I like the internal programmed use of the Solver to numerically solve the transcendental Kepler equation. Those who know about this stuff will see that I use the known Mean Anomaly as a reasonable initial guess to the desired Eccentric Anomaly. In our solar system this is a pretty good approximation since the elliptical orbits are actually almost circular in most cases, and even in the exceptions like Pluto and Mercury things are still pretty close.

Info on the math is [link:http://en.wikipedia.org/wiki/Kepler's_laws_of_planetary_motion]here[/link].

The RAW file, for Free42 users, is here.

Hope someone else also finds this amusing.

Les

in response to message #1 by Les Wright

I took the time to enter the steps in my real 42S. It runs well, return a result in a couple of seconds, but isn't quite as accurate as on Free42 as there is usually some accuracy loss (a digit or two usually) due to rounding.

> but isn't quite as accurate as on Free42 as there is usually some accuracy loss (a digit or two usually) due to rounding.

It's nice chain calculations on Free42 are carried out internally with 20 or more digits. On the other hand this is quite contrary to HP rounding philosophy (at least on real HP calculators) - please read the first message in this thread. For the sake of replicating the real 42S as faithfully as possible, I think Free42 should provide the classic rounding method as an option. Of course, Free42 is just great the way it is and I am glad Free42Decimal has been available since the first versions.

Re: Kepler Orbits for the 42S

*Message #4 Posted by **Reth** on 13 Aug 2009, 11:19 p.m.,*
in response to message #3 by Gerson W. Barbosa

I disagree with the idea Free42 should copy the original. Free42 is already superior to it in every possible aspect so it should go further adding more features to address the needs of the modern world

calculator users. Probably that's the only way we get (sort of) Walter's HP-43S.
Or should program storage for example be taken off to match the original?.

Regards,
Reth

Re: Kepler Orbits for the 42S

*Message #5 Posted by **Gerson W. Barbosa** on 14 Aug 2009, 11:44 a.m.,*
in response to message #4 by Reth

I didn't mean Free42 should be crippled just to match the original 42S. It just happens sometimes original features are more desirable than the enhanced ones. For instance, Free42BCD is way faster than the Decimal version but programs that depend on decimal arithmetic will not work properly on the former. I cannot think of any original HP-42S program, however, that won't work due to the extra internal digits.

Best regards,

Gerson.

Re: Kepler Orbits for the 42S

*Message #6 Posted by **Les Wright** on 15 Aug 2009, 11:58 p.m.,*
in response to message #3 by Gerson W. Barbosa

Gerson, for folks who want authentic emulation of the original I think Emu42 is the better solution.

I use Free42 in all of its incarnations precisely because its capabilities supersede the original. I have a 42S in fair condition as my collectible, but Free42 on my handhelds and PCs is what I actually use. The Achilles heal of the original is the absence of fast and convenient I/O.

Improved Internal Accuracy in Newest Version of Free42

*Message #1 Posted by **Les Wright** on 11 Aug 2009, 10:00 p.m.*

Hugh Steers responded to me recently in some detail when I wrote to compliment and thank him for revisions to his BCD-20 library that has made Free42 even more accurate than before. It looks like transcendental and special functions (like GAMMA and !) have been improved to give 25 digits of internal accuracy within 1 ulp in most cases.

Most intriguing for me was the claimed improvements in the integration algorithm. Hugh has improved the Romberg code to incorporate the variable transformations described by Kahan in his December 1980 HP digest paper (on the MOHPC DVD). In experimenting with the pathological integral described by Kahan in that same article, I have been able to get it correct to 23 digits within 5 ulp by setting ACC to the absurd 1e-23. I was using Free42 Decimal 1.4.52 on my Palm XT, and this took a few minutes, but it worked. In previous versions of Free42, the integrator would not return a result if ACC was smaller than 1e-13 or 1e-14.

Byron Foster has told me that the next release of 42S for iPhone will incorporate this most up to date math code.

I thought this info would be of interest to those who love Free42 in its various incarnations. Numerical integration is hot topic around here occasionally and I thought that these refinements would be of great interest to some.

Les

Re: Improved Internal Accuracy in Newest Version of Free42

*Message #2 Posted by **hugh steers** on 12 Aug 2009, 10:07 a.m.,*
in response to message #1 by Les Wright

Hi, Thanks for the compliment.

This is true, although the original code still applied the transformation. This "trick" is described in the HP15c advanced function handbook page 46. you set x = u/2*(3-u^2) and integrate u. This changes the Romberg integrand into an open form and, according to the book "suppresses resonance". Unfortunately, the old code suffered from a defect in the Richardson extrapolation logic (part of the Romberg method) that meant many more function evals were being called than necessary. This has been fixed. Also, i'm hoping the error estimate returned in Y is more accurate.

Hugh, I should look at the code myself and try to decipher, but could you tell me what you use for the error estimate? I am assuming the difference between the final and penultimate approximation to the integral that satisfies the relative error requirement stored in ACC?

Thanks in advance,

Les

HP48G ROM transplanted in a HP38G

*Message #1 Posted by **Thomas Chrapkiewicz** on 11 Aug 2009, 12:49 p.m.*

I have an application that requires HP48G functionality in a HP38G package.

My preliminary investigation shows that a simple ROM replacement in the HP38G should work.

Of course there will be keyboard issues as the HP38G package is missing a couple of keys (and this can be obviated with menu commands).

Has anyone tried this? I'm curious of any hardware issues.

Is there an existing HP38G schematic out there? I am aware of the fine HP48G schematic).

Thanks and Regards,

TomC

OT: "Dekadische Nummerierung" - english translation

*Message #1 Posted by **Mike (Stgt)** on 11 Aug 2009, 10:30 a.m.*

Sorry for disturbing with this OT: Numbering items in a TOC like 1/1.1/1.1.1/1.1.2/1.2/1.2.1/2/2.1 and so on is called "dekadische Nummerierung" in german, what is a very specific expression. I looked quite a while in several sources for a translation, but I am not sure that "decimal numbering" is realy it. Who knows the exact term for it?

TIA.....Mike

Re: OT: "Dekadische Nummerierung" - english translation

*Message #2 Posted by **Walter B** on 11 Aug 2009, 12:07 p.m.,*
in response to message #1 by Mike (Stgt)

Hallo Mike,

after asking a friendly librarian, she meant "decimal classification" may be the right term. Reason: there is such a system in English libraries.

HIH (hoffe es hilft)

Re: OT: "Dekadische Nummerierung" - english translation

*Message #3 Posted by **Ken Shaw** on 11 Aug 2009, 12:29 p.m.,*
in response to message #2 by Walter B

Sounds like your librarian may be thinking of the "Dewey Decimal Classification" which is a system for classifying books by subject and discipline, not for numbering the contents.

In English, I've never encountered a specific term for numbering the contents in one particular way vs. any other way. Decimal numbering sounds like a reasonable expression.

HTH

Re: OT: "Dekadische Nummerierung" - english translation

> Sounds like your librarian may be thinking of the "Dewey Decimal Classification" which is a system for classifying books by subject and discipline, not for numbering the contents.

I'm aware of Dewey. You use Dewey in libraries, but you may use similar decimal systems for other

purposes as well. E.g. for structuring topics covered in a text. If I understood it correctly, that's what Mike was looking for. Nevertheless, "decimal numbering" may be an alternative translation. Further proposals?

[rant]Dewey was not the first one using a decimal structure, so he couldn't even patent it. So you are free to apply a decimal structure elsewhere. That doesn't mean you shall copy it exactly. Think![/rant]

Heat staked keyboards with sticky, bouncy or corrosion present keyboard PCAs

*Message #1 Posted by **Geoff Quickfall** on 10 Aug 2009, 9:30 p.m.*

Thought I would post the following which is found embedded in a previous topic soon to be lost. I hope this helps the community at large. It was in response to the question:

What did you mean by "washing" the PCA's?

When I restore a calculator with a heat staked keyboard, especially one with corrosion due to either battery leakage or out gassing I use a wash on the PCA.

```
a:  To remove any vertigris (green or white precipitate) I rinse
   (wash) the PCA with a mild vinegar solution followed by a
    distilled water rinse and then 95% anhydrous ethanol (in Canada
    thats known generically as 95% rubbing alcohol although I have
    seen it labelled isopropyl alcohol).
b:  For stickey keys, a very dilute soap and water wash with water
    rinse and anhydrous ethanol rinse
c:  If there is no corrosion or stickey keys I use the water wash
    followed by the anhydrous ethanol rinse.
```

Of course, sticky keys with corrosion would get both treatment a and b.

Heat staked keyboards with bouncy keys or even intermittant keys respond well to this and I have resurrected bad keyboards on:

```
Woodstocks
Coconuts
Voyagers
Pioneers
Stretch Pioneers
```

Of course the Classics and Spice keyboards can be diassembled and cleaned mechanically.

Cheers, Geoff

Fill the glass to a level below the LCD or LED if they are soldered in place. In the case of the woodstocks the LED module can be removed.

Re: Heat staked keyboards with sticky, bouncy or corrosion present keyboard PCAs

*Message #2 Posted by **Dan W** on 12 Aug 2009, 12:29 a.m.,*
in response to message #1 by Geoff Quickfall

Thanks Geoff. Very interesting. I do have one keyboard/display PCA from an HP-45 with a bit of that verdigris. A lovely aqua really. Never thought of immersing it. But you do not submerge the IC's or LED

chips?

Re: Heat staked keyboards with sticky, bouncy or corrosion present keyboard PCAs

*Message #3 Posted by **Geoff Quickfall** on 12 Aug 2009, 3:56 p.m.,*
in response to message #2 by Dan W

Dan,

I try to stay away from the ICs but if there is corrosion/vertigris present, you can be sure it is active, especially in humid environments. When present it will be a certainty that the corrosion will enter the chip via the connectors.

The LED block however has wire bonded (extremely thin) connections. These too can suffer from the outgassing or battery leakage. It is a trade off. They will also deteriorate. You have to make the decision whether to hault the corrosion and risk harming the LED block or leave the vertigris and keep the calculator dry (silica gel).

I do stay away from the LED block if corrosion is not present as the water may stain or leave a dry film (depends on the hardness of tap water, another reason to use distilled) under the block where it is seen but cannot be removed. This applies to LCD panels on heat staked calculator also.

So the thinking by me is:

```
1  include the IC's if corrosion is present around the connectors.
   the vinegar wash may be applied with a brush to limit exposure
2  include the LED if you are concerned enough with the
   possible corrosion.
3  try to keep the water and other washes clear of the LED block
   and LCD panels.
```

I had a bottle in the lab with a spout which originated in the bottom of the bottle (name?). If you can get a hold of one of these you can direct the wash at specific parts of the PCA.

Hope this helps,

Geoff.

P.S. I just completed two HP-41CX halfnuts. Soaked both keyboards with logic PCA attached in a glass of soap/water mix overnight. Followed with the rinse and a two day dry box. Instead of the dry box prop the keyboard PCA vertically and place in front of a fan for a couple of days. Both keyboards with intermittent and faulty keyboards as well as rocker switches came back to PERFECT function for both feel and logic response.

Edited: 12 Aug 2009, 3:57 p.m.

Re: Heat staked keyboards with sticky, bouncy or corrosion present keyboard PCAs

*Message #4 Posted by **Dan W** on 12 Aug 2009, 10:41 p.m.,*
in response to message #3 by Geoff Quickfall

Well Geoff, I'll give it a try. Do you let it soak in vinegar overnight, or just go at it with an old toothbrush?

Also, dumb question, what is a "heat staked" keyboard? (The only keyboard PCA's I am familiar with are the classics).

I have a candidate in mind...

Re: Heat staked keyboards with sticky, bouncy or corrosion present keyboard PCAs

*Message #5 Posted by **Geoff Quickfall** on 13 Aug 2009, 1:23 a.m.,*
in response to message #4 by Dan W

Ah, a picture is worth a thousand words.

Clean the OFF/ON contact with some alcohol to remove the silicon grease remnant.

Using a paint brush, natural bristle or a SOFT tooth brush and vinegar clean around the LED block and the ICs.

Soak overnight to just below the level of the two ICs marked 1820-1061.

If you had key contact problems, cut long strips of construction paper (heavy weight paper) wide enough to fit through the key contacts. Press down on a contact while dragging the strip through. The strips could be damp with vinegar also.

Rinse with water and alcohol.

Woodstocks, Voyagers, Pioneers and later families had the keyboard PCA heat staked (plastic welds) which preclude diassembly like the classics and spice. Removal of the heatstakes is the only way to gain access to the keys and key contacts. Once apart they are difficult to restake. Voyagers have over 40 stakes holding them together.

Of course the "book" will have some methods explained to re-stake the keyboard ;-)

Cheers, Geoff

Here is a Museum link that I wrote about a 45 restoration last year:

HP 45

I subsequently modified this to accept the Quartz crystal and enter key modification to allow easy and accurate timing.

quartz crystal

Cheers, Geoff

Results!

*Message #6 Posted by **Dan W** on 13 Aug 2009, 11:09 a.m.,*
in response to message #5 by Geoff Quickfall

I cleaned the kybd/LED PCA pictured above by soaking in a vinegar/water solution, up to the top row, for about 30 minutes, then took a toothbrush using the same solution to scrub around the chips.

The result is pictured below. The keypad cleaned up nicely. I have tested each key and I get a

good positive "HP click" and the calculator does what its supposed to do. Obviously the LED drivers and the LC circuit are all working.

The only bad news is that there is inside damage to the LED chips. This appears to get progressively worse from left to right, and the rightmost chip appears to be working fine. I do not think the damage to the LEDs was a result of the cleaning.

So, two thumbs up for the technique. Hard to believe it is the same PCA as I photographed earlier.

-- Dan

Re: Results!

*Message #7 Posted by **Geoff Quickfall** on 13 Aug 2009, 12:04 p.m.,*
in response to message #6 by Dan W

Good job!

Now find a defunct keyboard PCA and swap out the LED blocks. I just swapped an LED block from a spare HP-55 parts machine into an HP-45 and an HP 80. In fact the 45 in my pictures above had one decimal place that was not working. ONE decimal place in the 5th division, amazing, but now it works. It was to be a spare parts machine as it did not work either!

Once and awhile just the keyboard PCAs show up on Ebay or a completely dead machine shows up with no chance of resurrection. I keep these around for LED spares, drivers and etc.

Your correct, if you kept the solution clear of the LED block or if the LED block was in excellent condition and the solution was introduced the LEDs would still be functional. Judging from the amount of corrosion and the diameter of the bonding wire in the LEDs i am not surprised that some of the bonds let goe. Remember, each LED dot has a wire as opposed to the bar LEDs from later periods.

Cheers, Geoff

Edited: 13 Aug 2009, 12:15 p.m.

Re: Results!

*Message #8 Posted by **Dan W** on 13 Aug 2009, 12:54 p.m.,*
in response to message #7 by Geoff Quickfall

As it turns out I do have another PCA with bad key bubbles - cracked all the way through. But it has a good display.

I have recently been studying the LED driving technology. Very interesting, using inductors to provide the current. Usually when I put it on a scope it is fairly obvious

where the fault is. There is one problem that alludes me. I call it ghosting. It is where one LED has a 3-4 segments that are faintly lit when those same segments are lit on some other digit. Any ideas what causes this?

I have restored a number of Classics. I'll buy dead units from auction and restore them and sometimes sell. Often the problem is as simple as crud build-up on the power switch (I think they over applied the silicon lube). I've learned a lot and it helps finance my collecting habit.

Ghosting LED numbers, anyone else?

*Message #9 Posted by **Geoff Quickfall** on 13 Aug 2009, 4:18 p.m.,*
in response to message #8 by Dan W

I have one 65 that has a really minor ghost, visible at night in the dark.

I remember someone, somewhere swapped a resistor to limit current to the LED driver or Block, can't remember, and this fixed the problem.

Anyone out there with an idea and specific location for the resistor, that would be helpful.

Congratulations on reserrecting another HP-45! Something I never thought of but convenient; flipping the logic PCA over while applying power, duh, no why didn't I think of that!

;-)

Re: Ghosting LED numbers, anyone else?

*Message #10 Posted by **Dan W** on 14 Aug 2009, 2:04 p.m.,*
in response to message #9 by Geoff Quickfall

After staring at scope images of cathode and anode signals a while and coming up empty, I decided the best approach was the time honored brute force method. I swapped LED chips. The ghosting followed the chip. Therefore the problem is the LED chip itself.

I suppose it may be possible to add a resistor somewhere to mitigate the problem by dimming the LEDs, but I don't see that it would solve the problem.

I did see a minor difference in scope signals when comparing with a known working calculator.

Also in the before picture note a very slight ghosting of segment e in the digits immediately left and right of the bad digit. This disappeared after the swap. I had not even noticed these segments lit until I saw it in the photo.

I swapped the right and center LED chips. The ghosting was on the left most digit of the right chip.

Before the swap:

After the swap:

Re: Ghosting LED numbers, anyone else?

*Message #11 Posted by **Geoff Quickfall** on 14 Aug 2009, 3:31 p.m.,*
in response to message #10 by Dan W

Thanks Dan, emails to follow!

Away from home at the moment, but thanks for your email.

Looks like, as you said, a LED Block problem and not the driver. Well that is better news then the driver problem. I have not been able to find the article on the resistor addition so anyone out there who knows, that would be a help.

At least I know that I can swap the HP-65 ghost block out if need be as I do have a spare 65 blocks.

Does the scope still show a difference when compared to the 'normal' calculator. Of course, what is normal in a run of two!

Cheers, Geoff

Re: Ghosting LED numbers, anyone else?

*Message #12 Posted by **Dan W** on 14 Aug 2009, 11:32 p.m.,*
in response to message #11 by Geoff Quickfall

I think I found the post that referred to a resistor fix.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv019.cgi?read=150663

> Quote:
>
> I decided that maybe the driver for the left digit needed to be pulled up a little. This was because it just seemed to sink current during the time that the other digits were driven, causing the cross-talk from the other digits.
>
> Indeed the problem vanished with a resistor of 150 Ohm between Vcc and k15. To avoid possible damage and to stay on the conservative side I chose to use 200 Ohm. In the pictures you can see that the display is now much better looking, though a little less bright than the other HP45 that I have.

I am thinking that some ghosting could be due to stray capacitance or a resistance path between traces due to crud. I think what he's done is attenuate the current, sort of masking the problem.

Re: Heat staked keyboards with sticky, bouncy or corrosion present keyboard PCAs

*Message #13 Posted by **Geoff Quickfall** on 15 Aug 2009, 7:55 p.m.,*
in response to message #1 by Geoff Quickfall

Dan,

I agree with the fault being in the LED block!

I have a 45 with a ghost problem and missing decimal point in the middle of the ghosting block.

Swapped with a spare 55 block and the decimal is back and the ghost gone.

Another salvaged 45!

Cheers, Geoff

All We Wanted For Christmas....

*Message #1 Posted by **Joerg Woerner** on 10 Aug 2009, 3:05 p.m.*

Hi Calculator Aficionados,

I just received a small box from Canon (USA) and found a very, very interesting calculator inside:

At first glance it looks like their standard four-banger, maybe with solar cells, a memory or even an alarm clock. .

.

.

.

.

.

.

.

.

Guess again!

.

.

.

.

.

.

.

.

.

.

.

.

.

If you open it, a wonderful display - the crispest I ever recognized at a calculator - stares at you:

This new FN-600 allows you interactive, financial calculations and sports even a clock and calendar and performs days-between-dates calculations with ease:

I'm impressed!

And it sold for just $19.95 including free shipment...

Regards, Joerg

Re: All We Wanted For Christmas....

in response to message #6 by Joerg Woerner

I wonder why they forgot to translate "BATTERY" :)

Btw. putting a little switch in there would be a very nice way to confuse workmates...

Re: All We Wanted For Christmas....

*Message #8 Posted by **Don Shepherd** on 13 Aug 2009, 4:55 p.m.,*
in response to message #1 by Joerg Woerner

Joerg, I ordered it a couple of days ago and it arrived today. That is one cool little gadget! It "defines" shirt pocketability: 4" x 3" x .5".

If you're the kind of person (and I think that there are a lot of them out there) who just wants to know what the monthly payment on your new car will be, having traded in your "clunker," or you want to know what your CD will be worth in 2 years, this calc was made for you. You don't have to know and/or understand the mechanics of TVM or BEG/END modes. And its display is second to none.

I think the free shipping and $10 off expire at the end of today, however.

HP 42S - Problem

*Message #1 Posted by **Michel Lahcem** on 10 Aug 2009, 11:07 a.m.*

Hi everyboby

I’ve found in a flea market an HP 42S in excellent cosmetic conditions. When I inserted batteries and turned it on I had no display and all keys (except ON) only played a beep when pressed and screen remained empty. The only way to turn it off was to remove batteries. Pressing keys randomly I could see sometimes “Memory clear” on the first display line and the value of x register “x:0” followed by other figures I don’t remember on the second one. The batteries are good because they make an HP 12C and an HP 32S work fine. I’ve tried all tips found here (and in the archives) and no way to make it work. Things I tried were : - shorting battery terminals without batteries, - E+, XEQ ON keys sequence, - Reset key sequences as indicated in the owner manual. I must add that the top of the right battery terminal is broken. Normally it looks like a reverse P and in my case it looks like an I. However, contact is made as I can hear beeps and see that screen is powered on. Is contact surface important? Does anybody here have any idea on how to make it work?

Sincerely, Michel

Hi Michel,

have you tried the self test?

http://www.rskey.org/~mwsebastian/selftest/hp_test.htm

Re: HP 42S - Problem

*Message #3 Posted by **Michel Lahcem** on 10 Aug 2009, 12:08 p.m.,*
in response to message #2 by hpnut

Hello,

First of all thank you for your quick answer. Indeed I have tried these tests but without result. The fact is that when I press any key I ear a beep. For instance if I press 7 I ear a beep and I don't see 7 on the display. Even, I can't turn off the calculator using keys because [SHIFT] also plays a beep. In such a case, I'm not able to know if calculator freezes at boot or not. I'm quite desperate...

*Message #4 Posted by **Jeff O.** on 10 Aug 2009, 12:32 p.m.,*
in response to message #3 by Michel Lahcem

Michel,

I'm no expert, but it sounds like your unit has some sort of internal problem, i.e., it's not just a matter of clearing the memory or resetting it. If and when you decide that you have nothing to lose, Paul Brogger has written a couple of articles regarding how to disassemble Pioneers, see here and here. If you are lucky, perhaps it is a problem with the "zebra stripes." If you are unlucky, it is a keyboard problem.

...

in response to message #1 by Michel Lahcem

I have a 27S with the same problem. Leaving the battery out for more than a year didn't solve it. My best guess is that the electronics has suffered from ESD damage.

Perhaps the tantalum decoupling cap has gone bung and is causing odd behaviour?
Try putting a 100uF cap across the battery terminals.

Internal shot for your reference:

Dave.

You just need to hold the capacitor across the battery terminals. Make sure you get the correct polarity though, it should be marked with either a minus symbol on the case next to the corresponding negative

lead, like this:

Any electronic component shop should have one.

It's a long shot, but if you are out of options...

Dave.

HP-41cx "plastic film" in battery contacts

*Message #1 Posted by **Giovanni Jimenez** on 9 Aug 2009, 10:54 p.m.*

Some time ago I got a nice HP-41CX, and I noticed that there is some sort of "plastic film" covering the contacts in the battery compartment; not all of it because the calculator works fine, so obviously the batteries are making contact, but it is around these contacts and I have no idea what this film is for. It is a bit loose but I don't want to take it off, just in case it has some purpose.

I have another calc (HP-41CV) and it doesnt have that "film".

Any idea what this might be ? THX

Re: HP-41cx "plastic film" in battery contacts

*Message #2 Posted by **Eric Smith** on 10 Aug 2009, 2:01 p.m.,*
in response to message #1 by Giovanni Jimenez

Hard to say without actually seeing it, but is it possible that the flex circuit is delaminating?

Re: HP-41cx "plastic film" in battery contacts

*Message #3 Posted by **Geoff Quickfall** on 10 Aug 2009, 9:40 p.m.,*
in response to message #2 by Eric Smith

I would have to agree with Eric. Having now fixed two of these, both suffering corrosion damage there are three layers.

The film the gold is bonded to and a film that covers the gold contact. This film is bare at the contact points for the batteries and the module connections and can delaminate. As long as the gold is intact and not cracked there should be no problem.

I suppose you could glue the plastic back in place with contact cement ensuring you clean any access but it is not required.

Cheers, Geoff

HP-41 question

*Message #1 Posted by **Monte Dalrymple** on 9 Aug 2009, 9:39 p.m.*

Does anyone have the physical specifications for the daughterboard in a fullnut?

In particular, I'd like to find out the exact location and sizes for the two holes in the circuit board that hold it in place over the zebra-strip connectors.

By my measurement, looking fron the top of the board and starting on the left side, I have 15.5mm to the edge of the first hole, a 4.5mm hole, 28mm to the edge of the second hole, another 4.5mm hole and then 14.5mm to the other edge of the board.

Obviously there's some play allowable... but I don't want to much play when mounting a board. And I _really_ don't want to end up with holes 0.1mm too small or 0.1mm too close together.

Thanks, Monte

Re: HP-41 question

*Message #2 Posted by **Eric Smith** on 9 Aug 2009, 9:53 p.m.,*
in response to message #1 by Monte Dalrymple

Even if HP was willing to turn loose of HP-41C mechanical drawings, I doubt that they could do it because the drawings most likely no longer exist. A huge amount of stuff was thrown away when responsibility for calculators moved from Corvallis to Singapore, and more thrown away when it moved from Singapore to Australia, and more when it moved from Australia to San Diego.

Measuring it is the only realistic option at this point.

HP 48 & HP 49...1999 and 2003 releases

*Message #1 Posted by **juan demin** on 9 Aug 2009, 2:59 p.m.*

Hi, could you tell me the difference between these models? It seems that HP kept the 48 and 49 series alive making new releases of both in 1999 and 2003…

1999….HP-48 G+ and HP-49 G

2003….HP-48 GII and HP-49 G+

Thanks…

Re: HP 48 & HP 49...1999 and 2003 releases

*Message #2 Posted by **Dave Britten** on 9 Aug 2009, 6:27 p.m.,*
in response to message #1 by juan demin

The 48G+ is nothing more than a 48G with 128 KB RAM (but no expansion slots). The 49G was the first major redesign, with a significant software update (Metakernel, etc), and lots more internal RAM (512 KB, plus 2 MB flash). Plus a keyboard that is probably the worst that has ever been included on any calculator in the history of calculators.

The 49G+ (and 50G and 48GII) is a complete hardware overhaul - it runs on the ARM CPU, and simply emulates the old Saturn architecture in software. In terms of software capabilities, it's pretty much the same as the 49G, but with a much less atrocious keyboard. The 49G+ and 50G have SD card slots, though I don't think the 48GII does. The 49G+ and 50G have a somewhat taller screen, and the 48GII has the traditional 48G screen size.

in response to message #2 by Dave Britten

Worth adding that the 49G doesn't have an IR port either - great shame that. I believe it came with a special cable for calc to calc transfer.

I also think that another factor which let down the 49G even further was not just the horrible tactile feel of the keyboard with its horrible (easily worn-off) painted labels, but the layout and relegation of important keys to shifted positions, eval and '. The 49G+ and 50G corrected this but still leaves the MTH and PRG menus as shifted keys. Users coming from a 48S/48G background might consider these two menus as

major functionality "gateways" (I certainly do) so having them shifted is a major PITA.

Just to note that I have a 49G+ which has the atrocious keyboard. At least, I assume it does: I've never had a 49G, but I can't imagine that any keyboard could be worse than the one on my 49G+! So the change in the internal hardware (ARM processor, etc.) must have taken place before the keyboard was fixed. All very confusing!

No, no, the early atrocious version of the 49G+ keyboard was atrocious in entirely different ways than the 49G keyboard was. The 49G+ had hard plastic keys but the internal snap domes or hinges or whatever were easily broken. The 49G, on the other hand, had rubber keys; the standard (on cheap calcs, and never before an HP calc) type, except that the designers were aware that HP keyboards were supposed to be snappy, so they did their best to make... *snappy rubber domes.* Which were very stiff. And had the key legends silk-screened on. Which wore off. And some of the keys were sometimes upside down. They were unlike anything else I've ever seen. Here's a link to Joe Horn's site.

*Message #8 Posted by **David Hayden** on 10 Aug 2009, 1:39 p.m.,*
in response to message #1 by juan demin

Other differences between the 48Gii and the 50G: the 48Gii indeed has no SD card and it has a smaller display. Also less RAM (256K I believe) and no Equation library. I think it's a great deal for many users who'd otherwise get a 50G.

HP has actually made (at least) two versions of the 48gii that are, in my opinion, so different that they should have called them different models. The older version had no USB, only 80k of memory and used 3 AAA batteries. On the plus side, they came with a fabric case. They also came with a serial cable. The newer version has serial and USB, 256k of memory, uses 4 AAA batteries and comes with a turtle shell plastic cover (is that the right name??) and USB cable. You can tell the difference by looking for two connectors on the top edge (USB and Serial for newer version, serial only for old). If it's new in the bubble package then the top edge is hard to see, so check if it mentions USB on the package, or turn it around and look for 3 vs. 4 batteries.

I own both machines; so far as I am concerned the only difference is that the 50G has a working keyboard (actually a rather good one) and a much nicer colour scheme! I think the 50G uses 4 AAA batteries instead of 3 and it has some sort of serial port which I've never used. I think that computationally both calculators are equivalent.

Nigel

The following link is an Australian youtube comparing the 50G with the 49G+:
http://www.youtube.com/watch?v=HxfxlVjbrkY&feature=related

For some reason, the 49g+ is slightly faster - he says something about the letters 'HLT' in the 50G upper right display. Maybe the 50G also has as SD card in it, who knows?

It would be totally awesome if they did that. I would be in seventh-heaven! The 50G is an amazing calc really but the key layout is its main failing. Ideally, it should have stuck to a layout very similar to the 48G series with 6 keys across on the middle group which would make room for the

big enter in the correct place as well as providing an additional 4 keys.

I know that us users on this forum must represent a small faction of the total userbase but I am equally sure that there is a large number of users out there who want the RPN style keyboard on a 50G.

If this were to happen, the large 48 series community would certainly go for it and with the enhanced software and faster speed, it would surely create a surge of new user-development and a real buzz in the community.

It would be a completely killer calculator, just amazing.

How can we make HP aware of this desire so they might actually give it some thought? Rhetorical question I know but it frustrates me that this staggering combination has to live in my imagination only.

Mark

*Message #17 Posted by **Mike Morrow** on 14 Aug 2009, 7:26 p.m.,*
in response to message #16 by Bart (UK)

They must not care that the HP48S and G-series have the worst LCD display quality ever put on a graphing calculator by anyone. The LCDs were poor brand new right out of the box. The display clarity of the HP49g+ and later is stunning by comparison. My early HP49g+ display is actually perceptibly better than that of my HP50g, when a side-by-side comparison is made.

They must not care that HP48-series LCDs are woefully unprotected and can easily be damaged with slight pressure from a sharp surface (like the edge of a stapler in a drawer).

They must not care that HP48 memory expansion cards were (and are) quirky and unreliable (as the backup battery died) and *extremely* expensive. The SD card technology for the HP49g+ and later is a tremendous feature which seems seldom to be credited the value it deserves in the HP49g+ design.

They must not care the the keyboard and labeling color scheme used in both the HP48S and G series are studies in poor contrast and legibility, and just plain left-coast artsy-campy ugliness. The HP49g+ and HP50g keyboards have far better contrast, even if one doesn't

like the colors used.

As an HP calc user for more than 35 years, IMHO the HP50g is the best handheld calculator ever made, by wide margin. Which is not to say it couldn't be improved.

Days between dates challenge for 11c and 34c

*Message #1 Posted by **Don Shepherd** on 9 Aug 2009, 9:56 a.m.*

Katie Wasserman and I have been extolling the virtues of the HP-11c via emails recently, and we decided to implement the days between dates algorithm found in the "Formulas Used" Appendix of the HP-12c manual. Each of us developed an RPN program on the 11-c for this algorithm, and then we shared them so we could benefit from the other's ideas. Katie thought this would be a good challenge for this community, and I agree. So here are the rules.

The goal is to develop an RPN program on either the HP-11c or HP-34c that conserves the scarce resources on these calculators as much as possible. To this end, these are the evaluation criteria to determine the "best" program. Like golf, the lowest score wins.

Evaluation criteria:

1. One point for each line of code.
2. Seven points for each register used (not including the stack and lastx).
3. Two points for each label used.

You must implement the delta-DYS (actual day basis) algorithm in the Formulas Used Appendix of the HP-12c manual. Katie and I discovered that this algorithm, as listed, does not work correctly if the date range includes century years that are not divisible by 400, such as 1800, 1900, 2100, etc. (although the 12-c does work correctly for these years, so the actual implemented algorithm is different than the printed algorithm). Nevertheless, implement the algorithm as printed in the manual.

Let's see who comes up with the lowest (best) score. I have to admit, Katie is a master at this and I will be surprized if anyone can top her effort. To the winner goes the honor of being identified as the winner in this thread!

Re: Days between dates challenge for 11c and 34c

*Message #2 Posted by **Katie Wasserman** on 9 Aug 2009, 11:50 a.m.,*
in response to message #1 by Don Shepherd

FYI, here's the formula that's to be implemented, taken from the 12C appendix:

```
Actual Day Basis
delta-days = f(DT2) – f(DT1)

where:
f(DT) = 365 (yyyy) + 31 (mm – 1) + dd + INTG (z/4) – x

and
for mm <= 2
x = 0
z = (yyyy) – 1

for mm > 2
x = INTG (0.4mm + 2.3)
z = (yyyy)
```

```
INTG = Integer portion.
```

Edited: 9 Aug 2009, 11:53 a.m.

Re: Days between dates challenge for 11c and 34c

*Message #3 Posted by **Mark Edmonds** on 9 Aug 2009, 1:46 p.m.,*
in response to message #2 by Katie Wasserman

Just one question on the scoring - with these calcs, is one line of code always the same size irrespective of what that line of code is? Although I am a big fan of the 11C, I don't program it much if at all and coming from a UserRPL perspective, I am used to variable command sizes, often with surprising results.

Mark

Re: Days between dates challenge for 11c and 34c

*Message #4 Posted by **Mark Edmonds** on 9 Aug 2009, 1:51 p.m.,*
in response to message #3 by Mark Edmonds

And another point just thinking this through - us Europeans are going to produce a different program I suspect to those Stateside due to the different date formats.

You'll need to define the date format before people start coding on DD.MMYYYY.

Mark

Re: Days between dates challenge for 11c and 34c

*Message #5 Posted by **Don Shepherd** on 9 Aug 2009, 1:56 p.m.,*
in response to message #4 by Mark Edmonds

You're right. Let's use the US standard, mm.ddyyyy. It would be interesting, however, if dd.mmyyyy might result in more efficient code. :)

Re: Days between dates challenge for 11c and 34c

*Message #6 Posted by **Don Shepherd** on 9 Aug 2009, 1:53 p.m.,*
in response to message #3 by Mark Edmonds

Mark, I'm pretty sure the answer is "yes." A line of code might be "4", or it might be ".", or it might be "x>y". I think they are all one byte long.

Re: Days between dates challenge for 11c and 34c

*Message #7 Posted by **Mark Edmonds** on 9 Aug 2009, 2:05 p.m.,*
in response to message #6 by Don Shepherd

Thanks Don. I'm pretty certain it is 1:1 now myself having just reacquainted myself with the 11C program model. In fact, as soon as I did this, I realised what a daft question it was!!

Will use US date format.... but as you say, doing it the European way would be interesting for comparison.

Mark

Re: Days between dates challenge for 11c and 34c

*Message #8 Posted by **Mark Edmonds** on 9 Aug 2009, 2:12 p.m.,*
in response to message #7 by Mark Edmonds

And another question as this might make a difference. What is the stack order, DT1 in y, DT2 in x or the other way round?

Also, are we assuming the program pointer is at 000 for running the program or do we need to define a starting label?

Mark

Re: Days between dates challenge for 11c and 34c

*Message #9 Posted by **Don Shepherd** on 9 Aug 2009, 2:55 p.m.,*
in response to message #8 by Mark Edmonds

DT1 and DT2 order in the stack, your choice, although Katie and I assumed that you would enter DT1 first, so it would be in Y. We also had LBL A as the first instruction, although you could omit that and assume you are at 00 when you R/S, I suppose, to gain 2 points on one fewer label.

Re: Days between dates challenge for 11c and 34c

*Message #10 Posted by **Mark Edmonds** on 9 Aug 2009, 4:00 p.m.,*
in response to message #9 by Don Shepherd

Me again!

Please can you post some official results so we can check our programs against them - ideally, these results should include an example where the algorithm fails as detailed above.

Thanks :)

Mark

Re: Days between dates challenge for 11c and 34c

*Message #11 Posted by **Don Shepherd** on 9 Aug 2009, 5:03 p.m.,*
in response to message #10 by Mark Edmonds

Sure, Mark, here are a couple:

```
8.141950
8.092009
--> 21545 (my age in days)

7.121960
12.042008
--> 17677

2.281900
3.011900
--> 2 using this algorithm (incorrect)
--> 1 on a real 12c (correct, because 1900 is not a leap year)
```

Re: Days between dates challenge for 11c and 34c

*Message #12 Posted by **Mark Edmonds** on 9 Aug 2009, 5:20 p.m.,*
in response to message #11 by Don Shepherd

Thanks Don :)

My first draft has weighed in with a hefty score of 103 (written on an 11C). Not sure I can reduce that by much unless I change the main algorithm.

Mark

ok, i tried it on my 15c.

lines = 60 regs = 3 labels = 3 (including main one)

= 60 + 21 + 6 87

also, tidied, register and label names to be more 11c ish.

Re: Days between dates challenge for 11c and 34c

*Message #15 Posted by **Katie Wasserman** on 9 Aug 2009, 6:30 p.m.,*
in response to message #13 by hugh steers

I haven't test it either, on an 11c the score would be: 58 lines (expanding numbers as needed) + 3 x 2 points/label + 3 x 7 points/register = 85. This would be a good score, but it doens't implement the formula as presented. My best score so far is a bit less than this: 66 lines + 1 label (it's reused) + 2 registers = 82. You could save 4 points by label reuse too since all your branches are forward.

Edited: 9 Aug 2009, 6:32 p.m.

Re: Days between dates challenge for 11c and 34c

*Message #16 Posted by **Mark Edmonds** on 9 Aug 2009, 7:08 p.m.,*
in response to message #15 by Katie Wasserman

Also, it uses recall arithmetic which the 11C doesn't have unfortunately.

I think I can see a way of reducing mine a bit which might enable me to remove a register and save a few lines. Also, if I implement Katie's label trick, I can save one label - but I am not going to do that as I didn't know that trick existed so would be cheating!

Mark

Re: Days between dates challenge for 11c and 34c

*Message #17 Posted by **Katie Wasserman** on 9 Aug 2009, 7:20 p.m.,*
in response to message #16 by Mark Edmonds

Right, the 11C and the 34c don't have RCL arithmetic.

Aside form the integrate and solve functions I think that the 11c and 34c are 100% program code compatible and have the same memory size.

Label reuse isn't a trick, it's suggested in the 11C manual!

Re: Days between dates challenge for 11c and 34c

*Message #18 Posted by **hugh steers** on 9 Aug 2009, 7:41 p.m.,*
in response to message #17 by Katie Wasserman

Sure it implements the formula presented :-) i just rearranged some of the calculation to be an equivalent form. it should get the exact same answers.

i didn't know about the rcl arithmetic. strange that's missing on the 11c really, when it's there on the 15.

> Sure it implements the formula presented :-) i just rearranged some of the calculation to be an equivalent form. it should get the exact same answers.

You sure confused me on this. Some program commentary might help convince me that these are the same algorithms. Anyway, the final RCL+2 is easily adjusted for the 11C and I end up 59 lines (I change 100 --> EEX 2 and 1EEX4 --> EEX 4), 3 registers and you can get away with 1 label I think (even though you used 3). So your score is potentially 81, wow!

Re: Days between dates challenge for 11c and 34c

*Message #20 Posted by **Katie Wasserman** on 9 Aug 2009, 8:48 p.m.,*
in response to message #1 by Don Shepherd

Here's my entry.

Assumes dates are in the format mm.ddyyyy with starting date in Y and ending date in X. GSB A will return the days between them per the 12c manual appendix function description.

LBL A is used 3 times, this is fine as long as the program is not starting in the middle (like with a GTO .005) followed by a GSB A.

Registers I and 0 are used and will and not be restored, no other register is touched.

No flags are used and any output format is ok.

score= 82 (66 lines, 2 registers, 1 label)

```
001 LBL A --  expects Y=starting date (mm.ddyyyy), X=ending date (mm.ddyyyy)
002 0
003 STO 0 --  zero the days accumulator
004 Rv
005 GSB A --  get the negative number of days for the ending date in register 0
006 CHS  --  flip the sign of register 0
007 STO 0
008 R^ --  get the starting date -- and process the same way -- the final RTN will end the
program
009 LBL A -- reuse of 'A' expects X=mm.ddyyyy and subtracts the day count from register 0
(it also preserves Y in T)
010 STO I
011 INT
012 X<>I --  I now contains 'mm'
013 FRAC
014 EEX
015 2
016 x

Re: Days between dates challenge for 11c and 34c

*Message #21 Posted by **Mark Edmonds** on 11 Aug 2009, 9:20 a.m.,*
in response to message #20 by Katie Wasserman

Can we keep this open a little longer please? I have a problem with my code - when you step-run it or do it manually, it appears to work OK but when you run it properly, it fails. There is a stack-lift problem in it somewhere which is proving to be a real bloody nuisance to track down. I remember getting caught like this with an HP32S program but I wasn't using all 4 stack levels in that one so an extra enter didn't cause a problem.

I can't remember the exact code size because it is riddled with R/S commands at the moment but I think it was 66 or 67 with 1 label and 2 registers. I really want to get this fixed before we start discussing our solutions.

Thanks,

Mark

Re: Days between dates challenge for 11c and 34c

*Message #22 Posted by **Katie Wasserman** on 11 Aug 2009, 9:44 a.m.,*
in response to message #21 by Mark Edmonds

Stack problems are the worst, especially since there's variation among HP calculations models in the way they handle stack lift. A good rule of thumb to help avoid bumping stuff you need off the top of the stack is to use a roll-down before after storing a number before you start a new calculation that doens't immediately need the stored result. It's amazing what you can do with a 4-level stack with careful planning, but it's often a challenge to figure it out a a basic RPN machine -- the 41C and 42S make stack manipulation far too easy.

Re: Days between dates challenge for 11c and 34c

*Message #23 Posted by **Steve Perkins** on 11 Aug 2009, 1:20 p.m.,*
in response to message #20 by Katie Wasserman

I guess I do better at improving others marvelous efforts. I'm not so good at programming from scratch.

I improved Katie's efforts just a little. The first trick was to just clear the registers instead of storing 0 to reg 0. Not what one usually does in a program since it destroys what you might really want saved, but it is two instructions shorter.

Then I used division by 2.5 instead of multiplication by .4 so I could just test with 2.5 instead of 2. That saved just one step.

Here's my small improvement. It wouldn't exist without Katie, so she gets the credit:

```
001 LBL A --  expects Y=starting date (mm.ddyyyy), X=ending date (mm.ddyyyy)
002 CLEAR REG
003 GSB A --  get the negative number of days for the ending date in register 0
004 CHS  --  flip the sign of register 0
005 STO 0
006 R^ --  get the starting date -- and process the same way -- the final RTN will end
the program
007 LBL A -- reuse of 'A' expects X=mm.ddyyyy and subtracts the day count from register
0 (it also preserves Y in T)
008 STO I
009 INT
010 X<>I --  I now contains 'mm'
011 FRAC
012 EEX
013 2
014 x
015 INT
016 STO - 0 --  subtract 'dd'
017 Rv --  needed just to preserve the starting date
018 3
019 6
020 5
021 LASTx
022 FRAC
023 EEX
024 4
025 x
026 x
027 STO - 0 --  subtract 365 x 'yyyy'
028 Rv --  needed just to preserve the starting date
029 LASTx --  get back 'yyyy'
030 X<>I --  swap places with 'mm'
031 3
032 X > Y --  if 'mm'<=2 then
033 DSE --  'yyyy' - 1
034 Rv --  get 'mm' back into I
035 X<>I get 'z' into X
036 4
037 /
038 INT
039 STO - 0 --  subtract INT(z/4)
040 Rv --  needed just to preserve the starting date
041 RCL I --  get 'mm'
042 1
043 -
044 3
045 1
046 x
047 STO - 0 subtract ('mm' - 1) * 31
048 X<>I -- get 'mm' while preserving starting date
049 2 -- constant for test, and also possible division later
050 .
051 5
052 X > Y -- if 'mm'<=2 don't need adjustment
053 GTO A -- this is a forward branch to the next 'LBL A'
054 / -- dividing by 2.5 is the same as multiplying by 0.4
055 2
056 .
057 3
058 +
059 INT
060 STO + 0 --  add  INT('mm' x .4 + 2.3)
061 LBL A -- re-use of this label
062 RCL 0
063 RTN
```

Re: Days between dates challenge for 11c and 34c

*Message #24 Posted by **Don Shepherd** on 11 Aug 2009, 2:05 p.m.,*
in response to message #23 by Steve Perkins

Hey Steve, I'll let Katie speak for herself, but I too thought of CLR REG to save one instruction, but I'm sure Katie's point is to not alter any registers other than the two she is using, and CLR REG certainly does that!

Re: Days between dates challenge for 11c and 34c

*Message #25 Posted by **Steve Perkins** on 11 Aug 2009, 2:58 p.m.,*
in response to message #24 by Don Shepherd

I agree. It's not the prefered method at all for a real routine. One that might be used in other contexts and with a surrounding application.

It saves two lines, but it could be argued that it "uses" all the registers and thus the point penalty is extreme.

Re: Days between dates challenge for 11c and 34c

*Message #26 Posted by **Don Shepherd** on 11 Aug 2009, 3:14 p.m.,*
in response to message #25 by Steve Perkins

> Quote:
>
> It saves two lines

Actually, one, right?

0

STO 0

vs.

CLR REG

Re: Days between dates challenge for 11c and 34c

*Message #27 Posted by **Steve Perkins** on 11 Aug 2009, 5:58 p.m.,*
in response to message #26 by Don Shepherd

That one line replaces

```
002 0
003 STO 0 --  zero the days accumulator
004 Rv
```

But Katie interprets it as "using" 19 additional registers, so I withdraw it.

My tricks now only save two lines in her wonderful code. It's sure great to have nice code to start with, right?

Re: Days between dates challenge for 11c and 34c

*Message #28 Posted by **Don Shepherd** on 11 Aug 2009, 6:12 p.m.,*
in response to message #27 by Steve Perkins

Oh, I see what you are saying now, Steve. You're right.

Re Katie, I agree. I'm not even in the same league!

Re: Days between dates challenge for 11c and 34c

*Message #29 Posted by **Steve Perkins** on 11 Aug 2009, 3:10 p.m.,*
in response to message #23 by Steve Perkins

Actually, it seems that my line 40 can be deleted too. The starting date is still preserved in the top stack register where it's expected after the first call to the date numbering subroutine. With that refinement we have:

score= 78 (62 lines, 2 registers, 1 label)

Re: Days between dates challenge for 11c and 34c

*Message #30 Posted by **Katie Wasserman** on 11 Aug 2009, 5:18 p.m.,*
in response to message #29 by Steve Perkins

Steve,

Refinements of my code are most welcome and appreciated. Combining clever ideas of many of the people here can result in some amazing code.

Yes, I avoided Clear REG for the obvious reason that would count as using another 19 registers :(

Your use of 2.5 / instead of .4 * is brilliant!

I had concluded that I needed the Rv at line 40, but that may have been in a earlier version of my code and I left it in place unnecessarily.

Thanks for the improvements!

-Katie

Re: Days between dates challenge for 11c and 34c

*Message #31 Posted by **Mark Edmonds** on 12 Aug 2009, 6:57 a.m.,*
in response to message #30 by Katie Wasserman

Here is my version. I haven't looked at anyone elses' code so I don't know how it compares. This was a useful exercise for me and a lot of fun as I don't normally do any programming outside RPL. The 4 line stack and stack-lift problems caught me out a couple of times but here is the result:

64 lines, 1 label, 2 registers.

```
x SWAP I
Rdown
GSB A
x SWAP I
GSB A
```

```
RCL I
-
RTN

LBL A
INT
LASTx
FRAC
EEX
2
*
INT
STO 0
LASTx
FRAC
EEX
4
*
3
6
5
x SWAP y
*
STO+ 0
LASTx
Rup
ENTER
SF 0
1
-
3
1
*
STO+ 0
x SWAP y
3
X>Y
GTO A
Rdown
CF 0
.
4
*
2
.
3
+
INT
STO- 0
LBL A
Rup
F? 0
1
F? 0
-
4
/
INT
RCL 0
+
```

You will notice that I didn't include an opening label and I took advantage of the implied RTN at the last step. I consider both these omissions legit. It was agreed at the start that an opening label wasn't necessary and my program returns to 000 after each run so no manual re-pointing is necessary. Concerning the implied RTN, HP document this in the manuals so quite happy to use it!

However, this might give me a 2 line advantage so I'll let the adjudicators decide on that one :)

Written on 11C and thanks for the fun challenge!

Mark

PS: Living in a dd.mm.yyyy part of the world, working with mm.dd.yyyy is unbelievably confusing! It's like have to learn left is right!!

Re: Days between dates challenge for 11c and 34c

*Message #32 Posted by **Katie Wasserman** on 12 Aug 2009, 11:18 a.m.,*
in response to message #31 by Mark Edmonds

Mark,

Very nice code!

The way you use I register and the 0 flag is a great idea, much more obvious than my convoluted program.

Dropping the fist LBL and last RTN, well it's ok if nothing else is in memory, not so good if there's other code in there but Don's the contest judge....

Re: Days between dates challenge for 11c and 34c

*Message #33 Posted by **Mark Edmonds** on 12 Aug 2009, 3:46 p.m.,*
in response to message #32 by Katie Wasserman

Thanks for the feedback Katie :) To be perfectly honest, I don't think my code is especially elegant and would be a pain to maintain if a functional change is needed.

In comparison, I thought your code was much easier to understand and works using the same resources, even less actually and as such, I consider it to be a neater solution.

I liked the clever use of DSE and the way you run into the sub on the second pass so the sub's RTN acts as the end. I thought of doing that myself but it wasn't possible the way I set things up.

Looking at your code made me realise another method of calculating the date difference by negating the actual DT1 value before passing to the sub. You wouldn't need to negate the return value and everything would be simple addition (but the month test would be more difficult).

HP 925 main body color

*Message #1 Posted by **mark murphy** on 8 Aug 2009, 5:34 a.m.*

I'm not 2/3rds of the way through refurbishing the 9825 I have - everything is in perfect working order. The main casing is quite worn and scratched. In order to be an authentic restoration I need to know the paint method (powder, spray etc) and the pantone color or equivalent (the color today will have aged). I've spent 6 months searching high and low for any clues but nothing to date.

Any help would be appreciated - I've been to all the sites - so I'm just looking for an answer :-)

Re: HP 925 main body color

Re: HP 9825 main body color

*Message #3 Posted by **Steve Leibson** on 10 Aug 2009, 4:11 p.m.,*
in response to message #1 by mark murphy

I contacted the HP 9825's industrial designer, LeRoy LaCelle on your behalf. Here's what LeRoy wrote:

"When I was developing the design of the 9825, HP was also looking for a new color scheme for the calculator products, a little more definitive.

I worked for weeks developing many different approaches and finally came up with the direction which I applied to the 9825 model. We calibrated the color in local paint facilities and presented the direction to California.

Well the color scheme (main body) on the model was a little too yellow, so we worked with HP's Palo Alto color lab to develop a grayed down version.

They developed and specified the color there and I don't really have any references to the final color in any of my documents. Additionally, since it was a custom color developed by HP Palo Alto color labs, there would not be a Panatone equivalent color.

Regards,

LeRoy"

For detailed info on the HP 9825's industrial design, go here:
http://www.hp9825.com/html/industrial_design.html

No. I use my 41cx and 71 because they're a functional part of my work.

Not really, I just like calculators, and designing them. I actually prefer Casio's (*gasp*) most of the time, but the fellow calculator enthusiasts on here is hard to beat, HP or not.

Dave.

I teach Physics in a secondary school (ages 11-18) so I do need to use at least one calculator for my job. However, I definitely count as a collector as well! Although I like HP machines I collect many others too. I like the forum because there are so many interesting and knowledgeable people here. A lot of what is discussed is relevant to calculators in general, and not just HPs.

A very small collection here, most are my own units, no longer in daily use. For everyday use, I have a 33S that I will not miss if gets lost or broken. On custody, I have 2 HP25 (one from a gift, other from cheap eBay purchase), my old HP41C, my 42S, a 32Sii, a 20S from a person who no longer uses it, a 200LX, a 35S from HHC 2007, a 17Bii+ and a 12C platinum from HHC 2007 door prizes, a 48G+ bought at a local electronics shop, and not much more. In the last years I put little effort (or money) in collecting, however they seem just to get together!

The forum is a very nice place to find excellent friends and to learn more about calculators, math, electronics and many other things. The people who cames here make it great, and the MoHPC setup by Dave Hicks is superb.

Welcome and thanks for your postings, I like all space-related issues and took many interesting points from your comments and from others' answers to them.

in response to message #1 by hecube

I am a working civil engineer. I have a small "collection" of HP calculators, which I purchased to use, not collect. But I found that I like different features on different models depending on the task at hand. I also have duplicates of my most frequently used models, as back-ups, because all of mine are older models no longer in production.

I belong to this group for the information I get about the calculators, and because the posts can be challenging, interesting, and just plain fun.

I am also a civil engineer. My collection consists almost entirely of calculators I bought for use at school or work.

In high school, I started with an HP-35 that I bought from my dad when he upgraded to an HP-45. I bought an HP-55 a few months before graduation.

In college I purchased an HP-34C. After graduation I got an HP-41CV, then upgraded to an HP-41CX. I sold the CV to a co-worker to help fund the CX. That's the only calculator I ever sold. My dad later gave me his old HP-41C to add to my collection.

In 1988 I bought an HP-42S, which is still my everyday calculator.

Since then I have purchased an HP-48G and and HP-48G+ (both on sale for $25 and $29, respectively. The HP-48G+ is my secondary calculator and travel alarm. I bought an HP-32SII when they were being discontinued, and that was my home office desk calculator until I got an HP-35S.

I also won and HP-10B in a contest and a friend gave me a non-op HP-21.

Oh, and I have collected lots of excellent emulators and simulators for my PC, Palm TX and iPhone.

in response to message #1 by hecube

I am an engineer - first marine then general/mechanical - and bought my first HP calculator, a slightly used HP 15C in university in 1985. I have a small collection (a dozen or so - all HP with duplicates of the 15C and 42S) but they were all purchased to be used and not necessarily put on display. I keep a (relatively) discardable 33s in the office, I always have a 15C in my briefcase, and the remainder rotate through the office or are on stand-by at home. I often use my HP 21 that sits in a really nifty and well-made wooden stand as my main desktop calculator at home. Although my collection does not include a 12C, most programmables (except the 33E because it is a bit of a pain to program) have a TVM implementation at the ready.

I love math/stats and physics and do try my hand at some of the interesting 'challenges' presented on the site, but I just like the posts. I often solve practical engineering problems either for work or fun. I can't wait to get my hands on Geoff's manual when he releases it so I can keep my small collection running for years to come! I just, as in yesterday, received my very first slide rule in the mail, a Hemmi 260 Advanced Engineering Slide Rule. Something new to learn and master. Haven't quite got RPL down pat... maybe someday.

I started using HP's at University (engineering) over 20 years ago - starting with the 28S, then 48G, etc ... I have gathered a rather large collection now (well over 50!), but I still use them on a daily basis for work.

So my collecting has been a direct result of using HP's throughout my career. I think that most HP collectors start out this way as humble users, upgrade, get interested in new/old models and end up with a collection - intended or otherwise.

Cheers, Keith

It's a spiritual thing for me. Restoring, using, and just experiencing the most amazing computing machines of my youth. Other than an HP-25, and a friend's 19C, I could only dream of using them back then. Now, a whole collection is proudly displayed and still enjoyed. Preserved rather than disposed. It's definitely a spiritual thing.

Classic HP SuperCharger

*Message #1 Posted by **Dan W** on 7 Aug 2009, 9:08 p.m.*

Hi all,

Often when Classic battery packs are rebuilt, we want to use modern high energy NiMH batteries. Problem is, with the original charger at about 55-60 mA, it takes forever to charge these things. Better would be 250 mA.

So for fun, I created an external "Super Charger". This is a small box with a switch that toggles either 60 mA or 250 mA. If 250 mA is selected it turns on a small 40 mm fan that has a blue LED to remind me it's on (I doubt it really needs the fan; I do recommend a visual indicator if the 250 mA is selected).

The box is connected to the accessory external charging cradle through the standard charger cable. But I don't see any problem connecting directly to the calculator since the charge current circuit is independent of the power supply.

The circuit is fairly straightforward. It uses an LM317T to supply the charge current and the switch changes the resistance that governs the output. A 7812 provides the 12V for the fan, followed by a 7805 and a diode to provide the 4.3 Vbsw.

Cheers.

Forum Search - help!!

*Message #1 Posted by **Mark Edmonds** on 7 Aug 2009, 6:06 p.m.*

Hate to admit this but I find the forum search very awkward to use and very unintuitive.

Is there any way of searching all the archives at once?

Despite the date range function, I can only get results from the current archive unless I go to the archive list and then search in each archive individually. Obviously, this is very tedious and slow.

There have been many times when I've wanted to scan the entire forum for a topic but haven't been able to find it when I know it is there because I can't work out how to use the search feature!

If this is an intelligence test, I have failed miserably!!!

Mark

Re: Forum Search - help!!

*Message #2 Posted by **Garth Wilson** on 7 Aug 2009, 6:24 p.m.,*
in response to message #1 by Mark Edmonds

I, too, have found the forum search function to be nearly worthless. When I want to find something I know is there, I use the Yahoo search engine and specify the website I want to search. It's not ideal, but I've been able to make use of it.

For the forum search, I would like to be able to click on "search", then specify the search terms **and** the author **and** the date range, regardless of how the archives are grouped. It doesn't let you do that though.

Re: Forum Search - help!!

*Message #3 Posted by **hecube** on 7 Aug 2009, 7:14 p.m.,*
in response to message #2 by Garth Wilson

Well, Google can help of course. You just have to go to the Google advanced search page and specify hpmuseum.org in the field labeled "Search within a site or domain:".

Google has already indexed the topic below this one so it's quite up to date...

Re: Forum Search - help!!

*Message #4 Posted by **Dave Britten** on 7 Aug 2009, 8:03 p.m.,*

I 2nd that. Like a few others I use "foo bar blah site:hpmuseum.org" from Google.

Re: Forum Search - help!!

*Message #9 Posted by **Garth Wilson** on 8 Aug 2009, 4:27 p.m.,*
in response to message #8 by Egan Ford

It would still be nice if the forum search worked right too though, so you could search for certain things that you remember a particular member wrote in a particular possible range of dates.

Just to anticipate another problem or question, a frustration I have on another forum is that if you enter a phrase in the box to search for the *exact* phrase, word for word, it kicks out the "the", "of", etc., maybe separates words differently or changes punctuation, is not case-sensitive (which makes a difference when it's a rarely mentioned brand name versus 100,000 uses of the same word without the capitalization), etc., and gives you stuff that's not the exact thing you're looking for.

Re: Forum Search - help!!

*Message #10 Posted by **Mark Edmonds** on 8 Aug 2009, 5:33 p.m.,*
in response to message #9 by Garth Wilson

Well, in a silly way, I feel slightly less embarrassed that other people find the search feature difficult or not ideal.

I didn't realise you could use Google to search the site in that way so I will use that in future. Thanks for the tip! :)

However, it would be better if the site's own search feature was made a bit better, perhaps similar in functionality to a typical phpBB forum search engine as that seems to be quite a popular standard.

Re: Forum Search - help!!

*Message #11 Posted by **Mark Edmonds** on 8 Aug 2009, 5:36 p.m.,*
in response to message #10 by Mark Edmonds

Here is a quick way to set up a Google search in the forum without having to type in the domain each time.

Open Google and run a search with the text:

site:http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi

When the results come back, bookmark the page and rename it to something sensible like "HP Forum Google Search".

Next time you want to search the entire forum, open the bookmark link and at the beginning of the search text box, add the text you seek, leaving the rest of the search text in place.

Forum Search -Helping Improve It

*Message #13 Posted by **db (martinez, ca.)** on 8 Aug 2009, 7:37 p.m.,*
in response to message #12 by db (martinez, ca.)

A few years ago i mentioned to Dave that i had trouble with the search function. He asked me to list when where & what so he could improve it. At the time, i had a Toshiba with so many problems that the factory rebated all us buyers 75% of the purchase price. I didn't think that any data from me would be generally applicable. If he has time now; he might still want to work on it with people who can give him good descriptions of

input vs output. I imagine that a search engine is a fascinating project for someone who writes this type of code but it would be hard to check it's efficacy yourself if you already know how to make it work.

Re: Forum Search - help!!

*Message #14 Posted by **Mark Edmonds** on 9 Aug 2009, 7:19 a.m.,*
in response to message #12 by db (martinez, ca.)

Hmmmm, I don't know what to suggest as it works OK here. Maybe it is dependent on your browser? I am using IE - which one are you using?

You are putting a space between the search text and the text that starts "site:"?

When you've made the bookmark, what exactly is the text stored in that bookmark?

Mark

Re: Forum Search - help!!

*Message #15 Posted by **db (martinez, ca.)** on 9 Aug 2009, 11:02 a.m.,*
in response to message #14 by Mark Edmonds

Mark;
The bookmark is "site:http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi" which gives about 19,700 results. Some lead me to a museum page, some a thread, some an individual post and some the dreaded "no message" page from the museum. Then i put in a space and a subject. I tried a few, "novus" for example gave just three results, all from this forum. However when i click on any of those all i can get is that "no message" announcement from MoHPC. Maybe that is just the luck of the draw there.
I Usually use Mozilla Firefox but because of your question i tried Internet Exploder and in this case i get the same results. This computer is an IBM Thinkpad and it usually works pretty much like every one else's.
I appreciate the individual help but i realize that this may be the best i can get it to work. I've lived without a search function here for eight years and it's no big deal. However; if you have a suggestion for a refinement i'll try that.
thanks - db

Re: Forum Search - help!!

*Message #19 Posted by **db (martinez, ca.)** on 10 Aug 2009, 2:38 a.m.,*
in response to message #18 by Thomas Klemm

Thomas; Thanks for the suggestion but in this case i was using something as a test that i know would have been in the archives, from years ago. It did bring up results, it just couldn't get past the museum's error screen. It's only the internet, not mathematics; i shouldn't expect it to work the same from day to day. It's only what was a top of the line IBM brand computer running XP Pro, not a real system like a 41 that will give reliable results.

If you have another idea to try i gladly will but what works on your system may not work on mine. In my limited experience, all a complicated windows (or Windows CE) program can guarantee is that it will take 30% longer and generate 24 times the error than doing it for real. Anyway, thanks again for the answer. It may help someone with an OS, browser, etc closer to yours. - db

Complex numbers - ideal display representation?

*Message #1 Posted by **Mark Edmonds** on 6 Aug 2009, 4:54 p.m.*

A question for those who are hard-core complex number users. A simple question, hopefully there is a simple answer.

What is the ideal way to display complex numbers on the stack? If you could design the format for complex numbers display, how would you do it? Don't worry about any display size limitions or character sets. If you have an area 22 characters across and 4 lines deep to play with, what would be the perfect way of displaying a complex number?

Many thanks for ideas and suggestions here. As part of a program I am writing, I want to do something similar to "Pretty Print" for complex but not being a user of them, how I would display them could be a low-budget solution!

Thank you,

Mark

Re: Complex numbers - ideal display representation?

*Message #2 Posted by **hugh steers** on 6 Aug 2009, 5:33 p.m.,*
in response to message #1 by Mark Edmonds

this came up during the uWatch complex number feature. we had a 16 char line. the problem is that this is not enough to display all of both parts of the number. The same is the case for you with 22 (although it's nearly enough). so firstly, there needs to be a "show" button that shows all the digits. Since i had 2 lines, my show feature simply displays all of both parts, one on each line.

then there was the very good idea to use custom chars to create +i and -i characters, so that 1 character is saved on the line. There were also people who wanted "j" instead of "i". this was not implemented in the end, but was a good idea. You could do the same with exponents too if you get fancy.

then there's the problem of polar forms. if you support polar forms, how do you display them. i didn't, but we did think about it.

what happened in the end is that it tries to fit as much as possible in the space. when both parts are competing, i show more of the real part than the imaginary part. something like 8 vs 5 digits. Also, i implemented a tidier that tries to compact the string representation eg 0.1 -> .1 and 1.23e-07 -> 1.23e-7 and a few things like that. this only happens when you're short of space, because when you want to display the real number 0.123, it's nice to have the "0." for clarity.

Re: Complex numbers - ideal display representation?

*Message #3 Posted by **Mark Edmonds** on 6 Aug 2009, 5:59 p.m.,*
in response to message #2 by hugh steers

Thanks Hugh - you've already given me some good points for thought.

I was banking on using 2 lines so if I did it this way, some questions:

1. Should there be a comma between the parts at the end of line 1?

2. Are thousands separators useful?

3. For the i or j, should this be a prefix or suffix on the imaginary part?

4. Space character between the number and the i or j?

5. For polar mode, if I use an angle symbol (128 CHR on a 48), use this as a prefix and again, with or without space and the number?

6. Should the both parts be enclosed in one pair of brackets?

The starting format of the number will be the current mode the 48 is set to which determines various factors and there will be no interaction once the formatting is done as this is simply for display purposes only.

Thanks,

Mark

Re: Complex numbers - ideal display representation?

*Message #4 Posted by **hugh steers** on 6 Aug 2009, 6:40 p.m.,*
in response to message #3 by Mark Edmonds

If you're using two lines, then 22 chars per line ought to be plenty without any tricks. you're going to need a way to make this visually look like one result rather than two numbers on the stack. You might like to experiment with using "i" or "j" maybe with a leading space. However, i don't have an answer for what might look best on two lines.

As Raymund has pointed out there's also the (a,b) format. I didnt use this on a single line since the brackets take up space, but on two lines, maybe it works.

> Quote:
>
> 1. Should there be a comma between the parts at the end of line 1?

No.

> Quote:
>
> 2. Are thousands separators useful?

I like them, some may not. Can't it be left as a personal choice?

> Quote:

> 3. For the i or j, should this be a prefix or suffix on the imaginary part?

Prefix.

> Quote:
>
> 4. Space character between the number and the i or j?

Hmmm. 1.2345 + i6.7890 or 1.2345 + i 6.7890. Nah, no space necessary.

> Quote:
>
> 5. For polar mode, if I use an angle symbol (128 CHR on a 48), use this as a prefix and again, with or without space and the number?

Yes prefix. No space.

> Quote:
>
> 6. Should the both parts be enclosed in one pair of brackets?

If you are going to use two lines, I guess you need to somehow identify that the two lines represent a complex number. I loathe the brackets or parentheses or whatever that the 48/49/50 insist on putting around complex values. Maybe indent the bottom line (imaginary part or angle) one space from the top line (real or magnitude.) That, plus the "i" or angle symbol on the bottom line should sufficiently identify the two values as a single complex number.

Just my two cents. For numerous posts on how complex numbers should be entered, displayed, and in general handled by the "perfect" calculator, search the archives for posts by me and/or Karl Schneider. (for example, here and here.)

I agree with Jeff on most points. Differences:

> Quote:
>
> 4. Space character between the number and the i or j?

I vote for a multiplication sign: 1,2345 + i*6,7890 or the same with "j".

> Quote:
>
> 6. Should the both parts be enclosed in one pair of brackets?

No brackets. Indentation plus "i" will do.

My 0,02 Euros only.

Re: Complex numbers - ideal display representation?

*Message #7 Posted by **Raymund Heuvel** on 6 Aug 2009, 6:20 p.m.,*
in response to message #1 by Mark Edmonds

The HP71B with Math-Pac display complex nummers like (123,456).
Furthermore FIX/SCI/ENG modi are supported.
So i:=3.1415, j:= 2.5 in SCI 2 results in (3.14E0,2.5E0).
Also entering complex values is possible in the form (i,j).

Re: Complex numbers - ideal display representation?

*Message #8 Posted by **John Cadick** on 6 Aug 2009, 8:05 p.m.,*
in response to message #1 by Mark Edmonds

I use complex numbers a lot. A couple of points:

The use of 'i' and 'j' in complex numbers is not the same as it is in vectors. In vectors the 'i' unit vector is the vector of unit length and 0 degrees. The j vector is a vector of unit length and 90 counterclockwise degrees. The 'k' vector is unit length at 90 degrees to the plane formed by 'i' and 'j' vectors.

For complex numbers, both 'i' and 'j' are unit length at 90 degrees. Mathematicians use 'i' and electrical engineers use 'j' because the letter 'i' is used for current flow.

You mentioned pretty print which would require the format a + ib (or a +jb for electrical engineers). If polar form is to be included it should be a/_30 where the /_ is the angle sign (alpha-shift-6 on the HP49G for example.

The 42S (as in Free42) uses about as the best implementation for a scientific. The 48G through 50G calcs have the overall best. (My opinion)

My $3.50 worth (that's 2 cents with inflation.)

*Message #9 Posted by **David Hayden** on 6 Aug 2009, 8:49 p.m.,*
in response to message #1 by Mark Edmonds

Here's an idea that I haven't seen mentioned.

Think of the display as a window into the real and imaginary parts of 4 numbers. So normally, it shows the real part of 4 numbers. Press a button and it shows the corresponding imaginary parts of the numbers. Press the button again and it toggles back to the real part.

In other words, the way to efficiently show complex numbers is: "DON'T". :) Instead let the user toggle back

and forth between the real and complex parts.

You could use a single character on each line to indicate that there is a complex part of the number. This would serve as a hint to the user. You'd also need an indicator to tell whether the display is currently showing the real or complex part of each number.

This doesn't help with polar representation much. I suppose you could have the display toggle between angle and magnitude, but that might be awkward.

This *does* solve the problem of using "i" vs "j" for the imaginary part since you don't need to show either. Perhaps the real/imaginary indicator could show "i" or "j" depending on the user's preference.

In fact, it's wasteful of display space to show the entire real part or entire imaginary part at once. If the precision is 12 digits, you could use a key to switch between the leftmost six digits and the right most six digits of each part.

Obviously I'm being facetious to make a point, though the Casio Mini, introduced in 1972, did exactly what I've described.

If I've got a complex number in the stack, I want to see all of it, even if that means that by default I see fewer decimal places. I don't want the imaginary part to be hidden, because that might mislead me into thinking that it is a real number.

*Message #11 Posted by **Egan Ford** on 7 Aug 2009, 11:00 a.m.,*
in response to message #1 by Mark Edmonds

After reading this thread it should be apparent that there is no single ideal. If you are going to implement something on something, then I'd suggest that you support 2 or 3 of the most popular and allow the user to select. You may also need sub options, e.g. I want 'i', not 'j'. For the advanced user perhaps you can allow them to store a printf/scanf format string. For me flexibility is ideal.

I suppose your next question would be, "what is the ideal way to input complex numbers?"

Re: Complex numbers - ideal display representation?

*Message #12 Posted by **Mark Edmonds** on 7 Aug 2009, 2:25 p.m.,*
in response to message #11 by Egan Ford

Thank you everyone for your input - all very useful and has given me far more insight into what people want than I would have deduced myself.

One thing I perhaps ought to clarify is that this requirement is for output only. I may not have made this clear in my original post. The intention is to display a complex number in a format that is technically correct, "textbook" style and independent of the format used for entering the values. Originally, I wasn't going to support complex numbers in the program but as the method of display used in the RPL calcs is more of a generic number pair display, I decided to include it and the code overhead isn't going to be too heavy.

Thanks again for all the help and suggestions.

Mark

Re: Complex numbers - ideal display representation?

*Message #13 Posted by **Karl Schneider** on 7 Aug 2009, 3:40 p.m.,*
in response to message #1 by Mark Edmonds

Mark --

Quite a bit of input here. Like John and Jeff, I am a power-system engineer who uses complex numbers routinely. Here is an archived post of mine:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=63415#63415

The HP-42S, in my view, offers the ideal representation of complex-valued numbers. It also has two lines and the ability to display 22 digits per line. Complete, rounded complex numbers can be displayed, even with exponentiated values. SHOW will display the full values of each part of a complex number, one part per line.

I dislike the parenthesized ordered pairs of the HP-71B and RPL-based models, because that representation is ambiguous.

Showing one part of a complex number at a time (rectangular format only) is what had to be done on the HP-15C, due to display limitations. However, it's not the ideal, as imaginary parts can be overlooked.

Memory problem on 48G+

*Message #1 Posted by **Iqbal** on 6 Aug 2009, 3:43 p.m.*

I have a program about 40KB on my 48G+. I tried to transfer another program about 44kb. It started to transfer, but I believe one had weak batteries and it stopped during the process. I tried again another day and the program was successfully transferred. So my calculator should have around 40kb remaining. However it only shows a small amount of memory available (around 6kb). I cant find this unaccounted memory anwhere. I did memory reset, and now all the memory is available. Any explanations on where that memory was hiding?

GTO Go back to the main exhibit hall

early HP-80 restoration and Tallnut HP-41C question.

*Message #1 Posted by **Geoff Quickfall** on 5 Aug 2009, 5:29 p.m.*

Hello all,

Just repaired a minty HP-80 with the metal strip below the red lens and above the numbers. I knew it was an early version with the metal strip but the lower label at the foot of the calculator stated "HEWLETT PACKARD 80" indicating a later case badging. Apparently this had never been opened as witnessed by the intact perfect label on the back.

HP-80:

```
Condition:

-  back label intact(as new)
-  functions on adapter only
-  minty although very dusty
-  lower back label states made in USA, patent pending contrary to
   my my 1973 version which has the serial number embossed on the
   lower label and made in Singapore.
-  no serial number in the battery hatch as with the early versions
-  the badge at the end says "HEWLETT PACKARD 80" which indicates
   a later version.
-  this has the metal strip between the lens and the keys above the
   OFF/ON switch

Repair:
-  clean all contacts
-  clean case
-  clean keys
-  wash logic PCA and keyboard PCA
```

Upon removing the battery hatch to gain access to the screws I noticed no serial number in the battery hatch area (early versions) or on the bottom label between the lower feet (later versions) which is typical.

The ICs are all coded 72. The clincher is that I found a small sticky label under the PCA attached to the battery frame with the follwing number: 1247A43253. That makes it one of the first made according to the HP Museum and made prior to the release date in January, 1973! Conclusion:

It would appear that this calculator with the serial number 1247Axxxxx was sent in for repair and a new back label attached as well as a new badging at the foot. The serial number was probably removed inside the hatch to indicate that this was repaired under warranty and the paper serial number added.

Any one else come across this type of serial number and rebadging after repair?

Also, when was the last year of the Tallnut key version of the HP 41C?

In any case, a lucky find, I think.

Cheers,Geoff

Re: early HP-80 restoration and Tallnut HP-41C question.
*Message #2 Posted by **Dan W** on 5 Aug 2009, 8:10 p.m.,*
in response to message #1 by Geoff Quickfall

There are people who know how to remove and replace the metal plate without leaving a trace. Also I have seen NOS back plates, as well as reproductions, on eBay - for those who can't.

It is possible you have a "Frankencalculator", one built up of spare parts. In my parts bin I even have a few of those rolled up paper serial number tags (including coincidentally, one with a 1247 datecode).

Re: early HP-80 restoration and Tallnut HP-41C question.
*Message #3 Posted by **Geoff Quickfall** on 5 Aug 2009, 9:14 p.m.,*
in response to message #2 by Dan W

I would normally agree accept that:

```
-  the PCA date codes were correct.
-  There was a dead LED block which I removed and replaced.  The
   code on the block was 1972.
-  the case top is correct; i.e. missing the raised OFF/ON markings
   the later ones have.
-  the case top is correct; i.e. the metal top bar instead of
   paint.
```

In other words, the only non-1972 stuff is the missing serial number in the battery hatch and the "HEWLETT PACKARD 80" at the foot. Both of these attached to the correct electronics, case bottom and case top.

The calculator was sold 'as is' for $35 dollars so all the work to make it a franken-calculator copy by smoothing out the original label or supplying a new one would appear to be for naught. Also why fake the serial number UNDER the PCA where it would not be seen except by a repair person.

One more point, not that I am trying to convince anyone, the logic PCA is older; 7202 versus 7210 found in my correctly serial numbered version stamped 1247-xxxxx.

I am aware of the ability to heat the label, remove it, remove the glue, then smooth it inside a vinyl card holder. This has the effect of saving the label for later use after a restoration. In fact there is a section on that in my book.

So, I am thinking that HP probably removed the metal serial number inside the battery hatch and replaced it with a type written serial number inside the calculator to indicate that it had been in for warranty work. Similar to a watch maker inscribing a code or date inside the back of the watch indicating work done and when.

The fact that you have some of the rolled up serial number tags suggests a few frankens around or some type of HP procedure to identify warranty repairs.

Just speculation at the moment.

Cheers, Geoff

Re: early HP-80 restoration and Tallnut HP-41C question.

*Message #4 Posted by **Michael de Estrada** on 6 Aug 2009, 1:33 a.m.,*
in response to message #3 by Geoff Quickfall

Geoff,

I own or have owned all 4 versions of the HP-80, to wit:

Version 1 - metal trim strip and "Hewlett Packard" on front label

Version 2 - metal trim strip and "Hewlett Packard 80" on front label

Version 3 - silver painted trim strip and "Hewlett Packard 80" on front label

Version 4 - silver painted trim strip and "Hewlett Packard 80" on front label and OFF / ON labels raised molded and not painted

Now, all 7 of these calculators have/had the serial number prefix 1247A. The only difference was in the following 5 digit sequence number. The version 1 is 07486 and the version 4s are 53367 and 58340. So this whole bit about the prefix being the year and week of manufacture is pretty much off base. I'd say the sequence number is the better indication of the manufacturing date.

The 43253 sequence number that is shown on the paper s/n in your photo is consistent with the numbers on my version 2s, which are 27000, 44973 and 50245.

I can believe that HP would replace the back label, but why bother with the front label, that does not have to be disturbed when opening.

Therefore, it appears to me that you have a version 2, not a version 1, and that nothing has been changed.

As far a Dan's comment regarding the aftermarket non-OEM back labels, I bought some of these, and they are all identifiable by their lack of the bottom text "MADE IN U.S.A., PATENT PENDING, 3.75V 500 MW". When I inquired with the seller of the label as to why he didn't include this, I was told that he didn't want to violate any laws, which helps prevent fakes from being made like the fake RED DOT that was recently on eBay.

Michael

Re: early HP-80 restoration and Tallnut HP-41C question.

*Message #5 Posted by **Geoff Quickfall** on 6 Aug 2009, 2:52 a.m.,*
in response to message #4 by Michael de Estrada

Spot on Michael,

Yep, with your numbers I have a two, three and four version.

Thanks for the insight.

Also, I was told that HP would swap out scratched labels for new labels. So although the series number puts it in version two, it would not be rare to find a version one series number with a version two badge. The example I was given was an HP-25 sent for service under warranty. It had a

scratch on the badge at the foot of the calculator "HEWLETT PACKARD 25". It came back as a "HEWLETT PACKARD 25C" which it was not!

Also the inside typed serial number was a service item done after warranty.

Cheers, Geoff

p.s i had two HP-80 that did not work this morning and now have two fully functional nice looking ones going now. Granted one of them has an HP-55 LED block inside the display now instead of the dead segments on the original.

Edited: 6 Aug 2009, 3:08 a.m.

The prefix

*Message #6 Posted by **Frank Boehm (Germany)** on 6 Aug 2009, 4:41 a.m.,*
in response to message #4 by Michael de Estrada

The prefix is a "product revision" date. For example, the 35s were made starting about 7215, still the "1143" (aka 7143) revision has been used for mass production. There even was a later 1146 revision (obviously long before public release), which hadn't been used. And remember: The 1143 represents the red dot and V2, even early Singapore units have a 1143 prefix. So using the prefix is only a rough indicator of the manufacturing date, the postfix is a much better indicator, best would be to check the chip dates, which should be very close (2-4 weeks) to actual manufacturing date.

Re: The prefix

*Message #7 Posted by **Joel Setton (France)** on 6 Aug 2009, 5:15 a.m.,*
in response to message #6 by Frank Boehm (Germany)

Folks,

The prefix is not the week the calculator was manufactured. It is the week when the *the last engineering change* was made to this specific model.

The same prefix is then used on all subsequent production of this model, until another engineering change is implemented and the prefix changes once again.

In other words, a 1247 prefix means that the calculator includes a technical change that was first implemented in the 47th week of 1972. This particular calculator with the 1247 prefix may have been manufactured in the last month of 1972, or in 1973.

In theory, two calculators with the same prefix are completely identical when they are shipped from the factory, except for their serial numbers (the postfix). Of course this may no longer be true after repairs are made.

I hope this helps!

Joel Setton

Okay, now I am confused..

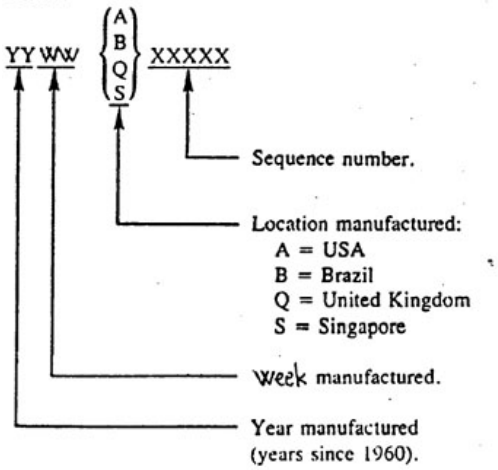
*Message #8 Posted by **Geoff Quickfall** on 6 Aug 2009, 12:46 p.m.,*
in response to message #7 by Joel Setton (France)

I accept the postfix/prefix argument as making the most sense. That is the first time I have read or seen this explanation but it would certainly explain the anomalies in case style, badge style and internal date codes.

However, here is a copy of the HP-41C manual, page 1-2 section 1.9:

1-8. IDENTIFICATION

1-9. The serial number of the calculator is used for identification and determination of warranty status. It is located on the bottom case at the upper right-hand corner, adjacent to the I/O ports. Its format is described below:



You can see it does not mention revision dates, ALTHOUGH that could be implicit in the explanation as this manual was for staff and licensed repair shops. That is, Year of manufacture may actually refer to the chip set revision.

Any more thoughts before I commit information to the book!

Cheers, and thanks to all, Geoff

Re: Okay, now I am confused..

*Message #9 Posted by **Dan W** on 6 Aug 2009, 1:14 p.m.,*
in response to message #8 by Geoff Quickfall

The HP-97 Service Manual says the first 2 digits are the years since 1960, and the second 2 digits are the MONTH manufactured (pg 1.1).

Interesting! It appears the definition of the second 2 digits has changed from time to time.

For the earlier Classics, if the second 2 digits did in fact represent weeks, we should see examples from every week. But I would wager there are only a handful of variants.

Re: Okay, now I am confused..

I bought my calculator from a London store called Metyclean (don't know if they still exist). Going by the formula, my HP 41CX would have been manufactured in Singapore on 26 November 1983. (25 years and still calculating :-)

does anyone know what is HP policy with regards to production and sales of their calculators? I also have a 12C that was made in Malaysia which is where I live. Would HP sell in Malaysia a HP 12C that was made in USA or Brazil, for example? of course now, all HP calculators are made in China, AFAIK.

Re: Okay, now I am confused..
*Message #13 Posted by **Eric Smith** on 6 Aug 2009, 11:24 p.m.,*
in response to message #11 by Mark Edmonds

It's possible that no calculators were made in the UK, but that some accessories (e.g., mains adapter) were.

Re: Okay, now I am confused..
*Message #14 Posted by **Joel Setton (France)** on 7 Aug 2009, 2:56 a.m.,*

I think this may be a typo... IIRC, products manufactured in the United Kingdom used the letter U. HP had a factory in Scotland (South Queensferry) but it made telecom-testing instruments, I don't remember any calculators being produced in that facility. Of course that was more than 25 years ago, I hope other HP old-timers have a better memory!

That was true of HP products other than calculators, and of early HP calculators. However, at some point they realized that the run rate for calculators was too high for that to work effectively, and they switched to using the actual manufacturing week for the prefix.

I'm not sure when that switch occurred, but I suspect that it was before or at the introduction of the Woodstock series.

Re: The prefix

*Message #16 Posted by **Geoff Quickfall** on 6 Aug 2009, 1:46 p.m.,*
in response to message #15 by Eric Smith

Hello and thanks all!

So nothing is as easy as it seems but this appears to be the timeline on the postfix/prefix deal:

```
-  non calculators    *  revision date introduction/country/sequence number.
-  early calculators  *  revision date introduction/country/sequence number.
-  calculators post classic (around the woodstock era), with a change from month to week for the second digit
pair
   some where between HP-97 and HP-41C:
                      *  manufacture date/country/sequence number.
```

Not that it is life or death but I want the introduction to be factual.

Cheers, Geoff

This would simply mean that the chips were made in 1973, and the last engineering change to the calculator was in the 47th week of 1972. It makes sense, as the chips are obviously older than the calculator.

Joel Setton

Re: early HP-80 restoration and Tallnut HP-41C question.
*Message #19 Posted by **Ken Shaw** on 7 Aug 2009, 2:46 p.m.,*
in response to message #18 by Joel Setton (France)

It does make sense.

Also, it's apparent that the "1247A" part of the serial number is pre-printed on the label, with only the last 5 digits imprinted.

If "1247" was in YYWW format, this would be a very cost-inefficient method of producing the labels.

Hi Geoff,

A little OT, but what did you mean by "washing" the PCA's?

-- Dan

Hello Dan; Washing the keyboad...

*Message #21 Posted by **geoff quickfall** on 10 Aug 2009, 2:32 p.m.,*
in response to message #20 by Dan W

When I restore a calculator, especially one with corrosion due to either battery leakage or out gassing I use a wash on the PCA.

```
a:  To remove any vertigris (green or white precipitate) I rinse
   (wash) the PCA with a mild vinegar solution followed by a
   distilled water rinse and then 95% anhydrous ethanol (in Canada
   thats known generically as 95% rubbing compound).

b:  For stickey keys, a very dilute soap and water wash with water
    rinse and anhydrous ethanol rinse

c:  If there is no corrosion or stickey keys I use the water wash
    followed by the anhydrous ethanol rinse.
```

Of course, sticky keys with corrosion would get both treatment a and b.

Heat staked keyboards with bouncy keys or even intermittant keys respond well to this and I have resurrected bad keyboards on:

```
Woodstocks
Coconuts
Voyagers
Pioneers
Stretch Pioneers
```

Of course the Classics and Spice keyboards can be diassembled and cleaned mechanically.

Cheers, Geoff

Medical Pac 1 for HP-65

*Message #1 Posted by **Matthias Wehrli** on 5 Aug 2009, 6:11 a.m.*

Can somebody let me know the HP code? 00065-670.. Does anybody has a manual?

Thanks, Matthias

Re: Medical Pac 1 for HP-65

*Message #2 Posted by **Didier Lachieze** on 5 Aug 2009, 8:14 a.m.,*
in response to message #1 by Matthias Wehrli

According to the first number of HP Key Notes (V1N1p7) the part number of the HP-65 Medical Pac 1 is 00065-67004. I don't have the manual, but it's part number should be 00065-90211.

There is a nice presentation of some of the HP-65 Pacs HERE.

in response to message #2 by Geoff Quickfall

A agree with Geoff Quickfall. The modification in the calculator will not be very much, you could easyly do it by yourself. The problem will just be the software. as long as this is not a complete set the price is muuuuuuuuch too high.

Matthias

> It sure answers questions.

Yes. At least we know for sure now, that it is no "flight computer", but a programming device for a specific multifunction display. I strongly doubt, that these displays are "readily available on Ebay" (or anywhere else), as the seller claims. And without the Bendix unit, the calculator is pretty much useless, isn't it? Even

as a collectibe...

Happy landings, Max

HP and Bendix and the Canadian Quickie, any other weird applications for HP out there?

*Message #5 Posted by **Geoff Quickfall** on 5 Aug 2009, 1:02 p.m.,*
in response to message #2 by Geoff Quickfall

I must say it would certainly be interesting to have the complete unit for 1500 (not that it is in my budget). But the actual Bendix colour display, the interpreter for generating alpha characters on the HP-67 and the HP-67.

I remember seeing and bidding on an alpha generator for the HP-67. The seller did not know what it was intended for and did not have the instructions for accessing keys. From what I read on the current auction the sheet of paper posting indicates that a through Z can be accessed by a series of key pushes. The alpha code can be scanned onto a card and used as "alpha" prompts for data input.

Pretty slick, an alpha numeric HP-67, MY DREAM MACHINE!

I remember being at an air show in 1986. There was an aircraft with a large canard called the Canadian Quickie (no relation!).

Canadian Quickie

In the cockpit was an HP 41CX which sat in a cradle and was hardwired through a modified module to the digital Bendix dashboard (all LEDS). This allowed the HP to access the digital data from the aircraft sensors, OAT, IAS, TAS, Temp, Altitude and etc. It provided the pilot with an flight *dynamic* management system.

Cheers All, Geoff

Cases, especially for 200LX

*Message #1 Posted by **P.Hart** on 4 Aug 2009, 10:04 a.m.*

I bought a HP 200LX second-hand about twenty years ago (and it still works fine) contained in a black leather wallet which seemed to be made to measure. The 200LX fits snugly in a pocket on one side. There are four slit pockets on that side and four on the other, each pocket able to accommodate a SRAM card for the 200LX. The two sides fold together to close and are secured with a strap with press stud. “GENUINE LEATHER” is embossed inside the wallet. There are some letters embossed very faintly on the outside in two lines within a rectangular cartouche which might read in part “ ???? POCKET”, “P S HIDE”. Does anyone know whether my case is an accessory provided by Hewlett Packard? Or what other provenance it might have?

On the subject of cases, I have bought new HP machines 71B, 41C, 48SX, 49G, 49g+ and 50g. The zipped cases for the first three could be scrunched up and stuffed in a pocket and the 49G could be held in its cover while the instrument was in use, but what do you do with the stiff, awkward cases for the last two while wandering around using the calculator? Is this yet another sign that HP calcs are no longer made by people who know how they are used?

Re: Cases, especially for 200LX

*Message #2 Posted by **Dave Britten** on 4 Aug 2009, 1:31 p.m.,*
in response to message #1 by P.Hart

That's my exact grievance with the 35s case. The stupid thing is so large and rigid that it makes the calculator no more portable than a 48! But of course, they did make the calculator just a tiny bit larger, so that it doesn't *quite* fit properly in a Pioneer case. Ho hum.

Re: Cases, especially for 200LX

*Message #3 Posted by **Hal Bitton in Boise** on 4 Aug 2009, 1:39 p.m.,*
in response to message #1 by P.Hart

With the 50G case, you could tuck the open flap under your belt, or into your waistband. In the days when there were belt loops on calculator cases, this was a non-issue. In the late 70's, I carried my HP-29C everywhere on my belt and thought nothing of it. Doing so today draws uproarious laughter from my wife and son ;(
Best regards, Hal

What's so special about this 71B?

*Message #1 Posted by **Keith Midson** on 4 Aug 2009, 6:20 a.m.*

This ebay listing is going crazy - item: 220460807506. Up to USD510. Does anyone know if there is a logical reason for this? Is it something rare, is the math module something special? Or is it just a bidding war? I'm curious. Cheers, Keith

Re: What's so special about this 71B?

*Message #2 Posted by **Walter B** on 4 Aug 2009, 6:31 a.m.,*
in response to message #1 by Keith Midson

Well, the math module is something special, but no reason to go that high IMHO. I'd have guessed a total of 200 US$ being reasonable still. Anything exceeding this must have other "reasons".

Re: What's so special about this 71B?

*Message #3 Posted by **Howard Owen** on 4 Aug 2009, 10:19 a.m.,*
in response to message #1 by Keith Midson

It's in unusually nice condition, too, if the photographs can be trusted. Still the current value has me scratching my head.

Regards,
Howard

Re: What's so special about this 71B?

*Message #4 Posted by **Geoff Quickfall** on 4 Aug 2009, 12:04 p.m.,*
in response to message #1 by Keith Midson

I don't get it either, unless someone REALLY wants a clean version. What is surprising is no HPIL either!

The math module and the faux leather case are both rare and the unit looks clean but still, 200 would suffice on a normal day!

Cheers, Geoff

Re: What's so special about this 71B?

*Message #5 Posted by **PeterP** on 4 Aug 2009, 1:34 p.m.,*

Re: It's not a Casio calculator

*Message #8 Posted by **Mark Edmonds** on 4 Aug 2009, 3:47 p.m.,*
in response to message #7 by Joerg Woerner

These prices are completely crazy. There is a Casio that I can understand going for a high price (successor to the 602P) but even $200 for that would be high. What on earth is going on?! Wish I had something like that to sell!

I saw an HP go recently for an eye-popping price that made no sense. There is also a manufacturer of camera filters that I attempt to bid on sometimes but recently, people have been paying more than shop prices for second-hand filters or near-new prices for filters with scratches on them. Total madness, especially when all they've got to do is place an on-line order with a dealer to get brand-new.

If anyone knows the trick to get people into obsessive bidding-wars on listings, please let me know! I want to exploit that myself :)

Mark

> That kinds of put a damper on my quest to acquire a HP-71B...

The 71B is an awesome machine. A must have. I strongly recommend the Math ROM and if you like Forth/RPN the 41 Translator ROM. Don't give up. I have had good luck with eBay and the

museum classifieds (http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/adforum.cgi).

For eBay use Auction Sniper and create a bid group. Each time you see a 71B you like put it in your bid group with the max price you are willing to pay for each different 71B (don't forget to set the max number of wins to 1, or you could end up with too many 71Bs).

As for the classifieds here, you can post a request or make an offer. There are 71Bs there now. The classifieds prices are fair (better than eBay).

In the short term get EMU71. It can use any ROM image. It's exactly the same, just faster, and runs on any platform (even Linux and OS/X).

One can feel remarkably secure from an anonymous Internet Cafe ;-)

Dave.

Re: It's not a Casio calculator

*Message #16 Posted by **Mark Edmonds** on 6 Aug 2009, 1:34 p.m.,*
in response to message #11 by John Robinson

Here is a link with photo. It does seem to be a 16C equivalent but with a much smaller feature set. Elsewhere, I saw it listed as being released in 1986.

http://www.devidts.com/be-calc/poc_13622.html

If the 1986 date is accurate, the following year, HP released the 28C which does everything that the CM100 appears to do in terms of binary maths.

Early HP-41C PCA picture as well as memory problem...

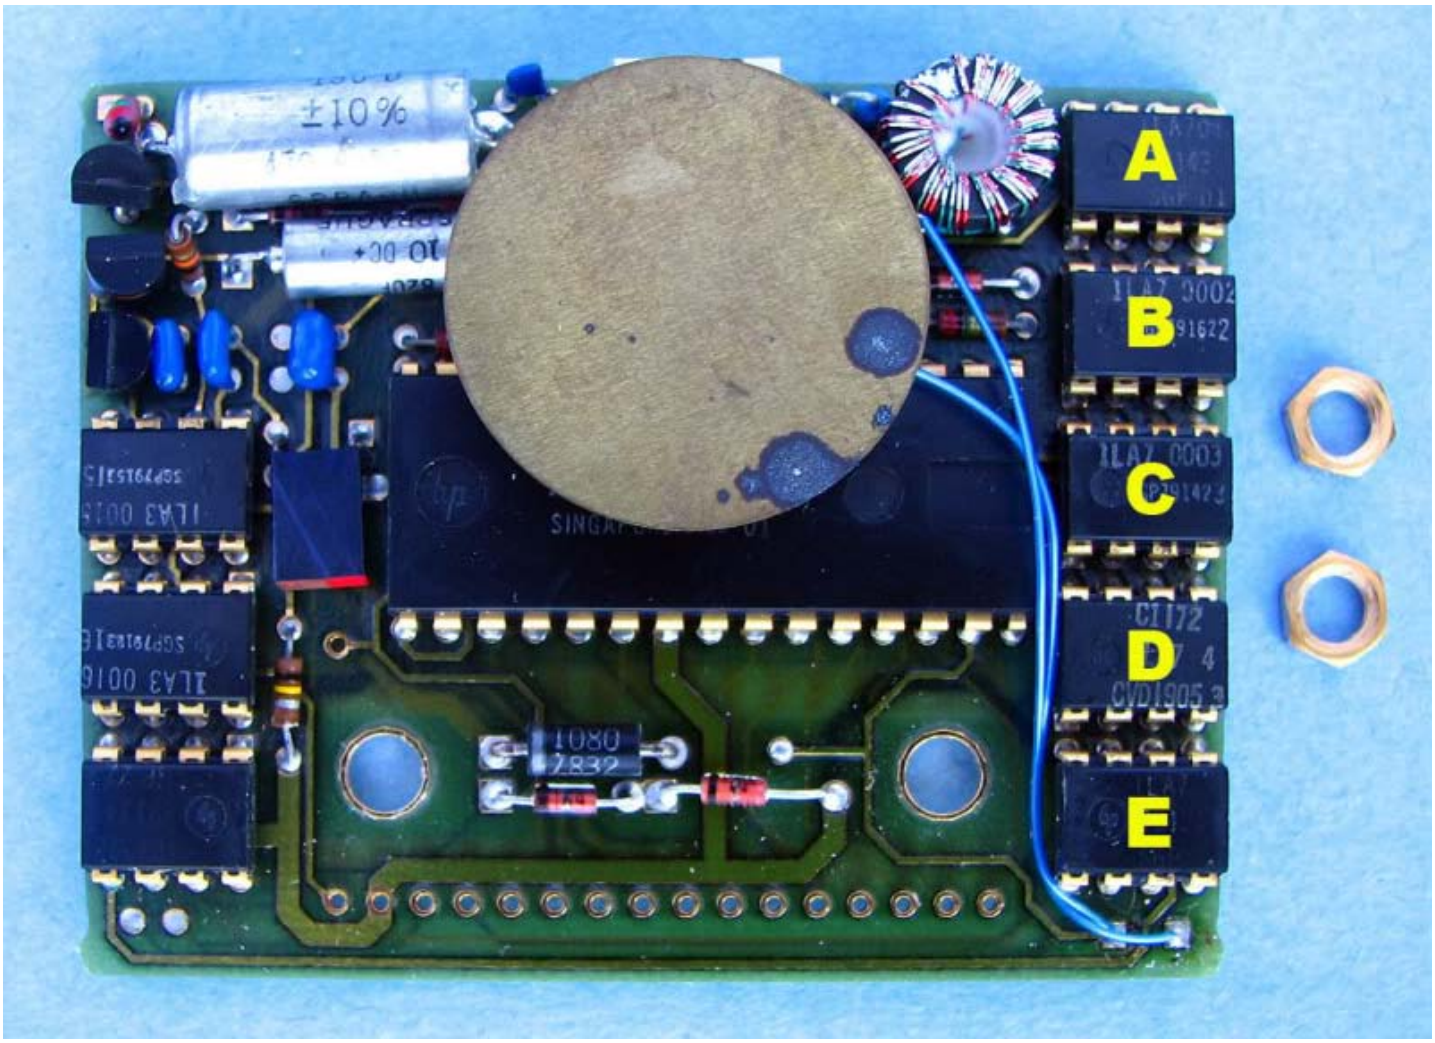
*Message #1 Posted by **Geoff Quickfall** on 3 Aug 2009, 8:06 p.m.*

HP-41C 7931Axxxxx tall keys with ac contact balls and all the bugs! Just one problem:

Setting size equals zero results in program memory totalling 47 instead of 63. Obviously one of the D/S chips is shot as each chip is 16 56-bit registers. Which one though? All programs function in the allotted memory. The machine acts normally except 47 registers instead of 63. Since the curtain moves between program memory-registers and machine memory could it be the last D/S chip that is unserviceable?

Here is a shot of the PCA with the defunct D/S chip. Since I do not have a service module (anyone out there willing to throw one at me for free ;-) am I correct in my assumptions that:

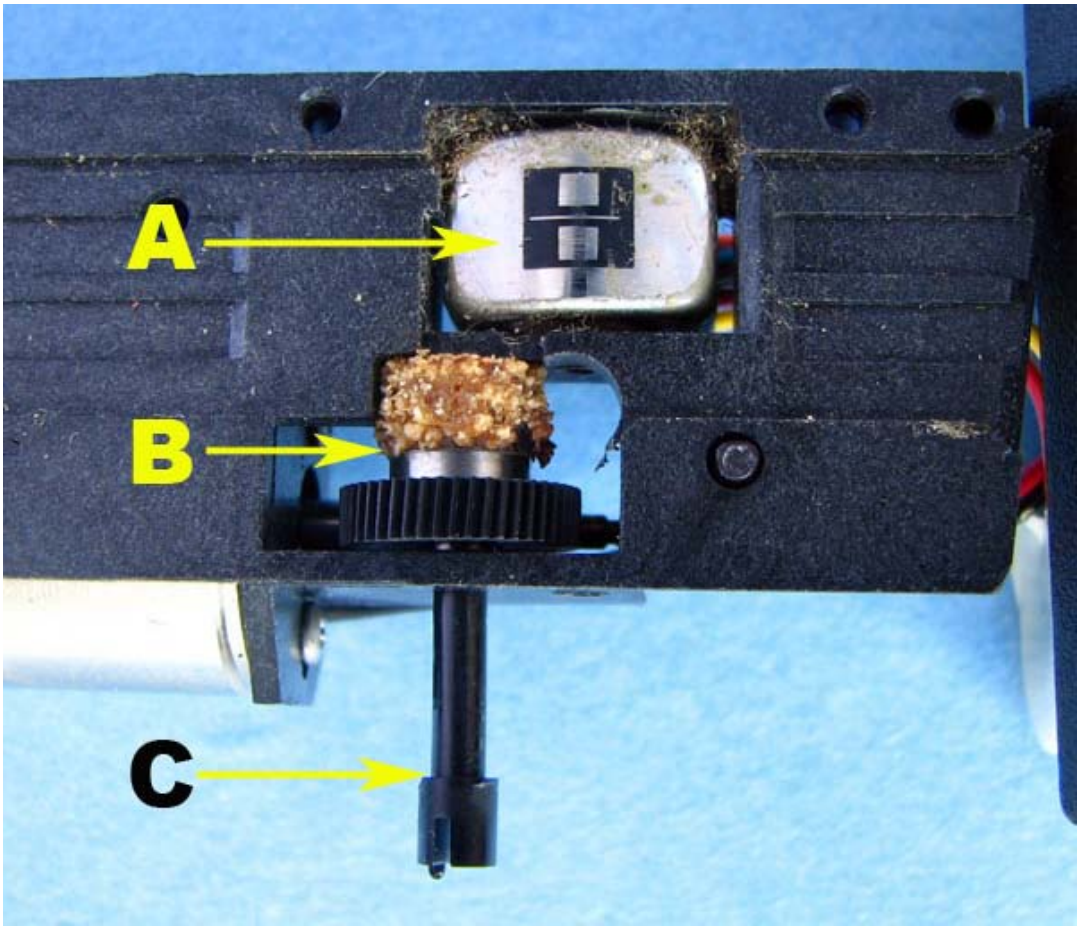
```
a.     it is the last 16 bit D/S chip (63-47=16)that is shot and
b.     it is chip marked E in the figure below.
```

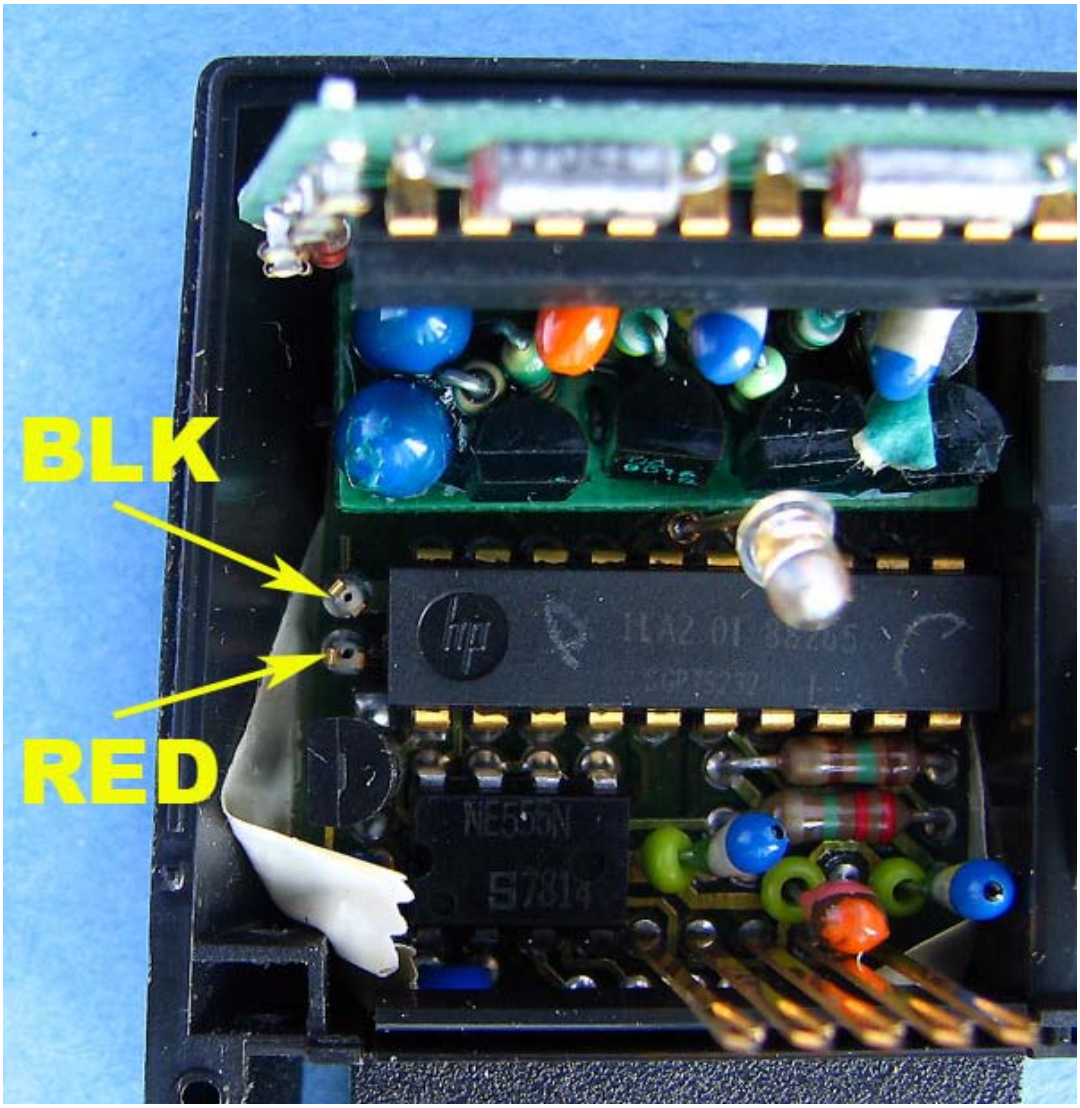


Note the hex nuts that hold this in place!

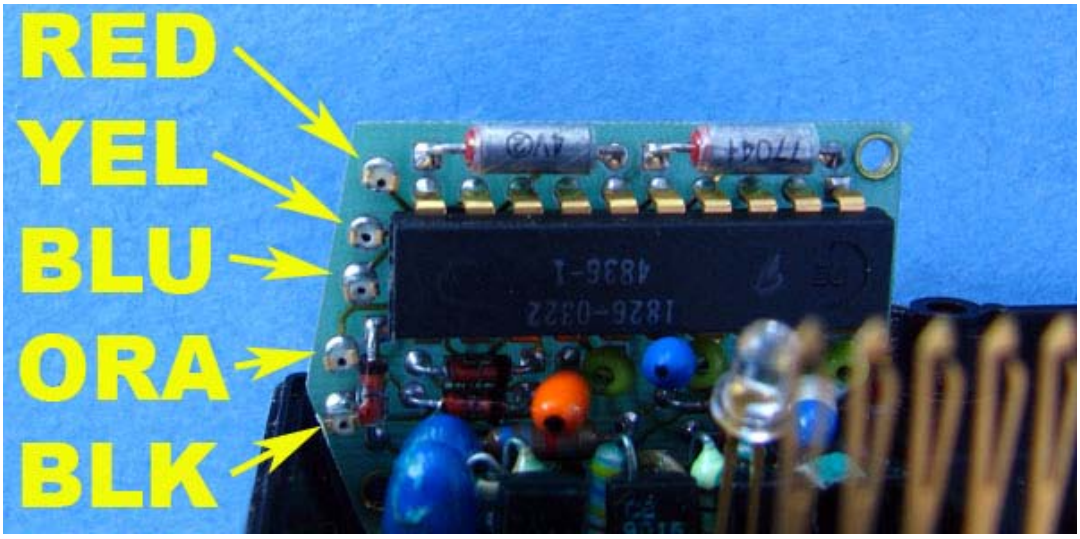
Here are some off topic pictures of the card reader internals going into the manual. Just trying to pique your interest.

By the way, what is the correct term for the wire connectors pictured in the second and third pictures below, I think the term starts with a Z (zygat)?





BLK
RED



RED
YEL
BLU

Re: Early HP-41C PCA picture as well as memory problem...

*Message #8 Posted by **Eric Smith** on 4 Aug 2009, 3:54 p.m.,*
in response to message #1 by Geoff Quickfall

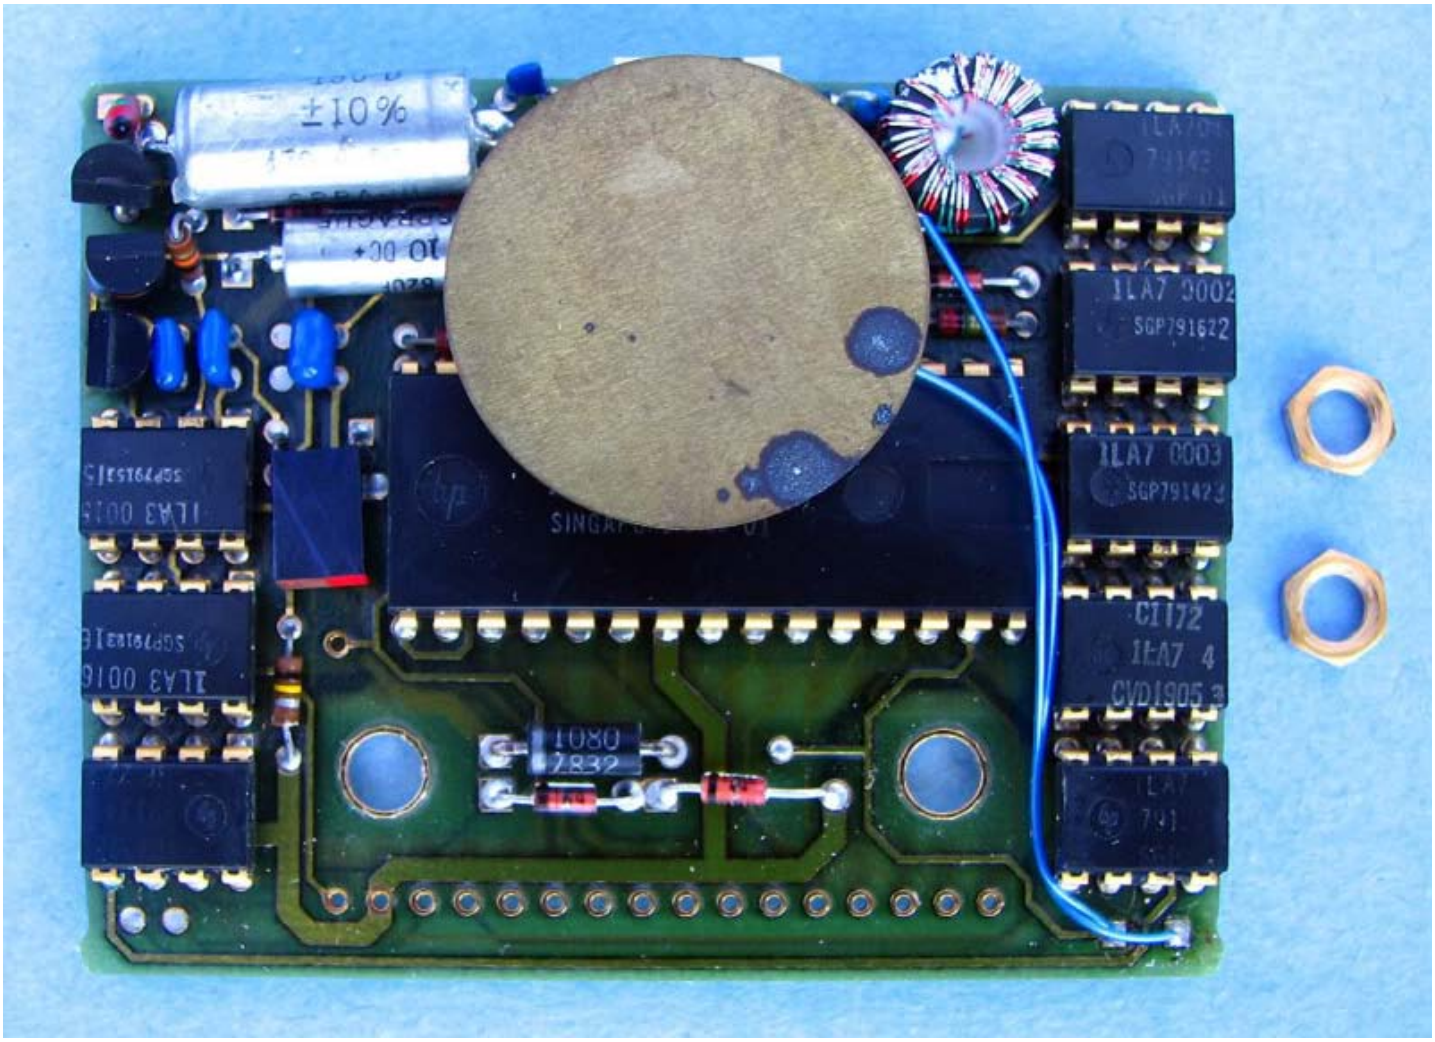
The bad chip should be the one marked 1LA7-0005 (or 1LA7-05). I can't read the markings on the chip you labeled "E", but that's probably it.

If you do a "0 SIZE" and plug in one or more memory modules (starting with port 1) or a single quad memory module, you should be able to address their registers starting at register number 16. There will be a gap from 0-15 for the bad chip.

You could replace the complete set of 1LA7-0002 through 1LA7-0005 with a single 1LE7-0001 or 1LH5-0001 (but keep the 1LA7-0001). If you also added the 1LE7-0002 through -0005 (or 1LH5), the result would be a CV.

Re: Early HP-41C PCA picture as well as memory problem...

*Message #9 Posted by **Geoff Quickfall** on 4 Aug 2009, 5:27 p.m.,*
in response to message #8 by Eric Smith



Thanks Eric, still not clear but yes the one labelled E is 1LA7-005.

So the repair has now entered a new realm. To create an early HP-41C and creat a hybrid CV board.

That would be Gene's call as it is his machine! What to do eh Gene?

Now to source some spare D/S chips so labelled!

Cheers, Geoff

Re: Early HP-41C PCA picture as well as memory problem...

*Message #10 Posted by **Diego Diaz** on 4 Aug 2009, 6:59 p.m.,*
in response to message #9 by Geoff Quickfall

Hi all,

Geoff, although the faulty IC has already been identified as 1LA7 005, you can always configure your Clonix as any of the service modules available:

ET-11966: for HP-41C and Card Reader test

5061-7221: for HP-41C, CV and CX test

ET-11968: for 82143-A printer test

The required files are available at my web, under "Download" on the left.

Best wishes.

Diego

Diego, great idea but I...

*Message #11 Posted by **Geoff Quickfall** on 4 Aug 2009, 10:31 p.m.,*
in response to message #10 by Diego Diaz

don't want to mess with the clonix that I have as it set up with my own ROM images as well as CCD and PPC.

So, I guess I should order another Clonix with the ROM images of the test modules.

Another email to follow!

Geoff

Re: Early HP-41C PCA picture as well as memory problem...

*Message #12 Posted by **Eric Smith** on 4 Aug 2009, 7:41 p.m.,*
in response to message #9 by Geoff Quickfall

I read 1LA3-0015 and 1LA3-0016 for the top two ROMs. Can you make out the designation on the bottom one? Is it 1LA3-0017?

Does this unit have bugs 1-4? I'm guessing that without the service module you don't know the firmware version, but I'd like to try to correlate ROM versions to part numbers.

Re: Early HP-41C PCA picture as well as memory problem...

*Message #13 Posted by **Geoff Quickfall** on 4 Aug 2009, 7:42 p.m.,*
in response to message #12 by Eric Smith

Hi Eric,

Let me take a look under good light and a magnifying lens, but it does have ALL the bugs so version one would be a good guess.

Yep 1LA7 005 production date 7924

Edited: 5 Aug 2009, 12:23 a.m. after one or more responses were posted

Re: Early HP-41C PCA picture as well as memory problem...

*Message #14 Posted by **Eric Smith** on 4 Aug 2009, 8:14 p.m.,*
in response to message #13 by Geoff Quickfall

Sorry, I don't think my request was as clear as it should have been. I'm interested in the markings on the ROM chip at the bottom left of the photo. I think it's probably 1LA3-0022, the earliest rev listed in the service manual.

Eric and Gene

*Message #15 Posted by **Geoff Quickfall** on 4 Aug 2009, 10:28 p.m.,*
in response to message #14 by Eric Smith

Eric

ILA322: date code 7917.

Wasn't you Eric, I have been running a limo service here all day for family, and catch the museum in between runs!

Missed the nuance of the question and just assumed it was about the D/S chips.

Gene, I am game, just have to find some donor D/S as Eric has described!

Also one could hard wire a Quad directly into the board if we can only find a replacement for the bad chip.

Cheers, Geoff

Re: Early HP-41C PCA picture as well as memory problem...

*Message #16 Posted by **Gene Wright** on 4 Aug 2009, 7:56 p.m.,*
in response to message #9 by Geoff Quickfall

Well, it will already be a repaired machine, so it isn't vintage, is it? :-)

So, sure... why bother having to have a QUAD module in this machine if it can already have the full memory? I'll drop the QUAD into the other all bugs machine I have. :-)

So, if we can bump it to the full memory, by all means... if it works and if it still has all my bugs! ha!

(Would the other all bugs machine be of interest to you two to be disassembled to check on stuff? It is a 1932A S/N while the one pictured here is a 1931A S/N)

EMU41, Hdrive1 and a 9114

*Message #1 Posted by **Gerry Schultz** on 3 Aug 2009, 3:14 p.m.*

Hello:

Now that I've gotten EMU41 to run properly under XP on my P4 machine, I've begun moving my programs from magnetic cards to both floppy and PC storage. Moving files to and from the 9114B using EMU41 works great. I've left the hdrive1 declaration in the EMU41.INI file to try to save files to virtual mass storage file but that hasn't worked for me.

I tried renaming the hdrive1 file but that made no difference as well as deleting and generating a new hdrive1 file via NEWM 100. Finally, I commented out the XIL 300 in the INI file and then EMU41 would properly save files the virtual mass storage device in the hdrive1 file.

It appears to be some kind of conflict between virtual mass stroage and the 9114B though that doesn't make sense as J-F planned for both internal and external HP-IL devices and they both have separate address IDs and you can have multiple mass storage devices on same HP-IL loop. Has anyone seen this behavior before? I've sent an email to J-F yesterday but I haven't heard back from him yet. I also searched the HP Museum website but found no specific mention of storage issues between virtual and real mass storage devices in EMU41.

It's very possible that J-F never saw any reason to have both virtual and real mass storage devices in use at the same time when he wrote EMU41. If you have a real disk drive connected to the PC, why would you ever need virtual storage? This is a pure guess on my part though. My reasoning for wanting to save files to both devices is that as useful the floppy storage is, I believe strongly in backing up files. I'm thinking of having multiple hdrive1 files with all my programs on them so that in addition to my floppies, I can back up the hrive1 files when I do a PC backup. Also, the 9114B floppy file format is non-standard with Window or Mac PCs so I can't use a regular floppy drive to copy the files to a PC.

Finally, I could just be doing something wrong. I don't have a copy of my EMU41.INI file with me but it's a standard HP-41CX setup with Extended Functions, Time, Printer and HPIL controller along with the Advantage ROM. My declared HP-IL devices are Display, HDRIVE1, FDRIVE1, LPRTER1, DOSLINK and XIL 300.

Any insights are appreciated.

Thanks everyone,

Gerry

Re: EMU41, Hdrive1 and a 9114

*Message #2 Posted by **Christoph Klug** on 4 Aug 2009, 3:51 a.m.,*
in response to message #1 by Gerry Schultz

Dear Gerry,

nice to hear from you and your EMU41 & HP-IL activities :-)

I work with EMU41 and HDRIVE1 and external IL-Cass Drive without problems, I think there is no system limitation working with virtual drives and real drives in combination.

May be you get some trouble form the virtual FDRIVE1. This works only correct when you insert a floppy disk (= medium). Without inserted medium you will get trouble. For older floppy drives the firmware is compatible to read the medium from the IL-Disk-Drive 9114, but unfortunately this is not possible for the modern floppy drives. Therefore the best solution is to disactivate the FDRIVE1 in the EMU41.INI file :-)

May be you have the CCD-Module available. If not in real hardware you can use it as rom image file for EMU41. The CCD-Module includes the CAT 0 command, which lists you the virtual and real IL devices on the PC screen: Execute SF15 than CAT 0 and you get the complete list of IL-Devices... The star indicates the primary IL-device.

For some IL-Devices it is better to operate them in the MANIO mode (for example a Printer).

In my IL2000 Interface System manual you find some advanced samples and software routines for HP-41 to operate EMU41 and external IL-devices...

Best wishes - Christoph Klug

Re: EMU41, Hdrive1 and a 9114

in response to message #1 by Gerry Schultz

Hi Gerry,

Using multiple mass storage units with the HP41 can be quite tricky! And many HP41 users are not used to manage multiple units, due to the cost involved at the time.

Excerpt from Emu41 documentation:

Note about the use of multiple mass storage units:
If more than one HDRIVE1, HDRIVE2 and FDRIVE1 drives are simultaneously declared, the Emu41 (like the HP-41) behaviour is such as this: in AUTOIO mode, Emu41 searches on all drives for the file to read or write. Espacially:
You can't know on which drive the HP-41 will write in AUTOIO mode! In case of no disc in the FDRIVE1 floppy drive, an error is returned, even if the operation was targeted to the HDRIVE1 or HDRIVE2 drive!
So it is recommended to use both HDRIVE1 et HDRIVE2 with care, and to declare FDRIVE1 only when it is needed.
Look at the HP82160 manual under "Using Multiple Mass Storage Devices", page 39 in the english edition (feb.81).
This note also applies when using external drives (HP9114, HP82161), or when using an external HP41C.

And as Christoph mentionned, FDRIVE1 doesn't work on WinXP.

Hope this helps, otherwise give me more details on the errors.

J-F

in response to message #3 by J-F Garnier

Thanks Christoph and J-F for your feedback.

I have been a little reluctant to modify the INI file anymore than necessary with all the issues I've had with it. I have wondered about the FDRIVE1 declaration and I will comment it out tonight to see if that changes the symptoms.

Christoph, I have seen your references to the CCD-Module in your book and I started looking for the BIN file in Warren's DVD on Sunday but it wasn't there. I would like to locate it and put it on my EMU41 as I wanted to use that CAT 0 command to see what actually shows up on the HP-IL loop. It's the perfect troubleshooting tool for this situation. I also started looking for exactly what flag 15 does, but in the 41CX manual, it says flags 12 through 20 are for external device control and to refer to the appropriate manual for details. Which manual?

If it hasn't been obvious, I'm learning HP-IL from scratch and it's a steep learning curve and I'm also learning EMU41 at the same time. I don't understand AutoIO or ManIO yet so I haven't played with them to see what happens and how it affects access to peripherals. There's a lot to absorb and I get confused as to where to look for information and filter it through how the emulator works.

J-F, I agree, using multiple mass storage devices can be tricky. What's so hard for me is that I keep trying to determine that status and location of devices in the loop and I get weird responses. I've been using the SELECT and DIR commands assigned to keys to see what responds as I move up and down the loop. For instance, HDRIVE1 shows up at both address location 1 and 2, with addresses 3, 4 and 5 all being my 9114B. I hadn't started troubleshooting that issue as I was just glad to see EMU41 consistently accessing the 9114. I'm not sure if the DISPLAY declaration puts an actual device on the HP-IL loop but I think it does but I don't know how it would show up in the DOS window. There are many questions that come up when I work on the EMU41 but I'm trying to take it one small piece at a time to see how things work. I'm hoping as time goes on I will gain experience and understanding of the HP-IL loop which I can apply to the real devices through the HP-41. I also have an HP-71B with an HP-IL interface but I've shelved it until I understand HP-IL better. I never got into HP-IL back in the 1980s as it was just too expensive for my use.

Last Sunday night, after I wrote you J-F, I sat down with your EMU41 documentation and read the part you referenced. I completely misinterpreted your first line as I thought it meant if you declared multiple HDRIVE1s, HDRIVE2s or FDRIVE1s at once in the EMU41.INI file which made no sense to me. I thought I was just not understanding what you were talking about. Now I think what you meant was that if you declare HDRIVE1, HDRIVE2 and FDRIVE1 together in the INI file, EMU41 goes out to try to read or all those devices.

Thank you again for your feedback. I will try to implement your ideas tonight or over the next few days and let you know what I find.

I should mention that I did buy another 9114B Sunday and I should see it next week. I still like rotating media like floppy drives. There's something satisfying when I hear the disk spin and know that I made it do that (for better or worse).

Gerry

Re: EMU41, Hdrive1 and a 9114

*Message #6 Posted by **Gerry Schultz** on 5 Aug 2009, 1:55 p.m.,*
in response to message #5 by Christoph Klug

First of all, a correction. The FDRIVE1 declaration is NOT in any of my EMU41.INI flies. Here is a copy of the INI file I'm presently using:

```
; emu41.ini        emu41 init file

[MODULES]
; page size filename
0  12 rom41cx.bin
3   4 cxfcn2d.bin
5   8 cxtime2c.bin
6   4 prter1e.bin
7   4 hpil1h.bin
; ------------
8  12 adv41b.bin
10  4 xio1a.bin

[DEVICES]
DISPLAY
HDRIVE1
LPRTER1
DOSLINK
XIL 300
```

As far as I know, this is a standard EMU41.INI file yet the internal mass storage device shows up at addresses 1 and 2 and the 9114B shows up at addresses 3 and 4. I tried commenting out DISPLAY, LPRTER1 and DOSLINK and it changed the device addresses on the loop but I'm not sure to what.

There must be something I'm missing because I'm getting really confused on how to configure EMU41.

J-F, the EMU41.INI files you supply with your distributions are fine. I was wrong about what I said and have removed my comments from my original post. My apologies.

Gerry

Re: EMU41, Hdrive1 and a 9114

*Message #11 Posted by **Gerry Schultz** on 6 Aug 2009, 1:03 p.m.,*
in response to message #10 by Howard Owen

All I can say is WOW, now that's an EMU41.INI file. Thank you Christoph for posting this and to Howard for reformatting it to make it readable.

At first blush, my thought is to not remove any lines from the file, only comment out any lines that are not in my version of the INI file. Then I can see how

functionality has changed and if the device addressing stabilizes. Now that I have the CCD1B.BIN file, I can use CAT 0 to get a clearer look at what devices are defined and where they are located in the loop. I will need to review the CCD documentation to see what other gems there are to help learn how to control HP-IL.

Even though I have Warren's HP-41C CD, I don't know if it contains all the BIN files listed. I will do some searching and start enabling the newer functionality as I get more comfortable with the application. I am concerned that once I get use to all these new functions, I'm going to have to buy the real thing for my 41s. Oh my aching wallet.:-)

Finally, is there a specific version of EMU41 recommended? I noticed that 2.40 and 2.47 are available on J-F's website. In the What's New page he identifies 2.47 as beta and that it fixes slow access to internal devices from an external HP-41 due to PIL-Box support. With what I'm presently doing, should I stick to 2.40 or move up to 2.47?

Thank you for your support,

Gerry

Re: EMU41, Hdrive1 and a 9114

*Message #12 Posted by **J-F Garnier** on 6 Aug 2009, 1:11 p.m.,*
in response to message #11 by Gerry Schultz

is there a specific version of EMU41 recommended?

If version 2.47 works for you, then use it. I kept version 2.40 available as a backup, since the HPIL ISA board support of version 2.47 failed on some systems (but version 2.40 works), and Christoph and myself were unable to identify the problem.

Version 2.47 doesn't add any new features, except the experimental support of the PILBox.

Hypothetical calculator with USB ports

*Message #1 Posted by **hecube** on 2 Aug 2009, 11:59 p.m.*

I wonder why HP, or other calculator makers, don't make calculators with USB ports.

It would seem logical and I would imagine that it would be a hit...

Real calculator with USB port

*Message #2 Posted by **Raymond Del Tondo** on 3 Aug 2009, 12:18 a.m.,*
in response to message #1 by hecube

The 50g features an USB port...

If it only had a better keyboard layout, that would be a hit;-)

Yes, a 50G with a keyboard layout design simliar to the 48GX and the same perfect feel to the keys would be a STUNNING calculator. It almost makes me weep to see all the superb enhancements on the 50G but coupled with a keyboard layout that just doesn't suit RPN/RPL. Why can't HP realise this and do something about it?!?!?!?

Mark

*Message #4 Posted by **Patrick Rendulic** on 4 Aug 2009, 10:59 a.m.,*
in response to message #3 by Mark Edmonds

I have been reluctant to buy a 49G+ or a 50 G for several years, using primarly an 48GX (and a 49G ...). The main reason why I did so were all those negative descriptions I heard here and there.

Sure, in comparision to an 48, the calculator feels cheap, but, it is a pleasure to use it !!!

The keyboard is much, much better than I expected, the screen is wonderful and with the SD-port, no more playing around with annoying file transfers over RS-232 plus USB adapter and those annoying

128kb memory cards ... .

There are certainly things to improve, but believe me, I do regret that I did not buy that 50G earlier.

Re: Hypothetical calculator with USB ports

*Message #5 Posted by **hpnut** on 3 Aug 2009, 4:45 a.m.,*
in response to message #1 by hecube

I think an SD card slot is more useful than an USB port.

Re: Hypothetical calculator with USB ports

*Message #6 Posted by **Walter B** on 3 Aug 2009, 5:16 a.m.,*
in response to message #5 by hpnut

The 50G features both, USB and SD d:)

The only drawbacks are its RPL and too large for a pocket calc.

Ceterum censeo: HP, launch a 43S.

Don't any of the top TI calcs offer USB support for measuring/data acquisition? I just had it in the back of my mind that they offer an add-on system for this.

Personally, just for the fun of it, I'd like HP-IL or HP-IB on the back of any of the RPL calcs to conncect disk drives, printers and stuff. Unfortunately, I suppose that both these interfaces are pretty well dead and I'm not even sure a PCI card exists for either type for PC use.

Mark

Re: Hypothetical calculator with USB ports

*Message #10 Posted by **Don Shepherd** on 3 Aug 2009, 8:28 a.m.,*
in response to message #9 by Mark Edmonds

Yes, the TI-83 and 84 series have an interface to a data acquisition system. I've seen it used in the classroom before. I'm not sure it is USB but it might be because the cable that connects these calcs to the PC is mini-usb on the calc side and regular usb on the computer side.

Re: Hypothetical calculator with USB ports

*Message #11 Posted by **Katie Wasserman** on 3 Aug 2009, 1:03 p.m.,*
in response to message #10 by Don Shepherd

Casio offers this too, the EA-200, it interfaces to several of their high-end calcs and the latest fx-9860g has a built-in app that makes using this device easy. However, even though the fx-9860g has a USB port I think that EA-200 uses the custom serial port on the calculator instead.

Actually, HP offers something similar as well, the StreamSmart 400, but it only interfaces with the HP-39gs and HP-40gs. Which is probably why it's never discussed on this forum.

Re: Hypothetical calculator with USB ports

*Message #12 Posted by **Tim Wessman** on 3 Aug 2009, 1:38 p.m.,*

It's not dead yet. JFG above has created the PILBox, an USB to HP-IL gateway for modern computers. The PILBox can changed to serial as well. Since the 50g has a serial port, it should be possible to create the solution you are looking for with a little bit of effort.

HrastProgrammer has done complete HP-IL implementations for the 48 series. It would not take much to port to the 50g serial port.

All of the pieces are there. Someone just has to want it enough to do something about it.

hello,

the problem is not to offer USB Host capability... that is easy... the problem is to have the drivers and applications to support that capability... I would doubt that USB gizmo makers will be creating drivers and apps for HP calculators for their stuff... I mean, they most of the time don't even do it for macs... so, you would end up with a great host capability that is unusable :-(

Re: Hypothetical calculator with USB ports

*Message #18 Posted by **David Hayden** on 3 Aug 2009, 1:44 p.m.,*
in response to message #1 by hecube

I think all of the programmables should have access to external storage - either via USB or a memory card. The lack of this I/O is what prevents me from getting a 35S. After all, who wants to have to key in every program??

I think HP would do a lot better if they went back to expandable calculators. Get the customer into the calculator and then get them to purchase the add-ons. This worked great with the 41's, at least it did for me (I bought memory cards, printer, card reader, modules, oops, time to upgrade from 41C to 41CV...)

Finally, I think that with high-end calculators so complex these days, they really should have keyboard overlays available. User mode isn't helpful when there's no simple way to know what function is assigned to

what key. Since most people will use a small fraction of the capabilities most of the time, I think they'd be happy to reassign the keys so that the functions they use most were easily accessible. It would greatly improve the usability.

Just my $0.02 worth.

Dave

in response to message #18 by David Hayden

I think you nailed the unwritten assumption of my first post. For my life, I can't understand all the hoopla about the HP-42S because information can not be easily transferred back and forth.

There's a reason why the HP-65, 67, 41 and 71 were successful: you could exchange information rapidly from machine to machine.

Re: Hypothetical calculator with USB ports

> For my life, I can't understand all the hoopla about the HP-42S because information can not be easily transferred back and forth.

I would say that the hoopla is because of all the significant extensions to the 41 programming language which the 42 provided with soft keys, alpha variables, multi-line display, etc. It is simply a shame that this level of advanced RPN programming was not ported to a box with I/O and/or a memory card. There is still an opportunity, if HP can be convinced that enough would sell to make such a box profitable.

Jake

P.S. - See you at the HHC2009 conference on 10/3-4/09 in Fort Collins, CO. For more info on HHC2009, see http://holyjoe.net/hhc2009/.

*Message #21 Posted by **htom trites jr** on 3 Aug 2009, 5:29 p.m.,*
in response to message #20 by Jake Schwartz

Three great ideas, all of which need to meet in one calculator.

Four SDHD slots (#0 of which is the calculator's personality ROM), keyboard overlays (the base and keytop labels are for a "no personality", basic RPN machine), and both USB device and USB host ports (so that the calculator can read/write flash drives, etc, and also be read and written as one.) Bluetooth could be accessed via an SD card plugin, as could wireless b/g.

Re: Hypothetical calculator with USB ports

Yes! The 42S represented the highest level RPN keystroke programming ever reached. I view the 32S as a step backward, jettisoning alpha, matrices and much else. But the 32S is the line that went forward.

I recognize that what I want is to turn back the clock. The Pioneer series represented a turning away from calculator-as-computer. The 41C was the last complete calculator/computer system HP produced. The later 48 machines pushed a lot of the systems features back onto the PC. And of course, the rise of the PC is why the Pioneer series made the turn toward calculator-as-appliance.

What I want is the history that never happened. You know that history, the one where the PC never came to dominate general purpose computing. I want the machine that was produced by 20 years of development of calculator-as-computer beyond the 41C. In my dreams, this machine's RPN keystroke programming would be advanced in surprising and original ways, but it would have followed the sign posts past the 42S on its way to fantasy modernity.

I'll never get that, of course. So what I'll settle for, if I get the chance, is a RPN machine at least as capable as the 42S, using similar or identical keystroke programming (but feel free to improve that) and with I/O so I can store and load programs. A large memory that can store lots of these programs, which I'll undoubtedly crib from my fellow enthusiasts, or write myself, would be nice too. A faster processor would be fine, but that's less important to me than battery life. Simple.

I just don't get why HP doesn't wave a wand and create my dream machine.

:)

Regards,
Howard

in response to message #23 by Martin Pinckney

I'm sure there's a market for an instant-on programmable scientific/programmable calculator. The problem is that HP does too well with their other businesses to care.

The calculator business should have been spun-off with Agilent.

Re: Hypothetical calculator with USB ports

*Message #25 Posted by **Hugh Evans** on 5 Aug 2009, 1:19 a.m.,*
in response to message #1 by hecube

There are plenty of calculators with USB capabilities. If you're asking about function as a USB host, that's another story. USB devices tend to be somewhat power-hungry, at least from a portable device standpoint, and they require drivers for the host device. So if HP wanted to make a bunch of USB devices they could certainly do it, but who wants to carry around a lead-acid battery backpack to keep the thing running all day? (only a sight exaggeration)

Re: Hypothetical calculator with USB ports

*Message #26 Posted by **Garth Wilson** on 5 Aug 2009, 2:40 a.m.,*
in response to message #25 by Hugh Evans

So they just need to bring back HPIL and the various interface converters. The new version would be much faster, but same idea.

USB is also a misnomer. It's not a true bus, in that you can't connect one port to lots of devices simultaneously unless you have an external hub. HPIL could go to 31 devices with primary-only addressing, and over 900 with secondary addressing.

I'll try to answer a few posts in one shot here:

USB device connectivity is useful for data exchange with the PC. USB host connectivity might help with a few standard devices like memory sticks, keyboards, data aquisition units and, most important, a companion calc of the same or similar bread for data exchange. The later can be accomplished with a hybrid port that can switch to host mode if neccessary. AFAIK, this exists and is called USB-to-go or something similar. Modern TIs can connect this way vie their USB ports.

TI's data aquisition with the CBL (calculator based laboratory) is via a serial custom connection, the same that

is used for calc-to-calc and calc-to-PC transfers. It's a little like I C. I've just bought a Vernier Lab Pro (a "super CBL" by the original manufacturer) with USB connetivity. I've yet to find out what it offers more then a standard CBL.

For a portable device that stores some valuable information (be it telephone numbers or programs) removable storage is the key. In order to ease data transfers, Bluetooth seems to be a viable option.

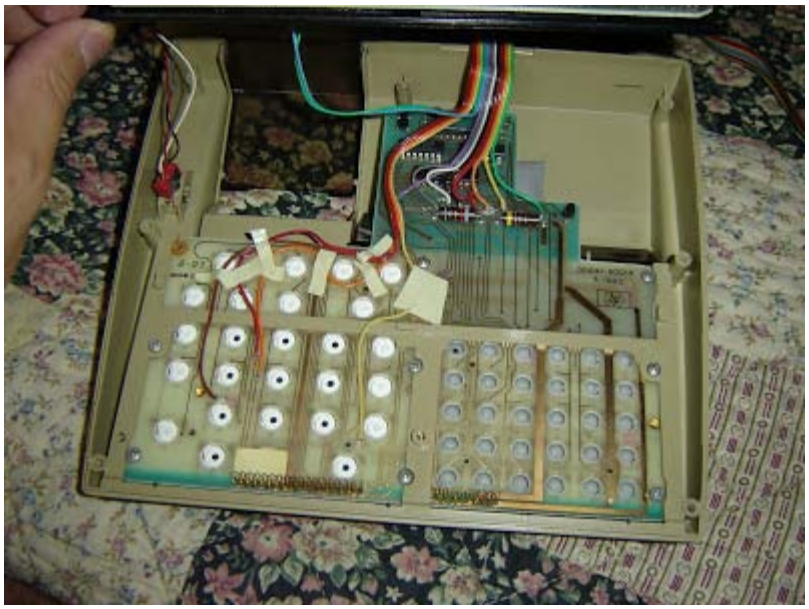
Los Alamos HP-97: what do you make of this cable?

*Message #1 Posted by **hecube** on 2 Aug 2009, 1:56 p.m.*

I bought this HP-97 on eBay a couple of weeks ago. I still haven't powered it up. I was thinking of removing the cable and putting it back in its original state but the connections inside give me pause.

I think the calculator may have been rigged to act as a controller. Why else would some of the keys be wired?

Here are some pics:



Blue and green wires going up are routed to this circuit board:

Re: Los Alamos HP-97: what do you make of this cable?

*Message #2 Posted by **Katie Wasserman** on 2 Aug 2009, 3:28 p.m.,*
in response to message #1 by hecube

This 97 was made before HP offered the 97S, you can tell them from the layout of the main circuit board. The wiring looks to me like someone wanted to bring the same control lines out of this 97 as are brought out from the standard 97S. Most of the control lines are indeed accessible from the keyboard/display circuit board and that's why most of the wires go there. Furthermore, there seem to be 4 column scan lines going to the keyboard matrix and that's exactly what's needed for external keypad-like input.

So, this appears to be an early 97 that was retrofitted to interface to something like a 97S i/o pod.

16C Manual - different version?

*Message #1 Posted by **Mark Edmonds** on 31 July 2009, 6:47 p.m.*

A few years ago, I sold my 16C (dumb move but I wanted the money for another project).

The manual I had with that 16C had a different cover to the usual 16C manual and I have never ever seen the manual cover I had since.

The cover was a cream colour with grey filled rectangles of different shades, a large dark grey rectangle across the top, a smaller medium shade grey rectangle down the right hand side, a smaller still blue-grey rectangle partially along the bottom side and a very small horizontal red rectangle on the left edge.

If anyone is familiar with this manual type, does it signify a particular production run of the 16C? I don't know what the serial number was unfortunately.

Did I make the mistake of selling something that was quite rare or was this manual style typical for 16Cs from one of the factories or a certain time frame?

This has been a mystery I've often wondered about so I'd like to clear it up!

Thanks if anyone can shed any light on this...

Mark

Re: 16C Manual - different version?

*Message #4 Posted by **Mark Edmonds** on 31 July 2009, 8:14 p.m.,*
in response to message #3 by Allen

Thanks Allen - those are very similar but not exactly the same. So they are reprints then? Presumably done after the original manual print had run out? I remember the text being almost as if it had come off a line-printer and in a very plain format. Actually, it gave the manual a really nice low-level techy style, minimal diagrams or clip-art, just paragraphs of pure text. Yummy! :)

At least I didn't sell something unusual or "rare".

It was 2005 when I sold it and I got 150GBP for it which wasn't bad and the funds enabled me to buy a D-SLR but in hindsight, I regret it badly. Live and learn...

Strange 15C behavior

*Message #1 Posted by **cyrille de Brébisson** on 31 July 2009, 3:56 p.m.*

hello,

A question for you who know everything...

on the 15C, when you do an operation that results in an overflow (like 999 Y^x 999), the screen displays 9999999 99 and blinks...

but the strange thing is that how do you turn the blink OFF after that? it seems to just stay on blink until you do a OFF ON cycle...

regards, cyrille

Re: Strange 15C behavior

in response to message #5 by Andrés C. Rodríguez (Argentina)

15C+ here we come!

I know that the following idea is pie-in-the-sky but I would really like to see the 11C get reissued as well. So many aspects of the 11C are so spot-on that I consider it one of the most elegant machines HP ever came up with. It might seem rather primitive compared to the all-singing, all-dancing machines of today but I like to believe there is still demand for the simpler and more immediately intuitive calculator which the 11C typifies.

Mark

Re: Strange 15C behavior

*Message #7 Posted by **Katie Wasserman** on 31 July 2009, 5:51 p.m.,*
in response to message #6 by Mark Edmonds

Mark,

I like the 11C as well for the same reasons that you mention. However, if you ignore the features on the 15C that the 11C does not have (matrix operations, complex math, etc.) the only usability differences are that most of the tests (x<0, etc.) on the 15C have to be looked up on the back of the calculator. All of the un-shifted and most of the shifted functions are assigned to the same keys on both calculators. I'll be happy with the 15C+ even though I like the 11C for it's simplicity.

All of the un-shifted and most of the shifted functions are assigned to the same keys on both calculators.

Hi, Katie --

Yes, that's exactly right. H-P actually managed to slightly improve the arrangment of functions on the keyboard of the HP-15C over the HP-11C, even as four major elements of functionality were added using the same keyboard. Great thinking and engineering!

The broad set of functions on the on the HP-15C required intelligent use of two-byte operation codes where necessary. (The HP-11C and HP-34C used only one-byte keycodes, which explains why some reasonable functions were curiously missing from each.)

A thread from 2006 with many contributors:

HP-34C/11C instruction codes (corrected)

Essentially, when the HP-15C was introduced, the fine HP-11C was eclipsed, superseded, and supplanted, except maybe to occupy a price niche.

Here's a detailed discussion from three years ago:

HP-15C functionality and keyboard layout

Yes, thank you for this message.

The 32SII was a popular machine for good reasons, and here we have a worthy successor - if it weren't for those bugs. I bought one but dislike using it, since I have to keep too many problems with it in mind. I'd buy an updated version that includes a R<>P conversion.

These would be nice to have for sure. But the 15C+ seems like it will be 150 times faster than the original 15C which will allow for programs that were impractical before. Slow running solve, integrate or matrix functions will be instantaneous.

I really appreciate the speed improvements on the 12C+ over the original 12C. It's really nice to not have to wait for an answer on a TVM calculation.

Well, I don't know about "instantaneous", but I do have a program to solve for eigenvalues using matrix operations and the root solver, which takes about 5 minutes on average to execute. I guess it would run in about 2 seconds, which is pretty awesome.

It should count substantially faster if you shorten the program to + 1 RST and press RST R/S to start the program. With a real TI-59 the count for a minute increases from 507 to 658 for a minute.

Open up HP12cp?

*Message #1 Posted by **Mike (Florida)** on 31 July 2009, 7:42 a.m.*

Is it possible, okay to open up HP12cp? My understanding is the procedure to do it on regular 12c is to remove battery door / battery and rubber strips on feet then 5 screws. I have an HP12cp that appears to have some "artifact" or debris between the clear cover on case and actual LCD. In doing some research, I found that one calc repair place would not work on the HP12cp stating they were not designed to be opened up. Had anyone opened one up? Does it cause any irrepairable damage? Pictures? Any thoughts are appreciated. I would like to try and open it up to see if I can remove that artifact in there. And in case you are questioning it, it does appear to be some little bit in there and not a problem with LCD itself. Thanks for any information you can provide!

Re: Open up HP12cp?

*Message #2 Posted by **cyrille de Brébisson** on 31 July 2009, 8:48 a.m.,*
in response to message #1 by Mike (Florida)

hello,

removing these debits will be realy hard because, althrough you can open the 12C, you can not detach the PCB from the top case without causing hard to fix damages...

maybe it's time to get one of these new super fast 12C :-)

However, if what you have IS a new super fast 12C, then you should be able to open and clean the issue as the PCB has changed.

regards, cyrille

Re: Open up HP12cp?

*Message #3 Posted by **Mike (Florida)** on 31 July 2009, 11:10 a.m.,*
in response to message #2 by cyrille de Brébisson

Yes, for clarification I do have the new Platinum version. I was disappointed that a blemish like that would get past HP QC, which I guess no longer exists. Too bad.

Re: Open up HP12cp?

*Message #4 Posted by **Don Shepherd** on 31 July 2009, 11:36 a.m.,*
in response to message #3 by Mike (Florida)

Mike, the new platinum version is not the same as the new super-fast 12c Cyrille is talking about. If yours is the platinum, it is not the new ARM-based 12c, what is being called the 12c+ now.

Re: Open up HP12cp?

*Message #5 Posted by **bill platt** on 31 July 2009, 12:15 p.m.,*

in response to message #3 by Mike (Florida)

Well, to be fair, HP is no longer producing these in Corvallis, and the unit price is about what, say 33% of what it was when originally issued, in real dollars?

That is not to say that there shouldn't be QC. But it isn't the same thing is it?

Really, with these sorts of very low-cost technical devices, there isn't enough money to do "QC" the old way. Rather it has to be SPC/SQC of the manufacturing system. This means that some finite number of flawed devices will come through the line ,undetected--and that you them minimize the total cost by accepting some finite number of warranty trades for less expensive processing....and by statistically tracking the warranty issues, you then improve the process to reduce the statistically significant flaws.

Lots of gobbledygook but the fact is that any significant handwork is out of the question....

Edited: 31 July 2009, 12:17 p.m.

Re: Open up HP12cp?

*Message #6 Posted by **cyrille de Brébisson** on 31 July 2009, 3:55 p.m.,*
in response to message #5 by bill platt

hello,

As a mater of fact, they are QC, and if indeed there is dirt in the screen, it should not have passed QC...

can you send a picture?

regards, cyrille

Re: Open up HP12cp?

*Message #7 Posted by **Marcus von Cube, Germany** on 31 July 2009, 4:18 p.m.,*
in response to message #6 by cyrille de Brébisson

If the dirt has crept in after manufacture (from you pockets?) it should be possible to blow it out with some canned air.

Re: Open up HP12cp?

*Message #8 Posted by **Vladan Dugaric** on 1 Aug 2009, 6:08 a.m.,*
in response to message #6 by cyrille de Brébisson

My 12c (latest pre-ARM version) that I bought last year also has a few specks of dust under the display cover (had them since day 1 when they emerged after a few hours of use). They are pretty annoying.

I tried canned air, but it did not dislodge any of them (nor did it introduce new ones). I suppose that there aren't any significant gaps between the display and the case.

Vladan

This made me curious, so I just looked up the original MSRP ($150 in 1981) in the CPI Inflation Calculator. In today's dollars, the original 12C would cost US $355.93. The new 12C is available today for US $66.00 at some retailers, so it's really only 19% of its original cost, and many times faster! That's quite something if you think about it.

48GX - screen is all black - please help!

*Message #1 Posted by **Kath** on 30 July 2009, 2:06 p.m.*

Hit the 'on' button on the 48GX this morning and the whole screen is displaying all black pixels except for one vertical stripe down the middle. It's not responding to the 'off' command. Took out the batteries and replaced them with all new batteries, and the all-black screen displayed immediately, without even hitting the 'on' button. It's 10-yrs old, barely used during the past 5 years or so, never been dropped, worked fine yesterday... too old for HP to service. Any ideas on how to get it up 'n running again? Please help!! Thanks in advance, ~~Kath

Re: 48GX - screen is all black - please help!

*Message #2 Posted by **Raymond Del Tondo** on 30 July 2009, 4:03 p.m.,*
in response to message #1 by Kath

There are different things you could try, given you have batteries installed:

- NEVER PUT IN THE BATTERIES IN THE WRONG DIRECTION!

- ON+C

If that doesn't work, then

- If you turn the HP-48GX around, the upper right rubber foot hides a reset hole. CAREFULLY stick a needle into it until it hits ground, then remove the needle.

About the battery polarity warning: There's a big chance that you will fry the zener diode if you put in batteries with the wrong polarity.

free42 for the HTC touch pro 2

*Message #1 Posted by **hugh steers** on 30 July 2009, 1:39 p.m.*

Hi,

I got a touch pro 2 today. it has an 800x480 screen. so i thought i'd compile up a version of free42 for it.

looks like this (there is only the one skin):

i put a copy of the installation CAB here for anyone who's interested

NOTE: not very tested!

Re: free42 for the HTC touch pro 2

*Message #2 Posted by **hugh steers** on 30 July 2009, 1:41 p.m.,*

Good programming environment for a 200LX?

*Message #1 Posted by **Dave Britten** on 30 July 2009, 9:18 a.m.*

I've got a 200LX that I quite like, though I don't use it nearly as much as I would if I had a decent semi-interactive programming environment for it. I'm not looking to create full-blown desktop applications on the thing, but something high-level like programming a 28S/48G would be great.

A DOS version of Free42 would be fantastic, but that might be asking too much. :) What do the other 200LX fans use to fill the niche of programmable calculator? Aside from just pulling out the 48GX, of course...

Re: Good programming environment for a 200LX?

*Message #2 Posted by **Marcus von Cube, Germany** on 30 July 2009, 9:56 a.m.,*
in response to message #1 by Dave Britten

The old Borland tools, Turbo C and Turbo Pascal for DOS should run fine on the LX. There are libraries around which mimic the GUI so your applications look simililar to the built in PIM software. Google for the S.U.P.E.R. site if it still exists.

Re: Good programming environment for a 200LX?

*Message #3 Posted by **Bill (Smithville, NJ)** on 30 July 2009, 10:10 a.m.,*
in response to message #1 by Dave Britten

Hi Dave,

I second Marcus recommendation of the old Borland programming languages. I have used Turbo Pascal on the HP-200LX and it works great.

If you are looking for HP Calculator emulations, I think that both emu41 and emu71 work on the 200LX. You won't have the pretty calculator image, but you will have the calculator environment.

Bill

Re: Good programming environment for a 200LX?

*Message #4 Posted by **Thomas Chrapkiewicz** on 30 July 2009, 11:09 a.m.,*
in response to message #3 by Bill (Smithville, NJ)

I've used and/or recommend on a 200LX:

1. The aforementioned Borland languages. 2. QBASIC/Quick BASIC 3. PowerBASIC 3. bigcalc (a high/variable-precision DOS rpn emulator) 4. Derive (DOS version of course)

in response to message #4 by Thomas Chrapkiewicz

Another interesting one to look at is Clipper. I don't know about availability, nor to be honest whether it would work on the 200LX but off hand, I can't think of any reason why not.

Altough Clipper was designed to be a compiler for dBase applications, there is much more to it than that and I remember one particularly handy feature was the ability to effectively compile code on the fly from strings. This made for some interesting techniques in building dynamic code, substituting values for variables and so on.

For its time, I always thought it was quite a neat language that would have been better off shedding its dBase compiler image. Many many many years since I used it in anger though so I hope my recollections are accurate!

Mark

*Message #9 Posted by **Katie Wasserman** on 31 July 2009, 3:28 p.m.,*
in response to message #8 by Andrés C. Rodríguez (Argentina)

Thanks for pointing that out. I knew that there was a reason why I liked this archaic language so much!

Re: Good programming environment for a 200LX?

*Message #10 Posted by **Dave Britten** on 30 July 2009, 2:09 p.m.,*
in response to message #1 by Dave Britten

I like the sound of some of these suggestions - I'll have to try a few out. I've got about 210 MB left on my CF

card, so why not! Turbo Pascal sounds like it could be of some use. I think I'll steer clear of C in this case, since there's usually a much larger time investment to get a working program (and I don't need the performance gain that C would afford). Might be nice to keep around just in case, but I don't anticipate heavy use.

I'd prefer to find something simpler and more akin to a programmable calculator, though. I don't intend to pound out any lengthy applications on these little keys.

I've been playing around with Lotus 123 macros a bit, and they're more flexible than I expected, but having only one "sheet" per .wk1 file, and having to jam your macros in there beside your data is kind of a pain. If you stash them in extra columns off to the right, inserting rows in your main data columns will break the macros... Any Lotus pros have suggestions for effective macro storage?

Re: Good programming environment for a 200LX?

*Message #11 Posted by **Katie Wasserman** on 30 July 2009, 2:39 p.m.,*
in response to message #10 by Dave Britten

There's always the Solver in the built-in calculator app. I think it's by far the best version of the solver HP ever implemented and it has extensions that link to Excel. Look at the bottom of this thread for an example of what you can do with it.

Re: Good programming environment for a 200LX?

*Message #12 Posted by **Marcus von Cube, Germany** on 30 July 2009, 4:12 p.m.,*
in response to message #11 by Katie Wasserman

Not to Excel, to 1-2-3. Otherwise you're correct.

Re: Good programming environment for a 200LX?

*Message #13 Posted by **Katie Wasserman** on 30 July 2009, 6:18 p.m.,*
in response to message #12 by Marcus von Cube, Germany

Right, thank you for the correction! Old age stinks, at least I didn't say VisiCalc :(

Re: Good programming environment for a 200LX?

*Message #14 Posted by **Dave Britten** on 30 July 2009, 7:57 p.m.,*
in response to message #13 by Katie Wasserman

I suppose I *could* load Excel on it, but dropping out of System Manager, connecting a mouse, and starting up Windows 3.0 probably isn't worth the trouble. :)

But that's never stopped me before!

Re: Good programming environment for a 200LX?

*Message #15 Posted by **Marcus von Cube, Germany** on 31 July 2009, 3:58 a.m.,*
in response to message #14 by Dave Britten

You can try Multiplan instead. ;)

HP 33e repair

*Message #1 Posted by **Lincoln R.** on 29 July 2009, 9:05 p.m.*

I recently acquired an HP 33e (serial #1835A08027) that hadn't been used in some years. The positive battery contact was broken off, but I was able to power on the machine with a bench power supply. At first, almost none of the keyboard keys worked, and the display was very dim and displayed nothing but fives. I disassembled the entire calculator, and cleaned all the ICs and the flexible circuit board with contact cleaner.

After that, the display now works properly and is bright, but some of the keys will only work if you squeeze the unit together or push down on the faceplate near the key. Any suggestions on this? I've thought of trying to bend out the legs on the ICs a little bit but am afraid that one would break off. Would throwing a piece of cardboard into the back help? Also, for the battery contact, I have suitable metal, but does anyone know where I might find a screw and nut of the right size? The only sources I've found so far have a minimum order of around 100, way more than I need.

Re: HP 33e repair

*Message #2 Posted by **Michael de Estrada** on 29 July 2009, 9:30 p.m.,*
in response to message #1 by Lincoln R.

Does it pass the STO ENTER self-test? Usually if the problem is bad contact between the IC terminals and the keyboard traces you will get an Error 9 instead of all 8's. The problem could be in the snap dome circuit traces, which sometimes crack or the solder connections between the snap dome sheet and the keyboard. I tried re-soldering a bad connection once and ended up ruining the keyboard, but my soldering skills are not very good.

Re: HP 33e repair

*Message #3 Posted by **Lincoln R.** on 29 July 2009, 9:55 p.m.,*
in response to message #2 by Michael de Estrada

Yeah, it passes the STO ENTER test. When I do that, the screen goes blank for about a second, then all 8s, commas, and the negative sign on the far left appear. Also, the keys that act up are very random, it's not always the same keys, it's never one line of keys straight down or anything, all the keys work at least some of the time, and pushing down or pressing the key harder will make it go, which makes me think that possibly there is too much space between the snap disks and the keyboard, caused by old foam.

Question on MLDL2k Bankswitching

*Message #1 Posted by **Ángel Martin** on 29 July 2009, 2:54 p.m.*

I'm having trouble getting the Advantage rom configured on my MLDL2k. I'm not sure if there's any known issues , not that I'm aware of for a simple 2-bank situation (I know of the bank2 vs. vs bank3 blues but that should not be the case).

I tried many user register combinations, both on SRAM and FLASH, but to no avail. When calling any of the bank-switched functions the calc goes to see the wizard (aka freezes off, no display, no response).

Ironically the HEPAX module seems to work quite well (using the tricks published in Howard Owen's article). I have not upgraded to the latest firmware revision, but somehow I don't think that's the problem, given that the Hepax emulation works.

Any ideas would be appreciated, hope I don;t have a defective unit.

Best, ÄM

Re: Question on MLDL2k Bankswitching

*Message #2 Posted by **Ángel Martin** on 30 July 2009, 1:08 a.m.,*
in response to message #1 by Ángel Martin

Well it appears that I'll have to upgrade the firmware - but can't do it using the update tool because my unit has revision 1.0 and the tool requires 1.5 or later...

Meindert, you around or (likely) on vacation? No rush.. :)

Re: Question on MLDL2k Bankswitching

*Message #3 Posted by **Meindert Kuipers** on 30 July 2009, 3:46 a.m.,*
in response to message #2 by Ángel Martin

Hi Angel,

I was travelling this week, therefore the late answer. The firmware upgrade is recommended, but not really needed. If HEPAX works, then Advantage should also work. Keep in mind that a Bankswitch will switch the banks of both the odd and the even page, so the optimum configuration for Advantage that shoudl always work is:

```
Page $8                 Page $9
Bank 1: AdvL1-1B.rom    Bank 1: AdvU1-1B.rom
Bank 2: AdvL1-1B.rom    Bank 2: AdvU2-1B.rom
Bank 3: AdvL1-1B.rom    Bank 3: AdvU2-1B.rom
Bank 4: AdvL1-1B.rom    Bank 4: AdvU2-1B.rom
```

In your firmware version banks 2 and 3 are probably interchanged, but that is not relevant here (it does matter for HEPAX!)

If you want to update firmware, just download the latest M2kM and firmware file, this should normally work. If it does not, send me an email and we can setup a remote session so I can assist you there.

Meindert

Re: Question on MLDL2k Bankswitching

*Message #4 Posted by **Ángel Martin** on 30 July 2009, 4:59 a.m.,*
in response to message #3 by Meindert Kuipers

Hi Meindert, many thanks for responding so quickly. Indeed it was a "user misunderstanding", I wasn't aware that I had to FILL the four pages up with rom images - I was only using the first bank within page1, I guess that was my issue.

So just a RTFM problem, shame on me :)

Thanks again, now it's time to do some math crunching on the MLDL with my SandMath - which of course uses the Advantage...

All the best, ÁM

Curve fitting question (OT)

*Message #1 Posted by **Walter B** on 29 July 2009, 9:30 a.m.*

Hi experts,

So far, I thought I know some statistical data analysis, but here's something strange leaving me confused:

Fitting a model curve to measured data points, i.e. data with errors > 0 , reduced chi square (RC2) is one method to assess the goodness of fit. Browsing some textbooks and the net, I find just one-sided tests for RC2. I.e. it is said to be a good fit model if RC2 is less than or approximately equal to 1, and a bad fit model if RC2 >> 1. Why isn't this a two-sided test?

Reasoning: The model curve hitting all data points right in the middle is very improbable for physical data. So it should be a two-sided test for RC2, excluding very low values of RC2, too. OTOH, fitting is done minimizing the sum of squared distances from all data points to the curve, so zero would be optimum.

You see me confused. What's wrong? Help is appreciated.

Walter

Re: Curve fitting question (OT)

*Message #2 Posted by **Namir** on 29 July 2009, 1:35 p.m.,*
in response to message #1 by Walter B

Hi Walter,

Most books use R-square and the F statistics to measure goodness of fit. One popular tool is found in the Excel Data Analysis add-in. It generates an ANOVA table that shows the F statistics and its significance. Also, the tool calculates and shows the R-square and its adjusted value. Finally the output also shows the standard error, student-t, and significance of student-t for each regression coefficient (and intercept).

I rely on the regression ANOVA table and other statistics displayed by the Excel Data Analysis add-in more than just the Chi-square.

If you want to examine the relevance of yoru curve fit I highly recommend Excel's tool and the richness of the output.

Namir

Re: Curve fitting question (OT)

*Message #3 Posted by **Walter B** on 30 July 2009, 6:02 p.m.,*
in response to message #2 by Namir

Hi Namir,

Thanks for your friendly advise. I know and use this tool already. It is just that almost every author I see demonstrating simple Chi Square tests uses **single** sided tests to measure goodness of fit, while the same authors have no problems with double sided t-tests, for example. That's what puzzles me. Maybe a bit academic, but I just want to understand it.

Walter

Re: Curve fitting question (OT)

*Message #4 Posted by **Paul Dale** on 29 July 2009, 5:45 p.m.,*
in response to message #1 by Walter B

> Quote:
>
> Why isn't this a two-sided test?

You're squaring the differences so the closer to zero you get the better the fit. Thus no need for the other side. Or am I missing something in the question?

- Pauli

Re: Curve fitting question (OT)

*Message #5 Posted by **Walter B** on 29 July 2009, 6:09 p.m.,*
in response to message #4 by Paul Dale

Hi Pauli,

> Quote:
>
> Or am I missing something in the question?

Maybe. Please check my "reasoning" above and Dave's answer below. IMHO a contradiction remains.

Walter

Edited: 30 July 2009, 3:03 a.m.

Re: Curve fitting question (OT)

*Message #6 Posted by **Paul Dale** on 30 July 2009, 5:09 p.m.,*
in response to message #5 by Walter B

Missed that bit for some reason -- probably my own stupidity and haste :-(

I've never heard of a test for a too-good fit of the data. That has always been a cause for great rejoicing not concern. However, if you are interested in that why not do another test at the 99.9999% (or whatever) level and reject if that accepts the fit?

- Pauli

Re: Curve fitting question (OT)

*Message #7 Posted by **Dave Shaffer (Arizona)** on 29 July 2009, 6:02 p.m.,*
in response to message #1 by Walter B

> Quote:
>
> so zero would be optimum.

Not really! Reduced chi-square includes the estimated size of your errors, so if you have estimated your errors correctly (sometimes a task in itself for real-world data), the fit value should be near 1. If it is much below one, either your error estimates are not good (too pessimistic), or you are fitting to too many variables or the wrong equation(s) and fooling yourself that you know what is going on!

Re: Curve fitting question (OT)

*Message #8 Posted by **Walter B** on 30 July 2009, 6:16 p.m.,*
in response to message #7 by Dave Shaffer (Arizona)

Hi Dave,

What you state matches what I remember from the old days, too. But it doesn't seem to be very popular, does it? So maybe I miss an important reason for single sided testing here, being so simple nobody thinks its worth explaining?

Re: Curve fitting question (OT)

*Message #9 Posted by **Bart (UK)** on 30 July 2009, 6:17 a.m.,*
in response to message #1 by Walter B

The Reduced Chi Square test is the Chi Square devided by the degrees of freedom. So it seems to me to be a "normalised" Chi Square, hence 1 being the optimum value. This makes it easier to present results without the reader having to worry about D.O.F., number of samples etc.

The Chi Square test itself can be either a one sided (upper or lower) test, or a two sided test. However, only the upper one-sided test lends itself to the Reduced Chi Square.

Bart

Re: Curve fitting question (OT)

*Message #10 Posted by **Walter B** on 30 July 2009, 5:07 p.m.,*
in response to message #9 by Bart (UK)

Hi Bart,

I agree with everything you wrote but the last sentence. Nothing prevents me from dividing a lower Chi Square by its DF.

Walter

Re: Curve fitting question (OT)

*Message #11 Posted by **Bart (UK)** on 30 July 2009, 6:24 p.m.,*
in response to message #10 by Walter B

Hi Walter

The problem at the lower tail of the CS is that except for very large DOF, CS/DOF < 1, even if it is a

bad fit.

Bart

Re: Curve fitting question (OT)

*Message #12 Posted by **Walter B** on 30 July 2009, 6:51 p.m.,*
in response to message #11 by Bart (UK)

Hi Bart,

CS/DOF will *always* stay <1 for the lower tail, as well as it will stay >1 for the upper tail d8)
Both values will approach 1 for large DOF.

Walter

Re: Curve fitting question (OT)

*Message #13 Posted by **Bart (UK)** on 30 July 2009, 8:04 p.m.,*
in response to message #12 by Walter B

Hi Walter,

Sorry, I seem to have the wrong end of the "tail", RC2 is more suited for a lower tail GOF check, if <=1 is to be the acceptance criteria.
However, as CS/DOF=1 is around the 60th percentile, the RC2 seems a very loose check for goodness of fit. As the 5th percentile is a more acceptable criteria, then RC2 < 0.78 for 100 DOF or <0.5 for 20 DOF.

Let me add that I've used the Chi2 and looked into the RC2 when I saw your question this morning.

Re: Curve fitting question (OT)

*Message #14 Posted by **Walter B** on 1 Aug 2009, 5:21 p.m.,*
in response to message #13 by Bart (UK)

Just to illustrate what we are talking about: This is a diagram of Reduced Chi Square over Degrees Of Freedom. The lines are for different confidence levels and number of sides, and "einseitig" means single sided, while "zweiseitig" means (surprise!) double sided. Solid lines are for single sided, blue lines are for 99%, so broken lines are for double sided, and red lines are for 95%.

Regards

Re: HP 12C/15C emulators for iPhone by HP

*Message #5 Posted by **Les Wright** on 8 Aug 2009, 1:37 a.m.,*
in response to message #4 by Reth

I think the proprietary HP apps are pricey, given that the Tom Fors versions are somewhat cheaper and seem fine to me. I have SCI15C, though I must confess I use it little.

Some have suggested that by spending the extra and supporting the HP app we may encourage HP to release the 15C anew by showing interest. I must admit that I don't know if I buy into that logic.

And, yes, Reth, the 42s simulator, particularly in its most recent release, is so much more pleasurable to use, and cheaper too. The program I/O is the deal breaker for me. i41cx+ is a bit more expensive, but just keeps getting better, and is a must have for the aficionado. But for daily use, 42s is my fave.

Les

42s emulator for iPhone is brilliant and getting better all the time!

*Message #6 Posted by **Reth** on 9 Aug 2009, 1:14 a.m.,*
in response to message #5 by Les Wright

IMO 42s is on its way to its second life, with the 4 line display (+ 4 line AVIEW is on Thomas' to-do list) and dynamic overlay keys plus practically unlimited memory and great speed and already excellent IO cappabilities, it's my favorite too. What's more - it's a living thing and I believe future improvements will follow.
I take the opportunity to recommend it to all iPhone/iPod Touch owners among HPCalc fans who still don't have it.
Cheers,
Reth

in response to message #4 by Gerson W. Barbosa

Unlike the first time, the page now says it has reached its 10-download limit, and I can't download it. I did get it just before I posted above however, and there was nothing on it about calculators.

Re: HP or Texas? The difficult decision.

*Message #6 Posted by **Thomas Radtke** on 29 July 2009, 6:32 a.m.,*
in response to message #1 by Saile (Brazil)

I don't bother downloading a PDF if there's no other content in your message except that link. But I'll answer the message title: The dicision is difficult only if you don't know what you want. The features offered by HP and TI calculators are not secret, manuals and additional information are available online.

Re: HP or Texas? The difficult decision.

*Message #7 Posted by **Marcus von Cube, Germany** on 29 July 2009, 9:42 a.m.,*
in response to message #1 by Saile (Brazil)

Saile, can you upload the file again. Its no longer available. Or can someone who has already downloaded the file put it somewhere else? (e.g. MegaUpload.com, where I have an account). I'll be happy to host it on my site if I can get it.

in response to message #8 by Marcus von Cube, Germany

Thanks, just read the last paragraph and the conclusion is that the TI is more accurate and the hp easier to use...

Funny, I would think it would be just the opposite.

Re: HP or Texas? summary

*Message #11 Posted by **marais** on 29 July 2009, 2:48 p.m.,*
in response to message #10 by Don Shepherd

If you want an executive summary of the article, here you go:

- HP's build quality is superior to TI's

- HP's documentation for the 25 was quite good, the 33's user guide is poor, the 67 not much better,

the 34 however is appreciated. The TI documentation, on the other hand, is boring and lacks didactical quality. Clear win for HP, although only because TI's documentation is so poorly written.

- RPN is superior compared to AOL

- RPN programs are shorter: 1 line of RPN equals 1.5 to 2 with AOL

- TI internal precision is 11 decimals, HP seems to be only 8. TI wins in this (quite important) category.

I found the article quite amusing and worth reading.

Andreas

Nice article, but perhaps the author did not put the calculators to the right tests. What calculators would perform better in Savage Benchmark, for instance?

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103356

Regards,

Gerson.

HP calculators don't perform well in repetitive tests, like squaring 1.0000001 27 times (see link below - results in the first column, %errors in the next one) because the results are rounded to the number of digits in the display (internally the computations are carried out to 2 or 3 more guarding digits though).

RPL: Binary to "long ints"?

*Message #1 Posted by **Mark Edmonds** on 28 July 2009, 4:48 p.m.*

I have to admit that I am slightly confused by the exact/approx modes of machines from the 49G onwards. I also find it slightly frustrating in that porting programs over that use display formatting get messed up by the extra decimal point.

Anyway, here is the question.

With Exact mode set ON, I don't understand why doing this doesn't result in an exact mode integer that preserves all digits:

\<< TICKS B\->R \>>

The only way round this I've found so far is to convert the result from TICKS into a string, edit out the # and base indicator and then use OBJ-\> to get it to the correct integer.

It would be a lot neater and more efficient if this conversion could be done with a single command.

Does anyone know how this would be done please?

Thanks!

Mark

Re: RPL: Binary to "long ints"?

*Message #2 Posted by **Tim Wessman** on 28 July 2009, 6:54 p.m.,*
in response to message #1 by Mark Edmonds

It would help a little to know what you are trying to do, but I don't think there is any way to change a hex value directly into an integer. It has always converted into a real number AFAIK.

As to the rest, use R->I commands in your display program and everything will work fine.

TW

Re: RPL: Binary to "long ints"?

*Message #3 Posted by **Mark Edmonds** on 28 July 2009, 7:30 p.m.,*
in response to message #2 by Tim Wessman

Thanks for the tip Tim! I didn't even know about the R->I command and I was wondering how that conversion was done.

Mark

Voyager series, logic PCA and keyboard PCA

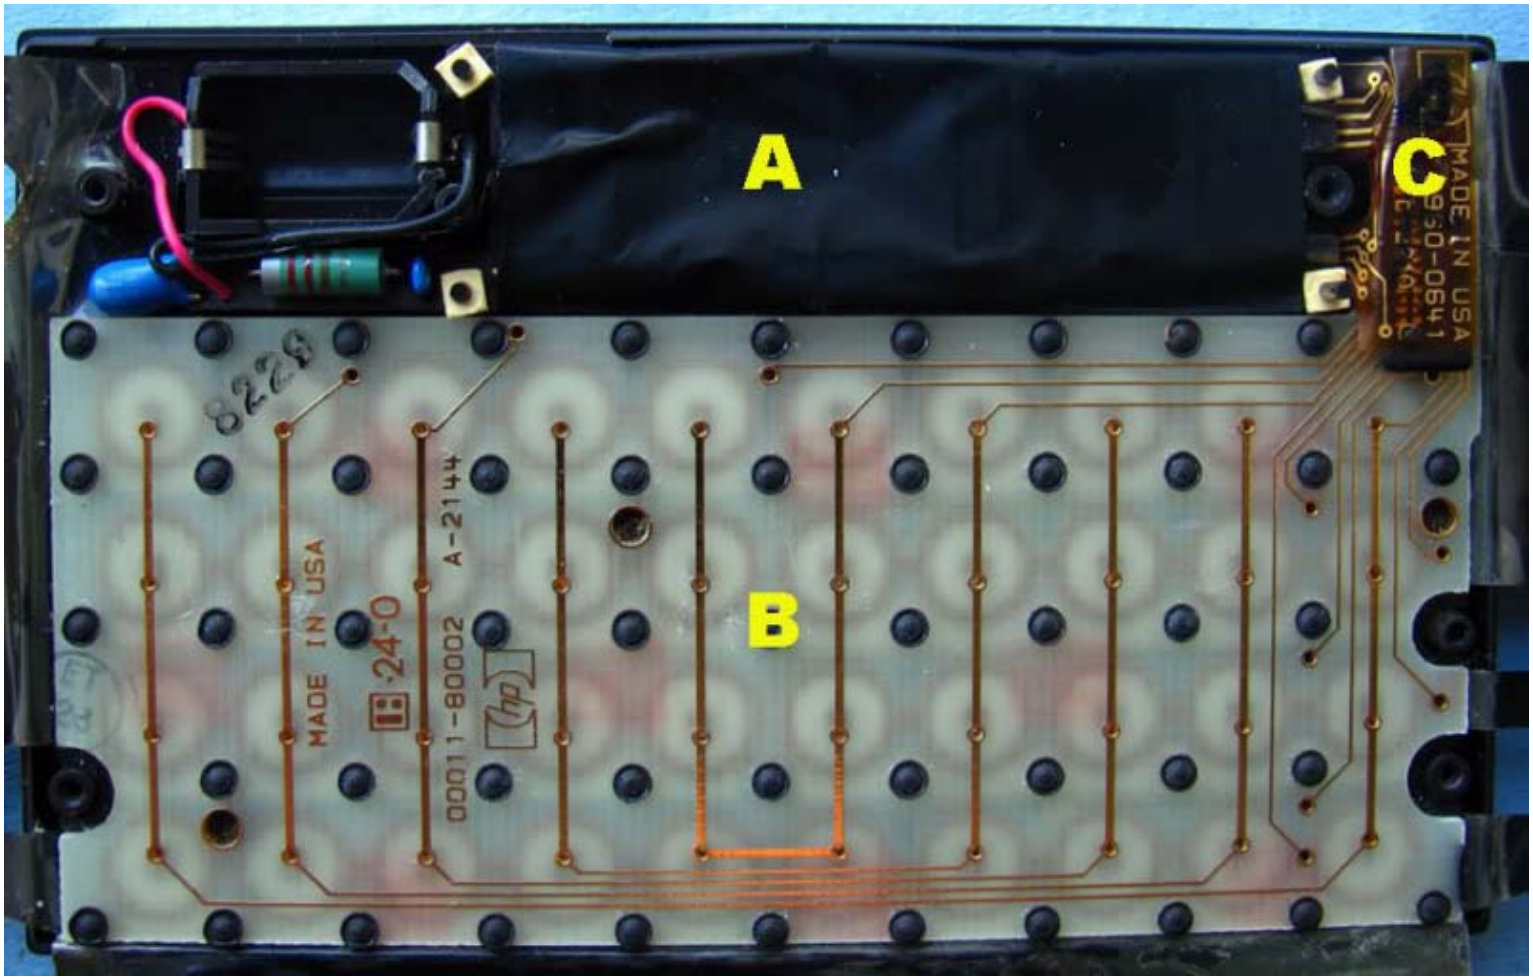
*Message #1 Posted by **Geoff Quickfall** on 28 July 2009, 2:19 p.m.*

Hello and thanks for the help in advance.

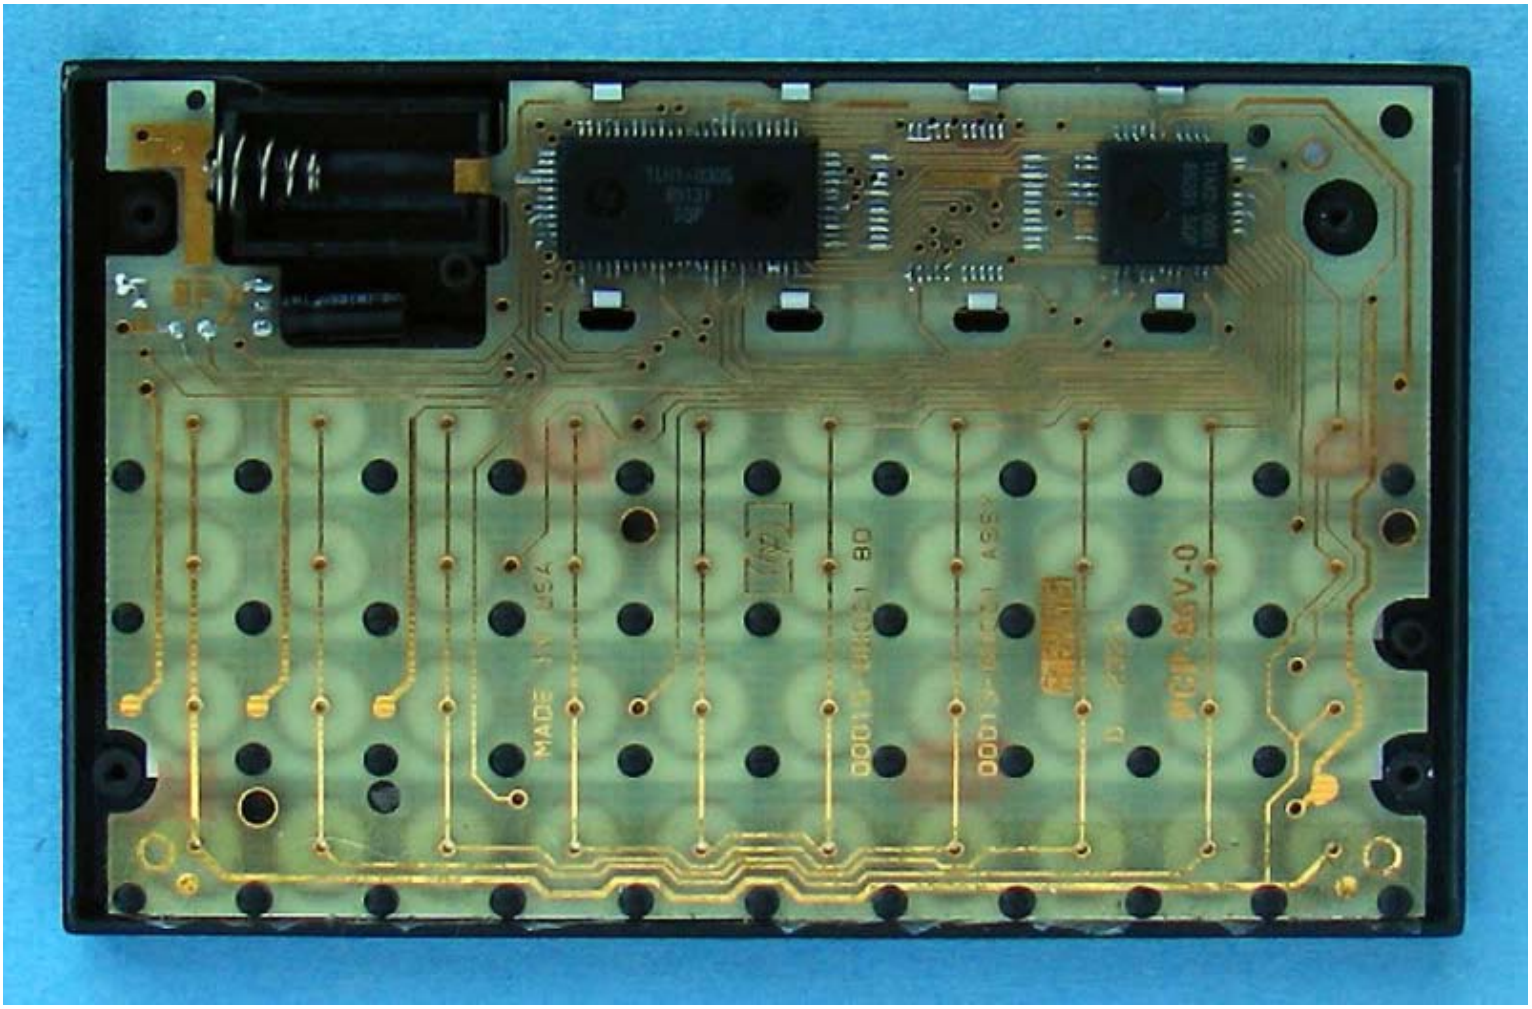
Pictured are the three PCA versions I have in my collection (ignoring all the 12C variations of late!). These are the ones during the production run of the Voyagers from 1980 to about 1989.

