of the Crout-algorithm L and U matrices might explain the determinant of 2.0000000001
(3. * .66666666667), as well as the slightly-inexact elements of the inverse.

The HP-28C, HP-42S, and HP-48G return integer values for the determinants, and in the process do not warn of overflows or return "-0". However, the HP-28C and HP-42S return the very same inexact matrix-inverse values as the HP-71B does, while the HP-48G returns the exact values.

The HP-48G does return "LU error: Overflow" for LU decomposition of the singular matrix

```
[ 0  1 ]
[ 0  0 ]
```

apparently becuase no non-zero element is present in the left column. However, a valid Crout LU decomposition can apparently be produced; please see this Forum thread from 2006.

A comment by Rodger Rosenbaum in a thread from 2007:

> Quote:
>
> The HP48G and its successors have matrix arithmetic that was reworked by Paul McClellan to use 15 digit arithmetic for internal operations, rounding to 12 digits only occurring after everything is done.
>
> The HP71 and HP48S rounded internal operations to 12 digits at intermediate steps in the carrying out of matrix operations.

Further insights, anyone?

Hello, Egan --

That seemed to be an extremely generous offer, given that I'm using a physical HP-71B with Math ROM version 1A. (I don't know if there was a later version.)

I read the archived thread you posted, but still don't quite understand the "MATHROM" product that is recorded on EPROM. Is it a hardware item? Is it designed to plug into the HP-71B, or must it be loaded via HP-IL or other means? Or, is it an emulator for the HP-48GX or HP-49g+/50g? (I have neither.)

A comment by Rodger Rosenbaum in the same 2007 thread you cited indicates that further refinement was done for the HP-48G, so I would doubt that any official HP product for the HP-71B would address these minor issues.

My main objective in starting this new thread was to explain the HP-71 results listed by J-F Garnier in his bug list, and to re-introduce HP matrix methods and LU decomposition.

Thanks,

-- KS

I do not have a MATH ROM for the 71B, so I opted to have one burned to an EPROM. The individual that did this for me had a newer unofficial version of the MATH ROM. It is discussed in the aforementioned thread (last post).

I can send you the LEX file. If you have enough RAM and HP-IL you can transfer it into memory. To avoid confusion you may want to remove your MATH ROM first. Or I can send you an HDRIVE1.DAT with MATHROM.LEX for testing with EMU71.

> Quote:
>
> I would doubt that any official HP product for the HP-71B would address these minor issues.

Agreed.

Re: HP-71 matrix methods (LU decomp?)

Hello again, Egan --

Thank you. I do have a physical HP-71B with 36 kB added RAM and HP-IL. However, I do not have Jean-Francois' PIL-Box HPIL-USB device, HP's HPIL-to-ISA bus device, or Emu71 software. I'd have to obtain some hardware before being able to put MATHROM.LEX to use.

I'll send an e-mail before too long.

Re: HP-71 matrix methods (LU decomp?)

*Message #6 Posted by **Werner** on 6 Sept 2010, 3:37 a.m.,*
in response to message #1 by Karl Schneider

```
- the HP48G and successors get the inverse right thanks to the 15 digits used throughout.
- the 42S calculates the determinant of a 2x2 matrix directly. If you calculate the
determinant of
 [[ 1 2 0 ]
  [ 3 4 0 ]
  [ 0 0 1 ]],
it is no longer exactly 2.
- the 48G series and successors have an additional test: if the matrix contains only
integers, the determinant returned will be rounded to the nearest integer.
```

Re: HP-71 matrix methods (LU decomp?)

*Message #7 Posted by **Karl Schneider** on 9 Sept 2010, 1:26 a.m.,*
in response to message #6 by Werner

Werner --

> Quote:
>
> - the HP48G and successors get the inverse right thanks to the 15 digits used throughout.

Yes. Incidentally, I added that piece of info independently as an edit to my original post, after Egan provided a link to an archived thread.

> Quote:
>
> - the 42S calculates the determinant of a 2x2 matrix directly. If you calculate the determinant of [[1 2 0] [3 4 0] [0 0 1]], it is no longer exactly 2.

That makes sense, as the determinant of a 2 x 2 matrix is more easily calculated in a straightforward manner than via LU decomposition.

Incidentally, for a 1 x 1 matrix, the HP-15C still produces an (identical) 1 x 1 result matrix with the determinant, but doesn't identify it as an LU decomposition (e.g., "C--"). All things considered, that is the best approach -- and another example of attention to detail in the HP-15C.

How to fix vintage 12C enter key?

*Message #1 Posted by **Peter Matthews** on 3 Sept 2010, 9:46 p.m.*

I have just purchased a 12C off eBay and the ENTER key is not working well. It doesn't press down very much. Everything else is fine but the ENTER. It almost feels as if it does not move (but it does work if you mush it down).

Is this fixable if I open it up?

If not, where might I get a "part" to fix it?

I recall seeing a photo with a bubble-like keyboard layer. Maybe that's the culprit?

Please advise, oh HP experts!

Thanks

Re: How to fix vintage 12C enter key?

*Message #2 Posted by **Randy** on 5 Sept 2010, 9:52 a.m.,*
in response to message #1 by Peter Matthews

Try pushing on TOP of the key, directly between the Clx and 1 keys... chances are good you are pressing in the middle or at the bottom. Since the key hinges at the bottom, the normal travel can only be felt by pushing the top of the key.

Re: How to fix vintage 12C enter key?

*Message #3 Posted by **Peter Matthews** on 6 Sept 2010, 4:30 a.m.,*
in response to message #2 by Randy

Hi - thanks but I think the key needs to be mechanically fixed. I have a 11C and the travel is totally fine.

I tried opening up the 12C but there seems to be many layers of plastic wrapping and some kind of black paper wrapping. I didn't want to cut through the paper without knowing ahead of time what's going on.

Re: How to fix vintage 12C enter key?

*Message #4 Posted by **Jeff O.** on 7 Sept 2010, 8:36 a.m.,*
in response to message #3 by Peter Matthews

The following is from memory from disassembling an 11C a few years ago.

You should be able to unwrap or unfold the plastic wrapping to expose the back side of the keyboard printed circuit board, i.e., no cutting should be necessary. It may be necessary to peel off an adhesive edge on the plastic, I do not really recall. With the back off and plastic out of the way, the rest of the calculator (keyboard pcb, key contacts and top half of the calculator shell) is held together by about 40 plastic pins, known as heat stakes. The top of each of these pins is mushroomed over the keyboard pcb

to hold the “sandwich” together. So further disassembly requires these heat stakes to be removed. Do not just slice the head off of each stake, instead carefully trim just the mushroomed portion off of each stake, leaving the center of the post sticking through the pcb. Once they are all trimmed, the keyboard pcb should come off. The key contacts consist of a sheet of metal domes, my guess is that the dome for the enter key is collapsed. I do not know if it will be possible to repair a bad dome, you might need a new sheet of contacts from a donor unit. If you succeed in repairing/replacing the contact, then you get to the hard part: reassembling the keyboard “sandwich.” You must hold the “sandwich” tightly together while either melting over the remaining portion of each heat stake or gluing each stake with your choice of adhesive. I believe someone here once reported building some sort of jig to hold the sandwich together while gluing or melting the stakes, but I do not recall who or if they reported total success.

I am not really a repair expert and like I said, the above is from memory. So, while I believe the information to be accurate, follow at your own (or your 12C’s) risk.

...

Re: How to fix vintage 12C enter key?

in response to message #4 by Jeff O.

Wow thanks Jeff! That really puts things in perspective and is great info before I even attempt such a thing.

Re: How to fix vintage 12C enter key?

*Message #6 Posted by **David** on 18 Sept 2010, 11:07 p.m.,*
in response to message #5 by Peter Matthews

If you do pull apart your calculator, you have some luck on your side:

The buttons each have a 'snap disk', which is both a simple electrical switch, and also what makes them feel right. The Enter key has two, one which is used (at the top) and one which is not (at the bottom); this because the Enter key takes two positions on the 4x10 grid.

You could conceivably take the lower disk and put it in the upper position, restoring snappiness.

Fair warning: this will be a lot of work with risk of not getting the disk position correctly. The disks are joined into strips of 5 disks, and you would be moving a disk from one strip to another. Plus the adhesive film will likely be destroyed and will need to be replaced. Not a big deal as it is pretty much the same a box sealing tape, though you may find it challenging to find some tape wide enough.

Electrically you should be fine making this change, because the PCB wires the disks together redundantly with respect to their continuity being formed from strips.

The other disk is utterly unused and is there surely for the manufacturing economies.

HHC Carpool to/from Denver

*Message #1 Posted by **PeterP** on 3 Sept 2010, 1:52 p.m.*

Hi, not sure if there is a better place for this but - I'm coming from NYC on Friday night, landing in Denver at 7:56 coming from NYC) and leaving from Denver Sunday night at 5:52.

Anyone with compatible travel schedule who is interested in car-pooling please contact me via the forum email link (just click on my name)

Looking forward to my first HHC!

Cheers

Peter

Display tech

*Message #1 Posted by **Jimi** on 3 Sept 2010, 11:22 a.m.*

I was writing this into another thread I started, but then I sort of thought it deserved it's own.

After playing with this new TI-89 for a few more days, and gone through some tutorials I found for it, I've decided that the main thing that really sucks about it is the screen. To me anyway, it's only readable in bright light conditions, and only in the morning, since my eyes are too tired to read the amazingly small stuff on it in the evening. The screen on my 48s isn't the best either though, but there is nothing on it that is ever too small. Maybe just a better menu font.

In these days with all these amazing devices coming out, ePaper displays, oLED, "retinal" displays on phones, I really wish someone would put some thought into improving the screens on these calculators. While certainly limited in many ways, I loved my old LED HPs (think 34C) for being so readable indoors. Imagine a nice backlit screen even. Sure, battery life would suffer, but it did on older calculators as well. I think in this day, people are used to charging devices every so often. Imagine something like a HP-50 with an iPhone like screen for graphing and display. I'd be waiting in line to buy one.

Just wondering what your thoughts were. Yes, I know that the market for $300 calculators would be limited, but who among us never spent that on one. I've never compared the $300 I spent on my HP-41C when it first came out, but I can only imagine what that is equivalent to today.

Re: Display tech

in response to message #1 by Jimi

> Quote:
>
> the main thing that really sucks about it is the screen

I agree, the font is so tiny that you can barely read it sometimes. And the NSpire is no better. The NSpire's resolution is better but you still need a very strong light source to be able to read it; I keep a flashlight next to mine when I use it.

The best black and white display going these days is the Casio 9860g slim, with a marvelous backlight. Once you see that backlight you really realize how substandard the screens such as the TI-89 and NSpire are.

I would hope the manufacturer would improve these screens, but I'm not holding my breath.

Re: Display tech

*Message #3 Posted by **Donald Williams** on 3 Sept 2010, 12:26 p.m.,*
in response to message #1 by Jimi

If you ever get the chance to try the Casio 9850 G slim you will never be satisfied with any other calculator

display. It also has backlighting. It is the only display my tired 63 year old eyes can handle anymore.

Re: Display tech

*Message #4 Posted by **Don Shepherd** on 3 Sept 2010, 12:42 p.m.,*
in response to message #3 by Donald Williams

The only downside to the fx9860g slim is the software for transferring programs between the unit and your PC. It's awful. I've never been able to figure it out so I just write my programs on the calc.

Re: Display tech

*Message #5 Posted by **Katie Wasserman** on 3 Sept 2010, 2:32 p.m.,*
in response to message #3 by Donald Williams

You don't need to buy the "slim" the regular format "fx9860g ii" model has the same back light. It also offers a newer operating system/programing language with more features.

BTW, the "slim" is back on sale at J&R for $60 w/free shipping.

Re: Display tech

*Message #6 Posted by **Nigel J Dowrick** on 3 Sept 2010, 1:52 p.m.,*
in response to message #1 by Jimi

When I first got my TI-89 I thought the display was fine; certainly it was a significant improvement on the TI-92 which I'd had previously. I could even read it without glasses! No longer - it's far too small for that! I don't think that the contrast is all that bad, though.

Manufacturers don't seem to give the contrast of their LCD calculators the priority I would expect. The contrast of the original HP-48SX was abysmal (even to my early 1990s eyes!). The HP-42s and other machines using the same two-line display are better, but still not very clear to me. The TI Nspire display is a big step backwards, without even the excuse of a touch-sensitive layer to justify its poor contrast.

I don't really understand the issue. Back in 1990 or so I had a Psion 3a organizer with a high-resolution display and splendid contrast. Why can't all displays be at least this good? At least Casio have shown that the art of high-contrast monochrome displays is not entirely lost!

*Message #7 Posted by **Martin Pinckney** on 3 Sept 2010, 2:03 p.m.,*
in response to message #1 by Jimi

This discussion has come up many times. Many of us say the same thing as you, Jimi, but the naysayers always counter that "everyone expects calculators to turn on instantly, and the batteries to last a long time."

Personally, I think the calculator business needs a little thinking outside the marketing "box". I.e., spend that extra proverbial dollar on quality keyboards, backlit displays, easy I/O. Maybe the professional world, starved for so long for truly great calculators, will respond favorably.

Edited: 3 Sept 2010, 2:05 p.m.

Re: Display tech

*Message #8 Posted by **Tim Wessman** on 3 Sept 2010, 2:57 p.m.,*

*Message #9 Posted by **Jimi** on 3 Sept 2010, 3:47 p.m.,*
in response to message #8 by Tim Wessman

And this is what is in the back of my mind as well. Maybe the market isn't there, since most people I know pull up the Windows calculator for example. I rarely see one on someone's desk anymore, and I was working in an engineering environment till last year.

In poking around though, I did find a cool thing though. Maybe it's been on here before, but this app for the iPhone, Windows Mobile, is pretty neat.

http://www.spacetime.us/

I downloaded it and played around. It'll do everything the TI was meant to do, and is easy to read. The lack of a keyboard is a real negative though.

Think about it though. Come up with a calculator looking case with a keyboard and a dock that you plug an iPod Touch into. Much like portable keyboards I've seen with docks, just have it translate the keys or something, and work with the company a little on the interface. That would be pretty slick.

advice needed to visit USA

*Message #1 Posted by **Patrice** on 2 Sept 2010, 4:29 p.m.*

Hello all,

off topics mode

I will attend to HHC 2010 and will have some holidays around HHC and I'd like to visit intersting things.

I will travel by car between Montréal and Fort Collins.

I already know interresting places:

```
Niagara Falls
Cedar Point (Roller coster park)
Rushmore mountains
NIST on Monday :)
Rocky mountain park
American Computer Museum in Montana (I have read that they have a replica of the antikytera
artifact)
```

If you know other interesting places, just let me know.

Patrice

Yellowstone Park in Montana and Wyoming.

Re: advice needed to visit USA

*Message #3 Posted by **Martin Pinckney** on 2 Sept 2010, 5:09 p.m.,*
in response to message #2 by JDonley

Well, that might be a little out of the way, but if you go to Wyoming, the Tetons.

Re: advice needed to visit USA

*Message #4 Posted by **Martin Pinckney** on 2 Sept 2010, 5:06 p.m.,*
in response to message #1 by Patrice

How much time do you have? Personally, I just enjoy sight-seeing along the way, no matter which way it is.

Vermont is unusual because it tends toward small businesses instead of the big box stores. I might be considered an oddball, since I think downtown Cleveland is beautiful. The Chicago skyline is fabulous! I would seek out dairy farms in Wisconsin, cornfields in Iowa and wind turbine fields in Nebraska.

Of course in Colorado, the Rockies...

Re: advice needed to visit USA

*Message #5 Posted by **DaveJ** on 2 Sept 2010, 5:22 p.m.,*
in response to message #1 by Patrice

I'd recommend you continue on to Zion, Bryce, and Grand Canyons.

Not that far from Fort Collins, after having gone all that way already.

I found Meteor Crator very interesting too.

Dave.

Re: advice needed to visit USA

I live near these, and certainly second DaveJ's nominations. The Grand Canyon should be first.

My wife and I talk occasionally about those things that are even better in person than you can possibly imagine. On our list: The Grand Canyon, Niagara Falls, and the Fjords of Norway.

If you can get as far as Meteor Crater, let me know. I'm an astronomer and live only 40 miles away (and, in fact, the owner (Drew Barringer - the crater's other name: Barringer Crater) lives just a few hundred yards/meters from us!). I'd be glad to be a tour guide if it fits my schedule.

Re: advice needed to visit USA

*Message #7 Posted by **Tim Wessman** on 2 Sept 2010, 7:49 p.m.,*
in response to message #6 by Dave Shaffer (Arizona)

I have to disagree. Grand Canyon is one of those places that is lots of fun if you actually hike down into it. Just for looking though, Arches NP or Zion NP is much more interesting and fun.

Course, that is just my biased opinion and carries no real weight.

TW

I wouldn't disagree. Grand canyon is awesome in it's size, but others like Bryce and Zion are places you can easily get into and appreciate up close.

If you go to Zion and don't do the canyoning, then do the Angles Landing walk, it's pretty awesome.

On my whole world trip the place I took the most photos was Bryce canyon. Make of that what you will!

Dave.

Re: advice needed to visit USA

*Message #9 Posted by **Walter B** on 3 Sept 2010, 12:15 a.m.,*
in response to message #5 by DaveJ

I concur. Try to reach the Grand Canyoun from the south, turn to the west and proceed to Zion from the south again. Most spectacular IIRC. Imagine when the Spanish first came to the south rim of the Grand Canyon - mierda, no way further north!

Death valley may be worth a detour as well. And ...

It all depends on the amount of time you have and the amount of miles you are willing to drive. And of your personal interests and hobbies, of course.

in response to message #14 by DaveJ

Dave;
If you are going to be in lala land, when you get free you should see Yosemite - for 9 of those ten days. Or slightly less if you *want* to stay married. There are only a couple of places in the world with that kind of astounding unrelenting dizzying vertical relief; Torres del Paine in Patagonia, some gorge in the Himalaya i can't remember the name of, and the Ruth amphitheater on Denali - but that's half filled with ice. There will be people all over the valley but Muir's *gentle wilderness* starts just a few feet from every road and his *range of light* is 95% of the park.

Re: advice needed to visit USA

*Message #22 Posted by **Dave Shaffer (Arizona)** on 5 Sept 2010, 2:25 p.m.,*
in response to message #21 by db (martinez, ca.)

Quote:

> There will be people all over the valley but Muir's gentle wilderness starts just a few feet from every road

In technical terms: the 1/e distance for the thinning out of the tourist crowd is about 100 meters from the nearest car-accessible point (except, perhaps, on the MOST popular of trails)!

Yosemite

*Message #23 Posted by **designnut** on 5 Sept 2010, 11:20 p.m.,*
in response to message #21 by db (martinez, ca.)

Just visited Sequoia and Yosemite, went to Glacier point, what a vista. It has been a year of high snowfall and many minor waterfalls are magnificent. If there was ever a time to go, this is it. We added SFO, Monterey acquarium, LA and return to San Diego Sam

Re: advice needed to visit USA

*Message #24 Posted by **htom trites jr** on 3 Sept 2010, 10:21 a.m.,*
in response to message #1 by Patrice

If you're going to Montana, you should go to Glacier National Park (they've shrunk, but are still there.) One of the best ways to enter Yellowstone National Park is via the Beartooth Pass (using the Beartooth Highway); it is a spectacular drive through the mountains. I used to recommend Yellowstone, but it's so crowded and built up ... the scenery is still spectacular. Go through that park and into the Tetons National Park next door, not really as crowded, and then south.

South Dakota's Badlands, Crazy Horse Memorial, Mt. Rushmore, and Devil's Tower are all close together and worth seeing.

The canyons are spectacular. The Grand Canyon is perhaps best by river; from ground level it's overwhelmingly huge, from the water it's eternal. The smaller ones are much more user-friendly and at maybe even more beauty-filled.

Of all of those, though, Jenny Lake in the Tetons is where I'd love to be, any day.

Hello all,

Thanks guys for all the advices.

Actually, I am putting points on the maps to see what is possible

To be precise, I arrive in Montréal the 17 of septembre and go back to France the 7 of October.

So it is about 1 week before HHC and 2 little weeks after.

Thanks again

Patrice

Re: advice needed to visit USA

*Message #28 Posted by **Dave Shaffer (Arizona)** on 4 Sept 2010, 4:13 p.m.,*
in response to message #27 by Patrice

Perhaps the most important advice would be: don't try too much!

Unless you have another driver, you don't want to do more than perhaps 400-500 miles (700-800 km) a day (on days when you are not visiting anywhere). The Interstate highways allow high speed (65-70-75 MPH; 105-120 km/h) travel, but I find stayinhg alert while traveling that fast and that far wears me out by the end of the day.

Take the time to more fully explore some of the places we have suggested.

Re: advice needed to visit USA

*Message #29 Posted by **Patrice** on 4 Sept 2010, 6:42 p.m.,*
in response to message #28 by Dave Shaffer (Arizona)

Hi Dave,

It is about what I was planning.

Meteor crater is very appealing, I will let you know if I make it or not. If I visit Meteor Crater, I think it will be on 21 or 22 of September.

Patrice

Re: advice needed to visit USA

*Message #30 Posted by **htom trites jr** on 7 Sept 2010, 6:48 p.m.,*
in response to message #29 by Patrice

It might make more sense to fly from Montreal to Phoenix, AZ, and rent a car there, and drive north, or to Seattle, rent and drive through the Going to the Sun Pass and then south. One-way rental so you don't have to drive a loop.

Re: advice needed to visit USA

*Message #31 Posted by **Eric Rechlin** on 5 Sept 2010, 2:12 p.m.,*
in response to message #1 by Patrice

A lot of people have suggested things that are nowhere near the route you will be taking, but if you're going to be going to the Rapid City area anyway (and presumably Badlands National Park), you could go a little bit farther west and see Devils Tower just across the border in Wyoming.

If you're willing to go out of your way and travel farther south, I second the suggestion of Pikes Peak, and if you keep going south you might want to see Great Sand Dunes and Mesa Verde, but by the time you are at Mesa Verde you're halfway to the Grand Canyon, and might as well keep on going (but that will be hard to properly do in just a couple weeks).

If you're serious about making it out to Bozeman, definitely go a bit farther north to Glacier, and then go back into Canada so you can see Banff, Jasper, and Yoho. But doing all that would probably have to be done separately from the above paragraph -- you simply don't have enough time.

But thinking about your route and what you have listed, most of those are right on your way and are no-brainers. Bozeman and Rapid City are the only ones that are not, but Rapid City isn't that far out of the way (maybe even stop by the corn palace in Mitchell on your way there!), and Bozeman would make sense if you are planning a northern loop on your return trip.

Seller's Hyperbole

*Message #1 Posted by **Michael de Estrada** on 1 Sept 2010, 11:15 p.m.*

We've all seen how advertisers use hyperbole to get the attention of potential buyers and to outdo their competitors. Words like "super" and "ultra" and "premium". Well, I just saw two competing TAS listings for an HP-31E, in which the first seller refers to it as "rare." So, not to be outdone, the second seller refers to it as "ultra rare." I'm wondering what would happen if there were to be a third listing. Would it then become "super ultra rare" ?

Re: Seller's Hyperbole

*Message #2 Posted by **Martin Pinckney** on 1 Sept 2010, 11:48 p.m.,*
in response to message #1 by Michael de Estrada

The use such superlatives has always puzzled me. Typically the item is far from rare. I have seen this term used many times to describe a garden-variety 48sx, for crying out loud.

Now if a true collector is reading the description, he or she will know if the item is rare or not.

If the viewer is not knowledgeable about the type of product, would they jump to buy something just because the seller says it's rare? And why would someone be collecting something they know nothing about?

So the use of the term "rare" is worse than useless, it actually makes the seller look shady.

Re: Seller's Hyperbole

*Message #3 Posted by **Namir** on 2 Sept 2010, 12:06 a.m.,*
in response to message #2 by Martin Pinckney

Those descriptions pale in front of erroneous model names, like HP- 12CC and HP84GX. These errors appear in the title and auction text, repeated over and over. Does the seller ever bother to look at the machine and learn the ACTUAL product name???

Namir

Re: Seller's Hyperbole

*Message #4 Posted by **M. Joury** on 2 Sept 2010, 12:19 a.m.,*
in response to message #3 by Namir

How about those items with a starting bid price that is 1.5 to 2 times as high as the HP direct or Amazon price. Or items being sold for 100's of dollars when further down the page they are $20-$30. I always have to wonder if they ever sell anything. Based on some of those prices I could sell off my collection and retire to a mansion somewhere.

M. Joury

Re: Seller's Hyperbole

*Message #5 Posted by **Namir** on 2 Sept 2010, 12:43 a.m.,*
in response to message #4 by M. Joury

I sometimes track this kind of auctions and to no one's surprise they don't sell--especially not in this terrible economy where many folks are watching their wallets.

I guess there are auction sellers who put these HP items (and my guess they know little to nothing about) with a personal hunch or the advice of an uninformed friend that they will be worth a lot. I have seen an A/C charger for vintage HP calculators being offered for something like $150!!! Really???!! Of course there was no takers.

Your guess doesn't match my experience. At least some of them offering repeatedly know their items pretty well.

Re: Seller's Hyperbole

in response to message #5 by Namir

You mean "no takers" on every auction. The reason there are often no takers, is because the seller DOES know the value of the item. Items put up for auction, in auction style, typically sell at far below actual value.

The best seller model is one where an item is priced at what the top 10% are happy with; not what the other 90% might be happy with. But I guess there are other models.

The ones I can't figure out are the ones who put a $50 actual value item and try to get $500. And when you check their feedback, you see they have never sold one. Never!

Re: Seller's Hyperbole

*Message #8 Posted by **Namir** on 2 Sept 2010, 10:09 a.m.,*
in response to message #7 by Mike

Also, I sometimes check to see **WHAT ELSE** that seller is offering. Often I discover that the expensive calculator (or accessory) is the **ONLY piece of electronic offered** among a

wide selection of clothes, ceramics, and other non-electronic items. In such case, it's easy to conclude that the seller has little or no idea about what they are selling--probably doing it as a favor for a friend.

*Message #9 Posted by **M. Joury** on 2 Sept 2010, 11:58 a.m.,*
in response to message #7 by Mike

Those $50 items for $500 are the auctions I was referring to. An HP41 HPIL module for over $300? Something I remember seeing at some time in the past. Isn't that a bit steep?

in response to message #4 by M. Joury

That's sales policy :((We all know some sellers doing this over and over again. They benefit from special days at TAS ("no fee this weekend"), put their stuff in for nothing at starting prices 5 to 10 times exceeding the usual values and wait for stupid buyers. Usually those people won't sell a lot, but one or two may balance their effort which is near zero, since they have their offers prepared for long and recycle them repeatedly. Not that I like that, but it's a free market so we'll have to live with that :-/ After all, they are few and regular visitors of TAS learn about them pretty fast.

Regarding hyperbole - my favorite (relevant) joke is of three pizza restaurants on the same block. The first had a large sign claiming it has the best pizza in the country. The second's sign claims the best pizza in the world.

The third's sign claims that it has the best pizza on the block.

One day decades ago, my brother (Joe) and I were stranded in Billings, Montana and, on a lark, tried a local pizza restaurant. The above joke came to mind abundantly when we tried their product.

Sometimes the seller doesn't know what the competition is...

HP 28C - horizontal bars across display ?

*Message #1 Posted by **Kao_Tai** on 1 Sept 2010, 4:54 p.m.*

This afternoon my HP 28C would no longer work!

(Had worked properly ever since I bought it 23 year ago, and still did so this morning.)

When I tried to switch it on, there were only two horizontal lines on the display. http://www.stadler-christoph.de/P1030754.jpg

And I could no longer turn it off.

I tried the self tests, and they would still work, and the display was fine during these tests.

But afterwards there still were only these bars.

I replaced the batteries for a new set (gladly our company still has them in stock). But this didn't help.

After putting the calculator away for a few hours I tried it again. And now it works again properly - for the time being ...

Any idea what could be the problem ?

sad news

*Message #1 Posted by **db (martinez, ca.)** on 1 Sept 2010, 4:38 p.m.*

Ted Kerber, the Land Surveyor who wrote the D'zign programs for the 65, 67, 41, 42, 48 & 50 series calculators died a couple of days ago, in the arms of his wife Phyllis, after a long battle with cancer. Many of you here met Ted and Phyl (who is also a surveyor) at the San Jose and San Diego HHCs. Many more used his work. His signature was writing routines for unusual applications like the barnet's spiral and tunneling for handheld calculators - and back when there were no programs to do that at all.

I'm wrote out, so i'll just copy part of what i wrote to Phyllis here:
Ted is irreplaceable, in different ways, to all of us. Besides the thousands that used his programs daily; he was a mentor and teacher to more surveyors than i will ever know. He was a great teacher too - i've still got his red pencil all over my apprentice papers. I won't make those mistakes again, and i'll know how - because he took the time to explain why. He was a great man and a fine human being in a line of work, and world, where neither of those is obligatory. In everything, Ted exceeded his specifications.

If you have any stories or memories of Ted, i'm sure that the family would enjoy hearing them. You could send them to dzign@msn.com or look up the real world address at the D'zign website.

Sorry to have this bad news to give - den belillo

Re: sad news

*Message #3 Posted by **BruceH** on 1 Sept 2010, 8:36 p.m.,*
in response to message #2 by Namir

Me too. At HHC2009 I gave Ted a lift somewhere during the afternoon break - I forget exactly what for now. Anyway, it took rather longer than I was expecting, what with chatting, Ted taking everything real slow, plus a stop for a smoke or three, so we missed all of Richard Nelson's talk and half of yours, Namir. So not so bad after all. </cheapshot>

;-)

Re: sad news

*Message #4 Posted by **sjthomas** on 1 Sept 2010, 11:25 p.m.,*
in response to message #1 by db (martinez, ca.)

Ted always remembered me at the HHUC meetings I've been able to attend -- although he had no reason to. I'm not a surveyor and have never purchased any of his products. He was very "down to earth" -- which I suppose is appropriate for a surveyor. Go with God. Requiescat in pacem, Ted.

Re: sad news

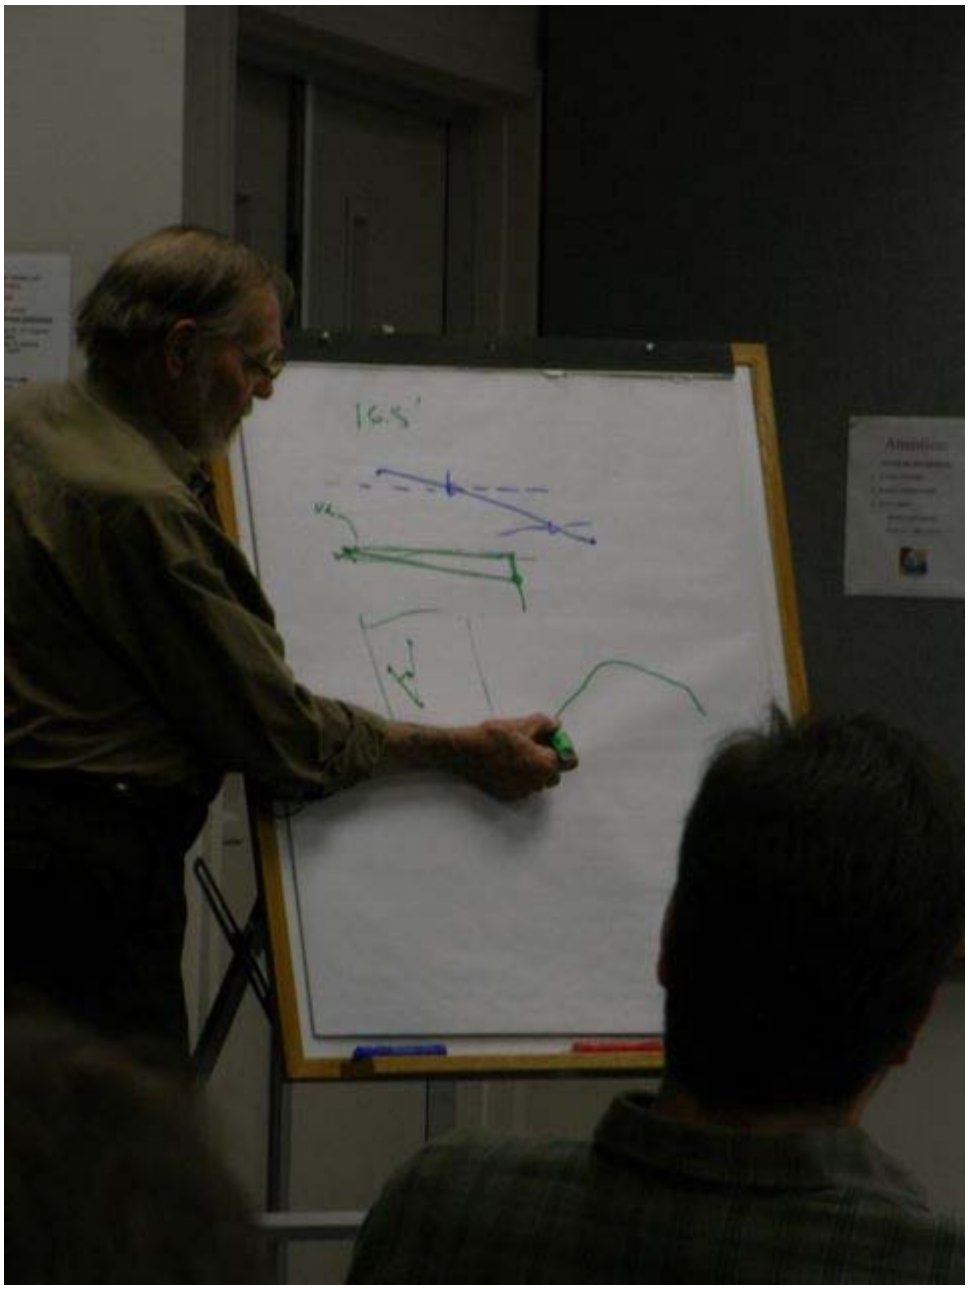
*Message #5 Posted by **Iqbal** on 3 Sept 2010, 10:19 p.m.,*
in response to message #4 by sjthomas

My condolences to his wife and family. He was a very good programmer, and I know he would be missed by the surveying community.

Re: sad news

*Message #6 Posted by **BruceH** on 5 Sept 2010, 6:00 p.m.,*
in response to message #1 by db (martinez, ca.)

Here is Ted presenting at HHC2009 and giving all us non-surveyors an insight into how the job drove his software.



Re: sad news

*Message #7 Posted by **db (martinez, ca.)** on 7 Sept 2010, 1:03 a.m.,*
in response to message #6 by BruceH

Bruce; Good point about job driven. That is exactly what i like about his programs. For example: all routines to stake slope cuts and fills are based on an alignment & offset from a line. Like Ted's, most are IDd like surveyors think - station & offset. Ted took that one step further. He lets the shot that you take tell you the station and offset with the cut or fill. This lets one find the "daylight" point where cut and fill meet very easily. All but one other commercially available program that i know of forces the user to input a station and then find the catch point - again and again till he trips over the daylight accidentally. This is also true of the the nose of maximum cut or fill, which is another useful point to know. BTW: That one semi-good program won't let you enter a precise alignment like D'zign, just a "spline curve" approximation. So yes; "job driven" is fine indeed.

Brian; Re: sharing information. You & me probably don't know the half of it. One example of that was Ted giving away his 41 program books to any apprentice in our union, while he was still selling them through

stores like International Calculator in Florida & Educalc in Ca., and in the professional magazines.

Re: sad news

*Message #8 Posted by **Brian Walsh** on 6 Sept 2010, 1:34 p.m.,*
in response to message #1 by db (martinez, ca.)

Very sorry to hear this. Ted was an example to all by the way he openly shared information and helped others. He was down to earth, easy going, and quick to smile.

Have to shout out - I have a 41 again!

*Message #1 Posted by **Norman Dziedzic** on 1 Sept 2010, 12:23 p.m.*

It's new (old) calculator week here!

After ditching my original 41CX post college I once again have a true blue HP41 (Not a CX but CV). Loving every minute of it and the Survey Pack I got with it is way cool! Should be getting another 41-CV later this week to mess around with (it is non-functioning).

Now if the post office can find the 31E that was shipped to me I'll be happier than a pig in <>.

Edited: 1 Sept 2010, 12:24 p.m.

in response to message #1 by Norman Dziedzic

Congrats! I just got my old 41CV, which was not working, up and running again. Now I'm working on the card reader. :)

Re: Have to shout out - I have a 41 again!

*Message #3 Posted by **Jim L (OHIO)** on 6 Sept 2010, 9:45 p.m.,*
in response to message #1 by Norman Dziedzic

Yeah, I can't explain it, but I absolutely agree! Something about holding such a well designed--and well made piece of machinery--just makes one elated. I had an early HP-41C which I gave up on when the battery terminals corroded and I (mistakenly) thought it wasn't worth repairing. Went with that many peripherals too.

So in a fit of nostalgia recently, I went crazy to simply buy up a bunch of stuff on the popular auction site. So now I have a very nice HP-41CX, Advantage module, combined Math/Stats module, Finance module, and most recently a PPC ROM. So now the machine is "fully loaded" and not only can I not recall how to use 99% of the functions available to me, I don't have any reason to use them anyway. How's that for irrational?

Re: Have to shout out - I have a 41 again!

*Message #4 Posted by **Gerson W. Barbosa** on 6 Sept 2010, 11:11 p.m.,*
in response to message #3 by Jim L (OHIO)

Back in the day I had a 15C which was all I needed. I would press **g SF 8** to get into complex mode and I was all set for circuit analysis class. Even so I wanted to have a 41, but because it cost twice or three times as much, not to mention the peripherals, I resisted... until about four years ago. I was lucky enough to get an unused late production run 41CX from a friend, for a reasonable price. Later I got a card-reader, an Advantage module and two IR modules. Although I like the 41CX, I think I would have regretted if I had switched my 15C for a 41, but it would be great if I had owned both then.

Rarity and Value of the 82184A Plotter Module

*Message #1 Posted by **DavidShenk** on 1 Sept 2010, 12:27 a.m.*

As part of a box of HP stuff I bought was the HP 41 Plotter module and manual. The manual is quite thick. I always like to look things up to see how good of a deal I got, but it does not seem that these sell on TAS that often.

Any ideas from previous auctions?

Re: Rarity and Value of the 82184A Plotter Module

*Message #2 Posted by **M. Joury** on 1 Sept 2010, 12:36 a.m.,*
in response to message #1 by DavidShenk

I don't have any idea, but I have several of the things so I would be interested in any answers you get.

Cheers,

M.J.

Re: Rarity and Value of the 82184A Plotter Module

*Message #3 Posted by **Juergen Keller** on 1 Sept 2010, 3:07 a.m.,*
in response to message #1 by DavidShenk

The plotter module is not that rare, it appeared regularly on eBay in the last few years. To get a plotter with an HP-IL interface is more difficult. But fortunately, there is also the HP-IL/HP-IB interface so you can also look for a plotter with HP-IB interface. These plotters are more common and therefore much cheaper.

Plotting using an HP-41 is SLOW. If you want to see it in action, look at my YouTube video: HP-41 draws sine curve

Cheers, Juergen

Re: Rarity and Value of the 82184A Plotter Module

*Message #4 Posted by **DavidShenk** on 1 Sept 2010, 1:42 p.m.,*
in response to message #3 by Juergen Keller

Hi Juergen, I have a plotter with the HP-IB and a converter, but have not used the plotter module with it yet. I saw your video when you first posted it and I think that is what got me excited to get a plotter. It looks like the module has some ML routines that may speed up things some, so I'm going to rewrite a program I created and see if it does. It draws a "spirograph" type of design.

Backed into corner on HP48GX

*Message #1 Posted by **Don Jennings** on 31 Aug 2010, 8:30 p.m.*

I was learning the equation solver, hit solver and entered an equation but it didn't work out, I wanted to delete that equation and start another one but can't get to the edit mode. I have a bunch of stack objects, like list 1 and #'s, but can't clear them out or anything. Nothing I do seems to be able to clear the stack or get back to delete the original equation. Not sure what to do here. Tried a bunch of buttons, drop, next, back, clear, purge, nothing I do helps. HELP! For some reason the top bar says pgm and I don't know how I did that, I didn't start out in program mode.

Re: Backed into corner on HP48GX

*Message #2 Posted by **M. Joury** on 1 Sept 2010, 12:11 a.m.,*
in response to message #1 by Don Jennings

Have you tried "ON" or "ON+C" ?

Re: Backed into corner on HP48GX

in response to message #2 by M. Joury

> Quote:
>
> Have you tried "ON" or "ON+C" ?

Yep, tried that of course, not sure what to do.

Re: Backed into corner on HP48GX

*Message #4 Posted by **M. Joury** on 1 Sept 2010, 11:37 a.m.,*
in response to message #3 by Don Jennings

If ON+C does not fix things I don't have any real good ideas that don't result in a Memory Lost state. Anything else I can think of would potentially lose your RAM. I am guessing that you don't want to pull the batteries because you don't have a current backup? You say that "PGM" is displayed on the status line? That indicates that you are in program entry mode. Are you using the built-in editor or a third part tool? Not that the answer to that really helps, just wondering.

Re: Backed into corner on HP48GX

*Message #5 Posted by **Don Jennings** on 1 Sept 2010, 1:05 p.m.,*
in response to message #4 by M. Joury

I was just using the built in 'solver' function, where you get the line to input an equation and such. I imagine an expert could get me out of trouble in seconds if he actually had it his hands but it sure is flummoxing me!

Re: Backed into corner on HP48GX

*Message #6 Posted by **Don Jennings** on 1 Sept 2010, 1:31 p.m.,*
in response to message #5 by Don Jennings

I don't know why it worked now, but doing 'solve' again got me back to the beginning, was able to delete the formula. Now I can start over! The formula btw, is one used to calculate chess ratings, I was starting with the 'win expectancy' part of it:

1/(10^((opponents rating-your rating)/400)+1) One question I have is, on a casio scientific calculator, you have the ^ function isolated so you can do 10^ or 4^ or whatever but I don't see just the ^ function on the HP. Is it there somewhere? It has a 10^x function but it calls itself 'ALOG()'. Is that exactly the same thing as 10^ ? I put that expression in using variables O for opponents rating and Y for Your Rating to see if it would solve ok, and assigned 1500 to each variable (the results in that case better be 0.5, the expected win percentage of two chess players with the same rating (1500 in this case). I was not able to get expression solve to work, it just sat there. Doing it again, I input 1/(ALOG((O-Y)/400)+1) and it gives an Invalid Syntax error message. with ALOG highlighted. What am I doing wrong? Thanks for your help eveyone!

Edited: 1 Sept 2010, 1:43 p.m.

What am I doing wrong? Thanks for your help eveyone!

I got past that by re-entering the formula and have the formula highlighted and hit EXPR= it came up with a solution but put a number of 201166.1581 in the "O" variable slot which previously held 1500. Any reason why? I thought, stupid me, that with the formula highlighted and you hit EXPR= it should come up with 0.5, the correct answer but I didn't want it to 'solve' for O. I wanted to just input O and Y and solve the frigging expression but no joy yet. ?? It also took a minute or two just to calculate that rediculous 201166 number. Why would it take so long for this simple expression?

My impression is that ALOG is not the same as 10^ on the casio. I did the same thing, but

with the O=1500 highlighted and after that long delay it came up with the same number. Any ideas here? Thanks for your patience with my bumbling here.

Edited: 1 Sept 2010, 3:37 p.m.

Re: Backed into corner on HP48GX

*Message #8 Posted by **Gerson W. Barbosa** on 1 Sept 2010, 4:01 p.m.,*
in response to message #7 by Don Jennings

If you solve 'P=1/(10^((O-Y)/400)+1)' for R, assuming you have assigned 1500 for O and Y, you will get P=0.5. Is this what you are looking for? By the way, exponentiation is accessed through the *y^x* key, but if you prefer you can use the ALOG function instead of 10^x, of course.

Edited: 1 Sept 2010, 4:04 p.m.

*Message #11 Posted by **Don Jennings** on 2 Sept 2010, 8:23 a.m.,*
in response to message #10 by Gerson W. Barbosa

Do you play chess online? The site I play at is called Red Hot Pawn, redhotpawn.com where you can take 3 days to make a move if you want, you can play for free as long as you play a max of 6 games at once or about 30 bucks a year for full subscription. The thing I like there is the forum system. There are separate forums for sports, religion, debates, science, general topics, puzzles and posers, and the like. My handle there is Sonhouse, I play blues on guitar and Son House was one of the great ones. You can access anyone's games and play them over, you can record your own games and play them back if you want to improve your own skills. I think it's a great site. There are others of course but a lot of other sites like Pogo games and Yahoo have some real asssholes who boost their ratings using computer programs like Fritz or Rybka to play the games and you don't have a chance against those extremely strong programs but at RHP they have people who check out games of suspicious nature, they can match the game play against a certain CPU/program combination and find an almost total match between the

players moves and the moves generated by some combination cpu/pgm and when they spot that they kick that person off the site. There have been many people kicked off that way so it leaves the rest with a fair degree of confidence you are playing an actual person not some chess engine. So that's my story and I am sticking with it:) Check the place out, it's a blast. I contribute to the puzzles forum, the science forum, the culture forum a lot as sonhouse.

Re: Backed into corner on HP48GX

*Message #12 Posted by **Gerson W. Barbosa** on 2 Sept 2010, 11:19 a.m.,*
in response to message #11 by Don Jennings

No, I don't play chess online. I tried it a couple of times, it's really better than playing against the computer, but I think I have to improve my game a bit before getting back. Some years ago I played blitz 5-minutes games at work during lunch-time on a regular basis. I have Ubisoft's ChessMaster (Grandmaster edition), but I don't play with it often. Also I have Leonard Barden's "Play Better Chess", but haven't read it seriously yet. Thanks for the tip, anyway.

Re: Backed into corner on HP48GX

*Message #13 Posted by **Don Jennings** on 2 Sept 2010, 12:20 p.m.,*
in response to message #12 by Gerson W. Barbosa

RHP has over 100,000 members, and at all levels. Try it out, it's free, there are people with ratings from 700 to 2400 there. You can find your level and work up from there for sure. Anyway, good luck.

*Message #14 Posted by **Don Jennings** on 1 Sept 2010, 9:46 p.m.,*
in response to message #8 by Gerson W. Barbosa

> Quote:
>
> If you solve 'P=1/(10^((O-Y)/400)+1)' for R, assuming you have assigned 1500 for O and Y, you will get P=0.5. Is this what you are looking for? By the way, exponentiation is accessed through the *y^x* key, but if you prefer you can use the ALOG function instead of 10^x, of course.

Yes, if you use most any equal rating you will get 0.5 as the answer, 1200 V 1200, 2400 V 2400, etc. That just means if you are both say, 1600, and you play 100 games, you are pretty sure of winning 50 games and losing 50 games or drawing all games, like most of the games of the Kasparov/Karpov matches, titanic struggles that ended up one game up after something like 130 games, not in one match of course, but they tied a lot of games!

So to use Y^x you would go say, 10, enter, Y^x, ((bla bla bla)) for the exponent? or in the equation solver, 10, Y^x, ((Bla))? Does it recognize that last as the proper format for exponents?

I was just sneaking up on the full rating formula, it's a bit more complex than just the win expectancy part, but I wanted to get that right before I finished the rest. The win expectancy is the key, if you don't have that right you are screwed trying to get the change in rating after a game.

Well it sure isn't working like I thought it should, I simplified the expression just to see it work, I entered 4/6 in the equation line of the 'solve' function and hit EXPR= and the exact same thing happened, the hourglass came on for about a half second, goes off and nothing else happens, no answer pops up. What am I doing wrong here?

Ok, figured that one out. You have to hit NXT and do CALC and EVAL, THEN the frigging answer comes out.

*Message #15 Posted by **M. Joury** on 1 Sept 2010, 10:26 p.m.,*
in response to message #14 by Don Jennings

Don,

I entered it on a 48SX (GX should be identical--if you have issues I'll dig my GX out) exactly as you presented it and it worked perfectly. Here are the Keystrokes I used (more or less)

'P=1/(10 Y^X ((O-Y)/400)+1)'

ENTER

'RATE'

STO

LftShft-SOLVE

'RATE'

STEQ (soft menu)

SOLVR

1500 O

1500 Y

LftShft-P

Fraction of a second later I get 0.5

Hope this helps.

Edited: 1 Sept 2010, 10:27 p.m.

Re: Backed into corner on HP48GX

*Message #16 Posted by **M. Joury** on 1 Sept 2010, 11:03 p.m.,*
in response to message #14 by Don Jennings

Don,

I tired it on the 48GX and it is slightly different. Here are the keystrokes after entering the equation:

LftShft-SOLVE
ROOT (sub menu)
'RATE'
LftShft-EQ (stores the equation)
SOLVR (and then you are at the soft menu where you enter your variables)
1500 O
1500 Y
LftShft-P

Note that on the GX you can also do this with a CHOOSE menu.

RgtShft-SOLVE (pulls up a window menu)
Solve equation (first option-already selected)
OK
CHOOSE (soft menu to select your equation)
'RATE' OK
use the arrow keys, the number keypad, and OK to enter your knowns.
Use the arrow keys to go to your unknown (P) and hit SOLVE (soft menu)

Re: Backed into corner on HP48GX

*Message #17 Posted by **Don Jennings** on 1 Sept 2010, 11:32 p.m.,*
in response to message #16 by M. Joury

Thanks, I was having a bit of trouble with the SX version, that's a big help.

I was considering this a training exercise to do the whole rating formula as a real program rather than just an equation solver thing. I guess it wouldn't make a lot of difference but I want to do the program thing also, it adds score, K factor and so forth.

Edited: 1 Sept 2010, 11:35 p.m.

Question for Tim Wessman

*Message #1 Posted by **Namir** on 31 Aug 2010, 2:15 p.m.*

Tim,

What algorithm does the HP-50G use to find the roots of polynomials? Is it the Jenkins-Traub algorithm? The HP-50G seem to have a polynomial roots solver that works pretty well.

Namir

Re: Question for Tim Wessman

*Message #2 Posted by **Tim Wessman** on 31 Aug 2010, 4:04 p.m.,*
in response to message #1 by Namir

I assume you are talking about the PROOT command, or the Solve Poly interface? This is what is found in the source there:

** The algorithm is Laguerre iteration with stepsize control
** and is based upon the ZERPOL program contained in the thesis
** entitled "A Zero Finding Algorithm Using Laguerre's Method"
** by Brian T. Smith (directed by W. Kahan).

** The implementation is a modified version of the HP-71 Math
** ROM PROOT runtime execution code implemented by Laurence Grodd.

Thanks Tim ... gives me a good insight of how the 50G (and other graphing machines) handle getting the roots of polynomials.

Namir

Re: Question for Tim Wessman

*Message #6 Posted by **Namir** on 31 Aug 2010, 9:35 p.m.,*
in response to message #2 by Tim Wessman

Tim and Gerson,

I was looking at the HP-71B Math Pac manual and it does mention the Laguerre method as being used for that ROM (and I am sure for many other HP calculators). I have a Matlab function that implements of the Laguerre method and it works very well ... so the method is good, even though my implementation is bare bone -- not scaling or other programming tricks.

Re: Question for Tim Wessman

*Message #7 Posted by **Didier Lachieze** on 3 Sept 2010, 3:04 a.m.,*
in response to message #6 by Namir

Hi Namir,

You may be interested by the discussion/comparison of several Polynomial Rootfinder programs as well as the matlab sample program (Appendix A) in this document: Iterative Methods for Roots of Polynomials

Regarding PROOT on HP calculators, the following post from Bill Wickes on comp.sys.hp48 back in 1992 shows that it was quite easy to port HP 71B assembler functions to the HP-48: HP 48 Polynomial Rootfinder

Given this, I'm a bit surprised that the results for the second test on the HP 71B (+ Math Pac) and the HP 48GX (same CPU, same algorithm, same assembler code?) or the 49G+ in the following post on this forum are somewhat different (The Turtle (HP-71B) and the Hare (HP49G+) [LONG]):

```
0.999999999944, 1.312E-12 for the HP 71B
0.999999994032, 2.066E-12 for the 48GX
0.999999994031, 1.441E-12 for the 49G+
```

... the HP 71B while being the oldest machine is the closest to the exact result (1,0)!

*Message #6 Posted by **Namir** on 30 Aug 2010, 11:18 p.m.,*
in response to message #2 by Katie Wasserman

Not sure how secure a Pyramid is. Pharaoh Ramses II had his beautiful collection of HP-67, HP-41, and HP-15C (here HP stands for Holy Pharaoh) ALL stolen by grave robbers (actually was my greet great great .... great great uncle Ali Baba and his 40 thieves)!!!

:-(

Namir

Re: Estate sale calculators

*Message #7 Posted by **Walter B** on 31 Aug 2010, 6:06 a.m.,*
in response to message #6 by Namir

AFAIK, that theft was only possible due to the fact that twice the base length divided by the height of this pyramid deviates from pi by 4E-4 after the plaster cover was washed down in the great Egyptian flooding of 1123 B.C. <<8-)>

So thereafter, pyramid power broke down to minimum, i.e. ppm.

Why No Solar Calculators?

*Message #1 Posted by **Jeff** on 30 Aug 2010, 6:11 p.m.*

My Casio G-Shock is solar-powered. I have a Casio 4-function solar calculator.

Why can't HP go solar? Aesthetics? Power limitations? I like solar because the batteries tend to last a long, long time.

Re: Why No Solar Calculators?

*Message #2 Posted by **Lyuka** on 30 Aug 2010, 8:09 p.m.,*
in response to message #1 by Jeff

HP easy calc 100, office calc 100, office calc 300, 10S and SmartCalc 300s are all solar and battery powered.

Re: Why No Solar Calculators?

*Message #3 Posted by **Katie Wasserman** on 30 Aug 2010, 8:19 p.m.,*
in response to message #2 by Lyuka

... and the 6S solar. I like this one a lot. I found a ton on a liquidation site for next to nothing and put them in geocaches.

Re: Why No Solar Calculators?

*Message #4 Posted by **Tim Wessman** on 30 Aug 2010, 9:15 p.m.,*
in response to message #1 by Jeff

Anything but the simplest chip won't have enough power to run with solar. The ARM7 in the 20/30 and 12c spike too high to be fed with solar.

I would like to see someone power a 50g with solar though. Would be interesting to see exactly how big of a panel it would need. . .

TW

Re: Why No Solar Calculators?

How many hours a day do people actually use their calculator? And how many hours a day are the lighting conditions sufficient to charge a battery? So even a small solar panel can be totally sufficient to provide enough electricity for a calculator. Even for one with a powerful processor.

Regards, max

In theory, yes. In practice, no, not even close.

If you do the math it just isn't practical.
Factor in indoor fluoro light being orders of magnitude less capacity than sunlight.
Factor in battery charging circuit efficiency at low power levels.
Factor in that lights get turned off at night.
Factor in calcs get left in draws etc.
It simply isn't practical for all but the most flea power processors.

You'd only have to have the thing run down on you and not be ready to use when you need it ONCE to realise who annoying and unreliable it would be to have a solar rechargeable calculator. You are infinitely better off having it simply battery powered.

I've been there and done the calcs and the measurements.

Dave.

35 years later

*Message #7 Posted by **Frank Boehm (Germany)** on 31 Aug 2010, 8:54 a.m.,*
in response to message #6 by DaveJ

Considering the first solar powered calculators have been sold 35 years ago, I wonder where the technological advancement got stuck. (OK, solar & battery tech has not advanced much further, but CPU tech certainly has...)

Not by a huge amount when it comes to this sort of stuff.

Those ASIC's used in the solar calc from 20+ years ago were already very low voltage and had a quite high mips/MHz figures.

Today's devices with all the improvements in solar and silicon manufacturing technology might only might give you say an order of magnitude increase at best. But even 10x the performance of the old solar scientific calc's ain't much to right home about.

That's evidenced by the fact you can still only buy pretty basic scientifics as a solar calc. The 300S would maybe be an order of magnitude more powerful than the old scientifics for example, but it's got battery backup.

Dave.

Re: Why No Solar Calculators?

*Message #9 Posted by **Crawl** on 31 Aug 2010, 10:47 a.m.,*
in response to message #4 by Tim Wessman

Several years ago (maybe more like 10...) I saw some solar panels that were intended to power Game Boys. They were about 4 inches by 6 inches, as I recall.

I know someone who used a 3"x3" solar panel to power an MP3 player (of course, that only had to replace a single battery, not four). The Game Boy thing was a commercial product; this was more of a hobbyist project. He had to use something like a 1F supercapacitor to get it to deliver continuous power.

There are many usb chargers on the market. I like devices like this which provide flexibility for charging cell phones, iPods, etc. from a/c, auto d/c or solar sources.

Link to usb charger

I assume that something like this could be used to power the 50G. Does anyone have any experience with solar usb chargers?

Regards,

John

Re: Why No Solar Calculators?

*Message #11 Posted by **Crawl** on 31 Aug 2010, 1:02 p.m.,*
in response to message #10 by John B. Smitherman

That supposedly can put out 3W, and, if this is right, the HP50g uses about 0.6W at most -- it might be possible! (in bright, direct sunlight)

Failing that, I do have a battery charger for AAA's that can use solar power, but I think the ratio of

the time spent charging the batteries to the time they can be used in a calculator is rather large.

Forced to buy a TI-89 for school....I feel dirty

*Message #1 Posted by **Jimi** on 30 Aug 2010, 4:05 p.m.*

Really. I've played with it for a while now, and it's junk. Why couldn't they at least require a 35 or something I wouldn't mind owning. A 50 would be nice, and surely I could use the pile of 48 variants I have laying around. Instead, I'm out $100+ for what will basically end up in a drawer at the end of the semester.

Re: Forced to buy a TI-89 for school....I feel dirty

*Message #2 Posted by **Nigel J Dowrick** on 30 Aug 2010, 4:59 p.m.,*
in response to message #1 by Jimi

I feel sorry for you to the extent that you could probably do most of what the TI-89 can do on the HP-48s that you already own (though I think you'd need an HP-49 or 50 to equal or beat it in all areas), but I'm afraid that I can't agree that the TI-89 is junk! I remember being astounded when I got mine, both by how much it could do and by how easy and intuitive I found it to use. At that time I didn't have any HP machines (that has changed now!) so perhaps that explains our different reactions, but I'm afraid that I still love it. Apart from the lack of RPN, what bothers you about it so much?

I agree with you that a course should specify what a calculator is required to do and then leave it to the students to choose any model that fits the requirements. Tying a course closely to a particular calculator seems odd to me, although I realise that it is common (at least in the U.S.?)

Nigel (in the U.K.)

Re: Forced to buy a TI-89 for school....I feel dirty

*Message #3 Posted by **Jimi** on 30 Aug 2010, 10:37 p.m.,*
in response to message #2 by Nigel J Dowrick

I unfortunately don't find it intuitive at all. To me, a scientific calculator shouldn't hide all it's primary functions in menus you have to dig for. Luckily I bought it at Walmart. If I end up not using it, can use something else, then I'll take it back. It was an extra $110 I really did not want to spend this semester. Definitely a new record for school expenses (books and misc).

Re: Forced to buy a TI-89 for school....I feel dirty

*Message #4 Posted by **Nigel J Dowrick** on 31 Aug 2010, 8:25 a.m.,*
in response to message #3 by Jimi

I liked (and still like!) two main things about it. First, the ability to copy previous answers and inputs directly into the new command line. Making exploratory calculations using this editor is arguably even easier than with RPN, and I don't say this lightly! Second, the brave decision to devote four primary keys (X, Y, Z, and T) to one-character variables. This makes algebraic expressions so much faster to type, and algebra was/is one of its main selling points.

This decision means that sin, cos, and tan are shifted functions (and log to base 10 is missing entirely

from the keyboard, I think), but I felt that this was a price worth paying. I understand that others may feel differently!

In any case, make the most of a bad job and enjoy the machine. The algebra in particular is fun!

Nigel

Look at it from the teacher's perspective. If they require a calculator, then they will need to answer questions that students will inevitably have. So rather than becoming experts in several calculator models, the teacher learns one model and then requires that one for the course.

> Quote:
>

If HP provided keyboard overlays for their calculators similar to the HP 41, then this issue would largely disappear. Each of us would assign the functions that we use most often to keys and that would be the end of it. To me, the lack of overlays seriously impairs the usefulness of assignable keys.

Perhaps my memory is really failing me and I am starting to remember things that didn't happen but I seem to recall earlier posts in this forum that noted that some professors insisted on the use of RPN machines in their courses.

Fair point, although they could still say "Use the preferred model and I can help you; if you choose to use anything different you can, but you're on your own." I personally teach Physics (ages 11-18), for which any basic scientific calculator is fine, and I know that the maths department in my school is equally relaxed. In practice this means that nearly all the students have the Casio FX-83 or its close relatives; here in the UK it is very rare to see a student with a TI calculator, and HP (as a calculator manufacturer) is unknown.

Incidentally, I showed one of my classes the HP-300s. Functionally this is a clone of the Casio FX-83, but it looks gorgeous in its elegant blue casing. From their reaction it's clear that if the HP had been next to the Casio in the shops they would have chosen the HP!

*Message #8 Posted by **Crawl** on 31 Aug 2010, 10:52 a.m.,*
in response to message #3 by Jimi

Any calculator that has as many functions as the TI89 would have to have most of its functions in a menu. The HP50g is the same way. Worst come to worst, sometimes I'll use a graphing calculator in conjunction with a cheaper scientific that does have all its functions on the keyboard. That gives the best of both worlds.

I think the TI89 is a great calculator. I don't know what sort of class you're using it for, but if you have to derive expressions, as opposed to just crunch numbers, it can be tremendously useful, and a huge time saver. I only wish I had gotten a CAS calculator earlier.

> Quote:
>
> Apart from the lack of RPN, what bothers you about it so much?

I'll respond to that one...it's cumbersome to use. Consider the following points:
1. The command line on the TI89 is a tedious environment for anything but the simplest of expressions. It's single line format requires you to add parenthesis for groupings that would be implicit in other notations. Although the TI89 has "pretty print", you will note that you don't get to see your expression displayed in pretty print until you're done with the problem and it goes into the history stack (so you can then confirm that you entered it wrong!).
2. Why is there no 1/x key on the 89? My theory for that is that TI viewed a 1/x key as a concession to the

superiority of postfix notation, so they just omitted it. Think about it...taking the reciprocal of anything with terms in it requires you to scroll to both ends to add brackets, then key in either "1/" in front, or "^-1" behind, and finally hit enter! In fact, any unary function you want to use in a follow on calculation requires you to use this "keystroke happy" technique.
3. Want to use the matrix writer on the 89? You must first assign your matrix to a variable, and then specify the dimensions before you're allowed into this application. Even after all that, you can't put your matrix onto the command line, only it's variable name.

I could go on, but I think I've made my point; this machine just confounds you with (many) extra keystrokes and convoluted logic at every juncture. I honestly think most people that use it do so because they just don't know any better.
...but I digress...
Best regards, Hal

As far as I can tell from my collection TI introduced the use of x^{-1} in place of a 1/x key when they introduced the Equation Operating System with the TI-68 and TI-80. TI's subsequent graphic calculators from the TI-81 through the TI-86 and the Voyage 200 all have an x^{-1} key instead of a 1/x key. I can't explain the omission of either a dedicated x^{-1} or 1/x key on the TI-89. Maybe there really is a bogeyman behind every bush.

*Message #11 Posted by **Nigel J Dowrick** on 3 Sept 2010, 2:07 p.m.,*
in response to message #9 by Hal Bitton in Boise

My take on your three points:

1. What you say is true; however, the big advantage of the command line approach is the ready availability of previous inputs and outputs. For complicated expressions I find the advantage of this outweighs the extra typing. It is rarely necessary to assign results to a variable, because you can simply scroll back to them when needed. I could really fly on this machine!

2. The omission of the 1/x key is odd, but there is a (postfix, of course) ^(-1) function in the catalogue. (I much prefer this to the prefix INV() function that HP use in algebraic mode.) Assigning this to the custom menu allows access to it in two keystrokes (plus enter if you want to see the answer, of course!).

3. You are correct that the matrix editor isn't as elegant as the one on the HP-48/49/50. On the other

hand, you can type a matrix directly into the command line if you want to, and specifying the dimensions when using the editor isn't really so hard.

Like you, I've used lots of calculators and for me the TI-89 is one of my all-time favourites. It's got an infinity key, for heavens' sake! How cool is that?!

>
> Nigel (in the U.K.)

I worked for TI for a few years (in semis, not calcs), but I can tell you exactly why classes are like this in the US. TI spends most of it's money in the calc operations on sales/marketing, and the main marketing is creating free course materials for high school classes with a TI calc as the star.

Teachers get all of these learning materials free, and a free TI calc. They spend millions doing this, hence the penetration into the educational market. The calc division at TI is small, has few people, is a spot on TI's income statement, but the margins are obscenely high.

You can liken this a bit to other professions where you're heavily solicited by a company and then you recommend that product. Good example is in the pharmaceutical biz; docs get bombarded with salesdroids/literature/freebies/etc., and it does influence what prescriptions they write.

It was upposedly required for both our sons too, but I had the older one just use my old TI-59 and he got through just fine. My wife got one for the second son, but the model again proved to not matter, and he could have just as easily used any basic non-programmable scientific. Both of them said what most kids used the required calc for was playing games while looking studious.

I took a lot of flak for rating the Ti-89 over the Hp 50g in my calculator review.

http://www.rskey.org/buyguide.pdf

However, the Ti-89 is the natural upgrade path for the Ti-83/84 line (which 90+% of high schooler’s use) and

most people do not know or want to adopt the advantages of RPN. Since most people who buy graphing calculators wouldn't switch over to RPN on the Hp50G, the Ti-89 is a better algebraic calculator and I was forced to endorse that calculator from an objective view. I noted that trig functions (and other often used functions) are second shifted functions.

However, a flaw of the Hp 50G (that is not realized or noticed by RPN users) is the poor units' conversion and the flawed vector functions / features in algebraic mode. For RPN user's that use the Hp50G for common vector math, put it in algebraic mode and try your hand at using it. If the Hp50G had implemented its algebraic function set better, I would have happily endorsed it as the superior calculator.

That left me with the dilemma of recommending a superior (Hp50G in RPN mode) calculator to an audience of 80+% that would not use it in RPN. Therefore the superior calculator for the normal algebraic user is the Ti-89 for the majority of applications. The La'Place and Fourier transforms functions of the Hp50G can be of use to some of these users' but the majority are best served by a Ti-89.

Power user's often augment their high end calculator with a Math package as well or often bypass the high end calculator market altogether. With the popularity of notebooks and low cost math software, this is certainly another option.

I welcome positive feedback from my knowledgeable friends on this review and will take serious offense to wild, unsubstantiated, biased, ridiculous criticism from all other crazy fanatics. However, every so often, I sometimes listen to the crazy fanatics too. ;o)

Greetings from Puerto Rico.

I agree on the TI-89 as a better algebraic calculator to the HP-50g.

I wonder why HP did not make the algebraic CALC mode like the HP-71B on which the intermediate answers appeared when the close parenthesis key is pressed so you can follow and pinpoint errors better. That's will be a definitive advantage.

*Message #16 Posted by **Manatee** on 1 Sept 2010, 9:19 a.m.,*
in response to message #1 by Jimi

I've been out of school for a long time (30 years), so I'm wondering what sort of math in involved here? I realize calculators have far greater capability now than they had when I was a student. We were were just using them for trig, stats and such in the late '70s, and almost everyone had a different calculator. (Ahh, there were so many choices in those days.) Nobody expected a teacher to know a particular calculator, and math wasn't taught as "keying a recipe into a calculator". The calculator was just for solving the problem -- however you chose to do it.

I understand that it can be challenging for a student to learn math that is new to her/him, and then immediately have to figure out how to use a particular calculator to solve problems. But still, it seems like the learning process should not be dependent on a student knowing which combination of buttons to push in order to actually solve problems. The understanding of the concepts should be largely independent of solving a particular numerical example.

So... as long as you take responsibility for understanding your own calculating device, why does it matter to an

instructor which one you use? Do assignments and exams consist of indicating to the instructor which button you push to solve the problem?

I know, I'm a dinosaur, and I've been out of academia for a long time. In my day, understanding the math and understanding the tools were separate joys, and they were both truly joys.

Manatee, I say you are right on target... for college instruction, for sure. My guess is, the middle/high school teachers on here will say its much different in that environment. My wife teaches high school English, and from the anecdotes I hear, there are so many challenges to teaching theses days, that any simplification possible is welcome, to include standardization of calculators.

Re: Forced to buy a TI-89 for school....I feel dirty

*Message #18 Posted by **Don Shepherd** on 1 Sept 2010, 10:50 a.m.,*
in response to message #17 by Martin Pinckney

I'm in my fifth year of teaching middle school math, and the presence and use of calculators in the math classroom is totally up to the teacher. Some teachers allow them and encourage their use, some don't. I don't know of any teacher in middle school that "requires" students to have a calculator, much less a certain brand. High school is probably different.

Most of the "older" teachers (who were in school before calculators were even invented) don't use them very much at all, even the simple 4-function ones. Most of the "newer" teachers allow them, but can't really answer students' questions regarding calculators (teachers, unlike us, are not geeks, typically).

The good (or bad, depending upon your perspective) news is that kids are still learning and practicing math concepts much as we did when we were in school.

Except, of course, 1 is not prime today.

:)

One thing we didn't have in the slide rule days was professors dictating which manufacturers machine to use. They did encourage us to get a log-log trig as soon as we could afford it. Meter readers were encouraged to get a log-log vector.

I didn't know it at the time but there was one advantage to using the Mannheim slide rules which had a "well" behind the slide. Many years later I saw one of those at a garage sale and another person told me that he never would have passed physics without it. I asked why. He told me that he used the well as a crib sheet for formulas that he had trouble remembering.

*Message #23 Posted by **Jimi** on 1 Sept 2010, 6:06 p.m.,*
in response to message #16 by Manatee

I think the idea of how to use them in the class is somewhat for the graphing, and perhaps, also to check your solutions. While the calculator isn't going to solve the problems step by step, it will let you know if you properly derived the trig function as an example.

In the first class, which wasn't much more than going over the syllabus, the professor acknowledged that the requirement is forced on him by the math department, but he could personally care less if we had one or not. He's going to want to see the problems worked out by hand, and said that while some teachers in the department use them in class, he does not.

Really, for checking answers, I can probably just as easily use something online like Wolfram Alpha.

*Message #24 Posted by **Dave Britten** on 2 Sept 2010, 8:16 a.m.,*
in response to message #1 by Jimi

The big problem with the TI-89 is that it's running an OS that was specifically designed for a device with a full QWERTY keyboard - namely, the TI-92. Thus there's not a lot of thought to menu usability, since you can generally type function names more quickly on the 92. By putting this OS on the 89, you end up with a calculator that's actually pretty good, albeit algebraic, but which is crippled with terrible usability as a result of severely reducing the number of keys, and falling back on menu structure that wasn't that great to begin with.

My advice is to skip the 89 and just get a 92+ or Voyage 200. They're the same thing, minus the suck.

Am I the only one?

*Message #1 Posted by **Donald Williams** on 30 Aug 2010, 2:27 p.m.*

Recently there has been much discussion, pro and con, concerning the new calculator model releases by HP. Since I am a collector, I am interested enough to acquire each and every model, and at least briefly put them through a few of their paces.

Unfortunately it is only “briefly” since I do not consider any of them candidates for a professional in the work place.

HP where is the I/O?

I just don’t understand why this feature is missing in all the new releases. I don’t hear it mentioned by others. Am I the only one who insists upon the option of backing up my work?

I don't think any programmable calculator should be allowed to be produced without a USB or Ethernet port. It just doesn't make sense in this day and age to not be able to transfer programs back and forth to your laptop or PC.

So I'm going to say I'm with you!.

I think this is the main reason I gravitate to my 48gii (w/ USB) and not my 35s. (That and the multiple equation solver :-)).

*Message #4 Posted by **Donald Williams** on 30 Aug 2010, 3:18 p.m.,*
in response to message #3 by Tim Wessman

That makes sense. I knew there had to be resistance somewhere along the line. I spoke to Cyrille at the 2008 meeting and came away convinced that USB OTG was at least theoretically possible and might???? be "just around the corner".

I don't want to disparage the great strides the calculator division has made as of late, but I think the lack of this feature is a “deal breaker” for at least some segment of the potential market.

I guess I will continue along with my Casio 9860 and hope for a remedy soon.

*Message #5 Posted by **Norman Dziedzic** on 30 Aug 2010, 5:43 p.m.,*
in response to message #3 by Tim Wessman

With all due respect, I think the testing bodies should enter the 21st century.

They should either make the tests so that you don't need a calculator which I would argue should be doable for almost any test (perhaps with the help of a table or two)

OR

Allow any calculator to be used because that will mimic what the real world looks like anyway.

Re: Am I the only one?

*Message #6 Posted by **Martin Pinckney** on 30 Aug 2010, 8:44 p.m.,*

Why doesn't HP make a case that has a "cut-out" for the IO? Put a mini-USB connector behind the case somewhere, indicate the shape, and let us use an exacto-knife to expose the connector.

It might take less time to expose a connector behind a plastic enclosure than it took me to open my HP 35s blister pack!

I cannot be absolutely certain, but I strongly suspect that USB I/O capability already exists in the underlying silicon. I am very frustrated that no attempts have been made to expose it. Using some method like you have mentioned does not seem be so terribly difficult. However I would hate to see the same “lame” excuse for serial I/O that was implemented on the 50G

Re: Am I the only one?

*Message #9 Posted by **Katie Wasserman** on 30 Aug 2010, 8:46 p.m.,*
in response to message #8 by Donald Williams

At least in the 20b/30b/12C+ the only silicon inside (except for some diodes maybe) is an AT91SAM7L128 and it's doens't have USB support. It's a pretty limited processor on many accounts, but is has just enough i/o pins to drive an LCD display for a simple calculator, a low off state current draw and good speed.

Needing many LCD driving pins is a real limitation in choosing a processor. I think using two or three chips: a processor and two LCD drivers would give HP a lot more flexibility to pick a processor with more memory (RAM and ROM), USB drive, etc. while allowing for a display with more segments. Is it really that much less expensive to use a single chip design than one with three chips?

I'm with you as well.

I've been using a 48GX since 1993 and more recently a 50g. I/O is not an option for me. The only calculator I've used for an extended period of time that didn't have I/O was the 15C. However, the 15C's limited memory allowed me to backup manually to my Moleskin notebook.

My recreational needs are best served by the 41CX and the 71B because they both have I/O.

Lastly, having I/O is fun. I've automated my lights with the 41CX. I've used my 71B with a GPS. I've used my 48GX as a programmable remote. I've used my 50g to drive MS Paint as a plotter. And, I've always had backups and can use my PC/Mac/whatever for development and testing and then download to my calc.

Egan, is I've been thinking about this recently. Is/was there a way to run say an X10 controller off a 48sx?

Re: Am I the only one?

*Message #12 Posted by **Egan Ford** on 30 Aug 2010, 6:30 p.m.,*
in response to message #11 by Martin Pinckney

Depends on the X10. The old firecracker toggles DTR/RTS to provide power and generate 0s and 1s. There is no RTS on the 48SX. If a newer X10 uses Rx/Tx and provides its own power then it should be possible.

*Message #13 Posted by **Ron Ross** on 30 Aug 2010, 2:55 p.m.,*
in response to message #1 by Donald Williams

I like the idea of taking an Hp 17Bii+ and cutting in a mini USB slot and a Micro 1 gig (or more) SD slot. Re-crafting the Hp42s software with extended Memory and directory support (or gut the graphics and CAS from the present ARM line of Hp48/50g series) and stuff that into a scientific calculator in the Hp 17Bii+ package.

When I was a field tech calibrating instruments, a calculator with a timer helped me immensely. If my Hp48G had been the size of an Hp42s. The lack of real I/O, no directories (for my 32K Hp42s) and no clock are the only three faults of the Hp42s. Yeah, I like the nicer programming set of an Hp48G, but that isn't really needed for a pocket calculator for number crunching.

Re: Am I the only one?

*Message #14 Posted by **Crawl** on 30 Aug 2010, 2:58 p.m.,*
in response to message #13 by Ron Ross

Yeah, I don't think even USB is enough anymore. A serious programmable calculator should also have an SD (or microSD) card slot.

Anyway, all this is partially why I use my 50g about a hundred times more frequently than my 35s.

That's the same reason all this talk doesn't interest me either. They're "justacalculators." I want a hand-held controller. Even USB does not qualify because it does not allow a battery-powered hand-held to be a controller, and you can't connect one port to more than one thing at a time unless you use external hubs. I've controlled a rack full of lab test equipment with the 41cx and 71B though, through the HP82169A HPIL-to-HPIB (IEEE488) converter which is transparent in most ways, ie, IEEE-488 equipment looks like it's on HPIL.

P.S., based on other posts below: I don't care one bit about exam approval.

It's been mentioned a huge amount of times over the last three years. But not so much recently because the testing explanation has also been discussed here a lot.

Tim: Another good reason for HP to come out with another scientific. One that may not be test-approved, but more user-friendly.

HP design and sell calculators to specific market segments and/or price points.
The non-programmable scientific ones are necessary to meet exam approval.

The rest are financial calcs that probably have no real market requirement for USB, so they presumably left it out to save cost and development time.

Dave.

Re: Am I the only one?

*Message #18 Posted by **Egan Ford** on 30 Aug 2010, 7:59 p.m.,*

I'm sure this is true for many other calc manufactures as well. The number of people that actually program calculators is shrinking as is the need to provide I/O.

However, I think it is reasonable to expect that any programmable calculator with a large memory to provide some type of backup capability.

*Message #19 Posted by **Jerry Raia** on 30 Aug 2010, 6:25 p.m.,*
in response to message #1 by Donald Williams

HP abandoned its roots a long time ago. I don't think we will see anything like the HP41/71 with all the capabilities (IO included) it had, ever again. The 48/50 are nice, but they don't have the HP feel or quality anymore. There is a reason this site is called a museum. The really good stuff is now history I think. I doubt anyone will be looking for an old 35s 20 years from now.

Re: Am I the only one?

*Message #20 Posted by **David Hayden** on 31 Aug 2010, 4:02 p.m.,*
in response to message #19 by Jerry Raia

Another big reason to provide I/O is to allow programs to be loaded on the calculator. This thread describes a student desperate to get surveyor software loaded onto a 35s. Personally, the only reason I haven't bought a 35s is the inability to easily load programs on it. I don't want to type them in by hand.

If test acceptance is an issue, then I'd take the approach they used with the 39gs and 40gs: two nearly identical models except one supports I/O and the other doesn't.

Or return to the expandability of the 41C (and 48 I think) lines where all the good stuff is available as an add-on. We geeks just love to buy our add-ons :)

I don't think SD cards are required as long as the calculator has sufficient built-in storage. What I really mean here is that given the choice between USB and an SD card, I'd take USB. I'm sure others would differ, but that's another reason to make these things add-ons - everyone can get what they want while still buying the same base model calculator.

> HP where is the I/O?

Build into the 50G.

Add too many features and the user needs a manual all the time and/or has to look up functions in menus.

Add I/O and the users ask e.g. for naming programs.

... and gone are the easy-to-use programmable calculators the 3x models once were.

Recommended Oscilloscope

*Message #1 Posted by **aj04062** on 29 Aug 2010, 10:37 p.m.*

Anyone have a recommended inexpensive oscilloscope for debugging HP calcs?

Is 1Mhz bandwidth sufficient?

Edited: 29 Aug 2010, 10:37 p.m.

Re: Recommended Oscilloscope

*Message #2 Posted by **Lyuka** on 30 Aug 2010, 4:29 a.m.,*
in response to message #1 by aj04062

Hi.

'Inexpensive' is different according to the purpose. 1MHz bandwidth is not sufficient except some audio applications.

Expressions to choose an adequate oscilloscope from signal-bandwidth are,

1. Signal-BW(band width) = 0.5 / rise-time
2. Oscilloscope-BW >= 2 * Signal-BW
3. Oscilloscope-sampling-rate >= 4 * Oscilloscope-BW

Example: If you wand to measure a circuit operating at several MHz of system clock and its rise-time is assumed to be 10ns,

1. Signal-BW = 0.5/10ns = 50MHz
2. Oscilloscope-BW >= 2 * 50MHz = 100MHz
3. Oscilloscope-sampling-rate >= 4 * 100MHz = 400Msps

Regards,
Lyuka

in response to message #1 by aj04062

I have a feeling that you're asking about one of those very inexpensive USB 'scopes or one that's built into a DMM. Mostly what you need to work on digital electronics is a logic analyzer, but given that most vintage calculators were bit-serial devices you don't need too many channels, just one to watch the signal line and a couple of others to watch the handshake lines. Also an oscilloscope will let you debug problem power supply lines and such while a logic analyzer won't help at all in that regard.

If you're only interest is in old HP LED calculators the clock speeds were pretty slow, you could just barely

get by with a 2MHz 2 channel 'scope, but 4 channels and some more speed would be most helpful. I wouldn't recommend anything less than 5MHz. Some of the low cost USB scopes have 2 analog channels and 8 digital ones (these are usually referred to as a mixed signal oscilloscope or MSO). They might be a good compromise. Here's one such device but you should read the reviews of this.

However, I find that there's nothing as good as having a dedicated digital oscilloscope of some sort on your workbench, it defiantly beats a USB scope feeding a computer for ease of use. You also want to look for one with a lot of memory depth so that you can scroll around and see the history of the signals you capture.

in response to message #1 by aj04062

This is the one I've used for many of my embedded projects, and it's a beautiful device. Works great too! ;-)

Portable oscilloscope

I highly recommend it.

For the logic analyzer side, I chose this...

USBee DX

...after a long period of research, which included comments and opinions from many on this forum. The second choice unit was this one:

Saleae logic analyzer

I ultimately chose the USBee unit because of the software, which I thought was better. Plus, it had some nicer features in the hardware design (external trigger). The Saleae unit was a very close second, though -- it's a beautiful device too.

Now below is another interesting new product with many functions built in, and it would be great for many embedded projects:

Protolyzer

thanks,

Bruce

I don't!

http://www.eevblog.com/2010/05/11/eevblog-86-buy-a-real-analog-oscilloscope-please/

Plus:

http://www.eevblog.com/2009/06/17/eevblog-13-part-1-of-2-digital-storage-oscilloscope-tutorial/

http://www.eevblog.com/2009/06/17/eevblog-13-part-2-of-2-pc-based-digital-storage-oscilloscope-comparison/

But as usual, horses for courses.

Dave.

Re: Recommended Oscilloscope

*Message #6 Posted by **Bruce Bergman** on 31 Aug 2010, 10:55 a.m.,*
in response to message #5 by DaveJ

But I *DO* have a "real" oscilloscope as well. A nice color Fluke 100MHz with all the bells and whistles. I just don't find the need to bust it out all that often. When I do, it's nice to know it's there, but 90% of the time the little one is sufficient for my small projects.

And, it's important to recognize the difference between someone who NEEDS a full-blown oscilloscope and sits in front of one all day (like Dave here! ;-), and someone who just putts around in the embedded world from time to time (like me). With that distinction, I stand by my original recommendation (but, of course, I respect yours too, Dave ;-).

Thanks,

bruce

Define inexpensive.

Define what you want to "debug"

If you just want to see if a signal is there or not then a 2nd hand 20MHz or so analog oscilloscope is just fine.

If you want to capture and debug signals then a USB logic analyser is a better bet.

If you want a "real" digital storage bench scope that is excellent value for money with a deep sample memory. Go the Rigol DS1052E. I have a ton of info on it on my site and the EEVblog forum.

When was 1 a prime number?

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 29 Aug 2010, 9:21 p.m.*

In my first response to Bill's Bowling Challenge Variation challenge I used 1 as a prime number. Don Shepherd noted that 1 isn't a prime number, but Katie came to my rescue by noting that 1 had been considered to be a prime number in the past.

Even so, I wasn't sure what I might have relied on from the olden days to accept 1 as a prime number. Then I found that Table 24.9 on page 870 of my copy of AMS-55 published in 1964 didn't include 1 in the list of prime numbers. But yesterday I was looking up something else in my copy of *Mathematical Tables from the Handbook of Chemistry and Physics* (1959). I looked at the table of factors and primes starting on page 242. A note at the top of the table states "If n is prime the mantissa of its logarithm is given." The mantissa is given as 0000000 for 1.

Re: When was 1 a prime number?

*Message #2 Posted by **Egan Ford** on 29 Aug 2010, 9:42 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

> Quote:

> When was 1 a prime number?

In hindsight it never was. However, according to http://en.wikipedia.org/wiki/Prime_number#Primality_of_one, the 18th century, 1956, and 1941 (death of the last believer).

Re: When was 1 a prime number?

*Message #3 Posted by **htom trites jr** on 30 Aug 2010, 1:12 a.m.,*
in response to message #2 by Egan Ford

Always was, never was, depending on how you defined "prime number". These days it's mostly not, but the question shows up sometimes when non-professional people are asked about prime numbers. We had this just last week at our health club, the daily question was "What is the sum of the first five prime numbers?" and the "correct" answer was (1 2 3 5 7 11) either 18 or 28, depending on whether you started with 1 or 2.

(The definition "a natural number divisible, without remainder, only by itself and one" leads to the conflict; there's an implication that that the word "and" means "itself <> one" but not everyone sees or agrees with that.)

Edited: 30 Aug 2010, 1:18 a.m.

Re: When was 1 a prime number?

*Message #4 Posted by **Don Shepherd** on 30 Aug 2010, 7:39 a.m.,*
in response to message #3 by htom trites jr

The definition of prime number that the school textbooks use today is "a number with exactly 2 factors, 1 and itself", and a composite number is "a number with more than 2 factors". Since 1 has only 1 factor, it can't be prime, nor can it be composite.

Re: When was 1 a prime number?

*Message #5 Posted by **Gerson W. Barbosa** on 30 Aug 2010, 8:48 a.m.,*
in response to message #4 by Don Shepherd

> Quote:
>
> The definition of prime number that the school textbooks use today is "a number with exactly 2 factors, 1 and itself",

Don,

Shouldn't this be "a number with exactly 2 **distinct** factors, 1 and itself"? Otherwise one could argue that 1 is prime because 1 = 1 * 1. I was taught composite numbers are those that can be expressed as a finite product of prime numbers. This would exclude 1 from the set of prime numbers because 6, for instance, could be expressed by the infinite product 2 * 3 * 1 * 1 * ...

Gerson.

Re: When was 1 a prime number?

*Message #6 Posted by **Don Shepherd** on 30 Aug 2010, 12:27 p.m.,*
in response to message #5 by Gerson W. Barbosa

Gerson, I see what you are saying, but I don't know that you need the word "distinct." I think the definition works because 1 only has 1 factor, which is 1 (you can't count 1 twice), and a prime number needs to have exactly 2 factors, and 1 doesn't.

We teach it that way. We teach that both 0 and 1 are neither prime nor composite, they are special cases. I'm sure kids couldn't care less.

Re: When was 1 a prime number?

*Message #7 Posted by **Egan Ford** on 30 Aug 2010, 1:42 p.m.,*
in response to message #6 by Don Shepherd

IMHO, "exactly 2" implies a quantity with no mention of uniqueness. *Distinct* implies uniqueness. I know I can find a person on the street that will insist that 1 factors into exactly 2 numbers. 1 x 1. Because, most children spend a lot of time on a x b = c and remember that as adults.

From Wikipedia:

A prime number (or a prime) is a natural number that has exactly two distinct natural number divisors: 1 and itself.

Re: When was 1 a prime number?

*Message #8 Posted by **Don Shepherd** on 30 Aug 2010, 3:18 p.m.,*
in response to message #7 by Egan Ford

Hey Egan.

Well, I have no doubt that you could find a person on the street who would agree to almost anything; that doesn't mean they are right. I'm sure there are some today who would say man never landed on the moon. And, please everyone, let's not steer this thread into an examination of did man, in fact, ever land on the moon!

The Wikipedia definition is fine. Middle school textbooks typically don't say "distinct", but that's OK, most kids are able to correctly distinguish prime and composite numbers, at least long enough to demonstrate that knowledge on a test. And, believe me, kids have no interest in debating whether or not 1 is prime.

I'd bet that if you took a survey of people on the street and asked what is the difference between a prime and a composite number, maybe 5% would know. Things like that are just not relavent in people's lives.

Don, So, does that mean that 12 has only 2 prime factors? ... I think you'll confuse the kids greatly if you don't say when duplicates matter.

Regarding the primality of 1, I think the key thing is that defining it as non-prime makes some other mathematical concepts work out better. I wish I could remember what those concepts were though.... :) This is an example of a key concept that I think should be taught explicitly in school - that sometimes in math we define things a particular way to make the model work better or easier.

Re: When was 1 a prime number?

*Message #10 Posted by **Don Shepherd** on 31 Aug 2010, 6:08 p.m.,*
in response to message #9 by David Hayden

Well, 12 has 6 factors, which makes it a composite number (>2 factors). That's as far as middle school kids get into this subject.

The non-primality of 1 (and 0, for that matter) is just something we don't get into with these kids. And most of them understand which numbers are prime and which are not. And they LOVE making factor trees, which is nice.

Then we move from prime/composite into greatest common factor and least common multiple, which of course are used for simplifying and adding/subtracting fractions with different denominators.

But by the time they graduate high school, they've probably forgotten it all. Which, honestly, doesn't disturb me. They've exercised their minds and learned how to think logically, and that's really the important part.

That pretty much agrees with my experience. Somewhere in my early education I was exposed to prime numbers, Mersenne numbers, perfect numbers, et al, but in forty years of work with military electronics systems I can't recall a single instance in which I had any use for any of them. Is work with these numbers primarily limited to mathematicians? Are there engineering disciplines depend on them in some way?

Palmer

> Is work with these numbers primarily limited to mathematicians? Are there engineering disciplines depend on them in some way?

Palmer, I can't speak for the engineering disciplines regarding their possible use of prime numbers, but I do know that the entire security system behind the Internet is based upon the impossibility of factoring certain very large numbers into their two prime factors. I believe this is the RSA public key encryption system. I'm certainly no expert in that, but I do tell my students that if they can figure out a way to factor huge integers, they just might put the Internet out of business or, more likely, earn a few million dollars by agreeing to keep their discovery secret!

RSA at one time offered lots of money to anyone who could factor certain large numbers; I believe they discontinued that. I printed out one of those numbers and showed it to my students and told them how much they could win if they could factor it. One student actually spent the weekend trying to divide the number by 2, and when he reached the last digit he realized that there would be a remainder. On Monday morning he brought in his work, and I remember the really bad feeling he had when I pointed out that he could have saved himself all that work

if he had only realized that the number ended in 3 and therefore could not be divisible by 2!

Re: When was 1 a prime number?

*Message #13 Posted by **David Hayden** on 1 Sept 2010, 7:02 a.m.,*
in response to message #10 by Don Shepherd

Don, do you teach Euclid's algorithm to find the greatest common factor? I think it would be a great way to show kids the joy of a good algorithm and a nice way to introduce them to the concept of programming. I'm not suggesting that they would write a program, but you could explain the algorithm and then say "this is the sort of step-by-step procedure that can be done by a computer."

Re: When was 1 a prime number?

*Message #14 Posted by **Don Shepherd** on 1 Sept 2010, 7:50 a.m.,*
in response to message #13 by David Hayden

For the sixth graders, we generally teach it this way. For the seventh and eighth graders (if it is included in their curriculum), I might teach them Euclid's algorithm like this if I think they are capable of understanding it. With some classes, the simplest method is the best, but a good teacher challenges inquisitive students with methods they are capable of understanding and using. I try to be a "good teacher," of course.

It is much easier to tailor your instruction to the individual student if you have 13 students a day, as opposed to 150 students a day. Fortunately, I have 13.

Re: When was 1 a prime number?

*Message #15 Posted by **Mike** on 1 Sept 2010, 9:18 a.m.,*
in response to message #5 by Gerson W. Barbosa

I disagree with the belief that 1 isn't a prime number the same as I disagree with Pluto not being a planet.

However, "exactly 2 factors" means 2 and no more or less. 1 = 1 * 1 is two factors but not "exactly" 2 factors because 1 = 1 * 1 * 1 also.

However, I think that definition is also wrong. Definition changes are done for one reason and that reason is to try and exclude 1, for no particular purpose. 1 being a prime violates nothing in mathematics and fits the old definition of a prime number.

Re: When was 1 a prime number?

*Message #16 Posted by **Don Shepherd** on 1 Sept 2010, 10:30 a.m.,*
in response to message #15 by Mike

Mike, you are free to believe what you like, of course. But the reality is that 1 is not a prime number, and that's what kids are taught.

Re: When was 1 a prime number?

*Message #17 Posted by **Gerson W. Barbosa** on 1 Sept 2010, 12:40 p.m.,*

in response to message #15 by Mike

Ultimately, 1 is defined as non-prime to keep a pattern intact, according to Dr. Math:

http://mathforum.org/library/drmath/view/57058.html

Re: When was 1 a prime number?

*Message #18 Posted by **Katie Wasserman** on 1 Sept 2010, 12:51 p.m.,*
in response to message #17 by Gerson W. Barbosa

I've been staying out of this since my initial comment on Palmer's use of 1 as a prime number.

But if you want to debate something more relevant to HP calculators, why does the 20b and 30b define 0^0 as 1? I think that this is wrong but there are plenty of examples of this, try the Google calculator.

Edited: 1 Sept 2010, 12:55 p.m.

Re: When was 1 a prime number?

*Message #19 Posted by **Gerson W. Barbosa** on 1 Sept 2010, 4:40 p.m.,*
in response to message #18 by Katie Wasserman

For 0^0 the 33s returns INVALID y^x, the 48GX returns 1.The HP 50g returns ?, that is, a mathematical indetermination, however for 0.^0. it returns 1. Perhaps there's a practical reason for this behavior, but I can only guess.

> Quote:
>
> **Treatment on computers**
>
> The IEEE 754-2008 floating point standard is used in the design of most floating point libraries. It recommends a number of different functions for computing a power:[19]
>
> * pow treats 0^0 as 1. This is the oldest defined version, it checks if the power is an exact integer and uses the value defined by pown in that case otherwise the value is as for powr except for some extra exceptional cases. * pown treats 0^0 as 1. The power must be an exact integer. The value is defined for negative bases, e.g. pown(-3,2) is 9. * powr treats 0^0 as NaN (Not-a-Number - undefined). The value is also NaN for cases like powr(-3,2) where the base is less than zero.
>
> **Programming languages**
>
> Most programming language with a power function are implemented using the IEEE pow function and therefore evaluate 0^0 as 1. The later

> C[20] and C++ standards, and the Java standard[21] mandate this behavior. The .NET Framework method System.Math.Pow also treats 0^0 as 1.[22]

Re: When was 1 a prime number?

*Message #21 Posted by **Katie Wasserman** on 1 Sept 2010, 6:20 p.m.,*
in response to message #20 by Martin Pinckney

There's a good, short discussion of the issue here. The vast majority of HP calculators (and I think all of them from the Pioneer series backward) return an error for 0^0 as do most other calculators. I wonder if there's much thought given to this or whether it's just a matter of convenience as to what the calculator returns.

Just curious, has TI been consistent over the years as to how they handle this? (I don't have enough TI calculators to check.)

It seems like TI and HP have been following a similar path, I think it pretty strange (and a bit disturbing) that both companies chose to abandon consistency on this with some of their recent high-end calculators. Pretty soon they'll start returning answers when you divide by zero like some of the earliest calculators did.

in response to message #21 by Katie Wasserman

Katie:

You wrote:

> Quote:
>
> Just curious, has TI been consistent over the years as to how they handle this? (I don't have enough TI calculators to check.)

Here are some results from older TI's:

```
TI Business Analyst I  1
TI-30  1
SR-40  1
TI-55  1
TI-59  1
TI-68  Error
TI-80  ERR:DOMAIN
TI-81  ERROR 04 MATH
TI-83+ ERR: DOMAIN
TI-85  ERROR 04 DOMAIN
TI-86  ERROR 04 DOMAIN
TI-89 Titanium  undef
voyage200  undef
```

where my result for the TI-89 Titanium is different from the result reported by Gerson. I don't know how to explain the difference unless there is a difference between the TI-89 and the TI-89 Titanium. I get the "undef" result whether I am in AUTO, EXACT, or APPROXIMATE. Using my results there is a consistency of sorts. Before the TI-68 the result is 1, and from the TI-68 forward the result is an error.

Here is an interesting one from the HP-19BII: ERROR: 0^0

where it has separate error messages for 0^NEG, 0/0, 0^0, and /0.

0^0 = 1 is somewhat logical if you look at the graph of y=x^x, and then take the limit as x->0 from the right. Obviously the limit is 1. Weird #$@%$#!! happens from the left, but I'm comfortable with the right-hand limit value 95% of the time. :)

Factor 1: 1 Factor 2: itself

Factors imply multiplication

1 * itself = 1

IF one is not a prime, then the definition was changed along the way. The definition I was taught (in olden times) was "a prime is a number that is divisible only by itself and one". And I'm sticking with that, unless someone asks me to bet on that sum of first five primes question.

One is not prime today. It and zero are neither prime nor composite. That's what we teach the kids.

Re: When was 1 a prime number?

*Message #31 Posted by **Mike** on 1 Sept 2010, 9:40 p.m.,*
in response to message #30 by Don Shepherd

Yeah! But what we teach kids, isn't the the criteria for deciding whether or not 1 should be prime. It's not a prime today, for only one reason... to be consistent with a new definition.

Mathematics has been around for eons. Up until a hundred years ago, and even into the 20th century, many professional mathemiticians considered 1 a prime. Up until the 50s and even in the 60s when I was in school, '1' was a prime number.

What has changed is a definition; not mathematics.

Hell, "what we teach kids" is not only often wrong, but irrlevant. It wouldn't surprise me that some history revisionists "teach" that the U.S. lost the Vietnam war and offer as proof, the helicopters landing on the embassy in Saigon. Nevermind that the U.S. had alread been out of Vietnam for 2+ years and the war ended in a peace agreement.

I agree. In 2010, 1 is not regarded as a prime number. That is the mathematically-accepted truth. We teach kids the mathematically-accepted truth.

> Quote:
>
> "what we teach kids" is not only often wrong, but irrlevant.

You've got it partially right. We don't teach kids "wrong" things. We teach the curriculum, and the curriculum is defined by the state educational organizations. Now they are not perfect, but at least where math is concerned I can't think of a single fact that we teach our kids that is "wrong."

Some of what we teach is, in my opinion, irrelevant. Box-and-whiskers plots and stem and leaf plots are examples. Kids will never see one of these once they leave middle school. But, truth be told, most kids will never see a quadratic equation once they leave high school either. But we teach them, because they make the kids think, and that's a

value that never goes out of style.

> Quote:
>
> Always was, never was, depending on how you defined "prime number".

I was taught that a prime was a positive integer that was only divisible by 1 and itself. 1 does fit that definition. And there may have been a period of time in my youth that I also believed it. The missing term *distinct* I read from a book later on. I believe that confusion is still being spread because that term is being dropped from casual (and perhaps formal) conversation.

1 is neither prime or composite--it is truly the loneliest number. 1 does have the unique distinction of being the *unit*, i.e. unit = 1/unit (or unit == 1/unit for TW, et al :-).

One reason why 1 is not a prime is that it would be in conflict with the Fundamental Theorem of Arithmetic.

Re: When was 1 a prime number?

*Message #36 Posted by **Ken Shaw** on 31 Aug 2010, 10:13 a.m.,*
in response to message #35 by John Mosand

This is elegantly expressed in the video found here:

Re: When was 1 a prime number?

*Message #37 Posted by **Mike** on 1 Sept 2010, 9:25 a.m.,*
in response to message #35 by John Mosand

I must be in a disagreeable mood today.

How does 1 violate the Fundamental Theory of Arithmetic? If what you say is true, then making 1 a prime number would violate that theorem. But if 1 was prime, it fits perfectly with the definition of Fundamental Theory of Arithmetic.

Fundamental Theory of Arithmetic

"In number theory and algebraic number theory, the Fundamental Theorem of Arithmetic (or Unique-Prime-Factorization Theorem) states that any integer greater than 1 can be written as a unique product of prime numbers."

In fact, in my view if that is the definition, you it is flawed without 1 being a prime.

For instance, according to that theory, what is the factors of 2?

2 must have uniquie product of prime number**s**.

2 = 2 * 1

According to the theory, those factors must be prime. In order for that theory to hold, 1 must be a prime. If 1 is not a prime number, then there is no product of factors at all for 2. Product implies multiplication of 2 numbers.

The problem I see, is that all of these definitions are designed to exclude 1 from the list of primes, for no particularly good reason. The definitions are flawed. 1 being a prime voilates no rules of mathematics that I know of, unless it's related to a flawed definition.

So here is a test

1) What is the oldest known list showing 1 as a prime? (no definitions please; just lists of numbers)

2) What is the oldest known list showing 2 as the first prime? (no definitions please; just lists of numbers)

3) Which is older?

I know "todays" answer as to whether or not 1 is prime. I know when I was going to school, many, many moons ago 1 was prime. I also know that when I was going to school, Pluto was a planet.

From where I sit now; nothing has changed but definitions.

> of numbers)
>
> 2) What is the oldest known list showing 2 as the first prime? (no definitions please; just lists of numbers)
>
> 3) Which is older?

If you look at the first item in this thread you will see that my AMS 55 of 1964 does not show 1 as prime.

My *Mathematical Tables from Handbook of Chemistry and Physics* does show 1 as prime. It is fourth printing of the eleventh edition with the first printing in December 1959. The book was originally copyrighted in 1931.

In its definitions of "prime' my *Webster's Collegiate Dictionary* (Fifth Edition 1946) states

> Quote:
>
> 5. *math* a. divisible by no number except itself or unity; as, 7 is a *prime* number. b. Having no common divisor but 1; -- used with *to*; as, 12 is *prime* to 25.

My 1969 issue of *Encyclopedia Britannica* says

> Quote:
>
> PRIME NUMBER, a positive integer (whole number) greater than 1 that cannot be expressed as the product of two positive integers neither of which is one.

Those are the oldest references that I have here in North Carolina. I have some older references in Florida including the "Mathematical Tables from ..." that I purchased in 1946 when I was a freshman in college. I also have the algebra and geometry texts that my father used in about 1918 where my memory says that the copyrights were in the very early 1900's. I will be able to look at those in about two weeks.

I told my wife that those old books would come in handy sometime!

Palmer

"Is 1 a prime number" and "0! = 1"?

*Message #39 Posted by **Karl Schneider** on 2 Sept 2010, 12:50 a.m.,*
in response to message #34 by John B. Smitherman

> Quote:
>
> Palmer, in my opinion defining 1 as non-prime is similar to defining 0! = 1. It seems to be an arbitrary way to get the math to work.

There's been much parsing in this thread about the reasons for or against the primality of 1, but the fundamental point seems clear to me:

The purpose of integer factorization is to decompose an integer into a product of factors (smaller integers). A prime factor is one that itself cannot be decomposed. Any number -- integer or not -- can be expressed

as the product of itself and unity (1), which renders 1 a "sub-factor" that cannot be used for decomposition. Thus, 1 would be trivial as a prime number.

It follows that two (2) cannot *possibly* be broken down, due to an absence of any smaller factors. However, to divide a positive even number by 2 will render an integer quotient that is smaller than the original number, so 2 is a valid factor that is prime.

As for the factorial of 0 (0! = 1): Yes, it seems arbitrary, but it fits the inductive mathematical definition and is useful in practice:

```
1! = 1        (by definition)
k! = k(k-1)!  {k is integer}

--> (k-1)! = (k!)/k

Let k = 1,

--> (1-1)! = (1!)/1
-->     0! = 1/1 = 1
-->  (-1)! = (0!)/0 = 1/0  (undefined)
```

Re: When was 1 a prime number?

*Message #42 Posted by **Mike** on 1 Sept 2010, 9:46 p.m.,*

in response to message #40 by Don Shepherd

And I wager the algorithm is different for '1' than any other number. I bet the algorithm is something like:

```
isprime (n)
 {
  if (n==1)
  {
    return "false"
  }
  is_modernconvention_prime(n);
 }
```

It's simply one extra step to the actual algorithm, to eliminate '1' by convention and nothing more.

I also bet you think Pluto isn't a planet?

Mike, slavery is also no longer accepted in the United States.

Things change.

If you want to consider 1 prime or Pluto a planet, hey, it's a free country. But I've got to teach prime numbers to kids, and I want to teach the truth, and the truth is 1 is not a prime number. Maybe it once was, fine, but today it's not.

If you really feel strongly about this, perhaps you should write the American Mathematical Association and plead your case. I wish you luck.

Don

Re: When was 1 a prime number?

*Message #44 Posted by **Martin Pinckney** on 1 Sept 2010, 11:29 p.m.,*
in response to message #43 by Don Shepherd

I think I understand both viewpoints. There appear to be valid reasons why today 1 is defined as not prime, whether we* understand them or not; that is mathematical convention today, so that is what is taught in the schools.

However, "convention" is not the same as "truth". As David Hayden said:

> Quote:
>
> ...sometimes in math we define things a particular way to make the model work better or easier.

*By "we", I mean "me". To me, it seems intuitive that 1 is prime. However, intuition often fails to maintain rigor in mathematics.

Re: When was 1 a prime number?

*Message #45 Posted by **htom trites jr** on 1 Sept 2010, 11:46 p.m.,*
in response to message #44 by Martin Pinckney

It seems that the natural numbers are divided these days into four classes: 0; 1; primes; and composites. Glad I'm not a mathematician, and I still call Pluto a planet. Wrong, wrong.

Anyway, MathWorld has a discussion of this, with dates and sources. It's one of those arbitrary "math things". Primacy of One, and Primes

The Fundamental Theorem thing doesn't do it for me. If N is a prime > 1, then it has two factors, itself and one, and is the product of those two primes. But one is not a prime, so the theorem seems to fail. I suspect this is one of those "don't do math in English" problems, which I'm frequently reduced to in attempts to explain quantum and relativity physics.

Re: When was 1 a prime number?

*Message #46 Posted by **Gerson W. Barbosa** on 2 Sept 2010, 1:20 p.m.,*
in response to message #45 by htom trites jr

It's just occurred to me that the Eratosthenes Sieve would not work if 1 were defined as prime. In that case all multiples of 1 (that is, the whole set of integer numbers but 1) would be striken from the list and 1 would be the only prime number. Perhaps 1 should be called a *primary number* to distinguish it from the primes, but I'm not sure this is another Mathematics reserved word.

Including 1 in the set of prime numbers would spoil the mnemonic for the first seven primes in your reference. Likewise the exclusion of Pluto from the planetary family has ruined "My Very Educated Mother Just Served Us Nine Pizzas" :-)

Ah, very interesting - in German it's "Mein Vater Erklärt Mir Jeden Sonntag Unsere Neun Planeten", so the loss of Pluto is even worse since both the number nine and the word "planet" are explicitely mentioned. ;-)

And what about other languages? How do you memorize the planets in French, Spanish or in other parts of the the world?

Dieter

Re: When was 1 a prime number?

*Message #48 Posted by **Gerson W. Barbosa** on 2 Sept 2010, 5:25 p.m.,*

Thanks!

The HP-15C was my first HP calculator. I still have it plus two more, including one of the last units made (1989).

Quoting from your website:

> Quote:
>
> The Simulator uses the Simpson method to compute an integral. Unfortunately, I do not know which method the HP-15C uses (the handbook does not say a word about it).
>
> Quote:
>
> I do not know which method the real HP-15C uses to find the roots of an equation. The Simulator uses the "Regula Falsi" method.

The HP-15C, like its predecessor HP-34C, uses a Romberg method. Perhaps the author of both SOLVER and INTEGRATE algorithms, Prof. Kahan, can give more detailed explanations:

http://www.cs.berkeley.edu/~wkahan/Math128/INTGTkey.pdf

http://www.eecs.berkeley.edu/~wkahan/Math128/SOLVEkey.pdf

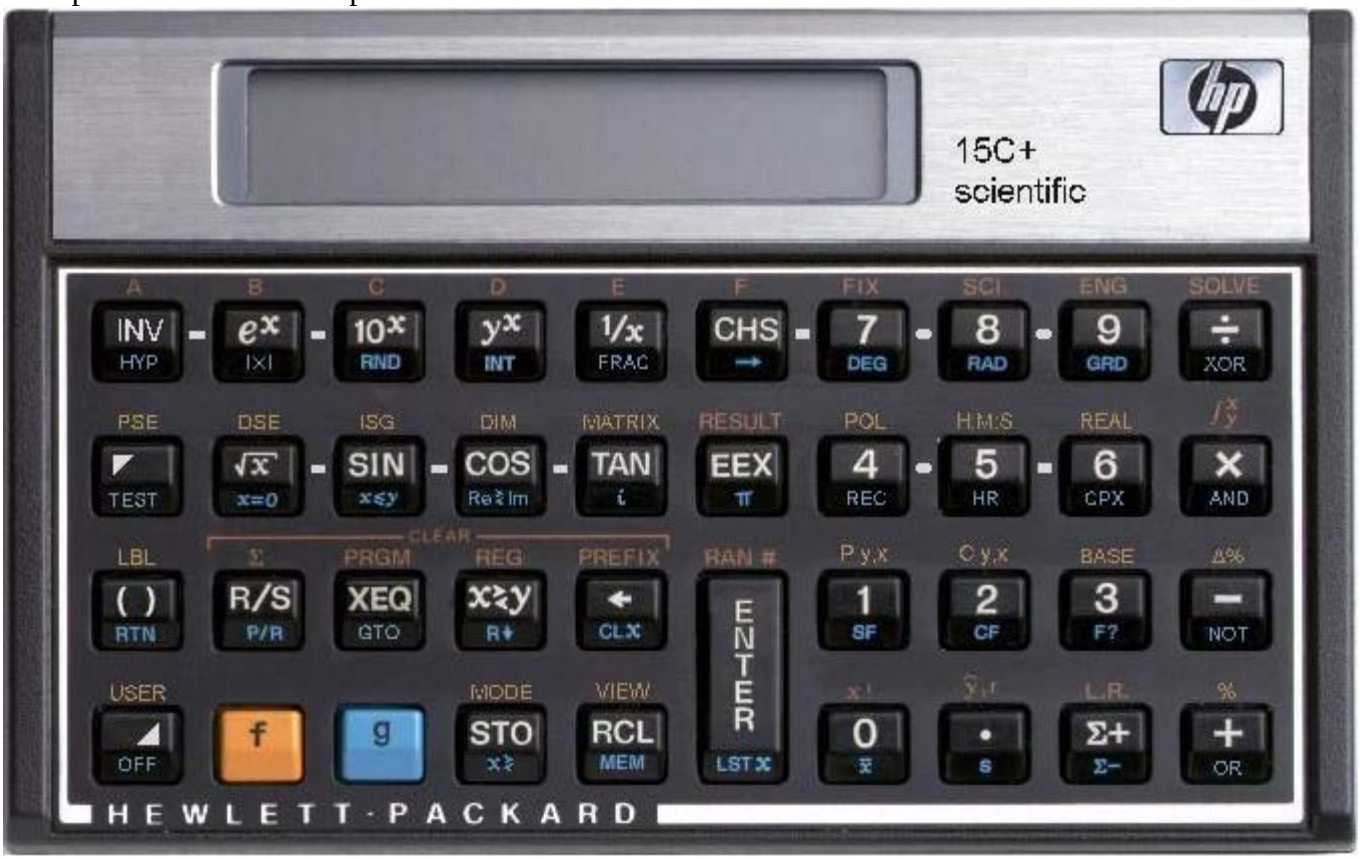
Design contest ;)

*Message #1 Posted by **Walter B** on 29 Aug 2010, 1:59 p.m.*

Ok, I didn't want to do that again, but since two requests were posted recently you find here a number of drafts showing some opportunities present HP calculator housings allow. As mentioned elsewhere, most drafts were posted earlier already. With respect to the upcoming HHC2010, they are published here in a new thread to foster discussions about a new **scientific** RPN calculator. After all, these financial guys drove us into last crisis, now, HP, give the engineers a good, handy pocket calculator **before** they will do alike! ;)

First picture shows what's possible based on a 15C with minimal modifications:



You may note an INV prefix for inverting functions top left, and an arrow prefix for conversions (top right). Respective applicable functions are connected with a white dash. Everything else is old technology (no need to get used to something new, hurrah!).

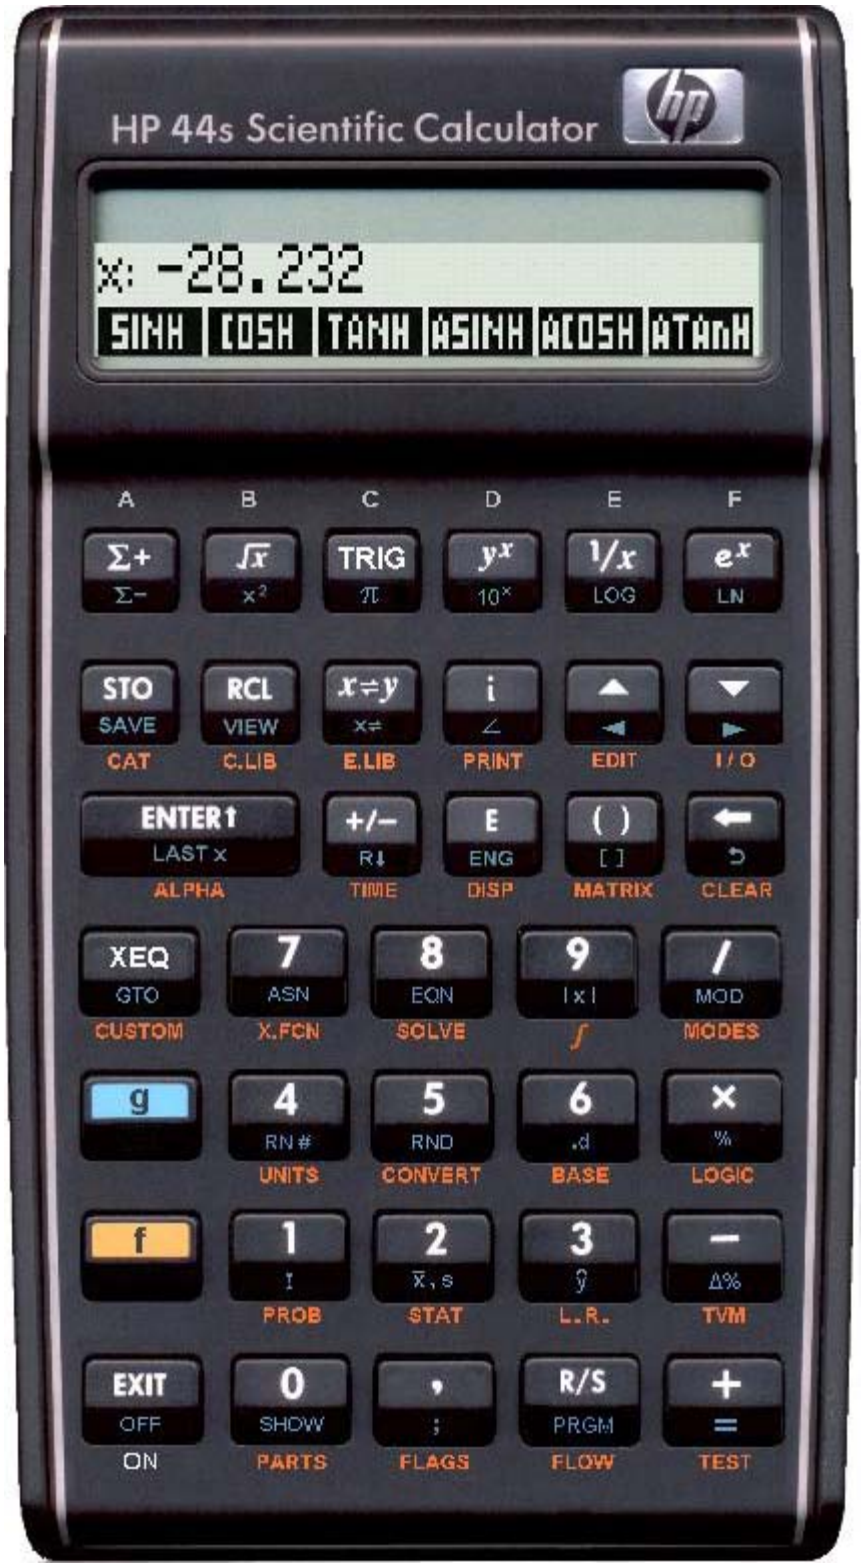
With a little more effort, particularily a full dot matrix display (hey, a change after almost 30 years! How dare you!), one may reach something like this:

Design contest ;)

Similar layouts can be done easily based on

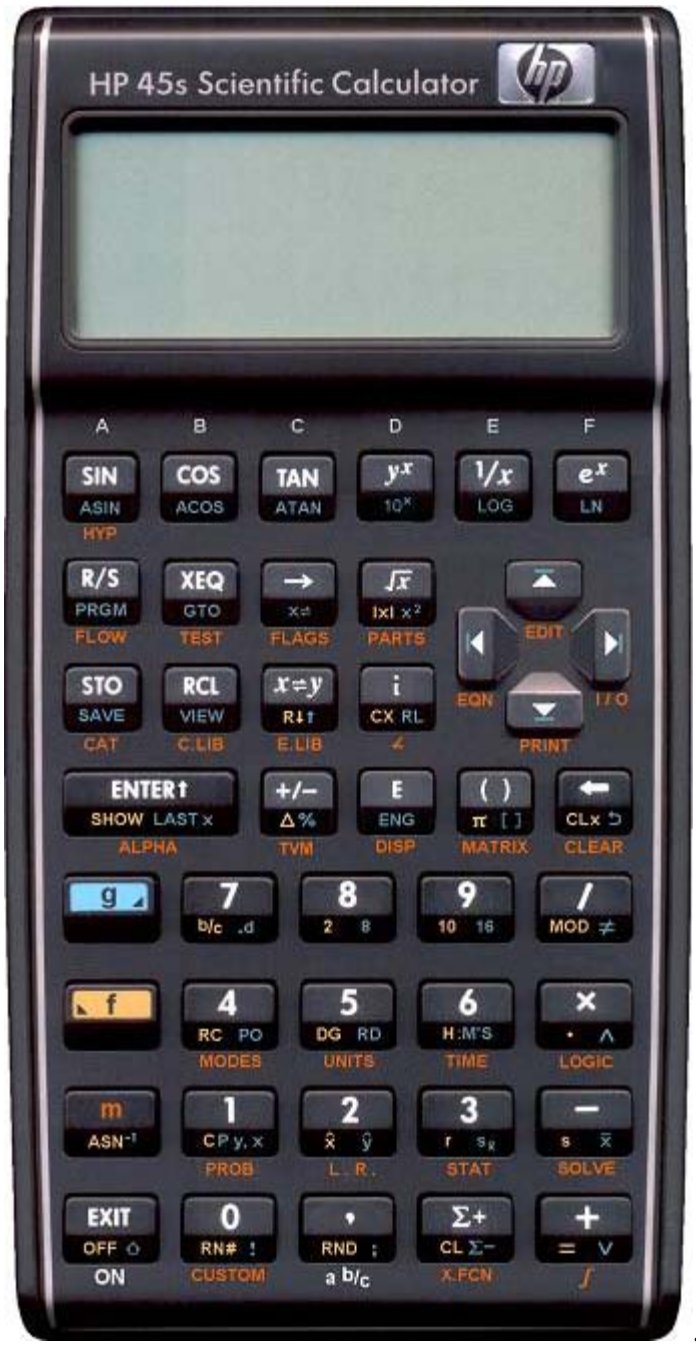
a 42S: 
, a 17BII Silver:

Design contest ;)



, or a 35S:

Design contest ;)



As many of you know, Paul Dale and me have started a 20B repurposing project some (many) months ago. This is our present layout:

Of course, we'll use the 30B HW now. There is a 49-page manual available for this draft already - if you want a copy please drop me a note.

This as well as all other drafts published here and the related documentation are subject to updates without notice. So, as written elsewhere already, comments, critics, suggestions etc. are most welcome, especially if some reasoning is included. Don't hesitate to ask questions you may have! Though you can't buy any of these models yet, maybe you may get one of them once when either our repurposing project will end successfully or a renowned calculator corporation which will not be named here will take the chance ... ;)

Ceterum censeo: HP, launch a new scientific!

FWIW,

Walter

in response to message #1 by Walter B

All these implementations look good, especially those based on the 15C. However, the question that we have to ask ourselves is, is anyone with any power to bring out a new calculator, listening.

It seems that the calls for a good rpn scientific calculator have been going on for years. The 33s with it's chevron keyboard and it's decimal point, wasn't an option. The 35s apparently has keyboard issues.

That said though, those mock ups look really good.

What's inside

*Message #7 Posted by **Walter B** on 31 Aug 2010, 2:38 a.m.,*
in response to message #1 by Walter B

Responding to the questions raised by M. Joury in the old thread:

> Quote:
>
> If you were able to design your own machine where would you start? What current or past implementation would you base it on? I think I would vote for the HP42S as the starting point. Then add the best of the current crop (35s, 30b, etc.) and make sure to give it at least 32K RAM and some form of offline backup.

For the 34S, we took the function set of the HP-42S as you suggest. We added the

- function set of the HP-16C,
- fraction mode of the HP-32SII and successors,
- statistical distributions of HP-21S,
- constants and conversions of HP-35S,
- complete Greek and extended Latin letter set (beyond English),
- a real time clock,
- date and time calculations,
- and more SI<->IMP conversions, physical constants, statistical distributions (like Poisson, Exponential, Geometric, Weibull and the error function), and some more arcane functions (like Euler's Beta, incomplete regularized gamma etc., coming Paul's way while coding ;))

RAM is given and thus limited there, of course, but it's sufficient for all this and 500 program steps, 100 general purpose registers, and 100 user flags. No way for I/O for backup as you suggested. And we had to drop the matrix functions due to display limitations :(

A little more than a simplistic start :)

The other drafts are just this - drafts - based on the housings given. Sometimes I dared to dream of reasonable displays allowing matrix operations and a row of softkeys, and an SD or Micro SD slot for I/O. FWIW

Edit: Forgot date and time.

*Message #1 Posted by **Namir** on 29 Aug 2010, 7:04 a.m.*

In the last few weeks I have been looking at various algorithms for solving polynomials. Our own museum web site contains routines developed by Jean-Marc Baillard that handle the roots of polynomials with real and complex coefficients. I have been working with Matlab (as the first language to implement various polynomial root seeking methods) and realize that some techniques are not easy to implement. Yet when I look at the work of Jean-Marc Baillard it is beyond amazing! Today I found on TOS his (new?) JMB Matrix ROM which handles matrices and polynomials. Some the ROM's routines are the same/similar to Baillard's posting on this web site. With the ROM module loadable in the HP41CX software, you don't have to type the code! It does not get any better!!

So, Jean-Marc if you visit this museum site often, I want you to know the very high level of esteem I hold you and your work, making the HP41C perform tasks not so easily suited for it, especially with complex math.

Your humble fan, Namir

PS: The JMB ROM is based on Baillard's initials. If his name was something like Jean Irene Marie Bailliard Obergonois ... his ROM would be **JIMBO ROM** ..... :-) .... sorry could not help myself!

The acronym would be more appropriate if the first name were Jacques instead of Jean, since Jacques is the French equivalent of James. By the way, have you ever heard of **GW B**asic? :-)

Regards,

Gerson.

in response to message #1 by Namir

Hi Namir,

Thank you for all these appeciations !
I must also say that these new ROMs
have been put together by Angel Martin,
and they wouldn't exist without his huge job !

I'll try to continue to write programs
for our fantastic HP-41s.

Best wishes,
Jean-Marc.

Labelling HP41/67/97 magnetic cards

*Message #1 Posted by **Dieter** on 28 Aug 2010, 8:53 a.m.*

At the moment I am having my good old HP-41 card reader serviced. From what I've heard so far it has come back to life, almost 20 years after the fatal day I dropped it and it broke into pieces.
Now I would like to reuse the magnetic cards I still have from the eighties and early nineties. I think some of them may be overwritten without the loss of important (or just interesting :-)) programs or other data.
However, in the old days most of these cards were labelled with a black overhead marker (Staedtler Lumocolor permanent SF). So the first question is how to remove this (with alcohol?) while the second, more interesting idea is to make a completely new label, preferably laser-printed.

So I made a kind of template in Photoshop, having the look and size of a blank HP magnetic card, so that individual text and other info can be easily added. My first idea is to print this on self-adhesive labels or adhesive paper, but - will the added thickness cause any problems while the card passes trough the reader?
Or maybe someone has a better idea?

Dieter

Re: Labelling HP41/67/97 magnetic cards

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 Aug 2010, 11:27 a.m.,*
in response to message #1 by Dieter

Hi, Dieter;

I usually follow the manufacturer suggestion, so, based on the HP82104A manual, I'd not try adhesive labels on it. I am also taking into consideration the fine adjustment available with the pressure roller, and I think it is almost as fine as a paper thickness. Should check.

I use CD markers and have achieved good results. If you are actually going to remove the existing labels, I'd suggest backing their contents up (read all cards, save their contents into another media like disk, tape, MLDL2000 RAM, CLONIX series and related HEPAX stuff, then save it into the computer) prior to any cleaning procedure. Just in case... Then perform the cleaning and new labeling and check if contents are still valid.

I have cards written in the 80's that were all backed up about eight years ago. Most of the original cards still retain their contents, others I had to rewrite and just two of them (amongst 80) are lost.

Hope this gives you some perspective.

Cheers.

Luiz (Brazil)

Re: Labelling HP41/67/97 magnetic cards

*Message #3 Posted by **Dieter** on 28 Aug 2010, 2:47 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, Luiz -

I couldn't resist and made a sample card with an self-adhesive label. With the label attached the card is 0.32 mm thick, compared to 0.22 mm without. Since my card reader is being serviced at the moment I can't say whether this will cause any problems or not. On the one hand it's only 0.1 mm more, on the other hand it's about 50 percent. :-)

Back in the eighties I used black permanent marker pens, similar to what's today known as CD marker, just with an extra fine tip. About half of the cards still looks fine, i.e. with sharp contours, perfectly readable, while others appear somewhat washed-out.

Most of the cards hold programs that I would like to keep (if they can still by read). Others are less important and can be overwritten, and for these cards I'm looking for a way to remove the existing labelling and/or provide a new one. And, if possible, something that looks better than before. :-)

Backups? Disks? Tape? MLDL-stuff? Sorry, I don't have anything like that. Yes, some kind of computer connectivity would be nice, recently I read about this PIL-box thing. I think I have yet to get familiar with all this. I'm more interested in software and algorithms than in hardware. You know, I'm one of these guys with *five left thumbs on each hand*, as we say over here. ;-) Well... maybe using MCODE could be something I would like to try. But that's a different story.

Dieter

Re: Labelling HP41/67/97 magnetic cards

*Message #4 Posted by **geoff quickfall** on 28 Aug 2010, 8:06 p.m.,*
in response to message #3 by Dieter

from experience, DO NOT use adhesive labels. ;-(

The added thickness (which translates into resistance) stresses the pinch roller, dampening couple and therefore the motor.

I tried the clear adhesive lable type and they look fantastic but ended up ruining the the dampening couple which then cause me to enter the calc and repair the already repaired couple.

Cheers, Geoff

In the old days letroset worked but did smudge after a time.

Cheers again!!

HHC 2010

*Message #1 Posted by **David Hayden** on 27 Aug 2010, 10:15 p.m.*

I thought I'd start a new thread for all things related to HHC 2010.

I have a question: what do people think of renting a car vs. taking one the shuttles? I'm coming in Friday and leaving Monday.

Dave

Re: HHC 2010

*Message #2 Posted by **Bruce Bergman** on 28 Aug 2010, 12:25 a.m.,*
in response to message #1 by David Hayden

I haven't been there before, but it's like an hour drive. I'm just planning on Green shuttling it (assuming they don't stop a hundred times between the airport and the hotel).

Re: HHC 2010

*Message #3 Posted by **Tim Wessman** on 28 Aug 2010, 4:33 a.m.,*
in response to message #1 by David Hayden

The shuttle is about an hour. It is very quick.

Really, I think the only reason to rent a car is if you plan on going to other places around the area by yourself, or really want to get off the beaten path. I'll have the minivan so we can fit plenty in that, and there should be at least a few more local people.

New HP 12C Platinum - 2 Batteries???

*Message #1 Posted by **Jeff** on 27 Aug 2010, 7:44 p.m.*

I had to replace my 25th Anniversary edition because one of the keys doesn't work right. The new Platinum has two 2032 batteries instead of one. I wasn't happy to see that.

What is the reason? Faster processor? Will the batteries last longer than one?

Re: New HP 12C Platinum - 2 Batteries???

*Message #2 Posted by **Don Shepherd** on 27 Aug 2010, 8:11 p.m.,*
in response to message #1 by Jeff

Yeah, this was reported a couple of months ago by another user. The probable reason for two batteries in the platinum is that the ARM-based 12c+ has two batteries now, so it's probably more economical to have one case format for both the 12c+ and 12c platinum. I think the processor in the platinum is the same as the older platinum, so no speed advantage. I would think that two batteries would last longer than just one, but I'm no power expert.

Re: New HP 12C Platinum - 2 Batteries???

*Message #3 Posted by **Allen** on 28 Aug 2010, 11:50 a.m.,*
in response to message #1 by Jeff

I think this is a very good sign that the Platinum has joined the Gold 12c+ in housing 2 batteries. (Whether absolutely necessary or not!)

This design change suggests a migration to a common body design for 21st century Voyagers. To me, the common body might also suggest the existence of a medium- to long-term strategy for the Voyager series to amortize design/production costs for later models.

Re: New HP 12C Platinum - 2 Batteries???

*Message #4 Posted by **Nigel J Dowrick** on 29 Aug 2010, 7:40 a.m.,*
in response to message #1 by Jeff

Have you tried running it with just one of the two batteries installed? Maybe they are connected in parallel. (If this works, it would clearly cut the battery life in half.)

Nigel

Re: New HP 12C Platinum - 2 Batteries???

*Message #5 Posted by **Jeff** on 30 Aug 2010, 11:27 a.m.,*
in response to message #4 by Nigel J Dowrick

I will try that today. I am wondering if having two batteries is a good thing or a bad thing. I liked having

only one battery in my previous 12C.

Too bad it's not a solar calculator.

Re: New HP 12C Platinum - 2 Batteries???

*Message #6 Posted by **Katie Wasserman** on 30 Aug 2010, 5:28 p.m.,*
in response to message #5 by Jeff

You can run it just fine with one cell, the cells are in parallel with no blocking diode. While 2 cells will last longer than one it's a bad arrangement when considering low battery replacement. When the low battery indicator comes on it means that both cells are near dead. One of them may indeed be completely dead and if that's not the one replaced first you're likely to lose memory when changing the cells.

Using one cell at a time will remedy this problem since you can put in a new cell in the other position then remove the one that's nearly dead.

I think it's preferable to only use one cell in the new 12C's with dual cr2032 cells -- whether it's ARM processor or the older one.

-Katie

It does work. My question is if there is any advantage to 2 batteries vs. being designed with one. In other words, do the 2 batteries last longer than 12C calculators that are just designed with one?

Thanks. P.S. Good clip, by the way!

OT: Which non HP Scientific calculator?

*Message #1 Posted by **ravwalia** on 27 Aug 2010, 4:11 p.m.*

Hello All,

I know this is OT, but thought I would ask your thoughts anyway.

My 32sii has seen better days and the 35s seems not to be very highly regarded, so which calculator would you recommend if one didn't want to go to the second hand market.

I really only need the standard trig functions, logs and a basic solver.

It seems that HP feels it has covered the Scientific calc bases with the 50g and the 35s, but I though I read good things about the 50g, I don't about the 35s.

Thanks.

Re: OT: Which non HP Scientific calculator?

*Message #2 Posted by **Juergen Keller** on 27 Aug 2010, 4:22 p.m.,*
in response to message #1 by ravwalia

> Quote:
>
> I really only need the standard trig functions, logs and a basic solver.

Why not go for the new 30b? It's cheap, has a good keyboard, RPN, standard scientific functions and HP Solve, it is even programmable, and looks stylish ...

Re: OT: Which non HP Scientific calculator?

*Message #3 Posted by **ravwalia** on 27 Aug 2010, 4:39 p.m.,*
in response to message #2 by Juergen Keller

Firstly, I really need to have quick access to log10 and 10^ buttons and also as an engineer I'd hate to have so many primary buttons that I would never use.

thanks for the suggestion though.

Re: OT: Which non HP Scientific calculator?

*Message #4 Posted by **gene wright** on 27 Aug 2010, 5:52 p.m.,*
in response to message #3 by ravwalia

The 30b keyboard can be reassigned. You can make those keys be pretty much anything you want.

Just saying. Might still be better to buy a dedicated scientific, but ...

Re: OT: Which non HP Scientific calculator?

*Message #5 Posted by **Crawl** on 27 Aug 2010, 6:31 p.m.,*
in response to message #1 by ravwalia

I like this, but it you want an HP-style calculator it might not be to your liking. But it's got LOG, trig, and a basic solver.

Re: OT: Which non HP Scientific calculator?

*Message #6 Posted by **Katie Wasserman** on 27 Aug 2010, 6:57 p.m.,*
in response to message #1 by ravwalia

While it's more than a basic scientific calculator, I and many others here really like the Casio fx9860g series. It's graphic, algebraic and programmable with a solver and a lot more, but it also can be loaded with a completely customized application. Several users here have created some really nice RPN calculators for it, see this thread

The "II" version and the "slim" have a fantastic back light that helps makes this the easiest screen to read that I've ever seen on a calculator. Look around and you can sometimes find the "slim" for $50, even though it normally sells for about $100. Other models are normally less than $100.

Edited: 28 Aug 2010, 11:22 a.m.

Re: OT: Which non HP Scientific calculator?

*Message #7 Posted by **Bruce Bergman** on 27 Aug 2010, 8:43 p.m.,*
in response to message #1 by ravwalia

Agreed with several points above.

First, you should consider the 30b. You can make any of your "important" keys the main ones on the keyboard by simple reassignment. You can even put your version of the function on them.

Second, Katie (and I, both) love the Casio FX-9860G, especially the "Slim" version. You can get an RPN program for it that's easy to install and use. There are several new models (9860G-II's) that are also out.

From there, go to TI.

thanks,

bruce

You're right, Katie, it doesn't.

Re: OT: Which non HP Scientific calculator?

*Message #11 Posted by **Mike Morrow** on 27 Aug 2010, 11:55 p.m.,*
in response to message #1 by ravwalia

Everything you ask for (as long as it isn't RPN and programmability) is provided in the amazing solar/battery-powered Casio fx-115ES, which is known in some places as the fx-991ES. A look at the User's Guide reveals a Newton's method solver and a Gauss-Kronrod numerical integrator, among many other features. It provides the most numerically accurate results of any calculator that I have ever owned. Best of all, it's dirt cheap. In the US, Wal-Mart has been selling it for $13, though $18 is typical in other places. It also packs 40 conversions and 40 constants. I carry this when I don't want to put my HP 42S in harm's way, and I don't feel ill-served.

Edited: 28 Aug 2010, 12:26 a.m.

This Casio, however, has a very soft keyboard - key feedback is as on a 20b. On the 30b this is as you know it from your 32sii.

Re: OT: Which non HP Scientific calculator?

*Message #13 Posted by **Crawl** on 28 Aug 2010, 10:27 a.m.,*
in response to message #11 by Mike Morrow

I have that calculator, but I prefer the Sharp I mentioned above for a few reasons.

Superficially (sue me), I think black calculators usually look better than silver ones.

I also like that the Sharp has more functions directly accessible from the keyboard. For example, all the linear regression functions are there out in the open. For the Casio, you need to go into menus. This is also

something the Sharp has over the HP35s (another is that the HP35s's base 2/16 stuff is really poor)

As I recall, both the Sharp and the Casio use a number code to select scientific constants (Eg., 01 gives the speed of light in m/s), which is not a very good way of doing things. The HP35s (or 50g...) has the advantage here.

On the plus side, the Casio has a pseudo-programming feature which isn't even documented. The manual mentions the multiple line replay feature, but it's not clear why you would ever want to use it. However, the lines can use the memory registers and can be used to assign values to them, so you use the feature to do things like calculate infinite series more easily. It's only "pseudo" programming because it doesn't run automatically, you need to press the equals button to step, and of course there's no branching.

Though if you'd want programmability, I guess you could ask why you wouldn't just get the HP35s (or, again, the 50g)

*Message #15 Posted by **Chuck** on 28 Aug 2010, 1:28 a.m.,*
in response to message #1 by ravwalia

I too vote for the Casio Slim. I've used most everything from the 11C (28 32 41 48 49 50 35) and recently the 30B along with the various TI's over the last 20 years. I've not yet found one that would make me sell everything else, but the slim seems to be able to do just about everything I need. In times it doesn't I'll use Mathematica which is always up and running.

I also agree that that the Casio fx115 powers a huge punch for $15, and Sharp also has an under $20 calc that knocks the sock off most TI calculators (I forget the exact model number as it's at work.)

There are several non-HP and non-TI calcs out there that our feature packed and easy to use. I tell all my students to purchase a solar powered two-variable stats calc under $20 for all my classes; far better to learn and do math with than any graphing calculator (in my opinion).

in response to message #1 by ravwalia

It seems to me that the HP-35s is the best choice for your needs. The layout of the key legends is very good and easy to read with only one shifted legend above the key and the other on the bottom of the sloping key. For me it's much easier to use than my HP-32SII, with both the shifted legends cramped together above the key. Key action is good and the display is clear. All your basic trig and log functions are either on the keys or one shift key away. The equation and root solver is easy to use. The basic quality of the calculator is just as good or better than the non-HP competition.

Re: OT: Which non HP Scientific calculator?

*Message #19 Posted by **ravwalia** on 29 Aug 2010, 3:05 p.m.,*
in response to message #1 by ravwalia

Thanks for the responses guys.

I suppose it's been said a lot on the forums here and on the web, but I wish that HP would give us some more options regarding scientific calculators.

I can understand why they might think that the business decisions don't justify more scientific calculators. However, I do hope that they'll bring some more out, especially when I see so many financial calculators from them.

Doesn't seem much point for new calculator users to learn rpn unless they're going down the finance route.

With that said, it may be time that I start to look at some other brands and try and get used to non rpn calculators.

The 35s does look like a good machine, but the reports of the keyboard problems are too numerous to ignore.

So it seems that I'm going to be looking at the Casio and Sharp calculators mentioned above.

Thoughts?

The HP-35s gives you the choice of RPN mode (default) and algebraic. Again, you seem to be trying very hard not to want it, when in fact it offers everything you need.

But ravwalia just said

> Quote:
>
> The 35s does look like a good machine, but the reports of the keyboard problems are too numerous to ignore.

What I get out of the many posts about the 35s, is that there is one group that knocks it about the bugs, another group that doesn't like the keyboard layout, another that doesn't like the implementation of the feature set, and finally a group that says in spite of all the above, it is a good calculator, a welcome new effort by HP, *but if one cannot rely on keypress registers*, then all else is moot.

Perhaps ravwalia belongs to the latter.

Good question. Don't know the answer. I wonder if anyone at HP even knows?

Re: OT: Which non HP Scientific calculator?

*Message #24 Posted by **Palmer O. Hanson, Jr.** on 29 Aug 2010, 8:49 p.m.,*
in response to message #20 by Michael de Estrada

> Quote:
>
> The HP-35s gives you the choice of RPN mode (default) and algebraic.

But anyone who is used to working with the classical algebraic mechanizations won't like the HP-35s very much. The problem is the parentheses key which enters both an opening and a closing parentheses at the same time. The user then has to use the right arrow key to navigate across a closed parenthesis when he wants to close it.

RPNers who don't understand what the fuss is about over a change in accepted keyboard practices with algebraic need only consider the amount of fussing directed at HP when the HP-33s came out with a single width ENTER key.

Re: OT: Which non HP Scientific calculator?

*Message #25 Posted by **Martin Pinckney** on 29 Aug 2010, 9:02 p.m.,*
in response to message #24 by Palmer O. Hanson, Jr.

Palmer, I agree the single parenthesis key is foreign to users of dedicated ALG calculators, which always separated the opening and closing parentheses on different keys, whether or not both or either parenthesis were visible on the display.

But there is an HP precedent in the 48 series.

But anyway, the OP wanted RPN, not ALG.

in response to message #24 by Palmer O. Hanson, Jr.

OK, fair enough. I've never bothered to use algebraic mode with my HP-35s or even my HP-50g for that matter, so I wasn't aware of any idiosyncrasies. It's just that I find it irritating when people complain about every miniscule detail of what is basically a very good and easy to use basic scientific calculator. If you want sophisticated programming and built-in everything, buy a HP-50g.

Before I obtained some of the older HP machines I believed the story of "higher quality standards of the HP of yore". Then I discovered battery contact problems that could yield a burnup of internal circuitry and machines that needed to be twisted to make the displays and keyboards work. Sometimes I think that the newer machines aren't being held to actual higher standards of yore but rather to mythical higher standards of yore.

Re: OT: Which non HP Scientific calculator?

*Message #29 Posted by **Martin Pinckney** on 31 Aug 2010, 11:14 p.m.,*
in response to message #28 by Palmer O. Hanson, Jr.

Palmer, you are right about design faults with certain of the older HP's. Someone once remarked that the power circuitry design on the Woodstocks was "criminal".

However, I think most comments about HP quality are referring to the excellent keyboards, molded key legends, general quality of manufacture that gives these machines their look and feel. These are not mythical.

I started with TI's, and only moved to HP when 1) Two TI's keyboards failed; 2) I learned that HP made algebraic models; 3) The cost of HP's came down. The first HP I purchased (1993) still looks and works fine.

Symbolic math with the 35s (well.. sort of)

*Message #1 Posted by **Dieter** on 27 Aug 2010, 8:14 a.m.*

After reading this forum for about three or four years I now decided to join this community, so this is my very first post here. Hope I'm doing everything right. :-)

I'd like to discuss a special feature of the 35s (and possibly other HP-calculators with HP Solve) that I haven't seen mentioned yet. It's about the way the Solver handles equations while it tries so solve for a given variable.

Consider the following equation:

```
A^2 + 2xAxB + B^2 = 8
```

Let's keep it simple and assume B = 0. This leads to A = +/- sqrt(8) = +/- 2.8284...
After providing two guesses in A and x like...

```
0  STO A   9
```

...and starting Solve A, leaving B=0, the 35s is SOLVING for a few seconds and finally returns the expected result A=2.82842712475 in x. The y-register holds the second-best result 2.82842712474, indicating that the result that solves this equation exactly is somewhere between these two values (which in fact is the case). Changing the initial guesses to 0 and -9 returns the same values with a negative sign. So far everything works like expected.

Now let's try the same equation, just simplified to

```
(A+B)^2 = 8
```

Again we provide two guesses 0 and 9, start Solve A and let B=0. What happens now? The 35s *immediately*(!) comes back with A=2.82842712475, both in x and y - there are no two adjacent solutions, just one single value: the one the 35s returns for sqrt(8).

Now let's try to find the negative solution with the same negative guesses as before: 0 and -9. And again, the 35s *immediately* returns the same positive (!) solution as before. For any intial guess this is the only result it returns.

Okay, what happens here? It seems to be something like this: If the 35s realizes that it can easily solve an equation because the desired variable appears only once, it *transforms* this equation symbolically, in this case giving A = sqrt(8) - B. In all other cases the usual iterative numeric approach is used.

Please forgive me if this is old news, but I was a bit puzzled when I found this... er... "special feature" of the 35s. :-)

Regards, Dieter

*Message #2 Posted by **gene wright** on 27 Aug 2010, 11:54 a.m.,*
in response to message #1 by Dieter

Hi Dieter! Good post.

You are quite correct. The HP 35s attempts to compute a "direct solution" first, and if possible, returns that value without completely invoking the solver.

This is described in a learning module for the HP 35s found here:

HP 35s learning modules

The one you want to check out is the Part 2 of the Formula Solver module, found here:

Part 2

But, that's not exactly flashing on a page somewhere, is it? So it is always good to bring these things out like you have done very well.

*Message #3 Posted by **Thomas Radtke** on 27 Aug 2010, 12:23 p.m.,*
in response to message #2 by gene wright

Btw., the very first RPL calculator already tried to find the 'direct solution'. In 1985!

Re: Symbolic math with the 35s (well.. sort of)

*Message #4 Posted by **Dieter** on 27 Aug 2010, 5:21 p.m.,*
in response to message #2 by gene wright

Hi Gene,
thank you very much for your friendly reply. And I thought I had read all the learning modules. Well, so it seems I've reinvented the wheel. #-)
However, there still is one thing I'd like to know. In part 2 the learning module says on page 6:

> Quote:
>
> Where more than one solution is possible, for example ASIN(Y)=0, the direct solution is the "principal" value. For example, for ASIN(Y)=0, this is 0 degrees, not 180 degrees, or –180 degrees

If I understand this example correctly, the only solution of the equation arcsin(y) = 0 simply is y = sin(0) = 0, so there is exactly one single result for this equation. Did I miss something here?
On the other hand, the solver obviously does *not* try a direct solution if periodic functions like sin(), cos() or tan() are involved. In this case a direct solution would require e.g. an arcsine which in fact has an infinite number of possible values. So, as far as I can see, an equation like sin(x) = 0.5 is always solved numerically, so that it will return x = 30 or x = 150 or any other solution, depending on the user's initial guesses.

Sorry, I don't want to bore you with these details, but I just want to know... ;-)

Regards, Dieter

Re: Symbolic math with the 35s (well.. sort of)

*Message #5 Posted by **Karl Schneider** on 28 Aug 2010, 1:35 a.m.,*
in response to message #1 by Dieter

Hello, Dieter --

Excellent first post! And impeccable English, I might add...

The HP-35s "direct method" rootfinder was carried over from the HP-33s; a direct method was also implemented in the HP-17B/27S Solve routine, IIRC.

Please read this archived thread from 2004 for some discussion regarding the HP-33s direct-method rootfinding. (Apparently, my suggested "seven step" approach was not adopted in the HP-35s.)

We even independently employed the same tongue-in-cheek phrase ("special feature") to describe the logic that always returns the directly-calculated solution wherever possible. Such logic is not an attribute, because it may preclude identification of the physically-meaningful root(s) of interest. The best workaround is likely to add an inert term like "+0*X" to the equation. This causes the solution variable X to appear more than once in the equation, rendering it to the calculator 'possibly unsolvable' by algebraic methods.

Scientific, Financial Calculator

*Message #1 Posted by **Gerry Schultz** on 26 Aug 2010, 4:53 p.m.*

I've been reading a lot of positive reports about the 30b here on this forum and I'm glad to see HP produce a calculator that is so well received. When I first saw a 30b last year in HHC 2009, I didn't think much of it (I didn't get a 30b as there weren't enough samples for all the attendees) and I don't use financial calculators much. I do wish it has more programming memory an I/O.

This is the second new calculator that has been released by HP that's specifically for the financial field which obviously indicates this this is their strongest market. I would like to see a new scientific, programmable calculator but as was indicated to me in a previous post, there is little market for a new scientific calculator with all the other products, like Laptops, Netbooks, iPhones, etc., that do a great job and do lots of other things as well.

So, perhaps what HP could do is make the successor to the 30b be a scientific, financial calculator that would be fully programmable and have a full set of financial functions. That way financial power users would be able to program whatever they wanted to do using the scientific functions. We users with a scientific bend would also buy it to program it for our uses and ignore the financial functions.

It would also need some kind of I/O (USB) to store and retrieve programs from a PC. One area of a scientific, programmable calculator that I'm not sure how to solve is the display. One solution might be to use a 30b display on the calculator itself and reserve all graphing for the software emulator that HP would release to the Windows, Mac, and Linux platforms. Any calculator plotting commands written in a program on the computer simulator would show up as XROM commands (a la 41C) in the calculator itself, or something more friendly to the user.

Or perhaps a display peripheral could plug into the top of this imaginary calculator's USB port, like a 41C card (you can see what old HP clacs I like) reader that would have a full dot-matrix display for local plotting. It too would have a USB port on top of the Dot-matrix display to still connect to a PC. It would be more expensive that the 30b but less than a 50G which would help fill out a line of HP calculators for various needs.

I know this is just idle dreaming but if those of us who prefer scientific calculators need to take a back seat to the needs of the financial market to get a scientific calculator built by HP, I for one am willing to sit at the back of the bus.

Just my 2 cents worth of thoughts for today. See you at HHC 2010.

Gerry

HP 35s

*Message #1 Posted by **Brian Healy** on 26 Aug 2010, 2:56 p.m.*

I have previously given up on my HP-35s because the keyboard was unreliable, not good for a structural engineer. That was almost 2 years ago. I use my trusty HP-32sii that was made in 1993, and it has been 100% reliable.

My HP-35s is a replacement unit that HP sent me because the original one that I purchased also had an unreliable keyboard. When I complained to HP that my replacement unit also had problems with the keyboard, they refused to do anything about it.

Does anyone know if this problem has been corrected by HP, or are people still experiencing keyboard reliability issues with newly purchased HP-35s?

Re: HP 35s

*Message #2 Posted by **Chris Randle (UK)** on 26 Aug 2010, 3:28 p.m.,*
in response to message #1 by Brian Healy

I bought one in the UK at the end of April this year. One of the keys (GTO) *sometimes* requires a *slightly* more positive prod than the others before it registers.

I thought for a while about returning it, but intuitively felt that there was a good chance that its replacement would be no better or perhaps even worse.

It's not something that bothers me unduly, but it's certainly not the way things used to be. But what is? :-)

Re: HP 35s

*Message #3 Posted by **Thomas Radtke** on 27 Aug 2010, 3:34 a.m.,*
in response to message #2 by Chris Randle (UK)

> Quote:
>
> One of the keys (GTO) *sometimes* requires a *slightly* more positive prod than the others before it registers.

It's one of the arrow keys on my sample and this problem developed over the time. Since then, my 35s is retired. I do not use a keyboard which doesn't register a key press despite a 'key click' feedback. That's more disgusting than no key click at all.

Besides all keyboard problems, the firmware bugs makes it a serious tool only to those who know them inside out to get around them.

Nothing happened about the various problems since it came out several years ago, so I doubt there will be anything done about it in the future.

I'm currenty using the 32SII (again) and watch this forum for any comments about the 30b. When no problems arise over the next years, it will probably be my next choice (when the 32SII breaks). Either that, or HP brings back the 15C, which I would probably buy immediately.

Re: HP 35s keyboard reliability

*Message #4 Posted by **Jeff Kearns** on 26 Aug 2010, 9:14 p.m.,*
in response to message #1 by Brian Healy

My 35s, SN CNA 72500764 purchased in 2007, is also prone to missed keystrokes, but they are not repeatable. I have noticed the problem while entering statistics data and solving lenghty equations.

Bottom line: Unless they have since corrected this problem, you cannot trust the 35s calculator's keyboard without veryfying each number entered. I also prefer the 32sii or even the 33s in many ways, not the least of which is keyboard 'layout' - the 35s has no primary key for STO, LN or e^x as an example. Too bad, since the calculator is a very nice looking unit an 'could' have been so much better, if for example, it had checksums that meant something, or even rectangular to polar conversions on the keyboard. It is a failed unit.

Jeff Kearns

Re: HP 35s keyboard reliability

*Message #5 Posted by **Maarten Ambaum (Reading, UK)** on 27 Aug 2010, 4:53 a.m.,*
in response to message #4 by Jeff Kearns

This all seems a bit harsh ... the bugs are irritating but haven't bitten me in any serious fashion at all. You really need to seek out the bugs to see them. The only serous bug in my opinion is the flaky implementation of complex numbers, but then I hardly use those myself.

The keyboard on my 35s is very good indeed, although I need to press the () key harder than the others; luckily, in RPN this key is not used. Surely it is more logical to have RCL as the primary key and STO as the secondary key? One STO for several RCLs of a variable in some calculation and RCL is used effectively as the ALPHA key in program/equation input. I agree with the LN, e^x problem; but a keyboard has to make compromises and this compromise is not bad.

IMHO there are too many keys with programming instructions on; I would have preferred to have these in menus. But that would probably make it into a 42s clone - which would have been great!

I'd recommend the 35s to anyone without hesitation. You have to compare it with the competition and the 35s is really a much nicer machine than most of them. See also Tim Wesman's recent post.

Re: HP 35s keyboard reliability

*Message #6 Posted by **brian healy** on 27 Aug 2010, 8:59 a.m.,*
in response to message #5 by Maarten Ambaum (Reading, UK)

I compare the HP-35s to the HP-32sii, and the 32sii is the winner in my opinion. I say that because of its total reliability. My 32sii is one of the older versions that has the numbers molded into the keys, I understand that the later ones made in China are not as well built. In fact, even the HP 33s that I have has a reliable keyboard.

The reason that I do not use my 35s is because the keyboard is unreliable; I have not had a problem with the bugs mentioned by others. If only the keyboard was reliable, the 35s would be my daily use calculator.

How hard is it to make a calculator with a reliable keyboard? HP used to be able to do it. I think it is sad that they have not corrected this problem.

Rather than give HP any more of my money, I have bought enough 32sii's on ebay to last me the remainder of my career (about 25 years). I also have my HP 11c from 1986 that continues to function reliably too.

Yes, if he manage to buy a *new* calculator when the old one fails. Unfortunately, they are aging despite not being used. So, if half-life is 17 years, he'd need 3 calculators (calculated on my 32SII ;-).

Re: HP 35s keyboard reliability

*Message #9 Posted by **brian healy** on 27 Aug 2010, 3:47 p.m.,*
in response to message #8 by Thomas Radtke

Actually, I'm on my second HP32sii in 17 years. I dropped my first one repeatedly from drafting tables, I had a stack of books fall on it once, and one time an aluminum stick file speared it. Finally, some of the keys became loose. I ripped the thing apart to see if I could fix the keys, but saw that I couldn't. That calculator still works, and if I carefully press the loose keys they still register. The same cannot be said for my replacement 35s.

I decided to stop using it because of the loose keys, and bought an almost unused 32sii on ebay. I did try the 33s, and of course had the issues with the wierd (imho) colors and layout (little enter key), and also the invisible decimal point when you typed 2.2. I also had to replace it once because after a couple months of using it a key became loose and it wouldn't work.

Then when the 35s came out I thought, "at last they finally got it right again". And then I noticed that various keys would sometimes not register. This also happenend on the replacement, and HP said, "too bad", but at least they were polite about it. And now it seems that several years after introducing the 35s, the problems remain. At least with the 33s they addressed the invisible decimal point. In my opinion HP is just a purveyor of cheaply disposable electronics. I understand they do not have a large staff working on calculators, but they should at least be able to do a reliable keyboard! Come on HP, pull it together!

I treat my current 32sii like it was gold, and it almost looks like it was brand new (except where I engraved my initials into the aluminum around the display. It is truly a tool for an engineer.

Re: HP 35s keyboard reliability

*Message #10 Posted by **Walter B** on 27 Aug 2010, 10:43 a.m.,*
in response to message #5 by Maarten Ambaum (Reading, UK)

This is printed in the Owner's Handbook of my first HP, a 25C:

> Quote:
>
> **"The success and prosperity of our company will be assured only if we offer our customers superior products that fill real needs and provide lasting value, and that are supported by a wide variety of useful services, both before and after sale."**
> *Statement of Corporate Objectives.*
> *Hewlett-Packard*

I do not find this in recent manuals anymore, presumably because of changed corporate objectives. IMHO, however, this old statement is in no way outdated for a company striving to make professional quality tools. One major difference between such tools and toys is RELIABILITY: such tools must be 100% reliable, 99.5% are unacceptable. You won't accept a medical instrument missing a keystroke, will you? So if HP wants to be regarded as a maker of professional quality calculators still, then it must fulfill the necessary conditions :-/ else ... :-((

Personally, I'd feel sad seeing the original HP spirit fading. Hope dies last. No personal offense to any forum poster intended.

Re: HP 35s keyboard reliability

*Message #11 Posted by **Katie Wasserman** on 27 Aug 2010, 12:00 p.m.,*
in response to message #10 by Walter B

I agree completely and urge HP to create a detailed list of known bugs for all their calculators. This would go a long way toward giving users confidence in what they're using. I know that all the current HP calculators have bugs in them -- some more than others -- and HP should recognize this and publish an easy to find list of them.

While I play with all the HP calculators, old and new, quite a lot, I only trust the older calculators for my real work because I can't afford a mistake. Keyboard reliability is critical as well, I too continue to use a 32sii and now a 12C+ (it's got the old firmware).

>
> Jeff Kearns

Same situation here. My 33S has a better, non-error prone keyboard but I detest the layout. My 35S has been replaced once under warranty, and the replacement still occasionally misses key strokes, namely the

"4" and "ENTER" key. I have to wonder why HP bragged about the keyboard in the 35S when so many find it error prone.

Re: HP 35s

*Message #16 Posted by **Martin Pinckney** on 27 Aug 2010, 5:20 p.m.,*
in response to message #1 by Brian Healy

Every few months this same topic pops up again here and gets beat to death again, still no fix from HP.

OTOH, the 30b continues to get good reviews on here, and so far as I know, no keyboard reliability issues have surfaced.

So I repeat my earlier prediction: HP doesn't fix the 35s because they plan to drop it as soon as sales slow after the market for this particular model is saturated.

Then they create some excitement by introducing a ARM-based emulated 15c, followed up with a completely new scientific, perhaps based on the 30b form factor.

Walter, wouldn't it be a good idea to start a new thread here? This way the old one wouldn't t get even longer and the new subject would stand out better - so that it's much easier to find for us Newbies. ;-)

Dieter

Re: HP 35s

*Message #24 Posted by **M. Joury** on 30 Aug 2010, 5:20 p.m.,*
in response to message #18 by Walter B

I'll take 'em all!

Seriously, I like aspects of all the designs shown and being a HP nut I would buy any/all of them. But I am really more interested in the programming implementation than in the exterior (beyond it HAVING to have a full width/height enter key).

So, what do you all say? If you were able to design your own machine where would you start? What current or past implementation would you base it on? I think I would vote for the HP42S as the starting point. Then add the best of the current crop (35s, 30b, etc.) and make sure to give it at

least 32K RAM and some form of offline backup.

Ok, how's that for a simplistic start...

Have at it.

M.J.

Calculator watch returns

*Message #1 Posted by **Bruce Bergman** on 26 Aug 2010, 12:48 p.m.*

ThinkGeek, purveyors of everything awesome, have resurrected the old Casio Calculator watch. $19 is a pretty good price. Of course, it doesn't do RPN, but it still brings back fond memories.

What I found hilarious, though, is the second picture in the item description. There was some recent discussion about just this thing, but I thought you all would appreciate the picture. Take a look:

Calculator Watch

:-)

Thanks,

Bruce

in response to message #1 by Bruce Bergman

Casio have never stopped selling 4 function calculator watches.[ul] Unfortunately they stopped selling the

scientific model around 1987 or so.

Now if they bring that back, THEN I'll get excited!
They even still sell the exact same case that was used for the CFX-400 scientific model, so all they need is a new keypad overlay and firmware.

Dave.

The uWatch2 is always an on-again off-again project. I just played around with it last night actually. Hard to make a decision on direction. I need my toes to count the design revisions! Keypad is always the sticking point.

The uCalc sits there ready to be fired up, it just need the firmware and the backing plate.

The blog is going strong. So well in fact that I can see it one day becoming a full time job...

Dave.

Re: Calculator watch returns

*Message #10 Posted by **Jim Horn** on 27 Aug 2010, 12:55 p.m.,*
in response to message #5 by DaveJ

Considering that HP has put their logo on all sorts of products that they've bought from other OEMs (e.g. Kinpo, Epson, Canon), I've often wished (and stated) that it would be great if HP would sell rebranded Casios but with HP firmware in them. Specifically, the Casio Scientific with RPN would make a terrific HP-02 (or HP-01C) with minimal NRE for HP and no risk for Casio - a win-win for both.

Casio already wrote the firmware for the algorithms, user interface, etc. decades ago so the customization would be minor.

Of course, my Android phone is easier to use for this than the tiny buttons on a watch - but I still want one...

Re: Calculator watch returns

*Message #11 Posted by **Bruce Bergman** on 27 Aug 2010, 8:44 p.m.,*
in response to message #10 by Jim Horn

Jim, I totally agree. Make a nice Casio variant with some RPN in it and I'm on board. They've done similar things (but not as RPN) before.

Thanks,

Bruce

in response to message #1 by Bruce Bergman

I couldn't resist!

Dave.

Re: Calculator watch returns

*Message #13 Posted by **Johnny Bjoern Rasmussen** on 29 Aug 2010, 2:41 p.m.,*
in response to message #12 by DaveJ

Ha ha, very nice Dave!
I actually had the exact Casio that Bruce linked to. It was handy when I was a TV-service guy back in 1992 and had to do miscellaneous calculations on the fly. I knew that this little "beauty" was always on my wrist.
Anyway if Casio or HP (?) ever starts a production of wrist watch calculators with scientific functions I

gotta have one. If not for the high prices on Casio CFX's on E*** I would really like to wear one.
uCalc is really a fantastic piece of technology but just too big for the wrist. No wonder when it is developed by hand - certainly not to offend you, Dave. But HP should really consider a cooperation with Dave.
Geekish? Naaaa!

30b, Reviews, HHC2010

*Message #1 Posted by **Tim Wessman** on 26 Aug 2010, 12:42 p.m.*

Hello,

I wanted to post this in a separate thread as it is a bit assorted and doesn't fit perfectly with the ongoing discussion. There are several things I want to bring up to the group in whole.

First, if you are not aware, I work for the HP calculator group as one of the R&D engineers. Everything I say here is my own opinion and is not official policy or thinking.

I am glad to see a bit of general excitement about the 30b. I think it is a great unit, (granted with some shortcomings as some point out) but a very nice machine overall. I definitely think it beats the BAII+ professional hands down. :-D

One of the most frustrating things to see for me personally is how there are some many ridiculous reviews out there on the internet, and a shortage of knowledgeable ones. For example, I remember reading one on the HP website that basically gives the 39gs a 1 of 5 rating because the user couldn't install notes easily using the connectivity kit (for cheating during exams I'd presume).

Granted, there are issues with the 39gs series in terms of connectivity ease of use, but the fact that there is almost no useful information there, and no other informed reviews leaves a potential buyer with little information and the idea that it is a horrible machine. Personally, I think it is better than the 83/84 series, much better in many ways, and a bit lacking in others, but overall a superior choice if it isn't for a specific class that require it. A general consumer would have no way to know anything though to make an informed decision. . . :-(

Other times, there is just silly or strange things. For example, there are plenty of people who make reviews of the 12c and say things like "I've had mine for 25 years now and it still works. A+++!!!! Highly recommended!" and so on. Unfortunately, they often do this on a 12cp model. . .

People often wonder how they can help the calculator group. Writing useful, informative reviews on internet sites (amazon, hp.com, and the like) is a simple way to do so. Simply put, the more calculators that are sold, the more likely the calculator group will grow and develop things that continue to excite us calculator nuts.

Please note, I am *NOT* in ***ANY WAY*** suggesting that people go out and write padded, glowing reviews; nor am I trying to imply that by doing so you will receive any personal benefit or compensation.

Feel free to criticize or complain as needed in reviews. A larger number of knowledgeable, informed, and easy to find reviews is always an aid to consumers. What doesn't help is reviews with bad information, no information, or just nothing relevant. Unfortunately, those tend to be all there are for many machines. :-(

Rather, if you have an informed, knowledgeable review or comment, don't hesitate to share it in places *besides* the hpmuseum forum. General customers don't tend to hang around here, and so they don't see the amazing

discussion that happens.

Wrapping up, I'd like to extend a personal invitation to everyone out there to come to HHC2010. It is hosted in Fort Collins, Colorado (United States) again this year. HP is taking a big part in the conference and there will be many very exciting things.

Have you wanted to ask us why the calculator group does X or Y and not Z? What was the thinking behind N? What are the plans for Q? This is the chance to do so.

You also get to put faces to names, talk about lots of fun stuff we all love, and just have a great experience. I don't think I've ever heard anyone express regrets after going to an HHC conference.

Please also invite other people you know that enjoy math, calculators, or things like that. You never know who might want to go.

TW

Re: 30b, Reviews, HHC2010

*Message #2 Posted by **Bruce Bergman** on 26 Aug 2010, 1:13 p.m.,*
in response to message #1 by Tim Wessman

Well said Tim!

I am ashamed to admit that I probably do not put positive reviews out there as often as I should for good products that I buy. I, too, occasionally come across a completely bogus review out there and it's frustrating. I suppose I should do more to actually write some that are positive and help balance it out. In fact, I'm going to go blog about the 30b today. Count on it. ;-)

I have to say, though, that SOME of this is HP's fault. Now you KNOW that I love HP and their calculators, so take this as constructive criticism from someone who is a huge supporter. The sad fact is that someone above you -- perhaps in charge of the marketing and sales of recent calculators -- is doing a really really BAD job of promoting these calculators!

I mean, it's one thing to say that we should post positive reviews, but it's quite another to consider that there are like FIVE places you can buy some of the HP calculators. If they were available in more places (like at Target, Wal-Mart (only 50g, 17bii, 10bii), Radio Shack, OfficeMax, Costco, etc), then you probably would see many more reviews. All of those sites have a review section which can be used to pass the message, but they do not sell HP calculators (or only sell the token ones).

The idea of getting the word out only works if the word is wide spread and available everywhere. If I wrote 1,000 positive reviews of the 30b, but it was only available at Office Depot, then what value is that? On the other hand, if I wrote 10 positive reviews on 10 different sites where it was available, THAT would be helpful.

Another issue is misinformation.

If the information being sent out were accurate (like the fact that the 30b does NOT have 32kb of RAM, even though that's been corrected about 100 times), then we probably would have fewer negative reviews as well. Fortunately, I have yet to see one person complain about mis-marketing the memory size on a 30b, but it will happen one day. I would think HP would really want to go to great lengths to correct these mistakes and make sure the right information is out there. My perception is that this is NOT happening at all. It's not just the 30b,

but also the 12c/p/+ family.

Finally, the other issue is the education market. As you know, this is my pet peeve. HP let this market fall to TI back in the past, and that is understandable given what happened then. But it doesn't appear that HP is doing anything to try and take back that market (or heck, even just make some sincere inroads). I can write positive reviews of the 50g (or 39g) all I want, but the fact is that TI has like 5-6 models in the same space, all heavily marketed, available just about anywhere (including my local supermarket, for goodness sake), and which students are conditioned to use. If you want good press, get the dang calculators into the hands of the teachers and students! Incur a cost of marketing and *give away* a crapload of them to a bunch of schools! Give huge discounts to students on back-to-school promotions! And then go write learning modules that show how the same exercises in textbooks can be done with non-TI calculators.

I'm not saying that any of these items are things you and Cyrille need to address, but that they are perceptions of why it's hard for us dedicated fans to keep supporting the brand. It almost feels like HP is working AGAINST us at times, you know? Try helping us out and giving us opportunities to praise, and I bet you'll see it.

I also bet that if you asked members of this forum for more information, the majority would say that they are frustrated by the lack of marketing by HP. I mean, most of us here *really* have no problem with any of the calculators. Some are better than others. But it's incredibly frustrating to try and be the field sales force for HP when HP is working against us, you know?

(Okay, I feel better now... ;-)

I will be there at HHC2010, so can't wait to hear what everyone has to say!

Thanks!

bruce

Re: 30b, Reviews, HHC2010

in response to message #2 by Bruce Bergman

Just a note (since Bruce brought it up), the PDF version of the specs on HP's site (linked to from the specs page) STILL states that the 30b has 32KB of RAM. Copied below.

Memory Stores up to 50 cash flows or statistic data items, plus 10 storage memory registers. Stores up to 32KB of user programs.

Cheers,

M.J.

Re: 30b, Reviews, HHC2010

*Message #4 Posted by **Don Shepherd** on 30 Aug 2010, 5:15 p.m.,*
in response to message #3 by M. Joury

I'm sure Tim knows, and I imagine he's reported it to somebody with authority to do something about it. The fact that it is still not fixed speaks volumes about HP's support for its calculators.

Re: 30b, Reviews, HHC2010

*Message #5 Posted by **David Hayden** on 26 Aug 2010, 3:07 p.m.,*
in response to message #1 by Tim Wessman

An excellent point Tim, and well articulated.

You might also consider tapping the user community for other volunteer work. For example, if HP needs learning modules for the 39gs, you could ask here for volunteers to write them and post them to hpcalc.org.

I'll be at HHC2010 and I hope to meet you and others from this forum.

Dave

There *are* learning modules for the HP 39gs. :-)

HP 39gs learning modules

Re: 30b, Reviews, HHC2010

*Message #7 Posted by **David Hayden** on 28 Aug 2010, 8:04 p.m.,*
in response to message #5 by David Hayden

Here's another idea for volunteer work. It's my understanding that many math books have exercises for calculators but they are taylored to the TI 83 line of calculators. Perhaps we could write companions to these textbooks that show how to setup the problems with various HP calculators instead. That way, if a teacher wanted to use HP's with a certain textbook, they'd have the resource.

HP35 exp(ln(x)) bug, a new number found.

*Message #1 Posted by **Kiwi Geoff** on 25 Aug 2010, 11:35 p.m.*

The famous exp(ln(2.02)) bug on the original HP35 resulted in HP printing an Errata, part of which said:

" The numbers are 0.7030975114 and 0.995033085 x 10E-2, or integer multiples of the latter number through nine, by itself, or when added to the former. "

I was curious as to whether there were any other numbers that were not in the above "set" that would cause an incorrect answer on the original HP35.

Doing a numerical search, I did find another number that does not compute the exponential correctly on the original HP35.

exp(ln(1.12211)) = 1.111

After a little more number crunching, it seems the full list of original HP35 exp(ln(x)) errors are as follows. They all produce values that need to be multiplied by 1.01 to give the correct answer:

exp(ln(1.0201))

exp(ln(1.04060401))

exp(ln(1.12211))

exp(ln(2.02))

exp(ln(2.060602))

Only 5 numbers, from an astronomical number of correct results.

A true needle in a haystack problem.

For those who do not have an original HP35 (circa 1972) calculator, you can try the above numbers on this

HP35 Simulator.

If anyone can find more than the above 5 numbers - I would be very interested.

Story of the new number and the HP35 Errata.

Regards, Geoff Hitchcox (Christchurch, New Zealand).

*Message #2 Posted by **Chuck** on 26 Aug 2010, 1:07 a.m.,*
in response to message #1 by Kiwi Geoff

Was this error barring internal rounding error? I tried exp(ln(3.2001)) and got 3.2000999999. Does this fall under the "bug" category or does the result need to be "way off"?

Re: HP35 exp(ln(x)) bug, a new number found.

in response to message #2 by Chuck

> Quote:
>
> Was this error barring internal rounding error? I tried exp(ln(3.2001)) and got 3.2000999999.

Hi Chuck, I should have explained what the bug is. It's when you go exp(Ln(x)) and get an answer that is not x, but needs to be multiplied by 1.01 to get back to x.

The example you gave is simply a "rounding" issue Chuck, if we take your answer of 3.200099999 and multiply by 1.01 we get 3.232101 which is not your starting number.

> Quote:
>
> Does this fall under the "bug" category or does the result need to be "way off"?

The "bug" is at the 1% level Chuck. It is fascinating to study why this bug happened, because it's every programmer's nightmare, where an issue way down in the 12th place, can suddenly become a very much larger error.

The original HP35 firmware was an absolute wonder (mainly by Dave Cochran)- even the exp(ln(x)) bug is still a salient lesson for modern programmers.

If interested, Jacques Laporte has a great web resource discussing the bug, and how the HP 35 works internally.

Regards, Geoff Hitchcox, (Christchurch, New Zealand).

Re: HP35 exp(ln(x)) bug, a new number found.

*Message #5 Posted by **Dieter** on 27 Aug 2010, 8:45 a.m.,*
in response to message #2 by Chuck

Chuck wrote:

> Quote:
>
> I tried exp(ln(3.2001)) and got 3.2000999999

Well, this is one of the many cases where the calculator seems to give a wrong result just because it works perfectly correct. :-)

Your calculator does not evaluate exp(ln(3.2001)), but exp(1.163182059) - simply because every result carries at most ten significant digits, and 1.163182059 is the best possible 10-digit result for ln(3.2001). So, in the second step this 10-digit value is exponentiated, which equals 3.2000 99998 98425... or, rounded to ten digits, exactly the 3.20009 99999 you mentioned.

This also is the reason why even a perfect calculator with limited (n-digit) precision usually will not return the original value after evaluating some transcendent functions followed by their inverses. Try sqrt(5) on a 10-digit calculator: the exact result is right in the middle between 2.236067977 and ...78. Squaring these two values gives 4.999999998 resp. 5.000000002. So there simply **is** no 10-digit value whose square (even when rounded to 10 digits) equals exactly 5.

HP 41 to PC possible?

*Message #1 Posted by **SpeedyVV** on 25 Aug 2010, 7:37 p.m.*

Hello: I have "restored" my HP41CX that had been put away since Uni back in 85. My daughter asked if I had a scientific calculator...I said..."do I ever".

I was very surprised that the batteries on it while dead did not ruin the calculator.

To my bigger surprise, the Source in Canada still sold N size batteries, and that the calculator came to life. :)))

Last but not least, there is all this stuff on the net regarding this calculator, including a virtual museaum. How cool is that.

My HP has a PPC, Math I, abd Circuits I rom.

The one thing I could not find on the net, is if there is a way today to connect the 41CX to a Windows PC. That was the one thing I always wished this calculator could do.

Save programs, files, etc., on the PC and be able to send it back would be really cool.

I remember there was a HP\IL interface to connect to devices but there was nothing to connect to a PC.

Does anyone know if there is a solution today for that?

Thanks

Re: HP 41 to PC possible?
*Message #2 Posted by **Allen** on 25 Aug 2010, 8:19 p.m.,*
in response to message #1 by SpeedyVV

Yes, 2 options: 1) ISA HP-IL board (HP82973A) (requires ISA Slot) http://www.hpcc.org/datafile/hp41/PCGatewayEmulator.html

2) PIL box for USB connectivity: http://www.jeffcalc.hp41.eu/hpil/index.html

Re: HP 41 to PC possible?
*Message #3 Posted by **SpeedyVV** on 25 Aug 2010, 9:40 p.m.,*
in response to message #2 by Allen

Thanks... the PIL box looks like a great option.

Re: HP 41 to PC possible?
*Message #4 Posted by **John Robinson** on 26 Aug 2010, 1:13 a.m.,*
in response to message #1 by SpeedyVV

Welcome back to the wonderful world of the HP41 !! - Of course with your daughter using you're old calc, you'll need to obtain another for yourself - HAHA !!

I can vouch for the PIL-box, I bought one a few months ago - way cool !! You'd probably need some other tools to do anything with the files written to the Mass Storage (HP-IL Cassette Drive) device, as they are written in LIF format. Jeff has a viewer called ILvlif, but it shows raw bytes on the media.

Cheers, John

Woodstock battery tip

*Message #1 Posted by **Michael Meyer** on 24 Aug 2010, 11:19 p.m.*

I wanted to post a quick tip that I don't think I've seen mentioned here. I've had some problems with intermittent contact in Woodstocks with modified battery packs replaced with primary cells. This intermittent contact is due to the slight misalignment of the positive pole of the battery. The contact in the calculator ends up rubbing against the side of the postive end of the battery. I've started inserting a small piece of double sided mounting tape under the positive cell. This corrects the alignment, resulting in perfect and reliable contact every time. A very simple modification that has made a big difference in all of my Woodstocks.

Edit: make sure you only uncover one side of the tape so that the battery will slide on the other.

Can the HP 41 Read HP 65 Programs

*Message #1 Posted by **aj04062** on 23 Aug 2010, 9:20 p.m.*

I continue to try and debug/fix my newly acquired 65. If I knew the 65 can write a program (to be read by the 41), it might help me narrow down some things.

Re: Can the HP 41 Read HP 65 Programs

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 23 Aug 2010, 10:40 p.m.,*
in response to message #1 by aj04062

IIRC, the HP-41 can read HP-67/97 cards; but no HP-65 cards. I think the recording format is the same, but the data (op codes) are possibly meaningless... However, trying will not hurt.

Re: Can the HP 41 Read HP 65 Programs

*Message #3 Posted by **Jim Horn** on 24 Aug 2010, 1:07 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

The HP-65 used six bit op codes to store its programs; the HP-67 and 97 used 8 bit codes. No machine after the 65 could read its card data (programs or registers). Sorry.

Trivia - the 65's program storage was a dynamic shift register so the program was constantly circulated around same. There was no addressing for the data. The way a particular instruction was found was that a particular index value (all zeros if I recall) was stored *once* in the register. When that came by the read circuit, a counter was started. When the appropriate number of values clocked by after that, the desired value was read.

Of course, if more than one index value ended up in the program store the data read would be randomly chosen as so many values after either one. I'm still boggled that one of the old HP-65 Users Club members figured this all out on his own without any logic analyzers, oscilloscopes, internal documentation, etc.

HP71B (Ver. 1BBBB) Date Bug?

*Message #1 Posted by **M. Joury** on 23 Aug 2010, 7:06 p.m.*

I often need to know the day of the year in my job. So for fun I decided to write a program for each of my calcs to get this info. Easy enough with a calculator with date support such as a 41C/CV with Time Module or a 41CX or a 48. A little more complex if you don't have date support. At any rate I had written programs for my 41, 35S, and 42S and had gotten around to taking a look at my 71B.

It took me about 5 minutes from putting in the batteries (I had not played with it in a while) to figure out that this support was built right in. DATE returns YYDDD where YY is the year and DDD is the day of the year. So, no fun here, works right out of the box. I set the correct date and time and keyed in "date" and I got 236 (for 8/23/10)… WOAH! Wrong answer! My 48, 42, 41, and 35 all agree that the correct answer should be 235. I thought about this for a moment and then set the date to 2/28/10. Date = 10059. Ok, all good. Now try 3/01/10. Date = 10061. Uh-Oh. Not so good. It seemed to think that 2010 was a leap year. Ok, so try to 'setdate "10/02/29"'. Nope, caught that, won't let it happen. Ok, so 'setdate 10060'. That works fine. Now try date again. Answer? 10061. Tried the same series of tests for 2011, no problems there. So the calc appears to have a problem with the numeric date routines for 2010 but the setdate routines recognize the fact that 2010 is NOT a leap year just fine. Note that date$ also appears to work correctly in that 'setdate 10060' returns the correct string date when DATE$ is used.

I have not bothered to try any other ROM versions which I might get around to a little later as I have a couple more of these beasties.

Cheers,

M. Joury

*Message #2 Posted by **Jerry Raia** on 23 Aug 2010, 7:35 p.m.,*
in response to message #1 by M. Joury

I'm curious, did you set the year as '2010' or just '10'?

Re: HP71B (Ver. 1BBBB) Date Bug?

*Message #3 Posted by **M. Joury** on 23 Aug 2010, 7:49 p.m.,*
in response to message #2 by Jerry Raia

Just 10. Did I miss something in the docs? Mind you, Year 10 can't be a leap year either and all other dates appear correct.

Now you got me thinking. Back to the drawing board.

Although, it would seem that using 'setdate 10060' should handle any issues of string date formatting that may show up in using 'setdate 10/03/01'. And the fact that setdate 10060 results in date returning 10061 would seem to indicate a problem.

Cheers,

M. Joury

Re: HP71B (Ver. 1BBBB) Date Bug?

*Message #4 Posted by **J-F Garnier** on 24 Aug 2010, 12:17 p.m.,*
in response to message #3 by M. Joury

This is a known bug of version 1BBBB: "Invalid leap year determination for even year in odd decade". Was occuring in all these 90's years, and now in 2010, 2012 up to 2018. But will work well again in 2020 :-)

Fixed in versions 2CCCC/2CDCC.

J-F --

Thanks for the info; did personal modesty preclude you from providing the link to your own fine webpage, where presumably all the known HP-71 bugs are listed? Many users may not know that it moved to a new URL (away from Lycos) since the previous retrieval...

My own HP-71B with 1BBBB ROM exhibited the bug, as might be expected. The bug surprises me, as the leap-year rule is rather straightforward.

Re: HP71B (Ver. 1BBBB) Date Bug?

*Message #9 Posted by **M. Joury** on 23 Aug 2010, 7:57 p.m.,*
in response to message #2 by Jerry Raia

Here is the example of setdate usage from the manual:

Both these statements set the date to March 7, 1985...

SETDATE 85066

SETDATE "85/03/07"

Of course what you are getting at is 1910 as opposed to 2010. But that is not a leap year either.

I guess I was not seeing the obvious implication of your question in my first response.

Here we go... From the reference manual:

For numeric date inputs and for date string inputs, if you use the two-digit year format, and if:

* 60 <= YY <= 99, then YY = YY + 1900

* 0 <= YY <= 59, then YY = YY + 2000

So I guess the HP71B is Y2K safe <g>.

M. Joury

Re: HP71B (Ver. 1BBBB) Date Bug?

*Message #10 Posted by **Jerry Raia** on 23 Aug 2010, 8:21 p.m.,*
in response to message #9 by M. Joury

Yes I thought about that because I had recently resurrected my 71B. The first thing was to set the time and date. Years ago I had written date and time LEX file utilities. I remember how the 71 handled dates and times. Thats why I asked :)

30b - Not Impressed

*Message #1 Posted by **Jeff** on 23 Aug 2010, 9:33 a.m.*

I have to admit that I haven't taken it out of the package yet. If I do, I can't take it back.

I am having trouble with the size of the thing. It's looks bulky and unwieldy.

Your thoughts?

Re: 30b - Not Impressed

*Message #2 Posted by **Bruce Bergman** on 23 Aug 2010, 9:56 a.m.,*
in response to message #1 by Jeff

It's the exact same size as the 20b, and smaller than the 35s. Have you tried or used either of those? What makes you think it's unwieldy or bulky? I actually think it's pretty sweet...

Thanks,

Bruce

Re: 30b - Not Impressed

*Message #3 Posted by **Walter B** on 23 Aug 2010, 11:59 a.m.,*
in response to message #2 by Bruce Bergman

It has approximately the same size as an HP 17bii Silver, which compares well with other calc sizes. It's shirt pocketable for sure, though it could even have been made some mm smaller.

Re: 30b - Not Impressed

*Message #4 Posted by **Jeff O.** on 23 Aug 2010, 12:57 p.m.,*
in response to message #2 by Bruce Bergman

I agree with Bruce, I think the 20b/30b package feels pretty good. Much smaller and more nimble than the 35s, for example. My only (slight) complaint is with the sharp edge on the gray plastic outside edge. That can easily be remedied with a file and some sandpaper. I did that to one of my 20b's, now it feels nice and smooth when held in my hand. I haven't gotten around to doing it to my 30b yet, but plan to do so.

...

Re: 30b - Not Impressed

*Message #5 Posted by **John B. Smitherman** on 23 Aug 2010, 1:19 p.m.,*
in response to message #2 by Bruce Bergman

What's your opinion of the keys, display and overall build quality?

Regards,

John

Re: 30b - Not Impressed

*Message #6 Posted by **Mike Morrow** on 23 Aug 2010, 11:17 p.m.,*
in response to message #2 by Bruce Bergman

I have to wonder why one would make judgements like this without even taking the unit out of the packaging. What's keeping one from opening the package???

I too think that the HP 30b size, shape, and style is very well executed. I'd love to see an HP42S-capable machine in the same package. I've been playing with the one I bought at Office Depot last Saturday. The programming model is rather different from any other HP that I've tried. For example:

(1) Number entry is not completed by initiating program execution. The INPUT key must be pushed. Likewise, within a program, entering a numerical value is not complete until INPUT has been programmed after the last digit...entering, say, a LBL 00 after the last digit will not enter the value.
(2) The mathematical routines accessed by the MATH key *within a program* must be selected by the DOWN key (Hold SHIFT and push the DOWN ARROW/DEL key) or by the UP key (Hold SHIFT and push the UP ARROW/INS key). For each push of the ARROW key, the calculator actually performs the indicated operation on the X-value without replacing the X-value until the desired value is selected. For example, to select arctan(x), one must push SHIFT, MATH, INPUT, DOWN, DOWN, DOWN. If this example is performed in run mode, the display will show the value of PI after INPUT, the value of arcsin(x) after the first DOWN, the value of arccos(x) after the second DOWN, and finally the value of arctan(x) after the third DOWN. The program can be shortened slightly (and perhaps the speed improved) in this case by selecting the arctan(x) function with SHIFT, MATH, INPUT, UP. There is no clue given

while in program mode how many DOWNs or UPs it will take to select the desired function, nor is there indication within the program listing after the function has been selected just which function has been programmed.
(3) The "programming overlay" included at the back of the "manual" for affixing to the keyboard is helpful. But...even though the 114-page HP 30b User Guide says the overlay is intended to remain affixed for the lifetime of the calculator, the labeling on it rubs away *very* easily after the overlay has been affixed. (The User Guide is not available on the HP website unless one knows the URL of the FTP site where Tim Wessman posted it recently. However, a fair number of "learning modules" are available.)
(4) When inserting a new program step during a program edit, the new step appears in the listing BEFORE the step that was displayed, not AFTER as I would have expected.
(5) While getting accustomed to the quirks of the HP 30b programming model, I somehow caused a "reverse video" display of "Prgm 0" for which the User Guide gave no clue to its significance or cure. I could only make it go back to normal by deleting program 0.

I wrote a version of the well-known Savage Benchmark for HP 30b.
In Prgm 0:
1 STO 0
2 0
3 Input
4 Lbl 00
5 1
6 +
7 sqrt
8 x^2
9 Ln
10 e^X
11 Math
12 Input
13 Up
14 Tan
15 DSE 0
16 Gto 00
17 Stop

(Checksum 22.085)

Set the HP 30b for RPN, RADIANS, and FIX 11. Then execute:

2500
Input
Prgm 0
=

The result is 2499.99946106 (perfect would be 2500). Execution time (from a stopwatch) is 6.5 seconds!

The User Guide states that the CPU speed is reduced to conserve batteries when program execution lasts longer than one second. Regardless of that, the observed HP 30b speed is TEN times faster than the same routine performed by the HP 50g. The HP 50g numerical result is identical to that of the HP 30b, but takes about 65 seconds. That really shows the price paid for the HP 50g having ARM-emulated Saturn coding, rather than native ARM coding.

The HP 30b result takes about seven seconds if the arctan function is selected by MATH, INPUT, DOWN, DOWN, DOWN rather than MATH, INPUT, UP.

Re: 30b - Not Impressed

*Message #7 Posted by **Bruce Bergman** on 24 Aug 2010, 12:07 a.m.,*
in response to message #6 by Mike Morrow

If you see "Prgm x" in the display in reverse video, that indicates that the program has been assigned to a key. For example, you could create your own addition routine as program 0 (I dunno what for, but...) and assign it to the "+" key. Once you do that, the display will show "Prgm 0" in reverse video.

You assign programs to keys by going into the program and pressing UP (to move BACK a program step) into Step 0, then press the key you want that program to be assigned to.

You can remove a key assignment by going UP to Step 0 and using the "<-" key to erase the keystroke. Likewise, you can see what key a program is assigned to by doing the same thing, but just don't press "<-". ;-)

Thanks,

Bruce

Re: 30b - Not Impressed

*Message #8 Posted by **Bruce Bergman** on 24 Aug 2010, 12:09 a.m.,*
in response to message #6 by Mike Morrow

And yes, the 30b is one of the fastest production calculators on the market right now. It's even faster than the previous champ (the Casio FX-9860G) by quite a margin. It's a marvelous calculator!

Thanks,

Bruce

Re: 30b - Not Impressed

*Message #9 Posted by **Don Shepherd** on 24 Aug 2010, 5:59 a.m.,*
in response to message #6 by Mike Morrow

> Quote:
>
> entering, say, a LBL 00 after the last digit will not enter the value

You don't need to press INPUT after entering a label. After you enter the second digit (all labels are 2 digits) it should let you enter the next instruction without pressing INPUT. Also, numbers are terminated with things like STO or RCL, so you don't need to do 12 INPUT STO 4. But just entering a number, like 0, does leave the cursor hanging there. If you want a 0 in the display, use shift+hold ON (clear), rather than 0 INPUT.

You do need INPUT (or =) after menu choices, for example FP (fractional part) is MATH shift+hold UP =. That's a nuisance, but a bigger nuisance is that it takes 3 bytes and not just 1 as in most HP calcs. Because of this, the 290 bytes available is roughly equivalent to the 12c's 99 bytes of program space. And, yes, when entering a program you need to know that FP is math up = and IP is math up up =. But as you use it more you'll remember these.

See the article I put in the articles section recently for some more tips and observations. Programming the 30b is quirky, no doubt about it, but it is fast.

Re: 30b - Not Impressed

*Message #10 Posted by **Mike Morrow** on 24 Aug 2010, 7:07 a.m.,*
in response to message #9 by Don Shepherd

Don, I see that I did not clearly express what I meant.

Within my benchmark program, I initially tried:

```
1 STO 0
2 0
3 Lbl 00
```

and expected that the value 0 would be placed in X by the Lbl 00 step. But it was not. I had to use:

```
1 STO 0
2 0
3 Input
4 Lbl 00
```

to accomplish what I needed.

In RUN mode, to begin execution of my benchmark, I initially tried:

```
2500
Prgm 0
=
```

which behaved as if 0 were in X rather than the desired 2500. I had to use:

```
2500
Input
Prgm 0
=
```

to get 2500 in X before starting Prgm 0.

These examples where an INPUT was required to actually get the desired value in X were a surprise to me.

Re: 30b - Not Impressed

*Message #11 Posted by **Don Shepherd** on 24 Aug 2010, 7:22 a.m.,*
in response to message #10 by Mike Morrow

Yeah, I see what you mean, you're right.

It would have been nice if LBL terminates digit entry, like STO and RCL does.

Cyrille/Tim, how about it?

Re: 30b - Not Impressed

*Message #12 Posted by **Don Shepherd** on 24 Aug 2010, 7:44 a.m.,*
in response to message #10 by Mike Morrow

Mike, not that it will solve this particular problem, but I strongly suggest assigning each program to a key and running the program from that key.

I never execute programs from within the PRGM environment by pressing =. My favorite key for this purpose is the AMORT key since I never run amortization schedules.

If your program starts out this way:

```
STO 0
etc.
```

and you enter 123 and press the key to start your program (or = = within PRGM mode), it will store 123 in R0 as you would expect. But if your code starts out this way:

```
5
STO 0
```

you will get 1235 in R0.

Not like most RPN calcs, but that's the way it is for this one.

Program execution is fast, programming is slow :(

Re: 30b - Not Impressed

*Message #14 Posted by **Don Shepherd** on 24 Aug 2010, 7:24 a.m.,*
in response to message #13 by Walter B

Yeah, I meant execution is fast. Programming is slow, but the more you do it the easier it gets.

Reverse video...

*Message #15 Posted by **gene wright** on 24 Aug 2010, 7:27 a.m.,*
in response to message #6 by Mike Morrow

is covered in one of the programming learning modules.

The modules covering programming are **much** more detailed sources of information regarding programming that the manual.

One module is dedicated as a *reference* module containing as much information as was available about all sorts of areas related to programming.

So... moral of the story? :-)

Treat the learning modules as extensions of the manual and refer to them when possible.

Re: 30b - Not Impressed

*Message #16 Posted by **Don Shepherd** on 23 Aug 2010, 2:29 p.m.,*
in response to message #1 by Jeff

Don't forget, the case is in that package too, right behind the calculator. The calculator itself is not big and bulky at all.

Re: 30b - Not Impressed

*Message #17 Posted by **Jeff** on 23 Aug 2010, 5:37 p.m.,*
in response to message #16 by Don Shepherd

Thanks - I'll look at it in a new light...

Re: 30b - Not Impressed

*Message #18 Posted by **Jeff** on 24 Aug 2010, 10:12 a.m.,*
in response to message #17 by Jeff

Office Depot will not accept calculator returns if the packages have been opened.

I will never buy from them again, but that's a different story.

And, look over the sample 30b programs ... Re: 30b - Impressed

*Message #19 Posted by **gene wright** on 24 Aug 2010, 10:12 a.m.,*
in response to message #17 by Jeff

Several good sample programs for the 30b are included in the learning modules related to programming and using HP Solve.

Don't forget that HP Solve is present either.

The sample programs include:

PI finder (written by Katie). Shows very nice usage of the CF/STATS data registers that can be accessed indirectly.

Odd Days Loan solver program - very nice if you're buying / refinancing a house!

Lunar Lander game ;-)

etc.

Re: And, look over the sample 30b programs ... Re: 30b - Impressed

*Message #20 Posted by **Thomas Klemm** on 24 Aug 2010, 5:40 p.m.,*
in response to message #19 by gene wright

Example 3: Base conversions

This program can be made somewhat shorter. I transliterated an old HP-15C (or whatever) program to the new 30b syntax.

Here's the original:

```
001 - 42,21,11   LBL A
002 -    44  2   STO 2
003 -       34   x<>y
004 -    44  1   STO 1
005 -       30   -
006 -       34   x<>y
007 -    44  0   STO 0
008 - 42,21, 0   LBL 0
009 -    45  1   RCL 1
010 -       34   x<>y
011 -    45  2   RCL 2
012 -       10   ÷
013 -   43  44   INT
014 -   43  20   x=0
015 -    22  1   GTO 1
016 -       33   R-v
017 -       20   ×
018 -       33   R-v
019 -       20   ×
020 - 44,30, 0   STO - 0
021 -       33   R-v
022 -    22  0   GTO 0
023 - 42,21, 1   LBL 1
024 -    45  0   RCL 0
025 -   43  32   RTN
```

And here's the 30b version:

```
Step    function        comments
1       STO 2           Store the output base in memory 2.
2       ) Swap          Performs a stack swap of the X and Y registers.
3       STO 1           Store the input base in memory 1.
4       -               Difference of output base and input base.
5       x<>y            Performs a stack swap of the X and Y registers.
6       STO 0           Store the number to convert in memory 0.
7       LBL 00          Label 00 is the main loop.
8       RCL 1           Recall input base.
9       ) Swap          Performs a stack swap of the X and Y registers.
10      RCL 2           Recall output base.
11      /               Divide number by output base.
12      Math            Accesses the IP (integer part) function in the math menu.
13      Up              Accesses the IP (integer part) function in the math menu.
14      Up              Accesses the IP (integer part) function in the math menu.
15      Input           Accesses the IP (integer part) function in the math menu.
16      Input           Duplicates value to stack y since GF consumes stack x value.
17      GF 01           Exit loop if value is zero.
18      ( R-v           This executes a roll down of the 4-level stack.
19      *               Multiply weight by input base.
20      ( R-v           This executes a roll down of the 4-level stack.
21      *               Multiply dividend by weight.
22      STO - 0         Subtract from the number to convert.
23      ( R-v           This executes a roll down of the 4-level stack.
24      Gto 00          Loop back to label 00.
25      LBL 01          Exit from the main loop ends here.
26      RCL 0           Recall final output number in new base.
27      Stop            Inserts a Stop command. Program ends execution.
```

Unfortunately I can't test the program as don't own a 30b. Yet I hope I didn't forget something this time.

The usage is the same as in the example:

> Quote:
>
> Convert 175 base 8 to base 10. Key in 175 = 8 = 10 = and run the program.

How does it work? The number is continuously divided by the output base while the difference of input base and output base is multiplied by the input base. The product of dividend and weight is added (or subtracted) from the original number.

```
175             =    175
 17  *      -2  =  -  34
  1  *     -16  =  -  16
                    -----
```

```
                  125
                  ===
```

> Quote:
>
> 175 base 8 is equal to 125 base 10. Now convert this result to base 2.

```
125               =        125
 62   *       8   =   +    496
 31   *      80   =   +   2480
 15   *     800   =   +  12000
  7   *    8000   =   +  56000
  3   *   80000   =   + 240000
  1   *  800000   =   + 800000
                     -------
                     1111101
                     =======
```

In the HP 30b programming example the following is used to get a digit:

> Quote:
>
> - Divide number to convert by output base.
> - Accesses the FP (fractional part) function in the math menu.
> - Multiply fractional part by output base to get digit.

I assume severe rounding errors may happen when trying to convert big numbers and/or when one of the bases is not 2, 4, 5, 8 or 10.

On the HP 15C you get:

`1,234,567,890 ENTER 7 / FRAC 7 *   ->   2.8`

While the correct answer for 1,234,567,890 MOD 7 is 3. On the HP 30b you get probably a similar result.

Therefore I assume the following conversion will not work correctly when the program from the HP 30b programming examples is used:

$123{,}456{,}789_{(10)} \rightarrow 3{,}026{,}236{,}221_{(7)}$

These kind of errors can't happen with the program above as only integer values are used (given that only integers are entered).

Kind regards
Thomas

Addendum:

> Quote:
>
> Bases greater than 10 are not supported by this program.

True, but you may use the following trick to convert a decimal number to its hexadecimal presentation:

`51966 = 100 = 16 =`

Run the program to get:

`12:10:15:14`

This can easily be transliterated to:

`CAFE`

> ```

Hmm, if these 'instructions' are actually recorded as such... that is not good, because they are *incomplete and/or relative* rather than *absolute*. It's better to record only the specific command, even if it is reached by scrolling through multiple levels of a menu. For example, the HP-32S and HP-42S record only specific instructions, not all the steps required to reach them.

Doesn't the HP-30b have the MOD function? The only way to do modulo division robustly is to process entirely at machine-code level. Otherwise, rounding errors can spoil the results.

A few years ago, a number of Forum regulars held a programming challenge to write a robust keystroke program for the MOD function. I did not participate, but no one really succeeded, as I remember.

Please don't blame Thomas for this. This is not an error, this is a feature of 30b programming :(We all know better programming paradigmas - and you mentioned two of them - but apparently the creator(s) of the 30b did not ... :-/

Re: HP-30b sample program

*Message #24 Posted by **Thomas Klemm** on 25 Aug 2010, 7:18 a.m.,*
in response to message #21 by Karl Schneider

Hi Karl

What's even worse is that several possibilities of these *instructions* may lead to the same function depending on whether you prefer using up- or down-keys in the menue. This makes reading code a nightmare. Okay, most of us will take the shortest path but this isn't unique in all cases (e.g. COS^{-1} may be accessed by both Math-Input-Up-Up-Input and Math-Input-Down-Down-Input).

> Quote:
>
> Doesn't the HP-30b have the MOD function?

Apparently not. You may also miss the roll-up-key. Instead you have to hit the roll-down-key thrice:

> Quote:
>
> From Jeff's program 3:
>
> ```
> 7       ( Rv            Roll down
> 8       ( Rv            Roll down
> 9       ( Rv            Roll down
> ```

> Quote:
>
> A few years ago, a number of Forum regulars held a programming challenge to write a robust keystroke program for the MOD function. I did not participate, but no one really succeeded, as I remember.

Interesting! Do you still remember what can go wrong with the obvious idea:

```
MOD(Y, X) = Y - IP(Y/X)*X
```

Kind regards
Thomas

The 30b programming "paradigm"

*Message #25 Posted by **gene wright** on 25 Aug 2010, 11:12 a.m.,*
in response to message #21 by Karl Schneider

Does anyone remember the early 20b manual seemed to have "Macro" in it?

The 30b programming paradigm is somewhat macro-ish because it records keystrokes and essentially "plays them back".

Hence, the MATH UP INPUT DOWN type of thing. It is also the reason that when you type 12 and then start a program, if the program begins with 3, you get 123 entered as a value because the program has essentially pressed a 3.

When the 30b executes a program, it plays back the keystrokes, very fast, of course.

Think Choose boxes vs. soft menus. It is simply the paradigm being used. Isn't necessarily good or bad, it is just the approach.

The 30b has some amazing capabilities given is speed. It blows the n-queens benchmark program out of the water - roughly 11 seconds to do that program that is easily keyed by the user where the 50g using UserRPL at 203Mhz takes 67 seconds and the 42s in FAST mode takes over 200 seconds and the HP 35s takes over 250 seconds. 11 seconds vs. 250?

All for $49.99?

Would all of us have liked 16MB of ram, a USB connection and a touch screen? Sure! :-)

Key (to me) is movement in the right direction.

Not to mention it blows the TI financial calculators to pieces on a functional comparison. :-)

Re: The 30b programming "paradigm"

*Message #26 Posted by **Walter B** on 25 Aug 2010, 12:18 p.m.,*
in response to message #25 by gene wright

If the 30b were a bad calc, we won't discuss it here at length. Looking at it from the 20b, it's a step in the right direction for sure. Based on what we experienced in other HP vintage calcs, it seems to be ambiguous (random walk?). Being a technical person like many fellow forumers, and an old European (ambiguous as well ;), I see the achievements but focus on the shortcomings. What I've liked (for the US: loved) to get from HP:

- a *scientific* calc featuring
- a display as flexible as in the 17bII+ Silver, allowing soft keys,
- keystroke programmable like the 42S
- with the amount of memory the 42S provides.

IMHO, this is kind of a minimum request after 22 years. OTOH I'd be willing to spend significantly more than 50 US$ for this. It may well be within the form factor of the 30b. I appreciate the opportunity to reconfigure this animal, but it's difficult to overcome HW limits. So if HP wants to focus on financial business calcs, and this potential 40b as sketched above will be reconfigurable, I think many of us could live with this as second best solution.

FWIW

*Message #28 Posted by **Raymond Del Tondo** on 27 Aug 2010, 12:19 p.m.,*
in response to message #26 by Walter B

I got my 30b today.

First impression when looking at the sealed blister: Looks very nice, has a nice keyboard layout. Then I took it out of the package, and the next thought was: Who the hell designed that housing, with the shiny back, and worse, the awful sharp edge around the case! It can easily be seen that the designer(s) took the Woodstock series as model, but why didn't they also take over the ergonomic idea of the Woodstock series, with case sides which don't hurt the holding hand.

The Woodstock series calcs fit into the hand like a glove around (the hand). The 30b (and obviously the 20b) fit into the palm if you don't try to hold it in place. If you do, the unnecessary sharp edge will press into your fingers, a very unpleasant and unergonomic thing.

One of the first things I tried after turning it on was to switch the calc to RPN. There are no ALG/RPN legends on the keyboard, and no Alg/RPN menu items.

Believe it or not, the RPN toggle sits behind a menu entry called "Chain". There are three options, Chain, Algebraic, and RPN.

For this I had to consult the manual, which enlighted the issue on page 8. At least for me, the "Chain" mode was rather unexpected. After all, this mode may make sense on a business calc.

BTW the legends of the shifted functions of keys printed in the manual are next to unreadable.

> Quote:
>
> If the 30b were a bad calc, we won't discuss it here at length. Looking at it from the 20b, it's a step in the right direction for sure.

I also believe the 30b is a good calc, technically. But the ergonomics of the case are not very good IMHO. A slope on the back is good for the palm, but the sides should be more finger-friendly. Take a look at the Woodstock series, at the Pioneer series, or even at the 35s to see how it can be made much better.

This is surely the last calc in this housing that I'll ever buy, and I'm still not sure whether returning it to the seller and get a 17bII silver instead.

Hopefully the 17bII+ silver has a better designed housing. If it's similar to the one of the 35s, it should be ok.

Sorry for the "negative-sounding" impressions, but I was so eager to get my hands on that very interesting 30b, and then the first touch was such a disappointment, that I had to write down my opinions.

Don't get me wrong, the housing feels solid, the keys feel good so far, and overall it is a nice machine, but OTOH it's one of the very few HP calcs which I don't like to hold in my hand because of the unpleasant sharp edge. I remember only one HP calc series with similar bad ergonomics regarding the housing, the Clamshell series. If you fold the left keyboard to the back, the calc sits very unpleasant in your hand.

Sorry for the maybe OT;-)

Ray

Ray,
The sharp edge feel can be significantly improved with a file and/or sandpaper, or even scraped with a knife blade held perpendicular to the edge. It can be rounded over quite a lot without any structural problems. Of course I won't blame you if you feel that you should not have to use such tools on your new calculator.

These slopes are the oldest tricks to make calcs looking smaller and more elegant than they really are. An extreme example was the HP-19C. Take a look at the picture on the ad sheet, and compare it with the real thing. Such pictures are usually taken under an angle slightly steeper than the slope of the lower section of the housing so you won't see this part on the picture. The sharper the edge of the upper section of the housing the flatter the calc looks. Simple but successful :-/

I've always admired the Woodstocks more than any other HP line for their natural fit for hand held use. But now the Woodstocks have been relegated to second-place. The HP 30b provides a package that is much better.

The edges on my HP 30b (serial 4CY024xxxxx, made in June) are not sharp in any conceivable sense of the word. They have a definite palpable and visible round-off. (Could there have been a late manufacturing change?) The unit is very comfortable to use in the hand. This is the sturdiest and most attractive calculator of the 30-plus HPs that I've owned in the past 34 years.

I simply love the mechanical/industrial design of the HP 30b!

Interesting debate. After reading the comments about the sharp edges, I looked up all the side and angled views of this calculator that I could find, and I just don't see them. I guess you have to hold one to get what's being discussed.

Re: The 30b programming "paradigm"

*Message #34 Posted by **Raymond Del Tondo** on 28 Aug 2010, 6:40 p.m.,*
in response to message #33 by Martin Pinckney

The problem is that I didn't find good pictures of the sides of the unit before, else I would not have bought it.

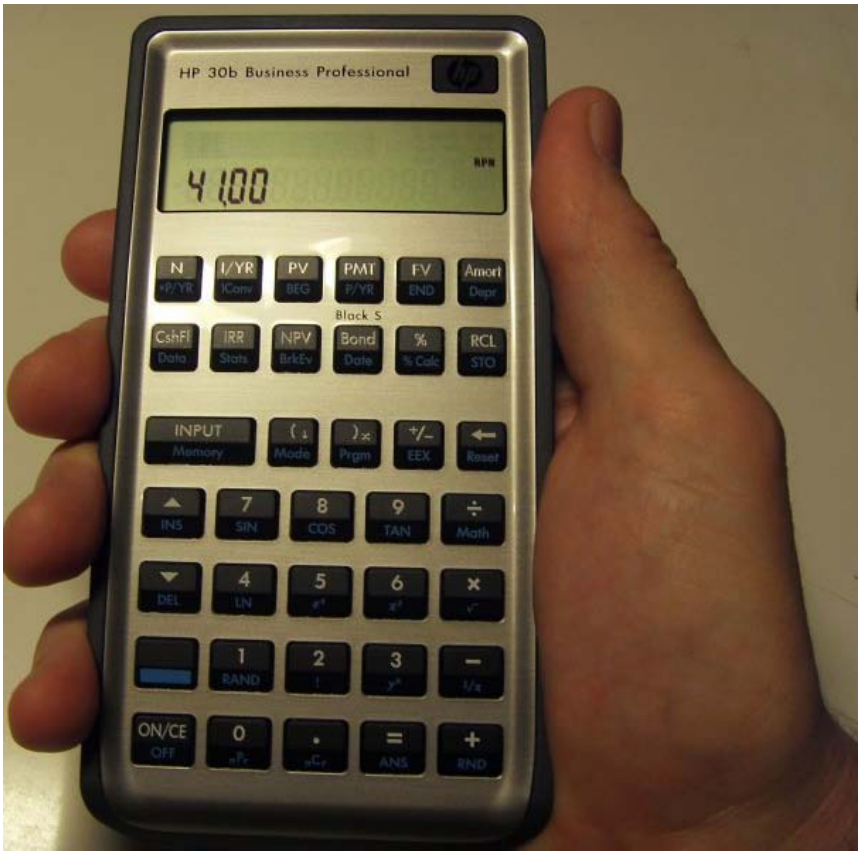
Below are some pics of the 30b comparing to a Woodstock and a Pioneer calculator.

As can be easily seen, the side edge of the 30b is very sharp compared to the Woodstock and Pioneer. On the Woodstock and Pioneers, one holds the calc by pressing the finger and prolonged thumb (palm) against the sides of the housing, which are flat and wide (Woodstock), slightly rounded (Pioneer), or sharp (30b). The finger contact surface is very narrow on the 30b, at least if one holds the calc in a way shown in the pics, to prevent it from slipping out of the hand accidently. This is very uncomfortable for my taste. The Pioneer calc shows how a flat calc can be made, still featuring rounded, finger-friendly sides. The 30b is thicker than the Pioneer series calcs.

Needless to say, my brand-new 30b already has tiny hair scratches on the awful shiny back. I really handled it extremely carefully, and always put it into the protective sleeve immediately after looking at it.

So given that I actually did not really use the unit, it has usage marks, and if I wanted to return it to the dealer, he may not give me a full refund. Now _that's_ an experience I could have lived without:-(

Holding in hand:



The 30b from top. Here one can directly see that this device will be unpleasant to hold in the hand. Even most cheap remote controls have a more ergonomic housing (but worse keys;-)

Both from the side:

and side by side (25C 30b 22S):

Re: The 30b programming "paradigm"
*Message #35 Posted by **Don Shepherd** on 28 Aug 2010, 7:15 p.m.,*
in response to message #34 by Raymond Del Tondo

Nice pictures, Raymond. I just picked up my 30b and did some calculations, then I picked up my 32s and did some calculations. Yes, there is a different feel because of the shape the two calculators, but honestly I wouldn't say that one is better or worse than the other. To me, either is acceptable.

And, yes, the back of the 30b is shiny, as opposed to the textured back of the 32s. But I won't be looking at the back until I have to change the batteries, so that's not a major factor for me.

It comes down to personal tastes, like most things. Aesthetically and physically, I have no problems with the 30b.

I wish it had more memory, however.

Don

Indeed, the pictures do explain the issue. I would probably say the edges are "sharply angled" (which may be uncomfortable to hold because of the shape), rather than "sharp", which to me implies actually digging in to the hand.

The slope of the sides of the HP 30b and that of the bottom half of the Classic series are very close. I've never heard anyone disparage, say, the HP-45 as "sharp-edged" or uncomfortable in any way.

This issue appears to be one of individual aesthetics, not ergonomics, identical in that aspect to a dislike of the bottom cover color.

The HP 30b has outstanding ergonomics, possibly the best ever on an HP calculator. It is very comfortable when used in the hand, and it is very stable when used on the tabletop. It is an excellent example of superior industrial design.

I kind of like it. :-)

Please read the text and look at the pics, I'm not talking about the bottom half, but the top edge.

> Quote:
>
> This issue appears to be one of individual aesthetics, not ergonomics, identical in that aspect to a dislike of the bottom cover color.

It has nothing to do with aesthetics. From an aesthetical point of view the 30b looks very good IMHO, regardless of the fact that I don't like shiny surfaces on calculators. It's the "sharp angled edges" I dislike.

> Quote:
>
> The HP 30b has outstanding ergonomics, possibly the best ever on an HP calculator.

This is simply not true. If the "sharp angled edges" would have been smoother, or more rounded, then maybe it would be very good regarding ergonomics. Nearly every other HP calc (except the Clamshells and the 6s) is better from an ergonomic point of view.

> Quote:
>
> It is an excellent example of superior industrial design.

No. The Pioneer Series were examples of superior industrial design, the 30b is way behind.

> Quote:
>
> I kind of like it. :-)

Glad you like it, but as I wrote, I pointed out reasons why I don't like certain aspects of the 30b.

Overall I'm sure it's a nice machine, but not as perfect as the Pioneer series. And for me, the 30b has some ergonomic flaws.

Re: The 30b programming "paradigm"

*Message #39 Posted by **Mark Harman** on 29 Aug 2010, 1:33 a.m.,*
in response to message #38 by Raymond Del Tondo

Raymond,

The HP 30b looks like it was designed to follow the natural angles of the hand while it is in its relaxed position (curved). This allows the calculator to be held in this rested position while maintaining a good grip. Personally, I think it fits very well in the hand and is extremely comfortable because of this design. However, looking at your photos it appears you are doing an almost a flat-palmed wraparound grip. Perhaps you might want to change your approach to holding the device.

Try resting the sides of the 30b against the pads of your fingers, thumb, and thumb side of the palm instead of wrapping your fingers and thumb over the edges (so, behind the edges). Make sure your hand is in its relaxed curved position. You still get an excellent grip this way with minimal force. In fact, holding the 30b this way I can turn my hand over and the device still wont fall on the floor - and that is with little force in my grip.

If you hold it the way I describe, I think you might look at the ergonomic design of 30b in a new light.

Now, if HP can redesign the programming overlay with better ink, I would be very happy. As it stands, my DISP and ISG are almost completely worn off.

I am also hoping they fix the Best Fit bug and the Cash Flow Reset bug, which I reported to them last week. If you or anyone else wants details on these bugs, please feel free to ask and I will describe them in detail. Other than these issues, I think the HP 30b is the best financial calculator ever made. Heck, it is what finally got me to switch from a TI BA II Plus Professional. I've had mine for almost a month and I absolutely love it.

Regards,

Mark

That's exactly what happened on my HP 30b. All four overlay labels on that row of keys have half disappeared, plus the label above the N key.

I wish there were some way to order replacements, because that overlay is very useful. I'd like to see its labels permanently fixed as part of the keyboard.

But, that's a minor issue on such a great design.

My wish, which Katie explains as reasonably possible with only minor hardware modification, is for an upgraded version with real-time clock/calendar functions and a few K-bytes more programming RAM (plus those permanently affixed programming labels).

I can't understand why they can't make the new machines smaller than the 1970s machines. They are thinner, but larger. What's up with that ?!

Re: The 30b programming "paradigm"
*Message #45 Posted by **Mike Morrow** on 29 Aug 2010, 12:53 p.m.,*
in response to message #44 by bill platt

Smaller is not necessarily better, just cuter. I'd much rather have my hand held calculators be the size and shape of the HP 30b, rather than say, credit card sized.

Re: The 30b programming "paradigm"
*Message #46 Posted by **bill platt** on 29 Aug 2010, 1:24 p.m.,*
in response to message #45 by Mike Morrow

Yes, credit card sized is too small. But Voyager size is certainly not, and Pioneer is even larger. Both are significantly smaller than the 30B.

The voyager can easily fit in almost any pocket, even a trouser front pocket.

The Pioneer is somewhat too large for that.

The 30b is even larger. So is the 35s. It doesn't make sense.

Nowadays, the calculator is even more marginalized than ever. If it is going to be larger than an ipod touch, then it is sort of useless...you can put a 42s sim on an ipod touch...

Since so many people now carry cell phones around, they will need a really good reason to carry a calculator around...and size really gets in the way of that.

Maybe HP is thinking, "we can't compete with 'mobility' devices" and so we will focus on desktop applications...where it is somehow easier and better than the computer...

It is a tough market for sure!

What strikes me, is there are so many differing opinions on this forum about most recent HP calculators. Some comments are rather strident. Perhaps it's no wonder HP does not appear to "listen". Which voices do they listen to? Angled sides or straight? Smaller or bigger? Landscape or portrait? Menus or shifted keys? I could go on.

About the only commonly held opinion is that the keys must click and actually register!

True, but that's telling in and of itself. I don't think you'll find many (if any) negative comments about the calculators in the voyager or pioneer series. HP got these "right" and even now these calculators are in high demand.

Back in the day, HP didn't ask for our opinions at all. They had a core group of talented people that carefully hashed out the ideas themselves and collectively refined them until they reached near perfection. This takes a large corporate commitment. Although HP has a couple of very talented people in the calculator group now I don't get the sense that the company has made much of a commitment to calculator development. I don't know if we can expect too much in the way of innovative new scientific calculators until HP is willing to commit more resources to their development and support (starting with

posting the 30b manual on their main website, for crying out loud).

Sorry if some of my comments sounded harsh, I didn't meant to offend anyone...

However, I had (too?) high expectations regarding the 30B, since from what was written in the forum and in the HPCC datafile, it sounded like a machine I had to get my hands on. And I have to admit the 30B looks good, no question!

When I got my hands on a 30B actually, I realized that this machine was not meant for me because of the IMHO suboptimal case sides. I know that I don't like to take this calc into my hands. Therefore I was disappointed. Today, I returned the 30B to the calc dealer. If the price had been about 30 Euros, like in the US, _maybe_ I would have kept the unit for my collection, but here in Germany the 30B costs 50 Euro + shipping, and that's too much to waste for a thing I don't even like to touch. I think I'll get a 17BII+ silver, which at least seems to have a more hand-friendly housing;-)

> Quote:
>
> About the only commonly held opinion is that the keys must click and actually register!

This seems to be an immanent problem since (and inluding) the 49g FHB. How does the 17BII+ silver compare in this respect?

I had to return mine for a replacement because some keys were registering unreliably despite the click.

in response to message #53 by Raymond Del Tondo

Yesterday I got my NIB and still sealed 17bII+ silver/gun (s/g) metallic overlay.

Now _that's_ a difference compared to the 30b! The 17bII+ s/g has much better haptics IMHO. The housing has a slightly trapezoid form, too, but the upper left and right edges, which were the reason to return the 30b to the dealer, are much better (less sharply) angled on the 17bII+ s/g. The 17bII+ s/g is much nicer and comfortable to hold than the 30b.

The 17bII+ s/g LCD resolution is the same as on the classic Pioneer high-end machines (17BII, 42S), but the contrast is much better. So far no missed or bounced keys.

And as if this weren't good enough, the price I paid for the new in blister and still sealed unit was 39 Euros incl. shipping, and there was a free promotional QuickCalc in the blister, too.

This 17bII+ s/g was a very good compensation for my annoyances with the 30b:-)

Now if hp made a 42SII based on the 17bII+ s/g , but with a reachable serial I/O connector, I would definitely buy at least one or two units.

Ray

IMHO, the HP 17bII+ is a cheaply-made replacement for the HP 17BII. Other than improved display contrast, there is nothing about the HP17 BII+ that is an improvement over the HP 17BII, or any other HP calculator design. Like the unfortunate HP 35S, it's really too large to be termed a shirt-pocket calculator.

The HP 30b, IMHO, has far better ergonomics, is smaller than the HP 17BII+, has much much better scientific and programming support, is blazingly fast, and is mechanically far better designed and constructed.

But I will admit, there is ONE feature that the HP 17BII+ has that is missing (without any reasonable justification) on the HP 30b: Real time clock/date/calendar functions. I wish I didn't have to pull out my old HP 17BII for those functions.

I would hate to see HP waste time and effort producing an HP42S successor in the obsolete HP 17BII+ package. In that event, I'd just have to be satisfied with my three old HP 42S units. But an HP 42S successor in the form of the HP 30b would be an instant and universal hit. I'd buy several. Especially if it had micro-SD card support, and the battery capability to support it (likely not practical). Serial I/O, if not USB, would be valueless in the modern era.

Sorry, here it becomes clear that you never had a 17bII+ silver in your hands. The 17bII+ has much more memory than the 17BII, and more functions.
And about dimensions: The 17bII+ silver has a **smaller** footprint than the Pioneer series calcs. The 17bII+ is about 1mm thicker than the Pioneers, but the belt size is still smaller, so it fits into smaller shirt pockets than a Pioneer.
The front view of the 17bII+ may be similar to the 35S, and maybe the keys are similar, but the housing of the 17bII+ silver is completely different from that of the (agreed too large) 35S.
It's ok if you more like the 30b, that's why they make different models. Tastes are different, and facts are facts, see above.

> Quote:
>
> I would hate to see HP waste time and effort producing an HP42S successor in the obsolete HP 17BII+ package.

I don't think the package is obsolete. IMHO it's the better, but more expensive package. It looks as if the 20b/30b housing is made for the low-cost entry models with limited graphics, and that's ok.
The 17bII+ package is much more suited as a replacement for the higher-end models, with better display, less sharply edged sides, etc.

Re: The 30b programming "paradigm"

*Message #57 Posted by **Walter B** on 12 Sept 2010, 3:05 a.m.,*
in response to message #55 by Mike Morrow

Design is a matter of taste, so either you feel it or not.

To the hard ;) facts:

- **The 30b is even some 4mm longer than the 17bii+ Silver, while the latter is 1mm wider.**
- The 17bii+ S has approximately the same size as the Pioneers.
- Both have slanted keys - an advantage over the Pioneers allowing cleaner keyboards.
- The display of the 17bii+ S is far more versatile than that of the 30b. Softkeys are only possible on the 17bii+ S.
- The 30b may be reconfigured, the 17bii+ S not.

So, if HP would give the 30b a reasonable display like the 17bii+ S then I'd be happy :) - as if HP would make the 17bii+ S reconfigurable. I'd be even happier if they would give them a state-of-the-art display and some way of data I/O as well :)), but I've learned that's expecting too much :-/

My 20 milli Euros only.

Ceterum censeo: HP, launch a 43S d8)

Edited since I made a wrong size statement :(Sorry, but corrected now :-/

I've updated the n-queens benchmark with the new result of 9.3 seconds for the 30B. This speedup was possible by replacing register arithmetic with DSE/ISG commands.

I've also tested the fast mode tsys=on, but the execution speed doesn't increased significantly. The reason is the DOWN command for accessing the ABS function, that puts the calculator temporarily (less than 1 second) into the fast mode. With other words DOWN, UP and BACKSPACE can be used for speeding up loops without using tsys=on. Possibly there is a better way to do this. Now we know why the 30B is so fast in the n-queens benchmark.

Re: 30b - Not Impressed

*Message #59 Posted by **Egan Ford** on 24 Aug 2010, 12:18 p.m.,*
in response to message #1 by Jeff

I am also not impressed, but not disappointed either. Ambivalent perhaps.

I cannot comment on the 30bs usefulness as a financial calculator since I do not rely on them.

Aesthetically I feel that its case design was designed just to be designed. Whereas the Pioneer series were minimalist. I still feel that the Pioneer platform was one of the best ever for a calculator. That said the trapezoidal design does fit very well and feel good in the hand. Function trumps form perhaps?

The buttons feel good, but why do I need an overlay for programming? That should have been printed on the face.

The new programming model is different. Neither good or bad. Just different.

The display is easy to read, but I'd give up a little bit of readability for the more flexible 42S screen.

When I look at the 30b it doesn't invoke any passionate response. But it is a business calculator, perhaps it shouldn't.

*Message #61 Posted by **Egan Ford** on 24 Aug 2010, 10:53 p.m.,*
in response to message #60 by Martin Pinckney

The first sentence was serious. My initial response to the 30b was, "yet another business calculator." *sigh* I'm sure for many here the response was "Wow! Another business calculator! 2K of RAM! Yippee!!!"

The second sentence was just a friendly jab at our business types on this forum. I probably should have added a smiley face. :-) Or, perhaps since I work for very large three letter company with "business" in their name, their smiley face. :-| Just in case there is any doubt. :-)

in response to message #61 by Egan Ford

Oh, business types have thick skin.

However, rather than "just another business calculator", the 30b does have several advantages.

1) Cheapest RPN programmable from HP.

2) Includes a VERY nice (IMO) set of scientific and statistics functions for a business model.

and

3) Is the fastest native-programming programmable calculator HP has ever made.

Not a bad list.

Re: 30b - Not Impressed

*Message #63 Posted by **Egan Ford** on 25 Aug 2010, 10:19 a.m.,*

in response to message #62 by gene wright

No arguments here. The 30b represents forward motion. And that is exciting.

Re: 30b - Not Impressed

*Message #64 Posted by **Katie Wasserman** on 25 Aug 2010, 11:14 a.m.,*
in response to message #62 by gene wright

> Quote:
>
> 3) Is the fastest native-programming programmable calculator HP has ever made.

I have to take exception to this. The new 12C+ is faster in some instances. Depending on where the program is located in memory on the 30b the 12C+ is faster in the "loops of addition" test and other programs that require the 30b to do a long label search. Even with a clear program memory on the 30b, the 12C+ is nearly the same speed as the 30b. In addition, many programs that use indirect register access are faster on the 12C+, bubble sort in particular is much faster.

Since the 12C+ is running an emulator of the original 12C processor and the running the original 12C firmware this is a testament to both the efficiency of the emulator and the original 12C code.

*Message #65 Posted by **Egan Ford** on 25 Aug 2010, 2:18 p.m.,*
in response to message #64 by Katie Wasserman

Correct me if I'm wrong, but can't you write ARM ASM on the 50g? That'd make the 50g the fastest native-programming programmable calculator HP has ever made. Or does native mean the default language?

Re: 30b - Not Impressed

*Message #66 Posted by **gene wright** on 25 Aug 2010, 2:28 p.m.,*
in response to message #65 by Egan Ford

Katie, good point. Exception taken! The loop + test does show the 30b faster if Test sys is turned on, but on an "out of the box" 12c+ or 30b running the "normal" + test, the 12c+ is faster. The 30b does have the 12c+ beat on price. :-)

Egan, perhaps I should say "non-assembly language" native programming environment - something you can take out of the box, turn on, type in, and run.

The percentage of any users who can take out a 50g, type up an ARM program on the calculator itself from scratch and run it must be vanishingly small, but I think I will amend my statement to "non-assembly" as above. :-)

And, I also have to imagine it would take a lot longer than writing something in the 12c+ RPN or the 30b "mostly" RPN language.

OK - it's available in Germany; it would cost me an extra 13 euros to get it delivered to the UK. I am not too keen on that.

Slightly cagey response there regarding UK and Europe; it is really just a manner of speaking in Britain. Europe can be used to mean Europe proper (that is, including UK), or used to mean the European continent (that is, Europe, excluding UK). I agree it may be a bit much to use the two meanings in a single sentence. Anyway, being from the Netherlands myself (or Holland - don't start on this one as well!), I do not subscribe to anti-European feelings that some people may have here in the UK. And also: it is not as bad as some might think. Do remember that the French, Dutch, and Irish (am I missing out other countries here?) fairly recently voted against one European reform or another - that cannot be said of the British.

Re: 30b - Not Impressed

Surveryor needs help with HP 35s program entry

*Message #1 Posted by **Stefan Vorkoetter** on 22 Aug 2010, 8:15 p.m.*

I received an e-mail from a land surveying student who's about 2 months from her license exams. She purchased some HP 35s surveying software, but is getting confused by the details of entering programs into the 35s. She asked if I could enter and test the programs for her. There are 37 pages of programs, and 10 pages of test cases.

Unfortunately, I don't have time to do this right now, and was wondering if anyone here would be interested. If so, please contact her directly:

37 pages of programs?! For what? Taking an exam? If she knows and understands the material, I'd bet she doesn't need a single one of them. It is an exam, not a computer programming project...

Re: Surveryor needs help with HP 35s program entry

*Message #5 Posted by **Stuart Sprott** on 23 Aug 2010, 7:36 a.m.,*
in response to message #4 by bill platt

I am a Surveyor and would just like to add that I think that all your responses are spot on.

Now days if you ask a young Surveyor to solve a problem, there response usually is, "where do I find the program to solve it." This applies to simple as well as complex problems.

I love to program and have written a lot of survey programs, but I come from a generation who knew how to all solve all the problems just from first principles.

The trouble is that we programmers have made it too easy for the current generation.

Re: Surveryor needs help with HP 35s program entry

*Message #6 Posted by **Norman Dziedzic** on 23 Aug 2010, 8:37 a.m.,*
in response to message #5 by Stuart Sprott

It might depend on the requirements of the test.

In a test with ample time to work the problems and partial credit then I would have to agree that there should be no need for extra programs.

If the test is designed to only allow time to run the problems through a calculator then shame on the test makers.

Re: Surveryor needs help with HP 35s program entry

*Message #7 Posted by **db (martinez, ca.)** on 23 Aug 2010, 10:02 p.m.,*
in response to message #6 by Norman Dziedzic

Norman; In the California LS exam, the writer of each question grades his or her question and gives partial credit if applicable. Furthermore; a failing student is shown the correct answers and what partial credit was given. One may also contest the credit given. A wrong answer due to a mathematical bust but figured with a good method can score well. However, once in the mid '80s it seemed that everyone scoring the test figured that his question should be graded hard but those other folks would make up for him and grade easy. Only about 3% of the people sitting for the exam passed that year.

Then, there is the theory that they pass one resident from each county, each year. This has unprepared but hopeful mathophobes getting an Alpine County post office box each year.

Perhaps not a slip.

Furthermore, perhaps Freud would be amused with your term "field day" since the OP was about a surveyor!

Need help finding info from ace math folks

*Message #1 Posted by **Namir** on 22 Aug 2010, 2:54 p.m.*

Hi All,

I am searching for good pseudo-code or source code or very clear step-by-step explanation for the Lehmer-Schur algorithm used in calculating polynomial roots by applying a special version of root-bracketing method.

Any links or info (beyond Wikipedia and the general algorithm description in Acron's book "Numerical Methods that Work") is greatly appreciated.

Thanks!

Namir

Massimo

Re: Need help finding info from ace math folks

*Message #3 Posted by **Namir** on 22 Aug 2010, 3:34 p.m.,*
in response to message #2 by Massimo Gnerucci (Italy)

Thanks .. I have already seen those in my net search. I am hoping to find better code. I will dig into the material if nothing else comes along.

I have developed a complex-plain search scheme that works very well and can find all roots, including multiple ones. I am curious about the Lehmer-Schur algorithm as it basically seems to use a geometrical search *based on the description in Acton's book). The LS algorithm seems a bit elaborate.

I have developed a complex-plain search scheme

Is that a plain search scheme for the complex plane? Will you have a fancy search scheme for the complex plane later?

[Sorry, couldn't resist. GDR!]

Re: Need help finding info from ace math folks

*Message #5 Posted by **Namir** on 23 Aug 2010, 2:46 a.m.,*
in response to message #4 by Eric Smith

Eric,

Actually I have developed a very simple scheme in Matlab that I will translate to other languages that do not support complex math. I also have a more efficient version for languages that DO support complex math. In latter version I perform polynomial deflation and detect complex conjugate roots (when the polynomial coefficients are all real). The more advanced version can detect multiple roots, while the simple one calculates distinct roots only. Both methods work with polynomial coefficients that are real and complex.

Re: Need help finding info from ace math folks

*Message #6 Posted by **Crawl** on 24 Aug 2010, 4:22 p.m.,*
in response to message #1 by Namir

It doesn't seem like it would be too hard to implement on a TI89, which can do complex numeric integrals (I think the HP50 for some reason doesn't like it if integrals are complex).

I imagine you start with

a < real part < b

m < imaginary part < n

You believe there is one (or more) zeros in that rectangle.

Then you divide the rectangle into quarters, a to (a+b)/2 to b, and m to (m+n)/2 to n

Then you just numerically integrate f'/f around the rectangle. So, for the upper left one, it could be the sum of integrals

from a + m i to b + m i

then from b + m i to b + n i

then from b + n i to a + n i

and finally from a + n i back to a + m i

Then divide this number by 2 * pi * i. It should be an integer greater than or equal to zero. Because we're working with polynomials, there should be no poles, and the integer should equal the number of roots in the rectangle.

If the number of roots is greater than zero, quarter this new rectangle and try again.

If the number of roots equals zero, forget about this rectangle and move on to the next.

I'll see if I can whip up an example program on the TI89 later.

I can give one example that's simple enough to do by hand.

x-1=0.

Suppose the rectangle is bounded by

0<real<2 -1<imaginary<+1

In this case, f'/f = 1/(x-1)

The integral of this is log(x-1) = log|x-1| + theta * i

Along the bottom side of the rectangle, the integral will be

(log(sqr(2))- pi i / 4) - (log(sqr(2) - 3 pi i / 4)

= pi i / 2

Likewise, each other side contributes pi i / 2. So the total integral is 2 pi i. Divide by 2 pi i to get 1, the number of roots in the rectangle.

In this case, the next step, the quartering of the rectangle, will fail, because the root is exactly at the center. So all four rectangles will have zero for their winding number. But in the unlikely event that that happens, you should know that's where the root exactly is.

Re: Need help finding info from ace math folks

*Message #7 Posted by **Crawl** on 24 Aug 2010, 5:08 p.m.,*
in response to message #6 by Crawl

Actually, I'm not even sure if the TI89 likes to do numeric complex integrals. I can finesse it into doing some, but I'm not sure if it's really doing them numerically, or if it's doing them exactly, then converting the exact result to a number.

I guess you could always use your own numeric integration techniques.

For the previous example, if you used either the trapezoidal rule or the midpoint rectangle rule, with one rectangle / trapezoid on each side, then each side would give an approximate integral of i. Then the whole loop integral would be 4i, and the winding number would be 2/pi ~ 0.6. That's not exactly 1, but I guess your program could be prepared for approximations like that.

Re: Need help finding info from ace math folks

*Message #8 Posted by **Namir** on 24 Aug 2010, 8:04 p.m.,*
in response to message #6 by Crawl

Crawl,

Can you rewrite your pseudo-code using indentations, loops, and decision making constructs?? It looks very interesting.

Of course a TI-89 example will be splendid since it will spell out things more clearer than pseudo-code.

Thanks!

Re: Need help finding info from ace math folks

*Message #9 Posted by **Crawl** on 25 Aug 2010, 8:24 p.m.,*
in response to message #8 by Namir

Okay. I think I'll try it for the HP50g after all, since it looks like with either calculator I'd have to numerically integrate.

My batteries are dead, though, and I'm charging rechargeables for it as I type (the first time I'll try that). So I won't be able to get around to it until tomorrow at the earliest.

Re: Need help finding info from ace math folks

*Message #10 Posted by **Crawl** on 27 Aug 2010, 12:05 p.m.,*
in response to message #9 by Crawl

Update: Looks like I might have to go back to the TI89. I can't figure out for the life of me how to do complex integration on the Hp50g (not counting "making my own routine" as an option -- I don't want to do that much work)

I figured out how to do it on the TI89, though.

Say you want to integrate e^(-x^2) from -1+i to 1+i. (You can be sure the calculator isn't doing this symbolically, since that would be impossible)

Just change it to

e^(-(x+i)^2), from -1 to 1. Then it works.

It seems as though the problem the TI89 has is with complex arguments in the LIMITS, so if you can avoid that (it doesn't matter if the integrand is complex), you can make it work.

I'm a little annoyed by this since I prefer programming on the HP50g, but whatever.

Re: Need help finding info from ace math folks

*Message #11 Posted by **Namir** on 27 Aug 2010, 2:57 p.m.,*
in response to message #10 by Crawl

Thanks Crawl!

I am going to try to code some of cubic routines on the HP50G next ewek. I think I have come across some bugs in Matlab since two functions that use basically the same equations (expressed

somewhat differently) give different results IN SOME CASES!!!

I would like to see if the 50G can do the job AND does not show similar bugs.

Namir

Re: Need help finding info from ace math folks

*Message #12 Posted by **Crawl** on 27 Aug 2010, 5:45 p.m.,*
in response to message #11 by Namir

If you're interested in cubic equations, I posted a solution to the quartic equation (and the cubic) for the HP50g here. It works for symbolic or numeric input. I believe it has no bugs, but if you could find one I'd be interested.

Some day I might enter the simplified (from Mathematica) solution to the quartic into the HP50g.

Okay, I have to go back to the HP for the other thing. I figured out how to do complex integrals on it. Not only do the limits need to be real, the integrand does, too. But if you put a complex integrand in the RE() or IM() functions, it'll work.

On the other hand, the roadblock I was running into on the TI was that f(x+i)->g(x) doesn't work. Let's say f(x) = 1/(x-1), like in the earlier example. Then obviously what you want is g(x)=1/(x+i-1). However, what you actually get is g(x)=f(x+i). In other works, it doesn't evaluate the function f before making the assignment to g. You obviously could do that manually in normal calculator mode, but since program mode doesn't work the same as calculator mode (that's the advantage to programming in RPL), I don't know a workaround.

Re: Need help finding info from ace math folks

*Message #13 Posted by **Crawl** on 27 Aug 2010, 11:26 p.m.,*
in response to message #12 by Crawl

And ... it's done! And I checked it with at least one example.

You can download the programs from here. WIND calculates the Winding Number of the curve on the given rectangle for the given function. LEHMER is the main program, and each time it's run it quarters the previous rectangle.

First, you need to define F(X) to be f'(x)/f(x), with f(x) the function you're trying to zero.

In our example, f(x)=x^4-2*x^2+10. Then F(X)=(4x^3-4x)/(x^4-2*x^2+10)

I so happen to know that the exact solution to this equation is x = sqrt(1+3i)~1.442+1.0397i. Let's say that we know the solution is between x = 1+i and 2 + 2i.

So, you put those numbers on the stack. I believe that I intended the lower left corner of the rectangle to be on the stack first, but I also think I tried to make the program work even if the numbers were reversed.

Then just press LEHMER to iterate.

This is what it looks like:

The program assumes that there is one, and only one, root in the given rectangle, and also no poles. The case for which multiple zeroes are in the rectangle can be left as an exercise for the reader.

One thing you'll note about this program (really the method's fault more than my programs): It is INCREDIBLY slow! And somewhat error prone. I would definitely not recommend using it on a real HP50g. I did, and the first iteration took about a half an hour. Even on an emulator, it seems as when you approach the root, the integrations become slower. For the GIF I posted, even on an emulator, the last iteration took quite a while. So be forewarned.

Also, the first time I tested it, I checked to make sure the calculated winding number was within 0.1 of 1. It ran for a while, and terminated with "ERROR". I single stepped through the program, and the calculated winding number was something like 1.15. So I changed the margin of error to 0.3. It still should have to be closer to 1 than 0.

I don't know if this method has much use. It seems to me to be much worse than bisection for real numbers -- and bisection is a pretty poor algorithm. At least bisection is robust -- if there's a root in the interval, you're almost guaranteed to find it. This method has all kinds of problems.

If it's of any help, in my copy of "Numerical Recipies 3rd Ed.", for a detailed description of Lehmer-Schur it refers me to "Newton Methods for Nonlinear Problems" (P. Deuflhard, pub. Springer 2004).

Re: Need help finding info from ace math folks

*Message #15 Posted by **Namir** on 24 Aug 2010, 7:37 p.m.,*
in response to message #14 by megarat

The Deuflhard books looks interesting (and so is it's price). I may bite the bullet and buy it.

I have been a fan of solving nonlinear equation since the mid 70s. I have always focused on non-polynomial functions and solved for real roots. Armed with Matlab, RPL, and other piece of software, solving for ALL roots of polynomial now seems possible. So I am cataloging iterative and non-iterative methods to solve for the roots of polynomials. The Matlab roots() function is a good tool to check my code, since it yields all of the roots of a polynomial. I think the roots() function is based on the Jenkins-Traub algorithm.

HP-97S External Printer?

*Message #1 Posted by **Katie Wasserman** on 22 Aug 2010, 12:03 p.m.*

I've never seen one of these before but it looks to have been professionally made.

What's really curious about this is that the 97s has no obvious way of using this as printer since it has only 4 flag bits for output. All the other pins on that 50 pin connector are for input with a couple of handshaking lines. Is this auction just wrong about the printer plugging in to the 97s i/o pod?

Re: HP-97S External Printer?

*Message #2 Posted by **Bill (Smithville, NJ)** on 22 Aug 2010, 3:04 p.m.,*
in response to message #1 by Katie Wasserman

Katie,

If you look down the listing, he shows it hooked to a BCD Interface box and then to the HP-97. Check his other listings. He has a HP-97S with the BCD interface listed as a separate auction. From the photos, on the other listing, it looks like the BCD interface box is hard wired to the 97S. A shame he didn't list the entire package as a single listing. You need to win both auctions to have a complete working printer/interface/97S.

Bill

Re: HP-97S External Printer?

*Message #3 Posted by **Katie Wasserman** on 22 Aug 2010, 6:36 p.m.,*
in response to message #2 by Bill (Smithville, NJ)

Bill,

I think that the "BCD interface box" mentioned is the 97s i/o pod. The 97s came with the i/o pod hard wired to the 97, that's what the "s" indicated. The 4 flag lines for output and all the input pins are on the 50-pin connector of the i/o box. Unless there is some addition equipment not shown it appears as though this external printer plugs into the i/o pod of the 97s and that's what seems so strange to me.

I may have to bid on this for a chance to see what it's all about.

-Katie

Re: HP-97S External Printer?

*Message #4 Posted by **BobVA** on 22 Aug 2010, 10:30 p.m.,*
in response to message #3 by Katie Wasserman

That's fun to think about. A couple of possibilities:

- It really isn't for output from the 97S, but rather is supposed to echo data sent *to* the 97S; i.e. it's

listening on the 97S input bus and printing the data. Why? Perhaps for record or debug purposes? Or, if the measured parameter was intended to be included with whatever thing was being tested/measured as part of its documentation, the ink-printed paper would have been a lot more durable than the thermal print from the HP.

- You could, of course, use the four lines to shove out characters in two or three bit nibbles (using one line as a data strobe), or asynchronously using all four lines. That could then be buffered by the printer until a special "print" byte was received (or, if using two bit nibbles for data, a "print" line was strobed). But doing that AND using those lines for other signaling (for normal input via the pod) would be a mess. Seems pretty elaborate, but I guess if you needed ink hardcopy...

Separate topic: Thanks again for posting on the AAA battery pack trick for classic HP's. (Rather than glue on contacts I used some adhesive copper foil which seems to be working OK and made for a fast build.)

Regards, Bob

Re: HP-97S External Printer?

*Message #5 Posted by **Bill (Smithville, NJ)** on 23 Aug 2010, 6:37 a.m.,*
in response to message #3 by Katie Wasserman

Katie,

Thanks for the clarification on the 97s and it's i/o pod. I wasn't that familar with the 97s version. If you win the auction, please let us know of your conclusions on how it could work.

Bill

Re: HP-97S External Printer?

*Message #6 Posted by **Katie Wasserman** on 23 Aug 2010, 10:16 a.m.,*
in response to message #5 by Bill (Smithville, NJ)

I made a minimum bid and didn't win the auction, I hope that whoever was the winner reads this forum and will tell us about it. But, I agree, we might have more fun by continuing with Bob's speculations.....

I think that there must be some other input to this printer box. If so, the printer might indeed be there just to echo the input while the HP-97 crunches it. Sending data 2, 3 or 4 bits at a time via the flag lines would be painfully slow.

> Quote:
>
> Separate topic: Thanks again for posting on the AAA battery pack trick for classic HP's. (Rather than glue on contacts I used some adhesive copper foil which seems to be working OK and made for a fast build.)

Actually what I did was to melt the added beryllium-copper contacts into the plastic of the battery holder. But your solution seems just as good as long as the foil is pretty thick and can take some abuse.

Re: HP-97S External Printer?

*Message #7 Posted by **Michael Meyer** on 23 Aug 2010, 7:17 p.m.,*
in response to message #6 by Katie Wasserman

I've used adhesive copper foil strips that are sold in rolls to wire doll houses. Well, I'm actually on my first and only roll. They're thick enough to be soldered, etc. There's even a different shade on the positive and negative foil, but, of course, since they run next to each other in parallel, I have to cut them apart. Perfect for HP classics, thin connections in Spices, etc.

HP 9845A vs 9845B vs 9845B/A

*Message #1 Posted by **Mike** on 22 Aug 2010, 10:51 a.m.*

I have a very nice and nearly perfect 9845A. The printer is the only thing less than ideal. A few of the dots are not working (in just one area).

I bought a junker 9845B, in hopes that between the two, I could get my printer back to 100%.

When the 9845B arrive, it was marked 9845B/A. The A was hand labeled. Also, the ROM drawers have Brown and Red colors, which is what was used on the "A". And they have the OS in them. I believe the B has them internal and not in ROM drawers.

Is this likey an in between model. Or is it more likely that they keyboard might just have been swapped and remarked to show that it's actually an "A".

There is no monitor on the new unit so I can't really test it. I hesitate to put my great 9845A monitor on it, for fear that something might damage my nice monitor. I tried typing PRINTER IS 0 and then typing something on the keyboard, to see if the printer works. But I get nothing. It might be because the monitor is missing. Anyone know if the monitor being removed will keep the 9845 from starting and running (minus the display however)?

Anyone familar with these, to know what might be going on here, **with the B/A lableing**? I don't have time to disassemble it just yet.

Edited: 22 Aug 2010, 10:54 a.m.

Re: HP 9845A vs 9845B vs 9845B/A

*Message #2 Posted by **Tony Duell** on 23 Aug 2010, 4:44 a.m.,*
in response to message #1 by Mike

To answer the last part first, I believe you do need a monitor on a 9845 for it to work. There is some synchronisation signal sent back from the monitor, and the processors get somewhat confused without it. HP actually made a 'turnon fixture' for the 9845 (I am not talking about the one for the colour monitor) that would allow you to power the machine up without a monitor for testing. Good luck in finding that!

I don't know the 9845A very well (not having got one), but AFAIK the easiest way to tell the -A from the -B or -C (the latter 2 are very similar) is to remove the cover (it takes a few minutes max) and look at the processors. If you have a PCB with 2 HP hybrid processors (in the big metal heatsinks nicknamed 'Honda Heads' :-)) on one PCB it's a -A . If you have the 2 processors on separate PCBs, one at each side of the machine, it's a -B or -C. And if you have just one hybrid processor module on a PCB at the left and a set of 3 PCBs connected by a little backplane on top at the right, then you are lucky enough to have a -B or -C opt 200 (high speed language processor).

HP71B Demo Program

*Message #1 Posted by **Jerry Raia** on 21 Aug 2010, 9:46 p.m.*

When I first got into all of this I worked at an HP dealer. I found on a tape a demo program that HP made that runs on the 71. It starts with the HP logo and a little man running across the screen. then goes on to describe the features of the "new" HP71. It's pretty cool to watch it. There was also a little memory game that you can run too.

I miss the old HP

HP71B - My favorite HP

*Message #2 Posted by **Mike** on 22 Aug 2010, 10:38 a.m.,*
in response to message #1 by Jerry Raia

I wonder if I have a copy of the program. It's probably in the LIF archive somewhere.

I have owned over 200 of these devices over the years. I'm down to 3 right now, I think. Well, 3 that work. I probably have a dozen or so in various states of decomposition. The most I ever bought at one time was 24. .

I love the HP-71B. In my opinion, it is the best handheld that HP ever made. I still use one at work. I have owned almost every handheld that HP ever produced. The HP 71B and the HP 41 were two calculators that I drove from Seattle to Corvallis, on the day of release, to get one. I still remember having to beg one of the sales staff to take one home and I'd pick it up at his home, since I couldn't get there before they closed. He obliged. :-) Direct from HP. That was service. Those days are gone. .

in response to message #4 by Diego Diaz

If anyone wants to send me a tape I can do likewise. I wish I still had the 9114 floppy drive.

I'm down to 24 of those.

24 tapes or 9114 drives? :)

HP 50g SD card reader problem

*Message #1 Posted by **JJB299** on 21 Aug 2010, 8:29 p.m.*

The card reader on my 50g always thinks the card is "write protected" and gives an error when trying to format the SD card or paste into the SD card directory.

So.. I tried to fix it. Unsuccessfully.

But I have some really cool pictures of the inside of the 50g.

Does anyone know what pins or wires need to be connected/disconnected so a card reader disables the write protection? I can send images if needed.

I've tried a few different configurations without success (and without frying the calculator, so I guess that is a small victory).

Thanks. -Justin

Re: HP 50g SD card reader problem

in response to message #1 by JJB299

Hi, JJB299;

please, forgive me if the questions seem silly, I do not mean to:

1 - have you tried with different Secure-Data cards?
2 - what is the size of the SD card you are using?
3 - Brand?
4 - Have you used the SD card elsewhere?

I just want to figure out possible reasons hence applicable solutions. I used many cards in my HP49G+ and HP50G (three units), all of them from 256MB to 2GB (this one checks only 1GB, discussed here some months ago). Apart of not being able to 'see' more than 1GB (I successfully tried two different SD cards, different brands), I had no problems formatting/writing with the HP50G.

One 'last minute' possibility: have you tried to update, if applicable, the O.S.?

Success!

Luiz (Brazil)

Re: HP 50g SD card reader problem

*Message #3 Posted by **JJB299** on 22 Aug 2010, 1:06 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

I found the problem! To answer your questions, yes I've tried all of those points. The card is a lowly 256MB, but the card wasn't the cause.

The card reader assembly inside of the calculator had a bad contact. I was focusing on the upper portion of the card reader near the SD card contact. But the problem was a contact on the lower left corner of the card reader (when facing the back of the calculator with the case open). I'll try to recreate it here (view with Courier font):

|| | | | | | | | | (top pins into board) _____ | | | SD card reader |
~~~~~~~~~~~~~~~~~~~~~~ (break) | | |*_____|

* = bad contact near bottom of calculator.

I couldn't manage to solder it on, since the original contact was adhesive and the solder wouldn't stick. I just tried to hold it against the board contact with padding. After that, the card formatted and wrote just fine.

Hope this helps someone else with the same problem. P.S. Not for the faint of heart (look for how to disassemble a 50g on Y**Tube). It looks painful, but the screen went back on fine.

-Justin

Hi;

about the 'write lock': you could try with an empty SD card adapter and safely measure which terminals are shorted while opening/closing the 'write lock' switch.

Success!

Poking a string directly into the 71B as a lex file problems

*Message #1 Posted by **Jerry Raia** on 20 Aug 2010, 1:10 p.m.*

Ok here is what I am trying to do. I want to poke a lex file into the 71B as just a plain string not using the pokelex basic program. I assembled the lexfile on my pc. All this lex file does is display the number one (this is the sample in the 71B forth/assembler rom manual). I have the file length correct when I make the dummy file. When I poke the string into the 71B directly on top of the Dummy file as the pokelex program does it creates it fine. The keyword even works and displays the "1" but the file chain must be getting trashed because after that I can no longer create a new file. When I do a CAT ALL the files are all there until I get to the end of the list, then I get strange characters and I have to reset the 71B (INIT:3).

Here is how I'm doing this on the 71b:

```
CREATE TEXT DUMMY,34 ! LENGTH REPORTED BY THE DUMPLEX PROG AS WELL
DIM F$[100] ! ACTUAL LENGTH OF STRING
A$=ADDR$('DUMMY')
ENTER 1; F$ ! GETS THE STRING FROM THE PC VIA THE RS232 INTERFACE
POKE A$,F$
```

I know the string I'm trying to poke is correct and matches what the dumplex program shows. What am I missing here? any ideas?

*Message #2 Posted by **J-F Garnier** on 24 Aug 2010, 12:38 p.m.,*
in response to message #1 by Jerry Raia

You are corrupting the file chain with this method. A cleaner way is to encapsulate your LEX file with a LIF header, and do a "COPY :1", the HP-71B will take care of the file chain.

I made such a tool: aLIFhdr (add LIF header), available in my JPC ROM page here

*Message #3 Posted by **Jerry Raia** on 25 Aug 2010, 4:50 p.m.,*
in response to message #2 by J-F Garnier

Yes thanks I figured thats what I was messing up. I did find a way and that was to add NIBHEX 00000 to the end of the source file. The dummy text file has a FFFFF at the end which was not being accounted for. I'm sure you already knew that. I will your try your solution as it is cleaner. Thank you for the link! :)

BTW any change of seeing emu71 on 64 bit windows, or perhaps making the source code available?

I cant copy anything except a string of ascii characters to my HP71. So I had to use this method. I'll use the sample lex file from the Forth/Assembler ROM manual:

```
0003 00000 B4549575          NIBASC 'KEYWORD '
     00008 F4254402
0004 00010 802E              NIBHEX 802E      file type lex
0005 00014 00                CON(2) 0         flags and copy code
0006 00016 82                CON(2) #28       * creation time
0007 00018 90                CON(2) #09       *
0008 0001A 20                CON(2) #02       * creation date
0009 0001C 80                CON(2) #08       *
0010 0001E 01                CON(2) #10       *
0011 00020 94000             REL(5) FiLeNd    offset to next file
0012 00025 D5                CON(2) #5D       flex file ID
0013 00027 10                CON(2) 001       lowest token
0014 00029 10                CON(2) 001       highest token
0015 0002B 00000             CON(5) 0         next lex table link
0016 00030 F                 NIBHEX F         no speed table
0017 00031 7100              REL(4) 1+TxTbSt  text table offset
0018 00035 0000              CON(4) 0         no msg handler
0019 00039 00000             CON(5) 0         no poll handler
0020 0003E                   * * * M A I N   T A B L E * * *
0021 0003E 000               CON(3) (TxEn01)-(TxTbSt)
0022 00041 41000             REL(5) FNCT      Keyword code starts at this label
0023 00046 F                 CON(1) #F        The keyword is a BASIC function
0024 00047                   * * * T E X T   T A B L E * * *
0025 00047           TxTbSt
0026 00047           TxEn01
0027 00047 5                 CON(1) 05
0028 00048 F4E454            NIBASC 'ONE'     This keyword is called "ONE"
0029 0004E 10                CON(2) 1
0030 00050 1FF               NIBHEX 1FF       End of BASIC keyword tables
0031 00053 00                NIBHEX 00        Minimum and Maximum number of parame
0032 00055 AF2       FNCT    C=0    W         Clear register C
0033 00058 2E                P=     14        Point to most signifcant digit in C
0034 0005A 301               LCHEX  1         Load a hex 1
0035 0005D 8D612F0           GOVLNG =FNRTN1   Send result to the system
0036 00064 00000             NIBHEX 00000     Padding for copy to 71B
```

Notice the padding at the end. This makes the file big enough to cover the end of the dummy text file which is FFFFF and not included in the size of the text file in bytes. Now I can copy the string to the 71 and run this basic program. It's sloppy but it works. I'm sure there are better ways to do this.

```
10 DESTROY ALL
20 INPUT "LENGTH? ";L  ! Length of Lex String
30 DIM F$[L]
40 SFLAG -23
50 ENTER :1 ;F$        ! Get string from RS232 Interface
60 T$=F$[33,37]        ! Get length of lexfile after header
70 T=HTD(REV$(T$))
80 N=IP((T-4)/2)       ! Compute size of Dummy file
90 CREATE TEXT DUMMY,N
100 A$=ADDR$('DUMMY')
110 POKE A$,F$         ! Poke it over the Dummy file
120 DISP "DONE!"
```

Some 30b Routines

*Message #1 Posted by **Jeff O.** on 20 Aug 2010, 1:02 p.m.*

In the absence of a complete repurposing of the 30b, I decided to come up with a set of key reassignments and/or programs to make the 30b more easily useable (to me, at least) as a scientific calculator. I decided to implement the following functions in the 10 available program slots:

SIN^{-1}

COS^{-1}

TAN^{-1}

Complex add
Complex subtract
Complex multiply
Complex divide
Complex Invert
Polar to Rectangular Conversion
Rectangular to Polar Conversion

Complex numbers and Rectangular to Polar functions are based on the (old) paradigm of representing a complex number in rectangular form with the real in stack-x and the imaginary in stack-y. Stack-z and stack-t hold the second complex value for add, subtract, multiply and divide, with the 4-level real stack considered a 2-level complex stack. Complex invert preserves the stack-z and stack-t values. The polar to rectangular routine also preserves the stack so you can enter a complex rectangular value, then enter a complex polar value, convert it to rectangular form and then add, subtract, multiply or divide with the first value. R->P and P->R work in both radians and degrees mode. All programs display a message when complete to announce the function just executed. I also put the same message as step 1 to act as a program label for several of the routines, but did not have enough room to do so for all. I did not really attempt to optimize the programs - once I got them working with all routines fitting in memory, I stopped. I'm sure there is room for improvement. I'd like to have enough room to add the program labels to all programs, but I'll leave that as an exercise for the reader.

I wish the 30b had 10 more program slots and maybe double the memory so I could move a few more functions to the keyboard and create some additional routines.

```
Prgm 0

in response to message #1 by Jeff O.

Good job!

The assignment programs for the inverse trig functions are in one of the learning modules for the 30b.

If you haven't seen those, they are available at the link that Tim Wessman set up.

Not sure WHY they aren't available on HP's website somewhere.

> ```

You might consider the following formula:

$$\tan(t/2) = \frac{\sin(t)}{1 + \cos(t)} = \frac{r \sin(t)}{r + r \cos(t)} = \frac{y}{r + x}$$

1. r = 0: t = 0
2. r + x = 0: t = 180 (or Pi)

3. `else:  t = 2 atan(y/(r+x))`

It makes the program somewhat shorter:

```
Prgm 8
Program Description:    Rectangular to Polar Conversion

Step    function        comments
0       IRR             assign to the IRR key
1       message R->P    Program label
2       STO 1           store real component
3       x^2             square real component
4       ) Swap          swap squared real component and imaginary component
5       STO 2           store imaginary component
6       x^2             square imaginary component
7       +               add squared imaginary component
8       square root     take square root to calculate magnitude
9       STO 3           store magnitude
10      GF 02           branch to end if magnitude = 0
11      RCL + 1         add real component: r + x
12      GF 01           branch if magnitude + real component = 0
13      RCL 2           imaginary component: y
14      ) Swap          swap y and r + x
15      /               divide to calculate tangent of half-angle: y / (r + x)
16      Math            execute TAN-1 function
17      Input           execute TAN-1 function
18      Up              execute TAN-1 function
19      Input           execute TAN-1 function
20      2               enter two
21      *               multiply half-angle by 2 to get angle
22      Gto 02          branch to end
23      Lbl 01          Routine to handle magnitude + real component = 0 part
24      1               enter 1
25      -               subtract 1 from 0 leading to -1
26      Math            execute COS-1 function to obtain 180 (or Pi)
27      Input           execute COS-1 function to obtain 180 (or Pi)
28      Up              execute COS-1 function to obtain 180 (or Pi)
29      Up              execute COS-1 function to obtain 180 (or Pi)
30      Input           execute COS-1 function to obtain 180 (or Pi)
31      Lbl 02          Label for branch in steps 10 and 22
32      RCL 3           recall magnitude
33      message R->P    displays R->P upon completion
34      Stop
```

As I don't have a 30b I can't test the program nor can I show the amount of bytes and the checksum. However I like your style of commenting each line very much and tried to preserve it.

Kind regards
Thomas

Re: Some 30b Routines

*Message #4 Posted by **Jeff O.** on 23 Aug 2010, 12:36 p.m.,*
in response to message #3 by Thomas Klemm

Thomas,
Thanks, that is a much more elegant method and a major improvement in program length. When I entered your program as listed above, it did not function properly. Since you do not have a 30b, did you realize that the "GF" statements in step 10 and step 12 consume the value in stack-x? I added a couple of steps (Input function in steps 10 and 13) which I believe will fix this issue and ran some tests. All seems well now, the program seems to handle all cases. I like the way it normalizes angles over 180 to be negative, and handles an input of 0, 0 (which my version did not handle). But I may have missed something, so please feel free to review to make sure it will still work as you intended. The revised listing is below.

> Quote:
>
> ... I like your style of commenting each line very much and tried to preserve it.