```
-3 variations of the 11C circuit board
    *the early two-piece-PCA; logic/LCD flex PCA and keyboard PCA
     (1980)
    *the early one-piece-PCA-two-ICs
     (1985)
    *the one-piece-PCA-one-IC
    (1989)
```

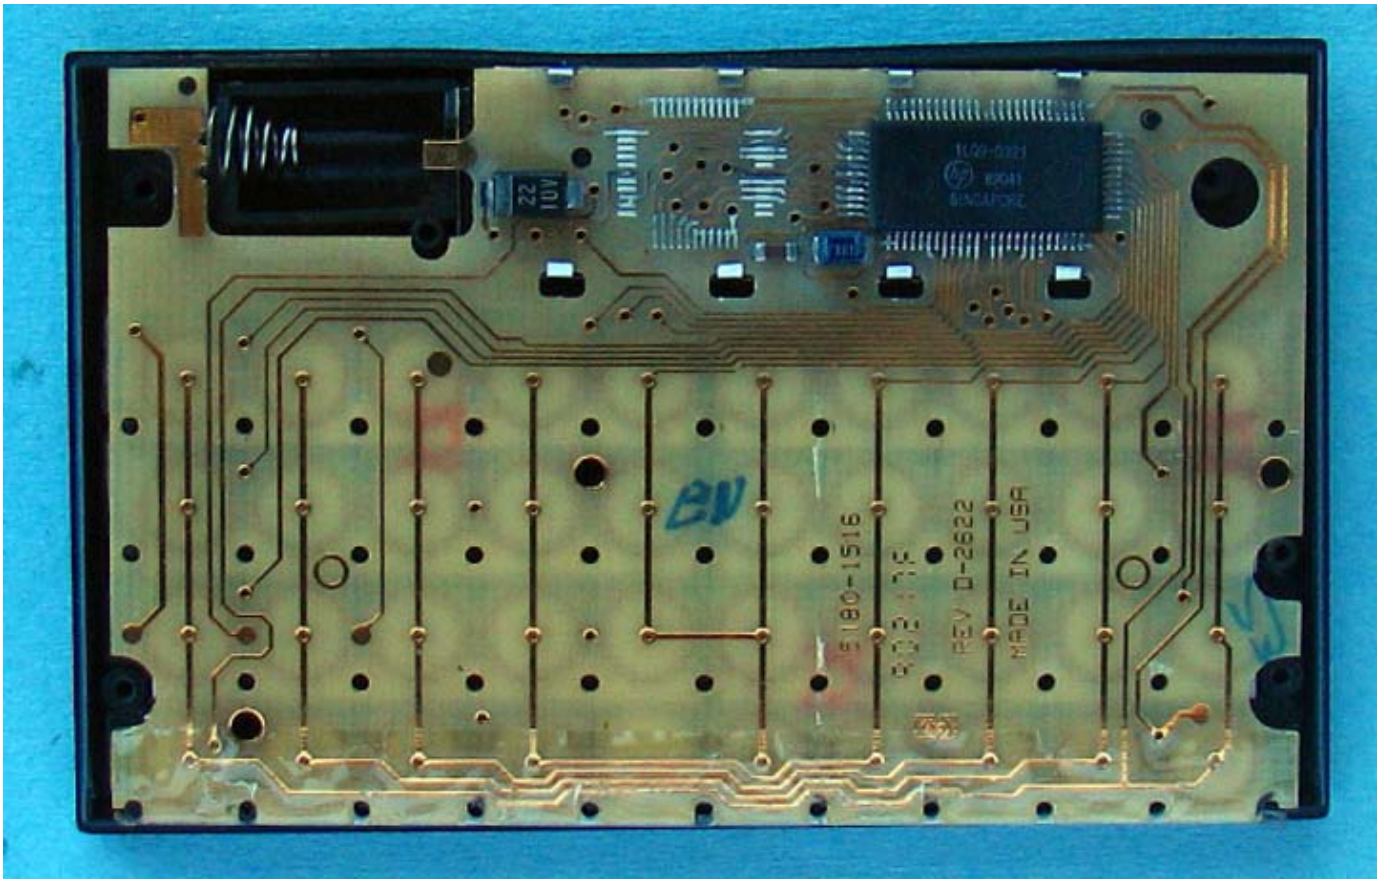
Here is an HP-10C early version two-piece-PCA (I have an 11C with the a similar board):



Here is an early one-piece-two-ICs HP-11C:



Here is the one-piece-PCA-one-IC HP-11C:



My questions are,

- Were all the early versions of the 10C to 16C a two-piece-PCA system (I have only two examples; a 1980 11C and a 1982 10C). First picture.

- Was the one-piece-two-ICs an intermediate between the two-piece-PCA and the one-piece-one-IC version? Second picture.

- Was the final iteration the one-piece-PCA-one-IC pictured? Third picture.

Cheers, and thanks.

Re: Voyager series, logic PCA and keyboard PCA

*Message #2 Posted by **Eric Smith** on 28 July 2009, 2:40 p.m.,*
in response to message #1 by Geoff Quickfall

I. Yes. I've seen all five models in the two-PCA form. (I've never seen a 10C in single-PCA form.)

II. Yes

III. There were multiple "one-chip" variants. The 11C, 12C, 15C, and possibly the 16C had a variant using the 1LQ9 chip (with a 1LH1 in the 15C). The 12C went through two further single-chip revisions prior to the recent ARM-based platform, using the 1RR2 and 2AF1 chips.

Note that the 15C always has one more IC than the other Voyagers, so the "one-chip" 15C variant has two chips.

Many thanks Eric! Will you be there on October?

*Message #3 Posted by **Geoff Quickfall** on 28 July 2009, 3:06 p.m.,*
in response to message #2 by Eric Smith

;-)

Re: Many thanks Eric! Will you be there on October?

*Message #4 Posted by **Jake Schwartz** on 28 July 2009, 3:50 p.m.,*
in response to message #3 by Geoff Quickfall

Well, the conference registration list at http://holyjoe.net/hhc2009/reglist.htm seems to indicate that Eric is already registered for HHC2009. He's been to just about every one in the past ten or so years, so I'd bet the answer to be "yes".

Jake

P.S. - 27 people have now registered....

I should have checked, oops

*Message #5 Posted by **Geoff Quickfall** on 28 July 2009, 3:55 p.m.,*
in response to message #4 by Jake Schwartz

Or maybe that was a plug for the conference ;-)

Re: Many thanks Eric! Will you be there on October?

*Message #6 Posted by **Eric Smith** on 28 July 2009, 4:18 p.m.,*
in response to message #3 by Geoff Quickfall

Yes, barring some unforeseen catastrophe, I expect to be there. I have in fact experienced several unforeseen catastrophes recently, but perhaps it is good fortune to have gotten them all out of the way well in advance of the conference.

Re: Voyager series, logic PCA and keyboard PCA

*Message #7 Posted by **Mark Edmonds** on 28 July 2009, 3:06 p.m.,*
in response to message #2 by Eric Smith

Just out of interest, is there any difference in current draw between the 1 and 2 chip versions?

Mark

Re: Voyager series, logic PCA and keyboard PCA

*Message #8 Posted by **Eric Smith** on 28 July 2009, 4:20 p.m.,*
in response to message #7 by Mark Edmonds

I haven't measured them, but I'd be surprised if the 1LQ9 version didn't have slightly lower current drain than the earlier versions. The 2AF1 version that ran on a single CR2032 probably had even lower current drain than the 1LQ9.

HP17bII+ Solver - Payback Period formula

*Message #1 Posted by **RMIER** on 27 July 2009, 3:24 p.m.*

Here is an accurate but long first attempt at a payback period formula for the HP17bII+ Solver.

If anyone has a shorter, more elegant version please feel free to share.

Background: Payback Period is number of years required to recover the invested capital in terms of free cash flows. By definition it ignores time value of money hence it is less useful than IRR and NPV, but it is sometimes used. http://www.investopedia.com/terms/p/paybackperiod.asp

For example, an investment of -$300,000 (Cash Flow 0) that generates free cash flows of $200,000 in Year 1 (Cash Flow 1) and $160,000 in year 2 has a payback period of 1.625 years (wish all my investments were like this).

In other words, it takes the entire first year and a fraction of the second year to recover the investment. The fraction of the second year is given by: (absolute value of accumulated cash flow Year 1/Cash Flow Year 2), or ($100,000/$160,000) = 0.625

Notes:

- Cash flow list has been named "CFLIS". FIN - CFLO - NAME - CFLIS - This works for 16 cash flows, cash flow in year 0 is negative (the investment). For more cash flows you'll have to adjust the formula. - Assumes cash is earned uniformly within each year (if I make $100,000 free cash flow in a year, by the end of month 9 of the same year I would have $75,000) - For clarity I am including line breaks, but when entering the formula everything should be one single line of code without spaces. - If for some reason the payback exceeds year 16, the answer will be 101 years, as in why bother with the project if it takes so long. The why bother limit of 16 years is of course at your discretion. - The calculator takes a little to compute the answer. Hence the ask for a faster, more elegant solution.

Here we go:

PAYBK=L(S1:FLOW(CFLIS:0)+FLOW(CFLIS:1))*0+ L(S2:S1+FLOW(CFLIS:2))*0+
L(S3:S2+FLOW(CFLIS:3))*0+ L(S4:S3+FLOW(CFLIS:4))*0+ L(S5:S4+FLOW(CFLIS:5))*0+
L(S6:S5+FLOW(CFLIS:6))*0+ L(S7:S6+FLOW(CFLIS:7))*0+ L(S8:S7+FLOW(CFLIS:8))*0+
L(S9:S8+FLOW(CFLIS:9))*0+ L(S10:S9+FLOW(CFLIS:10))*0+ L(S11:S10+FLOW(CFLIS:11))*0+
L(S12:S11+FLOW(CFLIS:12))*0+ L(S13:S12+FLOW(CFLIS:13))*0+ L(S14:S13+FLOW(CFLIS:14))*0+
L(S15:S14+FLOW(CFLIS:15))*0+ L(S16:S15+FLOW(CFLIS:16))*0+

IF(S1>=0:1-(S1/FLOW(CFLIS:1)): IF(S2>=0:2-(S2/FLOW(CFLIS:2)): IF(S3>=0:3-(S3/FLOW(CFLIS:3)):
IF(S4>=0:4-(S4/FLOW(CFLIS:4)): IF(S5>=0:5-(S5/FLOW(CFLIS:5)): IF(S6>=0:6-(S6/FLOW(CFLIS:6)):
IF(S7>=0:7-(S7/FLOW(CFLIS:7)): IF(S8>=0:8-(S8/FLOW(CFLIS:8)): IF(S9>=0:9-(S9/FLOW(CFLIS:9)):
IF(S10>=0:10-(S10/FLOW(CFLIS:10)): IF(S11>=0:11-(S11/FLOW(CFLIS:11)): IF(S12>=0:12-
(S12/FLOW(CFLIS:12)): IF(S13>=0:13-(S13/FLOW(CFLIS:13)): IF(S14>=0:14-(S14/FLOW(CFLIS:14)):
IF(S15>=0:15-(S15/FLOW(CFLIS:15)): IF(S16>=0:16-(S16/FLOW(CFLIS16)):101)

Re: HP17bII+ Solver - Payback Period formula

*Message #2 Posted by **Katie Wasserman** on 28 July 2009, 12:58 a.m.,*
in response to message #1 by RMIER

Wow, that's a long equation.

Disclaimer: I wrote and tested this on a 17bii not a 17bii+

Here's a simpler, more general solution that will work for any length cash flow list and follows your assumptions. It's doesn't stop at year 16 however.

```
PAYBK =
0 x L(X:FLOW(CFLIS:0)) +
Sigma(I:1:SIZEC(CFLIS):1:
0 x L(Y:FLOW(CFLIS:I)) x L(X:G(X)+G(Y)) +
IF(G(X)<=0:1:IF(G(X)<G(Y):(G(Y)-G(X))/G(Y):0)))
```

- Sigma is the summation symbol on the 17BII

- G(..) simply gets the value of the variable but does it without trying to solve for it and without showing it as a variable in the menu.

Edited: 28 July 2009, 1:06 a.m.

Re: HP17bII+ Solver - Payback Period formula

*Message #3 Posted by **Marcus von Cube, Germany** on 28 July 2009, 2:47 a.m.,*
in response to message #2 by Katie Wasserman

Katie, the problem is the case where the sum of cash flows is negative. The formula will spit out the number of cash flows but no error indication is given.

Re: HP17bII+ Solver - Payback Period formula

*Message #4 Posted by **Katie Wasserman** on 28 July 2009, 9:41 a.m.,*
in response to message #3 by Marcus von Cube, Germany

That's correct, there's no check to see if total doesn't end up as a positive number and therefore it will just terminate showing the total number of cash flows. But it's simple to correct that:

```
PAYBK =
0 x L(X:FLOW(CFLIS:0)) +
Sigma(I:1:SIZEC(CFLIS):1:
0 x L(Y:FLOW(CFLIS:I)) x L(X:G(X)+G(Y)) +
IF(G(X)<0:IF(I=SIZEC(CFLIS):9E499:1):IF(G(X)<G(Y):(G(Y)-G(X))/G(Y):0)))
```

The above formula will return a 9E499 if the sum of the cash flows never turns positive.

Re: HP17bII+ Solver - Payback Period formula

*Message #5 Posted by **RMIER** on 2 Aug 2009, 1:45 p.m.,*
in response to message #4 by Katie Wasserman

Katie, thanks for the elegant and short solution, clever use of sigma, SIZEC and G(X) to get the job done. It works well on the 17bII+.

Marcus, thanks for your comment also, it resulted in an improvement to the solution.

Much appreciated, Rafael.

Re: HP17bII+ Solver - Payback Period formula

*Message #6 Posted by **Marcus von Cube, Germany** on 28 July 2009, 2:50 a.m.,*
in response to message #1 by RMIER

Your formula doesn't check the total number of cas flows and will (probably, I haven't checked) error out if the sum of all cash flows is negative.

Re: HP17bII+ Solver - Payback Period formula

*Message #7 Posted by **Peter A. Gebhardt** on 2 Aug 2009, 5:36 p.m.,*
in response to message #1 by RMIER

In addition to Katie's solution, here is my Discounted Payback Solution (from a 200LX) which takes into account that:

1) SAF% == 0 (Opportunity Cost per Period) results in Payback Periods instead of Discounted Payback Periods

2) Grouped CFs are possible

```
0*SAF%
+DPB
-G(D)                       ! see PS below !
=
0*(
    L(CF$:0)
   +L(DPB$:FLOW($:0))
   +L(N:1)
   +L(D:9E99)               ! see PS below !
)
+
0*
SIGMA(G
     :1:SIZEC($):1
     :0*L(CF$:FLOW($:G))
      *SIGMA(T
            :1:#T($:G):1
            :IF((G(DPB$)+G(CF$)*SPPV(SAF%:G(N)))>=1E-15
                 :L(D
                   :G(N)-1
                    +IF(G(CF$)<>0
                        :ABS(G(DPB$))/(G(CF$)*SPPV(SAF%:G(N)))
                        :0
                        )
                   )
                 :L(DPB$
                   :G(DPB$)
                    +G(CF$)*SPPV(SAF%:G(N))
                   )
                  +0*L(N:G(N)+1)
                 )
           )
      )
```

To reduce the number of characters to be typed into your 17bII+ finetuning of the above code should be possible still. As examples: Somebody might reduce the code in the init section or might play around with some clever MIN/MAX usage instead of IF's ...

Best regards,

Peter A. Gebhardt

PS (3-Aug-2009,10:46 MESZ): The following code, which was thought of covering the case of sum of the CFs being negative, gave spurious erroneous results.

Therefore I replaced

```
-if(G(DPB$)<0:L(D:9E99):G(D))
with
-G(D)

and

+L(D:0)
with
+L(D:9E99)
```

Voyager HP-10C restoration and bezel replacement. and the book.

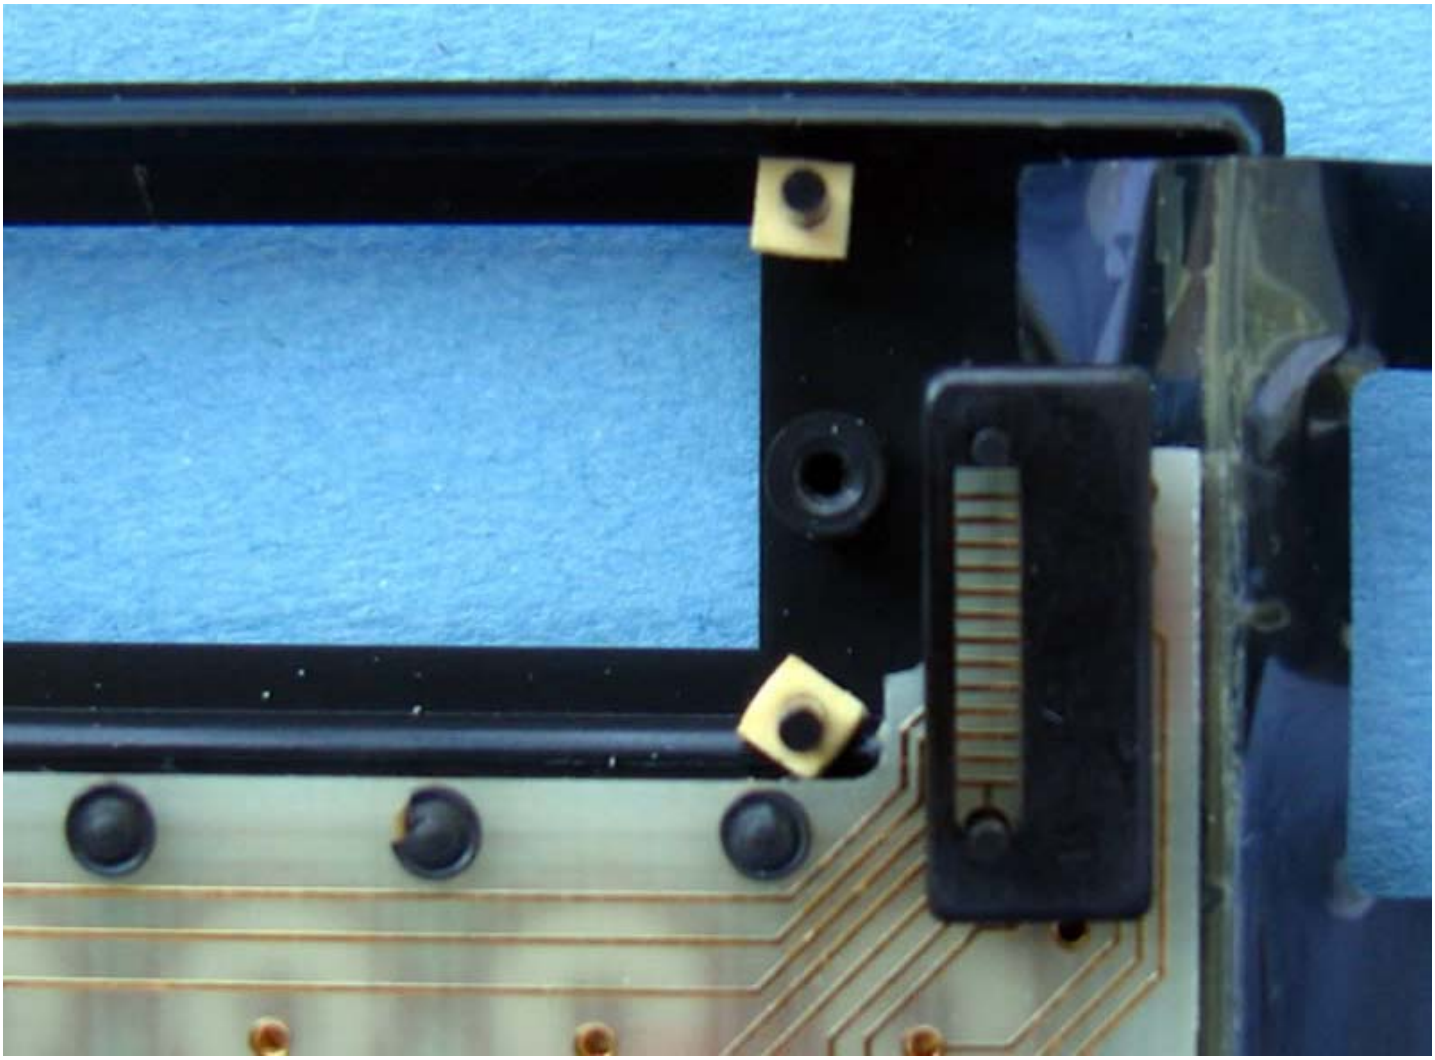
*Message #1 Posted by **Geoff Quickfall** on 27 July 2009, 12:37 a.m.*

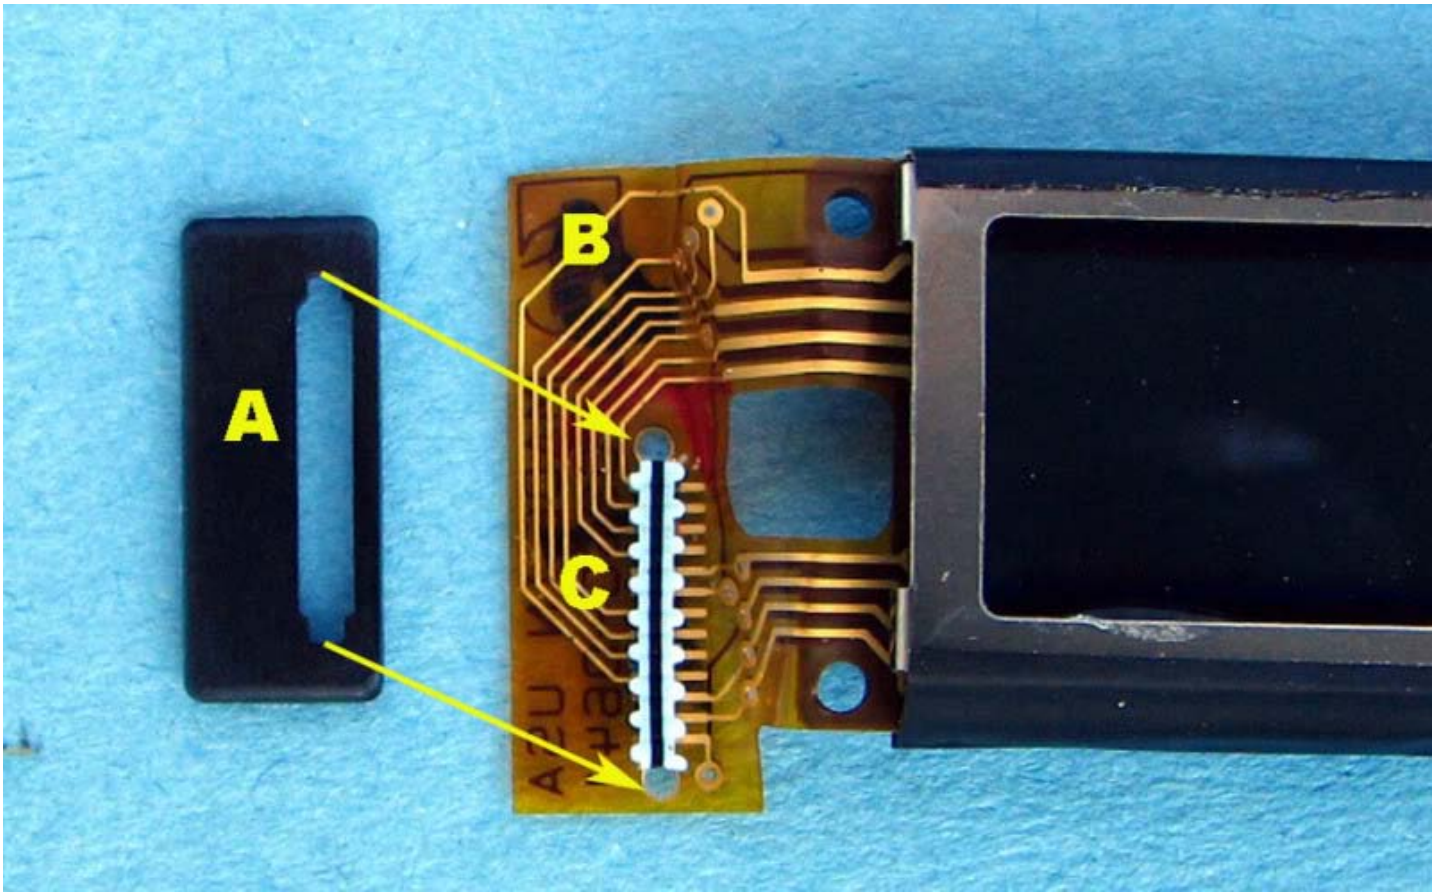
Hello all,

Here is a shot of a 10C that I did today and the restoration techniques used comprise the bulk of chapter 9 "Voyagers". The aluminum bezel was replaced with an undented donor that I restored to it's brushed finish. The keyboard is now functional, in fact this one did not work due to a broken solder joint and dirty logic pca zebra connector. This is an early version with the separate logic pca and LCD panel.

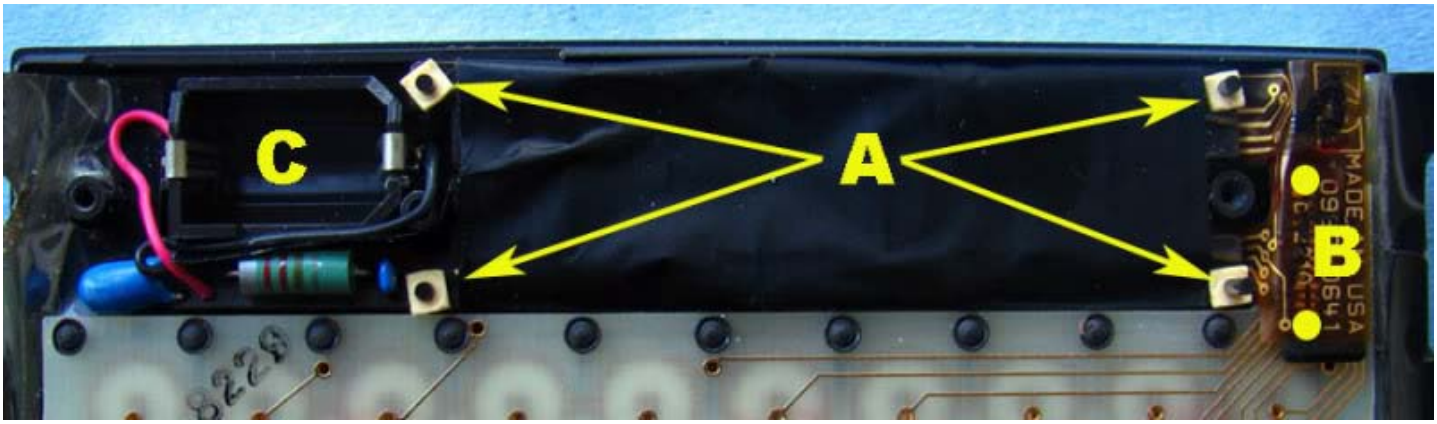
The second half of chapter 9 will feature a complete strip down of an 11C and removal of the keyboard from the case. The book is up to 105 pages and should top out at 230 pages when completed. So far there are 144 figures all referenced to the text in a step by step restoration process, similar to the following:

Voyager HP-10C restoration and bezel replacement. and the book.

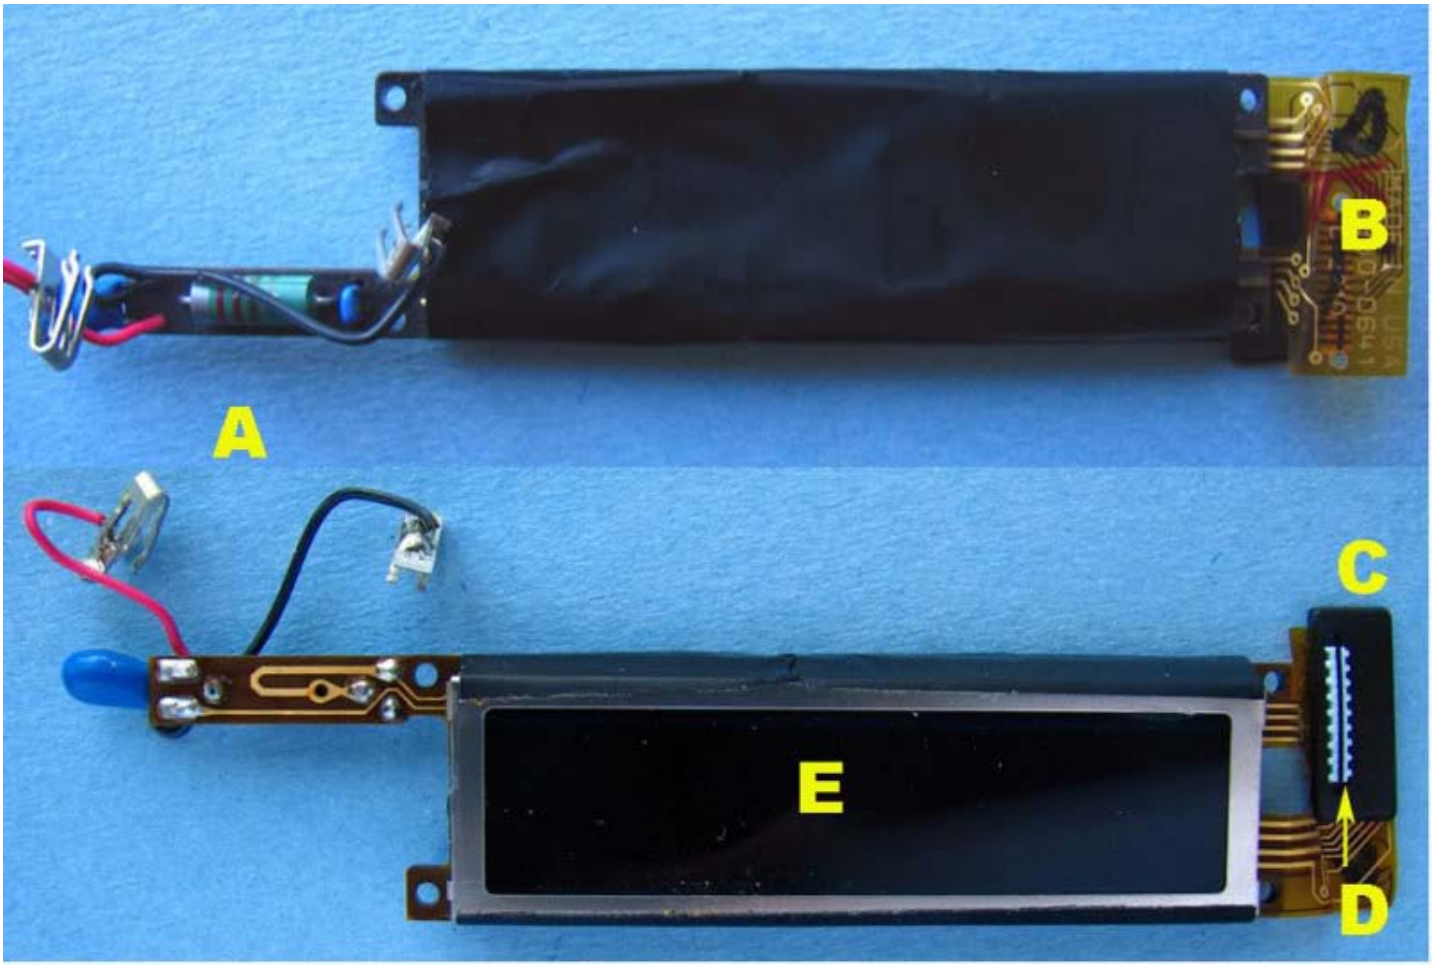




A
B
C



C
A
B



So far the following chapters/appendices are completed:

Introduction
Acknowledgements
Contents
Chapter 1 About Restorations
Chapter 2 Classics 34 figures
HP-65
HP-45
HP-55
Chapter 3 Woodstocks 8 figures
HP-29C
Chapter 6 Cricket 25 figures
Chapter 8 Coconut 55 figures
HP-41CX halfnut
HP-41CV fullnut
Card reader
Rechargeable battery pack
Double x-memory module
Chapter 9 Voyager 25 figures
HP-10C early version with separate logic PCA 1982
HP-11C late version 1989
Appendix A Tools and Materials
Appendix B Battery Pack Substitute 20 figures
Drying boxes
Overlay labels for the HP 41
Rubber feet fabrication
Static Electricity protection techniques
Appendix C Diagnostic programs for various early calculators
Appendix D Terms and definitions
Appendix E Links to the Web

The following need to be completed:

Chapter 4 TopCat
HP-97
Chapter 5 Sting
HP-19C
HP-10C
Chapter 7 Spice
HP-34C unsoldered

```
Chapter 10    Titan
              Early version HP-71B
              Late version HP-71B
Chapter 11    Clamshell
              to be annouced (possible an HP28C)
Chapter 12    Pioneer
              to be announced (possible an HP42S with memory
              enhancement)
Chapter 13    Charlemagne
              HP48SX
```

I am hoping to have this ready for HCC2009 but we shall see if life gets in the way. In fact, most of the uncompleted chapters have been photo documented but the text needs doing so they should flow rather well.

I hope some one out there would like a copy. It will be spiral bound, full colour 8.5 by 11 inches in size so that the photo/figures are easily readable.

Thats all for now!

For sure they will :) Any idea about the price?

Re: Voyager HP-10C restoration and bezel replacement. and the book.

*Message #3 Posted by **Geoff Quickfall** on 27 July 2009, 1:09 p.m.,*
in response to message #2 by Walter B

Don't know the costs yet! That of course is based on the quality of paper, number of colour photos and etc. Once the book gets closer to completion I will have a handle on the cost.

I would like to cover the costs to produce the copies and of course shipping and at the end of it all, take my wife out for dinner based on the profit ;-)

Cheers, Geoff

Re: Voyager HP-10C restoration and bezel replacement. and the book.

*Message #4 Posted by **Marcus von Cube, Germany** on 27 July 2009, 5:53 a.m.,*
in response to message #1 by Geoff Quickfall

Put me on the list, even if I will never be nearly as proficient as many others here. The book will possibly prevent me from killing one of my precious HPs.

Re: Voyager HP-10C restoration and bezel replacement. and the book.

*Message #5 Posted by **Gerry Schultz** on 27 July 2009, 3:27 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Count me in too, Geoff. If you bring copies to HHC 2009, I will buy one. From what I've seen in your postings, I am very impressed by all the work you put into this, so save me a copy.

See you in Ft. Collins!

Gerry

Hi Geoff

Very nice, I certainly like to have a copy when available.

I suggest you also add a chapter on the HP10 / HP 19C.

I can suply you with pictures from the insde when needed.

Ronald

Re: Voyager HP-10C restoration and bezel replacement. and the book.

*Message #7 Posted by **Geoff Quickfall** on 27 July 2009, 11:58 a.m.,*
in response to message #6 by RonaldP

Hello Ronald,

Chapter 5, "Sting" is both the 10 and 19C printer calculators. Wlodek Mier-Jedrzejowicz has lent me both the 10 and 19C for disassembly for the book.

I will be picking them up on my next London layover, but will keep your kind offer in mind. However I would appreciate a set of your photos. I am trying to keep the photo consistent (blue background for printing) and also part of the novelty of the book is that I have done all the restorations and repairs. Each step is photo documented with labels and text references so consistency is a requirement!

I am using a lot of resources including service manuals, the museum articles and archives as well as HP employees and consultants from the past.

Cheers, Geoff

in response to message #7 by Geoff Quickfall

Hello,

We saw many examples of Geoff's restoration skills at HHC 2008 and read about them in *HP Solve*.

He will demonstrate his restoration techniques for the HP-41 at HHC 2009 in Ft. Collins CO. See details at:

HHC Websites

When HP provides their facilities to hold the conference we have a special situation in terms of keeping cost down and the benefit/cost ratio is exceptionally high. See the Conference reports at the above link. We have only had this situation during a small percentage of our Conferences since the first in 1979. With everything changing so fast these days the future is evermore unpredictable. If you have been putting off attending and you have a special interest in the future (and sell/buy/swap the 30 year old HP-41 system) this should be the year you attend. With HP selling off their campuses we may not have these opportunities as often in the future.

X < > Y,

Richard

in response to message #1 by Geoff Quickfall

Please save a copy for me, and a question for you:

I have a nice working HP-15C, but the aluminum bezel is scratched. In your opinion, is it worth restoring the bezel to bring the calc close to perfection, or are there any risks (collaterla damage) to the functionality of the calc in doing this ?

Thank you !

Bezel restoration in place with pictures and glimpse of what the book includes:

*Message #10 Posted by **Geoff Quickfall** on 12 Aug 2009, 5:48 p.m.,*
in response to message #9 by Giovanni Jimenez

Hello all

Any one wondering what will be in the book can look forward to a variety of techniques for restoring the calculator from electronics to physical shape. Here are some steps found in the Voyager section (in point form here, not quite as in depth) with accompanying pictures. The text will have many more intermediary photos with accompanying explanations.

I have designed the book to help the (like me) non technically oriented to restore the basic problems in mechanical design as well as the most frequent, fixable electronic problems (LED block replacement, contact cleaning, substitutes in foam inserts and etc.)

```
In a nutshell the book is:

1.      about 250 pages

2.      over 300 photo illustrations with accompanying text for all
        thirteen calculator families up to and including the
        Stretch Pioneers.

3.      130 pages completed so far including chapter 8, the HP-41C
        series

        a.      HP halfnut restoration

        b.      HP fullnut restoration

        c.      Rechargeable battery pack reconditioning

        d.      Memory enhancement (2X-memory)

4.      Hoping to be done for HCC2009 in October but it still has
        to be peer reviewed by the committee.

5.      Expecting to be on demand publishing but I should have some
        copies made up prior to that (don't know the cost yet).
```

Hello Giovanni!

Thanks for the order, now to complete the book (half way and counting).

There are two methods to restoring the Bezel.

"REPLACING" OR "RESTORING while in place."

I am going to consider that the bezel is scratched and not dented, i.e. you would rather remove the scratches and refinish

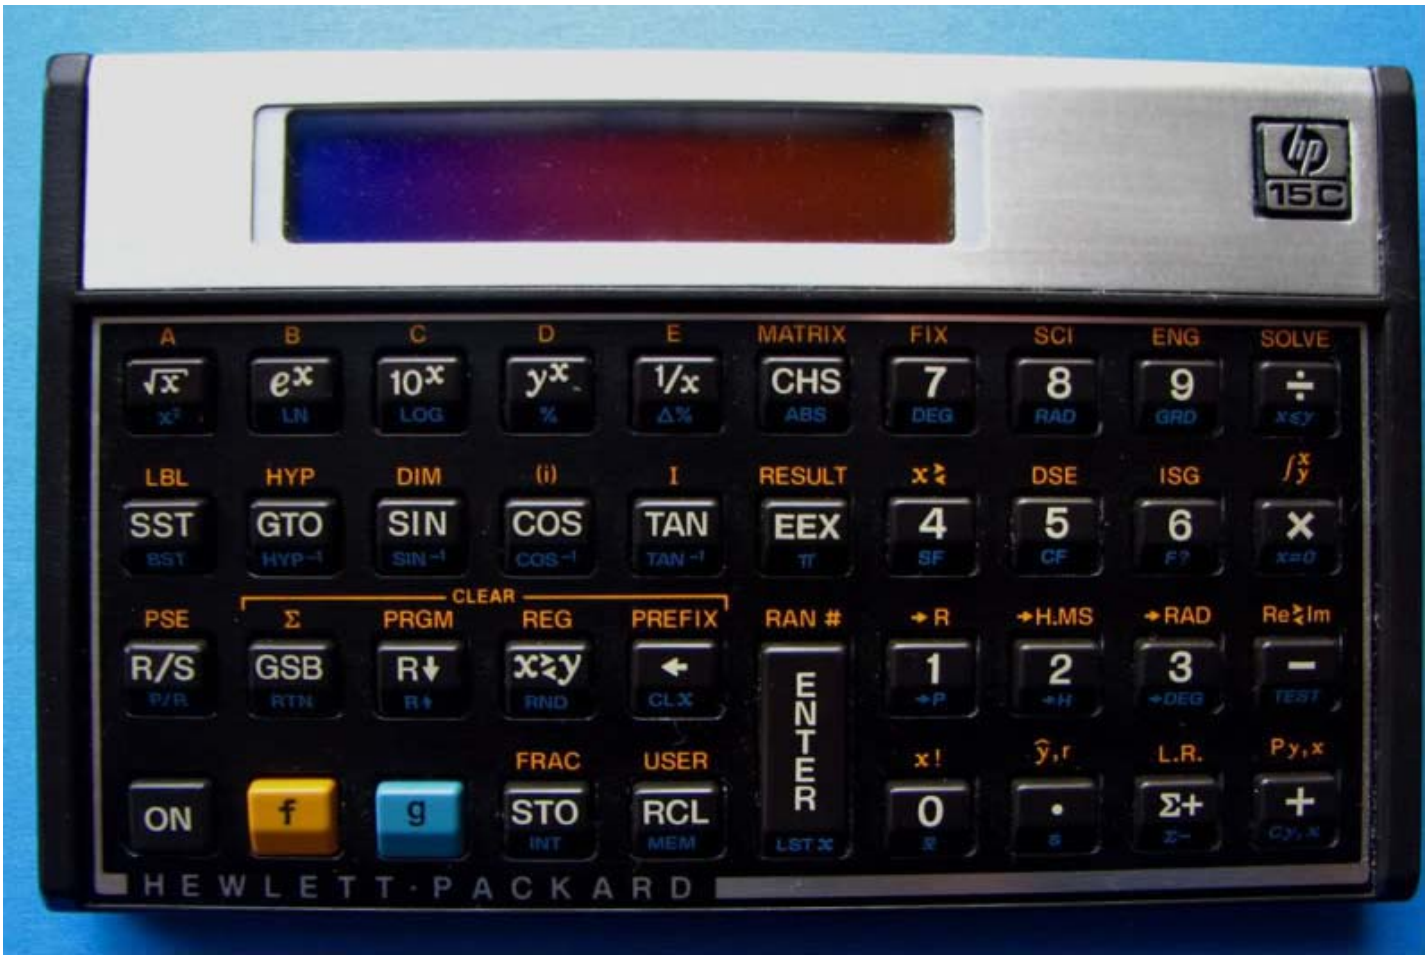
with a brushed finish with the bezel **in place.**

```
1  cover the clear plastic lens with a non sticky piece of paper
   which covers the lens only and not the two depressed bezel
   pieces at either end.  Any application of a sticky mask to the
   lens and subsequent removal may only serve to remove part of the
   anti reflective coating.  Hold this in place with a piece of
   masking tape long enough to attach to the two depressed bezel
   pieces at either end.
2  if the HP15C badge is metal (pre 1982?) then mask it, other wise
   remove it by applying heat to the badge with a hair dryer then
   gently prying it off.
3  mask the entire calculator seen in the picture below.
4  once masked, secure a piece of 400 grit wet dry sand paper,
   green plastic pot scrubber (scotch brite), alcohol and gloss
   lacquer spray can.
5  using a parallel motion, be as accurate as possible, use a
   stroking motion with the sand paper parallel to the
   longitudinal axis of the calculator until the old lacquer is
   completely removed as well as the scratches.
6  to remove the harshness of the finish, repeat step 5 with the
   plastic pot scrubber material.
7  clean with alcohol to remove any oily residue and remask the
   lens if required.
8  spray the lacquer according to the manufactures requirements,
   many light coats as opposed to a runny heavy coat.
9  let dry overnight.
10 heat the masking tape until warm to the touch to soften the
   adhesive prior to removing the tape.  This IS IMPORTANT!!!!
   The heat softens the adhesive and when removing from the back
   of the calculator it, when warm, will release without removing
   any labelling on the instructions.
11 Reglue the badge in place with contact cement.
```

Removing the bezel is a long process that must be carefully done with precautions. It requires lots of heat so the LCD must be removed in the early two piece versions (HP-15 I don't think was ever the two piece PCA) or protection of the LCD panel with cloth. You will have to wait for the book for that! If the bezel is just scratched and not dented then refinish the bezel in place.

HP-15C MASKED FOR REFINISHING AND LACQUERING IN PLACE WITH NEW OLD STOCK METAL BADGE MASKED:

HP-15C WITH REFINISHED BEZEL WHILE BEZEL WAS IN PLACE (dark LCD lens due to polarizer on camera interfering with polarizer on LCD panel):



HP-10C BEZEL BEFORE BEZEL REMOVAL PICTURING THE THREE DENTS ON THE RIGHT SIDE WHICH COULD NOT BE SANDED OUT:

HP-10C BEZEL REPLACED WITH AN HP-11C DONOR THAT WAS REFINISHED AFTER REMOVING IT:

BEFORE AND AFTER BEZEL REPLACEMENT ON THE HP-10C:

Hope this helps!

Cheers, Geoff

BATTERY LONGEVITY

*Message #1 Posted by **Howard Lazerson** on 26 July 2009, 11:06 p.m.*

I use an 11c daily and the batteries last forever [well at least it seems that way]. Is that true for the newer 12c?

Re: BATTERY LONGEVITY

*Message #2 Posted by **Don Shepherd** on 26 July 2009, 11:18 p.m.,*
in response to message #1 by Howard Lazerson

Howard, I can't tell if it will be forever, I only received my ARM-based unit a couple of months ago, but so far so good. I use it every day, mostly running programs on it, and the batteries are fine so far.

Re: BATTERY LONGEVITY

in response to message #1 by Howard Lazerson

> Quote:
>
> I use an 11c daily and the batteries last forever [well at least it seems that way]. Is that true for the newer 12c?

No, absolutely not. See HERE and HERE

The 20B with the same basic architecture is rated for a battery life of around 9 months, Cyrille has implied the new 12C should be a bit better than this this. That's the general figure HP quote.

But it could be as low as a few months if you really used it hard.

Technically speaking, if you had a program loop running continuously (Katie gives an example of a "long amortization function"), the batteries would be dead within 20 hours. And that's being generous, that figure does not include various losses.

Dave.

Re: BATTERY LONGEVITY

*Message #4 Posted by **Katie Wasserman** on 27 July 2009, 11:04 a.m.,*
in response to message #3 by DaveJ

To take this a step further....

Even if you never turned on the new 12c(12c+) the batteries would run out in around 12 years based on 220maH capacity is each CR2032 cell. The original 12c with original silver oxide batteries could last a lot longer than that. If you had the 12c+ on but weren't entering numbers or running any functions the batteries would last just about one year. Of course it does have an auto power off function so that this won't happen.

Re: BATTERY LONGEVITY

*Message #5 Posted by **Michael de Estrada** on 27 July 2009, 11:41 a.m.,*
in response to message #4 by Katie Wasserman

Pretty much my experience with the HP-33s and HP-35s. The original batteries in my HP-15c lasted over 20 years!

Re: BATTERY LONGEVITY

*Message #6 Posted by **Quan** on 27 July 2009, 5:12 p.m.,*
in response to message #5 by Michael de Estrada

I agree on the 33s (CNA 815xxxxx) which I bought a couple months ago new in box. Batteries had already expired before I turned the calc on.

I imagine the 35s which I bought ealier this year will experience the same.

Regards,

-Quan

Repaired HP41CV hangs on error.

*Message #1 Posted by **Dan Koller** on 25 July 2009, 2:33 p.m.*

Hi folks,

I've recently rebuilt the posts on my old HP 41CV calculator. I gave each of the contacts on all the boards a good cleaning with an alcohol swap and blew dry with air and re-assembled the calculator.

The calculator now appears to work fine (whereas it wouldn't even turn on before) but there is a problem. Upon any error, e.g. divide by 0 or Log(0), the display goes blank and the calculator appears to hang up. CLX or <- do not restore the display. The ON button does not respond. Sometimes holding the CLX key while toggling the ON button results in a CLX command and the calculator continues to function normally until the next error. The calculator is clearly on because I do not get a MEMORY LOST message in this scenario.

...and on further investigation, in PGRM mode, hitting the SST key results in the SHFT flag in the display being show, and the calculator also hangs up. So there are other problems.

Does anyone have any suggestions on how to procede to fix this?

Thanks much, and I love this museum!! If all else fails, I will revert to the HP25C emulator on the links page. Very nice!

Dan

Re: Repaired HP41CV hangs on error.

*Message #2 Posted by **Randy** on 26 July 2009, 2:17 p.m.,*
in response to message #1 by Dan Koller

It does sound like a bad ROM. But, crud can cause similar behavior so I would recommend you clean the processor board with isopropyl on both sides and let it dry well. If there is any flux on the solder side, get it completely cleaned off.

That might cure it but if not, again, it is most likely a bad ROM.

Re: Repaired HP41CV hangs on error.

*Message #3 Posted by **Geoff Quickfall** on 26 July 2009, 5:38 p.m.,*
in response to message #1 by Dan Koller

Hi there,

firstly, Randy is the guru here so I bow to his diagnosis but before you lose all hope read on!

I have just restored two HP 41CX halfnuts and a 41CV fullnut. These too required repaired screw posts:

(battery post repair

All three also needed bottom shell washer reconstruction:

washer posting

Now to the crux of this posting. The two CX's failed to respond after a thorough cleaning, repairing and reassembly. If I was lucky I got nothing but strange characters, other times no display at all.

I tried the memory lost salute, removing the batteries and shorting the far left battery contact with the far right, master clear with batteries removed and all the other methods to reset that are available. I ultimately **left the calculators with batteries removed for 4 days** as I happened to leave for a trip.

When I came back, I installed the batteries (new) and tried both calculators starting with the memory lost keys (ON and back arrow). I got the memory lost display which I cleared with the back arrow key and they both **WORKED** and have ever since! I remembered that this was one of the ways to reset the HP 41 series in the event of a severe Synthetic programming mistake.

So try removing the batteries and leaving the unit for a couple of days.

Cheers, Geoff

HP-IL I/F Card on a New(er) PC - Part IV - SUCCESS!!

*Message #1 Posted by **Gerry Schultz** on 25 July 2009, 6:02 p.m.*

To All:

Complete success with some questions. Using EMU41 version 2.45, I can talk directly to my 9114B disk drive under XP on a P4 2.66 GHz PC. Here's what happened.

Last weekend, I started working on why running EMU41 version 2.40 booting from floppy would not see the 9114B. I swapped out the rev A 82973A I/F card with the rev C card and it worked. I found that I had set the I/O address on the rev A card to 3000 hex instead of 300 hex. With EMU41 now working under DOS, I knew all the hardware was functioning.

I installed UserPort on the P4 and EMU41 would NOT see my 9114B. UserPort can be installed two ways. You can run UserPort from a DOS prompt and manually start the UserPort.sys driver from the UserPort.exe frontend whenever you want. Or you can copy the UserPort.sys driver into c:\windows\windows32\drivers subdirectory and have it startup automatically whenever XP starts up. Christoph recommends the latter in his book but the manual loading of the driver works fine and I think is more secure since I can control when it starts.

Now, why didn't EMU41 not see my 9114B connected to the I/F card? It appears to be a version issue. I have three versions of EMU41 installed; 2.40, 2.45 and 2.47. I've been using 2.40 for all my testing but it can't see the external HP-IL loop. It does work correctly under DOS as this is the version I put on my floppy. Version 2.45 DOES see the external HP-IL loop and reads the disk catalog from the 9114B just fine. 2.47 also does not see the external HP-IL loop. Perhaps J-F can clarify the why.

One last question and I'm done. When I swapped the 82973A I/F card between my two PCs, I had something weird happen. The rev C version of the PC I/F card had been in my PII 233 MHz with its I/O address set to 300 hex and it booted fine. When I swapped in the rev A card and set its address to 300 hex, the PII 233 hung during booting. I changed it's address to 1700 hex and the PC now boots fine. Is there a hardware difference between the two revisions to account for this?

Thanks for the help and I look forward to your comments.

Gerry

Re: HP-IL I/F Card on a New(er) PC - Part IV - SUCCESS!!

*Message #3 Posted by **J-F Garnier** on 27 July 2009, 4:18 a.m.,*
in response to message #2 by Gerry Schultz

Hi Gerry,

Thanks for your extensive tests of Emu41 and the HPIL board with Win XP. I'm happy that you suceeded to make it work.

I confirm what you reported: when using XIL in case of missing HPIL board (or not at the right address), the HPIL loop can be completly disturbed including internal devices.

Emu41 normally bypasses the HPIL board in case the external loop is open to give access to internal devices, but doesn't check if the board is actually here. If the value returned at the supposed board address is such Emu41 thinks a frame is received, and if this frame is not the same that Emu41 sent (it is generally the case), then Emu41 considers the loop as completly broken.

J-F

*Message #4 Posted by **Howard Owen** on 24 July 2009, 4:26 p.m.,*
in response to message #3 by Namir

One was a 5 - scarred a bit, working printer, gummy wheeled card reader. The other was a 4 - scarred a bit, jammed printer, gummy wheeled card reader. Both were otherwise functional and I repaired both. Neither was advertised as working in any way.

Regards,
Howard

Re: Government surplus HP-97

*Message #5 Posted by **Mike Morrow** on 24 July 2009, 4:24 p.m.,*
in response to message #1 by hecube

It's good that some of these government-owned units were dispositioned as surplus rather than as trash.

When I was an engineering department officer on a US nuclear submarine 35 years ago, I got the ship to purchase a SR-52 mag card calculator and PC-100 printer for rad-chem lab use. (The SR-52 was considerably more capable than the HP-65, particularly with the support of the PC-100 printer.)

Then the HP-67/97 appeared. I used my new personal HP-67 for other reactor plant calculations. After that turned out to be so useful, I got the ship to purchase an HP-97. I had tried using the much more "featured" TI-59 with PC-100C, but after going through three TI-59s and two PC-100Cs in less than a year, I concluded that the latest TI gear was too unreliable for military use.

I'd love to know how long these units survived in service, and what ultimately happened to them (the boat was decommissioned in 1994). I suspect they most likely wound up in the trash long before that, and long before anyone valued old calculators.

I wouldn't mind having that HP-97 today!

Edited: 24 July 2009, 4:33 p.m.

Re: Government surplus Humans

*Message #6 Posted by **db (martinez, ca.)** on 24 July 2009, 11:29 p.m.,*
in response to message #5 by Mike Morrow

Mike; Which boats? I had my grimy little fingers in most everything that got fixed at Mare Island in the late 70's and early 80's. It was good work if one could forget the ultimate purpose of the boomers. The only drawback was that working for Rickover's Navy as a youth pretty much ruined me for jobs anywhere in private enterprise. Aiming for perfection is not a habit most middle managers want their subordinates to have.

Re: Government surplus Humans

*Message #7 Posted by **Mike Morrow** on 25 July 2009, 2:42 a.m.,*
in response to message #6 by db (martinez, ca.)

db:

I attended nuclear power school at Mare Island in 1974. I spent four years on the USS Daniel Boone (built at Mare Island, but operating from Scotland). Ballistic missile boats were top defense department priority during the cold war...they did not lack any funding for design, engineering, construction, operation, and upkeep. These boats and their missile/warhead systems are magnificent examples of applied science and engineering. IMHO, the integrated SLBM system easily required technological development efforts exceeding that expended for the manned lunar landing program. I'm fonder of that lunar program!

Rickover was a very mixed blessing. He was forced out (under Reagan!) in 1982 after 60 years of active duty. I think he should have [been] retired 20 years earlier. He groomed his officers to be more like engineers and technicians than like naval combat leaders. For a navy, that's generally a bad idea.

Re: Government surplus Humans

*Message #8 Posted by **hecube** on 25 July 2009, 11:07 a.m.,*
in response to message #7 by Mike Morrow

Be thankful they were groomed as engineers or else the floor of the ocean might be littered with rotting nuclear cores.

Re: Government surplus Humans

*Message #9 Posted by **db (martinez, ca.)** on 28 July 2009, 1:28 a.m.,*
in response to message #7 by Mike Morrow

Mike;
So we probably never crossed paths. I started at the Island in '76 after a couple of years repairing surface craft. I got to work on the 598, 599, 601, 621, the Sea Wolf, the "Triple Nickle" (that was a cool boat), the ice breaker Point Loma and a couple of others i can't remember. Good times working for and with good people who showed up at the job expecting to do the best quality work that was humanly possible. Doing less on a sub was unthinkable. I got into surveying (and RPN) by doing optical tooling for the nav, then moved to Nevada which as you can guess killed any chance of working at another shipyard while i was there.
I know what you mean about the difference between engineers / technicians and naval combat leaders. While i can't name any politician that i have more respect for than Jimmy Carter; he *does* have the "engineers disease". It's cool that you got to be there when you were, to invent a place for our favorite machines in those regrettable necessities.
I agree with you about the lunar program. I believe that was the greatest thing the human race ever did, and it was done in our time, and our countrymen did it. Still, now, i think our money today will be better spent on the space station and better ascent vehicles to get into low earth orbit. We have to learn to live in space where help is near before we go sailing off into blue water.

Re: Government surplus HP-97

*Message #10 Posted by **Dan W** on 24 July 2009, 5:05 p.m.,*
in response to message #1 by hecube

What is that ribbon cable used for?

Re: Government surplus HP-97

*Message #11 Posted by **hecube** on 24 July 2009, 5:31 p.m.,*
in response to message #10 by Dan W

I have no idea. I just disassembled it and the cable disappears between the the top cover and the plastic board inside the calculator. This would have required further disassembly and I was not in the mood to do that right now.

The guy who sold it advertised it as B-. After some cleaning, I would classify it as a strong B+ on appearance alone. I can't power it up right now so next step is acquiring some means of powering it up.

More 41 birthday fun.

*Message #1 Posted by **Egan Ford** on 24 July 2009, 2:03 p.m.*

Ladies, Gents, and others, here is a simple programming challenge:

What are my lottery numbers?

To find my lottery numbers you just need to find all the positive integers such that $x^2 - x + n$ is a prime number for $x = 0, 1, ..., n - 1$. (NOTE: 1 is *not* a prime number.)

Rules:

1. 41C, 41CV, 41CX RPN only.
2. No modules.
3. Enter as many times as you like. I like community/group solutions where speed and size gets optimized over time.

Prizes:

Well, *if* I win the lottery, then the authors of the shortest and the fastest programs will get a cut. The lottery drawing is July 31st.

Edit: typo

Edited: 24 July 2009, 6:00 p.m. after one or more responses were posted

Re: More 41 birthday fun.

*Message #2 Posted by **Howard Owen** on 24 July 2009, 4:40 p.m.,*
in response to message #1 by Egan Ford

Is that for *n* in 0,1, ..., ***x***-1? And is that for *all n* in that range?

Re: More 41 birthday fun.

*Message #3 Posted by **Egan Ford** on 24 July 2009, 6:11 p.m.,*
in response to message #2 by Howard Owen

Oops! I see the typo, fixed. To be clear, here is an example:

Take $n = 2$, therefore $x = 0, 1$:

```
x = 0, 0 - 0 + 2, prime, passed
x = 1, 1 - 1 + 2, prime, passed
```

All passed. 2 is one of the 6 numbers. What are the other 5?

Take $n = 7$, therefore $x = 0, 1, ..., 6$:

```
x = 0, 0 - 0 + 7, prime, passed
x = 1, 1 - 1 + 7, prime, passed
x = 2, 4 - 2 + 7, not prime, fails
```

If any one test fails, then *n* is not a solution.

in response to message #3 by Egan Ford

Well, I don't have my 41 here, but I get the first 4 numbers with paper and pencil easily. Time to go to bed ;)

Edit: Ooops, Hugh was faster than me.

*Message #6 Posted by **hugh steers** on 24 July 2009, 10:28 p.m.,*
in response to message #5 by Walter B

now, i remember where i've seen that polynomial before. turns out it's not easy to prove there are only 6 solutions in general (although 49 is a given max for the problem here).

looks like the easiest way to prime test is trial division because the numbers are small.

Re: More 41 birthday fun.

*Message #7 Posted by **Gerson W. Barbosa** on 24 July 2009, 11:31 p.m.,*

Well, neither the shortest nor the fastest, but it's a start.

I haven't tried it on the 41CX yet. This was done on Free42.

Gerson.

*Message #8 Posted by **Mark Edmonds** on 25 July 2009, 8:32 a.m.,*
in response to message #7 by Gerson W. Barbosa

I know this is meant to be 41 RPN only but I thought I'd submit a RPL version just in case it has any interest. It uses ISPRIME? so only works on any CAS equiped RPL machine. Note that I always work with a 48GX so don't have to deal with the exact/approx mode in the later machines. Consequently, there might be flags that need setting - putting it into approx mode for example - and I am not familiar with testing in this manner (2. <> 2) etc.. Note that the SEQ and SigmaLIST commands can probably be combined into a single Sigma command.

I accept that performance wise, this is not the most efficient as it evaluates the entire sequence for each value of n but using SEQ keeps the code simpler and this program is a one-off anyway.

```
\<< {} 2 \-> r n
  \<<
    DO
      \<< x SQ x - n + ISPRIME? \>> 'x' 0 n 1 - 1 SEQ
      SigmaLIST
      n ==
      \<< n 'r' STO+ \>> IFT
      'n' INCR DROP
    UNTIL
      r SIZE 6 ==
    END
    r
  \>>
\>>
```

The program returns a list with the lottery numbers in it as:

{ 41 17 11 5 3 2 }

If any RPL people can suggest ways of improving the code, I'd be glad to hear it!

Mark

Re: More 41 birthday fun.

*Message #9 Posted by **Dave Britten** on 25 July 2009, 9:02 a.m.,*
in response to message #8 by Mark Edmonds

I whipped up an RPL version too, just for the hell of it. It's pretty verbose and unoptimized, but here we go:

```
\<< 0 1 0 1 \-> t n c p
  \<<
    WHILE t 6 <
    REPEAT 0 'c' STO 1
'p' STO
      WHILE p c n < AND
      REPEAT c n \-> X N
'SQ(X)-X+N' ISPRIME? 'p'
STO 'c' INCR DROP
      END
      IF p
      THEN n DUP 1 DISP
't' INCR DROP
      END 'n' INCR DROP
    END t \->LIST
  \>>
\>>
```

I did it on my 48GX, so I had to make my own ISPRIME?. It's a fairly naive algorithm, but it gives the correct results for -1, 0, 1, and 2.

```
\<< ABS 0 1 2 \-> X SX p n
  \<<
    CASE X 1 ==
      THEN 0
      END X 2 ==
      THEN 1
      END X 2 MOD NOT
      THEN 0
      END X \SQRT IP 'SX'
STO
      WHILE p n SX \<= AND
      REPEAT X n MOD 'p'
STO 2 'n' STO+
      END p SIGN
    END
  \>>
\>>
```

Re: More 41 birthday fun.

*Message #10 Posted by **Thomas Klemm** on 1 Aug 2009, 3:57 p.m.,*
in response to message #9 by Dave Britten

1. Your program ISPRIME? didn't work on my 48GX. I had to replace \SQRT by \v/ which translated to SQRT.

2. When running your main program I get the following list:

```
{ 2 3 5 7 9 11 }
```

This is **not** the solution I think we should get.

3. According to your program ISPRIME? all the numbers 9, 15, 21, 27, ... are considered primes.

Re: More 41 birthday fun.

*Message #11 Posted by **Thomas Klemm** on 2 Aug 2009, 3:01 p.m.,*
in response to message #8 by Mark Edmonds

Not that I consider myself a RPL expert but you run the code to check whether the numbers are prime over the whole sequence. But as soon as one item fails you could stop and reject that number. I'm afraid you can't do that with SEQ. An optimization would be to use only primes as n. Another would be to use only prime twins. But then you're already on your way to roll up your program.

Besides being a little slow a very elegant solution.

Re: More 41 birthday fun.

*Message #12 Posted by **Gerson W. Barbosa** on 25 July 2009, 9:32 p.m.,*
in response to message #1 by Egan Ford

A couple of obvious optimizations but still rather slow: 14min 09s on the HP-41CV. Definitely LOG and 10^x in the floor function routine is not a good idea, even thought they don't appear to take too long for those arguments. Also, a faster primality test would help...

Anyway, compared to the other 41 birthday challenge, this is a piece of cake :-)

Re: More 41 birthday fun.

*Message #14 Posted by **hugh steers** on 26 July 2009, 8:25 p.m.,*
in response to message #13 by Gerson W. Barbosa

Hi, I'm glad to see an 41 implementation. I was going to point out that no one had entered an _actual_ 41 program, although i am also guilty :-)

Looking into the prime test, the smallness of the numbers means we can get away with trivial division. here's a short LUA program where i've rolled all the stages together into 3 loops,

LUA syntax is pretty easy to see what's going on. the only non-obvious syntax is n\k means floor(n/k).

```
function findlots2()
   -- condensed into one function
   for i = 2,49 do
      ok = true
      for j = 0, i - 1 do
         n = j*j - j + i
         for k = 2,math.sqrt(n) do
            if n\k * k == n then ok = false; break end
         end
         if not ok then break end
      end
      if ok then print(i) end
   end
end
```

i would think this would code up to a fairly short 41 program, especially since there is an extra test to escape the middle loop which could actually just be a goto.

Re: More 41 birthday fun.

*Message #15 Posted by **Gerson W. Barbosa** on 27 July 2009, 7:14 a.m.,*
in response to message #14 by hugh steers

Your concise algorithm fits even the HP-12C! I tried it on the newest 12C+. It takes 25 seconds to run or about 25 minutes on a normal 12C (and under 10 minutes on the 41CX, I estimate). Although the Pascal code works, on the 12C 2 doesn't show up. I have to find out what's gone wrong with that.

Regards,

Gerson.

I like it!

congrats to you. I think you deserve to win the competition as no one else (including myself) has an actual 41 program.

it does show just how slow the real 41 is though. 25 seconds vs 10 mins. hmmm.

Re: More 41 birthday fun.

*Message #17 Posted by **Mark Edmonds** on 27 July 2009, 7:20 p.m.,*
in response to message #16 by hugh steers

As I was guilty of posting a non-41 RPN program, I have to confess I had an ulterior motive behind posting that RPL program.

With so many people not being fans of RPL, I wanted to show that RPL could solve this problem in a fairly elegant manner with quite a simple program and I also wanted to use lists in the solution as that is a key part of the language.

Mark

*Message #18 Posted by **Gerson W. Barbosa** on 27 July 2009, 10:47 p.m.,*
in response to message #17 by Mark Edmonds

I think there is no problem posting non-41 solutions. There's always a chance the algorithms may be interesting and useful. I thought of posting an RPL version solution too but I don't think it would be any better than the ones you have already posted.

Gerson.

*Message #19 Posted by **Gerson W. Barbosa** on 27 July 2009, 9:35 p.m.,*
in response to message #16 by hugh steers

Exactly 10min 22s on the HP-41CX, but the credit goes to you because of the algorithm. Anyway, the odds of Egan's numbers winning the lottery are very dim :-)

Since 2 is very obvious, it is displayed at once, then only the odd numbers are tested (but the increase in speed should not be significant because of this). I don't know the 41 enough to try further speed optimizations though.

```
          2   00min 00s
          3   00min 04s
          5   00min 11s
         11   00min 48s
         17   02min 12s
         41   10min 22s
```

I cannot post the program: I've been receiving the message "Sorry, data too long for this forum" but the program is only 68 stepts long. I'll try later.

Another optimisation would be to only test primes instead of odd numbers. Don't know if this can be incorporated easily or not.

In this case this would be equivalent to testing for divisibility by 2, 3 & 5. Add 7 if your lotto includes 49. Doing the even optimisation which is already there, one 3 & 5 need to be checked.

- Pauli

Re: More 41 birthday fun.

*Message #21 Posted by **Gerson W. Barbosa** on 27 July 2009, 10:32 p.m.,*
in response to message #20 by Paul Dale

What really takes time are the primality tests required for $x^2 - x + n$, for $x = 1, 2, ..., n - 1$. For instance, when $n = 41$, 40 tests have to be performed. Skipping the few non-primes in the range 2..49 would have a very low effect in the reduction of the overall running time.

Gerson.

*Message #22 Posted by **PeterP** on 28 July 2009, 1:30 p.m.,*
in response to message #19 by Gerson W. Barbosa

Gerson,

beautiful as always! Having done my own little code, I now have the pleasure to see the gems posted already.

Really nifty prime checking algorithm, not the clunky thing I have!

I wonder how much your speed would increase if you replace the numbers with registers. Digits really are very slow on the hp41. Another 'expensive' calculation on the 41 is SQRT so I tried to not have it in a loop. I can't quite tell if you recalc it more than once, but probably not :-)

Also, I saw that Paul suggested to only test for prime numbers as I do in my code.

However I do think that makes a difference in run-time. For example, 49 gets very quickly abandoned without ever checking a single x.

Lastly, I think that starting the x^2-x+n test with n-1 is advantagious. It is the largest number to be tested for prime and hence has the highest chance to be not prime, at which point no further tests have to be done. This is why I started from 49 -> 2 rather then the other way around.

Cheers

Peter

Thats Hugh Steer's algorithm, to whom the compliments go. I just ported his Lua code to the 41, not in an efficient way though as I've never been an HP-41 user (back in the day I had a 15C). Your optimization tips are very much appreciated, thanks!

Gerson.

I did this in my first 41 program (Edited: 25 July 2009, 9:41 p.m.). I remember the running time dropped from 14m50s to 14m09s, not a significant gain to justify the extra steps, I think.

Regards,

Gerson.

*Message #25 Posted by **Paul Dale** on 29 July 2009, 5:58 p.m.,*
in response to message #24 by Gerson W. Barbosa

I fiddled a bit and an subroutine to do a full check for being prime doesn't seem to help any (actually, it hurts).

Just checking for divisibility by 3 and 5 ought to help a little, however the first evaluation of the polynomial will catch these out anyway so the saving will likely be slight.

Storing the first dozen or so primes in registers and using these for both the outer loop and the primality tester might be a win.

The other thing that looks bad in the inner loop is the square root which should also be avoidable. I'm thinking along the lines of
if $s_n = \text{sqrt}(n^2 - n + p)$ then, $s_{n+1} = 1 + s_n$ and start s_0 as sqrt(p).

I like the new compact algorithm.

The improvement I would make is to only use odd numbers for the trial division. Since we're only testing odd n, and x*(x-1) + n must be odd, we don't need to divide by 2 (or other even numbers).

I only modified Gerson's code slightly, but it executed in just over 6 minutes on my HP-41 CX.

```
          2   00min 00s
          3   00min 04s

Hi Steve,

> Quote:
>
> I like the new compact algorithm.

Courtesy of Hugh Steers :-)

I do appreciate you efforts in reducing the running time. The first program I

submitted would take about 15 minutes to run (provided the compability issues are resolved).

Avoiding repeatedly used numbers in program lines as Peter has suggest will help and should be easy to implement.

Gerson.

Re: More 41 birthday fun.

*Message #29 Posted by **Steve Perkins** on 28 July 2009, 4:44 p.m.,*
in response to message #27 by Steve Perkins

Here are my improvements.

1. Calculate the sqrt once and store for testing.

2. Get rid of the OK flag. Not needed with GTOs.

3. Clean up the logic and use numbers already on the stack.

I kept the test from low to high because as is it gives us a free prime test for n when x=1. The code is much shorter, but not as efficient as calling a prime testing subroutine twice as PeterP has shown us.

Final execution time is now 4m 26s.

Suggestions and improvements are welcome. It wouldn't exist without the ideas of Gerson and PeterP, so my thanks to them.

in response to message #30 by Gerson W. Barbosa

Nice.

My gut feeling was stack operations would be faster than X^2, so I used your original method.

Empirical evidence wins! Shorter and faster is better.

Thanks for the improvement.

Nice use of the stack instead of registers. Great idea.

I incorporated your ideas with my latest changes. Most significant was I realized the HP-41 has a MOD command. That replaces the divide and FRC sequence and saves a bunch in the inner loop. I also got rid

of a redundant RCL after LBL 02, and used register 04 to hold the constant 2 following PeterP's idea.

Since I couldn't get PeterP's code to run on my simulator, I think this is the current leader.

The code now executes in 3min 0sec.

*Message #34 Posted by **Gerson W. Barbosa** on 29 July 2009, 6:19 p.m.,*
in response to message #33 by Steve Perkins

Great improvements, congratulations!

It appears we can break the 3-minute barrier if we change line 28 to:

```
28 X<>Y
```

2min 55sec

I've been using a real 41CX (SN 2819S21701). Notice both parts of the serial number are primes! Even S is prime, being the 19th letter :-)

Gerson.

Edited: 29 July 2009, 6:39 p.m.

Re: More 41 birthday fun.

*Message #35 Posted by **Steve Perkins** on 30 July 2009, 12:59 p.m.,*
in response to message #34 by Gerson W. Barbosa

I was able to shave a second or two by replacing lines 28 and 29 in the inner loop with

```
28 X<> L
```

The code is also now only 46 lines long. I've also saved a little bit with a change to the code at LBL 05, but it makes little overall difference. LBL 02 has to move before the STO 01:

```
8  1
9  LBL 02
10 STO 01
...
32 LBL 05
33 SIGN
34 RCL 01
35 +
36 RCL 00
37 INT
38 X<>Y
39 X#Y?
40 GTO 02
41 VIEW X
42 LBL 09
...
```

I hope this makes sense. My calculator may be a bit slower than yours. The SN is 2850S22061, so it's clearly not optimized for prime testing.

We could also save a little bit using synthetic registers, but I think it's nicer to use instructions that any HP-41 user can enter and try. I've relearned a lot about this nice machine in the last few days.

Re: More 41 birthday fun.

*Message #36 Posted by **PeterP** on 30 July 2009, 1:31 p.m.,*
in response to message #35 by Steve Perkins

I love this collaboration! Using all the great improvements posted and incorporated I made one more change to the above code. Namely starting from x = n-1 rather than x = 1. I also added a couple of lines to replace the number 3 with a Rcl. Last but not least I used synthetic registers.

Using Steve's run-times as a benchmark I would think that

the code below should execute on his machine in **61 seconds**. (The last number, 41, should appear after about 51 seconds as it takes another 10 to check that there is no number between 41 and 49)

I wonder if we can drop below the 1min barrier?

Cheers

Peter

*Message #37 Posted by **Steve Perkins** on 30 July 2009, 3:42 p.m.,*
in response to message #36 by PeterP

Wow!

That's impressive. I clock the code at 1m 04s on my emulator (which set at lowest speed matches my HP-41CX as close as my watch and fingers can tell).

I'm using the wonderful V41 emulator by Warren Furlow for these sythetic ones. I use the HP41UC User Code file converter by Leo Duran to compile the text to RAW format.

I check my own code on my real HP-41CX, but I can't do synthetics on it right now. I need to get my card reader working with a good rechargable battery for that.

I'm still looking at what you did to try to understand it, but I'm impressed.

Re: More 41 birthday fun.

*Message #38 Posted by **Steve Perkins** on 30 July 2009, 4:32 p.m.,*
in response to message #36 by PeterP

I think there is a bug in your code. Can code be buggy that produces the proper output? Hmmm.

I guess we could write code that merely displays the numbers we know we want with no calculations, but that wouldn't satisfy the requirement, right?

The problem seems to be that register N only gets set to n-1 when we successfully find and show the values that pass. It should also be set to the new n-1 when we find a non-prime and increment n for the next set of trials.

I made a fix and your code is still the fastest we have seen so far. 2m 41s.

I've included my changes to the end of your code. I really like the way you indent and comment to make the code readable, by the way. Did I missunderstand, or do you have a different idea how this should go?

```
LBL 05 ;next x
  DSE N ;(x)
  GTO 02
RCL 00 ;(n)
INT
View X ;all were prime, show result
LBL 09 ;loop over n
  RCL 00 ;(n)
  INT
  STO N ;(prep next max x)
  ISG 00
  GTO 02
BEEP
END
```

Re: More 41 birthday fun.

*Message #39 Posted by **PeterP** on 30 July 2009, 4:38 p.m.,*
in response to message #38 by Steve Perkins

yes, indeed you are right, my bad! Great fix!

Just for kicks and giggles, we can shave off 1 sec by replacing 'BEEP' with a synthetic tone 7 (BEEP takes a bit over a second and tone 7 about 1/10th of a second)

I wonder if there is a way to get rid of the repeated RCL 00, INT sequence. INT is not very expensive, but somewhat... But then we have to find an elegant way to do the ISG...

Cheers

Peter

*Message #41 Posted by **Steve Perkins** on 30 July 2009, 7:00 p.m.,*
in response to message #39 by PeterP

Now my turn to admit to a bug.

I intialized the next x for testing to n-2. It should start at n-1.

This equation is quite forgiving. For n which don't pass, it usually fails for lots of values of x!

Re: More 41 birthday fun.

*Message #42 Posted by **Gerson W. Barbosa** on 30 July 2009, 11:37 p.m.,*

in response to message #35 by Steve Perkins

> Quote:
>
> I was able to shave a second or two

Actually 4 and a half: now it runs in 2m 50.5s. Yet another second is gained when changing line 08 to

```
08 SIGN
```

Now, changing the outer loop, as Peter has suggested:

```
01 LBL 'HP41BD2
02 2
03 VIEW X
04 STO 04
05 49
06 STO 02
07 3
08 STO 00
09 LBL 01
10 SIGN
11 LBL 02
12 STO 01
13 X^2
14 LASTx
15 -
16 RCL 00
17 +
18 STO 03
19 SQRT
20 3
21 LBL 03
22 X>Y?
23 GTO 05
24 RCL 03
25 X<>Y
26 MOD
27 X=0?
28 GTO 09
29 X<>L
30 RCL 04
31 +
32 GTO 03
33 LBL 05
34 SIGN
35 RCL 01
36 +
37 RCL 00
38 X<>Y
39 X#Y?
40 GTO 02
41 VIEW X
42 LBL 09
43 RCL 04
44 ST+ 00
45 RCL 00
46 RCL 02
47 X>Y?
48 GTO 01
49 BEEP
50 END

-> 2m 47s
```

Or, if we want to save one step:

```
45 RCL 00
46 X<=NN?
47 GTO 01
48 BEEP
49 END
```

But then the running time rises to 2m 49s...

Just smalls steps though. Looking forward to the giant leaps you, Peter and others have been making :-)

*Message #43 Posted by **Steve Perkins** on 31 July 2009, 12:09 p.m.,*
in response to message #42 by Gerson W. Barbosa

Very nice routine.

I was working on removing the ISG myself, in order to avoid all (2 here) of the INT instructions, especially in the inner loop. I couldn't get it to work as well as I hoped in the backwards testing case following Peter's code.

There is one quibble I'd make with your implementation. It looks like you're skipping the test for n=49, since in step 47 you use the X>Y test with 49 in X so all odd values stictly less than 49 get tested. This is different than what we have been doing with the ISG code, so I don't think it was intentional.

In my testing using 51 in register 02 instead of 49 only added 1 second to the code. You could also change the test to X#Y? with the 51 value, but this is the outer loop, so it only saves 24 * 14ms or 1/3 second. Yes, I did obtain a table of HP-41 function times. I'm probably working way too hard for small incremental gains.

To save the last little bit of time we could save the constant 3 in register 05, and RCL 05 at your line 20 to save a little more time but make the code 51 steps.

I'm now starting to be confused about which registers are used for which constants. Just to confound the issue, I've changed so the following apply:

```
REG  Usage
 00   trial n
 01   trial x
 02   2
 03   3
 04   p = x^2 - x + n
 05   51
```

Acording to my HP-41CX and my fingers on my wristwatch it takes 2m 44s. I guess I need to add stopwatch code to be more precise.

Here's my code as it currently stands:

```
1  LBL "41BD2"
```

```
2  2
3  VIEW X
4  STO 02
5  51
6  STO 05
7  3
8  STO 00
9  STO 03
10 LBL 01
11 SIGN
12 LBL 02
13 STO 01
14 X^2
15 LASTX
16 -
17 RCL 00
18 +
19 STO 04
20 SQRT
21 RCL 03
22 LBL 03
23 X>Y?
24 GTO 05
25 RCL 04
26 X<>Y
27 MOD
28 X=0?
29 GTO 09
30 X<> L
31 RCL 02
32 +
33 GTO 03
34 LBL 05
35 SIGN
36 RCL 01
37 +
38 RCL 00
39 X<>Y
40 X#Y?
41 GTO 02
42 VIEW X
43 LBL 09
44 RCL 02
45 ST+ 00
46 RCL 00
47 RCL 05
48 X#Y?
49 GTO 01
50 BEEP
51 END
```

P.S. Using the internal Stopwatch, I get 2m 44.5s (stopping before the beep).

Edited: 31 July 2009, 12:23 p.m.

Re: More 41 birthday fun.

> There is one quibble I'd make with your implementation. It looks like you're skipping the test for n=49, since in step 47 you use the X>Y test with 49 in X so all odd values stictly less than 49 get tested. This is different than what we have been doing with the

> ISG code, so I don't think it was intentional.

You're right! I used to inspect register 00 after program execution to see if 51 was there, but I may have forgotten to do it after this change. My feeling was X<Y was faster than X<=Y as the test is evidently simpler.

> Quote:
>
> Using the internal Stopwatch, I get 2m 44.5s (stopping before the beep).

2m 42.5s on mine! That's 5.5 seconds faster than the previous (corrected) program. Quite another leap! Actual measurements: 2m 42.48s, 2m 42.47s, 2m 48s. Leave or take some milliseconds due to distance from ear to HP-41 buzzer. Temperature (51.8 °F) and air humidity (87 %) might affect timing also :-)

Edited: 31 July 2009, 1:24 p.m.

Re: More 41 birthday fun.

*Message #45 Posted by **Gerson W. Barbosa** on 31 July 2009, 4:32 p.m.,*
in response to message #43 by Steve Perkins

Now it takes 2m 39.5s (2m 39.39s, 2m 39.45s; 50°F, 93% :-) It's like trying to milk a stone...

```

I know the register usage is a bit confusing but I wanted to try X#NN? (this ended up being half a second slower). Better revert to the original usage in your next improvement.

Re: More 41 birthday fun.

*Message #46 Posted by **Steve Perkins** on 31 July 2009, 6:00 p.m.,*
in response to message #45 by Gerson W. Barbosa

I'm unfamiliar with the X#NN? instruction. Perhaps it's from an extension module that I don't have, or something? Likely something they added on the CX that I'm not familiar with.

Nice usage of the stack to save a memory register and tighten the inner loop!

I actually tried doing it backwards as Peter originally did, with the starting value given to the program in X. In my emulator it was faster, but on the real HP-41CX it wasn't. It spends the vast majority of the time verifying that 41 passes. All the other values fail quickly or pass quicker (being smaller). It took nearly 2 minutes just to display 41! It saved a memory register and made the code a bit smaller, but not as fun to watch, unless you like the flying "goose".

From HP-41CX Quick Reference Guide, page 25:

```
X=NN?      \
X#NN?       | Conditional: Uses
contents of
X<NN?       | Rnn (NN specified in
Y-register)
X<=NN?      | for comparison. If not
true, skips
X>NN?       | next program line.
X>=NN?     /
```

*Message #49 Posted by **Gerson W. Barbosa** on 31 July 2009, 8:53 p.m.,*
in response to message #48 by Steve Perkins

Let's not forget Hugh, who gave us the first version of the algorithm... provided of, course, anyone doesn't come up with a faster program. But since all Egan's numbers are odd, the odds of winning are very unlikely! Anyway, I'm pleased with what I have learned here lately :-)

Re: More 41 birthday fun.

*Message #50 Posted by **Steve Perkins** on 31 July 2009, 6:54 p.m.,*
in response to message #45 by Gerson W. Barbosa

I decided to look at your clever stack usage one last time. If we put P=x^2-x+n both in Z and T to enter the loop at LBL 03, we can use R^ instead of RCL Z. It saves a whole 8ms, but requires that we do a double ENTER to start the loop. The auto dup of register T when doing the MOD and + instructions keeps the stack the same for the next loop.

I think I'm getting too obsessed with this, but it should save about 2 seconds. Who knew a stone could be milked?

This time I included my stopwatch code. Leave it out for a non-CX.

```
1  LBL "41BD2"
2  CLX
3  SETSW
4  RUNSW
5  2
6  VIEW X
7  STO 02
8  51

Gerson,

beautiful as always!Having done my own little code, I now have the pleasure to see the gems posted already.

Really nifty prime checking algorithm, not the clunky thing I have!

I wonder how much your speed would increase if you replace the numbers with registers. Digits really are very slow on the hp41. Another 'expensive' calculation on the 41 is SQRT so I tried to not have it in a loop. I can't quite tell if you recalc it more than once, but probably not :-)

Also, I saw that Paul suggested to only test for prime numbers as I do in my code. However I do think that makes a difference in run-time. For example, 49 gets very quickly abandoned without ever checking a single x.

Lastly, I think that starting the x^2-x+n test with n-1 is advantagious. It is the largest number to be tested for prime and hence has the highest chance to be not prime, at which point no further tests have to be done. This is why I started from 49 -> 2 rather then the other way around.

Cheers

Peter

in response to message #1 by Egan Ford

Can anyone prove that there are no such numbers > 41? If not, can a counter example be found?

I rather doubt the second is likely given the massive increase in the number of numbers to validate as things get large. However, the first would be interesting.

- Pauli

Re: More 41 birthday fun.

*Message #55 Posted by **PeterP** on 28 July 2009, 1:18 p.m.,*
in response to message #1 by Egan Ford

late to the party I just saw this a few hours ago -> productivity went rapidly to zero to produce the code below. It is not the shortest but it seems to find the numbers in about 3' flat on a normal CX (i41cx on default speed). I must have made some mistake...

Here are my thoughts about the code:

- as $1^2 - 1 + n$ has to be a prime, n has to be a prime. This is used by only checking odd n and doing a primality test on n itself first. If that test fails, that n is discarded and the next n = n-2 is checked
- as n is odd, $x^2 - x + n$ is also always odd. So the primality test does not check for 2
- The primality test uses division by 3 and 5 directly and then starts by checking divisors <= sqrt(number_to_be_checked). Speed could improve if one were to start with smaller divisors towards sqrt(n), but I have not implemented this.
- as digits are the slowest things on the 41, often used numbers are stored in registers. To give you a sense how incredibly slow numbers are, the sequence clx, sign is faster than '1'! And times for numbers are linear with the digits
- Status registers (incl M,N,O) are used as they are slightly faster than normal registers.
- last but not least, 2 is simply displayed as the last result, given that it was already provided as a solution

Usage: enter the highest possible number, 49, and press R/S. In about 3 minutes 02 seconds the sequence 41, 17, 11, 5, 3, 2 is displayed.

Registers:

- STO N: number n currently tested
- STO M: x currently tested, x e[1,n-1]
- STO O: 1
- STO 00: 2
- STO 01: 3
- STO 02: 5
- STO 03: current divisor
- STO 04: number tested for primality (either n or x^2-x+n)

Sub-routines

- Lbl 00: Main loop fro testing n, starting with the value the user entered to start the program

- LBL 01: Loop to check for all x that x^2-x+n is prime
- Lbl 05: primality test
- Lbl 06: show n as a valid result
- Lbl 02: move to next n -> current n-2

Code:

```
LBL 'EF3'

in response to message #55 by PeterP

A very nice entry, and I like your ideas.

Especially sweet as you apparently didn't look at what others had tried before your attempt!

I'm impressed with your knowledge of what operations are faster on the HP-41 and your use of synthetic register operations. It's been a while since I've done such programming, but it was lots of fun back when I had the time and energy to study it. When I get home, perhaps I can find my table of execution times for instructions.

The biggest speed improvement may be the backward testing, from high to low, as you mention above. We'll see if I can find time from work to tweak my code.

Learned this from Valentine's challenges. There are thunderous intellects on this forum and so peeking ahead would rob the average Joe, I mean, Peter, from all the fun in solving things on my own.

> Quote:

> I'm impressed with your knowledge of what operations are faster on the HP-41 and your use of synthetic register operations. Don't be. The only calc I know something about is the 41 and I always liked speed improvements. You can actually still buy the Synthetix Pocket Reference guide which has execution time tables towards the end IIRC.

> Quote:

That would be great. I think if we combine the ideas that we have come up and incorporate it into the sleek algorithm from you/Hugh/Gerson we might have quite a speedy little program.

Cheers

Peter

in response to message #57 by PeterP

Timing for my RPL version above using an emulated 49G+ set to authentic speed is 18.7 seconds. I can chop that in half with one simple modification (using NEXTPRIME instead of INCR).

The reason why I was looking at improving the speed is to find the 7th number. So far, even after leaving the emu running at max speed for over 10 minutes, it hasn't been found yet. At max speed, the basic 6 number requirement takes 0.6 seconds so is about 29 times faster. That means that at real speed, finding the 7th number is going to take over 4h 50m !

Mark

The Lucky Numbers of Euler (by F. Le Lionnais)

Now that we have the programs, I started some digging to find out more about this sequence. I'm sure Egan will fill us in with far more clarity, but this is what I have learned so far.

Our little problem is related to Eulers Polynomial, even though Egan has disguised it a little. Note that the sequence x^2-x gives the same result as x^2+x just with the addition of 0 at the start, namely (0),2,6,12,20,30,...

Below is the quotation from wikipedia which talkes about a Heegener Number, something I have never heard off. Here is the link to Heegener numbers at Wolframs

It would appear that Rabinowitz proved that there is no result >41. The article is in german and I was not able to find a link to a free version on the internet.

> Quote:
>
> *...from Wikipedia*
>
> **Euler's prime-generating polynomial**
>
> $n^2 + n + 41$,
>
> which gives (distinct) primes for n=0,...,39, is related to the Heegner number 163 = 4*41 - 1.
>
> Rabinowitz[1] proved that
>
> $n^2 + n + p$
>
> gives primes for n=0,...,p-2 if and only if its discriminant 1-4p equals minus a Heegner number.
>
> (Note that p-1 yields p^2, so p-2 is maximal.) 1, 2, and 3 are not of the required form, so the Heegner numbers that work are 7,11,19,43,67,163, yielding prime generating functions of Euler's form for 2,3,5,11,17,41; these latter numbers are called lucky numbers of Euler by F. Le Lionnais.[2]

Edited: 29 July 2009, 11:04 a.m.

Re: More 41 birthday fun.

*Message #61 Posted by **hugh steers** on 29 July 2009, 11:38 a.m.,*
in response to message #60 by PeterP

It's to do with the class number of the imaginary quadratic field being 1. This is only the case for a few discriminants; Q[sqrt(-d)], for d in 3,4,7,8,11,19,43,67,163. if d = 1-4q, then we have q in; 2,3,5,11,17 and 41.

I originally wondered if there is a quick way to determine the class number h(1-4q) for small q. This would solve the problem, but it appears to need d = 1-4q to be factored (for the kronecker symbol see "class number" on mathworld).

if the class number is 2 we get some other polynomials

```
2x^2 + p, p in {3,5,11,29} all prime for x = 0,..p-1
2x^2+2x + n, n in {3,7,19} prime for x = 0,1,..n-2
px^2+px + n for pairs (p,n) in
(3,2),(3,5),(3,11),(3,23),(5,3),(5,7),(5,13),(7,5),(7,17),(11,7),(13,11)
prime for x = 0,1,..n-2
```

[from the "book of prime number records"]

Re: More 41 birthday fun.

*Message #65 Posted by **Thomas Klemm** on 1 Aug 2009, 2:18 p.m.,*
in response to message #1 by Egan Ford

I know I was not allowed to do so but first I wrote a program in UserRPL:

```
\<< { } 1 ROT
    FOR n
        n DUP
        IFERR
            1 OVER 1 -
            FOR i
                IF DUP PRIM? NOT
                THEN DOERR
                END
                i 2 * +
            NEXT
        THEN DROP
        ELSE DROP +
        END
    NEXT
\>>
```

Run it with a number bigger than 41 and you will get:

```
{ 2 3 5 11 17 41 }
```

Then I used a Perl-script "rpl2focal.pl" to translate it into the following listing. Nah, just kidding. Of course I had to use my brain. Without modules there's no such thing as PRIM?. So we have to do that on our own. My goal was to make the innermost loop as short as possible. That's why I keep the list of divisors in registers. It might be faster though to keep only primes in that list but then it's not so easy to calculate the upper bound in lines 46-51.

So here's my contribution. Now I'm going to read all the other solutions.
Egan, thanks a lot for the fun I had thanks to your challenge.

Best regards
Thomas Klemm

Listing

```
01 LBL A            26 LBL B            51 +                71 LBL C

```

A Initialization

```
14
XEQ A
```

This program will fill the registers R00 - R14 with the following values:

```
R00:    2
R01:    3
R02:    5
R03:    7
R04:   11
R05:   13
R06:   17
R07:   19
R08:   23
R09:   25
R10:   29
R11:   31
R12:   35
R13:   37
R14:   41
```

You may have noticed that this is not exactly the list of primes. It takes 0'02" to complete on an emulated HP-41CX.

B Lottery Numbers

```
14
XEQ B
```

This program will display the following numbers:

```
 5.0000
11.0000
17.0000
41.0000
```

It takes 1'45" to complete on an emulated HP-41CX. So what about 2 and 3 you may ask and I must admit that's a bug. But it's quiet easy to fix that: just add X#Y? after line 57. After that it took 1'50" to complete.

C Is it a prime?

This program isn't really needed but you can use it to check whether a number is a prime or not. Unless it is a prime 0 will be returned, otherwise a value > 0.

Assuming the size is big enough you might run:

```
200
XEQ A
```

Now you can check numbers up to 358,801 = 599^2. However it's probably not the fastest method. It may work for bigger numbers too though for some it may not.

```
76543
XEQ C
91.0000
```

Hence it is a prime.

```
181663
XEQ C
0.0000
```

Hence it is not a prime. You can find the smallest factor in LAST x:

```
LASTX
389.0000
```

Re: More 41 birthday fun.

A wonderful entry!

I like the way you used counts of prime candidates. I've been trying to put together something similar, skipping multiples of 3 as you did, but my efforts so far have taken 2m 50s or so.

I increased the number tested to 17 to get up to 49 as we did, since this is up to the assumed possible lottery numbers. It ran in 2m 10s at default emulator speed.

In my tests, turning the V41 emulator speed down to minimum most closely matched my genuine HP-41CX. It takes about twice as long to run at that setting on my computer at home. I'm not sure if that's exactly the same or not.

A very nice first attempt! I'm impressed.

P.S. My home computer is a bit slower than the one I was using earlier. Hard to calibrate these things precisely, I guess.

Edited: 1 Aug 2009, 11:42 p.m.

Re: More 41 birthday fun.

*Message #67 Posted by **Steve Perkins** on 2 Aug 2009, 2:21 p.m.,*
in response to message #65 by Thomas Klemm

I finally produced an acceptable version that stores an array to skip odd numbers divisible by 3.

It runs on my real HP-41CX in 2m 29.3s, but your mileage may vary.

As usual, improvements are welcome. Of course the challenge is officially over and my wife would like me to return to earth, so...

Quotations

> Quote:
>
> although 49 is a given max for the problem here
>
> Quote:
>
> ```
> 02 3.04902
> 03 STO 00
> ```

I wasn't aware of this fact. But I realized that there are no solutions bigger than 41. That's why I considered

that as an upper limit. From now on I will do my timing based on 49. IIRC the Swiss lottery used 6 out of 42. Now they are using 45.

Quote:

- as n is odd, x^2-x + n is also always odd. So the primality test does not check for 2

That saved nearly 100 tests I guess. So my list is starting now with 3, 5, 7, ...

Quote:

```
04 2
05 VIEW X
```

I consider that a little cheating. But I'm sure I can use that trick as well since 2 and 3 are missing now in my solution.

Quote:

- as digits are the slowest things on the 41, often used numbers are stored in registers

Quote:

```
  STO a  ;(3)
```

I wasn't aware that I could use register *a* without harm. Or probably I just forgot about that. But since I'm not using subroutines I'm on the safe side. Using register *P* is probably a bad idea, I guess.

Quote:

Another optimisation would be to only test primes instead of odd numbers.

Not exactly what I did but a little closer. I'm using only 17 numbers instead of 24 of which only 25, 35 and 49 are composite.

Quote:

Lastly, I think that starting the x^2-x+n test with n-1 is advantageous. It is the largest number to be tested for prime and hence has the highest chance to be not prime, at which point no further tests have to be done.

I'm not sure whether I understood that correctly but if you suggest to count x down from n-1 to 0 then there are certain cases where you start testing a big prime but you could find the smallest composite much faster.

E.g. n = 37

ascending:
37 is a prime, therefore you have to check 3 and 5 to find out
39 is composite, divisible by 3

3 checks needed to reject 37

descending:
1297 is a prime, therefore you have to check 3, 5, 7, ..., 35 to find out
1227 is composite, divisible by 3

18 checks needed to reject 37

Here are the other cases:

```
  7:  37
 15: 197
 21: 401
 25: 577
 27: 677
```

However as you may see from the following table there's only one case (namely 29) where you'd have to check more than on prime prior to find the first composite. Primes are marked with a sharp #.

```
  3:    3#    5#
  5:    5#    7#   11#   17#
  7:    7#    9    13#   19#   27    37#
  9:    9    11#   15    21    29#   39    51    65
 11:   11#   13#   17#   23#   31#   41#   53#   67#   83#  101#
 13:   13#   15    19#   25    33    43#   55    69    85   103#  123   145
 15:   15    17#   21    27    35    45    57    71#   87   105   125   147   171
197#
 17:   17#   19#   23#   29#   37#   47#   59#   73#   89#  107#  127#  149#  173#

 48 3
 49 /
 50 INT
```

This would save around 30 tests in the innermost loop. But since these lines are executed about 90 times the saving of time is nullified.

What I might try is to reverse all the indexes and use DSE instead of ISG. This would save the division by E3. But then I'd have to solve the problem that 0 is skipped.

Just wanted to thank you for all the contributions so far. They have been a great help. Nevertheless I don't think that I can beat Peter's solution. It seems that caching the numbers isn't suitable in this situation. Most of the numbers can be rejected by simply trying 3, 5 or 7 as divisors. But for exactly these cases my list doesn't differ from what he's using.

Best regards
Thomas

*Message #69 Posted by **Thomas Klemm** on 2 Aug 2009, 6:36 p.m.,*
in response to message #65 by Thomas Klemm

Only now I realized that I compared my program to Peter's buggy version from message #36. Compared to the fixed version in message #38 it isn't that bad. So I've concatenated my formerly separate parts A and B, added the missing view of 2 and 3, replaced subtraction of 2 with DSE, used register Q to store the number 3 and added the same stopwatch-code as in message #67 to measure the time.

Listing

```
01 LBL A
02 0

Re: More 41 birthday fun.

*Message #70 Posted by **Steve Perkins** on 3 Aug 2009, 12:58 p.m.,*
in response to message #69 by Thomas Klemm

I've been trying to benchmark and understand your code better. I'm having trouble in two spots. The main one is where you seem to be calculating the polynomial to test for primality:

```
42 RCL N
43 INT
44 ST+ X
```

```
 45 +
```

We've been testing for prime candidates P=x^2-x+N for given N. If I'm not mistaken you're testing P=x*2+N. When I made the change to your code, however, it did't seem to work. Probably I've missed something that should be obvious, or my programming changes were bad:

```
 42 RCL N
 43 INT
 44 X^2
 45 LASTx
 46 -
 47 +
```

I'm also partly responsible for another possible problem area. In my suggested fix for Peter's entry, my code tested all x from 1 to N-2. As stated originally we should be testing from 0 (or 1) to N-1. This seems to be reflected in the code:

```
 35 DSE X
 36 DSE X
```

I hope you can clarify these issues, or help me understand your ideas better. Thanks!

Steve

Re: More 41 birthday fun.

*Message #71 Posted by **Thomas Klemm** on 4 Aug 2009, 5:11 a.m.,*
in response to message #70 by Steve Perkins

> Quote:
>
> If I'm not mistaken you're testing P=x*2+N.

I'm calculating the sequence recursively, thus saving the multiplication:

dP(x) = P(x+1) - P(x) = 2x = x + x

What might be confusing is the fact that register *N* keeps track of x and **not** N. P(x) is kept only on the stack.

> Quote:
>
> As stated originally we should be testing from 0 (or 1) to N-1.

My code tests all x from 1 to N-1, however the counter in register *N* runs from 0 to N-2.

```
 x    dP(x)        P(x+1)
-----------------------
 0        0         0 + N
 1        2         2 + N
 2        4         6 + N
 3        6        12 + N
 4        8        20 + N
(...)
```

Hope this clarifies the issues.

Kind regards
Thomas

*Message #72 Posted by **Steve Perkins** on 3 Aug 2009, 2:10 p.m.,*
in response to message #69 by Thomas Klemm

It looks to me like there's a problem handling the stack in the loop at LBL 04.

I think you're trying to maintain the value P=x^2-x+N that we're checking for primality on the stack, but you've lost N that you need when you decide P is prime and loop to LBL 03 to check the next value of x.

I'm still trying to understand and see if there's an easy fix.

That's true.

> Quote:
>
> but you've lost N that you need when you decide P is prime and loop to LBL 03 to check the next value of x.

That's the other advantage of using recursion: N is kept hidden in P(x). Therefore no need to keep that value separately on the stack. Otherwise I couldn't take the full advantage of the most convenient feature that T is copied and not only moved to Z when executing MOD in line 58. The counter of the innermost loop (55-62) is kept outside the stack in register *O* thus not interfering. I can't think of a tighter solution.

in response to message #74 by Steve Perkins

I had better commented my code as Gerson and Peter did. Most probably even I will have difficulties to understand my program in half a year.

Re: More 41 birthday fun. Lottery results.

*Message #76 Posted by **Egan Ford** on 2 Aug 2009, 7:48 p.m.,*
in response to message #1 by Egan Ford

So what were my lottery numbers?

Steve was correct in assuming I selected this problem because it had a 41 in it. I also selected the lottery theme, as Peter and others have pointed out, because they are the only 6 known Euler Lucky Numbers (Fascinating!) and they happen to fall within most (if not all) lottery ranges. However they are not Egan's Lucky Numbers. That's right. I lost. Only one of the 6 (17) was *lucky*. I am a dollar poorer, but much wiser after reading this fascinating thread. Thank you all.

My solution was neither short, speedy, or sexy (read synthetic). I made no attempts to optimize after my initial proof-of-concept. I tip my party hat to all of you that participated with your brief, quick, and exotic solutions.

My solution was built on the following assumptions:

1. If $x^2 - x + n$ is a prime number for $x = 0, 1, ..., n - 1$, then n must also be prime for the simple fact that when $x = 0$ or 1, then $x^2 - x = 0$. So only prime n need be checked.
2. Because of #1, there is only the need to check the range $x = 2, 3, ..., n - 1$.
3. Because of #2, $n = 2$ can be a given (trivial), and it was given in my 2nd post. So you only need to find 5 odd prime numbers.

First I needed to generate a list of primes to be used as the candidates and for trial division. When I started on my prime number generator I started with the assumption that 2 was prime, I also knew that 3, 5, and 7 were also prime, but then so was 11. Before I knew it I had coded all 16 primes < 56 into my 41CX. It's amazing that being forced to memorize times-tables as a child that you were also indirectly memorizing a list of trivial primes. So I stuck with the bloated prime table method.

Now why < 56? I didn't give a range for the lottery because most range from 1-50 or greater. And the answer for any lottery known to me would have been the same. But, given that some searched from top down I should have given a range. I assumed that all would search from bottom up. So, back to why < 56? Well that was the range for the lottery I entered.

Once I had my prime table, my program simply processed each odd prime (#3), with the range in (#2). I used MOD instead of divide to check primality.

My program takes an embarrassingly 3.5 minutes on a 41CX with a printer attached (should run a bit faster without it). But the fun for me was watching others play.

BTW, I did dig a bit deeper into the mystery of Euler's Lucky Numbers, but did not find any quick or elegant tricks to mathematically make this problem easier to code. Such is life when working with prime numbers.

Again, thank you all for your participation.

Code:

```
01 LBL "BDC2"       28 STO 10           55 RCL 18           82 ISG 18

The sad irony of the HP-41 and Lottery games

*Message #77 Posted by **Karl Schneider** on 2 Aug 2009, 8:17 p.m.,*
in response to message #76 by Egan Ford

Hi, Egan --

The losing Illinois Lottery Mega Millions ticket whose image you displayed -- and I doubt that you would have posted a winning one for the world to see -- seems to be one panel of the "pick six" Lotto Game type. 41 was your chosen "money ball" number.

According to the Illinois Lottery's website, the probability (not "odds", as is commonly misrepresented) of matching six unique numbers from 1 through 52 inclusive is 1:20,358,520.

> Quote:
>
> *Lotto Game Panel - That area of an Official On-Line Lotto Game ticket identified by an alpha character, A through J, containing six (6) two-digit player or computer-selected numbers.*
>
> *Lotto Game Winning Numbers - Six (6) two-digit numbers, from one (01) through fifty-two (52), randomly selected at each Lotto Game drawing, which shall be used to determine the winning Lotto plays contained on Official On-Line Lotto Game tickets.*

http://www.illinoislottery.com/Games/OnLineRules.htm#_Toc123708150

20,358,520 is the statistical combination of 52 and 6.

The irony? Unfortunately, the HP-41 does not have statistical combination or permutation built-in, and the factorial function must be spelled out as "FACT". The HP-41 Stat Pac doesn't have 'em, either.

Re: The sad irony of the HP-41 and Lottery games

*Message #78 Posted by **Egan Ford** on 3 Aug 2009, 11:19 a.m.,*
in response to message #77 by Karl Schneider

Hello Karl,

IIRC, the Mega Millions is a multistate lottery with nearly 200 million combinations. The first 5 numbers are in the range 1-56 and the Mega Ball is in the range of 1-46. So, C(56,5)*46.

> Quote:
>
> The irony? Unfortunately, the HP-41 does not have statistical combination or permutation built-in, and the factorial function must be spelled out as "FACT". The HP-41 Stat Pac doesn't have 'em, either.

I commented on this in my last challenge. I was unable to find any HP41 ware that had COMB and building one from FACT was inaccurate for integer work. Quite a mystery to me that HP's flagship product for many years never had this function.

The good news is that HP41 development is not dead. SandMath 5 recently released with nCr and nPr.

*Message #80 Posted by **Steve Perkins** on 3 Aug 2009, 11:29 a.m.,*
in response to message #77 by Karl Schneider

This seems strange to me.

Looking at the lottery ticket printed, I get the impression that the payout is $77 million. But the probability of getting all 6 numbers correct is only 1 in 21 million!

That would seem like a good bet to make. However, it is well known that lottery payouts, on average, are terrible. Much worse than casino gambling for example. Usually the expected return is something like 50%. That's why it's such a money maker for whoever is funding the lottery (and those who take there cut along the way).

I'm sure I'm missing something. Can someone clear this up for me before I become a gambler?

Re: The sad irony of the HP-41 and Lottery games

*Message #81 Posted by **Egan Ford** on 3 Aug 2009, 11:38 a.m.,*
in response to message #80 by Steve Perkins

From above, its 1 in C(56,5)*46 or 194,810,616.

Re: The sad irony of the HP-41 and Lottery games

*Message #82 Posted by **Walter B** on 3 Aug 2009, 1:00 p.m.,*
in response to message #81 by Egan Ford

Hmmh, my 15C as well as my 42S concur, displaying 175.711.536 = 1,76E8 instead.

Re: The sad irony of the HP-41 and Lottery games

*Message #83 Posted by **Egan Ford** on 3 Aug 2009, 1:46 p.m.,*
in response to message #82 by Walter B

Oops. You are correct. Unsure where I got it wrong on Free42/iPhone. There is a risk to not having real keys.

Edit: Found it. It was an old calculation on the stack and I assumed was the value I precomputed earlier. C(56,6)*6 was the value assuming all six balls were 1-56 and that the power ball was the last drawn. 1/C(56,6) is the probability of getting all 6 balls correct with a 1/6 chance of selecting the correct ball as the power ball. C(56,5)*51 is the same.

Edited: 3 Aug 2009, 1:53 p.m.

*Message #84 Posted by **Mark Edmonds** on 3 Aug 2009, 1:52 p.m.,*
in response to message #82 by Walter B

194,810,616 is C(56,5)*51

Mark

Re: The sad irony of the HP-41 and Lottery games

*Message #85 Posted by **Egan Ford** on 3 Aug 2009, 2:05 p.m.,*
in response to message #84 by Mark Edmonds

The power ball is a duplicate ball in the range 1-46. Something I failed to report earlier in my summary. I'm clearly a novice at this lottery stuff. I live in a state with no lottery (Utah). When I staged the challenge I knew I was going to be in Chicago that week. So, I made a mental note to get a ticket for a lottery ending on the 31st as I said I would in the challenge.

There were many lotteries to choose from, but I liked the size of the pot for the Mega Millions and it also allowed me to choose 41 as a position of prominence.

So the combinations are C(56,5) for the main 5 balls and 46 for the mega ball. With a total of C(56,5)*46. Apparently the two sets can intersect as seen if you Google for Mega Millions past numbers.

Re: The sad irony of the HP-41 and Lottery games

*Message #86 Posted by **Katie Wasserman** on 3 Aug 2009, 1:18 p.m.,*
in response to message #80 by Steve Perkins

At $77M Mega Millions is a mega-bad bet, but there are times in most lottery games where the bet becomes favorable in that your expected payout is greater is greater than your bet. The problem is that lotteries don't publish information on their current take so you can't accurately figure this out. You know the prize and you know the odds of winning but you don't know your odds of having to share that prize.

Still, I often join the throngs of idiots playing the lottery in the hope of winning enough money to acquire an HP-95C some day :)

Re: The sad irony of the HP-41 and Lottery games

*Message #87 Posted by **Michael Meyer** on 3 Aug 2009, 1:40 p.m.,*
in response to message #86 by Katie Wasserman

I buy a ticket now and then as well. I figure that buying a ticket increases my odds of winning, but not by much. There's a still a much greater chance of getting struck by lightning, which is still free. I'd rather win the lottery, so I figure a ticket improves my odds relative to either winning the lottery or being struck by lightning....

Re: The sad irony of the HP-41 and Lottery games

*Message #88 Posted by **Steve Perkins** on 3 Aug 2009, 1:51 p.m.,*
in response to message #86 by Katie Wasserman

All lotteries are a bad bet. Even when the pot gets big so that it starts to seem like a good idea, the reason it is getting that big is there are a lot of tickets purchased! Therefore your odds of having to share the pot increase proportionally.

Those who run the system are not stupid. They don't let the odds get in the players favor, even when they make it seem like it is.

I just wanted to make sure everyone is clear on that. It can be fun to play, but you shouldn't ever bet a lot assuming your expectation of winning is good enough to justify the expense. Fund your IRA or 401K or make other sound investments instead. It's what anyone who understands math does.

Lottery games

in response to message #88 by Steve Perkins

> Quote:
>
> Those who run the system are not stupid. They don't let the odds get in the players favor, even when they make it seem like it is.

I agree with your advice that the money should simply go to savings/investments. I've never played a lottery.

However, from an analysis point of view the expected value for your $1 lotto ticket does increase as the jackpot rolls over, and the interesting question is when is the expected value at least $1 for your purchased ticket.

The lotto people are not stupid, as you say, they get a fixed amount of money from the sale of tickets, usually just under 50%, this is true even with the fixed payout prizes since the fixed payouts are deducted from the jackpot. So regardless of increasing player expected value, the lotto people get their money always, and consistently!

Exploring the point at which the expected value reaches at least $1 would take into account adjusting the jackpot amount with:

```
 * Roll over jackpot amount
 * Number of tickets purchased on current go around.
 * Chance the jackpot needs to be split (derived from above)
 * During the current game how much money goes toward the jackpot with each
ticket (Probably about 48%).
 * The Jackpot cash payout.. not the annuity (the cash payout is about half
the reported jackpot)
 * Taxes
```

My feeling is that the point at which the expected value is equal or greater to the purchase price for a ticket is much higher then people think. Something for me to work on on a rainy day :)

Re: Lottery games -- "expected value"?

*Message #90 Posted by **Paul Brogger** on 9 Aug 2009, 10:13 a.m.,*

*Message #94 Posted by **Thomas Klemm** on 6 Aug 2009, 5:59 p.m.,*
in response to message #76 by Egan Ford

Inspired by your table of primes I wondered whether I could use that to make my program faster.
The biggest problem was to determine the upper bound for the innermost loop (73-78). This might be improved since there are still cycles that could be avoided.
Using + to create the primes turned out to be nearly a second faster than just entering them.

Interesting that there is a penalty when storing constants in 41 RPN code.

Just a curiosity: lines 07 through 22 can be replaced with the code below, thus saving three steps.

```
07 .00701
08 STO 17
09 2.566543832
10 LBL 05
11 ENTER
12 INT
13 STO IND 17
14 /
15 1
16 -
17 1/X
18 ISG 17
19 GTO 05
```

After what Peter and Thomas have stated about *numbers* in 41 RPN code, I expect that it will run faster too.

I have another challenge brewing and it will require many more prime numbers. I guess I'll have to write one after all.

I don't believe so because of the constant in line 09. I remember Peter told something about number length too. This makes sense because on the 15C, for instance, that constant alone would take up eleven steps. Anyway, this is just an exotic way to generate a (somewhat limited) prime table (http://hypography.com/forums/physics-and-mathematics/17006-the-holy-grail-of-mathematics-8.html).

In fact, your program could be seven steps shorter, but it would require a little more time to run, as we can see by the output:

More 41 birthday fun.

smartassed ebaby seller

*Message #1 Posted by **db (martinez, ca.)** on 24 July 2009, 2:16 a.m.*

I've seen some complaints here about unscrupulous ebay sellers. Yes; some are dishonest, some are liars, some are sneak thieves, some are internet versions of used car salesmen. Sometimes the problem is just someone not knowing the exact English word to describe what he honestly means. I just saw a new benchmark set in PETTY larceny today: kind of like that guy in about 2001 who would sell a calculator and it's battery door in separate auctions.

http://cgi.ebay.com/HP-Prism-Frame-Survey-Construction-Engineer-Target-NR_W0QQitemZ110413331070QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item19b525ba7e&_trksid=p3286.c0.m14&_trkparms=65%3A13|66%3A2|39%3A1|293%3A1|294%3A50 was sold on 7/14. This just came on the market and was buy-it-now'd, from the same pickpocket / er, seller. I watch for these because as folks at the San Diego HHC saw; I have one of the old HP survey instruments (yes i've used it at work), and want a triple bucket for it. I didn't even bother bidding because i had no interest in just a frame.

Little did I (or the "winner") know; this jerk was parting it out, even though nothing was wrong with it except the missing target. He clearly just thought he would get more money for it this way. He didn't. They go for about $60 or $70, when complete. He got $20 total for the pieces and no doubt had to bother boxing and shipping them separately. Don't you just love it when one of "the smartest guys in the room" shorts himself?

Re: smartassed ebaby seller

in response to message #1 by db (martinez, ca.)

Reminds me of my days selling at Ham Radio Hmfests. I'd arrive really early, usually before daylight. I would put my stuff out on the table and in under 15 minutes sale about 75% of it to OTHER VENDERS.

Each were sure they could sell it at a higher price and make a nice profit.

I always enjoyed walking around at the end of the day seeing all my stuff that I had sold "too low" still on the tables unsold at a much higher price. Sometimes I would see these same venders at the next hamfest still trying to sell my stuff at their overpriced markup.

Of course I never was very good at finances :)

Bill

This is a libelous posting. Offensive, pointless, and illegal- e.g. pointless criticism (defamation). It does not conform to the museum terms of use regarding anonymous attacks on specific ebay sellers.

If you are going to accuse someone in a public of petty larceny, he has a right to know, and possibly a right to legal recourse against you and/or the museum for defamation.

Re: smartassed ebaby seller-

*Message #4 Posted by **db (martinez, ca.)** on 26 July 2009, 2:12 a.m.,*
in response to message #3 by Allen

If the seller was not trying to pull a fast one; he would have said: "as soon as this first piece sells, i will auction off the rest of the parts which i took off - you know: the ones you will need to make it work." He didn't. His loss. He could have gotten about three times the price of the pieces if he had offered it as what it is: surveying gear. People still use hp glass. It's as good as anything made today and what HP set it at became, and still is, the most common offset. Treating it as just another hp collectible to be flogged off at the highest possible price by any means cost this "power seller" about 40 gollies. That's funny. Really.

As far as the schoolyard lawyer stuff is concerned: You can use my initials to find my name on an HHC roster, look my name up in an old phone book from my little town, and pay some schister attorney to write me vaguely threatening letters. I just don't know why you'd bother. Me, I won't comment on this seller in the future; I wouldn't want to give some tool a reason to sue the museum.

Two questions: 38g/39gs aplets and HP ODU

*Message #1 Posted by **bbeamer** on 23 July 2009, 4:07 p.m.*

Will aplets for the 39gs run on a 38g? I thought I could save some frustration if the answer is no.

Also, with the HP overhead display unit, can I use the cable for the unit that has the 10 pin adapter for the 38g and 49g with this

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&ssPageName=STRK:MEWNX:IT&item=330344807098

and connect the unit to the serial port on a 48s or 48g?

Thanks,

Brian

*Message #2 Posted by **Marcus von Cube, Germany** on 26 July 2009, 12:16 p.m.,*
in response to message #1 by bbeamer

Not answering the second question, sorry.

The applet format has changed between the 38G and it successors, they are not directly compatible. I can't tell from the top of my head whether there is a conversion utility.

Re: Two questions: 38g/39gs aplets and HP ODU

*Message #3 Posted by **bbeamer** on 26 July 2009, 4:18 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks.

The adapter is on its way to me. I'll give it a try with the ODU and post the results.

Brian

Re: Two questions: 38g/39gs aplets and HP ODU

*Message #4 Posted by **bbeamer** on 28 July 2009, 6:00 p.m.,*
in response to message #1 by bbeamer

Just in case anyone was wondering, I tried the above adapter today. It does not allow the 48s/g to work with the ODU directly from the serial port.

Brian

More on the new 12C

*Message #1 Posted by **Katie Wasserman** on 23 July 2009, 2:37 p.m.*

In playing with the new new ARM-based 12C I found that it has two functions that don't work as the older models do and yet the documentation says that they do. Holding down the SST (single step) key when trying to debug a program doesn't show you the program step that's about to be executed. This makes program debugging much more difficult. Also, when in program mode, holding down SST or BST won't advance through the program lines at the rate of about 1 per second. It just does one step no matter how long the key is held down. I still love the super fast speed, but programming it is not quite as much fun.

Re: More on the new 12C

*Message #2 Posted by **Dave Britten** on 23 July 2009, 3:35 p.m.,*
in response to message #1 by Katie Wasserman

Interesting. Maybe the keyboard routines aren't interpreting separate key-down/key-up events for the emulator to handle. What happens if you do Clear Prefix (which also functions as Show)? Does it continue displaying the full precision if you hold down the key, or does it revert quickly back to the standard display?

Re: More on the new 12C

*Message #3 Posted by **Katie Wasserman** on 23 July 2009, 5:57 p.m.,*
in response to message #2 by Dave Britten

Clear Prefix works as it does on the old 12C, so the emulator can detect held-down keys properly.

Re: More on the new 12C

*Message #4 Posted by **Don Shepherd** on 23 July 2009, 5:08 p.m.,*
in response to message #1 by Katie Wasserman

Good catch Katie. They fixed one problem (no RUNNING display if program has CLR SIGMA) but removed the functionality you described.

Re: More on the new 12C

*Message #5 Posted by **hugh steers** on 23 July 2009, 5:57 p.m.,*
in response to message #4 by Don Shepherd

Sounds like a timing issue. The original code probably did all the delays with a busy loop and these features were probably disabled by patching the original ROM so as to make emulation work.

That could very well be the case. But they must have patched the "PSE" instruction because that works just fine. I see no obvious reason why SST/BST couldn't have been patched the same way, but I don't have their source nor even the object code. I don't know if this was an oversight or just too hard to implement. In any case, the documentation should be updated to match the functionality -- or vice-versa.

Re: More on the new 12C

*Message #7 Posted by **Don Shepherd** on 23 July 2009, 7:33 p.m.,*
in response to message #6 by Katie Wasserman

Hmmm, for what it's worth, these two errors that Katie found in the new 12c also exist in the new Windows 12c $19.99 emulator. And the problem I identified a month ago regarding the Windows emulator was also, I think, related to the PSE command. That problem has been fixed in the Windows emulator.

Re: More on the new 12C

*Message #8 Posted by **Tim Wessman** on 23 July 2009, 11:06 p.m.,*
in response to message #6 by Katie Wasserman

I think the long key press handling had to be individually patched in various locations and it was missed for those. That is why some work and others don't. I really don't know for certain though.

Re: More on the new 12C

*Message #9 Posted by **cyrille de Brébisson** on 24 July 2009, 8:28 a.m.,*
in response to message #1 by Katie Wasserman

hello,

it's always interesting to see you guys speculations on these issues :-)

anyhow, I did not know about this so I did not do any special allowances to patch it...

the 12C emulator, in order to try to preserve power usually tells the calculator that the keys are released instantaneously. this avoid a dead loop waiting for the key to release in the 12C ROM and the power use associated with that...

Of course, the PREFIX and MEM keys are handle slightly differently to deal with the issue... but since I did not know about SST I did not do anything for that :-)

look for a new software release if I manage to fix it...

regards, cyrille

Re: More on the new 12C

*Message #10 Posted by **Katie Wasserman** on 25 July 2009, 12:16 a.m.,*
in response to message #9 by cyrille de Brébisson

About 20 hours after I posted my finding about this problem I had in my email a modified version of the firmware from Cyrille. The new firmware not only fixes these issues but has the original self-test functionality restored and is another factor of 2.5 times faster due to code optimization.

I now have a 12C+ that's in every way (that I've been able to check) identical to the original 12C but runs about 150 times faster. I have to keep a fire extinguisher handy when it's on :)

As before, it fixes the Clear-Sigma LCD blanking bug in the original 12C and it adds some extended self-tests using ON+g and ON+g+ENTER.

Totally AWESOME!

Cyrille, thank you again.

-Katie

Re: More on the new 12C

*Message #11 Posted by **Gerson W. Barbosa** on 25 July 2009, 12:56 a.m.,*
in response to message #10 by Katie Wasserman

> Quote:
>
> The new firmware not only fixes these issues but has the original self-test functionality restored

Perhaps this is the most important update. As I said in another occasion I had trouble finding a 12C+ in São Paulo as most vendors did not want to sell it because prospective buyers would not trust the new model - exactly because the self tests did not work like they expected them to.

After more than one hour searching through the stores I eventualy found one (CNA 83816873)

Gerson.

in response to message #10 by Katie Wasserman

Katie,

Were you somehow able to update the firmware of a physical hp12c(+)? JTAG?

Or are you talking about the windows simulator/emulator?

Thanks.

Re: More on the new 12C

*Message #13 Posted by **Katie Wasserman** on 25 July 2009, 2:00 a.m.,*
in response to message #12 by Pal G.

The physical 12C+.

There's no JTAG connection but there is a serial port connection in the battery compartment and I have a cable that HP supplied for work on re-purposing. If HP were to make the object code publicly available it would still be a challenge to install it.

The firmware flashing code is free from ATMEL, SAM-BA version 2.6. However, the cable would be difficult to make. The logic-level translation for the serial port is simple enough (and might not even be needed) as are the reset and erase buttons. The real challenge is finding the right 6-pin connector, I've never seen anything like it -- 6 spring-loaded pins in a 2 x 3 configuration with 2mm pitch and a asymmetric tabbed attachment.

Re: More on the new 12C

*Message #14 Posted by **Quan** on 25 July 2009, 8:07 p.m.,*
in response to message #13 by Katie Wasserman

It would still be nice if HP were to offer the cable interface as an option for those who wish to do the update themselves.

I have one of these latest arm-based 12c and I know I wouldn't mind giving it a shot. :)

Ah, well!

HI Katie,

Does it mean there is no change in battery life with the increase in speed?

-Quan

Re: More on the new 12C

*Message #16 Posted by **Eric Smith** on 25 July 2009, 2:21 p.m.,*
in response to message #15 by Quan

There shouldn't be. The CPU is running at the same speed, but the firmware has been optimized.

Re: More on the new 12C

*Message #17 Posted by **Katie Wasserman** on 25 July 2009, 11:51 p.m.,*
in response to message #16 by Eric Smith

Surprisingly current consumption has increased a bit with the latest firmware. I had made earlier measurements and posted to this forum and I've now re-tested using the exact same setup and confirmed on two different 12C+ calculators.

Here's what I found:

Condition	Old firmware	New firmware
power off	4uA	4uA

power on, static display, no keystrokes	45uA	45uA
continuous keystrokes (number entry)	1mA	2mA
long amortization function	15mA	20mA
tight program loop	15mA	20mA
continuous self-test ([ON]+[+]):	4mA	12mA
extended test modes ([ON]+[g] and [ON]+[g]+[ENTER]) static display	1.8mA	2.5mA

When running, the average clock speed must be higher, a lot higher when running the continuous self test. I say average clock speed because I believe that the firmware frequently changes the clock speed.

Cyrille and Eric, do these current measurements make sense to you?

Thanks, Katie

*Message #18 Posted by **cyrille de Brébisson** on 27 July 2009, 8:10 a.m.,*
in response to message #17 by Katie Wasserman

hello,

these numbers are strange, the power consumption should be lower on the new Firmware.

For example, your numbers when running the (new) auto test show 1.5 to 2mA consumption increase, but in both cases the CPU runs at it's default speed of 2Mhz...

the 2 mains differences in the SW are: - code optimization - the cpu speed is put at only 17Mhz when the key executed is NOT n-FV, RS/SST, DDays or a bond key. Ie, when the key presses is NOT one of the 'long'/'slow' functions, it runs at 1/2 speed to conserve power.

regards, cyrille

*Message #19 Posted by **Katie Wasserman** on 27 July 2009, 10:51 a.m.,*
in response to message #18 by cyrille de Brébisson

I was surprised by this too, so I doubled checked all the measurements and the fact that the off state and idle state currents are the same as before confirms that my measurement setup is correct. Is it possible that some other part of the CPU is switched on by mistake in the new firmware, like the serial interface?

Re: More on the new 12C

*Message #20 Posted by **tony(nz)** on 13 Aug 2009, 2:18 a.m.,*
in response to message #19 by Katie Wasserman

Hi Katie, I don't know if this has been mentioned - debugging on the fast 12c via SST in run mode doesn't recognise that pressing and holding SST is supposed to show the line of code and releasing shows the result. The fast 12c merely shows the result. Cheers, Tony

Re: More on the new 12C

*Message #21 Posted by **Katie Wasserman** on 13 Aug 2009, 11:14 a.m.,*
in response to message #20 by tony(nz)

Tony,

We discussed this bug here earlier but I can't find the thread any more. In addition to not showing the step about to execute, SST/BST doens't auto repeat in program mode.

The result was that Cyrille fixed those problems and in the process a new bug cropped up. That's been fixed now too the thread on this is here.

*Message #23 Posted by **Don Shepherd** on 13 Aug 2009, 9:13 p.m.,*
in response to message #22 by John Cadick

John here is a link to Katie's excellent review. See the picture of the battery cover on the new 12c; it is much bigger than the old battery cover (because it encloses two 2032 cells, not one), and it is visible from the shrinkwrap package, so you can tell in the store whether a unit is the old one or the new one.

Re: More on the new 12C

*Message #24 Posted by **John Cadick** on 14 Aug 2009, 2:29 a.m.,*

Re: More on the new 12C

*Message #27 Posted by **Katie Wasserman** on 30 July 2009, 1:44 p.m.,*
in response to message #9 by cyrille de Brébisson

Cyrille,

I found a critical bug in the latest 12C+ firmware.

In program mode: If you press a number key after hitting SST or BST it will enter a STO instruction not the number! The STO will be either to register 0 - 9 or .0 - .9 depending on the instruction that is being overwritten.

I'm pretty sure that this bug was introduced when you fixed the original SST/BST problem.

-Katie

Re: More on the new 12C

New SandMath-5 Module available

*Message #1 Posted by **Ángel Martin** on 23 July 2009, 2:06 p.m.*

For those of you interested (you know who you are :-) version_5 of the SandMath module is now available at TOS.

It includes a few new MCODE functions, many improvements to old ones (error handling and general ruggedness), plus lots of program optimization. But better to take a look at the QRG to see what's on it -

While working on this update I discovered how quickly one gets rusty on MCODE, not sure that I'll be able to do it for much longer, even the simplest thing becomes a tough feat!

Hope you enjoy it, let me know what you think.

Best, ÁM

in response to message #1 by Frank Boehm (Germany)

Hello!

> Quote:
>
> Additional challenge: Port to HP65 :)

I've been playing with this thing for a few days now (it runs on the Macintosh :-)) and am still truly amazed. It was designed nearly 10 years before the HP65, but is much more powerful. It interfaces to the spacecraft systems, is fully multitasking capable, has two kilowords of RAM (magnetic cores!) and had to run for nearly two weeks continuously in a very hostile environment. One of the true milestones of technological development, the ancestor of the flight management system of evey modern aeroplane.

Greetings, Max

SPAM

*Message #1 Posted by **Howard Owen** on 22 July 2009, 6:11 p.m.*

Anyone else receive unsolicited commercial email with the subject "Fwd: Hewlett Packard HP 42S RPN Scientific Calculator"? It was sent by a member of this community, who I will not name. But let me point out two things:

1. The email addresses of all the targets of this mailing are included in the headers of the message you sent. Some of us (but not including me) might not want that information shared without their consent.
2. Another name for SPAM is Unsolicited Commercial Email (UCE). A mailing is SPAM if the recipients didn't ask you for it. The size of the SPAM is not relevant.

Please take my name off the list for any future commercial mailings. I also suggest you think about it before you do this again.

Regards,
Howard

*Message #3 Posted by **Gerson W. Barbosa** on 22 July 2009, 6:02 p.m.,*
in response to message #2 by Paul Dale

Thanks!

It took me only five minutes or so to find this one on the 12C:

```
3.141592654
ENTER
1 e^x /
ENTER ENTER ENTER

; now press * n times until something interesting shows on the display:

*  => 1.335705708  not close enough to sqrt(sqrt(pi)) -> ignore
*  => 1.543711618  don't recognize -> ignore
*  => 1.784109737  not close enough to sqrt(pi) -> ignore
*     and so on...
*
*
*  => 3.183047554  From memory, close to 10/pi -> near idendity (pi/e)^8 ~ 10/pi, but
useless for my purpose
*
*
*
*  => 5.678906136 -> =(pi/e)^12. Since I have 12 and 56789, decide to try a pandigital
approximation (only 3 and 4 missing).
                      Luckily e^-12 = e^(-3*4) does the job nicely! :-)
```

Gerson.

Where do all the manuals go?

*Message #1 Posted by **Mark Edmonds** on 22 July 2009, 3:36 p.m.*

I know this is a bit of a rhetorical question but it never ceases to amaze me how high the proportion of calculators sold without any manuals is against those sold with manuals on the second-hand market.

I gather that there are lots of 21S out there without manuals and that was how they were supplied but for surely all other machines, they came with manuals, and in typical HP style, comprehensive manuals too with supplements and other information.

I find it hard to believe that people simply throw the manuals in the bin or are so slack with things that they just get "lost". Losing a book as actually quite difficult.

Let's not forget as well that many of these manuals date from the time when people really did RTFM and use them for reference.

So how is it that thousands and thousands and thousands of HP manuals have simply disappeared over the years?

Maybe there is a magical planet out there where all the HP manuals gradually float off to?

Mark

Re: Where do all the manuals go?

*Message #2 Posted by **Don Shepherd** on 22 July 2009, 4:16 p.m.,*
in response to message #1 by Mark Edmonds

Mark, I suspect that, believe it or not, this is due to HP's legendary quality. You buy an HP calculator as a student at the university. Then you graduate, get married, get a job, move a few times, then come the kids, you get other jobs, etc. You keep the calc because it still works (on the same set of batteries!), but the manual is misplaced over the years and is eventually offered at your parents yard sale, and doesn't sell so your parents trash it. That's probably what happened to all my old Beatles albums that I wish I had today.

On the other hand, I've seen many auctions where the manual is not included (because the seller can't find it), but after the item sells the seller finds the manual while poring through old boxes and sends it to the buyer. That happened to me once and I was very greatful.

Re: Where do all the manuals go?

*Message #3 Posted by **Eric Smith** on 22 July 2009, 4:27 p.m.,*
in response to message #1 by Mark Edmonds

Not just for calculators, either. Almost all used test equipment is sold without manuals. And often without other accessories that the equipment came with.

When I've looked for used HP 428A or HP 428B clip-on milliammeters, they almost always come without the probe, despite the fact that the probe ONLY works with the 428, is of no use with anything else, and that

there's usually no reason to ever disconnect it.

The 428A/B was a great instrument, and it's a shame that they discontinued it since I've never found anything better to replace it, but don't buy one without the probe!

Re: Where do all the manuals go?

*Message #4 Posted by **Mark Edmonds** on 22 July 2009, 6:26 p.m.,*
in response to message #3 by Eric Smith

Well, on Ebay, some people put the manuals up in a separate auction to the calculator - and I must admit that annoys me quite a lot! Actually, I think that fairly recently, I saw one where the seller had split it into multiple auctions - calculator, psu, case and maybe battery cover as well! I believe he got bids on each item as well.

I am pleased to hear of Don's experience though when the seller found the manual later on and sent it to the buyer. That is good.

Mark

Re: Where do all the manuals go?

*Message #5 Posted by **Don Shepherd** on 22 July 2009, 8:27 p.m.,*
in response to message #4 by Mark Edmonds

Yeah, I think it was a 17bii on Ebay a couple of years ago. She found the manual after I won the auction and before she shipped, so she included it in the box. That was great, and of course I gave her super-good feedback.

Surprise, the 428 milliammeter is still in production

*Message #6 Posted by **Steve Leibson** on 22 July 2009, 7:29 p.m.,*
in response to message #3 by Eric Smith

Yup, HP discontinued it and Agilent doesn't make it. But I'm in the middle of a job search and a little Bay area company named Applied Physics Systems was advertising for a tech writer. I jogged to their Web site and saw something very familiar, a milliammeter probe that looked positively 1960s attached to a digital metering box dubbed the 428D. HP made the 428A and B with this same probe, which I discovered contains a device with my all-time favorite name: a flux-gate magnetometer. It looks like Applied Physics has the tooling or the same supplier for that probe and has updated the instrumentation electronics for it. Still waiting to hear from the company about the job application.

*Message #11 Posted by **Palmer O. Hanson, Jr.** on 22 July 2009, 9:43 p.m.,*
in response to message #1 by Mark Edmonds

I, too, find that manuals are typically not available when buying a used calculator. It is even worse in the slide rule world, but there is a reason for that. In the olden days no self-respecting engineering student would be caught looking at a slide rule manual.

Re: Where do all the manuals go?

The GI bill provided us EE's with a Kk77E log-log duplex decitrig rule known as the fog -fog gooflex guessitrig. In class with ME students we were finished with the tests while the ME's were staring at their rules with a glazed expression.I made good use of the Ohmite and Centralab cardboard slide rules, sufficient accuracy and no decimal point worries. Sam 80

Re: Where do all the manuals go?

*Message #13 Posted by **Palmer O. Hanson, Jr.** on 23 July 2009, 10:48 p.m.,*
in response to message #12 by designnut

My recollection at the University of Minnesota was that in 1946 every engineering student on the GI bill got a K&E Log Log Duplex Decitrig (or Trig) or an equivalent Pickett. There weren't enough to satisfy all those who qualified so some were back-ordered and not delivered in 1947. I was not a GI and the bookstores simply wouldn't sell one of the high end slide rules to me. In 1947 I belatedly

realized that I might be able to get a K&E at the store in downtown Minneapolis. They didn't have one but referred me to the St. Paul store. After a two hour ride on the streetcar I had my log log duplex decitrig in hand. I told the other non-GI students and they quickly cleaned out the St. Paul store.

There was a reason for all of this. The bookstores were allowed to add a substantial processing fee to the GI Bill orders so they supplied everything the law would allow and more. One arts college friend got five or six colors of ink the first quarter. Every GI Bill student automatically got more railroad manila for scratch paper than could possibly be used. They gave what they didn't need to non GI Bill students.

That sort of excess was one of the reasons that the Korean GI Bill operated differently. The student could use the monthly compensation however he saw fit -- there were no vouchers for books and supplies.

Palmer

*Message #14 Posted by **Garth Wilson** on 24 July 2009, 12:24 a.m.,*
in response to message #13 by Palmer O. Hanson, Jr.

Much to my delight when I was 18 or 20 and was always designing and building stereo and amateur radio projects, I inherited a K&E Log Log Duplex Trig, model N4080-3 with beautiful leather case from my grandfather, and used it all the time until I needed something programmable and initially got a TI-58c. I know he didn't get the K&E as a GI though because he was just slightly too old to be drafted in WWII and he became an accountant anyway. It says "Copyright 1947" on it, but it has a couple of vertical numbers on the left end, and I'm wondering if one of them is a serial number, and if that could be matched to a manufacturing date. On the trig side the slide has the number 806858. The body has the number 858 on it. And yes, I still have the manual. I still have manuals to virtually everything I've ever bought, even after the products went in the trash.

Is this a 97S on ebay?

*Message #1 Posted by **Mark Edmonds** on 21 July 2009, 1:03 p.m.*

Have a look at item number 360172881797.

It is labelled as a normal 97 but there is a ribbon cable coming out the back where the cable does on a 97S. As there is no other reason that I know of for any external cable of this type on a 97, I can only assume this 97 has 97S internals although no interface unit.

Does anyone agree with that conclusion or have any other ideas?

Mark

Re: Is this a 97S on ebay?

*Message #2 Posted by **Katie Wasserman** on 21 July 2009, 1:36 p.m.,*
in response to message #1 by Mark Edmonds

There are no internal differences between the later model 97 calculator and the 97S calculator. The layout of the circuit board changed from the original 97 to accommodate a 16 pin connector for the cable going to the i/o pod but I think that any 97 can be used with the i/o pod if you connected to the needed control lines in the calculator.

The logic in the pod is pretty complicated but you can do external keypad input relatively easily without the pod if that's all you need. Perhaps that's what this cable was used for.

The meaning of "Mint" in Portugese

*Message #1 Posted by **Michael de Estrada** on 20 July 2009, 9:46 a.m.*

I found this auction for an HP-55 in which the Brazilian seller describes the calculator as being in "Mint" condition. I guess the adjective "Mint" has a different meaning in Portugese.

http://cgi.ebay.com/Calculator-Hewlett-Packard-HP-55-MINT-CONDITION-W-CASE_W0QQitemZ230358975094QQcmdZViewItemQQptZCalculators?hash=item35a2770276&_trksid=p3286.c0.m14&_trkparms=65%3A1%7C66%3A2%7C39%3A1%7C293%3A1%7C294%3A50

Re: The meaning of "Mint" in Portugese

*Message #2 Posted by **Mike Reed** on 20 July 2009, 10:05 a.m.,*
in response to message #1 by Michael de Estrada

Michael, the government facilities, here in the USA, that print our money and stamp out our coins are called mints. To say something is in mint condition means that it is now as it was when it was brand new, unused, never opened, etc. - it is "fresh from the mint" and hasn't had time to acquire wear. Hope that helps. It has nothing to do with the herb!

polarbear Mike

The meaning of "Mint" in any language...

*Message #3 Posted by **Jeff Kearns** on 20 July 2009, 10:24 a.m.,*
in response to message #2 by Mike Reed

The seller is rather liberal in his/her interpretation of the word 'Mint'. This calculator is used and has been subjected to noticeable wear and tear, as has its case.

JeffK

New looking but witouth box for instance.

*Message #4 Posted by **jbssm** on 21 July 2009, 6:28 a.m.,*
in response to message #2 by Mike Reed

Ok, this is obviously not MINT for sure.

But what about a unit that is new in appearance but without all the accessories, for instance the box?

Re: New looking but witouth box for instance.

*Message #5 Posted by **Michael de Estrada** on 21 July 2009, 8:53 a.m.,*
in response to message #4 by jbssm

Well, sure, the calculator itself could be "mint", however, it simply would not be a "complete" set. I have a few calculators that I found by themselves without any accessories that look like they are new with no visible signs of wear, and work perfectly. I would accept someone describing them as "mint", although I personally do not like to use such terms. I tend to use terms like "excellent" and "no visible wear" when rating the calculators in my collection. This is different from NIB (new in box), which suggests that the item is complete and has never been used. I have never seen an HP that fits this description, however, I do have a few non-HP calculators that were truly NIB. I think that some people do interpret the term "mint" to be synonymous with NIB.

Re: New looking but witouth box for instance.

*Message #6 Posted by **Bart (UK)** on 21 July 2009, 4:33 p.m.,*
in response to message #5 by Michael de Estrada

Hi Michael,

Would this fit your MINT and NIB? I guess this person kept it especially for auctioning off as a collector's piece.

Disclaimer: I am not the seller of this item. I do not know the seller of this item and have no interest in its sale.

Bart

Re: New looking but witouth box for instance.

*Message #7 Posted by **Michael de Estrada** on 21 July 2009, 11:16 p.m.,*
in response to message #6 by Bart (UK)

Yes. Note that the manual is still in its wrapping. I am not interested in these newer vintage HPs from a collector's standpoint. Mainly my interest ends with the HP-41, although I do own and use many of the new models. I have yet to see a truly NIB classic for example.

Re: The meaning of "Mint" in Portugese

*Message #8 Posted by **Quan** on 20 July 2009, 10:28 a.m.,*
in response to message #1 by Michael de Estrada

The word "Mint" is the most often abused word on eBay, in my experience, in describing the conditions of a HP calculator product.

However, often in these cases, the pictures are worth thousand words. Then some.

Good chuckles, though. ;)

Re: The meaning of "Mint" in Portugese

*Message #9 Posted by **BruceH** on 20 July 2009, 6:07 p.m.,*
in response to message #8 by Quan

Surely the most abused word in eBay is "rare" ;-)

Re: The meaning of "Mint" in Portugese

*Message #10 Posted by **Geoff Quickfall** on 20 July 2009, 6:28 p.m.,*
in response to message #9 by BruceH

Then by extension a "rare mint" would be the hardest to find?

;-)

Re: The meaning of "Mint" in Portugese

in response to message #9 by BruceH

Quote:

> Surely the most abused word in eBay is "rare" ;-)

God yes! Ebay ought to charge a fee each time that word is used. One unused AA battery - ultra rare!

Mark

Re: The meaning of "Ultra Rare" in English

*Message #12 Posted by **Bart (UK)** on 21 July 2009, 5:17 p.m.,*
in response to message #11 by Mark Edmonds

I just noted a 48GX described as "ultra rare". I guess one appearing at least once every 2 months on UK Ebay alone makes some sellers think it to be ultra rare? Compared to the AA battery, I suppose it is :)

Re: The meaning of "Mint" in Portugese

*Message #13 Posted by **Raymond Del Tondo** on 20 July 2009, 8:34 p.m.,*
in response to message #1 by Michael de Estrada

Hi,

the auction description is incorrect in various places.
Given that the pictures are of the unit on offer, the calc is far from mint.
On the contrary, it has seen intensive use.
The "chrome edging" as the seller calls the silver trim, has been washed out on different areas.
And one of the springs in the battery compartment is badly corroded.
That one will break in the near future.
The rear label has many scratches on the edges.

And the answers to questions to the seller are somewhat irritating;-)

Michael; About eight years ago someone posted most of this here. I added a bit and include it on the page when i eBay something. The funny thing is how often someone who doesn't speak English will take me to task over how it can't be all those things and i'm lying or how i'm breaking eBay rules. I tell them that they're just too smart for me and to not bid on this fraudulent auction. Sometimes someone will ask permission to use it on his auctions. To that i answer "ask the guy who *I* stole it from. - db

-EBAYese to English DICTIONARY-
Hard to Find = It's the only one I'm auctioning today.
Rare = "It's the only one I'm auctioning this week.
Very Rare = It's the only one I'm auctioning this month.
Unique = It's the only one I'm willing to sell.
Seller Prefers PayPal = I want your money and I want it NOW.
Mint = It looks more-or-less like it did when I bought/inherited/salvaged/found/stole it.
Minty = It's mint (q.v.), except for the funny green sauce I dribbled on it while eating lamb chops the other night.
M.I.B. = Mint In Box, but the item and box got slammed in the tailgate at the flea market.
New in Box (NIB) = I bought this with the sole intent of selling it for many times what I paid for it.
Nice = Looks great - doesn't work.
Complete = Except for the valuable, hard-to-find bits required to make it work.
Not Tested/Sold As-Is = 12VDC? 120VAC? There's a difference?

Like New = Like running over it with a car could really be that bad for it.
With Extras = I didn't feel like auctioning the manual, battery door, and case separately.
Buyer protection on eBay = We have your money. What's your problem?"
I'm no expert on this.... = broken
I don't have batteries to test it = broken
I don't know how to test it = broken
It worked last time my dad used it = broken
Reserve Price = Cost of an item in Heaven - the SELLERS Heaven.
No Reserve = none needed in light of the outrageous miniium bid.
Buy It Now = ...for twice what it's worth, or risk paying three times as much to stave off snipers.

Re: ebaby dictionary

*Message #16 Posted by **Martin Pinckney** on 21 July 2009, 9:19 a.m.,*
in response to message #14 by db (martinez, ca.)

That word "rare" really bugs me. The funny thing is, I wonder who do these sellers think they are fooling?

1. If a true collector views the auction, he will know what is rare and what is not. So telling the collector it is rare is pointless.

2. What newbie will buy something he knows nothing about just because the seller tells him its rare? If one set out to buy up rare items for resale, wouldn't one first do some research? If so, then one would at least have some idea of the rarity. So again, stating that it is rare seems pointless.

So in the end, the seller is only fooling himself.

Re: ebaby dictionary

*Message #17 Posted by **Quan** on 21 July 2009, 11:26 a.m.,*
in response to message #16 by Martin Pinckney

Hi Martin,

I think the word "rare" or any catching word is probably for the search engine, although I don't know if one can do searching in the description.

Knowledgeable and experienced buyers can filter out the junk from the real thing. Most of the time.

It's always make me smile when "mint" or "rare" just doesn't go hand-in-hand with the pictures the sellers so proudly present them. :)

On the other hand, English is a very rich language... I am told.

Re: ebaby dictionary

*Message #18 Posted by **db (martinez, ca.)** on 21 July 2009, 9:33 p.m.,*
in response to message #17 by Quan

English **is** a rich language. That's because we stole the best words from every other language on earth, and we're not giving them back.

We especially like the dirty ones.

I41CX - new version 3.0

*Message #1 Posted by **Nigel Bamber** on 20 July 2009, 8:39 a.m.*

Antonio has posted a major new version which is now showing on the Appstore.

It has some significant new features :

1. 24 new functions 2. New VERY modern skin desgned by a 41 guru, Lewis Dickens - its a sort of HP 41CX Disco Version ! 3. Ability to programme your own new characters to show on the screen. 4. Double tap copy/paste of printout/registers/flags/screen etc. onto main Iphone/Itouch clipboard.

The application just gets better and better.

Nigel

20b keys

*Message #1 Posted by **Paul Dale** on 20 July 2009, 2:44 a.m.*

Just noticed something on the 20b's keys. They've got their primary function embossed on the back. So e.g. the INPUT key has "input" on the inside. The shift key has "shift" etc.

Not having much luck wiping the writing off them. Washing did nothing (as expected), ammonia (window cleaner) didn't touch it. I'm sure I could sand them off but that would look horrible. Perhaps caustic soda will be my next try.

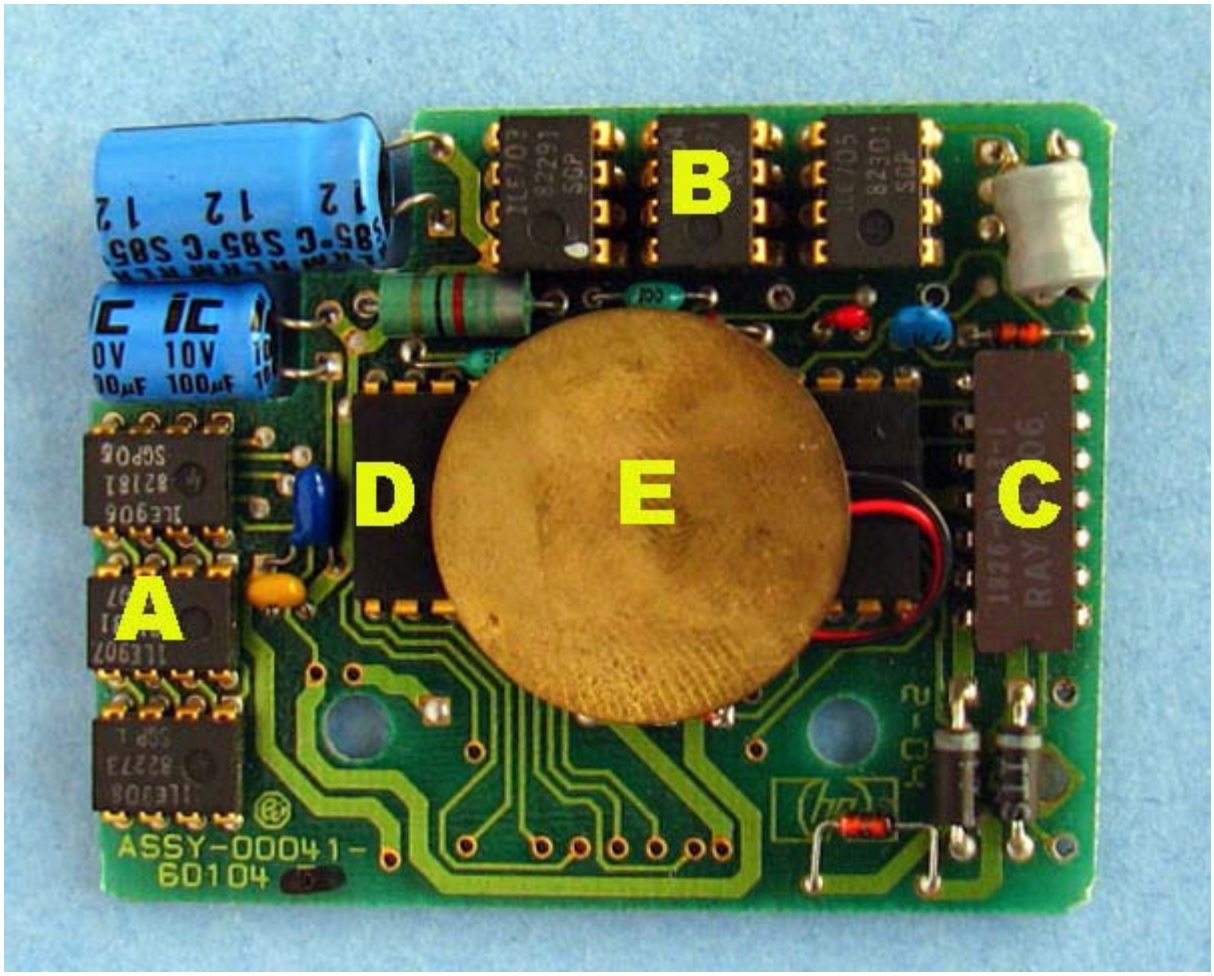
Technical question; HP-41CV logic PCA

*Message #1 Posted by **Geoff Quickfall** on 19 July 2009, 1:59 p.m.*



Pictured above is the Logic PCA from a fullnut HP41-CV circa 1984. I have the manual for the HP-41C of which there are similarities. However I am trying to identify specific chips.

INSCRIPTION	YELLOW LABEL	TYPE?
ILE 906 ILE 907 ILE 908	A	ROM
ILE 703 ILE 704 ILE 705	B	DISPLAY
RAYT8306	C	POWER SUPPLY
N/A	D	CPU

```
N/A                    E          PEIZO TRANSDUCER
```

Do I have A, B, and C correct?

Cheers, Geoff

edited to correct the CX reference .

in response to message #3 by Geoff Quickfall

My pleasure.

I've been staring at (and carefully measuring dimensions) of exactly this board for a couple of weeks. It's a marvel of miniaturization given the technology of the day. I especially like the capacitors mounted sideways, and on later versions the stacked 8-pin DIPs.

Trying to squeeze an FPGA, a CPLD, a Flash memory and a static RAM, plus power supply and voltage translation circuitry on a board with these physical dimensions is "an interesting intellectual exercise" to say the least. Finding capacitors and an inductor that met the height restriction was a royal pain.

Monte

Re: Technical question; HP-41CX logic PCA

*Message #5 Posted by **Randy** on 19 July 2009, 7:52 p.m.,*
in response to message #1 by Geoff Quickfall

That is not a CX board, it is a either a C or CV as the board part number (on opposite this view) is 5081-5563.

There were a total of six different board layouts used in the life cycle of the 41, this was the fifth variant. The next board in sequence was 5081-5564 which was the only CX capable board. It was also used for the C and CV variants by installing the corresponding ROM and D/S parts. The CX added the timer IC 1LF6-0001.

OOOPS, sorry, it is a CV logic PCA...

*Message #6 Posted by **Geoff Quickfall** on 19 July 2009, 8:41 p.m.,*
in response to message #5 by Randy

Got my photos mixed up! I was working on a CX halfnut board when I typed the posting and I meant to say CV but CX was stuck in my head, REALLY ;-)

There are no coincidences,

I was just on my way to Deigos site to copy his I/O-assembly flex-PCB pad instructions and thought to visit here first.

So coincidence? off to Deigos,

Cheers, Geoff

The only manual I have is of the original HP-41C with screwed down logic PCA.

Re: Technical question; HP-41CV logic PCA

*Message #9 Posted by **Eric Smith** on 21 July 2009, 7:31 p.m.,*
in response to message #1 by Geoff Quickfall

FYI, the RAYT8306 line on the ceramic chip C is the vendor and date code, not the part number. The part number is the on first line, probably 1820-0953. The -1 suffix is most likely a minor manufacturing variation such as the case type, as any significant functional change would have resulted in a new part number assignment. Earlier 41s used the 1820-0566.

Re: Technical question; HP-41CV logic PCA

*Message #10 Posted by **Randy** on 21 July 2009, 8:12 p.m.,*
in response to message #9 by Eric Smith

The 1820-0953 replaced the original 1820-0566. The new part eliminated two resistors, R2 (100k) and R3 (1m) which were moved onto the die. The parts are otherwise interchangeable, so long as the resistor issue is addressed with the swap.

Thanks guys, thanks to Randy I am

Hawkeye: Remember this one? (1/?)

*Message #1 Posted by **Etienne Victoria** on 19 July 2009, 12:00 p.m.*

Remember this one??

The Hawkeye with an additional connector!

It was not exactly pretty:

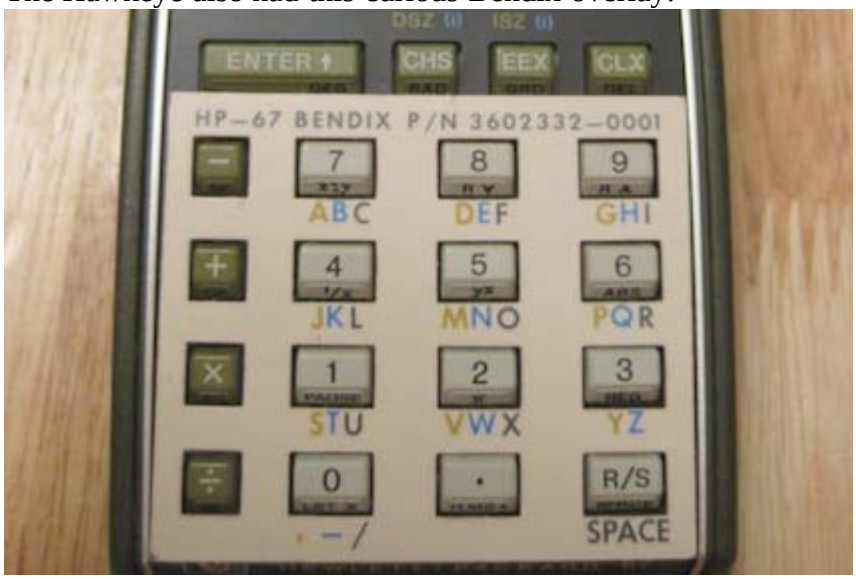
with a missing battery connector and corrosion all over the place...

Nevertheless, I purchased it:

- hoping to find some parts to repair a friends HP-67...

- and, out of curiosity, to check this:

The Hawkeye also had this curious Bendix overlay:



Before opening it, let's check the connector with close-ups:

This 7 holes connector is marked :

- on the top side: MIKM0-1-7SH003, that is a Microminiature Circular 7 pins connector. The MIKM series has a steel shell and improved ruggedness (Source is The ITT Industries website) .

- on the bottom side: ITT 7938.

We'll check it further after powering up and opening the calculator.

After cleanup, the battery compartment confirms the poor condition and corrosion of the connectors:

After checking the serial number, it appears the Hawkeye was built in 1980 and in Singapore:

which is pretty late for a Hawkeye, considering that the 41C was launched in 1979 (but we know from the Museum that the Hp-67 was discontinued as late as 1982).

Warning: do not power-up an Hp-67 and operate the card reader without a known good battery pack correctly connected.

...and know some good news:

Let's power up:

- it works :-)))))

- the keyboard is immaculate (but I hate those legends below the keys)

- the card reader is goeey (but this is good news as I like repairing them).

In the upcoming messages, I will update you on my investigations and findings.

Don't expect:

- frequent postings: I'm quite busy...

- High-res pics: I don't want to clutter Dave's server as I use the guest directory,

- complete reverse engineering: we would need the HIR for this ("Hacker In Residence", Tony, are you here ?)

Just to share the fun.

See you in the next post and have a nice summer!

Etienne

Edited: because, after all those years, I still cannot get a post nicely formatted first shot.

Edited: 19 July 2009, 12:47 p.m.

Re: Hawkeye: Remember this one? (1/?)

*Message #2 Posted by **Katie Wasserman** on 19 July 2009, 1:22 p.m.,*
in response to message #1 by Etienne Victoria

Etienne,

Thanks for the followup information and pictures! I'm glad you posted it as it was an interesting topic for discussion earlier that we can continue now..... Here's my guess:

I've been looking at the the 97S connection its pod and I'll bet that this connector is a subset of that one using just the lines needed for keystroke input. In particular:

```
Ground (the shell)
Vcc
KBA
KBC
KBD
KBE
STR
RCD
```

The keyboard is arranged in a 14 x 4 matrix. A 1-of-14 counter is reset by the RCD line and incremented by the STR line. The KBA, KBC, KBD and KBE are the outputs. Whatever plugged into this MIKM series connector had to have a good bit of logic to make sure that the correct KBx line was at logic 0 (I think) at the correct time. This is exactly what the 97S pod does in addition to decoding some of the 97S instructions.

In what year was your HP lust kindled?

*Message #1 Posted by **hecube** on 19 July 2009, 12:03 a.m.*

For me, it was in either in 1981 or 1982. I already had had a Sharp PC-1211 and a Radio Shack pocket computer (was it the PC-1?). Anyway, I read an article in french science magazine Science & Vie about which was the fastest pocket computer. The shoot-out was between the HP-67, the HP-41 and I'm pretty sure the above-mentioned Radio Shack (or Sharp equivalent). The method to determine the fastest was a program to calculate something like the first 500 decimals of Pi or thereabouts...

The HP-41 came out on top. I had to get one then and there. I finally got one a year later and I still have it...

in response to message #1 by hecube

I got my first HP (20s) in 1993 to replace my failing TI. But it was just a tool. Later (about 2003), admiring my associates 48GX's, I bought a 38G for the big display. The "lust", as you term it, did not begin until after I found this site, and learned about the many other models available. Maybe 2006.

in response to message #2 by Martin Pinckney

A Scientific American came with a cardboard punch-out that made a mock HP-35. I played with it 2 days and decided I could use it for my Electronic solutions. With 3 memories and a 4 stack I tried every way I could to get better use of it. In idle time I played with it and discovered a shortcut to a somewhat laborious problem. I bought each new model and sold the old one. RPN was all I knew and I changed the book formulas into keystroke sequences. I was able to simplify all the EE formulas to easy to remember routines. I decry using book formulas and algebraic as backwards and inefficient. Once you change them to suit your use you speed your work and I discovered previously unknown relations that had not been noticed because they did not have the tools for computation I had. Sam 80

*Message #6 Posted by **Les Bell** on 19 July 2009, 2:04 a.m.,*
in response to message #1 by hecube

It was 1974. I built a Sinclair Scientific from a kit, but it had a faulty clock chip and when finally fixed, I was frustrated by its 3-level stack and lack of an x<>y key. One of the labs at my university had an HP-35 in a security cradle, so I wrote to HP and they sent back some product brochures, including one for the HP-45.

Lust barely begins to describe it.

I worked as a bartender for the Easter holiday break, in order to make enough money to buy an HP-45. I've always had HP calcs since then.

Best,

--- Les

in response to message #1 by hecube

For me it was about 1980-81 when I heard about the HP41C & decided to buy one as I was finishing my Engineering Degree. Then moved onto the the 48GX & now the 50G. I still have my original 48GX which is in excellent condition & recently purchased a 41CV & 41CX (both in perfect condition) for old times sake. Also purchased a new 35S earlier this year for my daughter who recently started at Uni.

Must say I still love the feel of the 41 series calculators & enjoy using them for simpler calcs but when I need for flexibility & power out comes the 50G.

Cheers,

Michael

*Message #9 Posted by **Walter B** on 19 July 2009, 5:15 a.m.,*
in response to message #1 by hecube

For me, it was a refurbished HP-25C in 1977. I easily sold my first calculator then, a TI SR 50 I bought 2 years earlier since HP was way (!) too expensive for me as a student at university. I remember when I first saw an ad of the HP-45 it was priced >1200 DM. I leave it to the experts to calculate this in today's currencies.

There were many internal debates in mid-seventies in physics classes about the "best" scientific calculators one could buy. It was only between TI and HP then, the other brands available were rated "cheap scrap". At that time, build quality and durability of HP's keyboards was exceeding TI's by far. So, yes, it was a kind of "lust" (German) to use one of those, though it was a bare necessity for me.

5 years later I replaced it with a 11C. A 15C or 41C was too expensive, and the 11C had all I really needed -- even L.R.! It was great progress compared to the 25C, so I enjoyed it.

I had to buy a replacement 8 years after this. And I bought an HP again, a 32S (42S was too expensive), but I don't remember a "lust" then. It was a tool, nothing more. I still have it today. My collection started many years later, when I saw an old HP-97 at work.

1972, HP-35 (for about 900 DM. I was the first among my colleagues to get rid of the slide rule), sold it. Then came a HP-25 (learned to program in a very tight space), sold it. Then came a HP-67 (a big machine, but no letters), sold it. Then came a HP-41C (built two memory modules INTO the case), sold it. Then came a HP-48SX (after many years some keys failed), took it apart. Then came a HP-50g (very good machine, but lousy manual), still have it.

Greetings, DK2ZA

1979....from a computer shop in Billings, Mt. called "The Computer Store". They carried HP and Apple products.....When I saw the 41C, I had to own it for $325 approximately (does that sound right?). Learned to program in basic on the 41C and that lead me to buy an HP85 (desktop) and later an HP9816 desktop. Over the years have bought several 41CX's and all of my 41's are in use every day. Don't hold your breath thinking HP will ever produce a product like the 41 and all the other calcs we have come to admire, anymore than GM will produce a vehicle as sexy as the 57 Chevy.

1976 - My playing Lunar Lander on father's HP97 to pass away the time on a transatlantic flight.

Actually this machine kick started my whole interest in computers and programming, and I think I used it more than my father did until I got my own HP33C (which I still have today) in 1978 but I never took to the later models in quite the same way.

Mike T.

PS - I do remember being rather disappointed when I discovered that 'real' computers could only cope with integers 0 - 255.

OK I'm a newbie around here !

2009 - after downloading the excellent I41CX Itouch application.

In May of this year got my hands on my first real HP calculator , 41 CV.

But my interest in calculators was sparked by my maths master at Prep school showing off his non-HP one in 1974.

in response to message #14 by Nigel Bamber

I was always aware of HPs and very curious about them but they were always far too expensive for me to consider. I survived with loaned Casios and bought a Tandy/Sharp PC1 and later another Sharp programmable which was horrible. Eventually, I got so fed up with the Sharp and as I was in work and earning money, I went up to town to do some research with the intention of coming back with the best calc I could get.

That turned out to be a 48SX which was an amazing eye-opener!

I didn't get into collecting until a little later but still before the internet became readily available so HPCC got me my first additions. Then I went completely off it all for many years until something triggered the interest again. Still seeking the holy grail, a 9100B...

Around 1978. I'd become fascinated with programmable calculators after seeing a TI 52(?) owned by a friend of my parents. My brother got an HP 25C and around 1978, I convinced my father to buy me a 29C. I tried to get him to spring for the 19C, which had a built-in printer but I couldn't justify it.

A couple of years later a got a 41C, then memory modules, card reader, math module printer... I replaced the 41C with a 421CV in college in 1982 I believe. That was my main calculator until 2 years ago when my daughter needed a TI 83 and I started to wonder what had happened in the world of HP calculators in the intervening 25 years. Bought a 50G and learned to program it. I'm still learning the functions in this nifty little machine and I've been writing code in system RPL and C/C++ for it.

Got a side gig writing software for a 48gii, which is a nice less-expensive alternative to the 50g.

*Message #17 Posted by **Bart (UK)** on 21 July 2009, 5:41 p.m.,*
in response to message #1 by hecube

1988 when I got a 28C. It only had 2k RAM, so I was soon tempted by a Casio fx-850P because it had more RAM.

I soon found that I wasted most of it reprogramming calculator functions! I got to hate the Casio. On the 28 everything was integrated and just about all keyboard functions were available for programming. RPL was just more efficent and flowed so much easier.

I trashed the Casio (it ended up under the wheel of my car) and got a 28S. I still use it to this day. Unfortunately the battery door is broken. Since then it's been only HP's for me. Although stuck on RPN, I find the 20S quite an amazing little unit.

I do not have a "lust" in the collector sense, I just can't imagine using any other calculator.

My elder brother introduced me to his HP-41. I thought this so called reverse polish notation was a bit confusing, but I could spot out some nice things about it too. Still I had my beloved Casio PB-100 and my Sinclair ZX-81, both basic programmable so they were perfect mates. But later on I got an HP-42S as a present from my brother. That was how it all started. I bought an HP-48SX in 1992 and sold the HP-42S to a classmate (most regretfully). Today I have more than 40 different HP's...

HP classic latches

*Message #1 Posted by **Tim** on 18 July 2009, 11:58 p.m.*

Does any on know where to get a latch for the HP 45 door?

Re: HP classic latches

*Message #2 Posted by **Dan W** on 19 July 2009, 1:30 a.m.,*
in response to message #1 by Tim

From an HP45?

No I'm serious. Spare doors or latches for the Classics seem hard to come by. I could use a few myself. Best bet is to probably wait until a non-functional Classic shows up on auction and try to buy the whole thing for cheap. The 35, 45, 55, and 80 all use the same door (the 70 is the wrong color). There's a door thief out there, probably related to the sock thief.

Edited: 19 July 2009, 1:32 a.m. after one or more responses were posted

Re: HP classic latches

*Message #3 Posted by **Tim** on 19 July 2009, 3:07 p.m.,*
in response to message #2 by Dan W

That's just it. They are not cheap. I have an HP 45 it has one latch that is broken in half. Most fixit calculators are missing the door. I thought maybe veteran collectos would have spare latches but they probably fixed up thiers and thus their is a short supply of them.

Re: HP classic latches

*Message #4 Posted by **Michael de Estrada** on 19 July 2009, 8:36 p.m.,*
in response to message #2 by Dan W

The HP-55 is also a different color, sort of a khaki green. Although I have on occasion seen classic battery doors for sale, the prices have always been exorbitant. Fortunately, all my working classics have doors with good latches.

*Message #5 Posted by **Jonathan Eisch** on 20 July 2009, 11:54 a.m.,*
in response to message #4 by Michael de Estrada

I sent my latches to someone on this list a while back, as they offered to try to fabricate some new ones for me. Don't remember what ever happened with that, but it sounds like if they got around to it, there are enough people here to make their time worth while.

-Jonathan

Re: HP classic latches

*Message #6 Posted by **Tim** on 20 July 2009, 5:32 p.m.,*
in response to message #5 by Jonathan Eisch

That would be an excellent idea. They are plastic. You wouldn't think it would take much to fabricate for someone who works with plastics.

Re: HP classic latches

I guess you've never seen what it takes to make a molded plastic part... molds are anything but easy.

To recreate those latches it would be unbelievably expensive to make in quantity. Several thousand dollars would be good starting point for the tooling since there are two molds involved, one for the slide, one for the rubber foot insert. That latch system relies on some tight tolerance molding and good material, not a good match to try on a small, limited scale.

There was a guy around a couple of years ago that talked about this. He did make some knock-off classic battery shells. He sold them for a short while on eBay then promptly disappeared from sight when they stopped selling. IMO, they were pretty awful.

Re: HP classic latches

*Message #8 Posted by **Dan W** on 20 July 2009, 8:53 p.m.,*
in response to message #7 by Randy

That was Don Shaffer. I thought they were pretty good, and bought a number to build battery packs and sell on that_site with rebuilt calculators. Of course they weren't as good as the originals, but they were much better than not having a shell at all.

Re: HP classic latches

*Message #9 Posted by **Randy** on 20 July 2009, 9:08 p.m.,*
in response to message #8 by Dan W

> Quote:
>
> Of course they weren't as good as the originals, but they were much better than not having a shell at all.

I cannot agree with you. Never had problem one with a Mark Hoskins battery and I've bought at least thirty of them. They may not be pretty but they always work. I bought five of the other brand and I had to trim the case on two to get them to work, a third was never 100% reliable as the case was warped due to too much hot glue and never fit quite right in the calculator.

Your mileage was obviously different...

Re: HP classic latches

*Message #10 Posted by **Dan W** on 20 July 2009, 10:24 p.m.,*
in response to message #9 by Randy

I can't comment on the battery packs. I only bought the plastic frames, then built up my own packs.

Re: HP classic latches

*Message #11 Posted by **Michael de Estrada** on 20 July 2009, 11:23 p.m.,*
in response to message #10 by Dan W

Don Shaffer is selling his classic battery packs again. He has changed his assembly technique from hot glue to heat staking, and they now fit properly inside the calculator. They cost more than Mark Hoskins' battery packs, and since Mark has now upgraded his packs to 1000 mAH cells, there is less reason to buy Don's anymore. Also, Mark is the only one that I know of that sells replacement battery packs for the HP Spice series.

Printing statistics calc // 46

*Message #1 Posted by **Walter B** on 18 July 2009, 5:28 p.m.*

Hi all,

here's an auction showing a print of something called "model 5" looking like an HP 46 but with different keys. I haven't seen this model before, at least I don't remember. Does anybody know more about it? The photo of the relevant page is too blurred to read anything there :(

Look here.

Salvatory clause: I'm not linked to the seller.

Walter

*Message #2 Posted by **Thomas Radtke** on 18 July 2009, 5:50 p.m.,*
in response to message #1 by Walter B

Could be the 9805, maybe in France just labeled 5?

Edited: 18 July 2009, 5:51 p.m.

Re: Printing statistics calc // 46

*Message #3 Posted by **Walter B** on 18 July 2009, 6:10 p.m.,*
in response to message #2 by Thomas Radtke

Thomas, thanks for the hint. You must be right. I just checked the "9805 Expanded Stat Guide" on Dave's DVD, and it even states "Model 5" on its first page. So, not only in France ...

Re: Printing statistics calc // 46

*Message #4 Posted by **Mark Edmonds** on 18 July 2009, 8:25 p.m.,*
in response to message #3 by Walter B

Yep, easy to identify from the 46 or 81 by its swappable left hand keyblock. I love the way they printed the graphs on those keys and used such "wordy" key labels! I've never seen any alternative keyblocks other than the standard one though - has anyone got any pictures or descriptions of any others please?

Mark

Sanmath-5 ?

*Message #1 Posted by **Geir Isene** on 18 July 2009, 3:37 p.m.*

Over at TOS, Angel Martin has released Sandmath-5. But still with manuals from Sandmath-III.

Angel; What is the changes in 5?

Re: SandMath-5 ?

*Message #2 Posted by **Angel Martin** on 19 July 2009, 1:34 a.m.,*
in response to message #1 by Geir Isene

Good things happen to those who wait...

My personal contribution to the 30th. anniversary (say celebrate?) is this updated version of the SandMath Module.

More changes still happening, rather wait until the final version is posted on July 21st...

What's different:-

a.- 4 new MCODE functions replace the FOCAL programs from previous versions (GCD, LCM, nPr, nCr)

b.- Error handling added to GAMMA, BETA, and other MCODE functions likely to get beyond range.

c.- corrected a bug in KNBS (Bessel K) and added support for negative integer indexes to all of them (In, Jn, Kn, Yn).

d.- lots of small code improvements and code compacting, allowing more functions to be staffed into the ROM.

An updated version of the QRG, as well as new blueprints will also be posted on July 21st.

Best, AM

Edited: 19 July 2009, 1:35 a.m.

Re: SandMath-5 ?

*Message #3 Posted by **PeterP** on 19 July 2009, 6:36 p.m.,*
in response to message #2 by Angel Martin

Awesome! Based on Egan's last challenge I started to work on a nPn and nCn mcode function, glad I did not finish them!

Thanks a lot angel, I still have. Virtually all of the calcs I use at home, office, iPhone etc with sandbox/sandmath configurations!

Cheers

Peter

Re: SandMath-5 ?

*Message #4 Posted by **Ángel Martin** on 21 July 2009, 1:27 a.m.,*

What company now embodies the qualities of the HP of old?

*Message #1 Posted by **hecube** on 18 July 2009, 2:37 p.m.*

And where is the chinese equivalent of HP? Where is the indian equivalent of HP? or Russia's? These countries are experiencing construction (and the associated engineering) boom.

They must have need for portable computational power like HP provided in the 70s and 80s?

Where is all that?

*Message #5 Posted by **Mike T.** on 19 July 2009, 7:20 p.m.,*
in response to message #1 by hecube

Personally I'd say Apple's iPod, iPhone, and MacBook show that Apple has the qualities of Innovation, Design and 'Quality' that were associated with the older HP1x, HP2x and HP4x series machines. Perhaps surprisingly you could even make a case for HP themselves based on products like the HP digital pen and HP printing system, HP2133 netbook, and high end products like the HP2465 - except that though very good the HP products were not all the first to appear in each segment of the market.

Of course only of one of these the two still makes an RPN calculator.

Perhaps in today's consumer market place it should not be a surprise that none of these products feel quite as special as the old machines did in the '70s and '80s , but these days you do get a lot more for your money...

the top programmable calculators

*Message #1 Posted by **juan demin** on 18 July 2009, 2:29 p.m.*

Hi, I wonder how to follow the list of top hp programmable calculators: hp-65, hp-67, hp-41.... What's your oppinion? Thanks

Not including the graphing calculators and sticking with RPN:

*Message #2 Posted by **Geoff Quickfall** on 18 July 2009, 3:58 p.m.,*
in response to message #1 by juan demin

My list, in order of introduction:

```
HP-65      after all, it was the first.
HP-67      after all, it was the second and for expanded capability.
HP-97      a 67 with a printer, easy documentation.
HP-29C     small, portable, and 98 lines of programming.
HP-19C     as above but with the convenience of a printer.
HP-34C     has the minimum number of registers in my opinion for a
           truly handy machine.
HP-41C,    the ultimate of course in RPN
CV, CX
HP-15C     the size, programming and pocket factor.  To bad it
           didn't have LEDs.
HP-42S     the second ultimate but I need my clock!

HP35S      excellent come back but I need polar functions and a
           clock.

I am really amazed at some of the replies here! What criteria are you using to make these selections? I think it is necessary to set a few baseline specifications to appreciate what does make a great programmable rather than picking the best model of each generation.

Also, not one of you has mentioned the HP that I think is the closest they got to the "perfect pocket programmable". Actually, I've been meaning to start a thread on the "perfect HP" to get this being discussed but haven't finished my opening text yet. Maybe tomorrow...

Mark

in response to message #8 by Mark Edmonds

You are right Mike..!! An maybe this could be a nice debate once we can settle the basis to compare each model... Which one are ypou talking about?

Mark, there were/are no criteria! That's the fun. But seriously..

*Message #10 Posted by **Geoff Quickfall** on 18 July 2009, 8:46 p.m.,*
in response to message #8 by Mark Edmonds

Give me some criteria and I will narrow the list down.

Obviously, for me, the most important calculators, as evidenced by their use by me, are in this order:

```
HP-41CX
HP-42S
HP-01
```

They accompany me to work. I wish the 42S had a clock, it would actually replace the 41CX if it did. I don't use the modules or HPIL as much as I used to and its profile is much slimmer for my flight bag.

On another note, what would the criteria be:

```
BEST LED PROGRAMMABLE
BEST LCD GRAPHING
BEST LCD NON GRAPHING
BEST HPIL CAPABLE CALCULATOR
BEST TIMING FUNCTION CALCULATOR
BEST CONTROLLER
BEST CALCULATOR THAT IS EASY TO USE
BEST CALCULATOR IN EACH FAMILY
BEST OVER ALL CALCULATOR THAT HP EVER BUILT
BEST RESTORABLE OR FIXABLE CALCULATOR
...
```

This could go on forever, but for me, each calculator that I mentioned in the first post twig my interest and have their reasons for being in my expanded list. Of course that is all personal by definition.

Cheers, Geoff

I would simplify: increase power no matter costs, instead of producing cheaper calcs for more people. Thanks

Re: Mark, there were/are no criteria! That's the fun. But seriously..

*Message #13 Posted by **Mark Edmonds** on 20 July 2009, 2:16 p.m.,*
in response to message #11 by juan demin

Well, briefly, the sort of things I would be thinking of are:

Does it have step insert/delete? Does it have label addressing? Does it have subroutines? Does it have continuous memory or offline storage?

Those are only a small part of my "master list" for the "perfect HP" and I would want all of them to be true for a particular model before I would consider it in my top programmables list. However, I would make an exception on the last point if the step memory was small and as a consequence, only small programs were possible. You will note that I am not including anything like "historical significance" or "personal significance" because they can be more subjective.

By the way, one of the reasons why I said I was surprised by the original nominations is that no one included an RPL machine! I know why RPL isn't popular but even if you don't like it, you can't deny its power and the massive feature set built into the 48 models and onwards. By most definitions, those machines would be the ultimates - although my nomination for the perfect HP is not one of them by a long shot!

Mark

I think that's because we don't actually rate them that highly, Mark. Powerful, yes, but too complex, a design that places orthogonality/consistency over convenience, too big, not a great keyboard, unengaging documentation. Fine for a maths teacher or a schoolkid who's got no alternative, but not for engineers and scientists.

Nope, when I want to do some computing, I use a computer, but when I want to do some calculating, I reach for my trusty 41.

Best,

I am quite a fan of the 28S.

Plenty of memory for most purposes. Very nice keyboard and layout.

Really awful battery door.

in response to message #15 by Paul Dale

I'm in partial agreement with you there, Paul. The 28S's form factor was comparatively uncluttered - although I never had one, I was quite fond of my wife's 18C which was similarly laid out. Plus, it came with much better (imho) manuals than the later 48 series - in fact, I found some of the 28 books quite useful in getting my head around some of the subtleties of the 48's.

Yes, the 28s is a good calculator. Like its very felxible RPL and good conversion library. The 48 familie is to bulky and often and to hard to use/learn with many bells and jingles. Only the absence of I/O is something I really miss on the 28. Almost everything later used in the 48 came from the 28. It is a milestone in the HP-history and after 20+ years still compatible IMHO.

Cough!!!

Ignoring the machines with their computer bias like the 71B, surely the 41 series have the distinction of having the largest feature set that needs to be typed in character by character and therefore, the smallest proportion of functions that can be entered directly from the keyboard?

Also, the Alpha key has that nasty pivot mechanism which means you have to push it down on the right hand side and for people with large fingers, you actually need to angle your finger to push it with the narrow tip to get full travel. I am not a fan of that key and I don't really understand why HP didn't make all those top keys individual with normal travel because the 41 has a lovely keyboard otherwise.

I know the 41 series are very popular and I understand some of the reasons behind that but ease of use? No, I don't think it deserves plaudits in that direction.

It was significantly easier to use because it displayed program steps as alphanumerics, rather than the row/column code used by the non-alpha machines. Coupled with the ability to fit many more functions by the use of the [alpha] key you so revile, it was a significant leap forward in ease of use. Pretty much the sweet spot, for many of us.

Right. In it's context, the 41C was *very* easy to use. So I guess it's a matter of whether you allow the historical context to be taken into consideration when compiling a list like this. Another way to say that might be whether you live in the past or not. :) (Like me, btw)

No, I'm saying it *absolutely* has a better capabilities/awkwardness ratio than the RPL machines. I have a 48GX, and I've *tried* to love it, really I have, but life's too short and I've got things to do. The 48GX stays mostly in the drawer, while the 41CX is always on top of my desk, right by the keyboard.

Naww. I can admire the elegance and orthogonality of RPL, its object-oriented approach, etc. It's a Thing of Beauty and a Joy Forever, as they say. It's just that most of my *calculating* needs don't merit all that sophistication or the learning effort. I think it's the same for most engineering/scientific types, and the resultant impedance mismatch between HP's RPL designs and user needs partially accounts for HP's decline in market share.

Re: the top programmable calculators

*Message #27 Posted by **Mark Edmonds** on 21 July 2009, 12:21 a.m.,*
in response to message #25 by Howard Owen

No, please! I didn't want to start a RPL/RPN war at all. I didn't know it was a regular topic here either. All I was wanting to say was that in terms of sheer functionality, RPL can go places where none of the RPN

machines can go. Whether it goes there elegantly or not comes down to personal viewpoint.

When I said "flame war" it may have given the wrong impression. Maybe this would be better: "RPN vs RPL is one of the topics people seem to enjoy discussing with vigor around here." I think such discussions reveal a lot about why people love the old calculators. But "Naww" is cool for me too :) (However what I would prefer in a discussion carries weight here only so far as my own contributions go.)

in response to message #24 by Les Bell

The 48GX replaced my 28C (which replaced my Casio fx-7000G) - boy, what a difference. It saved me more than once in thermodynamics and maths (well, we could use and bring in whatever books and tools we liked - doing a quick numerical test on a symbolic solution helped for sure). I think this was the most advanced calculator (a pimped up 48SX), even compared to the 41/65/67, and other than speed issues and maybe size, I did not find a lot to complain about :)

Re: the top programmable calculators

And here's my list:

1. HP-41C, because it was a *system*, complete with a network and mass storage. And because its longevity and popularity gave rise to a vibrant community that produced tons of applications and hardware and software hacks. That community is still chugging along, with the PIL box the latest episode in a distinguished history of such creative hacking.
2. HP-42S, for representing the highest degree of refinement RPN keystroke programming ever reached.
3. HP-97, for being a marvelous, tough, compact, ergonomic little feline.
4. HP-48GX, for being such a complicated and rich beast. The nerd in me loved learning RPL on my 48GX. It's also got some elements of a complete computing system, but fewer cool geehaws than the 41C. No doubt this is because PCs had thoroughly obliterated most low cost alternative computing systems by then.

If this list was about hand held computing devices from HP, the 71B would be right there next to the 41C, at the top.

Regards,
Howard

One feature that HP later included in the 28S (and C?) that would have helped usability or ease of entry in the 41 was the ability to select commands/functions from the catalog. I hope I am correct in that fact - you can't use the 41 series catalog to enter commands can you? I would rate entry on the 41 series a little higher if this is possible.

A little side question if I may - I haven't found this in the manuals but is there a 41 series equivalent to the 48 series TICKS command? I ended up writing a program on the 48 instead of the 41 because of this when it probably would have been a simpler programming job on the 41.

Back to the main topic, I really must knuckle down and finish the text off for my "perfect hp" thread. Only then will it be clear why I am making the comments I am and the basis for my criticisms.

Mark

Although I'm a big fan of the 71B, I don't really consider it a calculator, but rather a hand-held computer. When I want a calculator, I reach for my 41cx.

> Quote:
>
> surely the 41 series have the distinction of having the largest feature set that needs to be typed in character by character and therefore, the smallest proportion of functions that can be entered directly from the keyboard?

That's what the user keyboard is for. It had to be that way because of all the functions that would be coming that hadn't even been thought of yet, by way of plug-in modules and user-written programs. I seldom spell out a function or program name on the 41. It would be nice though if different user keyboards could be swapped out more nimbly like they

can on the 71, for different applications.

> Quote:
>
> Also, the Alpha key has that nasty pivot mechanism which means you have to push it down on the right hand side and for people with large fingers, you actually need to angle your finger to push it with the narrow tip to get full travel. I am not a fan of that key and I don't really understand why HP didn't make all those top keys individual with normal travel because the 41 has a lovely keyboard otherwise.

I too have wondered why they put those on rockers, but I've never heard any complaint about their operation. When I press the ALPHA key, I push it to the right, not just straight down. Works perfectly.

I am partial to the 34C. I have used it, the 20S, 32SII, 48G, 48G+, 49g+, 33s, 35s, and 50g.

I agree that the 48G series and 49g series machines are incredibly powerful and have been very useful to me many times, but I tend to like the smaller not so incredibly powerful but still very powerful scientific RPN programmables. This is because they are more easily carried, held, used, and stored, and yet still have a lot of calculating power.

At the time, the HP-34C offered just about the maximum handheld programming space, storage space, and some very powerful keyboard or keystroke accessible functions, like SOLVE and integration! Programming it, including debugging, after frequent use familiarized me with the keyboard, was very easy, especially after writing several programs.

For me, it did not begin to physically fail until about two decades later after I bought and used the stuffing out of it. And my only complaint was that the aesthetically beautiful LED display drained the Ni-Cd batteries all too quickly, but that was a symptom of the technology of the time. Also, a complaint still today, is that your "normal" small form factor scientific programmable has no I/O; I don't think anything fancy is required, only the usual USB connector would be more than super.

HP calculators and space exploration

*Message #1 Posted by **hecube** on 17 July 2009, 12:03 p.m.*

I just put up a blog about the use of HP calculators in relation to space exploration. This intersects two topics that are of high interest to me.

I just put it up yesterday so it's still a bit rough around the edges. References to sources will be included, so no need to flame me about this.

I read earlier last week a post, in this forum, of a guy working in the space program and discussing the HP-42S so that's why there's already a pic of the 42 in there.

It's a safe bet to assume that all HP calculators over the years were used in the space program. I am aiming for documented use here and pictures if possible.

Here's the link: http://hpinspace.wordpress.com/

That's a pretty good web page. If you want I could give you a little more anecdotal detail on what I used the 42S for, and more importantly, why it was such a valuable tool at the time.

I sent you an email message. I put together a short document in Word (or PDF if you want) and I have a photo of the 42s. I also have a couple other photos of HP's in space, one with Sally Ride, one of the HP41 in a museum. I found these on the internet some time ago. If you respond to the email I will send it all.

And one of the G series judging by the colours.

If they take one up on every Shuttle, I wonder how many they have and what will happen to them in "the gap"?

Mark

Using pictures from other sites

*Message #13 Posted by **Juergen Keller** on 19 July 2009, 1:01 p.m.,*
in response to message #1 by hecube

Thank you for your interesting work. Just a short note: I saw that you used one of my pictures (the 42S picture, copyright fjk.ch). This is not really a problem as the picture is used on a HP related site, but often, my pictures are used on eBay to advertise HP calculators. I think that's a real problem because then the picture does not show the actual item (and normally, the seller gives no hint about that fact). That's why I normally put the copyright notice on my pictures.

Cheers, Juergen

Re: Using pictures from other sites

*Message #14 Posted by **hecube** on 19 July 2009, 2:02 p.m.,*
in response to message #13 by Juergen Keller

Hello Juergen, thanks for the heads up. As I wrote earlier, I intend to properly credit all texts and pictures. I had the idea for this blog this week-end and threw it quickly together.

The blog is not intended for a commercial purpose and no ads will ever be placed in it.

Because I'm going camping for the next few days, proper credits will not be placed until next week-end at least.

*Message #16 Posted by **Bill (Smithville, NJ)** on 21 July 2009, 8:06 a.m.,*
in response to message #1 by hecube

Great Blog - good to see one central location about the HP calculators and space.

As to the HP-41, I have a copy of NASA document HP41/SPOC 2102, dated November 1985, titled:

Hewlett-Packard 41 Calculator/Shuttle Portable Onboard Computer Training Manual.

This manual covers both the HP-41 and the Shuttle Portable Onboard Computer (SPOC) which is a GRID computer. Sections in the manual are:

```
Section 1: Introduction
Section 2: HP-41
Section 3: HP-41 Mode Control
Section 4: HP-41 Display & Keyboard
Section 5: HP-41 Program Loading
This section covers using the Digital Cassette Drive to load
programs.  No metion is given of using a card reader.

Section 6: HP-41 Flight Programs
Brief overview of each of the Shuttle flight programs used
by the HP-41 calculator.

Programs are:
Center of Gravity
Orbit
Alarm/Hex
Landing
Proximity Operations
Tail

NOTE:  THe Alarm/Hex program makes use of a special Module,
which looks a lot like the Card Reader (in size).
This module is "HP-41 Tone Amplifier".

Section 7: Shuttle Portable Onboard Computer
Section 8: Shuttle Portable Onboard Computer Flight Programs

Programs are:
Launch Time Update
State Vector Update
Set Grennwich Mean Time
World Map
Deorbit
Orbital Refueling System
Crew Controlled Free Drift

Appendix A: Reverse Polish Notation
Appendix B: HP-41 Maintenance and Service
Appendix C: HP-41 Troubleshooting
Appendix D: HP-41 Error and Status Messages
Appendix E: HP-41 Function Index
Appendix F: HP-41 Calculator
```

Following is quote from manual:

"Because the HP-41 is being used by the crew as a program monitoring device rather than a programming tool, programming aspects of the calculator will not be covered in the training manual."