Thanks, I'm glad you like it, although I don't think I can take credit for inventing it. :-)

Best regards,
Jeff

```
Prgm 8
Program Description:    Rectangular to Polar Conversion
Bytes and checksum: 57.255
Step        function        comments

> Since you do not have a 30b, did you realize that the "GF" statements in step 10 and step 12 consume the value in stack-x?

Oops, I forgot that in this aspect the 30b behaves more like RPL. So it's necessary to DUP the top of the stack using "Input" before executing "GF". This makes two additional lines. Mmh, let me see how we could get rid of them:

Remove the following two lines:

```
26      1               enter 1
27      -               subtract 1 from 0 leading to -1
```

Shift lines 22-23 down to LBL 02:

```
33      Lbl 02          Label for branch in steps 11 and 24
22      2               enter two
23      *               multiply by 2
34      RCL 3           recall magnitude
35      message R->P    displays R->P upon completion
36      Stop
```

Of corse the line numbering has to be adjusted.

However now the program might lack some clarity. Why do I have to multiply 0 by 2, you may ask. Well, it just doesn't hurt.

Best regards
Thomas

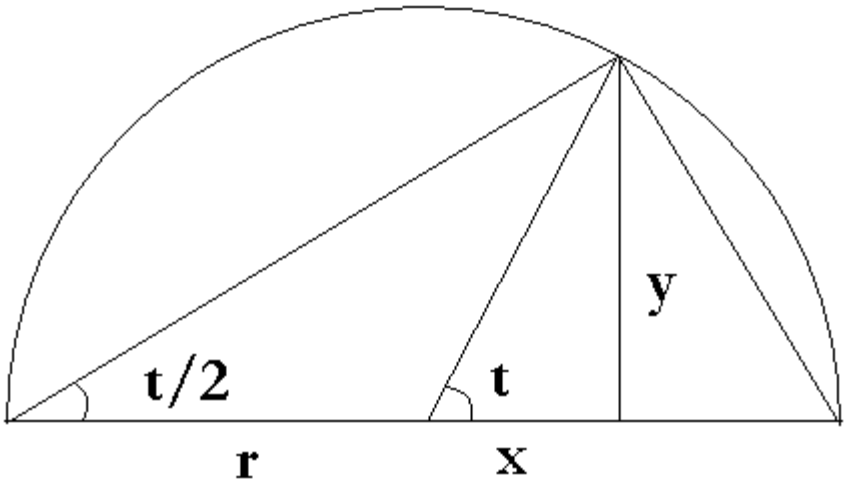
I'm afraid I've come to an end. All I can offer is a sketch that hopefully makes the formula plausible:

$$\tan(t) = \frac{y}{x}$$

$$\tan(t/2) = \frac{y}{r + x}$$



Cheers
Thomas

Re: Some 30b Routines

*Message #8 Posted by **Jeff O.** on 24 Aug 2010, 8:07 p.m.,*
in response to message #7 by Thomas Klemm

I looked up half-angle formulas to verify your method (for my own information, I did not doubt that you were correct.) The diagram shows nicely why it is true.

> Quote:

> I'm afraid I've come to an end.

Feel free to tackle the others. The improvements to R->P allowed me to label all but two routines, but I need a few more bytes to label COS^{-1} and TAN^{-1}

...

Jeff, I think STOP's at the end of programs are optional. Get rid of them and see if it still works, I suspect it will. Might give you a few bytes.

Don

Re: Some 30b Routines

*Message #10 Posted by **Jeff O.** on 24 Aug 2010, 8:52 p.m.,*
in response to message #9 by Don Shepherd

The programs work, but is that "poor programming practice"? :-)

However, I still need one more byte.

Re: Some 30b Routines

*Message #11 Posted by **Katie Wasserman** on 24 Aug 2010, 9:26 p.m.,*
in response to message #10 by Jeff O.

You really don't need the first message step in each program since they only serve to remind you which function is in which memory slot when you are in program mode. Your keystroke assignment in step 0 is probably a good enough reminder.

Re: Some 30b Routines

*Message #12 Posted by **Jeff O.** on 25 Aug 2010, 10:23 a.m.,*
in response to message #11 by Katie Wasserman

> Quote:
>
> You really don't need the first message step in each program..

I agree that I don't *need* them, but I do *want* them. It's nice to be able to scroll through the program list and see the labels instead of "Prgm 0", Prgm 1", etc. Besides, now it's personal - the classic challenge to fit what you want in the available memory. (Strange that we have this challenge with a new machine

in 2010...)

> Quote:
>
> Your keystroke assignment in step 0 is probably a good enough reminder

The message I put as the last step to be displayed after the program runs is an even better reminder :-)

...

*Message #13 Posted by **Katie Wasserman** on 25 Aug 2010, 11:45 a.m.,*
in response to message #12 by Jeff O.

> Quote:
>
> (Strange that we have this challenge with a new machine in 2010...)

Although I like these kinds of challenges there should be little need for them these days considering how cheap memory is. I understand HP's requirement to stick to a single processor capable of running the LCD directly, that has a low quiescent current draw, enough ROM, etc.. This Atmel processor fits the bill on that account, it's a good choice for a non-programmable calculator. But a programmable calculator needs more memory and this chip should be supplemented by some external RAM at least.

Re: Some 30b Routines

in response to message #13 by Katie Wasserman

Agreed!

Re: Some 30b Routines

*Message #15 Posted by **Thomas Klemm** on 25 Aug 2010, 3:44 a.m.,*
in response to message #8 by Jeff O.

Jeff, you could try the following:

```
Prgm 5
Program Description:    Multiply two rectangular form complex numbers

Step    function        comments
0       SH*             assign to shift-hold x
1       message CPLX*   Program label
2       Lbl 04          Program label for call from divide routine
3       STO 1
4       ( Rv            Roll down
5       STO 2
6       ) Swap
7       STO * 1
```

```
8       *
9       ( Rv            Roll down
10      STO * 2
11      ) Swap
12      ( Rv            Roll down
13      *
14      +
15      RCL 1
17      RCL - 2
18      message CPLX*   displays CPLX* upon completion
19      RTN             Return for Call
```

If I counted correctly this saves 6 bytes. Not much, but maybe just enough.

Cheers
Thomas

Interesting idea for a calculator (non-HP, non-RPN)

*Message #1 Posted by **Bruce Bergman** on 20 Aug 2010, 3:00 a.m.*

Mind you, this is just your basic $10 desk calculator, but it DOES have a very interesting twist to it. I can see this would be very useful if you were routinely calculating numbers and showing people the results. Anyhow, check it out:

Interesting calculator

Thanks,

Bruce

11C Keyboard Rattle

*Message #1 Posted by **Dallas Osborne** on 19 Aug 2010, 11:42 a.m.*

If someone with an 11C-ish model could do me the courtesy of giving it a gentle little shake like you are fanning yourself with it?

Do the keys rattle a bit in their sockets?

Re: 11C Keyboard Rattle

*Message #2 Posted by **Allen** on 19 Aug 2010, 6:47 p.m.,*
in response to message #1 by Dallas Osborne

Some of them rattle a little, some do not. I'd only be concerned if one or two keys alone (usually the ENTER) rattles but the others on the same machine don't.

Re: 11C Keyboard Rattle

*Message #3 Posted by **Jon S Canale** on 19 Aug 2010, 7:52 p.m.,*
in response to message #2 by Allen

Yes, seems like one or two keys rattle. Seems like the enter and the 6 key.

Use it every day - haven't noticed any problem.

Re: 11C Keyboard Rattle

*Message #4 Posted by **Dallas Osborne** on 21 Aug 2010, 8:04 a.m.,*
in response to message #1 by Dallas Osborne

Thanks folks! Everything works of course, but I am less worries now about what seemed to sound like a mass exodus of my keys.

Unit conversion on the 50G

*Message #1 Posted by **Jim Creybohm** on 19 Aug 2010, 3:49 a.m.*

Does anyone know an easier method for converting units on the 50G? Here is the process I have found thus far:

Enter the first number

select orange "units"

select correct unit (say, degrees C)

Enter a 1

select the second unit (to convert to say, degrees F)

Press white "convert"

-> Units -> tools -> convert

Coming from the 41, I find this a little bit of a challenge for a fairly simple process. And I haven't even tried variations of units such as hogsheads per fortnight!

Does anyone know of an easier method to do this? Am I doing this correctly?

Re: Unit conversion on the 50G

*Message #2 Posted by **Ralf Fritzsch** on 19 Aug 2010, 5:24 a.m.,*
in response to message #1 by Jim Creybohm

Do it the plain old HP48 way.

- make sure you use RPN mode
- use Soft MENU rather than CHOOSE boxes (flag 117)

and then:

- select orange "units"
- press NXT then soft key F6 (labeled TEMP)
- enter a 1
- press soft key F1 (labeled °C)
- press left (white) shift, then soft key F2 (labeled °F)

and you get the converted temperature 33.8_°F

Hope that helps,
Ralf.

Re: Unit conversion on the 50G

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 19 Aug 2010, 5:30 a.m.,*
in response to message #1 by Jim Creybohm

Hi;

I think the fastest way is through menu instead of choose boxes.

First, set flag -117 (your way)

Then:

1 - enter first number
2 - press [orange][UNITS]
3 - choose and press softkey for 'origin' unit
4 - locate 'destination' unit
5 - press [white] [destination unit softkey]

You´ll press less keys, though you must be in menu mode instead of choose boxes (I prefer so).

Hope this helps.

Luiz (Brazil)

(after editing: I decided to maintain... matter of six minutes)

Why engineers need both scientific and business calculators

*Message #1 Posted by **Martin Pinckney** on 18 Aug 2010, 11:05 p.m.*

In addition to the obvious need for TVM and date calculations, I find the % functions on scientific calculators to be woefully lacking for the kind of % calculations that I do on a regular basis. Even the 27s (my overall favorite), which has excellent TVM and date math, only has the typical scientific implementation of % math. Of course I could easily write a Solver routine, but that takes precious memory.

This is one reason why I always keep a 17b handy.

Following the recent thread on the 30b, I was gratified to see it also has the full implementation of % math, what the 17 series calls "Business" functions (%Change, %MU-cost, %MU-price, %Total). With the added bonus of the scientific functions, I can see why it has developed a big following.

Re: Why engineers need both scientific and business calculators

*Message #2 Posted by **Angel Martin** on 19 Aug 2010, 2:05 a.m.,*
in response to message #1 by Martin Pinckney

I always suspected me as not a good engineer, I guess now I know why :)

Well, I did my part to redeem myself - the SandMath module includes a %Total function, but I confess not having any inkling about the "other" percentages you mention.

Many times I found the issue with financial terms was on their insisstence to name and label every possible ratio, inverse ratio, and combination of ratios. The real problem for me wasn't to calculate what you needed to find out, but to "map out" the available ratios names to the problem in question.

Just as I said, typical of a bad engineer no doubt :)

Cheers, "AM

in response to message #1 by Martin Pinckney

%Change is on many scientific calculators already.

%MU-cost corresponds to "% +" which isn't onerous.

%Total is "SWAP / 100 *", again not too difficult.

I doubt that a decent engineer would have trouble with any of these :-) I'm not sure what %MU-price is.

Seriously, though you could say the same about many built-in functions. But isn't that the value of having a calculator with many built-in functions, to save time? Why don't we all just go back to using the HP 35, and forget about all the added utility since.

Re: Why engineers need both scientific and business calculators

*Message #5 Posted by **Norman Dziedzic** on 19 Aug 2010, 1:01 p.m.,*
in response to message #3 by Paul Dale

> I'm not sure what %MU-price is.

This is used when you want to make a specific margin on selling an item. For instance, if it costs you $20 for something and you want to make a 15% margin, you don't sell it for 20*1.15=$23.00. You have to sell it for 20/(1-.15)=$23.529.

The %MU-Price does this.

All our commissioned sales people use this type of calculation all the time. Many can do it in their heads but none of them use HP calculators :-(

Re: Why engineers need both scientific and business calculators

*Message #6 Posted by **Paul Dale** on 20 Aug 2010, 7:47 p.m.,*
in response to message #5 by Norman Dziedzic

Thanks for this. I know of this just not by the name given. Something to add to the firmware when I eventually get back to it.

Re: Why engineers need both scientific and business calculators

*Message #7 Posted by **Walter B** on 19 Aug 2010, 4:40 a.m.,*
in response to message #1 by Martin Pinckney

Do you think of something like this?

Δ%	Calculates $100 \cdot \frac{x-y}{y}$ like %CH in HP-42S.
%	Calculates $x \cdot y/100$.
%T	Calculates $100 \cdot x/y$.
%Σ	Calculates $100 \cdot x/\sum x$.
%+	Adds a mark-up of x% to y , calculating $y \cdot (1+0.01 \cdot x)$.
%–	Subtracts a discount of x% from y , calculating $y \cdot (1-0.01 \cdot x)$.

Just to be clear, I wasn't talking about the % key on the 17 series, but the % functions in the [BUS] softkey menu. I for one find them to be very useful. Am I the *only* engineer (or non-business type) on here that does?

HEPAX manual Vol. 2 reprint.

*Message #1 Posted by **Diego Diaz** on 18 Aug 2010, 11:00 p.m.*

Hi all,

I've been heavily using the copy of the HEPAX manual, and found it useful to develop my NoV's project.

However, the available copy is not very handy since it's just a scanned image.

So I've taken the time to rebuild the volume 2 (the one I use more often) and think it may be of interest to some of you.

Thanks to Ángel Martín for providing the scanned images of the covers.

The PDF file is available here.

I've tried to make it as accurate as possible, including the addendum errata, as well as correcting some known errors in the original print. Anyhow, some OCR errors may have found their path into the PDF file. Please notify if you find any.

A couple of Appendices have been removed since they are not useful any longer: "Warranty and service information" & "Addresses of User groups"

Best wishes from Spain.

Diego.

P.S. I don't use the volume 1 very often, however, if there is a general interest in having it also reprinted. I can do it (just allow a few weeks, it's a time consuming task... ;-) A good quality scan of the pictures on module insertion/extraction will also be welcome for the volume 1... :-)

Edited: 18 Aug 2010, 11:07 p.m.

Re: HEPAX manual Vol. 2 reprint.

*Message #2 Posted by **Angel Martin** on 19 Aug 2010, 2:00 a.m.,*
in response to message #1 by Diego Diaz

What a wonderful job Diego, many thanks for taking the time and effort to get this jewel avaiable to the masses (all those people programming 41 MCODE :)

Even if you never do a byte of MCODE this manual is worth reading from cover to cover, so great news it's now here, searchable and in all full glory.

Best wishes, 'AM

Re: HEPAX manual Vol. 2 reprint.

*Message #3 Posted by **Diego Diaz** on 19 Aug 2010, 5:00 a.m.,*
in response to message #2 by Angel Martin

Ha, ha... good point indeed Ángel...

Not that Dan Brown is gonna feel uncomfortable by this new Best Seller pushing him out of the "Top List"... but may his editor is about to seek my cel. number... :-))

Ok, bit more serious now, I've done that mostly for myself, and think it may be useful for the NoV's users out there who

may find easier to gaining access to M-code; even if they just give a go for the fun...

I'm glad you appreciate it.

Best from "The Canaries"

Diego

Re: HEPAX manual Vol. 2 reprint.

*Message #4 Posted by **Antoine M. Couëtte** on 19 Aug 2010, 2:02 a.m.,*
in response to message #1 by Diego Diaz

Diego,

Thank you very much for the high quality of your job.

If you happen to scan Vol. 1, I would be most happy to download a copy also.

I have an HEPAX Module and I use it now and then but I could certainly use it much better with a User's Manual.

Thank you and Best Regards

Antoine M. Couëtte

Re: HEPAX manual Vol. 2 reprint.

*Message #5 Posted by **Diego Diaz** on 19 Aug 2010, 5:09 a.m.,*
in response to message #4 by Antoine M. Couëtte

Thanks for your compliments Antoine.

Vol. 1, will more likely see the light sooner or later, although it may take a while. (I travel a lot...)

I have not the originals, and the scanned copy available is not of much quality, therefore, the pictures in the vol. 1 are not useful for a verbatim replica of the original. But that can be worked out (with a little help of some friends around here... :-))

Kind regards and enjoy your 41!

Diego.

Re: HEPAX manual Vol. 2 reprint.

*Message #6 Posted by **John Robinson** on 19 Aug 2010, 2:55 a.m.,*
in response to message #1 by Diego Diaz

Good effort Diego - a pdf of an old HP document that is searchable - Woo Hoo !! I like the way it's nicely formatted for double sided printing too.

I guess Volume 1 would be nice for completeness :-)

I wish someone would do the same for Ken Emery's book.

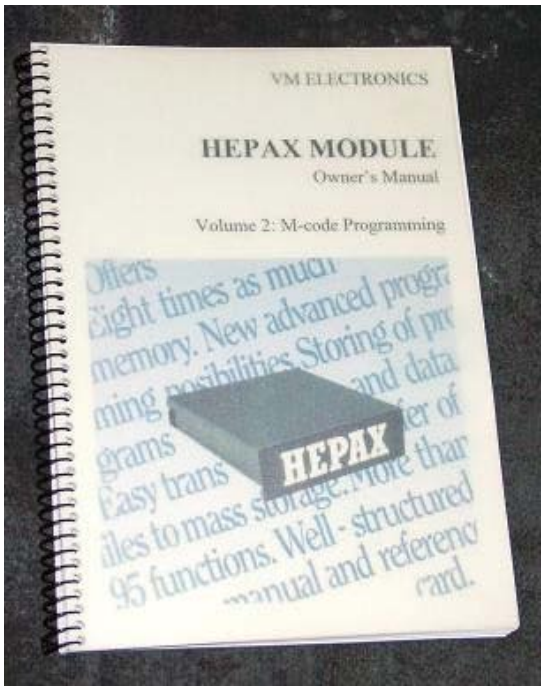
Cheers, John

Re: HEPAX manual Vol. 2 reprint.

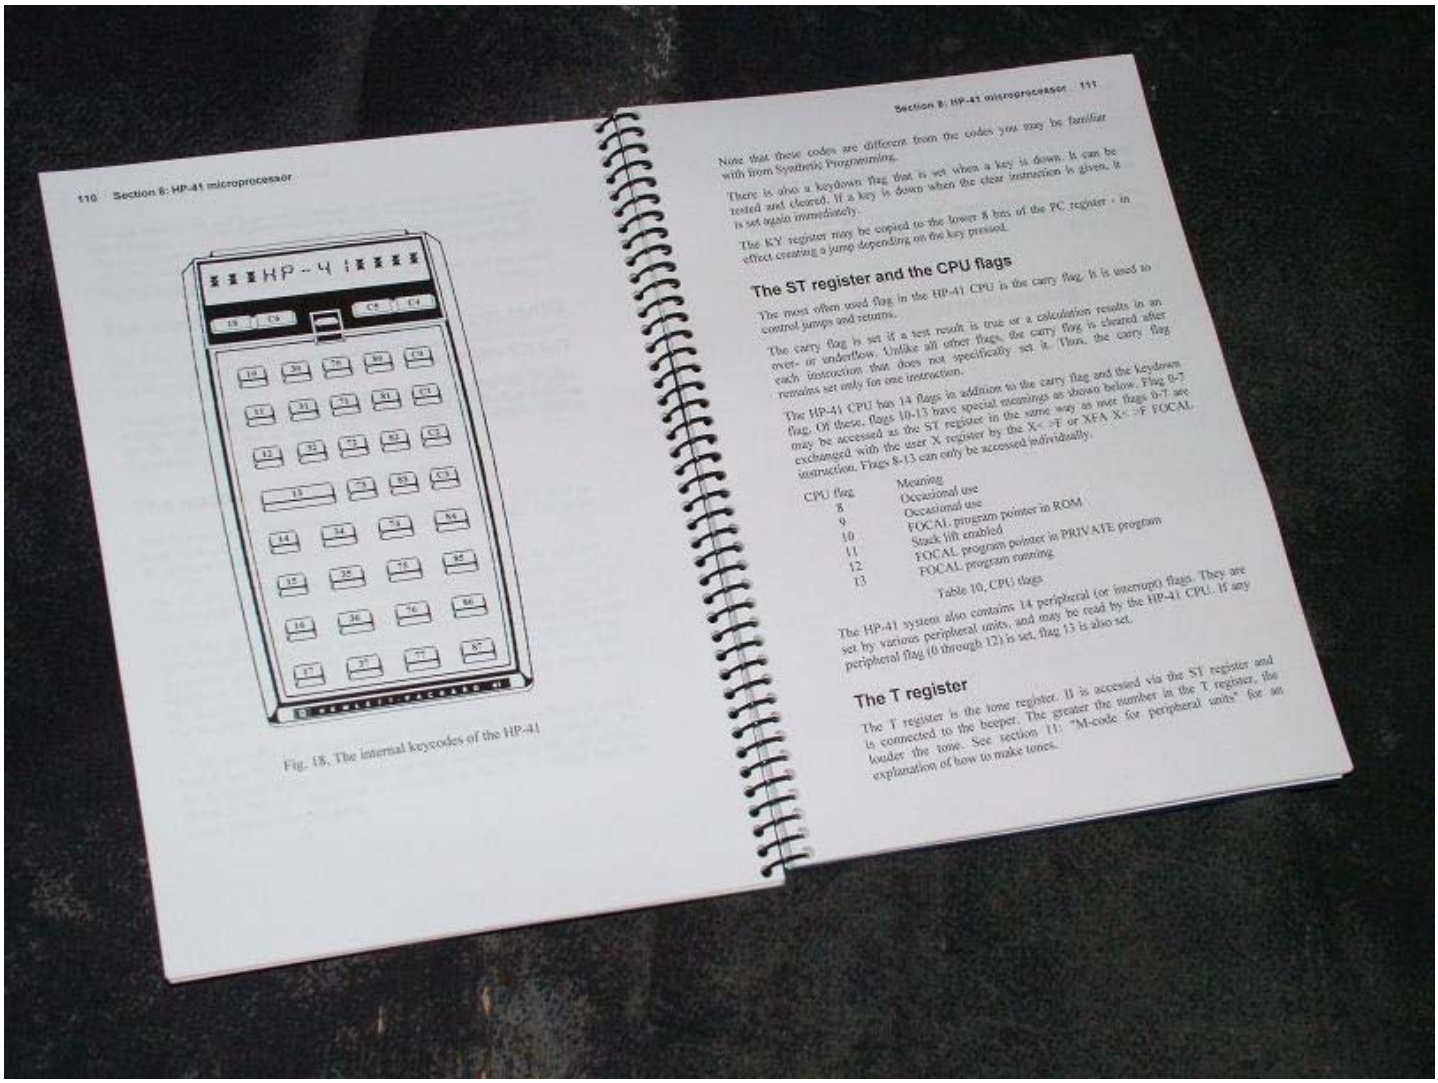
*Message #7 Posted by **Diego Diaz** on 19 Aug 2010, 4:42 a.m.,*
in response to message #6 by John Robinson

Thanks for your kind words.

This was the primary aim: a printed, good quality manual:



VM ELECTRONICS
HEPAX MODULE
Owner's Manual
Volume 2: M-code Programming
HEPAX



110 Section 8: HP-41 microprocessor
HP-41
Fig. 18. The internal keycodes of the HP-41
Section 8: HP-41 microprocessor 111
Note that these codes are different from the codes you may be familiar with from Synthetic Programming.
There is also a keydown flag that is set when a key is down. It can be tested and cleared. If a key is down when the clear instruction is given, it is set again immediately.
The KY register may be copied to the lower 8 bits of the PC register - in effect creating a jump depending on the key pressed.
The ST register and the CPU flags
The most often used flag in the HP-41 CPU is the carry flag. It is used to control jumps and returns.
The carry flag is set if a test result is true or a calculation results in an over- or underflow. Unlike all other flags, the carry flag is cleared after each instruction that does not specifically set it. Thus, the carry flag remains set only for one instruction.
The HP-41 CPU has 14 flags in addition to the carry flag and the keydown flag. Of these, flags 10-13 have special meanings as shown below. Flag 0-7 may be accessed as the ST register in the same way as user flags 0-7 are exchanged with the user X register by the X<>F or XFA X<>F FOCAL instruction. Flags 8-13 can only be accessed individually.
CPU flag Meaning
8 Occasional use
9 Occasional use
10 FOCAL program pointer in ROM
11 Stack lift enabled
12 FOCAL program pointer in PRIVATE program
13 FOCAL program running
Table 10. CPU flags
The HP-41 system also contains 14 peripheral (or interrupt) flags. They are set by various peripheral units, and may be read by the HP-41 CPU. If any peripheral flag (0 through 12) is set, flag 13 is also set.
The T register
The T register is the tone register. It is accessed via the ST register and is connected to the beeper. The greater the number in the T register, the louder the tone. See section 11: "M-code for peripheral units" for an explanation of how to make tones.

:-)

Cheers.

BTW, I've already found a few "formatting bugs"... they're *de-bugged* now.

HP-12C Clone, New?

*Message #1 Posted by **Katie Wasserman** on 17 Aug 2010, 10:16 p.m.*

I don't think this has been discussed here before...

I came across another HP-12C clone calculator on the web -- not the Victor V12 nor the Aurora FN1000 -- the Compucessory CCS 28956.

Functionally it's a modified version of the code used in the earliest version of the HP-12C Platinum. It has RPN/ALG, parenthesis, undo, and 400 program steps but only 31 cash flow registers. It adds a Cost/Sell/Margin subsystem complete with dedicated annunciators on the display. The key layout is completely different than the 12C but the unsifted/shifted function bindings are identical, with the new functions making use of non-designated shifted keys on the 12CP.

It comes in a hinged, clamshell case, which is sort of nifty but cheap. While the display is pretty large and readable with adjustable contrast, the decimal points and commas are tiny. But the real problem with this machine are the tiny keys making the overall ergonomics of this calculator simply horrible. The manual at first blush looks complete if brief but it omits much of the functionality that's actually in the the firmware (like storage register arithmetic).

It runs off of one CR2032 cell and it's pretty fast. About 4.5 times faster than the 12CP Anniversary edition. The best part about this is that it sells for about $20 (shipping included) on many websites.

Here's are some pictures of it:

COMPUCESSORY
Financial calculator
CCS28956

Most of the firmware in this machine is apparently taken directly form the 12CP since it has the standard built-in tests, which are undocumented. The keyboard test requires that you press the keys in the same order as they appear on a 12C which has no relationship to the layout on this calculator. If you do that this display ends by showing "12" in the middle of it!

Cyrille and Tim, did you know about this machine?

-Katie

*Message #4 Posted by **Don Shepherd** on 18 Aug 2010, 3:12 a.m.,*
in response to message #1 by Katie Wasserman

Katie, very interesting. Good find!

x->m and m->x, are those STO RCL?

Since you said it uses the early platinum firmware, apparently, does it have that bug about GOTO's not working correctly if you have more than 200+ program lines? If it does, how can this company legally just use the same ROM as HP?

I can't see the blue-chip financial types replacing their nice gold professional looking 12c's for this.

Re: HP-12C Clone, New?

*Message #5 Posted by **PatrickR** on 18 Aug 2010, 4:19 a.m.,*
in response to message #4 by Don Shepherd

Illegal or not (I don't imagine this will hurt HP sales), for 10$/piece you can buy a few and lose a few. As a student I'm always afraid or misplacing or losing the 12C, this is a great find for the coatpocket.

Re: HP-12C Clone, New?

*Message #6 Posted by **Katie Wasserman** on 18 Aug 2010, 10:26 a.m.,*

> Quote:
>
> Since you said it uses the early platinum firmware, apparently, does it have that bug about GOTO's not working correctly if you have more than 200+ program lines?

The GOTO bug doe not seem to be there, the firmware was from a later model Platinum but not the most recent one. The most recent one uses 12 digit math and allows for more cash flows.

I wonder if whoever made this calculator had the source code or just intercepted the keystrokes in order to include the added Cost/Sell/Margin functionality along with the adjustable contrast. The contrast adjustment is done with <shift-hold>+<x> or <shift-hold>+</> which happen to be the same keys used for Cost and Sell. This lends credence to the idea that the additional functionality is done with intercepting keystrokes and that the programmer just had the object code from the Platinum. Besides, if they had the source code, why leave in the keyboard self test that makes zero sense on this calculator.

Re: HP-12C Clone, New?

in response to message #4 by Don Shepherd

> Quote:
>
> x->m and m->x, are those STO RCL?

That's what I was wondering. Surely that can't just be the X stack register. How many storage registers does it actually have, and how do you access them?

Re: HP-12C Clone, New?

*Message #8 Posted by **Katie Wasserman** on 19 Aug 2010, 10:32 a.m.,*
in response to message #7 by Michael de Estrada

Yep, they are just STO and RCL.

The firmware in this thing is identical to the 12CP (version just before the latest one) with the addition of Cost/Sell/Margin and contrast adjustment. The keys and functions the are bound to are also identical except for their position on the keyboard. The key labeling is not identical however.

Looks like Compucessory is not aware of the specifications of the calculator they have *created*. In their site they say 99 steps and 20 cash flows:

http://compucessory.com/?page_id=4&nav=39|208&catfilter=1240&keyword=&search=&page=1&id=1014440533

48GX

*Message #1 Posted by **Robin Shelton** on 17 Aug 2010, 8:02 p.m.*

Is there anyone out there that knows how to operate the 48GX?

Re: 48GX

*Message #2 Posted by **Allen** on 17 Aug 2010, 8:48 p.m.,*
in response to message #1 by Robin Shelton

email me your address, I'll mail you a free set of manuals. (US only)

Re: 48GX

*Message #3 Posted by **Robin Shelton** on 18 Aug 2010, 11:13 a.m.,*
in response to message #2 by Allen

Actually I have the manual but it's so confusing to me.I was hoping that there would be someone that I could e-mail back and forth with specific questions on operations. I'm an engineering student and really want to use this calculator instead of the TI 89 which is what all my teachers use.

Re: 48GX

*Message #4 Posted by **Pal G.** on 18 Aug 2010, 11:33 a.m.,*
in response to message #3 by Robin Shelton

You may be better off searching first and then posting questions about the 48GX at comp.sys.hp48

http://groups.google.com/group/comp.sys.hp48/topics?lnk=gschg

This group is very knowledgable when it comes to the 48 family, but I would say prefers RPN calcs, collecting HP calcs, and discussing math, engineering and other trivia. The comp.sys.hp48 group is a much better resource if you are in school and/or just learning the 48 series.

Re: 48GX

*Message #5 Posted by **Allen** on 18 Aug 2010, 1:55 p.m.,*
in response to message #3 by Robin Shelton

Do you have the Quick Start Guide? That might help matters compared to the thick manual. If you have any specific questions, post them here, there are plenty of 48GX aficionados in this forum..

Re: 48GX

*Message #6 Posted by **Martin Pinckney** on 18 Aug 2010, 3:06 p.m.,*
in response to message #3 by Robin Shelton

> Quote:
>
> ... I have the manual but it's so confusing to me...

You are not alone. I have been slowly learning my 48SX for about 2 years now. Some folks seem to pick up and learn how to use these 48/49/50 series models so easily, but for me they are not very intuitive to use, other than for some simple RPN math. Still, I press on, because of the power that these machines hold.

It seems to me the biggest initial hurdles were understanding that *everything* is an object, and *everything* is entered postfix, even STO and RCL.

in response to message #6 by Martin Pinckney

I was lucky. I worked my way up slowly via the following machines: HP-25-->HP-11C-->HP-28C-->HP-28S-->HP-48SX-->HP48GX. Still the transition to a HP-28C (which is simpler than a 48GX) was a big jump.

Re: 48GX

*Message #8 Posted by **Norman Dziedzic** on 19 Aug 2010, 2:07 p.m.,*
in response to message #3 by Robin Shelton

For me understanding the VARS menu and the directories in the calculator really helped a lot (48gii but same thing or this discussion).

I have a directory that I call Junk where I sit when just mucking around in general. If I have a specific type of problem I'm working on then I will set up a directory and maybe even some sub directories and only go there when working on those problems. Otherwise, I find my list of variables gets unruly very quickly. I purge the junk directory regularly.

Have you worked with any other HP calculators in the past?

Re: 48GX

*Message #9 Posted by **Robin Shelton** on 20 Aug 2010, 7:14 p.m.,*
in response to message #8 by Norman Dziedzic

This is my first Hp calc. Actually this is my first graphing calc. I bought it at a garage sale, I have both the huge manual and the quick start one. I have used it in my trig class and college algebra. In the college algebra there were a couple things that I couldn't figure out. Now I'm in calculus and getting worried that I won't be able to use it because no one knows how, not even the teacher. I would like to keep it because I've heard so many great things that it can do, and that it's great for engineering students. But now that I've found this forum I will just post my question/problem here and see if anyone can help me. You people are great.

How to install/run this program in an Hp 50g.

*Message #1 Posted by **Vasheer** on 17 Aug 2010, 5:37 p.m.*

Hi all

I just bought a 50g and dont know how to install this one program for plotting root locus'. Here is the address of the files (http://www.hpcalc.org/details.php?id=1178). Im familliar with library instalations but this is beyond me because these files are only .dir and .src

So what do i do with them.

Thanks.

Re: How to install/run this program in an Hp 50g.

*Message #2 Posted by **Tim Wessman** on 17 Aug 2010, 6:31 p.m.,*
in response to message #1 by Vasheer

Haven't looked at it, but my guess is to move the .dir file into your HOME memory, and then access the directory using VARS.

TW

Re: How to install/run this program in an Hp 50g.

*Message #3 Posted by **Daniel Oliva** on 17 Aug 2010, 6:34 p.m.,*
in response to message #1 by Vasheer

Move RLocus3.dir file to HOME using an SD card. That is, using your PC, unzip the RLocus3.dir file to the SD card. Then put the SD card on the 50g, hit L-Shift Apps to open the filer, go to the SD card, copy the RLocus3.dir file to HOME. Get out of the filer with ON, then press VAR and you'll see the program dir (RLOCU). Press F1 to access the program dir.

display compatibility

*Message #1 Posted by **alessio136** on 17 Aug 2010, 11:53 a.m.*

some days ago a dark spot appeared on my hp15c display. i dont know how it could happen, maybe i just pressed it in the bag.

anyway, i'd like to fix it becouse i'm quite afficionated to that calculator.

i'm thinking to substituting the display with one from a hp12c. do you think it will work? since i dont own a 12c yet, i'm not sure aboute it...

for example, does the 12c have the exponent small digits?

thank you in advance :)

Re: display compatibility

*Message #2 Posted by **Eric Smith** on 17 Aug 2010, 7:05 p.m.,*
in response to message #1 by alessio136

for example, does the 12c have the exponent small digits?

No, but neither does the 15C!

The 15C display is the same as the display of a 12C from approximately the same timeframe, but not from one much earlier or later. You definitely can't use one from a 12C that uses one or two CR2032 coin cells; it has to be a 12C that uses three button cells. But even that isn't sufficient to guarantee that they are interchangeable. Early 12C and 15C calculators used a 2:1 multiplex display with about 52 electrical contacts, and later ones used a 4:1 multiplex display with about 29 electrical contacts.

> Quote:
>
> ...You definitely can't use one from a 12C that uses one or two CR2032 coin cells; it has to be a 12C that uses three button cells...

Need to change "definitely can't" to "might be able to" as both the later three cell and the one cell 12C's all used the 4:1 arrangement as did the last version 15C with two IC's.

The only difference on the 15C was that for a while, they used a silver polarizer rather than the 12C's gold. They eventually used gold on the last 15C's. It is obvious if you're looking for it, otherwise you need to put an older 15C next to the later versions to see the difference.

The two cell supply 12C's have thermally bonded displays so they cannot be reused.

HP82069B charger, weird ...

*Message #1 Posted by **Alberto Fenini** on 17 Aug 2010, 4:25 p.m.*

ciao a tutti,

while sorting out things in a drawer I have found this :

I think it's weird because it clearly says 110V but it also has an EU plug
I have searched the website but couldn't even find it as a model
anyone has ever seen it before ?

take care Alberto

Re: HP82069B charger, weird ...

*Message #2 Posted by **Etienne Victoria** on 17 Aug 2010, 5:38 p.m.,*
in response to message #1 by Alberto Fenini

Hi Alberto,

Sure, it's a 90-120V adapter/charger for countries using a "European plug".

More info here

IIRC a couple of years ago a part of Europe was still on 110V.

Ciao

Etienne

Re: HP82069B charger, weird ...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2010, 3:23 p.m.,*
in response to message #1 by Alberto Fenini

Ciao, Alberto;

I have one almost like this (same AC IN connector) for more than 20 years, it came with a n 82143A bought in Europe (not by me...). The only two differences are:

1 - it reads 220V~ 50Hz (Germany?) and
2 - it is coded 82066B Eurocharger.

Luiz (Brazil)

Re: HP82069B charger, weird ...

*Message #4 Posted by **Walter B** on 18 Aug 2010, 4:22 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Ola Luiz,

what you have was the normal European type. IIRC, some 15 to 20 years ago they merged 220 VAC 50 Hz(continental Europe) and 240 VAC 50 Hz (UK) to 230 VAC 50 Hz with tolerances that everybody was happy. I do not remember, however, any larger European country with 110 or 120 VAC. But I will try to find out.

*Message #5 Posted by **Massimo Gnerucci (Italy)** on 18 Aug 2010, 6:01 p.m.,*
in response to message #4 by Walter B

I remember that in the sixties, when I still was in Rome, we had both 110 VAC and 220 VAC in hour homes. A few years later only 220 VAC was left.

Of course you had to be careful where you put what... ;-)

Greetings,
Massimo

> Of course you had to be careful where you put what... ;-)

If we consider a DC, controlled power source with interchangeable poles, this goes far beyond where to put what...

Some people have their equipments also fried after a wrong DC connection (capacitors usually blow away...). That´s why I prefer having a full-bridge, four-diode rectifier inside the equipment right after a low-voltage input connector. No matter polarity or even if it is AC, having the source enough amps and being it in the voltage range, all goes well.

Cheers.

Luiz (Brazil)

in response to message #5 by Massimo Gnerucci (Italy)

Ciao a tutti,
I'm from 1964 and I can't remember back in the seventies
that we had in Milano 110 volts with that plug.
Well, I can't remember of any european country either.
I'll see my parents tonight for a pizza and I'll sure ask them.

I'll let you know

Re: HP82069B charger, weird ...

*Message #10 Posted by **Massimo Gnerucci (Italy)** on 19 Aug 2010, 2:42 p.m.,*
in response to message #9 by Alberto Fenini

Ciao Alberto,
be careful: I mentioned Rome not Milan! A quick Google search confirms I am not (totally) mad... :-) AC in Rome...
I am just 4 years older than you and I only found this when I lived in Rome, during the sixties: I never found 110VAC in Milan since 1970.

Greetings,
Massimo

Re: HP82069B charger, weird ...

*Message #11 Posted by **Alberto Fenini** on 20 Aug 2010, 2:18 a.m.,*
in response to message #10 by Massimo Gnerucci (Italy)

I asked my father last night
btw he worked at Enel the Italian Electrical Energy Company for a long time in the IT dept
which is where I have been using my first HP-25 just to tell where the story began
and as far as he can remember we had in Italy 115, than 125 then 220.

Anyway, the oldest model for which the charger is suitable is a Topcat unit,
which has been introducted at earliest in 1976, by that time in Italy the distribution was all at 220 ,
which lead me to say that the charger wasn't for Italy.
On the other side, that plug will not fit in all EU sockets, UK for example has a different one
the question we should find an answwer to is : which EU country had 110V back in 1976 ?

P.S. : Massimo remember to send me your email address for the boxes scans ...

Re: HP82069B charger, weird ...

*Message #12 Posted by **Walter B** on 20 Aug 2010, 3:28 a.m.,*
in response to message #11 by Alberto Fenini

Ciao,

I found a somewhat older website claiming different AC voltages for different Italian cities. Seems it was still worth mentioning in the nineties. No idea about the plugs, however.

Loops of Addition benchmark for the 41CL

*Message #1 Posted by **Monte Dalrymple** on 17 Aug 2010, 1:34 p.m.*

I am finally able ot run the "Loops of addition" benchmark on the 41CL. The code is the usual: LBL 00 + GTO 00, and runs for 60 seconds. Starting condition is X=0, Y=1, Z=1, T=1.

1X mode: 1,055
2X Turbo mode: 1,913
5X Turbo mode: 4,153
10X Turbo mode: 6,538
20X Turbo mode: 9,179
50X Turbo mode: 12,022

The results are not linear because the NEWT CPU automatically throttles back to 1X for those instructions that must run at this speed for compatibility. For a user program such as this, each program line samples the keyboard flag and the peripheral request flag, and both of these operations must be done at 1X. In addition, all LBL program lines move the "goose" in the display, and both the display select and the display update must be done at normal speed.

Even with these "speed bumps" the results are pretty good...

Monte

Re: Loops of Addition benchmark for the 41CL

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 17 Aug 2010, 1:41 p.m.,*
in response to message #1 by Monte Dalrymple

> Quote:

Indeed!

Thanks for the update Monte! Always waiting for one/two of those marvels...

Greetings,
Massimo

Re: Loops of Addition benchmark for the 41CL

*Message #3 Posted by **gene wright** on 17 Aug 2010, 4:24 p.m.,*
in response to message #1 by Monte Dalrymple

Excellent! I can't wait.

I've been saving an HP 41c fullnut with this in mind.

:-)

Re: Loops of Addition benchmark for the 41CL

*Message #4 Posted by **Angel Martin** on 19 Aug 2010, 2:22 a.m.,*
in response to message #3 by gene wright

I can already see all those auctions for plain 41C's skyrocketing in a while..

So Gene, will you update your comprehensive article to include these data?

Best, 'AM

Edited: 19 Aug 2010, 2:24 a.m.

Re: Loops of Addition benchmark for the 41CL

*Message #5 Posted by **Paul Dale** on 19 Aug 2010, 3:04 a.m.,*
in response to message #4 by Angel Martin

They'd better not go up too much, I don't have a plain 41c and that would be ideal for conversion...

- Pauli

Re: Loops of Addition benchmark for the 41CL

*Message #6 Posted by **gene wright** on 19 Aug 2010, 7:29 a.m.,*
in response to message #5 by Paul Dale

As I think I remember, Monte has said that this **requires** a fullnut HP 41c.

Is that right, Monte?

Re: Loops of Addition benchmark for the 41CL

*Message #7 Posted by **Monte Dalrymple** on 19 Aug 2010, 10:45 a.m.,*
in response to message #6 by gene wright

The replacement CPU board goes in any fullnut: C/CV/CX. The flash contains CX operating system code. It will contain the CX version of the time module code, but you'll need a Time Module plugged in to get the actual timer functionality. I couldn't fit that function into the circuitry.

Monte

Re: Loops of Addition benchmark for the 41CL

*Message #8 Posted by **gene wright** on 19 Aug 2010, 11:50 a.m.,*
in response to message #7 by Monte Dalrymple

Thanks for the clarification.

I'm sure quite a few people at the conference in Fort Collins will be interested in hearing more too. :-)

Re: Loops of Addition benchmark for the 41CL

*Message #9 Posted by **Wlodek Mier-Jedrzejowicz** on 19 Aug 2010, 9:48 p.m.,*
in response to message #8 by gene wright

As Gene Wright says:

> Quote:
>
> I'm sure quite a few people at the conference in Fort Collins will be interested in hearing more too. :-)

Some might even bring a fullnut 41 with them!

HP71b - which power supply

*Message #1 Posted by **Alberto Fenini** on 17 Aug 2010, 12:27 p.m.*

ciao a tutti,

which external power supply can be used safely with an HP71b ?
my guess would be the same as for the HP41 family
but I will appreciate your help

take care, Alberto

Re: HP71b - which power supply

*Message #2 Posted by **Raymond Del Tondo** on 17 Aug 2010, 12:37 p.m.,*
in response to message #1 by Alberto Fenini

Ciao Alberto,

the one that fits into the 82161A will do, in Germany it's the 82066B.

Regards

Raymond

Re: HP71b - which power supply

*Message #3 Posted by **Don Shepherd** on 17 Aug 2010, 12:47 p.m.,*
in response to message #1 by Alberto Fenini

The 82059D works fine with my 71b.

Re: HP71b - which power supply

*Message #4 Posted by **Gerson W. Barbosa** on 17 Aug 2010, 1:47 p.m.,*
in response to message #3 by Don Shepherd

That's the one I use on mine. The output is rated 8VAC/3VA MAX but on I measuring it I found 13.4V (12.6V when the 71B is turned on, but not running). This should be normal since the HP-71B represents no load to the power supply. However the first time I used it one tantalum capacitor blew up inside the 71B (which has not been replaced yet). I don't remember what I did wrong, I only remember I had removed the batteries, but this would not damage the computer, according to the manual. The recommendations in the manual might be useful:

"Turn the HP-71B off before connecting the unit to a power outlet. This will prevent unexpected voltage 'spikes' from disturbing the contents of memory. When connected to a power outlet, the HP-71B uses the batteries as a backup power and normally doesn't draw any power from them. You won't damage the HP-71B by using the computer without batteries, but you may lose everything in memory should there be a

power outage or an intermittent connection to the voltage source."

Re: HP71b - which power supply

*Message #5 Posted by **Etienne Victoria** on 17 Aug 2010, 5:40 p.m.,*
in response to message #1 by Alberto Fenini

The 82066 is fine in Europe 220V

The 82059 is suitable to the 110V mains.

Ciao

Etienne

Re: HP71b - which power supply

*Message #6 Posted by **RamLab** on 18 Aug 2010, 10:36 a.m.,*
in response to message #5 by Etienne Victoria

Not only for the Power Supply, but also to replace a Capacitor, have a look at the hpmuseum site http://www.hpmuseum.net/collection_document.php ther you can find the 71 Handheld Computer Service Manual 5-13 AC Adapters.

RamLab

HP 35s - scratched screen

*Message #1 Posted by **Matt Schilling** on 17 Aug 2010, 2:36 a.m.*

I was wondering if anyone has any solutions to repairing scratches to the display of the 35s? Any other information about the type of screen and whether it is a cover would be helpful. I don't want to go trying to fix it and making things worse. Cheers

Re: HP 35s - scratched screen

*Message #2 Posted by **Thomas Radtke** on 17 Aug 2010, 3:17 a.m.,*
in response to message #1 by Matt Schilling

There's a plastic cover on top of the LCD in my sample. It can likely be repaired by e.g. Displex. However, I've read in this forum that there were 35s without that cover IIRC, so be careful.

I'd try to replace it with a less reflective material if my 35s were concerned (and were still in use).

Re: HP 35s - scratched screen

*Message #3 Posted by **Dallas Osborne** on 17 Aug 2010, 11:35 a.m.,*
in response to message #1 by Matt Schilling

Yup, pop it apart and replace it.

Here you go: HP 35S Screen Replacement/Upgrade (and alignment)

EDIT: I used the plastic LCD cover from an unsuspecting co-workers office phone. (He hasn't noticed yet.)

Edited: 17 Aug 2010, 12:29 p.m.

Re: HP 35s - scratched screen

*Message #4 Posted by **Bruno Férard** on 17 Aug 2010, 2:40 p.m.,*
in response to message #3 by Dallas Osborne

Very good tutorial, thanks for sharing. I haven't this problem at the moment, but it can be useful someday...

Re: HP 35s - scratched screen

*Message #5 Posted by **Matt Schilling** on 23 Aug 2010, 2:29 a.m.,*
in response to message #3 by Dallas Osborne

Thanks for the help. How do I pop it open? And will it go back together the way it was beforehand?

Re: HP 35s - scratched screen

*Message #6 Posted by **Jeff O.** on 23 Aug 2010, 1:13 p.m.,*

in response to message #5 by Matt Schilling

Matt,
Opening the case is easy. Remove the rubber plugs in the four corners of the battery compartment, then peel off the rubber strip on the bottom of the calculator, and remove the six screws. The front and back halves of the case are also held together by five plastic catches, one in the middle on the top edge, one in the middle on each side, and one near the bottom on each side. These catches are not exceptionally tenacious; some gentle tugging at the case halves and careful prying between them will fairly easily separate the front and back. When re-assembled it should appear is if it has never been opened.

For further information on the internal construction of the 35s, you may wish to review this post of mine from a few years ago when excitement was high over the prospect of repurposing the 35s.

....

Re: HP 35s - scratched screen

*Message #7 Posted by **Dallas Osborne** on 23 Aug 2010, 2:27 p.m.,*
in response to message #6 by Jeff O.

Oops,

Jeff, I missed your post while I was typing that response.

That is one detailed disassembly!

Re: HP 35s - scratched screen

*Message #8 Posted by **Dallas Osborne** on 23 Aug 2010, 2:23 p.m.,*
in response to message #5 by Matt Schilling

Okay… this is the fun part and there are many more experts here. I strongly suggest searching the archives for posts concerning this type of surgery.

Here we go!
Prep the work area.
-Good lighting.
-Serving tray (keep the bits and pieces from making a break for it) -Cellophane tape (the kind that comes off easily without leaving sticky patches)
-Pencil
-Straight edge (ruler)
-Little Philips screw driver
-Tweezers
-Double sided tape.
-Plastic something for prying. I use a plastic knife with the end cut off and filed down a bit.
-X-acto knife with a little pointy bit or a sewing needle.
-A wee bit of superglue. (Cyanoacrylate)
-New screen material. This is entirely up to you and I don't have any good sources to recommend. You will need to look around for something with about the same thickness. Again, I used the LCD cover from a co-workers office phone. He never noticed(and he uses a TI). The material has a nice matt finish.
-Lots of time. Working under pressure, such as before the spouse comes back and finds you at the table with a naked… calculator, is not good. Some spouses don't understand why one would devote that type of time to something that can be purchased new at the local office store when there are plenty of other useful things to do around the house. The serving tray is nice because you can just shove it somewhere.

-Lastly, place two pieces of tape at the top of the work tray: one flat about 10 cm long and the other with the ends folded back to keep the sticky side up. This is the landing pad for the rubber feet (nonsticky-side-up piece) and the screws & springs (sticky-side up).

*) Go to the link in my above post and review the photos. (EDIT: The photos in Jeff's post are also encreadibly helpful in seeing the guts before you dive in.)
1) Remove the batteries.
2) Remove the rubber feet by using the X-acto knife or needle.
3) Remove the six screws and put them on the sticky-side-up tape.
4) Remove the back cover and put the two springs next to the screws. I put another piece of tape over the batch to keep them all together. (Photo 1 & 2)
5) Gently lift the LCD/cushion foam set away from the front cover. You can use the plastic pry piece, but I urge you to go at it very, very slowly. Some folks have had success changing the temperature to alter the adhesive properties of the double-sided goo. Mine worked just time with slow and gentle pressure. Flip this package over and cover with a lint-free cloth. (Photo 3)
6) With gentle pressure again, press out the screen cover from the front while lifting from the back. Remove any residue on the inside front of the calculator.
7) Now look at the old cover. There is cushion foam that frames the original cover. BE VERY CAREFUL WHEN REMOVING THIS; you want to use it again. The adhesive is very tenacious and the foam is weak and stretchy. Maybe lifting it away with while working the gap with the edge of the X-acto blade may work as well. To be honest, I just started pulling gently and did end up with a bit of stretching and tearing. As I put it back together, I just mushed it back into place best as possible and it worked out right in the end. Set this very lightly aside somewhere.
8) Prepare your new screen by covering the new front part with tape. (Remember… the type that comes off easily and doesn't leave sticky leftovers.)
9) Match up the old screen and mark up the corners on the new plastic. Now for cutting fun! I used a ruler and placed it to the outside of new cover and on the markings. Then ever so carefully, I scored the new edge before cutting through with a few strokes. About five to six did the trick.
*This may take a couple of runs if you goof up somewhere.
10) Test fit the new screen cover.
11) Put the foam boarder back on the inside of the new piece. (Photo 4)
12) Remove the tape from the front and put this front-side up on a piece of cloth.
13) Replace the double-sided adhesive that will hold the new cover in place to the front of the calculator. Place strips of new double-sided tape to the front along the edge at a width slightly less than the inside ledges of the hole in the calculators front plate. (Photo 5) Then trim off the excess.
14) Place the new cover into the front plate and carefully seat it. (Photo 6)
15) Replace the LCD/foam cushion over the cover and check the alignment. Obviously, you will need to put the springs back in, close the back, and replace the batteries. (Photo 7. You can see, I eagerly put the screws back in, too. This was when I decided to fix the screen alignment issue that bugged me from about thirty seconds after I turned the calculator on for the first time.)
16) If needed, cut a little shim – I used a piece of a plastic zip-tie; the thickness was perfect. Yours may not need adjustment. If less adjustment is needed, use a thinner shim or grind the thicker one down (pop a piece of double-sided tape between your finger and the shim this work it over a nail file?). Stuff this shim between the screw post and the LCD frame. Check the alignment. If it is good, pry enough of a gap to wick a small bead of the superglue into the space between the screw post and the shim. (If you have decent humidity, this should cure in around ten seconds.) (Photo 8)
17) Confirm alignment. (Photo 9)
18) Put your new rig back together and show off to yourself. (Photos 10, 11, and 12)

(Photo 13 was only to show off my spiral bound manual. Na-na-na-na-nah-nah!)

Best of luck!
-Dallas

Oldies and goodies?

*Message #1 Posted by **Egan Ford** on 16 Aug 2010, 10:05 p.m.*

Just ran across this and thought I'd share.

http://www.vintage-technology.info/pages/calculators/general/calccompany.htm

Forgot to add this.

http://www.aaronaddingmachines.com/

Edited: 16 Aug 2010, 10:20 p.m. after one or more responses were posted

Re: Oldies and goodies?

in response to message #2 by Don Shepherd

Yes. Very odd. When I think calculator I've always thought HP.

Re: Oldies and goodies?

*Message #4 Posted by **Jerry Raia** on 17 Aug 2010, 12:03 a.m.,*
in response to message #1 by Egan Ford

I did have the TI SR10. I think it was my first calculator.

Edited: 17 Aug 2010, 12:04 a.m.

Re: Oldies and goodies?

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 17 Aug 2010, 8:11 a.m.,*
in response to message #4 by Jerry Raia

I had a SR-10, later replaced with a SR-11 when the first got lost. My next calculator was a HP-25, and from that moment I never looked back to TI models.

Re: Oldies and goodies?

*Message #6 Posted by **Jerry Raia** on 17 Aug 2010, 8:05 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

I believe the 25 was my next one too :)

Missing from the list

*Message #7 Posted by **Palmer O. Hanson, Jr.** on 17 Aug 2010, 1:22 a.m.,*
in response to message #1 by Egan Ford

It isn't only HP which is missing from the list. Others from my limited collection include Checkmate, Cybernet, Korvette, Miida, Monroe, Montgomerry Ward, Royal, Soundesign, Teal and Unicom.

As to old adding machines I prefer some of the genuine antiques where my favorites include the rotary Addometers (made by a typewriter company and built like a truck) and the Magic-Brain pocket size push down adders.

Palmer

Office Depot - HP30b & HP 12c

*Message #1 Posted by **Joe Burwell** on 16 Aug 2010, 7:53 p.m.*

Interesting that the Office Depot in Athens, Georgia has completely redone the calculator section. The HP 30b is there - has a spot. The HP 12c Platinum is there - has a spot. I saw no HP 12C or place for it. Surely they are not going to stop carrying it.

I must admit, now that I know how to program the HP 30b it is fast becoming my favorite. I did not think any calculator would measure up to the HP 12C.

Re: Office Depot - HP30b & HP 12c

*Message #2 Posted by **Bruce Bergman** on 16 Aug 2010, 10:57 p.m.,*
in response to message #1 by Joe Burwell

That's what I keep telling people: give the 30b a chance! It truly is an amazing calculator. Far underrated by many people here who give it only a passing glance and then write it off. It has a ton of features, it's blazing fast, and is a very capable programmable. It's just different in some ways. Still, a lovely calculator.

(Oh, and I too am keeping an eye on my local Office Depot, but no sign of a 30b yet).

Thanks,

Bruce

Re: Office Depot - HP30b & HP 12c

*Message #3 Posted by **Allen** on 17 Aug 2010, 5:09 p.m.,*
in response to message #2 by Bruce Bergman

I agree with Bruce.. Today I saw 2 "30bii" calculators in Office depot for $49.95 a piece, along with several SmartCalc 300, some 10s, and 10bii. I'm very proud to finally see HP calcs showing up again in mainstream B&M stores. Quality calculators like the 30b and retail store shelf space: that's a good way to open up name recognition and branding back to the younger generation. Not that I know anything about selling calculators.

Re: Office Depot - HP30b & HP 12c

*Message #4 Posted by **Mike Morrow** on 26 Aug 2010, 8:58 a.m.,*
in response to message #2 by Bruce Bergman

I wholeheartedly agree with Bruce's (and Don's and Martin's and Gene's) assessment of the HP 30b. I'm on my sixth day of ownership, and the last time I was this satisfied and happy with a new HP calculator was the HP 42S, 20 years ago. The mechanical qualities alone make this unit remarkable. It is the most comfortable *handheld* calculator that HP has made since the Woodstocks (IMO). This is a very sturdy and handy package, and the keyboard feel is excellent. The mechanical/industrial design is the best of any of the 30+ HPs that I've owned since 1976.

There is really very little to complain about, and a tremendous amount to praise. Right now, the most irksome characteristic to me is how easily the labels rub off of the programming overlay. I lost most of one line while trying to press the overlay on to the keyboard. I can safely predict that the rest of the labels won't last very long, and I doubt that overlay replacements are available. That's a shame, because the overlay information is very helpful. I wish its labels had been permanently marked on the keyboard.

Office Depot sells the HP 30b for $50, and the HP 12C+ Platinum for $90. There's no doubt in my mind of which is the better machine, regardless of price. Plus, the Voyager landscape configuration is very inconvenient for a handheld calculator that will actually be used hand held.

To return to the discussion thread, I'm surprised in the listings of former great HP calculators that there has been no mention of the machine that many consider the greatest RPN calculator of all time...the HP 42S. Right now, my dream machine would be an updated HP 42S (including IR printer output and tone functions) in the form of the HP 30b (and native-ARM firmware...no Saturn emulation!).

The HP 30b...it is one beautiful product! Thanks, HP.

Re: Office Depot - HP30b & HP 12c

*Message #5 Posted by **Ron Ross** on 26 Aug 2010, 10:19 a.m.,*
in response to message #4 by Mike Morrow

In Response to this statement: “To return to the discussion thread, I'm surprised in the listings of former great HP calculators that there has been no mention of the machine that many consider the greatest RPN calculator of all time...the HP 42S.”

I feel the Hp 42s is overlooked because it did not sell well. People cannot comment on something they never had. And for that, Hp is really to blame. Hp priced the Hp42s at the same price as the Hp48G and no self respecting student would buy the Hp 42s when they could buy the Hp48G and have a machine that was the ugly twin of the better featured Hp48gx (I am biased towards hand held calculators and graphing models barely qualify). If Hp had sold the Hp 42s for $20 less, I suspect the Hp 42s would have sold much better. If Hp had developed the serial port (yes, it was supposed to have one), it would have been the darling of Hp calculators, but Hp did NOT want to rob sales from the Hp 48g line.

I suspect (and am only speculating) that Hp felt students would buy the Hp48g, graduate and then buy the Hp 48gx. The advent of cheaper, portable computers and laptops negated this along with the superior long lasting quality of the Hp48g meant there was never a great demand for the Hp48gx outside of the surveying field.

So to beat a dead horse, the Hp 42s is often brought up in discussions about which calculator was Hp’s best ever. It usually loses to the Hp 32sii due to “Great LCD, perfect complexity or fractions capability of the Hp 32sii, etc”. Most often though most Hp 32sii users never used an Hp 42s or had a brief experience and note the poor readability of the Hp 42s (in comparison to an Hp 32s or LCD display of the earlier voyager lines).

However, in only one or two cases have I ever heard of an Hp42s user / owner prefer any other calculator.

I still love my Hp 42s the most, but use an Hp 48g+ due to the ability to reload programs into the calculator should I have a machine reset when I change batteries. Let that happen one or two times with a couple K of RAM lost and you will tend to become somewhat fickle with the Hp 42s. And an Hp 48G or G+ is 25-50% the cost of an Hp42s to replace.

Re: Office Depot - HP30b & HP 12c

*Message #6 Posted by **JDonley** on 27 Aug 2010, 10:59 p.m.,*
in response to message #2 by Bruce Bergman

Got my 30b two days after ordering from HP. It is going to stay on my desk, rather than going into a drawer like the 20b did. The keypad is outstanding. They really got this one right. The one change I would make would be to have a dedicated "store" key in place of the "%" key.....do many people actually use the "%" key (programming maybe?)?

Well done HP.

Re: Office Depot - HP30b & HP 12c

*Message #7 Posted by **Don Shepherd** on 27 Aug 2010, 11:16 p.m.,*
in response to message #6 by JDonley

As Gene and Bruce have said many times, you can reassign the % key (or any key) to the STO function. Then it's a one-keypress to STO.

Re: Office Depot - HP30b & HP 12c

*Message #8 Posted by **Mike Morrow** on 28 Aug 2010, 8:36 a.m.,*
in response to message #7 by Don Shepherd

I've always liked the requirement to use a shift function to access STO. That way, it takes two active errors to wipe out the memory's contents with something that I did not intend to store there.

Re: Office Depot - HP30b & HP 12c

*Message #9 Posted by **Katie Wasserman** on 28 Aug 2010, 12:42 p.m.,*
in response to message #7 by Don Shepherd

Don,

I don't think you can assign STO to another key. STO requires at least a register number in order to enter it into a program. You could assign 'STO 0', for example, to a key but not just 'STO'.

This isn't really a macro recording calculator, although it acts like it in some circumstances.

-Katie

Re: Office Depot - HP30b & HP 12c

*Message #10 Posted by **Don Shepherd** on 29 Aug 2010, 11:03 a.m.,*
in response to message #9 by Katie Wasserman

Yeah, that's right.

Re: Office Depot - HP30b & HP 12c

*Message #11 Posted by **M. Joury** on 2 Sept 2010, 12:11 a.m.,*
in response to message #9 by Katie Wasserman

You can, however, use the TVM keys as single key STOs. You don't actually have to key 'SHIFT STO N'. Simply keying 'N' will store the value in the 'N' register. Of course you now

really don't have any protection from a finger fumble.

At least I have yet to find any situation where this does not work. Of course you can't store 0 in 'N' but you can in the other TVM registers.

Great, now that I've read this, I feel a bit like a calculator snob. After my incredible find of an HP-12C for $5 at a garage sale a few years ago, I thought it was the perfect calculator--functions, form factor, quality, etc. So much so that I recently scored a great deal (about 1/2 of new in box) on eBay for a pristine one just to ensure that I have another ready to go just in case.

But in spite of the fact that this 30b may be more functional, it just doesn't seem to have the panache of the 12c--it's svelte good looks, heft, and provenance. Please don't kill me by saying that something else has replaced my HP-41CX that I just got...

*Message #13 Posted by **Martin Pinckney** on 18 Aug 2010, 12:59 p.m.,*
in response to message #12 by Jim L (OHIO)

Jim, not sure how familiar you are with the whole HP calculator landscape, but here goes. The 41c series was top-of-the-line in it's day. This status was replaced by the evolving 48/49/50g series, which are quite different animals.

But if you like the build quality, look and feel, and capabilities of the 41cx (and 12c, for that matter), why worry about any superseding models?

Re: Office Depot - HP30b & HP 12c

Thanks for weighing in on my dilemma. It's not really a problem though, as I was just pontificating on how I am apparently not opened minded enough to see the advances in calc design since I last had a big interest in them (all HP of course).

As for my awareness, I started in 1974 with a used HP-45 (which still works on AC!), an HP-34C, then moved to an HP-32SII, an HP-41C (with memory, Math, Stats, Machine Design, Structural, and Advantage pacs and the Wickes Synthetic Programming book), an HP-48S, and now the HP-12C. Strangely, along the way I also tried a Novus and Sinclair (I think those were their names), since they were also RPN. My brother went the route of HP-19C, HP-29, and then HP-15C which he still has.

So basically, I'm just stuck in the past...

Re: Office Depot - HP30b & HP 12c

*Message #15 Posted by **Martin Pinckney** on 26 Aug 2010, 8:54 a.m.,*
in response to message #14 by Jim L (OHIO)

> Quote:
>
> So basically, I'm just stuck in the past...

Me, too. I use several Pioneers and a couple 48sx's.

This illustrates my point: The calculators I use have all the features I need, and the look and feel, build quality, are superior to anything new available today. So I'm not really "stuck", but use these HP's by choice. Some use the argument that the older models are not easily replaceable. This may have been true years ago, but not since the advent of eB**.

Martin

P.S. I also use Nikon film cameras from the 1970's.

I still use table top vacuum-tube (er...valve) radios like my two Philcos from 1937 and 1940, a Crosley from 1934, and a RCA from 1939. (No old Volksempfänger sets, though. I bought one once, but the only thing it would pick up was "Deutschland Über Alles".)

Where are the Internals for the 50g?

*Message #1 Posted by **Jerry Raia** on 15 Aug 2010, 10:55 p.m.*

I have searched and searched and so far I haven't found any info on the 50g internals, entry points etc. are they there somewhere and I just haven't found them?

Re: Where are the Internals for the 50g?

*Message #2 Posted by **Han** on 16 Aug 2010, 8:03 p.m.,*
in response to message #1 by Jerry Raia

The HP50G entry points are more or less the same as that for the HP49 and HP49G+. The addresses themselves may be slightly different depending on what ROM version you have, but the list of entries can be found at hpcalc.org.

You may also want to download Debug4x (also available at hpcalc.org) which also has the complete list of entries.

Re: Where are the Internals for the 50g?

HP's webpage for former CEO's:

http://www.hp.com/hpinfo/execteam/formerceos.html

See what happens when the link for Mark Hurd is clicked. (It seems that the page had been created, and it wouldn't seem too difficult to make minor updates as necessary.)

Also, Carly Fiorina's page seems terse, but maybe there isn't as much useful biographical content available as for the others.

There is an interesting article on all of this on page 54 of the August 14th issue of *The Economist*. Here are two important quotes from the article but you need to read the entire article:

> Quote:
>
> ... It is all rather confusing. If his ethical lapses were serious, then why is he being given a golden parachute of $12.2m? And if they weren't serious, then why is the company getting rid of a star exectutive?

and

> Quote:
>
> ... HP needs to find a good replacement executive, and fast. That should not be hard; the firm has one of the deepest benches in high-tech. But it also has a patchy record in picking the boss. And history suggests that a good one can make the difference between success and failure: look at how Lou Gerstner revived IBM or how Jack Welch opened up General Electric's lead over Westinghouse. Or look at the way that HP itself began to crumble under Ms Fiorina.

Meanwhile, Carly wants to be a senator.

Still in awe over HP50g

*Message #1 Posted by **Glenn Shields** on 15 Aug 2010, 12:29 a.m.*

I know I'm a random contributor and biased toward the 50g (but still like the 35s, 33s, and 20s). Looking at the "recursive programming" examples in the AUR, I recalled the number of nested subroutines of the 35s, which is 20. But the 50g has this ability only limited by its memory, and can "unwind" this nesting with amazing speed. As an illustration, this program will run through recursions of itself until the limiting number is reached (1000 here), then unwind through the "end"s in just a fraction of a second. If you make it 2000 loops, it barely becomes noticable that it is busy "ending" the loops and finishing the program. << 1 + DUP IF 1000 =/= THEN DUP 1 DISP RECUR END >> Store in 'RECUR' and start with a 0 in the stack. Pretty amazing, no? cheers, Glenn

Re: Still in awe over HP50g

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 Aug 2010, 6:23 p.m.,*
in response to message #1 by Glenn Shields

Hi, Glenn;

I wrote a small recursive program (recursive programs tend to be small while doing big things...) for DFS - Depth-First Search - using matrix representations for graphs. I still need to refine it because it has some parts that might be reduced, but it calls itself each tine a vertex is found in a branch being searched. Because it uses local and global variables and it is not optimized, searching takes a lot of time and adding new branches causes the program to take some considerable extra time. It does not use Dijkstra's algorithm, the idea is just to show that it must test all possibilities, not only the shortest path.

I wrote it to show my students that if an HP50G could handle DFS with such a small code, they would be able to do that with Delphi easily.

It´s been two years and none of them has yet beaten my listing...

User RPL is amazing, ahn?

Cheers.

Luiz (Brazil)

Re: Still in awe over HP50g

*Message #3 Posted by **Glenn Shields** on 16 Aug 2010, 1:26 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thank you, Luiz, for your input - I don't know much about your subject but appreciate having something new to explore. I found so many additional tips and info for the 50g and RPL in general through this forum and other posts (Graham Kendall?), and I hope that by sharing random stuff that somebody new to this system will have more to work with. Cheers, Glenn

Re: Still in awe over HP50g

*Message #4 Posted by **David Hayden** on 16 Aug 2010, 10:53 p.m.,*
in response to message #1 by Glenn Shields

I have the same awe but for a different reason. I enjoy playing with C code on the 50g and it's hard to believe that this little hand-held device is as fast as a desktop PC from 10 or 15 years ago.

Re: Still in awe over HP50g

*Message #5 Posted by **Crawl** on 17 Aug 2010, 9:43 a.m.,*
in response to message #1 by Glenn Shields

I've had a 49g+ since 2004 (updated to a 50g not because I really needed to, but when Circuit City put them on clearance when they went out of business I figured why not) and have been in awe of it continuously ever since. It makes me feel like I'm living in the future every time I use it. For some people, they'd need a flying car to feel like that. For me, it's a pocket (more or less...) calculator that can do algebra.

HP 30b finally arrived

*Message #1 Posted by **Hubert Weikert** on 14 Aug 2010, 9:03 a.m.*

Hello,

More than five months after ordering here in Germany, I received my HP 30b today. Packaged in a blister pack, he arrived with three manuals, a French, Italian and German, with about 40 pages. The programmers keyboard overlay was well hidden in the French manual.

The package also contained a nice pouch, looks like black brushed aluminium, but is made of some sort of flexible leather like material.

Serial No. is 4CY02100084.

SW Version date is "4 5 2010", with a 1 in the exponent display.

Hubert

Re: HP 30b finally arrived

*Message #2 Posted by **gene wright** on 14 Aug 2010, 12:49 p.m.,*
in response to message #1 by Hubert Weikert

The "1" indicates the day of the week.

Re: HP 30b finally arrived

*Message #3 Posted by **Hubert Weikert** on 15 Aug 2010, 3:15 a.m.,*
in response to message #2 by gene wright

Thank you!

Having changed the date display format (to dd.mmyyyy) I get now the same string ("4 5 2010"), but 2 as the day of the week.

Hubert

Re: HP 30b finally arrived

*Message #4 Posted by **Tim Wessman** on 15 Aug 2010, 12:10 p.m.,*
in response to message #3 by Hubert Weikert

That would be as expected.

The hard coded date version code assumes mdy format since that is the default like would be seen in the factory. When you change it, the calc reads it as d.my and displays as such, but since this isn't a value you input it is really displaying May 4, not April 5.

TW

Re: HP 30b finally arrived

*Message #5 Posted by **Jean-Michel** on 15 Aug 2010, 5:53 a.m.,*
in response to message #1 by Hubert Weikert

Güten Morgen, Hubert.

FIVE MONTHS!!!!!

How is it possible?! It's incredible and really disappointing. Nowadays, one gets quite everything in days, sometimes weeks, but months?! This delay sounds more likely for cars, not for a simple electronic device. Do you have any idea of what made it that long? Or does HP sell that few units that they wait to launch a production batch until they have enough units ordered?

Herzliche Grüsse,

JML

in response to message #1 by Hubert Weikert

You are lucky, I still didn't got mine (I live in Switzerland). Perhaps they first have to drill some holes into to adapt it to the Swiss market ;-)

Re: HP 30b finally arrived

*Message #9 Posted by **Christoph Giesselink** on 22 Aug 2010, 4:29 p.m.,*
in response to message #8 by Juergen Keller

Hello Juergen,

I ordered a 30B on Tuesday late evening at http://www.dynatech.de/ and it arrived on Thursday.

It may not be too difficult for you to order the calculator in Germany. They accept credit cards.

Christoph

Re: HP 30b finally arrived

*Message #10 Posted by **Mike Morrow** on 22 Aug 2010, 6:31 p.m.,*
in response to message #1 by Hubert Weikert

I bought one for $50 yesterday at Office Depot in Huntsville, Alabama. They had several on the rack where the calculators are displayed, but I don't think they've been there very long.

Mine is software version "4 5 2010" and physical serial number 4CY02404593. (I guess this must be some sort of new HP serial numbering system.)

Interesting machine. So far, to me the most significant problems are: (1) very little program memory, (2) the lack of a real-time clock/calendar, and (3) the very minimal and barely usable manual.

The HP 20b/HP 30b User Guide that TW referenced does not explain how to initiate the self tests or the significance of each.

Edited: 22 Aug 2010, 6:52 p.m. after one or more responses were posted

Re: HP 30b finally arrived

*Message #11 Posted by **Tim Wessman** on 22 Aug 2010, 6:41 p.m.,*
in response to message #10 by Mike Morrow

They aren't discussed in the users guide because they aren't there for the user. They are there for factory and support use.

TW

Re: HP 30b finally arrived

*Message #12 Posted by **Mike Morrow** on 22 Aug 2010, 7:08 p.m.,*
in response to message #11 by Tim Wessman

Yes, but what about us techno-geeks?

I really like what I've seen of the HP 30b, except for the very small program memory. It's much better than my 25-year-old HP-12C. It has a compact, classy, modern but high quality feel.

I'd love to see a similar machine with HP 42S capabilities (including IR printer and audio tone capability). I'd buy several of those in a heartbeat.

IMHO, the HP 30b is, overall, a very fine product.

Re: HP 30b finally arrived

*Message #13 Posted by **Katie Wasserman** on 22 Aug 2010, 7:04 p.m.,*
in response to message #10 by Mike Morrow

The processor used in the 20b/30b is the AT91SAM7L128 and is limited to just 2K of battery backed RAM. There's another 4K available for run time use but anything in that RAM would be lost at power down. I agree it's quite small, the same limitation that the HP-28C had, but without the overhead of RPL.

Adding an external 4K flash memory chip would allow for use of all 6K of RAM at minimal expense I think.

The AT91SAM7L128 does have a RTC subsystem and an independent low power 32KHz clock. All that would be needed to add this functionality to a 20b/30b is a cheap 32K crystal, no more than $0.20 in quantity and there's a provision for this on the PCB. You can do this yourself and "re-purpose" the calculator with time/date functions and whatever else.

I agree that it would have been nice to have this built into the 20b/30b firmware. This processor has 128K of ROM which seems like a huge amount to me, more than enough to include some time/date functions, but if you program it all in C/C++ (see the SDK) it's hard to make the most efficient use of that.

HP 9101A Memory Unit

*Message #1 Posted by **Rick Bensene** on 13 Aug 2010, 10:26 p.m.*

I recently came across a 9101A memory expansion unit for the HP 9100 calculators. I hooked it up to one of my HP 9100B machines, and found that it mostly works but there are some memory locations that always report that they are protected and no amount of fiddling with the settings change this behavior. I have cleaned all of the circuit board connectors and reseated boards with no improvement. I haven't been able to find any service info on this device. Does anyone here have insights into how to go about diagnosis and repair?

Bowling Challenge Variation

*Message #1 Posted by **Bill (Smithville, NJ)** on 12 Aug 2010, 9:30 a.m.*

Don's bowling challenge has led me to come up with a variation on it.

1. Each throw of the ball results in a prime number of pins falling.

2. No gutter balls allowed.

3. The running frame totals are prime.

What is highest game total?

Confession - I do have one solution but I have don't know what the maximum total could be.

Bill

Re: Bowling Challenge Variation

*Message #2 Posted by **Don Shepherd** on 12 Aug 2010, 4:07 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Well, let me start the "ball rolling" (sorry for the tired pun). Spares are tricky, I tried a couple of them and couldn't make much progress, but how about this for a start:

frame	1	2	3	4	5	6	7	8	9	10
roll	2,5	3,3	2,2	3,3	5,3	3,3	3,3	2,2	3,3	5,3
cum. score	7	13	17	23	31	37	43	47	53	61

Re: Bowling Challenge Variation

*Message #3 Posted by **Bill (Smithville, NJ)** on 13 Aug 2010, 6:56 a.m.,*
in response to message #2 by Don Shepherd

Don,

Very good. Spares are possible. Just to tease you, I have one solution with three spares in it.

Bill

Re: Bowling Challenge Variation

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 13 Aug 2010, 11:31 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

frame	1	2	3	4	5	6	7	8	9	10	
roll	5,5	3,1	3,3	7,1	5,5	2,2	3,3	3,3	1,7	5,5	2
cum. score	13	17	23	31	43	47	53	59	67	79	

Re: Bowling Challenge Variation

*Message #5 Posted by **Don Shepherd** on 13 Aug 2010, 11:37 p.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

Palmer, at the risk of starting world war III, 1 is not a prime number.

Don

Re: Bowling Challenge Variation

*Message #6 Posted by **Katie Wasserman** on 14 Aug 2010, 2:06 a.m.,*
in response to message #5 by Don Shepherd

1 is not a prime but the modern definition, but it used to be considered so and not all that long ago.

Besides, this would be an excellent reason for WW III, it sure beats race, land, resources and religion.

Edited: 14 Aug 2010, 2:08 a.m.

Re: Bowling Challenge Variation

*Message #7 Posted by **Bill (Smithville, NJ)** on 14 Aug 2010, 2:34 p.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

Hi Palmer,

Well, I hadn't really considered 1 as a prime, but as Katie showed, it could be.

Good solution using 1's, and three spares. As far as I can tell, 79 is the maximum that can be achieved without considering one as a prime. So it's interesting that by using 1, 79 can still be achieved.

I tried starting with 83 & 89 and working the frames backwards from the tenth frame with no success.

Bill

My non-geezer solutions

*Message #8 Posted by **Palmer O. Hanson, Jr.** on 14 Aug 2010, 9:29 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Since one isn't considered to be a prime number in modern times I will have to admit that a solution using ones is a geezer solution. The solutions below which don't use ones are my non-geezer solutions:

```
frame         1    2    3    4    5    6    7    8    9   10
roll        5,5  3,3  2,2  5,3  5,5  2,2  3,3  3,5  3,3  5,5  2
cum. score   13   19   23   31   43   47   53   61   67   79
```

and a second solution only changes the first two frames

```
frame         1    2    3    4    5    6    7    8    9   10
roll        5,2  5,5  2,2  5,3  5,5  2,2  3,3  3,5  3,3  5,5  2
cum. score    7   19   23   31   43   47   53   61   67   79
```

where both solutions yield 79, and I agree with Bill that a score of 79 may be the maximum attainable.

Palmer

Re: My non-geezer solutions

*Message #9 Posted by **Bill (Smithville, NJ)** on 15 Aug 2010, 6:37 a.m.,*
in response to message #8 by Palmer O. Hanson, Jr.

Hi Palmer,

Your second one matches the one I came up with.

I had tried several times to get a spare to work in the first frame, with no success. But I now see it is possible.

Thanks,

Bill

in response to message #26 by Sancerre (Phoenix)

Sancerre:

Thank you for your help. Here are couple of interesting quotes from the reference:

> Quote:
>
> Students who exhibit the correct understanding of the equal sign show the greatest achievement in mathematics and persist in fields that require mathematics proficiency like engineering, according to their research.

As a fan of algebraic I loved that quote. But I read on and here is another quote that troubles me:

> Quote:
>
> “Students who have learned to memorize symbols and who have a limited understanding of the equal sign will tend to solve problems such as 4+3+2=( )+2 by adding the numbers on the left, and placing it in the parentheses, then add those terms and create another equal sign with the new answer,” he explains. “So the work would look like 4+3+2=(9)+2=11.
>
> “This response has been called a running equal sign—similar to how a calculator might work when the numbers and equal sign are entered as they appear in the sentence,” he explains. “However, this understanding is incorrect. The correct solution makes both sides equal. So the understanding should be 4+3+2=(7)+2. Now both sides of the equal sign equal 9.”

So, here are some questions that may display my lack of familiarity with the way algebra is taught these days:

Do modern students really solve problems in algebra that way?

Is the use of adjacent opening and closing parentheses without anything enclosed a standard procedure? It isn't acceptable when using the solver in the hp-35s and will result in a syntax error. The syntax error can be avoided by enclosing a variable inside the parentheses, or by simply replacing the () with a variable.

I have stumbled on some even stranger examples of students using the running equal sign technique which suggest to me that the reason students in India, China, Turkey and elsewhere who do better do so only because they haven't been allowed to use the running equal sign technique.

Palmer

Re: 70% of US students don't understand the equal sign

*Message #28 Posted by **Don Shepherd** on 14 Aug 2010, 12:04 a.m.,*
in response to message #27 by Palmer O. Hanson, Jr.

> Quote:
>
> Do modern students really solve problems in algebra that way?

No. At least my students don't. The example quoted might be used to teach the student that the equality must be "balanced." That is, the value to the left of the equal sign must be the same as the value to the right of the equal sign. So they would fill in the parentheses with the value that would make that true. That's fine for teaching how things must be balanced, but it is not "solving" an algebraic equation.

An "algebraic equation" must contain a variable, something to solve for. The example shown is not an algebraic equation.

I wouldn't read too much into this example. Kids are learning algebra today the same way we learned it years ago, at least in most schools.

Re: 70% of US students don't understand the equal sign

in response to message #28 by Don Shepherd

I'll second what Don said. I also teach algebra the old fashioned way, with x's and y's. I think the problem may illustrate the idea of equations needing to be "balanced", but I don't think it's a good problem.

As far as the running equal, that's something I've not really seen at all.

Brian

Re: 70% of US students don't understand the equal sign

*Message #30 Posted by **Crawl** on 15 Aug 2010, 12:18 a.m.,*
in response to message #29 by bbeamer

Again, the question is ambiguous. There is no established meaning for (), so it's up to the student to guess what the question is asking. Really, the correct interpretation of the results is not "Students don't understand the equals sign" but rather "Students don't understand what the meaningless "()" symbol means ... but why should they?"

I recently saw another study -- was it linked here? -- that ALSO said that students don't understand the equals sign. But the test-makers in that case meant it to mean something completely different! There example was

a=5 b=2 a=b

So now what?

Of course, the answer is supposed to be that now a=b=2, but if you think "equals" always means "you must balance", then those statements made no sense.

In my opinion, teachers often do a very poor job of asking unambiguous questions. One example from my education I remember was when I was asked in an oral example about things traveling backwards in time. I had no idea what was being asked. I ventured, "Are you talking about tachyons?" That seems to me, then as now, to be a reasonable interpretation of the question. Then they rephrased the question, "No, I mean does time have an arrow?" Well, phrased that way, I immediately knew they were talking about entropy. Although in that case, it wasn't so much a question testing my understanding of entropy so much as a test of me having read A Brief History of Time, and knowing that specific

phraseology from it.

*Message #31 Posted by **bbeamer** on 15 Aug 2010, 4:46 p.m.,*
in response to message #30 by Crawl

Yes, context is important. In this example, the context seems to be more related to programming than to algebra and the = is interpreted as "is assigned the value" .

I think I would agree with crawl. Just that statement with no other directions would be ambiguous as best, meaningless at worst. If this was a problem in a math textbook or workbook and the directions for the problem stated: "In the following problems, enter a value within the parentheses that makes both sides of the equation equal, such as 3+5+1=(**4**)+4+1", then that would be reasonable.

In the absence of a clear instruction like that, the problem is meaningless and it would be impossible to draw any valid conclusions from the answers provided by the students.

That's my opinion.

in response to message #1 by DavidShenk

I vote for the KR "C"´s implementation:

= is attribution, so 'A=2' is not "A is equal to two", instead it is "Attribute 2 to variable A";
== is a relational operator, so 'A==2' is not "Attribute 2 to variable A", instead it is "A is equal to two", and a 'TRUE' or a 'FALSE' flag returns.

No doubts about, no double interpretation. But hey, when the equals sign was created there was no such thing as a programmable computer nor programming languages, right?

Cheers.

Pascal totally avoids the ambiguity by using **:=** for assignment. So does the **LET** instruction in BASIC (when it's not omitted).

Cheers,

Gerson.

I found the following discussion at this site: http://castingoutnines.wordpress.com/2010/08/11/student-misunderstanding-of-the-equals-sign/"

> Quote:
>
> The biggest problem I seem to encounter with “=” sign use is that students use it to mark a transition between steps in a problem. For example, when solving the equation for x, you might see:
>
> 3x - 2 = 10 = 12 = x = 4
>
> The thought process can be teased out of this atrocious syntax, but clearly this is not acceptable math — even though the last bit of that line (x=4) is a correct statement. If the student would just put spaces, tabs, or even a semicolon between the steps, it would be a big improvement. But many students are so trained to believe that the right answer — the ending “4? — is all that matters, they have little experience with crafting a good solution, or even realizing that a mathematical solution is supposed to be a form of communication at all.

Do some mathematics teachers really allow stuff like that? We would have discouraged it when I was teaching algebra by grading not only the solution but also the solution process.

Palmer

*Message #36 Posted by **Don Shepherd** on 16 Aug 2010, 6:23 a.m.,*
in response to message #35 by Palmer O. Hanson, Jr.

> Quote:

> Do some mathematics teachers really allow stuff like that?

Good God no!!!

As I teach algebra, the equals sign separates the two sides of an equation, and there better be one per each line when you re-write the modified equation, and each line is a step of solving the equation. It better look something like this:

```
3x-4=8
  +4 +4
3x  =12
/3   /3
x   =4
```

Re: 70% of US students don't understand the equal sign

*Message #37 Posted by **Walter B** on 18 Aug 2010, 1:51 a.m.,*
in response to message #36 by Don Shepherd

FYI, we were taught this way some decades ago to solve such problems:

```
3x-4=8    | +4
3x  =12   | :3
x   =4
```

Unambiguous, one line per step, easy to follow, economic. But only possible where you write a real 1. Sorry d8-)

> Walter, I kind of like that style, but what do you mean by "only possible when you write a real 1"?

I didn't originally make the effort to 'get the reference' at first, but I see it now.

Europeans write the numeral "one" with a 'streamer' connecting to the top. Americans tend to write only a vertical line segment, which could be confused with the vertical bar in Walter's notation.

Re: 70% of US students don't understand the equal sign

*Message #41 Posted by **Don Shepherd** on 18 Aug 2010, 3:10 p.m.,*
in response to message #40 by Karl Schneider

So he's really referring to the delimiter between the equation and the steps you take to solve it, here.

Like I say, I kind of like this approach but it's not taught this way in the US and, as a teacher, I would be reluctant to teach it to my students when the next math teacher they have may not understand it.

Re: 70% of US students don't understand the equal sign

*Message #42 Posted by **Walter B** on 18 Aug 2010, 4:41 p.m.,*
in response to message #41 by Don Shepherd

Don,

there is a single vertical stroke in each line, no continuous line over the whole calculation. Behind that stroke stands the operation to be applied to both sides of the equation in the respective calculation line, resulting in the next line. The stroke will stay close to the right end of an equation. So particularily in the process of reducing long formulae, the stroke will wander to the left from line to line. Another nice thing is you may use this notation in matrix algebra as well.

And Karl is right, at least in good ol' Germany people write 1 like printed here, but without the horizontal bar at the bottom. OTOH, a handwritten 7 often gets an extra horizontal stroke through its middle.

Re: 70% of US students don't understand the equal sign

*Message #46 Posted by **Jeff Kearns** on 21 Aug 2010, 7:41 p.m.,*
in response to message #45 by Massimo Gnerucci (Italy)

The Continental Europeans and French Canadians among others (I was educated in French in Quebec), and presumably most non-anglophone Americans (North and South), generally do not confuse the 1 and 7 in hand-written form, by adding the horizontal line across the seven.

In a high school math book, I recall learning that there is apparently a historical reason why this is so, as well as why the '1' is written with the upward slash almost like an inverted 'v' but without the horizontal line at the base; if you write all numbers from 1-9 'properly', using straight lines, you should have a number of acute + right angles equal to the number itself. A little creativity is required for the 9, as I recall... This explains the horizontal line in the 7. Try it! The zero is no exception, of course; no angles at all in a circle.

an interesting challenge

*Message #1 Posted by **Don Shepherd** on 10 Aug 2010, 9:18 p.m.*

Now here is something very interesting. I'm not sure it requires a program to calculate, although you may try.

What is the highest possible score in a standard game of bowling if your score in each of the ten frames is required to be a prime number?

Re: an interesting challenge

*Message #2 Posted by **Karl Schneider** on 10 Aug 2010, 11:27 p.m.,*
in response to message #1 by Don Shepherd

> Quote:
>
> What is the highest possible score in a standard game of bowling if your score in each of the ten frames is required to be a prime number?

Note to international readers: this is 10-pin American bowling, not German 'Kegeln' or other game...

- The player throws twice in each of ten frames, or until all ten pins are knocked down, whichever comes first.
- For a 'strike' (all pins down in one throw), the player gets to add the number of pins knocked down in the next two throws.
- For a 'spare' (all pins down in two throws), the player gets to add the number of pins knocked down in the next throw.

So, a score in one frame may be contingent on the success in subsequent frames. A perfect game is 12 strikes, for a score of 300, because up to two extra throws can be allowed in frame 10.

There's the trivial solution of a seven in every frame for a total of 70, but we can do better...

Assume strikes in frames 1 and 2, followed by a nine and a miss (zero) in frame three. This gives 29 and 19 as the scores in frames 1 and 2 (excellent!), but leaves a non-prime nine in frame 3. A nine as the first throw in frame 3 leaves no acceptable outcome, so we must make the next-largest prime: 23.

Now assume strikes in frames 1 and 2, followed by a three and a four in frame 3. This gives 23 and 17 as the scores in frames 1 and 2, with a seven in frame 3 -- all primes.

Repeat that sequence twice for frames 4-9, then two strikes and a nine in frame 10:

3(23 + 17 + 7) + 29 = 170.

That's my best answer...

-- KS

Thanks, Karl. According to my source, that is not the correct answer. I'll leave it at that for now.

Don

Re: an interesting challenge

*Message #4 Posted by **Don Shepherd** on 10 Aug 2010, 11:38 p.m.,*
in response to message #2 by Karl Schneider

And the 10th frame final score of 170 is not a prime number!

Re: an interesting challenge

*Message #5 Posted by **Bart (UK)** on 11 Aug 2010, 10:31 a.m.,*
in response to message #4 by Don Shepherd

You said:
"score in each of the ten frames"
means the score of each *individual* frame (which still would depend on the consecutive frame depending on spare/strike).

But if you had said:
"the ten frame scores" or "the scores of the ten frames"
it could be interpreted as the score at the end of each frame, i.e. cumulative, as is the norm of the scoring.

"each of" implies individual, don't complain when people interpret correctly what you say rather than what you think you are saying. Although the second way of stating it could still be open to mis-interpretation, you could correct those less familiar with scoring norms without exclamation marks and examples of how wrong they are.

Re: an interesting challenge

*Message #6 Posted by **Don Shepherd** on 11 Aug 2010, 12:22 p.m.,*
in response to message #5 by Bart (UK)

Bart, I used the same language that was used in the source of this riddle. I assumed that those who know about how bowling scores are calculated know that "score" = cumulative score, not the pins knocked down in an individual frame. Bowling score sheets have a little box at the top of each frame where you record either the pins knocked down (on each of two throws) or strike (X) or spare(/). But then, when you can--and this might be two frames later--you write the final cumulative score in the bigger part of the box for each frame, at the bottom. So if you realize that "score" = cumulative score, then the language "score in each of the ten frames" means the cumulative score as recorded in each frame, and those 10 numbers must all be prime.

My post about 170 not being a prime number was written before I realized that Karl had interpreted "score" as an individual frame score, which was not the intent.

And I didn't "complain." Don't interpret an exclamation point as a "complaint." I merely pointed out that 170 was not prime and it has to be given what "score" means in this context.

Don

Re: an interesting challenge

*Message #7 Posted by **Bart (UK)** on 12 Aug 2010, 5:16 a.m.,*
in response to message #6 by Don Shepherd

> Quote:
>
> I assumed that those who know about how bowling scores are calculated know that "score"

Your replies came after Karl's message clearly highlighted that those outside the US may not be that familiar with the game.

> Quote:
>
> My post about 170 not being a prime number was written before I realized that Karl had interpreted "score" as an individual frame score, which was not the intent.

It was followed by a terse one liner that "cumulative" was the norm and a reference to a single obcure picture of a scoring card, rather than - as Karl did - a link to the whole article so as to benefit the wider international audience of the forum.

It may or may not have been your intent, but your messages *cumulatively* did come across as "stupid man, do you not know that". May I kindly remind you that there is a "rest of the world" outside the US.

Re: an interesting challenge

*Message #8 Posted by **Don Shepherd** on 12 Aug 2010, 7:42 a.m.,*
in response to message #7 by Bart (UK)

Bart, if you were offended by anything that I wrote, and apparently you were, then I'm sorry. But, honestly, I don't care.

My purpose in posing this problem was not to educate the rest of the world on how bowling is done. It was to offer an interesting problem related to mathematics. And two people were able to arrive at the final solution, and I congratulate them, and I hope that some of us learned something in this little exercise.

Don

Re: an interesting challenge

*Message #9 Posted by **Mike** on 11 Aug 2010, 5:04 p.m.,*
in response to message #5 by Bart (UK)

Someone said: "score in each of the ten frames"

You replied: means the score of each individual frame (which still would depend on the consecutive

frame depending on spare/strike).

I reply:

You don't bowl, do you. The score "in each frame" has been the accumulated total, since the game was invented. :-)

Re: an interesting challenge

*Message #10 Posted by **Bart (UK)** on 12 Aug 2010, 5:38 a.m.,*
in response to message #9 by Mike

Now your message *really* comes across as "stupid man, do you not know that". May I kindly remind you also that there is a "rest of the world" outside the US.

By the way, I have bowled (not as a regular, but 2-3 times a year), and though I may not be good at it I do know how it works (here in the UK it's the same). However, it was clear from Karl's first post that perhaps many don't, but would still like to attempt the challenge. A simple explanation and a link to the article as in Karl's second post would have been so much more beneficial rather than a few terse sentences and a link just to an obscure picture of a scorecard.

Now, I particularly like the article on scoring primes, certainly a challenge for my next game.

Re: an interesting challenge

*Message #11 Posted by **Martin Pinckney** on 12 Aug 2010, 9:29 a.m.,*
in response to message #10 by Bart (UK)

Bart, with all due respect, in this interchange between you and Don, I for one did not read anything condescending in Don's original messages. Explaining bowling scoring to "the rest of the world" is another matter.

Perhaps it's a language thing. After all, we *are* "two people separated by a common language."

Don, saying "I'm sorry... but I really don't care" is contradictory, shall we say?

My contribution to international relations for today. :-)

Re: an interesting challenge

*Message #12 Posted by **Don Shepherd** on 12 Aug 2010, 10:23 a.m.,*
in response to message #11 by Martin Pinckney

Thanks Martin.

Contradictory? I considered that possibility, but here are my thoughts.

I'm sorry that anyone would or could interpret things I wrote as offensive to anyone because, as you pointed out, that certainly was not my intent. I thought the language I used would be perfectly clear to anyone familiar with bowling. Everyone should know that we're talking about the cumulative score as listed in each frame. And so in my original post I used the exact language from the book where I first read about this riddle. I would not have predicted that this brouhaha would have ensued, and I'm sorry that it

did too.

And I would think that a "terse" explanation would be better than a lengthy explanation, but if someone doesn't see it that way, and reads offense in it, well I'm sorry about that too.

But, ultimately, I'm not going to care if someone misinterprets or feels otherwise offended because there are much bigger problems in the world to be concerned about, and life's too short to dwell on things like this.

Hope this helps.

I'm beginning to understand why we don't hear from our friend V anymore.

Don

Then you should have stated, "cumulative score". It's been a long time since I bowled, but don't the traditional score sheets have a place in each frame for the frame score and the running total? This facilitates manual addition, particularly in the era before automatic scoring. (The pinsetting machine was invented only in 1962.)

Accumulating the score as you go makes sense for convenience, and to see who's ahead.

A prime-valued cumulative score makes for a much more difficult challenge -- probably best suited for a computer program.

Re: an interesting challenge

*Message #17 Posted by **Don Shepherd** on 11 Aug 2010, 12:13 a.m.,*
in response to message #16 by Karl Schneider

Here is an example of a bowling score sheet. The cumulative score goes in the big area at the bottom, those are the numbers that have to be prime.

Don

Re: an interesting challenge

*Message #18 Posted by **Karl Schneider** on 11 Aug 2010, 1:06 a.m.,*
in response to message #17 by Don Shepherd

Don --

The webpage where you apparently obtained that particular photo also lists frame scores under "Breaking Down a Sample Score".

Alas, of the scoring sheets offered at the sites found by web-search, I did not see any that provided a designated place to write frame scores. This may explain why arithmetic-challenged folks scribbled in the margins when necessary. Having frame scores (intermediate results) written down would have helped prevent errors in the old days of manual scoring -- a lesson on the virtues of RPN!

Another lesson pertaining to calculators and other electronic ADP equipment: Some of these sites discuss how people are forgetting (or never learned) how to score manually, because the automated systems do everything for you...

Re: an interesting challenge

*Message #19 Posted by **Don Shepherd** on 11 Aug 2010, 7:51 a.m.,*
in response to message #18 by Karl Schneider

You are right, the "frame scores" were typically not written on the standard bowling score sheets. I think the cumulative score was deemed much more important, so that the current leader would always be known.

I'm sure many newbies to bowling today have no idea how the score is calculated, since all the bowling alleys I have been in lately use automated scoring equipment. When I was growing up in the 50's and 60's, bowling was big; my mother was always in a league at the local alley, and everyone learned how to keep score. And if you were serious about it, you bought your own bowling ball and shoes (I've still got mine from around 1970; alas, the shoes don't fit anymore).

I took my 8th grade math class bowling a couple of years ago (very small school, only 3 girls in the 8th grade). They had bowled before, and loved it.

Don

Re: an interesting challenge

*Message #20 Posted by **Karl Schneider** on 11 Aug 2010, 11:31 p.m.,*

> Quote:
>
> You are right, the "frame scores" were typically not written on the standard bowling score sheets. I think the cumulative score was deemed much more important, so that the current leader would always be known.

I noticed that some of the template score sheets provided two small boxes for recording the throws and a generous amount of space in each frame; others were compact and offered only one small box. I'll bet that many folks wrote down the frame score in small numerals on the left side of the frame box, space permitting. That might be helpful for mid-game scores like, e.g., 86 + 27 = 113.

Yes, cumulative summing keeps the players abreast of the situation, but the scores of good bowlers are always a frame or two behind in tabulation. The more important reason for as-you-go cumulative summation is so that the scorer didn't have to add up all the frames at the end, without benefit of an adding machine or calculator.

This brings to mind several features -- which may likely be a reality -- of automatic scoring:

1. An option to hide the frame and cumulative scores, then compute final scores at the

end of the game, leaving the identity of the winner a possible surprise.

2. Showing the *minimum and maximum* cumulative scores for a frame (pending subsequent throws) in a different color, until the results are complete.

> The more important reason for as-you-go cumulative summation is so that the scorer didn't have to add up all the frames at the end, without benefit of an adding machine or calculator.

Karl, as another poster pointed out, bowling scores have always been done this way, with the cumulative score being the prominent feature of each frame. In league play, before the advent of automated scoring, most alleys had projectors that displayed the handwritten entries on a screen above the alley, for all to see. Bowling was very competitive, and everyone wanted to see which team was ahead of the other. Sometimes bets were made, and there was keen interest in the current score. The little box (or, as you say, sometimes boxes) at the top were really there only for the purpose of calculating the cumulative score, especially for strikes and spares. And every bowler knew how to keep score. For many, probably, it was the only math they used on a regular basis.

In recent years, with the automated scoring system, I've only been bowling about 3 times, so I can't speak to the options available in those automatic scoring systetms. But I'd be very surprized if they have an option to suppress the cumulative score until the end of the game. Imagine a football or basketball game where the scoreboard was blank until the end of the game. I think the fans would revolt!

Thanks for participating in this little exercise.

Don

I am not unfamiliar with any of this. I've a bowled a few times (decades ago), and I've been inside bowling alleys over the years. Next opportunity, I'll take a closer look at the scoring technology inside the alley I pass by on a routine basis.

> Quote:
>
> Bowling was very competitive, and everyone wanted to see which team was ahead of the other. Sometimes bets were made, and there was keen interest in the current score.

Of course, in the case of good bowlers, that 'current score' is rarely known precisely, due to the need for adding the results of one or two pending throws. Still, it would make little sense not to accumulate scores 'as you go', especially when the arithmetic was done manually.

> Quote:
>
> The little box (or, as you say, sometimes boxes) at the top were really there only for the purpose of calculating the cumulative score, especially for strikes and spares.

Hmm? They are there for recording the results of the individual throws...

Imagine a football or basketball game where the scoreboard was blank until the end of the game. I think the fans would revolt!

I'd also thought of the (American) football or basketball comparison: Football and basketball are clock-driven, and a team's strategy and tactics as the clock winds down will be influenced by the ahead-or-behind standing. Bowling, like baseball, is not clock-driven. Also, I doubt that a player's objective would normally depend on the score: just try to roll strikes and spares each time. (Knowing he's behind, though, may put some pressure on a player.)

> I doubt that a player's objective would normally depend on the score: just try to roll strikes and spares each time.

I fully agree. A bowler's strategy is to get as many strikes as possible. Failing

that, spares. Failing that, just knock down as many pins as you can. That is the strategy, regardless of the current score. But the goal is to beat the other players (if you are in a league, especially, and especially if there is money riding on it, which is not uncommon). And to beat the other players, you need to know where you, and they, currently stand. Hence, cumulative score.

If you're bowling for fun, which is what I have always done, your goal is just to have a good time.

Re: an interesting challenge

*Message #26 Posted by **Alex L** on 11 Aug 2010, 10:54 a.m.,*
in response to message #25 by Don Shepherd

Here's the result of manually applying a greedy algorithm...

```
X   X   3/  8/  8/  8/  6/  8/  X   XXX
23  43  61  79  97  113 131 151 181 211
```

Curious to see if there are improvements.

Re: an interesting challenge

*Message #27 Posted by **Don Shepherd** on 11 Aug 2010, 12:05 p.m.,*
in response to message #26 by Alex L

Alex, a higher score is possible.

Don

Re: an interesting challenge

*Message #28 Posted by **Alex L** on 11 Aug 2010, 1:02 p.m.,*
in response to message #27 by Don Shepherd

I figured more might be possible, looking heuristically for runs of primes separated by 30 & 20...

```
 -/  7/  X   X   X   X   X   42  -/ XXX
 17  37  67  97 127 151 167 173 193 223
```

The two gutter balls can actually be any rolls.

in response to message #30 by Don Shepherd

I'm actually enjoying working this problem manually. But I have to think that with 6 consecutive strikes and no open frames, I've got to be close.

At least I've narrowed down any brute force search. :)

```
 -/  7/  X   X   X   X   X   X   2/ 2/8
 17  37  67  97 127 157 179 199 211 229
```

** after posting, I see that Jeff O. beat me to this score. **

*Message #32 Posted by **Bill (Smithville, NJ)** on 11 Aug 2010, 8:59 a.m.,*
in response to message #1 by Don Shepherd

Don,

Very interesting challenge. What's interesting is the question "do you want to maximize the first frame score", or would a lower score in the first frame ultimatelly result in a higher total score.

From a calculation point, I'm thinking a brute force recursive method would solve it on a computer, but wouldn't work on a calculator.

For the mathematical bowlers, you might want to try the following bowling game next time at the lanes:

Rules for Bowling for Primes

Bill

I like it, but the scoring is a little complex and hard to remember. Maybe we can convince Nintendo to add this option to their Wii bowling games. I'm sure the retired mathematicians in the Wii bowling league will appreciate this. For brick and mortar bowlers, this would be a perfect program to put on your favorite, programmable HP calculator.

Re: an interesting challenge

in response to message #1 by Don Shepherd

This is starting to look hard.

If this problem is extended to an arbitrary number of frames (greater than 10), could someone here figure out if it's another one of those NP-complete problems? Maybe we can get the Clay Institute to offer up $1,000,000

:-)

Re: an interesting challenge

*Message #35 Posted by **Alex L** on 11 Aug 2010, 1:38 p.m.,*
in response to message #34 by Ken Shaw

Once the score reaches 1327, there's a prime gap of 34, so no next frame score is possible (Wikipedia - Prime Gap). So there's an upper bound on the number of frames.

Re: an interesting challenge

*Message #36 Posted by **Ken Shaw** on 11 Aug 2010, 2:27 p.m.,*
in response to message #35 by Alex L

I guess that was obvious. Oops.

Jeff and Alex, congratulations, you got it. You are steely-eyed misslemen, or at least math whizzes.

My source.

Re: an interesting challenge

*Message #39 Posted by **Jeff O.** on 11 Aug 2010, 3:38 p.m.,*
in response to message #38 by Don Shepherd

Well, I don't think that I "devised an ingenious solution to a tough problem under extreme pressure." There was no pressure, other than the glory of being first to get the correct answer in a very clever group. Not a math whiz either, got it more or less by trial and error. Figuring the highest score would start with two strikes, I then tried "rolls" that continued to give prime numbers. If I hit a dead end, I back-tracked and tried again. The best I could do starting with two strikes was 193, which did not seem very high. Then I tried starting with one strike and came up with 193 again. I thought I tried starting with a spare, but if so I must have made an error because as Alex demonstrated, doing so can lead to the correct answer. I ended up going with an open first frame with the highest score possible, 7, and went from there. Helped a lot that 37, 67, 97, 127, and 157 are all primes, as seven strikes in a row does a lot to get a good score.

Regarding your source, great, another book about prime numbers that I will have to buy. I already have "Music of the Primes" and "Prime Obsession" (which is an awesome book that didn't make me feel too stupid.) I'm sure there many, many more books about prime numbers, but I only have so much time to read such things.

Re: an interesting challenge

*Message #40 Posted by **Don Shepherd** on 11 Aug 2010, 4:19 p.m.,*
in response to message #39 by Jeff O.

Thanks, Jeff. As you and Alex showed, there is more than one solution (first frame 7, first frame 17). The book's solution is first frame 17. The book's authors claim that 229 is the highest score possible, and I was wondering if anyone here in this august group might find a higher score, and we could write the authors and tell them they are wrong.

I thought it was an interesting problem, if not earth-shaking. It does make you do one thing that seems to have diminished importance today, and the word was an IBM motto for many years: think.

Congratulations to you and Alex again (and everyone who contributed) and thanks for participating.

Edited: 11 Aug 2010, 4:20 p.m.

Re: an interesting challenge

*Message #41 Posted by **Egan Ford** on 11 Aug 2010, 5:24 p.m.,*
in response to message #40 by Don Shepherd

I would argue that Alex's 223 solution is the practical highest since the 229 solutions (there is more than one) requires that 2 pins be knocked down on the first ball. Near impossible.

Maybe that can be the HHC 2010 challenge--knock down 2 pins on the first ball.

Edited: 11 Aug 2010, 5:24 p.m.

Don:

In response to the statement that getting two pins on the first ball was nearly impossible you wrote

> Quote:
>
> Near impossible? Bowl with me sometime and you'll change your mind!

I think getting two on the first ball is about as likely as a golfer getting a hole-in-one. It is particularly unlikely for a bowler who has just got the string of strikes in the solution. While I can't recall seeing a two on a first ball I can recall seeing a bowler pick up a seven-ten split but I can't recall if a rebound from the pit was involved.

My bowling experience predates yours. My high school had an intramural coeducational bowling league in my senior year (1946). I was also on a team that competed (ineptly, in my case) interscholastically.

I also did some pin setting. That was one of the best paying jobs for teen age boys in those days but it was a little dangerous.

Palmer

> Quote:

> I think getting two on the first ball is about as likely as a golfer getting a hole-in-one. It is particularly unlikely for a bowler who has just got the string of strikes in the solution.

You may be right, but I've had some pretty bad rolls in my day and I seem to recall my ball just barely hitting the 7 pin and the 7 pin then knocks over the 8 pin (or, on the other side, the 10 pin and 9 pin). I've also got many a 7-10 split for hitting the 1 pin headon, rather than aiming for the "pocket" which I've never been able to do consistently. I know I've never converted a 7-10 split into a spare, but many a time I've hit either the 7 or the 10!

Yeah, the likelihood of getting a string of strikes and THEN getting a 2 would appear to be pretty small, I admit.

And I've rolled many a gutter ball, but I'm too proud to ask for bumpers today!

*Message #3 Posted by **Jonathan** on 10 Aug 2010, 1:41 p.m.,*
in response to message #2 by Joel Setton (France)

Thanks a lot!!!!!!! Now I can repair my calculator, I will need time but now I can repair my calculator :-)

Re: How to repair my HP 9100A calculator ?

*Message #4 Posted by **Katie Wasserman** on 10 Aug 2010, 1:55 p.m.,*
in response to message #2 by Joel Setton (France)

I'm not so sure the service manual will help. It has schematics for the power supply and video driver boards but nothing else. It, like many of the HP calculator repair manuals, suggest swapping boards. Which might be an ok thing to do (I know that Tony will disagree) but only if you have a bunch of spares.

-Katie

Re: How to repair my HP 9100A calculator ?

*Message #5 Posted by **Jonathan** on 10 Aug 2010, 2:05 p.m.,*
in response to message #4 by Katie Wasserman

Perhaps... but I think there is a first problem with the power supply of the calculator (there is only a point on the screen) and with this manual I will be able to test voltage. Of course after perhaps there will have a second problem with logic system... but if I can just repair it in order the normal display appears, I will be very happy! :-)

Re: How to repair my HP 9100A calculator ?

*Message #6 Posted by **Israel Otero** on 10 Aug 2010, 4:27 p.m.,*
in response to message #5 by Jonathan

Hi from Puerto Rico

These are very robust machines. In 1983 a service technician, that serviced the University of Puerto Rico Natural Sciences Faculty's computer centre HP-2000 Basic Access System give me a HP-9100A and he told me that he did not know if the machine worked or not (the only thing given was the power cord) I went home, plugged it in and after waiting more than 5 minutes the image on the display started to show and after that it continuing working fine ever since. Once in a while I fire it up to make sure is working as I live in the Caribbean and heat and humidity make difficult for the calculator to boot sometimes. But it is still there with me. As a matter of fact is the oldest electronic device I own. When this machine was launched in 1969 I was 15 and on high school, and I never dreamed of still having a technology of the sixties as revolutionary as this one is. On this year along with, UNIX, the Apollo Guidance Computer are the three concepts that were to change the next decade for portable operating system written in a high level language, first navigational portable computer, and the personal computer (for engineers and scientists only at least) that made me part of the history of achievements to dedicate the rest of my life to love HP classic calculators, UNIX/Linux and space exploration.

I hope Jonathan that you will able to repair your HP-9100 soon.

It represents to me the eternal truth of an ethical corporation as HP was in it's golden years and a pleasure to me to share and be here with everyone of you.

in response to message #6 by Israel Otero

Thanks for your story! It's always very interesting to listen this! This period of the beginning of the computers should have been very exciting! Nobody have invented yet the time machine ??? :-)

Re: How to repair my HP 9100A calculator ?

*Message #8 Posted by **Israel Otero** on 12 Aug 2010, 4:57 a.m.,*
in response to message #7 by Jonathan

Israel Otero from Puerto Rico.

Thanks Jonathan for your kind response.

One thing that I learned is if you want to know something very well, you need to study from its earliest beginnings so you grasp, value and make you understand it and in some way love it better. That's why history is so interesting to me.

Talking of that special year of 1969 Linus Torvalds the creator of Linux born in that year too (28.12.1969) I just discovered it today.

I see things in life linked because of the relation of dates and facts and that eases understanding.

I wished so many times that someone could invent a time machine too. Let propose it to HP

to do it. :-).

I love to know about those beautiful people who love these devices, they make feel happiness and my life has a purpose.

Let wish your HP 9100 will be alright soon.

Re: How to repair my HP 9100A calculator ?

*Message #9 Posted by **Jonathan** on 12 Aug 2010, 12:48 p.m.,*
in response to message #8 by Israel Otero

Ok for the inventor who will create the time machine: Don't forget to come back with many HP 9100A! :-) You can see my HP 9100A here: http://procedural-objects.pagesperso-orange.fr/collection.htm Have you got other calculators or just only this ? Kind regards

Re: How to repair my HP 9100A calculator ?

*Message #10 Posted by **Israel Otero** on 12 Aug 2010, 3:42 p.m.,*
in response to message #9 by Jonathan

Israel Otero from Puerto Rico

Hi Jonathan,

Unfortunately this only one I have.

I have some other HP calculators about a couple of them because of sentimental value. But a collection as such no. The ones I have were given to me when I was a student or purchased by me when they were at sale.

I feel that those machines are to be used and enjoyed because there is always persons like you are that are able and lucky enough to start and maintain a proper collection large enough to be relevant historically.

I wish you that you are able to keep growing your collection and in the future land in the hands of a person or group that value it and take proper care.

Re: How to repair my HP 9100A calculator ?

*Message #11 Posted by **Tony Duell** on 11 Aug 2010, 4:07 a.m.,*
in response to message #5 by Jonathan

The display is entirely driven by the processor section. If the digital side is malfunctioning, you will get no display (or maybe just a dot). And while (obviously), 'no display' can be caused by a problem in the CRT driver cirucits or PSU, most of the time it is a logic problem.

From the Australian museum site you can get the official HP service manual ('boardswapper guide' :-)), the interfacing manual (you may wonder why you need this -- it's actually the most technical of all the 9100 manuals and is well worth reading), but no full schematics. I don't own a 9100A, you see... But there are 9100B scehamtics that might be a starting point.

The 9100A and 9100B are similar in some areas and quite different in others. From what I remember :

The flip-flop boards are the same

The control logic (clock and core-on-a-rope microcode) board is similar, different ROM programming, but otherwise much the same

The core memory system is very different (but similar is design concepts?)

The main ROM/gate board assembly is different (again similar concepts?)

The keyboard is pretty similar.

The card reader is different

The entire top case, PSU and CRT circuitry is the same.

Now, getting started...

Firstly, I would take the whole machine apart (this includes removing the 'sideboards' that connect the ROM to the gating board) and clean all the edge contacts. Look for silly faults too at the same time.

Check the 3 fuses (mains, -15V supply, EHT supply) on the PSU chassis in the top case. Also check the 3 little filament lamps up there, you need them for the tests.

Reassemble, but leave the card reader out for the moment. You must connect the keyboard (the machine will not run if there keyboard is not present). Power up.

Check the -15V supply to the logic. Normally, if the 2 lamps that illuminate the register label to the right of the CRT are lit then the -15V supply is OK, but it's worth checking.

Press STOP twice (in case the thing is stuck in a running program), the do something that will cause an error -- 1, CHS, SQRT is my normal sequence. If the error lamp (left of the CRT) comes on, then the processor is basically working, so troubleshoot the CRT driver circuits

Check the CPU clock is running (test connector on the control logic board, leftmost in the cardcage). Check the various bias supplies on that connector (and on the flip-flop board connectors).

Now, some of the flip-flops are the program counters for the microcode and firmware ROMs. I can look up which ones they are for the 9100B, but the -A may well be different. If you can find them (I can give you hints...) then check the outputs (E and F signals) on the test connectors on the flip-flop boards. All should be toggling. If not, either the flip-flop is defective, or the logic driving it, or...

A 'silly' that will remove the display is a lost of the mains sync signal (the display routine is synchronised to the mains to prevent flicker). In the 9100B it's a transsitor on the right sideboard -- no idea where it is on the 9100A, but tracing the AC signal in the PSU cableform should find it.

Re: How to repair my HP 9100A calculator ?

*Message #12 Posted by **Jonathan** on 11 Aug 2010, 3:13 p.m.,*
in response to message #11 by Tony Duell

Hello, thanks a lot for your knowledge about this computer. My father works in electronics and he will help me to try to repair it. Of course I will tell on this place my progress on the problem. Kind regards

Re: How to repair my HP 9100A calculator ?

*Message #13 Posted by **Donald Williams** on 10 Aug 2010, 4:48 p.m.,*
in response to message #1 by Jonathan

In case you have not already done so, I suggest you remove all the boards (one at a time), clean the edges, and securely re-seat the board. Then try it again.

Re: How to repair my HP 9100A calculator ?

*Message #14 Posted by **Jonathan** on 11 Aug 2010, 3:24 a.m.,*
in response to message #13 by Donald Williams

Thanks, but like I said, into it's practically new. But ok I will clean all the connectors. Just in case, do you know if somebody had a same problem with his HP9100 ? Kind regards

Re: How to repair my HP 9100A calculator ?

*Message #15 Posted by **Tony Duell** on 11 Aug 2010, 4:09 a.m.,*
in response to message #14 by Jonathan

I've got a couple of 9100Bs that have had similar problems.

One time it was a defective address driver transistor on the main ROM PCB. The other time it was a defective transistor on the microcode branch logic on the left sideboard.

Basically, a 'no display' fault can be almost anywhere in the machine.

PIL Box - communication with an external HP71B

*Message #1 Posted by **Roland Storz** on 10 Aug 2010, 4:08 a.m.*

Hello, since a couples of years I did use the ISA HPIL board, however, since I was trying to switch to PIL Box I have to admit I'm somehow lost (frankly speaking I do not feel like an HPIL expert).

I do hope somebody could briefly describe his procedure how to exchange files from the Emu71 HDRIVE1 to a real HP71B and backwards?

My "simple" environment looks as follows: Emu71 (latest version), PIL Box (via COM2), ILPer (via COM2), real HP71B

FTDI driver installed (driver setup OK), ILCtrl shows Device ID (1): HP71, ILper shows my "hdrive1.dat" in Mass Storage LIF file: (nothing else, no error message)

In the past I used the following procedure, which worked perfectly:

- communication with an external HP-71B To exchange program and data files with an external HP-71B, just make it a device by typing CONTROL OFF on the HP-71B. Then do RESTORE IO on Emu71. You can now copy files between Emu71 and HP-71B. Emu71 to HP-71B: do 'COPY :LOOP' on the HP-71B do 'COPY file TO :HP71' on Emu71 HP-71B to Emu71: do 'COPY file TO :LOOP' on the HP-71B do 'COPY :HP71' on Emu71

I would be very grateful for any help, Many thanks in advance, Roland,

Re: PIL Box - communication with an external HP71B

*Message #2 Posted by **Raymond Del Tondo** on 10 Aug 2010, 12:59 p.m.,*
in response to message #1 by Roland Storz

IIRC, you have to use the HDRIVE as buffer when using the PIL box.
Thus, a COPY file TO :TAPE (or whatever addr the HDRIVE is) should work;-)

However what does the doc say?

HTH

*Message #3 Posted by **Roland Storz** on 11 Aug 2010, 8:21 a.m.,*
in response to message #2 by Raymond Del Tondo

Raymond, thanks for the advice, I will try tonight,

by the way, which doc are you refering to, is there anything available to look at?

Thanks again, Roland

Re: PIL Box - communication with an external HP71B

*Message #4 Posted by **Roland Storz** on 11 Aug 2010, 1:21 p.m.,*
in response to message #2 by Raymond Del Tondo

Raymond,

the COPY to :TAPE works fine, however, to copy the file to :HP71 does not work, on my real HP71b I got: PILERR: File not found

Do you have any idea, what I could try to overcome

Thanks in advance, Roland

Re: PIL Box - communication with an external HP71B

*Message #5 Posted by **J-F Garnier** on 24 Aug 2010, 12:50 p.m.,*
in response to message #4 by Roland Storz

Roland, in case you didn't solve the problem yet: latest Emu71 version should work with the PILBox as with the HPIL ISA board, however it may fail on some systems (== not 100% reliable).

My recommended method for reliable communication between Emu71 and HP71 with the PILBox is to use the IL-Per software (available on my PIL-Box page): do not declare any XIL in Emu71.ini and use IL-Per as a gateway by sharing the hdrive1.dat file: You can now copy files between Emu71 and HP-71B. Do 'COPY file TO :HDRIVE1' on the one side, then do 'COPY file:HDRIVE1' on the other side. Fast and efficient.

Identifying equations on HP 35s

*Message #1 Posted by **Richard S** on 9 Aug 2010, 8:30 p.m.*

Is there a way to add a title to the upper display register so it will show an easily identifiable title of the equation, while the lower display register will show the actual equation? I searched the Hp 35s manual but didnt see the answer to this question. Thanks for any help i may receive.

Richard

Re: Identifying equations on HP 35s

*Message #2 Posted by **Pablo P (Spain)** on 10 Aug 2010, 5:10 a.m.,*
in response to message #1 by Richard S

Hi Richard, yes you can do it. First add the equation in the list and then add a second equation just above the first one. The second equation will be the title that you can create usign the combination RCL + letter. You can compose any text.

For example, in the equation list you can create the next two equations. The first equation will be the "real" one and the second equation will be the title:

```
upper line: AREA CIRCLE        (PRESS: RCL + R/S, RCL + 7 ...)
lower line: PIxR^2
```

Nice price?

*Message #1 Posted by **matti** on 9 Aug 2010, 11:55 a.m.*

Hi

What do you think about this auction in E___.co.uk - nice price, isn't it?

HP FINANCIAL CALCULATOR HP17B11PLUS Price: £0.99 Buy It NowBuy Postage and packaging £125.21 United Kingdom Royal Mail 1st Class Standard

wishes matti (Finland)

Re: Nice price?

*Message #2 Posted by **DavidShenk** on 9 Aug 2010, 1:41 p.m.,*
in response to message #1 by matti

Sellers that think they have outsmarted the system by hiding the purchase price in the postage should watch out. All it takes is one person to buy that and then complain that ebay's guidelines for what can be charged for postage are not being followed. I think if someone pushed the issue, you would receive the item at the cheap price with only a fair postage charged. The seller will lose on that one.

Dave

Re: Nice price?

*Message #3 Posted by **Dave Shaffer (Arizona)** on 9 Aug 2010, 2:08 p.m.,*
in response to message #2 by DavidShenk

You can (or at least used to be able to) tell ebay that a current auction violates their terms of use - excess postage to avoid selling fees being one of them.

Re: Nice price?

*Message #4 Posted by **NateB** on 11 Aug 2010, 5:14 p.m.,*
in response to message #3 by Dave Shaffer (Arizona)

You can report auctions that violate TOS, but anymore eBay doesn't seem to care.

I reported a few similar auctions, one was buy it now with a $349 shipping charge. The same seller had multiple auctions with low buy it now or start bids and shipping charges that ran several hundred dollars. The listings were never removed and several of the items sold. As a buyer using PayPal, I think you'd only be covered for the $0.99 purchace price , not the shipping...

More FPGA progress

*Message #1 Posted by **Olivier De Smet** on 9 Aug 2010, 9:29 a.m.*

Hi,

Just some news for those interested : A new HP86b+ in FPGA

Some more bugs but many progress ...

Olivier

Re: More FPGA progress

*Message #2 Posted by **Eric Smith** on 9 Aug 2010, 5:32 p.m.,*
in response to message #1 by Olivier De Smet

Looking very good!

My own recent FPGA project (RetroChallenge 2010 winner, "best hardware hack") was much less ambitious: implementing the old COSMAC ELF microcomputer from the Popular Electronics article in an FPGA. Runs 100 times faster than the original.

It's not really calculator related, but I do have CamelForth running on it, so at least it does RPN. :-)

Much thanks to Jim Donnelly, former HP Corvallis Division calculator engineer, for machining the aluminum front panel for me. Much thanks also Richard Ottosen and Jim Phillips, who also helped with the front panel. Richard recorded the demo video using my cell phone.

Re: More FPGA progress (OT - COSMAC)

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Aug 2010, 6:13 p.m.,*
in response to message #2 by Eric Smith

Eric:

Back in the last 70s, I was a fan of the CDP1802 and the ELF. I built my own ELF, which is still operable today, with its eight toggle switches using DMA to initialize RAM from console (no ROM monitor needed), a speaker driven by Q, and so on. The original ELF had a couple of HP hex displays that were very nice but also expensive, so I resorted to standard 7-segment displays driven by Mitel 4368 decoders (if memory helps). I bought an 1861 for video, but never found time to put it to work. In fact, in the Memories section of the Museum, in an old article by me, there are photos of my ELF and also of a "chemical process monitor" I developed with the 1802. The fact that it was CMOS captured me, but not to the point of consuming all my hobby money; some was directed to my HP-41C and its accessories.

I would like to know more about your FPGA-based COSMAC, because I became a EE professor, and we have some courses here where the students replicate classic microprocessors using FPGA.

Best regards, congratulations, and thank you for the chance to refresh these memories!

Canon's X Mark I Mouse

*Message #1 Posted by **Martin Pinckney** on 8 Aug 2010, 8:42 p.m.*

No = key, no parentheses.

RPN? Adding machine logic?

Here or here.

Re: Canon's X Mark I Mouse

*Message #2 Posted by **Katie Wasserman** on 8 Aug 2010, 9:01 p.m.,*
in response to message #1 by Martin Pinckney

I'm sure that the Enter key is just a dual purpose "=" and "enter" for use as the computer number pad. The reason I'm sure is that Canon sells a calculator called the X Mark I too, and it has an "=" key.

HP, how about one of these for us RPN fans?

-Katie

Edited: 8 Aug 2010, 9:03 p.m.

*Message #3 Posted by **Walter B** on 9 Aug 2010, 4:29 a.m.,*
in response to message #2 by Katie Wasserman

HP has something *similar* here already, though algebraic :-/ Should be a no-brainer to add the mouse functions ...

Re: Canon's X Mark I Mouse

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Aug 2010, 9:55 a.m.,*
in response to message #1 by Martin Pinckney

HI;

I am not sure if I am reasoning backwards, but... Isn't a mouse designed primarily to slide over a working surface with the smallest movement resistance possible so the user could move it easily? If so, wouldn't this 'mousulator' ('calculouser' sounds weirder to me...) sleep away while the user is trying to press the correct keys? Cannot see a way to make it work reasonably well in both circumstances.

Any thoughts?

Yup, I now, the little thing has not yet reached the sales points and I am already trying to sink it...

Cheers.

Luiz (Brazil)

Edited: 9 Aug 2010, 9:57 a.m.

Re: Canon's X Mark I Mouse

*Message #5 Posted by **Walter B** on 9 Aug 2010, 6:32 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Olá Luiz,

You're right, maybe a trackball on this 'mousulator' (I love this word) is a better solution, so the whole device rests stable on the desk.

Cumprimentos,

Walter

HP 9845A Printer Problem

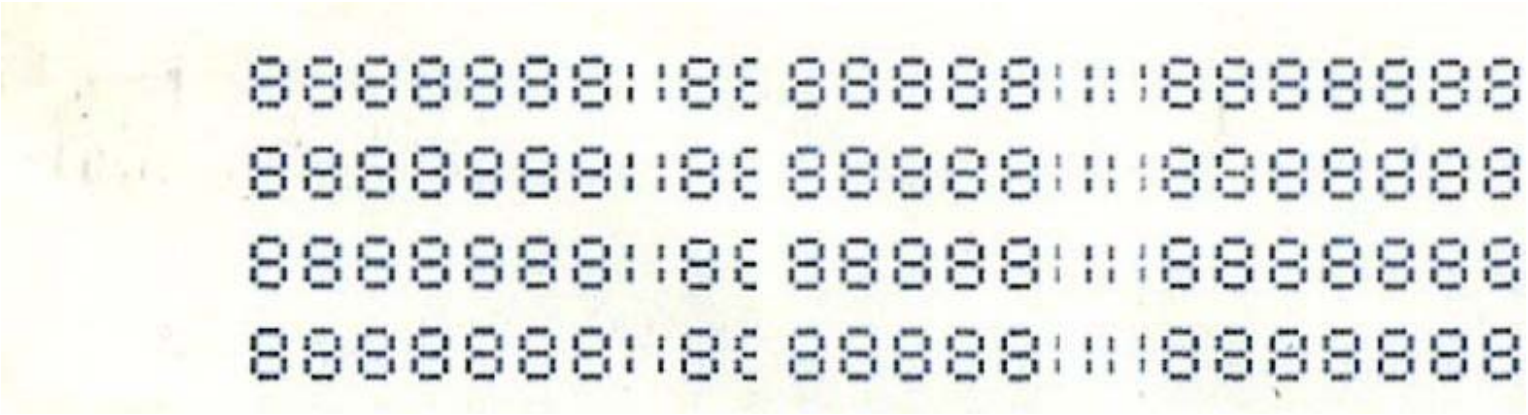
*Message #1 Posted by **Mike** on 8 Aug 2010, 7:39 p.m.*

I think I know the answer to this but I have to ask anyway.

I have a nice HP 9845A, with dual tape drives and built in printer. It's had a memory upgrade to 64K. Everything works great, after I repaired the tape capstans, except the printer. It's like a 9825 on steroids. ;)

It works fine except there are some pixels missing. Is there any way to repair these, short of finding a parted out 9845? Is this printer used in other printers or computers? I'd like to find a replacement.

This is what the print looks like:



The rest of the 80 columns look fine. Only in a few places at the beginning is it missing pixels.

Is this problem likely in the print head, or might it be in the electronics, that might allow me to repair it?

Edited: 8 Aug 2010, 7:41 p.m.

Re: HP 9845A Printer Problem

*Message #2 Posted by **Tony Duell** on 10 Aug 2010, 4:46 a.m.,*
in response to message #1 by Mike

I am going to assuem that the 9845A printer is very similar to the one used in the 9845B. I have some knowledge of the latter machine.

The printhead/mechanism is used in another HP product (at least) -- the HP9876A thermal printer. But I suspect those are as rare as 9845s now.

Anyway, the printhead is actually quite complicated. It consists of a 560 bit shift register driving the 560 thermal print elements. The shift register/drivers are contained in 7 hybrid circuits (80 bits each) mounted inside the printhead, they are connected to the thermal elements and to a simple PCB which joins the shift registers together by connectors similar to those used in the original HP41.

On the Australian museum site, you can get the 9876 service manual, and 'my' schematics of the 9845B. That may

be a start as to how things work.

The printhead can be dismantled, but you have to go carefully. Remove the printer chassis from the machine, then remove the complete printhead assembly. Hold it with the front surface down, and make sure nothing is pressing on the electrolytic capacitors on the front of the printhead. Don't bother to remove the heatsinks, but carefully remove the screws on what is now the top face of the printhead. Slacken them a bit at a time, in a diagonal pattern, like taking the cylinder head off a car engine. With the screws out, lift off the metal block.

You can now see the 7 hybrids. Take them out carefully, keep them in order. They are all the same, actually, but it will help debugging if you put them back in the same place. Take out all the connector strips (there are 2 lengths -- 7 of one type and 28 of the other -- and HP say never to touch them with your fingers. That may be going a bit far, but I use tweezers anyway..). Now lift off the plastic frame that holds the connectors.

You can test the printhead elemenets using an ohmmeter between the printhead common connection (on the PCB) and each of the 560 pads that connect to the hybrids. My notes suggest that each element should read 110 ohms or so. If any are open, you need a new printhead (or at least the front block/thermal element part).

Clean all the pads and put it back together, try again. If it works, it was just bad contacts. If not and the defective columns are in the same places, take it apart again, take out the hybrid at one end, move the others along one position and put the removed one back at the other end. Reassemble and try again. If the bad columns have moved, then you have a defective hybrid. The only source is another printhead, of course, but you could move it to the right hand end, which would let you print short lines correctly.

If the defective columns have moved after the first reassembly, it sounds like bad connectors. Try cleaning them more carefully.

Re: HP 9845A Printer Problem

*Message #3 Posted by **Mike** on 10 Aug 2010, 12:07 p.m.,*
in response to message #2 by Tony Duell

Thanks, I have a copy of the 9845B schematic that you reverse engineered. :-)

I hope it's just a contact but if it's not, I will move the first hybrid to the last position. Unfortunately, it looks like the problem area spans two hybrid positions. The first two. That is the area where most of the printing might take place, so it might just be bad hybrids. In any case, moving the first 2 to the last two positions is preferable to where they are now.

I will be looking for another trashed 9845 or other printer, when I can come across one. It's kind of a shame because the 9845A is very nice condition. No mold on monitor, almost no cosmetic conditions and tape drives both work great (now that I have repaired the capstans).

Another question

It is marked 9845A on the keyboard cover. But it has 64K RAM, a 2nd tape drive, and a built in printer. It seems to be configured as the 9845S. Did the "S" version have that designation on the keyboard cover (i.e. 9845S) or was it still a 9845A, with upgrades (options)?

I think I just got lucky on my HP-9845A

*Message #4 Posted by **Mike** on 12 Aug 2010, 1:16 p.m.,*
in response to message #2 by Tony Duell

I found someone selling an HP 9845B, that was missing the monitor, for $100. I bought it and hopefully, I'll be able to get one working printer between the two of these.

At a very minimum, I can restore the drives and sell the remainder for parts or rebuild and recoup that cost

and have a 100% working 9845B.

hmmmm... wonder which would be better to restore? I can probably get either working, assuming a 9845A monitor work on a 9845B. Anyone know?

I have heard the 9845A is more reliable and there are probably fewer of those around. Something to think about.

in response to message #10 by Martin Pinckney

Man, he's getting hosed.

Only 12.2 million will barely buy him a 100 footer. That's in the bush leagues. And he needs to maintain it and use it every year--that's about 1 million.

I feel sorry for the bastard. He's going to have to settle for a 50 footer and still have to watch his pennies to keep her floating.

Re: Mark Hurd resigns

*Message #12 Posted by **db (martinez, ca.)** on 7 Aug 2010, 1:41 p.m.,*
in response to message #11 by bill platt

bill; no kidding. it's a good thing that the ruling/owning class take care of their own, or it could have been even "worse" for him.

i think that the lesson here, that not enough people will get is: give someone power and he or she will abuse it. a difference between a petty tyrant and a hitler can be measured in-- how many people have abdicated their personal responsibility to him (or again, her).

what i wonder is; how many people did he step on (to cover up his tracks or just for fun) on his way up to the "golden parachute jump"?

Re: Mark Hurd resigns

*Message #13 Posted by **bill platt** on 7 Aug 2010, 10:39 p.m.,*
in response to message #12 by db (martinez, ca.)

That is so true.

My favorite political show is the Black Adder, in the period of Richard the "IV". Hilarious and oh-so-insightful about power. which is made that much better by the hilarious British Low Comedic effect.

Kerry is just yet another sleazy politician.

I had to laff when Kennedy's spot went to an irreverent young Republican and the whole Liberal pres was "shocked" at it. I was just cracking up like a crazed hyena in a true Mogambo laffing fit, because I knew that at least part of Massachusetts had had enough!

Oh, but don't take this the wrong way. I could have written this about some Conservative SOB but since Kerry is Liberal I had to go that direction...

Edited: 7 Aug 2010, 10:40 p.m.

Re: Mark Hurd resigns

*Message #14 Posted by **bill platt** on 7 Aug 2010, 10:44 p.m.,*
in response to message #12 by db (martinez, ca.)

But I'd disagree with the ruling/owning "class' analysis. There really isn't a class of those two, because both money, and power, move too fast. Most millionaires are self-made, so they aren't a "class" because they came from something else. And with the exception of the Kennedys and the Bushes, most sleazy bastard politicians are new to the fold, in their own lifetime. That's not to say there isn't any wagon circling--there is! But it really isn't distinguished as an entrenched "class." And this is an important distinction to make, if the People are to have any way to control their rulers...

you get no argument from me bill

*Message #15 Posted by **db (martinez, ca.)** on 8 Aug 2010, 2:47 p.m.,*
in response to message #14 by bill platt

Bill;
I agree that most politicians, whether democrat or republican, are sleazy - or worse. Exceptions like Ron Paul and Jimmy Carter are rare on the ground.

I think that there are *interests* with overlapping goals. Look at the amount of "people" in politics and government that are in the oil industry, Masons, Bilderburg Group and Council on Foreign Relations, among others. To me, it is apparent that those who are supposed to be representing you, me and future generations are really the representing the transnational corporations and the military industrial complex.

So yes; I also agree that mostly these are not multi-generational dynasties, but they function like one. Instead of every time there being a Jr. or "the III" - theres a succession of asserts that are willing to see us with gutted pensions and our kids literally gutted in some war for oil or raw materials. With Democrats like Feinstein, we don't even need more Republicans.

"if the People are to have any way to control their rulers... " i think voters in the US & GB (and the rest of the world which can vote too) need to stop voting for rich kids, the well connected, and actors. We could root out the vicious next.

As a (middle) class; we need to start looking for common interest, and looking *out* for those interests. But i'm not holding my breath on that.

To bring this back on topic.....and we need to buy hp RPN calculators that are made in the free world too.

> I feel sorry for the bastard. He's going to have to settle for a 50 footer and still have to watch his pennies to keep her floating.

Don't feel too sorry and don't count on him settling for a 50 footer. One financial report says that as of May 20 he owned 396,374 shares. Even at Friday's closing price of $41.99 that's another $16.6 million. I suppose that we could feel sorry for him because the change of -$4.38 on Friday cost him over $1.7 million.

Investors really don't care about the $12.2 million severance package in a financial sense. Look at it this way. There about 2.33 billion shares outstanding. The $12.2 million amounts to about $0.0052 per share. Suppose that I had an investment portfolio of a million dollars (I don't!) and I had it all invested in HP stock (Again, I don't and I wouldn't!) then at the opening price on Friday I would have owned about 21,500 shares. The $12.2 million severance would be equivalent to a little over a hundred dollars.

Investors do care about the nearly ten percent drop in the stock price and the damage to HP's credibility.

Palmer

Re: Mark Hurd resigns

*Message #19 Posted by **db (martinez, ca.)** on 8 Aug 2010, 11:58 p.m.,*
in response to message #18 by Palmer O. Hanson, Jr.

Soft Porn Actress Jody Fischer, who's credits include such landmarks as Sheer Passion, Body of Influence, & Intimate Obsession was identified today as the object of Mark Hurd's affections. Here's a sample of her parts: http://www.youtube.com/watch?v=h9P85hnT2RQ&feature=player_embedded

I don't think that she was at the HP shindig that i got to go to. The women who put that on were real pretty, but not porny at all.

Any boat he wants?

*Message #20 Posted by **Palmer O. Hanson, Jr.** on 10 Aug 2010, 9:37 p.m.,*
in response to message #1 by Bruce Bergman

An AP story says that Hurd could leave HP with $40 million made up of " ... $12.2 million in severance, plus stock and options that could bring the value of the package to more than $40 million ..."

A 100 foot boat may not be a problem after all.

> Personally, I am immigrating to another universe where PI is exactly 3

You DO live in a place where pi=3; planet earth! Go to the North Pole with a long rope and a stake. Stake the rope down, and pull it tight exactly 30-degrees down from the pole. Draw a BIG circle at this parallel. The circumference of the circle is EXACTLY 3 times twice the "radius" (your rope). Pi does equal three in the correct geometry, (or more correctly, in special cases of the correct geometry.)

Now, how long does your "radius" need to be so that pi = e? or even 1?

Cheers

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #12 Posted by **Gerson W. Barbosa** on 6 Aug 2010, 10:02 p.m.,*
in response to message #11 by Chuck

> Quote:
>
> Now, how long does your "radius" need to be so that pi = e? or even 1?

I came up with the formulas (I hope I haven't made any mistakes)

(1) $pi_L=180*\sin(L)/L$

and

(2) $R_L=pi*r*L/180$

where

  L = latitude in degrees
pi_L = pi at latitude L
 R_L = "radius" or length of the rope
  r = radius of the sphere (or the Earth radius in this case)

Thus, solving 180*SIN(L)/L=EXP(1) for L on the 33s, for instance, we get

L = 56.6160486813 degrees, which implies R_L = 0.9183233r

Likewise, solving 180*SIN(L)/L=1 for L we get

L = 132.567200683, which implies R_L = 2.313734r

Notice we can use the ->RAD function (degrees to radians conversion) to compute R_L

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #13 Posted by **Chuck** on 7 Aug 2010, 3:52 p.m.,*
in response to message #12 by Gerson W. Barbosa

Nicely done. I think I came up with a little formula for what "pi" is for any angle (looks similar to what you have also):

"pi" = pi sin(a) / a

for 0<a<pi

where the unquoted pi is the usual 3.1415.....2 :)

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #14 Posted by **Gerson W. Barbosa** on 7 Aug 2010, 5:23 p.m.,*
in response to message #13 by Chuck

Yes, it is better to work in radians instead of degrees as the answer becomes straightforward when solving P=pi*SIN(A)/A for A in radians mode. It is interesting to notice P ranges from pi at North Pole (which is understandable as the surface tends to flatness when the "radius" tends to zero) to 0 at South Pole, which is not intuitive to me. (*)

Anyway, I guess Namir would prefer a universe where pi is always 3 or at least a rational number :)

Copyright (c) 1993 by Thaves. Distributed from www.thecomics.com.

Gerson.

(*) On second thought the latter should be easier to understand than the first, the result is just 0 over something which is obviously zero.

Edited: 7 Aug 2010, 9:02 p.m.

PI is ALWAYS 3

*Message #15 Posted by **Namir** on 8 Aug 2010, 8:07 a.m.,*
in response to message #14 by Gerson W. Barbosa

That's right ... where PI is ALWAYS 3. THEN I can (easily) boast on the hp museum web site (on THAT universe) that I have calculate PI to gazillion and kajilliam decimal places with an HP-5s.

Always a reason for my madness.

Re: PI is ALWAYS 3

*Message #16 Posted by **Andrew H.** on 9 Aug 2010, 7:11 p.m.,*
in response to message #15 by Namir

Moving back on topic, pi should ALWAYS appear on the keypad of a calculator as a shifted function of the 3-key, where it can be easily found — not on the CHS key (11C), the EEX key (15C), the RCL key (32S), the roll-down key (42S), the SPC key (50g), etc.

Re: PI is ALWAYS 3

*Message #17 Posted by **Norman Dziedzic** on 10 Aug 2010, 3:28 a.m.,*
in response to message #16 by Andrew H.

I rather like it as a shifted zero key like on the 41. The zero looks most like a circle on the keyboard so this is my "perfect" placement.

PI location on keyboard

Nah... the only important thing is that 'pi' be grouped on the keyboard with the other data-entry keys. Both the HP-11C and HP-15C meet that test, but the HP-15C's location is slightly better because the EEX key and the blue shift key are closer together than is the CHS key to the yellow shift key.

Why would it be important that the shifted '3' key be used, just because pi is approximately 3?

-- KS

Edited: 11 Aug 2010, 1:53 a.m.

Re: PI location on keyboard

*Message #19 Posted by **Andrew H.** on 11 Aug 2010, 8:41 p.m.,*
in response to message #18 by Karl Schneider

Karl,

You're right: the most important thing is that pi be grouped with the other data entry keys. However, I think that, ideally, pi should be in the same position on every HP calculator, just so it is easier to find (especially if the keypad is crowded). I'd go further and say that other common keys (e.g. STO and RCL) ought to have a consistent place on the keypad as well.

Pi is approximately 3, so I can't think of a more appropriate place on the keypad for it.

Andrew

*Message #20 Posted by **Dan W** on 10 Aug 2010, 9:38 p.m.,*
in response to message #11 by Chuck

I recall an interesting idea in Carl Sagan's fictional "Contact". After many trillions of digits of PI were calculated, they discovered a non-random pattern of digits. Essentially the digits formed some sort of message.

Of course,for some alien intelligence to be able to insert a message in the digits of PI, they would have to be able to manipulate the universe itself.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #21 Posted by **Steve Perkins** on 11 Aug 2010, 2:58 p.m.,*
in response to message #20 by Dan W

The idea that some ultra-advanced group or entity could embed a message in pi is absurd.

Even God cannot manipulate the value of an abstract mathematical constant.

Legislatures may try it, but apparently they think they are above God!

in response to message #1 by Egan Ford

Since this is a record, presumably that means no one else has done this.

How do we know they are right? :-)

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #27 Posted by **Egan Ford** on 11 Aug 2010, 6:42 p.m.,*
in response to message #26 by Mike

BBP algorithms have been proven mathematical correct. They can be used to find specific Pi digits without the overhead of computing all digits.

The record holders used BBP to validate some digits, but not all (it'd take far too long). It's reasonable to assume that if you got the last 100 or so correct then the path to get there must also be correct. Got faith? :-)

I'm sure there is a computable probability that there is a wrong digit somewhere. However, the percentage

of people that care round to zero.

I read somewhere that to compute the circumference of the universe to the precision of a photon you would only need 22 or 23 digits of Pi.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #28 Posted by **Dave Shaffer (Arizona)** on 12 Aug 2010, 12:58 a.m.,*
in response to message #27 by Egan Ford

> Quote:
>
> I read somewhere that to compute the circumference of the universe to the precision of a photon you would only need 22 or 23 digits of Pi.

Not quite - but close if your units are meters rather than photon (wavelengths).

Age of the universe - about 13.7e9 years. In the big bang theory, one might interpret this as (very roughly!) the radius of the universe in light years.

One light year = number of seconds in a year (3.2e7) times the speed of light (3e5 m/sec) = 9.5e12 meters.

If circumference is 2*pi*r, then the circumference is about 8e23 meters. Thus, 23 or 24 digits would suffice for full accuracy in meters if we knew everything else that accurately - about what you read.

However, the wavelength of light (in the middle of the optical spectrum) is around 5000 angstroms, or 500 nanometers (500e-9 meters) in proper SI units. So, you need to multiply the circumference just given by another 1/5e-7 = 2e6 . So, you would need more like 30 digits in wavelength (or photon) units.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #29 Posted by **Walter B** on 12 Aug 2010, 6:48 a.m.,*
in response to message #28 by Dave Shaffer (Arizona)

Dave,

may I correct a bit?

> Quote:
>
> One light year = number of seconds in a year (3.2e7) times the speed of light (3e5 m/sec) = 9.5e12 meters.

Speed of light is 3e5 **km**/s = 3e8 m/s so 1 Ly = 9.5e15 m. Thus the circumference of the universe is about 8.1e26 m so 27 digits are necessary for 1 m precision. BTW, a photon may be any electromagnetic radiation particle, so it may have an arbitrary wavelength. Assuming - as you did - visible green photons of 500 nm, we would need 33 digits for such "photon accuracy".

As my late professor in theoretical physics used to say: "For sake of simplicity, we may set pi = 1." But he would never have dropped an order of magnitude nor even three. d8-)

> Speed of light is 3e5 km/s = 3e8 m/s so 1 Ly = 9.5e15 m

Of course you are right - I know that, but that's what happens when you start calculating at 10 PM, after a couple glasses of wine!

> Quote:
>
> Thus the circumference of the universe is about 8.1e26 m so 27 digits are necessary for 1 m precision.

Yep. And per ths discussion continuing below, if you want it in units of protons, then (as you point out), the proton size (a somewhat fuzzy concept in itself!) is around 1e-15 meters, so another 15 digits are needed, or about 42 in all.

Edited: 12 Aug 2010, 2:06 p.m.

Ok, I'll dig up the reference...

Back. You're right. I misquoted. The actual statement:

> Quote:
>
> If one were to find the circumference of a circle the size of the known universe, requiring that the circumference be accurate to within the radius of one proton, how many decimal places of Pi would need to be used?

The actual number stated was 39 decimal digits (Pi Unleashed, 1998).

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #35 Posted by **Walter B** on 12 Aug 2010, 11:02 a.m.,*
in response to message #34 by Egan Ford

Egan,

> Quote:
>
> If one were to find the circumference of a circle the size of the known universe, requiring that the circumference be accurate to within the radius of one proton, how many decimal places of Pi would need to be used?

OK, that changes the game significantly. Assume a proton has a diameter of 1e-15 m (being its Compton wavelength), then the circumference as calculated above corresponds to about 1e42 protons. So 43 digits would be sufficient.

Edited: 12 Aug 2010, 11:04 a.m.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #36 Posted by **Egan Ford** on 12 Aug 2010, 1:02 p.m.,*
in response to message #35 by Walter B

A quick search has values ranging from 39 to 47. Some 39's are using a hydrogen atom vs. a proton.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #37 Posted by **Walter B** on 12 Aug 2010, 1:32 p.m.,*
in response to message #36 by Egan Ford

Don't search, think! Diameter of an atom is about 1e-10 m, so five orders of magnitude larger than a proton. So, we'll end with 1e37 atoms.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #38 Posted by **Egan Ford** on 12 Aug 2010, 1:44 p.m.,*

in response to message #37 by Walter B

I think you missed my point. Other calculations are using various other constants. Opinions and calculations range from 39 to 47. Your solution falls in the middle. It was my way of saying that others generally agree.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #39 Posted by **Katie Wasserman** on 12 Aug 2010, 2:45 p.m.,*
in response to message #38 by Egan Ford

Fram a (sort of) practical point of view, maybe we only need 50 digits of pi. But for a deeper meaning of life, the universe and everything we need to keep calculating. In Contact Carl Sagan told us that there's important stuff encoded in the expansion of pi. :)

Re: OT: The five trillionth digit of Pi is..... 2!

Sorry about that, I got lost in this giant thread and missed that post.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #42 Posted by **Walter B** on 12 Aug 2010, 4:36 p.m.,*
in response to message #38 by Egan Ford

I hope I got your point. IMHO it's just more than a bit disturbing that by "using various other constants ... opinions and calculations range from 39 to 47" - that's 8 orders of magnitude or a factor of 100 millions. Due to some coarse assumptions I made, though each of them is well within a confidence intervall of +/- 33%, I may be off by a factor of 3 but not more.

Assuming we all live in the same universe with the same universal laws of physics and thus the same physical constants, a range "from 39 to 47" points to very different boundary conditions, wild guessing, massive errors, or a combination of these. It may have happened in my calculation - though it is correct IMHO ;) - but in any case such big differences must be explained for the sake of science.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #43 Posted by **Martin Pinckney** on 12 Aug 2010, 5:10 p.m.,*
in response to message #42 by Walter B

> Quote:

> ... a range "from 39 to 47" points to very different boundary conditions, wild guessing, massive errors, or a combination of these.

And do you really think that when science attempts to define something as vast (presumably) and complex (ditto) as the universe, that it is anything else other than the above?

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #44 Posted by **Dave Shaffer (Arizona)** on 13 Aug 2010, 12:15 a.m.,*
in response to message #43 by Martin Pinckney

The universe is actually amazingly well-defined!

The age is 13.7e9 years, to about a per cent or two, and the Hubble constant, which measures the expansion rate due to the Big Bang (BB), is good to a couple of per cent. Measurement of the fluctations in the "3 degree" background radiation agree to an amazing extent with the predictions of BB cosmology.

I'm not sure I want to get into an argument about god, creationism, evolution, etc., but my opinion is that everything we can measure is in COMPLETE agreement with a Big Bang cosmology that occurred 13.7e9 years ago and the accompanying evolution of the universe and life, in a system completely devoid of any requirement for divine intervention!!!!!!!

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #45 Posted by **Martin Pinckney** on 13 Aug 2010, 9:19 p.m.,*
in response to message #44 by Dave Shaffer (Arizona)

Dave, not to pick on you particularly, or to knock science, but I sometimes find it amazing how utterly arrogant (so it seems to me) present-day scientists can be. Do they not realize that each generation before them also believed that the "universe" was well-defined? Do they not have any concept of the limits of human knowledge?

Now I am certainly no scientist, and claim no cosmological knowledge, but it seems to me that many theories about the nature of the universe are based on HUGE extrapolations. Somewhat akin to an ant measuring vibrations passing through his anthill in central Africa, and developing complex theories about automobile traffic in downtown Manhattan. Within 2% error.

Indeed, there are now many competing theories on the origin of the universe. Some atheists in particular are uncomfortable with Big

Bang, because it implies a beginning, and opens the question of causation.

Science in a nutshell

*Message #46 Posted by **Walter B** on 14 Aug 2010, 7:27 a.m.,*
in response to message #45 by Martin Pinckney

AFAIK the basic approach in science is as follows in plain English:

1. You observe something.
2. You try to explain it as simple as possible, and consistent with the observations explained already.
3. You check: Does the explanation meet the observation?
    - If true then you're done. Return to step 1 if you like and focus on something else.
    - Else your explanation was too simple. Return to step 2, taking into account even older explanations may be wrong.

This means in our case:

1. Egan reported 8 orders of magnitude deviations between different results for our challenge.
2. I tried to find out about the reasons - no answer yet, so we are stuck. Instead, you tell us something off topic.

BTW, there may well have been repeated big bangs, i.e. a pulsing universe, but that has no influence on the solution of our simple problem.

HTH

Re: Science in a nutshell

*Message #47 Posted by **Martin Pinckney** on 15 Aug 2010, 12:14 a.m.,*
in response to message #46 by Walter B

> Quote:
>
> Instead, you tell us something off topic.

Walter, it's only off-topic if you believe that science has the ability - right now - to apply the "scientific method", which you kindly reminded me of, and make observations of sufficient accuracy to define the universe to an order of magnitude or less.

I was responding, albeit philosophically, to your statement

> Quote:

> a range "from 39 to 47" points to very different boundary conditions, wild guessing, massive errors, or a combination of these.

I am suggesting, that just maybe, scientists 100 years from now may look back and say exactly that, just as we look back 400 years and say the same thing.

Re: Science in a nutshell

*Message #48 Posted by **Walter B** on 16 Aug 2010, 1:08 a.m.,*
in response to message #47 by Martin Pinckney

Martin,

> Quote:
>
> I was responding, albeit philosophically, to your statement
>
> > Quote:
> >
> > a range "from 39 to 47" points to very different boundary conditions, wild guessing, massive errors, or a combination of these.
>
> I am suggesting, that just maybe, scientists 100 years from now may look back and say exactly that, just as we look back 400 years and say the same thing.

Nobody knows what will be in 100 years. If, however, people will then find significantly different results, I sincerely hope they will check them and will not rest earlier than their reasons are known and thus these problems are settled.

Martin, I share your guess "we" will probably know better in 100 years. OTOH I didn't compare ancient results with those of today - that would have been unfair IMO - and I hope our successors will treat us just the same way. But they will rightfully shake their heads if they will find us unable solving today's problems. If we can't even settle such simple topics like deviating results of different authors today in a forum of educated experts, how shall mankind cope with the real challenges of our planet? Let's go - or there may be no human being left wondering in 100 years.

A basic challenge

*Message #49 Posted by **Walter B** on 13 Aug 2010, 6:21 a.m.,*
in response to message #43 by Martin Pinckney

Martin, to answer your question, let's go back a second. I wrote (and the first half of my sentence is important):

> Quote:
>
> Assuming we all live in the same universe with the same universal laws of physics and thus the same physical constants, a range "from 39 to 47" points to very different boundary conditions, wild guessing, massive errors, or a combination of these.

And you responded:

> Quote:
>
> And do you really think that when science attempts to define something as vast (presumably) and complex (ditto) as the universe, that it is anything else other than the above?

Answer: What did the other folks do differently? I agree with Dave: The universe as we know it is pretty well defined. So I don't see any reason yet for such big deviations in results (except confusing protons and atoms). Since there must be reasons (no sorcery in physics), however, we should **know** them at least IMHO to settle this problem, eeh challenge. For the advancement of science or whatever you like better.

Re: A basic challenge

*Message #50 Posted by **Martin Pinckney** on 13 Aug 2010, 9:23 p.m.,*
in response to message #49 by Walter B

> Quote:
>
> The universe *as we know it* is pretty well defined.

Emphasis added. See my response to Dave Shaffer.

Re: A basic challenge

*Message #51 Posted by **Walter B** on 14 Aug 2010, 7:00 a.m.,*
in response to message #50 by Martin Pinckney

Now you missed my point. I hate to quote myself, but:

> Quote:
>
> What did the other folks do differently? ... I don't see any reason yet for such big deviations in results ... Since there must be reasons, however, we should

know them ...

Boiled down a bit - please find the complete text above.

Re: A basic challenge

*Message #52 Posted by **Martin Pinckney** on 14 Aug 2010, 12:09 p.m.,*
in response to message #51 by Walter B

Quote:

Now you missed my point.

Actually, I got your point, although I did not explicitly acknowledge it. Rather my response is more on the philosophical side.

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #53 Posted by **Pal G.** on 13 Aug 2010, 12:38 a.m.,*
in response to message #1 by Egan Ford

Egan, thanks for your original post, and I've certainly enjoyed the entire thread..

But, I hope I am not the only one who is struck by the _irony_ that the guys who calculated the five trillionth digit of pi were using hardware that has 6.17E-4 the processors of the computer you, the original poster, have the keys to..

If you wanted to, could you not own that record in a few hours??

Re: OT: The five trillionth digit of Pi is..... 2!

*Message #54 Posted by **Egan Ford** on 13 Aug 2010, 7:40 p.m.,*
in response to message #53 by Pal G.

Quote:

If you wanted to, could you not own that record in a few hours??

Dunno. The last system we built has over 30,000 cores, over 30 terabytes of RAM, and a multi-petabyte parallel file system. It also requires about a megawatt of power and has a MTBF of 24 hours. When I benchmarked it for the top500.org list last summer it was the 16th fastest system in the world (#1 in Canada).

However, systems like this need applications and data sets that can be broken up and run in parallel to realize any speed advantages. Although many of the current PC Pi programs better utilize multiple cores in a share memory system, I doubt that they can scale up to a 30K core distributed memory system. Something new would have to be written or something old in a different way. E.g. BBP.

BBP is a great algorithm that can compute any series of Pi digits without the overhead of computing all of Pi. So, I should be able to assign each of the 30K cores a slice of Pi. Furthermore, since BBP runs in $O(n^2)$ time you can speed up the computation by giving the cores that represent the beginning of Pi more digits

and the cores representing the end of Pi fewer digits (IOW, equal time slices). BBP is not the best algorithm for computing all the digits of Pi, but it may be one of the simplest to run on a distributed memory machine. IOW, its a great algorithm to through hardware at.

Another option would be to use any series that computes Pi and split that up and use a binary tree to sum it all up. That would probably be much faster. However, it would slowly bottleneck on the sum and would require a shared file system. It would be fun to see and try. Google for "distributed Pi". One call PiHex used BBP as described above. Can this be done in hours on a 30K core system? I do not know. I'd have to run a few benchmarks first.

As for the keys, well, after we finish building a system and benchmarking it, we turn the keys over. In some cases we get access to run a few benchmarks, but real work takes priority and someone has to pay the power bill. On this most recent system we automatically power off unused resources to save power. So, cycle harvesting is not an option.

These beasts take a long time to architect, sell, build, and test. This cycle takes about two years. Perhaps next year I'll have a bigger system to play with and give it a shot.

on nicads

*Message #1 Posted by **db (martinez, ca.)** on 5 Aug 2010, 10:09 p.m.*

from the font of all knowledge:
http://www.straightdope.com/columns/read/349/do-nickel-cadmium-batteries-develop-charge-memory-if-not-fully-discharged

it sounded ok, with the exception of the damage he spoke of being the reversal of polarity and his not mentioning the possible wives tale which i heard: stating that the memory effect (or false memory effect) is not that the batteries won't charge fully - it's that they won't discharge fully.

i mostly use nimh cells now, so it's not a big deal to me. i just want to read what someone who knows a lot may write.

Re: on nicads

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Aug 2010, 12:10 a.m.,*
in response to message #1 by db (martinez, ca.)

Hi, db;

all I'd add about that is something mentioned by Katie Wasserman a couple of weeks ago: NiMH cells work better/live longer if kept charged at 60% +/-15% of their full charge, based on Prius battery regulation. Please, follow this thread; Katie's is one of the last two.

I sometimes find only NiCad's when searching for certain types, like the ones to rebuild the 82143A batteries (and related cases: Topcats, 82162A, etc.). I never found NiMH Sub-C batteries where I searched for them.

Cheers.

Luiz (Brazil)

Edited: 6 Aug 2010, 12:20 a.m.

NiMH Sub-C batteries

*Message #3 Posted by **tim m.** on 6 Aug 2010, 2:12 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I've bought many from BatterySpace.com, mainly for rebuilding Roomba battery packs (with 12 cells in series, usually one or two die, bringing down the entire pack voltage enough that I get very little operating time from the robot).

-Tim

Edited: 6 Aug 2010, 2:24 a.m.

*Message #4 Posted by **designnut** on 6 Aug 2010, 12:21 p.m.,*
in response to message #3 by tim m.

I have hadsuch good reesults with Sanyo Eneloop low discharge AA cells I use them in most appliances. I used to have 2 4 station chargers on nearly full time, now one used rarely. I read there has been further improvement lately in the self discharge rate. I use them in shells to substitute for D cells in one application where I get long life. I had a portable telephone that would lose it's nicad charge in 2 days. I bought some NiMh cells with tabs ans replaced them. They are satisfactory after years of use. Sam

Homebrew graphing calculator

*Message #1 Posted by **Bruce Bergman** on 5 Aug 2010, 1:47 p.m.*

Since this is all homebrew, I wonder if it's worth whipping up an RPN version of the software? A little pricey, but seems to provide a lot of functionality...

http://antipastohw.blogspot.com/2010/07/introducing-100-open-source-hwsw-r.html

Has anyone played with this unit at all?

Thanks,

Bruce

Re: Homebrew graphing calculator

*Message #2 Posted by **Egan Ford** on 5 Aug 2010, 6:15 p.m.,*
in response to message #1 by Bruce Bergman

It's nothing more than an ARM-based Linux handheld. I've had multiple over the years and you can get them cheap on eBay. Sharp and Nokia have been providing Linux/ARM handhelds for years. And you can probably run 'R' on any of them. You can also run nonpareil, free42, and x48.

IMHO, this project lacks imagination and is not very practical. If I want a backlit, ARM-based, battery draining device that can also function as a calculator, then I'd take my pick of any of the Android or Apple Phones/PDAs/PMPs.

I think we have all hashed this out over and over, but a proper calculator should have:

1. Buttons, for speed, accuracy, and ease of use.
2. Reliability. E.g. Power on when needed (incredible battery life) and use off the shelf batteries.

Re: Homebrew graphing calculator

*Message #3 Posted by **hugh steers** on 6 Aug 2010, 2:49 p.m.,*
in response to message #2 by Egan Ford

indeed. i'd say it has to have a keyboard to count. otherwise you could just run a virtual calculator on a phone.

Re: Homebrew graphing calculator

*Message #4 Posted by **Crawl** on 6 Aug 2010, 4:45 p.m.,*
in response to message #3 by hugh steers

And from the sound of it it doesn't have a CAS, so I don't see how it could replace the TI89/HP50g.

Re: Homebrew graphing calculator

*Message #5 Posted by **Mike** on 11 Aug 2010, 3:22 p.m.,*
in response to message #2 by Egan Ford

I'm not so sure buttons are required. At least not hard buttons.

I wrote a calculator program (not even RPN) and sold over 10,000 copies of it for the Palm. It has soft buttons.

I love gadgets... especially electronic gadgets. I have a house full of single board computers. :-) Or should that be :-(

I just ordered two of these. One the one shown in the photo and the other that is the MegaPalm. The one difference between these platforms and a phone device, is the ease of access to development tools AND the ability to easily add hardware.

HP thermal printer differences

*Message #1 Posted by **Alberto Fenini** on 4 Aug 2010, 10:08 a.m.*

ciao a tutti,
this should be an easy one for most of you, but for me ...
what is difference between the Hewlett Packard HP 82162A Calculator Thermal Printer
and HP82143A ?
Would it be worth to have both ??

Thanks in advance for any suggestion,
take care Alberto

Re: HP thermal printer differences

*Message #2 Posted by **James Grenert** on 4 Aug 2010, 11:25 a.m.,*
in response to message #1 by Alberto Fenini

What calculator are you planning to use the printer with? The 82143A plugs directly into the HP 41, and it cannot be used with other devices. The 82162A plugs into the HP-IL interface, and it can be used with any HP-IL devices.

See this thread for more: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=49059

Re: HP thermal printer differences

*Message #3 Posted by **Alberto Fenini** on 4 Aug 2010, 11:39 a.m.,*
in response to message #2 by James Grenert

Thank you very much for your reply,
actually I was just thinking about adding a new piece
to my collection, and since I have just purchased an HP71B
with the HP-IL module I think it would make sense to get this as well
right ?

take care Alberto

TI-30 durability testing (slightly off topic, BTW).

*Message #1 Posted by **Michael Meyer** on 3 Aug 2010, 4:49 p.m.*

I've ended up with WAY too many TI-30's that have been in boxes of old calculators that I have bought for the other models. (My definition of Way too many is more than 3...) I know they've been used for various interesting purposes, such as "packing material" for HP calculators. I would like to perform some "durability tests", and would like some input on this. I know they don't stand up to every-day use very well, but I still want to give them a chance. I'm thinking I might even get around to photographing these tests. My ideas so far: running over with car, bullet resistance, dissolvability in acetone, and surviving a fall from a tall building. Oh, and there's fire resistance and blending ability. Any other ideas?

Re: TI-30 durability testing (slightly off topic, BTW).

*Message #2 Posted by **Geir Isene** on 3 Aug 2010, 5:57 p.m.,*
in response to message #1 by Michael Meyer

Video this: Testing if it will survive lying on top of a jar of glass containing zinc powder and sulfur powder with a Bunzen burner heating the jar from below... until the jar cracks.

I'd like to make a suggestion

*Message #3 Posted by **Frank Boehm (Germany)** on 4 Aug 2010, 5:57 a.m.,*

First impressions HP30B

*Message #1 Posted by **bt_schmidt** on 2 Aug 2010, 1:04 p.m.*

Received my new HP30B courtesy of CalcPro.com - thank you Paul Nelson. First impressions:

1) Keys are hinged. Key presses are not spongy (as unfortunately they are on my HP20B).

2) Display is easy to read with good contrast (unlike my earlier gold HP17BIIs).

3) HP30B retains the HP20B's scalloped design, but unlike HP20B, if you place it upside down the calculator's sides don't support & protect the keys. Rather the HP30B keys end up being what the calculator rests on. Odd of HP to retain the 'high sides' design without retaining this aspect of it.

4) While the HP30B is similar in appearance to the sliver HP 17BII+ and has a two-line display, it doesn't provide labels on the display over the topmost row of keys. I miss this ease-of-use feature found on the HP17BII-family and HP42S.

Conclusion:

I still prefer my silver HP17BII+ as the best HP financial calculator and, if you can live w/o the scientific functions, best readily available RPN calculator. However the HP30B adds scientific functions and a lower price point. So for me, it's just deciding which stays at work, and which lives in the briefcase.

Edited: 2 Aug 2010, 6:32 p.m.

Re: First impressions HP30B

*Message #2 Posted by **allen** on 3 Aug 2010, 9:16 p.m.,*
in response to message #1 by bt_schmidt

Thanks for your concise assessment! Have you tried the programming aspects of the 30b? The Silver 17bii+ (too bad they couldn't pick another model designator since that was already taken by the golden brick) is definitely a force to be reconed with.

Does the HP 10B calculator not support Order of Operation?

*Message #1 Posted by **David Adams** on 2 Aug 2010, 10:34 a.m.*

Hi,

I own the HP 10B calculator which is listed as a business/scientific calculator. I noticed when entering simple algebraic equations, the calculator does not implement the order of operation feature which dictates multiplication/division operations are done prior to addition/subtraction. (ie. entering 1+2x3 result in 9, when it should be 7).

Does this calculator not support this at all or does it have to be configured first?

Thanks.

Re: Does the HP 10B calculator not support Order of Operation?

*Message #2 Posted by **Tim Wessman** on 2 Aug 2010, 11:01 a.m.,*
in response to message #1 by David Adams

The 10b and the later 10bII only implement chain algebraic, which evaluates as things are entered as you've noticed. No order of operations. Sorry. :-(

TW

Re: Does the HP 10B calculator not support Order of Operation?

*Message #3 Posted by **Walter B** on 2 Aug 2010, 12:44 p.m.,*
in response to message #1 by David Adams

David,

IIRC, some extended discussions about RPN, ALG and Chain mode took place in this very forum in the past. There were also quite nasty remarks about the reasons for Chain mode in business/financial calculators (instead of ALG supporting the common mathematical operator precedence). Many comments from technical/scientific people. Must have been past 2008 IIRC. It's a pity, but I don't find them right now anymore d;-)

Edited: 2 Aug 2010, 12:50 p.m.

Re: Does the HP 10B calculator not support Order of Operation?

*Message #4 Posted by **David Hayden** on 2 Aug 2010, 1:14 p.m.,*
in response to message #1 by David Adams

Hi David,

The "order of operations" problem is one of the great reasons to use one of HP's calculators that supports RPN entry instead. RPN is a much more natural way to evaluate an expression and you never have to worry about

the order of operations. You may want to consider an HP 20b or the much faster 30b instead.

You can learn more about RPN here.

When you say "listed as a business/scientific calculator", do you mean by HP? My 10b manual only refers to it as a "business calculator". MANY eB** sellers refer to this model (and the 12c or 17b, etc.) as "scientific", but that is just ignorance, IMO.

Re: Does the HP 10B calculator not support Order of Operation?

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 3 Aug 2010, 3:28 a.m.,*
in response to message #1 by David Adams

David:

The 10B is a capable business calculator. It can not be considered a scientific calculator since the trigonometric functions are not available.

The 10b uses the the type of algebra that is generally accepted as appropriate for business calculators. It does not provide order of operation. The reason that the business community accepts that methodology has never been clear to me. Some say it is because the operation mimics that of the old mechanical desktop calculators. Others suggest that business users have trouble with order of operation or "... aren't interested in fancy ideas like ..." order of operation. You can buy calculators which don't implement order of operation from H-P, TI and Casio but you will have a hard time finding them which offer the generally accepted scientific functions such as the trigonometrics and hyperbolics.

In this forum you will always get a recommendation to use RPN as a more natural way of doing arithmetic. I have never found that to be so, probably because I had become proficient in higher order languages such as BASIC and FORTRAN in computers before obtaining my first electronic calculator. RPN is actually a lower order language akin to what I knew as machine language in computers.

If you are comfortable with order of operation and the use of parentheses in evaluating equations you will not have a problem with calculators which use those methodologies and which are widely available from TI and Casio and in a few models from H-P.

If you elect to go to RPN you should be aware of the need to manage the stack unless you limit yourself to the simplest kind of arithmetic. Otherwise, you will eventually encounter stack overflow which will result in incorrect answers for apparently innocuous calculations.

The "fancy ideas" quote is from page 120 of Wlodek Mier-Jedrzejowicz's *A Guide to HP Handheld Calculators and Computers*.

Well, the great thing about that low-level code that is RPN is that it doesn't do anything automatic for you (except duplicating the T-register). You control precedence and everything else. The only sticky wicket is stack depth. In the 70s, compared to the then infix/postfix mix that was "algebraic" calculators, RPN was elegant. Today, not so much. But look what happened in the 80 and 90s and beyond--a rash of different versions of algebraics came out--all with their own rules--so that a user switching from one to the other could easily fall into a hole. Not so with elegant, simple RPN.

Of course I happen to like some of the albebraic designs very much! I am a dyed in the wool RPN who is not afraid of the "dark side." Yopu can probably find posts of mine here from years back, before I learned to appreciate the Algebraic versions. SO Ironically I learned about AOS by reading this forum!

in response to message #7 by Martin Pinckney

I think that HP has recognized that not everyone loves RPN too (although i do). All of the recent HP RPN calculators also allow the user to switch to some form of infix operator syntax. The only exception that comes to mind is the 12C ARM-based machine, but that's not really a "new" calculator.

Unfortunately HP hasn't done a very good job of offering an alternate algebraic mode. Part of the problem is that they run out of keyboard space. As a result the HP-33s has parentheses a second functions which is totally unacceptable in an algebraic mode. The HP-35s offers a curious single parentheses key which enters both an opening an closing parentheses which is a concept which is largely foreign to algebraic users. They are a lot like RPN users in one respect. They don't like change.

This all reminds me of something that occurred back in the eighties when I was publishing a newsletter for TI calculators. A reader wondered if my attachment was to TI or to algebraic and asked "Would I buy an algebraic if HP offered it?" I wrote back and said no. But I added that I wouldn't buy an RPN machine if TI made it either. I supported my answer with the following: Suppose that I wanted to buy some bottles of really fine scotch whiskey. Would I go to the Jack Daniels distillery in Kentucky to do that?

*Message #11 Posted by **Walter B** on 3 Aug 2010, 5:04 p.m.,*
in response to message #7 by Martin Pinckney

I concur with Katie. Nowadays, RPN is so exotic for over 95% of the target population of pocket calculator users that even HP has to offer ALG additionally at least - and hope to gain some young RPN aficionados this way. One advantage RPN still keeps today is it allows monitoring all intermediate results in a calculation most easily, supporting the understanding.

Stack depth 4 with top level repetition, however, was cutting edge technology when the HP-35 was launched. As Palmer stated, however, 4 stack levels require stack management in real life calculations. This extra effort was justified as long as memory was expensive, but it is no more. 6 levels will allow for straightforward smooth and secure solving all real world formulae IMO. 8 levels will even take care of problems I did never encounter so far. Still, such a stack stays small enough to be handled easily. Add an operation FILL copying **x** into all stack registers in 1 step, so calculations using constants stay as known. Rv and R^ may be dropped instead. IMHO the one and only reason for keeping stack depth 4 is tradition. Or, less friendly: "We stick to this way because we've always done it this way."

And for the dying species of old RPN users (= us!) HP may offer a settable 4-level "compatibility mode" if it pays. Else we have to recode our favourite routines, so HP will keep our brains trained d;-) We shall be thankful :-)

FWIW,

Walter

Tommy,

You are free to use as many general purpose registers as you like. By "straightforward smooth and secure" I wanted to say you may deal with an arbitrary real world formula trouble-free without using such registers. You don't need to memorize the contents of all stack registers. They are paid to store your data reliably - and recall them when their turn has come in your calculation.

I've never had that problem, regardless of the complexity of operation. With DUPs ROLLs etc, I have always been a happy camper.

Today I tried using the Windows calculator with parentheses and got hopelessy lost (the fact that it doesn't have e^x didn't help - you've got to use inverse-Ln). I guess it depends what you "grew up" with, even though I had a Sharp EL-506P before my HP-28C.

Have you tried the old problem

[(3+1)(4+3)+(2+6)(4+6)]/[(2+3)(2+1)+(3+5)(4+2)]

on a 4 level RPN machine.

Re: Does the HP 10B calculator not support Order of Operation?

*Message #16 Posted by **Bart (UK)** on 5 Aug 2010, 5:33 a.m.,*
in response to message #15 by Palmer O. Hanson, Jr.

The secret is in my last sentence, I started my HP life with the first RPL machine ;). I have never got on with algebraics since. I later replaced the 28C with the 28S. When that broke a few years ago, I got the 35S and had to learn about stack lift and the limits of a 4-level stack. I now have a 50G too.

I must add that I do occasionally use the modern formula display calculators. They are much easier to use, you can see the formula and go back to check for mistakes.

Getting back to your example, keeping track of the stack is as much effort as keeping track of parentheses. On simpler scientifics when formulas start getting that long I prefer to use the memory function. Multiple storage registers are very useful as found on HPs from as early as the HP-45. It was another thing that led to my frustration of the Windows calculator (It is a newly setup PC at work and I have since installed Thomas Okken's Free42). It's also a reason I like the 20S (the HP algebraic that I did use for some years), I never used parentheses on it because with 10 storage registers I didn't have to. Why bother with something I can't even spell? :) (I don't even know if I've spelt "parentheses" correctly every time in this message).

Parentheses with an algebraic computer work just like parentheses in textbook equations. There is no need to keep track of them when working with equations such as the old, supposedly hard for algebraics, Mach Number equation. You just enter them when you encounter them.

in response to message #17 by Palmer O. Hanson, Jr.

> Quote:
>
> Parentheses with an algebraic computer work just like parentheses in textbook equations.

Hi Palmer, as my intro to calculators was at university, textbooks were not allowed in exams. Formulas had to be remembered. Working out of my head, I never bothered to remember a formula like a parrot, but rather how the parts of the fomula were developed and fitted together. Thus an RPL calculator offered the best possible solution for me, I could work out the parts and then put them together in the correct fashion. Similarly with the 20S and it's 10 memories, I can work out each part, store it in it's own memory and then recall as necessary to form the whole. It's like having a 10-level stack. I do not scribble down my

formulas and work through them as written, so for me parentheses is a hopeless case.

So, bottom line: it's all about WHAT SUITS YOU BEST. I think both HP and TI did a disservice by fuelling the "fight" by attempting to proclaim their method better and finding "examples" to support it. It has allowed people to be discouraged to try "the other way". I believe everybody should be actively ancouraged to try different methods so that they can decide on what's best for them. HP has seen the light in some ways by offering alternate input modes on some of their calculators.

Done straightforward with a 6 level stack in RPN:

```
                x   y    z    a    b    t
3 ENTER 1       1   3    -    -    -    -
+
4 ENTER 3       3   4   3+1   -    -    -
+ *
2 ENTER 6       6   2   ()()  -    -    -
+
4 ENTER 6       6   4   2+6  ()()  -    -
+ * +          num
2 ENTER 3       3   2   num   -    -    -
+
2 ENTER 1       1   2   2+3  num   -    -
+ *
3 ENTER 5       5   3   ()() num   -    -
+
4 ENTER 2       2   4   3+5  ()() num   -
+ * +          den num
/            result
```

That's why I claimed what I did above.

> Quote:
>

Yes, the TI-30 had only four pending operations. The old Mach Number equation was proposed by HP as a problem easily solved with RPN but difficult on an algebraic. But the problem requires only four pending operations. Thus, the TI-30, the least capable of the TI scientifics, was able to easily handle what HP thought was a difficult problem for algebraics. If HP had wanted to make the equation too difficult for the TI-30 to handle with a straightforward left to right entry all they had to do was interchange the two bracketed quantities and five pending operations would have been required.

If RPN calculators only had add, subtract, shift and mask operations, I'd agree with you. And the fact that LISP is AFAIK PN, and not exactly a low level language, I'm not sure I can agree with your conclusions. As someone who learned Fortran IV, BASIC, and had a TI-30 before getting a 34C, I think RPN is more natural.

But then, anecdotal evidence does not a proof make.

Muito obrigado! Thanks for correcting my rusty Portuguese.

Regarding the seller, an erroneous factor of 1E6 is a bit too much. I wonder what (s)he was thinking when fixing the price. I am not aware of any currency conversion in your area needing a factor of 1E3, so applying this the wrong way may cause 1E6 easily. Way back, we had Italy for such conversions in Europe - now it is contributing to the strength of the Euro ;))

Cumprimentos,

Walter

OT: Casio fx9850g Slim on Sale

*Message #1 Posted by **Katie Wasserman** on 1 Aug 2010, 11:32 a.m.*

We've discussed the Casio fx9860g calculators here quite a bit and a couple of our regulars have re-purposed them with RPN. So I thought that I'd mention that the very nice "slim" version is on sale for $50 (half the usual price) here. J&R also sells these via Amazon for the same price.

-Katie

p.s. Apparently Casio is closing these out and so there might be even better deals to be had out there.

Edited: 1 Aug 2010, 11:36 a.m.

Re: OT: Casio fx9850g Slim on Sale

*Message #2 Posted by **Bruce Bergman** on 1 Aug 2010, 11:39 a.m.,*

I haven't seen the "II" series yet. I hope there will be a "II slim", but I have not seen any announcements to that effect.

[OT?] SDK Capabilities?

*Message #4 Posted by **Tim Wessman** on 1 Aug 2010, 3:59 p.m.,*
in response to message #1 by Katie Wasserman

I've been meaning to check for quite a while now on what exactly the SDK for C development allows you to do because I'm curious, but I've been busy with more important things. Perhaps someone who has played with it can answer quickly if they have time. . .

1. Do the programs tie into the system in any way? (availiable as commands for graphing, in menus, etc) Or are they just run in the prgm icon area?
2. Do you have access to system calls and variables? Or are they essentially isolated, self-contained programs?

3. If just self contained, I assume you get your basic, C lib calls and not much else?
4. Can you replace the OS completely?

Thanks!

TW

Re: [OT?] SDK Capabilities?

*Message #5 Posted by **Katie Wasserman** on 1 Aug 2010, 7:20 p.m.,*
in response to message #4 by Tim Wessman

There are people here that can answer these question better than I, but.... From what I remember you are given a limited set of operating system calls that do not allow access to any of the application-level functions, just interfaces to the keyboard, screen, memory structures (you can read and modify the values of variables used by other Casio apps) and i/o. I don't know if it's possible to replace the operating system, the SDK is designed for you to write "apps". The operating system allows for one app at a time to run and presents all the apps on the "home" screen.

The calculator firmware itself is really a series of weekly interrelated apps (they share variable space and some allow sharing of the built-in math functions). There are several sites on the web where users post and share apps that they've written and Casio provides a handful of additional ones that you can download, beyond what's supplied when you purchase it. Casio also provides firmware updates, very complete manuals and the SDK on their site. They also have a simple data acquisition hardware module and a built-in app that controls that. (Actually this app is rather clever in that it generates a program in their BASIC-like language that the user can edit later to further customize.)

The PC program to talk to the calculator, for uploads/download and backups, can also serve as a editing tool for writing program off the calculator. It's must easier to write long programs this way. It does not have an emulator component, however.

For $50 it's a massive amount of technology in a wonderfully usable form factor. My only complaints are:

1) The programming language is missing some obvious functionality. They've only recently added strings but did a poor job of it slowing down the generally very fast interpreter and missing some critical functions.

2) I miss (built-in) RPN and HP key clicks.

-Katie

Re: [OT?] SDK Capabilities?

*Message #6 Posted by **hugh steers** on 2 Aug 2010, 10:04 a.m.,*
in response to message #5 by Katie Wasserman

further to Katie's description; yes, there appears only limited interface to casio's built in functionality. basically you get the screen & keyboard basics, even then it's a bit limited. For example, i wound up doing my own low-level keymatrix decoding (source of my version bugs) because i wanted to detect low level key down and up and also the shift and alpha keys. Further, for the screen, it's easier to hit the screen memory directly.

however, you might find interesting the way it works: Everything is an app - even the calculator itself.

They share a limited amount of data (eg equations for the graphing etc.). So the graphing app is a separate app (ie separate binary). Presumably casio use a common set of libraries for all their apps (eg for calculation) and just link them to each app.

To be clear, im not a big fan of this "modular" approach. it works well when you're following an education curriculum where you're either doing complex numbers, matrices, graphing, but never combinations thereof.

However, there's one really cool aspect of this architecture; each app gets the whole machine! Since you can run only one app at a time, each app can use all the RAM (only 64k). Furthermore, the app executable runs directly from flash and is not copied into RAM nor is it position independent code. I think the Hitachi chip has a built-in simplified MMU that essentially supports a few base registers for code and data (rather than a page table). This approach is also used on the Microchip 32 bit PICs.

It's possible for apps to read and write "files" to flash, so you can save/load programs or data like this. The flash memory is quite generous 1.5MB (i think), so there's lots of space for apps and their code size is not super-critical.

[As an aside here, i think your 30b architecture has the same feature. ie can self-flash. i was toying with the idea of writing a repurposed programmable that saves (and runs) its program from a portion of set-aside flash rather than the built-in RAM. as you know, this might be a way to have much bigger programs than the 2-6k built in, whilst using the true RAM for workspace (arrays, strings etc.). would be interested in your view on this]

regarding the SDK, this is really quite good. casio give away a free version of the Hitachi Renesas tool chain (superH) which is a C++ compiler, IDE, debugger and simulator (on the PC). the C++ works well. i've had no problems with it, although i haven't tried giving it template hell :-)

so: 1. No, they're just new apps 2. only screen, keyboard, some IO 3. most of Clib, plus a few extra bits. 4. Yes, when you run you're the OS! when you "exit" it causes a trap which soft-resets the machine back to the main menu.

- hugh.

Re: [OT?] SDK Capabilities?

*Message #7 Posted by **Matt Kernal** on 3 Aug 2010, 1:14 p.m.,*
in response to message #6 by hugh steers

Just want to acknowledge Hugh's "Reckon" and Nigel's "CasioRPN" applications help make the fx9860g Slim a very nice RPN calculator for the end user. The Casio's hardware is lightning fast! The backlighting is a plus too.

I've been working with both Manfred Pfieffer's and Eddie Shore's RPN aplets for the 40GS, and find the biggest obstacle to be lack-of-speed. Then again, I realize they're written in HPBasic.

Good job everyone! (and did I say how fast the Casio is? :-)

Re: [OT?] SDK Capabilities?

*Message #8 Posted by **hugh steers** on 3 Aug 2010, 2:02 p.m.,*
in response to message #7 by Matt Kernal

Thanks!

However, it turns out HP's ARM platform of the 20/30b and new 12c have faster hardware (but less ram - hint, hint). Also the 50g is faster.

It is possible, however to double (or even triple) the speed of the casio 9860g. the base speed is 14.7Mhz and this can be doubled to around 30 - approximately the same as HP.

I selectively speed double, for evaluating the plot function and inside the factorization code. otherwise i try not to because it increases power consumption.

Re: [OT?] SDK Capabilities?

in response to message #7 by Matt Kernal

Thank you very much! I'm glad that you've found CasioRPN useful.

Of all my calculators the Casio Slim is the one that I nearly always have by my side: it has a great high-contrast display, a nice form factor, a reliable keyboard, useful built-in software, and if I lose it I can replace it. While Hugh is correct to point out that the HP-50g's hardware is faster, when used as a calculator (e.g., for evaluating definite integrals) the Casio wins hands down!

in response to message #1 by Katie Wasserman

Just when I decided to buy, the Casio fx9860g calculator is now shown as sold out at J&R. "Sold out" is defined as "we have no more and we do not expect any more from the manufacturer."

It is still shown as available direct from Amazon, but the price is $78. Availability given as "Only 5 left in stock--order soon (more on the way)."

*Message #13 Posted by **Eric Smith** on 13 Aug 2010, 3:55 p.m.,*
in response to message #1 by Katie Wasserman

I bought one just to see why so many people like it. The first thing that struck me is that it isn't actually "slim". It's thicker than my notebook computer!

It also seems fairly difficult to figure out how to do any non-trivial calculations without referring to the manual, which I haven't done yet.

Has anyone taken one of these apart and photographed the innards?

HP-65 sensor chip failure

*Message #1 Posted by **aj04062** on 1 Aug 2010, 11:23 a.m.*

What are the symptoms of a failed chip (from over voltage via charger)?

Does the drive cease to operate?

I am in the middle of restoring a 65 and I just corrected all the damage from a severe battery leak and before I get into the gummy wheel repair, I'd like to know if the chip is good.

If I start a card into the slot, the drive does come on, but because the wheel is toast, I can't tell if a program will load.

Re: HP-65 sensor chip failure

*Message #2 Posted by **Michael de Estrada** on 1 Aug 2010, 12:16 p.m.,*
in response to message #1 by aj04062

I believe that the motor would not run if the card sensor were bad, but I can't say for sure, since I've never had this situation. Perhaps an expert like Randy can say for sure. I'd do the gummy wheel repair, regardless, and just see if it reads/writes cards correctly. You may also need to repair the motor/worm gear coupling (aka clutch).

Also, it's not certainty that the sensor chip will fail if operated from the AC adapter w/o a battery, just more likely.

Edited: 1 Aug 2010, 12:19 p.m.

Re: HP-65 sensor chip failure

*Message #3 Posted by **aj04062** on 3 Aug 2010, 11:35 p.m.,*
in response to message #2 by Michael de Estrada

Well I think it is OK. I have replaced the wheel and now have a smooth running card reader.

Smooth running EXCEPT it doesn't appear to read or write a card. There was a fair amount of crud on the head. Anyone have a suggested method to clean? Could this be the source for the read/write problems?

Also, any suggestions on whether I should replace, touch up or glue back on the label? What would retain the best value?

to my dismay the small piece of black flaked off due to the battery leak (yes it was pretty bad)

Re: HP-65 sensor chip failure

*Message #4 Posted by **Michael de Estrada** on 4 Aug 2010, 9:22 a.m.,*
in response to message #3 by aj04062

I use GooGone to disolve any buildup and then isopropyl alcohol to clean the heads. This may solve the read/write problem or it might not. There are many other possible reasons for read/write problems, including bad reed switch adjustment, incorrect card reader speed and bad circuits. If there is an error during card reading, you will get a blinking display, but also if you attempt to read a blank card. During normal card reading, the display does not blink and does not change.

As far as the back label is concerned, I have always simply replaced it with a replica that you can buy on TAS. As to value, I don't think about such things, since I buy calcs to repair/collect rather than resell, but IME when I've decided to sell excess inventory of a given model, I've mostly at least recovered my "investment". I noticed that the bottom feet are missing; did you remove them? Also, you have a Version 2 of the HP65, based on the serial number label being located outside of the battery compartment. Were the card reader wire connections sockets or soldered?

Re: HP-65 sensor chip failure

*Message #5 Posted by **Ignazio Cara (Italy)** on 4 Aug 2010, 11:07 a.m.,*
in response to message #3 by aj04062

Have you checked the resistance among the two couple of wires of the read/write head? You must disconnect the wires from the sense amplifier PCB and read the value between the couples red/yellow and blue/orange to know if all the coils are ok. Let us know about

Don't worry and try again with your baby!

Ignazio

BTW, if you need a couple of green feet, I can help you.

Re: HP-65 sensor chip failure

*Message #6 Posted by **aj04062** on 4 Aug 2010, 1:13 p.m.,*
in response to message #5 by Ignazio Cara (Italy)

Guys,

Good on the green feet, they are in the "box of parts"

wires are soldered into the board. I will try the goo gone/alchohol first, then move to the resistance checks. Presume that some resistance is ok and I am primarily checking for open circuits.

I too am in this for the challenge of fixing these vintage rigs and don't plan to sell this one unless I come across a better one.

How can you tell if the card WROTE to the card? The display does blink indicating nothing was read, but I don't know if it's telling me it can't read or if I'm reading a blank card.

I have no period cards with this machine, only blanks ones from my 41C.

Re: HP-65 sensor chip failure

*Message #7 Posted by **Michael de Estrada** on 4 Aug 2010, 2:34 p.m.,*
in response to message #6 by aj04062

Try writing a program to a card first, and then reading it back in.

Re: HP-65 sensor chip failure

*Message #8 Posted by **aj04062** on 4 Aug 2010, 2:58 p.m.,*
in response to message #7 by Michael de Estrada

Tried that, it blinks.

Re: HP-65 sensor chip failure

*Message #9 Posted by **Michael de Estrada** on 4 Aug 2010, 3:19 p.m.,*
in response to message #8 by aj04062

OK, then at least you have a problem with the card reader writing cards. This doesn't necessarily mean that it won't read cards, but you would need a card that had been written to test it. You can read a card written for the HP41C into a HP65 w/o getting a blinking display, although the program won't execute properly to test the read function of your card reader.

Re: HP-65 sensor chip failure

*Message #10 Posted by **Ignazio Cara (Italy)** on 5 Aug 2010, 3:30 a.m.,*
in response to message #8 by aj04062

I could send a tested card on my '65, so you can test the reading capability of your calculator. It's possible that it be able to write but due a bad capacitor, it does not read properly the cards.

Regards

Ignazio

Re: HP-65 sensor chip failure

*Message #11 Posted by **aj04062** on 8 Aug 2010, 9:56 p.m.,*
in response to message #10 by Ignazio Cara (Italy)

I tinkered some more. Cleaned and inspected the wires. None appear to be broken @ the board.

It will read a 41C program on some of my cards.

It will not read a card that I tried to write. Does it give any feedback when it writes a card correctly?

Ignazio, thanks for the offer. I think I'll pass as it does seem to be reading. Now I need to fix the writing.

I suppose the next step is to detach the wires and check the resistance across the coils.

Re: HP-65 sensor chip failure

*Message #12 Posted by **Ignazio Cara (Italy)** on 9 Aug 2010, 6:39 a.m.,*
in response to message #11 by aj04062

The '65 use a 6 bit code instructions, so it's not able to read cards from '67 or 41C. Unfortunatelly it don't leave any feedback after a writing operation. And if you are not SURE that your calculator is reading correctly the cards, you must detach the five wires and check them with an ohm-meter to verify the coils.

Lookin forward for good news.

Ignazio

Re: HP-65 sensor chip failure

*Message #13 Posted by **aj04062** on 11 Aug 2010, 10:20 p.m.,*
in response to message #12 by Ignazio Cara (Italy)

Measured 50ohms across the following: Yellow-Red Blue-Orange Remaining wire is Black. It measures about 15 ohms to the outer shell.

Sounds about right, agreed?

Must be a problem in the mechanical drive. I will try to adjust the eccentric to get better force.

Re: HP-65 sensor chip failure

*Message #14 Posted by **Ignazio Cara (Italy)** on 12 Aug 2010, 10:57 a.m.,*
in response to message #13 by aj04062

Hello, yes, the value of resistance is ok. The black wire is the ground, and must be connected to the body of the magnetic head. And now? If you want I can send you a card with a trivial program to verify the read capability of your reader. Let me know your address.

Ignazio

Re: HP-65 sensor chip failure

*Message #15 Posted by **aj04062** on 16 Aug 2010, 10:37 p.m.,*
in response to message #14 by Ignazio Cara (Italy)

Well through continued help from Ignazio, I am slowly trying to find the fault.

I have connections between the motor control board and the Sense Amplifier Chip. It seemed I had found a fault when I discovered high resistance from RA connector to the RA pin on the IC.

Well, I jumped the trace (the motor control board has seen severe battery acid) and it STILL doesn't work.

I'm Stumped. I don't have a background in electronics so this question may be dumb, but I can't check the caps & resistors while soldered in, correct?

I also can't seem to be able to correct the break in the RA trace without desoldering the IC from the board. Is this advisible?

One thing I noticed playing around with the head is that it is slightly loose. If I push it in a little, the card will not go through and jambs up. If I wiggle it out, it allows the card to pass.

More suggestions are welcome, let me know if anyone has spare parts to buy!

RPN Programming

*Message #1 Posted by **hpnut** on 30 July 2010, 11:43 p.m.*

I wonder why HP choose to introduce difficult examples in RPN programming? for example, the HP30b modules have these examples:

1. calculating digits of PI 2. finding prime factors of an integer 3. base conversions for bases 2-10

http://h10025.www1.hp.com/ewfrf/wc/document?docname=c02047259&tmp_task=useCategory&lc=en&dlc=en&cc=us&lang=en&product=4031712

why can't they use examples like celcius to fahrenheit or solving quadratic equations like in the earlier HP 41C manuals?

I am still at a loss programming the new HP calculators from HP 35S onwards.

Re: RPN Programming

*Message #2 Posted by **bill platt** on 31 July 2010, 12:28 a.m.,*
in response to message #1 by hpnut

35s really is mostly the same as the 41C, to me. The odd parts are the new aspects with gotos that don't fit with the 32s paradigm. But it is still fundamentally the same as a 41, no?

Why not "simple" examples? Well, the two you gave are built-in functions, so that wouldn't be particularly useful, would it? May most of the "simple stuff" is already taken up with built-ins!

I think the base conversion program is very useful for learning the programming.

Re: RPN Programming

*Message #3 Posted by **Don Shepherd** on 31 July 2010, 3:09 a.m.,*
in response to message #1 by hpnut

I think the idea was just to include some examples that most folks could relate to, so that they could see how programming is done on this machine, because it is somewhat different than "standard RPN" as many of us know it.

Here is a list of some "gotcha's" that you probably need to know about the 30b in order to program it effectively. Once you get used to some of its weird habits, I think you will like it, especially its speed.

The prime factor program shown is not the fastest in the world, but it is simple. Any regular member of this forum who knows RPN should be able to write a quadratic equation solver with little effort, especially since it won't need any conditional statements, typically. The 30b conditionals are a bit tricky until you understand how they work.

Re: RPN Programming

*Message #4 Posted by **gene wright** on 31 July 2010, 11:49 a.m.,*
in response to message #1 by hpnut

Probably because there are examples of simpler programs elsewhere.

Examples of assigning programs to keys.

Examples of using HP solve.

etc.

then again, I'm certain that if the modules ONLY had the quadratic equation and F->C and C->F, more people here would have complained that the examples were too simple.

So, here you go. RPN mode assumed.

C->F... key celsius temperature, press = = while in the program catalog to execute.

```
LBL 0
9
X
5
/
3
2
+
R/S
```

F->C...key fahrenheit temperature, press = = while in the program catalog to execute.

```
LBL 1
3
2
-
5
X
9
/
R/S
```

For a quadratic, I would use the solver, not a program.

The learning module for using HP Solve shows several examples of how to do this.

HP Solve module

Example 1: Finding the roots of y = (x-2)^2 - 1

Example 2: Finding the roots of y = (x-2)^2 + 1

I can't help the typos in this web document.

Hope these help.

> For a quadratic, I would use the solver, not a program.

On the 30b, to use the solver you're going to have to write a program anyhow, and if I'm going to write a program for this problem I'll implement the quadratic formula which will give me both roots without having to "guess." That's the one thing I've always disliked about the HP solver, it makes you guess in order to get both roots, and if you guess, you probably already know the answer!

Re: RPN Programming

*Message #6 Posted by **gene wright** on 1 Aug 2010, 3:36 p.m.,*
in response to message #5 by Don Shepherd

True, true.

But if someone is unsure about programming enough that they really need examples for converting F->C and C->F, then a short program in the solver for X^2-4X+4 is probably easier to type in and run than a longer one to give both roots at once.

But, I do agree with your point, certainly. :-)

Re: RPN Programming

*Message #7 Posted by **Don Shepherd** on 1 Aug 2010, 4:36 p.m.,*
in response to message #6 by gene wright

Thanks, Gene. That's one thing I like about the NSpire, it's SOLVE function. Now, I know the NSpire is a CAS and the 30b is not, but if you type in SOLVE(x^2+5x+6=0,x) it comes back with x = -2 or -3. Now that's what a solver ought to do!

Rootfinding function (SOLVE) and guesses

*Message #8 Posted by **Karl Schneider** on 2 Aug 2010, 12:15 a.m.,*
in response to message #5 by Don Shepherd

> Quote:
>
> That's the one thing I've always disliked about the HP solver, it makes you guess in order to get both roots, and if you guess, you probably already know the answer!

I can't concur with that statement. The idea behind the 'guesses' is to bound the interval for the root of interest. The user may know the approximate value of that root, but requires automated numerical iteration in order to efficiently "home in" on it.

Also, periodic functions may have an infinite number of real-valued roots.

From your subsequent post:

> Quote:
>
> ...if you type in SOLVE(x^2+5x+6=0,x) it comes back with x = -2 or -3. Now that's what a solver ought to do!

Sure, but that's a quadratic function with two exactly-specified, easily calculated roots (which may or may not be real-valued). A solver can be programmed to find all roots of a polynomial function; the convenient "SOLVE POLYNOMIAL" screen of the HP-48G series, as well as the PROOT function of the HP-71B Math Pac, will do so.

Re: Rootfinding function (SOLVE) and guesses

*Message #9 Posted by **Don Shepherd** on 2 Aug 2010, 7:06 a.m.,*
in response to message #8 by Karl Schneider

Karl, I guess we'll have to agree to disagree. Yeah, the user may have an idea of the value of the second root, but he may not also and will have to do more work with the solver to find it. I think the real value of the HP solver is finding solutions to first-degree equations with multiple variables, where you know the values of all variables except one and it will calculate and tell you that one. And I like the approach used in machines like the 17bii where you just enter the equation (don't have to set it to 0) and provide values for the known variables and it tells you the unknown. I like that approach more than requring you to write a program, as in the 30b for example.

But, truth be told, I think the method I like best is doing it in my head, like completing the square or factoring or using the quadratic formula manually. I've read that doing mental things as you get older (I'll be 60 in a couple of weeks) keeps you from getting Alzheimer's disease, plus it's just fun!

I took your sentiment of not liking the 'make a guess' requirement in more general terms, as opposed to pertaining specifically to quadratic solutions.

I still maintain, though, that the user ought to be able to deal adroitly with quadratics, even working them out manually in lieu of programming a solution. The best way for a calculator to return both/all solutions automatically, without the benefit of guesses entered by the user, is with a polynomial-solving function.

Oftentimes, one mathematical quadratic solution will have no practical use in a real-world problem.

> Quote:
>
> I think the real value of the HP solver is finding solutions to first-degree equations with multiple variables, where you know the values of all variables except one and it will calculate and tell you that one.

They need not be 'first degree' equations; the multi-variable equation can be of any form. RPN-based HP solvers will use two 'user-supplied' guesses from stack contents and the stored value of the 'solve' variable. I would assume that the stored value (if present) is the starting point for the HP-17B/27S solver.

If the guesses are the same, the solver will decide in which direction to proceed. If the solver is to succeed, neither guess must cause a math error.

Re: Rootfinding function (SOLVE) and guesses

*Message #12 Posted by **Bart (UK)** on 5 Aug 2010, 7:18 a.m.,*
in response to message #11 by Karl Schneider

I think the problem is again what the older generation complains so much about - people want to just punch problems into computers and get answers, losing all inkling of whether the answer makes sense. This has been discussed so often on this forum. The same goes in this case where calculators can be programmed to give answers to simpler quadratics without guesses, but for more complex problems there can be a multitude of answers and you can be sure the calculator giving you definite solutions will give the ones you don't want. I think working with a calculator that forces you to guess even for the simple quadratics, teaches you to do it right for the more complex ones.

in response to message #12 by Bart (UK)

> Quote:
>
> This has been discussed so often on this forum.

I think we can all agree with that!

Here's what I think. It's not the calculator's responsibility to make sure that the person

pushing its buttons understands the answer it provides. That's probably somebody's responsibility, but not the machine's. If a solver application can find a solution without the button-pusher providing a guess first, do it. Personally, I'd like the solver to do this for a quadratic equation: recognize that it's a quadratic, get the coefficients of x^2 and x and the constant term (a, b, and c), apply the quadratic formula, and return the two solutions (if there are two solutions) in x and y. Now, there may be a legitimate reason that the solver has not taken this approach in the past, so that's OK. But maybe it's time to update the solver (radical idea).

I teach my middle school students to find the solutions to quadratics by factoring, if possible, then completing the square, then applying the quadratic formula, and I think that's good because it makes them think (and work!). Once they leave school, they will probably never have to do such things again in their life (similar to box-and-whiskers plots, don't get me started on those), but the process of doing it now exercises their brains in ways that video games cannot.

This requires that the equation be entered in full detail. And, what if the terms had not been gathered -- should the calc still be able to recognize it as a quadratic? Any sophisticated solution will entail CAS.

I still say that the ideal solution is a polynomial solver, like that of the HP-48G and its descendants: Choose "Solve Polynomial" from the SOLVE menu, enter [1 5 6], hit "Solve", and read -2 and -3 as the answers. A PC might be a better tool if the problem is more complicated than that.

A quadratic-equation problem came up at work recently. After failing for a short while at simply reckoning an operating point, I derived a quadratic expression, programmed it as an equation on the HP-32SII, and quickly solved it numerically, knowing what a realistic answer would look like. (The other solution, which I computed manually, was indeed unrealistic -- well outside the operating limits of the equipment. The HP-32SII found that one, too, with suitable guesses steering it in that direction.)

Re: Rootfinding function (SOLVE) and guesses

*Message #15 Posted by **Don Shepherd** on 6 Aug 2010, 3:48 a.m.,*
in response to message #14 by Karl Schneider

Yeah, trying to determine if a solver program represents a quadratic equation would be problematic, given all the possibilities and different coding styles of users. So I admit, that's a bad idea.

One thing I like about the SOLVE command on the TI-Nspire is that it is general purpose. It solves simple equations, quadratic and higher order equations, and systems of equations (what we called simultaneous equations when I was in high school, I always wondered why they changed the name). And it doesn't require you to set the whole thing equal to zero.

```
solve (x-12=30,x) yields x=42
solve (x^2+5x+6=0,x) yields x=-2 and x=-3
solve (x+y=11 and x-y=-3,x,y) yields x=4 and y=7
```

There is also a CSOLVE command for complex numbers, but I've never used it.

in response to message #11 by Karl Schneider

Solving for the roots of polynomials (with real coefficients) using the Lin-Bairstow algorithm requires no guesses for the roots. This algorithm will find all of real and complex roots of the polynomial. Unfortunately, when it comes to non-polynomial functions, at least one guess for the root is required to tell, whatever algorithm being used, where to start looking.

Namir

However you need to give initial values (guesses) for the quadratic polynomial. Also Wikipedia states:

> Quote:
>
> As first quadratic polynomial one may choose the normalized polynomial formed from the leading three coefficients of f(x),

Is there a reason for that choice? In my experience it just doesn't matter much, what you chose.

For those interested I once wrote a program for the HP-11C. However the trick using L.R. to solve the linear equation might not always work with later HP models since n is checked to be positive.

My first encounter with this algorithm was with an article in PRISMA, the magazine of the former CCD. The program was written for the HP-41C (of course) and I didn't understand a single thing, what was going on. It must have been around 1984. Unfortunately I've lost the copy of the article but maybe someone in this forum can still find it.

Jean-Marc Baillard contributed a solution to the MoHPC HP-41C Software Library: Polynomials for the HP-41
cf. g) Quadratic factors (Bairstow's method)

Kind regards
Thomas

*Message #18 Posted by **Namir** on 5 Aug 2010, 3:51 p.m.,*
in response to message #17 by Thomas Klemm

Thomas,

The implementation I use of Lin-Bairstow internally provides the initial guesses for the quadratic coefficients. The caller to the Lin-Bairstow subroutine needs not supply any initial guesses.

Thank you sooooo much for the HP-11C listing your provided. I was looking for such an implementation that uses no memory registers. Good job!!

Also thanks to the link to Baillard's excellent 41C listings. I was thinking of writing a (new) Bairstow method. The listing is interesting/

in response to message #18 by Namir

The images in the Wikipedia-article suggest that there are initial guesses that might lead to divergence for certain polynomials. Do you know how this is avoided in the implementation you use? Are there best initial guesses that can be easily computed from the coefficients as suggested? Do you know the reason for this suggestion?

My implementation of course uses some memory registers but I tried to use as few as possible. Otherwise you run out of memory for the program. IIRC it's possible to solve polynomials up to degree 7, probably even a little more if you sacrifice the quadratic solver program at LBL A.

It's nice you like the program.

Re: Rootfinding function (SOLVE) and guesses

*Message #20 Posted by **Namir** on 5 Aug 2010, 5:22 p.m.,*

in response to message #19 by Thomas Klemm

I emailed you the listing of a VB SUB that implements the Lin-Bairstow algorithm. The museum email server may have converted some characters. You can write me at nshammas{AT]aol[DOT].com if you want me to send you the entire Excel file.

Namir

Re: Rootfinding function (SOLVE) and guesses

*Message #21 Posted by **Thomas Klemm** on 6 Aug 2010, 2:39 a.m.,*
in response to message #20 by Namir

From the listing you sent me:

```
' start the main Lin-Bairstow iteration loop
' initialize the counter and guesses for the
' coefficients of quadratic factor:
'
' p(x) = x2 + alfa1 * x + beta1
'

alfa1 = 1
beta1 = 1
```

It appears the same initial values are used as in the example of my solution:

```
1       STO 7
        STO 8
```

Remark: Please note the slight difference in the definition of the remainder polynomial:

Wikipedia:

```
cx + d
```

My solution:

```
R(x) = b1 ( x + p ) + b0
```

It turns out to make the algorithm more concise since there's no special case in calculating b0 (in my solution) as it would be for:

```
d = a0 - v b0
```

Please note also the shift of indexes by 2 when comparing the quotient:

$Q(x) = b_n x^{n-2} + b_{n-1} x^{n-3} + ... + b_4 x^2 + b_3 x + b_2$

These kind of subtleties may have a considerable impact on the code.

ADV or STD HEPAX?

*Message #1 Posted by **Diego Diaz** on 30 July 2010, 6:44 p.m.*

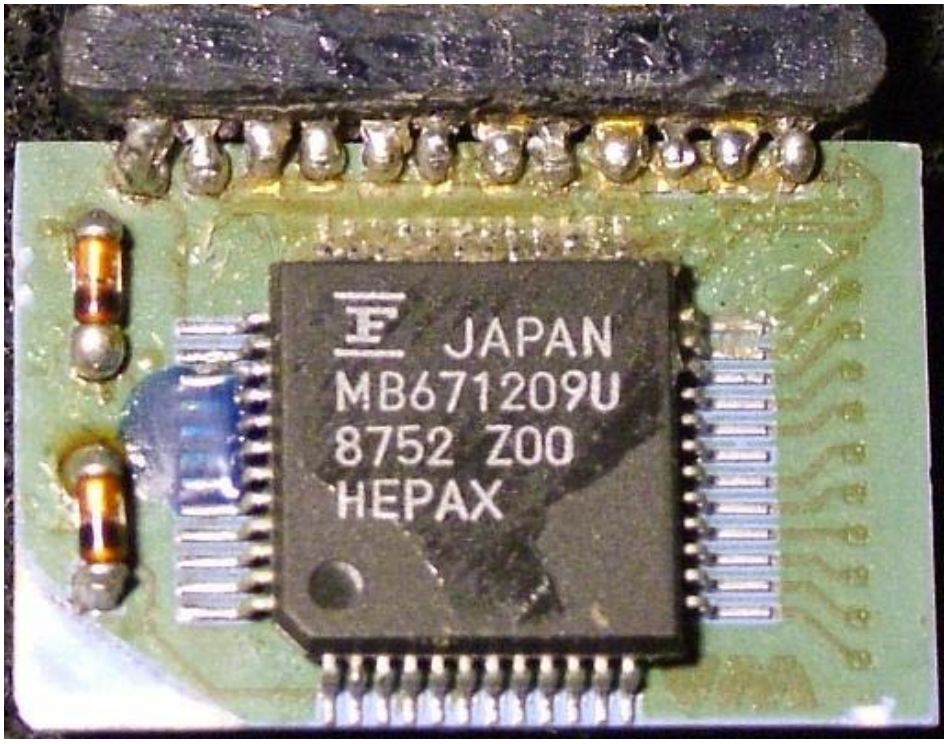
Hi all,

I'm trying to restore an HEPAX module to its better day's splendor... :-)

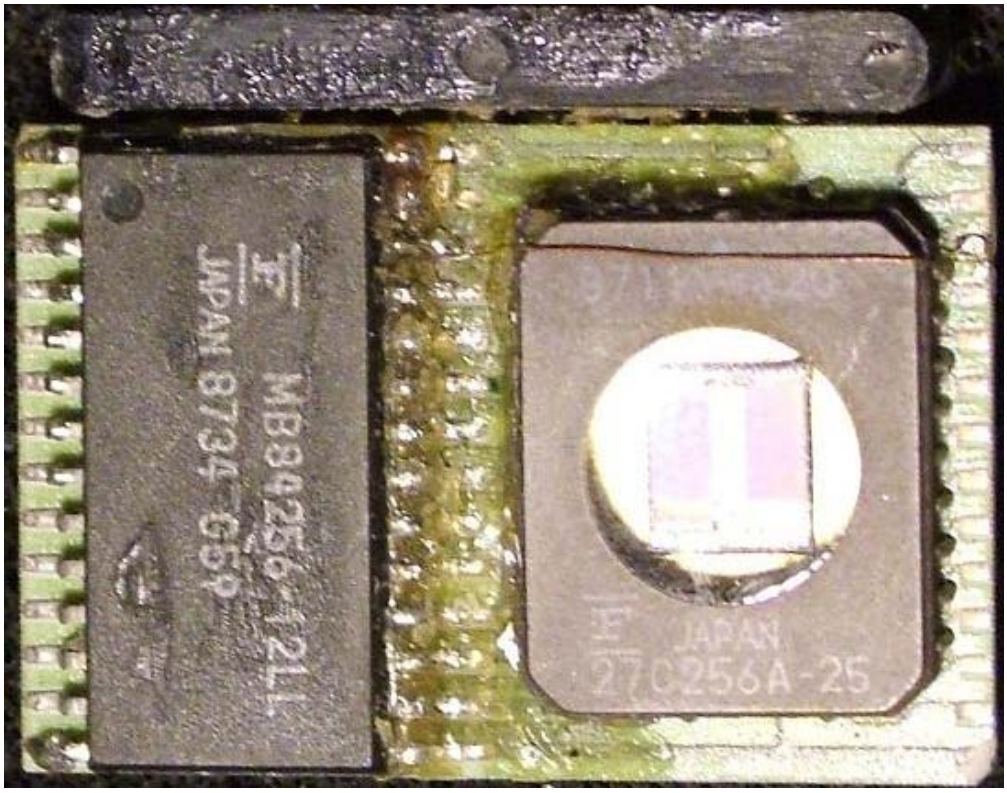
The poor little thing arrived in a very bad state.

See pics:

Seems that someone has attempted sort of repair with little success.



It also seems that back in the late 80's silicon glue must be considered the coolest thing on earth! (what a mess) :-(



Ok, the silicon glue has been removed, the connector solders have been reworked and the RAM chip replaced (the original one had one broken pin, thus the tiny wire in the second PIC).

I need some help from those which may have pictures (or may take them) form HEPAX chip (MB671209U) both from STD and ADV HEPAX.

The question comes from the fact that the rebuilt HEPAX above arrived into an "ADV HEPAX" labelled shell, however, once rebuilt it shows only two pages of HEPAX RAM.

Also both port-detecting lines (B3 & B4) are connected to the HEPAX chip. Advanced HEPAX only needs B4.

But, to make things a little bit more confuse, the module shows up in CAT 2 as "HEPAX 1D".

Possibilities:

- Module is a late (ver 1D) STD HEPAX, and it was placed into the wrong shell.

- Module is an ADV HEPAX with a faulty address line, thus the lack of two RAM pages.

Questions:

Are there different chips for STD and ADV HEPAX?

Does someone have pictures to clarify this doubt?

Test which can also help:

With ADV HEPAX inserted into port 2, [<-] [ON] (perform memory lost)*, then execute "HEPAX 002" and check which page is HEPAX 1D using. Try with ports 4, 3 and 1.

*NOTE: [ENTER] [ON] [ON], may also work without losing main memory contents.

Any help will be very welcome.

"clonix41(at)gmail(dot)com" in case you can't place pictures in the forum.

Thanks and best wishes for the summer... ;-)

Diego.

Re: ADV or STD HEPAX?

*Message #2 Posted by **Raymond Del Tondo** on 30 July 2010, 7:51 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

I thought the difference between STD and ADV HEPAX was that the latter has RAM pages at all..

Peter P should have pics of both variants;-)

Regards

Raymond

Re: ADV or STD HEPAX?

*Message #3 Posted by **Diego Diaz** on 30 July 2010, 9:15 p.m.,*
in response to message #2 by Raymond Del Tondo

Hi Raymond,

Thanks for your reply, I'll mail Peter if he doesn't show up around here... ;-)

According to HEPAX manual Standard HEPAX comes with 8K (two pages of RAM) which are allocated to the port addresses where the HEPAX is plugged in... (that's exactly the way the module I've rebuilt is behaving) and Advanced HEPAX comes with 16K RAM (4 pages), and uses both ports addresses (1 & 2, if you plug it into port 1 *or* 2) or (3 & 4 if you plug it into port 3 *or* 4).

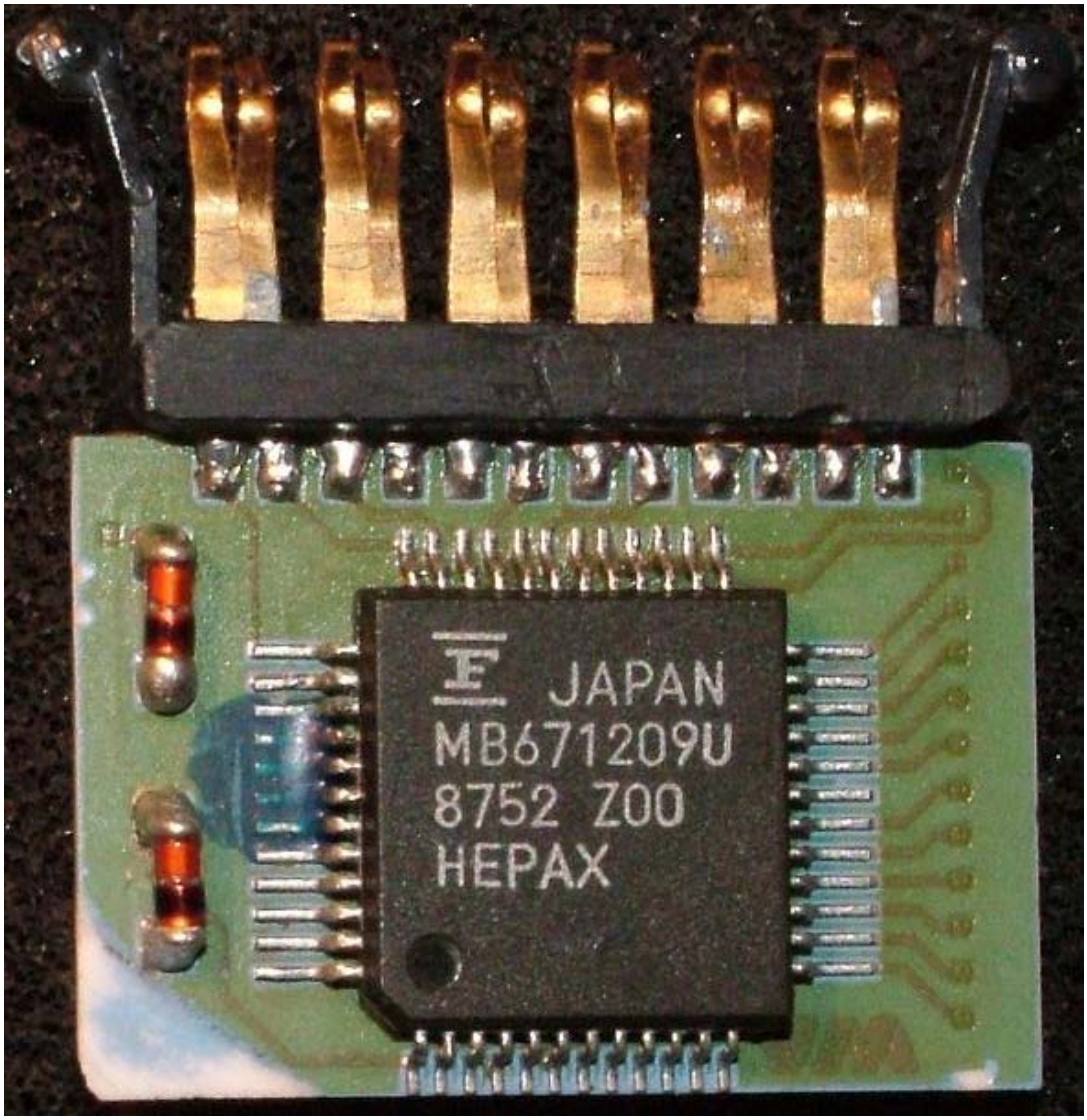
With this info alone, the referred module should be a Standard HEPAX. Which BTW is ok for me. The doubt arises from the fact that is shows-up in CAT 2 as HEPAX 1D. I assume that this is the ROM version for ADV HEPAX. (I may be wrong on that). At a more technical level there are two contradictory facts:

- On one hand, the Address line A14, required to address two more pages, is properly connected to the RAM chip. Thus pointint to an ADV HEPAX.

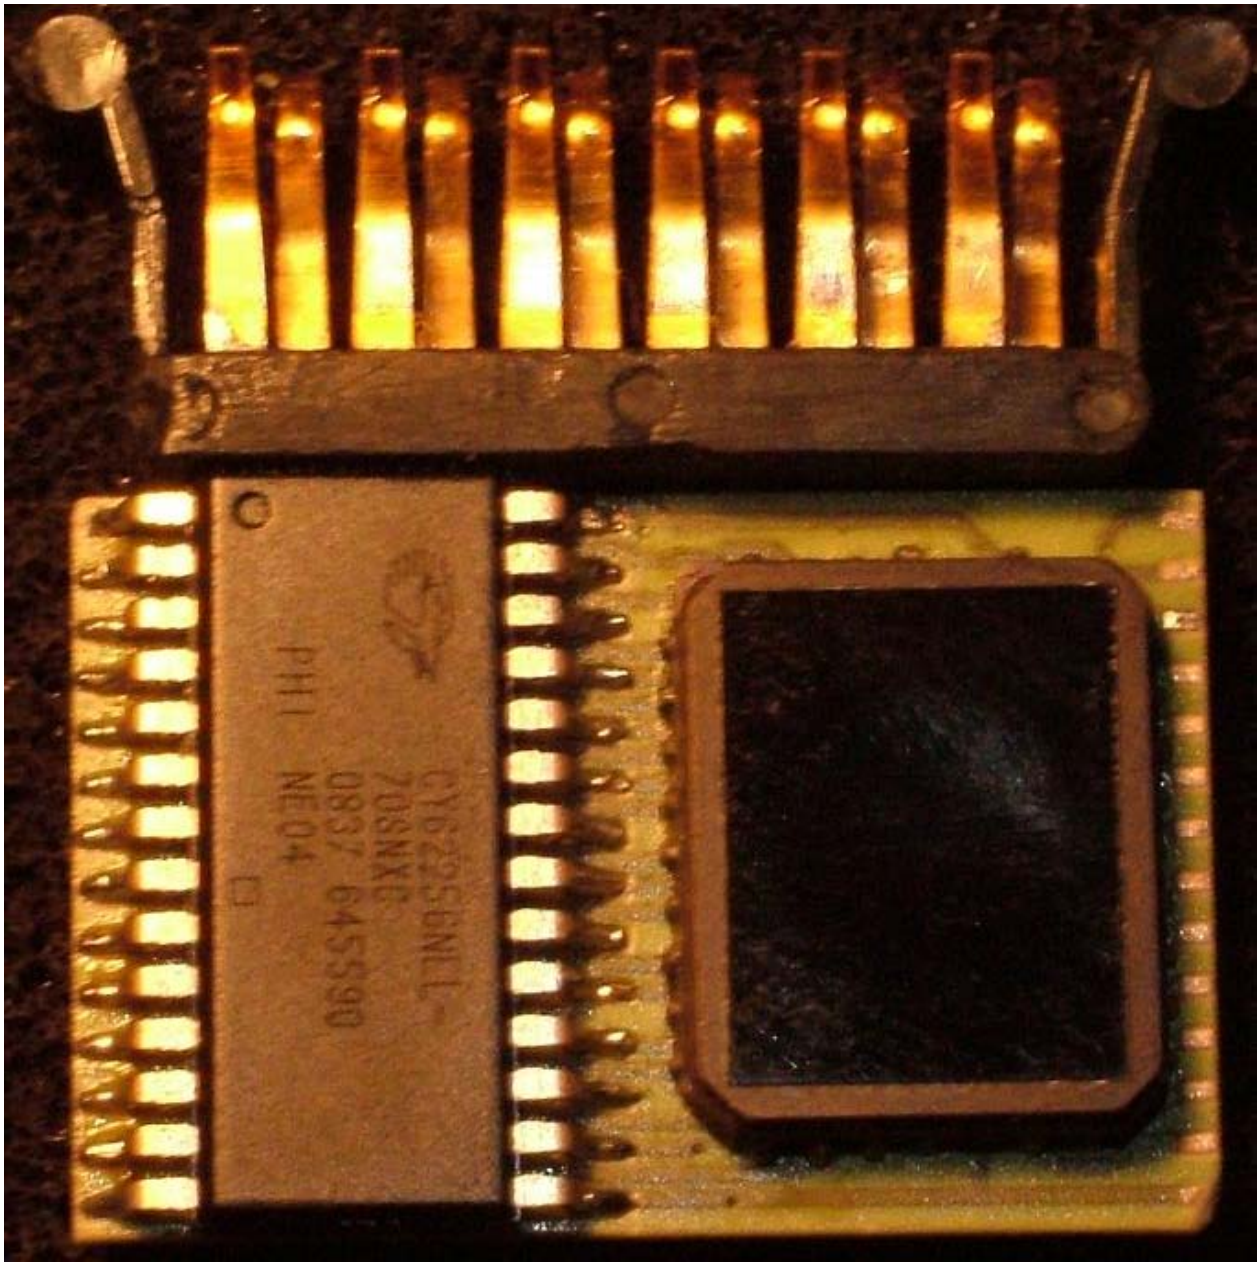
- On the other hand, the lines B3 and B4, required to sense the port in which the module is plugged in, are both connected. Pointing to a STD HEPAX, since ADV. HEPAX only needs B4.

Either case I'm very happy to have bring back to life a very badly damaged HEPAX module.

To whom may be interested in the "after" pictures, here they are:



JAPAN
MB671209U
8752 Z00
HEPAX



Cheers.

*Message #4 Posted by **Angel Martin** on 31 July 2010, 1:52 a.m.,*
in response to message #3 by Diego Diaz

What a superb restoration Diego! There's no telling that the before and after pics come from the same unit, fantastic job.

I can confirm (as though it were required, which it isn't) that the Advanced Hepax has 4 pages of memory as you indicate - so perhaps there's something elso wrong with that unit.

Saludos, 'AM

Re: ADV or STD HEPAX?

*Message #5 Posted by **J-F Garnier** on 31 July 2010, 4:52 a.m.,*
in response to message #3 by Diego Diaz

I always suspected that the STD and ADV HEPAX varieties were only a marketing plan. The RAM chip is 32Kbytes in both cases, providing 16kwords. At the time (and still now), there was 8kbytes and 32kbytes chips but no 16kbytes chip.

The ROM version is independant of the STD or ADV variations. If I was the HEPAX designer, I would have differentiate the 2 variations at PCB level, maybe using a pin of the ASIC.

J-F

Re: ADV or STD HEPAX?

*Message #6 Posted by **Diego Diaz** on 31 July 2010, 7:17 a.m.,*
in response to message #5 by J-F Garnier

Hi Ángel, J-F,

Thanks for your kind words Ángel. A nice part of the good final appearance is thanks to the ceramic PCB which allows a high level of abuse.

J-F, as usual your contributions are both enlighting and accurate :-))

Paraphrasing Sting: "There's a little 'blue' spot in the 'board' today..."

One of the things that called my attention was this "blue spot" you can see in the pictures covering a few pins of the HEPAX IC.

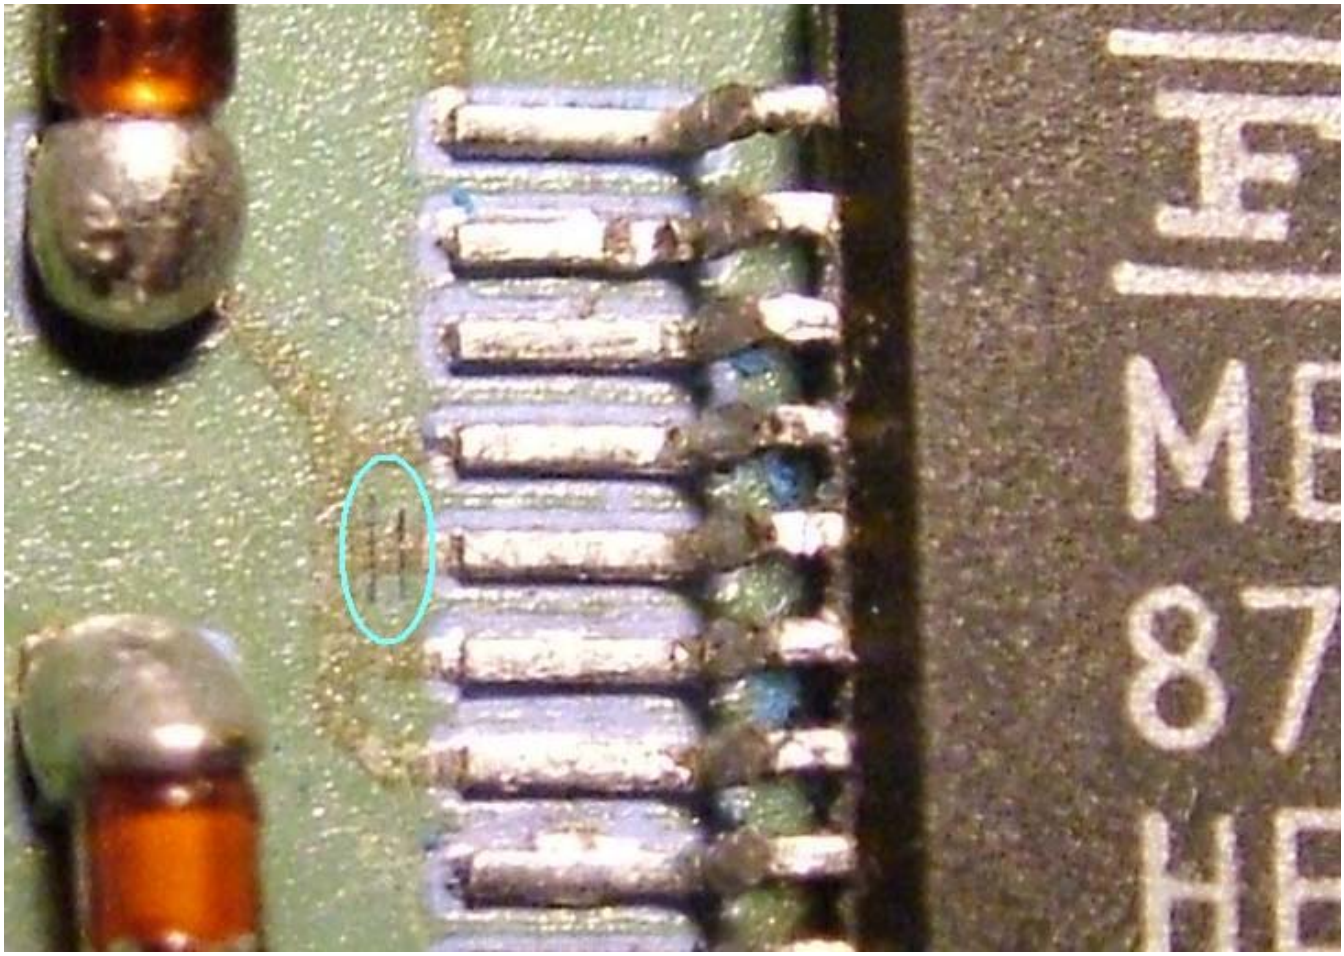
It was suspictious just because:

a) it was completely useless

b) it was extremely hard

c) it was just covering four contiguous pins from which 3 are connect to Vcc and the other one was not connected to anything...

Took me about 30 minutes to remove... to find this:



Circled in blue the (astoundingly narrow) cuts, probably made by a diamond saw, since very few materials can cut ceramic with this precision.

The four pins are too conspicuous to be a sort of PCB strapping cofiguration as J-F, has pointed out.

Now, all that we need is some generous ADV HEPAX user who can confirm which of these four pins are connected/cutted in the ADV type module. (16 possibilities ar too many to test soldering/unsoldering...)

Hopefully every HEPAX module out there could be converted into ADV type... :-))

As a collateral effect I've ended up with a full detailed schematic of the HEPAX module. Will place it at TOS as soon as I move it from paper to file.

Cheers.

Diego.

Re: ADV or STD HEPAX?

*Message #7 Posted by **Angel Martin** on 31 July 2010, 7:39 a.m.,*
in response to message #6 by Diego Diaz

wow, it'd be something if you had uncovered the HEPAX plot :)

Perhaps now we know why they were so keen on using silicon glue!

I wonder sometimes: where are all those people who created these masterpieces? How come they don't peep into this (or other forums)? I'd give an arm and half leg to have the documented source code for the HEPAX, or the CCD for that matter (BTW, I suspect *someone* must have them... I wish he'd share it with the community but no such luck).

Never mind, just rumbling about it I guess.

Cheers, 'AM

Re: ADV or STD HEPAX?

*Message #8 Posted by **Diego Diaz** on 31 July 2010, 11:27 a.m.,*
in response to message #7 by Angel Martin

Hi again,

I think it can be assumed that the population of ADV HEPAX owners, who have the module case opened, and a handy multimeter is anything but large... ;-)

So, I decided to give a go myself and after some more testing here is the (so called) "HEPAX plot" unveiled:

The pins in the strap are numbers 40, 41, 42 & 43 (top to bottom). In fact #43 is internally connected to Vcc so it doesn't matter.

#41 is open (as seen in the picture above) for the STD HEPAX, just open #42 and you'll have an Advanced HEPAX in a snap!! ;-))

Hope someone can confirm my point (assumend someone dares to fiddle into his/her beloved Standard HEPAX...)

Thanks a lot for your comments and support, and enjoy your 41's!

Cheers from the Canary Islands.

Diego.

HP 32S Successor

*Message #1 Posted by **ka6uup** on 30 July 2010, 6:45 a.m.*

My beloved HP 32S died after about 20 years of continual use and about 5 years of twisting and such to get the right row of buttons to work. Since I had nothing to lose, I managed to get it apart and determined that it was the lower right corner of the pc board that was at fault. While pressing HARD on it I could get it to work but even after cleaning everything no luck. Then I managed to break of the tab on that corner and finis. Which of the current HP calculators comes closest to a replacement for the 32S? Thanks, Chuck

Re: HP 32S Successor

*Message #2 Posted by **David Hayden** on 30 July 2010, 7:28 a.m.,*
in response to message #1 by ka6uup

Look at the 33s and possibly the 35s. I think these have similar features to the 32s, although things like programming and entering complex numbers is probably different.

There are others on the forum who know much more about these models than I do, so if someone disagrees with me, you should believe their opinion, not mine :)

Dave

Re: HP 32S Successor

*Message #3 Posted by **bill platt** on 30 July 2010, 9:31 a.m.,*
in response to message #1 by ka6uup

33s is very similar in programming--almost identical. It has equations as well as RPN and you can put the equations in the programs, too. The 33s is a newer replacement for the 32sii, which also had equations but in all other senses was almost identical in function to your 32s.

The 35s is also similar, but there are some significant differences in the details of programming it, compared to the 32s. You will find that the 33s takes no adjustment to your programming understanding, though you do have to get used to the new keyboard layout. The 35s takes more reading of the manual to understand the "aha!" differences.

Or you can try for an ebay special.

Re: HP 32S Successor

*Message #4 Posted by **Ed Look** on 30 July 2010, 11:04 a.m.,*
in response to message #1 by ka6uup

Let me chime in with these guys and suggest the 33S. I also am using the 33S as a replacement for my 32SII, which I love (but it's getting OLD). Initially, I was put off by the 33S, which did not physically resemble much the black/brown Pioneer series machines. But after using it, I love it, just as much as the 32SII because of its similarity in use and not only in its programming. While the 33S keyboard is obviously not quite the same as

that of the 32SII, there's essentially no real learning curve involved with switching from the 32SII to the 33S. And then, the 33S has more program memory, which is nice. I did not program my 32SII much; I do program my 33S. Oh yeah, the 33S feels good in my hand.

As to the 35s, it looks much nicer, but I like the 33S more, most likely due to its operational ease and similarity to the 32SII.

*Message #5 Posted by **Michael de Estrada** on 30 July 2010, 12:28 p.m.,*
in response to message #4 by Ed Look

I have an HP 32SII, 33S and 35S. The keys and display on the 32SII are much better that the 33S (awful) and 35S (just OK). I've long ago removed the batteries from the 33S and use the 35S infrequently, but use the 32SII regularly. I don't do any programming with any of these calcs, and mostly do programming on my 50g in RPL.

Re: HP 32S Successor

*Message #6 Posted by **Dave Shaffer (Arizona)** on 30 July 2010, 1:03 p.m.,*
in response to message #1 by ka6uup

You might get BOTH a 33S and a 35S - total on ebay (the site which is not to be mentioned, but which gets mentioned a lot here!) should be under $100 - less than a replacement 32S on ebay.

Try them and see which you like better, then sell the other one! I have both. The 35S looks better, but they both do what I need (which doesn't involve much programming). They are what I grab to do something quick (rather than my 11S and 41CV, which seem to be living in the drawer these days - maybe subconsciously I don't want to risk damaging them).

*Message #9 Posted by **Walter B** on 30 July 2010, 4:41 p.m.,*
in response to message #1 by ka6uup

Please note the previous posters talked about the 33S and 35S succeeding the 32**SII**, not really the 32**S**. There is a big difference in keyboard layout between the 32S and 32SII, however. So if you loved your 32**S** - try to get another one on TAS. Since many people prefer more functions printed on the keyboard (i.e. the 32SII kind of layout), you may even get a 32S for less $$$.

Re: HP 32S Successor

*Message #10 Posted by **Martin Pinckney** on 1 Aug 2010, 9:31 p.m.,*
in response to message #9 by Walter B

I second this. The 32s and 32sii have rather different user interfaces.

New versions of Emu28 and Emu48 available

*Message #1 Posted by **Christoph Giesselink** on 29 July 2010, 5:16 p.m.*

New versions of Emu28 v1.21 and Emu48 v1.50 are available at http://hp.giesselink.com/.

Emu28 v1.21 is a hotfix release. I recognized that the checksum correction for ROM patches (like the BEEP patch) modified wrong addresses assuming that these are the ROM checksum addresses. The assumed byte at each end of the four pages is code. I confirmed this on the first two pages. Because nobody was able to tell me, where are the four checksum addresses for the ROM 1BB and 1CC are, I disabled the checksum correction for ROM patches.

To avoid a ROM checksum fail during the self test with the BEEP patch, I modified the BEEP.28C file adjusting the checksum in the skin archive.

Emu48 v1.50 mainly is a source code fix version. Now the document file of a x64 compiled version is compatible with the IA32 (Win32) version. The WinXP common control styles are now also enabled in versions generated with VS2005, VS2008 and VS2010. The new MS VS2010 compiler has a strange bug in the code optimizer. The release versions of Emu48 v1.49 and earlier created with VS2010 aren't working.

The Emu28 v1.21 and Emu48 v1.50 sources have a workaround for this problem (hopefully the only one). The Emu42 v1.12 source still has this problem. Both Emu28 and Emu48 are still compiled with the old VC6 compiler.

Regards

Christoph

>
> 10b, 14b, 20s, 32sii, 42s, and 48sx do not.

(Also, the HP-12C does not require the extra step.)

The likely rationale:

The HP-17B and HP-27S are business models having the same alphanumeric paradigm as the HP-42S. Business-oriented users are less likely than scienctific/engineering users to utilize the exponential-entry function -- denoted "E" instead of the traditional "EEx" -- and might confuse it with the alphabetical "E". Forcing pre-entry of a "1" or other numerical value on the HP-17B and HP-27S eliminates that risk. The HP-12C, HP-10B, and HP-14B were not alphanumeric, so that was not an issue.

I also disagree with requiring this extra data-entry step for the scientific-based HP-35S.

Re: 1Enn on the 35s and others: likely reason

*Message #4 Posted by **Norris** on 5 Aug 2010, 3:31 p.m.,*
in response to message #3 by Karl Schneider

The 35S (introduced 2007) is the latest model in an evolving series, which began with the 32S (1988), and continued with the 32SII (1991), and 33S (2003).

I have a 32SII and 33S, and they both allow one million to be entered as "E" "6", without an initial "1". Don't have a 32S, but expect that it would do the same.

If the 35S is different, then it would appear that this change was introduced as the 35S was developed.

Hello, Norris! Long time no post?

I and others have noted that some RPL-based 'ways of doing things' were adopted in the HP-35S, such as:

- Entry of input into a buffer that is processed upon completion, rather than handling entry as a 12-digit number (except in Alpha, Program or Equation mode) and processing it as it is entered.
- Identification of a binary, octal, or hexadecimal number by an appended lowercase letter instead of by entry mode.

Perhaps the intent was unification of source code, but we RPN fans didn't like it very much...

You don't need to press 1 first on the 30b, but EEX is normally a shifted function. However, you could assign it to a non-shifted key via a macro.

*Message #7 Posted by **designnut** on 3 Aug 2010, 11:40 p.m.,*
in response to message #6 by Don Shepherd

OK, so that is a minor annoyance, but try revising a program. It has some sticky labels hiddden in it that it won't let go of until you start all over. It doesn't tell you anoutt it, but it can surely make you put it away and turn to another calc. Sam

Re: The most annoying feature on the 35s

The mother of all distributions with HP SOLVER?

*Message #1 Posted by **Peter A. Gebhardt** on 29 July 2010, 8:00 a.m.*

Dear fellow forists,

although the headline might be exaggerating, the Gamma Distribution is nowadays heavily used in financial problem solving (eg. insurance) - besides its many uses in engineering & operations research.

Therefore I'm kindly asking you: Has anybody already tried to implement a Gamma Distribution with the HP17bII+ (or compatible) SOLVER routines?

I have a working solution already, but because of it's implementor (me), it's far from being a quick to enter formula - albeit working correctly, as far as I can tell (I used Gauss Integration & coefficients from Stegun).

Somebody able to reach a helping hand?

TIA!

Peter A. Gebhardt

*Message #2 Posted by **Martin Pinckney** on 29 July 2010, 11:38 a.m.,*
in response to message #1 by Peter A. Gebhardt

I remember seeing that Viktor T. Toth has a Gamma function for the 17BII on his site at:

http://www.rskey.org/detail.asp?manufacturer=Hewlett-Packard&model=HP-17BII

Perhaps this can help? (Sorry, I am not very literate in statistical mathematics).

Re: The mother of all distributions with HP SOLVER?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2010, 1:33 p.m.,*
in response to message #1 by Peter A. Gebhardt

Hi, Peter;

I know that the Gamma Distribution implies some hard brainjob (see here or the Wikipedia's way), but I do not recall seeing the implementations you mention. Not an excuse of mine, at the time I was studying at the engineer's course, I did not have the inclination to go deeper in math and research tools. If I only could tell how I regret...

Can you point me to some reference? I am always digging to find information, it is easy when we know where to dig.

Thanks.

Luiz (Brazil)

Re: The mother of all distributions with HP SOLVER?

*Message #4 Posted by **Angel Martin** on 29 July 2010, 3:30 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Here's the obvious (and obligued) reference for the Gamma distribution:

http://en.wikipedia.org/wiki/Gamma_distribution

Having a Gamma function takes you half way there, the rest is just achievable with a little further effort.

cheers, 'AM

HELP with programming the HP50G

*Message #1 Posted by **Namir** on 28 July 2010, 6:33 p.m.*

I am tinkering with RPL on the HP graphing calculators. Today I wrote a program on my HP50G to do multiple regression using vector/matrix commands. I was able to store, debug, and run the program just fine. **HOWEVER,** For some reason I was unable to store my test data in variables (I created a special directory for the program). When I enter the name of a variable (enclosed in single quotes) to store a vector or matrix, and click the STO button, the data disappears! I don't see new variables listed in either the current directory OR ANY OTHER directory. I ended up having to re-key in the data many times in several debugging sessions. Ugh!!!

What setting must I change for the HP50G to store data like it should?? I must be missing something or must have set something in the Mode->Flags menu that produces this bizarre behavior.

Thanks,

Namir

Re: HELP with programming the HP50G

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 July 2010, 7:57 p.m.,*
in response to message #1 by Namir

Hi, Namir;

the only explanation that comes (at this point, at least) to my mind is that you are storing data in local variables that have been created by instance(s) of the program still HALTed. Please, check if the HLT annunciator is shown in the upper right corner of the display and, if so, use KILL to stop/remove any pending session, hence killing any local variables still active.

I am not sure if there is something else, like storing/retrieving data in a directory chain, but once I had observed such particular memory handling structure while step-by-step executing HP48/49/50 programs, I think yours is the same case.

You see, if you are debugging a program and notice one problem, edit it, correct the problem, store the edited version and go ahead stepping through the halted version, you are actually stepping into the original, unmodified version. If you start a new one without KILLing any pending programs, you have something like a memory leak (described in previous threads... I liked the term!!!): the newly executed program, either in straight execution or in step-by-step mode, does not automatically kill the halted executions, and these program 'ghosts' use memory in a 'hidden' way. You can only go back to previously halted program(s) instances once you go ahead and finish the one(s) halted after those. KILL, however, wipes them all out.

Hope this helps a bit.

Luiz (Brazil)

Re: HELP with programming the HP50G

*Message #3 Posted by **Namir** on 28 July 2010, 8:44 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

You are a genius!!! Since I was debugging the program (several times) I had pressed the HTL menu and the HLT annunciator was on. I pressed KILL as you suggested and the proceeded to store data. It worked!

Thank you very much for your valuable help!

Namir

Edited: 28 July 2010, 8:44 p.m.

Just to add.. (was: HELP with programming the HP50G)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 28 July 2010, 9:23 p.m.,*
in response to message #3 by Namir

Hi, Namir;

good to know that the mystery is solved.

> Quote:
>
> Luiz, You are a genius!!!

I´m flattered, thanks! Anyway, the actual geniuses are the ones who created such gentle beasts... I just figured that out prior to read about it later, though.

Cheers!

HP-10 repair, strange piece of plastic.

*Message #1 Posted by **Kees van der Sanden** on 28 July 2010, 11:48 a.m.*

Currently I am repairing an HP-10 calculator.
I opened the case and cleaned all PCB's.
On the backside of the CPU PCB I found a piece of red colored plastic.
It seems that there is something broken/missing here.
What is the original shape of this piece of plastic and
what is its function?

Photo of the back side of the CPU print

Any help is welcome,

Kees van der Sanden

Re: HP-10 repair, strange piece of plastic.

*Message #2 Posted by **Michael Meyer** on 28 July 2010, 1:18 p.m.,*
in response to message #1 by Kees van der Sanden

I'd have to look at one of mine to be sure, but I believe that is exactly how it is supposed to look. The plastic is to keep the moving print mechanism (ribbon cable) from scraping against the back of the circuit board.

Re: HP-10 repair, strange piece of plastic.

*Message #3 Posted by **Kees van der Sanden** on 28 July 2010, 1:45 p.m.,*
in response to message #2 by Michael Meyer

Michael,

Many thanks for your fast and clear response.

Kind regards,

Kees

HP-35s that does not exhibit LOCKUP DEMO bug

*Message #1 Posted by **NateB** on 27 July 2010, 5:32 p.m.*

I was running through the bug list with my 35s. I can not repeat bug 16. From this thread, the problem seemed to be caused by R/S being pressed after 'LOCKUP DEMO' was displayed. I can run the program without issue.

The calc was purchased from Amazon in May of this year, Serial No. CNA 00207423.

Any thoughts? All of the other bugs are repeatable, except for 11. The program correctly displays I=10. If HP was going to fix bugs, why not fix all of them (especially the mantissa issue with 'DISPLAY ALL.')?

Re: HP-35s that does not exhibit LOCKUP DEMO bug

*Message #2 Posted by **Seth Morabito** on 27 July 2010, 5:59 p.m.,*
in response to message #1 by NateB

Hello Nate,

Can you tell us what ROM version your 35s is?

This page has instructions for finding it through the self-test menus.

My 35s is ROM version 1 (meaning, it shows the '0' flag annunciator in the LCD). Maybe yours is newer?

Re: HP-35s that does not exhibit LOCKUP DEMO bug

*Message #3 Posted by **NateB** on 27 July 2010, 6:08 p.m.,*
in response to message #2 by Seth Morabito

ROM version is still 1

Re: HP-35s that does not exhibit LOCKUP DEMO bug

*Message #4 Posted by **Seth Morabito** on 27 July 2010, 6:25 p.m.,*
in response to message #3 by NateB

How strange! Oh well, there goes that theory.

Re: HP-35s that does not exhibit LOCKUP DEMO bug

*Message #5 Posted by **NateB** on 27 July 2010, 6:40 p.m.,*
in response to message #4 by Seth Morabito

False alarm it seems... I ran

```
X001 LBL X
X002 SF 10
X003 EQN HERE COMES Y!
X004 CF 10
```

```
X005 VIEW Y
X006 PSE
X007 GTO X007
```

and it locked up. After resetting, I re-entered