Interesting that cassette tape rather than cards were used.

Another quote:

"However, the HP-41 and SPOC Flight Procedure Handbooks shoud be referred to for detailed information

concering the latest set of programs."

and

"For deatails on each program, refer to the HP-41 Flight Procedure Handbook."

I haven't been able to locate a copy of the Flight Procedure Handbooks.

Another quote:

"The large capacity HP-41CVs are flown onboard the Space Shuttle and the lesser HP-41Cs, formerly flown, are now used for training at the Shuttle Mission Simulator (SMS). The SMS HP-41s, however, have had their memories expanded top make them equivalent to HP-CVs."

So both HV-41C and HP-41C have flown.

The Training manual is only 45 pages long and doessn't give a lot of info but does help to complete the picture of HP-41 in space.

Doing some searches, I found the following link:

Judith Resnick Material

This is archival material at the University of Akron in Ohio.

Go down to Box 3 on the web page and you'll find:

"HP-41 Computer Handbook: Basic Flight Operations Directorate"

Judith Resnick was one of the Astronauts who was on the Challenger.

Maybe someone who lives close to Akron could review the archives at Akron and see what this handbook is.

Bill

*Message #20 Posted by **Etienne Victoria** on 23 July 2009, 9:04 a.m.,*
in response to message #1 by hecube

Hecube,

On the use of the Hp-65 during the Apollo-Soyuz space mission (aka ASTP):

- The HP-65 was used in both normal calculation for approach and positioning and also in case of onboard system failures.

- IIRC this is documented in the ASTP CSM RENDEZ-VOUS BOOK (June 1975): I have to dig out my copy.

- The Rendezvous book gives the input for the programs but does not provide the listings.

- Source for this document should be published by the NASA archives as I believe it is declassified.

I'll try to find it out. However, will have to check the copyright status and am not sure of the way/confitions it can be published.

...all this info to be crosschecked because this is rocket science which I do not claim to be an expert in :-)

All the best!

Etienne

How much will this Red Dot sell for?

*Message #1 Posted by **Michael de Estrada** on 16 July 2009, 10:37 a.m.*

This is the latest HP-35 Red Dot for sale, and it looks very clean and complete. I think the last one for sale fetched $875, and wondered what you thought this one would get. I'm thinking this may get over $1000.

Legal disclaimer: I am not the seller of this item. I do not know the seller of this item and have no interest in its sale.

Red Dot for sale

Re: How much will this Red Dot sell for?

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 16 July 2009, 12:42 p.m.,*
in response to message #1 by Michael de Estrada

Manual is from a later version...

Being a Red Dot owner I hope that it gets as much as it can! ;-)

Greetings,
Massimo

I pulled mine out and looked at it, and I see what you mean. You are very observant! There was another subtle difference that I noticed, and will send you an email to see what you think.

Best regards from a fellow Red Dot owner,

Michael

Re: How much will this Red Dot sell for?

*Message #4 Posted by **Michael Eckstein** on 16 July 2009, 4:00 p.m.,*
in response to message #2 by Massimo Gnerucci (Italy)

Except the manual there are at least three other signs from versions two and higher. S/N is not known, too. If this is a Red Dot, then it's not in its original state.

Re: How much will this Red Dot sell for?

*Message #5 Posted by **Michael de Estrada** on 16 July 2009, 4:16 p.m.,*
in response to message #4 by Michael Eckstein

Agreed. Massimo and I have confirmed two differences on the calculator. I think I know what the third one is.

Very suspicious.

Re: How much will this Red Dot sell for?

*Message #6 Posted by **Mark Edmonds** on 16 July 2009, 5:07 p.m.,*
in response to message #5 by Michael de Estrada

Well, I am no 35 expert - I haven't even got one so I can only guess what you might be seeing based on photos I have seen on the museum site.

So, taking a stab in the dark:

1. The hole diameter looks too big 2. The insert red plastic is recessed and not flush. 3. The red dot looks like it could be a red piece of plastic, not the material used for the display area or shining an LED through. 4. White screws inside the case look unusual to me.

Are you thinking that someone has opened up a MK3, drilled a hole in it and stuck a piece of red plastic underneath the hole?!

Mark

Re: How much will this Red Dot sell for?

*Message #7 Posted by **Michael de Estrada** on 16 July 2009, 6:45 p.m.,*
in response to message #6 by Mark Edmonds

Mark,

Several Red Dot owners and I have noted a number of anomalies, which make it highly improbable that this is a genuine original Red Dot. We choose not to divulge the specifics of these observations, lest someone go to school on how to build a fake.

Michael

Re: How much will this Red Dot sell for?

*Message #8 Posted by **Mark Edmonds** on 16 July 2009, 8:36 p.m.,*
in response to message #7 by Michael de Estrada

I understand Michael and share your concern. However, I could also argue that by keeping this information private, people wont know what to look for when making sure they are getting the real-deal.

On the balance of things, someone making a fake might stand more chance of getting away with it if the key information for spotting a fake isn't readily available in places like this. Although that same information can help a faker, it would still increase awareness of the problem and hopefully make potential buyers more careful.

It is still a difficult call though...

Mark

Re: How much will this Red Dot sell for?

*Message #9 Posted by **Dan W** on 16 July 2009, 8:59 p.m.,*
in response to message #8 by Mark Edmonds

I reluctantly agree. It would be too tempting, and too easy, if someone knew the exact dimensions of the hole, and knew exactly how the red was created (painted, or plastic). I figured out how to remove and replace the metal backing without leaving a trace and I am very reluctant to talk about it because of the potential of mix and matching parts to create what appears to be a working, unrepaired calculator. Am I being ridiculous?

Re: How much will this Red Dot sell for?

*Message #10 Posted by **Michael de Estrada** on 16 July 2009, 9:00 p.m.,*
in response to message #8 by Mark Edmonds

Mark,

I think the mere fact that we have raised these red flags are sufficient to alert any auction bidders who might visit this site. In this instance, there were initially 3 bids on this item, and the highest bid was $595, which met the reserve price. I now see that apparently this bid has been retracted, and the next highest bid is only $255, which does not meet the reserve price. Since we are actual owners who can physically examine the item, and there is more than one of us to corroborate our findings, we should have sufficient credibility to make these assertions without having to disclose the specifics. I understand your intellectual curiosity in this matter, however, I feel that I must invoke the Red Dot secrecy act on this one.

Regards,

Michael

Re: How much will this Red Dot sell for?

*Message #11 Posted by **Dan W** on 16 July 2009, 9:08 p.m.,*
in response to message #6 by Mark Edmonds

Comparing the auction photo with the one from the HP museum, the hole looks too big to me, and slightly off-center. [EDIT: I have found some photos on the web, and several look just the same.]

It would really help if someone would post a closeup quality photo of a real red dot version (hint hint). But I am about 90% sure this one is not real.

Edited: 16 July 2009, 9:21 p.m.

Re: How much will this Red Dot sell for?

*Message #12 Posted by **Michael de Estrada** on 16 July 2009, 9:32 p.m.,*
in response to message #11 by Dan W

I'm more like 99.9% sure it's a fake. There are many other issues, some pretty glaring, but like I said to Mark, I think discretion is the best policy here. I sent a message to the seller asking for additional information/photos to check out other identifiers for a legitimate Red Dot. I didn't alert him of my suspicions, so it will be interesting to see if he/she replies. The seller is clearly not the owner (said it was obtained from an estate sale), so may be totally unaware of these issues.

Re: How much will this Red Dot sell for?

*Message #13 Posted by **Mike Morrow** on 18 July 2009, 12:41 a.m.,*
in response to message #4 by Michael Eckstein

I got my red-dot HP-35 from its original owner in exchange for a new TI-58, in 1978. (I think that was a good trade, for me.) I didn't know anything was special about red-dots until 25 years later. Unfortunately, the owner had HP correct the firmware errors.

The leather calculator case that is shown is not appropriate for a red-dot. The red-dot case is much simpler. The one shown is like the one for the HP-65. I bought one as an option for my HP-67 in 1977.

The red hole on the auction example is definitely bogus.

Re: How much will this Red Dot sell for?

*Message #14 Posted by **Michael de Estrada** on 18 July 2009, 12:59 a.m.,*
in response to message #13 by Mike Morrow

> Quote:

Wow. It just keeps getting better. First the manual is not correct, then the calculator has a bunch of bogus issues, and now you point out that even the soft case is wrong. Actually, the case would be wrong for any version of the HP-35 or for any classic other than the HP-65. It's bigger to accommodate the larger HP-65 housing and has a pocket to hold a case of magnetic cards in addition to the pocket for the Quick Reference Guide. The HP-45 and HP-80 soft cases have QR Guide pockets. The HP-35 soft case does not have any little pockets.

I guess in 1978 you got shortchanged in the deal, but now you can laugh all the way to the bank.

Re: How much will this Red Dot sell for?

>
> I guess in 1978 you got shortchanged in the deal, but now you can laugh all the way to the bank.

I considered it a great trade for me, because the HP-35 held nostalgia value for me even as early as 1978. I couldn't begin to think of buying one as a Ga. Tech sophomore when it came out in 1972.

That incorrect for HP Classic leather soft case is the best case ever made for the HP-41 without card reader. The two front pockets are great for holding several ROM modules, and also several module quick reference guides. I don't think HP ever advertised it for the HP-41...in fact I don't believe it was still available by the time that the HP-67 was discontinued in favor of the HP-41.

But it's definitely not for the auctioned HP-35.

Re: How much will this Red Dot sell for?

*Message #16 Posted by **Dan W** on 18 July 2009, 1:46 p.m.,*
in response to message #13 by Mike Morrow

You are correct about the case; it is for the HP-65. So clearly the seller has cobbled together a bunch of pieces to create a set. Also the users manual doesn't show a red dot on the cover.

It is also obvious to me that the chrome decorative surround has been touched up. I have done this on a few Classics too. But I would be very hesitant to do that to a red dot.

I am curious about the accessory catalog shown. Was the locking cradle available when the red dot came out?

Re: How much will this Red Dot sell for?

*Message #17 Posted by **Michael de Estrada** on 18 July 2009, 2:34 p.m.,*
in response to message #16 by Dan W

> Quote:
>
> I am curious about the accessory catalog shown. Was the locking cradle available when the red dot came out?

If you look very closely at the photo, the calculator held in the cradle appears to be a Red Dot. However, the Accessory Order Card included with my Red Dot makes no mention of it. Furtheremore, it has a note that the Battery Holder W/Battery Pack (reserve power pack) will be available in April 1972, and it is not listed as a currently available accessory.

All of this is a moot point, since the calculator itself is clearly a fake.

This is certainly a fake - buyer beware.

*Message #18 Posted by **Frank Boehm (Germany)** on 17 July 2009, 5:30 a.m.,*
in response to message #1 by Michael de Estrada

There is one sign of it being fake - something that is impossible to falsify, but obvious even with these blurry pictures. The red dot hole looks a bit too large too, but you can't fully trust low res pictures there...
And it's not the white screws, those are not uncommon, as this is simply corrosion from leaked batteries (zinc covered screws + leaking batteries = bad).

Buyer beware - you don't get what you (might) pay for.

I notified ebay about this auction, lets see if they pull it...

Re: This is certainly a fake - buyer beware.

*Message #19 Posted by **Thomas Radtke** on 17 July 2009, 7:00 a.m.,*
in response to message #18 by Frank Boehm (Germany)

Interesting, even the center is vertically out of position (the top image is stolen from this site ;-).

Edited: 17 July 2009, 7:01 a.m.

that's not a hint :)

*Message #20 Posted by **Frank Boehm (Germany)** on 17 July 2009, 9:04 a.m.,*
in response to message #19 by Thomas Radtke

I'd say the "dot" is not aligned to anything, neither the switch nor the printing (the position of the printed lettering will differ due to manufacturing tolerance) - but I agree that the dot looks too large. Might be due to strange lightning, but since it's a fake anyway, that's probably not important <g>

The whole world now knows it's a fake.

*Message #21 Posted by **Michael de Estrada** on 17 July 2009, 9:39 p.m.,*
in response to message #20 by Frank Boehm (Germany)

A German bidder has retracted his bid in this auction. His reason:

Falscher Gebotsbetrag eingegeben

I wonder why.

Re: The whole world now knows it's a fake.

*Message #22 Posted by **Walter B** on 22 July 2009, 4:51 p.m.,*
in response to message #21 by Michael de Estrada

Actually, two bidders have retracted for the same reason. But now enough fools are there :(

Re: The whole world now knows it's a fake.

*Message #23 Posted by **Michael de Estrada** on 22 July 2009, 5:57 p.m.,*
in response to message #22 by Walter B

I think the current high bidder is Italian. There is a little over an hour to go in the auction, and the reserve price has still not been met. I sent a message to the seller requesting the serial number and some additional photos, but he/she did not reply. Since eBay changed their policy regarding identifying the bidders while the auction is still in progress, it is no longer possible to alert them about this, so someone is going to be defrauded. I really don't think eBay cares; they just want to make their commission.

Edited: 22 July 2009, 5:58 p.m.

Sold for $776, hard to believe ...

Re: The whole world now knows it's a fake.

*Message #25 Posted by **Dan W** on 22 July 2009, 8:51 p.m.,*
in response to message #23 by Michael de Estrada

Did everyone here who had reason to believe it was fake report it to ebay? There is a mechanism for this and they will pull an auction if it is reported. Sometimes anyway.

My wife bought a fake Louis Vitton purse some years ago and later went on a crusade to report every such fake bag. She learned all the little details and can spot one very quickly. Believe me, virtually all of them are fake.

Over time she did it enough that they gave her a special phone number to call if she wants, and they will pull an auction she reports 99% of the time within 10 minutes.

Point is that if those of us who are expert report these often enough, I wager ebay will eventually pay attention.

On the other hand, HP is probably not threatening to sue them.

Re: The whole world now knows it's a fake.

in response to message #25 by Dan W

Dan,

Frank Boehm says he reported this back on July 17. I was not aware of a reporting mechanism, otherwise I would have done so as well. Could you PM me on this? Like you said, this is a different situation, since the claimant is not the manufacturer but the buyer instead.

Michael

There is no "proper" way to report these items.

*Message #27 Posted by **Frank Boehm (Germany)** on 23 July 2009, 7:24 a.m.,*
in response to message #26 by Michael de Estrada

ebay pretty much insists that all thinkable problems can be categorized into 2 dozens of issues. There is no way to report faked hardware or general fakes - unless you chose the closest option. I guess the whole customer service system is a. My issue number has been mailed through "charity@ebay.com", my additional complaint was confirmed twice within seconds. I don't think there is much hope to protect the buyer from being ripped off :(

Re: The whole world now knows it's a fake.

*Message #29 Posted by **Michael Eckstein** on 23 July 2009, 5:46 a.m.,*
in response to message #28 by Massimo Gnerucci (Italy)

I don't know the winner, but I wonder why -***h and t***d were bidding so high at this item, since I probably correctly guessed their identity, they both well know HP 35 Red Dot and I suppose they were aware of most differences.

Re: The whole world now knows it's a fake.

*Message #30 Posted by **Michael de Estrada** on 23 July 2009, 8:36 a.m.,*
in response to message #28 by Massimo Gnerucci (Italy)

Massimo,

Although it is no longer possible to positively identify the nationality of a bidder, you can infer it by the language used in items listed in the bid history for the bidder. For example, the bidder I was referring to had mostly bid on items in Italian on the eBay Italy site, such as "Informatica e Palmari > Calcolatrici". Other bidders had primarily bid in German, so there is a high likelihood they are German. This primarily applies to non-English speaking European bidders, since there is no way to differenciate bidders living in countries such as the UK where English is spoken and they also bid on other European eBay sites.

Anyway, hopefully this fraud will eventually be exposed and the perpetrator revealed so as to protect the sanctity of Red Dot.

Regards, Michael

NEWT processor update

*Message #1 Posted by **Klaus** on 16 July 2009, 3:20 a.m.*

The forum at TOS contains a thread in "General discussion->HP-41 30th Year Anniversary":

> Quote:
>
> Here is an update on that project [the NEWT processor]. See the NEWT Manual at the link. The idea is to send him your machine/board and he swaps it out. Now speed (my biggest complaint) won't be an issue). OK serious 41ers what do you think? Is there interest?

Any feedback from you? I am not sure if I would do that to my HP-41CX, since speed is acceptable for the programs I run. But I understand NEWT simply as a faster NUT-CPU, but the manual indicates that it has some more I/O?

This may be the wrong forum to discuss that, but there is little activity on the TOS-forum.

Re: NEWT processor update

*Message #2 Posted by **Meindert Kuipers** on 16 July 2009, 12:27 p.m.,*
in response to message #1 by Klaus

For those who are interested, this discussion is continued on the HCC email discussion list. I would prefer to have the discussion here, since this forum have more visibility. I will ask the initiator of the thread to come visit us here as well,

Meindert

Re: NEWT processor update

*Message #3 Posted by **Geir Isene** on 17 July 2009, 10:51 a.m.,*
in response to message #2 by Meindert Kuipers

I would love to see the NEWT project seen to fruition with compatibility with HEPAX/NoV-64. I would give an arm to get my upgrade.

Rounding Revisited

*Message #1 Posted by **Rodger Rosenbaum** on 16 July 2009, 2:06 a.m.*

There was a mini-challenge involving rounding back in 2003:

MC: round up/down

I said at the time:

"It should be noted that the reason some of these various algorithms are failing with the test values of Meyers and Prange is due to a property of the floating point system on the HP48. There is a largest odd number that can be represented on the 48 and that is 999999999999. Numbers greater than this are all even integers; their fractional parts are zero. Adding one to a number greater than 999999999999 on the 48 will not change it from even to odd (these remarks don't apply to internal 15 form numbers; their threshold is higher). Any algorithm that expects this property (change of parity with addition of unity) to hold for all integers may fail."

There are probably some on this forum who didn't see or participate in that topic. It might be interesting to look at it again.

Re: Rounding Revisited

*Message #2 Posted by **Werner** on 18 July 2009, 1:36 p.m.,*
in response to message #1 by Rodger Rosenbaum

Following the link, apparently no correct program that handled any input was ever produced?

here's my first try, then ;-)

```
@ Round to Odd
@ 50.5 bytes
@ # 7FB5h
\<<
  DUP 2 MOD
  SWAP OVER - SWAP
  500000000001 DUP ROT
  + - -
\>>
```

Re: Rounding Revisited

*Message #3 Posted by **Werner** on 19 July 2009, 5:21 a.m.,*
in response to message #1 by Rodger Rosenbaum

Followed by a second try ;-)

```
40.5 # 165Ch
\<<
 DUP 2 MOD
 100000000001
 DUP2
 + -
 + -
\>>
```

Re: Rounding Revisited

*Message #4 Posted by **Rodger Rosenbaum** on 21 July 2009, 11:57 p.m.,*
in response to message #3 by Werner

Here's one I came up with that works (I think) on all positive integers, including near the EOPR (defined above):

35.0 bytes

Round to odd integer

<< DUP 2 MOD 3 2 / == - 0 RND >>

It doesn't work for negative integers.

It seems to me that you can find very short routines that work for all positive and negative numbers, but that fail near the EOPR. Or, you can find short routines that work for only positive (or negative) numbers, and don't fail near the EOPR. But you can't (so far) find short routines that work for both positive and negative numbers, and don't fail near the EOPR.

Re: Rounding Revisited

*Message #5 Posted by **Werner** on 22 July 2009, 2:49 a.m.,*
in response to message #4 by Rodger Rosenbaum

40.5 bytes for a routine that works for any input vs. 35 for one that works for positive inputs only is not so bad, is it?

Re: Rounding Revisited

*Message #6 Posted by **Rodger Rosenbaum** on 22 July 2009, 2:29 p.m.,*
in response to message #5 by Werner

No, it's not bad at all. In reality I suppose if I really needed to do this function, I'd just take one of the examples from that long ago thread and add a test to take care of the exceptions. But, that's not as much fun.

I was just commenting that it's annoying that the EOPR causes such trouble. One of my professors used to say that the "perversity of the universe is maximized".

I'm back!

*Message #1 Posted by **Dan W** on 15 July 2009, 10:49 p.m.*

Hi folks,

I just posted a question to the forum, and decided I should re-introduce myself.

I'm back after 2 years. 2 years ago I was actively buying, selling, collecting, and repairing the classic series, and the 67/97 models. One day I was looking at my 42s and remembered how I always wanted an HP in my younger days, but never could afford one. I was in Junior High when the 35 came out. By the time I could afford one, the HP-11c was out. Later I bought a 42s, and still use it. Back in the day I had programmed part of the Space Shuttle ascent guidance system on the 42s. Yes, I am in fact, a rocket scientist.

Over a few months I collected a 35, 45, 65, 67, 97, and an 80. Never could find an affordable 55, 70 or the 91. To fund my hobby I learned to repair just about anything that typically goes wrong with these.

I even thought about starting a little side business repairing these, but I doubt I could earn a living off of it. But one never knows; I'll probably get laid off soon, so the skill may come in handy.

Anyway, its good to see many of the same names here from 2 years ago. Hopefully I can contribute a bit, but I have to relearn a few things.

Cheers

Dan W

Re: I'm back!

*Message #2 Posted by **Nigel Bamber** on 16 July 2009, 1:21 a.m.,*
in response to message #1 by Dan W

Interesting !

I knew that 41CVs were used on the Space Shuttle program but you are implying the 42s was as well.

Some more questions if I may .

Do you have copies of your program you could share ? Or maybe they aren't publically available ? Do they still need or use calculators on the lates shuttle missions and if so which ones.

Cheers

Nigel

Re: I'm back!

*Message #3 Posted by **Dan W** on 16 July 2009, 10:14 a.m.,*

in response to message #2 by Nigel Bamber

I used the 42s while designing a new shuttle ascent guidance algorithm called "TAL Droop". Getting time on the mainframe simulation was slow so I found it a lot easier to do all the prototype work on the 42s. Only after I verified the equations of motion, did I code it into the main simulation.

I also used the thermal printer to create a graph of the shuttle altitude. I'd end up with graphs about 6 inches long showing the altitude going up, then drooping down, then up again.

TAL Droop was a scenario where 2 SSMEs fail sometime soon after SRB sep. The T/W was so low that the vehicle would begin to loose altitude. After a while it would burn enough fuel to begin rising again. The altitude it drooped to was critical. If too low, thermal stress on the ET would cause the tank to explode. I had to predict that altitude well ahead of time so the crew would know to either ride it out hoping for a TAL landing, or get off the tank before it was too late and ditch.

I kept the program on the 42s for a few years, then I printed it, taped it to paper and photocopied it. I probably have it in my records somewhere.

Re: I'm back!

*Message #5 Posted by **Dan W** on 16 July 2009, 8:43 p.m.,*
in response to message #4 by Katie Wasserman

Hi Katie,

Yea the abort mode I developed was part of a larger activity to create "contingency aborts" that started after the Challenger disaster. We looked seriously at multiple SSME failures and wanted to keep the crew alive in the event of a ditch in the ocean. The bailout was created during this time. This is where they open the hatch and slide out on a pole. The pole was required because without it, the crewmember would probably hit the wing by just jumping out. A bailout was required because structural analysis showed that in the event of a ditch, whatever was in the payload bay would come through the cockpit when it hit the water.

By the way, I used your idler gear replacement idea on one HP-97 printer. Thanks! Worked like a charm.

Re: I'm back!

*Message #6 Posted by **Nigel Bamber** on 16 July 2009, 10:42 a.m.,*
in response to message #3 by Dan W

Thanks. That's more than enough information for a non rocket scientist ! I suspect the maths/physics equations used in your program would go someway beyond my A Level Maths/Physics knowledge now long forgotten anyway.

Nigel

*Message #7 Posted by **Jeff O.** on 16 July 2009, 7:21 a.m.,*
in response to message #1 by Dan W

Welcome back!

Is your potential near-term unemployment related to the winding-down and impending retirement of the STS, or just the general economy? (Obviously you may provide as much or little information on your personal situation as you like.)

...

Re: I'm back!

*Message #8 Posted by **Dan W** on 16 July 2009, 8:46 p.m.,*
in response to message #7 by Jeff O.

I don't work for the space program any more. I left out of frustration with the inability to do long term planning, and I thought the space station was of little scientific value. They could have done so much more were it not for politics. I could go into a lot of detail here, but I'm not sure I want to get up on my soap box at the moment. I hope one day to go back. Space is my first love.

Re: I'm back!

*Message #9 Posted by **Don Shepherd** on 16 July 2009, 9:58 p.m.,*
in response to message #8 by Dan W

Dan, since you worked for NASA, did you ever see any of the listings or documentation for the programs that were written for the HP65's that were used in the Apollo-Soyuz Test Project? If not, do you know anyone that might have info on these? I've been trying to get that information for years (along with others), with no success. I even wrote Sol Liebergot, EECOM on Apollo 13, and he tried but came up short too.

Re: I'm back!

*Message #10 Posted by **Dan W** on 16 July 2009, 10:51 p.m.,*
in response to message #9 by Don Shepherd

Hi Don,

At the time I worked there I wasn't especially interested in the classic HP's. The Johnson Space Center has a great technical library. All of the records would be there on microfiche.

Once I was tasked to develop a precision lunar lander algorithm for a robotic explorer (which was

canceled, like most of the really interesting stuff back then). At any rate I asked around JSC: Who knows how to land on the moon?

Guess what! No one did. The technology had been forgotten. This still amazes me, it is very possible to loose the knowledge to do things, like land on the moon, or build pyramids. Fortunately I had the library. I scrounged around in there for a week or so and dug up a bunch of Apollo technical documents, some of the original algorithm designs as far back as 1963. I am indebted to an engineer named George W. Cherry who did the initial design work.

So I am confident the documentation is there somewhere on microfiche. They were good about documenting everything. It may be hard to find though.

I've been gone long enough that I don't really have any contacts there now. Let me think about it. It may be very possible to get guest access too, if someone is in Clear Lake.

Re: I'm back!

*Message #11 Posted by **Don Shepherd** on 16 July 2009, 11:44 p.m.,*
in response to message #10 by Dan W

Thanks, Dan.

I did contact some library researcher at JSC a few years ago, and she checked some data base and couldn't find anything about those HP65 programs, but I'd bet there is something there, like you say, on microfiche. If I lived there, instead of Louisville KY, I'd go myself and try to find the info.

Yes, if you do find something, please let me know. Wow, today is the 40th anniversary of Apollo 11 liftoff. I was there, ten miles away in a post office parking lot in Titusville FL, with my super-8 movie camera. I transferred the film to DVD a few years ago and show it to all my math students. They love those old cars!

Re: I'm back!

*Message #12 Posted by **hecube** on 17 July 2009, 1:40 p.m.,*
in response to message #11 by Don Shepherd

Have you uploaded it to Youtube?

Re: I'm back!

*Message #13 Posted by **Don Shepherd** on 17 July 2009, 2:13 p.m.,*
in response to message #12 by hecube

I don't do youtube, or facebook, or twitter, or any of that kind of stuff. I'll leave all that for the younger generation.

The file on the dvd is big, 88 mb. The video clip is only about 3 or 4 minutes long, and it shows cars in the parking lot around where I was parked, and an Army helicopter that flew by right before launch. The actual launch pad was 10 miles away, but you can see the ignition and flames and liftoff. It's home movie quality, and I have no objections with sharing it with anyone who is interested, but I think it's too big to upload anywhere and I've never copied DVD's before, although I "think" my computer can do that.

Re: I'm back!

*Message #14 Posted by **Marcus von Cube, Germany** on 18 July 2009, 5:48 a.m.,*
in response to message #13 by Don Shepherd

Don, the free file sharing platforms like MegaUpload.com or RapidShare.com (free for the uploader and the occasional downloader, fee based for the downloader who wants maximum speed, like me) provide massive space. An 88MB file is of moderate size. You need some uploading power (most Internet lines have asymmetric bandwidth) or you must be patient while uploading. If you upload the file I can put it on my MegaUpload account so that it will not expire.

Re: I'm back!

*Message #15 Posted by **Don Shepherd** on 20 July 2009, 9:10 a.m.,*
in response to message #14 by Marcus von Cube, Germany

OK, thanks to Marcus, the video is uploaded here. You will need the DivX codec to view it, if you don't have that already.

Odd sign problem with HP-97

*Message #1 Posted by **Dan W** on 15 July 2009, 9:05 p.m.*

I have an odd problem with the CHS key on my HP-97 I have never seen before.

When I enter a number and hit the CHS key, a minus sign shows twice, at the left where expected, and at the right where it is used for the EE component. However the number is still correct (a negative number). The extra minus sign stays after hitting ENTER. If I do a calculation that results in a negative number, both sign segments show.

When I enter a number with an exponent and try to change the sign of the exponent, no minus sign shows, although the number is entered correctly. However even though the number has a negative exponent, the minus sign does not show.

Also if I do a calculation that results in a number with a minus exponent, the minus does not show, but the number is correct.

The problem is with the LED display only, the numbers print with the correct signs and the math is right. It passes the HP97 diagnostics program.

So it seems the problem might be with the LED display drivers. Any ideas on how to debug this, and determine if it is an IC or a problem with a discrete component of the PCB? Anyone else ever seen such a problem?

Thanks, -- Dan

Key presses and running programs

*Message #1 Posted by **Mike T.** on 15 July 2009, 5:05 p.m.*

I'm after a bit more information on the way the HP67, HP29, and HP25 machines behave when a key is pressed while a program is executing.

The HP33 and HP34 both simply stop executing the program and stop at the current instruction (even if it is a pause) and otherwise ignore the keystroke.

Unfortunately I can't check the behaviour of the other models myself.

I believe that an HP67 will execute the keystroke if pressed while a pause instruction is executing but can't remember what happens if a key is pressed while a program is running. I did have some information but can't find my old notes at the moment.

I suspect that behaviour of the HP29 may be the same as the HP67 as they are both similar but I have no idea what happens on an HP25.

I'd really like to know if my assumptions are correct and what really happens on these models both when a key is pressed while a program is running (including a label key or GSB) and when a key is pressed during a pause instruction.

It might be interesting to compare this to the behaviour of current models like the HP20b so see which scheme 'won'..

Thanks

Mike T.

integrating on the HP35s

*Message #1 Posted by **ezoob** on 15 July 2009, 3:38 p.m.*

I'm an old HP15c user and I'm used to integrating by entering a program with a label and just integrating the program.

I just bought a 35s, and I can't integrate on it the same way as with my 15c. When I try to integrate a program it prompts for an integration variable. How can I just integrate the program without entering an "equation" specifically? Is there a way I can do it like I used to on my 15C?

Thnx in advance.

Re: integrating on the HP35s

*Message #2 Posted by **Gene Wright** on 15 July 2009, 3:55 p.m.,*
in response to message #1 by ezoob

Try the learning modules found here:

Numeric integration on the 35s

And, the 35s manual has a rather large section on integrating. Reading it is usually a good first step. ;-)

All of the 35s modules can be found on this page:

All 35s modules

Re: integrating on the HP35s

*Message #3 Posted by **ezoob** on 15 July 2009, 4:14 p.m.,*
in response to message #2 by Gene Wright

I read the manual. The section on integrating programs states on page 15-7:

"Integrating a Program

In chapter 8 you saw how you can enter an equation (or expression) — it's added to the list of equations — and then integrate it with respect to any variable. You can also enter a program that calculates a function, and then integrate it with respect to any variable. This is especially useful if the function you're integrating changes for certain conditions or if it requires repeated calculations."

My question is: Can the calculator still integrate the program without me having to specify a variable? i.e. can it integrate the way my HP15C does, without having to specify a variable?

Re: integrating on the HP35s

*Message #4 Posted by **Jeff Kearns** on 15 July 2009, 6:12 p.m.,*

in response to message #3 by ezoob

You must specify a variable, but so what? It is 'one' line of programming and one keystroke during integration. And it's no problem at all once you get the hang of it. It is not much different from the 15C and can be mastered very quickly.

Here is a simple example: Integrate 5x^2-3, from x=0 to x=2. (The answer is 7.33)

On the 15C, you would write a simple program:
001 LBL 1
002 x^2
003 5
004 *
005 3
006 -
007 RTN
Then you enter your limits of integration, 0 ENTER 2, and Integrate whatever program label contains the equation.

On the 35s, the procedure is as follows:
Write a program with the same equation as above, but call it LBL I as an example. Here goes...
I001 LBL I
I002 INPUT X
I003 x^2
I004 5
I005 *
I006 3
I007 -
I008 RTN
Then press LS FN= 'I' to specify the program label to be executed/integrated, enter the limits of integration as per the 15C, and Integrate 'X'. That's all there is to it.

Jeff

"ezoob" --

Integration on the HP-32S, HP-32SII, HP-33s, and HP-35s requires that a single-letter storage location be specified as the dummy variable of integration. Unlike the HP-34C, HP-15C, and HP-41 Advantage Pac, variables are passed to the user by register, not through the stack.

Philosophy of implementation is discussed in my MoHPC article concerning SOLVE/INTEG on RPN-

based models:

20b - Observations

*Message #1 Posted by **Thomas Radtke** on 15 July 2009, 9:04 a.m.*

It appears, the 20b acts partially like a RPL calculator: 1 ENTER 2 ENTER + results in 3 instead of 4. OTOH, a percentage operation a b % leaves a on the stack, as opposed to RPL calculators like the 48 series. Quite confusing, but I like it.

An interesting bug: Some error conditions apparently leave an invalid number on the stack. Try e.g.:

```
CE
TVM reset
N I/YR PV (ignore errors)
```

Now cycle through the stack, some entries are missing. These are maybe invalid numbers.

Re: 20b - Observations

*Message #2 Posted by **Gene Wright** on 15 July 2009, 10:50 a.m.,*
in response to message #1 by Thomas Radtke

Hi Thomas!

1) Yes, the 20b uses a "command line" approach as an input to the stack. Your addition example points out the effect quite well. Another result can be that if you have a stack full of 4 values and begin typing another number, if you press ON/CE, you still have all 4 values. On a "true RPN" machine, you would have lost the value in T. On the 20b, T is lost only if you do something with the value you are keying it. ON/CE is an "abort" button.

2) The % operation works as "RPN" does.

So, a bit of a hybrid, probably because it reuses the RPL approach to inputs on the stack.

3) If you're referring to an apparently blank display, then yes, this is a non-normalized number aka error result. I know HP is aware of this. Of course, a blank display should never be returned to the user, so this is a bug.

What ROM revision is on your 20b?

Re: 20b - Observations

> What ROM revision is on your 20b?

How to find it out?

Re: 20b - Observations

*Message #4 Posted by **Tim Wessman** on 15 July 2009, 11:40 a.m.,*
in response to message #3 by Thomas Radtke

On-PMT opens the hidden menu. Scroll up and down and you will see it in there.

Also, can you give the example that returns the blank screen so I can check it is fixed? Thanks.

TW

SW Version shows 8 01 2008

> Quote:
>
> Also, can you give the example that returns the blank screen so I can check it is fixed? Thanks.

As a more simple approach to get one blank entry, press

```
CE
N
I/YR
Arrow down (4 times)
```

Re: 20b - Observations

*Message #6 Posted by **Walter B** on 15 July 2009, 3:44 p.m.,*
in response to message #4 by Tim Wessman

FWIW, SW Version 6 17 2008 shows the same bug.

*Message #7 Posted by **Gene Wright** on 15 July 2009, 3:53 p.m.,*
in response to message #6 by Walter B

Of course, since that is an earlier firmware, it means it had not been fixed by August of last year. :-)

Hopefully, unlike some software companies, updated HP firmware does not break things that used to work!

LINUX LIF tools error

*Message #1 Posted by **Sean Connor** on 15 July 2009, 6:02 a.m.*

Hi All,

I have been trying to use Mr Duell's excellent looking LIF utils on a new DELL Optiplex 755 at work. The disks are initialised with a volume header (I think) on my 71b/9114a with say

Initialize TEST:1

I then try to use the LIF utils running under MINT 2.6.28-11-generic

Whatever I do , the disk spins for a while and I get the same error:

mint@mint ~/Desktop/LIF $ ./lifdir /dev/fd0 Error on recalibrate

Any ideas ?

Best Regards

Sean Connor

Re: LINUX LIF tools error

*Message #2 Posted by **Marcus von Cube, Germany** on 15 July 2009, 7:52 a.m.,*
in response to message #1 by Sean Connor

The error looks quite low level as if the drive or controller were unable to adjust themselves to the physical disk format (sector size, density and such.)

20b display problem

*Message #1 Posted by **Paul Dale** on 15 July 2009, 4:20 a.m.*

I've got a 20b with a display problem. Some of the pixels don't go dark. Anyway, I've opened it up and have located the problem. The zebra strip connecting the main PCB and the display has detached at one end (two tracks maybe three are broken). If I press down lightly, the display comes good.

Do any of the restorers have a suggestion as to how to reattach it?

- Pauli

Re: 20b display problem

*Message #2 Posted by **Marcus von Cube, Germany** on 15 July 2009, 7:53 a.m.,*
in response to message #1 by Paul Dale

The 20b should still be under warranty. Try to contact HP or your dealer.

Re: 20b display problem

*Message #3 Posted by **cyrille de Brébisson** on 16 July 2009, 8:35 a.m.,*
in response to message #1 by Paul Dale

hello,

contact 1 800 HP INVENT and get your product replaced under warranty.

Else, use no melt solder tape and place it on the strip, then use a soldering iron to re-heat glue the strip on the contacts.

cyrille

Re: 20b display problem

*Message #4 Posted by **Paul Dale** on 16 July 2009, 6:40 p.m.,*
in response to message #3 by cyrille de Brébisson

I don't think that phone number will help in Australia (although I did buy the unit from the US).

I'll try the solder tape.

This one is somewhat sacrificial: I've drilled out the four plastic mushroom rivets so I can get to the keys and relabel them :)

- Pauli

Edited: 16 July 2009, 6:40 p.m.

Re: 20b display problem

*Message #5 Posted by **Paul Dale** on 20 July 2009, 2:31 a.m.,*
in response to message #1 by Paul Dale

Fixed the problem.

Examined under magnification, the problem is the end conductor or three on the Zebra strip hadn't seated down properly. The obvious solution is to re-melt it in place.

Then the complication, the unlike other such strips which solder fairly nicely, this zebra strip melts instantly on contact with a soldering iron and by the time I'd figured this out, it had melted past the end of the PCB. Not to worry, a short piece of solid wire can be placed on the pad on the PCB in such a way that it pokes into the zebra strip. Solder the wire to the PCB quickly and the heat imparted to the wire seems to melt the zebra strip in place. In fact, the wire ended up poking through the zebra strip. Be careful here or you'll melt the adjacent conductor on the zebra and the process will have to be repeated. When done and verified, cover the whole thing with a generous blob of epoxy -- I used 90 second Araldite but any should work.

If you're very quick, it is possible to lightly tap the zebra at the bottom most end with the soldering iron and this will melt it onto the pad okay, you do have to be very quick though.

I don't know if this has been mentioned before or not, but the 20b runs fine on one battery.

Now to figure out how to best re-label the keys and attach the debugger pins.

HP-25 turns itself off

*Message #1 Posted by **Des McPherson** on 14 July 2009, 5:04 p.m.*

Ok, here's a strange one. I was playing around with my HP-25 the other day making sure all the buttons work. I went through each number and pressed it over and over until it filled the display. When I got to the number 7, I pressed it 5 times and the calculator turned off. It turned back on again after sliding the switch to off and then on. Here's some of the patterns that turn the unit off.

77777 177777 2277777 3337773377

You get the idea. Any help would be appreciated.

Re: HP-25 turns itself off

*Message #2 Posted by **Geoff Quickfall** on 14 July 2009, 6:28 p.m.,*
in response to message #1 by Des McPherson

I would like to say that entering five '7's in a sequence or over the 10s display is the "secret off code" for the HP 25 but I can't!

Sounds like a memory and display problem. The x register is a memory. Did any of the other keys when entered five times in a row or any sequence of five presses over the 10s display cause a similar fault. Also try:

388885 ENTER 5 /

this should develop 77777,

Does it turn off when it generates the 5 sevens.

Cheers, Geoff

HP-41CV retiring / HP-20b entering active duty

*Message #1 Posted by **hecube** on 14 July 2009, 4:19 p.m.*

I bought my HP-41CV brand new back in 1983. I loved this calculator so much. I was already a HP calc fan back then.

The PRGM key has been cranky for the last few years and I decided to enshrine the calculator. I have a HP-48SX I bought used for 20 dollars 10 years ago but I never felt the connection I had with the 41.

I've been looking for a HP calc that might take the place of the 41 and the HP-20b has me excited. It seems that HP has got many things right in a long long time with this model...

Re: HP-41CV retiring / HP-20b entering active duty

Well, except for the fact that it's a financial calculator :->

If they bought out a proper scientific model it might be a tad more exciting, but I reckon it needs more keys anyway.

Dave.

Emu48 update v1.48 / v1.17

*Message #1 Posted by **Christoph Giesselink** on 14 July 2009, 3:25 p.m.*

Hello together,

it's quite a long time ago that I published my latest Emu48 version.

My latest version can be downloaded at http://hp.giesselink.com/.

Emu48 v1.48 (classic edition without Apple series support)

- symbolic entries in assembler debugging
- RPL object viewer
- PCO code detection in debugger
- GIF image support for background bitmap
- the usual collection of bugfixes

Emu48 for Pocket PC v1.17

- redesign of dialogs, work on portrait, landscape or on square screens now
- GIF image support for background bitmap
- the usual collection of bugfixes

Cheers

Christoph

Piezoelectric transducers and the 41C

*Message #1 Posted by **Geoff Quickfall** on 13 July 2009, 12:56 p.m.*

Does anyone know the electrical specifications the HP-41C piezoelectric tansducer requires. I have 3 CXs that need new ones due to some hackers soldering attempts, not me ;-)

Also looking for a supplier in North America, perferably Canada. I did find what I was looking for on the web in the UK but I don't know the voltage requirement.

link to piezoelectric transducers in UK

```
Version one at the above site

Specifications:
Piezo Transducer 27mm/18kHz
Resonant frequency: 18kHz ±05kHz
Impedance at resonance: 800Ù
Capacitance: 25nF ±30%
Maximum input voltage: 30V p-p
Operating temperature: -20C to +70C

Version two also at the above site

Piezo Transducer 27mm/42kHz
Resonant frequency: 42kHz ±05kHz
Impedance at resonance: 500Ù
Capacitance: 14nF ±30%
Maximum input voltage: 30V p-p
Operating temperature: -20C to +70C
```

The original transducer is 27mm and appear identical but of course appearances can be decieving!

Cheers, Geoff

HP-IL I/F Card on a New(er) PC - Part III

*Message #1 Posted by **Gerry Schultz** on 12 July 2009, 9:24 p.m.*

Hello All:

Last week I posted that putting the HP-IL I/F card in 2.66 GHz P4 D845GECL MB PC hangs up during the boot process. I started a new post as last week's entries are pretty far down the page. Earlier this week I cut the IRQ 7 strap on the card and it booted into XP!

I've got EMU41 version 2.40 up and running in a DOS window. I've set up the emu41.ini set up as follows:

[Modules] 0 12 rom41cx.bin 3 4 cxfcn2d.bin 5 8 cxtime2c.bin 6 4 prter1e.bin 7 4 hpil1h.bin

8 12 adv41b.bin 10 4 xiola.bin

[Devices] DISPLAY HDRIVE1 LPRTER1 DOSLINK XIL 300

The 82973A I/F card is set to 300 (revision A) as explained by HP's documentation. I have my 9114B connected to the I/F card with a formatted floppy in it and has a one program stored on the floppy. The directory with EMU41.EXE has the original HDRIVE1.DAT included in the distribution.

What I'm confused about now is that when I use SELECT to access any HP-IL device and try to do a directory (virtual or real), the EMU41 reports NO DRIVE.

Okay, first what's the best and easiest way to test the HP-IL I/F card to see if it can be seen by EMU41? Second, how does EMU 41 assign HP-IL addresses to internal and external devices? I did modify EMU41.INI to indlude FDRIVE1 to see if I could access the 3 1/2 floppy disk drive on the PC from EMU41 without success.

What am I doing wrong?

Gerry

Re: HP-IL I/F Card on a New(er) PC - Part III

*Message #2 Posted by **Marcus von Cube, Germany** on 13 July 2009, 6:13 a.m.,*
in response to message #1 by Gerry Schultz

Gerry if you enclose your config file citations with PRE tags (in square brackets) the line breaks will be preserved for easier reading:

```
[Modules]
0  12  rom41cx.bin
3   4  cxfcn2d.bin
5   8  cxtime2c.bin
6   4  prter1e.bin
7   4  hpil1h.bin

8  12  adv41b.bin
10  4  xiola.bin
```

```
[Devices]
DISPLAY
HDRIVE1
LPRTER1
DOSLINK
XIL 300
```

Now to your question: XP does not allow a DOS box to access I/O ports directly. You will need some port redirection device driver (which has been mentioned here in the forum) to make this work.

Re: HP-IL I/F Card on a New(er) PC - Part III

*Message #3 Posted by **Gerry Schultz** on 13 July 2009, 5:33 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Thank you Marcus for reformatting my EMU41.ini file. I am confused and a little frustrated with what you are saying as it is different from other sources. In Christoph Klug's HP Article 311, "HP41 - PC Gateway & Emulator" and his book do not mention any need for a port redirection device driver to make EMU41 work on XP. What he seems to stress was that the HP-IL I/F card's I/O address needs to be set to 300 hex, which I've done. I have searched for EMU41 and XP restricting Google's search to the HP Museum website and found, so far, no mention of EMU41 needing anything special to run properly on XP.

I went into this little project thinking that the EMU41 software took XP's NT roots into account and that it works correctly under XP. When I ran it under Win98, it worked and responded as expected and I was able to talk to my 9114 floppy drive through EMU41. So, with it responding with NO DRIVE no matter what HP-IL storage device I try and talk to, I thought I had done something wrong. If XP is interfering with EMU41 accessing the hardware, can this be solved? Does EMU41 or for that matter EMU71 run properly under Windows XP with both internal, virtual HP-IL devices and external HP-IL devices connected through the HP82973A HP-IL interface card?

I intend to continue working on this and I hope the HP Museum community can shed some light on this to help expedite my efforts. There are a lot of variables in this situation from the PC BIOS to the interface card to EMU41 software. I'm hoping someone has already faced this as I think it related to the EMU41 software and XP. Since I can't get the virtual, internal HP-IL storage devices to work, either it's a configuration issue or an initial setup issue and the EMU41 documentation is not especially clear on how it assigns HP-IL addresses to devices. An example of strange behavior I have noticed is that I could not get EMU41 to save the state of the 41 at first when I shut down using F1. When I changed the name of the mem41.dat file to something else, EMU41 then saved the state of the 41 to a new mem41.dat file and now that file is updated whenever I quit using F1. Do I need to purge the HDRIVE.dat file included with the EMU41 distribution and have it build a new file, then use the new media command to format it? I don't remember doing that with Win98 so that may be a dead end.

Sorry that I'm rambling on so much. I hope you have some suggestions or insights.

Thanks,

Gerry

In Christoph Klug's HP Article 311, "HP41 - PC Gateway & Emulator" and his book do not mention any need for a port redirection device driver to make EMU41 work on XP. What he seems to stress was that the HP-IL I/F card's I/O address needs to be set to 300 hex, which I've done. I have searched for EMU41 and XP restricting Google's search to the HP Museum website and found, so far, no mention of EMU41 needing anything special to run properly on XP.

AFAIK, you cannot access I/O ports directly with XP. I do not have Klug's book with me so I have no idea what trick is used for XP to access the HP-IL ISA adapter.

You may want to give CrackNT a try (http://www.it.hs-esslingen.de/~zimmerma/software/index_uk.html). CrackNT has a tool to unlock I/O port ranges (you should only need to unlock 0x300 - 0x301, however I think on Linux I am unlocking 8 bytes). It may or may not work. As for direct floppy access, same issue.

If you have not already I would suggest booting up a DOS diskette with EMU41 and verify that EMU41 works with your mod card and address 0x300. IIRC, EMU41 enumerates the internal devices before the external devices, however, that may be because XIL is last in the device list. To avoid any ambiguity while testing comment out HDRIVE so that all DIR, WRTP, READP commands will default to the 9114B.

Good luck.

P.S. Ubuntu Linux is not a bad alternative to Windows. DOSEMU has an option to allow direct access to HW. I use Linux/DOSEMU with my ISA adapter. Works great.

Re: HP-IL I/F Card on a New(er) PC - Part III

*Message #5 Posted by **Howard Owen** on 13 July 2009, 9:33 p.m.,*
in response to message #3 by Gerry Schultz

I believe JF's documentation mentions that access to modern floppy drives from EMU41 doesn't work due to the smaller sector size on the 9114 disks.

I use DOSEMU on Linux to run EMU41 also. There you have to make provisions to allow the emulators to access the I/O memory directly. DOS is primitive in that way, allowing any old program to bang directly on the hardware.

<humor>

Since Windows up through WinME was really just DOS with an elaborate, broken windowing shell, those versions also took a cavalier attitude toward access to critical hardware resources. It wasn't until Windows NT came along that Microsoft started to make half hearted, ineffectual attempts to write reliabilty into their operating systems. That effort has largely failed, but, one side effect is that you have to make special provisions in order to do dangerous things like writing and reading directly to and from memory mapped hardware. Unlike a real operating system, Windows doesn't provide a standard way to allow such dangerous access, leaving the implementation to third parties who name their software things like "Hack and Slash my Windows Box Until it Rolls Over and Dies." Despite the scary names, these third party programs doubtless do a far better job of implementing the scary access than the clowns in Redmond ever could.

</humor>

Kidding aside, the inability to write directly to memory is a feature of any "real" operating system. You absolutely need some way to get around that to make EMU41 work with the ISA card. If Egan recommends the "Hackomatic" program, you can rest assured the solution is among the better ones available. He's a professional, and is occasionally forced to work with Windows. :)

> I believe JF's documentation mentions that access to modern floppy drives from EMU41 doesn't work due to the smaller sector size on the 9114 disks.

I've wondered about that. My HP-IL ISA Box is an old 66/200 Mhz Overdrive circa 1995 mini tower, with 32 MB RAM and Linux. I have no problems using various DOS-based tools to read/write 9114B floppies. However both this old junker and my circa 2004 IBM server have no problem reading and writing 9114B disks using Tony Duell's Linux LIF tools. I have not tested DOS/LIFUTIL/EMU41 on my server, so I cannot confirm that it works with *modern* floppy drives. If Linux can do it, I'd suspect that DOS can too. Perhaps my server works because it truly is 100% IBM Compatible. :-) BTW, when did *modern* start?

> However both this old junker and my circa 2004 IBM server have no problem reading and writing 9114B disks using Tony Duell's Linux LIF tools.

Wow, brain fade here. I've used LIF utils to access 9114 floppies too. Of course, the issue here is whether you can do it in EMU41. Here's what JF has to say about that in the EMU41 documentation

```
    Note: This emulation doesn't work on some modern PC. Reason is that this
emulation relies on
    low level BIOS calls to manage LIF formatted discs (256 bytes/sector).
These calls are historic
    (there are not used by DOS/Windows) and seem to have been removed (or at
least are no more
    supported) in modern PC BIOS.
```

That says he ran into trouble with BIOS calls that used to work for him, presumably under DOS on a "modern" PC. (No idea when "modern" started. :) Tony's source code is available, but may not be easily applicable given the differences in I/O models between DOS and Linux, i.e. Tony is making syscalls into the floppy driver, which in turn makes the low level BIOS calls. The driver source is available too, of course.

Regards,
Howard

*Message #8 Posted by **J-F Garnier** on 15 July 2009, 6:09 a.m.,*
in response to message #7 by Howard Owen

Hi,

"Modern" here means OS that came after pure text mode DOS and command line interface :-)

The main point regarding this subject is that it's not a hardware limitation; when booting a "modern" PC with a DOS disk (or a Win9x if you wish), LIF disc can be read using the PC internal floppy. This question by itself is almost obsolete since laptops don't have a floppy drive anymore...

Of course, LIF discs can still be read using a 9114 connected with the HPIL ISA board or the PILBox (to anticipate the next question: no, there is not yet a LIFutil-like software to do that with the PILBox - but it is possible).

Here is an article describing the problem and methods around it. Linux seems to be the better choice. BTW, OS/2 is a possible option, too. Its DOS box is closer to a real PC than Windows'. I will have to try it out one day. There is an old OS/2-PC somewhere around here. :)

By far the best way would be a custom device driver for the HP-IL card which does all the hardware and timing sensitive stuff. This could then emulate a serial port for access through any application, including emulated DOS. The new USB-HP-IL box works in this way. But instead of providing a custom driver, it uses a standard Serial-USB chip and its corresponding driver and does all the tricky stuff with an embedded controller. What's left is a modification to EMU41's HP-IL code to make use of a (pseudo) serial device.

*Message #10 Posted by **Gerry Schultz** on 14 July 2009, 1:20 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Egan, I've never thought about not trusting your writings (a double negative in this case seems correct). I've already downloaded CrackNT and read the documentation. It is the perfect answer to

having direct access o the hardware but I'll have to experiment with how large the I/O window should be.

Howard, when I was reading the humorist entry in your post, I had this image of Yosemite Sam popping up in my mind saying (in his Mel Blanc's voice) "I hate Windows." I too use Windows a lot in my work so I'm very familiar with it. But I cut my teeth on Apple IIs and at home I have two Macs as well as PCs. There are many days when I say "I hate Windows."

Marcus, I'll take a look at the article you recommend when I get some time. What I'm thinking about is a single, integrated PC that I can do all my Windows related work on without having specialized PCs for specific projects, like EMU41. I deal a lot with HP products here at Fox (Fox has a special deal with them) so we have several HP Blade Servers as well as a lot of other printers and desktop PCs. HP is so PC centric, I never think of using Linux or OS X with their products.

I sent an email yesterday to Jean-François Garnier yesterday to see about purchasing a PILBox. From Egan's postings I'm quite excited about using it. In that email, I asked Jean-François Garnier about EMU41 running on XP but I haven't heard back from him yet. He will have the definitive answer on this since he wrote EMU41.

Finally, I have a confession to make. I mentioned last weekend that there was another HP-IL I/F card up for auction on that unmentionable website. At the time, with my suspicion of my card having a problem, I won the auction for that newer card. I got it late last week and since it had no IRQ strapping, it confirmed that that was the problem. It's a REV C version of the I/F card and I think it works fine even though I haven't had to test it yet.

Now that the PILBox is shipping, I feel a bit foolish for getting it. I don't know what I'm going to do with it yet. I have a tendency to collect hardware, not get rid of it. Just ask my wife.

Thanks,

Gerry

I got a response from Jean-Francois this afternoon. Here is what he said:

And don't throw your HPIL ISA board away! It is still a valuable board, actually with higher performance than my PILBox! I don't use the ISA board with XP, I just know that a special driver for I/O access is needed and Christoph Klug is the right person for advices. Personnaly, I'm keeping an old computer and OS (maximum Win98) for it.

Interesting...

Hi Marcus,

What's left is a modification to EMU41's HP-IL code to make use of a (pseudo) serial device.

This is an excellent idea! Actually, Emu41 already supports HPIL through a serial port (starting from Emu41 2.47): instead of declaring XIL 300 (for instance), use XIL COM4. This is for the (experimental) support of the PIL-Box.

The problem I'm facing with Emu41 is that it's a DOS application that uses the BIOS INT 14 interface to communicate with the serial port. It works very well on pure DOS systems but it is VERY unreliable in Wondows environment, characters are lost from time to time and I don't know how to solve it. That's why I recommend to use ILPer, a native Wondows program, as a gateway between Emu41 and the PILBox.

J-F, have you tried to access the virtual COM port as a regular file? Or is INT14 just that?

Re: HP-IL I/F Card on a New(er) PC - Part III

*Message #16 Posted by **J-F Garnier** on 19 July 2009, 4:45 a.m.,*
in response to message #15 by Marcus von Cube, Germany

I tested several methods some years ago when I added serial port support to Emu41/71 and got acceptable but not 100% reliable results. This is the limit of the DOS Emu41/71 implementations.

If a driver for the HPIL board through a virtual COM port is developed, main interest will be to a have a common access method for both the ISA board and PILBox, and new software (ILper for instance) could be used for both.

Marcus:

I owe you an apology. I went back to Christoph Klug's post from last week and found this:

> Quote:
>
> For WIN XP operating system you need the address setting 300 by dip switches plus the address routing software tool, described in my book.

Last night, for some bedtime reading, I started scouring his book "HP-41 Input/Output Board" to see what I could find. On page XV.18, Christoph talks about installing the UserPort software tool for running the HP-IL/PC Interface Card and Trans41 or EMU41 under WIN2000/NT/XP. It's just like what Egan was talking about with CrackNT and from the picture Christoph includes at the bottom of the page, UserPort has a GUI interface. Also, I now understand why he insists that the I/O range address for the I/F card needs to be changed to 300 hex when used under NT based OSes. The UserPort utility only accepts arguments up to 3FF hex so it can't access 1700 hex. Finally, in UserPort's window graphic, Christoph shows by example that he opens 300 hex through 308 hex for the I/F card to work, just like what Egan was talking about.

I remember reading this but at the time I didn't understand what Christoph was talking about or how it related to running EMU41. I'm feeling pretty sheepish right about now.

I now have a clearer understanding of what I must work on so I will keep working on this. Thanks to everyone for your contributions.

Gerry

in response to message #18 by Marcus von Cube, Germany

Hello All:

A minor update this week. I figured out the problem with the NO DRIVE issue with EMU41 reporting all internal and external devices as NO DRIVE when I SELECTed them and tried to do a DIR. First, I built a bootable floppy and put the 2.40 version of EMU41 in a subdirectory and when I ran it from the floppy, it still reported NO DRIVE for all HP-IL peripherals. So, I cranked up my old P2 233MHz machine with Win98 and it showed the same problem. That machine didn't have the HP-IL I/F card in it since I had moved it over to the P4 machine. So, I grabbed the newer HP-IL I/F card I had recently received and plugged it in. I also added my 9114B disk drive to the external HP-IL loop and it worked as expected. Back on the P4 machine, I commented out the XIL 300 line and that fixed the problem. Apparently, having the XIL 300 line in the INI file confuses EMU41 if it can't find the I/F card in the machine. What I still need to figure out is why EMU41 didn't see the HP-IL I/F card when I booted from a floppy disk running DOS. I wonder if the external loop needs to be complete before EMU will function properly. I will have to try that next.

I didn't have as much time as I expected this weekend so I didn't get to play with modifying XP yet to directly access the hardware. I did install a KVM switch so I can work on either PC from one

location. I'll let you know what I find.

Gerry

*Message #20 Posted by **Gerry Schultz** on 20 July 2009, 6:26 p.m.,*
in response to message #19 by Gerry Schultz

I would also like to note that J-F did suggest that I disable interrupts on the HP-IL I/F card before I figured it out. In the process of troubleshooting this problem, I lost track of J-F's suggestion and forgot about it. If I had gone back and re-read the posts, I would have saved myself a lot of consternation.

I would like to thank J-F for his help as well as everyone else as you all have a lot more experience than I do with this HP-IL hardware. I will do better in the future at reading your suggestions. I know I can get pretty excited about new hardware and software as well as trying to resolve problems and issues as I run into them. If you notice me getting off track again, please don't hesitate to throw a tomato (gently, please!) at me in the form of a comment. It is fun to be actively involved in this group as I have lurked for years but made few comments until now.

Thank you for your patience.

PILBox initial testing. HP-IL Lives!

*Message #1 Posted by **Egan Ford** on 12 July 2009, 3:41 p.m.*

I received my PILBox (http://www.jeffcalc.hp41.eu/hpil/index.html) yesterday and assembled it using the solderless instructions. Essentially it does work as advertised. I was able to use ILPer as an HP9114B drive and as an HP83163 32 column video adapter with my 41CX via HP-IL. Sweet! The PILBox really opens up the possibility for PCs to emulate any HP-IL device.

I write all my 41CX programs on my laptop and compile with HP41UC and test with Nonpareil. To get into a physical 41CX I print barcodes and wand it in. This is faster than booting up my 200Mhz PC so that I can do electronic transfers with my HP-IL ISA adapter. With the PILBox I now use HP41UC to create a disk image and then use that with ILPer. That's laptop -> PILBox -> 41CX. Nice!

Given that I am an OS/X user I had to do all of this with VMware. No problems, the USB pass-through worked just fine.

Presently I am unable to use the PILBox as an ISA HP-IL replacement with EMU41. This support is experimental and still being worked on. A better solution would be for modern emulators to use the PILBox directly. I'll be attempting to get Nonpareil to do this (when I find time). 99% of the work is already done (http://pagesperso-orange.fr/kdntl/hp41/nonpareil-patch-doc.html).

Hi Egan, all,

Glad to know it works great also for you!

Success also here with the PIL-Box connected to my Hp-71Bs!

Normal speed works great, both :HDRIVE1 & :DISPLAY +scope and on any port.

It even works with Virtual Pc (I'm also a Mac user).

I still did not succeed in activating high speed with JP3 + port at 115kbs (Ilper answers "pas de réponse de la PIL-Box) but this feature is still experimental as per JFG site.

And the case is nice too. I had secured an Hp-IL printer enclosure to fit the circuit in but it is much more transportable in the case provided by Jean-François.

Definitely an awesome job from Jean-François Garnier.

Best regards from France!

Etienne

Is this Ebay auction breaking any copyright?

*Message #1 Posted by **Mark Edmonds** on 9 July 2009, 12:26 p.m.*

Please have a look at auction item #330343462507.

Someone is selling the HP15C manual in PDF format with a buy it now price.

I am really not sure where the copyright of these old manuals lies. Presumably HP still own it and have given permission for this museum site to make them available. So where does that leave people selling individual copies on Ebay?

Policing Ebay is not my style but if someone is going to pay money for a PDF manual copy, I'd rather they pay it here than on Ebay!

Mark

What about the manuals which are available for download at HP. Can you include them on a CD when you sell a calculator?

Example: you have an HP50 with an english manual and include a german one on CD, so that the buyer does not need to download it. Is that legal?

Re: No longer listed... funny that!

*Message #7 Posted by **Namir** on 11 July 2009, 2:39 p.m.,*
in response to message #6 by Patrick Rendulic

Selling electronic manuals (in any media) for recent calculator models IS DEFINITELY ILLEGAL. The copyright and ownership belongs to HP. They can sell it, give it away, or whatever. It's their product and they can do what they see fit. No one else can sell HP manuals without their permission.

If it's clear you are not selling the actual material, but are selling the *service* of putting publicly downloadable information on a CD, then it's not illegal.
That's how the Shareware industry used to work in the days before the Internet, and still works in some niche areas. e.g. many companies sell CD's full of service manuals or datasheets, it's quite common.
There are laws about modifying the document though.

Dave.

That's no distinction; if you accept money, you are selling the materials.

Are you a lawyer? Why do I think HP would have a problem with someone taking their products and selling them to other people; in other words, profiting for doing no real work? I think HP lawyers would be all over that, and rightfully so.

There is a big distinction between selling material like a scanned hard copy manual for example, and including a CD of an exact publicly available PDF file that HP have on their website as part of an ebay auction for that product.

No I am not a lawyer, but there are plenty of examples of people having done this *legally* (past and present) e.g. shareware programs, Linux distributions, datasheet archives etc.
Although much less common these days though with the widespread adoption of broadband Internet.

HP couldn't give a rats if you give someone an exact copy of a PDF manual they already have on their website. This is what Partick was asking.

Dave.

That's not my understanding of copyright law, Dave. Can you point to a specific provision of either legislation (e.g. the Copyright Act, in Australia) or case law, that makes this distinction? In both cases, you are breaching the copyright of the original author, publisher or their assignee. HP, as owner of the copyright is free to make material available on their website - or withdraw it, as they see fit. Anyone else is not.

> Quote:
>
> No I am not a lawyer, but there are plenty of examples of people having done this *legally* (past and present) e.g. shareware programs, Linux distributions, datasheet archives etc.

Note that, with the exception of public domain software, the above is subject to copyright - which gives the copyright owner the ability to enforce a licence controlling redistribution (or even *requiring* redistribution, as in the case of the GPL). You can't just unilaterally make up your own rules or ignore copyright.

> Quote:
>
> HP couldn't give a rats if you give someone an exact copy of a PDF manual they already have on their website. This is what Partick was asking.

That's *probably* true - however one should beware of a requirement in law for a copyright holder to defend their rights or see them lapse. In other words, HP may be effectively forced to pursue their rights in the face of an egregious violation. So it's best to keep one's head down.

Best,

--- Les

Not for 1-off ebay auction of a PDF that Hp have already publicly released, that's just insane.
Remember what we are talking about here.

From HP's own 50G PDF manual you can download:
"Reproduction, adaptation, or translation of this manual is prohibited without prior written permission of Hewlett-Packard Company, except as allowed under the copyright laws."

The only thing being violated there is the "reproduction" part, and oops, I just did that when I downloaded the PDF to my computer, I made a copy of it.

Be realistic guys. Including an exact copy of a publicly downloadable PDF to someone on disk on a 1-off basis as a courtesy is so far from copyright infringement it's laughable.

Dave.

Unfortunately, that's not what the law says. While I'm not a copyright lawyer, I've hired them a few times over a long career as a writer, etc. and I do have a copy of the relevant Act on my bookshelf. It's an infringement of HP's rights, pure and simple. In Australia, it's a breach of S.36 of the Copyright Act, 1968. It's probably also a breach of S.132AD, since the copy may well be made with the intention of "obtaining a commercial advantage or profit". Notice that this is a criminal offence.

You might think it laughable, but court proceedings often end in tears.

I wouldn't redistribute HP's manuals without a licence to do so, in writing (which I understand Dave Hicks has for the Museum, for example) and I certainly couldn't advise anyone else to do so.

Best,

--- Les

Oh, Dave's a bright lad, Don - I think he's just been misinformed and when he looks into it, he'll understand. My reason for posting is for the lurkers - I'd hate anyone to get the wrong idea and wind up in trouble.

Incidentally, although I've made reference to Australian law - that's my primary concern, since that's where I live, as does Dave - it's broadly similar around the world, since most countries are

signatories to the Berne Convention on copyright. And actually, Australia's law is partially harmonised with that of the US, due to the terms of the Australia-US Free Trade Agreement.

Finally, there's some interesting (Australia-specific, but useful background) reading at http://www.copyright.org.au/g056.pdf. Note specifically the section, "When might you infringe copyright?" as well as "Can I copy material from the internet for my clients?".

Best,

IANL

As far as I know, criminal copyright is rarely enforced against individual, small-scale violations in the US. In fact, apart from the RIAA and the peer-to-peer debacles, I'm unaware of any such actions. (Since IANL, I could be badly misinformed on this. But I *am* a member of the EFF, and they tend to make a big deal out of that kind of thing - and tell their members about it.) Civil actions for copyright violations are a lot more common. But in that context, you have to show a tort. How exactly is HP harmed in this instance? To what monetary extent?

As to the letter of the law, it may be that this use violates statutes. But as a practical matter, to expect actual consequences from that in a single instance of the reproduction of a manual for a machine that HP no longer sells - that is over the top in my non-lawyerly opinion.

Regards,
Howard

As a practical matter, I agree with you, Howard. I wouldn't expect HP to care one way or another. However, nor can I say "Go ahead and copy it", and especially I can't say "Go ahead - it's legal to copy it". It isn't. The "debacles" you allude to are often the result of people not understanding that.

Incidentally, in Australia there have been several criminal convictions over illegal music file-sharing.

Wow, it didn't take any time at all for you to resort to name calling, a very sad reflection on your character Don, really.

Take a few deep breaths fella's, and keep in context Patrick's original question.

The law is far from "pure and simple" as Les put it, there are limitless defences and precedences etc. Lawyers could spend countless dollars and years on something as "trivial" as this issue, or some law student could do their thesis on it. Who cares?

There are many innocent things we do in our everyday lives that could be technically "illegal" in some way shape or form if it actually came down to that, getting up tight and worried about them is just silly. If Patrick wants to innocently give someone a CD with a publicly downloadable PDF file on it then he can do that, no one is going to care.

Dave.

Patrick's original question is:

> Quote:
>
> Is that legal?

The answer is: No, it is not (though the practical consequence of this is another matter).

I don't know why you have stated in this thread - both explicitly ("I would be absolutely amazed if that is illegal in any way") and implicitly - that it is, or that there are ways around it ("not selling the actual material, but are selling the *service* ..."). I'm just

worried that someone acting on your advice could end up in trouble.

The law is quite clear on this.

Given that you are not a lawyer who specialises in copyright law, you have absolutely no basis for claiming it is clear cut illegal. There are many and varied circumstances in any case like this, not the least of which you actually own the calculator and manual you are selling as used goods, likely across country boundries. That complicates and muddles things, a lot.

> Quote:
>

>
> The law is quite clear on this.

The complications of law are never clear cut, that's why many law suits take years. That's why you can get professional legal advice on something and still find yourself on the wrong side of a ruling etc etc etc

I mentioned the "service" part because a LOT of people do that kind of thing, such as in examples I mentioned, and there are plenty more similar examples.

I'm not encouraging "breaking the law" and making a profit out of it, I'm just helping make Partick feel at ease that it's ok for a 1-off private 2nd hand ebay sale. No one will care. It's not the big deal people are making it out to be, not even close. The technicalities of it being "illegal" will always be moot unless it actually went to court and got ruled on. And really, who cares?

Have fun debating the legal technicalities all you like, if I want to do that I'll join a legal newsgroup, thanks.

Dave.

Go and read the Copyright Act or the information sheet I linked to, Dave. Those are the basis.

> Quote:
>

You do not have the rights to reproduce a downloaded PDF, which is the case under discussion. Sell an original, by all means - copyright has nothing to do with this. Go and re-read the copyright statement in the manual, then read the Copyright Act or the information sheet I linked to, Dave.

> Quote:
>

Well, it's cheaper than asking a lawyer. :) In my own case, we covered it as part of night school at Sydney Tech College. I remember we had to buy the Copyright Act but the Government Printing Office was out of stock, so one of the guys on the course, who was a printer, offered to run off some copies for us. . . .

Next time you're passing Macquarie Uni, give me a buzz (I'm not hard to track down) and I'll buy you a beer at the U Bar - if it's open (we're out of semester time right now).

OK, Dave, it was wrong of me to refer to you in that way, and I apologize. But, in spite of all the comments in this thread to the contrary--from very knowledgeable people, although not lawyers--you still persist in thinking that it is OK to make copies, distribute, and even sell other people's work, and I just think that's wrong. I suspect several people on this forum have obtained copyrights on work they have done, and they expect those copyrights to be honored. I myself obtained a copyright in 1988 for an air traffic control program I developed for the Macintosh computer. This was a copyright for "the textual expression of a computer program," and I interpreted that to mean that no one else could use my code (MS compiled QuickBasic) as the basis for their own ATC simulator. Had that happened and I knew it, I undoubtedly would have taken action to enforce the copyright. So this wasn't about documentation or manuals. I just wanted to protect my work.

I think those individuals, or companies, that produce things of value have a right to ensure that no one else profits from those products. Yes, if HP makes available ON ITS WEBSITE the owner's manual for the 12c, I think they know that people will download it and use it; fair enough. But I don't think they would approve of someone trying to sell it, or even include it on a CD for an EBay auction for a real 12c they own, but they don't have the printed manual anymore.

And I agree with what some others have posted here: assuming that HP will not enforce their copyrights in the future is a risky way to live.

Apology accepted, no worries.
I still think you are reading too much into my position on

this. I do not think it's ok to sell other peoples work and profit from it. I'm simply being realistic when I talk about the distribution of a publicly available PDF document, this happens how many 10's of millions of times a day with all sorts of products?. If it meant anything at all to HP they would not have made it available for public download in the first place, they would have simply included it on a disk with the product. And in that case I would *not* be ok with re-distributing it as a "courtesy service" if you don't have the original.

Actually, you don't "obtain" a copyright, you automatically get it (or can assert it) as the creator of a work. At least under Australian law. I believe it's the same in most countries though.

Nor do I, selling direct is different from an incidental "courtesy service" as part of a 1-off eBay auction in my view.

> Quote:
>
> or even include it on a CD for an EBay auction

On that point I think you are wrong. But hey, if everyone agreed on everything, forums would be boring!

In fact I'd like to think HP would actually support it, giving the user the manual so they can better make use of their fine product. If I worked for HP and wrote that manual, that's certainly what I'd want.

> Quote:
>
> And I agree with what some others have posted here: assuming that HP will not enforce their copyrights in the future is a risky way to live.

I see absolutely zero risk in this particular trivial case.

Dave.

Auctions like this one are common as dirt on eBay, and have been for years and years, That certainly doesn't prove the practice doesn't violate copyright laws, but it does suggest that HP may not be aggressively pursuing their copyrights in these materials. That makes sense to me when you consider that the intellectual property in the manuals is not HP's primary product. The hardware and software the manuals document are the primary products.

This community's perspective on manuals - collectible treasures as valuable as the calculators themselves - is not the common view. To most a manual is a necessary evil that helps you use a piece of hardware/software. On balance. I think HP is glad to let people learn how the publicly exposed portions of their hardware and software work, however they come by the information.

Regards,
Howard

That is a different case to what Patric was asking.
He is talking about including (as a courtesy service) an exact copy of a PDF file that HP already have on their website for public download. I would be absolutely amazed if that is illegal in any way, let alone HP actually batting an eyelid or even anyone on this forum getting their knickers in knot over it.

The one you point out is scans of printed manuals that HP have not made publicly available, different case entirely. But even then, as you say, that practice has been going on for decades without HP or any other manufactures ever batting an eyelid. They simply don't care.

Dave.

Copyright violations are illegal

*Message #30 Posted by **Steve Leibson** on 12 July 2009, 2:09 a.m.,*
in response to message #29 by DaveJ

I'm not a lawyer, so you'll have to settle for the opinion of a 3-time editor-in-chief. Every article on cnn.com, msnbc.com, abc.com, etc. is publicly downloadable as soon as you point your browser there. Make a copy, stick it on a CD and include it with something you sell and that's a direct violation of copyright law. Exceptions are made for use of small portions of a copyrighted document for quoting or criticism or other journalistic purposes. Small numbers of copies can be made for educational purposes in academic situations. Whether or not HP has provided the download on their site is not material to whether or not you're in violation. Just because HP hasn't pursued small fish doesn't mean it's legal. I've quoted many parts of HP's HP Journal on my history site (www.hp9825.com) and I keep a document posted by HP Labs that gave express permission to do that.

For the most part, Google doesn't host content they don't have permission for. They aggregate other people's content in their news offering, for example. It's true that their search results return snippets of copyrighted content, and these don't fall under any of the traditional "fair use" categories. I believe the law is unsettled around this question. It's possible a new fair use exception for this sort of thing could emerge, or maybe not.

Most people like having their sites returned in Google searches, but the company has run into trouble with their news aggregation. I believe a European press agency sued them over the use of their content in tags on the news page. I vaguely recall they settled - it was more about ad revenue than copyright. Google also ran into a forest of copyright buzz saws when they tried to make every book on earth searchable. Their idea was to return the search results with some context. You could argue that this is could fall under the fair use exception for research. But again, the law is not completely settled on this point.

The balance between copyright protection and free flow of information has been challenged by the rise of digital technologies, particularly the Internet. The initial response in the US was to enact some rather draconian laws to try and hold the lid down on the misappropriation of intellectual property. I think that was a gross overreaction, and I'm not alone in that opinion. I could continue to wander farther off-topic in this direction talking about the specifics of why the DMCA is a terrible law, but I'd be repeating arguments others have made far more eloquently. I'll spare all of us that journey. :)

Howard

It wasn't always that way.
When Google were still operating from Stanford University (and for some time after too I think) they were almost forced to shut down by companies not happy with the concept of them "stealing" their data from their website en masse.

Similar thing still happens with the likes of the Internet Archive who archive your complete website on a periodic basis without your knowing, and make it all publicly available.

The content aggregate part is interesting, as you are not only "redistributing" but also "modifying" the work.

Someone actually did this to me recently. I have a freely downloadable PDF eBook released, with the copyright proviso that it only be redistributed in it's original and complete PDF form. and I found someone had extracted the data and turned it into HTML and rehosted it. They have since taken it down after I complained though.

Dave.

Re: Copyright violations are illegal

*Message #35 Posted by **Howard Owen** on 12 July 2009, 8:59 p.m.,*
in response to message #34 by DaveJ

Yep, the Wayback machine has been purged of a lot of content due to DMCA complaints from copyright holders. That shows the basic conflict between free flow of information and copyright. Both archive.org and google.com demonstrate the value of freely available information. How that impinges on copyrights, and how the balance should be drawn are very much unsettled questions.

In the US, the DMCA provides the rules for copyrights in digital form. It weighs heavily in favor of copyright holders. For example, if you host some content and a copyright holder claims you are

violating their rights, they can give you notice, and the content must immediately be removed. At some level this seems reasonable until you realize that the legal system is completely disconnected at that point. Any old troublemaker can claim a DMCA violation, without any legal process other than a form letter, and a content provider must honor the takedown order. This is one problem of many in the DMCA.

All this is made worse by the fact that the developed world keeps extending the term over which copyrights are enforced. In the US, Congress extends terms every time the copyright for Mickey Mouse is due to expire. (This is only half a joke. Disney is always at the forefront of lobbying efforts in favor of copyright extensions.) The US Constitution says that copyrights should be granted for limited terms, but if those limits keep getting lengthened, are they truly limits at all? The US Supreme Court has declined to second guess Congress in this matter, so it's a purely political issue now. And the big copyright holders like Disney have had a good handle on the politics so far.

It's my view that both freedom of information and copyright are necessary, and that the current balance tilts too far in the direction of copyright holders. However the fact that Google and the Internet Archive can do business at all shows that there have been adjustments made in practice to the letter of the law. These adjustments are made because strictly enforcing copyright everywhere would grind those services, and many, many others to a halt. The economic value of something like Google is abundantly clear, even to Walt Disney, so the service thrives. Because of this, I predict that legal interpretations, and code changes, will continue to evolve toward a more balanced system.

Aaaak! Pardon my Pontification. :)

Hi Patrick,

I think some of these responses are off the mark to your question.

I am not a lawyer but I believe it is perfectly legal for you to include the pdf manual with the calculator.

My reasons: The calculator and the manual are yours. When you sell the calculator/manual combo, the only requirement I can think of is that you must destroy any copy except the one you sell to the new owner.

Think of it as transferring ownership. It was yours. Now it belongs to a new owner. Provided that you no longer retain any copy of the manual, printed or otherwise. Except when you own more than one HP50g. :)

There is no law against selling used HP calcs. Sites like eBay wouldn't be where it is today. :)

Otherwise, I believe it is illegal to sell or distribute copyright materials that you don't own without permission. Period.

That's my 3-cent worth.

Even then, there is nothing stopping Patrick or anyone else downloading the manual from HP's site and having a personal copy of that PDF file without owning the calculator.

Dave.

Yes, that does happen, I noticed a tad of "HP emotion" in it all!
I doubt it would have reached the same level if the subject was about an LM555 PDF datasheet (which is no different :->).

Dave.

Perhaps it's because writers, artists, songwriters and others who create copyrightable material inevitably feel some personal attachment to their creations. Even programmers feel this way - as Fred Brooks wrote in "The Mythical Man-Month":

"The programmer, like the poet, works only slightly removed from pure thought-stuff. He builds his castles in the air, from air, creating by exertion of the imagination. Few media of creation are so flexible, so easy to polish and rework, so readily capable of realizing grand conceptual structures."

In this sense, software is a creation of craftsmanship and inevitably reflects the personality of its creator.

This is one reason why programmers are sometimes willing to release their work as FLOSS: pride, satisfaction, etc. Copyright is important to these programmers so that their work is attributed correctly, even if they don't seek payment for it.

In the context of HP manuals, the early calculator manuals are obviously more than the simple bare minimum required to document the calculator functionality - in terms of graphic design, artwork, and even the creation of the curious characters who inhabit some of the example problems, they are clearly artistic creations.

Best,

--- Les

The marvelous thing about that is the manual's artistry is part and parcel of the art of the machines. They complement each other wonderfully.

Too true, Howard. I remember that when I bought my HP-65, back in the mid-70's, I was living in Toronto and reading "Zen and the Art of Motorcycle Maintenance" while commuting. The theme of the book is the nature of quality, and I remember that my experience with the 45 and 65 contributed enormously to my interpretation of Persig's book.

Copyrights and Rights of Attribution (or Credit Rights) are two different rights. The history of copyrights muddies the border - but we could abolish copyright and enforce Credit Rights. One could envision a world without Patents and Copyright but with Credit Rights and Trade Marks to ensure attribution and authenticity of works (ant thus limit forgery).

The modern reality is that non-trivial programs can no longer be created without violating a patent, if not many, which makes most acts of software development illegal.

Show me a program with a few hundred lines of code or more, and I'll find a patent that it violates. I'm not completely anti-patent, but yes, it's ridiculous.

Patents and Copyrights

*Message #55 Posted by **Geir Isene** on 13 July 2009, 11:56 a.m.,*
in response to message #54 by Byron Foster

I was originally pro patents and pro copyright. I even tried to patent a Role-Playing Game back in 1987.

About 5 years ago, I decided to research patents to the bone to really make up my mind about it as I was confronted by arguments that I found hard to argue against. After two years of study, I came to the conclusion that I am against all patents. The patent system needs to go.

Having done away with patents, I was still confronted by similar arguments that where hard to refute in the area of copyright. Another 2 year stint and I concluded that copyright must be abolished.

I am pro free market, anti patents, anti copyright, pro trade marks and pro credit rights.

I am pro Ant Hill Innovation - Wikipedia being an example of this.

I'm undecided on patents. I believe the public still does derive benefits from the disclosure inherent in the patent process, as opposed to trade secrets. I oppose software

patents, but it's very hard to draw the line. Perhaps simply making the term of all computer-related patents shorter, say 5 years rather than 20, would solve a lot of the problems.

I think that copyrights are a good thing, and that they should be renewable indefinitely. However, the cost to renew should increase exponentially with time. Perhaps divide the potential term into four year intervals, start the first interval at just over the cost of administration, perhaps $50, and make every subsequent interval cost four times as much as the previous. Then Disney can keep Mickey Mouse in copyright for as long as they want (and can afford).

Re: Patents and Copyrights

*Message #59 Posted by **Les Bell** on 14 July 2009, 1:05 a.m.,*
in response to message #58 by Eric Smith

I'm with you, Eric. I wrote a paper a couple of years ago taking a strong stand against software patents and arguing that copyright is a far more appropriate form of protection for programmers (primarily on the basis that copyright allows for independent authorship and invention, where patent law does not). I'm not sure about the benefit of disclosure; having tried to read - for example - the patent in the Kodak vs Sun case a few years ago, I found that the writing style used in the patent seemed quite opaque (and there are obvious reasons for that).

However, I'm still of the view that despite the flaws in the patent system (the limited resources available to patent examiners, the activities of patent trolls, the exceptionally low bar of the non-obviousness test) patents are still the best form of protection for the independent or small-business inventor.

Similarly, when I examine the rights of authors and artists from a Kantian perspective (Kant's Categorical Imperative essentially asks "How would you like it if someone did it to you?") then I'm forced to conclude copyright is the best approach. It certainly isn't a "monopoly on ideas", for several reasons, not least of which is the fact that anyone else is free to express the same ideas differently. It's not as if the first artist to paint a landscape prevented all the others who followed.

Best,

In most cases they aren't actually, but it depends on what you intend to do with the idea and what it is. Small time inventors and business people think that a patent protects them from someone ripping off their idea, it doesn't, as patents are easily beat (trivially so in most cases). All a patent does is effectively give you the leverage to sue someone if they try. But if you don't have at least a million dollars for the law suit, don't bother.

That's why for the small time inventor/business person, unless you think you can sell the patent to someone, it's essentially a waste of money. You are much better off getting your product out the door and staying one step ahead of your competition.

I think software patents are a bad idea too, but that doesn't stop me from seeing where the patent system helps people. Beyond the obvious and

pervasive use of patents as offensive and defensive weapons in corporate warfare, there are instances where the little guy wins with patents. Two old friends of mine hired me on to a startup they had going in 1999. One of them, the primary technological genius, had patented quite a few novel ideas having to do with virtual private networks and and OS level virtualization. (He was an early pioneer in that sort of thing, having ported 4.2 BSD to the VAX - on top of VMS!) When Nokia bought the company in 1999, those patents made my friends instant millionaires. (The principals all got to cash in at the time of sale. Low level people like me had to sit on our options, and they got wiped out in the crash.)

Those patents are now part of Nokia's strategic patent portfolio, where they serve what I consider to be pernicious purposes. But I applaud patents when they work as intended by the framers of the US Constitution - to promote the arts, including technology. My friend deserved his millions, and patents were how he got them.

in response to message #61 by Howard Owen

Definitely, there are times when the little guys wins with patents just like he/she deserves too, but it's an unmeasurably small percentage of the cases.

Sadly, patent lawyers and those dodgy "invention help" organisations won't tell you the real value of a patent in your specific circumstance, and will happily take your money, and lots of it.

I humored my patent attorney brother-in-law by letting him write me a software patent a few years back, paid my $70 for the one years provisional but then wasn't silly enough to fork out the $5K!

Dave.

I don't disagree with your point, but I think your example may be flawed. 1999 was a "special" time in tech startups. I knew several people who became instant millionaires with nothing but vaporware. I'm willing to bet that your friends would have become financially successful with our without patents, especially given that they actually had useful, novel software.

Re: Patents and Copyrights

*Message #64 Posted by **Howard Owen** on 14 July 2009, 9:35 p.m.,*
in response to message #63 by Byron Foster

Nonsense. The pace of acquisitions was frantic in those years, and ideas (including many awful ones) had a premium, but ideas have always been and will always be valuable. Patents are, among other things, a mechanism to secure part of that value to the person or entity that came up with them. The specific value of a particular idea is dependent on the business climate, but the general principle is not.

The "among other things" is a zinger though. As the distance between pure thought and it's embodiment has shortened, in some places to zero, more and more areas of human thought have fallen under the terms of the patent laws, as interpreted by the courts. "Business method" patents are an especially pernicious example of that, but software in general is problematic in that regard. (Fortunately, the patent system seems to be taking a step back from the travesty of business method patents.) It's also possible to freeze innovation in an area the patent owner doesn't want developed. "Submarine" patents can surface in the middle of international standards, forcing changes or the addition of an additional tax on the use of the standard. Frivolous patents get granted by clueless inspectors that end up encumbering idea factories and the court system. And any innovator is faced with legal uncertainty about the patent status of her inventions. Big companies maintain defensive patent portfolios and can afford the legal staff to

wield them effectively. But the small guy is at a big disadvantage here. And if that small guy happens to be writing Free Software, there's a basic legal and moral conflict that is unavoidable.

So I think patents should go, on balance. But it won't do to disregard the positive effects the patent system has *when it works as originally intended.* Any overhaul of the system needs to take this into account, and preserve that benefit somehow.

Regards,
Howard

I'm very uncomfortable with the general notion that X is a good idea because X occasionally makes some little guy a millionaire. Not that I begrudge anyone their good fortune, but I'd much rather support policies that benefit people *in general*, rather than those that allow people to win some big jackpot that they haven't actually done anything much to deserve.

I mean, sure, if Y creates some product or service that becomes wildly popular, and makes Y filthy rich, well, more power to Y. This is the main selling point of capitalism. I have no problem with that whatsoever.

What does trouble me, though, is when that Y uses a patent to prevent others from selling the same kind of product or service. If Y's product took lots of time and money to develop, patent protection seems fair; if the only merit of Y's idea is that Y happened to be the first one to think of it, it doesn't seem fair. Not to me, anyway.

Pharmaceutical companies often have to invest astronomical amounts in developing medicines; allowing others to simply copy their products would take the economical incentive out of developing them, and innovation in that area would stop, unless governments or other not-for-profit subsidizers would step up and fincance the process instead. (Note that I'm not trying to imply that one approach is inherently superior to the other; only that this is the kind of choice you'll have to make.)

I have yet to see a software patent that comes anywhere near being justified like pharmaceutical patents. Compared to the millions that pharma has to spend on the development of any single product, software patents tend to cover things that any reasonably competent programmer could have figured out in at most a few months' time, representing an investment of maybe a few tens of thousands of dollars at most.

The way they're used at present, software patents seem to me like the business equivalent of a child yelling "dibs on the front seat" when the family gets ready to get into the car for a holiday trip. People reap huge rewards simply for being first, while what the patent system *should* be doing is rewarding those who make large investments in developing things that are truly new, orignal, and non-obvious.

I totally disagree with Geir's point that patents and copyrights should be abolished. Patents are important because they allow people to recoup the costs of developing innovative products, and copyrights allow people to make a living from being genuinely creative. It seems to me that most of the controversy surrounding patents nowadays stems from patent examiners' lack of reluctance to grant patents on things that are obvious (which in turn is caused by the insane idea that the patent office should be funded by the income from patent applications), and from the way

that some record companies are seeking excessive damages from people who infringe copyrights on the Internet... The excesses are bad and should be fixed, but the basic ideas are sound, and, in my humble opinion, important.

I didn't actually make that argument; see above. I'm opposed to software patents.

Also, I probably should have made more clear the following: I think it's cool my friends became millionaires, but that's not why I think it was a good outcome based on patents. Those guys worked really, really hard for over 20 years to achieve their success. Their first company was wiped out by Microsoft and bought for a pittance by Cisco Systems. Their second try made them, and many of their friends rich. In the meantime, they were driven to create new and valuable technologies, and to employ lots of really bright people. They had a positive economic impact through these actions, and an equally positive impact on the society they are a part of. It's a capitalist success story, alright, but not because of the money. The money was just a driver for the energy these guys put into their professional lives. This is why "promoting the useful arts" is a good thing for governments to do - it has benefits far beyond the enrichment of a few inventors.

Re: Patents and Copyrights

*Message #68 Posted by **Howard Owen** on 15 July 2009, 3:21 a.m.,*
in response to message #67 by Thomas Okken

Quote:

> I'm very uncomfortable with the general notion that *X is a good idea because X occasionally makes some little guy a millionaire.*

I don't think software patents are a good idea,

so I didn't make this point. My argument was summarized by:

> Quote:
>
> So I think patents should go, on balance. But it won't do to disregard the positive effects the patent system has when it works as originally intended. Any overhaul of the system needs to take this into account, and preserve that benefit somehow.

So that's more like "X is a bad idea, but it sometimes enriches a little guy or two. Let's see if we can preserve that salutary effect of an otherwise flawed system."

I'm sorry if this seems confusing. It's a case of "X" being a complicated phenomenon with multiple effects.

Finally, in response to your post, I added the observation that the benefit isn't merely that people get rich. Many folks do useful things, both in economic and social terms, in response to the incentive the prospect of getting rich provides. That was certainly true in the case of my friends.

Regards,
Howard

That's why I'd rather keep the option there. Sure, there are cases where keeping an idea as a trade secret might be the way to go, but there are also times when it's not. And I'd also welcome a review of anti-trust law at the same time as a review of the patent process - the two go together.

Best,

I have come to the conclusion that for patents and copyrights to be abolished, reverse engineering must be allowed.

As a side note; The original sales pitch for patents was "for the greater good". And to keep with that focus: Wikipedia and FOSS have emerged very successful *despite* patents and copyrights.

More recommended reading; Free Culture by Lawrence Lessig.

A law shouldn't be blindly followed.

*Message #72 Posted by **jbssm** on 14 July 2009, 10:57 a.m.,*
in response to message #1 by Mark Edmonds

About if it's legal or not, well, that depends on the country it happens.

For instance, in Sweden it is not illegal, in fact it's not even copyrighted material, since to be copyrighted it must be a creative work ... and a product manual is not a creative work.

Then you must see how it goes with other laws. In some countries (EU countries for instance) when a product is

sold, it must have a manual ... so, how does it fit here? The manual it's actually considered a part of the product, so when you (or someone before you) bought the product, you already paid for having the manual with it so do you really have to pay for it again in case you loose it? Which is something similar to buying a music CD, then losing the original ... are you entitled to ask a copy from a friend, since you already paid for the copyrighted material? Well, in most of EU at least for now, fortunately you are. But if in your country you aren't allowed what are you going to do? Buy the CD again?

If everyone keeps following blindly the most stupid rules, then of course the state is going to impose more and more unfair rules upon you.

You may just choose not to follow the law in cases where it is absurd ... it's called "civil disobedience" and helped shape the society for better many times in the past. Many people think it's time for that to happen with copyrighted material now.

Amen, Steve. I don't know about Sweden, obviously, but the Copyright Act, 1968, here in Australia, *specifically* mentions manuals as an example of a creative work. Because of the Berne Convention and the resultant harmonization of copyright law internationally, I would expect Sweden to be similar.

White spirit for cleaning?

*Message #1 Posted by **Mark Edmonds** on 8 July 2009, 10:35 a.m.*

I recently got a great deal on a 41CX but the card reader has the gummy wheel problem. All the repair guides talk about using isopropyl alcohol but I can't get that round here except from hi-fi shops where they charge silly amounts for a small bottle (a few cc).

How about using white spirit instead? I've used it for cleaning all kinds of things in the past and it works great but I'm not sure about using it on electronics other than bare wire. I've got a hunch it might be corrosive on some plastics so I am concerned about the card reader internals.

Does anyone know - can I use white spirit or would this be a big mistake?

Thanks for any advice here...

Mark

Re: White spirit for cleaning?

*Message #2 Posted by **Geoff Quickfall** on 8 July 2009, 1:47 p.m.,*
in response to message #1 by Mark Edmonds

Try it on a hidden piece of plastic to see but I would suggest a big NO on any petroleum product.

The HP plastic does not age well and becomes porous and brittle with age. The only products I use on the plastic is lemon oil glue remover, alcohol and water.

Did you try your local drug store. Rubbing alcohol (isopropyl alcohol) is an excellent substitute and comes in 75% and 95%. I use the 95% and it dissolves the gummy wheel rubber quickly.

While you are in the guts of the reader replace the dampening couple (incorrectly referred to a the clutch).

Cheers, Geoff

in response to message #2 by Geoff Quickfall

Thanks Geoff. I'll try my local chemist - I had never thought about that as a source. You have also confirmed my gut reaction to using white spirit.

in response to message #3 by Mark Edmonds

Be aware - rubbing alcohol is a combination of isopropryl alcohol and lanolin. The lanolin is added to prevent drying of the (human) skin. The lanolin is not required and is certainly detrimental to using on electronic/mechanical parts as it will leave a residue. Isopropyl alcohol is readily available at any local pharmacy/drug/department store.

in response to message #4 by Thomas Chrapkiewicz

Interesting,

I would suspect that each country has it's definition. The rubbing alcohol bottle I have states 99% iso propyl alcohol and absolutely nothing else including lanolin.

So the caveat here is to read the label first incase your bottle has different ingredients.

I have been using the 99% stated above for about 12 years with no adverse affects on electronics or plastics.

Cheers, Geoff

In the US where I live it is hard to find "rubbing alcohol" with more ahn 70% isopropyl. I used to get 90% ethyl but can't find it any more.

You can buy "Everclear" 190 proof grain alcohol from your local lush-enabler. That is pure as pure can be except for 5% water.

in response to message #3 by Mark Edmonds

In the UK the closest my chemist was able to offer was surgical spirit but I'm not sure how pure that is or what may have been added to it. Suspect it may be a mix of alcohol and methanol but don't know as there aren't any clear indications on the bottle (Contents 100% surgical spirit - which isn't terribly helpful)

Re: White spirit for cleaning?

*Message #8 Posted by **Martin Pinckney** on 8 July 2009, 6:57 p.m.,*
in response to message #7 by Mike T.

In the U.S. we have "denatured" alcohol, which is simply ethanol (Ethyl alcohol) with something (methanol?) added to make it undrinkable (hence no liquor taxes or other regulation). Available at

hardware and do-it-yourself stores.

I am not familiar with the term "surgical" alcohol, but I suspect it is pure isopropal, since I believe that is the type used for sterilization. Perhaps someone in the medical field can chime in on this.

Re: White spirit for cleaning?

*Message #9 Posted by **Nigel J Dowrick** on 9 July 2009, 3:53 a.m.,*
in response to message #8 by Martin Pinckney

I have a bottle of "industrial methylated spirit" which I obtained from my chemist to use to sterilize medical equipment and injection sites. I don't know whether this is the same as "surgical spirit", but it certainly isn't the same as isopropyl alcohol: the smell is quite different. Don't use industrial meths on any part of a calculator that you care about: I tried to clean the green plastic "display screen" of a 1970s Commodore calculator with it, and the plastic fell to pieces!

Nigel (in the UK)

in response to message #9 by Nigel J Dowrick

Surgical spirit is defiantly not the same as methylated spirit - I know from experience not to try cleaning cleaning plastic with methylated spirit as it will discolour it at the very least...

Does anyone know if 'Goo Gone' is sold under a different trade name in the UK or Europe?

Mark,

A product I've used to remove gummy residue as well as soft adhesives goes by the trade name "Goo Gone" and is normally available in a pump spray bottle. It is very safe with plastics and I've even used it to clean the LED/LCD bezel without any adverse effects. It is manufactured in the USA by Magic American. I don't know if it is available in the UK.

Regards,

Michael

in response to message #11 by Michael de Estrada

Thank you very much for all the help here.

Just to clarify the solutions I have already:

White Spirit is listed as "Naphta (petroleum) hydroesufurised heavy UN No 1300 Turpentine Substitute (White Spirit)"

and Methylated Spirits is listed as "Ethanol and Methanol UN No 1170 Ethanol Solution"

I remember from my early modelling days that meths had a nasty habit of decaying plastic so I wont be using that!

I think meths is the same as denatured alcohol.

I am going to see what the local chemists have along the lines advised in posts above and I'll report back what I find. I am not a chemist so it can get very confusing with all these names, especially when different countries use different identifiers!

*Message #13 Posted by **Mark Edmonds** on 9 July 2009, 12:13 p.m.,*
in response to message #12 by Mark Edmonds

RIght, update on this is that I went to my local chemist/pharmacy/drug store and asked for isopropyl alcohol. They didn't have it in stock but have it ordered for collection tomorrow. I am getting a 0.5 litre bottle of 100% isopropyl alcohol for about 5.50GBP which seems quite a reasonable price to me, especially given the over-inflated prices you can pay for it in small quantities on some markets. So for UK people, given that all chemists should be able to get the same range, this is probably the best way to buy it in bulk and easily.

Which chemist did you go to?

Only a couple of weeks ago I tried to buy some Isopropyl Alcohol in the UK, asking for it by that name. However, both Lloyds Chemists and Boots told me that they didn't sell it...

Unfortunately (or perhaps fortunately) I don't have a rare vintage HP calculator that needs cleaning, but I do want something to clean some model railway track that won't leave any residue.

Mike - it wasn't one of the main chains. I think it is run by a family and they only have this one local branch. The chap there didn't bat an eyelid when I asked for the stuff and went straight onto his computer to order it so it clearly wasn't as if I had asked for something unusual. He also gave me various purity options of which I selected the 100% type. So why Boots and others don't sell something so basic, I don't know - probably being lazy to find out if it is available when you asked for it.

OT: Keyboard with potential

*Message #1 Posted by **Egan Ford** on 8 July 2009, 10:05 a.m.*

I am not a fan of external keyboards. I prefer using my notebook keyboard only. But this new keyboard has some very nice possibilities: http://www.engadget.com/tag/eee%20keyboard. E.g. calculator emulators that can have X sent to the PC application.

I've asked for this feature in i41CX and I'll also ask that Free42 for the iPhone also have this feature. There are keypad applications for the iPhone already. If the two ideas could be merged, then my iPhone could be my smart calc extension to my keyboard.

Re: OT: Keyboard with potential

*Message #2 Posted by **Mark Edmonds** on 8 July 2009, 10:28 a.m.,*
in response to message #1 by Egan Ford

Holy smoke! That could be awesome!

I would want to have it as a normal keyboard with the built-in display operating as a mini-screen for dedicated applications - such as an HP EMU of course. Being a touch-screen, it would be ideal for this.

For my studio work, this would also have huge potential for providing a mini-keyboard dedicated to the current area of the main application being worked on. I don't know if any of you know about the hardware X-Keys unit, but imagine an extended keyboard in touch-screen form. It could also be used to control plugins and transport.

I do hope ASUS don't limit this keyboard to a "PC in a keyboard" and offer its undoubted benefits for use with a normal full PC by removing the internal computer. Let's hope so...

Free42 for Mac OS X

*Message #1 Posted by **Les Wright** on 7 July 2009, 6:46 a.m.*

Just wanted to share that Thomas Okken is close to finishing a port to the Mac OS. I have an almost complete beta and it is very nice.

I will gladly share the interim beta executable with Intel Mac users who want to give it a go. Please to NOT bug Thomas directly--he is very busy and I for one would like him to finish up this Mac port and post it sourceforge AND his iPhone port and get it to the App Store.

I am sure Thomas would not mind me sharing this executable in progress. It is open source, after all!

I can be reached at leslie dot wright at rogers dot blackberry dot net.

Saving i41cx+ states and configurations--what's the difference?

*Message #1 Posted by **Les Wright** on 7 July 2009, 3:27 a.m.*

S.L. says it all. The newer iterations of the app allow one to save the calculator State or Configuration, and for the life of me I can't find in the online material anything that explains the difference.

I suppose I should email Antonio directly (FYI, if I bring a concern or bug report to him he always writes me when it is addressed in a subsequent release), but with a few contented users I thought I should start here first.

Les

*Message #2 Posted by **Chuck** on 7 July 2009, 11:58 a.m.,*
in response to message #1 by Les Wright

I haven't looked into it much, but when I looked at the two different saves sent to my email, the "State" save email contained about 5 times more code than the "Configuration" code. My guess is that the config save is a subset of the state save. Just a shot in the dark.

[edit]I think the size difference has to do with the embedded image. So disregard my shot in the dark. :(

Math module d´ont works

*Message #1 Posted by **Marcelo Vanti (Brasil)** on 6 July 2009, 6:25 p.m.*

Hi all I did buy an math module hp 00041 - 14023 but it seems d´ont work. Some times, my 41c LCD blinks and shows a very weird behaviour, and keep so until to stop completely. When i pres the program key i see 00 REG 05 ?! Other times it d´ont turn on at all, and i was forced to remove the batteries a couple of times. Are there anything i doing wrong? I have tried the ports 2,3, and 4, and the only memory module is in port 1. Thanks for any help, and sorry my poor English Marcelo

Mental juggling: Calculating the day of week

*Message #1 Posted by **Thomas Klemm** on 6 July 2009, 4:47 p.m.*

My father has a quirk: When he meets someone new, he asks after the date of birth and then after a few seconds of reflection, he says the corresponding day of the week.
I do not know exactly how he makes, but he knows many of the weekday data from memory. This is used to calculate the difference to this particular day.
Though there are algorithms to do that with a computer or a programmable calculator I was trying to find a way to do it in my mind. However mental arithmetic is not one of my skills.

Let me explain it first with an example: 22.06.1955

```
Day   22      -> 1
Month  6      -> 4
Year  55      -> 5
                --
                10 -> 3 -> Wednesday
```

Day

This one is easy: it's calculating the remainder after division by 7.

```
Example: 22 = 3 * 7 + 1
```

Actually you don't have to divide by 7. You just need to know the closest multiple of 7 which is smaller or equal and then calculate the difference:

```
22 - 21 = 1
```

Month

Here you don't have to calculate anything but keep a table in your mind:

```
Month           1  2  3  4  5  6  7  8  9 10 11 12
Magic number    1  4  3  6  1  4  6  2  5  0  3  5
```

As I can't remember such a table very well I rearranged it a little:

```
Month          Magic number

 1  2  3       1  4  3
 4  5  6       6  1  4
 7  8  9       6  2  5
10 11 12       0  3  5
```

For Januray and March the mapping is identity, for October it is 0 which means it can be ignored. Then you can see that the 2nd and 3rd line both start with 6. In the 2nd line 1 4 from the first line is repeated but shifted by 1 whereas in the 3rd line 1 is added giving 2 5. Well, the last line: 10 is 0 and 1 added to 2 gives 3 and 5 is keept. But I'm sure you'll find a different way to memorize this table.

How did I calculate this mapping?
Starting with March which is set to 3 either 31 or 30 is added depending on how many days the previous month has:

month	# days	sum	% 7
3	31	3	3
4	30	34	6
5	31	64	1
6	30	95	4
7	31	125	6
8	31	156	2
9	30	187	5
10	31	217	0
11	30	248	3
12	31	278	5
1	31	309	1
2	*	340	4

(*) Since February is the last month in the list we don't have to take leap years into account here. This is the reason why we started with March.

Year

Leap years make things complicated. Here again we have a mapping table:

0 :	00	06		17	23	28	34		45	51	56	62		73	79	84	90		101	107
1 :	01	07	12	18		29	35	40	46		57	63	68	74		85	91	96	102	
2 :	02		13	19	24	30		41	47	52	58		69	75	80	86		97	103	108
3 :	03	08	14		25	31	36	42		53	59	64	70		81	87	92	98		109
4 :		09	15	20	26		37	43	48	54		65	71	76	82		93	99	104	110
5 :	04	10		21	27	32	38		49	55	60	66		77	83	88	94		105	111
6 :	05	11	16	22		33	39	44	50		61	67	72	78		89	95	100	106	

Search the year (- 1900) in the table and find the corresponding number in the leftmost column.
Now this is something I don't want to learn by heart. However you may notice that the pattern repeates after 28 years so we just need to remember the first 28 years. Unfortunately calculating modulo 28 isn't something I can do easily in my mind.

This is the easiest way I came up to calculate the number:

1. Find the closest multiple of 4 smaller or equal to the year. Keep the difference.
2. Divide that multiple of 4 by 2.
3. Find the difference to the closest multiple of 7 bigger or equal to that number.
4. Add this to the difference from step 2.

```
Example: 55 = 52 + 3
              52 : 2 = 26
              26 + 2 = 28
              3 + 2 = 5
```

As the calculations are carried out modulo 7 we can also subtract the difference to the closest multiple of 7 smaller than that number in steps 3 and 4.

```
Example: 46 = 44 + 2
              44 : 2 = 22
              22 - 1 = 21
              2 - 1 = 1
```

Shortcut for years that are a multiple of 7:

1. Find the remainder after dividing by 4
2. Multiply that number by 5

```
Example: 49 = 48 + 1
                  1 * 5 = 5
```

```
        91 = 88 + 3
                 3 * 5 = 15 = 1 (7)
```

Important note: You may have noticed that the mapping table for the months starts with March. Thus January and February belong to the year before the actual year. Therefore for these two months the year has to be reduced by 1 before any calculations.

There are different ways to do that calculation. But it turned out that I can calculate n modulo 4 quiet fast while I have difficulties to divide a number by 4 if it's bigger than say 50. On the other I find no trouble to divide a number by 2. Probably it's all a question of training. However it seems I just don't do enough divisions by 12 to use Lewis Carroll's method:

> Quote:
>
> Add together the number of dozens, the overplus, and the number of 4s in the overplus.

Day of the week

The following table is used to map the resulting number to the day of the week:

```
0  Sunday
1  Monday
2  Tuesday
3  Wednesday
4  Thursday
5  Friday
6  Saturday
```

Explanation

What we actually do is calculating the difference of the date to 28.02.1900 modulo 7. This interval is split into three parts from which modulo 7 can be found easier:

```
22.06.1955
            22                 = 1 (7)
 0.06.1955
            31 + 30 + 31 = 92  = 1 (7)
 0.03.1955
            55 + 13 = 68       = 5 (7)       // 55 : 4 = 13 leap years
 0.03.1900
28.02.1900                     = 3
                                --
                                10 = 3 (7)
```

Since 28.02.1900 was a Wednesday the mapping table of the months starts with 3.

What remains unexplained are the two formulas to calculate the mapping of the year:

```
Let's assume y = 4n + r  ; 0 <= r < 4
Then d = 365y + n = y + n (7)   // since 365 = 1 (7)
                  = 4n + r + n = r + 5n = r - 2n (7)
2n = 4n / 2

d = r - 4n / 2 (7)    // here we use that 2 | 4n
```

Last not least the case where the year is a multiple of 7:

```
y = 4n + r = 7k = 0 (7)
r = -4n = 3n (7)      // multiply both sides by 5
5r = 15n = n (7)
d = y + n = 0 + 5r (7)
```

Restriction

The method described here works only for dates from 01.03.1900 to 28.02.2100. However it could easily be adjusted.

Examples

6 July 1979

```
79 - 76 = 3
76 / 2 = 38
38 - 3 = 35
3 - 3 = 0

July -> 6

0 + 6 + 6 = 12 = 5 (7)
```

or shortened

```
79 76  3
38 35 -3
       0 6 -1 5 -> Friday
```

December 7th, 1941

```
41 - 40 = 1
40 / 2 = 20
20 + 1 = 21
1 + 1 = 2

Dec -> 5

2 + 5 + 7 = 14 = 0 (7)
```

or shortened

```
41 40 1
20 21 1
      2 5 0 -> Sunday
```

20.02.1964

```
63 - 60 = 3
3 * 5 = 15 = 1 (7)

Feb -> 4

1 + 4 + 20 = 25 = 4 (7)
```

or shortened

```
63 60 3
     15
      1 4 -1 4 -> Thursday
```

Programming

How about a training program for your favorite HP calculator that displays a random date and asks you to enter the appropriate day of the week?

Pretty cool trick.

Do people get suspicious of identity theft when asking their birthdate?

Re: Mental juggling: Calculting the day of week

*Message #4 Posted by **Thomas Klemm** on 7 July 2009, 2:04 p.m.,*
in response to message #3 by Mad Dog ebaycalcnut

Your question is interesting since people are indeed sometimes irritated. But usually they just tell their date of birth. However someone turned the table on him and told him only birthday and weekday and asked him to tell the year. He had a little longer and guessed the person too young but the result would have been possible.

I remember a similar irritation when traveling in Viet Nam since people always ask you how old you are. Yet they need to know because they call you different depending on whether you are older or younger than they are.

So I assume that identity theft isn't the main concern but simply the fact that somebody asks something personal.

This is Lewis Carroll's method already mentioned. So you can also combine my method (for the year) with Doomsday Algorithm if you like. Then you don't have to memorize the mapping table for the months.

a question of cases ...

*Message #1 Posted by **Glenn Becker** on 6 July 2009, 12:31 p.m.*

Hi all -

I recently won an HP at ... some auction site or other, and it came complete with the original brown [fake?] leather zip up case.

More pertinently, when I received it, the calc was _inside_ this case, and when I opened the case up ... the unit was filthy! It had this crumbly, dark brown grud all over it.

Cleaning it was not difficult, but I soon established that the grud (my portmanteau word for grime/crud) in question had come off the inside of the case. There is a black mesh on the inside of that case, and beyond that is the inner wall of the [p]leather, which when rubbed releases the grud.

I guess I am wondering - are these cases known for this sort of material breakdown? Or perhaps this is a kind of mold? Perhaps it is because of the conditions in which it was kept (the unit came from Texas)? Just wondering too if it is worth trying to clean the case (can I just throw it into a washing machine by itself?) ...

Thanks,

GB

Re: a question of cases ...

*Message #2 Posted by **Jeff O.** on 6 July 2009, 12:37 p.m.,*
in response to message #1 by Glenn Becker

That is a common problem, particularly with the HP-41 case. I have remedied the problem with at least one such case by turning it inside out and tossing in the washing machine with a general load of laundry. Your mileage may vary, of course.

...

Re: a question of cases ...

*Message #3 Posted by **Randy** on 6 July 2009, 12:42 p.m.,*
in response to message #1 by Glenn Becker

It's referred to as "dry rot". The Spice and 41 cases are the most commonly affected. Excess heat is the most likely cause.

Washing them does work if they aren't too far gone.

Re: a question of cases ...

Just like when I received my 71B case. At first I thought of throwing it in the trash bin but then I decided to wash it in a powder soap and some Vanish stain remover solution. I rinsed it twice or three times and let it dry overnight. It became like new!

Gerson.

How do I disassemble a hex number with Jazz?

*Message #1 Posted by **Matti Övermark** on 6 July 2009, 9:31 a.m.*

I have started to study the Art of SysRpl using my HP48 GX and Jazz 6.8. I would like to know how to disassemble a commmand using the Hexadecimal number as input, if I know that.

I do get results when I take, for instance, #7D27h DOB =>

"LABEL STO CON(5) (*)+5 ST=0 0 . . . "

and that above is not SysRpl. I think it is system assembly.

The DIS command (#7D27h DIS) just returns "HXS 10 72D7000000000000"

Any help appreciated!

Regards, Matti

Re: How do I disassemble a hex number with Jazz?

*Message #2 Posted by **Christoph Giesselink** on 7 July 2009, 7:30 p.m.,*
in response to message #1 by Matti Övermark

> Quote:

>
> ```
> "LABEL STO
> CON(5)   (*)+5
> ST=0     0
> .
> .
> "
> ```

This is the correct answer. STO is a so called PCO (Primitive Code Object), special assembler code which can be directly called from RPL code.

The construct *CON(5) (*)+5* is the preamble for such an object located in ROM. You should have a look at James Donnelly's book Introduction to System RPL and Assembly Language.

TNX to Eric Rechlin making this book electronically available.

The basic for SysRPL programming is still RPLMan from Goodies Disk 4.

Another book is Programming in System RPL (PDF) from Eduardo M. Kalinowski.

And finally for the hard core programmers the assembler code tutorial Introduction to Saturn Assembly Language (PDF) Third Edition.

I hope that I don't forgot to mention any other important books. If so, add them to this thread.

Cheers

Christoph

Hp50g Serial Number

*Message #1 Posted by **Quan** on 5 July 2009, 1:57 p.m.*

While performing the ROM upgrade for the first time, ever, via SD card yesterday, I noticed the serial number display after releasing the [+][-] keys to be different from the one on the sticker on the back. The format of the serials is identical.

Is this the actual serial or it means something else?

Thanks.

Re: Hp50g Serial Number

*Message #2 Posted by **Mike Morrow** on 5 July 2009, 10:16 p.m.,*
in response to message #1 by Quan

The same thing can be seen on the HP49g+. They are always different, though the time differential between them seems to vary significantly. On my HP49g+, the internal number is three weeks later than the external. On my HP50g, the internal number is three weeks before the external.

On the HP49g+ and HP50g, if the Development Library has been activated (set system flag -86, then warm restart with a ON+F3), the SERIAL command will be available. When executed, it returns the internal serial number.

Re: Hp50g Serial Number

*Message #3 Posted by **Michael de Estrada** on 5 July 2009, 11:22 p.m.,*
in response to message #2 by Mike Morrow

And on my HP-50g, the internal S/N is also 3 weeks earlier than the external S/N (717 vs 720). So, maybe the internal S/N relates to when the EPROM was burned and the external S/N relates to when the housing was made?

Re: Hp50g Serial Number

*Message #4 Posted by **Quan** on 5 July 2009, 11:57 p.m.,*
in response to message #3 by Michael de Estrada

Thanks all!

I found similar explanation from comp.sys.hp48, which I completely forgotten about when I posted this question.

I only searched the forum but didn't see anything. Nevertheless, it was interesting that they don't match.

The reason I was curious was because I used to work in a cell phone manufacturing facility. The serial number from the bar code sticker always matched the internal serial number. Whenever a repair was

done, a new bar code sticker must be re-printed so it matched the internal serial number. I believe this was done to prevent phony warranty claims.

HP-67 Power trouble

*Message #1 Posted by **benitoprat** on 5 July 2009, 9:34 a.m.*

Hi If I turn off the Off/On switch and put it On again, the HP-67 doesn´t work. Npt a single dot appears. If I remove the battery and put it on againwith the Off/On switch to ON it starts and works perfect, (even the Card Reader)

Please if someone knows how to fix this I would be very grateful

Best regards

Re: HP-67 Power trouble

*Message #2 Posted by **Michael de Estrada** on 5 July 2009, 10:50 a.m.,*
in response to message #1 by benitoprat

Try again with the AC adapter/charger plugged in. Could be battery not fully charged or poor battery connection. Also, could be dirty OFF/ON switch contacts.

Re: HP-67 Power trouble

*Message #3 Posted by **benitoprat** on 6 July 2009, 9:02 a.m.,*
in response to message #2 by Michael de Estrada

Thank you for your answer. I tried with the AC adapter/charger plugged in and with a fresh charged battery (I have an external HP battery charger) and still have the problem. Best regards Daniel

Re: HP-67 Power trouble

*Message #4 Posted by **Michael de Estrada** on 6 July 2009, 9:56 a.m.,*
in response to message #3 by benitoprat

There are others on this forum who have a greater knowledge of this, and may have some ideas. The only thing I can think of is that the capacitors that are used in the LED circuit may be weak, and although the calculator ICs are getting powered, the LEDs are not. Why removal and then re-installation of the battery pack fixes this I do not know. Then again, I could be completely wrong on this, so it is just idle speculation.

HP 71B versions

*Message #1 Posted by **Keith Midson** on 5 July 2009, 1:28 a.m.*

Hi HP world, Can someone please tell me what versions of the 71B are out there? I know of 1BBBB, 2CCCC & 2CDCC. Also what are the differences (memory, speed, features, etc)? Many thanks, Keith

Re: HP 71B versions

*Message #2 Posted by **Allen** on 5 July 2009, 2:13 p.m.,*
in response to message #1 by Keith Midson

Keith, Go to google.com and search on "71b versions".

Re: HP 71B versions

*Message #3 Posted by **Olivier (Wa)** on 5 July 2009, 10:36 p.m.,*
in response to message #2 by Allen

Even faster: Search Here (Sorry, 'could not resist!).

Re: HP 71B versions

*Message #4 Posted by **Keith Midson** on 6 July 2009, 4:43 a.m.,*
in response to message #3 by Olivier (Wa)

Thanks guys - glad that's sorted. I just got "SYNTAX ERROR" when I typed "Google 71B versions" in the 71B! Haha. Keith

Re: HP 71B versions

*Message #5 Posted by **Marcus von Cube, Germany** on 6 July 2009, 1:31 p.m.,*
in response to message #4 by Keith Midson

That's no problem. Just connect your HP-IL WLAN bridge and download Firefox onto your HP-71. You'll probably need a video interface for easier viewing of the results.

;)

Re: HP 71B versions

*Message #6 Posted by **Allen** on 6 July 2009, 5:37 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Actually if they can do it with a 300 buad modem (with youtube posting) it should be possible with an acoustic coupler and a video display using a 71b.

Re: HP 71B versions

*Message #7 Posted by **Garth Wilson** on 6 July 2009, 6:02 p.m.,*
in response to message #6 by Allen

There were 300bps and 1200bps HPIL modems from Firmware Specialists, Inc. (FSI). I pulled out one of my old Educalc catalogs (1987) to get the dope on it:

<quote> Modem 1200 Brand New, and Fast! Print-through software included Free!

Automate your telecommunications, gather remote data! Direct-connect, 300/1200 baud, AC/DC rechargable [sic] auto-dial/auto-answer-- all with integral HP-IL interface and Hayes command set.

Tone or pulse, full or half duplex mode, baud rate, 7 or 8 data bits, 1 or 2 stop bits, odd or even or no parity (program-selectable). Senses speed at which incoming data is being received and adjusts itself accordingly.

Stock #IL-796 [Modem 1200] List $349.....$299.95 <end quote>

Of course since you could also get HPIL-to-RS232 interface converters (HP82164A or FSI164A), you could connect one of those to a more-modern, faster dial-up modem too. I've even seen Commodore 64's being used as web servers, so it's not out of the question.

Edited: 6 July 2009, 6:04 p.m.

Re: HP 71B versions

*Message #8 Posted by **Eric Smith** on 6 July 2009, 5:27 p.m.,*
in response to message #1 by Keith Midson

Those were the only three versions released to production. The differences are bug fixes, although 2CCCC introduced a nasty bug that resulted in the minor update to 2CDCC.

Re: HP 71B versions

*Message #9 Posted by **Keith Midson** on 6 July 2009, 10:14 p.m.,*
in response to message #8 by Eric Smith

The best web site I found that explained it all was this: http://www.jeffcalc.hp41.eu/emu71/bug71.html
I was hoping that there were features that made the differences between the version akin to the 41C/CV/CX series, but it's all about bugs, bugs and bugs. AND there isn't even a version with a red dot ... It hasn't stopped me from getting 1BBBB, 2CCCC & 2CDCC though.

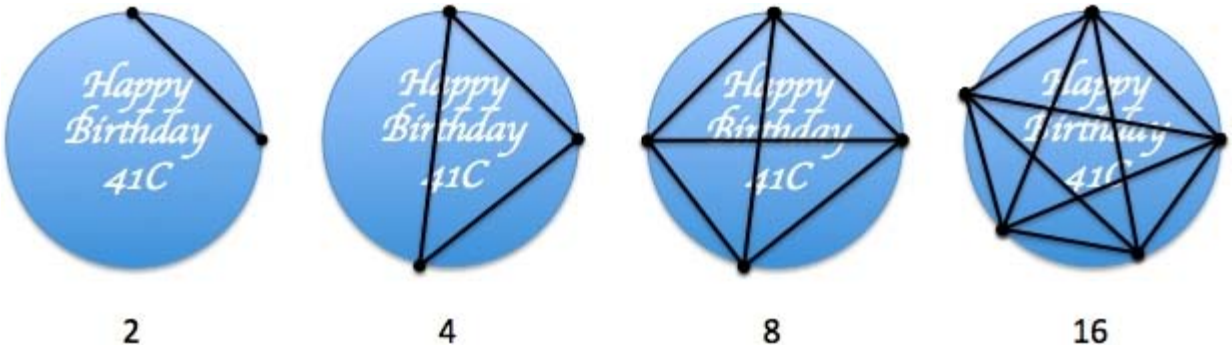
41C 30th Birthday Game

*Message #1 Posted by **Egan Ford** on 4 July 2009, 5:28 p.m.*

The 30th anniversary of the 41C is almost upon us. So dust of your 41 and give this simple challenge a try. What? No 41C? No worries, any calculator will do.



Above is a classic round birthday cake. As I was placing the candles around the cake I imagined that each candle was connected to each other candle with a line. I then wondered, “If I cut the cake following these lines, how many pieces will I have?” To answer this I drew the above four diagrams representing 2, 3, 4, and 5 candles. Remarkably, this divided the cake into 2, 4, 8, and 16 pieces. With all 30 candles around the edge and the cake divided along the imaginary lines what will be the *maximum* number of pieces?

Edit: Emphasized (italicized) maximum.

Edited: 7 July 2009, 12:46 a.m. after one or more responses were posted

Re: 41C 30th Birthday Game

*Message #2 Posted by **Don Shepherd** on 4 July 2009, 5:50 p.m.,*

in response to message #2 by Don Shepherd

I would say 2^29 = 536,870,912 pieces

Re: 41C 30th Birthday Game

*Message #4 Posted by **Walter B** on 4 July 2009, 5:55 p.m.,*
in response to message #1 by Egan Ford

2^29 = 536,870,912

Re: 41C 30th Birthday Game

*Message #5 Posted by **Don Shepherd** on 4 July 2009, 6:05 p.m.,*
in response to message #1 by Egan Ford

OK, I see, they are right, 2^29. Mybad.

Re: 41C 30th Birthday Game *** Spoiler ***

*Message #6 Posted by **Gerson W. Barbosa** on 4 July 2009, 6:35 p.m.,*
in response to message #1 by Egan Ford

> Quote:
>
> Remarkably, this divided the cake into 2, 4, 8, and 16 pieces.

Unfortunately this scheme fails when we have six candles or more. For six candles, there are 9 diagonals and 24 regions comprised among them, so we'll have 30 pieces, 24 + 6, not 32. Not willing to think, I made a table for a few cases and looked up in OEIS:

```
number of  number of  internal external  number of
candles    diagonals  regions  regions    pieces
    4          2          4        4          8
    5          5         11        5         16
    6          9         24        6         30
```

Searching for the sequence 4, 11, 24, I found

A007678. From a link there, I found 21480 for n=30. Therefore we'll have 21510 pieces (21480 + 30).

Gerson.

Edited: 4 July 2009, 6:39 p.m.

*Message #7 Posted by **Egan Ford** on 4 July 2009, 7:59 p.m.,*
in response to message #6 by Gerson W. Barbosa

Nope, but close.

Re: 41C 30th Birthday Game *** Spoiler *** Not Quite

*Message #8 Posted by **Gerson W. Barbosa** on 4 July 2009, 8:46 p.m.,*
in response to message #7 by Egan Ford

Well, I've just checked this heptagon:

I've counted all the pieces and have found 50 of them which added to the 7 outer pieces make up 57 pieces, in accordance with this table:

n	d	in	ex	pieces
3	0	1	3	4
4	2	4	4	8
5	5	11	5	16
6	9	24	6	30
7	14	50	7	57
8	20	80	8	88
9	27	154	9	163
10	35	220	10	230
11	44	375	11	386
12	54	444	12	456
13	65	781	13	794
14	77	952	14	966
15	90	1456	15	1471
16	104	1696	16	1712
17	119	2500	17	2517
18	135	2466	18	2484
19	152	4029	19	4048
20	170	4500	20	4520
21	189	6175	21	6196
22	209	6820	22	6842
23	230	9086	23	9109
24	252	9024	24	9048
25	275	12926	25	12951
26	299	13988	26	14014
27	324	17875	27	17902
28	350	19180	28	19208
29	377	24129	29	24158
30	405	21480	30	21510

The third column was taken from OEIS A007678 - Number of regions in regular n-gon with all diagonals drawn. So 21510 appears to be the solution. Of course I may be wrong...

P.S.:

There's another OEIS seguence: A006533:

1, 2, 4, 8, 16, 30, 57, 88, 163, 230, 386, 456, 794, 966, 1471, 1712, 2517, 2484, 4048, 4520, 6196, 6842, 9109, 9048, 12951, 14014, 17902, 19208, 24158, **21510**, 31931, 33888...

Edited: 4 July 2009, 9:02 p.m.

Re: 41C 30th Birthday Game *** Spoiler *** Not Quite

*Message #9 Posted by **Egan Ford** on 5 July 2009, 11:15 a.m.,*
in response to message #8 by Gerson W. Barbosa

Great looking picture. It looks like a birthday cake too. I edited the original problem to emphasize the requirement for the *maximum* number of pieces.

BTW, your odd number results are correct.

Re: 41C 30th Birthday Game *** Spoiler *** Not Quite

*Message #10 Posted by **Gerson W. Barbosa** on 5 July 2009, 11:55 a.m.,*
in response to message #9 by Egan Ford

> Quote:
>
> I edited the original problem to emphasize the requirement for the *maximum* number of pieces.

You're right! I overlooked the word *maximum*, something I used to do during examinations... For n=6 for instance it is easy to see the maximum number of pieces will be 31, rather than 30, when the candles are not equally spaced around the cake. It's hard to compute the differences for large n though...

Interesting problem!

I haven't read anything added to the thread so I don't know if the solution has been posted. I did accidentally read the first couple of replies. To be honest, I don't think this is a 2^n type problem as the numbers just seem in the wrong ball-park to me.

However, my method is far from certain and short of drawing out the diagram, I don't know how to prove it and I think my solution only works for an even number of candles.

This answer is dependent on equal spacing of each candle round the perimeter. With non-equal spacing, you can't actually answer the question. So...

My result which I am far from confident on is: 5940. (give or take 30 maybe).

Mark

Yes, it was a silly thing to say and I've realised that now but at the time, I was thinking that intersections that didn't meet would form a number of additional sections which would be extremely difficult to calculate.

I would like to see an explanation for how the example 15C programs calculate the correct result please. The method I tried using was based on dividing the circle into a number of triangles where you could easily calculate the number of intersections and then the number of individual portions. However, this only worked up to a point because it then left a polygon in the middle and my attempt to find a way of counting portions in that polygon failed.

So a friendly explanation would be much appreciated!

Mark

*Message #14 Posted by **Gerson W. Barbosa** on 5 July 2009, 4:21 p.m.,*
in response to message #13 by Mark Edmonds

There's an OEIS sequence, A055795, which replicates the table generated by Valentin's program when 1 is added to each term. The sequence is called *Binomial(n,4)+binomial(n,2)*, hence the HP-15C program. Of course this doesn't answer your question. The exact sequence related to this problem is OEIS A000127. You can find some links therein, like this one: Regions of a circle Cut by Chords to n points, which may be of help.

It is interesting to notice Egan's pictures suggested the candles did not have to be equally spaced, which was nice. Cutting along all those diagonal is not an easy task, now imagine placing all thoses candles on the edge of the cake so they make up a regular polygon...

Congratulations for trying to solve the problem by yourself! (unlike me)

Gerson.

Mark,

I'll provide an explanation of both Valentin's and Gerson's solutions shortly. However, if you want to figure it out, then I would suggest that you start with any circle with at least four points and then draw the chords slowly and write down all your observations. You'll *see* it.

Hello Valentin,

nice formula! But I'd prefer an explanation over an implementation. I don't even see easily why the polynomial always produces an integer result.

This form of the result seems quite elegant, R(n) the number of cake regions:

I've been trying to think of whether it makes the result any easier to understand. for example, it's the sum of combinations of pairs, triangles and quads for all points except one. but why?

Also, in a variation, if you didnt want to cut all the combinations of points but just wanted to make 15 cuts across the cake. can you achieve `n' new pieces for each nth cut, so that the total after n cuts = n(n+1)/2+1

Further, suppose you could place the candles anywhere on the cake (but not co-linear), but wanted to minimise the number of pieces.

so, for 6, instead of:

Click and discover Imageshack.

you have,

You would then have the rectilinear crossing number of intersections. eg for 6 point K6 (above) this is 3. is the RCN related to the number of regions created and if so does this mean the number of pieces is NP-complete to calculate.

?

I've shown below that R(n) = 1 + C(n,2) + C(n,4). You have shown that:

```
R(n) = C(n-1,0) +  C(n-1,1) + C(n-1,2)  +  C(n-1,3) + C(n-1,4)
```

So,

```
R(n) =     1    + (C(n-1,1) + C(n-1,2)) + (C(n-1,3) + C(n-1,4))
```

```
R(n) =     1    +         C(n,2)        +         C(n,4)
```

It's the only relationship I see.

Here Dr. Math explains the formula 1 + C(n,2) + C(n,4), which clearly produces integer results. It is equivalent to

```
1 + n!/(2!(n - 2)!)) + n!/(4!(n - 4)!)) =

1 + n(n-1)/2 + n(n-1)(n-2)(n-3)/24 =

1 + (n^4 - 6n^3 + 23n^2 - 18n)/24
```

Regards,

Gerson.

Re: 41C 30th Birthday Game -- Solution

*Message #24 Posted by **Egan Ford** on 6 July 2009, 11:53 p.m.,*
in response to message #1 by Egan Ford

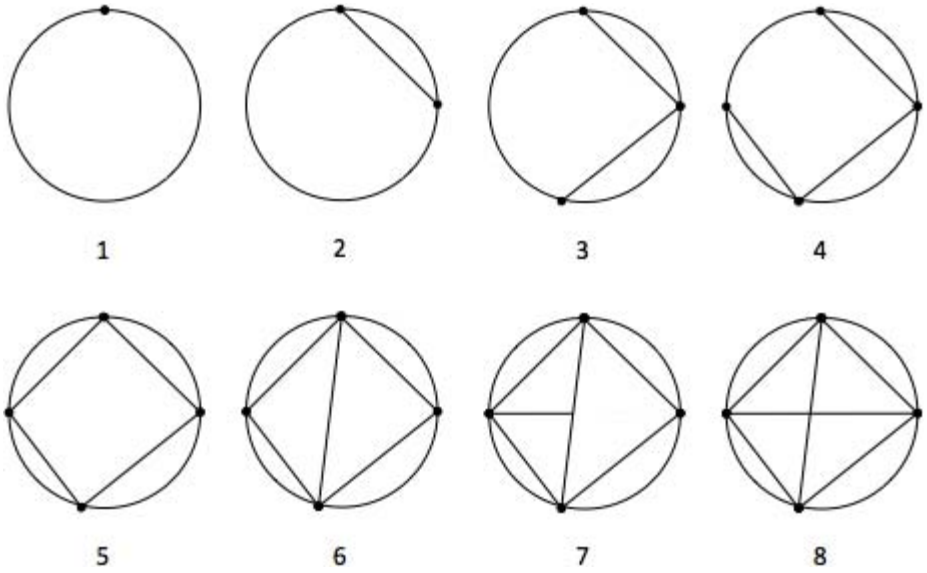
> Quote:
>
> With all 30 candles around the edge and the cake divided the along the imaginary lines what will be the *maximum* number of pieces?

The answer is 27,841.

The number of pieces for any *n* number of candles is:

$$1 + C(n,2) + C(n,4)$$

This formula can be obtain from the following observations:



With one point there is one region. Each time a chord is added an existing region is split into two and the overall region count is increased by one. For steps 1-6 above this should be straightforward.

When a chord intersects with another chord, the chord still splits a region in two, however it also splits any region that has the intersected chord as an edge. (Follow step 7 to 8).

That's it, so the number of regions is:

initial regions + number of chords + number of intersections

The *initial regions* is 1. Since all points connect to all points the number of chords is the number of unique combinations of point pairs or C(*n*,2). And, since two unique chords make a unique intersection and four unique points make two unique chords, then the number of intersections is the number of unique combinations of four points or C(*n*,4). Therefore: regions = 1 + C(*n*,2) + C(*n*,4). And that is the formula used in Gerson's 15C solution.

Unfortunately the 41C does not have a combination function, and for large *n* such as 30, you cannot create your own using *n*!/*k*!(*n*!-*k*!). The only 41C module I could find that had a combination function was the PPC ROM and its implementation hoses Z making chain calculations challenging. However there is a better COMB function by Werner Huysegoms that can be obtained from here http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=39655 message #13. With this COMB loaded into my 41C, I can use the following program to compute the number of pieces created by 30 candles:

```
01 LBL "BDAY"      13 ST- Y           25 LASTX
02 STO 00          14 X>Y?            26 INT
03 4               15 X<>Y            27 ST/ Z
04 XEQ "COMB"      16 +               28 RDN
05 RCL 00          17 1 E-3           29 DSE X
06 2               18 ST* L           30 ISG L
07 XEQ "COMB"      19 X<>Y            31 GTO 02
08 +               20 ISG L           32 LBL 00
09 1               21 X=0?            33 RDN
10 +               22 GTO 00          34 1 E3
11 RTN             23 LBL 02          35 *
12 LBL "COMB"      24 ST* Y           36 END
```

An alternative would be to expand 1 + C(*n*,2) + C(*n*,4) to:

$$1 + n(n-1)/2 + n(n-1)(n-2)(n-3)/24$$

and then simplify to (the lazy may just want to cut and paste into Wolfram Alpha):

$$(n^4 - 6n^3 + 23n^2 - 18n + 24)/24$$

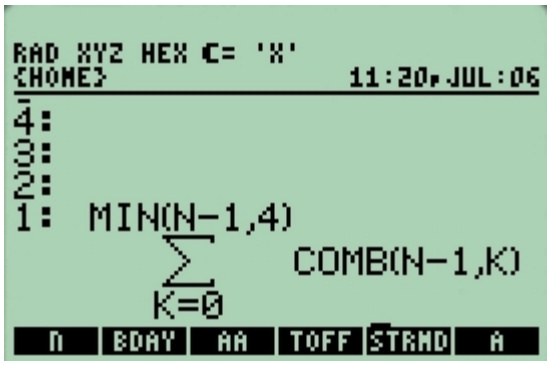
Look familiar? This was the approach taken by Valentin. Here is my 41C version using the same:

```
01 LBL "BDAY2"      14 X^2
02 ENTER^           15 23
03 ENTER^           16 *
04 ENTER^           17 +
05 4                18 X<>Y
06 Y^X              19 18
07 X<>Y             20 *
08 3                21 -
09 Y^X              22 24
10 6                23 +
11 *                24 LASTX
12 -                25 /
13 X<>Y             26 END
```

Hugh also pointed out an interesting relationship to the sum of the first five values of the n^{th} line of Pascal's Triangle:

```
n =  1                        1                              R(n) = 1
n =  2                     1     1                           R(n) = 2
n =  3                  1     2     1                        R(n) = 4
n =  4               1     3     3     1                     R(n) = 8
n =  5            1     4     6     4     1                  R(n) = 16
n =  6         1     5    10    10     5     1               R(n) = 31
n =  7      1     6    15    20    15     6     1            R(n) = 57
n =  8   1     7    21    35    35    21     7     1         R(n) = 99
n =  9 1     8    28    56    70    56    28     8     1      R(n) = 163
n = 10   1     9    36    84   126   126    84    36     9     1   R(n) = 256
```

For grins, expand Hugh's equation and then simplify. You'll get the same equation Valentin used. Or just use as-is, here is my 50g version:



What I like best about this challenge is that it is so easy to get mislead. 2^{n-1} is a common answer to this problem. And, if you assume a perfectly even distribution of points, then you get the minimum for even numbers, not the requested maximum. My drawings were intentionally unevenly distributed as a hint.

Thanks to all that participated in this birthday challenge.

Edited: 7 July 2009, 1:58 a.m.

Re: 41C 30th Birthday Game -- Solution

*Message #25 Posted by **Valentin Albillo** on 7 July 2009, 5:39 a.m.,*
in response to message #24 by Egan Ford

Hi, Egan:

Egan posted:

"(n4 - 6n3 + 23n2 - 18n + 24)/24

Look familiar? This was the approach taken by Valentin. Here is my 41C version using the same:

```
01 LBL "BDAY2"      14 X^2
02 ENTER^           15 23
03 ENTER^           16 *
04 ENTER^           17 +
05 4                18 X<>Y
06 Y^X              19 18
07 X<>Y             20 *
08 3                21 -
09 Y^X              22 24
10 6                23 +
11 *                24 LASTX
12 -                25 /
13 X<>Y             26 END
```

"

First of all, thanks for the challenge and your very detailed, thorough solution, and most especially for the considerable time and effort you generously put in it, much welcomed and appreciated.

Now, that said, and in regard with your quoted 41C RPN solution above ... **Egan, please !!!**

It hurts the eyes, man !! ... :-)

Didn't you ever heard of **Horner's Rule** as a particularly efficient way to quickly and accurately evaluate polynomials which further is uncannily suited to RPN and which was *mentioned, demonstrated, and heartily recommended in each and every HP classic calculator's manual since the very beginning*, even for non-programmable models ?

The obvious plain-vanilla RPN solution for the HP-41C (or any RPN model for that matter) using it is as follows:

```
01  LBL "VBDAY"
02  ENTER
03  ENTER
04  ENTER
05   6
06   -
07   *
08   23
09   +
10   *
11   18
12   -
13   *
14   24
15   +
16  LASTX
17   /
18  END
```

which is *8 steps shorter* (31 %), simpler, clearer, and much faster as well !

Taking into account your extreme proficiency when solving my past S&SMC challenges, I'm really surprised indeed ! ... :-)

Were you one of my students you'd be getting an **F-** for this and a severe reprimand as well ...

Best regards from V.

> Didn't you ever heard of **Horner's Rule** as a particularly efficient way to quickly and accurately evaluate polynomials which further is uncannily suited to RPN and which was *mentioned, demonstrated, and heartily recommended in each and every HP classic calculator's manual since the very beginning*, even for non-programmable models ?

Sheez! What was I thinking?! I wasn't...

To be perfectly honest I lazily typed the expansion into Alpha, scrolled down to the *Alternate form:* and proceeded to enter the polynomial into my 41 emulator from left to right. It never occurred to me to use *Horner's Rule*. Most amateurish. Ah, the shame... :-)

Now I assure you that if this polynomial had be longer, then a deeper laziness would have kicked in (you know, that type of laziness where much more time is spent thinking about it so that much less time can be done doing it. Often the total time is greater as is the satisfaction).

> Quote:
>
> Taking into account your extreme proficiency when solving my past S&SMC challenges, I'm really surprised indeed ! ... :-)

It'll never happen again as long as my stack (short term memory) gets checked into my registers (long term memory).

> Quote:
>
> Were you one of my students you'd be getting an **F-** for this and a severe reprimand as well ...

Man, Dad will be disappointed. It's going to be a long day, and its starting to rain here in Toronto. Good grief. :-)

Re: 41C 30th Birthday Game -- Solution

*Message #27 Posted by **Gerson W. Barbosa** on 7 July 2009, 11:16 a.m.,*
in response to message #26 by Egan Ford

Actually, for the program to fit in 18 steps Horner is not necessary in this case. If we rewrite the polynomial as

$(24 + n(n - 1)((n - 2)(n - 3) + 12))/24 =$

$(24 + (n^2 - n)((n-2)^2 - (n-2)) + 12))/24$

then one possible HP-41 program will be

```
01  LBL "BDAY3"
02   x^2
03  LASTX
04   -
05  LASTX
06   2
07   -
08   x^2
09  LASTX
10   -
11   12
12   +
13   *
14   24
15   +
16  LASTX
17   /
18  RTN
```

Horner is more efficient though as it will require less operations (two multiplications and two subtractions versus three of each kind here).

Gerson.

Not that it is of any relevance to where I live of course, but how about these two gems:

```
4 SIN e^x ->H.MS 6 +
4 LN 3 3 / 7 +
```

The first is good in degrees mode on many/most scientific models. The second works on a 12c and is only one operation longer. Both need FIX 6 set.

*Message #6 Posted by **Gerson W. Barbosa** on 5 July 2009, 8:12 p.m.,*
in response to message #5 by Paul Dale

Getting them in just a few steps is very hard. I would guess you have written a special software to find them... If such is the case, it is interesting just the same.

Twice as much steps on the 12c but relevant to where I live:

```
EEX 2 12x ENTER 7 e^x EEX 3 / LN - LN
```

It works with the 12c default FIX 2 (but would work up to FIX 7). Our national date in our date format, DD.MM... :-)

Regards,

Gerson.

P.S.: Not so exact but works with FIX 2 and takes the same number of steps it would need to just writing the date:

```
EEX 2 12x LN
```

Yes, I do have a little helper program that simplifies searching for these :) It started off just applying a set of functions to a value and printing the nearer misses. Later, it grew to allow several function applications. Now it is closer to a mini-rpn calculator that does a real search. My goal is to ultimately have it do an automatic search.

I've been meaning to finish it and clean it up so I can post it online for one and all to use. When I get some time and motivation...

Looking forward to it! Quite useful when one wishes to save some steps when entering constants in programs. For other applications, Inverse Symbolic Calculator might be an option. It correctly identifies 7.04200892003 as '7+2/33*LN(2)' but doesn't simplify it (Advanced lookup). However it fails for 7.04200900084: it just returns "*Wow, really found nothing.*" That'll require Valentin's HP-71B program (Datafile V26N2P24, March/April 2007).

Regards,

Gerson.

*Message #4 Posted by **Randy** on 4 July 2009, 3:56 p.m.,*
in response to message #1 by asher levy

Don't start cutting it apart assuming it is a failure of the plug. The easiest check is to measure the resistance from the center pin to either outer pin. If either measurement is infinite, yes, the wire has most likely failed at the plug. But, it is just as common for the 400uf capacitor to fail. There is a schematic online here:

Classic charger schematic

PS: If repair is out of the question, list a want to buy in the classifieds here. Beyond that, eBay is about the only source.

Re: hp 45 charger

*Message #6 Posted by **Gerry Schultz** on 6 July 2009, 4:56 p.m.,*

in response to message #5 by asher levy

I repaired the AC charger for my HP-55 quite easily. In this case, the charger would run the 55 on AC but never charge the battery. I bought a generic PNP power transistor (I would have to go home to look) from Radio Shack, traced out the schematic from the circuit board layout and replaced it. You do have to be care for the Base, Emitter and Collector layout as the replacement part is different from the original. There is plenty of space inside of the case for the new part. Now it works great.

If the cord is bad at the connector end, I have seen replacement cord kits show up on eBay periodically. I got one for when my cord fails. If the cord it bad at the PS side, then just cut out the bad section and re-solder. As Randy suggests, do some continuity tests first to figure out where the problem is.

Oh, I almost forgot, when you pull the power supply case apart, be sure to keep track of the 120v/240v switch parts so you can put it back together properly. I think some people have hard-wired the switch to 120v, but I think that reduces the value of the PS. I just cleaned the contacts for more reliable operation.

I'll look up the parts I bought and post them.

Good Luck,

Gerry

in response to message #1 by asher levy

Not long ago I would've sold you one cheaply, but as I am left with only two I want to keep both (one to use, one as backup) to charge my 45, 65, 67, and 80.

These adapters are fortunately not rare and can be had for a price via The Auction Site That Must Not Be Named.

I advice against cutting these things open, as Randy can attest, given that he usually is the one to correct my "experiments". Unlike many here, I am dangerous with a soldering iron.

HP-35s simulator: Alternate skins?

*Message #1 Posted by **Dan Greil** on 4 July 2009, 11:41 a.m.*

I was surprised HP made the Voyager simulators realistic yet slapped a gimmicky skin on the HP-35s. They already have great images to work with - like the image they used on the back of the HP-35s packaging.

Anyway, before I pay $30 for this simulator, I had a few questions for those that already have:

1) Does the HP-35s simulator support alternate skins?

2) If so, is the skinning self-contained in the executable or can we create and apply our own skins?

3) Are there any noteworthy features in the Windows menu bar (i.e. the File, Edit, View, Tool, Help menus)?

4) Is there a 'Check for Updates' menu option or something similar? Just curious if there's any hint we're to anticipate updates or not.

Thanks,

Dan

Rounding conventions

*Message #1 Posted by **Wayne Best** on 4 July 2009, 9:16 a.m.*

Dear All,

I'm sure this must have been discussed before but I couldn't find it so apologies if it's a repeat.

When trained as a scientist many years ago I was taught that when rounding numbers the convention was to round 5's to the nearest even number, thereby averaging out any introduced error when working with data. Everything I've seen and done in science in the last 30 years has reinforced this convention. I've only just found out that rounding away from zero (i.e., rounding up for positive numbers) is also an acceptable convention according to IEEE Standard Arithmetic. While this may be ok for accounting and finance, it introduces a bias when rounding data sets, and would appear to be unsuitable for many scientific applications especially those involving sets of data. I've used numerous calculators (nearly all HP) and they all round away from zero even calculators clearly designed for scientists and engineers like the 41C and 15C. I've also looked through a few of my manuals and I can't find any real discussion on the subject and there doesn't seem to be any setting or flag to allow the user to choose between the rounding methods. This is very inconvenient because it means that the number displayed is not the true rounded number (according the the scientific round to even method).

So, my question is, why do all these calculators, even the scientific ones, use this round away from zero method, and is there any way around the problem (other than witting a program)? Are there any calculators on the market that round "properly" for a scientist?

Thanks, Wayne

Re: Rounding conventions

*Message #2 Posted by **Gerson W. Barbosa** on 4 July 2009, 11:53 a.m.,*
in response to message #1 by Wayne Best

On the HP-71B you can choose one out of four rounding methods:

```
OPTION ROUND NEAR  (default)
OPTION ROUND ZERO  rounds towards zero
OPTION ROUND POS   rounds up
OPTION ROUNT NEG   rounds down
```

These can also be selected by clearing or setting the appropriate flags (-11 and -12).

See HP-71B Owner's Manual, pages 56 and 198.

For more on HP rounding philosophy refer to

Re: Rounding conventions

*Message #3 Posted by **Wayne Best** on 4 July 2009, 12:22 p.m.,*
in response to message #2 by Gerson W. Barbosa

Thanks Gerson,

I have a 71B and this still doesn't round the display "properly". The 71B (like other calcs) still appears to use "round away from zero" for the display when the last digit is 5. For example, enter 2.005 with a fixed 2 decimal place format and it will show 2.01 instead of what most scientists would want, 2.00. It seems to me from checking p56 of the manual that "OPTION ROUND NEAR" only dictates how the 71B rounds the final 12th digit, not how it rounds the currently viewed display (eg, fixed 2).

Cheers Wayne

*Message #4 Posted by **Quan** on 4 July 2009, 1:03 p.m.,*
in response to message #3 by Wayne Best

Hi Wayne,

I am curious as to why you or most scientists would want to round down to 2.00 instead round up to 2.01?

If there was a reason, I surely cannot recall as I can only remember to round up. Last year I helped my niece (3rd grade) with her homework, and the school also taught rounding up.

Thanks.

Quan

Re: Rounding conventions

*Message #6 Posted by **Don Shepherd** on 4 July 2009, 1:45 p.m.,*
in response to message #1 by Wayne Best

Schools teach it this way: if the digit to the right is 0, 1, 2, 3, or 4, leave the rounding-to digit alone; if the digit to the right is 5, 6, 7, 8, or 9, add 1 to the rounding-to digit. So, five digits go one way, five digit go the other way. Sounds fair to me. I thought that is how all calculators do it too.

Re: Rounding conventions

*Message #7 Posted by **Thomas Radtke** on 4 July 2009, 2:55 p.m.,*
in response to message #6 by Don Shepherd

Don, 0.5 is the average of 0 and 1. If you always round it up, you'll introduce a bias. If your rounding depends on whether the INT is even or odd, you get rid of the bias in most cases. That's how I understand it. I might be wrong though :^).

Re: Rounding conventions

*Message #8 Posted by **Walter B** on 4 July 2009, 5:45 p.m.,*
in response to message #7 by Thomas Radtke

That's what I like at this forum: There's a good chance I learn something I didn't know before. I admit I had no idea about round-to-even and the reasons for it (or have forgotten that completely), though having a Ph.D. in physics and having worked with large data sets (way back).

IMHO, in real life the error introduced by rounding 5 up (as I did it so far all the time) seems neglectable as long as you discard more than one digit in rounding.

Re: Rounding conventions

*Message #9 Posted by **Don Shepherd** on 4 July 2009, 6:12 p.m.,*
in response to message #7 by Thomas Radtke

So, 92.5 would be rounded to 92 (nearest even number). OK, one of you engineers will have to come to my math class and explain to my students why a 92.5 average results in a B now, rather than an A, on their report cards (standard range for A is 93-100). Jeesh, no wonder kids hate math! :)

A 92.5 average *should* get a B, rather than an A, shouldn't it?

They don't hate averaging, do they? Rounding is easier than averaging.

You can't round to 2 digits before you do the comparison "IF score < 93 THEN grade = B.

Re: Rounding conventions

*Message #11 Posted by **Katie Wasserman** on 4 July 2009, 3:27 p.m.,*
in response to message #1 by Wayne Best

Actually, I'm not so sure that it's ok in finance either. I work on wall street and I've never personally seen any programs using the round-to-even method, but they call it "Banker's Rounding" here which must mean that some financial places do that.

I can't think of a single hand-held calculator (not even the HP-50g) that has round-to-even as a possible rounding method. But some large math packages have this; Mathematica's "rint" function, for example.

Edited: 6 July 2009, 2:25 p.m. after one or more responses were posted

All the Saturn based calcs do round-to-even arithmetic (except the HP71 can do something else if selected); it's just the display rounding that isn't round-to-even

Re: Rounding conventions

*Message #13 Posted by **Katie Wasserman** on 5 July 2009, 12:25 a.m.,*
in response to message #12 by Rodger Rosenbaum

I thought that we're talking about display rounding in this thread. The original post said:

> Quote:
>
> While this may be ok for accounting and finance, it introduces a bias when rounding data sets, and would appear to be unsuitable for many scientific applications especially those involving sets of data.

The "data sets" imply that the data was from an experiment or whatever and input into the calculator. So I thought that the discussion has been about display rounding on input not rounding of the internal functions to their maximum accuracy.

Edited: 5 July 2009, 12:31 a.m.

Re: Rounding conventions

*Message #14 Posted by **Rodger Rosenbaum** on 5 July 2009, 3:51 a.m.,*
in response to message #13 by Katie Wasserman

But display rounding on input has no effect on the data that ends up in a data set in the calc (to be processed further, presumably).

The data could have been captured from an HPIL device, such an HP3468 voltmeter. In that case, clearly display rounding has no effect on the captured data.

Even if the data were typed in, the fact that the typed-in data appears different in the display doesn't change what is stored in a variable.

For example, if the calc is in FIX 2 mode and you type in 2.005, it doesn't matter that the display shows 2.01; the number upon which arithmetic will be performed is still 2.005

The display rounding only matters when the human operator is looking at the final result.

Re: Rounding conventions

*Message #15 Posted by **Katie Wasserman** on 5 July 2009, 12:28 p.m.,*
in response to message #14 by Rodger Rosenbaum

How about if assume that the user enters the data via a program (keystroke entry or HP-IL device) and that the program uses the Round Function in the calculator (usually marked as RND on HP calculators) to force the data to N decimal places as set by the display format. I think that this would be a likely scenario for entering data into a calculator and display rounding is important since RND works based on display rounding.

Re: Rounding conventions

*Message #16 Posted by **Wayne Best** on 6 July 2009, 8:05 a.m.,*
in response to message #14 by Rodger Rosenbaum

Just to put this into the context of my real life situation. I was using my calculator to calculate the purity of a number of samples of a chemical. There are a number measurements (weight, volume, detector response, etc) for each purity calculation which I manually enter into the calculator to produce the answer. The number of significant figures I need (based on errors involved in the measurements) is 4, ie xx.xx% So I set my calculator to FIX 2, and just read off the (rounded) answers. I report these individual purity measurements separately. At this point all the answers have been rounded up which is probably no real issue but then I want to average these purities and this is when the bias introduced by rounding up (rather than to even) becomes an issue because the average purity will be slightly higher than it really should because all the 5's have been rounded up. I realise the error will be small but it could (and should) be removed entirely by simply rounding to even. I hope this makes sense and explains why this is a real problem. You may well ask why didn't I just use a spreadsheet for the whole process but this is another story .....

Re: Rounding conventions

*Message #17 Posted by **Garth Wilson** on 6 July 2009, 3:08 p.m.,*
in response to message #16 by Wayne Best

Makes sense; but even if you don't want the calculator to keep all the values simultaneously and then average them at the end, you could still have the calc keep a running average and

avoid the problem. One register keeps the total of the results, and another one keeps the number of results added together to get that total, so at any time you can divide one by the other to get the average so far, to as many digits as you want, even if individual purities were dispalyed in only FIX 2.

Re: Rounding conventions

*Message #18 Posted by **Wayne Best** on 7 July 2009, 10:42 a.m.,*
in response to message #17 by Garth Wilson

Thanks Garth

That would certainly solve the problem in many cases. But there are a couple of issues that still remain. I should also point out that as well as needing the average, I also needed the standard deviation because I had to multiply this by a factor (based on the number of samples) to give an error to a 95% confidence limit.

Firstly, I was using a HP21 which, with only 1 memory register and no Stats, wasn't capable of doing what you suggest. Ok, I could have reached into my calculator cupboard and pulled out any number of calculators which could have handled this easily so it's not really much of an excuse.

Secondly, and this is my main concern, I have collaborations with biologists, pharmacologists, computational chemists, and other disciplines. We routinely exchange data sets back and forth for various types of analysis. Naturally, we only send/receive the data with the appropriate number of significant figures, ie rounded data. So now we have (or sent) a biased data set which then gets used in further analysis. I accept that any errors will be small and in most circumstances will not have a material effect on the results. But I think the point is that, if the rounding were done "properly" then there would be no issue at all.

Thirdly, and this is the actual event which highlighted the issue to me. I had to report the data and the average result to the client. So the option was to report the average of the rounded data (even though this was slightly higher than the real average) or report the real average based on the unrounded data even though this wasn't exactly the average of the reported results. It sounds rather pedantic but the report was to be presented in court in relation to a patent dispute. If the report had even a minor inconsistency like this, it could impact on our credibility as an expert witness. In the end I just manually rounded the data using the round to even method and that was fine. But it did strike me as odd that scientific calculators couldn't round "properly" and hence my post on this forum. I was hoping that there might be some undocumented trick such as setting a flag but it seems not. I'll be the first in line to buy the first calculator than can round to even!

It's true that most of our "number crunching" these days is done in spreadsheets but there's nothing quite like running the numbers through a calculator yourself to really have faith in the answer.

Re: Rounding conventions

*Message #19 Posted by **Gerry Schultz** on 7 July 2009, 1:07 p.m.,*
in response to message #18 by Wayne Best

Wayne:

I have been reading this thread for the last couple of days. It has made me think

about rounding conventions after many years and this morning I was struck with the thought of why are you using an HP calculator to process this data? I can understand wanting to use an HP calculator to manually process the data sets to confirm what an Excel spreadsheet has done, but in this discussion, you have implied that you are passing data processed in the calculator on to your coworkers.

I am the first to admit that I know nothing about what you do or how careful you need to be with your data. But, if this data is going to be used in a legal proceeding and any question is raised by an attorney about how you reached you expert conclusions, I would think you would want a well documented trail to deflect any question of credibility. I lived with an attorney for 5 years and she always looked for any means to discredit an expert witness in a trial.

My thought, in my tiny mind, is that an HP calculator should be used as an independent means to confirm the validity of your Excel processed data sets which increases you confidence when on the stand and if asked if you confirmed this data you have that HP calculator ace in your back pocket and have dealt with any potential rounding errors.

It's not that HP calculators are not "good" enough to do this work, it's that if your legal opponent catches wind that you used a calculator to process this data and he was technical enough (and some attorneys are) he could ask about rounding errors during cross-examination and place doubt in the eyes of a naive jury. Just ask any criminal attorney about what the CSI TV shows have done to the public's perspective on how crime scenes are processed. Then stand back and be prepared to cover your ears.

Others in this thread have covered well the issue of rounding errors and your posts show that you are rightly thinking about this issue. I've enjoyed this thread as it has made me think about things I have taken for granted or forgotten. I always look forward to the next posted question. What else we will all learn?

Gerry

Re: Rounding conventions

*Message #20 Posted by **Jeff Kearns** on 7 July 2009, 1:50 p.m.,*
in response to message #18 by Wayne Best

I too have been following this thread with interest and I found it odd that the data sets are not analyzed in Excel or even better, a proper statistical analysis package like Minitab or Statistica.

On the one hand, there is the issue of expert witness credibility and on the other hand the desire (for whatever reason, albeit not fully explained) to use a time-consuming handheld calculator, with no 'paper trail' to show exactly how the data were processed.

For your sake, I hope that there are not more a handful of data pairs... Would you be willing to share examples of the data with the forum in such a fashion that we are unable to determine the units or purpose - just for discussion purposes?

Jeff Kearns

Re: Rounding conventions

*Message #21 Posted by **Jeff Kearns** on 7 July 2009, 1:59 p.m.,*
in response to message #20 by Jeff Kearns

My curiosity is really piqued now...

I have analyzed some rather interesting data sets in my day (LeanSigma practitioner) and have always been impressed with the rapidity and reliability of a HP 49G+ or a 50G to calculate summary statistics, confidence intervals and conduct hypothesis testing on relatively small data sets (>20 pairs).

Just how many of your data points end in 5's anyway? What is the worst case difference (statistically speaking) in mean values between the two rounding methods for your data sets? It seems to me that the difference would be negligible. I need to see the data!!!

Jeff

Edited: 7 July 2009, 2:03 p.m.

Re: Rounding conventions

*Message #22 Posted by **Wayne Best** on 8 July 2009, 12:14 p.m.,*
in response to message #21 by Jeff Kearns

Dear Jeff and others

Thanks for your comments. I was trying to keep my description of the problem and how it arose simple so as not to confuse or bore people but here is a bit more background for those that are interested in the origin.

Unfortunately, we don't have any nice stat packages and we probably couldn't justify the cost as most of our number crunching is pretty basic stuff. And no, I'm neither a troglodyte nor masochist, I do most of this sort of work in a spreadsheet, not a calculator :) I use OpenOffice not MS Excel but I don't think there's much difference. OpenOffice, like the calculators, does not round to even but rather rounds all the 5's up. In my "real life" example

The actual data to be analysed was relatively small, 6 standards (in triplicate) to calculate a standard response (by linear regression) and then 8 samples (in triplicate) which were fitted to the regression to calculate concentration from which purity was finally calculated. There was several stages involved in the calculations with the early stages being manually recorded in a lab book before being transferred to a spreadsheet for further calculations and linear regression. The final spreadsheet was then brought to me for checking. I like to check results ab initio by an independent process rather than just check what has been done. As the data set was relatively small I thought I'd just check a few selected preliminary calculations manually by calculator (HP21) and then check the regression and line fitting for which I pulled out my 48GX (I wasn't aware that it could calculate confidence limits so thanks for the tip, I'll look into that). This is the point at which the saga began to unfold because my 8 manually calculated purity results did not agree with the spreadsheet. It took some time to find the source of the discrepancy between the two methods which had nothing to do with rounding up versus rounding to even but an inappropriate manual rounding of the slope and intercept in

the spreadsheet was part of the problem. However, in tracking down the problem I started to take a closer look at potential sources of error and the rounding issue arose. I think the maximum error is only 1 in the final significant digit. So if you have 4 significant digits the error should only be between 1 in 1,000 to 1 in 9,999 but if you are rounding to only 2 significant figures it could in theory be as high as 1 in 10 (it's just gone midnight here and my mind is getting a little fuzzy so you might want to check that :))

From this simple data set (2.05, 2.15, 2.25, 2.35, 2.45, 2.55) you can see that the error is 0.1 in 2.3 or just over 4%, not insignificant at all. Ok, it does contain a lot of 5s. You ask "how many numbers end in 5 anyway" and this really does depend on where the numbers come from and how many significant digits you drop off a t a time. I guess from normal calculated numbers one would expect only 10% of numbers would end in five but for some visual measurements 5s are very common, for example melting points are normally given to the nearest 1/2 degree so every second measurement might end in 5.

I need to look into this a bit more and see what the typical error might be in a more typical data set and significant figure reduction. I suspect it only really becomes significant if one reduces to 1 (not very usual) or 2 (not uncommon) significant figures. Ironically, I think the problem is worse when you only drop one figure because 1 in 10 are 5s whereas if you drop 2 at a time the number of 50's is only 1 in 100. I hope that makes sense.

Also, I think I have found one example of round to even....the HP-95LX has a RND function which seems to do this but I need to look at this in more detail as I don't have a manual for this calc.

Thanks all

*Message #23 Posted by **Katie Wasserman** on 8 July 2009, 1:27 p.m.,*
in response to message #22 by Wayne Best

I tried the RND function on my 95LX and 200LX and I don't think that it works any differently than the RND function on all the other HP calculators that I've tried. Perhaps I'm doing something wrong, is there a particular reason why you think it does a round-to-even on the 95LX?

in response to message #23 by Katie Wasserman

Hi Katie

I'm pretty sure my 95LX is using "round to even" . I am using the calculator feature of the device and have the format set to FIX 2. If I input 2.005 and presse ENTER the display shows 2.01 as all the other calculators do (of course the number is still 2.005). If I then press the RND function (F2) the display changes to 2.00, ie it has actually

rounded down to even. The only downside of this is that it actually changes the number and not just the way it's displayed. It would be nice to keep the original number but just changed the display rounding. When I try the same procedure using the RND feature of the 41CV or 15C the result is 2.01 not 2.00 so it seems that the 95LX is the odd one out here. I wonder why this is? Perhaps it has something to do with it running on a DOS system? Unfortunately, I don't have a manual for the 95LX. Give it a try and let me know if it works for you, perhaps there is an option on the 95LX for this?

Regards Wayne

*Message #25 Posted by **Thomas Radtke** on 9 July 2009, 3:02 p.m.,*
in response to message #24 by Wayne Best

It appears to be the default method of the 95LX calculator application. Interesting.

Edit: I almost forgot I have the manual. The RND description is wrong. It states that the number is rounded to correspond with the number displayed.

Edit 2: Serial ABD3128A03721

Re: Rounding conventions

*Message #26 Posted by **Katie Wasserman** on 10 July 2009, 9:31 p.m.,*
in response to message #24 by Wayne Best

Wayne,

I just tried your example on my 95LX and it doesn't work as yours does. Setting format Fix 2 and entering 2.005 will show 2.01 certainly. But when I press RND (F2 on the MATH menu) the X register stays at 2.01. I get the same results in ALG mode as I do in RPN mode I don't think that there are any other options that can be set in the calculator that would effect rounding. Could your 95LX and mine be different ROM versions with a changed Calc program?

My 95LX is the last release based on the information found here. The serial numbering prefix found on this same page does not agree with the number of my machine, it's SG30300278 which indicates that it was made early in 1993 I think.

*Message #27 Posted by **Wayne Best** on 11 July 2009, 7:15 a.m.,*
in response to message #26 by Katie Wasserman

Hi Katie

Gee, that's really odd. Mine is a USA made model S/N ABA3139A00067 and is the early 512k version. I understand (from the excllent link in your post) that the calculator applet is based on the 19BII which also rounds up not even. I wonder if mine is an earlier version which came with round to even which was "fixed" in later models. Or perhaps mine is broken or I'm doing something wrong? I'd be interested to hear from other 95lx owners about the behaviour of theirs.

Regards Wayne

Does Excel round-to-even?

The answer to your original question is that HP calcs don't do what you want when display rounding is in effect.

However, if you want a properly rounded-to-even result with a fixed 2 digits after the decimal point that will also display properly when the calc is in FIX 2 mode, 6 keystrokes will do it on a Saturn based calc:

EEX 9 + EEX 9 -

You could assign this as a tiny program to a used defined key, if the calc has that ability. Otherwise, just remember it.

And, of course, if you want a different number of digits after the decimal point, adjust the constant 9.

No. Microsoft calls in banker's rounding. Read this quite extensive writeup about rounding in VBA, Excel and in general.

Re: Rounding conventions

*Message #30 Posted by **Rodger Rosenbaum** on 11 July 2009, 12:47 a.m.,*
in response to message #29 by Katie Wasserman

What I see on that page is:

```
Product                                 Implementation
   ---------------------------------------------------------------
----------
   Visual Basic for Applications 6.0    Banker's Rounding
   Excel Worksheet                      Symmetric Arithmetic
Rounding
   SQL Server                           Either Symmetric
Arithmetic Rounding
                                        or Symmetric Round Down
(Fix)
                                        depending on arguments

   Java Math library                    Asymmetric Arithmetic
Rounding
```

It looks to me like you would only get Banker's rounding in Excel within a VBA application.

Do you read it differently?

Re: Rounding conventions

*Message #31 Posted by **Katie Wasserman** on 11 July 2009, 2:38 a.m.,*
in response to message #30 by Rodger Rosenbaum

Exactly, you'd have to write in VBA to get banker's rounding in Excel. There's no function within Excel itself for that, although it does have ROUNDUP, ROUNDDOWN and regular ROUND.

Re: Rounding conventions

*Message #32 Posted by **Werner** on 13 July 2009, 7:28 a.m.,*
in response to message #28 by Rodger Rosenbaum

or, as I use it:

```
2 E9
+
LASTX
-
```

Cheers, Werner

Re: Rounding conventions

*Message #33 Posted by **Rodger Rosenbaum** on 14 July 2009, 1:14 p.m.,*
in response to message #32 by Werner

Why 2 E9 rather than 1 E9?

Re: Rounding conventions

*Message #34 Posted by **Werner** on 15 July 2009, 1:33 p.m.,*
in response to message #33 by Rodger Rosenbaum

so that it works for negative numbers as well, eg:

```
-55.451 + 1e9 - 1e9 => -55.451
but
-55.451 + 2e9 - 2e9 => -55.45
```

Cheers, Werner

Re: Rounding conventions

*Message #35 Posted by **Rodger Rosenbaum** on 16 July 2009, 2:02 a.m.,*
in response to message #34 by Werner

Of course.

I assumed without good reason that he would be rounding positive data. I should have mentioned that for negative numbers, he should use the sequence EEX 9 - EEX 9 +.

I do all my calculator programming on an HP50 these days, and to enter 2E9 takes 1 more keystroke than to enter 1E9; that is, 2 EEX 9 versus EEX 9.

And, the HP50 has no LASTX key; LASTARG isn't available as a key on the non-user-shifted keyboard.

I happened to look at an old thread on rounding from 2003, and I think it might be fun to revisit it. I'll start a new thread.

Re: Rounding conventions

*Message #36 Posted by **Wayne Best** on 4 July 2009, 8:43 p.m.,*
in response to message #11 by Katie Wasserman

Thanks Katie

I'ver never heard it called Banker's rounding before but now I have a new respect for the financial sector. I thought the banks would always want to claim that extra half cent for themselves :)

You said:

> Quote:

> While this may be ok for accounting and finance, it introduces a bias when rounding data sets, and would appear to be unsuitable for many scientific applications especially those involving sets of data.

The HP71 and later Saturn based calcs round-to-even (unless you set the rounding mode in the HP71 to something else) during arithmetic calculations, so this problem only shows up in the *display* of final results. One way around it without doing any programming is to set your calculator to display all 12 digits in the result and do the rounding to a smaller number of significant digits yourself.

Or, if you have a large number of final results to print at some lower number of significant digits, you can cause that number of digits to be rounded-to-even using a technique I described on comp.sys.hp48 in 2004:

Imagine that you want to round a number on your calculator to a reduced number of digits, smaller than the calculator's full precision, with proper rounding (round-to-even, that is!). If the calculator does N digit arithmetic and you want a K digit rounded result, R, the formula:

R = value - value * 10^(N-K) + value * 10^(N-K)

or

R = value + value * 10^(N-K) - value * 10^(N-K)

gives the K digit properly rounded result where "value" is the original full-precision number you want to round to K digits. These formulas use Dekker's method, and only work correctly if the calculator does proper rounding during arithmetic.

For example, on the HP48, if we have the number 123450000001 in the display and want to round this to 4 digits, we compute:

123450000001 - 123450000001 * 1E8 + 123450000001 * 1E8

and we get: 123500000000

But if my starting value is 123450000000 and I compute:

123450000000 - 123450000000 * 1E8 + 123450000000 * 1E8

we get: 123400000000

The result is rounded to even. Now start with 123550000000 and compute:

123550000000 - 123550000000 * 1E8 + 123550000000 * 1E8

we get 12360000000, and we see that the result is rounded to even, as it should be because the discarded digits were 50000000..., that is, a 5 followed by only zeroes.

Try reversing the order of the addition and subtraction in the last example:

123550000000 + 123550000000 * 1E8 - 123550000000 * 1E8

we still get: 123600000000

Now try this with a TI86 calculator:

123550000000 - 123550000000 * 1E10 + 123550000000 * 1E10

(use 1E10 as the multiplier because the TI is a "14" digit machine) we get 123500000000 (only 12 digits are shown)

But if we try:

123550000000 + 123550000000 * 1E10 - 123550000000 * 1E10

we get 123600000000 on the TI86. So Dekker's method fails on the TI.

*Message #38 Posted by **Wayne Best** on 4 July 2009, 9:17 p.m.,*
in response to message #37 by Rodger Rosenbaum

Thanks Rodger

Yes, you're right, it's all about the rounding on the display. As a user, that's all I see. I take it for granted (perhaps naively) that the precision of the calculations are fine and I cannot recall a single real life example where I've needed all the precision of a modern calculator. So I guess most of us set the display for the number of significant figures we need (for me that's rarely more than 4 decimal places). Once I set the display, I expect (would like) that when I average data that the display shows the "properly" rounded average but this is not so. Sure, I can set the calculator to display all the digits and do the rounding myself but this introduces human errors and, to be honest, I expect the calculator to do this for me and not present me with the "wrong" number. Ok, it's not really wrong but it's not really right either.

Regards, Wayne

You asked in the first post "... is there any way around the problem (other than writing a program)?". If you don't want to look at all 12 digits and do the rounding-to-even yourself, then the answer is no.

Presumably, you've been doing some arithmetic on a data set. This probably was the result of a program. It doesn't take much extra programming to use Dekker's method to round the final result(s) to K digits. Then with the display set to show K digits, you'll see the result rounded-to-even.

20b - ABS?

*Message #1 Posted by **Thomas Radtke** on 4 July 2009, 5:01 a.m.*

Thanks to Dave Shaffer, I'm now an owner of the new 20b :-).

After some successful surgery (gluing the bottom of the LCD to the faceplate to make the top row keys not sticking anymore), I was ready to explore it. Besides the excellent display, finding the ABS function in the math menu came very much as a surprise. Has a macro functionality, as indicated by some erroneous entries in the manual, originally been considered for the 20b? What else could be the reason to have the ABS function available?

Does anyone know if a new firmware is planned to support macros?

Thomas

I've been working (on and off) on new firmware for the 20b, the 34s. Been more off than on for the recent past but I'm still making slow progress.

Highlights include 500 programming steps, 100 registers, comprehensive suite of scientific functions, better binary suite than the 16c.

Slightly dated source code available from the 20b repurposing wiki. Current version available on request.

Proprietary HP Brand 15C and 12C iPhone emulators

*Message #1 Posted by **Les Wright** on 3 July 2009, 10:27 p.m.*

Just noticed these in the App Store, even though they have been out for awhile.

They are quite pricey compared to the open source alternatives from Tom Fors & Eric Smith and RLM.

Anyone splurge on either? Any benefits over the cheaper choices, besides just the reassurances of the Official HP imprimatur?

Les

*Message #2 Posted by **Howard Owen** on 4 July 2009, 5:50 a.m.,*
in response to message #1 by Les Wright

Yes and yes, though that second affirmative is probably not what you'd expect. Yes, I bought the 15C emulator, and the differences between it and SCI-15C are minor. Both feature a flip over quick reference diagram when you touch the 15C logo. Both reproduce what's on the back of a real 15C. HP's is more readable because it's larger. You flick-scroll to see successive parts of the much more legible guide. SCI-15's QRG looks just like the real one, but doesn't scroll. The HP emulator will do portrait mode as well as landscape. Because of those two features, you could say the HP emulator is better adapted to the iPhone. But other than those things, which are pretty minor, the machines both appear to be very faithful simulations of the real thing.

I bought the HP15C emulator because I want to vote with my dollars for an official HP product involving a classic calculator. If HP sees there's a market for an HP-15C at $30.00, they might be more likely to bring out other products based around old machines. On the other hand, if this community won't pay $30.00 for such a thing, then I'd guess the chances of a 15C+ or 43S are even slimmer than they seemed to be before these programs appeared.

Regards,
Howard

I don't think these calculators are open source.

Re: Proprietary HP Brand 15C and 12C iPhone emulators

*Message #4 Posted by **Les Wright** on 5 July 2009, 4:08 p.m.,*
in response to message #3 by Byron Foster

I stand mostly corrected.

The RLM programs are of course not open source.

However, I thought the Nonpareil basis of Tom Fors' series of emulators WAS, and that the issues with proprietariness has to do with the ROMs, not the UIs.

I still have the long-since-pulled Crimson Research emulators, but the only one I actually keep on the iPod is the curious 16C emulator.

Les

Upgraded iPhone Simulators in App Store today

*Message #1 Posted by **Les Wright** on 3 July 2009, 8:28 p.m.*

RLM's 12C Classic v. 3.0 is OS 3.0 ready, has a lot more options (my favourite is the option to turn off the annoying auto orientation feature), and just downright looks and responds better.

Byron Fosters 42S is in v. 2.1 and has incorporated some changes, my personal favourite is the automatic exportation of the printer output as a text file. Getting at this text file is not clearly documented, but it is there--one logs into the web server over wifi at the given URL as one does to import or export programs, and the file is simply print.txt in the root directory and can be easily viewed in the web browser, saved to desktop, etc.

I think both of these upgrades are OS 3.0 dependent, so if you haven't splurged the ten bucks for the upgrade I don't think you can use them.

Antonio Lagana recently advised me that i41cx+ v. 2.3 has been submitted, but the approval turnaround time has been slow. The fix here that I am interested in is synchronization with the iPhone clock. This feature was broken with OS 3.0 and a workaround had to be implemented.

Hope this is of interest.

Les

in response to message #1 by Les Wright

With T-mobile and other claims that more than a Million G1/Android Phones already on the market, do you forsee enough demand for 20b/42s/41c/12c emulators compatible for the Andriod?

Re: Any feel for community interest in Andriod -compatible calcs?

*Message #3 Posted by **Les Wright** on 3 July 2009, 10:24 p.m.,*
in response to message #2 by Allen

I do know that here in Canada Rogers Wireless is marketing the new HTC phone up the ying yang, ostensibly as an alternative to iPhone and BlackBerry. I don't know much about the interface or developement issues, but it would be interesting to ask someone like Eric Smith or Thomas Okken whether they see it worthwhile porting their work to that platform.

Re: Any feel for community interest in Andriod -compatible calcs?

*Message #4 Posted by **Thomas Okken** on 5 July 2009, 3:27 a.m.,*
in response to message #3 by Les Wright

When it comes to calculator emulators/simulators for the new mobile platforms, I can only comment on Free42; here are my thoughts:

Regarding Android, the last time I checked (admittedly, a while ago), that platform only supported Java for application development. I like Java a lot, but when it comes to porting Free42, being limited to *only* Java is a big problem; Free42 relies heavily on C++ operator overloading (for the Decimal version only), and, to a lesser but still significant degree, on C unions (for both the Decimal and Binary versions); neither of these features are available in Java, and working around that would be a major effort -- read, hundreds of hours.
More recently, I have heard rumors that support for C/C++ application development for Android is in the works; maybe it is even available already. If so, that would remove the major stumbling blocks.

Having said all that, the other major issue when porting something as nontrivial as Free42 is motivation. The reasons I wrote Free42 for Unix/X11/Motif, PalmOS, and Windows, are (1) I like the HP-42S enough to make the effort, and (2) I was using those 3 target platforms regularly myself.
The Free42 ports I did for Unix/X11/GTK, PalmOS/ARM, and Pocket PC, were not motivated by my own needs; I did those in response to requests from users, *and* I agreed to do them because they weren't terribly hard to do. The GTK port was easy because almost everything Motif allows you to do, GTK lets you do more easily; the PalmOS ARM port was easy because all I had to do was deal with the nasty details of compiling and integrating ARM code in a PalmOS application; and the Pocket PC port was easy to do because that environment has APIs that are mostly identical to those of Windows.

The first major port to a *completely* new environment was the iPhone port, which was something I wasn't particularly interested in at all... but others were, specifically, Byron Foster and Susan Mackay both created initial basic iPhone ports, and Byron's port has since matured into a very nearly complete one (and in some ways even better than any of my own versions). I'm cooperating with Byron, but he has done almost all of the heavy lifting, while I have contributed mainly suggestions, bug fixes, and only a small part of actual functionality (i.e. the HTTP server for program import and export).

While I still enjoy the results of all of these porting efforts, it is getting to be harder and harder to justify all the time and effort that it takes. There is not a lot of money in the calculator emulator/simulator business; you may be able to make some money from it, through donations, or iPhone App Store revenues, but it is *not* a living; if I divide my income from Free42 by the hours I have spent on it, I arrive at something like Chinese sweatshop wages -- which would be OK if I were living in China, but with the cost of living in New Jersey, it's a different story.

Don't get me wrong; I'm not complaining! I have enjoyed writing Free42, and porting it (and helping port it) to several platforms in addition to the original three, and I still get a big kick out of all the feedback I get; not just the compliments, donations and iTunes payments, but also the complaints, bug reports, and suggestions; *all* of these kinds of feedback, positive *and* negative, tell me that there are people out there who are actually using Free42, or just having fun with it, and that is perhaps the greatest reward of all.

My problem lies in the diversity of *mobile* platforms. When it comes to computers, there's really only Windows, Mac OS X, and Linux (and other Unixes) to worry about; in the mobile arena, on the other hand, there's PalmOS, Pocket PC (or Windows CE), Symbian, BlackBerry, Java ME, Android, iPhone, and WebOS, and maybe others as well. Making *everybody* happy would be awesome, but life is too short support all those platforms in my spare time... and doing these kinds of ports *commercially* does not appear to be feasible because calculator emulators/simulators just aren't much of a market. HP-12C clones, maybe; HP-42S clones, no.

I would love for the mobile arena to settle on just one or two OSes, and if those platforms support C++ application development, I'll be happy to port Free42 to them... But until them, trying to support everything is a lot like fighting the Hydra.

So, my plans for the future of Free42 are: once I'm happy with the state of Free42 on the iPhone (meaning, Byron's and/or my own port) and the Mac (my own port which is one or two weeks from

completion), I am going to stop creating any new ports, and focus only on maintaining the existing ones. Between the Windows, Pocket PC, PalmOS, PalmOS ARM, Unix/X11/Motif, Unix/X11/GTK, iPhone, Mac OS X, and Mac OS X Dasboard versions, there's enough there to keep me occupied.

I'll be happy to collaborate with anyone who wants to port Free42 to a new platform, but I am reluctant to commit to taking the lead in any such ports.

For a project I do just for the love of it, this is becoming too much work, and for something I'd do for a living, there's not enough demand for it to pay my bills.
I'm still glad I did this project, still happy to support it, but I just don't have the time or energy to expand the scope of the project any further, at least not any time soon.

Thomas, I do think it is more than fair for you to draw a firm line about taking the lead in expanding the project to accommodate every handheld operating environment that keeps popping up.

I am primarily a BB user as my handheld communication device--phone, SMS, email--and after weeks of careful experimentation, research, and deliberation I chose it over the iPhone. But I still tote around my first gen. iPod touch, now getting dinged and scratched, as my media player of choice and a handheld computational machine loaded up with all of the finest--Foster's 42S, i41cx+, SCI-15C, RLM's 12C classic. I recall that in my pre-BB days I would have no problem toting around two handheld devices (usually a simple cell phone and my Palm TX for calendar, address book, and Free42), so this is no more cumbersome, and actually gives me more handheld gizmo power in my pockets or bag or on my belt.

I can appreciate the BB Storm or Android user yearning for the all inclusive one device experience of the iPhone user, but so far my arrangement keeps me content. I don't think there is yet an ideal "do it all" handheld system out there. Some may argue that the iPhone 3GS comes close, but I have tried one and for the life of me I can type nearly as quickly on the touch screen as I can on the real QWERTY of my 8900 Curve.

I know many cannot justify the expense, but for those willing to splurge I have no trouble suggesting to the BB, Symbian, or Android user that picking up at least the entry level iPod touch is a much faster, effective, and gratifying way of accessing all of these great simulators and emulators than waiting around for a port to their handheld OS of choice.

Les

I like what RLM did on the 12C with highlighting the label keys when active. I think it's an effective use of the iPhone interface. I also like how the portrait mode is full featured with all the buttons. I may be biased, but I bet portrait mode will become the mode of choice among most users of RLM's 12c.

$100 Shipping?

Either the case, the watch, or both must weigh a ton!

Or a typo?

No, that's normal. It's using UPS courier, probably their top service with insurance for "valuables". That would be expected on a product like this.

Would you want your $30K watch shipped by USPS parcel post?

Dave.

Re: OT: Value of a desire

*Message #4 Posted by **Quan** on 4 July 2009, 9:38 a.m.,*
in response to message #3 by DaveJ

I know there are watches that cost lots of money, such as Rolex. But the sticker shock still hit me when I saw it, nonetheless.

You are right about the shipping insurance.

I just can't imagine paying $30K for a watch. Even I ever won a lottery.

But that's just me. :)

HP 50g Programming

*Message #1 Posted by **Brian Wort** on 3 July 2009, 11:03 a.m.*

I have a new HP 50g, and am working on a small program that displays a definite integral on the screen. The one I am working on now is the definite integral for the area of a circle. With the push of a button, I'd like the program to display the unsimplified definite integral, followed by the simplified version (pi*r^2). Problem is, if I enter the equation in memory, it only displays the simplified version. I need some help on how to write a small program to do this for me. Thanks!

HP75 Accessories as new - any value or should I just use them?

*Message #1 Posted by **Tony de Groot** on 3 July 2009, 9:28 a.m.*

Hi, I bought an HP75 on eBay in as new condition. When I received it, it was almost new. The HP75 itself has been dropped so it has sprung in one corner, and the LCD has a black mark at the bottom at one end. I put a battery in it and it all works OK, except that when the case springs apart a bit, it shuts down. Hold the case together and it seems fine. It also came with the original cards in a tube, unopened, the manual, still shrink wrapped, and the carry case, still in the plastic bag. What I was looking for were some cards for my other (very used) HP75, plus a backup machine etc. The question is, do the wrapped/unused items have any value to a collector, or should I just go ahead and use them. I do not need pristine bits, but do like to preserve older HP gear and I think that since these is still in new condition, may be worth preserving by someone more dedicated than me. I am putting together a small test system (and have an HP71 plus peripherals, and an HP85 plus instruments) but am missing mass storage devices (that work) so would be happy to trade.

Thanks,

Tony.

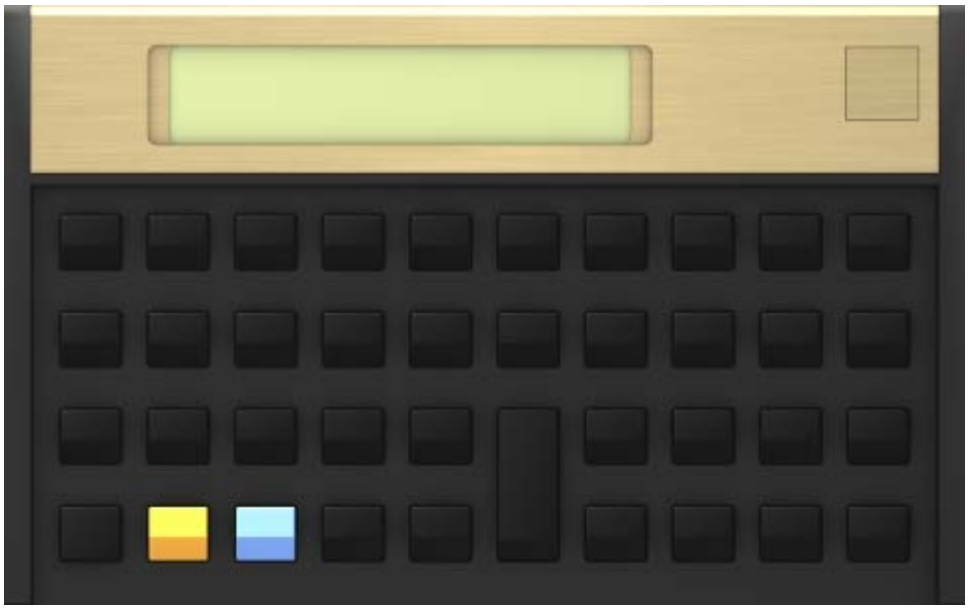
WIP: hp12c iphone skin.