```
A001  LBL A
A002  SF 10
A003  LOCKUP DEMO
A004  0
A005  GTO A004
```

and it also locked up. Previously that program was not giving me a problem. I re-chechecked several times to make sure I had entered it correctly. Strange.

This is not exactly a bug, but an annoying feature. By the way this is what I disliked most on the 35s. I also disliked the XEQ LABEL ENTER sequence to execute a program. But I suspect HP will not change these features just because I didn't like them :-) Anyway, it's good news if a couple of bugs have really been addressed.

HP-65 repair

*Message #1 Posted by **aj04062** on 26 July 2010, 9:10 p.m.*

I've just acquired a 65 that has had a pretty bad battery leak.

Before I took it appart, I cleaned the battery cavity and contacts and tried it. Nothing. Then I plugged in a charger and viola it can to life.

Well almost. It briefly showed 0.00 (left justified) but now most of the time shows 00 00 (center/right). Does the display show four 0's in program mode?

More importantly, NO KEYBOARD ACTION.

I decided the leak must have been bad enough to foul something inside. Now I have it apart and the card reader PCB had some copper oxide buildup as did the backside of the keyboard. There is some oxide on the front side and I'm afraid there may be some beneath one or two rows of the keyboard.

I've carefully scraped and washed these areas I can get to. Still nothing when I tried it. Works the same way.

suggestions? keep cleaning or is it on of the chips?

Peace

Re: HP-65 repair

*Message #2 Posted by **tim m.** on 26 July 2010, 11:14 p.m.,*
in response to message #1 by aj04062

Do you have any electrical contact cleaner? It might be worth giving the contacts a good douse-and-scrub. I found a can at Radio Shack a while back for the princely sum of $10.

Failing that, any corrosion on specific components that might help localize failure?

Re: HP-65 repair

*Message #3 Posted by **Lincoln R.** on 27 July 2010, 12:37 a.m.,*
in response to message #2 by tim m.

I'd be wary of Radio Shack contact cleaner on calculators. Much of the contact cleaner I've seen there contains oil (Look at the ingredients on the can, see if it says "Mineral Oil" somewhere). Problem is, lots of contact cleaners were formulated for old open-air variable capacitor TV and radio tuners, not so much for digital electronics. The contact cleaner I've had the best results with is Deoxit.

Re: HP-65 repair

*Message #4 Posted by **tim m.** on 27 July 2010, 12:43 a.m.,*
in response to message #3 by Lincoln R.

Good point. I checked my bottle and it does not list mineral oil as part of the formulation. That said, when I do use the cleaner, I try to confine it to the metal parts only, sometimes by spraying it onto a Q-tip and using the saturated cotton swab to clean metallic parts.

-Tim

Re: HP-65 repair

*Message #5 Posted by **aj04062** on 27 July 2010, 6:50 a.m.,*
in response to message #4 by tim m.

I'll try it. You mean the gold plated contacts connecting the boards, correct?

Re: HP-65 repair

*Message #6 Posted by **tim m.** on 27 July 2010, 8:52 a.m.,*
in response to message #5 by aj04062

I'd probably go for those, as well as the keyboard switch contacts and anything near the area where the leak occurred.

Re: HP-65 repair

*Message #7 Posted by **aj04062** on 27 July 2010, 11:07 p.m.,*
in response to message #6 by tim m.

Well I've tried some Newtek "Tronic Clean" It was the only thing I could get locally. I'll try to get Deoxit later.

Cleaned up the gold pretty good. While moving items around the ground wire broke off of the keyboard. Perhaps it was this bad connection causing the issue.

In any event, it's ALIVE.

Anyone have some pointers why the unit will not run without the charger? I repaired a 35 by fixing the gold contact in the socket. I tried this here, but didn't seem to fix. This one is far less corroded than the 35.

Re: HP-65 repair

*Message #8 Posted by **Michael de Estrada** on 28 July 2010, 9:54 a.m.,*
in response to message #7 by aj04062

> Quote:
>
> Anyone have some pointers why the unit will not run without the charger?

Could be the bridge contact in the AC adapter receptacle isn't making good contact. Try shorting the 2 outer pins. Otherwise, there is probably an open circuit someplace between the battery terminals and the circuit board.

Also, don't operate the calculator from the AC adapter w/o a battery installed; you may damage the card reader electronics.

Re: HP-65 repair

*Message #9 Posted by **aj04062** on 28 July 2010, 6:40 p.m.,*
in response to message #8 by Michael de Estrada

I've had the battery in everytime I plug it in.

I haven't tried the card reader yet, hopefully it is ok

Re: HP-65 repair

*Message #10 Posted by **aj04062** on 28 July 2010, 10:14 p.m.,*
in response to message #9 by aj04062

I can't find a break.

Continuity from the contact to the socket pin (red wire). the contact is pretty coroded where the wire connects but is hangin on.(anyone know a source? I presume a donor calc is needed)

Continuity from pin (either one) to the pad for the power switch.

Still nothing. When unit is plugged in, everything works. If the battery loses contact the UNIT SHUTS OFF. Is this a clue?

Re: HP-65 repair

*Message #11 Posted by **Michael de Estrada** on 29 July 2010, 8:23 p.m.,*
in response to message #10 by aj04062

The calculator does not need a battery to operate from the AC adapter, so loss of battery contact should not cause the calculator to turn off. When you insert the AC adapter plug into the calculator, you bypass the battery for power to the calculator main board, keyboard and LED display. Only the card reader receives power from both the AC adapter and the battery, which is why the card reader circuit can be damaged if a battery is not present, since it's receiving power from the charging side of the AC adapter, which outputs about 17 vdc no load.

HP-28C ROM checksum addresses?

*Message #1 Posted by **Christoph Giesselink** on 25 July 2010, 8:25 p.m.*

Hello together,

I'm looking for the addresses of the four block byte checksums of the 1BB and 1CC HP-28C ROM's.

In difference to the CRC checksums of the HP-28S, these are not at the end of each protected block. I confirmed this on a 28C-1CC ROM at address #0FFFF and #1FFFF. On both positions is valid assembler code, so there can't be two of the checksum addresses.

Regards

Christoph

HP-45 board swap

*Message #1 Posted by **kubla** on 25 July 2010, 2:52 p.m.*

This is probably answered somewhere here, but I couldn't find it. If I swap the logic board from an HP-45 into an HP-80 of the same vintage, is it compatible with the mating display/keypad board?

Re: HP-45 board swap

*Message #2 Posted by **Dan W** on 28 July 2010, 9:46 p.m.,*
in response to message #1 by kubla

Yes, you could put a 45 mainboard in an 80, but then it would act like a 45. The keyboard/display PCB is common between the 35, 45 and 80.

New Version of the 41Z

*Message #1 Posted by **Angel Martin** on 25 July 2010, 4:42 a.m.*

A new version of the 41Z module is available and should be posted at TOS in a few days.

In addition to some bug fixing and code optimization, version 5C includes programs to calculate the Lambert W, and Bessel functions for complex variable and in all cases (yes, including negative and positive integer orders!).

Don't expect blazing performance on the coconut CPU (use V41 for that!) - but of course accurate results :)

I also separated the buffer functions into their own dedicated ROM, also available. That freed up some space on the 41Z module to add the new functions.

If used, the buffer module should be loaded in the next contiguous page after the 41Z. It's basically a diagnostics facility so there's no point in having it always on-line (which would turn the 41Z into another 12k ROM).

Your feedback and suggestions is welcome. Hope you enjoy it as much as I did programming them.

Cheers, 'AM

Re: New Version of the 41Z

*Message #2 Posted by **Angel Martin** on 25 July 2010, 6:22 a.m.,*
in response to message #1 by Angel Martin

In case you're curious, here are the formulae used in the Bessel functions implementation:

Orders can be either real or complex. I use an iterative algorithm for J (and I) which is valid for Re(z)>0 and all orders but negative integers due to the Gamma singularities.

J(w,z) = SUM {U(k)|k=1,2,….} * (z/2)^w / G(w+1)
U(k) = -U(k-1) * (z/2)^2 / k(k+w)
U(0) = 1

Then I use the following two continuation rules:

1. for negative integers, J(-n,z) = (-1)^n * J(n,z)
2. for Re(z)<0, J(w,-z) = (-z)^w * (z)^(-w) * J(w,z)

For non-integer orders, Y and K are derived from J and I using the well-known formulas involving sin(pi z) and cos(pi z).

Y(w,z) = [J(w,z) cos(w(pi)) - J(-w,z)] / sin(w(pi))
K(w,z) = (pi/2) [I(-w,z) - I(w,z)] / sin(w(pi))

For integer orders however those don't work, and I have to resort to the more elaborate summations, as follows:

pi* Y(n,z) = 2[geu + Ln z/2] J(n,z) – SUM{(-1)^k fk(n,z)} – SUM{gk(n,z)}
(-1)^n+1 * 2 K(n,z) = 2 [geu + Ln z/2] I(n,z) – SUM{fk(n,z)} – (-1)^n * SUM{(-1)^k * gk(n,z)}

where: gk(n,x) = (z/2)^2k-n (n-k-1)! / k! ; k=0,2,…(n-1)
fk(n,z) = (z/2)^2k+n [H(k) + H(n+k)] / [k! (n+k)!] ; k=0,1,2,…..
H(n) = SUM {1/k}, k=1,2...n

Hope this helps.

Edited: 25 July 2010, 6:24 a.m.

*Message #8 Posted by **Angel Martin** on 25 July 2010, 3:18 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Not a problem Luiz, hope your adventures w/ the AC unit fare well...

If I'd only had the 41Z when I was in eng. school... although it may have ruined all my exams so on reflection it's probably better that I didn't.

Cheers, 'AM

Ditto!

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2010, 12:20 a.m.,*
in response to message #8 by Angel Martin

I had an HP41C with one memory module, and later I bought an HP15C. This was 'heavy army' at that time (80´s), but the fact that I was so desperate to use them led me to study harder, mostly to write the programs for the HP41C.

If, at that time, I had access to all information I have now about the HP41´s internals and had the chance to build some of the stuff I see now, chances are that I'd have many subjects flunk... (is this construction correct? Never used the verb 'flunk' before...)

Cheers.

Luiz (Brazil)

Re: Ditto!

*Message #10 Posted by **db (martinez, ca.)** on 26 July 2010, 12:40 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Luiz; Since you asked; it's flunked, with the ed sounding like a lone t. Your english has improved from good (better than New Yorkers) to usually idiomatically correct in the last few years. Are you still studying?

I've had cause to use that verb, but never in the low level math, surveying and physics classes i took, just in waste of time classes like "critical thinking" (a.k.a. "agree with teacher") and "logic" (a.k.a. "forget Boole, let's all worship Aristotle for an entire semester").

new book on the Apollo Guidance Computer

*Message #1 Posted by **Don Shepherd** on 24 July 2010, 3:04 a.m.*

Just published.

Anyone interested in how early digital computers were designed to work aboard spacecraft will find this book fascinating. It illustrates how far we have come in the past 50 years, in terms of computer systems development. This should be required reading for all newly-hatched engineers and programmers.

Re: new book on the Apollo Guidance Computer

*Message #2 Posted by **Maximilian Hohmann** on 24 July 2010, 4:45 a.m.,*
in response to message #1 by Don Shepherd

Hello!

Thanks for the information, this will make a welcome addition to my stack of books on the Apollo/early space program.

> Quote:
>
> This should be required reading for all newly-hatched engineers and programmers.

Well, applying the same principle, when I finished university 25 years ago (aerospace engineering) this would have meant reading books on abacusses and slide rules... No, I think it is far more important that newly hatched engineers have a thorough understanding of present, state-of-the-art technology!

Regards, max

Re: new book on the Apollo Guidance Computer

*Message #3 Posted by **Don Shepherd** on 24 July 2010, 7:42 a.m.,*
in response to message #2 by Maximilian Hohmann

> Quote:
>
> this would have meant reading books on abacusses and slide rules

Thanks, Max. Well, I admit abacusses (abacusi?) would be a bit much, but I'd bet that some of the slide rule fanatics among our little group would say that a new engineer would be a better engineer if he/she understood what a slide rule did, in the years prior to the HP-35.

On the software side, when I went to programming school (1968) we learned to "desk check" our code, which meant following the code, instruction by instruction, on paper with some test data to make sure it really did what you wanted it to. We were taught to do this even before running our program on the computer with real data, and we almost always found errors that otherwise might have slipped by us. I

don't think the current generations of programmers are taught that, and despite huge advances in the software development and testing fields today, errors can still slip by.

Heck, we all know from experience that in order to find bugs in our RPN programs we sometimes just have to SST through it and look at the stack and registers along the way. Desk checking just means doing this manually before running it, and I don't think that is taught today in programming classes, and maybe it should be. There was an old saying my boss used to repeat: don't use the computer to debug your program. I think that is still good advice.

Don

We were taught to do this even before running our program on the computer with real data...

The reason you had to desk check your code before running it on the computer was because it was expensive and time consuming to run it on the computer. These days, it's much faster and easier to run the real data through the program itself to see if it gets the right answer. So the purpose for desk checking has largely gone away.

The one time when desk checking is useful is when you're changing a piece of code to deal with input that is hard to reproduce, such as a rare failure condition deep within the program. In this case, we usually get 2 or 3 different people to desk check the code.

> Quote:
>
> There was an old saying my boss used to repeat: don't use the computer to debug your program. I think that is still good advice.

Ask yourself "why is this good advice?" The computer is the perfect tool to debug your program and I think you should use it whenever possible.

The key is that you do need to debug your program. You need to feed it real-world input and, most important, you need to feed it erroneous input to test the error handling.

Dave

Thanks, David. I'd agree with that assessment to a large extent. Certainly mainframe computer time was expensive in the 70's, and where I worked they funded the computer division by charging the other divisions time for their use of the system. So, yes, desk checking was always encouraged.

I've been out of software development since the late 80's, and I wonder if the quality of the code produced by programmers today is comparable to the quality of code produced in the 70's and 80's. I suspect it is somewhat better, given the automated testing systems that exist today as well as peer reviews.

Interestingly, when I became a programmer in 1974 I was the only person who tested the FORTRAN code I developed prior to putting it into production. If I felt it was ready, that was good enough. I think those days have long since past!

Don,

More important than automated testing systems are the large standardized libraries of working code that handle much of the drudgery that was hand-coded over and over again. Many of the common bugs that were made in the past gone now.

The industry is also VERY slowly starting to realize that you need to think about reliability and maintainability when designing programming languages. Java, for example, does all the memory management for you because the designer realized that memory management bugs were common in languages like C. So he took the approach of designing the problem right out of the language.

Still, programming is, to a large extent, still in the dark ages. Ironically, it's about the ONLY discipline where you still work mainly with flat ASCII files.

David, can you give an example of what this means? I was always under the impression that Java and C were somewhat closely related (and, therefore, I stayed away from Java!), as opposed to VBScript and C which were totally non-related. For example, what does C make you do that Java does not?

thx, Don

Re: new book on the Apollo Guidance Computer

*Message #10 Posted by **David Hayden** on 24 July 2010, 4:11 p.m.,*
in response to message #9 by Don Shepherd

Hi Don,

The issue arises when the program needs to allocate memory at run-time to store some data. In C, you call malloc(), which returns a pointer to some memory that you can use. When you're done using the memory, you have to call free(), passing it the pointer that malloc() originally returned. If you don't call free(), then the program thinks that you're still using the memory. This is called a memory leak, and if it happens frequently, or if the program runs for a long time, it can eat up all the memory in the computer.

In Java, you don't have to call free() or anything like it. Instead, the runtime environment keeps track of whether you're still using the memory and when you no longer are, it automatically makes it available again through garbage collection.

The 50g calculator uses the same basic principle as Java: every now and then, it does garbage collection where it figure out which objects are still in use and which aren't, and gets rid of the ones that aren't in use.

Hope this helps, Dave

Hi;

this made me remember PACKING and TRY AGAIN in the HP41 series. Interesting: I never used malloc() when programming in C/C++ because I never had to allocate memory after the initial variables were defined/created. In fact, I have always programmed in C/C++ with a predefined memory space to be used.

Time to go ahead learning some more...

Cheers.

Luiz (Brazil)

So, that's what a "memory leak" is! I'd believed that it was a block of object code or data that was lost/overwritten during execution due to poor memory management or sloppy coding.

> Quote:

So that might explain in part why Java-based apps tend to be so sluggish. I use a commercial software package whose calculation engine is written in C, but the graphical user interface is in Java. Screens that have not been used in a while as other applications were performed, tend to take a very long time to respond to input when they are revisited. I had attributed that to lack of abundant RAM on my PC, requiring use of virtual memory on hard disk.

"malloc" and "calloc" provide capabilities of dynamic memory allocation that were not available in Fortran '77 and prior. Programs in those versions of Fortran, if I understood correctly, grabbed all the RAM they would need at the outset, and didn't give it up until the program was finished, or virtual RAM was used. I would also believe that dynamic memory allocation made recursion practicable: C and Fortran '90/'95 have them; Fortran '77 didn't.

Hi Karl,

> Quote:
>
> So that might explain in part why Java-based apps tend to be so sluggish.

Partly, yes. The other big performance hit with Java is the fact that it is an interpreted language. I'm no expert, but I've heard that newer java runtime environments will compile sections of the code on-the-fly to improve performance, so you may want to see if your JRE is recent and fast.

> Quote:

I would also believe that dynamic memory allocation made recursion practicable: C and Fortran '90/'95 have them; Fortran '77 didn't.

You are partly correct. To make recursion possible, you need a stack, which provides a limited way of allocating memory at run-time in the form of local variables per-call return addresses. The RPL calculators have this in the form of the return stack. Malloc()/calloc() on the other hand let the program allocate memory at any point in program execution, so they are much more flexible (and dangerous as a result).

During I chat I had with a programmer who had grown up totally within the Windows generation, I was aghast to find he didn't know how many bits were in a byte! When I pushed him on this, he replied, "why do I need to know?".

That sums it up for me.

There just isn't the need to know or understand low level details these days and no doubt, techniques which might use bitfields and such could well be discouraged for "code readability" or the economies afforded by the bit aren't important or relevant in C++ etc.

So is this a problem?

Well, we might be gradually losing the skill to build code akin to the most finely crafted miniature watch but we are gaining applications that enable anyone to produce a hit record on an average laptop or produce films that would have been the preserve of professional establishments a few years ago and so on.

I'd consider that progress!

Mark

PS: I understand with the AGC that once it was built, they dunked the whole thing in epoxy to seal it up! There's something about that which always makes me laugh!

That programmer will be very confused indeed when he tries to store 256 in byte. Or maybe even 128.

For readers who don't twiddle bits, a byte can store 256 unique bit patterns. These usually represent the numbers 0-255, or -128 to +127. Attempting to store a number outside that range will result in an error, or, more typically, a different number will be silently stored in the byte.

Dave

I can assure you that the need for bit twiddlers is alive and well in the machine control area wherever Programmable Logic Controllers (PLC's) are used.

We use bits and words like they were going out of style. We have to understand signed vs. unsigned, etc. and even have to deal with big endian vs. little endian when connecting hardware made by various manufacturers.

We connect analog signals into hardware inputs with varying bit A/D sections and have to scale those numbers back into engineering units for display to the machine operators.

Although, some of the machine controls manufactured by Siemens have now become the target of a Worm so I'm sure we'll be assimilated into the Borg of Computer programming before long and all this ancient knowledge will be relegated to the threads of obscure news groups frequented by dinosaurs and ghosts.

Re: new book on the Apollo Guidance Computer

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 27 July 2010, 10:38 p.m.,*
in response to message #6 by David Hayden

We used the kind of line-by-line checking of programs that Don describes in a computer programming class at the University of Minnesota in 1961. We were using a RemRand 1103. We prepared our programs on paper tape and presented the tapes to a computer operator. If our program ran satisfactorily we received the output data on another paper tape which was read out on a flexowriter.

The people who were using the 1103 for more serious things considered the use of the machine to support a class in programming as a necessary nuisance for a machine owned by a university. Our machine time was limited. Our class of 30 students was broken up into teams of three individuals. For the final exam each team wrote a program and submitted it to the computer. If it ran successfully the members of the team were given an A. If it did not run successfully their next submission could not yield a grade higher than a B, and so on. So you can see that careful off-line checking of our program was a necessity.

I left the university that summer and rejoined Honeywell as a field engineer on the H-317 inertial system for the Fairchild SD-5 drone. The computer was the M-252 manufactured by Hughes. It was a drum machine in which multiplication and division took many word times. If you are interested in more details you can read about the M-252 at http://www.ed-thelen.org/comp-hist/BRL61-h.html. Efficient programming required that division be avoided like the plague and that the machine was kept multiplying while additions and subtractions were going on in parallel. The user could scale the result of a multiply or divide by a premature readout. That kind of programming was truly an art.

I could read code fairly well but was not very good at writing code. I described one of my mistakes in a thread on "My Greatest Computer Fault" back May 2005 -- http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=72743. That was a case where careful line-by-line checking failed to reveal that there was an error in concept not in code.

That was a long time ago. One of the irritants was in the use of hexadecimal notation. Hughes used

a through f for 10 through 15 in their documentation and with the flexowriter delivered with the computer. The Army used U through Z for system input and output so we had to be able to jump back and forth between the two notations. That was long before TI and HP offered their programmer models. We did our conversion between decimal, octal and hexadecimal on a Friden or with a set of conversion tables.

*Message #19 Posted by **Don Shepherd** on 28 July 2010, 1:33 a.m.,*
in response to message #18 by Palmer O. Hanson, Jr.

Palmer, your experience using a computer at university predates my experience doing the same thing by about 10 years. I used an HP-2000 minicomputer at University of Louisville in the early 70's. We wrote and ran BASIC programs using that system. I well remember my very first program, it determined the Koppen climate classification code for a region based on things like average precipitation, temperature, level of humidity, and things like that. My geography teacher was so impressed with that program I think he gave me an A mostly because of it. We also used paper tape to save our programs.

The book that is the subject of this thread has a very good section where the author describes how computing was done in the early days of computing, the 50's and 60's. The Apollo Guidance Computer had an instruction word that was 15 bits long (not including the parity bit): 3 bits for the op code (allowing 8 instructions) and 12 bits for the operand code (allowing the addressing of up to 4096 words). The problem was that the final computer needed 41 instructions and 38,000 words of memory to be addressed. How the designers achieved that, given the hardware, was a very interesting story. It's a great book.

Don:

If you include mechanical analog computers my experience goes back to 1951 and the Mark 1A fire control computer used with the 5"38 caliber gun fire control system. While assigned to the fire control technician school I also worked as a draftsman making overhead projector images for use in classes on one of the first non-mechanical systems.

When the Fairchild drone project was cancelled in late 1962 I worked in-house on the Dynasoar program which was a idea similar to what later was the shuttle program. The system computer was a Verdan DDA manufactured by Autonetics. All I can say about the DDA mechnization is that it was a foreign to my way of thinking then as RPL is now.

I left the Dynasoar program in mid 1963 to go on the Blackbird programs. The system on the YF-12 used a Hughes computer similar to the M-252 but with extended capability to allow it to do more than just the inertial navigation problem. The lead programmer on both the SD-5 and YF-12 projects was Bruce Robinson of Hughes -- a really, really bright guy.

On the A-11 we used a Honeywell computer which was similar to a computer that had originally been designed for use on another classified program. In 1966 we used those computers as part of an ESG based navigation system.

Display readability, function names instead of keycodes when stepping through code, and clean keyboard. Yep, I like 'em all. Also, rich programming feature set, speed of execution is pretty nice, base conversions on a 36 bit word with easy shift right/left to see the whole result, 390 bytes of user memory, great manual, plus it just looks professional.

Katie's right, it's about as good as it gets.

Re: new book on the Apollo Guidance Computer

*Message #24 Posted by **Andrés C. Rodríguez (Argentina)** on 28 July 2010, 4:20 p.m.,*

The HP-41 allowed for browsing programs by function name instead of keycodes (row-column). On the old, 7-segment LED models, keycodes were the only possible option; although the HP-97 offered funtion names and abbreviations on printed paper (IIRC). A minor improvement was the "key phrases" from the HP-25 on, where keycodes were "merged" in one line when multiple keystrokes were

needed for a function (i.e.: STO + 05, f SIN, etc.).

When the displays become alphanumeric with the HP-41, function names appeared. However, a little after HP-41 time, Voyagers using LCDs (HP 10, 11, 15, etc) still used a 7-segment display, hence keycodes were unavoidable for them.

I'm sorry to say that I did not cross paths with Grace Hopper. That's not surprising. I suspect that she was working on newer technology at the time that I was working on the Mark 1 and 1A gunfire computer where the original design preceded WW II. You can read about that at http://en.wikipedia.org/wiki/Mark_I_Fire_Control_Computer. One of the relatively new things at the time that I was working with it was an increase in range rate capability to handle post WWII aircraft speeds. It could handle significantly larger negative range rate than positive range rate the idea being that it was more important to track and fire on incoming aircraft. The stable vertical for the system used the old foot high mercury vapor tubes and a Rube Goldberg system of weights and screw drives to provide the precession required to compensate for earth rate.

I will try to find something on Dynasoar. It was a lifting body device. The program was cancelled in late 1963.

The slide rule fanatics might say that. It wouldn't make it true. Just like spending an hour in school with an abacus would be interesting, so would an hour or two with a slide rule. Any more than that rapidly becomes a waste of time.

You do realize that the first engineers to start a career **after** the scientific calculator was invented, have pretty much all retired? The majority of engineers working now had scientific calculators before they

started college. (I started using a scientific calculator before age 12, and they were widely available very cheaply by then even if my teachers had no clue.)

There was an old saying my boss used to repeat: don't use the computer to debug your program. I think that is still good advice.

A colossal waste of time. This manual work would have to be done after every change to the program. The modern equivalent is writing unit tests that when run *by the computer* put test data thru the code and validate the result. Even those don't get done, because programmer (software engineer) time to create the unit tests is very expensive compared to computer time and test person time to find functional problems.

Unit tests can be run automatically on every build to catch regressions rather than requiring a manual "desk check" which is prone to human error.

You have a lot more faith in computer tests finding all errors in code than I do. Even automated test systems can only find errors they are programmed to find. The fact is that, even today, it is possible for a programmer to make a mistake and have a bad line of code that may cause disastrous consequences if a certain set of circumstances occurs, and all the computer testing in the world may not find that error, but desk checking may (and it may not also). I wouldn't call it a waste of time; I'd call it doing everything you can to make sure the code is right.

I think the first line of defense against software errors is the programmer him/her self. The person who wrote the code should verify that it does what it was intended to do, and desk checking should be part of that process. The second line of defense is peer review of the code. Then the test organization gets involved to make sure the original system requirements are being satisfied. Unit tests, module tests, regression tests, build tests, integration tests, all have their place. The more tests you have, the more likely you will have bug-free code. Sure, it's expensive, but consider the consequences if the code fails, especially in areas like air traffic control where lives are literally at risk.

I'm all for automated test systems, intelligently used. But I want the original programmer systematically looking at his/her code and verifying its correctness.

With the surplus of disk, memory, etc., current programmers write tests as part of the complete development project (a.k.a test driven development). The requirement is that all tests complete

successfully before checking code into the shared repository - which triggers a new build. Breaking the build results in a usually ribald sharing of commentary from ones peers ;)

We called it a dry run.

The thing that I find frustrating is that a load of effort has been put into developing programming languages and programming styles that seek to eliminate errors before they can be made e.g. the automatic garbage collection in Java, but precious little effort has been put into standardising 'display environments' (for want of a better phrase). So, back in the days of glass teletypes, most screens worked to VT100 as a minimum and you could safely code assuming that. Then graphical terminals came along and X windows was developed but the whole Window manager business (e.g. Motif v. XWM) caused fragmentation and a standard was never reached.

Then the Web came along and the horror that is Internet Explorer. All the time, effort and cost savings gained by using Java were immediately squandered many times over by the difficulties of trying to code around the bugs in the various versions of IE.

Sometimes I really do think that Microsoft have held back the economy more than advanced it, because of their poor software. No doubt in a few years time, some economist will analyse it and pronounce one way or the other.

Things are better now with HTML4 being widely implemented properly but did it really need the best part of 20 years to get there?

I wonder when the people who make FMS computers are going to leave the Apollo-age!

As I have begun to read this book today, I can't help but think of the astronauts who had to learn how to use this system (they had no choice; it was the only way to get to the moon). Now, they were undoubtedly used to entering octal digits in their transponders, but learning how to use the AGC must have been pretty foreign to them, with all its "programs" and "nouns" and "verbs" and "program alarm codes." They were probably thinking "just let me fly the damned thing."

Yes. The slide rule gives a better understanding of number relations-- not that you have to keep using it, but I still benefit from having gotten proficient at it even though I haven't used it in many years.

Quote:

> Quote:
>
> > On the software side, when I went to programming school (1968) we learned to "desk check" our code, which meant following the code, instruction by instruction, on paper with some test data to make sure it really did what you wanted it to. We were taught to do this even before running our program on the computer with real data, and we almost always found errors that otherwise might have slipped by us. I don't think the current generations of programmers are taught that, and despite huge advances in the software development and testing fields today, errors can still slip by.
>
> The reason you had to desk check your code before running it on the computer was because it was expensive and time consuming to run it on the computer. These days, it's much faster and easier to run the real data through the program itself to see if it gets the right answer. So the purpose for desk checking has largely gone away.

When I started in school on the mainframe computer in the late 1970's, you had to write your code out by hand, then go to the machines where you punch it into the cards, then submit your card pile to the operators, then come back sometime later hoping they had run your program, only to find a long printout of all the reasons it wouldn't run. Turnaround was anything but instant. But, continuing:

> Quote:
>
> > Quote:
> >
> > There was an old saying my boss used to repeat: don't use the computer to debug your program. I think that is still good advice.
>
> Ask yourself "why is this good advice?" The computer is the perfect tool to debug your program and I think you should use it whenever possible.

I would change the advice to "The computer should not be the only thing you use to debug your program." Debugging needs to be like a concurrently running mental task, part of the process even before you run anything. Working by myself for small, low-budget outfits, I have found that when the lack of expensive debugging tools actually teaches you to write better code. You can't have the attitude that "I'll whip out this code in record time and debug it later." Out of necessity, I've become more structured and neat in my programming, documenting everything thoroughly, making the code as readable as I know how, and proofreading.

Ten years ago, large companies finally started seeing the value in this, and the industry magazines ran some articles on code inspection and having committees of the programmers' peers proofread the code. I sometimes catch bugs when further commenting code that's already working but not exhaustively tested yet. I comment as if trying to explain it to someone else who hasn't been following my train of though on it. (If I need to change it a year later, I'll need the comments anyway.) As a result of this madness, no user has ever found a software bug in any product or automated test equipment I programmed. The projects have ranged from 700 to 10,500 lines of code, and have always been for control of equipment, quite different from desktop applications or data processing.

BTW, using a lines-of-code-per-day benchmark of programming performance is a sure way to end up with inefficient, buggy code that's hard to figure out and fix or modify later. I once worked with a programmer who typed non-stop. I always wondered what he was typing. After he left the company, I had to fix a 4-page routine he wrote. When I was done, it was down to a half page, bug-free, clearer, faster, and did more with less memory. Eventually most of what he wrote had to be redone.

> Quote:
>
> More important than automated testing systems are the large standardized libraries of working code that handle much of the drudgery that was hand-coded over and over again. Many of the common bugs that were made in the past gone now.

It just frees you up to advance to the next level of programming and therefore the next level of bugs. ;) As long as there's programming, there will be bugs of some kind.

> Quote:
>
> Still, programming is, to a large extent, still in the dark ages. Ironically, it's about the ONLY discipline where you still work mainly with flat ASCII files.

That's a good thing. I can express myself most clearly and accurately in writing, and I hope the keyboard never goes away. I do of course use INCLude files, which can be nested, so it's not flat in that respect. I also like the DOS/ANSI characters above 127 for drawing diagrams and tables with smooth lines in the source code, as well as for the Greek letters, special symbols, etc. that we use all the time in engineering.

> Quote:
>
> During I chat I had with a programmer who had grown up totally within the Windows generation, I was aghast to find he didn't know how many bits were in a byte! When I pushed him on this, he replied, "why do I need to know?"

It's like people in Washington not having a grasp on what a trillion is, or even the cost of a single dollar. Bloatware anyone? Of course it matters! And if you're writing applications for embedded control of equipment where you have to know the ports and various hardware resources intimately, there's no way around it.

3421: any tips on calibrating?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2010, 11:03 p.m.*

Hi, all;

after a while waiting (some years...) I got my 3421, at last! My friend that had it actually took good care of it and had some personal issues (it took him about seven years to send me the unit... no problem, I can handle it once knowing we are dealing with friendly human beings that may surely have their reasons and circumstances), but anyway I finally have my own 3421!

These 'beasts' are timeless...

Before trying anything, I opened it and saw a 6.3V/2,4Ah sealed lead-acid battery. I also noticed that it came with a multiplexer/actuator assembly board. Needless to say the battery was dead: 1.8Vcc. I did not even try to charge it; the poor thing has already been sent to a proper recycle container, only for batteries (I do my part...). Then I measured the small battery that keeps RAM data and found 3Vcc! Amazing! That one was alive.

Before plugging it into the AC line (I found the mains supply voltage selection quickly), I replaced the lead-acid battery for another (taken from a 9114 battery pack) and the 3421 reacted with a small 'click' from a relay, I guess. I tried the POWER switch and it woke up with ERROR 0 (no RAM data). After plugging it into the AC line, the lead-acid battery voltage raised from plain 6.12Vcc to 7.01Vcc: the power supply seems OK.

I plugged it to an HP41 with MLDL2000 previously loaded with the X-IO and Data Acquisition ROM, and I tried some HPIL commands. The 3421 responded to all acceptable commands as expected, and generated some error messages, also as expected. I also performed the fastest measuring test described in the first pages of the manual: shorting the resistance input terminals and turn the unit ON. Both errors 0 and 7 (shortened input) showed up in the display. INSTAT returned a number to the X-register and set related flags.

Because I never had any HPIL measuring device before, I am still 'trying it out' with a lot of reasonable care. I will take some specific time this weekend to read some material about it: user manual, HP41 Data Acquisition ROM manual and four application notes related to calibration. The 254-page manual will give me the basics, I hope, along with the HP41 data acquisition ROM manual, but if there is something else I should know about, I'd appreciate any info/advise you can give me.

I remember seeing some posts about the 3421 at this very forum many years ago, but back then I neither have my HPIL, nor many stuff I have now (9114 disk driver, MLDL2000, Clonix/NoVRAM, documentation, knowledge basis... thanks to many of you, guys!), so I just read those messages briefly. I am now collecting many of them and I'll read them prior to go ahead.

I am positive it will take me some time, but hey! Better now then never. This is my first HPIL measuring device, I really want to go ahead using it accordingly.

Thanks a lot, from a 3421 'newbie'.

Luiz (Brazil)

Re: 3421: any tips on calibrating?

*Message #2 Posted by **RamLab** on 2 Aug 2010, 6:44 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Indeed, those HP3421A's are timeless. I have two of them, that I frequently use, most of the times as MUX in front of an HP34401A, under HP-IB control. But sometimes on Battery under HP-71B control (battery charge measurements) One of them also has the Self Test Failed #0 (Calibration RAM Checksum error). I have so far not been able to find out what the cause is, nor how to fix it. There is a remark in the Service Manual "Error #0 will occur if an option 442A 10 channel multiplexer Assembly is added or moved to another slot after the 3421A was calibrated". I added a second MUX to slot 1, still #0, and a third to slot 1, still #0. So I only used a MUX in Slot 0, and did the Temperature Calibration (in a faint attempt hoping that due to this the correct Checksum would be stored..) but to no avail.

To do a full Calibration you will need at least a 6 1/2 Digit DAM, and a lot of time.

RamLab

Re: 3421: any tips on calibrating?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 Aug 2010, 3:33 a.m.,*
in response to message #2 by RamLab

Dank je, RamLab!

I was afraid I'd have to spend some considerable amount of time calibrating this 'little' beast. I began reading the maintenance and calibration manual but I decided to ask if there is anything about it that was not written there. No problem, I'll just go ahead reading it.

I do not have a 6 1/2 digit measuring device, but I'll find a way to get this done. There is a 17-page operating note (03421-90011), page #5 and ahead, describing some calibrating procedures that predict the possibility of using the 3421 internal voltmeter to do so, but there is a Temperature Calibrator Board (03421-66505) that must be plugged onto the Multiplexer/Actuator Assembly. I do not have it and I am not aware of what such temperature calibrator board has in it. Given that currently available components and devices may achieve accuracy better than the ones form the 80's, I thought I could at least try building an equivalent calibrator board even if I do not achieve the same HP standard. Would you have any info about it?

Thanks again.

Luiz (Brazilie)

Re: 3421: any tips on calibrating?

*Message #4 Posted by **RamLab** on 3 Aug 2010, 5:22 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hello Luiz,

It all depends on what you want to do with the 3421, and what causes the #0 Self test error. Are you intending to measure Temperature with it, do you have Thermocouples, the correct connecting block ?

What do you get back from the 3421 when you send "REF" ?? This should return the temperature of the temp sensor on the MUX board in Slot 0. Do you get Temperature reading, an error, other than #0

Doing a Temperature Calibration is actually simple if you have a Fluke 51/2/3 or Fluke 16 with a K-couple. Place the K-couple as in the manual described for the Thermistor. Simple follow the instructions : "REF--" followed by "C00----" and fill the Temperature reading of the Fluke on the blacks.

Regards,

RamLab

HP-71b DTH$() and HTD() commands

*Message #1 Posted by **Don Shepherd** on 23 July 2010, 2:49 p.m.*

I am curious about the background of these commands to convert between decimal and 5-digit hex values. What's so special about 5-digit hex values? Does it have anything to do with importing machine code into the 71b?

Re: HP-71b DTH$() and HTD() commands

*Message #2 Posted by **Raymund Heuvel** on 23 July 2010, 5:19 p.m.,*
in response to message #1 by Don Shepherd

Hi Don

Assumption: 71B addresses are 20 bit -> 5 nybbles. The 71B Peek and Poke commands use 5 nybble addresses.

Also Forth is 20 bit based, probably also due to the 20 bit 'A' field in the working registers.

BR

Ray

Re: HP-71b DTH$() and HTD() commands

*Message #3 Posted by **John Pierce** on 23 July 2010, 5:24 p.m.,*
in response to message #1 by Don Shepherd

There are five HEX digits in the highest memory address in the HP-71B, ... FFFFF(HEX)=1048575(10).

Do you have to "help" cards through the 97?

*Message #1 Posted by **Keith Beyer** on 23 July 2010, 7:08 a.m.*

Hi all,

Just finished replacing the gummy wheel on the card reader of my 97. Many, many, thanks to those who have posted detailed instructions/advice on how to do this, particularly Mike Davis.

I replaced the gummy wheel with two rubber o-rings bought on e-bay. The cards feed fine now, however, I was getting Error with most feeds until I discovered that if I give the card just a little push as it is feeding through, then it reads the card fine. Again, this is just a gentle guiding of the card as the motor pulls the card. Just wondering if this is normal? Or should you just be able to feed the card in until the wheel grabs it and pulls it through with no extra assistance. Again, I would say I am not really "pushing" the card myself, just a little pressure on the card as it is moving.

Thanks for any thoughts!

Re: Do you have to "help" cards through the 97?

*Message #2 Posted by **Michael de Estrada** on 23 July 2010, 9:22 a.m.,*
in response to message #1 by Keith Beyer

What is happening is that the card sensor switch is detecting the card and starting the motor before the card is engaged by the wheel, and you are simply moving the card slightly further so that the wheel can fully grab it and pull it through. On a perfectly adjusted card reader wheel using exactly the right size model aircraft fuel line tubing, this won't be necessary, however, I've found this generally to be the case with O-rings, which only partially grip the the card across its width.

Re: Do you have to "help" cards through the 97?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2010, 12:50 p.m.,*
in response to message #1 by Keith Beyer

Hi;

I'd add some extra comments to Michael´s. I have noticed that in one of my cards readers the cards are pulled, say, differently. In the newest, G-version, if I hold the cards with the tip of my fingers while inserting them, I feel the card reader ferociously pulling them out of my fingers. In the earliest, E-version, the cards are pulled somehow softer, and in some cases, if I hold the cards with extra strength in the tip of my fingers, I get reading error. In both readers, if I partially insert the card and then push it by using the side of the finger, instead of holding it with the tips, the pulling wheels find their own way reading them, and error conditions do not happen so often.

I once thought it was a matter of adjusting the pressure of the pulling wheel, but it seems to me now that it is related to the motor control. I have not seen the motor power supply and I do not know if the different readers also have different motor control circuitry, but if the earlier units have a different current handling, chances are that either a current peak detector or a narrower speed tolerance might also trigger an error.

My thoughts, though. And my 2¢, too!

Cheers.

Luiz (Brazil)

Re: Do you have to "help" cards through the 97?

*Message #4 Posted by **Keith Beyer** on 23 July 2010, 12:59 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Thanks, both of your comments make sense. It does seem that I only need to add a bit of pressure initially when I put the card in to ensure no Error. I have switched to putting the card in part way, then pushing it forward with the end of my finger, and that seems to work.

Thanks for those insights. I really didn't want to have to go back into "surgery" to fix something if this behavior was not normal.

Keith

Re: Do you have to "help" cards through the 97?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2010, 1:04 p.m.,*
in response to message #4 by Keith Beyer

Hi, Keith;

have you tried to adjust the pressure? There is a way to slightly adjust it. I adjusted both my card readers to a minimum.

Cheers.

Luiz (Brazil)

Re: Do you have to "help" cards through the 97?

*Message #6 Posted by **Keith Beyer** on 23 July 2010, 9:30 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I don't know how to adjust the "pressure" - is there an article on that or what do you do?

Thanks, Keith

Re: Do you have to "help" cards through the 97?

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2010, 9:57 p.m.,*
in response to message #6 by Keith Beyer

Hi, Keith;

My mentioning of "pressure" without a concise reference 'sounded' dull, sorry...

Unfortunately, you'll have to remove at least the card reader's upper cover, meaning the four small screws and the big one in the rear of the card reader´s case. After that, you can follow both this thread and this other one, mostly from the second follow-up, written by Ed Sowell himself (message header) and ahead. If you have not noticed yet, the pulling gear´s shaft has a cut in the outer edge so you can use a small screw driver to rotate the shaft. It has a slight eccentricity so you can adjust its pressure over the card while reading/writing. The follow ups in the above mentioned thread give some info about how to adjust it. If you need extra advice, let us know, OK?

Cheers.

Luiz (Brazil)

Edited: 23 July 2010, 9:59 p.m.

Re: Do you have to "help" cards through the 97?

*Message #8 Posted by **Keith Beyer** on 25 July 2010, 10:22 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Thanks for the information. Upon further testing of several cards, it seems that some cards read well, while others do not. Do HP 67/97 cards "go bad" after some time? I know they are magnetic media, and as such probably don't last forever. The manual suggests cleaning cards with alcohol solution. Does this really work?

Thanks for any thoughts.

Keith

Re: Do you have to "help" cards through the 97?

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2010, 12:09 a.m.,*
in response to message #8 by Keith Beyer

Hi, Keith;

I have a few cards that no longer read their contents, some written by the HP41´s card reader, others by the HP97.

In fact, I had the contents of some old cards (others), recorded in the 80's, recovered after cleaning them with alcohol. You'll see that the card surface reflects differently when it is dirty (flat with some spots) and when it is clean (regular and glossy, not shiny).

I just get some soft cotton with alcohol (not enough to drip, something more than moistened), then I place the cards over an absorbent, clean, straight surface (some sheets of paper over a table) then I firmly press one of the edges of the card (tip of a finger) and then I pass the cotton over the surface with a bit of pressure, in the same direction as the card is read/written (after that, clean the small surface under the finger tip the same way). I have not done it more than twice in one single cleaning, mostly because I am afraid of removing part of the magnetic material OR any protective layer. Anyway, the cotton usually comes out with dirty material on it. I never lost a card with such cleaning procedure, just have many of them recovered.

BUT if they are stored closer to strong magnetic fields OR exposed to direct sunlight for

extended periods of time, chances are that their own magnetic field variations AND related contents will change. In these cases, chances are that overwriting may succeed, but it is not 100% guaranteed. Also, I am not aware of any effects on the card reader's head if the card has residual strong magnetic field after being exposed. This should also be taken into account.

Success!

Luiz (Brazil)

Edited: 26 July 2010, 12:12 a.m.

Forgot to mention... Please, read also!

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2010, 11:03 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi, Keith;

I forgot to mention that I also use a soft tissue to clean any exceeding material immediately after cleaning with alcohol. It also helps drying out any residue left by the alcohol itself.

Cheers.

Luiz (Brazil)

HP 31, 32 ,33, etc Battery covers

*Message #1 Posted by **aj04062** on 21 July 2010, 9:45 p.m.*

I posted before that I was going to make some of these via rapid proto plastic. Here are picts of the Alpha unit:

It needs more work. Please comment if you would like to see a finshed product. I plan to tweak the dims and make a Beta unit soon.

Edited: 21 July 2010, 9:46 p.m.

Re: HP 31, 32 ,33, etc Battery covers

*Message #2 Posted by **db (martinez, ca.)** on 21 July 2010, 11:42 p.m.,*
in response to message #1 by aj04062

that is one of the most useful replacement parts you could have made. a lot of those doors are lost. be sure to try your prototype in a few spice units. some doors will fit one calculator but not others. they had great keys but not very good casting (or whatever you call that process).

Re: HP 31, 32 ,33, etc Battery covers

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 July 2010, 9:51 a.m.,*
in response to message #1 by aj04062

Yep, I agree with db, some of these doors are always made for the other calc...

I have seen some of these broken, but it seems to me it is because of this very same fact: as they do not fit in, a bit of extra 'brute force' and they snap. Some of them are a bit loose sideways, and in this case they fit in almost every Spice. Something to check out... I cannot tell for sure, but I have been with a bunch of Spices and I saw at least three broken doors. I glued one of them and kept it in one of my Spices, 'just in case', and it is still in one piece. Of course, I do my job removing and replacing it carefully, so it does not count for a daily use.

Great handcraft! In time: have you thought about the little Voyager´s battery door? They are smaller and a lot easier to disappear and/or crack. Well, because they are smaller they may also be harder to carve, but they have less details to be considered and they are much easier to place/remove, so they do not crack so easy. I think it would find some more interested people, too.

About the color of the prototype:: you know what? I do not dislike it. My HP34C would look very distinctive with a white/beige battery door...

Cheers.and Congrats!

Luiz (Brazil)

Sorry, I thought your second statement were more relevant so I completely ignored the first one. Well, I cannot get the Museum's search tool to find what I want either. Not a problem though, as other search engines do the job...

Regards,

Gerson.

Re: Searching the Database

*Message #6 Posted by **tim m.** on 22 July 2010, 1:28 a.m.,*
in response to message #5 by Gerson W. Barbosa

Same issue here.

The forum should just do away with its own search and add a Google search box.

-Tim

Re: Searching the Database

*Message #7 Posted by **Walter B** on 22 July 2010, 2:47 a.m.,*
in response to message #5 by Gerson W. Barbosa

Museum search works here as usual. I.e. go here and

1. click on the archive you are interested in - e.g. #19.
2. Then click Search, and enter your search pattern - e.g.
   List: Only messages containing All of the following keywords: HP-10 printer repair.
3. Click View Message Index and you'll get what you want.

I agree it's tedious to search each and every archive separately. Seems it was meant to work differently. Anyway, this may be fixed pretty easily by making more entries on the search page "sticky" and adding at least a button "go to previous archive". More comfortable solutions are possible, of course. And I understand not everybody wants Google to know everything.

Thermal paper for the HP-10

*Message #1 Posted by **Kees van der Sanden** on 20 July 2010, 2:52 p.m.*

Today I bought a nice HP-10 calculator with manual, charger and pouch. To check the printer function i need a roll of thermal paper. The manual advices to use original HP paper but it don't mention the exact size or HP code. Is this thermal paper still for sale?

Regards,

An enthusiastic HP calculator collector.

in response to message #1 by Kees van der Sanden

Please see this thread.. The HP-19C and HP-10 use the same printer mechanism and therefore the same paper.

*Message #3 Posted by **Michael Meyer** on 20 July 2010, 7:41 p.m.,*
in response to message #1 by Kees van der Sanden

I'd test the printer before buying a lot of paper. Any old thermal paper cut to 1.5" strips would do. If it works, then you can buy a life-time supply!!

48gx Memory Cards

*Message #1 Posted by **Hugh Evans** on 19 July 2010, 7:08 p.m.*

I recently picked up a mint condition 48gx for $100 and it's starting to appear that RAM Cards will cost far more than the machine. Is there a good source for these at the moment?

Re: 48gx Memory Cards

*Message #2 Posted by **aj04062** on 19 July 2010, 8:18 p.m.,*
in response to message #1 by Hugh Evans

These are pretty hard to come by. There is one guy on the auction site that seems to mfg from some source.

Re: 48gx Memory Cards

*Message #3 Posted by **bill platt** on 19 July 2010, 9:25 p.m.,*
in response to message #1 by Hugh Evans

I bought some of them from Oliver Klotz in Germany, about 5 years ago. I don't know if he still makes them.

Re: 48gx Memory Cards

*Message #4 Posted by **Antoine M. Couëtte** on 21 July 2010, 4:43 p.m.,*
in response to message #3 by bill platt

I also bought some HP 48GX RAM Cards from CYNOX Germany some five years ago (http://www.cynox.de/index_e.htm).

Until now I have been extremely happy with these Cynox made HP48Gx RamCards.

Best Regards to all

Antoine M. Couëtte

Re: 48gx Memory Cards

*Message #5 Posted by **Richard Reed** on 20 July 2010, 4:46 a.m.,*
in response to message #1 by Hugh Evans

I can give a little perspective. I wound up buying a 1 MByte SMI card last November for $170, but you may eventually do better. Shipping between US and Europe usually ruins the deal, so I had mine shipped to my brother in the US. The previous August, I got a 128K HP one for £49 ($75) shipped locally in Britain. Bear in mind that these prices are a lot less than when originally released. They were always more than the calculator (about the same for 128K).

It's a question of waiting, I think. Stay away from the 'built-in battery' types, as these will require surgery when the old batteries stop taking a charge. Also stay away from seller 'coburlin', although his prices are at least

three times too high anyway. He also sells 'GRID' cards as 'for 48GX'. These have a nasty low-voltage detector that can ruin the calculator.

There are a number of sellers who have bought up a lot and are dribbling them out at 'collector' prices, but occasionally, someone shows up who just wants to auction one they own. You may do best buying a whole combination of calc and cards from one of these real owners, then selling on what you don't need.

I haven't seen the current manufacturer -- there is an 'OEM' from Singapore, but that again is expensive, and with a built-in battery.

Use lots of combinations of hp48gx, 48gx, hp 48 gx, hp48, etc to search. You do want one for the GX as opposed to 'bank-switched'.

in response to message #2 by Massimo Gnerucci (Italy)

Ahh... thank you Massimo. If I can get the display update
disabled perhaps I can get my design to do better on the
"loop of add" benchmark.

Monte

Re: Another dumb HP-41 question

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2010, 6:16 p.m.,*
in response to message #1 by Monte Dalrymple

Hi, Monte;

I have no idea about how to do it, but I am curious about how much of system time is spent with it.

AFAIK, the goose NORMALLY moves one digit to the right everytime a LBL is 'executed' in a running program, unless a user/system message is shown in the LCD; is that correct? I also have a vague recollection about one other circumstance it is also updated, but I cannot remember it.

So, if it moves only after a LBL is 'executed', I'd guess it would be a matter of either finding the part of the code that updates the goose on each LBL and remove the jump to it (replace the jump for NOP´s, perhaps).

Also, Bill Wickes' Synthetic Programming on the HP41 shows a way to make it fly backwards. Never tried it, though...

Not much of a help, I know. But I am curious a lot about it.

Cheers.

Luiz (Brazil)

Oops! : Another dumb HP-41 question

in response to message #4 by Vieira, Luiz C. (Brazil)

Hi, Monte;

I thought you were trying to change the OS for your Newt experiment...

Luiz (drifting out of Space...)

Re: Oops! : Another dumb HP-41 question

*Message #6 Posted by **Monte Dalrymple** on 19 July 2010, 9:32 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

It was never my intention to change the OS. I'm not a software guy, although I've become rather familiar with the code out of necessity. And there isn't really a way to patch the OS on the board without reprogramming the FPGA into something other than a NEWT while doing so.

The issue with my turbo mode is that I have to slow down the clock to normal speed when talking to the display or any other peripheral device. I also have to run 1x while fetching register data (writes run at speed). So my first numbers for the simple benchmark were disappointing, but not surprising. If I can somehow eliminate the display update the code won't have to throttle back as often.

I should have some numbers tomorrow.

Thanks,
Monte

Re: Oops! : Another dumb HP-41 question

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 20 July 2010, 12:41 a.m.,*
in response to message #6 by Monte Dalrymple

Hi, Monte;

about speeding up the machine: I support Raymund´s suggestion of compiling GTO´s. In fact, if I am not wrong, your HP41MD (how did you like it?) already deals with expansions, right? In a way, it incorporates features available with, say, MLDL2000 and HEPAX memory, right? If so, compiling programs is automatic when you incorporate their codes into HEPAX memory (HSAVEP), for instance. I am using HEPAX as an example because it needs only a few keystrokes

to generate a compiled copy of a user code as a ROM program, and this compiled program runs as fast as any other ROM-based user code, AFAIK.

If a single CLA (or any suggestive message, like WAIT...) AVIEW is added to the beginning of a time consuming routine or procedure, the LCD contents will be unchanged till it ends. Based on what has been written in the follow-ups, that would be just a matter of choice while writing programs.

Just an extra comment: back in the 80´s, when I was at the University, I remember being scared to death when running a program with controlled loops, error detection and status messages. Suddenly the message in the display began to rotate around the edges in the LCD and I briefly thought: "God d*** it! My 41C is broken!" I felt my heart pumping in my cheeks for a while, and then I decided to investigate. The only possible explanation was related to flag 25: after an error occurrence the display contents would behave as the flying goose. Scary experience of mine...

Cheers.

Luiz (Brazil)

Edited: 20 July 2010, 12:52 a.m.

Re: Oops! : Another dumb HP-41 question

*Message #8 Posted by **Monte Dalrymple** on 20 July 2010, 6:31 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I actually call the design the 41CL (41C -> 41CV -> 41CX -> 41CL ... roman numerals!).

As far as tricks like compiled GTO, perhaps I'll try that once I get the various bugs worked out. I just wanted to do something simple to see how the design was working.

You are right about the capabilities of the design. I have written and included some "Y-functions", and
it's a good thing that I did, because I use them in the debugging. Unfortunately I have some errors in the functions
so I have to patch them before I can use them. This involves copying the 4K block to RAM and the POKEing
different values to about a dozen different locations in the copy in RAM. Then I have to manually program the MMU
to point to this patched copy (because the PLUG function has a bug for RAM addresses) and then manually
enable the MMU (because the MMUEN function has a bug). All of this patching takes about 10 minutes, which
is more time than it takes to modify the design and download it to the FPGA. In retrospect I wish I had
included a way to reprogram the Flash memory easily. Live and learn I suppose.

Once I have the patched version of the Y-functions available it's cool to turn on the Turbo mode or
virtually plug ROM images into the ports and play with them.

Thanks, Monte

Ángel, maybe is this salivation from us all that causes bugs in Monte's actual design... :-D

Greetings,
Massimo

Re: Oops! : Another dumb HP-41 question

*Message #11 Posted by **Monte Dalrymple** on 21 July 2010, 4:58 p.m.,*
in response to message #9 by Ángel Martin

Answering my dumb questions is about all anyone can do right now. I only have two boards built up
(I ruined three trying to solder them myself). Until I figure out why the current drain in Light Sleep
is high I don't dare have more boards fabricated. At some point I _might_ ask for a beta tester for the
second board, but I haven't decided yet.

Since I am a hardware guy, my hope is that others will take the initiative to write software to do more
with the available memory. I have functions that plug module images into ports or unplug them from ports.
And of course the 4k block copy, but nothing like file management. I also don't have anything to use the
RS232 port except a way to PEEK and POKE bytes one at a time.

By the way is it okay that I include images of the 41Z, Sandmath and Games software in the Flash
memory on the board?

Thanks, Monte

Re: Oops! : Another dumb HP-41 question

It's more than ok to include them, I feel honored and glad to have something to contribute with to the project. BTW an updated version of the 41Z is in final testing stages, should be posted in a few more days. Also, don't forget the Alpha ROM and the ToolBox ROM :)

Re: Another dumb HP-41 question

*Message #13 Posted by **Raymund Heuvel** on 19 July 2010, 7:23 p.m.,*
in response to message #1 by Monte Dalrymple

Hi Monte

If your goal is maximum speed, consider using compiled GTO's in your program. Requires heavy synthetics, See "Synthetic Programming on the HP-41C" by Bill Wickes.

Don't forget to change the END instruction into "Packed"!

BR

Raymund

Re: Another dumb HP-41 question

*Message #14 Posted by **Ángel Martin** on 20 July 2010, 9:41 a.m.,*
in response to message #1 by Monte Dalrymple

The simplest way I can think of would be by displaying a blank (or any other text) message at the beginning of the program execution.

The caveat is error conditions with flag 25 set - then the complete message scrolls instead of the goose... even worse for your purpose.

AFAIK changing this would require patching the OS...

HTH.

Stupid question re HP-41 Sigma key...

*Message #1 Posted by **Jim L (OHIO)** on 19 July 2010, 10:30 a.m.*

Having only recently re-entered the world of the HP-41CX, I also acquired a Math/Stat module. In the module's stats manual, it refers to executing specific functions using a sequence of keystrokes, such as XEQ [Alpha]‡”STAT[Alpha]. I get everything with the exception of the summation character itself. How do I enter the ‡” symbol from the keyboard, or combination of keystrokes?

Re: Stupid question re HP-41 Sigma key...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 July 2010, 11:15 a.m.,*
in response to message #1 by Jim L (OHIO)

Hi;

if you are referring to the Greek letter *SIGMA* (cannot add it with current character set) it is available with [shift][F] while in ALPHA mode. In PRGM or RUN mode, [shift][F] performs [CL*SIGMA*] (clears statistical registers contents). Look at the back of your HP41, right below the battery compartment, and you'll see a drawing of the keyboard in ALPHA mode. You´ll find these symbols there.

BTW, there is no such thing as a stupid question once you do not know the answer...

Cheers.

in response to message #2 by Vieira, Luiz C. (Brazil)

First, allow me to express my sincere appreciation for such a quick and kind response to a rather simple (to answer) question. I am constantly amazed at the collegiality and expertise shown in this forum. The Greek letter Sigma is exactly what I was searching for.

In my defense, I haven't even seen an HP-41 since my days using it constantly through 1993--some 17 years ago. However, that hardly explains my inability to see the answer right on the back of the machine! I imagine this is what makes IT support personnel crazy--when the answers to the questions are right in front of the inquirers! Thanks again.

TI bash - and HP too?

*Message #1 Posted by **Jim Horn** on 19 July 2010, 1:39 a.m.*

A particularly on-topic XKCD:

http://xkcd.com/768/

Re: TI bash - and HP too?

*Message #2 Posted by **Walter B** on 19 July 2010, 1:53 a.m.,*
in response to message #1 by Jim Horn

Sad but true. As I've written here several times a state-of-the-art LCD is an important feature for advanced calculators. Don't expect customers being satisfied with the standard of 96.

FWIW

Re: TI bash - and HP too?

*Message #3 Posted by **Don Shepherd** on 19 July 2010, 4:27 a.m.,*
in response to message #1 by Jim Horn

In the case of the TI-83 family, I think there is probably another dynamic going on here. One might say that TI is a victim of its own success, but you don't usually picture a "victim" as driving to the bank with boatloads of cash day after day. I'd say you continue to see a technologically-inferior graphing calculator (TI-83) dominate the education market for the same reason you continue to see another technologically-inferior financial calculator (HP-12c) dominate the financial market: don't mess with a proven winner.

Don't look for revolutionary technical innovation to come from companies with a vested financial interest in maintaining the status quo, although the TI-NSpire and HP-30b do represent some degree of technical innovation.

Re: TI bash - and HP too?

*Message #4 Posted by **Ron Ross** on 19 July 2010, 8:27 a.m.,*
in response to message #1 by Jim Horn

I feel that it may be counter productive to make to good of a display. These are calculators, whose main purpose is to do math, not be great game machines. Teachers and other educators may balk at great graphics that are mainly used for gaming.

Just my $0.02

Re: TI bash - and HP too?

*Message #5 Posted by **Crawl** on 19 July 2010, 9:31 a.m.,*
in response to message #4 by Ron Ross

I do think color would help sort out which trace is which when you're graphing multiple functions, though. It also might help with making 3D plots more intelligible.

Someone here a while ago said that the TI89 display was terrible compared to the HP50g. Normally, I think both are serviceable. However, after then, I was trying to photograph them for some reason, and the HP50g screen showed up easily while the TI89's did not. So I guess there is some "objective" way in which the 50g's display is better.

Re: TI bash - and HP too?

*Message #6 Posted by **Katie Wasserman** on 19 July 2010, 10:01 a.m.,*
in response to message #1 by Jim Horn

Even though the Casio fx-9860g series now as a beautifully readable backlit display, it too should be better by today's standards. It needs to have much higher resolution.

OLED displays, inexpensive enough to be used on the $20 Sansa Clip (in monochrome), would look fantastic in a calculator but they suck up too much power. E-Ink would be a great solution, I think.

One of the success points of the HP-12C is that its display is still the most readable of any financial calculator made. While the 30b can run circles around the 12C in functionality, it's display is nowhere near as easy to see.

*Message #7 Posted by **Tim Wessman** on 19 July 2010, 10:56 a.m.,*
in response to message #1 by Jim Horn

I'd like nothing better to have a screen with a decent refresh rate, full color and the like.

The problem is that calculators really have to be "more convenient" then the other options out there or they just don't make sense. Does anyone think a calculator should take 45 seconds to boot?

1) Dedicated buttons/interfaces for inputting and solving math problems means it is quicker and easier to solve a certain level of calculation 2) You can stick it in a drawer/bag and be able to pull it out a week later and it turns on immediately.

Number 2 is a sticking point with all the display technolgies out there unfortunately. :-(

> Does anyone think a calculator should take 45 seconds to boot?

Tim is right. In order to save power, when you switch on the current TI-NSpire, if you haven't used it in a few days (I think that is adjustable), it has to "reboot" or copy the OS from some type of memory to

another type of memory, and this takes about 30-40 seconds it seems, which we find unacceptable in a calculator. We've come to accept our computers taking awhile to become operational, but we want our calculators to be instant-on.

Re: TI bash - and HP too?

*Message #9 Posted by **Martin Pinckney** on 19 July 2010, 11:42 a.m.,*
in response to message #8 by Don Shepherd

I don't understand all this. My cell phone takes some time to boot the cellular network, but the display comes on instantly.

>
> TW

I think there are two issues here. A cell phone takes a long time to boot, but that isn't because it's waiting for the *display* to be fully functional.

Tim may correct me, but I think the problem with putting a more modern display on a calculator is one of battery life. Color, backlit, or OLED displays probably consume more power than acceptable for a calculator.

This thread has pointed out two of the main requirements of a calculator. Meeting these requirements puts limitations on the implementation. The requirements are:

1. Long battery life
2. "instant on" boot time.

Sure a cell phone or a PDA has a better display, but would you be willing to recharge your calculator every couple of days? Would you be willing to wait 30 or 60 seconds for your calculator to turn on? And more importantly, would your 15 year old kid be willing to put up

with either of these things?

Re: TI bash - and HP too?

*Message #12 Posted by **Tim Wessman** on 19 July 2010, 2:32 p.m.,*
in response to message #11 by David Hayden

Just a follow on to your comment regarding 15 year olds.

Us young'uns are perfectly willing to charge our phones and things because we use them so much. A calculator that sits in a bag for a week or two though is another story. Makes it far to easy to say "Teacher! I can't take my test because my calculator is out of power. . ." :-)

TW

Re: TI bash - and HP too?

*Message #13 Posted by **David Hayden** on 21 July 2010, 8:23 a.m.,*

*Message #14 Posted by **Ren** on 29 July 2010, 1:05 p.m.,*
in response to message #9 by Martin Pinckney

A cell phone takes so long to boot because it first has to determine its location in relationship to multiple cell towers it may be receiving and forward that information to Big Brother(BB), so if you're on a watch list, BB can begin monitoring your movements and communications, when that's done the phone will let you use it.

Re: TI bash - and HP too?

*Message #15 Posted by **Lincoln R.** on 19 July 2010, 12:21 p.m.,*
in response to message #1 by Jim Horn

The main difference I see between a 1996 TI calculator and a modern one (other than USB and a restyled case) is that the newer ones (Since about 2003 or 2004) are very poorly made. I think TI just simply does not care, they have a de facto monopoly on the 'calculators for high school' market, and as a result nobody looks outside of TI even in college. (Yeah, I used to own a TI-89 until it got stolen from me, and a friend convinced me to try RPN so I bought an old 48g...)

I've seen lots of TIs start having display problems after 3-4 years. Culprit? The ribbon cable between the main PCB and the LCD is thinner than the cellophane wrapping on a piece of candy, and they make it too long and

fold up the excess. Those folds make the tiny carbon traces break, and you start getting dead lines on the screen. I just fixed this on a circa 2004 TI-83 Plus for my roommate, it involved cutting off the ribbon cable and painstakingly soldering on 20 or so little metal wires.

Re: TI bash - and HP too?

*Message #17 Posted by **Lincoln R.** on 19 July 2010, 12:40 p.m.,*
in response to message #16 by Tim Wessman

Heh, I'm certain TI sells a lot of TI-89s and n-spire's that way. Unfortunately I can't say anything about the build quality of the HP 50g other than what I've read here, but I couldn't see it being terribly difficult to do a better job than TI, who I'm pretty sure contracts all the hardware design to Inventec... the last TI I disassembled didn't even contain any TI parts. (If HP still does any of their own hardware design)

Chewing gum for the 50g

*Message #1 Posted by **Glenn Shields** on 18 July 2010, 1:26 p.m.*

The use of 'POS' in the last challenge gave me an idea, just type in these two programs: << 1 10 FOR i RAND 4 RND i E-6 * + NEXT 10 ->LIST SORT << E4 * FP 100 * R->I >> MAP >> and store in 'ARRY' then << 1 10 FOR j DUP j POS SWAP NEXT DROP 10 ->LIST R->I >> and store in 'SHUFF'. Then create a list with 'ARRY' to give a permutation of the first 10 (or however many you want) numbers. Then repeated use of 'SHUFF' returns a list of where the numbers were positioned in the first list, but then it toggles back to the original list, on and on, and it seems to work no matter how long the list. Can anyone offer the theory behind this? Thanks in advance. Glenn

Re: Chewing gum for the 50g

*Message #2 Posted by **Han** on 20 July 2010, 12:17 a.m.,*
in response to message #1 by Glenn Shields

'SHUFF' as programmed a bijective map that is its own inverse.

Re: Chewing gum for the 50g

*Message #3 Posted by **Glenn Shields** on 20 July 2010, 9:33 a.m.,*
in response to message #2 by Han

Thanks for your swift and sure response. I didn't know what I had stepped into, but it's amazing what a great resource these forum members can be (plus Wikipedia) - who needs school! I also noted which lists are invariant, like numbers in their "proper" positions or pairs in "each other's" position, such as {6,7,4,3,5,1,2,8,10,9}. Cheers, Glenn

almost RPN

*Message #1 Posted by **db (martinez, ca.)** on 18 July 2010, 2:00 a.m.*

There's a *Miida* desktop on ebaby that is billed as RPN and i thought "oh yea". Sure. Another pinhead seller using a buzzword that he heard somehow magically gets higher bids. I looked and at first glance it was just an adding machine logic calculator: i.e. postfix in + & -, prefix in X & /. Then i saw that - **only in "Konstant" mode** - it would be a type of postfix in multiplication and division too, with a permanently entered number in the X register. Even with my loose definition of RPN, this isn't it. But it is an attempt to take advantage of the ease of RPN's entry system while doing repetitive operations such as a surveyor checking cut sheets. I have seen "constant arithmetic" on old calculators before. I'll have to see if they all work like this.

They saw the reason that RPN is superior but just couldn't shed that silly assed equals key. Like a baby with a pacifier:

http://cgi.ebay.com/RARE-1972-RPN-MIIDA-MC1214-CALCULATOR-VTG-WORKS-/110561007703?cmd=ViewItem&pt=Calculators&hash=item19bdf31857

NoV-64 SW update (RAM2ROM4)

*Message #1 Posted by **Diego Diaz** on 17 July 2010, 9:50 p.m.*

Hi all,

For the Clonix/NoV's users:

A new update for NoV-64 has been released. (180710)

The only mod is the RAM2ROM4.exe file that was faulty on the previous CD compilation and has been fixed.

Link is here.

Production for Clonix & NoV's modules has been stopped as usual during summer rest... :-)

However, this year will restart later (mid/end fall) since I've run out of required parts and can't build nothing bigger than a simple Clonix-41.

Best wishes.

Diego.

COMPU-LS and COMPU-DC

*Message #1 Posted by **Mike** on 15 July 2010, 8:26 p.m.*

I have two EPROMs for the HP-71B that have these programs. When run they ask for Points, and some angle information and distances. Seems like it might be a survey or navigation program or such but I'm clueless at what they are for.

It has a file

Anyone know what these program are?

Re: COMPU-LS and COMPU-DC

*Message #2 Posted by **Forrest Switzer** on 16 July 2010, 10:50 p.m.,*
in response to message #1 by Mike

Mike,

COMPU-LS is a Land Surveyors COGO (COrdinate GeOmetry) program. HP did considerable business in serving Surveyors with programs and in the case of the 41, a module. HP had their own very capable survey module for the 71.

The Compu-Ls module was written and manufactured by Martin & Company, Alberta. Mathias was kind enough to send me a copy of the manual. I do not have the module. (if you decide to trade or sell yours I might be interested.) Basically a COGO program facilitates calculations in three dimensional rectilinear space. Points are generally described with Northing, Easting, and Elevation, and are given lable numbers or names. Then you can work directly with the point numbers to do circular curve, line, and intersection calculations.

I assume that COMPU-DC is the Data Collector complement to the COGO program, and I dont have a copy of the manual for it.

Like the HP 71 module, this COGO program could work in the field along with the ThinkJet (2225B), or the 2" 82162A printer, the Casette Drive (82161A), the Disk Drive (9114A), and HP or other memory modules, as a totally battery powered system. I assume that there may have been a cable connection from certain Total or Semi Total Station survey instruments, that allowed the surveyor to download shots into the Data Collector module, and to upload points from the Data Collector into the theodolite or Total Station.

Most Total Stations had their own manufactured and dedicated Data Collectors, but even so, there are a lot of Surveyors that preferred HP calculators and used HP95 thru HP200 and HP 48 calculators as data collectors. Some still use those, as you can see by the current cost and business in COGO and Data Collector Cards for the HP48 on the auction site.

forrest

Re: COMPU-LS and COMPU-DC

*Message #3 Posted by **Mike** on 17 July 2010, 3:30 a.m.,*
in response to message #2 by Forrest Switzer

Thanks for the info. The logo does say Martin & Co., when the program is executed. It is protected BASIC but I might be able to transfer it to floppy. How large is the manual? I have sent you an email.

Re: COMPU-LS and COMPU-DC

*Message #4 Posted by **Forrest Switzer** on 17 July 2010, 12:07 p.m.,*
in response to message #3 by Mike

Mike,

The listed e-mail is probably wrong - too many years since joining the forum. Try f-l-e-e-a-z-at-g-m-a-i-l-dot-c-0-m.

The manual does have the company phone number (of course maybe 20-years ago). I think it is probably the same company. The digital copy that I received was quite large (a high density scan), and I will have to look back in history to see if I still have it digitally. It would however be easy for me to scan the 100+ pages from the printed version that I have.

Forrest

Re: COMPU-LS and COMPU-DC

*Message #5 Posted by **Mike** on 17 July 2010, 1:06 p.m.,*
in response to message #4 by Forrest Switzer

Not necessary to scan 100 pages. It might help just to have enough information to see how the program works. That is, what data is expected, what format it should be input in, what are the expected outputs, etc.

I really don't need the program but I will try and put it onto floppies or get an electronic copy. The programs were protected but I think I can save a copy.

Re: COMPU-LS and COMPU-DC - company website?

*Message #6 Posted by **Jim Creybohm** on 17 July 2010, 8:04 a.m.,*
in response to message #1 by Mike

Not really certain, but is this the Martin geomatics company that created the module?

http://www.mgcl.ca/

I used to travel through this city a lot, and saw a lot of their signs up around construction zones. The founder is unfortunately, passed on.

Re: COMPU-LS and COMPU-DC - company website?

*Message #7 Posted by **Forrest Switzer** on 17 July 2010, 7:34 p.m.,*
in response to message #6 by Jim Creybohm

Jim,

I am reasonably certain it is the same company.

Martin & Company Land Surveyors & Consulting Engineers 725 - 29th Street North Lethbridge, Alberta T1H 5G3 ph. 403-329-0050

This would have been probably 1985 to 1990

There is no date on the manual

A Most Unusual Number, on the 10c/11c/12c/15c

*Message #1 Posted by **Katie Wasserman** on 14 July 2010, 11:44 p.m.*

I was thinking about the keyboard test timeout on the Voyagers and what it left on the display. See this thread for a little background.

If you start the keyboard test (turn off the calculator, hold down the divide key then press ON) on any of the original Voyagers (and the 12C+) and let it time out -- a few minutes, but only 2 seconds on the 12c+ -- you're left with a number ranging from 0.1 to 4.0 on the display after you clear the "Error 9" message. This number is apparently there it indicate the last key pressed that registered correctly starting with .1 (no key pressed) ending at 4.0 (sigma+ key pressed). However, these are not your run of the mill numbers, they have some very weird properties, some of which are potentially useful in programs.

For example:

1) Start the keyboard test but don't press any keys, let it time out, then press ENTER to clear the "Error 9" message

2) Store the ".1" shown in register 0, just to have it around to play with.

3) Take the reciprocal of it. It's zero, but there's more.... try 123.456 RCL 0 /, You'll see 234.56.

Dividing this magical number into any other number results in the removal of the left most digit followed by a divide by a real 0.1. The exception is when you divide this number by itself, it returns 1.

Here's another magical property of this number:

RCL 0 Ln returns 1, it's a pseudo Euler's number.

I haven't explored it's complex properties on the 15c, but I'll bet that they are equally interesting. I also haven't explored any of the other numbers that can be gotten to using the keyboard test timeout.

On the 16C, you can see that this is one strange number. It displays as an impossibly large binary number based on the word size but it can't stored nor used in calculations, not even in floating point mode. Other models of the 12C don't timeout the keyboard test so you can't get to this number on them.

I'm curious if anyone here has explored these numbers and what else they might allow the Voyagers to do.

-Katie

Re: A Most Unusual Number, on the 10c/11c/12c/15c

*Message #2 Posted by **Eric Smith** on 15 July 2010, 1:56 a.m.,*
in response to message #1 by Katie Wasserman

Except on the 16C, these are called non-normalized numbers (NNNs), and behave much the way that they did on earlier HP calculator. (The 16C in float mode deals with them in about the same way as the others.)

On the 15C, some NNNs are matrix descriptors. There are 16 possible matrix descriptors, of which only five are used. The other 11 do strange and wonderful things.

Re: A Most Unusual Number, on the 10c/11c/12c/15c

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 15 July 2010, 2:43 a.m.,*
in response to message #2 by Eric Smith

Hi, guys;

after reading Katie´s post (and before reading Eric´s), I wondered that the HP16C would let us know what are these numbers made of. I mean, considering that the keyboard test timeout also brings the same number to the display in an HP16C in floating point mode, storing this .1 in R0, setting HEX (or BIN or OCT) and recalling it back to the stack would show its guts, bit-by-bit.

I´ll try it later, but if anyone wants to go ahead and post about it, I'd gladly read it as well.

Cheers.

Luiz (Brazil)

Re: A Most Unusual Number, on the 10c/11c/12c/15c

*Message #4 Posted by **Eric Smith** on 15 July 2010, 3:14 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

On the 16C, the low 56 bits of the stack registers are stored in individual registers in the R2D2 chip, just as in the other Voyagers. The high 8 bits of the stack registers are combined in a separate R2D2 register.

When one of the stack registers has a value with bits set beyond the word length, it still gets displayed. However, setting the word length to 56 bits prior to doing this experimentation would be the best way to facilitate seeing the actual leftover X register contents.

Re: A Most Unusual Number, on the 10c/11c/12c/15c

*Message #5 Posted by **Katie Wasserman** on 15 July 2010, 3:51 a.m.,*
in response to message #2 by Eric Smith

Eric,

I just found and read Allyn Tennant's article on HP-15C synthetics on your web site, interesting stuff! I also found this thread from a few years ago where we discussed some of this too. All this seems to have been pretty well hashed out before, but it's still fun to play around with these things.

BTW, I found that ON+PMT doesn't work on the 12C+, it appears to have no effect on the X register at all. I guess the ARM-bsed emulator isn't quit perfect.

-Katie

Re: A Most Unusual Number, on the 10c/11c/12c/15c

*Message #6 Posted by **Eric Smith** on 15 July 2010, 11:03 p.m.,*
in response to message #5 by Katie Wasserman

The 12C ON+PMT is a hardware function of the 1LE3/1LF5 chips, independent of the Nut instruction

set. It forces a hardware reset, but at a specific time during the serial processing of a word, so it causes all of the processor registers to be shifted. There is no firmware involved in that process, so a Nut instruction set simulator won't reproduce it.

I suppose that in principle a simulator could have special-case code to do the equivalent, but it doesn't really seem very worthwhile.

Re: A Most Unusual Number, on the 10c/11c/12c/15c

*Message #7 Posted by **Katie Wasserman** on 16 July 2010, 2:34 p.m.,*
in response to message #6 by Eric Smith

That an interesting hardware function, are there others that you know of?

HP-35 Manuals

*Message #1 Posted by **aj04062** on 14 July 2010, 9:09 p.m.*

I just picked up a HP-35 Manual at auction and would like to know if there is a source that can tell me the versions of this book.

Thi picture on the front shows a 35 without the model number and, I think, the raised dot on the 5.

I am trying to pair it with the same era calc (with bug) to complete a collection.

It has a number on the back cover 00035-90008.

Same year? S/N on Calc is 1249A 03920

Re: HP-35 Manuals

*Message #2 Posted by **Lincoln R.** on 14 July 2010, 10:01 p.m.,*
in response to message #1 by aj04062

I don't think they revised the manual. This is the same one that came with my HP 35 version 3 (No raised dot, no bug, no red dot, Hewlett-Packard 35 on nameplate, serial # 1302A 47940). And I'm quite sure that this stuff is all original because there was a paper inside the back of the manual with a date of purchase of 9/17/73 and a matching serial number.

Re: HP-35 Manuals

*Message #3 Posted by **aj04062** on 14 July 2010, 10:35 p.m.,*
in response to message #2 by Lincoln R.

Okay,

the copy I have has the accesory & service card still in it. They aren't even torn apart.

It's actually in very good shape for being almost 40 yrs old.

Edited: 14 July 2010, 10:35 p.m.

Re: HP-35 Manuals

*Message #4 Posted by **Lincoln R.** on 14 July 2010, 10:51 p.m.,*
in response to message #3 by aj04062

Yeah, that is in really good condition. Now for the hard part: Finding an HP 35 in equally good condition.

I got lucky on mine, the battery pack was missing so it didn't sell for quite what they normally go for, and I got the leather carrying case, manual, service card, AC adapter, and plastic hardcase. And then I managed to acquire a rebuilt battery pack by trading someone for an HP 10b I had no use for.

early manual

*Message #5 Posted by **Frank Boehm (Germany)** on 15 July 2010, 4:08 a.m.,*
in response to message #1 by aj04062

I think the early V2 were delivered with a red dot manual, too.

Re: early manual

*Message #6 Posted by **aj04062** on 15 July 2010, 7:31 a.m.,*
in response to message #5 by Frank Boehm (Germany)

wo do you think it is unlikely an early v2 with bug came with the manual I have?

Should it have the one you have?

early manual

*Message #7 Posted by **Frank Boehm (Germany)** on 15 July 2010, 11:17 a.m.,*
in response to message #6 by aj04062

depends on the definition of "early V2" - the early ones have a red dot like serial number sticker, the later V2s have the common serial number sticker inside the battery compartment, these certainly didn't come with a red dot manual.
The manual will probably match your calculator fine, at least no one will notice :)
I just checked with my remaining HP stuff - there *are* different revisions of the manual. I have one stating only the part number and another one stating the part number and next to it "Rev. 08/73" (if I remember correctly) - the back of the manual is completely different too.

Re: early manual

*Message #8 Posted by **aj04062** on 15 July 2010, 8:59 p.m.,*
in response to message #7 by Frank Boehm (Germany)

This one has no Rev Date. Hmmm. Close enough I guess.

Re: HP-35 Manuals

*Message #9 Posted by **tim m.** on 16 July 2010, 1:49 a.m.,*
in response to message #1 by aj04062

My manual is identical to yours. I purchased it along with an HP-35, charger, hard case, leather case, receipts, repair slips, and personal correspondence--all from the original owner. My '35 is an early version 2 (no "35" on the front label, no red dot, raised bump on the "5" key, serial number label between the two bottom feet). It originally had the infamous bug, but was repaired and so has a newer "HP-35" back instruction label. The calculator has a serial number of 1143A 31237.

Hope that helps,

Tim

Re: HP-35 Manuals

*Message #10 Posted by **aj04062** on 16 July 2010, 7:48 a.m.,*
in response to message #9 by tim m.

Great. It's always better to be able to state the collection is original and correct.

Re: HP-35 Manuals

*Message #11 Posted by **tim m.** on 16 July 2010, 9:40 a.m.,*
in response to message #10 by aj04062

And for what it's worth, the receipts accompanying my calc state it was purchased in 1972 (can't remember what month off-hand, but it was the first half of the year, I think).

-Tim

[OT] FC5025 USB 5.25" Floppy Controller

*Message #1 Posted by **Gerry Schultz** on 14 July 2010, 2:27 p.m.*

I know this is WAAY off-topic but I ran across this piece of hardware/software and I find it interesting in that it allows me to access 5 1/4" floppies from a Mac or PC. It's called the FC5025 USB 5.25" floppy controller and it's available from Device Side Data (http://www.deviceside.com/). It works by taking a Teac FD-55GFR floppy drive (very available on eBay) and hooking it up to a Mac or PC via USB. It's been tested with 32-bit versions of WinXP SP3, OSX 10.4.11 and Linux x86 2.6.24. The Disk Image and Browse application allows you to browse the contents of MS-DOS and ProDOS disks directly from the floppy and copy individual files. It also does disk imaging of floppy disks. From what I've read, this interface supports MS-DOS, Apple II DOS 3.2, 3.3 and ProDOS disks, Atari and Commodore formats. It's a read-only device so its primary function is to read old 5 1/4" floppies and bring their files into modern PCs.

I purchased the interface based upon a review I read in the latest issue of Juiced.GS and I just got it today so I hope to test it this weekend. I'm mentioning it here because I am assuming that I'm not the only one looking for a solution to copying old 5 1/4" disks but not having a functioning computer that still reads them. I have several of the old HP disks that was used to share files and I don't even know if they are any good. Plus, I have old MS-DOS disks and a few Apple II floppies.

I will post more when I get some time to try out the FC5025 to see just how it works. I do have a Teac drive and an old Sony DVD burner case that I pulled the drive out of, so I can to see if I can set up an external 5.25 floppy drive with a USB connection.

It should be fun, Gerry

Re: [OT] FC5025 USB 5.25" Floppy Controller

*Message #2 Posted by **Egan Ford** on 14 July 2010, 2:51 p.m.,*
in response to message #1 by Gerry Schultz

This is the one of two solutions I've seen that does this (other: http://www.softpres.org/glossary:kryoflux). Both are limited to read-only. Since I only need to read (and write) Apple II floppies I opted to go with ADTPro. It's free, but you need a real Apple II and a serial cable.

Perhaps we should bring our gear to HHC 2010 and do floppy to image conversions for the masses.

Re: [OT] FC5025 USB 5.25" Floppy Controller

*Message #3 Posted by **Dave Shaffer (Arizona)** on 14 July 2010, 4:08 p.m.,*
in response to message #1 by Gerry Schultz

I'll make standing offer: I DO HAVE a PC with a functioning 5.25 drive and will be happy to take a look at any such disks sent to me.

Now, if I could only find a better way to get the files off of an old Apple Power PC (7600/132) hard drive. The HD has an Apple SCSI interface. Trying to get a few files at a time from it via 3.5 floppy is mind-numbingly slow, not to mention the messed up file names (translating to DSO 8.3 name style).

Re: [OT] FC5025 USB 5.25" Floppy Controller

*Message #4 Posted by **Egan Ford** on 14 July 2010, 4:25 p.m.,*
in response to message #3 by Dave Shaffer (Arizona)

Can I assume you have the Apple PPC? If so, try using a serial cable. Does it have Ethernet? If so, use that.

BTW, there are free Apple PPC emulators out there. If you can find a way to image the drive you can then boot in an emulator. From there file xfer should be easy.

Re: [OT] FC5025 USB 5.25" Floppy Controller

*Message #5 Posted by **Frank Boehm (Germany)** on 14 July 2010, 4:53 p.m.,*
in response to message #3 by Dave Shaffer (Arizona)

The easiest way would be the mentioned machine. Grab an AAUI to 10BaseT (RJ45 jack) adapter and fire up Ethernet. Already mentioned: the serial port. Other solution: Adaptec SCSI card (Mac version)

Re: [OT] FC5025 USB 5.25" Floppy Controller

*Message #6 Posted by **Gerry Schultz** on 14 July 2010, 9:14 p.m.,*
in response to message #3 by Dave Shaffer (Arizona)

Dave:

'I'll make standing offer: I DO HAVE a PC with a functioning 5.25 drive and will be happy to take a look at any such disks sent to me.'

Thanks for the offer Dave, but in my case, the P4 machine I have only supports 3.5" drives and the new Intel i7 machine I just built (using an Asus P6X58D MB) doesn't support floppy drives. What I especially like about the FC5025 is that it supports several floppy formats and since I still belong to an Apple II user group (for 25 years) and we meet monthly. Being able to read old Apple II floppies is important to me. And, no, I don't have any Apple II hardware anymore. My wife was ready to kill me with all the computers I had so the old Apple IIGS (fully loaded) had to be sold. Also, a fellow member owns an HP-15C and we chat about HP calculators regularly.

I do have an IBM 486 machine that still works, it runs Win95, but IBM uses an custom I/F (power in the connector) for the 3.5" drive so I can't daisy-chain in a standard 5 1/4" drive. I do have several 3.5"/5.25" floppy combo drives that work, just not a functioning machine to control them.

Gerry

Re: [OT] FC5025 USB 5.25" Floppy Controller

*Message #7 Posted by **Gerry Schultz** on 19 July 2010, 1:52 p.m.,*
in response to message #6 by Gerry Schultz

Quick follow up. I installed my 5 1/4" drive in an old external Syquest 88MB drive case along with the I/F card that has built-in a 5v and 12v power supply to run the drive. It appears to read MS-DOS disks well as it read some Microsoft distribution disks properly. But some of my older disks it showed read errors including my 5 1/4" HP-48 goodies disk.

The Windows software that's included works okay but is pretty crude. For instance, I could read the HORN subdirectory on the goodies disk but the file listing ran right off the bottom of the screen and

the command buttons to copy individual files are at the bottom of the window. When I maximized the window, I could get to the necessary buttons but then I could only access the bottom end of the file listing.

I was able to image the entire floppy and the resulting file is an .IMG filetype. Now I need to figure out what software can read and use the data file.

Just in case anyone was curious.

Gerry

Re: [OT] FC5025 USB 5.25" Floppy Controller

*Message #8 Posted by **Alejandro Paz (Germany)** on 21 July 2010, 1:06 p.m.,*
in response to message #3 by Dave Shaffer (Arizona)

The SCSI interface should be a standard Fast SCSI II 50 pins, like in the PowerMac 8600. Almost any PC SCSI controller should be able to talk to such a disk. If you use Linux (a LiveCD for instance) you mount the disk using the built-in hfs/hfs+ filesystem you can read the files. A cheap SCSI controller for PCI can for few $$ in that or other auction sites be bought.

Sinclair Calculator Repair

*Message #1 Posted by **John Robinson** on 14 July 2010, 8:25 a.m.*

Hi All, I know this is not HP related, but I didn't know where else to turn. I am looking for help to repair a Sinclair Cambridge Scientific calculator, can anyone point me in the right direction please ?

Thanks John

how-to-fix-a-pile-of...

*Message #2 Posted by **Frank Boehm (Germany)** on 14 July 2010, 10:24 a.m.,*
in response to message #1 by John Robinson

Sorry to say that, but the Sinclair calculators were never constructed to last (nor to work as expected when new) - I'd clean all key and switch contacts and check battery contacts for corrosion or cold solder, too. A really "dead" unit is unlikely, but expect bouncy keys...

Re: how-to-fix-a-pile-of...

*Message #3 Posted by **John Robinson** on 14 July 2010, 9:17 p.m.,*
in response to message #2 by Frank Boehm (Germany)

Thanks for the tips Frank, I will try them out. I do agree with you about Sinclair calcs being "a pile of ...", but this one is my wifes from her school days, so I wanted to get it going for her :-)

Cheers, John

Re: how-to-fix-a-pile-of...

in response to message #3 by John Robinson

> Quote:
>
> I do agree with you about Sinclair calcs being "a pile of ...",

That's a little harsh. Ammong other things the Sinclairs were truly shirt pocket size. No need to speculate on just how big the pockets in Bill Hewlett's shirts really were. And I think that the four volume library of programs for the Sinclair Cambridge Programmable was a impressive work for the time.

I have three. I will suggest one thing. You need to be sure that the 9 volt battery is in good condition. A battery which will run TI-30's, Business Analysts, etc., without a problem will give you fits in a Sinclair.

They are slow by today's standards Two solutions for Gene Wright's addition test are

```
Sinclair Cambridge Programmable
Count:  355
Code:  rcl + 1 = sto gto 00

Sinclair Cambridge Proigrammable
Count:  384
Code:  + 1 gto 00
```

Re: how-to-fix-a-pile-of...

*Message #5 Posted by **John Robinson** on 19 July 2010, 2:09 a.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

Hi Palmer,

Thanks for the tip about the battery. I think you're thinking of the Cambridge Scientific Programmable which took a 9V battery. I had one of those, but gave it away :-) The one I actually have now is the Cambridge Scientific (non-programmable), and it's powered by 2 x AA batteries, but taking your advice, I'll make sure they are fresh.

BTW, I have total respect for Clive, and his ideas, just sometimes the implementations lacked the quality they deserve - shame really.

Cheers, John

Amazing RPN calculator discovered

*Message #1 Posted by **Joerg Woerner** on 13 July 2010, 8:47 p.m.*

I just found this incredible scientific RPN calculator from xxxxx, made in Japan in 1982.

The specification sheet reads like a dream:

Floating Point 1.00000000001E-1024 ... 9.9999999999E1024

12 digits accuracy on most functions, some only 10 digits

Double wide ENTER key

DISP key shows "height" of stack

12 Memories

Statistical functions

And - it is not in db's photo collection ;-))

Your bet?

Regards, Joerg

Re: Amazing RPN calculator discovered

*Message #2 Posted by **Lincoln R.** on 13 July 2010, 9:49 p.m.,*
in response to message #1 by Joerg Woerner

Omron, I'd guess? I don't think Sharp/Casio/Toshiba ever bothered with RPN, but I know Omron made some RPN models. Anyhow, sounds like a nice acquisition.

Re: Amazing RPN calculator discovered

*Message #3 Posted by **db (martinez, ca.)** on 14 July 2010, 12:16 a.m.,*
in response to message #1 by Joerg Woerner

You found a Panasonic.
Pinche puta malcreado avericioso. I'll trade you my TI 150 for it.

Re: Amazing RPN calculator discovered

*Message #4 Posted by **Joerg Woerner** on 14 July 2010, 7:46 a.m.,*
in response to message #3 by db (martinez, ca.)

Deal....

Quasar HHC-1400 with RPN ROM ;-))

Regards, Joerg

Re: Amazing RPN calculator discovered

*Message #5 Posted by **Katie Wasserman** on 14 July 2010, 12:03 p.m.,*
in response to message #4 by Joerg Woerner

Joerg,

Are you referring to their version of FORTH called SNAP?

-Katie

Re: Amazing RPN calculator discovered

*Message #6 Posted by **Joerg Woerner** on 14 July 2010, 7:02 p.m.,*
in response to message #5 by Katie Wasserman

Katie,

I'm not sure - it might be based on Forth... See the pictures below.

Regards, Joerg

Re: Amazing RPN calculator discovered

*Message #7 Posted by **Katie Wasserman** on 14 July 2010, 9:23 p.m.,*
in response to message #6 by Joerg Woerner

I'm almost certain that this is SNAP, and it's the built-in language on this machine. It has BASIC too, but that was on a plug in ROM.

-Katie

Forth and Age

*Message #8 Posted by **Joerg Woerner** on 14 July 2010, 9:25 p.m.,*
in response to message #5 by Katie Wasserman

Katie,

We shouldn't talk too much about Forth - it reveals our age ;-))

I finished my diploma of Electrical Engineering in 1986 in Stuttgart and worked as a freelancer for companies like Bosch, AGIE and EPSON before joining a "Rapid Protoyping" company in Switzerland in 1990. In the years before 1990 I programmed microcontrollers (I-8085, HD6303) in Assembler and the famous Epson HC-20 in Basic.

My project in Switzerland were the Main-Controller and Display-Controller boards of a desktop blood analyzer, a total of 12 (!) microcontrollers. The smallest ones were National Semi Cops400, the larger ones nice NEC V25's. Every single controller was programmed in Forth, we teamed up with Mr. Flesch from Forth Systems in Germany.

I think early in the 90's it was still a very cool language! Very efficient in performance and compact

in the ROM and RAM.

Well, these days the smallest controller we use in our products are ARM9's, TI C6400 DSP's - don't ask about ROM sizes ;-))

By the way, I turned last month 50 ;-))

Cheers, Joerg

Re: Forth and Age

in response to message #8 by Joerg Woerner

Ohh, 6303 in Forth :) ¡That brings really nice memories!

I even made a decent multitasking kernel for the 6303-based TDS9090/9092 from the recently disappeared Triangle Digital Services.

Re: Forth and Age

*Message #10 Posted by **Garth Wilson** on 18 July 2010, 10:59 a.m.,*
in response to message #8 by Joerg Woerner

> Quote:
>
> We shouldn't talk too much about Forth - it reveals our age ;-))

It is not embarassing. Although some Forth *methods* are outdated, Forth itself is timeless--not outdated at all--and still offers huge advantages over other more-popular languages today.

Re: Amazing RPN calculator discovered

*Message #11 Posted by **Eric Smith** on 15 July 2010, 2:05 a.m.,*
in response to message #5 by Katie Wasserman

The RPN calculator ROM for the HHC is written in SNAP, but it doesn't provide direct access to SNAP programming.

I've done a fair bit of work on reverse-engineering the mainframe ROM, including the SNAP interpreter, though there's still a long way to go. SNAP is a token-threaded variant of FORTH, with some one-byte and some two-byte tokens. From the disassembly I've worked out what many of the tokens are.

I do have the SNAP development module, but unfortunately not the technical documentation.

I've got one other rare HHC module, which is SNAP BASIC. It's a BASIC implemented in SNAP, entirely unrelated to the more common Microsoft BASIC ROM.

Re: Amazing RPN calculator discovered

*Message #12 Posted by **Katie Wasserman** on 16 July 2010, 2:32 p.m.,*
in response to message #11 by Eric Smith

BASIC in SNAP, I love it! Ages ago I wrote a forth-like language for the Commodore PET and

used it to write a BASIC-like language too, even though it had an early Microsoft BASIC in ROM. I may have to find one of these HHC computers to play with too.....

Re: Amazing RPN calculator discovered

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 14 July 2010, 10:56 p.m.,*
in response to message #4 by Joerg Woerner

Hi, Joerg, guys;

as I was not aware of this model, I searched the www for it and found that one of these was sold in Brazil for R$400,00 (about US$200) but I could not find any reference about when it was sold. I was also pointed to this link about the Panasonic HHC 1400.

And Joerg: not fair! Without the RPN ROM it is a regular pocket computer!!! Well, it also needs a BASIC ROM, anyway... And as Katie mentioned, the resident OS is SNAP (BTW, what the heck does SNAP stand for? Could not find any concise info...)

NICE! The OS comes in (EP)ROM packets...

Cheers.

Luiz (Brazil)

*Message #18 Posted by **Eric Smith** on 15 July 2010, 1:58 a.m.,*
in response to message #4 by Joerg Woerner

The Panasonic and Quasar branded HHCs are identical other than the brand and minor cosmetic differences.

Re: Amazing RPN calculator discovered

*Message #19 Posted by **Eric Smith** on 15 July 2010, 2:01 a.m.,*
in response to message #3 by db (martinez, ca.)

I'd expect a TI-150 to be much more valuable than a Panasonic/Quasar HHC; the HHC routinely sells for a mere pittance on eBay.

On the other hand, the RPN calculator ROM for the HHC is fairly rare. I've got one, but if I didn't, I'd find an extra HHC ROM (maybe an extra copy of Microsoft BASIC), remove the chip, and replace it with a suitably programmed MC68764 EPROM.

Re: Amazing RPN calculator discovered

*Message #20 Posted by **Joerg Woerner** on 15 July 2010, 9:38 a.m.,*
in response to message #19 by Eric Smith

And I don't expect a TI-150 for the HHC ;-))

db contributed a lot of nice stuff to my little Datamath Museum and he will receive the whole HHC box with lots of manuals for free...

Just shipped.

Re: Can I (we) see it, now? (N.T.)

*Message #30 Posted by **Ren** on 29 July 2010, 1:22 p.m.,*
in response to message #24 by Joerg Woerner

Wow! I have one of those, it came with a carrying case, charger, some ROM chips, and the Printer/Cassette adapter, some paperwork. My nephew gave it to me as a (goofy) wedding present (10 years ago). It apparently had been used by an insurance agent for giving on-site quotes for policies.

I didn't know it was RPN! But it is Y2K compatible!

It's batteries (NiCd's) are old and don't hold a charge long.

Follow-up: Oops! I just checked again, mine doesn't have the Scientific Calc overlay or the ROM chips needed for that function. Is it possible I can get a HEX dump of the those ROM chips?

Edited: 29 July 2010, 1:31 p.m.

Re: Can I (we) see it, now? (N.T.)

*Message #31 Posted by **db (martinez, ca.)** on 30 July 2010, 9:46 p.m.,*
in response to message #30 by Ren

Ren; Joerg & me checked out the HHC he was talking about and it turns out that although it has the manual and overlay; it did not have the RPN ROM itself. We were bummed. I have found that the Motorola chip was still available as of 3 years ago and it is mountable in one of those plastic frames that the insurance ROMs are sitting in. I think there is a very small market (about 6 or 7) for these: you, me, probably Katie, Michael, Viktor (since this allows three short RPN programs), Telly, & maybe Craig. Who knows - maybe one or two more. I have had no luck so far but if you can find

how/where we can get them burned, maybe Eric or somebody can provide the code off their chip and we are all in business. I am waiting for a response on where to get the bare-nekid ROMs. and waiting.....

Re: Can I (we) see it, now?

*Message #32 Posted by **Ren** on 8 Aug 2010, 9:46 p.m.,*
in response to message #31 by db (martinez, ca.)

What is the chip?, I do have a small chip burner for 27xxx? family chips, Hmmm, IIRC the burner needs to plug into an ISA bus slot...

I still might have one of those...

Re: Can I (we) see it, now?

*Message #33 Posted by **db (martinez, ca.)** on 8 Aug 2010, 11:28 p.m.,*
in response to message #32 by Ren

ren; supposedly the eprom is the motorola mc68764. abra electronics had them as late as last january and they can be programmed. the guy who found them had his programmed somehow. i have tried to use abra's website to look it up but their search function can't find it. the search function can't find adapters, boards, resistors, LEDs or anything else either, so i think it is FUBAR, or it just doesn't like linux. i'll try to call soon. -db

Re: Can I (we) see it, now?

*Message #34 Posted by **Paul Berger (Canada)** on 10 Aug 2010, 7:21 a.m.,*
in response to message #33 by db (martinez, ca.)

I have at least one EPROM programmer that can program MC68764, and I may even have some of them as they where the EPROM equivalent of the ROMs used in the original IBM PC. I also recall making adapters to replace them with the more common 2764, but that would probably not be an option in the confined space of a hand held device.

HP11C

*Message #1 Posted by **Dominique Deprez** on 13 July 2010, 3:56 p.m.*

Hello I recently bought a new unit 11c on the ebay. I am a frequent user of my old 11c of 1986 that shows orange markings above the numerals. The recent unit shows yellow markings. It has number USA 2331A04119 What is the difference between these 2 units ?

Re: HP11C

*Message #2 Posted by **Raymond Del Tondo** on 13 July 2010, 6:51 p.m.,*
in response to message #1 by Dominique Deprez

Hello,

you mean the yellow keyboard legends, right?

Your frequently used HP-11C was made 1986 (as you say), and the latter one was mad in 1983.
There's a chance that these units have a totally different inner layout, regarding the pcbs, battery and LCD connections.

Depending on the production year and materials used, colors may vary to a certain degree.
If you compare HP-41CV units of every single production year, you'll notice slightly different keyboard legend colors, too;-)

HTH

Raymond

Mostly OT: What's your experience with LED flashlights?

*Message #1 Posted by **Paul Brogger** on 13 July 2010, 12:42 p.m.*

(The LED's involved aren't red, but they *are* LED's . . .)

Most of the stubby, multi-LED, 3-AAA flashlights I've purchased seem to be undependable, and when turned on often require a sharp knock against something to (at least temporarily) get them lit again. Some of those I've purchased have been clearly El Cheapo, and others not so much. They're not of identical manufacture, but share the same basic design: six or seven white LEDs in a stubby aluminum case, with three AAA batts in a plastic insert, and the on/off button on the end.

I find it strangely amazing that several different models, from several different manufacturers, could all share a similar problem.

I started casting about for a better LED flashlight, and the one I've found that behaves flawlessly (and gives TONS of light) is one that came with a Leatherman tool ("Blast", I think) from Costco. The flashlight ("LGX 200") is a single AA model with a single, large square yellow-looking-when-off LED, and has worked absolutely without problem.

I recently bought another Leatherman ("Freestyle" knife) from Costco, because it also came with an LED flashlight -- this one a single AAA style that is more compact ("Monarch 300"). It seemed to work for a while, and though not quite as bright as the other, it's smaller in the pocket.

However, lo & behold! The newer unit is now acting intermittently, and I have to slap it to get the light to come back on.

I'm more than a little perplexed. Is there something inherent in LED flashlight design that makes them vulnerable to corroded contacts or loose connections of one sort or another? It's amazing that, as many of these as I've tried, 90% share this annoying trait.

Any insight or work-around suggestions will be appreciated!

Re: Mostly OT: What's your experience with LED flashlights?

*Message #2 Posted by **Bill (Smithville, NJ)** on 13 July 2010, 12:58 p.m.,*
in response to message #1 by Paul Brogger

Paul,

I've had several different LED flashlights over the past few years and they are all still working today. Never a problem with them. There's one in each car and they get bounced around a lot, but always work.

I have a nice Energizer 3W LED, two AA batteries. It's all metal with a gasketed battery cap. It came with Energizer Lithium AA batteries. I use it for job site visits and it gets banged around alot - but still works great after two years. Throws out a very strong beam of light.

I think I paid about $15-20 on sale for each of the ones I have.

If you can find the Everyready one, I;d highly recommend it.

Bill

Amazing timing for your question! At this moment, I'm expecting the mail(wo)man to deliver my new LD10. All I read about is how great the quality of the Fenix series is. These videos describe it.

Re: Mostly OT: What's your experience with LED flashlights?

*Message #4 Posted by **Jim Horn** on 13 July 2010, 1:23 p.m.,*
in response to message #1 by Paul Brogger

I've had a pile of the multi-LED lights, a few single LED / single AA cell units and others over the course of over six years.

The first group has no electronics. Only the current limiting of the three AAA cells and the voltage / current curve of the LEDs control the current. When the cells are new, the LEDs are bright but they taper off rapidly and you finally replace the batteries when they're too dim to do the job. They have a number of pressure contacts that have to pass current to work (two per cell, two for the cell holder, two for the switch & endcap, at least one for the front - totalling at least eleven). Those are notorious for intermittents. A cheap switch doesn't help reliability either.

The single LED / single AA cell lights are generally more reliable if made well. With no cell carrier and only one cell, they have six less failure points. But again, cheap ones can often have intermittent case-to-switch and case-to-LED connections. They do include a switching power supply to boost the single cell voltage to the 3 to 4 volts needed for the LED. But the circuitry can vary drastically in quality and efficiency.

Be aware that many flashlights run their LEDs far beyond their design specifications. The manufacturers seem to feel that degrading a LED's 50,000 hour lifetime to 500 or so is worthwhile if they can blast 3 or 5 watts through a 1 watt LED (or similar abuse in general). Apparently they don't expect most users to have the flashlight that long.

My favorites have become an Energizer 1W single AA for US$16 that fits comfortably in my pocket all the time. A Maglight 3W 3AA and a Home Depot Husky 3W 2D sit in my car. They all blow the multiLED 3AAA units away in performance and reliability.

Others may mention Fenix and a raft of others. Those are spectacularly fine, being head and shoulders above the run of the mill units found in most stores. Of course, they're priced to match. The above three I mentioned cost me under US$20 each.

You will find a whole discussion group at <http://candlepowerforums.com/vb/index.php> if you really want to dive into this head first. Hmmm - I've heard of calculator enthusiasts doing so too, somewhere...

Jim Horn, Hood River, Oregon USA (PPC 1402, etc^n)

Re: Mostly OT: What's your experience with LED flashlights?

*Message #5 Posted by **M Tulloch** on 13 July 2010, 2:16 p.m.,*

Jim you said "Be aware that many flashlights run their LEDs far beyond their design specifications. The manufacturers seem to feel that degrading a LED's 50,000 hour lifetime to 500 or so is worthwhile if they can blast 3 or 5 watts through a 1 watt LED (or similar abuse in general). Apparently they don't expect most users to have the flashlight that long."

I wasn't aware LEDs had such a short lifetime and that their lifetime could be shortened by a factor of 100 by having them run at too high a wattage. Do you think this applies as well to LED nightlights? We have 4 watt incandescent nightlights throughout our house that we mostly leave on all the time so it's easier to walk around at night, and just today we were thinking of replacing them with LED nightlights from Superstore, but if they fail in a year or less then it'll be more expensive to replace them than to purchase new bulbs for our existing nightlights (assuming you can still buy such bulbs) :(

Re: Mostly OT: What's your experience with LED flashlights?

*Message #6 Posted by **Jim Horn** on 13 July 2010, 3:31 p.m.,*
in response to message #5 by M Tulloch

For nightlights that won't be an issue. We have a number of Feya 4W replacement night light bulbs that work fine. As such, like most LED replacments for screw-in bulbs, the 3mm or 5mm diameter bipin LEDs are run at low enough power that they should last a long time. The overall efficiency is no better than incandescents as they use series resistors to drop the rectified but not filtered 120 VAC down to the 9-11 volts the three LEDs in series use. That's nearly a 90% efficiency loss right there. But the power is so low it's not a real concern.

Haven't had one fail yet in about 6 device years of use... Of course, higher power screw-in replacements are another kettle of fish that is changing by the hour.

Re: Mostly OT: What's your experience with LED flashlights?

Maybe for cheap night lights, and low power, the efficiency is not so good for the LEDs.

However, I splurged ($20 bucks!) for a 8 W (rated by the manufacturer) bulb to replace the 26 W fluoroescent bulb (100 W equivalent) for the desk lamp at my computer. The light output from the LED is fully adequate for desk work. I just measured the actual power consumption of both with my "Kill A Watt" meter (another handy device to have around the house) and the LED shows 6 watts while the fluoroescent shows 26 W. Unless there is a power factor that the meter doesn't handle well, this LED bulb is quite efficient. It clearly runs cooler than the fluoroescent, although the ballast in the LED base does get too hot to touch after awhile. If it lasts the guaranteed 8 or 10 years (I kept the receipt for this one!), I will be quite happy with it - light wise and power wise.

Time will tell, of course. My experience with the highly-touted fluorescent replacements is that they do not last nearly as long as claimed. Sometimes barely twice as long as an incandescent. Perhaps the life claimed is theoretical, not actual "Made in China" performance.

> I wasn't aware LEDs had such a short lifetime ....

What???? you think 50,000 hours is "short"?

Quality household incandescant lights typically last 1000 to 2000 hrs. Flashlights almost always are used at higher than rated voltage and will probably only last 100 or so hours.

Note that nightlights are usually run at less than rated power because they are required to give a reduced output, so they'll last at least their design life. There are 8760 hours in a year, so even if you never switch your LED nightlight off, they'll last around 6 years (probably longer). Depending on construction, LEDs could use significanty less power than equivalent brightness incandescants. They are probably the most effecient light source we have available today. What you pay for the extra initial cost, you'll probably save on energy.

Re: Mostly OT: What's your experience with LED flashlights?

*Message #10 Posted by **M Tulloch** on 14 July 2010, 10:11 a.m.,*
in response to message #9 by Bart (UK)

Sorry, by "short" I meant comparing cost/hour based on replacement cost and bulb lifetime, and not just bulb lifetime in hours.

4W incandescent nightlight bulbs cost about 45 cents at our local outlet and they typically last about 2 years in our house since we never turn them off. (My experience is that an incandescent bulb's lifetime is shortened considerably if you cycle it on and off frequently.) The cost/hour for incandescent nightlights thus works out to about 2.6E-5 $/hr.

LED nightlights cost about $2.50 each at the same outlet, and if they last 6 years then cost/hour works out to 4.8E-5 which is around double the cost of replacing incandescent nightlight bulbs when they fail, and if 90% of the electrical power used by LED nightlights is wasted as heat (the resistor) then not green either and what's the point using them?

Re: Mostly OT: What's your experience with LED flashlights?

*Message #11 Posted by **Bart (UK)** on 14 July 2010, 11:06 a.m.,*
in response to message #10 by M Tulloch

Oh, sorry. Of course I think cost/life is just down to production issues. Although LEDs have been around a long time, they have not really been produced for "light for the masses". White light LEDs have been particularly expensive. However, I think that as popularity grows and production numbers increase, they will come down in price (more producers will enter the market fuelling competition).

Unfortunately there's always the cheap and nasty side, and particularly with low power nightlights there's no incentive to use anything other than resistors to drop the voltage and limit the current. One can just hope that for higher power lighting, some form of voltage convertor would be used. Maybe in future houses will be wired with low voltage supplies for LED lighting.

Of course I am seeing the advantage of LED in the flash lights I have, my head lamp runs on 3 AAA which seldom need changing, one of my scouting colleagues has an incandescent headlamp requiring 3 AA that need changing on every camp. As for the 3W LED flashlight, the power consumption is the same as my old incandescent 3W torch, but the light is MUCH brighter.

*Message #12 Posted by **Jim Horn** on 14 July 2010, 1:11 p.m.,*
in response to message #10 by M Tulloch

Please don't misunderstand me - the LED nightlights are less efficient than incandescents but they are so much lower in power that it's not an issue. They aren't nearly as bright, either, but are plenty bright enough for our house. Four watt incandescents have such long, thin and fragile filaments that they are notorious for failing if tapped or their power is cycled. We have automatic night lights that turn them off during the day.

If 1 watt incandescents were available they'd give enough light but would fail in no time (more so in countries with more than 120VAC - i.e. most outside the USA & Canada). As such, the roughly .6 watt LED lamps work just fine. Since they're only running at about 6mA, I expect they'll last far beyond 50k hours.

Why do LEDs fail? Two main causes: for white LEDs, the phosphors that fluoresce to make the blue LED die appear white fade with time, almost linearly with intensity. And the die reliability decreases with increasing temperature. When run at low power, that's not an issue either.

So don't worry about the el-cheapo night light replacements. I suspect they should outlast me. And hey, I'm not all *that* old...

My son got a 5-pack of Husky LED flashlights for $10. They're pretty much the standard cheapo lights. But there's a "twist." Both ends are threaded, and screw/twist off. The thing is, the light end, has soldered

wiring inside. You can't unscrew the end, without seriously twisting the wires, and basically ruining the flashlight. And if you do break and resolder the wires, you have to pretwist them (more damage), before returning the end to the barrel. It's a really odd arrangement.

Hi.

I've ever designed and wrote an article on "Simple single cell white LED driver" which is published in the part of the appendix of "Technique to utilize the high luminance power LED " (written in Japanese)

It can operates for about 200 hours with one AA battery in a wide voltage and temperature range.

Regards,
Lyuka

in response to message #1 by Paul Brogger

My experience is with the cheapest of the cheapest El Cheapo brand. 3 AAA battery cylindrical version in particular. Of course, I get what I pay for so I am not complaining.

I had a problem with the ground connection from the LED board to the metal body of the device, and had to bang the things to get them to turn on, even with fresh batteries, etc. This may be a common design feature: the ones I had used a solder pad on the back of the PCB (with a little bump of solder on it) to make contact with the rim of the cylinder. There isn't any spring or other device to keep the pressure on this connection, so it is susceptible to coming open. I dismantled my problem devices (taking the LED board out), cleaned up the solder bumps, and slammed it all back together again. They have worked OK since.

Again, I got what I paid for, and the bonus "pleasure" of using cheaply designed and constructed Chinese devices (with everything that implies) comes free.

I'm a Maglite fan as well. My favorites are the 2xAA model and the 3xD-cell model, and their LED models have worked fine for me w/o any problems several years now, even when banged around quite a bit.

There are certainly more "advanced" makes of flashlight out there, but the Maglite, in my opinion, is tried and true, highly effective, and utterly rugged. It's the flashlight equivalent of the Colt M1911.

Re: Mostly OT: What's your experience with LED flashlights? - Mag-Lite RULES !

*Message #18 Posted by **Dave Shaffer (Arizona)** on 14 July 2010, 12:24 a.m.,*
in response to message #16 by John Stark

Mag-Lite also guarantees their lights for life/forever.

I have no experience with their LED flashlights, but we had an incandescent 2 AA mini-maglite fail, after MANY years, and sent it back to the factory (without any "original receipts" which so many places want - who knows where they are after 15 years!?). Back it came (or a new one - hard to tell which) in a few weeks, no charge (except for our postage to send it in).

As to el-cheapo multi-light LEDs, my favorite of the moment are the 9 light / 3 AAA versions given away by Harbor Freight - look for their coupons in almost any magazine (The Sunday inserts, AARP, ...). I got three, and they are all still working after several months of mild use.

I have found that many of the TV remotes we use are intermittent much of the time. A good rap fixes them. I think the currents are so low that even a little bit of oxidation anywhere in the circuit breaks the connection(s). As noted somewhere above, keeping things jiggling around (in a car or truck) seems to help.

Love MagLites. Made in the good ol' USA (my apologies to the "rest of the world").

I did have a failure of a MagLite 3-D LED. Someone dropped it on a hard surface; a few weeks later it failed. (Glows very faintly).

I saw the 3-AAA ones at Home Depot; they want $40 for one. Has anyone found a cheaper price?

in response to message #20 by Karl Schneider

Karl,

The leaked, stuck battery is actually what happened to our Maglite. They still fixed it for free - they apparently have deals with the major battery manufacturers who typically warrant that if battery leakage damages your equipment, they will replace it.

Try sending it to Maglite (in Ontario, Calif, I think) and you may get a new one back!

> Any insight or work-around suggestions will be appreciated!

The only work-around I know is to throw them back into the bay and get decent ones ;-) I have experienced the same problems that you describe with various el-cheapo multi-led flashlights (one of them had 26! LEDs

from which not more than 10 are still working - after a couple of hours of use.)

Now I have a couple of real good and rather expensive ones that do what they are supposed to do. Always. One is a 4D-cell LED-Maglite (single LED) that I use at home, and the others are various small ones from the German manufacturer "Zweibrueder Optoelectronics" (http://www.zweibrueder.com/ENG/startseite_1024.php) that I take with me at work (flying). They are simply the best ones - rather expensive, but money well spent. Sooner or later I will buy their top product X21 (http://www.zweibrueder.com/ENG/produkte/html_highperformance/html_Xserie/x21.php?id=x21) ... a portable car headlight. In the price range of a good HP-71B.

Regards, Max

I keep a wind-up LED flashlight in the car for emergencies. Never need to worry about batteries, though my daughter has a habit of taking it :(.

And here's an interesting thought. When they really perfect LED lights, their lifetime will be comparable to other building materials. At that point, we'll start to see permanent lighting built into homes and offices. By that, I mean that the design and placement of the lights won't worry about replacing the bulbs, anymore than the design of your interior walls worries about the replacement of your wallboard.

Hmm. I guess this is an OT response to an OT post.... Bad Dave! Bad! No RPL for you tonight! :)

Hi Paul; I like LED headlamps. When in the dark i find i usually want two hands.... I got my first about eleven years ago at REI. it's a Black Diamond (formerly Chouinard) with two low intensity LEDs and one big long distance one. It has worked flawlessly in really shitty conditions, and as i just discovered; it's made in China! I've also bought several of the multi-fixture type at the flea market for five bucks to keep in the truck, at work, or give away. The results vary. If there is a problem it's in the switch. Last winter i found a few marketed by Iron Bridge Tools at home Depot for $3.70 a piece in the bargain bin and gave away all but one. They sport a single bright LED and so far all are working.....or lost. Their idea seems sound; design a solid light with only a few good parts and it will be cheap to build and last.

The best thing for me about the multi LED lights is that they are not focused at the same spot and you get this even haze of light that is generally in front of you without one bright focused spot. I've used them for mountaineering where you start at midnight so you come down before the avalanches start. Even (or especially) cheap LEDs provide low intensity light where you are looking without ruining you vision for routefinding out past where the light shines.

Plus; their low power use/frugal nature is going to save more energy than any invention since the bicycle.

In the no-frills one-AAA LED flashlight category, I can recommend the Fenix E01. Available online for $15 or so, it lasts for about 10 hours on a AAA battery (I use Eneloop rechargeables), weighs 14 grams + battery, outputs a bright-but-not-too-bright 10 lumens, and is very dependable. In years of use, it has never failed to turn on when I wanted it to.

Thanks to all for your input -- I appreciate the time.

For now, I found a Fenix LD01, which seems like a step up. Three brightness levels is nice, no push button is a minor drag (two hands required to turn on -- though that's one less thing to break). And, the price was more right than some of the other fabulous-sounding lights out there.

Thanks again!

If it's ok for it not to be a traditional flashlight shape, you could use a bicycle LED headlight. They're made to take incredible pounding for hours (possibly thousands of hours), mounted to the handlebars. Our road bikes with higher speed and hard, skinny tires definitely give them more pounding than a mountain bike would. I and my family of cyclists have used a lot of Cateye ones, first little halogen ones and later LED ones, stepping up as brighter and brighter models came out. We had trouble with earlier models where the various pieces of metal only pressed against each other and I had to solder them when the connections got intermittent, but it was easy to do and then they gave no further trouble. Now I have an EL-530 (see http://www.cateye.com/en/product_detail/345) which is a very nice, bright light considering it does not have the battery pack separate like the super-expensive HID and LED ones that practically give you stadium lighting. On those, the battery pack usually straps to the frame or takes up a water-bottle cage, which is not acceptable to us. The EL-530 however is about the size of my fist or a little smaller, and gets 90 hours from four alkaline AA batteries (although batteries have gotten so ridiculously inexpensive that I don't try to string them out that long).

At work (paramedic) I've been using a Surefire 6P LED Defender for more than a few years. Link: http://www.surefire.com/6PDL Zero complaints. It's been dropped, smashed, handled by surly NYC cops, covered in bodily fluids and sustained multiple cleanings with hospital grade disinfectants. Zero problems. The bezel is also crenellated in case you need to use it as a weapon. 120 Lumens of beautiful output.

Off duty, I carry the Surefire ED2 LED Defender. Link: http://www.surefire.com/E2DL Slimmer than the 6P. Has _200_ lumens or 5 lumens output with a simple press of the tail cap switch. The 200 lumens can easily blind somebody for a few seconds. Bezel is also crenellated. (I live in NYC)

Worth. Every. Penny.

P.S. Every EMT or medic I've known has always had issues with Maglites in the field, whether they were LED or incandescent.

I've been buying those cheap 3 LED flashlights that have a small NiMH battery inside and a small DC motor/generator for recharging. They certainly aren't rugged, but I don't worry about having dead batteries when I need a flashlight.

I also have had a number of keychain LED flashlights, but many of them would turn on and run their Lithium batteries down when I'd put the keychain in my pocket.

eh, I'm pretty sure that'd just be sorcery/magic. You wouldn't get dissected, just burned at the stake or dunked :-P

Great story, BTW. I'd imagine Newton would have been quite amazed by an HP 10c (Although I suspect he too would have suspected magic)

Re: Arrested and charged with "calculating."

HP 67 card reader error

*Message #1 Posted by **Mark Puscas** on 11 July 2010, 9:06 p.m.*

Looking for any troubleshooting suggestions...

Recently got an HP-67, disassembled it, cleaned it, repaired gummy wheel (thanks to reading the forums on this site!); everything seems to work fine mechanically, but magnetic cards all give me an "error" reading. I've tried pre-programmed cards, blank cards, all give the same "error" message. I've tried writing to cards, and that seems to work (although no way to verify). I re-opened calculator, verified all the little white balls in place, white roller pin in place, gold weird-shaped contact switch is well-positioned, cleaned the read/write head (several times), all to no avail.

Any suggestions? Mark

by the way, for the gummy wheel repair I got a 2 foot length of Du-Bro #222 Silicone fuel line tubing, purchased at a local shop that caters to remote controlled cars/planes. Fit and worked perfectly!

Dyslexic agnostic insomniac calculators like ours.

HHC2010 Web Page Is "Open for Business"

*Message #1 Posted by **Jake Schwartz** on 10 July 2010, 10:54 p.m.*

Hi,

The online registration for HHC2010 has finally gone "live". Please join us on September 25-26th at HP's Facility in Fort Collins, Colorado for this year's annual HP Handhelds Conference. Since this is the current location of HP calc-team "headquarters" and since they are offering us a great no-cost meeting spot for another year, Fort Collins is hard to pass up. As always, attendees will be gaining insight into HP's activities straight from "the horse's mouth", as well as connecting with fellow HP enthusiasts. You are not going to want to miss this one.

Check out the HHC2010 Web Page at http://holyjoe.net/hhc2010/ and please join us in the Fall. We've been meeting since 1979 and it is always fun.

Jake Schwartz

in response to message #1 by Jake Schwartz

Hi Jake,

I can't find details about the hotel. Last year, the special rate was available with a "shoulder" thing of 3 days before and 3 days after the conf. Is it the same this year ?

Patrice

Re: HHC2010 Web Page Is "Open for Business"

*Message #5 Posted by **Jake Schwartz** on 14 July 2010, 10:35 p.m.,*
in response to message #4 by Patrice

On the conference web site, it currently says the following:

"To reserve a room at the Cambria Suites, call the hotel direct at 970-267-9000. Be sure to mention HHC 2010 for the special $84 rate. This special rate offer is not available online or by toll-free telephone; it is only available by direct telephone call to 970-267-9000. The offer is good until they run out of rooms or September 10th, whichever comes first.

Cambria Suites 2921 Harmony Road Fort Collins, CO 80528 http://www.cambriasuites.com/hotel-fort_collins-colorado-CO214 Phone: (970) 267-9000 "

I am not sure what portion of this is unclear.

Jake

Re: HHC2010 Web Page Is "Open for Business"

*Message #6 Posted by **Patrice** on 15 July 2010, 1:48 p.m.,*
in response to message #5 by Jake Schwartz

Hi Jake,

> Quote:
>
> I am not sure what portion of this is unclear.

What the site says is very clear to me .
What is unclear, is what it don't says.
My first sentence was telling that I have a problem with hotel details. The next sentence was explaining where is my problem.

So, to be precise, /hhc2009/Cambria-Suites-Hotel.pdf , on page 2 is saying :

> Quote:
>
> Shoulder dates +/- 3 days

My question is "Is it the same this year ?"

Did I make myself clear ?

Patrice

a new challenge!

*Message #1 Posted by **Don Shepherd** on 10 July 2010, 10:30 p.m.*

Write a program for your favorite programmable calculator to determine this. The only prime number p with digits abcde such that p = (a! + b! + c! + d! + e!) + (a + b + c + d + e).

For example, if 10343 is prime, then 10343 = (1! + 0! + 3! + 4! + 3!) + (1 + 0 + 3 + 4 + 3). Of course, that's not the one (although 10343 is prime).

Don't give away the winning answer for a few days, but post your masterpiece program here for the world to see, or at least us nerds.

Re: a new challenge!

*Message #2 Posted by **Allen** on 11 July 2010, 10:15 a.m.,*
in response to message #1 by Don Shepherd

Don, Thanks for an interesting challenge! Shall we assume from the wording of the question that the answer is 5 digits long? (e.g. maximum search space is primes from 10,000 to 99,999) Cheers, Al

Re: a new challenge!

*Message #3 Posted by **Don Shepherd** on 11 July 2010, 11:29 a.m.,*
in response to message #2 by Allen

yes

Re: a new challenge!

*Message #4 Posted by **Glenn Shields** on 11 July 2010, 12:16 p.m.,*
in response to message #1 by Don Shepherd

Great challenge for a Sunday morning. This took 32 minutes on my HP50g - I started with 10007, the first 5 digit prime: << 10007 -> pri << DO ; pri NEXTPRIME DUP 'pri' STO ->STR 0 SWAP 1 5 FOR i HEAD LASTARG TAIL SWAP OBJ-> DUP ! + ROT + SWAP NEXT DROP DUP UNTIL pri == END >> >> The ; is "safedrop" for when the stack is empty. I wish it could be faster -- will watch and wait!! Thanks, Glenn (in West LA).

Re: a new challenge!

*Message #5 Posted by **Don Shepherd** on 11 July 2010, 12:49 p.m.,*
in response to message #4 by Glenn Shields

Thanks Glenn. I wish I understood RPL, but I'm too much of an RPN man to take the time to learn it. I'm working on a solution on the 30b, which I believe has the same processor as your 50g. Will post later today.

Don

Re: a new challenge!

*Message #6 Posted by **Glenn Shields** on 11 July 2010, 1:43 p.m.,*
in response to message #4 by Glenn Shields

Yes, Don, it's hard to be comfortable in both - when I got the 35s, I was doing lots of RPN, last one was a Mastermind program. Now I can't even remember it, but have written a new one for the 50g, which can do more for such a game (like display the history of your guesses and results). But for anyone else into RPL, here is another version of the one just posted, and faster (18 minutes) because I dumped the string manipulation for a loop using FP/IP decomposition of the number (of course we know 10007 is not it):

<< 10007 -> pri << DO ; pri NEXTPRIME DUP 'pri' STO 0 SWAP 1 5 FOR i 10 / FP LASTARG IP SWAP 10 * DUP ! + ROT + SWAP NEXT DROP DUP UNTIL pri == END >> >>

Cheers, Glenn

Re: a new challenge!

*Message #7 Posted by **Glenn Shields** on 11 July 2010, 2:56 p.m.,*
in response to message #6 by Glenn Shields

Sorry, when I ran this program it had real numbers, everything had a decimal point. Apparently this beast handles real numbers faster than integers (I'm sure this was mentioned somewhere in the past), so here is my final entry (Beta-tested):

<< 10000. -> pri << DO ; pri NEXTPRIME DUP 'pri' STO 0. SWAP 1 5 FOR i 10. / FP LASTARG IP SWAP 10. * DUP ! + ROT + SWAP NEXT DROP DUP UNTIL pri == END >> R->I >> (more like 19 minutes) :-)

Re: a new challenge!

Re: a new challenge!

*Message #9 Posted by **Allen** on 12 July 2010, 1:23 a.m.,*
in response to message #8 by Mark Storkamp

Mark, remind me which ROM contains "NEXTPRM" or is it built into the 41c?

Re: a new challenge!

*Message #10 Posted by **Don Shepherd** on 12 July 2010, 9:02 a.m.,*
in response to message #8 by Mark Storkamp

Thanks for your solution, Mark. Is the NEXTPRM at line 17 a standard feature of the 41 instruction set, or is it in a separate library? I don't really know much about the 41. I know most CAS calculators have an isprime function, and I wonder if the standard vanilla 41 has that too.

Re: a new challenge!

*Message #11 Posted by **Mark Storkamp** on 12 July 2010, 9:22 a.m.,*
in response to message #10 by Don Shepherd

As far as I know it's only available in the i41CX-Math module on the iPod/iPhone. Even if it were available in the regular 41, I don't have the patience (or enough batteries) to wait for it to solve it.

Since the answer must contain 7s or 8s, but no 9s, I thought there might be a way to dump out of the inner loop faster if I don't meet that criteria, but it seems the test for that is just as expensive.

If I could get to the BCD values, then adding 11111 and masking just the MSB of each nibble would tell me if I had a 7 or 8, but I haven't done MCode programming on the 41 yet.

Re: a new challenge!

*Message #12 Posted by **Mark Storkamp** on 12 July 2010, 2:41 p.m.,*
in response to message #8 by Mark Storkamp

Now I'm down to 6m 8.47s on the i41CX+. Also took out NEXTPRM so it should run on any 41CX.

Re: a new challenge!

*Message #13 Posted by **Egan Ford** on 12 July 2010, 5:02 p.m.,*
in response to message #12 by Mark Storkamp

Since you are using the ALPHA register you can probably use POSA and check for the existence of the number 9 (9! is too large). That will cut your number of tests from 1471 to 953. You also need at least one 8 or two 7's or 7 and 8. Unsure how quickly you can test for that; useless test *after* you know the answer.

If possible you could also count down avoiding numbers that end in 5. E.g. if number mod 5 == 0 then -2 from number.

Edited: 12 July 2010, 5:54 p.m.

Re: a new challenge!

*Message #14 Posted by **Don Shepherd** on 11 July 2010, 8:54 p.m.,*
in response to message #1 by Don Shepherd

Well, I planned on doing a 30b version but that turned out to be more trouble than I thought, so I did a TI-NSpire CAS Touchpad solution. It found the solution in 1 minute and 23 seconds! Seriously!

```
Define prime()=
Prgm
:Local i,a,b,j
:For i,10007,99999,2
:  If isPrime(i) Then
:    a:=i:b:=0
:    For j,1,5
:      b:=b+mod(a,10)+(mod(a,10))!
:      a:=iPart(((a)/(10)))
:    EndFor
:    If i=b Then
:      Disp i
:      Stop
:    EndIf
:  EndIf
:EndFor
:EndPrgm
```

Re: a new challenge!

*Message #15 Posted by **hpnut** on 11 July 2010, 9:08 p.m.,*
in response to message #14 by Don Shepherd

Programming the HP 30b in RPN is difficult. the fact that current hp calculators also have algebraic and "chain" modes only makes for a muddled instruction manual.

Re: a new challenge!

*Message #16 Posted by **Don Shepherd** on 11 July 2010, 10:19 p.m.,*
in response to message #15 by hpnut

I admit that programming the 30b takes some getting used to. Unlike the 12c and other "traditional" RPN calcs, it's not "pure" RPN; it's kind of a hybrid RPL/RPN environment. And the conditional tests don't obey the traditional "do if true" rule, and that REALLY takes some getting used to.

But if you can learn its habits you will appreciate its speed and the fact you can assign any command to any key (well, almost any key).

Re: a new challenge!

*Message #17 Posted by **Allen** on 12 July 2010, 1:03 a.m.,*
in response to message #1 by Don Shepherd

Here's a basic working versionfor 42s. Starts with 88,777 value and decrements by 2, printing all values that match the "abcde" requirement above. (as it turns out, there appears to be only 1 so it is not necessary to check for primacy)

```
(Assumes display is already set to ALL)
00 { 86-Byte Prgm }
01>LBL 01               'Begin program
02 SIZE 60              ' Set sz to 60 for indirect regs "0" to "8"
03 CLRG                 ' Clear the numbered registers
04 9                    ' Initial value for calculating n!
05 STO 09
06 48                   ' set up the indirect registers 48 above the
07 +                    ' number to correct for ATOX numbering scheme
08 STO 10               ' Setup indirect addresses for the numbers
09>LBL 06     <-        ' Loop for calculating n! for 1..9
10 RCL 09         |
11 N!             |
```

```
12 48
13 -                    ' subtract 48 for ATOX (will get added back)
14 STO IND 10           ' initialize values
15 DSE 10               ' decrement indirect register counter
16 DSE 09               ' decrement value counter
17 GTO 06       --      ' loop for initial values
18 -47
19 STO 48               ' Only add 1 for 0! (1-48)
20 -44
21 STO 44               ' trap the "," Character from "xx,xxx"
22>LBL 05
23 88777                ' using greedy method 99,999-max(n!) so we
24 STO 09               ' should start at 88777 and decrement by 2
25>LBL 02         <--   ' Main decrementing loop

in response to message #18 by Katie Wasserman

Thanks Katie and Allen for those very interesting solutions.

Well, I took the primality test out of the NSpire version, and the speed difference was remarkable. IT TOOK LONGER! Much longer, so long that I stopped it after 5 minutes. I used two methods to remove the prime test: comment out the two lines (If...Endif) and physically delete the two lines. It didn't matter, it was still running after 5 minutes.

I can't explain it, but unless I'm stupid (which is possible) there seems to be a bug on the NSpire. I'll post something to their forum and see what response I get.

Re: a new challenge!

*Message #20 Posted by **Don Shepherd** on 12 July 2010, 3:33 a.m.,*
in response to message #19 by Don Shepherd

I was stupid. If you remove the isprime() check code, it's going to execute all the code in the For loop for every number in the For loop, not just primes. That causes a longer execution time, obviously.

Duh.

unless isPrime is very slow. so, not dumb and worth a try!

Re: a new challenge!

*Message #22 Posted by **Egan Ford** on 12 July 2010, 7:35 p.m.,*
in response to message #20 by Don Shepherd

Without the knowledge that the only solution is prime, isPrime at some point is required.

Re: a new challenge!

*Message #23 Posted by **Don Shepherd** on 12 July 2010, 8:34 p.m.,*
in response to message #22 by Egan Ford

Thanks Hugh and Egan. I think isPrime() on the NSpire is very fast, which would explain why eliminating it resulted in a much longer execution time: the time saving by eliminating isPrime() is more than offset by having every number go through the following code.

I've tried to find the algorithm that isprime uses on the NSpire, and TI says it uses the trial factor increments for multiples of 2, 3, and 5 up to 1200, and then uses Montecarlo method for higher numbers, but the Montecarlo method sometimes will say that a prime is not prime, or something like that, I probably don't have it exactly right.

I'm in a lot of pain today; I had knee surgery to remove a huge infection area and I can barely walk. Gotta go take a pain pill.

Don

Here is my solution for the 50g. It takes 20 minutes 51 seconds to find the answer. In the listing "sigmaLIST" is the command to add the elements of a list (capital sigma, followed by "LIST").

I took a slightly different approach and used list processing. After finding the next prime, I break it into a list of the digits, then take the factorial of the list, etc. I haven't compared this to other solutions to see which is faster.

```
«
9999 -> PRI «
  DO
    PRI NEXTPRIME DUP 'PRI' STO
    PRI 1. DISP
    @ 12345
    I->R
    1. 5. FOR i
      DUP 10. MOD SWAP
      10. / IP
    NEXT
    DROP

    @ 1. 2. 3. 4. 5.
    5. ->LIST @ Now you have the digits as a list
    DUP
    ! sigmaLIST
    SWAP sigmaLIST
  UNTIL
    + PRI ==
  END
  PRI
  »
»
```

*Message #25 Posted by **Don Shepherd** on 12 July 2010, 9:06 a.m.,*
in response to message #24 by David Hayden

Nice solution, David. So the 50g can break up a number into its individual digits pretty easily, apparently. That is always harder to do in RPN or BASIC.

Don,

Breaking numbers into their component digits is actually pretty easy. In pseudo code:

```
while number <> 0 begin
    digit = number MOD 10
    ( store the digit somewhere)
```

```
    number = Integer_Part(number / 10)
end
```

Dave

Re: a new challenge!

*Message #27 Posted by **Don Shepherd** on 14 July 2010, 8:29 a.m.,*
in response to message #26 by David Hayden

Yeah, that's pretty straightforward. The problem is with machines that don't have the mod or rmdr function, such as the 12c or 30b. It takes three steps to get the digit on those machines:

```
/ 10
fp
x 10
```

I always save the result of step 1 above so I don't have to divide by 10 again later in the loop to adjust the number, just do an ip at that point.

Actually, breaking a number up into its individual digits is easy in BASIC if you use the string commands; for example, on the CC-40 and TI-74

10 INPUT N

20 S = 0

30 A$ = STR$(N)

40 FOR I = 1 TO 5

50 S = S + VAL(SEG$(A$,I,1))

60 NEXT I

70 DISPLAY S

80 PAUSE

will display the sum of the digits of a five digit number. A similar program on the Sharp PC-1261 requires only that SEG$ be changed to MID$.

If you store the factorials of the digits in an array F then you can get the sum you are looking for in your challenge by adding the term F(VAL(SEG$(A$,I,1))) to line 50.

And, if you want to automatically accept different numbers of digits you can change the upper limit of the loop to LEN(A$).

I could go on and on, but you get the idea.

Palmer

Agreed, as you have showed. But strings don't exist in most programmable calculators, at least the ones I play with today. If I wanted to use strings I'd get out my 71b, but I hate to think how long that program would run before finding the solution.

And, no, I don't believe in emulators.

*Message #37 Posted by **Alex G** on 25 July 2010, 5:28 p.m.,*
in response to message #24 by David Hayden

Hi - I am a newbie to RPL and the HP50g, though I have a smattering of functional programming understanding, and I really like what I've seen so far. Thanks to David and others, who've been useful signposts on the early stages of the road.

Here's my approach. I split it up into 3 programs, I'm a great believer in readability and re-use.

First the main proggy, FINDSPPR, to find that 'special' prime:
« DO NEXTPRIME
UNTIL DUP SPECPR
END
»
The above calls the function SPECPR, which returns 1 if the prime is 'special', 0 otherwise.
« DUP INT2LIST
« DUP ! +
» MAP sigmaLIST ==
»
(Lovely to have MAP available, BTW, FILTER is easy to write, too)

Finally INT2LIST, which turns the integer to a string of digits. Had a bit of trouble here, but in the end I used David's approach.
« DUP SIZE -> N
« 1. N
FOR J DUP 10. MOD SWAP 10. / IP
NEXT DROP N ->LIST REVLIST
»
»
27 minutes for the above! Too much really, for an ARM machine, but then , I suppose, I should remember it's an ARM emulating a Saturn. It would be nice to have the INT2LIST function built-in, or at least, maybe at SysRPL level. I found out a lot about the calc while writing it, and in a way, it was the biggest time-hog for this program.

My initial approach was recursive, using lists, and took about four times as long as "David's", above. I realised iteration would be quicker. I also used STO+ with lists, but this was still too slow. Then I realised that my indefinite WHILE loop was still taking too long. It was worth getting the SIZE and using a FOR (75% speedup). Finally, my intial approach was to use IDIV2 rather than MOD and IP, falsely thinking it would be faster. Wrong.
« DUP SIZE -> N
« 1. N
FOR J 10. IDIV2 SWAP
NEXT DROP N ->LIST REVLIST
»
»
Takes almost twice as long as the version finally used.

Now, I do realise that there are a whole lot of clever optimizations and/or assumptions available to sped things up, but I was really looking for a simple answer, without such ingenuities.

Much as I am liking RPL I think the speed issue is a huge problem, I wrote a similar program to the one above on my PDA using Scheme and SLIB and it ran in seconds! Hmm, I see there is an RPL/2 available out there... (lamp emoticon here)

in response to message #39 by Katie Wasserman

Okay, a brute force unoptimized program for six digits on the HP 50g. The program doesn't stop when it finds a solution, but keeps looking for more, leaving each one on the stack.

```
<<
 1. 9. FOR a
  0. 9. FOR b
   0. 9. FOR c
    0. 9. FOR d
     0. 9. FOR e
      a 10. * b + 10. * c + 10. * d + 10. * e + 10. *
      a DUP ! + b DUP ! + + c DUP ! + + d DUP ! + + e DUP ! + +
      0. 9. FOR f
       DUP2 f ! +
       IF == THEN
        OVER f + UNROT
       END
      NEXT
      DROP2
     NEXT
    NEXT
   NEXT
  NEXT
 NEXT
>>
```

I haven't done any timing test to see whether it's quicker to break a number apart or to put it together as I'm doing here. Another possibility might be to use an indexed table instead of a factorial computation.

Some combinatorics might be a possibility. We know there are at most two 9s in the number. If there are no 9s then there must be at least three 8s.

I have put in one minor optimization, in that I'm checking to see whether the number abcde0 == (a! + b! + c! + d! + e! + f!) + (a + b + c + d + e) [simply subtract f from both sides of Katie's expression].

Estimated runtime is somewhere between three hours and overnight.

> + or - not + and -. You have 1024 sums to search/number

Egan, I must be dense because I still don't understand.

Suppose you had 2 numbers (1 and 2 let's say) instead of 10.

```
+1 +2 = 3
+1 -2 = -1
-1 +2 = +1
-1 -2 = -3
```

It still adds up to zero. What am I not seeing here?

*Message #47 Posted by **David Hayden** on 18 July 2010, 10:09 a.m.,*
in response to message #46 by Don Shepherd

Don,

Let me try to rephrase Egan's challenge.

Given the digits of p (a, b, c, d, and e), combine a, b, c, d, e, a!, b!, c! d! and e! using only addition and subtraction to create an expression for p.

The original challenge was to use ONLY addition. Egan is saying "can you find other numbers using addition AND subtraction?"

Re: a new challenge (plus one more)!

Re: a new challenge!

*Message #51 Posted by **Han** on 13 July 2010, 10:44 p.m.,*
in response to message #1 by Don Shepherd

You should be able to reduce the runtime by pre-computing a table of factorials for each digit. Also, you can also rule out 9 as a digit as 9! is already too big (more than 5 digits), let alone being added to anything positive.

On machines such as the HP50G where exact numbers are handled differently from approximate numbers, it is faster to use the approximate form if you know the result will not overflow. I believe this was already mentioned. In general, though, the commands that take more than one argument (e.g. "+") will always convert to approximate numbers provided at least one of the arguments is as such. The overhead that notice in the runtime is due to this conversion.

Glenn,

You are right in that there is a typo. My program has:

DO p DO NEXTPRIME UNTIL DUP ->STR "9" POS NOT END 'p' STO

(There should be a p between the two DOs, and not after.)

Re: a new challenge!

*Message #55 Posted by **Glenn Shields** on 22 July 2010, 8:50 p.m.,*
in response to message #54 by Han

Thanks for that correction, Han. I tried your program again, and it does run in the time you say, about 30 seconds faster than my re-write. Could this be because i call p again, while you leave it in the stack with DUP ? It must be a real but very small difference, to add up to only 30 seconds in many (thousands?) iterations. Can't wait for the next one.

Re: a new challenge!

*Message #56 Posted by **Kiyoshi Akima** on 16 July 2010, 5:08 p.m.,*
in response to message #51 by Han

Sometimes the amount of that overhead can be staggering.

I first unrolled the innermost loop (the factorial lookups) and got the program to run in just under 12 minutes. Then I converted to SysRPL, which forces the programmer to worry about the data types. That almost doubled the speed, to 6.5 minutes.

```
::
 AtUserStack        ( no stack arguments required )
 40320 5040 720 120 24 6 2 ONEONE
 9973 FPTR2 ^#>Z    ( largest four-digit prime )
 BEGIN
  BEGIN             ( reject primes containing nines )
   FPTR2 ^Prime+ DUP FPTR2 ^Z>S tok9 ONE POS$ #0=
  UNTIL
  DUP FPTR2 ^Z>S DISPROW1
  DUP FPTR2 ^Z>R COERCE DUP
  TEN #/ SWAP DUP #5+ PICK #+ SWAP
  TEN #/ SWAP DUP #6+ PICK #+ SWAP
  TEN #/ SWAP DUP #7+ PICK #+ SWAP
  TEN #/ SWAP DUP #8+ PICK #+ SWAP
              DUP #8+ PICK #+
  #+ #+ #+ #+
  #=
 UNTIL
 10UNROLL 9 NDROP
;
```

PS: Is it too soon to mention that a tremendous speed gain can be achieved by starting from the other end?

No, this thread started several days ago and most folks have had time to digest it, I think. Yes, starting at 99999 and going down should reduce the times (since I know that the magic number is obviously >50000).

What surprizes me with the run times I have seen so far is that the TI-NSpire, running BASIC, seems to be somewhat faster than the 50g running RPL. I thought the 50g could do almost anything in less than a nano-second. I'm exaggerating, of course. I'm thinking that the NSpire isprime() function must be really optimized or something.

Don

Because the solution also can't stand three eights it would be possible to further reduce the time by starting somewhere in the neighborhood of 88800 and going down. To avoid that sort of silliness it would be better to require that the solution scan the entire range.

Palmer

But if someone can make a mathematical case for scanning a smaller range, as some have done in this thread, I think, then more power to them, use the smaller range and tell us why you can do it. For example, several folks mentioned that the number can't have a 9 in it because 9! is larger than a 5 digit number. The number 8 has limitations too. I'd rather see the thought behind these things than just scanning all 5-digit numbers. My NSpire method just did that too, because I was lazy and dumb! But I value and admire smarts.

Re: a new challenge!

*Message #60 Posted by **Allen** on 17 July 2010, 9:31 a.m.,*
in response to message #58 by Palmer O. Hanson, Jr.

> Quote:
>
> To avoid that sort of silliness it would be better to require that the solution scan the

entire range.

What's the point? I can prove fully that the number must:

```
1) The number is odd
2) The number is less than 88777 ( e.g. greedy algorithm by subtracting the
max n! from 99,999) and larger than 10087
3) The sum of digits (SOD) is between 14 and 37 (corollary to 2)
4) There exists at least one digit above 6, but no nines anywhere in the
number
5) The SOD is not a multiple of 3
6) The last digit is a 1,3, or 7
```

By implementing a selection of these rules, you can reduce the naive search by more than 60%. While that might not be important on the range of 99,000, imagine if the problem were expanded to six-digit numbers as Katie suggested? Suddenly a hard problem becomes much easier with a more purposeful algorithm.

For any problem like this, searching the entire range is like paying full price at one store despite the half-off sale next door.

in response to message #60 by Allen

7) There must be an odd number of the digits {0,3,5,7}, which implies that there is an even number (possibly zero) of the digits {1,2,4,6,8}. From #4 above there are no nines.

in response to message #61 by Kiyoshi Akima

Thanks, Katie, for this new challenge, and thanks Han for the method of pre-computing the factorials. I modified Han's program to include 9! and to increment by 1. It was hard to guess a range of numbers, but those around 770000 to 880000 seemed likely. But incrementing by ones was taking forever. I have two hp50g's, and set one to go up (using INCR) and one to go down from 775000. Six hours later, no answer, and batteries were getting low.

So, deciding to skip by 10, and taking a wild guess that the number ends in 7, the answer popped up in a short while (but far from the initial guess, btw). Also, the answer, I must confess, does have a 9 in it, and the sod is a multiple of 3.

Here's the program all in a row: << 362880. 40320. 5040. 720. 120. 24. 6. 2. 1. 1. 100007. -> n << DO 0. n 10 + DUP 'n' STO 1. 6. FOR i DUP 10. MOD DUP 4. + PICK + ROT + SWAP 10. / IP NEXT DROP UNTIL n == END 10. DROPN n >> >>

Again, thanks to Katie for this calculator fun! Incidentally, neither this number nor the original challenge number is listed in the "numeropedia" on-line which covers a huge range of numbers (yes I tried to cheat!) Cheers, Glenn

in response to message #62 by Glenn Shields

I cheated too, I found the number using a tiny AWK program on my PC in a couple of seconds. It's a lot of number crunching for a calculator.

Don't forget -- the HP50G can run off of USB power. Just plug it into your laptop or PC when doing heavy calculations for "free" power =)

Hello Don,

> Quote:
>
> since I know that the magic number is obviously >50000

Since you've given no other hints, we curious people here had to write our own programs or run someone else's program to know what it is. I won't spoil it all by simply listing it here. Instead, I present the following sequence that should work on any 10-digit HP RPN calculator that has Gamma function, like the HP-11C and 15C. I've made some arrangements to make your *magic* number look like one: 14 (2*7) palindromic lines, some 7s and exactly 7 calls to x! in the fourth line.

```
          7  1  1/x  1  7

                +

           SQRTx   SQRTx

       x!  x!  x!  x!  x!  x!  x!

                7

                1

               1/x

             3 SQRTx 3

                x!
```

```
                    /

                    +

                    2

                    *

                    -
```

Of course a simple INT might replace 10 lines (and make it work on 12-digit calculators too), but I like this pattern.

Gerson.

> ... a tremendous speed gain can be achieved by starting from the other end?

Indeed! Even my last-hour very inelegant solution on the 50g below finds the solution in less than 73 seconds (Too busy at work last week to give it a try). I tested only odd numbers ending in 7, 3 and 1 (There is no prime number ending in 5 but 5 itself and 9 cannot be in the solution).

```
%%HP: T(3)A(R)F(,);

  \<< DUP \->STR DUP HEAD STR\-> { } + SWAP TAIL DUP HEAD STR\-> ROT + SWAP TAIL DUP
HEAD STR\-> ROT + SWAP TAIL DUP HEAD STR\-> ROT + SWAP TAIL STR\-> +
  \>>
END
```

Re: a new challenge!

*Message #68 Posted by **Thomas Klemm** on 20 July 2010, 9:27 p.m.,*
in response to message #1 by Don Shepherd

First I wanted to have a rough estimate of the number of primes between 10,000 and 88,888. Using the aproximation n/log(n) I got 6,714 while the correct answer is 7,382. The constraint concerning the factorial of the digits seemed to be more rigid than that of beeing a prime. Since the order of the digits doesn't change the sum I wondered how many possibilities I'd have to check. I decided to have the digits ordered descending from left to right. Since we need at least two 7's and at most three 8's I check the following two ranges:

```
77000 - 77777: comb(10, 7) = 120
80000 - 88888: comb(12, 8) = 495
```

Thus I'd have to check only 615 cases. For each case the "magic" sum is calculated. To make it easier to compare the digits I use a representation where the position counts the digits, e.g. 34316 -> 1012010. When they agree the program stops and displays this representation. From this the number can be calculated using the "magic" sum. Now you only have to verify that this number is a prime.

Initialization (some may call it cheating):

```
10  STO 0
```

1st run (77000 - 77777):

```
7.007  STO 1  STO 2
0.007  STO 3
GTO 3  R/S
```

There's no solution within this range.

2nd run (80000 - 88888):

```
8.008  STO 1
0.008  STO 2
GTO 2  R/S
```

There's exactly one solution: 210101000. So we know we have two 8's, one 7, one 5 and one 3. I'm leaving it up to you to calculate the number. You probably already know it.

Here's the program for the HP-15C:

```
LBL A
STO 1  LBL 1  RCL 1
STO 2  LBL 2  RCL 2
STO 3  LBL 3  RCL 3
STO 4  LBL 4  RCL 4
STO 5  LBL 5
5  STO I
CLx  ENTER
LBL 9
  RCL (i)  INT  ENTER
  10^x  R-^  +
  x<>y  ENTER  x!  +
  R-^  +
DSE I  GTO 9
0  x<>y
LBL 0
  RCL / 0  INT  x<>y
```

```
  LSTx  FRAC  RCL * 0
  10^x  +  x<>y
TEST 0  GTO 0
R-v
TEST 5  R/S
ISG 5  GTO 5
ISG 4  GTO 4
ISG 3  GTO 3
ISG 2  GTO 2
ISG 1  GTO 1
RTN
```

This is just a raw version. It could be improved when some of the repeating results were cached in registers. It runs quiet fast in the emulator of my iPhone but I don't know how long it would take on the real calculator.

Thanks for the nice challenge and all the other solutions.

Best regards
Thomas

Shouldn't it be two 8's at most as 3*8! is a 6-digit number? Anyway, I haven't understood how you set up the range you want to check.

> Quote:
>
> I don't know how long it would take on the real calculator.

The second run took about 46 minutes on my 2.2x 15C, which translates to about 1 hour and 40 minutes on a normal 15C (or 1 and a half hour if the speed-up factor is 2 - I don't remember whether I changed it or not).

Regards,

Gerson.

Absolutely correct! Yet three 8's are still a correct upper limit.

> Quote:
>
> Anyway, I haven't understood how you set up the range you want to check.

Actually I'd like to check the digits 77000 - 88800. However my program doesn't allow to configure that directly, but it's possible to configure a range as 000 - 777 or 0000 - 8888. So I expanded the range a little and split it into two parts: 77000 - 77777 and 80000 - 88888. In the first case two digits are constant (7) while in the second only one is (8).

Many thanks for taking the time to meassure the runtime of my program. I'm surprised it took so long but the calculation in the inner-most loop is quiet complex. It might be possible to use something simpler as the (alternate) sum of the digits. It all depends on how many false positives are produced.

Cheers
Thomas

Hello Thomas,

Thanks for your explanations.

> Quote:
>
> I'm surprised it took so long but the calculation in the inner-most loop is quiet complex.

That's not so long, considering the HP-15C is a slow calculator. At least its power consumption is very low: it's running on a set of batteries that my HP-42S used to exaustion, yet there's some energy left to power up even a sped-up 15C (no blinking star so far).

Regards,

Gerson.

Here is a solution for the HP-30b. It finds the number in 31 seconds. The primacy of the number can be verified in less than 1 second using the code in message# 30 of this thread.

I start with 88777, the largest possible 5-digit number based upon 8! and 7!, and decrement by 2 to check only odd numbers. Following is BASIC-like pseudocode and the 30b RPN code that follows the BASIC model.

```
for i = 88777 to 1 step -2
  a=i
  b=0
  for j = 0 to 4
    d = a mod 10
    b = b + d + d!
    a = ip (a/10)
  next j
  if b = i then print b/stop
next i
```

```
88777
sto 0
lbl 10
sto 2
0
sto 3
4
eex
3
+/-
sto 1
lbl 11
rcl 2
10
/
ans
x<->y
math
up
=
x
sto+3
!
sto+3
rcl 2
10
/
math
up
up
=
sto 2
isg 1
goto 11
rcl 3
rcl 0
?=
gt 12
2
-
sto 0
goto 10
lbl 12
stop
```

Thanks to all who participated in this little endeavor, especially those who offered non-brute-force solutions. The intelligence and creativity of members of this forum are amazing.

No improvement from what's been posted so far. The number is found in 7 minutes and 48 second on my HP 33s (batteries starting to get low). Four more seconds can be gained if the constant in lines D0004 and D0014 is recalled from a register. Now the number only has to be checked for primality, which shoud take no more than a few seconds.

in response to message #74 by Gerson W. Barbosa

Thanks Gerson. I know that many here don't like the 33s because of its chevron keyboard, but that never bothered me, it is a fast little calculator, much faster than its successor, the 35s.

Until HP releases an ARM-based scientific RPN programmable calculator, I do recommend the 30b. It is a bit quirky to program, but it is blazingly fast.

*Message #76 Posted by **Gerson W. Barbosa** on 27 July 2010, 5:38 p.m.,*
in response to message #75 by Don Shepherd

You're welcome, Don. Than YOU for the interesting problems you've been posting.

I prefer the 33s over the 35s for a many reasons. Among them:

- It's faster;

- Checksums work;

- ALL mode works the way I like;

- XEQ works like it should (XEQ label only to execute a program);

- Many functions accessible right from the keyboard.

The 33s keyboard, however, is not good.

Regards,

Gerson.

4m 29s after replacing batteries with brand-new ones. This means it would take about 23 seconds on a 30b running the same algorithm (considering the performance of both calculators on Xerxes's benchmark).

In message #1 in this thread I used a different algorithm, but it took 31 seconds on the 30b. Quite a fast little machine, I wish Office Depot in my town had it, I'd like to get another one. Richard Nelson says August...

in response to message #79 by Don Shepherd

23 seconds is just an estimation which may be wrong. The actual timing would be only known by porting the algorithm to the 30b, but I fear this is not so straightforward. Anyway, the half minute running time you have actually obtained is pretty impressive. I don't have a 30b yet (I am reluctant to get another financial calculator - I got rid of one 12C Platinum, one 19BII and one 17BII. Only one 12C and one 12C+ left now, the first because it's a Voyager and the latter because it's its extremely fast version). Still waiting for a new 30s or something like that ...

Gerson.

The algorithm I used on the 30b should be translatable to the 12c+. You'd need to control the loop manually since there's no ISG, but we've been doing that for years on the 12c. The 30b and 12c+ use the same processor, so the timing should be similar.

HP-41CX halfnut speedup

*Message #1 Posted by **Theo Kas (Australia)** on 9 July 2010, 9:55 p.m.*

I have an HP-41CX HALFNUT that I would like to modify to run at 2X (or faster) normal speed. I have seen posts on speeding up hp-41 fullnuts but not half nuts. I have successfully increased the speed of a 41CX fullnut many years ago and would now like to do the same on a spare half nut that I have.

Any help would be greatly appreciated.

Thanks, Theo

Re: HP-41CX halfnut speedup

*Message #2 Posted by **Garth Wilson** on 10 July 2010, 12:47 a.m.,*
in response to message #1 by Theo Kas (Australia)

I got the kit from Educalc in the 80's when they were selling it, but when I read in the instructions that you couldn't use it with HPIL or combined modules (both of which I had and used regularly), I returned it. I believe it was for both Halfnut and Coconut. (There never was a "Fullnut.") Mine is a halfnut.

Re: HP-41CX halfnut speedup

*Message #3 Posted by **Theo Kas (Australia)** on 10 July 2010, 2:15 a.m.,*
in response to message #2 by Garth Wilson

I remember reading about the EduCalc kits long after production of the 41 had ceased - I think there were two kits available, fast and Turbo. However, I was a PPC member many years ago and read where members had increased the speed of their 41's by replacing a 140pF cap with anywhere from a 33pF to 22pF cap. I tried this - using a 22pF cap on my first 41CX (which has the same 41C LCD display and 41C/CV/CX common logic PC board - hence the 'fullnut' reference) which I still have and all modules including x-memory, HPIL AND card reader worked (and still do, although the card reader now has a gummy wheel) OK. I thought I would speed up a spare 41CX halfnut that I have, however, opening the machine reveals a totally different setup - there is a small PCB mounted on to the main PCB. I am assuming that any mod to increase the speed would have to be done to this small PCB....?????

Re: HP-41CX halfnut speedup

*Message #4 Posted by **Diego Diaz** on 11 July 2010, 12:27 a.m.,*
in response to message #3 by Theo Kas (Australia)

Hi Theo,

> Quote:
>
> I am assuming that any mod to increase the speed would have to be done to this small

PCB....?????

Nope! The LC resonant circuit in on the keyboard PCB.

The main question you'll have to answer is if you want a "permanent" speed-up or a "switchable" one.

In the firt case just replace the SMD capacitor between pins 9 and 10 of the CPU (just under key [5]) with one in the range 22pF to 47pF (depending on how much "thrust" you want to make your 41 run at)

The second case is somehow more complicated since you'll need a suitable means to turn the "turbo" mod ON and OFF; and involves some type of switch and cabling for the task and, eventually, some case mods (filing, drilling, etc.) to gain acces to the switch.

Wish you the best of lucks with your project.

Cheers from Spain.

Diego.

PD. Not intended to refrain your enthusiasm, but IMHO 41's were not "born to run" (even at 4x they're still pretty slow). As I said, just my opinion.

Re: HP-41CX halfnut speedup

*Message #5 Posted by **Theo Kas (Australia)** on 12 July 2010, 7:03 a.m.,*
in response to message #4 by Diego Diaz

Hi Diego, thanks for you help and advice. I think that I will leave it as it is and continue to use the one that is already modified. It must be a fluke that my 2X 41CX works with all modules and peripherals - maybe modding another might not be so lucky. Cheers, Theo

Replacing dead screen on my HP17BII with one from HP27S?

*Message #1 Posted by **John Hinz** on 9 July 2010, 8:16 p.m.*

Hi

My 18 month old son just threw my 17BII on the floor when it was turned on. The screen has stopped working and it is black over part of it, so I assume is is a goner. I have two HP27S's that are in hardly used condition but because they don't have RPN I don't like using them? Is it feasible to put a good screen from a HP27S in my HP17BII? I am not very good with electronics so would have to get someone to do it for me. If it's feasible can anyone recommend someone here in Australia who could do it for a reasonable price? Does anyone have any idea what this might cost? Otherwise I can buy a new HP17BII+ or a used 17BII ex ebay. The just dead 17BII is a used one that I bought on ebay to replace one that got drowned in a glass of wine. I bought this because I read some forum comments that the older model is superior to the new one. Has anyone got any thoughts on this + whether I should just get another machine rather than muck about swapping screens over?

Thanks

John

Re: Replacing dead screen on my HP17BII with one from HP27S?

*Message #2 Posted by **Raymond Del Tondo** on 9 July 2010, 8:26 p.m.,*
in response to message #1 by John Hinz

Hi,

I wouldn't bother fiddling with replacing LCDs, effectively wrecking even more HP calcs;-)

My suggestion: Sell the 27S units, and buy another used 17BII, either from TAS or elsewhere.

HTH

Raymond

Re: Replacing dead screen on my HP17BII with one from HP27S?

*Message #3 Posted by **John Hinz** on 9 July 2010, 10:49 p.m.,*
in response to message #2 by Raymond Del Tondo

Hi Raymond

Thanks for the advice. I just remembered I have the older 17BII that had wine split on the key board. Thanks to advice I got on this forum I was able to revive it several times but it eventually died. The screen on this one is OK, so assuming that on my recent accident the screen is the only issue, I could feasibly make one good one out of two dead ones. This would avoid me having to wreck one of the good 27S's. I have no idea how difficult it is to swap the screens so if I'm totally on the wrong track let me know. Looking at ebay I can probably pick up a good used 17BII for $50.

Thanks

John

I sacrificed a good 17B for a 27s. right direction?

HP-27S LCD transplantation

Re: Replacing dead screen on my HP17BII with one from HP27S?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2010, 3:25 p.m.,*
in response to message #1 by John Hinz

Hi!

Some people (PICK ME! PICK ME!) would gladly give you a mint (or two mint... PICK ME!) HP17BII+ for one of your HP27S...

About swapping LCD´s: I have once tried, and let me tell you that the 'operation' involves many steps: disassembled a calculator with many plastic rivets, totally remove the mainboard by twisting six metal tabs that may crack and you´ll be in trouble setting the mainboard back in place, choose between removing the 'metal chassis plate' with the keyboard contacts OR the LCD that is glued in the chassis plate, then bringing it all together in one piece, all of the steps above backwards...

Cheers!

Luiz (Brazil)

P.S. - just in case... PICK ME!

Re: Replacing dead screen on my HP17BII with one from HP27S?

*Message #7 Posted by **John Hinz** on 10 July 2010, 5:52 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi

I had no idea that HP27's were so attractive. To me the fact they don't have RPN makes them painful to use. Are they a lot rarer or the fact they are a scientific calculator that makes them appealing? I'll keep you in mind Luiz if my repair process fails. I've already started trying to make one good 17BII out of my two bad 17BII's, so both HP27's live on. Basically I have nothing to lose apart from wasting my time.

I'm following the procedures I found in this link headed "HP Pioneer Observational Internals" http://www.hpmuseum.org/guest/brogpion.htm

I've now got the two halves of the first calculator separated after using a small drill bit to ream out the plastic heat stakes inside the battery compartment.

I've now hit a snag with removing the board from the front half of the case.I've twisted the 6 tags so they line up with the slots in the PCB but the board won't easily pull away and feels like it's jammed. It feels like it's another problem, different to one or more of the tags not being lined up exactly with a slot. Any suggestions on what to do next? I'm worried that if I try and use a small thin bladed screwdriver to lever the board out near the tags I'm going to crack the board. Any suggestions would be most welcome.

The link explains how to remove and replace the screen from the steel frame. Hopefully this will go smoothly but any extra comments or ideas would be appreciated.

Thanks

John

Re: Replacing dead screen on my HP17BII with one from HP27S?

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 10 July 2010, 9:57 p.m.,*
in response to message #7 by John Hinz

Hi, John;

FYI, here in Brazil we have an 'e-bay' local equivalent called 'Mercado Livre' (could translate to Free Market). There are two HP27S´s being sold right now. One is new in the box for about R$450,00 (~US$255,00) and the other is just the calculator and protective cover, for about R$290,00 (~US$165,00). Used HP17BII can be found for less than half of it...

I like the HP27S because it is versatile. It lacks programming (but it has the SOLVER) and RPN, but it offers a lot more. If you are a Production Engineer the HP27S is a handy 'swiss knife' calculator. Of course, you can buy a new HP50G and customize it to go far beyond the HP27S, but the HP27S is from 1988, an almost 23 Y.O. design. And was available NIB from HP for no more than four years. It is a rare piece.

One of the guys that has been restoring and repairing calculators is Geoff Quickfall, along with some others. His works in restoration and repair led him to write a book about it. I consider it a must have...

Now for the HP17BII repair. I once rebuilt an HP42S from a non-working HP17BII 'who' donated the LCD and the keyboard contacts (the whole metal plate) and another HP42S with a relatively good case and mainboard. I also used this little 'frankencalc' as my first 32KRAM transplantation, and the little thing survived! Well, it has two columns and one row in the LCD that do not turn on (its 'scars'), but hey! That´s fine, I use it regularly.

I know that 'peeling' the keyboard faceplate out allows the plastic rivets to be accessed and the frame to be replaced, but I did that only with an HP15C I rebuilt from an HP11C´s case and mainboard. I removed the 11C´s IC´s and kbd faceplate and 'inplanted' the IC's and faceplate from two different HP15C's. I must tell you I had a lot of difficulties do remove the kbd faceplate, but one of our regular

contributors has the skills and have found a way This the 'frankensister' or 'frankenbrother' of teh other one... (sound too familiar, I know). The cosmetics are not exactly what I expected, but this little one is also working for many years.

About the mainboard: there must be a better way to remove it, if it feels jammed than I'd think twice prior to try to pop it out with a cutting blade. If I may, I'd suggest using something that bends itself instead of something that might bend the calculator case, the PCB or that might damage something...

Not so much of a help, though, but that´s what I'd try to.

Success!

Luiz (Brazil)

(P.S. - I'd LOVE to have an HP27S like the one announced in 'Mercado Livre' here, and I have an HP17BII of the early type - brown case, no language option - but I am not so sure if it is worth risking the mail for a trade... Picking me for a trade was more like a wish than a request... Others, fairly closer to you, would benefit in such trade, and I'd encourage so)

Bear in mind that the 27s was born in the era when HP finally realized there was a huge potential market they were missing: folks (Like me!) who find *RPN* a pain to use, but who longed for the legendary HP quality. So they came out with, 10b, 14b, 17b, 20s, 21s, 22s, 27s, all "algebraic" models, and later 17bii, dual mode, as you know. IMO the 27s is by far the best of them, combining both scientific and business functions. And it's Solver is just fabulous. The 27s is so good that *even some RPN users* (gasp!) get it and "put up" with its algebraic-ness.

That would be me. except that I "embrace" rather than "put up with" the algebraic.

I kick myself for not looking into this machine long ago. In 1995, when I lost my 11c, I remember seeing this 27S in the store. I turned my nose up at the "Algebraic" thinking, "I want something that is as like my 11c as possible." So I got the 32sii. Looking back, I chuckle. The 27s is fantastic and

soooo much better than the 32sii for my needs.

Maybe I shouldn't post this. It will drive up the prices on ebay.

My First Red LED Machine (HP 45)

*Message #1 Posted by **Norman Dziedzic** on 8 July 2010, 12:09 p.m.*

Whoo Hoo! I finally have red LED's in my Collection!!! S/N: 1350A10347

More images later. I have a field case, hard case and some literature too.

Re: My First Red LED Machine (HP 45)

*Message #2 Posted by **DavidShenk** on 8 July 2010, 12:27 p.m.,*
in response to message #1 by Norman Dziedzic

Looks good, I hope you also have batteries in that thing! You may already know, but you should never run it just on a/c. Many here even charge the batteries separate from the calculator. Because you have the a/c plugged in, I thought I would mention it.

Dave

Re: My First Red LED Machine (HP 45)

*Message #3 Posted by **Norman Dziedzic** on 8 July 2010, 12:37 p.m.,*
in response to message #2 by DavidShenk

Ouch! The previous owner, a college prof., said he ran it for years on the A/C alone. I guess I'm off to e-bay to find a battery pack. I did get what looks to be an external battery charger with the deal.

Thanks for the warning. It would be shame to fry my new baby.

Re: My First Red LED Machine (HP 45)

*Message #4 Posted by **Michael de Estrada** on 8 July 2010, 12:59 p.m.,*
in response to message #3 by Norman Dziedzic

Don't worry about running that particular calc off AC w/o a battery installed; it's completely safe. When you plug in the adapter, you completely bypass the battery circuit anyway, so the calc is going to see the same voltage regardless of whether or not a battery is installed. The models where that is a sure kiss of death are the Woodstocks and Stings, and to a lesser extent the Classic models with card readers.

Re: My First Red LED Machine (HP 45)

*Message #5 Posted by **Jeff O.** on 8 July 2010, 1:00 p.m.,*
in response to message #2 by DavidShenk

It can certainly do no harm to only use the adapter/charger with a battery installed, but I do not believe there is any danger at all in powering the 45 (or the 35, 55, 70 or 80 models) directly from the AC adapter/charger with no battery in the calculator. The AC adapter/charger used on the 45 provides a regulated supply voltage to power the calculator. When the connector is plugged into the calculator, the calculator’s internals get connected directly to the regulated supply from the AC adapter/charger. The battery gets completely disconnected from the calculator's internal circuitry and is connected to the variable-voltage charging output of the AC adapter/charger. Page 48 of the HP-45 manual discussed what to do if your battery pack went bad, stating "Remember, you can use your HP-45 on AC power until the replacement battery pack arrives.”

This does **not** apply to the HP-65 or HP-67 which use the same charger, but (if I recall correctly) leave the card reader circuitry connected to the battery and the variable voltage charging supply, so if there is no battery that voltage jumps up to something like 17 Volts which could damage things.

...

Optimizing programs: Writing a number VS calling a variable

*Message #1 Posted by **Pablo P (Spain)** on 7 July 2010, 5:54 p.m.*

Hi all!

Consider these programs:

```
(First store 1.999 in C)
| A001 | LBL A    |
| A002 | 1        |
| A003 | ISG C    |
| A004 | GTO C002 |
| A005 | RTN      |

(First store 1.999 in C and 1 in O)
| B001 | LBL B    |
| B002 | RCL O    |
| B003 | ISG C    |
| B004 | GTO B002 |
| B005 | RTN      |
```

Both programs do the same thing: to put number 1 in REGX 1000 times. But, in the HP 35s, program A takes 69 seconds and program B takes 42 seconds, so putting a number in REGX directly is 1.63 times slower than calling a variable.

When I am writing a program for the HP 35s and I need a constant in a loop, I store that constant in a variable and then I recall it in the loop insead of putting the constant directly as a number. With this, execution time is considerably reduced in many situations.

I know that this is not a new topic, others have mentioned it. But I want to know if this happens in other calculators.

Edited: 7 July 2010, 5:56 p.m.

Re: Optimizing programs: Writing a number VS calling a variable

*Message #2 Posted by **Jim Horn** on 7 July 2010, 8:51 p.m.,*
in response to message #1 by Pablo P (Spain)

That's been the case since the first machines (HP-65/25/67). The reason is that numeric entry requires the machine to go through entry checking, scaling the value as needed, adding it to a number being created, etc. The overall algorithm is pretty complex. Merely recalling a number takes a simple transfer that's easy.

By the way, your two programs may run at a roughly 1.6:1 speed ratio. However, most of the steps of both programs are similar so the difference of *just the number being loaded* is even greater still.

Back in the day we used to use "E" instead of entering "1" as it was a few clock cycles faster. In the '67, every 7 program steps had a semi-sawtooth execution time overhead. 'Tis amazing how many little tweakes these wonders can take to make them run faster...

All of which gives examples of why compiled programs run so much more quickly as they eliminate much of

all this overhead.

Re: Optimizing programs: Writing a number VS calling a variable

*Message #3 Posted by **Werner** on 12 July 2010, 4:05 a.m.,*
in response to message #2 by Jim Horn

You sure it's not a 1.618 : 1 speed ratio? Ah, another example where the golden mean turns up unexpectedly ;-)

Re: Optimizing programs: Writing a number VS calling a variable

*Message #4 Posted by **Don Shepherd** on 8 July 2010, 1:57 a.m.,*
in response to message #1 by Pablo P (Spain)

Well, here are the "surprizing" results for the HP-32s, optimized by placing subroutines W and Z at the beginning of code.

```
Factoring 99,999,989 (a prime number)
Old method, using numeric constants 2, 1, 4, and 6:  144 seconds
New method, assigning 2, 1, 4, and 6 to variables A, B, C, and D (outside the loops) and
RCL them:  146 seconds
```

So this would indicate the 32s does not seem to suffer from this malady.

Re: Optimizing programs: Writing a number VS calling a variable

*Message #5 Posted by **Katie Wasserman** on 12 July 2010, 11:25 a.m.,*
in response to message #4 by Don Shepherd

The 32s, 32sii (and many others) pre-process numbers on entry and store them not as keystrokes but in their near final, usable form. That's why you see them as the full number when editing programs rather than as a sequence of digits, one per step. Furthermore, some of these calculators take the trouble to store small integers in a more compact form to save memory instead of using say, 8 bytes for any number they will only use a fraction of a byte.

HP 50G says the SD card is write protected

*Message #1 Posted by **Daniel Perry** on 6 July 2010, 10:42 p.m.*

I have know idea what is going on! I have bought a new SD card after HP told me that the problem must be with the HP card that came with the calculator when I purchased it. The calc won't format the card or let me store things on it. The memory does appear in my filer on the calc but that is the best I can do. I have tried formating the sd cards in my laptop (HP also). I format as FAT, though I am a little skeptical about that because windows7 only shows Fat as fat 32. The options for formating the card are as follows: Fat 32, Fat (default) with an allocation size of 32kb, which makes that fat32 right? There is an option under Fat (default) for default allocation size, but even formatting the card like that hasn't given the calc access to it.

Please help I really love this calc and want all the option available to me.

Oh yeah, the calc's format option doesn't work on either card.