*Message #1 Posted by **Pal G.** on 3 July 2009, 2:16 a.m.*

Tim,

I sent you an email a few days ago, but haven't heard back. I am not certain whether or not you cared for virtual 12c & 15c skins, versus photos, for emulators. I mentioned I would model Voyagers if there was interest. My friend from Italy said 'do it', so I did. Please note, much can be changed with lighting and texturing, to achieve your preferred look.

(Silkscreening is next)



Best regards,
PG

The HP Restoration Guide, progress report

*Message #1 Posted by **Geoff Quickfall** on 2 July 2009, 9:25 p.m.*

Boy, there is a lot of research to do and so many aspects of each family to cover. In any case the intro, chapter one, two, three and six are complete. only 9 more chapters to go. The saving grace is that most of the photography is done. I have a few donor calculators on their way so that I can document them. I am including at the moment 5 appendices ranging from tools, battery pack rebuilds, drying box design, glossary, citations, sources for parts and URLs, how to make special tools.

Here are some preliminary pages to let you see the format and depth of explanation. 52 pages are completed so I figure about 200 pages should do it in a 8.5 by 11 inch format and the book will be spiral bound for ease of use. The larger size is for the inclusion of bigger pictures! There are a ton of photos all in colour with full explanations. Chapter two "Classics" alone has 35 photos and includes the 65, 45 and 55 restorations. I have included a couple of pages of chapter six which has 35 photos also.

I suspect the HP 41 chapter (eight) to be rather large as it encompasses the calculator, card reader and memory enhancements (double x). Those of you attending Fort Collins may have an opportunity to purchase the book (don't have a cost as it is not completed yet but I am not looking to make a profit). Also if the book is not done, the presentation will be Chapter Eight from the book so you will get a highlight of what the completed guide will look like.

In any case let me know what you think (I reserve the right to ignore it ;-)

Also, I keep finding things out after research, for example I had completely forgotten the radix jumper in the spice so of course now I have to add it to Spice chapter! Love this site.

Cheers, Geoff

Chapter 6, the HP 01 (only the first two pages for this post)

Chapter Six

The HP 01 "Cricket"

6.1 Description:

Figure 8.1

My all time favourite, most used HP calculator while in or out of the office! The HP 01 'Cricket' is HP's only attempt at a watch. The watch comes in two case versions; stainless steel and gold plaque. There are a combination of keyboard colours and key colours however the same functions appear on all the watches. What sets this apart from other HP calculators is the Algebraic input versus RPN. What sets this apart from other calculator watches is the *dynamic time functions*. The timing function is integrated with the calculator, allowing for a running display while in *stopwatch mode* of; rates. These can fuel flow (pilots), manufacturing numbers (plant managers) or money per second (long distance phone calls).

6.2 Disassembly:

The following three figures illustrate the parts to the tripartite case:

Figure 8.2

figure 8.2:

- **A** case top
- **B** main body
- **C** case back

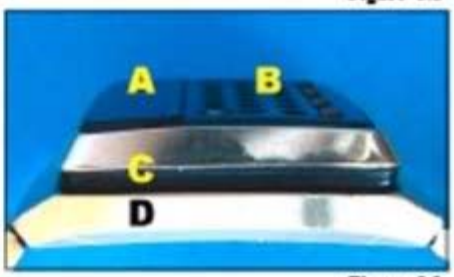

Figure 8.3

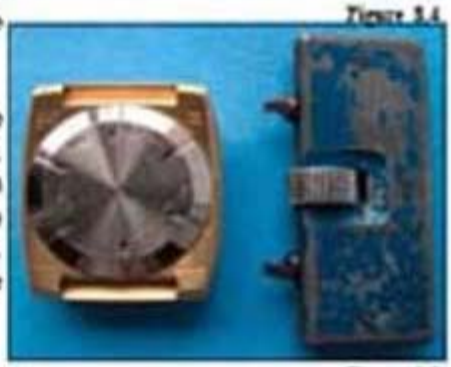
figure 8.3:

- **A** the LED mineral crystal
- **B** keyboard surround and keys
- **C** the keyboard bezel
- **D** the main body.

figure 8.4

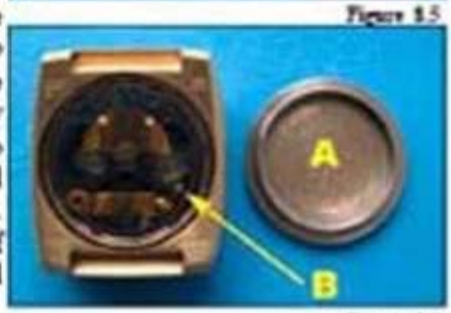
- circular case back o-ring
- square gasket for main body and keyboard interface .

The electronics are found inside the watch and are made up of the PCA, two retaining rings and the battery holder.



For ease of access and case restoration the strap should be removed. On some watches in disrepair this can be a problem as the pins can become contaminated with dirt, debris and rust. The lug pins are standard and can be removed with a fine screw driver.

Once the strap is removed the case back can be unscrewed. The best way is to purchase or borrow a case wrench, **figure 8.5**. Of course if you have the battery holder it contains a case wrench! If you do not have a wrench then your local watchmaker will loosen the back for you. If you attempt the removal with a pair of needle nose pliers, be careful as these will slip and scar the case back.



With the case back off the battery holder will be exposed, **figure 8.6**. The inside portion of the case back contains the piezo electric buzzer, A. The circuit is completed by the raised button on the battery holder, B.

Close examination of the interface of the black plastic battery holder and case will reveal two circular rings with

You'll need to ship your books overseas! :)

I'm wondering why you do not start with "the" classic HP-35 or a combined 35/45 chapter? The chapters should follow the line from "easy" to "advanced". This makes the book a better reading from cover to cover.

Marcus, who's self made battery packs tend to look a little "Frankenstein'sch" ;)

Re: The HP Restoration Guide, progress report

*Message #3 Posted by **Geoff Quickfall** on 3 July 2009, 10:12 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Hello Marcus,

That idea was in my mind but when I started the book I decided to break the guide into the families starting with the Classics. Next I had to think about the best way to show encompass the most detail in a specific restoration that could be applied to the entire family.

By selecting the HP 65, I have a pictoral essay that encompasses not only how to enter a 'classic' including the 35 and others, but also the card reader. Once the complete restoration of the 65 was written there was only a need to include any calculator in that family that had a variance in restoration as compared to the example I used.

So in chapter 2 "the classics" once the essay on the HP 65 was completed the only other two calculators that need to be talked about were the HP 45 quartz crystal modification and the HP 55 quartz crystal replacement. For continuity I selected a 'complete' restoration on the HP 65 and then a follow up on the 45 and 55 differences. Once the 65 was described I had covered:

```
1  how to enter a classic
2  how to repair a card reader
3  how to add a quartz crystal
4  how to replace a quartz crystal
```

in effect all the classics were now covered and onto chapter 3.

I guess the best way to put is:

by describing the HP 65 restoration I had covered the 35, 70, and 80 restorations inclusive, the woodstock 67 and only had to add the differences with respect to the 45 and 55 timing functions.

I hope this elucidates my convoluted thinking!

Cheers, Geoff

HP-IL I/F Card on a New(er) PC - Part II

*Message #1 Posted by **Gerry Schultz** on 2 July 2009, 5:42 p.m.*

As an update to putting an HP-IL I/F card in a P4 PC, I haven't had any success. I pulled Christoph's book on the HP-IL and tried both addresses 300 and 700 without success and yes I have printed copies of HP documentation on how to configure the I/F card. Any addresses I tried hung the booting of the PC before it ever got to starting XP. I went into the PnP setting in the BIOS but was surprised to find very little control of PnP; either it was off or on and the PC hung regardless of the setting. Of course the PC boots fine without the I?F card installed. Could it be the ISA slot? I doubt it given that the rest of the MB works fine.

I will continue to research this but my hope is fading that there will be a successful solution to this situation. I am reading Scott Mueller's Upgrading and Repairing PCs (18th edition) and there are sections on interrupts and PnP BIOSes. I hope this will give me some clues.

For those of you who are curious, the Motherboard I am playing with is an Intel D845GECL which is an OEM board made by Intel and I've had a very hard time finding any documentation for it. The obvious reason I chose this board is that it has an ISA slot to plug the HP-IL I/F card into it.

If anyone has some insights into what else to do, I'm all ears.

Thanks for your time and feedback,

Gerry

*Message #2 Posted by **Egan Ford** on 2 July 2009, 7:58 p.m.,*
in response to message #1 by Gerry Schultz

I have wanted to do the same for sometime. I.e. replace my old 200MHz Pentium Overdrive PC with something a bit snappier. Like you, I need an ISA slot. I've been looking at small form factor PCs with ISA slots so that I can still have HP-IL, but given your trials and the availability of the new PILBox, I think I will abandon that idea.

I've ordered my PILBox and am eagerly awaiting its arrival so I can give it a go with my laptop. I'll let you know how it goes.

*Message #4 Posted by **PeterP** on 2 July 2009, 11:20 p.m.,*
in response to message #3 by Katie Wasserman

Katie,

For what its worth, I think there was a short thread about this a couple years back where I had tried to make this thing to work.. I got stuck in various problems that have to do mostly with security. Basically giving the direct access the HP-IL card needs via USB is pretty much blocked in windows XP and I think also Win98. And dont even think about Vista...

Clearly I'm not an expert in all of this, but it is an expensive 'test' to do and unfortunately is less easy and direct as their ads would make it seem...

cheers

Peter

Katie,

> Quote:
>
> We currently offer support for DOS under *Widows* operating systems.

:)

The main problem is the virtualisation layer: DOS software assumes full control over the hardware with direct access to I/O ports, interrupts and so on. It's probably easier to add support for such a board in Virtual Box (an open source DOS emulator) than in the built in DOS boxes of Windows or Linux. A different (and better in my opinion) approach would be to give up DOS and code directly against the USB layer. That would mean a little work for JF. ;)

ARS Technologies sells an SDK for their board too. That might make your suggestion a bit easier to implement. They also sell a single board USB to ISA adapter, for $35 less than the triple board adapter.

In any event it sounds like a complete HP-IL to USB solution is going to require some work, probably developing this from scratch would be the best way to go. Which is exactly what Jeff has done with his PIL-Box, awesome!

-Katie

> I found this USB to ISA-Bus motherboard. It's a bit expensive but sounds like it offers an reasonable way to keep using all those old ISA cards, including the HP82973A. Has anyone here tried it?

Yes. Like Peter, no luck. I tried both Windows and Linux. Their technical support is abysmal. With Linux I could never get a kernel module to see the ISA adapter. With Windows I was able to chat with the adapter using their debug tool, but had no luck with EMU41 or EMU71 using their DOS shim. According to their documentation it *should* work.

Even if it did work, it is still a non-solution. Their software replaced the standard USB Windows support breaking other USB device compatibility. So, I gave up. If another wants to give this a shot for the good of the community, let me know and I'll send you mine (if I can track it down).

My objective was to get it working with Linux and DOSEMU so that I could reduce the size of my Linux-based HP-IL gateway. The new PILBox gives me hope for a much better solution. Drivers are available for Windows, Linux, and OS/X. Its compact and modern, and the technical support is undeniably superior. And, the SDK is free and source is included.

Re: HP-IL I/F Card on a New(er) PC - Part II

*Message #15 Posted by **Gerry Schultz** on 5 July 2009, 10:50 p.m.,*
in response to message #14 by Egan Ford

Hello and thank you for your responses.

I've been doing research on this issue this afternoon and have made some progress but also have some questions. First, I found that I was using the wrong version of the 82973A's Owner's Manual. My card is a revision A, which is not covered in Edition 4 of the Owner's Manual, dated May 1987. I ended up using Edition 3, dated November 1985, and it covers revision A and the I/O range address switches are identified properly. Edition 4 of the Owner's manual covers revisions after A and those address switches are labeled differently.

Second, I've been looking at my card it is set to use IRQ 7 which isn't talked about anywhere in the Owner's manual. It can be set via jumpers to any IRQ between 2 and 7. Is an interupt required for this card to work properly? If it doesn't this might help resolve the conflicts with this PC motherboard.

I found another HP-IL I/F card pictured on that unmentionable site today and the picture of that I/F card shows that it is strapped for no interrupts and this pictured

version of the card actually connects to different lines on the address bus in the ISA connector. My card uses address lines 0, 1, 2, and 8 through 15. In the other card's picture, it uses address lines 0 through 10 as far as I can tell. I don't know if it makes any difference which address lines the card accesses but I find it curious as I also have Christoph's book on how to build the HP-IL I/F card and I would like to figure out how he designed his card. I haven't done this yet as I have spent the rest of my time today working on this problem by adjusting the settings in the PC BIOS.

I disabled the MB from stopping booting on any errors and I was able to get the PC to boot once with the I/F card plugged in. It hasn't happened since but in comparing the I/O ranges and interrupts in use by the hardware through XP, IRQ 7 and I/O range 1700 looks like a good choice.

I'll keep chasing this down and if you have any insights into this mystery, I would appreciate it.

Gerry

Re: HP-IL I/F Card on a New(er) PC - Part II

*Message #16 Posted by **christoph klug** on 6 July 2009, 4:22 a.m.,*
in response to message #15 by Gerry Schultz

Dear Garry,

no IRQ is needed for the HP-IL/PC Interface Card.

For WIN XP operating system you need the address setting 300 by dip switches plus the address routing software tool, described in my book.

The latest hardware version of the HP-IL/PC Interface Card is available from me.

Best regards - Christoph Klug

Popularity of the HP-41C Calculator

*Message #1 Posted by **Gerry Schultz** on 2 July 2009, 5:19 p.m.*

To All:

I originally bought a 41C back in 1979 because I thought it was a cool calculator with a lot of promise. HP backed up that promise by releasing lots of modules and peripherals that allowed anyone to do just about anything with it, limited only by your imagination.

One thing I've never seen or heard discussed was how popular the 41C was in relation to its competitors of the time. Did sales figures show that it was the most popular high-end scientific calculator or did it end up a niche machine for HP fanboys like us? Was this machine the pinnacle of HP's penetration into the calculator market or was that later with the HP-48GX (a guess on my part)?

At that time, I didn't give a crap about how popular the 41C was as I just liked the machine. Now that I'm older, I'm wondering just how successful HP was with this product.

Thanks in advance for your comments.

Gerry

Re: Popularity of the HP-41C Calculator

*Message #2 Posted by **Thomas Okken** on 2 July 2009, 5:54 p.m.,*
in response to message #1 by Gerry Schultz

Hi Gerry,

I've never seen sales figures for the 41C -- I think most manufacturers are pretty secretive about this kind of information. However, when it comes to the 41C specifically, I'm pretty sure it was a resounding success, for two reasons: one, it was a killer machine, not just better than anything HP had built before but also competing with the TI-58 and TI-59 in terms of price/performance, and two, TI threw in the towel in the high-end calculator market, 4 years after the HP-41C was introduced, when they discontinued the TI-58 and TI-59 after 6 years of production, without introducing any successors or replacements. The HP-41 line, on the other hand, lasted 11 years, and was succeeded by even more powerful machines.

- Thomas

It isn't really correct to say that "TI threw in the towel... ... when they discontined the TI-58 and TI-59 ..." There was the debacle of the TI-88 which was strongly promoted and then suddenly withdrawn just before the TI-59 production was ended. That was followed by the TI-66, the CC-40, the TI-74, the TI-95 and the graphhics. TI had initiated a newsletter supporting the TI-74 and TI-95 and then suddenly withdrew it and started a new newsletter "It's About T.I.M.E." which was dedicated to the use of graphic calculators in education. I can't pinpoint the exact year as I don't have my files with me. But, from that point on it would be accurate to say that TI had thrown in the towel in the high-end, non-graphical market. Considering their domination of the education market in subsequent years I would have to say that was a correct business decision.

*Message #4 Posted by **Mark Edmonds** on 3 July 2009, 5:05 a.m.,*
in response to message #3 by Palmer O. Hanson, Jr.

Machines likes their Voyage 200 are pretty impressive and in some ways, out-strip functionality in HPs, at least up to and including the 49g series (I'm not entirely sure about the 50 and close relative 49s). I'm not going to quote specifics here because I can't remember but download the manual and look at the TI-basic language to see some aspects of what I mean.

Another massive benefit and wise move TI made was to use the M68000 CPU so if you want to get into assembler, you have a very elegant chip to work with.

However....., yes, there has to be a catch....

I find the Voyage 200 to be a strangely uninvolving experience, very boring, the Basic is slow and it has a confusing "file system" and a confusing front-end which doesn't leave you feeling in total control.

I think there is also a RPN suite for the machine too.

So I would also say that TI did not throw in the towel, they just went off in a different direction and if they sorted out a few aspects of operating their current top end calcs, they would be killer machines.

*Message #5 Posted by **reth** on 3 July 2009, 8:30 a.m.,*
in response to message #1 by Gerry Schultz

in surveyor's world HP-41 was huge, simply wiped out any competitors hands down; this lasted up until HP-48 came up. HP is still the calculator of choice for surveyors.

in response to message #5 by reth

And the 41C was done in 1979 not 1989. Simple switch to program and do what you do to calculate and it is automated (adding a global label for reference if you like or just press R/S to compute again). No complex language, just repeat the keystrokes in PRGM mode.

Surveyors in LA?

*Message #1 Posted by **Doug** on 2 July 2009, 6:17 a.m.*

My property melted in the Sayre Fires 11/08. Killed my equipment, all melted. Now trying to rebuild and dirt is odd terrain. Any local members who are capable of doing 3D drainage and survey of dirt/lines? Drop me a mail but only if you love the HP41C.

Doug

Re: Surveyors in LA?

*Message #2 Posted by **Howard Boardman** on 2 July 2009, 1:19 p.m.,*
in response to message #1 by Doug

Sounds like you need a civil engineer if you are doing any drainage design. If you are planning on recording an official map and setting property corners you need a licensed surveyor. Look in the phone book or internet. Lots of surveying and civil engineering firms with licensed people.

HP calculators on sale - HP 20b excluded

*Message #1 Posted by **Joerg Woerner** on 1 July 2009, 10:12 a.m.*

Just received from HP Marketing this wonderful July 4th eMail offering 15% discount and free shipping and was in the BUY mode.

I'm still looking for a HP 20b to compare it with the BAII Plus Professional - but it disappeared from the HOME & HOME OFFICE website.

Regards, Joreg

Re: HP calculators on sale - HP 20b excluded

*Message #2 Posted by **Tim Wessman** on 1 July 2009, 10:39 a.m.,*
in response to message #1 by Joerg Woerner

Compared to the BAII+prof it wins because of features, but loses simply because of the keyboard. It wins on features, screen, ease of use, and speed. Compared to the BAII+ (identical to the professional except the build quality) it wins hands down (except on price).

Someone just wrote a decent review a short while ago (first one on the top). Not sure who wrote it. I'd like to know who though and see if they will post it to amazon.

in response to message #7 by John B. Smitherman

According to PPC Journal V6 N4 Page 6 July 1979 column one paragraph two, its July 16th 1979.

IIRC, this has been discussed in the past, and I do not recall if the matter was truly settled.

A random selection of late 70s'/early 80s' entries on Craig's site has the first of the month used as the introduction date. I speculate that it is an estimate. IMHO, PPC Journal has more street cred.

Here we go:

NEWS RELEASES

NEWS FOR BUSINESS WIRE

PALO ALTO, Calif., July 16 -- A new advanced hand-held calculator that can be customized to fit user needs was introduced today by Hewlett-Packard Company. By plugging in a series of companion devices such as extra memory, a magnetic card reader, a printer, and special application 'modules', a user can create a powerful system for specific individual applications in areas such as business, finance, and engineering.

The $295 HP-41C is the most advanced and versatile calculator HP has ever developed. In addition to 130 preprogrammed scientific and mathematical functions, the continuous-memory, alphanumeric, liquid-crystal-display machine can be tailored to perform many other calculations through programs written by the user or through plug-in applications software available from HP. It is available immediately.

"The HP-41C establishes a new standard in portable, personal computation," said Richard Moore, general manager of HP's Corvallis Division, which designs, manufactures, and markets advanced personal calculators. "Both keyboard and memory can be customized to meet the requirements of the user, and plug-in modules and peripherals can expand the basic machine into a system as powerful as some small computers.

"Although it is the most advanced personal calculator on the market, the HP-41C is easy to operate by technical and business professionals who spend a little time to familiarize themselves with its capabilities," Moore said.

The HP-41C becomes a powerful calculating system with the addition of a series of options that can be connected to the basic machine through four 'ports' on the top.

Up to four memory modules ($45* each) can be added, increasing available program memory or data storage by 400 percent.

A card reader ($195*) allows the user to record and read programs on magnetic cards.

A portable thermal printer ($350*) provides permanent records of calculations. It is also capable of high-resolution plotting.

An optical wand (available early 1980) will read and enter programs and data from printed bar codes.

Plug-in application modules ($45* each) offer preprogrammed solutions to problems in specific areas.

*U. S. prices only.

Thanks for posting, Jake.

Cheers.

*Message #2 Posted by **Thomas Okken** on 1 July 2009, 12:18 a.m.,*
in response to message #1 by Michael de Estrada

The Buy It Now price seems high for this model, but then again, for a complete set, in excellent condition? Also, note that this auction has a "best offer" option, so you can bid less if you want.

Re: Now this is really ridiculous!

*Message #3 Posted by **Thomas Radtke** on 1 July 2009, 3:23 a.m.,*
in response to message #1 by Michael de Estrada

Allthough the source is quoted, I find it quite insolent to use that much of this sites text in the auction.

Re: Now this is really ridiculous!

*Message #4 Posted by **Howard Owen** on 1 July 2009, 3:48 a.m.,*

Re: Now this is really ridiculous!

*Message #7 Posted by **Don Shepherd** on 1 July 2009, 7:29 p.m.,*
in response to message #1 by Michael de Estrada

Ridiculous? Not if he actually sells it for his BIN price. Not if someone wants it bad enough to pay that, and most of us on this forum would pay top dollar for a model we are especially fond of, in pristine condition, right? Heck, I paid $350 for an HP-65 a couple of years ago, and many would have considered that rather outrageous, but it was worth it to me. Now, would I have paid $900? No, but who knows, someone might have.

Re: Now this is really ridiculous!

"There's a sucker born every minute" - David Hannum

BTW, the $350 you paid for the HP-65 is perfectly reasonable for that model, even $500 would be reasonable for a complete set in good cosmetic and working condition. The HP-80 is a much less significant model, and routinely sells as a complete set in the $100 to $200 range (I have 4 very good to excellent sets). If the one in the auction were completely new in the box, then perhaps it might be worth that, but it's not. In fact, the manuals are in only fair cosmetic condition and I think that the word "mint" used by the seller is hyperboly and unjustified. Certainly, it is not pristine. Note that a photo of the battery compartment is not provided.

It will be interesting to see if anyone bites on this.

Some collecting questions

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 30 June 2009, 9:55 p.m.*

1. I have two working HP-27's and a non-working HP-22 and a non-working HP-25. I have opened the HP-22 and HP-25 and have found that the top has popped off the module which is supposed to be damaged if the charger is applied without the battery pack installed. Does it make sense to remove the module from one of the HP-27's and install it in one of the other machines or is the risk too great?

2. I am in my summer home in western North Carolina. In past years there has always been a number of slide rules for sale in antique stores. One store in particular typically had eight or ten slide rules priced in the twenty dollar range -- typically out of my price range but once in a while I would buy one I REALLY wanted; e.g., when I bought one of the slide rules with an Addiator on the back. This year the store which typically had several slide rules doesn't have a single one. The only slide rule I have seen is a Post Versalog 1460 with a leather case but the plastic somewhat yellowed offered for 52 dollars. Does anyone know if the slide rule market has somehow heated up for some reason? If my memory is correct there was a jump in prices back in the 1990's when the New York Times published an article declaring that slide rules were collectibles.

Re: Some collecting questions

*Message #2 Posted by **Thomas Okken** on 30 June 2009, 10:46 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

I'm no expert but I'd expect that the market for slide rules has cooled down, not heated up. When the economy is bad and people are reluctant to spend money on non-essentials, it makes sense to hold on to your collectibles and wait for the market to recover, when you'll probably be able to get better prices as a seller.

Regarding swapping parts from an HP-27 to an HP-22: I think I read somewhere that the electronics in the HP-27 are not compatible with those in the other Woodstock models because they use NMOS technology, as opposed to PMOS in the earlier models and CMOS in the 25C and 29C. I googled a bit and found this link to an old HP Forum thread that may help shed some light on the issue.

Apart from the PMOS vs. NMOS question, I don't think you should gut a working HP-27 to repair an HP-22 or 25; the HP-27 is much rarer, you should treasure it, or sell it and get an HP-25 to gut, there are plenty of those -- although I personally have great nostalgia for the HP-25 and would not do this myself. :-)

- Thomas

> sense to remove the module from one of the HP-27's and install it in one of the other machines or is the risk too great?

I don't know what you mean by 'module' here, but you need to be aware that the HP27 is very different internally to all other Woodstocks. All other Woodstocks (and for that matter classics, topcats, the HP19C, hp67, etc) use PMOS ics. The HP27 uses NMOS. For this reason the supply voltages are totally different. None of the ICs can be swapped between a 27 and any other machine AFAIK.

In general it's only the -C (continuous memory) machines that are damaged by being connected to the charger without a battery pack fitted. I wouldn't risk it, though.

Dead batteries?

Re: HP 35s: Killed by software?

*Message #3 Posted by **Peter Niessen** on 30 June 2009, 12:42 p.m.,*
in response to message #2 by Quan

Took batteries out and in again, came back with memory clear message. Seems to be fine now.

Re: HP 35s: Killed by software?

*Message #4 Posted by **Quan** on 30 June 2009, 1:04 p.m.,*
in response to message #3 by Peter Niessen

If the batteries are not new, I think it's possible that the batteries are weakened to a point where heavy-duty computations draw more current than the batteries can handle, causing a blackout that would require a reset.

Good to know your 35s wasn't killed by software... like virus. :)

BTW, if this happens again, try the RESET hole on the back. It might save removing/re-inserting the batteries.

in response to message #1 by Martin Pinckney

New models may be warming up in the bullpen !

Sure hope so ;)

John

Re: HP calculators on sale w/free shipping.
*Message #3 Posted by **Quan** on 29 June 2009, 1:24 p.m.,*
in response to message #1 by Martin Pinckney

I have observed this HP 15% off every 3 or 4 weeks. It seems.

So, there is nothing really excited about it.

On the other hand, if HP were to release an updated 15C+ or 43S or 50gii with the ENTER key in the usual spot, then excitement might hit the roof...

I say the roof, but it could be the exosphere if the update were perfectly executed.

I just couldn't help dreaming...

Re: HP calculators on sale w/free shipping.
*Message #4 Posted by **designnut** on 29 June 2009, 2:01 p.m.,*
in response to message #3 by Quan

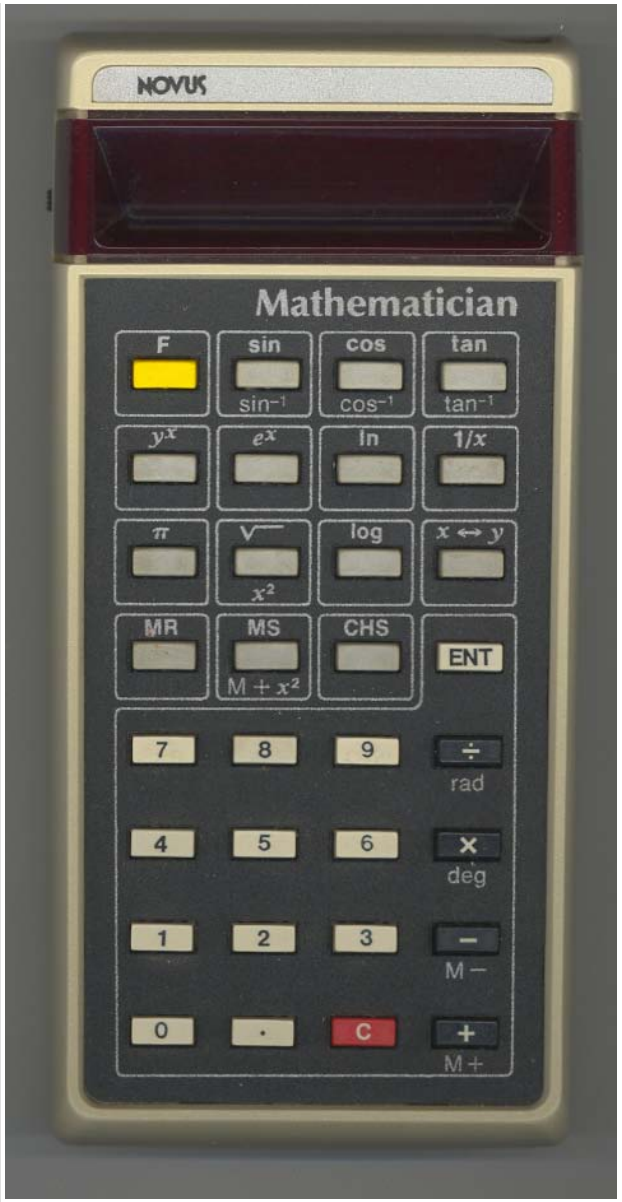
To me the problem is to to be consistent in key locations. The enter is up and left in this model, then it is low and right. There may be an ideal location but more is to be gained by consistency so you can establish a kinesthetic sense of location. Sam

Re: HP calculators on sale w/free shipping.
*Message #5 Posted by **bill platt** on 29 June 2009, 2:02 p.m.,*
in response to message #4 by designnut

That is a way too nerdy requirement. Adapt or die :-)

Re: HP calculators on sale w/free shipping.
*Message #6 Posted by **Michael de Estrada** on 29 June 2009, 2:49 p.m.,*
in response to message #3 by Quan

I have owned HP's since the beginning with the HP-35, and while I did become accustomed to the ENTER key in the "usual" location above the numeric keypad and to the left, I much preferred finding it to the right and directly above the operators as in my NOVUS (National Semiconductor) RPN calcs (Mathematician, 4640 etc.). Early HP's had the operators on the left, so it made some sense to also have the ENTER key there, but once they were moved to the right, that did not make sense, which is why I think it was moved to the right on models like the HP-50g. Unfortunately, it was placed at the bottom, which I find awkward.



Edited: 29 June 2009, 2:53 p.m.

Re: HP calculators on sale w/free shipping.
*Message #7 Posted by **Quan** on 29 June 2009, 3:06 p.m.,*
in response to message #6 by Michael de Estrada

I notice the CHS (I assume it means change sign) key in this model. I also see this in the 12C series, 15c, and maybe others.

Who was the first to use it? When did it switch to -/+ or +/-? Why?

Just curious.

Re: HP calculators on sale w/free shipping.
*Message #8 Posted by **Michael de Estrada** on 29 June 2009, 3:30 p.m.,*
in response to message #7 by Quan

Yes, CHS means "change sign" and is the same as +/-. AFAIK, HP used the CHS convention on all its RPN models from the HP-35 and including the HP-28 through the late 1980's. My 1990 HP-48SX is the first model I have that uses +/- instead of CHS. I have also seen the CHS convention used on non-HP RPN calcs such as the CORVUS 500. OTOH, non-RPN (algebraic) calcs like my LED TI Business Analyst from the late 1970s and various Sharps and Casios all use the +/- convention. So, I am speculating that HP wanted to become consistent with the convention used by the non-RPN calcs, which represented increasingly the majority of the market.

Re: HP calculators on sale w/free shipping.
*Message #9 Posted by **Robissimo** on 29 June 2009, 4:28 p.m.,*
in response to message #8 by Michael de Estrada

My guess is because +/- is a more global symbol and that [C][H]ange [S]ign is more locale specific since it is derived from an english phrase.

CHS vs. +/-
*Message #10 Posted by **Walter B** on 29 June 2009, 5:33 p.m.,*
in response to message #9 by Robissimo

I concur. After all, mathematical symbols are recognized internationally -- that's one of their benefits. Kind of a global language with an equal chance for all people, regardless of their mother tongue.

Ceterum censeo: HP, launch a 43S.

Walter

Re: CHS vs. +/-
*Message #11 Posted by **Michael de Estrada** on 29 June 2009, 5:51 p.m.,*
in response to message #10 by Walter B

I also have one of these. Can you guess which key is +/- ? Also, bonus points if you can guess which keys are ENTER, STO, RCL. Finally, can you tell what the right slider switch settings mean? Hint: It helps to know the pronunciation of the cyrillic alphabet.

HP calculators on sale w/free shipping.

Re: CHS vs. +/-
*Message #12 Posted by **Walter B** on 29 June 2009, 6:17 p.m.,*
in response to message #11 by Michael de Estrada

Don't want to spoil the challenge. We did discuss this some days ago already.

Re: CHS vs. +/-
*Message #13 Posted by **Quan** on 29 June 2009, 7:08 p.m.,*
in response to message #11 by Michael de Estrada

Totally guessing:

Going from bottom-to-top and left-to-right:

+/- ---> 13 ENTER ---> 55 STO ---> 53 RCL ---> 52

Right slider switch = Polar <-> Rectangular. If this is correct, I further guess:

To rectangular --> 61 To polar --> 62

HP calculators on sale w/free shipping.

*Message #14 Posted by **Thomas Okken** on 29 June 2009, 7:20 p.m.,*
in response to message #13 by Quan

I don't know Russian, but from what I do know of the Cyrillic alphabet, the right slider switch is rad/grad/deg.
As for the number entry and stack manipulation, I'd guess that the /-/ key is +/-, the two-headed arrow is X<>Y, and B^ is ENTER.

What do I win? ;-)

Re: CHS vs. +/-
*Message #15 Posted by **Michael de Estrada** on 29 June 2009, 7:53 p.m.,*
in response to message #14 by Thomas Okken

Correct on all counts! You win a free trip to the Garden State. ;>)

Re: CHS vs. +/-
*Message #16 Posted by **Michael de Estrada** on 29 June 2009, 8:00 p.m.,*
in response to message #13 by Quan

Yes, No, Yes, Yes, No

ENTER is 25 (B^) and the right slider switch is to set angular units (RAD, GRAD, DEG).

Re: CHS vs. +/-
*Message #17 Posted by **Egan Ford** on 29 June 2009, 7:17 p.m.,*
in response to message #11 by Michael de Estrada

My guess:

```
CHS = /-/
Enter = CX
STO/RCL under L2/L3
Slider Prog/Run
```

Edit: fixed formatting.

Edited: 29 June 2009, 7:17 p.m.

Re: CHS vs. +/-
*Message #18 Posted by **Michael de Estrada** on 29 June 2009, 8:10 p.m.,*
in response to message #17 by Egan Ford

Yes on CHS, no on the rest. B^ (up arrow) is ENTER, CX is clear X. STO = x>n and RCL is n>x, where n is the register number. The slider switch is for angular units (RAD,GRAD,DEG). Program / RUN modes are set by keys.

Re: CHS vs. +/-
*Message #19 Posted by **ZOleg** on 29 June 2009, 8:09 p.m.,*
in response to message #11 by Michael de Estrada

I live in Russia and have MK-61, because 100% true:
- ON/OFF switch
- Rad/Grad/Deg switch
- SST without execute step
- BST without execute step
- RTN from subprogram or GTO 01 if not in subprogram
- START/STOP program
- RCL [0-9,a-e]
- STO [0-9,a-e]
- GTO
- GSB in program mode, SST with execute step in Run mode
- X<->Y

- ENTER
- CHS (+/-)
- EEX
- to Run mode
- to Program mode

Edited: 29 June 2009, 8:19 p.m.

Great deciphering (Was: CHS vs. +/-)

in response to message #27 by Joerg Woerner

Joerg,

Not to take away from TI's very popular and innovative SR-10, but I think that the topic was the first HP calculator to use +/-. Most of the other manufacturers used this all along -- once they realized that a change sign key was important to have.

I have to look around to see if I have anything prior to the SR-10 that uses a +/- key.

HP made another more important change for consistency with the convention used by the non-HP world when they changed the sequence of the arithmetic keys (reading from the top of the calculator) from - +

x / to / x - + . That change was implemented after the HP-41.

*Message #33 Posted by **Mike Morrow** on 29 June 2009, 10:10 p.m.,*
in response to message #6 by Michael de Estrada

I agree completely with your observations on the location of the ENTER key. When HP changed the column containing /*-+ to the right, it was illogical and inefficient to have left the ENTER key on the opposite side. I too wish the hp50g had the ENTER above the / key. As it is, the / key being pushed into the sixth key row just doesn't look right.

It doesn't bother me that the hp50g ENTER key isn't oversized. It does bother me that the four arrow keys are arranged to take up the space of six keys. I'd rather see an arrangement such as found on the HP48GX, which frees up space for two more keys. That would allow an oversized ENTER key and still have one new key for other assignments.

Walmart locally has the hp10bii on clearance. One store has it for $17 and another has it for $11.

HP 50G LCD problem

*Message #1 Posted by **macbxx** on 28 June 2009, 6:47 p.m.*

I bought a used 50G, and was testing and did a soft reset, only to find the previous owner had installed a password application(SDP 2.2, good program). Instead of calling him, I tried to reset it multiple times, and at last left it without batteries overnight. Since it didn't work, I just called the seller like I should have from the beginning, and the password worked, but now I have a row of "dead" pixels in the middle of the soft menu. I don't think they're really dead, since making a vertical line in the graph window makes the pixels show, but nothing else makes them work. Could I fix it changing the lcd, or is the cause something else? Thank you.

Re: HP 50G LCD problem

*Message #2 Posted by **Bart (UK)** on 28 June 2009, 8:20 p.m.,*
in response to message #1 by macbxx

I had the same problem with my 50G about 2 years ago. Received a 2nd hand unit with clean memory. It was fine for a few months, then lost a horizontal line of pixels through the soft menu, soon after a second line did the same. I contacted HP support and they said to try leaving it without batteries for a few days. It didn't work. They offered to replace it but I chose to open it. The flexi tracks seemed to be "glued" to the PCB on which the screen is mounted. I could see no physical reason for the problem. In the meantime more lines have stopped working (everything else is fine). I also recently upgraded the ROM, but it didn't help. If you can get it replaced by HP, I suggest you do.

Any suggestions for repair are welcome.

Bart

Re: HP 50G LCD problem

*Message #3 Posted by **macbxx** on 29 June 2009, 6:17 p.m.,*
in response to message #2 by Bart (UK)

Well, the technical support guy says it's a "common" problem and that "probably" it won't get worse, and offered to get a new LCD for a huge fee, but since the pixels show up under some circumstances I'm not even sure it's the LCD, so I'm leaving it like it is for the moment, but will probably open it if it worsens. Is there any place to buy the LCD part online, by the way?

Exporting Table Values to Stack

*Message #1 Posted by **Hal Bitton in Boise** on 28 June 2009, 11:31 a.m.*

Hi folks.
I'm trying to figure out how to export the plot function table to the stack on my 50g. In the table setup screen, the file field seems to let me link a variable with the domain of the function, but I want to be able to put the whole table onto the stack...domain and range. Is there no way to do this?
Any ideas much appreciated.
Hal

*Message #2 Posted by **Tim Wessman** on 28 June 2009, 10:19 p.m.,*
in response to message #1 by Hal Bitton in Boise

I don't think so. Some hacking would do it, but nothing easy and supported.

You can just use the auto-generated function on a list. That would do it.

OT: Mathematica Home Edition

*Message #1 Posted by **Howard Owen** on 28 June 2009, 5:32 a.m.*

I could never justify paying for Mathematica. I have no professional requirement, and $1200.00+ for a hobbyist interest in math was just too much for me. All that has changed now.

Regards,
Howard

Re: OT: Mathematica Home Edition

*Message #2 Posted by **Quan** on 28 June 2009, 12:17 p.m.,*
in response to message #1 by Howard Owen

I am curious how freely available math software like maxima, sagemath, etc. compared to Mathematica since I have never used it when I was in school.

No questions that Mathematica is a powerful math software that it is often being compared to.

Back then I was aware of Mathematica and how expensive it was for students like on budget. I kinda wanted but could never justify to own a copy, even if a student edition were available (which I can't recall). There were, I believe, other math software like Maple, Mathlab, but HP calculators were all I ever needed for the undergrad study. Any other software, if needed for the course, was usually provided or available to students at very low cost.

If my understanding is correct, the difference between the professional and home/student editions is mainly the license restrictions. No other differences in terms functionality.

Am I right?

Thanks.

Re: OT: Mathematica Home Edition

*Message #3 Posted by **Howard Owen** on 28 June 2009, 1:13 p.m.,*
in response to message #2 by Quan

That's right. There are restrictions on the license that say you can't even think about making money while using the home edition. I suspect listening to coins clinking while running the program might violate the license as written. :)

I first saw Mathematica back in 1988 when it was introduced. It was a flashy application then, and the physicists I worked for seemed to like it quite a lot. It was more interactive, powerful and nice looking than Maxsyma, which was the standard tool my customers had used up until then. I remember taking a tour of the program and being impressed with its capabilities, so much so that I've wanted a copy ever since.

Based on a day or so of use, my quick impression of Mathematica 7 is that the software differs from freely

available alternatives in two respects. First, the program is a lot easier to use than Maxima et. al. It's not a given that free software should be inferior in this regard, but it seems to be so for this particular program. Second, and more important, Wolfram has an unbelievable support system behind Mathematica. It's not just the depth and breadth of the documentation, which is marvelous, it's the enormous body of supporting material, from video and interactive tutorials, to source code for applications to high quality scientific databases. Free software alternatives no doubt have similar resources available, but not from one source, and therefore not as accessible or well organized.

I come to a similar judgment when comparing GIMP to Photoshop, for example. I've used GIMP since 1998, early in its life. It's a very powerful program that will do practically anything you want a 2D graphics editor to do. Finding out how to do things can be challenging though. If I had to start from scratch learning it today, I'm sure I'd have a tough time. Photoshop on the other hand comes with huge resources, both from Adobe and third parties, which make learning the program much easier. I find the UI differences to be not so significant with these two programs, but that may be due to my 10+ years of experience with GIMP.

Of course the other big difference, for both these programs as compared to their Free alternatives is the cost..

Regards,
Howard

Re: OT: Mathematica Home Edition

*Message #4 Posted by **Don Shepherd** on 28 June 2009, 1:26 p.m.,*
in response to message #2 by Quan

I have had the student version of Mathematica (version 4) since I was a student a few years ago. I still have it although I rarely use it these days. I think it cost about $120 or $130 as I recall, something students could afford. Functionally, it is the same as the regular Mathematica. I also bought the 1500-page Mathematica book, from Wolfram, which cost almost as much as the software, as I recall. I would highly recommend that book too.

Spice - asterisk in serial - means?

*Message #1 Posted by **Mark Edmonds** on 27 June 2009, 4:21 p.m.*

I've got a Spice which has an asterisk stamped on the left of the serial number. I've also seen photos of other Spices with this.

Does anyone know what this means?

I've searched the forum and googled this but can't find anything.

I have a tentative theory what it might mean but there is probably something more sensible or rational.

The example I have is a 37E and the serial number reads *2109S...

The reason for the asterisk is????

Thanks,

Mark

Re: Spice - asterisk in serial - means?

*Message #2 Posted by **Mark Edmonds** on 27 June 2009, 6:28 p.m.,*
in response to message #1 by Mark Edmonds

Stupidly, I didn't say what I think the asterisk might mean.

This is a hunch based on a very small sample size!

Could it identify Spices which are hardwired to display the radix mark as a comma and thousands separators displayed as a full stop (or period)?

This is certainly how my 37E works and I can't find any magic key combination that switches the display to the alternative. Maybe there is a jumper inside the calc that can be set although I can't find any reference to this in the hardware description pages.

If anyone else has a Spice series with an asterisk on the left of the serial number, please can you check whether it displays commas or full stops/periods for the decimal point?

Thanks,

Mark

Re: Spice - asterisk in serial - means?

*Message #3 Posted by **Randy** on 27 June 2009, 6:53 p.m.,*
in response to message #2 by Mark Edmonds

While I cannot shed any light on your asterisk theory, I can tell you that the radix point is controlled by a wire jumper presence or absence.

Re: Spice - asterisk in serial - means?

*Message #4 Posted by **Mark Edmonds** on 28 June 2009, 6:24 a.m.,*
in response to message #3 by Randy

Thanks Randy - very useful to know and in a way, this is all tentatively fitting together to confirm my theory. Early days as yet though and I'd rather have a much larger sample size before getting too confident!

Mark

Re: Spice - asterisk in serial - means?

*Message #5 Posted by **Gerson W. Barbosa** on 27 June 2009, 9:38 p.m.,*
in response to message #2 by Mark Edmonds

> Quote:
>
> If anyone else has a Spice series with an asterisk on the left of the serial number, please can you check whether it displays commas or full stops/periods for the decimal point?

My Brazilian-made 33C has the asterisk while my 34C, which was made in Singapore, has not. The radix mark on both are commas, but on the latter I cut the jumper Randy has mentioned. I remember someone said an asterisk before the serial number meant the calculator was a replacement unit, but I am not sure of that.

You'll find links to a couple of pictures here:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv008.cgi?read=20346

Gerson.

Re: Spice - asterisk in serial - means?

*Message #6 Posted by **Mark Edmonds** on 28 June 2009, 6:21 a.m.,*
in response to message #5 by Gerson W. Barbosa

So that actually confirms my theory. Thanks for the information.

Does anyone else have an asterisk Spice for checking please?

Mark

Re: Spice - asterisk in serial - means?

*Message #7 Posted by **Ignazio Cara (Italy)** on 29 June 2009, 12:06 p.m.,*
in response to message #6 by Mark Edmonds

Hi, you can find an answer about the presence of the asterisk at the beginning of some serial number of the Spice/Spike serial calculator at page 64 of the 'A guide to HP Handheld Calculator and computers' Fifth edition, HHC 2007. It is related to the keyboard redesigned after the failures in the first serie (heavy calculator). It's reported that the calculator with the new keyboard have an

asterisk at the beginning of the serial number.

I hope this can help you. Regards

Ignazio

Re: Spice - asterisk in serial - means?

*Message #8 Posted by **Mark Edmonds** on 30 June 2009, 6:14 p.m.,*
in response to message #7 by Ignazio Cara (Italy)

Thanks Ignazio.

I don't have that publication so does it identify the source of the information?

I am a little surprised to read that is what the asterisk means given that haven't other series had significant component changes in their production run and never had similar treatment of the serial number? However, it does seem logical to me for it to indicate machines that have a jumper installed or not as they would be intended for different market areas and the jumper affects the way the calculator works. I need to collect more data on this to prove to myself that I am wrong with my theory!

Mark

Re: Spice - asterisk in serial - means?

*Message #9 Posted by **Ignazio Cara (Italy)** on 2 July 2009, 11:20 a.m.,*
in response to message #8 by Mark Edmonds

Sorry, but I can't identify the source of this information. I have merely reported what I have read in the pubblication of W.A.C. Mier-Jedrzejowicz. Neither more or less...

Regards

Ignazio

Re: Spice - asterisk in serial - means?

*Message #10 Posted by **Nigel J Dowrick** on 3 July 2009, 4:49 a.m.,*
in response to message #6 by Mark Edmonds

I have a HP-34C with an asterisk: the serial number is *1850S38178. It is made in Singapore; it displays a comma for the decimal point, and a decimal point as a thousands separator. The serial number suggests that it was made towards the end of 1978: wouldn't this be too early for the machine to have been fitted with an improved keyboard, as another poster has suggested?

I don't know whether the machine has ever been serviced. It's working fine still!

Nominal power supply for an HP-75D and question about batteries

*Message #1 Posted by **Tomás (España)** on 27 June 2009, 2:20 p.m.*

Hello all.

I am new here, and also new at the HP calculators world (I've been using for 25 years Casio's ones)

I have got an used HP-75D but it came without cable cord nor power supply. I guess my friend had it retired for several years, probably since he left the USA.

My questions are:

1) Which power supply does this unit need to work? (there is no signal nor label indicating it) (I have dismounted the calc from the pod too, to check) I am in Spain now, and here we have AC 220V@50Hz, moving towards 230~240V@50Hz. Also, don't know if there was a power transformer and then the unit needs DC at, let's say, 12V or so.

Reading http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=910 it seems it is 110V@60Hz minimum 2A, but would like to be sure to avoid damaging the HP-75D.

2) At the back of the pod there are 2 empty slots. Inside both, one can read: "PROPER OPERATION REQUIRES BATTERY IN THIS LOCATION". My doubts are:

a) are they really needed to work, or they are only needed if you don't want to lose your programs/data stored in the RAM if you un-plug the power cord?

b) if they are needed, could you give me the technical details or model of that batteries to look for them?

I find rare there is no written indication of these data in the calculator.

Excuse my poor english, and nice meeting you in this nice site!

Tomás.

Re: Nominal power supply for an HP-75D and question about batteries

*Message #2 Posted by **Michael de Estrada** on 27 June 2009, 4:50 p.m.,*
in response to message #1 by Tomás (España)

Tomas,

I copied the following from this site:

Computers HP-75/D Battery HP 82001B, Chargers HP 82059B/C/D - not A, (82066B, 82068B 240 VAC only)

You should be able to use any classic series (e.g. HP-35) battery. There are several vendors of replicas on ebay. You will want to use one of the 240 Vac model chargers.

Regards,

Michael

Re: Nominal power supply for an HP-75D and question about batteries

*Message #3 Posted by **Tomás (España)** on 28 June 2009, 5:45 a.m.,*
in response to message #2 by Michael de Estrada

Thank you very much, Michael.

Your comment has guided me in the correct way, and I will look at eBay for those replacements. Yes, I have to go for the 82066B (EUR) or 82068B (AUS) 240 VAC chargers.

But a doubt still remains...

Are the batteries pack mandatory to 'test' the unit? I am not going to use in day-to-day basis, but only to 'play around', try programming and so on, few hours/days. What happens if there are no batteries but the power supply is pluged? Does it works but when turning off or disconnecting from the AC power it loses the memory and data? Or it just doesn't work?

Regards,

Tomás

Re: Nominal power supply for an HP-75D and question about batteries

*Message #4 Posted by **Tomás (España)** on 28 June 2009, 6:37 a.m.,*
in response to message #3 by Tomás (España)

Hello again.

I think I have found the answer to my last doubt here: HP Battery Information

It says:

"**Warning!** Most models can be damaged if run from the charger without good batteries installed. Only the manuals for the HP 35 and 45 models say that it's OK to run without batteries, but many collectors feel that even those should have batteries installed for maximum protection and long life."

So I understand I should never try to run the HP-75D whithout the 2 batteries HP 82001B, using only the charge adaptor 82066B or 82068B. Rigth?

Thank you very much for the help.

Tomás

Re: Nominal power supply for an HP-75D and question about batteries

*Message #5 Posted by **Nigel J Dowrick** on 28 June 2009, 6:57 a.m.,*
in response to message #4 by Tomás (España)

Tomas,

I also have a used HP-75 without battery packs or charger. I have managed to run it by wiring a 4.5V dc (regulated) power source directly to the terminals in one of the battery compartments. I

used photographs of the battery packs on this website to decide which terminal was positive and which was negative. It worked fine; it was only necessary to power one of the two compartments.

Depending on your needs, this might be an easier way to go than obtaining a charger and battery pack. My plan is to obtain a triple AAA battery holder: this will provide the 4.5V needed, and the AAA cells in their holder should be small enough to fit inside one of the battery compartments. I intend to solder the leads from the holder direct to the battery compartment terminals.

Hope this helps,

Nigel

Re: Nominal power supply for an HP-75D and question about batteries

*Message #6 Posted by **Tomás (España)** on 28 June 2009, 11:22 a.m.,*
in response to message #5 by Nigel J Dowrick

Hello Nigel,

Thank you for your suggestion. But when I read it, I had already done something similar: I have connected 2 x 3R12C. The 3R12C is a 4.5V Zinc Chloride, I think they are the same or equivalent to those 3R12 shown on List of battery sizes

With that, the system seems to work nicely. I have not try to connect just one battery slot as you did. Nevertheless, I have just try to store a short BASIC program and run it.

Anyway, I will try to get an adaptor and 2 battery sets. What I wonder is how yours can work. I expected the two slots were connected in serial, so to give (in my case) an overall voltage of 2x4.5=9V (and crossing my fingers that it didn't harm the unit, as the charger is 8V DC)

If your setup works with only 4.5V then why does the unit needs an 8V charger? I am not good on electrics ;)

Tomás

in response to message #6 by Tomás (España)

Dear Tomas,

On my machine the two battery holders are wired in parallel, so even with a battery in each only 4.5V would be provided! This arrangement doubles battery life, and allows the packs to be changed one at a time without total loss of power, I suppose.

Incidentally, according to this link (www.rskey.org) the power pack for the HP-75C/D supplies 8VAC, not 8VDC! I haven't got the power pack so I don't know whether this is correct.

Good luck!

Nigel

Re: Nominal power supply for an HP-75D and question about batteries

in response to message #7 by Nigel J Dowrick

Nigel, thank you for your comments.

Yes, I didn't noticed, but you are rigth pointing out the charger supplies 8VAC... I will try to buy a pair of battery packs, and eventually, an original charger.

Tomás

HHC2009 Change of venue

*Message #1 Posted by **BruceH** on 27 June 2009, 9:36 a.m.*

Joe Horn posted the following on comp.sys.hp48 but I don't see any similar message here.

> Quote:
>
> Due to unforeseen circumstances out of our control, the location of HHC 2009 must change. HP has informed us that the fate of the Vancouver facility is up in the air and they had to back out on allowing us to use the conference space there -- but they offered Fort Collins, Colorado, as an alternative -- so we have no choice but to move the conference. Make no travel or hotel reservations until the details appear on the HHC 2009 website: http://holyjoe.net/hhc2009/description.htm
>
> -Joe-

Move it to Raddison Hotel, San Jose!!!

*Message #2 Posted by **Namir** on 27 June 2009, 2:01 p.m.,*
in response to message #1 by BruceH

That's a real bummer!

I say let's move it to San Joe's Radisson hotel, like we used to hae. HP has dropped he ball.

Namir

Fort Collins...

*Message #4 Posted by **Gene Wright** on 27 June 2009, 7:20 p.m.,*
in response to message #3 by Howard Owen

HP has invited us to their Fort Collins campus. Having HP participate is VERY important. That's why we've had the conferences where we have the last several years.

Fort Collins it is!

Gene

Re: Fort Collins...

in response to message #8 by Karl Schneider

I like Ft. Collins... hopefully I can change my tickets without much penalty (using frequent flyer miles). It does have a good benefit of being more 'central' in the USA.

If you're not flying into Ft. Collins directly, I suggest Denver Airport and driving. It's a nice ride, and the schedules into Denver from anywhere in the country are much, MUCH better than Portland.

Re: HHC2009 Change of venue

*Message #10 Posted by **Tim Wessman** on 27 June 2009, 9:09 p.m.,*
in response to message #9 by Allen

I live in and work in Ft Collins (at least I will be back there 1 mo from now).

Fly into denver. You could possibly fly into the loveland airport (I think they still have a few commercial flights still), but the denver airport is a 40 min shuttle ride for 30$.

That's 'cuz Denver International Airport (DIA) is a hub, while Portland International Airport (PDX) isn't. Some controversy ensued when DIA replaced Stapleton in the 1990's. Some critics asserted that, with direct flights increasing in poularity, Denver had built the airport of the 1980's.

It is a fairly long drive east from downtown Denver to DIA. I almost missed a flight in 1996, not taking that fully into account.

A connection to HP calculators: The seller of the pristine HP-10C I bought a few years ago claimed to have used it in his work designing DIA.

BTW: A conference in Fort Collins perhaps ought to include an optional group side trip to WWV, if possible.

Probably not a whole lot of people listen to WWV these days, nerdy hams like some of us here excepted. But there are a zillion "atomic" clocks, watches, weather stations, etc. that get time from WWVB which is also broadcast from the same location.

I would love to get a tour of the NIST site in Fort Collins. While their web site has an near infinite amount of information about WWV/WWVH/WWVB and the clocks they use, there's no indication that they give tours of the place. Does anyone here know if they do?

>
> -Katie

The NIST Atomic clock is in Boulder! about 45 miles SW of Ft. Collins. I don't recall how they get the signal from Boulder to WWV or how they compensate propagation delays, etc.

When I visited NIST in the late '90's they had a huge quartz crystal in the lobby (about 90cm tall). Down the hall you could see the two cesium clocks and a few predecessors (including a pendulum clock, IIRC).

Fool Disclosure: I have a friend that works for a former HP entity in Ft. Collins.

Folks who need good time (like us VLBI radio astronomers - we can tell the relative time between sites AFTER an experiment to the picosecond level (1e-12), and prefer sub-microsecond a priori time) all use GPS these days. It delivers tens of nanosecond time accuracy with no effort.

Re: HHC2009 Change of venue (Ft. Collins, CO)

Regarding WWV: In the northwestern part of the US during the early 1980's, I was able to hear the 5.0-MHz WWV/WWVH broadcast at night on a Sanyo shortwave, when the stations belonged to the National Bureau of Standards. Also easy to get was Radio Moscow and Voice of America.

That radio is no longer working properly, but my recently-acquired Zenith Trans-Oceanic can receive WWV at 5 MHz. With major political changes, though, the others are hard to find now...

-- KS

Edited: 8 July 2009, 10:27 p.m. after one or more responses were posted

Hello Karl!

*Message #17 Posted by **Geoff Quickfall** on 28 June 2009, 5:49 p.m.,*
in response to message #16 by Karl Schneider

Yes the Zenith Oceanic is great.

Radio Havana Cuba, Radio Nederlands in Hilversum (sp?) as well as Fort Collins and Hawaii, NRC time signals in Ottawa. Lots of DXing in the old days.

Most aircraft today (10 years or older) without GPS will have their clocks updated by the master clock and a time signal. Usually we use WWV or WWVB in Hawaii.

Even with the GPS and SAT NAV systems today I always do a time check in case of hidden software updating problems.

Cheers, and happy DXing...

Geoff

P.S. I was going to bring down in the station wagon a whole bunch of free vintage calculators to Vancouver, Wa. but now that I have to fly into Denver and rent a car it looks like they will be left at home. Oh well!!!!

(just kidding about the free vintage HP calculators)!!!!!

Hi, Geoff!

> Quote:
>
> Cheers, and happy DXing...

I have to admit, I wouldn't try serious shortwave DX'ing on the third-generation Royal D7000 unless I connected a 'real' antenna to its terminals -- although the built-in whip is fairly good.

AM and FM reception are excellent.

Not sure if I'll be attending this year with the change of venue from Vancouver, USA. I had a 2.5-hour direct flight and family in San Diego (2007); Corvallis (2008) was only a several-hour drive away; Vancouver is home. Fort Collins? Hmm...

SPICE question - repost

*Message #1 Posted by **Michael de Estrada** on 26 June 2009, 9:56 p.m.*

I asked this question previously, but received no replies, so I'm going to try again. I know somebody knows the answer.

I am quite familiar with the construction and repair of Spice type 1 series calculators (HP3xE/C) with the un-soldered press-fit design, having fully disassembled/reassembled 8 different units. Most of the "repairs" have consisted of swapping interchangeable parts from different units. One of the most common problems is broken/damaged battery contacts and/or charger circuit board traces. Another less common problem is a damaged ribbon connector between the contacts board and the power circuitry board. On the Spice Type 1 series, the battery/charger contact assembly terminates at a ribbon connector extension to the power circuitry board, which is press-fit to the main circuit board. Therefore, it is possible to swap a bad assembly with a good one sourced from a different calculator.

My question is whether this is possible with the later type 2 series with the soldered construction, or is the battery/charger contact assembly integral with the main circuit board?

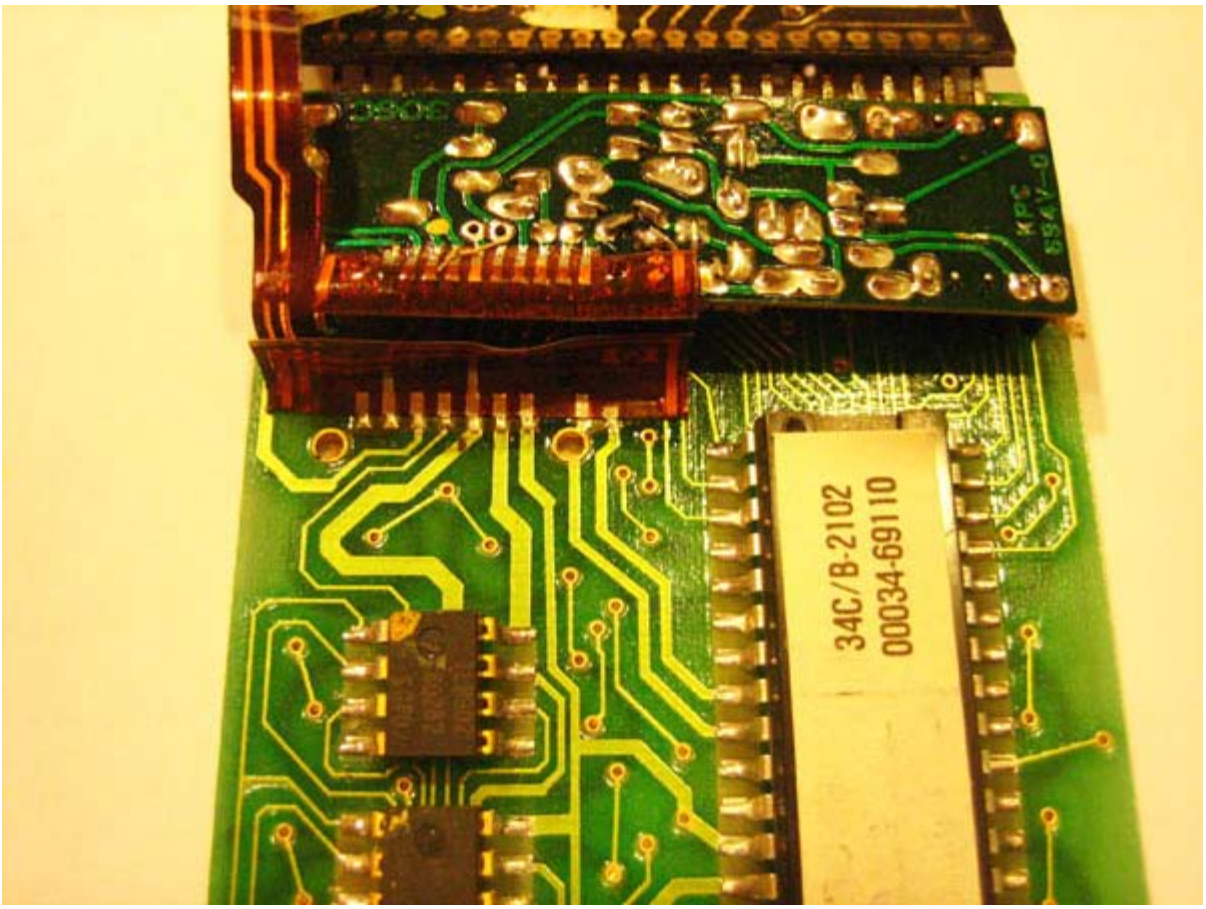
Thank you for your assistance,

Michael

Re: SPICE question - repost

*Message #2 Posted by **Randy** on 27 June 2009, 9:58 a.m.,*
in response to message #1 by Michael de Estrada

The same battery connection contacts and flex circuit are used but in the case of type 2 units, it is soldered to the main board.



Re: SPICE question - repost

*Message #3 Posted by **Michael de Estrada** on 27 June 2009, 10:16 a.m.,*
in response to message #2 by Randy

Thank you. I was afraid that was the case. It appears from your photo that the LED array is soldered as well. This is beyond my soldering skills.

Re: SPICE question - repost

*Message #4 Posted by **Randy** on 27 June 2009, 10:31 a.m.,*
in response to message #3 by Michael de Estrada

Yes, everything is soldered. The power supply module is very difficult to remove/replace and I would normally repair the battery contacts in almost all cases unless the charger contacts are damaged.

On units with bad LED arrays (which is very common, especially the right most digit) I simply cut all the pins individually then unsolder each one once the board is gone. Very easy to do.

Trying to remove a good LED from a soldered unit for reuse is again, very difficult.

Re: SPICE question - repost

*Message #5 Posted by **Hal Bitton in Boise** on 27 June 2009, 10:23 a.m.,*
in response to message #1 by Michael de Estrada

Hi Michael,
I repaired my "type 2" soldered machine about 2 years ago (a 34C)...there is indeed a ribbon connector between the two boards to which you referred.

I seem to recall, however, that both ends of the ribbon connector's traces were all attached with what looked like tiny hollow rivets.
Best regards, Hal

Re: SPICE question - repost

*Message #6 Posted by **Randy** on 27 June 2009, 5:23 p.m.,*
in response to message #5 by Hal Bitton in Boise

There are three hollow rivets on the battery connection board. Two hold the battery contacts in place, all three hold the flex circuit traces in contact with the pc board. On the other end, it is all solder connections as shown in the photo, no rivets there.

Seeking 42S Inspiration

*Message #1 Posted by **Mark Edmonds** on 26 June 2009, 3:26 p.m.*

If someone here can come up with the right idea, I'll be really grateful!

Situation is that I've had a 42S for a couple of months now and the only programs I've written have been noddy programs to check I understand how it works.

But now I've really got the urge to write a proper program and ideally, I want to write a game. Problem is, I can't think of anything suitable! I don't want to re-hash all the old ideas or regular candidates for calculator games. I want something that will be worth playing and fun. It will have to be turn based of course (unless there is a secret way of scanning the keyboard without halting program flow) and with nearly 7K available and limited graphics, there has to be something good out there.

Anyone able to come up with a cracking idea please?

Put your thinking-caps on please Ladies and Gentlemen!

Sincere thanks in advance for any suggestions :)

Mark

*Message #2 Posted by **Geir Isene** on 26 June 2009, 3:42 p.m.,*
in response to message #1 by Mark Edmonds

A full blown gladiator game where you build a character, win money, buy new weapons and armor, and where the real game is in the close combat tactics of attack/parry combinations.

I've been wanting to make such a game for the HP-41. If you start, I will pitch in :-)

Re: Seeking 42S Inspiration

*Message #3 Posted by **Mark Edmonds** on 26 June 2009, 4:31 p.m.,*
in response to message #2 by Geir Isene

Thanks for the idea Geir. I am having trouble seeing how this type of game would work in a turn-based setup. I've seen games that are similar to what you describe but they have been realtime, arcade type games. Is there a well known existing game that does what you are suggesting that I can look up and examine? Thanks :)

Mark

*Message #5 Posted by **Geir Isene** on 26 June 2009, 4:54 p.m.,*
in response to message #4 by Martin Pinckney

Nope, I was dead serious. And with the advent of the NoV-64 & ICEBOX.ROM, we have an enormous amount of memory available to accomplish stuff that you needed a C64 to do in the ole' days :-)

Re: Seeking 42S Inspiration

*Message #6 Posted by **Geir Isene** on 26 June 2009, 4:51 p.m.,*
in response to message #3 by Mark Edmonds

A turn based gladiator game could be as good as a real time time one IMO.

Remember the good old Dungeons & Dragons Role-Playing game? Or with a better combat system, we have the Amar RPG . Be inspired :-)

I once played an around-the-table Role-Playing game called... Gladiator (can't find it now) - and this is where I got this games idea from. Nowadays, we have the flash equivalents (but nowhere near as good a game system as the aforementioned Gladiator RPG): Galdiator2 flash game

Re: Seeking 42S Inspiration

*Message #7 Posted by **J Grim** on 27 June 2009, 12:53 a.m.,*
in response to message #3 by Mark Edmonds

Greetings. I have long followed the forum here but never posted. Thank you, Mr. Hicks for creating this museum for us to enjoy. I also enjoyed the pics of your various world travels. :-)

I think I have a source of inspiration for a game of this nature. My first computer was an Apple IIe and on that machine we had a game called Arena of Octos. It was a turn based gladiator game set in a sci-fi setting.

Mark, good luck in creating your game.

*Message #8 Posted by **Howard Owen** on 26 June 2009, 10:13 p.m.,*
in response to message #1 by Mark Edmonds

OK, use printing functions on the 42S to send game update data via IR to an external box. This box would coordinate game play among several calculators, and update a shared display. The 42S would do control input and have local state displayed. Presto - real time multiplayer. :)

You didn't say it had to be *practical* :)

Regards,
Howard

Re: Seeking 42S Inspiration

*Message #9 Posted by **Mark Edmonds** on 27 June 2009, 7:29 a.m.,*
in response to message #8 by Howard Owen

Howard - Thanks for the idea! Another practical idea - how about a pinball simulator? The program continuously calculates where the ball should be on the table and reports this using distance from a base point. The player then uses a tape measure to position the ball on the table and keeps this updated as the program calculates each new position. I'd call it something like "Slowball".

Mark

Slot machine. Brain dead simple.

Re: Seeking 42S Inspiration

*Message #12 Posted by **Mark Edmonds** on 27 June 2009, 7:18 a.m.,*
in response to message #11 by Egan Ford

Thanks everyone for the interesting ideas!!! :)

I'm sorry to say that I am not going to do anything remotely like a Dungeons and Dragons game. My feelings towards that game are not printable. Nothing personal and not trying to sound ungrateful for the ideas but "D&D" is a no-go area. If I roll my special one-sided dice, it says "run like hell!!".

Chess - now that is interesting. I had thought about that and a simple one-move lookahead might be feasable. However, lots of available moves need lots of available memory and I'm not sure how this would work out. Still not discounting it though.

Slot Machine - another interesting idea but I don't know much about how they work as I've never played one! Presumably, just a low probability of winning?

Other areas I am trying to think of involve card games or board games where the program would report a move which the player updates on a real board. Chess would be an example but maybe someone can think of a good board game where moves can easily be described.

In terms of program speed, I realise the 42s is not exactly a racehorse so the intended fallback is Thomas Okken's emulator or Christoph's one if I can work the 42s ROM dump.

Any more ideas hugely welcome! :)

Mark

Re: Seeking 42S Inspiration

*Message #13 Posted by **Katie Wasserman** on 27 June 2009, 10:14 a.m.,*
in response to message #12 by Mark Edmonds

Years ago I taught an intro programming course and assigned games as the coursework. The "big" project was to implement the game called Black Box where the computer would randomly hide N balls in an 8x8 grid and you had to guess the location by probing from the edge of the board. Probes had one of three results: hit, reflection or exit out of a different edge location, Wikipedia has all the details.

It's a good programming exercise and a fun game to play. It's likely impossible to play it all in your head but easy to print it out or write it out on scratch paper as you play.

-Katie

Re: Seeking 42S Inspiration

*Message #14 Posted by **Mark Edmonds** on 27 June 2009, 2:14 p.m.,*
in response to message #13 by Katie Wasserman

Very interesting idea, I like it! Thanks Katie. One thing that isn't clear to me from the rules though is when you get a hit, is the ball location revealed? Or do you just get told it is a hit with no ball revealed?

One aspect concerns me with doing this on a 42S is the limited vertical display height. Although I have never played it, I get the impression that being able to see the entire board is quite important. If you include the row/column results, that means finding a way of representing a 10x10 board on a display with 16 vertical pixels. I've got a few ideas on this though...

Thanks again for the great suggestion!

Mark

Re: Seeking 42S Inspiration

*Message #15 Posted by **Katie Wasserman** on 28 June 2009, 11:58 a.m.,*
in response to message #14 by Mark Edmonds

A hit is simply indicated by marking the edge position that you probed from. The balls are only revealed at the end of the game. You need to have some mechanism to tell the computer/calculator where you think the balls are. When you're satisfied that you have them all

located correctly you then tell the machine that you're done -- it revels the true location and scores how you did based on how many probes you made and if you have any incorrect guesses (this is described in the wikipedia).

Yes, you really do need to see the board all at once. A 10x10 (including edge labels) is needed and you need to allow for some way the player can indicate where he/she thinks the balls are located within the grid. You might be able to do a very little bit of vertical scrolling to allow the user to see more than a couple of bits for each location in the grid. Too much scrolling will make this very difficult to play. It's going to be a challenge to do this on a 16 bit display. A printer output option would be very useful.

*Message #17 Posted by **David Hayden** on 27 June 2009, 9:12 a.m.,*
in response to message #1 by Mark Edmonds

How about Sudoku? You could do it in 3 stages:

1. User inputs the known values, then guesses the unknowns. The program validates each guess and (of course) tells them when they've solved the puzzle
2. Use inputs the known values and the program solves the puzzle. There are plenty of sites that describes algorithms for solving the puzzle and I can provide C++ source code for my own if you like.
3. Program creates a board for the user (or program!) to solve.

Re: Seeking 42S Inspiration

*Message #18 Posted by **Mark Edmonds** on 27 June 2009, 2:25 p.m.,*
in response to message #17 by David Hayden

Thanks for the idea David. I can see a nice way of implementing a sodoku board in 3x3 blocks on the 42s display. Certainly one to give some serious consideration - but if I did it, I would have to write my own solving algorithms, no cribbing! It would be a matter of principle to work out how to do it, especially as I have never ever played the game (but I know the rules).

Mark

Re: Seeking 42S Inspiration

*Message #19 Posted by **Don Shepherd** on 27 June 2009, 9:38 a.m.,*
in response to message #1 by Mark Edmonds

How about the Fifty Game?

Two players (or one player and the computer) take turns, each entering a number from 1 to 6. A running total is established. The person who hits exactly 50 is the winner.

If you analyze the game, you will realize that the player who goes first will always win if he/she knows the "secret" and doesn't make a mistake. If the first player does not know the secret, but the second player (computer, in this case) does, then there is a very high probability that the second player will win.

My middle school kids love this game, and I always tape a one dollar bill above the board and offer it to whomever can beat me (I go second). I always end up losing the dollar when one of the bright ones figures out the secret.

Re: Seeking 42S Inspiration

*Message #20 Posted by **Egan Ford** on 27 June 2009, 10:53 a.m.,*
in response to message #19 by Don Shepherd

Sounds like Nim (http://en.wikipedia.org/wiki/Nim). IIRC, there are a few RPN versions of this around.

Mathematics Magazine a few months back had a great article on non-transitive dice games. Basically there are 4 dice, each has different numbers on the sides. Each dice has a probability of besting the other dice, e.g. A > B > C > D, however D > A. So in this game it is the person that goes 2nd that has the upper hand. Play that with your kids, best of ten, each time allow them to pick any dice first, you'll win *almost* every time. Even if you alternate you'll still have the advantage.

Now if they can figure out how that works, well then you truly have a gifted student.

Edited: 27 June 2009, 11:49 a.m.

Re: Seeking 42S Inspiration

*Message #21 Posted by **Mark Edmonds** on 27 June 2009, 2:19 p.m.,*
in response to message #19 by Don Shepherd

Thanks Don. As Egan has already said, this looks a bit like a Nim variation. Is that correct or have I misunderstood the concept? Certainly, the idea is a really good one for a calculator and as it isn't the classic matchstick Nim game, it would be new and worth doing. I shall consider this one. Thanks for the suggestion!

Mark

Re: Seeking 42S Inspiration

*Message #22 Posted by **Don Shepherd** on 27 June 2009, 3:05 p.m.,*
in response to message #21 by Mark Edmonds

Yeah, Egan is right, it is similar to Nim. I programmed the 50 game on my 12c in 67 steps. If you win, the final display says 55178 ("bliss" upside-down). If the calculator wins it says 3507.1 ("I lose"). I got that idea from an old HP-65 NIM game!

in response to message #1 by Mark Edmonds

I've always enjoyed the game Daleks. It's a very simple turn-based strategy game, but quite engaging. I'd

explain further, but I'm typing this on my phone - Google should turn up numerous implementations and explanations. The 42s graphics capabilities would probably be just enough to pull it off.

Re: Seeking 42S Inspiration

*Message #24 Posted by **Egan Ford** on 28 June 2009, 10:04 a.m.,*
in response to message #23 by Dave Britten

Great game. It was also called Robots. I built the BSD "robots" version for my Mac. Given all today's gaming choices, its the simple games that I find most enjoyable.

I tried to create a 41CX version using the 32 column HP-IL Video interface, but screen updates were too slow and the 41CX is just too slow for interactive games. I may try a 71B version using the 80 column HP-IL Video interface. Versions exist for the 50g.

There are a number of Star Trek turn-based games available that may also workout well. Graphics are not necessary, but providing updates on a printer may be nice (see example below). Think of "Trek" as a much more engaging version of the board game Battleship. There are many C-based (e.g. BSD) and BASIC versions around to base an RPN version on. Actually there is an RPN version already for the 41CX (http://www.rskey.org/gene/calcgene/trek41.htm). Build on that.

Example BSD printer output:

```
Short range sensor scan
  0 1 2 3 4 5 6 7 8 9
0 . . . . # . . @ . . 0   stardate       2800.05
1 . . . . . . . . . . 1   condition      GREEN
2 . . . . . . . . . . 2   position       5,6/5,5
3 . . . . . . . . . . 3   warp factor    5.0
4 . . . . . . . . * . 4   total energy   5000
5 * . . . . E . * . * 5   torpedoes      10
6 . . . . . . . . . . 6   shields        up, 100%
7 . . . . . . . . . . 7   Klingons left  6
8 . . * . . . . . . . 8   time left      7.95
9 . . . . . . . * . . 9   life support   active
  0 1 2 3 4 5 6 7 8 9
Starsystem Beta III
```

For the most part BSD Trek is like the 41CX Trek, but with more options and strategy. Both versions are line oriented, but the BSD version has short range and long range sensor commands than print the above output.

A 42S version of this would be very nice.

*Message #25 Posted by **Mark Edmonds** on 30 June 2009, 6:04 p.m.,*
in response to message #24 by Egan Ford

I just want to say a huge thank you to everyone who came up with ideas here. Lots of interesting thoughts including some which will translate on other machines (need to spend some time on the 85).

I had to select one idea of course and the one I've selected is Katie's Black Box suggestion. Currently, I am working on testing out a few program mechanics to find out how I am going to implement the program with the 42s functionality as well as mapping out all the features I want to implement. I've got a clear vision for how I want it to look and work at least. Displaying the board is going to be main contentious area but I think my solution will work.

Anyway, time to start work :)

Mark

in response to message #25 by Mark Edmonds

Mark,

looking forward to your game implementation, it looks like a great idea. One more to throw in which would definitely be above the capabilities of the display is Risk. Thinking of students, it might be interesting to play a game of risk say with the 50 states. Clearly the players would have to have a map of the US in their head. The better you know the map, the higher your chances of winning. Extensions to different maps (Americas, world, even the stars with a number of constellations as the 'map') are possible. It could be a fun game to play and teach something at the same point.

Cheers

Peter

HP SmartCalc 300s customer complaint

*Message #1 Posted by **hpnut** on 26 June 2009, 5:20 a.m.*

I never knew it was difficult to send my complaint to hp. Obviously, first I got an automated response. next, a HP person told me I must bring the complaint to the HP office in my region. I emailed HP Malaysia using their automated email by product group. sure, there is no email address for complaints about the HP SmartCalc yet, so I chose the closest product group. next, the eSupport engineer tells me to call HP Calculator support in Malaysia. The number is dead, so I sent another email to eSupport. I also emailed my complaint to the HP reseller. they forwarded that complaint to HP Singapore. sheesh..

anyone has direct access to HP Calculator Division (or are they non-existent?)

I recently bought an HP SmartCalc 300s serial no. 4CR XXXXXXXX.

I feel disappointed (and cheated) that HP saw it fit to use a 3rd party calculator and stick the HP badge on it. The Casio fx-115ES has more calculation modes. For example, these are missing from the HP:

1. Complex numbers 2. Base-N 3. Equations 4. Matrix 5. Vectors

If you examine the HP SmartCalc 300s display carefully, you can find these annunciators CMPLX, MAT, VCT, these are dimmed and presumably disabled. Why did HP disable these functions in a scientific calculator?

I have been an HP calculator user since 1979 with the HP 41CX, and I am always excited by new calculators from HP. Are the days of HP innovations and quality over? They appear happy to repackage someone else's calculators, not even improving them and certainly in the case of the SmartCalc, even crippling them. I bought the SmartCalc because I thought that it had the potential to be an innovative calculator such as the HP 20b Business Consultant (its J-tag connector may open up new possibilities). Even the SmartCalc's chassis is similar to the HP 20b, which is by no means an ideal calculator (mushy keyboard comes to mind).

I would appreciate a response from HP on these issues. Thank you.

Re: HP SmartCalc 300s customer complaint

*Message #2 Posted by **Mark Edmonds** on 26 June 2009, 9:00 a.m.,*
in response to message #1 by hpnut

Maybe the deal HP negotiated with Casio forced them to offer the calculator with certain functions switched-off?

Casio would know that the HP badge has more cachet value than their own so a calculator with identical functionality, the HP badge and a lower price would be damaging for them.

This is all guessing of course and is it certain that the HP is a re-badged Casio?

Also, I am sure I have seen re-badged clones with reduced functionality in other fields even if I can't think of one right now.

Mark

> Also, I am sure I have seen re-badged clones with reduced functionality in other fields even if I can't think of one right now.

I am not sure just how narrowly you define a "re-badged clone"; however, the Durabrand 828 was a machine that was packaged differently from the old Casio fx-7000G but mimicked the functionality of the fx-7000G. The 828 manual had nearly identical text to the manual of the fx-7000G and even had the same sample problems but with some typographical errors.

One major difference was that the 828 keyboard suggested that the SD2 and LR2 functions were available. A user could even get the display indicating the start of the mode; e.g., MODE SHIFT X would bring SD2 to the display, but the actual functions of SD2 weren't available.

This means both calculators most likely share the same display. For instance, the display in my 15C has D.MY and BEGIN annunciators which show up in the self test. There would be no point saying the financial functions are disabled on it.

Gerson.

Re: HP SmartCalc 300s customer complaint

*Message #6 Posted by **Michael de Estrada** on 26 June 2009, 9:40 a.m.,*
in response to message #5 by Gerson W. Barbosa

You are right! I ran the self-test on my HP-15C (2234A), and sure enough, it has the BEGIN and D.MY annunciators. I had never even noticed this before. By the same token, my HP-12C (2732A) has GRAD and C annunciators, which are unused on that model. After all these years, I am still learning new things about my old HP calcs.

Michael

Re: HP SmartCalc 300s customer complaint

*Message #7 Posted by **Gerson W. Barbosa** on 26 June 2009, 10:17 a.m.,*
in response to message #6 by Michael de Estrada

It appears C annunciator is meaningful on the 12C, but I don't remember now what it might be.

Regards,

Gerson.

Re: HP SmartCalc 300s customer complaint

*Message #8 Posted by **Don Shepherd** on 26 June 2009, 10:31 a.m.,*
in response to message #7 by Gerson W. Barbosa

Gerson, it has to do with calculating either compound or simple interest accruing during an odd period. You turn on the C annunciator (which means compound interest) via STO EEX. I've never used that particular function, but that's what it is for.

Re: HP SmartCalc 300s customer complaint

*Message #9 Posted by **Gerson W. Barbosa** on 26 June 2009, 10:47 a.m.,*
in response to message #8 by Don Shepherd

Thanks for the information, Don. I only use TVM functions on the 12c... and occasionally something not related any financial function at all, as in my updated post below :-)

Regards,

Gerson.

Re: HP SmartCalc 300s customer complaint

*Message #10 Posted by **Michael de Estrada** on 26 June 2009, 10:33 a.m.,*
in response to message #7 by Gerson W. Barbosa

Compound interest mode (manual page 59). When C is off, it is simple interest mode. On the HP-15C, it stands for Complex number mode.

Michael

Voyager models: "C" and "G" annunciators

*Message #11 Posted by **Karl Schneider** on 26 June 2009, 11:43 p.m.,*
in response to message #10 by Michael de Estrada

> Quote:

> *(HP-12C)* Compound interest mode (manual page 59). When C is off, it is simple interest mode. On the HP-15C, it stands for Complex number mode.

And on the HP-16C, "C" stands for carry bit. On the HP-10C and HP-11C, it doesn't mean a darn thing.

"G" changes RAD to GRAD on the HP-15C, HP-11C, and HP-10C; it indicates a binary/octal/decimal/hexadecimal result out of ranGe on the HP-16C.

What issues?

*Message #12 Posted by **Gene Wright** on 26 June 2009, 10:37 a.m.,*
in response to message #1 by hpnut

You bought an HP product that you could have researched before the purchase to see if it did complex, matrix, base, vector calculations, but you did not, it seems. You even say you bought it because it might have the potential to be ... but again, you paid next to nothing for this (retail is $15) on a hope...and you did not research enough before purchase.

After your purchase, you find it is different from a competitor. Caveat Emptor.

Several CHEAPER HP's bear a resemblance to other machines and HAVE for the last several years. If you have been watching HP calculators for more than a few months, you would know this. I assume HP corporate has decided to do this. Who knows? Perhaps it is to finance other higher end machines.

Are the days of HP innovation over? Apparently not - since HP has produced several distinct calculators over the last couple of years.

What exactly did you expect for your $15? Give me a break! If you like the casio so much, please buy one. It is a nice little machine.

Sorry, but I'd probably not respond in such a snippy manner if I hadn't read this posted to several locations.

P.S. the "C" indicator on the 12c is used to show the mode for computing interest - simple or complex for partial periods.

Edited: 26 June 2009, 10:40 a.m.

Re: What issues?

*Message #13 Posted by **Sancerre (Phoenix)** on 26 June 2009, 11:06 a.m.,*
in response to message #12 by Gene Wright

I'll have to agree with Gene's reply. I purchased a 300s, but certainly didn't expect to get a 15c. In fact, my daughter is happily using the calculator and considers it to be an upgrade on her TI 34II.

Re: HP SmartCalc 300s customer complaint

*Message #14 Posted by **Mike Morrow** on 26 June 2009, 12:04 p.m.,*
in response to message #1 by hpnut

I see no listing of what you have identified as failing to function according to the advertised specifications of this machine. What is the basis for complaint to HP?

Re: HP SmartCalc 300s customer complaint

*Message #15 Posted by **Richard J. Nelson** on 6 July 2009, 3:57 p.m.,*
in response to message #14 by Mike Morrow

Hello,

I don't believe that anybody would agree that rebadging/rebranding other designs and putting HP's name on them is a good thing. Some of the reasons that this is being done have been mentioned. If you want to put this topic more into perspective see an article at:

http://holyjoe.net/hhc2009/Recent%20Changes%20at%20HP%20Calculators.pdf

As explained in the article HP is trying to provide a broad product line and they need to start somewhere. The annual HP Handheld Conference, HHC, (first weekend of October this year) addresses these and other issues. Some years are more significant than others. Examples are 2002 and 2007. I believe that 2009 will be historically counted as one of these milestone years.

Richard J. Nelson

Re: HP SmartCalc 300s customer complaint

*Message #16 Posted by **Mike Morrow** on 8 July 2009, 10:46 a.m.,*
in response to message #15 by Richard J. Nelson

I'm only interested in the *specifics* of how this machine fails its *advertised* specifications. That would be rational basis for complaint...the *only* rational basis for complaint.

Re: HP SmartCalc 300s customer complaint

*Message #17 Posted by **Bart (UK)** on 8 July 2009, 11:16 a.m.,*
in response to message #16 by Mike Morrow

The HP SmartCalc 300s is *advertised* on the HP-UK website. I have looked at all the listed resellers (and more) and not found it available anywhere in the UK. Thus I cannot use *any* of the *advertised* specifications.

HP is saying "Look at this, do you like it? Well you can't have it because we don't **feel** like selling it in your country even though we say we are." (Note: It is not listed as "out of stock" on the HP-UK website).

I think this is quite a *rational* basis for complaint. Why advertise it if they do not **wish** to sell it?

Re: HP SmartCalc 300s customer complaint - I can't get it in the UK

*Message #18 Posted by **Bart (UK)** on 8 July 2009, 9:31 a.m.,*
in response to message #14 by Mike Morrow

I have a complaint about the 300s.

I CAN NOT FIND IT FOR SALE IN THE UK, even though HP UK list it on their website.

I have submitted a complaint to HP also asking when & where it will be available in the UK, without response.

Does any-one on this forum know where I can get one in the UK?

Bart

in response to message #18 by Bart (UK)

Try this link. They say it isn't available until July 13th:

http://shop.wfsleath.co.uk/hp300s-scientific-calculator-f2240aaaba-1495-no-stock-due-week-commencing-13th-july-251-p.asp

Mark

Re: HP SmartCalc 300s customer complaint - I can't get it in the UK

*Message #20 Posted by **Gene Wright** on 8 July 2009, 1:22 p.m.,*
in response to message #18 by Bart (UK)

Start holding your breath - I'm sure they will be right back to you personally on an irrational complaint.

A quick look at this link:

SmartCalc 300 specifications advertised on HP's site

shows a list of specifications. If the SmartCalc 300 does not do what is advertised here on the HP UK website, then a rational basis exists for the complaint.

Here is a link to the definition of the word "advertised":

Advertised

You'll note that what HP has done on their UK webpage falls into this usage.

1. To make public announcement of, especially to proclaim the qualities or advantages of (a product or business) so as to increase sales.

2. To make known; call attention to.

Sigh.

Re: HP SmartCalc 300s customer complaint - I can't get it in the UK

*Message #21 Posted by **Bart (UK)** on 9 July 2009, 5:29 a.m.,*
in response to message #20 by Gene Wright

I wish to thank Mark for the one useful reply. This is the first mention of it that I can find on a UK commercial website. I had browsed Sleaths before but not come across it.

Now for more useless blurb: (I usually say "if you have nothing useful to say, don't say it" - however I now feel oblidged to defend myself)
Why did HP not have the courtesy to reply with the info of when they intended to ship to the UK when I queried them a few weeks ago? Actually they should have put this on their UK website. I had pretty much given up as it has been for sale in other countries.

> Quote:
>
> You'll note that what HP has done on their UK webpage falls into this usage.
>
> 1. To make public announcement of, especially to proclaim the qualities or advantages of (a product or business) **so as to increase sales.**

I actually think they failed on point 1 - how can they increase sales if it's not made available to buy? If you cross reference various sources on the definition of "advertise" you'll see the crux is: to make known in order to sell. How can you attempt to sell what you don't provide? Whether it be a part of a product, a function of a product or a whole product - they are not delivering what they advertise! And then not have the courtesy to reply to a customer query on this.

The first post in this thread is an irrational complaint because the user got what was advertised.
I can not get what is advertised, therefore my complaint is rational.

Again thanks to Mark and no thanks to others that replied with useless info as to what they see as a "rational complaint" from within the boundaries of their technical pigeon-holes.

HP48s/x connectivity

*Message #1 Posted by **bbeamer** on 25 June 2009, 11:10 a.m.*

I recently acquired a 48s and 48sx. They both pass all their self tests and are in good shape. I'm trying to get them connected to my computer and am having problems. One of the calculators came with the HP serial cable and I am using the HPComm 3.0r4 software downloaded from educalc.net. I follow all the directions and prompts and the computer cannot connect to either calculator. What might I be missing?

I would also like to find out about testing the cable with my multimeter to make sure it's not the problem.

Thanks

Brian

Edited: 25 June 2009, 11:11 a.m.

Re: HP48s/x connectivity

*Message #2 Posted by **Mark Edmonds** on 25 June 2009, 11:19 a.m.,*
in response to message #1 by bbeamer

Make sure you've got the calcs to transmit over wire and not i/r. Go to leftshift+I/O then Setup.

I use the HP Serial Connectivity kit and Kermit for comms between PC and calc - if you want to consider downloading that from hpcalc.org, I could help get things setup. I haven't used HPComm so I don't know how that works.

Mark

Re: HP48s/x connectivity

*Message #3 Posted by **Dave Britten** on 25 June 2009, 12:51 p.m.,*
in response to message #1 by bbeamer

Try just doing a standard Kermit file transfer with, say, HyperTerminal (or your favorite serial comms package). Make sure hardware handshaking is off, as the 48 doesn't do this. Use the RECV command on the 48 (in the I/O menu), and the calculator will await a Kermit transfer.

You should also be able to use the XMIT and SRECV commands to send and receive strings directly over the serial port for more testing. Use CLOSEIO afterward.

Re: HP48s/x connectivity

*Message #4 Posted by **bbeamer** on 26 June 2009, 11:33 a.m.,*
in response to message #3 by Dave Britten

Thanks for the tips.

I tried doing a Kermit file transfer with Hyperteminal and that didn't work either. I'm pretty sure I've got the serial port configured properly. I could access the port, I just couldn't connect to the calculator.

I had no problem doing an IR transfer form calculator to calculator.

I tested the cable, and I've only got continuity in three of the four wires in the cable from the calculator. I'm guessing this is the problem. I'll try ordering a new cable. I just wanted to try everything, since the cable cost more than I paid for the calculators!

Any other advice would be appreciated.

Thanks again,

Brian

Re: HP48s/x connectivity

*Message #5 Posted by **Egan Ford** on 26 June 2009, 1:10 p.m.,*
in response to message #4 by bbeamer

Only 3 wires are required for RS-232 communications. Rx, Tx, Signal Ground. IIRC, pins 2, 3, and 5 on a DB9.

Re: HP48s/x connectivity

*Message #6 Posted by **Dave Britten** on 26 June 2009, 1:47 p.m.,*
in response to message #4 by bbeamer

Hmm, sounds like something isn't jiving right, config-wise. Here's how I set things up to get my 48GX and 48SX talking to HyperTerminal:

In HyperTerminal, select the serial port in the "Connect using" box, and hit Configure.
Bits per second: 9600 (or whatever you set on the calc)
Data bits: 8
Parity: None
Stop bits: 1
Flow control: None

On the 48, use these settings:
IR/wire: wire
ASCII/binary: Depends on what you're transferring, but I usually choose ASCII for UserRPL programs.
baud: 9600
parity: none 0
checksum type: 3
translate code: 1 (Again, depends on what format you want the files sent in. I think this is ignored for binary transfers.)

If all the settings match, you should be able to execute "HELLO" XMIT on the 48, and see "HELLO" appear in the HyperTerminal window. If you still don't get anything, try another computer. I've seen serial ports go bad, uncommon as it may be.

Re: HP48s/x connectivity

*Message #7 Posted by **bbeamer** on 26 June 2009, 5:07 p.m.,*
in response to message #6 by Dave Britten

Well, thanks to all the help I got, my calculators and computer are talking. I followed your instructions, Dave, and everything worked fine. I'm not sure what I did differently yesterday, but I obviously did something wrong.

The kicker is that now, after I was able to communicate using HyperTerminal, I can connect using the HPcomm software also, without making any changes to the calculator or the software. I must have had some setting incorrect.

Thanks for the info on the serial cable Egan, that saved $30 on an unneeded item. That's why my first thought is always operator error when something doesn't work for me.

Brian

21 RCL 0         44 y^x
22 y^x           45 /
23 2             46 GTO 00

12.12 R/S => 648,976,950.1 after 3.5 seconds (HP-12C+)

On the 15C,

12.12 x!  => 648,976,950.9
```

This is based on the following approximation I've come up with:

Gamma(x+1) ~ SUM(k=0,inf,(2*k+1)^x/2^k)/(sqrt2/2*(2/ln(2))^(x+1))

Obviously, this is not the proper way to compute the Gamma function. It's just an example of what can be done on the fast 12C+. Just for an idea, it would take about 7 minutes to compute Gamma(40) on a normal 12C using this method.

Gerson.

The approximation is being used reversely, that is, it is meant to approximate this integer sequence, not the Gamma function:

```
an ~ n!/(2*sqrt2)*(2/ln(2))^(n+1)
```

I found it when thinking about John Smitherman's math joke turned into a problem. The numbers 2, 6, 34, 294...

(which showed as the problem was getting progressively more complex) ought to mean something... I couldn't find it at OEIS but I found 1, 3, 17, 147..., the halved sequence. Eventually I found out the original sequence is the row sums of Sierpinski-Pascal-MacMahon triangle, whatever this might be. Next time someone starts a joke I'll try to just laugh, as everybody else :-)

I just intended to put a computationally intensive programming problem to the 12C+ to see how it performed. For computing Gamma function on the 12C+ or the normal 12C and 12c Platinum there isn't anything better than Egan Ford's program:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=100275

Just for fun I thought I'd try it on the new 35s to see how it did (considering it's slighly(?) old CPU).

12.12 XEQ is about 30.5s with an answer of 648,976,950.899 (FIX = ALL).
40 XEQ is about 1 min.

Bart

in response to message #2 by Bart (UK)

13 and 23 seconds, respectively, on the 33s which used to be my fastest RPN calculator. I wonder how nice it would be if they released a new 15C+. If it were as fast as the new 12C+, **60.5 CHS x!** would take about 200 ms to display -1.527756e-97 instead of current 13 seconds.

Gerson.

Re: 12C+ Gamma

*Message #4 Posted by **Bart (UK)** on 30 June 2009, 11:00 a.m.,*
in response to message #3 by Gerson W. Barbosa

A fast 15C would be a dream come true.

I tried a HP-20S implementation:

```
01 LBL A        23 2            45 1/x
02 STO 0        24 +            46 *
03 y^x          25 1            47 2
04 .            26 =            48 =
05 6            27 y^x          49 y^x
06 =            28 RCL 0        50 (
07 *            29 =            51 RCL 0
08 1            30 2            52 +
09 9            31 y^x          53 1
10 =            32 RCL 2        54 )
11 STO 1        33 =            55 =
12 0            34 1/x          56 *
13 STO 2        35 *            57 2
```

```
14 STO 3        36 LAST         58 SQRT
15 LBL B        37 =            59 /
16 RCL 2        38 STO+ 3       60 2
17 INPUT        39 1            61 =
18 RCL 1        40 STO+ 2       62 1/x
19 x<=y?        41 GTO B        63 *
20 GTO C        42 LBL C        64 RCL 3
21 RCL 2        43 2            65 =
22 *            44 LN           66 RTN
```

Compared to the original post, one can see the advantage of RPN here. Although this is probably not the most optimum.

12.12 XEQ A, 15.5s; 648,976,950.9
40 XEQ A, 30s

Considering the program is 50% longer, that makes the 20S 3x faster than the 35s. Possibly the advantage of simple data types?

*Message #8 Posted by **Marcus von Cube, Germany** on 30 June 2009, 4:42 a.m.,*
in response to message #7 by Raymund Heuvel

Mine must be on steroids:

.09 seconds for GAMMA(13.12).

It appears to be a very inaccurate measurement because several tries resulted in vastly disparate timing results, a few outcomes even with a negative sign.

Re: 12C+ Gamma

*Message #9 Posted by **Gerson W. Barbosa** on 30 June 2009, 7:51 a.m.,*
in response to message #7 by Raymund Heuvel

I was doing a=time @ GAMMA(13.12) @ time-a (without semicollon).

Now I get 0.21 to 0.22 and 1.02 to 1.05 for GAMMA(-68.5).

1BBBB version also with a 32K RAM module and card reader. They have no effect on timing though.

Thanks!

Gerson.

Which came first? 19B or 27S?

*Message #1 Posted by **Mark Edmonds** on 25 June 2009, 7:49 a.m.*

I can't find out the exact release dates of these machines. Their first appearance in an HP Catalog is in 1989 yet they were both available in 1988.

I have two downloaded brochures, one dated September 1988 which features the 19B and one dated November 1988 which features the 27S but these brochures are based on financial/scientific criteria and I wouldn't infer any release dates from them.

The lowest known serial numbers for the machines show a lead by a few weeks for the 27S (2747 vs 2801) but date of manufacture doesn't necessarily indicate availability in the shops or official release dates.

So is the official release date for each machine available anywhere please? I've gone through all the on-line sources I can find but without any luck.

Thanks,

Mark

HP-41CX Frozen Up

*Message #1 Posted by **Jeff Davis** on 24 June 2009, 9:57 p.m.*

I have a frozen HP-41CX. Does anyone have any ideas? I have tried the MEMORY LOST reset and no go. Please let me know if you know any other tricks.

Re: HP-41CX Frozen Up

*Message #2 Posted by **John Robinson** on 24 June 2009, 11:38 p.m.,*
in response to message #1 by Jeff Davis

Try shorting the battery terminals for a while, the outter two that is. Just connect them together for a while, i.e. minutes, if not hours and try again.

This assumes the calc was working at some stage recently ?

Cheers, John

Torsten Manz 15c emulator errors...?

*Message #1 Posted by **McBenney** on 24 June 2009, 12:16 p.m.*

Maybe I'm doing something stupid but using Torsten Manz's fine 15C emulator occasionally results in obvious and bizarre errors. For example, right now I'm dividing 3,750 by 76,700 and it's returning 0.181132872. That's clearly wrong. What gives? I've also encountered errors using the sin cos and tan functions. Can anyone replicate this?

Thanks!

Re: Torsten Manz 15c emulator errors...?

*Message #2 Posted by **Thomas Okken** on 24 June 2009, 9:52 p.m.,*
in response to message #1 by McBenney

I had never heard of this particular emulator until now, but if it is giving you incorrect results, you should probably send Mr. Manz a bug report. It sounds like his floating-point code is buggy.

HP releases multiple emulators for PCs, iPhone, iPod touch

*Message #1 Posted by **Steve Leibson** on 24 June 2009, 8:52 a.m.*

Today, HP announced several virtual calculators that run on PCs or Apple's iPhone and iPod Touch. Photos and more info here in my blog.

Steve

The fact that they have made a 15C emulator must surely point to a re-issue of the calculator coming out at some point. If it has the speed increase the new 12C has too, that should make for a very interesting machine! I suppose that if it is a completely strict emulator, there wont be any extra memory added.

If this does happen, there are going to be an awful lot of very happy people! Wonder how it would affect prices of original 15Cs?

Mark

It seems possible to upgrade the 15C memory with little modifications to the original code as discussed some time ago on this forum: Anyone interested in HP-15C memory upgrade?.

I would definitively be interested to buy a new 15C with the new 12C speed and more memory.

Btw, I've not found the new virtual calculators on hp.com.

New 15c - a dream that would come true.

I would like to have a backlit two-line alpha display, more speed, simple on screen menus, unlimited stack, decent solver (with real editing functions), some extra bytes of memory and multiple character labels. Oh, a good database with unit-conversions would also be great. But then it wouldn´t be a classic anymore.

If ever, I don´t think HP will come out with a simple 15c "copy". There must be some more Hi-Fi about the new thing. My main concern is keyboard quality. Will HP (Kinpo) ever come out with decent keys? (decent = work still flawlessly after 6 month)

I/O support - certainly a dream only. HP needs to keep the thing fit for professional exams. And without this option there is no need for more than 8 KB or so. Who wants to re-enter 32 KB of code if batteries should fail?

Re: HP releases multiple emulators for PCs, iPhone, iPod touch

*Message #8 Posted by **Tim Wessman** on 24 June 2009, 2:16 p.m.,*
in response to message #7 by Frank Rottgardt

Doesn't all of what you want turn it into a completely new unit rather than a 15c? Just asking. . . ;-)

I don't think there have been people complaining about the KBs on the 12Cs sold in the past 5 years, have they?

TW

This may be your secret wish;-)

Seriously, this could be due to the fact that most 12C users don't even know that this forum exists...

Apart from that: I also have a 12cp Anniversary, and like the normal 12cp, it misses key strokes (even the ON key) in a reproducable manner. I'm sure there were related posts here in the forum.

in response to message #9 by Raymond Del Tondo

I have a CNA746xxxx 12C (classic, not platinum), and no keyboard complaints whatsoever. I bash it every day at work - it is not treated like a "collector's treasure". A colleague has an eight years old 12C, and the keyboard is much worse (even with less use). I am not surprised about the number of complaints on 12C from this period. The keys on the recent 12C are not an exact replica of 80s Voyager keys, but still they have a very positive click and no missed keystrokes. 12CP is another story... it doesn't miss keystrokes because of the keyboard, but firmware. ON key is especially infuriating.

Re: HP releases multiple emulators for PCs, iPhone, iPod touch

*Message #11 Posted by **Mark Edmonds** on 24 June 2009, 5:55 p.m.,*
in response to message #7 by Frank Rottgardt

My guess would be that HP would do exactly a clone of the 15C - if they do re-issue the real thing.

The basic hardware components already exist in the new version of the 12C.

The software is already done for the emulator. They could modify this of course with some extras but to start enhancing it by modifying the original emulated code would be a potentially awkward and expensive proposition. To make a super 15C with all those extras might just be simpler to rewrite the whole thing from scratch.

So if HP keep things simple and use what they already have, it makes sense to me for them to release a pure 15C clone. An enhanced version with the extras you listed could actually form the basis of a completely new calc.

Mark

Wanna bet.
All the signs point toward a direct emulated copy of the 15C, just like the new ARM based 12C.
The hardware would be identical to the current 12C, only the faceplate is different. A new different 15C would require re-engineered hardware and a massive software effort, something HP likely don't really have the resources to dedicate on what would be a niche market machine.
A new "copy" of the original 15C would however be very simple (I bet you Cyrille already has one on his desk) and a no-brainer solution for a high margin niche retro market.

Dave.

OK, be sure I will also buy a "simple" 15c clone. This old lady is after all still an attractive package for daily number crunching that won´t let you (me) down in 99,9% of all mathematical problems I can imagine to face during my entire professional career. The only thing I got used to that I realy would miss is a second line. Just to have more control over what happens on the stack.

Very interesting thing... vertical format 4-function extras...

*Message #16 Posted by **Gene Wright** on 24 June 2009, 10:36 a.m.,*
in response to message #1 by Steve Leibson

On the iPhone or iPod Touch, if you orient the phone/iPod vertically, you get a 4 function RPN calculator presented for the 12c, 12cp, and 15c. The 12c and 15c vertical formats are exactly the same except for the gold/silver color differences. The 12cp is different to allow for algebraic and a few other additions.

I use these all the time for simple math.

Re: Very interesting thing... vertical format 4-function extras...

*Message #17 Posted by **Pal G.** on 24 June 2009, 1:02 p.m.,*
in response to message #16 by Gene Wright

That 12c (portrait) skin hurts my eyes. Looks like someone spent 20 minutes coloring over the lower button labels with MS Paint. (I wish HP would contact someone around here with graphic skills. Most would do it for nothing, knowing their work is out there among the masses).

And what's with the brushed aluminum plastic in the hp35s simulator? It looks ridiculous and it's distracting.

Virtual HP35s with bad skin.

(Image link stolen without permission from Mr. Liebson's article. Will remove upon complaint.)

Also stealing from Steve Liebson's blog, this quote:

> Quote:
>
> "We just felt that HP calculator emulators should really come from HP," said HP's Director of Calculator Product Development Sam Kim.

I agree with Mr. Kim. Emulators and simulators from HP is a cool proposition. But their software, in my opinion, needs to look better than amateur. In an organization that large, the software developer should not be responsible for creating the artwork. (I hope their graphic artist did not create these. And I suspect

Marketing had a hand in that hp35s simulator skin).

IMHO,
PG

ps - Sorry for being harsh. Sometimes you have to be firm with those you care about (calculator division).

in response to message #17 by Pal G.

Given that the image I pasted is fully 2X wider and taller than the actual image on the screen, you don't notice the graphics very much.

They are fine on the iPhone and touch.

Re: Very interesting thing... vertical format 4-function extras...

*Message #19 Posted by **Pal G.** on 24 June 2009, 1:23 p.m.,*
in response to message #18 by Gene Wright

Well, I saved your image to my iPhone Camera Roll and had a look at it full screen (brightness set at ~50%). I agree it's a little better, but I am still not terribly impressed.

Btw, actually seeing it on the phone I realize they could have easily added another row or two of keys. But I won't go there...

Re: Very interesting thing... vertical format 4-function extras...

*Message #20 Posted by **Tim Wessman** on 24 June 2009, 2:08 p.m.,*
in response to message #19 by Pal G.

Some nice, high def pictures of a 12c and 15c would go a long way for improving the look. Send them to me at my gmail account if you have one (timwessman at gmail). I am sure there are plenty around. The big issue is just having consistent lighting and correct looking shadowing, so a nice selection for me to pick for my base would be appreciated. I didn't do the graphics for those 2 models unfortunately.

I will be updating the graphics when I get some time though, so those pictures would be appreciated.

TW

*Message #21 Posted by **Pal G.** on 25 June 2009, 12:01 p.m.,*
in response to message #20 by Tim Wessman

Tim,

Here is an example of what I had in mind. A 3d model rendered with an orthographic camera. No time spent in Photoshop. All four were rendered within minutes of each other. I slightly adjusted the textures/lights for each shot, for different looks.

This calc has the fictional 15cg keyboard layout and multi-line lcd, so I would need to model a 15c and 12c if you are interested.

Thanks,
PG

edit: was three images, added one more.

*Message #23 Posted by **Bill (Smithville, NJ)** on 24 June 2009, 10:41 a.m.,*
in response to message #1 by Steve Leibson

Just checked iTunes store and they have the HP-12C from HP for 14.99 and the HP-15C for 29.99. Be interesting to see what the relative speed of each is. Also be intersting to know if they went outside or developed the emulation inside. Pricing is on the high side. I probally won't buy them.

The real question - Now that HP has released their emulations, will they be going after other people who have developed HP emulations and try to shut them down? I hope not.

Bill

12c iPhone speed test

*Message #24 Posted by **Gene Wright** on 24 June 2009, 10:44 a.m.,*
in response to message #23 by Bill (Smithville, NJ)

Running on a first generation iPhone.

Program is a counter: + then GTO 01. Stack has 1 in Y, Z and T and 0 in X.

60 second test counts to:

387,583.

Pretty quick, eh?

Re: 12c iPhone speed test

*Message #25 Posted by **Don Asmus** on 26 June 2009, 11:56 p.m.,*
in response to message #24 by Gene Wright

Just tried the same speed test with the 42s RPN Calculator app

On the 1st gen iPhone - count = 1,785,502 On the 2nd gen touch - count = 2,468,953

Approximately 5 times faster at 1/6 the cost. I also think the 42s is vastly superior to the 12c or 15c. I hope HP does not go after or scare away the other HP calc apps on the app store.

Give the 42s a try, I think you will be pleased.

in response to message #25 by Don Asmus

Hi Don. I agree that 42s is fast. I'm getting a result of 1.5 - 1.6 million on a 1st gen iPod Touch with version 2.2.1 OS and version 2 of 42s.

I've nevered owned a 42s and am enjoying learning of it's capabilities through 42s and Free42. So far, so good but I may need to buy a copy of the owner's manual from the museum.

Regards,

John

in response to message #26 by John B. Smitherman

Hi John,

I would certainly recommend getting the HP-42S manual from the museum, but if you just want to find out a bit more about the 42S without spending any money, you may also want to take a look at José Lauro Strapasson's alternative manual. It's at the Free42 web site, in the Documentation section, near the bottom of the page.
José's manual is pretty brief, only 33 pages, so it's no match for the excellent 358-page original, but nonetheless, it can be helpful for getting started with the 42S' niftiest features -- complex numbers, matrices, and the numerical solver and integrator.

---

Am I being stupid here, but why does it cost twice as much to run the HP-15C code under emulation than the HP-12C code ?

Re: HP releases multiple emulators for PCs, iPhone, iPod touch

*Message #30 Posted by **Frank Rottgardt** on 25 June 2009, 6:31 a.m.,*
in response to message #29 by Donald Ingram

Just have a look on the ....bay prices for a 12c and a 15c. Why shouldn´t HP have its share of this 15c demand? And time will tell them. If the turn over of the 15c emulator should be to low they always can lower the price.

Or (please let me be wrong) the emulator is a test case before they decide to launch a hardware-clone to the market. So everybody please buy the emulator ;-)

There's no 15C emulator offered at the site the above link points to. I found a 35s emulator at 22,64 Euro. If that's the price for the 15C software too, I won't consider buying it.

That's what's really worrying me : they will deem the demand for the HP-15C (physical remake) low due to low demand for the virtual machine. As we all know the real thing is much more desirable and tactile.

Given I've already got a real HP-15C and a virtual HP-41CX, the price would have to be low to justify a virtual HP-15C.

However I would really like a second physical HP-15C to keep at home, and would be prepared to pay much more for that.

Why the insane price difference?
I'm not familiar with iPhones apps, but isn't that very expensive for an iPhone app?

I wonder if Eric gets a royalty fee or took a one-off payment?

Dave.

No Windows version of the 15c :(

And where is MacOS? Should be easy given the iPhone versions are available.

Re: HP releases multiple emulators for PCs, iPhone, iPod touch

*Message #37 Posted by **Tim Wessman** on 24 June 2009, 12:57 p.m.,*
in response to message #36 by Marcus von Cube, Germany

15C version? I have one. . .

Going from the windows version to an OSX version isn't trivial. The iphone versions were essentially rewritten from scratch. It is probably easier to go from iphone->OSX, but there is still a lot of work to get all the same features back in that are on the windows versions.

Porting between OS X and iPhone is actually pretty easy. I'm in the middle of porting my iPhone version of Free42 to OS X, and it's a breeze; comparable to porting code between Windows and Pocket PC. There are the obvious differences in the UI classes, but everything else is pretty much the same.

Windows Version of the HP-15C

*Message #39 Posted by **Mike (Stgt)** on 25 June 2009, 3:03 p.m.,*
in response to message #36 by Marcus von Cube, Germany

No, I do not have a windows-only version, but if you have access from your PC to a host running IBM's VM - with all this ifs and buts I may help you. See here. Well, if you realy _do_ need it.

What I am still looking for: the ROM of the HP-10C as file.

Ciao.....Mike

Need some details before ordering

*Message #45 Posted by **Don Shepherd** on 24 June 2009, 5:49 p.m.,*
in response to message #1 by Steve Leibson

Does anyone know if the 12c emulator honors the "c" in 12c and keeps your programs intact between executions? As an educator, I already have the 12cp emulator, from a couple of years ago, and it does not. From HPs web site there is no way to determine this information. It would be nice if they described exactly what you are buying before you buy it. I'll wait and see.

Re: Need some details before ordering

*Message #46 Posted by **Tim Wessman** on 25 June 2009, 2:18 p.m.,*
in response to message #45 by Don Shepherd

All memory remains intact when you close and open the program. Same on the 12cp emulator. I have no idea what it did years ago, but it works fine now.

Re: Need some details before ordering

*Message #47 Posted by **Don Shepherd** on 25 June 2009, 2:42 p.m.,*
in response to message #46 by Tim Wessman

OK, thanks Tim.

Re: Need some details before ordering

*Message #48 Posted by **Don Shepherd** on 25 June 2009, 3:34 p.m.,*
in response to message #46 by Tim Wessman

Tim, the 12c Windows emulator does not execute programs correctly. Prime factor finder:

```
01 sto 0
02 2
03 sto 1
04 1
05 sto 2
06 rcl 0
07 rcl 1
08 /
09 frac
10 x=0
11 goto 13
12 goto 17
13 rcl 1
14 pse
15 sto / 0
```

```
16 goto 06
17 rcl 2
18 sto + 1
19 2
20 sto 2
21 rcl 0
22 rcl 1
23 enter
24 x
25 x <= y
26 goto 06
27 rcl 0
28 goto 00
```

Put 30 on stack and R/S. Should display 2, 3, 5 after pauses.

The emulator displays this:

```
01 44 0
r u n n
5.00
```

Not exactly a great launch.

Don Shepherd

Re: Need some details before ordering

Re: Need some details before ordering

*Message #52 Posted by **Tim Wessman** on 26 June 2009, 4:47 p.m.,*
in response to message #51 by Don Shepherd

There were two issues. First was the program as posted has a problem in one of the steps. Once that was fixed, it ran fine, but the display was not updating properly.

Turns out one of the optimizations to not update the screen when under 10ms was causing it.

TW

Re: Need some details before ordering

*Message #53 Posted by **cyrille de Brébisson** on 28 June 2009, 4:33 p.m.,*
in response to message #48 by Don Shepherd

hello your program does not seem to work on a real 12C either... but if you remove lines 23 and 24, it does...

however, it still does not work on the emulator... however, if you send me your email, I will send you an updated version where it does work!

01 sto 0 02 2 03 sto 1 04 1 05 sto 2 06 rcl 0 07 rcl 1 08 / 09 frac 10 x=0 11 goto 13 12 goto 17 13 rcl 1 14 pse 15 sto / 0 16 goto 06 17 rcl 2 18 sto + 1 19 2 20 sto 2 21 rcl 0 22 rcl 1 23 x <= y 24 goto 06 25 rcl 0 26 goto 00

regards, cyrille

Re: Need some details before ordering

*Message #54 Posted by **Don Shepherd** on 28 June 2009, 7:50 p.m.,*
in response to message #53 by cyrille de Brébisson

Cyrille and Tim, what's going on here? The program, as written and as listed, does indeed work. It works on a 12c from 8 years ago, it works on a 12cp 25th anniversary edition, it works on the new ARM-based 12c, and it works on the 12cp emulator that educators get. It works on all those machines. And another user pointed out above that it works on the iphone. The only place it doesn't work, is your new 12c emulator.

Please fix.

Don Shepherd

I concur, it works for me too on all the *real* 12C's I've tried.

-Katie

Re: Need some details before ordering

*Message #56 Posted by **Thomas Okken** on 29 June 2009, 3:38 a.m.,*
in response to message #55 by Katie Wasserman

At the risk of beating a dead horse, I also tried it on my HP-25; I had to change

```
21 rcl 0
22 rcl 1
23 enter
24 x
25 x <= y
```

to

```
21 rcl 1
```

```
22 enter
23 x
24 rcl 0
25 x >= y
```

for obvious reasons.
The algorithm and the program are fine. Sounds like the emulator is not.

Tim and Cyrille, I responded to each email you and Cyrille sent me. Tim on June 26 and Cyrille on June 29. I forwarded these to both of you just now.

Are you reading your email?

Don Shepherd

Re: Need some details before ordering

*Message #61 Posted by **Don Shepherd** on 1 July 2009, 5:54 a.m.,*
in response to message #57 by Don Shepherd

OK, HP provided a new 12c emulator that fixes this problem. There were a couple of email failures, apparently, and a misunderstanding about the "x" command, but everything is OK now.

Re: Need some details before ordering

*Message #62 Posted by **Byron Foster** on 29 June 2009, 7:21 p.m.,*
in response to message #53 by cyrille de Brébisson

You've substituted:

```
21 rcl 0
22 rcl 1
23 enter
24 x
25 x <= y
```

with:

```
21 rcl 0
22 rcl 1
23 x <= y
```

Which while still correct, removes the optimization that recognizes that all prime factors of Y, except for the final prime factor, will be less than or equal to the square root of Y, making your version less efficient.

Edited: 30 June 2009, 4:00 p.m.

30 bucks for another 15C seems a bit steep. But running the same emulator both on an iPhone and a Windows or MacOS (hopefully in the future) should allow things like using the iPhone keyboard to control the emulator running on a PC, sending programs from iPhone to PC and vice-versa, saving/loading programs as source code, etc.

Otherwise, there's not much incentive for me to fork $30, apart from supporting HP's calculator division :-)

Re: HP releases multiple emulators for PCs, iPhone, iPod touch

It is, especially since you can get a 15C using the same ROM for $20. For $30 you can get SpaceTime and do symbolic math and plots and for free you can do symbolics and plots with Safari/Wolfram Alpha.

Heck for $20 you can get i41CX+ AND Free42. Both support program/data transfer and printers and just

as calculators have a super set of the 15C features (i41CX+ will need a few modules).

I'd thought about getting the $20 15C just to support Eric, but it is unclear to me how much of that $14 (Apple gets $6) goes to Eric. I'd prefer to just send Eric $20 because he's a nice guy.

Yep. I guess some of the remaining $14 go to HP as well for the license to the 15C ROM. I don't know what happened to the GPL code though, because my understanding is only the ROM is (c) HP, but nonpareil is GPL, right?

Re: HP releases multiple emulators for PCs, iPhone, iPod touch

*Message #66 Posted by **Eric Smith** on 25 June 2009, 4:48 a.m.,*
in response to message #65 by Alain Mellan

The original Nonpareil source code is still GPL'd, though the various ROM images are not, and it was a mistake for me to not make that clear in the Nonpareil documentation and packaging.

While some of the source code for the iPhone calculator apps from Thomas Fors LLC and from AL Software is derived from Nonpareil source code, they are using it persuant to separately negotiated non-GPL licenses.

Thanks for the thought. All I should say about the iPhone apps is that I am perfectly happy for people to buy the apps from Thomas Fors LLC and AL Software. I think both of them have great apps. I'm sure everyone is aware of the cool new features that have recently been added to the i41CX and i41CX+ apps. While I can't promise anything, I think there will also be some nice new features in the SCI-11C, FIN-12C, SCI-15C, and PRG-16C apps in the future.

I have not yet used HP's iPhone calculator apps very much, but I'm sure that they must be fine quality products as well.

a strange '35

*Message #1 Posted by **Dana Bingham** on 23 June 2009, 3:13 p.m.*

hi

i quote: _____ "Only the first version had a red dot that showed when the calculator was on. It also had a raised spot on the "5" key. The serial number was on the back between the rubber feet. The serial number on these starts with 1143A.

The second version looked like the first but omitted the red dot. Early samples of this version still had a raised spot on the "5" key. The serial number was moved inside the battery compartment. Some of these also have serial numbers starting with 1143A." _____

i have a '35 which is neither... no red dot, but serial number is between the feet. of course, serial of 1143A.

i think it is special... i think it is a red dot at the very tail end of that production run, and as the "red dot" top plates ran out, someone on the production line grabbed a new "top plate" from the coming run of second version. but the serial was placed as this was a red dot run.

i bet this '35 is near unique. dana

28/48 used to validate scientific library

*Message #1 Posted by **Egan Ford** on 23 June 2009, 11:08 a.m.*

Last night I was helping an HPGCC user build GSL (GNU Scientific Library) for the 50g. After I got it compiled I needed to create a simple test case and opted for a complex square root. When I read the documentation (http://www.gnu.org/software/gsl/manual/html_node/Complex-Numbers.html) this gem was present:

> Quote:
>
> For multiple-valued functions the branch cuts have been chosen to follow the conventions of Abramowitz and Stegun in the *Handbook of Mathematical Functions*. The functions return principal values which are the same as those in GNU Calc, which in turn are the same as those in *Common Lisp, The Language (Second Edition)* and the **HP-28/48 series of calculators**.

The 28/48 was not the only source of validation, but interesting that it is mentioned and possibly implied as a trusted source.

Re: 28/48 used to validate scientific library

*Message #2 Posted by **Thomas Okken** on 23 June 2009, 2:09 p.m.,*
in response to message #1 by Egan Ford

That's interesting. When I implemented the complex functions in Free42, I simply went with whichever branch cut was easiest to implement, and there may well be discrepancies between that and what the real HP-42S does. I wonder if its complex functions have the same behavior as the 28/48 series?
I'll have to study this. Fortunately one can download Abramowitz & Stegun nowadays!

*Message #3 Posted by **hugh steers** on 23 June 2009, 2:24 p.m.,*
in response to message #1 by Egan Ford

The complex numbers in Reckon and the uWatch take the branch cuts that agree with the hp15c (presumably the same as the 48).

the 15c manual claims these cuts were chosen so as to make the trigs and their inverses composed return the same original values.

in response to message #3 by hugh steers

Same with CasioRPN (another RPN calculator for the Casio FX-9860 series). I'm lucky enough to have a

paper copy of the HP-42 manual; I checked it against the HP-28 manual on the museum disk and the cuts / branch points chosen appeared identical in each. From a programming point of view I don't recall that they were all the most natural; it's unlikely that simply choosing cuts / branch points as one goes along would lead to the same results.

Nigel

Re: 28/48 used to validate scientific library

*Message #5 Posted by **Thomas Okken** on 24 June 2009, 4:56 a.m.,*
in response to message #4 by Nigel J Dowrick

Nigel, are you referring to chapter 6 of the HP-42S manual? Could you point me to any specific examples in the manual that would give a clue as to which branch cuts the 42S uses?
In my 42S simulator, I chose the cuts that seemed the most natural, and I believe that my implementation returns results that are mathematically correct, but I would like to make sure that my implementation is faithful to the original calculator as well.

Re: 28/48 used to validate scientific library

*Message #6 Posted by **Nigel J Dowrick** on 24 June 2009, 5:18 a.m.,*
in response to message #5 by Thomas Okken

My memory must be going! You are quite correct - although I do own the HP-42S manual (and the calculator), the information about branch points / cuts is not in there. I actually used the information in the HP-15C "Advanced Functions" manual. Comparing this with my HP-42S showed that the same branch points / cuts were used by both calculators, and also by the HP-28S.

Sorry for any confusion.

Nigel

Re: 28/48 used to validate scientific library

*Message #7 Posted by **Thomas Okken** on 24 June 2009, 7:05 p.m.,*
in response to message #6 by Nigel J Dowrick

Thanks for the information! I don't have any paper manuals for the 15C but the PDF versions on the Museum DVD will do. :-)
I guess it makes sense for complex math to be consistent between all complex-capable HP models, but it's good to have confirmation.

Casio - nice on-line calc, worth looking at

*Message #1 Posted by **Mark Edmonds** on 23 June 2009, 7:24 a.m.*

Apologies if this is old news but Casio have recently setup an on-line calculator with some interesting features including a full library of pre-programmed applications, a C style programming language and an absolutely huge range for calculations.

So if you have ever wondered what the result of 10,000,000! is to 50 decimal places, pop over to this link to find out:

http://keisan.casio.com/

HP-IL I/F Module and a New(er) PC

*Message #1 Posted by **Gerry Schultz** on 22 June 2009, 9:41 p.m.*

Hello Everyone:

I'm sad and here is my tale of woe. Perhaps some wise man (or woman) can show me the way. A while back my old Gateway PIII 933 Mhz (no ISA slots) died a quiet death. My wife bought it for my birthday back in 1999 and I upgraded it to WinXP Home.

My PC prior to that is a Pentium 233Mhz with ISA slots (I built it myself.) and the HP-IL I/F card works fine and it runs Win98. I thought I could rebuild my dead PIII myself (Ha! I'm so smart!) with a later MotherBoard (MB) and microprocessor (uP) as long as it had an ISA slot for the HP-IL card. Then I could combine my HP-IL card with a new(er) PC and run an OS that is still being supported. I thought I was being so cool. But nooooooo, I get shown that not all PC ISA slots and BIOSes are equal.

I hadn't built a PC since the Pentium 233 but with Google and my Laptop, I could overcome any obstacle. I searched that unspeakable website and found an Intel D845GECL OEM MB which included a P4 2.66 GHz and it has one ISA slot. To get it running, I purchased a P4 heatsink and 2 GBs of RAM. After I got the MB it became obvious that the old PIII power supply didn't have the proper ATX power connectors for a P4 MB so I bought a new PS. Then I found that the Gateway case wasn't built to mount a P4 ATX PS, so instead of messing around with cutting and drilling, I bought a new PC case sans a PS.

This weekend, it was time to build my PC ISA masterpiece. Everything worked and I installed my old XP Home OS with no issues. Last night, I put in the HP-IL card and the Phoenix BIOS hangs at the display screen. AAAAAAAH! I take it out and the box boots like a champ.

I know there isn't much to the card but perhaps the UPnP BIOS doesn't like this card. Any suggestions how I should configure the HP-IL card address to not conflict with the BIOS? Can this card live in harmony with a P4 MB?

Thanks for listening (it's a form of geek therapy for me). It's a fast machine and I like it. Another surprise I ran into was that the BIOS doesn't support a B: drive or a 5 1/4" floppy disk drive. Crap! Another idea down the drain!

Gerry

Re: HP-IL I/F Module and a New(er) PC

*Message #2 Posted by **Christoph Klug** on 23 June 2009, 3:34 a.m.,*
in response to message #1 by Gerry Schultz

Dear Gerry,

does the PC start correctly when you change the address dip switches of the IL-card to address setting 300? (The standard address setting is 1700). Furthermore for XP you need a special address routing software tool - which is described in my "IL2000 Interface System" book. Which software you use for the IL-card ?

Re: HP-IL I/F Module and a New(er) PC

*Message #3 Posted by **Gerry Schultz** on 23 June 2009, 6:15 p.m.,*
in response to message #2 by Christoph Klug

Hi Christoph:

I have a copy of your book so I will take a look. Given how thick it is, what chapter or page is it on? I believe I'm using 300 for the base address and I do remember reading something about using 1700. Perhaps I read it in your book.

I'm using EMU41 on my Pentium 233 Mhz machine. I'm looking to consolidate PCs as I don't have the room to leave the Pentium 233 set up just for EMU41. With the HP-IL I/F card, I can use the EMU41 to move 41 programs between the PC, the 9114b and my real 41s.

I was thinking about this last night and the BIOS uses PnP to dynamically assign interrupts and addressing to peripherals. Since the HP-IL card has fixed addressing, perhaps the BIOS is assigning another device to the same address and when it tries to interrogate that device, data is corrupted which hangs the boot process. Does that make sense or am I blowing smoke? Perhaps a solution is to go into the BIOS and block out the address range associated with the HP-IL card so PnP will avoid the HP-IL card all together.

Knowing me, I'm over-thinking the problem. I'll check your book and change the base address to 1700 to see if that fixes the problem.

Thanks, Gerry

Re: HP-IL I/F Module and a New(er) PC

*Message #4 Posted by **Howard Owen** on 23 June 2009, 7:04 p.m.,*
in response to message #3 by Gerry Schultz

That makes perfect sense. The HP/IL ISA card is NOT plug and play. You can probably tweak the PnP settings in the BIOS, maybe even to the extent of turning PnP off, or move the card's address around with the DIP switches to an unused address. I hope that's all that is wrong with your setup.

This sort of problem was typical with the ISA bus. PCI was a big step up in this regard, and USB even more so.

If you get it working, please let us know. Using HP/IL on a relatively modern PC with an ISA slot would be nice to have while waiting for JF's USB solution.

Regards,
Howard

*Message #5 Posted by **J-F Garnier** on 24 June 2009, 6:02 a.m.,*
in response to message #3 by Gerry Schultz

One source of problem may be the interrupt level. You can try to disable it on the HP-IL board (unsolder or just cut the strap). Interrupts are not used in Emu41/71, or (AFAIK) in other software for the HP-IL board.

And yes, the USB PIL-Box IS the solution to connect HP-IL to modern computers :-)

*Message #6 Posted by **Gerry Schultz** on 26 June 2009, 1:08 p.m.,*
in response to message #5 by J-F Garnier

Thanks for your responses. I haven't had much time during the week to work on this but I should have time this weekend depending how many honeydos I have assigned to me. I'm in the process, when I can squeeze it in, to install all my apps to make the PC useful for things other than a pretty GUI. Last night, I had to troubleshoot why WMP 11 would play a DVD without audio but WinDVD 9 worked fine. I found I needed to install an AC3 codec from the web even though WMP 11 can use WinDVD's MPEG 2 codec to play the video. Windows is weird.

I'll let you know,

Gerry

I agree, maybe I won't have to do that code, it's hairy. I was working on the same sort of thing when my property all went poof and it is difficult! At least 5 protocols simulaineously. I was building the code in MCS51 but of course PIC will do, involves a LOT of libraries and top down from 30 years ago. I could maybe help with some macros, my mainframe was saved from the fires, no hardware was saved however (my brother gave me a CV afterwards). Aside: would anybody like to try -DISASM- 4D?

The Dumbest Generation: AOS vs RPN

*Message #1 Posted by **Joerg Woerner** on 22 June 2009, 3:10 p.m.*

This weekend I was reading both a book review:

The Dumbest Generation: How the Digital Age Stupefies Young Americans and Jeopardizes Our Future (Or, Don't Trust Anyone Under 30)

And a TI calculator brochure dated 1976:

Fast and easy. No calculator in its class is so easy to master.

The SR-50A lets you key the problem just as you would state it. A unique register system provides a sum-of-products capability directly at the keyboard. This ability to store the first product while the second is being calculated is in addition to the memory accessed by the memory keys. The efficiencies are suggested by this simple problem:

(2 x 3) + (4 x 5) = 26

TI’s Algebraic Entry Method:

2 [x] 3 [+] 4 [x] 5 [=] 26

Reverse Polish Entry Method

2 [^] 3 [x] 4 [^] 5 [x] [+] 26

It is easy to predict: "RPN is almost dead!"

Regards, Joerg

BTW: My four kids use TI-84 Plus Silver Editions, a requirement of the local schools. And I sold my [ENTER] keys to db ;-))

>
> (2 x 3) + (4 x 5) = 2

I note that what TI omitted from the above was a methodology for handling the *product of sums*, or any other departure from mathematical hierarchy...as indeed there was virtually no such methodology on the SR-50A (apart from user ingenuity and it's lone memory register), it being an AOS machine with no parenthesis.
No wonder most TI engineers of that era used HP calculators.

The only calculators I have more trouble with than algebraic calculators (or "algebraic" calculators) is trying to use the desktop printing calculators that use "adding machine logic".

In those, addition and subtraction are postfix, and multiplication and division are infix!

Re: The Dumbest Generation: AOS vs RPN

*Message #5 Posted by **Mark Edmonds** on 23 June 2009, 4:42 a.m.,*
in response to message #4 by Eric Smith

And I bet the SR50A uses postfix for trigs and logs.

The first calcs I used were algebraic except for those functions so for example, the sqrt of sin 45 was done entirely RPN style: 45 sin sqrt.

Now we have more modern AOS calcs that prefix functions and force brackets round them - a system which completely throws me even if technically, it is more logical.

Yes, I prefer RPN but I still have a theory that the only reason HP selected the method was because it made writing the OS in the 9100 easier. It is obviously far easier to let the user deal with hierachy on a stack than have to write potentially awkward routines to sort it out.

Keystroke saving in RPN is slightly over-hyped. Its main benefit originally was ease of system programming.

Do I need a flame-proof suit for that?!

The first time I drove an automatic, I somehow managed to stall the engine while the car was already rolling. Intending to press the clutch in preparation for restarting the engine, my left foot pressed the leftmost pedal all the way to the floor, as it was trained to do. Burnt rubber ensued; fortunately no one was close behind me at the time.
My passenger (grandpa) was not amused. :-)

*Message #9 Posted by **Don Shepherd** on 23 June 2009, 9:42 a.m.,*
in response to message #1 by Joerg Woerner

> Quote:
>
> It is easy to predict: "RPN is almost dead!"

From a marketing perspective, I'm sure TI wished this to be true. Has it happened, in 2009? Is RPN "almost dead?" By whatever indicator we attempt to evaluate this, if we're going to be honest, isn't the answer "yes?"

Indicators:

- number of people who actually use (and understand) RPN
- number of calculator manufacturers who build RPN machines
- number of books describing how to use RPN
- number of classes that teach RPN

sales of RPN calculators versus AOS and others

Now, members of this forum like RPN for many different reasons. Personally, I like it because it enables me to exercise my mind by writing programs for HP calculators to solve problems. I find RPN keystroke programming very similar to assembly language, which was the first programming language I learned way back in 1968 for the IBM 360. I loved assembly language because of its logic and because it required you to understand the actual hardware to a degree that higher-level languages did not. When I went to work in the industry, however, I never used assembly language; I used FORTRAN and COBOL. So my appreciation of RPN is based upon my affection for assembly language.

HP has always touted RPN as the "natural" way to do calculating, based upon how we do it manually and as we were taught in school. But I have always had a problem with that. We are taught to do pencil and paper math this way:

```
  12
+  3
____
  15
```

That is, we write down the first number, go down to the next line and write a +, write the second number on the same line as the +, then draw a line and do our actual work under that line. The operator doesn't come last, it actually comes before the second number. The last line we draw corresponds, essentially, to the = key. And that's how AOS calculators work, which is probably why they outnumber RPN calculators by a rather large factor.

I appreciate RPN because it provides a logic system that enables keystroke programming to work, and I enjoy keystroke programming. But if anyone actually believes that teaching RPN to school kids is what we need to do to save the newest generation from itself, I think that is wrong.

As a teacher for the past few years, I am keenly aware of how kids are more interested in their ipods than in learning long division. But when I was in junior high school, I was more interested in the Beatles than world history too. But most of us did OK in the world, and I believe that will happen to the current generation also.

> But if anyone actually believes that teaching RPN to school kids is what we need to do to save the newest generation from itself, I think that is wrong.

And I completely agree with that. RPN seems totally counter-intuitive when you have only had exposure to traditional means of solving calculations, ie 1+2=3 etc..

My school era was when calculators were still quite exclusive and all without exception were algebraic. The only person in the entire school who had an HP was our computer science teacher. He was obviously very proud of it and showed and explained how it worked during one lesson (I think it was a Spice). None of us could understand the benefit of RPN even when the teacher kept trying to tell us how elegant it was.

None of us could remotely afford an HP anyway but coupled with the use of RPN, Casio mainly and TI ruled the roost as they worked the way we did.

If had we been taught RPN instead, would it have improved our understanding of maths? I seriously doubt it. My pride and joy - a Ti57 was stolen - so I had to borrow a Casio for my exams. In both O and A level,

I hardly used it. At A level, I honestly don't think I touched it at all.

Nowadays, it seems that calculators are allowed at any level and all the time and by that, I would hunch that there is less attention to understanding methods and more emphasis on pure numeric results. Understanding RPN wouldn't change this for the better.

I often think back to that line from the Simpsons where Mrs. Krabappel asks her class, "now whose calculator can tell me what 2+2 is?" to which various comic answers are given.

If modern maths education is being reduced to a black-box process, it wont matter which method of calculation is used if people don't learn a basic feel for numbers.

Apologies for sounding like an old fogey.

Mark

When I manually add two numbers, I write down the first number, I write down the second number, then I perform the operation. That is exactly how the RPN stack works. I see the AOS sequence as an "un-natural" procedure, in comparison. I never start adding the second number to the first until both numbers are present in toto. To me, the "natural" claim some make for AOS fails completely, so AOS proponents must fall back on the claim that AOS is performed on an expression "just like it is written in a book." Weak!

> Quote:

> I appreciate RPN because it provides a logic system that enables keystroke programming to work, and I enjoy keystroke programming. But if anyone actually believes that teaching RPN to school kids is what we need to do to save the newest generation from itself, I think that is wrong.

No argument from me on any of that.

I appreciate RPN for its efficiency, and HP for its reliability. In 1977, I bought an HP-67 and a TI-59. The TI-59 was actually quite a technical advance over the HP-67, with much greater memory, precision, speed, innovative solid-state software modules, and the PC-100C print cradle. But typically, programming a non-trivial function in the TI-59 took about 40 percent more memory steps than did the HP-67. The real problem was reliability. I used the HP-67 (and later an HP-97) for real-life professional needs in a submarine nuclear propulsion plant. I did not use the TI-59 because I couldn't keep the TI hardware working for more than about six months before it would fail.

I remember admiring the "technical" achievement of TI's AOS, even though it was a very real and significant impediment to effective and efficient program creation on the TI-59.

in response to message #11 by Mike Morrow

My first calculator experience was with the first HP-35 so RPN was no problem for me. BUT, I quickly found the formulas written in books (and copied from book to book) were awkward in RPN, Indeed I think awkward with any calculator. I had to rewrite formulas to be handy for my calculator. I used keystroke sequences instead of formulas that were easy to remember and fast to do. some I wanted to do over and over at one frequency so having 2PiF in the repeating t register was my answer for easy usage. It wseemed important to do this when I saw people programming solutions that were rapid keystrokes for me. Thus I ask, do we need to be tied to the past by awkward formulas "as written in texts? Or can we do it better today, I can. sam 80

*Message #13 Posted by **Marcus von Cube, Germany** on 23 June 2009, 11:43 a.m.,*
in response to message #12 by designnut

I will not advocate either RPN, AOS or EOS. For quick calculations (mostly additions, sometimes a few multiplications and/or divisions), I get used to the calculator a hand very quickly. When it comes to more elaborate formulas, EOS with a history has advantages over RPN/RPL and over AOS, because I keep my input while getting the result. A quick cursor up lets me check and or modify the formula and reexecute it. On my RPL machines, I've often the problem that is much less intuitive to back out from a mistake or to repeat a calculation: I see myself hitting ENTER a few times to save some copies of what is on the command line or in stack level 1.

*Message #16 Posted by **Don Shepherd** on 23 June 2009, 7:31 p.m.,*
in response to message #15 by Dave Shaffer (Arizona)

Yeah, I learned enough about JCL to do the task at hand. Like Mike Morrow above, my first real programming job was with a Univac 1108 using FORTRAN-V and the Exec 8 operating system, which was a lot more intuitive than JCL. The 1108 was a workhorse.

I always kind of wished that I had a chance to work for a company that used one of the smaller IBM systems, like the System 3. It would have been fun to use assembler with such a small system.

My first HP machine was an HP-11C. My second was an HP-41C. After using those machines I was inclined to believe all the HP hoopla about quality and reliability. But then I started collecting and became acquainted with machines such as the HP-2X's and HP-3X's. When I couldn't get them to work the "old hands" gave me comments such as "twist the case and see if that helps" and "did you connect the charger without being sure that the battery pack was in place and making contact." I changed my impression of the HP. They have been as capable as everyone else of delivering inferior machinery to the customer, and not just recently.

My experience in teaching my oldest kid calculators and math from he was 6 (he is now 10) is that it doesn't matter much which methodology I teach him. He picks 'em up with equal speed.

Teaching him programming, however... then it seemed very easy to teach him Raven, a stack based programming language, RPN-ish with a good set of math functions.

Not all of us! I was taught to write it like this:

```
 12
  3
____ +
 15
```

-- I think that's the standard way in the Netherlands, maybe elsewhere in Europe as well.
Now to try to fit long division into this picture. :-)

Wow! That's exactly RPN. So do schools in the Netherlands use HP RPN calculators, since kids are taught this way?

I wouldn't make too much of the notation -- we just put the "+" sign in a different location than they do in U.S. high schools, but the mechanics of addition on paper are the same regardless!

Regarding calculators in schools... I attended High School in the early 1980s, just as calculators were starting to be accepted for school use. There were some government guidelines on the issue, as I recall, but the details were left up to the schools themselves; my HS went from "disallowing calculators altogether" to "allowing" them; they recommended a small number, including some TI-30 model and some Casios; their main concern was that the calculators should have logarithmic and trigonometric functions, and, most importantly, be affordable, which the TIs and Casios were, but the HPs... not so much.

I had HP calculators back then, and I was allowed to use them during Math and Physics tests, but as far as I know, there were only 2 or 3 students using HP calculators in the entire school (about 600 students total, grades 7 through 12).
Apart from being easy to use, in my experience the other main advantage of RPN was that nobody would ask to borrow my calculator more than once; they'd go "where's the equals key" and zone out when I tried to explain how it did work...

This matches my experience back in the seventies when I had the one time chance to carry a friend's HP-35 for one day at school: The calc that always gave PI as the result.

Indeed, while RPN may not save the latest generation from itself, it would at the very least force them to know and employ mathematical precedence, and in general be more involved in the calculation at hand. My 13 year old son, while compelled to use the school's TI84 classroom set from time to time, still prefers his HP 33s (in RPN mode). I really do think it's been of benefit to him to learn RPN.
Best regards, Hal

This statement rings true to me. I do not know if it having to learn mathematics without the aid of symbolic calculators/computers or my choice to start using RPN in 1985, but I always break equations into parts and never just read from left to right. RPN is great training.

*Message #25 Posted by **Mark Edmonds** on 23 June 2009, 2:50 p.m.,*
in response to message #24 by Egan Ford

Well, I am going to do a complete U-turn on my earlier comments when I said that teaching RPN wouldn't be any benefit.

If I think back to how I adjusted to RPN and what happened after that, it was obviously a benefit.

It was about 15 years after school that I got my first HP. I was expecting a real tussle with converting to RPN but much to my surprise, I found I adapted really quickly and then when I became fluent, I realised that I was approaching problems in a much more analytical manner than before. Rather than treating problems in a strictly linear left to right manner, I was breaking them down and thinking more about what exactly I was doing. It also made me appreciate precedence more so that in whatever high level language I was programming at the time, I started writing simpler more elegant expressions where use of brackets was rare.

Couple this with the unlimited stack in UserRPL and making efficient use of the stack rather than dumping values in variables as well as other programming benefits of a stack, RPN provides a programming solution that ticks all the right boxes; efficient, elegant, simple and fast.

So if I can be permitted to make this complete U-turn, I don't think RPN is going to save the educational system (!) but it should open up minds to its different approach which in turn should trigger more appreciation of number manipulation as well as important programming techniques.

I'd like to disagree. Having the stack as a means of transferring arguments and results back and forth between routines is a huge benefit over the way this had to be done with AOS TIs. It's just a clean interface.

But as soon as you start juggling the stack with OVERs, ROLLs and PICKs, your programs tend to become "write only".

Definitely! I find that I wind up drawing stack diagrams on scratch paper to untangle things. This is presumably why RPL introduced local variables. Sure, they have more run-time overhead, but I rarely use the calculator for such heavy-duty compute-bound tasks that it matters. In fact, since around 1984 or so, rarely in this case means never.

And, of course, messing with stores, recalls, rollups and rolldowns is exactly what one has to do if one writes any but the simplest kind of programs with the machines with a limited stack.

> Quote:
>

Sure, they have more run-time overhead, but I rarely use the calculator for such heavy-duty compute-bound tasks that it matters. In fact, since around 1984 or so, rarely in this case means never.

I also found that I needed to draw stack diagrams if I had the slightest suspicion that I might push data out the top of the stack. Working with stack diagrams is a real pain -- similar but not quite as bad as the pain with POS sheets that we had to live with when programming drum machines in the early 1960's.

The worst part for the novice RPNer was that there is no indication that pushout is occurring and the manuals aren't very good at warning the novice about that. By comparison the AOS machines all gave an error indication if the user exceeded the parentheses or pending operation limitations.

Extreme stack gymnastics does make things confusing, but a "write-only" result is still the programmer's fault. In those situations I like to put in the comment portion of each line what is on the stack after the line is executed, in addition to the normal comments. I still get more first-time-running success and fewer bugs with reverse polish than with algebraic languages.

RPN TKOs AOS RFN

*Message #30 Posted by **db (martinez, ca.)** on 25 June 2009, 3:05 a.m.,*
in response to message #1 by Joerg Woerner

Joerg;
I agree that "the digital age stupefies Americans" but not just young ones. Don't underestimate the ability of one mediocre programmer to sell half baked programs to know-nothing middle managers so that their mathaphobe drinking buddies can almost do, sometimes, what real thinking humans used to do every day. Trash like this is what makes people in general stupider each year. Neither AOS or RPN "Jeopardizes Our Future" (OK; AOS jeopardizes it just a little ;-)).
Still; you would probably have made more money off me if you had figured the correct value of those beautiful calculators you sold me on an hp12c instead of one of the TI BA series. I practically stole them. Thanks. And BTW: why are you selling your Garrett RPN on ebaby? You might need to impress some nerd someday. What TI will do that? We're talking an enter key **and** cabinetry here. Get with it man, cancel that auction. Give that big German desk of yours some class.

Re: RPN TKOs AOS RFN

*Message #31 Posted by **Joerg Woerner** on 25 June 2009, 8:25 a.m.,*
in response to message #30 by db (martinez, ca.)

Dennis,

Oops - I sold the ITM2 already last week to a collector in France ;-)) (Here in Upstate New York we have Canadian neighbors and still talk to French people.) But you mentioned on your website that you don't like the chicklet keyboard.

This week I have the Garrett 2000 on auction, nice Panaplex with ENTER key.

The real thing will be on auction next week, a wonderful operating Garrett 2002, this translates to 2 lbs american trees, the large Panaplex display glowing in warm orange, a full alarm clock and the ENTER key.

I have the auction pictures already on the server, view them here:

No, I won't cancel these auctions. I'm selling off some of my non- TI stuff, last inventory (after our minor flooding in the basement) revealed more than 3,500 calculators - time to say goodbye to at least 1,000 of them over the next years.

And, by the way, when we moved from Germany to Rochester, NY exactly 3 years and 1 day ago (we celebrated yesterday our 3rd year in this great country) it was a hot summer. Our 40-ft container was stored about 3 weeks w/o airconditioning in the full sun and most of the furniture didn't survive! The only THREE pieces that survived were the Garrett calculators ;-))

My nice desk is a piece of IKEA manufactured in China.

Greetings from Sunny-Rochester,

Joerg

PS: Thanks for your nice comments about the HP calcs - you don't have to feel guilty! I'm still figuring out what your TI-30 based terminal is doing - that was a great gift from you - worth at least my HP 21S ;-))

PSPS: Just browsed your pictures next to the software calculator, how is your Robotron baby doing? Still only used as a cup holder?

Re: RPN TKOs AOS RFN

*Message #32 Posted by **db (martinez, ca.)** on 26 June 2009, 2:05 a.m.,*
in response to message #31 by Joerg Woerner

Joerg; Yes, sadly, the Robotron is still just an RPN cup holder - but for fine California beer. Everything else runs, though my first 41 could use some work. Please let me know if you go to sell an RPN that i don't have. I'll bid like a maniac. But you should really keep a couple of them. You might have to do some engineering again someday ;-)
Took my first time off in eight months last weekend and walked up the Whitney glacier on Mt. Shasta - and met a German on the peak. You guys are everywhere. We didn't talk calculators but i did cut him a slice of watermelon. That surprised him so much he just about forgot his English. - db

Re: RPN TKOs AOS RFN

*Message #33 Posted by **Joerg Woerner** on 26 June 2009, 2:28 p.m.,*
in response to message #32 by db (martinez, ca.)

Dennis,

Keep in mind:

30 days vacation per year - and the Dollar is cheap for them (since one year we have the Greencard, otherwise I would write "for us") at an exchange rate of 1.40.

I compared last week the German vs US pricing of the Volkswagen Passat CC. There are different flavors in each regions, but I found one version (VW Passat CC - TSI, Tiptronic 2.0l, 200 PS) identical on both markets:

US / NY: $28,200 + Tax = $30,456

GERMANY: EUR 35,375 = $49,525

WOW - but know it from HP calculators ;-))

Regards, Joerg

BTW: And NO - I didn't bought a Volkswagen.

HP 16c - needs cleaning?

*Message #1 Posted by **Glenn Becker** on 22 June 2009, 12:12 p.m.*

I just received an HP 16c in cosmetically VG condition. It works fine, too ... except that the ENTER key has a strange, reluctant, "mushy" feel to it, almost as if there is dirt in there or something.

I have never opened a calculator in my life. How difficult would it be to open this unit up and clean it? And what is a safe method of cleaning?

Maybe I should just send to fixthatcalc, even though they have a big backlog/wait period.

Advice is welcomed. %^D

GB

Re: HP 16c - needs cleaning?

*Message #2 Posted by **Mark Edmonds** on 22 June 2009, 1:44 p.m.,*
in response to message #1 by Glenn Becker

I don't want to sound fatalistic about it, but from what I've learnt through recent experience of opening an 11C, I'd advise against attempting this as it is a seriously major job that involves breaking certain elements of the calc's construction.

My thread is just a few below this one:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=151913#151913

It contains some sage advice from other members as well as links to various pages with pictures and instructions. Access to the keyboard involves breaking over 40 "heat stakes" that hold the main PCB to the keyboard assmebly. If I was going to try this, I wouldn't do it on any Voyager that is in good condition!

I am sure that more experienced members can add to this to verify what I've written.

Indicentally, I used to have a 16C with a mushy On key yet never had mushy keys on my other Voyagers. Is this a strange feature of 16Cs?

Mark

*Message #5 Posted by **Glenn Becker** on 22 June 2009, 10:16 p.m.,*
in response to message #3 by Glenn Becker

Got a nice informative email from FixThatCalc re: the 'feel' of the ENTER key. Apparently it is due to the construction of the longer key & is quite normal.

But I was just playing around with the lil' beast and the display blanked out & doesn't appear to want to return. I'm hopeful it is just a matter of batteries, but who knows ... :(

GB

Re: HP 16c - needs cleaning?

*Message #6 Posted by **Glenn Becker** on 23 June 2009, 8:05 a.m.,*
in response to message #5 by Glenn Becker

... not batteries.

I checked the "Self Tests" section of the manual and pressing 'D' and 'ON' simultaneously, then releasing them, brought the monster back.

Re: HP 16c - needs cleaning?

*Message #7 Posted by **Mark Edmonds** on 23 June 2009, 8:23 a.m.,*
in response to message #6 by Glenn Becker

Regarding the "heat stakes" and breaking/removing them, has anyone tried melting them with a fine-tip solder iron? I am just wondering off the top of my head if it is possible to soften the plastic to make it easier to cut the "head" off and when it comes to reassembly, using a pastic adhesive to re-seal them? Feasable or not?

Mark

Re: HP 16c - needs cleansing?

*Message #8 Posted by **Klaus** on 24 June 2009, 8:03 a.m.,*
in response to message #7 by Mark Edmonds

I tried it with a HP-71b. I used a swiss army knive. Push the blade under the heatstake, then twist the knive. The edge of the mushroom-form will break off, but the center will remain intact. That means that after this procedure, the heatstakes are still as high as they were before, only the diameter of the mushroom head is reduced.

I put some foam in the case back to apply pressure towards the keyboard, works good enough now for me. I thought about re-melting a few heatstakes, there seems to be enough material left for that, but I did not test it.

Re: HP 16c - needs cleansing?

*Message #9 Posted by **Mark Edmonds** on 24 June 2009, 9:26 a.m.,*
in response to message #8 by Klaus

Thanks for describing that. Using foam as padding sounds like quite a sensible way of doing things and keeps it possible to do future maintenance without having to break re-sealed heat stakes.

Mark

SmartCalc 300s manual

*Message #1 Posted by **hpnut** on 22 June 2009, 10:57 a.m.*

Hi everyone,

I just got my HP SmartCalc 300s today.

going through the fine manual, I found this piece of gem:

"Handling Precautions - Be sure to press the ON key before using the calculator for the first time."

my goodness, the quality level of HP manuals has gone down the drain, groan :-(

Re: SmartCalc 300s manual

*Message #2 Posted by **Quan** on 22 June 2009, 11:24 a.m.,*
in response to message #1 by hpnut

"Handling Precautions - Be sure to press the ON key before using the calculator for the first time."

Wait a second! (Checking the pdf file of CASIO fx-115ES User's Guide ...)

Holy cow! I knew it!

There it is! On page 6 is a verbatim.

So, it is a CASIO in an HP suite.

Edited: 22 June 2009, 11:26 a.m.

>
> TW

Tim et al,

I feel disappointed (and cheated) that HP saw it fit to use a 3rd party calculator and stick the HP badge on it. The Casio fx-115ES has more calculation modes. For example, these are missing from the HP:

1. Complex numbers 2. Base-N 3. Equations 4. Matrix 5. Vectors

If you examine the HP SmartCalc 300s display carefully, you can find these annunciators CMPLX, MAT, VCT, these are dimmed and presumably disabled. Why did HP disable these functions in a scientific calculator?

I have been an HP calculator user since 1979 with the HP 41CX, and I am always excited by new calculators from HP. Are the days of HP innovations and quality over? They appear happy to repackage someone else's calculators, not even improving them and certainly in the case of the SmartCalc, even crippling them. I bought the SmartCalc because I thought that it had the potential to be an innovative calculator such as the HP 20b Business Consultant (its J-tag connector may open up new possibilities). Even the SmartCalc's chassis is similar to the HP 20b, which is by no means an ideal calculator (mushy keyboard comes to mind). I plan to write s strongly worded protest email to HP.

I hope other MOHPC members who bought this calculator also speak up of their experience, good or otherwise.

Spice type 2 question

*Message #1 Posted by **Michael de Estrada** on 22 June 2009, 9:18 a.m.*

I am quite familiar with the construction and repair of Spice type 1 series calculators (HP3xE/C) with the un-soldered press-fit design, having fully disassembled/reassembled 8 different units. Most of the "repairs" have consisted of swapping interchangeable parts from different units. One of the most common problems is broken/damaged battery contacts and/or charger circuit board traces. Another less common problem is a damaged ribbon connector between the contacts board and the power circuitry board. On the Spice Type 1 series, the battery/charger contact assembly terminates at a ribbon connector extension to the power circuitry board, which is press-fit to the main circuit board. Therefore, it is possible to swap a bad assembly with a good one sourced from a different calculator.

My question is whether this is possible with the later type 2 series, or is the battery/charger assembly integral with the main circuit board?

Thank you for your assistance,

Michael

HP17bii+ v HP12CP

*Message #1 Posted by **Paul** on 21 June 2009, 2:22 p.m.*

I have an excellent HP17bii+ (silver) where even the keyboard works. However, I do like the look of the HP12CP - does it provide any additional functionality over teh HP17Bii+ to justify buying, or would it just be one to add to a collection?

Re: HP17bii+ v HP12CP

*Message #2 Posted by **Dave Britten** on 21 June 2009, 6:06 p.m.,*
in response to message #1 by Paul

I find that the 17b series improves on the 12c in nearly every area. The one advantage the 12c has is programmability vs. the 17b's (extremely versatile) HP Solve, though the 12c's programming capabilities are quite limited. You don't get any flow control besides GTO and R/S - there's no LBL or GSB/XEQ, and the only conditionals are x=0? and x<=y?. Plus, the 17b is just loads faster than the 12c (though the new ARM-based 12c may have changed that).

That being said, I've got a 12c (original, not Platinum), and it's a nice little machine to have around for doing household finances, though I regard my 17bii as being the much more capable machine. The ability to store multiple stat or cash flow lists, and a bunch of formulas/programs in the solver is enough to sway me. And the alarm functionality is nice too. :)

Re: HP17bii+ v HP12CP

*Message #3 Posted by **Eric Smith** on 21 June 2009, 9:46 p.m.,*
in response to message #2 by Dave Britten

The 12c Platinum doesn't use the ARM, so the current-model 12c should be *much* faster than either the Platinum, 17B, or 17BII.

Re: HP17bii+ v HP12CP

*Message #4 Posted by **Don Shepherd** on 21 June 2009, 11:37 p.m.,*
in response to message #3 by Eric Smith

In tests I have run, the 12cp (25th anniversary edition) is about 2.4 times the speed of the original 12c. The new ARM-based 12c is exactly 60 times the speed of the original 12c. So if speed is important, you want the ARM-based unit, if you can find one.

I haven't compared the speeds of the solver-based 17b to the RPN-based 12c, but my experience is that the 17b (and 17bii) are significantly faster than the 17bii+ (both gold and silver models) in executing solver equations. And all 17b machines (17b, 17bii, 17bii+) are faster than the original 12c and much slower than the ARM-based 12c.

Re: HP17bii+ v HP12CP

*Message #5 Posted by **Martin Pinckney** on 22 June 2009, 8:57 a.m.,*
in response to message #1 by Paul

I have the original 17b (two of them). I find it a joy to use (except for the stupid chain logic). But I find the alpha prompts, operator display, and menu style easier to use. You might say the 17b series is a display-oriented device. The 12c series, on the other hand, is a keyboard-oriented device. Really a personal preference. I bought a 12cp 25th myself, then got rid of it.

Same difference between, say, the 27s and 20s (I am speaking of the type of interface). 20s was my first HP, but after discovering the joys of the 27s, it has been relegated to "keep in the truck for emergency" status.

Sounds like you'd be the perfect candidate for a 17bii, which added RPN back in. They can be found surprisingly cheap, too.

Re: HP17bii+ v HP12CP

in response to message #1 by Paul

Martin is correct about the basic human interface for the 12c and 17b. The 17b uses alpha menus to prompt you for values for variables in solver equations, while the 12c is just a plain old-fashioned pure RPN machine. So the 17b is more "human-friendly," while the 12c's RPN provides a more powerful programming environment (with limitations, of course) than the 17b's solver.

My principal problem with the original 12c was its speed, but that has been fixed with the ARM-based version, again, if you can find it.

The 12c does have this advantage over the 17b: it fits in your pocket!

in response to message #7 by Don Shepherd

And if you don't mind the clamshell, the 19B is even better than the 17B by a long way - 19BII even better still. I really don't understand why this machine doesn't have a wide fan-base. HP could have easily made the perfect non-programmable Pioneer by putting the 19BII functionality into a Pioneer "19S". The 19BII is under-rated for reasons I just don't understand.

Mark

Re: HP17bii+ v HP12CP

*Message #9 Posted by **Quan** on 22 June 2009, 11:37 a.m.,*
in response to message #8 by Mark Edmonds

I think because the 19B/BII and 28C/28S suffer the poorly designed battery door. The problem wasn't correct until much later when HP decided to move the battery door to the back on the latest 19BII.

Functionally, I agree it is a much better financial calculator than the 12C and 17B series. It also includes the not-often-use trig functions. And 4-line display. Etc.

Also, maybe it was quite expensive at the time. The 12c and the 17bii probably got what most people need for much less cost.

Isn't that pretty much a 27s? :)

I think the reason the clamshell models didn't really catch on is that they're not very handheld-friendly. They work great on a desk surface, though.

Well, I don't want to be too pedantic about it but there are quite a few big differences between the 19B and the 27S. Overall in functional terms, the 19B wins but ergonomically, the 27S is far better which is why I keep one handy, mainly for the Solver and Base conversion.

Re: HP17bii+ v HP12CP

*Message #12 Posted by **Paul** on 22 June 2009, 4:44 p.m.,*
in response to message #11 by Mark Edmonds

Thanks for all your responses - most helpfull. I do find the menu attributes of the 17Bii+ helpful and the solver is easy albeit scrolling through a long list of conversions can become tedious - pitty there isn't a way to group equations into a hierarchy.

in response to message #12 by Paul

> Quote:
>
> scrolling through a long list ... can become tedious - pity there isn't a way to group equations into a hierarchy.

Agreed, however, there is a way to make the list a little more user-friendly, using the solver's equation-naming ability. You can name the first equation that you want grouped together with a suitable group name separated from the first equation by a colon. Follow with other equations in that group w/o the group name. In fact, if you want the list to LOOK hierarchical, you can actually "name" the following equations with a bunch of spaces, the colon, then the equation.

Then name the first equation in the next group, and so on.

Clear as mud?

in response to message #1 by Paul

I am likely to get the new 12C, but that will really be just for my collection. I am a software developer by trade (and a geek by nature). But when it comes down to practical application, I strongly suggest sticking with the 17BII over the 12C. I have not used the 17BII+, but the 17BII was a very strong performer during my studies over the past two years. The ability to enter formulas with the solver is brilliant. Yes, you could achieve the same with keystroke programming. But for all but the most dedicated, entering a formula is going to prove a lot more useful then keying in an RPN program.

For what it is worth, my 50G is my day-to-day workhorse; I only use the 17BII when I am strictly in the financial world.

just my two cents...

HP70 transgenic

*Message #1 Posted by **Alberto Fenini** on 21 June 2009, 5:16 p.m.*

Hello everybody, I'm sure most of the folks around this forum knew it, but neverless, it may be of help to someone, if not, please forgive me for publishing this.

I have recently purchased an HP70 in non working condition. Now, the "non working condition" definition leave room for MANY (too many) meanings, nad this unit was in the possibly worst situation.

Even after the "vinegar" procedure, the keyboard part (including the display and the display drivers) was in a non usable condition. At the same time I had purchased for spare parts a logic-less HP45.

To my surprise, the keyboard unit is exactly the same, and this made my day.

Does anybody know of other possible combinations between similar machines ? Thanks for help and keep up with the excellent work.

Take care everybody, Alberto

> Quote:
>
> Does anybody know of other possible combinations between similar machines ?

Too numerous to count. HP generally didn't waste any money on engineering two hardware variants where one would do. That said, occasionally they did have hardware differences for no apparent reason.

OT: Casio fx-9860g updates

*Message #1 Posted by **Katie Wasserman** on 20 June 2009, 2:12 p.m.*

Although somewhat OT, we've discussed the Casio fx-9860g here on and off so I thought I post this.

Casio released a new version of their fx-9860g calculator a few months ago it has substantially updated firmware and a back light on the vertical format machine that is the same that they have on the "slim" format machine. They've dubbed this the fx-9860gII.

The new version adds:

- complex value matrix calculations (excellent)

- strings in their programming language (finally!)

- conversions (they could do more with this)

- more functions: various random distributions, mod functions, etc.

- support for their analog data collection module (would be nice to have, but the EA-200 is pretty expensive)

- new, alternative entry system (but sadly no RPN support)

What's really great about this upgraded machine is that you don't need to buy it. If you have the old version (like the fx-9860g slim) you can download the new firmware here and you'll have all the new functionality for free!

Edited: 20 June 2009, 2:37 p.m.

*Message #4 Posted by **hugh steers** on 21 June 2009, 9:05 a.m.,*
in response to message #3 by Marcus von Cube, Germany

I'll try to get a fix out for this asap.

it's because i use the OS version number to determine the slim vs non-slim key mapping. this is a bit hacky but, there no official call to tell the two models apart.

should be a quick fix tho'

incidentally, i've been working on a major rev of reckon. i'm hoping to add a programming language to it. however, right now im having trouble with the file IO.

Re: OT: Casio fx-9860g updates

*Message #5 Posted by **Marcus von Cube, Germany** on 21 June 2009, 9:19 a.m.,*
in response to message #4 by hugh steers

Thanks for your efforts.

I've just made some tests for the MySilicium forum: The BASIC like programming is slower then with version 1 of the operating system.

http://www.silicium.org/forum/viewtopic.php?p=296182#296182

Re: OT: Casio fx-9860g updates

*Message #6 Posted by **hugh steers** on 21 June 2009, 11:46 a.m.,*
in response to message #5 by Marcus von Cube, Germany

here's the fixed version,

http://www.voidware.com/reckon/RECKON.G1A

FYI, the Casio gurus over at casiokingdom have given me a better way to detect the slim vs non-slim editions, which it now uses. ive tried it on:

1.X slim 1.X non slim emulator 2.0 slim

so far, so good.

Re: OT: Casio fx-9860g updates

*Message #7 Posted by **Dave Boyd** on 21 June 2009, 12:52 p.m.,*
in response to message #6 by hugh steers

That does seem to have fixed it. The only other bug in Reckon that I notice is the scroll bug, where, if an integer that takes two lines to display (say, 12345678901234567890123456789O) is on the stack, starting a new entry underneath it causes the display to scroll up two lines instead of one, until ENTER is pressed. Minor, really.

Re: OT: Casio fx-9860g updates

*Message #8 Posted by **hugh steers** on 21 June 2009, 1:03 p.m.,*
in response to message #7 by Dave Boyd

Thanks for the bug report. i've added it to the list. At some point i am going to have a bug scrub and fix all these.

Also, here's something i just got working on the Casio,

program:

```
let rec fac n =
   if n < 2 then 1 else n*fac (n-1)
;;

begin
 print_string "hello world, 6! = ";
 print_int (fac 6)
end
;;
```

Still a lot to do before a release tho'. I'm hoping to integrate ML into Reckon.

:-)

HP 50G Matrix Writer

*Message #1 Posted by **Benning** on 19 June 2009, 6:11 a.m.*

Hello

I have to make a Matrix Table in the Matrix Editor to use it with a ANOVA Programm (Statistic). My problem is now that i have Tables with different Lenghts.

eg:

1 2 3 4

5 6 7 8

9 8 7

2 3

If i use this matrix, HP 50g fills in all the empty data points with a 0 (Zero). This makes a wrong result. Can you help me?

grats

Re: HP 50G Matrix Writer

*Message #2 Posted by **Namir** on 19 June 2009, 11:32 a.m.,*
in response to message #1 by Benning

Sounds like you need to use Excel and the Data Analysis pack.

Namir

Re: HP 50G Matrix Writer

*Message #3 Posted by **Benning** on 19 June 2009, 4:18 p.m.,*
in response to message #2 by Namir

Okay and where can i find this?

Thanks

Re: HP 50G Matrix Writer

*Message #4 Posted by **Gene Wright** on 19 June 2009, 4:51 p.m.,*
in response to message #3 by Benning

Try Google.

Search for "Excel data analysis pack"

and you get lots of hits. Here is the first one:

Link

"The Data Analysis pack is a powerful set of tools used to figure out the variance, correlation and covariance of data as well as other features. Although the Data Analysis pack is a standard feature that comes with Excel, it may not be loaded into Excel. It is usually found under the Tools menu."

To buy Excel, there are lots of options. Amazon, a local store, etc.

Re: HP 50G Matrix Writer

*Message #5 Posted by **Dave Britten** on 19 June 2009, 5:58 p.m.,*
in response to message #1 by Benning

Arrays are required to have rectangular dimensions. You'll get syntax errors if you try to input ragged dimensions from the command line as well.

Flag -91, when set, will cause the Matrix Writer to output a list containing each row as a list. You're still mostly limited to rectangular dimensions, however blank cells will be returned as NOVAL, and you can write programs to ignore/remove these null values.

Not sure if that helps you any with the ANOVA program, but maybe there's a partial solution in there somewhere.

HP 8S ?? What's this? Australia only?

*Message #1 Posted by **Mark Edmonds** on 19 June 2009, 8:26 a.m.*

I found a listing on Ebay for an HP 8S which I had never seen before. I couldn't find it on the US and UK HP sites but did find it on the Australia site.

It probably isn't a "true" HP anyway but is this a new machine which will make it worldwide eventually or is it limited to a specific market? If the latter, have there been any other examples of limited availability?

Just curious...

Mark

Such a thing is an unthinkable nightmare. Ten years ago, if someone predicted that HP would be re-badging Casio, they would have been laughed out of town. However, I fear you might be right. The HP8S could be a Casio FX85ES Scientific Calculator in disguise.

Casio aren't that bad of course. They have done a lot of good models and I have fond memories of the old VFD FX series but somehow, HP doing this seems really cheap and tacky.

Mark

Re: HP 8S ?? What's this? Australia only?

*Message #6 Posted by **Les Bell** on 19 June 2009, 9:12 p.m.,*
in response to message #2 by Michael de Estrada

At first glance, it looks rather like the Casio FX-82au, which seems to have "captured" the school system, at least here in New South Wales. See http://www.schoolstationery.com.au/calculators/fx82au.htm for an example - I haven't compared the keyboards, but they look superficially pretty similar, as does the construction with a sliding cover to protect the calculator when closed.

It's no HP, at least in the classical sense of quality and use of RPN, but I can't fault the company for making a buck by introducing something that's compatible with the classroom instructional materials and techniques of an entrenched competitor.

Best,

--- Les
[http://www.lesbell.com.au]

Re: HP 8S ?? What's this? Australia only?

*Message #7 Posted by **Didier Lachieze** on 20 June 2009, 3:03 a.m.,*

Voyager - opening up - small questions please

*Message #1 Posted by **Mark Edmonds** on 19 June 2009, 7:41 a.m.*

I've recently got an 11C that essentially is in excellent condition but needs a clean to make it near-mint.

I have searched and found instructions on how to open it up and what to expect but a few details remain which I need clarification on please.

The main area of dirt is behind the front glass. What has happened is that there is a small gap between the front metal and the glass on the top side of the glass. If you imagine there is adhesive between the two and pressure has been applied at some time in the past which has opened a gap.

Now, what isn't clear to me from the instructions and pictures for opening the machine is whether the front glass is attached to the top half of the case or whether it is attached directly on top of the LCD itself. In other words, when I take the top off, will there be a hole where the display goes in the top half or will there be a glass rectangle attached to the top case?

The serial number is 2143Axxxxx so it is a 1981 American machine and therefore, I suspect the display assembly is separate from the keyboard but can this be confirmed from the serial number before I open it up? I am very anxious about doing this for obvious reasons so want to make sure I know exactly what to expect before I commit.

Concerning the rubber sheet between the keys and pcb, does this come off cleanly or should I expect resistance either through adhesive or the nature of rubber and time? Is there any danger I can actually damage or rip it?

Finally for now, the keys themselves - do they just sit in the holes in the front case and drop out if inverted? I would like to separate the front case completely for cleaning in the edges round the front metal panel.

Maybe I am making a fuss out of an easy process but with the value of these machines and the basic condition this one is in, I would be livid with myself if I messed up. For someone with basic handy-man skills (but all the right tools), is this a safe job or am I opening myself to disaster?

Thanks very much for any help and advice here. This isn't a job I would tackle without getting some guidance and support!

:)

Mark

Re: Voyager - opening up - small questions please

*Message #2 Posted by **Jeff O.** on 19 June 2009, 3:28 p.m.,*
in response to message #1 by Mark Edmonds

Mark,
I took apart an 11C a long time ago. I'll try to provide some information from memory.

> Quote:

> Now, what isn't clear to me from the instructions and pictures for opening the machine is whether the front glass is attached to the top half of the case or whether it is attached directly on top of the LCD itself. In other words, when I take the top off, will there be a hole where the display goes in the top half or will there be a glass rectangle attached to the top case?

Sorry, I do not recall. I never put mine back together, if I can find it I will check and let you know.

> Quote:
>
> The serial number is 2143Axxxxx so it is a 1981 American machine and therefore, I suspect the display assembly is separate from the keyboard but can this be confirmed from the serial number before I open it up? I am very anxious about doing this for obvious reasons so want to make sure I know exactly what to expect before I commit.

I'm no expert on the construction details of the various vintages. Again, if I can find mine, I'll tell you the S/N and how it is put together.

> Quote:
>
> Concerning the rubber sheet between the keys and pcb, does this come off cleanly or should I expect resistance either through adhesive or the nature of rubber and time? Is there any danger I can actually damage or rip it?

My recollection is that there was nothing adhering the rubber sheet to the pcb, it came off easily and it did not seem to be overly fragile.

> Quote:
>
> Finally for now, the keys themselves - do they just sit in the holes in the front case and drop out if inverted? I would like to separate the front case completely for cleaning in the edges round the front metal panel.

My recollection is that the keys just sit in holes and will drop out.

The above is probably not particularly useful without me verifying the information by finding my unit. I'll try to remember to try to find it. Unfortunately, either task (remembering or finding) may be beyond my capabilities!

The reason mine was never reassembled was because I had no confidence in my ability to re-attach the heat stakes. I read of various methods, including re-melting them, or gluing them, either of which would require some means to firmly hold things together while working on 40 or 50 heat stakes. Screwing things back together sounded appealing, but where to find 40 to 50 tiny screws of the proper specifications? So all the parts went into a bag, then into storage. Do you have a plan for reassembling the pcb to the front of the case?

Good luck,

Jeff

...

Re: Voyager - opening up - small questions please

*Message #4 Posted by **Mark Edmonds** on 19 June 2009, 6:05 p.m.,*
in response to message #3 by Didier Lachieze

Thanks for your help chaps.

I am rather worried now. This business with the "heat stakes" is the problem. On the page I found which showed an 11C being taken apart, there was no mention of this. It seemed that the PCB just lifted out. In effect, I was left with this impression of what happens:

1. You undo the screws and remove the back.

2. You peel off the rubber backing.

3. You lift out the PCB leaving access to the front glass.

However, with the heat stake problem, I clearly need to check this much further, especially given the number of them. I was moderately optimistic that I could do this job earlier today - now I am not!!!

Just as well I posted the thread and thanks for making me aware of this :)

Mark

Re: Early Voyager display access

*Message #5 Posted by **Randy** on 19 June 2009, 8:38 p.m.,*
in response to message #4 by Mark Edmonds

In the case of SN 2143Axxxxx, keyboard heat stakes are not an issue when accessing the display and window. The photos on this very website detail exactly what you will find inside your 11C. http://www.hpmuseum.org/tech10.htm

Once you remove the back and peel back the "black diaper" (an easily reversed process) you can lift out the logic module and clean to your hearts content.

Pulling the heat stakes off to clean is calculator homicide, don't make this harder than it needs to be which isn't hard at all...

Start with some canned air to remove the big bits (safety glasses mandatory) then hit with a light mist of glass cleaner, scrub softly with very soft brush, finish with a soft cloth to dry. Repeat if necessary and do a final finish with canned air.

Re: Early Voyager display access

*Message #7 Posted by **Randy** on 20 June 2009, 5:10 p.m.,*
in response to message #6 by Mark Edmonds

The only HP's that can be "field stripped" for cleaning are the Classics and Spices. Everything else is heat staked or assembled in such a manner that external cleaning is the only option.

Some Voyagers get crud building up around the keys. This is due to small areas of exposed adhesive that attaches the aluminum legend plate to the plastic case front. Crap falls in, sticks to the adhesive on the back of the plate. Tough to really get clean in an absolute way.

Re: Early Voyager display access

*Message #8 Posted by **Mark Edmonds** on 21 June 2009, 11:39 a.m.,*
in response to message #7 by Randy

Right, well this has been done now and appears to have been successful. However, it wasn't without a major heart-stopping moment and only time will tell whether that turns out to be a problem or not.

A few points to note:

1. The pictures I found elsewhere which showed an 11C being opened with the internals attached to the back half of the case were rather misleading. When you undo the screws and take the thing apart, the internals are attached to the top half of the case and the back half comes off cleanly.

2. When removing the pastic envelope, I found that there was a slab of double-sided adhesive foam between the PCB and the envelope. This slab was nearly as wide as the PCB and about 1.5cm on the other axis. Obviously, this made opening the pastic envelope rather difficult and no matter how slowly and how carefully I did it, I couldn't help have a couple of small sections of foam detach.

3. There are two little springs you need to keep an eye on when removing the back. The longer one goes near the battery pack and the shorter on the right hand side as you look at the back of the calc.

4. To remove the main board and display section, I pulled off the four white "washers" that sat on the mounting pins and then removed the battery connectors. After that, it was a case of carefully lifting up the assembly keeping it parallel to the mounting pins and without putting too much strain on the flexi connecter area.

5. And this is when I had a horrible moment when I thought I had totally killed the machine. As I was lifting up the display assembly, the connecting area between this and the keyboard suddenly pinged loose leaving a strange looking connector on the display side. On the keyboard side, the pcb was completely clean with no sign of where this had attached. The only connectors I am familiar with have nice solid male/female mating so this strange thing looked broken to me and I couldn't see what hope in hell I had of lining it up again, yet alone fixing it back on the pcb.

6. Convinced I had killed the calc, I proceeded to clean everything up and pop the front glass back into its groove. Then I put it all back together again apart from the back case, stuck the batteries in and tried to operate it.

7. Nothing. Yep - killed it so I thought. However, I pushed down on where this connecter appeared to have broken and much to my huge relief, the keys started working and I could complete calculations.

8. I had intended to do much more cleaning but after this event, I thought I had better quit whilst ahead so put the screws back in and tidied up.

Thankfully, everything still appears to be OK. All the keys are working so whether that connector will be troublesome in the future or not, who knows.

Anyway, I've now got a better machine than I had but not as immaculately clean as I was wanting to achieve. Maybe another day.

Thanks again for all the help and advice that gave me the confidence to tackle this process.

Re: Early Voyager display access

*Message #9 Posted by **Randy** on 21 June 2009, 2:22 p.m.,*
in response to message #8 by Mark Edmonds

That little blue/black piece is an elastomeric connector a.k.a. a "zebra". These are very common in modern electronics and are most often seen used to connect LCD's. They need to be in compression to work, the back of the calculator provides the pressure points so without the back in place and a screw in the upper right position, the keyboard does not make connection and therefore will not turn on.

The double sided foam is easily handled with a few drops of heptane which is sold in craft stores as UN-DU adhesive remover.

Re: Early Voyager display access

*Message #10 Posted by **Mark Edmonds** on 22 June 2009, 10:43 a.m.,*
in response to message #9 by Randy

Randy - regarding the zebra connector, so it is actually designed to make contact purely by compression and I didn't damage it or break anything? That is very useful to know because it means I can take it apart again without any worry. Thanks very much for the info!

Mark

in response to message #7 by Randy

Randy, isn't it also true that the "under LCD window" cleaning that is the subject of this thread is almost impossible to do with the later Voyagers, which have everything mounted on one PCB heat-staked to the top cover assembly?

I disassembled one of my HP-15C units that had what appeared to be a hairline crack in the corner of the LCD. I could see no way to easily access the under surface of the LCD window. Fortunately, the "crack" was truely hairline...it was only a fine hair that had found its way there. Still, it took the strongest vacuum machine I could find to pull it out.

Had anything else been between the LCD and the window, I suspect I'd have been SOL.

Re: Early Voyager display access

*Message #12 Posted by **Randy** on 21 June 2009, 8:40 p.m.,*
in response to message #11 by Mike Morrow

Yes, beginning somewhere very late 1984 or early '85, the Voyager hardware packaging changed considerably.

Instead of the removable logic module built on a flexible film carrier, which was done to provide shock isolation for the LCD, everything was built on a single piece of FR4 that contained the keyboard, logic board and LCD as a single assembly.

I suspect this change was very close to or concurrent with the 41 changeover to the halfnut - which marked the first solidly mounted LCD design with a "unitized" keyboard/logic board/LCD combination in both product lines.

As a result, access to the LCD in both the later Voyagers and Halfnut 41's is only by removing the heat stake mushroom tops and pulling the complete board assembly out of the unit.

It the case of your 15C, you can carefully lift (pry) the logic board up a small bit to allow small bits of debris to come out with a vacuum. I would not recommend

blasting canned air into the gap or around the LCD as one of the things that does happen is for the anti-reflective coating to start to peel away on the inside of the polycarbonate window. You really, really don't want that to happen.

in response to message #12 by Randy

Thanks very much for the detailed information, Randy. Just by luck, as opposed to skill and knowledge, I had done exactly what you recommended and was successful.

On several websites I had seen some pictures of these later version PCBs removed from the Voyager case. I initially thought that was an indication that the PCB could be fairly easily removed from the case, only I couldn't figure out how. Now, I'm glad I didn't try the impossible.

i41cx+ Time and Date

*Message #1 Posted by **Les Wright** on 18 June 2009, 10:15 p.m.*

Does anyone here set and use the time and date functions in this App?

I am trying to set and maintain accurate time by turning on the Keep Time and Synchronize Time options, but everytime I load the app it seems that time starts afresh at midnight.

Any help to offer?

I am running the newest version under iPhone OS 3.0 on a first generation iPod touch.

Many thanks.

Les

Re: i41cx+ Time and Date

*Message #2 Posted by **Les Wright** on 18 June 2009, 10:55 p.m.,*
in response to message #1 by Les Wright

So far, I only can get this to work if I set Synchronize Time OFF and Keep Time ON, and set the time and date manually in the calc. Any other combo of thes options clears the time every time I relaunch. Can't get the time to sync exactly with the system clock....

Re: i41cx+ Time and Date

*Message #3 Posted by **Egan Ford** on 18 June 2009, 11:50 p.m.,*
in response to message #1 by Les Wright

I have no problem with iPhone 3G/2.2.1 with latest i41CX+. I'll test with 3.0 this weekend.

Re: i41cx+ Time and Date

*Message #4 Posted by **Les Wright** on 18 June 2009, 11:50 p.m.,*
in response to message #1 by Les Wright

Antonio Lagana just wrote me back to advise that a bug in OS 3.0 interferes with proper time synching.

Until this is rectified (a workaround is due in i41cx+ 2.3), it seems that time must be set manually, Keep Time set ON, Synchronize Time set OFF. And even then I am finding trouble with getting i41cx+ to keep correct time....

grrrr. First OS 3.0 bug for me....

HP49 with 48series KB...

*Message #1 Posted by **nacho** on 18 June 2009, 5:43 p.m.*

Hi everyone,

someone will think that it is something strange but today I opened a 49g and extracted the electronic module (CPU) and put it in a 48g+ body.

Of course I know the KB layout isn't the same and just only works the ON key.

Where can I find 49G KB layout to adapt a little bit it to my 48G+ body? it's just for fun purpose.

When I press ON key (direct to Saturn processor) it shows Try to recover memory and YES/NO

I use i41cx+ with no prob on 3.0

Re: iPhone 3.0 OS update does not seem to break 42s or i41cx+

*Message #3 Posted by **Les Wright** on 23 June 2009, 1:39 a.m.,*
in response to message #2 by Olivier TREGER

Antonio Lagana has advised me directly that that the i41cx+ clock will not sync properly with the system clock. This is due to a fresh bug in the 3.0 OS. Antonio has submitted a workaround to the App Store and the issue should be fixed in i41cx+ v. 2.3

Les

Re: iPhone 3.0 OS update does not seem to break 42s or i41cx+

*Message #4 Posted by **Thomas Okken** on 17 June 2009, 11:05 p.m.,*
in response to message #1 by Les Wright

I updated my 2nd generation iPod touch today, and 42S works just fine -- better than under 2.*, in fact; the R/S problem seems to have gone away, and it also seems to be faster than before.

But, Les, your German leaves something to be desired. I'd recommend "alles ist in Ordnung" or "alles ist in Butter". :-)

Re: iPhone 3.0 OS update does not seem to break 42s or i41cx+

*Message #5 Posted by **Hugh Evans** on 22 June 2009, 2:23 a.m.,*
in response to message #4 by Thomas Okken

Same result here, it does feel marginally faster. Sci-15c also still works like a charm.

Re: iPhone 3.0 OS update does not seem to break 42s or i41cx+

*Message #6 Posted by **Les Wright** on 23 June 2009, 1:37 a.m.,*
in response to message #5 by Hugh Evans

SCI-15C is the most expensive calculator app I purchased, and I agree it works well.

But, doggone it, I run the risk of offending voyageur fanatics by admitting I just don't use it. The lack of program I/O, both in the emulator and in the actual calc (I have a near mint one that I am afraid to look at funny) is a big limitation.

The Crimson Research free suite of nonpareil based Voyageurs has never reappeared.

Les

Re: iPhone 3.0 OS update does not seem to break 42s or i41cx+

*Message #7 Posted by **Byron Foster** on 23 June 2009, 6:51 p.m.,*
in response to message #6 by Les Wright

20 bucks for the 15C, and with the price of other comparable iPhone calcs, I'm beginning to doubt the price of the 42s at $5.

Re: iPhone 3.0 OS update does not seem to break 42s or i41cx+

*Message #8 Posted by **Eric Smith** on 23 June 2009, 9:02 p.m.,*
in response to message #7 by Byron Foster

Hard to say. It's entirely possible that the 15C would make more money at a lower price, since the demand curve is nonlinear.

Re: iPhone 3.0 OS update does not seem to break 42s or i41cx+

*Message #9 Posted by **Les Wright** on 23 June 2009, 9:04 p.m.,*
in response to message #7 by Byron Foster

Antonio Lagana doubled the price of i41cx+ and it still has a devout following.

42s is modestly priced indeed. I would've paid more quite cheerfully.

Does the HP-IL module for the HP-41C break the loop?

*Message #1 Posted by **Klaus** on 17 June 2009, 10:37 a.m.*

Hello, does the HP-IL module for the HP-41C break the loop when it is unplugged or the HP-41C is powered off?

I have a HP-IL device with a built-in HP-41C IL-Module. Since I know nothing about the device, I want to hook up a HP-71B to get the device id using DEVID$(1). Simply connected (via the 2 cables, so the loop should be complete with just these three devices [HP-71B, device, HP-IL module]) to the device, the HP-71B takes a long time (about 30 seconds), then displays "HP-IL Error: loop broken". Is this because the IL-module does not close the loop if the HP-41C is turned off?

I have a HP-41CX for using the device, however, I don't see how I could obtain any information about the device without the IL-extension module or the I/O module. So I want to try it with the HP-71B.

Re: Does the HP-IL module for the HP-41C break the loop?

*Message #2 Posted by **Eric Smith** on 17 June 2009, 1:13 p.m.,*
in response to message #1 by Klaus

Yes. AFAIK, all of the HP products using HP-IL break the loop when they are powered down. Some of them have a standby state in which loop activity will wake them up, but until they have awakened the loop is broken.

The 41 also "breaks the loop" when you have it in the loop with another controller (e.g., 71B), because the 41 doesn't support multiple loop controllers. (Exception - when you use the HP-IL development module to make the 41 act as a loop monitor only.)

Thanks (nt)

pet peeves: documentation and thermal printed receipts

*Message #1 Posted by **Don Shepherd** on 16 June 2009, 9:15 p.m.*

We have all bemoaned the fact that few products, calculators included, come with decent quality, readable documentation. To its credit, HP includes a good printed manual with every 12c and 17bii, and also the 35s (at least when I bought mine a couple of years ago; I understand they may not do that now; pity).

I bought a cheapo calculator at Walgreens earlier this year and the documentation consisted of a single multi-fold sheet on which the printing was so small as to make it virtually unreadable. I had to use my copier with a magnification factor of 200% and it was still almost unreadable at that. So kudos to HP, and lets encourage good quality printed manuals for all future products.

My other pet peeve is store cash registers that issue receipts on thermal paper because those receipts fade away, sometimes before the warranty even expires. How can you prove when you bought something if the receipt is unreadable? The best receipts are printed with real ink, which seems to hold up after many years in my experience.

Re: pet peeves: documentation and thermal printed receipts

*Message #2 Posted by **Mike Reed** on 17 June 2009, 10:12 a.m.,*
in response to message #1 by Don Shepherd

Photocopy those receipts while they are still fresh and legible and save the photocopies along with the original receipts. If the warranty requires you to submit the original as proof, you can then do so along with the readable copy (save a readable copy for yourself though!)

Re: pet peeves: documentation and thermal printed receipts

*Message #3 Posted by **Martin Pinckney** on 17 June 2009, 10:19 a.m.,*
in response to message #1 by Don Shepherd

> Quote:
>
> ...those receipts fade away, sometimes before the warranty even expires. How can you prove when you bought something if the receipt is unreadable?

Perhaps not the original intent, but definitely a side benefit to the retailer/manufacturer.

Re: pet peeves: documentation and thermal printed receipts

*Message #4 Posted by **Ken Shaw** on 17 June 2009, 11:45 a.m.,*
in response to message #1 by Don Shepherd

I've had the same problem with thermal receipts.

For those receipts that I need to keep, I now scan them so I can print a copy if necessary...

Re: pet peeves: documentation and thermal printed receipts

*Message #5 Posted by **Juergen Keller** on 17 June 2009, 5:33 p.m.,*
in response to message #1 by Don Shepherd

Here in Switzerland they normally only provide a 1 year warranty so fading receipts are not a real problem. What is the standard warranty period in your country?

Cheers, Juergen

Re: pet peeves: documentation and thermal printed receipts

*Message #6 Posted by **Don Shepherd** on 17 June 2009, 7:32 p.m.,*
in response to message #5 by Juergen Keller

Juergen, the warranties in the US are typically 1 year also, although it depends upon the product. Some cars have warranties for 5 years or more, and some small appliances have much shorter warranties, like 30 or 90 days. I bought a service contract for a treadmill a few years ago for three years. It failed after two years and when I went to invoke the contract, the receipt was so faded that you could not read the date on it; it was printed on thermal paper. Fortunately, they honored the contract since they had records when I purchased it.

they may fade sooner

*Message #7 Posted by **Frank Boehm (Germany)** on 18 June 2009, 9:05 a.m.,*
in response to message #5 by Juergen Keller

When exposed to sunlight, the receipt might turn into a plain white (yellow) sheet of paper within one or two months. On the other hand, if you glue your receipt to a sheet to store it away (as a business document e.g.), it might turn your receipt black, due to solvants used for the glue. Be careful when selecting a glue. Either way, a copy (laser/toner) is a good solution. (In Germany, a business has to keep book records for 10 years, of course including receipts etc. Receipts printed on thermal paper are quite a problem, since they *will* fade away within a couple of years, even when stored in a dry and cold and dark place.)

Re: they may fade sooner

*Message #8 Posted by **Don Shepherd** on 18 June 2009, 10:14 a.m.,*
in response to message #7 by Frank Boehm (Germany)

I've also noticed that if you take a copy (from a toner copier) and put the page in a binder as the first page (so that the toner on the paper copy is against the plastic back of the binder cover), that gets goofed up too. We put a man on the moon 40 years ago next month, why can't we solve these simple problems?

you did buy some cheap stuff :)

*Message #9 Posted by **Frank Boehm (Germany)** on 18 June 2009, 10:57 a.m.,*
in response to message #8 by Don Shepherd

This is the case with non-"document safe"-stuff. The flexibilizer used in cheap plastics will diffund into surrounding material, which of course does include plastics-based toner particels, loosening the particles and make them sticky. There are document-safe sheet protectors, which don't use flexibilizer and are recommended for anything of importance. Usually, these are more expensive than the standard sheet protectors and stating this feature. As for the binder: just use a paper-binder (pre war quality). These are more expensive (by factor 2-3), but will probably last forever. No

plastic to degrade in there 8)

Re: they may fade sooner

*Message #10 Posted by **KenH** on 20 June 2009, 2:46 p.m.,*
in response to message #8 by Don Shepherd

Hi Don,

It is because the binders contains PVC (poly vinyl chloride) with plasticizers which make the plastic soft. This softener will interact with your copy and smear or copy them off the paper as you mention.

To prevent this you need to use archival safe binders and sheet protectors and they are available at no significant extra cost over standard binders. Often these products are made in polypropylene.

You can read more at keepfiling web site about archival safety and archival safe binders I have attached a few links for your review.

Re: pet peeves: documentation and thermal printed receipts

*Message #11 Posted by **Andrés C. Rodríguez (Argentina)** on 19 June 2009, 11:55 a.m.,*
in response to message #1 by Don Shepherd

Don: In the past years I worked for the systems division of a large retail company; and we faced the problem of thermal receipts reliability. Local tax laws require the merchant to keep the copy-paper roll of the cash registers for many years. Thermal paper is not safe enough (there are certified thermal papers with longer stability, but the cost is high for such an operation); that brought dot matrix impact printers back to the Point Of Sale terminals, and sent thermal printers home, even with speed, reliability and noise advantages.

need help from surveyor or property laywer...

*Message #1 Posted by **cyrille de Brébisson** on 16 June 2009, 5:28 p.m.*

Hello,

I have a question that I hope some of you might be able to answer...

if a surveyor made a mistake 50~60 years ago in placing property lines (in this case, 5 parcels are affected), and everybody builds to these lines and uses these lines with no questions... what happen 60 years later when the error is discovered and someone complains? is everyone supposed to move to the 'real' property line (possibly destroying structures while doing so), or do the currently used, but erroneous, property lines take force of law and become the new property lines?

thanks, Cyrille (BTW, this is in Idaho)...

Re: need help from surveyor or property laywer...

*Message #2 Posted by **Frank Rottgardt** on 16 June 2009, 7:13 p.m.,*
in response to message #1 by cyrille de Brébisson

Without knowing anything about survey rules in the US:

The first question I have: what makes the actual property lines in the field to be regarded as "incorrect"?

Who and based on which data is declaring the lines to be wrong?

Re: need help from surveyor or property laywer...

*Message #3 Posted by **Steve Keeley** on 16 June 2009, 8:25 p.m.,*
in response to message #1 by cyrille de Brébisson

I'm neither a surveror nor a lawyer, so bear that in mind.

I'm pretty certain that a mistake that's gone unnoticed for 50 years is not rectifiable. The principle in law is called "laches."

Basically, you have to be vigilant in protecting your rights. For instance, if your neighbor builds and extension to his house that infringes on your property, and you wait until after he's completed the extension, lanscaped the area, and furnished the extension to complain, you're out of luck.

That's why you'll often see companies filing what seems like frivolous claims of copyright infringement. If they can be shown to have failed to act on a prior infringement, they could lose a subsequent, more serious case.

Re: need help from surveyor or property laywer...

*Message #4 Posted by **Brent Hillebrenner** on 16 June 2009, 8:50 p.m.,*

in response to message #1 by cyrille de Brébisson

Cyrille,

A quick search turned up the following about what is called "Adverse Possession:"

From Wikipedia

Re: need help from surveyor or property laywer...

*Message #5 Posted by **db (martinez, ca.)** on 17 June 2009, 12:16 a.m.,*
in response to message #1 by cyrille de Brébisson

Cyrille; You'll have mail as soon as i'm through babbling here. I'll send you the email address of the man to talk to - he's a licensed surveyor in Idaho along with a couple of other states and he uses HP calculators too. First though, a couple of things:
* This has nothing to do with adverse possession - that is legal thievery, your problem is an old error.
*I've never heard of "laches". I don't think it applies here. Most, if not all states have a "discovery clause" in statute or case law which states that SOMETIMES no matter how old a mistake is; property lines may be adjusted if the case is pressed within a certain number of years after discovery of the problem, usually seven or so.
*The age of the original survey may not be that important. What might be more pertinent to the outcome is if the 5 or 6 parcels were created simultaneously as a subdivision or if one was divided then one of those was divided etc. so you have senior rights to contend with. If there are old sectionalized land (aliquot parts) boundaries involved; you just added a whole other pile of complications to this.
*In the end: the only person who can decide where a property line actually is is a judge, and he will use testimony about math, history, intent of the original owner/subdivideor, lines of occupation, wording of the deed, common surveying practice in the area at the time of the mistake and more but all that may not matter much. His finding might be based solely on "gastronomic jurisprudence".
*Anyway; as Brown & Eldrige said: "The opposite may be shown". - den

addendum:
Don't loose too much sleep on this yet. If there is a problem; these things **can** be resolved relatively painlessly, with just a little application of money (like everything). If acreage is the problem and everyone (or the judge) decides to; you can probably do (in California you can do) a "lot line adjustment" where you hold the lines of occupation where there are improvements and adjust the property lines "down on the back 40" where only the cows will know that you've evened out the areas. Just be sure that a Land Surveyor and not a lawyer writes any new deeds. Even if Idaho allows lawyers to write legal descriptions; all they will do is to make sure that *your* kids will be back in court some day and that *his* kids will be on retainer to one side or the other.

Edited: 17 June 2009, 1:19 a.m.

Re: need help from surveyor or property laywer...

*Message #6 Posted by **Mike Reed** on 17 June 2009, 10:04 a.m.,*
in response to message #5 by db (martinez, ca.)

I'm polarbear Mike Reed, PLS 6049 (Ca). Essentially, I agree with what DB just wrote above. The laws are very different in each state, though. Make sure the surveyor you contact is licensed to practice in the state where the problem is! In California, even though the lines of occupation are not the same as the lines of ownership, the lines of ownership are still valid legally until/unless a lotline adjustment is agreed to or a judge settles their location and rules. Once the judge rules, they are and will forever remain where HE says they are. Also, as DB stated, money cures all evils! E-mail me privately if you want - polarbear_mike @ yahoo.com (no spaces)

> *In the end: the only person who can decide where a property line actually is is a judge, and he will use testimony about math, history, intent of the original owner/subdivideor, lines of occupation, wording of the deed, common surveying practice in the area at the time of the mistake and more but all that may not matter much. His finding might be based solely on "gastronomic jurisprudence".

Cyrille, regarding the issues with your five parcels, you might find this article interesting about lines of occupation affecting four very large "parcels".

What does this have to do with HP calculators?

Most likely, if the original surveyor had had an HP calculator, he would not have made the mistake in the first place...

Unfortunately, the original surveyor couldn't help it. HP calculators were nowhere to be found... 60 years ago.

*Message #11 Posted by **David Hayden** on 17 June 2009, 11:36 a.m.,*
in response to message #1 by cyrille de Brébisson

Cyrille,

First of all, hire a licensed, reputable surveyor to verify the error. My next-door neighbor tore down a barn because the former owner of my house had a survey that said part of the barn was on his land. As it turned out, the survey was incorrect, but now my neighbor doesn't have a barn....

Assuming that the mistake is real, talk to a lawyer who's knowledgeable about this stuff and see what he/she says. Actually, there's a good chance that the surveyor will be able to tell you about the laws in your state.

Finally, once you know the facts (from the survey) and the law, get all the people together and see if you can come to a friendly solution. If you can, then get the lawyer and/or surveyor to write up whatever legal docs are necessary. If you can't come to a resolution, then you'll have to argue the case before a judge I fear.

I'm not a surveyor, but I'm good friends with one and, for what it's worth, he's said on may occasions that after enough years, the agreed-upon property lines become legally effective, even if they aren't where they should have been, so I wouldn't worry that the property line will be redrawn through someone's bedroom.... :)

Re: need help from surveyor or property laywer...

*Message #12 Posted by **cyrille de Brébisson** on 17 June 2009, 6:54 p.m.,*
in response to message #1 by cyrille de Brébisson

hello,

First of all, thanks for your help...

To answer one of the question: what does that have to do with calculators... well, nothing, BUT I know that they are a bunch of surveyor on this forum and I knew that they would be able to help me. finding a surveying forum in which I am a total stranger would probably have been a whole lot less productive!

anyhow, for those of you interested in what I have found:

It looks like, in my case, an old surveyor pin does give the position of the corner of my property. the fact that this pin might have been misplaced is secondary to the fact that this 'monument' is now, because no one ever contested it, by definition the property boundary regardless of being properly or improperly placed...

If for some reason, a Judge rules otherwise and his judgment hold, I could then use an 'adverse possession' defence to still hold on the property, BUT this would mean that I admit that I do encroach on the other guy's

property (which I will not do unless a final judgement forces me to).

thanks for your help, Cyrille

*Message #13 Posted by **Iqbal** on 17 June 2009, 7:40 p.m.,*
in response to message #12 by cyrille de Brébisson

There is an old English law that says that if you occupy a piece of private land for a period of time with the owner's knowledge, then, you have certain rights over the land (Adverse possession). This situation reminds me of an old saying " Whereas doctors bury their mistakes, surveyor's dig them up ". I just discovered a mistake made by a very respected surveyor where he ran a boundary line 16 metres by 125 metres into someone else's property. The surveyor did the work in 1992 and now is 2009. To make matters worst, he died about 5 years ago also. The statutory period in my country (16 years) has passed, so I guess my clients dont have much of a case. Still, it is the job of the surveyor to pick up evidence and let the final say rest with a Judge. So while the law is clear, I am sure there is a lawyer who will gladly take my client's money and fight their case.

in response to message #13 by Iqbal

Hi Iqbal;
In California, and pretty much the rest of the states, we added a twist to the common law concept of adverse possession. The legalese here says that the thief must be open and notorious about his use of the land he is stealing and it must be used exclusively for himself and not for the rightful owner. That's probably just like your country. Here, in almost all of the very rare adverse possession cases; the thief fences the owner out of his land and he must have paid taxes on it for a specified number of years in order to gain title. Our "prescription" is closer to what these people here are talking about but that's not it either. If this is real; it's just a mistake and like the one you discovered; they happen all the time.
To your "doctors bury their mistakes" we add lawyers visit theirs in prison. We have another too. It goes: architects and lunatics are certified, engineers and sex offenders are registered, dogs and surveyors are licensed. Woof.

This happened to my parents many years ago (in Kansas), only probably in reverse. The neighbor had a survey done so that he could build a fence. The surveyor placed the flags marking the property boundary eight feet into my parents yard (out of a 100 foot wide lot). A fence existed between the properties. The error seemed to originate from a problem with determining the otherside of the neighbor's lot, which butted up against undeveloped land that used to be a railway right of way, but had not been in used for years (30-50). My parents were afraid the neighbor would build his new fence 8 feet on their side of the old one, and they consulted a lawyer. The lawyer said that if the neighbor decided to build the fence, they would have to get their own survey done, and contest the action in court. But, if they could only wait a few more years (for a total of 15, 17, 20, I can't remember), then all they had to do was prove the fence existed that long without being contested, and it would become the legal property boundary. This was from the mid-70's.

In the end, the neighbor was a good neighbor, and did not move the existing fence. The property had sold several times before that, and several times since then, and no other issues ever came up with the boundary. That original fence still stands today, almost 50 years after it was put in.

Dan

I am considering the same sort of thing on my property. The Magna Carta defines these rules but mostly one must just try to come to mutual agreement with neightbors (try to be frendly in negoations). It's just what is just is just. Maybe your guy says "I will not release that land but i will lease it to you for $1 per year for the next 100 years, pay me $100 and it's solved".

Edit Note: in 100 years all the structures will be gone. Don't try to take anyones rights and be friendly.

HP-41: Release: ICEBOX.ROM version 1E: News for NoV Users :-)

*Message #1 Posted by **Geir Isene** on 16 June 2009, 8:20 a.m.*

From the UC-41 page:

"In version 1E, swtching between HEPAX RAM blocks in the NoV-32 or the NoV-64 became really easy. I added the functions N100, N101, N102 and N103 to switch directly to the desired ram block. "

The updated 10 page user manual will give you the insides.

WROM is still there for generic write-to-hepax-ram. But now you don't need any FOCAL program to code/decode address/word for switching ram pages on the NoV-32 and NoV-64. You can very easily switch the ram blocks - even inside a program.

Someone wants to write a 64K chess program for the HP-41?

Edited: 17 June 2009, 11:08 a.m.

HP 46080A HP-IL Extension module

*Message #1 Posted by **ZOleg** on 15 June 2009, 8:49 p.m.*

How and where used HP 46080A HP-IL Extension module and there is documentation on it?

Re: HP 46080A HP-IL Extension module

*Message #2 Posted by **Eric Smith** on 15 June 2009, 9:30 p.m.,*
in response to message #1 by ZOleg

The HP 46080A is not an HP-IL extension module; it is an HP-HIL extension module. HP-IL and HP-HIL are two entirely different things. HP-HIL was mainly used to hook up keyboards, mice, and other relatively low-speed I/O devices to HP's "big computers" like the HP 9000 systems. HP-HIL is similar in purpose to low-speed or full-speed USB, though completely different in details.

Another way to restore the silver trim?

*Message #1 Posted by **Dave Shaffer (Arizona)** on 15 June 2009, 2:34 p.m.*

Looking through one of my photo magazines, I came across this

Gold/silver "pen"

It appears to be heated and uses gold or silver foil that transfers to the surface being written on. They claim it works on plastic. Maybe just the thing for restoring worn silver finishes on calculators.

Has anybody tried it?

Re: Another way to restore the silver trim?

*Message #2 Posted by **Michael Meyer** on 15 June 2009, 3:20 p.m.,*
in response to message #1 by Dave Shaffer (Arizona)

Looks very interesting.... I've used silver and gold markers, model paint, etc... nothing really holds up to any kind of handling. You'll have to try it and let us know!

Re: Another way to restore the silver trim?

*Message #3 Posted by **Dave Shaffer (Arizona)** on 15 June 2009, 3:48 p.m.,*
in response to message #2 by Michael Meyer

> Quote:

>
> Has anybody tried it?

I haven't, but a close reading of the advertisement reveals that the "foil" is "gold (colored)" and "satin finish",

as is the "silver". It appears to be a heated ball-point stylus, and you'd write with it on the back of the foil with the "metal" surface of the foil facing the work -- like using carbon paper. That would probably make it difficult to use on a surface like the top of the silver bar on the calc -- the pen would keep falling of the edge, I'd think. Also, it's a satin finish, instead of the shiny aluminum finish that metalized plastic usually sports. Of course, a satin finish might be more appropriate to the restoration, depending.

A cheap way to test it would be to simply buy some of the foil, and use a heated flat or slightly rounded utensil, like the head of polished steel rivet or carriage bolt held in a pair of vise-grips over a heat source (but not hot enough to melt plastic, of course)... As long as you were applying it to a raised surface, such as a worn-down HP-15C logo, it might look fine.

Re: Another way to restore the silver trim?

*Message #5 Posted by **Geoff Quickfall** on 15 June 2009, 9:31 p.m.,*
in response to message #1 by Dave Shaffer (Arizona)

Haven't tried it, and in it's present form (ball point) I warrant it would not the right tool for the job.

Pretty well the only way to get the original look would be to strip the calculator down, and present the bezel to an automotive detailer (one with a vacumm chrome applicator).

Maybe something to look into for the guide this summer.

Cheers, Geoff

Byron Foster's 42s for iPhone v. 2 upgrade in App Store

*Message #1 Posted by **Les Wright** on 15 June 2009, 2:29 p.m.*

Subject line says it all. Much improved over v. 1, though I for one am looking for "the Original" from Thomas Okken himself, as though the fellow isn't under enough pressure already!

As an aside, Antonio Lagana has provided yet another update of i41cx+ with even more groovy features (though as an iPod touch user many of them I can't use!)

hope this is of interest to some.

Les

Now, if we could only get an updated 35s ! (Hitting head on brick wall)

Regards,

John

Re: Byron Foster's 42s for iPhone v. 2 upgrade in App Store

*Message #4 Posted by **Egan Ford** on 15 June 2009, 6:19 p.m.,*
in response to message #1 by Les Wright

Feedback/Issues:

1. PRLCD fixed, however PRLCD only prints the top 2 rows in 4 line mode. I am unsure if graphics in 4 line mode have also been extended. Perhaps another can test.
2. Import/export requires a WiFi connection so that it can act as an HTTP server. Given how spoiled I have been with i41CX+, this level of import/export is very minimal, however better than nothing.
3. The new overlay labels are a nice touch. Very nice touch.
4. Love the 4 line mode, however I am disappointed that the keyboard is not adjusted for 4 lines. IMHO, a different keyboard should be provided in 4 line mode. I can think of a number of ways to do this. E.g.

smaller keys, smaller LCD font, or both, or perhaps dump the 20 pixel status line above and shift the keyboard down a bit. To please all, it should be user selectable. At least the toggle is quick and natural, so if you need the top row keys you swipe up and your thumb is already where it needs to be. A few minutes retraining my brain and I'll be set.

5. Left swipe the LCD to get to printer, however printer does not have a right swipe to return (gotta press a button). Feature request.
6. How about 5 line mode? Include L. Feature request.
7. Key click as annoying as ever (and too loud). Fortunately it is optional. Any chance for an option to use the default key click sound? And or have an option to adjust the volume of the key click? Again spoiled by i41CX+.
8. Feature request. Printer output save.
9. Still open source. You have the power to change it yourself. That is, if you have OS/X and $99.

As just a 42S+printer replacement its perfect without all the extras. However the import/export is what makes this a 42S+. I still give it 5 of 5 stars.

Thanks!

in response to message #4 by Egan Ford

I just noticed that you can scroll the stack and program listing using the right side of the LCD. Very nice, its just like the thumb wheel feature I've always wanted. In stack mode it is the same as rolling up/down. In program mode its faster than the arrows. BTW 5 line program mode is very nice. 5 line stack with L should be easy.

This was kind of a last minute thing and maybe I should have waited for another release before putting it in so it would be more robust.. but what the hell.

It's currently implemented by issuing up/down key presses. Of course this breaks when the menu is up, needs fixin. I want to implement the cool little iPhone watermark scrollbar on the right so you can tell where in the program you are. I would also like to implement momentum similiar to standard iPhone scrolling, and suggested by Thomas. Finally, I don't like how it rolls over at the begin or end. I think this method works when using key presses, but when scrolling it's confusion, and also counter to familiar iPhone scroll behavior.

I do. Getting from the bottom to the top of a long program is only a flick away. Perhaps it can be optional.

For the stack, well it should roll, right?

Thanks again.

Yea, the stack behavior will stay the same.

With momentum it will be faster to move through the program, so getting to the beginning and end should pretty easy, and there is always the key up/down to move back to the top and bottom. None of this stuff is set in stone however.

in response to message #4 by Egan Ford

As an iPod touch user, WiFi is all I have and I rather like the web-based interface. A lot simpler to use than the reverse arrangement with i41cx+, that requires me to run my Mac as a webserver to move my program files onto to i41cx+, with still no way to get them off in a format usable in, say, V41 or Free42. Antonio has the nifty email feature but the files are importable only by other i41cx+ users. the 42s interface really is two-way--import files from desktop via web server upload, download by clicking on links in web interface and saving the files, which are good old fashioned raw files that can be used in Free42 or even V41 (and i41cx+) if one adheres to just 41C commands.

I like it. Tomayto tomahto.

I agree with your other comments, but as I have a first gen. iPod touch the key click issue is only relevant with headphones, and to my ears i quite faint compared with the sounds out of i41cx+.

As I have mentioned elsewhere, Byron has improved the speed, but the "R/S sometimes won't stop running program" bug comes up in pathological and unrealistic situations (e.g. LBL 00 BEEP GTO 00). This bothers me not one fig. In normal programs that converge to a result, the simulator is so fast that the R/S bug is irrelevant. Fair trade off.

Now if we only had a decent RPN calc for Blackberry. I have something called 10C, but it is limited in features, hard to use, and relatively expensive!

Les

Note that the next release will have the "standard" key click, which also works on the 1st generation iPod touch without headphones. It also has TONE and BEEP implementations that are truer to the original.
Once I have finished printer emulation in my own iPhone port, I will also help Byron with print spooling (capturing printer output in text and GIF files) -- I expect both versions will be virtually identical as far as printing is concerned.
The curious who have the iPhone SDK set up with an ad hoc development certificate can run the latest and greatest code from http://free42iphone.googlecode.com/.

Very nice. I did not know that both versions were in the same SVN repo. I just built your version. Nice. Thanks.

Actually, I'd like both. As an OS/X/Linux/UNIX user I am accustom to building, installing, and testing 41/42 code with "make" from the command line. And, given that I have a full time web site, "make

test; make install" works great for me and makes it easy for me to share 41CX code with others. Of course, those of us with OS/X, Linux, or Cygwin can simply type:

```
python -m SimpleHTTPServer
```

and have instant private access to all of our 41CX programs for i41CX+ browsing.

Sharing 42S code requires that the user download to a PC and then upload via HTTP to Free42iPhone. Not really an issue if the user knows how to network both PC and iPhone. Like you said:

> Quote:
>

Something that I started working on that I will not have ready for sometime is an i41CX+ app store. Basically you visit the site, pick your 41CX app from mobile Safari and it automatically launches and loads into i41CX+. Here is a quick and dirty example to demonstrate how it works: http://sense.net/~egan/41cx/chars.html.

A 42S version of this would be nice too don't you think?

Whoa! You can install your own protocol in Safari on the iPhone, and have it be handled by an external app? I had no idea.
Now I'll have to find out how to do that. :-)

I just looked into this, and it doesn't appear that you can, unless I'm missing something.

However, what you can do is run UIWebView in application, and you can install handlers for hyperlinks, Which is probably the implementation that Egan is referring to.

I really like Egan's suggestion, and I was thinking about something like this in general terms some months ago, but this focuses on a reasonable implementation path. Bonus, this would

provide a nice way to associate documentation with programs for in-calc reference. This would be nothing more complicated then a quick reference page for the program.

in response to message #12 by Egan Ford

Egan, I have to admit that is way cool, the the web-based "store" idea with programs loadable using the customized i41cx// protocol.

On reflection, I have to admit I would love both in Free42 and iPhone42s--Byron's & Thomas' implementation where the handheld is the server, and Antonio's where the desktop or website is.

But let's face it, even with their limitations, Byron, Thomas, and Antonio (and Eric and others before them) have given us wonderful and useful little programs cheaply. I was one of the lucky ones who jumped onto i41cx+ at half the present price. And I have read some criticisms in the US App Store that 42S is too expensive at five bucks. C'mon! Some of us around here have spent a small fortune collecting the actual calculators!

There's just no pleasing some people. Judging by the reviews for the various Voyager emulators and simulators in the iTunes App Store, if the price for 42S/iPhone would have been $20 or more, there would have been no complaints whatsoever. Or maybe it's just that the Voyager fans are more fanatical than the Pioneer fans. :-D

But seriously -- I read a lot of on-line news, and I see complaints about open-source software on a daily basis; I'll bet you anything that the people who complain the loudest are exactly those who *enjoy* the benefits of free software while never (yet) having actually *created*, never mind *supported* any -- where "supported" means "donated dozens of hours of work or more" or "hundreds of dollars or more".

They, too, will grow up eventually. :-)

Thomas, I think I donated a measly thirty bucks to Free42 a couple of years ago and you advised me that that was generous as open source freeware users are not terribly munificent. I was mortified to hear that. Over the years, your extensive personal attention to my interest in Free42 has certainly given me my money's worth :)

Well, my top priority was and is to make sure that there will always be an HP-42S simulator available to everyone who needs or wants one, without having to rely on proprietary stuff which may be abandoned and then end up in software limbo -- hence my use of the GPL.
I would *also* like to make a ton of money from Free42, but those two goals are not compatible, because of the GPL.
I'm not complaining, though; Free42 has paid for a couple of vacations already and sales for the iPhone look like they'll pay for a third (I mean, for the Mac I had to buy to be able to do iPhone development in the first place!). Given that money wasn't my incentive for writing it in the first place, every penny I receive is a bonus. :-)

in response to message #4 by Egan Ford

Hi Egan, Thanks for your feedback and your five stars!. The best place from a development standpoint for enhancement suggestions and bugs is at:

http://code.google.com/p/free42iphone/issues/list

about PRLCD in 4 line mode, yea... there are probably several cases like this that 4 lines doesn't handle yet. In fact it was Thomas that fixed the original PRLCD issue. On the other hand, there are a few cases that it kind of falls out nicely, for example "SHOW" which operates unaware of 4 line mode, result in a nice effect such that it displays above the X and Y stack lines.

> Quote:

> Import/export requires a WiFi connection so that it can act as an HTTP server. Given how spoiled I have been with i41CX+, this level of import/export is very minimal, however better than nothing.

Better than nothing? :) I would agree with you there, I would add it is even better than something. I think the web server solution is consistent across platforms, a minimal amount of fuss for most use cases, and familiar/intuitive, in my subjective point of view. I even like this solution more then placing files in a directory system somewhere, say for example if the iPhone allowed you to network file browse, it's harder to get wrong this way.

Kudos to Thomas Okken for writing the Free42 web server that provides this functionality. It is actually more capable then demonstrated in 42s in that it will actually upload and download files and store them on the local directory system, and also navigate a filesystem. This functionality is not exposed at the moment. Initial implementations of it allowed you to browse the entire iPhone directory system from root down and download files.

Anyway, I think this whole scheme will pay dividends in future releases by providing a consistent general purpose way for moving data files around.

True. Eventually I'd like the option for both. But its not critical, just a nice to have. If you get 42S://post?... working like the aformentioned i41CX+ example, then that would actually be better for supplying apps to unteathered (WiFi to PC) iPhones.

Shift-OPTIONS. If you have a button labels "Import/Export Programs", you have version 2. If not, you still have version 1.

*Message #25 Posted by **Les Wright** on 18 June 2009, 12:52 p.m.,*
in response to message #23 by John B. Smitherman

John, this is one thing that is missing from 42s that Thomas has always had in Free42--access to "About" information that can confirm the version. As it stands now, the only way you know you have v. 1 or v. 2 is taking note of the slightly improved skin graphics, the much better speed, and the the extra functionality. Both i41cx+ and the Free42 build from source code I am playing with have version info very clearly available somewhere. This could be another request to Mr. Foster via Google Code.

Perhaps the issue is that I don't have the latest 2.2 Itouch software installed (let alone version 3).

However the 42s version 2 post date on the UK store is Jan 2009 not June 2009 and I purchased Byron's app in Feb/March of this year.

So I remain a little confused.

Nigel

You should be able to get 42S version 2.0 even with an older version of the OS; it does not require 3.0. (The next release probably will, though.)

Re: Byron Foster's 42s for iPhone v. 2 upgrade IS NOT YET IN UK STORE

*Message #30 Posted by **Les Wright** on 18 June 2009, 12:48 p.m.,*
in response to message #28 by Nigel Bamber

The App Store is not consistent with this. In some listings the post date reflects the date of the most recent release. In others, as in this case, the post date is that of the original v. 1 release to the App Store. What gives this away as the most recent release is that it is declared as v. 2, and in the right side bar you can read "What's new in this release" to see the various enhancements.

If you are having trouble with this showing up as an automatic upgrade in your Applications panel in iTunes, you may, as I did, have to manually remove 42s from the iPod, re-download 42s from the App Store (it will, eventually, tell you that this is free, so when it asks "would you like to purchase?" it is safe to say yes), and on resyncing the new version is written over to the iPod. Alas, this loses any existing data in 42s v. 1, so maybe you should try to sync first and see if that overwrites with the new version before removing the old version manually. I had to remove my old version manually since it was a build of the source code and as far as iTunes was concerned I was already updated! However, for completeness, I wanted the official App Store version, though I am sure Mr. Foster would indicate there was no difference.

Bottom line is this: you are seeing the newest version in the UK store and you can download for free. The Jan 2009 date is a bit misleading.

Les

Uhg, I'm sorry you had to pay for it twice, you shouldn't have to do that. I don't know what the deal is with the updates. Maybe this stuff rolls out slowly, or it's just simply bugged!

From the developer portal point of view, where versions are submitted, I don't see version 1.0 anymore (it was removed as soon as 2.0 passed review). Strange that version 1.0 is still "floating" around.

Re: Byron Foster's 42s for iPhone v. 2 upgrade IS NOT YET IN UK STORE

*Message #34 Posted by **Les Wright** on 19 June 2009, 6:51 p.m.,*

That's a glitch.

Write iTunes customer support and get your extra five bucks back. They were very good with me when I double-download a CD due to my own error. So if this not your error they should be even more flexible. You have proof in the system of owning the software and updates are supposed to be free.

Les

Re: Byron Foster's 42s for iPhone v. 2 upgrade IS NOT YET IN UK STORE

*Message #35 Posted by **Les Wright** on 19 June 2009, 8:09 p.m.,*
in response to message #32 by John B. Smitherman

I wonder if the failure to update the release date is the issue. Maybe iTunes uses this, and not just the version number, to discern that an update is due.

I think the release date is supposed to be corrected. Look at the page for i41cx+ 2.2. Says June 15th, 2009, like it should. Have never missed an update of that software.

Updating should not be such a hassle! Typically, it isn't.

Hope you get your fiver back.

HP 35s checksum repeatability observed

*Message #1 Posted by **JJB299** on 15 June 2009, 10:06 a.m.*

I have had the opportunity to work with a few 35s models in recent months. The well documented checksum problem with the 35s is a great disappointment, but I have seen some repeatability when programming multiple 35s calculators. I have 2 calculators (SNs: CNA 8380xxxx and CNA 8310xxxx) that show the SAME checksums for a set of programs I entered in.

Here's what I know so far:

-The calculators were brand new and have never been programmed before I programmed them.

-No variables (direct, indirect, statistics) were stored before I programmed them.

-I took care to enter the programs in correctly, but was still able to delete lines and variables and still get repeatability.

-I never ran the programs while programming.

-I didn't switch between RPN and ALG modes while programming.

Has anyone else seen this before? I'm no expert, but I think the checksum problem is rooted somewhere in the indirect addressing.

HP48G Problem

*Message #1 Posted by **Jno. Greenslet** on 14 June 2009, 11:53 p.m.*

Hi,

I have been reading and enjoying this forum for some time now. My wife thought that it was very strange of me, but she also realized that I like HP calculators. When she found the old HP48G that she bought 25 years ago, she gave it to me instead of throwing it away.

I put in fresh batteries and hit the ON button, but nothing happened. I tried the ON-C warm reset, and it came to life. "Great," I thought, "I have a new toy." But then I tried to turn it off.

At this moment, I can only turn the calculator on with ON-C or ON-A-F, and I can only turn it off by sticking a pin in the reset hole under the foot on the back (or leaving it for a while until it turns itself off). The only odd behavior I see (other than the on and off issue) is that none of the shifted ON commands work, and I cannot adjust the contrast with ON-+ or ON--.

Any ideas or suggestions to bring it back to normal? Thanks for your consideration.

Cheers,

Jno.

Re: HP48G Problem

*Message #6 Posted by **Jno. Greenslet** on 16 June 2009, 1:08 p.m.,*
in response to message #5 by Geoff Quickfall

Hi Geoff,

Thanks. The source of my problem never really went away, but Ron's message showed me how to work around it.

I'd like to tackle the source next. Would you be kind enough to describe how you took the case apart (or maybe point me to some directions online)? I came across directions for getting in from the front, but if I can avoid prying off the faceplate and drilling out rivets, I'd rather go that way. Thanks.

Cheers,

Jno.

Re: HP48G Problem

*Message #7 Posted by **Jean-Michel** on 17 June 2009, 4:23 p.m.,*
in response to message #6 by Jno. Greenslet

Hi Jno,

It seems you didn't notice that Ron and me were giving the same advice in different words...Above the row of soft keys, that's exactly on the bezel below the screen, but no matter. Try "Openning HP-48" or something similar on Google and you may find a very well detailed site explaining with pictures how to open this calc, but if you let me give you an humble advice,

do not open your calc if it turns on with the simple trick Ron and me told you. You may brake something you will regret after. That's what prevented me to try anything. I consider it's a minor problem one can live with. Anyway, after having read the full openning procedure, you'll have your own opinion! Kind regards.

Re: HP48G Problem

*Message #8 Posted by **Jno. Greenslet** on 17 June 2009, 8:31 p.m.,*
in response to message #7 by Jean-Michel

Jean-Michel,

You are absolutely right. Sorry I missed that when I read your message the first time.

And you are right, too, about opening it up. I have been doing some reading up on the different methods people have come up with for disassembling the HP48 calculators. The methods that involve cutting the case and slicing rivets are a bit troubling. I think I should practice on a few TIs first.

Thanks for your advice.

Cheers,

Jno.

HP-97S Pod Schematic

*Message #1 Posted by **Katie Wasserman** on 14 June 2009, 12:31 p.m.*

I'm working with a friend on repairing a broken 97S pod, I also have another 97S with no attached pod and am considering building a replacement pod. I've mapped out how it interfaces to the calculator and it's fairly complicated, it does some partial instruction decoding and uses all the basic control lines inside the calc. There are some 45 mostly 4000 series CMOS chips on two 4-layer boards inside the pod so it's not that easy to reverse engineer but it is easy to find replacement parts for it. Does anyone have a schematic for this?

Thanks, Katie

Re: HP-97S Pod Schematic

*Message #2 Posted by **Eric Smith** on 14 June 2009, 6:55 p.m.,*
in response to message #1 by Katie Wasserman

Tony Duell reverse-engineered schematics, which are on the HPCC Calculator Schematics CD-ROM.

*Message #3 Posted by **Katie Wasserman** on 15 June 2009, 12:38 a.m.,*
in response to message #2 by Eric Smith

Eric,

Thanks! I forgot to check those, I got them several years ago and filed them away. Tony did a amazing amount of work tracing all those connections and they're quite helpful in tracking down specific problems.

It sure would be nice to see them woven together so that you can get a feel for the whole circuit.

Re: HP-97S Pod Schematic

*Message #4 Posted by **Thomas Chrapkiewicz** on 29 June 2009, 11:20 a.m.,*
in response to message #3 by Katie Wasserman

Does anyone know how to determine (via the serial number) whether a HP97 can accept external wiring - like for the 97s 'pod'?

Are the ROMs in the 97s the same as in the 97?

Thanks, TomC

Re: HP-97S Pod Schematic

*Message #5 Posted by **Katie Wasserman** on 29 June 2009, 5:53 p.m.,*

in response to message #4 by Thomas Chrapkiewicz

The 97 and the 97S are identical as far as the ROM's are concerned. The logic in the pod does all the special work by reading the control lines and placing the data on the bus at the correct time. Similarly, it partially decods the instructions to figure out when the flags are set or cleared.

The circuit board in the 97S differs slightly from the early 97 models to allow the connection of the pod easily using a 16-pin IDC header. I believe that HP changed the boards for all 97 calculators once the 97S was released.

There should be a cutoff date after which all 97 calculators are convertible to 97S calculators. If you figure this out, the serial number should be all you need to look at. My guess is that it should be something around 1730Axxxxx and after. This, of course, is the serial number etched into the plastic not the one stuck on when they added the pod.

Re: HP-97S Pod Schematic

*Message #6 Posted by **Thomas Chrapkiewicz** on 29 June 2009, 8:37 p.m.,*
in response to message #5 by Katie Wasserman

Thanks for the details. I was not aware that this was how the pod interface operated.

I do not have a 97s; just a few old 97s and was wondering how difficult it would be to make one a simple controller.

I will have to get the schematics and understand the logic further.

Regards, TomC

Re: HP-97S Pod Schematic

*Message #7 Posted by **Katie Wasserman** on 29 June 2009, 9:30 p.m.,*
in response to message #6 by Thomas Chrapkiewicz

I was thinking about that myself, it's not simple. Tony's schematics will be a help certainly. There are 40+ mostly 4000's series IC's in there and some resistor networks. I suppose you could just follow the schematics but they are hand drawn and only show a tiny fraction of the wiring on any one page.

I think a much better/more interesting approach would be to figure out the control lines that the 97 uses along with the flag set/clear instructions and create a more usable interface in firmware on a PIC, AVR, whatever you like. There aren't too many control lines but you definitely need a logic analyzer. I say "more usable interface" because the pod implements this rather awkward -- in today's world -- multi-digit BCD number capture. Almost anything else would be more general purpose, but with a firmware solution you could have several different interfaces implemented: straight binary, I^2C, USB, etc..

If you want a partner in this endeavor let me know and I'll do my best to help. I think it would be of value to everyone who likes the 97.

-Katie

Re: HP-97S Pod Schematic

*Message #8 Posted by **Thomas Chrapkiewicz** on 29 June 2009, 9:47 p.m.,*

in response to message #7 by Katie Wasserman

Thanks. I've done a bit of work with some PICs, so I was considering this approach.

I have found that the 97's that I have are both after date code 1812, so I presume that the pinouts are available. After I determine the operational status of these, I will then open one and study these lines. I have many questions and must do more studying - and this project is certainly not right at the top of my priority list.

Thanks again for your info.

HP 92198A video interface problem

*Message #1 Posted by **Ilyas B.** on 14 June 2009, 7:54 a.m.*

Hello! I've some problems with connection between HP-71b and video interface. After connection I got blinking cursor on the TV screen only. I try to print some symbols but nothing happens, just cursor blink. I tried to send some initialize commands also. I don't know, the problem in HP-IL interface or in Video interface. Somebody can help to recognize this problem and send a little procedure or list of commands to instant connection. With respect, Ilyas

A tribute to the old manuals (again :)

*Message #1 Posted by **Geir Isene** on 14 June 2009, 4:07 a.m.*

Working on a really big statistical analysis program based on the Multiple Curve Fitting by Kolb, I am including analysis on moments, kurtosis and skewness. Having searched for a while on the net, I did'nt find the simple formulas I needed for my program. I remembered that I did indeed see the formulas presented somewhere. I checked the HP-41 stat pac manual - and there it was. This is but one such example of easy formula presentation in our old trusted manuals. The HP-65, HP-67/97 and the HP-41 manuals have helped me out like this many times. Just letting someone know my sentiments here :-)

Re: A tribute to the old manuals (again :)

*Message #2 Posted by **Mad Dog ebaycalcnut** on 14 June 2009, 6:21 a.m.,*
in response to message #1 by Geir Isene

People used to have to think before using computers/calculators and thus spend a little time simplifying formulae analytically before touching a keypad or keyboard due to RAM or CPU constraints.

Nowadays, as powerful as computers are, they can be sloppy with code, and it doesn't matter. It's a shame.

Also, people just used canned stuff and thus need to think even less..

Re: A tribute to the old manuals (again :)

*Message #3 Posted by **Mark Edmonds** on 14 June 2009, 9:09 a.m.,*
in response to message #2 by Mad Dog ebaycalcnut

I agree that losing the understanding of the basics is a sad and undesirable problem.

Ultimately though, the consequence that people write sloppy code and get away with it due to sheer CPU/RAM horsepower is more of an academic problem than a functional problem these days. Programmers aren't paid to write beautiful code. They are paid to write code that gets the results even if it does it in the most ugly manner possible. The customer buys the result, not the method.

Additionally, it can also be argued that with so many ready-made solutions available these days, people can tackle greater problems because they spend less time working out the smaller steps.

So even if the tools are potentially more inefficient, even if the quality of engineering is reduced and even if the solution is an ugly behemoth, if the hardware power makes it work and keep prices down, it is difficult to argue that this is a "bad thing".

It is not a situation I like at all but one that needs to be accepted because certain skills that might have been important twenty years ago simply don't matter any more.

Mark

Re: A tribute to the old manuals (again :)

*Message #4 Posted by **Ron Ross** on 14 June 2009, 9:42 a.m.,*
in response to message #3 by Mark Edmonds

Except that it violates the basic principles of KISS.

And any time someone violates basic rules, trouble can result. If there are two ways to do something, the simpler method is less prone to problems either in errors or later in having to correct errors. Logic flow is much easier to trace in 5 steps vs 50 steps.

Admittedly, I have indulged in poor code on more than one occassion, but have found that my simpler more compact code was always easier to use and modify on future applications.

Re: A tribute to the old manuals (again :)

*Message #5 Posted by **designnut** on 14 June 2009, 10:34 a.m.,*
in response to message #4 by Ron Ross

When I first started using the HP-35 I realized the formulas were written for pen and pencil math and copied from book to book through the years. I rearranged and rethought all the formulas to be amenable to keystroke procedures. I discovered relationships between variables that had not been explored before as they did not have the tools I had. It made a real impact when I found people programming solutions that I could do with a few keystrokes and keep repeating with different values as I had used the t register to supply part of the equation, namely 2PiF. > skills that might have been important twenty years ago simply don't matter any more

Mark, if you're talking about skills such as keeping the code as simple and as clear as possible--not to mention using plenty of good quality comments in the code--then I have to, respectfully, disagree. As most programmers know, code can get extremely complex very quickly. Without some good standards and quality review procedures, even the best programmer can generate code that has hidden flaws. I would maintain that the likelihood of catching those hidden flaws decreases as code becomes more complex.

Sure, the code may work in 99% of the circumstances, but what about that other 1%? Does it really matter? You bet it matters. People can get killed due to hidden flaws in code. I worked many years in testing air traffic control software. If that code does not work correctly 100% of the time, in all different situations, targets may not show up at the right place on the controller's display, or may not show up at all, and lives are at stake. You just cannot take a chance on that code not working 100% of the time.

Regarding the recent tragic Air France crash in the Atlantic, I hope they find the black boxes because that is probably the only way they will know what caused that crash.

Re: A tribute to the old manuals (again :)

*Message #7 Posted by **Antonio Maschio (Italy)** on 23 June 2009, 4:10 a.m.,*
in response to message #6 by Don Shepherd

I generally follow any post on this Forum regarding manuals and documentation, both because I love old HP manuals and because I always hope someone write here "Hp manuals are back!".

But, no surprise, instead of good news, I read reports about inconsistencies, errors and even fun facts.

What I like best, in old HP manuals, is that you find everything you need when you are a beginner and have to learn how to use your calculator, but years after, any manual turns into a book of mathematics, that can be read as it is, with no calculator aside, just to refresh some knowledge and/or for the pleasure of reading it (for instance the HP34C manuals, the HP15C manuals, the HP48g manuals and, I'm sure but have no experience in it, the HP41C and the HP42S manuals).

My little contribute.

Re: A tribute to the old manuals (again :)

*Message #8 Posted by **Mike Morrow** on 23 June 2009, 9:55 a.m.,*
in response to message #7 by Antonio Maschio (Italy)

IMHO, the best manual set *ever* for any calculator is the HP-15C Owner's Handbook with the optional HP-15C Advanced Functions Handbook, both spiral bound. This set is perfection and has never been bettered, not even by HP-41 or HP48 manuals. It's too bad these manuals didn't set the pattern for all later high-end HP calculators.

The HP42S Owner's Manual is acceptable...really not bad overall, especially the early spiral-bound version. Still, it's a very long way from matching the appeal of HP-15C manuals. In fairness, an HP42S manual in the style of the HP-15C manual and as comprehensive with examples and helpful appendices would be huge, due to the many additional features of the HP42S.

Re: A tribute to the old manuals (again :)

*Message #9 Posted by **Antonio Maschio (Italy)** on 23 June 2009, 11:01 a.m.,*
in response to message #8 by Mike Morrow

That's it. I have never read a HP41/42 manual. But I own the original HP15C manual and a printed copy of the advanced manual and I agree with you they are the best (as far as my experience can say).

Missing keystrokes

*Message #1 Posted by **Quan** on 13 June 2009, 3:18 p.m.*

Had it ever been determined the problem with missing keystrokes was hardware or firmware related in the current versions of 17bii+ silver and 35s? Maybe both?

I tried to read through the numerous posts here and other places, and what I got from these were that some have problem and some don't.

I did the simple test suggested in other posted by adding up single digit numbers consecutively, keying them in fast enough to cause the problem to occur on both my 17bii+ silver (CNA751...) and the 35s (CNA833...).

At first I thought the keyboards were the cause since I read so many complaints about their older siblings, but then I tried to punch the number keys only to see if they are registered. Neither calcs fail to record the keystrokes.

I performed these tests with both hands holding the calcs and using my thumbs for quickly entering the numbers and the add key.

The test seemed to fail only when doing (+ - * /). My guess is that they would fail for other function keys as well but since their locations are further away from the number keys, I didn't run the test on them. Somewhere in the sequence of number-add-number, one of these keys was missed or not registered.

I know at the end, as far as the users are concern, the problem is still summarized as annoying missing keystrokes, but I wonder if they could be fixed with a firmware update for the next production run. Or the problem is not that simple.

BTW, the tactile is quite good on the 35s, though not the same as the older 32sii/48sx I have. Also, none of the older brothers have missing keystrokes problem, no matter how quickly I hit the keys. They worked every time.

Re: Missing keystrokes

*Message #2 Posted by **Mark Edmonds** on 13 June 2009, 7:39 p.m.,*
in response to message #1 by Quan

Key weight is just about OK on the 35s but I don't like the key profile in relation to the pivot point, nor the feel of the matt surface. Given how absolutely perfect the keys on the Pioneers and 48 series are, it is such a shame that such an important part of the design has degraded so much.

I haven't read much about the verdict on the new 20b keys - are they similar to the 35s?

Mark

Re: Missing keystrokes

*Message #3 Posted by **Thomas Chrapkiewicz** on 14 June 2009, 12:38 p.m.,*
in response to message #2 by Mark Edmonds

I've recently received a 20b and am VERY let down. It is not even close to the 35s. Further, keypresses result in a scraping/scuffing sound - not certain if the key is rubbing on the edge of the hole or what exactly is causing this. Pressure and throw are also unacceptable. I was expecting the feel to be closer to the 35s.

My 'point of reference' by the way goes back to the 45/65 through the 48 series - all of which I have found to be ideal. I use a 35s and 48 daily.

I certainly hope that newer machines are closer to the 48 or at the very least the 35s.

Regards, TomC

Re: Missing keystrokes

*Message #4 Posted by **John B. Smitherman** on 14 June 2009, 1:17 p.m.,*
in response to message #1 by Quan

Hi Quan. I assume that you are referring to the test in Joel Koltner's post at link

Using Joel's test I'm unable to get the 35s to calculate the correct answer consistently regardless of whether I'm using +, -, x or /. However, if I only enter numbers as fast as I can it makes no mistakes.

I've noticed that when I use the +, -, x or / in a sequence that the "B" symbol comes on in the display which means that the calculator is "Busy". I'm guessing that our missed keystrokes are due to the calculator being busy after certain function keys are used.

My conclusion is that HP should be able to fix this problem with software improvements.

Regards,

John

in response to message #4 by John B. Smitherman

> Quote:
>
> the "B" symbol comes on in the display which means that the calculator is "Busy".

John, it has always been obvious that there is a substantial speed difference between the 35s and the 33s; the 33s being much faster. While I have never seen a definitive reason for this speed difference, we do know that the 35s allows several different formats of data in its registers, such as vectors, complex numbers, etc. Since it takes some processing time for it to figure out what exactly it has in the registers, that always seemed to me to be a possible reason for its slowness relative to the 33s. And this could be a reason for the "B" annunciator.

Re: Missing keystrokes

*Message #6 Posted by **Mark Edmonds** on 14 June 2009, 3:12 p.m.,*
in response to message #5 by Don Shepherd

It is almost as if the 35s doesn't implement a keyboard buffer or an interupt driven handler so it can only detect keystrokes when it is in the main-prompt idle state. Having said that, you can break out of

programs quickly but maybe the On key is a special exception? Lots of armchair guessing here!

One thing for certain:

In the Pioneers and 48s, you can pound away on the keyboard and all the keystrokes get buffered so you can watch them being processed as the calculator catches up.

On the 35S, fast keystrokes whilst the "B" (broken?) indicator is on get missed as well as the extra problem of physical contact failure causing intermittent keystroke loss. Not a happy combination for not a happy calculator.

Mark

Hi Mark!

This was exactly what happen when I ran the test on the old 17bii. On the 42s the results were displayed as soon as the keys were pressed.

The 17bii and the 35s are still very usable. In their case, slow is better.

Brand new HP-35 for sale on eBay $1489

*Message #1 Posted by **jotne** on 13 June 2009, 1:18 p.m.*

If any ha a load of money, they can get a brand new HP 35 for $1489. h**p://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=270407799805

Also, brand new HP-80 for $1289

*Message #2 Posted by **Michael de Estrada** on 13 June 2009, 1:50 p.m.,*
in response to message #1 by jotne

Personally, I don't think they are worth it, since they are both extremely common models. The HP-35 is a version 3, which is the most common HP-35. I own some complete HP calc sets, which are in "like new" condition, and paid far less.

Edited: 13 June 2009, 1:55 p.m.

Re: Also, brand new HP-80 for $1289

*Message #3 Posted by **Ronald P** on 13 June 2009, 3:11 p.m.,*
in response to message #2 by Michael de Estrada

Hi,

Are you sure it is the type 3? As far as I can see on the picture the front label is only Hewlett Packard which would make it a mark 2 to me.

Br

Ronald

Re: Also, brand new HP-80 for $1289

*Message #4 Posted by **Walter B** on 13 June 2009, 3:27 p.m.,*
in response to message #3 by Ronald P

Anyway type 2 is seen often, too. IMO, you can get very nice specimens for far less than offered here.

Ceterum censeo: HP, launch a 43S.

Walter

Re: Also, brand new HP-80 for $1289

*Message #5 Posted by **Michael de Estrada** on 13 June 2009, 3:45 p.m.,*

in response to message #3 by Ronald P

Hard to see, but I think you are correct. The S/N 1230Axxxxx would make it a late production type 2, which would not have any of the ROM bugs. Although not as common as the type 3, the later non-bug type 2 is still relatively common as compared to the type 4 or early type 2 S/N 1143Axxxx with the ROM bug. I'll admit that I have seen several "mint" type 3s, but never a mint type 2. Of course, you can't even compare it to a type 1 RED DOT.

Re: Also, brand new HP-80 for $1289

*Message #6 Posted by **Mark Edmonds** on 13 June 2009, 7:27 p.m.,*
in response to message #5 by Michael de Estrada

Personally I think those prices are totally mad but what worries me is someone could be crazy enough to buy them - and then probably never take them out of the boxes so they never get used! Gloves included :)

Can't blame the seller for trying I suppose.

Out of interest, if one had the money spare for buying a single HP and not including the HP01, which machine would justify that sort of expense? Difficult to rationalise under any circumstances.

Mark

Re: Also, brand new HP-80 for $1289

*Message #7 Posted by **Michael de Estrada** on 13 June 2009, 8:41 p.m.,*
in response to message #6 by Mark Edmonds

For me, the only model that might justify such a price would be an HP35 type 1 RED DOT, assuming it was absolutely new and complete. Also, it would assume the owner had the good sense to remove the battery pack before storage. I paid the original owner of a complete RED DOT $700, and it included all the original accessories, the shipping box, invoice with his name, address and calculator S/N, unopened paperwork, and HP apology letter for the ROM bugs. The calculator is in excellent condition with only minor silver trim wear and display scratches. One key has lost some of its click probably due to a cracked snap dome. So, a perfect RED DOT, assuming such an animal exists, might be worth twice as much.

Re: Also, brand new HP-80 for $1289

*Message #8 Posted by **Reth** on 14 June 2009, 4:34 a.m.,*
in response to message #2 by Michael de Estrada

these are worth as much as someone is ready to pay for them; they are collectors items these days and the market will determine their price.
cheers

Re: Brand new HP-35 for sale on eBay $1489

*Message #9 Posted by **db (martinez, ca.)** on 13 June 2009, 10:15 p.m.,*
in response to message #1 by jotne

disclaimer: i'm not selling this. i'm not buying this. i'm not not planing on selling one or buying another. however; i was curious so i looked up the price here and found that a 35 without the extras this one has, adjusted for inflation, may be worth about 2000 gollies.

i'll be playing golf with a former boss next tuesday, the man who gave me my 35 when he retired. now that i know what these things are going for; i might just "let" John win.

82104A card reader current measurements?

*Message #1 Posted by **Eric Smith** on 10 June 2009, 4:03 p.m.*

Does anyone happen to have measurements of the current consumption of the card reader while reading or writing a card? Or the total of the 41 and card reader?

Re: 82104A card reader current measurements?

*Message #2 Posted by **marais** on 10 June 2009, 4:16 p.m.,*
in response to message #1 by Eric Smith

I only recall a measurement of the motor alone, between 7 and 9mA.

Andreas

Re: 82104A card reader current measurements?

*Message #3 Posted by **Michael de Estrada** on 10 June 2009, 4:48 p.m.,*
in response to message #1 by Eric Smith

I think you can hook up a regulated DC power supply with a DC ammeter in series to the battery terminals to do this. I have done this with a number of calculators, although never with one that included a card reader. You have peaked my interest so maybe I'll try it with one of card reader calcs (HP65/HP67/HP97). I own two HP41CV's but no card reader. I think they all use the same DC card reader motor, so I'd expect comparable current draw.

Michael

Re: 82104A card reader current measurements?

*Message #4 Posted by **Eric Smith** on 10 June 2009, 5:25 p.m.,*
in response to message #3 by Michael de Estrada

Yes, I could measure it myself, if I had a card reader. I don't, and thus the request.

Re: 82104A card reader current measurements?

*Message #5 Posted by **Michael de Estrada** on 10 June 2009, 5:56 p.m.,*
in response to message #4 by Eric Smith

Here's some preliminary info based on a HP65:

Applied voltage at battery terminals - 3.75 Vdc

1) Calculator powered on and idle - display 0.00 - 140 mA

2) Calculator during a card read - 300 mA

3) Net current draw of card reader = 160 mA

Note that the current draw initially peaks as high as 450 mA as the motor does extra work grabbing the card and overcoming initial static friction (sliding friction is less). Also, I imagine this will vary between different card readers based on the tightness of the drive roller. If you are interested, I will test other calculators as I have 3 HP65's, 2 HP67s and a HP97. Also, all of these have been refurbished, so I have no baseline to the original.

in response to message #5 by Michael de Estrada

Thanks for taking those measurements. I'm assuming that the HP-67 measurements will probably be similar, and that will help with another one of my mad scientist projects that I hope to show off at HHC 2010. (I've got a different mad scientist project in the works that I hope to show at HHC 2009.)

Re: 82104A card reader current measurements?

*Message #7 Posted by **Eric Smith** on 10 June 2009, 6:09 p.m.,*
in response to message #1 by Eric Smith

Found the information in the archives, while looking for something else. Summary: 150-200mA continuous (while in operation), with peak current of up to 1A.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv007.cgi?read=13849

Re: 82104A card reader current measurements?

*Message #8 Posted by **Michael de Estrada** on 10 June 2009, 6:20 p.m.,*
in response to message #7 by Eric Smith

Seems consistent with my results.

SpeedUI units bug?

*Message #1 Posted by **Mark Edmonds** on 10 June 2009, 12:58 p.m.*

I recently installed SpeedUI 9.05 but now I find I can't perform left-shift unit conversions in the normal manner. Is anyone with SpeedUI installed able to confirm this please?

Example sequence:

Go to the Unit menu and select Length.

Enter 1_m Press left shift ft to convert to feet. Nothing happens.

To convert, you need to specify the second unit and use the Convert command which is not so nice as the left shift option!

Thanks,

Mark

Re: SpeedUI units bug?

*Message #2 Posted by **Raymond Del Tondo** on 10 June 2009, 4:46 p.m.,*
in response to message #1 by Mark Edmonds

Hello Mark,

many thanks for trying SpeedUI:-)

It seems you have found a bug, or limitation in
the key handling mechanism of the current UI lib.

As far as I can see, this problem is limited
to the leftshift and rightshift direct conversion
functions in the UNITS submenus.

I'll fix this ASAP. It may take some days,
but this issue has highest priority, of course.

Meanwhile, I hope you like the remaining parts of SpeedUI;-)

Regards

Raymond

Re: SpeedUI units bug?

*Message #3 Posted by **Mark Edmonds** on 12 June 2009, 4:50 p.m.,*

in response to message #2 by Raymond Del Tondo

Thanks Raymond :) Yes - enjoying SpeedUI a great deal and I've switched over to it and now use it without even thinking about it.

If anyone is considering SpeedUI, I highly recommend it. Yes, it does have a heavy memory footprint but the speed benefits are huge - totally excellent.

Mark

Help with Free42 + T3 + Ehrling42sm = cut off image?

*Message #1 Posted by **htom trites jr** on 10 June 2009, 9:52 a.m.*

Hi, Thomas (and other Free42 on Palm Tn things.) I've recently acquired a Palm T3 (ver 5.2.1, app ver 4.5.1P) and installed Free42 (decimal, 1.4.49). It works great except that when I put on the Ehrling42sm skin the Graffiti2 area doesn't disappear when the device is opened (and it doesn't shrink when it's closed, but I'm not sure it was supposed to do that?) I tried setting the maximum gif size to 450 and 480 from 256, but that appeared to have no effect. Help?

Re: Help with Free42 + T3 + Ehrling42sm = cut off image?

*Message #2 Posted by **Thomas Okken** on 10 June 2009, 6:11 p.m.,*
in response to message #1 by htom trites jr

You should be able to collapse the graffiti area manually by clicking on the arrow in the bottom right corner of the screen. Once you've done that, the input area will expand and collapse automatically as needed, like when you select a different skin, or when dialog boxes are presented or dismissed.
Whether the graffiti area is expanded or collapsed is a global setting, not application-specific; Free42 will collapse the graffiti area when Ehrling42sm is selected, *if* it was collapsed when Free42 was launched.
Think of it this way: the graffiti area can be in two states, expanded or collapsed. When a fixed-size window is presented, the input area is forced into its expanded state (if the window is square) or into its collapsed state (if the window is tall, like the print-out window), but the user-selected state is remembered, and is restored when a resizable window becomes topmost again. You can tell which state the input area is in by looking for the arrow in the bottom-right corner: if it is missing, the current window is fixed size; if it is present, the current window supports both small and large sizes.
Allowing the graffiti area to expand when a 320x450 skin is selected is a feature, not a bug; this allows the use of graffiti in ALPHA mode.

(The "maximum GIF height" setting specifies the maximum height of the GIF files generated when printer output is captured. This has nothing to do with skins.)

- Thomas

*Message #3 Posted by **htom trites jr** on 10 June 2009, 7:02 p.m.,*
in response to message #2 by Thomas Okken

If I open free42+Ehrling42sm from the expanded Home with no Graffiti input showing, the first thing that shows is "Loading", with the Graffiti area, and then the Ehrling skin under that. The Graffiti close icon is greyed out, with any skin.

*Message #4 Posted by **Thomas Okken** on 10 June 2009, 9:20 p.m.,*

in response to message #3 by htom trites jr

Could you try uninstalling Free42, then hard-resetting the Palm, then reinstalling? Does that make a difference? Also, what does the print-out window look like?

Re: Help with Free42 + T3 + Ehrling42sm = cut off image?

*Message #5 Posted by **htom trites jr** on 10 June 2009, 10:25 p.m.,*
in response to message #4 by Thomas Okken

Currently a grey square (probably half the pixels white, half black); doing a print stack, the four lines at the top are white, T= value, ... X= value, then the rest grey. Keying 1 ^ 2 ^ 3 ^ 4 print stack, those values are now below the others. Hot Syncing ... Hard Reset ... Hot Sync ... problem has not gone away. I'm a little surprised that both Free42 and EatWatch were automaticly reloaded. I'll try deleteing them from both places and trying again tomorrow. Is there some update to the T3 that might change this? The only one I saw was something to do with SD cards, and I'm not using those.

Re: Help with Free42 + T3 + Ehrling42sm = cut off image?

*Message #6 Posted by **Thomas Okken** on 10 June 2009, 10:38 p.m.,*
in response to message #5 by htom trites jr

I believe there is an OS update for the T3, but I don't know what it does - the link to it at palmone.com is broken.
So, the arrow is disabled on the print-out screen, too (disabled or missing?). Strange, it's like the OS does recognize that the main screen is resizable, but for some reason it refuses to collapse the graffiti area. I'll have to look into the API docs to check if that version of the OS requires any special treatment. I thought that the dynamic input area was introduced in 5.3; I may be doing something wrong with the OS capability checks.

Feel free to contact me off-line if you want to continue this discussion outside of the forum. If hard-resetting and reinstalling doesn't fix this, this may require some actual debugging, and that could become a bit boring for the rest of the forum participants.

- Thomas

*Message #7 Posted by **htom trites jr** on 11 June 2009, 5:41 p.m.,*
in response to message #6 by Thomas Okken

Will do. I'm sure it's something about the differences between the T and T3 and T5, we just have to figure out what it is. We'll report back when we succeed.

Free42 runs fine on the very old HandSpring Visors, btw.

Fixed; directions here

*Message #8 Posted by **htom trites jr** on 15 June 2009, 2:11 p.m.,*
in response to message #7 by htom trites jr

Fixed, unpublicized Palm T3 software update.

There are a pair of files (AppSlipRotate.prc and StatusBarLib.prc) distributed with several apps that are for "!!! T3 only !!!"; upon installing this pair prior to installing

Pimlico's DateBK6 which requires them on a T3, the screen now properly shows the shrink graffiti icon, and it works as expected.

Thomas, you should probably put a note in the install docs for Free42 that these are needed for Tungsten T3 use.

Re: Fixed; directions here

*Message #9 Posted by **Thomas Okken** on 15 June 2009, 9:37 p.m.,*
in response to message #8 by htom trites jr

That's good to hear -- thanks for figuring this out!
Do you know if those two prc files are freely redistributable? If so, I'd like to include them in Free42PalmOS.zip, or maybe offer them as a separate download at free42.sourceforge.net.

Re: Fixed; directions here

in response to message #9 by Thomas Okken

Quoting from http://fitaly.com/fitalyvirtual3/readthisfirst.htm

---

T3 Dynamic Input Area libraries

FitalyVirtual requires the presence of two libraries — AppSlipRotate.prc and StatusBarLib.prc — for the Dynamic Input Area of the Tungsten T3 to work properly. Installing these libraries will override built-in ROM libraries and will require that you do a Reset at the end of the Hotsync. (This is normal and does not cause any data loss. It only occurs once when you install these libraries.)

These libraries are provided by PalmOne who endorses their use. You may find other third-party applications also asking you to install these same libraries but you only need to do it once. Note that reinstalling them does no harm: the Hotsync log will include a message telling you that they are already present. Finally, if you attempt to enable FitalyVirtual without having installed these libraries, enabling will fail and you will get a warning message asking you to install them.

These libraries should never be installed on a T5 or a LifeDrive.

The other places I've seen the files have similar messages; provided by PalmOne, needed on T3, dire results if they are installed on any other Palm, or if they are not installed together. Finding "official" news about these is difficult, at least for me. If you have access to the old Palm developer docs you might find some info there.

I hot-synced, dragged the two into the install box, hot-synced, got a soft-reset, opened Free42, and it was working.

---

http://www.handshigh.com/html/tungstent3.html

http://www.red-mercury.com/t3.html

are two other sites with similar info. Seems the T3 shipped without something, and for some reason they didn't put it into the flash update that came along later.

Edited: 16 June 2009, 1:55 p.m.

Re: Fixed; directions here

*Message #11 Posted by **Thomas Okken** on 16 June 2009, 6:01 p.m.,*
in response to message #10 by htom trites jr

That agrees with a few other web sites I found -- simply googling for AppSlipRotate.prc turns up several sites that have these prc files for the T3. OK, since those files are pretty small, I'll just add them to the Free42PalmOS.zip package, with an additional README file to explain what they're for.

Re: Help with Free42 + T3 + Ehrling42sm = cut off image?

*Message #12 Posted by **Les Wright** on 10 June 2009, 11:26 p.m.,*
in response to message #1 by htom trites jr

Sorry you are having trouble with this. I use Free42 on a Palm TX (indeed, Free42 was the main reason I got that particular Palm a few years ago) and that skin is my skin of choice. Never any problems.

I am suspecting you have some specific issue with your Palm model or the OS. I hope you you sort it out. Free42 really works well on Palms, and the flash card storage makes program I/O a piece of cake. Free42 is the only reason I keep my old Sony Clie and Palm TX in commission.

HP-15C Mini-Challenge: Magic squares !

*Message #1 Posted by **Valentin Albillo** on 10 June 2009, 6:28 a.m.*

Hi all:

Since these next four days will be a loooong weekend here in Madrid, I feel like concocting a brand new ***HP-15C Mini-Challenge***™ for you to try, namely:

A **magic square** is a square arrangement of numbers such that *each* row, column, and main diagonals add up to the *same* value, say **K**, which is called the magic square's *constant*.

Now let's say you're given an *arbitrary 3rd order magic square* which has some (not given) value **K** as its constant. You must write a routine which takes the given magic square as its input and then computes the elements of *another* magic square of the same order but having $\mathbf{K^3}$ as its constant instead.

You don't need to include any input or output procedures in your routine, it may assume that the given magic square is already stored in memory in any way you find convenient (such as sequential numeric registers, or a matrix, or whatever) and it just needs to *compute* the elements of the new magic square and leave them stored in memory, no need to actually output them to the display.

For example, if given the following magic square:

```
 71   89    17
  5   59   113
101   29    47
```

which has **K = 177** (all rows, columns, and main diagonals add up to **177**) you must compute and store the elements of another magic square of the same order but having **K** = 177^3 = **5,545,233**.

You must optimize for program length, the shorter the better. Not counting label and return, it can be done in the number of steps corresponding to a very famous integer traditionally considered having to do with luck (whether good or bad is up to you ...), and further an additional step can be shaved off with one little proviso.

I'll provide my solution and comments next Monday or so, maybe earlier if someone stumbles upon it. Have a nice weekend and all that, and

Best regards from V.

Edited for typos

Edited: 10 June 2009, 6:39 a.m.

Re: HP-15C Mini-Challenge: Magic squares !

*Message #2 Posted by **Eamonn** on 10 June 2009, 11:13 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

Great to see another 15c Mini challenge.

Here is my solution - 4 steps excluding the LBL and RTN. The solution assumes that the magic square is stored in a Matrix and that the Matrix descriptor is in the X-register before being called.

```
LBL A
ENTER
f MATRIX 7
x^2
*
RTN
```

It could be reduced to 3 steps if the matrix descriptor is in both the X and Y registers before the routine is called. In this case the first ENTER can be removed.

The only caveat is that it does not work for magic squares which have negative entries for some of the elements.

Best regards,

Eamonn.

Re: HP-15C Mini-Challenge: Magic squares !

*Message #3 Posted by **Didier Lachieze** on 10 June 2009, 12:45 p.m.,*
in response to message #2 by Eamonn

Great to see a mini challenge I can solve !! :-)

My solution, assuming that the magic square is in matrix A: 7 steps excluding LBL and RTN, should work for all magic squares.

```
01 LBL A
02 f RESULT B
03 RCL MATRIX A
04 ENTER
05 *
06 f RESULT C
07 RCL MATRIX A
08 *
09 RTN
```

Result is in matrix C and is different from the one obtained with Eamonn solution.

Edited: 10 June 2009, 12:47 p.m.

Re: HP-15C Mini-Challenge: Magic squares !

*Message #4 Posted by **Eamonn** on 10 June 2009, 7:57 p.m.,*
in response to message #3 by Didier Lachieze

Hi Didier,

I like your solution. I was not aware that the third power of a magic square matrix is itself a magic square matrix with a magic sum that is the third power of the magic sum of the original matrix. Very nice result.

I played around with some more ideas and here is another seven step solution (not including the LBL

and RTN) that I believe solves the challenge as stated and generates a solution that is different to the earlier posted solutions.

This solution requires that the original magic square be stored in the 3x3 Matrix A, with the center square stored in A(1,1). The other values from the original square can be stored in any order in A that is convenient for the user.

```
LBL A
f MATRIX 1
RCL A
3
y^x
9
*
STO MATRIX A
RTN
```

The result is returned in the Matrix A, with the very magic property that the new magic square can be read from Matrix A in conventional fashion (i.e. the center of the new magic square ends up in A(2,2), the top left value is in A(1,1), etc. This solution should work for all 3x3 magic squares, even those with a mix of positive and negative values, always returning a square in which all the rows and columns and the main diagonals sum to the cube of the magic number of the original square.

Best regards,

Eamonn.

Re: HP-15C Mini-Challenge: Magic squares !

*Message #5 Posted by **Didier Lachieze** on 10 June 2009, 9:53 p.m.,*
in response to message #4 by Eamonn

Well, I realize that I've been a bit quick to jump to a solution. I found it quite intuitively and I've verified it for several magic squares but I don't have a complete demonstration ...

Here are some explanations: let's take two 3x3 magic squares X, constant K and Y, constant L

$$X = \begin{pmatrix} a, & b, & c \\ d, & e, & f \\ g, & h, & i \end{pmatrix} \qquad Y = \begin{pmatrix} r, & s, & t \\ u, & v, & w \\ x, & y, & z \end{pmatrix}$$

then

$$X*Y = \begin{pmatrix} ar + bu + cx, & as + bv + cy, & at + bw + cz \\ dr + eu + fx, & ds + ev + fy, & dt + ew + fz \\ gr + hu + ix, & gs + hv + iy, & gt + hw + iz \end{pmatrix}$$

the sum of the first column is:

$$(a+d+g)r + (b+e+h)u + (c+f+i)x = Kr + Ku + Kx = K(r+u+x) = K*L$$

and you can see in the same way (using only rows and columns constant property) that the result is the also K*L for all rows and columns.

However I've not found a way to prove it's the same for the main diagonals ... btw it's not true as on a few examples I've tried the diagonal constant is not K*L.

If we suppose that the rows and columns constant of X*Y is K*L then for X*X it's K^2 and for X*X*X it's K^3; and strangely this last one is also true for the diagonals for the different magic squares I've tried so far.

So I still have to prove that the constant for the diagonals of X*X*X is K^3...

Now, to add something else to this incomplete and potentially wrong solution, and as Valentin has expressed previously his interest in the old Sharp Pocket Computers, here is a program for the Sharp PC-1403 using the Matrix functions entry points described earlier on this forum in this thread:

The Sharp PC-1403 uses 3 matrix: X and Y for calculation, M for memory.

The program below assumes that the magic square is in X and return the result of X^3 in X.

```
10:"A":CALL 26191:REM X->M
20:CALL 26186: REM X^2->X
30:CALL 26163: REM X<>Y
40:CALL 26199: REM M->X
50:CALL 26119: REM X*Y->X
60:PRINT X(0,0)+X(1,1)+X(2,2),X(0,2)+X(1,1)+X(2,0)
```

Example:

```
CALC mode
SHIFT down                  'to enter in Matrix mode
3 ENTER 3 ENTER             'to dimension matrix X as 3x3
 71 ENTER 89 ENTER  17 ENTER 'enter first row
  5 ENTER 59 ENTER 113 ENTER 'enter second row
101 ENTER 29 ENTER  47 ENTER 'enter third row
3 ENTER 3 ENTER             'to dimension matrix Y as 3x3
ENTER (9 times)             'until you get MATRIX OPERATIONS on the display
BASIC mode
DEF A                       'to run the program
```

It ends by printing the constant for the 2 main diagonals, so you can verify it's K^3. For the example above it shows:

```
5545233.       5545233.
```

Edited to add some precisions to the explanations.

Edited: 11 June 2009, 3:25 a.m.

Re: HP-15C Mini-Challenge: Magic squares !

*Message #6 Posted by **Eamonn** on 12 June 2009, 1:18 p.m.,*
in response to message #5 by Didier Lachieze

Hi Didier,

Section 8 of the book "Mathematical Explorations with MATLAB" deals with Magic squares. Part of exercise (v) on Page 104 is to prove the the product of an odd number of magic squares is also a magic square. The relevant sections are viewable in Google books (here is a link: Mathematical Explorations with MATLAB).

So, it appears that your solution is good.

Best regards,

Eamonn.

Re: HP-15C Mini-Challenge: Magic squares !

*Message #7 Posted by **Didier Lachieze** on 12 June 2009, 5:42 p.m.,*
in response to message #6 by Eamonn

Eamonn, thanks for the link, I will check it. I've prepared my solution below before seeing your post so I'm posting it anyway as it reflect my findings.

Introduction

To provide some formal content to my 15C program submitted above, here is a complete demonstration showing that if **M** is a 3x3 magic square having **K** as its constant, then $\mathbf{M}^3$ is also a magic square with $\mathbf{K}^3$ as its constant.
I suppose there are some smarter and nicer demonstrations as mine is a bit on the "brute force" side, being based on the direct calculation of each term of $\mathbf{M}^3$.

The trick

After several tries, I've come to the conclusion that I needed to take advantage of the magic square properties to reduce the number of variables to a minimum.

As I was manipulating 3x3 magic squares I've found an interesting property:

```
    ( r, s, t )
M = ( u, v, w )
    ( x, y, z )
```

being a magic square with K as it's constant, we can write using the rows properties:

```
3K = (r+s+t) + (u+v+w) + (x+y+z)
```

Rearranging the terms to use also the diagonals properties we have:

```
3K = (r+v+z) + (x+v+t) + (s+u+w+y) -v
3K = (r+v+z) + (x+v+t) + (s+v+y -v + u+v+w -v) -v
3K = (r+v+z) + (x+v+t) + (s+v+y) + (u+v+w) -3v
3K = 4K -3v
3v = K
```

So: **v = K/3**

This tell us one thing about 3x3 magic squares: their constant is always a multiple of 3.

Having a direct relation between the magic square constant **K** and the center value, we can now write **M** differently:
let's name **a** the central value and use it as a reference, expressing each value as **a** + or - something:

```
    ( a+b   a-b-c  a+c   )
M = ( a-b+c   a    a+b-c )
    ( a-c   a+b+c  a-b   )
```

Now we have an expression of **M** using only the central value **a** (which is equal to one third of the constant **K**) plus 2 others parameters **b** & **c** that can be positive or negative and are sufficient to completely define the magic square.

Calculating M^2

If we calculate **M*M**, for the first element (top left) we have:

$$
\begin{array}{lll}
(a+b)(a+b) & a^2 + ab + ab + b^2 \\
+ (a-b-c)(a-b+c) & = + a^2 - ab + ac - ab + b^2 - bc - ac + bc - c^2 \\
+ (a+c)(a-c) & + a^2 - ac + ac - c^2 \\
 & = 3a^2 + 2b^2 - 2c^2
\end{array}
$$

after calculating all terms we get the following matrix:

$$
M*M = \begin{pmatrix} 3a^2+2b^2-2c^2 & 3a^2-b^2+c^2 & 3a^2-b^2+c^2 \\ 3a^2-b^2+c^2 & 3a^2+2b^2-2c^2 & 3a^2-b^2+c^2 \\ 3a^2-b^2+c^2 & 3a^2-b^2+c^2 & 3a^2+2b^2-2c^2 \end{pmatrix}
$$

We can see that for $\mathbf{M^2}$ each row and column as well as the diagonal bottom left to top right has the same sum which is $\mathbf{9a^2 = K^2}$ (remember: **a = K/3**) , but the remaining diagonal (top left to bottom right) has a different sum so $\mathbf{M^2}$ is not a magic square.

Calculating M^3

Now let's calculate $\mathbf{M^2*M}$.

First, what's the center value of $\mathbf{M^3}$:

$$
\begin{array}{lll}
(3a^2-b^2+c^2)(a-b-c) & 3a^3 - ab^2 + ac^2 - 3a^2b + b^3 + bc^2 - 3a^2c + b^2c - c^3 \\
+ (3a^2+2b^2-2c^2)a & = + 3a^3 + 2ab^2 - 2ac^2 \\
+ (3a^2-b^2+c^2)(a+b+c) & + 3a^3 - ab^2 + ac^2 + 3a^2b - b^3 - bc^2 + 3a^2c - b^2c + c^3 \\
 & = 9a^3 \quad \text{(we can simplify a lot of terms above)} \\
 & = 9(K/3)^3 \\
 & = \mathbf{K^3/3}
\end{array}
$$

That starts to look interesting as we want to prove that $\mathbf{M^3}$ is a magic square with $\mathbf{K^3}$ as constant...

Let's continue with all terms (it took me some time to get it right ...) and we have:

$$
M^3 = \begin{pmatrix} 9a^3+3b^3-3bc^2 & 9a^3-3b^3+3c^3+3bc^2-3b^2c & 9a^3-3c^3+3b^2c \\ 9a^3-3b^3-3c^3+3bc^2+3b^2c & 9a^3 & 9a^3+3b^3+3c^3-3bc^2-3b^2c \\ 9a^3+3c^3-3b^2c & 9a^3+3b^3-3c^3-3bc^2+3b^2c & 9a^3-3b^3+3bc^2 \end{pmatrix}
$$

If we add up each row, column or diagonal we can see now that $\mathbf{M^3}$ is a magic square with a constant of: $27a^3 = 27(K/3)^3 = \mathbf{K^3}$, so we are done !!!

Conclusion

As a conclusion, many thanks to Valentin for crafting the Mini-challenges. This one has been for me both challenging and rewarding as I've been able to solve it practically with the requested 15C program based on my intuitions and theoretically with a formal demonstration. Overall this was an excellent brain exercise !

Edited to fix a few typos.

Re: HP-15C Mini-Challenge: Magic squares !

*Message #8 Posted by **Valentin Albillo** on 16 June 2009, 8:26 a.m.,*
in response to message #7 by Didier Lachieze

Hi, Didier:

Thanks for your appreciation and congratulations for your correct solution and excellent further exposition.

My original solution was the following 7-step HP-15C code:

```
RCL MATRIX A
ENTER
ENTER
RESULT B
 *
RESULT C
 *
```

which could be shortened by one step by making A one of the result matrices (instead of B or C) and taking advantage of the fact that after a memory reset the A matrix is the default result matrix, but that's too specific and contrived and would work just once, unlike the general, repeatable 7-step solution above.

When applied to

```
6  1  8
7  5  3   K = magic constant = 15
2  9  4
```

the above code quickly produces:

```
1101  1221  1053
1077  1125  1173    K2 = magic constant = K^3 = 15^3 = 3375
1197  1029  1149
```

as required.

Just in case you're interested in trying some more of my HP-related challenges, here you are, some links to most of the ones I posted to this forum in the past years, complete with all contributions and full commented solutions:

Re: HP-15C Mini-Challenge: Magic squares !

*Message #10 Posted by **Didier Lachieze** on 16 June 2009, 12:08 p.m.,*
in response to message #8 by Valentin Albillo

Hi Valentin,

I find your original solution nicer than mine, even if they do the same thing in the same number of steps. Yours is more elegant with a similar structure for the two operations and looks simpler.

This is, I suppose, the Zen of RPN coding:

1) Operand:

```
RCL MATRIX A
ENTER
ENTER
```

2) First operation:

```
RESULT B
 *
```

2) Second operation:

```
RESULT C
 *
```

While my solution is mixing data, operations and result assignments and at the end seems more complex and less elegant (at least to me):

```
RESULT B
RCL MATRIX A
ENTER
*
RESULT C
RCL MATRIX A
*
```

... a lot could be learned from even the smallest code.

The list of your HP-related challenges is amazing ! I've not realized there were so

many as I'm quite a newbie on this forum (I've been hooked again on HP calculators last year when I got a 11C and a 35s, nearly 30 years after my 41C).

HP-41 w/NoV-64: Funny module conflict

*Message #1 Posted by **Geir Isene** on 9 June 2009, 10:55 a.m.*

I have the following setup active in NoV-64 (XROM numbers in parenthesis - verified by HEXEDIT addresses X000):

```
ROM:
  Bank1 (Regular):
    ICEBOX (4)
    CCD OS/X (5)
    (empty - cater for 8K modules)
    (empty - cater for 8K modules)
RAM:
  Bank1 (Math):
    (Hepax ram)
    (Hepax ram)
    SandMath III L (3)
    SandMath III U (2)
```

The other ROM-bank and the other 3 HEPAX RAM banks give me no trouble - but the above gives a loss of functionality: The additional characters available through the CCD OS/X are gone. When I Use the following setup (HEPAX RAM bank 0 active, the characters are appearing as they are supposed to:

```
ROM:
  Bank1 (Regular):
    ICEBOX (4)
    CCD OS/X (5)
    (empty - cater for 8K modules)
    (empty - cater for 8K modules)
RAM:
  Bank0 (Time):
    (Hepax ram)
    (Hepax ram)
    (Hepax ram)
    (Hepax ram)
```

Why is this?

Edit: I even tried to change the XROM numbers of SandMath III since that module is the only difference between the two setups - but the problem persists; No access to CCD's special characters (when Flag 27 is cleared).

Edited: 9 June 2009, 11:07 a.m.

*Message #2 Posted by **Raymond Del Tondo** on 9 June 2009, 3:12 p.m.,*
in response to message #1 by Geir Isene

Hi,

I don't know what the SandMath does, but maybe that ROM also catches key strokes in ALPHA mode.
You could try to load the CCD OS/X into a lower page than the SandMath.

Do the docs of the SandMath mention any extended keyboard features?

Symbolic integration

*Message #1 Posted by **Valentin Albillo** on 9 June 2009, 9:37 a.m.*

Hi all,

Quite an interesting subject, most especially for small handhelds with symbolic integration capabilities.

For those who don't know about it, this on-line symbolic integrator might be of interest to try some cases and check the results and capabilities against those of your favourite handheld:

Wolfram Online Integrator

I suggest you try this example I've concocted, to see why many times straight numerical approximations are far more preferable than using an exact symbolic expression, even if it exists in terms of elementary functions:

1/(1+x^1024)

You won't get a "Traditional Form" so try either the "Input Form" or "Output Form" and be astonished at the result. How does your handheld fare with my example ?

If it doesn't fare, try reducing the exponent from 1024 to 512, 256, 128, 64, ... , until it can cope.

Another nice example to try, this time resulting in no trigonometrics at all, is:

1/(1+x^(1/4096))

Again, marvel at the result's length and complexity, most especially when compared to those of the input, a mere 16-character in length.

Best regards from V.

If I understand correctly, the 35s doesn't do symbolic integration.

Am I wrong?

Re: Symbolic integration

*Message #4 Posted by **Egan Ford** on 9 June 2009, 4:23 p.m.,*
in response to message #2 by Jorge I. Rodriguez (Pasadena, CA)

Your 50g will run out of memory. It does work on another handheld. The iPhone.

Re: Symbolic integration

*Message #5 Posted by **Jorge I. Rodriguez (Pasadena, CA)** on 9 June 2009, 4:34 p.m.,*
in response to message #4 by Egan Ford

You are right the HP35s does not do symbolic integration, but I can try putting limits on the integrand and do numerical integration to see if the answer matches what HP-50g gives or what Mathematica gives.

Re: Symbolic integration

*Message #6 Posted by **Karl Schneider** on 10 June 2009, 1:29 a.m.,*
in response to message #1 by Valentin Albillo

Welcome back, Valentin!

For integrands of the form

```
1/(1+x^n)
```

those who remember their calculus should be able to easily solve the integral for n = 1 or 2. For n = 3 or n = 4, looking up the closed-form solutions of cubic and quartic equations, substituting the roots into the denominator, expressing the integrand as a sum of partial fractions, and performing the elementary integrations should provide the answer. However, this gets tedious right away.

For the symbolic solutions for n > 4, I suppose that Mathematica is doing something like the following procedure found at the following link:

http://mathforum.org/library/drmath/view/53784.html

With n as an integer power of 2, there might possibly be simplifications, but maybe not. The sin, cos, sec, and csc terms are present for every solution with n >= 7, as far as I looked.

The number of terms in the integral generally equals the order of the polynomial, as might be expected from the basic approach described above. Exception: When one term is a scalar multiple of $\tan^{-1}(x)$, as with n = 2, 6, 10, ...(?), there are only n-1 terms in the solution.

Re: Symbolic integration

*Message #7 Posted by **Marcus von Cube, Germany** on 10 June 2009, 1:55 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

I could not resist and put it into Derive 6. At least, Derive is capable of solving the integral. On my iMac (with Windows XP in a Parallels virtual machine), processing time was 276 seconds!

I'll probably check with the TI Nspire later.

Edit: I'll probably leave the Nspire alone. ;) I'm just trying with the Nspire software on my iMac which is busily working on the n=16 case for a few minutes now without a result so far. The same case is solved by Derive almost instantaneously, even while the Nspire software is eating resources.

New Iphone & Itouch calculator - Access RPN and Active RPN

*Message #1 Posted by **Nigel Bamber** on 9 June 2009, 8:22 a.m.*

A new application has been uppoaded to the App Store. Access RPN is free and and shows how RPN works by showing the numbers moving up/down the stack.

It is an intuitive application and very appealing to use.

Active RPN has more functions, programming ability and costs, but I haven't tried this yet.

Access RPN and Active RPN webpage

Nigel

HP cassette mass storage device...

*Message #1 Posted by **Geoff Quickfall** on 9 June 2009, 1:18 a.m.*

Just wondering, the manual states that the device can record the calculators full statis including memory modules, flags, registers and display.

The term memory modules would apply to the HP 41C with up to a quad memory module or the CV and CX with the standard 319 registers.

Is there anyway to use the WRTA command to record the state of the extended memory?

I have a lot of programs and ascii files residing in my double ex memory module that are never included in the write all WRTA command be it the 9114B or the cassette storage device. Instead the backups reside on magnetic cards and are transferred to extended memory from the card to main memory and from main memory to extended via a READ and WRITE program.

Cheers, Geoff

I will put the Extended IL ROM in the Clonix.

Cheers, Geoff

Re: HP cassette mass storage device...

*Message #4 Posted by **Eric Smith** on 9 June 2009, 3:05 a.m.,*
in response to message #1 by Geoff Quickfall

No, unfortunately WRTA can't be used to write extended memory to HP-IL mass storage devices. You have to transfer the XM files individually. For ASCII files, the SAVEAS and GETAS functions can be used to transfer between XM and mass storage. HP didn't provide any easy functions to do that for other kinds of files.

The third-party "Extended IL" ROM by SKWID INK apparently has functions for file transfers between XM and mass storage. Not to be confused with HP's 82183A Extended IO ROM, which is entirely different.

Re: HP cassette mass storage device...

*Message #5 Posted by **Ángel Martin** on 9 June 2009, 3:38 a.m.,*
in response to message #1 by Geoff Quickfall

I believe also the PANAME rom includes some functions to Write/Read the whole XMemory at once, but I'll have to dig it out to be sure about it.

I *vaguely* remember looking at such functions MCODE a few years ago, but didn't fully succeed in copying them to the SandBox.

Best, ÁM

Re: HP cassette mass storage device...

*Message #6 Posted by **Geoff Quickfall** on 9 June 2009, 11:18 a.m.,*
in response to message #5 by Ángel Martin

Thanks all

I didn't think there was an ability without synthetics or third party. I just thought, maybe I was missing something.

I use a program with synthetics by Kieth Jarrett which work for magnetic cards but not for cassette storage.

I will check the Paname module and see if that will load into the clonix and the Extended IL" ROM. At the moment it is not a tedious job when the machine crashes!

Cheers, Geoff

Re: HP cassette mass storage device...

*Message #7 Posted by **PeterP** on 10 June 2009, 1:13 a.m.,*
in response to message #6 by Geoff Quickfall

geoff, IIRC, there are synthetics programs which basically wrap the while xm registers into one large ASCII file which then can be written to hpil. I'm away from home this week so I can't look it up but maybe someone else can confirm/correct me...

Cheers

Peter

Re: HP cassette mass storage device...

*Message #8 Posted by **Raymond Del Tondo** on 10 June 2009, 4:06 a.m.,*
in response to message #7 by PeterP

Or as an alternative, you could change the file type of the individual XM files to ASCII/TEXT using the CCD module POKE,
or some synthetic method, and then simply save those file(s) to HP-IL using SAVEAS.

Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #1 Posted by **Les Wright** on 9 June 2009, 12:53 a.m.*

Click here

Hopefully, version 1 owners will see it in the App Store soon.

A programmer acquaintance compiled the source for me and I have been able to play with version 2 in advance. I/O support with a web interface, somewhat different from i41cx+, is now in place. Shifted label font is a little bigger. There is ability to display a four line stack, to rotate the stack with a swipe of the finger, and to scroll program listings with finger swiping. And the overall speed seems much improved--I noticed in some of my iterative programs v. 1 was much slower. Great little app. Alas, unlike with i41cx+, there is no way to export or forward printer output as text or images. Maybe in a future upgrade?

I hear that Thomas Okken's Free42 "original" is actively in the works and we should see it up on the App Store in a few weeks.

Great little simulators these are. I love i41cx+ for it's complexity and fidelity to the beloved 41CX original. But for importing and running 41C programs with greater speed and accuracy, these 42S simulators have a great edge.

Les

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #2 Posted by **Pal G.** on 9 June 2009, 1:06 p.m.,*
in response to message #1 by Les Wright

Les (or Thomas),

Can someone clear up how many Free42 ports are eventually going to be on the iTunes App Store? A day before this thread was started, I purchased the Byron Forster version, and now there is a mention of Thomas' "original" version. And an old post mentions a Susan Mackay version.

I thought these folks were assisting Thomas with the iPhone port, and that the Foster version is the official Free42 release.

Thanks,
PG

Edited: 9 June 2009, 1:07 p.m.

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #3 Posted by **Thomas Okken** on 9 June 2009, 2:56 p.m.,*
in response to message #2 by Pal G.

Quote:

> Can someone clear up how many Free42 ports are eventually going to be on the iTunes App Store?

Short version: at least one, probably two, possibly more.

Long version: Byron made some design choices in his iPhone port that are different from how I wanted to approach it, and I started working on my own version as a result. Mostly these have to do with the UI; Byron's skin code, in particular, is completely different from how the existing ports work, while my own iPhone port is basically a port of the Motif version.

Both approaches have their benefits: Byron's code lends itself better to nifty UI enhancements, such as 4-line display, and displaying menus on the keyboard. My code does not support these features, but it does support user-selectable skins, which Byron's does not.

There will be other differences in the UI as well, with my version being closely modeled after the PalmOS version. In other respects, I expect both versions will converge in terms of functionality, so you will have the same functionality offered on all the other platforms (including print spooling, which is the only thing missing from Byron's version 2.0) -- regardless of whose port you may be using.

For the time being, of course, my version is vaporware; I have a couple of weekends of coding left to do, and I haven't had the time to work on it lately. Hopefully I'll be able to submit the first release before the end of the month, but I can't make any promises.
Byron's version, on the other hand, is out now, and his next version (2.0) is in the submission pipeline at the iTunes App Store as we speak; it addresses the two most common complaints about 1.0, namely, a facility to import and export "raw" program files, and an improved skin with larger shifted key labels, and it also has the nifty UI enhancements mentioned above.

Susan Mackay's version is not available at the app store, and Susan has no plans to publish it; she shared her code with Byron and me, and some of it was used in Byron's version.

Perhaps there will be additional Free42 ports for the iPhone sometime -- part of the fun of publishing open source software is that you never know. :-) I wouldn't count on it, though, since porting Free42 is more work than you might think, and porting it to a hand-held platform, with its constraints on the UI, is harder still.

- Thomas

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #4 Posted by **Les Wright** on 13 June 2009, 7:03 a.m.,*
in response to message #3 by Thomas Okken

Thanks for the info, Thomas.

Byron's version 2 still isn't up on the App Store almost two weeks after submission. If you get your initial submission in during the summer, count on a similar delay. It's a shame that Byron's revision is taking so long to show up, because I suspect that fans who went nuts for v. 1 will really approve of the improved skin and speed, program I/O, and UI enhancements of v. 2.

FYI, the "R/S sometimes won't stop running program" bug persists in Byron's version 2. I think he removed some "pause" code to improve speed. Fortunately, for practical purposes this isn't a big deal, and it is hoped the problem will go away entirely when iPhone OS 3 is out.

Les

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #5 Posted by **Thomas Okken** on 14 June 2009, 9:53 a.m.,*
in response to message #4 by Les Wright

The problem with R/S sometimes being ignored is pretty frustrating, but it goes back to poor design of the iPhone's event handling API. Some background:

The Free42 core was designed to be single-threaded; it has to be, in order to work on operating systems without thread support, like PalmOS.

In a single-threaded calculator simulator, you have to somehow be able to execute programs, while still keeping the UI responsive -- it should still respond to mouse and keyboard events, repaint requests, etc. Most environments support this by providing a function that lets a program poll the event queue without actually invoking any event handlers: PeekMessage() in Win32, XtAppPending() in the X toolkit, g_main_context_pending() in GTK, EvtEventAvail() in PalmOS. While executing a program, Free42 simply calls the appropriate event queue polling function after finishing each program line; polling the event queue is a very cheap operation, so programs can run with little overhead, and still respond very quickly to events.
When Free42 detects that an event is pending, it returns control to the application framework. In order to be able to resume program execution once the application framework is done handling events, Free42 needs some way to schedule a function call to take place when the framework is otherwise idle; in Win32 and PalmOS, this is easy because the main event loop is part of the application itself, so it is a simple matter of inserting the call to run the program there; in more modern, callback-based environments like the X toolkit and GTK, you can use XtAppAddWorkProc() and g_idle_add(), respectively.

The iPhone makes this type of programming style difficult to impossible. First, there is no facility for peeking ahead in the event queue, so a single-threaded program has no choice but to drop out of the program execution loop at regular intervals and return to the application framework.
But it gets worse: in order for program execution to resume once the application framework has finished handling events, Free42 again needs some mechanism to schedule execution, but the only available mechanism is performSelectorOnMainThread, which will execute its target at the earliest opportunity, instead of being deferred until the event queue is empty. There is no mechanism for scheduling any activity to take place if and only if there are no pending events.

Byron has so far tried to work around the iPhone API limitations using straightforward hacks like inserting small delays in which the event queue can be emptied; in the latest code, this is working pretty well; you really have to try hard to get it into a state where the keyboard becomes unresponsive, and even when that does happen, it is easier to get out of that state than it was before. Still, the situation is not ideal, and stupid programs like LBL 00 BEEP GTO 00 can still cause the problem to occur fairly easily.
In my version, I chose a different approach, using a secondary thread for running programs, while the main thread stays in control of the UI and thus never becomes unresponsive. This has proven to be robust, but the code is very hairy, and the overhead from thread-to-thread context switching is considerable.

Byron has indicated to me that iPhone OS 3.0 has an improved event handling API, and that he thinks we'll be able to do Free42 "right" with it. I haven't studied the 3.0 APIs yet myself, so I can't confirm this, but, assuming the shortcomings of the existing API have indeed been remedied, I'd expect a point release to take advantage very quickly.

Of course "very quickly" can mean "one day for us to make the code changes, then two weeks or more of being stuck in the iTunes App Store submission queue". Such is life in iPhone developer

land.

- Thomas

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #6 Posted by **Eric Smith** on 14 June 2009, 6:59 p.m.,*
in response to message #5 by Thomas Okken

I have generally found that even on platforms that have decent event management APIs, it still tends to work best to run simulations in a separate thread from the UI thread. (Assuming, of course, that the platform supports threads.)

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #7 Posted by **Thomas Okken** on 15 June 2009, 9:11 a.m.,*
in response to message #6 by Eric Smith

> Quote:
>
> I have generally found that even on platforms that have decent event management APIs, it still tends to work best to run simulations in a separate thread from the UI thread.

I'm sure that's true, but not all simulations are created equal. :-) In particular, simulating a calculator at the user-code level is a bit different than simulating it at the hardware level. One advantage of the former is that you always know exactly what state the simulator core is in; the basic flow is simply idle -> key press -> execute the appropriate function -> update the display -> idle.
This is very simple to implement and has zero overhead.
Things get tricky only when you are simulating a programmable calculator; then you have to somehow run the program and handle events concurrently. Threads are an elegant solution for this kind of problem in principle but can be hairy in reality, because of the need to synchronize access to shared resources etc. In a single-threaded app, reentrancy is much easier to avoid or manage.
Polling the event queue from the program execution loop may not be architecturally elegant, but it is actually very efficient. I was pretty annoyed to find that the iPhone has zero support for this programming style; while I was able to get things to work reliably using threads, I ended up having to spend several days ironing out all the wrinkles -- several days that I never had to spend on any of my single-threaded implementations.

> Of course "very quickly" can mean "one day for us to make the code changes, then two weeks or more of being stuck in the iTunes App Store submission queue". Such is life in iPhone developer land.

Updates are probably sorted by popularity and not FIFO. E.g. the *twitpocalypse* broke a very popular iPhone Twitter app. The developers fixed this *and* had it available for app store download all within 48 hours.

42S 2.0 is now out. Interesting that 3 calculator apps including i41CX+ also updated. Perhaps the *calculator* app store czar was behind.

4th RPN Calc iphone app updated today: MAcalc/MAcalc Pro by Márcio Almeida, http://www.ttrix.com/

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #13 Posted by **Pal G.** on 18 June 2009, 9:53 p.m.,*
in response to message #12 by bt_schmidt

Has anyone played with Lua on MAcalc?!

It must be watered down and/or flying under the radar to be on iTunes. I believe Apple still has a "no programming languages allowed" law. Maybe the calc app czars thought MAcalc is RPN programmable or this version of Lua harmless. (After all, it is stuck inside MAcalc).

Here is a blurb regarding languages on iPhone.

"Javascript is an interpreted programming language, and thus forbidden as per Apple's terms of service.

Also banned from the iPhone: programming languages Ruby, Python, Perl, and Java. Quake, the video game engine ported to practically every platform (including Google's Android), as well as Microsoft's Word, Excel, and .NET are also persona non grata."

(year old link: http://news.cnet.com/8301-13739_3-9889159-46.html)

I like Lua. Any user experiences with MAcalc and Lua would be appreciated.

Cheers,
PG

Re: Byron Fosters 42s for iPhone version 2 submitted to Apple App Store

*Message #14 Posted by **Thomas Okken** on 18 June 2009, 10:06 p.m.,*
in response to message #13 by Pal G.

I'm pretty sure that the idea behind the "no programming languages" rule is to prevent application developers bypassing the App Store. In order for a language to make that possible, it has to provide access to the iPhone APIs for creating windows and UI components, etc; language interpreters that don't provide such access, can't be used to build unauthorized applications and are therefore not considered a problem.

Note: I'm not an Apple representative; the above is just my take on the underlying rationale behind the "no programming languages" rule. I am encouraged by the fact that Apple do not seem to have a problem with the many programmable calculators available on the App Store; I'd expect them not to object to spreadsheet macro languages etc. either.

Until the app store came along all apps were Safari based and written in

Javascript. And, you can still create and use Javascript apps for Safari.

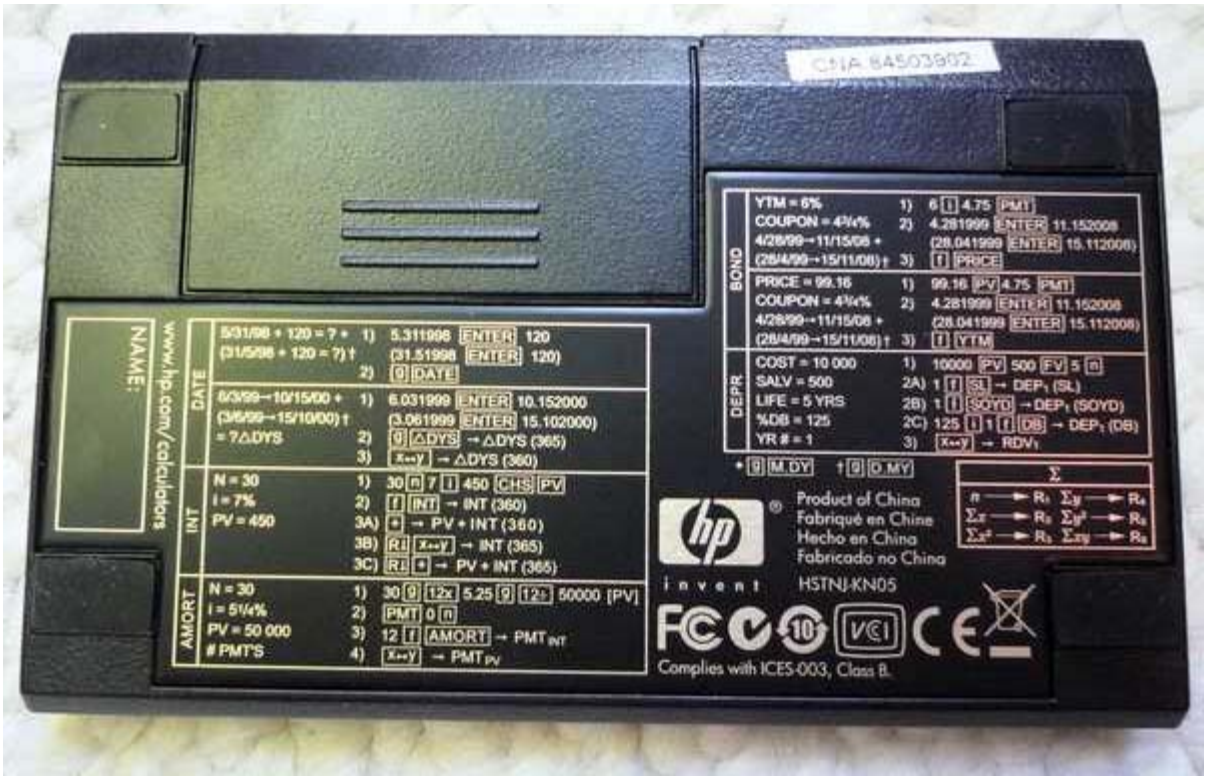
HP-12C+ .... the mistake is back on the back!

*Message #1 Posted by **Katie Wasserman** on 8 June 2009, 10:25 p.m.*

I was blindly staring at the back of the new HP-12C+ thinking about what to repurpose this for (more info here) when I saw that the D.MY mistake is back! The calculator label shows that 31/5/1998 is to be entered as 31.51998. This is an old mistake (more here and here) that was fixed on the Anniversary edition.



Edited: 8 June 2009, 10:29 p.m.

Re: HP-12C+ .... the mistake is back on the back!

in response to message #1 by Katie Wasserman

Hi Katie, Thanks for the links. I had a couple of observations not really related to the subject.

First, I wish Luiz C. Vieira still posted here. He provided a kind, steady, reasoned voice to the discourse.

Second, I found this post by the legendary Norm to be unusually prescient:

> Quote:
>
> Coyote ugly, business vs. engineers Message #15 Posted by Norm on 13 May 2003, 1:23 p.m., in response to message #13 by Raymond Del Tondo

> Maybe Carly is on our side after all.
>
> They released the business major's latest calculator with yellow lettering on yellow metal ?? WELL, maybe they want to cause the business majors to make plenty of mistakes while they are calculating their option strike prices and the takeover target price and the puts and calls and the return on equity.
>
> Then when they screw it all up, they go broke instead of ransacking another $20 Billion from Ma & Pa Buick out of their 401K. So U see, that latest 'platinum' 12C calculator design is the best friend of decent Americans and the engineering dep't, who are in high need of seeing all these business crooks go broke for a change, and management like Mr. Hewlett and Mr. Packard re-instated. A "rigged" 12C that makes mistakes will help get the job done.

I believe you work in the financial area Katie, no offense intended. I'm sure that you were not responsible for our recent economic meltdown :-)

....

*Message #4 Posted by **Gerson W. Barbosa** on 9 June 2009, 9:44 a.m.,*
in response to message #1 by Katie Wasserman

Yet another mistake on the back, actually a typo:

```
Fabricado no China
```

should read

```
Fabricado na China
```

This is inconsequential but might make buyers here (in Brazil) think it is a fake product. I bought one in São Paulo last Saturday. I had some trouble to find it. According to one seller the new model hasn't been reordered because buyers don't trust it, not because they are faster but because the self tests don't work as expected. The new battery comparment is shown in the Portuguese manual but the self tests section hasn't been updated.

Regards,

Gerson.

Re: HP-12C+ .... the mistake is back on the back!

*Message #5 Posted by **Katie Wasserman** on 9 June 2009, 8:36 p.m.,*

in response to message #4 by Gerson W. Barbosa

Gerson,

This makes sense to me. Even being a serious calculator nerd, I was bothered by the self tests not working as documented. The whole point of the self tests is to give you confidence in the calculator and many people that bother to read the manual or know the older version of the 12C will try them out only to have their confidence completely shaken.

That said, I have found no basic functionality flaws in this machine. I'm really beating up on it -- repurposing included -- and it's been perfectly reliable.

BTW, the English version of the manual is the same -- new battery section followed by old (and wrong) self-test section.

-Katie

*Message #6 Posted by **Michael de Estrada** on 9 June 2009, 10:08 p.m.,*
in response to message #5 by Katie Wasserman

What I really miss in all these modern HP products is the wonderful printed documentation of the originals. My HP-12C is an original USA made (S/N 2732Axxxxx), which came with a 246 page spriral-bound manual with heavy paper stock pages that is magnificently written. Even though I'm an engineer, and only used a fraction of its capabilities, I thoroughly enjoyed reading the Owner's Handbook cover to cover. It's much more than simply a handbook; it's a textbook that even non-financial types can understand.

Re: HP-12C+ .... the mistake is back on the back!

*Message #7 Posted by **Quan** on 9 June 2009, 12:48 p.m.,*
in response to message #1 by Katie Wasserman

This, to me, is another example of pathetic quality control in the current HP calculator products.

How can something like this even passed quality check is beyond comprehension.

I don't want to come off negatively about HP, but I just couldn't get past the depressing feeling I had whenever I read repeatedly about the little mistakes like these.

For me, the most disturbing of all is the numerous mistakes or typo or whatever found in the manuals. It seemed no one really went through the pages and actually performed these exercise examples.

I have been a frequent, if not everyday, visitor to this site and comp.system.hp48 since started taking an interest in HP calculator late last year.

Excellent site, BTW. Very informative. I really enjoy coming here. :):):)

From all my reading and my own experience, the one problem seems to stand out above the rest was the missing keystrokes. It also appeared that HP is really trying to correct the problem as seen in the production of 35s, 17bii+, and 50g. But only the 50g shows sign of success. The 17bii+ and the 35s, both of which I have, still have problem in regard to missing keystrokes.

On the other hand, the 35s, 17bii+, and 50g show signs that maybe HP is working to rebuild its image. There is hope, I think.

I am also hoping HP continue to make corrections so that their next releases will be what I come to expect from HP: the calculators that not only look like professional tools, but also work flawlessly. Of course, that means the manuals are also more complete with very little or hard to find errors. Tough but it can be done.

OK, I switch to dream mode now.

Thanks :)

in response to message #7 by Quan

There are many many pressures on engineering and product design groups these days to get products out the door, all with ever declining human (and financial) resources. Mistakes like these are bound to creep in, it's the nature of the game. So I wouldn't beat-up on HP too much here, I can imagine the calculator group being very small indeed.

If HP were smart though, they would make use of the fantastic community of calculator nerds to beta test products and manuals etc (under NDA) well before they hit production. You simply cannot beat the power of the enthusiastic nerd :->

Dave.

Most likely because when it comes to most consumer goods these days the quality of the documentation really doesn't matter all that much. In most markets you don't loose market share or market credibility because you have bad documentation. And conversely, good documentation won't really increase your market share. That's just the reality of it, like it or not. So good documentation is something that is usually driven by an internal desire and not by a need, and that is often a hard sell in internal company politics.

For what it's worth though, I agree with you, a good technical writer is worth their weight in gold.

Dave.

*Message #13 Posted by **db (martinez, ca.)** on 11 June 2009, 2:09 a.m.,*
in response to message #11 by DaveJ

Hi Dave;
I wish you weren't right, but you obviously are. Me; I think it's worse. It's like worthless techies try to make systems un-usable. If it does work at all; one needs to download the bits that made it worth buying- from the website, in an unknown file type, using a de-compressor one can't find, that only runs in vista and can't be accessed using firefox. This may be one reason that so many of us still use 30 year old technology (or the u-watch!): the manual shows how to do what the sales blurb says it will do, and it does it, every time, not just on odd numbered Tuesdays in a leap year.
Mostly gone are the days when developers like Ted Kerber (D'zign), who spends as much time on his manuals as on his programs, were the norm.

in response to message #11 by DaveJ

Sad, but true. Please see my post above in reply to Katie. Yes, there still are a few persons like myself

who remember the good old days of great printed documentation, but we represent an insignificant part of the consumer market. I don't just blame the manufacturer's for this, but also us as consumer's who have become a society of mindless button-pushers instead of thinkers and problem-solvers. We don't try to understand a problem, and instead just look for some device that will give us a quick and easy answer.

Re: HP-12C+ .... the mistake is back on the back!

*Message #15 Posted by **Don Shepherd** on 11 June 2009, 10:46 a.m.,*
in response to message #14 by Michael de Estrada

We have come to the point where we rely too much on our machines. We do that because (a) it is convenient and (b) the machines work pretty well, most of the time. But when the machine fails, we are vulnerable to the consequences. One of my favorite movies of all time is "Fail Safe" from 1964 which shows what could happen if we rely too much on our machines.

Now I must go to the ATM to get some money.

Re: HP-12C+ .... the mistake is back on the back!

*Message #16 Posted by **Michael de Estrada** on 11 June 2009, 12:15 p.m.,*
in response to message #15 by Don Shepherd

The problem with machines is that they are subject to GIGO (garbage in garbage out). If the human user doesn't have a good understanding of the problem, then it's possible to accept bad results without question. I remember a rather unpleasant experience in the early 1970s with a young manager at the engineering firm where I worked, who informed us engineers that we were going to be largely replaced with computers that would automate design, and render us obsolete. Fortunately, this was proven to be wrong; we continued to do our design work and he eventually left the firm and became a stock broker.

I am rather disheartened at the current batch of engineering graduates that I have been interviewing. They seem to have retained very little of their technical course material from college, and don't seem to see the importance of it either. They just figure we'll train them to use some magic computer software that will figure everything out.

You mentioned "Fail Safe" as an example, but I would suggest a real-world example to be "Miracle on the Hudson." The airplane was saved because of the pilot's experience, rather than any technology on the airplane. The airplane's computer could not advise the pilot of the preferred course of action; it could only tell him that things were very abnormal. Captain Sollenberger testified that the airline industry is at risk of reducing safety as it continues to hire less experienced pilots who only meet the basic inadequate FAA certification requirements. Personally, I fly as little as possible, and will never fly on a regional "puddle-jumper" airline.

Well, I better stop here before I digress any more from the subject of this thread.

After figuring out how to use my HP 50g, despite being thrilled with its capabilities I started to feel I was relying on it too much.

So lately I've been re-learning how to use a slide rule and doing most rough calculations using

my trusty Hemmi 260. (It's more handy for doing rectangular to polar conversions than most calculators.)

But if I have to deal with matrices I grab the 50g. I'm only willing to take machine independence so far...

*Message #18 Posted by **Don Shepherd** on 11 June 2009, 8:26 p.m.,*
in response to message #17 by Steve Keeley

Steve, what challenges me is taking a simple problem, thinking about it and kicking it around for awhile using pencil and paper, then solving it using something like the 12c or 65, with limited programming capabilities.

For instance, consider this problem (I learned in education school preparing to become a middle school math teacher): you have an unlimited supply of .05 and .08 stamps. For which postage values under $1.00 can you NOT represent the postage using combinations of these stamps? Simple problem. Kids will try to solve it using all sorts of methods: draw pictures, make tables, investigate factors, investigate combinations, use manipulatives, etc. I would choose to write an RPN program on the 12c (I have the new one that is FAST!). I think this is one of the keys to good quality education: let the kids solve it their way. If they do that, they will learn it for life. If you force them to do it your way, they will forget it in about 3 seconds.

Even I use a slide rule at times when I feel for it. Just for fun. Use to have an scientific Aristo pocket slide rule in my jacket. And this cute thing makes one really to check results! All the way down longer calculations you need to make estimations in order to figure out where to place the comma or if you have made your reading on the wrong scale. So half the time you are sitting and wondering "can this be true?" Now I can understand what a relief it must have been back in 72 when the HP-35 became available.

In the "olden days" we had a way to keep track of the decimal point without doing all of

the estimating. The method was fairly easy to remember as it was equivalent to the manipulations of the characteristic and mantissa when doing multiplication and division with logarithms and pencil and paper.

Palmer

*Message #21 Posted by **Ed Austin** on 17 June 2009, 5:58 p.m.,*
in response to message #20 by Palmer O. Hanson, Jr.

Lets all face the facts. The Old "HP", the old 200+ Odd Page Printed Color Manuals and the printed Advanced User Guides as well as Quick Ref are a thing of the past.

"HP" as is now is not an Engineering but Marketing firm.. as was reflected perhaps by two pivotal events (in my mind)

1) When the 39g/49g replaced the 48GX of the 48 series - the last great HP Calcs (imho). The 38G was kind of caught in the middle of this transition.

2) When Alg replaced RPN (at the same time).

I'll never forget the excitement of my youth and opening that big HP41C box... and those beautiful manuals... and fiddling with a custom overlay for my programs. Its all now history. I don't look twice at any Post 1995 HP Calculator.

Re: HP-12C+ .... the mistake is back on the back!

*Message #22 Posted by **Mike Morrow** on 18 June 2009, 10:00 a.m.,*
in response to message #21 by Ed Austin

> Quote:
>
> I don't look twice at any Post 1995 HP Calculator.

That's too bad.

I've used HP calcs since the HP-35 appeared in 1972. (I couldn't afford one of my own until 1976, after I'd been an EE grad for two years!)

The HP50g is a remarkable machine, easily the best overall by large margin of my 30-plus HP calcs. It it the only machine that displaces my all-time RPN favorite, the HP42S.

I have one HP48SX and two HP48GX machines, all purchased for work, not for collecting. They are real dogs in comparison. The HP48-series is extremely unsatisfactory if for no reason other than having the poorest LCD quality of any graphing calculator ever made by anyone. The HP48 LCD is also one of the easiest displays to damage with modest work-environment handling. I'll give up an oversized ENTER key any second for HP50g LCD quality. (But there are many many other advantages to the HP50g. It has the best performance-to-price ratio of any calculator ever made.)

IMHO, of course.

Re: HP-12C+ .... the mistake is back on the back!

*Message #23 Posted by **Michael de Estrada** on 18 June 2009, 11:33 a.m.,*
in response to message #22 by Mike Morrow

The issue here is not the quality of the new generation calculators, themselves, but the quality of the documentation. After owning an HP50g for about 6 months, I am only now beginning to appreciate its capabilities. In fact, when I first bought it, the printed documentation made no mention of it's I/O capabilities, and I needed several postings on this forum before I could figure out how to do IR output to a printer. Indeed, the HP50g has now replaced my 19 year old HP48SX, which as you mentioned, has an absolutely awful LCD display. The overall quality is quite good, certainly as compared to the cheaper HP35S, and I can live with the somewhat stiff and high-effort key buttons; at least they are reliable.

> The issue here is not the quality of the new generation calculators, themselves, but the quality of the documentation.

No, my response was directed specifically at the quoted segment of Ed's post. I doubt that Ed disdains post-1995 HP calcs due *only* to the documentation issue. I think there is a perception, demonstrably inaccurate, that the era of acceptable calculator *hardware* and *firmware* made by HP ended with the HP48GX.

Even the documentation issue is NOT that bad. If one downloads all the official HP documents associated with an HP49g+/HP50G, including the tutorials, he will have about 2000 pages of information. That seems a pretty decent effort to me, for a device that's bound to have little profit margin and less than broad market volume.

I've as *long* a history of HP calculator usage as anyone except the original designers of the HP-35, and on that slim basis alone I feel safe in my assessment that the HP50g is easily the best overall machine HP has ever made. It's not perfect (what is?), but its designers need feel nothing but pride.

HP41CV with missing registers

*Message #1 Posted by **Jorge I. Rodriguez (Pasadena, CA)** on 8 June 2009, 5:05 p.m.*

Hello everyone

I just received an HP-41CV that I won in an auction on that famous auction site. The calculator seems to be in excellent condition except that there is some corrosion in the battery terminals. Further, after installing the batteries I found out that in program mode it shows 46 registers instead of the 319 that you see when everything is okay. There are no programs stored in memory in case you are wondering, and when I installed the batteries the first thing I saw was the dreaded "Memory Lost" message.

My question is this. Is it possible that the corrosion is affecting the internal ram chips? Is that something that can be repaired by cleaning the corrosion with alcohol or some other chemical? I read somewhere after purchasing the calculator that corrosion can spread to other components internally. I wish I had read that article before hand. I will probably take it apart just to find out, but I want to know from someone that knows if that is the case. The calculator does not seem to have any broken posts since it is pretty snugg. My guess is that corrosion is the culprit please let me know if I am wrong.

Re: HP41CV with missing registers

*Message #2 Posted by **Thomas Okken** on 8 June 2009, 7:37 p.m.,*
in response to message #1 by Jorge I. Rodriguez (Pasadena, CA)

What happens when you do SIZE 00? What does the register count in program mode show then? (Bear in mind that the number displayed on line 00 represents the number of registers available for programs; it does not include the number of registers currently allocated for data registers.)

- Thomas

Re: HP41CV with missing registers

*Message #3 Posted by **Jorge I. Rodriguez (Pasadena, CA)** on 8 June 2009, 8:27 p.m.,*
in response to message #2 by Thomas Okken

I see Reg 319. Mystery solved. It is been a while since I used an HP-41 calculator. Now I remember that Size partitions program memory with storage registers. Thanks for your quick response. By the way, I opened up the calculator and saw that the corrosion is only in the two middle battery connectors. I did that because soon after I started using it, the calculator would not come back on. I found out that the inside is in perfect condition except for the corrosion in those two terminals. I used a couple of small pieces of aluminum foil to create a temporary fix. It seems that did the trick and the calculator now powers up, but the terminals need to be fixed permanently. I saw an article on the forum title "Repairing an HP-41CX" that describes such procedure, but I need to go purchase a couple of things like the glue and the brass strip to attend such a repair. Otherwise, the calculator is just better than what I expected to find.

Re: HP41CV with missing registers

*Message #4 Posted by **Juergen Keller** on 9 June 2009, 2:46 p.m.,*

in response to message #3 by Jorge I. Rodriguez (Pasadena, CA)

Sometimes these battery connectors are offered on eBay. Another way to fix it was developed by Diego Diaz:

Replacement Flex PCB

Don't know if the replacement flex PCB is still available from Diego.

Good luck and enjoy your 41CV,
Juergen

HP48 I/R comms with PC?

*Message #1 Posted by **Mark Edmonds** on 8 June 2009, 4:16 p.m.*

I've searched the forum on this but can't find anything.

I would like to try linking a 48 with a PC using IRDA. I think I know how to set the 48 OK but finding a solution for the PC is a bit unknown.

I see that today you can buy USB IRDA adaptors. Here is an example:

http://www.b2cshop24.com/en/wireless-usb-to-irda-infrared-red-adapter-ir-dongle-new.html

Has anyone ever used one of these? How do they appear as a device within Windows XP? Are they another serial port (in which case, I presume tranfer is quite simple)?

I know that using IR is much slower than cable but for logistical reasons, using IR is more convenient for me than a serial cable.

Grateful for any sage words on this please!

Thanks,

Mark

Re: HP48 I/R comms with PC?

*Message #2 Posted by **Christoph Giesselink** on 8 June 2009, 5:00 p.m.,*
in response to message #1 by Mark Edmonds

The communication between a HP48 and a PC over an IrDA adapter was a topic in the usenet comp.sys.hp48 years ago.

From this time there's a summary of my experinces published at http://www.hpcalc.org/details.php?id=4856.

For further information look at the discussions at comp.sys.hp48 please.

Cheers

Christoph

Re: HP48 I/R comms with PC?

in response to message #2 by Christoph Giesselink

Thanks for your help Christoph :)

Having looked at the documentation for a couple of these current adaptors, there might be a major problem

in WinXP anyway. It seems that in Win 9x, the IrDA gets installed as a new serial port so presumably, it wouldn't be a problem to get old programs like the serial link kit to communicate over it. However, in W2K and XP, the IrDA device appears to be a new device class in its own right so how you would get an old DOS program to talk over it is beyond my knowledge.

Bearing in mind the problems you highlighted in your own research, I'll have to pass on this one. Aside from the fun of doing comms over IR, the main reason I wanted to use this technique was to save having to route a lengthy serial lead from the machine room through a badly accessible cable duct.

Mark

*Message #4 Posted by **Marcus von Cube, Germany** on 9 June 2009, 2:20 a.m.,*
in response to message #3 by Mark Edmonds

This web page may help: http://www.ircomm2k.de/English/

IRCOMM2K is a virtual COM port driver for W2K and XP. The last update is five years old. But how old is our equipment? ;) So you could at least give it a try!

Re: HP48 I/R comms with PC?

*Message #5 Posted by **Frank Rottgardt** on 9 June 2009, 6:28 a.m.,*
in response to message #2 by Christoph Giesselink

Did not check the link nor did I read the articles. Wonder if it is possible to link up an HP-28s with a PC (Windows XP) using the internal IR-link? I might be wrong, but I guess I read somewhere that HPs IR-protocol is not compatible with the usual industry IR standard? Do one need special receivers or "translation" software?

I know about the HP-28s COM but are not keen on opening my beloved calculator. IR would be more comfortable. Maybe a dumb question: is the 28 IR-link one-way only? (send)

Re: HP48 I/R comms with PC?

*Message #6 Posted by **Marcus von Cube, Germany** on 9 June 2009, 9:21 a.m.,*
in response to message #5 by Frank Rottgardt

The HP-28s IR port is transmit only with a proprietary protocol, understood just by the printer (or the HP-48 with special software). So no way to use it for general communications.

The later models have a bidirectional IR port that can talk IRDA. As far as I know not the OBEX protocol for file exchange but the IRCOMM serial port emulation. X-Modem and Kermit are running on top of IRCOMM.

Re: HP48 I/R comms with PC?

*Message #7 Posted by **Christoph Giesselink** on 9 June 2009, 6:38 p.m.,*
in response to message #5 by Frank Rottgardt

Like Marcus wrote, the HP28S build in IR protocol for the HP82240 printer isn't compatible with "normal" one.

Nevertheless the HP28S has full support to execute self written assembler code. So it's possible to write

your own protocoll by directly accessing the IR-transmitter LED. But you still have the same problem finding a capable IR-receiver on the PC side.

So to your last question, yes the HP28S supports only one way IR-communication by default.

But the hardware port inside the HP28, which controls the IR-LED, is bidirectional. I opened a HP28S, removed the IR-LED and connected a simple hand made signal level adjuster with a COM port interface to the calculator. With self written assembler software on the calculator I'm able to do serial communication with 2400 baud in both directions.

Cheers

Christoph

*Message #8 Posted by **Frank Rottgardt** on 10 June 2009, 6:49 a.m.,*
in response to message #7 by Christoph Giesselink

So with this in mind one can only wonder why the he.. HP did not decide to implement this bidirectional IR when the were going from 28C to 28S (as last chance)? Almost everything was there. Would have been a simple and cheap? way to introduce communication possibilities. Would it have been to much work to rewrite the IR-functions and add a new IR tranceiver? How many of us did not see KB of programs vanish when batteries were changed, without any possibility to get it back. I still can feel the sweat every time the battery indicator came up :-(I am convinced many of the 28s users would gladly have given away some dollars for a special PC-IR-link if only HP had made one. Maybe HP did not want potential 41 customers to go for a HP28-"IR com" (so I am not sure when the 41 has been put out of production)

It never ceases to amaze me how much skill and thought so many of you apply to your HPs. Some of the things you do are so beyond anything I can think of, it is on a different level!

With the RPL machines for example, the kick for me is becoming expert at UserRPL and writing the most elegant code possible within the supplied confines. For the rest of you though, a task like controlling the rods in a nuclear power station with your HP48 represents a worthwhile achievement!

HP-41CX Bug?

*Message #1 Posted by **Namir** on 5 June 2009, 5:55 p.m.*

Hi All,

Using my HP-41CX, I happened to execute CAT IND followed by the decimal and a stack register name (such as X or Y), expecting the command to use the value in the references stack register. Instead the calculator behaved like I entered CAT 0. Is this a know bug? Is it a bug at all? Am I missing something?

Namir

Re: HP-41CX Bug?

*Message #2 Posted by **Vladan Dugaric** on 5 June 2009, 6:17 p.m.,*
in response to message #1 by Namir

My HP-41CX exhibits the identical behaviour, V41 too. If I put 2 into register 00 for example, CAT IND 00 performs CAT 2. If I put 2 into a stack register (any of them), CAT IND ST X (or Y or Z or T) performs CAT 0. Strange.

Another interesting thing: i41CX+ does not allow CAT IND. When CAT is pressed, it comes out as CAT' and SHIFT key is ignored after that.

Edited: 5 June 2009, 6:22 p.m.

Re: HP-41CX Bug?

*Message #3 Posted by **Nigel Bamber** on 6 June 2009, 10:30 a.m.,*
in response to message #2 by Vladan Dugaric

Regarding the I41CX and CAT ' , you probably have CCD installed. Without CCD, it does allow you to enter CAT IND etc.

Nigel

Re: HP-41CX Bug?

*Message #4 Posted by **Dan Grelinger** on 6 June 2009, 4:54 p.m.,*
in response to message #3 by Nigel Bamber

Nigel, I believe that you are wrong. I have an HP-41C (early, all bugs version), an HP-41CV 'fullnut', an HP-41CX 'fullnut' and an HP-41CX 'halfnut'.

All four instruments allow me to execute a CAT IND X, with no modules of any kind installed.

The result is the same for all of them, regardless of what resides in the X register. The HP-41 executes a CAT 3.

Dan

Re: HP-41CX Bug?

*Message #5 Posted by **Eric Smith** on 5 June 2009, 8:22 p.m.,*
in response to message #1 by Namir

Got any modules installed? ZenROM, CCD, and maybe other ROMs affect the way "partial key sequence" entry works.

Re: HP-41CX Bug?

*Message #6 Posted by **Namir** on 6 June 2009, 6:33 a.m.,*
in response to message #5 by Eric Smith

I have the IR printer module and an X-Mem module in my HP-41CX.

Re: HP-41CX Bug?

*Message #7 Posted by **Vladan Dugaric** on 6 June 2009, 6:04 p.m.,*
in response to message #5 by Eric Smith

You're right. After I removed CCD, Advantage, Math, and PPC modules, I now can execute CAT IND. However, as stated in a post below, the bug appears to be identical to the one on V41 and real HP-41.

Re: HP-41CX Bug?

*Message #8 Posted by **Dan Grelinger** on 6 June 2009, 10:29 a.m.,*
in response to message #1 by Namir

If memory serves me correctly, this 'bug' has been documented in at least one of the popular '3rd party' HP-41 books (Extend your HP-41?) It exists in all the HP-41 versions. It was omitted from almost all 'bug lists' because it was inconsequential. There was no real application for CAT IND (X-T), (CAT is not programmable) so the design and engineering effort was never expended by HP to 'fix' it.

Dan

Re: HP-41CX Bug?

*Message #9 Posted by **Namir** on 7 June 2009, 4:44 p.m.,*
in response to message #8 by Dan Grelinger

Thanks Dan. I just wanted to know if I was just "re-visiting" a previously known bug.

Namir

Why is complex number support so essential to some of you?

*Message #1 Posted by **Mark Edmonds** on 5 June 2009, 3:47 p.m.*

This is something I have been puzzling about for a while. For many of you, complex number support is essential and the elegant solution in the 15C makes it the prime choice whilst other machines that I rate highly but do not support complex numbers so well get dismissed.

Since my educational days, I've never touched or gone near complex numbers. Perhaps that was down to the way it was taught. For me it was 1980 GCE A-Level (UK people will understand) and having just looked at my original maths notes, we didn't do much other than the basic methods: +, -, *, /, Argand diagrams, modulus and argument and *nothing* to show real-life usage.

So.... I was wondering if those of you who need complex number support could give me some feel for their usage, the type of solutions you are looking for and the field of use?

If I can understand actual usage of complex numbers more, maybe I can find ways of using them programaticaly or at least round-out my education!

Thanks for any replies here :)

Mark

Re: Why is complex number support so essential to some of you?

*Message #2 Posted by **Jeff Kearns** on 5 June 2009, 4:25 p.m.,*
in response to message #1 by Mark Edmonds

Aside from the requirement of many of the forum members to solve polynomial equations that have complex roots, imaginary numbers are used extensively by the electrical engineering and aeronautics communities. I, myself am a mechanical engineer... Handling vector quantities necessitates the use of complex numbers for adequate mathematical treatment of the problem (which involves magnitude and direction). You must bear in mind that real numbers as well as imaginary numbers are are only special cases of the complex number set, so the ability to easily handle these complex numbers on a calculator can be of trememdous importance to users.

To really answer your question would take a lot of space and I would much rather refer you to an excellent book entitled: "An Imaginary Tale; The Story of the square root of minus 1", by Paul Nahin ISBN-10: 0-691-12798-0. --- JeffK

OT: Some Basic Algebra Help (was: Re: Why is complex number support so essential to some of you?)

> an excellent book entitled: "An Imaginary Tale; The Story of the square root of minus 1", by Paul Nahin ISBN-10: 0-691-12798-0. --- JeffK

Can I crave everyone's indulgence and drag this thread off topic a bit? I'm part-way through this book and hugely enjoying it, but I tripped up slightly on p.5 - Diophantus's solution to finding the sides of a right triangle given its area and perimeter. After showing how Diophantus cleverly reformulates the problem to solving for one variable, Nahin continues:

"The first equation reduces to the identity 14 = 14, and the second to:

1/x + 14x + sqrt(1/(x^2)+196x^2) = 12

which is easily put into the form given above,

172x = 336x^2 + 24"

Now, for the life of me, I can't see how he gets from the first form to the second. I've played around with paper and pencil for ages, but am just not seeing it. In my defence, it's well over thirty years since I studied basic algebra, but he says this is easy!

Can somebody please point me to the basic technique I'm missing, and put me out of my misery? ;)

Best,

--- Les

>
> 172x = 336x^2 + 24"
>
> Now, for the life of me, I can't see how he gets from the first form to the second.

```
1/x + 14x + sqrt(1/(x^2)+196x^2) = 12

sqrt(1/(x^2)+196x^2) = 12 - 1/x - 14x

Square both sides (hint: (a+b+c)(a+b+c) = a(a+b+c)+b(a+b+c)+c(a+b+c)):

1/(x^2) + 196x^2 = 196x^2 + 1/(x^2) - 336x - 24/x + 172

0 = - 336x - 24/x + 172
```

```
0x = -336x^2 - 24 + 172x

-172x = -336x^2 - 24

172x = 336x^2 + 24
```

Hello!

> Quote:
>
> So.... I was wondering if those of you who need complex number support could give me some feel for their usage, the type of solutions you are looking for and the field of use?

For some years I did research work on radar imaging. This involves a lot calculations on electromagnetic wave propagation, where both the signal amplitude and phase were measured and processed. Complex numbers were essential to that kind of computation! An Hp-15 would have been no great help however, as millions of multiplications and additions had to be performed for every image. (I did this work in the early nineties and one of the fastest desktop comupters then awailable, the Sun SparcStation, usually needed a whole night for an 800 x 800 pixel image. The Hp-15 would have taken several thousand years for the same job...)

Since then, I haven't seen complex numbers again, I'm afraid.

Greetings, Max

Re: Why is complex number support so essential to some of you?

*Message #8 Posted by **Michael de Estrada** on 5 June 2009, 4:32 p.m.,*
in response to message #1 by Mark Edmonds

Mark,

I am an engineer, not a mathematician, and I use complex numbers simply because they afford solutions to many practical problems. Any mechanical or electrical problem in which both magnitude and phase are required can be handled easily using complex numbers. Most common mathematical functions have complex results in certain ranges, such as the square root of X < 0 or the Arc Sine of X > 1 or X < -1. The fact is that all general numbers are complex, with a real and imaginary part, and only special problem cases can be solved using only the real part. For example, the solution to a second order ordinary differential equation is ultimately complex, although the solution can be expressed as two apparently real parts.

Michael

Re: Why is complex number support so essential to some of you?

*Message #9 Posted by **Garth Wilson** on 5 June 2009, 4:32 p.m.,*
in response to message #1 by Mark Edmonds

To simplify it almost to the point of lying, aside from simple DC circuit analysis, complex numbers are inseparable from virtually any electronics engineeiring work. Capacitors and inductors that are constantly either storing or releasing energy as a voltage or current changes throughout any waveform shift the phase, and off we go, leaving real-number-only calculations behind. Take that into mechanical engineering, and resonances and so on give you the same kind of thing.

Take that into mechanical engineering, and resonances and so on give you the same kind of thing.

Depends entirely on what aspect of electronics engineering. I've been doing practical electronics engineering design for over 20 years and have rarely had the need to use complex numbers. When I have it's usually heavier data set computational stuff as others have mentioned, so in the realm of computers and not calculators.

Engineering school theory is different however, complex numbers are commonly used in learning many theoretical aspect. But as with most electronics engineering theory you learn, it's not so common to actually use in practice.

YMMV of course.

Dave.

Re: Why is complex number support so essential to some of you?

*Message #11 Posted by **marais** on 5 June 2009, 4:59 p.m.,*
in response to message #1 by Mark Edmonds

I'm an EE, and I think it is our discipline that is responsable for the demand for complex number calculations. I remember programming the basic operations in my Casio FX-602, which of course was far from the comfort that was offered by the 15C or later the 28C. In circuit analysis, complex numbers are essential, as has been said in several replys. Today I work in non-destructive evaluation, and in eddy-current signal analysis, we need complex numbers all the time. Being able to carry out these calculations on a pocket calculator is quite useful in the field, or sometimes in a meeting. I wrote programs to calculate some of the post-processing treatments when multi-frequency eddy-current is used. It's an EE thing I'd say.

Re: Why is complex number support so essential to some of you?

*Message #12 Posted by **Nigel J Dowrick** on 6 June 2009, 7:06 a.m.,*
in response to message #1 by Mark Edmonds

Don't forget quantum mechanics - quantum amplitudes are complex numbers and although all observable quantities are real, to calculate probabilities these complex amplitudes have to be added together (usually by integration). Many operators (matrices) will have complex eigenvalues and eigenvectors too, and this will be true in engineering as well.

A more down-to-earth use is simply to use complex numbers as a convenient representation of 2-D vectors, to make them easy to add and to subtract without fiddling with R<->P conversions.

And so on! There are a *huge* number of applications of complex numbers!

Nigel

Re: Why is complex number support so essential to some of you?

*Message #13 Posted by **Mark Edmonds** on 6 June 2009, 7:59 a.m.,*
in response to message #12 by Nigel J Dowrick

Thank you all very much for the informative replies. I'm not into EE or the other fields although one area I work in gets close occasionally in a related way - audio engineering. I do this at the production and testing level rather than circuit or DSP algorithm design levels. Sometimes though when a new product is in development, it helps to try to understand a bit of what is going on under the hood. From what I have read above and the directions it has pushed me to look elsewhere on the net, I can see that complex numbers are a vital part of the mathematics. I doubt I'll ever get to the stage of being able to program my own DSP routines though.

Regarding use as vectors, yes, when being taught CNs it was difficult for me not to think of them in this way and always struck me as being a rather sledgehammer method to crack a simple nut but then perhaps that betrays my superficial understanding of complex numbers.

Interesting to read all your comments - thanks for the help and I hope it didn't seem too basic a question!

Mark

Re: Why is complex number support so essential to some of you?

>
> As the EEs have explained above, and elsewhere (as a radio astronomer who does interferometry, I use a lot of Fourier transforms) the complex numbers undergo a lot of multiplication - as long as they are complex, you just go ahead and (complex) multiply and the answer comes out OK. Try thinking about how you'd do that in vector space - perhaps 1e6 rotations! Makes my head hurt!

Re: Why is complex number support so essential to some of you?

*Message #15 Posted by **Egan Ford** on 6 June 2009, 10:34 a.m.,*
in response to message #1 by Mark Edmonds

Would it be too nerdy to say, "I just like complex numbers?"

The book mentioned above is a great read. If you want a little bit of everything with a *complex* ending checkout the book *Prime Obsession*.

Re: Why is complex number support so essential to some of you?

*Message #16 Posted by **designnut** on 6 June 2009, 3:37 p.m.,*
in response to message #15 by Egan Ford

Whenever you use magnitude at an angle it is a complex number whether expressed as real and imaginary components. These appear through electronics and mechanics. When adding vectors it is convenient to use their real and imaginary parts separately. Being at right angles they do not interact. Sam

Re: Why is complex number support so essential to some of you?

*Message #17 Posted by **John Cadick** on 7 June 2009, 1:06 p.m.,*
in response to message #1 by Mark Edmonds

Electric Power Engineers use complex numbers extensively in areas such as network analysis for power systems, power system stability, short circuit analysis, load flow, Power factor analysis and correction, generator and transformer design, power system protection; and a whole host of others.

in response to message #1 by Giuseppe Marullo

Hello Giuseppe!

I am sorry I did not get in touch earlier but I was away in London, England when you posted.

Try this link posted awhile ago at the hpmuseum:

After reading that try this step first. Take an eyedropper with 99% alcohol and place a drop on the ON key (or any sticky key). Exercise the key by repeated pressing. Let the alcohol dry by using forced air or passively by letting dry over time. This should cleanup any oil residue.

sticky key 15C

If this did not work, take an eyedropper of water and place the drop on the ON key (or any sticky key). Again exercise the key and then allow to dry. Use a dropper of alcohol after the water to expedite the drying process. This will clean up the sugar residues.

Let us know how it works out.

Cheers,

Re: here you go Giuseppe, also emailed you!

*Message #6 Posted by **Giuseppe Marullo** on 7 June 2009, 3:48 p.m.,*
in response to message #5 by Geoff Quickfall

Hi Geoff, sorry to bother you with this, I already saw your article, just wondering if this is a case of dirt or something else, I will try the alchool eyedropper trick and report any progress here.

Do I have to remove batteries? Suppose I don't have a dyer box, how many days should I allow it to dry?

The key always registers, is the huge pressure I need to perform to make it happen tha puzzles me.

Giuseppe

Dirt or contact or rivet problem...

*Message #7 Posted by **Geoff Quickfall** on 7 June 2009, 4:56 p.m.,*
in response to message #6 by Giuseppe Marullo

The water and alcohol should remove grime that seeps under the key domes. Dirt, grit and etc that is physically stuck will require the wash technique as described in the linked posting.

Try the water and alcohol dropper solution with the batteries out. Shake the water and alcohol out after exercising the key. If you have a hair dryer warm the area around the key. Not to hot but bursts of heat. The idea is not to heat up the calculator but to accelerate the drying.

If you just air dry but are thorough about shaking the water out then a couple of hours should be fine. In fact, if the water drops are confined to the key itself then the shaking or blowing and blotting of the key should suffice for a quick test with the batteries in within minutes of doing the cleaning. Confirm it works then let dry overnight.

If you end up soaking and washing the keyboard under water then the drying period would be a couple of days without a drying box.

Second point about pressure on the key.

Open the back of the calculator. Looking at the calculator inside front at the Circuit Board (CB). Find the area associated with the ON key. Press the key and observe the plastic rivets surrounding the ON key area on the CB. Are these rivets secure or is the CB flexing outward, that is, do the rivets hold the CB in place? If not then it is the rivets which are allowing to much travel for the ON key prior to it contacting the CB. Try pushing on the area of the CB near or at the ON key and simutaneously press the ON key ON, batteries in place. See if this helps in contact. If the rivets flex and the pressing action on the inside of the calculator works then read on.

To fix this, you will have to press down on the Circuit Board and melt the heads of the loose rivets with a flat soldering iron element or hot knife. Heat just enough to soften the rivets, not melt them. Do this while applying pressure.

Another way to enhance the contact between key and board is to place a thin foam cushion in the vicinity of the offending key and the screw the back of the case in place. This to will add pressure and help hold the CB against the keyboard contacts.

Cheers, Geoff

O.T. XP RAM utilization

*Message #1 Posted by **designnut** on 4 June 2009, 11:48 a.m.*

I recently had 2GB of RAM installed which is recognized in my 2001 computer, and 2 new hard drives. It is faster by far, but the system never uses more than 25% of the RAM. Everything it has pagefiled and cached and swapped would easily fit in RAM, yet it doesn't use it. I use Everest to look into my computer and can see all this. Does anyone know of a fix to get XP out of the beta stage? Sam

Re: O.T. XP RAM utilization

*Message #2 Posted by **Dave Britten** on 4 June 2009, 12:06 p.m.,*
in response to message #1 by designnut

If you're looking at Task Manager, the "PF Usage" label is a bit misleading. It really means, "This is how much memory is allocated". If that amount happens to be within the size of your physical memory, there shouldn't be any paging going on. If it's larger, then you're going to see some paging. I recall they changed that label to indicate what the figure actually reflects in Vista.

The System Cache number just tells you how much RAM is being used to cache disk I/O, and probably some other stuff. This RAM is relinquished if a process needs it, but Windows figures it might as well put it to some use if nobody else is using it, and so it uses it for caching to improve performance.

I'm not familiar with Everest, so I don't know what kind of metrics it provides. What sort of numbers is it showing you?

in response to message #3 by Tim Wessman

So is this REALLY available to the general public?

I can't find anyplace on HP's site to buy it - but the linked website lists HP as the publisher?

I'd certainly expect a legit emulator to show up there, here, or at least be a pretty easy search on Google!

Re: hp 35s emulator

*Message #5 Posted by **Tim Wessman** on 6 June 2009, 12:57 a.m.,*
in response to message #4 by Earl Kubaskie

It is legit. I know because I made the screenshots. I actually had to redo them all because I forgot about the window transparency and there was a slightly fuzzy firefox logo showing in all of the title bars. :-)

As to why it isn't on the HP site yet. . .red tape can take a while to cut. Same reason the ROM updates that were ready a month ago aren't up yet.

in response to message #5 by Tim Wessman

Speaking of ROMs, does anyone know if the hp 35s ROM running in the simulator is the same as we all have in our machines? Is there key sequence that reveals revision?

I wonder if HP has thought about using the proceeds from simulator sales to pay a software engineer to update the hp 35s

ROM.

Re: hp 35s emulator

*Message #7 Posted by **Eric Smith** on 7 June 2009, 5:05 a.m.,*
in response to message #6 by Pal G.

Most likely it is compiled to native x86 code from mostly the same source code that is used for the actual calculator. But not the same actual executable, if that's the question.

However, I don't have it, so I could be wrong.

Re: hp 35s emulator

*Message #8 Posted by **Pal G.** on 8 June 2009, 12:22 a.m.,*
in response to message #7 by Eric Smith

I see. I was thinking fundamentally the hp 35s and the simulator have a "rom.bin" inside, kinda like all the emulators we've used over the years, including yours.

But instead, if I'm correct, HP has several well preserved .c or .asm files, with a bunch of routines that haven't been looked at in a while, that were a long time ago written and compiled for the hp 41 Math Pac, then compiled for the hp 32s/ii, then the hp 33, and now finally the hp 35s, and the simulator.

I don't know enough about what's going on under the hood. I am just trying to figure out how easy/difficult it is to fix current calculator bugs, regardless of economic decisions. In essence, could/does a bug free version of the hp 35s exist, even if HP is not interested in updating manufactured units, and would work in the simulator? Or is fixing the legacy code itself too monumental a task?

Re: hp 35s emulator

*Message #9 Posted by **Eric Smith** on 8 June 2009, 1:06 a.m.,*
in response to message #8 by Pal G.

At past HHC conferences, Cyrille has explained that relatively recent HP calculator models such as the 33s, 35s, 20b, and 12c Platinum are compiled from C source code that is of recent origin. While some of the source code for older Saturn-based calculators was undoubtedly used as a reference (e.g., for the "Napier" floating point library, and the TVM algorithms), none of the original code was directly usable for the new calculators.

Do you know what the differences are between this commercial version and the educational version? Does it mean the ROM has been updated?

On a side note, would it be to HP benefit to release their emulators free of charge so more users can give feedback on how to improve them before the next product update, given the fact there aren't enough people in their calculator department to do quality control on usability?

Just wonder.

Re: hp 35s emulator

*Message #12 Posted by **Namir** on 6 June 2009, 2:46 p.m.,*

Who in the world - apart from us nerds on this forum - would use a calculator emulator instead of a spread sheet or a dedicated application? ;-) I guess most people who use calculators have a need to use it away from their PC: at the client's home, in the field, on the plane. And even nerds do buy the real thing: why else would prices of 15c, 42s etc. be so high? I have seen plenty of photos of calculator collections on this forum. But not a single photo of a PC Desktop showcasing the guy's emulator collection! ;-)

HP "Virtual Tech Museum" contest

*Message #1 Posted by **Eric Smith** on 3 June 2009, 7:10 p.m.*

I got some unsolicited email yesterday that I almost deleted, from someone at a company Waggener Edstrom, claiming to be representing HP. Apparently HP is running a contest for a HP Virtual Tech Museum and soliciting entries. They're looking for the oldest powered computing or entertainment devices, with photos and stories.

I have several items that I'd submit, but the contest is only open to the Asia Pacific region. See the contest rules on the web site for details.

Re: HP "Virtual Tech Museum" contest

OT: Cancel the BarB, mate!

*Message #7 Posted by **Jeff Kearns** on 4 June 2009, 6:16 p.m.,*
in response to message #6 by Les Bell

Les,

Your post reminded me of the following:

Understanding International Security Levels

The British are feeling the pinch in relation to recent terrorist threats in Islamabad and have raised their security level from "Miffed" to "Peeved." Soon, though, security levels may be raised yet again to "Irritated" or even "A Bit Cross." Brits have not been "A Bit Cross" since the blitz in 1940 when tea supplies all but ran out. Terrorists have been re-categorised from "Tiresome" to a "Bloody Nuisance." The last time the British issued a "Bloody Nuisance" warning level was during the great fire of 1666.

The French government announced yesterday that it has raised its terror alert level from "Run" to "Hide". The only two higher levels in France are "Collaborate" and "Surrender." The rise was precipitated by a recent fire that destroyed France's white flag factory, effectively paralyzing the country's military capability.

It's not only the French who are on a heightened level of alert. Italy has increased the alert level from "Shout loudly and excitedly" to "Elaborate Military Posturing." Two more levels remain: "Ineffective Combat Operations" and "Change Sides."

The Germans also increased their alert state from "Disdainful Arrogance" to "Dress in Uniform and Sing Marching Songs." They also have two higher levels: "Invade a Neighbour" and "Lose".

Belgians, on the other hand, are all on holiday as usual, and the only threat they are worried about is NATO pulling out of Brussels.

The Spanish are all excited to see their new submarines ready to deploy. These beautifully designed subs have glass bottoms so the new Spanish navy can get a really good look at the old Spanish navy.

Americans meanwhile are carrying out pre-emptive strikes, on all of their allies, just in case.

In the Antipodes...

New Zealand has also raised its security levels - from "baaa" to "BAAAA!". Due to continuing defence cutbacks (the airforce being a squadron of spotty teenagers flying paper aeroplanes and the navy some toy boats in the Prime Minister's bath), New Zealand only has one more level of escalation, which is "crap, I hope Australia will come end rescue us". In the event of invasion, New Zealanders will be asked to gather together in a strategic defensive position called "Sydney".

Australia, meanwhile, has raised its security level from "No worries" to "Fair dinkum, mate". Three more escalation levels remain, "Crikey!', "I think we'll need to cancel the barbie this weekend" and "The barbie is cancelled". There has not been a situation yet that has warranted the use of the final escalation level.

OT: Gratuitous non-HP calculator picture

*Message #1 Posted by **hugh steers** on 31 May 2009, 10:06 a.m.*

took this picture yesterday.

I confess that i'd never heard of this model until recently when tony duell told me about it. I have established, the C interpreter supports pointers as well as structures. looks like the usual C lib is available and implicitly included. you don't include any headers.

the c_lang.zip here describes the C implementation, although this particular file is for a different machine. i'm hoping they are very similar. http://www.silrun.info/casio/pb2000/pb2000.htm

there's another one on ebay.

Re: OT: Gratuitous non-HP calculator picture

*Message #2 Posted by **Marcus von Cube, Germany** on 31 May 2009, 1:36 p.m.,*
in response to message #1 by hugh steers

It's in my collection. :)

The VX-4 lacks graphics commands and has no file system, so there is no fopen and the like. The C itself does not support ANSI style declarations and is quite slow.

The PB-2000C has a file system and graphics but otherwise the C translator/interpreter system is equivalent.

If you want a faster machine, the Casio Z-1 (or its FX-890P sibling) is an option. It offers more memory (installed and maximum) as well.

In the MySilicium forum is a recent discussion about Sharp's offering in the C arena, the PC-G850 in various subversions (S, V). The C is considerably faster then the Casio implementation.

Re: OT: Gratuitous non-HP calculator picture

*Message #3 Posted by **Bart (UK)** on 1 June 2009, 5:24 p.m.,*

in response to message #1 by hugh steers

Aaaah, can't bear to look at it, reminds me too much of an FX-850P I used to have. Absolutely LOATHED it.

New HP 41CX

*Message #1 Posted by **Nigel Bamber** on 30 May 2009, 4:25 p.m.*

A new HP41CX is for sale on EBAY right now for US$650. Three questions :

1. Is it for real ?

2. Have there been other new ones for sale before ?

2. If it is real, is it worth it ?

What does everyone think?

Nigel

Edited: 30 May 2009, 5:07 p.m.

Re: New HP 41CX

*Message #2 Posted by **Dan Grelinger** on 30 May 2009, 5:27 p.m.,*
in response to message #1 by Nigel Bamber

That same seller has attempted to sell these units (they have 7 of them listed, correct?) before, with no takers that I am aware of. So, in answer to your question as to whether they are worth it, it appears that the voting buyers have answered with a resounding.... no. They are bare (few accessories) and may be refurbished units from HP that have been in storage. I would guess they are good condition, fully functional units, and based upon past ebay sales for such, would be worth about $300, maybe a bit more, in an international auction. As with many such "Buy-it-Now" listings, I interpret it as "For Sale, To Those with More Money than Brains".

Dan Grelinger

in response to message #2 by Dan Grelinger

BIN = 2 X TV

where:

BIN = Buy It Now

TV = True Value

Note: This formula does not apply to Coburlin.

Re: New HP 41CX

*Message #4 Posted by **Michael Meyer** on 31 May 2009, 3:19 p.m.,*
in response to message #3 by Michael de Estrada

I know that someone in England found a pallet of brand new ones 6 or 7 years ago. I bought two of them early on for about $50 each... the last ones ended up selling towards the end for closer to $300, if I remember correctly. The two I have, are indeed, brand new and unused. I don't think they're refurbished. I've never used mine. I don't know if they'll be worth anything more in the future, but they're the only unused units in my collection. Except for one unused HP-71B.....

Edited: 31 May 2009, 3:22 p.m.

Re: New HP 41CX

*Message #5 Posted by **Randy** on 31 May 2009, 3:59 p.m.,*
in response to message #4 by Michael Meyer

Actually, several crossed the $700 mark before he ran out... I think one hit $850 or so during the Christmas season. Early on, $200-$300 was the range once people heard they where in fact as advertised. Initially he was selling multiple units at the same time but soon learned to do one at a time.

I bought several. Sold all but one that I have in safe keeping :)

IMO $650 isn't out of line.

Re: New HP 41CX

*Message #6 Posted by **Nigel Bamber** on 31 May 2009, 4:41 p.m.,*
in response to message #5 by Randy

If it is new, I tend to agree that such an item that should be 30 years old , but sort of isn't, is worth a premium.

As a matter of interest would the electronics within such a machine be 'as good as new' or would they be susceptible to sudden failure , as a used model might ?

Nigel ' slightly tempted by one ' Bamber

PS $50 - what a bargain !

Re: New HP 41CX

*Message #7 Posted by **Glenn Becker** on 5 June 2009, 11:11 a.m.,*
in response to message #1 by Nigel Bamber

I hope this isn't too boneheaded a question. I will soon be getting reimbursed for a training course I took this spring, and have decided I would like to use a bit of the money to try and get myself a 41CX. However, experience has taught me that I'm not awfully good at winning things on eBay, partly because I often don't know what my bidding limit "should" be for a particular item.

What would a reasonable price be for a 41CX with, say, manuals and a couple of modules included, in good working condition?

I appreciate any input.

Re: New HP 41CX

*Message #8 Posted by **Egan Ford** on 5 June 2009, 1:33 p.m.,*
in response to message #7 by Glenn Becker

$250 if in great condition.

My advice:

1. Track down 10 that you like. Put them on your watch list, see what they sell for.
2. Open up an Auction Sniper account.
3. Track down another 10 that you like. Decide what you are willing to pay for each one. Some may only be worth $100 to you, others more.
4. In Auction Sniper create a bid group. Put all 10 in there and the price you are willing to pay for each. Also put in the bid group to quit after wining just one. AND, be very careful that the end times for all 10 are separated by a few minutes. (You do not want to win more that one).

If the above fails, then you need to spend more. Take your time, no rush, there are always 41CXes for sale. Start cheap, and if you like it, get a better one later, and then put your old one back out in to the community for others.

Just my $0.02 US.

*Message #10 Posted by **Thomas Okken** on 5 June 2009, 5:30 p.m.,*
in response to message #8 by Egan Ford

I'd definitely second the sniping suggestion. Although I have never used automatic auction sniping services, I have won a few auctions by simply logging in a few minutes before the auction I was watching ended, and then, with seconds left on the clock, entered my maximum bid. This worked pretty well for me (although it will probably become less and less successful as automatic sniping becomes more common). Bidding earlier just gives other bidders more time to respond.

The advantage of sniping is that you don't announce your willingness to bid any earlier than necessary. As long as eBay auctions have a fixed duration, there is zero advantage to *you* of bidding any earlier than necessary. But, whether you're sniping or not, it is advisable to decide how much you're willing to pay for a particular item, and stick to that maximum no matter what. It is easy to get excited and spend an amount you end up regretting -- I think psychologically speaking, it's similar to what happens to some people in casinos (hint: bring however much you can afford to lose, in cash, and leave your checks and credit cards at home).

Tip: if you see something that looks really interesting but that nobody has bid on at all yet, you may want to make a very low initial bid. That bid is virtually guaranteed to get beaten (and if it doesn't, you'll get the item at a ridiculously low price!), but it has the effect of preventing the seller from withdrawing the auction or changing its terms. This prevents some annoying practices by certain people we all know and love. ;-)

Happy collecting!

- Thomas

The xth root of y on the hp 35s

*Message #1 Posted by **Quan** on 30 May 2009, 2:46 p.m.*

While quickly going through the first few chapters of the manual to get acquainted with the 35s, I came across an example on page 4-3 which shows the calculation of 3th root of -125 to be -5.

This perked my interest since I was under the impression that taking any xth root of a negative number is not possible on the 35s.

I performed the example, then tried calculating the xth of a handful of negative numbers.

Conclusion?

It only works if x is odd (and y can be any negative real numbers). If x is even, it will fail.

The only condition mentioned on the page is that for y<0, x must be an integer.

Can someone tell me why?

My guess is that the condition should be for y<0, x must be an even integer.

Thanks.

Re: The xth root of y on the hp 35s

*Message #2 Posted by **Karl Schneider** on 30 May 2009, 4:22 p.m.,*
in response to message #1 by Quan

Quan --

"x-th root of y" on the HP-35s (and its predecessors HP-33s and HP-32SII) has a real-valued range and real-valued domain of x and y. The negative real-valued odd root of a negative number can be obtained. However, complex-valued roots cannot be obtained with the function, and complex-valued inputs are invalid.

The domain and range of "y^x" do encompass complex numbers, but there are some peculiarities. Please see the following archived posts:

"x_root_y" and real vs. complex roots

35s complex-number functionality

xth root of y

*Message #3 Posted by **Hal Bitton in Boise** on 31 May 2009, 11:39 a.m.,*

in response to message #1 by Quan

Hi Quan
Since real valued roots are (apparently) all the 35S will return, and since a negative real number has 1 real odd root, that's what is returned. Since that same negative real has no real valued even roots (they're all complex), nothing is returned. All the even or odd roots of any number, real or complex, are relatively easy to come up with (DeMoivre's Theorum), but it would be nice if the calculator would just give them to you. If the 35s will solve for the zero's of a polynomial (I don't have a 35s, so I don't know), a workaround would be to transform to polynomial form and get the roots that way (cube root -8 would be (x^3 + 8), and the three cube roots (ie zero's) returned would be (in polar form) 2@60deg, 2@180deg (ie,-2), and 2@-60deg.

Best regards, Hal

the experience of programming: old vs. new

*Message #1 Posted by **Glenn Becker** on 30 May 2009, 1:43 p.m.*

Good day, all.

I hope this doesn't come out sounding heretical. ;) I have spent some time the past few weeks slavering over 'Net sales / auctions of classic HPs like the 41C/CV/CX ... but if I am honest with myself, I must admit I really don't have the handy cash to become a collector - if I did have it, I would jump.

So with that in mind I have also given the 35s a look, and it appears (and according to some reviews, does have) a good deal of resemblance to an 'old classic.' I find myself wondering, outside of the obvious differences in build quality, number of available registers, etc., will I have a comparable experience programming something like the new 35s as I would if I broke the bank and got an old model from the 70s?

I'm not questioning whether money spent on a classic calc would be "worth it," I just don't think it would be wise for me. But I would like to have roughly the same experience I would have had back in the 1970s if I'd been a) more aware and b) more true to myself.

Thanks for any impressions/opinions.

Regards,

Glenn

Re: the experience of programming: old vs. new

*Message #2 Posted by **Don Shepherd** on 30 May 2009, 1:54 p.m.,*
in response to message #1 by Glenn Becker

Glenn, if what you are interested in is pure RPN programming, get a 33s. It is significantly faster than the 35s, its functions work better, and it does not have any "bugs" that I am aware of.

If you don't need scientific functions, get a 12c, especially if you can find one of the newer "60 times faster than the original 12c" ones.

*Message #5 Posted by **Thomas Chrapkiewicz** on 31 May 2009, 11:00 a.m.,*
in response to message #1 by Glenn Becker

Glenn:

I believe I understand your desire to have a machine with the older/'classic'/simple feel.

Firstly, I must precede the following by saying that I am not familiar with, nor have I tried the 33s.

I have used the 35s quite a bit and do find it does truly have the 'feel' - both in programming and esthetics of the old/classic HP Programmables (I have used a HP65 since 1974 and have programmed the 25, 67 41 through the 48 series).

1. With the 35s, the ENTER^ key is properly sized and positioned. Personally, I find using any RPN/RPL machines (like the 49/50 series) with the 'newer' ENTER^ key size/position to be quite disturbing.

2. The programming is very 'comfortable' compared to the older line-oriented RPN machine.

3. The keyboard feel is quite close to the classic feel (I've recently been let down by the feel of the 20b - mushy and scratchy).

You may find the code listings on my webpage of interest: http://tchrapkiewicz.googlepages.com/hp35s I oonfigured the machine with 100 data registers, and some of the code on my page demonstrates some functionality with that register set.

Good luck - for the price, I believe it's worth trying the 35s.

Regards, TomC

Re: the experience of programming: old vs. new

*Message #7 Posted by **Egan Ford** on 31 May 2009, 12:52 p.m.,*
in response to message #1 by Glenn Becker

Why not start with a few emulators? There are 41 and 42 emulators for just about every platform including PDAs/iPhones.

Re: the experience of programming: old vs. new

*Message #8 Posted by **Glenn Becker** on 31 May 2009, 1:06 p.m.,*
in response to message #7 by Egan Ford

I have one of the 41 emulators on a Windows install somewhere. I don't know, I am very fond of the actual physical artifact as opposed to an emulation. That sounds foofier than I mean it. :)

Of course a good emulator _would_ give me and idea of what the process of programming was like on, say, a 41C.

Re: the experience of programming: old vs. new

*Message #9 Posted by **Egan Ford** on 31 May 2009, 1:22 p.m.,*
in response to message #8 by Glenn Becker

That was the point. Before you spend a lot of $, give it a test drive first.

For programming I find that the 41 and 42 have the most to offer. There is no publicly available 35s emulator. Cost wise it is a low risk.

Re: the experience of programming: old vs. new

*Message #10 Posted by **Mark Edmonds** on 5 June 2009, 1:13 a.m.,*
in response to message #9 by Egan Ford

Too late now perhaps but one machine I rate very highly that is far better than most people give it credit is the 32sII. Not only does it have the superb Pioneer series ergonomics, it has one feature that is closer to the older machines than the 35s - a lack of memory!

But it still has enough memory to write serious programs and I'd rather have a machine which feels designed for the size of memory it has instead of a new machine that has huge memory but due to its programming model, it is almost impossible to take advantage of the large memory size.

The 32sII should definitely have its own feature page in the museum and I hope one day, will be regarded as a classic. It does nearly everything the 35s does (the 35s is actually like the 32 with a few extra functions), has hugely better ergonomics and because it is such a relatively new machine, prices are not as mad as the older machines.

My 35s sits on a shelf unused. My 32sII remains on my desk. It is a fun machine.

*Message #12 Posted by **Mark Edmonds** on 5 June 2009, 1:10 p.m.,*
in response to message #11 by Egan Ford

I must admit to being very curious as to why complex number support is so important to so many people. I'll start a new thread.

I suppose with the 32sII you have to say that complex number support is a bonus rather than

something that seems to have been an essential design consideration from the start (ie, 15C).

The 32sii actually has a few features that are superior to the 35s: (1) Polar to Rectangular conversions (2) faster integrator and solver (3) better interface and footprint (3) better overall build quality with no missed keystrokes. -- I am sure there are others.

As for the complex number support; it may be lacking compared to the 15C and 42S, but it serves most purposes. It is a great little machine nonetheless and arguably easier to keystroke program (or at least edit programs) that the 15C. The only downside for me is its limited memory!

Re: the experience of programming: old vs. new

*Message #14 Posted by **Mark Edmonds** on 6 June 2009, 8:26 a.m.,*
in response to message #13 by Jeff Kearns

One benefit the 35 has with P->R conversion is that you can convert immediately on input.

However, I've just realised I don't know how to split the result. The 32 returns two results but the 35 is one so if I've just done a conversion and got 3*i*4, how do I isolate them?

Another area where the 32 totally blows away the 35 is base conversion. I need this a lot. I detest the way the 35 works with explicitly needing to specify the base each time. Absolutley daft design. I honestly cannot find a single advantage for the 35's method over the tried and trusted methods in all previous calcs.

The 35 does have logic operations though which is a big plus.

Have you been successful composing them in polar notation in any other way than just typing them in? Say, you have r in register x and phi in register y. How would you compose them? This is on of the weakest points of the 35s.

The deficient abilities of the rectangular to polar, polar to rectangular and related functions on the HP 35s were discussed at length in the summer of 2007 upon its release. A search of Archive 17 will yield lots of information, for example see this thread.

The following program will convert a complex number to its rectangular components.

```
Z001    LBL Z
Z002    SF 10
Z003    eqn CPLX->RECT
Z004    PSE
Z005    CF 10
Z006    ABS
Z007    CLx
Z008    eqn ABS(LASTx)*SIN(ARG(LASTx))
Z009    eqn ABS(LASTx)*COS(ARG(LASTx))
Z010    RTN
```

...

The display of the 35s is quite dissapointing. A less reflective cover and some space between annunciators and border would have been geat.

It's about time for a 35sII :^).

All true and that it why I wanted one, but I expected it to be a 15C++, not an 11C++. My bad. So I'll just be happy with my 15C/42S and emulators. Emulators will live forever.

True, they will and the development of emulators to preserve our computing heritage is a wonderful thing ... but in terms of devices like pocket calculators, don't you find them a strangely detached experience and very removed from operating the real thing?

Myself, I use emu48 for quick calculations but when I want to program something, I always grab the real thing. For some reason, I just cannot get into programming an emulation.

> Myself, I use emu48 for quick calculations but when I want to program something, I always grab the real thing. For some reason, I just cannot get into programming an emulation.

It's a matter of perspective, I guess. My experience seems to be the opposite of yours: I regard my real HP-42S as a museum piece, cherished but rarely used, kept around more for old times' sake than anything else; when I need to use a calculator in everyday life, I use an emulator on whatever device is close at hand.

At work, I always have a PC (I'm a computer programmer so PC availability is an occupational hazard). At home, my iPod touch is never far away... And when I'm travelling, I always have my Palm with me. I have and use these devices anyway; installing calculator emulators on them means I have a calculator with me at all times, too, without needing to carry Yet Another Physical Device -- and without having to worry that my hard-to-replace vintage HP will break or get stolen.

I do miss the HP-42S keyboard sometimes, but my virtual calculators run on commodity hardware, and can always be ported to new hardware should the need arise... The HP-42S, on the other hand, is slowly dying out. That reality, sad as it may be, makes using the real HP-42S feel like a detached experience, and it makes using an emulator feel more like the real thing -- for better or worse. ;-)

Not really. But when I go back to using the real thing there is a noticeable improvement, but not enough to make me switch back.

I travel frequently, and used to carry a 48GX/50g (for my programs) and a 15C (small and quick). Now that I have an iPhone with 15C/42S/41CX and my MacBook with x49gp (50g emulator with ARM support, i.e. I can run my C programs too), I opted to reduce space and weight by leaving them behind.

I know what you mean, however if you get use to the keymap its not that bad. I

find with RPL programming that alpha entering commands is very fast on a QUERTY keyboard.

HP-35s and HP-32SII complex-number support

*Message #22 Posted by **Karl Schneider** on 6 June 2009, 4:01 p.m.,*
in response to message #11 by Egan Ford

Hi, Egan --

> Quote:
>
> I obtained a 32SII because of the positive hype, and now I know where the 35s got its brain dead complex number support.

It goes back further than that, as indicated in this archived thread from 2007:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv017.cgi?read=119576#119576

A self-quote from the thread:

"The complex-number functionality of the HP-32S, HP-32SII, HP-33s, and now apparently the HP-35s, was essentially a porting of the HP-41 Math Pac's RPN routines."

*Message #23 Posted by **Mark Edmonds** on 6 June 2009, 4:35 p.m.,*
in response to message #22 by Karl Schneider

So for all the hardcore complex number users, what is the general verdict on the way the 48 series deals with them? It looks relatively elegant to me but I can see that having to enter the brackets each time can be a nuisance - although it wouldn't be difficult to setup a user-Enter key to combine lvls 1 and 2 into a CN automatically. Anyway, is the 15C still preferred to the 48 series?

Mark

Complex-number support for the HP-48 series and beyond is mathematically complete. Numbers can be entered and displayed in polar mode (unlike the HP-28 series). However, I also dislike representing a complex number as an ordered *parenthesized* pair, which could also be a point on a graph, a pair of statistical data, or an open range of numbers.

The "R->C" function on RPL-based calc's combines levels 1 and 2 into a complex number. However, it differs from "COMPLEX" with two reals on an HP-42S, in that R->C always treats the two reals as the components of a complex number in rectangular format. COMPLEX treats the two reals as the components of a complex number in the selected format.

More on the general topic from the Archives:

Karl - there is a solution to this problem in the 48 series which enables you to enter levels 1 and 2 and have them combined into a complex number of the currently selected format. It doesn't involve any programming, just a different command and a flag.

Please try this:

1. Set flag -19.
2. Put the machine into Polar.
3. Enter for example 5 and 53.1 in levels 2 and 1.
4. Goto MTH/VECTR and press ->V2
5. You now have a complex number in the correct format.

Obviously this also works in rectangular mode. I agree it isn't as neat as being able to do it with a single shift+key in the 42s but at least the solution does exist in the 48 machines and if you keep the Vector menu open in the 48, it is still very immediate.

Flag -19 sets between creating a vector or a complex number with the ->V2 command.

HHC2009 HP Conf Attendance 20 and Counting

*Message #1 Posted by **Jake Schwartz** on 30 May 2009, 10:32 a.m.*

Hi,

With around four months until the HHC2009 HP Calc conference at HP's Vancouver, Washington facility in October 3-4, we now have reached 20 registrants. For those on the fence, it's always an enjoyable time with usually something new for everyone to learn and probably something "old" for everyone to rediscover as well. For the third time in as many years, the U.S. conference will be held at an HP facility, thanks to the current calculator development group, and this eliminates significant cost and complications which usually plague the organizers. Come meet those people whom you've only known by the typed name on the computer screen or reconnect with old friends...you won't regret it. For more info on HHC2009, consult http://holyjoe.net/hhc2009/ or to see info on the past decade of conferences, check http://holyjoe.net/hhc/.

See you in Vancouver,

Jake Schwartz

Restoration Guide, ideas, help, suggestions and etc....

*Message #1 Posted by **Geoff Quickfall** on 30 May 2009, 12:40 a.m.*

Hello all!

I have been thinking of a publication project and want to know if it would be recieved by the HP community. I am looking to cover production only and shipping only.

Also, I will be floating some ideas out there and want to make sure credit is given where it is due. For example, Katie's HP 97 printer gear solution or Karls dental floss spice opening technique, Card reader o-rings or tube solutions and etc.

I know for a fact that I am not the only one that has independently, or with research, come across an idea for restoration and I want to make sure I acknowledge the originators.

There will probably be an extensive bibliography!!! I am, however, going to, or have done all the projects myself that will be included. All photos will be original by me for consistency of publication.

I have quite a collection of restoration photos made up now. Raw images and labeled all done on the blue background. I do this intentionally so that any booklet will have matching photos throughout.

So far the book will include:

1. HP 65 ground up restoration complete with about 25 labled figures including PCB, Card Reader, exterior finish, etc. This will be the most in depth restoration it explains all that can go wrong with a classic, and many subsequent models designs.

2. HP 97 gear replacement, cleaning, case restoration and a light focus on the specific card reader and printer removal. The rest of the techniques would be covered on the HP 65.

3. Woodstock restoration including keys, switches, (non invasive techniques for cleaning and restoring)

4. Spice opening and restoration as in this posting

5. Voyager opening, keyboard repair as well as keyboard dis-assembly, yes the dreaded rivet removal and replacement

6. Pioneer repairs as well as case opening and memory enhancement of the 42S and quartz timing crystal installation (?)

7. Stretch Pioneer repairs, case opening and etc

8. HP 01 cricket repairs and case restorations

9. HP 9825A tape deck repair and printer repair as well as the typical case restoration and etc.

10. HP 71B opening and ribbon repair, aluminum bezel finish restoration, keyboard resurrection....

11. TDS memory card battery change.

12. and of course every thing to do with the HP 41 and it's card reader including battery post problems, corrosion problems keyboards and etc. (thanks for reminding me that I forgot to include the 41 especially this year).

Of course there will be overlap so after the HP 65 main restoration topic, the other chapters will be specific to the challenges that each series/family present to the restorer.

Many appendixes with tool lists, polish and compound used for cleaning, cleaning solutions that have been successfully tested and etc.

There will be many colour pictures, which will increase the cost but as this is an 'on demand publication' the costs will be kept lower.

What will not be included at this time is an in depth electronic repair section, not my forte. However this may change with help from you, the community, as the project matures.

So the question is:

Is there an interest in a 50 to 100 page book full of how to illustrations, before and after photos, labelled figures, tool requirements and restoration techniques with appendices including diagnostic programs for the 65, 67 and 97?

Let me know as I will be doing this anyway, for me! (in fact the 20 page HP 65 restoration section is already completed) and the photos for 90% of the book project have all ready been taken.

Hope to hear from you all,

Geoff

in response to message #1 by Geoff Quickfall

The HP 9825 tape repair techniques probably ought to be in a separate book. (I'd want it.) In fact, each calculator series might be in its own ebook. You could probably charge $9.95 for each ebook with a discount for the entire library.

Re: Restoration Guide, ideas, help, suggestions and etc....

*Message #3 Posted by **Geoff Quickfall** on 30 May 2009, 4:21 a.m.,*
in response to message #2 by Steve Leibson

Steve, get some sleep.

The E book sounds like an interesting idea.! And the HP9825A might be more your forte, especially the tape drive. I will proceed as far as I can go and document the steps in any case.

Cheers, Geoff

P.S. your link to the HP 45 restoration has been broken. I should stick it in the articles section but will have to find it in the archives again.

Cheers again, Geoff

in response to message #3 by Geoff Quickfall

Geoff - Greetings from the NCR

I would definitely be interested in your booklet. I have successfully (i.e. no damage that I am aware of) opened up Spice units half a dozen times using the method described at www.voidware.com/calcs/spicerepair.htm. But understand how it can be a risky understaking... It's funny, but I remember trying Karl's floss method a couple of years ago and was unsuccessful at that one (maybe the floss was too thin).

Anyway, I own at least one Woodstock, Spice, Voyager, HP-41, Pioneer series calculator so I could benefit from your manual. Great photos and enviable collection, by the way! I want to 'memory enhance' one of my 42's!

*Message #5 Posted by **hugh steers** on 31 May 2009, 9:49 a.m.,*

in response to message #4 by Jeff Kearns

Hi,

the method described here (as mentioned) http://www.voidware.com/calcs/spicerepair.htm

was shown to me by Tony Duell. He gets the credit for this method. I tried the floss method, but it didnt work for me. perhaps my floss was too thin/weak etc. not sure.

Tony's spice opening method involves applying pressure in a certain way that is difficult to describe in words, you have to really see it and try it.

one other thing. i've been told my scraping the contact method to clean them is not recommended!

:-)

*Message #6 Posted by **Geoff Quickfall** on 1 June 2009, 10:48 a.m.,*
in response to message #5 by hugh steers

Hello Hugh,

That was my preferred method until I found 5 of these spices in a box all exhibiting the same intermittant LED faults. It involved simutaneously pulling the bottom shell towards you while pushing the top shell away.

The method was dependent on the stiffness of the latch and whether or not the bottom shell would slide out of the lip it resides in on the top shell.

Although better than the " brute force method " one could still damage the lip and latch.

I am not saying I have perfected the method, but the method I have illustrated takes into consideration the lip and latch and requires minimal effort, just a little finesse.

The force used in the "push pull technique" you refer to is again almost extreme, unless you can leverage the bottom shell out of the lip in the top shell while pushing and pulling at the same time!

Wednesday, pub crawl, see you there, Geoff

P.S. clean the oxide of grit with a brush and alcohol. I then use a fibre glass pen with alcohol and top it off with a film of silicon grease for slide contacts

*Message #11 Posted by **Michael de Estrada** on 1 June 2009, 5:42 p.m.,*
in response to message #10 by Saile (Brazil)

Saile,

There is one problem with the HP67 repair that you show. The epoxy fix for the motor to worm gear coupling effectively disables the clutch feature, which limits the torque that can be transmitted from the motor to the worm gear in the event of a card jam or some other problem that could stall the motor and damage it. Geoff has a fix using wire insulation that effectively preserves the clutch feature, while providing efficient transfer of torque under normal circumstances. Hopefully, Geoff will include his clutch fix in his repair treatise for the HP65/67/97/41 card readers.

Michael

Saile and Michael, thanks for the inputs,....

*Message #12 Posted by **Geoff Quickfall** on 1 June 2009, 6:06 p.m.,*
in response to message #11 by Michael de Estrada

As the input from any other interested members progresses, I will know who or whom to credit with the original concept.

I intend to document the most efficient/extensive repairs that have been created by the group as well as myself. To that extent, thanks for the links Saile! Each repair will be done by me (most have already!) and then assembled into the booklet so keep the links comming.

Hello Michael, the HP 65 booklet has already been created and covers 22 pages with full colour matched and labeled photos. In that repair the pinch wheel and clutch have been covered as well as PCB cleaning, contact cleaning, case restorations, diagnostics, battery holder surgery and etc.

I will include in the 67 section some basic differences to the restorations. The 97 will include printer restorations as well as printer and card reader removals. Since the roller and clutch are similar it would not be cost effective to show the same repair for the 67 and 97.

The HP 41 card reader is a different animal with respect to reaching the roller. I will show the steps for disassembly and reassembly of course. The same repair for the HP 67 et al will apply.

Also the HP 41C dissection will in itself be a large section covering as many of the differing keyboards to PCB connections that I can find. So far I have 3 differing PCB's, one of which (Singapore 1986 CX halfnut) does not even need any of the screw posts or screws at all to function correctly. I.E. a couple of elastic bands to hold the shells together!!!!!!

The 41C section will be an offshoot of the paper at the October HCC2009 conference.

The other families have their own quirks, but mostly it involves the safe separation of the halves; especially the latter LCD voyagers, pioneers and stretch pioneers as well as the spice documented earlier at the museum.

Section on keyboard repairs (non-invasive) and invasive techniques. As we know some keyboards are riveted in place and preclude and easy dissassembly. I have an 11C here in need of a new LCD panel so for the heck of it I removed the rivet heads to gain access. It works now, however it is time to find a final fix for the rivets, small screws, melted plastic, epoxy.....

In conclusion

Now many of the repairs have been done before but again for the sake of consistency I will be documenting each repair step by step.

There will be two major repairs, the HP 65 and the HP 41. These will cover keyboard repairs, screw posts, connections, electronics, case restorations, label printing on home computer, label restorations.

The rest of the families will differ in access to the internal sections, keyboard differences, display differences, case restoration differences etc. In effect, this will be a differences section with a photo essay of diassembly of each family or series; photo documentation of fixes that would differ from the 65 or 41 section.

Cheers, Geoff

<sigh> clutch torque limit = urban legend

*Message #13 Posted by **Hans Brueggemann** on 6 June 2009, 8:28 a.m.,*
in response to message #11 by Michael de Estrada

micheal, can you provide us the HP-approved value to which the torque limt should be set when repairing "THE CLUTCH"?
that would be surely of greatest help to all 67/97... restorators in the forum!
cheers,
hans

Hans:

Bravo! I could not think of a kind way to state (once again) it isn't a clutch. Thank you for a most elegant way to prove that fact...

Re: <sigh> clutch torque limit = urban legend

*Message #15 Posted by **Michael de Estrada** on 7 June 2009, 8:26 p.m.,*
in response to message #14 by Randy

I found your original deleted reply much more than unkind. It was plainly rude and insulting. And the reply by Hans is sarcastic and arrogant. Regardless of the merits of your respective opinions, enlightened people simply state the reasons for their positions, and do not resort to personal attack. My reply to Saile above did exactly that, no less or more. I did not question his wisdom or intelligence. So, if you want to challenge my or anyone else's statements or positions, just do so factually without engaging in unnecessary vitriol.

Michael

I've certainly hijacked this thread...

*Message #16 Posted by **Randy** on 8 June 2009, 9:45 a.m.,*
in response to message #15 by Michael de Estrada

Which was not my intent and why I deleted my original post as I felt the topic didn't warrant further comment. I think it was up for no more than a minute before I deleted it.

If you felt it was rude and insulting, that's unfortunate as it was only an expression of my frustration with bad information being propagated. Personal attack? I don't see any names mentioned or implied. Harsh, yes, but personal? Not in my view. Believe me, I did that once on this board a long time ago and I've never repeated it.

Since you've now seen fit to mention something not seen by everyone, in the interest of fairness, here it is again.

[begin deleted post]

... because if somebody tells you an HP card reader has a clutch, don't believe them. It is never referred to in the HP documentation as a clutch because it isn't one.

The lead screw and motor combo was a complete assembly and in a functional, factory original reader, the screw is quite firmly attached to the motor shaft. The "clutch" action comes from the card slipping against the drive wheel.

To anybody that says otherwise is only parroting what they've read on the Internet. The proof is the 97 and 82104A service manuals. So is the proper motor adjustment procedure. You don't just adjust the eccentric until the the thing works... Do you really think that's how HP did it at the factory?

It is amazing to me how much bad information is out there that just keeps turning up again and again. Very sad. Let's not propagate it any further here, okay?

[end deleted post]

I believe I now understand why David Smith no longer posts... :(

Not really! this is the desire of the thread creator, accuracies for the book, not myths...

*Message #17 Posted by **Geoff Quickfall** on 8 June 2009, 11:48 a.m.,*
in response to message #16 by Randy

Aside from any frustrations with inaccuracies, urban myths postings and etc, the factually basis of the responses was the reason for the posting in the first place.

For example, the "clutch". What was the reason for the addition of the coupler from the motor shaft to the worm gear shaft:

```
1.  could the shaft and worm gear not have been one piece?
2.  was the coupler in the form of a rubber sleeve been used as a
    noise damper
3.  was the coupler in the form of a rubber sleeve been used as a
    vibration damper.
3.  was it used to allow slippage for a jammed card, (since 1981
    that has never happened to me and I use mine every day.
```

The 97 repair manual does not mention the reason for the coupling so urban legends are created. Also, not many of the originals designers around.

I have an HP67 new in box and the rubber coupler does not give, I haven't forced it! It is the original rubber, not glued or one piece. That has to lead to questions about replacement. Intuitively one would like to replace it with the actual material. In reality, that would lead to disintegrating rubber in 5 to 10 years necessitating another repair. That is why the 'insulation used as a replacement' idea was created.

The eccentric cam, as it is correctly called, yes it is adjusted after the system works although in C of the trouble shooting section figure 29 (refering to paragraph 4-40) it is used to adjust card reader speed.

Rotating the eccentric cam after assembly and with a reader that writes only or reads only has remedied many read/write problems, again, done by people after the repair and without manuals. On some machines the original rubber still functions, yes I have a 41C and HP 67 with functional original rollers. Both these had card reader read problems, not write problems. This may have been due the speed of the motor changing over time (lubrication?).

Randy and Hans, keep the 'Accuracies' coming, email me in person, better yet, write a small essay on the inaccuracies that you perceive are being perpetrated on the net and here. Post that in the articles section where it will not dissappear beyond the current page and maybe that info will be propagated. With permission I will add this to an appendix titled "truths" or something like that.

With respect to the word 'CLUTCH' you both are correct. There is no reference in the HP 97 manual to the CLUTCH, however, there is no reference to the motor 'CLUTCH' system. Even the exploded view does not refer to the more correctly called 'coupling' between the motor shaft and the worm gear. CLUTCH does appear, even if incorrectly, as the name given in popular literature.

This would probably mean the entire motor system was replaced as one piece and therefore did not warrant any mention of individual components, hence the made up name CLUTCH. Of course, I must say I have not read everypage of the 97 repair manual so if you could point out the reference to the correct name I would appreciate it. I will be calling it a coupling and still advocating an insulation repair which closely simulates the original properties of the the system. This may be a case where to much thinking has been applied to the system and this was the cheapest method to link a Swiss produced motor to a shaft at HP. That is, it requires no damping, slipping properties at all.

For Eric, I too, after a lot of research on the 'Internet' was led to believe it to be a 'clutch'. Although when I first saw the design, I was inclined to believe it to be a damper. It certainly removes vibration and noise from the system versus a 'glued' option which simulates a 'one piece axel'. My insulation replacement will much more accurately, in my mind, replace the design concept behind the rubber coupling. It can do that without knowing the 'reason or name' given to the disintigrated rubber coupling. But for the sake of the book, I want and need to be factual and therefore accurate.

There, the thread is back on track.

Geoff

Re: Not really! this is the desire of the thread creator, accuracies for the book,

not myths...

*Message #18 Posted by **Michael de Estrada** on 8 June 2009, 2:50 p.m.,*
in response to message #17 by Geoff Quickfall

Geoff,

I used the term "clutch" only because it seemed to be common usage that everyone would recognize. In fact, it could not be truly a clutch, since a clutch is a device which gradually equalizes the speed between between a motor and some driven system such as a transmission in a car. A more appropriate description would have been an elastomeric torque-limiting slip coupling, which at some point would permit slippage between the motor shaft and the inner bore of the elastic coupling material. The slippage point would be determined by the tightness of the press-fit. Devices like this do in fact exist in the real world, and are used as safety-devices to protect electric motors from being stalled under power when some malfunction occurs such as a seized bearing. I assumed that HP had done this on purpose, whereas it now appears I was mis-informed.

I had absolutely no problem with Randy or Hans correcting me on this point; just the way they chose to do it. I have been politely corrected numerous times on this forum for my mis-statements, and will readilly acknowledge such errors without being offended. Suggesting that I or others are no more intelligent than a parrot is rude and insulting to me. Perhaps I'm a little too thin skinned to participate in a form such as this, where I may be subjected to such treatment dare I not do exhaustive research before posting my opinions.

Edited: 8 June 2009, 2:57 p.m. after one or more responses were posted

Michael see my post below!

*Message #19 Posted by **Geoff Quickfall** on 8 June 2009, 2:57 p.m.,*
in response to message #18 by Michael de Estrada

I agree with you, as explained below.

The Popular term is clutch for right or wrong. It would seem that I will need an appendix which translates popular terms to correct terms, unfortunately in this case, clutch, damper, or coupler may be the correct term and function!

The fact is the entire assembly was replaced and the manuals do not refer at all to the components! So as far as I am concerned clutch can suffice although I would add the damper and coupling terms.

I am awaiting more orignial info by mail from some of the period designers at HP. Of course I will also raise this in October.

As far as your postings, and any postings, information helps. Unfortunately we can never tell if sarcasm is nasty or humorous as we cannot read the facial expressions of the poster. I also missed the original posting that was edited so I missed the 'parrot' term.

I too think that with the above limit in postings, that sarcasm be kept at a minimum and corrective information be kept at a maximum.

Cheers, Geoff

Edited: 8 June 2009, 2:59 p.m.

This is an opinion?

*Message #20 Posted by **Randy** on 8 June 2009, 3:14 p.m.,*

in response to message #20 by Randy

As stated below in my response to Geoff, I have no problem with your statements correcting the facts....just the way you did it.

an addendum to the CLUTCH myth

*Message #22 Posted by **Geoff Quickfall** on 8 June 2009, 2:51 p.m.,*
in response to message #17 by Geoff Quickfall

It would seem after careful reading of the 97 manual that HP replaced the entire motor assembly. Therefore they either:

```
a  did not think to add a design explanation to the coupling or
b  the coupling is just that, a coupling of two components produced
   at two differing sites that needed to be linked.
```

This fact coupled with the information that the motor was supplied from a swiss manufacturer and not specific for the HP designs MIGHT lead to the following conclusions (any original concept people from HP on the card reader out there? as it would seem everything else would be speculation).