Re: HP 50G says the SD card is write protected

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 July 2010, 12:23 a.m.,*
in response to message #1 by Daniel Perry

Hi;

what is the memory size of your SD card? I succeeded formating 1GB SD cards in a PC and fully use them in the HP50G, but I never succeeded formating SD cards bigger than 512MB in the calculator itself. Also, even after formating a 2GB SD card in a PC, the calculator never reads more than 1GB. I tried to format the 2GB in the HP50G and, after an error message (don´t recall which one), the calculator identified about 997MB and the card could not be red in a PC (the computer asked me if I wanted to format the media...).

I also recall reading something about format error due to discharged batteries, because the formating process demands some extra current.

Because you can format the cards in your computer I guess that there are no chances that the LOCK switch is in the wrong position, right?

In time: OS Rev. #2.15

Not much of a help, though...

Success!

Luiz (Brazil)

Edited: 7 July 2010, 12:25 a.m.

Re: HP 50G says the SD card is write protected

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 7 July 2010, 8:51 a.m.,*

in response to message #1 by Daniel Perry

Just to mention that FAT32 is not related to 32-kBy allocation untit size (a.k.a. "cluster"). Succesive versions of FAT included the original FAT12, for the IBM PC diskettes and 5-MBy hard disks (1980-1981). FAT12 cannot manage drives larger than 32 MBy. FAT16 then replaced it (around 1988, if memory helps), to allow for drives up to 2 GBy. To manage large drives, FAT16 needed to use large allocation units (32 kBy), which may be inefficient. FAT32 (around 1998) moved the limit to TBy heights, allowing for small-cluster options at the same time.

Suggestions:

a) Check that the SD card capacity is not greater than 2 GBy. Larger cards follow the SDHC standard, and are not backwards compatible with plain SD devices.

b) Format the card in a PC with the FAT16 option (your FAT with 32 kBy allocation units may do).

Good luck!

Re: HP 50G says the SD card is write protected

*Message #4 Posted by **Mike Reed** on 7 July 2010, 10:02 a.m.,*
in response to message #1 by Daniel Perry

I currently have a 1GB EP Memory (brand) SD card in my HP-50 - the calc sees and formatted it just fine. I notice on the side opposite the clipped corner there is s switch to lock/unlock the card; mine is in the unlocked position. I have used up to 2GB SD cards of several different manufactures in my calc with no problems at all. I have also used microSD's in SD adapters with no problems. The only time I have ever had problems was if I exceeded the 2GB limit, or if I tried to use SDHC - for some odd reason, the HP-50 does NOT like SDHC cards. Hope this helps!

*Message #5 Posted by **Tim Wessman** on 7 July 2010, 10:54 a.m.,*
in response to message #1 by Daniel Perry

A card greater that 2GB will not function. It actually isn't an SD card, but rather an SDHC card.

If the card is smaller than 2GB, your lock switch on the card is down.

How would a new HP 15c+ affect 15c market value?

*Message #1 Posted by **megarat** on 6 July 2010, 7:20 p.m.*

Hey all,

I'm curious to hear your thoughts: if HP released a shiny new 15c+ calculator (akin to the 12c+, as repeatedly requested/fantasized about here), how do you think it would it affect the market value of the original 15c?

I think it's interesting that the original (pre-1990) 12c -- in spite of better construction quality and (probably) battery life -- only goes for $40 or so on eBay, unlike its no-longer-extant cousins. I suspect this has to do with the fact that the 12c never went out of production, so it never really achieved collector's status, as it's been there all along. Even though it got slowly downgraded in terms of production quality and experienced minor stepwise changes in engineering (e.g., different batteries, now a different CPU), people, even collectors, regard them as equivalent.

But what about the 15c?

My own opinion: I suppose it would have a lot to do with the quality of the finished product, but I still have a difficult time seeing how even a well-made, feature-for-feature 15c tribute, even with a faster CPU and more memory, would negatively affect the original 15c's current market value. In fact, the release of such a calculator might even (temporarily?) raise the original's market value, as its release would get the original back into the public eye and renew/ignite their interest in obtaining one.

I'm curious to hear what others think.

Re: How would a new HP 15c+ affect 15c market value?

*Message #2 Posted by **bill platt** on 6 July 2010, 9:06 p.m.,*
in response to message #1 by megarat

I think it would lower it. The 33s and 35s definitely put a damper on 32sii prices.

*Message #3 Posted by **Michael de Estrada** on 6 July 2010, 10:50 p.m.,*
in response to message #2 by bill platt

I think this is a purely speculative question. Despite all the ruminations on this forum, the HP-15c+ seems unlikely.

Re: How would a new HP 15c+ affect 15c market value?

*Message #4 Posted by **Katie Wasserman** on 6 July 2010, 11:10 p.m.,*
in response to message #1 by megarat

I love rehashing speculations on the 15C+! I'd vote for a decrease in the original 15C values since a 15C+ would run 150 times faster and that would much more than make up for an lower quality issues that might

exist.

However, I have to say that the quality on the 12C+ is really excellent. Key clicks are superb, maybe even better than the original and the display seems to have more contrast too. The only thing to nit pick about is the plastic used to make the keys, it's not quite as dense as the original 12C used and the lettering appears to not be molded in.

At the expense of battery life.
Forget the battery life that the old 15C got, that is history.

I think a new one that's essentially identical could do nothing but drop the price of the originals.

Many still buy the old 15C to actually use it, and that market would surely vanish overnight.

Dave.

My sentiments exactly. I recently obtained a current 12.C after keen disappointment with a 30.B so-called "Professional".

General "feel" and "aura" of this unit closest I've seen to vintage HP gear in modern series.

Anyway, this is what I now have in my nassty little pockettses.

Does what I need with considerable 1980s Gordon Gekko retro chic :).

Self tests: what do they actually do?

*Message #1 Posted by **megarat** on 6 July 2010, 7:06 p.m.*

Hey all,

I was performing the "ON"-"x" self test for my HP 15c lately and it caused me wonder just what is going on behind the "Running" message.

The keyboard/display tests on modern HP calculators are pretty self-explanatory, but what about the other (ROM/RAM) tests? I suppose the actions taken by the test will vary by model, but for ROM/"circuitry" tests: does it do a checksum on the ROM to make sure it isn't corrupt? Or perform a battery of operations and make sure the results are as expected? For RAM tests, does it read/write to all/some addresses/registers to make sure they work?

Just curious.

Re: Self tests: what do they actually do?

*Message #2 Posted by **Thomas Falk** on 8 July 2010, 1:52 a.m.,*
in response to message #1 by megarat

Hello,

self test for the rom check typically the checksum of the content of the memory. They do not check the correctness of the software. This must be tested during the developement and in going to production, but not later anymore.

For testing RAM certain patterns are written into the memory and read back. If you read the same as you have writtem the memory is assumed to be ok. The releability of this test depends on the patterns used.

What a definit calculator does in its self test only HP can say. The above is how we are doing it for comparable systems.

Best regards,

Thomas

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 8 July 2010, 8:07 a.m.,*
in response to message #1 by megarat

Hi;

the big question might also be:

In case a self-test procedure returns an error/faulty message, could it be an error in the self-test routine itself, hence the circuit/routine under test is OK?

I have seen, and I guess many others here too, such circumstance in regular, hardware-based supervisory circuits. I worked in a switching network system (telephony) about 15 years ago (Siemens ESK), and from time to time we needed to change the contacts of some relays. I remember once in a while having to replace contacts in relays signaling false errors: it happened that they were the error themselves.

But this is something I saw in a 'hardwired' switching network. Never found such event in solid state, software controlled systems.

Have any of you?

Cheers.

Luiz (Brazil)

Re: Self tests: what do they actually do?

*Message #4 Posted by **Marc Ferrer (France)** on 8 July 2010, 12:11 p.m.,*
in response to message #1 by megarat

Hello,

As a personal story, I remember back in the 80s some systems which at power-up ran BISTs (Built-in Self-Tests) during hours ! before booting -Intel systems running iRMX.

Besides that, I read an HP Journal issue related to some "big" HP processors in HP 9000 systems; they gave a very interesting description of a thorough self-test for a microcoded CPU :

1- a hardwired sequencer triggers CPU functional blocks while a hardware check is done on various output signals. Then the microcode ROM is checked the same way.

2- using as few instructions as possible, a first routine tests register banks or caches, then some RAM and so on...

3- if everything is still OK, extensive tests are done on the whole RAM array.

A funny note : If I remember well, in some systems of that era the first test was done using an on-board microcontroller -which of course had to run, first of all, its own BIST... eh ? who said "matrioshka ?"

As you can see it's a hierarchical process in the way that you can only rely on already-tested devices. And if you really want to test everything, it can take forever to complete.

Returning to our calculators, Eric Smith (please Eric, correct me if I'm wrong) told that the Spice series added new instructions to their CPU, devoted to the ROM test, and even a hardware CRC checker I think. I suppose that the goal was to use as few CPU hardware as possible at this stage of testing.

By the way, it means also that if the CPU is defective, the calculator won't even start, as you already guessed.

Luiz : I worked with people who did maintenance on relay-based switching telephone equipment, they all said it quickly could become a real nightmare, crowded with false errors :-)

Regards from France,

Marc

Re: Self tests: what do they actually do?

*Message #5 Posted by **Eric Smith** on 12 July 2010, 2:08 p.m.,*
in response to message #4 by Marc Ferrer (France)

The self-test code in the Spice and Voyager series mainly check the ROM and the RAM. In the Spice, they added a special instruction to the CPU which causes it to compute the CRC10 of a 1Kx10 "quad" of ROM. The Nut CPU used in Voyager does not have a comparable instruction, so it uses a loop that computes a checksum of the ROM.

The RAM test is very cursory. It really just makes sure that each RAM location can be written and read back, but does not test all the bits of a word independently nor does it test for pattern sensitivity.

*Message #6 Posted by **Mike (Stgt)** on 9 July 2010, 9:29 a.m.,*
in response to message #1 by megarat

If you like I may log the trace in my emulator/CPU-simulator. I will do it this WE and could send it on Monday. But I have only a copy of the ROM at hand Eric Smith removed 2008 from his Nonpareil distribution and which is most probably modified.

Just an other story: The Service ROM for the HP-41 made my emulator/simulator display "CPU OK" but the Time Module calculated the 1-Jan-1900 to be a Sunday, it was a Monday (I am told). So you may only be sure that there _is_ something wrong if it displays "CPU BAD" but not that everythings fine if you see "CPU OK".

Nice WE.....Mike

Re: Self tests: what do they actually do?

*Message #9 Posted by **Mike (Stgt)** on 12 July 2010, 10:31 a.m.,*
in response to message #6 by Mike (Stgt)

To megarat: if you are interested (if yes I need your mail address) I have a 10k-ZIP with two trace logs for

sending you. The first is just the ON/OFF sequence (from deep sleep back to deep sleep) and the second one is the ON+* sequence. Alas it is without contents of the CPU registers, it shows only the address and command.

As I assumed, I have only a modified ROM at hand where the checksum is not corrected. So the selftest ends with "Error 9" in the display and the number 2 in register X. In contrast Nonpareil 0.77 shows the same message but has the number 3 in the regsiter X. So my question to Eric Smith is if his Nonpareil allows log tracing.

Ciao.....Mike

HP 9120A Printer Platen Gone Gooey

*Message #1 Posted by **Rick Bensene** on 6 July 2010, 2:57 p.m.*

Hello, all,
I recently acquired an HP 9120A printer for my 9100A/B calculators. The platen that feeds the electrosensitive paper through the printer is made of a rubber substance that has turned to an oily black goo, rendering the unit useless. I have taken it apart and removed the platen and cleaned up all of the parts, but there was no way to find out what the thickness of the rubber material was.
I'm trying to figure out something that could serve as a replacement. I've thought of surgical tubing with the appropriate inside and outside diameters that could slide into the metal shaft that served as the base for the rubber material, but without knowing the proper outside diameter for the material, it's difficult to go shopping for the right sized tubing, or any other material for that matter. Has anyone else had this problem and been successful in repairing it? I'd love to hear from anyone that might have any ideas. Or, perhaps someone who has a working 9120A would be willing to try to measure the diameter or circumference of the platen and let me know.
Thanks,
Rick Bensene

optimized prime factor finder for HP-32s

*Message #1 Posted by **Don Shepherd** on 6 July 2010, 1:38 p.m.*

In this thread, Dave Britten presented excellent prime factor finders for both the HP-20s and HP-32sii. This was also implemented on the HP-30b by Tim Wessman. Katie Wasserman pointed out that faster results will be obtained (on machines like the 30b and 32sii) by moving the most frequently-called subroutines to the top of code.

I recently acquired an HP-32s, a very beautiful machine. I wanted to implement the optimized algorithm on the 32s and reduce the label count if possible, since labels are a valuable resource on these machines. I was able to eliminate the V label (which was required because the 32s does not have a x<=y instruction like the 32sii) by reversing the order of variables M and F on the stack and using x>y, and I was able to eliminate the X label by simplifying the logic involved with displaying the final factor.

Here is the code that works on the HP-32s:

```
optimized prime factor program for HP-32s

Usage:
num to factor
xeq f
r/s to see all factors
0 = done

lbl w
rcl + f
sto f
rcl x
x<->y
/
fp
x=/=0
rtn
rcl x
rcl / f
sto x
sqrt
ip
sto m
view f
0
goto w
lbl z
4
xeq w
2
xeq w
4
xeq w
2
xeq w
4
xeq w
6
xeq w
2
xeq w
6
xeq w
rcl x
```

```
ln
x=0
rtn
rcl f
rcl m
x>y
goto z
rcl x
sto f
view f
clx
rtn
lbl f
sto x
sqrt
ip
sto m
0
sto f
2
xeq w
1
xeq w
2
xeq w
2
xeq w
rcl x
ln
x=0
rtn
goto z
```

Re: optimized prime factor finder for HP-32s

*Message #2 Posted by **Pablo P (Spain)** on 7 July 2010, 8:34 a.m.,*
in response to message #1 by Don Shepherd

Hi Don, a time ago I wrote a program in the HP 35s to factorize numbers. I am curious, how long it takes to factorize 999,983 in the HP 32s?

Re: optimized prime factor finder for HP-32s

*Message #3 Posted by **Don Shepherd** on 7 July 2010, 10:20 a.m.,*
in response to message #2 by Pablo P (Spain)

Pablo, that takes exactly 15 seconds.

Optimized prime factor finder for HP-35s

*Message #4 Posted by **Pablo P (Spain)** on 7 July 2010, 11:41 a.m.,*
in response to message #3 by Don Shepherd

HP 35s takes 18.2 seconds using a modified version of Dave Britten's program.

Basically, I rewrote the original program to use one label, simplified the logic involved with displaying the final factor and replaced each appearance of 2, 4 and 6 with RCL D, RCL C, RCL S respectively.

The last is because in the HP 35s putting a number directly is 1.62 times slower than recalling a variable. In fact without doing this, the program takes 25 seconds to calculate the factors of 999,983 (by the way, does this happen in other calc?)

Line	Instruction
F001	LBL F
F002	STO X
F003	SQRT

```
F004   IP
F005   STO M
F006   0
F007   STO F

Re: Optimized prime factor finder for HP-35s

*Message #5 Posted by **Don Shepherd** on 7 July 2010, 3:32 p.m.,*
in response to message #4 by Pablo P (Spain)

Quote:

> HP 35s takes 18.2 seconds

I'm surprized it's that fast! I did some benchmarks on the 35s a few years ago and noticed it was markedly slower in executing programs than its predecessor, the 33s. Running the unoptimized algorithm on the 33s for 999,983 takes 10 seconds; optimizing the program by moving the W and Z subroutines to the top of memory (before Lbl F) would probably take a second or two off that, at the most.

> Quote:
>
> I rewrote the original program to use one label

Ah, you took advantage of a feature available in the 35s but unavailable in the 32s or 33s. I wish that was available in the 32s, but wishing just won't make it come true!

> Quote:
>
> in the HP 35s putting a number directly is 1.62 times slower than recalling a variable

Interesting. I'll have to modify my 32s program to do that and see if it makes a timing difference. I'll do that and let you know.

Re: optimized prime factor finder for HP-32s

*Message #6 Posted by **Pablo P (Spain)** on 7 July 2010, 5:23 p.m.,*
in response to message #1 by Don Shepherd

> Quote:
>
> ...and I was able to eliminate the X label by simplifying the logic involved with displaying the final factor.

Basically you fused LBL W with LBL X and replaced XEQ X with VIEW F, isn't it? At least this is what I did.

As this is so simple I am wondering why did not Dave do it? So I am asking if this modification is correct. (I have not had time to study carefully the original algorithm).

Re: optimized prime factor finder for HP-32s

*Message #7 Posted by **Don Shepherd** on 7 July 2010, 6:23 p.m.,*
in response to message #6 by Pablo P (Spain)

> Quote:
>
> As this is so simple I am wondering why did not Dave do it? So I am asking if this modification is correct.

When I looked at the code around the original label x:

```
x=0
goto x
rtn
lbl x
```

I realized that that whole goto/lbl could be avoided if I changed the x=0 to x!=0. But then I saw the reference to xeq x over at the end of the z routine, and I knew this would have to change if I eliminated label x, obviously. So then I considered that the end of the label z routine is really the end of the program, which has the net effect (although achieved in a rather roundabout way) of displaying the final factor which is still in x, if you reach that point in the code. So, yes, I basically replaced xeq x with view f, and that seemed to have the effect I wanted and it made the end-of-file logic clearer, at least to me.

Now, why didn't Dave do it that way too? I suspect because he adapted his programs for the 32sii and 20s from an existing HP-67 program that did MORE than just find prime factors, and considering the other functions that that program had, there was probably a reason that the original programmer did xeq x and handled end-of-file that way. Dave also had an extra label that was unnecessary (Lbl A for the 20s and Lbl Y for the 32sii) in this code that was undoubtedly in the original code and Dave just left it there in case it was necessary here, which is is not since there are no other references to A or Y.

The other label I got rid of, Lbl V (which a followup poster in the original thread listed as a solution to the problem that the 32s has no x<=y), could be safely deleted by changing the order of variables M and F on the stack and using x>y. The followup poster probably considered this option but was unsure if changing the stack order would harm the rest of the program, and I looked at it and determined that it wouldn't. As you know, changing the order of things on the stack sometimes goofs everything up, but sometimes it has no effect, as in this case (I hope and think!).

I'm pretty sure these changes are correct. I've tested them with a bunch of numbers that are prime and not prime and it still seems to give me the correct factorization.

Don

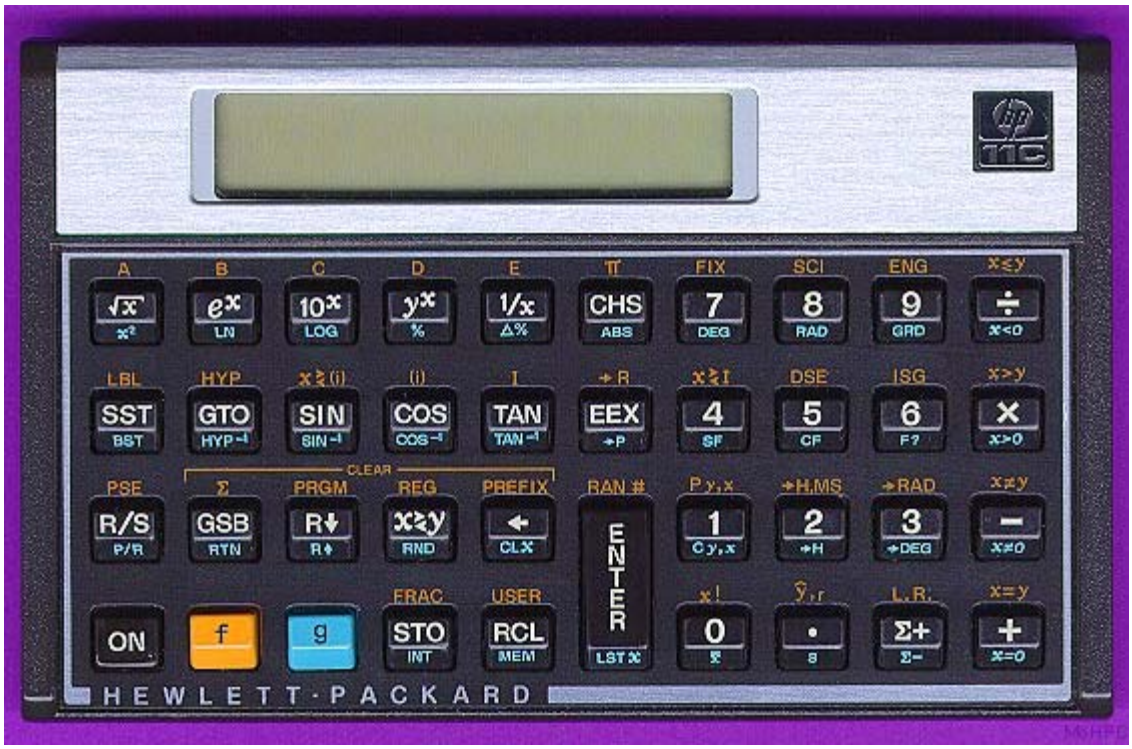
HP-11C - Amazing Battery Life

*Message #1 Posted by **Bill Zimmerly** on 6 July 2010, 8:13 a.m.*

Today (7/6/2010) I removed the *original* batteries from my 1986 HP-11C and wrapped it up for permanent storage in my collection. I used the calculator infrequently over the years, but it was always nearby for a quick calculation. Believe it or not, the batteries still powered it enough for usage today. I am amazed! 24 years on the original set of batteries! Wow!!!



(The image is from *this* site and is not my calc.)

Edited: 6 July 2010, 8:16 a.m.

Re: HP-11C - C'mon HP !!! Bring 'em Back !

*Message #2 Posted by **John Stark** on 6 July 2010, 12:47 p.m.,*
in response to message #1 by Bill Zimmerly

Dear Bill:

What a beauty.

I know this has been beaten to death already, but here is another plea to HP to bring back a horizontal-format scientific of traditional construction and layout.

I recently bought a "gold", garden-variety HP.12C (no "Platinum" or "Anniversary" gingerbread) and am

pleased to say that, at least in feel, it approaches the 1980's original.

We'll see how it holds up - I may not be around in 24 years to check the batteries :).

In any case, HP CAN produce a stout, well built horizontal format machine, and with use of modern central processor and ROM system program it any way they want.

New faceplate and keys and you have ---->>>> HP.11/15C II ++

Last, but not least, some of you microcode experts may be able to "reprogram" the 12.C through its plug and provide a keyboard overlay for an "Ersatz-15" or such.

John Stark

There is no such thing as a traditional landscape (or as you term it...horizontal-format) HP calculator. Everything before and after the unfortunate landscape Voyagers has been in the much more practical portrait format...for very good reason: The landscape format is terrible for those who ever actually use a handheld calculator as (imagine this!) a handheld calculator. HP has done a number of stupid things in the years since the HP-35 appeared...but they've never been stupid enough to re-introduce the Voyager format except for those interminable HP-12C variants that appeal to business major types.

Re: HP-11C - C'mon HP !!! Bring 'em Back !

*Message #5 Posted by **Bill Smith** on 7 July 2010, 4:32 p.m.,*
in response to message #3 by Mike Morrow

As one of those who have actually used the 15C as a hand held, I must disagree with your assessment of its utility. It is my favorite calculator, precisely because it worked so well as a shirt-pocketable and hand held device in my earlier days, mostly spent on my feet in a lab and field environment. The HP-25 and and 41 rarely left my desk.

in response to message #5 by Bill Smith

There is nothing natural about using a Voyager as a **handheld** calculator unless one has a very bizarre palm and finger-length arrangement. Those who like that layout usually will ultimately

admit that its real appeal is that it is sooo "cutesy". I still have two HP-15C units and one HP-12C unit that I've used for more than 25 years, and IMHO their landscape arrangement is idiotic in the extreme. The portrait Pioneer HP42S greatly exceeded and improved the capabilities of the HP-15C in every aspect. Unfortunately, the HP42S is 1988 technology, and HP hasn't the technical talent to produce something with the capability and size of the 22-year-old HP42S. Instead, abominations like the HP32SII, HP33S, and HP35S characterize the best that HP has been able to muster the past two decades. However, I fully admit that for a rather large calculator, the HP50G is a damned fine machine, one that is much better than TI competition. I wonder who HP got to design it.

Re: HP-11C - C'mon HP !!! Bring 'em Back !

*Message #7 Posted by **Thomas Radtke** on 8 July 2010, 12:01 a.m.,*
in response to message #6 by Mike Morrow

Maybe just a problem of mine: I rarely have enough 'vertical' space left on the desk to place a portait calculator, but my TI-66 fits nicely underneath (would 'below' be the better word to use?) my keyboard. I agree, it certainly is not made to fit the palm, but I prefer using the calculator on a more stable surface anyway.

I don't want to buy another new HP calculator due to all the problems they have. OTOH, a reintroduced 15C could make me think twice.

in response to message #4 by Alejandro Paz (Germany)

I wonder if, as part of the HP / Agilent split a few years ago, there had to be an agreement of some sort agreement that Agilent would not develop any directly competing products.

If so, they would have to focus on specific markets like this and might not be able to produce a "for the masses" device.

Just speculating. Really. I have no knowledge at ALL whether such an agreement is / was made. If there WERE an agreement, then this speculation might explain. But...

Re: An Agilent patent on a calculator

*Message #7 Posted by **Namir** on 6 July 2010, 10:28 a.m.,*
in response to message #6 by gene wright

My diabetes specialist has complained for over 10 years about the decentralization of medical records and the lack of specialized tools that gather and access patients' data. Today he has such tools in his office. The machine in question might be an attempt to service the medical market using a calculator-based tool.

CFA Exam and calculators

*Message #1 Posted by **Joe Burwell** on 5 July 2010, 5:48 p.m.*

I believe the HP 12C is the only HP calculator approved for the CFA exam. Is there any chance the HP 30b will ever be approved to use on the exam?

Re: CFA Exam and calculators

*Message #2 Posted by **gene wright** on 5 July 2010, 6:35 p.m.,*
in response to message #1 by Joe Burwell

Don't know. Probably not something HP can really answer either. The group that administers the CFA exam is probably reluctant to change, as many groups are.

On another note, in the past, I was a video review lecturer for a CFA exam review course. Did 2 hours on using the 12c. 3 hours on using the TI BAII Plus.

Did a live session in San Francisco on statistics - inferences and hypotheses testing. Yum. :-)

But, as to your basic question, the answer really is that no one here knows or would be able to predict. Sorry!

Valuing of Calcs and Related Stuff?

*Message #1 Posted by **Woody** on 5 July 2010, 2:37 p.m.*

Although I have been and probably always will be a great HP calc fan, I have been away from the forum for the last few years with work, I have sort of lost track of the value of some of the calc-related stuff that I have.

I am probably going to sell most of what I have gathered together, since my work and interests have taken me in different directions, but I don't know what any of the calcs, parts, or manuals are worth. I assume this question also comes up when considering another purchase, insurance coverage, shipping costs, etc.

Is there any other way of identifying what to sell it for other than the obvious auction site? I have looked through the classifieds and don't see enough history to tell me. I thought that there used to be a vintage calculator website, but I haven't found it. I remember the pricing guide of several years ago, but I don't think that it has been updated for a while.

I am not trying to post an ad in the forum, but if this violates the rules please delete it.

Re: Valuing of Calcs and Related Stuff?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 July 2010, 3:07 p.m.,*
in response to message #1 by Woody

Hi, Woody;

what about having a look at the Classified Adds? Chances are you'll find better, up-to-date references.

Cheers.

Luiz (Brazil)

(I am still trying to find an HP41 HPIL unit for sale, to be kept as a spare unit, and a CX fullnut... The very moments, amongst many, I would like to have a chance to buy somewhere else without worrying about paying more of taxes then price/cost...)

Re: Valuing of Calcs and Related Stuff?

in response to message #1 by Woody

> Quote:
>
> Is there any other way of identifying what to sell it for other than the obvious auction site?

Well, the advantage of the auction site is that you don't have to determine the value, the bidders will do that. There are enough people wanting to buy classic HP calcs that you will most certainly get the highest price that knowldegeable (and unknowledgeable, sometimes) bidders are willing to pay.

If I wanted to sell any of my HP calcs, which I don't, I'd probably try the museum classified ads first, because you know that these folks really care about and know HP calcs. I recently bought a calc through the museum classified ads and it was a very pleasant experience; I recommend it.

Re: Valuing of Calcs and Related Stuff?

*Message #4 Posted by **Woody** on 5 July 2010, 4:22 p.m.,*
in response to message #3 by Don Shepherd

Actually, I have sold a few items in the classifieds several years ago. I also think it is probably a good place to post things like this.

Re: Valuing of Calcs and Related Stuff?

*Message #5 Posted by **Juergen Keller** on 5 July 2010, 5:59 p.m.,*
in response to message #4 by Woody

Auction site: good chance to get a high price for your HP stuff
Classified ads: good chance to find a good new home for your HP stuff
If you are lucky you get both, good price and good home, on both sites ...

Re: Valuing of Calcs and Related Stuff?

*Message #6 Posted by **Namir** on 6 July 2010, 2:59 a.m.,*
in response to message #5 by Juergen Keller

Agree ... you can experiment by selling a few items on both sites and see which site gives you more satisfaction (ease of transactions, prices, payments, mailing fees/issues, and so on). After selling a few items you can focus on one site to sell the rest of your calculators and accessories.

Namir

Just out of curiosity: What would you consider to be a _bad_ home for your HP stuff?

Regarding the question: I would go the eBay (not afraid to call it by name!) route. Using the classifieds, I think would be a little suspicious - unless the buyer is one of the regular posters here - especially with high-value items.

Regards, Max

in response to message #7 by Maximilian Hohmann

> Quote:
>
> Just out of curiosity: What would you consider to be a _bad_ home for your HP stuff?

I think the definition of "good home" comes to mean "someone who really appreciates, knows a lot about, and wants the calculator for the long term".

Myself, the quintessential "bad home" would be someone that I gave a good deal to, under the expectation that they're a kindred spirit and happy about the acquisition, but then they turn it around and try to profit from the deal, coburlin-style.

(EDIT: I also suppose the definition would also include someone who intends to destroy the calculator while wearing a TI t-shirt as a means of performance art, but I don't think there are many of those out there.)

When I had the nice luck of finding a lot of working HP 27 calculators at a surplus sale, I sold nearly all of them through this forum and they were great transactions. I think it worked out best all around: I got a reasonable price (~ current eBay auction value minus 20%), the buyers finally got the scarce calculator they were looking for (at a reasonably good price), and I got to meet all these nice HP enthusiasts all over the world. I wish I could have that sort of luck again, and only partially for the money.

Hmm, a 'good' home is where the stuff is appreciated and taken good care of. A 'bad' home is just the opposite ;-)

Probably, you just have more control when selling by ads than by auction. But as prices are quite high, only fans will spend so much money, so the new home will be 'good' anyway.

Re: Valuing of Calcs and Related Stuff?

*Message #10 Posted by **Maximilian Hohmann** on 6 July 2010, 4:18 p.m.,*

Hi!

> Quote:

> Hmm, a 'good' home is where the stuff is appreciated and taken good care of. A 'bad' home is just the opposite ;-)

I once (not so long ago) killed a nice HP-25, actually my all-time favorite calculator, by using it every day. Maybe not really using it, but carrying it around in my bag in case I might need it.

I am still unsure if I was a good owner (using it what it was designed for despite it's old age) or a bad owner (by not putting it into a shoe-box together with hundreds of its companions)?

Regards, Max

Re: Valuing of Calcs and Related Stuff?

*Message #11 Posted by **Michael de Estrada** on 6 July 2010, 4:53 p.m.,*
in response to message #10 by Maximilian Hohmann

Funny you should mention the HP-25, because it is one of my favorites as well and IMO about the best hand-held ever made. I believe that all my calculators, regardless of rarity, deserve to be used, but not abused or misused. Therefore, I do not have any truly "mint" calculators, and have chosen to use all my calculators, even when I received them NIB, never used and in original packaging. I take what I consider to be reasonable precautions, such as not charging the battery pack inside my Woodstocks. Yes, even my Red Dot gets powered up on occasion, although admittedly I don't use it heavily.

Re: Valuing of Calcs and Related Stuff?

*Message #12 Posted by **Juergen Keller** on 7 July 2010, 8:38 a.m.,*
in response to message #10 by Maximilian Hohmann

You're a good owner if you bring the HP-25 back to life, or if you at least don't throw it to the bin ;-)

I have the same attitude as you: I use my HP calcs (or rather play with them) and don't put them to storage. For me it's just too boring to only look at them ...

Re: Valuing of Calcs and Related Stuff?

*Message #13 Posted by **DaveJ** on 6 July 2010, 7:12 p.m.,*
in response to message #1 by Woody

Ebay has a "completed items" option that tells you what things have actually sold for in the past 3 months. Just search for your model(s) and there should be some history there, then set your minimum price a bit below the average figure.

Dave.

Re: Valuing of Calcs and Related Stuff?

*Message #14 Posted by **DavidShenk** on 7 July 2010, 1:35 a.m.,*
in response to message #13 by DaveJ

Unfortunately, it's more like 3 weeks. That is fine for popular items, but not too good for researching more rare items. I'm still curious about the value of the plotter module for the HP41, but they just don't sell

often.

If there is a website that keeps track of previously sold items, or a way to do a google search, I'd like to know.

Dave

Re: Valuing of Calcs and Related Stuff?

in response to message #1 by Vieira, Luiz C. (Brazil)

Thanks, but your 4th July congrats are neither appropriate for nor wanted by Canadian north americans.

Re: Happy 4th. of Jully, folks!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 July 2010, 2:47 p.m.,*
in response to message #2 by P.Hart

HI;

Forgive me but I am not aware of what you are referring to; lack of historical background from a foreigner, perhaps. Anyway, my wishes go to those who are celebrating the date, right?

BTW, forgive me again if I am jumping into conclusions but as your biblio tells you are in England and you are thanked for what I wrote, are you from the US as well?

Cheers and thanks for the warning.

Luiz (Brazil)

Re: Happy 4th. of Jully, folks!

*Message #4 Posted by **Geoff quickfall** on 4 July 2010, 3:11 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

No need to apologize Luiz!

Canadians, part of the North American continent which includes Mexico, celebrate the Confederation day on July 1st (aniversary of July 1st, 1867; akin to the U.S. residents celebrating July 4th, 1776). My ignorance extends to the Mexican's founding day (?).

The confusion occurs when people refer to U.S. citizens as North Americans excluding the other two nations. The correct terms would be U.S. citizens, Canadians and Mexicans which are all North Americans by definition.

So the appropriate statement would be:

Happy 4th of July to our U.S. friends (of which I totally agree).

Cheers, Geoff

Yep, I see what you mean.

Something like to congratulate the South Americans for, say, Brazilian´s 7th. of September (our independence day). My fault.

Cheers.

Luiz (Brazil)

Re: Happy 4th. of Jully, folks!

*Message #6 Posted by **P.Hart** on 5 July 2010, 9:56 a.m.,*
in response to message #4 by Geoff quickfall

Besides the geographical exceptions it's a good idea to keep in mind the historical exceptions to triumphalist celebrations. Many loyalists were involved in the New England rebellion (aka American revolution) and suffered at the hands of the rebels but they are never remembered. King George was protecting the loyalists as well as trying to crush the rebels. Also, probably many descendants of native people displaced after the rebellion do not celebrate 4th July.

Re: Happy 4th. of Jully, folks!

*Message #7 Posted by **db (martinez, ca.)** on 5 July 2010, 10:54 a.m.,*
in response to message #6 by P.Hart

Your King George picked the wrong rebels to try to crush.

Our King George The Second made the same mistake in Iraq, while ignoring the real enemy hiding in the hills of Afghanistan. I think they must all belong to the same secret club, which is not for *our* benefit.

Political O.T. Happy 4th. of July, folks!

> Our King George The Second made the same mistake in Iraq, while ignoring the real enemy hiding in the hills of Afghanistan.

Even though I take issue with your characterization of Bush 43, You are correct that the Iraq insurgency was poorly prepared for (if I take your point properly), however, don't ignore the later success in stabilizing the country and bringing democratic elections.

Certainly Bush did not give Afghanistan the full military attention it deserved, and one may make the case that the resources necessary to stabilize Iraq could have been used in Afghanistan. However, don't ignore the fact that Bush did send forces to Afghanistan *first.*

I believe the jury is still out on whether the Iraq incursion was ultimately a good thing or not. Time will tell.

I guess that statement was written by one who has not known the horrors of war and is ignorant of the effect of the invasion on ordinary Iraqis. Just a few facts:- Before the invasion Iraq was internally stable. Since then well over 100,000 civilians have died violently, many of them by actions of the invading armies. Killings continue. Some huge number of people are now refugees from Iraq. One of the birthplaces of western civilisation has been vandalised. In 2003 guards were provided for the ministry of oil but cultural treasures were left to be looted from museums. The US army has built a base on at least one ancient site. One could go on. The invasion of Iraq was completely unnecessary and thoroughly wicked.

I would guess the above was written by someone who conveniently ignores the conditions that existed prior to the 2003 invasion, and the positive changes that have happened since.

> Quote:

> Just a few facts:- Before the invasion Iraq was internally stable.

Most repressive dictatorships are indeed "internally stable". Most of the time. It is approaching stability again - but now with a democratic government.

> Quote:
>
> Since then well over 100,000 civilians have died violently, many of them by actions of the invading armies. Killings continue. Some huge number of people are now refugees from Iraq.

The deaths caused by Saddam and his regime are so numerous that no firm number is agreed upon by researchers. In any case several times the number you quote.

Using your logic is akin to saying that the Allied war against Germany was reprehensible because it resulted in the deaths of over 4,000,000 Germans!

War is always an evil thing. So let me rephrase my offending statement:

I believe the jury is still out on whether the Iraq incursion was ultimately the lesser of evils, compared to allowing the dictator to continue to murder his own people, and threaten his neighbors. Time will tell.

Re: Political O.T. Happy 4th. of July, folks!

*Message #11 Posted by **P.Hart** on 8 July 2010, 3:31 p.m.,*
in response to message #10 by Martin Pinckney

See http://english.aljazeera.net/news/middleeast/2010/07/2010 7717324072400.html for news of the latest 50 to die violently in Iraq (some pilgrims, yesterday). I wonder how many would have preferred to be alive under Saddam rather than dead in a dubious democracy which (given Iraqi tribal structure) can last only while propped up by US guns. See also e.g. http://www.opendemocracy.net/conflict-iraqconflict/women_ 2681.jsp for the deteriorating situation of women in Iraq since the invasion.

The Iraq invasion had nothing to do with democracy nor with anti-terror (Saddam did not tolerate Al Quaeda). The sole touted excuse for the invasion was non-existent WMD, and the UN inspectors had to be turfed out before they reached the unwelcome conclusion that there were no WMD. Numerous dictators elsewhere need not worry as they will not be bombed into democracy if they have no oil. Even in the anti-Nazi war (which you mention) the US was content to rake in the dollars for armaments (while I was being bombed nightly by Adolf Hitler) until it was forced into the war by Japan. Oh, and in the Iraq/Iran war Saddam was the US's favoured belligerent.

"Time will tell", you say. Time was all that was needed for the democratisation of e.g. Portugal, Spain and the Soviet satellites. Much better than democratisation by US bombs, bullets and depleted uranium.

Additionally, there's more to North America than Canada/Mexico/USA. The "continent" also includes central America down to Panama, the Caribbean, and Greenland. All said, there are approximately 23 countries defined being within the boundaries of North America.

Even Trinidad and Tobago, which is within eyeshot of Venezuela's urban glow (and you could probably swim there if you absolutely had to (sharks notwithstanding)), is regarded as part of North America.

Usually, the american continent is divided in North America, Central America, and South America. Your classification effectively merges Central America as part of North America (granted, it is above the Equator, after all...)

Re: Happy 4th. of Jully, folks!

*Message #14 Posted by **megarat** on 7 July 2010, 6:02 p.m.,*
in response to message #13 by Andrés C. Rodríguez (Argentina)

This isn't my classification, actually. (I.e., I'm not making this up.) There are many location-dependent definitions of continental boundaries (and yours may use the north/central/south demarcations), but this is the one most "officially" (if not commonly) employed by those in North America.

More here: http://en.wikipedia.org/wiki/North_america

> your biblio tells you are in England

July 4, 1776 was not exactly a red-letter day in England. Probably a bit of animosity still exists. But, hey, you gave us the Beatles, for which I am thankful!!

in response to message #3 by Vieira, Luiz C. (Brazil)

Not to worry, there are a vast number of Americans who know nothing about the meaning of July 4th, at least according to this poll. OTOH, I'll bet that this same 40% of 18 to 29 year olds could tell you everything about Lady Gaga.

And for those who are still wondering. Today America celebrates the anniversary of our Declaration of Independence. This was written in Philadelphia in 1776 in the midst of the revolutionary war against England.

in response to message #20 by David Hayden

Sorry for cutting the dramatics, but in my humble understanding that was a guerilla war of independence in 1776, not a "revolution". A revolution overthrows the government or administration in *its own* country or state. E.g. the British had their revolution in 1688, the French in 1789, the Russians in 1917, the East Germans in 1989. OTOH, former colonies had their movements, struggles or wars for becoming independent from their "motherlands" - and sometimes needed a revolution many years later.

Just my personal 20 Milli-Euros, of course d;-)

in response to message #21 by Walter B

Walter; you're right. i never looked at it that way. that's what the words mean though.

Luiz; i saw your original post and i just thought that Brazilians must use norte-americano as the polite replacement for "gringo" like the folks in spanish speaking South America do. Being one tenth our population; Canadians get lumped in with us a lot. They hate it. We like it, mostly because they are such good hockey players. And the Molsen. The fourm's main Canuk, George, didn't take offense so i guess you didn't make a bad mistake. I do the same thing by dragging "Americanisms" into my bad Spanish. Example: if an American girl is "hot", that's a compliment. I learned that a Chilean woman is **NOT** caliente, even if she is, and it's no compliment, and please remove your fangs from my throat so i can apologize again, senorita. por favor.

db to the rescue... (gracias, ermano!)

*Message #23 Posted by **Vieira, Luiz C. (Brazil)** on 7 July 2010, 2:09 a.m.,*

> Quote:
>
> (...)i just thought that Brazilians must use norte-americano as the polite replacement for "gringo" like the folks in spanish speaking South America do.

You could not be more correct! Whenever we say 'norte-americano' (sounds closer to North-American) in Brazil, it is actually a general reference to anything related the U.S. : people, technology, movies, food, music and so. If the reference goes to anything else we use 'america do norte' (now meaning 'north american').

I honestly regret having started this thread the way I did. Have I briefly suspected it would cause such controversy, I'd never do it. And As I saw it drifting to politics, I gave up trying to clear it out. Thank you, db, for opening the correct door.

But I still keep my wishes to congratulate the nation and people who celebrate the 4th. of July. That ´s all I wanted to do.

Best regards.

Luiz (Brazil)

"Correction" to a non-mistake

*Message #24 Posted by **Andrés C. Rodríguez (Argentina)** on 7 July 2010, 9:04 a.m.,*
in response to message #23 by Vieira, Luiz C. (Brazil)

I once (1987?) wrote a column for a national newspaper, covering Videotex systems (Videotex was a prehistoric, primitive predecessor of the current WWW). I mentioned the NAPLPS protocol, expanding the acronym as "norteamericano" [northamerican]; which was right in this case because NAPLPS was sort of an offspring from the Canadian TELIDON. NAPLPS was an ANSI standard, but it was used both in the USA and in Canada, and it was far superior than its European counterparts.

The newspaper editor felt my "mistake" should be corrected, and published NAPLPS as "estadounidense" [from the USA]...

in response to message #21 by Walter B

Yep, as a (US)American, I agree with you, indeed. And our "revolution" was fought by a pretty small portion of the population, albeit an influential part.

And we did have our true revolution later: the Civil War.

(just to get the politics thing really going here...)

Edited: 7 July 2010, 9:33 a.m.

Successful revolutions were always controlled by small fractions of the local "intelligenzia" - no other way the brute forces of the masses can be focussed sufficiently, wherever it may be. Seems to hold for guerrilla wars as well d;-)

in response to message #25 by bill platt

> Quote:
>
> And we did have our true revolution later: the Civil War.

I thought that was just a plain old civil (i.e. internal) war -- no overthrow of government was attempted, just a secession?

Where I'm from (Netherlands) the word "revolution" specifically means a popular overthrow of government, like the French Revolution of 1789 or the Russian October Revolution of 1917. Less popular takeovers like Hitler's power grab of 1933 are not usually called "revolutions" -- I guess we've mostly allowed Communists and other leftists to appropriate the word.

I was confused when I first saw books about the American Revolution in bookstores in the U.S. -- I thought to myself, didn't we cover modern history pretty well in High School? What did I miss? *grin* (In Europe the event is usually referred to as the American War of Independence or words to that effect.)

in response to message #21 by Walter B

> Quote:
>
> ...in my humble understanding that was a guerilla war of independence in 1776, not a "revolution".

Not at all. The main military effort on behalf of the American colonies was by a uniformed formal army, the Continental Army. Guerrilla tactics played only a small part. (Frances Marion comes to mind).

It was indeed a revolution against British Royal authority.

Re: Happy 4th. of Jully, folks!

So in analogy you must call the Indian struggle for independence against British Royal authority before 1947 a revolution. Really? Hard to believe d:-?

Edited: 7 July 2010, 8:33 p.m.

Re: Happy 4th. of Jully, folks!

*Message #31 Posted by **Martin Pinckney** on 8 July 2010, 11:14 a.m.,*
in response to message #30 by Walter B

Walter, I must admit I do not know enough about the history of the Indian independence movement to comment on that (But perhaps now I will study it!).

My comment was mostly about the American Revolution not being a guerrilla war. That is, independence was openly declared by an elected representative body (Continental Congress), and the war (mainly) prosecuted by an army raised by the same body. With help from militias and the French, of course.

Now during 1775, it was more of a guerrilla war, fought by militias.

Re: Happy 4th. of Jully, folks!

*Message #32 Posted by **Walter B** on 8 July 2010, 11:42 a.m.,*
in response to message #31 by Martin Pinckney

Martin, my post was just for stating my opinion the term "revolution" is not the right word for the events at the north American east coast of 1776. So I used the history of another continent for a "reductio ad absurdum". Nothing more.

MLDL2000 update

*Message #1 Posted by **Meindert Kuipers** on 4 July 2010, 11:56 a.m.*

I have worked out the hardware redesign and most of the preliminary layout, and will have a meeting with the assembler soon, I hope to have a quote before the holidays. currently the MLDL2000 V2 will be a (appr) 60 * 110 cm PCB. I have selected a transparant blue housing that is external to the HP41. It connectes with a cable to the HP41, and for that an old module with connector is needed. If you want an MLDL2000 V2, do not throw away your old modules! The new MLDL will come with a small additional piggyback PCB that has a few LEDs (visible through the transparant housing) and digital I/O signals. These LEDs and I/Os can be controlled from mcode! Instead of the I/O piggyback a microSD card controller may be piggybacked. This is a standard product that comes seperately or can be purchased by the user (see www.ghielectronics.com). As a background project, I have decided to create support for the MLDL2000 on operating systems other than Windows (Linux and OSX) and I am therefore switching from my trusted Delphi to Lazarus. During the porting I am meeting some challenges, but this is now priority before adding any more features to M2kM. In a test version I can import MOD and HEPAX RAM files mailed from i41CX (but that is still in Delhpi). Lazarus has compliers for various operating systems, and thus M2kM can become a real cross-platform application.

Re: MLDL2000 update

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 July 2010, 12:24 p.m.,*
in response to message #1 by Meindert Kuipers

Hi, Meindert;

these are GREAT news, indeed.

Looking forward to see (and buy, as I really do want) one of these 'specimens'.

Cheers and congratulations.

Luiz (Brazilië)

Re: MLDL2000 update

*Message #3 Posted by **Ángel Martin** on 5 July 2010, 5:37 a.m.,*
in response to message #1 by Meindert Kuipers

Hi Meindert,

Sounds like you have quite a number of "moving parts" going on with this new project - hope you can control the spin of that many simultaneous changes, not an easy feat.

Have you given some thought to some USB support enhancements, like device auto-recognition? I have no idea how complex that'd be (or if even feasible) but it'd be a great enhancement.

Cheers, ÁM

Re: MLDL2000 update

*Message #4 Posted by **Håkan Thörngren** on 5 July 2010, 9:12 a.m.,*
in response to message #1 by Meindert Kuipers

This sounds very interesting, the Mac OS X support in particular. Are there any more in depth information available of specifications?

Will the Mac OS X support also be available for MLDL2000 V1?

I like to see pictures! :)

Re: MLDL2000 update

*Message #5 Posted by **Meindert Kuipers** on 8 July 2010, 6:02 a.m.,*
in response to message #4 by Håkan Thörngren

It will certainly support V1, as there will always be only one software version, supporting both MLDL2000 V1 and V2. I will first port a Linux version (as I can test that easier) and then OSX. I do not have a MAC myself, and need to go to a friend to test it.

Meindert

HP-41 Games Library near completion

*Message #1 Posted by **Ángel Martin** on 3 July 2010, 11:17 a.m.*

Greetings

The Games project is close to completion - after a few weeks collecting old classic games from different sources
 - notably this museum and TOS, as well as dozens of old PPC issues.

When I first started with this idea I thought I'd end up with a couple of 8k

modules, but soon enough it became apparent that it'd have to be quite some more.

Then I got some requests to also include "adventure" games, and that of course changed things even more.

So meet the "HP-41 Games Library", which so far has reached 52k split into 4 modules as follows:

Volume I.- Rubik & Chess, an 8k Module already available at TOS
Volume II.- Funstuff, a 16k module containing traditional games
Volume III.- Adventures, a 24k Module with... yes, that!
Volume IV.- Trekkies, a (meager) 4k ROM with ST favorites.

Here's a short index of the contents, no doubt you'll recognize
 some titles (and some authors, a real who's who in the 41 world):

Volume II
=========

Function	Description	Author
-PLAYGROUND	Section Header	Ángel Martin
3DTTT	3D Tic-Tac-Toe	hp
BSHIP	Battle Ship	Luis Gasperini
FLIP	Flip-Flop	hp
HANGM	Hangman	Michael Harwood
HANOI	Hanoi Towers	Stefan Fegert
MAGIC	Magic Squares	JM Baillard
MMIND	Master Mind	JM Baillard

FRUIT	Fruit Machine	Brian Ward
HOLD	Hold Reels	Brian Ward
NUDGE	Nudge Reels	Brian Ward
SPIN	Spin Reels	Brian Ward
WIN	Winners	Brian Ward
-SOUND FX	Section Header	Ángel Martin
BZZON	Buzz mode on	Andreas Meyer
CLAXON	Claxon	Mark Power
NOBZZ	Buzz mode Off	Ángel Martin
MORSE	Morse Code	JM Baillard
RASP	Rasp	Mark Power
TONEXY	Tone	Nelson Crowle
LEFT	Moves display to left	Nelson Crowle
GOOSE	Left Goose chr	Nelson Crowle

Volume III
==========

Dungeons, by Antonio Lagana (Yes, the author of i41CX!)
Adventure, by Bruce Bailey
The Caves, by James Surber
Black Tower, by Doug Hanson
The Castle, by P. Legros & P. Marysaael
The Hobbit, by Dejan Ristanovic
Hunt the Wumpus, by David Hayden
Swords & Sorcery, by Peter O. Johnson
Arena of Death, by Tom Longland
Terror Damm, by Layne Johnsoon
Truck, by hp??

There's of course material for more, and I'll gladly add your contributions if you send me RAW files for them (both my firgertips and my wand are too tired to keep expanding it more!)

The project is under final testing phase, should be ready in a few more days. As you can imagine the testing won't be exhaustive, specially for the adventure games of course. Feel free to report errors back for correction if you happen to find some.

Have fun!

ÁM

DIM LCD HP-11

*Message #1 Posted by **aj04062** on 3 July 2010, 8:41 a.m.*

I posted this question a while ago and am reposting to see if there are any new ideas.

I picked up a Brazilian HP-11C that has a very dim LCD. One forum member suggested the Capacitor. Can someone confirm this is the cause?

If it is, can someone identify it for me?

SN is 2825B29156

Re: DIM LCD HP-11

*Message #2 Posted by **Randy** on 3 July 2010, 9:55 a.m.,*
in response to message #1 by aj04062

There are two caps, one across the battery and one in the rc clock oscillator. The battery bypass would have no effect but if the clock circuit is not the correct speed, it could affect the contrast.

The simplest means to test is to run the "X" key self-test. Typical time is about 25 seconds to complete.

Re: DIM LCD HP-11

*Message #3 Posted by **aj04062** on 3 July 2010, 10:30 a.m.,*
in response to message #2 by Randy

using a stopwatch it took about 13.5 seconds for the display to read all 8's.

Does this mean the clock is too fast. Does too fast result in a dim lcd or the other way around?

BTW, I ran the same test on my 12C and it finished about the same time. It's display is fine. (SN MY81707265)

I have a donor 12C from singapore (SN 3519S05250) which is built with the same 1 pc board. I want to determine if I can fix this with caps or if I should tear into it to replace the LCD. I prefer to do this as a last resort but will do so if it is the cause.

Thanks, Adam

Edited: 3 July 2010, 10:46 a.m.

Re: DIM LCD HP-11

*Message #4 Posted by **Randy** on 4 July 2010, 9:33 a.m.,*
in response to message #3 by aj04062

How many chips in the 15C? Two or three?

Re: DIM LCD HP-11

*Message #5 Posted by **aj04062** on 4 July 2010, 12:29 p.m.,*
in response to message #4 by Randy

on the donor 12C or the 11C (the unit I want to fix is a 11C)? Both have 1 main chip. If you mean the caps, I'll have to pull them apart again to confirm, but I think they both have 2 caps.

Re: DIM LCD HP-11

*Message #6 Posted by **Randy** on 5 July 2010, 8:40 p.m.,*
in response to message #3 by aj04062

The time you saw is correct for the one chip variant. Most likely a bad LCD but there is no way for sure to know other than to swap it out.

Re: DIM LCD HP-11

*Message #7 Posted by **aj04062** on 6 July 2010, 8:21 p.m.,*
in response to message #6 by Randy

Randy,

The donor 12C does not work so I do no know if the LCD is good. Do you know of a way to energize the display to test?

Adam

Re: DIM LCD HP-11

*Message #8 Posted by **Randy** on 7 July 2010, 8:52 a.m.,*
in response to message #7 by aj04062

The only way to test is on a working calculator.

Russian mathematician turns down $1 million prize

*Message #1 Posted by **Don Shepherd** on 1 July 2010, 11:22 p.m.*

Amazing.

Re: Russian mathematician turns down $1 million prize

*Message #2 Posted by **Ángel Martin** on 2 July 2010, 1:33 a.m.,*
in response to message #1 by Don Shepherd

Indeed, yet not that completely unexpected given his former responses to similar events. Something to reflect on, that's for sure.

Re: Russian mathematician turns down $1 million prize

*Message #3 Posted by **jbssm** on 2 July 2010, 11:03 a.m.,*
in response to message #1 by Don Shepherd

It's strange. This news is about 1 year old already but only now was published in the site you mention.
Seems like one of the reasons for turning down the prize was some attrition with a Japanese researcher that was trying to take credit for what he made.
But it's also nice to know that some people are in science just for knowledge, not for the money, even if given to them.

Re: Russian mathematician turns down $1 million prize

*Message #4 Posted by **bill platt** on 2 July 2010, 1:53 p.m.,*
in response to message #3 by jbssm

I love science, but I also have to eat :-)

Re: Russian mathematician turns down $1 million prize

*Message #5 Posted by **Gerson W. Barbosa** on 2 July 2010, 4:23 p.m.,*
in response to message #4 by bill platt

So does he, but apparently he doesn't spend much money on food. Quoting from this link:

"Every day they see him walk to a grocery shop at 1.30pm where he buys the same things: eggs, cheese, spaghetti, sour cream, bread and a kilo of oranges."

Re: Russian mathematician turns down $1 million prize

*Message #6 Posted by **Glenn Shields** on 2 July 2010, 4:49 p.m.,*
in response to message #5 by Gerson W. Barbosa

At least he peels his own citrus fruit, unlike Paul Erdos, the late number theory genius who had no

home of his own, but would get his "guardian" to peel his grapefruits for him. From the article in Atlantic Monthly about "The man who loved only numbers" (is there a book?) about 10 years ago. According to him, Mr. Perelman has "died" (left the math world), but if a mathematician friend of his had passed away, he "left." A unique breed to be sure. :~)

Re: Russian mathematician turns down $1 million prize

*Message #7 Posted by **bill platt** on 2 July 2010, 5:23 p.m.,*
in response to message #6 by Glenn Shields

I think that article on Paul Erdos was more like 20 years ago! I remember reading in Atlantic or something like it about a "homeless" mathematician who could only wear silk.

I stopped reading Atlantic regularly after college--work and HAM radio and other fun stuff got in the way--so it *must* have been 20 years ago:-)

Re: Russian mathematician turns down $1 million prize

*Message #8 Posted by **Gerson W. Barbosa** on 2 July 2010, 5:44 p.m.,*
in response to message #6 by Glenn Shields

> Quote:

[quote With a million dollars he could *leave* Russia. [/quote] And where would he go? ;-)

Pace current events, if he went to the US he might have to register as an agent of a foreign power. Or in his case, an agent of a foreign geometric topology.

HP 85 power failure

*Message #1 Posted by **Claudio Perottoni (Brazil)** on 1 July 2010, 9:29 p.m.*

Hi Folks!

I have a HP85 that just stopped to power on (no beep, no leds on, nothing on CRT). I have noticed that the power transformer (HP part number 00085-60017) has become very hot, as did the 2N6317 component on the PS/PTN board. Could anyone please provide me some details about the power transformer? For instance, what are the expected voltages on the connector J7 of the PS/PTN board (three conectors, red-white-red, that comes from the power transformer) for 220V input voltage? Before attempting anything I would like to check the output from the power transformer. Any other hint on the possible origin of this problem that could help to bring my HP85 back to life is very welcome!

Regards,

Claudio

Re: HP 85 power failure

*Message #2 Posted by **Thomas Falk** on 2 July 2010, 6:45 a.m.,*
in response to message #1 by Claudio Perottoni (Brazil)

Hi Claudio,

at the address

http://www.series80.org/Manuals

you can find an service manual for the hp85 under the name of a Computer Laerning Guide:

http://www.series80.org/PDFs/HP85-RepairCourse.pdf

On Page B5 you will find some voltages to expect on the boards. I suspect that the transformator is not the cause of your problem.

I wish you luck,

Thomas

Re: HP 85 power failure

*Message #3 Posted by **Claudio Perottoni (Brazil)** on 2 July 2010, 2:33 p.m.,*
in response to message #2 by Thomas Falk

Dear Thomas,

Thank you for your comments. I have taken a look at the HP85-Repair Course manual and there is now

information regarding the output voltage of the power transformer. I agree that the transformer is probably ok, but I would like to start checking the board voltages from the very beginning. Following the instructions on the Repair Course manual, I have checked voltages on J1 and J2 board connectors on the HP 85 rear board and they are all dead. There is probably a short-circuit somewhere...

Claudio

Hi Gene,

I saw your name in my inbox the other day from some HP email list I'm on that I never read. Had to do with the 30b I think.

Re: HP Solve Issue 19 available - has several articles by museum forum contributors!

*Message #4 Posted by **gene wright** on 1 July 2010, 3:35 p.m.,*
in response to message #3 by bill platt

Hey, I never gave them permission to spam people with my name! Lol

I did put an article in this HP Solve issue about making key assignments on the HP 30b. Was it related to that?

Downloading the PDF of the HP solve by opening the HP email and clicking through it is VERY important to indicate to HP that these things are USED by the recipients!

I think this will become as close to a reincarnation of PPC as we will ever see again, Datafile present exception of course. ;-)

in response to message #4 by gene wright

Haha, I only saw you because you were in my field of vision in the preview pane. Now I see that Geoff is in there, too, and Jake and Richaard and and and.

And here is a good tidbit from Jake:

"One such idea, HP Solve #19 Page 44 Page 3 of 5 proposed in 2005 by Tim Wessman, won HP's annual Design-the-Calculator contest. He suggested physical keys surrounded by an E-Ink surface where the key labels would appear and remain there (even if powered off), until changed. More recently, Samsung has developed a mobile phone called the "Alias 2", with E-Ink on each key so the labels may change depending upon the currently-active application. (See figure 4.)"

No wonder Tim has a job now!

I wonder where Ben S. is these days? He won that contest as a high school student some years ago--maybe the first year they did it?

*Message #17 Posted by **geoff quickfall** on 2 July 2010, 7:58 p.m.,*
in response to message #1 by gene wright

Hello all,

Gene, Pete and Jake as well as Richard, thanks for the interesting articles. The HP 30b is on the desk as well as the 41CX (again). Nothing like a good magazine to cause one to haul out the calcs from the display case.

As with any essay, thesis or article, typos manage to squeak through. Having read and re-read and had others do the same, somehow the instructions on page 4 of 13 on my restoration article got duplicated in mid stream replete with the appropriate sequential numbers!

Easy fix but to late for the editor to change it; so it you are reading that article, remove instructions 7 through 12 associated with figure 5, smoothing the label. It is obvious when you read the instructions, but what the heck. These are just repeats of the first 6 instructions:

```
7. Heat the label.
8. Remove the label.
9. Remove the adhesive from the label, citric based adhesive
   remover will work.
10. Remove the adhesive from the bottom shell.
11. Place the label between two thick sheets of vinyl, an
    ID .holder works well.
12. Place the ID holder and label facing up on a flat surface; a
    thick glass pane on a kitchen counter for example
```

The other articles are fantastic and Richard Nelson has given us something that we all will find informative, historical and interesting.

Cheers, Geoff

97 printer paper not advancing

*Message #1 Posted by **Keith Beyer** on 30 June 2010, 10:44 p.m.*

Hi, I've looked at the articles to repair the 97 printer gear, but my problem is that the paper is not advancing. The pinter prints fine, but the paper does not, or barely advances. Does anyone have a solution for this?

Thanks!

Re: 97 printer paper not advancing

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 June 2010, 11:01 p.m.,*
in response to message #1 by Keith Beyer

Hi;

In the HP41 peripheral printer (82143A) there are two small springs in each edge of the clutch axis that ensure enough pressure is provided to pull the paper as the clutch rotates. Can you check if the HP97 also has them and, if so, if they are correctly placed?

Cheers.

Luiz (Brazil)

Edited: 30 June 2010, 11:01 p.m.

Re: 97 printer paper not advancing

*Message #3 Posted by **Ignazio Cara (Italy)** on 1 July 2010, 1:05 p.m.,*
in response to message #1 by Keith Beyer

Hello Keith, I can suggest my procedure for fix this problem, but you must know that will require to take apart all the printer assembly. If you aren't skill enough, I can fix your printer if you send it to me. BTW I live in Italy! If it's not a problem for you...

Take care

Ignazio

Re: 97 printer paper not advancing

*Message #4 Posted by **Keith Beyer** on 5 July 2010, 5:54 p.m.,*
in response to message #3 by Ignazio Cara (Italy)

Hi Ignazio,

Thanks for the offer. I did find some more postings in the archive. It appears all advance wheels are turning, but the rollers just don't grab the paper. So I will try one of the fixes I saw very carefully using

sand paper to "roughen" the surface of the rollers.

Thanks again, but I think sending the calc to Italy would be a bit much for me.

Re: 97 printer paper not advancing

*Message #5 Posted by **Klaus** on 6 July 2010, 1:54 a.m.,*
in response to message #4 by Keith Beyer

I don't know the condition of your rollers, but one some of my calcs, the rollers, which should have a circumference shaped like a circle have a flat spot on them. Sandpaper helps a bit, but still produces uneven paper advance. I think you still have to rebuild the rollers.

Re: 97 printer paper not advancing

*Message #6 Posted by **Keith Beyer** on 6 July 2010, 8:06 p.m.,*
in response to message #5 by Klaus

Hi,

Thanks for the posts. I followed the procedure I found in Archive 15:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=89643

Basically, I cut a narrow (about 3 mm) and long (a few inches) piece of 600 grit sandpaper. I fed it through with the grit facing the roller (grit toward the front of the calc) and pressed the paper advance as I alternately held the tail of the piece of sandpaper and released it. This way it would scrape the roller and advance alternately. It took multiple passes on each roller, but now the paper is advancing as it should!

Thanks to those who posted and thanks to the original posts in the archive - and the Museum for maintaining the archive to begin with!!

Es un milagro

*Message #1 Posted by **Michael de Estrada** on 30 June 2010, 7:05 p.m.*

Some of you may recall that I previously reported the demise of my HP-25C, or more specifically it's continuous (CMOS) memory. It had been working fine for years off NiCads, which I only charged outside the calculator. Then, suddenly, I could no longer store programs in memory or data in the registers, however, all other functions of the calculator worked fine. I figured that CMOS memory had finally failed, perhaps stressed by prior use of the AC charger.

I went about looking for a donor calc with CMOS memory, but then found another perfectly functional and cosmetically excellent HP-25C for a very reasonable price IMO, and so I bought it. Meanwhile, I opened up my old failed unit, and decided to give the main PCB a good cleaning in white vinegar, since there was some evidence of corrosion. When I re-assembled the calc and switched it on, all I got was some faint activity in the display and then nothing. I opened it up again, and noticed that a solder joint connecting circuit traces near one of the battery terminals was missing. So I fired up the soldering iron and laid down some solder to re-establish the connection. When I re-assembled the calc and powered it up, it was again working. But then came the astonishing thing, CMOS memory was working again! I stored and ran a short program, and stored and recalled a number from all 8 registers. Furthermore, when I switched the calc off and then on again, the contents of memory had been retained.

I don't know if there is any direct connection between the bad solder joint and the previous problem with CMOS memory, or if perhaps the cleaning had something to do with this, but frankly I am just happy to have my calc fully operational again. To me, it's simply a miracle.

Yo non creo en las brujas...

HP 35s. Base conversions, fast way

*Message #1 Posted by **Pablo P (Spain)** on 30 June 2010, 2:00 p.m.*

Hi all, we know that base conversions in HP 35s require many keystrokes. Input of numbers in bases other than 10 require the suffix to be explicitly entered. Apart from that, to type A B C D E F digits require the hexadecimal mode to be set. I will prove that these programs will reduce the keystrokes in many situations.

```
HP 35s. Base conversions, fast way.

Table of Contents
=================
1 Using the program
        1.1 Example 1: Convert (F1)h to decimal
        1.2 Example 2: Convert (63)d to binary
        1.3 Example 3: Convert (99)d to hexadecimal and return to decimal mode
        1.4 Example 4: Convert (FF)h to binary, go back to decimal mode and later convert
(17)o to binary
2 Program listing
3 Registers
4 Revision

1 Using the program
~~~~~~~~~~~~~~~~~~~

  This set of programs are intended to do base
  conversions using less keystrokes. I will show you
  some examples comparing the standard way and the use
  of this set of programs:

1.1 Example 1: Convert (F1)h to decimal
---------------------------------------

    This is the best case. When you convert from
    hexacecimal to any other base:

      Original method   This program
     -----------------+--------------
             blue-key   XEQ
                    1   D
                    2   ENTER
              1/x (F)   1/x (F)
                    1   1
             blue-key   blue-key
                    1   1
                    6   6
             blue-key   R/S
                    1
                    1

        11 keystrokes   9 keystrokes

1.2 Example 2: Convert (63)d to binary
--------------------------------------

    This is the worse case. When you convert from
```

non-hexacecimal to other base:

Original method	This program
blue-key	XEQ
1	B
4	ENTER
6	6
3	3
ENTER	R/S
6 keystrokes	6 keystrokes

After converting the base, the calculator is set on binary mode (in this example). In many situations we want to go back to decimal mode to do other calculations. I will show you this in the next example.

1.3 Example 3: Convert (99)d to hexadecimal and return to decimal mode

Original method	This program
blue-key	XEQ
1	H
2	ENTER
9	9
9	9
ENTER	R/S
blue-key	R/S
1	
1	
9 keystrokes	7 keystrokes

1.4 Example 4: Convert (FF)h to binary, go back to decimal mode and later convert (17)o to binary

This is a common situation.: We do a conversion. Then we go back to decimal mode to do other stuff. And after a while we need to make other conversion to the same base as before:

Original method	This program
blue-key	XEQ
1	B
2	ENTER
1/x (F)	1/x (F)
1/x (F)	1/x (F)
blue-key	blue-key
1	1
6	6
blue-key	R/S
1	R/S
4	R/S
blue-key	1
1	7
1	blue-key
blue-key	1
1	7
4	R/S
1	
7	
blue-key	
1	
7	
ENTER	

```
        23 keystrokes   17 keystrokes

hp 41 register swap

*Message #1 Posted by **Sok-khieng Chum Hun** on 30 June 2010, 1:48 a.m.*

Hi, I saw that in some program in hte hp 41 program library section, this function : X<>T or X<>Z

how do I do this on my calcualtor? I tried to figure it out on my calculator but didn't find how to :S

Thank you :)

Re: hp 41 register swap

*Message #2 Posted by **Karl Schneider** on 30 June 2010, 2:51 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

> Quote:
>
> Hi, I saw that in some program in the hp 41 program library section, this function : X< >T or X< >Z

Good question. That one's rather arcane, and I had to learn it as well, about eight years ago.

```
[XEQ]
[ALPHA] X
[SHIFT] I   (gives < ; check the plate on the back of the HP-41)
[SHIFT] J   (gives > ; check the plate on the back of the HP-41)
[ALPHA]     (wait for the HP-41 to show 'X<> __', prompting for a two-digit register
number)
  .         (The HP-41 shows 'X<> ST _', now prompting for a stack register X, Y, Z, T, or
L)
  Z         ('X<> Z' is displayed or executed)
```

"X< > " is an open-ended function, found in CATALOG 0. Completion with stack register X will form an "X< > X" function that can be programmed or executed, useful only as a no-op that consumes clock cycles. It is also noted that "X< > Y" is not displayed the same as the built-in
"X< >Y", and likely does not have the same op-code.

If the [SHIFT] key is pressed instead of [.], indirection "IND" is invoked. [SHIFT] [.] will allow exchange with a storage register whose number is in a stack register.

Among the RPN calc's, only the HP-41 and HP-42S offer direct exchange between stack registers. The HP-42S will display "X< > ST Z", because 'Z' can also be the name of a variable.

Voyager-series connection: On the face of the HP-15C, the open-ended "X< > " replaced "X< >I" and "X< >(i)" on the face of the HP-11C, opening a valuable position and creating 27 unique functions completed with {0-9}, {.0-.9}, {A-E}, I, and (i). Sharp thinking; sound engineering.

Hi, where can I find more information about ucalc (its hardware, specifications, etc...)? Any official website?

Thanks Pablo (from Spain)

Re: uCalc

*Message #7 Posted by **Bill Zimmerly** on 2 July 2010, 4:21 a.m.,*
in response to message #1 by DaveJ

Dave - your Youtube videos are fantastic! Great job, and I love the enthusiasm that you bring to your work.

Not only was I highly entertained, but I learned a lot of things too.

Although they were all great, my favourite video was #31 on the documentation of the NEC micro-controllers. Also, the series on your DIY watch and the Bible of Electronics, "The Art of Electronics" - keep up the good work!

Sting curiosity

*Message #1 Posted by **Alberto Fenini** on 29 June 2010, 12:52 p.m.*

ciao a tutti,

pure curiosity...
Has ever existed an external battery charger for the
HP10 and HP19C ??

Take care Alberto

Re: Sting curiosity

*Message #2 Posted by **Katie Wasserman** on 29 June 2010, 2:51 p.m.,*
in response to message #1 by Alberto Fenini

Hi Alberto,

I've asked the same question before, and the answer is no.

-Katie

Re: Sting curiosity

*Message #3 Posted by **Alberto Fenini** on 29 June 2010, 5:27 p.m.,*
in response to message #2 by Katie Wasserman

ciao Katie, thanks for the reply
That's too bad,
I'm thinking about adapting a HP91/92/97 power pack
To me,it should make sense, both batteries packs have the same
voltage output although maH capacity is different.
Even the width of the power pack should be make possibile to host the
Sting battery pack

What do you think ? Waste of time or it might work ?

Re: Sting curiosity

*Message #4 Posted by **Michael Meyer** on 29 June 2010, 6:33 p.m.,*
in response to message #3 by Alberto Fenini

Alberto, I've modified all of my Sting packs by cutting out the two cross-bars on the front side and gluing in three sets of double springs to allow me to place regular AA rechargeable batteries into the packs. You can then easily charge the batteries in a regular charger. This eliminates the danger of trying to charge the pack in the calculator. With the newer NiMH batteries that hold their charge for up to a year, I've had no problems at all. Just a thought.

Re: Sting curiosity

*Message #5 Posted by **DavidShenk** on 29 June 2010, 10:08 p.m.,*
in response to message #4 by Michael Meyer

That is a good idea. From a comment in another thread, isn't the danger to the calculator "eliminated" if you only charge in the calculator, never turning it on when it is plugged in? I just bought a 19c, so I'm trying to figure out what I want to do.

Dave

Re: Sting curiosity

*Message #6 Posted by **Michael de Estrada** on 30 June 2010, 10:11 a.m.,*
in response to message #5 by DavidShenk

Well, it is probably only totally safe to charge a battery in a Woodstock/Sting calculator w/o continuous memory, because even with the calculator switched off, power is still being delivered to continuous (CMOS) memory. Any calculator with the "C" suffix in the model number (25c, 29c, 19c) has continuous memory.

Re: Sting curiosity

*Message #7 Posted by **Alberto Fenini** on 30 June 2010, 5:49 a.m.,*
in response to message #4 by Michael Meyer

ciao Michael,

that's a good idea, no doubt about it.
This said, let me tell you that I do belong to the category of collectors that will not use his toys(*)
I'm trying to keep them as much as possible close to the original look, which is why I have recelled my pacs and I wish I can avoid the modification.
Considering that even the power supply has the same voltage output for both Topcat and Sting, I think it should work.

It's more the pleasure of making it that the real need ....

(*) not really true, this is my idea of using the collected items :

1st unit : definetely collection item, not for use
2nd unit of the same model : backup of the collection, not for use
3rd unit of the same model : you never know, may be you'll need a donor ... not for use
4th unit : i'm running out of space, may be will be traded ... not for use

Honestly ... Do I need some treatment ??

Re: Sting curiosity

*Message #8 Posted by **Donald Williams** on 30 June 2010, 11:12 a.m.,*
in response to message #7 by Alberto Fenini

-"Honestly ... Do I need some treatment ?? "

Yes definitely!

And your not the only one. Example. Some of the endless discussion about purely subjective perceptions about keyboards, favourite models, etc.etc.

As a corporation, HP should do the right thing and step up to the plate, and get some help for the majority of the members of this forum. I am talking about a "12 Step Program" for the HP calculator obssesed.

Sorry I woun't be able to participate. Someone has to stay home and take care of my collection.

Programming challenge - can someone write a "12 step Program" for the calculator obssesed in RPN? :>)

Re: Sting curiosity

*Message #9 Posted by **Michael Meyer** on 30 June 2010, 11:31 a.m.,*
in response to message #7 by Alberto Fenini

I can understand re-celling packs, but to really preserve these calculators, you'd have to re-cell every 5 years or so... the cells eventually leak, etc. I think modification is an acceptable alternative that will hopefully allow the calculators to last much longer. I re-celled a bunch of non-HP's 10 years ago, and I haven't had the motivation to begin to recheck all of them. I'm sure that they will all need them replaced again.....

Re: Sting curiosity

*Message #10 Posted by **Katie Wasserman** on 30 June 2010, 11:57 a.m.,*
in response to message #9 by Michael Meyer

Michael,

I moved to using AAA and AA primary lithium cells to solve this issue.

For the classics, I made up a bunch of replacement battery packs using a 3xAAA plastic battery holder and glused metal contacts to the bottom of the holder. This fits nicely in the battery compartment.

For the spices, woodstocks and stings the solution was to just use AA lithium cells in place of the nicads.

For the topcats I used a 4xAAA plastic battery holder glued on top of one-half of the standard topcat battery pack plastic frame, with metal contacts like the classics.

So all the LED (HP and non-HP) calculators in my collection now have replaceable lithium cells that will hopefully never leak and not self discharge for many years.

But.... I remember your problem with your 19C not liking the slightly higher voltage of the AA lithium cells. I haven't had that problem yet, but it's something to be aware of.

-Katie

Re: Sting curiosity

*Message #11 Posted by **Michael Meyer** on 30 June 2010, 3:36 p.m.,*

in response to message #10 by Katie Wasserman

So far, so good. I've been asking about the lithium cells for years, now, on the Forum, and I've not heard a single report of cell leaking. (O.K., a few of the 3v flashlight cells have reportedly exploded, but that's a different formulation.) Pretty good track record over about 10 years. They all still seem to work, too! Not bad. I guess we'll find out for sure once they start dying... I'll probably end up with exploding Woodstocks or something. Anyway, so far so good.

Re: Sting curiosity

*Message #13 Posted by **Michael Meyer** on 1 July 2010, 11:01 a.m.,*
in response to message #10 by Katie Wasserman

I've been very pleased with having AA lithiums in all my HP's. I can pick up any calculator in my display case and turn it on and show it or use it, even ones that have sat for years. To me, it's well worth the higher cost of the cells. They predict a 10 year shelf life, but I'm suspecting it will be much longer than that. I'll find out fairly soon: some of my cells are approaching that age.

Re: exponential function on hp 12 c?

*Message #3 Posted by **Bart (UK)** on 29 June 2010, 10:14 a.m.,*
in response to message #2 by Bart (UK)

On second thoughts, were the main functions these keys not made with the double shot injection molding technique? This means that the key legends should never wear off?

Re: exponential function on hp 12 c?

*Message #4 Posted by **Vladan Dugaric** on 29 June 2010, 12:00 p.m.,*
in response to message #3 by Bart (UK)

On newer Chinese (and probably Indonesian) made HP-12C calculators the labels are silkscreened then the keys are sprayed with a clear matt coat that is somewhat resistant to rubbing. They do wear out after long and intensive use.

Blanknut differences

*Message #1 Posted by **Casey Drew** on 28 June 2010, 4:45 p.m.*

Hi,

I just acquired an HP41 Blanknut. I was wondering what is the easiest way to confirm if it is the Model 41C, 41CV or 41CX. There is no model labeling on the unit. Thanks!

Re: Blanknut differences

*Message #2 Posted by **Raymond Del Tondo** on 28 June 2010, 6:03 p.m.,*
in response to message #1 by Casey Drew

In an empty unit, w/o any modules plugged, CAT 2 shows whether it's a C/CV or CX. A C/CV doesn't show any CAT 2 entries.

To check for C vs CV, do SIZE 100 , then RCL 99. If no error (either in SIZE or RCL), it's a CV.

HTH

Raymond

Woodstock collectors: electrical care/prevention tips and practices?

*Message #1 Posted by **megarat** on 28 June 2010, 3:15 p.m.*

Hey all,

In the process of finding new homes for the HP27 calculators that I propitiously found at a local-ish university surplus sale, I've come to the conclusion that (unless I'm missing something) there isn't any real SOP about how to take care of these calculators, given that they are, shall I say, electrically sensitive.

For those of you who have Woodstocks, what are your thoughts? Particularly about:

-- Plugging the calculator into the wall. (E.g., is there ever a good reason to do this?)

-- What types of battery solutions are available?

-- 1.5V alkalines vs. 1.2V rechargables. (E.g., are 1.5V cells okay for long-term use?)

-- Is there a "best way" to safely charge the batteries and use the calculator to sustain its longevity? What strategy do you use?

I've found a lot of related information on this site, but scattered across different topics. Hence this post, to hopefully consolidate. I'm thinking that if we can get enough authoritative (or authoritative-ish) info for a FAQ or SOP then it can be re-posted as an article.

If you have any thoughts, I'd be curious to hear it.

Re: Woodstock collectors: electrical care/prevention tips and practices?

*Message #2 Posted by **Michael de Estrada** on 28 June 2010, 3:32 p.m.,*
in response to message #1 by megarat

My failsafe strategy is to NEVER plug the AC adapter into the calculator and wall, regardless of the condition of the batteries or whether or not the calculator is turned on. I use ONLY flat top 1.2v AA NiCads, and only charger them outside the calculator. I recently found a power pack charger so I no longer need to remove the battery cells from the holder in order to charge them.

Whether or not all of these precautions are necessary, I do not know, however, all my Woodstocks have remained functional over the years and I sleep comfortably.

Operating the calculator while the AC adapter is connected is risky, even if good NiCad batteries are installed, because if the electrical connection between the battery and calculator is not perfect, serious damage can occur.

Re: Woodstock collectors: electrical care/prevention tips and practices?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2010, 4:13 p.m.,*
in response to message #1 by megarat

Hi;

I totally agree with the fact that it is not safe charging the batteries while using Woodstocks, but it is harmless to charge the batteries while the regular Woodstocks (not the Continuous Memory type) are switched to OFF. By analyzing their circuits, the AC adapter is isolated from the calculator circuitry for as long as the ON/OFF switch is turned to OFF.

Anyway, some circumstances must be considered:

IF the batteries' contacts fail and you inadvertently switch it to ON, then you may regret that good time...

In the particular case of the HP27, which uses N-MOS circuits that are not compatible with the circuits from other Woodstocks (cannot donate to nor receive from other Woodstocks than another HP27)

The new batteries are different of the ones used some 30 years ago (ampere capacity, charging time/current, etc.) and these oldtimers would not charge these batteries accordingly.

SOOO... just let the batteries 'eat' energy from an outside source. It´s not worth the risk of burning such fine, rare and expensive HP27´s.

Cheers.

Luiz (Brazil)

P.S. - BTW, if there is any possible, tinny chance of selling one of these, a friend of mine here in Brazil is dying to have an HP27. Not me, a friend, really!

Edited: 28 June 2010, 4:14 p.m.

Re: Woodstock collectors: electrical care/prevention tips and practices?

*Message #4 Posted by **megarat** on 28 June 2010, 4:27 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I think your sentence beginning with "In the particular case of the HP27" was truncated. Or am I just mentally missing something?

Re: HP27 availability. Alas, all five of the ones that I found are now at new homes. That said (and with no regrets), it would have been fun had I heard from you earlier, as the first four ended up on four different continents (without trying). The sale of the fifth to South America would have diversified their distribution even further. Five calculators on five continents: that would have put a smile on my face.

(If you're of the teaching that North and South America are a single continent, ignore me.)

Edited: 28 June 2010, 4:38 p.m.

*Message #6 Posted by **megarat** on 28 June 2010, 7:08 p.m.,*
in response to message #5 by Gerson W. Barbosa

Awesome! We Americans are so worldly.

(Come on, who doesn't know that South Africa is located just south of Mumbambu ?)

Edited: 28 June 2010, 7:10 p.m.

Re: Woodstock collectors: electrical care/prevention tips and practices?

*Message #7 Posted by **Dave Shaffer (Arizona)** on 28 June 2010, 10:20 p.m.,*
in response to message #6 by megarat

I almost died laughing at this (fortunately (?!) my wife tells me that the Onion News Network is a spoof!). That was great. I am already planning my first trip to Mumbambu!

Re: OT: The Onion

*Message #8 Posted by **megarat** on 30 June 2010, 1:10 a.m.,*
in response to message #7 by Dave Shaffer (Arizona)

If you liked that one, I recommend looking at some of their others. They're consistently very funny.

On the topic of technology, I highly recommend this one.

Re: Woodstock collectors: electrical care/prevention tips and practices?

*Message #9 Posted by **David Hayden** on 30 June 2010, 9:30 a.m.,*
in response to message #6 by megarat

Can we have the HHCC in Mumbambu this year...?

On another note, a friend of mine says he was at a party one day. Someone asked "what is the capitol of Africa?" Without missing a beat he answered "Swahili." We American's can be so stupid sometimes.

Re: Woodstock collectors: electrical care/prevention tips and practices?

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 30 June 2010, 9:46 a.m.,*
in response to message #9 by David Hayden

In this case, I would go. Go Mumbambu!

Luiz (Brazil - in the south of America!)

Edited: 30 June 2010, 9:48 a.m.

Re: Woodstock collectors: electrical care/prevention tips and practices?

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 28 June 2010, 9:46 p.m.,*
in response to message #4 by megarat

> Quote:
>
> I think your sentence beginning with "In the particular case of the HP27" was truncated.

Yep, you are correct. I thought about writing:

'This is even worse in the particular case...'

Then I worked it out and intended to write:

'In the particular case of the HP27 this is even worse...'

And I ended up missing the 'this is even worse' part of it. I left home right after that and went back right now.

Thanks! (I hope now it is everything in place...)

About the America: geographically I see them all as one America only (hence a single name), but I must consider three of them as for their different people, cultures and history living in three different 'slices'. I cannot only take the fact that the three 'slices' are joined by common land (no ocean between them) because Europe, Asia and Africa also have a lot of joined lines.

Protective layer of the aluminium part on voyager series.

*Message #1 Posted by **jbssm** on 27 June 2010, 8:12 a.m.*

Hi all,

I've unexpectedly noticed while restoring an old HP-16C that the aluminium zone around the display is not really just aluminium; there seems to be some very thin film over it, maybe to give it a more mate finish, maybe for a bit of protection against scratching, maybe both.

I wonder if other members know what it is and how can it be re-applied to those unfortunate units that where not well taken care of and are full of scratches.

And one other thing. When polishing the unit aluminium parts, in those cases where they are heavily scratched, I managed to get a really good result, but still, I can't get the corners correct no matter how much I try, it just seems impossible to get to them and make them look exactly like the rest of the bezel. Have any tips for that?
Greets, Bruno

Re: HP-41CY emulation for NoV-64.

*Message #1 Posted by **Antoine M. Couëtte** on 27 June 2010, 1:03 a.m.*

I wish to offer just one comment about the following remark recently made in this third post down by Jean-François Garnier : " *I think the RAMBox just drives the ISA line in a weak way, so an external ROM can overdrive it.* " .

My comment is as follows :

YES ! things seem to happen exactly like this in a RAMBOX I (32K) or RAMBOX II (64K).

During my visit to him in Bergisch Gladbach Germany some 15 years ago Dr Wilfried Koëtz President of **W&W Software GmbH** explained it to me exactly as follows :

" ***A plugged in ROM will SPEAK LOUDER to the machine than a RAMBOX page*** " .

I can think of no better way to fully confirm this assumption of yours, Jean-François.

Antoine

Antoine M. "Kermit" Couëtte

Re: HP-41CY emulation for NoV-64.

*Message #2 Posted by **Diego Diaz** on 27 June 2010, 10:50 a.m.,*
in response to message #1 by Antoine M. Couëtte

Thanks for the confirmation Antoine,

The NoV-64 emulation of the CY indeed uses the principle suggested by J-F Garnier (and now confirmed by yourself), to allow physical modules to be plugged and "mask" the corresponding RAM pages.

One note to those that want to give this CY emulation a try: it does not work on Half-Nuts. Though it has nothing to do with the "weak ISA"...

I'll try to get a new version in short which can also run in Half-Nuts.

Best from the Canaries.

Diego.

Re: HP-41CY emulation for NoV-64.

*Message #3 Posted by **Winfried Maschke** on 27 June 2010, 12:06 p.m.,*
in response to message #2 by Diego Diaz

Quote:

... CY emulation a try: it does not work on Half-Nuts ...

Really? - It should be the other way around because the CY could only be a Half-Nut as there was not enough room inside the Full-Nut.

Re: HP-41CY emulation for NoV-64.

*Message #4 Posted by **Diego Diaz** on 27 June 2010, 2:25 p.m.,*
in response to message #3 by Winfried Maschke

I know, but that's how it is.

However the trouble has nothing to do with the CY (RAMBOX) code itself but with the way it is implemented into a NoV-64 module.

Cheers.

Diego.

Yes, 30 years ago I "invented" the conversion of the HP 82143 printer to print with half linefeed and wrote some programms for printing barcode. It was the time before the IL-printer HP 82162 came out and the only way to print barcode for a poor student.

And some years later when I started using internet, I found my name at www.rskey.org/gene/calcmuseum/162bc2.htm ;)

Funny Museum Posts From The Past...

*Message #1 Posted by **DavidShenk** on 26 June 2010, 7:16 p.m.*

I was searching for something or other and ran into this set of amusing postings from 2003. I thought I'd repost them for those of us that haven't been around here that long.

Anyone have another to share?

Dave

Nick on 10 May 2003 - Hello: I have a HP32sII that wont accept keystrokes, unless I press on the bezel. Then it works fine. I haven't taken it apart yet. Anybody run into such a problem? I am also wondering if it is possible to send a calculator in to HP for repair? Anybody try it recently on a recently discontinued 32sii? Thanks, Nick

Norm - the way to fix it is to carefully balance it on the mainline Burlington Northern railroad tracks. Wait for a train to come thru. After the train has passed, everything should be okey-dokey.

Randy Sloyer - Norm - don't give away all your good repair secrets. Is this the method for repairing all those 34C's you have? I was wondering how you got those chips to stay in the case. Now we know. A forged calculator :^)

Nick - Norm: I went to the railroad track. There are 2 tracks. Which one do I balance it on? I dont want to make a mistake an ruin my calculator.

Patrick - That was really funny! You idiot, it doesn't matter which track you use so long as you make sure you are standing *between* the tracks as you balance it.

Vieira, Luiz C. (Brazil) - At the moment the train passes, so you keep it in place???

Have anyone tried this enough times to confirm if it works fine? Anyone? Ahn? You?

Thanks!

8^D

Norm - If you are a really fussy repair person, you can be extra thorough with a bit of ducktape to keep it in place on the track.

As to which track (there are 2 ?) don't use the one that is used for a side-spur. If you use a sidespur, you'll be waiting too long for your calculator to get fixed.

:o)

slip cases for HP 35S

*Message #1 Posted by **Gerardo Rincon** on 26 June 2010, 3:38 p.m.*

I see the HP 35S comes now with slip cases (it's like the case for the hp 30b but bigger). My hp 35S came with a clam zipper case, which I think is too bulky. Is there a place where I can order a slip case for the HP 35S? I can't find them in ebay.

Edited: 26 June 2010, 3:39 p.m.

Re: slip cases for HP 35S

*Message #2 Posted by **megarat** on 28 June 2010, 12:11 p.m.,*
in response to message #1 by Gerardo Rincon

CalcPro tends to sell individual calculator cases, but I don't see any for the 35s right now. Dropping them a note with a request might be a smart way to go.

Re: slip cases for HP 35S

*Message #3 Posted by **John Stark** on 29 June 2010, 11:31 a.m.,*
in response to message #1 by Gerardo Rincon

Gerardo:

My experience is the same.

Slip Case for HP.33 series fits perfectly.

FWIW..

John Stark

Re: slip cases for HP 35S

*Message #4 Posted by **megarat** on 30 June 2010, 12:51 a.m.,*
in response to message #3 by John Stark

I second this. When I had a 35s, I used a 33s slipcase and it was a terrific solution.

You can get a used 33s for pretty cheap, and then sell the calculator/manual to help alleviate the cost.

Re: slip cases for HP 35S

*Message #5 Posted by **Martin Pinckney** on 30 June 2010, 8:23 a.m.,*
in response to message #4 by megarat

An eB** seller named teketron357 sells the cases by themselves. I bought one for about 10 U$D, I

think. They also work with Pioneers.

He calls them "leather", but they may be leatherette. In any case (pun not intended), they are very nice, a quality feel. They certainly look like leather, but don't smell like leather.

Owner's Manuals

*Message #1 Posted by **Don Shepherd** on 26 June 2010, 8:58 a.m.*

OK, we have discussed this topic to death, I know, but maybe if we keep hammering away at it something good might happen. I'm talking about including a comprehensive printed Owner's Manual with each new calculator. Not a file on a CD or DVD, but the real printed copy.

I've recently been playing around with my HP-20S, which came with an absolutely excellent Owner's Manual. It's got plenty of diagrams, a typeface you can actually read, example programs based upon real-world applications, all the technical information pertaining to its functions and operations, complete listing of error messages, a great index; in short, everything an owner would need to get the most out of his/her investment. And it's only 128 pages.

HP should include this type of Owner's Manual with every calculator they sell, and it should be in the package. If it means increasing the cost of the product by $5, fine, do it.

The 30b has a manual, Tim posted a link to it. But how likely is it that a non-member of this forum will ever see it (on the other hand, how likely is it that a non-member of this forum will ever buy a 30b)?

HP, are you listening? Printed User Manuals are not outdated anachronism's, they are essential ingredients of the calculator package.

Do the right thing.

Edited: 26 June 2010, 9:13 a.m.

Re: Owner's Manuals

*Message #2 Posted by **Michael de Estrada** on 26 June 2010, 9:33 a.m.,*
in response to message #1 by Don Shepherd

I hear ya. But I'm thinking that it's a waste of time attempting to make spiritual contact with the ghost of HP. The old printed manuals were written brilliantly, both technically and linguistically, and were as valuable as the calculator itself. Sadly, I'm resigned to the fact that we're unlikely to see the return of good printed owner's manuals.

Re: Owner's Manuals

*Message #3 Posted by **Katie Wasserman** on 26 June 2010, 12:51 p.m.,*
in response to message #1 by Don Shepherd

I agree, a well written printed manual with each calculator is the right way to do it. The 20b/30b manual isn't bad (I hope it will be on the HP website soon) but is lacking an appendix with the formulas used for the various financial functions. It's also lacking in examples, the on-line learning modules are indented to make up for that.

I would like to see the manual expanded to include these things and printed. It's really hard to print a properly sized manual at home with a decent binding. This can be done most cost effectively in mass by HP.

Re: Owner's Manuals

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2010, 1:22 p.m.,*
in response to message #1 by Don Shepherd

Hi, all;

up until today I use HP manuals as source of information and in-class material. A couple of months ago I showed a Portuguese (Brazilian) HP37 manual to a friend and he felt himself intrigued with its contents. Then I showed him the other two financial-addressed complements and he felt amazed with their contents. He borrowed the three of them and used many parts of them to compose some of its teaching material (amortization, cash flow and the like).

I have already used many examples taken from old manuals: HP55, HP25, HP67/97, HP34 and HP41 application packs/manuals mostly. So I treasure them all in all aspects.

BUT... I'd agree with a mid-term proposal. Sell the calculators with the CD/DVD, a brief, printed 'get started guide' like the ones that came with the HP48G, and a discounted coupon (50%? 75%?) for buying a VALUABLE, WORTH BUYING printed manual. So anyone who wants just the calculator (office? class-room?) would buy them as-is, and anyone who wants to have the manual, readily available at the sales office, would buy them cheaply, considering the affordable, discounted price. And if you loose yours, buying another would not be a problem.

If the HP ghosts are reading and you, guys, agree with, I think it would be harmless to everyone.

Cheers.

Luiz (Brazil)

Re: Owner's Manuals

*Message #5 Posted by **Gerardo Rincon** on 26 June 2010, 3:31 p.m.,*
in response to message #1 by Don Shepherd

I agree - Printed manuals make a huge difference. I just recently gave an HP 35S as a gift to a college freshman. I was hoping I could convert another TI owner to HP RPN. The manual that came with the brand new HP 35S was truly an embarrassment. It was like a flyer and the real manual came in a CD. That is no way to gain new users. I had a real manual that came with my HP 35S when it first came out and gave it to him and ordered another one from eBay for me.

Question: Are there services in the internet where one can send a PDF file and they print a manual, bind it and send it to you for a fee? It would probably be too expensive.

Edited: 26 June 2010, 3:45 p.m.

Re: Owner's Manuals

*Message #6 Posted by **NateB** on 1 July 2010, 7:50 p.m.,*
in response to message #5 by Gerardo Rincon

A manual for the 35s can be had by calling the 800 number listed in the quick ref. There is no charge, they only ask for the serial number of the calculator. I called for one on a Friday and had it on Monday.

LuLu.com is a print on demand service that has reasonable prices. The manual may have to be split depending on page count. I think they can only handle about 600 pages per book.

Re: Owner's Manuals

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 1 July 2010, 8:49 p.m.,*
in response to message #6 by NateB

Hi;

this is even better! I did not know about this because I have one HP35S (a gift from a friend: GWB, thanks!) without manual, and another one that came with an English manual, so I just red the manual without taking care for the telephone numbers and additional services because they'd not apply to my case.

I wonder where else buyers would have this kind of charge-free service.

Cheers.

Luiz (Brazil)

Re: Owner's Manuals

*Message #8 Posted by **Eric Rechlin** on 26 June 2010, 4:03 p.m.,*
in response to message #1 by Don Shepherd

It's not going to happen. I suspect that 90% of the buyers won't even open the manuals, and 90% of those who open it won't need more than is already provided in a <100 page quick start guide.

It's not fair to the majority of people who don't need the full manual to have to pay for the minority who do, especially when the full manual adds quite a bit to the shipping cost (a full set of manuals for the 50g weighs over 6 pounds!).

I think the best option would be for HP to provide a coupon with each calculator to obtain the full printed manuals at minimal or no cost. Few enough people would take them up on this offer that it wouldn't cost them much, while making everybody happy.

*Message #11 Posted by **Bill (Smithville, NJ)** on 26 June 2010, 4:33 p.m.,*
in response to message #1 by Don Shepherd

While I agree that a bound printed manual is nice, the days of printed manuals are gone and have been for quite sometime. When was the last time you received a bound manual of any size for anything you have purchased?

I much perfer the PDF of a manual than the actual bound manual. The one that usually ships is a half size or smaller manual. With a PDF, I can print it out full letter size and it really makes it a pleasure to read with my old eyes. I'm lucky to have a high speed double side printer and then a quick trip to Staples and I have a spiral bound manual.

Bill

Re: Owner's Manuals

*Message #12 Posted by **Garth Wilson** on 26 June 2010, 4:50 p.m.,*
in response to message #1 by Don Shepherd

> Quote:
>
> I suspect that 90% of the buyers won't even open the manuals.

I think a major reason people don't read manuals anymore is that the art of good manual-writing has been lost, and manuals are not clear and attractive. Another reason is that products frequently won't last long enough to warrant the time to read the manual.

> Quote:
>
> The Coupon suggestion is a great idea!

+1. I would always get it.

> Quote:
>
> I much perfer the PDF of a manual than the actual bound manual.[...] With a PDF, I can print it out[...]

When something gets that big, I won't try to print it at home. What I have done many times with technical documents is to email the file to a Kinko's or similar business for them to print it, then I go pick it up later. Even though I have the .pdf file there to see on the screen, I want it on paper. Outside of the computer's "search" function, the paper is faster to find things in, and I can put my notes in it, put markers along the edge with Post-It (or similar) notes, etc..

Re: Owner's Manuals

*Message #13 Posted by **Bruce Bergman** on 26 June 2010, 5:24 p.m.,*
in response to message #12 by Garth Wilson

Agreed -- the coupon idea is brilliant!

I'd easily pay a nominal cost for a printed manual that I can get after the fact.

thanks,

Bruce

Re: Owner's Manuals

*Message #14 Posted by **Don Shepherd** on 26 June 2010, 6:30 p.m.,*
in response to message #13 by Bruce Bergman

OK, I'll agree with the coupon idea too. HP, please make a quality printed manual available for ordering for those who want one, and I will want one!

Re: Owner's Manuals

*Message #15 Posted by **megarat** on 28 June 2010, 12:32 p.m.,*
in response to message #13 by Bruce Bergman

In a way, I think HP would regard the coupon idea as more unattractive (financially) than including it in the package and driving the price up.

In HP's cost-benefit analysis, they would need to consider the total number of manuals sold vs. the cost of production. The cost of production would be dominated by the salary/benefits/fringe/etc. of the technical writer, graphic designer, etc. If you want a clear, well-written manual, that would probably take 3-6 months to produce, which would be in the area of US$40-80k, not counting printing and logistics.

Would HP sell enough manuals to break even? I have no idea, but I suspect that this wouldn't be a clear-enough "win" for HP to go ahead with it. The cost of writing and laying out the manual is a big up-front cost that HP will need to invest whether they're printing one manual or a million.

However: if they're also releasing a PDF version of the same manual either with the calculator or for download (and thus investing in the cost of production anyway), and you're only asking for HP to print and ship a manual on demand, then HP only needs to worry about logistics. Still, HP seems to be pretty conservative about such details, so I would be surprised if they did it anyway.

Edited: 28 June 2010, 12:35 p.m.

Re: Owner's Manuals

*Message #16 Posted by **Peter A. Gebhardt** on 26 June 2010, 7:20 p.m.,*
in response to message #1 by Don Shepherd

Only my .02 EUROs:

Pls. HP take a PDF of (say) the old HP42 or HP17b manuals as a guide and use the very same typeface, keylegends and representations of numbers and symbols - and reformat the (say 30b) manual to a more readable version.

I think most of the PDF preferring forists, as well as the "printing" faction would honor this approach.

No SKU changes, no coupon handling stress - for anybody!

Best regards,

Peter A. Gebhardt

Re: Owner's Manuals

*Message #17 Posted by **Tim Wessman** on 26 June 2010, 8:38 p.m.,*
in response to message #16 by Peter A. Gebhardt

Typefaces/fonts are dictated by the corporate standard of the day. We have no choice in which fonts are used for text. Even the formatting must comply to an extent with this.

The same applies for packaging. It must match whatever the standard is at the time it is launched.

TW

Edited: 26 June 2010, 8:39 p.m.

Re: Owner's Manuals

*Message #18 Posted by **Peter A. Gebhardt** on 27 June 2010, 7:29 a.m.,*
in response to message #17 by Tim Wessman

Tim,

I feel with you, BUT did you ever try to convince upper ranks in PM or Marketing, that my proposal would only been applied to the PDFs of a "real" manual shipped on CD???

Make it happen (someway) that some "big brass" have to read the (say) 30b SKU "manual" w/o glasses - and look what happens afterwards ... ;-)

Cordially,

Peter A. Gebhardt

Re: Owner's Manuals

*Message #19 Posted by **megarat** on 28 June 2010, 12:40 p.m.,*
in response to message #18 by Peter A. Gebhardt

I suspect that the "big brass" are MBAs, not engineers. Thus they'll be more concerned about consistent branding than legibility.

Re: Owner's Manuals

*Message #20 Posted by **BruceH** on 28 June 2010, 6:09 p.m.,*
in response to message #1 by Don Shepherd

Don,

Try this. Think of it as another new hobby. :-)

in response to message #21 by Don Shepherd

I came across this ProClick system a while back. It's cheap, easy to use, close to spiral binding and sort of fun. The downside is that the low end punch machine can really only do 4 pages at time but it goes quickly.

It's much faster than a trip to Kinkos!

Re: Owner's Manuals

*Message #23 Posted by **Martin Pinckney** on 29 June 2010, 10:48 a.m.,*
in response to message #22 by Katie Wasserman

Depends on how many pages and how far to Kinkos. (The nearest one to me is 4 blocks).

Someone write an optimization program for this. {:-)

Re: Owner's Manuals

*Message #24 Posted by **Dave Shaffer (Arizona)** on 29 June 2010, 12:38 p.m.,*
in response to message #23 by Martin Pinckney

> Quote:
>
> Someone write an optimization program for this. {:-)

You may be closer than you think.

Most word processing programs have an option to print either the odd or even pages. If you do that (print odd, say) and then put the output stack back in the printer (properly oriented - may take a bit of fooling around to determine which side should be up and front or back in the paper tray!) and then print the even pages, you will have a stack of paper ready for Katie's hole puncher.

Also, check out acrobat printing. I have full-blown (i.e. not just the reader) version 5, and it, too, will print odd or even pages. Reader version 9 does not seem to have the odd/even option, but it will create a booklet: in my first try, I got it to print properly organized sheets with two (half-size) pages on one side of a sheet of paper. Then print front and back - using the two pass

method noted above. So, the first sheet had pages 1 and 96, the next sheet was pages 2 and 95, etc. These sheets are intended to be folded in the middle. Binding/punching might be trickier. I didn't look for, or try, other page size options.

Many (most?) printers also have multi-page options - you can print 2, 4, 9, or 16 pages (reduced in size, of course) on a single sheet of paper.

So, check your favorite software and hardware. With a bit of experimenting, you may already be ready to print optimized pages.

Re: Owner's Manuals

*Message #25 Posted by **Katie Wasserman** on 29 June 2010, 3:01 p.m.,*
in response to message #24 by Dave Shaffer (Arizona)

All good suggestions if you don't have an automatic double-sided printer (or even if you do) but I think...

> Quote:
>
> Someone write an optimization program for this. {:-)

... was referring to the choice between printing/punching yourself vs getting to Kinko's and waiting for them to do it.

My nearest Kinko's is 4 miles away with several traffic lights, I'd need a pretty big document for the Kinko's solution to be optimal. Martin only has 4 blocks so Kinko's is likely always the optimal solution for him -- unless the weather is really bad :)

-Katie

82240B vs 82240A

*Message #1 Posted by **Alberto Fenini** on 26 June 2010, 7:58 a.m.*

ciao a tutti,

since I began to add LCD units to my collection, the moment has
arrived to add a printer too...
However, it fails me what is the main difference between the A and the B model.

Thanks in advance for the explanation ! Alberto

Re: 82240B vs 82240A

*Message #2 Posted by **Diego Diaz** on 26 June 2010, 9:47 a.m.,*
in response to message #1 by Alberto Fenini

Hi,

And welcome to the LCD side... :-)

I think you should find a complete answer here.

Cheers from the Canary Islands.

Diego.

Re: 82240B vs 82240A

*Message #3 Posted by **Michael de Estrada** on 26 June 2010, 4:47 p.m.,*
in response to message #1 by Alberto Fenini

Alberto,

It depends which calculator you are using. For example, if you use an 82240A printer with an HP-48S(X) calculator, 24 of the HP-48S character set cannot be printed, whereas they can be with an 82240B. Also, many characters have to be remapped, because thay have different character codes. So, basically, if you can get a 82240B then do so, since it will be backwards compatible with older calculators as well as fully support newer ones. I use an 82240B with an HP-41CV with IR module, HP-28S, HP-42S, HP-48SX and HP-50g.

Michael

Re: 82240B vs 82240A

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 27 June 2010, 10:17 a.m.,*
in response to message #1 by Alberto Fenini

Ciao, Alberto;

I have one unit of each type, and I must confess I have not been using them for some time. I recently bought an 82240A for the sake of having one sample of it, not for the need.

I used the 82240B a lot since its printout reads much better than the 82240A (graphics print the same in both), but when 'heavy work' is needed with ASCII-based text files, I prefer collecting the IR emissions with an HP48 (S or G, no matter), save a copy of the file in a computer, organize the text in a word processor and then print it in a laser (or inkjet) printer. I choose this kind of output when there is a lot of things to be printed: program listings, registers/variables/memory contents, track programs (TRACE mode), and so.

Although it seems a lot of unnecessary work, you control the output format as you want/need, and the final printout is actually saved as a file, not only as a hard-copy (that may fade away with time and environment conditions).

I use the 82240A/B only when I need fast, fewer lines as output. The process above applies with many advantages when tracing programs. I found that useful back in the beginning of this 'century' (2002, perhaps) when tracking down large HP41 programs prior to generate their HP48, RPL versions. Looking at the trace output (200, 300 lines and even more) in a PC monitor or in A4-size paper sheets (three/four columns) was a lot easier. And whenever I needed, the plain-text file was available for further formatting.

Cheers.

Luiz (Brazil)

TI-58 Slimline

*Message #1 Posted by **ClausB** on 25 June 2010, 7:24 p.m.*

I never liked the bulky shape of the TI-58/9. It was necessary for the 59's card reader but not for the 58. Opening it up shows a lot of empty space. So why not cut it out?

A kind forum member sent me some disused case backs and I applied a Dremel cutter and some wet sandpaper. I added a new clear bottom and a cell phone battery. It needs finishing, such as black paint around the edges. It's now only as thick as a TI-84 and I hope to use it as a daily driver, if the battery life allows.

Re: TI-58 Slimline

30 years ago I was programming my 2nd personal computer, a TI-59 (couldn't afford an HP). 1st was a TI SR-56, 3rd was an Atari 400 (couldn't afford an Apple II).

Besides, where were Lithium ion batteries 30 years ago?

I wonder if that's possible with the 48G housing.

Re: TI-58 Slimline

*Message #13 Posted by **ClausB** on 5 July 2010, 8:05 a.m.,*
in response to message #12 by Thomas Radtke

The 3.7 V Li Ion battery does 850 mAh, which matches nicely the voltage and capacity of the old 3-cell NiCd packs from HP and TI. I don't know about the 48G, though.

In use, the battery does not get as warm to the touch as the 58's DC-DC converter.

number of calculators built of each model

*Message #1 Posted by **Jose Gonzalez Divasson** on 25 June 2010, 11:45 a.m.*

Good morning,

Is there any way of knowing how many calculators were produced of each HP model? I am interested, in particular, on the Voyager series.

The serial numbers on the back just tell how many were built each week, in each location - hard work!

Re: number of calculators built of each model

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 25 June 2010, 2:25 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

Hi;

I tried Craig Finseth´s Data Base and, although it has a 'Production-run' placeholder for for each entry, I found just a few with some numbers on it (e.g.: HP12C that is in the case of millions, or the HP41 that ran about about 1.5 millions for all types).

Cheers.

Luiz (Brazil)

How many non-HP RPN calculators do you own?

*Message #1 Posted by **Michael de Estrada** on 24 June 2010, 10:10 p.m.*

We all know that HP is synonumous with RPN, but the great guru DB has shown us the path to the alternative universe of non-HP RPN calculators. I was oblivious to this fact until only several years ago when I first came across the Spyropoulos site and then DB's wonderful collection of non-HP RPN calculators. Since then I've been ravenously collecting these wonderful machines, and today my collection increased its size to 17 when my most expensive acquisition to date, an immaculate OMRON 12SR, arrived in the mail. The quality of this Japanese made calculator rivals anything that HP ever made and was absolutely state of art with features like hyperbolic functions even before HP introduced them in the HP-32e. Definitely not a pocket calculator, it has nearly the size and heft of an HP-19c. Though not quite as clicky as the keyboard buttons on an HP, they have an excellent feel and action. Finally, the power system is very versatile in that it can be operated using AA alkaline cells, AA NiCad cells or a AC adapter; the only caveat being that any alkaline cells must be removed if the AC adapter is used. Unlike HP, the AC adapter uses a universal plug and there is no special battery pack. The same convenience applies to its Corvus 500 sibling. Anyways, lots to like in these old calcs.

I'm curious as to how many of you also possess and collect non-HP RPN calcs and how many you have. I am pleased to report that all 17 of mine are fully operational, although some needed repair, mostly internal battery transplants. I think my favorite is the Soviet Elektronika MK61, which is programmable. It even comes with it's circuit schematic, so presumably owner repairs can be made or it can be hacked. And of course, the keyboard is in cyrillic and the manual is in Russian.

Re: How many non-HP RPN calculators do you own?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 24 June 2010, 10:43 p.m.,*
in response to message #1 by Michael de Estrada

Hi;

I have only one non-HP RPN 'Frankencalc', something that was made with two different calculators. I´ll let the picture speak for itself.

Click to enlarge

What called my attention in this model is that the T-register contents is not duplicated when the stack registers contents drop after a two-number function (+, -, etc).

In time: I know that many of you know which Commodore is it. Any info?

Cheers.

Luiz (Brazil)

Re: How many non-HP RPN calculators do you own?

*Message #22 Posted by **Katie Wasserman** on 26 June 2010, 12:28 p.m.,*
in response to message #1 by Michael de Estrada

I'd like to ask a question...

What's the definition of an RPN calculator? Some of the calculators in db's collection aren't quite RPN in my opinion (sorry, db), they just use an alternate method to do basic arithmetic.

I'd say that a "real" RPN calculator has to have at least a 3-level stack and an ENTER key that pushes up the stack. I'd like to add the SWAP key into this too, but that's really just a convenience not a necessity, same for other stack manipulation functions.

I think that the Commodore Minuteman 6/6X is an interesting case to consider in defining an RPN calculator. The 6 and 6X are in fact exactly the same calculator with the 6X having an ENTER key which is simply a 2nd key that performs the exact same function as the "+=" key does. (That's right, the ENTER key does addition on this calculator.)

I'm curious what other people here think about this definition.

-Katie

Definition (functional requirements) of RPN?

*Message #23 Posted by **Karl Schneider** on 26 June 2010, 2:20 p.m.,*
in response to message #22 by Katie Wasserman

>
> ...

> I'm curious what other people here think about this definition.
>
> ---

Katie --

I'd say that Exchange (SWAP) and Roll Down are absolutely essential in order for RPN to be useful. RPN relies upon placement of mathematical arguments in the correct postions; Exchange and Roll Down allow the stack to be arranged in any order.

Roll Up, however, is convenient but not essential with a fixed stack if Roll Down is present. Roll Up is available but not directly accessible on the HP-41 and HP-42S; it is unavailable on the HP-32S and HP-10C.

-- KS

Re: How many non-HP RPN calculators do you own?

*Message #24 Posted by **Michael de Estrada** on 26 June 2010, 2:36 p.m.,*
in response to message #22 by Katie Wasserman

Hi Katie,

To me it's a matter of semantics. I have a NOVUS 650, which has a 2-level stack, no "=" key and a key labelled "ENT +". The first time a number is keyed and the ENT + is pushed, the number is raised in the stack. If a second number is keyed and ENT + is pushed, then the two numbers are added, however, the stack does not drop and the first number remains as constant in the stack. If I continue to depress the ENT + key, or -, or X, the number in the stack continues to be added, or subtracted, or multiplied. I consider this to be an RPN calculator, simply because it is postfix, where every time an arithmetic button is pushed it results in the execution of the arithmetic operation. However, what this calculator lacks is the ability to perform chained operations, which is equivalent to an algebraic calculator without parentheses. So, although it is very crude and limited, I still think it meets the basic definition of RPN.

BTW - This calculator lacks decimal arithmentic as well, and division results in truncation, so 9/6 = 1.

Edited: 26 June 2010, 2:46 p.m.

Re: How many non-HP RPN calculators do you own?

*Message #25 Posted by **BobVA** on 26 June 2010, 2:56 p.m.,*
in response to message #22 by Katie Wasserman

I tend to associate "RPN" with HP's particular implementation of post-fix notation, but I may be way off the formal definitions of these terms.

The most stripped-down non-algebraic (i.e. in-fix) interface I've seen is on the old Sinclair Scientific - it doesn't have a multi-level stack, roll operators or even an ENTER key! (Edit: very similar to the calculator Michael mentions above) I usually call it a "post-fix notation" calculator rather than RPN.

Edited: 26 June 2010, 2:58 p.m.

Re: How many non-HP RPN calculators do you own?

*Message #26 Posted by **db (martinez, ca.)** on 26 June 2010, 4:26 p.m.,*

in response to message #25 by BobVA

There's a concept in formal logic where one carries a proposition over literally and far beyond it's intended meaning. Like most of what i learned in college; i forget what it's called. Anyway:

To be an Real Hairy Chested Manly RPN; a calculator **must** equal or exceed HP's perfect implementation of postfix notation. It must have rechargeable nicads, a Norm friendly red LED screen, two shift keys, 1/100th the calculator forensics error of a 41, and a FIVE level stack with a replicating top register. It's just got to. The Heathkit 1401 is the only real RPN.

But really; i only get all-inclusive so i can say that there have been over 180 RPN (& RPL) calculators marketed so far. I don't mind being in a minority, and i know i'm unique (just like everyone else), but i don't want my calculator logic to be weird. Or an endangered species.

Re: How many non-HP RPN calculators do you own?

*Message #27 Posted by **Michael de Estrada** on 26 June 2010, 5:05 p.m.,*
in response to message #26 by db (martinez, ca.)

Actually, the only really good implementation was in the HP RPL calcs, because they have virtually unlimited stack levels. I can remember more than one frustrating instance at work where I carelessly wrote long chained calculations with more than 3 pending operations, and somewhere along the line lost results out the back of the t register. So even the HP's much heralded 4-level stack is quite limited. Even today, I use my HP-50g for all serious computing instead of my HP-35s.

Re: How many non-HP RPN calculators do you own?

*Message #28 Posted by **db (martinez, ca.)** on 26 June 2010, 3:41 p.m.,*
in response to message #22 by Katie Wasserman

Hi Katie; No lesser an authority than Dave Hicks has said that like you, he doesn't count a calculator with only a two level stack as true RPN. So i'm going against the big guns here.

IMHO, i count anything that uses postfix notation for all arithmetic functions as RPN. *Adding machine logic* calcs like most of the early units based on TI ROMs, and others, can use postfix in addition and subtraction but need an equals key in multiplication and division so they are not RPN to me. The Commodores insist on the user clearing the stack before beginning any calculating, so using the + or - key is literally just combining the first number with zero as it puts it into the x & y registers and gets ready to accept a second entry. One strokes clear, 2, +, 3, X, and gets 6. Then she can just continue on like on an hp or hit clear again to start a new chain. That's not too much of a stretch for me to call that RPN. And disqualification of two level stacks means that the scientific programmable MC 1103 doesn't count, How can that be good?

Everything i can think of uses postfix for one number functions like trig and log. So as an aside; i think RPN is the most consistent entry system. It's the only one that is always postfix.

Re: How many non-HP RPN calculators do you own?

*Message #29 Posted by **Mike T** on 1 July 2010, 5:05 p.m.,*

*Message #30 Posted by **Michael de Estrada** on 1 July 2010, 7:06 p.m.,*
in response to message #29 by Mike T

Yes, as per my above posts, I consider any postfix calc such as the Sinclair Scientific to be RPN. I have one of those beasts in my collection and use it occasionally as a 4-banger, since the trig functions work only in radians mode and pi isn't even present. Also, logs are base 10 only. Pretty useless for technical work. I also used to own a Sinclair ZX81, but it died many decades ago. Learned Basic programming on it.

Ditto!

*Message #31 Posted by **Vieira, Luiz C. (Brazil)** on 1 July 2010, 8:36 p.m.,*
in response to message #30 by Michael de Estrada

Ola, Michael;

I also learned (Sinclair) BASIC with a ZX-81 'clone', named 'NE-Z80'. I had it till a decade ago, but the 'flat keyboard' no longer worked and now I have some extra components for teaching digital electronics to my students... Needless to say that I totally regret not making any effort to repair it (it´s been about 12 years now) because it is worth showing our students what kind of tool we had some 30 years back in time... At least I have the HP's family to show them.

Cheers.

Luiz (Brazil)

Re: Ditto!

*Message #32 Posted by **megarat** on 2 July 2010, 11:29 a.m.,*

in response to message #8 by Don Shepherd

Hi,

it's a 3rd party reimplementation of the HP-41 CPU pcb, using modern electronics.

HTH

Re: "First Light"

*Message #10 Posted by **Monte Dalrymple** on 24 June 2010, 7:58 p.m.,*
in response to message #8 by Don Shepherd

The electronics is a form-fit-function (plus enhancements)
replacement for a fullnut HP41 CPU board. The board contains
a 2MByte Flash memory containing images of every HP plug-in
ROM, plus a number of others. The RAM on board is 512KBytes
that holds registers and full X-mem. The remainder of the RAM
can be used as program or data memory, RAM disk, etc. The CPU
contains a "turbo" mode that allows it to run at up to 50x
normal speed. Code is present that allows one to "virtually"
plug a ROM image or block of RAM into a port from the keyboard
or under program control. The board will work with HPIL, the
82143 printer, a wand or card reader.

There are still some bugs to iron out. For example, CAT 2
doesn't seem to work, I can't enter PRGM mode or XEQ a named
function. But it powers up and does keyboard functions, which
(at least to me) is no small feat.

More information is available at The NEWT status page

BTW, the BAT annunciator is on in the photot because I have
an error on the PCB that requires that I limit the power supply
to less than 4V. The rev of the PCB will correct that error.

in response to message #10 by Monte Dalrymple

As I said, Monte, where do I line up to buy one?

I'm really thankful you kept working on this project after you talked about it at HHC in San Jose (?) several years ago now.

If you have a version working by this year's HHC, any chance you could bring it and show?

Keep going! :-)

Re: "First Light"

*Message #13 Posted by **Monte Dalrymple** on 25 June 2010, 10:48 a.m.,*
in response to message #12 by gene wright

My objective is to be done before September, but debugging is
very slow. The speed difference between the native 41 bus
(155uS cycle time) and the memory bus (220nS cycle time) is a
real pain. Plus I didn't have a logic analyzer until yesterday.
It doesn't help that I didn't include a lot of test points on
the board because of space constraints.

But it's probably only one or two CPU instructions that aren't
quite working right that are the root cause of what doesn't
work, so the task is at least finite.

As far as HHC, we'll have to wait and see...

Thanks, Monte

in response to message #1 by Monte Dalrymple

Congrats Monte,

I know how difficult it is to get a project like this done!

Meindert

Re: "First Light"

*Message #24 Posted by **Monte Dalrymple** on 29 June 2010, 5:02 p.m.,*
in response to message #23 by Meindert Kuipers

First, thank you everyone for the congratulations. After all this time I was afraid that people might have lost interest.

I will start posting status on NEWT status page shortly, but I am now able to do CAT 2, with the new functions showing up, and XEQ functions.

Something still isn't right, because Gene's benchmark won't run properly. And when I try to enter Turbo mode it somehow messes up the program space available and sets PRIVATE mode.

Now I _really_ have to hook up the logic analyzer.

Monte

HP-42S display

*Message #1 Posted by **Dick** on 24 June 2010, 3:56 p.m.*

I inherited an HP-42S calulator and have no manual for it.

I have been able to use it for simple math functions, which is all I require. However, all of a sudden it changed display formats and I don't know how to get it to switch back to the normal 2 line basic display??

Any help would be most appreciated.

Thanks

Dick

Re: HP-42S display

*Message #2 Posted by **Thomas Okken** on 24 June 2010, 4:13 p.m.,*
in response to message #1 by Dick

It sounds like it's showing a menu and that's why you're only seeing X, instead of seeing both X and Y. If that is indeed the case, you can get rid of the menu by pressing EXIT; you may have to press it more than once if you're inside a nested menu.
If it's the number display format you're talking about, you can control that using the DISP menu (Shift E): FIX, followed by a two-digit number from 0 to 11, selects fixed mode, where you see a constant number of digits behind the decimal; SCI selects scientific notation, where there's always an exponent of 10, even if the number could be displayed without one; ENG, or engineering mode, is like SCI mode except the exponent is always a multiple of 3, making it easier to convert to SI-style magnitude prefixes. ALL mode is like FIX 11 but does not display trailing zeroes.

HTH,

- Thomas

Re: HP-42S display

*Message #3 Posted by **DavidShenk** on 24 June 2010, 4:19 p.m.,*
in response to message #1 by Dick

Hi Dick,

It sounds like your calculator is defective and should be sold to someone on the forum for $10 ;)

You can try resetting it by turning it off, then hold down the "ON" key, press and hold the E+ and XEQ buttons, then release the On button. This will erase everything in it's memory, but should bring you back to default.

Dave

Re: HP-42S display

*Message #4 Posted by **Walter B** on 24 June 2010, 5:32 p.m.,*
in response to message #1 by Dick

What Dave describes is a RESET of your HP-42S. Think of the 3 keys in Windows d;-)

You may as well have entered complex or matrix mode. Please note scans of the original manuals are available in pdf through this museum for little money. Excellent ROI.

Re: HP-42S display

OT: Warning regarding a TAS auction

*Message #2 Posted by **Martin Pinckney** on 23 June 2010, 10:14 p.m.,*
in response to message #1 by Michael de Estrada

Would be an interesting study for psychologist who likes to figure out people remotely. As an amateur, it would appear that such a person is so arrogant that he cannot keep himself from insulting others, even if it is detrimental to his goal (as in trying to sell something).

A true con man, OTOH, would conceal his contempt.

Re: OT: Warning regarding a TAS auction

*Message #3 Posted by **Randy** on 23 June 2010, 11:12 p.m.,*
in response to message #2 by Martin Pinckney

Another interesting study: those who would "warn" others off an auction with unverifiable information.

in response to message #4 by deleted

Hi, Michael;

I´d guess that the 'unverifiable information' applies to the auction terms, not your warning.

If there is anything wrong, surely it is not in your intention to avoid some newbie to believe that the HP19C has an ink-based printer. How often do people try to warn others in such cases?

Cheers.

Luiz (Brazil)

Re: Warning regarding a TAS auction

*Message #6 Posted by **David Hayden** on 24 June 2010, 7:43 a.m.,*
in response to message #1 by Michael de Estrada

I see this as a likely case of miscommunication.

I think you were really pointing out a problem with his description that reads "the printing function also worked, though there wasn't ink." Since it uses thermal paper, it would seem that the printing function *doesn't* work and he should change the description.

The seller's response indicates that he didn't see the connection between your message and the inaccurate description. Without making that connection, he thought you were just pointing out some meaningless detail of the calculator, like the fact that it uses BCD. If he had any sense of professionalism, he would have written something like "I don't understand why you're telling me this" instead of his rude response.

So both your question and his response left out the main parts of the communication - that the description may be inaccurate and that the seller didn't understand why you were writing.

Dave

Re: Warning regarding a TAS auction

*Message #7 Posted by **gene wright** on 24 June 2010, 8:29 a.m.,*
in response to message #6 by David Hayden

Of course, it *may* be that the printer simply doesn't have thermal paper in it. That would also cause it not to print.

in response to message #8 by deleted

Thermal paper is known to "fail" too - who knows how the paper/printer has been stored the last 30 years. Might as well be that someone put normal paper in there. I agree that the sellers respond

would certainly put a full stop to any intention to bid :)

HP-32s doesn't turn on

*Message #1 Posted by **Giovanni Jimenez** on 23 June 2010, 6:13 p.m.*

I am sure that this has already been answered on this forum, but it is very difficult to look for specific previous threads.

I have a very nice HP-32s that doesn't turn ON. Any suggestions ?

I already tried the "coin" on the conctacts and replaced the batteries. Any new ideas ?

thank you

Giovanni

Re: HP-32s doesn't turn on

*Message #2 Posted by **DavidShenk** on 23 June 2010, 7:15 p.m.,*
in response to message #1 by Giovanni Jimenez

Hi,

Try pressing on the metal bezel below the screen while turning it on to see if that helps. If so, you'll want to take it apart and clean the contact strip located there.

Dave

Re: HP-32s doesn't turn on

*Message #3 Posted by **Giovanni Jimenez** on 24 June 2010, 10:24 p.m.,*
in response to message #2 by DavidShenk

Tried that but doesn't work either.

Am I out of options now ?

Thanks again

Re: HP-32s doesn't turn on

*Message #4 Posted by **Dave Britten** on 27 June 2010, 10:31 p.m.,*
in response to message #3 by Giovanni Jimenez

I had the same problem with a 32s a few months ago. The problem was that the 1 key was stuck. If any keys are stuck, the CPU never starts properly, and it looks like the calculator won't turn on. If you look closely, the LCD does receive power, but none of the display elements are darkened.

Feel all the keys and see if any of them might have the little plastic dome switch stuck down. A firm

smack to the rear of the case may release it, otherwise you'll have to pop the back off and open the keyboard.

Re: HP-32s doesn't turn on

*Message #5 Posted by **Alexandre Penna** on 27 June 2010, 11:04 p.m.,*
in response to message #1 by Giovanni Jimenez

Did you try remove the batteries and short circuit the battery contacts? I had one of first 32S and it happened w/ it long time ago. Them I did this "hard reset" as instructed by HP manual and voila, it backs to live!

Regards

HP 35s Day of the week program

*Message #1 Posted by **Pablo P (Spain)** on 23 June 2010, 4:38 p.m.*

Hi all, I was watching a tv show about an extraordinary man who calculates mentally the day of the week of any date. Then I wrote this program for the HP 35s that uses one of that algorithms.

```
DAY OF THE WEEK FOR HP 35s (FROM 1901 TO 2099)

Table of Contents
=================
1 Using the program
2 Program listing
3 Registers
4 Revision

1 Using the program
~~~~~~~~~~~~~~~~~~~

  First execute the program: XEQ W ENTER.
  Insert the day and press R/S.
  Insert the month and press R/S.
  Insert the year (from 1901 to 2099) and press R/S.

  Then it will show a number that corresponds to the
  day of the week according to this table:

    Day          Number
   -----------+--------
    Sunday            0
    Monday            1
    Tuesday           2
    Wednesday         3
    Thursday          4
    Friday            5
    Saturday          6

2 Program listing
~~~~~~~~~~~~~~~~~

in response to message #1 by Pablo P (Spain)

Fixed.

Re: HP 35s Day of the week program

*Message #4 Posted by **Jeff O.** on 24 June 2010, 4:30 p.m.,*
in response to message #1 by Pablo P (Spain)

Hello Pablo,
Thanks for the program. I think I saw the show about the man who could tell the day of the week for any given date. There was a discussion here a while back about a method to determine on which day of the week the last of February, 7 March, 4 April, 9 May, 6 June, 11 July, 8 August, 5 September, 10 October, 7 November and 12 December will fall in a given year. From there you can quickly figure what day of week any other date will fall. It was called the "doomsday" method, but I preferred to think of it as the "magic day", so that's what I called the program I wrote to calculate it. The meat of the program is the equation below, which was found at the links in message 8 of the discussion.

RMDR((2+REGX+IP(REGX/4)-IP(REGX/100)+IP(REGX/400),7)

The year you are interested in must be in stack register x.

.

Nice Step by Step 50g (49+/48gii) Tutorial Videos

*Message #1 Posted by **Norman Dziedzic** on 23 June 2010, 2:17 p.m.*

The first one is here:

http://www.youtube.com/watch?v=x7I15VD1BV0

Search YouTube for further episodes. They are all titled HPxx where xx is a sequence number (01, 02 ...)

Later installments have an electrical engineering bent.

Re: Nice Step by Step 50g (49+/48gii) Tutorial Videos

*Message #2 Posted by **hpnut** on 23 June 2010, 5:30 p.m.,*
in response to message #1 by Norman Dziedzic

Nice. Thanks.

Re: Nice Step by Step 50g (49+/48gii) Tutorial Videos

*Message #3 Posted by **David Hayden** on 24 June 2010, 7:58 a.m.,*
in response to message #1 by Norman Dziedzic

Thanks Norman.

I especially like the way you show the keyboard at the beginning and the cursor that highlights the keys you press.

I have one suggestion for this first video. You don't show how you navigate through the menus. Perhaps you could display some text at the bottom that says "use the arrow keys to move around the menu." Also when you select "2" for the number of decimals to show, say that you pressed the number "2" on the keyboard.

Dave

Re: Nice Step by Step 50g (49+/48gii) Tutorial Videos

*Message #4 Posted by **Norman Dziedzic** on 24 June 2010, 10:00 a.m.,*
in response to message #3 by David Hayden

As a clarification, I did not create these videos and do not know the person who did. I just happened to stumble upon them when searching for something else and thought some people here would be interested.

I believe you can make comments at the YouTube site to the creator. It appears he has replied to some previous commentators.

HP-35S, display settings for entry line

*Message #1 Posted by **Mike (Stgt)** on 22 June 2010, 10:44 a.m.*

On an HP-35S if you enter a number the 1000-th separator is not shown, after you pressed ENTER the 1000-th separator is shown in the 2nd line but still not on the first. Other HP calculators show those separators during the entry of the number already. Is it possible to change this on the HP-35S too? (A colleague asked me and I have no time to RTFM.)

TIA.....Mike

Re: HP-35S, display settings for entry line

*Message #2 Posted by **Pablo P (Spain)** on 22 June 2010, 12:47 p.m.,*
in response to message #1 by Mike (Stgt)

Hi Mike, I have got an HP-35s and during the enter of a number the 1000-th separator is not shown. You cannot change it.

Once you press ENTER the separators are shown in both lines. In this case, you can disable the separators or you can choose a dot or a comma, whatever you want.

For example, I have a dot as separator and decimal places fixed to 3:

```
First with 0 in x and y registers:
  0,000
  0,000

I type 1234567:
  0,000
  1234567   //the separators are not shown

I press ENTER:
  1.234.567,000
  1.234.567,000
```

Edited: 22 June 2010, 1:02 p.m.

*Message #3 Posted by **gene wright** on 22 June 2010, 1:22 p.m.,*
in response to message #2 by Pablo P (Spain)

This ability went away with the RPL graphing calculators, because it was possible to enter a value with a comma as a valid value. Tough to know what is in the display when 123,456 might be 123456 or a complex number of 123 and 456, for example.

Most calculators since the RPL models probably use the RPL command-line approach for accepting inputs and don't allow the display of commas until after the line has been entered.

Been this way for 10+ years now, for what it's worth.

Re: HP-35S, display settings for entry line

*Message #4 Posted by **Mike (Stgt)** on 22 June 2010, 2:01 p.m.,*
in response to message #3 by gene wright

TNX 4 this explanation, sounds reasonable.

Ciao.....Mike

Re: HP-35S, display settings for entry line

*Message #5 Posted by **Norman Dziedzic** on 22 June 2010, 2:16 p.m.,*
in response to message #4 by Mike (Stgt)

Maybe your friend may have the calculator in ALG mode.

I'm set for showing 4 decimal places and ALG mode and when I key in 1 0 0 0 <ENTER>

The display looks like:

```
------------------
1000
         1,000.0000
------------------
```

Ergo, the easy answer is to use the much more efficient RPN mode. %^)

Edited: 22 June 2010, 2:16 p.m.

Re: HP-35S, display settings for entry line

*Message #6 Posted by **Mike (Stgt)** on 23 June 2010, 4:17 a.m.,*
in response to message #5 by Norman Dziedzic

Hehe! That's what I try to tell him since 1945. But tonite I had a look on my HP-35S which _is_ in RPN mode. Alas it is almost the same, the number you enter is shown in the bottom line without 1000th separator(s). It (they) show up after you pressed ENTER.

Ciao.....Mike

Re: HP-35S, display settings for entry line

*Message #7 Posted by **Katie Wasserman** on 22 June 2010, 2:55 p.m.,*
in response to message #3 by gene wright

That's not the case on the 20b/30b, they insert/remove as you enter/edit the number. This is true regardless of the mode (Chain, Algebraic, or RPN/RPL).

New HP-15C simulator

*Message #1 Posted by **Greg Hewgill** on 22 June 2010, 5:40 a.m.*

I've put together a new HP-15C simulator at http://hp15c.com. It does almost everything, with some minor exceptions as noted on the About page. I'm continuing to work on it to implement the missing bits, so expect updates.

Please try it out - feedback, bug reports, and even contributions are welcome!

Re: New HP-15C simulator

*Message #2 Posted by **Namir** on 22 June 2010, 8:53 a.m.,*
in response to message #1 by Greg Hewgill

Greg,

I checked the SOLVE feature with my usual test function, and your simulator came through with flying colors.

I want to salute your valiant effort to create an HP-15C simulator for browsers. Not an easy job, especially if you are using Javascript (are you?).

Namir

Edited: 22 June 2010, 8:59 a.m.

Re: New HP-15C simulator

*Message #3 Posted by **Greg Hewgill** on 22 June 2010, 3:25 p.m.,*
in response to message #2 by Namir

Thanks! It is indeed written in Javascript (which is a pretty capable language, all things considered). The "Source" link on the site links to the source repository if you want to have a look.

Re: New HP-15C simulator

*Message #4 Posted by **MK-52** on 22 June 2010, 10:35 a.m.,*
in response to message #1 by Greg Hewgill

SIN(PI = 3.14159265359) = 1.224646799e-16
SIN(3.14159265) = 3.589793029e-09
SIN(0.01) = 9.999833334e-03
SIN(PI-0.01) = 9.999833334e-03
TAN(355/226) = -7.497258179e+06

Very accurate trig. BTW, CHS doesn't work in EEX.

Re: New HP-15C simulator

*Message #5 Posted by **MK-52** on 22 June 2010, 10:48 a.m.,*
in response to message #4 by MK-52

If unimplemented functions is used in looping program, for example, Solver and Integration, the simulator keeps showing error messages. I think this is a small problem.

Edited: 22 June 2010, 10:49 a.m.

Re: New HP-15C simulator

*Message #6 Posted by **Greg Hewgill** on 22 June 2010, 3:26 p.m.,*
in response to message #4 by MK-52

The trig functions come straight out of the Javascript "Math.*" library, so I can't claim any credit for their accuracy. :)

I'll add the CHS in EEX bug to the known issues list.

Re: New HP-15C simulator

*Message #7 Posted by **hugh steers** on 22 June 2010, 3:00 p.m.,*
in response to message #1 by Greg Hewgill

some missing complex trigs.

also, try adding 0.1 ten times, then press H.MS to get 0.5960 opps!

large factorials go bad, also in FIX 9, you dont get the exponent.

otherwise neat!

keep up the good work.