```
1  melding an off the shelf motor with an in house designed system
   would create an coupling problem for the engineer.
2  either ask the motor to producer to create the shaft - worm gear
   as one piece or formulate a coupling in house.
3  since there are no specifications on TORQUE the assumption is
   that it is not a 'clutch', the popular common assumption.
4  there is no mention of damping or noise suppression characters
   either in the manual, this could be due to the fact that the
   unit is replaced in one piece and therefore the design
   specifications are not required.
```

Suffice to say, just because the TORQUE info is not supplied might just be an artifact of the idea that the repairer need not have the info as the entire motor worm gear assembly is provided as a replacement from the factory and the repairer need not know the parameters to affect a repair.

Again all this is speculating in a vacuum unless an original concept designer from the project can elucidate. I have a few feelers out there and am awaiting a definitive answer.

Until then the word 'coupling' may be appropriate although 'clutch' cannot be ruled out just because it is not mentioned in the repair manual. As stated this may just be as a result that the info was not required as the repair for the 'clutch' was a replacement of the entire "motor assembly" see table 6.4 of the repair manual.

Of course the assembly and component is mentioned in HP notes as a 'couple that dampens'. Oh well, who new!!!

Just a thought,

Cheers, Geoff

Re: an addendum to the CLUTCH myth

*Message #23 Posted by **Randy** on 8 June 2009, 3:05 p.m.,*
in response to message #22 by Geoff Quickfall

Some background info from the patent hosted on Eric's site:

http://www.brouhaha.com/~eric/hpcalc/patents/3893173.pdf

Some additional info here:

http://www.hpmuseum.org/techclas.htm

And the best description I'm aware, available on the HP labs archive:

Designing a tiny magnetic card reader Jump ahead to page 15.

FWIW, we could just ask the designer:

Bob Taggart, CEO & Chairman Chaparral Communications, Inc. San Jose, CA 95128

Randy,
*Message #24 Posted by **Geoff Quickfall** on 8 June 2009, 4:08 p.m.,*
in response to message #23 by Randy

the info provided is helpful.

The way it was presented to me was also appreciated. The component is referred to as a couple in the patent with no explanation as to it's design intent other than joining the two systems together.

The second reference is great in that it explains the couple is used for damping (noise and/or vibration?)

So hence forth 'coupler or couple' is the preferred name. Unfortunately until information supplied by you and others (and will be referenced in the book) other words have been coined, not parotted, as they are in common usage. So an appendix or addendum would suffice to correct the terminology.

Cheers, Geoff

Clutch, Coupler, whatever.
*Message #25 Posted by **Randy** on 8 June 2009, 4:47 p.m.,*
in response to message #24 by Geoff Quickfall

Geoff,

I have no problem with the name, only the continued propagation of the incorrect belief that the device is there to provide slip between the worm and the motor shaft. 'Nuf said.

Information, facts, misnomers and etc... and the Boeing 737 100 and 200 series...
*Message #26 Posted by **Geoff Quickfall** on 8 June 2009, 5:25 p.m.,*
in response to message #25 by Randy

I think for future reference that information be supplied, and that vague statements about 'torque' in this example (whether facecious or sarcastic or made in good humour) would be better off not made.

I am new to this restoration book idea, the reason for the posting was to solicit information exactly like that which you supplied, as opposed to the off handed statement made. That is also why it will be peer reviewed.

Now if the original statement had made about 'torque and the manual' and combined with the information you supplied of what exactly it is, then that would have been much more helpful and not have offended anyone.

Boeing 737

An interesting story (to me) was the coloration of certain subsystems on the over head panel of the Boeing 737. The colour scheme was dark grey with 4 subpanels being in a light grey. I asked an instructor of the import that the colour scheme. After getting several contradictory explanations about engine failures, generator failures and fuel switch cut off systems, I asked a Boeing representative. He stated he would make some calls as he did not know. 4 weeks later he called back and indicated that he had to call up an 87 year old engineer responsible for the colour design. It turns out that the explanations, over the years, from the experts was wrong. It had nothing to do with

engine failures, fuel switches, hydraulic problems, power failures. It was infact, placed there to graphically indicate to the third member of the crew in 1964 (the engineer) which switches and systems were his pervue and not the pilots.

Within 2 years of the design, the engineer was removed as redundant but the colour scheme remains in place to at least 2005. Since no one was around all the explanations were created in a vacumn.

Cheers, Geoff

*Message #27 Posted by **Philippe Lasnier** on 3 June 2009, 8:24 a.m.,*
in response to message #1 by Geoff Quickfall

Geoff,

I would happily buy a copy (or two, one for keeps, one as "working" copy) of your book.

I seem to have accumulated (how did that happen? ;-)) quite a few calculators, a few of which are in need of some restoration or other.

One question: would you be doing further editions, for instance to include chapters on models not yet covered such as HP-48S/SX/G/GX (from your own experimentations or others)?

Regards,

Philippe

in response to message #30 by Glenn Becker

Geoff, consider publishing on CD or DVD, this would minimize your costs and allow easy video presentations. Regards, Sam

table of contents and explanation, using the suggestions that have been posted and emailed!

*Message #32 Posted by **Geoff Quickfall** on 4 June 2009, 8:01 a.m.,*
in response to message #1 by Geoff Quickfall

This will be a peer reviewed book, maybe by the HCC committee, but this can all be hashed out.

The book will cover the following:

```
chapter and title             calculator for demonstration

1  classics                   65
2  topcat                     97
3  woodstocks                 29C
4  spice                      34C
5  voyager                    15C, 11C
6  pioneer                    42S
7  clamshells                 18C (don't want to mess with the 28S)
8  HP 71B                     metal back and plastic back
9  charlamagne (48 series)    48sx
10 41C and card reader

some appendixes
        tools
        dry box
        battery pack
        hints ideas
        credits and citations
        diagnostic routines (where they apply)
```

Since there is overlap in repairs and restorations the book will have a chapter dedicated to each family using the calculator given above as an example. Two chapters will be larger then the others; classics and 41C.

These chapters will entail all the steps for a complete restoration, for example the HP 65 is a perfect example of a classic plus some. The restoration of the full calculator inside and out including the card reader. Once the card reader has been described the only difference to restore a card reader in the 67, 97, 41C is in the access, which will be covered in the separate chapters that they reside in.

The 41C chapter is also larger as it includes problems such as screw posts, screw retainers, battery contacts. The card reader will be included here as it is very different in the access to pinch roller.

The other chapters will include the differences in access or keyboard restoration or any other difference that must be addressed to restore each machine.

The voyager will have two sections, including a non invasive restoration of keyboard, bezel and etc. The second section is a complete invasive restoration involving removal of plastic rivets for the keyboard and access to the LCD for replacement.

I am in London and have had a great time with Hugh Steers, thanks for the crawl (albeit short). When I get back I will post the actual table of contents. Most of the photos have been done so on to the text of the book and of course some more restorations.

Cheers all,

Geoff

The DVD form might be included with the spiral bound book, have to think about that as the DVD could include many more colour photos. The book will be an "on demand publication" which will limit cost. It will include MANY explanatory photos and as few spelling mistakes as possible ;-)

Re: table of contents and explanation, using the suggestions that have been posted and emailed!

Configurable Keyboard

*Message #1 Posted by **Paul Brogger** on 29 May 2009, 1:58 p.m.*

Has this configurable keyboard been reported upon before? (Sorry if this is a repeat.)

Now, a fixed HP-33S with dynamically reconfigurable keytops would be *really* cool!

[edit: Of course I meant 35s rather than 33.]

Edited: 30 May 2009, 2:01 a.m. after one or more responses were posted

Re: Configurable Keyboard

*Message #2 Posted by **Eric Smith** on 29 May 2009, 2:10 p.m.,*
in response to message #1 by Paul Brogger

Sure, if you don't mind a rather large $750 calculator. (Probably even more expensive than that, since the market would be miniscule.)

The keys on the actual production Optimus don't look so great. The display is recessed and does not move with the key, and the keycaps get greasy and dirty very quickly. If you have an iPhone or the like, how often do you find that you need to clean it or at least wipe it off? Now imagine having to do that to a whole bunch of separate keycaps.

Besides, when I operate a keyboard on a device, I want to be looking at the display, not the keys.

Re: Configurable Keyboard

*Message #3 Posted by **Pal G.** on 29 May 2009, 3:17 p.m.,*
in response to message #1 by Paul Brogger

Funny you should mention it. I thought about making the keyboard on my virtual calc OLED. So, if you press a Shift key, all of the other keys would change symbol and the Shift key would have inverse video, etc.

I've already filled out the paperwork for the patent, so I'm one step, and only one step, ahead of you ;)

Re: Configurable Keyboard

*Message #4 Posted by **Eric Smith** on 29 May 2009, 9:30 p.m.,*
in response to message #3 by Pal G.

Not to burst your bubble or anything, but there's quite a bit of prior art on that, so getting a patent may be an uphill battle.

Re: Configurable Keyboard

*Message #5 Posted by **Eric Rechlin** on 30 May 2009, 11:12 a.m.,*

in response to message #4 by Eric Smith

He should have no problem getting a patent, because they don't really check for prior art anymore (semi-officially the USPTO now leaves that burden to the courts). Anyone can get a patent for pretty much anything.

It would just be pointless, because he would have then wasted $10,000+ getting an unenforceable patent. But if he likes throwing away money just so he can brag to his friends that he has the cash to burn on obtaining a patent, you might as well let him humor himself.

Re: Configurable Keyboard

*Message #6 Posted by **Pal G.** on 30 May 2009, 11:41 a.m.,*
in response to message #5 by Eric Rechlin

I was joking about the patent my friends. I agree with Eric's assessment about astronomical costs. It's a cool idea that may never be implemented, or at least for a few hundred years, if calculators are still in use.

Cheers,
PG

Re: Configurable Keyboard

*Message #7 Posted by **Quan** on 30 May 2009, 11:59 a.m.,*
in response to message #6 by Pal G.

I bet the vintage HP calcs still work a few hundred years from now... in the Museum of Vintage Calculators. :)

Re: Configurable Keyboard

*Message #8 Posted by **Eric Smith** on 30 May 2009, 2:57 p.m.,*
in response to message #6 by Pal G.

I think the technology to do dynamic keyboard legends on low-cost consumer products such as calculators will probably be developed within the next 20 years. It just isn't quite here yet.

Re: Configurable Keyboard

*Message #9 Posted by **Eric Rechlin** on 30 May 2009, 10:01 p.m.,*
in response to message #8 by Eric Smith

I'm not sure if it meets your definition of low cost, but Samsung has a mobile phone with a keyboard with dynamic legends, using electronic ink technology (like the Sony Reader):

http://jkontherun.com/2009/05/11/samsung-handset-keypad-morphs-using-e-ink/

HP spy photo?

*Message #1 Posted by **Pal G.** on 29 May 2009, 1:00 a.m.*

Greetings, Programs.

While reviewing most of the HHC2008 conference photos, I saw a nice calc on the first powerpoint slide of Cyrille's talk. I've never seen it before. It looks like an expensive SmartCalc 300s or something. Definitely in that family, and high end. I wonder if anyone at the conference knows about it. Or are we just looking at a nice picture? Or could it be the hp 60g?

Here is the photo:

http://holyjoe.net/hhc2009/HHC2008pix/DSC06874.jpg

And here is my version. After seeing that photo I got fired up, so I made one to look at, sans the HP logo.

(The next rendering will have better lighting and textures. And maybe an abacus.)

Link to larger, 1440 px x 900 px version.

Cheers,
PG

Re: HP spy photo?

*Message #2 Posted by **Eric Smith** on 29 May 2009, 4:17 a.m.,*
in response to message #1 by Pal G.

I'm pretty sure that what's on Cyrille's slide is either a conceptual illustration or a photo of a non-functional model. HP has shown us various non-functional physical models at past conferences, as examples of things they might do.

Re: HP spy photo?

*Message #3 Posted by **Jean-Michel** on 29 May 2009, 3:15 p.m.,*
in response to message #1 by Pal G.

Hi Pal!

Welcome back to the forum with very nice renderings, as usually. What a strange similarity between this calc and an iPhone...is this an iCalc ? :-)

Kind regards.

Jean-Michel.

Troubles connencting Conn4x <--> HP48G

*Message #1 Posted by **Matti Övermark** on 28 May 2009, 6:58 a.m.*

I am having troubles connecting my HP48G to the Conn4x version 2.3 build 2439. I try to install the XModem library, but I get the error message "The connectivity kit is unable to open communications to COM1".

I do know that the COM-port is ok since I can use my plotter.

Any help appreciated.

TIA Matti

Re: Troubles connencting Conn4x <--> HP48G

*Message #2 Posted by **Michael de Estrada** on 28 May 2009, 9:29 a.m.,*
in response to message #1 by Matti Övermark

Assuming you are using a serial (not USB) cable to connect the HP48G to the PC com port, check the following:

1) Both calc and Conn4x are set for 9600 baud, no parity (0), checksum CRC (3), no translation (0) and binary transmission.

2) Windows has not allocated the com port to another device, such as a modem. Look into Windows Device Manager to see port allocations. Use AUTO in Conn4x to find a free com port and make sure you are physically connected to it. Com1 = Com3 and Com2 = Com4.

However, I have personally never tried to do this, so it may not be possible.

Good luck,

Michael

Re: Troubles connencting Conn4x <--> HP48G

*Message #3 Posted by **Matti Övermark** on 28 May 2009, 9:42 a.m.,*
in response to message #2 by Michael de Estrada

Hi Michael,

thanks for the reply, but unfortunately it doesn´t quite work out. I had this problem earlier, and cannot remember what on earth I did to get the XModem into my 48G...

In the mean time I connected my 50g to the PC, that went well.

Well still trying...

/Matti

Re: Troubles connencting Conn4x <--> HP48G

*Message #4 Posted by **Michael de Estrada** on 28 May 2009, 10:39 a.m.,*
in response to message #3 by Matti Övermark

Matti,

If you previously downloaded XModem into your HP48G, then it should still be there. It is a library of commands that you attach in the HP48G. See the help topic "XModem Library" in Conn4x. You need to run XModem on the calc before it will connect to the PC.

Also, if you have an HP50G, you can connect it to the HP48G via serial cable, and transfer the XModem library from the HP50G to the HP48G using Kermit. You can get the serial cable for the HP50G from:

HP50G Serial RS232 Cable

Michael

Re: Troubles connencting Conn4x <--> HP48G

*Message #5 Posted by **Matti Övermark** on 28 May 2009, 11:30 a.m.,*
in response to message #4 by Michael de Estrada

Hi Michael,

Well I had it on the calc, but managed to get a mem-lost. So now I do not have it.

As I live in Sweden it´s actually not really an option to buy a 50g<-->48g cable.

As I recall, I made several attempts with no success until I managed to get the download to work.

As I try it right now: 1. Connect the two together with the PC-cable to COM1. 2. Set IOPAR to {9600 0 0 0 3 1} 3. Set the baud rate on the Conn to 9600, and parities to match. 4. I try to launch the command on the PC by File->Download HP48Server (manual XRECV) => Error(The connectivity kit is unable to open communications to COM1 [or Auto])

I have no modems, and the COM port seems to work fine, as device manager tells.

And the search goes on... /Matti

Re: Troubles connencting Conn4x <--> HP48G

*Message #6 Posted by **Egan Ford** on 28 May 2009, 12:05 p.m.,*
in response to message #1 by Matti Övermark

> Quote:
>
> "The connectivity kit is unable to open communications to COM1".

Is COM1 visible under the device manager?

If you use COM1 with something else, is that something else running? If so it could block conn4x from using

the COM port. I have not worked with serial printers on Windows so I do not know how to tell Windows to release the COM port so that something else can use it.

Re: No more (Troubles connencting Conn4x <--> HP48G)

*Message #7 Posted by **Matti Övermark** on 29 May 2009, 4:30 a.m.,*
in response to message #1 by Matti Övermark

I solved the problem eventually. As pointed out I did have a conflict with the port, COM1, so I just put the plotter on another comport, and - dadaaa - I was able to connect.

Thanks for the help!

Matti

HP-41 MLDLs

*Message #1 Posted by **Garth Wilson** on 28 May 2009, 3:07 a.m.*

A co-worker just got a 41cx and was interested in the MLDL modules. I never paid enough attention to know much about them and I'm not able to remember all the possibilities to tell him. Can someone here list (or give a link to) what's available, whether new (like Clonix or MLDL2000) or old (like Hepax or W&W), what's needed to put ROM images of the various modules in them, URLs for the modern ones, pros and cons for different applications, what they can and cannot do (for example, can they do the paging of the Advantage?), whether a card-reader shell or module shell is needed, whether kit or complete product, and any other important information. Depending on what we find out, I might want to get one too. Thanks to double modules, I have six modules plugged into my four ports; but I might like to add a couple more plus larger file memory. Thanks.

Re: HP-41 MLDLs

*Message #2 Posted by **Marcus von Cube, Germany** on 28 May 2009, 5:09 a.m.,*
in response to message #1 by Garth Wilson

From the top of my head:

MLDL2000 by Meindert Kuipers: http://www.kuiprs.nl/support.htm

Needs card reader shell or similar housing, stores ROM images in flash or RAM. Very flexible (multiple dip switch selectable configurations, USB connectivity to PC for full control of the RAM and ROM configuration) but adds considerably to the size of the 41. Bank switching (Advantage) and Hepax (on device development) are supported. Battery backup is possible.

Clonix & NoVRAM by Diego Diaz: http://www.clonix41.org/

Clonix is a flash only ROM emulator which supports bank switching. It fits into a module housing. To flash ROMs you'll need a prommer device (for PICs). Bankswitching is supported.

NoVRAM in its various incarnations adds RAM for Hepax emulation and ROM storage but you still need a prommer. The size is the same. The contents is protected even if you remove the module. So you can use the Hepax file system to transfer programs between machines.

All MLDLs or ROM emulators will eat on your batteries to various degrees. This is somehow firmware dependent. (I'll need to update my devices.) AFAIK none of them can emulate extended memory (but they can hold the EM functions in ROM, of course.)

Edited: 28 May 2009, 5:11 a.m.

Re: HP-41 MLDLs

*Message #3 Posted by **PeterP** on 28 May 2009, 2:25 p.m.,*
in response to message #2 by Marcus von Cube, Germany

As marcus covered all the new mldl's, a quick word to vintage mldl's:

Without exception, they are a)much harder to find, b) much more expensive (recently a hp41cx with built in W&W mldl went for over 2000$ on eBay) and c) less versatile.

For someone starting with mcode, I'd probably recommend a simple NoVram. It has a very attractive price point, and the new USB pic programmers work very well and it uses only one physical port. Also, the HEPAX (and the emulation in the NoVrams) relocate themselves to page 6, saving one page.

For owners of the iPhone/iTouch there is now an even cheaper option - the fantastic i41cx+ program which allows hepax emulation.

Hth

Cheers

Peter

Re: HP-41 MLDLs

*Message #4 Posted by **Marcus von Cube, Germany** on 29 May 2009, 2:51 a.m.,*
in response to message #3 by PeterP

> Quote:
>
> and the new USB pic programmers work very well

What is the recommended programmer? Mine is a Windows-only-needs-physical-serial-port type of device which I'd like to replace. If the thing could burn EPROMS as well that would be absolutely great.

Re: HP-41 MLDLs

*Message #5 Posted by **PeterP** on 29 May 2009, 3:45 p.m.,*
in response to message #4 by Marcus von Cube, Germany

Diego offers one on his web-page but you can find it on eBay and other places easily. I never checked if it also does EPROMS but Diego can probably answer that questions.

If works much better than the old Serial programmer, especially as it works with Laptops as well.

I do have a USB burner that (claims to) do EPROMS as well as the Pic-chips but I have never tried it. I can get the name of it if you want.

Cheers

Peter

Re: HP-41 MLDLs

*Message #6 Posted by **Marcus von Cube, Germany** on 31 May 2009, 3:00 a.m.,*
in response to message #5 by PeterP

Thanks Peter, please tell me the name and the price you've paid for it.

Re: HP-41 MLDLs

*Message #7 Posted by **Angel Martin** on 28 May 2009, 2:24 p.m.,*
in response to message #1 by Garth Wilson

Hi Garth,

I'll add just one thing to Marcus excellent summary: get one yourself, it's worth every penny!

Clonix, or NoVRAM are much easier to handle. MLDL is a Juggernaught - a tad difficult to master.

Best, AM

Spice restoration continue, or, how to open a spice without damage!

*Message #1 Posted by **Geoff Quickfall** on 27 May 2009, 1:43 p.m.*

Hello again,

To start, I hesitated to repair and restore my spice units until I read or developed a technique to separate the two calculator shells. I have seen described a pull apart method with a lot of force used and deformation to the polycarbonate case. Hence the following posting.

I have used this method succesfully on 5 out of 5 spices. It did take one almost destroyed unit to figure this out. Actually the unit came in a total mess and the only salvageable stuff was the LED panel (solderless), battery hatch and battery hatch ribbon.

Obviously HP had an easy way to get into a spice, apart from the pry and pull and push method that makes one very reticent to work on one of these.

After careful examination of the case I have created the following steps to get in.

Of course, the obvious, looking at the back of the calculator or bottom shell we see the battery hatch. Unlike other HP's there are no hidden screws (figure 1).

FIGURE 1

Remove the hatch and you will see two screws (figure 2), remove these.

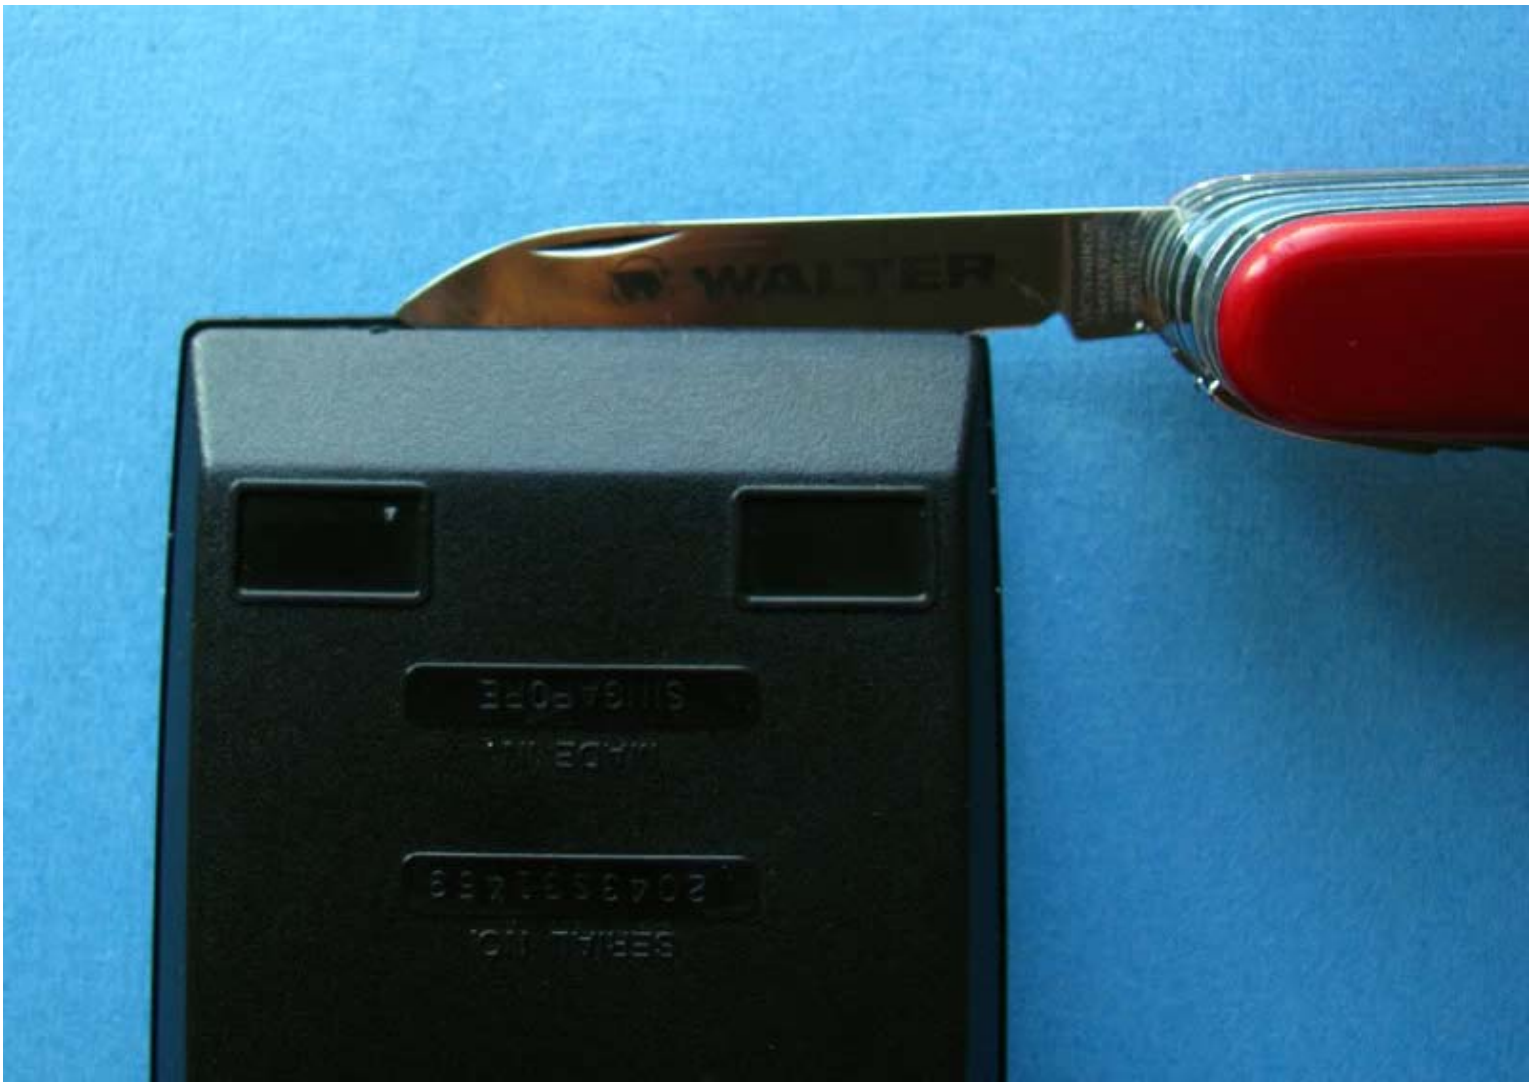
FIGURE 2

Once the screws are removed, grasp the calcuator and lift apart the two halves at the battery end (figure 3). The calculator will pivot around the foot of the two shells. Only pull the calculator apart as far as the figure indicates.

FIGURE 3

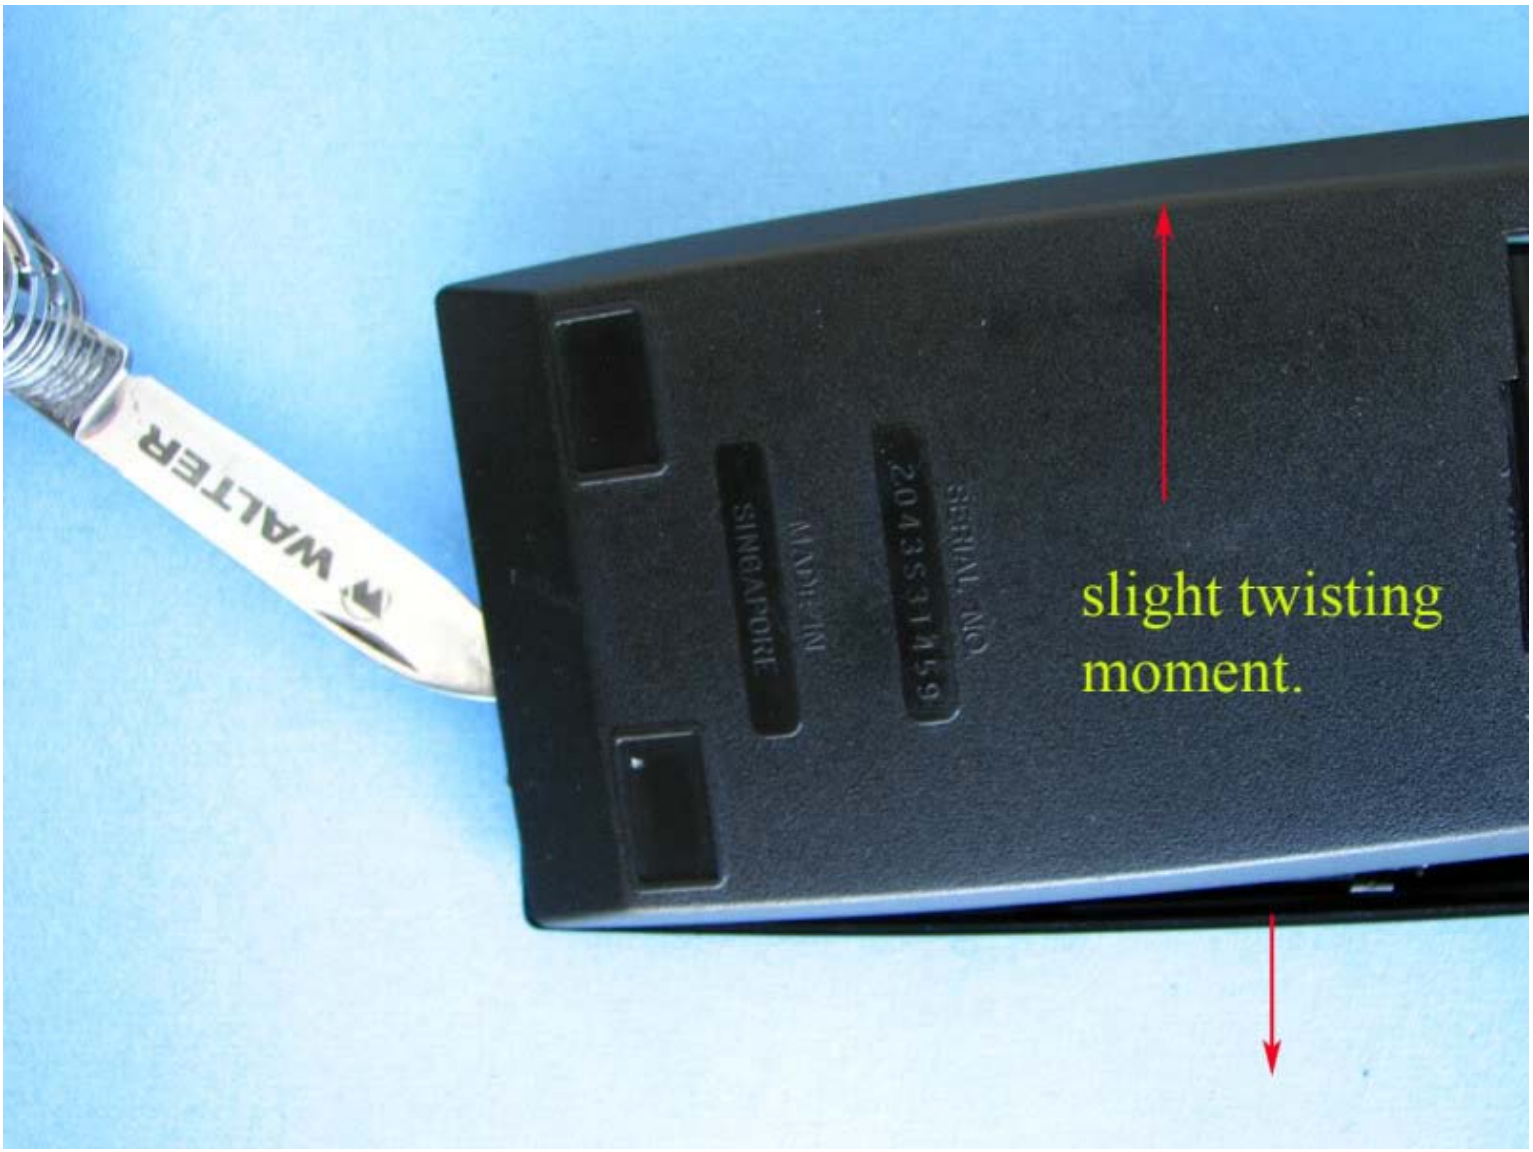
Now that the two parts are separated at the top of the calculator, insert a long and extremely thin knife blade into the seam which separates the shells at the foot of the calculator (figure 4). The seam is vertical to the longitudinal plane of the calculator. That is, the bottom shell fits inside a lip of the top shell. The knife must be inserted vertically for a very shallow depth (1mm) and then turned horizontally. This has the affect of lifting the bottom shell out of the upper shell lip at the foot of the calculator. You will see why this is important soon.

FIGURE 4



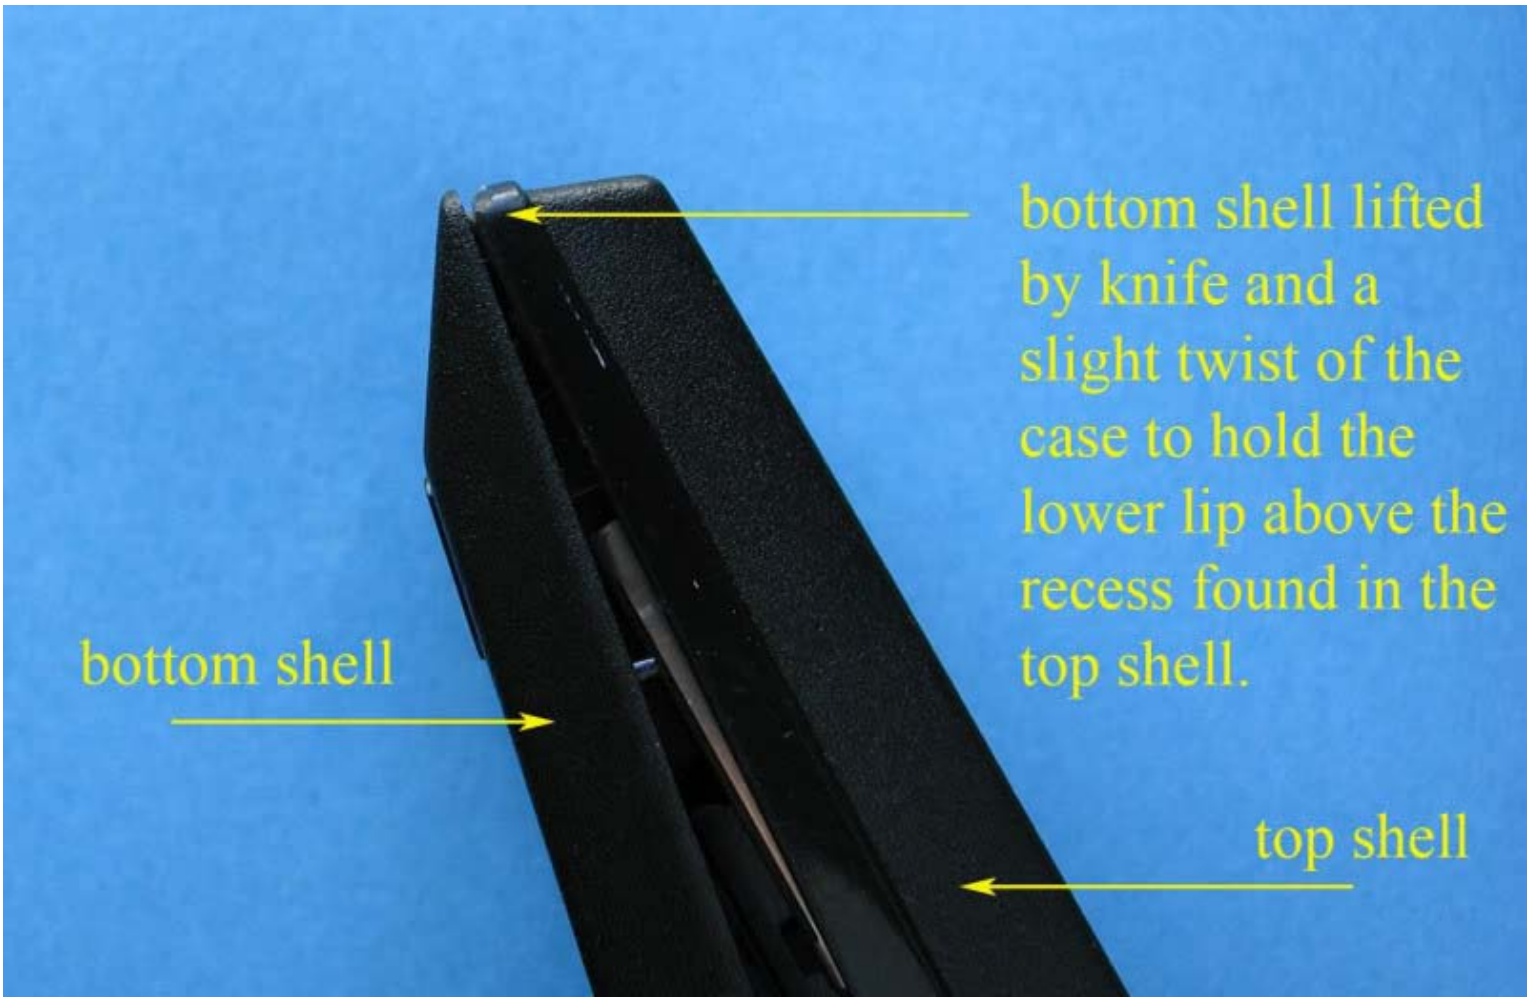
Now that the bottom shell is above the lip of the top shell and while keeping the knife in place to keep the bottom shell out of the top shell recess, give the calculator shells a twist (figure 5). This is a horizontal twist; each shell in the opposite direction of the other. Be gentle as this method does not require force.

FIGURE 5



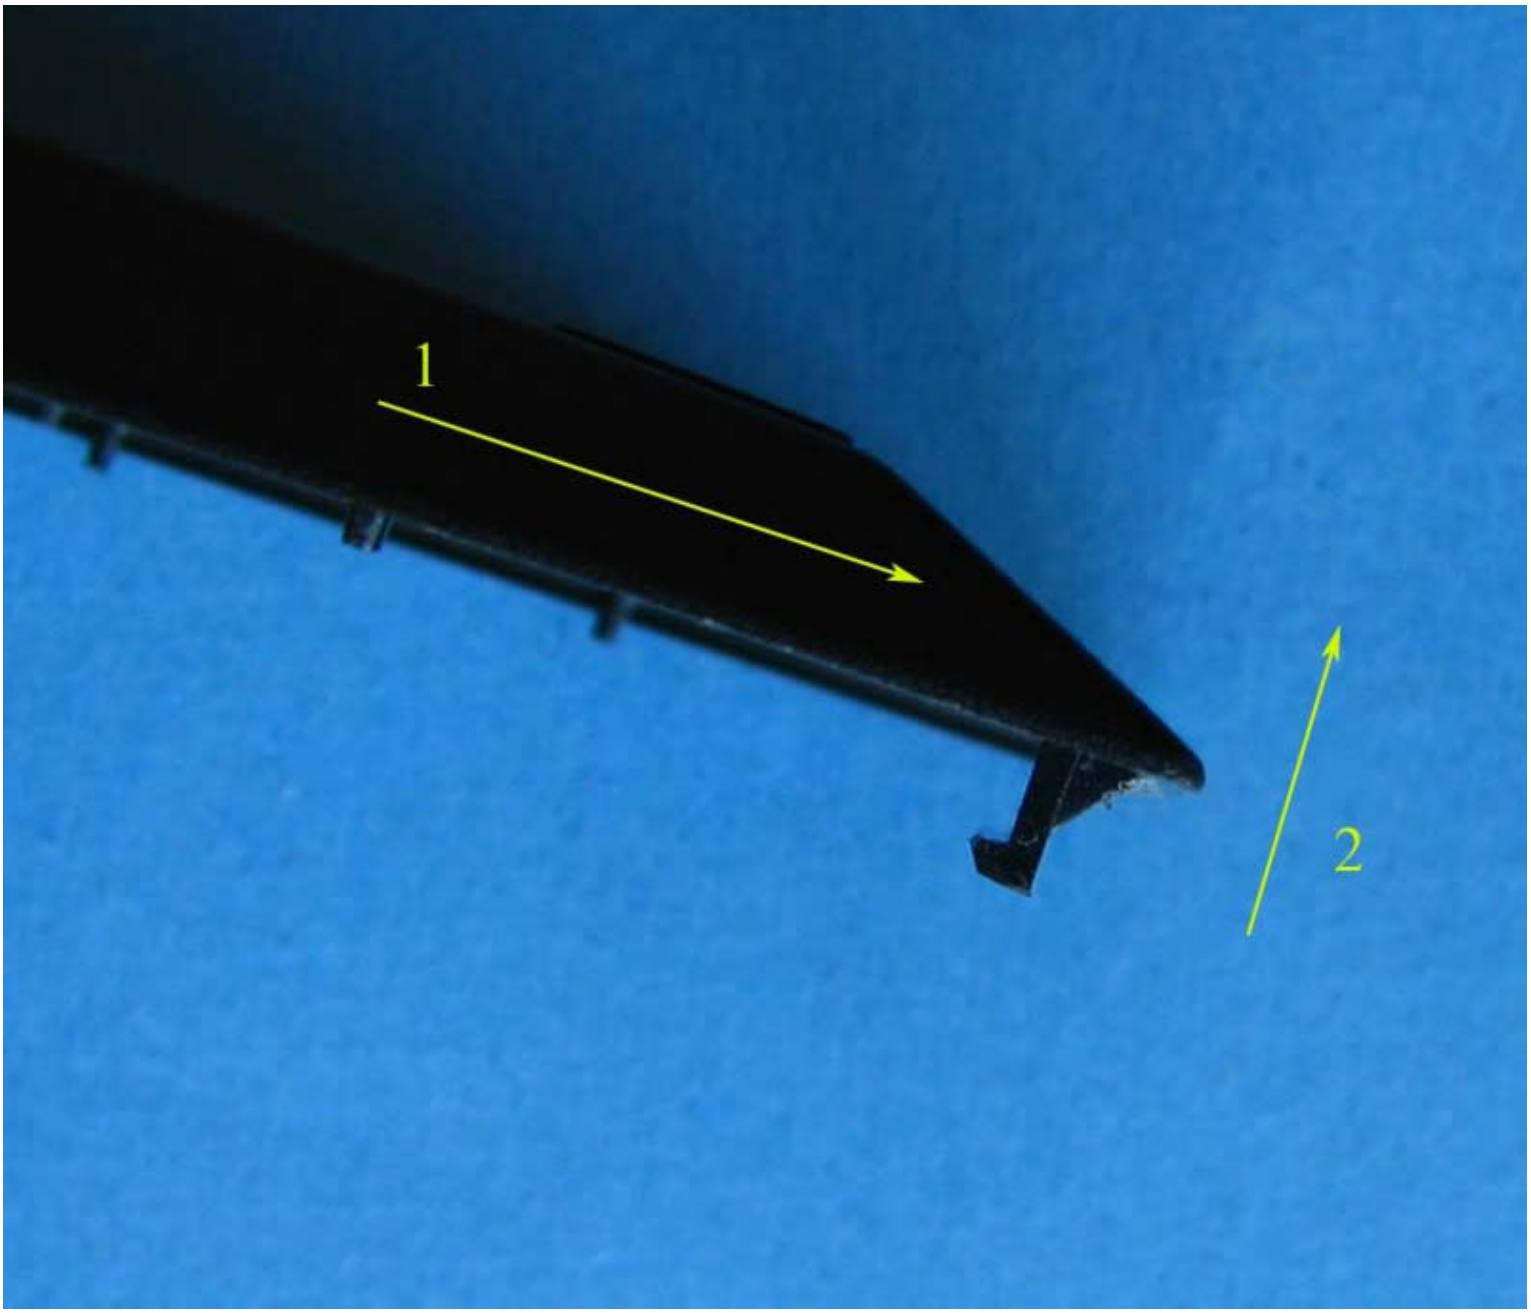
In figure 6 we can see that the bottom shell now protrudes past the top shell. Refering to figure 5 again, and while still applying a twisting moment as described, give the knife a gentle twist. This will pry apart the bottom shell and top shell. This combined with the twisting moment you are applying to the case will release the internal latch mechanism. The mechanism will release with a quiet snap.

FIGURE 6



In figure 7 you can see the L shaped latch which causes the headache, well, maybe not any more! Arrow 1 shows the direction of the twisting moment applies on the latch with the knife in place and the bottom shell raised out of the lip. Arrow two shows the final twisting moment of the kife releasing the two halves.

FIGURE 7



Of course it is difficult to describe but in summary:

1. remove screws
2. insert flat blade at foot of calculator to raise the bottom shell out of it's recess (lip) in the top shell
3. while the blade is in place and the bottom shell is raised; give the two shells a rotational twist which will raise the rest of the bottom shell out of the recess
4. give the knife a rotational twist while still applying the rotational twist to the two shells
5. you should hear a gentle satisfying snap as the L shaped latch separates from its anchor point.

It's that easy!!

Cheers, Geoff

Re: Spice restoration continue, or, how to open a spice without damage!

*Message #2 Posted by **Michael de Estrada** on 27 May 2009, 2:59 p.m.,*
in response to message #1 by Geoff Quickfall

Geoff,

Another tour de force from you! You should write a book on HP calculator restoration and repair. I've opened a number of Spices (spicem?) by the traditional "hope and pray it don't break brute force method" and while I've never broken one outright, in a few cases I did chip some material off the front of the top shell due to prying action from the bottom shell. Your method should prevent this.

Now, how about doing one with photo-illustrations on HP-65/67/97 HP-41C/V/X cardreader clutch repair?

Thanks,

Michael

Re: Spice restoration continue, or, how to open a spice without damage!

*Message #3 Posted by **Geoff Quickfall** on 27 May 2009, 3:47 p.m.,*
in response to message #2 by Michael de Estrada

Hi Michael,

Thanks for the kudo's!

In fact I have done a 35 page monogram on an HP65 calculator including card reader as an addendum for a book by another author.

However, in discussion with the author, the addendum will be converted into a stand alone HP restoration guide encompassing the classics, 41c's, woodstocks, spices, 48's, cricket, 71B's and whatever else I get my hands into.

I was wondering if there would be a small market for an on demand 'restoration' booklet covering the various models?

If you can make it to the HCC 2009 conference in Vancouver, Washington, I will be presenting a paper on HP 41C restoration including card reader in honour of the 25th anniversary of the 41. That is the theme for the meet this year. I am sure that the paper will be included in any subsequent disc from the meeting or will be made available. Included will be an HPIL lab set up by Richard Nelson and myself with help from others so if anyone is an HP 41 fan this is the place to be in October.

At the moment there are excellent sources in the repair section and by googling 'HP 67 card reader repair". These are extremely well written and documented.

Now for my next project!

Geoff (and all),

If there's a booklet available, I'll be the first one to send in an order!!!

Thanks for the vote Joel! Yes there will be a book or booklet spanning most of the HP families!

Cheers, Geoff

How to open a Spice without damage! (dental floss)

*Message #6 Posted by **Karl Schneider** on 28 May 2009, 5:52 a.m.,*
in response to message #1 by Geoff Quickfall

Geoff --

Much appreciation for your recent postings with excellent photography and documentation regarding restoration of Spice-series calculators. They should be posted in the Articles section.

Almost seven years ago, I posted a technique using dental floss to separate the case halves. The objective is to detach the L-shaped latch from the other half without breakage. It worked well.

The peculiar arithmetic of the SmartCalc 300s

*Message #1 Posted by **Javier Goizueta** on 27 May 2009, 4:48 a.m.*

I've received my HP SmartCalc 300s and I'd like to share some findings about its arithmetic. This calculator shows 10 digits but keeps 16 digits of internal precision in its registers. So this machine should have impressive precision, right?

I'll do a little test that appeared on Fred Gruenberger's Computer Recreations in Scientific American, April, 1984 (I actually read it from the spanish "Investigación y Ciencia" in June 1984) The test consists in computing (1.0000001)^(2^27) by applying the square operation 27 times starting with 1.0000001. The correct answer is 674530.47074108455938....

First, to know what kind of precision we can expect we'll do some testing with a HP50G. The HP50G has 15 internal digits and we can operate with that precision using the XREAL library So let's try it:

```
<< 1.0000001 R~X 1 27 START XSQ NEXT >>
```

The result is 674530.467837207 with a percent error of **0.0000004305**

But we can do better with 15 digits: the internal 15-digit arithmetic of the HP50G is truncated because it's not meant to be seen; we can operate with 15 rounded digits (or any other rounding/number of digits) using the LongFloat library

```
<< 1.0000001 R<-->F 1 27 START FSQ NEXT >>
```

Now the result is 674530.469940699 and the percent error is **0.0000001186**

So now we know what to expect with so many digits of precision; let's try the SmartCalc. We'll use the LinearIO mode so that we operate numerically and not with the mini-CAS that MathIO uses.

If we type 1.0000001 and then [x^2] [=] 27 times we get: 674529.1123 with a percent error of **0.0002014** (that's like 468 times larger than the XREAL result which one less digit and truncating the results!!) That's even worse that what can be achieved with 13 digits (percent error of 0.00002264 with LongFloat).

How can this be? Well, I wasn't too suprised becaused I'd played with Casio calculators before.

The reason is that following Casio tradition, some weird rounding if done on the internal numbers, trying to hide the fact of a limited precision, so that for example 1-(4/3-1)*3 = 0 (which in a honest numerical calculator would reveal the internal precision.) This rounding makes errors unpredictable and much larger than they could be. Note also that these attempts are bound to fail: 1/9-(10/9-1) = 0 but (1/9 - 0.01 - (10/9-1) + 0.01 = 1E-16

The results of the HP300S in the 1.0000001 test can be explained by a special rounding of the result of arithmetic operations performed after normalization:

- if the trailing 6 digits are less than 000050, they are rounded down to 000000.
- if the trailing 4 digits are greater than 9949, the number is rounded up (so it ends in 0000)

You can see these rules in action here

```
1E9 + 1.000050 - 1E9 = 1.00005
1E9 + 1.000049 - 1E9 = 1
1E9 + 0.100049 - 1E9 = 0.100049
1E9 + 0.009950 - 1E9 = 0.01
1E9 + 0.009949 - 1E9 = 0.009949
```

Note that numbers typed in the calculator are truncated to 15 digits; if you need to enter a value with full 16 digits you must add a pair of numbers or do some other operation.

The special rounding explains all the intermediate results of the test, which are show here with full internal precision

```
1.0000002
1.0000004
1.00000080000016
1.00000160000096
1.00000320000448
1.0000064000192
1.00001280007936
1.000025600322562
1.0000512013005
1.000102405222573
1.000204820931975
1.000409683815564
1.000819535471956
1.001639742582301
1.003282173920338
1.006575120506319
1.01319347322231
1.026561014180287
1.053827515834859
1.110552433130669
1.233326706732449
1.521094765539508
2.31372928575169
5.353343207745025
28.65828349990979
821.2972131612017
674529.1123463563
```

I've traced similar *magic* rounding in a Casio FX9960G (using an emulator) and in an old Casio FX750P. These machines have more complicated rounding rules and the results of the test are similarly poor. In the case of the FX750P we can operate either at the internal precision of 12 digits (using variables) or at the displayed precision of 10 digits. Due to the idiosincratic rounding the result of the test using 10 digits is more precise than with 12 digits!

It's a shame that the SmartCalc tries so hard to be smart. The result of computing 1-(4/3-1)*3 numerically should be 1E-15 showing that it is operating with limited precision. It should be 0 only if fractions or the MathIO mode are used, but the user should know the distinction between exact and approximate computations and be able to compute numerically with predictable results. The SmartCalc is very unreliable, with some results in accordance to its high internal precision and others randomly affected by large errors.

And now for something totally different: My HP300S has a sticker on the back "Prototype Not for Sale" I saw it after ripping the package and then noticed the sticker on it too:

> Quote:
>
> Prototype - Not For Sale. The unit and contents of this packaging are currently undergoing quality testing and verification and are subjected to changes. ...

I wonder if there's any difference with a production unit; my keyboard misses keystrokes quite often and the cover cannot be snapped on the back as the user manual suggests.

Anybody with a production 300S can tell about that?

*Message #2 Posted by **hugh steers** on 27 May 2009, 12:02 p.m.,*
in response to message #1 by Javier Goizueta

this is very interesting. i am wondering if this rounding is actually to disguise the fact that the 300 works in binary internally rather than BCD.

I first noticed a new and weird kind of rounding in the 30s. This is the calculator that not many people liked because it was one of the first not really made by HP at all. afaik the 30s and 9g use binary math internally and perform some weirdo rounding to hide it.

i spend a while trying to figure this out, but i found the rounding not consistent. both these models work to approx 25 digits, but the effective accuracy is around 12 due to the fact that it will round at every stage.

is the 300s really a binary machine?

in response to message #2 by hugh steers

> Quote:
>
> is the 300s really a binary machine?

I don't think so. All the results reveal exactly 16 decimal digits. Also, the result of 1/9 - 0.001 - (10/9-1) + 0.001 is exactly 1E-16 which I find hard to explain in a binary machine.

Roger Rosenbaum has shed some light on this subject in the following threads:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103356

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=103151

I just hope the HP SmartCalc 300s gives the right answer to expressions like '3979/LN((sqrt2+sqrt3)/sqrt3)'

Regards,

Gerson.

Re: The peculiar arithmetic of the SmartCalc 300s

*Message #5 Posted by **Javier Goizueta** on 27 May 2009, 1:36 p.m.,*
in response to message #4 by Gerson W. Barbosa

> Quote:
>
> I just hope the HP SmartCalc 300s gives the right answer to expressions like '3979/LN((sqrt2+sqrt3)/sqrt3)'

The result is 6666.000006 (internally it is 6666.000005835731 which I believe is the correct result rounded to 16 digits). The results look very good except when the special rounding is triggered.

Thank you for the links, I'll have a look at them.

Re: The peculiar arithmetic of the SmartCalc 300s

in response to message #1 by Javier Goizueta

There was a recent discussion in the French MySilicium forum (this part is even in English). Some Casio BASIC machines have a means of turning the weird rounding behavior on and off via MODE 10 and MODE 11 commands.

HP 41C LCD/Display

*Message #1 Posted by **Damian Rios** on 25 May 2009, 8:29 p.m.*

I have a 41C that is having trouble displaying the numbers/letters clearly. The funny part about it, is that when I go outside and the sun hits it directly, it shows everything fine and plus some. As soon as I go back inside, it goes back to it's original issue. CAN ANYONE LET ME KNOW WHAT THE HELL IS GOING ON WITH MY CALC?

Re: HP 41C LCD/Display

*Message #2 Posted by **Geoff Quickfall** on 26 May 2009, 1:14 a.m.,*
in response to message #1 by Damian Rios

A few questions come to mind:

```
1.  Has this just started?

2.  Is it coincidental with new lighting situation inside?

3.  what type of indoor lighting, incandescent, florescent,
    mercury vapour?

4.  When viewing the LCD panel indoors what angle are you using
    to view the calculator?

5.  Is this angle different to the angle you use outside to view
    the calculator?

-  Viewing angle is important with LCD panels.
-  LCD panels fade with age.
-  The type of artificial lighting affects clarity and resolution.
-  LCD panels on watches have a polarized filter built into the
   lense and I am 90% sure that the HP 41 LCD panel is the same.
```

To my knowledge there is no photo-sensitive system or variable system to alter the 'darkness' of the LCD display as in subsequent models (48, 28 etc). My guess is the LCD is slowely fading as they all do. The non-polarized natural light is the best source for contrast. Try using, if you are not already, an incandescent bright light while inside.

Cheers, Geoff

Re: HP 41C LCD/Display

*Message #3 Posted by **Garth Wilson** on 26 May 2009, 2:22 a.m.,*
in response to message #2 by Geoff Quickfall

My 41 has the same, bold, high-contrast display it did brand new 23 years ago. I have other LCDs of about that age, all of which I can say the same thing about. As long as the LCD is electrically fed correctly (which is not a concern with a calculator whose display-driving electronics were debugged long ago), the only threats I can think of to LCDs are heat and humidity (especially the combination), freezing the liquid (which I have found does not always damage the display like the manufacturer says you might), and mechanical pressure (which is also not a problem when there's a transparent protective window in front of it.

All LCDs do however have polarizers that are part of how they operate. If your light source is polarized, the LCD background may look dark, depending on the orientation compared to the polarity of the light source or even polarized glasses.

Years ago I was designing a wide-temperature-range LCD into one of our aircraft products. After it passed the temperature tests, I tried the polarized sunglasses, since many pilots in the cockpit would be using them. It failed that test. I called the manufacturer, and they said they cut the polarizer however they can get the best yield; but they understood the importance in the application and said they could cut it in any orientation we wanted.

Re: HP 41C LCD/Display

*Message #4 Posted by **Eric Smith** on 26 May 2009, 6:46 p.m.,*
in response to message #3 by Garth Wilson

> Quote:
>
> To my knowledge there is no photo-sensitive system or variable system to alter the 'darkness' of the LCD display as in subsequent models (48, 28 etc).

In halfnut models, the display driver does have programmable contrast, but the microcode does not ever adjust it. There's no way to set it without some kind of third-party ROM containing suitable microcode.

If the display contrast setting of a halfnut gets changed, and you don't have a suitable third-party ROM to set it back, the only way to recover it will be to remove the batteries long enough that the display driver completely loses its state. Removing the batteries momentarily and shorting the terminals will probably NOT be sufficient.

I don't think this is likely to be the cause of hte problem Mr. Rios is having, especially since there are very few halfnut 41C units in circulation.

Re: HP 41C LCD/Display

*Message #5 Posted by **Forrest Switzer** on 30 May 2009, 12:13 a.m.,*
in response to message #3 by Garth Wilson

I have never had any problems with my 41 or 42S displays, except the creeping crud in one 42S.

But as a point of interest, we use HP-200LX as survey data collectors for some 1995 vintage total stations and have had to create special cloth covers to cover the display in the field. If left uncovered for any length of time the display darkens to the point where it is difficult to read. This occurs even when the 200LX is in an environmental case, and it doesnt seem to make a difference with the calculator as we have used up a number of them (maybe as many as ten). Although most surveyors use the 48SX/GX, we have found the 200LX to be faster and the alphabetics an advantage. The TDS card for the 95/100/200 is virtually impossible to get though.

Forrest

Re: HP 41C LCD/Display

Accurate.

> Quote:
>
> ... My guess is the LCD is slowly fading as they all do. ...

Not so accurate.

I think you'll find that problem to be associated with backlit LCDs in which the light source begins to dim. This is not the case with the LCDs used in HP calculators, they are all reflective designs without backlight.

The most common causes for dim HP calculator displays, in the order of occurrence:

1) In models where contrast is adjustable, it is set too low. As pointed out, the 41 is not among this group.

2) Weak, exhausted batteries. Don't count on the battery low indicator to be 100% accurate.

3) A hardware fault of some kind.

FWIW, in the case of the 41 being discussed, I seriously doubt it is a bad LCD. I've seen individual segments become dim (usually

due to battery leakage) but never the entire display. That would more likely be a display driver or CPU timing problem.

Re: HP 41C LCD/Display

*Message #7 Posted by **Geoff Quickfall** on 26 May 2009, 4:58 p.m.,*
in response to message #6 by Randy

Interesting,

In the watch industry, I have been restoring watches for about 13 years, there is a definite fading of displays over time. So much so that there is a large demand on sealed lcd panels for early vintage LCD panels.

In fact, if you see old LCD seikos as well as many first generation LCD calculators you will see a yellow tint to the display. This was a UV filter to slow or prevent fading displays.

Displays have evolved since then but I still think they are subject to a fading.

Having said that, and restored a few 41's including 6 of my own dating back to 79, I have not had a problem with them at all. Some have different viewing angles but all are crisp and clear..

Cheers, Geoff

Re: HP 41C LCD/Display

*Message #8 Posted by **Randy** on 26 May 2009, 6:07 p.m.,*
in response to message #7 by Geoff Quickfall

Geoff,

I've seen many just flat out broken displays and many "creeping crud" failures (permanent black areas) with all HP calculator products but never have I seen an HP display uniformly dim.

Most models get used outdoors for survey work (41's, Voyagers, Pioneers, 48's) in direct sunlight so if UV was the cause, we would have see failures. I have seen many 48 LCD's fail due to over-temperature where the polarizer actually melts. Discounting those obvious abuses, HP displays seem to me to be pretty darn good and reliable. Heck, all 41 displays are at least 20 years old, some now at 30 and counting.

Re: HP 41C LCD/Display and Seiko

*Message #9 Posted by **Geoff Quickfall** on 27 May 2009, 2:10 a.m.,*
in response to message #8 by Randy

Hi Randy,

I agree with you, the HP LCD's are excellent. I have noticed different brand watches have various quality displays.

For example, the Seiko is meant to be viewed at 45' and start to fade as the tilt angle is greater then 90' and less then 30', a viewing angle of 60 degrees.

My Omega LCD however, can tilt through 100' without any fading outside the direct best angle.

It would seem that the watch industry has differing standards of quality, and maybe this is the reason they fade. Of course they are in the sun 24/7, certainly more so then HP calcs.

I have replaced quite a few Seiko World timers shown here, some of which have the yellow UV filter. All the yellow watches are 1976 era and suffered faded displays. The displays in them now were NOS sealed in aluminum pouches.

*Message #10 Posted by **Damian Rios** on 27 May 2009, 2:04 p.m.,*
in response to message #9 by Geoff Quickfall

I think it's a hardware problem. As far as the sunlight, I agree, most HP displays tend to fade away when brought back indoors. I appreciate all of your responses. Thanks for the help. By the way, It's a fullnut 41c.

Re: HP 41C LCD/Display and Seiko

*Message #11 Posted by **Karl Schneider** on 28 May 2009, 6:08 a.m.,*
in response to message #9 by Geoff Quickfall

Geoff --

I still wear this classic 1981 Seiko H357 Duodisplay model, shown in the linked photograph (which is not of my personal watch):

Seiko H357-5030T

The LCD is angled toward the wearer, but can be read from different orientations. There has been no problem of fading. Maybe LCD technology improved during the late 1970's? (Remember that few calculators had LCD's until about 1980.)

Exceptional quality and a clean, sensible design -- just like H-P calc's of the era. It's hard to find consumer products like that anymore.

A coincidence, really, but I just finished restoring this HP 34C!

*Message #1 Posted by **Geoff Quickfall** on 23 May 2009, 6:51 p.m.*

It started with another box with 4 spice calculators in it as well as 4 chargers, and 3 metal battery holders with one plastic separator. Also included was a 34C and 38E quick reference cards.

I have ignored the spice series for awhile and decided to tackle the 34C, as this unit really is impressive. Not only does it have the program continuous memory but also a 3 colour coded set of shift keys reminiscent of the HP 67.

This unit is coded 2045SXXXXX for 1980, Singapore.

Of course the first order of business was to inspect the case, top and bottom shell. You can see glue residue on the top LED display cover; figure 1. Also note the filthy keyboard and keys. The ON/OFF key was intermittant at best and would not stay on once selected. By pressing gently on the key I got the display to be stable, where upon I pressed "STO" followed by "ENTER". I waited a few seconds and up popped the -8,8,8,8,8,8,8,8,8,8,. Signifying a successful electronics test. The keyboard response on this calculator is nothing less then stunning. The positive click on each key is incredible.

FIGURE 1.

A coincidence, really, but I just finished restoring this HP 34C!

I then turned the calculator upside down to document the bottom shell when I noticed a bunch of dirt fall out of the now inverted calculator. You can see, with reference to the Canadian penny for scale, the outline of the calculator (enhanced with the boxes); figure 2. This is the dirt that fell out of the spaces between the keys and the keyboard bezel. A close up of the dirt can be seen in figure 3 with R/S key for scale. I was amazed that the keyboard functioned at all as this calculator looks as though it was buried in the sand for a prolonged period of time! However this is a testament to the HP quality and the sealed keyboard.

FIGURE 2

A coincidence, really, but I just finished restoring this HP 34C!

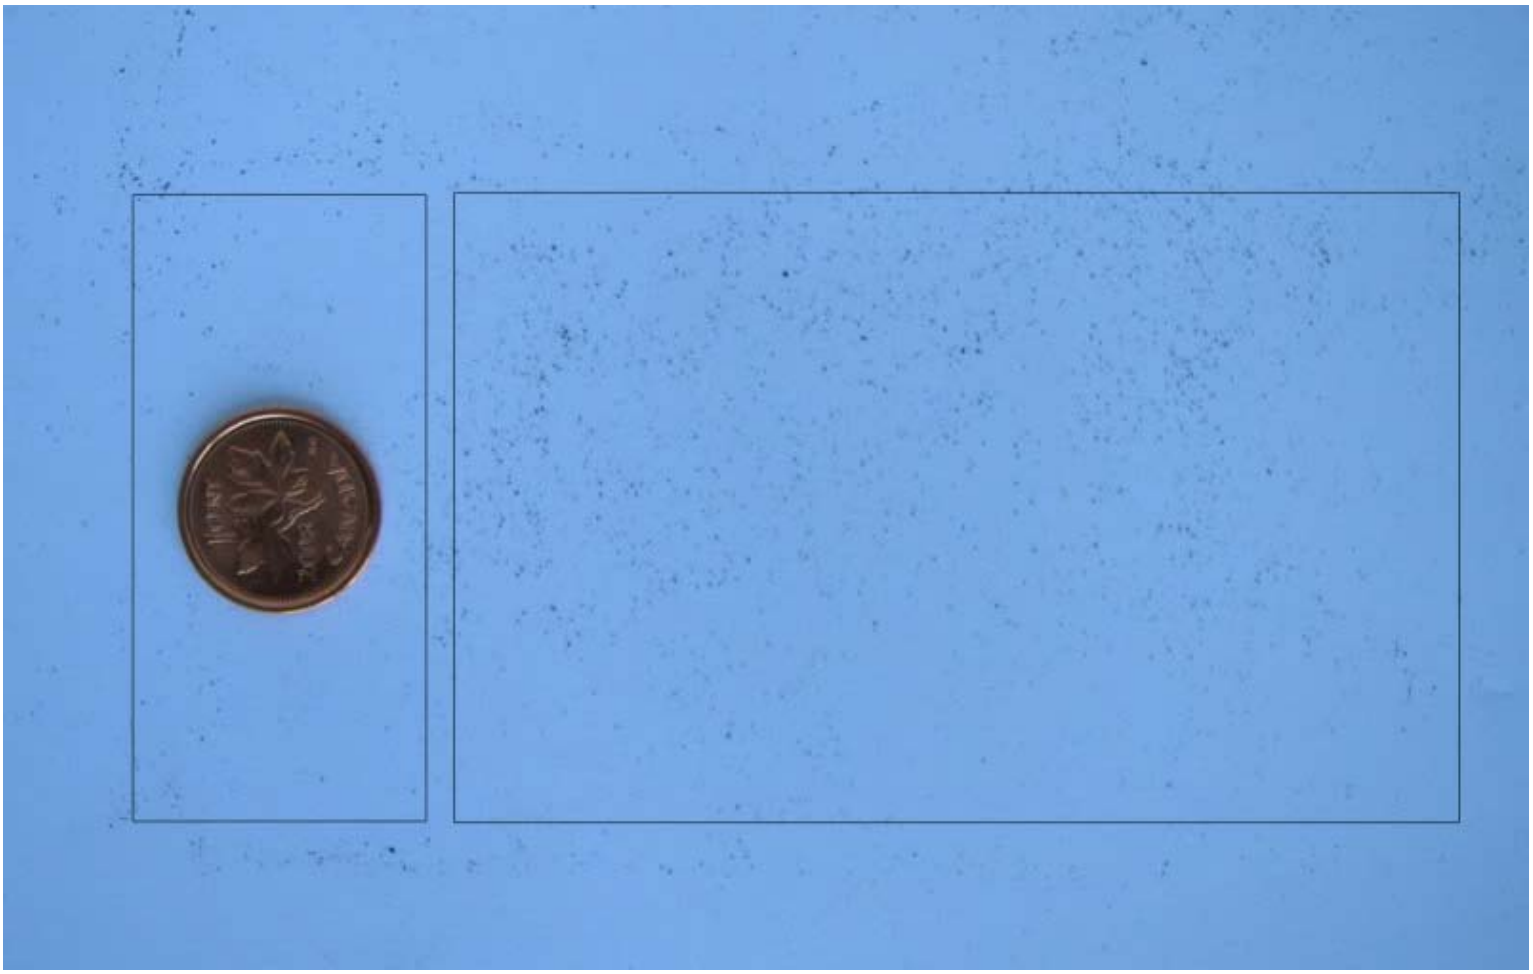

FIGURE 3

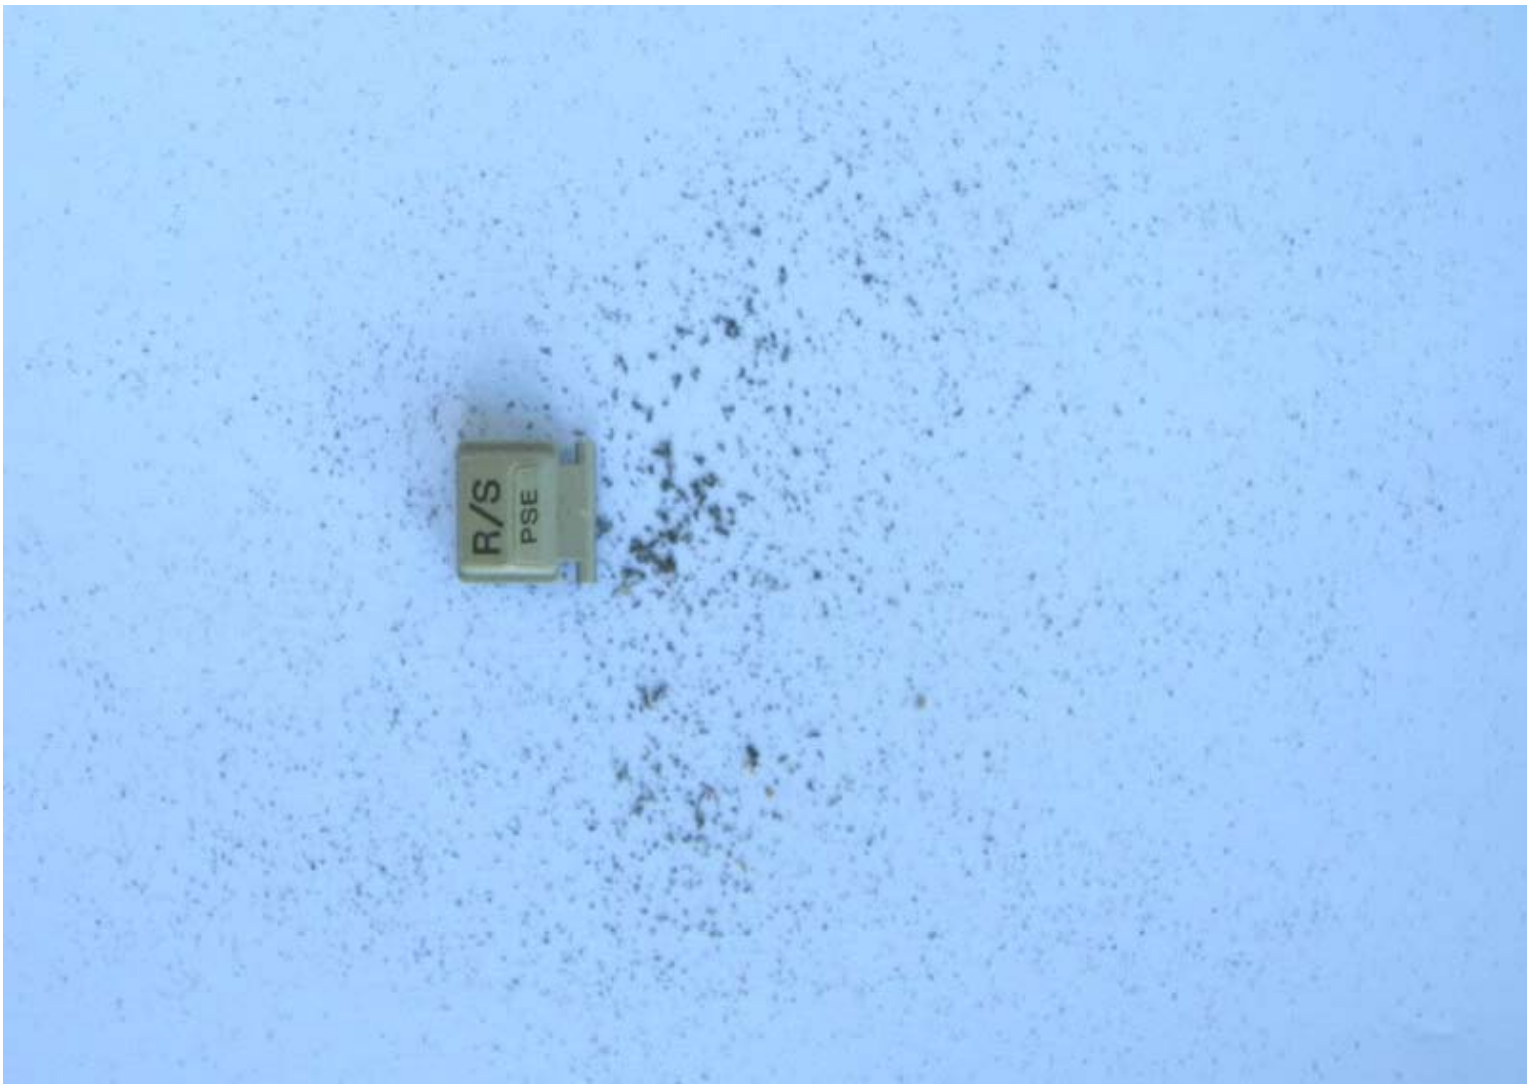

Eventually I took a picture of the bottom shell with the glued on label; figure 4.

FIGURE 4

A coincidence, really, but I just finished restoring this HP 34C!

The battery compartment, battery holder and battery compartment contacts are all in excellent condition with no corrosion traces or cracks; figure 5, 6, and 7 respectively.

FIGURE 5

A coincidence, really, but I just finished restoring this HP 34C!

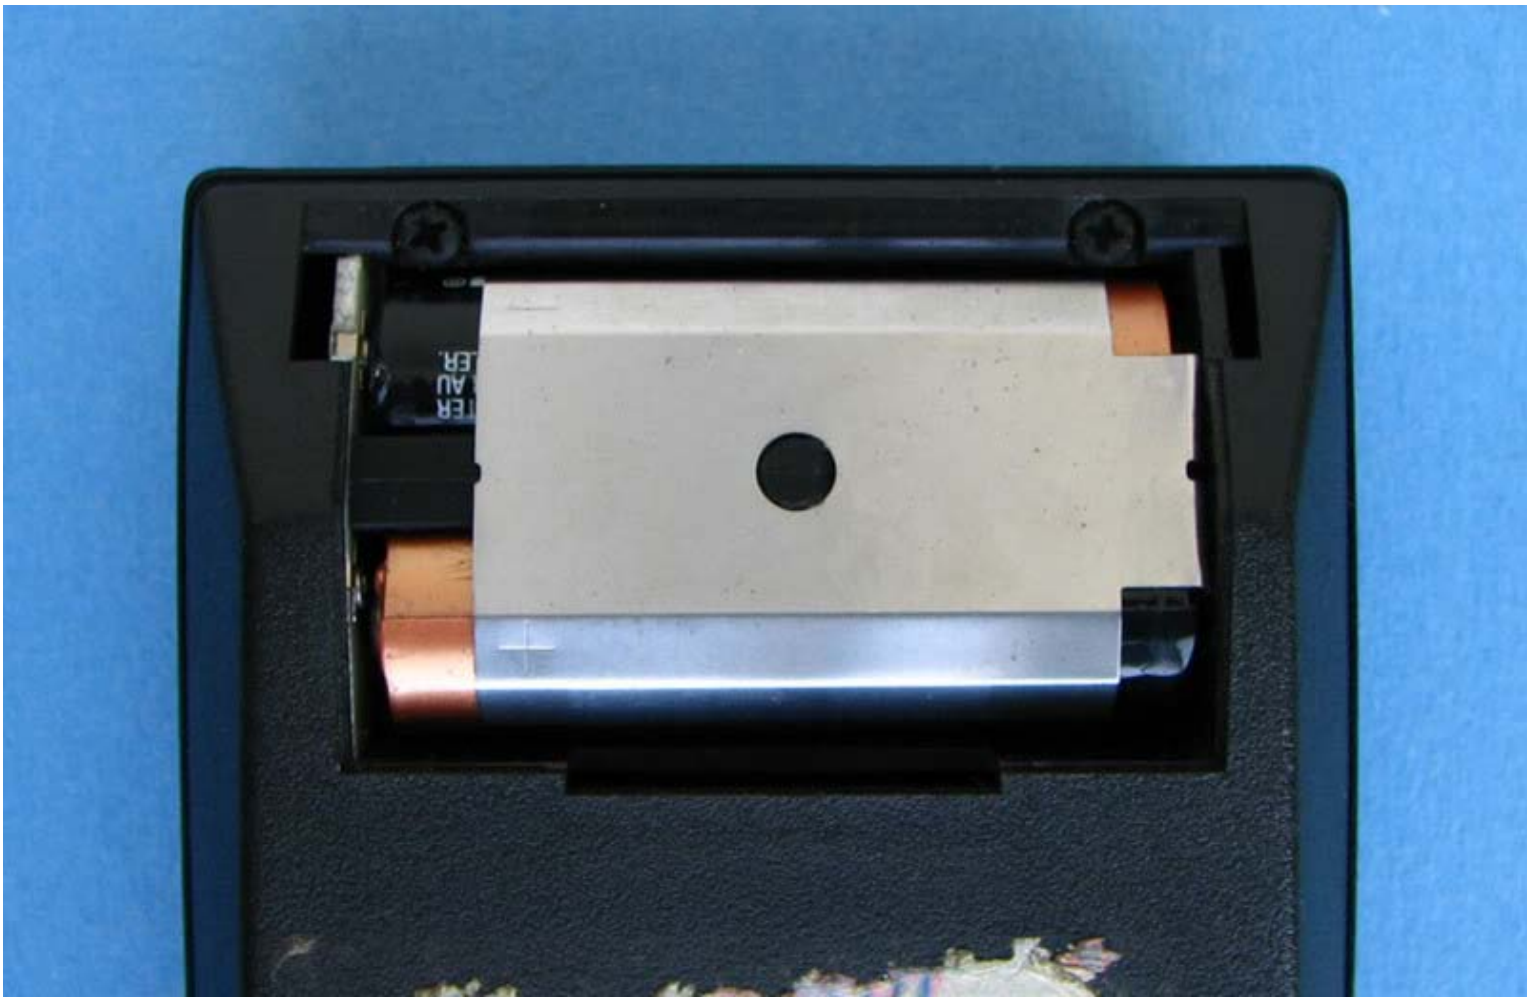

FIGURE 6

A coincidence, really, but I just finished restoring this HP 34C!

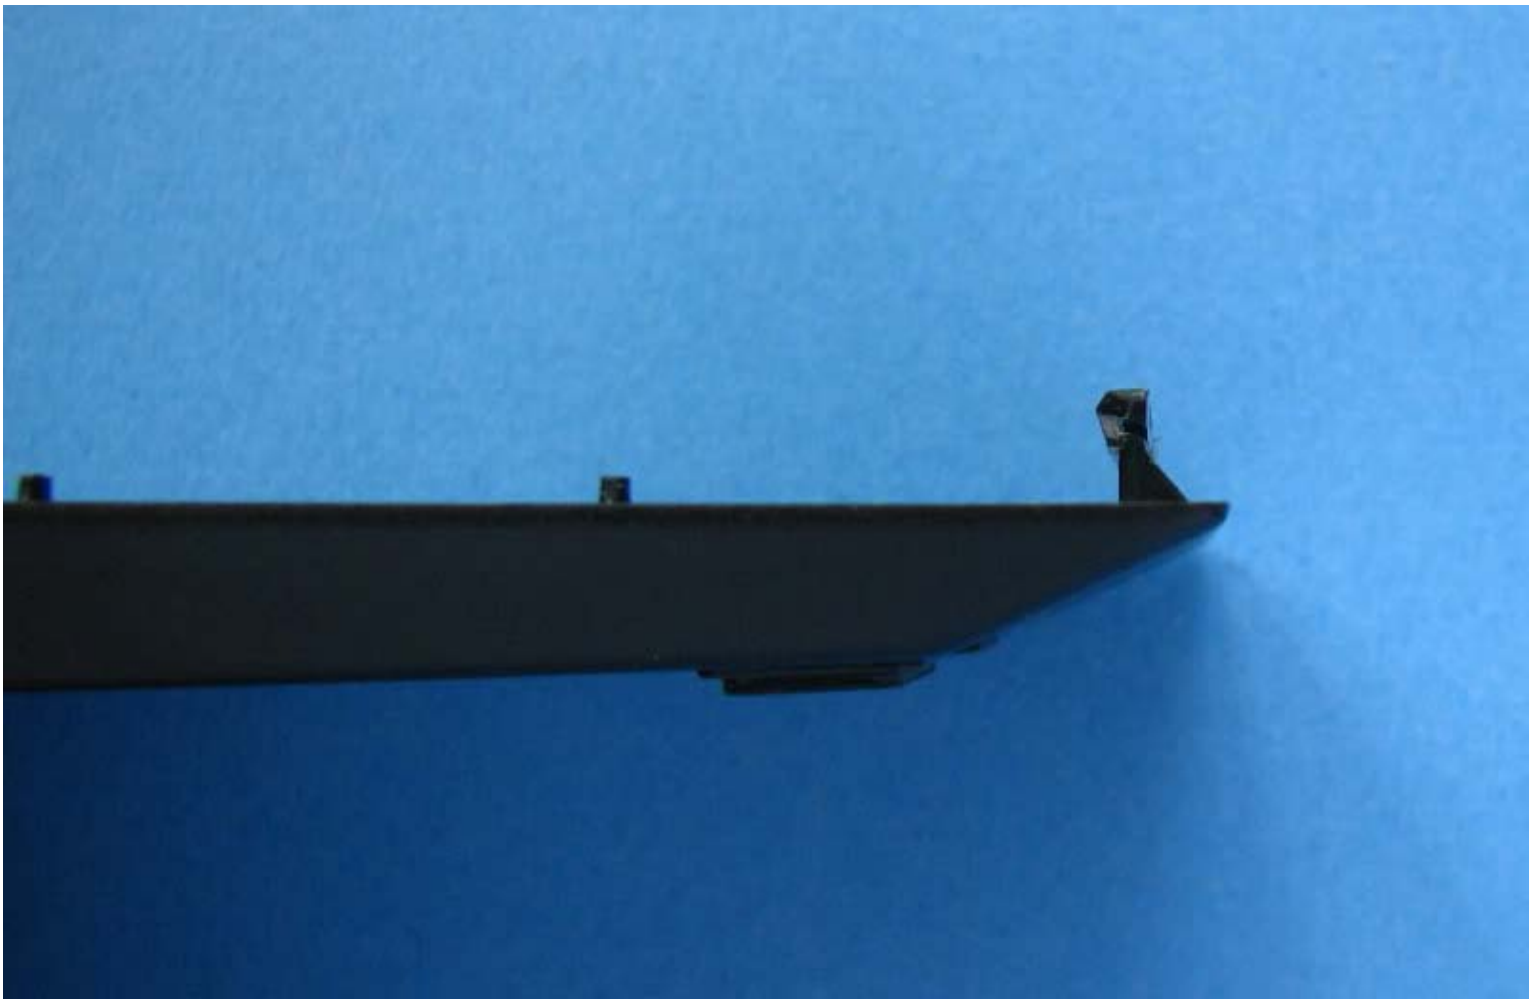
FIGURE 7

A coincidence, really, but I just finished restoring this HP 34C!

Of course the hardest part about a spice restoration is entering the case! After undoing the screws, I inserted a sharp long bladed knife between the upper shell and bottom shell at the foot of the calculator. This separated the bottom half of the calculator enough (a knifes blade in width) to allow me to simutaneously pull the upper half apart, and push the bottom shell down longitudinally to the calculator. You can see the L shaped clip that resides at the foot of the calculator that causes such a problem for shell separation; figure 8. This is the reason for separating the lower halves with the knife to allow the two halves to slide apart.

FIGURE 8

A coincidence, really, but I just finished restoring this HP 34C!



Once inside, luckely without breaking or cracking the case, I was able to expose the top shell back; figure 9. Also the inside portion of the top shell holding the framework and PCB; figure 10.

After removing the framework, holding the entire PCB in the case, by gently prying three clips out of the way on one side and lifting one edge of the PCB out, I was able to gain access to the keys and upper shell; figure 11.

FIGURE 9

A coincidence, really, but I just finished restoring this HP 34C!

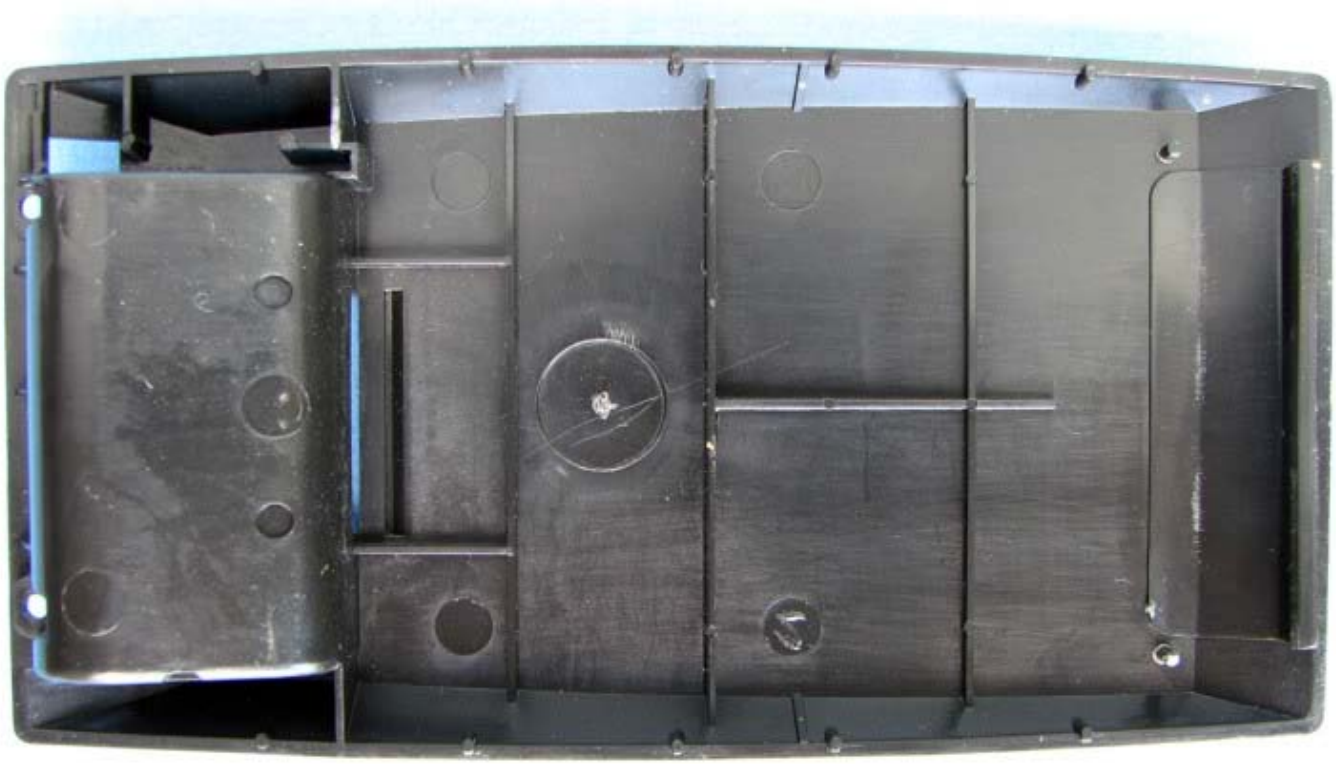


FIGURE 10

A coincidence, really, but I just finished restoring this HP 34C!

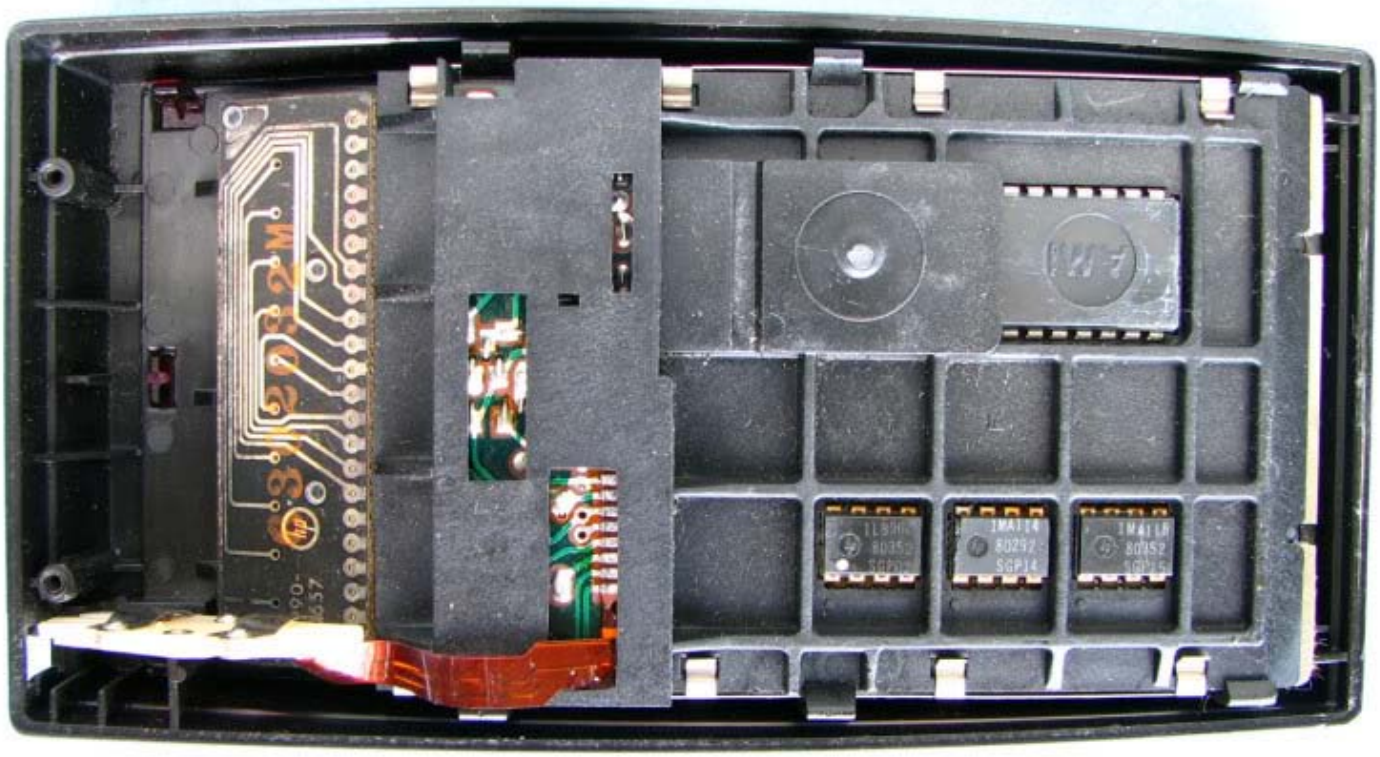

FIGURE 11

A coincidence, really, but I just finished restoring this HP 34C!

The keyboard was now exposed indicating the problem with both switches. They were encrusted with a yellow stain and gritty dust; figure 12. A close up of the ON/OFF switch cleaned in contrast to the PRGM/RUN switch on the left can be seen in figure 13. Finally figure 14 shows both switch contact areas cleaned and greased ready for assembly.

FIGURE 12

A coincidence, really, but I just finished restoring this HP 34C!

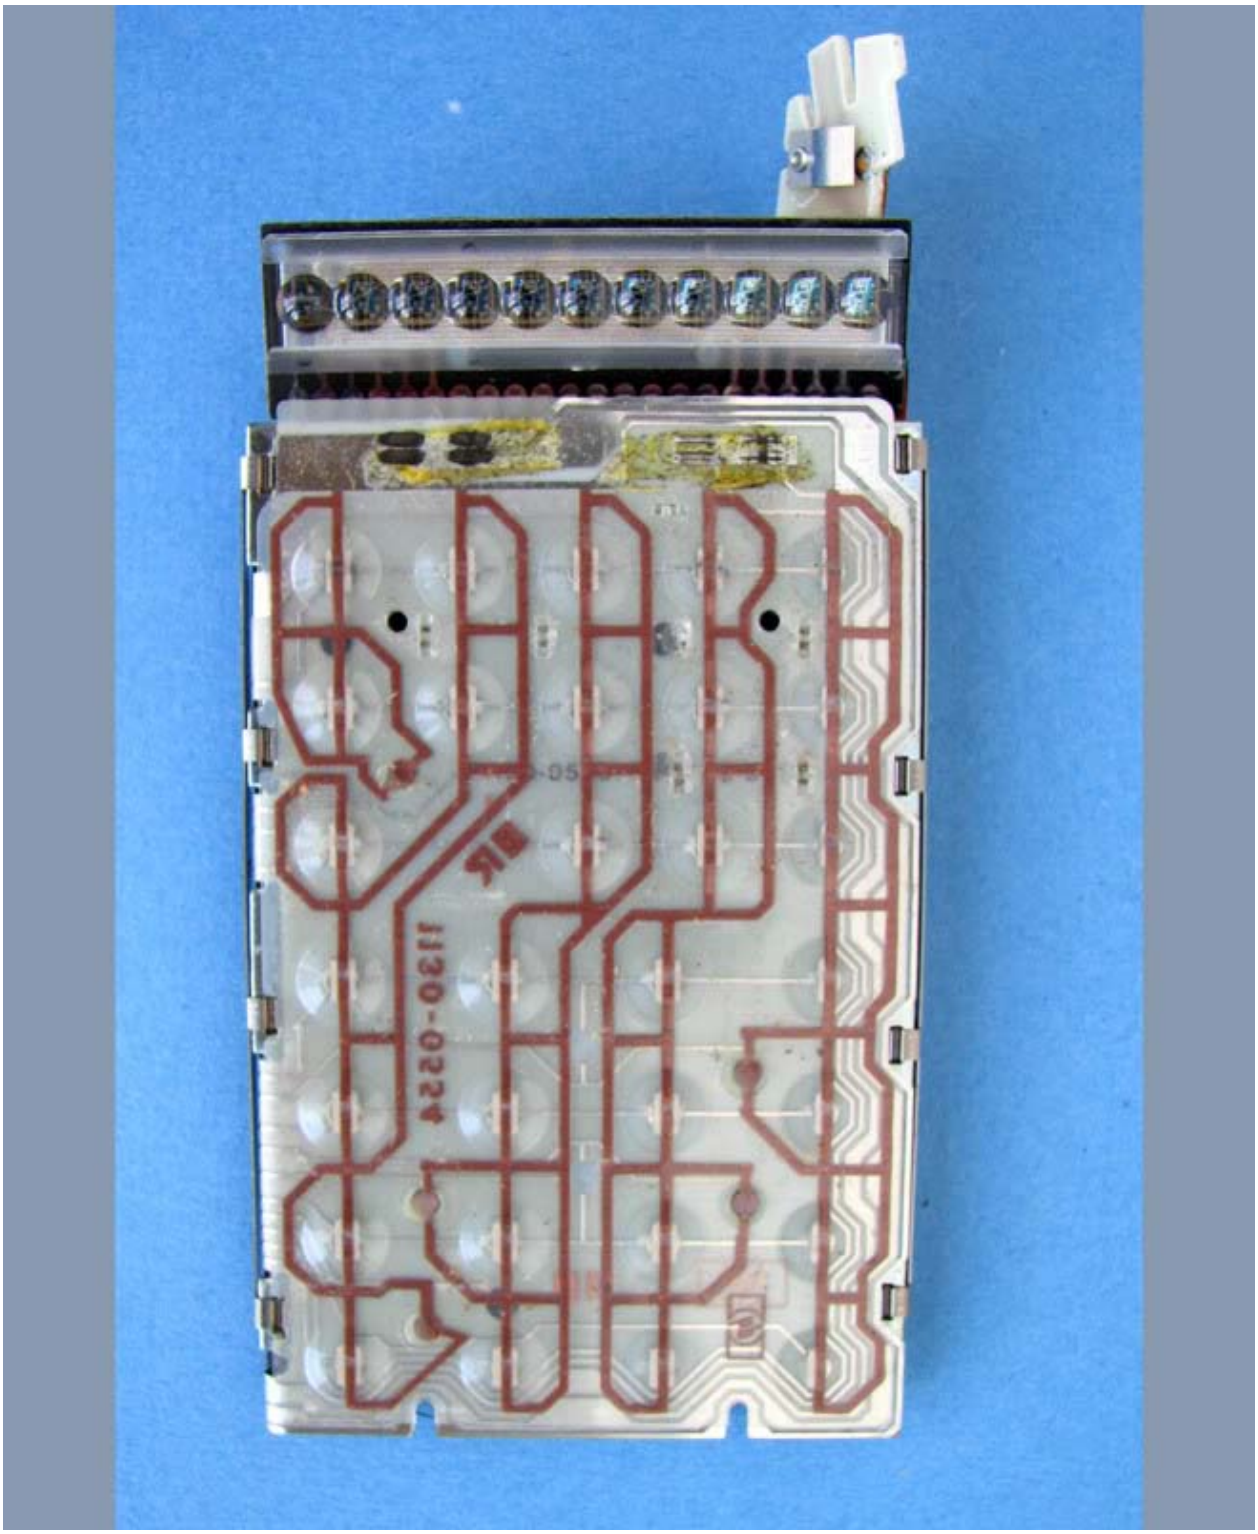

FIGURE 13

A coincidence, really, but I just finished restoring this HP 34C!

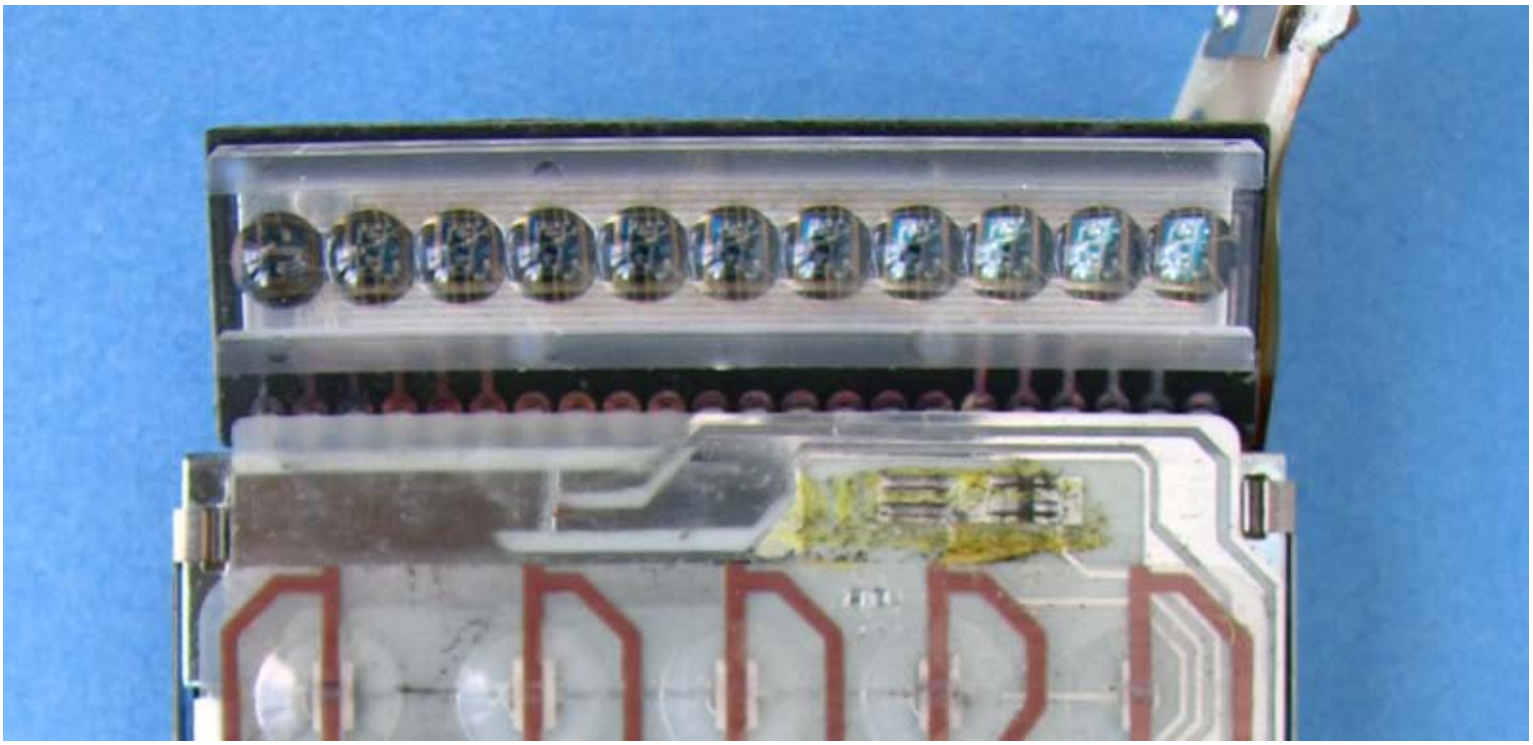

FIGURE 14

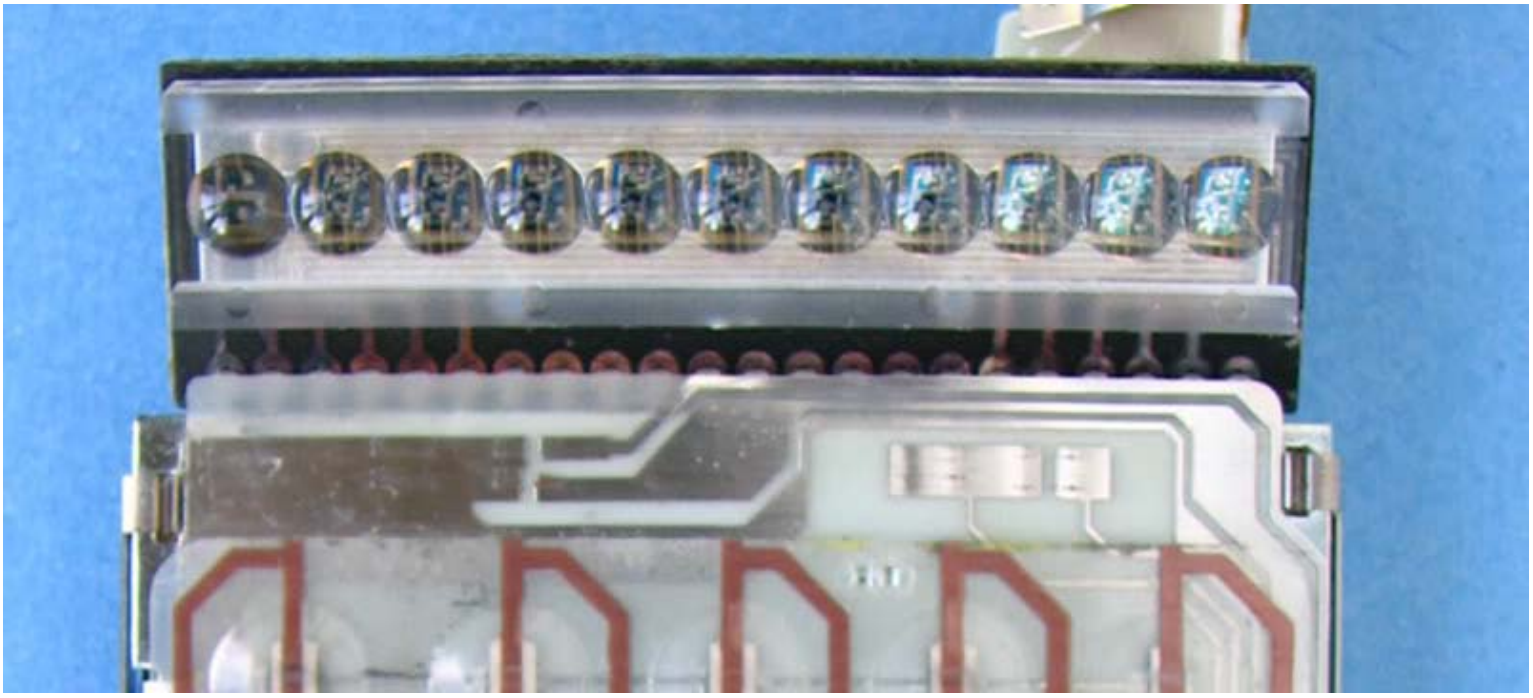

This calculator has the floating (non-soldered) IC's and since the calculator passed the self test I did not think it wise to open up the next set of clips and expose the IC's. I did give this calculator a good dusting down with a blower and then tested it before reassembly. I must say that the dirt was confined to the exterior portion of the keypad and that the cello wrapped key pad was perfectly protected from dirt intrusion.

The case was gently cleaned in soapy warm water with natural soft bristled paint brush. After applying some citrus oil to the goop on the LED cover lense I managed to remove the detritus and expose the mildly scratched cover. A bit of plastic watch crystal polish cleared up the scratches. A touch paint around the ON/OFF switch bezel completed the top shell.

The bottom shell lable was also removed via the citrus oil and the case cleaned. Each key appeared to be covered in a dirt/oil/grime residue so the were individually scrubbed with a tooth brush.

Everything was dryed in my drying box and then the calculator was tested without the back in place with the self test; figure 15.

The end result as seen in figure 16 and a side by side comparison of before and after can be seen in figure 17.

FIGURE 15

FIGURE 16

A coincidence, really, but I just finished restoring this HP 34C!

FIGURE 17

Hope you enjoyed this little presentation!

Cheers, Geoff

Hi Geoff,

Again a beautifull restored machine. Can you share with us how you restored the worn edges at the on-off switch, Did you use a filt pen, if yes what type?, Also it looks like the word "on" is now much scharper, as if it was painted again?

Kind regards

Ronald

*Message #4 Posted by **Nigel J Dowrick** on 24 May 2009, 12:15 p.m.,*
in response to message #1 by Geoff Quickfall

An amazing job - thank you for documenting it so thoroughly and for sharing it. It's rather inspiring to see examples of what is possible given skill, patience, and a lot of time!

Can I take advantage of this HP-34C thread to ask a question about this machine's keyboard? My HP-34C is the only LED HP calculator that I have. The keyboard works well, as does the rest of the machine. However, the keys rattle! They are so noisy that I keep expecting them to fall out, although they seem secure. None of my other HPs have this "feature".

Is this normal for the machine, or is it a problem that I should be trying to fix?

Thanks for any advice that anyone can give me.

Nigel

Re: A coincidence, really, but I just finished restoring this HP 34C!

*Message #5 Posted by **Robert Hollyer** on 24 May 2009, 2:48 p.m.,*
in response to message #4 by Nigel J Dowrick

Nigel,

Is your HP-34C the soldered version or is it unsoldered? As mentioned in the previous thread, I have a soldered HP-34C with a deteriorated elastomeric keyboard overlay. The overlay is approximately 0.025" thick and is located between the plastic keys and the metal snap domes of the soldered HP-34C. The locations where the overlay is missing, result in loose keys since there is approximately 0.025" of extra space for key movement.

In comparison, I have an unsoldered HP-31e that does not use an elastomeric overlay. Instead it has plastic snap domes. The plastic snap domes are about 0.040" tall whereas the metal snap domes are about 0.016" tall. This difference in snap dome height corresponds to the thickness of the elastomeric overlay, which seems to imply that HP used the same case tooling and compensated for the snap dome height difference by inserting the elastomer.

Re: A coincidence, really, but I just finished restoring this HP 34C!

*Message #6 Posted by **Nigel J Dowrick** on 24 May 2009, 5:13 p.m.,*
in response to message #5 by Robert Hollyer

I've haven't opened it yet (after all, it does work!) but the serial number starts "1850", which suggests that it was made in 1978. From what I've read, this isn't possible as this model wasn't released until 1979! Either I'm mistaken about this, or the calculator's back is from another 3x-series model.

Although I don't know which sort it is, your idea of a missing overlay sounds reasonable. The keys definitely have too much freedom in the vertical direction, which matches with what you suggest. I think that I shall open it up and have a look, especially since (with the false back) it must have been opened before. I would also quite like to find out whether it is soldered or solderless.

Thank you for the information.

Nigel

It's likely that the production line was ramped up before the official introduction in order to have sufficient quantities available through the distribution channel.

Loose keys on Spice units.

*Message #8 Posted by **Randy** on 24 May 2009, 9:23 p.m.,*
in response to message #6 by Nigel J Dowrick

It is very unlikely you'll find anything out of place with the unit, the version one units with the plastic dome switches did have very loose keys which rattled when shaken. The rubber dampener sheet made its first appearance on the 41 so the original Spices did not benefit from that improvement, only the second generation Spice keyboards had it.

My advise would be to let it be, there is a chance you'll chip the edge of the center case band when removing the back. Further, there is a risk of breaking one of the six tabs that hold the keyboard assembly in place.

I personally find the original Spice keyboard to have the worst key feel of any HP, the pressure required to collapse the dome is higher than any other keyboard design and the travel is too far for speed efficient entry.

Re: Loose keys on Spice units.

*Message #9 Posted by **Nigel J Dowrick** on 25 May 2009, 6:47 a.m.,*
in response to message #8 by Randy

I've slept on it, and I think that I'll take Randy's advice, at least for now. Cosmetically the calculator is in good condition, and apart from the rattle the keyboard works reliably with no missed or double presses. I haven't taken a Spice calculator apart before, and possibly a working HP-34C isn't the machine to practise on! I also don't have a clear idea of what material to put beneath the keyboard to stop the rattle, even if this is possible.

Thank you all once again for your comments. I'll attack a Commodore 5R39 instead - the penalty for failure there is much lower!

Nigel

Re: Loose keys on Spice units.

*Message #10 Posted by **Robert Hollyer** on 26 May 2009, 6:06 p.m.,*
in response to message #9 by Nigel J Dowrick

Nigel,

I agree, don't open the unit. My guess is it's a solderless 34C due to the early serial number and would not have the overlay.

Re: Loose keys on Spice units.

*Message #11 Posted by **Randy** on 26 May 2009, 6:16 p.m.,*
in response to message #10 by Robert Hollyer

It is very easy to determine whats inside without opening it, just weigh it without batteries.

A coincidence, really, but I just finished restoring this HP 34C!

~200 grams = solderless (V1)

~130 grams = soldered (V2)

Re: Loose keys on Spice units.

*Message #12 Posted by **Nigel J Dowrick** on 27 May 2009, 7:07 a.m.,*
in response to message #11 by Randy

The mass of my calculator - without battery pack, but with the pack cover - is 176g, so it's closer to 200g (solderless) than 130g (soldered). That seems to settle it - thanks!

Nigel

HP-34C Spice series keypad

*Message #1 Posted by **Robert Hollyer** on 23 May 2009, 2:20 p.m.*

In the process of repairing a soldered version of the HP-34C, I noticed that the keypad has a rubber cushioning material located between the keys and the key snap domes. In this particular calculator, the material has completely deteriorated. I searched the HP Museum archives for references to Spice series keypads, and discovered a few prior discussions of this topic. However, there didn't seem to be a conclusion about which material to use as a replacement. The rubber membrane is approximately 0.025" thick and is tan in color. I searched MSC Direct and Smallparts.com for substitute materials, and turned up a few options for 1/32" thick elastomeric sheets with various Durometer values, etc. Before I place an order for a random replacement, I am curious if there are any suggestions regarding what materials has been previously tried/used?

Re: HP-34C Spice series keypad

*Message #2 Posted by **Geoff Quickfall** on 23 May 2009, 6:56 p.m.,*
in response to message #1 by Robert Hollyer

I will be interested in the outcome here Robert. Keep us posted.

It seems to be a firm type of foam and I guess I have been lucky so far with my 6 spices.

I just posted the restoration which I did this morning coincidentally!

Cheers, Geoff

Fast editor for 48SX/GX??

*Message #1 Posted by **Mark Edmonds** on 23 May 2009, 7:37 a.m.*

Greetings folks,

I was wondering if anyone knows of a fast editor program for the 48 series?

The editor is the major achille's heel on these machines and editing a large program is a very tedious and slow business.

I've looked through hpcalc.org but can't see anything.

The editor on the 49G is really fast. Is there something like that which can be loaded on a 48?

Or are there any "secret" tips for speeding up editing on a 48 please?

Any suggestions here gratefully received. The 48s are still the pinnacles for me but editing is a major PITA!

Thanks :)

Mark

*Message #2 Posted by **Chris Foley** on 23 May 2009, 5:27 p.m.,*
in response to message #1 by Mark Edmonds

You should try StringWriter from JYA.

It is very fast and easy to use. It is close to the version available in the 49+.

You can DL it at this address : http://www.hpcalc.org/details.php?id=129

Good programming ;-).

Chris

Re: Fast editor for 48SX/GX??

*Message #3 Posted by **Mark Edmonds** on 24 May 2009, 6:18 a.m.,*
in response to message #2 by Chris Foley

Thanks Chris :)

I've got that installed and trying it out. Shame you can't enter programs exactly the same way you can in the built-in editor (a few quirks I've found so far) but old habits die hard.

Not too impressed with how long it takes to load a large program though.

For a prog I am working on now that is about 7K big, loading it into the built-in editor takes 41 seconds on a 48G and 45 seconds on a 48GX. Odd as I thought the GX had a faster CPU.

Using StringWriter, it still takes 41 seconds on a GX. However, scrolling in SW is massively faster!

So despite the loading time, SW is obviously a huge step-up from the built-in editor. Thanks for the recommendation :)

Using SpeedUI, you can nearly immediately start editing, since loading of your 7K program will take a few seconds only.
Loading the 2.7K EXAMPLES directory takes less than 2 seconds:-)

And scrolling is very fast, too, and you have a multiple clipboard,
and online keyword browser with parameter help, and more.

And not o forge: The SpeedUI editor IS the new cmd line;-)

For the GX, I'd suggest to try my SpeedUI,
an older version is available on hpcalc.org, and v9.0x from me directly,
which includes (amongst many other things) a super fast CMD line and full screen editor replacement,
with global multiclipboard and online browser for all built-in HP-48 cmds and fcns.

HTH

Raymond

BTW: SpeedUI for the HP-48G+/GX is still supported and updated.

*Message #13 Posted by **Mark Edmonds** on 7 June 2009, 3:13 p.m.,*
in response to message #10 by Raymond Del Tondo

Raymond - I have installed SpeedUI and have to say how impressed I am. A spectacular piece of programming! Thank you very much for making this available.

My only small criticism is that I would like to be able to use the UI.LIB in 4-line mode and not 6 but otherwise, your work has totally changed the 48 and corrected the main flaw of the slow editor. Although it takes up a lot of memory, SpeedUI is going to be a standard component from now on!

Thanks again :)

Mark

Re: Fast editor for 48SX/GX??

*Message #14 Posted by **Mark Edmonds** on 24 May 2009, 6:25 a.m.,*
in response to message #7 by Raymond Del Tondo

Thanks Raymond. I've downloaded the version on hpcalc and I'll give it a try. Looks like it might take a lot of memory though. I'm not too familiar with libs and such so I suspect running it from a non-merged mem card might be sensible. Is that right?

Mark

Re: Fast editor for 48SX/GX??

*Message #15 Posted by **Raymond Del Tondo** on 26 May 2009, 1:03 p.m.,*

in response to message #14 by Mark Edmonds

Hi Mark,

most of the components of SpeedUI can be run from any port,
but the configuration lib (CF.LIB) and the user interface lib (UI.LIB)
must be stored in port 0 or 1 of a GX.
For performance reasons, it's best to store all of the libs in an uncovered port (0 or 1)

As in my other posting, the latest version is not on hpcalc yet, but can be sent via eMail.

HTH

Raymond

Re: Fast editor for 48SX/GX??

*Message #16 Posted by **Egan Ford** on 26 May 2009, 3:02 p.m.,*
in response to message #1 by Mark Edmonds

For a bit of out-of-the-box thinking, you could use EMU48 for the speed, but still use your 48 as the keyboard. I have done this with the 50g, and it should work the same for the 48. See http://sense.net/~egan/skb/, section *Controlling EMU48* for details.

128k Ram modules for HP-85B

*Message #1 Posted by **Jeff Davis** on 21 May 2009, 6:33 p.m.*

How can you verify that the HP-85B is reading the RAM modules? Is there a memory test function? Please let me know.

Re: 128k Ram modules for HP-85B

*Message #2 Posted by **Eric Smith** on 22 May 2009, 2:54 a.m.,*
in response to message #1 by Jeff Davis

It acts as an "electronic disc", so you have to use the E-Disc commands (built into the 85B, optional for the 86 and 87) to access it. I don't know the details, but it should be covered in the manuals.

Re: 128k Ram modules for HP-85B

*Message #3 Posted by **Jeff Davis** on 22 May 2009, 10:32 p.m.,*
in response to message #2 by Eric Smith

Thanks for pointing me in the right direction. I had no idea there was a e-disc on the HP-85B!

Matrix software for the 41

*Message #1 Posted by **Geir Isene** on 21 May 2009, 5:36 p.m.*

I've not been doing matrix calculations since uni, but I'm wondering about your viewpoint on which module provides the best tool set to handle matrices. We have the Advantage module, the CCD Rom, the PPC and others. Anyone up for a short review of this?

Re: Matrix software for the 41

*Message #2 Posted by **Raymond Del Tondo** on 21 May 2009, 8:26 p.m.,*
in response to message #1 by Geir Isene

The Advantage module includes the CCD module Matrix functions,
plus some more, and both can of course handle matrices in X-Memory.
The Advantage module has some more math oriented functions than the CCD module,
whereas the CCD module covers some other topics, like OS extensions, FOCAL program manipulation, etc.

A good combination would be the Advantage module and my CCD OS/X ;-)

HTH

Raymond

Re: Matrix software for the 41

*Message #3 Posted by **Angel Martin** on 22 May 2009, 1:54 a.m.,*
in response to message #2 by Raymond Del Tondo

I agree with Raymond, the Advantage's implementation is better - just because they (legally) copied the CCD's from the scratch. They (HP, that is) also added a few important utilities also in MCODE, which were sorely missing in the CCD.

In fact a Matrix-less version of the CCD Module is what I decided to do once the superiority of the Advantage in this area was clear. I took them all off and replaced them with more general-purpose functions, in an 8k module - the "Modified CCD", also at TOS.

Raymond's OS/X is of course an absolute must to have on every system, a 4k jewel with all the great OS extensions from the CCD.

I wrote a few more matrix routines using the Advantage and the Sandmath functions, they may be interesting to you as well. They're in the upper 4k of the SandMath_3 module, available at TOS. One of them I fondly remember was a brute-force eigenvalues solver using the Advantages SOLVE function, where the characteristic equation to solve involves of course calculating the determinant on each iteration... fun to watch.

Best, 'AM

> A good combination would be the Advantage module and my CCD OS/X ;-)

... which incidentally is my favorite setup (CCD OS/X, ICEBOX, Advantage on a NoV-64) - but not because of the matrix functions. According to you guys I should be well set to dive into matrices once again. I should have a look at the eigenvalues solver - maybe port it to another module (ICEBOX) to not use to much memory space with the full Sandbox.

Re: Matrix software for the 41

*Message #5 Posted by **Angel Martin** on 23 May 2009, 5:07 a.m.,*
in response to message #4 by Geir Isene

Hi Geir,

The Eigenvalue solver (as well as many routines called by it and math programs) is not on the SandBox, but on the SandMath_3 - so porting it to the ICEBOX doesn't seem to be a good game plan.

There are a couple of programs in the SandMath_3 (not Valentin's) that really don't live up to the noble goal of being superb, so maybe you've got some of that kind to add to it - it'll be good. MCODE better, but not required :)

Best,

AM

Re: Matrix software for the 41

Hi, **Geir Isene**:

> You may also want to download and have a look at my 9-page article **Long Live the Advantage ROM!** in PDF format, which reviews its most important features and includes a sample program utilizing to the fullest some of them.
>
> It will probably give you a fair idea of what it is, what it can do, and its programming style.

Best regards from V

Re: Matrix software for the 41

*Message #8 Posted by **Ángel Martin** on 22 May 2009, 7:39 a.m.,*
in response to message #7 by Valentin Albillo

Indeed Valentin's excellent program showcases the Advantage prowess at matrix crunching..

Just to mention that it *is* also included into the SandMath_3 rom, under the POLFIT name. - so you won't have to type it in :-)

Here's the listing of the EIGEN program for your enjoyment - don't forget it's a brute-force approach, so you won't find math artistry in here... yet it's below 40 program steps.

The idea is simply to apply the definitions: solve for x so that Det([A]-x[I])= 0; where [I] is the identity matrix of same order as [A].

```
01 LBL "EIGEN"
02 "ORDER=?"
03 PROMPT
04 E
05 E3/E+
06 *
07 "AA"
08 MATDIM
09 XROM "IMR
10 DIM?
11 "!!"
12 MATDIM
13 LBL 00
14 "LOW'VAL=?"
15 PROMPT
16 "HI'VAL=?"
17 PROMPT
18 "SOLVING…"
19 AVIEW
20 "*VP"
21 SOLVE
22 TONE 4
23 "VP="
24 ARCL X
25 PROMPT
26 GTO 00
27 LBL "*VP"
28 STO 00
29 "!!"
30 XROM "MIDN"
31 RCL 00
32 "X"
33 MAT*
34 "!!,AA,!!"
35 MAT-
36 "!!"
37 MDET
38 END
```

OT: Math question

*Message #1 Posted by **KC** on 20 May 2009, 2:28 a.m.*

One day when I was waiting a bus in the bus-stop, a question came to my mind: Let's say I didn't know the exact schedule of the bus, what I knew was that a bus would come every 30 min. I knew that, on average, I would need to wait 15 min. Now the fact was that on the bus-stop, there were two different-numbered buses that I could take to the destination, so my question was: assuming both buses would depart every 30 min., on average, how long would I need to wait for either bus to come? I could not figure that out instantly in my mind, so I came back home and tried to derive the formula for that. Since I'm not a Mathematics major, after quite a looooog time I came up with the following formula:

t=D/(n+1)

where t=average time to wait; D=departure time (e.g. 30 min.); n=no. of buses that I can take

Here are the questions: 1. Is my formula correct? I can only gurantee that it is correct for n=1.

2. If it was correct, it seems that it is very simple. So is there an intuitive way of thinking (and solving) the problem? Again, I can only "see" the result for n=1.

Best regards, KC

Re: OT: Math question

*Message #2 Posted by **Michael Andersson** on 20 May 2009, 4:41 a.m.,*
in response to message #1 by KC

Let's assume you have two busses, if they arrive out of phase you would have a bus every 15 min an average waiting time of 7.5 min. On the other hand if they always arrive at the same time (in phase) the average waiting time would be 15 min also for two buses. So if several buses are involved the problem seems to be much more complicated, but since I'm not a mathematician either I think someone else can give a much more detailed answer.

Best Regards
Michael

Re: OT: Math question

*Message #3 Posted by **Thomas Radtke** on 20 May 2009, 10:31 a.m.,*
in response to message #2 by Michael Andersson

> Quote:
>
> On the other hand if they always arrive at the same time (in phase) the average waiting time would be 15 min also for two buses

So it's maybe a linear problem and therefore always the avarage of the two extreme combinations?

Re: OT: Math question

*Message #4 Posted by **Michael Andersson** on 20 May 2009, 11:27 a.m.,*
in response to message #3 by Thomas Radtke

The point I was trying to make is that if you have several buses to choose from you will have a solution that depends on some kind of phase angles between the time tables. However, assuming all the time tables have been coordinated so the different buses arrive at constant intervals your solution below (t=D/2^n) should be correct. /Michael

Re: OT: Math question

*Message #5 Posted by **Thomas Radtke** on 20 May 2009, 10:25 a.m.,*
in response to message #1 by KC

Maybe t = D / 2^n

Re: OT: Math question

*Message #6 Posted by **Chuck** on 20 May 2009, 11:04 a.m.,*
in response to message #1 by KC

Here's a possibility...

suppose the the second bus arrives c minutes after the first bus. Then, c/30 of the time you would wait c/2 minutes, and (30-c)/30 of the time you would have to wait (30-c)/2 minutes. This gives your weighted-average wait time:

```
c^2    (30-c)^2         c^2 - 30c +450
---  + --------    =   ---------------
60         60                  30
```

When c=0 this gives you 15 minutes, and when c=15 you get 7.5 minutes, and all others in between. This might be correct.

Re: OT: Math question

*Message #7 Posted by **PeterP** on 20 May 2009, 11:25 a.m.,*
in response to message #1 by KC

KC,

I know very little about math so please take this with a large grain of salt (which might make it unpleasant to your pallet...)

I believe that waiting for a bus is called a poisson process and actually a quite famous question. A quick google found the following potentially interesting links and explanations:

Waiting For the Bus

The Waiting Time Paradox

Unfortunately, this google brought up another paradox that I don't understand:

> Quote:
>
> In G. Wright & P. Ayton (Eds.), "Subjective probability" (pp. 353-377). Chichester, UK: Wiley], a passenger waits for a bus that departs before schedule in 10% of the cases, and is more than 10 min delayed in another 10%. What are Fred's chances of catching the bus on a day when he arrives on time and waits for 10 min? Most respondents think his probability is 10%, or 90%, instead of 50%, which is the correct answer. The experiments demonstrate the difficulties people have in replacing the original three-category 1/8/1 partitioning with a normalized, binary partitioning, where the middle category is discarded.

Why is the correct answer 50%?

Cheers

Peter

Re: OT: Math question

*Message #8 Posted by **Jonathan Eisch** on 20 May 2009, 12:54 p.m.,*
in response to message #7 by PeterP

> Quote:
>
> Why is the correct answer 50%?

It might make more sense if you read it as: "he arrives on time and waits for *at least* 10 min?" After waiting for 10 minutes, he has already determined that the bus is not 0-10 minutes late (80% of the time). So, the remaining options are: that the bus was early (10% of the time), or the bus is more than 10 minutes late (10% of the time). Since they are equally likely, the answer is 50%.

-Jonathan

Re: OT: Math question

*Message #9 Posted by **PeterP** on 20 May 2009, 2:38 p.m.,*
in response to message #8 by Jonathan Eisch

yes, if he waits for at least 10', the answer is 50%. small words can be very important... Thnks Jonathan..

Re: OT: Math question

*Message #10 Posted by **Chuck** on 20 May 2009, 1:05 p.m.,*
in response to message #7 by PeterP

I think as soon as you bring in the variance of arrival a Poisson distribution might be needed. The assumption here is that the arrival times are fixed, and with no variance. I ran a short simulation on mathematica. This one only shows 1000 arrivals. Any more than that, the graph of the mean-wait-time is obscured by the parabola:

```
In[16]:= n = 1000;

In[17]:= arrivals = Table[Random[Real, {0, 30}], {i, n}];

In[18]:= c = 15;

In[19]:= waittimes = Table[If[arrivals[[i]] < c, c - arrivals[[i]], 30 - arrivals[[i]]],
           {i, 1, n}];

In[20]:= Mean[waittimes]
Out[20]= 7.37633

In[21]:= meanwaittime[c_] :=
          Mean[Table[If[arrivals[[i]] < c, c - arrivals[[i]], 30 - arrivals[[i]]],
            {i, 1, n}]]

In[22]:= meanwaittime[30]
Out[22]= 14.5913

In[23]:= Plot[{(x^2 - 30 x + 450) / 30, meanwaittime[x]}, {x, 0, 30},
          PlotRange → {0, 15}]
```

Out[23]=

Re: OT: Math question

*Message #11 Posted by **KC** on 21 May 2009, 1:35 a.m.,*
in response to message #10 by Chuck

Thanks for all your positive response. However, I'm still not convinced. I think the formula
t = D / 2^n
only holds true if, as Michael said, the two buses are completely out of phrase. In reality, the phrase between the two buses may be random, even if they are not supposed to be, due to complicated traffic conditions (but we can still assume that traffic conditions would not affect the frequency of the same numbered-buses since they experienced the same traffic conditions). Assuming the phrase is random, so for the case of two buses, the average waiting time should be between 7.5 and 15 min.

Best regards,
KC

Re: OT: Math question

*Message #12 Posted by **Thomas Radtke** on 21 May 2009, 5:05 a.m.,*
in response to message #11 by KC

Yes, for 2 buses, it is between 15' and 7.5'. For 3 buses, the same logic applies (D is in the range of 15' and 3.75'.

Taking the mean of both extreme conditions...

t = (D / 2 + D / 2^n) / 2

...gives a linear approximation.

Well, the trick is probably to integrate all possible phases. But wouldn't this result in the same formula? Can anyone without (unlike me) a dyscalculia enlight me? :^)

Unfortunately, with zero buses the answer would be 22'30" which makes no sense to me, so I declare n>0 ;-).

Edited: 21 May 2009, 5:06 a.m.

*Message #14 Posted by **Valentin Albillo** on 21 May 2009, 9:36 a.m.,*
in response to message #1 by KC

Hi, **KC**:

Your **t=D/(n+1)** formula is correct. It can be arrived at in a number of ways, but let's try a Monte Carlo approach by running a simulation in our trusty **HP-71**.

This little 3-line (108-byte) program here will run a simulation for any given number of trials **N** and from 1 to 5 buses:

```
10 DESTROY ALL @ INPUT N @ RANDOMIZE 1 @ FOR B=1 TO 5 @ S=0
20 FOR I=1 TO N @ T=RND*30 @ FOR J=2 TO B @ T=MIN(T,RND*30) @ NEXT J
30 S=S+T @ NEXT I @ DISP USING "D,2X,2D.2D";B;S/N @ NEXT B
```

Upon running it with 1000 trials, then 100,000 (under **Emu71** to save time) we have:

```
>RUN

  ? 1000
```

```
          1   14.84
          2   10.04
          3    7.39
          4    5.98
          5    5.10

      >RUN

        ? 100000

          1   14.98
          2    9.98
          3    7.51
          4    6.02
          5    5.02
```

and the numbers clearly are going to **15, 10, 7.5, 6, and 5**, respectively, i.e. **30/2, 30/3, 30/4, 30/5, and 30/6**, thus the best fit to them is indeed your formula, **t=D/(n+1)**.

Best regards from V.

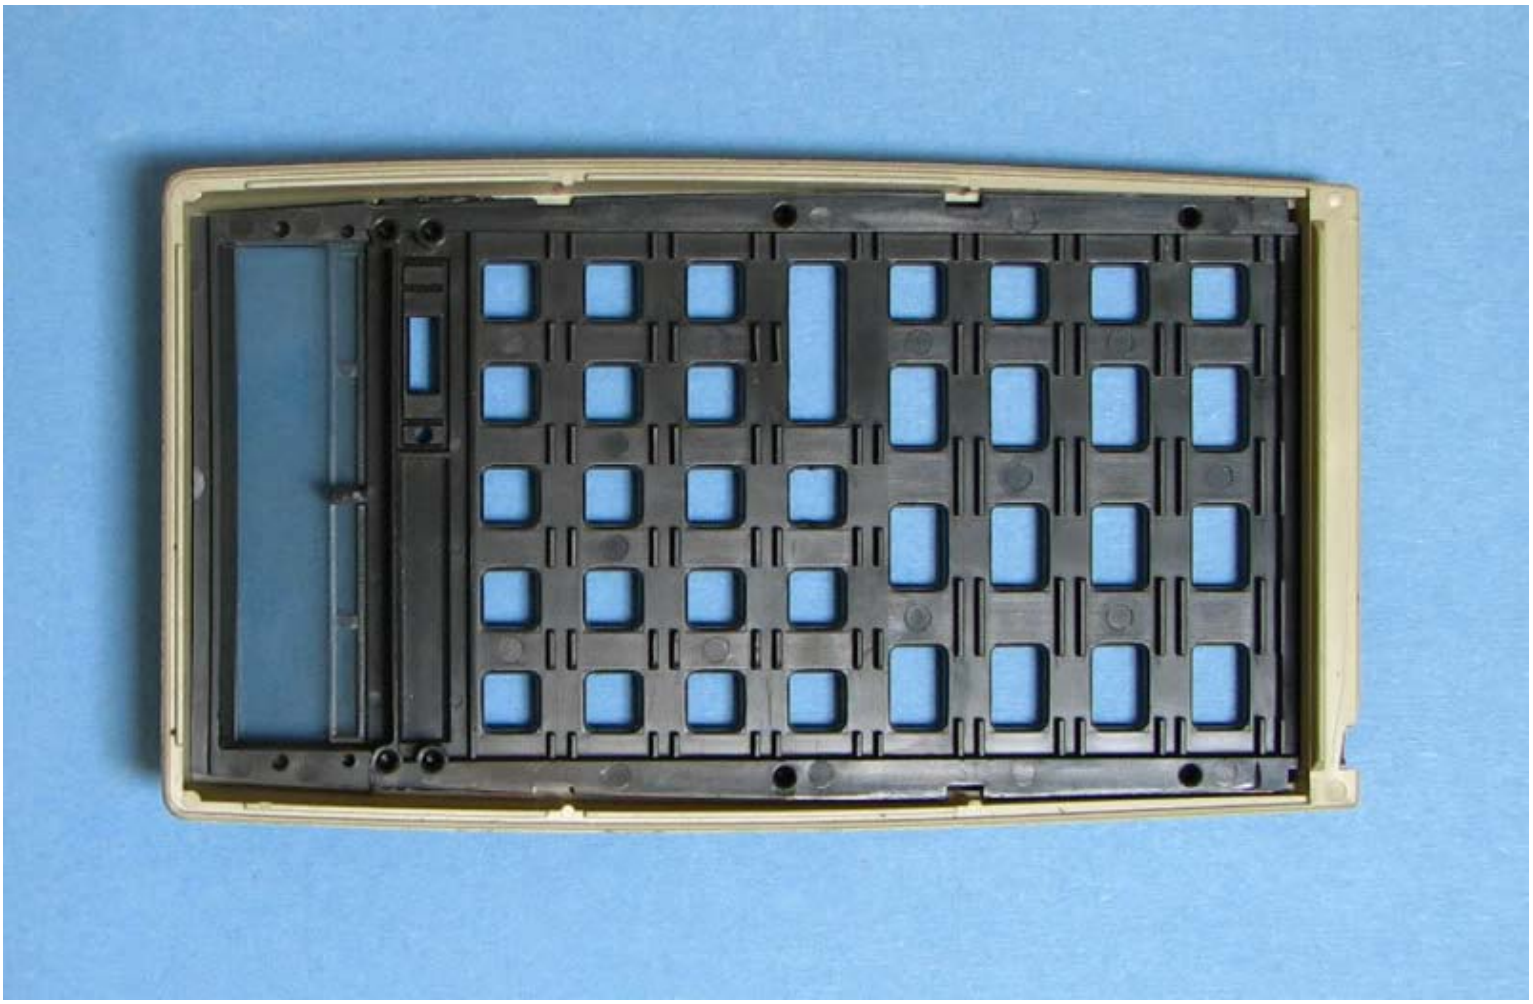
HP 35 red-dot prototype case, wohooo!!! and other pictures...Had to tell someone!!!

*Message #1 Posted by **Geoff Quickfall** on 19 May 2009, 10:07 p.m.*

I can't believe my fortune from a collector and restorer standpoint. I recieved a box of stuff in the mail containing among other things the following:

Prototype HP 35 red dot case in the original tan shell. See the HP Museum photos for the HP 35 that Dave has posted. You can see the hole just to the right of the on off switch.

Heres the top shell inside view also showing how the hole actually resides in it's little rectangular frame:



The two shells showing the insides:

Here is a later model 35 for comparison. Note the smokey LED plastic lense and the lack of silk screened labels for the keyboard bezel. Maybe I will temporarily place a spare HP 35 with labelled keys in position and take a picture of it for posterity.

Included among NOS manuals for classics, flip cards for classics, voyager manuals, HP75B leather case and cards, Hp 65 nav pac and standard pack was this beautiful NOS HP 67 case for a future project. Completely unused!!!

Top shell:

Bottom shell:

The same benefactor sent me two NOS HP 15C badges for my two HP 15C restorations bringing them up to NOS appearance:

Well there is more including some scarce brochures and manuals which I will scan for the Museum.

Thats all for now, enjoy the pictures. Any body got a spare red dot that needs a new case??????????????????????

Geoff

Johnny

Re: HP 35 red-dot prototype case, wohooo!!! and other pictures...Had to tell someone!!!

*Message #3 Posted by **Joel Setton (France)** on 20 May 2009, 4:42 a.m.,*
in response to message #1 by Geoff Quickfall

Hello Geoff,

If you have no use for that empty HP-67 case, I could certainly use it... I have repaired an HP-67 to full functionality (including the card reader with the O-ring fix), but the case is deperately beyond restoration. The silkscreened

legends (printed in blue/gold) are unreadable, which makes the calculator almost impossible to use!

Thanks,

Joel Setton

Re: HP 35 red-dot prototype case, wohooo!!! and other pictures...Had to tell someone!!!

*Message #4 Posted by **Jake Schwartz** on 20 May 2009, 3:45 p.m.,*
in response to message #1 by Geoff Quickfall

Hi Geoff,

I was wondering how different in color that prototype HP35 case was from an HP70 case...could you photograph 'em up side by side, by any chance?

Thanks,

Jake

The one classic I do not have is the HP 70! so I can't do a colour comparison!...

*Message #5 Posted by **Geoff Quickfall** on 20 May 2009, 9:29 p.m.,*
in response to message #4 by Jake Schwartz

That is the one Classic I do not have!

In fact the case was mistaken as an HP 70 without the silk screening. It wasn't until I pointed out the neat little hole to the right of the on off switch that the shell was recognized for what it really is.

If anyone has a spare HP 70 for sale, drop me a line.

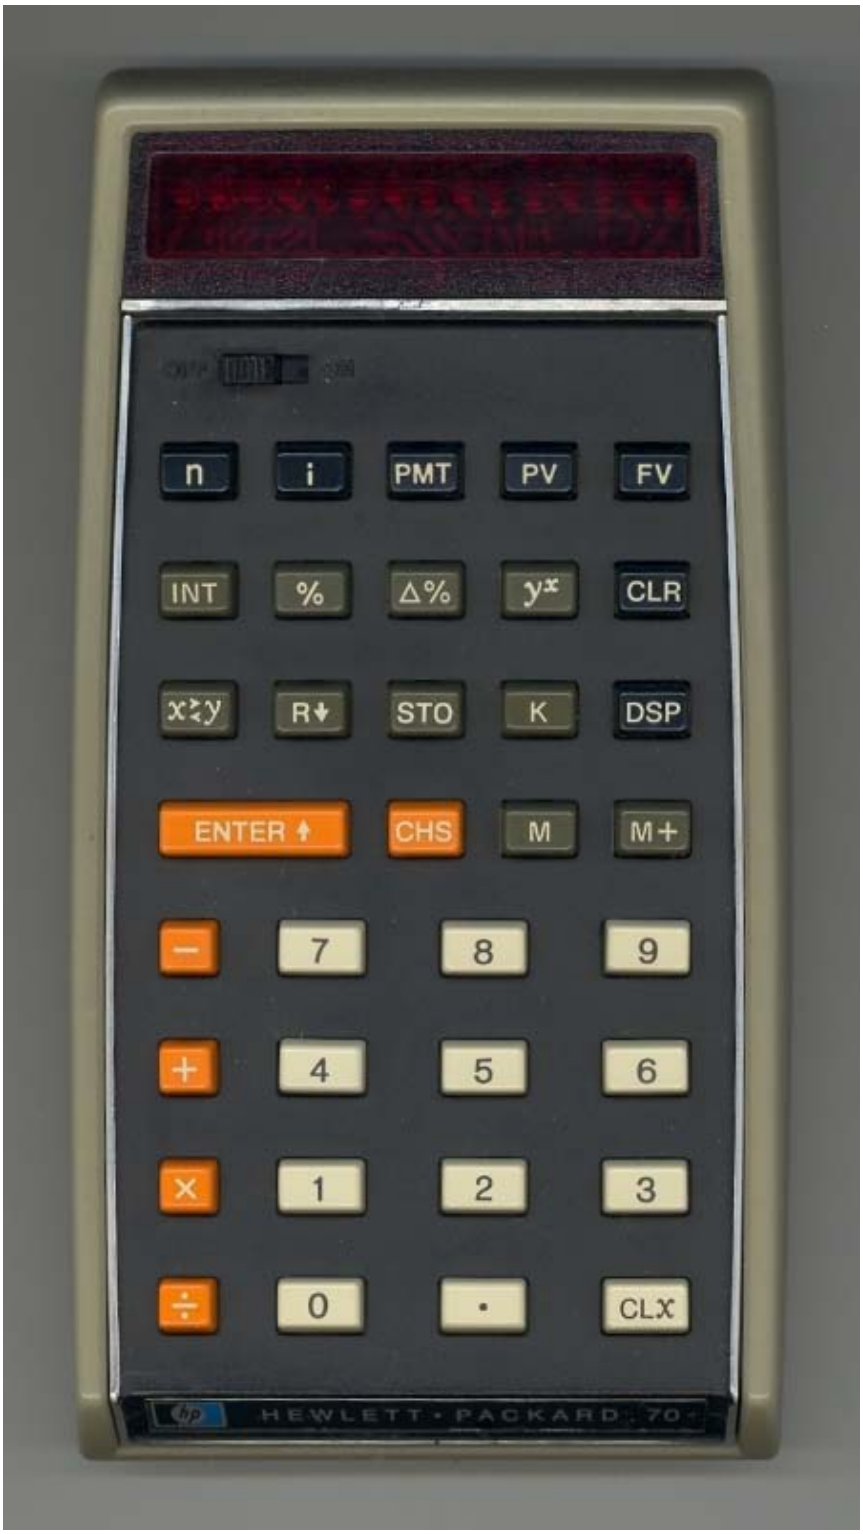
Cheers, Geoff

P.S. I will bring it with me in the fall to Vancouver, Washington.

Re: The one classic I do not have is the HP 70! so I can't do a colour comparison!...

*Message #6 Posted by **Michael de Estrada** on 20 May 2009, 10:04 p.m.,*
in response to message #5 by Geoff Quickfall

This photo suggests the colors are different



Clearly Not An HP70

*Message #7 Posted by **Jake Schwartz** on 20 May 2009, 10:04 p.m.,*
in response to message #5 by Geoff Quickfall

Hi Geoff,

Thanks....There is another way to tell that this was not an HP70 beside the hole for the "red dot"...The openings for the top rows of keys were the small ones for the original square HP35 keys with no labels, rather than those from the later versions with the funtion labels on the wider key tops.

Jake

uWatch2 Front Panel

*Message #1 Posted by **DaveJ** on 19 May 2009, 6:59 p.m.*

It's looking like I might now be limited to 24 keys with 7mm spacing, so I have been thinking adding some shift functions might be the way to go, so here is my first attempt:

Or do people think the display now looks too cluttered?
(The fonts need some trimming etc, it's just an example) Shift functions allow easy access to most needed functions without resorting to any menu system.

You could of course go berserk with multiple shift functions etc, but I think that's way too much.

The display window is now a different ratio to accommodate a new LCD I'm getting. If it doesn't work out I'll have to go back to the previous squarer shaped one, and that will cramp things a bit.

Due to the lack of keys, side function buttons have been dropped in favor of 4 above the display. This will work better in practice anyway.

Sorry, alpha keypad support is gone.

As usual, comments and passionate discussion invited :->

Dave.

Re: uWatch2 Front Panel

*Message #2 Posted by **Marcus von Cube, Germany** on 20 May 2009, 2:50 a.m.,*
in response to message #1 by DaveJ

I think you can get away with <ENG> conversions and put PI on the keyboard instead. Replace <ENG with a DISP key which shows a menu in the top row but can be easily followed by a digit to set the display precision without changing the display mode. Holding the key down for half a second could be used to show full precision numbers temporarily.

Your design lacks the arrow keys. :(

Re: uWatch2 Front Panel

*Message #3 Posted by **DaveJ** on 20 May 2009, 7:56 a.m.,*
in response to message #1 by DaveJ

Or hows about a new 40mm x 40mm case version with 24 keys:

Dave.

Re: uWatch2 Front Panel

*Message #4 Posted by **Jeff O.** on 20 May 2009, 12:39 p.m.,*
in response to message #3 by DaveJ

I think I like this one. Let's see, 40 mm is 4 cm, which is about 1.6 inches (my apolgies to the metricated world). Wow, that's tiny. Smaller than the small dimension of uWatch1.

I didn't think about the keyboard layout yet, I'll let you know if I come up with anything.

PPC vs. CCD vs. ZENROM module

*Message #1 Posted by **Nik Brem** on 19 May 2009, 6:27 p.m.*

Could anyone help me by comparing the modules PPC, CCD and ZENROM. Which one is the best? What differs and what do they have in common?

Thanks, Niklas

Re: PPC vs. CCD vs. ZENROM module

*Message #2 Posted by **Raymond Del Tondo** on 19 May 2009, 7:07 p.m.,*
in response to message #1 by Nik Brem

The modules you request have different focuses. In short words:

PPC: Completely FOCAL with Synthetics, various apps, like plotting, root finding, etc, and many utility fcns (mosty synthetic)

ZENROM: Completely in ML. Targeted at the ML and synthetic programmer.

CCD: Completely in ML. Targeted at the programmer _and_ the user. Unique user interface extensions (CAT,ASN,XEQ, direct synthetics), I/O fcns, PEEK/POKE, Matrix fcns, and much more.

You could take a look at the appriorate user manuals at TOS to compare the features in detail.

My favourite is the CCD module, and the CCD OS/X (of course;-)

HTH

Raymond

Re: PPC vs. CCD vs. ZENROM module

*Message #3 Posted by **jotne** on 21 May 2009, 9:02 a.m.,*
in response to message #2 by Raymond Del Tondo

My favorite is also the CCD

PPC is just a bunch of programs.

CCD is much more. It do also change how the CAT menu works.

You can also type the synthetic program codes directly like RCL-b etc.

Edited: 21 May 2009, 9:03 a.m.

Found a use for a dead 10-B (doing happy dance)

*Message #1 Posted by **htom trites jr** on 19 May 2009, 12:35 p.m.*

One of the few dead HP calculators I own is a 10-B; I've ignored it. Today, though, I found an HP-42s at the local thrift shop, missing the case and battery compartment cover, it was priced at $us1.99. The battery cover and case from the dead 10-B fit perfectly; is there some difference (transparancy) that I should be concerned about?

Re: Found a use for a dead 10-B (doing happy dance)

*Message #2 Posted by **Katie Wasserman** on 19 May 2009, 1:01 p.m.,*
in response to message #1 by htom trites jr

Wow, what a find! All the pioneer battery covers are the same and are transparent to IR, you should be all set.

Re: Found a use for a dead 10-B (doing happy dance) ; fix 42s

*Message #3 Posted by **htom trites jr** on 21 May 2009, 8:47 a.m.,*
in response to message #2 by Katie Wasserman

Thanks. Trying several got one that was a good fit. (The first one I tried kept hopping up about a sixteenth of an inch.) Passes all tests, just needed new batteries.

Re: Found a use for a dead 10-B (doing happy dance) ; fix 42s

*Message #4 Posted by **Les Wright** on 26 May 2009, 12:21 a.m.,*
in response to message #3 by htom trites jr

About three years ago I overpaid exorbitantly (about $400USD including shipping) for a well worn 42S with box and manual just for the sake of having it, and I don't even use it (various Free42 simulators on Palm, Windows, Linux, and now iPhone have replaced it). So I think you got a really good deal.

Re: Found a use for a dead 10-B (doing happy dance) ; fix 42s

*Message #5 Posted by **htom trites jr** on 26 May 2009, 3:49 p.m.,*
in response to message #4 by Les Wright

Gulp! That's ... a lot of money to pay for a calculator that you're not going to use. I use Free42 on a bunch of things and recommend it to those who use RPN. I discovered the problem with the cover fit was that one of the battery springs was protruding; pushing it down with my thumb, all of the covers now fit and stay down.

HP34C Black Scholes Model

*Message #1 Posted by **Ed Austin** on 18 May 2009, 5:14 p.m.*

Hi there

I am looking for Option pricing Models for my HP34C (might as well use it in the field!) - is the HP12C instruction set compatible - as the 12C has financial models plentiful. If only a few instructions are different I'd just convert... if not.. I might have to convert whole programs...

Many thanks!

Ed

Re: HP34C Black Scholes Model

*Message #2 Posted by **Gene Wright** on 18 May 2009, 5:43 p.m.,*
in response to message #1 by Ed Austin

That's a whole lot of work to use a hard to replace 34c for something a $30 HP 12c can do all day long.

Why not just pick up a used 12c, put in the already written black-scholes option pricing program into it, and use that in the field?

That program is in the 12c platinum solutions book, available in PDF form on HP's website (assuming the links work - you never know with HP's website these days).

Why do this on a 34c? Why risk a 34c out and about in the field?

Re: HP34C Black Scholes Model

*Message #3 Posted by **Ed Austin** on 18 May 2009, 7:40 p.m.,*
in response to message #2 by Gene Wright

Hi Gene

I take care of the 34C even in the field :) Still has its original soft pouch!

You do have a point though - and perhaps I will pick up a 12C (or 41 series) and keep the 34C at home for computation!

Many thanks Ed

in response to message #1 by Pal G.

I've been playing with it:

```
integrated functions
plot 2D and 3D fucntions
solved 2nd order differential equations
found laplace and inverse laplace transforms
create a star chart
found the atomic structure for caffeine
compared stocks....
```

and all on my **ipod touch!!!!** That's power, baby. And never ending fun!

in response to message #4 by Nigel Bamber

They're very elegant and efficient algorithms for calculating transcendental functions (trigonometric functions and others). These algorithms made it possible for the HP-35 to have a full set of trigonometric and logarithmic functions despite its small amount of memory. See CORDIC in Wikipedia for more information.

in response to message #1 by Pal G.

Hi **Pal G**:

Really, really nice, thanks a lot for letting us know, much appreciated ! :-)

Its mathematical capabilities are really astounding. I've tried a number of examples I've concocted myself that some of you might want to try in order to see the nice results, just copy-paste each line in its turn and don't forget to use the "More digits" option:

1) solve **LOG(PI^e+1491/505*LOG(x)^4)-PI=0**

A nice symbolic representation and 4 roots, the real ones being:

X = **0.500000000**51903

X = **1.999999999**79239

2) solve **(2002/X)^7+(2002/X)-71=0**

Six complex roots and the real one:

X = **1093.0000000**7366+

3) solve **GAMMA(X)-85/31=0**

5 real roots displayed and among them

X = **0.3259999**53+

4) solve **X^5+X+6=0**

5 roots (4 complex, one real), all of them returned in both numeric and fully symbolic form

Best regards from V.

*Message #11 Posted by **Namir** on 19 May 2009, 10:53 a.m.,*
in response to message #1 by Pal G.

Awsome site! I tried several examples for solving equations. Got the results I was looking for. You sometimes have to put the equation in a certain form to get the solution. for example:

solve log(X^4)-X=0

Does not give numerical roots, while:

solve 4*log(X)-X=0

Does give the two roots.

Namir

HP LED displays

*Message #1 Posted by **Richard Ottosen** on 17 May 2009, 11:50 a.m.*

Recently, a friend was showing off some old electronic parts he had accumulated over the years. What caught my eye were some 3-digit 7-segment displays. They are marked HP 5082-7433.

I am curious if these are the same parts used in any of the early HP calculators.

*Message #2 Posted by **Randy** on 17 May 2009, 4:46 p.m.,*
in response to message #1 by Richard Ottosen

Some classics used 1990-0335, later units 5082-7405. There are five digits in these packs so the three digit version you have would not be compatible.

*Message #4 Posted by **Michael de Estrada** on 17 May 2009, 8:22 p.m.,*
in response to message #3 by Katie Wasserman

Interesting. The power receptacle looks similar to the one on my HP Model 46, which has a fuse and reversible voltage selector card (120/240). Is it?

Also, while on the topic of the HP 46 (and HP 81 as well), I found a cheaper and more available printer ribbon than the Porelon 483-B/R. It is the Nu-kote NK80BRC and cost me $2.99 at Office Depot.

Thanks for the neat photos.

Michael

> The power receptacle looks similar to the one on my HP Model 46, which has a fuse and reversible voltage selector card (120/240). Is it?

Yes, it looks like this display board uses the same power connector as the 46 and 81 do. My guess is that this display board was built in the late 1970's near or after the end of the 46 and 81 production cycles. It has a non-standard HP serial number, 332-2, I can't tell the date from that.

Yeah, it could be used to feed 5v and data to an external device. I'm wondering, could it be used to load data INTO the displays from an external device like a keyboard?

Gerry

Re: HP LED displays

*Message #10 Posted by **Tony Duell** on 21 May 2009, 9:14 a.m.,*
in response to message #7 by Katie Wasserman

Some HP logic probes had a BNC plug on the end of the cable for the 5V (and ground) connection. And thus some HP instruments have such a socket to plug the logic probe into when you're testing them.

I know my 6940B Multiprogrammer has one inside the front door, and my 59403 Common Carrier interface has one on the back. I am told the I/O module extenders for the HP98x0 and 98x5 series have such connectors too, but I've not obtained those (yet!)

Re: HP LED displays

*Message #11 Posted by **Katie Wasserman** on 21 May 2009, 11:03 p.m.,*
in response to message #10 by Tony Duell

Tony,

Yes, I think that's it. The BNC connector is hooked directly to the +5V on the power supply board. Here's a picture of the inside of the display:

HP LEDs 6

The date codes on the chips indicate that this was likely made in early 1983, I thought it would have been made earlier, but I guess the smart LED displays that it shows off must have been hot items around that time. It's running a 6802 microprocessor with 8K bytes of EPROM, not exactly state of the art in 1983 but it got the job done.

Re: HP LED displays

*Message #13 Posted by **Andrés C. Rodríguez (Argentina)** on 18 May 2009, 7:37 a.m.,*
in response to message #1 by Richard Ottosen

There were small HP LED displays in 3, 4 and 5-digit clusters. The last was the type used in Classic calculators. I still have some of each variant, I bought them as a small surplus lot (may be from Jameco, not 100% sure) by mail around 1977; however some of them have non-working decimal points.

Please feel free to correct mistakes in this message if you think it will be for good.

Where the new HP 12C+ ?

*Message #1 Posted by **Jose Ernesto** on 17 May 2009, 9:51 a.m.*

I've been following the threads on the characteristics and availability of the new HP 12C+. I was able to me one of those here in Sao Paulo, for something around US$ 85.00. It came with a manual in Portuguese and behaves exactly as mentioned in this Forum. And exactly as was mentioned, it emulates in detail the original features of the original model, including less memory and functions than the "silver" models. If it didn't have the double battery cover, the astonishing speed and the smell of brand new thing, you couldn't it from the old series HP12 C.

Regards from Brasil

Jose Ernesto

Re: Where the new HP 12C+ ?

*Message #2 Posted by **Don Shepherd** on 17 May 2009, 11:53 a.m.,*
in response to message #1 by Jose Ernesto

Jose, one thing that is different with the new 12c is that it does not have the bug that was in the original 12c regarding not displaying "running" if your program has a clear sigma instruction. This is a good thing.

Atmel ARM7 LCD driver: alphanumeric display

*Message #1 Posted by **Michele Signorini** on 15 May 2009, 5:09 a.m.*

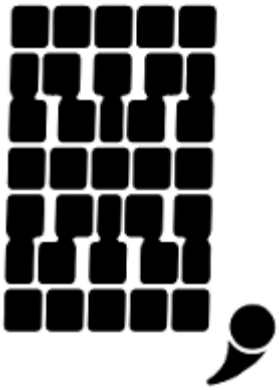
As already discussed, using the Atmel ARM7 cpu in the voyager line opens the exciting possibility to resurrect the beloved hp 15c. The largest limitation of the machine would be, as was in 1982, the simple 10 characters numeric display: I would like to discuss [again] about using the 400 pixel display driver of the cpu to control an alphanumeric display.

With a 5x7 dot matrix design, we could get one line of 10 characters with dots/commas (370px) plus 30 annunciators: probably, only 10 characters are not very suitable for complex number handling, equations editing or soft menu implementation.

With a 14 segments design, we could get up to two lines of 12 characters each with dots/commas (384px) plus 16 annunciators: quite good, but the dimensions of the voyager case (without any redesign) fits better a single line display. Furthermore, segmented displays are quite limited in font set.

I propose here an hybrid 5x5 "quasi" dot-matrix design, on which we could fit one line of 14 characters with dots/commas (378px) plus 22 annunciators. This design is probably not original, but I am not able to remeber where I saw it (maybe a VCR, dvd player or car audio display...). Here you see the configuration of the character matrix, a proposed character set and a picture of an hp 15c (original picture from the Museum, by Dave Hicks) showing an equation. It has already been discussed about the availability of large dot matrix displays with integrated driver chip (like on the Smartcalc 300s), but consider the dimensions constraints to fit a voyager case.

Comments are welcome!



Re: Atmel ARM7 LCD driver: alphanumeric display

*Message #2 Posted by **DaveJ** on 15 May 2009, 6:15 a.m.,*
in response to message #1 by Michele Signorini

Are you talking about a real hardware PCB upgrade?, or just dreaming about something you would like HP to do?

If you are talking about a real hardware upgrade then details have been discussed a fair bit before for a 15C. From memory a suitable 2 line by 40 character display was looked at. And from my recent uWatch2 LCD investigations, there would likely be more options available.

Replacing a 10 character segment display with a single line 14 character dot matrix display isn't much of an

upgrade IMO. Any hardware upgrade would ditch the built-in ARM LCD driver for sure.

Dave.

Re: Atmel ARM7 LCD driver: alphanumeric display

*Message #3 Posted by **Egan Ford** on 15 May 2009, 11:48 a.m.,*
in response to message #2 by DaveJ

> Quote:
>
> Are you talking about a real hardware PCB upgrade?, or just dreaming about something you would like HP to do?

My guess. Dreaming. That display would imply added functions, so a different calculator and a different case to leverage the added functions. It would have limited use with existing ROM images. But for a new calculator I like it, but I prefer the flexibility of a regular dot-matrix. Take the existing 35s. The dot-matrix display is not contiguous limiting the possibility of a 42S style menu system.

If I were to build a fantasy calculator with limited new stuff, then I'd start with the existing 17BII+ display. It has all the announcers you'll need and has a contiguous dot-matrix display.

If I wanted something a bit larger, then start with any 48/49/50 series display. Both the 17BII+ and 48-50 displays are still being manufactured. Unsure how you'd get such a display outside of HP.

Re: Atmel ARM7 LCD driver: alphanumeric display

*Message #4 Posted by **Eric Smith** on 15 May 2009, 5:18 p.m.,*
in response to message #2 by DaveJ

He's talking about what could be done with the new AT91SAM7L128-based 12C platform, by only replacing the display glass. (Well, the display glass would have more electrical contacts, so the PCB layout would have to be revised too.)

The point is that HP is standardizing on the AT91SAM7L128 for midrange calculators, so they're more likely to do build new products that don't require a separate LCD driver chip.

Re: Atmel ARM7 LCD driver: alphanumeric display

*Message #5 Posted by **Michele Signorini** on 18 May 2009, 10:09 a.m.,*
in response to message #4 by Eric Smith

Right, Eric: my investigation was about replacing the only display glass, which will obviously require a PCB revision. No other hardware or physical changes (add lcd drivers or change case dimensions to fit larger displays), unless keytop labels. I think this would be a viable industrial way to get a modern small calculator.

Edited: 14 May 2009, 7:28 p.m.

Re: OT: or a Streamsmart 400 + a 40gs??

*Message #10 Posted by **Dave Shaffer (Arizona)** on 14 May 2009, 9:32 p.m.,*
in response to message #9 by Allen

Quote:

Easily collect data points at up to 5,700 samples/second

Copied from the Stream Smart 400 reference.

Unless you are doing very low speed stuff, I don't think you would be very happy at this data rate.

I got a pretty nice 100 MHz Tektronix dual-trace scope on ebay a couple of years ago for around $200, including shipping, so I tend to agree with DaveJ - spend a few bucks more, and get a real scope! (My latest ebay toy is a 1.8 GHz spectrum analyzer. I'm having GREAT fun with it!)

Re: OT: or a Streamsmart 400 + a 40gs??

*Message #11 Posted by **agodwin** on 15 May 2009, 1:44 p.m.,*
in response to message #10 by Dave Shaffer (Arizona)

I dunno - I've got lots of lovely old analog scopes and I wouldn't let them go. They all cost less than $400, too. But this is nice and small and portable and $35 really isn't very much. I could be tempted to have a play.

Though a scope module for a 50g (that lets you do something with the data you read) would be a much nicer idea.

Re: OT: or a Streamsmart 400 + a 40gs??

*Message #12 Posted by **Egan Ford** on 15 May 2009, 4:51 p.m.,*
in response to message #11 by agodwin

Quote:

But this is nice and small and portable and $35 really isn't very much. I could be tempted to have a play.

That was the point of my original post. It was my no means a contender for a *real* scope. It's a DYI project with open source software just like uWatch. Something to play with and learn from.

Bug in article 893? (HP 35s Triangle solver)

*Message #1 Posted by **Dave Britten** on 13 May 2009, 9:09 p.m.*

In article 893, there's a rather nice triangle solver, though I think there's an error in the calculation of the 2nd SSA solution (menu option 6). Observe this bit of code:

```
T096    CF 10
T097    EQN ASIN(S/R*SIN(U))
T098    STO V
T099    EQN ACOS(-COS(U+V))
T100    STO W
T101    FS? 1
T102    GTO T084
T103    EQN ACOS(1)-W
T104    STO W
T105    GTO T084
```

I see two problems with this. First, ACOS(1) is always zero, so W (angle 3) is just negated, whereas it should be replaced with its supplement(ACOS(-1)-W).

The second problem is that it's actually angle 2 (V) that needs to be replaced with its supplement, not angle 3 (W).

I've made the following changes. Anybody care to confirm that this makes sense? It looks like I'm getting the correct results now.

```
T096    CF 10
T097    EQN ASIN(S/R*SIN(U))
T098    STO V
T099    FS? 1
T100    GTO T103
T101    EQN ACOS(-1)-V
T102    STO V
T103    EQN ACOS(-COS(U+V))
T104    STO W
T105    GTO T084
```

Checking my daughter's homework

*Message #1 Posted by **Sancerre (Phoenix)** on 12 May 2009, 6:59 p.m.*

My daughter asked me to go over her homework. Today's lesson covered operations with fractions. After going through the work manually, we took out our calculators to check the work. I do most of my work on my 50G, but chose my 35s since it is so easy to enter/calculate/display fractions.

We looked at the following problem: 1/5 + 3 7/8 (that is one fifth plus three and seven eights).

Our manual solution was 3 3/40.

However, the 35s came out with 3 1/13.

Naturally, this wasn't a good thing with my 10 year old daughter watching. So, we did the same calculation on her Smartcalc 300s. The 300s confirmed our manual result. I then entered the calculation as an equation on my 50g, it came back with the same answer as the 300s.

So, how come the 35s came back with a different solution? I must be making some stupid mistake (it has been a long day!). Or, is this some display setting with fractions on the 35s?

--Tod

in response to message #1 by Sancerre (Phoenix)

You've probably (accidentally) set a small maximum denominator via the /c command. Try 100 /c and see what result it gives.

0 /c should reset to maximum.

Remember the 35s doesn't do real fraction like the 48 series.

- Pauli

i41CX+ 2.0 Released.

*Message #1 Posted by **Egan Ford** on 12 May 2009, 5:48 p.m.*

Go to the app store for all the details, some things I found few very interesting:

1. A new I41CX command that will take a parameter from the ALPHA register and return the results. E.g. you can now write i41CX+ programs that can get GPS, accelerometer, and other HW data. E.g. CURRLOC returns:

   ```
   Y= -1.948783840
   X=  0.701899541
   ```

   So, where am I? NOTE: I was in RAD mode.
2. URL-based data acquisition. Create an ASCII File and put the URL in the first record, then use the DWNLOAD function.
3. HEPAX support added.

Thanks Al!

Re: i41CX+ 2.0 Released.

in response to message #2 by PeterP

> Quote:
>
> I placed the HP-IL idea with him...

I asked as well. Since the core of i41CX+ is Nonpareil and the aforementioned HP-IL emulation was developed for Nonpareil, it shouldn't be too hard to add.

> Quote:
>
> would that be somewhere near Provo, next to Provo Bay on Utah Lake?

Yep. Working in Provo, UT today. Great attention to detail, if in RAD use RAD, if in DEG use DEG. This new code truly makes an 41CX+. Time to play with some of the 41CX surveying modules.

Re: i41CX+ 2.0 Released.

*Message #4 Posted by **Nigel Bamber** on 13 May 2009, 9:32 a.m.,*
in response to message #3 by Egan Ford

I was also in contact with Antonio who provided further explanation as to how this new I41CX function worked and I thought you would find it interesting. In particular his reference to an unimplemented function in the HP-41CX intrigued me.

Over to him :

" . Enter the command name (e.g. ACCXYZ) in the Alpha register . Execute the "I41CX" function

In other words, strictly speaking, there is one new function called "I41CX" that takes multiple arguments in the Alpha register to execute different commands.

In case you're curious, I chose this implementation because the new function uses an unimplemented instruction in the HP-41CX that is intercepted by the Cocoa part of the code that in turn executes the appropriate command. This has several advantages, including future expansion, ease to implement new commands or modify existing ones without having to deal with MCODE, and the fact that the new commands run at full native speed since they are not running in the emulation layer. The latter will make a difference if I ever implement some complex algorithm commands that require a lot of processing power or long loops. "

It seems to me that this opens the door to other 'goodies' to come.

Nigel

in response to message #2 by PeterP

> Quote:
>
> BTW - I placed the HP-IL idea with him...

You know, that makes my sick mind wonder...

The 3.0 version of the iPhone firmware will allow access to the 30-pin dock connector. Wouldn't it be great (famous last words) to create an iPhone to HP-IL cable?

OK, OK, to be fair, this might be a pipe dream. While I am a registered iPhone developer, I'm not part of the "Works with iPhone" accessory licensing program (yes, that's what it's called), so I don't have access to the proper tech specs or API. Still, it kinda makes me all wistful and misty-eyed to think about hardware HP-IL on the iPhone/iPod.

Re: i41CX+ 2.0 Released.

*Message #6 Posted by **Egan Ford** on 13 May 2009, 4:45 p.m.,*

in response to message #5 by Seth Morabito

You may need to do very little. If any one creates an RS-232 or USB Host adapter for the connector, then you could use the to-be-released PIL-Box.

My aforementioned plan was to use the PIL-Box with a PC and create a TCP to IL gateway. Then i41CX+ would just need to leverage the existing network support of the iPhone. Since HP-IL devices are for the most part tethered this makes more sense to me.

Re: i41CX+ 2.0 Released.

*Message #7 Posted by **PeterP** on 13 May 2009, 4:49 p.m.,*
in response to message #5 by Seth Morabito

...that's exactly what I suggested to Al. He drove the idea further and said 'Why not wireless?'. Personally I think that would make it more complicated from a software perspective and require more complicated hardware (e.g. wireless module).

But this is exactly my dream - to seamlessly move software from i41cx+ to/from my other real HP41Cs, RamDrives and emu41. The true engineers among us could even hook up the i41CX to HP-IL enabled devices on their play-, sorry,'work'bench... While it currently is already super easy to save programs from the i41cx for later retrieval onto the i41CX, communication of modules and programs between a real 41/emu/RamDrive and the i41 is possible, but a bit more cumbersome. For development of programs and especially MCODE I like the PC or a real 41 much better than the i41cx, but once it is developed I want it on my i41CX, which I always have with me (iPhone). It would be great to be able to transfer things quickly and seamlessly from one environment to the other, either via RamDrive/IL-Drive or emu41.

In any case, Al is doing a superb job with this application and I don't regret the money I spent on it (even though now most apps are <5$). He provides top notch support and constantly updates the app

So I have good hopes that he will hear our HP-IL plea...

Cheers

Peter

months ago. Les

At a minimum you now have the ability to store more active programs than before. Without HEPAX you are limited to clearing and restoring from iPhone/iTouch or Extended Memory. HEPAX unlike X-Memory allows programs to be executed without storing them in 41CX main memory.

Re: i41CX+ 2.0 Released.

*Message #10 Posted by **Les Wright** on 22 May 2009, 10:07 p.m.,*
in response to message #9 by Egan Ford

Antonio has paid extra special care to ensuring that the virtual Hepax modules behave as they do in the real calculator. For example, If one tries to "insert" the modules in a configuration that doesn't work, one gets a message stopping the operation. I have lost count of how many times I did a fresh reinstall of V41 to restore Hepax MOD files I kept corrupting because the correct ordering of Hepax modules in Warren's setup just isn't intuitive for the neophyte.

It is amazing that Antonio go this to work. When I asked him about it some months ago, I go the impression that configuring things to write to imported MOD files rather than just read them.

I was one of the lucky ones who jumped onboard when the app was only half the price but think it is still a must-have for serious fans at the $15 price.

As an aside, the source code of Byron Fosters 42s simulator has been upgraded to include wireless import and export and the printer now works properly. (A friend was kind enough to compile it for me.) Unfortunately, the official release has not appeared yet as an upgrade through the AppStore. Indeed, there have been no upgrades since the original release in January. On a positive note, Thomas Okken's own Free42 for iPhone is in the works and should be out eventually, or so I am told! I think it will be as cheap as Byron's version, thus easily worth supporting.

Les

50g integration oddity

*Message #1 Posted by **dbatiz** on 12 May 2009, 4:30 a.m.*

The 50g has surprised me with some results when working with roots. I'm hoping some of the folks in the forum can offer an explanation for this behavior:

Take the integral from -2 to 5 of the following:

1/(3rd root of (x^2+6x+9))

The 50g produces -3

However, recognizing that is a square trinomial, I rewrote it like this:

(x+3)^(-2/3)

Same integral produced 3.

I checked both forms of the equation in my 35s and both returned a positive 3.

Any insight would be greatly appreciated,

Very respectfully,

David

Math Curiousity...an old fashioned approach

*Message #2 Posted by **Hal Bitton in Boise** on 12 May 2009, 11:16 a.m.,*
in response to message #1 by dbatiz

Hi David,
When I did the integration symbolically of the equation 1/(3rd root of (x^2+6x+9)) I got the same result as you did (-3). When I tried to symbolically integrate (x+3)^(-2/3), however, the calculator did not simplify to a solution at all. When I evaluated the integrals of both forms of your equation numerically (by graphing and taking the area under the curve), I got the result (3) for both. I'm pretty sure the 35S integrates numerically (iteratively), which would explain it's solutions.
This is above my pay grade as far as the calculus goes, but I,m guessing what's going on is that your integrand needs to be first transformed in order to find the antiderivatave (closed form), or there may not even be an antiderivative for it. There are math wizards on this forum who can and will elaborate on this I'm sure. At least I hope they will 8]
Best regards, Hal

Re: Math Curiousity...an old fashioned approach

*Message #3 Posted by **dbatiz** on 12 May 2009, 3:36 p.m.,*
in response to message #2 by Hal Bitton in Boise

Here is the kicker Hal,

If you put the original equation in the stack, and use the intx (I think) from the calculus menu, it returns an equation that will be negative. I've had a couple of surprises when working with odd/even roots. The 50g always seems to know a little more about how to handle them than I do, but I think it missed the mark on this one.

Thank you for the response, I'm looking forward to some of the wizards input also,

Very respectfully,

David

Re: 50g integration oddity

*Message #4 Posted by **Martin Pinckney** on 12 May 2009, 2:13 p.m.,*
in response to message #1 by dbatiz

I did both forms of the expression on my 32sii, and it returned 3 in both cases. Not too surprising, since the 35s is a further evolution of the 32sii. Haven't figured out how to do integration on my 42s, yet.

Re: 50g integration oddity

*Message #5 Posted by **dbatiz** on 12 May 2009, 3:39 p.m.,*
in response to message #4 by Martin Pinckney

I'm pretty sure it has something to do with the symbolic handling of the integral. The graph is complete (sometimes negative odd roots get dicey on the 50g), and always positive. The solution should be positive as well (so far as my understanding).

Thank you for the response,

Very respectfully,

David

Re: 50g integration oddity

*Message #6 Posted by **Dave Britten** on 12 May 2009, 3:58 p.m.,*
in response to message #1 by dbatiz

I get -3 in Exact mode, 3. in Approx. mode. Strange.

-Dave

Re: 50g integration oddity

*Message #7 Posted by **Marcus von Cube, Germany** on 13 May 2009, 4:03 a.m.,*
in response to message #1 by dbatiz

My TI-nspire CAS returns 3 as the numeric result and 3(x+3)^(1/3) for the indefinite integral, no matter which form of the term is input.

Re: 50g integration oddity

*Message #8 Posted by **Bart (UK)** on 13 May 2009, 6:23 a.m.,*
in response to message #1 by dbatiz

By hand:

Simplifying & integrating:

integral((x+3)^(-2/3))dx; x=-2,5

substitute u=3+x, then du/dx=1 and dx=du

integral(u^(-2/3))du = 3*u^(1/3) + c

substituting back:

= 3*(3rd root(x+3)); x=-2,5

= 3*(3rd root(8)) - 3*(3rd root(1))

=3

Using my old 48sx: positive 3

even older 28s: positive 3

(using (x^2+6*x+9)^(-1/3) as the eqn on both)

I don't know where the 50g is going wrong. (I can't use my 50g as the display has too many missing lines :( )

Bart

Re: 50g integration oddity

*Message #9 Posted by **Arnaud Amiel** on 13 May 2009, 8:39 a.m.,*
in response to message #8 by Bart (UK)

When in numerical mode, the 50G will also return +3. The problem arises when it tries to solve it symbolically.

Why? I don't know

Arnaud

Re: 50g integration oddity

*Message #10 Posted by **Bart (UK)** on 13 May 2009, 9:15 a.m.,*
in response to message #9 by Arnaud Amiel

Sorry, yes, the 28 & 48 solutions were numerically performed.

Bart

Re: 50g integration oddity

*Message #11 Posted by **Gerson W. Barbosa** on 13 May 2009, 2:02 p.m.,*
in response to message #9 by Arnaud Amiel

There is no problem here. Both solutions are correct... and since 6th root of x is a multivalued function we should expect for more four solutions, if I am not wrong:

$$\int_{-2}^{5} \frac{1}{\sqrt[3]{x^2+6x+9}}\,dx = \frac{1}{\sqrt[6]{x^2+6x+9}}\Bigg|_{-2}^{5} =$$

$$-3\left|\frac{1}{\sqrt[6]{x^2+6x+9}}\right|_{-2}^{5} = -3\left(\frac{1}{\sqrt[6]{64}} + 3\right) = -3\left(\frac{1}{\sqrt[6]{1}}\right) =$$

solution #1:

-3*2 + 3 * 1 = -3

solution #2:

-3*(-2) + 3 * (-1) = 3

On the hp 50g, considering flags -3 and -105 are not set, that is, function -> symb and exact mode on:

```
'integral(-2,5,1/XROOT(3,X^2+6*X+9,X)'
ENTER
EVAL              ->  -3   (first solution)
<-
|->  ->NUM        ->   3.  (second solution)
```

Regards,

Gerson.

Edited: 13 May 2009, 2:30 p.m.

Re: 50g integration oddity

*Message #12 Posted by **dbatiz** on 13 May 2009, 4:16 p.m.,*
in response to message #11 by Gerson W. Barbosa

Gerson,

What rule did you use to get:

$$-3\left|\frac{1}{\sqrt[6]{x^2+6x+9}}\right|_{-2}^{5}$$

$$\int_{-3}^{\int_6 x^2 + 6x + 9} = -2$$

How did you avoid needing to use du/dx and such?

Very respectfully,

David

in response to message #12 by dbatiz

> Quote:
>
> What rule did you use...

Actually, I used the hp 50g rule, as did Karl :-)

```
'INV(XROOT(3,SQ(X)+6*X+9))'
INTVX

-(3*sqrt(cbrt(X^2+6X+9)))
```

Regards,

Gerson.

Re: 50g integration oddity

*Message #14 Posted by **Chuck** on 13 May 2009, 11:57 p.m.,*
in response to message #11 by Gerson W. Barbosa

Hmmm.

In this case, there are also several complex results due to the original result involving cube roots (two complex results), or this result involving 6th roots (four complex results). All should have a magnitude of 3, I presume (total guess. It's been a few decades since complex analysis).

However, I really don't think Reimann and his rectangles had any of this in mind when the definite integral was being born. I would say the -3 solution is "classically" incorrect, even though it may be analytically argued as possible. Interesting problem never-the-less.

Cheers.

Re: 50g integration oddity

*Message #15 Posted by **Karl Schneider** on 13 May 2009, 3:23 p.m.,*
in response to message #1 by dbatiz

"dbatiz" --

The oddity is rooted in the CAS for the predecessors of the HP-50g. On the 1990's HP-49G, INTVX obtains the following indefinite integral in symbolic form:

```
'INV(XROOT(3,SQ(X)+6*X+9))'
INTVX

-(3*sqrt(cbrt(X^2+6X+9)))
```

The negative sign out front negates the correct answer.

Interestingly, even though the HP-49G did not reduce the perfect square in the integrand, it made a difference: Change the +9 to +10 or +8, and the HP-49G *fails to find a symbolic solution.* However, the leading minus sign is still present in the result, which is a an evaluable command for numerical integration.

There are indeed multiple mathematical answers for cube root and square root. However, if *principal and/or real-valued* roots are always to be taken, I submit that H-P's CAS answer is incorrect.

The correct symbolic integral is

```
3*cbrt(X+3)
```

Certainly, there is only one correct definite-integral answer, which all of the models with built-in integration will find using numerical methods.

The moral: Know your calculus, so that you will always recognize balderdash in problems such as these.

(Edited to add some content.)

Re: 50g integration oddity

*Message #16 Posted by **dbatiz** on 13 May 2009, 4:11 p.m.,*
in response to message #15 by Karl Schneider

Gerson and Karl,

Thank you for the insightful words! I ran across this problem while helping somebody with their calculus homework. We had trouble getting started with the problem, but once we re-wrote it using (x+3)^2 the solution jumped off the page. I still grapple with the multi values that some roots produce. I've learned more about that by reading this forum than in all my math classes combined.

Again, thank you!

Very respectfully,

David

Where to find HP200LX ROM files ?

*Message #1 Posted by **bloo** on 11 May 2009, 5:42 p.m.*

Hello,

I have a HP200LX but it is a German version and I don't speak German at all ! I'd like to install an English version of the system on a seperate memory card in order to boot the computer in english. Are those files available for download somewhere ? Off course I could use the HP200 in DOS mode but in that case I would not take advantage of the HP200 included softwares.

Thanks for your help !

Re: Where to find HP200LX ROM files ?

*Message #2 Posted by **Raymond Del Tondo** on 11 May 2009, 6:05 p.m.,*
in response to message #1 by bloo

Hello,

maybe it would be easier to trade your HP 200LX with someone
from Germany who has a 200LX localized to English ?

Also note that the keyboard layout and legends of the German version
are slightly different to that of the English/International version.

The hpmuseum classifieds section would be a good place for a start.

HTH

in response to message #2 by Raymond Del Tondo

Hello,

I already thought about an exchange or selling it but my HP200 is in poor cosmetic condition so it would not be a good trade. Although it works fine, that's why I'd like to use it and not let it on a shelf. Any help to find the files would be appreciated !!

Thanks

Re: Where to find HP200LX ROM files ?

*Message #4 Posted by **robert rozee** on 13 May 2009, 9:39 a.m.,*
in response to message #3 by bloo

the rom images would be copyrighted, so unlikely available for download. remember, there's those included applications like lotus 123 and quicken in there.

plus, once you had the files, what would you do with them? obtain a blank set of programmable SMD roms, burn them with your eprom programmer (that accepts SMD chips), then unsolder the old roms and solder in the new ones?

a far easier approach would be to look for a 200lx with a broken screen or damaged keyboard, then swap over the PCBs.

cheers, rob :-)

HP200LX ROM files?

*Message #5 Posted by **Mike (Stgt)** on 14 May 2009, 10:37 a.m.,*
in response to message #4 by robert rozee

We need an emulator for that, the Connectivity Pack is not a full replacement of an HP200LX. If I only had the time to make "Felix" jump arround...

Ciao.....Mike

OT: uWatch firmware v1.6.0 Released!

*Message #1 Posted by **hugh steers** on 11 May 2009, 1:10 p.m.*

A treat for uWatch fans, a completely new version is released today. We've been testing it for a couple of weeks and hopefully there are no (serious) bugs. I'm hoping this is a pretty good version.

Lots of new features have been added such as:

```
* completely re-written menu system with custom characters.
* new calculator functions (nPr, nCr, Stats, bin ops)
* new constants and conversions.
* apps like: Factorise, Quadratic, Stopwatch, Mini Calendar.
* Games: Chess, 21 and Lunar Lander.
* number bases: Dec, Hex, Oct, Binary (with scrolling windows).
```

picture of the time display (uWatch looking a bit beat up :-))

Picture of the chess board (you scroll up and down with the right column keys).

Get yours now from sourceforge including source code:

https://sourceforge.net/projects/calcwatch/

Credits: the uWatch team, DaveJ, Andrew Davie, Zowki and myself.

Awesome work guys!
All that in 64KB FLASH, 8KB SRAM, a 16x2 character LCD, and a paltry keypad - incredible!

Dave.

in response to message #3 by DaveJ

The latest manual can be found at

uWatch User Guide - Latest Version

I've been working on this for a few days or so, so it's changing quite rapidly at the moment. It's about half done, but even now gives a pretty good idea of the capability of the watch and systems... if you don't have one of these things, I can *highly* recommend a purchase.

The above is a composite of the chess board display. For just 8 custom-characters (one of which is the arrow), only *5* pixels wide, it's nothing short of awesome... and very usable on the watch. Interestingly, the LCD doesn't have more than one colour/shade -- the white pieces are done by drawing/undrawing the pieces very rapidly and relying on the LCD fading characteristics to give the effect.

Cheers A

in response to message #7 by Charles Oxford

> Quote:
>
> Nice work as usual Andrew. Will you be including instruction for updating, etc?

Yes. The instructions for updating are included in the latest manual. The uWatch now handles "squashed", engineering, fixed-point, and scientific notation... and optionally display of units in SI notation (i.e.: 12345 is displayed as 12.345k). It handles bases 2, 8, 16, and of course 10... and I have also added bit shifting operations.

HP 41CV Key Issues

*Message #1 Posted by **Michael Lopez** on 11 May 2009, 7:27 a.m.*

Hi all,

I recently acquired a 41CV which is in excellent cosmetic condition & works fine except for the "." & "Alpha" keys occasionally not registering despite a positive click. All the keys on this calculator feel fine & very similar to the ones on my 41CX which works flawlessly.

The 41CV is a fullnut version where the 41CX is a halfnut.

Just wondering if there is any simple way of cleaning/lubricating the contacts in these keys without pulling the whole calculator apart as it is hardly worth doing when they work 8 out of 10 times?

Many thanks,

Michael

Contamination??? probably...

*Message #2 Posted by **Geoff Quickfall** on 11 May 2009, 12:35 p.m.,*
in response to message #1 by Michael Lopez

I had the same problem on two restorations. Both had positive clicks but failed to register the key input.

One was the on/off rocker arm similar to you alpha key and the other calculator had 3 of the digit keys not registering. The keyboards were in excellent condition.

Try the following, get an eye dropper and place a drop of water on the offending key. Work the key back and forth numerous times. Blot the water off and then add a drop of alcohol, repeat the key exercise. Let dry and try the keys. I use a lens cleaner bulb blower to force air around the key when drying.

If it does respond, or does not, the next step and with nothing to lose, dis-assemble the calculator; i.e. remove the back case, then remove the PCB and the zebra strip from the keyboard.

During the following, keep the LCD above the level of the liquid.

```
- Get a tall glass wide enough to accept the keyboard upright.
  Fill with luke warm mildly soapy water to BELOW the level of the
  LCD panel.  Insert the keyboard and let soak.  Agitate the water
  by stirring or by subsequent and repeated removals of the
  keyboard out of and back into the water.  The intent is to
  remove any sugar based or sticky water soluble material from the
  keyboard contacts.

- If you suspect corrosion as indicated by leaky batteries or blue
  corrosion on some of the contacts then using the same glass,
  rinse the keyboard in dilute white vinegar.

- I then rinse the keyboard in the glass with water, using the
  same method.

- Next rinse with alcohol in the same manner.

- Air dry or use a drying box to accelerate the drying proceedure.
```

(see photo below)

-Re-assemble and try it out.

1 The soapy water will remove non conductive oil based, sugar based (coffee spill, sherry!!) as well as particulate contamination.

2 The vinegar will dissolve the corrosion due to outgassing batteries.

3 The water rinse will also remove sugar based contaminants, particulate matter and soap residue.

4 The alcohol removes or mixes with remaining water and will help in the drying process

THIS HAIR DRYER HAS A "COLD" SETTING, no heat applied!!!

Re: Contamination??? probably...
*Message #3 Posted by **Michael Lopez** on 12 May 2009, 7:03 a.m.,*
in response to message #2 by Geoff Quickfall

Thanks Geoff. I'll try the eye dropper trick first & see how that goes.

Cheers,

Michael

Re: Contamination??? probably...
*Message #4 Posted by **Michael Lopez** on 12 May 2009, 7:59 a.m.,*
in response to message #3 by Michael Lopez

Done & can confirm Geoff's eye dropper trick works. Thought I would start with an even slightly simpler approach & just added a drop or two of rubbing alcohol to the keys & repeated use with the calculator off then on whilst absorving the excess alcohol with tissue paper.

The "." key improved immediately whilst the "alpha" key took a little longer & I think I got a bit carried away with the amount of alcohol I added as the display went a bit funny for a while (a bit disturbing) but all came good with a bit of forced cool air drying.

Now all keys work fine first time.

Thanks again Geoff.

Cheers,

Michael

Re: HP 41CV Key Issues

*Message #5 Posted by **John Mosand** on 12 May 2009, 1:59 p.m.,*
in response to message #1 by Michael Lopez

Shortly after I bought my 48SX in 1991, the following happened: One morning I came down to the kitchen and found that the cat had tipped over a flower vase, dumping its contents over the calculator. Unfortunately, the water contained an amount of 'growing additive'. Turning it on resulted in crazy displays, numbers that I never knew existed :-) Keys sticky. I removed the batteries and rinsed it under running tap water, shook it out and left it in the convection oven at its lowest temperature. When I came back from work and replaced the batteries I was pleasantly surprised. Wow, it behaved like normal and has been perfect ever since! (BTW I have changed batteries only once.) Of course, I don't know if the 41CV and the 48SX are similar in this respect...

Sitting in Business class with my HP 41CX

*Message #6 Posted by **Geoff Quickfall** on 13 May 2009, 2:44 p.m.,*
in response to message #5 by John Mosand

in 1986. Flight attendant places a glass of sherry on my table tray and then reaches over to the passenger beside me, knocking over the glass onto the keyboard.

I watched the display act up and die. Of course the sugars in the sherry as well as other compounds completely altered the resistivity and electrical qualities of the circuit.

Rubbing alcohol did not work as a cleaner as it did not dissolve the sugar. I had to resort to a warm water rinse and then the alcohol to aid in drying.

Cheers, Geoff

HP BASIC for HP86B

*Message #1 Posted by **Bill Lafferty** on 11 May 2009, 2:07 a.m.*

Can anyone help me by re-writing two small BASIC programs written for a very old IBM PC into HP BASIC language, suitable for the HP86B computer?

The full text of the two programs can be seen at the following links:

http://www.lacegumnuts.com/index.php?option=com_content&task=view&id=190&Itemid=2

http://www.lacegumnuts.com/index.php?option=com_content&task=view&id=189&Itemid=2

I am a retired surveyor, trying to get some old Kern electronic survey instruments linked to a HP86B computer, and am stuck for the programs required for the PC.

Bill Lafferty in Cooma, Australiahttp://www.lacegumnuts.com/index.php?option=com_content&task=view&id=190&Itemid=2 and following page

Re: HP BASIC for HP86B

*Message #2 Posted by **Marcus von Cube, Germany** on 11 May 2009, 3:52 p.m.,*
in response to message #1 by Bill Lafferty

Bill, to make things a little more clear: what is your equipment? Does your HP86B have HP-IL? Which HP-IL devices are connected to your 41C?

Re: HP BASIC for HP86B

*Message #3 Posted by **Bill Lafferty** on 11 May 2009, 6:46 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Marcus, the HP41-CV/CX sits in a unit called a DIF41. This is connected to the electronic theodolite, and also to the computer by an RS232 interface. The electronic theodolite takes the readings, they are stored via the DIF41 in the HP41-CV/CX for later transfer in the office to the computer. It also works in reverse - data in the form of co-ordinates can be typed into the HP86B in the office, and transferred into the HP41-CV/CX in its DIF41 holder via the serial link.

I have the programs to go into the HP41-CV/CX to transfer the data, they was in the handbook for the DIF41 as well as the Basic program for the IBM-PC. I also have the serial interface module plugged into the back of the HP86B, and a unit called a DL40 Data Link which plugs in between the DIF41 and the serial interface module.

I can add a typed up version of the HP41 programs to the web site if anyone is interested. (Incidentally, the website is my wife's site for her lacemaking friends). ....Bill

Re: HP BASIC for HP86B

*Message #4 Posted by **Tony de Groot** on 14 May 2009, 10:24 a.m.,*
in response to message #3 by Bill Lafferty

Hi Bill,
Did you get some help on this yet?
A couple of comments - the REM should be replaced by the ! character, and the print command to print messages to the screen should be replaced by the DISP command for clarity, though the printer is directed to the screen by default if I remember correctly - it has been about 20 years since I played with an 86 ..
Tony.

Re: HP BASIC for HP86B

*Message #5 Posted by **Bill Lafferty** on 20 May 2009, 1:43 a.m.,*
in response to message #4 by Tony de Groot

No Tony, no response at all. Thanks for the tips. My wife, who has some BASIC programming skills from many years ago, is attempting to re-write the programs, but is making very slow progress, as so many of the commands are completely different. ...Bill

Re: HP BASIC for HP86B

*Message #6 Posted by **Mark Edmonds** on 5 June 2009, 3:59 p.m.,*
in response to message #5 by Bill Lafferty

Bill - have you at least got the documentation for the 86 and serial port? If not (and you probably already know this), you can get it at hpmuseum.net. I am hoping to get a serial interface for my 85A in the near future but I'm afraid I have no practical knowledge of programming the interfaces in these machines.

Mark

Re: HP BASIC for HP86B

*Message #7 Posted by **Bill Lafferty** on 9 June 2009, 11:17 p.m.,*
in response to message #6 by Mark Edmonds

Thanks Mark, but I have all the documentation from the hpmuseum site. I'm about to give up, and try connecting the whole thing to a modern computer, instead of trying to utilise the 86B, but I'll still need someone to write a program to receive the data. ...Bill

Re: HP BASIC for HP86B

*Message #8 Posted by **Mark Edmonds** on 10 June 2009, 2:04 p.m.,*
in response to message #7 by Bill Lafferty

Bill - I am sure that somewhere I saw in one of the official HP manuals, example programs for communicating between an 80 series and a 41 series. I am completely stuck trying to find it now but if I can, I'll post the details. Whether it helps or not, I can't tell but it might be a lead - it is out there in one of the manuals.

Mark

Re: HP BASIC for HP86B

*Message #9 Posted by **Jeff Davis** on 10 June 2009, 5:22 p.m.,*
in response to message #6 by Mark Edmonds

Hi, I have extra serial interfaces. Qty.(2) w/.001 option and Qty. (2) regular. I do not have any documentation though. Please see my add on the items for sale page on this web site.

HP32E Hardware Question

*Message #1 Posted by **Mike T.** on 10 May 2009, 5:16 p.m.*

I decided to open up my HP32E as after 30+ years it stopped responding to any function key in the third column or any numeric key in the second column while I was using it to test my HP32E simulator. Based upon its age and weight I was expecting it to have the dreaded foam sandwich construction so I'm not exactly surprised that it is finally giving some trouble.

Removing the back cover wasn't too much of a problem though it did require a LOT of force, and I discovered that the top edge of the back of the case is surprisingly sharp. After applying band-aids to two of my fingers I noticed that the middle IC on the left hand side appears to be missing pin 5 (IC is sliver and marked 0031 SGP80008).

Assuming that the missing pin is not the source of the trouble I'd appreciate any useful repair tips. I was planning on just removing the IC carrier and giving all the pins and contact pads a good clean - unfortunately replacing a pin on an IC is well beyond my capabilities!

Although it is the most obvious solution I really don't want to attempt to solder the pins to the circuit board unless I absolutely have to for two reasons - Firstly I killed my original HP33C that way (though at the time I didn't have an anti static mat and didn't realise that the ICs were NMOS), and secondly my electronics tutor used to suggest that I'd be more suited to plumbing than electronics and my soldering hasn't improved since...

Thanks

Mike T.

Re: HP32E Hardware Question

*Message #2 Posted by **Eric Smith** on 10 May 2009, 9:08 p.m.,*
in response to message #1 by Mike T.

A missing pin on one of the ROMs in 3xE-series is normal. I have no idea why.

Re: HP32E Hardware Question

*Message #3 Posted by **Randy** on 10 May 2009, 9:50 p.m.,*
in response to message #1 by Mike T.

If all the keys of the row or column are involved, the problem would typically be a loss of contact with the cpu keyboard/display connections on pins 21-35.

IMO, soldering them is the best solution, I've done dozens of them without issue. You can fix them without soldering but once they start getting intermittent, them more you fiddle with them, the worse they get.

I would first look at your soldering iron... if it was the typical $10 -$20 class of unit, it's no surprise you killed a calculator with it. No ESD protection nor temperature control.

HP35s Program Memory Quirk

*Message #1 Posted by **Thomas Chrapkiewicz** on 10 May 2009, 2:30 p.m.*

I've just been documenting/scrolling through my HP35s's program memory. I have the machine set for 100 data memories, and have about 150ish lines of code in it under about 15 different labels.

When scrolling through 'line count' program memory [via the <-MEM 2] menu, downward, I will find a LBL ; that the list seems to be stuck at. Repeated attempts to scroll down past this label has no result - the LBL ; continues to be displayed.

Keying <-SHOW displays a checksum of 1C5A for this strange label.

Scrolling up through the program list can proceed with no ill effects.

Scrolling down again will again hit this strange LBL ; [with the same resultant checksum].

Has anyone else experienced this?

Thanks, TomC

ps: BTW, this is a relatively early HP35s [CNA72103302].

pps:Also, (FWIW) my first line in PRGM memory is an unlabelled GTO X001 - this gives me a quick 'GTO . . R/S' which displays owner information.

Re: HP35s Program Memory Quirk

*Message #17 Posted by **Patrick Rendulic** on 14 May 2009, 1:25 p.m.,*
in response to message #3 by Reth

Exactly my case. It is lying somewhere and when looking after it, there is still some strange behaviour.

Mine still refuses to do quick additions. It seems that my fingers are too fast for the key buffer / data input routine so that it hangs when keying data in.

HP, please allow me to express my opinion: the HP35s is the biggest piece of crap you produced in the last years.

Re: HP35s Program Memory Quirk

*Message #18 Posted by **Les Wright** on 26 May 2009, 12:36 a.m.,*
in response to message #3 by Reth

I like playing with mine, and I must say it is an attractive unit compared to its coyote ugly 33s predecessor.

But as a programming device it really just isn't practical. All of the that memory to harness, but no easy way to get programs into or out of the thing, just dogged key poking.

My favourite RPN programmable these days is Free42 on my Palm TX, and indeed it is the only reason I keep that handheld active. That will get retired when Thomas Okken finalizes the port for iPhone/iPod touch. i41CX+, which just keeps getting more powerful with each revision, is a close second.

Ease of I/O has made this hobby a lot more fun than it ever was for me, especially since discovering thing like hp41uc for converting programs between various formats. The aesthetically pleasing 35s is just too much of a step back.

Re: HP35s Program Memory Quirk

*Message #19 Posted by **Thomas Radtke** on 26 May 2009, 7:51 a.m.,*
in response to message #18 by Les Wright

I imagine this series of calculators has never been intended to build more complex software libraries upon it. This was clear before the 33s. There was the chance to automate things when needed, but at the same time, the memory was quite limited. For more sophisticated things there was always a machine that allowed for saving and restoring programs.

I'd love the 35s, if it weren't affected by so many bugs, even without a card reader.

Edited: 26 May 2009, 7:53 a.m.

Re: HP35s Program Memory Quirk

*Message #20 Posted by **Pal G.** on 26 May 2009, 10:58 a.m.,*
in response to message #19 by Thomas Radtke

Has HP already produced ALL of the hp 35s they are ever going to produce? If not, they probably would update the ROM, right? It would be the right thing to do. I don't want to start a petition pledging how many units I would purchase, but I would most likely pick up a few new 35s' if all of the bugs were removed.

Surely HP has already done the math on this quandary. Anyone know HP's official or unofficial posture on the bugs inside the hp 35s? The unofficial might be better reading..

PG

Re: HP35s Program Memory Quirk

*Message #21 Posted by **Paul Dale** on 26 May 2009, 5:04 p.m.,*
in response to message #20 by Pal G.

A ROM update would depend on sales and the severity of the bugs.

Fixing the bugs and releasing a new ROM would be a fairly expensive exercise and there is no way to retro-fit the ROM to existing units.

Re: HP35s Program Memory Quirk

*Message #22 Posted by **Thomas Radtke** on 26 May 2009, 5:39 p.m.,*
in response to message #21 by Paul Dale

You know these things better than me, Pauli. OTOH, there has been some work on the

33s, which gives me some hope. Maybe HP consideres a new revision or even a 35sII (with R<->P funcionality)in the future.

Re: HP35s Program Memory Quirk

*Message #23 Posted by **Pal G.** on 27 May 2009, 4:29 p.m.,*

Thomas,

What do you mean by this: ".. there has been some work on the 33s"?

Re: HP35s Program Memory Quirk

*Message #24 Posted by **Thomas Radtke** on 27 May 2009, 6:27 p.m.,*
in response to message #23 by Pal G.

There was a redesign of the display due to a nearly unreadable decimal separator. The keypad has also been improved iirc.

in response to message #24 by Thomas Radtke

Even the Algebraic system was slightly tweaked after the first units. The swap function was changed--somewhere in the past I wrote about this.

Re: HP35s Program Memory Quirk

*Message #26 Posted by **Pal G.** on 27 May 2009, 7:09 p.m.,*
in response to message #25 by bill platt

Oh, I see. This is exactly what I was trying to get at. So, in the recent past HP has updated a ROM prior to having more units manufactured. This is good news, for someone who is partial to the hp 35s (looks at reth).

Did HP let the public know the hp 33s was updated? How were you notified?

Finally, does anyone think the hp 35s would be more esteemed if many of the bugs on Paul Dale's list were fixed after the first production units sold out? (Perhaps the first production units have not sold out yet; I don't know).

ps - just kidding, Reth.

Re: HP35s Program Memory Quirk

If the fixed bugs are the *serious* ones that can screw things badly, then yes. Losing memory, showing incorrect results, locking up and having to reset are serious. Going back and looking at the list, most of the bugs would rate serious in my book :-(

- Pauli

Re: HP35s Program Memory Quirk

*Message #28 Posted by **bill platt** on 27 May 2009, 11:02 p.m.,*
in response to message #26 by Pal G.

There are at least three, and possibly even more, ROM versions of the 33S.

There was pre-production ROM, and an early production ROM ("Walmart 1st issue") and a Production ROM with R-->P bugs and H.MS bugs and others, with small comma and decimal.

Then IIRC there was new ROM to deal with the R-->P.

I can't remember when the period where fixed, but some of us pushed buttons through blister pack in Walmart to figure it out--I can't remember the results, my old emails to Craig Finseth are lost, I don't know that he put all the details on his site, and they might be buried in the museum archives.

Maybe Paul's comprehensive list caught all of my discoveries but it has been a while.

Yes. The 35s has had a warm welcome in this forum and raised high expectations. This calculator does not follow a new concept but is a descendant of the very popular 32S(II) and his ancestors (I deliberately leave out the 33S).

Furthermore, if a compact programmable non-graphing calculator is all you want, the 35s ist your only choice (if a Casio is out of discussion). This market ist quite limited and so is the assortment.

in response to message #29 by Thomas Radtke

> Quote:
>
> Furthermore, if a compact programmable non-graphing calculator is all you want, the 35s ist your only choice.

Not so! I much prefer the 33s over the 35s. The 33s is still readily available via Ebay, at a decent price, and its functions (especially operations with number bases) work great, and it is MUCH MUCH faster than the 35s. Sure, it doesn't have 800 registers and its use of labels is not optimal, but it a great little machine to program in pure RPN.

Re: HP35s Program Memory Quirk

> The 33s is still readily available via Ebay

I think it's still being manufactured. Every place that I've checked online still sells it and you can still buy it directly from HP.

Re: HP35s Program Memory Quirk

*Message #32 Posted by **Michael de Estrada** on 28 May 2009, 10:57 a.m.,*
in response to message #30 by Don Shepherd

I hate my HP33S; haven't used it at all since I got my HP35S. I'd be happy to sell it without the batteries, which I removed to use in my HP35S when they wear out.

Re: HP35s Program Memory Quirk

*Message #33 Posted by **Pal G.** on 29 May 2009, 2:14 p.m.,*
in response to message #30 by Don Shepherd

In Don's post, he mentions the hp 33s is much faster than the hp 35s. I went and had a look at the N-Queens benchmarks

article here at the museum, and noticed two listings for the hp 35s, one of which mentions "Turbo x1.5".

Does anyone have more information about this? I searched the archives to no avail.

Here is a link to the article: Article #700

And here are the entries for the hp 35s. (And yes, the hp 33s is faster than the hp 35s).

```
 -    4:17          HP-35S            Keystroke / RPN
 -    ...
 -    2:49          HP-35S            Keystroke / RPN
/ Turbo x1.5
 -    ...
 -    2:11          HP-33S            Keystroke / RPN
```

Thanks,
PG

Re: HP-35s speed vs. HP-33s

*Message #34 Posted by **Karl Schneider** on 30 May 2009, 12:36 a.m.,*
in response to message #33 by Pal G.

Pal --

Here is an archived post of mine comparing execution speeds for numerical integration between the HP-32SII, HP-33s, and HP-35s. At the end, you'll see that the HP-35s takes just more than twice as long as the HP-33s for the same problem, performed in the same manner. The timing-test results for my benchmark are virtually identical to those of Article #700.

I suspect that the short battery life of the HP-33s might have led to a power-saving slowdown for the HP-35s.

(BTW, the typo "HP-35SII" in the archived post should read, "HP-3**2**SII".)

Re: HP35s Program Memory Quirk

*Message #36 Posted by **Xerxes** on 30 May 2009, 9:38 a.m.,*
in response to message #33 by Pal G.

The 35S Turbo is the result of an experiment for the maximum possible speedup. The speed can be changed by replacing the resistor R1 to 39kOhm, if I remember correctly. I assume a similar speedup is also possible with the33S, but I haven't tried it, due to the disappointing result of the 35S.

Re: HP35s Program Memory Quirk

*Message #37 Posted by **Pal G.** on 30 May 2009, 4:26 p.m.,*
in response to message #36 by Xerxes

Thanks Xerxes, that's awesome. I was hoping for a software, Nintendo-like keyboard combo to throw my hp 35s into turbo mode. I think I'll pass on the hardware hack.

Cheers,
PG

Never having a 32SII or 33s the 35s was a bit foreign to me. I could not understand why it did things the way it did (e.g. difficult to use complex, alphanumeric line numbers).

I recently obtained a 32SII and now understand were the 35s inherited some of it deficiencies. I am not a fan of the 32SII. IMHO, RPN software design reached it's apex with the 42S.

HP33s versions

*Message #44 Posted by **Bart (UK)** on 17 May 2009, 5:12 p.m.,*
in response to message #43 by Thomas Chrapkiewicz

Thomas, I have managed to re-create the problem. By creating 0001 GTO X001 at the PGM TOP and a small routine at LBL X to display info. Each on it's own does not seem to produce the problem.

By the way, to the rest: I have not had problems keying in data (even practiced adding a shopping till slip several times - speeding up as I started memorising it). Perhaps I'm still too slow. I have a newer model, S/N: CNA 84902974. Although it does seem to have most of the bugs reported in Paul Dale's HP-35s bug list (article 735).

PS Paul, I keyed in the 710-line game. I take my hat off to you for doing it in the first two weeks of owning the 35s. It took me several hours just to key it in!! (well, perhaps I am just slow on the keyboard)

Re: HP35s Program Memory Quirk

*Message #46 Posted by **Bart (UK)** on 18 May 2009, 7:55 a.m.,*
in response to message #45 by Paul Dale

Update to Thomas' quirk:

It seems to be the 35s' attempt of listing [using <- MEM 2] an unlabelled program.

All that is required is an unlabelled program (which of course has to occur directly after PRGM TOP otherwise it will automatically resume with the previous label's numbering).

When doing a program listing it will start at the first labelled entry and end with "LBL ;" and the "length" of the unlabelled program.

It also only seems to occur if the program counter is at PRGM TOP (e.g. after GTO..), in other cases it totally omits listing the unlabelled program.

> What happens if the unlabelled program is the only program in memory? I don't know and I'm not prepared to wipe the memory to find out! :-) [Oh how we wish for a comms port]

HP 100LX and CF cards

*Message #1 Posted by **Chris Foley** on 10 May 2009, 11:44 a.m.*

Hello,

I'm trying to expand the memory of my HP 100LX with a PCMCIA + CF card (Viking).

I don't manage to format the A drive on my pocket, I get this "Format not supported on drive A" error message.

I did format this card on my laptop (FAT16) but I still don't see the volume in the Windows Explorer.

Is it something wrong I'm doing or should I get another brand as a CF card (SunDisk for instance)?

Chris.

Re: HP 100LX and CF cards

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 10 May 2009, 11:48 a.m.,*
in response to message #1 by Chris Foley

Sometime ago I tested a CF with PCMCIA adapter in my HP 200 LX (may be different in -100 LX), without any special work. You mentioned not seeing the volume in Windows Explorer, which suggests a problem with the card or the adapter, since the LX 100 seems non-related to this problem...

Re: HP 100LX and CF cards

*Message #3 Posted by **Katie Wasserman** on 10 May 2009, 12:55 p.m.,*
in response to message #1 by Chris Foley

There's a lot of information about this here. Most of this is about the 200LX but at least some cards will work on the 100LX too.

Edited: 10 May 2009, 12:56 p.m.

Re: HP 100LX and CF cards

*Message #4 Posted by **Dave Britten** on 10 May 2009, 6:56 p.m.,*
in response to message #1 by Chris Foley

How big is the card? You more than likely need the Acecard driver, though I'm having a hard time digging up a working link at the moment.

Install the driver, reboot, and format. I've had to use that for anything 512MB and up so far. I found a 256MB PNY card over the weekend, and that one works fine on my 200LX without it.

Re: HP 100LX and CF cards

*Message #5 Posted by **Peter A. Gebhardt** on 11 May 2009, 12:10 p.m.,*
in response to message #1 by Chris Foley

Chris,

search for Acecard here:

http://www.hp200lx.net/super.html

As stated above, 256 MB is the maximum for CF cards in the (1/2)00LX w/o this driver. It is recommended not to throw away those old PCMCIA cards (8 MB FAX cards as an example) and use them as a backup for a "clean" install of your C: drive (naturally including a proper config.sys & autoexec.bat combo that do start with the Acecard driver).

Best regards,

Peter A. Gebhardt

Re: HP 100LX and CF cards

*Message #6 Posted by **Chris Foley** on 13 May 2009, 5:48 p.m.,*
in response to message #5 by Peter A. Gebhardt

Hello,

I forgot to mention: it is a 256MB CF. So I shouldn't need a driver.

The thing is, have no way to download the driver on the pocket (I don't own a cable), I was expecting to install everything on the PCMCIA + CF card with my laptop before using it with the HP 100LX.

It seems I have no solution :-(

Chris.

Re: HP 100LX and CF cards

*Message #7 Posted by **BruceH** on 21 May 2009, 7:07 p.m.,*
in response to message #6 by Chris Foley

You do have a solution and it was mentioned above.

You need to format the flash card and have it visible in Windows before you go any further, otherwise you are just wasting your time.

Try reformatting the card in a camera as this can often clear problems that Windows gets stuck on. Then reformat in Windows. Then try in the 100LX.

I've used a PCMCIA adaptor + CF card in my 200LX for years. In fact it is "only" a 16Mbyte card which shows just how long ago I bought it.

Nice "bug" in one HP-41C Users' Lib

*Message #1 Posted by **J-F Garnier** on 9 May 2009, 9:26 a.m.*

I recently scanned the French "Livret d'Applications - Statistiques Appliquées" for the DVD7 of the MoHPC and I found a nice "bug" in one listing.

In the Stat 04 program called "ECHPAIR", on line 154 we can read the alpha string "FS?C02" instead of the instruction FS?C 02:

```
150♦LBL 13
151 1
152 X<>Y
153 -
154 "FS?C02"
155 XEQ 17
156 FIX 3
157 "P"
158 XEQ 11
159 FIX 2
160 RTN
161♦LBL 17
162 2
163 /
164 RTN
165♦LBL 20
```

What is worth to note is that the error is not only in the printed listing, but is also found in the program library of this site: Related Samples , and the same programs (with the "bug") are also in the V41 package available on "The Other Site".

Another question is if this Users' Lib is a specific French package, or if it existed also in English version. What makes me think that this is a specific French package is that many program names and alpha strings are in French. For instance the program name "ECHPAIR" means "Echantillons appairés" (Related samples), in the program we can find the message "MOY." for "moyenne" instead of "mean".

Did an English version exist, and was the "bug" mentionned above also present in it?

J-F Garnier

how to tell my 12c's manufactured date

*Message #1 Posted by **mateo999** on 8 May 2009, 12:33 p.m.*

I'm new to the site, having only stumbled upon it when looking to replace my 8 year old 12c whose screen just died. I just bought a new 12c platinum with serial number CNA84102235. Can somebody tell me how to decipher this into a manufacture date? Does this particular run have any problems or quirks (i.e. non-responsive keys)? I miss the rattling, higher-density keys of my old 12c already.

Also, other than only being able to store 30 cash flows (vs. the Anniversary Edition's 80) are their any functional differences between my model and the AE?

Thanks, Matt

Re: how to tell my 12c's manufactured date

*Message #2 Posted by **Mike Morrow** on 8 May 2009, 6:04 p.m.,*
in response to message #1 by mateo999

CNA = Made in China, 8 = 2008, 41 = Week 41, 02235 = 2235th unit serialized that week.

Re: how to tell my 12c's manufactured date

*Message #3 Posted by **Katie Wasserman** on 8 May 2009, 10:22 p.m.,*
in response to message #1 by mateo999

This isn't answering the question, See later in this thread for correction.

You have one of the new 12C's that are also referred to as the 12C+. It's functionally the same as the original 12C but runs 60 times faster! The downside is that it's limited to 20 cash flows since the firmware in the calculator is emulating a calculator from 1981 that only 203 bytes of user RAM.

The Anniversary Edition has a different CPU and different firmware. It has a lot more memory, algebraic mode (in addition to RPN), backspace correction and a few other features. It's faster than the original 12C but nowhere near as fast as the 12C+.

HP has replaced the original 12C with the 12C+ without repackaging it or even announcing this change.

Katie, he said he just bought a platinum....

I assume they are still selling those.

Don

Re: how to tell my 12c's manufactured date

*Message #5 Posted by **Katie Wasserman** on 9 May 2009, 2:31 a.m.,*
in response to message #4 by Don Shepherd

Pretty dumb of me.

Going back to the original question, the first model 12CP had several bugs, lacked undo and backspace and could only handle 30 cash flows. I thought that later models, like the one you have, are functionally equivalent to the 12CP Anniversary Edition with 80 cash flows. Here's a spec sheet that says that. I think that you might have 80 cash flow registers in your calculator it's just that the manual has not been updated.

*Message #6 Posted by **mateo999** on 10 May 2009, 6:25 p.m.,*
in response to message #5 by Katie Wasserman

Thanks so much for your help guys (and gals). Although i've always known about the programming capabilities of the calculator, I just used it for the first time to store the black scholes option pricing model. Are there any other good programs out there?

Re: how to tell my 12c's manufactured date

*Message #7 Posted by **Don Shepherd** on 10 May 2009, 7:12 p.m.,*
in response to message #6 by mateo999

I guess it depends upon what your interests are. The programming model is very simple, but quite a bit can be done in 99 steps, actually. My area is math, and things like prime factors, lcm/gcd, Pythagorean theorem and quadratic equation are relatively simple on the 12c (not all at once, unfortunately, in 99 steps).

Re: how to tell my 12c's manufactured date

*Message #8 Posted by **Don Shepherd** on 10 May 2009, 8:05 p.m.,*
in response to message #6 by mateo999

Oh yes, you have a platinum, so you have 399 program steps. So you can have several things stored at once, but the tricky thing is that you have to remember what line number each one starts at in order to execute it.

Spice Type 1 vs 2 parts interchangeability?

*Message #1 Posted by **Michael de Estrada** on 8 May 2009, 10:16 a.m.*

We all know that HP made two versions of the Spice series. The first had the metal plate unsoldered keyboards, and the second had fiberboard and soldered keyboards. Most of the parts in the first version are interchangeable, including the battery contact/power control assembly, keyboard, rear case and battery door, slider switch contacts and LED assembly. Even the red LED cover is interchangeable. Everything is snapped together; no soldering, no glue and only 2 screws. This has allowed me to "construct" several completely functional and cosmetically excellent calculators by mixing and matching parts from several incomplete, faulty or damaged calculators. All my refurbishments have been made on the early type 1 versions, so I have no experience with the later type 2.

I have therefore two questions:

First, how many of the type 1 parts are interchangeable with the type 2?

Second, how many of the type 2 parts can be swapped? For example, are the IC's now integral with the keyboard, such that keyboards cannot be swapped or are they part of a separate PCB?

Finally, I have managed to open many type 1 cases without damage; are the type 2 cases more difficult to open?

Thanks in advance for your input,

Michael

Re: Spice Type 1 vs 2 parts interchangeability?

*Message #2 Posted by **Randy** on 9 May 2009, 3:19 p.m.,*
in response to message #1 by Michael de Estrada

That was three questions... :)

1) The only thing that is different is the keyboard.

2) All active devices are interchangeable with the notable exception that you'll have to unsolder the IC's and LED array from the circuit board on version 2 units.

3) No differences in opening.

Be sure to check out the info here on the two versions: http://www.hpmuseum.org/tech30.htm

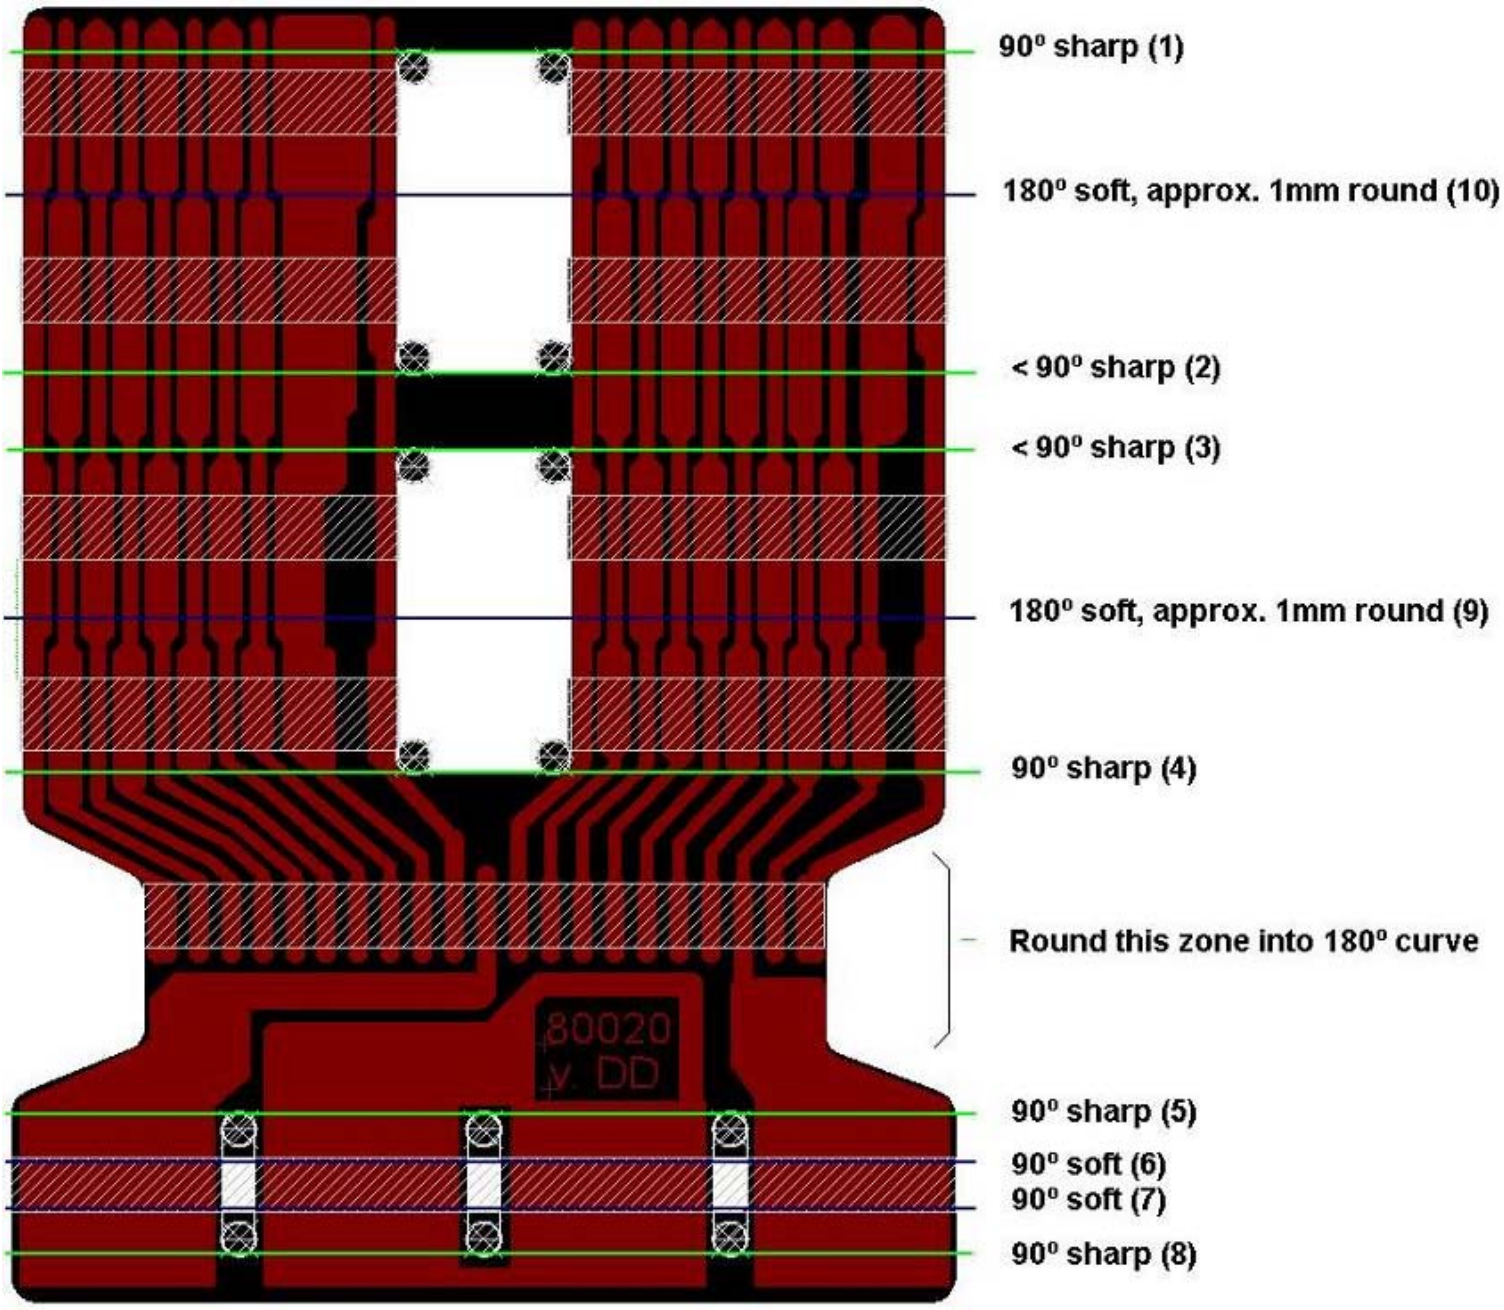
HP-41 Flex-PCB (improving replacement)

*Message #1 Posted by **Diego Diaz** on 8 May 2009, 7:15 a.m.*

Hi all,

I think this may be useful. As I receive the last batch of Flex PCB replacements, I took a couple of them to fix damaged 41's of my own.

When I was in the point of beginning with the bending process I realized that the sharp 90º angles needed at (green) lines 1, 2, 3, 4, 5 and 8 will be far more easy to obtain if I pierced the Flex PCB along these green lines. (see picture)



Using a steel pin, carefully pierced between the tracks along the lines 1, 2, 3 & 4.

And about 1mm step along lines 5 & 8.

As a result the bending process is much more easy and the final shape is achieved and kept with more precision.

Best from Spain.

Diego.

New 12C availability

*Message #1 Posted by **Charles Oxford** on 7 May 2009, 3:07 p.m.*

Does anyone know if the knew 12C is going to replace the old model or are they just going to randomly seed the market with a few scattered ARM versions? I went to Fry's last night and they had 3 12C's, but all were the older version.

Re: New 12C availability

*Message #2 Posted by **Eric Smith** on 7 May 2009, 3:17 p.m.,*
in response to message #1 by Charles Oxford

All new manufacture is of the ARM-based design. However, there are lots of the older design still in the distribution channels. This is presumably exactly why HP did a "soft roll".

Disks for 9114B ?

*Message #1 Posted by **Sean Connor** on 6 May 2009, 4:00 p.m.*

I have I hope just bought one !

What kind of disks should I use ?

Sean

Re: Disks for 9114B ?

*Message #2 Posted by **Eric Smith** on 6 May 2009, 4:12 p.m.,*
in response to message #1 by Sean Connor

Double-sided double-density (not "high-density"). The kind that are called 720K when used in PCs, or 800K when used in old Macs.

Re: Disks for 9114B ?

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 6 May 2009, 4:33 p.m.,*
in response to message #2 by Eric Smith

Just to add a couple of details that may help to spot them: IIRC, such floppies have 80 tracks, and the radial density is 135 tpi (tracks per inch). For PC (MS-DOS) usage, they are formatted with 9 sectors per track. They were also used in Amiga 1000 and Amiga 500 computers, but with a proprietary format. And also were used in some MSX and other computers around 1986.

PC: 720 KBy

Macintosh: 800 KBy

Amiga: 880 KBy

in response to message #2 by Eric Smith

I may still have a few of them lying around. If I do, I would be happy to send them to you.

Re: Disks for 9114B ?

*Message #5 Posted by **Egan Ford** on 6 May 2009, 6:25 p.m.,*
in response to message #1 by Sean Connor

In a pinch you can tape over the hole on a 1.44 and use that. I have had no problems doing that, however I prefer to use 720k disks. You can get them from floppydisks.com. They have great return policies.

Re: Disks for 9114B ?

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 7 May 2009, 10:08 a.m.,*
in response to message #5 by Egan Ford

The "currently standard" 3.5" floppies, which are usually formated at 1.44 MBy and marked as HD (High Density) instead of DD (Double Density), should be useable (I don't have a 9114 to check by myself). You may wish to tape the square hole opposite to the write-protect tab, because that hole is what "tells" the drive that it's a HD and not a DD floppy.

As HD and DD both have 80 tracks, HD should work with no problem. In the PC world, DD are formatted with 9 sectors per track, and HD with 18 sectors per track, here is where the capacity increase comes from. Be sure to reformat the disks before usage.

A different case was the one concerning 5.25" floppies, where the higher density disks (1.2 Mby) had 80 tracks while standard disks had 40 tracks. The narrow tracks of the "larger" disks created many alignment issues and read errors at those times.

Re: Disks for 9114B ?

*Message #7 Posted by **Eric Smith** on 7 May 2009, 2:59 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

The big problem with using 5.25" HD media as standard density (DD) is that the coercivity of the media is MUCH different (600 vs. 300 Oe). It was entirely unreliable to use HD as DD or vice versa, even if you were using the same track pitch. Writing to HD media on a DD drive usually wouldn't result in data that could be read back again reliably on any drive.

With 3.5" disks, the coercivity of HD and DD media is much closer, 750 vs. 600 Oe if memory serves. That's close enough that a DD drive can write to the HD media, though the error rate is measurably higher and the long-term reliability is probably reduced.

If I had some kind of emergency where I needed a 3.5" disk to use in a DD drive (like the 9114), and all I had were 3.5" HD disks, I'd cover the hole and use one, but I wouldn't ever do that as general practice. DD disks just aren't that hard to get.

Stock up now, though. In a few more years it will become difficult and expensive to get either DD or HD disks.

Re: Disks for 9114B ?

*Message #8 Posted by **Diego Diaz** on 7 May 2009, 4:29 p.m.,*
in response to message #7 by Eric Smith

I fully agree with previous comments: By all means try to use DD disks.

You can use HD instead just as "emergency" media, but get DD's as soos as you can...

However, what I can't figure out is how could HP (or SONY which is the actual manufacturer of the drive inside a 9114B) place a "media desity detection switch" into a drive... years before HD media become available? ;-)

Ok, (couldn't resist) a long way to say that there is no such switch into 9114 drives, so no need to tape the hole... just insert your disk and try formatting!

Cheers

Diego.

Re: Disks for 9114B ?

*Message #9 Posted by **Eric Smith** on 7 May 2009, 6:01 p.m.,*
in response to message #8 by Diego Diaz

IIRC, the switch in the DD drive was intended as a "media present" detector. If you insert HD media, it doesn't think there's any media present.

HD drives sense media present using a detector in a different position, so that they sense the presence of either DD or HD media. They have a separate sensor for the HD hole.

Re: Disks for 9114B ?

*Message #10 Posted by **Diego Diaz** on 7 May 2009, 8:27 p.m.,*
in response to message #9 by Eric Smith

Hi Eric,

That's true for the PC world... but 9114B has nothing to do with densities, DOS formats, etc. Its "media present" switch is placed in the same side where "write protection" is, but at the top of the disk, besides the sliding head window cover.

The only reason for taping the "media density hole" in an HD disk while dealing with LIF formats, is in the case that you need to use your disks in a DOS running old PC with LIF utilities.

This will allow the PC to accept the disk as a DD, and LIF to work as expected. But remember that reliability is compromised by this practice.

Hope this helps...

Diego.

I've got some DD disks, too (15 or 20) that I would be happy to send to whoever can use them.

Re: Disks for 9114B ?

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 7 May 2009, 8:16 p.m.,*
in response to message #7 by Eric Smith

Of course, Eric is right and more precise than me about the coercitivity issue.

I did some design with 3.5" floppy drives back in 1989 and also found important differences between similar units from different maunfacturers (IIRC, we were using mostly Fujitsu drives with our 64180-based data capture device). I think that the ability of a DD drive to write on HD media may also differ from one drive manufacturer to other. In my particular experience, HD media performed well when used in DD drives, but I cannot deny the chance for higher error rates that were perhaps masked by software or brute-force retries, and being not that apparent (at least for me). One funny thing that happened with some very slim drives we used in some units, was that a particular brand of diskettes seemed to require more rotational torque, and we detected many cases in which the specific combination of those drives and those disks, with some dirt added, resulted in more service calls than all other combinations.

Of course, sometimes we don't have all the brands and options available here, and also... while I enjoy recalling stories from the past, I realize my comment have gone way OT, so I apologize.

My new traction system for Topcat printers.

*Message #1 Posted by **Ignazio Cara (Italy)** on 6 May 2009, 4:30 a.m.*

This is my last and, I hope, final work on the Topcat's printers traction system. How you can see, I have removed the original stuff wich was the wheel traction, its plastic support and I have created a support groove for the o-ring.

Original wheel.

After wheel stuff removing.

You can see only the plastic support.

Grooved!

And finally, the new wheel!

On my HP-97 the system work very well, even after weeks of not using the printer does not overlap the printed lines and drag the paper in the right way. Only the line density has fallen from 6.2 to 5.9 lpi. For those wishing to experience this change, the o-ring measures are: - outer diameter 8.5 mm; - internal diameter 4.5 mm; - thickness 2.0 mm

I apologize for my bad english and I hope you have improvements to be proposed, thanks in advance.

I wish you good job!

Ignazio

Re: My new traction system for Topcat printers.

*Message #2 Posted by **Marcus von Cube, Germany** on 6 May 2009, 10:04 a.m.,*
in response to message #1 by Ignazio Cara (Italy)

Well done!

Can you point me to the printer disassembly instructions somewhere? I know it's not trivial.

How did you do the modifications to the plastic parts? Which tools have been used?

Marcus

Re: My new traction system for Topcat printers.

*Message #3 Posted by **Ignazio Cara (Italy)** on 6 May 2009, 11:21 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Thanks Markus, I don't know where and if you could find the instruction, I have used only the exploded view showed in the Service Manual of the HP-97 and I tried to do it.

These are the parts of the printer, disassembled:

Disassemble the printer is not particularly difficult, you must pay attention to the thermal-head flat cable.

The tools do you need are a exacto knife and a hacksaw blade for the groove; it is not necessary to use adhesives to fix the o-ring.

Sure, it takes a lot of patience and attention. Before making this type of job, I have always completely dismantled printers to be able to clean and lubricate better.

Regards and thank you for your interest.

Ignazio

Faulty LED's on HP 55

*Message #1 Posted by **Michael de Estrada** on 5 May 2009, 12:13 p.m.*

I have an HP 55 with some faulty LEDs that I'd like to replace, however, first I'd like to be sure that the problem is confined to the LEDs themselves. One of the LEDs has segments that fail to light up when powered, which I assume means that they are burned out. However, another LED has segments which are dimly lit when NOT powered, and become progressively brighter as other LEDs are powered. So, I am wondering if this is indicative solely of an LED problem or some other electrical or IC problem as well.

Also, is there an alternate source of LEDs for this model, other than another HP Classic series calculator?

The calculator is very clean, and there is absolutely no indication of any battery corrosion or outgassing problems.

Thanks,

Michael

good question, any techies that can answer it.

*Message #2 Posted by **Geoff Quickfall** on 5 May 2009, 1:35 p.m.,*
in response to message #1 by Michael de Estrada

I have a similar problem on a 45

Specifically a decimal point does not light up. No other problems so I am looking at replacing that block of LEDS.

I also have an hp 65 that exhibits the ghost led effect. That is, one of the LEDs lights up with the digit you have input in a previous block, producing a very faint ghost image.

```
ex.  input 8.80, fix 2 display

digit display reference   1  2  3  4  5  6  7  8  9  0
should see                8 .8  0
do see                    8 .8  0        8

the 8 in position 6 is a very faint image.
```

Cheers, Geoff

P.S. the circuit board has been cleaned of corrosion and the traces or check for continuity. I don't have an ocilliscope or the expertise to run 'yet'!

Re: good question, any techies that can answer it.

*Message #3 Posted by **Gerry Schultz** on 5 May 2009, 2:08 p.m.,*
in response to message #2 by Geoff Quickfall

It's been a while but I'm willing to take a stab at what I think is wrong. I would first suspect the display driver chips before the display LEDs themselves. If the LEDs are "burned out" due to excessive current then something in the display electronics had to fail to allow that.

As I remember, to reduce the parts count, the display driver strobes through each LED display with "ripple blanking" one side of the LED to turn on and off each element very quickly with the other side being fed with the proper character for it. That's why if you look at a classic calculator display that has been video taped, it will have a flickering pattern as it beats with the 30 Hz of the video scan.

If you are getting dimly lit LEDs or 'ghost' elements, that implies that the display switching is allowing leakage current to partially turn on elements that are suppose to be off. Again, I would suspect the drivers before the display elements though I could be wrong.

I don't know how the driver chips are wired with relation to display so I can't say how easy it is to repair. I do remember that the driver chips are custom HP parts and I doubt that there is a third-party source for replacements. Where the display chips sealed in epoxy? I also seem to remember how the display worked in the classic calculators being discussed in an old HP or PPC article.

Finally, I have an HP-55 that I bought new back in 1974 and I remember being very curious about how the display worked and why it was so bright. I was surprised to learn that there are lenses in front of each LED 7-segment display to enlarge them. In reality they are much smaller and even brighter than they appear in the calculator.

Amazing.

Gerry

Thanks Gerry

*Message #4 Posted by **Geoff Quickfall** on 5 May 2009, 4:52 p.m.,*
in response to message #3 by Gerry Schultz

I was afraid the display drivers would be at fault.

In the case of the dissappearing decimal I am thinking it is an actual connection fault as this calculator was severely corroded. I bought it for parts and found out that the PCB is fully functional.

The ghost images would appear to be chip drivers. Fortunately they are IC's and soldered into place. Now to find good spares!!!

Geoff

in response to message #5 by Gerry Schultz

Darn tootin,

Hotel booked and I will be presenting an HP 41 restoration paper and slide show; replete with the screw post problem, back case screw head washer problem, LCD replacement (maybe) and of course a general spa.

Included in the presentation (slide show) will be an HP 41 card reader restoration also.

All in aid of the conference theme this year. I was going to present aviation specific programs on the HP 41 but I will leave the programming to the consumate pros.

Cheers, Geoff

Re: Faulty LED's on HP 55

*Message #7 Posted by **Randy** on 5 May 2009, 9:25 p.m.,*
in response to message #1 by Michael de Estrada

> Quote:
>
> Also, is there an alternate source of LEDs for this model, other than another HP Classic series calculator?

In a word, No.

Within the classics, the LED arrays can and will be different. On the back of the package is a letter that is the brightness code. Mixing arrays that are more than one letter apart will be noticeable. Original sets will all be matched to the same letter.

Some arrays have gold leads, some have tin. Mixing them will result in different vertical character positions.

The problem with ghosting segments in the order of occurrence:

1) Bad LED array 2) Leaky keyboard contacts or corrosion 3) Bad driver IC's

You really, really need to get Tony Duells schematic set from HPCC to do any real troubleshooting. Anything less is just guessing. Further, attempting LED or driver IC replacement with anything less than a professional desoldering station will result in board damage.

Just my opinions, your mileage may vary.

Re: Faulty LED's on HP 55

*Message #8 Posted by **Geoff Quickfall** on 6 May 2009, 12:15 a.m.,*
in response to message #7 by Randy

Your absolutely right on the "Leaky keyboard contacts or corrosion". I had this problem on an HP 35 with ghosts prior to a restoration.

Lots of 'blue' oxidation and crystalline accumulation from battery outgassing. After a thorough cleaning (vinegar, soap and water, and alcohol) the ghosts had all disappeared.

In fact, nothing displayed!!! Just kidding, it now functions perfectly.

Geoff

maybe a solution

*Message #9 Posted by **Frank Boehm (Germany)** on 6 May 2009, 5:18 a.m.,*
in response to message #1 by Michael de Estrada

This is a finding of Mr. Timmerman, full credits to him :)

HP71B PCB interconnection strip

*Message #1 Posted by **Tony de Groot** on 4 May 2009, 10:11 a.m.*

Hi, I have just got around to testing a 71B I have had for a while and it hissed when I put the batteries in it. I pulled it apart and the flexible connector between the 2 PCBs was badly corroded. Does anyone have any ways of replacing the flexible interconnect or building a new one?

Thanks,

Tony

Re: HP71B PCB interconnection strip

*Message #2 Posted by **Etienne Victoria** on 4 May 2009, 5:02 p.m.,*
in response to message #1 by Tony de Groot

Hi Tony,

Sure. If you refer to this particular strip:

The possible repair has been addressed in this particular thread.

and a possible repair option could include soldering:

with more details on the procedure here.

Best regards from France.

Etienne

Edited: 4 May 2009, 5:04 p.m.

Re: HP71B PCB interconnection strip

*Message #3 Posted by **Tony de Groot** on 5 May 2009, 8:54 a.m.,*
in response to message #2 by Etienne Victoria

Hi Etienne,
Thank you for the very detailed reply. This definitely looks possible, however I prefer to repair in a way that keeps the same functionality and operation, so will try to avoid soldering for the moment.
I was thinking about maybe getting some very fine gold wire (maybe from a jeweller) and setting up a row of pins to get the right spacing and winding the wire backwards and forwards to get the array of wires, then using something like adhesive tape to hold it in place, trim the ends to remove the short circuits, and then replace the original zebra strip with that. How to stop the tape from sticking to the holder is something I have not worked out yet.
Just had another thought that maybe I could wind the wire around the flexible strip and cut along it to form a set of wire segments.
I am assuming that the zebra strip used for LCDs are of too high a resistance to work correctly as a substitute, but I was wondering if anyone had tried that already?
Thanks,

Tony.

A few questions 42S Global Labels

*Message #1 Posted by **Egan Ford** on 3 May 2009, 7:54 p.m.*

First, are there "hidden" global labels? I.e. a way to create a global label that can be called from a program, but does not appear with XEQ?

Second, is there a way to organize global labels in the XEQ list?

The challenge I face with a program I am writing is that my program front-ends the solver and PGMSLV requires a global label. Now I have many global labels that have limited use outside of this program.

Thanks.

Re: A few questions 42S Global Labels

*Message #2 Posted by **Thomas Okken** on 3 May 2009, 11:15 p.m.,*
in response to message #1 by Egan Ford

> Quote:
>
> First, are there "hidden" global labels? I.e. a way to create a global label that can be called from a program, but does not appear with XEQ?

No.

> Quote:
>
> Second, is there a way to organize global labels in the XEQ list?

No, the global labels appear in the catalog in the order in which they appear in program memory, from last to first. There is no control over this, no grouping or reordering like on the RPL machines.

> Quote:
>
> The challenge I face with a program I am writing is that my program front-ends the solver and PGMSLV requires a global label. Now I have many global labels that have limited use outside of this program.

That's life on the HP-42S... There are ways to ameliorate the problem, though. You can use one global label for multiple functions; if you combine all the functions you want to be able to solve into one program, using a variable to select between them, then you can use one single global label as the entry point for all of them, thus reducing global label clutter at the expense of some obfuscation in your program:

```
LBL "FCNS"
MVAR "X"
GTO IND "SEL" <-- selects which function to execute
```

```
LBL 00
1
RCL "X"
RCL/ "C"
X^2
-
SQRT
1/X
RCL- "D"
RTN
LBL 01
...
RTN
LBL 02
...
END
```

Using only one global label has the disadvantage that you're stuck with the same set of MVARs for all the sub-functions, but since you were talking about running the solver under program control, I'm guessing that's not a problem.

- Thomas

Re: A few questions 42S Global Labels

*Message #3 Posted by **Egan Ford** on 4 May 2009, 8:00 p.m.,*
in response to message #2 by Thomas Okken

Thanks. Great idea. Worked out perfect. Since I use VARMENU in the calling program there is no need for MVAR in the Solver global.

Re: A few questions 42S Global Labels

*Message #4 Posted by **Karl Schneider** on 4 May 2009, 10:45 p.m.,*
in response to message #2 by Thomas Okken

Thomas --

Good workaround. It's very similar in concept to my solution when someone asked how to be able to select which *variable* to SOLVE or INTEGrate using a pre-Pioneer model.

An excerpt from my article #556:

```
f(x, y, z) = 2*x - ln y + 1/z
x in R1; y in R2; z in R3
indirect in R00 (HP-41 only)

HP-15C/HP-34C program:      HP-41C/CV/CX program:
LBL A                       LBL "AA"
STO (i)                     STO IND 00
RCL 1                       RCL 01
2                           2
*                           *
RCL 2                       RCL 02
LN                          LN
-                           -
RCL 3                       RCL 03
1/x                         1/x
+                           +
RTN                         RTN
```

And finally - a simulator for the HP32E.

*Message #1 Posted by **Mike T.** on 3 May 2009, 6:47 p.m.*

For those of you who are interested my collection of calculator simulators just got bigger - at last I've been able to add an HP32E.

I'm particularly pleased to be able to add this model to my collection, as even though I've found the HP33C much more useful over the years, I've not forgotten the HP32E's remarkable ability to evaluate the normal and inverse normal distribution functions accurately at a time when everyone else was still having to use look up tables.

Enjoy - as ever feedback is welcome.

Mike T.

Edited: 3 May 2009, 7:09 p.m.

Re: And finally - a simulator for the HP32E.

in response to message #1 by Mike T.

What I find most impressive is that it yields the same forensic value (9.000417403) as my real HP 32E. Excellent job! I too find this to be one of my favorite non-programmable vintage HP's. It was the first HP with hyperbolics, which were removed from the HP 33E/C and HP 34C to make room for programming keys. How about an HP 27 next? I don't have one of those. :<(

Keep up the good work, Michael

Re: And finally - a simulator for the HP32E.

in response to message #1 by Mike T.

Awesome!

I really liked the 32e, it was my first HP calculator. I bought it new when I was in college, it was much more expensive than offerings from casio or TI at the time, but I liked it. The construction was superior and although it offered only the usual scientific functions, the competitor scientific models had less.

Hyperbolic functions and unit conversions were there too, stats worked well and I genuinely wanted the Q function for real use. I remember, even though we all used calculators, everyone else was forced to resort to tables for their normal distributions. It was an eerie throwback watching them.

Furthermore, you were lucky to get 5 figures out of the tables, but the 32e was giving a full 10 figure accurate result – almost instantly. It was a remarkable achievement and I was always puzzled why HP couldn't carry Q and invQ on to their later models.

invQ appeared to work through a convergent iteration. It took about 10 seconds or so. It always got the right answer though. I never actually needed this for real work, but it was always fascinating.

Thanks for making the simulator!

Re: And finally - a simulator for the HP32E.

> why HP couldn't carry Q and invQ on to their later models

They did, just not as obviously. The 21S had these functions explicitly, I'm not sure if any other HP's had these functions as such. However, several calculators that have a good implementation of the HP solver have the Q function as UTPN and, of course, you can use this function in the solver to obtain the inverse. Also, various STAT modules and packs have this function too.

And finally - a simulator for the HP32E.

What do the following have in common, other than they are used to calculate?

*Message #1 Posted by **Geoff Quickfall** on 2 May 2009, 3:28 p.m.*

starting at the upper left corner:

```
1.  BOWMAR 901
2.  OTIS KING MODEL "K"
3.  COMMODORE MINUTEMAN 1
4.  POST 1461 6" SLIDE RULE
5.  JCE MARK II
6.  UDC "TKB 1"
```

You could find them all in the local tech store or university book store in 1972, maybe in the same display case!

What do the following have in common, other than they are used to calculate?

Then of course, this showed up:

Edited: 2 May 2009, 3:31 p.m.

*Message #2 Posted by **Juergen Keller** on 2 May 2009, 5:34 p.m.,*
in response to message #1 by Geoff Quickfall

My guess is that they are all manufactured around 1972. BTW, 1972 was the longest year in the Gregorian calendar. As a leap year, it was one day plus an additional 2 leap seconds longer than normal.

Do I win the very nice HP-35 for the correct answer? ;-)

Cheers, Juergen

in response to message #5 by Geoff Quickfall

Your pictures are so nice and it was around midnight, so I just skipped your answer. Anyway, if you ever have a spare red dot remember me ;-)

BTW, the 35 looks very nice. Did you (master of restoration) restore it or were you just lucky to get such a nice item? I'm looking for information of how to restore the top silver trim. I read about bare metal foil which gives good results. Any hints you can share?

Juergen

Re: Ha, Ha, wish I had a spare red dot to give you ;-)

*Message #7 Posted by **Geoff Quickfall** on 5 May 2009, 2:08 a.m.,*
in response to message #6 by Juergen Keller

Yes, a restoration.

The silver trim is a problem, at the moment remedied with aluminum/chrome modellers paint.

I am going to experiment with chrome foil. This requires a size (base glue) be applied and then the foil placed on top. The foil is rubbed on with a cloth and the excess trimmed off.

I shall see if that works!

Re: Ha, Ha, wish I had a spare red dot to give you ;-)

*Message #8 Posted by **Ron G.** on 5 May 2009, 1:33 p.m.,*
in response to message #7 by Geoff Quickfall

I tried this, Geoff, and it did not work well at all. I just used the glue that came with the foil leaf, and it didn't hold the foil well. There may be a better glue available for this particular application.

What about contact cement? (But, you only get one chance to lay it on straight! Although, if you are planning to trim the excess away, that shouldn't be a problem.)

BASIC 45th anniversary

*Message #1 Posted by **Don Shepherd** on 2 May 2009, 8:33 a.m.*

Yesterday was the 45th anniversary of the BASIC language. On May 1, 1964 at Dartmouth University, at 4:00 AM, Professor John Kemeny and a student programmer entered a simple program and typed RUN at the same time, and BASIC was born.

Re: BASIC 45th anniversary

*Message #2 Posted by **Johnny Bjoern Rasmussen** on 2 May 2009, 12:35 p.m.,*
in response to message #1 by Don Shepherd

My first computer was a Sinclair ZX-81. So here's my tribune to my first programming language (except from entering program lines in my TI-57, wich was before my ZX-81).

```
10 REM BASIC BIRTHDAY GREETINGS
20 FOR A=1 TO 49
30 PRINT "HURRAY"
40 NEXT A
50 PRINT "H U R R A Y Y Y Y Y Y Y ! ! !"
60 STOP
```

Re: BASIC 45th anniversary

*Message #4 Posted by **Namir** on 2 May 2009, 3:59 p.m.,*
in response to message #1 by Don Shepherd

Don,

In the mid 80s I had the opportunity to meet the parents of BASIC, John Kemeny and Thomas Kurtz in their True BASIC office in Dartmouth, NH. When I met John Kemeny (who was once the dean of Dartmouth) I asked him about his experience working for Einstein. Kemeny was helping Einstein solve PDEs. He said that even in his seventies, Einstein was an incredible person. After a year of working for him, Kemeny told Einstein that the task at hand was very difficult. Must have been really tough equations to solve.

I had teh chance to meet with Prof Kurtz a few times. Both founders of BASIC were very nice and very approachable.

Namir

Re: BASIC 45th anniversary

*Message #5 Posted by **Marcus von Cube, Germany** on 2 May 2009, 4:21 p.m.,*
in response to message #4 by Namir

BASIC was the first programming language I had encountered as a young student at the age of 16, 33 years ago. It was Wang BASIC running on a computer located at the school of a friend of mine. I wasn't supposed to use the computer at all, but it was so challenging that we just did it. ;)

On my first attempts in programming I thought I had to use GOTO if I wanted to jump to a line below the current line and GOSUB if I wanted to jump backwards. My English was as basic as my understanding of BASIC.

I think, I've made some progress by now. ;)

My contribution to the BASIC community: http://www.mvcsys.de/doc/basic_compare.html

CLTKTD or CLKT Status ?

*Message #1 Posted by **Saile (Brazil)** on 2 May 2009, 7:41 a.m.*

```
How do I know the status clktd or clkt in a program?
The reason is that one of mine hp-41CX it is always losing the hours.
I would like to do a routine that automatically asked the hour and the date when they
initialized.
I would always test if the way clkt was active because I use the clktd.
Thank's
```

Edited: 2 May 2009, 7:43 a.m.

Re: CLTKTD or CLKT Status ?

*Message #2 Posted by **Dan Grelinger** on 2 May 2009, 8:26 a.m.,*
in response to message #1 by Saile (Brazil)

Saile,

That is a tough one. The CLKT/CLKTD flag is stored in a register located in the Time module. It is only accessible through M-Code instructions. Some time in the past year, I found documentation on the Time module and its internal registers, it may have been in "Extend you HP-41".

Rattling 9114B

*Message #1 Posted by **Steve (Australia)** on 2 May 2009, 2:40 a.m.*

I am in the process of cleaning my room (yes, my wife has me under orders) :-D

I picked up my 9114B drive to put it away and was astonished (and somewhat surprised) to hear it rattle. On opening it I found a loose piece of metal (possibly aluminium) about 13mm x 13mm x 0.5mm.

It has a red spot in one corner, a yellow in an adjacent corner and the letters C68A19 on the opposite edge. The reverse side has a stripe of what appears to be glue across the middle.

It looks like the glue has deteriorated and this has simply come adrift.

My guess is that it is a shield of some sort, perhaps covering a drive head.

I don't have time to take the drive apart at the moment, or to test to see that the drive still works.

Has anyone seen something like this when delving inside their 9114B? These are so reliable that I'm sure most people have had no need to open the cover.

If these are starting to fall off, it would be great to find out from where they're falling off so we can do preventative maintenance. A chunk of metal this size could very easily spell the end for a drive if it shorted out something :-(

Better get back to work ;-)

Re: Rattling 9114B

*Message #2 Posted by **diego diaz** on 7 May 2009, 8:39 p.m.,*
in response to message #1 by Steve (Australia)

Hi Steve,

As you've corectly supposed, this is the top head shield... and yes, it can certainly (and easily) ruin a drive if it falls in the wrong place...

However, if your drive is operating properly, just forget about it. This shield is by no means critical and there shouldn't be any difference if you leave your drive without it.

Cheers.

Diego.

17bII+ keypad problem

*Message #1 Posted by **Dewdman42** on 1 May 2009, 7:50 p.m.*

Can anyone confirm or deny that this is a known problem with the current 17BII+? I have one and generally have been happy with the feature set, but every once in a while, the keypad doesn't enter a number I have hit. its really annoying because I can't trust my fingers to rapidly enter a series of numbers to add up, I have to visually confirm every single one I enter to make sure the calculator took all my keystrokes. When it screws up, I notice that no matter how hard I hit the key, it won't enter. I seem to have to clear and start over or hit the back button and re-enter. Seems like a software bug to me, not really sure.

Anyway, just wondering if this is a known issue or not. I'm about ready to throw this one in the trash, drives me crazy.

Re: 17bII+ keypad problem

*Message #2 Posted by **Don Shepherd** on 1 May 2009, 11:13 p.m.,*
in response to message #1 by Dewdman42

Yeah, I have experienced this on occasion on my 17bii+. I have never experienced it on my 17b or 17bii.

Re: 17bII+ keypad problem

*Message #3 Posted by **Bruce Bergman** on 2 May 2009, 10:57 a.m.,*
in response to message #2 by Don Shepherd

I've seen it once on my 17bii+ Non-Silver, but I can't remember missing a step on the other models. The Silver hasn't missed.

BTW, I think this is less about software and more about the quality of the keyboards. Honestly, if HP has gone backwards in quality anywhere, it's in their keyboards. There is absolutely no rival to the older keyboards. In today's day and age, it's frustrating to me that anyone (HP, TI, Casio, whoever) produces a keyboard that has any issue at all. If you boil it down, the MAIN purpose of a calculator is to be consistently accurate at calculating, and it can't do that with a crappy keyboard.

thanks, bruce

Re: 17bII+ keypad problem

*Message #4 Posted by **Marcus von Cube, Germany** on 2 May 2009, 4:06 p.m.,*
in response to message #3 by Bruce Bergman

My first 17bii+ silver had an unreliable keyboard. Dynatech.de has replaced the unit w/o a problem. I'm not a frequent user of the machine but it seems to be fine now.

Re: 17bII+ keypad problem

*Message #5 Posted by **Horacio R** on 3 June 2009, 2:46 p.m.,*

in response to message #1 by Dewdman42

Hi, I own an hp 17bii+ silver, I have experienced just what you said, I tried to figuried out which is the trouble, it seems that if you press CLR the calculator takes sometime in "clearing the screen" if you are fast enougth, you will press the next number before de CLR task is done, and the number will not be registered. My HP 12c (I sould say ancient HP12c) has no trouble at all in the keyboard.

HP-41: how to extract name of current XM-file?

*Message #1 Posted by **Geir Isene** on 1 May 2009, 5:47 p.m.*

How do I get the name of the current extended memory file (and its type) for use in a program?

Re: HP-41: how to extract name of current XM-file?

*Message #2 Posted by **Dan Grelinger** on 1 May 2009, 8:09 p.m.,*
in response to message #1 by Geir Isene

There may be an easier way....

The current Extended Memory file is stored in a byte in the first pointer register in XM. That is always in the same absolute address, so you could use a technique that PeterP described a short time ago in this forum to move the curtain appropriately, store the pointer register into an accessbile Extended memory register, and decode the result. Once you have the number of the file, EMDIRX will return it's name.

Re: HP-41: how to extract name of current XM-file?

*Message #3 Posted by **PeterP** on 2 May 2009, 1:09 a.m.,*
in response to message #2 by Dan Grelinger

for example, the following program will place the name of the current working file in alpha and a 2-letter code into X with regard to its file. It only works on a CX (which is your 'workhorse' IIRC) and assumes the CCD. A second version uses the Sandbox. Both rely on the principle pointed out by Dan - the structure of the absolute register 64, which is the first pointer register of the X/M. (see EFME p181). it is |00|0W|WP|PP|NN|NT|TT|, with WW being the number of the current working file. NNN is the address of top register in the next XM block and TTT is the adress of the top register of the current XM block.

HTH

Cheers

HP-41C with Tall Keys?

*Message #1 Posted by **Dan Grelinger** on 1 May 2009, 1:40 p.m.*

I purchased an HP-41C recently just to have a spare unit to leave on my desk at work without worrying so much about losing a valuable calculator, and when I got it, I found that it had a serial number starting with 1932, and it had the 'tall keys'. It's in very good shape, and now I am wondering if this is really the -41 I should be using for my intended purpose. I've never really had an interest in this early of vintage of a -41C, and don't know if they are worth any more than subsequent, and more common, standard keyed models. If it is, I probably should get a different model, and put this one up for sale.

Any help on this one?

Dan

Re: HP-41C with Tall Keys?

*Message #2 Posted by **PeterP** on 1 May 2009, 2:04 p.m.,*
in response to message #1 by Dan Grelinger

Dan,

It might be a very cool calc. Do a 49, STO 01 and do a SF IND 01 to see if it has the Bug 3 (i think) - the BAT indicator should turn on. If so, it probably has all bugs. I was lucky to find an all-bug 41C in my hands one day and have it similarly safely stored away as some of my other calcs.

This page has all the bugs listed if you scroll down

HTH

Cheers

Peter

Edited: 1 May 2009, 2:10 p.m.

Re: HP-41C with Tall Keys?

*Message #3 Posted by **Dan Grelinger** on 1 May 2009, 2:42 p.m.,*
in response to message #2 by PeterP

Peter,

I hadn't thought of checking the ROM versions. I have an HP-41 Diagnostic module, I'll check the ROM versions this evening.

Dan

Re: HP-41C with Tall Keys?

*Message #4 Posted by **PeterP** on 1 May 2009, 2:59 p.m.,*
in response to message #3 by Dan Grelinger

cool, I'll keep my fingers crossed for you. 1932 is a very early number and if you can turn on the BAT indicator, you should be in good shape to have an all bug 41!

Cheers

Peter

Re: HP-41C with Tall Keys?

*Message #5 Posted by **Dan Grelinger** on 1 May 2009, 8:04 p.m.,*
in response to message #4 by PeterP

The HP-41 Diagnostic ROM reports ROM ID DDE. I verified the ability to set system flags using indirect flag functions. I could not duplicate the ability to STO and RCL INDirectly into non-existent registers. The couple of attempts I made resulted in "NONEXISTENT", as a bug-free HP-41 would report.

And a correction, the Serial number begins with 1933 instead of 1932. Fifth character is an 'A', so I guess it is a USA made model.

Dan

Re: HP-41C with Tall Keys?

*Message #6 Posted by **PeterP** on 1 May 2009, 11:37 p.m.,*
in response to message #5 by Dan Grelinger

Hmm, that is odd. According to the list at the link above, rom version DDE has all bugs. And bug 3 (the set system flags bug) was the first one to be removed. Last but not least, the first calcs without bug 3 have a serial number of 1936 I think. So on all three accounts it would appear that your calc is an all bugs calc that should allow you to 'sto' into program memory.

Re: HP-41C with Tall Keys?

*Message #7 Posted by **Dan Grelinger** on 3 May 2009, 10:49 p.m.,*
in response to message #6 by PeterP

I verified that bugs 1,3 and 4 exist. If I set size to one, store 1 into register 00, and STO or RCL IND 00, I get 'NONEXISTENT'. Do you get something different?

Re: HP-41C with Tall Keys?

*Message #8 Posted by **PeterP** on 4 May 2009, 1:42 a.m.,*
in response to message #7 by Dan Grelinger

Dan,

I just tried mine and it works. From the PPC J V6 N5 P28

> Quote:

> [...] Test as follows. from 'MASTER CLEAR', SIZE 000. No data registers. Key 999, ENTER, PI. Now store Pi indirectly in register 999 by: STO IND Y. Clear the stack. Recall Pi by 999, RCL IND X

In the Wickes book on p2 it says that it works for regs 719 to 999 through some kind of 'wrap around'...

HTH

Cheers

Peter

Edited: 4 May 2009, 1:43 a.m.

Re: HP-41C with Tall Keys?

*Message #9 Posted by **Dan Grelinger** on 4 May 2009, 2:00 p.m.,*
in response to message #8 by PeterP

OK, I didn't try registers 719 to 999. I'll try those when I get home.

I have never watched the selling prices for an early version HP-41C. Are they significantly higher than a normal 41C, which in my experience has been ballpark $100 in good condition with original box and accessories?

Dan

Re: HP-41C with Tall Keys?

*Message #10 Posted by **Dan Grelinger** on 4 May 2009, 11:00 p.m.,*
in response to message #8 by PeterP

Yes, the -41C will allow me to access 'register 999' indirectly.

Advice on buying a HP67

*Message #1 Posted by **Nigel Bamber** on 30 Apr 2009, 3:41 p.m.*

I am interested in expanding my meagre collectionand have seen a HP 67 for sale with the following info :

"I FOUND THIS CALCULATOR IN A BOX FROM A HOUSE CLEARANCE. I WAS INTERESTED ENOUGH TO PURCHASE A BATTERY FROM AMERICA TO SEE IF IT STILL WORKED. WHILE WAITING FOR MY BATTERY I DID SOME RESEARCH ON THE INTERNET TO FIND THAT THESE ARE STILL VERY MUCH LOVED BY PEOPLE TODAY.

MY BATTERY ARRIVED WHICH I FITTED TO THE CALCULATOR & SWITCHED THE ON BUTTON.

(1) IT STARTED WHIRING & PUSHED OUT THE MAGNETIC CARD THAT WAS STILL INSIDE THE MACHINE.

(2) THE RED L.E.D DISPLAY (For lack of better words) WENT CRAZY!

(3) THE CARD FINISHED BEING PUSHED OUT & THE L.E.D DISPLAY SPELLED OUT THE WORD (Error)

(4) THE L.E.D THEN DISPLAYED A MINUS FOLLOWED BY MULTIPLE ZEROS (See picture)

(5) AT THIS POINT I WAS READY TO DO SUMS BUT COULD GET IT TO DO NO MORE THAN CHANGE THE ZEROS TO NINES BY PRESSING TWO BUTTONS AT ONCE (See picture)

(6) I TRIED TO REINSERT THE MAGNETIC CARD BUT THE MOTOR DID NOT RUN AGAIN.

THE BATTERY PACK HAS NOW RUN OUT OF POWER & I DO NOT HAVE A CHARGER SO BEING SOLD AS SEEN & AS DESCRIBED FOR REPAIR."

In answer to a question the seller said " Hi, This calculator is in excellent condition with no wear to the silver lining or keys & no scratches on the outer case. The battery compartment has no corrosion as when i got the calculator there was no battery pack inside. The overall condition is near mint as it has probably been in the protective soft case unused for many years. I hope this helps your decision"

My questions are (if you don't mind) :

1. What sort of money is it worth bidding for a working HP67

2. Do the error messages etc. seem to be resolveable ?

3. Do you think the card reader might work?

4. Is it easy to get batteries to use in an HP67 or alernatively a charger to power up these batteries ?

Many thanks for your help.

Nigel

> 1. What sort of money is it worth bidding for a working HP67
> 2. Do the error messages etc. seem to be resolveable ?
> 3. Do you think the card reader might work?
> 4. Is it easy to get batteries to use in an HP67 or alernatively a charger to power up these batteries ?

1. Impossible to answer, I'm afraid. Whatever it is worth to you. 100 Pounds/Euros for a working 67 would be my personal limit as there are plenty of these machines. I got mine for much less and it is in similar cosmetic shape as the one in your auction. But it works.

2. Impossible to answer, as the seller dosen't tell us, what exactly he did. Maybe he could have cleared the display by simply pressing "CLX"? If he really only got these zeros whatever keys he pressed, then there is not much hope. No spare parts to be found anywhere...

3. It was able to eject the card, which is a good sign. The motor is working and the "gummy wheel" seems to have some grip left. But it's not so good that the motor dosen't run, when a card is inserted. Wether this is due to the general "all zeros"-condition of the calculator or to a faulty card sensor switch (very difficult to repair, I'm told) - who knows.

4. It is very easy to get newly made rechargeable battery packs from the States (as this seller describes). Not even expensive. A puristic collector will probably not like them, but they work better than the originals, because modern battery cells have more than double capacity of the originals. Chargers are also easy and quite cheap to find, because many classic HP calculators use the same charger (HP-35 HP-80 HP-70 HP-45 HP-55 HP-65 chargers all work).

Greetings, Max

NB: I personally would not pay more than 10 Euros for this calculator (e.g. for replacing the worn case of a working calculator)!

Edited: 30 Apr 2009, 4:21 p.m.

Re: Advice on buying a HP67

*Message #3 Posted by **Michael de Estrada** on 30 Apr 2009, 6:15 p.m.,*
in response to message #1 by Nigel Bamber

Nigel,

1) The card reader on an HP-65/67 needs to run off a charged battery; it should not/cannot be run properly from a charger without a battery installed. If the seller bought a fresh battery, he should have charged it prior to use. It looks like he did not because he lacked an AC adapter/charger. If the battery charge is low, all kinds of funny malfunctions can occur, such as the motor not running, keys not registering, error messages etc.

2) If the calculator has never been opened, then the card reader feed (gummy) wheel and probably the clutch (motor to worm gear torque limiting slip coupling) have deteriorated badly, and need to be re-built.

So, odds are that it is fixable, however, there are no guarantees. It's a very good sign that there is no visible corrosion. If it were me, I might gamble up to $100 USD, but certainly not any more.

Re: Advice on buying a HP67

*Message #4 Posted by **Nigel Bamber** on 1 May 2009, 3:26 p.m.,*
in response to message #3 by Michael de Estrada

Thanks for the advice. Its already at £75 so it seems best to leave it alone. Having been tracking Ebay for a little while now , it seems that because of a greater level of supplies in the US , the prices there are generally lower.

Nigel

It depends. If the auction is worldwide such as the following example, prices are comparable.

USA worldwide auction

HP-97 Printer Motor keeps spinning

*Message #1 Posted by **Gil Gutierrez** on 30 Apr 2009, 2:00 a.m.*

I have an HP-97 and I was trying to see why my printer was not advancing the paper when i started to hear a humming noise. The noise turned out to be the printer motor spinning. Now, when the calculator is turned on the printer motor keeps spinning. Does anyone know how to fix this? I have not checked the paper advance switch wires to see if one of them has broken (disconnected). Thanks

Re: HP-97 Printer Motor keeps spinning

*Message #2 Posted by **Randy** on 30 Apr 2009, 11:33 a.m.,*
in response to message #1 by Gil Gutierrez

The idler gear has stripped. You can make a replacement: HP-97 Printer Gear Replacement

Re: HP-97 Printer Motor keeps spinning

*Message #3 Posted by **Geoff Quickfall** on 30 Apr 2009, 12:55 p.m.,*
in response to message #1 by Gil Gutierrez

Randy is correct, and Katie's article is excellent.

Both my HP 91 and HP 97 have benefitted from this repair.

Cheers, Geoff

P.S. I tried to find the gear at Small Parts website and was unable to, try emailing them directly with your request:

```
- 80 pitch
- 30 teeth
- 1/8" gear face
- 3/8" hub diameter
- 3/16" hub projection
- 1/8" bore
- made of aluminum, acetate, plastic
```

Cheers, Geoff

Re: HP-97 Printer Motor keeps spinning

*Message #4 Posted by **Gerry Schultz** on 30 Apr 2009, 2:07 p.m.,*
in response to message #3 by Geoff Quickfall

I've also bought replacement gears for my 97s from that unmentionable website. I haven't seen any replacement gears for sale lately but the seller does pop up periodically.

Gerry

Re: HP-97 Printer Motor keeps spinning

*Message #5 Posted by **Michael de Estrada** on 30 Apr 2009, 2:45 p.m.,*
in response to message #4 by Gerry Schultz

His name is Dave Bowman, and he no longer sells on ebay. However, you can still contact him via ebay messaging at DAVEHAL2001. Last time I checked with him, he still had some printer gears which he was willing to sell direct.

Re: HP-97 Printer Motor keeps spinning

*Message #6 Posted by **Randy** on 30 Apr 2009, 4:13 p.m.,*
in response to message #3 by Geoff Quickfall

Small Parts does not sell gears, PIC Design is the source.

If you can get a gear from Dave, even at $25, they are a bargain and a better fit than making your own. Been there, done both. Buy the custom part from Dave if possible.

Re: HP-97 Printer Motor keeps spinning

*Message #7 Posted by **Gil Gutierrez** on 8 May 2009, 11:19 p.m.,*
in response to message #6 by Randy

Ordered the gear from Mr Bowman. Received it earlier this week and installed it today. Printer works great. Thanks to everyone for their help.

hp 20B keypad

*Message #1 Posted by **JDonley** on 29 Apr 2009, 9:04 p.m.*

I have one of the early HP 20B's and the keypad is pretty ordinary....can anyone tell me if the newer units have improved keypads?

thanks

don

Re: hp 20B keypad

*Message #2 Posted by **Gene Wright** on 30 Apr 2009, 8:14 a.m.,*
in response to message #1 by JDonley

I am unaware of any changes to the 20b keyboard.

Re: hp 20B keypad

*Message #3 Posted by **hugh steers** on 30 Apr 2009, 8:15 a.m.,*
in response to message #1 by JDonley

Mine is 6 months old and I don't really like the keyboard, there's no positive click feel and if you hit a button obliquely, it tilts but doesn't always register.

I don't know if the keyboard was worse in early models. It works, if you're careful, but I don't trust blind key pressing. I would have much preferred the keys of the 12cp.

HP35s how to recall last expression?

*Message #1 Posted by **hugh steers** on 29 Apr 2009, 8:25 p.m.*

Hi,

some people use the Hp35s in alg mode. does anyone know if there is a way to recall the last expression for editing/evaluation.

thanks for any info,

Re: HP35s how to recall last expression?

*Message #2 Posted by **Gene Wright** on 29 Apr 2009, 10:55 p.m.,*
in response to message #1 by hugh steers

Press the left arrow key to start moving back through the expression... IF it is still shown in the top line of the display.

This is referenced in the Algebraic learning module for the 35s found on the HP website.

Re: HP35s how to recall last expression?

*Message #3 Posted by **hugh steers** on 30 Apr 2009, 1:31 p.m.,*
in response to message #2 by Gene Wright

thanks. that did it. pretty obvious really !

Re: HP35s how to recall last expression?

*Message #4 Posted by **John B. Smitherman** on 30 Apr 2009, 7:14 p.m.,*
in response to message #2 by Gene Wright

Thanks for pointing this out Gene. This feature was not on the 33s and thus made it less attractive as an algebraic calculator compared to others from Casio, Sharp and TI.

By the way, if you want to get frustrated try working on a 32sii, 33s and 35s at the same time. :-(

Regards,

John

Customized HP-67, What is it?

*Message #1 Posted by **Michael de Estrada** on 29 Apr 2009, 5:07 p.m.*

I saw this modified HP-67 for sale, and wondered if anyone knows what it is. There is some sort of connector on the back and a special keyboard template. Maybe it's some sort of equipment calibrator or tester? Any ideas?

Custom HP 67

Re: Customized HP-67, What is it?

*Message #2 Posted by **Dan Grelinger** on 29 Apr 2009, 6:42 p.m.,*
in response to message #1 by Michael de Estrada

Probably a little more bland than that. Perhaps a power supply hack, or just a custom installed connector for a security cable.

Re: Customized HP-67, What is it?

*Message #3 Posted by **Jeff Davis** on 29 Apr 2009, 7:39 p.m.,*
in response to message #2 by Dan Grelinger

Looks like someone was trying to use this as an auto phone dialer or something to use to test phone lines. The keyboard overlay shows the telephone letters. The connector on the back could connect to a telephone line???????

Re: Customized HP-67, What is it?

*Message #4 Posted by **Martin Pinckney** on 29 Apr 2009, 10:31 p.m.,*
in response to message #3 by Jeff Davis

> Quote:
>
> The keyboard overlay shows the telephone letters. The connector on the back could connect to a telephone line???????

The letter assignments are not the same as standard telephone usage.

Can't see enough of the connector to figure out what it is.

Re: Customized HP-67, What is it?

*Message #5 Posted by **Charles Oxford** on 29 Apr 2009, 11:23 p.m.,*
in response to message #3 by Jeff Davis

the letters are color coded to the three shift keys yellow, blue and black. There would be a program to use those keys for text.

most humbly, Charlie

Re: Customized HP-67, What is it?

*Message #6 Posted by **Klaus** on 30 Apr 2009, 9:46 a.m.,*
in response to message #2 by Dan Grelinger

If it is a power supply hack, maybe a "phase box" for synthetic programming was connected to it?

Re: Customized HP-67, What is it?

*Message #7 Posted by **Dave Britten** on 30 Apr 2009, 7:36 a.m.,*
in response to message #1 by Michael de Estrada

The overlay says "BENDIX" on it. Apparently they supply air brake systems for commercial vehicles.

A google search of the part number (3602332-0001) yields a handful of hits that appear to be aircraft part lists. Interesting.

The connector looks like it's threaded, but I'm guessing it's too small to be a coax F-connector.

Re: Customized HP-67, What is it?

*Message #8 Posted by **Randy** on 30 Apr 2009, 11:35 a.m.,*
in response to message #7 by Dave Britten

in response to message #8 by Randy

Hello!

> Quote:
>
> Among other things... once upon a time, Bendix was also in the avionics business.

They still are in the business, they even keep their name, but they belong to Honeywell since many years (http://www.bendixking.com). I use their products at work every day. What that HP-67 could have been used for, I have no idea. Without the proper magnetic cards, this whole modified thing is useless anyway.

Greetings, Max

Re: Customized HP-67, What is it?

*Message #10 Posted by **Martin Pinckney** on 30 Apr 2009, 1:06 p.m.,*
in response to message #8 by Randy

My mother had a Bendix clothes washer when I was little!

Re: Customized HP-67, What is it?

*Message #11 Posted by **Steve Leibson** on 30 Apr 2009, 11:14 p.m.,*
in response to message #7 by Dave Britten

Bendix also made a famous line of high-end electronic connectors favored by mil/aero contractors.

Re: Customized HP-67, What is it?

*Message #12 Posted by **Michael de Estrada** on 1 May 2009, 12:25 a.m.,*
in response to message #11 by Steve Leibson

OK, guys. I asked the seller to post a photo of the connector, so here it is:

7-pin connector

I remember seeing some mil-spec Amphenol connectors that looked like this. Usually used for data transmission between a computer and a controller. The Hp 67 would be the computer in this case.

Re: Customized HP-67, What is it?

*Message #13 Posted by **Katie Wasserman** on 1 May 2009, 2:26 a.m.,*
in response to message #12 by Michael de Estrada

Goggling the Bendix part number, 3602332-0001, hits several military and aviation surplus dealers. One lists this as a "PLACARD" so apparently this was just the part number for the overlay. That sounds like a *very* military term to me. I'll bet that this is puppy is a Combat Model HP-67

Who knew that our beloved collectibles were used for such horrible purposes.

Re: Customized HP-67, What is it?

*Message #14 Posted by **Mike Morrow** on 1 May 2009, 9:06 a.m.,*
in response to message #13 by Katie Wasserman

> Quote:
>

>
> Who knew that our beloved collectibles were used for such horrible purposes.

I'm sure the "horrible" attribution must be whimsical.

The cited abstract is interesting, and its date of July 1977 is very close to the time that the HP-67 was making it to the street in quantity. But...doesn't the unit on auction have a 1980 serial number, making it one of the last units off the HP-67 assembly line?

I programmed an HP-67 for a fair number of calculations supporting operation of a ballistic missile submarine (magnificent machines and technology!) about that time. That worked so well that soon a government-purchased HP-97 replaced my personal HP-67.

Support of defense is honorable use of our "beloved" machines.

Re: Customized HP-67, What is it?

*Message #15 Posted by **Juan J** on 1 May 2009, 9:01 p.m.,*
in response to message #14 by Mike Morrow

> Quote:
>
> Support of defense is honorable use of our "beloved" machines.

Hello,

And part of a sort of tradition, too.

From the Norden bomber computer and the artillery tables calculated with the first computers in World War II to the F-22 Raptor Common Data Processor, calculators and computers have played an important role in defense and weapons systems.

Bomber crews and artillery gunners, to name two examples, have to perform a lot of calculations to get on target and hit it with their ammunition. There is not much space for thick data tables, and a compact device that replaces them is a welcome addition to their equipment.

My two cents.

JuanJ

Lucky Day

*Message #1 Posted by **Chuck** on 27 Apr 2009, 8:03 p.m.*

Back in 1987 a professor of mine purchased an HP-28S which he immediately loaned me after purchase to play with over Christmas break (he not being an HP person.) After I gave it back to him, he placed it in his desk, and there it sat..... for 22 years, never again touched. He gave it to me this last weekend, and, with fingers crossed, I opened the battery compartment. Perfect. No leakage! A mint unit with only about 20-hours of my own time on it. Woohoo. :)

Re: Lucky Day

*Message #2 Posted by **Egan Ford** on 27 Apr 2009, 8:08 p.m.,*
in response to message #1 by Chuck

Congrats! Was memory/stack intact after 22 years?

Re: Lucky Day

*Message #3 Posted by **Chuck** on 27 Apr 2009, 9:39 p.m.,*
in response to message #2 by Egan Ford

Nope totally dead. But with fresh batteries, the beep with "Memory Clear" was the best sound ever. :)

Re: Lucky Day

*Message #4 Posted by **Dan Grelinger** on 27 Apr 2009, 11:29 p.m.,*
in response to message #1 by Chuck

I thought the first HP-28Ss didn't show up until January of 1988?

Re: Lucky Day

*Message #5 Posted by **Chuck** on 28 Apr 2009, 1:05 a.m.,*
in response to message #4 by Dan Grelinger

It could have been winter break of 1988 (by the looks of the serial number). My mind is going. Daisy, Daisy, give me your answe....

in response to message #5 by Chuck

Quote:

> It could have been winter break of 1988 (by the looks of the serial number). My mind is going. Daisy, Daisy, give me your answe....

Dave, please stop...

And I thought I was the only one confusing dates. Is there a way to age gracefully?

That beep, or the clock missing a few minutes in years, are welcome sights/sounds in the 28S.

Some time ago I recalled my 28S from storage in a garage, after a few years (can't remember how many.) Not only it lighted up, the clock was running. From what I was told in this forum, the time difference was not significant.

If only the battery door was not so brittle...

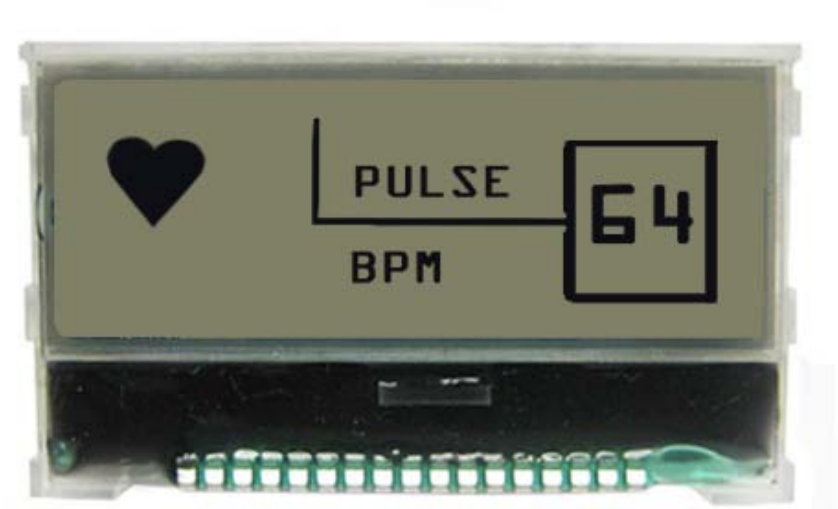
uWatch2 128x32 option

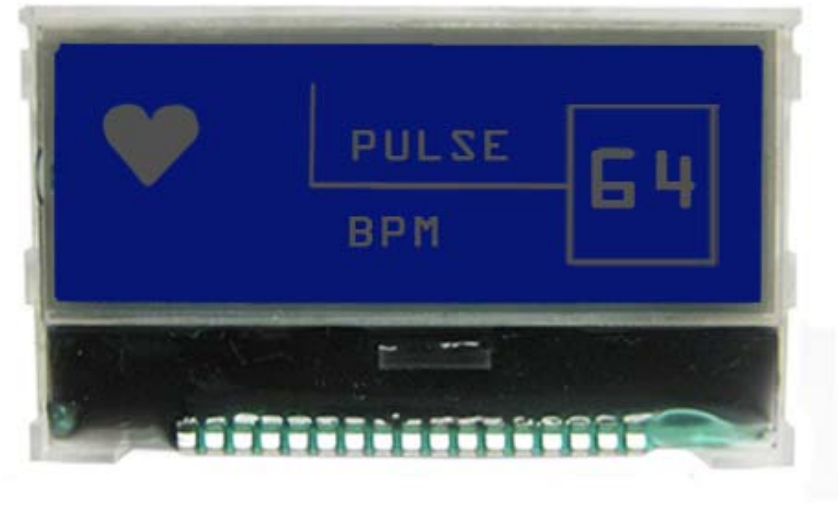
*Message #1 Posted by **DaveJ** on 27 Apr 2009, 7:01 p.m.*

I've been looking at a 128x32 display option, which depending upon certain circumstances, might be the best or possibly only practical option.

At present the actual physical implementation for the 128x64 display is not looking that great, board-to-board interconnects are looking troublesome (unless someone has a source of easy to get and cheap custom elastomeric connectors).

The 128x32 display solution is a bit cheaper, a bit more rugged, and available in white and blue displays:





As usual, comments and heated discussions welcome :->

Dave.

Edited: 27 Apr 2009, 8:58 p.m. after one or more responses were posted

I can make the 128x64 display work easily if I don't center it, but I just can't bring myself to produce an unsymmetrical design!

Note that the 128x32 display has a significantly wider visible display window than the 128x64.

A sample polydome switch overlay is on it's way, and I've got some samples of some really nice Snaptron domes, but they are 6mm and hence we'd probably have fewer keys. But it would be a higher quality keypad with a real "click" instead of the "spongy" polydome feel.

Dave.

Re: uWatch2 128x32 option

*Message #4 Posted by **Nigel J Dowrick** on 28 Apr 2009, 4:11 a.m.,*
in response to message #3 by DaveJ

In general, I'd vote for quality over quantity so far as keys are concerned. How many fewer would it be?

Nigel (a satisfied uWatch owner!)

I can certainly understand the desire for symmetry. With that said, could you post an image of how it would be arranged and let the keyboard designers have a crack at making it look good?

.

Here it is:

As you can see, one column on the left has to be dropped, and there is really no room above the B and C keys for extra keys. Perhaps one if you keep the staggered layout like last time.

Oh, I forgot the Z alpha which needs to go somewhere.

4mm polydome samples should be in today so I can see if this is even remotely feasible.

Dave.

Nah, Q and Z got dropped from the phone keypad, you can drop it too. :-) Or, just try something new like the Greek alphabet. Only 24 characters. That leaves you an extra character, use it for "space".

Of course you can always do the alpha à la 42S.

From a design perspective, asymmetry = visual interest. There have been many asymmetrical calc designs -- look at the big single ENTER key on many of out beloved HPs, or the layout of the Voyagers with an offset screen. In terms of watches, there have also been quite a number of asymmetric layouts, including many high-end watches, and almost all big rectangular LCD sports watches. At least show us where the screen would be you did use it; we might come up with a layout that pleases you...

> Quote:
>
> Note that the 128x32 display has a significantly wider visible display window than the 128x64.

Well I agree that would be preferred. What about contrast, which should be as high as possible? Do you have a sample to look at?

> Quote:

Few keys means more shifted keys means more keystrokes, but that's par for the course on a calc watch -- my CFX-200 might require ten keystrokes for a function if it was in the wrong place in the "function ring". The CFX-400 had four shift keys, which was OK, but even so the keyboard was really too small to use easily.

-- Dave

In terms of watches, there have also been quite a number of asymmetric layouts, including many high-end watches, and almost all big rectangular LCD sports watches. At least show us where the screen would be you did use it; we might come up with a layout that pleases you...

It's not really about coming up with a key layout, that's easy, it's just a fundamental issue I have with an offset screen in this design. I just don't like it, but that's not a show stopper.

Yes, some designs look very good when asymmetrical, but in this case I don't think it does. See for yourself, an image is up. It might be a moot point anyway if the keypad is just not practical at this spacing.

BTW, the wife (director of R&D finances) has vetoed the smaller screen, she likes the look of the bigger one. So asymmetrical it might have to be.

Yes, I have both LCD's, but have not powered them up yet. That requires a bit of work...

Dave.

in response to message #9 by DaveJ

My preference is the version at the beginning of this thread. But even if I buy one I probably wouldn't use it.

My original is still waiting for assembly.

> Well I agree that would be preferred. What about contrast, which should be as high as possible? Do you have a sample to look at?

Here you go, the screen IN ACTION

Contrast appears to be very good. Although I have not tweaked it much to find out what it's capable of, this is just some random contrast value I entered that works well. Contrast is adjustable in software up to 64 steps.

Dave.

Re: uWatch2 128x32 option

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Apr 2009, 7:56 p.m.,*
in response to message #1 by DaveJ

128 x 32 is comparable to the much appreciated HP42S, so it may be quite acceptable... It may restrict the menu keys, but with a small font (like the HP48 menus, which I don't like at all), it may work...

Re: uWatch2 128x32 option

*Message #13 Posted by **Egan Ford** on 27 Apr 2009, 8:13 p.m.,*
in response to message #1 by DaveJ

I was hoping for 64.

IMHO, the position of the lower left keys would be more familiar like this:

```
Rv      x<>y
Shift   STO/RCL
C/ESC   FUNC
```

Re: uWatch2 128x32 option

*Message #14 Posted by **Dennis Trafananko** on 28 Apr 2009, 12:15 a.m.,*
in response to message #1 by DaveJ

Howdy: A few days ago I posted a suggested keyboard design, to the previous thread regarding its layout. The text of that post and its logic applies similarly, to these two suggested layouts for the bottom three rows.

Thanks Dennis Trafananko

*Message #15 Posted by **DaveJ** on 28 Apr 2009, 1:03 a.m.,*
in response to message #14 by Dennis Trafananko

Thanks Dennis
A few people have suggested this sort of "reverse" number pad layout, and that it somehow "makes sense", but I can't say I've ever seen a calculator with such a layout. Almost every calc on the market starts with the "1" at the bottom left and works right then upwards.

Dvorak keyboards "make sense" too, but they represent <0.0001% of the market. So I'd need a pretty darn good reason for going against the traditional bottom left then upwards layout.

Dave.

New HP-12C Review

*Message #1 Posted by **Katie Wasserman** on 27 Apr 2009, 6:47 p.m.*

Thanks entirely to Charlie Oxford's efforts I now have a new HP-12C to play with.

If you like the original 12C you will love this machine. It's functionally identical to the original (we know this because it's emulating the original) but everything runs 60 (sixty) times faster: a long program (my 70 decimal digits of pi) ran in 90 seconds vs 90 minutes on the original 12C; a long amortization, 1.5 seconds vs 90 seconds, 69 factorial gives you an answer almost before you hit the key, it's ludicrously fast! I hope that this blazing speed does not scar the set-in-their-ways wall street crowd from believing the calculation results.

Build quality, key clicks and display readability are excellent. Most importantly, no missed keystrokes. The keys themselves use the new, lower density plastic compared to the original, but this is a very minor nit to pick.

The only things that are functionally different are the self tests. The manual has not been updated in this section, so it's wrong in most cases:

- "ON" + "/" runs the sequential key press test but shows 1,2 or 3 segments at a time and does not give "error 9" if you press the keys in the wrong order. When the test ends it doesn't show the "12" on the display just returns you to the X register.

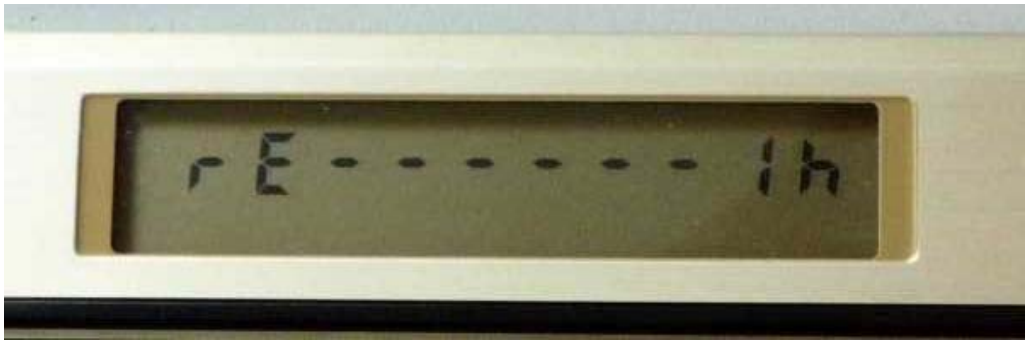
- "ON" + "x" run a self test (I think) for one second and just results to the x register.

- [ON] + [-] will clear the calculator and show "Pr Error".

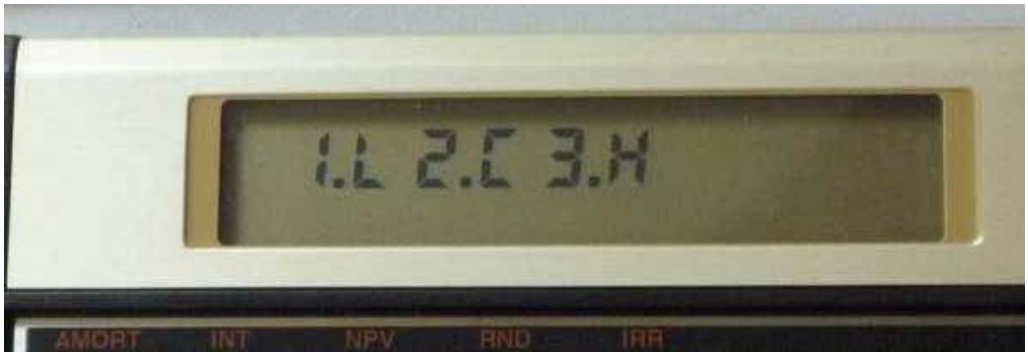
- [ON] + [+] will run a continues self test (I think) ending when you press and hold any key.

Now for the new stuff that I found from playing around:

- [ON] + [g] shows the curious display below but I haven't found anything that you can do with this yet:

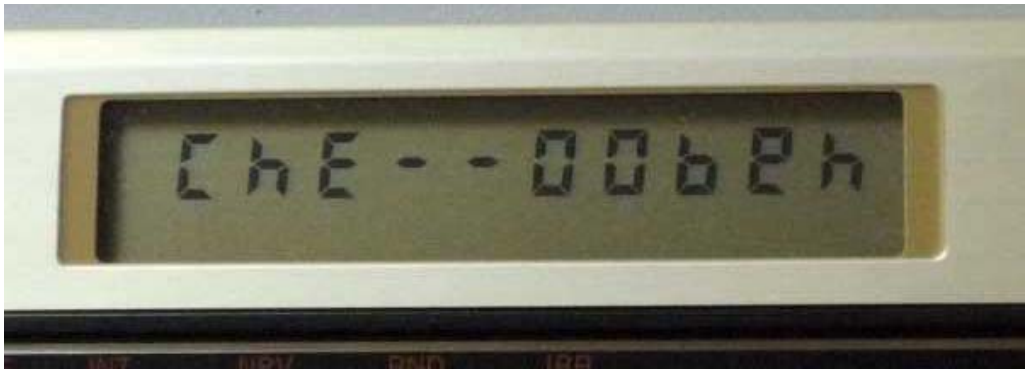


- [ON] + [g] + [ENTER} starts a testing menu:

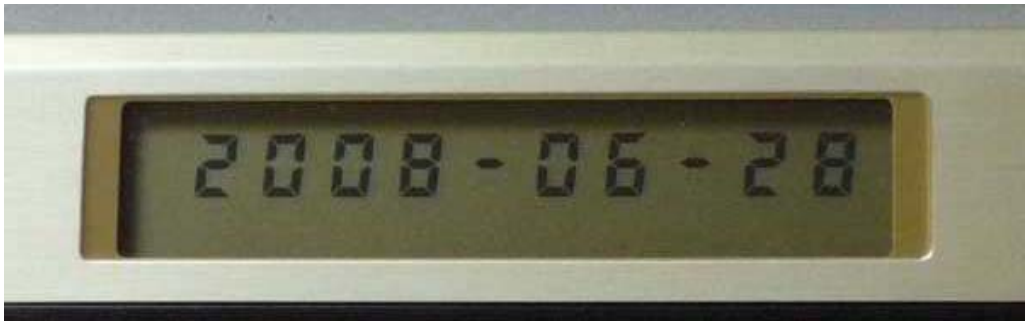


1.L - LCD test -- this turns on all the segments. If you then press [Rv] it will turn off half of them, press [Rv] again and you'll toggle the segments on to off and vice versa

2.C - Copyright. First you'll see this:



the next key press will give you this:



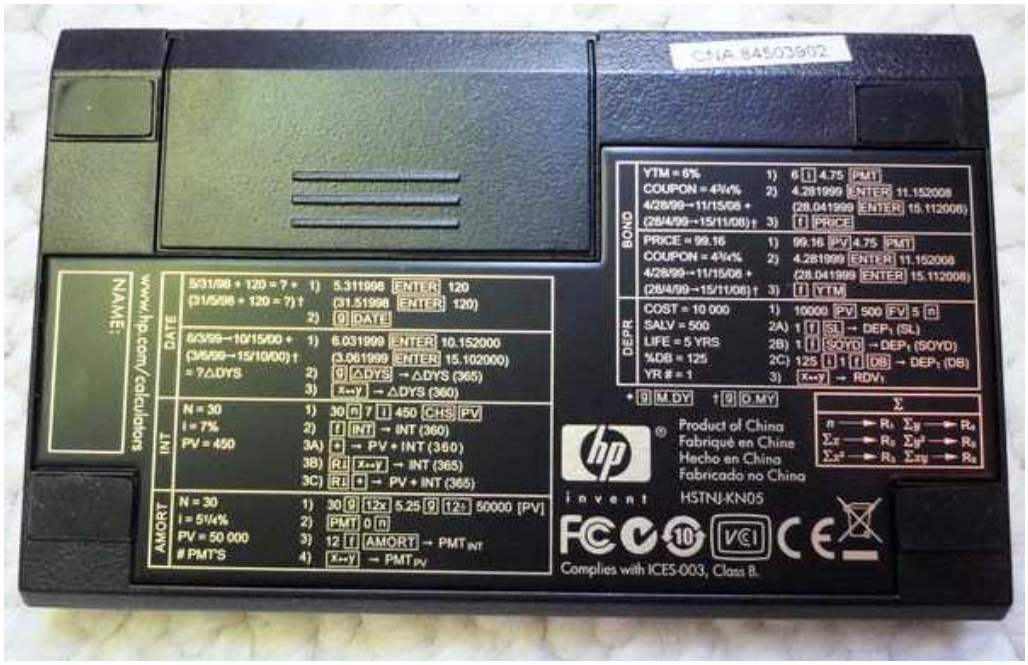
then next you'll see this:

3.H - Extended LCD and key test. All segments will turn on at first. hit any key and it will turn off 1 to 3 segments that sort of map to the position of the keys -- rows and columns.

There are probably other easter eggs in here too, but I have yet to find them.

So, how do you find one of these in the store? You can see the bottom edge of the calculator through the packaging, here's what it looks like:

Here's a picture of the back, see how big that batter cover is?



And here's what it looks like under the door, I need to get one of those special SDK cables from HP so I can start playing around with some alternative firmware.

(I'm tempted to pull off the feet and peek at the circuit board, but I'm going to wait for a bit longer.)

I think they did a great job on this. Proven technology and ergonomics updated with modern speed and firmware replacement/updatability. I can't wait for the modern 15C (and, dare I suggest, 16C). Way to go HP! Kudos to Eric, Cyrille, Sam, Gene and whoever else had a hand in this.

It's a pity that the serial number label is so shoddy looking -- but, I'm picking the tiniest of nits here. I'm really pleased with what you've described! I think I'll have to get one. Believe it or not, I don't own a 12c in any incarnation yet!

Re: New HP-12C Review

*Message #11 Posted by **tony (nz)** on 27 Apr 2009, 10:41 p.m.,*
in response to message #1 by Katie Wasserman

Brilliant review, thanks Katie. I have one with serial number CNA 849... and the LCD screen has the most "yellowy" tinge I have seen in a 12C. Still useable though. The "ON" key action is more direct than on the old 12C - on the new one the screen "lights up" even when I press and hold the "ON" down. The old one only turns on when the "ON" key is released. This makes the self test proceedure here a little different - more like [/] + [ON] rather than the old [ON]+[/] :-) I managed all your tests - great fun - oh except for the last one I couldn't escape from the menus ;-)

Cheers, Tony

Re: New HP-12C Review

*Message #12 Posted by **Katie Wasserman** on 28 Apr 2009, 10:19 a.m.,*
in response to message #11 by tony (nz)

Tony,

On that last test you need to press all the keys down at least once to blank the display. Once the whole display is blanked you can exit the test. A hardware reset (under the battery door) is the only other way to quit that I found.

Also, when a program starts with [f][CLEAR sigma] the display is not blanked when running like it is on the original 12C.

-Katie

Go back to Katie's original post. She describes how to identify the new version by looking through the packaging.

Re: New HP-12C Review

*Message #16 Posted by **Michael de Estrada** on 28 Apr 2009, 11:16 a.m.,*
in response to message #1 by Katie Wasserman

Reading through the Hewlett-Packard Digest, Volume Eight, 1981, there is an article entitled "Quality By Design," which expounds on the key reliability of the Voyager keyboard design. Metal key operators and a gold-plated circuit board ensures low resitance contact points for precise actuation and durability, resistive to to wear and corrosion. Indeed, the many original Voyagers still in use today attests to this quality. I have a 1982 HP-15C and 1987 HP-12C with keyboards that still work perfectly.

So, I have to wonder how much of this sort of quality has carried over to the newest incarnation of the HP-12C. The cheesy serial number sticker does not concern me as much as any compromises in quality that may have been made under the skin. I suppose it is unreasonable to expect the modern pricepoint calculators to have 25+ year lifespans, but I still hope that HP has set the bar high on this product with regards to quality.

Re: New HP-12C Review

I would assume the quality would be on a par with the existing 12c or 12c platinum, if anyone has any experience with these.

Re: New HP-12C Review

*Message #18 Posted by **Don Shepherd** on 28 Apr 2009, 4:12 p.m.,*

in response to message #17 by Martin Pinckney

Martin, I would say the quality of the new unit is the same as that of a 12c I bought 8 years ago, and a 12cp 25th anniversary edition I bought about 3 years ago. They are all made in China, but I have never had any problems with any of those units. The first platinums had a problem with keystroke programs that were more than about 250 lines, as I recall, and I had one of those. But the new unit is blazingly fast. Like Katie said, a program I had that took maybe 2 minutes to run on the old 12c takes less than 2 seconds on this one. That ARM processor does make a huge difference!

Michael, IMHO the current 12C keyboard is the best of any of the current models. In fact, I really don't understand why HP don't use this key mechanism with the 20B, for example.

Re: New HP-12C Review

Yep, pure RPN, just like the original 12c.

New 12c loop count speed test

*Message #22 Posted by **Gene Wright** on 28 Apr 2009, 6:23 p.m.,*
in response to message #21 by Don Shepherd

Program of

01 + 02 GTO 01

with the stack filled with 0 in X and 1 in Y, Z and T

counts to well over 45,000 in 60 seconds.

Re: New 12c loop count speed test

*Message #23 Posted by **Katie Wasserman** on 28 Apr 2009, 10:07 p.m.,*
in response to message #22 by Gene Wright

Gene,

You have a hyper-speed 12C! I only get to about 30,000 in 60 seconds. The factor of 1.5 difference agrees with your statement several months ago that the new 12C runs 90 times faster, I (and Don too) found that it's "only" 60 times faster.

How do I get to hyper-speed? :)

Don't get too excited about that speed, it comes at the expense of battery life efficiency.

See here for why:
http://www.alternatezone.com/eevblog/?p=32

I bet they are running this sucker at 30MHz just like the 20B. And if they are, continuous processing would drain the batteries in way under 30 hours. Anyone want to put their unit into a continuous loop and see how long it actually lasts?

Dave.

You can reduce the losses in the battery resistance by running at a slower speed, yes. This will give greater battery life at the expense of calculation speed.

A big speed reduction will almost certainly have no visible speed impact on normal calculations. It's only looping program calculations where the speed matters, but even then 30MHz seems crazy. My uWatch runs at 250KHz and does C floating point calculations all but instantly. In fact it's practically instant running at 32KHz.

Quote:

The 20B runs at 30MHz only when doing calculations, then sits idle drawing almost nothing at a slow speed. So it's doing it properly except for the fact that they chose the top speed of 30MHz, and it peaks like this for *every* calculation regardless if it needs it or not! This is very poor low power calc design IMHO.

I can hardly imagine a program running on such a calc that would warrant a 30MHz clock rate on a 32bit ARM processor.

Every time you do a calc you are gulping a quick 15mA from those poor little CR2032 batteries with their high output resistance, it makes me want to cry!

I don't know about the 12B, I'm just assuming it's the same as the 20B.

Dave.

uWatch is running native math code, and the ARM-based 12C is not. Cyrille's put in a lot of optimizations [*], but at 250 kHz it would most likely be slower than the original 12C.

I agree, though, that 30 MHz is absurd and wastes battery life.

Eric

[*] I proposed some optimizations to the BCD math, and I know Cyrille experimented with them, but I'm not sure whether he put them in the production code. Aside from that, I know he designed his emulation code from the ground up to be very efficient.

Re: New 12c loop count speed test

*Message #28 Posted by **Katie Wasserman** on 29 Apr 2009, 4:51 a.m.,*
in response to message #27 by Eric Smith

I just measured the current draw on the new 12C with good equipment. You need two power supplies for this as the batteries are in parallel with a common positive contact. Here are my findings:

power off: 4uA

power on, static display, no keystrokes: 45uA

continuous keystrokes (number entry): 1mA

long amortization function: 15mA

tight program loop: 15mA

continuous self-test ([ON]+[+]): 4mA

test modes ([ON]+[g] and [ON]+[g]+[ENTER]) , static display : 1.8mA

So it beats up on those CR2032's but only to give you the fast speed. I think this is justified however since you really do want the amortization results as fast as possible. Other functions run so fast that stress to the batteries is minimal. For most practical user programs on the 12C the same is true.

Given the higher current draw in the new modes, my guess is that the the boot loader on the Atmel chip is running. You probably need to be in this mode to talk to the serial port. Perhaps that's the purpose of [ON]+[g], just to put you in that mode and show the the status of the CPU.

Thanks for the measurements. But are you SURE it doesn't actually take 15mA spikes during normal calculations?

What equipment?, what method? "good equipment" doesn't mean anything if your method has limitations (e.g. you are only reading the average with a multimeter). Sorry to be pedantic, but it's easy to get false measurements on pulse current readings like this.

Obviously the processor is working at 30MHz during program execution as expected, so your 15mA figures are spot on. My bet is it also peaks at 15mA doing a simple addition.

> Quote:
>
> Other functions run so fast that stress to the batteries is minimal.

Sorry, you can't beat ohms law. The battery losses remain the same as I pointed out in my video, regardless of how "quick" the pulse is.

Dave.

in response to message #29 by DaveJ

I was using a Fluke 867b, measuring the current draw from the common "+" supply line from the batteries to the calc (burden voltage drop is minimal on the 10 amp range). Yes, it does draw 15ma peak on every function. I just rechecked this using a HP 34401A and got the same readings. They also seem to agree with what Cyrille posted.

Re: New 12c loop count speed test

*Message #31 Posted by **cyrille de Brébisson** on 29 Apr 2009, 10:07 a.m.,*
in response to message #28 by Katie Wasserman

hello,

the basic figures for the ARM are: power off 4µA running at 2Mhz (internal oscillator) ~1.5ma running at 30Mhz 15ma LCD on (12C, no charge pump: 45µa, 20b, charge pump, 150µa)

cyrille

Yes, the 12C is a different beast because it's running an emulator which has much more overhead. The 20B on the other hand...

If you assume the new 12C works at 30MHz, and it's been measured as 60 times faster, then it's obvious it only needs to run at 500K to emulate the original 12C speed (sounds about right to me). Speed improvement is nice, so a nice round 5 or 10 times improvement would have been sufficient for marketing, giving only a few MHz operation which would be very sensible. Or better yet, if possible, make it smart - so for normal calcs keep it running at a low 500KHz, and only switch to high clock speed when it's running a program or something.

Or even better still, give the user a speed option, it's only a few lines of code. By default, make it slow for maximum battery life, and those who need super speed can select it if needed.

Dave.

*Message #33 Posted by **Katie Wasserman** on 29 Apr 2009, 12:30 p.m.,*
in response to message #32 by DaveJ

I like the user-specified speed setting with a default of a few MHz. Most users would never read the manual to know how to change it but would experience a 10x speedup over the original 12C and very long battery life. Geeks would push it to the limit but have plenty of spare batteries around.

Still, at 30MHz when functions are run -- even with the bad battery losses -- given typical usage patterns I think that most users will experience several years of usage on one set of batteries.

The 20B is rated at "an average of 9 months" battery life, so the 12C should be an identical spec.

Dave.

> The 20B is rated at "an average of 9 months" battery life, so the 12C should be an identical spec.

actually, no. the 20b in idle mode (screen ON, not 'working') uses 150µa versus 45 or so for the 12C. so there will be a difference in battery life.

it also takes more keys to do something on average with the 20b, so there is more overhead there...

Yep, the emulator is quite efficient. As for BCD calculations, I further optimized the code that you proposed in 32 bit ARM assembly using the full power of 3 operations per instruction offered by the ARM (shift + operation + carry detection) allowing me to do a 64 bit BCD add in 18 instructions..

Of course, for Nut emulation you don't NEED 64-bit BCD operations. Maybe you've incorporated the routines into firmware for other calculators that do need 64-bit BCD operations?

Just imagine trying to produce a product for THIS group of fanatics . . .

But my code works for 64 bits :-) thanks to assembly codding and the power of ARM assembly, adding the last nibble only required one extra instruction...

// used to do an addition on 2 DCB number with a result in DCB // for example, dcbAdjust(a, b) when a and b are dcb representation // of number will return the dcb represention of the number r=a+b... // note that the addition is done prior to the call... // int64 dcbAddAdjust(int64 r, int64 b); // r=a+b

// a += 0x0666666666666666ULL; // preadjust as if carries occur // u64 s = a + b; // compute the sum // b = a ^ b ^ s; // find the carries // b = ~b & 0x1111111111111111ULL; // compute mask for non-carries // return s - ((b >> 4)*6); // subtract out 6 * non-carries dcbAddAdjust: ldr r12, cte66666666 // load 66666666 in lr to perform the a+666666666666666 /* 10hex = 16decimal. so the difference between the BCD representation of 10 and the hex value of 10 is 6. Adding 6 to each digit of one of the 2 numbers correspond to assuming that the addition will generate a carry for each digit and preemtively adds the 6 to each digit.

This need to be done so that we can easely detect which digit addition really had a carry. Then the algorytm will remove the extra 6 from these digits.

The carry for each digit does appear as an extra '1' added to the last bit of each digit. This means that the parity of each digit is equal to parity of digit in a exclusive or parity of digit in b exclusive or carry from previous digit.

This means that calculating a xor b xor (a+b) and only looking at the first bit of each digit will tell us for each digit if there is a carry or not. Note that the fact that we addedd 6 to each digit of a does not affect the calculation of parity for a as 6 is an even number */ adds r0, r0, r12 // a+=6666666666666666 adc r1, r1, r12 ldr r12, cte88888888 // preload 888888888888 preloading it earlier than needed will reduce 1 wait state later on... /* step 2 of the algorythm. we now have pre addjusted a, we calculate the sum of a+b. however, here we pay attention to keeping the carry out of that calculation in the CPU carry flag (this is why we use the adcS instruction as in add r1 and r3 and the current carry AND keep the carry out in the flag register) so that we can later remove the 6 from the last digit of the result if that carry is clear, or in our case, clear the bit in the bitfield representing the digits where we need to remove 6 for digit 16 if the carry is set.*/ adds r4, r0, r2 // s= a+b adcs r5, r1, r3 // keep carry!!!

eor r2, r0, r2 // b=a^b. This calculates the combined parity of each digits of a and b. eor r3, r1, r3 // note that only the first bit of each digit has any interest. the others will be removed later eor r2, r2, r4 // b=a^b^s. 'removing' the combined parity of each digit of a and b from the parity of the eor r3, r3, r5 // sum of a and b gives the carry bit for each digit. /* the next 3 instructions perform 3 64 bit operations at once (a normal non ARM CPU would need 6 instructions to do so!), so please follow! we now have a set of 64 bits, 16 of them are of interest to us (the least significant bit of each digit) as it indicates the carry. so, we need to 1: clear all the other bits (the b&1111111111111111 in the C code) 2: if the carry bit for digit 'n' is NOT set (ie, no carry), it means that we need to remove 6 from digit n-1. So we need to invert each carry bit 3: we need to shift our bitfield to get the bit indicating the carry caused by

digit n located in the same region of the registers as digit n (for the moment, the bit for digit n is the least significant bit of digit n+1)

Thanks to the ARM cpu instruction set, we can do this in only 3 instructions. - as far as 1 and 2 are concerned we can use the bic instruction (Bit Clear) which performs a "a and ~b" operation so we can combine them - a shift operation normally takes 3 operations, but if we decide to shift the bitfeild by only 1 bit (which would place the carry for digit n in the bit 3 of digit n), then we can use the shift ability of the ARM to perform in 1 operation the 88888888 and (~b shift 1) for the lower 32 bits of b, then use 1 instruction (the sub) to handle the carry for digit 7 (which is now held as the least significatn bit of the register holding the upper 32 bits of b) and finish the work by handling the upper 32 bits of b. because the shift is done 'onthe fly', we now need to and b not by 11111..., but by 1111... shifted by 1 or 8888.....

Note that if the ARM had 64 bit registers, we could do the whole thing in only 1 instruction */ bic r2, r12, r2, lsr #1 // (~b>>1)&0x888888888888888 sub r2, r2, r3, asl #31 bic r3, r12, r3, lsr #1

/* Handles carry that we lost from the register due to 64 bit limitiation during the addition of a+b but that was kept in the flag register of the ARM CPU and never modified since! if the carry is SET (ie, there is a carry on the last digit), then we do NOT need to remove 6 from the last digit, and the bit corresponding to the need to remove that 6 is cleared from the register. */ subcs r3, r3, #0x80000000

/* the last step of the algorythm is to remove 6 (or remove 2 and remove 4 as 2+4=6) from each digit where they were no carry. for each digit, we have a bit (bit 3 to be precise) in variable b that is set if 6 needs to be removed from this digit. so, we need to remove b>>1 (correspond to carry bit*4) and b>>2 (correspond to carry bit *2) from the sum to get our result. note that because we know that only 1 bit in each group of 4 bit is potentially set, there is no need to handle bit movement from higher 32 bits to lower 32 bits of b. If the ARM had 64 bit registers, this would be a non issue. */ subs r4, r4, r2, lsr #2 // s-(b>>2)*3 = s-b<<2-b<<3 sbc r5, r5, r3, lsr #2 subs r0, r4, r2, lsr #1 sbc r1, r5, r3, lsr #1 END of Function

in response to message #39 by cyrille de Brébisson

Cyrille: with some guessing (I apologize), I tried to put the code you shared in a format compatible with the MoHPC Forum, which at times is rather unfriendly with respect to long posts formatting. Please correct any mistake. Andrés

```
But my code works for 64 bits :-) thanks to assembly coding and
the power of ARM assembly, adding the last nibble only required
one extra instruction...

// Used to do an addition on two DCB numbers with a result in DCB
// for example, dcbAdjust(a, b), when a and b are dcb representation
// of numbers, will return the dcb representation of the number r=a+b...
// Note that the addition is done prior to the call...
//
// int64 dcbAddAdjust(int64 r, int64 b);        // r=a+b
// a += 0x0666666666666666 ULL;
// preadjust as if carries occur
// u64 s = a + b;
// compute the sum
// b = a ^ b ^ s;
// find the carries
// b = ~b & 0x1111111111111111 ULL;
// compute mask for non-carries
// return s - ((b >> 4)*6);
// subtract out 6 * non-carries

dcbAddAdjust:
```

```
ldr     r12, cte66666666        // load 66666666 in lr to perform the
a+666666666666666

/* 10hex = 16decimal, so the difference between the BCD
representation of 10 and the hex value of 10 is 6.
Adding 6 to each digit of one of the 2 numbers correspond to
assuming that the addition will generate a carry for each digit
and preemptively adds the 6 to each digit.
This need to be done so that we can easily detect which digit
addition really had a carry. Then the algorithm will remove the
extra "6" from these digits.
The carry for each digit does appear as an extra '1' added to the
last bit of each digit. This means that the parity of each digit
is equal to parity of digit in an exclusive-or parity of digit in
b exclusive-or carry from previous digit.
This means that calculating a xor b xor (a+b) and only looking at
the first bit of each digit will tell us for each digit if there
is a carry or not. Note that the fact that we added 6 to each
digit of a does not affect the calculation of parity for a as 6 is
an even number */

adds    r0, r0, r12             // a+=6666666666666666
adc     r1, r1, r12
ldr     r12, cte88888888        // preload 888888888888; preloading it
earlier than
                                // needed will reduce 1 wait state later
on...

/* Step 2 of the algorithm. We now have pre adjusted a, we
calculate the sum of a+b. however, here we pay attention to
keeping the carry out of that calculation in the CPU carry flag
(this is why we use the adcs instruction as in add r1 and r3 and
the current carry, AND keep the carry out in the flag register),
so that we can later remove the 6 from the last digit of the
result if that carry is clear or, in our case, clear the bit in
the bitfield representing the digits where we need to remove 6 for
digit 16 if the carry is set.*/

adds    r4, r0, r2              // s= a+b
adcs    r5, r1, r3              // keep carry!!!
eor     r2, r0, r2              // b=a^b.

/* This calculates the combined parity of each digits of a and b. */

eor     r3, r1, r3              // Note that only the first bit of each
digit has any interest.
                                // The others will be removed later.
eor     r2, r2, r4              // b=a^b^s. 'Removing' the combined parity
of each
eor     r3, r3, r5              // digit of a and b from the parity of the
sum of a and b
                                // gives the carry bit for each digit.

/* The next 3 instructions perform 3 64-bit operations at once (a
normal non-ARM CPU would need 6 instructions to do so!), so please follow!
We now have a set of 64 bits, 16 of them are of interest to us
(the least significant bit of each digit) as it indicates the carry. So, we
need to:

1.      Clear all the other bits (the b&1111111111111111 in the C code)
2.      If the carry bit for digit 'n' is NOT set (i.e., no carry),
        it means that we need to remove 6 from digit n-1. So we
        need to invert each carry bit
3.      We need to shift our bitfield to get the bit indicating the carry
        caused by digit n located in the same region of the
        registers as digit n (for the moment, the bit for digit n
        is the least significant bit of digit n+1) */

/* Thanks to the ARM CPU instruction set, we can do this in only 3
instructions. - as far as 1 and 2 are concerned we can use the bic
instruction (Bit Clear) which performs a "a and ~b" operation so
we can combine them - a shift operation normally takes 3 operations,
but if we decide to shift the bitfield by only 1 bit (which
would place the carry for digit n in the bit 3 of digit n), then
we can use the shift ability of the ARM to perform in 1 operation
the 88888888 and (~b shift 1) for the lower 32 bits of b, then use
1 instruction (the sub) to handle the carry for digit 7 (which is
now held as the least significant bit of the register holding the
upper 32 bits of b) and finish the work by handling the upper 32
bits of b. because the shift is done 'on the fly'; we now need to
and b - not by 11111..., but by 1111... shifted by 1 or 8888......
Note that if the ARM had 64 bit registers, we could do the whole
thing in only 1 instruction */
```

```
bic     r2, r12, r2
lsr     #1                          // (~b>>1) & 0x888888888888888
sub     r2, r2, r3
asl     #31
bic     r3, r12, r3
lsr     #1

/* Handles carry that we lost from the register due to 64 bit
limitation during the addition of a+b but that was kept in the
flag register of the ARM CPU and never modified since, if the
carry is SET (i.e., there is a carry on the last digit), then we
do NOT need to remove 6 from the last digit, and the bit
corresponding to the need to remove that 6 is cleared from the
register. */

subcs   r3, r3, #0x80000000

/* The last step of the algorithm is to remove 6 (or remove 2 and
remove 4; as 2+4=6) from each digit where there were no carry. For
each digit, we have a bit (bit 3 to be precise) in variable b that
is set if 6 needs to be removed from this digit. So, we need to
remove b>>1 (correspond to carry bit*4) and b>>2 (correspond to
carry bit *2) from the sum to get our result. Note that because we
know that only 1 bit in each group of 4 bit is potentially set,
there is no need to handle bit movement from higher 32 bits to
lower 32 bits of b. If the ARM had 64 bit registers, this would be
a non issue.*/

Re: New 12c loop count speed test

*Message #41 Posted by **Eric Smith** on 1 May 2009, 12:36 a.m.,*
in response to message #40 by Andrés C. Rodríguez (Argentina)

For comparison, here's the C code I sent to Cyrille that inspired his ARM assembly code:

```
uint64_t bcd15d_add (uint64_t a, uint64_t b, bool carry_in)
{
  if (carry_in)
    b++;
  a += 0x0666666666666666UL;            // preadjust as if carries occur
  uint64_t s = a + b;                    // compute the sum
  b = a ^ b;                             // find the carries
  b = ~(s ^ b) & 0x1111111111111110UL;  // compute mask for non-carries
  return s - ((b >> 2) | (b >> 3));      // subtract out 6 * non-carries
}
```

This works for 15-digit BCD addition, but not for 16 digits, because in C code there is no simple portable way to obtain the carry out from an addition of 64-bit unsigned integers. Cyrille wrote ARM assembly code based on this, and in ARM assembly it's easy to obtain the carry out.

Note that when given non-BCD input, neither the C code nor the ARM code will match the results given by the HP Nut or Saturn processors. My latest code first does an efficient parallel test for valid BCD digits of each operand, and chooses the fast BCD addition for valid operands, or a digit-by-digit method for invalid operands. I've sent the C code for the efficient parallel BCD test to Cyrille in case he wants to do something similar in other HP calculators such as the 50g.

Excellent book! I seem to have misplaced my copy (or maybe lent it out and forgotten?), so I might have to buy another one.

Re: New 12c loop count speed test

*Message #44 Posted by **J-F Garnier** on 1 May 2009, 3:51 a.m.,*
in response to message #40 by Andrés C. Rodríguez (Argentina)

When I started to design my Saturn emulation engine (for Emu71), back in 1995, I investigated the most efficient way to implement BCD operations on x86 processors in 16-bit "real" mode (Emu71 was, and still is, a pure 16-bit "DOS" program...). I quickly recognized that I had to handle the nibbles in packed form, i.e. 2 nibbles per byte to have some degrees of parallelism. I used the native BCD support of the Intel processors. The result is a quite efficient code for a 16-bit processor, and this explains most of the speed of Emu71:

```
; BCD 16 nibble addition: [dest] += [src]
; di points to dest, si points to src
_addd_w:        mov  ax,[di]
                mov  bx,[si]
                add  al,bl
                daa
                xchg al,ah
                adc  al,bh
                daa
                xchg al,ah
                mov  [di],ax
                mov  ax,[di+2]
                mov  bx,[si+2]
                adc  al,bl
                daa
                xchg al,ah
                adc  al,bh
                daa
                xchg al,ah
                mov  [di+2],ax
                mov  ax,[di+4]
                mov  bx,[si+4]
                adc  al,bl
                daa
                xchg al,ah
                adc  al,bh
                daa
                xchg al,ah
                mov  [di+4],ax
                mov  ax,[di+6]
                mov  bx,[si+6]
                adc  al,bl
                daa
```

```
                xchg al,ah
                adc  al,bh
                daa
                xchg al,ah
                mov  [di+6],ax
                update_carry
```

If I had to rewrite Emu71 in 32-bit mode, I would do differently, maybe using Eric/Cyrille method. Is it a public domain method, or is it an innovative code of yours?

And a million more if you rewrite it AND open source it. Given current processor speeds I would hesitate to require assembly optimizations in the event someone wanted to port it to a different architecture.

What makes EMU71 useful for me is the hardware HP-IL support. This would need to be ported as well. This is probably the hardest part of the deal: write a Win32 or Linux device driver for the hardware (HP's or Christoph Klug's or the yet to appear PIL box.)

I share your dream. My plans:

1. Get a PIL Box to work with Windows, Linux, Mac.
2. Leverage the work of Khanh-Dang Nguyen Thu Lam (http://pagesperso-orange.fr/kdntl/hp41/nonpareil-patch-doc.html) and create a TCP front-end to the PIL BOX. I'll also support the virtual IL devices create by KDNT. This way IL can be added to any emulator and TCP can be used to get to the PIL-BOX for physical devices.
3. Beg i41CX+ author to add TCP/IL support.

> You have a hyper-speed 12C! I only get to about 30,000 in 60 seconds. The factor of 1.5 difference agrees with your statement several months ago that the new 12C runs 90 times faster, I (and Don too) found that it's "only" 60 times faster.

Because of the emulator, I wonder if the speed is sensitive to how the program is aligned in memory. There's a good chance that reading something on a 4-byte boundary is faster than reading something that starts at an odd nibble address.

Dave

So has HP upgraded the 12cp at all? How does the current 12cp compare to this new 12c?

Re: New HP-12C Review

*Message #56 Posted by **Don Shepherd** on 1 May 2009, 11:17 p.m.,*
in response to message #55 by Dewdman42

I don't think the 12cp has been upgraded. I have the 25th anniversary edition. How does it compare to the new 12c? The cp has algebraic mode, 400 lines of program space, more cash flows, and x^2. The new 12c has pure RPN and raw speed.

The curta Calculator.

*Message #1 Posted by **Stuart Sprott** on 27 Apr 2009, 7:27 a.m.*

I am just curious. How many of you out there still have a Curta calculator that actually works?

I have keept mine that dates back to the early 70s, just before the HP 35 came out and changed the world. Or at least that is how it felt at the time.

Every now and then I take out the Curta and check to see that it does still operate.

They are still a remarkable piece of engineering.

Re: The curta Calculator.

*Message #2 Posted by **Miki Mihajlovic** on 27 Apr 2009, 5:34 p.m.,*
in response to message #1 by Stuart Sprott

I have both Type I and II and they are both working flawlessly. This is by far the most sophisticated mechanical piece of gadgetry I have ever held in my hands and (successfully) disassembled and put back together.

Re: The curta Calculator.

*Message #3 Posted by **John Mosand** on 28 Apr 2009, 2:55 a.m.,*

My Curta I works perfectly. If they aren't damaged og handled roughly, they ought to 'last forever'. (Like a good slide rule :-)

Re: The curta Calculator.

*Message #4 Posted by **Stuart Goldberg** on 29 Apr 2009, 9:06 p.m.,*
in response to message #1 by Stuart Sprott

I several Model I and Model II Curtas which still are amazingly smooth and silent running. No one to whom I show them believes they are as old as they are. They still look as if they have just been unpacked for the first time (pristine pieces and both metal and plastic cases, too) and they feel as if they have just been lubricated. Truly amazing pieces of engineering and manufacture.

Re: The curta Calculator.

*Message #5 Posted by **David Ramsey** on 30 Apr 2009, 12:57 a.m.,*
in response to message #1 by Stuart Sprott

I have a pristine Model 1 my wife got me for my birthday a few years ago. It was a little rocky when I received it but I had it professionally overhauled and it's perfect now.

I'd like a Model II. Maybe Stuart will sell me one of his.

OT: Math Joke

*Message #1 Posted by **John B. Smitherman** on 25 Apr 2009, 7:47 p.m.*

This came my way and I thought that some might enjoy it ...

An infinite number of mathematicians walk into a bar. The first one orders a beer, the second orders half a beer, the third asks for a quarter of a beer. Before the next one can speak, the bartender says "You're all idiots", and pours two beers.

Reminder: 1 + 1/2 + 1/4 + 1/8 + ... + 1/inf = 2

Please post your favorites.

Regards,

John

Some have probably heard this one before, but if not, it's kinda cute:

After the flood, Noah tells the animals from the Arc to "go forth and multiply."

After a few months, Noah figures he better wander around and see how the animals are doing. Everybody is happy until he comes across a couple of snakes - they are quite downcast and not very happy. Noah asks what wrong, and they say "We are Adders, so we can't multiply!"

Noah rubs his chin for a few moments, and then goes into the forest, cuts down a couple of trees, and makes a table out of them.

Then he puts the snakes up on the platform he has made, and says "Now you should be happy. Everybody knows that adders can multiply with log tables!"

A physicist, an engineer and a mathematician are each asked to empty a bucket of water placed on the floor in front of a sink.

The physicist picks up the bucket and empties it into the sink.

The engineer picks up the bucket and empties it into the sink.

The mathematician picks up the bucket and empties it into the sink.

The bucket is now placed on a shelf above the sink and each are asked to empty it into the sink.

The physicist picks up the bucket and empties it into the sink.

The engineer picks up the bucket and empties it into the sink.

The mathematician picks up the bucket, puts it on the floor and says "now we've reduced it to a problem that we have already solved".

Re: OT: Math Joke

*Message #8 Posted by **DK2ZA** on 26 Apr 2009, 1:50 p.m.,*
in response to message #7 by Nigel J Dowrick

A group of mathematicians and a group of engineers were taking a train to attend a joint conference. They all sat in the same car and after a while the engineers found out that only one of the mathematicians had a ticket. Each of the engineers of course had a ticket. Some time later a mathematician returned to the car and shouted, "Conductor's coming!"

All of the mathematicians crammed into a restroom, and when the conductor came by, he knocked on the door and said "Ticket please." The mathematician with the ticket passed it under the door, and the conductor punched it and returned it. After the conductor left, the engineers sat there in amazement.

On the return trip the engineers had only one ticket.

This time however, none of the mathematicians had a ticket. Some time later an engineer ran in the car and shouted "Conductor's coming." All of the engineers piled into one restroom and all of the mathematicians into another. The last mathematician went to the restroom of the engineers, knocked on the door: "Ticket, please."

What this story exemplifies:

Engineers use the methods of the mathematicians, but they do not understand them fully.

*Message #10 Posted by **Kiyoshi Akima** on 26 Apr 2009, 2:18 p.m.,*
in response to message #1 by John B. Smitherman

A group of people are asked to prove or disprove the statement "All odd numbers greater than one are prime."

The mathematician says "Three is prime, five is prime, seven is prime, nine is not prime. Thus the statement is false."

The engineer says "Three is prime, five is prime... seven is prime... (slowing down because he doesn't have his slide rule with him) nine is prime... eleven is prime. Looks like they're all prime."

The physicist says "Three is prime, five is prime, seven is prime, nine... well, that could be experimental error, eleven is prime, thirteen is prime, fifteen... oh, we have too many data points. They're all prime."

The computer scientist says nothing, but comes back a month later with a huge ream of printout showing that every even number greater than two is not prime, thus having solved the wrong problem by brute force.

A mathematician, a physicist, and an engineer, are all placed 8 feet from a beautiful woman and the stipulation that at each time interval, they may move half of the remaining distance towards her.

The mathematician concludes that after N iterations there will be 8 divided by 2N feet remaining which will never equal zero so he gives up on the spot.

The physicist opines that if each iteration requires a finite amount of energy then the energy expended in the approach will be inversely proportional to the distance remaining and gives up on the spot.

The engineer says "8 feet, 4 feet, 2 feet, 1 foot, 6 inches, good enough for practical purposes".

A ten year old public school boy was finding fifth grade math to be the challenge of his life. His mom and dad did everything and anything to help their son... private tutors, peer assistance, CD-ROMs, textbooks and even hypnosis. Nothing worked. However, as a last resort they enrolled him into a small Catholic school.

At the end of the first day of Catholic school the boy walked in with a stern expression on his face and walked right past the parents and went straight to his room and quietly closed the door. For nearly two hours he toiled away in his room with math books strewn about his desk and the surrounding floor. He only emerged long enough to eat and after quickly cleaning his plate he went straight back to his room, closed the door, and worked feverishly at his studies until bedtime. The parents were not sure if they should comment on the boys extra efforts for fear of him losing this new found fervor so they seemingly ignored it. This pattern continued ceaselessly.

One day the first quarter report card came out. Unopened, he dropped the envelope on the family dinner table and went straight to his room. His parents were petrified. What lay inside the envelope? Cautiously the mother opened the letter, and to her amazement she saw a bright red "A" under the subject, MATH.

Overjoyed, she and her husband rushed into their son's room, thrilled at the remarkable progress of their young son! "Was it the nuns that did it?", the father asked. The boy only shook his head and said, "No." "Was it the one-on-one tutoring? The peer-mentoring?", asked the mother. Again, the boy shrugged, "No." "The textbooks? The teacher? The curriculum?", asked the father. "Nope," said the son. "It was all very clear to me from the very first day of Catholic school."

"How so?", asked his mom. "When I walked into the lobby, and I saw that guy they'd nailed to the plus sign I knew those people meant business!"

A jet airliner flying over the south Pacific loses power and is forced to make an emergency landing near a deserted island. The landing goes well, but the plane quickly sinks. All the passengers get out without major injury, and all make it to shore. They assemble on the beach, and procede to introduce themselves and discuss what to do.

One woman speaks up. "I'm a Vice-President at Amalgamated Assets, and here's what we should do. We need to form up teams, appoint team leaders, and divide up responsibilities for finding shelter, food, water and other necessities among the teams. Everybody should fan out over the island and exercise their assigned core competency. Team leaders, report back to me at sunset.

Another man is fiddling with an oversized cell phone, obviously frustrated. "Does anyone have a signal?" he asks. "No? All right then, I'm an engineer with Connectroid Telecomm, and here's what we should do.

You folks over there, go inland a bit and bring back any dry wood or palm fronds you can find. You people over there, scour the shoreline and bring back some damp seaweed. Anybody got a lighter or dry matches? Yes? Good. We're going to build a signal fire."

A third man has been busily scratching equations in the sand. "Ah-hah!" he shouts. "I'm an economist at Leveraged Derivatives Bank, and it's all so simple! First, assume a raft..."

Not a joke anymore but how many beers would the bartender have poured them if the second mathematician had ordered three-halves of a beer, the third one had asked for five-fourths of a beer, the fourth had asked for seven-eighths of a beer... and so on? Notice the bartender has neither calculator nor computer to figure this out, only the knowledge and skills he had used before.

Regards,

Gerson.

Re: OT: Math Joke

*Message #30 Posted by **Marcus von Cube, Germany** on 1 May 2009, 1:44 p.m.,*
in response to message #29 by Gerson W. Barbosa

The way you're asking the question, the bartender has to pour an infinite number of beers because you're adding an infinite number of values >= 1.

IIRC, the infinite sum of 1/n is unbound, too. So even if the 2nd would have ordered 1/2, the 3rd 1/3 and so on, the beer will never be enough.

Re: OT: Math Joke

*Message #31 Posted by **Gerson W. Barbosa** on 1 May 2009, 1:51 p.m.,*
in response to message #30 by Marcus von Cube, Germany

> Quote:

```
Sequence: (2n+1)/2^n

n=0: 1
n=1: 3/2
n=2: 5/4
n=3: 7/8
n=4: 9/16
...
```

We are looking for

```
   oo
  Sum (2k+1)/2^k
  k=0

   oo           oo
= Sum 1/2^k + Sum 2k/2^k
  k=0          k=0

        oo
= 2 + Sum k/2^(k-1)
      k=0

        oo
= 2 + Sum k/2^(k-1)      since the first element is 0.
      k=1

        oo
= 2 + Sum (k+1)/2^k
      k=0

        oo           oo
= 2 + Sum 1/2^k + Sum k/2^k
      k=0          k=0

        oo
= 4 + Sum k/2^k
      k=0
```

The last term is definitely greater then 2 so I doubt the solution which has been posted so far.

Did I make an obvious mistake? I don't know.

Gerson, you're right, it's not obviously greater than 2 (mathematicians can't compute ;))

```
1/2
1/4 1/4
1/8 1/8 1/8
... ... ... ...
--- --- --- ---
 1  1/2 1/4 1/8 ...
```

I was quick enough to see your solution, so this is not my idea. :)

A more formal approach:

```
 oo
Sum k/2^k
k=1

   oo   oo
= Sum  Sum 1/2^j     as can be seen from the schema above
  k=0 j=k+1

   oo    oo           k
= Sum ( Sum 1/2^j  - Sum 1/2^j )
  k=0   j=0          j=0

   oo         k
= Sum ( 2 - Sum 1/2^j )
  k=0       j=0

   oo
= Sum 1/2^k
  k=0

= 2
```

Quote:

> I was quick enough to see your solution, so this is not my idea. :)

I guessed you would be, but I knew you would work out your own idea :-)

Congratulations for your solution and thanks for your nice analytical approach.

Here is mine again, more like the one the bartender would have come up with:

```
     1 + 3/2 + 5/4 + 7/8 + ...

=                            1  +

                       1/2 + 1/2 + 1/2 +

                 1/4 + 1/4 + 1/4 + 1/4 + 1/4 +

           1/8 + 1/8 + 1/8 + 1/8 + 1/8 + 1/8 + 1/8 +

            .     .     .     .     .     .     .
            .     .     .     .     .     .     .
    ...     .     .     .     .     .     .     .       ...

    ---------------------------------------------------

=   ...  + 1/4 + 1/2 +  1  +  2  +  1  + 1/2  + 1/4 +  ...

=                       2  +  2  +  2

=                            6
```

Best regards,

Gerson.

Re: OT: Math Joke

*Message #39 Posted by **Paul Guertin** on 3 May 2009, 1:23 a.m.,*
in response to message #38 by Gerson W. Barbosa

To evaluate sum(k*r^k, k=0..infinity), one can also use the fact that (k+1)*r^k is the derivative of r^(k+1) with respect to r (and trust that the derivative of a sum is the sum of the derivatives, even when the sum is infinite, provided it converges absolutely). Then,

sum(k*r^k, k=0..infinity)
= sum((k+1)*r^k, k=0..infinity) - sum(r^k, k=0..infinity) = sum(diff(r^(k+1),r), k=0..infinity) - 1/(1-r)
= diff(sum(r^(k+1), k=0..infinity), r) - 1/(1-r)
= diff(sum(r^k, k=1..infinity), r) - 1/(1-r)
= diff(r/(1-r), r) - 1/(1-r)
= 1/(1-r)^2 - 1/(1-r) = r/(1-r)^2

provided abs(r) < 1.

Putting r=1/2, we obtain 2 for the sum, so

sum((2*k+1)/2^k, k=0..infinity)
= 2*sum(k/2^k, k=0..infinity) + sum(1/2^k, k=0..infinity)
= 2*2 + 2
= 6

[Edited to correct an obvious mistake]

Re: OT: Math Joke

*Message #40 Posted by **Gerson W. Barbosa** on 3 May 2009, 11:10 a.m.,*
in response to message #39 by Paul Guertin

Thanks for providing yet another analytical solution. Geometrical arrangements are nice but clearly have their limitations, that is, the 3-D space...

An example inspired in the second problem:

Let's say we'd like to compute the infinite sum 1 + 9/2 + 25/4 + 49/8 + ...

By arranging the terms as the infinite square-base pyramid below, seen from above,

```
                .                       .
                .                       .
                .                       .

        . . .  1/4 + 1/4 + 1/4 + 1/4 + 1/4 +  . . .

               1/4 + 1/2 + 1/2 + 1/2 + 1/4 +

               1/4 + 1/2 +  1  + 1/2 + 1/4 +            (3-D)

               1/4 + 1/2 + 1/2 + 1/2 + 1/4 +

        . . .  1/4 + 1/4 + 1/4 + 1/4 + 1/4 +  . . .

                .                       .
                .                       .
                .                       .
```

and summing up all the terms, from top to base, we'd get square pattern below,

```
                .                       .
                .                       .
                .                       .

        . . .  1/2 + 1/2 + 1/2 + 1/2 + 1/2 +  . . .
```

```
                1/2 +  1  +  1  +  1  + 1/2 +

                1/2 +  1  +  2  +  1 +  1/2 +              (2-D)

                1/2 +  1  +  1  +  1 +  1/2 +

          . . .  1/2 + 1/2 + 1/2 + 1/2 + 1/2 +  . . .

                  .                       .
                  .                       .
                  .                       .
```

and eventually find the exact sum, 34.

In this case, yours and von Cube's approaches would be better. I would just integrate (2*(x-1/2)+1)^2/2^(x-1/2) from 0 to infinity and get 8*sqrt(2)/(ln 2)^3 = 33.97 ...good enough for practical purposes :-) (Just kidding, I always prefer exact solutions.)

Regards,

Gerson.

Re: OT: Math Joke

*Message #41 Posted by **Gerson W. Barbosa** on 5 May 2009, 11:37 a.m.,*
in response to message #40 by Gerson W. Barbosa

These are interesting but are just particular cases of

```
SUM(k=0,n,(2*k+1)^p/2^k)
```

where p is an integer greater than or equal to zero I have discovered expressions, but not proven them, which allow us to find not only the infinite sum for any power (this is just a matter of finding the limit when n tends to infinity, which is evident in the expression), but the exact sums of the first n terms of these series (the formulas include p-order polynomials but they appear to follow a pattern).

For instance, for p=0, the infinite sum is 2; for p=4, the infinite sum is 3394. For p=2, the sum of the first 20 terms is exactly 1190182/35009.

I will post the formulas later if someone is interested.

Gerson.

Re: OT: Math Joke

*Message #42 Posted by **John B. Smitherman** on 3 May 2009, 11:12 a.m.,*
in response to message #34 by Gerson W. Barbosa

Here's my quick and dirty program for a 33s:

A0001 LBL A
A0002 0

```
A0003 STO S
A0004 1
A0005 STO Y
A0006 STO X
B0001 LBL B
B0002 RCL Y
B0003 RCL X
B0004 /
B0005 STO+ S
B0006 2
B0007 STO+ Y
B0008 STOx X
B0009 GTO B
```

Executing A will result in the number 6 being stored in register S. I just let it run for a few seconds not worrying about counters or using relative error to test for convergence.

John

"Leibson's Law: It takes 10 years for any disruptive technology to become pervasive in the design community. "

I like this idea. It is really true with so many ideas. You can see this with Rapid Prototyping, with desktop 3D modeling; we will see this with 3D printing. 5 Years from now, the firms which make a lot of momey doing 3D printing for other firms, will have evloved--all their customers will be 3D printing!

And of course by 1985 the calculator was pretty pervasive. Of course by 1995 the PC was pervasive and the calculator dead.

Your idea also relates in some way to a thought of mine, which is that technologies achieve their best quality at about 10 years into production. After that, quality is optimized downward. You can see this in everything from tasters to of course, the Voyager calculators.

Some complicated things such as automobiles sort of have to be deconstructed to study this. 10 years after ABS invented or something like that.

There's just nothing like a 15c.

I wonder when the highest quality K&E slide rule came out?

Re: Plug for the MoHPC forum: 72 hours in a day

*Message #4 Posted by **Charles Oxford** on 26 Apr 2009, 12:36 a.m.,*
in response to message #3 by bill platt

The first K&E's were made by Dennart & Pape of Germany in the 1890's. When K&E began making their own a few years later they were high quality as were the last made in early 1970's.

Side by side it's hard to see or feel any difference.

Too bad we can't say the same about HP calc's.

> I like this idea. It is really true with so many ideas.

It's nearly true, but not quite, IMHO. What it should say is something like: "It takes 10 years for any disruptive technology to discover the *enabler* needed to make it truly disruptive."

So, for example, the discovery/invention of electricity was a disruptive technology but the thing that really kicked it off was the invention of the humble wall socket. Think about it.

Obscure 41 Module - FAC/WC

*Message #1 Posted by **Angel Martin** on 25 Apr 2009, 12:56 p.m.*

I just got a 41 module that seems to be peculiar enough / even if it's only because of its capacity.

It's the "Forward Air Controller / Wind Correction" (FAC/W). It appears to have 16k of ROM, a little unusual for a single module of the old generation - possibly a Zeprom??

Does anybody have any information on this peculiar little thing? Needless to say I have no manual or any overlay (if any existed). I suposse I should get a hex dump (disassembly) of the three bottom pages. It does have an automatic key assignment upon CALC_ON vector though.

Best, AM

Re: Obscure 41 Module - FAC/WC

*Message #2 Posted by **Dan Grelinger** on 27 Apr 2009, 11:24 p.m.,*
in response to message #1 by Angel Martin

I've looked at one of those. It is not a ZEPROM. It is a CMT-10, (16K version) and is reprogramable, with the right equipment and software.

Re: Obscure 41 Module - FAC/WC

*Message #3 Posted by **Ángel Martin** on 28 Apr 2009, 8:59 a.m.,*
in response to message #2 by Dan Grelinger

Thanks for the info, Dan. This ROM has some interesting aspects to it, starting with the 16k configuration. Only the first (lowest) page has a proper FAT to it, while the next two have a single "DUMMY" function on their FAT's - and none for the highest one.

I suppose they must be holding table-like data, shame they didn't implement a bank-switched configuration to save address space.

Best, ÁM

Re: Obscure 41 Module - FAC/WC

*Message #4 Posted by **Dan Grelinger** on 28 Apr 2009, 9:55 a.m.,*
in response to message #3 by Ángel Martin

The ZEPROM was a much better design, I think it was introduced after the CMT-10. The CMT-10 came in a 16K bank-switched version, too (called the 16B). As far as I know, the two different CMT 16K versions were fixed from the factory, either bank-switched or not, and could not be changed in the field.

There are other modules that have a FAT only in the lower page. One that HP produced was the

navigation module. I think the Real Estate module was another HP rom that was 8K and had no rom header in the second page.

Scientific notation on 50g

*Message #1 Posted by **skroops** on 24 Apr 2009, 6:19 p.m.*

I feel like when I used to type in '9' 'EEX' 27' to my 50g, it would display "9E27". But today it started showing "9.E27". Am I going crazy or is there an option to change this back somewhere. I have exact mode on.

Edited: 24 Apr 2009, 6:20 p.m.

Re: Scientific notation on 50g

*Message #2 Posted by **bill platt** on 24 Apr 2009, 9:10 p.m.,*
in response to message #1 by skroops

James Prange would know the answer. Where did he go, anyway?

Re: Scientific notation on 50g

*Message #3 Posted by **Bruce Bergman** on 25 Apr 2009, 12:32 a.m.,*
in response to message #2 by bill platt

I've been wondering the same thing... He was a genius as far as the 48/50 family went. Every answer was incredibly in-depth.

James, you still around?

thanks, bruce

Re: Scientific notation on 50g

*Message #4 Posted by **Mike Morrow** on 24 Apr 2009, 9:52 p.m.,*
in response to message #1 by skroops

I've never seen a number displayed in STD, FIXED, SCI, or ENG notation on my HP48GX, HP49g+, or HP50g without a decimal point *somewhere* in the mantissa. I don't believe that it is possible to suppress the decimal point in the displayed value.

Re: Scientific notation on 50g

*Message #5 Posted by **bill platt** on 25 Apr 2009, 8:49 a.m.,*
in response to message #4 by Mike Morrow

Something's coming to me on this--wasn't there a thread recently that talk about this--I rememeber it coming up--deja vu.)

```
I am looking at my 48gx and I see:

line 3: 131.900415187
line 2:          5525
```

```
line 1:             2

format is 'STD'
ML is checked

When I type in "5E31" I get '5.E31'
```

Re: Scientific notation on 50g

in response to message #5 by bill platt

Alright. Thanks for checking :)

Re: Scientific notation on 50g

*Message #7 Posted by **Gerry Schultz** on 27 Apr 2009, 4:28 p.m.,*
in response to message #6 by skroops

I seem to remember that if a number is displayed without a decimal point, its type is an integer and if there is a decimal point displayed, its type is floating point. I found this on page 2.1 of the 50g User's Guide:

Note that real must be entered with a decimal point, even if the number does not have a fractional part. Otherwise the number is taken as an integer number, which is a different calculator objects. Reals behave as you would expect a number to when used in a mathematical operation.

Gerry

Hi, Geoff --

Excellent photos (as well as those of Juergen Keller)!

Yes, our part of the world (SW Canada/NW US) has been mostly cool this year. In Portland/Vancouver (US) are, we've had only two short warm spells in March/April with temperatures near or above 25 C (77 F).

BTW, did you notice that I recently bought a Zenith T/O after learning about it from your post?

Re: Springtime photos...

*Message #7 Posted by **Geoff Quickfall** on 26 Apr 2009, 12:07 p.m.,*
in response to message #6 by Karl Schneider

Hello Karl,

I saw your post and question theme throughout. I was trying to formulate a thoughtful response but since spring has sprung, the yard work has taken over.

The Zenith Transoceanic is a fantastic reciever, probaly one of the best, last of the old style types made. No IC's, removable transistors, Beat frequency oscillators, RF gain and etc.

The last version is the rarest, as it was competing with Sony's one tenth the size.

Many hours of good listening on that machine. Here are some good sites to check up:

resource library

sales

Have fun with it, btw, I paid about $20 for mine and the refurbished it. It was in working condition but filthy. Tore it apart; cleaned the tuner and all the knobs with tuner cleaner. Cleaned the cabinet, purchased battery tubes, new cord, two transistors, users manual and the service manual.

Here is a restoration of the last model:

7000-2 restoration

Cheers, Geoff

in response to message #8 by Kiyoshi Akima

The "Camera obscura" is a camera without a lens. The smaller the hole the sharper the image but the longer the necessary exposure time.

Your pinhole could have been smaller. ;)

Re: And now for something completely off topic:

*Message #10 Posted by **Kiyoshi Akima** on 27 Apr 2009, 12:34 p.m.,*
in response to message #9 by Marcus von Cube, Germany

In theory yes, but in practice not much. After a certain point diffraction takes over and degrades quality further.

And now for something completely off topic:

HP 27S on Christophe Giesselink's Emulator

*Message #1 Posted by **bill platt** on 24 Apr 2009, 1:36 p.m.*

Has anyone run this emulator (on windows)?

Related to that, has anyone found a 27s emulator designed for the 48GX?

Edited: 24 Apr 2009, 1:38 p.m.

Re: HP 27S on Christophe Giesselink's Emulator

*Message #2 Posted by **Thomas Okken** on 24 Apr 2009, 9:47 p.m.,*
in response to message #1 by bill platt

Christoph Gießelink's Emu42 runs the HP-27S ROM just fine, as far as I can tell.
For the HP-48GX, you should probably talk to Hrast. :-)

Re: HP 27S on Christophe Giesselink's Emulator

*Message #3 Posted by **bill platt** on 25 Apr 2009, 11:27 p.m.,*
in response to message #2 by Thomas Okken

Wow! Hrastprogrammer has been busy! I have his 41 emulator for the 48, but now he has the voyagers--and the 42S. Wholey cow! The 27S maybe it isn't far behind...

New HP12C (ARM) SDK availability ?

*Message #1 Posted by **bloo** on 24 Apr 2009, 8:57 a.m.*

Hello,

I was wondering when the new HP12C (ARM) would be available ??? Also, has anyone bought one of these new HP12C ??

Thanks, regards

Gregory

Re: New HP12C (ARM) SDK availability ?

*Message #2 Posted by **Scott Newell** on 24 Apr 2009, 7:13 p.m.,*
in response to message #1 by bloo

I've been checking about once/month, but I've still not spotted one in any of my local office supply outlets.

Re: New HP12C (ARM) SDK availability ?

*Message #3 Posted by **Tim Wessman** on 24 Apr 2009, 7:35 p.m.,*
in response to message #2 by Scott Newell

I bet if you purchased all of them you could from the local supply place, you'd eventually get one. . . ;-)

Re: New HP12C (ARM) SDK availability ?

*Message #4 Posted by **Charles Oxford** on 26 Apr 2009, 12:42 a.m.,*
in response to message #1 by bloo

I bought 2 at Fry's Electronics in Phoenix and sent them off to 2 members of this forum. I look forward to reading their reviews.

Hopefully Fry's will restock.

:) Charlie

Re: New HP12C (ARM) SDK availability ?

*Message #5 Posted by **bloo** on 26 Apr 2009, 6:30 a.m.,*
in response to message #4 by Charles Oxford

As far as I can see, it's not so easy to find that new HP12C. Another question, is there a Model number for the HP12C that we could find on the HP12C packaging ? If so, is the Model number different for the "Old"

and the "New" HP12C ?

Re: New HP12C (ARM) SDK availability ?

*Message #6 Posted by **Bruce Bergman** on 26 Apr 2009, 12:47 p.m.,*
in response to message #5 by bloo

Agreed. If there was a clear way to tell which was new and which was old, solely from the outside of the packaging, that would be much easier. I was inspecting one at Staples and they were looking at me funny.

thanks, bruce

Re: New HP12C (ARM) SDK availability ?

*Message #7 Posted by **Charles Oxford** on 26 Apr 2009, 6:02 p.m.,*
in response to message #5 by bloo

If you look at the top of the calc thru package you will see the edge of the extra wide battery door, about 2/3 total width.

I saw no difference in packages of older and newer 12C.

HP75 HPIL IO

*Message #1 Posted by **Tony de Groot** on 24 Apr 2009, 5:02 a.m.*

Hi, I have an HP75C and an HP3421A Data Aquisition Unit. I have been able to talk to the HP3421A and get it to reset and measure DC Volts, but I cannot read the result back into the HP75C. I think that either the IO ROM or the I/O Utilities will allow me to do this. Can someone confirm this for me? If so, is there a way I can hold of these (I currently have a Wanted Ad running on the Ads page).

Thanks for any help,

Tony.

Re: HP75 HPIL IO

*Message #2 Posted by **Garth Wilson** on 24 Apr 2009, 5:41 a.m.,*
in response to message #1 by Tony de Groot

ENTER D;V should do it, where D is the device address of the 3421, and V is the variable you want to read the voltage into.

Re: HP75 HPIL IO

*Message #3 Posted by **Tony de Groot** on 24 Apr 2009, 6:57 a.m.,*
in response to message #2 by Garth Wilson

Hi Garth - Thanks for the quick reply.

When I try to enter the "ENTER" command I get a syntax error and the cursor points to the "t".

I should mention that I don't have the I/O ROM or Utilities. I am guessing that I need one or the other to make the HP75 recognise the ENTER keyword.

Is this correct?

Thanks,

Tony

Re: HP75 HPIL IO

*Message #4 Posted by **Marcus von Cube, Germany** on 24 Apr 2009, 1:28 p.m.,*
in response to message #3 by Tony de Groot

The 71B has ENTER in the ROM that comes with the HP-IL module. I assume that the 75 has only the mass storage and printer support readily available in its ROM.

Re: HP75 HPIL IO

*Message #5 Posted by **Walt Devaney** on 24 Apr 2009, 1:47 p.m.,*
in response to message #3 by Tony de Groot

What you need are the SENDIO & ENTIO$ commands from the HP-75 I/O Utiliities. The I/O Utilities manual is on the Museum DVD. I sent more details in an e-mail.

Re: HP75 HPIL IO

*Message #6 Posted by **Garth Wilson** on 24 Apr 2009, 1:54 p.m.,*
in response to message #3 by Tony de Groot

Ah yes-- I have an old beat-up 75 here someone gave me, but have never used it. I got the instruction above from the HP-75 section of a 28-page piece of HP literature that tells about using the 3421 with the 71 or 75, and in my quick scan, did not see that it says the 75 needs the I/O ROM (p/n 00075 15001). Like the other post says, the 71 (which I have used extensively, unlike the 75) doesn't need any extra modules because it has everything in its HPIL module.

Re: HP75 HPIL IO

*Message #7 Posted by **Tony de Groot** on 25 Apr 2009, 5:02 a.m.,*
in response to message #6 by Garth Wilson

Hi Everyone,

Thanks for the information. I understand that the easiest is to get the I/O Utilities as the I/O ROM is quite hard to find for the 75.

I will chase the I/O Utilities, but not give up on the I/O ROM just in case one turns up.

I am just starting to chase up the bits I need to get my system up and running so will be looking out for other HP-IL devices (eg an HP-IL to RS232 converter) as well since I want to send the data to a PC for logging and analysis. I tend to collect stuff, so may get other bits as well.

Thanks to everyone for their help.

Tony

HP calculator tattoo?

*Message #1 Posted by **Bruce Bergman** on 23 Apr 2009, 12:44 p.m.*

So a friend and I were talking this morning and we both have some ink on our arms of our favorite hobbies. His is Iron Maiden, and mine is Disney (Mickey Mouse). He knows of my interest in HP calculators and asked if I had a tattoo of one (jokingly).

That got me thinking, though. Does anyone here have a tattoo of an HP calculator? Or have you seen on one somebody?

:-)

thanks, bruce

Re: HP calculator tattoo?

*Message #2 Posted by **Michael Meyer** on 24 Apr 2009, 1:44 p.m.,*
in response to message #1 by Bruce Bergman

Well, I used to make my own temporary tattoos and other one-time transfers using an HP-71B, graphic reversing lex files and programs, and a Thinkjet printer printing on wax paper. So, yes, an "HP calculator tattoo"...

Re: HP calculator tattoo?

*Message #3 Posted by **Walter B** on 24 Apr 2009, 6:09 p.m.,*
in response to message #1 by Bruce Bergman

Tattoos are for seamen ... ;) Seriously, tattoos are something highly emotional. Thus, I doubt there is anybody with a sliderule in his skin nor with a calculator. Though, with 6e9 people, some ppb effects may occur.

Re: HP calculator tattoo?

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 24 Apr 2009, 9:17 p.m.,*
in response to message #1 by Bruce Bergman

The ENTER key (with its arrow) is a trademark of HP calcs, but I don't think someone would put that image on his/her skin...

SIN, LOG, FIX, EXIT, are also not likely. TAN may be acceptable, but if you want TAN on your skin, a little sunbathing (or UV lamp) may do.

Re: HP calculator tattoo? An option for HP 41 fans

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 25 Apr 2009, 12:23 a.m.,*
in response to message #1 by Bruce Bergman

... who prefer not to have tatoos, is just to put an overlay over their skin!

Re: HP calculator tattoo?

*Message #6 Posted by **Juergen Keller** on 25 Apr 2009, 8:35 a.m.,*
in response to message #1 by Bruce Bergman

First, I didn't believe that anybody had such a tattoo. But you know, there's nothing that doesn't exist. Here are some examples of geeky tattoos:

Scientific Tattoos

Euler's Identity Tattoo

And this guy has made a BIG and obvious error:
Calculator Tattoo

Just my 2¢, Juergen

TVM Program for the 42s

*Message #1 Posted by **Jeff Kearns** on 23 Apr 2009, 12:39 p.m.*

The HP 41C Advantage Pac has a very user-friendly TVM program that, when executed, initially displays the 5 variables in the Alpha register. Has anyone come across, or written, a 42s program based on the Advantage Pac TVM code that displays the variables as a soft menu on the 42s, and would you mind sharing.

I am new to the 42s and would really like a TVM program for it. I have a great 39 step program for the 32sii/33s/35s that prompts for the 4 (or 5 if you consider payment at beginning or end of period) unknowns that I would like to convert to the 42s, but if there is one out there already that would be better. Thanks!

Jeff Kearns

Re: TVM Program for the 42s

*Message #2 Posted by **Dan Grelinger** on 23 Apr 2009, 12:57 p.m.,*
in response to message #1 by Jeff Kearns

Jeff,

I feel like a dummy asking the question, but...

The 42S is code compatible with the HP-41. Couldn't you just key in the HP-41 Advantage TVM program? Or are you looking for a version that is customized to the HP-42S. I've never actually used an HP-42S.

I like this program, too. I use it a lot. It is probably the program that I use most frequently on my HP-41.

Dan

Re: TVM Program for the 42s

*Message #3 Posted by **Jeff Kearns** on 23 Apr 2009, 1:30 p.m.,*
in response to message #2 by Dan Grelinger

Dan, I feel even dumber answering... but how would one even get the code off the Advantage Pac in order to convert it to the 42s? As for code being compatible, that may very well be but the interface sure isn't!

Jeff

Re: TVM Program for the 42s

*Message #4 Posted by **Richard Garner** on 23 Apr 2009, 2:12 p.m.,*
in response to message #3 by Jeff Kearns

If I remember correctly on the 41C you enter the program you want to copy to RAM in the ALPHA register and then XEQ the COPY command. The 41C should copy that program from the module into the calculators RAM. From that point you can print, change or whatever you want to the program.

>
> Jeff

There is only one way to get code into an HP-42S, that I am aware of, no matter where the code comes from. Hand entering.

If you GTO "TVM", and into PGRM mode on the -41, you can single-step the TVM program, and enter each command into the -42S. I have not tried it, but it should work.

Dan

*Message #6 Posted by **Jeff O.** on 23 Apr 2009, 1:02 p.m.,*
in response to message #1 by Jeff Kearns

Jeff,
The listing below appears in the 42S manual, page 193. Start it from the Solver menu. Will it do what you want?

```
01 LBL "TVM"
02 MVAR "N"
03 MVAR "I%YR"
04 MVAR "PV"
05 MVAR "PMT"
06 MVAR "FV"
07 1
08 ENTER
09 ENTER
10 RCL "I%YR"
11 %
12 12
13 /
14 STO ST T
15 FC? 00
16 CLX
17 +
18 Rolldown
19 +
20 RCL "N"
21 +/-
22 Y^X
23 1
24 X<>Y
25 -
26 LASTX
27 RCLx "FV"
28 Rolldown
29 X<>Y
30 /
31 x
32 RCLx "PMT"
33 +
34 RCL+ "FV"
35 END
```

Flag 00 sets "Begin" mode (if set) and "End" mode (if clear)

...