Re: New HP-15C simulator

*Message #8 Posted by **Greg Hewgill** on 22 June 2010, 3:30 p.m.,*
in response to message #7 by hugh steers

Thanks! The missing complex trig functions are noted on the known issues list. I'll have a look at that ->H.MS rounding problem.

I suspect the large factorials are due to some display rounding problems, especially with numbers slightly less than 1e100. Which number did you notice specifically?

Re: New HP-15C simulator

*Message #9 Posted by **hugh steers** on 23 June 2010, 6:49 a.m.,*
in response to message #8 by Greg Hewgill

try FIX 9. then 69!

Re: New HP-15C simulator

*Message #10 Posted by **Greg Hewgill** on 23 June 2010, 7:46 a.m.,*
in response to message #9 by hugh steers

Thanks, should be fixed now.

Re: New HP-15C simulator

*Message #11 Posted by **Mike T.** on 23 June 2010, 3:06 p.m.,*
in response to message #8 by Greg Hewgill

Try 48.0 minus 47.8 then subtract 0.2 from the answer, the result should be zero - but it isn't so I know you are doing binary math.

Mike T.

Re: New HP-15C simulator

*Message #12 Posted by **Greg Hewgill** on 23 June 2010, 3:33 p.m.,*
in response to message #11 by Mike T.

Yes, that's true. I don't claim to be doing BCD math, that would be a substantial amount more work (but still possible). The simulator uses the native Javascript math library (as implemented in your browser) for all arithmetic.

Re: New HP-15C simulator

*Message #13 Posted by **hugh steers** on 24 June 2010, 2:32 p.m.,*
in response to message #12 by Greg Hewgill

is there a JS "decimal" type, or is that java only?

alternatively, you could pull a trick to "fix" these sorts of problems when working in binary as follows:

```
a + b = a <+> b  if |a <+> b| >= eps*|a|
      = 0 otherwise
```

where <+> represents computed addition rather than mathematical addition and eps is epsilon eg 10^-15

use the same idea for subtraction.

some real world calculators actually work in binary and they must do a trick like this, because i've tried to embarrass them with a binary rounding error and not been successful.

Re: New HP-15C simulator

*Message #14 Posted by **Steve Simpkin** on 22 June 2010, 5:25 p.m.,*
in response to message #1 by Greg Hewgill

Very nice!!! It even works using the browser on my Android phone.

Re: New HP-15C simulator

*Message #15 Posted by **Egan Ford** on 22 June 2010, 6:02 p.m.,*
in response to message #14 by Steve Simpkin

I tried it on my iPad. Works too. However "test" reported errors:

```
Unimplemented: complex log

Fail: 45g)
```

Update: Test also failed on Firefox, fail: 3^.

Test now working on iPad. I just turned it sideways, reloaded the page so I could see the registers and test passed after 1 min 45 sec.

Hmmmm.... Just tested on iPad again, this time the orientation is the same as my failed test and it passed.

Hmmmm..... 4th try. I cannot get it to fail again on the iPad. BTW, no need for 'h' on the iPad, fingers work great. :-)

Update 2: Firefox fails repeatably (fail: 3^). iPad works every time now. Unsure what the original issue was.

Feature requests:

Sound (click), some type of visual button press notification.

Excellent work. Thanks!

Update 3:

I tested with Safari 5.0. Also failed like Firefox 3.6.3 with "fail: 3^". If I press test again I get the error above (complex log). BTW Safari screams compared to Firefox.

Chrome is also a screamer and passes, but a retest generates the "complex log" error.

I speculate the "complex log" error is erroneous.

Update 4:

Just got the "fail 3^" with Chrome. I cannot get Chrome to pass again without restarting Chrome. After that I got 3 passes and then non-stop fail 3^.

Edited: 22 June 2010, 6:30 p.m.

Re: New HP-15C simulator

*Message #16 Posted by **Greg Hewgill** on 23 June 2010, 4:31 a.m.,*
in response to message #15 by Egan Ford

Wow, thanks for all the testing! I suspect many of those failures were due to the test function not resetting some critical flags (like the Complex flag) before running the test. Since the test ends with C set, this was sort of a problem. I've updated the script so the Test runs twice on my system, and would be interested to see whether that fixes the issues you saw.

Re: New HP-15C simulator

*Message #17 Posted by **Egan Ford** on 23 June 2010, 8:46 a.m.,*
in response to message #16 by Greg Hewgill

Complex Log issue fixed, however:

Firefox 3.6.3, Safari 5.0 (OS/X 10.6.4):

```
The page at http://hp15c.com/ says:

fail: 3^
result: 352.00000000000006
expected: 352
diff: 2.220446049250313e-16
```

Chrome 5.0.375.70 (OS/X 10.6.4). Passed 3 times, then I closed the pop-up, clicked on the image again to get a new session and then test failed with:

```
The page at http://hp15c.com/ says:

fail: 3^
result: 352.00000000000006
expected: 352
diff: 2.220446049250313e-16
```

2.220446049250313e-16 is a familiar number with 64-bit floats. The "diff:" is the relative machine precision (i.e., the smallest number + 1 > 1), e.g.:

```
perl -e '$eps=1;while($eps+1>1){$eps/=2.0}$eps*=2;print"$eps\n"'
```

and

```
#include <stdio.h>

int main(void)
{
    double eps = 1.0;

    while(eps + 1.0 > 1.0)
        eps /= 2.0;
    eps *= 2.0;
    printf("Epsilon is %.14e\n", eps);
}
```

yield:

```
2.22044604925031e-16
```

Rounding issues?

Why this works then fails on Chrome is odd. It should be consistent one way or another. Are all variables/arrays initialized? Does that question make sense for JavaScript?

Edited: 23 June 2010, 8:50 a.m.

Re: New HP-15C simulator

*Message #18 Posted by **Greg Hewgill** on 23 June 2010, 4:45 p.m.,*
in response to message #17 by Egan Ford

The nondeterministic behaviour is indeed odd. I haven't seen that on any of the browsers I've tried, but I'll investigate.

Re: New HP-15C simulator

*Message #19 Posted by **Bart (UK)** on 23 June 2010, 7:05 a.m.,*
in response to message #14 by Steve Simpkin

And on my Nokia 5800!! Just fits in on Full Screen mode.

Re: New HP-15C simulator

*Message #20 Posted by **Walter B** on 22 June 2010, 6:09 p.m.,*
in response to message #1 by Greg Hewgill

Good work!

Just pressing EEX without any preceding digit will not execute properly. You may even end with one stack level in a different format, i.e. displaying less decimals.

Re: New HP-15C simulator

*Message #21 Posted by **Greg Hewgill** on 23 June 2010, 4:44 a.m.,*
in response to message #20 by Walter B

Indeed, that does look like it's doing the wrong thing. Will fix!

Re: New HP-15C simulator

*Message #22 Posted by **Chuck** on 23 June 2010, 1:52 p.m.,*
in response to message #1 by Greg Hewgill

Nice simulator. Through trial and error I found that values can be as large as 1x10^308. Though only the last two digits are displayed in the exponent, all three are actually still there because if you Log the value you get 308.

This means for large factorials (or for any large number) the integer part of the log of the answer is the correct exponent. For factorials I believe you can go up to 170! which shows

```
7.2574     06
```

But logging the number shows the exponent is actualyl 306. Possibly an improvement over an actual 15C, as long as you are aware of this when dealing with large numbers (like e^500).

CHUCK

Edited: 23 June 2010, 1:58 p.m.

Re: New HP-15C simulator

*Message #23 Posted by **Greg Hewgill** on 23 June 2010, 3:45 p.m.,*
in response to message #22 by Chuck

Good catch - that's one of the situations I alluded to in the fine print, where "the numeric display is known to be totally wrong". :)

Behind the scenes, the calculator simulator uses the native Javascript Math library as implemented in your browser, which has the IEEE 754 double precision exponent range of approximately -308 to 308. I plan to detect such out of bounds display (beyond -99 to 99) and blink the result as a real 15C would do, rather than attempt to improve upon it.

Re: New HP-15C simulator

*Message #24 Posted by **Mike T.** on 23 June 2010, 2:59 p.m.,*
in response to message #1 by Greg Hewgill

Very cool - looks great and the buttons move too.

Mike T.

Re: New HP-15C simulator

*Message #25 Posted by **megarat** on 23 June 2010, 4:52 p.m.,*
in response to message #1 by Greg Hewgill

Please don't take me as a troll, because I'm honestly curious (plus a huge fan of the 15c).

Ignoring (a) the joy of creating such an application, and (b) the joy of dinking around with such an application, does anyone find that web-based calculator sims like this have practical application?

Loading it on a webphone sounds semi-practical ... but not nearly as practical as a native RPN calculator app. IMHO, most of these web apps are missing the features that make them truly useful, e.g., copying/pasting the results from the calculator into another app.

If I'm missing something, please enlighten me!

Edited: 23 June 2010, 4:53 p.m.

Re: New HP-15C simulator

*Message #26 Posted by **Greg Hewgill** on 24 June 2010, 3:34 a.m.,*
in response to message #25 by megarat

I think the idea of calculator simulators does not necessarily lean toward the "useful" side. Although some enthusiasts (like me and others that are probably found here) will use a simulator as their desktop calculator for nostalgic reasons (or even to provoke questions from curious bystanders), I don't think they are intended to be general purpose replacements for a fully functional calculator program or service.

For the 15C specifically, all of the "advanced" functions offered (complex, matrix, integration, solver) are provided in a much more usable, useful, and practical way by other services such as Wolfram Alpha. Surely you're aware of how tedious it is to actually enter matrix data into a 15C, for example.

Having said that, creating a web app does not preclude also creating a desktop app. A web user interface is an easy, quick, and widely accessible way of getting code out there that people can run instantly. The code is written in JavaScript, which is one of the most portable languages around today. I wouldn't rule out creating a corresponding application for desktop or mobile use. In fact, since it's open source, I would even encourage that!

I hope you enjoy the calculator simulators. That's what it's all about.

Re: New HP-15C simulator

*Message #27 Posted by **megarat** on 24 June 2010, 1:40 p.m.,*
in response to message #26 by Greg Hewgill

Thanks for your thoughts. Simulators like this definitely put a smile on my face (I especially like the web-based slide rule simulators), but I wasn't sure if there was something more to it than the fun/novelty.

I also use a 15c simulator (application) as a calculator in Mac OS X, but it has the added advantage of being able to give/receive data via copy/paste, which I use routinely. (IIRC, it will also save/load programs to disk, although I've never used that feature since, as I'm already using a computer, it's typically easier to write the code I need in something else.)

Edited: 24 June 2010, 1:41 p.m.

non hp RPN

*Message #1 Posted by **db (martinez, ca.)** on 19 June 2010, 7:21 p.m.*

I've added three more calculators to the alternate universe RPN museum.

National Semiconductor Scientist RPN

hp 94 RPN

Norman RPN

These are the calculators that Dave would have, in the continuum where Spock has a beard, Kirk is indecisive and Hoshi is Empress.

Re: non hp RPN

*Message #2 Posted by **Michael de Estrada** on 19 June 2010, 8:23 p.m.,*
in response to message #1 by db (martinez, ca.)

I have the NOVUS Scientist, and the front looks identical to your NS Scientist, except for the label at the top above the display. My label on the back says NOVUS 4520; what does yours say?

Also, what kind of display does the Norman have, VFD? I have a Microcifra 10, courtesy of Juan Denim.

Edited: 19 June 2010, 8:30 p.m.

Re: non hp RPN

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 20 June 2010, 4:01 p.m.,*
in response to message #2 by Michael de Estrada

IIRC, Norman 700 and Norman 701 had a .3 red 7-segment LED display

Re: non hp RPN

*Message #4 Posted by **Katie Wasserman** on 20 June 2010, 12:41 a.m.,*
in response to message #1 by db (martinez, ca.)

Finding the hp94 in this collection might only have occurred in City on the Edge of Forever. Where the hp94 line of hand held devices was wildly successful, Apple was defeated and Hewlett Packard became the biggest name in pocket computing. Heil HP!

So, db, how do you explain this seemly contradictory RPN entry? Have you been messing around with your time machine again?

Re: non hp RPN

*Message #6 Posted by **db (martinez, ca.)** on 21 June 2010, 3:25 p.m.,*
in response to message #1 by db (martinez, ca.)

Michael; My Nat Semi Scientist has no back label affixed but is in all ways the same as it's Novus and Hiradastechnika siblings. The Norman has an 8 digit, 7 segment LED with a negative sign on the left, pretty standard for Novus clones. BTW: What would we know about all those Argentine RPNs without Juan? Our display cases would certainly be less crowded if he collected them, instead of using hp programmables.

Katie; I may have inadvertently involved you in a paradox. Please look closely at any photos you have of your grandmother at your present age and get back to me.

Joerg; The Omron i got from you years ago still works great, I didn't want to get into a bidding war (i know *you* wouldn't have minded) on the wall wart. Anyway, 32 gollies total - must be some sort of record for a non-hp power supply. You couldn't have gotten that high a price for a non-RPN ac adapter. Score another win for postfix notation.

Edited: 21 June 2010, 3:35 p.m.

Re: replies

*Message #7 Posted by **Michael de Estrada** on 21 June 2010, 6:59 p.m.,*
in response to message #6 by db (martinez, ca.)

Yes, we all are forever indebted to Juan Demin for his generosity. I really enjoy playing with the Microcifra 10, which is built like a brick "outhouse", and twice as massive as its NS/NOVUS counterparts. It truly rivals any HP Classic for its ruggedness.

As to the recent auction for the AC adapter, I think it also works with the non-RPN Omron Financial that was also being auctioned, so technically it is not an RPN power supply ;>). I didn't see how much it sold for, however, the OMRON 12SR sold for $237, which if memory serves is about what the identical GE one went for some time ago. For sure the word "RPN" adds many C-notes to the value of a vintage calculator.

Edited: 24 June 2010, 2:52 p.m. after one or more responses were posted

Re: replies

*Message #8 Posted by **Alejandro Paz (Germany)** on 22 June 2010, 2:16 a.m.,*
in response to message #7 by Michael de Estrada

I remember those microcifra... but did you know about the CZCERWENY RPN models ?.. I'm not sure if they are the same. I ever saw 2 models (when I was still in Argentina) one with programming capabilities and one without. They dated from the early 80s or end of 70s if I'm not mistaken.

Re: Omron 12F

*Message #9 Posted by **Joerg Woerner** on 22 June 2010, 10:21 a.m.,*
in response to message #7 by Michael de Estrada

The 12F didn't sell - I have to spent a few bucks for a battery cover first ;-))

Maybe I buy from db some nice [ENTER] keys and upgrade or Photoshop the 12F to a 12SR ;-))

Regards, Joerg

hp 41

*Message #1 Posted by **Sok-khieng Chum Hun** on 19 June 2010, 9:04 a.m.*

Hi, I have a problem with my hp 41cx, when I try to set or clear a flag it returns : "nonexistent"

is this normal?

Re: hp 41

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 June 2010, 9:31 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

Hi;

if you are trying to set or clear any flag above 30, it is normal. These are system flags, you can only test them. The system sets or clears these flags when a particular condition (or command) is verified. E.g.: flag 55 is set when you connect an 82143A printer and cleared when you remove it. You can test it, though, to make sure if a printer is connected to the calculator while running a program with exclusive printer commands and avoid premature program halting.

Cheers.

Luiz (Brazil)

OT: Blackberry LifeScan barcode capture

*Message #1 Posted by **hpnut** on 19 June 2010, 6:16 a.m.*

Hi all.

LifeScan is a barcode capture program for most cellphones with cameras. I installed it on my Blackberry and took a snapshot of the barcode on the back of the HP 30b calculator.

After the software processes the scanned barcode, I got this image on my Blackberry:

http://i167.photobucket.com/albums/u151/topoguy/Capture16_16_6.jpg

it's kinda fun snapping various barcodes of items in my house and finding what they represent. a truly geeky pastime :-)

in response to message #1 by hpnut

Hi,
a single barcode contains that much informations, I mean including the enconding of the picture also?!
I am rather surprised. If someone could explain, I would be pleased to learn about this.
Anyway, thanks for posting this.
Kind regards.

Jean-Michel

What it’s got in its nassty little pocketses

*Message #1 Posted by **Norman Dziedzic** on 18 June 2010, 10:24 a.m.*

In the recent 32Sii thread there seems to be a lot of emphasis on being able to put a calculator in your pocket. Again I find myself feeling in the minority as I rarely have put a calculator in my pocket. I have a couple in my laptop bag. A couple in my desk drawer and if I'm moving about the workplace, I usually have a pile of papers to carry around and just plunk the calc I need on top and carry it around.

So, here's my informal poll to ask how important is it to you all to be able to put a calculator in your pocket. I'm thinking in the interest of being able to compare result to stick with a scale of 1 to 4 with

```
1 - Don't Care
2 - Nice but not critical
3 - Highly desirable but not essential
4 - Essential
```

My Vote: 1 - Don't Care

Re: What it’s got in its nassty little pocketses

*Message #2 Posted by **Bill Zimmerly** on 18 June 2010, 10:28 a.m.,*
in response to message #1 by Norman Dziedzic

At the very least, a calculator should be smaller than a Netbook.

Re: What it’s got in its nassty little pocketses

*Message #3 Posted by **Bart (UK)** on 18 June 2010, 10:36 a.m.,*
in response to message #1 by Norman Dziedzic

3 - Highly desirable but not essential

I like to carry a good scientific calculator around, but I don't want one hanging on my belt.

Re: What it’s got in its nassty little pocketses

*Message #4 Posted by **db (martinez, ca.)** on 18 June 2010, 8:52 p.m.,*

for me: #3. i sewed a big interior pocket vertically in my orange vest.
Bart (or anyone) - a fashion tip:
If you ever start to carry a calculator around on your belt, make sure the case matches the tape that holds your glasses together.

*Message #6 Posted by **Garth Wilson** on 18 June 2010, 10:45 a.m.,*
in response to message #1 by Norman Dziedzic

Putting it in your pocket is a good way to get a lot of lint in the keyboard. If it's in your shirt pocket, you bend over and it falls out. If it's in your pants pocket, you damage it. The calc is more practical to hold if it has some thickness to it.

Minimised by keeping it in it's cover.

> Quote:
>
> If it's in your pants pocket, you damage it.

I've done this quite often and not damaged any. I have kept my mobile phone in my pants pocket every day for the last 8 years without any problems. Perhaps if you put it in the back pocket and sit.... :)

*Message #8 Posted by **Egan Ford** on 18 June 2010, 11:47 a.m.,*
in response to message #1 by Norman Dziedzic

Since I have a dozen great emulators for my iPhone and my iPhone is almost always in my pocket I'd have to say "1" for a physical calc. But "3" for a virtual one. I travel; a lot. And, do not need the extra weight of a physical calc.

Point missing?????

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 18 June 2010, 12:15 p.m.,*

From the MoHPC´s HP35 page:

> Quote:
>
> Based on marketing studies done at the time, the HP-9100 was the "right" size and price for a scientific calculator. The studies showed little or no interest in a pocket device. However Bill Hewlett thought differently. He began the development of a "shirt pocket-sized HP-9100" on an accelerated schedule. It was a risky project involving several immature technologies. HP originally developed the HP-35 for internal use and then decided to try selling it. Based on a marketing study, it was believed that they might sell 50,000 units. It turned out that the marketing study was

> wrong by an order of magnitude. Within the first few months they received orders exceeding their guess as to the total market size. General Electric alone placed an order for 20,000 units.

I am not quite sure that "shirt pocket-size HP-9100" means it was made to be carried in our pockets, instead that it fits. I surely remember an HP12C´s folder where the calculator is actually placed in (or is taken from) a shirt pocket. How many others show such circumstance amongst the so too many where it is not?

Also, IIRC, the size of the HP35 was based on the internal pocket of one of Bill Hewlett´s coat (cannot remember the correct suit's name, sorry), a good pocket for safely keeping a calculator.

Cheers.

*Message #13 Posted by **megarat** on 18 June 2010, 12:58 p.m.,*
in response to message #1 by Norman Dziedzic

I suppose my vote is: 3 - Highly desirable but not essential

W/r/t regular use, I have a tremendous preference for small-form-factor ("pocket-sized") calculators. But even so, I cannot recall a single time that I have ever put a calculator in my pocket.

I also use a 48sx, which is clearly not pocket-sized, but it doesn't get the regular use that my 15c (or 12c/16c) get. (Since it is more of a hand-held computer rather than a calculator, it thus fills a rarer niche.)

Re: What it’s got in its nassty little pocketses

*Message #14 Posted by **Michael Plant** on 18 June 2010, 1:03 p.m.,*
in response to message #13 by megarat

I'd go with #3 as well. My preference is more for a handheld form factor; I never put a calcultor in my pocket.

Re: What it’s got in its nasty little pockets

*Message #15 Posted by **Marc Ferrer (France)** on 18 June 2010, 1:24 p.m.,*
in response to message #1 by Norman Dziedzic

Hello,

One more count for the 2nd option :

In the days I was doing electronics and prototyping at work, the hp11C was always in my shirt pocket. So lightweight, and just the right size. It made me let the 21 on my desk as a ..guess what ? desk calculator ;-)

More generally, I think that if a tool serves you well enough that you miss it as soon as you don't have it with you, no matter the size, the form factor, the weight... you carry it with you, it's a "must have"..

Regards from France, Marc

*Message #16 Posted by **Crawl** on 18 June 2010, 2:05 p.m.,*
in response to message #1 by Norman Dziedzic

#3.

I guess I can't say #4 because the HP50g does NOT fit in most of my pockets. Somehow I make do.

I have damaged a calculator once when I had it in a lapel pocket and I leaned over and it fell out (onto a concrete floor). Pants pockets are a better alternative.

What? Who’s got nasty little pockets?

*Message #17 Posted by **Martin Pinckney** on 18 June 2010, 3:48 p.m.,*
in response to message #1 by Norman Dziedzic

I would say 2 for me. I occasionally actually carry one in my pants pocket, never shirt. Then I always have one in my back-of-the-seat pocket in my truck, but that's a big pocket.

*Message #19 Posted by **Jim Horn** on 18 June 2010, 4:54 p.m.,*
in response to message #18 by Maximilian Hohmann

Perhaps #2. I use Free42 the most (it's in my Palm Tungsten E2 that's almost always with me) followed by my HP50g (thank you, Joe!!) then my HP20b (Thank you, Cyrille!!). I *used* to use my Casio scientific calculator watch daily until the "8" key fell out. I still wish somebody would license the Casio Databank watches and redo the ROM slightly to make them scientific and RPN. Now that is a calculator that would always be available.

Jim Horn (don't use my HP-01 any more - too heavy and limited - and really miss my HP42S)

*Message #20 Posted by **Peter A. Gebhardt** on 18 June 2010, 4:59 p.m.,*
in response to message #1 by Norman Dziedzic

Putting it (Pioneers size and less) into my jackets inner pockets often - not in shirts pockets.

So I'm preferring #3

Best regards

Re: What it’s got in its nassty little pocketses

*Message #21 Posted by **Walter B** on 18 June 2010, 6:15 p.m.,*
in response to message #20 by Peter A. Gebhardt

#3, too. I like to put it in my shirt pocket or - safer - in the inner pocket of my jacket. But I won't wear my jacket wherever I may need a calc. Yes, there's a risk it may fall out of my shirt - my Nokia does it every once and a while but survived so far, so why can't a calc be as sturdy? No such problem with the old belt bags, a more modern design may do it today as well.

Simply because the vast majority around DON'T fit in your pocket, there are hardly any truly small scientific calculators around. Small can be good for many reasons, not just fitting in your pocket.

Wish I had the time to finish this one:

Dave.

Has anyone else noticed how gender-specific these responses are? No consideration of how well a given calculator fits into a purse, to what extent the key spacing accommodates long fingernails, and similar considerations.

Some would say that it is this kind of thing that is keeping women out of technical fields, but I don't know.

Perhaps the problem is more general. After all, women have been slaves for the last 5,000 years; why should they now want to get into science or engineering?

If you-all don't stop being nassty, I'll button up my pocketses and go home.

With work, the video blog, other higher priority projects, and a bunch of other everyday stuff, I doubt I'll ever get time to even work on it again, let alone finish it.
It's a shame really, as in theory it just requires the firmware and the back panel (that holds the batteries in place) and it's complete. That's assuming the capacitive touch sensor keypad works as expected, that's the big unknown. The LCD should of course work, and the micro SD card is just an SD card. The hardware just sits there, I haven't even got Hello World on the LCD yet!

It really needs someone to take over the firmware I think.

Dave.

Re: What it’s got in its nassty little pocketses

*Message #38 Posted by **Keith Midson** on 20 June 2010, 5:21 a.m.,*
in response to message #1 by Norman Dziedzic

I'm a bit late in responding to this one, but seeing as I made a comment in the 32Sii thread, here goes ...
For me it's [3] - nice but not really essential. I recently wrote an article for a local engineering newsletter along these thoughts - not so long ago, no self respecting engineer would be caught without his trusty calculator by his side - his tool of the trade ... these days most things are done by computer. We carry around laptops, we have a computer at our desk, and the role of the powerful calculator seems to have diminished.
I find this fascinating. I used to feel 'incomplete' without a calculator (of course an HP!), but these days tend to rely on spreadsheets more than anything.
Before the reign of calculators there were slide rules (this was before my time, but my grandfather was in this generation).
For me, I still have the need to have a good quality calculator on-site, or in a meeting, or in a court room (I do some expert witness cases as an engineer), so having a trusty HP in my jacket pocket can be essential.
Cheers, Keith

Jazz 50G and SysRPL debugger

*Message #1 Posted by **Han** on 17 June 2010, 3:28 p.m.*

I have finished porting Jazz over to the HP49G+ and HP50G (ROM 2.15). The latest version (version 1.1) includes support for FPTR2 and ZINT tokens, as well as all new opcodes. The SysRPL debugger (SDB) is also now available. One caveat is that Jazz has its own entries table (which can now be installed in any port without speed limitations nor RAM requirements to copy the tables from covered ports) whereas SDB uses extable. This choice was due to the fact that there are users who prefer the internal MASD compiler (which uses extable) and only want to use SDB.

The files have been uploaded to hpcalc.org, but until the site is refreshed, you can download the new versions via:

Download Jazz 50G v1.1

Download SDB

Cheers! Han

Edited: 17 June 2010, 3:28 p.m.

in response to message #2 by Bill Zimmerly

> Quote:
>
> What is Jazz? (Besides great nightclub music, that is. :)

Hi Bill!

Jazz is a programming suite for program development on the calculator (HP50G) itself. It is a library consisting of commands that allow one to write machine language, system RPL programs, and libraries, as well as debug machine language and debug system RPL programs -- again all on the calculator itself. It also includes a robust editor that allows the user to disassemble the ROM all while simultaneously editing source code program.

If you have a postscript reader (perhaps acrobat reader can read postscript files?), the full documentation can be found at:

http://www.hpcalc.org/hp48/programming/asm/jazz-ps.zip

*Message #4 Posted by **Bill Zimmerly** on 18 June 2010, 10:28 a.m.,*
in response to message #3 by Han

Thanks Han! :)

Re: Jazz 50G and SysRPL debugger

*Message #5 Posted by **Han** on 26 June 2010, 11:42 p.m.,*
in response to message #1 by Han

Here's a quick update to Jazz 50G. Minor fixes to label generation during disassembly. Major fixes in SDB, including updates to CK&DISPATCH1 emulation to handle updated sym/arry classes, conversion of integers to reals, and a patch to work around the 2 bugs in ROM 2.15.

Until hpcalc.org does another refresh of files, you can get the updates at:

Jazz 50G

Jazz 50G Source Code

SDB (SysRPL Debugger) - Standalone version

This update of the standalone version of SDB also includes the source code.

Dear Marcus:

Uh-oh.....

Thought they were rolling this machine out in Europe first.

Will keep everyone posted on the buying experience as it unfolds.

HP sure is not what is when the 45,55,and 65 ruled the roost.

Cheers.

John

30B - Showed up Sharp!

*Message #4 Posted by **John Stark** on 18 June 2010, 12:13 p.m.,*

in response to message #1 by John Stark

To All:

My 30B showed up today - sharp one day after ordering.

Initial impressions:

- Nice blister packaging - "Cut Here" line to remove; no Kung-Fu swordplay to open the retail packaging

- Case shape similar to "Casio" -derived SmartCalc 300S - would prefer closer to HP-35S

- Unusually light weight. Put some lead or depeleted plutonium in the hollow spaces to give it some heft :)

- Good keyboard tactile feel

- Scientific functions on shifted Blue keys; i believe they were originally buried in a menu somewhere.

- Crappy sleeve/pocket case - typical Ch****e stuff.

- Overall a nice horizontal-format business/stat/scientific machine. Good successor to HP-27 "Woodstock" (one of my favorites)

Will post detailed functional evaluation later.

Marcus - I hope you get yours quickly.

*Message #8 Posted by **Katie Wasserman** on 20 June 2010, 1:01 a.m.,*
in response to message #4 by John Stark

John,

Did you get a keypad "programming" overlay in the package? Per the 20b/30b User's Guide, it's supposed to be included and shows the position of the programming functions that are accessed by pressing and holding SHIFT along with one of the keys marked on the overlay.

-Katie

Re: 30B - Showed up Sharp!-Programming Overlay

*Message #9 Posted by **John Stark** on 20 June 2010, 9:31 a.m.,*
in response to message #8 by Katie Wasserman

Dear Katie:

Sure did. Slipped in amongst the HP promotional flyers and reply card.

I have no use for it. If it can't be done with keystrokes, out comes Excel,SPSS,Systat and the like on the ol' Lap-top.

If you need one, I will be happy to send mine to you.

John Stark

Re: 30B - Showed up Sharp!-Programming Overlay

*Message #10 Posted by **Don Shepherd** on 20 June 2010, 10:00 a.m.,*
in response to message #9 by John Stark

John, but suppose there is a keystroke that is in a menu somewhere on the 30b, and you need to use it frequently so you'd like to assign it to a key (or a shift key or, even better, a shift hold key). You can do it with a simple program. See Gene's examples in the learning modules at the HP site.

Don

Re: 30B - Showed up Sharp!-Programming Overlay

*Message #11 Posted by **Don Shepherd** on 20 June 2010, 11:07 a.m.,*
in response to message #9 by John Stark

John, here is Gene's learning module about assigning functions in menus to a key. He has two examples here. It's really pretty cool.

*Message #15 Posted by **Katie Wasserman** on 20 June 2010, 12:46 p.m.,*
in response to message #9 by John Stark

John,

I'm not a fan of keyboard overlays either, but thank you for the offer. Given the "Black S" (Black Scholes) printing above the "Bond" key I think it would have been ok if HP printed all the programming-related SHIFT-HOLD functions as well instead of providing them on a template. I suppose that this might make the calculator more intimidating to financial users, but no more so than the HP-12C is. Anyway, it's not hard to memorize the key locations and avoid the overlay.

Don't quite understand this...

*Message #18 Posted by **gene wright** on 21 June 2010, 12:19 p.m.,*
in response to message #9 by John Stark

I must admit I can't quite understand the comment:

"I have no use for it. If it can't be done with keystrokes, out comes Excel..."

For example, computing the coefficient of variation requires accessing the standard deviation and the mean. Both of these are in menus, so they are accessible by "keystrokes". By my count, it takes 5 keystrokes to get to the mean and 7 to get to the standard deviation, plus the keystrokes to store these values and do the required division. Since those are keystrokes, your comment might suggest you would use the 30b and not go off to Excel.

However, by writing an INCREDIBLY short / easy program ONE TIME, you can compute the coefficient of variation in a total of 2 keystrokes.

So, at least 14-15 keystrokes turned into 2 by spending 5-10 minutes writing a program.

Sure, if you only compute that one time, then why bother? But if there are any things you do that you might need to do repeatedly, then the time spent is very well rewarded.

Using functions in menus are much more user-friendly when placed into VERY short programs and assigned to keys. The examples in the learning modules show how to assign the inverse trig functions to the shift-hold trig key positions. MUCH easier and faster than going through the menus.

I think that was Don's point. You can certainly access those through keystrokes, but why not consider entering a few short programs one time to reduce your keystroke count by a large number?

And, yes, we're all different, I know.

Testy..testy

*Message #19 Posted by **John Stark** on 21 June 2010, 2:16 p.m.,*
in response to message #18 by gene wright

Now I remember why I switched majors from Engineering to Finance.

Engineers ALWAYS HAVE TO BE RIGHT. AND SAY IT IN CAPS.

Anyway, will investigate doing repetitive things on the 30B via short "keystroke" programs.

John

in response to message #19 by John Stark

That was actually the original intent of the 30b "programming". In fact, it was called "macros" for a long time. The idea was you could pull frequently used things out of menus, and write a short little equations to use with the solver.

However, those nasty beta testers kept asking and complaining for more and more. . . pretty soon you had loops, tests, subroutines and more just to shut them up! ;-)

Re: Testy..testy - Muddled Feature Set

*Message #22 Posted by **John Stark** on 21 June 2010, 3:17 p.m.,*
in response to message #21 by Tim Wessman

Dear Tim:

Very interesting. Good example of a "muddled" feature set, terminology, and message to the end-user.

"Programmable" scares off some folks, and raises the expectations of others.

"Keystroke Shortcuts", or "Macros" implies convenience and end user customization.

The latter recalls the user-defined keys on the Classic card-programmables and the 48-50 series. Indeed I have used the U/D keys on 48-series to quickly access functions buried in the menu system, although I am by no means a "programmer".

Appreciate everyone's comments - hope HP is listening.

John

Again, this makes me concerned about the processes and procedures at HP.

First determine the feature set
Then freeze the baseline
Minimize product feature creep - beta testers are *testers*, not product developers
Keep the valuable feature requests from your beta testers as a wish list for a product upgrade, people are more willing to buy an upgrade if the original worked properly in the first place.

40 years ago one could get away with loose development methods because markup margins were high, but in today's cut-throat, short-time-to-market environment, stricter processes and procedures are needed and have to be followed in order to survive.

AND THIS IS MY OPINION (which is always right, of course ;-))

But if the beta testers are screaming for something, it's a very safe bet that the end-users will also. Basically, it means that the original feature set wasn't right.

If the 30b just had macros and no loops or other flow-of-control instructions, we would be roasting HP for making such an obvious mistake.

*Message #27 Posted by **Tim Wessman** on 22 June 2010, 10:24 a.m.,*
in response to message #26 by David Hayden

Just so you feel a bit better Bart, all the major features were determined before the full beta group was officially organized. I was being a bit sarcastic when I was talking about them "whining and complaining" causing things to be added. In initial product feedback with a few individuals is where the requests for that showed up. Us being calculator nuts, we tend to agree with stuff like that. :-)

Mostly, the beta testers did a fantastic job with the polishing - especially to get the 30b the point that everyone was happy with the program editing. Originally, it had a few quirks due to the underlying system and everyone was much happier after the polishing.

What you describe fits very well using a traditional waterfall development method. However, your description of a 1) cut-throat 2) short-time-to-market situation describes a perfect example of where one would choose to use a more agile method IMO.

I feel exactly the opposite, let's agree to dis-agree.

I guess I've touched on this point enough times now, so I'll attempt to restrain myself from doing so in future posts.

Re: Testy..testy

*Message #29 Posted by **Bart (UK)** on 22 June 2010, 10:27 a.m.,*
in response to message #26 by David Hayden

Either the original feature set wasn't thought out properly, otherwise, TOUGH - there's too much risk of faults like those on the 35s slipping through due to last miniute changes.

We're already continually roasting HP for not making the quality products of old and going on and on about "HP integrity" and quoting the "2.02 ln e^x" bug. Both sides (producers and users) must understand you can't have it all. In 1972 it was easy, there was nothing like the original 35 out there. Now everybody has had calculators for years there's an endless wish list - we all know how to build a better one.

By the way, apart from a few eager programmers (which most of this forum's members consist of), there are probably many more financial calculator users out there that just want to acces deep menu items quickly - macro's would be just fine for them. They would probably not need to program new functions or formula's or routines that require loops etc.

Besides, adding loops and flow control would be well partnered with more user memory, in a 30bii.

Re: Testy..testy

*Message #30 Posted by **gene wright** on 21 June 2010, 5:29 p.m.,*
in response to message #19 by John Stark

Actually, I didn't feel I was being all that testy.

I just didn't understand the blanket rejection of anything "non-keyboard".

If you really don't want to be efficient (and finance people usually do), then by all means, pull out a laptop, wake it from sleep, start Excel, and do something you could have already loaded into the HP 30b.

I did not even mention the HP SOLVE feature on the HP 30b. Since you are in finance, you might have a need to solve loan problems where the first period does not have exactly 30 days in it. By entering the program found in this learning module once, you will always have the ability to run the program and solve for all the TVM variables when there are an odd number of days in the first period. Useful? Perhaps.

Generalized odd-days loan solver example for the HP 30b

And, yes, I have enough of my undergraduate computer science degree to act somewhat like an engineer, but as a former college professor, I have always tried to encourage people to choose wisely and not dismiss things out of hand.

Testy? Not yet.

Re: Testy..testy

*Message #32 Posted by **John Stark** on 22 June 2010, 11:56 a.m.,*
in response to message #31 by Martin Pinckney

dear martin:

neither am i.

perhaps you are the exception to the observed anecdotal rule.

anyway - what an INTERESTING!!!! :) thread on the 30B; to repeat meyself, I sure hope HP listens to this entire forum and considers it in its development cycle.

of course, not being ever involved in a large corporate structure, i do not konw or understand the details of how a new product is developed in today's lean, mean world.

keep on posting, everyone !

john

PS: My fling with the 30B started when I wanted to supplement an HP.80 in use for some time. I had an older 12.C which started getting flaky.

Bought 30B online and began my narrative.

This morning, went to Office Despot and got another 12.C. Two batteries and a "programming" plug under the cover. You experts can tell me what that means.

Bottom line, emotionally, not logically: The 12.C still has a "soul"; the 30B is "hollow". Both do what I need in terms of simple financial,bond,and statistical work.

30B will most likely wind up in the "For Sale" section of this forum available to a good home.

Thanks for listening to a "McCoy" in the midst of a forum of "Spocks" :).

JTS

Re: Testy..testy

*Message #33 Posted by **Katie Wasserman** on 22 June 2010, 12:33 p.m.,*

> Quote:
>
> This morning, went to Office Despot and got another 12.C. Two batteries and a "programming" plug under the cover. You experts can tell me what that means.

It means that you bought a calculator with "the soul of an old machine". It's got an new ARM-based processor in there that's running an emulator of the original voyager CPU and the code the emulator is running is the original 12C ROM image. So it's both really fast and really old.

I have to say that I like the 12C+ (what you bought) better than the 30b as a financial calculator. You can certainly do much more on the 30b, in the way of financial functions, statistics and programming, but for overall usability and looks I like the 12C+ the best.

*Message #3 Posted by **John Robinson** on 21 June 2010, 9:05 a.m.,*
in response to message #2 by Raymund Heuvel

Hi Raymund,

I mean an image file of a 9114 disk. Is there any such tool ?

Thanks John

Re: LIF file viewer for windows ?

*Message #4 Posted by **Raymund Heuvel** on 21 June 2010, 11:45 a.m.,*
in response to message #3 by John Robinson

Hi John,

a long time ago, I started such a thing.. I'll look in the deep
archives and let you know. I am afraid it is still in Win-ME
times. The version worked did NOT work on a disk, just on an image file of it.

What functionality do you expect? An image file editor at hex
level, directory functionality, file viewing functionality,
directory entry editing ... :)

Please give me a month or so.

BR

Ray

Re: LIF file viewer for windows ?

*Message #5 Posted by **John Robinson** on 21 June 2010, 8:01 p.m.,*
in response to message #4 by Raymund Heuvel

Hi Raymund,

That sound like what I am after, something to view the image. I don't actually have the disk.

I am wanting to view the contents of the 9114 disk image written by the PILBox. So viewer would be great.

Cheers, John

Interchanging IC´s in Spices

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 17 June 2010, 1:09 a.m.*

Hi, all;

as we all share experiences, here comes one of mine.

A few hours ago I was struggling to make one working Spice of about four different nonworking units. I checked Eric´s marvelous reference page and found that some Spices - HP34C, HP38C and HP33E - share the same processor - 1820-2162 or 1820-2162A. I also remembered reading somewhere (old posts, very old posts...) that although Spices might have processors with same identification, they might not be interchangeable from one model to another (I concluded that the firmware might be different, though).

Anyway, desperate circumstances lead to desperate measures, so after trying different power boards and 'sandwiched' flex circuit, I took an HP38C´s 1820-2162 and tested it with an HP34C´s chipset. It worked well, and I (sadly) concluded that I have at least two Spices´ processors burnt out!

Well, I must confess that the HP34C worked well at least until I assembled the whole unit and realized that I kept an E-series power board inside of it, I mean, the poor thing shows

```
Pr Error
```

in the display every time it is turned on if left off for more then a couple of seconds. There we go again...

Although many people do not feel too well with Spices, I would like to point out some of their characteristics that call my attention:

- they are the last LED-based series calculators from HP;
- the HP38E/C is the first of all programmables with a [P/R] toggle key (all prior units have PRGM/RUN switch keys)
- the HP38E/C and the HP34C are the first pocket calculators with registers/program shared memory (I am not sure if the HP95C also have it, but anyway, it is not a pocket calculator, right?)
- they were the only HP pocket calculators with solderless assembly (yep, I know it is the cause of many bad contact and faulty operation, but there is nothing easier to maintain...)
- they were cheap instead powerful (someone once mentioned that the postfixed 'E' was from Economics...)

Please, if there is anything wrong in the above list I apologize. I wrote it by heart, and chances are that some data miss accuracy.

Yep, I like them. No favorites, I only prefer the HP34C and the HP38C because they have continuous memory and offer more resources than the others.

Cheers.

Luiz (Brazil)

Edited: 17 June 2010, 1:18 a.m.

Re: Interchanging IC´s in Spices

*Message #2 Posted by **Jeff Kearns** on 17 June 2010, 8:52 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Interesting story... I only have the 33E and 32E units. Without continuous memory, the 33E is, in my opinion, not a very practical programmable calculator. My favorite (until I get my paws on a 34C) is the 32E, which I purchased for an exam a couple of years ago that did not allow programmables. This is a well-designed and very useful general purpose scientific and statistical calculator with built-in hyperbolics and normal and inverse normal distribution functions. The keyboard layout is indicative of the ergonomics of the day. A far cry from the 50G (a 49g+ with different colours), with the poorly placed and sized ENTER key and division key that is smaller than the other three. What's up with that?

Although not as 'sturdy' as some of the other older models - Valentin Albillo's review of the 34C described it as "...rather flimsy, like you could crush it by merely closing your fist...", the Spice series calculators (34C in particular) were a great alternative for students to the more expensive contemporary models like the 41C.

Jeff Kearns

Re: Interchanging IC´s in Spices

*Message #3 Posted by **Mark Henderson** on 17 June 2010, 4:04 p.m.,*
in response to message #2 by Jeff Kearns

As I posted a few weeks ago after receiving and reviving my first Spice - a 34C - although I thought I was a Classic guy (with some Woodstock yearnings since my first HP was a 25) I really quite like these Spices. I did a full tear-down on the 34C and it's looking good and working really well. I do like the continuous memory, and the LEDs (of course) and the thousands separators! So I picked up a reasonable deal on a clean 38C, which arrived yesterday, and it's also a very nice little calc (it needs some clean-up around the battery/charger area but that's easy).

Couple of questions to the experts:

- The thin foam layer under the keyboard of the 34C is breaking up, does anyone have a good, readily available substitute for this ? the keyboard actions on both my Spices are really good, I don't want to mess this up. - The battery cover on the 34C was all warped and won't stay in place, but the one on the 38C is tight and straight. The locking features look the same on both, is there a trick to these things?

Interesting HP-32E with comma for decimal point

*Message #1 Posted by **Michael de Estrada** on 16 June 2010, 5:40 p.m.*

The HP-32E in this auction uses a comma (,) for the decimal (radix) point and a period (.) as the thousands separator. Note that the serial number on the back of the case has an asterisk (*) as a prefix to indicate this convention. I have converted one of my Spice units to this convention by cutting a jumper on the power circuitry board inside the calculator.

See here

Re: Interesting HP-32E with comma for decimal point

*Message #2 Posted by **Bart (UK)** on 16 June 2010, 6:45 p.m.,*
in response to message #1 by Michael de Estrada

I have one like that given to me from Brazil (made in Singapore though). Probably made for the likes of continental Europe (UK uses period for decimal like the US).

Re: Interesting HP-32E with comma for decimal point

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 17 June 2010, 12:07 a.m.,*
in response to message #2 by Bart (UK)

Hi;

actually the comma for decimals and period for thousands applies to Brazilian standard, too. I also have a Woodstock with a LED display that happens to use comma instead of period. I´ll post pictures later (have to find the LED display, first...)

Cheers.

Loops of addition

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 15 June 2010, 10:10 p.m.*

A loop of addition is inherent in a FOR-NEXT loop. A FOR-NEXT loop typically provides a substantial increase in the accumulated count relative to that provided by an A = A + 1 function in a GOTO loop. Some examples:

TI CC-40:

Count: 12,110 where the previously reported count for a GTO loop was 9,339

Code: 10 FOR I = 1 TO 99999 20 NEXT I

Sharp EL-5500III:

Count: 9,140 where the previously reported count for a GOTO loop was 2,056 where I was surprised by the 4.5 fold increase.

Code: 10 FOR I = 1 TO 9999 : 20 NEXT I

Substantial increases in the count are also realized with the TI graphic machines using the code :For(I,1,99999) :End

TI-80: Count: 3,080

TI-83+: Count: 19,020

TI-85: Count: 15,490

TI-86: Count: 12,690

Palmer

Re: Loops of addition

*Message #2 Posted by **Don Shepherd** on 16 June 2010, 9:56 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Palmer, I suspect Gene did not take that approach because all programmable calculators do not have looping instructions like FOR/NEXT or ISG/DSZ DSE, etc. He wanted some simple method of doing addition that could be used to compare lots of calculators. For example, the 12c has no looping instructions, but you can still loop manually.

My experience with the 33s, which does have looping instructions, is that using the looping instructions takes significantly longer than just controlling the loop manually. I did some benchmarks years ago and determined that.

in response to message #2 by Don Shepherd

Don:

The introduction to Gene's Article 1002 states in part:

> Quote:
>
> ... Alternative methods that count one at a time are allowed and included, such as going through an ISG/DSE loop. ...

For an example, see the entry for HP30b with TSTSYS ON.

I agree with you that the methods which use looping instructions other than a simple GOTO tend to be slower. The FOR/NEXT loop seems to be the exception.

My recollection is that Maurice Swinnen did some of this back when the TI-88 came out as a way to show that it was faster than the TI-59, but I have't been able to find the material.

I've found some speed comparisons of the TI-88 vs. TI-59 here: http://www.ti59.com/V7N9.pdf
Thanks to Viktor Toth, the TI-88 is also present in the n-queens benchmark.

*Message #5 Posted by **Palmer O. Hanson, Jr.** on 18 June 2010, 10:06 p.m.,*
in response to message #2 by Don Shepherd

OOPS! The numbers reported herein are with the machines operating in the APPROXIMATE mode. When the mode is changed to EXACT the count for the TI-89 for the Lbla ... Goto a changes from 6,790 to 8.860 which is substantially closer to the previously published value. Furthermore, the For ... EndFor loop increases the count instead of decreasing it as with the APPROXIMATE mode. So, I'll have to generate a new set of data for the EXACT mode and (maybe) generate a new set of data for the AUTO mode as well.

Don:

> Quote:
>
> My experience with the 33s, which does have looping instructions, is that using the looping instructions takes significantly longer than just controlling the loop manually.

I did some work with my TI-89 which is in agreement with your idea that use of looping instructions takes longer. First, I did a :Lbl a :b + 1 > b :Goto a : EndPrgm loop and got 6,790 counts which is subtantially lower than the previously published value of 9,339. I could not make the Ans + 1 method work. A

For...EndFor loop gave a reduced count of 4,685 per minute. That is consistent with your comment but is not consistent with results from other TI graphic machines. A Loop...EndLoop lop gave an increased count of 7,266 counts per minute. The details are:

TI-89 Platinum: Count: 6,790: Code :Prgm :Lbl a :b + 1 > b :Goto a :EndPrgm

TI-89 Platinum: Count: 4,685: Code :Prgm : For a,1,99999 :EndFor :EndPrgm

TI-89 Platinum: Count: 7,266: Code :Prgm :Loop :a + 1 a :EndLoop :EndPrgm

I did the same tests on my TI Voyage 200 with similar results but with with counts about 3 to 4 percent higher:

TI Voyage 200: Count: 7,000: Code :Prgm :Lbl a :b + 1 > b :Goto a :EndPrgm

TI Voyage 200: Count: 4,860: Code :Prgm : For a,1,99999 :EndFor :EndPrgm

TI Voyage 200: Count: 7,546: Code :Prgm :Loop :a + 1 a :EndLoop :EndPrgm

*Message #6 Posted by **Don Shepherd** on 19 June 2010, 3:15 a.m.,*
in response to message #5 by Palmer O. Hanson, Jr.

Palmer, it is interesting that using the looping instructions sometimes takes longer than just controlling the loop index yourself on some machines; I put a yellow post-it note in my 33s manual years ago to NEVER use ISG/DSE. But it really does depend upon the individual machine. I did a benchmark on the new 30b, and on that machine it is much faster to use the looping instructions than to do it manually.

I guess it depends upon how efficiently these instructions were implemented by the OS programmer. Obviously, Tim and Cyrille did a good job on the 30b. But Katie pointed out another area in which the 30b is not nearly as efficient as, for example, the 42s and others. I believe she said that the 42s caches the physical address of each label (object of a Goto or Call), so subsequent executions do not have to search for the location to goto. The 30b does not do this, and some programs take much longer to run because of this. We created an optimized version of the prime factor program in which the most commonly used labels are located at the beginning of memory, and did some benchmarks comparing this version with the non-optimized version, and the results were striking. Let's hope that, if the 30b ROM is ever updated, this is fixed. Of course, one could argue that the 30b is not primarily a programming machine...

I admit that the ISG and DSE functions are not "speedy" when it comes to counting. But, that is not all that they do, and more importantly, they do what they do without messing with the stack.

Palmer

Re: Loops of addition

*Message #8 Posted by **Don Shepherd** on 21 June 2010, 5:26 a.m.,*
in response to message #7 by Palmer O. Hanson, Jr.

True, but I value speed over stack (and number of instructions, usually). And, in almost every loop I've ever done, I want the loop index in X when I begin the loop during each iteration, so to loop from 1 to 30, for example, at the end of the loop I would do this on the 33s:

```
1
STO + 1
30
RCL 1
X<=Y
GOTO A01
```

In the benchmarks I did on the 33s, this code runs faster than ISG 1.

On the 30b, there is no X<=Y, there is ?<= (which is really Y<=X), which would require a GF 1, or ?> (which is really Y>X) with GT 1, to maintain the desired loop index in X. The ISG on the 30b is much more efficient than the ISG on the 33s, however.

HP-32Sii

*Message #1 Posted by **jweisskohl** on 15 June 2010, 7:05 p.m.*

I just received an HP-32sii calculator is new condition. It looks as if it was hardly used and is in perfect pristine condition. The back says Singapore with the HP logo and the year 1987. S/n is 3318S20199.

I paid $175 on Ebay for it. The seller said he won it from HP and it was hardly used.

Having only the new HP-35s to compare against I'm really liking the limited menus and the two shift keys with direct keyboard access.

How does this model rate against the other HP models? It seems to me that it is head and shoulders over the newer 35s. I understand that it has 384 bytes of memory but for me this is not a big limitation.

Would be interested in how well the 32sii was received in it's day.

in response to message #1 by jweisskohl

Your calculator S/N 3318S20199, was made in the 18th week of 1993, according to the first four digits of the serial number.

You will find many positive reviews on this model if you search the site. The 33S and 35S were based on the 32sii - a Pioneer. It was and is an excellent calculator made with the classic quality that is now a thing of the past.

Although the 15C (for the most part) and the 42S rival its capabilities, you will undoubtedly enjoy using it! Don't be fooled by the condition either; I used mine daily from 1994, when I bought it new, until 2005 when I retired it from daily use. I still use it now and then and it also looks like new. The previous owner may have simply taken good care of it.

Hi;

I was checking the HPmuseum files and I saw that the HP32II is mentioned to be introduced in 1991. Yours is a 1993 uint (taking the first two digits of the serial# plus sixty: 33 + 60 = 93)

It was my first year after finishing the University when HP introduced the HP32SII, and I remember that the 'HP41 fever' was getting lower because of the Sharp and Casio pocket computers, along with the advent of the PC's (at least here in Brazil they were beginning to take place). I cannot tell for sure, but the HP32SII, as an HP32S upgrade, had bigger competitors in the HP48S/SX and the HP42S, both introduced in a very closer period of time.

I did not see so many HP32SII as I saw HP41's, HP11C's (15C's were fewer) and HP28's, but I still think Sharp, Casio and PC's themselves were their actual competitors.

Cheers.

*Message #4 Posted by **bill platt** on 15 June 2010, 10:03 p.m.,*
in response to message #1 by jweisskohl

32sii positives: Good buttons. Good display. Lots of functions. Fraction handling is really neat. Unit conversions is useful. Ability to put algebraic equations into a solver is very useful. For 11c users, feels like a more powerful 11c.

32sii negatives: Keyboard function layout is busy, and not as "unified" or something, as say, the 11c was.

"Unary minus" in the equation list is very weird and confusing, and there is even a bug with it. I think it might be discussed at craig finseth's site. There was some bug with the fraction feature on early units.

The Equation List is not a fully functional system. No editing without backspacing over stuff. Very limited memory makes equation list very limited in long term utility. Of course who wants to put a lot of long term stuff on a non-io machine anyway.

32sii is currently the most in-demand "obsolete" model, and also possibly the most numerous as far as I can tell.

Re: HP-32Sii --- USA specific?

in response to message #1 by jweisskohl

To those that use it, the fractions function is without a doubt one of the 32sii's most unique features.

Re: HP-32Sii --- USA specific?

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 16 June 2010, 1:31 a.m.,*
in response to message #5 by Randy

True!

Dealing with inches is somehow easier when you can see their non-integer part as a fraction. I know that the HP33S allows choosing the denominator basis, is it the same with the HP32S/SII?

O.T.: I was not aware of some non-HP modules for the HP41 series until I bought and built my first MLDL2000. I tried many (at least for me) unknown modules and I must confess that the AECROM was a big, pleasant surprise (I´m an electrical engineer), and its ability to deal with length units (including

fractions viewing) and expression writing is amazing.

Cheers.

Re: HP-32Sii

*Message #7 Posted by **Mike Morrow** on 15 June 2010, 10:43 p.m.,*
in response to message #1 by jweisskohl

I purchased an HP32SII in 1997 to retire a ten year old HP-15C. What a disappointment! The HP32SII has incredibly poor complex number support, compared to the HP-15C. The HP32SII "pioneered" the sorry, awkward, illogical, un-natural complex number support that infected the later HP33S and HP35S models. I immediately retired that new HP32SII in favor of the old HP-15C.

I was later able to get a couple of new HP42S units. The HP42S is similar in appearance to the HP32SII, but far more capable, versatile, and easy to use (as numerous threads on this forum have demonstrated in the past). Most acknowledge the HP42S as the finest RPN machine ever made, even today, 22 years after introduction, and 15 years after discontinuance. The HP42S is THE most sought after RPN calculator on sites such as ebay. Prices well above $300 are common.

To be fair, the HP32SII is a limited but servicable calculator if one doesn't need competently or logically implemented complex number support, and if one can forget that the HP-15C and HP42S ever existed.

Re: HP-32Sii

*Message #8 Posted by **Karl Schneider** on 16 June 2010, 12:40 a.m.,*

Gee whiz, Mike. You never miss an opportunity to express your vendetta against the HP-32S/SII. We've read it a number of times, over and over again.

> Quote:
>
> The HP32SII "pioneered" the sorry, awkward, illogical, un-natural complex number support that infected the later HP33S and HP35S models.

That is incorrect. The functionality closely parallels that of the HP-41 Math Pac of 1980, and first appeared as built-in microcoded routines in the HP-32S. I've posted that information a few times.

Although admittedly awkward for interactive use, that functionality is quite useful in programs. Just today, for a real-world problem, I employed my Two-bus AC Power Transfer routine, which computes complex power using five of the HP-32SII's complex-domain functions.

> Quote:
>
> To be fair, the HP32SII is a limited but servicable calculator if one doesn't need competently or logically implemented complex number support, and if one can forget that the HP-15C and HP42S ever existed.

Harsh assessment, there. I have all three, starting with the HP-15C in 1983. My AC power program could

be ported to the HP-15C, but it wouldn't be nearly as user-friendly without the INPUT and VIEW functions, as well as single-letter storage registers. Also, the HP-32SII runs 12 times as fast as the HP-15C.

The HP-42S could run a more-refined implementation of that program, but the display is not easy to read.

Don't knock the 32S/Sii because you made the wrong choice. The 42S was a compatible replacement for the 15C, not the 32.

To compare: The 15C was the top-of-the-line scientific Voyager
The 42S was the top-of-the-line scientific Pioneer
The 32S/Sii was the middle-of-the-line scientific Pioneer, which is more akin to the 11C, which does not have complex number support at all.

*Message #10 Posted by **Bart (UK)** on 16 June 2010, 4:31 a.m.,*
in response to message #1 by jweisskohl

Personally I prefer the 32S above the 32Sii/33S/35S because I prefer menus. I hate having to scan the keyboard for a function. Everytime I need a less used function, I have to scan the keyboard - "is it a keytop/orange/blue function?" What a bother! Arranged logically in menu's I know to just go to a menu and there it is.

Re: HP-32Sii

*Message #11 Posted by **Norman Dziedzic** on 16 June 2010, 7:23 a.m.,*
in response to message #10 by Bart (UK)

I must be in the minority here but I used a 32Sii for about 5 years and much prefer the 35s. I don't use much in the way of complex numbers or programming so that probably tilts my perspective.

I love having the two line display and make a lot of use of the equation solver which I like better in the 35s.

I do keep the 32sii around for doing calculations in different bases as the 35s is a pain there (and I don't have a 16c).

Re: HP-32Sii

*Message #12 Posted by **Martin Pinckney** on 16 June 2010, 10:55 a.m.,*
in response to message #1 by jweisskohl

Jerry, as you can see, there are differing opinions on this machine. But after 3 years of reading posts here, I think it reasonable to say that most members here view it positively. I am not an RPN man, I have no need for complex numbers, and I prefer the 27s Solver, so I use it mostly for fractions, which IMO is well-implemented.

I bought a 35s thinking since it was dual RPN/ALG, it would roll the best of 32sii and 27s into one (plus all that memory), but was very disappointed that it kept the very limited 32sii Solver.

There is always the debate over multiple keyboard shifted functions vs. menus, but IMO that is a user preference issue, not good/bad design issue. You pays your money you makes your choice.

I've been using my 32sii for 12 years virtually every day. It is very rare that I don't have it with me.

Not a single problem up to now and it still is in a very good shape. For me the last serious non graphing calculator HP made.

It's successors, above all the HP-35s are pure CRAP, because of design faults and bad hardware. And the worst, HP doesn't have the guts to admit that and to change something.

For the case that something goes wrong with my 32sii I still have 5 brand new in the box, which I bought for less than $80 a piece. That stock should be sufficient for my lifetime ;) (currently I am 32).

Yes, I think you have it covered. Don't know how long you plan to live, but let's assume 92 is a good number. That's 92 <Enter> 32 - 5 ÷ years apiece, not counting the one still in service. Perhaps someone on here has computed the MTF for a 32sii, but I feel confident it is > 12 years.

Of course to be accurate we would have to know if yours are Singapore or Indonesia, and what the

difference in MTF for these is.

Come to think of it, we would also have to know from your family history, your own MTF.

Perhaps someone can write a calculator program for this? {:-)

I think the problem is that electronics do age even when not used. So maybe one will end up after 30 yrs with all spare calculators in bad condition, so to say "new crap in box" I always think to myself the best way to honour these HP folks who developed such calculators is to use em daily, what is what I do.

I own a swedish made mechanical calculator "Original Odhner" from 1925. What a beauty under the hood. Handmade parts in bronze. It works like a charme and I bet these quality calculators can easily get 150 yrs old without any problems at all. No need for spare calculators here :-)

Re: HP-32Sii

*Message #17 Posted by **Keith Midson** on 17 June 2010, 4:41 a.m.,*
in response to message #13 by Katie Wasserman

I agree with Katie, I have all Pioneer models (and pretty much every other HP calc ever made!) and the 32Sii is one of my favourites. I have 3 x 32Sii's - the only one i'm not overly happy with is the green/purple version made in Indonesia - the quality isn't as nice as the Singapore version.
I *love* the 42S, but for quick calculations it is hard to beat the 32Sii as all the functions are easy to find. And as someone else rightly pointed out, the 32Sii was a mid-range calculator - the 42S is far more powerful and an amazing machine for lots of other reasons.
I actually don't mind the 35S, but it's size in its cover is an issue for me as it doesn't fit into my jacket pocket!
Cheers, Keith

But it doesn't beat the 32S* (or any Pioneer) for pocketability. I don't think HP currently has anything on offer to match the Pioneers. The 10S just doesn't look the part and the 300s & 35s are just that bit bigger. The Pioneers were perfect "pocket calculators".

Interesting thought, but it looks to me like it's more of an all-in-one approach in that the 30b does everything the 20b does and a whole lot more. Also, the 30b has a lot of scientific functionality for a business calculator. However, the form factor is obviously taken from the Pioneer series, the key layout is nearly identical and the outer dimensions are within a couple of millimeters of the Pioneers.

Unfortunately, yes. The bevelled edges make this models quite wobbly. It is interesting that HP repeated this mistake with the 30b. Usuallay, they introduce a *new* problem with each calculator.

Both approaches (keeping a bad design and replacing a bad design by another bad design) are hard to understand. One would think that a "design evolution" as a third approach would be far more superior. It should reduce necessary investments and should lead to designs of increasing quality/usability. HP never used it in a notable manner, not even in the good old days (the Woodstock - Spice transition comes to mind).

But this thread is about a Pioneer calculator (sorry for hijacking it for my little rant). Whoever designed it, he created the best series of calculators of all times, with the 32SII on top of all others due to display and programming (as Katie already mentioned).

*Message #25 Posted by **Bart (UK)** on 18 June 2010, 4:51 a.m.,*
in response to message #21 by Katie Wasserman

OK, if we're including financial calculators, the new 10bii is a nice form factor. It's compact and has a contoured soft slip on cover like the pioneers, unlike the bulky 35s zipper (or even the 33s cover, which although it's "slip-on" it adds about 1cm to the dimentions). It also looks nice with the dark body and silver bezel on the top.

Re: HP-32Sii

And there is also the joy of using a calculator that you really appreciate the design, build, functionality, and feel of. $200 might seem like a lot for the up-front cost of a calculator, especially one that is 10-15 years old, but amortize that over the 5-10+ (or more) years of using it. It's totally worth it, at least in my humble opinion.

in response to message #29 by Martin Pinckney

I agree Martin, such a variety of responses from those who like it and don't like it. A couple of observations on this thread:

> Quote:
>
> 32sii is currently the most in-demand "obsolete" model

> Quote:
>
> The HP42S is THE most sought after RPN calculator on sites such as ebay.

Is there any scientific evidence to support either claim, or are these maybe just opinions of the respective authors?

Re: HP-32Sii

*Message #31 Posted by **Allen** on 17 June 2010, 7:58 p.m.,*
in response to message #30 by Don Shepherd

Don, I think you make a good point. Although I suspect the long and short term price trends are

slightly higher for the HP-42s, ebay is not a perfect supply/demand environment, and that 10-20% average margin may or may not equate to "higher demand". A collector-quality 42s will generally sell for more than a collector quality 32sii, I think because the 42s is slightly harder to find in fine condition- which may also drive the price up for the really nice ones.

I also suspect there were far fewer 42s calculators made, perhaps as many as three or four 32sii's for every 42s that came off the HP line.

Re: HP-32Sii

*Message #32 Posted by **bill platt** on 17 June 2010, 9:44 p.m.,*
in response to message #31 by Allen

I would bet the ratio is more like 10 or 20 more 32sii than 42s!

the 42s was discontinued pretty quickly. The 32sii kept going right up into the new millennium--and it had the distinction of being the last scientific RPN machine on the market--for quite a long time.

Maybe the ratio was 4:1 while they were concurrent, but not in the long haul.

And what does "in-demand" and "sought after" mean? To me they mean number of people that are looking for such items, not the prices they go for. In which case neither of those claims might be true.

Re: HP-32Sii

*Message #34 Posted by **Martin Pinckney** on 18 June 2010, 9:51 a.m.,*
in response to message #30 by Don Shepherd

> Quote:
>
> Is there any scientific evidence to support either claim, or are these maybe just opinions of the respective authors?

Surely such claims are subjective, but even so, not without merit.

Anyway, how would you set up a "scientific" study of such questions. No. of bidders? No. of bidders per auction occurrence? Price range from starting bid to final? Number of watchers? Some combination of above? Perhaps someone could write a test algorithm and program it into their 32sii/42s. {:-)

From reading the news, it seem even the scientists don't know what scientific evidence is these days.

Re: HP-32Sii

*Message #35 Posted by **Don Shepherd** on 18 June 2010, 10:36 a.m.,*
in response to message #34 by Martin Pinckney

Oh, I'd say they are without merit.

When someone makes a claim like "the HP-15c is the most desired calculator among collectors" and doesn't cite any verifiable evidence to back it up, the claim is without merit; it's just one's opinion. Now, opinions are fine, we all have them (just look at this forum!). But to state a "fact" without saying it is one's opinion is, well, I don't know the right word to use, but it just strikes me as wrong.

You are right, there are countless ways to study Ebay sales and auctions and arrive at statistics, and if one wants to do that and show how they arrived at a "fact," then fine, do it; readers can determine for themselves how valid they believe the results to be based upon the method used.

Facts, without cited supporting evidence, are just opinions and should be identified as such.

That's my "opinion"!!

Re: HP-32Sii

*Message #36 Posted by **Martin Pinckney** on 18 June 2010, 2:43 p.m.,*
in response to message #35 by Don Shepherd

Don, perhaps I should have said "not *totally* without merit".

Yes they are opinions, and should be stated as such. Nevertheless, it *should* be somewhat obvious to anyone who tracks these calculators on eB** that both the 32sii and 42s are in high demand, at least most of the time. It's definitely a stretch to say either are the *highest* demand, without some data to back it up. So the statement is partially true, hence not *totally* without merit.

My opinion, of course.

Re: HP-32Sii

*Message #37 Posted by **Don Shepherd** on 18 June 2010, 3:22 p.m.,*
in response to message #36 by Martin Pinckney

Agreed. And, really, all the old HP calcs get a lot of interest, which speaks to their great workmanship I'd say. There aren't many things that old that still work! I got a 65 about 3 or 4 years ago and it is one of my favorite calcs, and my students love those flashing LEDs when a program is running.

Re: HP-32Sii

*Message #38 Posted by **jweisskohl** on 21 June 2010, 8:07 a.m.,*
in response to message #29 by Martin Pinckney

I wanted to thank everyone for the replies. I appreciate all the responses. I have now had a chance to use the HP-32sii and also have spent considerable time trying out the HP-42s, which is also a very impressive calculator with all the Functions available, albeit a difference interface with the menus. I'm not sure how I feel about the menus, they are not bad but I see they are necessary with all the functionality the 42 has.

You probably just need some time to get comfortable with them.

I have plans to go get my Doctorate in Computer Science and find that I need to take the GRE's as part of the entrance requirements. I work as a computer programmer (actually, now in management so I am no longer hands-on) but it's been about 15 or more years since I have used any of the math that are on the GRE's. I'm more than a bit rusty. So my immediate goal is to get back up to speed with the help of a Scientific Calculator, therefore, I picked up the HP-32sii. I'm also looking for a good review book.

I really like the HP-32. The display is nice and big and it certainly appears to have the functions that I will need. I work with computers all day and don't like turning one on in the evening, unless I need to find something on the Web and read email. The Hp-32sii is light enough to carry around and turns on and responds quickly. My computer takes 5 - 10 minutes from boot time before it quiets down and is fully usable.

I know that the trend is now towards computers and was a bit disappointed to see that many of the more capable HP calculators have been retired. This HP-32sii I hold in my hands looks extremely durable and I am hoping it will last me through my doctorate program.

Newbie w/ Relay Actuator on HP-IL with 71B

*Message #1 Posted by **Miles Willmek** on 13 June 2010, 12:07 p.m.*

I have been trying trial and error to figure out commands to control an Air Therm ATC-0010 relay device connected by HP-IL to my 71B. I have searched the web but can't find any documentation. Does anybody have any experience with this device or something similar?

It is the only other device on the loop. RESTOREIO is successful and DEVID$(1) returns "HP82166A". I have tried sending some strings like OUTPUT:1,"A1" and the device seems to respond, but not as expected (channels 2 + 4 seem to come on whatever i send). ENTER:1,A$ always just times out.

I would appreciate some pointers to get me started.

Re: Newbie w/ Relay Actuator on HP-IL with 71B

*Message #2 Posted by **DavidShenk** on 13 June 2010, 12:31 p.m.,*
in response to message #1 by Miles Willmek

I've been curious about these myself. I hope someone has some info about them.

in response to message #1 by Miles Willmek

> Quote:
>
> I have tried sending some strings like OUTPUT:1,"A1" and the device seems to respond, but not as expected

I'm not familiar with the 82166, but I suspect you might need an actual string, like A1$, not A1. I've done a lot of equipment control with HPIL and never had any problems when I just followed the manuals. As I remember though, it always had to be an actual string.

Re: Newbie w/ Relay Actuator on HP-IL with 71B

*Message #4 Posted by **Garth Wilson** on 13 June 2010, 11:06 p.m.,*
in response to message #3 by Garth Wilson

Correction: my apologies-- I guess I was in too big of a hurry. I missed the quotes and thought you were sending numeric *variable* A1.

Re: Newbie w/ Relay Actuator on HP-IL with 71B

*Message #5 Posted by **Raymund Heuvel** on 13 June 2010, 9:15 p.m.,*
in response to message #1 by Miles Willmek

```
You could try:

Assuming HP82166A is #1 in the loop:

RESET HPIL                       // Optional
RESTORE IO                       //
SEND IFC UNL UNT LISTEN 1        // Resets devices on the loop, makes HP82166A a listener
OUTPUT 1;CHR$(161)              // THIS IS HEX A1 !

Br

Ray
```

Re: Newbie w/ Relay Actuator on HP-IL with 71B

*Message #6 Posted by **Miles Willmek** on 15 June 2010, 9:18 a.m.,*
in response to message #5 by Raymund Heuvel

Thanks, for the responses guys.

I still am not having any luck getting a consistent response.

I looked HP2166A and it is apparently an embedded HP-IL to HP-IB interface. So I think I need to put one side or the other on some kind of pass thru mode.

I know some information is going through to the relay, but how do I ensure I am talking to the device and not the interpreter?

Re: Newbie w/ Relay Actuator on HP-IL with 71B

*Message #7 Posted by **Garth Wilson** on 15 June 2010, 1:49 p.m.,*
in response to message #6 by Miles Willmek

> Quote:

The HPIL-to-HPIB interface converter is the 82169A which I have used a lot. For most things, it is transparent, meaning the HPIB devices appear as though they were on the HPIL. It does have a mailbox mode, but it sounds like what you're looking for is better addressed in the next question:

> Quote:
>
> I know some information is going through to the relay, but how do I ensure I am talking to the device and not the interpreter?

Without being familiar with the '166A, I suspect REMOTE will make the device interpret the stuff you send as commands, and LOCAL will make it pass it on as data to whatever equipment is on the other side.

*Message #3 Posted by **DavidShenk** on 13 June 2010, 11:30 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

No, not quite. I was watching this auction and I know it was ended early, though it really does not say that anywhere. To end an auction early, you have to give a reason, so that really should be displayed somewhere on the page. I think the seller must have realized that the included PPC ROM module should have been listed separately and so he ended the auction to do that.

Dave

Re: Excellent purchase! (not mine, what a pity)

*Message #7 Posted by **Jim L (OHIO)** on 21 June 2010, 11:00 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

Well, I never saw this auction; with a PPC ROM and all. But--I was successful (in my 1st ever eBay attempt) in getting a 41CX with an Advantage Module for $275, and I'm happy with that. Especially considering I was foolish enough to have gotten rid of an early HP-41C, Finance, Statistics, Mechanics, Statics, and Memory modules back in the late '80s. And the Wickes Synthetic Programming book too.

Guess I'm trying to recreate that era, and since the $275 I just paid for a 41CX is less than the $395 I paid for the 41C plus inflation, I think I'm not doing too bad so far.

HP 12c Platinum

*Message #1 Posted by **Joe Burwell** on 12 June 2010, 10:07 a.m.*

For the first time I have seen the new HP 12c Platinum. The model that has the 2 batteries. I saw it at Office Max in the Atlanta area. Just like the new HP12c you have to look at the battery compartment through the package to tell it is the new model.

Re: HP 12c Platinum

*Message #2 Posted by **Katie Wasserman** on 12 June 2010, 11:54 a.m.,*
in response to message #1 by Joe Burwell

Joe,

Are you saying that HP as a redesigned 12C Platinum that uses 2 CR2032 cells to power an ARM-based CPU? Furthermore that they're doing a soft roll-out of it like they did with the 12C+. If so, that's news to me, did I miss some discussion on this?

-Katie

Edited: 12 June 2010, 11:58 a.m.

Re: HP 12c Platinum

*Message #4 Posted by **Joe Burwell** on 12 June 2010, 4:13 p.m.,*
in response to message #2 by Katie Wasserman

Katie,

That is certainly what it looks like. I am a financial calculator junkie so I bought it. It does have the two batteries. Concerning the ARM-based CPU that is beyond my knowledge. I am just a financial planner and I love RPN calculators and financial calculators in general. I do a little programing on the calculator but nothing like the kind of stuff ya"ll do.

Joe

Re: HP 12c Platinum

*Message #5 Posted by **Don Shepherd** on 12 June 2010, 5:01 p.m.,*
in response to message #4 by Joe Burwell

Joe, I think Katie is questioning whether what you bought is a "platinum." 12c platinums have a silver faceplate; regular 12c's, including the new ARM-based 12c+ with the two CR2032's, have a gold faceplate. If the faceplate on the unit you just bought is gold, it is not a "platinum", it is the ARM-based 12c+ and you will find that it is extremely fast.

Re: HP 12c Platinum

*Message #6 Posted by **Joe Burwell** on 12 June 2010, 7:36 p.m.,*
in response to message #5 by Don Shepherd

Don,

No question it is the platinum. I also have the 25th anniversary edition of the platinum and a regular platinum model with the one battery. Is this new model faster, I don't know. The platinum models have always been fast unlike the older 12c gold models.

Joe

in response to message #16 by gene wright

Gene,

Thanks again for helping me with this. If you let me know how to do the loop test I will give it a try.

Joe

Re: HP 12c Platinum ... here are the pics ... Hmm... :-)
*Message #18 Posted by **gene wright** on 13 June 2010, 11:40 a.m.,*
in response to message #17 by Joe Burwell

Here's what to do for the loop test.

Press:

```
shift P/R
shift CLPRGM
+
shift GTO 001
shift P/R

1 ENTER ENTER ENTER ENTER CLX

shift GTO 000
```

R/S and let it run for 60 seconds. The number in the display is the important one.

Re: HP 12c Platinum ... here are the pics ... Hmm... :-)
*Message #19 Posted by **Joe Burwell** on 13 June 2010, 12:49 p.m.,*
in response to message #18 by gene wright

Gene,

When I let it run for 60 seconds and stop it by pressing the R/S key the number in the display is 1,402.

Joe

*Message #21 Posted by **Mike Morrow** on 13 June 2010, 12:56 p.m.,*
in response to message #16 by gene wright

I'd have bought one of these, based only on everything being mirror-image of the standard HP-12. :-)

Re: HP 12c Platinum

*Message #22 Posted by **Tim Wessman** on 13 June 2010, 11:20 a.m.,*
in response to message #14 by gene wright

It was mainly the implication that it is now an ARM processor that would be news to me. The platinum was done long before I showed up, but I definitely know it isn't running the same chip as the 20/30.

I know there was the original silvery one that had a few issues, such as having forgotten parenthesis and so on. When it was changed to black did it sprout another battery? There was also a 25th anniversary one if I remember correctly. Was that when it gained another battery?

As a side note, should we ever get to go back to the 12cp, are there any known issues with the current one, or additions/changes anybody thinks should happen?

*Message #23 Posted by **Don Shepherd** on 13 June 2010, 11:36 a.m.,*
in response to message #22 by Tim Wessman

My 25th Anniversary edition of the 12c platinum has a single 2032. From the picture of the battery compartment furnished by Joe, I don't see the little 6 pin connector that is associated with the ARM. This two-battery version is interesting. Thanks Joe.

Re: HP 12c Platinum

*Message #24 Posted by **gene wright** on 13 June 2010, 11:41 a.m.,*
in response to message #23 by Don Shepherd

The 25th anniversary edition became the default 12c platinum once the 25th anniversary units ran out, I think.

So, sadly, it isn't an ARM unit, but a slight mod. :-)

Re: HP 12c Platinum

*Message #25 Posted by **Joe Burwell** on 13 June 2010, 11:40 a.m.,*
in response to message #22 by Tim Wessman

Tim,

This is what I remember of my purchases of the platinum. The very first one was completely silver and had a very cheap feel to it. I did not like it, rarely used it, and am not sure if I still

have it. Then later when the 25th anniversary model came out and I purchased it. It just has one battery. Later a platinum model came out that looked like the 25 anniversary model but without 25th Anniversary Edition on the face plate. Again this model has just one battery. Then last week the new platinum with the two batteries.

I like collecting calculators, financial calculators. There are 10 office supply stores within about 35 miles of my home. I regularly check out what is in the stores just to see if there is something new. I know it is a little odd but as my wife says at least it is not blondes or red sports cars that interests me.

*Message #26 Posted by **Tim Wessman** on 13 June 2010, 11:44 a.m.,*
in response to message #25 by Joe Burwell

My pure *guess* then would be that the same mold used for the ARM 12c body is now being used for the 12cp. That one has two batteries, so rather than have two sets of different parts, it was standardized on the one mold.

*Message #27 Posted by **Katie Wasserman** on 13 June 2010, 1:02 p.m.,*
in response to message #26 by Tim Wessman

Tim,

This is an interesting statement. Does that mean that once calculators are in production they are no longer in your hands as far as management goes? Adding a 2nd battery and likely a correspondingly changed circuit board I think would at least need some testing and certainly a manual change about the battery configuration.

I don't think it is SOP anywhere that R&D is also in charge of manufacturing operations. The only time I'd expect R&D to be involved in any organization is if there is a problem with something that isn't a manufacturing type problem (plastic warpage, bad components, etc), or if changes are made.

TW

Re: HP 12c Platinum

*Message #29 Posted by **Katie Wasserman** on 13 June 2010, 3:00 p.m.,*
in response to message #28 by Tim Wessman

Of course, but doens't a circuit board of this type constitute development/change. There's at least a decent chance that adding a 2nd battery could affect the low battery indication function, for example.

I'm not at all trying to be critical, just trying to understand how HP manages its calculator group. How much of the responsibility lies in the US verses with manufacturing in China?

I took out each battery one at a time and they both have metal connectors. Also, the inside of the battery cover has the following "Warning Turn off before changing batteries. Please replace batteries one at at time."

Joe

Re: HP 12c Platinum

*Message #32 Posted by **Joe Burwell** on 13 June 2010, 8:21 p.m.,*
in response to message #30 by Tim Wessman

Tim,

I put in the CD that came with it and looked at the users guide. In the section on the batteries, page 264, it indicates the platinum shipped with 2 batteries. It actually does say platinum. Further down it has a drawing of the double compartment and indicates the batteries should be replaced one at a time.

Joe

Re: HP 12c Platinum

*Message #33 Posted by **Katie Wasserman** on 13 June 2010, 1:16 p.m.,*
in response to message #13 by Joe Burwell

Joe,

I need to apologize too as much of this was my fault. I assumed that a 2nd battery would imply an ARM-processor or at least a different processor that needed more power. That would be a major change and would no doubt have resulted in a discussion here.

In any event I very much appreciate your posting this "find" and your question here. Sorry if you got some negative waves about it we're really a friendly group almost all of the time.

in response to message #4 by Joe Burwell

Okay, while I am a huge HP fan, I'm certainly no afficienado of the genre. I bought an HP-12C at a garage sale maybe 8-9 years ago. The lady didn't know what she had and asked $5 for it so I had to snap it up.

Here's my question: It has 3 A76 button batteries in it. Does that help identify what generation it is, or approximately a range of years? Any help would be appreciated. Thanks.

Re: HP 12c Platinum

*Message #39 Posted by **Bart (UK)** on 22 June 2010, 6:04 a.m.,*
in response to message #38 by Jim L (OHIO)

This would be the first genre of the HP-12C. However, there were some modifications to this too. Some forumers may be able to give you better details if you provide the first four digits and fifth letter of the serial number. (See decoding serial numbers).

You may be interested in the following link: HP Voyager Calculator Variants.

Re: HP 12c Platinum

*Message #40 Posted by **Jim L (OHIO)** on 23 June 2010, 12:38 a.m.,*
in response to message #39 by Bart (UK)

Bart, many thanks for your quick and kind response. The link to the Voyager page was most helpful. While I cannot find a S/N on the bottom of my calculator, I am satisfied that it is an earlier version, albeit year unknown. For my $5 and the value I have received from it since purchase I am very happy. Thank you again.

Re: HP 12c Platinum

*Message #41 Posted by **Vieira, Luiz C. (Brazil)** on 12 June 2010, 11:59 a.m.,*
in response to message #1 by Joe Burwell

Hi;

I also saw, in the beginning of this year, a 'regular' (at least from the outside) HP12C with two CR2032 (3.3Vcc) cells. What I am not sure is if it was a regular, golden HP12C or an HP12C Platinum. What called my attention was the fact that it did not perform the [ON][X] selftest, so I was asked about a possible failure. When I look at the back of the calculator, I saw the large cover of the battery compartment. Surprise, surprise: two cells!

Although it was here, in Brazil, I cannot tell if it was bought here.

Cheers.

Luiz (Brazil)

Edited: 12 June 2010, 12:02 p.m.

Re: HP 12c Platinum

*Message #42 Posted by **Katie Wasserman** on 12 June 2010, 1:21 p.m.,*
in response to message #41 by Vieira, Luiz C. (Brazil)

Luiz,

That would be the 12C+ (ARM-based 12C replacement that HP still calls the regular 12C) that you held in your hands. The first release of it did not implement the standard 12C self tests but that's been corrected.

-Katie

Re: HP 12c Platinum

*Message #43 Posted by **Vieira, Luiz C. (Brazil)** on 12 June 2010, 9:25 p.m.,*
in response to message #42 by Katie Wasserman

So, there`s a new breed...

Well, matter of fact, after all of this repurposing discussion, I believe that reprogramming an HP12C+ to act as an HP12C Platinum would just be a matter of available user RAM. Is it correct?

Cheers. And thanks, Katie!

Luiz (Brazil)

Re: HP 12c Platinum

*Message #44 Posted by **Katie Wasserman** on 13 June 2010, 2:36 a.m.,*
in response to message #43 by Vieira, Luiz C. (Brazil)

I'm speculating since Tim said that there is no ARM-based 12C Platinum calculator. The ARM chip used in the 12C+ (20b and 30b too) has 2K of non-volatile RAM and 128K of ROM, both of which should be more than adequate for a 12C Platinum design. However, I think it would be quite a bit of work to make the 12C+ into a 12C+ Platinum.

The 12C+ is running an emulator of the chip used in the Voyager calculators the emulator runs the ROM image from the original 12C. The 12C Platinum uses an 8502 processor chip with en entirely different code base. So the ARM chip would either have to emulate an 8502 and run the ROM image from a 12C Platinum, or would need to be re-written to run on the ARM natively. It's also possible that the 12C Platinum code was written in C and complied for the 8502 so the conversion to an ARM-based calculator might not require a complete re-write, but I suspect it would still be a lot of work.

HP 41 batteries

*Message #1 Posted by **Peter Creyf** on 11 June 2010, 4:49 p.m.*

Hi, I've got my HP 41 (CV) and the rechargeable batteries do not charge very well any more. There are some battery holders online (ebay), but read a thread where some handy users replaced the N-batteries with what I think are AAA batteries (I think 4 ea) and where they described having done some sanding and grinding work to make it fit. I am not adventurous to do this and am afraid to kill my battery pack altogether. (mine is a rechargeable module, so I'm guessing this person was talking to start from the non-rechargeable pack). Any suggestions, or since I am not too handy in these kind of things, is there anyone who has done this in the past (and available to do this again?) Many thanks, Peter

Re: HP 41 batteries

*Message #2 Posted by **DavidShenk** on 12 June 2010, 2:04 p.m.,*
in response to message #1 by Peter Creyf

Hi Peter,

If I were you, I would buy an N size battery holder and be done with it. For the more adventurous, you can rebuild the rechargeable packs. I did two a few months ago, but had a little trouble because the springy metal contacts in one had corroded and needed to be replaced. I have not tried, nor see, photos of a holder modified to take AAAs.

You can also sell your rechargeable pack to help pay the cost of the regular holder and let someone else work on it.

Dave

Re: HP 41 batteries

*Message #3 Posted by **Peter Creyf** on 13 June 2010, 4:44 p.m.,*
in response to message #2 by DavidShenk

Dave, Both you and Etienne (see message below) suggest the same. I was thinking in the rebuilt type because of "short" battery life. I've been working with the rechargeable ones, and these didn't last very long (any more, and I can't remember how long they lasted in the beginning). But the non-rechargeable batteries should last well enough. So I'll just buy the battery holder (I only seem to find this on eBay), and fit it with the correct size battery.

Many thanks, I do agree this is probably the easiest solution. Cheers, Peter

Re: HP 41 batteries

*Message #4 Posted by **Etienne Victoria** on 12 June 2010, 2:11 p.m.,*
in response to message #1 by Peter Creyf

Hi Peter,

- AAA rechargeable batteries will not fit: too long.

- 1/3 AAA will fit

- 1/3 AA will fit with great effort and pain but hold more power. I've done it once and the fit is extremely tight.

Therefore, if you're not absolutely comfortable doing it yourself, I suggest you get a regular battery holder and feed it with either regular N's or N-sized Nicads or NiMHs. You would have to recharge the latter externally though.

Best

Etienne

Re: HP 41 batteries

*Message #5 Posted by **Peter Creyf** on 13 June 2010, 4:49 p.m.,*
in response to message #4 by Etienne Victoria

Etienne, thank you to you as well. I will as explained in my response to Dave buy a battery pack and fit this with the N-Nicad batteries. Many thanks to you to Etienne. Thank you both to your support to the HP Museum forum !!! Cheers, Merci,

Peter

Re: HP 41 batteries

*Message #6 Posted by **Garth Wilson** on 13 June 2010, 5:44 p.m.,*
in response to message #5 by Peter Creyf

NiCads are 1.2V, meaning my 41's low-battery indicator would *never* go off. With alkalines, I normally got two years to a set, but it dropped to about six months when I got the double extended memory module. That's still way, way longer than it takes NiCads to self-discharge, even if they did have a high enough voltage.

Edited: 13 June 2010, 5:45 p.m.

Re: HP 41 batteries

*Message #7 Posted by **James Grenert** on 13 June 2010, 7:54 p.m.,*
in response to message #4 by Etienne Victoria

Anyone know where to buy a holder for N batteries? I'm looking for a generic holder to use for a charger, not one specific for the calculator. I can put together the charging circuit, but I would rather not try to cobble a battery holder.

Thanks! -J. P.

in response to message #8 by Katie Wasserman

This place has an incredible selection of battery holders, including several holders for 1, 2 or 4 N cells. They have a really lame order form page and prices too in a weird way. Batteryholders.com, of course!

Edited: 13 June 2010, 10:54 p.m.

About life expectancy of any rechargeable battery (was: HP 41 batteries)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 14 June 2010, 12:45 a.m.,*
in response to message #1 by Peter Creyf

Hi;

about four (maybe five) years ago I started using a pack of four Sanyo Cadnica 150mAh N-cells, and they are still working. I

have at least five working HP41´s (halfnut and coconut units), and two CX kept without batteries (the internal clock is not a good friend of rechargeable batteries...), so using disposable batteries is not an option. I also have three 82242 IR modules, three card readers and one 82153A (optical wand), and all of these guys use battery power. Using rechargeables makes perfect sense, right?

Now for the facts. The current capacity in batteries is measured in Ampere X hours, and the nominal value (e.g. 150mAh in this case) means the maximum current in one hour till the nominal voltage in the battery terminal drops to 90% (I also found 85% in some literature). So, if a NiCad, 1.2Vcc, 150mAh battery keeps a 150mA load, after one hour its terminals might be measuring about 1,08 (or 1,02 if 85% is the factor). The 150mAh pack I have still keeps an HP41CV memory contents (no modules at all) for about three to four months before the battery indicator lits.

I ended up buying a brandless Chinese pack of four NiMH 400mAh, which lasts less than double the time of the four Sanyo. I was also given twelve 190mAh Sanyo Cadnica (three packs of four) that work almost the same time as the 400mAh Chinese units.

But the secret lies in the way you charge them, not the way you use them.

The average 1,000 charging cycles applies only if you respect the '10% nominal current' charge limit while charging (that's why the charging time is always 10 hours). Any fast charger will charge the batteries according to a non-linear charging curve, but chances are that fast charging will also reduce battery life or discharging characteristic. Also, many of the standard charges apply high current to the batteries, and most of them heat the batteries up somehow. I measured a regular charger right after getting my first 150mAh NiCads and it gave me almost 100mA charging current. It would kill the batteries very soon, I guess.

While measuring the charge current I noticed that the charger had about 3.8Vcc in its terminals with no batteries, so I measured its current and voltage in many circumstances and I realized it was just a passive current source. So I used a pair of NiCads in series (about 2.4Vcc) and added a small series resistor. Please, look at the pictures: (link to photobucket)

Assembly with two batteries

I used two-side coated PCB´s to accommodate the resistors

Assembly with batteries and resistors

As I did not open the charger to see the circuit, I simply tested with two different resistor values, measured their voltage drop with the two NiCads in series then I computed the correct one that would give me something closer to 15mA needed to charge the two NiCads (47 ohms) and another one closer to the 40mA for the two NiMH (27 ohms - should be smaller, about 23 ohms, but I decided to use a higher, commercially available value, hence a smaller current).

The batteries never heat up after their ten hours charging time (they do not even get warm to the touch) and their discharging periods did not significantly reduce so far.

Hope this helps a bit.

Luiz (Brazil)

Re: About life expectancy of any rechargeable battery (was: HP 41 batteries)
*Message #11 Posted by **Katie Wasserman** on 14 June 2010, 2:42 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Luiz,

Nifty idea, and nicely done! Yes, high charge rates result in high heat and that's what kills batteries. Some nicads tolerate heat better than other and these are rated for faster charging, but the best rule of thumb is to not charge at a rate more than C/10 where C is their capacity in mAh. Nimh cells are similar but to maximize their life you need to not fully charge nor fully discharge them. In fact, hybrid cars like the Prius carefully control their battery charge/discharge to vary +/- 15% around a set point of about 60% of a full charge.

-Katie

Hi, Katie;

> Quote:
>
> the Prius carefully control their battery charge/discharge to vary +/- 15% around a set point of about 60% of a full charge

Thanks for the valuable information! From now on I´ll charge the NiMH´s for no more than 7 hours. I measured their charging current and found about 36mA with the 27 ohms resistor. Considering that the batteries voltage increase as they charge and the series resistor does not significantly changes its value, the charging current tends to reduce as the batteries charge.

Thanks again!

Luiz (Brazil)

6114A power supply initial price (sorry, slightly OT)

*Message #1 Posted by **Marc Ferrer (France)** on 11 June 2010, 1:26 p.m.*

Hello,

Last year I put hands on a venerable hp6114A power supply at no cost.

To my delightment, it was perfectly working. Within days it was cleaned, and I even found a service manual ^^

It found a quiet home in my little lab, and a question arose : how much dit it cost 30 years ago ? I'd be happy if someone could answer. Considering how well built and designed it is, I suppose it wasn't a cheap item.

It helped me doing funny things, amongst them rebuilding a little bit of the technology lying in the HP 9100 : based on the "green machine" patent, I successfully built a BCD counter, then I devised a 7-segment decoder.... just for fun !

Now I wish I have enough time to build a clock, but that's another (OT) story...

Cheers, Marc

Re: 6114A power supply initial price (sorry, slightly OT)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2010, 1:54 p.m.,*
in response to message #1 by Marc Ferrer (France)

Hi;

I have an HP 1978 Electronic Instruments and Systems Catalog and the 6114A (DC-Power Supply) is listed US$830,00 at page 638. Opt. 009 (10-turn control) is listed US$35,00 and Opt. 015 (decadial C Contr) is listed R$85,00.

I have some other HP catalogs, not all in a series, up until 1991.

Hope this helps.

Cheers.

Re: 6114A power supply initial price (sorry, slightly OT)

*Message #3 Posted by **Marc Ferrer (France)** on 11 June 2010, 3:15 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thanks a lot for your answer, I've been enjoying reading your posts for a long time.

I expected a high price, but not to such an extent -and mine has the 015 option. Needless to say, it was just for information, I don't plan to make money with it.

Besides that, maybe some of you will ask why I'm doing strange things like rebuilding some of the 70's technology stuff ?

- it's funny, I like it. - it is the best way to understand how it works. - after 25 years doing software and computing at work, I find it mind-refreshing to get back to my "electronic" roots as a hobby.

And in our days of billion-transistor processors, I think it's a good thing to remember these times when you had to get the most of what you had -so few hardware.

These constraints led engineers to produce masterpieces which still work. I consider it a duty to preserve all that, because behind well-done and well-thought items, one always discover great men. Thomas E. Osborne is one of them, IMHO.

Just my 2 cents, and...

Thanks again, Luiz !

Regards, Marc

Re: 6114A power supply initial price (sorry, slightly OT)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 11 June 2010, 4:57 p.m.,*
in response to message #3 by Marc Ferrer (France)

Hi, Marc;

First of all, mercy!

> Quote:
>
> I've been enjoying reading your posts for a long time.

What else could I ask for? 8^) Thank you! I appreciate.

Next, I cannot tell you how much I agree with you. All the way!

I have complete collections of 70´s and 80´s Brazilian magazines and some foreign literature I red that time, and now I treasure them all so much. Technology of that time is the very foundation of what we have today.

I am building some stuff myself, and the project I'm dealing with right now is a 10Hz-1MHz frequency meter with scratch stuff. So far I have a partially working prototype with:

```
six LED digits, seven segment;
1 CD4511 (BCD -> 7 segment decoder/driver);
3 CD4518 (dual decade up-counter);
4 CD4503 (hex buffer, tristate, for multiplexing the CD4518 outputs);
2 CD4017 (timing/control);
1 CD4011 (some control signals)
```

Join to these a time reference (Xtal-based) and an input equalizer/squarer (I´ll use an MC10116 line driver configured as a programmable Schmitt-trigger) and we have a complete frequency meter with

hold and event-counting possibilities. I was able to generate all multiplexing and control signals from the two CD4017, so the frequency meter needs only the guys up here. Actually I tested it with the power line -60Hz- as clock reference and it worked well. I just need to provide a stable power supply and a custom PCB layout. Will post the pictures soon.

BTW, have you checked my photobucket album for Electronics and the other one for HP calculators? Please, be my guest!

I think I gave my students some hope about Electronics because there's a group very interested on a summer course in Electronics and hardware, preferably in this very July.

As soon as I have news I'll post about.

Cheers.

Luiz (Brazil)

in response to message #4 by Vieira, Luiz C. (Brazil)

Hello Luiz,

It's always good finding people sharing same points of view and hobbies :-)

I wish you good luck for your frequency meter, hoping it'll soon work. Nice project, your design is clever ! (from what I guess given the parts list)

It reminds me of a TTL-based stopwatch I built many years ago -it was in my young years, when I already collected electronics magazines (didn't understand everything by then) which I consider now as a treasure -just like you do.

This morning I took a look at your photobucket albums, the HP side is impressive; I'd love to have as much time as you : I've got many machines (HPs, TIs, mechanical ones) waiting for restoration.

The other side brought me straight back to the times I dismantled every out-of-service electronic item I could grab; the kid I was had as much fun doing this as playing with Lego...

I'm happy that you spark interest in electronics by your students, teaching is such a noble task... and speaking about kids (they're already students, aren't they ?) : my 13-year old daughter masters the soldering iron an impressive way ! Eh eh

Keep up the good work !

Regards, Marc

Autistic HP-65 needs help!

*Message #1 Posted by **Michael Meyer** on 11 June 2010, 10:27 a.m.*

I bought an HP-65 that is showing an odd display, but responds to keypresses. The logic board is fine... operates in another HP-65. That leaves only the two chips on the keyboard circuit board as culprits. Does anyone know which chip to look at, and are these interchangeable with a dead HP-45 or HP-80? Thanks! Mikey

Re: Autistic HP-65 needs help!

*Message #2 Posted by **db (martinez, ca.)** on 11 June 2010, 2:49 p.m.,*
in response to message #1 by Michael Meyer

Maybe it can be used as-is to design abattoirs.

in response to message #4 by Thomas Okken

Yes. Her. The most famous autistic person i know of, fascinating speaker, and straight thinker. She alone has done more for animals' welfare than PETA will do in a century. I guessed Dr. Mike would have read about her, if only to learn how to get along around here.

BTW: With it's card reader, wouldn't the 65 have been the worlds first NON-autistic pocket calculator?

I heard an interview with Temple Grandin on NPR. She was very interesting. She described going into the cattle chutes to get a cow's eye view and her perceptions were really interesting--the sort that afterwards you think, "of course! why didn't I think of that!"

Re: Autistic HP-65 needs help!

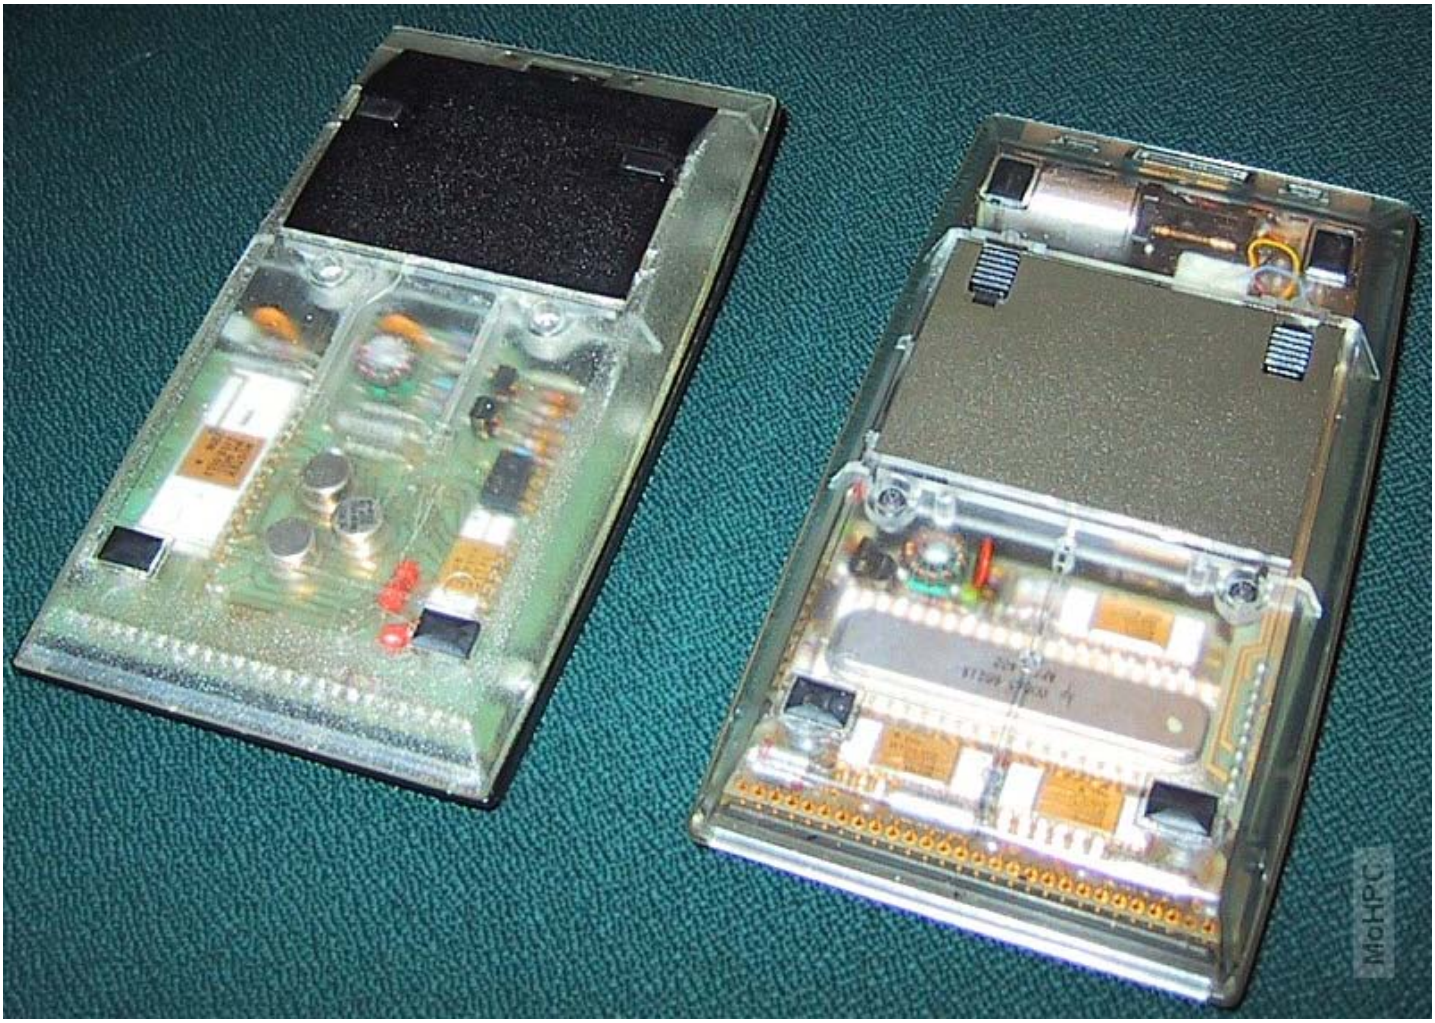
HI, Doc;

I do not know the HP65 circuitry, but if you have a display with 'garbage', I'd suspect either the display driver/decoder OR the main ROM contents. As you managed to test the mainboard in another HP65 and it works fine, you are in the right way trying to find the problem in the external circuitry. So, my question would be: the LED display is driven by circuit(s) in the mainboard or somewhere else in the calculator? I have an HP55 but I do not recall how do its internals look like, neither if they remind the HP65's... Anyway, if the LED driver/decoder chips are not in the mainboard, they may also be the cause of it.

The other way to get into a conclusion would be running a pre-recorded program (mag. card) and see it the calculator´s display shows something understandable. I also do not know if the HP65 has the auto-run feature (I know nothing about this dude...), but if it has, that would help a lot.

The closer way to 'see' inside of it was through this picture:



But I did not get too much insight from it.

Sorry not helping the way I would like to...

Cheers.

in response to message #1 by Michael Meyer

Can you describe what is wrong with the display? Enter 8 ten times then press EEX and 8 two more times. Do you have:

- All digits illuminating but are missing the same segment(s)?
- All segments working but one or more digits are missing?
- Something totally random every time you press a key?

HP-25C needs chips to come back to life

*Message #1 Posted by **Jean-Michel** on 10 June 2010, 3:52 p.m.*

Hello all,

my HP-25 I was given recently powers up and shows "0.00" on display, but unfortunately the keyboard remains non responsive. Sounds like the keyboard controller is dead. One or probably three chips are fried.

If anyone of you has some spare chips he could give/sell me, please contact me, I will give him the exact part numbers of the chips and the way to proceed.

Before you tell me: I have already asked Randy (FixThatCalc). Unfortunately he does not have the parts.

Kind regards. Jean-Michel.

By the way... (was: HP-25C needs chips to come back to life)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 10 June 2010, 9:20 p.m.,*
in response to message #1 by Jean-Michel

Hi;

did you read this post? That's the main reason I may have the chips you need. In fact, I have already tested two of the ACT units and they are not OK. I use an HP25 PCB with IC´s sockets so I can easily test any of them. Even the two IC's under the LED display are readily changeable.

Cheers.

HP-15C program to compute 3x3 complex matrix determinant

*Message #1 Posted by **Karl Schneider** on 10 June 2010, 11:58 a.m.*

Please refer to the following archived thread:

Complex Matrix Determinant on the 15C

The HP-15C represents an *m* x *n* complex-valued matrix as an *m* x *2n* real-valued matrix. The HP-15C's built-in utility functions will transform an
m x *m* complex-valued square matrix represented in this 'complex' format into an *2m* x *2m* real-valued square matrix. The determinant of such a matrix is the squared magnitude of the complex-valued determinant of the *m* x *m* original matrix.

This procedure can be employed to obtain the magnitude of the determinant of a complex-valued matrix dimensioned up to 4 x 4. However, no built-in capability is available to return the complex-valued determinant itself.

Here's my completed program to calculate the complex-valued determinant of a 3 x 3 complex-valued matrix on the HP-15C. The matrix must be entered as a 3 x 6 real-valued matrix "A" in standard HP-15C 'complex' format. The program was tested with the following matrix **A** on the HP-15C, and verified using the built-in DET function on the HP-42S:

A =

```
[ 1+i3  2-i5   7+i1 ]
[ 4-i2  6+i9  -8+i4 ]
[-3-i7  3+i2  -1+i6 ]
```

det **A** = -217 + i231, as computed exactly by this HP-15C program and by the HP-42S. The HP-15C's native capabilities return 100,450.0000 as the squared magnitude of the determinant, whose calculation time is 15 seconds.

If **A**(1,3) is edited to 7-i1, my HP-15C program returns the exact determinant of -75 + i289, and the HP-15C's native capabilities return 89,146.00002. (The HP-42S computes a slightly-inexact -74.9999999999 + i289, suggesting that the HP-42S does not calculate determinants directly.)

It may be that the exact answers produced by the HP-42S for the original matrix are attributable to the squared magnitude of the determinant exceeding 10^5. If so, that was pure luck. My only criterion for populating **A** was that each component of each element be a single-digit integer, with a variety of signs.

This HP-15C program consumes about 25 registers and takes 21 seconds to run. It utilizes indirect access of any matrix {A-E} by storing the descriptor of the matrix into the indirect register I.

```
Procedure:  Store 3 x 6 matrix in 'complex' form with identifier {A-E}; RCL {A-E}; GSB D.

  1.  Check if dimension of matrix is 3 x 6
  2.  (If not, display blinking descriptor and stop)
  3.  Compute and store first complex sub-determinant
```

```
  4.  Compute second sub-determinant
  5.  Combine with first sub-determinant and store
  6.  Compute third sub-determinant
  7.  Combine with first two sub-determinants
  8.  Display complex result
  9.  NOTE: "(u)" denotes user mode, which is necessary for advancing the matrix-element index.

Re: HP-15C program to compute 3x3 complex matrix determinant

*Message #2 Posted by **hugh steers** on 11 June 2010, 12:57 p.m.,*
in response to message #1 by Karl Schneider

i wonder if the 42s does its complex matrices through LU decomposition, like the 15c does real ones. This would then give it a working complex matrix math which the 15c lacks.

it might explain the slight inaccuracy in this case.

Re: HP-42S computation of complex matrix determinant

> I wonder if the 42s does its complex matrices through LU decomposition, like the 15c does real ones.

It's certainly a possibility, although that is not documented, in my recollection. If so, however, I would assume that the HP-42S internally transforms the complex matrices to the 'quadrupled' real-valued matrices.

The HP-48 and descendants provide an "LU" function that returns the L, U, and P matrices. The Crout algorithm -- instead of the Doolittle algorithm of the HP-15C -- is employed.

-- KS

Re: HP-42S computation of complex matrix determinant

*Message #4 Posted by **Thomas Okken** on 13 June 2010, 10:49 a.m.,*
in response to message #3 by Karl Schneider

Regarding the algorithms used, I tried DET on the matrix

```
   [ 1+i3  2-i5   7-i1 ]
A= [ 4-i2  6+i9  -8+i4 ]
   [-3-i7  3+i2  -1+i6 ]
```

I get these results:

HP-42S: -74.9999999999 + i289
Free42: -74.999999999999999999982 + i288.999999999999999999998

Free42 uses a straightforward LU decomposition algorithm straight from *Numerical Recipes in C*. The similarity of the errors makes me suspect the 42S does, too.

Trying this same test case on the 48G, the result is -75 + i289 exactly. This is interesting because the 48G uses the same floating-point representation as the 42S. I wonder: is the 48G more accurate because it uses a different algorithm, or does it use the same algorithm but with 15-digit intermediaries? Given that the 48 series has a lot more RAM than the 42S, it would make sense to use some of that to gain some extra precision.

Re: HP-42S computation of complex matrix determinant

*Message #5 Posted by **Werner** on 20 June 2010, 5:19 a.m.,*
in response to message #4 by Thomas Okken

- The HP-42S uses LU-decomp for complex matrices, not the transformation to real-valued ones. That can be verified: with a matrix in X, executing DET will need to have spare memory for a copy of the matrix (since the original one must be kept in L). If the transformation to a real-valued matrix would be used, the amount of spare memory needed would be twice the size of the original matrix. In my case, I have about 5900 bytes free. With a Cplx 13x13 matrix in level X, that is

reduced to about 3200 bytes, leaving enough room for a second 13x13 Complex matrix (a bit over 2700 bytes), but not enough for a 26x26 Real matrix, which is twice the size. And I can run DET without problems.

- The HP48 and successors have a refinement built-in: since the determinant of a matrix with integer elements is itself an integer (or a complex number with integer real and imag components), the calculated result is *rounded* to the nearest integer, which of course occasionally produces a wrong result.

Re: HP-15C program to compute 3x3 complex matrix determinant

*Message #6 Posted by **Thomas Klemm** on 14 June 2010, 3:14 p.m.,*
in response to message #1 by Karl Schneider

Inspired by Andrew's request I had a look at Wikipedia where I found the following formula to calculate the determinant of a 3x3 matrix **A**:

$$\det(A) = (\mathrm{tr}(A)^3 - 3\mathrm{tr}(A)\mathrm{tr}(A^2) + 2\mathrm{tr}(A^3))/6;$$

Calculating the powers of matrix **A** would be easy but what about the trace function?

```
|R * *|     |R * * I * *|     |R * * I * * *|     |R R R|                 |R|
|* R *|  ->  |* R * * I *|  ->  |R * * I * * *|  ->  |* * *|  x  |1|  =  |*|   ->  R + iI
|* * R|     |* * R * * I|     |R * * I 0 0 0|     |I I I|     |1|     |I|
|I * *|                                            |* * 0|     |1|     |*|
|* I *|                                            |* * 0|               |*|
|* * I|                                            |* * 0|               |*|
```

With the picture above in my mind I wrote the following program:

```
                                          X:              Y:              Z:

017 -   45   13  RCL C                   R               C   7 1         1
3
018 -   43   33  g R-^                   3               R               C   7 1
1
019 - 44,40, 0   STO + 0                 3               R               C   7 1
1
020 -        34  x<>y                   R               3               C   7 1
```

```
1
021 -    45  13   RCL C                          I               R               3
C    7 1
022 -    42  25   f I                            R + iI          3               C    7 1
C    7 1
023 -    43  32   RTN                            R + iI          3               C    7 1
C    7 1
```

But unfortunately there's not enough memory to do the calculation of the powers of a complex 3x3 Matrix. Still the program might be useful.

Best regards
Thomas

Re: HP-15C program to compute 3x3 complex matrix determinant

*Message #7 Posted by **Karl Schneider** on 16 June 2010, 11:55 p.m.,*
in response to message #6 by Thomas Klemm

Thomas --

Thank you for the contribution. The HP-15C, due to modest data-storage capability and computational speed, is certainly not the ideal tool for heavy-duty matrix calculations. However, it's good to demonstrate that certain things can be done within the limited resources available.

in response to message #1 by Karl Schneider

Karl,

Thanks very much for all the work you have done on this.

I originally thought it might be possible to achieve this without having to resort to 'brute force', e.g. using the trace formula, but it appears that the 15C just doesn't have the capacity to do so.

However, I do like your original solution: get a 42S!

Thanks again,

Andrew

Andrew H --

> Quote:

> Thanks very much for all the work you have done on this.

You're welcome. It's a topic that came up a few years ago, but which I never tackled.

My program is now improved, in that any matrix {**A**-**E**} can be used, not just **A**. The HP-15C allows matrix descriptors to be stored in any register; the "I" register allows indirect access to an element in any matrix. Note also that the program checks matrix dimensions in a concise manner for correctness by using built-in logical comparisons in complex mode. The thoroughness and attention to detail exhibited by the HP-15C's developers has always impressed me -- it is a case study of first-rate software engineering.

> Quote:

'Brute force' is a bit pejorative; I'd prefer to call it the 'direct' or 'straightforward' method. There's a certain amount of computational grinding involved with multiplying two complex-valued matrices, as well -- the traces are the easy part.

In fact, my modest program could be utilized four times in succession to calculate the complex-valued determinant of a 4 x 4 matrix:

1. Store three columns of the last three rows of a 4 x 4 complex matrix in two parts: a 3 x 6 real matrix, and the remaining 'short column' as a separate 3 x 2 matrix.
2. Use the program to calculate one sub-determinant, multiply by the corresponding complex element of the top row, and accumulate in registers R4 and R5.
3. Swap one 'short column' with the separate column (maybe write a short utility program for that), and repeat step 2.
4. Repeat step 3 twice more.

This procedure will fit within the HP-15C's capabilities: 18 registers for the 3 x 3 complex submatrix, 6 more for the 3 x 1 complex submatrix, 25 registers for the program, 4 registers for temporary storage, 5 registers for complex mode, with space left over for a column-swapping utility program.

Or, use an HP-42S or RPL-based calc...

Chalkboard Math

*Message #1 Posted by **Chuck** on 10 June 2010, 12:21 a.m.*

The recent thread about the chalkboard math from the movie "The Day the Earth Stood Still" reminded me of a photo from the current Discover magazine (July/August) advertising a calculus course. I asked my son (recent AP calc student) what was wrong in this picture. Took him about 5 seconds to see the omission. Not that I'm perfect on a chalkboard (or white board) either, but it's a fun past-time to spot these things. Any others out there?

CHUCK

Re: Chalkboard Math

*Message #2 Posted by **Bill Zimmerly** on 10 June 2010, 1:15 a.m.,*
in response to message #1 by Chuck

I believe the middle formula should be $$f''(x) = \lim_{h \to 0} \frac{f(x+h) - 2f(x) + f(x-h)}{h^2}.$$

The derivation looked fine, assuming that the function was f(x) = x^2. Was it the missing hash mark from the second "f(x)"?

> Quote:
>
> Was it the missing hash mark from the second "f(x)"?

I´d have mentioned the same thing... mostly because the thread refers to an omission. The second line of the derivative evaluation should start with

```
f'(x)=
```

instead of

```
f(x)=
```

The Astro2010 module

*Message #1 Posted by **Geir Isene** on 9 June 2010, 1:04 p.m.*

To my very pleasant surprise, I discovered the new ASTRO2010 module over at TOS.

Excellent stuff by Jean-Marc Baillard!

Now, the MOD-file breaks down to three ROM-files (ASTRO-1, ASTRO-2 and ASTRO-3) all with XROM #6.

Whereas I haven't yet done the needed cleaning out of less interesting modules on my NoV-64 to accommodate for this gem, I wanted to ask how to make it work on the NoV-64 (if there are any issues to tackle with the three-in-one module).

Any thoughts?

Re: The Astro2010 module

*Message #2 Posted by **JMBaillard** on 9 June 2010, 5:16 p.m.,*
in response to message #1 by Geir Isene

Hi Geir

I wrote the programs & RAW files
but Angel Martin has built the MOD & ROM files.
He is the expert in those things
and I cannot answer to your question, sorry...

All the Best
Jean-Marc.

Re: The Astro2010 module

*Message #3 Posted by **Ángel Martin** on 9 June 2010, 6:16 p.m.,*
in response to message #1 by Geir Isene

It should not be any issue to burn on NoVo-RAM or any other advanced MLDL system. The only requirement is to put the ROM files in the sequential order (1-2-3) in adjacent addresses - that's where the single FAT needs the programs to be located.

Best, ÁM

Re: The Astro2010 module

*Message #4 Posted by **Geir Isene** on 13 June 2010, 6:11 p.m.,*
in response to message #3 by Ángel Martin

Works like a charm!

This is the most excellent stuff. Thanks.

June 26, 2010 from most Sunny, Warm and Beautiful France

Hello to all !

CONGRATULATIONS to Both Jean-Marc and Angel for this Superb and Wonderful Astro2010 Module !

Jean-Marc you also have achieved a very professionnal and excellent User's Guide.

Angel, you have it perfectly right : as I just checked, Astro2010 works extremely well also on :

- HP41X/Y/Z, the HP-41Y ("RAMBOX II") Emulator running on HP-48GX from HrastProgrammer, and

- Emu41, the Ms-Dos HP-41Y ("RAMBOX II") Emulator from Jean-François Garnier

And if it works with me, it should work with absolutely anybody else (see here) :-)

Again CONGRATULATIONS to the four of you : Jean-Marc, Angel, Hrast and Jean-François !!!

And Very Best and Most Grateful Regards to you all !

Antoine M. "Kermit" Couëtte

OT: Jornada 680 communication problem

*Message #1 Posted by **Karl-Ludwig Butte** on 8 June 2010, 3:43 p.m.*

Dear all,

I need some help with my Jornada 680 exchanging data via Microsoft ActiveSync under Windows 2000. The situation is the same with both ActiveSync versions 3.6 and 3.8. When I connect the 680 via the RS232-Interface, ActiveSync recognizes the 680 and pops up the partnership/guest-dialogue. After selecting the guest-option I can select the backup-function, which works fine. But when I select the explore-function, a Windows-Explorer window "Mobile Device" opens but stays empty and showing the full hourglass. One can wait for hours but the directory of the 680 never shows up. In Task-Manager, the application is shown with status "not responding".

So in principle, the communication channel works - otherwise ActiveSync wouldn't recognize the 680 and wouldn't backup the memory contents. On the other hand I don't have any explanation why the explore-function doesn't work.

Does anyone of you has an idea what's wrong and/or what can I do to get the explore-function to work ?

Any hint will be very much appreciated. Thank you very much in advance.

Kind regards

Karl

Re: OT: Jornada 680 communication problem

*Message #2 Posted by **Karl-Ludwig Butte** on 14 June 2010, 3:32 p.m.,*
in response to message #1 by Karl-Ludwig Butte

Dear All,

for all who may run into the same problem, I found out what caused this strange behaviour: In the combination of Windows 2000, McAffee Firewall and ActiveSync 3.8 the Firewall blocked especially the explore-process of ActiveSnc. Add an allowance for this process (or replace this firewall with a better one) and everything works fine.

Regards

Karl

HP Calc Repurposing

*Message #1 Posted by **Gene Dorr** on 7 June 2010, 3:03 p.m.*

The HP-20B and HP-12C repurposing projects sounded pretty interesting, but I haven't seen or heard of any activity in this area. The Repurposing Wiki hasn't been maintained in quite a while. Anybody aware of anything going on? Also, I'm wondering if the HP-30B has the same repurposing provisions as the 20B?

Re: HP Calc Repurposing

*Message #2 Posted by **Katie Wasserman** on 7 June 2010, 3:46 p.m.,*
in response to message #1 by Gene Dorr

Yes the 30b has the same re-purposing options as the 20b. The 12C+ is more restricted in that it lacks a JTAG connector and other internal parts. There are a few regular members of this forum working on their own projects with these machines but are not posting what they're doing on that wiki.

-Katie

Re: HP Calc Repurposing

*Message #3 Posted by **hugh steers** on 7 June 2010, 7:47 p.m.,*
in response to message #1 by Gene Dorr

Hi,

yes, there is some background activity. a while back, i got going with the 20b/30b coding. last thing i did was try to bring up a dev chain on gcc (as opposed to IAR). the gcc dev chain works, but i needed to hack some more low level stuff. IAR is good, but you are limited to 32k of code, which i know wont last long :-)

i've had a lot of other stuff on at the moment, but i was hoping to make a stab at the 12+ too. i have enough code hanging around to put together an open source scientific RPN calculator for the 12/20/30 - i just need to get around to doing it!

-- hugh.

Re: HP Calc Repurposing

*Message #4 Posted by **Paul Dale** on 8 June 2010, 5:35 a.m.,*
in response to message #1 by Gene Dorr

I've mostly done replacement firmware for the 20b/30b with a decent scientific load out.

I was laid off in February which really impacted progress -- I lost access to all the nice debug and development tools that my employer had. Not to mention getting more than a bit depressed for a while. I've got a new job but haven't had time to progress anything and seem unlikely to for the foreseeable future.

So if anyone is willing to take my firmware load out and finish the port to the 20b, I'd be very happy. What

remains is the actual hardware support and you can use HP's development base for the majority of this. PM me if interesting in finishing this project....

- Pauli

Re: HP Calc Repurposing

*Message #5 Posted by **Walter B** on 8 June 2010, 3:32 p.m.,*
in response to message #4 by Paul Dale

And there's quite some documentation available here, too. Includes an index of operations, addressing, catalogues, keyboard layout, fonts, messages, constants and conversions etc. FWIW ... d:-/

Re: HP Calc Repurposing

*Message #6 Posted by **Bruce Bergman** on 9 June 2010, 4:24 p.m.,*
in response to message #1 by Gene Dorr

Hi Gene --

I'm actually the owner of the wiki you mentioned. There definitely have been a few updates in the past couple of months. Any wiki like this one depends on user contributions in order to grow, so the more folks post things to the wiki, the better.

Also, the more word gets out there, that should improve things too. I know there is a fair amount of interest in the embedded world on how to repurpose these calculators. Especially in circles like the PIC and Arudino groups. It's just a matter of keeping up content and sharing the knowledge.

I have several things I need to post, and some updates to put there as well, but I've just been swamped. If anyone wants to help, just let me know -- I'd LOVE some help keeping things updated.

@Katie: I know you're one of the few consistent contributors to the wiki as well (thank you!!), but you mentioned other projects that weren't being followed on the wiki. If you can convince them to post and share information, or at least route stuff through me, I will try and get information up there.

Thanks!

Bruce

16C display problem

*Message #1 Posted by **John Robinson** on 7 June 2010, 7:45 a.m.*

Hi All, I have a 16C which had a leaky display, so I bought a 12c of the same vintage (1984) as a display donor. The 12c display was working perfectly, so I swapped out the 16c old display for the new 12c display, and after various attempts I have it working as best I can. However, one segment in one digit refuses to work.

I would have though these displays would be multiplexed, so if one segment doesn't work, then that same segment in all digits would not work. I have counted the number of contact pads for the siplay to be 57, which would not be enough to individually address all 7 segments and decimal point for 10 digits and annunciators etc, so I figure it must be multiplexed.

Can anyone help me to sort out this problem please ?

Thanks John

Re: 16C display problem: that´s new!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2010, 9:15 a.m.,*
in response to message #1 by John Robinson

Hi;

I have swapped some Voyager´s displays but never had such problem before.

In time: can you take a picture OR indicate which segment is the one refusing to 'lit'?

Sorry not helping the way I would like to...

Thanks and success!

Luiz (Brazil)

Re: 16C display problem: that´s new!

*Message #3 Posted by **John Robinson** on 7 June 2010, 7:12 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I have it working now. I have been doing this with the display and metal surround as one unit. So coming in at an angle to install one edges four clips, then bring down the other edges clips. The results seem very much dependant on how well seated the display zebra strips are. I just kept on re-seating the display unil it worked. It's just a little tricky installing the display on one edge with the metal clips, then do the other edge, but by then then zebra strip on the first edge is not seated correctly.

I realise I could have removed the metal surround, and placed the display flat on the circuit board, then slid

the metal surround over and push the clips through the holes. Maybe that's the better way to do it to avoid problems like missing segments.

Cheers, john

Re: 16C display problem: that´s new!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 June 2010, 10:26 p.m.,*
in response to message #3 by John Robinson

HI;

I use a long sewing needle to seat the zebra stripe correctly. The needle helps aligning it, either from the inside or the outside of the zebra stripe. If you look at the LCD assembly from the extreme edges, you´ll notice small cuts in both sides of the metal frame where the zebra stripes end. This is where I carefully insert the needle and align the zebra stripe accordingly.

I also came to the conclusion that placing the metal frame after the LCD + stripes works better. Unfortunately I had nothing but bad results with the early models with the flex circuit assembly...

Cheers.

Luiz (Brazil)

HP-41 FOCAL to .ROM for Clonix/NoV's (or any other ROM-box)

*Message #1 Posted by **Diego Diaz** on 5 June 2010, 7:00 p.m.*

Hi all,

Since the Clonix module was released many users have tried to get their (or others') FOCAL programs converted into a .ROM image file. I still receive mail asking for such a solution.

Some detailed procedures have been described and eventually, with the appropriate hardware, several users have managed to have their own .ROM file gathering FOCAL programs of their own or available elsewhere.

Many FOCAL programs are available in .RAW format, but the process described below is usefull regardless the way you get the FOCAL program into MAIN memory.

Let's say that I'm not the one to credit about this all. I just find the pieces and put them together. Credits goes to Warren Furlow's for his V41 emulator and companion software.

The Pieces:

- V41 windows emulator. You'll find the link in this very site.

http://www.hpmuseum.org/simulate/simulate.htm

Go to "Free Simulations at other sites:", the fourth line leads you to the appropriate place.

- The .MOD file for the HEPAX module (included in V41 "MOD" directory)

- The ModFile.exe (or ModFileWin.exe) utility. Also available in V41's site.

- The .RAW files you want to include in your .ROM image. AND/OR patience enough to key in your own FOCAL program into V41... :-)

Procedure:

Dowload and install V41 (in case you haven't done yet)

Run V41 and go to edit configuration to include HEPAX.MOD.

Please note that V41 will start as 41CX. It is recommended to use 41CV instead to avoid HEPAX emulation failure. If you "really" need 41CX mode in V41 then you'll (also) "need" 82143A.MOD printer loaded, in order to push HEPAX to page #7.

If HEPAX is not loaded into an odd page it will run at first instance but will refuse to start-up after power cycling. This is not a malfunction of the V41 emulator, it's just that HEPAX has its own instructions and V41 emulates just the HP-41, not the module itself.

Once V41 is running with HEPAX:

- Load as many .RAW program files as you want/can (or type them) into main memory.

- Use HEPAX "HSAVEP" to compile the FOCAL program(s) and move it into HEPAX RAM. (See HEPAX manual for details on HSAVEP command.)

- Once you've saved a program into HEPAX RAM you can clear it from MAIN memory using CLP command.

- Repeat the steps above as needed to get your HEPAX RAM page(s) loaded with the program(s) you want. There are two RAM pages in HEPAX.MOD emulation. (8K in total)

- Once finished you may want to run HEXEDIT to modify H'8000 and/or H'9000, these are the XROM # of the .ROM(s), in order to avoid conflicts with other known XROM numbers.

- Turn OFF (close) V41.

- Execute MODfile.exe (or MODfileWin.exe) and extract .ROM files from HEPAX.MOD.

- You'll get 4 HEPAX??n.ROM files (we don't need these) and two HPX-STD-RAM1.ROM and HPX-STD-RAM2.ROM. Yes!, these are the files we've been doing it all for... ;-)) If your program(s) fits in 4K, only RAM1 file is needed.

- Rename these files at your convenience. If you're about to use them with Clonix/NoV's use 8.3 naming convention, and place them in the Clonix/Nov working directory.

That's all folks. All in a row, no extra hardware required, plain and clear.

Hope you find it useful.

Cheers from the Canary Islands

Diego.

Re: HP-41 FOCAL to .ROM for Clonix/NoV's (or any other ROM-box)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2010, 7:54 p.m.,*
in response to message #1 by Diego Diaz

Hi, Diego;

and thanks! This is enlightening in any way, even when the user has done this before. I have once done that a few years ago, when I had the hardware to do it, but the way you post about it eases the procedure.

Just a question/suggestion: isn't it worth an article? 8^)

Cheers and thanks again!

Re: HP-41 FOCAL to .ROM for Clonix/NoV's (or any other ROM-box)

*Message #3 Posted by **Diego Diaz** on 6 June 2010, 11:57 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I was pretty sure that some other users must as well have gone this path, but haven't found it detailed, so I decided to post.

I'll gladly put it into the Articles forum if it deserves general interest. A better text formatting will be required though.

Thanks for your kind words and best wishes.

Diego.

Re: HP-41 FOCAL to .ROM for Clonix/NoV's (or any other ROM-box)

*Message #4 Posted by **PeterP** on 7 June 2010, 11:19 a.m.,*
in response to message #1 by Diego Diaz

Diego,

a little while ago I posted an article which allows the very same thing, using different means. It also helps in case users want to mix and match Focal and MCODE programs in the ROM.

You can find the article here

Cheers

Peter

Re: HP-41 FOCAL to .ROM for Clonix/NoV's (or any other ROM-box)

*Message #5 Posted by **Diego Diaz** on 7 June 2010, 12:30 p.m.,*
in response to message #4 by PeterP

Hi Peter,

Good to read from you... :-)

I do know your article. Just think this is intended for a different user target.

My notes are mostly aimed to de "average" user. No M-code, no MS-DOS PC to run EMU-41, or SDK-41... just wanting a few FOCAL programs into a .ROM file, the easiest possible way.

(Still don't know if I hit my target though...;-)

BTW, I'll mail you in short regarding those VASM listings.

Meanwhile, best of lucks from Spain.

Diego.

Re: HP-41 FOCAL to .ROM for Clonix/NoV's (or any other ROM-box)

*Message #6 Posted by **Ángel Martin** on 8 June 2010, 8:52 a.m.,*
in response to message #5 by Diego Diaz

If I may chime in here...

This is a slippery subject. Diego's procedure is easy enough to be successfully used by casual users without a deep understanding of the intricacies involved.

I currently use the MLDL2k to download the HEPAX ram ROM files (either from V41 or the real

mlife machine,, that's the beauty of it). To edit them (subtleties like converting XEQ to XROM, FAT changes, MCODE additions, etc) is possible using the disassembler (also part of MLDL2k software). But this is a tad too much for "casual users" - assuming they exist :)

Cheers, ÁM

Re: HP-41 FOCAL to .ROM for Clonix/NoV's (or any other ROM-box)

*Message #7 Posted by **Meindert Kuipers** on 8 June 2010, 1:44 p.m.,*
in response to message #6 by Ángel Martin

And for the i41CX users: my next version of M2kM supports extraction (and thus disassembly) of emailed .MOD files or HEPAX RAM files ...

The CMOS memory has died in my HP-25C

*Message #1 Posted by **Michael de Estrada** on 5 June 2010, 5:21 p.m.*

Yesterday I turned on my HP-25C and discovered that the contents of program memory and the storage registered had been lost. Thinking it was just a low battery, I replaced it with a fully charged NiCad battery pack, but still CMOS memory would not retain any entries. Even with the calculator powered on, I could not store data in any of the registers or a program. Also, statistical operations would not function properly, as they rely on the contents of the storage registers. This calculator has not been subjected to the killer AC adapter, since I charge the batteries externally, and only operate the calculator from batteries, so I don't think this failure is the result of any abuse or misuse. Has anyone else on this forum experienced this type of failure?

(edited) Re: The CMOS memory has died in my HP-25C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2010, 6:08 p.m.,*
in response to message #1 by Michael de Estrada

(added: I checked Eric´s HP Calculator Chips and I would like to call your attention to some data I posted. I seem to have seen some ACT chips elsewhere, but chances are that I mixed the pictures. Please, follow Eric´s link and confirm.)

Hi;

I bought an HP22 some weeks ago and it has the same problem. I could also buy two HP25 and three HP21 that are not working, and along with some previous pictures I kept from other HP25, HP22 and HP21 I was able to repair, I consolidated some information.

Both HP22 and HP25 use the same PCB layout and differ only in their ROM chips. I found that three of the five IC´s in these calculators have the same codes. The ACT varies from some models, and I collected these codes:

```
1820-1523
1820-1596 (both seen in the HP21, too)
1820-1741 (seems to be used by the HP29C, too)
```

Display driver appears in all three of them with the code:

```
1820-1382
```

ROM chip varies:

```
1818-0163 + 1818-0164 for the HP22 (found in two different units)
1818-0154 + 1818-0168 for the HP25 (I seem to read 1818-0158 in one of them...)
1818-0129 for the HP21
```

I found the same RAM chips in both the HP22 and the HP25 (the HP21 seems to use available ACT registers only)