18 STO+ ST Z
19 RCL* "PMT"
20 X<>Y
21 1/X
22 RCL+ "BEG"
23 *
24 X<>Y
25 RCL* "PV"
26 +
27 RCL+ "FV"
28 END
```

Re: TVM Program for the 42s

*Message #9 Posted by **Jeff Kearns** on 24 Apr 2009, 1:19 p.m.,*
in response to message #8 by Werner

```
...
15 LN1+X
16 RCL* "N"
17 E^X-1
...
```

For the life of me (perhaps an exaggeration ;-), I cannot figure out how to enter lines 15 and 17, above. Can you please explain how to do this?

Jeff K.

Re: TVM Program for the 42s

*Message #10 Posted by **Marcus von Cube, Germany** on 24 Apr 2009, 1:37 p.m.,*
in response to message #9 by Jeff Kearns

Jeff,

you'll find them in the CATALOG->FCN menu.

Re: TVM Program for the 42s

*Message #11 Posted by **Karl Schneider** on 24 Apr 2009, 3:08 a.m.,*
in response to message #6 by Jeff O.

Jeff K and Jeff O --

This program is so compact because it relies on numerical iteration to solve each variable, not just "I%YR". The others could be solved by direct algebraic equations, but that would make for a longer program.

A time-saving step for entering this program: Create (store any value for) each variable in RUN mode beforehand. That way, it can be selected from a menu when needed in an instruction, instead of being typed in, letter-by-letter.

A former colleague of mine liked to run this program on his HP-42S a few years ago, but was frustrated by repeatedly and laboriously re-entering the program, each time memory was lost by a battery swap (a common HP-42S problem). He later got an HP-12C -- at my suggestion, I believe.

HP-42S faulty keys

*Message #1 Posted by **wesjones** on 23 Apr 2009, 2:43 a.m.*

I have three of these machines and two have the same problem. Of the right most column of keys on the keyboard the bottom six do not work at all. Only the XEQ works in this column and it takes a bit of extra pressure to make it work. The +, -, X, /, <, and TAN keys are completely dead.

Is there something common that can cause these keys and only these keys to fail?

I've owned and used 42S's extensively since they were introduced and I sure would like to fix the two that don't work. I've never seen this (or any other key problems) with any of the 42's I've used over the years.

Any help or idead much appreciated. I'm not beyond taking them apart if that's necessary but of course would rather not.

Best, wes

Re: HP-42S faulty keys

*Message #2 Posted by **Dallas Osborne** on 23 Apr 2009, 11:36 a.m.,*
in response to message #1 by wesjones

I am sorry to say that once these keyboards fail, they are really dead. The contact domes are made of plastic; once they lose their 'spring' they are dead forever. Though, it is possible to rebuild the keyboard, it is highly dependent on voodoo, requires great dedication (and JB Weld), and you will need a working keypad dome sheet.

Again, sorry for your loss; toss it in a box in case you need an LCD or a main board for the replacement you will most likely get...because the 42s is just that good. (Just avoid buying from*that ebay guy*.)

*Message #3 Posted by **Michael de Estrada** on 23 Apr 2009, 12:03 p.m.,*
in response to message #2 by Dallas Osborne

Could the keyboard from another Pioneer, such as an HP 32Sii be used for this? I'm just asking, because I've never opened one of these, but have done so with the Spice series.

Finding a working HP 42s for less than a fortune is quite difficult these days. I'm sticking with my Free42.

Re: HP-42S faulty keys

*Message #4 Posted by **Dallas Osborne** on 23 Apr 2009, 12:12 p.m.,*
in response to message #3 by Michael de Estrada

It is possible to replace the keyboard sandwich with another Pioneer series, but it is very, very intense.

See the 4th posting on

I can't say because I've never used a 32Sii at all. It's not like the keys are worn out really, the problem appeared on all the keys affected at the same time. And on the one machine, it's been in storage for a couple of years and was working fine when it was put away. Now, no-go on just those six keys along the right side of the board.

> Quote:
>

I've noticed that. Last one I followed on eBay went for well over $150. At least I have one that still

works and the 48GX and even an old 25C that still lights up.

Thanks for the thoughts.

Best, wes

Well, not quite. It's true they were going for $400 +/- a few months ago. I recently picked one up for $150 on eBay. Mint USA version, but w/o manual. Got one of those for $7.

No loss of spring to the keys...they feel the same as always and the same as the others that do work. On both these machines the failure seems to have been fairly sudden and all the affected keys at once. It's not like they are worn out because neither have been used except very causally for about 7 years now. The hard thing is keeping working batteries in them so they work on the occasions I do pick one up. No corrosion issues either...

It's pretty much a mystery to me.

*Message #10 Posted by **Steve Perkins** on 24 Apr 2009, 12:37 p.m.,*
in response to message #8 by wesjones

It seems to me that this is may be just a problem with the connectors. I read somewhere on this site that a relatively easy way to fix the problem of a row or column not responding is to tighten the 6 twisted tabs holding the circuit board in place. Of course, you have to open the calculator to do this. I have had some success doing this with a 32-SII in the past.

I'd try this simpler solution first. Good luck.

i worked on a 42s for a friend a while back, and as i recall the contact between the keyboard matrix and the 'motherboard' is purely by pressure, through a dozen or so contacts in a row. i'd guess that the failure is here, and that cleaning may well fix the problem.

to dismantle, the best method i've found is to drill out the 4 (?) plastic rivets in the battery compartment area, and through the back of the calculator to disconnect the 4 (?) at the bottom edge - after some careful measuring to work out where you want to drill.

once the back is off, you can easily remove the motherboard and clean the connections between it and the keyboard, before reassembling it back into place. the only repair work then required will be reattaching the back. oh, and while it's apart, you could upgrade the ram from 8k to 32k.

cheers, rob :-)

Thanks Rob, that sounds like something I can handle and it seems worth a try. I have the face plate off one of them already.

I seem to recall reading elsewhere on this site about dunking one in distilled water for a time and then slowly and thoroughly drying it out. Anyone here tried that approach and have any luck/failures or?

Best, wes

Hi, wesjones

I've ever repaired two 32sII with faulty contact of the keypad. It may be possible to repaire the 42s if the deformed foam rubber is the cause.

Repairing 32sII: http://www.finetune.jp/~lyuka/interests/calc/hp32sII/

How to open the hp-42s: http://www.finetune.jp/~lyuka/interests/calc/hp42s/

Regards, Lyuka

Hi Lyuka. I read here and there in the forum before posting my question and I think I looked at both of those pages. Nice work and thanks for posting them for everyone.

What I think I'll do eventually is take the one apart and at least check the foam pad and the contacts there. Then play it by ear if that's not the problem.

Best, wes

great photos!!

how did you handle the 4 lower heat stakes? my solution was drilling from the back of the calculator, then repairing the damage to the back of the housing - were you able to just prise them apart?

i'd be very reluctant to remove the front plate unless it was absolutely necessary!

cheers, rob :-)

Re: HP-42S faulty keys

*Message #16 Posted by **Lyuka** on 27 Apr 2009, 2:38 p.m.,*
in response to message #15 by robert rozee

Hi.

I've ever opened three 32sII and two 42s successfully by untightening the four lower heat stakes as follows.

After drilling off the upper four heat stakes, warm the back of the calculator and the metal back plate of the key pad, very tenderly to some 50 degrees centigrade (120'F), by using hair drier.

This level of the temperature won't damage the calculator (however the LCD should better be isolated) but is enough to soften and deform the brim of the lower heat stakes rather easily, to get the housing apart.

Then using no tools but with your own hands, grab the case stiffly and open it very slowly and carefully.

Good luck.

*Message #17 Posted by **Dallas Osborne** on 27 Apr 2009, 2:44 p.m.,*
in response to message #15 by robert rozee

(Sorry about lack of response; I've been away from electricity for a bit).

Since all the keys seem to click just fine, I agree with the others that this may be a debris or keyboard/mainboard contact issue.

I would defer to Lyuka on the repair strategy. (Lyuka, great pages, by the way.)

Proposed Additions to the DVD Version 7

*Message #1 Posted by **Allen** on 22 Apr 2009, 7:10 p.m.*

I came across a collection of HP-80 Application Notes, and see that several are missing from the Current DVD and Planned Verstion 7 list . Is there a way to know if this publication stopped at #10 in the series?

I'll try to get these scanned soonest to send in. Likely re-scan the two that are already include so they are all consistent.

Currently on DVD

```
 #007 HP-80 Application Note December, 10 1973, Logs, anti logs and roots
#010 HP-80 Application Note March 28 1974, Linear Regression
```

Proposed additions

```
#001 Direct Reduction Loan Amortizations - July 9, 1973
#002 Annuity Due Calculations for Savings Funds - July 30,1973
#003 Annuity Due Calculations with differing Compounding and Payment Periods- August 17, 1973
#004 Annual Percentage Rate with Balloon Payment- August 31, 1973
#005 Price and Yield Calculations For Mortgages traded at Discount/Premium - October 26,1973
#006 Annuity Due and Present Value- November 16,1973
#008 Yield and Periodic Amount Calculations for Leases with Balloon Payment or Residual Value-
January 17,1974
#009 Internal Rate of Return for Uneven Cash Flows- February 22, 1974
```

HP48GX: lost tactile responce in F keys

*Message #1 Posted by **Harold A Climer** on 22 Apr 2009, 5:22 p.m.*

I have a HP48GX (and not the oldest one I purchased) on which the top row of keys no longer give tactile feedback when pressed. What causes this? Is there a fix without having to tear open the calculator? Were calculators manufactured during a certain time period more prone to this problem? I have three HP48GXs. Two were made in the USA and one in Indonesia

Harold A Climer Dept. Of Physics Geology, and Astronomy U.T, Chattanooga Rm. 406A Engineering, Math & Computer Science Building 615 McCallie Ave. Chattanooga TN 37403 Harold-Cimer@utc.edu

A few questions to ask. Then we can talk about it as invasive key fixes are difficult on the 48's

*Message #2 Posted by **Geoff Quickfall** on 22 Apr 2009, 7:57 p.m.,*
in response to message #1 by Harold A Climer

Harold, hello

```
1.  Do the keys still function
2.  The second row to the top, do these keys have the same tactile
    response as the lower rows of keys.  That is, does the tactile
    response increase the farther away from the f keys one travels?
3.  spilt anything on it lately?
4.  using a dropper, place some 99% alcohol on the offending keys,
    work the key with succesive pushes (many 20 or 30 clicks each
    key.  Allow to dry.
5.  did the keys respond to the cleaning?
6.  was the calculator dropped?
```

Cheers, Geoff

in response to message #2 by Geoff Quickfall

1. Do the keys still function? Yes but sometimes one is not sure if they took or not.

2. The second row to the top, do these keys have the same tactile response as the lower rows of keys? Yes In fact the F1 key still has a bit of the tactile feel left. 2A.That is, does the tactile response increase the farther away from the f keys one travels? After the first row they are all about the same: maybe a bit better as you go towards the bottom, but is hard to tell. 3. spilt anything on it lately? No. 4. using a dropper, place some 99% alcohol on the offending keys, work the key with successive pushes (many 20 or 30 clicks each key. Allow to dry. Will try.

5. did the keys respond to the cleaning?

6. was the calculator dropped? No.

Re: A few questions to ask. Then we can talk about it as invasive key fixes are difficult on the 48

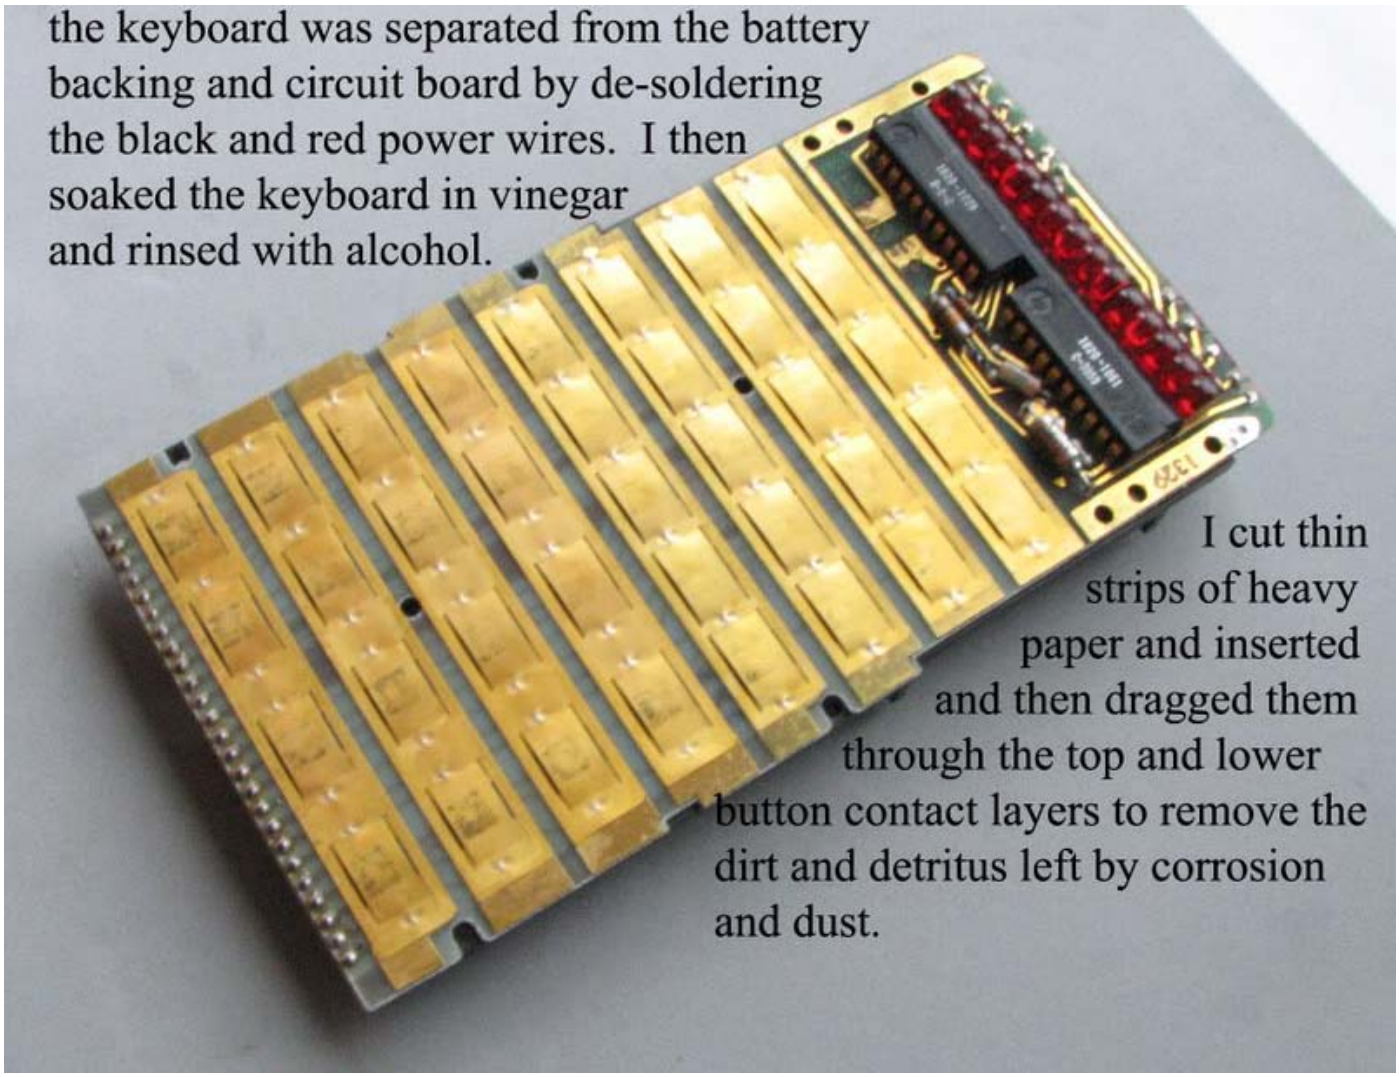
*Message #4 Posted by **Geoff Quickfall** on 22 Apr 2009, 11:02 p.m.,*
in response to message #3 by Harold A Climer

There are three ways to lose the 'feel' of the keys. Especially ones used as frequently as the F keys on a 48 that has dedicated F functions; i.e. the VAR menu with assigned folders and variables

Firstly:

The construction of the keyboard includes a domed contact. As the key is pressed into the apex of the dome, the dome deforms toward the keyboard contact completing the circuit and giving the resounding click.

The setup is similar to the following HP 45 keyboard with the exception that the raised portion is domed not rectangular (I currently don't have a picture of the keyboard layout for a 48):



With consecutive use this system will fail over time.

Secondly:

The calculator is held together by plastic rivets. Actually plastic inserts into plastic tubes which are then glued under pressure. The upper rivets, depending how well they were formed at construction may give. Especially under duress such as a drop or extensive use. As the rivets loosen, the distance the key has to move to engage the 'dome' increases and the deformation of the dome may have a reduced click to it.

Thirdly:

The sticky residue problem. This will entail the cleaning of the keyboard, non-envasively. This can be done by removing the batteries, battery hatch and memory cards as well as the memory card hatch.

Conclusion:

Without seeing your calculator and assuming it is not the sticky residue problem or rivet problem; it would seem that it metal fatigue of the dome contact system.

Not much can be done for that other than 'Fix that Calc'. If the cleaning does not improve the feel, try the following:

```
1.  Place the calc on a flat surface.
2.  Gently apply finger pressure at the edges of the calculator
    corresponding to the row with the F keys
3.  while applying pressure, press the keys with your free hand
    and see if the keys respond normally.
```

This would indicate that the rivets may be at fault. Both the dome fatigue and rivet would require surgery unfortunately.

Good luck!

Geoff

I was under the impression that the HP48 uses plastic domes with some sort of conductive spot on the underside. I've never had one apart, so I cannot say for sure.

...

HP 48 keyboard design

*Message #6 Posted by **Didier Lachieze** on 23 Apr 2009, 9:15 a.m.,*
in response to message #5 by Jeff O.

About the HP 48 keyboard design, here is an extract from the "Hardware Design of the HP 48SX Scientific Expandable Calculator" article in the June 1991 HP Journal, page 29:

> Quote:
>
> The tactile feel of the keys is a result of painstaking design, testing, and quality assurance efforts. The 0.004- inch-thick **Mylar** dome sheet contains 49 details, which provide the snap feel as each key is depressed. Each key has an actuator which presses against the top center of the dome. As the dome is pressed it deflects at its base into a dome spacer recess. At this stage the force is building linearly with deflection. As the force builds to the trip point the dome buckles, causing a sudden drop in force. Momentum and the resulting imbalance of force between the finger pushing on the key and the key no longer pushing back causes the inside of the dome to impact firmly against the keyboard contacts. The inside of the dome is printed with a pad of conductive carbon graphite. Upon switch closure the dome pad shorts the interdigitated carbon graphite contact fingers of the keyboard. Below each key switch is another recess created by a 0.003-inch-thick chassis spacer. This recess allows the keyboard to wrap around the depressed dome, resulting in a much more reliable area contact instead of the point contact of a dome against a flat plane.

HP48 keyboard

*Message #7 Posted by **RETH** on 23 Apr 2009, 9:38 a.m.,*
in response to message #5 by Jeff O.

I just pulled one apart (and cut one of my fingers :)) - 4 layers, top one made of clear plastic with stamped domes partly filled with dark conductive material, next one made of slightly thinner clear plastic with holes below the domes, third one - thin white plastic painted circuit board with lines on both sides and the fourth - made of paper to insulate the third from the bottom. I took picture but I'm not sure how to post them here. I can't believe it looks so simple and cheap and still worked perfectly after all these years!

Thanks for the description..

*Message #8 Posted by **Geoff Quickfall** on 23 Apr 2009, 11:59 a.m.,*
in response to message #5 by Jeff O.

My intent was to show the deformation style. The mylar dome is a variant of the HP 45 click response in that it deforms a convex structure which is subject to fatigue.

If you have pictures, post them. Not that one can fix a cracked mylar dome, but it would be interesting.

Cheers, Geoff

HP50g ROM Version 2.15

*Message #1 Posted by **Mike Morrow** on 22 Apr 2009, 4:00 p.m.*

ROM version 2.15 made it out yesterday. It is apparently just version 2.14-2 with revision number changed to 2.15 for official release. It is now "officially supported."

I had just installed version 2.14-2 a few days ago, but installing ROM updates requires only trivial effort, so I repeated that process today.

Re: HP50g ROM Version 2.15

*Message #2 Posted by **hpnut** on 23 Apr 2009, 3:11 a.m.,*
in response to message #1 by Mike Morrow

Hello Mike,

how come HP's 50g page http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=150113#150113 says latest ROM is v.92 dated 11 Aug 2006?

am I looking at the correct page?

Re: HP50g ROM Version 2.15

*Message #3 Posted by **Mike Morrow** on 23 Apr 2009, 8:01 a.m.,*
in response to message #2 by hpnut

Click on the embedded link (first "ROM" in my post above) and you'll get the www.hpcalc.org page with link to the update zip file at the top (www.hpcalc.org always seems to get official ROM updates well before any HP sites).

Version 2.15 apparently revises version 2.09 to make the corrections of the long awaited but never released version 2.10, plus adds the HP StreamSmart application. The zip file contains a pdf file listing the changes (plus other changes since ROM version 2.00). ROM version 2.15 does *not* have the changes of unofficial version 2.10-7.

The version 2.15 zip file also has updated versions of the Equation Library and Periodic Table Library. The new versions will also need to be installed as described in the pdf file. There's also a fix file for port 2 memory problems, but I didn't need to use that.

After opening the update zip file, I copied the scp, bin, and three lib files (five total) to a FAT SD card, put the card in the calc, and followed the instructions from the pdf file. All is done from the keyboard...no paper clip in the reset hole is called for! I'm just a user, so that's all I know about version 2.15. I've found nothing strange about it.

Edited: 23 Apr 2009, 8:48 a.m.

Re: HP50g ROM Version 2.15

*Message #4 Posted by **Dave** on 23 Apr 2009, 10:30 a.m.,*
in response to message #3 by Mike Morrow

First time I'd upgraded via SD card. Had a little trouble, but eventually got it. My first problem was the timing on the + and - keys. I had to press them precisely 1/2 second after a short press of ON/F3. Any more or less wouldn't work. My second problem was the SD card format. Even though I'd used this card for a long time on my calc, I kept getting a NO CARD error during the upgrade. Even though I'd correctly formatted it FAT on my PC, turns out the upgrade routine wouldn't recognize it until I formatted it on the calc itself. After that, all was well.

*Message #5 Posted by **Ed Look** on 23 Apr 2009, 11:15 a.m.,*
in response to message #4 by Dave

Dave, I had the same experience with a SD card update attempt. I didn't realize I should have re-formatted in the calculator, so I gave up and updated via cable.

The strange thing about this is that before and after this, the calculator, a 49g+ was able to recognize the card in the filer and access it.

Perhaps I should move my files off the card, format it in the calculator, do the update, and then move my files back.

Incidentally, my 50g was able to be updated by SD card, but that was the HP-branded SD card that came with it.

Re: HP50g ROM Version 2.15

*Message #6 Posted by **hpnut** on 23 Apr 2009, 12:27 p.m.,*
in response to message #5 by Ed Look

After some panicky moments, all went well with the upgrade via the SD card.

so now, after pressing the APPS key, I see in 12. EQN LIBRARY 13. PERIODIC TABLE 14. StreamSmart

13 and 14 are new to me.

I conclude that this upgrade is worth the effort. Just follow the instructions in the PDF diligently and you will have no trouble :-)

cheers,

If you set system flag -86 you'll get another application: "15. Development Lib". You may need to reset (ON/F3) after setting the flag. This library is described in Chapter 6 of the HP49g+ Advanced User's Reference Manual.

Application 14 is support for the HP StreamSmart 400. I don't think that a large percentage of HP49g+ or HP50g users will find use for this.

Application 13 (Periodic Table) has been around since the days of the HP48SX, though it wasn't provided with the HP49g+ or ROM updates until somewhat recently.

Edited: 23 Apr 2009, 2:58 p.m.

Re: HP50g ROM Version 2.15

*Message #8 Posted by **Ed Look** on 23 Apr 2009, 3:59 p.m.,*
in response to message #7 by Mike Morrow

The periodic table is very, very similar to that of Arnold Moy's that can be downloaded from hpcalc.org. The only difference is that the one now included on the ROM update uses a smaller size table and smaller size font. If you have to deal with at least a little chemistry, it's pretty useful.

Re: HP50g ROM Version 2.15

OK i found the answer in the 49G AUR

"In order to enable this library, you must attach it with the command 256 ATTACH or by setting flag 86."

:-)

Re: HP50g ROM Version 2.15

*Message #15 Posted by **Mike Morrow** on 23 Apr 2009, 11:34 p.m.,*
in response to message #13 by hpnut

The AUR does NOT say "by setting flag 86." It says "by setting flag -86."

Flag 86 is a user flag, not a system flag. The system flags are negative, so you must

set flag -86 (minus 86), not 86.

Or 256 ATTACH works too, as you found.

now I learn that there are such things as negative flags ;-)

Re: HP50g ROM Version 2.15

*Message #17 Posted by **Mike Morrow** on 24 Apr 2009, 11:24 a.m.,*
in response to message #16 by hpnut

The system flags are the most interesting! You can scroll through a screen showing most of the system flags, their function, and status by pushing MODE, then F1 (FLAGS). This screen leaves out the - (minus) sign that has to be used before the flag number.

System flag -86 is not shown. System flag -78 is also not shown, which is used to designate the serial or USB port on the HP50g. Perhaps there are others as well.

Edited: 24 Apr 2009, 11:32 a.m.

Re: HP50g ROM Version 2.15

*Message #18 Posted by **Michael de Estrada** on 24 Apr 2009, 1:19 p.m.,*
in response to message #17 by Mike Morrow

I didn't know about the flag -78. I was switching between serial and USB ports in the I/O Transfer screen. According to Appendix C of the HP 49g+ AUG, flag -78 is a "Kernel parameter, Not used." Also, the AUG describes flag -86 as "Program Prefix." I did see the Developement Lib once flag -86 was set and the calculator was rebooted. Do you know if is there is a flag to switch between Kermit and Xmodem transfer types? When I change from Kermit to Xmodem in the I/O Transfer screen, it always reverts to Kermit when I return to the I/O Transfer screen. However, selecting right shift and then the right arrow keys still places the calculator in XModem server mode, and communications can be made with the PC via USB cable. I was using Kermit and the serial port to communicate with my HP48SX.

Re: HP50g ROM Version 2.15

*Message #19 Posted by **Michael de Estrada** on 24 Apr 2009, 12:08 a.m.,*
in response to message #3 by Mike Morrow

I'm frustrated! I've been trying to do the ROM upgrade from the SD card. I do the ON/F4 thing and get the Test Menu OK. Then I try to do the ON/F3 +/- thing, but all it does is briefly show some graphic

and then revert to the regular display. No Update Menu. I've tried various timings between the ON/F3 and +/- key presses to no avail. I had absolutely no trouble updating the libraries, and the 1 Gb FAT SD card is definitely recognized.

Any ideas. I really don't like the USB approach because it requires resetting the calculator.

Re: HP50g ROM Version 2.15

*Message #20 Posted by **Mike Morrow** on 24 Apr 2009, 1:31 a.m.,*
in response to message #19 by Michael de Estrada

It took me several attempts to get to the UPDATE menu when I was trying to install version 2.14-2 a few days earlier. But when I later installed version 2.15, the process worked flawlessly the first time because I had practice the day before.

A. After pressing ON and F4 together, the [1. LCD 2. KEY etc.] TEST MENU will appear and stay on screen. B. Press and hold ON and F3, then immediately release. The screen will go blank. The machine is begining a restart. C. Within about a half second of the screen going blank, simultaneously press and hold - AND + for about three seconds before releasing.

This should start the UPDATE screen. At worst, the machine will just warm start and the whole process can be repeated. Up to this point, it doesn't even matter if your SD card has been put in the machine yet. It's just a matter of timing, since pushing the - and + keys too early or too late will not initiate the UPDATE menu as the machine restarts.

There is another way to call up the upgrade screen. It is an alternate ROM upgrade initiation process described at hpcalc.org. This was formerly the standard approach, and requires depressing the - and + keys while inserting a paper clip in the reset hole. I find it far more awkward than this "new" process.

Welcome to one of the greatest features of the HP49g and 50g series: upgradeable firmware. My 2003 HP49g+ has been through about six upgrades from the shipped version 1.20, and my HP50g has been through three from the shipped 2.08. I couldn't do that with my HP48SX and GX units.

Edited: 24 Apr 2009, 1:58 a.m.

Re: HP50g ROM Version 2.15

*Message #21 Posted by **Michael de Estrada** on 24 Apr 2009, 9:51 a.m.,*
in response to message #20 by Mike Morrow

Thanks Mike. This time it worked on the first try. I used the one-finger approach shown in Tim's YouTube video to push the +/- keys. Unlike other postings, it had no problem recognizing or reading my SD card, which came out of my digital camera. I'm glad I didn't have to mess with the reset button.

As far as my HP48SX is concerned, it is now officially retired, as all its RPL programs and data have been successfully ported to my HP50g. About the only issue I encountered was that some variable names were in conflict with newly added reserved names such as RECT and EQW and had to be renamed. Just as well, I guess, as I was starting to go blind trying to read its dim display.

Re: HP50g ROM Version 2.15

*Message #23 Posted by **Michael de Estrada** on 24 Apr 2009, 9:55 a.m.,*
in response to message #22 by Tim Wessman

Thanks a bunch Tim. That video is great and I've bookmarked it. The secret is in the one-finger method to push the +/- buttoms. The whole process went seamlessly.

Re: HP50g ROM Version 2.15

*Message #24 Posted by **Dave** on 24 Apr 2009, 10:36 a.m.,*
in response to message #23 by Michael de Estrada

I think if the published instructions said to quickly press and release on/f3 together I think people would have less trouble too. As it is now, the instructions say "hold" on/f3, which simply doesn't work since you end up holding it through the reboot and missing your chance to get the +/- right. You also have a better chance of success if you formatted your card on the calc.

Re: HP50g ROM Version 2.15

*Message #25 Posted by **Mike Morrow** on 24 Apr 2009, 12:13 p.m.,*
in response to message #22 by Tim Wessman

Very nicely done video, TW! The single finger on + and - makes the process work with much greater certainty.

I wonder why the "paper clip reset" method was specified for so many years in official ROM upgrade instructions. This easier and more elegant technique works on my old 2003 HP49g+ (boot version 3.15.04), as well as on my HP50g (boot version 4.01.03.03).

HP-25C strange behaviour

*Message #1 Posted by **Alberto Fenini** on 22 Apr 2009, 9:27 a.m.*

Hello Everybody,

I'm considering buying an HP25C with some minor (I hope) problems, I recall the topic was already discussed, and I did some digging, but couldn't find anything. Please forgive if the question has already been answered.

There are two known issues, the first is that key numer 1 doesn't allow any input, but I hope it's just a matter of cleaning the keyboard.

The second one looks more complicated. If key number 4 is pressed a number 6 will show up on the display and will be treated like that.

Does anyone has ever had this problem and know how it can be fixed ?

Thx for help, Alberto

Re: HP-25C strange behaviour

*Message #2 Posted by **Michael de Estrada** on 22 Apr 2009, 10:06 a.m.,*
in response to message #1 by Alberto Fenini

I had a similar problem with my HP-25C in which pressing the "4" key resulted in a "5" being entered. I also had a similar problem with a HP-33E. In both cases the problem was solved by chemically cleaning the keyboard by soaking in distilled vinegar, and then drying in my oven @ 150 degrees F (66 degrees C) for 3 hours. The keyboard on the HP-25C is heat-staked to the front of the calculator, so there is no direct access to the key contacts. You have to disassemble the calculator, so you can soak only the keyboard assembly. As to why it does this, I believe it's due to the one-piece film design of the keyboard snap buttons, where pushing one button can lead to actuation of a different button.

Hope this helps.

Good luck, Michael

Re: HP-25C strange behaviour

*Message #3 Posted by **Geoff Quickfall** on 22 Apr 2009, 12:51 p.m.,*
in response to message #1 by Alberto Fenini

Hello Alberto

Michael is absolutely correct, it should be a minor keyboard cleaning problem.

In the case of your #4 key, sometimes a conductive dust or battery corrosion precipitate can short the keyboard. What happens is two traces from two keys can connect and the logic input sent to the keyboard processor is recognized as the wrong key input.

In the case of your #1, either it is a non-conductive piece of debris or broken dome that creates the 'click' sound and creates the contact. The broken dome problem is not easily fixable but you can determine if the dome is broken by the sound and feel. They should be identical to the other working keys.

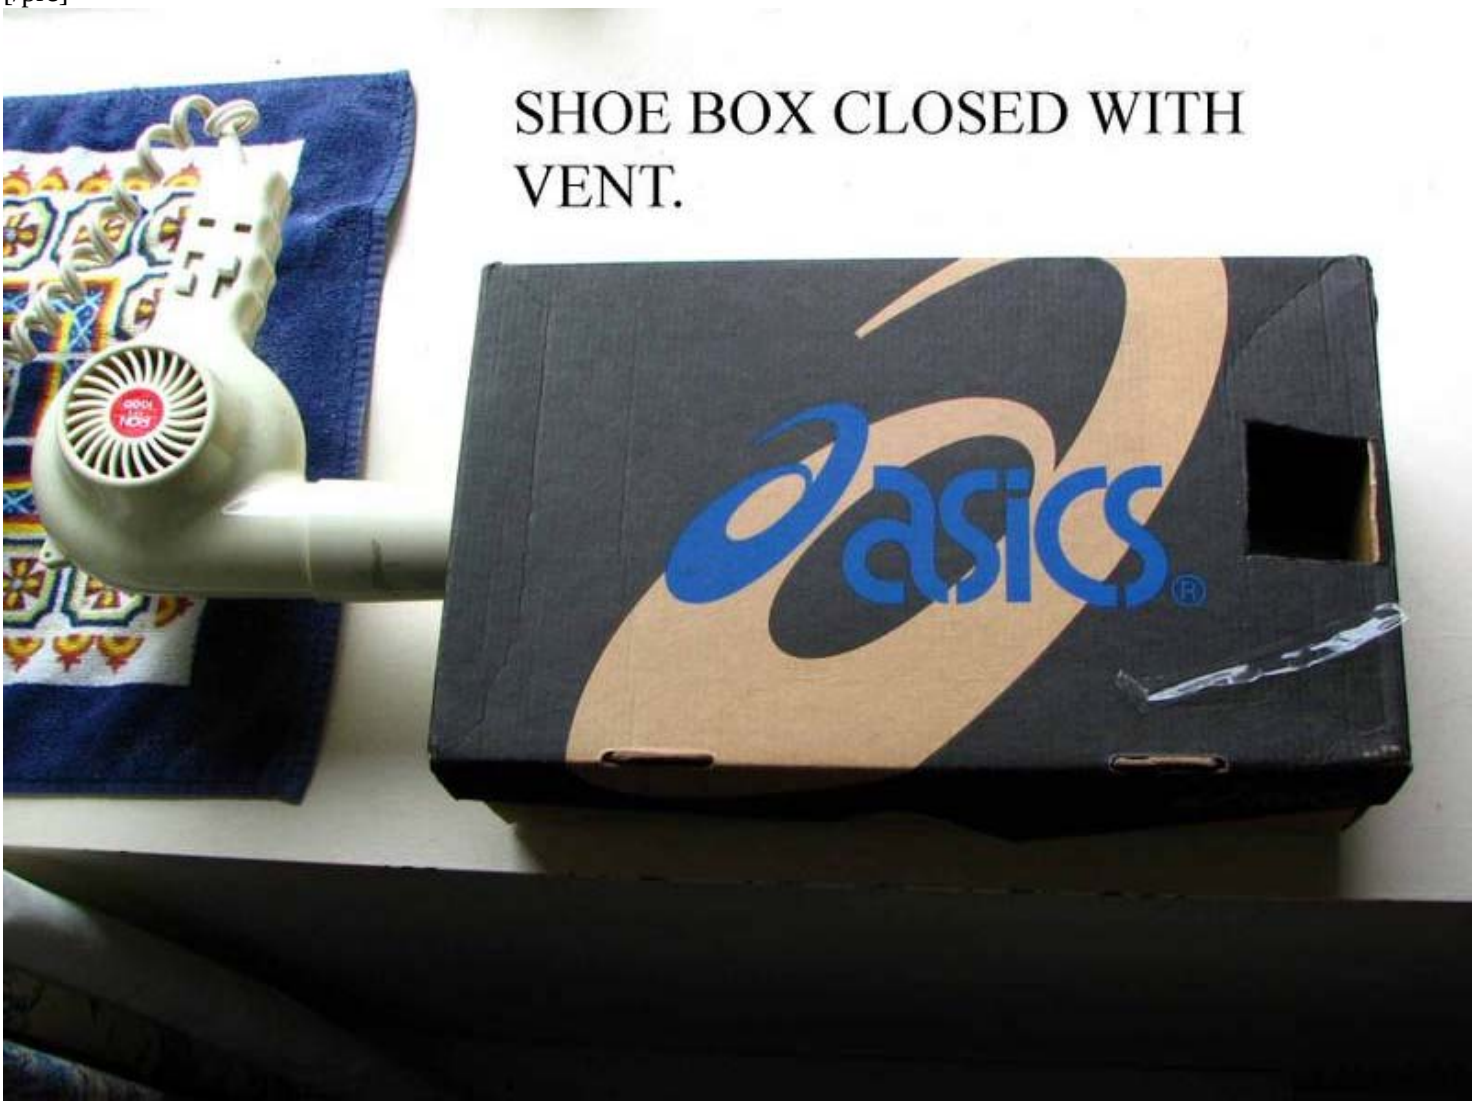
Another problem on the keyboard is that the keyboard processor is not processing the info due to a bad connection at the

chip itself, again due to conductive debris or corrosion.

When cleaning the keyboard use water to dissolve any sugar residue such as spilt beer or wine or pop. Then rinse with Michael's vinegar solution. Then rinse with 90% alcohol. I personally use an ambient air drying box. That is, a shoe box with an hair dryer attached to one end as in the picture. The hair dryer is set to COLD causing only room temperature air to pass over the keyboard and PCB.

Shoe box:

[/pre]



In conclusion:

1. remove the PCB from the Keyboard 2. remove the LED panel from the PCB 3. soak both the PCB and the Keyboard in warm (not hot) dilute water. 4. rinse 5. soak both PCB and Keyboard in dilute vinegar 6. rinse 7a. dry the units (I prefer ambient air temperature as my controls are not that accurate and there is actual airflow penetrating the units cracks and crevaces) 7b. while drying your keyboard do not wipe the front dry. Dab it dry with a soft cloth. The Woodstock silk screening is notorious for comming off. This is due to the Clear Laqueur finish decomposing from UV rays over the last 30 years. 8. assemble and test.

As a last resort, but very safe, I use a citrus based adhesive remover found at your local electronics shop. I have some HP 15C that have been working perfectly (Really, perfectly) with respect to the keyboards after using the above method and finishing it with the citrus adhesive remover. It is safe for the silkscreening and internal keyboard components.

On the reverse side of the keyboard you will see holes corresponding with the centre of the keys. A quick spray of the cirtrus oil in the offending keys hole will invariably solve the contact, and key bouncing problems.

This link to an old post might be helpful.

Re: HP-25C strange behaviour

*Message #4 Posted by **Alberto Fenini** on 22 Apr 2009, 5:55 p.m.,*
in response to message #3 by Geoff Quickfall

Thanks for all of you for you hints, I had a similar problem with one of my HP-25 and I have learned a lesson ! I had used a contact cleaner sparay, a 90% alcool spray and water to rinse.

As a result, most of the yellow labels simply faded away and the structure itself has become gray.

What do you exactly mean with "distilled vinegar", is this the same we use as a salad dressing ? I'm very interested in finding a good product for soaking the keyboard without problems.

Thx for help, Alberto

P.S. I'd like to include some pics, how I'm supposed to do that ?

Re: HP-25C strange behaviour

*Message #5 Posted by **Geoff Quickfall** on 22 Apr 2009, 7:20 p.m.,*
in response to message #4 by Alberto Fenini

The local store should have some white vinegar. I dilute this 50%.

Cheers

*Message #6 Posted by **Alberto Fenini** on 22 Apr 2009, 7:37 p.m.,*
in response to message #5 by Geoff Quickfall

Has the vinegar some cleaning properties ? Do you think it will dissolve and remove the corroded parts ?

Re: HP-25C strange behaviour

*Message #7 Posted by **Michael de Estrada** on 22 Apr 2009, 7:58 p.m.,*
in response to message #6 by Alberto Fenini

White distilled vinegar is clean from impuities and is usually reduced with water to 5% acidity. It is primarily used for cleaning purposes. For example, you can pass it through a coffee maker to clean coffee residue and remove odors. It is very good at removing copper (green) corrosion, as it reacts chemically to disolve the corrosion without damaging the underlying circuit traces.

Re: HP-25C strange behaviour

*Message #8 Posted by **Geoff Quickfall** on 22 Apr 2009, 8:01 p.m.,*
in response to message #6 by Alberto Fenini

Vinegar is slightly acidic. The battery precipitate is a base. I am not talking about corrosion, but the powdery precipitate that outgassing of the batteries can cause to the circuits not directly exposed to leakage.

Water will not dissolve the precipitate which has it's own electrically conductive properties. Vinegar will. The down side is a severly corroded trace inside or under a IC may dissolve to the point of no contact. This would of course be undetectable without a logic probe.

Suffice to say that I have so far (45 calculator restorations) never had a calculator come out of the procedure worse then it went in. I have successfully resurrected many keyboards with this technique.

Cheers, Geoff

And here we go with the picture (not for the faint at heart)

Ouch!

*Message #11 Posted by **Geoff Quickfall** on 23 Apr 2009, 6:38 p.m.,*
in response to message #10 by Alberto Fenini

Unfortunately the white bloom is the Clear laqueur finish breaking down. This is repairable on the "classics" that allow the keyboard to come apart. The keys drop out and the calculator can be re-laqueued with success.

Unfortunately the 'woodstocks' do not allow for keyboard dis-assembly.

Cheers, Geoff

Re: Ouch!

*Message #12 Posted by **Michael Meyer** on 24 Apr 2009, 12:19 a.m.,*
in response to message #11 by Geoff Quickfall

I've had great success fixing this with a rag treated with the automotive vinyl and plastic restorer "Armor All". I've rubbed it on keyboards as bad as this and restored them to nearly new appearance. The treated calcs have been on display for well over five years without apparent problems. You can keep rubbing it on until it dissolves the marred finish, and I've not had this remove any painted key labels. Give it a try!*

*Best results have been obtained by sitting in bed, watching t.v. and polishing the calculator as a prized treasure. LEEEEDDD's!!!

Re: Ouch!

*Message #13 Posted by **Alberto Fenini** on 24 Apr 2009, 9:05 a.m.,*
in response to message #12 by Michael Meyer

Thank you very much, that's absolutely worth a try, as far as for the yellow labels no hope I can restore them, right ?

Re: Ouch!

*Message #14 Posted by **Michael Meyer** on 25 Apr 2009, 9:07 p.m.,*
in response to message #13 by Alberto Fenini

I've never tried, but am wondering if simply printing the key labels from a good scan onto adhesive paper with a color laser printer and then cutting them out might work. I've had good

luck doing this to produce missing HP calculator faceplates. They look almost as good as the originals.

Re: Ouch! (photo)

*Message #15 Posted by **Alberto Fenini** on 26 Apr 2009, 6:21 p.m.,*
in response to message #14 by Michael Meyer

Thank you so much for the polishing hint, I have used a teflon based product, and this is the result (to be finished yet, but wow ...), I didn't have considered the idea of using car polishing products for HP keyboards ....

As for the letters, I would think of Letraset, if size, font and colors are available, I'll check it out and let you know.

Thank everybody for the help ! Alberto

41c keyboard overlay templates

*Message #1 Posted by **Sean Connor** on 22 Apr 2009, 8:55 a.m.*

Sorry if this is an old chestnut but .... Has anybody produced a template in say Word (or any other package come to think !))

I have the circuits module and would like to make up the overlays.

I did do a search but couldn't find anything

Best Regards

Sean

Re: 41c keyboard overlay templates

*Message #2 Posted by **Bill (Smithville, NJ)** on 22 Apr 2009, 9:23 a.m.,*
in response to message #1 by Sean Connor

Hi Sean,

After seeing those TV ads for some sort of craft cutter, I'm wondering if Keyboard Overlays could be designed and cut out in vinyl using one of them. Did a quick search and found the Silhouette by QuicKutz which has a computer interface and looks like a printer with cutting blades.

Has anyone tried out one of these type devices? Could they do overlays?

Bill

Yes,

*Message #3 Posted by **Geoff Quickfall** on 22 Apr 2009, 12:57 p.m.,*
in response to message #1 by Sean Connor

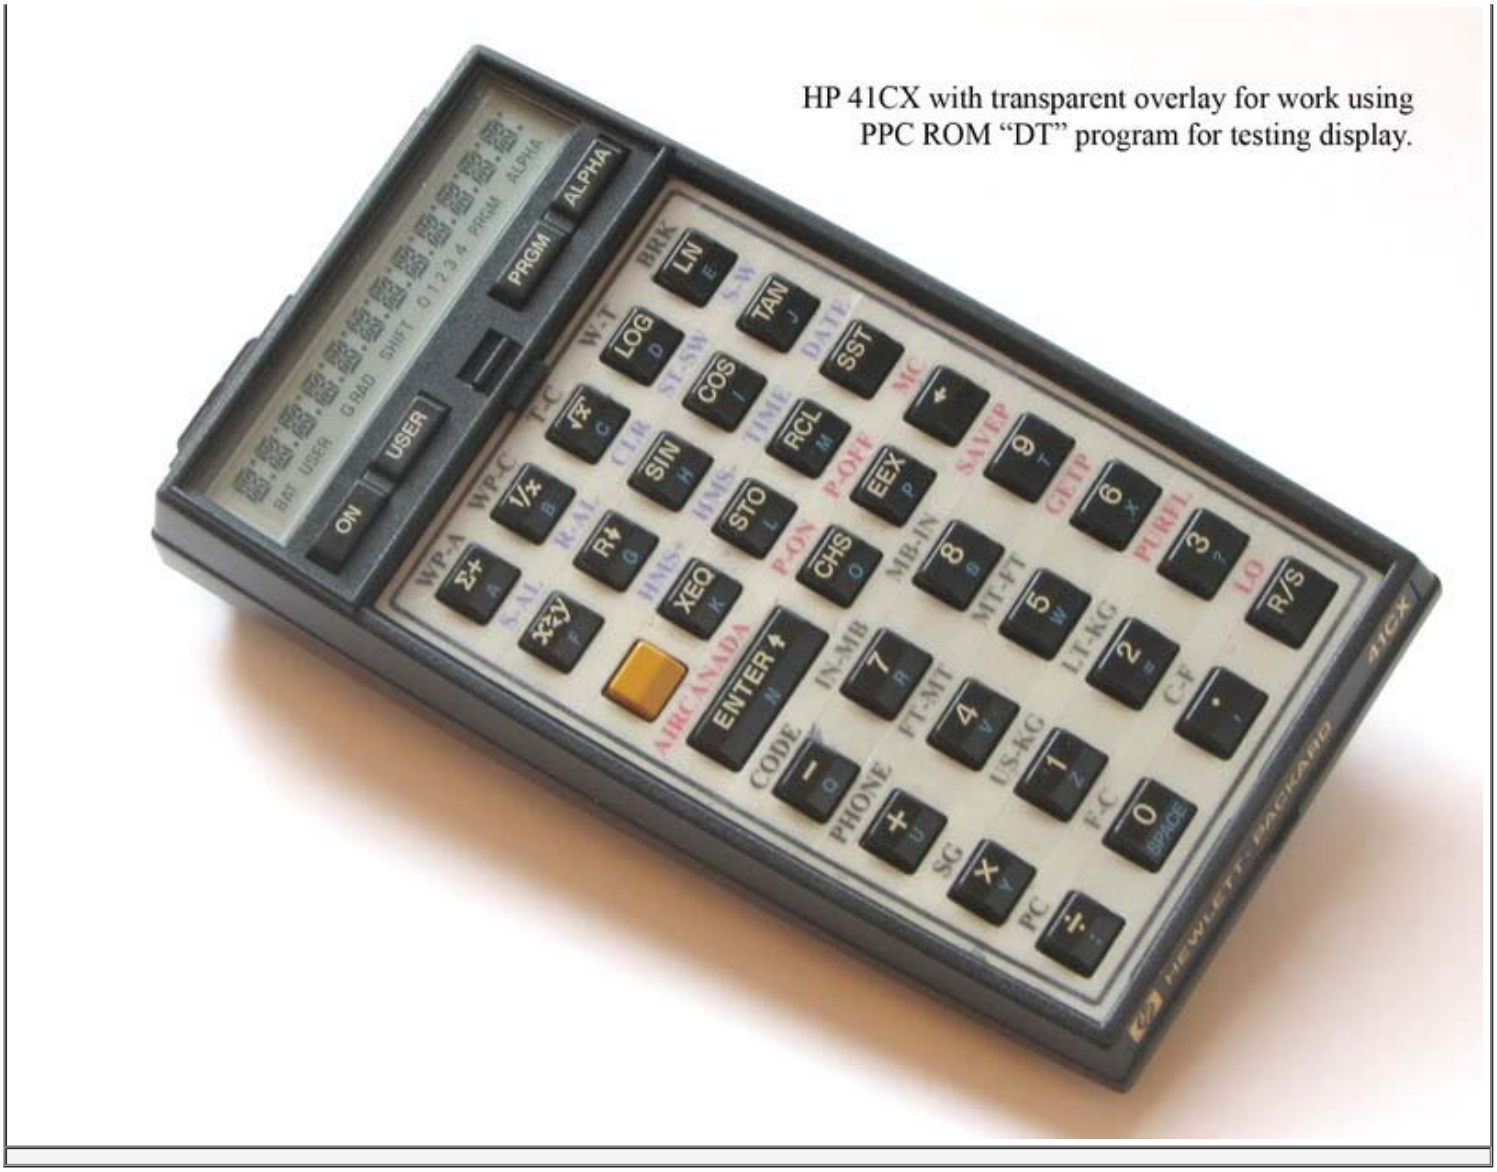
Sean;

do you have a laser printer or ink jet, not that it matters, The product you are looking for is an adhesive back **clear** printable sheet for your printer.

Take a plane sheet of paper and work out your labels using the correct font. Create your overlay using font sizes and spacing that will match the keyboard correctly.

Then, once you are happy with the outcome, print off a the overlay on the adhesive clear sheet. Slice the sheet in horizontal rows, of the correct thickness and place over your blank overlay.

It should look like this:



Re: Yes,
*Message #4 Posted by **David Hayden** on 22 Apr 2009, 8:49 p.m.,*
in response to message #3 by Geoff Quickfall

I think Sean doesn't have a blank overlay. I believe he's starting from scratch.

I've also been thinking about the computer controlled craft-cutter idea. Combined with an adhesive backed material, one could create overlays pretty easily I imagine.

Dave

Re: Yes,
*Message #5 Posted by **Tim Wessman** on 22 Apr 2009, 10:23 p.m.,*
in response to message #4 by David Hayden

The best ways to make overlays is to laser cut them. There are usually plenty of places you can find around that will take a pdf or dxf and run whatever material you like through a laser CNC mill at a very cheap price. They usually charge a setup fee (which you can often get them to waive with a little sweet talking) and then time on the machine. For a bit of plastic or paper, it is really quick.

If you can't get a lasercutter, the next best is a little die press that has formed edges to cut it. You just can't do small radii.

TW

Re: Yes,
*Message #6 Posted by **PeterP** on 22 Apr 2009, 11:45 p.m.,*
in response to message #5 by Tim Wessman

Tim, any tips on some companies that do laser cutting via CNC, either online or in the NYC area?

Cheers

Peter

Re: Yes,
*Message #7 Posted by **Tim Wessman** on 23 Apr 2009, 1:31 a.m.,*

Well let's qualify that a little. I used the same process for a machine shop to make my Stainless Steel HP 41c Overlays. I paid a machinist to make a precision DXF file for this project.

The Stainless Steel material was expensive, and the 41c overlay is a complicated piece with three dozen cuts per item. This equates to some considerable cut time.

If you want some stainless steel ones to write on, let me know (I use them this way- it's nice) , but I encourage you not to spend time and money on a large production run like I did.

Re: Yes,
*Message #9 Posted by **Tim Wessman** on 23 Apr 2009, 1:33 a.m.,*
in response to message #8 by Allen

Wow! I was talking 'material' as being paper, mylar, or something similar that could be run through a regualar printer. Never considered someone would want something more durable. :-)

TW

Re: Yes,
*Message #10 Posted by **Sean Connor** on 23 Apr 2009, 3:34 a.m.,*
in response to message #9 by Tim Wessman

Gentlemen,

Thanks for the ideas. I like the idea of cutting a few using a Laser CNC or the craft cutter . I'll have to

look around on the internet to see if anybody offers this service in the UK.

Allen I think SS is maybe a bit too rigid/heavy for carrying around in the 41's case but thanks for the kind offer.

I still have to figure out how to trace/draw/digitise the outline though.

Best Regards

Sean

Hand-Cut 41 Overlays in 1980

*Message #11 Posted by **Jake Schwartz** on 23 Apr 2009, 7:38 a.m.,*
in response to message #10 by Sean Connor

Hi,

As a historical note, back in 1980, I hand-traced an overlay and used that to have a rubber stamp made. One mod to that shape prior to the making the stamp was having it symmetrical on the ENTER-key row for "reversability". Then it became a straightforward (albeit work-intensive) process to stamp the shape onto index cards and cut them out with an Exacto knife against a 6-inch metal ruler. They were sold through the PPC Journal at 5 for a buck and I ended up making 2000 before the demand dropped off. Based on the time it took to make them, it was slave wages, but a few pen pals were made along the way. Check PPC Journal V7N4P4 under "Club Projects".

Jake

Re: Yes,

*Message #12 Posted by **Dave Shaffer (Arizona)** on 23 Apr 2009, 10:55 a.m.,*

You ought to ba able to scan your calculator with a flat bed scanner, or take a digital camera picture, to get started. (If you'd like me to do either, or both, of those and send you a jpg or pdf or post it/them here, just ask.) If somebody could do this with an existing template, that would be even better.

Re: Yes,

*Message #13 Posted by **Sean Connor** on 23 Apr 2009, 11:13 a.m.,*
in response to message #12 by Dave Shaffer (Arizona)

Dave,

Thanks for the offer. I think however that we are up and running. A fellow 41 enthusiast at work thinks that he has the Math overlays at home

The HHC2009 HP Conference Web Site Is Open

*Message #1 Posted by **Jake Schwartz** on 21 Apr 2009, 11:26 a.m.*

Hi,

Just FYI, the HHC2009 HP Handhelds Conference Website has gone active, with a few items remaining under construction. Start at http://holyjoe.net/hhc and click on the top link. We are able to hold this conference at the HP facility at Vancouver, Washington (just north of Portland, OR), which saves tons of money and simplifies logistics quite a bit. Thanks go out to Sam Kim of the HP calculator group for his arranging this so we can be at HP for the third consecutive year (after San Diego in '07 and Corvallis in '08). Make sure you leave Saturday and Sunday, October 3-4 open for our annual "geekfest".

Jake Schwartz

HP 41 post repairs, yeah been done before but this is simple and it works.....;-)

*Message #1 Posted by **Geoff Quickfall** on 20 Apr 2009, 2:19 p.m.*

I saw Nigel Bamber's posting earlier and coincidentally was in the process of repairing a CV myself.

Mine came with the x functions, x memory and a time chip with a really worn keyboard. I mean REALLY worn. Well thanks to Wlodek in England I secured a new looking keyboard with two cracked posts.

Heres how I went about the repair:

Firstly, I preassembled the new keyboard to the rest of the CV and had to use some finger pressure to ensure contact as two of the posts were cracked. I determined the 'on' rocker key was not working as well as the E+ and 1/X keys.

I removed and soaked the keyboard in a solution of liquid detergent and warm water. The keyboard was placed vertically with the LCD above the level of the water. I rinsed the keyboard with water, dilute vinegar, water and then 99% alcohol. The keyboard was placed in a drying box with the dryer set for ambient air temperature.

The calculator was again assembled and the keyboard tested perfectly for all key punches and rocker arm switch function.

Now to the posts:

Tools required:

```
1.  liquid plastic cement and brush.
2.  old piece of soft plastic (ex. memory module housing).
3.  exacto knife.
4.  silicon tubing or small o-rings (inner diameter smaller then
    outer diameter of post).

silicon tubing:  ID   2.55 mm
                 OD   5.60 mm
                 Fuel line hose for model aircraft.  Specify
                 military specs as the hole is dead centre and
                 therefore usable for pinch roller
o-rings          ID   2.55  mm
                 OD   6.50  mm
                 Hardware store.
```

In figure 1, you can see the reverse side of the keyboard. The two posts on the right are cracked in two places, almost opposite of each other.

FIGURE 1

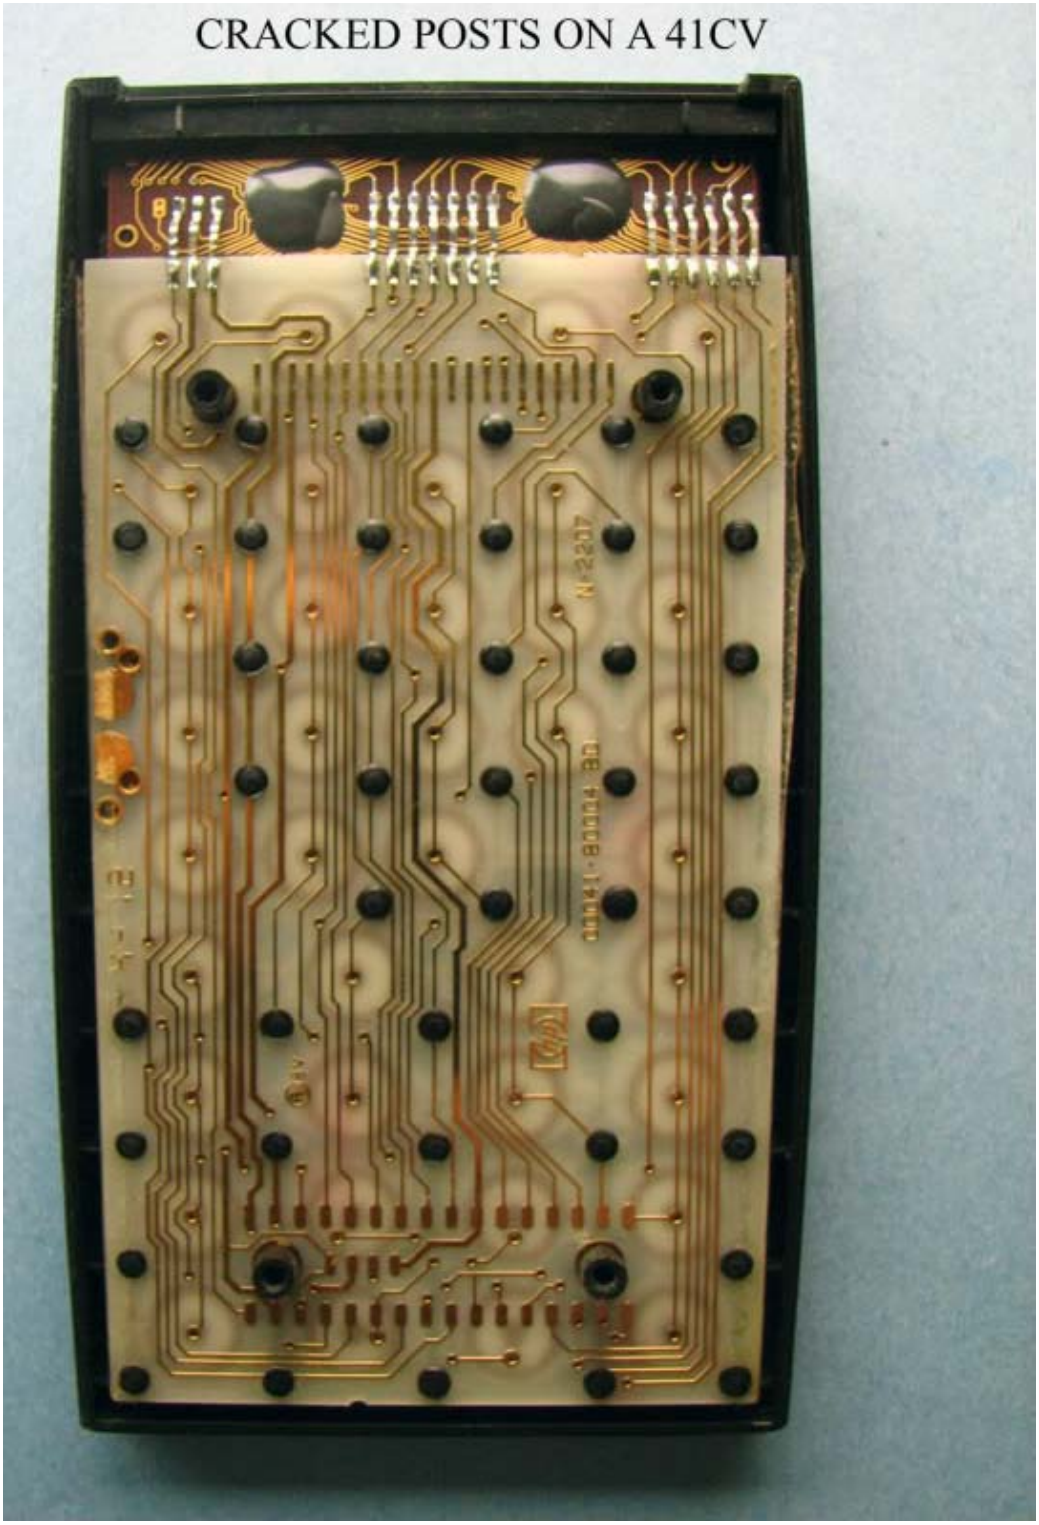

Figure 2 is a close-up of a typical cracked post, usually in two places nearly opposite to each other. The correct procedure for screwing an HP screw back into it's socket is to place the screw in the hole. Then reverse the screw motion, that is unscrew the loose screw until you feel it click. Then screw gently in the correct direction for tightening. By doing this you set the threads of the screw in synch with the threads of the post thereby not cross threading.

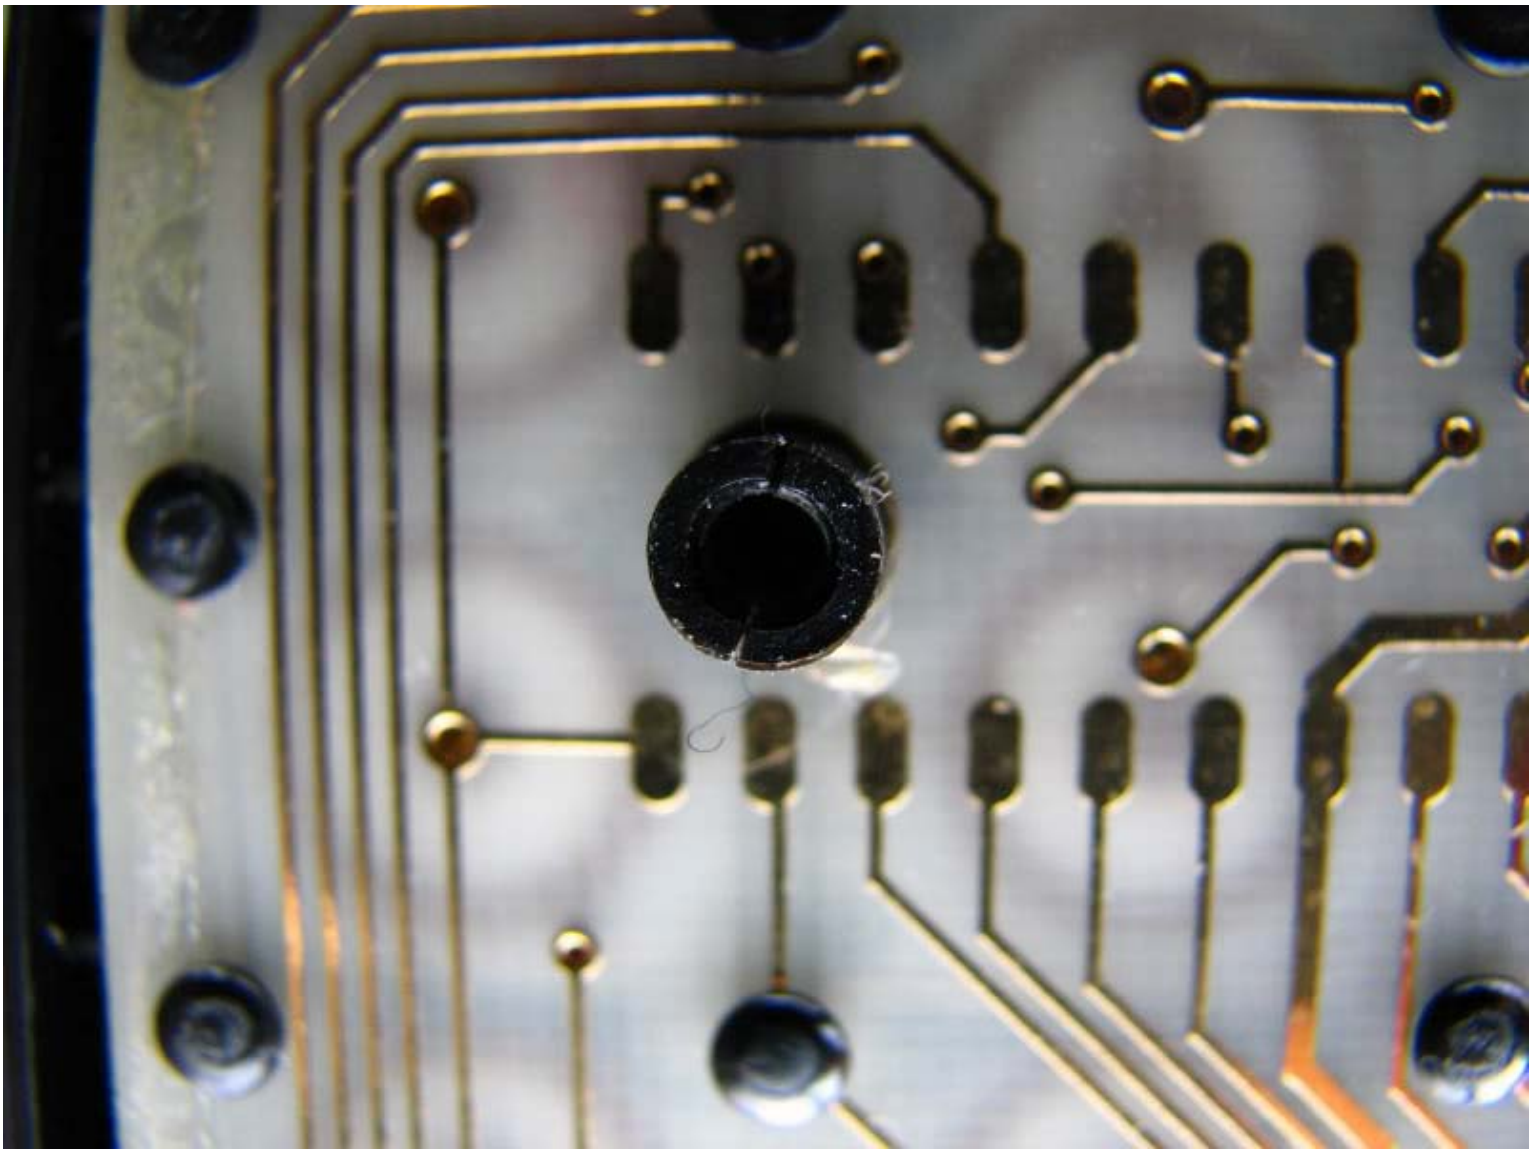
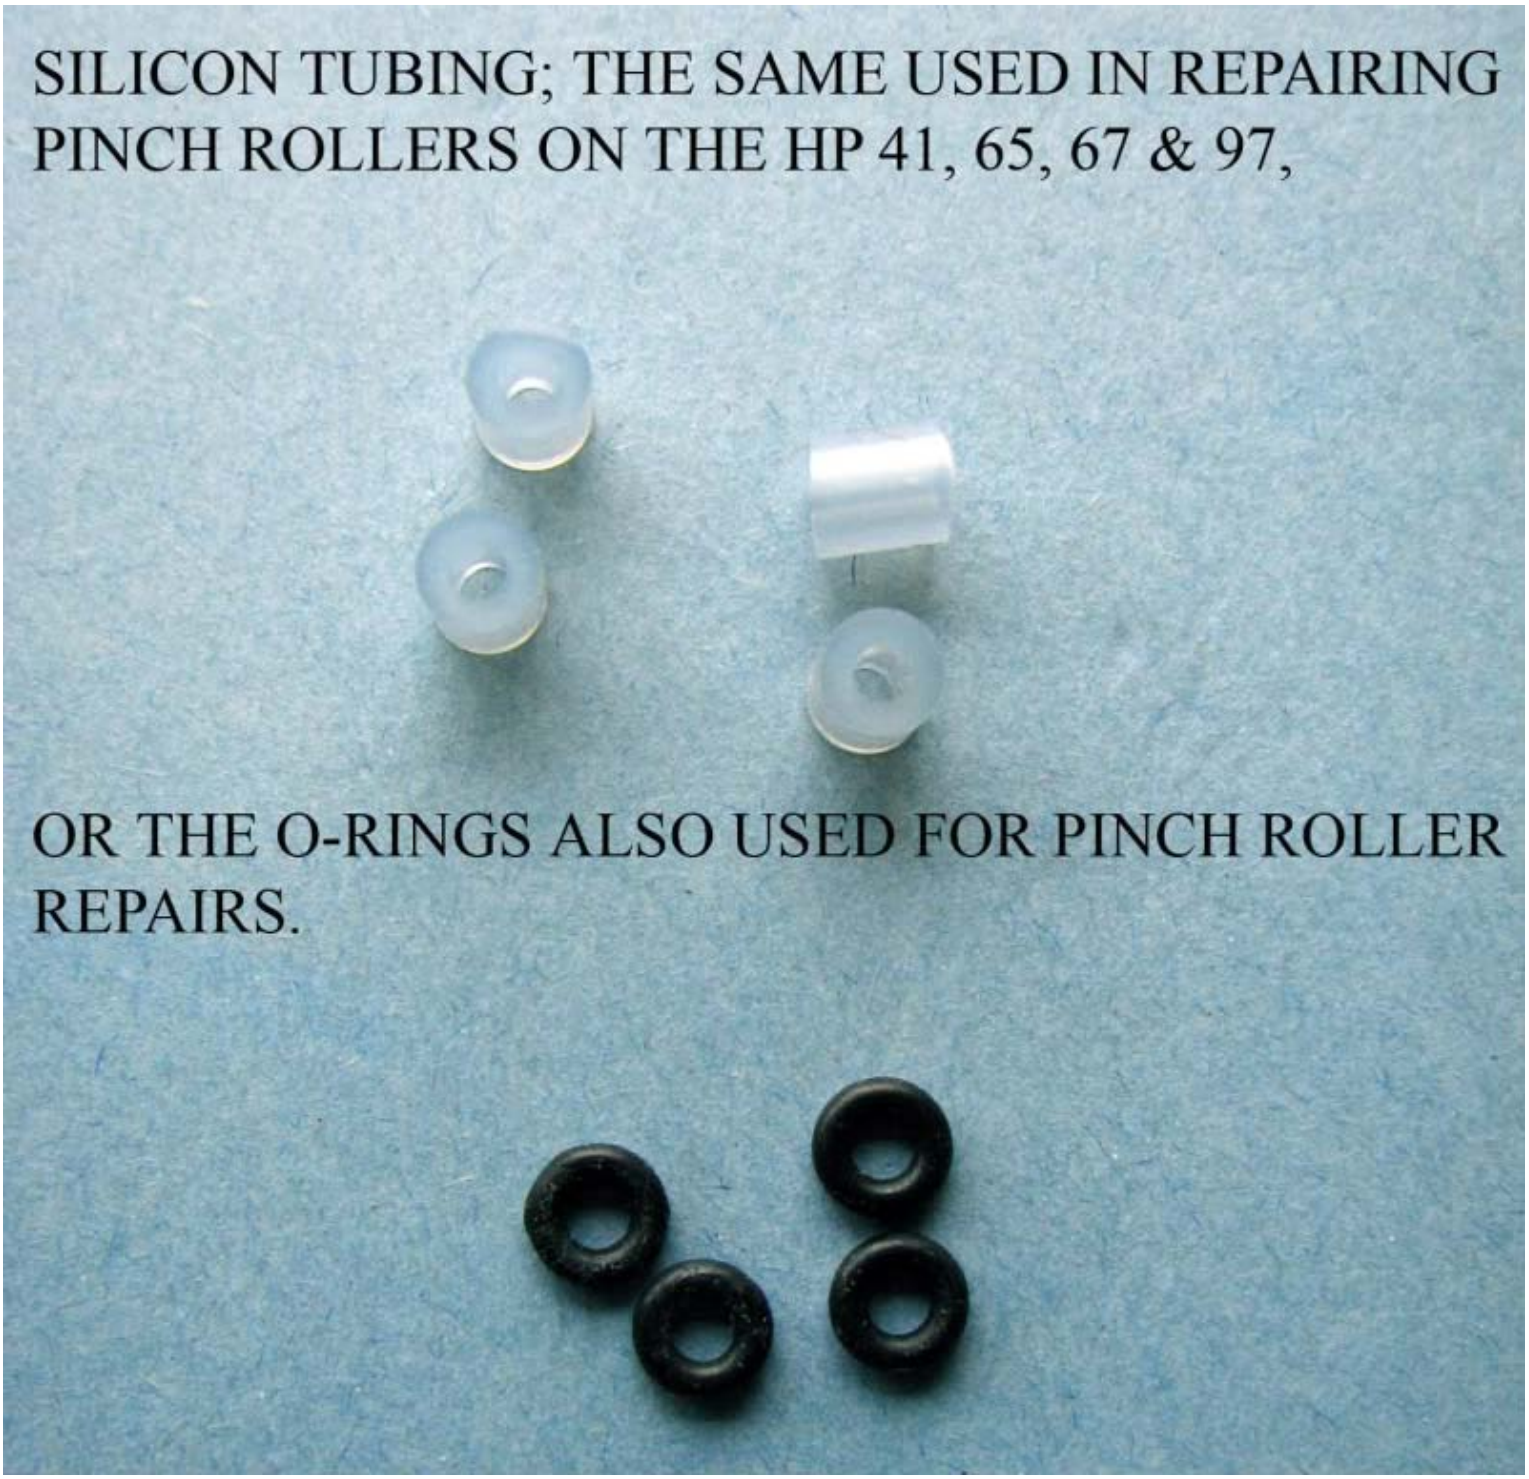
FIGURE 2



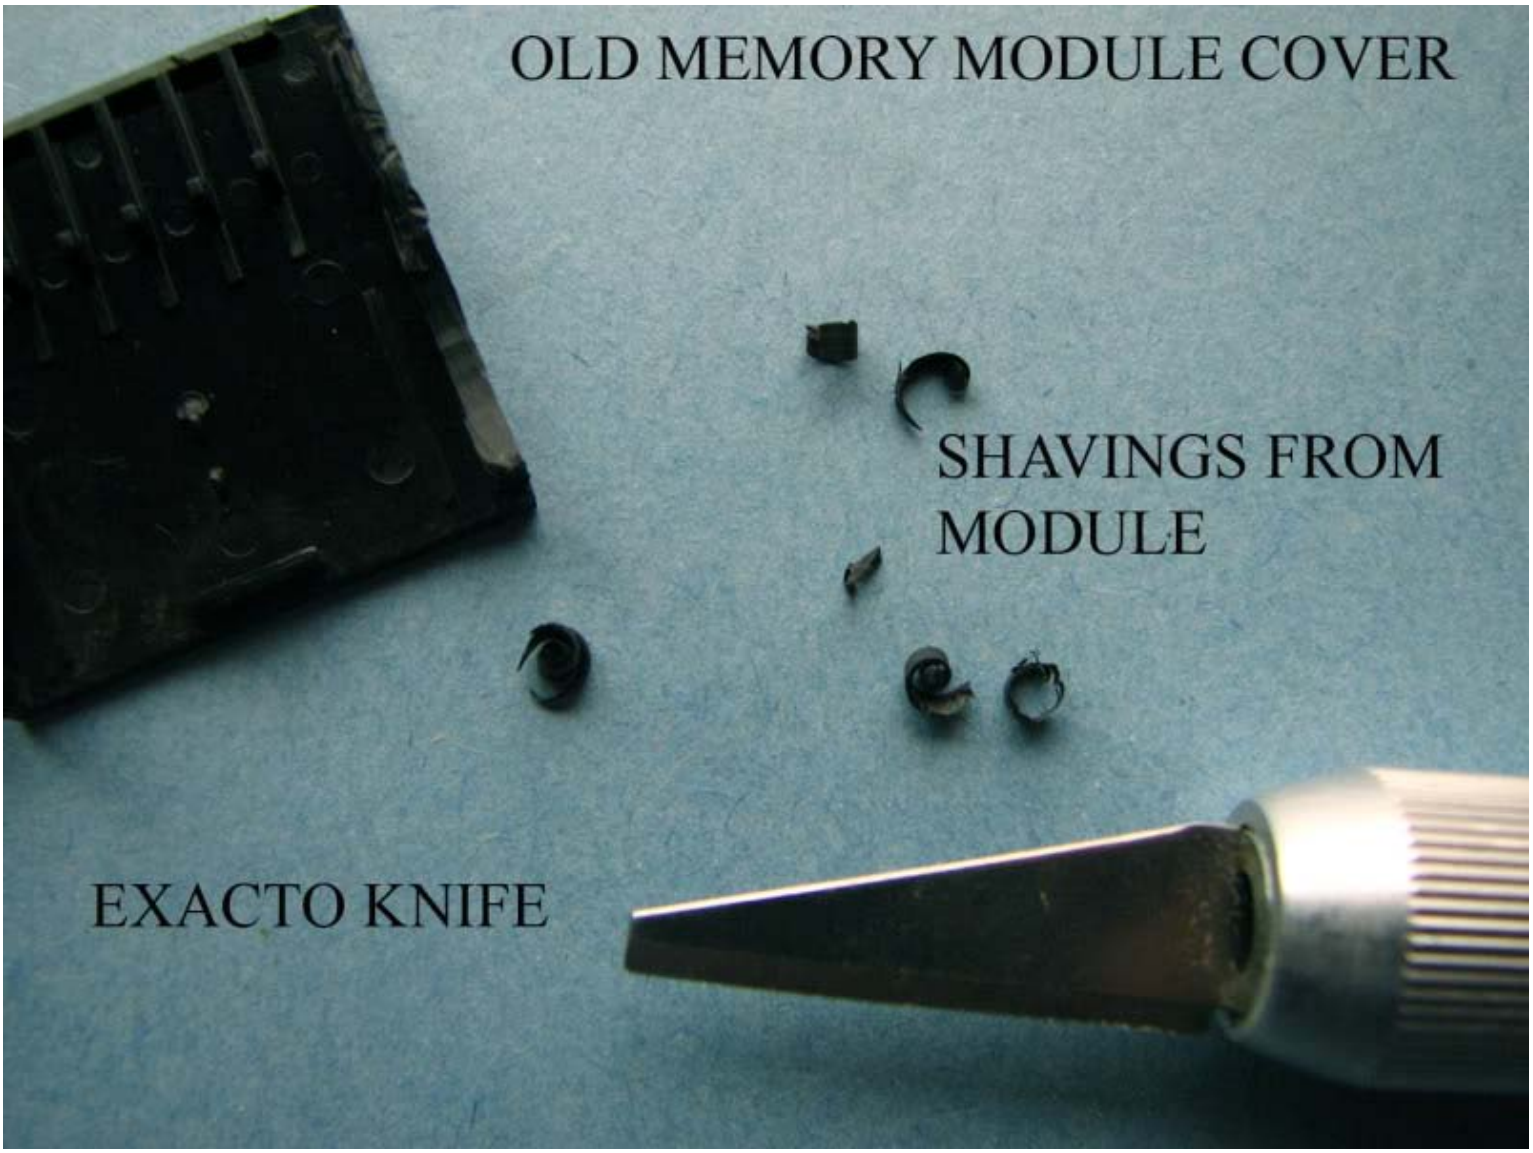
Once the cracked posts have been identified (or stripped posts as this routine works for these) a clamping system must be formulated. I used silicon tubing, the spare tube I have for fixing pinch rollers in HP card readers. Conversly the o-rings for the same purpose, suffice to say that the tube must have an inner diameter smaller then the outer diameter of the post (Figure 3).

FIGURE 3



Since the cracks are to be repaired we can assume that the internal threads of the posts are either stripped or damaged. Every time the screw enters and is removed it grates away at the internal threads of the post removing material and leading to a stripped post. I remedied this by securing a soft plastic material in the form of memory module housing. Shave off some of the plastic using an exacto knife. When the shavings flake off some of them form a perfect circle. I inserted these into the posts along with some straight flakes. This is done before the glue is applied. (figure 4)

FIGURE 4



Here you can see a series of photos where the cracks have been clamped together by the silicon tubing or the o-rings. Once these posts are clamped, add the shavings into the post.

FIGURE 5

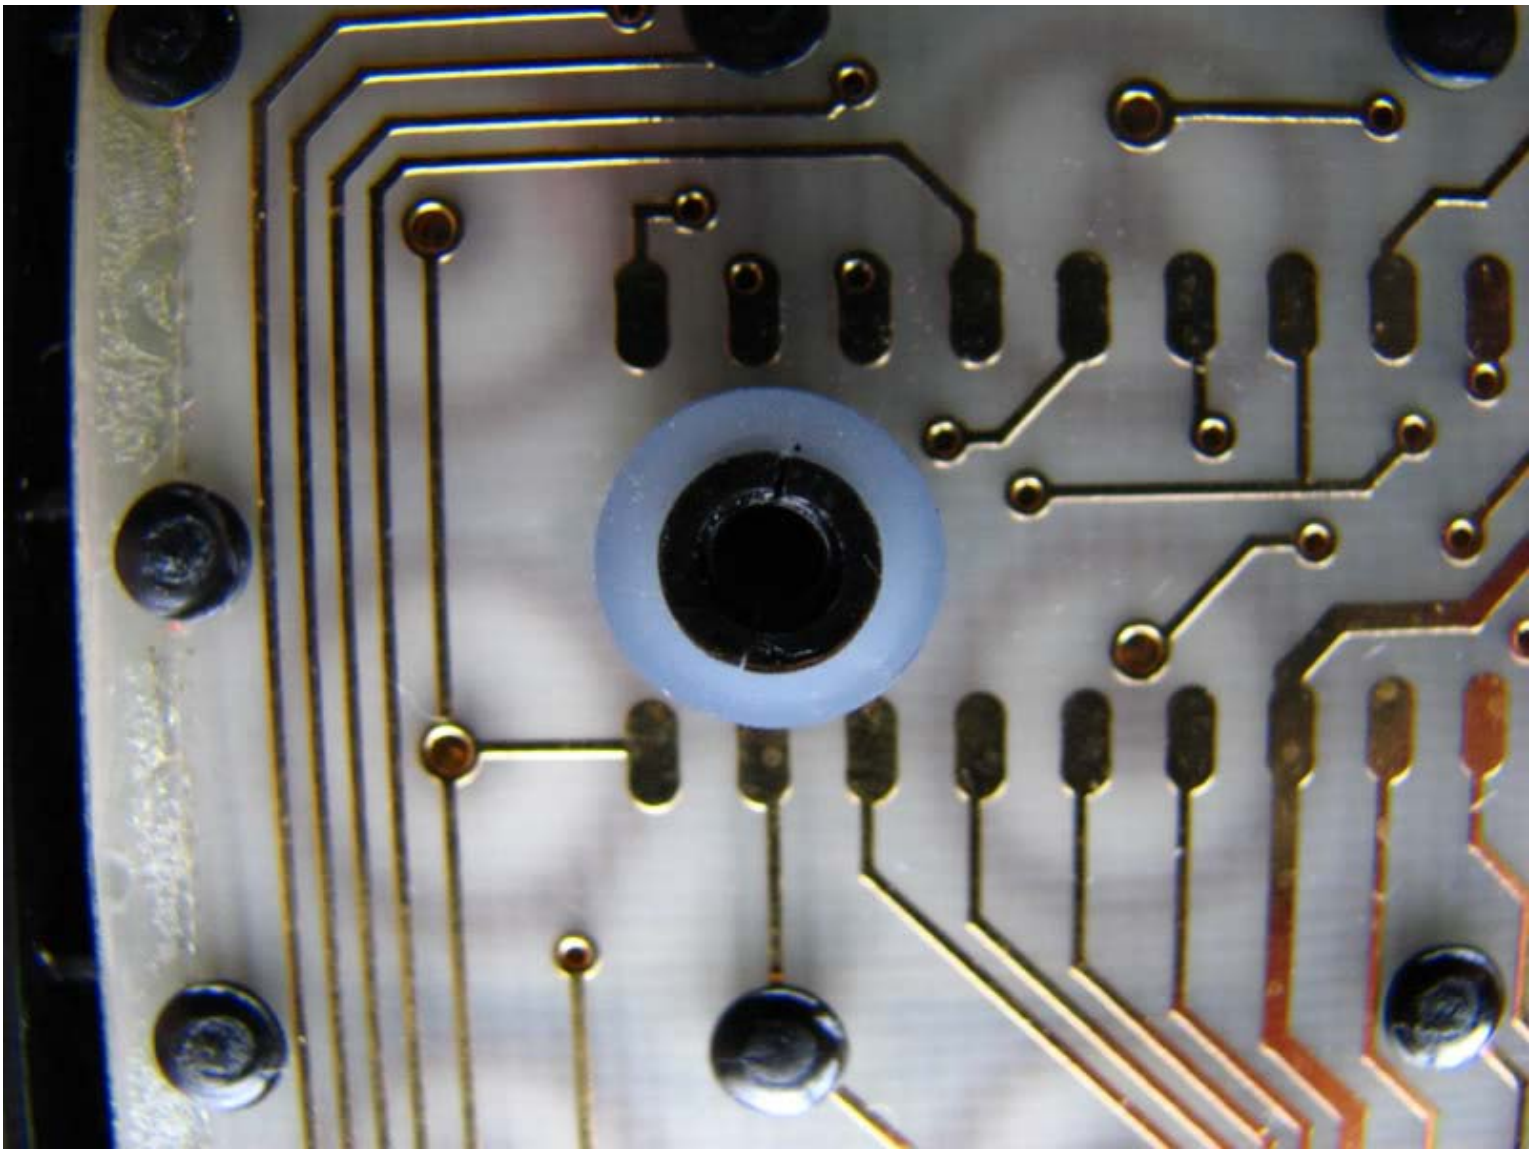


FIGURE 6

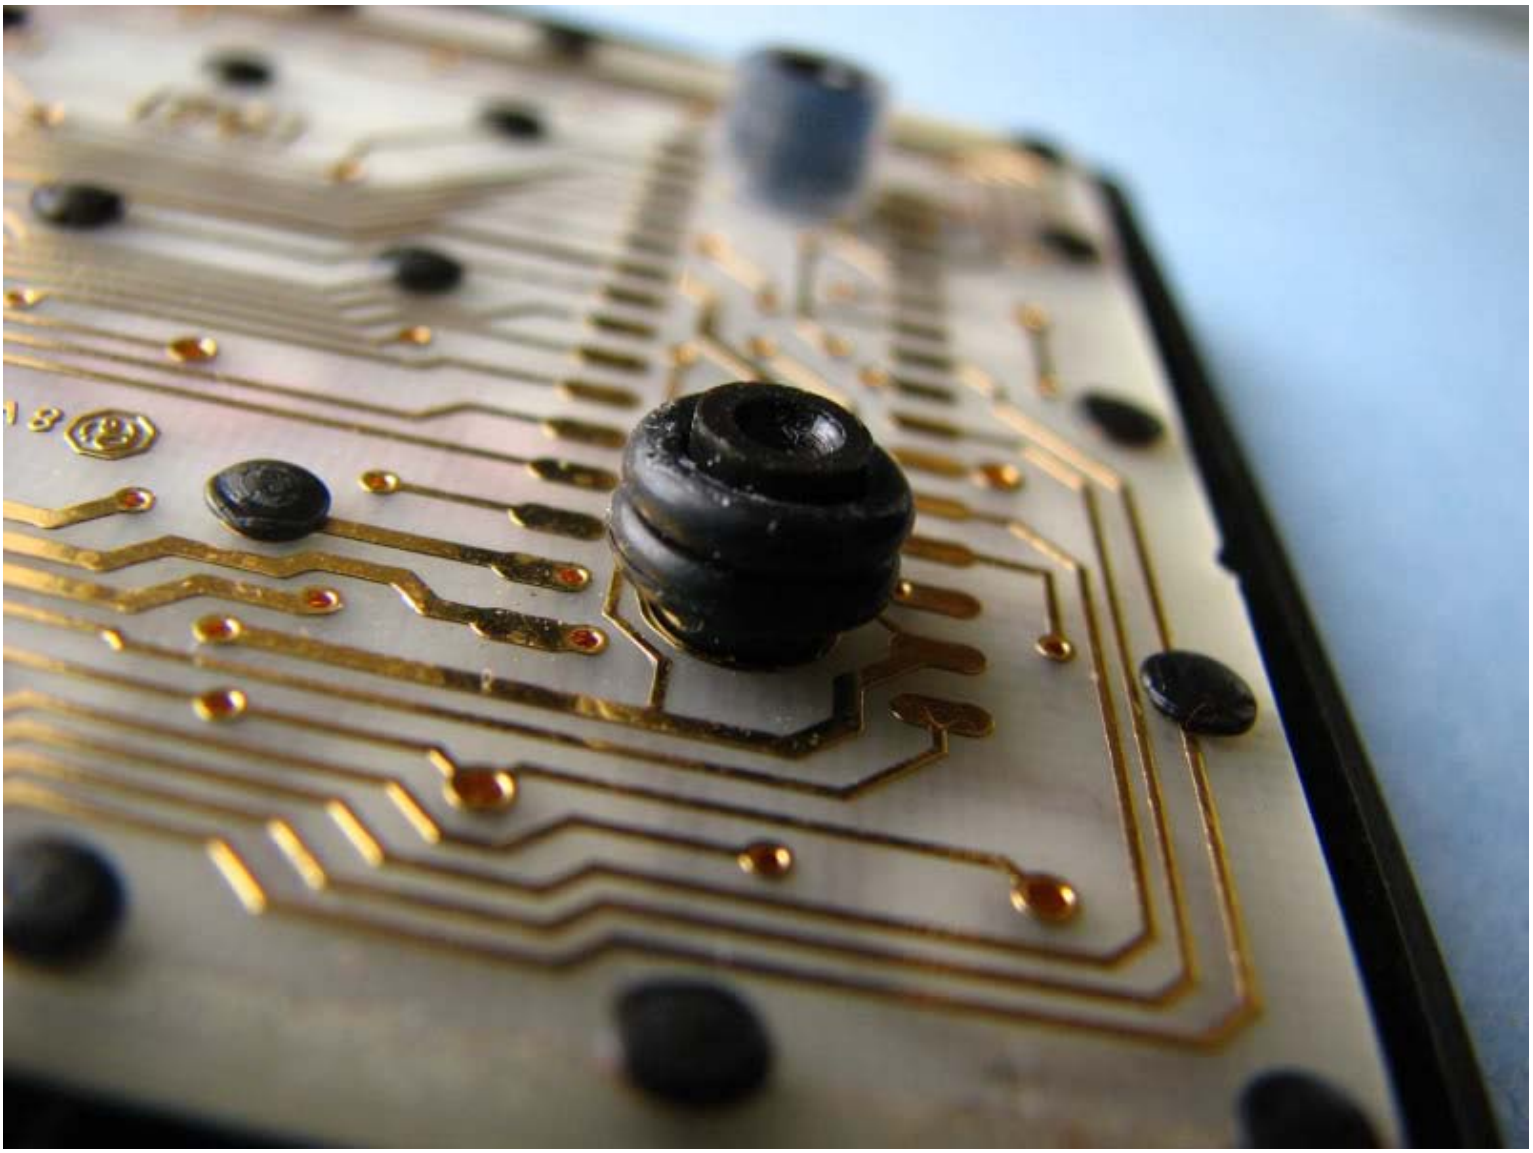

FIGURE 7

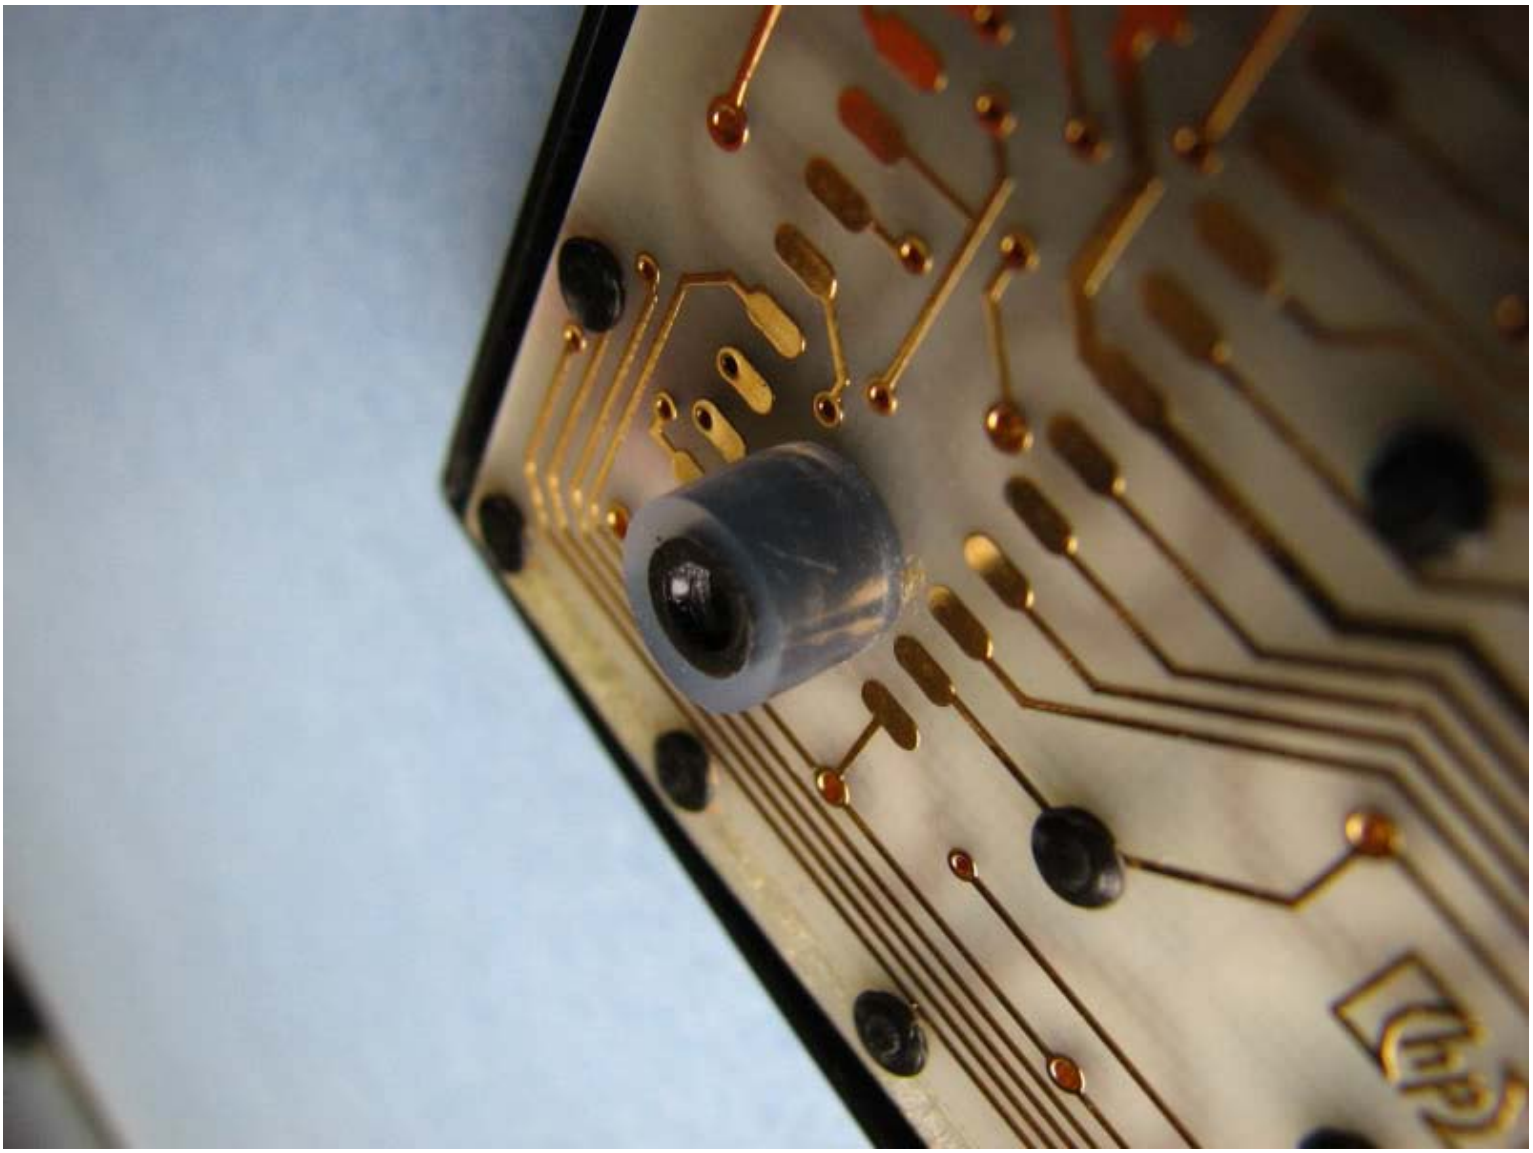

Using the liquid plastic cement, add a good dollop (a drop) to the inside of the clamped post with shavings added. The glue will seep into the cracks and soften the shavings. It will also bond the shavings to the posts, especially the cylindrical shavings added before hand. The clamps will insure the posts cracks have the requisite pressure exerted for glueing purposes.

FIGURE 8

Now let the post dry. I left it for a day; you certainly don't want to rush things.

As a last step I screwed the screws into the posts gently starting them as I outlined earlier. I also did this with the silicon clamps in place and the back of the case not attached. Do not screw all the way down but just start them until they bite. Since the back of the case is not in position the screws will be too long for the posts and you can damage the keyboard!

Now remove the clamps (silicon or o-rings) and replace the back. Using the screw technique mentioned above, tighten up the case.

It's that easy ;-)

Geoff,

Please post this as an article, including the pictures. This is a fantastic description! I have tried similar things with using a wire or sewing thread wrapped around the post, but the tubing is an excellent idea. Would you mind telling us what is the exact tubing dimensions to use and where one can obtain it?

Also love your idea of shaving plastic off. I have a liquid plastic glue that came with plastic powder that I poor into the posts, then the glue which melts it. However as the pulver fills up the post rather than attach to the sides, I normally have to screw the screw in while the glue+pulver is liquid and then let it dry that way with the screw in. Certainly not ideal.

Anyway, please post it as an article!

Cheers

peter

OT: Calling all front panel calculator designers...

*Message #1 Posted by **DaveJ** on 19 Apr 2009, 7:05 p.m.*

The design for the uWatch2 is hotting up, and I'm likely going to need some help with the front panel membrane keypad design.

I know there are plenty of excellent conceptual calc designers on this forum, so who wants to show off their skills and design the front panel for the new uWatch?

A free watch and eternal fame is on offer to the winning designer(s) (assuming it all comes together and works of course)

Here is an initial key layout sketch:

22 keys with 6mm row spacing. I figure anything smaller would be impractical.
The case and front panel are 50mm x 35mm (with rounded edges), and the LCD window is in the position specified, and this can't really change.

I'm going to need:
1) actual real-size graphics in the desired colours (there is probably a colour limit (i.e. 2 or 3 colours). Key graphic can be any shape you like really, but it will have circular embossing for the dome key.

2) A suggested keypad layout. The current layout could change a bit in key placement, but I think it's probably optimum already.

NOTE1: there may be some side navigation buttons, but I don't think these need to be marked on the front panel.

NOTE2: Bare in mind the uWatch2 is going to be "application centric" so that means users will be able to download apps to the calculator and call them up as needed, so there needs to be main "app" or "mode" button that does this. Perhaps this could be a side button.

NOTE3: The keypad needs to be algebraic/RPN neutral, so kind of like the current uWatch with its ENTER/= and brackets buttons. No BIG ENTER button on the bottom rows, sorry, we can't afford to waste a key there. But perhaps double width buttons beside the LCD?

NOTE4: This is not just an RPN calc, so don't get carried away, the regular punter will want to use it too for all sorts of things.

NOTE5: Some logo above the screen is probably in order, I'm just thinking maybe a simple "µ2" or something like that.

Any help appreciated!
Thanks
Dave.

Re: OT: Calling all front panel calculator designers...

*Message #3 Posted by **Jonathan Purvis (New Zealand)** on 19 Apr 2009, 10:30 p.m.,*
in response to message #1 by DaveJ

I'm no designer, but i think it should be something like this:

```
  EEX |           | HOME
  +/- |           | UP
   .  |___________| ENTER/=
 0 <-  #  #  #  #  -> 9
 1  2  3  4  5  6  7  8
```

Where # is a key for a softmenu, <- and -> are arrow for scrolling the menu left or right a page, UP goes up a directory and HOME takes you to the root menu. So make the entire thing menu based, even the arithmetic functions. I realise that i haven't included backspace/delete key, but there aren't enough keys.

Re: OT: Calling all front panel calculator designers...

*Message #4 Posted by **DaveJ** on 19 Apr 2009, 11:12 p.m.,*
in response to message #3 by Jonathan Purvis (New Zealand)

I don't mind that actually. But you are dedicating 4 menu keys to function buttons which isn't really necessary when you can just press a MENU button and have the keys mappings change, like how it works on the current uWatch. That's a more efficient approach for limited key systems I think.

The left and right scroll buttons can probably go on the side of the watch.

Dave.

Re: OT: Calling all front panel calculator designers...

*Message #5 Posted by **Paul Dale** on 19 Apr 2009, 10:44 p.m.,*
in response to message #1 by DaveJ

I'm not really any good at this, but here is something losley based on the 4-banger we discussed a while back.

```
SHIFT |           | MODE
  x-y |           | ?
  EEX |___________| ENTER/=
+/- 5  6  7  8  9  /  *
 .  0  1  2  3  4  -  +
```

And shifted:

```
  INV |           | MENU
   Rv |           | ?
   ?  |___________| undo
STO .  .  .  .  . 1/x y^x
RCL .  .  .  .  .  .   .
```

Where the numeric keys 0 - 9 and - & + are:

```
        SIN  COS  TAN  LN   LOG
         !   sqrt R->P H.MS  Q   DEG D->R
```

INV inverts the operation of the subsequent (shifted) key stroke. For the numerics, - & + these are:

```
        ASIN  ACOS  ATAN  e^x  10^x
         ?    x^2   P->R ->HR  Q^-1 RAD R->D
```

The others are y^1/x and R^.

The MENU is there for extra functions hidden away. There are two '?' in the shifted positions that I can think of nothing overly useful. I guess one could be PI or a constants menu.

- Pauli

Re: OT: Calling all front panel calculator designers...

*Message #6 Posted by **DaveJ** on 19 Apr 2009, 11:09 p.m.,*
in response to message #5 by Paul Dale

Thanks Pauli.
Only problem with SHIFT functions is you limit the number of functions you can have on the keys, and the front panel display looks really "busy" with all the info. So menu options for all functions is the best approach I think.

Remember, this isn't just a scientific calc.

Dave.

*Message #7 Posted by **Maximilian Hohmann** on 20 Apr 2009, 3:15 a.m.,*
in response to message #1 by DaveJ

Good morning!

Great concept so far. I'm afraid I am no kepad designer, but I would prefer the six buttons beside the display to be double width (as you suggest in note 3) and unmarked. Application dependent softkeys (your display provides enough pixels for that!) would be the main and only reason for me to buy such a device!

Like in this example here (sorry, not my photo):

And another thing to attract the fans of "glow in the dark" products (like myself :-)): If there is enough space above and/or below the LCD for little glass tubes about 20mm long and 2mm diameter, then permanent lighting with GTLS light sources might be an option (http://en.wikipedia.org/wiki/GTLS). I bought one of these "Traser" watches recentely and this is just so cool. Nearly as cool as LEDs...

Greetings, Max

That could be possible, but then you'd have to have them displayed on the screen permanently for it to be user friendly enough, losing a fair chunk of your 128 pixels. They could of course only pop up when you press a menu key, but you'd have to otherwise memorise them.

BTW, just so it's clear, any "double width" keys are only double width in graphical appearance on the silkscreen, the actual keypad dome is circular in either the center or off to one side.

> Will the white LED LCD backlight be enough to keep you amused?
> I can add a tilt sensor so it turns on automatically when you tilt your wrist :->

The tilt sensor is an excellent idea: Not just to turn on the backlighting, but also for displaying the softkey labels for a couple of seconds without needing to press a menu-key.

Regarding the backlighting: I spend quite a number of nights at hotel rooms every month. Having a luminous watch (with alarm!) beside the bed can really be useful sometimes. If I need to press a button or shake the watch to turn the backlight on, I can switch on the room light as well.

Greetings, Max

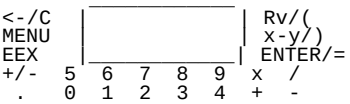
*Message #11 Posted by **Walter B** on 20 Apr 2009, 6:42 a.m.,*
in response to message #1 by DaveJ

If you want to have it RPN/ALG neutral, you'll need primary parentheses. A first shot front panel may look like this:



MODE will be just another menu. By MENU 0 through 9 and .0 through .9 we can reach up to 20 menus. With a menu displayed, keys 6 through 9 will turn into soft keys, and Rv will display the next level of this menu, and C will return to the previous level or exit the top level.

Without a menu displayed, Rv will roll down in RPN or open a parenthesis in ALG, <- will delete as usual, and pressing <- twice will act like C.

Walter

> Do you think there's enough space on the front panel to print two items per key? ie 2nd functions?

Most likely. The entire front panel is 50mm x 35mm, so it's easy to do mock-up's of a layout actual size and find out.

But like I've said, you have to have a menu system anyway, so might as well put everything in the menu and keep the layout visually clean and simple. The more I think about the more I like Max's idea of keeping the side keys as soft only-keys, from a visual simplicity point of view. But you have to figure out how the work that on the screen without taking up too much space or being annoying.

Dave.

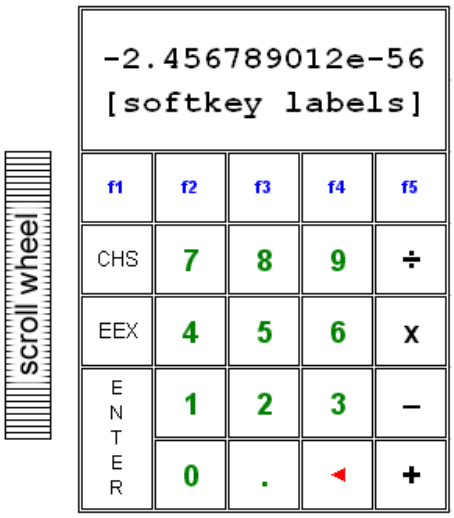
*Message #14 Posted by **robert rozee** on 20 Apr 2009, 10:11 a.m.,*
in response to message #1 by DaveJ

hi, i'm going to suggest something completely different:

keep a conventional key layout, with a row of function keys that have a dedicated line on the display. the function keys would then flip though a series of options as a scroll wheel located on the side of the calculator/watch/thingy was turned.



btw, i don't wear a watch... so i'm much more inclined towards a mini-calculator :-)

Re: OT: Calling all front panel calculator designers...

*Message #15 Posted by **DaveJ** on 20 Apr 2009, 6:39 p.m.,*
in response to message #14 by robert rozee

That would not be physically possible with a watch design of course, only a "mini calculator" as you say. That's not on the cards at the moment though, sorry!

Dave.

Re: OT: Calling all front panel calculator designers...

*Message #16 Posted by **Nigel J Dowrick** on 20 Apr 2009, 12:47 p.m.,*
in response to message #1 by DaveJ

How about using the numeric keys themselves as menu keys? Pressing and releasing a number enters it in the usual way. But holding it down and then pressing another number key without releasing the first performs some function. A list of what those functions would be could pop up automatically on the screen after the first key had been held down for a short time.

It might be hard to hold down two adjacent keys at once given the pitch of the keyboard. A slight variation would be to not require the first key to be held down for more than about 0.5s, time enough for the keymap to pop up. It could then be released and the second key pressed.

I can see two advantages for this: (i) it would allow the MENU key to be omitted; (ii) there'd be no need to press MENU repeatedly to reach a particular function. The disadvantage would be that you'd have to learn where your favourite functions are!

Just a thought, anyway.

Nigel

P.S. I love the V1 uWatch!

Some Nokia phones had a menu system where every page was selected through a sequence of numerics and the value was displayed in the top right corner of the display. Thus, once you knew where the menu was, you could reference it by its index more quickly than manually selecting each level from the tree. Maybe you could use this idea if the menus become very deep ?

The latest uWatch beta firmware kind of works like that, you can "hot key" to various commands in deep nested menus.

Dave.

*Message #19 Posted by **Jeff O.** on 20 Apr 2009, 12:52 p.m.,*
in response to message #1 by DaveJ

Here's a variation on the similar themes, but with a nifty graphical illustration ;-) :

This assumes that the MENU and MODE buttons would be on the sides. Also suggests that the menu functions would be accessed with the keys on the sides of the display. Looks like there will be plenty of room in the display for more than six function labels, so I propose that F2, F4, F7 and F9 would be accessed by pressing two keys at once, which may or may not be a good idea. I toyed with the idea of putting a bunch of menu labels under the second row, such that to get a menu you would press the menu key, then one of those keys instead of having to press the menu key as many times as it takes to get to the one you want.

Good luck, I can't wait to see the hardware!

so, what are the chances of a third button row and an alpha key to access letter code. that's 24 below plus the two lowest side buttons to make 26. maybe some punctuation on the other side buttons?

Re: OT: Calling all front panel calculator designers...

A third row is physically possible, but the key spacing would be almost unusable. People already complain about the 8mm x 5mm key spacing on the current uWatch. So I settled on an arbitrary 6mm spacing for this one as the keys will be raised in a dome that should make it easier to press without hitting others.

No point making a fantastically small keyboard with lots of keys if no one can actually use it.

There is room for 6 more buttons, two rows of 3 on either side of the screen, but I thought that would look "a bit much" and not as visually appealing as the current layout with the key centered half way between the bottom row keys.

I can't see a huge need for alpha keys, as inputting large amounts of text would be pretty horrible any way you do it. But an alpha button on the side would be possible. Even with the current number of key would could double up on letters, pressing the alpha key twice.

Perhaps we should just cram an extra 6 keys on there while maintaining the 6mm spacing, sacrificing visual appeal for functionality? Comments?

Dave.

I don't think the dual key system will work, as people already complain the keys are already cramped with a single finger. Simpler to have F1-F6 on the sides, and F7-F10 on the 4 keys below the display I think. Not that there is any real need to print the function numbers beside the keys, as the LCD soft button text will make it obvious these are soft keys.

Oh, and I'd swap the +-*/ divide keys to the more familiar

* /
+ -

> Quote:
>
> Good luck, I can't wait to see the hardware!

I should get the LCD's and case tomorrow, and I'll hopefully have a circuit soon once I figure out what processor it's going to have, and a few other key component choices. And then comes the PCB which will give us some real hardware to play with and stick in the box.

I have to talk to a membrane keypad place to see what's possible, that's a pretty crucial step. At present I don't know if they can do the key spacing, what they can offer for a display window (cutout or clear window), colours etc.

I already have a 3D model spinning on my screen , but doesn't help much :->

Dave.

OK, I think you are probably right.

> Quote:
>
> Simpler to have F1-F6 on the sides, and F7-F10 on the 4 keys below the display I think.

My only objection to this would be that in your latest design, F1 to F6 would be dedicated soft keys (which is great), while F7-F10 would still require other keys to do double-duty. Also, this would break the nice symmetry of having the soft-key label directly left or right of the function name in the display.

With the above said, your latest rendition looks great, much better than my simple rendition.

Jeff

Re: OT: Calling all front panel calculator designers...

*Message #27 Posted by **DaveJ** on 20 Apr 2009, 9:07 p.m.,*
in response to message #1 by DaveJ

Here is a quick 3D mock-up with 6 extra buttons:

Yes, the case is the real actual case I'll be using (without cutouts).

The 6 extra buttons isn't too bad, and all still on 6mm spacing. The soft keys deliberately left blank for visual appeal, although you could argue that they should be used for something when not in MENU mode. MENU mode could be left on permanently if the keys are blank, but that would reduce the usable screen area.

As you can see, probably room for more keys on top if you wanted to cram them on, but it's probably already pushing the boundary of visual appeal.

The alpha key would be in the upper right corner to match the location on the overlay, so maybe no need for a label. MODE and NAV keys on the side somewhere.

Dave.

Re: OT: Calling all front panel calculator designers...

*Message #32 Posted by **hugh steers** on 21 Apr 2009, 4:10 a.m.,*
in response to message #31 by DaveJ

Like it is (ie bottom to top), the alphabet conveniently stops before the "C" key. clearly the C (or delete) key must be available whilst entering text. Going to to bottom, this key would have to be skipped.

Additionally, im wondering if the top left key (opposite C) should be labelled "shift" or "2nd" or "F" (?) or something, as a general 2nd function key. right now on the uW1, 2nd page operation is part of the menu system which means it has to occupy one of the soft menu keys on every page. Having a dedicated key would allieviate this. Do we really need X<>Y on a

dedicated key (eg could it be a shifted op?). It would be nice to have the 6 soft keys free of baggage.

Further to this idea. i suggest the alphabet labelling skip this shift key, so that the labelling is like it is, but the top right soft menu keys gets to be "Z" (just before C). This creates a nice symmetry and allows a shift/2nd/whatever key to be available whilst entering text (lowercase/punctuation etc. etc). would be a route to more characters and other stuff.

Also, the shift/2nd key could be generically useful all over.

?

Doesn't Dave's latest incarnation do so, i.e, aren't the six-soft keys dedicated soft-keys?

...

in response to message #33 by Jeff O.

In RPN mode, the arrow keys can duplicate as roll up/down, x<>y and del. This is why my design (see above) does not offer these. I tried to avoid a too "calculatric" legend and therefore have put the few calc keys like sqrt, E or the parentheses on 2nd functions and have put more generic keys like ESC (duplicates as clear) in prominent places. Without a true 3x4 numeric keypad, arranging the digits bottom to top is not neccessary. Having 1-4 right below the display make it easy to use them for function keys. Mem is meant as a generic way to store/retrieve information und should act as a means of storing/recalling numbers in calc mode (Mem+1:RCL 1, Shift+Mem+1:STO 1)

In over 35 years of calculator usage, I have not pressed an X<>Y key once (really!). I do not even know what it's there for... Also, I cannot imagine why alpha keys could be useful on a calcualtor watch?

Greetings, Max

Unbelievable!

I use X-Y on my algebraic calc almost every day, let alone an RPN calc. I'd prefer an X-Y dedicated key in ALG mode as well as RPN, but it can probably live with the right bracket as I've shown.

Dave.

I grew up with products made in Texas ... there is (at least: was) no X<>Y key on them. Later, when I could afford HPs, it was to late to get used to such fancies.

And regarding the colour: What's wrong with black and white only?

Greetings, Max

My first calculator was not a Ti, but a Privileg 883 actually (there is a picture on "typenkorb"s website, but the link contains blank spaces) with no X<>Y key. After that, I got a Ti-59 that broght me through my last two years of school and all the way through university. No X<>Y key eiter!

Greetings, Max

I think it looks ok on the screen, I'm just wondering what it will look like on the wrist as a membrane overlay.

The idea is (I think) to make the watch as subtle as possible, to make it more wearer friendly so you get less of those "what is THAT on your wrist?" comments Perhaps the white might stand out a bit too much (too much contrast)?

Dave.

Re: OT: Calling all front panel calculator designers...

*Message #43 Posted by **DaveJ** on 21 Apr 2009, 8:02 a.m.,*

Labeling rearranged from the top left, 2nd shift key added, and alpha chars centered.

I'm really starting to like this layout.
Basic calc keys on bottom two rows, next two most used keys (EXP and +/-) next row up, then some RPN/ALG neutral keys, then two menu opp type keys. Evened out by the 6 unlabeled soft buttons. Very symmetrical :-)

Not sure about what is best for a soft key graphic.

All of this is actual size too, from my PCB/3D model. I have no idea about colour - and my wife agrees!
The case will be black.

Dave.

*Message #47 Posted by **DaveJ** on 21 Apr 2009, 6:00 p.m.,*
in response to message #1 by DaveJ

Ok, now I've been thinking...

I'm trying to keep the cost down on this thing, and side switches are expensive. Given that I'm already paying for the front panel, extra buttons there are free. So how about use the space above the screen for some extra buttons?

5 extra - Left/Right arrows, HOME and MENU keys, and the u2 symbol would actually be the backlight key (I really like that).

HOME would get you back to the main application kernel screen (exit the program you are in).

The only thing lacking is up/down keys.

Dave.

Final dimensions are as quoted before - 50mm x 35mm x (approx)13mm
Trackball may not be workable in practice, but I have not done much investigation in this area.
Jog dial is still a possibility, will see if it can fit.

Dave.

in response to message #52 by Nack

I like it, it does make sense to me.

Re: uW 2 layout suggestions (uW is on topic, indeed!)

*Message #54 Posted by **Andrés C. Rodríguez (Argentina)** on 24 Apr 2009, 7:36 a.m.,*
in response to message #52 by Nack

Just my opinion, I think this kind of number-keys arrangement is good, but something keeps making noise on me. I know this is very personal and subjective, but...

If we count from 1 on ("natural" numbers), my suggestion would have been:

```
1 3 5 7 9
2 4 6 8 0
```

If we count from 0 on, it could have been

```
0 2 4 6 8
1 3 5 7 9
```

In other words, reading (or scanning) direction should be "down, then up & right" (as in the abovementioned examples); or "right, then down" (as in "0 1 2 3 4; 5 6 7 8 9" or "1 2 3 4 5; 6 7 8 9 0").

I know, it's the old "calculator vs. telephone" keypad discussion; "higher up" vs. "lower up", so to speak; but since we are not keeping the 3 x 3 matrix that calculators use, I think it's better to put the numbers in "reading order" as suggested above...

Edited: 24 Apr 2009, 7:41 a.m.

Re: uW 2 layout suggestions (uW is on topic, indeed!)

*Message #55 Posted by **Nack** on 25 Apr 2009, 8:42 a.m.,*
in response to message #54 by Andrés C. Rodríguez (Argentina)

That's it. I like your first suggestion

1 3 5 7 9
2 4 6 8 0

I felt quirky in my suggestion because of the location of zero. The zero key is now closer to the Enter key. Easier to type like 100, 1000, etc. This looks much natural now.

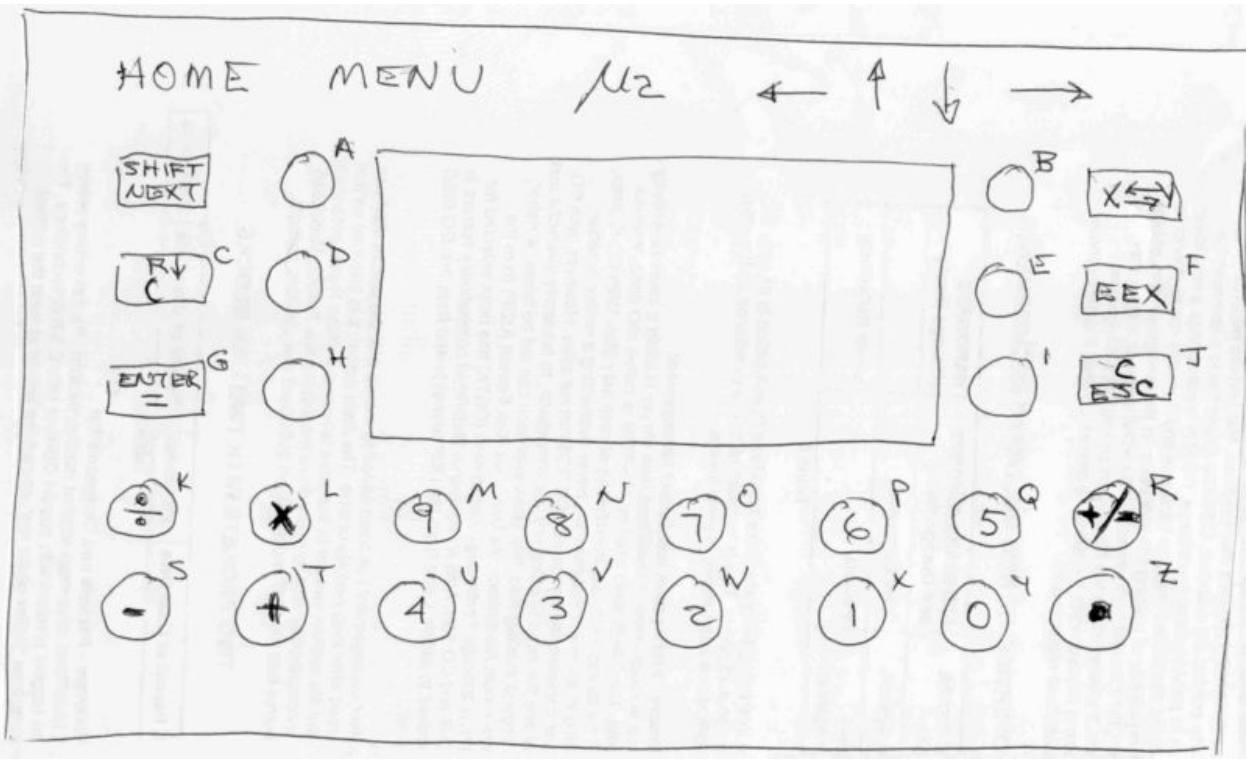
Yep, I agree, will do.

Dave.

One more version

*Message #59 Posted by **Dennis Trafananko** on 26 Apr 2009, 4:34 p.m.,*
in response to message #58 by DaveJ



Here is another suggested layout with a rough scanned drawing.

The general layout was chosen to minmize finger movement across the face of the watch, to keep the fingers away from the screen when scrolling the display, to logically keep keys together, and to have a layout familiar to the classic HP placement:

-group the numbers from top left to bottom right in decreasing numerical magnitude. There have been many suggestions for the number placement lately, because; all of them look strange.

-keep the zero, one, change sign, decimal key, and C clear backspace keys together

-group the aritmetic operators in a heirarchical order as we see them on our calculators

-I chose the rectangular keys, for the keys that perform operations, to differential them from the round numeric keys representing the numbers. I like the position of the square Enter key (historically similar), and I also like the the position of the C/ESC key close to the numbers zero, one, and decimal, where it can be used for backspace editing.

-if there will be arrow navigation keys, keep them all together, to minimize finger movement, and in the top right hand corner of the case to leave the screen free when a right hand user is scrolling the display

-the top of the calculator may not have things spaced out symetrically, but designers gave us the HP33S design (I own one and like its quality but not the layout).

Just my opinion, thanks for your consideration. Dennis Trafananko

I love this one, makes perfect sense!
Cheers

Re: One more version

*Message #61 Posted by **ncrook(UK)** on 27 Apr 2009, 5:28 p.m.,*
in response to message #59 by Dennis Trafananko

- I wonder whether it would be better to swap the ENTER and ESC keys: if you wear this on your left wrist, you will use your right hand to operate the buttons. You might tend to obscure the display when operating the buttons on the left?

- I liked Dennis's suggestion of using different-shaped key indents as a visual cue to different functionality, especially for a keyboard with a small number of colours. For the soft-keys, how about a stretched "D" shape and its mirror image; the straight edge adjacent to the display to 'cue' it to the menu there. Just don't get sued by Dolby labs.

- Nobody has yet mentioned hex entry mode. Nice support for hex would suggest a desire to keep A-F close to the number keys (or maybe they'd be soft-keys?)

- As a 'joggle' navigator was mentioned at one point in the past, I feel obliged to draw attention to http://midp-calc.sourceforge.net/Calc.html - a java mobile phone calculator that uses the phone joystick to implement menu-based selection for all the calculator functions. Of all the phone calculators I've tried, this is the first that has I might actually use in anger on the small screen of a mobile phone. Oh, and RPN. And scientific. Did I mention the complex number support (soo useful in the grocery store). Worth a look.

Neal.

New 12C question

*Message #1 Posted by **Charles Oxford** on 19 Apr 2009, 5:43 p.m.*

I went to my local Fry's to get speakers so I could hear the IEEE video. I checked the calc dept and they didn't have the 20B but they had 3 12C's, 2 of which had a double length battery door visible from the top of package. Price is 69.99 USD plus 8.33% tax. No difference in the packaging of the 2 styles of 12c. Does the battery door width mean it will have the port on the back?

Re: New 12C question

*Message #2 Posted by **Eric Smith** on 20 Apr 2009, 3:36 a.m.,*
in response to message #1 by Charles Oxford

If it has the double-width battery door, then it uses the Atmel AT91SAM7L128 ARM processor and has a serial port in the battery compartment.

Re: New 12C question

*Message #3 Posted by **Don Shepherd** on 20 Apr 2009, 1:34 p.m.,*
in response to message #1 by Charles Oxford

I looked at Fry's online and they did not mention the 12c, only the Platinum. I checked Office Depot and Best Buy here in Louisville KY and they don't have the new 12c yet. Would someone be willing to buy a new 12c in an area where it is available, and send it to an interested (and pre-paying, of course) party?

Re: New 12C question

*Message #4 Posted by **Charles Oxford** on 20 Apr 2009, 9:24 p.m.,*
in response to message #3 by Don Shepherd

I can do that.

Charlie in Phoenix

Zenith, the Trans-Oceanic, and some "food for thought"

*Message #1 Posted by **Karl Schneider** on 19 Apr 2009, 4:45 p.m.*

Versatile multi-band radios as well as calculators also held my interest during adolescence. After seeing Geoff Quickfall's recent post with links and photos of the vintage Zenith Trans-Oceanic radio, I was enticed to purchase a similar one. My 1981 Sanyo AM/FM/SW/cassette "boom box" hasn't worked well at all the past few years.

I just received a T/O Royal D7000 from 1969 similar to Geoff's; everything functions well, sounds very good, and has only minor cosmetic flaws.

So, why a vintage radio instead of a modern one with digital tuning, informative display and other convenient features? For the same reasons I find H-P's calculators of the 1980's appealing -- indisputable quality, rock-solid construction, no-nonsense design, American engineering (and also assembly in this instance). The Trans-Oceanic (T/O) series -- and particularly this version -- is legendary.

I also respect what Zenith once was, up through the 1980's: a 20th century American company making high-quality radios and CRT televisions. I'm still using a 1988 19" CRT Zenith whose NTSC picture is still as good as new, when I bought it for $329. Our family had owned a 1962 Zenith B/W TV (with tuning-fork remote!), later replaced by a Zenith color TV in 1975.

Zenith was driven from the radio business in 1982 largely by a Sony multiband radio -- smaller, cheaper, and with digital-display tuning -- that outcompeted the last T/O from 1979. (It should be mentioned that the latter did incorporate significant circuit-design advancements from my 1969-1978 model of the T/O).

Zenith's last significant technological upgrade in conventional TV was the "System 3" chassis in 1978 that was utilized for more than a decade. (Zenith also invested developmental work in HDTV in the early 1990's.) Most production was shifted to Mexico in 1985, but the TV sets were still very good.

Zenith Data Systems also made PC's for the US government in the 1980's, under a program that cost Zenith much money and led to the sale of that division to Groupe Bull of France in 1990.

Today's Zenith-branded HDTV's and converters are made and serviced by LG of South Korea, which acquired Zenith in 1995.

This year, the US government mandated a switch to digital over-the-air TV broadcasting. As far as I know, however, no mass-market US manufacturer engineers and builds HDTV receivers. For a few years, the same has applied to CRT televisions. Now, *how* much money do Amercians spend every year on television sets? Even if the US can't make world-class consumer products at a competitive free-market price, it's not a good situation when we can't make them *at all*.

Does this saga of lost pre-eminence, offshored manufacturing, and withered commitment to product development sound familiar? There are many examples of it today...

7991.7 :-0

Actually trimmed to run 145.95 in my Gonset Communicator.

That J-38 *is* grungy! It is my father's from the 1940s.

Now, here is dreaming of the futre. Someday,. maybe someday...http://www.contesting.com/articles/294

Nothing important (my first little hw mod)

*Message #1 Posted by **Geir Isene** on 19 Apr 2009, 8:59 a.m.*

Never done any hardware mods before - I'm a software guy. But after visiting Diego around NewYear, I got some inspiration :-)

I now have a "light module" - when I plug it into my 41, a LED on two stiff wires lights up the LCD screen. Nothing big, but useful.

Re: Nothing important (my first little hw mod)

*Message #2 Posted by **Jake Schwartz** on 19 Apr 2009, 11:12 a.m.,*
in response to message #1 by Geir Isene

Ahhh...must be like AME's Port-X-Light module they built and sold in 1982 in addition to their more popular Port-X-Tender. They had a very busy vendor table at the Philadelphia HP Handhelds Conference in the Spring of that year.

Here is a shot of the original Port-a-lite

*Message #3 Posted by **Geoff Quickfall** on 19 Apr 2009, 2:09 p.m.,*
in response to message #1 by Geir Isene

Richard Nelson showed me one still in it's box. Slick idea but what is the power drain. Also, not a hard item to assemble as I was thinking of doing it.

You could make it from existing supplies at Circuit city. Must look into it. Geir, how about a picture?

Here is a shot by Richard Nelson of light module system:

Edited: 19 Apr 2009, 2:11 p.m.

Re: Here is a shot of the original Port-a-lite

*Message #4 Posted by **Geir Isene** on 19 Apr 2009, 2:50 p.m.,*
in response to message #3 by Geoff Quickfall

Mine has a socket at the light's end so that I can easily swap the LED - to choose between white, red or green light (being an amateur astronomer, these things are important).

Picture = later.

Re: Here is a shot of the original Port-a-lite

*Message #5 Posted by **Eric Smith** on 20 Apr 2009, 3:43 a.m.,*
in response to message #4 by Geir Isene

Swap the LED? Why didn't you use an RGB LED so that the HP-41 could control the color?

[Of course, I know the reason. While doing what I suggest would be possible, it would be *much* more work than what you've done. Consider it a tongue-in-cheek suggestion.]

Re: Here is a shot of the original Port-a-lite

*Message #6 Posted by **Geir Isene** on 20 Apr 2009, 12:41 p.m.,*
in response to message #5 by Eric Smith

Yeah, I thought about that myself - and also a simpler little thing (maybe?) to have the light only go on when I turn the calc on. Now it's always on when the module is plugged in.

But as you might suspect, I'm nowhere near even envisioning how any of that could be done (yet).

Re: Here is a shot of the original Port-a-lite

*Message #7 Posted by **Meindert Kuipers** on 20 Apr 2009, 2:22 p.m.,*
in response to message #6 by Geir Isene

That is simple, just use the PWO signal to control power to the LED. PWO is high when the calc is running. You could also make a wired OR (with two diodes) to have the LED on when running and when in STANDBY. To control power make a simple FET switch or transistor, or drive a LED directly if it does not draw too much power. Drive a multicoloured LED would really require more complicated stuff. My MLDL2000 can drive LED's by choice with access to reserved memory locations. Cheapest solution would be a Novram like device with some spare I/O. It would be fun for amateur astronomers to read the current time and date to check if the sun has set already and then drive the red LED ...

What was the Earliest Touchscreen Handheld?

*Message #1 Posted by **Jake Schwartz** on 18 Apr 2009, 4:45 p.m.*

Hi,

I was wondering if anyone knows the intro date and the identity of the earliest consumer handheld device with a touch screen. I somehow don't think it was the Apple Newton (introduced Aug 1993) . According to Wlodek Mier-Jedrzejowics' book "A Guide to HP Handheld Calculators and Computers", the HP Omnigo 100 was introduced in October of 1995. And of course, the 95/100/200LX series (starting in '91) did not have touch screens. Perhaps it was a programmable remote control? I am curious and any help is appreciated.

Thanks,

Jake Schwartz

Re: What was the Earliest Touchscreen Handheld?

*Message #2 Posted by **Dave Britten** on 18 Apr 2009, 5:45 p.m.,*
in response to message #1 by Jake Schwartz

This old FAQ seems to suggest that a couple old models of Sharp Wizards were released in Oct. 1993:

http://scout.wisc.edu/Projects/PastProjects/NH/95-03/95-03-27/0001.html

As I vaguely recall, the OZ-9500 was their earliest touch-screen model, with 256 KB RAM. I had one for a couple years when I was in 6th or 7th grade. I actually did school work on the thing, and printed directly to an old HP Deskjet with the infrared printer interface Sharp sold.

The Wizard and the first Zaurus units (the ones before Sharp recycled the name for their Linux-based PDAs) didn't have any sort of hand-writing recognition, which makes sense, as they had a full keyboard anyway, and didn't have the ability to fold the screen all the way back, like the HP OmniGo.

Re: What was the Earliest Touchscreen Handheld?

*Message #3 Posted by **Xerxes** on 18 Apr 2009, 5:58 p.m.,*
in response to message #1 by Jake Schwartz

Maybe the CASIO PF-8000 (1980) with a touchpad or the CASIO IF-8000 (1986) with a touchscreen.

Re: What was the Earliest Touchscreen Handheld?

*Message #4 Posted by **Jake Schwartz** on 18 Apr 2009, 7:05 p.m.,*
in response to message #3 by Xerxes

Well, it looks like the PF-8000 only had a touchPAD which was not a display. The IF-8000 probably meets the requirements except I wonder if they actually put touchable controls on the LCD in addition to allowing one to write on it.

Re: What was the Earliest Touchscreen Handheld?

*Message #5 Posted by **Xerxes** on 19 Apr 2009, 6:22 a.m.,*
in response to message #4 by Jake Schwartz

I'm not sure, but I don't think so. Some other remarkable early touchscreen devices:

- CASIO PB-1000 Pocket Computer (1986)
- CASIO VDB-1000 Wrist Watch (1991)
- CASIO TC-50 Wrist Watch (1983)
- EPSON RC-20 (1984)

Re: What was the Earliest Touchscreen Handheld?

*Message #6 Posted by **Jake Schwartz** on 19 Apr 2009, 11:21 a.m.,*
in response to message #5 by Xerxes

I think that the Casio TC-50 watch definitely fits the requirements.since it provided soft keys for a touchscreen calculator where the top portion of the LCD served as the single-line numeric display. If it actually dates back to 1983 (or earlier), we might have a "winner" (until someone locates something from an even earlier time.

Thanks,

Jake

Hi Jake,

In 1989, Poqet introduced the PoqetPad, which was a handheld MSDOS touch screen computer. I think it was mainly designed for vertical markets with custom software overlaying the dos. A few years ago, I has one that also included a bar code wand. Unfortunately, I never had any software for the wand. A very interesting msdos machine.

Bill

New HP products on the horizon?

*Message #1 Posted by **Michael de Estrada** on 18 Apr 2009, 11:54 a.m.*

I've been reading posts about developer kits, eproms and I/O interfaces on various platforms such as the new HP 12c and existing 20b. Presummably, new products can be implemented by simply re-programming this hardware and making new keyboard templates. So, the question I have is whether all of this discussion in simply pie-in-the-sky banter or if HP and/or others are seriously contemplating implementing these ideas as publically available commercial products?

Comments anyone?

Michael

This has been discussed before, but the general feeling is that yes, HP is going to release a new scientific calc based on one or both of these platforms. Unless HP quit the calculator business, this seems like their only direction.

HP have been re-enforcing "rights" to the original voyager ROM's lately, and their first product was the new 12C.

HP also undertook a user survey that was heavily biased toward the 15C, so a new emulated 15C using the original ROM seems the most likely calc because it is bordering on trivial to get to market. And I'm sure they are aware of how popular it would be for minimal engineering outlay:
http://www.hp15c.org/

A 20B based scientific is harder because they don't have ROM images to fall back on, but I think it's almost inevitable they will.

Dave.

Reading the flow of this discussion, I find it interesting that no thought has been given to the re-introduction of the HP 11c as opposed to the HP 15c. As has been pointed out, when the HP 15c was introduced, it had new capabilities such as complex numbers and matrices that were not previously available. Once the HP 42s and particularly the HP 48SX were introduced, the HP 15c was relegated to second class status in this regard. Once I bought my HP 48SX, I ported all my HP 15c programs to it, but continued to use the HP 15c for most of my work, which involved relatively simple direct calculations. What really made the HP 15c and all Voyagers enduringly popular was their unique ergonomics, excellent quality and durability. Even today, the Voyagers are used as simple fixed function calculators along side their more powerful but complicated to use modern counterparts. The HP 11c has all the capabilities that most people would want in such a device, just as a HP-32Sii is more useful for simple manual tasks than a HP 42s.

That's true I guess, but given that both are programmable calcs, you might as well implement the one with more advanced capabilities such a complex number support and matrices.

It would be better from a marketing point of view as well, and the known demand would be higher.

I would personally prefer a non-programmable version with more primary keys, but given that the 11C has the same primary key layout as the 15C, there is no keystroke usability advantage to "simpler" 11C, so you might as well have the 15C.

Dave.

AFAIC HP should not release any calculator until they manage to develop descent keyboard

Re: New HP products on the horizon?

*Message #9 Posted by **Frank Rottgardt** on 19 Apr 2009, 8:28 a.m.,*
in response to message #1 by Michael de Estrada

I agree that it might be possible to reintroduce a 15c with a comparable low budget like HP did with the 12c, but I wonder how attractive such a single line display calculator without Alpha-capability would be for current customers (read students), even with an AOS option? In that respect the 33s is better. The question is if the better complex arithmetic of a (new) 15c could outweight such an disadvantage?

I wonder how many young engineers preparing for their professional exams buy the 33s simply because it is one of the few programmable calculators allowed and not because it is RPN or ease of use.

I think in the end HP would need to put more effort on the redesign of the 15c to make it fit for the market (2 line dot-matrix + alpha + menus) than one might think. And once again I think we would badly miss a SD-slot or USB-port :-)

Re: New HP products on the horizon?

Fullheartedly agree. The 15C's complex number handling was very good for its time, but made obsolete by the 42S already. So HP shall not expect to win much by resurrecting an unchanged 15C with split stack. Looking only from outside, the overall form factor may be kept, but the display *must* take into account the changes of the 27 years since the old 15C was launched. Else - forget it.

Ceterum censeo: HP, launch a 43S (or 15S - suggestions were published here earlier).

Walter

Re: New HP products on the horizon?

*Message #11 Posted by **Svend Broholm** on 19 Apr 2009, 2:04 p.m.,*
in response to message #10 by Walter B

To keep it short:

You cannot rewrap a 27 year old calculator, HP-15, and expect any succes except to old well off affectionatos, who don't use the calculator in daily use.

You have to adapt to current trends: two line alpha display, SD-card, USB-port just to mention some items to be included. The market is young people at the universities, not to members of this forum. See the success of the inferior Texas products!! They market their products to schools and high schools. When you reach university level nobody wants to shift to RPN - they have been used to ALG and all the annouiencies in many years previously.

Bottom line: HP35S is a step forward compared to HP33S, but give us HP43S/HP15S as "announced" in this forum.

Re: New HP products on the horizon?

*Message #12 Posted by **designnut** on 19 Apr 2009, 4:59 p.m.,*
in response to message #11 by Svend Broholm

HP lost the game to algebraic. Ken Kuhn said his students have Casio or TI but they do an astonishing amount of button pushing with no results. They are astonished how fast RPN is, but nobody changes. Some students have HP but don't know how to use RPN!!! More algebraic HP calculators? Sam

The answer is of course that it wouldn't be popular to the masses, it would be a pure "retro" marketing exercise. They would sell 50-100,000 for sure (www.hp15c.org number), but whether or not that is enough to cover their costs I don't know, but 50,000 units @ $100 is $5M in sales minimum which isn't bad.

> Quote:
>

It's safe to say 99% of them.

I'm sure everyone will agree. But a "retro" 15C replica would be pretty cool, not much development outlay, and a nice clever marketing exercise. I think they would be foolish not to try.

Dave.

I think that is the point. I am confident that is what HP has in mind for the 15c, if anything at all. They will simply add an algebraic mode to pick up some more of that limited market share, and have a go at it. That's what they did with the 12c platinum editions, and it seems to have been successful, why not try and repeat the success with the 15c?

Re: New HP products on the horizon?

*Message #15 Posted by **Eric Smith** on 20 Apr 2009, 3:46 a.m.,*
in response to message #14 by Martin Pinckney

Adding an algebraic mode requires that the firmware be redeveloped essentially from scratch, as the source code to the firmware for all of the Voyager family calculators is long since lost. While HP certainly could develop new and improved firmware for a superset of the 15C, it is a significantly bigger job than developing the firmware for the 12C Platinum was, so it is not obvious whether it would be a worthwhile investment of HP's limited calculator engineering resources.

Re: New HP products on the horizon?

*Message #16 Posted by **Didier Lachieze** on 20 Apr 2009, 5:12 a.m.,*
in response to message #15 by Eric Smith

One thing that could be possible with an alphanumeric display while keeping the original ROM, would be to display in program mode the instructions mnemonics instead of the key codes. This could be handled in the display interface module of the emulator: as the display knows when the unit is in PRGM mode (via the PRGM indicator) it could interpret the key codes sent by the original ROM and replace them with clear instructions mnemonics.

Combined with the speed increase coming from the updated ARM CPU this would be a great improvement in my opinion over the original 15C at a minimal software cost, but with an additional HW/NRE cost as the display would not be shared with the current 12C. Btw nothing prevent the 12C to benefit from this excepted the 12C customers ....

HP 41CX Auto power-off problem

*Message #1 Posted by **Jose Poyan** on 17 Apr 2009, 4:31 p.m.*

Hi all, I just bought a faulty HP 41CX. I fixed it; it was just the usual cracked back. Now it turns off after only 20 seconds all the time. This can't be normal! It didnt come with manuals so I'm searching for some help in the Forum(I didnt find this problem already posted). I'm using a fully charged battery pack. No "BATT" message is shown in the screen; it just turns off.

Thanks

Oh I forgot: although I didnt fix the back of my calculator tight enought, I can leave the screen in watch mode and I stays like that; so its not a contact problem.

Edited: 17 Apr 2009, 5:49 p.m.

Re: HP 41CX Auto power-off problem

*Message #2 Posted by **Dan Grelinger** on 17 Apr 2009, 9:10 p.m.,*
in response to message #1 by Jose Poyan

Jose,

I can't help very much, but here is what I know, or suspect:

There is no normal function that would change the HP-41's auto-off functionality as you describe. Therefore, the manual will be of no use to you with this problem.

When the clock is in the display, the calculator is actually running a routine every second to update the display. I assume that if you use the calculator, or have a user program running, it won't turn off. This would indicate that it is the auto-off functionality that is turning the HP-41 off, just not after the 10 or so minutes it is supposed to wait.

I believe, from some long ago reading, that the auto-off functionality is located in the display controller. Not knowing much about the internals, I would not be able to rule out a contact problem (there are plenty in an HP-41), but it may be a faulty display controller.

Dan

Re: HP 41CX Auto power-off problem

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 18 Apr 2009, 9:48 a.m.,*
in response to message #2 by Dan Grelinger

I'm not familiar with the CX specific features such as clock or timers, but I suggest you can explore the ON function (XEQ "ON"), which prevents the calculator from turning off after 10 minutes.

The 41C and CV CPU have 3 states: Runnning (when actually performing calculations), Idle (just

displaying data) and Sleep (no display, just status and memory contents are preserved).

Re: HP 41CX Auto power-off problem

*Message #4 Posted by **Monte Dalrymple** on 17 Apr 2009, 11:30 p.m.,*
in response to message #1 by Jose Poyan

While the clock is displayed the cpu is running. When the cpu goes idle there is a time-out function that powers down the cpu after 10 minutes. This timer is actually in the display controller, BUT the capacitor that determins the time constant is on the cpu board. If this specific connection is bad, or the capacitor is bad, the time-out time will be much shorter than the default 10 minutes. This is probably the cause of the symptom you are seeing.

Monte

Re: HP 41CX Auto power-off problem

*Message #5 Posted by **Garth Wilson** on 18 Apr 2009, 12:20 a.m.,*
in response to message #1 by Jose Poyan

To get around it until you get it fixed, you should be able to use the ON function to make it ignore the timeout, right? That's part of the startup routine on mine all the time. I always turn it off with a program assigned to a key, which sets flag 11 (the autorun flag) before executing OFF. then when I turn it on, it checks to see if there's anything in the DAYTIMR file it's supposed to remind me of that day, and if not, sees if there are any alarms set and show how much time is left, otherwise move on to show the time and date. (Yeah, it takes a couple of seconds.) One of the other things it does is to set the continuous-on flag, flag 44, with TOGF in the ZENROM. **I'll** be the one to decide when it's time for it to go off! The calc is 23 years old and has never shown any signs of a bad connection except that it forgets what the time and date are if I drop it, but I suppose the auto-turn-off time could go wacky and I wouldn't know it. I don't think that has happened yet though, because if an alarm turns it on and it doesn't go through the same start-up routine, it will indeed stay on for something like ten minutes by itself if it's not a control alarm with a program that turns it off again.

Edited: 18 Apr 2009, 12:23 a.m.

OT: uWatch MK2

*Message #1 Posted by **DaveJ** on 17 Apr 2009, 5:15 a.m.*

For those playing along at home, some preliminary uWatch MK2 specs that looks very do-able on the surface:

50mm x 40mm x 16mm

Fully enclosed case, no protrusions. 128 x 64 dot matrix display with white LED backlight:
http://www.newhavendisplay.com/index.php?main_page=product_info&cPath=21_96&products_id=2072

Visible area is quite mall though, only 26mm x 16mm.

Watch band would have no attachment, i.e. velcro completely through holes in the case, nothing to break.

16 key tactile dome keypad minimum, probably 20.

Possibly a micro trackball and/or scroll switches (WOW factor).

Rechagable NiMH battery, life probably around several hundred hours continuous display.

USB interface allows comms and charging. Firmware upgrade via USB would be nice, but might be processor dependent.

Perhaps an IR LED, and another expansion port.

Processor choice is open, but more powerful than the PIC24F. Maybe 512K flash and 32KB or 64KB SRAM. 32bit ARM probably a good choice.

It could be made smaller with a different battery choice, but I'm thinking single AAA is cheap and simple.

Only custom bit would be the case, but I think that should be pretty simple.

Sound like a dream come true?, bad idea?, something else entirely?

Dave.

Just my $ 0.02

AAA battery or similar is a GOOD idea. Non-standard batteries (I mean "non easily available") are a real pain, specially if soldered. When aging reduces charge capacity, you end with a pile of nice devices that you cannot use anymore. And the replacement batteries are no longer manufactured.

Using a uWatch implies some soldering skills on the owner's side, but I still prefer a standard battery.

Eventually, the "pair of CR2032 approach" may be acceptable.

Congratulations for your fine design and also for the EEVlog.

Andrés (not a uWatch owner yet, but...)

Not sure if it is quite a dream come true, but certainly not a bad idea. Put me on the list to buy one :-)

Make that about 48mm x 40mm x 14mm

Now I've gotta do is find a place that makes membrane keypads protos cheaply. There are ways to DIY but probably won't look as good.

Dave.

20 keys would definitely be much better than 16. Even 24 if you can cram them in.

I'd recommend the PIC32 (MIPS) or various Atmel AT91SAM family ARM parts. Power consumption will definitely be higher than for the PIC24, though.

I've been told that essentially all of the companies that make membrane keyboards do it for fairly low NRE. However, those usually don't have domes, so I'm not sure whether that adds a lot to the NRE.

Yep, will all depend on the final size of each button.

> Quote:
>
> I'd recommend the PIC32 (MIPS) or various Atmel AT91SAM family ARM parts. Power consumption will definitely be higher than for the PIC24, though.

Yes, both of those would be my first initial pick.

Power consumption isn't much of an issue given that the unit is rechargable, and most of the time it will operate at say 32KHz running and displaying a clock.

> Quote:
>
> I've been told that essentially all of the companies that make membrane keyboards do it for fairly low NRE. However, those usually don't have domes, so I'm not sure whether that adds a lot to the NRE.

I've got two ways I can do the front panel. Either domes directly stuck onto the front panel PCB and silkscreen labeling (cheaper DIY solution). Or a proper stick-on membrane front panel. The membrane has the advantage of looking more professional, and having the text directly over the button thus potentially reducing the button spacing (more buttons). But the membrane has the NRE and I'd have to come up with a proper graphical design template (not my area of expertise)

The advantage of this new uWatch2 idea is that the LCD is inside the case, so the membrane keys can come right up to the display window giving much more room for the keypad. And you can protect the LCD with some glass or polycarb sheeting. Should be fairly water resistant too.

Dave.

Why NiMH rather than lithium polymer? They have higher energy density, partly because they don't require a metal jacket. They require careful control of charging, but just about all of the fancy USB power control/regulator/battery charger chips (e.g. Linear Tech LTC3455, LTC4088) are designed for lithium cells, while most of them don't support NiMH. Lithium polymer cells don't have the safety problems that have plagued lithium ion batteries.

Cheap and easy to replace, and standard size available from any electronics store (people like that sort of thing).
Plenty of battery charger chips in usable packages available, and oodles of single cell DC-DC converter options. I don't need to use an integrated charger/DC-DC chip.

I'm open to suggestions though, might have a look, got some links?

Dave.

*Message #10 Posted by **DaveJ** on 18 Apr 2009, 12:35 a.m.,*
in response to message #9 by DaveJ

Actually, looks like it may have to be Lithium Polymer.

I've found a perfect size off-the-shelf case (50mm x 35mm x 15mm), but it won't fit a AAA or AAAA along with either of the specified LCD's. Once I get LCD samples there is a slight possibility I could squeeze in a AAAA and the 128x32 display, but it's a bit ugly. What a shame, I would liked to have used a standard battery :(

The LP452030P6H from HERE looks almost ideal. 200mAh @ 3.7V

The final watch thickness will depend upon whether I use the supplied case lid or roll my own. If I roll my own the thickness could be as small as 13mm, which is quite amazing really as that's the same as my standard Timex watch. But 15mm is probably more achievable.

This is all starting to really come together now. The hardware part looks to be the membrane keypad.

This is quite exciting! (again)

Dave.

Dave;
Are quad A cells common in Ausland? The only place we see AAAAs in the states are inside 9v batteries or on 12 year old Chinese Olympic gymnasts.
Those Li-Poly batteries look too good to be true, except for the picky charging system. They may be worth the trade off though.

I guess i have to start saving my new toy money again. - db

Looks like I don't have any choice if I want to use an off-the-shelf case.

If I used a bigger custom case I could use a single AAA, but the watch would be bigger and there is that NRE and design work to contend with.

This way it's cheap and simple to get a good looking proto for minimum cost, just drill out the holes for the USB and watch band connectors. For production I can order the boxes with holes pre-drilled.

Dave.

No, as I stated in another recent thread I think that would be a complete waste of time and effort. Not to mention boring and un-cool.

Unless you call a 50mm x 35mm x <15mm calc with 24 keys a pocket calc? I can leave the watch band holes out for those who want to slip it into their fob pocket.

Dave.

I now have LCD's and cases in my hot little hands.

Unfortunately the LCD wasn't able to be used the way I wanted it, so that means a lot less space in the case than hoped for.

This means a MUCH smaller battery, only 70mAh, but this should still give a reasonable life when just displaying the time/date or operating at minimal speed.

It looks like I can still fit everything into 50mm x 35mm x 12.8mm which will be amazing if it all comes together.

Forget the trackball though, but amazingly there might be room for a micro SD card slot too.

The super tiny Lithium Polymer battery is on it's way.

Creating your own calculator is FUN!

Pray for no show-stoppers.

Dave.

Nice article, and a very nice tribute.

My cousin, as a young Air Force Cadet majoring in mathematics, bought a brand new HP35 from the Cadet Bookstore in 1973 for the discounted price of $295. I can just imagine him taking it out of the box and marveling at it's capabilities. About 2 years ago, when he heard I collected HP calcs, he dug out that old HP35 and sent it to me. Needless to say, I was most grateful to add it to my collection.
Right now it's on display at my son's school, where I rotate my collection through.
Best regards, Hal

Purely Synthetic PCAT 1

*Message #1 Posted by **PeterP** on 16 Apr 2009, 8:05 p.m.*

Hi,

A little while ago we were asked if there is a program that can display all the CAT 1 entries. As it turns out there was none, but pretty quickly a version using the CCD (next to the Sandbox my favorite module) was written.

Nevertheless the discussion started if it would be possible to do the same without any external modules, only using synthetics. As it turns out, Dan and I found a way how it actually can be done, if one allows the use of X/F and X/M. For what its worth, the code is produced below. It uses a few functions from the PPC module, which can be typed in as separate functions so one does not need the actual modul. Needless to say, these purely focal programs are very adagio. Just in case, I have added in parenthesis the respective functions from the Sandbox, however if one were to allow the Sandbox a much faster version could be written using its NRCL function…

The concept is as follows:

1. Do a GTO .., size at least 018, make sure there is at least one free register available in the main memory
2. Calculate the length of program memory and add 2 registers
3. lower the curtain to one register below the .END.
4. using SAVERX, move the whole program area up to and including the original R00 into X/M. SAVERX normalizes only the top and bottom registers of the block that is transferred. This means the original R00 (that's fine, its normalized anyway) and the 1 empty register below the .END. (which we don't care about). If there is not enough room in the X/M the calc will tell you.
5. Now we can use GETX, which does not normalize, to analyze the CAT 1 chain. Starting with the second register in our data-file (the first one contains the empty register below the .END.) we can decode the .END., find the distance to the next END, decode it to find the distance to the next Alpha or END, display if it is Alpha, rinse and repeat until we have reached the top end

Biggest nuisance is when ENDs or Alpha labels cross register boundaries as we have to get the next register and decode again. We use SEEKPT to move around quickly from one register to the next.

Clearly this was far more fun for me to do that it will be of use to anyone, but maybe this does interest someone.

Cheers

Peter

HP 41CV intermitent fault

*Message #1 Posted by **Nigel Bamber** on 16 Apr 2009, 5:37 p.m.*

I have been given a 41CV which requires me to keep squeezing the front/back together at the bottom of the calculator in order to keep it working. Otherwise the display goes blank and I need to squeeze it again and then press the ON key in order to get it working again.

I suspect the calculator hasn't been used for sometime.

What is likely to be the cause ? Should I take it apart and try and find the lose connection if that is what it is ? Or should I not take it apart and try to fix it with some tape ?

All help appreciated ?

Nigel

Re: HP 41CV intermitent fault

*Message #2 Posted by **PeterP** on 16 Apr 2009, 8:10 p.m.,*
in response to message #1 by Nigel Bamber

This is one of the most common ailments of the 41 series (next to corrosion). Most likely a broken post or two. If you carefully shake the calc I would not be surprised if you her some rattling. And/or you can probably see/feel that the top and bottom halve are not fitting together strongly. There are a few threads you can find here on this ailment (search for things like 'broken post', 'funny display', 'display @', etc). it can be repaired, but can be finicky.

Also check out this articleRepairing an 41CX

Hope that helps.

Cheers

Peter

Re: HP 41CV intermitent fault

*Message #3 Posted by **Nigel Bamber** on 20 Apr 2009, 2:19 a.m.,*
in response to message #2 by PeterP

Thanks for the advice Peter. I opened her up and discovered the expected cracked posts. I took fright at their repair and decided on a different tack.

The screws in fact hold themselves quite well but not just not well enough. Also squeezing the bottom right hand side resolved the lost contacts issue. Therefore I decided to attach a little plastic washer inside the back of the case to increase the pressure on the flexible PCB and it worked !

The calculator now turns on and off normally without those funny characters in the display.

Cheers

Nigel

Temporary at best., here is an easy fix...

*Message #4 Posted by **Geoff Quickfall** on 20 Apr 2009, 1:12 p.m.,*
in response to message #3 by Nigel Bamber

Yes the posting about new wires and etc are daunting.

I just repaired a 41CV with two cracked posts and the same contact problem.

Unfortunately the fix you have done is temporary as the cracks wil propogate, especially now since the compression is putting more stress on the the posts and cracks.

I am posting the repair as a new topic as this is falling by the wayside.

Cheers, Geoff

TI-84+, a humbling experience

*Message #1 Posted by **Egan Ford** on 16 Apr 2009, 11:52 a.m.*

I often get tasked to help my daughter with her calculus homework. Usually its symbolic pen and paper work. I often tease her about the 84's lack of symbolic support and frequently demonstrate the symbolic gymnastics of the 50g (it's a lazy man's way to check her work too).

Last night was different. The problem set was all about finding volumes with rotation and cross sections with equations that were somewhat unfriendly. Fortunately, the problems were to be solved numerically only with a calculator.

After discussing various approaches on how solve various problems, she went to work solving it numerically on her 84+. I was blow away and how quickly she could find intersections, input equations, integrate, etc... using it's menu driven interface (no shell). It was as if this calculator with it's interface was specifically designed for this task. And, we all know that it was.

I'm sure the 50g has some similar efficient ways to do the same (does it?). But, I have never explored them. I still use my 50g just like I used my 48GX, and I used my 48GX like I used my 15C (all from the stack). My kid frequently bests me in Stats and Calculus as we race to get the numeric answer. And for that I am happy because time is very precious when taking tests.

I've always dismissed TI's because of the weak programming support and lack of RPN/RPL, and still will, but I have new respect for TIs as a leaning and test taking tool for students.

And, unfortunately for HP, the "learning and test-taking tool for students" is a huge market for calculators.

Re: TI-84+, a humbling experience

*Message #3 Posted by **Tim Wessman** on 16 Apr 2009, 1:31 p.m.,*
in response to message #1 by Egan Ford

My experience actually working side by side with other students is completely different. They use the graphing calculators like glorified 4 bangers 99% of the time. The problem is she uses it to do exactly those functions in class while YOU have not. Put two people side by side who have been in the same class and learned how to do

that specific type of problem and the hp will be quicker every time. It was the same in high school and through college.

Most of the time the teachers just sat and complained how many steps it takes to do something. Finding a root on a graph is a perfect example. On all the TIs you have to move to one side, mark, and then move to the other, and mark to specify a range to search for the root. You can't just push a button and it jumps to the closest root.

Granted the 50G isn't the friendliest of calcs, but anyone using a 39/40 will run circles due to the simple and consistent interface.

TW

> Put two people side by side who have been in the same class and learned how to do that specific type of problem and the hp will be quicker every time.

Possibly, and I did consider that, however my impression of the 84+ is that it was created for specific tasks and that is where the speed comes from. Whereas the 50g is very flexible. Granted with a bit of time I could possibly complete with any 84+ user, but I've seen the speed, the difference in performance for this type of work would be negligible. The 84+ is a very capable machine for student workloads. I admire TI for adjusting to market demands.

> Quote:
>
> Granted the 50G isn't the friendliest of calcs, but anyone using a 39/40 will run circles due to the simple and consistent interface.

I completely forgot about the 40, I do not have one, but I do have an emulator. I'll see how it stacks up next time...

Re: TI-84+, a humbling experience

*Message #5 Posted by **Egan Ford** on 16 Apr 2009, 2:21 p.m.,*
in response to message #3 by Tim Wessman

I forgot to add in my observations that the TI keyboard is very fast compared to the 50g. There is much less effort to press a TI key. My kids fingers danced over the TI in a way that I cannot mimic on the 50g. However, I can on my iPhone.

OT: uWatch new look

*Message #1 Posted by **hugh steers** on 16 Apr 2009, 10:57 a.m.*

Hi Guys!

For those with uWatches...

There's loads more stuff soon to be out on the uWatch, including a new facelift with moonphase graphics, games like chess and lunar lander as well as other exciting new features.

Cracking!

new VChess engine, tiny 1k memory usage, but will still give you a challenge!

Hopefully a tested release by first week of May.

Let's build a calculator...

*Message #1 Posted by **robert rozee** on 16 Apr 2009, 9:02 a.m.*

hi all, this would be my first posting here.

over the years many have suggest that HP should either re-release the HP42, or create a follow-on product based upon it. it occurs to me that the technology and software now exists for the open source community to instead realize this goal.

there exists 'free42', a set of C++ code that duplicates nearly identically the HP42 functionality, and which continued to be refined. the code footprint is somewhere in the 500k region, and it runs on a processor of less than 20mhz (thinking of a low-end palm pda here) with acceptable speed.

there also exists a set of hardware in the form of the uWatch (http://www.calcwatch.com) created by david jones. a quick check on microchip's website reveals that the pic24 processors dave uses are available with up to 512kb of flash and 32k of ram, with speeds up to 80 mips.

it seems that with a PCB costing perhaps $10, a $5 processor, $10 LCD, and a handful of small SMD switches, realizing a HP42 would take little more than porting the free42 code.

comments anyone? in particular i'd like to hear dave's thoughts!

cheers, rob :-)

that has already been done

and futher discussed (OpenRPN), but I doubt it will lead to anything beyond prototype stage. 50USD in parts usually lead to prices up to 150-200USD for commercial products.

Re: that has already been done

*Message #3 Posted by **Steve Leibson** on 16 Apr 2009, 10:14 a.m.,*
in response to message #2 by Frank Boehm (Germany)

Your timing is interesting. I just attended an award presentation for the HP35. It turns out that the most difficult and most costly part of a calculator these days is the keyboard. Processors are cheap, cheap, cheap as are displays. Any 32-bit RISC processor core can deliver what's needed for computation at low power (that's what's used in the latest HP35s) but read the posts of the people in this forum and you'll quickly see how important the keyboard feel and reliability are to the overall impression of calculator quality. It's far more important than the phrase "a handful of switches" would imply. Keyboard reliability and feel were big problems for the HP35 and were also problems for the HP 9825A desktop calculator/computer project that I worked on. Those simple, mechanical keyboard keys are always a problem that drives manufacturing bats.

Re: that has already been done

*Message #4 Posted by **robert rozee** on 16 Apr 2009, 10:23 a.m.,*
in response to message #3 by Steve Leibson

well, small switch construction has come a long way over the years, and it is relatively easy to add just a little more componentry and use a bit of spare computing power to hide away a multitude of switch issues.

for development i'd use just the individual small switches with a printed overlay that covered the whole keyboard (similar to many modern appliances, in particular whiteware). then move on to either a simple plastic moulding (with hinged keytops) over the same switches and with a metal screen-printed escutcheon... i'd possibly even consider using domes.

btw, i've spent the last 4 years working in a group developing winCE machines with in-house designed keypads, so i've got

a little bit of experience on that front.

Never underestimate the time, effort, skill and craftsmanship required to make truly outstanding mechanical parts.

Same goes for software...what is that "law" of software budgets?

Re: that has already been done

*Message #6 Posted by **robert rozee** on 16 Apr 2009, 10:36 a.m.,*
in response to message #5 by bill platt

"Never underestimate the time, effort, skill and craftsmanship required to make truly outstanding mechanical parts": the trick is to come up with a design that works without the parts needing to be outstanding, yet still provide a function and finish that allows the user to imagine how precision the internal workings are.

parts cost

*Message #7 Posted by **Frank Boehm (Germany)** on 16 Apr 2009, 10:43 a.m.,*
in response to message #3 by Steve Leibson

AFAIR from an old Heathkit spare parts sheet, the costs ("back then, in the early 70s") where something like 1/5th CPU 1/5th display+driver 1/5th keyboard 1/5th NiCd cells 1/5th enclosure, bits&pieces and rest of electronic components

I'd assume that the "CPU" (containing several state-of-the-art chips) probably made up 50% or even more on HP calculators. The TI Klixon keyboard was probably as expensive as the HP keyboard (stainless steel framing), besides the keyboards on early ICC-804Ds and JE-850Us (which both used reed relays) the best keyboards ever encountered :)

The chinese HP "clones" are probably less than a handful of USD when mass produced - but one has to consider 50000-100000 USD or even more for development/tooling, plus an "initial production run". That's probably 0.5 million USD of geek investment :)

Re: parts cost

in response to message #7 by Frank Boehm (Germany)

Frank,

I guess that your hand has 5 fingers ;-))

Think about 2 fingers for a two-line scientific calculator and about 5 fingers for a "Natural Textbook" calculator similiar to the SmartCalc 300S (which I still use and like)!

Here we have a Casio fx-82MS Clone for USD 2.10 @ 5,000 pieces.

Here a Casio fx-82ES Clone for USD 5.10 @ 3,000 pieces.

And in this business you are not talking about these "sampling" quantities.

Regards, Joerg

just had a quick look at openRPN. it lacks one important thing - any software!! but free42 exists, is fully functional, with source code ready to be ported to a new platform. i'd never consider such a project if free42 hadn't already been developed already over a number of years.

and i suspect than many people would be quite happy to pay us$150-$200 for an HP42 built out of modern components, with code that is upgradable and maintained.

As much as I would like to believe this, I have my doubts. The only reason that the old HP 42s commands such high prices is limited supply. Once you introduced a new version with unlimited availability, market prices will drop significantly. See what happened with the Voyagers; the HP 10c, 11c, 15c and 16c are no longer made, so prices remain high, but the HP 12c sells for much less due to production of the modern version. Even true vintage original versions of the HP 12c sell for a fraction of the price of the other out-of-production Voyagers. Ultimately, I think the market size for a resurrected HP 42s may not be large enough to justify its return.

Re: that has already been done

*Message #12 Posted by **hugh steers** on 16 Apr 2009, 11:10 a.m.,*
in response to message #11 by Michael de Estrada

I agree. You couldn't just re-release the 42 nor the 15 as it was and expect anything like the same level of enthusiasm as the originals. People have moved on and have different expectations - like text and graphics for example.

Here's my pitch: I've already developed all the software; http://www.voidware.com/reckon runs on the Casio fx-9860g. It could also run easily on the Hp50g or any independent platform. It uses no dependent libraries and has its own computation code including its own number system.

You can play with the number engine (my test system) here: http://www.voidware.com/reckon/reckon.exe

Remember that's a command line test, so no graphics nor use of the Pi symbol or anything else, bare bones only!

So when you say, let's build a calculator. go ahead make me the hardware, i've already done the software :-) i would like:

```
a good keyboard, say 4 rows of 10 for landscape.
a hi-res mono screen, say 320x240 min. Color? if you've got it.
works off ordinary batteries please.
512k ram min.
256k rom space min.
something like an ARM processor, or at least something with a half decent compiler (the casio has
the hitachi HS3)
real time clock.
USB connection.
```

anything more than that, the skys the limit!

That's incorrect.
openRPN has software called *fix(?)
What OpenRPN has always lacked is hardware, not even a prototype, that's why the project died.

Dave.

Re: Let's build a calculator...

*Message #18 Posted by **Eric Smith** on 16 Apr 2009, 6:39 p.m.,*
in response to message #1 by robert rozee

512KB of flash on a PIC24 is not enough for Free42 without hacking some stuff out. 512KB of flash is barely enough on an ARM in Thumb mode with high optimization.

Also Free42 is designed for systems that have much more RAM available for working storage than is available in the PIC24. Getting it to work in 32KB of RAM is possible but not easy. (I know, as I've worked on it for use on a different microcontroller.)

Re: Let's build a calculator...

*Message #19 Posted by **Paul Dale** on 16 Apr 2009, 7:13 p.m.,*
in response to message #18 by Eric Smith

I just did a quick free42 build with -Os optimisation and gcc-4.2 and got the following sizes:

```
$ size free42bin free42dec
   text    data     bss     dec     hex filename
 374317   11720   34120  420157   6693d free42bin
 473136   12984   34928  521048   7f358 free42dec
$ ls -l free42bin free42dec
-rwxr-xr-x 1 pauli pauli 388916 2009-04-17 09:10 free42bin
-rwxr-xr-x 1 pauli pauli 490832 2009-04-17 09:13 free42dec
```

My experience is that ARM Thumb is a little bit smaller than x86.

Not a great test (especially for the binary math version) since I'm not statically linking but there does appear to be some headroom there.

- Pauli

Re: Let's build a calculator...

*Message #20 Posted by **robert rozee** on 16 Apr 2009, 7:52 p.m.,*
in response to message #19 by Paul Dale

there seems to have been a few interesting contributions over night - it's now 11:30am here in new zealand.

my suggestion of a pic24 was largely influenced by the existence of the uWatch project, and the presence of someone on the forum who had experience with the toolchain. can anyone suggest a better processor choice, perhaps an Atmel arm7? the only major limitations i will impose are practical ones:

- enough (1mb or more) flash on board,
- enough (64kb or more) ram on board,
- NOT a BGA package - needs to be something i can hand-solder,
- capable of a more-or-less single chip design,
- obtainable in small quantities,
- we also need someone who is already familiar with programming it

my criticisms of the openRPN project still stand: a quick look at their website revealed no hardware design, and the only software seemed to be version 0.2 :(
again, free42 is a mature set of software, which is 100% what is guiding my suggesting this project.

and regarding costings: the HP48 used to cost HP something like us$10 to manufacture when it first came out, with much of the 'profits' that the company made above this going into repaying the R&D costs. here today we are looking at a product where all the cost will be in the hardware (that cost HP us$10 or so), with R&D for free (in the form of free42 and donated development time).

Re: Let's build a calculator...

*Message #21 Posted by **Paul Dale** on 16 Apr 2009, 8:32 p.m.,*
in response to message #20 by robert rozee

> Quote:
>
> my criticisms of the openRPN project still stand: a quick look at their website revealed no hardware design, and the only software seemed to be version 0.2

The version number isn't flattering. Download the software, compile it and try it out. Most of RPL is there and it is fairly bug free. More functions need to be added naturally but what is there is decent enough. I even used *fix as my text based calculator of choice for a while.

- Pauli

Re: Let's build a calculator...

*Message #22 Posted by **Egan Ford** on 16 Apr 2009, 8:20 p.m.,*
in response to message #19 by Paul Dale

Here are my ARM versions from http://sense.net/zc/free42/.

```
-rw-r--r--    1 egan     egan       448880 Apr 26  2006 free42bin
-rw-r--r--    1 egan     egan       552324 Apr 26  2006 free42dec
```

Dynamic linked.

I have already tried to cross compile free42 sans GUI for the 50g, but it is too large. The 50g has ~400K for C programs, however I have been unable to launch executables > 80K. Although I have no problem using all ~400K for application data.

What I find amazing is the collective works of Hrastprogrammer, e.g. 42S emulation using the 42S ROM on the 48GX! http://www.hrastprogrammer.com/hp42x/index.htm

Re: Let's build a calculator...

*Message #23 Posted by **Paul Dale** on 16 Apr 2009, 8:26 p.m.,*
in response to message #22 by Egan Ford

What arm compiler version are you using?

There has been some significant improvements in the 4.x gcc versions.

Back on 3.x, I did a bit of testing gcc and -O1 produced the smallest fastest code for low cache ARM CPUs. -O2 and -Os produced about the saem (larger & slower) code.

- Pauli

Well, what a coincidence... just last night I started back-of-the-envelope work for a Mk2 uWatch. Time will tell if anything comes of it...

Some comments:

#1
Forget software, don't even think about it, the hardware is *everything*.
Without a decent hardware platform to work from a calculator does not exist. This has been proven time and time again with DIY calc projects. Once you have a hardware platform, the software will come, the software is flexible, and there is no shortage of code and coders out there. It never ever works the other way around for something like a calculator, unless your aim is purely a software project and you don't care about how crap the hardware is.

#2
Forget group projects, they are doomed to failure. A project like this needs one person and one person alone to come up with some hardware and make all the decisions.

#3
The hardware is not trivial, in fact it is very difficult.
Sure, in a day I can lay out a circuit and a PCB with a processor, some switches and an LCD, and it will work like a calculator. Unfortunately it will look and feel so "prototype" that no-one will want to use it.

Ask Eric how much time and effort he has put into his DIY-RPN calc, that has only in recent revisions just started to resemble something that people would be happy to use physically.

#4
Unless you have the resources and money of a large company, a fully custom calculator hardware design that looks and works like a decent product is very difficult to achieve. And if you can't achieve a reasonable working quality, I say don't bother.

Hardware is not cheap either. Yes, processors are fairly cheap, blank PCBs are cheap, but things like quality switches and LCD's are not. At least not in small volume. My uWatch is expensive because the parts are expensive, and all the small parts add up. The switches are expensive and single source, connectors are expensive, battery holders are expensive, some of the screws are a dollar each etc.

You have to either cheat and/or be very very clever in off-the-shelf part design if you want to produce a calculator that people will want to buy and use.

On the uWatch I cheated a lot. I used a PCB for the front panel and labeling, I got away without keytops, and by the novelty of the design I got away without a custom case or any other custom parts.

It is not a hugely usable design, but it's the only one out there and it's novel. So it's been reasonably successful in a niche way.

#5
Quite frankly I've come to the conclusion that it would be a waste of time and effort for anyone to try and do a full-size custom DIY calculator.
Why?
There are just too many hardware options available off-the-shelf. The iPhone, PDA's, the Casio 9860, the HP 20B, HP48/50 and even some TI's can be preprogrammed? etc
And newer calculator designs are becoming more more open and re-programmable. HP are moving in this direction.

There has been talk about hacking an existing product (e.g. LCD and PCB replacement), and that may have some merit to a niche market if someone can find a cheap and easy way to do it.

If your goal is to have a new HP42 then you can have that right now on an iPhone or other device. Why anyone would bother with a custom hardware project to recreate the real thing is beyond me. All that effort, time and money, just so you can have something with real buttons seems a tad silly, even if you did manage to pull it all off at a reasonable price and quality.

If you really want a high end DIY calc, don't waste time and effort doing it from scratch. Simply take an existing re-programmable calc, use it as the hardware platform, and look at changing the front panel and key legends. Low cost, low risk, short development, and a high quality result. You won't get that result with DIY from scratch for any cost you'd be able to afford.

#6
What do I think is a worthwhile project?
Given the above that the full size calculator market is difficult and options already exist. I'm going to concentrate on smaller calcs, with either another watch, or maybe even a REALLY TINY shirt pocket or belt clip calc.

My current sketches and thinking show a tiny (38mm x 27mm) 128x64 LCD, small tact switches again (but possibly bigger than the uWatch) that surround the screen, and the PCB front panel worked good last time. A thin rechargable battery, perhaps some rocker encoder switches, and a more powerful processor.

The case and front panel integration is the hardest part, but I have some ideas that may simplify this.

I'm getting the initial feeling it should be possible to come up with a smaller, thiner uWatch with integrated watch band, more rugged, and a dot matrix display that takes much less power. Fewer keys probably, but anyone who thinks that is a negative is missing the point of a project like this.

Intended market?
The uWatch is fiddly to assemble and not very rugged. That is why I have not sold it as anything but a kit. Also, the uWatch is very niche because it's pretty much just a calculator and not much else, and most people don't want to buy a kit.

So any next device I picture being less calculator-like, and more general purpose computing-like. Easier to assemble, more rugged, and sellable as a built-up product. Not designed for the calculator enthusiast market, but the infinitely bigger geek market. (Flame mail welcome)

Yet, I also plan to keep the uWatch's off-the-shelf parts concept to keep development costs down. Perhaps a custom case will be needed, but I have an idea to possibly make that simple enough I can do with my feeble mechanical CAD skills.

Oh, and last but not least. It doesn't matter what you come up with, you will never ever please anything but a minority. And even then they'll still want something different.

Will I actually go through with it? Don't know, I work on whims :->

Dave.

HP has handed you TWO completely re-writable blank slates; the new 12c with it's ability to *be* an 11c, 15c, 16c or 10c or a combination thereof (or a 15c minus some things, plus your specialized routines) and the 20b with it's (ok strange) 2 line screen.
And HP will *give* you the development package.
Use it or loose it.

> Use it or loose it.

Yep, and it's a safe bet to say there is more to come. So I wouldn't be rushing into any DIY calc from scratch...

Curiously, I wonder if it would be possible to have say the 11C, 15C, and 16C ROM's fit inside the new 12C calc and then switch between them?

BTW, has anyone done a tear-down on one of those new 12C's yet?, I don't remember seeing anything...

Dave.

dave, et al;

sam kim said "or" not "and" but who knows? by axing the useless algebraic portion of the 12c and adding trig, nailed to 6 of the unused "g" keys (and p<>r/r<>p on two others of course) one could have a real do-it-all calcer.
17c anyone?

the really intriguing thing he hinted at was that by using the base of say the 15c (minus any unused functions); one can make a trade, or profession specific calculator out of eitherthe 12c or 20b. if i understood him correctly; he has handed the illuminati (that's you guys & girl) a chance to turn your programming skills into pin money.

FWIW, find a draft here (I posted a similar one earlier here). The function set includes 15C and a good part of 16C. As was mentioned already many times, the LCD ist the limiting factor of both platforms HP opened recently. So I'm looking forward to Dave's work with a real dot matrix.

Ceterum censeo: HP, launch a 43S.

Walter

I've just ordered a couple of THESE and THESE

Not huge, but usable, very tiny, and low power.

And on the keyboard front I have a novel idea to save space. And how does a tiny trackball sound?

Dave.

> And how does a tiny trackball sound?

Not so good, to be honest... For me, two of the main purposes of a calculator is to save time and increase accuracy. Compared to a proper keyboard, track ball is much worse in both respects.

Greetings, Max

CR2032 coin cells 20 for $5

*Message #1 Posted by **designnut** on 15 Apr 2009, 7:47 p.m.*

I found the coin cells used in the 33S and 50G to be expensive from stores. I found them at auction at the above price. I went through 10 overnight. I found them in garage door remotes, blood sugar meters. Thought you should know. Sam

*Message #3 Posted by **Paul Dale** on 15 Apr 2009, 9:33 p.m.,*
in response to message #1 by designnut

I've been buying these cheap CR2032 batteries for quite a while via eBay sellers in Hong Kong and the like. Mostly for my children's Tamogotchi's and other similar toys. My calculators don't use batteries up anything like as quickly :-)

I'm not confident they last longer than "name" brands but they are way way way cheaper.

We all know that Bill Hewlett was hoping for a pocket-sized model 9100A but since that one was programmable, we really didn't achieve that until the intro of the HP65 in 1974. This year marks the 35th anniversary of that amazing box and I bet there must be another "boatload" of history which would be worth hearing from that design team.

Hi Steve,

This is great stuff! Hearing the history from the actual participants is really rewarding. And reading how they showed the 9100A to Mr. Wang prior to introduction just about made me cry - they just don't make great people like this anymore. It is so sad. Can you imagine anyone worrying about "burying" their competition today? If only today's world wasn't only about money....<sigh>

HP 50G user manual

*Message #1 Posted by **hpnut** on 14 Apr 2009, 10:58 p.m.*

Hello all,

I would appreciate some help with the manual on Page 3-12.

1. do you agree that the ENTER key is not necessary for the example

12 m ENTER 1.5 yd ENTER x 3250 Mi ENTER 50 h ENTER /

2. I can't figure out how to convert 33 watts to btu's in the example. either in ALG or preferably in RPN.

I would appreciate a step by step answer, thanks in advance for any help.

hpnut in Malaysia

Re: HP 50G user manual

*Message #2 Posted by **Michael de Estrada** on 15 Apr 2009, 1:57 a.m.,*
in response to message #1 by hpnut

1. Yes. Once the menu item is selected, the stack entry is automatic. If you then type ENTER, you duplicate the entry. The manual is incorrect.

2. You cannot convert Watts to BTUs. Watts are units of Power and BTUs are units of Energy. Again this is simply an error in the manual. Note that the example is actually a coversion between Watts and horsepower(hp), which is correct since they are both units of power. Also, they make this coversion much too complicated. Assuming you are operating in RPN mode, all you need to do is type:

33 W <left shift> hp

and you get the same result. No need to enter all this stuff into the stack and then use the Convert function.

The HP-50g is a magnificent device with mediocre documentation.

Michael

Re: HP 50G user manual

*Message #3 Posted by **George Bailey (Bedford Falls)** on 15 Apr 2009, 2:00 a.m.,*
in response to message #1 by hpnut

My guess is that because 1 BTU is 2.931 ×10^-4 kWh (kilowatt hours), you can NOT convert BTU to Watt at all - they are inconsistent units.

I have an HP-70 vintage calculator for sale

*Message #1 Posted by **rebecca yurkanin** on 13 Apr 2009, 1:58 a.m.*

My father whom I sold several calculators on ebay last year has found another nice working HP-70 calculator. While I have sold many other models, I don't think we ever sold this model. It comes with an a/c adapter and all functions tried seem to work fine. My question is, this website claims $295 to $425 is its value. However I cannot find it anywhere, not even on eBay for sale? Is eBay the best place to sell it, and where would I get the most money out of it? I do not like selling on eBay, so is there an alternative and what really is the value? Does anyone know? thanks, Becky

Re: I have an HP-70 vintage calculator for sale

*Message #2 Posted by **Namir** on 13 Apr 2009, 2:06 a.m.,*
in response to message #1 by rebecca yurkanin

Becky,

I'd say eBay IS the best place to sell it. If you want to get the most money, you should set your personal dislikes aside. One cannot have it both ways--maximum cash for minimum effort.

Namir

Re: I have an HP-70 vintage calculator for sale

*Message #3 Posted by **Dan Grelinger** on 13 Apr 2009, 1:39 p.m.,*
in response to message #1 by rebecca yurkanin

If you want the maximum selling price, and can put up with all the fees (close to 12% when everything is factored in) then ebay is probably the best way to go.

An alternative is the classified ads on this site.

Re: I have an HP-70 vintage calculator for sale

It's nowhere near 12%.
On eBay Australia (other countries should be very similar I presume?), for say a $250 listed item there would be a $2.50 listing charge + $0.59 for the gallery photo (the only essential option).
Another $3.93+$4.81 final value fee if it sells for say $250.

Then 2.4% PayPal fee ($6) if they pay that way.
Total fees $17.83 or 7.1%, or only 4.7% if not using PayPal.

Yes it's high and outrageous, but not 12%

See:
http://pages.ebay.com.au/help/sell/fees.html

Only a fool would use Ebay's picture hosting service for bigger and extra photos and pay the extra fees, plenty of fee options exist.

Dave.

Re: I have an HP-70 vintage calculator for sale

*Message #5 Posted by **Dan Grelinger** on 13 Apr 2009, 10:05 p.m.,*
in response to message #4 by DaveJ

Here is an example of what it costs to sell via Ebay and take PayPal.

$10 Initial Bid: $.55 Insertion Fee
$25 Winning Bid: $2.19 Final Value Fee
(Assume $10 in shipping cost)
Pay Pal Fee: $1.32

So, a total of $4.06 in fees for a $25 sale. If you whip out your trusty HP, you will see that the fees are over 16% of the sale! If the above transaction was to someone across the boarder, make that 17%!

So, you don't think the fees can be anywhere near 12%?

BUZZZZZZZ! Wrong Answer, try again.

Dan

Re: I have an HP-70 vintage calculator for sale

*Message #6 Posted by **Michael de Estrada** on 13 Apr 2009, 11:02 p.m.,*
in response to message #5 by Dan Grelinger

Dan,

Ebay final sale fee rates for auctions decrease significantly for higher amounts. The rate is 8.75% for the first $25 and then decreses to 3.5% for the amount over $25 and up to $1000, where it decreases to 1.5%. So, yes, it really does not pay to sell anything for less than $25 unless you are a powerseller, but if your item sells for several hundred dollars or more, it makes a lot more sense.

Michael

The fees come down very significantly based on final value price.
Please re-do your calcs based on a realistic selling price for what we are talking about here and compare apples with apples.

I do believe you'll find it's closer to 5% (list+sale) for a $250 item, not including PayPal. So I stand by my comment that it's nowhere near 12% for the OP's calculator we are talking about here.

http://pages.ebay.com/help/sell/fees.html

Only a fool or high volume power seller sells cheap things (like $25) on eBay where the fess are a killer.

On Ebay Australia, to sell a $250 item, the fess are as I quoted previously. 7.1% using PayPal, or only 4.7% without PayPal. This is slightly less than it is in the US.

Dave.

Ditto for both of your posts when you failed to mention the fees are only as high as you claim on low priced items, which clearly does not relate to the subject of this forum. Therefore your statements are inaccurate when it comes to selling almost any vintage HP calculator.

Dave.

Re: I have an HP-70 vintage calculator for sale

*Message #10 Posted by **Dan Grelinger** on 15 Apr 2009, 5:30 p.m.,*

Re: I have an HP-70 vintage calculator for sale

*Message #11 Posted by **bennyboy6** on 13 Apr 2009, 5:00 p.m.,*
in response to message #1 by rebecca yurkanin

Recently, a couple of HP-70's sold on ebay for $170- or so each.

Why not give classifieds on this site a free spin? Ask for $250 or more. If you don't get what you want on classifieds here, you can try ebay next.

You can use Paypal as payment for mutual protection.

Your only fees would thus be the Paypal fees, which vary based on whether you are Paypal premier/business or Paypal personal. Either way, it should be 3-5%. No need to pay ebay fees.

Re: I have an HP-70 vintage calculator for sale

*Message #12 Posted by **DaveJ** on 13 Apr 2009, 5:29 p.m.,*

My PayPal personal Premier account (the free one) is only 2.4% + $0.30

Dave.

Re: I have an HP-70 vintage calculator for sale

*Message #13 Posted by **bennyboy6** on 13 Apr 2009, 5:52 p.m.,*
in response to message #12 by DaveJ

If you go to this page, assuming monthly sales under $3K,

For USA Paypal, it is 2.9% plus 30 cents, if you have a premier or business account. 4.9% plus 30 cents if you only have a personal account.

I assume you are Australian and I am guessing Paypal Australia has different rules.

Paypal fees page

and I neglected to mention that there is an additional 1% surcharge for cross border transactions (assuming you are in the USA and are accepting payment from someone outside the USA).

However, if you insist on non-credit cards, where the buyer has to get the money out of their bank and into Paypal before paying, you can avoid fees by acceptance into a personal account.

Re: I have an HP-70 vintage calculator for sale

*Message #14 Posted by **DaveJ** on 13 Apr 2009, 5:31 p.m.,*
in response to message #1 by rebecca yurkanin

I agree with the others, Ebay is the place to sell if you want the most money.
I don't know where you are based, but if you want the most bidders then you have to sell worldwide, and tick the box on the auction to make sure your listing is seen world wide.

The most important thing is BIG clear photos, and lots of them.

Dave.

L() and G() sample

*Message #1 Posted by **Sancerre (Phoenix)** on 13 Apr 2009, 12:07 a.m.*

Hi,

A while back, (3/17/2009) to be exact, there was a long thread concerning a solver equation that would be able to solve (iteratively) two unknowns. During that thread, it was mentioned that the Let/Get functions did not have a clean translation when ported over to the 49/50G.

Can some provide an appropriate example of using Let/Get with either the 17BII/19BII? I've been 'playing around' a bit with RPL and would like to see whether there are some routines that could easily mimic the functionality.

Regards,

Tod

Re: L() and G() sample

*Message #2 Posted by **Don Shepherd** on 13 Apr 2009, 2:54 a.m.,*
in response to message #1 by Sancerre (Phoenix)

The purpose of the Let and Get functions in the 17Bii, I would say, is to allow "local" variables; that is, variables that will not appear in the menu and that the user will never see. This functionality, along with the sigma and IF functions, allows the 17Bii solver to operate somewhat as a "programming" language. The Let function allows you to assign a value to a local variable, and the Get function allows you to reference that variable without it appearing in the menu.

```
L(A:12*INT) loads local variable A with 12 times variable INT
G(A) references the current value of local variable A
The variable A will not appear in the menu.
```

I don't know much about RPL and the 50g, or how its menu system works, but I assume that local variables are no problem on that system, since it is a "real" programming system.

Re: L() and G() sample

*Message #3 Posted by **Sancerre (Phoenix)** on 13 Apr 2009, 9:37 a.m.,*
in response to message #2 by Don Shepherd

That is just what I thought. I suggested that the 50G solver could handle pretty much anything you threw at it. The 'problem' stated was that you could not (easily) port over formulas from the 17BII/19BII due to let/get. I am looking for an example of a problematic formula so that I can find a solution to the problem.

Re: L() and G() sample

*Message #4 Posted by **Peter A. Gebhardt** on 13 Apr 2009, 6:38 p.m.,*
in response to message #1 by Sancerre (Phoenix)

Tod,

I've brought that issue up in the following threads:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=94969

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv016.cgi?read=99856

I didn't follow-up on using this proposed solution for myself, because I "fell in love" with the 200LXs shortly afterwards ... ;-))

Best regards,

Peter A. Gebhardt

Re: L() and G() sample

*Message #5 Posted by **Sancerre (Phoenix)** on 13 Apr 2009, 6:53 p.m.,*
in response to message #4 by Peter A. Gebhardt

Thanks Peter,

I actually found the post, but hadn't had a chance to update the thread. Can you provide a typical formula that you might want to port over to the 50G?

I would like to take a look at the problem just for the challenge. Besides, you might end your love affair one day, and perhaps I'll have a solution for you. By the way, I am a huge fan of the 17BII, and I found a 19BII recently just because I had too. However, the display and connectivity of the 50G are just too much to ignore.

--Tod

Re: L() and G() sample

*Message #6 Posted by **Peter A. Gebhardt** on 14 Apr 2009, 4:39 a.m.,*
in response to message #5 by Sancerre (Phoenix)

Tod,

one of the most useful, albeit also most challenging apps is found here:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=234

This is W. Bruce Maguire II's fine work on implementing a refined & faster version of the "basic" FMRR algorithm found in Chris Coffin's book.

Thanks for taking the challenge of this issue of portability!

Peter A. Gebhardt

Re: L() and G() sample

*Message #7 Posted by **Sancerre (Phoenix)** on 15 Apr 2009, 10:36 a.m.,*
in response to message #6 by Peter A. Gebhardt

Peter,

Admittedly that is a bit more complicated than I had wished. I'll put together a simple formula that uses let/get first; then I'll add using cash flows. I'll keep you posted.

--Tod

Re: L() and G() sample

*Message #8 Posted by **Peter A. Gebhardt** on 15 Apr 2009, 6:23 p.m.,*
in response to message #7 by Sancerre (Phoenix)

Tod,

I've choosen the example above, because it is well tested already in it's native SOLVER form on the old 17bII to the newest 17bII+ and it shows the deficiencies of my proposed approach - declining readability of the resulting code after "parsing" it to some 50G compatible code.

It was not meant to stress your willingness or ability to tackle the problem ;-))

Thanks again for taking on the challenge!

Peter A. Gebhardt

It is worth this calculator more than $2500?

*Message #1 Posted by **Gonzalo Fernandez (Spain)** on 12 Apr 2009, 5:45 a.m.*

See link

Re: It is worth this calculator more than $2500?

*Message #2 Posted by **DaveJ** on 12 Apr 2009, 7:01 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

That's almost $3600 Australian dollars, that is INSANE!

If bought as an investment/resell then surely there would be very little chance of an upside and only an eventual (big?) downside. Crazy.

If bought for use as a usable tool, then that's even crazier.

If bought to complete a collection etc and the person has plenty of cash to throw around, then fair enough, but I find it puzzling there would be so many bidders willing to pay very serious money for this thing. There are half a dozen bidders over EU$1000.

Can anyone explain this at all?

Dave.

I don't think I did. You sniped the interesting part:
"but I find it puzzling there would be so many bidders willing to pay very serious money for this thing. There are half a dozen bidders over EU$1000."

Now, one or two crazy cashed-up collectors I can understand, but half a dozen or so?

I'm not entirely up on the collectable market (is there something incredibly special about this one?), but people don't even pay anywhere near these crazy prices for arguably more collectable machines.

Dave.

You'll find enough heads visiting this forum, and there are some more folks floating around outside.
(For sake of clarity: I didn't take part in this auction).

A few years ago, a Japanese eBayer bought a boxed HP-01 for about US $4500,
and that was at a time when the USD was worth much more than today,
and despite the fact that there exist many more HP-01 units than W&W HP-41CY Turbo units.

Also don't forget that most of you didn't even _know_ that something like a CY was ever made;-)

HTH

Now that poses an interesting question. Does that make it *generally* more collectable in that case? Or is the calculator collectable market more limited to the mass produced items more familiar to the collectors?
If more unique and obscure units are more valuable (as this auction seems to demonstrate), could you

increase the value of your collection by modifying units? :->
I can see the eBay ad now: "This is the worlds only example of a custom produced HPxx running at X.xx MHz with a red racing stripe!"

Dave.

Actually, it was worth a lot more to the winning bidder, since he or she placed 4 additional higher bids. It looks to me like this may be a special case of a unique and very rare custom item, which might justify the price. I've seen this sort of thing with autos, where one-off custom-built specials command much higher prices at auction.

Michael

When it was new, the whole package was worth what, maybe $1300 or so? Factoring in inflation, minus some for wear; the buyer still got a bargain and the seller lost a bit but got to use the tool for 25 years. I don't need that setup for my 41 but it looks like a win/win for them. I'd sure hate to spend that much for 30 year old technology but it's a 41. It does everything and does it in RPN.

Way too EXPENSIVE

*Message #10 Posted by **Namir** on 13 Apr 2009, 2:13 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

In as much as a fan of the 41 line that I am, I would say that $2500 is way too much. I keep things in focus and ask myself about the computational power of the 41CY compared with the CPU power of computers today. I have a power-user desktop (which I call Hercules) that performs calculations that seemed to be in the realm of science fiction 30 years ago!!! No calculator exists that can be in any shape or form, in the same league of my Hercules.

There's a lot more to the practical usefulness of such a calculator than raw computing power, which is why I use my 41cx far more than my 71's, and why I use it every day even though I also have a modern PC. I'd like to have a 41CY, but not to the tune of $2500.

Are there not modern replacements, like an iPhone with a 41 emulator?

Dave.

This is probably a rhetorical question, but I'll answer anyway.

Yes. If you can get past the physical keyboard, then i41CX+ on the iPhone/iTouch is a very good 41CX replacement. The 5X adjustable speed bump, built-in printer, module support, and the ability to backup and restore flags, registers, state, and programs makes this a very viable 41CX (or multiple with state backup/restore). i41CX+ also works in the dark (and full sun), supports overlays, and programs/modules can be downloaded (http) and uploaded (email). Lastly HEPAX support may be available soon. And, with the to-be-released iPhone 3.0 OS with dock connector API it may be possible to integrate JFG's PILBox with the iPhone and add HP-IL.

Yes there are alternatives.

I think the issue here is whether this particular item should be considered a collectable and rare antique or a practical modern appliance. Therein lies the true value. Why would someone pay 100 times as much for an HP-35 Red Dot with ROM bugs and bulky NiCads, than something far more useful that can be purchased in any store? To me, the Red Dot is an antique and nothing more, however, I regard my HP-48SX as a modern appliance, which is why I recently upgraded to a HP-50g. That is also why I will not pay the very high prices currently being asked for the HP-42S, and am perfectly happy with Free42.

I want to be able to use it as a controller to a dozen IEEE-488 lab instruments at once like you can a 41. I also want full control, which I don't feel I can have with a huge GUI OS turning me into an appliance operator. I also want the stability you don't get in consumer products that are here today and gone tomorrow that require transferring and adpating everything to a new system so frequently. I've had certain programs in my 41 continuously for nearly 20 years.

In that case an old DOS PC you can pick up anywhere for free is by far the cheapest solution for IEEE-488 control. It's not uncommon for DOS programs to stay up and running for a decade or more, the limitation essentially being the power supply reliability.

No need to use your expensive HP41 for that.

Dave.

Actually, in addition to my modern PC, I do still use an old DOS one for some things. I also want the handheld's portability though. Even though the lab instruments aren't portable, the 41 or 71 can be disconnected in an instant to go from the workbench to my desk to the attache case and you can work on your project on the commuter train home, taking up a lot less room than a laptop and booting nearly instantly.

Using resource-rich PCs allows me to explore complex algorithms to solve very hard nonlinear regression problems that NO calculator can even touch. Being able to venture in such areas of new algorithms is an opportunity that I cherish. Portability in my case, is not an issue.

At the end of the day, my money goes to the computing devises that DO DELIVER!

Namir

It's worth even more ...

*Message #20 Posted by **Juergen Keller** on 13 Apr 2009, 5:08 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

... at least I wouldn't sell mine for EUR 2000.- :-)

The problem is that there are more people that want to buy a 41CY than there are 41CY for sale, so it's simply a matter of demand and supply. That's capitalism in its essence, may the money be with you!

Can a calculator collection be considered an investment? I don´t think so, is not the same collecting old watches, stamps, coins or paints than collecting calculators.

I thought this to be rhetorical, because yes, to the buyer it was worth it.

*Message #22 Posted by **Geoff Quickfall** on 13 Apr 2009, 1:09 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

Only he can tell us the 'Why'.

I use the HP41CX extensively at work and at home as a brain teaser. I have outfitted it with a Clonix, double x-memory, IR transmitter for printing and numerous modules for fun and use.

I probably have overstepped the boundary of what others would be willing to invest with respect to time and money. In fact, I purchased a spare for when I go back to school as my self created programs still apply to my field and program running time is not a factor.

I also restore watches, over 150 of them so far. These are only going to be an investment when I start selling them (after retirement). I have done my homework on type and complication, that employs the most fun for repair and the highest return in future sales. The only unkown is whether anyone will want a museum restored, mechanical watch in the future?

So back to the buyer, as an earlier poster said, if you have the money to play then play. For me the CY would finish my HP 41CX series off perfectly.

So the question is, does anyone have a spare CY for sale for under $200 that they are willing to sell? Mainly because it means nothing to them including the possibility of a $2500 sale?

Drop me a line and make a quick $200 ;-)

That's my 2 cents!!!

Geoff

This is a very interesting and enjoyable article!

I used my first HP, the HP-67, to perform reactor power calorimetric calculations on a U.S. ballistic missile submarine in the late 1970s. The magnetic card programable HP-67 saved a *lot* of time performing this procedure, which could often compromise ship mission. I used it to compute closest point of approach for nearby maritime traffic and other navigational tasks when I was officer of the deck, and to perform other engineering calculations. That HP-67 was a personal purchase, costing me most of one month's take-home pay

as a Navy lieutenant junior grade, and I wrote all programs used. I still have it, though it needs card reader roller repair. Were I to do the same things today, the HP50g would easily be my choice for these critical applications.

These small machines performed very real and important functions. Your interview shows that. It brought back memories. Thanks!

Hi Geoff,

Thanks. I did not have to wait too long to read about you and your calculators. Wonderful! You are one of the lucky fellows who can combine work with pleasure. If you are still looking for the HP35S let me know. I should be able to get one in Singapore.

Best regards,

Prabhu

Thanks everyone, I was extremely surprised and honoured by the interview..

*Message #6 Posted by **Geoff Quickfall** on 12 Apr 2009, 12:49 a.m.,*
in response to message #5 by Prabhu Bhooplapur

and as I stated earlier, I can think of many more deserving HP'iers to interview than me!

Prabhu,

thanks for the offer, but I have secured the HP35s and enjoy playing with it. It however will not fulfil all the abilities of the HP 41, 42s or 48 series as the printer functions do not exist.

Still, fun to convert and see all the old programs, sans timer, printer and HPIL, function in a 'new' calculator! And mine does not have the slanted display and (it's new) none of the keys bounce and etc..

Cheers, Geoff