```
1820-1564
```

I also happen to have seen an HP25C with two RAM chips but their codes were not visible. In another HP25C there is a RAM chip written:

HP5061-0469 2

That is all information I have so far. Please, if there is something else to be added, I'd appreciate. If there is more information about this somewhere else, please, point the addresses out!

AND if I messed some information up, PLEASE, point it out!

Cheers.

Luiz (Brazil)

Knocking on HP-41s back door :-)

*Message #1 Posted by **Juergen Rodenkirchen** on 5 June 2010, 4:45 p.m.*

Hello all!

The display of my HP-41CX sometimes fades out (goes off) immediately after switching the machine on. Slightly tapping on the back (battery compartment door) usually brings it back to life. Any idea what the reason for this behavior could be?

Regards, Jürgen

Re: Knocking on HP-41s back door :-)

*Message #2 Posted by **Diego Diaz** on 5 June 2010, 5:22 p.m.,*
in response to message #1 by Juergen Rodenkirchen

Hi Juergen,

It seems a typical case of weak contacts.

There are several points inside HP-41 that may lead to such a behaviour.

- Battery <> I/O block, (both coconut and halfnut), often caused by battery leakage corrosion, or mechanical damage in the I/O block battery terminals/or battery compartment springs.

- I/O Block <> Keyboard (both coconut and halfnut), more likely caused by broken post in the upper screws, or battery leakage corrosion.

- CPU board <> Keyboard (only coconut -AKA fullnut-), caused by broken post in the lower screws, or damaged "zebra" strip (be it polymer or metallic)

- LCD <> LCD control board (coconut, very unlikely on halfnuts) again damaged "zebra" strips are the more common cause.

If your I/O block is clean and shows no traces of corrosion, my advice is to take your HP-41 apart and check for broken/cracked screw post(s).

Hope this helps.

Diego.

Re: Knocking on HP-41s back door :-)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2010, 5:27 p.m.,*
in response to message #1 by Juergen Rodenkirchen

Hi;

there is also a capacitor that might be responsible for a similar behavior. I had one HP41C with a similar problem and this is the thread after it. Hope this helps.

Luiz (Brazil)

Edited: 5 June 2010, 6:18 p.m.

Any information about Canon f-788dx?

*Message #1 Posted by **Manolo Sobrino** on 5 June 2010, 12:13 p.m.*

Hi,

This is my first post after some time lurking in the forum. I don't know if the subject really belongs here, but this is the most learned calculator forum around and I'm really intrigued by this Canon calculator currently (and rarely) sold in Europe,

http://www.canon-europe.com/For_Home/Product_Finder/Calculators/Scientific/F_788dx/

Specs (got them somewhere),

10+2 digits Mantissa + Exponent, Double line LCD with 12-character dot matrix, Screen size: 63 x 22 mm, Memory: 1 = 20 store and recall memories, Battery: CR2032 x 1; General Calculations: 24 levels of parenthesis, Trigonometric Calculations, Coordinate Conversion, Factorial, Combination, Permutation, Fraction, Complex, 170 metric conversions, Statistics Calculations; 79 scientific constants, 9 engineering values, Last digit corrections, Last answer recall, Multiple replay; Total functions: 497 functions including calculus calculations and matrix vector calculation, Size: 155 x 80 x 14.5 mm (without cover), 158 x 84 x 18 mm (with cover), Colour: Dark gray, white; Protective hard cover, Auto-power Off: 7 min with memory protection while Power-Off

There is very little information on the web (besides some Romanian reviewer that claims it has some kind of CAS... Sounds strange for a calculator under 18£ (at Amazon UK)). I've been looking for the Kinpo model (I suppose it's a Kinpo, am I wrong?).

Any information would be appreciated (Maybe any owner out there?)

Regards

Re: Any information about Canon f-788dx?

*Message #2 Posted by **Lyuka** on 5 June 2010, 1:06 p.m.,*
in response to message #1 by Manolo Sobrino

Hi.

Though it is written in Japanese, at least you can get a manual of the F788DX from,
http://cweb.canon.jp/manual/calculators/f/f788dxs.pdf

Re: Any information about Canon f-788dx?

*Message #3 Posted by **Manolo Sobrino** on 5 June 2010, 2:00 p.m.,*
in response to message #2 by Lyuka

Thank you!

I get the picture... kind of casio fx 991ms with some more conversion options and more scientific constants

(codata 2002). The CAS appears to be just a very limited ability to evaluate polinomial integrands, it looks a bit odd too. Complex support is minimal, at least it can solve cubics. Basic matrix operations, scalar and vector products... I can't figure out anything about the precision. Metric conversions look nice.

Regards

Re: Any information about Canon f-788dx?

*Message #4 Posted by **Lyuka** on 5 June 2010, 3:08 p.m.,*
in response to message #3 by Manolo Sobrino

The internal digits are 16, and its precision is +/- 1 least significant digit per operation. (see p.10)

Re: Any information about Canon f-788dx?

*Message #5 Posted by **MK-52** on 6 June 2010, 11:50 a.m.,*
in response to message #1 by Manolo Sobrino

Hello,
I have a F-788dx. Actually, this calculator is the brother of Casio fx-991MS because F-788dx has the same bad RCL behavior or RCL bug like Casio S-VPAM models. I think F-788dx is a 2nd generation of Canon calculators. Canon fixed the RCL bug in 3rd generation.

1st generation of Canon calculators
F-502 F-720i
2nd generation
F-788dx
3rd generation
F-715S F-766S F-502G
4th generation
F-718S (Natural Display, 18 internal digits, no solver and numerical integration)

HP12C programming primer?

*Message #1 Posted by **PatrickR** on 5 June 2010, 7:06 a.m.*

I am new to programming the HP12C and I was wondering if there are any "best practices" or primer/tips&tricks guides on the technique, especially loops and conditional logic (as these are very limited). Is it possible to say e.g. a FOR loop is always constructed with XXX commands, and a IF should always be translated to YYY, or is it best to just find a made-to-measure method every time?

I have succeeded in making some simple macro programs (e.g. quadratic root solver and similar keystroke automation) and I do understand the architecture of the bigger programs (moon lander, fast trigonometric), but I am sometimes surprised by clever tricks that I would never think of, and am unsure where to start.

Re: HP12C programming primer?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 June 2010, 12:49 p.m.,*
in response to message #1 by PatrickR

Hi;

I think the 'HP12C Owner´s Handbook and Problem Solving Guide' is the best source of basic techniques, but you may also find these ones very useful:

HP12C Platinum Solutions Handbook (also for the basic HP12C)
Writing a small Program (HP12C)
Programming in Algebraic Vs. RPN
Introducion to the Learning Modules

Maybe (almost sure about it) some of the links point to some already known material, but it is worth having a look at them. I am also trying to find the HP12C Learning Modules in PDF version but I failed. If anyone else knows where to download them from I'd also be thanked.

Success!

41C - Fun Stuff modules soon available

*Message #1 Posted by **Ángel Martin** on 5 June 2010, 5:22 a.m.*

Coming back to the games ROMs idea, here's the list of the top-three ROMS - soon available at TOS:-

1. Playground ROM, includes such classics like Valentin Albillo's Reversi, MiniChess, and Checkers plus a few others (Rollers, MasterMind, Morse Code and sound effects)

2. Rubiks ROM.- Includes Julian Perry's Rubiks Cube Solver - plus a couple of extras (Roman numbers, Hanoi Towers, 8-Queens solver).

3. CHESS ROM.- Finally the CH136 construct (by Claude Roeltgen) has been harnessed into a ROM. It took serious work to re-populate the missing labels but now it's all compatible with standard programming. I augmented it with a MCODE move input function for ease of use.

So far they are three individual 4k roms. Could be combined into a single 12k module if preferred, but that'll take some changes. Ideally suited for V41 execution in Turbo Mode... (where's NEWT??)

Have fun!

Hey, I'm honored!

My favorite game and, along with SKUNK, the only big games I ever programmed!

Re: 41C - Fun Stuff modules soon available

*Message #7 Posted by **Paul Dale** on 8 June 2010, 5:36 a.m.,*
in response to message #1 by Ángel Martin

Another couple of things worth adding:

* A decent random number generator. HP's suggested a linear congruential for many years and this would be okay but something a bit more modern would be better.

* Based on the above some dice rolling routines -- d6 2d6 ndm+k

- Pauli

Re: 41C - Fun Stuff modules soon available

*Message #8 Posted by **Geir Isene** on 8 June 2010, 8:12 a.m.,*
in response to message #7 by Paul Dale

If I get around to it I have a short and sweet Mcode RNG routine based on the Time module/CX.

Re: 41C - Fun Stuff modules soon available

*Message #9 Posted by **Ángel Martin** on 8 June 2010, 8:39 a.m.,*
in response to message #8 by Geir Isene

Jean-Marc Baillard has written such a routine, you can find it at his hp41 program pages: (scroll down until you find it)

http://hp41programs.yolasite.com/m-code.php

Håkan Thorngren wrote another implementation using a seed stored in a buffer - this one is available

on the SandMath, functions SEEDT and RAND.

It's very easy to add them to the games module, but that only makes ense if they're used in the programs of course. Modyfying them will require some time though.

Edited: 8 June 2010, 8:45 a.m.

Re: 41C - Fun Stuff modules soon available

*Message #10 Posted by **Geir Isene** on 8 June 2010, 3:25 p.m.,*
in response to message #9 by Ángel Martin

My idea is to take the time register (current time) and reverse all the bits and save it to X as a fractional number. Simple.

Windows7 calc

*Message #1 Posted by **Glenn Shields** on 4 June 2010, 9:36 p.m.*

Just got a new HP desktop with Windows7, and checked out the calculator in scientific mode. Even the "standard" mode has a new look to it, but the scientific is really new. It has many features that resemble a 35s or 50g in algebraic mode (no, no RPN to be found) but with special features which attach to the right side like spreadsheets or "inform" windows of the 50g. It also had digit grouping (commas) - they must have read previous posts on this forum. Even has a pseudo-stack (history) but it really isn't the same. Worth a look. Glenn in West-LA

Re: Windows7 calc

*Message #2 Posted by **Norman Dziedzic** on 4 June 2010, 10:08 p.m.,*
in response to message #1 by Glenn Shields

I was watching over a friends shoulder and did a double take at this calculator. I seem to remember it had some decent additions to the "programmer" functions as well as far as hex & binary modes but I don't remember for sure. Can you take a look at that aspect and report back?

Re: Windows7 calc

*Message #3 Posted by **Martin Pinckney** on 4 June 2010, 11:00 p.m.,*
in response to message #2 by Norman Dziedzic

Yes, I was impressed with it, myself. Even thought of posting on here about it, but figured all you geeks already knew.

Besides Basic and Scientific modes, it has Programmer and Statistics.

Then you can add Unit Conversions, Date Calculations, or Worksheets to the essential calculator function. The window expands to the right of the calculator and these appear.

Worksheets include Mortgage, Vehicle lease, and fuel economy (U.S. and S.I. units).

Re: Windows7 calc

*Message #4 Posted by **sjthomas** on 4 June 2010, 11:02 p.m.,*
in response to message #2 by Norman Dziedzic

Hex, dec, oct & binary modes. Qword, Dword, word & byte (displays?). Bit-shifting & logical operators. Full 64-bit binary display in addition to regular display. Memory register. Square root, percentage & reciprocal. Mod. Oh, and PARENTHESES!!!

Re: Windows7 calc

*Message #5 Posted by **Martin Pinckney** on 4 June 2010, 11:20 p.m.,*
in response to message #2 by Norman Dziedzic

The Unit Conversions really caught my eye.

Some categories are very well implemented, with such units as *chain*, *fathom*, *span* and *hand* in Length, and *long ton*, *short ton*, *tonne*, *carat*, and *stone* in Weight/mass, for example.

Pressure could have been done better.

I won't give up my 48sx, though.

Re: Windows7 calc

*Message #6 Posted by **Lyuka** on 5 June 2010, 1:41 p.m.,*
in response to message #5 by Martin Pinckney

Hi,

You can download ' Microsoft calculator plus ' from MS Download center.

It's look is really cute, but the unit conversions of the Power category should better include dBm.

Lyuka

Re: Windows7 calc

*Message #7 Posted by **Namir** on 5 June 2010, 4:00 a.m.,*
in response to message #1 by Glenn Shields

Looks like someone in Microsoft did a good job updating the clunky old calculator application and forgot to advertise the worthwhile upgrade. I really like the new calculator accessory. I also like that it also displays (at least in sci mode) the operations that lead to the current results. I thought using sind() and asind(), for example, indicated that you were using sine and arc-sine in degree mode, was clever. In case you changed angle mode and kept on calculating, you still know how you got the currently displayed value!

The next upgrade should include RPN.

Namir

HP 9830A mentioned in recent book "The Quants"

*Message #1 Posted by **Scott Newell** on 4 June 2010, 9:31 p.m.*

There's passing reference to Ed Thorp using an HP 9830A in Scott Patterson's book "The Quants: How a New Breed of Math Whizzes Conquered Wall Street and Nearly Destroyed It". In the book it's described as a computer, not a calculator. Still, I was surprised that he actually listed the model number!

It's on pages 37 and 38 of the book. Google book search for "9830A he'd installed in his office in Newport Beach" should take you right to it.

HP12c repurposing project

*Message #1 Posted by **TomL** on 4 June 2010, 8:29 p.m.*

Hi

I read about the repurposing project for the HP12c and was wondering if anyone has updates?

HP12C Wiki

The photographs show 2xCR2032 batteries and the serial connector yet I've seen that the new HP12Cs only use one CR2032. Does anyone know if this also has the serial connector?

And speaking of the serial connector, Ive read that it is available on HPs site but I haven't found it there or even seen a mention of it in the HP20B SDK?

All the best Tom

Re: HP12c repurposing project

*Message #2 Posted by **Don Shepherd** on 4 June 2010, 8:40 p.m.,*
in response to message #1 by TomL

The new 12c+ uses two CR2032's; you can tell by the extra-wide battery door, which is visible from the shrinkwrap. If you buy a 12c today and it has one CR2032, it is not the ARM-based unit.

Re: HP12c repurposing project

*Message #3 Posted by **Katie Wasserman** on 4 June 2010, 9:53 p.m.,*
in response to message #1 by TomL

> Quote:
>
> And speaking of the serial connector, Ive read that it is available on HPs site but I haven't found it there or even seen a mention of it in the HP20B SDK?

I haven't heard anything about this, do you have a pointer to where you read this?

Thanks, Katie

p.s. Richard Nelson's artcile tells you pretty much everything you need to know in order to make your own serial programming cable except how to make the fancy 6 pin plug (or better still, where to buy it).

Edited: 4 June 2010, 9:57 p.m.

Re: HP12c repurposing project

*Message #4 Posted by **TomL** on 4 June 2010, 10:09 p.m.,*

in response to message #3 by Katie Wasserman

Hi Katie

It says that its available from HP on the Wiki site (I linked to it on my first post)

I suppose it is easy enough to make that serial cable but itll be a pain to need to hold it in place while flashing. Suppose we need to contact Cyrille for this?

Tom

Re: HP12c repurposing project

*Message #5 Posted by **Katie Wasserman** on 4 June 2010, 10:16 p.m.,*
in response to message #4 by TomL

This is getting rather circular, I was the one that wrote that on the Wiki. Yes, as far as I know Cyrille or Tim from HP are the only people who can provide this cable.

-Katie

Edited: 4 June 2010, 10:18 p.m.

Re: HP12c repurposing project

*Message #6 Posted by **TomL** on 4 June 2010, 11:04 p.m.,*
in response to message #5 by Katie Wasserman

So, I received an email from Richard (very fast!) and it appears that Cyrille at HP is the only person with these cables so Ive contacted him

Has anyone tried the HP20B SDK with an HP12C? Any experiences?

Re: HP12c repurposing project

*Message #7 Posted by **Katie Wasserman** on 5 June 2010, 12:31 a.m.,*
in response to message #6 by TomL

The 20b SDK won't work on the 12C+, only the CPU is the same the peripherals are all different, but there is an SDK of sorts (sample program actually) for the 12C+. Ask Cyrille about this.

Re: HP12c repurposing project

*Message #8 Posted by **Scott Newell** on 4 June 2010, 10:31 p.m.,*
in response to message #3 by Katie Wasserman

> Quote:

I've been wondering if the Mill-Max strips (Mill-Max product page) would work. That wouldn't get you the nice snap in housing, through. Next time I place an order I'll see about getting one of those strips to test.

Re: HP12c repurposing project

*Message #9 Posted by **Katie Wasserman** on 5 June 2010, 12:38 a.m.,*
in response to message #8 by Scott Newell

Pogo pins are pretty easy to find maybe even in 2 x 3 arrangements. But unless you can create some sort of locking plug it's going to be hard to hold the connector in place while programming. Maybe you could come up with some sort of fixture that the calculator could rest in when programming. The pogo pins would point up and I think that the weight of the calculator would be enough to make contact with all 6 pins.

Re: HP12c repurposing project

*Message #10 Posted by **Scott Newell** on 5 June 2010, 1:40 a.m.,*
in response to message #9 by Katie Wasserman

I too had thoughts of a fixture. Now that I've moved to windows XP, SAM-BA programs pretty quickly. It wouldn't be the end of the world to have to hold the contacts in place while programming (but unworkable if you were using the serial port for debugging). The trick would be hitting the calc's on key while holding the connector in place, holding down the erase button, and starting up SAM-BA.

If I was to build a fixture or cable from scratch, I'd seriously consider using the PC's serial port handshake lines to control the erase and reset pins, and maybe included a 3.3V regulator to power the calc from the PC as well. If only you could hit the on key through the cable, the whole programming process could be automated.

Now I did modify my programming cable so that I can power the calc off a 6218A power supply instead of using the coin cells. It also makes it easier to measure the current drain without having clip leads dangling everywhere.

Re: HP12c repurposing project

That's an excellent idea and a cute little power supply too. (Yes, describing a power supply as 'cute' is more than a little weird but this family of of HP (pre-Agilent) power supplies really are.)

DIY Calc Hardware Platform

*Message #1 Posted by **Donald Williams** on 4 June 2010, 2:28 p.m.*

Lots of past discussions about DIY calcs, so I thought some people might find this device interesting. The NanoNote might not make an ideal calculator platform, since there would be a problem with dedicated keys, but everything is documented and keycaps are replaceable.

Link to NanoNote

$99.00 USD (I think?)

Why hyperbolic functions are critical !

*Message #1 Posted by **gene wright** on 4 June 2010, 12:26 p.m.*

TI had them. HP's did not.

In this case, TI was correct. Hyperbolic functions were critical to avoiding doom!

I saw this while watching the classic 1951 movie "The day the earth stood still" recently, which if you haven't seen, you should.

Professor Barnhardt's blackboard has equations written all over it that are critical for humanity to solve to get into space. Klaatu gives him a helping hand.

The equations definitely show hyperbolic trig functions. I had never noticed them until this time. Below is a picture of the blackboard, but it is too blurry to show the equations well...but they are there!

Anyone find a better picture or have the DVD to capture a frame to show?

:-) Who knew?

Re: Why hyperbolic functions are critical !

*Message #2 Posted by **Namir** on 4 June 2010, 12:56 p.m.,*
in response to message #1 by gene wright

And if we can calculate hyperbolic functions (and inverses) using an HP12C, then all is good in the land!

:->

Namir

Re: Why hyperbolic functions are critical !

*Message #3 Posted by **Ken Shaw** on 4 June 2010, 1:11 p.m.,*
in response to message #1 by gene wright

I vaguely recollect that the top left part of the blackboard has some equations that you would expect to find in an introductory calculus course, not on a scientist's blackboard! (OTOH, they are at least valid equations, IIRC.)

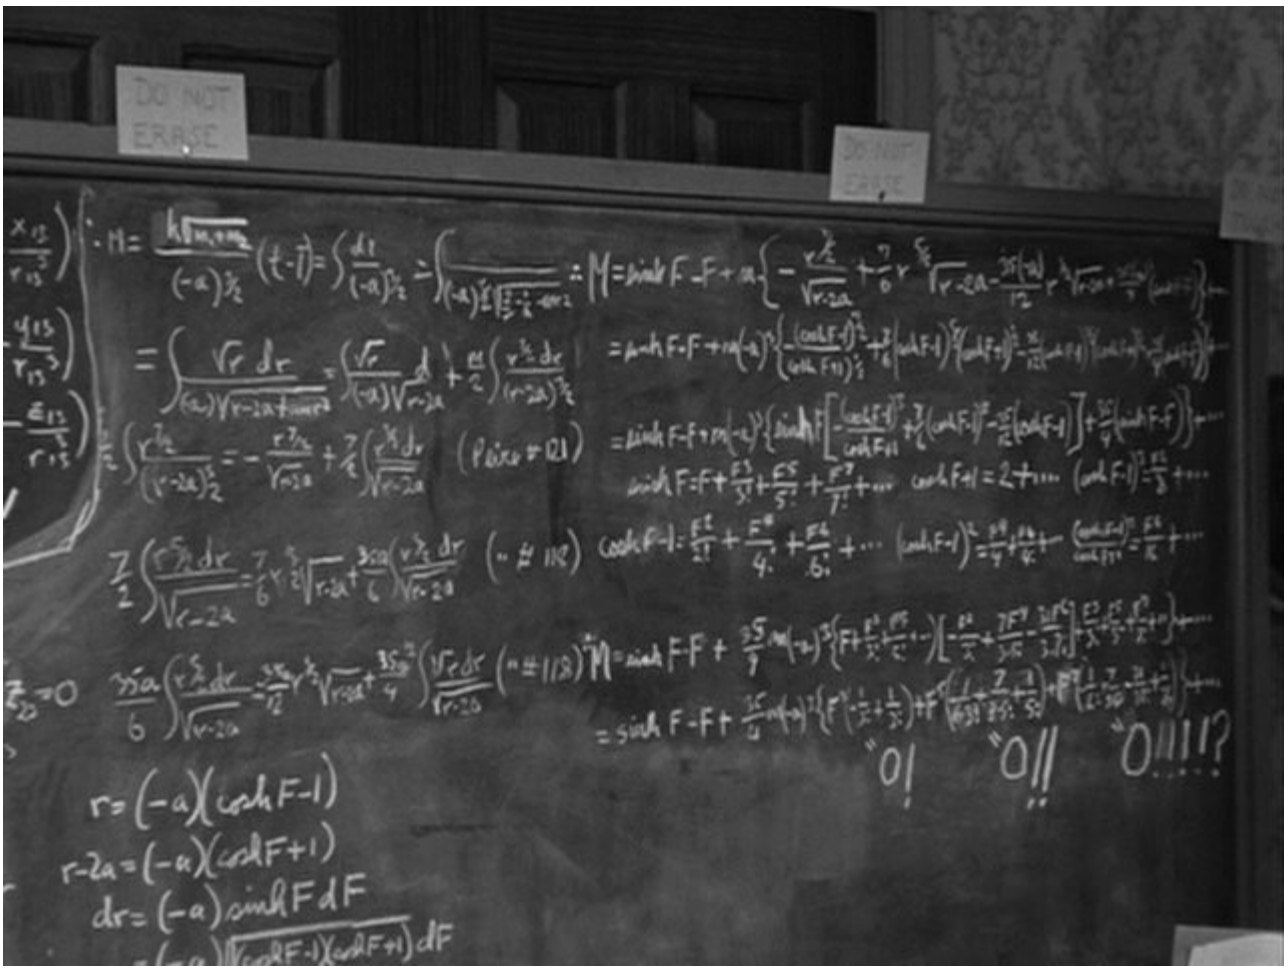
But I have the DVD. I'll see if I can grab a useful frame for you.

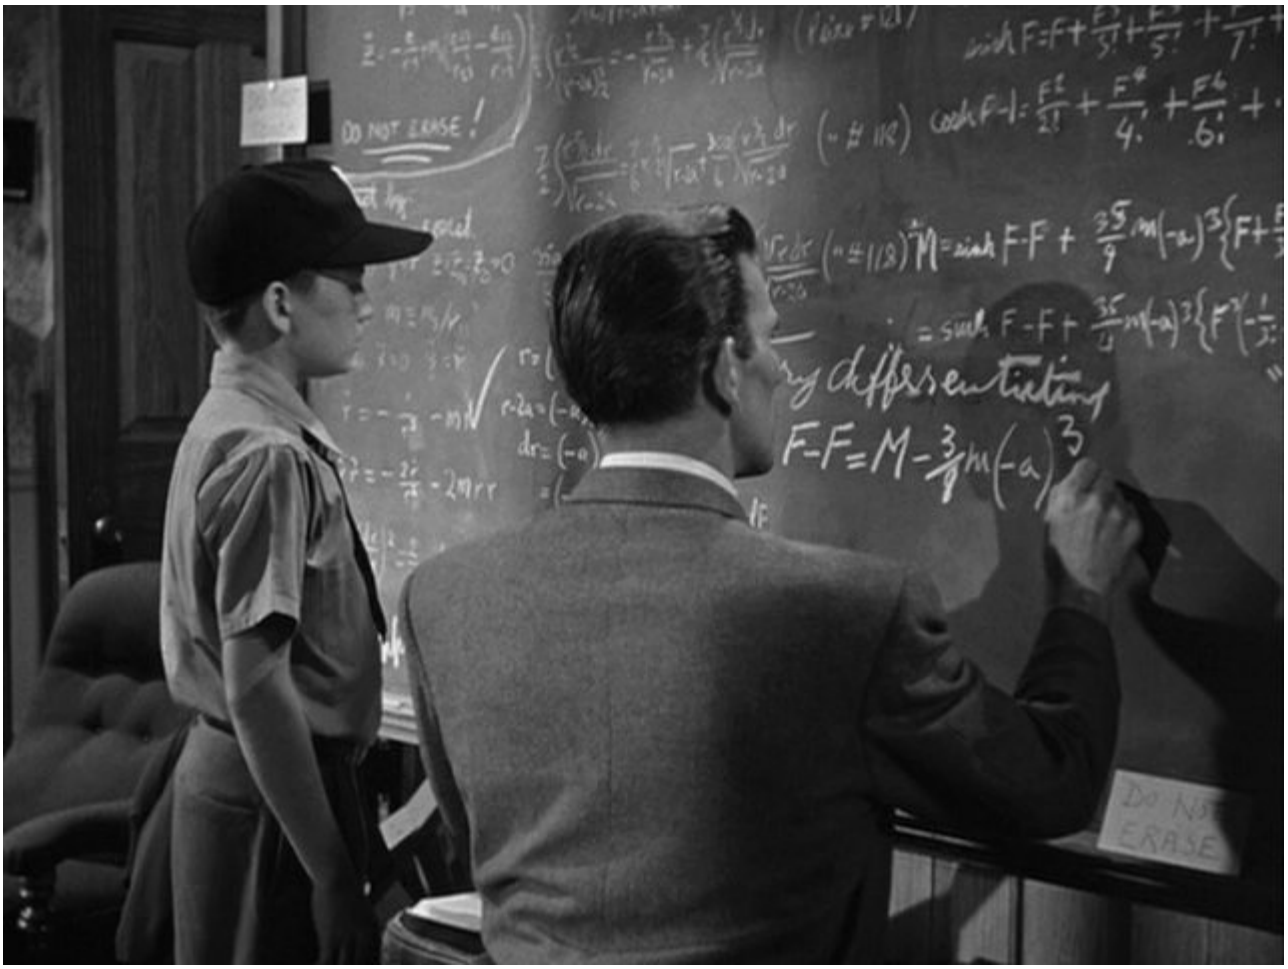
Re: Why hyperbolic functions are critical !

*Message #4 Posted by **Gene Wright** on 7 June 2010, 11:18 a.m.,*
in response to message #3 by Ken Shaw

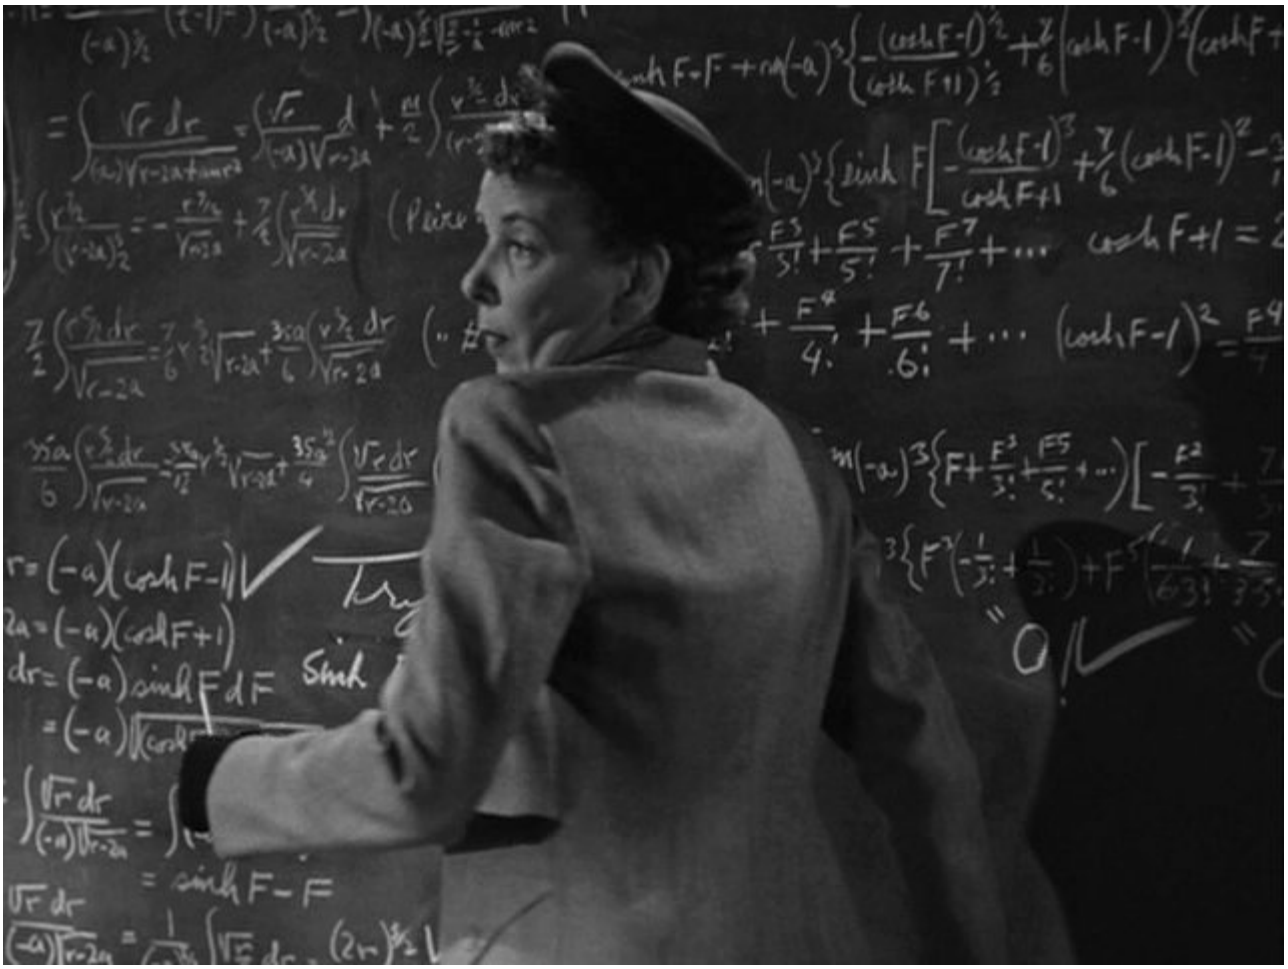
Here are the screen shots from the DVD courtesy of Ken. Thank you!

As I said, hyperbolic functions were critical to avoiding destruction of the human race in 1951. TI may have simply been trying to make sure we continued to survive! Why wasn't HP interested? lol. :-)





DO NOT ERASE !
differentiating
F-F=M-3/9 m(-a)3
DO NOT ERASE



Re: Why hyperbolic functions are critical !

*Message #5 Posted by **Don Shepherd** on 7 June 2010, 11:29 a.m.,*
in response to message #4 by Gene Wright

Gene, I think the key to the survival of the earth is found in the first picture of your post. Bottom right corner: 0! and 0!! and 0!!!!?

If we can find a way of logically explaining to students why 0! = 1, then we will have the capacity to figure out how to survive as a species. And if can explain double-factorial and quadruple-factorial, we will indeed be the supreme species!

Re: Why hyperbolic functions are critical !

*Message #6 Posted by **Gene Wright** on 7 June 2010, 12:05 p.m.,*
in response to message #5 by Don Shepherd

Lol

I'm not sure that's intended to be 0 factorial, etc, but surprise that the term turns out to BE zero.

Love this movie.

Re: Why hyperbolic functions are critical !

*Message #7 Posted by **Norman Dziedzic** on 7 June 2010, 1:53 p.m.,*
in response to message #5 by Don Shepherd

You missed the " before each term so we actually need to figure out the double derivative of the quad-factorial of 0. <hmmm>

Re: Why hyperbolic functions are critical !

*Message #8 Posted by **Walter B** on 7 June 2010, 2:48 p.m.,*
in response to message #7 by Norman Dziedzic

Look like equal signs to me, pointing to northwest or southeast :->

Re: Why hyperbolic functions are critical !

*Message #9 Posted by **Gene Wright** on 7 June 2010, 2:52 p.m.,*
in response to message #8 by Walter B

lol.

I think it is an equals sign for the terms above it. The !!! are the surprise of Dr. Barnhardt that the terms were equal to 0.

Re: Why hyperbolic functions are critical !

*Message #10 Posted by **Gerson W. Barbosa** on 7 June 2010, 5:41 p.m.,*
in response to message #9 by Gene Wright

Yes, one of the terms appears to be

```
 5   /   1        7          1     \
F * | - ---- + ------  + -----    | ,
    \  6*3!     3*5!        5!    /
```

which is indeed equal to 0.

Re: Why hyperbolic functions are critical !

*Message #11 Posted by **Martin Pinckney** on 7 June 2010, 9:25 p.m.,*
in response to message #10 by Gerson W. Barbosa

What is "F" in the relations?

Re: Why hyperbolic functions are critical !

*Message #12 Posted by **Gerson W. Barbosa** on 8 June 2010, 7:29 p.m.,*
in response to message #11 by Martin Pinckney

I don't have the foggiest notion ... By the way, does anyone know if those equations have a meaning at all?

Re: Why hyperbolic functions are critical !

*Message #13 Posted by **Ken Shaw** on 9 June 2010, 12:46 p.m.,*
in response to message #12 by Gerson W. Barbosa

In an interview, Robert Wise (the film director) said they hired an academic

to write a problem in orbital mechanics on the board (or words to that effect).

There's something like it here (link).

Re: Why hyperbolic functions are critical !

*Message #14 Posted by **Martin Pinckney** on 9 June 2010, 1:39 p.m.,*
in response to message #11 by Martin Pinckney

Turns out "F" is the "hyperbolic eccentric anomaly". This is clearly explained in *Spacecraft Systems Engineering* By Peter W. Fortescue, John Stark, and Graham Swinerd.

Re: Why hyperbolic functions are critical !

*Message #15 Posted by **Eric Smith** on 8 June 2010, 3:19 a.m.,*
in response to message #5 by Don Shepherd

> Quote:
>
> If we can find a way of logically explaining to students why 0! = 1

Trivially.

```
(n+1)! = n! * (n+1),  by the definition of factorial
n! = (n+1)! / (n+1)
2! = 3! / 3,   and since 3! = 6, 2! = 2
1! = 2! / 2,   and since 2! = 2, 1! = 1
0! = 1! / 1,   and since 1! = 1, 0! = 1
```

One more step shows why (-1)! is undefined, and by extension, the factorial of any negative integers.

> Quote:
>
> then we will have the capacity to figure out how to survive as a species.

If only it were that easy!

Carly runs for the Senate

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 3 June 2010, 10:36 p.m.*

Pages 34 through 39 of the June 7 issue of *The New Yorker* covers the Republican primary race for the U. S. Senate seat from California which is currently held by Barbara Boxer. Interesting reading, if only to see once again how Carly sees her stint at HP.

Re: Carly runs for the Senate

*Message #2 Posted by **Garth Wilson** on 4 June 2010, 12:40 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I have mixed feelings; but almost anyone would be better than the incumbent!

Re: Carly runs for the Senate

*Message #3 Posted by **Namir** on 4 June 2010, 2:12 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

She could be facing a challenge from someone who used to run TI??? I mean this HP/TI rivalry, where does it end???!!!

:-)

namir

Re: Carly runs for the Senate

*Message #4 Posted by **John B. Smitherman** on 4 June 2010, 11:26 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Well, the important question that the voters want answered is what is their stand on algebraic vs rpn vs rpl? ;-)

My guess is that Boxer is a 12c user while Fiorina hires people to do her calculations. ;-)

John

7470A Plotter Programming Examples

*Message #1 Posted by **DavidShenk** on 3 June 2010, 5:32 p.m.*

Is it just me, or is there not a lot of information about programming the 7470A plotter with a 41CX if you don't have the plotter module? I have a 7470A with HP-IB and an HP-IL/HP-IB interface. In looking thorough the Museum CDs I can find a few programming examples, but there really isn't a single webpage devoted to this (is there?).

My interest is to use the plotter not for charts and graphs, but for fun stuff. I'd like to see if I can get the plotter to draw fractals, random walks, etc. I am starting to learn the individual HP-GL commands, but thought it would be nice if there were some examples somewhere.

Dave

Re: 7470A Plotter Programming Examples

*Message #2 Posted by **Thomas Chrapkiewicz** on 4 June 2010, 9:11 a.m.,*
in response to message #1 by DavidShenk

Hi Dave:

True, there are few (if any) general hpgl plottter examples.

The best (although minimal) resource I've found are the users manuals and programming manuals for the plotter (I've used the 7475, 7550, 7586, 7596). My experience is with RS232 plotters driven by a PC or HP48. I am not familiar with the manuals for the 7470. I believe it is similar to the 7475 but limited to 'A' size paper.

Of course, the auction site has manuals available, and also at hpmuseum.net.

Email me if you would like more details.

TomC

Re: 7470A Plotter Programming Examples

*Message #3 Posted by **DavidShenk** on 4 June 2010, 11:10 a.m.,*
in response to message #2 by Thomas Chrapkiewicz

Thanks Tom,

I have not looked at the other plotter manuals, so that may help. I am figuring it out, I just wanted to make sure I wasn't missing an obvious resource. I just found this pdf that explains things well, but I am sure the 7470A does not have all of those commands.

Dave

hp-80 behaving badly

*Message #1 Posted by **kubla** on 3 June 2010, 4:02 p.m.*

I have an HP-80 that's working perfectly except for one strange behaviour: any attempt to calculate using the top 5 keys (e.g., present value) causes the display to go blank until the calculator is turned off and then on. The calculator accepts inputs for each key, it just won't calculate the answer when the key for the dependent variable is pressed.

My other HP-80 works just fine using the same inputs. Any idea what's happening?

Edited: 3 June 2010, 4:02 p.m.

Re: hp-80 behaving badly

*Message #2 Posted by **Namir** on 4 June 2010, 2:10 a.m.,*
in response to message #1 by kubla

The HP-80 with the strange behavior is seeking more of your attention???? You know, like kids who misbehave??

:-)

Namir

Re: hp-80 behaving badly

*Message #3 Posted by **kubla** on 4 June 2010, 10:01 a.m.,*
in response to message #2 by Namir

Maybe it's jealous of the other HP calculators; however, I expect one of the ROMs has gone south. Playing with it more, I find that all the financial algorithms don't work; the normal math functions work fine.

hp 50g

*Message #1 Posted by **Sok-khieng Chum Hun** on 3 June 2010, 6:39 a.m.*

Hi,

I bought an hp 50g graphing calculator yesterday, and when using it it's interface is very similar to an hp 48gx with metakernel :S, is this normal?

Tank you :)

Re: hp 50g

*Message #2 Posted by **Sok-khieng Chum Hun** on 3 June 2010, 6:44 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

and also with erable and alg48

Re: hp 50g

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2010, 8:40 a.m.,*
in response to message #1 by Sok-khieng Chum Hun

Hi;

please, when you compare both MMI, what similarities do you refer to? The HP48G/GX/G+ inheritance is actually a fact, because the HP50G is based on them although having a different hardware (processor, OS, I/O ports) and keyboard layout. Both series show information through the LCD that shares:

```
- menus with softkeys;
- header with same annunciators;
- stack levels (the HP48GII, HP49G+ and HP50G add the history for algebraic mode)
- equation writer
- matrix writer
```

and many other features. If this is what you are referring to, I consider it normal. But the HP50G has many new stuff not available with the 48G series, and the three of them that called my attention are:

```
- upgradeable OS (since the HP49G)
- expandable memory through SD card (since the HP49G+)
- USB port (also since the HP49G+)
```

People should be careful about the HP48GII that has a serial, RS232 compatible I/O port instead of a USB, because it uses a connector commonly known as 'mini-USB'.

Cheers.

Luiz (Brazil)

36-year-old calculator ad

*Message #1 Posted by **Don Shepherd** on 2 June 2010, 11:55 p.m.*

I was thumbing through my old Time magazines from 1974 and I came across this ad comparing Bowmar and TI calculators. Interesting what they considered important in 1974. Bowmar claims their offerings are superior to those of TI. Perhaps, but 36 years later TI is still going strong and Bowmar is just a faint memory.

funny enough

*Message #2 Posted by **Frank Boehm (Germany)** on 3 June 2010, 3:53 a.m.,*
in response to message #1 by Don Shepherd

the MX-25 uses a Texas Instruments TMS0803NC as a brain (which was then used a bit later by TI for the 2500-II)

Re: funny enough

*Message #3 Posted by **geoff quickfall** on 3 June 2010, 11:06 a.m.,*
in response to message #2 by Frank Boehm (Germany)

not to mention most Bowmars were TIs Klixon key pads. They did make their own LEDs and these were in some cases, bigger then the TIs.

actually

*Message #4 Posted by **Frank Boehm (Germany)** on 3 June 2010, 11:30 a.m.,*
in response to message #3 by geoff quickfall

Bowmar only went into calculator business to sell their displays, this is why they started with OEM business only.
Bootnote of history: At times, Bowmar used TI displays, as well as TI used Bowmar displays - they were obviously interchangeable.

Re: actually

*Message #5 Posted by **Joerg Woerner** on 4 June 2010, 10:24 a.m.,*
in response to message #4 by Frank Boehm (Germany)

At these times Bowmar couldn't pay cash for the (overpriced) TI calculator ships ;-))

Regards, Joerg

Re: actually

*Message #6 Posted by **Don Shepherd** on 4 June 2010, 11:54 a.m.,*
in response to message #5 by Joerg Woerner

"Ships" as in boats? Please explain.

What a lame comparison table. This looks more like an exercise to come up with any traits whatsoever that the Bowmar calculator has vs the TI. Ooh, a percent key! (At the sacrifice of the "CE" key, mind you.) And love that slimmer styling! And wow, the batteries are included, that's like so totally awesome!

They might as well have said:

```
-- Mostly beige
-- Vertical on-off switch
-- Smaller corporate logo
-- Easy to dust
-- Incorporates the word "brain" to sound really smart
```

Edited: 4 June 2010, 5:45 p.m.

Re: 36-year-old calculator ad

*Message #9 Posted by **Don Shepherd** on 4 June 2010, 6:27 p.m.,*
in response to message #8 by megarat

Those are good observations. In 1974, electronic calculators were so new that Bowmar could get away with meaningless comparison criteria; or, maybe they couldn't, because TI survived and they did not.

Which brings us to today, and if I were to make a list of criteria that a calculator had to include, to get me to buy it, it might look like this:

1. conveniently fits in my shirt pocket
2. solar powered so never needs batteries
3. a large, clear display that I can read without a flashlight (TI NSpire, are you listening?)
4. the keys always register the first time and are of sufficient size that I don't miskey entries
5. you can figure out how it works without looking at the manual
6. but, yes, there needs to be a printed manual with large type and no grammatical errors
7. the calculator should look "professional", and I'll be the judge of that
8. it must, of course, have the four basic arithmetic functions, plus typical math functions like square root, Log, etc.
9. must support large integers; 20! should show me all the significant digits, not just 10 or 12

10. programmable with sufficient memory and a way to backup/restore programs from a PC without a Master's degree in IT
11. it must be a dedicated piece of hardware, not something that runs on devices that are also phones/cameras/gps recievers/voice recorders/Internet trash

I don't think my ideal calculator exists today. Hugh's Reckon probably comes closest.

Oh, they exist, all right. Just not on the store shelves.

[O.K., maybe not *ideal*, but close to it]

Re: 36-year-old calculator ad

*Message #11 Posted by **megarat** on 5 June 2010, 2:53 a.m.,*
in response to message #9 by Don Shepherd

Not to ruin the "if wishes were fishes" theme, but requirements (2) and (10) don't seem mutually inclusive to me. You will need a battery of some sort for memory persistence.

One could argue that flash memory might be a solution, but I suspect that reading/writing to flash memory would take more power than a calculator-sized photovoltaic can muster.

Re: 36-year-old calculator ad

*Message #12 Posted by **Bart (UK)** on 5 June 2010, 6:05 a.m.,*
in response to message #11 by megarat

This NVSRAM might be an option. I was thinking of using this to make my own 48SX/GX RAM card.

Why HP Really bought Palm

*Message #1 Posted by **Norman Dziedzic** on 2 June 2010, 9:10 p.m.*

http://tech.fortune.cnn.com/2010/06/02/bombshell-hp-bought-palm-to-compete-with-chromeos/?source=yahoo_quote

Re: Why HP Really bought Palm

*Message #2 Posted by **Bruce Bergman** on 2 June 2010, 10:50 p.m.,*
in response to message #1 by Norman Dziedzic

Actually, anyone who owns a WebOS device could tell you THAT in a heartbeat! :-)

WebOS is amazing. It really beats the pants off the iPhone and iPad. For example, on WebOS, I can listen to Pandora streaming music (or my own MP3's) through a bluetooth stereo connection to my headphones, all the while browsing the web and sending/receiving text messages, and at the same time, picking up my email and navigating a GPS route with voice guidance. You simply can't do that with an iPhone or iPad. Not even close.

And lately, there have been some really awesome games for WebOS -- better looking and better functioning than those on the iPad/iPhone. I just wish there were more of them at this point. There's no question that Apple wins on the number of apps available. Even Android has more apps than WebOS, unfortunately. But the developers are trying (and the development stack is much friendlier on WebOS).

WebOS a brilliant piece of software. The Palm Pre (and Pre Plus) are "just okay" devices, but they have reliability problems and glitch up from time to time. The battery life sucks too. That's not the fault of WebOS, but of Palm, for putting out piece-o-crap phone hardware. I keep waiting for the next WebOS hardware to come out...

As soon as I had heard that HP bought Palm, I knew what they were after. They wanted WebOS. Put it on something like the HP Slate and you're going to, IMHO, have the strongest and only "real" competitor to the iPad that will come out for the next few years. The Android tablets are going to be a good third place, but when you see WebOS running on that kind of form factor, and understand what it can do, you would agree, I think.

The sad part is that just last week, HP said that they wouldn't have WebOS on the Slate because it's just not ready (the hardware, not WebOS). I was planning on waiting for the Slate, but until they put WebOS on it, I'm not interested.

Thanks,

Bruce

New Benchmark

Enjoy! Gene

Re: Loop of + benchmark now in Articles section

*Message #2 Posted by **Glenn Shields** on 2 June 2010, 4:01 p.m.,*
in response to message #1 by gene wright

It's interesting that the 35s is faster doing register arithmetic (STO + Z) than simply +ing on the stack. Is that because dropping the stack each time uses more steps? regards, Glenn

Re: Loop of + benchmark now in Articles section

*Message #3 Posted by **gene wright** on 2 June 2010, 4:25 p.m.,*
in response to message #2 by Glenn Shields

Maybe it is due to the different types that might be on the stack. Is it a real? Is it a complex number? Each + might require that to be checked, whereas a STO+ operation might not. Guessing.

in response to message #9 by Mark Storkamp

Hp 50G 12,000,000
User-rplfunction 'SUM(I=1, 12000000,1)' interpreted by custom library in HPGCC. The library evaluates functions, sums and numerical integrals from the Equation Writer in double precision for most real functions.

Re: Loop of + benchmark now in Articles section

*Message #11 Posted by **Frido Bohn** on 8 June 2010, 5:40 a.m.,*
in response to message #1 by gene wright

Hello Gene,

congrats, a real great compilation of that simple benchmark across several generations of calculators!

However, for the great HP41C/CV/CX one benchmark is missing: MCODE
In the book "HP41 MCODE for Beginners" of Ken Emery, published 1985, a 20-step machine code for this 1+ addition algorithm is presented (pages 50-52) which I wont list here.
To make things short:
Count: ~130 000
This is about 100-fold of FOCAL or Synthetic programs!

The 41 was, is and remains amazing

HP 30B not in blister pack

*Message #1 Posted by **hpnut** on 2 June 2010, 10:37 a.m.*

Hi everyone,

today I bought the HP 30B calculator. The dealer sold me the unit and it did not come in the usual hard-to-open blister pack. Instead, it came in a fancy folding box with velcro to keep the two box sides together.

http://i167.photobucket.com/albums/u151/topoguy/hp30bpackage.jpg

secondly, there is no serial number at all in the back. no stick-on label nor engraved serial number.

anyone bought their hp 30b in a similar package?

hpnut in Malaysia

Re: HP 30B not in blister pack

*Message #2 Posted by **hugh steers** on 2 June 2010, 10:55 a.m.,*
in response to message #1 by hpnut

i've seen that package. isn't it some sort of display version? also did you get a printed manual?

Re: HP 30B not in blister pack

*Message #3 Posted by **hpnut** on 2 June 2010, 11:15 a.m.,*
in response to message #2 by hugh steers

yes. a Quick Start Guide came inside the box

Re: HP 30B not in blister pack

*Message #4 Posted by **Bruce Bergman** on 2 June 2010, 11:03 a.m.,*
in response to message #1 by hpnut

Interesting! I have not seen that version yet. This might explain the sudden absence of the the 30b in the HP store. Maybe they've been rebranding it with more "professional" packaging.

I'd be really interested in hearing if this improves sales.

thanks!

bruce

Re: HP 30B not in blister pack

*Message #5 Posted by **Katie Wasserman** on 2 June 2010, 11:42 a.m.,*

in response to message #1 by hpnut

Thanks for the picture of this, very interesting. What's the date on the firmware?

To check that:

```
1) Turn off
2) Press and hold PMT
3) Press ON
4) Press DOWN 4 times
```

Thanks, Katie

Re: HP 30B not in blister pack

in response to message #5 by Katie Wasserman

It's SW Version 11 19 2009 4

copyright 2,048.00

Re: HP 30B not in blister pack

*Message #7 Posted by **Tim Wessman** on 2 June 2010, 1:00 p.m.,*
in response to message #1 by hpnut

That is one of the introduction packages sent out to the dealers when units are being introduced. They are usually sent out 2-3 months before release and have included marketing info and so on in a USB drive. They also don't have final firmware as they are just packaged with the latest version we have that seems to be working ok. They are packaged in a special box.

You probably didn't also have an overlay to put on it either since those weren't ready then.

TW

Re: HP 30B not in blister pack

*Message #8 Posted by **Jon S Canale** on 2 June 2010, 1:37 p.m.,*
in response to message #7 by Tim Wessman

Tim,

"...the latest version we have that seems to be working ok" is just not the right way to phrase this!

Re: HP 30B not in blister pack

*Message #9 Posted by **Tim Wessman** on 2 June 2010, 1:47 p.m.,*
in response to message #8 by Jon S Canale

Why?

It hasn't necessarily gone through a complete testing cycle, isn't for production use, and is just to allow the unit to turn on and perform basic calculations so the vendor can see it powered on. It isn't supposed to go to a customer either. It is a protoype.

TW

Dear Tim,

whoa! thanks for the info. I am missing (1) an USB stick drive and (2) an overlay. OK, I am being greedy here ;-) may be not the USB which contains HP marketing info but surely I am entitled to the overlay for my (not yet written) custom made programs :-)

Pls tell me what are in the standard blister pack?

Do you know the keyboard steps to check the HP 30b's serial number?

Best regards, hpnut in Malaysia

*Message #12 Posted by **Pal G.** on 2 June 2010, 1:52 p.m.,*
in response to message #1 by hpnut

Does anyone agree HP might sell more of these Financial Tools and scientific calculators to professionals without that ghoulish, immature marketing?

I know skulls and stylish morbidity are in right now - observe kids clothing at any department store - but does the financial and scientific community appreciate HP's latest marketing look and feel?

Re: HP 30B not in blister pack

*Message #13 Posted by **Martin Pinckney** on 2 June 2010, 2:30 p.m.,*
in response to message #12 by Pal G.

By "goulish" are you referring to the sort of gothic style of the packaging?

By "immature" are you referring to putting a product in dealer hands with unfinished firmware?

Please clarify!

Re: HP 30B not in blister pack

*Message #14 Posted by **Martin Pinckney** on 2 June 2010, 2:51 p.m.,*
in response to message #1 by hpnut

So maybe you should take it back to the dealer and get one that will let you do more than "see it turned on".

Then again, perhaps you should put it on eB** as "rare prototype".

[:-)

Re: HP 30B not in blister pack : Serial no

*Message #15 Posted by **hpnut** on 5 June 2010, 11:02 p.m.,*
in response to message #14 by Martin Pinckney

I did a check on the serial # as follows:

OFF

PMT and ON simultaneously

<UP ARROW>

I get this display:

Serial 0.000

http://i167.photobucket.com/albums/u151/topoguy/HP30bserial.jpg

so this is an unnumbered prototype?

Re: HP 30B not in blister pack : Serial no

*Message #16 Posted by **Katie Wasserman** on 5 June 2010, 11:13 p.m.,*
in response to message #15 by hpnut

I believe that this shows the status of the serial connection used during testing -- not the serial number. I doubt that there is a serial number encoded into these calculators.

-Katie

Re: HP 30B not in blister pack : Serial no

*Message #17 Posted by **hpnut** on 6 June 2010, 12:44 a.m.,*

"OFF g ENTER ON" on 12c platinums

*Message #1 Posted by **tony(nz)** on 2 June 2010, 7:02 a.m.*

In April last year Katie posted how the g ENTER in the 12c+ brings up the threefold menu "1.L 2.C 3.H". It also does basically the same thing on the original 12c platinum (AND on its clone called VICTOR) and on the newer platinum where we get a fourfold menu!! Something we missed all those years ago when the platinum first came out (2003?).

Re: "OFF g ENTER ON" on 12c platinums

*Message #2 Posted by **Lyuka** on 2 June 2010, 9:17 a.m.,*
in response to message #1 by tony(nz)

The 12C platinum 25th anniversary edition (CNA64311xxx) shows fourfold menu as follows.

Re: "OFF g ENTER ON" on 12c platinums

*Message #3 Posted by **Martin Pinckney** on 2 June 2010, 10:49 a.m.,*
in response to message #2 by Lyuka

So what does it do? (the menu).

Re: "OFF g ENTER ON" on 12c platinums

*Message #4 Posted by **Katie Wasserman** on 2 June 2010, 11:52 a.m.,*
in response to message #3 by Martin Pinckney

Pressing (1) does an LCD test. It lights up all segments then allows you to press Rv to light up half of the segments, then Rv again to see the other half.

Pressing (2) computes a ROM the checksum, then press ENTER to see the version number, then ENTER again to see the copyright message.

Pressing (3) starts a keyborad test. You then need to press every key at least once in any order to complete the test. Each key press will turn off 1 to 4 (I think) segments on the display.

Pressing (4) seems to do a CPU check of some sort. (The 12C+ doesn't have this test.)

-Katie

I knew TI were evil but I never saw it actually advertised

*Message #1 Posted by **Norman Dziedzic** on 1 June 2010, 7:24 p.m.*

Check out the title on this one...

http://chicago.craigslist.org/nch/sys/1769469421.html

graft [graft, grahft] –noun 1. the acquisition of money, gain, or advantage by dishonest, unfair, or illegal means, esp. through the abuse of one's position or influence in politics, business, etc.

ooops ;-0

*Message #2 Posted by **geoff quickfall** on 1 June 2010, 10:52 p.m.,*
in response to message #1 by Norman Dziedzic

nt

Grafting is Good!

*Message #3 Posted by **Namir** on 2 June 2010, 2:20 a.m.,*
in response to message #1 by Norman Dziedzic

Also has meaning in biology. Grafting branches by taking a small branch or bud from one plant and placing it in another similar plat. I think the term grafting also applies to genetic engineering.

So grafting is not ALL that BAD!! It is also life giving@

Namir

Edited: 2 June 2010, 2:21 a.m.

Re: Grafting is Good!

*Message #4 Posted by **geoff quickfall** on 3 June 2010, 11:08 a.m.,*
in response to message #3 by Namir

That would only apply to the scientific calculator Namir. The business calc would take on the other definition for grafting!

;-)

Makes sense if...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 3 June 2010, 3:37 p.m.,*

HP 50g PARTFRAC, INTVX Error/Problem

*Message #1 Posted by **Sean Kane** on 1 June 2010, 3:26 a.m.*

Hi,

I've had my HP50g for about 2 years now, but today was the first time I've ever had to use the PARTFRAC function.

I was trying to do the PARTFRAC example in the user guide to do with integration (p. 13-20), and my calculator will not give the answer that the user manual says it should give. It asks for a mode switch to approx. mode, and if this is denied it only partially resolves the equation. If accepted it leads to a mish-mash of weird complex numbers. I've also tried the INTVX example on the same page, which has the same problem.

Is there any flag or mode that I need to set to stop this happening? If not, what's going on?

I'd appreciate any help you can give.

Re: HP 50g PARTFRAC, INTVX Error/Problem

*Message #2 Posted by **Bart (UK)** on 1 June 2010, 4:27 a.m.,*
in response to message #1 by Sean Kane

Hi Sean,

First, in the manual the equation is not the same as used in the screen shots, the last term in the denominator is X^2. Mine works as shown in the screen shots.

Make sure you do not have a variable X defined in the VAR menu (or whatever variable you are integrating with respect to otherwise the symbolic integrator will attemp to use it).

Try resetting the CAS to the defaults:

```
To return the CAS to its default state, press "right shift" followed
by SYMB (CAT), ALPHA F3(C), DOWN cursor. With CASCFG selected, press ENTER.

OR by typing CASCFG (double press "ALPHA" to lock ALPHA mode) on the
command line followed by ENTER.
```

See also the HP help forum for Calculators:
HP Calculator help forum

Gene, very interesting. Who would have thought that the lowly 12c would be number one in any speed contest?

I agree with you regarding emulator results, keep 'em outta here.

I don't think an overclocked ARM chip doing nothing but looping and adding counts as a 12c anymore. . .

TW

Good point. It says "custom firmware". Is this anything remotely similar to a 12c *calculator*?

> I don't think an overclocked ARM chip doing nothing but looping and adding counts as a 12c anymore. . .

A custom firmware design or overclocked calculator is not a product than anyone here could get and have a use as intended.

Is my opinion to consider for testing those machines that in one time or the other were sold or there is usually a market for them.

Re: New addition speed test (updated with results as of 8am CDT 20100531) ...add machines / methods

*Message #6 Posted by **Tim Wessman** on 31 May 2010, 4:10 p.m.,*
in response to message #5 by Israel Otero

Well, the custom firmware of which he is referring is either that function stuck in as a part of a larger software program which does allow calculations and so on, or else it just boots, begins to run, and then waits for the button press to stop it.

Running full out at 36MHz, the battery will be completely drained in about 6 hours. That is why you probably don't want to run your 12c+ or 20/30b in test system mode. Unless you've got a lot of spare coin cells that is. . . :-)

in response to message #3 by Tim Wessman

I'm pretty sure that if you wrote a native ARM loop on the 50G, you would obtain a result that is even faster than that of the 12C. HPGCC is still slow with its overhead.

Also, the HP50G is faster when calling UsrRPL commands that operate on reals as opposed to integers.

Re: New addition speed test (updated with results as of 8am CDT 20100531) ...add machines / methods

in response to message #2 by Don Shepherd

While on the topic of irrelevant speed tests, I did another pass on the Casio fx-9860g Slim. Using the Casio SDK I compiled a simple DO LOOP with an iteration count in the statement of the loop. By trial and error I hard coded the loop count and tested for the loop exit. The counter value had to be set for an iteration of 350,000,000 for the loop to last for 60 seconds. Of course the results of this type of test are, once again trivial, since the tools are not available to the casual user, but the fx-9860 is one really fast calculator.

Re: Faster results for TI graphic machines

*Message #12 Posted by **Palmer O. Hanson, Jr.** on 31 May 2010, 10:55 p.m.,*
in response to message #1 by gene wright

Gene:

TI CC-40 Count 9,339 Program: 10 A = A+ 1 : 20 GOTO 10

If the program it placed at higher line numbers the execution slows down.

The entries already submitted for the TI graphic machines have typically used a program such as

Lbl A : B + 1 > B : Goto A : End

which works but which is slowed considerably by the storing and recalliing of the contents of B. A faster program will be

Lbl A : Ans + 1 : Goto A : End

where the result is recovered by pressing 2nd ANS ENTER . This method avoids using a memory register which is similar in a way to the RPN solutions which use only the stack. For the TI-81 the entries for your table would be

TI-81 Count 20,191 Code: Lbl A : Ans + 1 : Goto A : End

TI-81 Count 15,116 Code: Lbl A : B + 1 > B : Goto A : End

Results using the Ans method for other TI graphic machines are

TI-80 Count 1,809 Code: Lbl A : Ans + 1 : Goto A : End

TI-83+ Count 6,860 Code: Lbl A : Ans + 1 : Goto A : End

TI-85 Count 11,100 Code: Lbl A : Ans + 1 : Goto A : End

TI-86 Count 5,347 Code: Lbl A : Ans + 1 : Goto A : End

where I don't know why the TI-81 is so much faster. It seems to me that we addressed that in this forum before but I can't find it.

Re: Faster results for TI graphic machines

*Message #13 Posted by **PatrickR** on 1 June 2010, 3:14 a.m.,*
in response to message #12 by Palmer O. Hanson, Jr.

Your TI83+ is a lot slower than my TI83. They both have the same chip. Mine: 8106 Code: LBL B, A+1->A, goto B Could it be that the use of ANS instead of the variable is making a speed difference? I will check on mine later.

edit: I tested following: Lbl B: ans +1: goto b This gave 12986! This is a significantly faster method than assigning to variables. This leaves me even more puzzled why your 83+ is doing nearly half of that.

The TI-83+ number I used was for the LBL B : A + 1 : goto B method. I apologize for that.

The correct TI-83+ number for the LBL B : Ans + 1 : goto B was 10,385. I don't know why it's slower than your TI-83.

I also transmitted an incorrect number for the TI-80 with the Ans method. It should have been 2,279.

I will edit the original transmission.

Re: Faster results for TI graphic machines

*Message #18 Posted by **Xerxes** on 1 June 2010, 12:55 p.m.,*
in response to message #12 by Palmer O. Hanson, Jr.

Some additional results using the "Ans+1" method:

```
Code: Lbl 0 : Ans+1 : Goto 0

FX-5800P -> 5,340

TI-83+ SE -> 24,840

FX-9860G SD -> 110,140

FX-9860G SD Fast Mode -> 237,780
```

Re: New addition speed test (updated with results as of 20100601) ...add machines / methods

*Message #19 Posted by **Ken Shaw** on 1 June 2010, 11:55 a.m.,*
in response to message #1 by gene wright

```
Human hand tapping + key
on a 17BII (which is otherwise excluded from this test)
Count: 458
```

This beats the previous poster's human hand result, but I must disclose that the displayed count continued to climb about half a dozen or more after I stopped tapping, so there is a non-trivial keyboard buffer on this machine, which I wasn't really aware of.

Edited: 1 June 2010, 11:56 a.m.

```
Going for the first place with available approach ....

HP-71B USA:2504A00223 HP71:1BBBB FTH:1A, year of production 1984?
Count: 1,069,543
Code: Forth + Assembler: ADD1 D.

Press any key (except ON) to stop counting. Count => double length value on the stack.

First assemble ADD1 into the Forth dictionary:

File: ADD1
  FORTH
  WORD 'ADD1'
** overflows in about 470 secs .... P= xx where xx>6 gives more time
  P= 6
  C=0 A
  A=0 WP
LOOP A=A+1 WP
  C=IN          // Keyboard touched (except ON key !)
  ?C=0 A
  GOYES LOOP
  D1=D1- 5
  DAT1=A A
  ASR W
  ASR W
  ASR W
  ASR W
  ASR W
  D1=D1- 5
  DAT1=A A
  RTNCC
  END

BR

Ray
```

Re: Titan hits back !! Re: New addition speed test (updated with results as of 20100601 noon CDT) ...

*Message #27 Posted by **Egan Ford** on 1 June 2010, 4:16 p.m.,*
in response to message #26 by Raymund Heuvel

> Quote:
>
> Going for the first place with available approach ....

HP 50g 2.15, HPGCC, 75MHz: 24,041,072

```
#include <hpgcc49.h>

int main(void)
{
    unsigned int c=0;

    sys_slowOff();
    while(!keyb_isAnyKeyPressed())
        c++;
    sat_push_zint_llong(c);
    return 0;
}
```

Notes:

1. keyb_isAnyKeyPressed() may be slowing me down. May look for alternative.

2. Someone else can do the ARM ASM version.

Edited: 1 June 2010, 4:21 p.m.

Re: Titan hits back !! Re: New addition speed test (updated with results as of 20100601 noon CDT) ...

*Message #28 Posted by **Egan Ford** on 1 June 2010, 4:36 p.m.,*
in response to message #27 by Egan Ford

> Quote:
>
> keyb_isAnyKeyPressed() may be slowing me down. May look for alternative.

Faster version:

HP 50g 2.15, HPGCC, 75MHz: 161,722,281

```
#include <hpgcc49.h>

int main(void)
{
    unsigned int c=0;
    unsigned int volatile * GPFDAT = (int*) 0x7A00054;

    sys_slowOff();
    //press ON to stop
    while(!(*GPFDAT&1))
        c++;
    sat_push_zint_llong(c);
    return 0;
}
```

I guess the next step would be to run at 192MHz, but then I'd have to flash my 50g with a special 2.09 firmware. Too lazy. ARM ASM should still be better.

Edited: 1 June 2010, 4:37 p.m.

Re: Titan hits back !! Re: New addition speed test (updated with results as of 20100601 noon CDT) ...

*Message #29 Posted by **Raymund Heuvel** on 1 June 2010, 6:15 p.m.,*
in response to message #28 by Egan Ford

```
Considerations:
register unsigned int c=0;
register unsigned char volatile * GPFDAT = (char*) 0x7A00054

could speed up, depending on compiler and processor.

I have no ARM neither 50G knowledge.

The Titan counting with C=C+1 A versus C=C+1 W results in +30% using only the A
field. (Therefore the WP construction).

BR.

Ray

Re: Titan hits back !! Re: New addition speed test (updated with results as of 20100601 noon CDT) ...

*Message #30 Posted by **Egan Ford** on 1 June 2010, 7:11 p.m.,*
in response to message #29 by Raymund Heuvel

After I posted I did try 'register c' and also used a compiler #define for GPFDAT. No increase. Modern compilers are pretty smart.

Code:

```
#include <hpgcc49.h>

#define GPFDAT (int*)0x7A00054

int main(void)
{
    register unsigned int c=0;

    sys_slowOff();
    while(!(*GPFDAT&1))
        c++;
    sat_push_zint_llong(c);
    return 0;
}
```

Optimizer on? Interrupts off? Cache on? At 75MHz, I would expect the ARM9 to whip a ~50MHz ARM7 running from flash with wait states.

Yes. No. Yes.

I am a bit stumped as well, but to be honest I didn't really try. If I have time this weekend I'll take a look at the compiler options more closely or try my hand at ARM ASM.

I think this statement is ambiguous. I would argue that any benchmark method is available to anyone.

If you are looking for a way to distinguish relatively easy vs. hard. Then I would suggest 'on-board' vs. external development. I think that is what you were aiming for. That would put my HPGCC results up there with Scott's.

I agree it is ambiguous.

I mean...

Should it be limited to "using the machine as-is out of the box without being hooked up to any external

devices?"

Should it be "using code that can be typed in / edited on the machine even if using an external tool previously loaded into the machine?"

etc. :-)

Re: New addition speed test (updated with results as of 20100601 noon CDT) ...add machines / methods

*Message #37 Posted by **Egan Ford** on 1 June 2010, 5:37 p.m.,*
in response to message #36 by gene wright

The later. Regardless on how the code got into the machine any should be able to reproduce the results with only the machine.

For Scott and myself it is clear. For HP41 M-code, its clearly easier to do this externally, however it is possible to do M-code on-board (e.g. HEPAX). Why suffer if you do not have to?

Perhaps internal vs. external too limiting. Perhaps stock vs. modified? e.g. HPGCC code runs on unmodified 50gs. Scott's 12C+ is only a 12C+ shell; its soul was ripped out and is now possessed by something more powerful. Of course, what does modified mean? Is using a FORTH or HEPAX module a modification?

Unsure if this really matters.

Re: New addition speed test (updated with results as of 20100601 noon CDT) ...add machines / methods

*Message #38 Posted by **gene wright** on 1 June 2010, 5:48 p.m.,*
in response to message #37 by Egan Ford

True, and I won't worry about it. With each entry showing the code/method used, it should be ok.

For being about to get fast results VERY easy, the following three machines really stand out (to me):

HP 30b

FX-9860G SD

HP 12c+

I give them an extra round of applause.

So far, the solution that had me laughing and applauding for its audacity is certainly Raymund's synthetic HP 41CX solution. :-)

I'm also quite sad that my FAST MODE HP-42s that I've cherished all this time is no longer looking quite so fast. :-(

Personally I admire Raymund's 71B FORTH/ASM solution the most. I'll double my admiration if Raymund developed, tested, and debugged his program on the 71B. I've never written a 71B program on the 71B. I always use EMU71 and then HP-IL it to my 71B.

Re: New addition speed test (updated with results as of 20100601 noon CDT) ...add machines / methods

*Message #40 Posted by **Raymund Heuvel** on 1 June 2010, 5:40 p.m.,*
in response to message #35 by Egan Ford

I agree it is ambiguous. I just copied it from the (previous) list of Xerxes. Nice marketing teaser! (You couldn't see the smile on my face ...)

Maybe we should introduce A and B grades, The A for the technical/performance part and B for the way it is implemented.

Then I would strongly promote my 'STO b' solution on the 41CX (again a smile ..).

Although your C Solution copes with the level "Real programmers don't use Pascal", resulting in a best note for this!

This was the best reason to buy a Wizard. It was a really fast BASIC for a small device with 20 digit BCD math (using double precession), a full DOS-like OS and even (undocumented) calls to machine code along with PEEK and POKE. I used this a lot until I got my HP100LX and later HP200LX.

Re: New addition speed test (updated with results as of 20100602 1pm CDT) ...add machines / methods --- new champion Casio FX-9860g Slim

*Message #48 Posted by **Paul Dale** on 13 June 2010, 11:50 p.m.,*
in response to message #1 by gene wright

I fiddled around with my 16c a bit more and came up with a slightly better result:

```
LBL A
ISZ
GTO A
```

In float mode this gave 325 after a minute. In unsigned integer mode 378 (size of the integer didn't seem to make a difference).

Of course, I started with 0 in I.

sum of the first n integers

*Message #1 Posted by **Gerson W. Barbosa** on 30 May 2010, 5:28 p.m.*

Most everybody here knows **the story** of young Gauss being asked by his teacher to add together the first 100 natural numbers and how he did it quickly in a very genial way. Lacking his genius, I will do it the old-fashioned way, summing the numbers one by one, not only the first 100 of them, but as much as I can do in 60 seconds using some different programmable calculators:

```
HP-12C                  HP-33s                  HP-34c

01 1                    G0001 LBL G             001 LBL A
02 ENTER                G0002 1                 002 1
03 ENTER                G0003 ENTER             003 ENTER
04 1                    H0001 LBL H             004 LBL 1
05 +                    H0002 1                 005 1
06 +                    H0003 +                 006 +
07 STO 0                H0004 +                 007 +
08 LST x                H0005 STO A             008 STO 0
09 GTO 04               H0006 LAST x            009 LST x
                        H0007 GTO H             010 GTO 1
```

Execute the program and start your chronometer. When exactly one minute has elapsed, press the R/S key, recall the sum S from the memory register and compute n = (sqrt(8*S + 1) - 1)/2 or INT(e^((ln(S) + ln(8))/2 - ln(2))), in case 8*S might exceed the number of digits in the display.

The following results were obtained:

```
calculator         S              n

HP-12c+       58 001 835        10 770

HP-33s         7 610 851         3 901

HP-12c            14 365           169

HP-34c             6 441           113
```

These can be used to be benchmark the performance of the calculators. For instance, I gather from the table my HP-12c+ is 63.7 times faster then the ordinary 12c (10770/169) and my 33s is 34.5 times faster than my 34c. The latter agrees with other benchmarks:

Tony Thimet's Benchmark

```
HP-33s: 44.0
HP-34c:  1.3

     -> 33.85x
```

Xerxes's Benchmark

```
HP-34c: 4390 s
```

```
HP-33s:  131 s     (my units)

     -> 33.51x
```

Gene Wright's Benchmark

```
HP-33s: 9900
HP-34c:  269      (my units)

     -> 36.8x
```

Apart from the benchmarking feature, I am interested in how many counts you can get, either from trying the program in faster calculator or improving the method. For instance, on the HP-41 **1 STO** and then **RCL 1** inside the loop is faster than the **1** in the beginning of the loop (thanks PeterP!).

Gerson.

That's almost 700 times more numbers than in the original problem! Well, considering the story is true which after reading the American Scientist article I am not sure about anymore. Anyway, as the Italian say, *se non è vera, è ben trovata*.

> Quote:
>
> Amazing little machine. :-)

Agreed! It's a shame a scientific version is still not available.

Re: sum of the first n integers - HP 30b

*Message #5 Posted by **gene wright** on 30 May 2010, 6:28 p.m.,*
in response to message #4 by Gerson W. Barbosa

Well, Gerson... given its speed AND the scientific functions built-into it as well as being RPN and having a (relatively) low cost, it can certainly substitute for many scientific wishes!

I do hope a good number here will get one as they can. And, no, I get no commission. :-)

Re: sum of the first n integers - HP 30b

*Message #6 Posted by **Gerson W. Barbosa** on 30 May 2010, 7:41 p.m.,*
in response to message #5 by gene wright

I read your review of the HP 30b in Datafile V28 N6 and found it impressive. I would get myself one, but I haven't seen it around yet. Sure I don't like inverse trigs accessible through menu, as I didn't like it on the 28S, but at least they are there.

Re: sum of the first n integers - HP 30b

*Message #7 Posted by **gene wright** on 31 May 2010, 12:17 a.m.,*
in response to message #6 by Gerson W. Barbosa

Yes, the inverse trig are there and can be assigned to the keyboard at the cost of about 24 of the 290 bytes and 3 of the 10 program locations. Really not too bad to make "run" mode much more useful. Make sure to get a copy of the HP Solve newsletter now being edited by Richard Nelson. Has had a couple of articles about the 30b with perhaps more to come.

Re: sum of the first n integers

*Message #8 Posted by **Scott Newell** on 30 May 2010, 6:58 p.m.,*
in response to message #1 by Gerson W. Barbosa

12C+, custom integer firmware, overclocked to 48 MHz. N=152,361,930 and S=11,607,078,932,843,415. (Had to use 64 bits for the accumulator on the 12C+, and I had to check my results with bc to handle the range.)

```
unsigned long long acc=0;
do
{
   ++x;
   acc+=x;
} while ((((*(unsigned long int*)PIOC_PDSR) & c_mask)==c_mask));
```

That's really amazing, a hard-to-break record on the 12C+! My hopes now lie on the 50g overclocked to maximum speed. Anyone? :-)

I checked your value for N on the 50g in exact mode. It worked but the calculator froze afterwards, probably because the Ni-MH had gotten low. As it would not turn off I removed one of the batteries for a moment and it restarted with the memory intact.

I suspect a C or assembly coded routine on either the 50G or the Casio would easily beat it. I can't seem to get the 12C+ to run reliably at 50MHz, and those calcs should do what, 200?

Re: sum of the first n integers

*Message #11 Posted by **Tim Wessman** on 30 May 2010, 10:14 p.m.,*

Re: sum of the first n integers

*Message #12 Posted by **Eric Smith** on 1 June 2010, 7:16 p.m.,*
in response to message #10 by Scott Newell

200 MHz? Where did you get that? The part has a rated maximum of 36 MHz. If you exceed that by much, reads of the flash memory will become unreliable.

Re: sum of the first n integers

*Message #13 Posted by **Gerson W. Barbosa** on 1 June 2010, 7:28 p.m.,*
in response to message #12 by Eric Smith

I think he's referring to the 50g's processor, which is underclocked at 75MHz but can run at higher speeds, up to 192MHz according to Xerxes's Benchmark article.

Edited: 1 June 2010, 7:32 p.m.

I looked up the 50G and the Casio on Wikipedia, and they claimed much faster CPUs (50G: 203 MHz?, Casio: 133 MHz?), with cache.

I have not bothered to run code from sram, but that might make it to 50MHz or so. I have also not tried to increase the number of flash wait states.

I did look through the AT91SAM7L128 datasheet (mine may not be the latest version) abs max ratings, but couldn't find a hard limit of 36 MHz. The PLL shows a max of 47 MHz, master clock max of 39.7 MHz, and max flash operating frequency of 39.7 MHz. Considering how sloppy the PLL reference is (20-44 kHz!), I just assumed I could overclock it a bit, just for fun.

Re: sum of the first n integers in HP 35s

*Message #15 Posted by **Pablo P (Spain)** on 31 May 2010, 4:41 a.m.,*
in response to message #1 by Gerson W. Barbosa

```
HP 35s
----------
S: 480 690
N: 980
----------
A001 LBL A
A002 1
A003 ENTER
A004 ENTER
A005 1
A006 +
A007 +
A008 STO A
A009 LASTx
A010 GTO A005
```

It is very slow compared to HP 33s.

Edited: 31 May 2010, 4:45 a.m.

Re: sum of the first n integers in HP 35s

*Message #16 Posted by **Gerson W. Barbosa** on 31 May 2010, 6:11 p.m.,*
in response to message #15 by Pablo P (Spain)

```
HP-33s

G0001 LBL G
G0002 1
G0003 ENTER
G0004 STO B
H0001 LBL H
H0002 RCL+ B
H0003 +
H0004 STO A
H0005 LAST x
H0006 GTO H
```

```
S: 11 122 686
n:      4 716
```

Is the extra ENTER really necessary on the 35s? On the 33s, it is not.

One less instruction inside the loop causes the count to increase about 20% (6/5), but the gain should be even greater on the 35s (Courtesy of Katie Wasserman :-)

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=119195

Hi Gerson, the second ENTER was unnecessary. Thanks

The improved program without the constant in the loop:

```
HP 35s
----------
S: 1 813 560
N:     1 904
----------
A001 LBL A
A002 1
A003 STO B
A004 ENTER
A005 RCL+ B
A006 +
A007 STO A
A008 LASTx
A009 GTO A005
```

Edited: 31 May 2010, 7:16 p.m.

A faster program for the HP33s

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 31 May 2010, 11:23 p.m.,*
in response to message #1 by Gerson W. Barbosa

Gerson:

Try this on the HP-33s starting with LASTx cleared by entering 0 X:

LBL A

LASTx

1

+

+

GTO A

Read the sum from the display, rolling down if necessary. Read n by pressing LASTx, or as one less than the number in the display if the content of LASTx is 1.

To cross check calculate n(n+1)/2.

Two one minute tries with this method yielded

Sum = 9,114,315 with n + 4,269

Sum + 9,097,245 with n + 4,265

Palmer

You're right, I should have sticked to the old K.I.S.S. rule :-)

Your HP-33s is a bit faster than mine. I obtained 4245 and 4254.

The slightly modified version below is even faster, provided 1 is previously stored in register B:

```
A0001 LBL A
A0002 LASTx
A0003 RCL+ B
A0004 +
A0005 GTO A
```

time (s)	n	S
59 + 99/100	5 255	13 810 140
59 + 97/100	5 252	13 794 378

Thanks for your suggestion,

Gerson.

Publisher of HP-related books

*Message #1 Posted by **JJB299** on 30 May 2010, 11:10 a.m.*

Does anyone know of a publisher that has produced books in the past that are about HP calculators? Or non-HP calcs? If not calculators, then other handhelds/laptops from HP?

Thanks. Cheers(just trying it on).

-Justin

*Message #2 Posted by **Namir** on 30 May 2010, 11:34 a.m.,*
in response to message #1 by JJB299

Amazon carries books related to the TI-83 and the new TI Nspire. I'd search there first.

As for books for HP calculators, well they are only old books you may find on eBay and also Amazon. What is available is based on what sellers happen to have for sale.

*Message #3 Posted by **db (martinez, ca.)** on 30 May 2010, 12:03 p.m.,*
in response to message #1 by JJB299

Grapevine published a series of books on the 41, 12, 48 and more.
TK enterprises published a book on RPN.
Wilson Barnet (Guy Ball's father in law) published the Collector's Guide to Pocket Calculators.
Dr. Mier-Jedrzejowicz self published his great collection of (mostly) other peoples' essays about HP & RPN.
Synthetix of Berkeley California published the books on the 41 by Kieth Jarret and others
D'Zign (Ted & Phylis Kerber) published many books of surveying and geometry programs for the 67,41,42,& 48 series. Most could come with mag cards or discs.

There's more that i'm not remembering.

Another is Colin Croft who published a couple of books on the 38/39g series.

in response to message #4 by Martin Pinckney

Well, I will toot my own horn a bit and say that my business math book using the HP 10bII, the HP 12c and TI BAII Plus is still available on Amazon.

Tony Hutchins has a very detailed book on the TVM using calculators but I believe it is out of print. I am fortunate enough to have one.

in response to message #5 by gene wright

Hi Gene,
I have been looking at that, but UK Amazon wants £83 for your book. That's around 5x the US Amazon price. Unfortunately I cannot justify that.

Re: Publisher of HP-related books

*Message #9 Posted by **Eric Rechlin** on 6 June 2010, 11:27 p.m.,*
in response to message #8 by Bart (UK)

Order it through my site and it's $64 shipped by Priority Mail. Might be able to do it for $50 by Airmail, though (let me know if you're interested). Unfortunately shipping across the pond adds a lot to the price.

Re: Publisher of HP-related books

*Message #10 Posted by **Martin Pinckney** on 30 May 2010, 10:24 p.m.,*
in response to message #3 by db (martinez, ca.)

There was *HP 48 Insights* and *HP 41/48 Transitions* published by Larken Publications.

HP 48 Handbook and *The HP 48 Programmer's ToolKit* published by Armstrong Publishing Company.

Re: Publisher of HP-related books

*Message #14 Posted by **Gordon Strickland** on 30 May 2010, 9:31 p.m.,*
in response to message #1 by JJB299

"Computational Analysis with the HP 25 Pocket Calculator" by Peter Henrici, published in 1977 by John Wiley & Sons.

This book contains 35 programs dealing with various intermediate- and advanced-level mathematical topics, such as continued fraction representation of real numbers, Aitken-Steffensen iteration, exponentiation of power series, complete elliptic integrals, Bessel functions, and so on.

Amazon is currently listing four used copies, starting (unfortunately) at $59.97.

in response to message #1 by JJB299

Hi;

I have "The HP48 Calculus Companion", by Mathews J, Eldswick J., Harper Collins College Publications.

Also, you could try GU (Great Unpublished - link seems not to work, though) They published many of Urroz's

books about the HP48G series.

(added) I found this reference and after that I found this one which points to this one... which points to nowhere. I think I found nothing, though.

As a humble reference of mine, Brazilian Erica publisher printed 'Da HP41 para a HP48' ('From the HP41 to the HP48'), written by me in the mid 90's (Portuguese only... so far). There are some other books printed in Brazil about calculators, and I happen to have a printed copy of 'Usando a HP41CV na Engenharia' (Using the HP41CV in Engineering), by Mirshawka, V. printed by Brazilian Nobel publisher.

Cheers.

Luiz (Brazil)

Let's Make This List Complete and Put It In the Articles Section

*Message #16 Posted by **db (martinez, ca.)** on 31 May 2010, 1:08 a.m.,*
in response to message #1 by JJB299

That was a great question. I've compiled the answers so far. Could anyone with something to add or organize: copy and paste to this till we have a fairly complete bibliography to store in the Archives? Maybe the final version should be sorted alphabetically or by calculator, although i think that sorting by language is important to those of us not from Europe or Brazil.

IN ENGLISH
-Grapevine Published:
An Easy Course In Programming The HP-41 by Chris Coffin & Robert Bloch
(they also published books on the 12c & 48)
-Everything you've always wanted to know about RPN but were afraid to peruse: published by TK enterprises
-The Collector's Guide to Pocket Calculators by Guy Ball & Bruce Flamm.Published by Wilson Barnet
-RCL 20; Dr. Mier-Jedrzejowicz's self published collection of (mostly) other peoples' essays about HP & RPN.
-Synthetix of Berkeley California published:
HP-41 Synthetic Programming Made Easy by Kieth Jarett
HP-41 Extended Functions Made Easy by Kieth Jarett
HP-41 Advanced Programming Tips by Alan McCornack & Kieth Jarett
Inside the HP-41 by Jean-Daniel Dodin
Extend Your HP-41: Dr. W. Mier-Jedrzejowicz
-D'Zign (Ted & Phylis Kerber) published books of surveying and geometry programs for the 41,42,& 48 series. Most could come with mag cards or discs.
-Colin Croft who published a couple of books on the 38/39g series.
-Quantitative Analysis For Business: The Time Value of Money and Basic Business Statistics Using a Business Calculator by Gene Wright
-The Time Value of Money: Business Math Using a Business Calculator by Gene Wright
-?????? TVM ??????? by Tony Hutchins -HP 48 Insights and HP 41/48 Transitions published by Larken Publications.
-HP 48 Handbook and The HP 48 Programmer's Tool Kit from Armstrong Publishing Company
-Algorithms for RPN Calculators by John A. Ball, 1978.
-Computational Analysis with the HP 25 Pocket Calculator by Peter Henrici, published in 1977 by John Wiley & Sons.
-The HP48 Calculus Companion by Mathews J, Eldswick J., Harper Collins College Publications
-Practical Navigation by Calculator by Gerry Keys, 1982, pub. by Stanford Maritime, London
-PPC ROM Users Manual 1982. Written and published by PPC, Santa Anna California

IN PORTUGUESE
-Da HP41 para a HP48' ('From the HP41 to the HP48') , by Luiz C. Vieira
-Usando a HP41CV na Engenharia' (Using the HP41CV in Engineering), by Mirshawka, V. printed by Brazilian Nobel publisher.

Re: Let's Make This List Complete and Put It In the Articles Section

*Message #17 Posted by **Felix Gross** on 31 May 2010, 2:10 a.m.,*
in response to message #16 by db (martinez, ca.)

Please check out the Calculator literature list on the HP Museum DVD2. It comprises almost 800 book references sorted by subject, with ISBN number, page number etc (if available). A discussion of this list can be found in Datafile V29N1P7.

The English books mentioned in this thread should be in the list. I will include Luiz Viera's books and would be grateful to receive more information about those books. In fact I would be grateful for all information about books not yet included in the list. The current version has more than 1000 references and is still growing.

Cheers,

Felix

Re: Let's Make This List Complete and Put It In the Articles Section

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 31 May 2010, 1:37 p.m.,*
in response to message #16 by db (martinez, ca.)

Hi db, guys;

I'll compile all information I have about these books. I also have four Urroz's publications, originally from GU, all of them about the HP48G series. As the HP48 has already been discontinued, I believe it is already a museum electable item, right?

I´ll post about these later.

In time: will the HP12C literature be considered here? I guess we´ll never know how many books about it has been written so far...

Cheers.

Luiz (Brazil)

Go back to the main exhibit hall

New addition speed test (updated with results as of 5pm CDT 20100530) ...add machines / methods not yet included..includes 42s FAST mode

*Message #1 Posted by **Gene Wright** on 28 May 2010, 3:24 p.m.*

Presently in order from fastest to slowest.

I'd like to get a list of speeds for a much simpler program, that ONLY goes after one thing: a loop of additions.

```
LBL 01
+
GTO 01
```

where the stack contains 0 1 1 1 on 4 level machines. In other words, start with 0 and do repeated additions of 1 for 60 seconds. What is the result? I know Xerxes' test checks many other things, but how do they stack up with this?

```
Please post:

The machine used
Your count after 60 seconds
Your program code.

Ok, :-)

While emulators running on iphones, ipod touch, etc. are interesting, I'm personally only interested in real units with buttons that (mostly) click.

I won't be including any FREE42, etc, results in the table.

Not that they aren't interesting... :-)

Hi Gene,

Nice list of results, I assume you will put it into an article once the entries dry up.

Just a note on the "Human hand tapping + key", that was performed on the MK-61, many can probably do it faster, but the MK-61 just doesn't seem to accept inputs any faster - I was just trying to see if I could beat the program.

HP-71B Forth Xerxes:
COUNT= 46575 TIME USED=: 60.01 Seconds
Code: 46575 0 DO 1+ LOOP

Since this is not valid in run-time use:
Forth
: XERXES 1 SWAP 0 DO 1+ LOOP ;
46575 XERXES DROP
BYE

Very brute force program (Forth, Math Pac) to calculate count in 60 Seconds:

```
10 FORTHX ": XERXES 1 SWAP 0 DO 1+ LOOP ;"
20 DEF FNX(C) ! C=COUNT
30 C=INT(C) @ DIM T,F$ @ F$=STR$(C)&" XERXES DROP" @ T=TIME @ FORTHX F$ @
FNX=TIME-T-60
40 END DEF
50 R=FNROOT(20,50,FNX(FVAR))
60 DISP "HP-71B Forth Xerxes:" @ DISP "COUNT=";INT(R);" ";
70 DISP "TIME USED=:";FNX(INT(R))+60;" Seconds"
80 FORTHX "FORGET XERXES"
```

Of course with the use of HP-IL and 82164A RS-232 to get this listing ....

Re: New addition speed test (updated with results as of Noon CDT 20100529) ...add machines / methods not yet included

*Message #16 Posted by **Palmer O. Hanson, Jr.** on 29 May 2010, 2:00 p.m.,*
in response to message #1 by Gene Wright

Gene:

Way back when, in the dark ages, and working on the dark side, we found that the count that we could get

depended on the method of mechanizing the loop. Not really surprising, of course. Thus, with my TI-59 if I mechanize the loop as

1 + RST I get a one minute count of 635

1 + GTO 000 I get a count of 337

LBL A 1 + GTO A I get a count of 396

We decided that we really only wanted to compare add times. If I do the RST loop with different number of additions per loop I get

635 with 1 + RST

707 with 1 + 1 + RST

735 with 1 + 1 + 1 + RST

771 with ten additions per loop

779 with twenty additions per loop, and

787 with one hundred additions per loop.

We also found that we could get a comparable result to the 100 additions per loop measurement by doing a little algebra on the cases with one and two additiions per loop.

Palmer

*Message #17 Posted by **Gene Wright** on 29 May 2010, 2:14 p.m.,*
in response to message #16 by Palmer O. Hanson, Jr.

Hi Palmer!

I still owe you an email. :-)

I know that higher counts would occur if memory were filled with + instructions and not just a single + in a loop.

So, this test is addition and loop, I guess.

I'm sure the counts would be much higher for many machines like the TI 59, etc, if most of memory were + 1 + 1... and the HP machines might have an intense advantage since program memory would just be + and the numbers would be on the stack - no digit entry delay in a program.

But, yes, I know you're correct. :-)

The difference between these two is surprising. My HP-16c (the top one) hasn't been overclocked or anything yet it runs 20% faster.

Could there have been some extra code floating around in the second case? The GTO has to search to find the LBL and an extra step would slow things down.

It is probably worthwhile making sure that all LBL addressed calculators have had their program memory cleared before doing the test.

in response to message #26 by BobVA

> Quote:
>
> I was sort of surprised at the low number for the 97.

The HP-97 performs GTO by searching up to the entire program memory, from the GTO forward, wrapping around at line 224 if necessary. This is very inefficient when running tight loops where you're jumping backwards a lot. Think about it: "GTO 0... OK, I'm at line 003, where's LBL 0? Is it at line 004? No. Is it at line 005? No. Is it at line 006? No..." and so on.
HP tried to ameliorate this with the "rapid reverse branching" feature (GTO (i) where I < 0, which jumps -I lines backward, so you can jump to a specific line without the label search) but that is so awkward that hardly anyone ever uses it. The TI-58 and its relatives do this better because they support both "goto label" and "goto line number", but the HP-41C and HP-42S do this better still by using memoization, where you get the best of both worlds, i.e. freedom from having to keep track of line numbers, *and* the efficiency of a direct jump: they perform the same kind of label search as the HP-67/97/etc, but once they find the label, they store its location, and the next time that GTO or XEQ is executed, they can then jump straight to that LBL without having to search for it.
The HP-25 outperforms the HP-67 and HP-97 by a wide margin on this test, even though it uses pretty much the same hardware... just because its simplistic "goto line number" is much more efficient than the 67/97 "goto label".

HP 49g+ USB question

*Message #1 Posted by **Guido** on 28 May 2010, 12:12 p.m.*

Hi everybody,

I have an HP 49g+ and I don't have the USB cable. Is it a regular standard USB cable?

I mean, is a regular MiniUSB >> USB cable?? (like the photo cameras) Or is a "special" USB cable?

Thanks!

Re: HP 49g+ USB question

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 May 2010, 1:23 p.m.,*
in response to message #1 by Guido

Hi;

I have already used regular USB cables with the HP49G+ that came with other USB-based devices (photo cameras, spare cables, etc), shorter that the one that comes with the calculator, and I also have used the original cable that came with the HP49G+ with other USB devices. Had no troubles with that.

Cheers.

Luiz (Brazil)

Brute force addition speed test - various models - results?

*Message #1 Posted by **Gene Wright** on 28 May 2010, 10:26 a.m.*

Xerxes has done a great job with the complex speed test N-queens problem for various calculators as detailed in his Benchmark article (and Hi Xerxes...I've found your posts on a Casio board as well).

I'd like to get a list of speeds for a much simpler program, that ONLY goes after one thing: addition.

```
LBL 01
+
GTO 01
```

where the stack contains 0 1 1 1 on 4 level machines. In other words, start with 0 and do repeated additions of 1 for 60 seconds. What is the result?

I know Xerxes' test checks many other things, but how do they stack up with this?

Please post:

```
The machine used
Your count after 60 seconds
Your program code.

I'll start:

Machine: HP 12c+
Count: 78640
Code: + GTO 01

Machine: HP 12c platinum
Count: 1386
Code: + GTO 001

Machine: HP 30b
Count: 72517
Code: LBL 00 + GOTO 00
(as first program in memory)

Machine: HP 67
Count: 226
Code: LBL 1 + GTO 1

Machine: HP 41c
Count: 1063
Code: LBL 01 + GTO 01
```

Edited: 28 May 2010, 10:26 a.m.

*Message #5 Posted by **Bart (UK)** on 28 May 2010, 5:59 p.m.,*
in response to message #4 by Tim Wessman

I used the <<1 + A>> stored in A method to as closely as possible emulate Gene's RPN routine. It did not seem to make much difference in Exact or Approximate. I also stick to User RPL without speed enhancement as I think that's what most users use.

Edit: of course in hindsight the <<1 + A>> is not fair as it exits and re-enters the program continously, so a loop is indeed better.

*Message #18 Posted by **Don Shepherd** on 28 May 2010, 2:47 p.m.,*
in response to message #16 by Raymund Heuvel

Raymund, I imagine there is some overhead in setting (and especially checking) a timer. It would be interesting to not do the timer and just manually interrupt it at 60 seconds and see what the count is.

Re: Brute force addition speed test - various models - results?

*Message #19 Posted by **Raymund Heuvel** on 28 May 2010, 7:08 p.m.,*
in response to message #18 by Don Shepherd

Hi Don,

about 10 times hand stopped: Average := 4295
about 10 times hand stopped: Average := 4303 (2 minutes / 2)
Program:
10 A=A+1 @ GOTO 10
A=0 [RUN]

Variant (all statements in direct mode):
about 10 times hand stopped: Average := 3136
about 10 times hand stopped: Average := 3131 (2 minutes / 2)
Immediate code:
A=0
FOR T=1 TO 999999 @ A=A+1 @ NEXT T

I think the timer is more accurate. According to the IDS, it generates an interrupt.
It is not a polling timer!

BR
Ray
PS, See also this approach to determine the best guess.
Could be changed for the basic variant of course ....

*Message #25 Posted by **Paul Dale** on 28 May 2010, 6:19 p.m.,*
in response to message #1 by Gene Wright

First some results:

```
HP 16c: 293 (float 4)
HP 16c: 230 (decimal, wsize 16, 2-complement)
HP 34c: 259 (standard program)
HP 34c: 277 (I program)
```

The first three used this program:

```
LBL A
+
GTO A
```

For the fourth, the 34c used:

```
LBL A
+
GTO f I
```

With -1 stored in I.

The thing I find interesting here is that the integer version of the code is substantially slower than the floating point equivalent. That really doesn't make a lot of sense but it does indicate how much effort was likely put into the floating point implementation.

pleas help me to send "txt" file to 48sx by usb irda from the computer

*Message #1 Posted by **samiroch** on 28 May 2010, 8:42 a.m.*

hello i'm a new member in this frum and i want a help i have usb irda and a hp48sx calculator and i want to send txt file from the computer to hp48sx hwo can i do it pleas help me.

Re: pleas help me to send "txt" file to 48sx by usb irda from the computer

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 May 2010, 10:24 a.m.,*
in response to message #1 by samiroch

Hi;

just to make sure: based on your post, your computer does not have a serial, RS232 compatible port, is that correct? If not, you will need a USB/RS232 converter/translator because the HP48SX offers only a RS232 compatible I/O port. Also the HP48SX IR protocol is different of the IRDA (the HP50G is IRDA compatible, IIRC). I am not sure if your IRDA computer port can be configured to communicate with the HP48SX.

Success! And sorry not helping the way you need, though.

Luiz (Brazil)

I know it doesn't make sense but ...

*Message #1 Posted by **Alberto Fenini** on 27 May 2010, 4:38 p.m.*

ciao a tutti,

I know, it's a non sense, but it's happening.
I have just received this HP65 (S/N 1511A01736), and when I mean just received, I mean I have opened now the postal box.
Battery is dead, so I have put under charge one of my spare battery packs with an external charger.
Few minutes of charge, and then I couldn't resist.
Since the unit was sold "as is", I was expecting the worst.
Anyway, the unit lights up, and does work (basic calculations)
I was ready to open for a card reader inspection,
battery had been removed for a minute or two, while I wanted to test the programming mode (I usually wirte few lines to compute the area of a circle).
When I switched in programming mode and ... some lines of code where already there.
Turn the machine on and off several time, again take the batteries out and ... the lines don't go away.
Then I take out of the shelfs my other two HP65 units (S/N 1604S01890 and S/N 1503S09967) and ...they do the same.
The listing that it's already in the machine is the same, if of interest I can copy it down.

Now, to the questions :
was the HP65 capable of retaining a program when switched off ?
Which program is ?
I mean, even if the answer to the question before was yes, and
let't say that after restoring on both my other units the card reader I have loaded by accident the same program, it's certainly cannot be true for this third machine ...

What do you think ?

Re: I know it doesn't make sense but ...

*Message #2 Posted by **Don Shepherd** on 27 May 2010, 4:44 p.m.,*
in response to message #1 by Alberto Fenini

Yes, when you turn on the HP-65 it has the program lines that support the default functions associated with the A, B, C, D, and E keys: 1/x, sqrt(x), y^x, roll down, and x<->y. That's normal.

Re: I know it doesn't make sense but ...

*Message #3 Posted by **Alberto Fenini** on 27 May 2010, 4:47 p.m.,*
in response to message #2 by Don Shepherd

Thank you very much,
I hoped I had discovered a rarity, but looks more like I have discovered the hot water
anyway,the older units have a bigger keyboard lettering

the newer have smaller characters, how many different versions are known ?
take care and thx again, Alberto

Hi Gene,

From France, I see all 6 of them.

However, I don't see the Hp-80 or anything close...so won't buy.

Best

Etienne

*Message #20 Posted by **John Stark** on 28 May 2010, 10:45 a.m.,*
in response to message #1 by Gene Wright

To all:

Logging-in from USA, get "purchase/checkout" page for 30 series financial, then "Available for pre-order" box in corner.

Delivery time and availability unknown.

Maybe they are going to drop the 30-series and try to combine 35S and 12C in an "Hp-80 Plus" or "Hp-27 Plus" (remember the HP-27 scientific/financial ??).

Anyway, today's HP calc division never ceases to amaze and puzzle.

John

PS: Fully stocked up on several vintage HP.45's and 80's converted to AAA lithium power, along with a spare-parts supply -- Me no worry :)

Re: 10bII, 12c, 12cp, 17b2+ ... these are the ones I see...Poll...how about you?

*Message #21 Posted by **Manatee** on 29 May 2010, 9:46 p.m.,*
in response to message #1 by Gene Wright

I see all six in Safari on my iPad. Guess I'll finally get the 30b.

What functions make the 17bII+ cost twice as much? I have one (ok, two), and I can't think of what it is. Well, nothing I consider useful, anyway.

Re: 10bII, 12c, 12cp, 17b2+ ... these are the ones I see...Poll...how about you?

in response to message #21 by Manatee

> Quote:
>
> What functions make the 17bII+ cost twice as much?

That's a good question. I wouldn't expect the 17bii+ to remain at that price necessarily. The solver on the 17bii+ is somewhat easier to use than on the 30b, and has more features; the 30b requires you to write a small program to use the solve function.

Re: 10bII, 12c, 12cp, 17b2+ ... these are the ones I see...Poll...how about you?

*Message #23 Posted by **Katie Wasserman** on 30 May 2010, 3:04 a.m.,*
in response to message #22 by Don Shepherd

Don,

I think that the solver on the 17bii+ is vastly better than the one on the 30b. The 17bii+ also has multiple user-defined cash-flow and stat lists and with the much larger memory can hold many times the number of entries than the 30b lists. The 17bii+ also has a RTC with alarms. I think that the soft-key menus on the 17bii+ make it a lot faster and easier to use as well. It also has "real" RPN as far as stack lift is concerned.

OTOH, The 30b offers some scientific functions, programming, more financial calculations, much greater speed and hack-ability.

Overall, I think a substantially higher price on the 17bii+ is justified.

A related question might be why the 12C is more expensive than the 30b. The 30b does everything the 12C does and a much more. [The only thing I can think of that the 12C does that the 30b does not do is handle odd period TVM calculations in one shot. On the 30b, and all other financial calculators that I can think of, you need to break off the odd period into a separate calculation.]

-Katie

Agreed.

One thing I've noticed on the 17bii+ solver, in regards to its vastly superior (compared to the 30b) memory capacity, is that the memory is shared between your solver formulae (and stat data, I presume) and the "compiled" version of the solver formula you are currently executing. When you press the CALC key, I hesitate to use the word "compile" in the traditional sense, but it "scans and prepares" your formula for evaluation. And this takes memory; the larger the formula, the more space this step requires. What this really means is that, if you fill up most of your available memory with all of your favorite solver equations, you may not be able to run any of them because when you press CALC it may not have enough free memory to store the result of the CALC. I've run into that a few times when I had lots of solver equations stored. Practically, what this means is that you need to leave enough memory free to enable the solver to evaluate and solve your largest equation.

Voyager display swapping - any advice ?

*Message #1 Posted by **John Robinson** on 27 May 2010, 7:59 a.m.*

Hi All,

I'm about to replace a a 16c display with a 12c display. I have a 12c of the correct vintage, opened both cases and verified they are compatible. Both calcs are 1984 vintage, USA made. They don't have the separate display and flex circuit board, these are the next generation with display mounted directly on the circuit board. I believe they may be referred to as "fine pitch" from reading other forum postings. I have removed all heat stakes from both calcs and taken both circuit boards out.

I am after advice about removing and installing the actual display. There are 8 metal "tags" holding the display to the circuit board, which are part of the display bezel. Should I bend these tages up completely ? (I fear that may snap off), or just move them enough to get them back through the holes in the circuit board without actually bending them ? And how to I get them all through the eight holes again ??

All advice welcome :-)

Thanks John

in response to message #2 by Bart (UK)

Hi;

AFAIK, all 1.5V, LR44-like, 3-cell Voyager **EXCEPT some new HP12C´s** use the same LCD and they all share the same status indicators (only the HP12C Platinum has fewer indicators). Should check if the HP12C you are using as a donor has one of the two possible, compatible inside layout. If you open the two calculators and they either have a small flex-circuit assembly with the LCD and all electronics OR a one-piece MB with two IC´s, the LCD´s are interchangeable. If the HP12C has a PCB with provision for one single IC, I cannot tell the same.

Can you post a picture of the two calculators so we can evaluate it better?

Cheers.

Luiz (Brazil)

Leather case recommendations for HP 48?

*Message #1 Posted by **megarat** on 27 May 2010, 1:20 a.m.*

Hey all,

I remember some years ago, Calcpro sold a "leather desk" product for the HP48 calculator that was (I believe) a leather secretary-style chequebook/wallet repurposed as an HP48 case. There was an interior pocket the size of business cheques that the calc fit in, an interior slip-pocket held the quick-reference manual, and the credit card slots worked great for software cards. Other appointments, like the pen loop, came in handy for what they were.

I had one at the time, which I liked, but while in a fugue state I unloaded it with the rest of my HP48 kit. Since I've started to get back into the HP48, I've regretted that sale. While Calcpro still sells a "leather desk", but it's of a different design. There isn't an interior pocket and I don't really see how it could be used with the HP48 without scuffing it up.

So I'm back in the market of looking for a new leather case for my HP48, in the general style of a secretary chequebook/wallet: with interior pockets for the calculator, software cards, etc. Does anyone have anything they can recommend? (Ideally something that can still be purchased.)

Edited: 27 May 2010, 1:21 a.m.

1LG9 ROM chip tech info?

*Message #1 Posted by **Eric Smith** on 26 May 2010, 6:06 p.m.*

I could have sworn that at one time PPC or CHHU published a spec or at least a technical description of the 1LG9 ROM, but I can't seem to find it now. Does anyone else know where it was found? Or am I just hallucinating?

The 1LG9 120Kbit ROM (3 pages of 4Kx10) was used for the 41CX mainframe ROMs, the 41C and 41CV halfnut mainframe ROM, the 82242A "Blinky" IR printer module, the Advantage ROM, and any other 12K application ROM modules. It was HP's first (and probably only) chip to support ROM bank-switching on the 41.

The 1LG9 could be configured to be hard-addressed or port-addressed, with selectable bank switching (not used for the base mainframe ROM).

Re: 1LG9 ROM chip tech info?

*Message #2 Posted by **J-F Garnier** on 27 May 2010, 3:41 p.m.,*
in response to message #1 by Eric Smith

Details on the 1LG9 configurations can be found in the SDSII documentation. The document is on the MoHPC DVD.

I don't remember any other document on it.

*Message #2 Posted by **hugh steers** on 26 May 2010, 10:03 p.m.,*
in response to message #1 by Olivier De Smet

impressive! and most interesting.

i had a read of your emulator code and, presumably, you've implemented the 80 series cpu instructions in vhdl? so how fast is it running. im thinking it ought to be amazingly quick, any benchmarks?

does this open the feasibility of re-implementing the hardware of other processors like that of the 41 or the saturn - but at modern cpu clocks !!

Re: Some news (HP85 now A and B)

*Message #3 Posted by **Olivier De Smet** on 27 May 2010, 1:06 a.m.,*
in response to message #2 by hugh steers

For the CPU it's not done from the software emulator code. It's based on the hardware description of the system in an HP patent. The described microcoded machine is coded in verilog.
Actually it's running at real speed (625 kHz) for debugging reasons but the actual code should run at x4 speed and perhaps at x10 which is the maximum this board could achieve (50 MHz base clock with 110 ns RAM). As the cpu can access to memeory every cycle, the limit is the RAM speed (plus some timing delays).
In fact a pure software emulator could be faster but not as energy efficient :) (2 GHz system to have x50 speed)
The IO system is more based on the behavior from the software emulator which is enough to have a running system.
For other architecture, I don't know if the hardware description is detailled enough to permit this kind of emulation.
Olivier

Edited: 27 May 2010, 1:09 a.m.

Battery problems with an aging 12c

*Message #1 Posted by **Peter Schweitzer** on 26 May 2010, 1:50 p.m.*

I have a 15 year old 12C made in Singapore. After 14 years of faultless service it began using up batteries rapidly in the last year. They used to last years and now I am down to a few weeks. Is this typical? I thought it may be that they place where I was getting the batteries was supplying me with old ones so 2 weeks ago I purchased a set from Radio Shack. They worked fine until yesterday when the screen went dim but the battery warning indicator did not flash. I called HP and was told to take the batteries out for more than 24 hours and see if that helps. In the mean time I tried the batteries from someone else's unit and mine seemed fine. Is it just time to get a new 12c????

Hp48G top plastic cover bent?

*Message #1 Posted by **Luis Moreno** on 26 May 2010, 4:41 a.m.*

Hi everyone,

I've just bought an HP48G and, after a detailed exam, I've found that the upper pastic cover seem apparently to be slightly bent in the top part:

http://img266.imageshack.us/img266/3025/topwlz.jpg

It forms a slight "U" shape.

Is it normal? Or maybe is it due to a misplacement of the top latches and/ or rivets?

Thank you very much, any help will be appreciated.

Re: Hp48G top plastic cover bent?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 26 May 2010, 6:47 a.m.,*
in response to message #1 by Luis Moreno

Hola, Luis; ¿como estás?

I have some units with this case (HP48S/SX/G/G+/GX) and some of them have their edges 'lifted up' a little bit, as yours in the picture. I cannot tell for sure, but it seems to be normal.

Cheers!

Luiz (Brazil)

Re: Hp48G top plastic cover bent?

*Message #3 Posted by **Luis Moreno** on 26 May 2010, 12:08 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Obrigado Luiz, thank you for your response. I didn't know wether it was a common effect in the 48 series or a particularity of this machine.

Re: Hp48G top plastic cover bent?

*Message #4 Posted by **Bart (UK)** on 26 May 2010, 4:42 p.m.,*

in response to message #2 by Bart (UK)

Some sellers will try anything.

What I don't understand is when you see the same item relisted over and over again - with no bidders - at the same price! What part of "it's not worth that much" do they not understand?

Re: US$30k? Well, it does have Nixies ...

*Message #4 Posted by **Stefan Vorkoetter** on 26 May 2010, 1:00 p.m.,*

The "there's a sucker born every minute" part. They're just waiting for the right minute to come along.

Re: US$30k? Well, it does have Nixies ...

*Message #5 Posted by **Martin Pinckney** on 26 May 2010, 3:45 p.m.,*
in response to message #4 by Stefan Vorkoetter

Sometimes it seems to me like the seller is the sucker, though, since he keeps paying eB** listing fees, with no sale.

Re: US$30k? Well, it does have Nixies ...

*Message #6 Posted by **megarat** on 26 May 2010, 9:22 p.m.,*
in response to message #5 by Martin Pinckney

That's my feeling too. Not to mention the time one needs to maintain persistent auctions.

If you honestly think someone is going to chuck out $30k for this, then that's one thing, but I see some of the same calculators listed persistently with a price that is only high enough to be undesirable (rather than empirically unreasonable, say an HP 48sx for US$200), and I can't imagine that persisting with such an auction would be worth their time and money.

The only motive I can see for this would be a matter of pride: "I know this calculator is worth this much, and darnit, someone will pay for it sooner or later." (Or maybe if you personally don't want to part with it for less than that amount, but even so, why post it persistently.)

If you a different perspective on this, please enlighten me.

Re: US$30k? Well, it does have Nixies ...

*Message #7 Posted by **db (martinez, ca.)** on 27 May 2010, 1:18 a.m.,*
in response to message #6 by megarat

One thing that feeds the *leave it on the market at a crazy price* mentality is that if you have an average ebaby store, you pay 5 cents for a 30 day "buy it now" auction. One insane buyer for the 50 or 3000 items you have up for sale and you've made your month. You and me can laugh at it but it's probably a good business model.
In a related auction this dildo thinks if he just claims that an item is RPN; he can raise it's worth by two orders of magnitude. But it's not RPN, not unusual, possibly rare only because the majority have been thrown away. Who knows what VTG means.

Re: US$30k? Well, it does have Nixies ...

This makes sense. However, I have seen *regular 7-day auctions* repeated like this. You know they have to pay non-trivial fees in that case.

Re: US$30k? Well, it does have Nixies ...

I think (it hasn't been relevant to me in awhile) that you can relist for no additional cost if your item doesn't sell. I just looked - seems you can do it only once.

HP 15C+ - when?

*Message #1 Posted by **Jose Gonzalez Divasson** on 25 May 2010, 5:45 p.m.*

Of all my collection of HPs, the 15c is the one that gets more use, and is always in my jacket pocket. (Try that with a 41c or similar)

I am an engineer that betrayed the trade and I'm into finance - I have programmed all the HP12c main features in the 15C (IRR, NPV, TVM, weighted avg, DDAYS, etc) and still got registers enough for a 4-square matrix inversion or a 3x3 equation system.

As HP has figured out how to put the 15C in a iPhone, and the 12C in an ARM-powered machine, I guess is just a question of willingness to do the same thing with the 15c - hence the 15c+. Imagine the IRRs 60 times faster. Imagine twice the programming space.

Even the 42 does not match the form factor or the ease of use of the 15c. The 42 will not come back - there is no compatible hardware there now (maybe the new HP17bii+ silver?)

I do not mind having the bezel in gold - whatever. Please... I promise to buy 2.

Re: HP 15C+ - when?

*Message #2 Posted by **Gene Wright** on 25 May 2010, 6:02 p.m.,*
in response to message #1 by Jose Gonzalez Divasson

More importantly...

If you have put all that into a 15c, then PLEASE take the time to write-up your programs and post them here or in the articles section.

Don't keep all these goodies to yourself.

Personally, I'm waiting on HP to introduce the HP 65+.

Re: HP 15C+ - when?

*Message #3 Posted by **Jose Gonzalez Divasson** on 31 May 2010, 4:52 p.m.,*
in response to message #2 by Gene Wright

Gene,

For TVM, I use the program provided in the Advanced Programming manual - as good as it gets, and makes use of all the A-E user keys.

The weighted average uses the statistic registers and leaves avg(y) weighted by x in y, and avg(x) weighted by y in x:

Lbl 0 -so that it coincides in the same key as avg(x) rcl 7 rcl / 3 rcl 7 rcl / 5 rtn

Excuse the poor programming technique.

The Net Present Value and IRR are a little longer. Requires 11 registers and is valid for up to 10 periods. Data is not destroyed and can be used with other interest rates. I take care of not using labels us

Re: HP 15C+ - when?

*Message #4 Posted by **Jose Gonzalez Divasson** on 31 May 2010, 5:57 p.m.,*
in response to message #2 by Gene Wright

```
Gene,

For TVM, I use the program provided in the Advanced Programming manual - as good as it
gets, and makes use of all the A-E user keys.

The weighted average uses the statistic registers and leaves avg(y) weighted by x in y,
and avg(x) weighted by y in x:

Lbl 0 -so that it coincides in the same key as avg(x)
rcl 7
rcl / 3
rcl 7
rcl / 5
rtn

Excuse the poor programming technique.

The Net Present Value and IRR are a little longer. Requires 11 registers and is valid
for up to 10 periods. Data is not destroyed and can be used with other interest rates.
I take care of not using labels used by TVM!

Net Present Value: It takes the following arguments:

Number of periods: register .1
Initial cashflow: register 0
cashflows for periods 1 to 9: registers 1 to 9 (how clever ;-))
discount rate in %: register x
NPV result: register x

LBL 1
EEX
2 - from % to decimal
/
1
+
1/x - calculate 1/(1+i)
ENTER
ENTER
ENTER  - to load the stack with 1/(1+i)
RCL .1 - number of periods (so that is is kept for further trials with other interest
rates)
STO I
CLX
LBL .2 - loop for periods
RCL + (I)
X      - calculates f(n) = (f(n-1)+ I(n))/(1+i)
DSE I
GTO .2  - Return if not 0
RCL + 0 - Add start cashflow
RTN

IRR - this is the elegance of the HP-15 - just load your guesses in x and I and use
SOLVE ( f SOLVE 1)
```

```
Another day I will put the adaption of DDAYS to HP15c (European format DD,MMYYYY) but
it is trivial from other adaptions (65, 41, 42s)
```

Re: HP 15C+ - when?

A prototype has apparently been shown.
Yes, it's just a matter of willingness. The design is fairly trivial and essentially already exists.

Who knows when or if, I lost my bet some time ago.

60 times faster, yes, and 1/60th the battery life to go with it!

Dave.

Apparently there is no experience base using the HP42S, for that statement is total nonsense.

I have decades of experience with both the HP-15C and the HP42S. Th HP42S is a stunning advance over the HP-15C...there's absolutely no contest between them at all. It is far faster, more capable, has much greater precision, is much easier to use (especially with its alphanumeric support), and has about 15 times as much memory. It has IR printer output and sound capability. It is not pointlessly compromised by that cute but moronic landscape design that makes the HP-15C handheld very awkward to actually use as a handheld (so ironic, but at least HP never repeated that mistake except with all those HP-12 zombies that it has re-issued over and over).

The HP-15C, as good as it was (and it is mostly better than the unfortunate HP32SII, HP33S, and HP35S), is garbage compared to the HP42S. The worst business decision that HP could make would be a resurrection of some anachronistic HP-15C zombie. It would appeal only to those who have an irrational regard for a 28-year-old device that lags far far behind the 22-year-old HP42S.

If HP lacks the competency to produce something that is at least the equal of the HP42S, outside of their excellent HP50G, that's fine. It should drop that small calculator market entirely rather than dig up some tired old inadequate corpse modeled on the ancient and awkward HP-15C. That marketing effort would doubtless be a total failure. I've used HP calcs for 36 years, but I'll only buy some "new" HP-15C after it gets marked down to $4.99 during the inevitable clearance of unsellable mechandise. Walmart, which recently dropped the price of the TI-89 to $40.50 locally to clear it off the shelf, certainly won't be tempted to waste store space on such a bauble.

If Valentin red that...

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 26 May 2010, 1:03 a.m.,*
in response to message #7 by Mike Morrow

Hi;

allow me to support every single word about the HP42S, but I cannot agree with the destruction of the HP15C... Sorry but calling it garbage when comparing to the HP42S is far beyond unfair.

Every time the subject is 'ancient technology', people usually mention 'slow device', 'lack of resource' and related 'handicaps'. In most cases, that was the best technology possible at their times, when it was neither slow nor 'resourceless'. This applies to the HP15C as well as to any 80286, 80386, 68000 (and others) architectures in their time. They were amazing, and it does not make them trash today even if we compare them to quad-core architectures or new calculators. They are still the same machines, just 'living' in another time.

When the HP15C was introduced it was the most resourceful stand alone calculator HP could offer with its architecture. This fact hasn't changed. Form factor may also be a matter of taste, but I still love the landscape design. And it seems TI has found its way to bring it back...

Cheers.

Have you stopped to consider that in today's market such retro appeal may actually trump a more powerful yet almost as old machine in a market that essentially no longer exists for either of those machines?

Throw in the fact that the 42S is odds on to simply never happen, it's a moot point. HP don't have the resources or existing development base to bring out such a machine for any reasonable cost. The 15C on the other hand is just a matter of pushing the button.

Dave.

Re: HP 15C+ - when?

*Message #13 Posted by **Maarten Ambaum (Reading, UK)** on 26 May 2010, 8:54 a.m.,*
in response to message #12 by DaveJ

... and to add to DaveJ's point: the 12C is still going strong. Surely that is the best indication there is still a viable market for this type of product, whatever the appeal may be: retro or simply because the 12C/15C were and still are great calculators. Note that the financial people also have computers, so their arguments against using calculators would be the same as those made by the technical people. Apparently there is still demand for a calculator a la 12C/15C.

If it is so easy to make an updated 15C it would be truly baffling that HP hasn't done so yet, after so many years of people asking for a new 15C. I suspect there must be a more fundamental problem in putting out a new 15C - but I don't know what it is.

While it has been years of people asking to bring back the 15c, it's been a relatively short time since the release of the 12C+. This is the hardware/software platform that allows HP to easily release a 15C+. I think it's just a matter of time and management willingness before we see it.

-Katie

Re: HP 15C+ - when?

*Message #15 Posted by **Don Shepherd** on 26 May 2010, 9:56 a.m.,*
in response to message #13 by Maarten Ambaum (Reading, UK)

The 12c became the "gold standard" among financial types, I imagine, because it is absolutely trustworthy and, frankly, has classic good looks. I'm sure the financial guys are not huge RPN fans, but they put up with that aspect because the 12c works so well and they can rely on it. If it ever stops working well, that may change, of course. The release of the 12c+ brought with it some bugs. If HP doesn't step up and fix these (and get the fixed versions in the ROMs on the units in the stores where the financial guys are buying the 12c+), it's reputation may start to suffer, and that would be tragic. I would bet that 95% of HP calc sales comes from the 12c.

I don't know what the market would be for a reissue of the 15c; no one does. But I wouldn't expect it to become the "gold standard" of engineers, as the 12c has become for financiers. I'm not an engineer, but I gather most current engineers rely on the PC for a lot of their computing and calculating needs.

Re: HP 15C+ - when?

*Message #16 Posted by **Gene Wright** on 26 May 2010, 10:49 a.m.,*
in response to message #15 by Don Shepherd

Hey Don.

A couple of things have been found that did not work quite as expected with the 12c+, but those are not things that would dramatically impact many 12c users at all.

To my knowledge, the ONLY bugs are:

1) "When the SST-button is held down the program line should be shown, and on release of the button this line should be executed. But when I press down the button the line is not shown and the instruction is executed even before releasing the button."

2) This simple program will blank the screen and lock up 12C+ in a such way that you need to turn off the calculator to recover from:

01 1 02 AMORT 03 GTO 01

3) The keyboard self-test times out in about 2 seconds giving an error message. The original 12C does this too, but it takes several minutes so it's gone unnoticed.

If there are any more, please let me know.

The ONLY one of any real consequence would be #2 and that requires a program that on an original 12c runs in an infinite loop. Stopping the program will mean you are some distance into

the amortization of the loan, but how far? Depends on how long you let it run. While there might be a use for that program, I would bet that bug affects such a small amount of 12c users as to be insignificant to the 12c+ reputation.

Now... don't get me wrong. Bugs should be fixed POST HASTE!

But, will these cause a loss of confidence in the 12c+? I don't think so. Not at all.

An incredibly small...I mean REALLY REALLY small percentage of users program.

Anyone who does not program and who does not ever run the self test will NEVER run into these three problems. I have used a 12c for over 25 years and was never aware of the SST feature. Perhaps I was the only one? :-)

Anyway, I really don't think the 12c+ is in any imminent danger.

Re: HP 15C+ - when?

*Message #17 Posted by **Katie Wasserman** on 26 May 2010, 11:49 a.m.,*
in response to message #16 by Gene Wright

The earliest version of the firmware also did not have the standard 12C self tests. In particular [ON] + [/] did not work at all but the manual still documented it. This was probably the biggest issue.

Hopefully the new firmware version is on the store shelves now. It fixes all the issues except (3). (2) was actually a worse issue requiring a remove batteries reset, but it's just an ON button press now.. (3) is a bigger deal since users may think that their calculator is broken if they don't press the keys fast enough during the test. I think a note in the manual will take care of that problem.

Also, the latest firmware is 2.5x faster. So it's a knock-your-socks-off 150x faster than the original 12C!

I love my 12C+

-Katie

Re: HP 15C+ - when?

*Message #18 Posted by **Don Shepherd** on 26 May 2010, 2:23 p.m.,*
in response to message #16 by Gene Wright

Gene, I think Katie mentioned above the major bug that some 12c users will find: that the self-test, as documented in the manual, does not work. I agree with you, that a very small percentage of 12c users will write/run programs. Katie and I discussed this one time, since she works with these users on a regular basis. She said almost none of them write programs, and a very small percentage run programs written by others (including her). So they won't see the debug step-by-step bug at all. But users who are used to running the self-test will see that problem.

Who is to know if the fixes are on the machines in stores now. I get the impression that the ARM-based 12c+ is still not widely available; I haven't seen any in Louisville stores.

Maybe not so much any more but when the 80, 70, 22, 37, 38 & 12c were introduced, the majority of financial calculator users had learned their trade on adding machines. Both RPN and the plethora of "adding machine logic" offerings acted just like what they were used to in addition and subtraction. RPN had the added advantage of being consistently postfix in multiplication, division, trig, and logs.

TI and National Semiconductor made forgettable calculators that did pre-programmed TVM calculations and used adding machine logic (not AOS). That the HPs were so bombproof they became heirlooms is just gravy.

I must say I am a menu man. I get dizzy trying to find functions on the 33S or 35s (even 20S). The 28C was my first HP, and I loved the menus and have preferred them ever since.

I think we all have our own preferences and should express them without trashing other's favourites. Both the 15C and 42S have a strong contingent of followers, and the online auction prices of both reflect this.

*Message #24 Posted by **Andrew H.** on 26 May 2010, 11:33 p.m.,*
in response to message #7 by Mike Morrow

I agree that the 42S has far greater functionality than the 15C. For instance, it can easily calculate the determinant of a matrix with complex elements. (See my post of a few days ago about doing this on a 15C.)

However, the Pioneers, including the 42S, are butt ugly compared with the Voyagers with their comforting gold and aqua labels. (The 14B is brown with yellow labels!) In particular, they don't have the bevelled keys of previous HP calculators. (Fortunately, HP has brought bevelled kays back in recent models.)

I'd prefer to see the 11C, which was one of the two original Voyagers (along with the 12C), and the 42S (in the same format as the 30b) make a comeback.

*Message #25 Posted by **bill platt** on 26 May 2010, 10:15 a.m.,*
in response to message #1 by Jose Gonzalez Divasson

Hi Jose,

Let me interpret your passion for the 15c through my own interest in these HP machines. I think the bulk of your belief in the greatness of the 15c comes from a combination of nostalgia and a hard-won appreciation of the machine's capabilities.

Going forward, building technical products, nostalgia will only buy you a very small niche market. That is my opinion. If it is the styling, that is a different case--it can have mass appeal. But the performance needs to be modern to be widely appreciated. For example, look at the plethora of "retro" car models on the market. Starting approximately with the new beetle, we then have the Ford thunderbird, then the mini cooper, and more recently the dodge charger, and the chevy something--is it a new "retro" camaro? Note that all these cars attempt to "hark back" to the originals--but from a technical standpoint, they are completely new. Would anyone buy a brand-new car with a 4 barrel carburetor, drum brakes, and bias-ply tyres?

Would you really want to buy a new *programmable* calculator with keycodes?

Think about that....

Of course, I would buy a re-issue of the 15c. Because I do have nostalgia and the hard-won appreciation. To me, it would be great!

Best regards,

Bill

Because it works reliably. The other programmable scientific calculator HP offers doesn't. If you need one, HP is out of discussion.

I bet, most people buying the 35s aren't aware of its countless bugs. If they find out in a critical situation, HP in general will be out of discussion to them, if they aren't die hard HP fans. But then, they would have known better than to use that miscalculator for anything else than just toying around.

Re: HP 15C+ - when?

Doubtless you are correct. This is probably why HP doesn't bother to correct them.

Also, perhaps HP never intended to keep the 35s in the lineup for the long term. After all, it is an evolutionary model based on the 32s/32sii/33s lineage. Perhaps they intend to start a new scientific line, like the 20b/30b series.

Re: HP 15C+ - when?

*Message #31 Posted by **Thomas Radtke** on 26 May 2010, 3:03 p.m.,*
in response to message #30 by Martin Pinckney

I think the 3x line is/was a big success because it is permitted in several exams. Messing it up means bye bye to the educational market, if no replacement can be made soon. I still have and like my 32SII, and I would have loved the 35s w/o bugs. But obviously, HP has no capacity to develop a good and advanced scientific programmable anymore, and that's where the 15C+ comes in. It should work, and if there's some cleverness left at HP, should be sold for a price low enough to compete with a good Casio programmable.

But then, I have no hope that it will become a reality, and if, HP will likely mess it up again by stupid problems.

If DaveJ is correct (and I think he is), it will be sold primarily for the retro/nostalgia market, not to compete with anything else. It will list for $ 99.99, with occasional sales lower..

My prediction.

in response to message #1 by Jose Gonzalez Divasson

It seems to me, with all the high power processing power available for cheap money these days, that the best approach would be to make an uber-C model where you just select which mode you want (10C, 11C, 12C, 15C, 16C or at least a 12/15/16) and use overlays like the 41.

From a manufacturing standpoint, there is a tremendous advantage to not having to support multiple versions of the same thing. Pop out the same thing all the time and you can use volume to your advantage in purchasing and tooling etc...

Ah, but then how can I sell you 5 different calculators? :-D

Selling a 5-in-1, just think of what a good selling point that would would be!! Of course it would be even better to have 5-for-the-price-of-1 too.

If you really want to have 5 different things to sell then make the mode selection via an internal jumper in the battery compartment. You can even not document it if you like - except to let us know here :-) - but you still get to make just one thing (less the key and case graphics). You still get the benefit of higher volumes on the guts of the calc.

Its funny, in the machine tool industry they figured this out a long time ago. You could buy a basic machine and then when you wanted an option, you would have to pay the manufacturer for the upgrade. However, that upgrade consisted of a service man coming out and typing a code into your machine that unlocked the feature. It was always in there because it's easier to make one control with all the options there than manage 100's of different board designs. I suspect now they just give you the code and let you type it in. They probably charge the same and save the expense of the trip out to your facility.

Well, of course the problem with the Voyagers is the different key/faceplate legends. And I just don't see HP making a Voyager system with overlays. Most non-geeks wouldn't want to mess with such a system.

Maybe not, but the new 30b has an overlay to show all the programming functionality. The 20b and 30b have exactly the same keyboard and LCD. The only distinguishing features are the color the faceplate, the "Black S" label above the "Bond" key and the "keypad" label on the front of the swap key.

Some of the Compucorp 300 series machines had an easy "upgrade" path too. All you needed to do was to punch a hole in the faceplate and add a slider switch and you could save a couple of hundred (1973) dollars.

You probably can't. You sell one calculator, and n emulators.

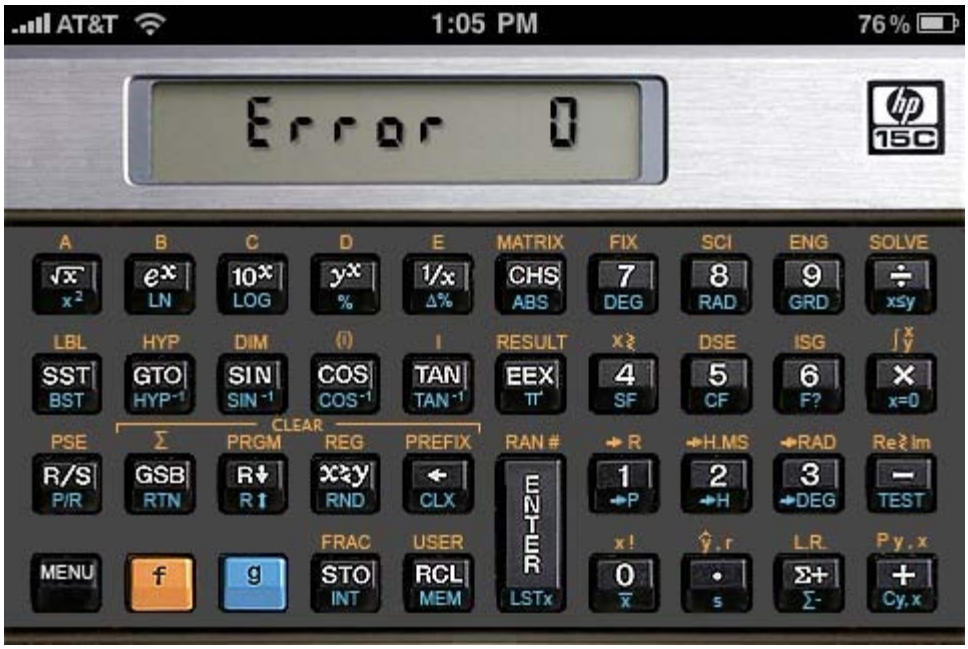
Well, <sort of tongue in cheek but true>

Right now you are selling me 0 calculators...

what is the percentage increase from 0 to 1?



8^)

You can start by selling me just one - a 15C+...

;-)

What do you print on the primary keys?
To work, such a calculator would have to have blank keys on all but the standard 4 function keys. And then you can argue that they should be blank too to make it truly universal.

I don't know about anyone else, but I like having my functions printed on the actual key tops.

The devil is always in the detail.

Now if HP came out with a calc that had such a replaceable template *and* a bunch of interchangeable keys and a novel way to change them, it would be both retro *and* fun to play with and configure. And it would fit in well with the new HP open hardware strategy, so people could copy/flash whatever they wanted and HP would still be able to make money on selling different keytop sets and standardised overlays.

Oh, and it would allow them to build only one model, yet sell it either pre-configured (the 12C crowd who like their "standard"), or in bits'n'pieces to the nerdy retro/engineering/enthusiast crowd who want that versatility.

But that takes extra effort, so just bring out the 15C again, easy.

Dave.

Re: HP 15C+ - when?

*Message #46 Posted by **Katie Wasserman** on 28 May 2010, 2:23 a.m.,*
in response to message #45 by DaveJ

Dave,

You're on to something here. 28 of the 39 keys on the Voyagers (ignoring the 10C) have the same printing on the top of the keys, so HP could label those keys. The remaining ones (upper left 2 rows of 5 + the SST/GSB key) could be blank. A thin template would easily fit securely on top of the 12C+ faceplate and be below the raised edges on all 4 sides.

I think that there is enough ROM in the current ARM chip to store 4 voyager ROM images. So HP could come up with a retro 11/12/15/16 C+ calculator for little more than the cost to them of a 12C+. They would provide 4 printed templates and a couple of blank ones for re-purposing. This would be an uber-geek-retro calc and I think would sell well even if priced somewhat over $100. Of course they'd have to throw in a programming cable because there's no JTAG connection on this machine.

Good thinking, I like it!

I would like to see a display like the HP-41 so that we can have alpha characters as well. It can still be "crippled" and only use the standard 7 segments for traditional Voyagers, but it would be a great asset for repurposing.

If I could really dream, add a crystal to stabilize the time and possibly also a beeper.

Re: HP 15C+ - when?

*Message #48 Posted by **Bart (UK)** on 28 May 2010, 4:21 a.m.,*
in response to message #47 by Håkan Thörngren

I think that would be an idea for another model. I think the general idea of this thread is the standard Voyagers with just a faster processor.

Katie,

That's brilliant. Multiple old calculators in one package with repurposing capability. Now that's the future of retro calculators! (excuse the oxymoron :))

Trying to revive an HP-25C

*Message #1 Posted by **Mark Henderson** on 24 May 2010, 4:38 p.m.*

I bought a non-working 25C from TAS and am trying to fix it. My first HP was a 25 and I've always wanted a 25C. I've got a good amount of experience now fixing Classics and recently my Spice (34C). The 25C is in good cosmetic condition, keyboard is great, display lens and digits clean. I've read Katie's article on repairing Woodstocks, and every other 25/25C article I can find. The symptoms I have are pretty heavily loaded toward a dead ACT and/or RAM in the traditional Woodstock manner, but not everything follows the patterns I've seen described. Here are my symptoms:

As received:

- Calc would not show/do anything on power up (good battery from 25) - Seeing some of the posts, I left the calc on for a few minutes, and sure enough, after off-on the display would show "0000000000000" - Calc non-responsive to keys or switches, once "0000.." showing it would stay on display

So I was pretty sure the ACT was dead. I opened the calc and everything inside looked good, except for some blue-ish corrosion on the battery contacts, the traces above the ACT and generally around that end of the battery bay. Couldn't see anything eaten away, though.

Based on Katie's article I put a resistor from ACT pin 11 to ground (12). Effect of this was that the calc stopped showing anything on the display, even after a "warm up" of several minutes. Removed the resistor and the original behavior returned. Hmmm.

Next I gave the main board a dilute warm water/vinegar bath and gently cleaned off the corrosion after soaking for a while. There is discoloration to many of the traces where the corrosion was worst, but no breaks visible.

Behavior after this operation is subtly different: no display when cold, after warm up there is a display after power on - but instead of solid "00000000.." I now get assortment of random and rapidly changing digits across entire display, which then disappear after <1 second. Sometimes a couple of DPs will be left on, otherwise blank. Katie's resistor is not in-circuit anymore.

Any thoughts? I'm keeping optimistic that the fault might be a broken trace or other corrosion damage, not a blown chip (yes, I know this might sound desperate) - and since the behavior changed quite noticeably just from a cleaning...

Next step will be to power up the scope and do some probing around. I can use my 25 as a reference, too. I'm pretty sure I'll need an ACT in the near future...?!

Cheers

Mark

Archaeology attack: Rubik's Cube on the 41

*Message #1 Posted by **Ángel Martin** on 24 May 2010, 1:34 p.m.*

Greetings fellow time travellers :)

Out of curiosity and with a tinge of amusement I dug out the Rubik's cube solver programs written by Julian Perry and published in PPC CJ V9N2 (Feb 1982)

I remember reading that one back then and wondering if it'll work on a ROM... almost 30 years later I know the answer.

I should be posting the module and RAW files at TOS soon - or maybe they're already available somewhere? At any rate, email me if you'd like them rushed to you before.

Cheers, 'AM

in response to message #1 by Ángel Martin

Interesting!

Here's an idea. How about a new "games rom" that includes some of the favorites?

Such as Dungeon of Doom from Datafile? That thing is AWFUL to scan or type in.

Such as Craig Pearce's Pinball Wizard?

Such as The Caves?

Or some of the adventure games with text files that were in the PPC Journal?

:-)

You get the idea.

Re: Archaeology attack: Rubik's Cube on the 41

*Message #3 Posted by **Ángel Martin** on 24 May 2010, 4:15 p.m.,*
in response to message #2 by Gene Wright

Yes I get the idea - and it's a cool one :) I've been thinking of the same for a while now and have put together a few of my favorite ones (Morse, Roman numbers, Mastermind, and the all-MCODE ROLLERS as well - sorry but I'm partial to MCODE).

Not to forget the ever-elusive Chess CH-136, which cannot get compiled and thus remains impossible to

write to ROM!

A few considerations are probably in order:-

1. These things are huge.- The Rubik's solver alone takes up almost three quads of a 4k rom. Likely to end up with a 12k or even a 16k module before you notice.

2. These things are tough to come by: not likely to be RAW files available, or ASCII either. Barcodes help (converted via MLDL) but it's quite time consuming.

3. These things are subjective: which ones are the " best" games ever written for the 41? Here's the question, worth a poll amongst the forum dwellers for sure...

A proposal: if anybody cares enough about a certain game to produce the RAW file for it I'll be more than glad to add it on the POWER-GAMES module.

Here are a few more to the list: -Valentin's Reversi, Checkers and Mini Chess

Anybody wants to chime in? Send your proposals and your code!

Cheers, 'AM
